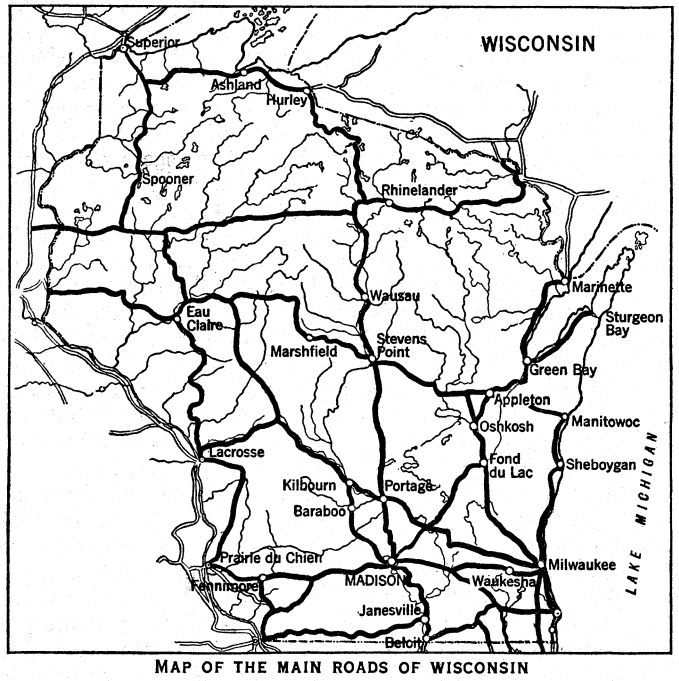
WIRTH, KARL JOSEPH *(1879–* **),** German statesman, was born at Freiburg im Breisgau on Sept. 6, *1879,* the son of a foreman mechanic. Educated at Freiburg university, he became (1908) professor of natural science at the technical college in Freiburg. In 1913 he obtained a seat in the Baden diet, and in 1914 became a member of the Reichstag. In 1919 he was minister of finance for Baden and was elected to the Constituent Assembly of the Reich. In March *1920* he succeeded Erzberger as Reichsminister of Finance, a post which he held until Feb. *1922.* In May *1921* he became chancellor on the occasion of the Allied ultimatum regarding reparations, with an avowed policy of the fulfilment of treaty obligation (*Erfüllungspolitik*). In August and September of that year he came into conflict with Von Kahr, the Bavarian premier, who refused to apply to Bavaria the state of national emergency which Wirth had proclaimed consequent on the murder of Erzberger. Wirth stood his ground, and Von Kahr was compelled to resign, but two months later the decision of the League of Nations on the partition of Upper Silesia between Germany and Poland led to a widespread revolt against the policy of fulfilment and to the secession of the German democrats, including Rathenau, from the cabinet. Wirth resigned, but resumed office on Oct. *26.* He then sought to establish a "Great Coalition" which should include all but the Nationalists and the Communists, but failed to secure the support of the Social Democrats, although he had obtained a measure of agreement, for the People's Party abandoned their opposition to the forced loan of a milliard gold marks and the majority socialists postponed their demand for a gold levy. But the appointment of Rathenau as foreign minister alienated the People's Party, for Rathenau, though a great industrial magnate himself, was suspected by "heavy industry" of socialist tendencies. He was unable to carry out the necessary financial measures to stop the depreciation of the mark, and in Nov. *1922,* when the mark had fallen to 9,000 to the $, again resigned, and Dr. Cuno (*q.v.*) formed a cabinet to cope with the financial crisis *(Kabinett der Arbeit).* Wirth resigned from the German Centre Party in Aug. *1925,* but rejoined the party in *1926,* after the reaffirmation of the party allegiance to the republic.

WISBECH, a municipal borough, market town, and port in Isle of Ely, England, on the L.N.E.R. It lies in the flat fen country, on the east bank of the river Nene, 11 mi. from its outlet on the Wash. Pop. *(1938) 15,620.* Area, 7.29 sq.mi. The church of St. Peter and St. Paul has a double nave, with aisles, the north arcade being Norman; but the rest of the building is mainly Decorated and Perpendicular. There are remains of a Norman west tower; the Perpendicular tower stands on the north side. The shipping trade is carried on both at the town itself and at Sutton bridge, 8 mi. lower down the river. The chief imports are timber and general merchandise, and the exports coal, corn and other agricultural products and salt. In the neighbourhood large quantities of fruit are grown, including apples, pears, plums, gooseberries and strawberries. The borough received a charter of a fair in 1327 and was incorporated in 1549.

See W. Watson, *History of Wisbech* (Wisbech, 1827); N. Walker and C. Thomas, *History of Wisbech* (Wisbech, 1849); *History of Wisbech* (Wisbech and London, 1833); C. Marlowe, *The Fen Country* (1925).

WISCONSIN, popularly called the "Badger State," is one of the North-central States of the United States. It is bounded north by Lake Superior and the upper peninsula of Michigan, east by Lake Michigan, south by Illinois and west by Iowa and Minnesota. The greater part of the western boundary is formed by the St. Croix and Mississippi rivers flowing southward. From south to north (42° 30′ N., 47° *3′ N.)* the greatest length of the State is about *300* m. and from east to west (86° *49′* W., to 92° *54′* W.) its extreme breadth is about *260* miles. The lake shore boundaries on the north and east are over 500 m. in length. In area the state totals 56,154 sq.mi., of which 1,439 are water surface.

Physical Features.— The surface of Wisconsin is generally of a rolling or undulating character, interrupted only by the sharper ridges of changing geological strata, the bluff lands along the Wisconsin and Mississippi rivers, and isolated hills and ridges of older rocks which, especially in the north-central part of the State, have thrust themselves up through the younger sedimentary rocks. Rib Hill (1,940 ft.), the highest point in the State, near the town of Wausau in north-central Wisconsin, is an elevation. of the latter character. So also are the Baraboo hills, a range in the south-central part of the State. The lowest part of the State is along the shore of Lake Michigan *(579.76* ft. above sea level). The mean elevation is *1,050* feet. The divides which form the water sheds between Lake Superior, Lake Michigan and the



MAP OF THE MAIN ROADS OF WISCONSIN

valley of the Mississippi river and its tributaries — the three main drainage areas — are very slight. Of these areas that of Lake Superior is much the smallest. Its short, rapid streams seldom rise more than *30* m. S. of the lake shore. Of the streams flowing into Lake Michigan the Fox river *(260* m.) is the most important. Rising in the south-central part of the State it flows north and east by a circuitous route through Lake Winnebago, and thence into Green bay. In its upper course it is joined from the north by Wolf river, an important tributary. The Menominee and Oconto are smaller rivers also flowing into Green bay, while

farther south the Sheboygan and Milwaukee rivers empty directly into the lake. The harbours along Lake Michigan are mainly enlarged mouths of rivers.

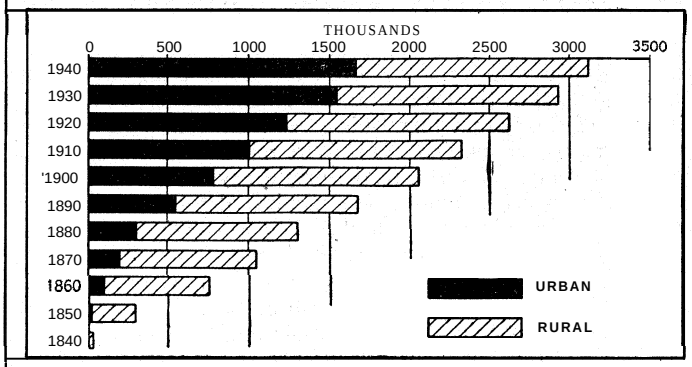
The largest by far of the drainage areas is that whose waters flow into the Mississippi river. The Wisconsin river, the principal tributary, rises on the upper Michigan border and flows south and west for 600 m. through the heart of the State to join the Mississippi near Prairie du Chien. It is navigable for light craft as far as Portage, 200 m. from its mouth. At this point the Fox river, flowing into Lake Michigan, is but a mile to the east across low, marshy ground. The proximity of the two rivers made this a frequent route for early explorers and fur-traders travelling by canoe from the lake to the Mississippi; a canal now connects them. North of the mouth of the Wisconsin the Mississippi receives several rivers of considerable length, the most important of which are the Black, Chippewa and St. Croix, the latter forming the Wisconsin-Minnesota boundary line for 135 miles. The southern part of the State is drained by a number of streams which find their way to the Mississippi after passing into Illinois. The largest of these are the Rock, Fox (of the Illinois) and Des Plaines rivers.

Glacial ice sheets covered all but the south-western quarter of Wisconsin and greatly influenced the topography and soils. They levelled the hills, filled in the valleys and ground and mixed the soils. In the terminal moraines invaluable sand and gravel deposits were left. The glacial ice was further responsible for the thousands of lakes which not only add to the beauty of the State and serve increasingly as summer resorts but also serve to control the water flow of the rivers and prevent floods. The largest of 'these is Lake Winnebago with an extreme length of 30 m. and breadth of 10 m., on the banks of which are several important manufacturing cities. In the south and east portions of the State the lakes are beautiful, clear bodies of water with sandy or gravelly shores, and, as a rule, high banks heavily wooded. Many of them are famous as summer resorts, notably Lake Geneva, Green lake, the lakes in Waukesha county and the famous "four lakes" near Madison. A second group of many hundreds of lakes is found in the highland district of northern Wisconsin, chiefly in Vilas, Oneida and Iron counties. Most of these are small, but there are few portions of the world where so large a proportion of the total area is occupied by lakes. A third group, also consisting of hundreds of small lakes lying close together, is to be found in north-western Wisconsin, especially in Washburn, Burnett, Polk, Barron and Sawyer counties.

In all parts of the State, except the driftless area of the south-west, numerous large and small marshes are also to be found, many of them representing filled in or drained lake beds. The driftless area is lakeless, and has in general a much rougher topography. In its limits much of the most attractive scenery of the State is to be found. Between the Wisconsin and Mississippi valleys is the Western Upland, a plateau, ordinarily about 1,200 ft. in elevation, but dissected in every direction by tributaries of the two rivers which bound it into a succession of ridges and coulees, the former from 300 to 500 ft. above the valley bottoms. The bluffs are wooded and often capped by picturesque limestone cliffs. Originally the greater portion of Wisconsin was covered with forests, although in the south and west there were large tracts of open prairie land. In the south the predominating trees were hickory, elm, oak and poplar. Along the shores of Lake Michigan, and extending inland a quarter of the distance across the State and northward through the Fox river valley, there was a heavy belt of oak, maple, birch, ash, hickory, elm and some pine.

Climate. — The climate of the State is influenced by the storms which move eastward along the Canadian border and by those which move northward up the Mississippi valley; that of the eastern and northern sections is moderated by the Great Lakes. The winters, especially in the central and north-westem sections, are long and severe, and the summers in the central and south-western sections are very warm; but cold and heat are less felt than they are in more humid climates with less extreme temperatures. The average length of time between the last killing frost of spring to the first killing frost in the fall ranges from 170 days in the south-eastern corner of the State to 75 days near the Michigan boundary. It is much longer near the lakes and along the Mississippi river. The distribution of rainfall is remarkably uniform, the mean precipitation being about 31 inches. About half the rainfall comes in May, June, July and August, the period of greatest crop growth. The average snowfall is 45 in., though along Lake Michigan and in the northern part of the State it reaches an average of 53 inches.

Population. — The population of Wisconsin in 1840 was 30,945; in 1860 it was 775,881; in 1880, 1,315,497; in 1910, 2,333,860; and in 1940, 3,137,587. This last figure represents an increase of 6·8% over the population in 1930. The population per square mile was 57.3, as compared with 44·2 for the United States as a whole. Of the 1940 population, 1,679,144, or 53.5%, lived in urban places, that is, in cities and villages of 2,500 or more.



BY COURTESY OF THE U.S. BUREAU OF THE CENSUS

URBAN AND RURAL POPULATION OF WISCONSIN: **1840–1940**

The number of occupied dwelling units returned in the housing census of 1940 was 827,265, which is approximately the same as the number of families. The average population per family (occupied dwelling unit) declined from 4·1 in 1930 to 3.8 in 1940. The white population of Wisconsin formed 99·2% of the total in both 1940 and 1930. The number of males per 100 females in the entire population of the state was 104·6, though there was a considerable excess of females in the urban population, the sex ratio being 96.4 for the urban and 114·8 for the rural population. The number of persons 65 years old and over in Wisconsin increased from 192,059, or 6·5% of the total population in 1930 to about 242,000, or 7·7%, in 1940. The population of the state and of its principal cities is summarized below:

Area	Population			Per cent of increase	
	1940	1930	1920	1930–40	1920–30
The State	**3,137,587**	2,939,006	**2,632,067**	6·8	11·7
Urban	**1,679,144**	1,553,843	**1,244,858**	8·1	24.8
Rural	1,458,443	1,385,163	1,387,209	5·3	—0·1
Per cent urban	53·5	52·9	47·3	..	..

Superior	**35,136**	**36,113**	**39.671**	—2.7	—9·0

The first wave of settlement (1824–40) in the lead regions of southwestern Wisconsin was made up principally of southerners who had ascended by the convenient Mississippi route. The next wave (1835–50) consisted of those coming west from New York, Pennsylvania, Michigan and other eastern states who took up a large proportion of the land in the southeastern counties of Wisconsin. After them (1840–60) came the great tide of German and Norwegian immigration. The Germans settled mainly from Milwaukee west and north to the Fox river and Lake Winnebago. The Norwegians settled in Dane and other counties of south-central Wisconsin. Swiss, Swedish, Danish, Irish, Dutch, Belgian, Austrian and Polish colonies were also soon founded. The Germans total more than one third of the foreign stock,

Government. — The original constitution of the state, adopted in 1848, is still in force, though a number of amendments have been made. An amendment may be proposed by either house of the legislature, and if passed by a majority of the members of each house in two successive legislatures. it must be submitted for ratification by a majority vote of the people. A constitutional convention may be called if the proposal is adopted by a majority of the senate and assembly and voted upon favourably by the people at the following election. The legislature, composed of the senate and assembly, meets biennially in January of odd-numbered years. It may also be called into special session by the governor, but only to transact the specific business named in the governor's call. There were in 1940 100 assemblymen and 33 senators, the former chosen for two-year terms, the latter for four years.

Executive power is vested in a governor and a lieutenant governor, elected for two years. The governor has a veto on legislation which may be overridden by a two-thirds vote of the members present in each house. The lieutenant governor is president of the senate with a casting vote only. The administrative officers, a secretary of state, treasurer and attorney general, are elected for two years and in *ex-officio* capacity act also as commissioners of public lands. The secretary of state is also *ex-officio* auditor. A state superintendent of public instruction is elected for a four-year term. A number of very important governing commissions have been established, the chief ones being the industrial, tax and public-service commissions. The industrial commission has authority in matters involving relations between management and labour. With the rise of Wisconsin as an industrial state, the commission has become increasingly important, and its advanced policies have challenged the attention of the economic world. The public service commission has jurisdiction over the rates and service of railways and other public utilities. Each of the three commissions consists of three members, appointed by the governor with the consent of the senate. Other important commissions and departments are: the state highway, banking, conservation, insurance, and grain and warehouse commissions; the department of agriculture and markets; the bureaus of engineering, of personnel, of purchases, and of the budget; the boards of engineering, of health, of vocational education and of control (over charities and correction).

The judicial power of the state is vested in a supreme court of seven members, each elected for a term of ten years, which has appellate jurisdiction throughout the state. Two terms a year are held at Madison.

There were in 1940 20 circuit courts, the court in the second circuit (Milwaukee) having 9 branches.

Finance. — The assessed valuation of all tangible property for state tax purposes in 1929 was $5,975,952,415; but by 1934 it had declined to $4,133,546,513 and rose only to $4,393,151,680 by 1939.

Since 1931 only a negligible proportion of the state revenue has been derived from a general property tax although this source continues to be the main reliance of local governments and school districts. In 1939–40 revenues going into the state's general fund totalled $112,948,987, of which $12,170,329 was raised by a state levy on incomes; $2,782,887 by a surtax for old-age pensions; $14,801,473 by a tax on various classes of public-utility and transportation corporations; $1,875,209 by a tax on insurance companies; $2,384,202 by inheritance taxes; $6,381,036 by liquor taxes; $22,444,020 by a motor fuel tax; and $13,524,069 by automobile registration fees.

Expenditures for 1939–40 amounted to $114,587,978, of which $7,855,906 was charged to educational aids; $34,257,645 to highways; $17,437,167 to charitable aids; and $10,811,841 to support of the state university. In 1940 the state debt was only $1,184,000 or 37½ cents per capita.

Banks in Wisconsin numbered 580 in Oct. 1939, of which 105 were national banks. Their resources and liabilities totalled $1,068,856,000; their capital, surplus and undivided profits were $111,970,000; deposits amounted to $946,869,000, of which $444,000,000 were in the nature of time or savings accounts.

Education. — Wisconsin's population of school age (5–17 inclusive) was 687,324 in 1940. Its public-school enrolment for the same year was 535,175, as compared with 564,022 in 1930 and 465,243 in 1920. Of the 1940 enrolment, 374,864 pupils were in the elementary and 160,311 in the secondary grades. The steady decline of the school enrolment during the decade was generally ascribed to a decrease in the birthrate, the cessation of immigration and more accurate statistics. In the year 1939–40 there were 21,577 public-school teachers in the schools of the state whose average salary was $1,307. New laws giving tenure rights to teachers and fixing the school term at nine months accounted for slight increases in salary averages. Expenditures for public schools in the state in the year 1939–40 amounted to $51,791,020, or $16.57 per capita of the total population. Most of this amount was raised locally by the ordinary school tax, but almost $8,000,000 consisted of state aids appropriated by the legislature. The elementary and secondary public-school system is under the supervision of the state department of education, headed by the state superintendent elected for four years. The department also has charge of the school for the blind at Janesville and the school for the deaf at Delavan.

The state maintains nine teachers colleges which, listed in the chronological order of their establishment, are situated at Platteville, Whitewater, Oshkosh, River Falls, Milwaukee, Stevens Point, Superior, La Crosse and Eau Claire. All offer courses ranging from one to four years and grant the bachelor's degree to graduates of the four-year course. They are administered by a board of regents of normal schools composed of 11 members including the superintendent of public instruction *ex officio*. By act of the 1911 legislature, Stout institute, located at Menominee, was taken over by the state and is supported as a training school for vocational teachers. It is administered by the state board of vocational education. The University of Wisconsin (*q.v.*) is the highest of the state educational institutions.

It is estimated that there are about 115,000 pupils of grade- and high-school rank in the private and parochial schools and academies. Of private institutions of collegiate rank the leading are Beloit college at Beloit, Carroll college at Waukesha, Lawrence college at Appleton, Milwaukee-Downer (for women) at Milwaukee, Milton college at Milton, Marquette university at Milwaukee, Northland college at Ashland, Ripon college at Ripon, and St. Norbert college at West De Pere.

Charities and Corrections. — A department of public welfare controls most of the state charitable, curative, correctional and penal institutions. It also directs the activities of other agencies related to the work of these institutions, such as the juvenile and probation departments, and has supervisory and inspectional powers with respect to county asylums for the insane, county tubercular sanatoria, county and city care of the poor, private child welfare and child placing agencies and jails and lockups within the state. There are 13 state institutions under the management of this board, namely: state hospital for the insane at Mendota, Northern hospital for the insane at Winnebago, Central state hospital for the criminal insane at Waupun, Northern Wisconsin colony and training school for the feeble-minded and epileptics at Chippewa Falls, Southern Wisconsin colony and training school for feeble-minded and epileptics at Union Grove, industrial school for boys at Waukesha, industrial school for girls at Milwaukee (to be transferred to Oregon), state reformatory (for males) at Green Bay, an industrial home and a state prison for women both at Taycheedah, state prison at Waupun, workshop for the blind at Milwaukee and the state public school at Sparta. Supervision of state sanatoria for the care of tubercular patients was transferred in 1939 to the state board of health.

Agriculture and Livestock. — Wisconsin is one of the leading agricultural states of the United States. In 1940, 62·5% of the total area of the state or 22,876,494 ac. was farm land. Of this 10,280,526 ac. were classified as cropland, 2,757,420 ac. as pasture land and 9,838,548 ac. as woodland and miscellaneous. Farm population in 1940 was 873.462, an increase from 1930 of 0·1%; the number of farms was 186.735, an increase during the decade of 2·7%. During the same period the average size

of farms increased from 120·3 ac. to 122.5 ac.

The value of all farm lands and buildings was set in 1930 at $1,731,517,017, but by 1940 had declined to $1,188,559,407. On Jan. 1, 1938, the estimated value of all livestock in the state was $285,865,000, of which cattle accounted for 65.9% and horses and mules for 23%. Between 1930 and 1940 the value of farm buildings decreased from $745,932,000 to $592,488,721, but the value of implements and machinery increased from $170,279,000 to $173,830,861. Land values, however, declined steadily from $1,618,913,000 ($73.09 per acre) in 1920 to $985,585,000 ($45.06 per acre) in 1930 and to $596,070,686 ($26.06 per acre) in 1940. The highest land values are in the southern and eastern counties.

Cash farm income in 1940 was $303,203,000, of which $38,637,000 came from the sale of crops and $264,566,000 from livestock products. The chief crops and their acreage in 1940 were: tame hay, 4,086,000; corn (maize) 2,255,000; oats, 2,251,000; barley, 654,000; soybeans 311,000; rye 193,000; potatoes, 193,000; wild hay, 140,000; wheat, 86,000; tobacco, 24,500. The production of each crop (with yield per acre in parentheses) was as follows: tame hay, 7,416,000 tons (1·81); corn, 93,582,000 bu. (41·5); oats, 96,793,000 bu. (43.0); barley, 24,525,000 bu. (37.5); soybeans for beans, 648,000 bu. (17·5); soybeans for hay, 455,000 tons (1·85); rye, 2,509,000 bu. (13·0); potatoes, 15,054,000 bu. (78·0); wild hay, 154,000 tons (1·1); wheat, 1,743,000 bu. (20·3); tobacco, 36,532,000 lb. (1,491). Wisconsin's climate is so favourable that failure of any one crop is unknown.

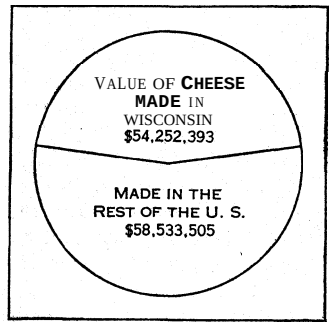
A very small proportion of Wisconsin's crops is marketed direct, but they are fed to the livestock on the farms, and the farmers receive their income chiefly from livestock products. Chief of these are dairy products, for Wisconsin is the leading dairy state in the United States. In 1937 it was estimated that 50% of all farm income came from farm milk produce. In 1941 Wisconsin ranked fourth among the states in the total number of cattle owned, the number being 3,542,000 and their value, $219,504,000. Of this number 2,289,000 were milch cows and heifers two years old or more, so that in the number of milch cows Wisconsin was far in the front of all other states. Doubtless it was the large proportion of Swiss, German and Danish settlers in Wisconsin that gave the cheese making industry its momentum, for very early these people were making and selling the famous cheeses of their native lands. In 1937 Wisconsin produced nearly 55% of all the cheese made in the United States. It also produced about one-third of the condensed and evaporated milk. In the production of creamery butter the state formerly ranked next to Minnesota. but after 1925 Wisconsin lost this relative position to Iowa and fell off in the absolute quantity of its output from 170,202,000 lb. in 1925 to 155,306,000 lb. in 1929 and 150,265,000 lb. in 1933. By 1938, however, the production of creamery butter in Wisconsin had risen to 188,933,000 lb., an all-time high record.

The dairy industry is so dominant in Wisconsin farm life that other livestock is forced into a minor position. Nevertheless in the southern part of the state swine are important. There were 1,689,000 swine valued at $15,959,000 in 1941, as compared with 1,611,993 valued at $18,671,225 in 1930. The number of chickens in the state on Jan. 1, 1940, was 16,361,000.

Sheep and lambs are much less important, although there is a place for them in the rough bluff country. In 1941 they numbered 513,000 and were valued at $3,320,000. The wool clip of 1940 was 2,918,000 lb.

Horses and mules on farms Jan. 1, 1941, numbered 505,000 and were valued at $47,849,000.

Manufactures. — Manufacturing, as the result of a remarkable growth, has become the chief industry of the state. The value of its products in 1900 was $360,818,942; in 1914, $695,172,000; in 1929, $2,152,382,000; but in 1933 was only $824,040,000; and in 1937, $1,772,310,000. Despite the increase (1900–29) in value of products, the number of manufacturing establishments decreased from 9,104 in 1914 to 7,415 in 1929 and to 6,318 in 1937, revealing a clear trend toward fewer and larger factories. The number of wage earners increased from 194,310 in 1914 to 264,646 in 1925 and was 234,067 in 1937. The total of wages paid rose from $112,193,000 in 1914 to $352,383,000 in 1929 and stood at $296,365,000 in 1937. Between 1914 and 1931 Wisconsin consistently held the rank of tenth among the states in the value of its manufactured products but dropped to twelfth place in 1933 (being overtaken by North Carolina and Missouri). By 1939 it was again tenth.



PROPORTION OF TOTAL UNITED STATES OUTPUT OF CHEESE PRODUCED IN WISCONSIN, 1937

Wisconsin's chief branch of manufacture is that connected with its great dairying industry. In 1937 its butter, cheese and condensed milk products were valued at a total of $175,539,638, an amount giving it the leadership among the states in dairy products. Something of the growth of this industry prior to the depression may be seen by comparing the amount of product in 1914 ($72,859,000) with that of 1925 ($309,260,384). The industry is the most widely diffused of all manufacturing industries in the state, its factories being small and close to the supply of raw material. Of the 6,318 manufacturing establishments in 1937, more than one-third were creameries or cheese factories. Next in the order of the amount of its output was the paper and pulp industry, which in 1937 produced goods valued at $128,226,460. Motor vehicles, manufactured to the value of $155,944,640 in 1925, were not separately listed in the census of manufactures for 1937 although motor vehicle bodies and parts worth $90,700,733 were produced. The output of malt and malt liquors in 1937 amounted to $94,275,803. Other major manufactures in the same year were: meat-packing products, sausage, sausage casings, etc., $80,177,471; foundry and machine-shop products, $24,217,96j; boots and shoes (not rubber), $41,477,062; printing, publishing, $44,037,755; knit goods, $23,301,857; electrical machinery, apparatus and supplies, $50,495,855; canned and dried fruits and vegetables, preserves, etc., $26,468,623; paper boxes, envelopes and other paper products. $28,373,812; bread and other bakery products, $29,038,884; tanned, curried and finished leather, $34,640,267; furniture, $26,179,608; engines, turbines, tractors, water wheels and windmills, $33,776,587; machine tools and machine tool accessories, $14,825,064; clothing $6,816,947; lumber and timber products, $19,835,901; planing mill products, $19,086,829.

In 1910 Milwaukee was responsible for more than one-third of the state's manufacturing output and she is still the chief industrial centre of the state. Since 1914, however, other cities have developed considerable manufactures, especially Kenosha, Racine and Janesville. Racine and Janesville are famous producers of farm implements. Important enterprises are also located at West Allis, Madison, Oshkosh, Sheboygan, Beloit, Green Bay, Superior, La Crosse, Manitowoc, Fond du Lac, Eau Claire and Appleton. Madison, Beloit and Janesville are all in the Rock river valley, which is the route for two of the leading railroads from Chicago to the northwest. A more notable concentration of manufacturing cities is in the Fox river valley, including the shores of Lake Winnebago. Here are Oshkosh, Fond du Lac, Appleton and Green Bay. Their location makes them the centre for the papermaking and wood-working industries. This is also the region of greatest development in water power. It is noticeable that only one of the important cities, La Crosse, is on the Mississippi river, and one only, Superior, on Lake Superior.

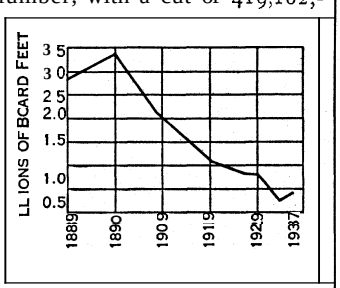
Mines and Quarries. — Wisconsin's mineral products are varied and though in value they fall far below the farm, forest and factory products of the state, they nevertheless amount to considerable sums each year. During the decade, 1920–30 the annual production ranged close to $20,000,000 and in 1929 exceeded $24,000,000. Mining activity, however, diminished in 1930 and subsequent years until 1933 when production stood at the low mark of $7,154,000. Thereafter, a slow recovery began, and in 1938 the state's mineral output was worth $10,636,741.

The lead mines of southwestern Wisconsin were the earliest developed, and they reached a peak production in the decade

1840–50 since which they have slowly declined. In 1918 there were produced 4,533 short tons valued at $643,686. In 1938 the production was but 320 short tons, worth but $29,440. Most of the lead is only a by-product of zinc mining which has become of main importance in the same region. The zinc-bearing ores are chiefly found below the water level, and their production was not stimulated greatly until the rise in price of zinc about 1900. The production of this metal amounted to 27,285 tons in 1920, 10,952 in 1922, 26,800 in 1926 and 2,073 in 1938. The value of the 1938 output stood at $199,008. Whereas early lead mining was largely carried on by individuals in shallow mines, the deeper zinc ores are mined almost exclusively by large companies using modern power machinery for mining and milling.

Of the great Lake Superior iron-producing district shared by Minnesota, Wisconsin and Michigan, Wisconsin possesses the smallest part. Two producing ranges extend into north Wisconsin, but the richer portions of each are in the upper peninsula of Michigan. The Wisconsin portion of the Penokee-Gogebic range is in Iron county, where most of the ore is mined, though one small mine operates in Dodge county. Production in 1935 amounted to 788,483 gross tons and in 1939 to 972,685, the latter output coming entirely from two mines in Iron county. The chief mineral output of Wisconsin is building and ornamental stone, the value of which was $4,590,528 in 1923 and $3,880,935 in 1938. Granite of many different colours is quarried. The lime product of 1938 was valued at $483,111. At hundreds of places in the state, clay deposits suitable for making brick and tile are to be found, and products of this industry in 1924 were valued at $1,063,164. In 1933 the value of clay products fell to $156,743, but it rose to $557,152 in 1937. Another important resource of the state is its mineral waters. Fuel briquets, however, lead in value with a total of $3,782,367 for 1937, 61.6% of the value of the entire output of the U.S.

Forests and Lumbering.— Originally all Wisconsin, except a few thousand square miles of prairie region in the south, was covered with forests, the heavier timber being in the northern half of the state. Wisconsin's many rivers, fairly even topography and nearness to the Great Lakes and Mississippi river favoured the rapid exploitation of these forests, and unrestricted and wasteful cutting went on apace. The most valuable original timber, the white pine, is almost exhausted as a result. The great age of lumbering in Wisconsin was from 1890 to 1905, for the last five years of which Wisconsin was the leading lumber-producing state of the United States. The value of rough lumber reached nearly $70,000,000 annually. In 1937 Wisconsin ranked seventeenth in the production of lumber, with a cut of 419,162,000 bd.ft. besides 31,548 squares of shingles (800 shingles to the square) and 19,665 thousand laths. In wood-pulp manufacture the state came second, with an output for 1937 of 638,217 tons (exceeded only by Washington). Its timber resources, however, are by no means exhausted. Its remaining stand is estimated at 2,000,000 million bd.ft., much of which is protected in national and state forests. In 1938 the area of national forests within its boundaries was 1,320,413 ac. while nonfederal forests covered 696,162 ac. Of the standing timber, the most plentiful variety is hemlock, the other principal woods being maple, birch, basswood, pine and elm.



LUMBER PRODUCED 1889–1937

Commerce and Transport.— In Lake Superior, Lake Michigan and the Mississippi river Wisconsin is supplied upon three sides by unusual facilities for water shipping. In addition to their actual commerce these waterways are of great importance because of the continual check they supply upon land transport rates. Since pioneer days and the building of east-west railways the Mississippi has lost its importance as an actual carrier, but the Great Lakes have not. In 1937 the chief lake ports were as follows: In addition Wisconsin shared in the business of the great Duluth-Superior port which in 1937 registered receipts of 11,227,000 short tons and shipments of 45,912,000 short tons.

The first railway in the state was constructed from Milwaukee westward in 1851 and completed to the Mississippi river at Prairie du Chien in 1857.

The first railways were built east and west with the idea of connecting the waterways as quickly as possible, but as the railways grew more independent the main lines were built in a general northwest and southeast direction so as to connect Chicago and Milwaukee with the cities of St. Paul and Minneapolis by lines as direct as possible. Other lines run from Milwaukee northwest to Ashland, Superior and Duluth. The railway mileage in the state amounted to 6,828 mi. in 1937 as compared with 7,638 mi. in 1915.

The largest systems are the Chicago and North Western, the Chicago, Milwaukee, St. Paul and Pacific and the Minneapolis, St. Paul and Sault Ste. Marie. For passenger service, railway lines have been supplemented since 1923 by an increasing network of motorbus lines running over the principal highways and connecting the chief cities.

There were in 1930, 81,784 mi of rural roads of which 29,632 mi. were surfaced. Of the 10,012 mi. in the state highway system in 1937, 9,829 were surfaced, 5,499 of high type surface and 4,330 of low type. Expenditures on highways during 1938 (including federal aid) amounted to $35,991,000. Motor vehicle registrations numbered 782,562 in 1930 and 840,291 in 1938.

HISTORY

The region comprising the present state of Wisconsin was first explored by the French, who in their eagerness to find a "northwest passage" rapidly penetrated the Great Lakes waterways.

French Explorers and Traders.— Jean Nicolet came in 1634, having been sent by Samuel Champlain, then governor general of New France to investigate rumours of a distant race called the "People of the Sea" who, it was hoped, might be Asiatics. Nicolet landed at a point in Green bay and made a treaty of alliance with the "People of the Sea" whom he found, were merely the populous tribe of Winnebago Indians then living in the neighbourhood. Champlain died shortly after Nicolet's return and no further explorations in the west were undertaken for 20 years. In 1654 Pierre Esprit, Sieur de Radisson and Medard Chouart. Sieur des Groseilliers, two French traders, visited Green bay and explored the country west and south. The vagueness of Radisson's journal leaves the interpretation of their itinerary much in doubt. Some scholars are disposed, from certain phases, to accord them the honour of having entirely crossed Wisconsin and discovered the Mississippi river, but this, while possible, is doubtful. The same explorers undertook a second voyage into the west in 1658–60 in which they were the first to skirt the Lake Superior shore of Wisconsin On Chequamegon bay they built a log hut—the first white habitation, so far as is known, in the state—and the following winter made a long inland trip to the Ottawa villages in northern Wisconsin. In 1660 seven traders, accompanied by the Jesuit, Father René Ménard, the first missionary in Wisconsin, wintered at Chequamegon bay on Lake Superior; and Ménard, the next summer, perished while trying to reach the Huron villages near the sources of the Black river. In 1665 other traders came into Lake Superior and with them came Father Claude Allouez who, on the shores of Chequamegon bay, established the first permanent mission in Wisconsin. In 1668 Jean Peré began a three-year exploration of Lake Superior and its northward connections, and among other things verified the report of Father Allouez that copper was available in considerable quantities upon its shores. Within a few years after the first Frenchmen reached Lake Superior, the main copper deposits were known.

In 1668 Green bay was again visited, this time by Nicolas Perrot and Toussaint Baudry who made several trips to inland tribes on the Wolf and upper Fox rivers with whom they concluded trading treaties. Other traders came. In 1669 Allouez was succeeded at his Chequamegon mission by Father Marquette and went into the Fox river valley where at the first rapids he founded the mission of St. François Xavier, one of the most successful of those established by the Jesuits in the west. It became the centre for further missionary efforts to all the surrounding tribes. In 1671 Father Marquette was forced by Indian wars to abandon the Chequamegon mission and in 1673, *in* company with Louis Joliet, he set off down the Fox-Wisconsin water route to discover the Mississippi river of which the Indians had told them. On July 17 they reached the mouth of the Wisconsin and sailed out upon the Mississippi waters.

In 1679 Daniel Greysolon Du Luth explored the upper Mississippi, St. Croix and Black rivers. The same year Michel Accault, accompanied by Father Hennepin, explored the Mississippi along Wisconsin's western boundary until they met Du Luth who returned with them by the Wisconsin-Fox route to the St. François Xavier mission. Du Luth continued his explorations on the Mississippi and Lake Superior until 1689 when he left the west never to return. His work was supplemented by the Mississippi expeditions of Perrot, who in 1686 built Fort St. Antoine on Lake Pepin, an enlargement of the Mississippi river. Perrot was now the French commandant in Wisconsin and most influential with the Indian tribes. In 1671 Saint-Lusson at Sault Ste. Marie had taken formal possession of the Great Lakes region in the name of the king of France; in 1689 Perrot staged a similar ceremony at his Fort St. Antoine on the Mississippi river. The 18 years between the two events had marked the period of French discovery and occupation of Wisconsin. Traders entered the region in increased numbers, and to protect them from the Indians and to control the trade properly a military force was necessary.

In 1712 the slaughter of a band of Foxes near Detroit was the signal for hostilities which lasted almost continuously until 1740, and in which every tribe in the Wisconsin country was sooner or later involved either in alliance with the Foxes or with the French. This war seriously interfered with the French plan of trade and development. The difficulty of maintaining a chain of settlements which might have connected Canada and Louisiana was a contributing cause to the overthrow of French dominion. Wisconsin was little disturbed by the Seven Years' War. However, the French and Indians of Wisconsin contributed a force under the half-brted, Charles Michel de Langlade, which made the long journey to lower Canada to share in the war. With the fall of Montreal (1760), French rule in Wisconsin was over.

British Occupation.— The first period of British occupation was brief for on the outbreak of Pontiac's conspiracy in 1763, the evacuation of the Green bay fort was forced. When the conspiracy was crushed in 1765, Wisconsin was reopened to traders, and not only French and English, but American traders from the colonies entered the region. British prestige among the Indians and the French habitants was hurt by a policy of confining the Indian trade to the forts instead of permitting the traders to go into the Indian villages. Little as they cared for their British rulers the French and Indians in the region remained loyal to the British during the Revolutionary War. De Langlade again led his French and Indian forces against the American frontier communities west of the Alleghenies.

The close of the war, although it conveyed the region to the sovereignty of the United States, was not followed by American occupation. The newly formed North-west company, a British fur-trading organization, kept control of the posts, built new ones, extended their trade and dominated the region. The control of these posts was one of the issues in the War of 1812, for American traders were becoming powerful enough to demand that the British traders should be made to withdraw. The end of the war meant the termination of British influence in Wisconsin, and actual military occupation of the country by the United States came in 1816 with the establishment of garrisons at Green Bay (Ft. Howard) and Prairie du Chien (Ft. Crawford).

Incorporation with Michigan.— Wisconsin in 1800 had nominally been attached to Indiana Territory; and in 1809, on the admission of Indiana as a State, it was attached to Illinois. In 1818 Illinois was admitted to the Union and Wisconsin was incorporated in Michigan Territory. It was only at the latter date that American civil government in Wisconsin was established on an orderly and permanent basis. Until 1830 the fur-trade, controlled largely by the American Fur company, continued to be the predominating interest in the Wisconsin region, but then the growing lead-mining industry in the south-western part of the State began to overshadow the fur-trade. The lead-mining activity which began in 1824 was the first incentive to genuine settlement in the State since the fur-trade discouraged settlement except around the few trading posts. In 1830 there were about 2,500 miners in the region. Friction between these settlers and the Indians could not be avoided and in 1832 occurred the famous Black Hawk War, which broke the Indian power within the State. In addition the war made Wisconsin better known, and with the Indian menace removed there was an appreciable impetus to settlement. A series of Indian treaties in 1829, 1831, 1832 and 1833 extinguished the Indian titles and opened up vast areas to settlement.

In 1834 two land offices were opened, and by 1836, 878,014 ac. had been sold to settlers and speculators. In 1836 a special census showed a population of 11,000; in 1840 the number was about 40,000. From 1835 to 1845 settlers from the eastern States poured into the south-eastern part of the State, founding Milwaukee and other cities along the lake shore.

Wisconsin Becomes a Separate Territory.— When Michigan entered the Union in 1836 Wisconsin was erected into a separate Territory which at first included not only its present area, but the present Iowa and Minnesota and a portion of North and South Dakota. Henry Dodge was appointed the first territorial governor by President Jackson. The first territorial council met in 1836 at Old Belmont, now Leslie, Lafayette county, but in December of that year after a contest in which Fond du Lac, Milwaukee, Racine, Green Bay, Portage and other places contended for the honour, Madison was selected as the capital.

Population increased so rapidly that it was not long before a movement for the admission of Wisconsin as a State was taken up in earnest and on Aug. 10, 1846, an enabling act for that purpose passed Congress and was approved by President Polk. The first Constitution drafted was rejected by the people, however, owing to liberal articles relating to the rights of married women, prohibition of banks, the elective judiciary, etc. A second convention, thought to be more conservative than the first, drafted another Constitution which in 1848 received the approval of both the people and Congress so that the State was admitted. The State governmental officers were sworn into office in June with Nelson Dewey in the governor's chair. In the same year the free public school system was established, and the great stream of German immigration set in. Railway construction began in 1851.

At the time of its admission Wisconsin, still a frontier State, was strongly democratic in spirit. The incoming Germans were likewise of the same sympathies. But Wisconsin was also a strong anti-slavery State and as the Democratic Party affiliated itself more and more completely with the cause of slavery, it lost its hold on Wisconsin. In 1854, one of the first steps in the organization of the Republican Party was taken at Ripon, and in 1856 a Republican governor was elected. In 1854 also the State supreme court rendered a decision which declared the Fugitive Slave Law to be null and void in Wisconsin. In 1860 the State aided in the election of Lincoln and supported his administration during the Civil War. To the Northern armies Wisconsin furnished 91,379 troops out of a total population of 775,881. In 1874 a Democratic liberal reform administration came into office and in the legislative session which followed the Potter Law, one of the first attempts to regulate railway rates, was passed. The Republicans regained control in 1876 and modified the law. In 1889 the passage of the Bennett Law, providing for the enforcement of the teaching of English in all public and parochial schools, roused the Germans, both Catholic and Lutheran,

usually Republicans, so that they voted the Democratic ticket and installed a Democratic adminstration from 1890 to 1895 which repealed the law. After 1895 the Republican party grew more secure. It placed on the statute books a series of progressive enactments in regard to railway rate legislation, taxation, publicity of campaign expenditures, civil service, forest conservation and finally a direct primary law. In all these reforms a leading part was taken by Governor Robert M. La Follette (1901–06), elected to the U.S. senate in 1905 when the reform movement was at its crest. Opposition to his program resulted in a serious split in the Republican ranks; the opposition, taking the old name of "Stalwarts," captured the governorship (1915–21). La Follette, however, retained his senate post until his death in 1925 and carried the state's electoral vote for president in 1924. The progressive tradition was ably continued by Robert M. La Follette, Jr. in the senate since 1925 and by his brother Philip, elected governor in 1930, 1934 and 1936. These progressive Republicans supported Roosevelt in 1932, and as Progressives again in 1936. In 1938, however, the regular Republicans regained control of the state, electing Julius P. Heil, a Milwaukee industrialist, to the governorship. Heil was re-elected in 1940.

WISCONSIN, UNIVERSITY OF, a co-educational institution of higher learning at Madison, Wis., the capital of the state. It was established in 1848, is under state control, is supported largely by the state and is a part of its educational system. The university occupies a picturesque and beautiful site on an irregular tract of 600 ac., including both wooded hills and undulating meadow-lands stretching for a mile along the shores of Lake Mendota. The main building, Bascom Hall, which crowns University hill, is exactly one mile from the state capitol. The university includes a college of letters and science made up of a library school, schools of commerce, journalism and music, with general courses in liberal arts and special courses in chemistry and pharmacy; a college of engineering with courses in chemical, civil, electrical, mechanical and mining engineering; a college of agriculture with a government experiment station, long, middle and short courses in agriculture, a department of home economics, a dairy course, farmers' institutes and an extension service; a law school; a medical school; a graduate school; a school of education including physical and art education; and an extension division including departments of correspondence study, debating and public discussion, group and community service. There is a summer session of either 6 or 8 weeks for undergraduates and graduates. Instruction is given in the summer session in all colleges. Several scientific institutions are associated with the university, including the U.S. forest products laboratory, the U.S. weather bureau, Washburn observatory, Wisconsin psychiatric institute, the Wisconsin geological and natural history survey, the state laboratory of hygiene and the state toxicological laboratory.

In June 1941 the university library and the state historical library, housed in the state historical library building, contained 1,100,000 bound volumes and 400,000 pamphlets; the special libraries housed in other buildings bring the totals up to 1,580,000 bound volumes and 565,000 pamphlets. In 1940–41 there were 11,376 students enrolled in the two semesters of the regular year —7,656 men and 3,720 women. The summer session enrolled 4,672 students. The faculty for the regular year for both residents and extension work consisted of 1,413 men and 323 women, making a total of 1,736. Admission to the university is by examination or certificate from accredited high schools or academies. Tuition is free for residents of the state. Courses in the first two years are largely prescribed; in the last two years, elective under a prescribed system of majors and minors. The university is governed by a board of regents of ten members of whom one, the state superintendent of public instruction, is an ex-officio member. The other nine members are appointed by the governor for a term of nine years and must be confirmed by the state senate.

(R. Fs.)

WISCONSIN RAPIDS, a city near the centre of Wisconsin, U.S.A., on the Wisconsin river; the county seat of Wood county. It is served by the Chicago and North Western, the Chicago, Milwaukee, St. Paul and Pacific, the Green Bay and Western and the Soo Line railways. Pop. (1940) 11,416 (89% native white). It is in the heart of a dairy region which ships great quantities of cheese and is the centre of the second largest cranberry-producing region in the United States. Hydroelectric power is generated by local plants.

Among the important manufactures are paper and pulp, gasoline and kerosene stoves, camping equipment, men's clothing, dairy products, paint and fibre cartons. A state forest nursery is situated on Nepco lake, just south of the city. Under the name of Grand Rapids, a city on the east bank of the river was chartered in 1869.

In 1900 it annexed Centralia, on the west bank; and in 1920 the present name was adopted.

WISDOM, BOOK OF. This book of the Apocrypha was not—as its title runs—composed by King Solomon, but emanates from the more intellectual circles of the Jewish Diaspora in Alexandria. It falls naturally into three parts which may or may not be the work of a single writer: (a) chs. li.–vi.–8 in which, in opposition to the views of the ungodly, the author argues that so far as the righteous are concerned, death is not the end: on the contrary "their hope is full immortality"; (b) vi. 9–xi. 1 which is written more particularly to portray Wisdom; (c) xi. 2–xix. an historical retrospect which is introduced in order to explain the origins and calamitous results of idolatry.

The book belongs to the closing period of the evolution of the Jewish Wisdom Literature (*q.v.*). No part of it would appear to have been written earlier than 150 B.C. Though Thackeray favours 130–100 B.C., Gregg 125–100 and Gfrorer 100 B.C., some modern opinion (*e.g.*, Goodrick) tends to favour a date as late as A.D. 40 (as indeed did Farrar). On the hypothesis of diversity of authorship, Holmes assigns the earlier part of the book to 50–30 B.C. and the last chapters (in his estimation an intentional addition to the first part) to 30 B.C. to A.D. 10. In this case the author was a younger contemporary of Philo (with whom Jerome identified him), slightly a senior of Jesus of Nazareth; and he had not long written his book when it fell into the hands of St. Paul, provided the author of the Epistle to the Hebrews with ideas and with terminology in which to express them, and, somewhat later, influenced, though to a much smaller extent, the authors of Epistles of 1 Peter, St. James and of the Fourth Gospel.

The whole book, as is now generally maintained, originally was written in Greek, and almost certainly in Alexandria by an Alexandrian Jew (or Jews) versed in the Septuagint translation of the Old Testament. To what extent was the author really acquainted with Plato's writings and with Plato's thought, with Pythagorean speculations; with Stoicism and with the Greek mystery cults?

For example, his doctrine of God's transcendence and unity reaches the high-water mark of Jewish theology and piety He does not abandon the thoroughly Jewish conception of "spirit' as the agent and medium of the transcendent Deity's self-revelation to the Universe and to His chosen people; he even refers twice to the "Word" in this connection without any indication that he has hellenized it as Philo did. But in his description of his favourite intermediary between earth and Heaven, "Wisdom," it is difficult not to suppose that he was (though not so directly as some scholars have urged) influenced by the Stoic doc-

trine of the *anima mundi*. In the end, however, he shows that he has not really gone so far in the direction of hypostatizing "Wisdom" as did the author of Proverbs ch. ix. *(See* especially, Goodrick, *The Book of Wisdom,* Additional Notes D and F, pp. 404–410, 416–419.)

Till comparatively recently the view that the author was an exponent of the doctrine of the pre-existence of souls was unchallenged. The crucial passage is viii. 19, 20, which had hitherto been read in the light of other passages such as i. 4, ix. 15, xi. 17, which might seem to presuppose the evil of matter which was originally "formless" and the body as the prison of the soul in true Platonic fashion. But in 1908 F. C. Porter *(Studies in Memory of W. R. Harper)* put forward the revolutionary thesis that the author's statement in the passage has as its background neither Platonic nor Pythagorean speculations'. It is, he urged, a native Hebrew evolution of primitive Semitic beliefs as to the union of the Divine breath with the material clay which results in the production of an individual man.

The tendency of the author's eschatology is equally problematical. It would appear that even if he contents himself with believing in the immortality of the *soul* only, he conceives of this as ensuring the conscious survival of the individual's personality. It is therefore difficult to believe that he does not refer to these same *dead* righteous rather than (as some urge) to the living righteous. It would seem that he did not completely abandon contemporary Jewish eschatological speculations of a materialistic or semi-materialistic nature for Greek ideas as to the immortality of individual souls. He accepted both without evolving a real synthesis of them, probably without grasping the necessity for one, as was obviously his tendency in regard to several other doctrines in which he held to his Jewish beliefs though attracted by their Hellenistic counterparts and the terminology of pagan philosophers who had won his admiration.

BIBLIOGRAPHY.—*See* especially Gregg in *Camb. Bible* (1909); Holmes in Charles' *Apocrypha and Pseudepigrapha of the Old Testament,* i. 518-534; Goodrick in *Oxford Church Bible Commentary* (1913), where copious references will be found. (D. C. S.)

WISDOM LITERATURE. The extant writings of the Jewish sages are contained in the books of Job, Proverbs, Ben-Sira, Tobit, Ecclesiastes, Wisdom of Solomon, Fourth Maccabees, to which may be added the first chapter of Pirke Aboth (*q.v.*), certain of the Elephantine Papyri and isolated sections (*e.g.,* the parable of Jotham) and verses in the historical prophetical Books, as well as Pss. viii.; xix. 2–7; xxix. 3–10; xxxvii., xlix., lxxiii., xc. 1–12; xcii. 6–8 (5–7), cvii. 17–32, cxix., cxxxix., cxliv. 3 f., cxlvii. 8 f. The climax of the intellectual element in this movement is to be found in Philo.

Most of the extant literature doubtless dates only from the post-exilic period. But the Book of Proverbs (*q.v.*) contains minor collections of proverbs which are now recognized as pre-exilic in origin, while individual maxims contained in this and other books may be part of the heritage of post-exilic days from a comparatively hoary antiquity. The Wisdom Movement among the Hebrews was, in fact, no isolated phenomenon, and at no period in its development did it exist, as it were, in a watertight compartment. As the mythology of the Hebrews, their earlier religious ideas in general, many of their deities and several elements in their ecclesiastical calendar were shared with and mostly derived by them from neighbouring peoples, so too it was with the aspect of their culture comprised under the general term "Wisdom." From Mesopotamia to Egypt there existed an "international" stock of traditional Wisdom which passed and repassed from nation to nation, each adding its quota to the common stock, and each adapting to the needs and the requirements of its own culture what it received from those of others. Edom was a famous centre of such "Wisdom" activity in Palestine, and the Hebrew Humanists more than once admit their indebtedness to those of Edom. But the great creative centres of "Wisdom" activities were to be found in Babylonia and Egypt.

Doubtless the early Hebrew exponents of Wisdom at times did more than merely borrow, Hebraise, and conserve the proverbs of other nations. Hebrew tradition, at any rate, points to the reigcs of Solomon and Hezekiah as epochs of outstanding importance in the development of Hebrew Wisdom literature. Certainly by the reign of Hezekiah the "wise men" formed a definite stratum in Jerusalem society, and like the priests, prophets and military leaders sought to shape, in accordance with their own economic and political ideals, the fortunes of the Jewish state.

But, as the post-exilic period advanced, and Jewish history and theology unfolded themselves, new problems arose for which no satisfactory explanation could be given by the old religion of the pre-exilic type, the new priestly development, the new scribism, and the still newer "Chasidaean" piety. Prophecy of the pre-exilic and exilic type was dead, and the principle of inspiration for which it stood found its expression more especially in Apocalyptic (*q.v.*). The latter, however, made its greatest appeal to the masses. It remained for the exponents of Wisdom to attempt to solve these problems in a form acceptable to men of culture and to specialize in the instruction of the youth of aristocratic families.

Their intellectual instincts led them to look, not to Persia whence Apocalyptic took so much of its imagery and some of its central ideas, but to the new world of the Mediterranean. With this world they were becoming increasingly familiar owing to the conquests of Alexander the Great and his successors, the rise of Greek cities in Palestine and the spread of Greek culture in Palestine and elsewhere, particularly in Egypt where the Jewish community mostly prospered and kept in close touch with their co-religionists in Jerusalem. The book of Wisdom (*q.v.*) emanated from this Alexandrian centre of Wisdom in the first Christian century, just as Egyptian Jewry in pre-hellenistic days had produced the book of Tobit (*q.v.*). Ecclesiastes and Proverbs (*qq.v.*) chs. i.–viii., on the other hand, are examples of the hellenizing Wisdom literature of Palestine, while Ecclesiasticus belongs to the period before Hellenism had contributed much of moment to the sages of Palestine.

The new problems which confronted these later sages were numerous, both in the practical and in the theoretical sphere. In the former, general looseness of life had to be combated. In the latter, they had to face questions such as the following: If God is transcendent, how can He still be held to intervene in mundane matters? If God is the ruler of the whole universe, is it possible, in the face of facts, still to maintain that His government of it is moral? In particular, what is the bearing of the problem of suffering upon this question? If He is the God of the individual soul, does He abandon that individual at death? Each Wisdom writer gave his own answer to these questions. Sometimes there is substantial agreement: sometimes they contradict each other. The answers of the authors of Proverbs i.–viii., Ecclesiasticus and Wisdom were constructive. In Ecclesiastes, in its original form, and in Prov. xxx. 2–4 instances have been preserved of a sceptical element in the Wisdom Movement.

WISE, HENRY ALEXANDER (1806–1876), American politician and soldier, was born at Drummondtown (or Accomac), Va., on Dec. 3, 1806. He graduated from Washington (now Washington and Jefferson) college, Pa., in 1825, and began to practise law in Nashville, Tenn., in 1828. He returned to Accomac county, Virginia, in 1830, and served in the National House of Representatives in 1833–37 as an anti-nullification Democrat, but broke with the party on the withdrawal of the deposits from the United States Bank, and was re-elected to Congress in 1837, 1839 and 1841 as a Whig, and in 1843 as a Tyler Democrat. From 1844 to 1847 he was minister to Brazil. In 1855 he was elected governor of the State (1856–60) as a Democrat. John Brown's raid occurred during his term, and Wise refused to reprieve Brown after sentence had been passed. He strongly opposed secession, but finally voted for the Virginia ordinance, was commissioned brigadier-general in the Confederate army and served throughout the war. He died at Richmond, Va., on Sept. 12, 1876. He wrote *Seven Decades of the Union 1790–1860* (1872).

See the *Life* of H. *A.* Wise, by his grandson, B. H. Wise (1899).

WISE, ISAAC MAYER (1819–1900), American-Jewish theologian, was born in Bohemia. From the moment of his arrival in America (1846) his influence made itself felt. In 1854 he was appointed rabbi at Cincinnati. Some of his actions, as his compiling of a new prayer-book, roused considerable opposition. He was opposed to political Zionism, and in keeping with this denial of a Jewish nationality, he believed in national varieties of Judaism, and strove to harmonize the synagogue with local circumstances and sympathies. After a campaign lasting 25 years he was instrumental in founding the Union of American-Hebrew congregations in Cincinnati in 1873, and as a corollary in 1875 the Hebrew Union college, of which he was president and which has trained a large number of the rabbis of America. Wise also organized various general assemblies of rabbis, and in 1889 established the Central Conference of American rabbis. He was the first to introduce family pews in synagogues, and in many other ways "occidentalized" Jewish worship. He was not only a leader in liberal Judaism but also a scholar and the author of many works. He died in Cincinnati on March 26, 1900.

Rabbi Wise's *Reminiscences* (1901) were translated with an intro. by David Philipson (1901), who with Louis Grossman prepared a biographical sketch for the *Selected Writings* (1900). A tentative bibliography was prepared by *A.* S. Oko. *See* also D. Philipson, *The Reform Movement in Judaism* (1907); *M.* B. May, *Isaac Mayer Wise* (1916); and Henry Berkowitz, *Intimate Glimpses of the Rabbi's Career* (1921).

WISEMAN, NICHOLAS PATRICK STEPHEN (1802–1865), English cardinal, was born at Seville on Aug. 2, 1802, the child of Anglo-Irish parents recently settled in Spain for business purposes. On his father's death in 1805 he was brought to Waterford. He was educated at Ushaw college, near Durham, and at the English college in Rome, of which he became vice-rector in 1827, and rector in 1828. He held the rectorship for twelve years. From the first a devoted student and antiquary, he studied the oriental mss. in the Vatican library, and a first volume, entitled *Horae Syriacae,* published in 1827, gave promise of a great scholar. Leo XII. appointed him curator of the Arabic mss. in the Vatican, and professor of oriental languages in the Roman university. At this date he had close relations, personal and by correspondence, with Mai, Bunsen, Burgess (bishop of Salisbury), Tholuck and Kluge. His student life was, however, broken by the pope's command to preach to the English in Rome; and he visited England in 1835–1836, and delivered lectures on the principles and main doctrines of Roman Catholicism in the Sardinian Chapel, Lincoln's Inn Fields, and in the church at Moorfields, now pulled down. In 1836 he founded the *Dublin Review.* In the winter of 1838 he was visited in Rome by Macaulay, Manning and Gladstone.

In 1840 he was consecrated bishop, and sent to England as coadjutor to Bishop Walsh, vicar-apostolic of the Central district, and was also appointed president of Oscott College near Birmingham. Oscott, under his presidency, became a centre for English Catholics, where he was also visited by many distinguished men, including foreigners and non-Catholics. The Oxford converts [illegible] Wiseman's responsibilities. It was by his advice that Newman and his companions spent some time in Rome before undertaking clerical work in England. Shortly after the accession of Pius IX. Wiseman was appointed temporarily vicar-apostolic of the London district, the appointment becoming permanent in February 1849. On his arrival from Rome in 1847 he acted as informal diplomatic envoy from the pope, to ascertain from the government what support England was likely to give in carrying out the liberal policy with which Pius inaugurated his reign. In response Lord Minto was sent to Rome as "an authentic organ of the British Government," but the policy in question proved abortive.

Residing in London in Golden Square, Wiseman threw himself into his new duties with many-sided activity, working especially for the reclamation of Catholic criminals and for the restoration of the lapsed poor to the practice of their religion. He was zealous for the establishment of religious communities, both of men and women, and for the holding of retreats and missions, He preached (July 4, 1848) at the opening of St. George's, Southwark, an occasion unique in England since the Reformation, 14 bishops and 240 priests being present, and six religious orders of men being represented. The progress of Catholi'cism was undeniable, but yet Wiseman found himself steadily opposed by a minority among his own clergy, who disliked his Ultramontane ideas, his "Romanizing and innovating zeal."

In July 1850 he heard of the pope's intention to create him a cardinal, and expected to be permanently recalled to Rome. But on his arrival there he ascertained that a part of the pope's plan for restoring a diocesan hierarchy in England was that he himself should return to England as cardinal and archbishop of Westminster. The papal brief establishing the hierarchy was dated Sept. 29, 1850, and on Oct. 7 Wiseman wrote a pastoral, dated "from out of the Flaminian Gate'—a form diplomatically correct, but of bombastic tone for Protestant ears—in which he spoke enthusiastically, if also a little pompously, of the "restoration of Catholic England to its orbit in the ecclesiastical firmament." Wiseman travelled slowly to England, via Vienna; and when he reached London (Nov. 11), the whole country was ablaze with indignation at the "papal aggression," which was misunderstood to imply a new and unjustifiable claim to territorial rule. But Wiseman wrote an admirable *Appeal to the English People* in which he explained the nature of the pope's action, and argued that the admitted principle of toleration included leave to establish a diocesan hierarchy. In July 1852 he presided at Oscott over the first provincial synod of Westminster. In 1854 Wiseman was in Rome when the definition of the dogma of the immaculate conception of the Blessed Virgin (Dec. 8), was promulgated. In 1855 he applied for a coadjutor, and George Errington, bishop of Plymouth, his friend since boyhood, was appointed, with the title of archbishop of Trebizond. Two years later Manning was appointed provost of Westminster and he established in Bayswater his community of the "Oblates of St. Charles."

In the summer of 1858 Wiseman paid a visit to Ireland, where, as a cardinal of Irish race, he was received with enthusiasm. In 1863, addressing the Catholic Congress at Malines, he stated that since 1830 the number of priests in England had increased from 434 to 1,242, and of convents of women from 16 to 162, while there were 55 religious houses of men in 1863 and none in 1830. The last two years of his life were troubled by illness and by controversies in which he found himself, under Manning's influence, compelled to adopt a policy less liberal than that which had been his in earlier years. Thus he had to condemn the Association for the Promotion of the Unity of Christendom, with which he had shown some sympathy in its inception in 1857; and to forbid Catholic parents to send their sons to Oxford or Cambridge, though at an earlier date he had hoped (with Newman) that at Oxford at least a college or hall might be assigned to them. He died on Feb. 16, 1865. On Jan. 30, 1907, his body was removed with great ceremony from Kensal Green and re buried in the crypt of the new cathedral at Westminster.

Wiseman was one of the most learned men of his time. He was the friend and correspondent of many foreigners of distinction, among whom may be named Döllinger, Lamennais, Montalembert and Napoleon III. He combined with the principles known as Ultramontane no little liberality of view in matters ecclesiastical. He insisted on a poetical interpretation of the Church's liturgy; and while strenuously maintaining her Divine commission to teach faith and morals, he regarded the Church as in other respects a learner; and he advocated a policy of conciliation.

See the biography by Wilfrid Ward, *The Life and Times of Cardinal Wiseman* (2 vols., 1897; fifth edition, 1900). (A. W. Hu.; X.)

WISHART, GEORGE (*c.* 1513–1546), Scottish reformer, was accused of heresy in 1538, and fled to England, where a similar charge was brought against him at Bristol in the following year. In 1539 or 1540 he started for Germany and Switzerland, and returning to England became a member of Corpus Christi college, Cambridge. In 1543 he went to Scotland in the train of a returning embassy. Wishart began to preach in 1544, at Perth, Edinburgh, Leith and Haddington. At Ormiston, in Dec. 1545, he was seized by the earl of Bothwell, and transferred by order

of the privy council to Edinburgh castle on Jan. 19, 1546. Thence he was handed over to Cardinal Beaton, who had him burnt at St. Andrews on March 1.

See Knox's *Hist.;* Reg. P. *C.* Scotland; Foxe's *Acts and Monuments;* Hay Fleming's *Martyrs and Confessors of St. Andrews;* Cramond's *Truth about Wishart* (1898) and *Dict.* of *Nat. Biogr.* vol. lxii.

WISLICENUS, JOHANNES (1835–1902), German chemist, was born on June 24, 1835 at Klein-Eichstedt, in Thuringia, and emigrated to America with his father. In 1855 he was appointed lecturer at the Mechanics' Institute in New York. Returning to Europe in 1856, he continued his studies at Zurich university, where he was subsequently professor of chemistry from 1865 to 1872. He then obtained the chair of chemistry at Wurzburg, and in 1885, on the death of A. W. H. Kolbe, was appointed to the same professorship at Leipzig, where he died on Dec. 6, 1902. His work on the lactic acids cleared up many difficulties concerning the combination of acid and alcoholic properties in hydroxy-acids in general, and resulted in the discovery of two substances differing in physical properties though possessing a structure of proved chemical identity. So far back as 1873, before the publication of the doctrine of J. H. van't Hoff and J. A. Le Bel, Wislicenus expressed the opinion that the ordinary constitutional formulae did not afford an adequate explanation of certain carbon compounds, and suggested that account must be taken of the *verschiedene Lagerung ihrer Atome im Raume.* Later (see *Die räumliche Anordnung der Atome in organischen Molekülen,* 1887) he extended the application of the van't Hoff-Le Bel theory to "geometrical isomers"—substances iike fumaric and maleic acids which have identical formulae but are dissimilar chemically. Wislicenus and his pupils studied a number of cases of this type of isomerism. He is also known for his work on aceto-acetic ester and its application as a synthetical agent and for his syntheses in the penta-methylene series. He was awarded the Davy medal by the Royal Society in 1898.

WISMAR, a seaport town of Germany, in the *Land* of Mecklenburg, at the southern end of the Bay of Wismar, one of the best harbours on the Baltic, 20 mi. by rail N. of Schwerin. Pop. (1939) 35,005. Wismar is said to have received civic rights in 1229, and came into the possession of Mecklenburg in 1301. In the 13th and 14th centuries it was a flourishing Hanse town, with important woollen factories. A plague carried off 10,000 of the inhabitants in 1376. By the peace of Westphalia in 1648 it passed to Sweden, and in 1815 to Mecklenburg. It was severely bombed in World War II.

WISSEMBOURG or WEISSENBURG, a town of France, capital of an arrondissement in the department of Bas-Rhin, on the Lauter, at the foot of the eastern slope of the Vosges mts., 42 mi. N.E. of Strasbourg by the railway Basle-Strasbourg-Mannheim. Pop. (1936) 5,309. It grew up round a Benedictine abbey, founded in the 7th century by Dagobert II, and became the seat of a famous school. Here Otfrid, a native of the district, completed (c. 868) his Old High German Gospel book. (*See* GERMAN LITERATURE.) The town became a free imperial city in 1305. In Oct. 1793 the Prussians and Saxons under the Austrian general Wurmser stormed the "Weissembourg Lines." On Aug. 4, 1870, the Germans, under the crown prince of Prussia, gained there the first victory of the Franco-German War. In World War II they occupied the town in June 1940. Wissembourg is the seat of a subprefect. The chief industry is the manufacture of rubber.

WISTARIA, a genus of climbing woody vines of the family Leguminosae, inhabiting China, Japan and eastern North America, commonly called wisteria. The garden wisterias are mostly W. *sinensis* of China, and W. *floribunda* of Japan. Their violet-blue flowers, borne in long racemes, are effective floral decorations against a house wall or on trellis-work. The silky wisteria (*W. venusta),* with velvety leaves and large white flowers, is a native of China. The North Ainerican species, W. *frutescens,* found in southern states, has lilac-purple, fragrant flowers.

WISTER, OWEN (1860–1938), American writer, was born in Philadelphia, July 14, 1860. On graduating from Harvard in 1882 he intended to devote himself to music. He went abroad for study; but family reasons forced him to return, and he spent several years in Arizona and New Mexico. He then entered the Harvard law school, graduating in 1888, was admitted to the bar in 1889 and for two years practised in Philadelphia. Thereafter he devoted his time to literary work.

His novel *The Virginian* (1902) has the distinction of doing as much to shape the romantic conception of the cowboy West as any other single factor. *Red Men and White* (1896) and *Lin McLean* (1898) also contributed to the legends of the cunning horse thief, the chivalrous rancher and the vanishing red man. *Philosophy* 4 (1903), *a* diverting college story, and the romance *Lady Baltimore* (1906) were very popular. Wister's other publications include *Ulysses* S. *Grant* (1900), *The Seven Ages of Washington* (1907), *The Pentecost of Calamity* (1915) and *Neighbours Henceforth* (1922).

WITAN or **WITENAGEMOT,** the council of the Anglo-Saxon kings. It was in no sense a popular assembly, and its composition was determined by the king's pleasure. He would naturally wish to consult his greater nobles and his bishops, and such men are normally found in attendance at his councils. The ecclesiastical element was sometimes reinforced by the abbots of important monasteries. The king's household officers were usually present, and the council generally includes a varying number of thegns without specific duties at court. The general character of the council underwent little change throughout the Old English period, though it inevitably tended to become a larger body as the king of Wessex developed into a king of all England. Its essential duty was to advise the king on all matters touching which he chose to ask its opinion. It attested his grants of land to churches or laymen, it consented to his issue of new laws or new statements of ancient custom, and it helped him to deal with rebels and persons suspected of disaffection. King Alfred asked its advice about the testamentary disposition of his private inheritance. In late Old English times the witan had ceremonial functions. It attended the king when he received ambassadors, and in the 11th century, if not earlier, joined him in public feasting at Easter, Whitsuntide, and Christmas, commonly meeting for this purpose at Winchester, Westminster and Gloucester. At other times the king would summon his witan to attend him wherever he might choose. Important meetings of king and council were held in royal manors such as Wantage in Berkshire, Calne in Wiltshire and Andover in Hampshire. In its composition and duties the witan closely resembled its successor, the *Commune Concilium* of the Anglo-Norman kings; the fundamental difference between these bodies being the feudal tie which connected the baronial councillors of the Norman time with the king. (F. M. S.)

WITCHCRAFT. The actual meaning of this word appears to be the art or craft of the wise, as the word "witch" is allied with "wit," *to know.* From about the 15th century the word has been almost exclusively applied to workers of magic, whether male or female. Magicians and sorcerers are known in all parts of the world; among savage communities they are usually credited with supernatural powers by their fellow-tribesmen *(see* MAGIC). Divination (*q.v.*) or foretelling the future is one of the commonest forms of witchcraft; when this is done in the name of the deity of one of the established religions it is called prophecy; when, however, the divination is in the name of a pagan god it is mere witchcraft. This distinction is very clear in the account of the contest between Moses and Pharaoh's magicians as given in Exodus; but in the demotic story, which appears to give the Egyptian version of the incident, the wise priest of Egypt defeats the miserable foreign sorcerer whom he had saved from the water when a child.

Mediaeval Witches.—In England the legal definition of a witch is, according to Lord Coke, "a person who hath conference with the Devil to consult with him or to do some act."

The word "devil" (*q.v.*) is a diminutive from the root "div," from which we also get the word "divine." It merely means "little god." It is a well-known fact that when a new religion is established in any country, the god or gods of the old religion becomes the devil of the new.

When examining the records of the mediaeval witches, we are dealing with the remains of a pagan religion which survived, in England at least, till the 18th century, 1,200 years after the introduction of Christianity. The practices of this ancient faith car

be found in France at the present day, though with the name of the deity changed; and in Italy la vecchia religione still numbers many followers in spite of the efforts of the Christian Church.

The number of the witches put to death by the inquisitors and other persecutors in the 16th and 17th centuries is a proof of the obstinate paganism of Europe. Whole villages followed the beliefs of their ancestors; and in many cases the priests, drawn from the peasant class, were only outwardly Christian and carried on the ancient rites; even the bishops and other high ecclesiastics took part. As civilization increased and Christianity became more firmly rooted, the old religion retreated to the less frequented parts of the country and was practised by the more ignorant members of the community. This is very noticeable in the innumerable trials of the 15th to the 18th centuries.

The Witch-cult. — The religion consisted of a belief in a god incarnate in a human being or an animal, and thus resembled in many ways the religions of numerous primitive peoples of the present day. This god, who was always called the Devil by the Christian recorders of the trials, appeared to his worshippers disguised in various animal forms or dressed inconspicuously in black. The earliest form of the animal disguise is the figure of the man clothed in a stag's skin with antlers on his head, which is among the palaeolithic paintings in a cave in Ariège in southern France. Another early example is carved on a slate palette of the prehistoric period of Egypt; in this case the man is disguised as a jackal. The goat disguise is not found in Great Britain though common in France and Germany, where it is probably the survival of the god Cernunnos. In the British Isles the usual forms were the bull, the dog and the cat.

The rites with which this god was worshipped are known to all students of primitive or savage religions, ancient and modern. The sacred dances, the feasts, the chants in honour of the god, the liturgical ritual, and above all the ceremonies to promote fertility, occurred at public assemblies as now in the islands of the Pacific or in Africa. The fertility rites attracted the special attention of the recorders of the legal trials. But to the followers of the old god these rites were as holy as the sacred marriage was to the ancient Greeks; to them, as to the Greeks, it was the outward and visible sign of the fertility of crops and herds which should bring comfort and wealth and life itself.

The assemblies or "Sabbaths" took place four times a year; on Feb. 2 (Candlemas), May-eve (known later as Roodmas), Aug. 1 (Lammas), and November-eve (All Hallow E'en). To these joyous meetings came all the worshippers, from far and near, to the number of many hundreds, old and young, men, women and children, till the scene was like a great fair with dancing and singing and feasting. The celebrations began in the evening, lasted all night, and ended at dawn. These were the great Sabbaths, and the dates show that the year was divided at May and November. This division shows that the religion dates back to a primitive period, probably before the introduction of agriculture though after the domestication of animals, for the festivals emphasize the seasons of the breeding of animals. There were, however, smaller meetings (known in France as *"esbats"*), which took place weekly or at short irregular intervals. To these came the principal members of the cult, who held a position analogous to the priesthood. There were in each district a band of such persons, in number 13, *i.e.,* a chief or "devil" and 12 members. This band was known as a "Coven." They celebrated the religious rites. they practised as healers under the leadership and instruction of their divine master, and were'the consultants in all cases where "witchcraft" was required. The earliest record of a Coven is in the *Handlyng Synne,* a work of the early 14th century, in which the (Christian) priest's daughter and 12 "fools" danced in the churchyard as a *coueyne.* The next record is in the 15th century in the trial of Gilles de Rais, where it is apparent that he and his associates were 13 in number in the practice of their rites. In the later trials the word Coven is continually used, and the number in a Coven is always 13.

One of the most impressive and important rites was the sacrifice of the god, which took place at intervals of seven or nine years. The accounts suggest that the sacrifice was by fire (for similar sacrifices see Frazer's ***Golden** Bough).*

The Familiars. — There are two kinds of familiars, the divining familiar and the domestic familiar. The divining familiar is common to the whole of Europe and is found in all records of the trials. In ancient Rome divination by animals, especially by birds, was known as "Augury" (*q.v.*), and was considered a legitimate means of learning the future, but when it was practised by "witches" in the 16th and 17th centuries their persecutors claimed that they were inspired by the Devil. As a rule the witches were instructed by their chief in the method of divining by animals, and he usually appointed the class of animal which each witch was to use. Thus Agnes Sampson of North Berwick divined by dogs, so also did Elizabeth Style in Somerset; John Walsh of Netherberry in Dorset had "a gray blackish culver," and Alexander Hamilton in Lothian divined by a "corbie" or a cat. In France the familiar was always a toad, which was consulted before going on a journey or undertaking any enterprise.

Spells and Charms (*q.v.*).—Forms of words with manual gestures are used in all countries and in all periods to produce results which cannot be obtained by physical means. They may be used for good or evil purposes, for the benefit of the user or for the benefit of someone else. A good harvest, a good catch of fish, a favourable wind for a ship, victory over an enemy, could all be obtained by formulae of words addressed to the appropriate power. But as the power was always incomprehensible, not to say freakish, it was necessary that it should be approached by those who knew the right methods. Sacrifice (*q.v.*) in the temples of the ancient civilization was among the means to propitiate the god and render him favourable to the petitions of his worshippers. When, however, there was more than one god, it is obvious that if a prayer were ineffectual in one temple nothing could be easier than to petition another deity.

Among the ritual methods to destroy an enemy one of the most ancient as well as the most dramatic was the making of an image, generally in wax, to represent the enemy, and gradually destroying it. The earliest record of this charm is in the trial of some women and officers of the harem of Rameses III. in Egypt, about 1100 B.C. They made wax images of the Pharaoh with magical incantations, but unfortunately the record gives only the outline of the trial without details.

Transformation into Animals (see LYCANTHROPY).—The belief that certain persons can transform themselves into animals is common to all parts of the world. The power belongs to the shaman or priest. A wound inflicted on a human being when in animal shape is believed to be visible when the person resumes his human form. The method of transformation was by putting on the skin of the animal, as did Sigmund the Volsung when he became a wolf. This being the case, it is obvious that the wounds received by the transformed person must certainly have remained when he returned to his proper shape.

The Suppression of Witchcraft. — In comparing the witches and witch-cult of the middle ages with the rites and beliefs of pagan religions, whether ancient or modern, it becomes abundantly clear that in Europe traces of the ancient heathenism survived the adoption of Christianity. It was only when the new religion had gained sufficient strength that it ventured to try conclusions with the old. Backed by the civil law, it overcame the old religion, not only by persuasion but by the use of force, just as it destroyed the ancient religion of Egypt and in later times the religion of the Aztecs. That the old religion was not an ordinary heresy is clearly shown by the fact that in England, Scotland, France, Germany, Italy, Switzerland, the Netherlands and in New England in the days of Cotton Mather, the clergy as well as the laity hunted down and brought to trial and death persons suspected of witchcraft. For particulars of the Salem witchcraft delusion, see SALEM.

WITCHES' BROOMS, the name, in botany, by which peculiar broom-like outgrowths found on the branches of a number of trees are known. They consist of a closely set mass of short branching twigs formed at one place on a branch as a result of the irritating action of an insect or a fungus. They are very common on the birch, being conspicuous when the tree is in a leafless condition; the "brooms" have then the appearance of birds' nests. They may be caused by the attack of a mite (*Eriophyes rudis*); in other cases they are due to the species of fungus, *Exoascus turgidus,* attacking the birch. An allied fungus (*E. cerasi*) causes brooms of the same kind on cherry.

WITCHHAZEL, the common name for a North American shrub, *Hamamelis virginiana* (family Hamamelidaceae), native to low woods from Nova Scotia to Minnesota and south to Florida and Texas. It grows from 10 to 25 ft. high, with smooth, wavy-toothed leaves, somewhat unequal at the base. The showy bright-yellow flowers, borne in profuse axillary clusters, appear in autumn as the leaves are falling. The fruit, a hard, woody capsule that matures during the ensuing summer, contains two black shining seeds, which are forcibly ejected when ripe. A fluid extract, prepared from the leaves, is used as a tonic and a lotion. The name witchhazel is derived from the use of the twigs as divining rods, just as hazel twigs were used in England. The North American witchhazel is occasionally planted for ornament. as are H. *japonica* of Japan, and H. *mollis* of China. *H. macrophylla,* with leaves roughened by persistent tubercles, is a small tree of the southern gulf states of the U.S.A.

WITCH OF AGNESI: *see* **CURVES,** SPECIAL.

WITHER, GEORGE (1588–1667), English poet and satirist, son of George Wither, of Hampshire, was born at Bentworth, near Alton, on June 11, 1588. He went to Magdalen College, Oxford. He wrote an elegy (1612) on the death of Prince Henry, and a volume of gratulatory poems (1613) on the marriage of the princess Elizabeth, but his uncompromising character soon got him into trouble. In 1611 he published *Abuses Stript and Whipt,* twenty satires directed against Revenge, Ambition, Lust and other abstractions. In 1613 five editions appeared, and the author was lodged in the Marshalsea prison.

The influence of Princess Elizabeth, supported by a loyal "Satyre" to the king, secured his release at the end of a few months. He had figured as one of the interlocutors, "Roget," in his friend William Browne's *Shepherd's Pipe,* with which were bound up eclogues by other poets, among them one by Wither, and during his imprisonment he wrote what may be regarded as a continuation of Browne's work, *The Shepherd's Hunting* (printed 1615), eclogues in which the two poets appear as "Willie" and "Roget" (in later editions "Philarete"). The fourth of these eclogues contains a famous passage in praise of poetry. After his release he was admitted (1615) to Lincoln's Inn, and in the same year he printed privately *Fidelia,* a love elegy, of which there is a unique copy in the Bodleian. Other editions of this book, which contained the lyric "Shall I, wasting in despair," appeared in 1617 and 1619 In 1621 he returned to the satiric vein with *Wither's Motto. Nec habeo, nec careo, nec curo.* Over 30,000 copies of this poem were sold, according to his own account, within a few months. Like his earlier invective, it was said to be libellous, and Wither was again imprisoned, but shortly afterwards released without formal trial on the plea that the book had been duly licensed. In 1622 appeared his *Faire-Virtue, The Mistress of Phil' Arete.*

Wither began as a moderate in politics and religion, but from this time his Puritan leanings became more and more pronounced, and his later work consists of religious poetry, and of controversial and political tracts His *Hymnes and Songs of the Church* (1622–1623) were issued under a patent (later disallowed) of King James I. ordaining that they should be bound up with every copy of the authorized metrical psalms offered for sale. (*See* HYMNS.) Wither was in London during the plague of 1625, and in 1628 published *Britain's Remembrancer,* a voluminous poem on the subject, which he had to print with his own hand in consequence of his quarrel with the Stationers' Company. In 1635 he was employed by Henry Taunton, a London publisher, to write English verses illustrative of the allegorical plates of Crispin van Passe, originally designed for Gabriel Rollenhagen's *Nucleus emblematum selectissimorum* (1610–1613). The book was published as a *Collection of Emblemes, Ancient and Moderne,* of which the only perfect copy known is in the British Museum. The best of Wither's religious poetry is contained in *Heleluiah: or Britain's Second Remembrancer,* printed in Holland in 1641. Besides hymns proper, the book contains songs of singular beauty, especially the Cradle-song ("Sleep, baby, sleep, what ails my dear").

Wither had served as captain of horse in 1639 in the expedition of Charles I. against the Scottish Covenanters, but three years after the Scottish expedition, at the outbreak of the Great Rebellion, he is found definitely siding with the parliament. He sold his estate to raise a troop of horse, and was placed by a parliamentary committee in command of Farnham Castle. After a few days' occupation he left the place undefended, and marched to London. His own house near Farnham was plundered, and he himself was captured by a troop of Royalist horse, owing his life to the intervention of Sir John Denham on the ground that so long as Wither lived he himself could not be accounted the worst poet in England. After this episode he was promoted to the rank of major. He was present at the siege of Gloucester (1643) and at Kaseby (1645). He had been deprived in 1643 of his nominal command, and of his commission as justice of the peace, in consequence of an attack upon Sir Richard Onslow, who was, he maintained, responsible for the Farnham disaster. In the same year parliament made him a grant of £2,000 for the loss of his property, but he apparently never received the full amount. An order was made to settle a yearly income of £150 on Wither, chargeable on Sir John Denham's sequestrated estate, but there is no evidence that he ever received it. A small place given him by the Protector was forfeited "by declaring unto him (Cromwell) those truths which he was not willing to hear of." At the Restoration he was arrested, and remained in prison for three years. He died in London on May 2, 1667.

His extant writings, catalogued in Park's *British Bibliographer,* number over a hundred. Sir S. E. Brydges published *The Shepherd's Hunting* (1814), *Fidelia* (1815) and *Fair Virtue* (1818), and a selection appeared in Stanford's *Works of the British Poets,* vol. v. (1819). Most of Wither's works were edited in twenty volumes for the Spenser Society (1871–1882); a selection was included by Henry Morley in his *Companion Poets* (1891); *Fidelia* and *Fair Virtue* are included in Edward Arber's *English Garner* (vol. iv., 1882; vol. vi. 1883), and an excellent edition of *The Poetry of George Wither* was edited *by* F. Sidgwick in 1902.

WITHERITE, a mineral consisting of barium carbonate ($BaCO_3$), crystallizing in the orthorhombic system, and named after W. Withering, who in 1784 recognized it to be chemically distinct from barytes. The crystals are invariably twinned together in groups of three, giving rise to pseudo-hexagonal forms somewhat resembling bipyramidal crystals of quartz; the faces are usually rough and striated horizontally. The colour is dull white or sometimes greyish, the hardness is 3·5 and specific gravity 4·3. The mineral occurs in veins of lead ore near Hexham in Northumberland, Alston in Cumberland, Anglezark, near Chorlcy, Lancs,, and a few other localities. It is the chief source of barium salts, and is mined in considerable amounts in Northumberland. It is used for the preparation of rat poison, in the manufacture of glass and porcelain, and formerly for refining sugar. (L. J. S.)

WITHERSPOON, JOHN (1723–1794), Scottish-American divine and educator, was born at Giiford, Yester Parish, Scotland, probably on Feb. 5, 1722 or 1723. He was educated at the Haddington grammar school and the University of Edinburgh (M.A.,

1739), where he completed his theological studies in 1743. He was called to the parish of Beith in 1745 and in 1757 became pastor at Paisley. His militant tendencies, which made him a prominent figure during the American Revolution, manifested themselves at the invasion of the Young Pretender and in his ecclesiastical controversies. These he waged by sermon, debate, pamphlet and essay, revealing himself as a keen dialectician, an effective satirist and a convincing and entertaining speaker. Among his chief publications of this period are Ecclesiastical Characteristics (1753), Essay on Justification (1756) and a three-volume collection of his essays and doctrinal sermons (1764).

Witherspoon's popularity as a preacher is shown by his refusal of calls to Dundee, Dublin and Rotterdam; but his acceptance of a second call to the presidency of Princeton in 1768 marked a turning-point in his career. Thereafter, although he was received warmly by the American Presbyterian Church and although he took a prominent part in the meetings of the synod and was first moderator of the general assembly which he had advocated, he was more distinguished as an educator and as a statesman than as a clergyman. He seems to have brought to the struggling little college centred in Nassau Haii a vision of its potentialities as a cultural agency as well as a training-school for ministers. He opened a grammar school, announced graduate courses, encouraged the undergraduate societies, added Hebrew and French to the curriculum, provided scientific equipment and set out immediately on a quest for more money and more students. From arrival he was an enthusiast about America. He encouraged Scottish immigration, and in the dispute with the mother country ranged himself uncompromisingly on the side of the colonists. He presided over the Somerset county committee of correspondence in 1775–76; was a member of two provincial Congresses and of the New Jersey constitutional convention in the spring of 1776; and in 1776–79 and 1780–82 he was a member of the Continental Congress. He was the only clergyman to sign the Declaration of Independence; and in general he played a creditable part in the congressional body both in debate and on committees. He was especially distinguished for the soundness of his financial views, some of which were published later in his Essay on Money (1786). He died on his farm, Tusculum, near Princeton, Nov. 1j, 1794.

The first edition of Dr. Witherspoon's *Works* was published in four volumes in Philadelphia in 1800 with a biographical account by Dr. John Rodgers. A nine volume edition was published in Edinburgh in 1804–05. See his ***Lectures*** *on* Moral *Philosophy* (1918), edited by V. L. Collins, and the biography by the latter (2 vols., 1925).

WITNESS, in law, a person who is able from his knowledge or experience to make statements relevant to matters of fact in dispute in a court of justice. The relevancy and probative effect of the statements which he makes belong to the law of evidence (*q.v.*). In the present article it is only proposed to deal with matters concerning the position of the witness himself. In England, in the earlier stages of the common law, the jurors seem to have been the witnesses, for they were originally chosen for their knowledge or presumed knowledge of the facts in dispute, and they could (and can) be challenged and excluded from the jury if related to the parties or otherwise likely to show bias.

Competency.—Modern views as to the persons competent to give evidence are very different from those of Roman law and the systems derived from it. In Roman law the testimony of many persons was not admissible without the application of torture, and a large body of possible witnesses was excluded for reasons which have now ceased to be considered expedient, and witnesses were subject to rules which have long become obsolete. Witnesses must be *idonei* or duly qualified. Minors, certain heretics, infamous persons (such as women convicted of adultery), and those interested in the result of the trial were inadmissible. Parents and children could not testify against one another, nor could slaves against their masters, nor those at enmity with the party against whom their evidence was offered. Women and slaves could not act as witnesses to a will. There were also some hard and fast rules as to number. Seven witnesses were necessary for a will, five for a *mancipatio* or manumission, or to determine the question whether a person were free or a slave. As under the Mosaic law, two witnesses were generally necessary as a minimum to prove any fact. *Unius* responsio testis *omnino non audiatur* are the words of a constitution of Constantine. The evidence of a single witness was simply semi-plena *probatio,* to be supplemented in default of a second witness, by torture or reference to oath. The canon law followed the Roman law as to competence, but extended the disabilities to excommunicated persons and to a layman in a criminal charge against a clerk, unless he were actually the prosecutor. The evidence of a notary was generally equivalent to that of two ordinary witnesses. The evidence of the pope and that of a witness who simply proved baptism or heresy (according to some authorities) are perhaps the only other cases in which canon law dispensed with confirmatory evidence. It is probable that the incompetence of Jews as witnesses in Spain in the 14th and 15th centuries was based on what is termed "want of religion," *i.e.,* heresy or unwillingness to take the Christian oath on the gospels. But in England until their expulsion they were on the status of slaves (captivi) of the king. A policy similar to that of the Roman law was followed for centuries in England by excluding the testimony of parties or persons interested, of witnesses for a prisoner, and of infamous persons, such as those who had been attainted or had been vanquished in the trial by battle, or had stood in the pillory. All these were said *vocem non* Izabere. In the days of trial by battle a party could render a witness against him incompetent by challenging and defeating him in the judicial combat. Women were generally regarded as wholly or partially incompetent. English law had also certain rules as to the number of witnesses necessary. Thus under a statute of 1383 (6 Rich. II. st. 2 c, 5) the number of compurgators necessary to free an accused person from complicity in the peasant revolt was fixed at three or four. Five was the number necessary under the Liber *feudorum* for proving ingratitude to the lord.

In the course of the gradual development of the law of evidence, which is in a sense peculiar to the English system, the fetters of the Roman rules as to witnesses were gradually shaken off. In civil cases all disabilities by interest, relationship, sex or crime have been swept away. The witness need not be *idoneous* in the Roman sense, and objections which in Roman law went to his competence, in English law go to his credibility. The only general test of competency is now understanding. It excludes lunatics, idiots, dotards and children of tender years; a person convicted of perjury is said to be competent if convicted at common law, but incompetent if convicted under the act of Elizabeth. No trial ever takes place now under this act, and on this point the act seems to have been virtually repealed by Lord Denman's act (1843; 6 and 7 Vict. c. 85). The disqualification is not absolute as to lunatics; as to children it is sometimes made to depend on whether they are able to understand the nature of the witness's oath. And in certain cases within the Criminal Law Amendment Act, 1885, and the Prevention of Cruelty to Children Act, 1904, the unsworn evidence of children of tender years is admissible but needs corroboration.

Non-judicial witnesses are those who attest an act of unusual importance, for the due execution of which evidence may afterwards be required. They are either made necessary by law, as the witnesses to marriages and wills, or used by general custom, as the witnesses to deeds. In some cases the attestation has become a mere form, such as the attestation of the lord chancellor to a writ of summons. (See WRIT.)

Number.—The rule of English law as to the number of witnesses necessary is expressed in the phrase testes *ponderantur* non numerantur. But there are certain exceptions, all statutory. Two witnesses are necessary to make a will valid; two are required to be present at a marriage and to attest the entry in the marriage register; and in the case of blasphemy, perjury, personation and most forms of treason, two or more witnesses are necessary to justify conviction. Witnesses to bills of sale under the Bills of Sale Act, 1882, and witnesses on a charge of personation at elections, are required to be "credible." And in the case of dishonour of a foreign bill of exchange the evidence of a notary public is required, probably a survival from the law merchant or a concession to Continental practice. A warrant of attorney must

be attested by a solicitor, and certain conveyances of property held on charitable uses must be attested by two solicitors. In certain civil cases the evidence of a single witness is not sufficient unless corroborated in some material particular — not necessarily by another witness—*e.g.*, in actions of breach of promise of marriage, or affiliation proceedings and matrimonial causes, or where unsworn evidence of children is admissible. In practice, but not in strict law, the evidence of an accomplice is required to be corroborated.

In criminal cases an accused person could not formerly be sworn as a witness or examined by the court, though he was free to make statements. The origin of this rule is by some traced to the maxim *nemo tenetur prodere seipsum*, by others to the theory that the petty jury were the prisoner's witnesses. Moreover, witnesses for the defence could not be examined on oath in cases of treason and felony until 1702 in England, 1711 in Ireland and 1735 in Scotland. The husband or wife of the accused could not be examined on oath as a witness either for the prosecution or the defence except in prosecutions for treason or for personal injuries done by one spouse to the other. This exclusion was in accord with the disqualification of parties to civil causes; but there was a lack of reciprocity, for the prosecutor was a competent witness because the Crown is the nominal prosecutor. The rule had to a certain extent a beneficial effect for the defence, in saving the accused from cross-examination, which in certain periods and in political trials would have led to abuse. On the abolition of other disqualifications that of the accused was left. This inconsistency led to much legal discussion and to piecemeal and, ultimately, complete change in the law. Between 1872 and 1897 some 26 acts were passed rendering accused persons and their wives or husbands competent (but not in general compellable) witnesses in particular criminal cases; and finally, by the Criminal Evidence Act, 1898, which abrogates the common law rule above, and in practice supersedes, but does not repeal, the particular statutes just mentioned, and does not apply to Ireland, every person charged with an offence, whether solely or jointly, and the wife or husband of such person is rendered a competent witness for the defence, subject to certain specified conditions. For these conditions, and for the rules regulating the attendance, oaths, examination, and privileges of witnesses, *see* EVIDENCE.

The attestation of documents out of courts of justice is ordinarily not on oath; but where the documents have to be proved in court the attesting witnesses are sworn like others, and the only judicial exception is that of witnesses ordered to produce documents (called in Scotland "havers") who are not sworn unless they have to verify the documents produced. Questions as to competence (including questions of the right to affirm instead of swearing or as to the proper form of oath) are settled by examination by the court without oath on what is termed the *voir dire*. The evidences of judicial witnesses is taken *viva voce* at the trial, except in interlocutory proceedings and in certain matters in the chancery division and in bankruptcy courts. Where the witness cannot attend the court or is abroad his evidence may be taken in writing by a commissioner delegated by the court, or by a foreign tribunal under letters of request issued by the court in which the cause is pending. The depositions are returned by the delegated authority to the court of trial. Under English law evidence must be taken *viva voce* in a criminal trial, with a few exceptions, *e.g.*, where a witness who has made a deposition before a magistrate at an earlier stage in the case is dead or unable to travel, or in certain cases within the Merchant Shipping Acts, or of offences in India or by Crown officials out of England In Europe *commissions vogatoires* are freely used to obtain written depositions for the purpose of criminal trials, and are allowed to be executed in England.

On charges of treason lists of the witnesses to be called by the Crown must he supplied to the accused. In ordinary indictable cases there is no such obligation, but the names of the witnesses for the Crown are written on the back of the indictment; and where the witnesses have not been examined at the preliminary enquiry it is now established practice to require notice to the accused of their names, and a precis of what they will be called to prove. In Scotland, in all indictable cases, a list of witnesses must be served on the accused (the panel) (1887, c. 35), and the same rule is observed in France. In the United States the same course is adopted where a capital offence is charged.

(W. F. C.; S. L. PH.)

WITNEY, a market town and urban district in the Banbury parliamentary division of Oxfordshire, England, on the river Windrush, a tributary of the Thames, 75½ mi. W.N.W. of London on a branch of the G.W. railway. Pop. (est. 1938) 5,417. Area 2.4 sq.mi. Witney is the seat of an old-established industry in blanket-making, and gloves and other woollen goods are also made. The great church of St. Mary is cruciform with a lofty central tower and spire. The tower is Early English, but the church exhibits the other styles, including a remarkable Norman porch.

The manor of Witney was held by the see of Winchester before the Conquest. It was sold in 1649, but was given back to the bishopric at the Restoration. In the middle of the 18th century it was leased by the bishop of Winchester to the duke of Marlborough. Witney was a borough by prescription at least as early as 1278, and sent representatives to parliament fairly regularly from 1311–12 to 1359–60. There is reference to a fulling mill in a charter of King Edgar dated 909. In 1641 the blanket-makers petitioned the crown against vexatious trade regulations; in 1673 the town is described as "driving a good trade for blankets and rugs." In 1710 the blanket-makers obtained a charter making them into a company, consisting of a master, assistants, two wardens and a commonalty.

See J. A. Giles, *History of Witney* (1852); *Victoria County History, Oxon;* W. J. Monk, *History of Witney (1894).*

WITOWT or WITOLD (1350–1430), grand-duke of Lithuania, son of Kiejstut, prince of Samogitia, first appears prominently in 1382, when the Teutonic Order set him up as a candidate for the throne of Lithuania in opposition to his cousin Jagiello *(see* WLADISLAUS), who had treacherously murdered Witowt's father and seized his estates. Witowt, however, convinced himself that the German knights were far more dangerous than his Lithuanian rival; he accepted pacific overtures from Jagiello and became his ally. When Jagiello ascended the throne of Poland as Wladislaus II. in 1386, Witowt was at first content with the principality of Grodno; but jealousy of Skirgiello, one of Jagiello's brothers, to whom Jagiello committed the government of Lithuania, induced Witowt to ally himself once more with the Teutonic Order (treaty of Konigsberg, May 24, 1390). He strengthened his position by giving his daughter Sophia in marriage to Vasily, grand-duke of Muscovy; but he never felt secure beneath the wing of the Teutonic Order, and when Jagiello removed Skirgiello from the government of Lithuania and offered it to Witowt, the compact of Ostrow (5th of August 1392) settled all differences between them.

Nevertheless, subsequent attempts on the part of Poland to subordinate Lithuania drove Witowt for the third time into the arms of the Order, and by the treaty of Salin in 1398, Witowt, who now styled himself *Supremus Dux Lithuaniae*, ceded his ancestral province of Samogitia to the knights, and formed an alliance with them for the conquest and partition of Pskov and Great Novgorod. He nourished the grandiose idea of driving out the hordes of Tamerlane, freeing all Russia from the Tatar yoke, and proclaiming himself emperor of the North and East. This dream of empire was dissipated by his terrible defeat on the Lower Dnieper by the Tatars on Aug. 12, 1399. He was now convinced that the true policy of Lithuania was the closest possible alliance with Poland A union between the two countries was effected at Vilna on Jan. 18, 1401, and was confirmed and extended by subsequent treaties. Witowt was to reign over Lithuania as an independent grand-duke, but the two states were to be indissolubly united by a common policy. The result was a whole series of wars with the Teutonic Order, which now acknowledged Swidrygiello, another brother of Jagiello, as grand-duke of Lithuania; and though Swidrygiello was defeated and driven out by Witowt, the Order retained possession of Samogitia, and their barbarous methods of "converting" the wretched inhabitants finally induced Witowt to rescue his fellow-country-

men at any cost from the tender mercies of the knights.

In the beginning of 1409 Witowt concluded a treaty with Jagiello at Novogrudok for the purpose, and on July 19, 1410, the combined Polish-Lithuanian forces, reinforced by Hussite auxiliaries, crossed the Prussian border. The rival forces encountered at Grünewald, or Tannenberg, and there on July 14 or 15, 1410, was fought one of the decisive battles of the world, for the Teutonic Knights suffered a crushing blow from which they never recovered. After this battle Poland-Lithuania began to be regarded in the west as a great power, and Witowt stood in high favour with the Roman curia. In 1429, instigated by the emperor Sigismund, whom he magnificently entertained at his court at Lutsk, Witowt revived his claim to a kingly crown, and Jagiello reluctantly consented to his cousin's coronation; but before it could be accomplished Witowt died at Troki, on Oct. 27, 1430.

(Lemberg, 1850–1856); Teodor Narbutt, *History of the Lithuanian Nation* (Pol.) (Wilna, 1835–1836); *Codex epistolaris Witoldi Magni* (ed. Prochaska, Cracow, 1882). (R. N. B.)

WITTE, SERGE JULIEVICH, COURT (1849–1915), Russian statesman, was born at Tiflis, where his father (of Dutch extraction) was a member of the Viceregal Council of the Caucasus After completing his studies at Odessa University and devoting some time to journalism in close relations with the Slavophils and M. Katkov, he entered in 1877 the service of the Odessa State railway, and facilitated the transport of troops to Turkey in 1877–8. He now became general traffic manager of the South-Western railway of Russia and member of an Imperial commission which had to study the whole question of railway construction and management throughout the empire. Vishnegradski, minister of finance, recognized his ability and made him head of the railway department in the finance ministry. In 1892 he was promoted to be minister of ways of communication, and in 1893 he succeeded Vishnegradski, as minister of finance.

Witte was an ardent disciple of Friedrich List and sought to develop home industries by means of moderate protection and the introduction of foreign capital for industrial purposes. At the same time he succeeded by drastic measures in putting a stop to the great fluctuations in the value of the paper currency and in resuming specie payments. The rapid extension of the railway system was also largely due to his energy and financial ingenuity, and he embarked on a crusade against the evils of drunkenness by organizing a government monopoly for the sale of alcohol. In 'foreign policy he extended Russian influence in northern China and Persia. Witte struggled for what he considered the liberation of his country from the economic bondage of foreign nations. During his ten years' tenure of the finance ministry he nearly doubled the revenues of the empire, but he made for himself a host of enemies. He was transferred, therefore, in 1903 from the influential post of finance minister to the ornamental position of president of the committee of ministers.

The disasters of the war with Japan, and the rising tide of revolutionary agitation, compelled the government to think of appeasing popular discontent by granting administrative reforms, and the reform projects were revised and amended by the body over which M. Witte presided' But the Witte reforms were obstructed by the other departments, especially by the police. Naturally the influence of a strong man made itself felt, and the president became virtually prime minister; but he did not advance very far in this legislative work, and later he was transformed into a diplomatist and sent to Portsmouth, N H., U.S.A., in August 1905, to negotiate terms of peace with the Japanese delegates. In these negotiations he showed great energy and decision, and contributed largely to bringing about the peace. On his return to St. Petersburg he had to deal, as president of the first ministry under the new constitutional régime, with a very difficult political situation (see RUSSIA: *History*); he was no longer able to obtain support, and early in 1906 he was dismissed. His last service to the emperor had been to raise a large loan in France which made the government practically independent of the Duma. He died at St. Petersburg (Leningrad) on March 12, 1915.

See *Memoirs of Count Nitte* ed. *A.* Yarmolinsky (London and New York, 1921), indispensable to the study of the period: also a study of his career as minister of finance by D. Loutokhin (1915), and his diaries, posthumously published in *Pravda* (1918).

WITTELSBACH, the name of an important German family, taken from the castle of Wittelsbach, which formerly stood near Aichach on the Paar in Bavaria. In 1124, Otto V., count of Scheyern (d. 1155), removed the residence of his family to Wittelsbach, and called himself by this name. His descendants bore simply the title of counts of Scheyern until about 1116, when the emperor Henry V. recognized Count Otto V. as count palatine in Bavaria. His son, Count Otto VI., who succeeded his father in 1155, accompanied the German king, Frederick I., to Italy in 1154, where he distinguished himself by his courage, and later rendered valuable assistance to Frederick in Germany. When Henry the Lion, duke of Saxony and Bavaria, was placed under the imperial ban in 1180, Otto's services were rewarded by the investiture of the dukedom of Bavaria at Altenburg. Bavaria was ruled by the Wittelsbachs from that time onwards until the revolution of 1918, and the history of the house is closely connected with the history of Bavaria (*q.v.*). The ancestral castle of Wittelsbach was destroyed in 1208.

In 1329 the most important of various divisions of the Wittelsbach lands took place. By the treaty of Pavia in this year, Louis IV., German king, formerly duke of Bavaria, granted the Palatinate of the Rhine and the upper Palatinate of Bavaria to his brother's sons, Rudolph II. (d. 1353) and Rupert I. Rupert, who from 1353 to 1390 was sole ruler, gained the electoral dignity for the Palatinate of the Rhine in 1356 by a grant of some lands in upper Bavaria to the emperor Charles IV. It had been exercised from the division of 1329 by both branches in turn. The descendants of Louis IV. retained the rest of Bavaria, but made several divisions of their territory, the most important of which was in 1392, when the branches of Ingoldstadt, Munich and Landshut were founded. These were reunited under Albert IV., duke of Bavaria-Munich (1447–1508) and the upper Palatinate was added to them in 1628. Albert's descendants ruled over a united Bavaria, until the death of Duke Maximilian III. in 1777, when it passed to the Elector Palatine, Charles Theodore. The Palatinate of the Rhine, after the death of Rupert I. in 1390, passed to his nephew, Rupert II., and in 1398 to his son, Rupert III., who was German king from 1400 to 1410. On his death it was divided into four branches. Three of these had died out by 1559, and their possessions were inherited by the fourth or Simmern line, among whom the Palatinate was again divided. (*See* PALATINATE.)

In 1742, after the extinction of the two senior lines of this family, the Sulzbach branch became the senior line, and its head, the elector Charles Theodore, inherited Bavaria in 1777. He died in 1799, and Maximilian Joseph, the head of the Zweibrücken branch, inherited Bavaria and the Palatinate. He took the title of king as Maximilian I.

The Wittelsbachs gave three kings to Germany, Louis IV., Rupert and Charles VII. Members of the family were also margraves of Brandenburg from 1323 to 1373, and kings of Sweden from 1654 to 1718.

See J. Döllinger, *Das Haus Wittelsbach und seine Bedeutung in der deutschen Geschichte* (Munich, 1880); J. F. Böhmer, *Wittelsbachische Regesten bis 1340* (Stuttgart, 1854); F. M. Wittmann, *Monumenta Wittelsbacensia* (Urkundenbuch, Munich, 1857–1861); K. T. Heigel, *Die Wittelsbacher* (Munich, 1880); F. Leitschuh, *Die Wittelsbacher in Bayern* (Bamberg, 1894).

WITTENBERG, a town in the Prussian province of Saxony, Germany, on the Elbe, 59 mi. by rail southwest of Berlin, on the main line to Halle and at the junction of railways to Falkenberg, Torgau and Rosslau. Pop. (1939) 37,180.

Wittenberg is mentioned as early as 1180. It was the capital of the little duchy of Saxe-Wittenberg, the rulers of which afterwards became electors of Saxony. The Capitulation of Wittenberg (1547) is the name given to the treaty by which John Frederick the Magnanimous was compelled to resign the electoral dignity and most of his territory to the Albertine branch of the

Saxon family. It was occupied by the French in 1806, and re-fortified in 1813 by command of Napoleon; but in 1814 it was stormed by the Prussians. Its defences were dismantled in 1873.

Wittenberg is interesting chiefly on account of its close connection with Luther and the dawn of the Reformation, and several of its buildings are associated with the events of that time. Part of the Augustinian monastery in which Luther dwelt, at first as a monk and in later life as owner with his wife and family, has been fitted up as a Luther museum. The Augusteum was built in 1564–83 on the site of the monastery. The Schlosskirche, to the doors of which Luther nailed his famous 95 theses in 1517, dates from 1439–99; it was, however, seriously damaged by fire during the bombardment of 1760, was practically rebuilt, and has since been restored. The old wooden doors, burnt in 1760, were replaced in 1858 by bronze doors, bearing the Latin text of the theses. In the interior of the church are the tombs of Luther and Melanchthon. The parish church, in which Luther often preached, was built in the 14th century, but has been much altered. It contains a magnificent painting by Lucas Cranach the elder, representing the Lord's Supper, Baptism and Confession, also a font by Herman Vischer (1457). The university of Wittenberg, founded in 1502, was merged in the university of Halle in 1815. Luther was appointed professor of philosophy here in 1508; and the new university rapidly acquired a considerable reputation from its connection with the early Reformers. In opposition to the strict Lutheran orthodoxy of Jena it represented the more moderate doctrines of Melanchthon. The ancient electoral palace is another of the buildings that suffered severely in 1760; it now contains archives. Melanchthon's house and the house of Lucas Cranach the elder (1472–1553), who was burgomaster of Wittenberg, are also pointed out. The spot, outside the Elster gate, where Luther publicly burned the papal bull in 1520, is marked by an oak tree. Statues of Luther, Melanchthon and Bugenhagen embellish the town.

See Meynert, *Geschichte der Stadt Wittenberg* (Dessau, 1845); Stier, *Die Schlosskirche zu Wittenberg* (Wittenberg, 1860); Zitzlaff, *Die Begrabnisstatten Wittenbergs und ihre Denkmaler* (Wittenberg, 1897); and Gurlitt, "Die Lutherstadt Wittenberg," in Muther's *Die Kunst* (Berlin, 1902).

WITU or VITU, a sultanate of East Africa included in the Tanaland province of Kenya Colony. It extends along the coast from the town of Kipini at the mouth of the Ozi river (2° 30' S.) to the northern limit of Manda bay (2° S.); area 1,200 sq.m. The chief town, Witu, is 16 m. N. of Kipini. The state was founded by Ahmed-bin-Fumo Luti, the last Nabhan sultan of Patta (an island off the coast), who was defeated by Seyyid Majid of Zanzibar. Ahmed, about 1860, took refuge in the forest district, and made himself an independent chief, acquiring the title of Simba or the Lion. In 1885 Ahmed was induced to place his country under German protection, but in 1890 as the result of the Anglo-German agreement of that year the protectorate was transferred to Great Britain. In 1894 Omar-bin-Hamed of the Nabhan dynasty—an ancient race of Asiatic origin—was recognized as sultan, and Witu settled down to a peaceful life.

WIVELISCOMBE (wĭv'ĕls-kŭm), a market town of Somerset, England, 93 mi. W. of Taunton by the G.W.R. Pop. (1931) 1,262. It was an urban district from 1894 to 1933.

Traces of a large Roman camp may still be seen to the south-east of Wiveliscombe (Wellescombe, Wilscombe, Wiviscombe), which is near the line of a Roman road, and hoards of Roman coins have been discovered in the neighbourhood. The town probably owed its origin to the suitability of its position for defence, and it was the site of a Danish fort, later replaced by a Saxon settlement. The overlords were the bishops of Bath and Wells.

WLADISLAUS (WLADISLAW), the name of four kings of Poland and two Polish kings of Hungary[1].

[1]In Hungarian history the Polish Wladislaus (Mag. Ulászló) is distinguished from the Hungarian Ladislaus (László). They are reckoned separately for purposes of numbering. Besides the Wladislaus kings of Poland, there were three earlier dukes of this name: Wladislaus I. (d. 1102), Wladislaus II. (of Cracow, d. 1163) and Wladislaus III., duke of Great Poland and Cracow (d. 1231). By some historians these are included in the numbering of the Polish sovereigns, King Wladislaus I. being thus IV. and so on.

WLADISLAUS I. (1260–1333), king of Poland, called Lokietek, or "Span-long," from his diminutive stature, was the re-creator of the Polish realm, which at the end of the 13th century had split up into 14 independent principalities, and become an easy prey to her neighbours, Bohemia, Lithuania and the Teutonic Order. In 1296 the gentry of Great Poland elected Wladislaus, then prince of Cujavia, to reign over them; but later changing their minds, placed themselves under the protection of Wenceslaus, king of Bohemia, who was crowned at Gnesen in 1300. Wladislaus obtained the support of Pope Boniface VIII., and on the death of Wenceslaus in 1305 Wladislaus succeeded in uniting beneath his sway the principalities of Little and Great Poland. He had a long struggle with the towns and the prelates headed by Muskata, bishop of Cracow. He managed to suppress the magistrates of Cracow, but had to invoke the aid of the Teutonic Order to save Danzig from the margraves of Brandenburg; whereupon the Order not only proceeded to treat Danzig as a conquered city, but claimed possession of the whole of Pomerania. Wladislaus appealed to Pope John XXII. (1317) and ultimately (Feb. 9, 1321) obtained locally a judgment with costs against the Order, which however, appealed to Rome and got the judgment reversed. The result was a six years' war (1327–33) between Poland and the Order, in which all the princes of Central Europe took part, Hungary and Lithuania siding with Wladislaus, and Bohemia, Masovia and Silesia with the Order. 'It was early on Sept. 27, 1332, that Wladislaus, with his Hungarian allies, inflicted upon the knights their first serious reverse, at Plowce. In March 1333 he died. He had laid the foundations of a strong Polish monarchy, and with the consent of the pope revived the royal dignity, being crowned king of Poland at Cracow on Jan. 20, 1320.

See Max Perlbach, *Preussisch-polnische Studien zur Geschichte des Mittelalters* (Halle, 1886); Julius A. G. von Pflugk-Harttung, *Der deutsche Orden im Kampfe Ludwigs des Bayern mit der Kurie* (1900).

WLADISLAUS II., JAGIELLO (1350–1434), king of Poland, was one of the 12 sons of Olgierd, grand-duke of Lithuania, whom he succeeded in 1377. From the first Jagiello was involved in disputes with the Teutonic Order, and with his uncle, Kiejstut, who ruled Samogitia independently. By the Treaty of Dawidyszek (June 1, 1380) he contracted an alliance with the knights, and two years later, enticed Kiejstut and his consort to Krewo and there treacherously murdered them (Aug. 15, 1382). This foul deed naturally drove Witowt (*q.v.*), the son of Kiejstut, into alliance with the Order. But the two soon made common cause against the knights and invaded Prussian territory. In search of allies, Wladislaus in 1384 offered his hand to Jadwiga, the young queen of Poland, on condition they shared the Polish crown. Jadwiga renounced her previous fiance, William of Austria. Jagiello was elected king of Poland as Wladislaus II.; on Feb. 15, 1386, he adopted the Catholic faith, and on Feb. 18 he married Jadwiga. He at once proceeded to convert Lithuania to his new faith. At Vilna, on Feb. 17, 1387, a stately concourse of nobles and prelates, headed by the king, proceeded to the grove of secular oaks beneath which stood the statue of Perkunos and other idols, and in the presence of an immense multitude hewed down the oaks, destroyed the idols, extinguished the sacred fire and elevated the cross on the desecrated heathen altars, 30,000 Lithuanians receiving Christian baptism. A Catholic hierarchy was immediately set up. Ruthenia with its capital Lemberg was persuaded to acknowledge the dominion of Poland: and there on Sept. 27, 1387, the hospodars of Walachia and Moldavia submitted voluntarily to Polish suzerainty.

The knights endeavoured to re-establish their position by sowing dissensions between Poland and Lithuania. In this for a time they succeeded (see WITOWT); but in 1401 Jagiello recognized Witowt as independent grand-duke of Lithuania (union of Vilna, Jan. 18, 1401), and their union was cemented in the battle of Griinewald, which shook the fabric of the Order to its foundations.

Jagiello was married four times. At the dying request of the childless Jadwiga he espoused a Styrian lady, Maria Cillei, who bore him a daughter, also called Jadwiga. His third wife, Elizabeth Grabowska, died without issue, and in 1422 Jagiello married Sonia. princess of Vyazma, a Russian lady rechristened Sophia, who bore him two sons, Wladislaus and Casimir, both of whom

ultimately succeeded him. Jagiello died at Grodko near Lemberg; in 1434. During his reign Poland had risen to the rank of a great power, a position she was to retain for nearly 200 years.

WLADISLAUS III. (1424–1444), king of Poland and Hungary, the eldest son of Wladislaus II., Jagiello, by his fourth wife, Sophia of Vyazma, was born at Crarow, Oct. 31, 1424, succeeding to the throne in his tenth year. He had a turbulent minority; but Poland was wisely controlled by Zbigniew Olesnicki, while Wladislaus himself defeated the arch-traitor Spytek of Melztyn at Grotnik on May 4, 1439. On the sudden death of the emperor Albert, who was also king of Bohemia and Hungary, the Hungarians elected Wladislaus king, and he was crowned at Buda in July 1440. For three years, however, he had to fight against the partisans of the widowed Empress Elizabeth, till Pope Eugenius IV. mediated between them to enable Wladislaus to lead a crusade against the Turks. At the head of 40,000 men, mostly Magyars, and with Hunyadi commanding under him, Wladislaus made a glorious campaign in the Balkans in 1443, and by the Peace of Szeged (July 1, 1444), the Sultan Murad II., engaged to surrender Serbia, Albania and whatever territory the Ottomans had cvcr conquered froni Hungary, including 24 fortresses, besides paying an indemnity of 100,000 florins in gold. After swearing to observe the treaty, however, Wladislaus broke it two days later in the name of religion, and invaded the Balkans a second time, losing his life and more than a fourth of his army at Varna on Nov. 10, 1444. (*See* also POLAND and HUNGARY.)

WLADISLAUS IV. (1595–1648), king of Poland. son of Sigismund III., king of Poland, and Anne of Austria, succeeded his father on the throne in 1632. He had already served with distinction under Zolkiewski in the Muscovite campaigns of 1610–12, and under Chodkiewicz in 1617–18; and his first official act was to march against the Muscovites, who had declared war against Poland immediately after Sigismund's death, forcing the Muscovite general, after bloody engagements (Aug. 7–22, 1632), to raise the siege of Smolensk and surrender (March 1, 1634). Wladislaus then concluded peace (May 28), conceding the title of tsar to Michael Romanov, who renounced all his claims upon Livonia, Estonia and Courland, besides paying a war indemnity of 200,000 rubles. Wladislaus then marched to Lemberg, and under threat of invasion the Porte offered terms, which were accepted in October, whereby each Power engaged to keep its horderers, the Cossacks and Tatars, in order, and divide between them the suzerainty of Moldavia and Walachia, the sultan binding himself always to place philo-Polish hospodars on those thrones. In the following year the long-pending differences with Sweden were settled, very much to the advantage of Poland, by the truce of Stumdorf (Sept. 12, 1635). Thus externally Poland was everywhere triumphant. Internally, however, things were in their usual deplorable state owing to the suspicion, jealousy and parsimony of the estates. When Danzig rebelled openly against dues lawfully imposed by the king, and a Danish admiral broke the blockade and almost destroyed the flotilla Wladislaus had sent against the rebellious city, the *Sejm* connived at the destruction of the national navy and the depletion of the treasury, "lest warships should make the crown too powerful." For some years after this humiliation, Wladislaus sank into a sort of apathy; but the birth of his son Sigismund (by his first wife, Cecilia Renata of Austria, in 1640) gave him fresh hopes and energy. With the aim of bringing about a royalist reaction, he founded the Order of the Immaculate Conception, consisting of 72 young noblemen who swore a special oath of allegiance to the Crown, and were to form the nucleus of a patriotic movement antagonistic to the constant usurpations of the diet. After the *Sejm* had frustrated this attempt, Wladislaus, assisted by the grand hetman of the Crown, Stanislaw Koniecpolski, tried to use the Cossacks, who were deeply attached to him, to chastise the *szlachta,* at the same time forcing a war with Turkey, which would make his military genius indispensable to the republic. Simultaneously Wladislaus contracted an offensive and defensive alliance with Venice against the Porte, a treaty directly contrary, indeed, to the *pacta conventa* he had sworn to observe. The ill-prepared enterprise fell through; and the king, worn out, disillusioned and broken-hearted at the death of his son (by his second wife, Marie Ludwika of Angoulême, Wladislaus had no issue), died at Merecz on May 20, 1648.

See W. Czermak, *The Plans of the Turkish Wars of Wladislaus IV.* (Pol.) (Cracow, 1895); V. V. Volk-Karachevsky, *The Struggle of Poland with the Cossacks* (Rus.) (Kiev, *1899)*; *Letters and other Writings* of *Wladislaus IV.* (Pol.) (Cracow, 1845).

WLOCLAWEK, a town of Poland in the province of Warsaw. Pop. (1931) 56,277. Situated on the left bank of the Vistula, about 100 mi. below Warsaw, Wloclawek has always been an important city, being the capital of the district of Kujawia and the seat of one of the ancient Catholic bishoprics. The mediaeval cathedral, built in the "Vistula Gothic" style, still exists. The region suffered much in the 14th century from the invasions of the Teutonic Knights. The diocese of the bishops included all eastern Pomerania. Germany occupied the town in 1939.

WLODIMIERZ-WOLYNSKI or **WLODZIMIERZ,** town of Poland, province of Volhynia; population, mainly Jewish. The town is the ancient capital of Volhynia, but it soon declined in importance on the rise of Luck and other towns. Near the town arc the ruins of a church supposed to have been built by Vladimir, grand prince of Kiev in 973. It became the capital of the independent princes of Volhynia. Its name was Latinized as Lodomeria by the Austrians when they occupied it. It was occupied by the U.S.S.R. in 1939 and Germany in 1941.

WOAD, a herbaceous plant, known botanically as *Isatis tinctoria* (family Cruciferae), which occurs sporadically in England in fields, on banks and chalk-pits. The erect branched stem, 1 to 3 ft. in height, bears sessile leaves and terminal clusters of small yellow flowers; the brown pendulous pods are ½ in. long. The ancient Britons stained themselves with this plant. It is still cultivated in Lincolnshire.

WOBURN, a city of Middlesex county, Massachusetts, U.S.A., 10 m. N.N.W. of Boston; served by the Boston and Maine railroad. Pop. (1930) 19,434 (21½% foreign-born white); 1940 federal census, 19,751. The city has an area of 12.6 sq.mi., and embraces several villages. Its property valuation is $20,406,560 and it has excellent residential and recreational facilities. There is some manufacture of leather, chemicals and machine-shop products. In the burial ground are the graves of the ancestors of four presidents (Cleveland, Harrison, Pierce and Garfield). The public library, on the Common, was designed by H. H. Richardson. Among the colonial houses are the birthplace of Count Rumford (built about 1714, and kept as a museum) and the Baldwin mansion (1661), the home of Loammi Baldwin (1780–1838), "the father of civil engineering in America.'. Woburn was settled about 1638–40, and in 1642 was set off from Charlestown and incorporated as a town. The town was chartered as a city in 1888.

WOCHUA, a pygmy people of Africa, living in the forests of the Mabode district, south of the Welle. They were discovered (1880–1883) by Dr. W. Junker, who described them as "well proportioned, though the oval-shaped head seemed somewhat too large for the size of the body." Some are of light complexion, like the Akka and Batwa, but as a general rule they belong to the darker. crisper-haired, more genuine negro stock.

WODEN, a deity of the Anglo-Saxons, the name being the Anglo-Saxon counterpart of the Scandinavian Odin (*q.v.*). In German he was Wodan or Wuotan. Information is lacking as to how far the character and adventures attributed to Odin were known to other Teutonic peoples. Clearly, however, the god was credited with special skill in magic, both in England and Germany, and was also represented as the dispenser of victory. By the Romans he was early identified with Mercurius; "Wednesday" (Woden's day) is dies *Mercurii.*

WODROW, ROBERT (1679–1734), Scottish historian, was born at Glasgow, being a son of James Wodrow, professor of divinity. He was educated at the university and was librarian from 1697 to 1701. From 1703 till his death. on March 21, 1734, he was parish minister at Eastwood, near Glasgow. He had 16 children, his son Patrick being the "auld Wodrow" of Burns's poem "Twa Herds." His great work is *The History of the Suffer-*

ings of the Church of Scotland *from the Restoration* to the Revo*lution* (2 vols., 1721–22; new ed. with a life of Wodrow by Robert Burns, D.D., 1807–08).

WOFFINGTON, MARGARET [PEG] (1714?–1760), English actress, was born at Dublin, of poor parents on Oct. 18, probably in 1714. As a child of ten she played Polly Peachum in a Lilliputian presentation of *The* Beggar's Opera, and danced and acted in Dublin theatres until 1740, when her success as Sir Harry Wildair in The Constant *Couple* secured her a London engagement. In this, and as Sylvia in The *Recruiting Officer,* she had a great success; and at Drury Lane and Covent Garden, as well as in Dublin, she appeared in all the plays of the day. Among her best impersonations were the elegant women of fashion, like Lady Betty Modish and Lady Townley, and in "breeches parts" she was unapproachable. She built and endowed almshouses at Teddington, where she lived after her retirement in 1757. She died there in 1760.

See Austin Dobson's introduction to Charles Reade's novel *Peg Woffington* (1899), and Augustin Daly's *Woffington: a Tribute to the Actress and the Woman* (1888).

WÖHLER, FRIEDRICH (1800–1882), German chemist, was born at Eschersheim, near Frankfort-on-the-Main, on July 31, 1800. In 1814 he began to attend the gymnasium at Frankfort, where he carried out experiments with his friend Dr. J. J. C. Buch. In 1820 he entered Marburg university, and next year removed to Heidelberg, where he worked in Gmelin's laboratory. Intending to practise as a physician, he took his degree in medicine and surgery (1823), but was persuaded by Gmelin to devote himself to chemistry. He studied in Berzelius's laboratory at Stockholm, and there began a lifelong friendship with the Swedish chemist. He then taught in the technical schools of Berlin (1825–31) and Cassel (1831–36). In 1836 he was appointed to the chair of chemistry in the medical faculty at Gottingen, holding also the office of inspector-general of pharmacies in the kingdom of Hanover. This professorship he held until his death on Sept. 23, 1882.

In 1827 Wohler first obtained metallic aluminium by heating the chloride with potassium, and in the following year he isolated beryllium by the same method. His great contribution to the development of chemistry was the synthesis of the natural product urea (*q.v.*) in 1828. He worked with Liebig in a number of important investigations. One of the earliest was the investigation, published in 1830, which proved the polymerism of cyanic and cyanuric acid, but the most famous were those on the oil of bitter almonds (benzaldehyde) and the radicle benzoyl (1832), and on uric acid (1837), which are of fundamental importance in the history of organic chemistry. Most of Wöhler's work, however, lay in the field of inorganic chemistry. Together with Sainte-Claire Deville, he obtained "Adamantine boron," and with H. Buff he investigated compounds of silicon and prepared a hydride of that element. He also obtained pure titanium and showed the similarity between this element and silicon and carbon.

The Royal Society's *Catalogue* enumerates 276 separate memoirs written by him, apart from 43 in which he collaborated with others. In 1831 he published *Grundriss der anorganischen Chemie,* and in 1840 *Grundriss der organischen Chemie.* Still more valuable for teaching purposes was his *Mineralanalyse in Beispielen* (1861), which first appeared in 1853 as *Praktische Übungen in der chemischen Analyse.* He translated three editions of the *Lehrbuch* of Berzelius and all the successive volumes of the *Jahresbericht* into German from the original Swedish. He assisted Liebig and Poggendorff in the *Handwdrterhuch der reinen und angewandten Chemie,* and was joint-editor with Liebig of the *Annalen der Chemie und Pharmacie.*

A memoir by Hofmann appeared in the *Ber. deut. chem. Gesellsch.* (1882), reprinted in *Zur Erinnerung an vorangegangene Freunde* (1888).

WOHLGEMUTH, MICHAEL (1434–1519), German painter, was born at Nuremberg in 1434. In 1472 he married the widow of the painter Hans Pleydenwurff, whose son Wilhelm worked as an assistant to his stepfather. Wohlgemuth was the head of a Iarge workshop, in which many different branches of the fine arts were carried on by a great number of pupil-assistants, including Albert Diirer. In this atelier not only large altar-pieces and other sacred paintings were executed, but also elaborate retables in carved wood, consisting of crowded subjects in high relief, richly decorated with gold and colour. Wood-engraving was also carried on in the same workshop, the blocks being cut from Wohlgemuth's designs. The *Schatzbehalter* der *wahren Reichthümer* des *Heils,* printed by Koburger in 1491; and the *Historia mundi,* by Schedel, 1493–1494, usually known as the Nuremberg *Chronicle,* are both illustrated by woodcuts by Wohlgemuth and Pleydenwurff.

By Wohlgemuth are the retable dated 146j, now in the Munich gallery; the retable of the high altar in the church of St. Mary at Zwickau (1479); and the great retable painted for the Austin friars at Nuremberg, now in the museum. This last consists of a great many panels. He died at Nuremberg in 1519.

See Biirger Schmitz Beth, *Die deutsche Malerei der Renaissance* (1919).

WOKING, a town and urban district in the Farnham parliamentary division of Surrey, England, 24 mi. S.W. of London by the S. railway. Pop. (1938) 40,800. Area, 24.2 sq mi. The modern town, which is growing rapidly, has sprung up near the site of an older town. The river Wey and the Basingstoke canal pass through the parish. St. Peter's church dates from the 13th century. Modern structures include a public hall, and an Oriental institute including a museum of Eastern antiquities, a mosque built in 1889 and residences ior Orientals. In the vicinity are a crematorium and Brookwood cemetery.

WOLCOT, JOHN (1738–1819), English satirist and poet, known under the pseudonym of PETER PINDAR, was baptized at Dodbrooke, Devonshire, on May 9, 1738. He was apprenticed to his uncle, John Wolcot, a surgeon at Fowey. and he took his degree of M D. at Aberdeen in 1767. In 1769 he was ordained, and went to Jamaica with Sir William Trelawny, the governor. In 1772 he became incumbent of Vere, Jamaica, but on the death of his patron (1772) he returned to England, and settled as a physician at Truro. In 1781 Wolcot went to London, and took with him the young Cornish artist, John Opie, whose talents in painting he had been the first to recognize. He soon achieved fame by a succession of pungent satires on George III. Two of Wolcot's happiest satires on the "farmer king" depicted the royal survey of Whitbread's brewery, and the king's naïve wonder how the apples got into the dumplings. He had a broad sense of humour, a keen eye for the ridiculous, and great felicity of imagery and expression. Some of his serious pieces—his rendering of Thomas Warton's epigram on *Sleep* and his Lord Gregory, for example—reveal an unexpected fund of genuine tenderness. He died at Latham Place, Somers Town, London, on Jan. 14, 1819, and was buried near Samuel Butler, the author of *Hudibras,* in St. Paul's, Covent Garden.

Polwhele, the Cornish historian, was well acquainted with Wolcot in his early life, and the best account of his residence in the west is found in vol. i. of Polwhele's *Traditions* and in Polwhele's *Biographical Sketches,* vol. ii. Cyrus Redding was a frequent visitor at the old man's house, and has described Wolcot's later days in his *Pust Celebrities,* vol. i., and his *Fifty Years' Recollections,* vols. i. and ii.

WOLCOTT, ROGER (1679–1767), American administrator, was born in Windsor (Conn.), Jan. 4, 1679, the son of Simon Wolcott (died 1687). He was a grandson of Henry Wolcott (1578–1655), who emigrated to New England in 1628; assisted John Mason and others to found Windsor (Conn.), in 1635; and was a member of the first general assembly of Connecticut in 1637 and of the house of magistrates from 1643 to his death. (Henry Wolcott the younger [died 1680] was one of the patentees of Connecticut under the charter of 1662.) Roger Wolcott was a member of the Connecticut general assembly in 1709, one of the bench of justices in 1710, commissary of the Connecticut forces in the expedition of 1711 against Canada, a member of the council in 1714, judge of the county court in 1721, and of the superior court in 1732, and deputy governor and chief justice of the superior court in 1741. He was second in command to Sir William Pepperrell, with rank of major general in the expedition (1745) against Louisbourg, and was governor of Connecticut in 1751–54. He died in what is now East Windsor, on May 17, 1767.

He wrote Poetical *Meditations* (172j), an epic on *The Agency*

of the Honourable John Winthrop in the Court of King Charles the Second (printed in vol. iv., series 1. *Collections* of Massachusetts Historical Society). His *Journal at the Siege of Louisbourg* is printed in pp. 131–161 of vol. i (1860) of the *Collections* of the Connecticut Historical Society.

His son OLIVER WOLCOTT (1726–1797) was graduated from Yale in 1747 and studied medicine with his brother Alexander (1712–95). In 1751 he was made sheriff of the newly established Litchfield county and practised law in Litchfield. He was a member of the council in 1774–86 and of the Continental Congress in 1775–76, 1778 and 1780–84, and a commissioner of Indian affairs for the northern department in 1775. During the War of Independence he was active in raising militia in Connecticut. He was one of the signers of the Declaration of Independence; commanded Connecticut militia that helped to defend New York city in Aug. 1776; in 1777 organized more Connecticut volunteers and took part in the campaign against Gen. John Burgoyne; and in 1779 commanded the militia during the British invasion of Connecticut. In 1784, as one of the commissioners of Indian affairs for the northern department, he negotiated the treaty of Fort Stanwix (Oct. 22) settling the boundaries of the Six Nations. In 1786–96 he was lieutenant governor of Connecticut, and in Nov. 1787 was a member of the Connecticut convention which ratified the Federal Constitution. He became governor in 1796 upon the death (Jan. 15) of Samuel Huntington, and served until his death on Dec. 1, 1797.

His son Oliver wrote a sketch of him in Sanderson's *Biography of the Signers of the Declaration of Independence* (Philadelphia, 1820–27).

Oliver's son, OLIVER WOLCOTT, Jr. (1760–1833), was graduated from Yale in 1778, studied law in Litchfield, and was admitted to the bar in 1781. With Oliver Ellsworth he was appointed (May 1784) a commissioner to adjust the claims of Connecticut against the United States. He was controller of public accounts of Connecticut and auditor of the Federal Treasury. In June 1791 he became controller of the Treasury, and in Feb. 1795 succeeded Alexander Hamilton as secretary of the Treasury. At the end of 1800 he resigned after a bitter attack by the press. He re-entered politics as a leader of the "Toleration Republicans," and in 1817 presided over the State convention which adopted a new constitution, and in the same year was elected governor, serving until 1827. He died in New York city June 1, 1833.

His grandson George Gibbs (1815–1873) in 1846 edited *Memoirs of the Administration of Washington and John Adams . . . from the Papers of Oliver Wolcott, Secretary of the Treasury*. Wolcott wrote *British Influence on the Affairs of the United States Proved and Explained* (1804).

WOLF, FRIEDRICH **AUGUST** (1759–1824), German philologist and critic, was born on Feb. 15, 1759, at Hainrode, in the province of Hanover. He was educated at Nordhausen grammar school and Gottingen university. There he chose philology as his faculty, which then had no existence, and succeeded in carrying his point. He was dissatisfied with Heyne's treatment of Homer, and the two fell out. Later his edition of the *Symposium* obtained for him a chair at Halle. The moment was a critical one in the history of education. The literary impulse of the Renaissance was almost spent; scholarship had become dry and trivial. A new school, that of Locke and Rousseau, sought to make teaching more modern and more human, but at the sacrifice of mental discipline and scientific aim. Wolf was eager to throw himself into the contest on the side of antiquity. In Halle (1783–1807), by the force of his will and the enlightened aid of the ministers of Frederick the Great, he was able to carry out his long-cherished ideas and found the science of philology.

During his time at Halle Wolf published his commentary on the *Leptines* of Demosthenes (1789) and a little later the celebrated *Prolegomena* to Homer (1795). This book, the work with which his name is chiefly associated, was thrown off in comparative haste to meet an immediate need. It has all the merits of a great piece of oral teaching—command of method, suggestiveness, breadth of view. From it originated the great Homeric controversy and Wolf's main points, oral tradition, deliberate revision after reduction to writing, and plurality of authorship, are still the crucial questions. The French invasion swept away the university, and the rest of his life was spent at Berlin, where he had another professorship. His most finished work, the *Darstellung der Altertumswissenschaft,* though published at Berlin (1807), belongs essentially to the Halle time. At length his health gave way. He was advised to try the south of France. He got as far as Marseilles, and died there on Aug. 8, 1824.

Mark Pattison wrote an admirable sketch of Wolf's life and work in the *North British Review* of June 1865, reproduced in his *Essays* (1889); *see* also *J. E.* Sandys, *Hist. of Class. Schol.* iii. (1908), pp. 51–60. Wolf's *Kleine Schriften* were edited by G. Bernhardy (Halle, 1869). Works not included are the *Prolegomena,* the *Letters to Heyne* (1797), the commentary on the *Leptines* (Halle, 1789) and a translation of the *Clouds* of Aristophanes (1811).

WOLF, HUGO (1860–1903), German composer, was born on the 13th of March 1860 at Windischgraz in Styria. His father, who was in the leather trade, was a keen musician. From him Hugo learned the rudiments of the piano and the violin. After an unhappy school life, in which he showed little aptitude for anything but music, he went in 1875 to the Conservatoire. He appears to have learned very little there, and was dismissed in 1877 because of a practical joke in the form of a threatening letter to the director, for which he was perhaps unjustly held responsible. In 1884 he became musical critic to the *Salonblatt,* a Viennese society paper, and contrived by his uncompromisingly trenchant and sarcastic style to win notoriety.

The publication at the end of 1887 of twelve of his songs seems to have definitely decided the course of his genius, for about this time he retired from the *Salonblatt,* and resolved to devote his whole energies to song-composition. The nine years which followed practically represent his life as a composer. They were marked by periods of feverish creative activity, alternating with periods of mental and physical exhaustion, during which he was sometimes unable even to bear the sound of music. By the end of 1891 he had composed the bulk of his works, on which his fame chiefly rests, 43 Morike Lieder, 20 Eichendorff Lieder, 51 Goethe Lieder, 44 Lieder from Geibel and Heyse's *Spanisches Liederspiel,* and 22 from Heyse's *Italienisches Liederbuch,* a second part consisting of 24 songs being added in 1896. Besides these were 13 settings of lyrics by different authors, incidental music to Ibsen's *Fest auf Solhaug,* a few choral and instrumental works, an opera in four acts, *Der Corregidor,* successfully produced at Mannheim in June 1896, and finally settings of three sonnets by Michelangelo in March 1897. In September of this year the malady which had long threatened descended upon him; he was placed in an asylum, released in the following January, only to be immured again some months later by his own wish, after an attempt to drown himself in the Traunsee. Four painful years elapsed before his death on the 22nd of February 1903.

What little success he obtained was due to the efforts of friends, critics and singers, to make his songs known, to the support of the Vienna Wagner-Verein, and to the formation in 1895 of the Hugo-Wolf-Verein in Berlin. No doubt it was also a good thing for his reputation that the firm of Schott undertook in 1891 the publication of his songs, but the financial result after five years amounted to 85 marks 35 pfennigs (about £4 10s.). He lived in cheap lodgings till in 1896 the generosity of his friends provided him with a house, which he enjoyed for one year.

Wolf's place among the greatest song-writers is due to the essential truth and originality of his creations, and to the vivid intensity with which he has presented them. No other composer has exhibited so scrupulous a reverence for the poems which he set. To displace an accent was for him as heinous an act of sacrilege as to misinterpret a conception or to ignore an essential suggestion. Fineness of declamation has never reached a higher point than in Wolf's songs. (W FD.)

WOLF (*Canis lupus*), wild member of the typical section of the genus *Canis* (*see* CARNIVORA). Excluding some varieties of domestic dogs, wolves are the largest members of the genus, and have a wide geographical range, extending over nearly the whole of Europe and Asia, and North America from Greenland to Mexico, but are not found in South America or Africa, where they

are replaced by other members of the family. They present great diversities of size, length and thickness of fur, and coloration, although resembling each other in all important structural characters. The Eurasian wolf (C. *lupus*) enters north-western India, but in the peninsula is replaced by the jackal-like *C. pallipes*. In North America, besides the timber wolf (*C. nubilus*) there is a smaller species (*C. latrans*) called the coyote (*qq.v.*)

The ordinary colour of the wolf is grey. In northern countries the fur is longer and thicker, and the animal larger and more powerful than farther south. It is especially known to man in the countries it inhabits as the devastator of sheep flocks. Wolves catch their prey by running it down in open chase, which their speed and remarkable endurance enable them to do. Except during summer when the young families of cubs are being separately provided for by their parents they assemble in troops or packs, and by their combined efforts are able to overpower and kill deer, antelopes and wounded animals of all sizes.

The history of the wolf in the British Isles and its gradual extirpation has been thoroughly investigated by J. E. Harting in his *Extinct British Animals*. Wolf-hunting was a favourite pursuit of the ancient Britons as well as of the Anglo-Saxons, and it was not until the reign of Henry VII. (1485–1509) that wolves appear to have become extinct in England. In Scotland the wolf maintained its hold for a much longer period. There is a well-known story of the last of the race being killed by Sir Ewen Cameron of Lochiel in 1680, but there is evidence of wolves having survived in Sutherlandshire well into the following century. In Ireland the date of their extinction has been placed, upon the evidence of doubtful traditions, as late as 1766.

It is owing to their position that the British Islands have been able to clear themselves of these animals, for France, with no natural barriers to prevent their incursions from the east, is liable every winter to visits. In America wolves are now unknown east of the Mississippi and Lake Huron, but are numerous in the Rockies, on the Pacific coast and in North Canada. In Russia during the last few years wolves have not only been abundant, but numerous cases of rabies have occurred among them. In Tasmania, the name wolf is applied to the thylacine (*q.v.*).

WOLFDIETRICH, German hero of romance. The tale of Wolfdietrich is connected with the Merovingian princes, Theodoric and Theodebert, son and grandson of Clovis; but in the Middle High German poems of *Ortnit* and *Wolfdietrich* in the *Heldenbuch* (*q.v.*) Wolfdietrich is the son of Hugdietrich, emperor of Constantinople. Repudiated and exposed by his father, the child was spared by the wolves of the forest, and was educated by the faithful Berchtung of Meran. After the emperor's death Wolfdietrich was driven from his inheritance by his brothers. Berchtung and his 16 sons stood by Wolfdietrich. Six of these were slain and the other ten imprisoned. After long exile in Lombardy at the court of King Ortnit the hero returned to deliver the captives and regain his kingdom. Wolfdietrich's exile and return suggested a parallel with the history of Dietrich of Bern, with whom he was often actually identified; and in the *Anhang* to the *Heldenbuch* it is stated, in despite of all historical considerations, that Wolfdietrich was the grandfather of the Veronese hero. Among the exploits of Wolfdietrich was the slaughter of the dragon which had slain Ortnit (*q.v.*). He thus took the place of Hardheri, the original hero of this feat. The myth attached itself to the family of Clovis, around which epic tradition rapidly gathered. Hugdietrich is generally considered to be the epic counterpart of Theodoric (Dietrich), eldest son of Clovis. After his father's death he divided the kingdom with his brothers. Wolfdietrich represents his son Theodebert (d. 548), whose succession was disputed by his uncles, but was secured by the loyalty of the Frankish nobles. But father and son are merged by a process of epic fusion in Wolfdietrich.

Ortnit and *Wolfdietrich* have been edited by Dr. J. L. Edlen von Lindhausen (Tiibingen, 1906). G. Sarrazin, in *Zeitsckr. fur deutsche Phil,* (1896), compared the legend of Wolfdietrich with the history of Gundovald, as given by Gregory of Tours in books vi. and vii. of his *Hist. Francorurn.*

WOLFE, CHARLES (1791–1823), Irish poet, son of Theobald Wolfe of Blackhall, Co. Kildare, was born on Dec. 14, 1791. He was educated at English schools and at Trinity college, Dublin, where he matriculated in 1809 and graduated in 1814. He was ordained priest in 1817, and obtained the curacy of Ballyclog, Co. Tyrone, which he shortly exchanged for that of Donoughmore in the same county. He died at Cork on Feb. 21, 1823, in his 32nd year. Wolfe is remembered solely by his stirring stanzas on the "Burial of Sir John Moore" written in 1816 in the rooms of Samuel O'Sullivan, a college friend, and printed in the *Newry Telegraph.*

WOLFE, HUMBERT (1885–1940), C.B. (1925), poet and writer, was born in Milan on Jan. 5, 1885, and educated at Bradford Grammar School and Wadham College, Oxford. He entered the civil service in 1908, and in 1918 was appointed principal assistant secretary to the ministry of labour. He was also substitute member on the governing body of the International Labour Office His first publications were *London Sonnets* and *Shylock reasons with Mr. Chesterton* (both published in 1920); these were followed by *Circular Saws,* a volume of tales, in 1923.

In 1924 appeared *Kensington Gardens* and in 1925 *The Unknown Goddess,* which contain poems, delicate, original and moving; *Lampoons* (1925) and *News of the Devil* (1926) prove his powers as a writer of satire. His output of verse thereafter was plentiful and regular: after *Humoresque* in 1926 came *Others Abide* (translations from the Greek Anthology), *Requiem* and *Cursory Rhymes* (1927), and *The Silver Cat* and *This Blind Rose* (1928); in these his talent is thought by some to have lost freshness. In 1930 he published *The Uncelestial City,* a long satire in verse. and eight years later a play in free verse, *The Silent Knight,* was produced in London. *Dialogues and Monologues* (1928) was a volume of literary criticism Wolfe died Jan 5, 1940.

WOLFE, JAMES (1727–1759), was born at Westerham, Kent, on Jan. 2, 1727. He was the elder son of Lt.-col. Edward Wolfe, an experienced soldier, who afterwards rose to the rank of lieutenant-general, and of Henrietta, daughter of Edward Thompson, of Long Marston, Yorks. He received his brief education at private schools, the first at Westerham, the second at Greenwich. From his earliest years he was determined to be a soldier, despite his weak health, which just prevented him from sailing as a volunteer with the ill-fated Cartagena expedition of 1740. In 1741 he received a commission in the Marines, but, having transferred into the line, he was sent to Flanders in the spring of 1742 as an ensign in the 12th Foot. Until the close of the War of the Austrian Succession, he was continuously on active service, being present at the battles of Dettingen, Falkirk, Culloden and Laffeldt, where he was wounded. His zeal, intelligence and gallantry won him the regard of his superiors, notably the duke of Cumberland. In 1743 he was appointed adjutant of the 12th; next year he received a captain's commission in the 4th; in 1745 and 1747 he served as brigade-major; while in Scotland he was aide-de-camp to Gen. Hawley.

In 1749 Wolfe, with the rank of major, was appointed acting-commander of the 20th Foot, whose lieutenant-colonel he became in the following year. He was with this regiment for eight years, during which it was stationed at several towns in Scotland and, from 1753, at various places in the south of England.

In 1757 Wolfe was appointed quartermaster-general in Ireland, but before entering upon his duties he was chosen by Pitt for the same position in the expedition against Rochefort. Though the enterprise failed utterly, Pitt and the English public had substantial grounds for their belief that it would have succeeded if plans for landing suggested by Wolfe had been acted upon by the commanders-in-chief. Wolfe was consequently selected to serve as brigadier under Amherst in the force which was to attempt the capture of Cape Breton and Quebec in 1758. At the siege of Louisbourg he played a conspicuous and brilliant part.

Meanwhile, Wolfe had been made colonel of the 67th, but soon after his return home Pitt gave him the command of the expedition which was to renew the attempt to take Quebec. He was to have the local rank of major-general, and, though technically under Amherst, to enjoy full discretion in his conduct of operations. Leaving England in Feb. 1759, Wolfe mustered his troops, rather more than 9,000 in number, at Louisbourg; and thanks to

the inarvellous seamanship and the unselfish co-operation of Admiral Saunders, they arrived without mishap before Quebec in the last week of June. Wolfe's first intention was to land above, though near, the town, so as to attack the weak fortifications from the plains of Abraham; but the plan was abandoned, probably owing to the misgivings of Saunders. The British, however, seized the heights on the south shore of the St. Lawrence, opposite Quebec, which they were thus able to bombard, and established a camp at the mouth of the Montmorency river, between which and the city, Montcalm had entrenched nearly all his army. Perplexed by Montcalm's deliberate inactivity, Wolfe, on July 31, made an ill-conceived, unsuccessful and costly assault on the French lines. Wolfe, at this crisis, felt it his duty to consult his three brigadiers. When they counselled a landing to the west of Quebec, he readily concurred, and in a few days more than 3,000 men were transferred to ships above the town. Instead, however, of landing above Quebec, he resolved to take a force downstream and disembark it secretly at the Ause du Foulon, a cove only $1\frac{1}{2}$ m, from the city. This operation he successfully carried out in the early hours of Sept. 13. Montcalm was constrained to make a precipitate attack, and the British musketry decided the issue in a few minutes. Wolfe, however, was mortally wounded by a musket-ball, and died after the French gave way.

R. Wright, *Life of James Wolfe* (1864), still most valuable; F. Parkman, *Montcalm and Wolfe* (2 vols., 1885); A. G. Doughty and G. W. Parmelee, *The Siege of Quebec and Battle of the Plains of Abraham* (6 vols., 1901–03); W. Wood, *The Fight for Canada* (1905); *H*. R. Casgrain, *Wolfe and Montcalm* (Makers of Canada) (1905); B. Willson, *The Life and Letters of Janzes Wolfe* (1909); *Logs of the Conquest of Canada* (edit. *W*. Wood, 1909); *Capt. Knox's Journal*, edit. *A. G*. Doughty (3 vols., 1913); A. Wolfe-Aylward, *Pictorial Life of James Wolfe* (1926).

WOLFE, THOMAS CLAYTON (1900–1938), American author, was born Oct. 3, 1900, at Asheville, N.C., and was educated at the University of North Carolina and at Harvard. From 1924 to 1930 he taught at New York university. His best known novels were *Look Homeward, Angel* (1929), *From Death to Morning* and *Of Time and the River* (1935). He died Sept. 15, 1938.

WOLFENBÜTTEL, a town of Germany, in the *Land* of Brunswick, situated on both banks of the Oker, 7 mi. S. of Brunswick on the railway to Harzburg. Pop. (1939) 25,116. The library is rich in Bibles and books of the early Reformation period, and contains some fragments of the Gothic bible of Ulfilas.

A castle is said to have been founded on the site of Wolfenbiittel by a margrave of Meissen about 1046. When this began in 1267, to be the residence of the early Brunswick or Wolfenbüttel line of counts, a town gradually grew up around it The town passed into possession of the Brunswick-Wolfenbiittel family in 1671, and for nearly 100 years was the ducal capital.

WOLFF (less correctly WOLF), **CHRISTIAN** (1679–1754), German philosopher and mathematician, the son of a tanner, was born at Breslau on Jan. 24, 1679. At the University of Jena he studied first mathematics and physics, to which he soon added philosophy. In 1703 he qualified as *Privatdozent* in the University of Leipzig, where he lectured till 1706, when he became professor of mathematics and natural philosophy at Halle through the influence of Leibniz, of whose philosophy his own system is a modification. In Halle Wolff limited himself at first to mathematics, but presently added physics, and eventually all the main philosophical disciplines. But the claims which Wolff advanced on behalf of the philosophic reason *(see* RATIONALISM) appeared impious to his theological colleagues. Halle was the headquarters of Pietism, which, after a long struggle against Lutheran dogmatism, had itself assumed the characteristics of a new orthodoxy. Wolff's professed ideal was to base theological truths on evidence of mathematical certitude, and strife with the Pietists broke out openly in 1721, when Wolff, on the occasion of laying down the office of pro-rector, delivered an oration "On the Practical Philosophy of the Chinese" (Eng. trans. 1750), in which he instanced the moral precepts of Confucius as evidence of the power of human reason to attain by its own efforts to moral truth. For ten years Wolff was subjected to attack, until in a fit of exasperation he appealed to the court for protection. His enemies, however, told Frederick William I. that, if Wolff's determinism were recognized, no soldier who deserted could be punished, since he would only have acted as it was predetermined that he should. Wolff was at once deprived of office and ordered to leave Prussia on pain of death. He crossed over into Saxony, where the landgrave of Hesse received him with every mark of distinction, and the circumstances of his expulsion drew universal attention to his teaching at Marburg, where he was now established. Over 200 books and pamphlets appeared for or against Wolff's doctrine before 1737, not reckoning the systematic treatises of Wolff and his followers. One of the first acts of Frederick the Great was to recall Wolff (1740) to Halle. In 1743 he became chancellor of the university, and in 1745 he received the title of *Freiherr* from the elector of Bavaria. But his matter was no longer fresh, he had outlived his power of attracting students, and his class-rooms remained empty. He died on April g, 1754.

Wolff's most important works are as follows: *Anfangsgründe aller mathematischen Wissenschaften* (1710; in Latin, *Elementa rnatheseos universae,* 1713–1j); *Vernünftige Gedanken von den Kräften des menschlichen Verstandes* (1712; Eng. trans. 1770); *Vern. Ged. von Gott, der Welt und der Seele des Menschen* (1719); *Vern. Ged. von der Menschen Thun und Lassen* (1720); *Vern. Ged. von dem gesellschaftlichen Leben der Menschen* (1721); *Vern. Ged. von den Wirkungen der Natur* (1723); *Vern. Ged. von den Absichten der natürlichen Dinge* (1724); *Vern. Ged. von dem Gebrauche der Theile in Menschen, Thieren und Pflanzen* (1725). The last seven may be described briefly as treatises on logic, metaphysics, moral philosophy, political philosophy, theoretical physics, teleology, physiology: *Philosophia rationalis, sive logica* (1728); *Philosophia prima, sive Ontologia* (1729); *Cosmologia generalis* (1731); *Psychologia empirica* (1732); *Psychologia rationalis* (1734); *Theologia naturalis* (1736–37); *Philosophia practica universalis* (1738–39); *Jus naturae* and *Jus Gentium* (1740–49); *Philosophia moralis* (1750–53). His *Kleine philosophische Schriften* have been collected and edited by G. F. Hagen (1736–40).

In addition to Wolff's autobiography *(Eigene Lebensbeschreibung,* ed. H. Wuttke, 1841) and the usual histories of philosophy, *see* W. Schrader in *Allgemeine deutsche Biographie,* xliv.; C. G. Ludovici. *Ausführlicher Entwurf einer vollständigen Historie der Wolff'schen Philosophie* (1736–38); J. Deschamps, *Cours abrégé de la philosophie wolffienne* (1743); F. W. Kluge, *Christian von Wolff der Philosoph* (1831); *W*. Arnsperger, *Christian Wolffs Verhältnis zu Leibniz* (1897); *H*, Pichler, *Über Christian Wolffs Ontologie* (Leipzig, 1910); H. Ostertar, *Der philosophische Gehalt des Wolff-Manteuffelschen Briefwechsels* (Leipzig, 1910).

WOLFF, SIR HENRY DRUMMOND (1830–1908), English diplomatist and Conservative politician, the son of Joseph Wolff, entered the foreign office as a clerk. In 1874–1880 he sat in parliament for Christchurch, and in 1880–1885 for Portsmouth. being one of the small group known as the "Fourth Party." In 188; he went on a special mission to Constantinople in connection with the Egyptian question, and as the result various awkward difficulties, hinging on the sultan's suzerainty, were got over. In 1888 he was sent as minister to Tehran, and from 1892 to 1900 was ambassador at Madrid. He died on the 11th of October 1908. Sir Henry, who received the K.C.M.G. in 1862, and other honours later, was a chief mover in founding the Primrose League.

WOLFF, PIERRE (1865–), French dramatist, was born at Paris, Jan. 1, 1865. He began his literary career under the auspices of his uncle, the brilliant and witty journalist Albert Wolff. Like most of the outstanding playwrights of his time, he wrote his first plays for the Théâtre Libre, where his *Jacques Bouchard* was produced in 1890. *Leurs Filles* (1891) is in a similar vein of mordant and provocative irony. In his later works, Wolff tended more and more to take an indulgent if not optimistic view of human relations. He achieved fame in the early years of the 20th century with *Le Secret de Polichinelle* (1903), *L'Age d'aimer* (1904), and, above all, *Le Ruisseau* (1907), which deals with the moral recovery of a fallen creature. *Les Marionnettes* was produced at the Comédie Française in 1910, and established his popularity. The best of his post-war plays is undoubtedly *Les Ailes brisées* (1920). Wolff has collaborated with Dunernois, with

whom he wrote *Après l'amour,* in which Lucien Guitry achieved one of his last successes.

WOLF-FERRARI, ERMANNO (1876–), Italian composer, was born at Venice on Jan. 12, 1876, his father being a distinguished German painter and his mother an Italian. He studied with Rheinberger at Munich, and on his return to Venice brought out his oratorio, La Sulamite. He then went to Germany and revised his early opera, *Cinderella,* for production at Bremen in 1902. This was followed by Le dame curiose and I *quattro* rusteghi (1906), both of which were performed at Munich. His first great success came with *Il* segreto *di Susanna,* a one-act comedy, first given at Munich in 1909 and quickly taken up in other places. Still more popular was *The* Jewels of *the* Madonna (Berlin 1911), which gave him an international reputation. He has also written a chamber symphony, *Rispetti* for soprano, op. 11, and a pianoforte quintet (1920). From 1902–12 Wolf-Ferrari was director of the Liceo Benedetto Marcello in Venice.

WOLFRAMITE or WOLFRAM, a mineral consisting of an isomorphous mixture in varying proportions of the tungstates of iron and manganese, $FeWO_4$ and $MnWO_4$. Varieties with dominant iron are often called ferberite, with dominant manganese, hubnerite, but since iron and manganese have nearly the same atomic weight the percentage of tungsten reckoned as WO_3 (about 76%) shows little variation and the difference is of no commercial importance. Wolframite crystallizes in the monoclinic system, usually in prismatic forms, without end-faces, and there is a very perfect pinacoidal cleavage. The colour is dark brown or black, with a metallic lustre especially on cleavage faces. Hardness 5–5·5 and density 7·2–7·5.

Wolframite is very commonly associated with tin-ore in lodes and veins in and around granites. This form occurs in Cornwall; north-west Spain and north Portugal; Saxony; Tavoy (Lower Burma); the Malay Peninsula; Queensland; Tasmania. In the United States the biggest producer is Boulder Co., Colorado, where there is no tin, but many gold veins.

Wolframite is the chief ore of the metal tungsten, which is used as a constituent of high-speed and other special steels, as well as certain non-ferrous alloys; for the filaments of electric lamps; and for various other technical uses, often as sodium tungstate. During the World War there was a tremendous demand for tungsten steel for munition making, and many new sources of wolframite were developed. (R. H. RA.)

WOLFRAM VON ESCHENBACH, the most important and individual poet of mediaeval Germany, flourished during the end of the 12th and beginning of the 13th century. He was one of the brilliant group of Minnesingers whom the Landgrave Herrmann of Thuringia gathered round him at the historic castle of the Wartburg. We know by his own statement that he was a Bavarian, and came of a knightly race, counting his achievements with spear and shield far above his poetical gifts. The Eschenbach from which he derived his name was most probably Ober-Eschenbach, not far from Pleinfeld and Nuremberg; there is no doubt that this was the place of his burial, and so late as the 17th century his tomb was to be seen in the church of Ober-Eschenbach, which was then the burial place of the Teutonic knights. Wolfram probably belonged to the small nobility, for he alludes to men of importance, such as the counts of Abenberg, and of Wertheim, as if he had been in their service. Certainly he was a poor man, for he makes frequent and jesting allusions to his poverty. Bartsch concludes that he was a younger son, and that while the family seat was at Eschenbach, Wolfram's home was the insignificant estate of Wildenburg (to which he alludes), now the village of Wehlenberg. Wolfram seems to have disdained all literary accomplishments, and in fact insists on his unlettered condition both in *Parzival* and in *Willehalm.* But this is somewhat perplexing, for these poems are beyond all doubt renderings of French originals. Were the poems read to him, and did he dictate his translation to a scribe? The date of Wolfram's death is uncertain. We know that he was alive in 1216, as in *Willehalm* he laments the death of the Landgrave Herrmann, which took place in that year.

Wolfram von Eschenbach lives in, and is revealed by, his work. We has left two long epic poems, Parzival and Willehalm (the latter a translation of the French chanson de geste *Aliscans*), certain fragments, Titurel (apparently intended as an introduction to the Parzival), and a group of lyrical poems, Wachter-Lieder. These last derive their name from the fact that they record the feelings of lovers who, having passed the night in each other's company, are called to separate by the cry of the watchman, heralding the dawn. These Tage Lieder, or Wachter Lieder, are a feature of Old German folk-poetry, of which Wagner has preserved the tradition in the warning cry of Brangaene in the second act of Tristan.

The problem of the source of the *Parzival* is the crux of mediaeval literary criticism. (See PERCEVAL.) The Parzival is a soul-drama; the conflict between light and darkness, faith and doubt, is its theme, and the evolution of the hero's character is steadily and consistently worked out. The teaching is of a character strangely at variance with the other romances of the cycle. Instead of an asceticism, based upon a fundamentally low and degrading view of women, Wolfram upholds a sane and healthy morality; chastity, rather than celibacy, is his ideal, and a loyal observance of the marriage bond is, in his eyes, the very highest virtue.

Wolfram has moments of the highest poetical inspiration, but his meaning, even for his compatriots, is often obscure. He is in no sense a master of language, as was Gottfried von Strassburg. This latter, in a very interesting passage of the Tristan, passes in review the poets of the day, awarding to the majority praise for the excellence of their style, but one he does not name, only blaming him as being so obscure and involved that none can tell what his meaning may be; this un-named poet has always been understood to be Wolfram von Eschenbach, and in a passage of *Willehalm* the author refers to the unfavourable criticisms passed on Parzival. Wolfram and Gottfried were both true poets, but of widely differing style. Wolfram was, above all, a man of deeply religious character, and it seems to have been this which specially impressed the mind of his compatriots; in the 13th-century poem of Der *Wartburg-Krieg* it is Wolfram who is chosen as the representative of Christianity, to oppose the enchanter Klingsor von Ungerland. (J. L. W.)

Parzival was printed at Augsburg in 1477; other editions were issued at Magdeburg (1833) and Leipzig (2 vols., 1858) by A. Schulz, and at Berlin (1898) by W. Hertz. Titurel was also printed, probably at Augsburg, in 1477; the Leben und Dichten Wolfram's von *Eschenbach* was edited by San Marte (A. Schulz) (2 vols., Magdeburg, 1836–41), and Wolfram von Eschenbach (Werke) by A. Leitzmann (Munich, 1902 etc.). See also S. Singer, *Wolframs Willehalm* (1918); A. Schreiber, *Neue* Bausteine zu *einer* Lebensgeschichte *Wolframs von Eschenbach* (1922); M. F. Richey, *Gahmuret Anschevin:* a contribution to the study of W. von Eschenbach (1923); W. WOLGAST, a seaport town in the Prussian province of Pomerania, Germany, on the river Peene, which separates it from the island of Usedom, 30 mi. by rail E. of Greifswald. Population 7,633. Wolgast became a town in 1247, and after being the residence of the duke of Pomerania-Wolgast, it was ceded to Sweden in 1648. It was captured in 1675 by Frederick William, elector of Brandenburg. It was restored to Germany in 1815.

WOLLASTON, WILLIAM HYDE (1766–1828), English chemist and natural philosopher, was born at East Dereham, Norfolk, on April 6, 1766. Wollaston was educated at Charterhouse, and afterwards at Caius college, Cambridge. He was elected a fellow of the Royal Society in 1793 and became its secretary in 1806. He died in London on Dec. 22, 1828.

Most of Wollaston's original work deals more or less directly with chemical subjects, but diverges on all sides into optics, acoustics, mineralogy, astronomy, physiology, botany and even art. In chemistry he made a specialty of the platinum metals. Platinum itself he discovered how to work on a practical scale, and he is said to have made a fortune from the secret, which, however, he disclosed in a posthumous paper (1829); and he was the first to detect the metals palladium (1804) and rhodium (1805) in crude platinum. In 1809 he proved the elementary char-

acter of columbium (niobium) and titanium. In optics he was the first, in 1802, to observe the dark lines in the solar spectrum. Of the seven lines he saw, he regarded the five most prominent as the natural boundaries or dividing lines of the pure simple colours of the prismatic spectrum, which he supposed to have four primary divisions. He described the reflecting goniometer in 1809 and the camera lucida in 1812, provided microscopists with the "Wollaston doublet," and applied concavo-convex lenses to the purposes of the oculist. His cryophorus was described in 1813, in a paper "On a method of freezing at a distance." In 1821, after H. C. Oersted (1777–1851) had shown that a magnetic needle is deflected by an electric current, Wollaston attempted to transform that deflection into a continuous rotation, and also to obtain the reciprocal effect of a current rotating round a magnet. He failed in both respects, and when Michael Faraday, who overheard a portion of his conversation with Davy on the subject, was subsequently more successful, he was inclined to assert the merit of priority, to which Faraday did not admit his claim.

In geological circles Wollaston is famous for the medal which bears his name, and which (together with a donation fund) is annually awarded by the council of the Geological Society of London, being the result of the interest on £1,000 bequeathed by Wollaston for "promoting researches concerning the mineral structure of the earth." The first award was made in 1831.

An appreciative essay on Wollaston will be found in George Wilson's *Religio Chemici* (1862).

WOLLASTONITE, a rock-forming mineral consisting of calcium metasilicate, $CaSiO_3$, crystallizing in the monoclinic system and belonging to the pyroxene (*q.v.*) group. It differs, however, from other members of this group in having cleavages, not parallel to the prism-faces, but in two directions perpendicular to the plane of symmetry. Crystals are usually elongated parallel to the axis of symmetry and flattened parallel to the ortho-pinacoid, hence the early name "tabular spar"; the name wollastonite is after W. H. Wollaston. The mineral usually occurs as white cleavage masses. The hardness is 5, and specific gravity 2.85. It is a characteristic product of contact-metamorphism, occurring, especially with garnet, diopside, etc., in crystalline limestones. Crystals are found in the cavities of the ejected limestone blocks of Monte Somma, Vesuvius. At Santa FC in the State of Chiapas, Mexico, a large rock-mass of wollastonite carries ores of gold and copper; here are found large pink crystals which are often partially or wholly altered to opal. (L. J. S.)

WOLLIN, an island of Germany, in the Prussian province of Pomerania, the more easteriy of the islands at the mouth of the Oder which separate the Stettinisches Haff from the Baltic sea. It is divided from the mainland on the east by the Dievenow channel, and from Usedom on the west by the Swine. It has an area of 95 sq.m. Heath and sand alternate with swamps, lakes and forest on its surface, which is flat, except for low hills in the south-west. Cattle-rearing and fishing are the chief resources of the inhabitants. Some of the villages are summer bathing resorts. Wollin, the only town, is situated on the Dievenow, and carries on the industries of a small seaport. Pop. (1933) 4,942.

Near the modern town once stood the ancient and opulent Wendish city of Wolin or Jumne, called Julin by the Danes, and Winetha or Vineta (*i.e.,* Wendish town) by the Germans. The Northmen made a settlement here about 970, and built a fortress on the "silver hill," called Jomsburg, which is often mentioned in the sagas. The stronghold of Jomsburg was destroyed in 1098 by King Magnus Barfod of Norway. This is probably the origin of the legend that Vineta was overthrown by a storm or earthquake and overwhelmed by the sea. Some submarine granite rocks near Damerow in Usedom are still popularly regarded as its ruins. The town of Wollin became in 1140 the seat of the Pomeranian bishopric, which was transferred to Kammin about 1170. Wollin was burnt by Canute VI. of Denmark in 1183, and was taken by the Swedes in 1630 and 1759 and by the Brandenburgers in 1659 and 1675.

WOLLONGONG, an important town and seaport of New South Wales, Australia. Pop. 11,402. It lies in, and is typical of, the Illawarra district which extends south of Sydney from near Clifton to the Shoalhaven River (*c.* 48 miles). Tectonic and erosional processes have produced a narrow strip (2–12 miles broad, widening southwards) of lowlands backed by steep and often precipitous scarp (Illawarra "Range": Mount Kembla: 1,752 ft.). Along this stream-dissected scarp the seams of the Sydney coal basin are frequently exposed and can be worked by horizontal adits. The lowlands with their mild and equable climate (av. ann. temps. *c.* 70–54° F; av. ann. rainfall: 38–47 in.), hilly terrain, fertile soils and favourable position made this one of the earliest, and later one of the leading, dairying districts of Australia, and agriculture also flourishes in parts. Coal is mined at Bulli (*q.v.*), Mount Kembla, Clifton and other places, though the exposed nature of the coast tends to hamper direct loading on to vessels.

WOLOWSKI, LOUIS FRANÇOIS MICHEL RAYMOND (1810–1876), French economist and politician, was born in Ur̈arsaw and educated in Paris. but returned to Warsaw and took part in the revolution of 1830. Sent to Paris as secretary to the legation by the provisional government, he settled there on the suppression of the Polish rebellion and was naturalized in 1834. In 1833 he founded the *Revue* de *législation et* de *jurisprudence,* and wrote voluminously on economic and financial subjects. He established the first Credit Foncier in France in 1852, and in 1855 became professor of political economy at the Conservatoire in succession to J. A. Blanqui. He was a member of the national assembly from 1848 to 1851, and again from 1871 till his election as a senator in 1876. He was a free-trader and bimetallist.

Of his works the following are the more important: *Mobilisation du crédit fancier* (1839); *De l'organisation industrielle de la Prance avant Colbert* (1842); *Les Finances de la Russie* (1864); *La Question des banques* (1864); *La Liberté commerciale* (1869); *L'Or et l'argent* (1870).

WOLSELEY, GARNET JOSEPH WOLSELEP, VISCOUNT (1833–1913), British field marshal, eldest son of Major Garnet Joseph Wolseley of the King's Own Borderers (25th Foot), was born at Golden Bridge, Co. Dublin, on June 4, 1833. Educated at Dublin, he obtained a commission as ensign in the 12th Foot in March 1852, and was transferred to the 80th Foot, with which he served in the second Burmese War. Promoted to be lieutenant and invalided home, he exchanged into the 90th Light Infantry, then in Dublin. He accompanied the regiment to the Crimea, and did duty with the Royal Engineers in the trenches before Sevastopol. After the fall of Sevastopol Wolseley was employed on the quartermaster-general's staff and was one of the last to leave the Crimea in July 1856. After six months' duty with the 90th Foot at Aldershot, he went with it again, in March 1857, to join the expedition to China under Major-General the Hon. T. Ashburnham. Wolseley embarked in command of three companies in the transport "Transit," which was wrecked in the Strait of Banka. The troops were saved, and were taken to Singapore, whence, on account of the Indian Mutiny, they were despatched with all haste to Calcutta. Wolseley served at the relief of Lucknow under Sir Colin Campbell in November, and in the defence of the Alambagh position under Outram, taking part in the actions of Dec. 22, 1857, Jan. 12 and 16, 1858, and the repulse of the grand attack of Feb. 21. In March he served at the final siege and capture of Lucknow. He was then appointed D.A.Q.G. on the staff of Sir Hope Grant's Oudh division, and was engaged in all the operations of the campaign. In the autumn and winter of 1858 he took part in the Bniswara, trans-Gogra and trans-Rapti campaigns, ending with the complete suppression of the rebellion Having received his Crimean majority in March 1858, he was in April 1859 promoted to be lieutenant-colonel, and received the Mutiny medal and clasp. When Grant was nominated to the command of the British troops in the Anglo-French expedition to China in 1860, Wolseley accompanied him as D.A.Q.G. On his return home he published the *Narrative of* the *War with China in 1860.* In 1867 he was appointed deputy quartermaster-general in Canada. In 1869 his *Soldiers' Pocket* Book *for Field Service* was published, and has since run through many editions. In 1870 he commanded the Red river expedition to put down a rising under

Louis Riel (*q.v.*).

Appointed assistant adjutant-general at the war office in 1871 he worked hard in furthering the Cardwell schemes of army reform. From this time till he became commander-in-chief Wolseley was the prime mover and the deciding influence in practically all the steps taken at the war office for promoting the efficiency of the army under the altered conditions of the day. In 1873 he commanded the expedition to Ashanti, and, having made all his arrangements at the Gold Coast before the arrival of the white troops in January 1874, was able to complete the campaign in two months, and re-embark them for home before the unhealthy season began. This campaign made his name a household word in England. He fought the battle of Amoaful on Jan. 31, and, after five days' fighting, ending with the battle of Ordahsu, entered Kumasi, which he burned. He received the thanks of both Houses of Parliament, a grant of £25,000, promotion, and other honours. On his return home he was appointed inspector-general of auxiliary forces, but had not held the post for a year when he was sent to Natal as governor and general commanding. In 1878 he went as high-commissioner to the newly acquired possession of Cyprus, and in 1879 to South Africa to supersede Lord Chelmsford in command of the forces in the Zulu War, and as governor of Natal and the Transvaal and high commissioner of South-East Africa. On his arrival at Durban in July he found that the war in Zululand was practically over, and after effecting a temporary settlement he went to the Transvaal. Having reorganized the administration there and reduced the powerful chief Sikukuni to submission, he returned home in May 1880 and was appointed quartermaster-general.

In 1882 he was appointed adjutant-general, and in August of that year was given the command of the British forces in Egypt to suppress the rebellion of Arabi Pasha. (*See* EGYPT: *Military Operations.*) Having seized the Suez Canal, he disembarked his troops at Ismailia, and after a very short and brilliant campaign completely defeated Arabi Pasha at Tel-el-Kebir, and suppressed the rebellion. He was promoted general for distinguished service in the field, and raised to the peerage as Baron Wolseley of Cairo and Wolseley. In 1884 he was again called away to command the Nile expedition for the relief of General Gordon and the besieged garrison of Khartum. The expedition arrived too late: Khartum had fallen, and Gordon was dead; and in the spring of 1885 complications with Russia over the Penjdeh incident occurred, and the withdrawal of the expedition followed. Wolseley was now created a viscount and a knight of St. Patrick. He continued at the war office as adjutant-general until 1890, when he was given the command in Ireland. He was promoted to be field marshal in 1894, and was nominated colonel of the Royal Horse Guards in 1895, in which year he was appointed commander-in-chief. His powers were, however, limited by a new order in council, and after holding the appointment for over five years, he handed over the office to Earl Roberts in 1901.

Lord Wolseley married in 1867 Louisa, daughter of A. Erskine. He published *The Decline and Fall of Napoleon* (1895), *The Life of John Churchill, Duke of Marlborough, to the Accession of Queene Anne* (1894), and *The Story of a Soldier's Life* (1903).

He died at Mentone March 25, 1913, the title going by special remainder to his only daughter, Frances. He was buried in St. Paul's Cathedral, and an equestrian statue of him on the Horse Guards' Parade, Whitehall, London, was unveiled in 1920.

WOLSEY, THOMAS (*c.* 1475–1530), English cardinal and statesman, born at Ipswich about 1475, was son of Robert Wolsey (or Wuley, as his name was always spelt) by his wife Joan.

Thomas was educated at Magdalen college, Oxford. He is said to have graduated B.A. at the age of fifteen (*i.e.*, about 1490); but his earliest definite appearance in the records is as junior bursar of Magdalen college in 1498–1499, and senior bursar in 1499–1500, an office he was compelled to resign for applying funds to the completion of the great tower without sufficient authority (W. D. Macray, *Reg. of Magdalen College*, i. 29–30, 133–134). He must have been elected fellow of Magdalen some years before. As master of Magdalen college school he had under his charge three sons of Thomas Grey, first marquess of Dorset, who presented him (1509) to the rectory of Limington in Somerset. He had been ordained priest in 1498.

Rapid Rise.—At Limington he came into conflict with the sheriff, Sir Amias Paulet, who is said by Cavendish to have placed Wolsey in the stocks; Wolsey retaliated long afterwards by confining Paulet to his chambers in the Temple for five or six years. Dorset died in 1501, but Wolsey found other patrons. Before the end of that year he obtained a dispensation to hold two livings in conjunction with Limington, and Archbishop Deane appointed him his domestic chaplain. After Deane's death in 1503, Wolsey became chaplain to Sir Richard Nanfan, deputy of Calais, who apparently recommended him to Henry VII. Nanfan died in 1507, but the king made Wolsey his chaplain and employed him in diplomatic work. In 1508 he was sent to James IV. of Scotland, and in the same year he pleased Henry by his expeditious despatch of the business in connection with the king's proposal of marriage to Margaret of Savoy. His ecclesiastical preferments, of which he received several in 1506–1509, culminated in his appointment by Henry to the deanery of Lincoln on Feb. 2, 1509.

Henry VIII. made Wolsey his almoner immediately on his accession, and the receipt of some half-dozen further ecclesiastical preferments in the first two years of the reign marks his growth in royal favour. In 1511 Wolsey became a privy councillor, and secured a controlling voice in the government. The control of affairs had been shared between the clerical and peace party led by Richard Fox (*q.v.*) and Archbishop Warham, and the secular and war party led by Surrey. Wolsey turned the balance in favour of war, and his administrative energy found scope in the preparations for the English expedition to Biscay in 1512, and for the campaign in northern France in 1513. He arranged peace with France and a marriage between Mary Tudor and Louis XII. in 1514, and reaped his reward in the bishoprics of Lincoln and Tournai, the archbishopric of York, which was conferred on him by papal bull in September, and the cardinalate, which he had sent Polydore Vergil to beg from Leo X. in May 1514, but did not receive till the following year. Nevertheless, when Francis I. in 1515 succeeded Louis XII. and won the battle of Marignano, Wolsey took the lead in assisting the emperor Maximilian to oppose him; and this revival of warlike designs was resented by Fox and Warham, who retired from the government, leaving Wolsey supreme. Maximilian proved a broken reed, and in 1518 Wolsey brought about a general pacification, securing at the same time his appointment as legate *a latere* in England. He thus superseded Warham, who was *legatus natus,* in ecclesiastical authority; and though legates *a latere* were supposed to exercise only special and temporary powers, Wolsey secured the practical permanence of his office.

Foreign Policy.—The foreign policy followed after the election of Charles V. (*see* HENRY VIII.) as emperor, was Wolsey's policy. Friendship with the emperor served Wolsey's personal interests, and at the conference of Calais in 1521 Wolsey had ranged himself with the emperor. Parliament had in 1513–1515 showed signs of strong anti-clerical feeling; Wolsey probably hoped to distract attention from the church by a spirited foreign policy, as Henry V. had done a century before. He had, moreover, received assurances from the emperor that he would further Wolsey's candidature for the papacy; and although he protested to Henry VIII. that he would rather continue in his service than be ten popes, that did not prevent him from secretly instructing his agents at Rome to press his claims. Charles, however, paid Wolsey the sincere compliment of thinking that he would not be sufficiently subservient on the papal throne; while he wrote letters in Wolsey's favour, he took care that they should not reach their destination in time; and Wolsey failed to secure election both in 1521 and 1524. This ambition distinguishes his foreign policy from that of Henry VII., to which it has been likened. Henry VII. cared only for England; Wolsey's object was to play a great part on the European stage.

In any case the decision taken in 1521 was a blunder. Wolsey's assistance helped Charles V. to that position of predominance which was strikingly illustrated by the defeat and capture of Francis I. at Pavia in 1525; and the balance of power upon which

England's influence rested was destroyed. Her efforts to restore it in 1526–1528 were ineffectual; her prestige had depended upon her reputation for wealth derived from the fact that she had acted in recent years as the paymaster of Europe. But Henry VII.'s accumulations had disappeared; parliament resisted in 1523 the imposition of new taxation; and the attempts to raise forced loans and benevolences in 1526–1528 created a storm of opposition. Still more unpopular was the brief war with Charles V. in which Wolsey involved England in 1528. The sack of Rome in 1527 and the defeat of the French before Naples in 1528 confirmed Charles V.'s supremacy. Peace was made in 1529 between the two rivals without England's being consulted, and her influence at Wolsey's fall was less than it had been at his accession to power.

The Divorce. — This failure reacted upon Wolsey's position at home. His domestic was sounder than his foreign policy. By his development of the star chamber, by his firm administration of justice and maintenance of order, and by his repression of feudal jurisdiction, he rendered great services to the monarchy. But the inevitable opposition of the nobility to this policy was not mitigated by the fact that it was carried out by a churchman; the result was to embitter the antagonism of the secular party to the church and to concentrate it upon Wolsey's head. The control of the papacy by Charles V., moreover, made it impossible for Wolsey to succeed in his efforts to obtain from Clement VII. the divorce which Henry VIII. was seeking from Charles' aunt, Catherine of Aragon. Wolsey has been said to have been the originator of the divorce scheme. There is no evidence that he first suggested it, though when he found that Henry was bent upon it, he pressed for two points: (i.) that an application should be made to Rome, instead of deciding the matter in England, and (ii.) that Henry, when divorced, should marry a French princess. The appeal to Rome was a natural course to be advocated by Wolsey, whose despotism over the English church depended upon an authority derived from Rome; but its success depended upon the problematical destruction of Charles V.'s power in Italy. At first this seemed not improbable; French armies marched south on Naples, and the pope sent Campeggio with full powers to pronounce the divorce in England. But he had hardly started when the French were defeated in 1528. Their ruin was completed in 1529, and Clement VII. was obliged to come to terms with Charles V., which included Campeggio's recall in Aug. 1529.

Wolsey's **Fall.**—Wolsey clearly foresaw his own fall, the consequent attack on the church and the triumph of the secular party. Parliament, which he had kept at arm's length, was hostile; he was hated by the nobility, and his general unpopularity is reflected in Skelton's satires and in Hall's *Chronicle*. Even churchmen had been alienated by his suppression of monasteries and by his monopoly of ecclesiastical power; and his only support was the king, who had now developed a determination to rule himself. He surrendered all his offices and all his preferments except the archbishopric of York, receiving in return a pension of 1,000 marks (equal to six or seven thousand pounds a year in modern currency) from the bishopric of Winchester, and retired to his see, which he had never before visited. A bill of attainder, passed by the Lords, was rejected at Cromwell's instigation and probably with Henry's goodwill by the Commons. The last few months of his life were spent in the exemplary discharge of his archiepiscopal duties; but a not altogether unfounded suspicion that he had invoked the assistance of Francis I., if not of Charles V. and the pope, to prevent his fall involved him in a charge of treason. He was summoned to London, but died on his way at Leicester abbey on November 30, 1530, and was buried there.

Character. — The completeness of Wolsey's fall enhanced his former appearance of greatness. and, indeed, he is one of the outstanding figures in English history. His qualities and his defects were alike exhibited on a generous scale; and if his greed and arrogance were colossal, so were his administrative capacity and his appetite for work. "He is," wrote the Venetian ambassador Giustiniani, "very handsome, learned, extremely eloquent, of vast ability and indefatigable. He alone transacts the business which occupies all the magistrates and councils of Venice, both civil and criminal; and all state affairs are managed by him, let their nature be what it may. He is grave, and has the reputation of being extremely just; he favours the people exceedingly, and especially the poor, hearing their suits and seeking to despatch them instantly." As a diplomatist he has had few rivals and perhaps no superiors. But his pride was equal to his abilities. The familiar charge, repeated in Shakespeare, of having written Ego et *meus rex*, while true in fact, is false in intention, because no Latin scholar could put the words in any other order; but it reflects faithfully enough Wolsey's mental attitude. Giustiniani explains that he had to make proposals to the cardinal before he broached them to Henry, lest Wolsey "should resent the precedence conceded to the king." "He is," wrote another diplomatist, "the proudest prelate that ever breathed." He arrogated to himself the privileges of royalty, made servants attend him upon their knees, compelled bishops to tie his shoe-latchets and dukes to hold the basin while he washed his hands, and considered it condescension when he allowed ambassadors to kiss his fingers; he paid little heed to their sacrosanct character, and himself laid violent hands on a papal nuncio. His egotism equalled Henry VIII.'s; his jealousy and ill-treatment of Richard Pace, dean of St. Paul's, referred to by Shakespeare but vehemently denied by Dr. Brewer, have been proved by the publication of the Spanish state papers; and Polydore Vergil, the historian, and Sir R. Sheffield, speaker of the House of Commons, were both sent to the Tower for complaining of his conduct. His morals were of the laxest description, and he had as many illegitimate children as Henry VIII. himself. For his son, before he was eighteen years old, he procured a deanery, four archdeaconries, five prebends and a chancellorship, and he sought to thrust him into the bishopric of Durham. For himself he obtained, in addition to his archbishopric and lord chancellorship, the abbey of St. Albans, reputed to be the richest in England, and the bishopric first of Bath and Wells, then of Durham, and finally that of Winchester. He also used his power to extort enormous pensions from Charles V. and Francis I. and lavish gifts from English suitors.

During the first half of his government he materially strengthened the Tudor monarchy by the vigorous administration of justice at home and by the brilliance of his foreign policy abroad. But the prestige he secured by 1521 was delusive; its decline was as rapid as its growth, and the expense of the policy involved taxation which seriously weakened the loyalty of the people. The concentration of civil and ecclesiastical power by Wolsey in the hands of a churchman provided a precedent for its concentration by Henry VIII. in the hands of the crown; and the personal example of lavish ostentation and loose morals which the cardinal-archbishop exhibited cannot have been without influence on the king, who grew to maturity under Wolsey's guidance.

The *Letters and Papers of Henry VIII.*, vols. i.–iv., supplemented by the *Spanish and Venetian Calendars*, contain almost all that is known of Wolsey's public career, though additional light on the divorce has been thrown by Stephen Ehses' *Romische Dokumente* (1893). Cavendish's brief *Life*, which is almost contemporary, has been often edited. Fiddes's huge tome (1724) is fairly exhaustive. Brewer, in his elaborate prefaces to the *Letters and Papers* (reissued as his *History of the Reign of Henry VIII.*), originated modern admiration for Wolsey; and his views are reflected in Creighton's *Wolsey* in the "Twelve English Statesmen" series, and in Dr. Gairdner's careful articles in the *Dict. Nat. Biog.* and *Cambridge Modern History*. A less enthusiastic view is adopted in H. A. L. Fisher's volume (v.) in Longmans' *Political History* (1906) and in A. F. Pollard's *Henry VIII.* (1902 and 1905). *See* also E. Law, *England's First Great War Minister: how Wolsey made a new army and navy* (1916) and *Cardinal Wolsey at Hampton Court* (1923).

WOLVERHAMPTON, market town; municipal, county and parliamentary borough, Staffordshire, England, 125 mi. N.W. of London, on the L.M.S. and G.W. railways. Pop. (1938) 145,300. Area 14 sq mi. It lies at the northwestern edge of the group of great manufacturing towns extending southeast to Birmingham, but there are residential suburbs to the west, where the country is well wooded. The situation is elevated and healthy. The church of St. Peter, dedicated 994, is a fine cruciform building, part being 13th century work. A free grammar school, founded in 1515 by Sir Stephen Jermyns, occupies modern buildings (1876). There are a Blue Coat school (1710) and a school of art. South Staf-

fordshire is the oldest centre of the iron trade in England. There are enormous foundries and the town manufactures ironmongery and steel goods, especially locks, machinery, tools, cycles, enamel and galvanized ware, papier-mâché, rubber goods, chemicals, colours, varnishes, etc. Market gardening is carried on in the west and north of the town. An annual fair is held at Whitsuntide.

Wednesfield (pop. 13,920), and Willenhall (28,100) are neighbouring urban districts, with populations employed in similar manufactures.

The town of Wolverhampton (*Handone, Wolvernehamptone, Wollernehampton*) grew up round the church of St. Mary, probably founded in 996 by Wulfruna, who endowed it with extensive lands. The estates are enumerated in Domesday. In 1204 John granted the manor of Wolverhampton to the church, and at the Reformation it was held by the dean of the collegiate body: in 1553 Edward VI granted the college and manor to Dudley, duke of Northumberland, but Mary refounded the college and restored its property. Henry III (1258) granted the Wednesday market, which is still held, and a fair for eight days, beginning on June 29. During the Great Rebellion Wolverhampton was royalist. In 1751 its chief and noted manufacture was locks. In 1848 it was incorporated a municipal borough and a county borough in 1888. It was first represented in parliament in 1832, sending two members, but since 1885 it has sent three. The borough was extended in 1927 and 1933.

The Civic hall assembly rooms were opened in 1938 and a town planning scheme was prepared.

WOLVERINE: see GLUTTON.

WOLVERTON, an urban district of Buckinghamshire, England, near the river Ouse, $52\frac{1}{2}$ mi. N.N.W. of London by the L.M.S. Ry. Pop. (1938) 12,780; area 7.3 sq.mi. Its modern growth was due to the establishment of carriage works by the railway company. The technical college (1926) is important.

WOMBAT, the typical representative of the marsupial family *Phascolomyidae* (*see* MARSUPIALIA). All the teeth are of continuous growth, having persistent pulps. The incisors are large and chisel-like, much as in rodents. The body is broad and depressed, the neck short, the head large and flat, the eyes small, and the tail vestigial. The limbs are equal, stout and short. The feet have broad, naked soles; the forefeet have five toes, each with a long nail. The hind-feet have a short nailless first toe; the second, third, and fourth toes partially united by skin, the fifth distinct and shorter; these four with long nails. The wombat of Tasmania (P. *ursinus*) and the similar but larger *P. platyrhinus* of southern Australia belong to the typical group of the genus, with short ears, coarse fur, and naked muzzle. On the other hand, in the hairy-nosed wombat (*P. latifrons*) of South Australia, the fur is silky, the ears more pointed, and the muzzle hairy.

BROAD-NOSED WOMBAT (PHASCOLOMYS PLATYRHINUS), AUSTRALIA

In form and action wombats resemble small bears, having a similar shuffling walk, but they are shorter in the legs and have broader backs. They live on the ground, or in burrows or holes among rocks, and feed on grass, roots, and other vegetable substances. They sleep during the day but wander forth at night in search of food. They are shy and gentle, though they bite strongly when provoked. The prevailing colour is brownish grey. The large wombat of the mainland is variable in colour, some individuals being pale yellowish brown, others dark grey and some black. The length of the head and body is about 3ft. Fossil wombats, some of larger size than any now existing, have been found in the Pleistocene of Australia.

WOMBWELL, an urban district in the West Riding of Yorkshire, England, 4 mi. S.E. of Barnsley on the L.M.S. and L.N.E. railways. Pop. (1938) 17,780. Area 6 sq.mi. The population is employed chiefly in the extensive collieries.

WOMEN, DISEASES OF: see GYNAECOLOGY.

WOMEN, EDUCATION OF. Prior to the middle of the 19th century there was little provision for women or girls to engage in serious study except in the early middle ages. Between the 6th and 10th centuries there were good scholars and Latinists among the nuns, and the convents provided instruction to girls in the same subjects as that given to boys. Later the education received in the convent schools became increasingly meagre. The wave of enthusiasm for learning in the 16th century affected a limited number of women, mainly among the aristocracy.

Great **Britain.**—The movement for effecting a reform in Great Britain began in several quarters. In 1848 Queen's college (F. D. Maurice) led the way in providing scholarly intellectual training for girls. Bedford college (Mrs. Jesser Reid) followed in 1849: the North London collegiate school (Miss Buss) in 1850. Cheltenham Ladies' college (Miss Beale) first provided sound education under a boarding school system on the lines of that of the great public schools for boys. Between 1860 and 1870 the movement was promoted in various ways: (1) The schools inquiry commission (1864–67) threw light on the miserable deficiencies in the education of girls. (2) Various associations were formed:—*e.g.*, the North of England Council for promoting the Higher Education of Women (1867); the London Schoolmistresses' Association (1866); the Association for promoting the Higher Education of Women in Cambridge (1869). (3) Local examinations were opened to women (Cambridge 1865, Oxford 1870).

From 1870 things moved fast. The Education Act of that year made education compulsory for girls ("the three Rs"; domestic arts) as well as boys. Girton college (Miss Emily Davies), already started at Hitchin in 1869, was established close to Cambridge in 1873. In 1871 Merton hall, Cambridge (Henry Sidgwick, Miss A. J. Clough) was opened, to become Newnham hall in 1876 and Newnham college in 1880. In 1871 the Women's Education Union (Mrs. William Grey) was begun, parent of the Girls' Public Day School Company (the Misses Gurney) which between 1873 and 1901 founded 38 day schools where girls could receive an education parallel with the best afforded to boys. The reorganization of trusts facilitated by the Endowed Schools Act of 1869 provided excellent schools at low fees by devoting to girls a new and increased share of the funds at their disposal—*e.g.*, Harpur trust, Bedford (1873), Grey Coat and Christ's hospitals, King Edward's schools, Birmingham, Hulme trust, Manchester, St. Paul's, etc. Good boarding schools were started (*e.g.*, Miss Lawrence's, Brighton—now Roedean—1885). The Education Act of 1902 included girls in all its provisions for new secondary schools.

In all provided and grant-earning schools and those recognised as efficient the curriculum is now like that in boys' schools; the same examinations are entered for. In general less stress is laid on the classics, mathematics and physical science. Some periods are set aside for cookery, needlework, etc. The provision of science teaching and science laboratories has recently been much improved. In some schools a business training is afforded after the matriculation stage alternative to advanced courses for those who proceed to the universities. In 1926–27 there were 160,022 girls in grant-earning schools, the average leaving age being 16 years 2 months. The efficiency of the schools was made possible by the opening of the universities to women—at first as regards lectures and examinations only, later by full membership of every British university except Cambridge, which bestows only titular degrees on women. At first the proportion of graduate to non-graduate teachers was low, now in all recognised schools there is a small minority only of non-graduate mistresses. Most head mistresses demand training as well as a degree from their mistresses. Secondary training is afforded in the university departments of education; at the Maria Grey training college (1878) and St. Mary's college, London; the Cambridge training college (1884). Government grants for training are made to women as to men with a less maintenance allowance. Women sit equally with men on the teachers' registration council. The number of women in the universities has steadily increased in the present century. In 1926–27 in the faculties of art, science and medicine they numbered 7,873 (Oxford 800. Cambridge 472, London 3,136, provincial universities 3,465). State and county scholarships and four-year-scholar-

ships for intending teachers have contributed to this increase. All teaching posts are nominally open to women. Only in London and Wales have women held professorships.

In Scotland the universities are open to women. Glasgow has the largest number of women students of all British universities (1,464). In the Secondary day schools, boys and girls work side by side. There are good boarding schools for girls only; e.g.—St. Leonard's school, St Andrews (1877); George Watson's, Edinburgh. (See also EDUCATION: England, etc.; Secondary Education, etc.)

The Continent.--On the continent the universities are, generally speaking, open to women. Girls receive a solid education in state schools in France, Germany, the Scandinavian countries and Holland. Educational legislation of the last few years shows a tendency to assimilate the curricula in girls' schools to those for boys except in countries where dual schools have been the rule (*e.g.,* Italy, Czechoslovakia) where the tendency has been in a contrary direction. In France the assimilation is absolutely complete. Competition for all certificates and "agrégations" is now secured to women, though posts in boys' secondary schools and in the universities are still practically confined to men. (See also EDUCATION: France, *Germany,* etc.).

UNITED STATES

The first settlers brought with them from Europe the traditional belief that marriage was the only reputable vocation for women. During the colonial period the dame schools appear to be the first place and up to a short time prior to the Revolution practically the only place outside the home where girls might secure elementary instruction, though they were organized to prepare boys for the grammar schools. In certain localities girls were favoured. In New Hampshire when Hampton engaged a schoolmaster in 1649, and when Dover did likewise in 1658, it was with the understanding that instruction be given to all children both male and female. In Philadelphia in 1689 the Society of Friends established their public school, the predecessor of the famous William Penn charter school which was open to all classes and to both sexes. At Nazareth, Pa., the Moravians organized a school for girls in 1750. These, however, were the exception. In time the grammar schools greatly increased in number, though only a few admitted girls and then only at certain hours or at certain times of the year. In 1784 Dorchester, Mass., permitted girls to attend from June 6 to Oct. 1. In 1789 Boston established the "double-headed school," and a private school for girls, the "academy," was opened at Medford, Mass., which was the forerunner of similar institutions eventually established in large numbers.

In 1821 Emma Willard established her Female Seminary at Troy, N.Y., and in 1837 Mary Lyon founded Mt. Holyoke seminary at South Hadley, Mass. Similar schools followed in New England and in the South. By the middle of the 19th century the public high school had developed to provide secondary education for the great mass of the people and very largely to displace the academy and the seminary. Co-education is almost universal in the public schools; the number of girls attending them has become slightly in excess of that of boys, and equal educational opportunities are provided for both sexes. For the benefit of girls, courses in home economics have been added in practically all high schools and in the upper grades of the best grammar schools.

Higher Education for Women.—In 1833 Oberlin college, founded in Oberlin, O., signified its willingness to admit women. In 1865 Vassar college was established at Poughkeepsie, N.Y., and was the first separate college of unquestioned standing for women. In 1839 the first State normal school was established at Lexington, Mass., and in 1842 the New England Female Medical college was founded.

Preparation in the fields of medicine, journalism, dentistry, law, science, architecture and engineering is obtainable in the universities and technical schools. Secondary and higher liberal education is passing through a period of readjustment. Professional education is being standardized in the hope of producing more liberal and better trained persons. Vocational education is developing rapidly. (M. S. D.)

WOMEN'S COLLEGES

The history of the women's college in America may be said to fall into three periods, each of the first two covering 40 years, the third from 1915 on. The first period, roughly estimated from 1835 to 1875, was the age of beginnings. The institutions of this period were almost without exception seminaries; among them, Wheaton at Norton, Mass., opened in 1835, and Mount Holyoke at South Hadley, in 1837. Both were founded as permanent institutions for women. Mount Holyoke's first curriculum was evidence of Mary Lyon's intention that although not called a college, it should furnish to women as good educationai opportunities as the colleges for men then offered. Several other women's colleges of to-day were established as seminaries during this period, Wells, Lake Erie, the Western, Mills, Rockford, Milwaukee-Downer. The South shared in this interest, a development cut short by the Civil War. Hollins college in Virginia, a co-educational seminary, in 1852 dropped the course for boys, thus becoming the first chartered institution for girls in the State.

Among the earliest institutions authorized to grant degrees to women were the Wesleyan Female college at Macon, Ga., founded in the '30s, and Elmira college in Elmira, N.Y., opened in 1855. The first women's college having an endowment and curriculum sufficient, from the point of view of the times, to realize this ideal, was Vassar college, incorporated in 1861 and opened in Poughkeepsie, N.Y., in 186;.

The Second Period.—The period 1875 to 1915 was one of expansion, and was marked by an advance in the education of women, such as the world had never before seen. Three types of institution were developed: the separate college for women; the woman's college affiliated with the university; co-education. Coincident with the beginning of this period came the opening of two important colleges, both in Massachusetts: Smith at Northampton, established by Sophia Smith; Wellesley at Wellesley, founded by Mr. and Mrs. Henry F. Durant in memory of their only son. Ten years later Bryn Mawr college, founded by Joseph W. Taylor, was opened at Bryn Mawr, Pa. The same year the Woman's College of Baltimore City was incorporated, under the auspices of the Methodist Church, with Dr. Goucher, the first president, after whom it was subsequently named, as the chief factor. In 1888 Mount Holyoke obtained its college charter, five years later withdrawing the seminary course.

During this period several of the earlier seminaries became colleges: Rockford in Illinois, Lake Erie and the Western in Ohio, Milwaukee-Downer in Wisconsin, Mills in California, the Woman's College of Pennsylvania at Pittsburgh. Wells college in Aurora, N.Y., secured its college charter in 1870 after two years as a seminary. The leading Southern colleges for women date from this period: Agnes Scott college at Decatur, Ga. (1889), Randolph-Macon College for Women at Lynchburg, Va. (1893) and Sweet Briar at Sweet Briar, Va. (1906).

An outstanding illustration of another type of college for women is Simmons college in Boston, established by the will of John Simmons "as an institution in which might be given instruction in such branches of art, science and industry as would best enable women to earn an independent livelihood," and granted a charter in 1899. Somewhat like Simmons college are Skidmore at Saratoga Springs (1911), and Russell Sage at Troy, N.Y. (1916).

The Connecticut College for Women, at New London, Conn., opened in 1915, "owes its foundation to the wish and purpose of people of Connecticut to provide within the State adequate facilities for the higher education of women," the movement for its establishment being begun by the College Club of Hartford.

Holding a place midway between the college on a separate foundation and co-education is the women's college affiliated with the university. The first one of this type was the H. Sophie Newcomb Memorial, opened at Tulane university in New Orleans in 1887. It was followed in 1888 by the Women's college at Western Reserve university, Cleveland, the outgrowth of an informal system of co-education, dating from 1872; Barnard at Columbia in 1889, ten years after President Barnard had urged co-education at Columbia college; the Women's college of Brown university, authorized in 1892 to confer the Brown degree and made a department of the university in 1897. Radcliffe college, incorporated in 1894 and authorized to confer the bachelor's and master's degrees and Ph.D. subject to the approval of the president and fellows of Harvard college, dates from the organization in 1879 of the Society for the Collegiate Instruction of Women "for the purpose of providing systematic instruction for women by professors and other instructors in Harvard university."

Since the beginning of the present century, other "affiliated colleges" have been established, such as the William Smith college in Geneva, N.Y., opened as "co-ordinate" with Hobart college, in 1908; and in 1910, Jackson college, taking the place of entire co-education at Tufts college, Mass. By the so-called "segregation policy," started at the University of Chicago in 1902, and meaning separate instruction for women during the first two years of their undergraduate course, the university provision for women comes partially under the head of the affiliated college.

The Third Period.—The third period of the women's college in the United States—from 1911 on—bids fair to be as distinctive as the preceding epochs. It is not likely that the number of senior colleges will increase in the same proportion, even if the numbers seeking admission should continue, since the cost of establishing a college and the conception of necessary equipment are so much greater. A possible exception is along the line of the junior college. A development of the last few years, the junior college idea has taken possession of some of the long-established institutions for girls, such as Bradford academy, as well as being the type of an interesting new experiment—the Sarah Lawrence college for women in Bronxville, N.Y. It has been most widely developed in the co-educational sections of the country—the middle and far West, especially on the Pacific coast. The success of a junior college like Stephens college in Columbia, Mo., modelled on the women's college of the East, indicates a swing of the pendulum toward that form of education, at least for the first half of the college course.

Other indications are the establishment of Scripps college, opened in 1927 as the first one of the projected group of "Claremont colleges" in Claremont, Calif., of which Pomona, a long-established co-educational institution, is the "mother," and the division of Occidental college in Pasadena into two institutions, one for men and one for women. Until these recent developments, Mills college was the only separate college for women on the Pacific coast.

Popularity of Women's Colleges.—An outstanding characteristic of the college for women has been its increasing popularity. The fact that the leading colleges have had a large number of applicants from whom to choose has probably had an influence in several "trends." (1) The careful selection of candidates for admission has resulted in a group qualified for the most part to do college work and in turning into other fields those not fitted for the liberal arts course, a benefit to the individual as well as to college and community. (2) It has helped the college to hold to its own field of work. Since the World War, there has been a marked strengthening of the liberal arts course, a course which the colleges for women have continued more consistently than any other institution of higher education. The curriculum has been enriched and made more flexible but with slight concession to the strictly vocational. (3) It has led to stress on the education of the individual, rather than education en masse. The introduction of the "honour" as well as the "pass" course; the general examination in the major subject; an approach to the tutorial system; sectioning on the basis of ability—these and other developments, resulting in greater attention to the individual student, have been marked changes. (4) There has been an increase in the number of graduates going in for advanced work in various lines. (5) There has been an increase in the variety of professions and employments entered by graduates of the women's colleges. There have been a large number of graduates of women's colleges holding distinguished academic positions, distinguished posts in medicine, scientific research, journalism, social work and the arts, as well as in national and international organizations.

WOMEN, LEGAL POSITION OF. It is well known that at the common law the political and legal disabilities of women in Great Britain were many and serious. For illustration, women under the common law had no general right to vote and were disqualified to hold any important public office. Consequently, they could take no substantial part in the government of their country. Upon marriage the rights of the wife mere merged and lost in those of the husband. Husband and wife became a unit; and the wife had no independent legal existence. In questions as to the custody and education of children, the rights of the father were preferred over those of the mother in almost every respect. Until 1938, the husband could secure a decree of divorce on the ground of his wife's infidelity while the wife had no such corresponding right or remedy. The restrictions and disqualifications of which the foregoing are examples had by 1942 been almost entirely removed by statute. In essential matters men and women stood for the most part in equality before the lam. It is interesting to note that when the right to vote was granted to women in 1918, they made quick use of the great power which had been conferred upon them. In 1919, the Sex Disqualification (Removal) act was passed, which went far to remove all disqualifications because of sex. Undoubtedly, legislation will continue to be enacted for the purpose of bringing about a complete equality of the sexes before the law, and it is to be hoped that this high object will before many years be completely attained. These reforms have been largely accomplished by the enactment of a series of statutes for the most part after the turn of the century which to a great extent did away with these unjust restrictions and disqualifications. The legal position of women can be conveniently ascertained by the consideration of the more important of these great statutes and of the effect which they produced.

The Right of Women to the Crown.—Even at common law a woman had the right to ascend the throne of England and to assume its crown. The title to the crown was at that time governed, with some slight modifications, by the feudal rules of hereditary descent formerly applicable to land. Unless there were statutory prohibitions, therefore, the crown would descend lineally to the issue of the reigning sovereign, males being preferred to females. As an example, on the death of Henry VIII, there survived his son Edward and his two daughters Mary and Elizabeth. Edward, being male, was preferred in the succession and first took the crown. As he had left no issue, his sisters Mary and Elizabeth in-turn succeeded him. There was consequently at common law no prohibition against a woman being the Queen of England. The present title to the crown depends upon the Act of Settlement, 1700. By this statute it was provided that the Princess Sophia, the Electress of Hanover, should be next in succession to the crown "which should continue to the said princess and to the heirs of her body." On the death of Queen Anne in the year 1714 without issue, George I, the heir of Sophia, ascended the throne and the crown was still in 1942 held'by his successors. Among the outstanding, if not the leading sovereigns, have been Queen Elizabeth and Queen Victoria.

The Right of Women to Vote.—So long as women did not possess the privilege of franchise they were of necessity in a position subservient to that of men who had that right. In a constitutional monarchy such as that of England, the predominant force

is the popular will expressed by the voters in the election of the House of Commons. While women could not vote for membership in that house and could not sit as members therein, they had little or no direct voice in the government of their country. The struggle for equal suffrage extended over many years and was marked at times by much turmoil and bitterness. The first statute which gave to women a general right to vote was the Representation of the People act, 1918, which in effect gave equal suffrage rights to men and women. This act was succeeded by other statutes on the same subject, ending in the law entitled the Representation of the People (Equal Franchise) act, 1928, which provided that all these statutes might be cited together as the Representation of the People acts. This legislation not only admitted women to the franchise but gave them the vote on equal terms with men. In the hands of women, therefore, was for the first time placed the weapon of the vote. They possessed the right under these statutes to vote not only for members of the house of commons but for members of the councils, either town or county, and other like governmental bodies.

The Right of Women to Hold Office: Sex Disqualification (Removal) Act, 1919.—Although women now had the right to vote for members oi the house of commons, they were disqualified from sitting as members of that house and from holding almost all other important public offices. This was of course a highly anomalous condition. Beyond question, it was the new-found power in the hands of women that brought about the enactment of the Sex Disqualification (Removal) act, 1919. The passage of this law was a very long step in the direction of legal equality between men and women. It provided that a person shall not be disqualified by sex or marriage from the exercise of any public function or from being appointed to or holding any civil or judicial office or post or from entering upon or assuming or carrying on any civil profession or vocation or for admission to any incorporated society (whether incorporated by royal charter or otherwise), and "a person shall not be exempted by sex or marriage from the liability to serve as a juror." This general and sweeping language was modified by provisos that Orders in Council might be made relating to admission of women to the civil service and the conditions on which they might be appointed therein, and giving power to reserve to men any positions in the civil service overseas or in any foreign country. There was also a provision that any judicial officer might make an order that the jury be composed of men only or of women only, and might hear and pass upon any application by a woman to be exempted from service as a juror, with other rules on the same subject. The general intendment and effect of this broad law was to permit women to hold any public office, high or low, and to practise any profession or business, subject to rather unimportant regulations, and to serve as jurors.

The Right of Women to Hold Peerages.—At common law, even from the earliest times, women had the authority to hold title in the peerage. They have, however, never had the right to sit or vote in the house of lords. They hold merely the rather empty title. After the passage of the Sex Disqualification (Removal) act, 1919, it was claimed that the fact that women had not sat in the house "is due to the ordinary disqualification imposed by the common law of England upon persons of the female sex and that disqualification has been removed by the Act of 1919." The contention was advanced by the Viscountess Rhondda, who was a peeress of the United Kingdom in her own right. It was heard by the Committee for Privileges in the house of lords. That committee held that she was not entitled by virtue of that act to a seat in the house of lords. This conclusion was reached chiefly on the ground that it was not the intention of parliament, by the enactment of the law, to give to peeresses the right to a seat in the house of lords, this decision being based on the proposition that if parliament had intended to effect so radical a change in the constitution of the house of lords, it would have used words more specific and definite in the statute.

Women, therefore, even after the Act of 1919, were not permitted to sit or vote in the house of lords, although they could continue to enjoy the title to the peerage.

The Right of Women to Serve in the House of Commons and to Hold Other Public Offices.—At common law. women were disqualified to be elected to serve in the house of commons. By the statute Parliament (Qualification of Women) act, 1918, it was provided that "A woman shall not be disqualified by sex or marriage from being elected to or voting as a member of the Commons House of Parliament" (*Halsbury's Laws* of *England,* 219). Women, after that act, served as members in the house of commons. They sat in the councils, boards and other governmental bodies. They served as justices of the peace and as members of the police force and in other public capacities. Thev had not up to 1942 served on the bench of the higher courts.

The Right of Women to Carry on Any Civil Profession or Vocation and to Be Admitted to Any Corporate Society.—By the Sex Disqualification (Removal) act, 1919, it was expressly provided that a woman shall not be disqualified from carrying on any civil profession or vocation or for admission to any incorporated society. They serve in the law as barristers and solicitors, in medicine, as physicians, surgeons and veterinary surgeons. They are to be found in all the branches of the civil service except that they had not up to 1942 received the right of admission to the consular or diplomatic service abroad. There was a specific provision in the Act of 1919 which allowed the authorities to reserve to men these foreign diplomatic appointments. Although women are admitted to the civil service (except in the foreign diplomatic branches), the rate of compensation for women in the civil service is as a rule less than for men. The Church of England has not admitted women to the priesthood but many other organized churches in England, such as the Baptists, Wesleyans and others, do permit women to serve as ministers. Also, women have availed themselves freely of the privilege of entering incorporated societies such as the Institute of Actuaries, the Institute of Bankers and the like.

The Rights of Women as Industrial Employees.—In the statutes regulating industrial employment such as The Factory and Work Shops act, 1901, the Employment of Women and Children act, 1920, and similar laws, there are many clauses intended for the protection of women and applying only to women; for example, the provisions that they shall not work (with certain exceptions) on Sunday or at night or for more than a certain number of hours each week in different industries, with other like protective regulations. As in the civil service, the rate of compensation for women in industrial occupations is less than for men. The Trade Board acts direct that minimum rates of wages may be fixed for different classes of workers. Under this provision a lower rate of pay has been fixed for women than for men. It seems to be the policy of the law that although women may be admitted to the civil service and to practicaliy all industrial employments, they are to be paid, except in a few instances, at a lower rate than men. Working women are also entitled, in a general way, to participate in the benefits of national insurance. They are allowed a cash maternity benefit from the birth of each child. Also, they receive allowances for the educational expenses oi children of school age. Under proper circumstances, they are also entitled to receive pensions under the National Insurance plan. (In regard to the rights of working women which have been outlined, see LABOUR LAW; TRADE BOARD; NATIONAL INSURANCE.)

The Nationality of Married Women.—This subject is covered by British Nationality and Status of Aliens act, 1914, as amended in 1918 and 1922. Generally speaking, under this law, a married woman is considered to be of British nationality if her husband is British and of alien nationality if he is alien. There are certain exceptions set forth in the act; for example, if the husband, being British, changes his nationality after marriage, the wife has a right to retain her British status. If a British woman is married to an alien who after the marriage becomes an alien enemy, then the wife, with the consent of the secretary of state, may declare that she resumes her British nationality.

The Right of Married Women to Own Property and to Make Contracts.—By the passage of Married Women's Property acts of 1882 and 1893, a great reform was enacted. At the common law, the legal existence of the wife during marriage was regarded as merged into that of the husband. The wife was (with some unimportant exceptions), incapable of acquiring or enjoying any property, real or personal, independent of her husband. The harshness of this doctrine was to some extent modified through application by the courts of the doctrines of equity. There were also some statutory modifications but they were not of consequence. However, in 1882, by the passage of the Married Women's Property act of that year, a complete reversal of this common law doctrine took place. In that statute, which was effective Jan. 1, 1883, it was provided that "a married woman shall in accordance with the provisions of this act be capable of acquiring, holding and disposing by will of any real or personal property as her separate property in the same manner as if she were a *femme* sole without the intervention of any trustee." This doctrine is in force in England. There have been, of course, some minor statutory modifications, but the general rule holds good that a woman married after Jan. 1, 1883, can acquire, hold and dispose of her property, real and personal, as if she were unmarried (16 *Halsbury's Laws* of *England,* 613 et *seq.*). Likewise, under the common law, a married woman had no capacity at law to contract unless she was living apart from her husband under a decree of judicial separation or had obtained a protection order or was carrying on a separate trade in the city of London. This latter exception was based upon an old custom of that city (16 *Halsbury's Laws* of *England,* 682, note [L]). By the Act of 1882, it was provided that a married woman shall be capable of entering into and rendering herself liable in respect of and to the extent of her separate property on any contract. (Married Women's Property act, 1882, 1 [sec. 2]). There are various other provisions in the statute enlarging the right of a married woman to contract, but limiting that right to such separate property as she might have at the time of the contract. This continued to be the law until the enactment of the Married Women's Property act in 1893, which held that "Every contract hereafter entered into by a married woman otherwise than as an agent . . . shall bind all separate property which she may at that time or thereafter be possessed of or entitled to." This act was effective on Dec. 5, 1893. The result is as stated by Lord Halsbury:

"A contract entered into by a married woman on or after January 1, 1893, and before December 5, 1893, was not binding on her at all unless she had at the time of the contract some separate property which she might reasonably be deemed to have intended to bind, and it was therefore necessary in any action on such contract for the plaintiff to allege and prove that at the time of making it she had

some separate property in respect of which she might reasonably be deemed to have contracted."

He then goes on to say that every contract entered into by a married woman otherwise than as agent on and after Dec. 1, 1893, generally speaking, binds all separate property which she may at the time of the contract or thereafter be possessed of or entitled to (16 *Halsbury's Laws of England,* 1682–84). There was additional legislation after these two acts increasing the right of a married woman to own and dispose of property, real and personal, and to make contracts. This legislation merely follows the general principle laid down in the two Married Women's Property acts. These two laws have been a great charter for the liberties of the married woman in regard to her civil rights.

The Right of Married Women to Make Wills.—At common law a married woman could make a will disposing of her equitable interest in any real or personal property held to her separate use but she could not dispose of the legal estate in such property. By the Matrimonial Causes act, 1857, her right to dispose of her separate property by will was enlarged and by the Married Woman's Property act of 1882 it was still further extended (16 *Halsbury's Laws of England,* 631–34). By the Law Reform (Married Women and Tortfeasors) act, 1935, she was empowered to dispose by will of all her property, real or personal, as if she were a *femme sole,* and the will operates to dispose of all the property to which she was entitled at the time of her death (34 *Halsbury's Laws of England,* 40).

The Rights of Women under the Health and Unemployment Insurance Laws and also under the Pension Laws.—With certain modifications and exceptions it is the general policy of these laws (among the more important of which are the National Health Insurance act, 1924, and the Widows, Orphans and Old Age Pension act, 1928) that women, whether married or single, shall be included within their provisions. For example, a woman who has an insured husband, even if not herself insured, is entitled to a cash maternity benefit at the time of the birth of a child. She is also entitled to receive under certain circumstances during the life of her husband a weekly pension, which continues after his death. She also receives under certain conditions weekly cash benefits for her children of school age. On the other hand, it is provided that a woman who is employed by her husband shall not have the benefits of unemployment and health insurance.

The Rights of Women under the Criminal Law.—Generally speaking, the responsibility of women for violations of the Penal Statutes is the same as that of men. There are some relics of the old common law theory of the unity of husband and wife. Under that law there was a presumption in the case of certain crimes that where a crime was committed by a wife in the presence of the husband the wife acted under coercion of the husband and was not individually responsible. This presumption was abolished by the Criminal Justice act, 1925. Still, however, upon a prosecution of any crime other than treason or murder, it is a good defense to prove that the crime was committed in the presence of and under the coercion of the husband (g *Halsbury's Laws* of *England,* 24). The husband and wife cannot be charged with conspiracy because they are in law one person. The wife cannot be charged with harbouring her husband after he has committed a crime. In other words, she cannot be charged as an accessory after the fact because under the law she is not compelled to discover his crime (16 *Halsbury's Laws of England,* 710–11). With these and other rather unimportant exceptions, the responsibility of a married woman for a crime is the same as that of a man.

The Rights of Women in Respect to Divorce and the Custody of Children.—The differences and disputes between husband and wife with the attendant questions concerning the custody of the children of the marriage involve what are perhaps the most important and sacred rights of women. The history of divorce in England is curious. The common law had no jurisdiction over matrimonial causes. These controversies were held to be the peculiar concern of the church. They were heard and determined, therefore, in the ecclesiastical courts under the canon and not the common law. These tribunals did not grant any absolute divorce dissolving the marriage tie. They did decree under certain conditions divorce *ā mensā et thoro* or decree of separation under certain conditions. The ecclesiastical courts also granted annulment of the marriage upon the judicial finding that there had never been any valid marriage between the parties. But the marriage itself if valid in its inception was indissoluble. It is therefore not remarkable that there came into existence a method of parliamentary divorce *ā vinculo.* This was a difficult and expensive process. But until the enactment of the Matrimonial Causes act, 1857, it was the only method of securing in England an absolute divorce. There were during a century and a half preceding the enactment of that law about 280 such parliamentary divorces (10 *Halsbury's Laws of England,* 631). Absolute divorce by judicial process was, as has been said, first authorized in England by the Matrimonial Causes act, 1857. By that law which took effect on the first of Jan. 1858, and which applied only to England and Wales, an absolute divorce could be granted upon the petition of the husband for the infidelity of the wife; or upon the petition of the wife for the incestuous or bigamous infidelity of the husband or for such infidelity coupled with cruelty or with desertion for more than two years. It is evident this act was flagrantly unjust in its discrimination against women. A number of statutes were passed for the purpose of remedying at least in part this unfairness; also there was a growing pressure of public opinion for additional grounds for divorce. Finally, by the Matrimonial Causes act, 1937, which came into operation on Jan. 1, 1938, a divorce law was enacted which was fair and just to both men and women. By this law either spouse could obtain a divorce upon proof of infidelity, desertion, cruelty or insanity. There was a further provision intended to discourage precipitate divorces by forbidding, except by leave of the court in exceptional cases, the presentation of a divorce petition until after three years had elapsed from the date of the marriage (j *Encyclopaedia of the Laws of England,* 100–102). Not only did the English law rectiiy the injustice which denied equal rights of divorce to women; it went still further in giving to women their just rights as mothers over their children. Under the harsh rule of the common law the father had the jurisdiction over and the right to the custody of the child during infancy except that in the case of a daughter such right terminated on her marriage under age. The right existed even as against the mother. At common law the mother of the infant child had generally during the lifetime of the father no rights as against him with respect to the custody and control of such child (17 *Halsbury's Laws of England,* 663–64). This cruel discrimination was finally abolished by the Guardianship of Infants act, 1925. This law provides that where "the custody or upbringing of the infant or the administration of any property belonging or held in trust for an infant or the application of the income thereof is in question, the court in deciding that question shall regard the welfare of the infant as the first and paramount consideration, and shall not take into consideration whether from any other point of view, the claim of the father or any right at common law possessed by the father in respect of such custody, upbringing, administration or application is superior to that of the mother or the claim of the mother is superior to that of the father. . . . The mother of the infant shall have the like powers to apply to the court in respect of any matter affecting them as are possessed by the father." These rules are applied by all the English courts in all proceedings, including divorce, in which the custody of children comes up for decision (5 *Encyclopaedia of the Laws of England,* 136).

The Law Concerning Women in Scotland and Northern Ireland.—Both in Scotland and in Northern Ireland there are some differences in the law on this subject from the law which exists in England. But there are in general the same legislative measures in the three jurisdictions tending to equalize the legal rights of men and women.

UNITED STATES OF AMERICA

When the United States acquired its independence the common law of England was in force in each state. This common law consisted of the common law of England as modified by such English and colonial statutes and customs as were applicable (12 *Corpus Juris,* Common Law, sec. 3, p. 177). There was a presumption that this common law was in force in the original states and in such states as were carved out of British territory. By the Louisiana purchase and in other ways the nation came to include many states which had never been British territory. Among these states may be mentioned Florida, Texas, Kansas, Louisiana and California; and there are many others (31 CJ., Common Law, sec. 32–33, pp. 200–201). In these latter states the Roman or civil law with Spanish and French modifications was in force at the time they were acquired by the United States. However, even in these states so far as possible the principles of English common law were applied but there was no presumption that it existed. Generally speaking, therefore, it may be said that when the United States became an independent nation the rights of women were those which existed at the common law with some rather unimportant modifications. The disabilities and restrictions imposed upon women by the common law were gradually relaxed in the different states and territories by a succession of constitutional amendments and statutes. This American legislation followed the general lines of the English statutes. The result is that by 1942 great progress had been made toward attaining equality in law for men and women in the United States. There are still many discriminations, some of them highly unjust. It is believed that the amendment pending before the 77th congress known as the "Equal Rights Amendment" will eventually remove these differences and bring about a complete equality in the law. In view of the great number of the states and territories in the United States it is impossible to recite all the different legislative measures of this character. The most that can be done is to state generally the trend of such legislative action in its most important respects.

The Right of Women in the United States to Vote.—There was a long and at times a very bitter controversy, as in England, concerning the right of suffrage for women. When the 14th Amendment was passed it was thought by many to confer the immediate right of suffrage for women. In this movement for suffrage, one of the great leaders was Susan B. Anthony. She took the view that this amendment was self-executing and gave to women the right to vote. Accordingly, she cast her ballot, for which she was indicted. Upon her trial the court held that the 14th Amendment did not confer upon women the right to vote, and that further action by the state was necessary to give that privilege. (*U.S.* v. *Anthony,* 24 F.Cas. No. 14, 459, 11 Blatch F. 200). Several of the states passed constitutional amendments and statutes giving the right to vote to women. Finally

in 1920, the 19th Amendment was enacted, which provided:

"The right of the citizens of the United States to vote shall not be denied or abridged by the United States or by any state on account of sex."

After that day, the right of women and of men to vote was equal in the United States.

The Right of Women in the United States to Hold Office.—Women hold the most exalted public offices. They have been governors of various states; they are members of the United States senate and of the house of representatives. There was in 1942 a woman in the national cabinet. There is no legal reason why a woman may not be president or vice-president of the United States. The only substantial limitation on the right of women to hold office is found in the state of Oklahoma. The constitution of that state bars women from such offices as governor, lieutenant governor, attorney-general and other state offices. Also in the state of Wisconsin women may not serve as clerks of legislative committees or other employees of the state legislature. With these exceptions the right of women to hold office in the United States is unlimited.

THE RIGHT OF MARRIED WOMEN TO OWN PROPERTY AND TO MAKE CONTRACTS

At common law married women had few independent rights. As Blackstone said: "The husband and wife are one and that one is the husband." However, by constitutional amendment and by appropriate legislation the different states very largely abolished these disabilities which prohibited married women from owning property or making contracts. They have substantially the same rights as men in this respect. But there are some inequitable discriminations against married women in respect of these rights.

The Rights of Married Women in Those States in Which the System of Community Property Exists to Own Property and to Make Contracts.—Attention has already been called to the iact that some states were carved out of territory which was never the property of Great Britain. The original 13 states of course were created from British territory. However, many of the states which later became members of the union were created from lands which never had been British. In some of these states which were not originally British ground, there exists the system of community

"The general principle underlying the system of community property is that all property acquired during marriage by the industry and labor of either the husband or the wife or both, together with the produce and increase thereof, belongs beneficially to both during the continuance of the marital relation." (31 *C.J.*, Husband and Wife, Community Property, sec. 1069, p. 8).

This system obtains in the states of Arizona, California, Idaho, Louisiana, New Mexico, Nevada, Texas and Washington. It also prevails in Puerto Rico and in the Philippine Islands. There are also traces of the institution in other states which were not originally British territory. The obvious effect of this system is to create a partnership relation between husband and wife as to property acquired after marriage. There is a great volume of legislation by which this institution has been modified and adapted to modern conditions. It will be quite impossible to attempt within the scope of this article any recital or discussion of these laws. It may be said, however, that in community property states the property of married persons is divided into—

"(1) The separate property of the wife; (2) the separate property of the husband; (3) the community property in which both spouses have certain defined rights." (31 *C.J.*, Husband and Wife, sec. 1082, p. 16.)

Generally speaking, each spouse has orvnership of and control over his or her separate estate. In the several community property states there are substantial differences in the relative rights of husband and wife as to this joint estate known as the community property. In general, both husband and wife have beneficial interests in such property. The husband's rights, however, are active while those of the wife are passive. The wife's interest remains in abeyance until the termination of this relationship (31 *C.J.*, Husband and Wife, sec. 1172, pp. 79–80). As a result of this general principle the husband has the general management and control of the community property. He may lease, mortgage or sell it subject to the obligation that he must not defraud the wife in her interests. Of course, the proceeds of such lease, mortgage or sale will continue to be community property.

Also it is provided that:

"Either spouse may dispose by Will of his or her interest in the community property" (68 *C.J.*, Wills, see. 118, p. 501).

It will be seen that there is a radical difference between the rights of husband and wife in the community property states and those in which the institution does not exist. On the one hand, the system favours the wife because it recognizes marriage at any rate as a quasi partnership in which the wife has an equal beneficial interest although she has not the same power of disposition. On the other hand, the husband is recognized as the head and master of the community property with the attendant rights to manage and dispose of such property, having due regard to the interests of the wife. There has been much discussion as to the origin of this system. On this subject it has been said:

"The origin of the community property system has never been satisfactorily determined. . . . It seems to be fairly well settled that it was not derived from the Roman law. Intermediately it has been certainly traced to the laws of France and Spain. . . . It was unknown to the common law." (31 *C.J.*, Husband and Wife, Community Property, Section 1073).

It was said by Chief Justice White on this subject in the case of *Garrozi* v. *Dastas*, 204 U.S. 64–78:

"We need not consider whether the community was derived from the Roman law, from an express provision of the early Saxon law, or from the ancient customary law of the Continent. For, however derived, the very foundation of the community and its efficacious existence depend on the power of the husband, during the marriage, over the community, and his right, in the absence of fraud or express legislative restriction, to deal with the community and its assets as the owner thereof. The purpose of the community, as expounded from the earliest times, whilst securing to the wife on the dissolution of the marriage an equal portion of the net results of the common industry, common economy and common sacrifice, was yet, as a matter of necessity, during the existence of the community, not to render the community inept and valueless to both parties by weakening the marital power of the husband as to his expenditures and contracts, so as to cause him to be a mere limited and consequently inefficient agent."

He goes on to say:

"The rights of the wife are dormant during the marriage, because the husband is charged to watch over and conduct the affairs of the conjugal society. But this right, which is inert, as long as the husband is at the head of the affairs of the community, becomes active when the marital authority ceases to exist. The wife is like a silent partner, whose rights arise and reveal themselves when the partnership ceases." (Troplong, *Contrat de Mariage*, id. p. 79.)

It will be seen, therefore, that the rights of married women to hold property and to contract in those states which have the community property system are different from the like rights of married women in other states and in the United Kingdom.

The Rights of Women in the United States to Serve as Jurors and in Other Public Capacities and also to Carry on Any Civil Profession or Vocation.—In all the states there has been legislation allowing women to carry on civil professions and occupations. In many of the states, women are permitted to serve as jurors. In some states they have the option as to whether they shall serve or not according to their choice. These statutes vary in the different states. In some states a greater measure of liberty in these respects is allowed to women than in others. In many states there is not as yet full equality of rights between men and women in these matters. But the general trend of these laws is to grant these rights to women. Also in this connection it may be noted that the rights of women to share in the benefits of social service legislation including unemployment insurance and other like systems is universally recognized. They also participate in the benefits of the pension laws.

The Rights of women in the United States under the Criminal Law.—There is no longer the conclusive presumption that a crime committed by a married woman in the presence of her husband or under his compulsion is coercion. There is still, however, a presumption of coercion by him in cases where a wife commits a crime in her husband's presence. The burden of proof is then on the prosecution to prove the absence of coercion. This presumption, however, does not apply in cases of the most serious crimes such as murder or treason. Moreover, the presumption can always be rebutted by evidence. If it can be proved that the crime was committed independently by the wife and that as a matter of fact there was no coercion, she can be convicted alone upon an offence committed in the presence of her husband. (30 *C.J.*, Husband and Wiie, sec. 419–21, pp. 790–94.)

The Rights of Women in the United States in Respect to Divorce and the Custody of Children.—The changes in these respects by statute in the United States were substantially the same as those occurring in the United Kingdom. In all of the states except South Carolina in 1942, absolute divorce was recognized; and the right of the wife to divorce was admitted. There were in some states discriminations as to the grounds for divorce, the law being more favourable to the husband than to the wife. Also the rigorous rule of the common law which gave absolute control and custody of the children to the father has been verv largely abolished. In most of the states the law provides that in these matters of custody and control regard must be had only to the welfare of the child; the right of neither parent is paramount. The courts will consider all the circumstances and will make such decree as will best serve the interests of the child.

The Rights of Women as Industrial Employees.—Women are permitted by law in the United States to share generally in the benefits of labour legislation. They are allowed to be members of labour unions with the rights and privileges of such members. There is, however, one important exception. There are in many states laws which prevent women from working at night in certain industries. Also there are laws and regulations which prohibit women from working for as many hours during the day as men are allowed to work. Similarly, there are minimum wage lams setting a standard

below which the wages of women may not fall without a corresponding regulation as to men. These statutes and rules are said to be framed for the benefit of women. Undoubtedly in most cases they are enacted for that purpose. There has been a vast deal of discussion concerning these discriminatory measures. There is a large and growing group which held that this legislation, though well meant, is wholly mistaken; and that in the long run any discrimination is harmful.

It is claimed that such laws constitute a serious handicap to women in the industries. They are prevented from securing employment which they could otherwise obtain. As was said in a case in the District of Columbia concerning a minimum wage law:

"The hotel manager was not compelled to employ her (the woman in question) at a fixed wage; and her position went to a man who was willing to perform the service at a lower wage than that fixed by the Board. . . . The law to promote the good morals and general welfare of the community cast her adrift."

In the court decisions which uphold these discriminatory statutes stress is laid on the fact that the differences of physical structure between men and women disqualify women from work as hard and as continuous as that which men can perform. In the case of *Adkins* against *Children's Hospital,* 261 U.S. 525, the supreme court held an act of congress fixing minimum wage standards for adult women in the District of Columbia to be unconstitutional as an arbitrary restraint upon the liberty of contract. In the prevailing opinion written by Mr. Justice Sutherland, the court called attention to the fact that in many previous decisions these laws had been sustained on the ground of the differences of physical structure between men and women. Justice Sutherland then went on to say:

"But the ancient inequality of the sexes otherwise than physical, as suggested in the Muller case (p. 421) has continued with diminishing intensity. In view of the great—not to say revolutionary—changes which have taken place since that utterance, in the contractual, political and civil status of women, culminating in the 19th Amendment, it is not unreasonable to say that these differences have now come almost if not quite to the vanishing point. In this aspect of the matter, while the physical differences must be recognized in appropriate cases. and as legislation fixing hours or conditions of work may properly take them into account, we cannot accept the doctrine that women of mature age, *sui juris,* require or may be subjected to restrictions upon their liberty of contract which could not lawfully be imposed in the case of men under similar circumstances. To do so would be to ignore all the implications to be drawn from the present-day trend of legislation, as well as that of common thought and usage, by which woman is accorded emancipation from the old doctrine that she must be given special protection or be subjected to special restraint in her contractual and civil relationships" (*id.* p. 554).

This case was a long step in the direction of the equality of rights between men and women. The legislation which had fixed different hours of labour for women, which had prescribed minimum rates of wages for women and in other respects had been discriminatory as between the sexes, seemed doomed to extinction by the doctrine of this decision. However, the hopes of those who held these views were destroyed by the decision in the case of the *West Coast Hotel Company* v. *Parish,* 300 U.S. 279 (1937). In this case the supreme court completely changed its position and upon a vote of 5 to 4 expressly reversed the doctrine in the Adkins case. The opinion was written by Chief Justice Hughes. He held that the minimum mare and other like discriminatory statutes constitute a legitimate exercise of the police power.

After arguing this point he said.

"We think that the views thus expressed are sound and that the decision in the Adkins case was a departure from the true application of the principles governing the regulations by the state of the relation between employer and employe" (*id.* p. 397).

Under this decision of the highest court in the United States this discriminatory legislation prevailed and will continue to do so.

The Equal Rights Amendment.— Those who were opposed in 1942 to the views set forth in the West Coast Hotel case looked for relief to a proposed amendment to the Federal Constitution pending before congress, and known as the "Equal Rights Amendment." This proposed amendment reads as follows:

"Men and women shall have equal rights throughout the United States and every place subject to its jurisdiction."

This amendment was under consideration before appropriate committees both in the senate and in the house of representatives in 1942. Those who favoured the amendment called attention to the repeated pronouncements by federal and state courts as well as by legislatures and other governmental bodies that the equality of the rights of citizens is a principle of republican government. If and when the amendment is carried, then that principle will be established in the Republic. (*G. G.* B.)

WOMEN, WAR WORK OF. It is impossible here to attempt to describe the special work done by women of all the belligereht countries in 1914–18; this article, therefore, is confined to an outline of women's war work as organized in the United Kingdom and the United States.

I. IN GREAT BRITAIN

On Aug. 3, before the official declaration of war, the executive committee of the National Union of Women's Suffrage Societies decided to suspend political action and devote the organizing capacity of the Union to meet the changed conditions. The London branch started a free bureau under the name of "Women's Service" to direct the efforts of the thousands of non-professional women eagerly desirous of finding useful work. Many young women began at once to prepare themselves for nursing, joined voluntary aid detachments and worked in auxiliary hospitals. The raising of funds and making of comforts for the units of the original Expeditionary Force absorbed others, and the arrival of the Belgian refugees in England before the end of August caused the formation of 2,500 local Belgian relief committees, of whom the members were mostly women. Clubs to help the wives of soldiers and sailors were started.

By the spring of 1915, when the country began to feel the drain on its man-power, the Marchioness of Londonderry founded the Women's Legion, which from the first was intended to be a corps of paid women replacing paid men. A khaki uniform was worn and the women were subject to regulations and discipline. Ultimately over 40,000 were enrolled. This corps was the link between the independent voluntary associations of women, such as the Emergency Corps, formed on the outbreak of the war, and the official women's services, two of which were sections of the Women's Legion.

Work on Land.— Throughout 1915 and 1916 efforts were made by voluntary organizations, such as the Women's Legion and the Women's Defence Relief Corps, as well as by the Government, through the war agricultural committees of the Board of Trade, to induce women to offer their services on the land and to persuade farmers to accept them. The Women's Land Army was instituted early in 1917 as a women's branch of the Ministry of Agriculture.

Munition Making.— By the spring of 1915 shell work for women was beginning; in March women tram conductors started work at Glasgow, and girls were employed as telegraph operators in Liverpool. In connection with the demand for skilled workers, the London Society for Women's Suffrage, which promoted the introduction of women into occupations hitherto reserved for men, started a munitions and aircraft department in July 1915, and arranged the first training classes in oxy-acetylene welding. The pupils were the first women welders to enter the engineering trade, and after two years the Ministry of Munitions assumed financial responsibility for the school. Messrs. Beardmore in Glasgow and Messrs. Vickers at Barrow-in-Furness and at Erith employed women on shell-making in the spring of 1915.

Enrolled and Non-enrolled Women.— The women's services were of two types. First came those composed of enrolled women in the legal sense, who were in the direct employment of the war departments, and whose contracts brought them within the regulations of the Defence of the Realm Act. The women could be enrolled as mobile workers for home service only, or for service at home and abroad; or as immobile workers, recruited for local employment, who could not be required to move away from the district. Secondly came those composed of non-enrolled women in the legal sense, who did not render themselves liable to penalties under the Defence of the Realm Act and might be engaged on an annual or weekly contract. Some services enrolled their women for a year only; others for the duration of the war.

The enrolled women consisted of the various army nursing services; the Military Massage Service, which started its career in Aug. 1914, under the name of the Almeric Paget Massage Corps; the Women's Forage Corps; Queen Mary's Army Auxiliary Corps; the Women's Royal Naval Service, commonly known as the "Wrens"; and the Women's Royal Air Force. (See NURSING.)

In Queen Mary's Army Auxiliary Corps which was at first the Women's Army Auxiliary Corps or familiarly the Waacs, the women were enrolled as mobiles for home service only, or for home or foreign service, and for the duration of the war; they received a special rate of pay, not civilian or military, and were

not enlisted under the Army Act. At first substitution overseas only had been contemplated, but by March the number of women recruited by the Department of National Service was so great that home commands were included in the scheme. Recruiting was afterwards carried on through the employment department of the Ministry of Labour. In Dec. 1917, owing to the shrinkage of available woman power, an immobile branch was formed. Women employed in the Ordnance Army Pay Department and Record offices at home were not made to join the Corps. In all there were 1,200 officials and 56,000 women, of whom 9,500 were the outside number employed in France at any one time.

As regards the Women's Royal Air Force, 566 officers and 31,764 other ranks passed through the service, the strength at the time of the Armistice being rather over 25,000. The service consisted of mobiles and immobiles in approximately equal proportions.

Non-enrolled women included the Anti-Gas Department, the Army Pay Corps, the Army Remount Department and the Navy and Army Canteen Board. Practically the whole of the work on gas-mask manufacture was performed by women. There were 34 factories employing 12,000 under the immediate control of the Anti-Gas Department, and 160 contractors employed a further 90,000 on work for the department.

Army Pay Corps.—The Army Pay department was one of the earliest in the army to substitute female clerks. In July 1915, 479 were working and by Jan. 1, 1916, there were 4,5j6 female clerks and 13 lady superintendents. The engagement was a weekly one and there was no form of contract till Aug. 1917.

Navy and Army Canteen Board.—When the Navy and Army Canteen Board (then called the Army Canteen Committee) started operations in April 1916, only 20 women clerks were employed. During 1917 the Board's activities were enormously expanded to include catering for the Imperial Overseas forces and for the American and Allied troops. It was decided in March 1917 to institute a N.A.C.B. Women's Corps in mobile and immobile sections, and by the date of the Armistice the women employed in connection with canteen organization in the mobile corps numbered 10,000 and the clerical staff in the immobile corps. 2,000.

II. IN THE UNITED STATES

When the United States entered the World War in April 1917, but one organization depending mainly on the efforts of women was officially recognized by the Government, the Red Cross. Its upwards of 8,000,000 regular volunteer women workers in 3,500 chapters produced in 20 months over 371,000,000 relief articles, including surgical dressings, garments for the wounded and the refugees, and a variety of comforts and conveniences for soldiers and sailors. The value of their output was about $94,000,000. The Red Cross enrolled during the war 23,822 women as nurses. They served in the military and naval hospitals in the United States, Europe and the Near East, as well as in convalescent homes for soldiers and sailors and in relief work for adults and children both in the United States and overseas. They worked in 700 Red Cross canteens in the United States and 130 in France, serving refreshments to moving troops, giving them medical care and transferring them when sick.

When war was declared many large national organizations of women applied to the Government for instructions. The Council of National Defense appointed, at the end of April 1917, a committee of nine women (afterwards increased to eleven), to form a plan by which the women of the country could be utilized. This committee selected a woman in each State as a temporary chairman. She called together the heads of all national organizations of women in her territory to elect permanent officers for a State division. In turn the State division organized county committees and each county was to form a division in each city and town. By December 1917 the county organization was complete in 23 States, and a year later more than 80% of all the counties in the country had county chairmen.

The Women's Committee through ten national departments penetrated by means of this network throughout the country. It registered women for service in key industries to replace men, Michigan enrolling 98% of its women; it conserved food. 5,223,850 pledge cards being signed in 39 States in the first few weeks of the campaign; it helped to safeguard the health of the children; it assisted in keeping up the morale of the country by distributing news letters, 40,000 pamphlets and bulletins and sending out speakers to counteract rumours; it helped with the Liberty Loan campaigns; it inspired its volunteers to home and foreign relief.

The War Department asked the Y.M.C A. in August, 1917, to organize a group of women for welfare work with the American Army somewhat similar to that of the Women's Auxiliary Army Corps for the British troops. The American "Y" women served in the United States, France, Belgium, Italy, Germany, Constantinople and Siberia, 1,665 enrolled in the home camps and 3,480 going overseas, 561 of the latter entertainers. A special unit of coloured women was sent for work with the negro troops. The "Y" women remained on after the armistice, serving with the Army of Occupation from December 1918 until it was withdrawn and afterwards with the American Forces in Germany. The Y.W.C.A. organized in June 1917 a war council, under which it developed a variety of clubs, both in the United States and overseas, particularly France, behind the lines. The hostess houses of the association at the home camps of both white and coloured soldiers looked after women visitors, a service which proved of such value that the War Department at the close of the war took the work under its educational and recreational branch. Some 50 buildings were turned over to the Government by the war work council of the Y.W.C.A. Overseas the association conducted clubs which served Red Cross nurses and other women workers.

WOMEN'S CLUBS, THE GENERAL FEDERATION OF, a federation of approximately 15,000 clubs in the United States, 32 U.S. Territories and foreign countries. It was organized and a constitution adopted on April 24, 1890 after a preliminary meeting of women's clubs held in New York in 1889. It was incorporated under the laws of New Jersey in 1895, and a charter was granted by Congress in 1901. Membership in the federation is open to any women's club or organization which requires no sectarian or political test for membership, is not a secret society, does not tolerate violation of national or State laws, and agrees to the constitution and by-laws of the General Federation. While the membership of the organization extends into millions, no exact figure can be given owing to overlapping memberships.

While the first clubs existed largely for self-culture, there was unquestionably in the inner consciousness of the founders a realization that, since the great economic changes of the world were removing many tasks from the home, women must prepare to play a new part in the affairs of their community, State and country. That they looked forward to a programme of practical, civic, educational and welfare work is plainly recorded in their early writings.

The officers are elected by delegates from the member clubs at a triennial convention. At this meeting and at the two intervening councils. the members express themselves nationally in their endorsement of such movements or legislation as they consider important to the national welfare. The individual clubs and State federations plan and carry on their own activities. Some of the causes which the General Federation has supported are: greater educational opportunities, scholarship loan funds for girls, home economics teaching, home demonstration agents, public libraries, travelling libraries, greater appreciation of music, painting and sculpture, the eradication of illiteracy, training in citizenship, Americanization of aliens, better working conditions for women and children, the abolition of child labour, prison reform, adequate pure food laws, recognition by the U.S. Census of homemaking as an occupation, the raising of the standard of home equipment, conservation of our natural resources, the creation of national parks, prohibition, peace, and a better understanding of international relations. (S. O. D.)

WOMEN'S SUFFRAGE. The Women's Suffrage Movement dates, for all practical purposes from the middle of the 19th century. The systems of government of the ancient world were all based upoq the theory that women could take no part in political matters, except when they became reigning queens,

In Great Britain.— In spite of Plato and a few other political theorists, it was not until the French Revolution that the idea that women might share in political power gained any support. Then, however, Condorcet upheld it, and Mary Wollstonecraft wrote her great book *A Vindication of the Rights of Women* in 1792. The French Revolution speedily became unpopular in England, however, and although in the next 40 years a few isolated advocates appeared, it was not until the Chartist Movement began that it again attracted attention. The first draft of the "Charter of Rights and Liberties" was composed in 1838, and is stated to have included Women's Suffrage; but it was not allowed to remain, as it was thought likely to bring ridicule upon the agitation.

Between 1840 and 1850 a certain number of politicians mentioned the subject in their speeches, in particular Richard Cobden, who strongly supported it, and Disraeli, who spoke in its favour when a resolution was introduced into the House of Commons by Joseph Hume. The election of John Stuart Mill to parliament in 1865 marked its real beginning.

Mill was a convinced believer in the importance of this reform, and it occupied a foremost place in his election address. His return to parliament therefore encouraged those women who were thinking about the subject, and in 1866, when it was found that almost all the 50 members of the Kensington Ladies' Discussion Society were its supporters, a group of them, led by Barbara Leigh Smith (Mme. Bodichon), Elizabeth Garrett (Mrs. Garrett Anderson), Emily Davies and Bessie Rayner Parkes (Mme. Belloc) decided to form a provisional women's suffrage committee. Its first work was to collect a petition to parliament, and 1,499 names were secured. This petition, the first of a long series, was presented by Mill in 1867, and in the same year he moved an amendment to the Reform bill by which women were to be enfranchised.

A number of suffrage societies came into existence about this time in London, Manchester, Bristol, Edinburgh and Birmingham, and a real effort at propaganda was undertaken. Mill published The *Subjection of Women*, which he had written seven years earlier, and serious organization was begun. The leader in the north of England was Miss Lydia Becker, a woman of unusual political insight; and her first care was to make certain that women were not already enfranchised under the existing law. Over 4,000 claims to be put on the parliamentary register were sent in by women ratepayers in Manchester, and the same thing was done in other parts of the country. The test case (Chorlton *v.* Lings) was tried before the court of common pleas in 1868, and the decision was that women were disqualified, and attention was thereafter directed to promoting a bill in parliament. In 1869 the municipal franchise was extended to women ratepayers, and in the following year, when the school boards were created, women were made eligible and were actually elected to them.

In 1870 Jacob Bright brought forward a bill for extending the parliamentary franchise to women, and it passed its second reading, but was not allowed time to proceed further. The suffragists then began to hold meetings in various parts of the country.

In 1880 the vote was given to women owners in the Isle of Man, and it was subsequently extended to occupiers also.

During the years before the introduction of the Reform bill of 1884 the suffragists were very active. The political parties seemed to be favourable, and a majority of the members of the House of Commons was individually pledged, but W. E. Gladstone killed their chances of securing the amendment they hoped for. He announced that women would "overweight the Bill" and must be "thrown overboard," and accordingly 104 Liberal members broke their pledges, and the thing was done. The women at last realized the difficulty of trying to secure reform while they were themselves without political power. In 1888, when the county councils were created, women were included among the electorate. Two women were elected to the first London County Council, but their eligibility was challenged, and rejected by the courts, and it was not until 1907 that an act was passed making them eligible to serve on these bodies, and also to hold the office of mayor. The first woman mayor in Great Britain was Mrs. Garrett Anderson, mayor of Aldburgh in 1908.

The suffrage movement passed through a period of comparative discouragement after 1884, and though propaganda continued, and huge petitions were yearly sent in, no fresh developments took place. In the '90s a successful effort was made to interest the working women of the north, and although no progress was apparent in parliament the volume of support for the movement steadily grew. In 1897 the scattered societies united in a National Union, under the presidency of Mrs. Henry Fawcett, and their efficiency greatly increased.

In 1903 an event occurred which was both a symptom of renewed interest and a cause of further progress, namely the formation of the Women's Social and Political Union. Before many years were over this society, led by Mrs. Pankhurst, had developed "militant tactics."

The real development of this policy began in 1906, when the Liberal Party came into po er. The older societies were asking for pledges from individual candidates, but the new society believed that the only hope lay in the action of the Government. At a meeting in the Free Trade hall, Manchester, Christabel Pankhurst and Annie Kenney asked what the attitude of the new Government would be. Instead of an answer to their perfectly legitimate question, however, the two girls were seized by the stewards and thrown roughly into the street; and when they held an indignation meeting they were arrested for obstruction, and sentenced to fine or imprisonment. Both chose to go to prison; and the sensation caused by these events was an enormous advertisement to the cause. Thereafter the "militants" adopted the policy of heckling cabinet ministers, of marching with petitions to parliament, and of sending deputations to Downing street. Disturbances and arrests followed, and with every such demonstration the strength of their society grew.

From 1906 the movement entered upon its stage of greatest effort. Organised societies expanded with great rapidity, and the agitation they carried on became incessant. The meetings which multiplied in halls and drawing rooms, in schools and chapels, at street corners and on village greens were missionary meetings, and new converts flocked into the ranks. In 1907 the first 'public demonstration in the streets was organized, and on a wet afternoon 3,000 women took part in the "mud march" through London. Nothing dreadful happened to them, and the demonstration was repeated in other places. As time went on the scale increased, and vast crowds gathered again and again in the Albert hall, in Hyde park and in other open spaces, and processions, miles long, marched with bands and banners through the streets. Both suffragists and suffragettes developed great ingenuity in propaganda. They turned everything to their uses, and their war-cry, "votes for women," cropped up in the most unexpected places. They chalked the pavements, paraded in sandwich boards, sold their newspapers in the streets, picketed the House of Commons and flooded the streets with leaflets and handbills.

All this commotion put the Government into a very uncomfortable position, since H. H. Asquith, the prime minister, was a violent opponent of the cause. He was determined not to yield; and yet nothing but the granting of the vote seemed likely to stop the agitation. The militants courted arrest, and continued their protests in prison. They adopted the method of hunger striking, and after painful attempts at forcible feeding, which they invariably resisted, the authorities were obliged to release them. While the propaganda of both sections of suffragists developed, the political situation remained unaltered. Private members' bills were introduced, but owing to the opposition of the Government they were either defeated or blocked. In 1910 a serious effort was made to find a solution of the problem, and a conciliation committee of M.P.s with Lord Lytton as its chairman and H. N. Brailsford as its secretary was set up. This committee drafted a bill acceptable to all sections of suffragist opinion, and the second reading was carried in the same year by 110 votes. Asquith refused further facilities, but after the second general election of 1910 the same bill was brought forward again, and was again carried by an increased majority. But still the Liberal Government would not grant facilities, and in the autumn of 1911 Asquith announced that he proposed to introduce a franchise bill "for male persons only." This naturally enraged the suffragists,

and the militants began a campaign of greater violence, destroying property and breaking windows to mark their protest. Early in 1912 the conciliation bill again came forward, but this time, owing to the prospect of the franchise bill and the known wishes of the prime minister, it was defeated by 14 votes—and that in the same parliament as had carried the same bill by 167 votes not a year before. This treatment of their cause still further angered and stiffened the suffragists, but they fixed their hopes upon the coming reform bill, which Asquith had promised would be open to amendments including women.

In Jan. 1913 the committee stage of the reform bill was reached, and the women's suffrage amendments were tabled. Then followed a parliamentary surprise; for, by the Speaker's ruling these amendments were declared so to alter the bill as to make it a different one from that which had already passed its second reading. The consequence was that the whole bill had to be withdrawn, and the chances of women's suffrage seemed to be hopeless.

The militant outbreak which followed was met by the Government with severely repressive measures. An act was passed, officially known as the Prisoners (Temporary Discharge for Ill Health) Act, but commonly known as the Cat and Mouse Act, whereby released hunger strikers could be re-arrested and sent back to prison when their health was restored. Many prisoners were recaptured under this act, and Mrs. Pankhurst, who was sentenced to three years in 1913 was re-imprisoned eight times; yet even so she only served 30 days in the first year.

After the fiasco of the reform bill the National Union adopted the election policy of supporting the party which officially advocated their cause and at that time the only party to do so was the Labour Party. In 1913 the National Union organised a pilgrimage of women, which marched upon London from all over the country, and culminated in a monster meeting in Hyde park. The reception of the pilgrims all along the route was so friendly, and the meetings they held in the towns and villages they passed through were so enthusiastic that they began to feel sure that public opinion was won, and that success was near at hand.

The course of the movement was interrupted in August 1914 by the outbreak of the European war, and the members of the suffrage societies at once turned their energies to helping the country through the economic difficulties of the time. "Let us prove ourselves worthy of citizenship" said Mrs. Fawcett in a message to her followers, "whether our claim be recognised or not." The suffragette prisoners were pardoned and the Women's Social and Political Union ceased to exist, but the National Union remained as an organised body and undertook relief work of many kinds.

For a time it seemed as if the suffrage question was lost to sight; but the war work which women were able to do was of such value, and they revealed such unsuspected powers and abilities that public opinion became very favourable to them. In 1916 the question of a new registration bill arose owing to the impossibility of re-registering the men who were absent on war service under the old act; and when the suffragists pointed out that any change in the basis of registration would be a change in the franchise, and that if it were made the women's question ought at the same time to be considered, they found not only the Coalition Government, but the whole press and people of the country in agreement with them. After several unsuccessful efforts to settle the matter without raising the whole franchise issue, H. H. Asquith invited the Speaker to call a conference representative of all the parties. The conference reported in Jan. 1917 in favour of a limited form of women's suffrage to householders and the wives of householders provided they had reached the age of 30 or 35 years; and this proposal, with the lower of the age limits, was inserted into the bill which D. Lloyd George's Government introduced. In June 1917 the clause enfranchising women was carried in the House of Commons by a majority of 7 to 1, with the general approval of the whole country. Early in the following year it passed the House of Lords, and received the royal assent.

The reason for the insertion of the age limit and the other differences between the franchises of men and women was to reduce the numbers of women voters, so that they should not be in a majority; and the suffrage societies, although continuing to work for equality, accepted this as a first step. In Nov. 1918 the act making women eligible for election to Parliament was passed, and at the election of that year women not only voted for the first time, but stood as candidates. The only one elected was the Countess Markievicz, who, being a Sinn Feiner did not take her seat; but in 1919 the Viscountess Astor was elected.

It immediately became evident that there was no danger of the formation of a "Woman's Party," and the extension of the franchise worked so smoothly that within a year or two all three political parties declared themselves in favour of extending the vote to women upon equal terms. In March 1928 the Conservative Government brought forward a new Representation of the People bill for this purpose. This was carried with only ten dissentients in the House of Commons, by 387 to 10. The bill passed the House of Lords in May with a majority of 79, and received the royal assent on July 2, 1928. With its passage into law complete political equality was granted to women, and the Women's Suffrage Movement in Great Britain came to an end.

In the British Dominions.—In all the British Dominions except South Africa some form of women's suffrage is in force. New Zealand enfranchised its women in 1893, and the commonwealth of Australia in 1902, South Australia having previously granted state suffrage in 1894, and West Australia in 1899. New South Wales granted it in the same year as the commonwealth, Tasmania followed in 1903 and Queensland and Victoria in 1905 and 1908. Canada acted in the matter almost at the same time as Great Britain. All the provinces except Quebec adopted it in 1916, and the Dominion followed in 1917. In Newfoundland women vote at municipal elections on the same terms as men, but at the age of 25 instead of 21 at parliamentary elections. In the Irish Free State equal franchise and eligibility are in force. In India the Government of India Act specifically left the question to be decided province by province by the elected legislatures. Cochin, Travancore and Jehalwar adopted it in 1921, Mysore in 1923, Assam in 1924, Bengal in 1925 and the Central Provinces in 1927. Burmah also adopted women's suffrage in 1922 when it became a province of India. Jamaica, South Rhodesia and British East Africa gave votes to women in 1919 and 1920. At Trinidad, Tobago and the Windward islands women vote at 30 and men at 21, and women are not eligible for election, and in the Channel islands they vote on equal terms, but are eligible only in Guernsey.

In Other Countries.—Before the World War there were only four countries where women exercised the franchise. In 1928 it is the practice in the great majority of the countries of the world, the principal exceptions being France, Italy and Spain. The position in 1928, in countries other than Great Britain and the Dominions, is as follows: Equal suffrage and eligibility for all elected bodies prevail in Austria, Czechoslovakia, Denmark, Esthonia, Finland, Germany, Iceland, Lettonia, Lithuania, Luxemburg, the Netherlands, Norway, Poland, Russia and Sweden. In Hungary women have the municipal franchise and the parliamentary franchise at the age of 30 with eligibility. Municipal suffrage is granted in Spain, in the Argentine (province of San Juan), in Brazil (province of Rio Grande do Norte) and in Belgium, where women are also eligible for Parliament, but without the right to vote (except in the case of a limited class of war sufferers). In Greece limited municipal suffrage without eligibility was passed to come into force in 1927, but the necessary decree has not been issued. In Italy a limited measure of municipal suffrage has been granted, but is inoperative. In Palestine women have equal suffrage and eligibility for the Jewish National Assembly, but have no voting rights under the constitution.

BIBLIOGRAPHY.—*Women's Suffrage* (1912) and *The Women's Victory and After* (1920) by Dame Millicent Fawcett describe the progress of the Suffrage campaigns. Sylvia Pankhurst, *The Suffragette* (1911) and Mrs. Emmeline Pankhurst, *My Own Story* (1914) deal with the militant movement, as does also *Prisons and Prisoners* (1914) by Lady Constance Lytton. Ray Strachey, *The Cause: A Short History of the Women's Movement in Great Britain* (1928) covers the whole field, and contains a bibliography. (M. G. F.; R. St.)

THE UNITED STATES

As the first experiment in a so-called democracy was made in the new Government known as the United States, it seemed most

fitting that there it should reach its full fruition in complete and universal suffrage. The earliest colonists recognized the value of a vote for the law-makers and the laws, but in the beginning it was very closely restricted to the members of certain specified churches and to those whose names were on the tax list, while in some cases a slight educational requirement was made. Women, even though qualified, were almost universally excluded.

After the Revolutionary War when the convention met in Philadelphia to organize the States no question aroused such vehement discussion as that of the suffrage. It was so long continued that finally the only solution possible was to omit the subject from the National Constitution and leave each State free to make its own qualifications for voting.

Meanwhile women were receiving the rudiments of an education and slowly acquiring a voice. By 1832 the anti-slavery question was becoming acute. Women were intensely interested and were developing so much power as public speakers that the question of allowing them on its platform had divided the Anti-Slavery Association, the Garrison-Phillips branch standing by Lucretia Mott and her contemporaries. Among these were the "Quakers" who always had recognized the equal rights of women. In later years Elizabeth Cady Stanton, of Revolutionary ancestry, had joined the anti-slavery forces and she and Lucretia Mott decided that the rights of women as well as those of the negro slave needed redressing. In July 1848, at a Friends' Yearly Meeting in Western New York, they issued a call for the first Woman's Rights Convention in all history. It met in Seneca Falls, Mrs. Stanton's home, on July 19, and after a two days' session adjourned to Rochester.

This may be regarded as the beginning of the movement for woman suffrage not only in the United States but in the world. It received the wide publicity of the New York *Tribune* under Horace Greeley and was followed in 1850 by a convention in Worcester, Mass., under the auspices of Lucy Stone and a distinguished group of Eastern suffragists. The movement, however, still lacked the dynamic force which was to put it into effective action and this was soon supplied by Susan B. Anthony. In 1851 she first met Mrs. Stanton and the friendship began which remained unbroken for over 50 years. Each was the needed complement of the other. Miss Anthony attended her first woman's rights convention in Syracuse in 1852, her last in Baltimore in 1906, one month before her death.

At first no way of extending suffrage was known except through amendments to State constitutions, which required the consent of a majority of the male voters. The first attempt was made in Kansas in 1867, immediately after the close of the Civil War, in which for four years women had borne an heroic part. An amendment was submitted at the same time to enfranchise the newly-liberated male slaves, who had flocked into that State. Both were defeated but the latter received a much larger vote in its favour. The women then had their first lesson in what was before them. All the States had the word "white" in the suffrage clause of their Constitutions, and legislatures in a number of them submitted amendments to the voters to take it out. In every instance they were defeated and it was evident that some other method must be found if the negro men were to vote, which the Republican Party was very desirous that they should do. This Party was in power in all the States and a measure was decided on that had not been attempted since early days, which was for the Congress to submit an amendment to the National Constitution.

As soon as this intention was announced Miss Anthony and some of the woman suffrage leaders rose up in arms and demanded that this proposed amendment should not enfranchise only coloured men but all women. Most of the men who had been the strongest advocates of woman suffrage opposed this demand and they were supported by some of the women, all of whom feared that it would imperil the success of the amendment. Women were not included in this 14th amendment, and later, when a 15th was found necessary to strengthen it, they were also excluded.

The woman suffrage leaders, however, perceived a new method, which did not seem so utterly hopeless as amending the Constitution of every State by consent of a majority of the voters. In New York city in 1869, at the close of the May anniversary of the Equal Rights association, which had been formed soon after the war to protect the negro men, they formed a National Woman Suffrage association. Representatives from 19 States were present and its object was declared by resolution to be to secure the ballot for women by a 16th amendment to the Federal Constitution. Mrs. Stanton was elected president and Miss Anthony chairman of the executive committee. This organization held a national convention every year thereafter for 50 years and went before committees of every Congress asking for this amendment. Its leaders soon learned that pressure from the States on their representatives in the Congress would be absolutely necessary and so they began to organize the States to work on the legislatures until every State was organized. In the autumn of 1869 another distinguished group, headed by Lucy Stone, organized a national association called the American, solely for this purpose. In 1890 the two organizations united under the name of National American, which worked for both objects for almost 30 years.

Mrs. Stanton, Miss Anthony and their heroic contemporaries passed away, leaving the work to be finished by their successors in office, Dr. Anna Howard Shaw and Mrs. Carrie Chapman Catt, who now headed a determined army of women eventually increased to many thousands. Individual States began to yield and enfranchise their women and each one increased the members of Congress elected partly by women, who were thus obliged to vote for an amendment to the National Constitution. The revenues increased annually, $120,000 being subscribed in 1919 to the work of the National Association, exclusive of the amounts raised by the various States for their own work.

It was found that legislatures could give women the vote for presidential electors and in some States the municipal and various forms of local franchise. Those of Arkansas and Texas gave the primary suffrage, equivalent to a full vote. Meanwhile campaigns were being vigorously conducted to persuade the legislatures to submit to the voters amendments to the State Constitutions conferring the full suffrage in State affairs. This was accomplished in New York in 1917 and was the greatest victory yet achieved. By 1918 women had thus acquired equal suffrage with men in 15 States, offering the only instance in the world where the voters themselves gave the franchise to women.

Meanwhile other associations national in character had been formed. The Federal Association was organized in 1892, of which the Rev. Olympia Brown was president for 17 years and many prominent men and women were members. Its object was the passage of a law by the Congress authorizing women to vote for members of the lower house, which would have been constitutional. The College Equal Suffrage League was organized in 1908 with Dr. M. Cary Thomas, president of Bryn Mawr college, at its head during the nine years of its existence, and it co-operated with the National American Association. This was true also of the Friends' (Quakers') Association. Mississippi Valley Conferences were organized in 1912 and Southern Women's Conferences the following year, which did effective work in their sections as auxiliaries of the National American as long as it was needed. A Congressional Union was formed in Washington in the spring of 1913 to support the work of the association's Congressional Committee, but in December it became an independent organization with headquarters in Washington and Miss Alice Paul as its head. Its object was a Federal amendment, which it attempted to secure by aggressive and militant methods never before employed in the United States. At the time of the National Republican Convention in Chicago in 1916 it adopted the name National Woman's Party. Later it established permanent headquarters in Washington through a gift of Mrs. Oliver H. P. Belmont, who became its president. In 1911 a National Men's League for Woman Suffrage was organized in New York and soon had many State branches officered by prominent men.

By 1918 the United States had entered the World War, and the nation-wide response of the women to every demand made on them and their valuable work broke down the barriers of the opposition. All the political parties were committed to their enfranchisement, but there was still enough opposition in the

Congress to delay the final vote of both Houses to submit the amendment to the legislatures until June 1919. The tremendous struggle was then ahead of securing the ratification of three-fourths of the legislatures in time for the women to vote at the presidential election of Nov. 1920. Most of them had adjourned and this would have to be done by special sessions. It was accomplished and the last certificate, that of Tennessee, was delivered to Secretary of State Bainbridge Colby at 4 o'clock in the morning of Aug. 26, 1920. At 9 o'clock he issued the official proclamation that the 19th amendment having been duly ratified by 36 State legislatures "has become valid to all intents and purposes as a part of the Constitution of the United States." It reads as follows: "The right of citizens of the United States to vote shall not be denied or abridged by the United States or by any State on account of sex." From that hour complete and universal woman suffrage was the law of the land.

WONOSOBO, a town in Central Java, residency Kedu, the "capital" of Java's beautiful highland district known as the Dieng Plateau, is 7,000 ft. high and surrounded by mountains. Wonosobo is 3,400 ft. high and is connected by steam tramway with the main railways of Java. Pop. (1930) 10,701. A delightful climate makes Wonosobo a fine starting-point for excursions to the plateau. A motor road runs from Wonosobo to Garung, five miles distant, and from there to the plateau a rough road, traversed on foot, or by sedan chair, leads, by way of the charming lake of Mendjer, to Kejajar. A climb from here leads past the native villages of Tieng, Lowang, Wadasputi and Parikesit, on to the plateau. The plateau has a cold and bracing climate, almost Alpine scenery, small lakes, several Arjuna temples of Hindu construction. Wonosobo was occupied by Japan in March 1942, during the invasion of Java.

WOOD, ANTHONY A' (1632–1695), English antiquary, was the fourth son of Thomas Wood (1580–1643), B.C.L. of Oxford, where Anthony was born on Dec. 17, 1632. He was sent to New College school in 1641, and at the age of twelve was removed to the free grammar school at Thame, where his studies were interrupted by civil war skirmishes. He was then placed under the tuition of his brother Edward (1627–1655), of Trinity college. He was entered at Merton college in 1647, and made postmaster. In 1652 he amused himself with ploughing and bell-ringing, and "having had from his most tender years an extraordinary ravishing delight in music," began to teach himself the violin, and was examined for the degree of B.A. He engaged a music-master, and obtained permission to use the Bodleian, "which he took to be the happiness of his life." He was admitted M.A. in 1655, and in the following year published a volume of sermons by his late brother Edward. He began systematically to copy monumental inscriptions and to search for antiquities in the city and neighbourhood. He went through the Christ Church registers, "at this time being resolved to set himself to the study of antiquities." Dr. John Wallis, the keeper, allowed him free access to the university registers in 1660; "here he layd the foundation of that book which was fourteen years afterwards published, viz., *Hist. et Antiq. Univ. Oxon.*" He also came to know the Oxford collections of Brian Twyne to which he was greatly indebted. He steadily investigated the muniments of ali the colleges, and in 1667 made his first journey to London, where he visited Dugdale, who introduced him into the Cottonian library, and Prynne showed him the same civility for the Tower records. On Oct. 22, 1669, he was sent for by the delegates of the press, who arranged to publish his work. In 1674 appeared *Historia et antiquitates Universitatis Oxoniensis,* handsomely reprinted "e Theatro Sheldoniano," in two folio volumes, the first devoted to the university in general and the second to the colleges. His great work was produced by a London publisher in 1691–1692, 2 vols. folio, *Athenae Oxonienses: an Exact History of all the Writers and Bishops who have had their Education in the University of Oxford from 1500 to 1690, to which are added the Fasti, or Annals for the said time.* On July 29, 1693 he was condemned in the vice-chancellor's court for certain libels against the late earl of Clarendon, fined, banished from the university until he recanted, and the offending pages burnt. Wood died on Nov. 28, 1695, and was buried in the outer chapel of St. John Baptist (Merton college), in Oxford, where he superintended the digging of his own grave but a few days before.

Wood's original manuscript (purchased by the Bodleian in 1846) was first published by John Gutch as *The History and Antiquities of the Colleges and Halls in the University of Oxford, with a continuation* (1786–90, 2 vols. 4to), and *The History and Antiquities of the University of Oxford* (1792–96, 3 vols. 4to), with portrait of Wood. To these should be added *The Antient and Present State of the City of Oxford, chiefly collected by A. à Wood, with additions by the Rev. Sir J. Peshall* (1773, 4to; the text is garbled and the editing very imperfect). An admirable edition of the *Survey of the Antiquities of the City of Oxford, composed in 1661–66 by Anthony Wood,* edited by Andrew Clark, was issued by the Oxford Historical Society (1889–99, 3 vols. 8vo.). Wood bequeathed his library (127 MSS. and 970 printed books) to the Ashmolean Museum, and the keeper, William Huddesford, printed a catalogue of the MSS. in 1761. In 1858 the whole collection was transferred to the Bodleian, where 25 volumes of Wood's MSS. had been since 1690.

We are intimately acquainted with the most minute particulars of Wood's life from his *Diaries* (1657–95) and autobiography; all earlier editions are now superseded by the elaborate work of Andrew Clark, *The Life and Times of Anthony Wood, Antiquary, of Oxford, 1632–1695, described by himself* (Oxford Historical Society, 1891–1900, 5 vols. 8vo). *See* also *Reliquiae Hearnianae,* ed. Bliss (2nd ed, 1869, 3 vols. 12mo); Hearne's *Remarks and Collections* (Oxford Historical Society, 1885–1907), vols. i.–viii.; Macray's *Annals of the Bodleian Library* (2nd ed., 1890); Nichols's *Literary Anecdotes* (9 vols., 1812–IS), i. iv. v. viii.; T. Granger's *Biogr. History of England* (3 vols., 1806, ed. by Noble), i.

WOOD, MRS. HENRY [ELLEN] (1814–1887), English novelist, was born at Worcester on Jan. 17, 1814. Her maiden name was Price; her father was a glove manufacturer in Worcester. She married Henry Wood in 1836, and after her marriage lived for the most part in France, her husband, who died in 1866, being at the head of a large shipping and banking firm. In 1860 she wrote a temperance tale, *Danesbury House.* Her first great success was made with *East Lynne* (1861) which was translated into several languages, and was dramatized with great success. Other novels followed. She became proprietor and editor of the *Argosy* magazine in 1867. She died on Feb. 20, 1887.

Memorials of Mrs. Henry Wood, by her son, were published in 1894.

WOOD, SIR HENRY EVELYN (1838–1919), British field marshal, was born at Braintree, Essex, on Feb. 9, 1838, the youngest son of Sir John Page Wood, Bart. Educated at Marlborough, he entered the Royal Navy in 1852, and served as a midshipman in the Crimean War. He then transferred into the army. Wood served in the Indian mutiny, and returned from India with a V.C. and a growing reputation. In 1878 he became regimental lieutenant-colonel of the 90th, which he immediately joined in South Africa. In January 1879 he was in command of the left column of the army that crossed the Zulu frontier. At the close of the war Sir Evelyn Wood was appointed to command the Chatham district. But in January 1881 he was again in South Africa with the local rank of major-general, and after Sir G. P. Colley's death at Majuba he negotiated the armistice with General Joubert. He returned to the Chatham command in 1882, having meantime been promoted substantive major-general. In 1882 he commanded a brigade in the Egyptian expedition. Wood remained in Egypt for six years. From 1883 to 1885 he was Sirdar of the Egyptian army, which he reorganized and in fact created. During the Nile operations of 1884–85 he commanded the forces on the line of communication of Lord

[1] In the *Life* he speaks of himself and his family as Wood or à Wood, the last form being a pedantic return to old usage adopted by himself. A pedigree is given in Clark's edition.

Wolseley's army. In 1886 he returned to an English command, and in January 1889, he was appointed to the Aldershot command. In 1891 he went to the War Office as quartermaster-general. Four years afterwards he became adjutant-general. He was promoted full general in 1895. He commanded the II. Army Corps and Southern Command from 1901 to 1904, being promoted field marshal on April 8, 1903. In 1907 he became colonel of the Royal Horse Guards. After retiring from active service he took a leading part, as chairman of the Association for the City of London, in the organization of the Territorial Force. He died on Dec. 2, 1919. Sir Evelyn Wood published several works, perhaps the best known of which to the soldier are *Achievements of Cavalry* (1897) and *Cavalry in the Waterloo Campaign* (1896). He also wrote *The Crimea in 1854 and in 1894;* an autobiography, *From Midshipman to Field Marshal;* and *The Revolt in Hindostan.* In 1917 he published a volume of reminiscences entitled *Winnowed Memories.*

WOOD, SIR HENRY JOSEPH (1869–), English conductor and musician, was born in London on March 3, 1869. His musical education was largely received at the Royal Academy of Music, and at the age of ten he became deputy organist at St. Mary's Aldermanbury. As a conductor he first appeared in 1889 with Rousbey opera company, and for some years he toured with various companies, including the Carl Rosa (1891). His name has been closely bound up with the musical life of London since 1895, when the Queen's Hall Promenade concerts were started under a system of guarantees, with himself as conductor and Robert Newman as manager. These increasingly popular concerts, held nightly during August and part of September, have been conducted by Sir Henry Wood throughout, although the management has thrice changed hands and the concerts have, since 1927, been under the direction of the British Broadcasting Corporation. The educative results of Sir Henry's liberal programme policy have been very remarkable. As conductor of the Queen's Hall Symphony concerts, established in 1897, he has made for himself a high international reputation and has greatly raised the standard of orchestral playing in England. He was knighted in 1911.

WOOD, JOHN (*c.* 1705–1754), British architect, was born about 1705, probably in Yorkshire. He settled in Bath in 1727, and is known as "Wood of Bath." He paid several earlier visits to Bath for the purpose of constructing roads. As an architect he was particularly successful in his designs for streets or groups of houses, and became well known as a follower of the Palladian school. His designs in Bath include Queen's square; Prior park, built for Ralph Allen; and the Royal crescent, designed by himself, but built under the direction of his son. The Bristol (1740–43) and Liverpool (1748–55) exchanges were also designed by Wood, and he restored Llandaff cathedral. His best work is, however, to be seen in Bath, where his classical style harmonized with the spirit of the town as he found it. He died on May 23, 1754. Many of his designs were carried out after his death by his son John (d. 1782), who also, in addition to many groups of houses, built the Hot bath and the Royal Private baths.

The elder Wood wrote *Choir Ganre* (Stonehenge, 1747); *Essay Towards a Description of Bath* (2 vols., 1742; reprinted, 1749 and 1765); and several other works on architecture.

WOOD, LEONARD (1860–1927), American soldier, was born at Winchester, N.H., Oct. g, 1860. He graduated from the Harvard medical school in 1884, was appointed acting assistant surgeon, U.S. army, in 188 j, becoming assistant surgeon with the rank of first-lieutenant in 1886, when he was assigned to Capt. Lawton's expedition against the Apaches in the South-west, resulting in the capture of Geronimo. For distinguished services he was awarded the Congressional Medal of Honour. In 1891 he was promoted captain and full surgeon, and later, while stationed in Washington, D.C., became the close friend of Theodore Roosevelt, then Assistant-Secretary of the Navy. On the outbreak of the Spanish-American War in 1898 Wood was commissioned colonel 1st U.S. Volunteer Cavalry (the famous Rough Riders) with Roosevelt as lieutenant-colonel. For conduct at Las Guasimas and San Juan Hill, Wood was promoted brigadier-general, July 1898, and in Dec. major-general of volunteers. He was military governor of Cuba from 1899 to 1902, when the Cuban Republic was established. He was appointed brigadier-general U.S.A. Feb. 1901. In 1903 he was sent to the Philippines and appointed governor of the Moro province, being promoted major-general in that year. In 1908 he returned to America as commander of the Eastern Department. In 1910 he was appointed chief of staff, U.S. Army, serving until 1914, when he was again given command of the Eastern Department.

Gen. Wood as early as 1908 had urged preparedness. To him was largely due the establishment of a summer camp at Plattsburg for training civilian officers, which was taken as a model for other camps of the kind after America's entrance into the World War. Just before America's entrance into the World War in 1917 Gen. Wood was assigned to the South-eastern Division but was later transferred to Camp Funston, where he trained the 89th Div., N.A., the 10th Div. of the regular army and other troops. In 1919 he was put in command of the Central Department, with headquarters at Chicago. In 1920 he was a prominent candidate for the presidential nomination at the Republican National Convention. Harding, a "dark horse," was nominated on the 10th ballot, with 692½ votes to 156 for Gen. Wood. In 1921 Gen. Wood was sent at the head of the Wood-Forbes mission to the Philippine islands. Prior to leaving he was appointed head of the University of Pennsylvania, but did not assume charge because of the President's desire that he should remain in the Philippines as governor-general, a position which he held from Oct. 1921 until his death which occurred in Boston, Mass, on Aug. 7, 1927. Wood was the author of *The Military Obligation of Citizenship,* lectures at Princeton and elsewhere (1915); *Our Military History, Its Facts and Fallacies* (1916); *Universal Military Training* (1917); and *America's Duty as Shown by Our Military History* (1921).

See I. F. Marcosson, *Leonard Wood, Prophet of Preparedness* (1917); Joseph H. Sears, *The Career of Leonard Wood* (1919); and *Leonard Wood on National Issues* (1920), compiled *by* Evan J. David; Herman Hagedorn, *That Human Being, Leonard Wood* (1920); Walter Robb, *The Khaki Cabinet and Old Manila* (1926).

WOOD, ROBERT WILLIAMS (1868–), American physicist, born in Concord, Mass., May 2, 1868. He graduated at Harvard in 1891, studied a year at Johns Hopkins university and two years at the University of Berlin (1892–94). He was assistant professor in physics at the University of Wisconsin, 1897–1901, and then became professor of experimental physics at Johns Hopkins. A method which he originated in 1898 of thawing frozen water mains and service pipes by passing an electric current through them has been widely adopted. He was awarded the Rumford medal for investigations in light, particularly for his work upon the optical properties of metallic vapours, and the John Scott Legacy medal for his diffraction process of colour photography. Besides scientific papers and monographs he is the author of *Physical Optics* (1905; rev. ed., 1911) and *Researches in Physical Optics* (2 vols., 1913–19).

WOOD. In all classes of plants, including for instance ferns, more highly organized than mosses, wood occurs in all members of the plant and is continuous from the finest rootlets up the root and stem, into the leaves and flowers or the equivalents of these. Wood performs two functions in the plant's life: first, it serves for the transport of water and contained salts, absorbed by the roots, to parts where this "raw sap" is needed and especially to the leaves; secondly it gives mechanical strength to the plant.

In palms and bamboos the wood of the leaves is string-like in form and is confined to the nerves or veins; from these the strings extend into the trunk or stem, where they descend but join one another at intervals thus producing a more or less basket-like or loose loofah-like complex, which is embedded in the general mass of tissue composing the rest of the trunk. Thus it is this linked net-like complex of woody strings that corresponds to the solid mass of wood of a pine or oak.

Wood that has attained only slight thickness and accordingly cannot be termed timber, is nevertheless utilized, for instance in the form of thin branches and twigs to make besoms and baskets. Even when wood attains greater thickness it is not always timber

since there are some woods so soft, light in weight, and weak that they have little or no value as structural material upon which there is a demand for strength: such wood supplies means of flotation for fishing-nets and buoys, and insulation, while the lightest of all are pith-like and are the materials of which sun-helmets are composed.

(*See* also TIMBER.) (P. GM.)

WOOD ALCOHOL: *see* METHYL ALCOHOL.

WOODBINE', a plant name, applied in England to the honeysuckle (*q.v.*) and in America to the Virginia creeper (*q.v.*).

WOODBRIDGE, a market town in Suffolk, England; 79 mi. N.E. by E. from London by the L.N.E R.

Pop. (1938) 4,959.

Woodbridge Abbey occupies the site of an Augustinian foundation of the 12th century.

There is a large agricultural trade.

WOODBURY, LEVI (1789–1851), American political leader, was born at Francestown, N.H., on Dec. 22, 1789. He was a judge of the superior court from 1816 to 1823. In 1823–24 he was governor, in 1825 a member and speaker of the State house of representatives, and in 1825–31 and again in 1841–45 a member of the U. S. Senate.

He was secretary of the Navy in 1831–34, secretary of the Treasury in 1834–41, and associate justice of the U.S. Supreme Court from 1846 until his death, Sept. 4, 1851.

WOOD-CARVING, the process whereby wood is ornamented with design by means of sharp cutting tools held in the hand.

The term includes anything from sculpture in the round up to hand-worked mouldings to help to compose the tracery of screens, etc.

(For technique, *see* SCULPTURE TECHNIQUE: *Wood-Carving.*) (X.)

AFRICAN

In dealing with African woodwork, a distinction must be drawn between the Mohammedan and the fetishistic countries.

Mohammedan Art.—In the Mohammedan countries, which are mainly in the north, the art has remained decorative, and statuary has been excluded; this is due partly to the natural bent of the Semitic race, which, coming from Arabia, has dominated these regions since the time of Mohammed, and partly to specific commandments in the Koran. Objects in daily use, furniture, and semi-architectural work are consequently almost the only forms of art for which the natives have used wood in Egypt, Tripoli, Tunis, Algeria, and Morocco, and among the scattered tribes north of Lake Chad and the Niger. Among objects in daily use, mention may be made of the powder-flasks of the Berber tribes of northern Morocco, carved with geometrical designs, and in some cases ornamented with copper studs and filigree-work; rifle-stocks inlaid with silver, ivory, and mother-of-pearl; mirrors, small chests, and boxes, similarly inlaid, particularly among the peoples more directly influenced by Egypt and the East.

Special attention bas been paid by the Egyptians to furniture, and they have always excelled in inlaying, marquetry, and turned-wood work. There are but few types, however. Some are of a liturgical character, like the *kursi*, or Koran reading-desk, and the *minbar*, or pulpit, while others are for household purposes, like the *sanduq* or clothes-chest and the *marfoa* or dresser. These have often, particularly in Morocco, been carved with palm-leaves or conches and painted in gay colours. The Moors had also bed-ends, small cupboards, and large armchairs used at marriage-feasts, of chased wood, painted with delicate floral and geometrical designs. But it is in large-scale architectural decoration that the African Muslims have displayed the highest degree of skill.

The *mqarbe* or bees'-nest process consists in constructing arches, niches, or cupolas by placing together a large number of small wooden pales, all capable of reduction to seven fundamental forms, and each projecting corbel-wise in the manner of a trumpet. A series of these little trumpets is formed into vaults or portions of vaults hollowed out into hundreds of cells and bristling with stalactites, producing the most opulent effect,

Another process is the large-scale mosaic in wood, used mainly for ceilings and doors in magnificent buildings. For ceilings it is used in two ways: (1) The beams being left visible and assembled in lines agreeable to the eye, panels of various shapes being interposed between them at intervals to produce a large mosaic presenting various combinations and geometrical flourishes. (2) A rough frame ork, which is not visible, having inlaid upon it panels of wood on which baguettes and leaves of wood are applied so as to form a mosaic in relief. In the case of doors the processes are much the same, except that uprights and lintels take the place of beams and joists. This art of wood mosaic has been practised with great success, especially in Morocco and Egypt. In Morocco it has almost always been embellished with very delicate arabesques, painted with size, varnished, and gilded. In Egypt, in the best periods, it was adorned with elements in ivory, ebony, or even precious metal, with thin sheets of wood here and there.

Turned woodwork has been used mainly for balustrades and partitions. The native method is to fit little twirls between turned baguettes. Both twirls and baguettes are made on primitive lines, with a wire saw wielded in one hand, the other hand holding a chisel which is guided with the foot. The method is still in use among the Spaniards in certain Andalusian towns. Partitions of turned wood have been used chiefly by the Egyptians, for the kind of loggia called *musharrabieh* which gives so picturesque an appearance to the streets of old Cairo.

The Muslims have produced some most beautiful interior decoration in the form of wood-carving. In Morocco more especially, the inner courtyards of the houses in the 14th, 15th and 16th centuries were ornamented throughout with corbelled penthouses, friezes, lintels, and mural facings in carved wood. The carving is not very deep; it is a bas-relief, with sometimes an intermediate plane between the foundation and the most salient parts. The decorative motifs are floral twines composed of two-branched palm-leaves, interspersed with conches and pineapples. There are also inscriptions in Arabic characters artistically intertwined with the floral elements. The depth of the hollows is from 3 to 4 centimetres. Very often, however, especially in more modern buildings, the wood has been simply engraved on the surface, so as to accentuate the painting a little more heavily.

In practice these different methods of decoration are often combined. So in doors or very elaborate ceilings in wood mosaic, the boards may be carved with interlaced palm-leaves. The panels of which inlaid ceilings are composed are not always ornamented with mosaic; many of them are merely engraved with rectilinear geometrical designs. Again, partitions of turned wood are frequently embellished with baguettes forming combinations or even inscriptions in stylized Cufic characters.

It should be added that all these methods of woodworking have also been applied to objects not directly concerned with architecture, such as *mihrabs* (niches indicating the direction of Mecca in mosques), and in particular to some *minbars* (pulpits).

At the present day the native woodwork is not so excellent as it used to be; but highly-skilled joiners, carpenters, and wood-carvers are still to be met with in Morocco. Marshal Lyautey, while he was administrator attached to Sultan Mulay Yussef, helped to preserve these traditions of craftsmanship. Among the best-known examples are: At Cairo, the rich collections of the museum of Arab art, several doors and minbars of mosques, lids of tombs, etc.; at Kairuan (Tunis), the minbar (9th century) and the maqsura (11th century) of the Sidi-Okba mosque; at Algiers, the minbar of the chief mosque (11th century); at Fez, the splendid decorations in the inner courtyards of the Medersas of Buanania, El Attarin, El Mesbahiya, Es Sahrij (14th century), and Esh Sharrabin (16th century); at Marrakesh, the minbar of the mosque of El Kutubia, the wall-facings and friezes of the Ben-Yussef Medersa (16th century), and the stalactite vault of the mausoleum of the Saadian princes (16th century).

Fetishistic Art.—In the Fetishistic countries, peopled by black races, the development of art has been entirely opposite to that in the Mohammedan countries; it has been concerned mainly with the representation of living beings. This art is essentially religious, The carved wooden images are mostly

statuettes of gods and goddesses and masks for ritual dances. Drinking-cups, seats, head-rests, etc., are also met with. Though long regarded as purely barbarous, in recent years negro art has attracted the attention of a large number of enthusiastic collectors, who recognize in it not merely an unusual and individual character, but qualities of construction, synthesis, and even frequently expression, together with a striking decorative power and delicacy of ornament in objects of daily use. Few of the examples that have reached us are of any great age, the oldest dating back only some two or three centuries. According to the closest students, however, they follow for the most part traditional types the canons of which were established in very remote times. One of the features of the human effigies is the intentional smallness of the lower limbs. Some say that this deformity is intended to represent the primitive inhabitants of Africa, the Pygmies or Negrillos, who are supposed to have been deified by the negroes.

Roughly, the chief centres of negro art are: Benin, where local traditions have mingled with Portuguese influences dating from the 14th and 15th centuries, with engaging results; the Ogowé, in the north of Gaboon, where wooden fetishes sheathed in copper plating are the chief feature, the human form being completely conventionalized into a geometrical figure; Dahomey, where the human figures are much more realistic; the Congo, where there are statuettes covering a fairly wide range of types, and also, in the Kasai basin, objects of daily use which are remarkable both in form and in ornamentation — goblets, drinking-cups, musical instruments, chairs, etc.

Guinea, the Oil rivers, the Sudan, the Ivory coast, the Gold coast, Dahomey, Liberia, the Cameroons, Gaboon, etc., have produced statues and masks displaying the most painstaking workmanship. Wood-carving is also found in Loango and Angola. The finest collections of negro art are in the British museum, the Trocadéro museum at Paris, the Tervueren museum near Brussels, and various museums in Germany. (J. GAL.)

FAR EASTERN

Splendid examples of Japanese 8th century wood-carving may be found in the phoenix and musical angels adorning the canopy hung in the Kondō of Hōryuji and in the *gigaku* masks carved in paulownia wood and preserved in the Imperial treasure-house Shōsōin, the Hōryuji monastery and other ancient temples in Japan. The *gigaku* masks in the Shōsōin, numbering 164, the majority of which are in wood, the most of which are in paulownia, if not all, the rest being in dry-lacquer, are believed to have been used in connection with religious services observed at Tōdaiji, especially at the inauguration ceremony of the Great Buddha which took place on April 9, 752. The belief is substantiated by the carvers' signatures and dates written on the inside of the masks, and also on the original bags which contained them. Inscriptions on some of the masks indicate the number of days spent in carving the mask, some being 5 and 7 and others 9 days. The wooden masks used in bugaku, the music of which is still preserved and occasionally performed in the Palace, are smaller and less grotesque in appearance, as may be seen from the old masks scheduled as "national treasures" and preserved in some temples. The *no* masks, all carved in wood, which came into existence in the 16th century, taxed the resources of the talented carvers, and a large number of masterpieces are now in possession of the head families of the different schools of *no* drama.

Up to the 15th century, the work of the wood-carver was confined to the embellishment of the temples: carvings on the pedestals, nimbus, and baldachins of Buddhist figures, and some slight ornamentations on the building itself, such as the carving of the beam-ends into animal heads and the use of the *kaeru-mata*, a simple decoration between the beams. But in the second half of the 16th century, the decorative wood-carving came to assume an importance in palatial mansions of the shōguns and in shrines where wood carvings were inserted into the *kaeru-mata* between the beams, attached under the rafters, used as the panels of the gate, etc., a large number of which may still be seen at Kitano Jinsha and Nishi Hongwanji of Kyoto, Chikubushima Jinsha in Lake Biwa, etc. The predominance of wood-carving as an architectural decoration in the 17th century may be seen at the mausoleums of the Tokugawa shōguns at Shiba, Tokyo, and at Nikko, where both the interior and exterior of the buildings are profusely covered with wood-carvings ranging over a wide variety of subjects faithfully executed and realistically coloured.

The taste for simplicity has not tolerated wood-carving in the architecture of dwelling houses. The only place the carver could display his art was in *ramma*, the ventilating panel in the narrow partition wall over the sliding screens that separate one room from another. The *ramma* carving has made a special development of its own, all sorts of subjects being treated: flowers and birds, animals and insects, figures in history and romance, landscapes and mists, clouds and waves, etc., carved on board to give, together with the decoration on the sliding screens, a character to the room.

Some fine carving in wood, the temple decoration in miniature scale, may be seen in the family shrine (*butsu-dan*) where the ancestral tablets are kept, generally fitted into a recess in the room. In their profuse and minute decoration some of the portable shrines (mikoshi), used in the procession at the festival, are also beautiful examples of the art of wood-carving. So also are the small ornaments for cabinet decoration or for the *tokonoma*, the recess in the guest room for objects of art. Some wonderful workmanship in wood has been produced by the *netsuke* (ornamental button for suspending a pouch or medicine case) carvers when many of the talented sculptors in wood turned their attention from carving Buddhist figures to the production of smaller objects in greater demand.

The Chinese have utilized the wood-carving more lavishly than the Japanese in their home architecture. They have carved their heavy beams on the ceiling and the massive pillars as well with delicate tracery. The simplest of their chairs and tables are invariably carved in the "key^{n}-pattern, some simpler than others, and the doors are in delicate trelliswork design or ornamented with carvings in low relief. Lanterns with diapers or some other interesting designs in pierced work are held by brackets or arms carved in forms of dragon heads. Although rich in variety, the designs used in the wood-carving, show a fondness for geometric patterns that is distinctly Chinese. The following are some of the other motives resorted to by the wood-carvers: emblems of richness and happiness, clouds and thunder patterns, the curious mask of a creature "TaoTieh," "The Eight Trigrams" or "Pa Kwa," "The Four Quadrants," "The Five Elements," etc. Sacred scenes and figures incised in floral scrolls, intermingled with series of conventional emblems of one religion or another form subjects for wood-carvers in decorating the Buddhist, Taoist and Confucian temples. Sacred to Buddhism are the eight symbols, the chief among which is the lotus, an emblem of purity, chosen because the lotus lifts out of the mud its rosy or white blossoms unsullied, forming a fitting resting place for the Buddha. Taoists have their symbols of eight immortals and derive many floral emblems of longevity from sacred plants; the most prominent among which is the peach, the tree of life of their paradise, bearing fruits ripening but once in 3,000 years which confer immortality to those who partake of it. While Confucianism has no distinct emblem of its own, the symbol of culture and examples of filial piety, such as the well known 24 examples of filial piety, are sometimes attributed to it.

Artistic vitality characterizes even the highly conventionalized designs of the Japanese wood-carvers, but the bulk of the Chinese work reveals a sense of laborious and mechanical execution On

the whole, the Chinese wood-carvings are more effective as a design and ornament compared with the Japanese work, which, while the thing carved on is well decorated, carry a far less decorative value. The former aims more for the effect, while the latter pays much greater attention to the mode of execution and technical skill. The former covers the carving with paint or lacquer, while the latter delights in appreciating, whenever possible, the clear cut chisel marks in natural wood. Even the decorative panels in the temples and shrines which are coloured, show traces of the Japanese wood-carver's pleasure and satisfaction derived from the clear cuts of his chisel. There is a tendency in both for an effort to surmount formidable difficulties in design and execution, defying time and labour, with little regard for the artistic merit in the result achieved. GOTHIC

Such meagre fragments of woodwork as have come down to us from the 11th and 12th centuries, rend to show that the woodworker was following the stoneworker in every particular, and that where he failed to be constructive, he had to call in the help of the metalworker to make his ware hold together. The stoneworker was paramount until about the 15th century. From that time onward it was the woodworker who became predominant. By that time he had found that wood should be treated in quite a different manner from stone, and, inspired by new ideas and new motives, he invented new methods for the construction and embellishment of his work. The wood-carver, then, no longer followed the patterns and designs of the stone-carver, but he made them for himself in a manner to suit the material and tools he worked with, in fact he began to influence the stoneworkers in such a way as sometimes to divert them from their intrinsic principles.

Early Period.—The earliest examples of wood-carving are some remnants of Scandinavian carving dating from the ninth and tenth centuries. They are carved framings of doorways made of thick planks of pinewood. They follow the same form of designs as are found on Celtic stone crosses, or in the elaborate initial letters of early illuminated manuscripts. This carving is in low relief, and it is always kept up to the surface of the material out of which it is made. The designs are of interlacing stems sometimes foliated, and often terminating in a monster's head. Occasionally the stem is doubled and criss-crossed, and invariably the space which is decorated is so much filled with pattern as to leave scarcely any ground showing. An example of this kind of carving is shown in the reproduction of a Norwegian chair of the 9th or 10th century. (Pl. V., fig. 1.)

Of the Norman period in England only a few isolated pieces remain, and these are only enriched with a row of moulded arches, as in the railing at Compton church, Surrey, or the desks at Rochester, or the tomb at Pitchford church, Shropshire, which has also a shield carved in oak in each arch of the arcaded side of the tomb, supporting the carved wood effigy of Sir John Pitchford, which was made at the very end of the Norman period. It may be conjectured that the characteristic feature of Korman wood-carving is the rounded surface of most of the foliated forms, which appear to have avoided hollows. The leaves were often a series of lobes with a V-shaped sinking round the edge. Even in the mouldings, beads or rounds preponderated over hollows, and in the grotesque beaked heads carved on the arches to many a doorway the surface treatment is generally a series of ribs or small rolls, rather than a succession of hollows or V cuts as was the case in Byzantine ornament. Sometimes the stems of the foliage were enriched by a small bead carved on either side of a rounded stem, as may be seen on the Prior's doorway at Ely cathedral.

Of the early English period which lasted roughly from 1190 to 1310—a little over 100 years,—there is not a great deal of wood-carving remaining, though there is sufficient to tell us what it was like, even in elaborate work, as in the stalls at Winchester cathedral. These however were executed at the very end of the 13th century. They are carved with the utmost care and skilfulness but the work follows the idiosyncrasies of the stonemason and carver, inasmuch as it is cut out of solid blocks of oak and the forms and designs are identical with that of stonework. Some of the designs for foliage follow the typical early English forms, whilst others might be taken for the work of the next great divisional period of architecture which followed. The miserere seat from the Priory church at Christchurch, Hampshire is a good example of early English carving. (Pl. V., fig. 2.) Others may be found in Henry VII.'s Chapel at Westminster, and at Exeter.

In the traditional carvings of the 13th century the curves of the foliage are very simple. The leaves start from a fairly thick stem which is generally cut very square in section. Sometimes the curve of the stem is reversed as it nears the end of the spray, but more often than not it is one simple curve which quickens as it reaches the end of the leaf, and finally buries itself in a deep pocket in the centre lobe. The variations of this form of foliage are wonderful and beautiful in the extreme. The building where this form of carving may best be studied in England is Wells cathedral. Towards the end of the 13th century the wood workers were coming into greater prominence. There is an example of a groined roof with carved bosses at the junction of the ribs at Warmington, Northamptonshire, and of carved roof beams at Bradfield, Berkshire; and Rochester cathedral has a lean-to roof with moulded beams.

Decorated Style.—The next phase of Gothic work, which began about 1300, is known in England as the Decorated style. It lasted for the comparatively short time of 70 years, before it gave place to another type. Even during these 70 years carving had more than one character. At first there was a tendency to follow more closely naturalistic forms, though treating them conventionally, but this is rather more apparent in the stone-carver's work than in the wood-carver's. This faithful portraying of natural forms does not appear to have lasted for more than 10 to 20 years. What succeeded was a very conventional and exaggerated treatment of the surface of foliage applied indiscriminately to leaves of every description. It consisted of a large bump in the middle of the leaf, a smaller one in the centre of each lobe and a still smaller one on every serration. The effect of this arrangement was a deep hollow round each protuberance in the centre of the leaf, partly broken by the lip or raised edge to the circular eyes which divide the main lobes of the leaf.

The Fifteenth Century.—The 15th century was productive of the finest quality and of the largest amount of decorative Gothic woodwork that the world has even seen. Although there was a distinct style pervading the whole period, there was more variety in expressing it than had been the case in any of the previous developments in architecture. This period of work which is known as the Perpendicular style began about the year 1390 and continued until about 1550; after that date it was practised in a debased form for another 100 years.

It was a time of prosperity. Spacious and noble churches were built and sumptuously furnished and decorated. Not only did one parish vie with another in erecting churches with costly and elaborate fittings richly painted and gilded, but the merchants also built noble houses for themselves. There was no difference in the style of building between domestic and ecclesiastical edifices, save that many houses were constructed of timber. Screens, pulpits and font covers were invariably prepared with gesso and sometimes minute decoration added to the faces of the buttresses, as at Southwold, and then gilded, and sprays of flowers painted on the broad hollows. The beadings were picked out with a chevron, or a twist of two or more colours like a barber's pole. The corner posts generally received a greater or less degree of carved ornamentation such as is here shown from a house in Suffolk (Pl. V., fig. 4).

The most noticeable features of the work of this period are that carving became flatter, tracery was built up of several boards as one order was superimposed upon another and not cut out of one thick piece of oak as had formerly been done. It will be seen that in the emblems of S.S. John and Matthew (Pl. V.,

fig. 3), the work is applied and that a broad simple treatment is the outstanding characteristic of these vigorous carvings. Whereas in Decorated carving the prominent projections on the surface of leaves were made into round bumps, in Perpendicular carving these projections were made to take a rectangular form. Above all the carver worked in a manner that suited his tools and material. In the latter half of the 15th century some of the carved foliage is composed almost entirely of hollows divided by a V cut to represent the stem of the leaf, or by a softly carved raised stem. The edges of the leaves are kept up and the serrations are produced by a vertical cut with a gouge at right angles to the edge of the leaf and a hollow cut with the same tool on the edge of the leaf, getting deeper until the chip falls out as the cut meets the first incision. The inner edge of these gouge cuts form the centre stems of the serrations. The Poppy-head from Walpole St. Peter (Pl. V., fig. 5) partly illustrates this. It will be seen from this how very different is the carver's expression to what it was when every serration was elaborately carved with a swelling in the middle and a hollow round it. One type of leaf which was invented, for there is nothing in nature like it, was that in which the corners of the leaf ended in a tightly rolled ball, as may be seen in the left hand leaf on the miserere seat from Ripon cathedral, on which Samson is shown carrying away the gates of Gaza (Pl. V., fig. 6).

The wealth of pattern and fanciful design in crestings, strings, bosses, tracery, poppy-heads, bench ends, etc., is wonderful, and the rendering of fables and biblical stories in the miserere seats inimitable. The repeating patterns in carved tracery and cresting, etc., are always interesting, because although there is a sameness, there is never an exactitude. The curves of tracery are never mechanical but are drawn freely, and great care was taken to get a breadth of effect. The hollows of the tracery are very flat, and not like the cast iron effect produced by some revivalists who make the section of the hollow almost a quarter of a circle. In a few of the East Anglican churches an effect of great richness is produced by carving the back of the top rail of each bench with a simple band of ornament, as in Dennington church, Suffolk (Pl. V., fig. 8). As band beyond band is seen when viewed from the west end the impression it gives is quite startling.

An extraordinary development took place at this period in the erection of timber roofs. The skill and imagination of the carpenter together with the conception of the figure and foliage carvers produced a wealth of grand architectural effects that has never been surpassed. The roof of Westminster Hall will for ever be a wonder for its construction and magnitude.

In England the type of work differs considerably in different parts of the country. There is a great deal of beautiful oak carving of this period to be seen in France, Germany and Flanders. In St. Paul's church at Abbeville, there is a beautiful reredos (Pl. V., fig. 10) which is Flemish in character, illustrating the lace-like effect so often found in French carvings. Perhaps the most striking piece of work on account of its vast amount, its completeness, and its elaboration is the stalls at Amiens cathedral, which were begun in 1508 and completed in 1522. One characteristic feature of French Gothic tracery carving is that the section is often but little more than a chamfer and when there is a double order it is often made by dividing the chamfer by a square incision. Most of the foliage carving is expressed by the use of the gouge, that is to say it is composed of broad hollows. In German work the tendency is for the designs to be more intricate and to contain less breadth and freedom in the carving. Most of this work is very much undercut and the chief aim appears to have been definition of outline and strong shadows.

At the end of the 15th century Renaissance influence begins to make its appearance, and although the structural parts of woodwork remain purely Gothic in design, it is in the carvings that the innovation first makes its presence known. The four oak panels (Pl. VI.) are dated 1540 and indicate the effect the new style is beginning to have on the carver. The suggestion is that carvers were introduced from Flanders with which there was constant intercourse in connection with the trade in wool, and it is from this source that the splendid traditions of the Gothic period were undermined. When the fashion for this new form of art took hold of the popular imagination, the end of Gothic was not far off; although tradition born of centuries is hard to kill; for it was not quite dead until the middle of the sixteenth century. *(See* also SCULPTURE TECHNIQUE: *Wood-carving;* GOTHIC ART.)

MODERN

With the passing of the Gothic the symbolism that inspired the wood-carver gave place to ornament almost devoid of ideas. Under the influence of the builders it functioned to give expression to proportion and structural design, and to convey something of the joy of life in those effects with which man delights to surround himself. When symbolism or aesthetic understanding is not guiding the decorative instinct, manipulative skill becomes easily a snare, hence, the styles of decoration which have arisen throughout Europe since the Renaissance have provoked a constant struggle between sincerity and technical dexterity. Especially has this been the case with wood-carving. Wood is an intractable material to carve but, in skilful hands, lends itself to the production of *tours de force.* The wood-carver's rnethod of cutting with gouges leaves the trace of the tool on modelled surfaces to a greater or lesser degree, according to the vigour and spontaneity of his work.

The Renaissance.— The wood-carving of the Renaissance was chiefly in walnut, and is best understood if it be realized that the structural design of the woodwork was reminiscent of building and that structural features such as pilasters, capitals, etc., were employed decoratively. Further, the Renaissance being in essence the revival of classic *motifs,* familiarized by ancient examples in marble, which material was especially understood in Italy, it is not surprising that much of the work lacks a distinctive wood-like effect. Nevertheless the release from the domination of the middle ages with their limited symbolism brought a freedom and vitality into design that made the Italian carving the inspiration of the greater part of Europe for many centuries, and the inventiveness and opulence displayed have never been excelled or rarely equalled elsewhere. Its *motifs* taken freely from nature and treated naturalistically to an extent unknown in the classic prototypes on which the Renaissance was founded, were combined with arabesques, woven into designs by means of sinuous and scroll movements, and modelled to produce to the utmost a play of light and shade.

Towards the end of the 15th century, France felt the inspiration of the Renaissance. It was there welcomed avidly by the carvers, who had the Gothic insight to a degree never attained by the Italians. Perhaps the highest beauty achieved by the Renaissance was in the admixture of the new details and Gothic structure, so common in France, suggesting that it is during transitional periods in art that man is most vital and creative. The French understood the treatment of wood and, although sometimes over-lavish and small in detail, their technique was easy and unsophisticated, and in the designs of the best examples provision was made freely for surfaces broad enough to display the grain and beauty of the wood. A characteristic example of the period are the doors of St. Maclou, Rouen, which are attributed to Jean Gougon and if this work be compared with much of the stonework of the time it would appear that stone was influenced by wood.

The work of nearly the whole of Europe was gradually influenced by Italy either directly or through an intervening country. The influence was too vital to incite mere reproduction, even had the means existed to make this possible, so that, except where the craftsman was imported, the expression of Renaissance ideas in each country had its distinctive idiom. The Plateresque of Spain is noteworthy for the exceptional profusion

Illustrates modern trend in one type of wood-carving. 4. "Albigensian Woman Resting." by Jean Tirefort. 5. "Madonna" by a pupil of Professor Brzega, a typical example of modern semi-geometric wood carving. 6. "Oxen of Siena," a carved wood panel pierced, painted and gilded by Gilbert Bayes. 7. "Self-portrait" by Jens Lund, an example of the Danish style of wood carving

of small surface detail, sometimes of great refinement. In Germany, the Netherlands and England the Renaissance carving is associated with the development of strapwork, in some examples of which it scrolls vigorously while in others groups of fruit, grotesque masks and figures sculptured in high relief, enrich it. At a later date the Baroque carving of large figures was in Germany more remarkable for skill than taste and in Italy for wildness in its application to its architectural setting. Of great interest to the wood-carver as further examples of his art when uncontrolled by architectural considerations are a number of the pulpits of Belgium. That by Verbruggen, 1699, in St. Gudule, Brussels, is the most extravagant of the school and it was not improved by the addition of the elaborate railing in 1780.

The Eighteenth Century.— The most radical change in style after the Renaissance was the so-called Rococo (*q.v.*) of the reigns of Louis XIV. and XV. It reflects the artificiality and extravagance of its time and is distinguished by its arrangements of "C" scrolls and attenuated foliage for structural as well as decorative purposes, and for the substitution of richly ornamented broken curved movements for straight horizontal lines. Its draftsmanship is superb, and for effect it relies upon the perfect technique of its somewhat fantastic designs.

The inception of the 18th century in England, which is singularly remarkable for the fertility of its designers and carvers, witnessed the development of the art of Grinling Gibbons who fashioned wood with a freedom and delicacy unprecedented. His work has provoked controversy as to the suitability of wood for masses of fruit and flowers in such high relief and so freely undercut. The preservation of his work, in spite of the ravages of the wood-worm justifies the apparent liberties he took with his material and his freedom from the shackles of tradition; the variety of his designs and his sense of decoration proclaim him a great artist and craftsman. His most restrained work and probably his best, was done in association with Sir Christopher Wren for the choir of St. Paul's cathedral, London.

The effects of the French Rococo were disastrous everywhere. In Italy and Germany the character of the style was interpreted with a crudeness that almost amounted to a burlesque; and only in England, notably in the hands of Chippendale, were its suggestions controlled by refinement and discretion. The swing of the pendulum led to the production of the ornament of Louis XVI. in France, Biedermeyer in Germany, and the Adams brothers in England. These styles were a return to more severe classic ideals, and the enrichments involved the repetition of small patterns and *motifs* that had been exhausted in the past.

Decline of Wood-carving.— Since the end of the 18th century, wood-carving all over Europe and America has been almost confined to the reproduction of the styles of the past without any regard for nationality or the expression of individuality. *L'art nouveau* of France towards the close of the 19th century had its repercussions elsewhere but passed away rapidly because its tones were untrue to material; its wood-carving conveying the impression of metal or modelled clay. The carver works with the architect and furniture designer, and the tendencies of modern Europe influencing these in the direction of simplicity of structure and effect, his art has languished. In Scandinavia, where modern architecture is achieving triumphs, it is exceptional for carved wood to be employed as decoration.

In America the wood-carver has not produced anything national but there, as in Europe, are signs of activity and impending fruition. He is producing *objets d'art* and entering the domain of sculpture, hitherto almost monopolized by bronze and marble; and in harmony with the modern spirit in decoration which is rediscovering the nature of materials that may be fashioned artistically, he is using woods which have been carved rarely in the past, because of their grains and markings, and carving them with the partial object of bringing out these peculiar features. The general tendency is towards severe conventions, economy of method and occasional colouring, but is otherwise too individual to be categoried. The greatest encouragement is being given to this work in Germany and Czecho-Slovakia but there the animating motive is derived from a revolt against pre-war ideals and consequently, being largely a negative impulse, it would be devoid of promise but for the stimulating and modifying influences which in modern times circulate internationally.

WOODCHUCK (*Marmota monax*), a North American rodent, called also ground-hog or American marmot, found from Nova Scotia to British Columbia and Alaska and in the United States from North Dakota south to Oklahoma and eastward to the Atlantic. It is usually about 20 in. long, brownish or reddish grey in colour. with a heavy-set body, short tail. and strong claws adapted for digging. The woodchuck lives in burrows in the ground or in piles of rock, feeding upon grass and other vegetation. *(See* GROUND-HOG DAY; *MARMOT.)*

WOODCOCK. a bird in high favour with the sportsman and the epicure. It has a long bill, large eyes, and a mottled plumage of black, browns, greys, buff, and white, the latter confined to the tip of the lower side of the tail auills. There is much variation in the individual plumage, which is highly protective. The woodcock *(Scolopax rusticula)* breeds in suitable localities from Ireland to Japan, migrating southward in autumn, reaching India, Ceylon and northern Africa. It feeds largely on earthworms, which it gets by probing soft ground with its sensitive bill.

The nest is made on the ground, and the four eggs, laid during March, are yellowish in colour, blotched and spotted with reddish brown. During this season the male performs a remarkable flight (called in England "roding"). At dawn and at sunset he flies in a great triangle, often a mile in perimeter, travelling fast by means of slow, steady wing beats, and uttering a drumming sound at intervals. The young birds are carried between the thighs of their parents to suitable feeding grounds.

In North America there is a similar but smaller woodcock, *S. minor,* having its three outer primaries attenuated.

WOODCRAFT, the knowledge of forest conditions which enables one to enjoy and to supply oneself with the crude comforts of life in the wilderness. It includes a sufficient knowledge of mechanics to enable one to manufacture tools and weapons; to make stone axes; to dress and prepare skins; to build rafts and canoes of logs, bark or skins; to make baskets and cooking utensils; to procure food, drink, shelter and clothing, and to build and maintain fires for cooking and warmth from the materials supplied by the wilderness itself.

For untold centuries primitive man has understood the habits of animals and the causes which impel them to action; a knowledge absolutely necessary for primitive man's existence, a knowledge which is a fundamental of woodcraft. It was necessity as a task master, nature and the red men as instructors, which developed woodcraft in the United States to a fine art and produced such master woodsman as Boone, Kenton, Crockett and Carson.

In woodcraft one must be able to forecast the weather from the action of birds and mammals, as well as from the wind, and the appearance of the sky. Every language supplies weather proverbs, originally from wilderness folks.

On a gloomy, overcast day an old scout was asked to point north. He looked slowly up at the sky, up at the trees, around at the ground. Then, with his hand outstretched, his index finger pointed to the true direction. He was unable to tell how he made his decision because he did not know how to describe his own process of reasoning. It was not that spider webs are on the south side of trees; that fallen timber indicates the direction of ancient storms; that the limbs of the trees are heavier on the south side and thicker in diameter; that oak, ash, mesquite, hickory and

elm trees have moss or mould on the north side; that leaves are longer, darker green with lighter veins on the north side; that flying squirrels' holes favour the east side; that gum is soft and dusty on the south side of coniferous trees, or any one of these signs, but rather the accumulated evidence which impressed him.

On very hot days fishermen versed in woodcraft look for fish in the cool depths, in the shade of rocks or marine plants, knowing that fish, like cattle, seek shade in hot weather. One should understand birds, their calls and their actions. Birds understand certain weather signs and from their higher and more extended viewpoint are able to detect the approaching storm before a man on the ground can see the signs. The beach combers and sea-faring men know that atmospheric conditions affect the sea birds and that they invariably seek the shelter on shore from the onrushing storm. It was the great number of sea birds flocking in from Mobile bay, some years ago, that gave the first alarm of an approaching devastating storm.

The location of water holes and springs in desert and dry places; the knowledge which tells the traveller of the succulent plants with which he may quench his thirst and where to find such plants is an essential part of woodcraft. So also is the ability to find a trail and to know by the conformation of the land where trails must exist; to know that land inhabited by large game animals always has trails which can be traversed by man. The experienced woodcrafter knows that nothing can pass through the forest without leaving telltale marks on its trail; it may be only the misplaced leaf or the stone which has been lately turned over. Even the grass or weeds show where they have been pushed in front of travelling beasts. The trailer can point out the trail made by large animals early in the winter and since covered by succeeding falls of snow, because at a little distance, the slight depressions are marked by faint blue shadows.

The expert in woodcraft knows the language of the woods. He is familiar with the cry of alarm given by the different birds and different animals. He also knows from experience that that cry is understood by all the other denizens of the woods. When the squirrels are playing among the branches of the trees and the crow, detecting the approach of a trespasser, gives its cry of alarm, every squirrel will immediately disappear into its hiding place

The fallen tree by the brook side showing the marks of large chisel-like teeth told the woodcrafter that beaver had cut and felled the tree. The bark gnawed from another sapling by smaller chisel-like teeth told him that porcupines had been there. The torn bark of a black spruce, commencing at a point as high as a man can reach, exposing the fleshy part of the tree, from which sticky sap is exuding, proclaims a large bear has been there; it is the habit of these animals to rear up and scratch the trees with their claws. It also gives an accurate measure of the size of the bear. The bleeding tree indicates recent wounds.

A maple stripped and displaying marks of horse-like teeth shows the work of moose; whereas another tree which has been scarred, and from which the splinters of the wood are protruding from the lower edge of the scar, is evidence that the lynx, or wild cat, has, like the bear, "sharpened his claws." The freshly dismantled and broken rotten log is, to the expert, a note from Bruin saying, "Here I lately dined on ants' eggs."

To know how to build shelters; how to make and mend snow shoes, moccasins and wearing apparel from the material found in the woods; what to do in time of flood and storm; what to do when overtaken by a blizzard; how to avoid danger of avalanches and the knowledge that the danger from them is greater when the sun is high than in cool evenings and mornings, is essential.

It was the settlement of the United States which produced a renaissance of woodcraft or rather a new and more vigorous art. The tide rift of adventuresome pioneers preceding the advance of civilization were compelled to learn when and how to cut logs for their cabins; what wood was best for rails for their fences, how to substitute the semi-transparent skins of animals for glass in their windows. From the Indians, frontiersmen learned how to grind corn with stone, to parch corn for trail rations, to make cakes, to make maple syrup and sugar, to jerk meat or to make pemmican for emergencies.

It was the free trappers and the employees of the fur companies who learned how to trail like blood hounds and hide their own trails with skill surpassing that of the fox, by walking on stony places and wading the beds of streams. They developed their five senses to a superlative degree. (D. C. B.)

WOODCUTS AND WOOD-ENGRAVING. To-day the woodcut is used as a direct expression of artists who themselves cut and print the block. During the greater part of its history the medium has been used quite differently. It has been a reproductive process; a craft rather than an art. Craftsmen have cut out of the block drawings made for the purpose by artists and then passed the block to other craftsmen for printing. This is comparable to our photo-engraving reproductive process — the difference being that the older method was done by hand whereas the present one is mechanical. In both cases the method was merely a means to an end and quite detached from the original conceptions of the artists involved. In making drawings for reproduction, either by woodcut or photo-engraving, artists are thinking in terms of ink or pencil lines on paper — not of lines which their hands are carving out of wood. A work so detached from its medium does not exploit the peculiar quality of that medium. It lacks unity and completeness. It loses force. For some ten centuries of its known history the woodcut, as a process, has been so handicapped. Only during the last thirty or forty years has it arrived at what might be called its full functioning maturity.

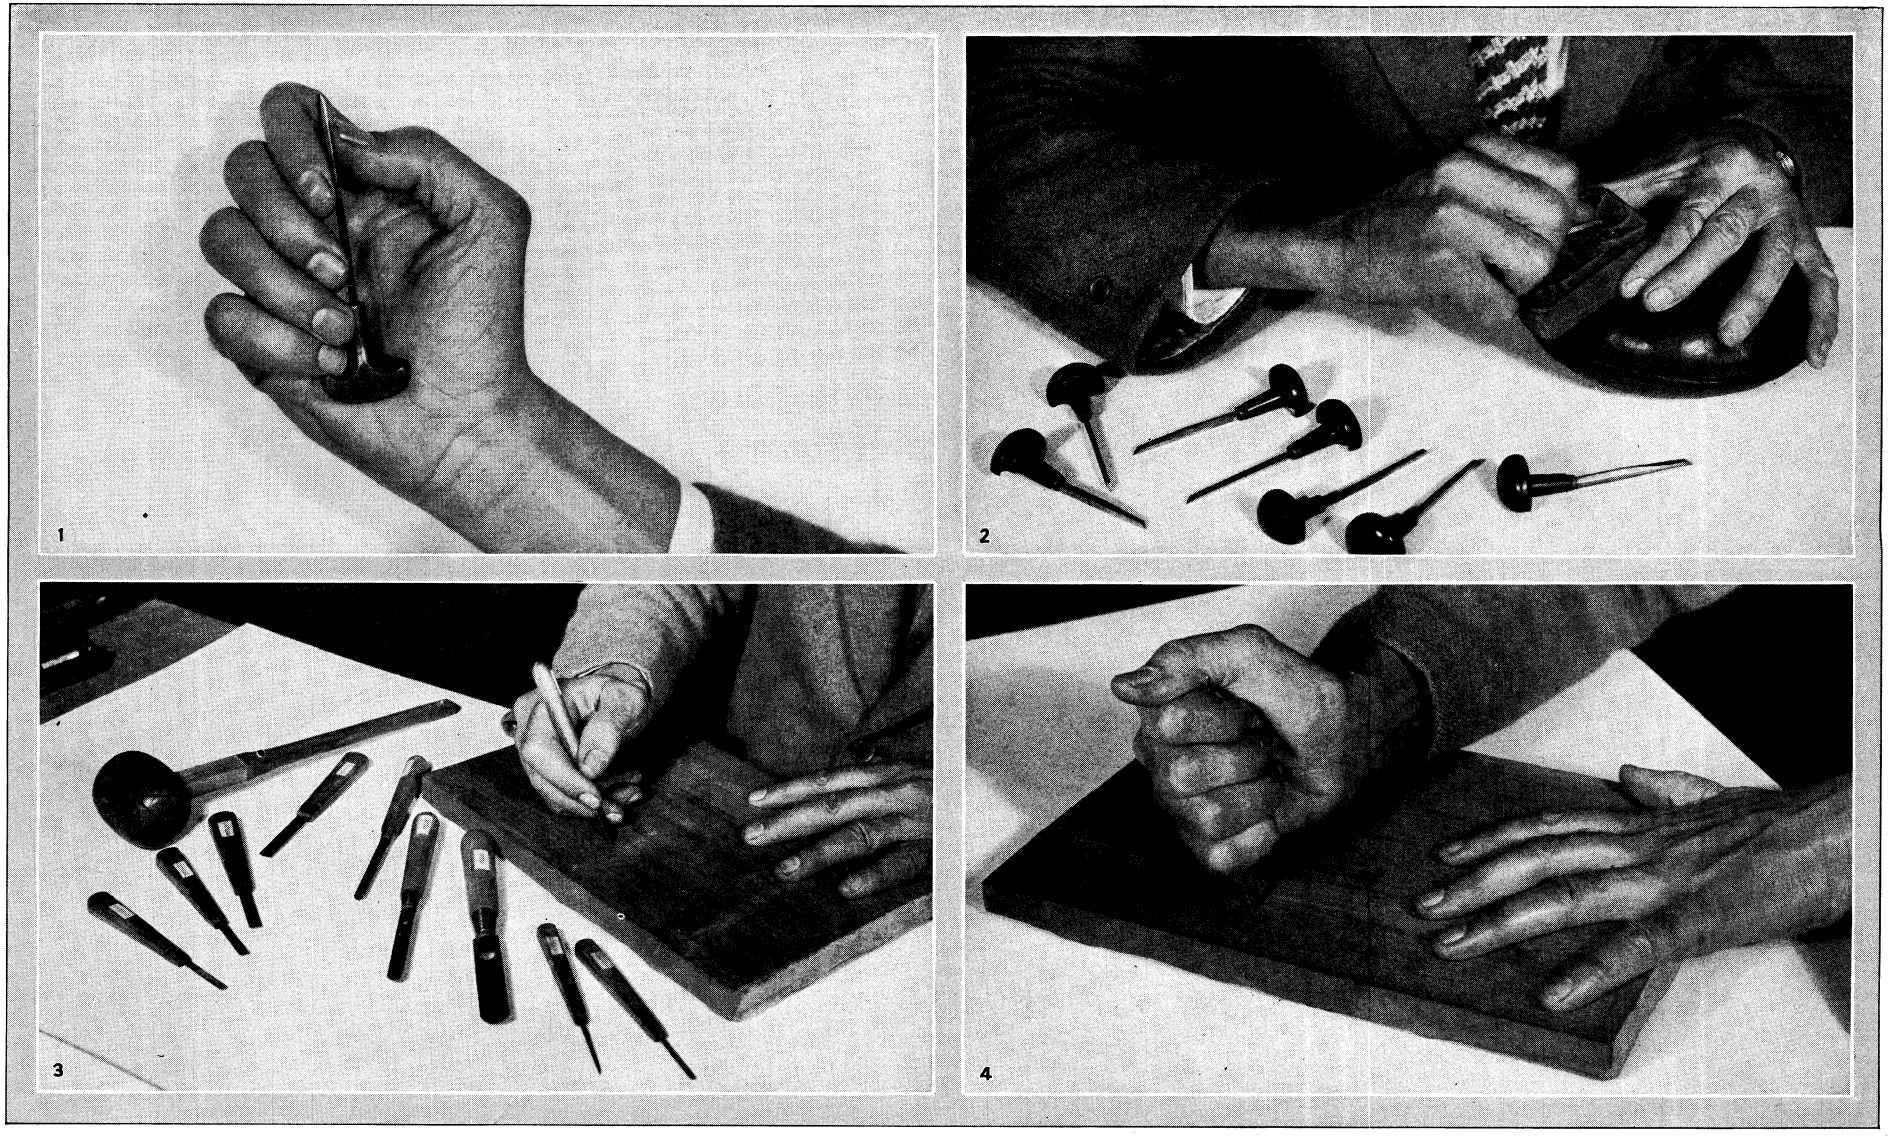
TECHNICAL PROCESSES

Technically speaking the woodcut is pictorial type. It prints pictures as type prints letters of the alphabet, by raised lines or areas that catch ink from a roller and deposit it on paper under moderate and more or less even pressure. This analogy roots in history as well as fact. The first printed letters were woodcut type carved into pictorial woodcut blocks in explanation of the picture. The first movable type was a cutting up of this block type in order to save labour by rearrangement and re-using. The woodcut raised line is the opposite of the intaglio, or sunken line, which is etched or engraved on copper. (See INTAGLIO.) In the print etched or engraved lines catch the light and cast minute shadows, thus giving a life or sparkle to the work that is impossible with any other mediums. The woodcut gives a flat surface print, with an interplay of solid black and white, and a slightly varying texture and intensity that is quite unique.

The raised line of the woodcut is simply a part of the original untouched surface of a block or plank of wood; if no cutting away were done the print from this block would be solid black. Each stroke of the tool removes a section of the ink-holding surface, thus preventing its printing and letting the white of the unprinted paper into the black of the printed. Like the world at dawn, the woodcut-picture actually emerges from blackness into light.

There are two kinds of woodcuts, the black line and the white line. The black line, or woodcut proper, is one for which a drawing is made on the block and all spaces between lines gouged out or cut away. In other words a black line drawing is reproduced in approximate (but never complete) facsimile. The black lines are conscious lines. The white lines or spaces are left-overs which receive either secondary or no consideration per se. In the white line cut, or engraving, the reverse holds; the white line that is gouged out will receive first attention, the black lines and spaces between, second. In the first case the artist conceives his drawing as starting with white paper and growing towards black; in the second as emerging from black into light, as in actual fact it does. Both systems have their advantages but the second, or white line, being the natural method, because it makes a positive instead of a negative use of each gouge or cut, would seem to be the most logical.

Cutting the Block. — The black line cut is ordinarily made on a plank or block of soft wood like beech, apple, pear, cherry, sycamore or whitewood cut parallel to the grain as in ordinary lumber. Preferably it is of type height (about $\frac{7}{8}$ in. as shown in fig. 2), planed and sanded to a perfectly smooth and level surface, and cut with a sharp knife. An ordinary pen knife will serve as a makeshift, but the carver (fig. 1) set in a cord-wrapped handle



THE PROCESS OF WOOD-ENGRAVING

1. Correct position of the **burin** for engraving on wood. The knuckles of the hand should rest on the block. Tool should be pushed forward or backward by a contractirg of the palm
2. Engraving into the hard end grain of a box-wood block with the **burin.** Various shaped **burins** and tools are on the table. Note leather cushion for holding block steady
3. Holding knife for cutting on the flat side of a plank block. On the table are various shaped gouges and flat chisels used for removing large or small areas of wood
4. Cutting a block of wood with the knife held in the sloping position. This gives a widened base to each black line left raised above the cut away portion

WOODCUTS AND WOOD-ENGRAVING

EARLY WOODCUTS

1. "The Buxheim St. Christopher," from a facsimile reproduced by the American Institute of Graphic Arts; earliest dated woodcut in Europe, made 1423. 2. Early Florentine woodcut. 3. Woodcut from Hans Holbein's "Dance of Death" series. 4. "Crucifixion" by Albrecht Durer. 5. Frontispiece to Breydenbach's "Pilgrimage to Jerusalem," 1486. First known woodcut in which cross-hatching was used. 6. Print made about 1560. typical of the decorative Italian style. 7. A woodcut of an owl from an illustration in Thomas Bewick's "History of British Birds," published in 1825. 8. White line woodcut by William Blake, one of the first woodcuts to have the qualities of the modern art

is better. The knife makes a sloping cut which tapers upward along each side of each line, thus supporting the line on a widened base (as shown in fig. 2).

When two lines are close together and parallel the sloping cuts on adjacent sides of each would remove a V-section between them. This V-cut can be made with one stroke instead of two by using the "V" or parting tool shown in fig. 1. Larger areas are

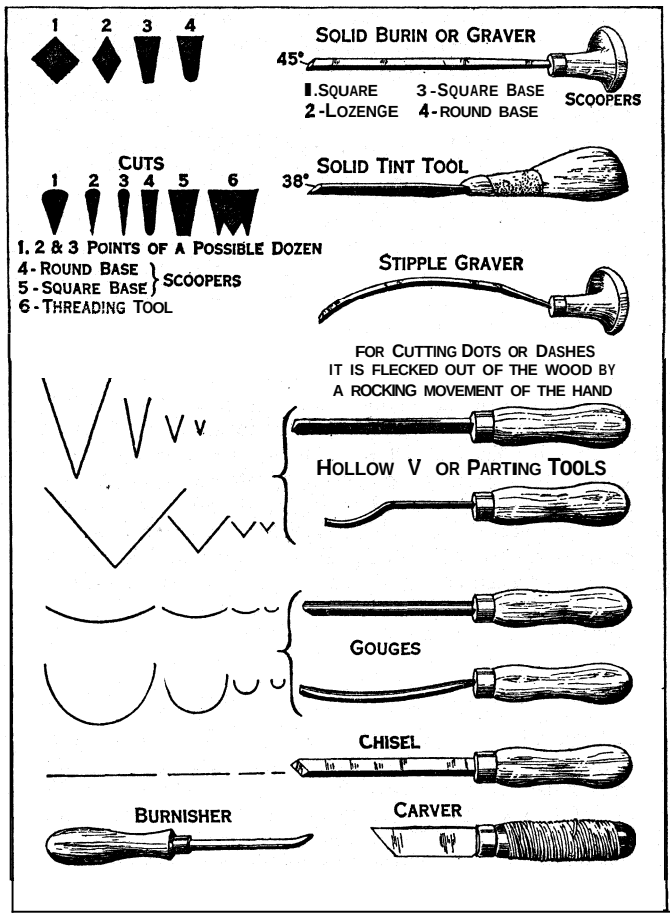


FIG. 1. — TYPES OF TOOLS USED IN WOOD ENGRAVING. AND SHAPES OF CUTS

removed with gouges of varying widths and depths (fig. 1). The method requires, as is readily seen, two or more cuts to release a single black line—two if the lines are in a parallel and close-together series, four if a line is segregated. and anywhere up to eight if the lines are cross-hatched. (See A, B, and C, respectively, fig. 2.) Laborious, round-about, forced—such is the reproductive black-line method.

The white line is engraved, rather than cut, into the end-grain of very fine hard wood, usually box-wood. The box-wood blocks are about $\frac{7}{8}$ in. high and across the grain. Into this hard fine grain lines are gouged out with hollow V- or U-shaped parting tools or gouges, or with solid metal burins or scoopers. All these tools are shown in their varying widths, depths and shapes in fig. 1. The burins, tint-tools and scoopers are held in the palm of the hand and pushed forward; the threading tool cuts several lines at once. The knife in cutting is pulled toward the body and may be held somewhat as a pencil is, or grasped as one would grasp a dagger. Chisels may be pushed by the hand or hit with a wooden mallet. In the process of cutting, the block is held on a leather bag filled with sand.

The left hand holds and turns the block easily against the pressure of the cutting tool in the right.

Fundamentally, the methods of the white and the black line woodcuts are the same in the actual technical process and the ultimate end achieved. In the black line cut the cutter is conscious only of the black lines he is reproducing; in the white line engraving he is exploiting the white lines, at the same time being fully conscious of the blacks by which he must obtain the whites. Xylography is a general title that covers both methods.

In etching and pencil drawing (*qq.v.*) the point glides easily over a smooth surface, flexibility and freedom being the consequent result. In copper-plate and wood-engraving there is resistance to a cutting tool which must be forced through resisting material. This tends to give a certain directness and rigidity to all lines, straight and curved. A slow uniformly changing curve would be more natural than a jerky, hectic, quickly curving one. The medium, therefore, lends itself to an abstract quality peculiarly adapted to contemporary creative expression. This adaptability, no doubt, explains the preponderance of woodcuts among the so-called "modern" works in prints.

Artists of Western civilization, it is interesting to note, have never made use of the potentially different characteristics inherent in lines of different types as have the artists of Japan and China. In Japanese art, for instance, there are the eighteen types of lines varying from stiff wiry ones expressing the starched garments of court nobles to the jagged ones expressing the rags of beggars Among Western woodcutters, John J. A. Murphy has probably canvassed such possibilities more thoroughly than any other artist.

Drawing on Block. — There are a number of ways of drawing on the block. For a black line cut the drawing to be reproduced can be made with India ink, or Chinese black, with corrections in Chinese white. For a white line-cut the simplest and most flexible method, in that it allows erasing as easily as on paper, is with a lead pencil. The pencil drawing can be fully developed and then translated into white lines as the cutting proceeds. When mechanical exactness is required the subject can be photographed directly on a block prepared by the proper sensitizing of its surface. Photographs or wash drawings on the block have been commonly used during the latter part of the reproductive period—*i.e.*, up to the end of the last century. Timothy Cole, for instance, so photographed his subjects onto his block and then proceeded to interpret the photograph into white lines.

Printing. — Woodcut printing is of two kinds, black and colour, and may be done either by hand or on a regular type-printing press. For black printing the finest obtainable quality of proving ink ground in oil is used. The ink is spread on a glass or marble slab with a special composition hand-roller (of the same type as used in printing presses). After a thorough working onto the

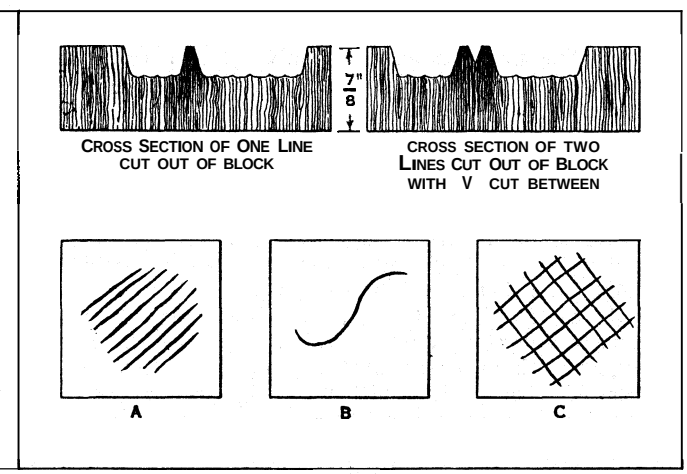

FIG. 2

roller in a uniform and exceedingly thin layer the ink is transferred to the surface of the block by several movements of the roller across the block in different directions. The paper may be India in several textures or soft hand-made Japanese such as the Gifu. Or it can be the less enduring machine-made domestic in many varieties. The India is adapted to the white line engraving, the harder textures to the finer lined blocks; the Japanese and domestic to the coarser lined blocks.

In the case of a hand print, the right sized sheet is laid over the inked block and pressed down with a sheet of cardboard. A second

cardboard coated with beeswax to make it slide easily, a steel burnisher, as in fig. 1, or a Japanese baren, is then rubbed over the first with considerable pressure which will vary in different sections of the block as the nature of the work demands. Less pressure means greyer and less even blacks, more means blacker blacks. This flexible control of pressure by the printer allows a quality of varied tone and texture in the hand-made print that can never be rivalled by any other method. In distinguished printing of this character a single print will take from 15 minutes to 3 hours of printing time. Corners of the print may be lifted to test results during this hand process.

In the case of a machine print the block is mounted in a printing press like any type form and the print made with uniform pressure. This pressure, however, can be varied artificially by the same overlay and underlay system used in type printing. When darker blacks are required thin sheets of paper are cut to proper size and pasted to the proper spot under the block itself or on the tympan against which the paper lies, in a registered position. The thicker these are the heavier the pressure in that spot, the darker the resulting black and the greyer the surrounding blacks.

Colour Printing. — Colour printing may be done from one block or a series of blocks. When printed from one block the colours are painted with a brush into the desired section of the uncut surface as in the case of a monotype. Each print thus becomes an original painting which is transferred by pressure to paper. If the colour is to be in spots no lines are necessary except guide lines. It facilitates the process of painting the block if these guide lines are white lines gouged out of the block around separate patches of colour. In the print the white unprinted line becomes part of the decorative pattern, giving a hint of mosaic effect. This process could never be used for a realistic picture. A regular line block could of course be printed in colour instead of black, thus getting a different effect. When many blocks are used for one print we have the Japanese colour printing process undoubtedly the highest developed art of colour printing the world has so far produced. (See JAPANESE PAINTING AND PRINTS.)

In this process there is a key line block to be printed in black or any desired colour. Each succeeding block, then. prints one, or sometimes two or three well-separated (so they do not overlap in painting on the black) colours onto the same key-block print. The number of blocks so printed may run all the way from two or three to a' dozen or fifteen, gaining in range and subtlety as the number increases. The blocks are larger than the actual print thus including an unprinted margin in which two sunken notches are cut into the block to take one corner and one edge of the paper and thus provide accurate registration. All the blocks, of course, are printed in succession on the same piece of paper.

Colour printing ink is made of any kind of finely ground dry ink colour mixed with water instead of oil. It is applied with brushes of varying widths, a separate one for each colour, which paint over the entire block high and low sections alike. The brush charged with colour is dipped into a paste made of finely ground rice flour either before it is applied to the block or immediately after, the paste and the water-paint being thoroughly mixed by a sufficient brushing on the block. This paste changes the character of the colour from a mat finish to a more brilliant one. Also it gives adhesive quality which under the pressure of printing incorporates it thoroughly with the paper. Carefully dampened paper is laid on the block and rubbed directly on the paper with a Japanese bamboo-covered, stiff, slightly convex pad called a baren. The amount of pressure that is used determines the intensity of the colour of the print. (See JAPANESE PAINTING AND PRINTS.)

Chiaroscuro (clear-obscure). — In Europe during the 16th century another type of colour printing developed called chiaroscuro. The method comprised two prints from two blocks on one paper. One was a usual black line print, which as a line picture was complete in itself. The other was a tone block to be printed as one solid ground-colour in sepia, soft warm grey or other colours from which certain spots were gouged out to leave significant white highlights in the print. The final result resembled the wash-drawings of the masters and undoubtedly came into use as a means of approximating their effect.

The method is said to have been invented by Jobst de Negker at Augsburg. In Germany Hans Baldung Grien (1475–1552), Lucas Cranach (1472–1553) and Burgkmair (1473–1531) were among the first to practice it. In Italy Ugo da Carpi who worked in Venice and whose first print was dated 1518 was its foremost exponent. After dying out it was revived in Germany at the end of the 18th century and has persisted to the present. In the United States Rudolph Ruzicka, A. Allen Lewis and others are practising the method today.

Uses.--"The possibilities of the wood block," says Frank Weitenkampf in his How *to* Appreciate *Prints*, "have been exploited to a remarkable degree. It has rendered line and tone, given the precision of the pen and ink sketch or the etching, and the free, granular irregularity of the charcoal smudge, translated paintings with the set regularity of the line engraving on copper or, abandoning the line per se, with an attention to tone and colour and texture, which often gave even the illusion of brush marks. It has been used for the rudest handbills and for the most elaborate reproductions of famous works of art; it has served as an original art, as a direct means of expression, and, crossing the bounds of black and white, it has imitated wash-drawings in two or three tints, and has entered the domain of colour printing in elaborate reproductions, as well as in the highly sensitive form of art exemplified in the Japanese chromo-xylograph. It has been employed to illustrate in the rudest form the songs and ballads hawked about the streets, and in perfection of craftsmanship works such as the Doré Bible; it has been put to the practical use of reproducing wallpaper, and it has brought forth works treasured by the collector, though so different in style as the engravings of Diirer or Holbein, and those which are the work of some of the modern disciples of art in the United States."

HISTORY OF THE WOODCUT

The principle of cutting relief characters in metal, wood or stone has been practised far back toward the dawn of history. Cut metal plates were used in Egypt, India, Greece and Rome. Carved stamps or dyes were used for pressing letters into the moist clay of bricks in Egypt and for branding slaves in Rome. Both intaglio and relief carvings were known and used for these various purposes. Woodcuts were used in the Middle Ages to stamp monograms and to print colour designs on textiles, a custom practised in the Orient from time immemorial.

The earliest prints on paper so far found come from China of the T'ang dynasty (A.D. 618–905) when woodcuts in one colour were produced in great quantities as cheap substitutes for religious paintings. The oldest of such cuts now known is dated A.D. 868 and was found by Sir Aurel Stein in 1907 in the caves of a thousand Buddhas at Tun-huang in Chinese Turkistan. Throughout their history in China no artist of any note designed expressly for the woodcut. Even when the complex colour printing from many blocks came into use, beginning, so far as is known, about the time that colour printing began in the Chiaroscuro prints of Europe, *i.e.*, in the 17th century, this medium was used by craftsmen for the reproduction of paintings. The earliest known Chinese colour print is from a book called "Shih chu chai Shu hua p'u" and is dated 1625.

The method spread to Japan in the 8th century and for a long time was confined to reproducing popular religious figures. In Japan, however, there arose a whole school of artists who, though like the Chinese, still valuing painting as the supreme medium, did design expressly for the woodcut, thus conceiving their designs in terms of the carved line and colour block. The best of these were masters of the first rank.

For the greater part of their entire history, then, particularly as a reproductive process, woodcuts have been a widely used pictorial medium. Cheap in price, printed in quantity, close to the hearts and minds of common people in their choice of subject and story, they were used not as the collectors' items they have become today, but in every home as part of the furniture of actual life.

CONTEMPORARY WOODCUTS

1. "Drummer," by Fred Becker (1913–), American
2. From the book of wood-engravings, ***Prelude*** to *a Million* ***Years,*** by Lynd Ward (1905–), American
3. "New England Church," by Howard Cook (1901–), American
4. "Military Escort," by Fritz Eichenberg (1901–), German artist living in America
5. "Allegro," by Paul Landacre (1893–), American
6. "Grablegung Christi," by Hans Alexander Mueller (1888–), German artist living in America
7. "Emigrants," illustration by Allen Lewis (1873–), American, from *Calico* ***Bush,*** by Rachel Field
8. "Stiil Life with Flowers," by Emil Ganso (1895–), American

They were looked at, studied, talked about, absorbed. They took the part of picture books when books were still the hand-lettered creations of monks, chained to the "library" tahles of churches and kings. They were books in embryo, in fact.

In the religious cuts (and in the beginning practically all were religious) the people could see the characters of the Christian drama intimately in a form different from but related to the great paintings in the churches. Brief printed captions began to appear beneath the pictures telling the story of their heroes. These cut into the block were the first type. Later, about 1436, when Gutenberg invented printing, cut into separate letters, they became the first movable type. When the printing of books began the woodcut inevitably became the means of illustration. Being pictorial type it went with letter-press type. In fact the harmony between text and illustration of the 15th and 16th centuries has never since been equalled in general practice. So right was the combination that even when, in the 18th century, taste ran to the greater elegance of copper plate engraving and the almost total abandonment of the woodcut, the latter still kept alive in incredibly rude form in chap books and other popuiar literature. It carried over in fact to the revivai in the 19th century when again it became the main medium of illustration in press and books. Memory in this country can easily go back to its general use in magazines and elsewhere. The form was decadent as it gradually died out before the advance of the cheaper photo-engraving process, but it was still the medium of the people as it had always been. Taking its history as a whole through its great period in the 16th century, decline in the 17th, decay in the 18th and revival in the weakened form of the white line toned picture in the 19th, the woodcut is undoubtedly a close second to the book in the role of entertainer, instructor and guide to the human race in the last 500 years of its struggle toward its present civilization.

In Europe the earliest known woodcuts were playing-cards dating back to the beginning of the 15th century. Pictorial prints go back as far as 1410. The earliest dated pictorial print is generally (but not always) admitted to be the St. Christopher of 1423. It is simple, crude, and naïve. It was done with single lines, almost an outline drawing, for its full effect it, and practically all prints of its time, depended upon hand-colouring after the print was made.

From 1423 to 1490 the black line woodcut developed from a crude beginning through the block-books that immediately preceded type printing to a mastering of the medium that has not been surpassed in that department to this day. The block books originated in Germany and the Netherlands—the oldest ones being *Biblia* Pauperurn (c. 1450) of German origin, and the Apocalypse, the *Canticum* Canticorem and *Biblia Pauperum* (*c.* 1470) of the Netherlands. Durer's drawings on the block made from 1492 to 1526 and cut laboriously by craftsmen woodcarvers, were complex, sophisticated, varied in quality of line and texture, yet they attained this complexity with lines that were most natural to the medium, that avoided, except in the darkest shadows, the forced (in this medium) cross hatching of pen and ink drawings. Here, then, at the time that America was being discovered was a mature art in mediaeval Germany, which set the pace for other nations. The subjects were mostly religious.

Durer (*q.v.*) was the first great master to use the woodcut extensively as a way of reproducing drawings made for it. Without attaining the unity of means and expression typical of today he refined and widened the process. He had many followers, among them the little masters Altdorfer, the Behams, Pencz and others who forgot the usual religious subjects to record, with a touch of un-German decorative quality learned from Italy, the labours, merriment or debauchery of the everyday life of their time. Influence flowed back and forth between Italy and Germany, Durer influencing leading Italians like Marcantonio Raimondi (1480–1530), and vice versa. By 1490 in the north countries individual blocks were giving way to blocks cut for such newspapers of the day as the Nuremberg Chronicle of 1493 and for book illustrations. In Italy the art centred in book illustrations from the beginning. Lippmann, in his Art of Wood Engraving *in* Italy in the Fifteenth *Century,* notes this difference between the North and the South by saying, "In Germany the proper function of book illustration was instruction; in Italy, ornament." In thus stating the case he must have meant obvious ornament for there is a decorative design quality in the German work that goes far beyond "instruction."

Holbein (*q.v.*) was the next great artist to design particularly for the woodcut. Working through the woodcutter, Hans Lützelburger, the greatest master of the knife the craft has produced, he achieved what is probably as complete a synthesis between the means and the expression as is possible with the black line method. His *Dance* of Death series of blocks is one of the outstanding attainments of the medium.

In France the woodcut started in Paris with the cutting of blocks for the popular and frequently published Books of the Hours. Its chief masters in the 16th century were Jean Cousin and Bernard Salomon who worked around 1550. In the 17th and 18th it gradually declined. In 1766 Jean Michel Papillon wrote his famous Treatise on Engraving and showed in his work the minuteness of technique that was typical of the decline.

Thomas Bewick (1753–1828) did not invent the white iine pictorial wood-engraving, there being evidence in his work that he was influenced by Croxall's cuts in his *Aesop* of 1722. He was, however, the first to give it popularity. The woodcut during the 18th and 19th century decline rivalled the camera as a recording instrument.

By adapting itself to the mirroring of a dozen mediums it had been forced into a sphere not its own. Bewick furnished the mechanism for this decline as well as that for the revival from it. His finest productions are the illustrations to British Quad*rupeds* (1790) and *British* Birds (1797).

William Blake (1757–1827) made only a few small woodcuts. He used the white line method. Technically they were not particularly skillful.

But pre-eminently they are *wood*-engravings. They emerge from blackness into light. They are plastic. They exploit the inherent quality of the medium. In doing these things they are the forerunners in character as well as technique of the significant work of today. (See BLAKE, WILLIAM.)

At the end of the century we find Felix Vallotton in Paris playing with solid areas of blacks and whites—one of the first to pick up the thread begun in Florence 500 years ago, the thread that in the 20th century is to develop into the dominant means of the modern expression.

MODERN TENDENCIES

The writer's contention that the present is the most fertile period in the history of the woodcut, in actual, contemporary achievement and in future possibilities is supported by two main reasons. The revolution in the mental approach to the making of pictures, which is the contribution of the first quarter of our 20th century to art history, and which involves a change from thinking of pictures as imitations or reports of nature to a conception of them as creatively reorganized interpretations, has brought the woodcut (which has been more sensitive to the new vitality than any other print medium) back into the fold of the grand tradition. Next in importance to this exceedingly significant event, the woodcut has found itself technically. That is, it has ceased forced service as proxy for another medium, the line drawing, and blossomed into a self-expression based on its inherent qualities. Its usefulness, however, has passed from the multitude who now find their pictorial entertainment in the photo and the pen and ink "funnies," to the few who care to seek out and pay the higher costs of what has become an aristocratic art—aristocratic, yet the lowest priced of all original pictorial works of art. (Prints made and signed by the artist are counted originals.)

This *grand* tradition includes work that is universal rather than particular in conception, creative rather than reportorial; it is older than the woodcut medium by many centuries. Work of today is rooted in fertile soil only when it belongs in both of these classifications. From the one it gains timelessness; from

the other timeliness. (For articles relating to the woodcut, see ENGRAVING; LINE ENGRAVING; PHOTO-ENGRAVING; PRINTING; ETCHING; LITHOGRAPHY.) (R. PN.)

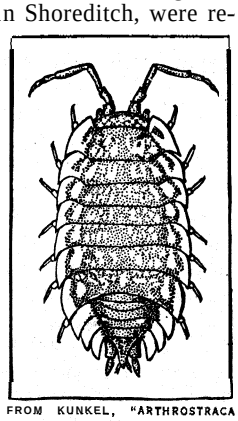
WOODFALL, HENRY SAMPSON (1739–1805), English printer and journalist, born in London on June 21, 1739. His father, Henry Woodfall, was the printer of the Public Advertiser, and the author of the ballad Darby and Joan, for which his son's employer, John Darby, and his wife, were the originals. From 1758–93 H. S. Woodfall controlled the Public Advertiser in which appeared the famous letters of "Junius." He died on Dec. 12, 1805. His younger brother, William Woodfall (1746–1803), also a journalist, established in 1789 a daily paper called the Diary, in which, for the first time, reports of the parliamentary debates were published on the morning after they had taken place.

WOODFORD: see WANSTEAD AND WOODFORD, England.

WOOD GREEN, a municipal borough in the Wood Green parliamentary division of Middlesex, England, 7 mi. N. of St. Paul's cathedral, London, on the L.N.E.R. and L.P.T.B. Pop. (1938) 53,190. Area, 2.5 sq.mi. The name covers a residential district lying N. of Hornsey and W. of Tottenham. Wood Green was incorporated in 1933. It contains the greater part of Alexandra park (173 ac.), with Alexandra palace, where the British Broadcasting corporation's television station was opened in 1936, the first transmission taking place on Aug. 26. However, the B.B.C. had been making television broadcasts since Aug. 22, 1932. Fuller's Almshouses, founded 1592 in Shoreditch, were removed there in 1933. The institutions for aged fishmongers and poulterers and printers are 19th century foundations.



FROM KUNKEL, "ARTHROSTRACA OF CONNECTICUT"

WOOD-LOUSE OR PILL BUG (ONISCUS ASELLUS)

WOOD-LOUSE, a name commonly applied to certain terrestrial Isopoda (Crustacea) (*q.v.*), found in damp places, under stones or dead leaves, or among decaying wood. They form the tribe *Oniscoidea* and are distinguished from all other Isopoda by living on land and breathing air, and by the small size of the antennules and the absence of the mandibular palp. The head bears a pair of sessile compound eyes as well as the minute antennules and the longer antennae. Each of the seven thoracic segments carries a pair of walking legs. The appendages of the abdomen (except the last pair) are flat membranous plates and serve as organs of respiration. In many cases their outer branches have small cavities opening to the outside by slit-like apertures, and giving rise internally to a system of ramifying tubules filled with air somewhat similar to the air tubes or tracheae of insects and other air-breathing Arthropods.

The female wood-louse carries her eggs, after they are extruded from the body, in a pouch or "*marsupium*" which covers the under surface of the thorax and is formed by overlapping plates attached to the bases of the first five pairs of legs. The young on leaving this pouch are like miniature aaults except that they are without the last pair of legs. Some twenty-four species of wood-lice occur in the British Islands. Some, like the common slaty-blue Porcellio scaber, are practically cosmopolitan. (W. T. C.)

WOODPECKER, the name applied to certain birds, forming together with the wrynecks (*q.v.*) the family Picidae, whose nearest allies are the toucans (*q.v.*). They generally have a bright particoloured plumage; the feet have two toes behind and two in front and the tail-quills are usually stiffened to form a prop on which the bird partially supports itself when climbing the trunks of trees.

The commonest species in Britain is the green woodpecker or yaffle (from its laughing cry), *Picus viridis*. It is about the size of a jay; the plumage is green, with a red crown and yellow rump. It obtains its food, consisting mainly of grubs, from the bark and rotten wood of trees; in search of these, it mounts trees in a spiral direction and bores holes in the decaying portions with its chisel-like beak. It also feeds much on the ground, being especially fond of ants. The nest consists of a hole drilled in the trunk of a tree, continued as a horizontal passage that reaches the core, whence it runs downwards for nearly a foot to expand into a chamber in which about six white eggs are laid on a bedding of chips. The two other British species, the greater and lesser spotted woodpeckers (Dryobates major and D. minor) are similar in habits, but have a plumage of black and white. They share with the red-headed woodpecker (*Melanerpes erythrocephalus*) of America, and other species, the habit of drumming with the beak on dead branches, etc., in lieu of a love-song. Inhabiting the pine forests of the Old World is the great black woodpecker (P. *martius*), larger than any of the previous species and with a black plumage and red crest. It is replaced in North America by the pileated woodpecker or log-cock, Ceophloeus *pileatus*, which is variegated with white.

BY COURTESY OF THE NATIONAL ASSOCIATION OF AUDUBON SOCIETIES

ABOVE: MALE AND FEMALE DOWNY WOODPECKERS (DRYOBATES PUBESCENS): BELOW: HAIRY WOODPECKER (DRYOBATES VILLOSUS), BOTH NORTH AMERICAN SPECIES

The Californian woodpecker, *Melanerpes formicivorus*, displays an amount of providence beyond almost any other bird in the number of acorns it fixes tightly in holes which it makes in the bark of trees, and thus a large pine forty or fifty feet high will present the appearance of being closely studded with brass nails, the heads only being visible. This is not done to furnish food in winter, for the species migrates, and only returns in spring to the forests where its supplies are laid up. The acorns thus stored are always those which contain a maggot, and, being fitted into the sockets prepared for them cup-end foremost, the enclosed insects are unable to escape, as they otherwise would, and are thus ready for consumption by the birds on their return from their winter migration to the south.

All woodpeckers are fond of ants, but one form, Colaptes *auratus*, the golden-winged woodpecker or flicker of North America, lives largely on grasshoppers and other ground insects and in this connection exhibits several interesting modifications, the bill being less sharp. The red is, in this species, reduced to a crescent on the neck. The red-shafted flicker (C. cajer) is a closely related species; the two interbreed where their ranges overlap, producing a variety of segregating types. Other common North American forms are the hairy woodpecker (Dryobates villosus) and the smaller downy woodpecker (D. *pubescens*), both black and white forms. The North American sapsuckers (*q.v.*) are also woodpeckers. Nearly one-half of the known species of woodpeckers occur in the New World. The remainder inhabit all parts of the Old World except Madagascar and the Australian region east of Celebes and Flores.

Some other woodpeckers deserve especial notice—the Colaptes or *Soroplex campestris*, which inhabits the treeless plains of Paraguay and La Plata; also the South-African woodpecker *Geocolaptes* olivaceus, which lives almost entirely on the ground or rocks, and picks a hole for its nest in the bank of a stream.

WOOD PULP: *see* PAPER MATERIALS.

WOODRUFF (Asperula *odorata*), a small herb of the madder family (Rubiaceae), found widely throughout Europe and northern Asia, native to Great Britain, and sparingly naturalized in the eastern United States. It has an erect stem, about 8 in. high, bearing lance-shaped leaves mostly in whorls of 8, and small white flowers in loose clusters. The dried leaves emit a hay-like fragrance.

WOODSTOCK, a city and port of entry of Oxford county, Ontario, Canada, 80 mi. S.W. of Toronto by rail, on Cedar creek, the Thames river and the Canadian National and Canadian Pacific railways. Pop. (1941) 12,461. It is one of the best agriculture sections of the province and has a large export trade in cheese, butter and farm produce. Organs, pianos and agricultural implements are manufactured.

WOODSTOCK, a municipal borough in Oxfordshire, England, 8 mi. N.W. of Oxford and the terminus of a branch of the G.W. railway. Pop. (1938) 1,598. Area 157 ac. The River Glyme divides the town into New and Old Woodstock. The church of St. Mary Magdalene, in New Woodstock, is Norman but has additions in later styles, and a west tower built in 1785.

After the battle of Blenheim the manor of Woodstock was bestowed in perpetuity on John, duke of Marlborough. In 1723 it was destroyed and the site levelled after the erection of Blenheim house, a mansion erected by parliament for the duke of Marlborough in consideration of his military services, and especially his decisive victory at Blenheim. The sum of £500,000 was voted for the purchase of the manor and the erection of the building, erected by Sir John Vanbrugh (*q.v.*), in a heavy Italo-Corinthian style. The magnificent park contains Fair Rosamond's well, near which stood her bower. On the hill stands a column commemorating the duke.

Domesday describes Woodstock as a royal forest; it was a royal seat from early times and Aethelred is said to have held a council there, and Henry I to have kept a menagerie in the park. Woodstock was the scene of Henry II's courtship of Rosamond Clifford ("Fair Rosamond"). It was a favourite royal residence until the Civil War, when the manor house was destroyed.

See Rev. E. Marshall, *Early History* of Woodstock Manor (Oxford, 1873); Adolphus Ballard, Chronicles of Royal Borough of *Woodstock;* Victoria County History, *Oxfordshire.*

WOOD-WORKING MACHINERY includes the various classes of tools for performing the operations on timber, from the rough log to the finished product. This group of machine-tools differs from those for metal-working in two important particulars. The speeds of cutting the material are relatively much greater, and the methods of holding or feeding it are usually quite different. These facts affect the design of the machines in numerous ways, while the saws, cutters, and knives possess much keener angles than those used on metal. Heavy pieces, such as logs, are held on a carriage or table which provides the means of movement in relation to a saw; in other cases ribbed rollers press against partly finished pieces and feed them along. There is also a good deal of direct hand feeding, with the assistance of fences or guides which keep the wood in a correct path, although much mechanically operated equipment is now in use.

Sawing Machines. — Taking the machines according to their class of operation, the saws comprise a wide range, from those dealing with big logs to the finest cutting necessary for cabinet work, and running blades of either circular, reciprocating, or band type. The first operation after tree-felling is to cross-cut the logs into suitable lengths for transport; for this purpose a stiff reciprocating blade, which cuts on the inward stroke, is driven by a steam or compressed air cylinder, the sole of the machine resting upon the ground. Or a crank-disc is driven by electric motor to reciprocate the blade, if current should be available. Tree-felling may be done by the same sort of machine differently mounted. Swing machines using a circular saw are likewise used for the cross-cutting of the smaller logs.

Several types of machines are employed for breaking down logs. A rapid-cutting machine which is much used, although it is rather wasteful of material, runs a big circular saw; past this the log is fed by a carriage on rollers, the log being held securely by a set of spiked dogs. A similar style of feed also occurs with the vertical band saws, with a blade thinner than that of the circular saw. The horizontal band-saw is a very fast-cutting and accurate machine, feeding the log by means of a carriage between two uprights up and down which the saw frame may be adjusted to cut successively the several boards or flitches from the log. The width of the saw blade reaches to a foot in the big machines, taking logs to 7 ft. diameter. Another manner of breaking down logs is with the log frame, with a feeding movement between uprights as with the horizontal band-saw; but the log is divided up by a number of reciprocating saws operated by a crank-shaft.

What are termed re-sawing machines do not deal with logs, but cut up the products from the latter, such as deals and flitches, into boards, etc. Such deal or flitch frames cut by a vertically reciprocating set of saws. For more varied cutting, a band re-saw is employed, this having the band-saw running vertically and the material fed over the table by ribbed feed rollers. A like class of feed apparatus is fitted to circular saw benches for re-sawing purposes. Saws for cross-cutting are used extensively, being of circular blade class, and with one saw, or two to cut to definite lengths. The pendulum saws are also utilized for this service, consisting of a frame pivoted from an overhead beam so that the circular sa at the bottom of the frame may be pulled by a hand motion through the wood. For general sawing the circular-saw bench is made in various styles, with a fence which guides the wood. The most complete types are the dimension saws which have a complete system of adjustments to angles and positions, with graduated scales for reading the amount that all sorts of cutting, as ripping, cross-cutting, bevelling, mitring, rebating, grooving, etc., require. Single machines carry one saw, double ones two, for ripping and cross-cutting respectively; either of these can be swung up through the table when required. By the use of a cutter-block on a saw spindle further operations beyond the capacity of a saw are practicable.

Band-sawing machines, and to a lesser degree fret-saws have to be utilized to cut straight and curved parts which cannot be dealt with by means of a circular saw. The table, through which the blade runs, may be used either in the horizontal attitude, or canted for bevel cutting. These saws need careful design in order to keep working well; the tension on the blade must be sensitive, and the latter has to run in anti-friction guides above and below the table so as to cut truly.

Planing Machines. — Those which finish sawn material on various faces vary greatly in design. The smallest are the hand-feed planers, along the surface of the table of which the operator slides the wood past the revolving cutter-block. For hand machines this has to be of the safety type, forming almost a cylinder so that the fingers cannot be drawn into the machine as with the older square cross-sectional shape. A vacuum effect is thus secured by the eccentric formation, leaving a space as marked. This both tends to draw the wood down on to the cutters and to suck away the chippings. The panel planers or thicknessing machines feed the wood along a table underneath the cutter cylinder, so that thick or thin pieces may be planed to uniform dimensions. With a second cutter-cylinder below the table each side of the wood is planed simultaneously. And with two extra vertical spindles, each carrying a short cutter-block, the edges of the timber may be treated as well, including tonguing, grooving, moulding, or rebating. Roller feed is applied to these panel machines. The most elaborate planing machines are those for flooring-boards, etc., the big ones having eight feed-rollers to propel the timber past the cutters and knives, the latter being of non-revolving class to impart a high finish after the revolving cutters have roughed off the surface. The rate of feed will sometimes exceed 400 ft. per minute. Machines for smaller dimensions of stuff are also made with four or five cutters, and either sort will do matching on the edges of the timber. The bottom cutter heads are constructed to draw out by means of a heavy slide, so that adjustments and settings may be effected and the head slid back into the working position.

Moulding machines produce shapes, planing all four sides at one

pass, and for mass production are built somewhat after the style of the large planing machines just mentioned. The vertical shaper or circular moulder has a cutter spindle standing up from a flat table, and the cutters may be of any desired profile, and will mould either straight, curved, or irregular mouldings. Fences of suitable shape guide the wood. Tenoning machines operate with cutters of appropriate shape, above and below the timber, which is fed along by a carriage. A grooving or drunken saw is often used: this is a circular saw set askew on its spindle, so that it wobbles and produces the groove. Dovetails are cut in machines of single- or multiple-spindle design. For the first, a pitching arrangement moves the wood into the successive positions for the high-speed cutter to pass through, and in the second all the dovetails are made at one feed, by the several cutters set at the correct distance apart.

Holes of round, square, or oblong shape are made in the boring and mortising machines. The first resemble drilling machines for metal in general form, but are of rather simpler construction: Mortising may be performed with a reciprocating chisel, which is pulled down by a slide and lever to penetrate the wood; but the hollow chisel is a faster-cutting tool. This is a hollow tool within which an auger revolves and removes the bulk of the stuff and as it is fed in the sharp corners at the end of the chisel square out the hole. Some machines, such as those for railway carriage and wagon work, have several boring spindles and a hollow auger spindle. Another fast-cutting machine is the chain mortiser. This has an endless steel chain the links of which are formed with chisel teeth, and it runs around a long guide bar that is fed into the wood, the teeth cutting the way before and producing the mortise.

Lathes. — Lathes produce all the numerous turned chisels, some of which are evolved with hand-controlled chisels and gouges supported on the hand-rest, others by means of a slide-rest having slides moved with handles and screws. When the contours of articles vary (*e.g.*, those of spokes, pick handles, cricket bats, or gun-stocks) a copying lathe is employed. This carries a model of the piece with one spindle and the roughly shaped wood with the other; the cutting is done by means of a revolving cutter block, and the frame holding this is moved in accordance with the copy, so that the shape of the latter becomes exactly reproduced on the wood.

Sandpapering machines finish wood of different shapes, some against a flat disc, others on an endless band. The drum machines are the largest kinds, for extensive output, and have three drums for successive action. The first has coarse paper, the second finer, and the third finer still with a soft cushion beneath to produce a high finish. A brush cleans off the dust.

Woodworking machines are extensively fitted with ball or roller bearings, to enable their high speeds to be maintained without heating and excess consumption of power. The mass of sawdust or chips, which is soon enormous with some machines, has to be taken away by a suction apparatus, as mentioned under FANS.

(F. H.)

WOOF. Another name for Weft: *see* WARP and WEFT.

WOOL. Animal fibres are usually spoken of as hair, with the exception of the coat of the sheep which is usually termed wool. Before the researches of Professor Cossar Ewart (Edinburgh) wool was looked upon as a modified form of hair. Now it is usual to look upon wool as the simpler structure and hair as a development from this structure. The difference between wool and hair is best realized by a study of the double coat of the primitive wild sheep. The under coat is fine wool—the fibre showing a twofold structure, inner or cortex and outer or cuticle. Microscopic examination of this fibre shows a highly imbricated or serrated surface. The outer coat is coarse hair—the fibre showing a threefold structure, medulla along with cortex and cuticle. The medulla is probably an air or gas-filled core of the fibre which markedly changes both the appearance and physical properties of the fibre. Certain animals are covered with wool only, others with hair only and others with both hair and wool. The sheep is possibly the only animal carrying a fleece of wool only and not every variety of sheep does this. Certain varieties of sheep are stated to carry hair only, but such animals as goats, cattle, horses, etc., are the chief hair-bearing animals. A few years ago the hair of the Angora goat (termed mohair) would have been classed as a hair but Duerdon (Grahamstown) has shown that it is the under-coat and therefore ought to be ranked as wool. That there may be gradations from wool to hair was shown by an analysis of the coat of the blackface sheep by Barker (Leeds) but further researches on this coat by Janet Blyth (Edinburgh) suggest rather modifications of the two extreme types of fibres towards a common type. The differentiation between the two types, however, is very difficult for both probably arise from the inturned epidermis; but as the sheep has two skins separated by a layer of fat it is suggested that the physiological process of bringing a fibre up from the lower skin produces hair and the process of bringing a fibre from the upper skin produces wool. This is borne out by the fact that if a small lock of wool is jerked from a fine merino sheep it brings the upper skin away with it. The camel produces two distinctive coats but perhaps the most interesting animal of this class is the "musk ox" or ovibos of the Arctic regions. This creature grows an under-coat of beautifully soft fibre, which perhaps should be regarded as wool, which it casts once a year; and an outer coat of strong hair of which presumably it distributes the casting throughout the entire year.

Wool in Britain. — Wool is one of the most important of the textile fibres. Owing to the ease with which it may be spun into thread, and the comfort derived from clothing made of wool, it would naturally be one of the first textiles used by mankind for clothing. Ancient records prove the high antiquity of wool textiles and the early importance of the sheep. The different kinds of wool and the cloth made from them in antiquity are described by Pliny and referred to by other writers. The sheep certainly was a domestic animal in Britain long before the period of the Roman occupation; and it is probable that some use was made of sheep skins and of wool. But the Romans established a wool factory whence the occupying army was supplied with clothing, and the value of the manufacture was soon recognized by the Britons, of whom Tacitus remarks, "*Inde etiam habitus nostri honor et frequens toga*" (*Agric.* c. 21). The product of the Winchester looms soon established a reputation abroad, it being remarked that "the wool of Britain is often spun so fine that it is in a manner comparable to the spider's thread." This reputation was maintained throughout the middle ages, and the fibre was in great demand in the Low Countries and other continental centres. There are many allusions to woollen manufactures in England in early times; but the native industry of the island could not rival the products of the continent.

In the time of William the Conqueror Flemish weavers settled under the protection of the queen at Carlisle, but later they were removed to Pembrokeshire. At various subsequent periods there were further immigrations of skilled Flemish weavers, who were planted at different places throughout the country. The cloth fair in the churchyard of the priory of St. Bartholomew was instituted by Henry II.; gilds of weavers were established; and the exclusive privilege of exporting woollen cloth was granted to the city of London. Edward III. made special efforts to encourage wool industries. He brought weavers, dyers and fullers from Flanders; he himself wore British cloth; but to stimulate native industry he prohibited, under pain of life and limb, the exportation of English wool. Previous to this time English wool had been in large demand on the continent, where it had a reputation exceeded only by the wool of Spain. The customs duties levied on the export of wool were an important source of the royal revenue. Edward III.'s prohibitory law was, however, found to be unworkable, and the utmost that both he and his successors were able to effect was to hamper the export trade by vexatious restrictions and to encourage much smuggling of wool. Thus while Edward III. limited the right of exporting to merchant strangers, Edward IV. decreed that no alien should export wool and that denizens should export it only to Calais. Legislation of this kind prevailed till the reign of Elizabeth, when the free exportation of English wool was permitted; and Smith, in his *Memoirs* of *Wool*, points out that it was during this reign that the manufacture made the most rapid progress. In 1660 the absolute prohibition of the

export of wool was again decreed, and it was not till 1825 that this law was finally repealed. The results of the prohibitory law were exceedingly detrimental; the production of wool far exceeded the consumption; the price of the raw material fell; wool-"running" or smuggling became an, organized traffic; and the whole industry became disorganized. Extraordinary expedients were resorted to for stimulating the demand for woollen manufactures, among which was an act passed in the reign of Charles II decreeing that all dead bodies should be buried in woollen shrouds — an enactment which remained in the Statute Book, if not in force, for a period of 120 years. On the opening up of the colonies, every effort was made to encourage the use of English cloth, and the manufacture was discouraged and even prohibited in Ireland.

Wool was "the flower and strength and revenue and blood of England," and till the development of the cotton trade, towards the end of the 18th century, the wool industries were, beyond comparison, the most important sources of wealth in the country. Towards the close of the 17th century the wool produced in England was estimated to be worth £2,000,000 yearly, furnishing £8,000,000 worth of manufactured goods, of which there was exported about £2,000,000 in value. In 1700 the official value of woollen goods exported was about £3,000,000, and in the third quarter of the century the exports had increased in value by about £500,000 only. In 1774 Dr. Campbell *(Political Survey of Great Britain)* estimated the number of sheep in England at 10,000,000 or 12,000,000, the value of the wool produced yearly at £3,000,000 (or about 5s. per lb.), the manufactured products at £12,000,000, and the exports at £3,000,000 to £4,000,000. He also reckoned that the industry then gave employment to 1,000,000 persons. In 1800 the native crop of wool was estimated to amount to 96,000,000 lb; and, import duty not being imposed till 1802, the quantity brought from abroad was 8,600,000 lb., 6,000,000 lb. of which came from Spain. In 1825 the importation of colonial wool became free, the duty leviable having been for several previous years as high as 6d. per Ib, and in 1844 the duty was finally remitted on foreign wool also.

British Wools. — English wool, known the world over as being of a long and lustrous type was doubtless the kind so much in demand in the middle ages. That it was as long and lustrous as the typical Leicester or Lincoln of to-day is doubtful, as the new Leicester breed of sheep was only fully developed by Bakewell after the year 1747, and the latter day Lincoln is even a later development of a similar kind. As already remarked, the long and lustrous wools are the typical English, being grown in Lincolnshire, Yorkshire, Nottinghamshire, Devonshire, etc., in fact in all those districts where the pasturage is rich and specially fitted for carrying a heavy sheep. It is claimed that the lustre upon the wool is a direct result of the environment, and that to take a Lincoln sheep into Norfolk means the loss of the lustre. Attempts were made in the 18th century to develop a fine wool breed in England, George IV. importing a number of merino sheep from Spain. The discovery was soon made that it was difficult to maintain a breed of pure merinos in Great Britain, but the final outcome was by no means unsatisfactory. By crossing with the indigenous sheep a race of fairly fine woolled sheep was developed. of which the present day representative is the Southdown — a sheep which feeds naturally on the downs of Sussex, etc., forming a marked contrast to the artificially turnip-fed Lincoln, Leicester, etc., sheep. Following the short, crimpy Southdown, but rather longer, come the Hampshire and Oxford down sheep; these are followed by Suffolk, Shropshire, Kent and Romney Marsh (Demi-lustre), until at last the chain from the Southdown to the Lincoln (lustre) is completed. Of course there are several British wools not included in this chain. Scotch or black-face wool is long and rough, but well adapted for being spun into carpet yarns. Welsh wool has the peculiarity of early attaining its limit of shrinkage when washed, and hence is specially chosen for flannels. Shetland wool is of a soft nature specially suited for knitting yarns, while Cheviot wool — said to be a cross between merino sheep saved from the wreck of the Great Armada and the native Cheviot sheep — has made the reputation of the Scottish manufacturers for tweeds. North wool — wool from an animal of the Border Leicester and Cheviot breed — Wensleydale, Masham and Ripon wools are also specially noted as lustre wools.

Merino. — For centuries the finer wools used for cloth-making throughout Europe had been obtained from Spain — the home of the famous merino breed developed from races of sheep originally introduced into the peninsula by the Moors. Till early in the 19th century the superiority of Spanish merinos remained unchallenged, but the Peninsular War and its attendant evils produced a depreciation of quality concurrently with the introduction of Saxon and Silesian wools, which suddenly supplanted the product of Spain. The Spanish merino sheep had been introduced into Saxony by the elector in 1765, and by judicious crossing with the best native race developed the famous electoral breed. Merinos were carried to Hungary in 1775, and to France in 1776, and in 1786 Daubenton brought them to Rambouillet, whence a famous race developed. In 1802 the first merinos known to have left pure descendants were taken to the United States, and in 1809–1810 an importation (4,000) of merino sheep was made.

Wool in Australasia. — The introduction of the merino sheep into Australasia about the end of the 18th century and later into South America, was an important move. It is probable that the marked improvement in the appearance of the first sheep taken out by the early colonists suggested the possibilities of Australia as a wool-growing country. As has been noted above, marked endeavours were being made at this time to extend the merino breed of sheep, so that it was but natural that this breed should be given the first chance. It should here be noted that the Australian fine wools were first shipped from Botany bay (near Sydney), hence the now universal term "botany" for fine wools. The colonists were not to be repressed, however, and eventually, through the endeavours of Captain MacArthur, the Rev. Samuel Marsden and others, notwithstanding the opposition of Sir Joseph Banks, the president of the Royal Society, the merino breed became established on a firm basis, and in a comparatively short time Australian wools were no longer a drug on the market. In the 19th century the possibilities of raising larger sheep on the better coastal pasturage was naturally suggested. Until about 1885 this tendency was largely repressed owing to the demand for merino as distinct from cross-bred wool. In other words wool was the dominating factor. But with the possibilities and the development of the frozen meat trade from 1880 to 1890 this condition was changed, and the tendency to breed a large sheep of an early maturing type, with a valuable carcass and mediocre wool grew apace. New Zealand was specially adapted for this development; thus New Zealand frozen mutton completely dominated New Zealand wool In this manner it came about that cross-bred wool supplanted merino wool to a very considerable extent throughout Australasia.

The final results of these crossings are somewhat peculiar. The Lincoln crossed on to the Merino and in-bred for at least ten generations has produced the world renowned "Corriedale" sheep which on a large body carries a heavy fleece of 48's/56's quality of wool. The half-bred Down cross Merino produces an early fattening lamb with a wool between the Down and the Merino. The Romney Marsh sheep has proved a wonderful sheep for New Zealand especially from the frozen mutton trade point of view. Its wool may be a useful demi-lustre but unfortunately has been allowed to deteriorate. This deterioration, however, is now being suppressed and wools at present being tested in the University of Leeds (1928) show a return to a useful quality. Any cross between an English breed and a Merino which has been crossed tonards the Merino again produces the fine "cross-bred" or "Comeback" wools for which Australia is specially noted. The Corriedale sheep crossed on to the Merino and in-bred for many generations form the Polworth sheep and wool.

A somewhat different evolution has taken place in later years with reference to the interior sheep stations. The merino sheep will thrive where a larger sheep would starve, hence its value for the stations where salt-bush and blue-bush dominate all vegetation. But the merino sheep is a "wool" sheep, not a "frozen mutton" sheep, hence all crossing here was carried out with the idea of simply developing the weight of fleece and if possible retaining the merino wool characteristics.

South American Wool.—Hardly second in importance to Australia as a wool-growing country comes South America. In most years Australia has produced the greater bulk, but until recently occasionally S. America has come out top. To-day, however, although Patagonia and Chile have shown remarkable sheep developments, South America as a whole has relatively declined as a wool-growing continent. Cattle and cereals prove the better paying products. The history of the introduction of merino sheep into S. America may be briefly summed up as follows. In 1842 Henri Solanet, a Frenchman, began to shear the comparatively few sheep round Buenos Aires. His example was soon followed by Edouardo Olivera and José Planer. The idea almost at once came to these pioneers of importing well-bred rams, and as S. America is essentially a Latin country it was but natural that the French flocks of Rambouillet should be first drawn upon. With the development of the meat trade—just as in the case of Australia and New Zealand—a larger carcass was then sought after. This led to the introduction of the Lincoln ram and the development of cross-bred flocks about the year 1885. Perhaps this cross was favoured owing to the skill of the Bradford spinners, who made excellent use of the cross-bred wool produced. Flocks of sheep were first introduced into the Falkland islands in 1867. The pasturage here being limited, the flocks have probably attained their limit, but from the Falkland islands flocks have been passed on to Punta 'Arenas, where there is practically unlimited pasturage. The chief centres from which wool from S. America comes to Europe are Buenos Aires, which exports chiefly long and cross-bred wools, Montevideo, which exports chiefly merino wools, and the Falkland islands and Punta Arenas, which export mostly wools of the finer Cheviot type. The industry is largely in the hands of Englishmen. In Peru the weight of fleece carried and the number of sheep are being so increased that Peru may soon be exporting over 100,000,000 lb. of wool annually in addition to its export of vicuna, alpaca, and llama markets.

South African Wool.—Prior to the introduction of the merino sheep into Australia it had been introduced into S. Africa by the Dutch. There the climate was not so helpful as was that of Australia. The newly acclimatized sheep appears to have cast its wool at about the fifth generation and to have generally deteriorated, necessitating the reintroduction of fresh blood from Europe. In this manner have been developed the Cape flocks and the considerable Cape wool trade—largely centred at Port Elizabeth, East London, Cape Town, Mossel Bay and Port Natal. The country is evidently specially adapted for the rearing of the merino type of sheep, as cross-bred Cape wool is almost unknown. In 1907 some thousands of Australian merino sheep were introduced, and this has been followed up by more recent importations. Thus to-day Cape merinos rival those of Australia.

Such remarkable advances have been made in the weights of fleeces carried by sheep of particular breeds that it is difficult to say if finality has been reached. The following list gives average weights:

Breed	Weight of average fleece	Breed	Weight of average fleece
Merino (Australian)	8 to 10 lb.	Southdown	6 lb.
Merino (South American)	4 to 63 lb.	Lincoln	12 lb.
Corriedale	8 to 10 lb.	Shetland	4 lb.
		Cashmere	4 oz.

In 1885 the average weight of wool per sheep per year was about 5 lb., while 7 to 8 lb. is now the average weight. The weights of Australian fleeces are to-day about double as compared with 1885.

The Colour of **Wool.**—The prevailing colour of sheep's wool is white, but there are races with black, brown, fawn, yellow and grey shades of wool. For manufacturing purposes generally white wool is, of course, most valuable, but for the homespuns, which in earlier times absorbed the bulk of wool, natural colours were in many cases used with good effect. In domestic spinning, knitting, and weaving, natural colours are still largely taken advantage of, as in the cases of rough yams, Shetland knitted shawls, Highland tweeds, etc.

†Turkey, Iraq and Syria.

Tables I. and II. give useful particulars of the World's sheep and wool and also illustrate recent developments in wool-growing.

The Physical Characteristics of Wool.—The most important physical characteristics of the wool fibre are the cell structure, the fibre diameter and the fibre length. Researches into the external structures of ranges of British and Merino wools reveal interesting differences which largely explain the felting qualities observable in the respective wools. It is usual to consider British wools under the headings-mountain wools, lustre wools, demi-lustre wools and *down* wools.

Fig. 1 illustrates typical fibres taken from the Swaledale (an improved Blackface Scotch sheep) showing in K the external structure of the kemp, in **I.** medullated and non-delullated coarse fibres and in *II.* the finest fibre, which in this case approaches the merino fibre in actual scale structure.

Fig. 2 illustrates typical fibres taken from the Lincoln sheep, typical of the lustre wool class; in this case in **I.** there are continuous and intermittent medullated fibres.

Fig. 3 illustrates typical fibres taken from the Romney Marsh sheep, typical of the demi-lustre class. This is a remarkably good felting wool and the very clearly defined external scale structure is probably a dominant factor with reference to this quality.

Fig. 4 illustrates fibres taken from Southdown sheep—the best of the fine British breeds—which are particularly interesting in that there are no medullated fibres, while both thick and thin fibres clearly show a merino origin. This is not a milling wool.

In fig. 5 a photo-micrograph of a typical merino fibre is shown, from which it will be gathered that the typical merino structure is of the coronal pattern in which each scale tends to encircle the shaft of the fibre and rests in the cup formed by the scale beneath it.

In fig. 6 a photo-micrograph of a New Zealand cross-bred fibre (Lincoln×merino) is given, this presenting a curious blend of the British and merino wools external fibre structures.

Wool fibres vary in diameter from more than $\frac{1}{400}''$ to less than $\frac{1}{2,000}''$. In the best bred merino wools, say a 70's quality,

shoulder staples or locks of wool will snow a useful uniformity varying only from about $\frac{1}{1,000}$″ to —, whereas in the typical mountain wools variations from $\frac{1}{400}$″ to $\frac{1}{900}$″ are quite usual. The explanation is that the well-bred merino wool is entirely the under coat of the wild sheep, while the mountain wool appears to be composed of fibres from both the under and outer coats of the wild sheep with modified fibres coming in between the two types.

Just as the life history of a fish may be recorded in its scales so the life history of a sheep is recorded in its wool fibres. The single factor—fibre diameter—usually reveals important facts with reference to both "race" and "environment."

Wool fibres vary in length from under one inch to more than 18 inches, in fact, on several occasions when sheep have accidentally missed shearing for two or three years a wool growth, in the case of crossbreds, has been recorded to more than 40 inches. The yearly growth of wool, however, is within the limits indicated. The following are the average yearly growths of the most important breeds of sheep.

Blackface	18″ to 10″	Southdown	3″ to 4″
Lincoln	12″ to 18″	Clothing Merino	2½″ to 3″
Romney	6″ to 8″	Combing Merino	2½″ to 5″
Shropshire	4″ to 6″		

It should be noted that the first year's growths of wool, sheared from what are termed "hogg" or "teg" sheep, are usually rather longer than the above owing to the lambs being dropped from February to April and the shearing not taking place until the following May or June. Hogg wool also reveals itself in its pointed fibre tips.

The dominant physical characteristics of the four classes of wool referred to are:—For mountain wools, strength of fibre and in some cases a free intermixture of coarse and fine fibres; for lustre wools, that lustre which the manufacturer can develop in his lustre fabrics; for demi-lustre wools, either an approach to a lustre type or more frequently a loftiness in handle well suiting the type of wool for the coarser hosiery fabrics. For down wools, a fineness combined with loftiness which specially fits these wools for the finer hosiery styles; and for merino wools, a special fibre fineness with plasticity of handle which enables the spinner to produce the finest possible wool yarns and the manufacturer to obtain a superb "handle" in his fabrics.

The other distinguishing qualities of good wool are uniformity and strength of fibre with freedom from tender or weak portions in its length, a condition which not unfrequently arises from ill health in the sheep, or is due to violent climatic changes. In ill-bred wool there may also be found intermingled "kemps" or dead hairs—straight, coarse, dull fibres which show conspicuously among the wool, and become even more prominent in the manufactured and dyed goods, as they will not take dye.

The Chemical Characteristics of Wool.—Wool as it comes from the sheep's back is in anything but a pure form. The following analyses carried out at Leeds university (Barker and Wilson) give an idea of the problem facing the wool-scourer who, receiving wool "in the grease," is expected to turn it out clean with a moisture content of about 16% in the weight of the clean dried wool.

Type of wool	Clean wool	Water	Oil	Fat	Potash	Organic matter burnt off	Ash per cent
	%	%	%	%	%	%	%
Lincoln (washed)	73·3	13·4	5·32	3·77	2·06	1·63	99·48
Merino	45·0	9·0	13·0	24·0	4·0	6·0	101·0
Corriedale	54·0	13·0	10·0	12·0	5·9	6·0	100·9
Southdown	50·0	11·0	16·0	10·0	5·2	8·0	100·2
Burry	62·0	12·8	9·3	10·0	4·5	4·6	102·9

A careful analysis of typical wools (Speakman) usefully indicates the percentages on the weights of the clean dry wool of "wool fat" and "suint" usually present.

Type of wool	Wool fat	Suint
	%	%
Australian wools		
Geelong, 80's quality	35·3	14·2
Merino, 64's quality	41·9	17·1
Corriedale, 56's quality	45·8	23·5
African wools		
Eastern state, 70's quality	27·9	26·8
Swagershock, 64's quality	29·6	21·4
Grootfontein, 70's quality	41·4	12·0
Peruvian		
Ordinary, 56's quality	9·4	29·2
Improved, 60/64's quality	14·0	35·0
English		
Wensleydale, 46's quality	9·3	27·3

The variations here in evidence are remarkable and well illustrate the difficulties with which the wool-scourer has to contend. It is usual now to recover the wool fat which is placed on the market as "lanoline," but it is not usual to attempt to recover the potash salts.

Chemical Composition.—According to Dr. Bowman, the chemical composition of the cell structure of the average wool-fibre is:—

Carbon	50·8
Hydrogen	7·2
Nitrogen	18·5
Oxygen	21·2
Sulphur	2·3
	100·0

It is said to be a most complex body of which the probable formula is $C_{42}H_{157}N_5SO_{15}$.

If wool is burnt, it largely resolves itself into ammonia gas—whence it derives its characteristic odour—and carbon "beads" or "remains," which serve to distinguish wool from cotton, which, upon being burnt, does not smoulder but burns with a flash and leaves no beads. For further particulars on the organic nature of the wool-fibre see FIBRES.

Lamb, Hogg and Wether Wool.—The bulk of the wool of commerce comes into the market in the form of fleece wool, the product of a single year's growth, cut from the body of the living animal. The first and finest clip, called lambs' wool, may be taken from the young sheep at about the age of eight months. When the animal is not shorn till it attains the age of twelve or fourteen months the wool is known as hogg or hogget, and, like lambs' wool, is fine and tapers to a point. All subsequently cut fleeces are known as wether wool, and usually possess relatively somewhat less value than the first clip. Fleece wool as it comes into the market is "in the grease," that is, unwashed, and with all the dirt, etc., present; or it is received as "washed" wool, the washing being done as a preliminary to the sheep-shearing; or, in some few cases, it is scoured and is consequently stated as "scoured." Skin wool is that which is obtained from sheep which have either died or have been killed. Typical skin wool is that which has been removed by a sweating process or by painting with sulphide.

Sheep Washing.—Where there is abundance of water and other conveniences it is the practice to wash sheep previous to shearing, and such wool comes onto the market as washed. Where running streams exist, the sheep are penned by the side of the water, and taken one by one and held in the stream while they are washed, one man holding and the other washing. Sheep washing appliances are now largely employed, the arrangement consisting of a pen into which the sheep are driven and subjected to a strong spray of water either hot or cold. which soaks the fleece and softens the dirt. This done, they 'are caused to swim along a tank which narrows towards the exit, and just as they pass out of the pen they are caught and subjected to a strong douche of pure water. They should then be kept on grass land free from straw, sand, etc., so that the wool may be sheared free from vegetable matter, etc. After a few days the wool of a washed sheep is sufficiently dry for shearing or clipping.

Sheep Shearing.—A skilful shearer will clip the fleece from a sheep in one unbroken continuous sheet, retaining the form and relative positions of the mass almost as if the creature had been

skinned. In this unbroken condition each fleece is rolled up by itself and tied with its own wool, which greatly facilitates the sorting or stapling which all wool undergoes for the separation of the several qualities which make up the fleece. Mechanical shears have almost revolutionized the shearing industry, a good shearer shearing from 100 to 200 sheep per day.

Wool Classing. — On the great Australian sheep stations wool classihg is one of the most important operations, largely taking the place of sorting in the English wool trade. This is no doubt due to the wonderful success which has attended the efforts of the Australian sheep breeders to breed a sheep of uniform staple throughout. Thus the fleeces as taken from the sheep are skirted and trimmed on one table and then passed on to the classer, who places them in the 56's, 60's, 64's, 70's, 80's or go's class according to their fineness, these numbers approximately indicating the worsted counts to which it is supposed they will spin. The shorter Australian wools not coming under any of these heads are classed as super-clothing, ordinary clothing, etc., being more suitable for the woollen industry.

The technique of sheep shearing, skirting, classing, packing and transporting has been brought up to a wonderful state of perfection in Australia, and the "get up" of the wool is usually much superior to the "get up" of the "home-clip."

Wool Sorting. — Sorting or stapling was formerly a distinct industry, and to some extent it is so still, though frequently the work is done on the premises of the comber or spinner. Clothing wools are separated and classed differently from combing wools, and in dealing with fleeces from different breeds, the classification of the sorter varies. In the woollen trade short-staple wool is separated into qualities, known, in descending series from the finest to the most worthless, as picklock, prime, choice, super, head, seconds, abb and breech, and the proportions in which the higher and lower qualities are present are determined by the "class" of the fleece. In the worsted trade the classification goes, also in descending series, from fine, blue, neat, brown, breech, downright, seconds, to abb for English wools. The last three are short and not commonly used in the worsted trade. The greater proportion of good English long wool will be classified as blue, neat and brown; it is only in exceptional cases that more than from 5 to 8% is "fine" on the one hand, or of lower quality than breech on the other. Generally speaking, the best portion of a fleece is from the shoulders and side of the animal. The quality decreases towards the tail end of the sheep, the "britch" being frequently long, strong and irregular. The belly wool is short, worn and dirty, as is also the front of the throat, while on the head and shins the product is short, stiff and straight, more like hair than wool and is liable to contain grey hairs. The colonial wools come "classed," and consequently are only as a rule sorted into three or four qualities. Thus a 60's fleece may be sorted into 56's, ordinary 60's, super 60's and skirtings.

The sorter works at a table or frame covered with wire netting through which dust and dirt fall as he handles the wool. Fleeces which have been hard packed in bales, especially if unwashed, go into dense hard masses, which may be heated till the softening of the yolk and the swelling of the fibres make them pliable and easily opened up. When the fleece is spread out the stapler first divides it into two equal sides; then he picks away all straws, large burrs, and tarry fragments which are visible; and then with marvellous precision and certainty he picks out his separate qualities, throwing each lot into its allotted receptacle. Sorting is very far removed from being a mere mechanical process of selecting and separating the wool from certain parts of the fleece, because in each individual fleece qualities and proportions differ, and it is only by long experience that a stapler is enabled, almost as it were by instinct, rightly to divide up his fleeces, so as to produce even qualities of raw material. Cleanliness is most essential if the wool sorter is to keep his health and not succumb to the dread disease known as "anthrax" or "wool-sorters' disease." Certain wools such as Persian, Van mohair, etc., are known to be very liable to carry the anthrax bacilli, and must be sorted under the conditions imposed by government for "dangerous wools." Fortunately wools can now be readily disinfected at the Government's station at Liverpool. Ordinary or non-dangerous wools are perfectly harmless from this point of view.

Scouring. — The washing which a fleece may have received on the live sheep is usually not sufficient for the ordinary purposes of the manufacturer. On the careful and complete manner in which scouring is effected much depends. The qualities of the fibre may be seriously injured by injudicious treatment, while, if the wool is imperfectly cleansed, it will dye unevenly, and the manufacturing operations will be more or less unsatisfactory. The water used for scouring should be soft and pure, both to save soap and still more because the insoluble lime soap formed in dissolving soap in hard water is deposited on the wool fibres and becomes so fixed that its removal is a matter of extreme difficulty. In former times stale urine was a favourite medium in which to scour wool; but that is now a thing of the past, and a specially prepared potash soap is the detergent principally relied on. Excess of uncombined alkali has to be guarded against, since uncombined caustic acts energetically on the wool fibre-especially in the presence of heat — and is indeed a solvent of it. A soap solution of too great strength leaves the wool harsh and brittle, and the same bad result arises if the soapy solution is applied too hot.

The scouring of wool has passed through many changes during the past fifty years, but to-day the principle upon which all scouring machines are based is that wool naturally opens out in water. The mechanical arrangements of the machines are such as to ensure the passage of the wool without undue lifting and "stringing"; to obviate the mixing of wool grease, sand, dirt, etc., once taken out of the wool with that wool again; to give time for the thorough action of the scouring agents, so that neither too strong a solution nor too great a heat be employed; and to allow of the ready cleansing of the machines so that there is no unnecessary waste of time. In England the recognized type of merino wool-washing machine is the fork-frame bowl. Three to five of these machines are employed. The "scour" is strongest and hottest in the first bowl (unless this is used as a "steeper") as the wool at first is protected from the caustic by the wool-fat, etc., present. The last bowl is simply a rinsing bowl. With modern "nip rollers" botany wool is sufficientlydry to be passed on directly — say by pneumatic conveyers — to the carding. This the worsted spinner does, thereby saving time and money. The woollen spinner, however, may require the wool for blending, and so may require it dry and in a fit state for oiling. He, therefore, will employ one or other of the drying processes to be immediately described. For English and cross-bred wools more agitation in the scouring bath may be desirable. If so, the eccentric fork action machine is employed, in which the agitation of the bath is satisfactorily controlled by the setting of the forks which propel the wool forward. An average wool will be in the scouring liquor about eight minutes, the temperature will vary from 120° F to 110° F, and the length of bath through which it will have passed will be from 48 to 60 ft.

It is interesting to note that the "emulsion" method of wool scouring as described above is practically universal in England. In the United States of America the "solvent" method is largely in use. The agent employed — say benzene — is recovered by volatilizing and condensing, thus being used over and over again.

Wool Drying. — The more gently and uniformly the drying can be effected the better is the result attained; over-drying of wool has to be specially guarded against. By some manufacturers the wool from the squeezing rollers is whizzed in a hydro-extractor, which drives out so much of the moisture that the further drying is easily effected. The commonest way, however, of drying is to spread the wool as uniformly as possible over a framework of wire netting, under or over which is a range of steam-heated pipes. A fan blast blows air over these hot pipes, and the heated air passes up and is forced upwards through the layer of wool which rests on the netting, or downwards, as the case may be. In either case, unless the wool is spread with great evenness, it gets unequally dried, and at points where the hot air escapes freely it may be much over-dried. A more rapid and uniform result may be obtained by the use of the mechanical wool drier, a close chamber divided into horizontal compartments, the floors of which have alternate fixed and movable bars, Under the chamber is a tubular

heating apparatus, and a fan by which a powerful current of heated air is blown up the side of the chamber, and through all the shelves or compartments successively, either following or opposing the wool in its passage through the machine. The wool is introduced by a continuous feed at one end of the chamber; the strength of the blast carries it up and deposits it on the upper shelf, and by the action of the movable bars, which are worked by cranks, it is carried forward to the opposite end. whence it drops to the next lower shelf, and so on it travels till at the extremity of the lower shelf it passes out by the delivery lattice well and equally dried. Another drying machine in extensive use is what is known as the "Jumbo dryer." This consists of a large revolving cylinder or churn which turns over the wool—as a churn turns butter—and owing to its inclination passes it from one end to the other. A hot air blast follows the wool through the machine.

Teasing.—The dried wool may be in a partially matted condition. If so, it must be opened out and the whole material brought into a uniformly free and loose condition. This is effected in the Willey, which consists of a large drum and three small cylinders mounted in an enclosed frame. The drum is armed with ranges of powerful hooked teeth or spikes, and is geared to rotate with great rapidity, making about 500 revolulions per minute. The smaller cylinders, called workers, are also provided with strong spikes; they are mounted over the drum and revolve more slowly in a direction contrary to the drum, the spikes of which just clear those of the workers. The wool is fed into the drum, which carries it round with great velocity; but, as it passes on, the locks are caught by the spikes of the workers, and in the contest for possessing the wool the matted locks are torn asunder till the whole wool is delivered in a light, free and disentangled condition. It is a debatable point as to whether willowing should precede scouring.

Burring.—For certain classes of wool, notably Buenos Aires, still another preparing operation is essential at this stage—that is, the removal of burrs or small persistently adherent seeds and other fragments of vegetable matter which remain in the wool. Two methods of effecting this—one chemical, the other mechanical—may be pursued. The chemical treatment consists in steeping the wool in a dilute solution of sulphuric acid (or other carbonizing agent), draining off the dilute acid by means of the hydro extractor, and then heat-drying in a temperature of about 250° F. The acid leaves the wool practically uninjured, but is concentrated on the more absorbent vegetable matter, and the high heat causes it to act so that the vegetable matter becomes completely carbonized. The burrs are then crushed and the wool washed in water rendered sufficiently alkaline to neutralize any free acid which may remain, and dried. The same burr-removing effect is obtained by the use of a solution of chloride of aluminium, a method said to be safer for the wool and less hurtful to the attendant workmen than is the sulphuric acid process. For mechanical removing of burrs, a machine something like the Willey in appearance is employed. The main feature of this apparatus is a large drum or swift armed with fine short spikes curved slightly in the direction in which it rotates. By a series of beaters and circular brushes the wool is carried to and fed on these short spikes, and in its rotation the burrs, owing to their weight, hang out from the swift. The swift as it travels round is met by a series of three burring rollers rotating in an opposite direction, the projecting rails of which knock the burrs off the wool. The burrs fall on a grating and are ejected, with a certain amount of wool adhering to them, by another rotating cylinder. With wools not too burry the worsted spinner largely depends upon burring rollers placed upon the first cylinder of the "carder," and possibly to one or other of the patent pulverizing processes applied further on in the card. In the latter process a complete pulverizing of the burrs is aimed at, this being effected by the introduction of specially constructed pulverizing rollers between the first doffer and the last swift of the carding engine. Wooled skins are now successfully deburred by a new machine—an Australian invention. (A. F. B.)

Wool in the United States.—The three types of wool produced in the United States are usually classed as fine, medium, and low. Fine wools come from the Merino and Rambouillet breeds of sheep or crossbreds which show a preponderance of Rambouillet or Merino blood. They vary from 1 to 4 in. in length. The United States Department of Agriculture estimated 48,414,000 sheep shorn in 1940, producing 388,692,000lb. of wool, 65% being of the fine-woolled type, called fine and half-blood or 64s/70s and 60s, English designation.

The fineness, crimp, elasticity and good felting properties make the longer-stapled fibres, 1¼ in. and over, most suitable for the finest worsted fabrics and the shorter-stapled for the choicest woollens and felts.

Medium wools, which are coarser and longer-stapled than the fine wools, come from the Down breeds of sheep: *i.e.,* Dorset, Southdown, Shropshire, Hampshire, Cheviot, and Oxford. These wools grade and are classed three-eighths blood and quarter-blood, the fleeces of the Cheviot and Oxford sheep usually being graded as low quarter-blood. These grades in the English count system are called 56s, 60s and 46s/48s.

The length of medium wool varies from 2 to 5 inches. This type of wool does not usually possess the elasticity and such well-defined crimp as the fine wools, but due to length and diameter of staple are adapted for the heavier worsted suitings and knitting yarns; the shorter-stapled wools being used in blankets, tweeds, overcoatings and other woollens.

The low wools, or "coarse wools" come from the Lincoln type of sheep, which would include the Cotswold and Leicester. The wool is graded as common and braid, the equivalent English terms being 40s/44s and 36s/40s. These fleeces are much coarser than medium wools, are very lustrous with the length of staple varying from 5 to 15 inches. The wools are adaptable for heavy, lustrous worsted yarns for linings and braids and are also used in the manufacture of paper makers' felts.

Wools grown in the United States are usually classed as territory and domestic. The territory wools are grown in the States of Montana, Wyoming, Idaho, Nevada, Utah, Arizona, New Mexico, Colorado, the Dakotas, Nebraska, and Western Kansas. Those grown in Texas, California, Oregon, and Washington are designated by the name of the State. Domestic wools are grown east of the States mentioned; these wools are also called fleece wools or fleeces.

Fine woolled breeds of sheep, having a natural tendency to herd and being hardy, are more suitable for western ranges than the medium and coarse woolled types. Some medium wool is grown on the farms bordering rivers and on small ranches. Texas and California wools, though grown far apart, have characteristic elasticity, strength, and fineness which distinguish them from the western-grown wools. Double shearing, spring and fall, in Southwest Texas and Southern California, results in a large production of quite short, though very desirable wools. Texas is the largest producing State, growing in 1940, 83,648,000lb. of wool, Wyoming second with 32,456,000lb., and Montana third with 28,384,000 pounds. Eastern Oregon wools, grown east of the Cascade mountains, are nearer to the Merino type and are noted for their fair length and strong staple. Washington wools are heavy in shrinkage, some clips containing 75% of dirt and grease.

New England, up to 1840, was the largest wool producing area, but with the opening up of new lands in the Middle West, with better systems of transportation, the sheep-growing industry centred in the States bordering the Ohio, Mississippi, and Missouri rivers. Ohio is the largest sheep-growing State in the Middle West, raising in 1940 18,200,000lb. of wool. Both Ohio and Michigan raise a large quantity of fine wool from Merino and Rambouillet sheep. The bulk of the wool grown in the so-called fleece wool States is of the medium order, grown principally from Shropshires, Hampshires, and other Down breeds. There are some purebred fine-woolled flocks in Western Pennsylvania and in West Virginia. (C. M. AL.)

WOOL, WAR CONTROL OF. Wool is an indispensable article in war. No fibre has yet been discovered, the properties of which can equal, for the clothing of armies, its hygienic and durable qualitiei; whilst for munition purposes, such as felt washers, for shells, guns, submarine and aeroplane engines, torpedoes, tanks, etc. and other equipment such as water bottle covers, wool is essential A soldier's clothing and equipment con-

sumes on a war basis from four to ten times the average wool consumption of a civilian in times of peace.

The question of wool supplies during the World War was in part met by each country from its domestic production, and by the utilisation of old woollens in the manufacture of new goods. By this latter method and by substitution by inferior materials, the German armies, in fact, maintained their military clothing supplies throughout the war on a level of efficiency adequate for their purpose, in spite of the Allied blockade which effectually prevented supplies of overseas wool from reaching Germany and her Allies. Germany achieved this, however, at the expense of her non-combatants, who had to rely largely upon inferior substitutes for all their textile requirements.

From the point of view of the Allies the importance of conserving supplies could not be minimised. It was true that 85% of the wool production of Australia consisted of the finer merino quality not specially required for military purposes. After some discussion, however, the British Government agreed in the autumn of 1916 to purchase the whole wool production, excluding local manufacturing requirements, of Australia and New Zealand on a f.o.b. basis of 55% over average pre war prices (1913–14) with the stipulation that this price should be maintained for all military and other Government requirements both of Great Britain and of her Allies, but that in respect of civil consumption the fullest possible price should be obtained, and any net profit resulting be divided equally between the Treasuries of the imperial Government and the Governments of the commonwealth and the dominion. The purchase was repeated in practically the same terms for the 1917–18 and 1918–19 seasons.

In 1914 the French Government had requisitioned its domestic wool clip on a price basis 25% over pre war, in 1916 the British Government requisitioned the British domestic clip on a level of 35% over pre war prices. The latter was a gesture rather than a necessity. In 1917 the price paid for the British clip was raised to 50% over pre war prices and in 1918 to 60%.

Institution of Control.—Owing mainly to factors external to its own peculiar difficulties the War Office in the autumn of 1916 found itself launched on a huge wool purchase scheme and had immediately to devise ways and means of dealing with the raw wool which it now owned. In the first place, arrangements were made with the shipping authorities by which the wool was brought from Australasia by requisitioned shipping at Blue Book rates. Special storage and transport arrangements had to be improvised both in Australia and at British ports. In the previous spring an organisation had been set up by the War Office for the valuation, collection, and distribution of the British domestic clip, a relatively small matter of 120,000,000 lb. The Australian and New Zealand clips, amounting to about 1,000,000,000 lb., were valued, collected, and brought to Australasian ports by a machinery set up by the selling brokers and other trade organisations under the supervision of their Governments, which worked amazingly well within a very short time. When it is realised that whilst the average price of Australian wool was 15½d. there were almost a thousand different prices in the schedules prepared, the detailed work of valuation alone will be appreciated.

The War Office then expanded its British wool purchase executive under a wool controller to deal with the supplies of colonial wool now coming forward. The distribution of wool and tops to manufacturers at fixed prices made it possible to fix also the prices at which the finished cloth was to be delivered. In making purchases of cloth and other textiles, the War Office contracts department up to the end of 1916 endeavoured to purchase within fixed prices, but owing to rising prices of raw material this method in practice broke down. Not only was wool now issued for military but also for civilian purposes, whilst control of the raw material gave automatically the opportunity of controlling the use to which machinery should be put and ensured the supply of finished war material at fixed prices. To cope with these difficult problems a department of wool textile production was set up. The shipping and political factors involved were not known by and could not, therefore, be justly appreciated by the trade. It seemed, indeed, to a vast majority of those in the wool textile industry that an unnecessary degree of State control and interference had been instituted and this was vigorously opposed. As a method of understanding, a board of control of the wool textile industries was set up consisting of Government officials, mainly brought in from the trade, employers' and also trade union representatives. This board in practice represented a buffer between the War Office and the trade, and under its auspices problems concerning the rationing and control of civilian trade were decentralised. The responsibility, however, for meeting the increasingly growing demands not only of the British military, naval, and air forces, but of the armies of Russia, Belgium, Serbia and to a certain extent of Italy and France, and later the entire equipment in Europe of the American troops, remained with the responsible officials. In addition they were responsible for supplies of essential public services, both voluntary and Government, throughout the empire, including the Red Cross and prisoners of war organisations, post office, police and municipal requirements at home and abroad, women's organisations, as well as such services as the Indian and Egyptian Government services, together with the initiation and control of standard clothing schemes for the civil population and for the needs of demobilisation after the war.

In March 1918, when the British armies lost large reserves of stores in France, and the demands of the Allies and America were rapidly increasing, the department had to extend its production by over one million yards of material per week. It did this without apparent difficulty. A costings department was set up to investigate and fix conversion costs at each stage of production, but owing to technical complications the fixing of these rates was a most difficult business. The practical workings of a central statistical and costings staff necessarily lacked the flexibility of the normal play of individual units in competition. The system inevitably tended to fix the recognised conversion rate in excess of average efficiency, for otherwise output suffered.

Success of the Scheme.—Viewed broadly the scheme achieved its object. It produced necessary supplies at a calculable price. To produce the varied and changing demands of peace at competitive prices, the system must have broken down, but to meet a fairly standardised demand, in which finance as the governing factor was absent, the system was satisfactory, and inevitable in the circumstances of war.

The wool purchase scheme was of special benefit to Australia and New Zealand. During the first year of the purchase the imperial Government paid to the commonwealth and dominion Governments £25,000,000 and received for sales £330,000. By June 1918, it had paid out over £100,000,000 and received not much more than £50,000,000 by the end of 1919. A year after the war the imperial Government had expended many millions sterling in the purchase of wool more than it had received and at the conclusion of hostilities it was responsible for about £75,000,000 of wool accumulated in Australasian ports owing to lack of shipping to transport it. In addition, an arrangement was entered into by the surveyor-general of supply, who had been appointed in 1917 to control all War Office supply services, by which one clear season's (1919–20) wool clip after the war was purchased by the imperial Government. During the war a large part of the South African clip was also purchased, on optional terms to growers, as well as that of the Falkland islands and of Iceland (from which country wool cargoes had been running the North sea blockade). East Indian wool was marketed at fixed levels of prices under a special scheme. Numerous proposals were from time to time put forward for the purchase of the wool clips of South America but were in turn all vetoed by the Treasury owing mainly to exchange difficulties.

In all 9,895,000 bales (approximately 3,250,000,000 lb. of wool) were purchased, for which approximately £300,000,000 was paid and a net profit of £70,000,000 was divided equally between the British and colonial Governments. The aggregate sales of British wool amounted to £40,000,000 on which a profit of £5,000,000 was made. Within one year of the war the whole organisation of the department of wool textile production was liquidated, but owing to the new arrangement made with regard

to the further purchase, wool control was maintained, and a wool control board set up to advise the War Office and the liquidation commission concerning the various post-war questions which arose.

Government wool control continued until 1921, when its functions were taken over by a company, called the British Australian Wool Realisation Association, referred to as B A.W.R.A. This rearrangement was made in order to avoid the restrictions and international complications which direct Government trading involved, and, incidentally, to minimise domestic political interference. During the post-war period the policy was followed of establishing price by the release of wool at auction at calculated quantities and at reserve prices based upon estimates prepared from centralised Government and other statistics, and this for a short time appeared very successful. The basing of potential consumption figures upon such estimates proved, however, within a short time unreliable. In spite of having at its command the fullest possible information, and in addition, being in the enormously strong position of the largest holder of wool stocks, the wool control was unable to make any estimate of a useful nature of future wool consumption, or to control the market, and as a result its predictions on price did not eventuate, and sudden and severe slumps overwhelmed the world wool trade both in 1920 and 1924. Apart, however, from this post-war experiment, which endeavoured somewhat unsuccessfully to control prices, it is generally conceded that the wool control exercised during the war was justified in the circumstances and by its results. (E. F. H.)

WOOL COMBING: *see* COMBING.

WOOLF, VIRGINIA (?–1941), English writer, daughter of Sir Leslie Stephen, married in 1912 Leonard Woolf. They controlled the Hogarth Press, which published most of her books. Her first novel, *The Voyage Out* (1915), was realized to be a remarkable book, and its success was followed up with *Night and Day* (1919) and *Jacob's Room* (1922). Meanwhile, Mrs. Woolf had published several shorter experiments in a new method, which were collected in *Monday or Tuesday* (1921). In this new style were written her next novels, *Mrs. Dalloway* (1925), *To the Lighthouse* (1927), and, to a lesser extent, *Orlando*, a "biography" (1928). Among her later novels, *The Years* (1937) was especially acclaimed by critics (with whom, incidentally, she was in constant argument). Instead of writing novels in which the thoughts of the characters are to be deduced from what they say and do, or in which the thoughts of individuals are recorded to show to what sort of person they belong, Mrs. Woolf chose to write novels in which thought is so minutely revealed that words and actions lose much of their importance. The merit of her books lies partly in her understanding of those about whom she wrote, partly in the felicity with which she used words. These gifts placed her among the best literary critics of her time; she published critical essays, *The Common Reader* (1925) and *The Common Reader, Second Series* (1932).

Mrs Woolf was drowned near Lewes, Sussex, March 28, 1941, and the coroner returned a verdict of suicide

WOOLLEN MANUFACTURE. The processes described in the article WOOL are common to English, cross-bred and botany wools, whether intended for woollen or for worsted yarns. From this point, however, differentiation starts. Wool may be manipulated with the idea of converting it into felt (*q.v.*), "woollen" fabrics or "worsted" fabrics.

Woollen and Worsted.—In a general way it may be said that *woollen* yarns are those made from short wools usually possessed of high felting qualities. These are prepared for spinning by the process of *carding*, a process which so thoroughly blends or mixes the fibres—long and short, black and white or coloured, or even of different materials—that a homogeneous fibrous mass in broad film form is obtained, which is then divided up longitudinally, as it emerges from the carder, into a number of pith-like filaments. These filaments are then extended into finer filaments and twisted to form the woollen thread upon the mule or mule-frame.

On the other hand *worsted* yarns are generally made from the long lustrous varieties of wool; the fibres are so combed as to bring them as far as possible parallel to each other; the spinning is usually effected on the frame, and the yarn is spun into a compact, smooth and level thread, which, when woven into cloth, is not necessarily milled or felted. At all points, however, woollen and worsted yarns and cloths as thus defined overlap each other, some woollens being made from longer wool than certain worsteds, and some worsteds made from short staple wool, carded as well as combed. The most fundamental distinction between the two rests in the crossing and intercrossing of the fibres in preparing woollen yarn, while for worsted yarn the fibres are treated by processes designed to bring them into a smooth parallel relationship to each other.

Woollen Yarn Manufacture.—To obtain a sliver which can be satisfactorily spun into a typical woollen thread the following operations are necessary: willowing, oiling and blending, teasing, carding (two or three operations), condensing and possibly roving. Spinning upon the woollen mule or frame completes the series of operations all of which are designed to lead up to the desired result. Of the foregoing operations the carding is perhaps the most important as it is certainly one of the most interesting. At the same time it must be fully realized that deficiencies in any one of these operations will result in bad work at every subsequent process. For example, let an unsatisfactory combination of materials be blended together and there will be trouble in both carding and spinning. The roving operation included above is not always necessary. In the old days, if a really fine thread were required, roving was absolutely necessary, as the carder could not turn off a sliver fine enough to be spun at one operation. To-day, however, with the "tape" condensers, such fine slivers can be turned off the condenser that it is easy to spin directly to the required count.

Blending and Oiling.—At the beginning of the 19th century woollen cloths were made of wool—some of them of the very finest wool obtainable. To-day woollen cloths are made from any and every kind of material, of which the following are the most important: noils (botany, cross-bred, English, alpaca and mohair), mungo, shoddy, extract, flocks, fud (short mill waste), cotton sweeping, silk waste, etc.; in fact it is said that anything which has two ends to it can be incorporated into a woollen thread and cloth. It does not follow, however, that all woollen cloth is cheap and nasty. On the contrary the west of England still produces the finest woollen fabrics of really marvellous texture and beauty, and Batley, Dewsbury, etc., produce many fabrics which are certainly cheap and yet not cheap appearing. The first essential for blending is that the materials to be blended should be fairly opened out. This is effected by passing each material, if necessary, through the willow or through the "fearnaught"—a machine coming between the willow and card—prior to beginning the "blend-stack." Sometimes it may be that a blending of different colours of wools to obtain a definite "colour mixture" is necessary, more often it will be a blending of various materials, such as noils, mungo, cotton, etc., to obtain a cheap blend which may be spun into a satisfactory warp or weft yarn. The blender proceeds as follows: first a layer of No. 1 material—say wool—is spread over the required area on the floor; it is then lightly oiled. A layer of No. 2 material—say noils—is now added to the first layer; then another layer of wool with rather more oiling; then No. 2, then No. 1 with still more oil until all the material is built up into layers in the stack. The stack is now beaten down sideways with sticks or pulled, and then the more or less mixed mass is passed through the willow and fearnaught still further to mix it prior to carding, where the true and really fine mixing takes place. After passing through the fearnaught the material is sheeted and left to "mellow," this no doubt consisting in the oil applied distributing itself throughout the material. If wool and cotton are blended together the wool must be oiled first, or the blend will not work to the greatest advantage. The oil may be best Gallipoli olive oil—which should not turn rancid—but there are many good oils—and unfortunately many bad oils—placed on the market at a reasonable rate which the really skilled judge may use to advantage. The percentage of oil varies from 2% to 12%—this remark applies both to the woollen and worsted trades—and there is no guide as to the amount required, saving and excepting experience, observation and common sense. Automatic oiling arrangements have now been applied in the woollen trade with a considerable amount of success, the sprink-

ling of the oil by means of a watering-can on the stack, made as described above, still being much in favour. The oil serves to lubricate the fibres, and to render them more plastic and consequently more workable, and to hold the fibrous mass together and thus prevent "fly" during the passage through the cards,

Carding. — Carding was originally effected by hand, two flat boards with convenient handles, covered with teeth or card cloth-

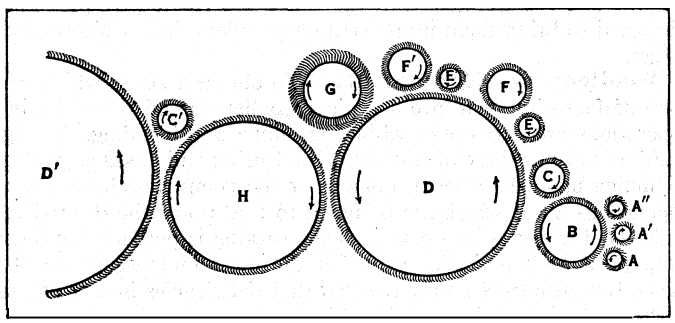

FIG. 1

ing, serving as a means of teasing out lock by lock, fibre by fibre, reversing root to tip and tip to root, so that a perfect mixing of the fibres resulted. It was but natural that, when an attempt was made to render the carding operation more mechanical, the operation should be converted into a continuous one through the adoption of rollers in place of flats. Flats combined with rollers still maintain their position in cotton carding, but in wool carding the pure roller card is employed. The factors of carding are size of rollers, speeds of rollers, inclination and shape of teeth and density of card clothing. Probably no operation in the textile industries is so little understood as carding. Thus the long wool carder would think a man an idiot who suggested the running of the teeth of the various cylinders actually into one another, while the short mungo carder regularly carries out this idea, and so on. The underlying principle of carding, however, is shown in fig. 1, in which a sectional drawing of part of a card is given. The wool is carried into the machine on a travelling lattice and delivered to the feed rollers A, A', A'' of which A and A'' in turn are stripped by the licker-in B working at a greater speed point to smooth side. This in turn is stripped by the angle stripper C again working at a greater speed point to smooth side, which in its turn is stripped by the breast D —the "carrying-forward and swiftest carding cylinder in the machine. The swift carries the wool forward past the stripper E— which as a matter of fact is stripped by the swift still working point to smooth side—into the slowly retreating teeth of the first worker F, which, being set a fair distance from the swift, just allows well laid-down wool to pass, but catches any projecting and uncarded staples. The worker in its turn is stripped by the stripper E, which in turn is stripped by the swift as already described. The passage of the wool forward through the machine depends upon its being carried past each worker in turn. Thus from beginning to end of a machine the workers are set closer and closer to the swift, so that the last worker only allows completely carded wool to pass it. Immediately on passing the last worker F the wool is brushed up on the surface of the swift by the "fancy" G—as a rule the only cylinder whose teeth actually work into the teeth of the swift and the only cylinder with a greater surface speed than the swift. The swift then throws its brushed-up coating of wool into the slowly retreating teeth of the doffer H, which carries it forward until angle stripper C' strips the doffer, to be in its turn stripped by swift D' and so on. The speeds of the cylinders are in the first place obviously dependent upon the principle of carding adopted, the greater speed always stripping (save in the case of the fancy). As to whether the speed shall be obtained by actual revolutions or by a larger diameter of cylinder depends upon the nature of the wool to be carded (long or short), the part which each cylinder has to play in the card, and upon the question of wear of clothing and power consumed. As a rule the strippers are all driven from a smaller circumference of the swift to obtain conveniently the necessary reduction in speed, and the slowly revolving workers are chain driven from the doffer, which indirectly receives its motion from the swift. The principles involved in the relative inclinations of teeth are very apparent, but the principles involved in the relative densities of teeth on the respective cylinders are again much involved and little understood.

A complete scribbler or first card engine consists of a breast, or small swift, and two swifts with the accompanying workers, strippers, fancies, doffers, etc. The wool is stripped from this card as a thin film by means of the doffing comb. This film is sometimes weighed on to the next machine—whether intermediate or condenser—a given weight giving a definite count of condensed sliver. Should an intermediate carder be employed, there must be an automatic feed, taking the wool, as stripped from the last doffer of the intermediate, and cross-feeding it evenly on to the feed sheet of the condenser. It is now more usual to automatically weigh into the scribbler and automatically feed the condenser or, if an intermediate is employed, both the intermediate and condenser. The condenser is a one-swifted or two-swifted card, the only difference in principle being that, whereas the sliver comes out of the scribbler or intermediate in one broad film, it is broken up into a number of small continuous slivers or films as it issues from the condenser, each one of which will ultimately be drafted or drawn out and twisted into a more or less perfect thread. These slivers— which are delicate and pith-like in substance—are wound on to light bobbins, and these bobbins are placed on the mule for the roving, or final spinning operations. There are many forms of condensing mechanisms such as the single-doffer, the double-doffer and the tape-condensers, which cannot be described here.

Mule Spinning. — The principles involved in mule spinning are comparatively simple, but the necessary machinery is very complex; indeed it is questionable if a more ingenious machine than the mule exists. The pith-like slivers received from the card must be attenuated until the correct count of yarn is obtained; they must be twisted while this attenuation or drafting is in process, otherwise they would at once break; and after being attenuated to the required fineness the requisite number of turns must be inserted. Great stress must be laid on the effects of what is termed the "drafting-twist" noted above; it is probably this simultaneous drafting and twisting which develops the most pronounced characteristics of the woollen yarn and cloth, and differentiates it entirely from the worsted yarn and cloth. The mule (see fig. 2) consists fundamentally of the delivery cylinders A, upon which the sliver bobbins B from the condenser are placed, which deliver the slivers as required to the front delivery rollers C (these rollers controlling perfectly the delivery of sliver for each stretch of the carriage), and the carriage EE carrying the spindles which may be

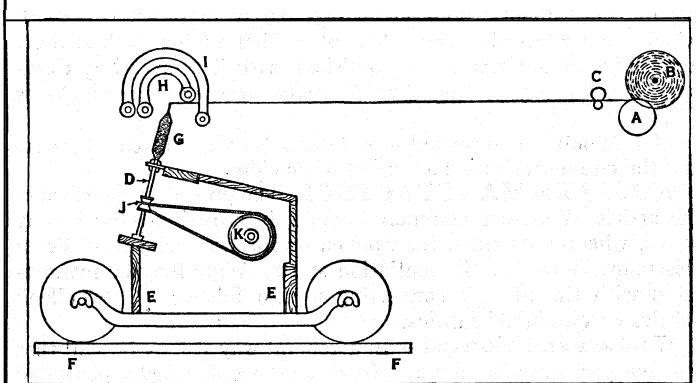

FIG. 2

run close up to the front delivery rollers and about two yards away from them to effect the "spin," which is of an intermittent character. The spindles D are turned by bands passing round a tin drum K in the carriage, but this motion, and every other motion in the mule, is controlled perfectly from the headstock. In brief, the operation of spinning is as follows: as the carriage begins to recede from the delivery rollers these rollers deliver condensed sliver at about the same rate as the carriage with its spindles moves out, the spindles putting in a little twist. When the carriage has perhaps completed half its traverse (say 36″) away

from the front rollers these suddenly stop delivering the condensed sliver, the carriage travelling more and more slowly outwards until it completes its traverse, drafting the sliver out to perhaps double the length. This drafting could not be effected but for the "drafting-twist," which, running into the thin parts of the yarn during drafting, strengthens them and thus from beginning to end equalizes the thread. Upon the completion of drafting the spindles are thrown on to "double speed" to complete the twisting of the 72″ of yarn just spun as rapidly as possible, the carriage being allowed to run inwards for a few inches, to allow for the take-up due to twisting. The mule now stops dead, backs-off the turns of yarn from the top of the spindle to the bottom, the faller H wire falls into position to guide the thread on to the spindle to form the required cop G, and the counter-faller I wire rises to maintain a nice tension on the yarn. The carriage now runs in, the spindles being revolved to wind up the yarn, and, in conjunction with the guiding on of the faller wire, builds up a firm cop or spool.

Woollen mules are made with several hundred spindles and of varying pitch to suit particular requirements. Thus if the mules are to follow a set of say three machines with a tape condenser, and are required to spin fine counts, the pitch of the spindles may be much finer than ordinarily, but a greater number will be required to work up the sliver delivered by the set of machines. There are many other details which require careful consideration; the inclination of the spindles, for example, must be suited to the material to be spun.

The mule-frame to which reference has been made is a ring-spinning frame arranged to spin condensed woollen slivers continuously, thus producing about double the weight per spindle as compared with the intermittent mule. Drafting-twist is introduced in this case between two pairs of drafting rollers by a "twizzler" which, however, only inserts false twist. The true twist is inserted later by the spindle and traveller. This method of spinning necessitates more twist than that necessary in mule spinning so that "frame" woollen yarn is most suitable for warp and is usually not soft enough for weft yarn.

The yarn as delivered by the mule is "single" and will serve as warp or weft for the great bulk of woollen cloths, warp being as a rule twisted harder than weft. Sometimes for strength, sometimes for colour, however, it will be necessary to twist two or more of these single strands together. This is best effected on a twisting frame of the ring type, which consists of delivery rollers, to deliver a specified length of yarn in relationship to the turns of the spindles, and the spindles, which serve to put in twist and to wind the yarn upon the bobbin or tube, which they effect by reason of the retarding action of the traveller. Fancy twists such as knops, loops, slubs, etc., may also be produced if the frame is fitted up with two pairs of delivery rollers and two or three special but simple appliances.

For woollen and worsted weaving, *see* WORSTED MANUFACTURE.

(A. F. B.)

WOOLLEY, MARY EMMA (1863–), American educationist was born at South Norwalk (Conn.), on July 13, 1863. She was instructor at Wheaton college, Norton (Mass.), 1886–91, before going to Brown university, where she graduated in 1894. She was a teacher of biblical history in Wellesley college, 1895–98, becoming in the latter year professor and head of the department of biblical history and literature. From 1900 to 1937 she was president of Mount Holyoke college and became one of the most influential women educators in the United States.

WOOLLY APPLE APHID, an American aphid (*Eriosoma lanigera*), sometimes called the woolly root-louse of the apple. Although of American origin, this insect has become a cosmopolitan pest of the apple and pear. Making its appearance in England toward the close of the 18th century, it became known as the American blight; and either from England or from America it has been carried to many different parts of the world, probably on nursery stock. It is likely to have been an indigenous pest of Crataegus and to have established at a very early date an alternate food plant in the American elm.

In the northern part of the United States and in general throughout its whole northern range, the insect lives almost entirely upon the roots of its host plants, causing swellings and other deformations and interfering seriously with the sap flow. In the southern part of its range it lives for the most part above ground, preferably upon suckers from the trunks but also upon normal twigs and even upon leaves. In south England and most parts of Europe, the aerial form predominates. This form is concentrated upon the tender growth and is conspicuous, the colonies appearing as whitish cottony masses beneath which are the reddish insects themselves. The winter eggs are laid in crevices of the bark on elm and occasionally on apple, and hatch in the spring. They develop parthenogenetically, winged forms appearing occasionally, by means of which the insect spreads. In the United States, the fourth generation is winged and migrates from elm to apple. There are usually seven generations each summer.

At present the insect is known in nearly all the European countries, in a number of South American countries, and also in Japan, Australia and New Zealand. It has many natural enemies among the insects, just as all plant lice have, and it has one specific parasite—*Aphelinus* mali—which since 1920 has been carried from America to many countries and has been acclimatized in France, Italy, Uruguay, South Africa, Australia and New Zealand.

(L. O. H.)

WOOLMAN, JOHN (1720–1772), American Quaker preacher, was born in Northampton township, Burlington county (N.J.), Oct. 19, 1720, the son, according to himself, "of religious parents," for whom "he wrought on the plantation." Although he chronicles some small faults in his youth, the majority of his life was one of the most unaffected piety, humility, and devotion to the cause of mankind. In 1772 he sailed for London to visit Friends in the north of England, especially Yorkshire, and died in York of smallpox, Oct. 7. He spoke and wrote against slavery, refused to draw up wills transferring slaves, induced many of the Friends to set their negroes free, and during the yearly meeting in 1760 at Newport (R.I.), urged the submission to the legislature of a petition he had prepared forbidding the slave trade. In 1763, in spite of the dangers, he "felt inward drawings" to preach to the Indians at Wehaloosing (now Wyalusing), on the Susquehanna. For the fate of the red man his heart yearned, as it did for the negro and the poor white. He was particularly concerned about the sale of rum to the Indians, and about the loss of their lands through the superior cunning and force of civilized man. Nevertheless remembering "that the people on the frontiers, among whom this evil is too common, are often poor," he was "renewedly confirmed in a belief that, if all our inhabitants lived according to sound wisdom, labouring to promote universal love and righteousness, and ceased from every inordinate desire after wealth, and from all customs which are tinctured with luxury, the way would be easy to live comfortably on honest employments," without temptation to unjust dealing.

Woolman's writings include *Some Considerations on the Keeping of Negroes* (1854; part ii., 1862); *Considerations on Pure Wisdom and Human Policy, on Labour, on Schools, on the Right Use of the Lord's Outward Gifts* (1758); *Considerations on the True Harmony of Mankind, and How it is to be Maintained* (1770); *A Word of Remembrance and Caution to the Rich* (1793); and the most important of his works, the *Journal* (1774), which was begun in his 36th year and was continued until the year of his death.

The works of John Woolman appeared in two parts in 1774 and have been frequently reprinted. The best-known edition of the *Journal* is that prepared, with an introduction, by John G. Whittier in 1871; it was translated into French and German; and it is in Everyman's Library. The most recent and scholarly edition is *The Journal and Essays of John Woolman,* edited from the original manuscripts with a biographical introduction by Amelia M. Gummere (1922). *See* also W. T. Shore, *John Woolman: His Life and Our Times* (1913).

WOOLSACK, a sack stuffed with wool and covered with red cloth upon which the lord chancellor sits in the House of Lords. Originally there were four woolsacks in the parliament chamber, upon which were seated the judges, barons of the exchequer, serjeants-at-law and masters in chancery. The uppermost woolsack now alone survives, but it is regarded as technically outside the precincts of the House.

WOOLSEY, THEODORE DWIGHT (1801–1889), American educationalist, born in New York city Oct. 31, 1801. He was the son of a New York merchant, a nephew of Timothy Dwight, president of Yale, and a descendant of Jonathan Edwards. He graduated at Yale at the head of his class in 1820: became a tutor there after studying theology and law at Princeton, in 1823–25; studied Greek at Leipzig, Berlin and Bonn in 1827–30; became professor of Greek language and literature at Yale in 1831; and was elected president of the college and entered the Congregational ministry in 1846. He resigned the presidency in 1871, and died July 1, 1889, in New Haven. During his administration the college grew rapidly, the scientific school and the school of fine arts were established, and the scholarly tone of the college was greatly improved. Much of his attention in his last years was devoted to the American commission for the revision of the authorized version of the New Testament, of which he was chairman (1871–81). He prepared excellent editions of *Alcestis* (1834), *Antigone* (1835), *Prometheus* (1837) and *Gorgias* (1843). He published several volumes of sermons and wrote for various periodicals. His *Introduction to the Study of International Law* (1860) and his *Essay on Divorce and Divorce Legislation* (1869) went through many editions. He also wrote *Political Science* (1877), and *Communism and Socialism* (1880).

See the memorial address by president Timothy Dwight (1890), and *Theodore Dwight Woolsey—A Biographical Sketch* by his son T. S. Woolsey (1912), also in the *Yale Review* (new ser., vol. 1).

WOOLSTON, THOMAS (1669–1731), English deist, born at Northampton in 1669, entered Sidney College, Cambridge, in 1685, and was made a fellow. After studying Origen, he devoted himself to the allegorical interpretation of Scripture, and advocated its use in his first book, *The Old Apology for the Truth of the Christian Religion against the Jews and Gentiles Revived* (1705). In 1720–1721 his open challenges to the clergy brought him into trouble. It was reported that his mind was disordered, and he lost his fellowship. From 1721 he lived in London, on an allowance of £30 a year from his brother, and other presents. His influence on the deistical controversy began with his book, *The Moderator between an Infidel and an Apostate* (1725, 3rd ed. 1729). The "infidel" was Anthony Collins (*q.v.*). Woolston denied the proof from miracles, called in question the resurrection of Christ and other miracles of the New Testament, and maintained that they must be interpreted as types of spiritual things. Two years later in a series of *Discourses*, he applied his principles to the miracles in detail. The *Discourses*, 30,000 copies of which were apparently sold, were six in number, the first appearing in 1727, the next five 1728–1729, with two *Defences* in 1729–1730. For these publications he was tried before Chief Justice Raymond in 1729 and sentenced (November 28) to pay a fine of £25 for each of the first four *Discourses*, with imprisonment till paid, and also to a year's imprisonment and to give security for his good behaviour during life. He failed to find this security, and remained in confinement until his death on Jan. 21, 1731.

See *Life* of Woolston prefixed to his *Works* in five volumes (London, 1733); *Memoirs of Life and Writings of William Whiston* (London, 1749, pp. 231–235); Appendix to *A Vindication of the Miracles of our Saviour, etc.*, by J. Ray (2nd ed., 1731); J. Cairns, *Unbelief in the Eighteenth Century* (1880); Sayous, *Les Déistes anglais* (1882); and the article DEISM, with its bibliography.

WOOLWICH, a metropolitan borough of London, England. Pop (1938) 150,900, area 12.9 sq mi. It lies mainly north of the river Thames. The most populous part is situated between Shooter's Hill Road and the river, the site falling from an elevation of 418 ft. to the river level. To the east lie the Plumstead marshes and in the south of the borough is Eltham.

Woolwich (Wulewich) is mentioned in a grant of land by King Edward in 964 to the abbey of St. Peter at Ghent. In Domesday the manor is mentioned as consisting of 63 ac. of land. The Roman Watling street crossed Shooter's hill. Numerous Roman urns and fragments of pottery have been dug up. Early in the 16th century Woolwich rose into prominence as a dockyard and naval station. Ships were built there in the reign of Henry VII. but it was with the purchase by Henry VIII. of two parcels of land in the manor, called Boughton's Docks, that the foundation of the town's prosperity was laid, the launching of the "Harry Grbce de Dieu," of 1,000 tons burden, making an epoch in its history. Woolwich remained the chief dockyard of the English navy until the introduction of iron ship building, but the dockyard was closed in 1869. The town became the headquarters of the Royal Artillery on the establishment of a special branch of the service in 1806.

In 1664, land was acquired for storehouses and sheds for repairing ship's carriages. In 1667, batteries were erected against the invading Dutch fleet. In 1668 guns, carriages and stores were concentrated at Woolwich, and in 1695 the laboratory was moved hither from Greenwich. Before 1716 ordnance was obtained from private manufacturers and proved by the Board of Ordnance. In 1741 a school of instruction was established. It was not until 1805, however, that the establishments at Woolwich became the Royal Arsenal.

By the London Government Act 1899 Woolwich was brought into line with other London districts. Woolwich returns two members to parliament. (X.)

ROYAL MILITARY ACADEMY

The Royal Military Academy, situated on Woolwich common and familiarly known as "The Shop," dates from 1741. It was composed not only of cadets but also of young and untrained officers. Intended for the artillery and engineers, the curriculum also included a general education. The ages of the students varied from 10 to 30. Cadets were admitted on the nomination of the master-general of the ordnance without examination, but as many possessed no education whatever an entrance examination of an easy character was introduced in 1774. This system has remained in force until our own day. In the early days discipline was of a low standard, and was enforced by corporal punishment or confinement to a dark cell on bread and water diet. The number of cadets in 1782 was 30, rising to 90 in 1812. By 1870 the strength had increased to about 150. From 1900 onwards the strength has varied between 200 and 250, except during the World War, when as many as 500 cadets were in residence. Between 1905 and 1911, owing to lack of accommodation at Sandhurst, cadets destined for infantry and cavalry were trained at Woolwich.

In 1806 buildings were erected on the present site and the academy was confined to cadets. Age limits for admission were fixed a few years later at 14 to 16, and in 1820 cadets were obliged to leave at the age of 20 or after having spent five years at the academy. In 1815 the rank of under officer (selected from cadets of the senior term) was instituted. In 1859 the east and west wings, gymnasium and racquet courts were built.

The honour roll of the cadets includes Gen. Gordon (1852), the duke of Connaught (1867), Lord Kitchener (1868), and the prince Imperial (1872). At the R.M.A. cadets are trained for commissions in the Royal Artillery, Royal Engineers and Royal Corps of Signals. A few vacancies are reserved for specially selected n.c.o.'s recommended for commissions, for nominations by the New Zealand Government and for selected Egyptian, Siamese and 'Iraqi cadets. The course consists of three terms, of which there are two per year. (Feb. 1st to mid July, and from Sept. 1st to Christmas.) Cadets enter each term in batches of 75 to 85 at the age of 18 to 19.

The army entrance examination is conducted by the Civil Service Commission. With the exception of certain candidates nominated by the Army Council, candidates are required to possess a school certificate before being permitted to sit for the examination. The cadets are organized in four half companies on the lines of an infantry battalion, and cadets of the senior term act as non-commissioned officers. The staff of the academy consists of a commandant, chief instructors and company officers for each half company (four), and a number of civilian instructors. These latter are especially responsible for instruction in non-military subjects, viz., imperial and foreign affairs, mathematics, science, languages. The military part of the course includes conduct of war, strategy, tactics and organization—illustrated from military history—map reading, military law, drill, riding and physical training. At the end of the course commissions are allotted in

the three branches of the service according to existing vacancies —choice of corps being given to those high up in the order of passing out. The normal fee is £100 a term and in addition certain charges are made for uniform, books, etc. The sons of officers of H.M. forces are, subject to certain conditions, admitted at a reduced normal rate of £60 a term. A limited number of cadets are admitted at still further reduced rates on account of pecuniary need at the discretion of the Army Council A certain number of scholarships are available for cadets on entering the academy (awarded on results of army entrance examination) and other scholarships are available for cadets during their course, and for young officers during the first five years of their service. The conditions of admission, fees and the syllabus of the army entrance examination are subject to alteration at any time by the War Office, from which Office all further information should be sought. (J. V. D.)

WOOLWORTH, FRANK WINFIELD (1852–1919), American merchant, was born near Rodman (N.Y.), April 13, 1852. In 1879 he opened in Utica (N.Y.) his first "five cent" store, which was a failure. Later in the same year he established a "five and ten cent" store in Lancaster (Pa.), followed by another in Harrisburg. When the F. W, Woolworth Co. was incorporated in New York in Dec. 1911 he became president. In 1912 the Woolworth building in New York city was completed from the designs of Cass Gilbert. It is 792ft. high, has 57 stories, and, excepting the Eiffel Tower in Paris, was the tallest building in the world at the time. He died at Glen Cove (L.I.), April 8, 1919, leaving an estate appraised at $27,000,000.

WOOLWORTH CO., F. W., an American chain store system, was started in Feb. 1879, in Utica, N.Y., by F. W. Woolworth (q *v.).* Woolworth's brother, C. S. Woolworth, his cousin Seymour H. Knox and his close friends F. M. Kirby and E. P. Charlton, as well as his old mentor W. H. Moore, all started stores of their own after F. W. Woolworth.

All of these parties operated independent units until 1912 when they were merged into the present F. W. Woolworth Co. There were 598 stores in the combined organization on Jan. 1, 1912. By the year 1940 the American chain had grown to 2,021 stores, and the total sales had grown from $60,557,767 for the year 1912 to $318,839,663 for the year 1939 in the United States, Canada and Cuba. The stores of the F. W. Woolworth Co. are located in every State of the Union. In addition to the Canadian and Cuban stores, the F. W. Woolworth and Co., Ltd. of England, which started in 1910, operates 759 stores; and the F. W. Woolworth Co. of Germany, which started in 1927, operates 82 stores. The F. W. Woolworth Co. of New York holds the controlling interest in both the British and German companies.

WOONSOCKET, a city of Rhode Island, U.S.A., on the Blackstone river. Pop. (1920) 43,496 (37% foreign-born white, of whom over half were French Canadians); 1940 federal census 49,303. The river with its tributaries, the Mill and the Peters, provides abundant water power. The city manufactures woollen, worsted and rayon yarns; worsted and pile fabrics; machinery, tools and gauges and rubber products. The value of products in 1937 was $47,821,500. Assessed valuation for 1940 was $73,181,500. Settlement began about 1666, when Richard Arnold built a sawmill on the Blackstone. Woonsocket was separated from Cumberland and incorporated in 1867 and was chartered in 1888.

WOOSTER, a city of Ohio, U.S.A., the county seat of Wayne county; on the Lincoln highway. Population (1920) 8,204 (92% native white); 1940 by federal census, 11,543. It is the seat of the College of Wooster (Presbyterian; 1866), occupying a beautiful site of 100 ac. on a hill 1,100 ft. above sea level; and of the Ohio agricultural experiment station, which operates 3,300 ac. of farmlands and 100,000 ac. of forests and state parks. The city has the largest paint-brush factory in the United States and is headquarters of the oil and gas industry of the county, whose farms are nearly all under lease for drilling. Wooster was laid out in 1808, incorporated in 1817 and as a city in 1869. It was named in honour of Gen. David Wooster (1710–77).

WOOTTON BASSETT, a market town in Wiltshire, England, 5¾ mi. W. from Swindon on the G.W.R. Pop. (1931) 2,419. It is the junction of the railway between London and the Severn tunnel with the main line of the Great Western. Wootton Bassett received its first charter from Henry VI, and returned members to parliament from 1446–1447 until the Reform Act of 1832.

WORCESTER, EARLS AND MARQUESSES OF. Urso de Abitot, constable of Worcester castle and sheriff of Worcestershire, is erroneously said to have been created earl of Worcester in 1076. Waleran de Beaumont (1104–1166), count of Meulan in France, a partisan of King Stephen in his war with the empress Matilda, was probably earl of Worcester from 1136 to 1145. He was deprived of his earldom, became a crusader and died a monk. From 1397 to 1403 the earldom was held by Sir Thomas Percy (c. 1343–1403), who in 1403 joined the other Percies in their revolt; he was taken prisoner at Shrewsbury, and subsequently beheaded, the earldom becoming extinct. The title of earl of Worcester was revived in 1421 in favour of Richard Beauchamp, Lord Abergavenny, but lapsed on his death in 1422. The next earl was John Tiptoft, or Tibetot, a noted Yorkist leader during the wars of the Roses, who was executed in 1470. On the death of his son, Edward, in 1485 the earldom reverted to the crown.

In February 1514 the earldom was bestowed by Henry VIII. on CHARLES SOMERSET (*c.* 1460–1520), a bastard son of Henry Beaufort, duke of Somerset. Having married Elizabeth, daughter of William Herbert, earl of Huntingdon, he was styled Baron Herbert in right of his wife, and in 1506 he was created Baron Herbert of Ragland, Chepstow and Gower. He was chamberlain of the household to Henry VIII. His son Henry, 2nd earl (c. 1495–1548), obtained Tintern Abbey after the dissolution of the monasteries. The title descended in direct line to Henry, the 5th earl (1577–1646), who advanced large sums of money to Charles I. at the outbreak of the Great Rebellion, and was created marquess of Worcester in 1643.

EDWARD SOMERSET, 2nd marquess of Worcester (1601–1667), is better known by the title of earl of Glamorgan, this earldom having been conferred upon him, although somewhat irregularly, by Charles I. in 1644. Under the Commonwealth he was formally banished from England and his estates were seized. At the Restoration his estates were restored, and he claimed the dukedom of Somerset promised to him by Charles I., but he did not obtain this, nor was his earldom of Glamorgan recognized.

See Henry Dircks, *Life, Times and Scientific Labours of the 2nd Marquess of Worcester* (1865); Sir J. T. Gilbert, *History of the Irish Confederation and the War in Ireland* (Dublin, 1882–1891).

His only son HENRY (1629–1700), the 3rd marquess, abandoned the Roman Catholic religion and was a member of one of Cromwell's parliaments. But he was quietly loyal to Charles II., who in 1682 created him duke of Beaufort. As the defender of Bristol, the duke took a considerable part in checking the progress of the duke of Monmouth in 1685, but in 1688 he surrendered the city to William of Orange. He inherited Badminton, still the residence of the dukes of Beaufort, and died there on the 21st of January 1700. The Worcester title was henceforth merged in that of Beaufort (*q.v.*). Henry, the 7th duke (1792–1853), was one of the greatest sportsmen of his day, and the Badminton hunt owed much to him and his successors, the 8th duke (1824–1899) and 9th duke (1847–1924).

WORCESTER, WILLIAM (*c.* 1415–*c.* 1482), English chronicler, was a son of William of Worcester, a Bristol citizen, and is sometimes called William Botoner, his mother being a daughter of Thomas Botoner. He was educated at Oxford and became secretary to Sir John Fastolf. When the knight died in 1459, Worcester, although an executor, found that nothing had been bequeathed to him, and with a colleague, Sir William Yelverton, he disputed the will, obtaining some lands near Norwich and in Southwark. He died about 1482. His *Itinerarium* of England is of great value. Portions were printed by James Nasmith in 1778, and the part relating to Bristol is in James Dallaway's *Antiquities of Bristowe* (Bristol, 1834).

Worcester also wrote *Annaks rerum Anglicarum,* a work of some value for the history of England under Henry VI. This was published by T. Hearne in 1728, and by Joseph Stevenson for the "Rolls" series

with his *Letters and Papers illustrative of the Wars of the English in France during the Reign of Henry VI* (1864). Stevenson also printed here collections of papers made by Worcester respecting the wars of the English in France and Normandy. Worcester's other writings include the last *Acta domini Johannis Fastolf. See* the *Paston Letters* edited by J. Gairdner (1904); and F. A. Gasquet, *An* Old *English Bible and other Essays* (1897).

WORCESTER, episcopal city, county and parliamentary borough and the county town of Worcestershire, England, 120½ mi. N.W. from London by the G.W.R., but served also by the L.M.S.R. Pop. (1938) 53,290. Area, 8.4 sq.mi.

The city is situated on a ridge parallel with the left bank of the river Severn, which is navigable here.

The cathedral church of Our Lord and the Blessed Virgin Mary is beautifully placed close to the river. The see was founded about 679, though owing to the opposition of the bishop of Lichfield it was not established till 780. (See WORCESTERSHIRE.) The bishop's church of St. Peter's, with its secular canons, was absorbed by Bishop Oswald into the monastery of St. Mary. The canons became monks, and in 983 Oswald finished the building of a new monastic cathedral. After the Norman Conquest the bishop of Worcester, Wulfstan, the only English prelate left in possession of his see, undertook the building of a Norman church. Of his work much remains, including (1084) one of the four apsidal crypts in England. The Norman cathedra1 was dedicated in 1218, and then the monks built a lady chapel and extended the building by 50 ft. In 1224 was begun the present splendid Early English choir. The nave was remodelled in the 14th century, and is principally Decorated early Perpendicular work. A Jesus chapel (an uncommon feature) is separated from the north aisle by a beautiful modern screen in the Perpendicular style. The exterior is plain, save the ornate tower, which dates from 1374, and is 196 ft. in height. The dimensions of the cathedral are — length 425 ft. (nave 170 ft., choir 180 ft.), width 145 ft. (choir 78 ft.), height of nave 68 ft. The cloisters are Perpendicular engrafted upon Norman walls. A Norman chapter house adjoins them, its Perpendicular roof supported on a central column, while on the south lies the Refectory, a fine Decorated room (1372) now the King's (or cathedral) school. There are also picturesque ruins of the guest hall (1320), which was still standing in 1860. A restoration was begun in 1857, considerably more than £100,000 being spent before the reopening in 1874.

Of the 11 parish churches, St. Alban's has considerable Norman remains, St. Peter's contains portions of all Gothic styles, St. Helen's has Gothic portions. The Commandery, founded in 1085, was a hospital. It was rebuilt in Tudor times, and there remains a beautiful hall, with music gallery, canopied dais, and a fine bay window, together with other parts. There are many old half-timbered houses. The guild-hall (1723) is an admirable building in the Italian style. The Festival of the Three Choirs is maintained here alternately with Gloucester and Hereford.

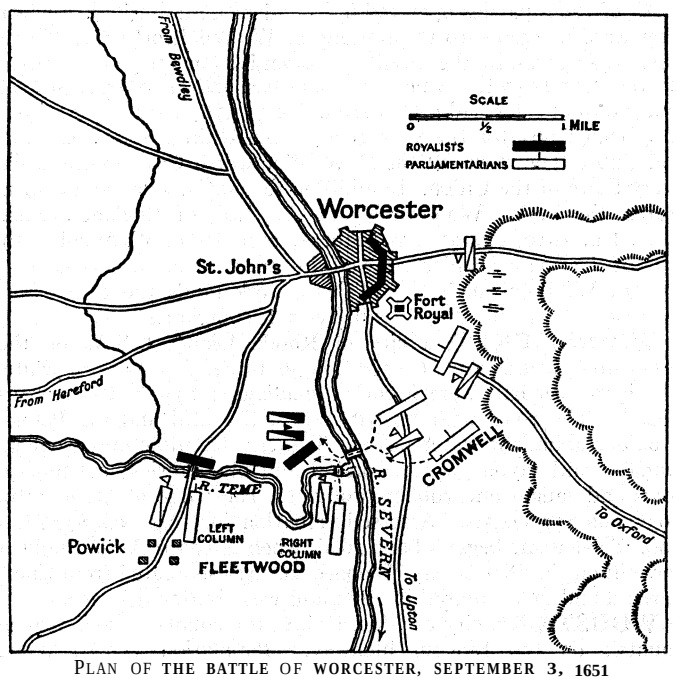
Public buildings include the shire-hall (1835), Corn Exchange and market house. Fairs are held thrice annually. The King's school was founded in 1541; the Royal Grammar school (Queen Elizabeth's), in a modern building, in 1563; there are also a choir school, a school for the blind, and municipal art, science and technical schools.

In the vicinity there is a Benedictine cohvent, at Stanbrook hall, with a beautiful modern chapel.

Traces of British and Roman occupation have been discovered at Worcester (*Wigeran Ceaster, Wigornia*), but its history begins with the foundation of the episcopal see. Being the chief city on the borders of Wales, Worcester was frequently visited by the kings of England. In 1139 it was taken by the Empress Maud and retaken and burned by Stephen in 1149. It surrendered to Simon de Montfort in 1263. In 1642, during the Great Rebellion, a handful of cavaliers was besieged here, and in spite of an attempted relief by Prince Rupert, the city was pillaged, as it was again in 1646. In 1651 Charles II with the Scottish army was defeated here by Cromwell and Lambert.

During the reign of King Alfred, Aethelred and Aethelflead, ealdorman and Iady of the Mercians, deferring to the request of the bishop, "built a burgh at Worcester." King Richard I in 1189 granted the town to the burgesses, and Henry III in 1227 granted a gild merchant. The first incorporation charter was granted by Philip and Mary in 1554, but James I in 1622 made the city a separate county. By the Municipal Reform act of 1835 the government was again altered. The burgesses returned two members to parliament from 1295 to 1885, when the number was reduced to one. As early as 1203, the manufacture of cloth is mentioned, the weavers, walkers and clothiers receiving an incorporation charter in 1590, but by 1789 had ceased to exist. Its place was taken by the manufacture of porcelain, famous as Royal Worcester, introduced in 1751 by Dr. John Wall, and by the increasing manufacture of gloves, which is one of Worcester's oldest trades, dating from the 15th century. The Glover's company apparently existed in 1561; it is said to have been incorporated in 1497 or 1661, but satisfactory evidence for either date is lacking. The city also makes wine and vinegar, besides Worcestershire sauce. There are many smaller industries; there is a considerable traffic in agricultural produce on the Severn.

Battle of Worcester, 1651.—Early in Aug. 1651 (see GREAT REBELLION) Charles II crossed the Scottish border with 16,000 men, nearly all Scots, in a last attempt to regain the English throne by invasion. His first intention was to march on London, hoping that recruits would flock to his standard; on the contrary, the local militia everywhere took arms to oppose him, Cromwell's cavalry clung to his flank and heels, and Cromwell himself followed a few days' march behind. In despair Charles turned westward, still hoping for a rising in his favour, and on Aug. 22 reached Worcester, where he was brought to bay. Worcester lies on the left bank of the Severn, with a small suburb, St. John's, on the right bank, a bridge connecting the two. The city was fortified, but its walls had been demolished in 1646 and, though partially restored, presented in 1651 no formidable obstacle. Fort Royal, outside the southeastern gate, was still of some strength, and this and the rest of the fortifications were now strengthened



PLAN OF THE BATTLE OF WORCESTER, SEPTEMBER 3, 1651

by Charles to the best of his limited means. The nearest bridges to Worcester were at Upton, 6 mi. down stream, and Bewdley, 15 mi. north. Bewdley bridge was already in the hands of the Parliamentarians, but Upton bridge the Royalists destroyed; on Aug. 28, however, it was seized by Lambert and repaired, Charles' last hope of commanding a considerable stretch of west country being thus snatched from him. None the less, his position was a strong one. About a mile below Worcester the river Teme joins the Severn, making a formidable obstacle to an advance up the right bank of the Severn from the south, while a smaller stream, running into the Teme from the north, formed some defense for

the western approach to St. John's. If only the walls of the city itself on the left bank had been in their proper condition Charles might well have held out for a considerable time. The king posted the main body of his army between the Severn and the Teme, using the city and its walls as a bridgehead. Cromwell himself reached Worcester on the 28th, and found himself in command of about 30,000 men, with many thousands more, chiefly militia, within a few days' march. He at once reconnoitred the Royalist position and decided Fleetwood was to advance up the right bank of the Severn, force the passage of the Teme, and destroy the Scottish forces between that river and Worcester; he himself would attack Fort Royal and the city. To connect the two operations a bridge of boats was to be laid across the Severn just above its junction with the Teme, and a similar bridge across the Teme close to its junction with the Severn. A force of cavalry was sent to Bewdley to cut off the Royalists' line of retreat to the north. The preparation of the bridges took a few days, but the time was well employed by Cromwell's guns on the high ground east of the city, which pounded the fortifications mercilessly and reduced the already exhausted defenders to a state of despair. Sept. 3, the anniversary of his great victory at Dunbar, was chosen by Cromwell for the day of his attack, and its watchword, "The Lord of Hosts," repeated. Fleetwood advanced in two columns, that on the right being directed upon the junction of the Teme and Severn, where the bridges were to be laid, that on the left against Powick, just north of which a bridge crossed the Teme. Little opposition was met with till the Teme was reached, but here the Scots were found to be in great strength, while the road bridges over this river, both at Powick and further west, had been destroyed. The left column's attempt to cross the Teme was repulsed with some loss, but in the meantime the bridge of boats had been successfully thrown across the Severn and Cromwell himself led a brigade of horse across on to the right bank. The second bridge over the Teme was quickly laid, and Fleetwood's right column joined Cromwell's horse, which had been already reinforced by foot. For a time the Scots fought fiercely to recover their river defenses, but they fell slowly back toward St. John's. Fleetwood's left column now crossed near Powick and it looked as if the battle would soon be over. But Charles, seeing that Cromwell had transferred a considerable part of his own force to the right bank to join Fleetwood's attack, decided to make a sortie from his bridgehead on the left bank and strike the remainder of the Parliamentary forces still lying on that side of the river. Issuing from the walls under cover of Fort Royal, Charles' cavalry, supported by such infantry as he could collect, made a furious attack upon the troops opposing them. The militia wavered, but they were stiffened by two regiments of regulars, and before long cavalry joined in the fight. For an hour or more the issue was in doubt, but Cromwell, warned of the danger, recrossed the Severn with reinforcements and gradually forced the exhausted Scotsmen back within the walls. Following close upon their heels. Cromwell's men burst into the city and put the Scotsmen to the sword. Panic spread like wildfire and the Royalist army dissolved into a rabble of fugitives. Fleetwood blocked the line of retreat to the west but some of the cavalry, including Charles himself, escaped northwards, though most of them were cut down or captured in the relentless pursuit. Charles himself got away to France, but his army was completely destroyed — 3,000 of his men were dead, more than 10.000 prisoners — while the Parliamentarians admitted a loss of but 200 men. The "Crowning Mercy" was complete.

WORCESTER, town of South Africa, near the Hex River mountains, is the centre of a fruit growing area. The annual rainfall is under 12 in., but irrigation is obtained from the Hex river. It is also intended to irrigate 8,000 ac from the Breede river. Much wine and brandy is produced, and fresh and dried fruit is exported. Many of the South African raisins come from this district. European population (1936) 5,631.

WORCESTER, a city of Massachusetts. U.S.A., 40 mi. W. of Boston, on the Blackstone river. Population (1920) 179,754 (30% foreign-born white, representing most of the countries of Europe); 1940, 193,694.

The city occupies 37.1 sq.mi., at an altitude of 480 feet. On its eastern border is Lake Quinsigamond (4 mi. long), spanned by a reinforced concrete bridge. Worcester is an important educational centre, the seat of Clark university (1887); Worcester academy (1832); the Worcester Polytechnic institute (1865), one of the oldest and best equipped schools of engineering in the country; the Jesuit College of the Holy Cross (founded in 1843 by the second bishop of Boston); Assumption college (1903); and a State normal school (1874). The public school system includes 81 grammar, a junior high, 4 high schools, a boys' trade school (1909) and a girls' trade school (1911). There are 17 parochial schools, five of which have high-school departments. The public library (founded 1859) was one of the first in America to admit readers on Sunday. In the library and museum of the American Antiquarian society (established 1812) are many valuable early portraits, books and pamphlets. The art museum (founded in 1896 by Stephen Salisbury) contains, among other important collections, the Bancroft collection of Japanese art. The Worcester Natural History society (1829) and the Worcester Historical society (1875) both maintain museums. An annual music festival is held. There are four daily newspapers, including one in French and one in Finnish. The city has more than 100 churches, and a boys' club of 5.500 members.

Worcester is a large producer of machine tools and of wire and wire products and mill machinery. In 1937 there were 516 factories, employing an average of 31,134 wage earners and with an output of $182,777,047. The city's trade area embraces a population of 450,000, and retail sales aggregate $100,000,000 annually.

Six insurance companies, with combined assets of $192,000,000, have their home offices there. Bank resources amount to over $200,000,000, and Worcester boasts never to have had a bank failure.

The first grant of land was made in 1657, and in 1668 the plantation of Quinsigamond was laid out, a committee of the general court expecting it to support from 30 to 60 families. In 1675, on the outbreak of King Philip's War, the settlement was abandoned. It was revived in 1684, and was named after the English home of several of the settlers. In 1702 it was abandoned owing to attacks by Indians. In 1713 a tavern and a mill were built, and a turnpike was constructed to Boston. Worcester became a town in 1722, and in 1780 was incorporated. Until the Revolution it remained an isolated frontier settlement and as late as 1783 its population was not over 2,000. During the Shays Rebellion it was taken by the insurgents and the courts were closed.

Utilization of waterpower and establishment of industries began about 1800, and by 1825 the town was manufacturing hats, clocks, chairs, paper, cards, carpets, corduroy, fustians, textile machinery and many other articles. In 1828 the Blackstone canal was opened from Worcester to Providence. The railroad to Boston was completed in 1835; to Norwich in 1840; to Providence in 1847; and to Springfield in 1849. In 1848 the town was incorporated as a city. Strong anti-slavery sentiment led to a serious riot in 1854, owing to an apparent attempt to enforce the Fugitive Slave law. By 1860 the population had grown to 24.960, and there has been a steady increase ever since. Many famous men and women of America have lived for longer or shorter periods in or near Worcester, including the inventors Elias Howe, Eli Whitney, Erastus Bigelow, Russell L. Hawes, Thomas Blanchard, William and George Crompton, L. J. Knowles, Draper Ruggles, Joel Nourse and J. C. Mason; and Gen. Artemas Ward, Gen. Rufus Putnam, Col. Timothy Bigelow, Isaiah Thomas, Dr. William T. G. Morton, Eli Thayer, Gen. Charles Devens, George Frisbie Hoar, George Bancroft, Dorothea Lynde Dix, Clara Barton, Edward Everett Hale and John B. Gough.

WORCESTERSHIRE, a midland county of England. Area 699 sq.mi. It covers a portion of the rich valleys of the Severn and Avon with their tributaries, the Stour and the Teme. The Avon valley, known as the vale of Evesham, lies on the Lias clays, and provides an excellent soil for orchards and market gardening. The Jurassic escarpment of the Cotswold

hills rises sharply from it in the south-east, the outlier of Bredon hill being a conspicuous spur Salmon and lampreys are taken in the Severn; trout and grayling in the Teme and its feeders. The Malverns rise from the flat vale of Worcester and reach a height of 1,395 and 1,114 ft. in the Worcester and Hereford beacons.

The ridge is continued in the Abberley Hills to the north. The Lickey Hills (goo ft.) in which there are Silurian, Cambrian and Pre-Cambrian rocks, cross the north-east corner of the county. Their northern parts, the Clent Hills (1,028 ft.), are formed of Permian breccias. Partly within the county are the sites of two ancient forests. That of the Wyre on the northern boundary, retains some of its ancient character; but Malvern Chase is hardly recognizable. Road metal is extensively quarried in the Malvern hills (Pre-Cambrian and Cambrian) and in the Lickey hills (Cambrian); lime is obtained from the Silurian limestones; coal is mined in portions of the Forest of Wyre, and the South Staffordshire coal-fields which come within the county.

History and Early Settlement.—Worcestershire was largely wooded in early times and is consequently not rich in prehistoric remains but some stone implements have been found on the surrounding hills and some bronze implements along the Severn, pointing perhaps to river communications or perhaps to occupation of the river banks. The great earthwork on the Malvern hills of Romano-British or late pre-Roman date should be specially mentioned, and there are others at Berrow Hill above the Teme west of Worcester and at Round Hill by Spetchley.

The earliest English settlers were a tribe of the Hwiccas of Gloucestershire, who spread along the Severn and Avon valleys in the 6th century. By 679 the Hwiccan kingdom was formed into a separate diocese with its see at Worcester, and the Hwiccas had made themselves masters of nearly the whole of the modern county. From this date the town of Worcester became not only a religious centre, but the chief point of trading and military communication between England and Wales. The shire originated as an administrative area after the recovery of Mercia from the Danes. Worcester was destroyed by Hardicanute in 1041.

In no county has the monastic movement played a more important part. Foundations existed at Worcester, Evesham, Pershore and Fladbury in the 8th century; at Great Malvern in the 11th century, and in the 12th and 13th centuries at Little Malvern, Westwood, Bordesley, Whistones, Cookhill, Dudley, Halesowen and Astley. At the time of the Domesday Survey more than half Worcestershire was in the hands of the church. This prevented the rise of a local aristocracy, and Dudley castle was the sole residence of a feudal baron. Worcester Castle passed in the 12th century to the Beauchamps, who owned Elmley and Hanley castles. The possessions of William Fitz Osbern in Doddingtree hundred and the Teme valley fell to the crown in 1074 and passed to the Mortimers. Hanley Castle and Malvern Chase were granted by Henry III. to Gilbert de Clare. The early political history focusses on the city of Worcester. In the Civil War of the 17th century Worcestershire was conspicuously loyal.

The Droitwich salt-industry was very important at the time of the Domesday Survey. In the 13th and 14th centuries Bordesley monastery and the abbeys of Evesham and Pershore exported wool, and in the 16th century the Worcestershire clothing industry gave employment to 8,000; fruit-culture with the manufacture of cider and perry, nail-making and glass-making also flourished. The clothing industry declined in the 17th century, but the silk-manufacture replaced it at Kidderminster and Blockley. Coal and iron were mined at Dudley in the 13th century.

Architecture — There are remains of the great abbeys at Evesham and Pershore, and the priory church at Malvern, besides the cathedral at Worcester. There are further monastic remains at Halesowen and at Bordesley, and there was a Benedictine priory at Astley. Good Norman work remains in the churches of Martley, Astley, Rous Lench, Bredon and Bockleton; while the Early English churches of Kempsey and Ripple are noteworthy. Half-timbered buildings add to the picturesqueness of many towns and villages; and among country houses this style is well exemplified in Birts Morton Court, Eastington Hall, Elmley Lovett Manor, and in Pirton Court. Westwood Park is a mansion of the 16th and 17th centuries; the site was formerly occupied by a Benedictine nunnery. Madresfield Court embodies remains of a fine Elizabethan moated mansion.

Agriculture. — The climate is equable and healthy, and is very favourable to the cultivation of fruit, vegetables and hops, the red marls and the rich loams being good both for market gardens and tillage. About 78½% of the land was under cultivation in 1939; of this 71% was in permanent pasture. Orchards of apples, pears and plums are extensive, the county being, after Kent, the greatest fruit producer in the country. In 1939 there were 23,242 ac. of orchards. There are large tracts of woodland. Wheat and oats are the principal grain crops. Peas, beans, potatoes, mangolds and turnips are important crops covering 17,480 ac. Near Worcester there are large nurseries. The National Trust owned 688 ac. in the county in 1942.

Industries.——In the north Worcester includes a portion of the Black Country. Dudley, Netherton and Brierley Hill, Stourbridge, Halesowen, Oldbury and the south and west suburbs of Birmingham, have a vast population engaged in ironworking, in chemical and glass works, and motor engineering. Worcester is famous for porcelain, Kidderminster for carpets and Redditch for needles, fishhooks, etc. Salt is produced from brine at Droitwich and Stoke Prior. The fire clays and limestone of the north unite with the coal measures to form a basis of the industries in the Black Country. Railway signals, made at Worcester, clothing, leather and buttons are important trades.

Communications. — The county is served by the G.W.R. main lines connecting Worcester with Birmingham, Oxford, Gloucester, Hereford and Shrewsbury, the L.M.S.R. serves the north, and the Birmingham-Bristol line passes through the county. The Severn is an important highway; the Avon, though locked up to Evesham, is little used. Canals follow the courses of the Stour and the Salwarpe, and serve the towns of the Black Country. There are 511 mi. of roads in the administrative county.

Administration and Population. — The area of the geographical county is 699 sq.mi., pop. (1938) 449,670. Wartime population movements raised the county's population by 7% between Sept. 1939 and Feb. 1941. Worcestershire has detached portions enclaved in Herefordshire. Staffordshire. Warwickshire and Gloucestershire. It comprises five hundreds, each divided into upper and lower sections. Oswaldslow having a middle section in addition. There are two county boroughs, seven municipal boroughs and four urban districts. The county is in the Oxford circuit, and assizes are held at Worcester. It has one court of quarter sessions, and is divided into 15 petty sessional divisions. Worcestershire returns four members to parliament, and the county boroughs of Dudley and Worcester return one member each.

WORDSWORTH, CHARLES (1806–1892), Scottish bishop, son of Christopher Wordsworth, Master of Trinity, was born in London on Aug. 22, 1806, and educated at Harrow and Christ Church, Oxford. He was a brilliant classical scholar, and a famous cricketer and athlete. He was tutor at Christ Church (1834–35) and then second master at Winchester. In 1839 he brought out his *Greek Grammar,* which had *a* great success. In 1847, he became warden of Trinity College, Glenalmond, the new Scottish Episcopal public school and divinity college, where his views on Scottish Church questions brought him into opposition at some important points to W. E. Gladstone. In 1853 he was consecrated bishop of St. Andrews, Dunkeld and Dunblane. Wordsworth was a strong supporter of the establishment, but conciliatory towards the Free churches. He was a voluminous writer, and one of the company of revisers of the New Testament (1870–1881), among whom he displayed a conservative tendency. He died at St. Andrews on Dec. 5, 1892.

See his *Annals of my Early Life* (1891), and *Annals of* My *Life.* edited by *W.* Earl Hodgson (1893); also *The Episcopate of Charles Wordsworth,* by his nephew John, bishop of Salisbury (1899).

WORDSWORTH, CHRISTOPHER (1774–1846), youngest brother of the poet, was born on June 9, 1774, and became a fellow of Trinity College, Cambridge, in 1798. He obtained preferments through the patronage of Manners Sutton, bishop of Norwich, afterwards (180j) archbishop of Canterbury. In 1810 he published an *Ecclesiastical Biography* in 6 volumes. On the death of Bishop Mansel, in 1820, he was elected Master of Trinity, and retained that position till 1841. His proposal as vice chancellor

(1821) for a Classical Tripos, though then rejected, was adopted in 1822. He died on Feb. 2, 1846, at Buxted. In his Who wrote Ikon *Basilike?* (1824), he advocated the authorship of Charles I.; and in 1836 he published, in 4 volumes, a work of Christian Institutes, selected from English divines. He married in 1804 Miss Priscilla Lloyd (d. 1815), a sister of Charles Lamb's friend Charles Lloyd; and he had three sons, John W. (1805–1839), Charles (*q.v.*) and Christopher (*q.v.*); the two latter both became bishops, and John, who became a classical lecturer at Trinity College, Cambridge, was an erudite scholar.

WORDSWORTH, CHRISTOPHER (1807–1885), English bishop and man of letters, was born in London on Oct. 30, 1807, and was educated at Winchester and Trinity, Cambridge. He, like his brother Charles, was distinguished as an athlete as well as for scholarship. He was public orator at Cambridge, Headmaster of Harrow from 1836–44, and bishop of Lincoln in 1869. He died on March 20, 1885. He married in 1838 Susanna Hartley; his eldest son was John, bishop of Salisbury, and author of Fragments of Early Latin (1874), and his daughter Elizabeth was first principal of Lady Margaret Hall, Oxford. As a scholar he is best known for his edition of the *Greek New* Testament (1856–60), and the Old Testament (1864–70), with commentaries; and for his *Inscriptiones Pompeianae* (1837).

His ***Life,*** by J. H. Overton and Elizabeth Wordsworth, was published in 1888.

WORDSWORTH, DOROTHY (1771–1855), English writer and diarist, the third child and only daughter of John Wordsworth, of Cockermouth, and his wife, Anne Cookson-Crackanthorpe, was born on Dec. 25, 1771, and, after her mother's death in 1778, lived chiefly at Halifax with a Mrs. Threlkeld, her mother's cousin. In 1787 she went to live with her maternal grand-parents in Penrith, where she was not very happy. From 1788–93 she stayed with an uncle at Forncett, in Norfolk. She and her brother William, the poet, who was a year older than Dorothy, were early drawn to one another; in 1794 they visited the Lakes together, and in the autumn of the following year they combined their small capitals and set up house at Racedown, in Dorsetshire, where they lived a frugal but ideally happy life. In 1797 they made the acquaintance of Coleridge, and in the same year moved to Alfoxden, on the northern slope of the Quantock hills, Coleridge about the same time settling near by in the town of Nether Stowey. On Jan. 20, 1798, Dorothy Wordsworth began her invaluable Journal, used by successive biographers of her brother, but first printed in its quasi-entirety by Prof. W. Knight in 1897. The Wordsworths, Coleridge and Chester, left England for Germany on Sept. 14, 1798; and of this journey also Dorothy Wordsworth preserved an account, portions of which were published in 1897. On May 14, 1800, she started another Journal at Dove cottage, Grasmere, which she kept very fully until Dec. 31 of the same year. She resumed it on Jan. 1, 1802, for another 12 months, closing on Jan. 11, 1803. These were printed first in 1889. She composed Recollections of a *Tour* in Scotland, in 1803, with her brother and Coleridge; this was first published in 1874. Her next contribution to the family history was her Journal of a Mountain Ramble, in Nov. 1805, an account of a walking tour in the Lake District with her brother. In July 1820 the Wordsworths made a tour on the Continent, of which Dorothy preserved a very careful record, portions of which were given to the world in 1884, the writer having refused to publish it in 1824 on the ground that her "object was not to make a book, but to leave to her niece a neatly-penned memorial of those few interesting months of our lives." Meanwhile, without her brother, but in the company of Joanna Hutchinson, Dorothy Wordsworth had travelled over Scotland in 1822, and had composed a *Journal* of that tour. In 1829 she had a serious nervous breakdown, from which she never recovered. For the last 26 years of her life her mind and body seemed broken; she died on Jan. 25, 1855, five years after William's death in 1850.

Dorothy Wordsworth claims a distinct place in the history of English prose as one of the very earliest writers who noted, in language delicately chosen, and with no other object than to preserve their fugitive beauty, the little picturesque phenomena of homely country life amid simple scenes and quiet people.

A Life, by E. Lee, was published in 1886; but it is only since 1897, when Prof. Knight collected and edited her scattered mss., that Dorothy Wordsworth has taken her independent place in literary history. The Journals of *Dorothy* Wordsworth. edit. by W. Knight, were republished in 1924; see also C. M. Maclean, *Dorothy* and William Wordsworth (Cambridge, 1927).

WORDSWORTH, WILLIAM (1770–1850), English poet, was born at Cockermouth, Cumberland, on April 7, 1770, the second son of John Wordsworth, attorney-at-law and agent to Sir James Lowther (afterwards first earl of Lonsdale). His mother was Anne, daughter of William Cookson, a Penrith mercer, and Dorothy, born Crackanthorp, "of the ancient family of that name, who from the time of Edward the Third had lived in Newbiggen Hall, Westmorland" (Autobiographical Memoranda). The Wordsworths were a Yorkshire family "settled at Peniston . . . probably before the Norman Conquest" (ib.); the first of the family to settle in the Lake District was the poet's grandfather.

Wordsworth's mother died in 1778; and in that year he was sent to the ancient grammar school of Hawkshead, boarding in the village with Anne Tyson, at the cottage still known as "Wordsworth's cottage." His father died five years later — Wordsworth speaks of him as having "never recovered his usual cheerfulness" after the loss of his wife. The family were placed under the guardianship of two uncles, Richard Wordsworth and Christopher Crackanthorp. Beyond the claims which he had against the Lowther family (amounting to well over £4,000), claims which were the subject of protracted dispute, until they were acknowledged and discharged, in 1802, by the second earl of Lonsdale, the father had left small provision for his children. Wordsworth, however, was sent in 1787 to St. John's, Cambridge, of which college his uncle, William Cookson, had been a fellow. Already he had contracted both the habit of verse and the temperament of poetry. Among his published works are included two sets of verses written as early as 1786; and "I wrote," he says, "while yet a schoolboy, a long poem running upon my own adventures and the scenery of the country in which I was brought up": a poem containing "thoughts and images" most of which were used later in the poet's "other writings." He had been sufficiently well taught at Hawkshead, at least in mathematics, to have "a full twelve months' start" of the freshmen of his year at St. John's; and to this circumstance he attributes it that he "got into rather an idle way," "reading nothing but classic authors according to my fancy, and Italian poetry" (Autobiogr. Mem.). His Italian master was a man who had "been well acquainted with the poet Gray." During his freshman year he composed a large part of the Evening *Walk,* finishing it in 1789. Of his Cambridge friends the chief was Robert Jones, who subsequently took orders, with whom, in 1790, Wordsworth undertook the walking tour in France and Switzerland which is commemorated in Descriptive Sketches. Forty years later, Jones, "fat and roundabout and rosy, and puffing and panting" up very moderate hills, "looked back to that journey as the golden and sunny spot in his life" (Dorothy Wordsworth: Letters ii., 497).

In Jan. 1791 Wordsworth took his B.A. degree. It is clear from Books iii.–vi. of the Prelude that he conceived himself to have derived from his three years residence in Cambridge little intellectual profit; and "the manners of the young men," he wrote later, "were very frantic and dissolute at that time" (Letters, i., 162). His guardians had destined him for the Church. But the thought of "vegetating on a paltry curacy" made no strong appeal to him (ib. i., 33); and it is probable that already before he had taken his degree he had experienced some unsettlement both of religious and of moral belief. He pleaded for delay; and he seems to have persuaded his guardians that the best preparation for the study of oriental languages (pressed upon him as a likely means of advancement) would be a year spent in learning French. He went to France at the end of Nov. 1791, and he remained there till the end of 1792, for the most part in Orleans and Blois. He took to France a keen sympathy with the principles of the revolution; and his faith in the revolutionary idea was deepened and intensified by the intimate friendship which he formed in Blois with Michel de Beaupuy, a captain (later general) in the republican

army. The ninth book of the *Prelude* bears witness to the profound influence exercised upon his political thinking by Beaupuy. In Orleans he formed an attachment to Marie-Anne Vallon ("Annette"), a girl of royalist family. by whom he had a daughter, Anne-Caroline (baptised Dec. 15, 1792); and by whose marriage in 1816 with Jean Baptiste Martin Baudouin he has a number of French descendants. Of "Annette" the *Prelude* tells us nothing. Yet, as first sketched, it contained the story of *Vaudracour and Julia*, of which the earlier sections, at least, were not written without some thought of her. The amatory colouring of the second paragraph of the poem is unlike the Wordsworth whom we know best; and the third paragraph attempts (we must suppose) such justification of the "Annette" episode as Wordsworth felt to be possible. He felt himself to have been betrayed by a false philosophy, by his creed of nature and freedom:

> tempted to decline
> To perilous weakness, and entrust the cause
> To nature, for a happy end of all.

During his sojourn in France he wrote the greater part of *Descriptive Sketches*. Isolated passages crudely expressed his revolutionary sympathies, his deep moral dejection; and even a mood of religious unbelief. Yet as late as May 1792, "it is at present my intention," he writes, "to take orders in the approaching winter or spring. My uncle the clergyman will furnish me with a title" (*Letters*, i., 42). "I should certainly have wished to defer the moment" (*Letters*, i., 42). The failure here, at once of religious and moral conviction, seems complete.

In Feb. 1793 Wordsworth published both *Descriptive Sketches* and *An Evening Walk*. Of both poems perhaps the principal interest resides in the conflict between style and substance: things freshly and romantically observed fight for expression within the limits of a diction which has all the faults of the worst 18th-century work. In the same month England declared war upon France — the first real shock, Wordsworth tells us, which his moral nature had received (*Prelude* x., 268 *et seq.*). At once he ranged himself on the side of his country's enemies. February 1793 was further notable in that it saw the publication of Godwin's *Political Justice*. Hitherto, Wordsworth had been content to take his philosophy from Rousseau, in ethics deifying "nature," and in politics making a gospel of "the general will." Under the influence of Godwin, he began now to deify Reason, the individual reason — collective reason being only another name for the general will, that is, for a tyranny.

The period 1793–96 is, in respect both of the external and of the internal biography of Wordsworth, still involved in considerable obscurity; an obscurity not much illumined by the rather confused account of his own development which he himself furnishes to us in Books xi.–xii. of the *Prelude*. Early in 1793 he wrote the "Letter to the Bishop of Llandaff . . . by a Republican," in which he is still the champion of the general will. The Letter attacks monarchy, the clergy and (here under Godwinian influence) the state penal code. For the bishop, a renegade liberal, Wordsworth entertains some such sentiments as, later, were felt for himself by Hazlitt and others. The Letter was not published until 1876. If its self-conscious loftiness of style and sentiment does not altogether lift it out of the commonplace, it is yet a composition which may be accounted, for the years from which it proceeded, remarkable. In the autumn of 1793, he began upon *Guilt and Sorrow*, his first considerable poem, in many parts of it distinctively "Godwinian." It was finished in 1794, and a portion of it, under the title of *The Female Vagrant* was printed in the *Lyrical Ballads* (1798); the whole saw the light (a good deal revised) in 1842. In 1795 he began, and in 1796 finished, *The Borderers: A Tragedy*, of which the gloomy perversities show him struggling out of the Godwinism in which he had been for two painful years involved. Sometime in 1795 he wrote his first truly characteristic piece, "Nay, Traveller, rest . . .", in which the victory over Godwinism is already complete.

For two years since his return from France Wordsworth had led a wandering life, making no attempt to find for himself a profession. In the early part of 1795 occurred the death of his friend Raisley Calvert, who left him a bequest of £900. He used the independence afforded to him to settle with his sister Dorothy at Racedown, Crewkerne. It was here that *The Borderers* was finished; and here (more important) *Margaret, or The Ruined Cottage* (incorporated, later, in Book i. of *The Excursion)* was begun. The poem was finished at Alfoxden, whither, in the summer of 1797, the Wordsworths moved, in order to be near Coleridge at Nether Stowey. In the *Prelude* Wordsworth traces the recovery of his moral, and poetical, health to the influence, first of his sister, and secondly of Coleridge. It was while these "three persons, and one soul" were living in close conjunction in Somerset that the *Lyrical Ballads* were conceived and written.

The publication (September 1798) of the *Lyrical Ballads* constitutes the most important event in the history of English poetry after Milton. Of the genesis of the book Coleridge has given, in the first section of chap. xiv. of the *Biographia Literaria*, an account which may be summarised by saying that, while his own share in the work was directed towards illustrating (in *The Ancient Mariner)* the naturalness of the supernatural, Wordsworth's task was to point the supernatural meanings, the inner spirituality of actions and incidents the most natural conceivable. We are concerned here only with Wordsworth; and it is notable that the *Advertisement* to the *Lyrical Ballads* is concerned only with him (save for the excuses made, in its last section, for the diction of *The Ancient Mariner)*. "It is the honourable characteristic of poetry' — says the opening sentence of the *Advertisement* — "that its materials are to be found in every subject which can interest the human mind." That is only to say that the natural, the ordinary, the obvious, has its poetry, its supernaturalness. It states the theme which, in Coleridge's account, it was Wordsworth's task to illustrate. But if poetry can draw its supernatural effects from natural objects and happenings, to what extent can it employ (its primary means being language) merely natural language? The *Ballads*, says the *Advertisement*, are an "experiment" to discover "how far the language of conversation . . . is adapted for the purposes of poetic pleasure." Perhaps the principal result of it was the discovery of a new blank verse — that of what Coleridge christened the "Conversation Poem." If we leave aside *The Ancient Mariner*, the best of the *Lyrical Ballads* of 1798 is that part for which blank verse is used; a blank verse neither Shakespearian nor Miltonic; domestic, but with a telling quality wanting to the domestic blank verse of Cowper; individual without eccentricity; attaining its perfection in *Tintern Abbey*. The same conversational triumph meets us in the second volume of the *Lyrical Ballads* (1800) in "There was a Boy . . .", *Michael* and *The Brothers;* and indeed, wherever in the two volumes blank verse is used, it is used to fine effect.

In the purely lyrical species Wordsworth is, in the 1798 volume, less successful. Perhaps, in this kind, only "It is the first mild day of March . . ." and "I heard a thousand blended notes . . ." have the perfect lyric quality which, two years later, he was to show in the Lucy Poems, *The Fountain, The Two April Mornings*, the *Poet's Epitaph*. Several of the lyrical experiments fail badly; e.g., *Goody Blake*, to which the *Advertisement* unhappily directed special attention. But the volumes of 1798 and 1800 contained, together, a sufficient number of lyrical successes to afford an overwhelming demonstration of the power of poetry to use natural language, even the "language of conversation." But Wordsworth had an affection for his failures; and in the preface of 1800 he threw after them many paradoxes of theory and much false history.

It is, however, neither a theory of diction nor the successful practice of a new diction which gives to the *Lyrical Ballads* the importance which they have in literary history. The greatness of the book may more truly be conceived to lie in the metaphysic of the imagination from which it proceeds (and from which, indeed, the theory of diction itself proceeds). The outlines of this metaphysic are hinted in Wordsworth's Prefaces and Notes, and in passages of the poems themselves (the *Prelude* being, in this connection, particularly valuable). The *Lyrical Ballads* owe their greatness to the power with which they revindicate for poetry the life of the senses. We are only poets in so far as we confide ourselves to the senses. We see into the life of things only when

we receive the impressions of sense in a "wise passiveness," disconnecting ourselves from the tie of reason and custom, from "the meddling intellect"—the operation of which is only one of the effects of custom. The source of truth—poetic truth—is not reason, but the eyes and ears. What is the matter with the poetry of the Age of Reason is that it had lost the art of seeing and hearing, or of performing these acts *purely*, in a fashion, that is to say, not vitiated by custom or theory. It had lost, at the same time, the gift of pure expression, using a mere customary or conventional diction. It is the supreme achievement of the *Lyrical Ballads* to have brought back the glory and the freshness of the senses. The work is done with the greater power and convincingness from the circumstance that Wordsworth had won his way back to nature and the senses through the valley of the shadow, through the rationalism of Godwin. To say that he had come back from Godwin to Rousseau would be to misconceive him. Obviously he supposes his later naturalism to escape the perils of Rousseauism. Obviously also he believes his metaphysic of the imagination—which might easily be taken for a very bare philosophic "sensationalism'—to rise above the difficulties of the ordinary sensationalist creed. A logical demonstration of his metaphysic he nowhere essays. We may be content with that practical demonstration of it which his poetry furnishes.

The six months following the publication of the *Lyrical Ballads* Wordsworth spent in Germany. In Oct. 1799 he settled in Grasmere; and in that neighbourhood, save for occasional tours in Scotland and on the Continent, the rest of his life was spent. A new edition of the *Lyrical Ballads* was called for in 1800, and this edition Wordsworth enriched by the famous preface and by a second volume of poems—among them some of his best and most original pieces. A third edition appeared in 1802 (with the appendix on Poetic Diction), and a fourth in 1805. In 1804 he married Mary Hutchinson—in 1802 he had visited "Annette," and her story had been revealed to Mary.

In the year in which the first edition of the *Lyrical Ballads* appeared, Wordsworth had already begun upon the *Prelude* (de Selincourt, p. **xxxi.)**; and in the year which saw the fourth edition of the Ballads he finished it. In this poem, "after *Paradise Lost* the greatest long poem in the language" **(A.** C. Bradley), he traces his spiritual autobiography, "the Growth of a Poet's Mind," from earliest childhood, from the first intimations which came to him of poetry and immortality, down to the date at which he took the resolution of devoting himself wholly to poetry. As a document of the romantic revival the book (not published until after his death) is of the first importance; and apart from this historical interest, it constitutes a handbook of the imaginative life unique in subtlety and power. It was intended to be a preparation for "a philosophical poem, containing views of Man, Nature and Society," of which the *Excursion* was a part (the only part finished). Of the same poem another part is the impressive fragment of *The Recluse*, written in 1800 but only published some years after in 1888.

In 1807 Wordsworth published the *Poems in Two Volumes*. These show a wide extension of his poetical power. New life is given to the sonnet—used with fine effect to express lofty patriotic sentiment—and to the ode—here were printed for the first time the *Ode to Duty* and the immortal *Ode on Intimations of Immortality*. The volumes of 1800 and 1807 establish Wordsworth as one of the great inventors of poetical forms. But, form apart, these volumes, taken together with the *Prelude*, the *Recluse* fragment, *Margaret, or the Ruined Cottage* (all written before 1807), constitute a body of poetical work of which the compass and original power are such as to place him among the greatest poets. By 1807, in fact, his best work was done; not all his good work, but his best work. The death, in 1805, of his brother John Wordsworth (of whom the *Happy Warrior* is, in part, a commemoration) had affected deeply a temperament to which melancholy was native, inducing in Wordsworth a regress upon religious orthodoxy, and upon orthodoxies less venial. By the end of the first decade of the nineteenth century his thinking, in religion and in politics, loses that speculative rebel quality from which it drew so much of its early strength; and his imagination, ever a miser of its memories, and now more so, tends to hoard barren incidents and trivial perceptions, to be the material of later poetry. It requires, henceforth, some cause in which his affections are passionately engaged to educe the old power. Perhaps he is, after 1808, most like himself, not in poetry, but in the noble prose of the tract upon the *Convention of Cintra* (1809). In 1814 appeared the *Excursion*. "This will never do," said Jeffrey. Yet Keats thought it "one of the three things to rejoice at in this age." Even outside the two first books, which belong to the Somerset period, the poem has lofty and noble reaches. The general decline of power, however (especially if it be compared with the *Prelude*), is marked. In 1815 was published the first collected edition of the poet's works (with the *Essay Supplementary to the Preface);* in the same year the *White Doe of Rylstone;* in 1819 *Peter Bell* (written in 1798) and the *Wagoner;* in 1820 *The River Duddon,* and *Miscellaneous Poems. A* further decline of power is witnessed, in 1822, by the *Ecclesiastical Sketches* and the *Memorials of a Tour on the Continent.* To the last, however, it is unsafe to regard Wordsworth as negligible; at any moment the old power is apt to reassert itself. It is to the period of his decline that we owe, in the *Prelude,* the magic of the famous description of Newton's statue—

> The marble index of a mind for ever
> Voyaging through strange seas of thought alone.

Many, again, of his best sonnets come from the late period. Here and there, from the *Evening Voluntaries* (1835) the old greatness flashes out. After 1835 Wordsworth published nothing new in poetry.

"Up to 1820 the name of Wordsworth," said De Quincey, "was trampled under foot; from 1820 to 1830 it was militant; from 1830 to 1835 it has been triumphant." In 1839 Wordsworth received the honorary degree of D.C.L. from the University of Oxford: he was presented by Keble, and the ceremony showed how deep was the hold that his poetry now had on young and old alike. In 1842 he was awarded a civil list pension of £300 a year (resigning the Distributorship of Stamps which he had held since 1813, a sinecure which had brought on him many reproaches). In 1843 he was appointed poet laureate, in succession to Southey. He died on April 23, 1850; and is buried in the churchyard of Grasmere. His wife survived him by nine years. Of his five children, two had died in 1812; his daughter, Dora, wife of Edward Quillinan, had died in 1847. Two surviving sons, John and William, left children. The present literary representative is the poet's grandson, Gordon Wordsworth of Ambleside.

BIBLIOGRAPHY.—The authorised edition of the Poetical Works is that published by Moxon in 1849–50 (6 vol.); which, however, does not contain *The Prelude* (first printed in 1850) or *The Recluse* (1888, Macmillan). Of subsequent texts the principal are: W. Knight, *1882–86,* 8 vols.; E. Dowden, 1892–93, 7 vols.; Nowell Smith, 1908, 3 vols.; and in one volume, J. Morley, 1888; T. Hutchinson, 1895. In 1926 E. de Selincourt published, from the original mss., Wordsworth's first version of *The Prelude* (with the "authorised" text *vis-a-vis).* The Prose Works were collected by A. B. Grosart, 1876, 3 vols. (out of print), and are accessible in W. Knight's edition, 1896, 2 vols. *The Letters of the Wordsworth Family* were printed by W. Knight in 1907 (out of print); other letters of Wordsworth are in Edith Morley's *Correspondence of Crabb Robinson with the Wordsworth Circle* (1927). Wordsworth's *Tract on the Convention of Cintra* was edited separately by **A.** V. Dicey in 1915; the *Guide to the Lakes* by E. de Selincourt in 1906; the *Poems and Extracts from the Works of Anne, Countess of Winchelsea* by *J. R.* Rees in 1905. *A Concordance to the Poems of W. W.* by Lane Cooper was published in 1911.

For the life of Wordsworth chief authorities are: *Memoirs of W. W.,* by Christopher Wordsworth, 1851 (with the poet's "Autobiographical Memoranda"); *Life of William Wordsworth* by W. Knight, 1889; *William Wordsworth, his Life, Works and Influence, by* G. *M.* Harper (containing new material 1910); *The Early Life of Wordsworth* by *E.* Legouis, E.T., 1897. New facts about Wordsworth are to be found in G. M. Harper's *Wordsworth's French Daughter,* 1921, and in E. Legouis' *Wordsworth in a New Light,* 1923. Among general interpretative studies of Wordsworth may be mentioned those of F. W. H. Myers, W. Raleigh, H. W. Garrod, O. Elton; among special studies E. Barstow, *Wordsworth' Theory of Poetic Diction,* 1917; W. Beatty, *William Wordsworth: his Doctrine and Art in their Historical Relations,* 1927. Upon bibliographical questions *Two Lake Poets: a Catalogue,* etc., *by T* J Wise (1927) should be consulted. (H. W. GA.)

WORKERS, EDUCATION OF: *see* **ADULT** EDUCATION.

WORKHOUSE. The workhouse (in Scotland known as the poorhouse) is a British institution in which paupers are maintained. It is administered in England and Wales by the board of guardians (the parish council in Scotland), under regulations prescribed by a central authority, the Ministry of Health or the Scottish Board of Health. Destitute persons are admitted to the workhouse by a written order of the board of guardians or the relieving officer, or in exceptional cases by the master or matron without an order. All inmates are subject to strict discipline whilst remaining in the workhouse, and, under ordinary circumstances, may not leave the institution without first giving "reasonable notice," which is usually held to mean not less than 24 hours and in some situations it may be as long as three days.

Primitive workhouses were set up here and there in the 17th century under the Poor Relief Act of 1601, which directed the overseers of every parish, amongst other things, to raise funds "for providing a convenient stock of flax, hemp, wool, thread, iron and other ware and stuff to set the poor on work." But in this early period the authorities were for the most part content with "houses of correction" for the chastisement of the vagabond.

The 18th century saw the establishment of workhouses in towns and rural parishes. The administration was either brutally hard or incredibly lax; they ranged, it has been said, from "houses of terror" to "houses of debauchery." In 1834 the modern system was introduced. The 15,000 parishes of England and Wales were organized into a few hundred poor law "unions," each of which was required to set up a "well-regulated workhouse." Only in this institution could an able-bodied man and his family get relief, and in order to deter him from coming, the regimen was purposely made repugnant.

The Workhouse Condemned. — But in the course of the 19th century the strict principles of 1834 were generally relaxed, and in 1909 a royal commission found the state of the workhouses with few exceptions deplorable, and unanimously recommended their abolition. They were not abolished, but some improvement was effected under pressure from the central authority. In particular, a better "classification" of the inmates was enjoined. Married couples aged over 60 are now not to be separated if they wish to live together, and children between the ages of 3 and 16 may not be maintained in the workhouse. Some boards of guardians, however, have persisted in breaking this latter regulation, and in 1927 it was reported that in Somerset 15%, in Dorset 31% and in Cornwall 37% of the pauper children were in the workhouses. An effort was also made to render the workhouse less repellent to the poor by calling it "the institution," but there was no popular enthusiasm over this, and the old name continued in general use. After World War I, with the general relaxation of the restrictions on outdoor relief, the workhouse became less than ever a place for "testing" the able-bodied by disagreeable tasks of work. The inmates are chiefly aged and infirm. (See POOR LAW.)

(C. M. L.)

WORKING MEN'S CLUBS have existed for workmen in England and Wales (there are few in either Scotland or Northern Ireland) since the middle of the nineteenth century.

The majority are organized in the Working Men's Club and Institute Union, which owes its existence to the Rev. Henry Solly, a Unitarian minister, and was born at a meeting at which Lord Brougham presided, on June 14, 1862.

Many of the clubs were eleemosynary and scarcely one then founded is in existence today. It was intended that such clubs should be teetotal and apart from the abandonment of this policy their objects remain as in the beginning, and are as follows:

(1) That working men's clubs and institutes are calculated not only to diminish excessive use of intoxicating liquors, but also to promote self-culture and the growth of a healthy public spirit among the mass of people.

(2) That there are few social reforms of greater importance to this country than the substitution of clubs and institutes for public houses as places of resort for the recreation and business of the working classes.

Although the Union did not become entirely independent of outside support till 1890 it had, under the guidance of Hodgson Pratt, worked steadily to that end. In 1884 it became completely democratic in constitution. J. J. Dent became Secretary in 1883 and was largely responsible for the establishment of the Union on a firm and financially sound basis. In August, 1939, it included 2,854 clubs, with over 1,050,000 members, unequally distributed over the United Kingdom. The Union maintains four convalescent homes, accommodating 4,500 members yearly at a cost of over £18,000; and its expenditure during 1938 on the provision of educational and recreational facilities for its members amounted to £6,000. In addition to the Union clubs official returns show that there were on the register at the end of 1938 1,391 ex-Service men's clubs with a membership of 320,900, and 1,321 Conservative and 546 Liberal clubs (membership 363,000 and 147,500 respectively), the large majority of which were of this class. These figures do not include the many clubs established in the special areas and elsewhere for the unemployed.

WORKINGTON, a seaport and municipal borough in Cumberland, England, 34 mi. S.W. of Carlisle. Pop. (1938) 27,380. Area, 8.8 sq.mi. It stands on the river Derwent, and the Lonsdale dock is 4½ ac. in extent. Engineering is the main industry, steel rails, tin plates, bridges and fences are made. There are also collieries, with some workings beneath the sea. The town was incorporated in 1888 and is in the Workington parliamentary division. Near by is the castellated Workington hall.

WORKMEN'S COMPENSATION. Until 1880 the only remedy which the law of Great Britain provided for a workman who had suffered physical injury in the course of his employment was a common law action in which the plaintiff had to establish that his injury was due to some personal fault in the employer. as that the employer had been guilty of personal negligence, or had knowingly employed an incompetent servant, or had committed a breach of some statutory duty. Even if the expense which had to be incurred was not an insurmountable obstacle, the cases where a workman would hope to recover damages for his injury by means of a common law action were comparatively rare. In an action for negligence formidable defences were available to the employer. Contributory negligence in the workman himself would be pleaded as a matter of course, and if it was established that the plaintiff could, by the exercise of ordinary care, have avoided the consequences of the defendant's negligence the action must fail. The doctrine of *volenti* non fit *injuria* might destroy the injured workman's right to damages on the ground that, knowing the risk he was running, he expressly or impliedly agreed to accept that risk. Then there was the defence of "common employment," which deprived the plaintiff of his right to damages when his injury was due to the negligence of a fellow workman. Moreover, the position of the dependants of a workman whose injuries had proved fatal was more desperate still, for the right of action was personal to the injured man and died with him. Lord Campbell's Act of 1846 created an exception to this rule in favour of a wife, husband, parent or child of the deceased, and enabled an action to be brought for the benefit of that limited class of persons in respect of the workman's death as a result of another's wrongful act or negligence. But the defences which were available in an action by the injured workman himself remained available as against the dependants of a workman whose injuries had proved fatal. So where a bricklayer was killed by the collapse of scaffolding which had been erected by men in the employment of the same employer who had not himself superintended the work, it was held that the master builder was under no liability (*Wigmore* v. Jay 5 Ex. 354).

Thereafter two different currents of opinion as to the manner in which the unsatisfactory state of the law should be remedied are observable. On the one hand, there was the view that any remedial measure should fit into the framework of the existing common law rules, and that all that was necessary was that those rules should be modified to remedy particular grievances. This school of thought found expression in the Employers' Liability Bill, introduced in 1893 by Asquith, who thus indicated its three vital principles: "The first is that it abolishes the doctrine of common employment; the second is that it prohibits contracts by

a workman renouncing his statutory rights; and thirdly, it simplifies the procedure by means of which the workman can seek his statutory remedy." The views of the opposing body of opinion were expressed in the amendment moved by Joseph Chamberlain when Asquith's bill was before the house of commons: "That no amendment of the law relating to employers' liability will be final or satisfactory which does not provide compensation to workmen for all injuries sustained in the ordinary course of their employment and not caused by their own acts or default." The House of Commons passed Asquith's bill, but abandoned it rather than accept an amendment of the House of Lords, the purpose of which was the preservation of the principle of contracting out, although subject to certain safeguards.

The British Workmen's Compensation Acts.—The Workmen's Compensation Act 1897 introduced a new principle into the law of the relationship between master and servant by imposing a liability on the employer to pay compensation to an injured workman, or if his injury proved fatal, to his dependants, although there had been no wrongful act or omission on the part of the employer or of anyone employed by him. Liability was imposed no less upon the employer who was blameless than upon him who had been guilty of negligence. Contracting-out was forbidden, save where an equally advantageous scheme, duly certified as such by the Registrar of Friendly Societies, was substituted for liability under the Act.

The Act of 1897 came up for review before a departmental committee appointed for the purpose in 1903. Many of the recommendations of that committee *(Report of Departmental Committee on Compensation for Injuries to Workmen,* 1904, Cmd. 2,208) were embodied in the Workmen's Compensation Act 1906, by which the Act of 1897 was repealed. In 1919 the departmental committee generally known as the Holman Gregory committee was appointed to report what alterations of the law were required "to remedy defects which experience has disclosed"; and "whether it would be desirable to establish a system of accident assurance under the control or supervision of the State." The committee reported in 1920 *(Report of Departmental Committee on Compensation for Injuries to Workmen,* 1920, Cmd. 816; *Minutes of Evidence,* Cmd. 908 and 909). Post-war conditions were not favourable to the achievement of the whole of the scheme of reform recommended by the committee, but a good deal of it was embodied in the amending Act of 1923. Finally, the consolidating Act of 1925 was passed and there the law must now be sought.

The Act of 1906 applied to the United Kingdom of Great Britain and Ireland. When the 1923 Act was passed the status of Ireland had changed. The present Act applies to England and Scotland only. It does not extend to Northern Ireland "except where otherwise expressly provided," and since the Irish Free State has dominion status it, of course, has its own legislation. Northern Ireland has passed an Act corresponding with the British Act.

From the first the remedy by way of the Workmen's Compensation Acts has, in Great Britain, been an alternative, and not an exclusive remedy. If circumstances are such that the Workmen's Compensation Act applies, the injured workman or his representatives are not barred from bringing an action at common law or under the Employers' Liability Act if the evidence necessary to support an action is forthcoming. The principle is laid down, however, that the employer is not to be liable to pay compensation twice over in respect of the same accident.

Employments to Which the Acts Apply.—The Workmen's Compensation Act of 1897 applied only to the more dangerous industries, and in effect to employers of the class best able to bear the liability. But the Workmen's Compensation Act 1900 applied the 1897 Act to "the employment of workmen in agriculture by any employer who habitually employs one or more workmen in such employment." Whereas the first Workmen's Coinpensation Act excluded from its scope all workmen not expressly included, the Act of 1906 included all "workmen" except the few classes expressly excluded, namely, non-manual workers whose remuneration exceeded £250 a year (the limit was raised to £350 by the 1923 Act); persons employed casually otherwise than for the purposes of the employer's trade or business; outworkers; members of the employer's family dwelling in his house; members of a police force, and persons in the army and navy. With the specific exceptions mentioned, the expression "workman" is defined to include "any person who has entered into or works under a contract of service or apprenticeship with an employer whether by way of manual labour, clerical work or otherwise." The sweep of the Act was thus widened in 1906 so as to include not only the coal miner and the engineer, but also the clerk in the counting-house, the shop assistant and the general servant.

Yet there were still workers excluded from the protection of the Act. These cases are a result of the general rule of law that, in the absence of an intention indicated in the Statute the presumption is that Parliament does not design its Acts to operate beyond the territorial limits of Great Britain. A seaman on a British ship meeting with an accident when abroad would be outside the Acts; so with the crews of British aircraft, when outside Great Britain. Again, if the legal relationship between, say, a cab proprietor and his driver is that of bailor and bailee, the relationship, the basis of which is a contract of service, which is the fundamental test for inclusion in the Acts, is absent. To bring such cases within the Workmen's Compensation Acts specific enactment has accordingly been necessary.

By Whom Compensation Is Paid.—The liability to pay compensation is imposed directly on the employer. It is not paid out of a fund to which the workman is himself a subscriber, as under national insurance. Nor does the employer's liability begin and end with the payment to a compensation fund, as in countries where there is a State scheme of workmen's compensation Although in Great Britain insurance in respect of these risks is not compulsory, most employers do, in fact, transfer their liability to an insurance company.

What Injuries Are Within the Acts.—The law defining the liability of employers is as follows: If, in the employments to which the Act applies, "personal injury by accident arising out of and in the course of the employment is caused to a workman, his employer shall, subject as hereinafter mentioned, be liable to pay compensation." It is quite true that this form of words has given rise to an unprecedented crop of litigation. Nevertheless, a simpler and more satisfactory formula appears to be hard to find, for the formula has remained unaltered to the present day. Furthermore, the British form of words has been generally adopted in the Workmen's Compensation statutes of the British dominions and the United States, and in the Act recently passed by India the same formula appears.

On analysis it will be seen that the formula requires four conditions to be satisfied. (i) There must have been an "accident." This may include heat-stroke, murder and rupture of an aneurism by the strain of work. It does not include disease which, although traceable to the workman's employment, is gradual in its onset. (ii) The personal injury must have resulted from the accident. The incapacity or death must not be the consequence of some new intervening cause. So, if a workman dies from the effects of anaesthetics during an operation made necessary by an accident, the fact that the anaesthetic and not the accident was the immediate cause of death does not render the occurrence any the less a "personal injury by accident." Not so, however, if the fatal result was due to unskilful treatment of the injury. (iii) The accident must have arisen "in the course of" the employment. If it occurred before the employment began or after it had ended, compensation will not be payable. The beginning of employment is not the same thing as the beginning of work: the employment may begin when the workman reaches, say, a private road leading to the place of actual work: it may extend to attendance at the employers' premises for the purpose of drawing wages when not actually at work. (iv) The accident must have arisen "out of" the employment. The circumstances in which an accident may happen are infinite, and the meaning of the three words "arising out of" has to be gathered from literally hundreds of decisions in the Court of Appeal and the House of Lords. No universal test, whether an accident arose "out of" the employment, seems possible; but Lord Sumner in L. & Y. *Rly.* v. *Highley* [1917] A.C. 352 suggested a test which has been frequently ap-

plied, namely, "was it part of the injured person's employment to hazard, to suffer or to do that which caused his injury? If yea, the accident arose out of his employment. If nay, it did not."

Compensation is not necessarily payable because illness overtakes a workman while at work. For compensation to be payable for disablement or death due to disease, it must either be shown that the illness resulted from an accident, as where blood poisoning sets in as a consequence of a wound, however slight, received when at work; or the disease must be one of those to which the Workmen's Compensation Acts are specially applied, viz., anthrax, lead, phosphorus, mercury or arsenic poisoning and the miner's disease known as ankylostomiasis, together with the long list of other industrial diseases brought within the scope of the Acts by order of the home secretary in pursuance of his statutory powers.

Conditions Which Disqualify for Compensation. — In some of the dominions and the United States, it is provided that an injury which is self-inflicted, or was the result of intoxication, shall not be the subject of compensation. In Great Britain it has been left to the courts to rule out such cases, and only two disqualifications for compensation are the subject of specific enactment, namely, serious and wilful misconduct (but only in cases not resulting in death or serious and permanent disablement) and the fact that the incapacity did not extend beyond what is known as "the waiting period."

It is alleged in justification of this "waiting period" that it excludes a vast number of trivial claims, the cost of investigating and dealing with which would be disproportionate to the amount at stake. The British Act applies the simple plan by which compensation is payable after the first three days in all cases and from the date of the accident if the incapacity lasts four weeks or more. It is a condition to the granting of compensation that the accident has been brought to the knowledge of the employer as soon as possible and a claim for compensation made within six months from the occurrence of the accident, or, in fatal cases, within six months from the date of death, unless the absence of notice or failure to make the claim can be excused on one or other of the grounds indicated in the Statute, such as mistake, absence from Great Britain or "other reasonable cause."

Scale of Compensation. — In fatal cases compensation takes the form of a lump sum payment to or for the benefit of the deceased workman's dependants. Where the accident results in incapacity only, compensation is paid to the injured workman, and takes the form of a weekly payment during incapacity. The sum payable in fatal cases varies, in the first place according as the workman leaves total or partial dependants or no dependants at all and, in the second place, according as the dependants do or do not include children under the age of 15. If the deceased workman leaves any person entitled to rank as a dependant within the definition of the Act wholly dependent upon his earnings, the lump sum payable is £200 or a sum equal to the workman's earnings during the previous three years, whichever is the larger, but not exceeding £300. If the workman leaves only partial dependants, compensation is the sum which is "reasonable and proportionate to the injury" suffered by the dependants as a result of the workman's death, subject to the same maximum. If no dependants are left, only expenses of medical attendance and burial up to £15 are payable. Until 1923 no distinction was made between the case where the only dependant was, say, a young widow, and the case where a middle-aged widow and a family of small children were left to be provided for. The 1923 Act made provision for compensation additional to the above, where the workman leaves a widow or other member of his family dependant upon his earnings and in addition leaves one or more dependant children under the age of 1 j. This additional "children's allowance" is calculated according to the formula laid down in the Act and depends on the number of children and their respective ages. By way of illustration take the case of a workman earning 30s. a week, who leaves a widow and two children respectively seven and 14 years of age, all totally dependent upon his earnings. If the widow had been the only dependant the compensation payable would have been £234. But the "children's allowance" payable in addition is £105 6s., so that the total compensation payable amounts to £339 6s. The absolute maximum payable in a fatal case, including children's allowances, is £600. The lump sum payable in fatal cases is not paid direct to the dependants who, being generally persons unused to dealing with large sums, would possibly use it in an improvident manner, but is paid into the county court and by that court paid out to the dependants, according to their needs, in periodical instalments.

Where the workman is injured, but not killed, his weekly payment during total incapacity is a sum equal to 50% of his average weekly earnings but not exceeding 30s. So that compensation may not be wholly inadequate for the necessaries of life, provision is made by which workmen earning less than 50s. a week receive compensation in excess of 50% of earnings. Thus a workman whose earnings were 30s. a week would receive as compensation for total incapacity 20s. a week, and a workman earning only 20s. a week would get compensation amounting to as much as 75% of his weekly earnings. If the injury leaves him not totally but only partially incapacitated, so that a certain degree of working capacity exists, his compensation will be on a scale designed to give him one-half the difference between his earnings before and after the accident, special consideration being shown to workmen on the lower scales of wages.

Special provision is made for the case of minors who may meet with injury at their work when receiving only a low rate of wages, which rate, however, would normally be substantially increased when they become fully skilled workmen. Seeing that compensation is based on the wage rate during the time immediately preceding the accident, it would manifestly be unjust that compensation based on an apprentice's wages should continue without possibility of increase after the time when, but for the accident, he would be qualified for an adult workman's wages.

Compensation may be reviewed, and diminished or increased, according as the workman's condition gets better or worse. Most commonly such a review takes place when the workman, hitherto totally incapacitated, recovers part but not the whole of his earning capacity.

The authors of the original Act expected that disputed cases would in general be settled by private arbitration without resort to the courts. In fact, however, workmen's compensation cases are, with very few exceptions, dealt with by the county courts.

Systems Adopted in the Dominions and U.S.A.—In Great Britain, the employer is allowed to insure against his liability, or not, according to his discretion. But in certain of the States of the United States of America, and in a majority of the Canadian provinces, and in Queensland, the earlier Acts on the British model have been changed and the State, through the agency of a public department, levies upon employers compulsory contributions and itself assumes the liability to pay compensation. It is to the State fund and not to the individual employer that the injured workman or his dependants must look for compensation. The system, including the determination of disputes, is in reality a system of State insurance.

An intermediate position is occupied by the Australian States (with the exception of Queensland) and is common in the United States of America. There State intervention in workmen's compensation matters is directed to the compulsory insurance of workmen's compensation risk coupled, in the case of Victoria and New South Wales and sometimes in the United States, with the setting up of a State accident insurance office with which, however, private insurance enterprise is allowed to compete. In New Zealand, without the incentive of compulsory insurance, the accident branch of the Government insurance department provides an alternative to private insurance companies.

The German System. — In Germany, compensation for industrial accidents is one part of a code of social insurance of which sickness insurance, and invalidity, old age pensions, and widows' and orphans' pensions insurance are other branches. In Great Britain the latter forms of social insurance are contained in separate statutes and are administered by a distinct department.

The existing German law relating to accident insurance is contained in Part iii. of the Social Insurance Code of 1911 as revised in 1924, but its origin goes back to the period 1883 to 1889

when, by the triple scheme of social insurance then established in Germany, it became compulsory not only to insure, but to be a member of an association with liability to support a particular fund. Germany was indeed the first country to admit this liability.

Germany imposes the liability not on individual employers but on groups of employers organized in mutual trade associations. The industries broadly include the manufacturing and mining industries, the building trades, commercial undertakings and transport. Agriculture and navigation by sea constitute separate parts of the code. The financial liabilities of each association are determined annually and the levy on members necessary to cover compensation, reserves and administration expenses is based on the wage roll, modified by the risk as manifested by the accident rates for the particular industry or occupation. Compensation is paid through the post office. The workers contribute in some degree in that in respect of accidents causing temporary incapacity for work for a period not longer than 13 weeks, the case is dealt with by the sickness insurance organization and benefit paid by the sickness insurance fund to which employers and employed contribute in proportions of one-third and two-thirds. Only from the 14th week does the accident insurance organization take over the case. Compensation for industrial accidents provides an incentive to employers to avoid conditions likely to result in accidents and illness. The German code requires the employers' accident associations to issue regulations concerning the arrangements for the prevention of accidents and the rules of conduct to be observed by the workers. (C. M. KN.)

THE UNITED STATES

In comparison with Europe, workmen's compensation came late in the United States. To be sure, the common law rules of employers'liability had scarcely been laid down by the courts before attempts to modify them by legislation began in certain American States. The first such statute was passed in Georgia in 1855, and by 1910 practically every State had passed some sort of employers' liability statute. But these laws as interpreted by the courts merely mitigated the harshness of the common law rules, frequently in some rather minor respect. Moreover, many of them applied only to railway accidents in which the fellow servant rule operated with especial cruelty. In general the essential liability basis of the worker's right to recover remained unchanged. The first act substituting compensation for liability as its basic principle was enacted in Maryland in 1902; another (limited to coal mining) in Montana in 1909. Both these acts were held unconstitutional by State courts. The first permanent compensation law was passed by Congress in 1908, but it covered only certain classes of Government employees.

Commission Period. — The 20th century brought increasing public concern over industrial accidents and the plight of their victims. In State after State official commissions were set up to investigate and recommend legislation. Eight such commissions were appointed in 1910, twelve in 1911, and seven in 1913. Altogether there were 40 commissions between 1903 and 1919. These bodies were unanimous in their condemnation of the existing legal situation. Their investigations revealed that very few injured workers or their surviving dependents secured any compensation whatever from their employers, and then only after long delay. Moreover, a large proportion of any award of damages went to pay the lawyer's fee. Some of the commissions considered the possibility of strengthening existing employers' liability statutes, but concluded that this would prove an inadequate remedy, since the necessity for court action and proof of negligence by the employer would remain. With almost complete unanimity, the commissions recommended the adoption of the compensation principle and drafted bills along that line.

Period of Legislation. — New York passed the first comprehensive compensation law in 1910 and a wave of such laws followed. Ten States acted in 1911; eleven in 1912–14. Nine States and three territories were added to the compensation area in 1915–16, and eight states in 1917–19. After that the remaining States, mostly Southern, came in slowly; a law was passed for the Philippine islands. a Federal law for the District of Columbia, and another for the longshoremen and harbour workers who had been excluded from State legislation. In 1939 only two States, Arkansas and Mississippi, remained without workmen's compensation laws.

Constitutionality. — Like other kinds of American labour legislation, workmen's compensation had to run the gamut of the courts. Though eventually held constitutional, it bears the scars of that encounter in the "elective" feature which still remains in a majority of State compensation laws. It has been noted that the earliest attempts at compensation legislation in Maryland and Montana mere invalidated by State courts. These laws were limited in scope and defective in plan. In 1910, however, the largest industrial State in the Union, New York, passed a compulsory compensation law for the industries which it designated as hazardous. This law was promptly invalidated by the highest court of the State in the famous case of *Ives* v. *So. Buffalo Ry. Co.*, 201 N.Y. 271 (1911). The statute was held to be in conflict with both the State and Federal constitutions. The court stated that it knew of "no principle on which one can be compelled to indemnify another for loss unless it is based upon contractual obligation or fault" Under the Federal Judiciary Act as it then stood, this case couid not be appeaied to the United States Supreme Court. New York at once amended its State constitution expressly to permit workmen's compensation legislation But doubt as to the validity of such laws under the Federal Constitution obviously remained.

This doubt led to the use of the "election" device in two-thirds of the laws passed prior to 1917, the year in which the constitutionality of compulsory laws was finally established. By that time the elective pattern was so generally accepted that its use continued in many States. Under an elective law, the employer and the worker chose whether to come under compensation. The employer, however, was induced to come in by provisions which abrogated some or all of his common law defences (described above) if he remained outside. Most of these laws presumed his election to come in unless he took affirmative action to the contrary. It was generally believed that the absence of compulsion would make these elective laws easier to sustain.

However, in 1917, the United States Supreme Court finally upheld both compulsory and elective laws in three important decisions *(New York Central Rail. Co.* v. *White,* 243 U.S. 188; *Hawkins* v. *Bleakly,* 243 U.S. 210, and *Mountain Timber* Co. v. *Washington,* 243 U.S. 219). In the first case the court unanimously upheld New York's second compulsory law, passed in 1913 after the State constitution had been amended. The opinion emphasized that the compensation act did not merely destroy the body of common law rules relating to industrial accidents, but replaced them with another system. The court further declared that "liability without fault is not a novelty in the law." In the second case the court unanimously upheld Iowa's elective law. In the third case it sustained the compulsory law of the State of Washington which further required all covered employers to insure in a State insurance fund. This decision was reached by a five to four vote.

Comparison of American and British Systems — American compensation laws differ from the British Act in several important respects. In the first place, they make compensation an exclusive remedy. In every State but one, the law denies the worker a choice *after the accident* between compensation and his right to sue for damages. Under compulsory laws he loses his right to sue entirely, except under certain special circumstances. Under elective laws he must choose between the two remedies prior to the accident; ordinarily he is presumed to accept compensation along with his employer. Again in contrast to the British system, employers are required under American acts to insure their compensation risk. In virtually all jurisdictions, all employers must carry insurance except those who can satisfy certain standards of financial responsibility and qualify as "self insurers." In seven States in 1939 employers were required to insure in the exclusive State fund; in 12 jurisdictions they had a choice between a State fund and private insurance; in the remaining States only private insurance carriers were available. Finally, unlike Great Britain, virtually every American State had by 1939 established some kind

of administrative agency for the decision of disputed compensation claims. Appeal to the courts from these quasi-judicial bodies could be made only on questions of law, not of fact. In addition these administrative agencies were charged with the affirmative responsibility to see that injured workers received the compensation due them. American compensation laws resemble the British Act in their benefit features. After a specified waiting period, compensation is paid covering medical care and a portion of wage loss measured as a percentage of average full time earnings. Various methods are used in different States in computing benefits due in case of death or one or another type of disability. The definition of injuries covered is typically the same as that used in Great Britain; namely, "injuries arising out of and in the course of employment." These terms have been interpreted in numerous court decisions. In addition to accidents, some kinds of occupational disease are included under more than half the American compensation laws. By 1939, 23 States and 6 other jurisdictions had amended their laws to this effect. However, only 14 of these acts provided complete coverage. The remainder compensated for certain listed diseases, or were more limited in scope. Though workmen's compensation had been generally accepted in the **U.S.** for about 20 years, it is important to note that in 1939, farm labourers, domestic servants, casual workers, and employees of small employers were still generally excluded from the scope of compensation laws. Interstate railway employees remained under a special employers' liability statute. The effect of these exclusions was to leave at least 20% of American workers outside the compensation system. Benefits are limited both in amount and duration so that they never equal the full wage loss.

WORKSOP, a municipal borough in the Bassetlaw parliamentary division of Nottinghamshire, England, on the L.N.E.R. and the Chesterfield canal. Pop. (1938) 27,890. Area, 28 sq mi. The civil parish is the largest in the county. The south door of the priory church of SS. Mary and Cuthbert possesses 12th or 13th century iron scroll work, the oldest in England. Of the priory, founded 1102–03, the gatehouse, containing the Early English shrine or chapel of St. Mary, remains. From 1894 to 1931, when it was incorporated, Worksop was governed by an urban district council. Coal mining is the chief industry, although there is also a large trade in timber.

WORLD COURT: *see* PERMANENT COURT OF INTERNATIONAL JUSTICE.

WORLD SOUL, in the history of philosophy, denotes the conception that there is in the world a universal spirit or soul which is related to the material world in a way that is similar or analogous to the relation of the human soul to the body. This view was taught by various Greek philosophers, notably by Plato and the Stoics. In modern times Schelling held a similar conception, and attributed to the world-soul the function of acting as an organizing principle of the material world, which is thereby made into a coherent system. *See* PLATO; STOICS; SCHELLING.

WORLD WAR I. The aim of this article is to trace the main strategic currents of World War I, and also the conditions and ideas which guided them. The causes of the war are not within its scope. (For the political and diplomatic history of the struggle *see* the article EUROPE.) A process of 50 years had gone to make Europe inflammable, and a few days were enough to detonate it. To study the causes of the conflict on the German side we should have to trace the influence of Prussia on the creation of the Reich, the political conceptions of Bismarck, the German philosophical tendencies, her economic situation—a medley of factors which transmuted Germany's natural desire for commercial outlets, unhappily difficult to obtain, into a vision of world-power. We should have to analyse that heterogeneous relic of the middle ages known as Austria-Hungary, appreciate her complex racial problems, the artificiality of her governing institutions, the superficial ambitions which overlay a haunting fear of internal disruption and frantically sought to postpone the inevitable end.

On the other side we should have to examine the strange mixture of ambition and idealism which swayed Russian policy; we should have to understand the constant and justifiable fear of fresh aggression which France had suffered since 1870, and follow the regrowth of confidence which fortified her to resist further threats; finally, we should have to trace Britain's gradual movement from a policy of isolation into membership of the European system and her slow awakening to the reality of German ambitions. Beside these fundamental causes the international "incidents" that took place between 1899 and 1914 are but symptoms.

I. INTRODUCTION

The Armed Forces.—World War I may be briefly epitomized as a progress from convention through chaos to co-operation. The nations entered upon the conflict with the conventional outlook and system of the 18th century merely modified by the events of the 19th century. Politically, they conceived of it as a struggle between rival coalitions based on the traditional system of diplomatic alliances, and militarily as between professional armies—swollen, it is true, owing to the continental system of conscription, yet essentially fought out by soldiers while the mass of the people watched, from seats in the amphitheatre, the efforts of their champions. The Germans alone had a glimpse of the truth, but—one or two prophetic minds apart—the "Nation in Arms" theory evolved by them during the 19th century visualized the nation rather as a reservoir to pour its reinforcements into the army than as a mighty river in which are merged many tributary forces, of which the army is but one. Their conception was the "Nation in Arms," hardly the "Nation at War." Even after the war this truth had still to be grasped in its entirety and its full implications understood. Progressively throughout the years 1914–18 the warring nations enlisted the research of the scientist, the inventive powers and technical skill of the engineer, the manual labour of industry and the pen of the propagandist. For long this fusion of many forces tended to a chaotic maelstrom of forces; the old order had broken down, the new had not yet evolved. Only gradually did a working co-operation emerge, and it is a moot point whether even in the last phase co-operation of forces had attained to the higher level of co-ordination—direction by unity of diversity.

The German army of 1914 was born in the Napoleonic wars, nursed in infancy by Gneisenau and Scharnhorst, and trained in adolescence by the elder Moltke and Roon. It reached maturity in the war of 1870, where it emerged triumphantly from a test against the long-service army of France. Every physically able citizen was liable to service, and the State took the number it desired, trained them to arms for a short period of full-time service, and then returned them to civil life. The feature, as also the object, of this system was the production of a huge reserve by which to expand the active army in war. A man served two or three years full-time, according to his branch of the service, followed by five or four years in the regular reserves. He then went into the Landwehr for 12 years, and finally passed into the Landsturm from 39 till 45. Further, an Ersatz reserve was formed of those who were not called on for service with the colours.

In this organization and the thoroughness of the training lay the secret of the first great surprise of the war, one which almost proved decisive. For instead of regarding their reservists as troops of doubtful quality, fit only for an auxiliary rôle or garrison duty, the Germans during mobilization were able to duplicate every first line army corps with a reserve corps—and had the courage, justified by events, to use them in the opening clash. This surprise upset the French calculations, as it dislocated their plan.

The Germans have been reproached for many miscalculations; less than justice has been done to the correctness of many of their intuitions. They alone realized what became an axiom—that, given a highly trained cadre of leaders, a military machine

can be rapidly manufacture? from the levies of the led, like molten liquid poured into a mould. The German mould was a long-service body of officers and n.c.o.s who in their standard of technical knowledge and skill had no equal in the world. But if the machine was manufactured by training, it gained its solidity from another process. The psychological element plays an even greater part in a "national" than in a professional army. Esprit de corps is not enough; the stimulus of a great moral impulse to action is necessary, a deep-rooted belief in the policy for which citizens are called on to fight. The leaders of Germany had worked for generations to inspire their people with a patriotic conviction of the grandeur of their country's destiny. And if their opponents went forth to battle in 1914 with as intense a belief in their country's cause, this flaming patriotism had not the time to consolidate such a disciplined combination as years of steady heat had produced in Germany. The German people had an intimacy with and a pride in their army, notwithstanding its severity of discipline, that was unknown elsewhere.

This unique instrument was handled by a general staff which, by rigour of selection and training, was unmatched for professional knowledge and skill, if subject to the mental "grooves" which characterize all professions. Executive skill is the fruit of practice; and constant practice, or repetition, tends inevitably to deaden originality and elasticity of mind. In a professional body, also, promotion by seniority is a rule difficult to avoid. The Germans, it is true, tended towards a system of staff control, which in practice frequently left the real power in the hands of youthful general staff officers. As war memoirs and documents reveal, the chiefs of staff of the various armies and corps often took momentous decisions with hardly a pretence of consulting their commanders. But such a system had grave objections, for such a happy combination as that of a Hindenburg and Ludendorff is rarely found, and from it came the grit in the wheels which not infrequently marred the otherwise well-oiled working of the German war-machine.

Tactically, the Germans began with two important material advantages. They alone had gauged the potentialities of the heavy howitzer, and had provided adequate numbers of this weapon. And if no army had fully realized that machine-guns were "concentrated essence of infantry," nor fully developed this preponderant source of fire-power, the Germans had studied it more than other armies, and by their method of grouping the machine-guns under regimental control, instead of distributing them among battalions, were able to exploit its inherent battlefield-dominating power sooner than other armies. Strategically, also, the Germans had brought the study and development of railway communications to a higher pitch than any of their rivals.

The Austro-Hungarian army, if patterned on the German model, was a vastly inferior instrument. 'Not only had it a tradition of defeat rather than of victory, but its racial mixture prevented the moral homogeneity that distinguished its ally. This being so, the replacement of the old professional army by one based op universal service lowered rather than raised its standard of effectiveness. The troops within the borders of the empire were often racially akin to those beyond, and this compelled her to a politically instead of a militarily based distribution of forces, so that kinsmen should not fight each other. And her human handicap was increased by a geographical one—the vast extent of frontier to be defended. Nor were her leaders, with rare exceptions, the professional equals of the Germans, and if common action was better than with the Entente Powers, Austria did not accept German direction gladly.

Yet despite all its evident weaknesses this loosely knit conglomeration of races withstood the shock and strain of war for four years, in a way that surprised and dismayed her opponents. The explanation is that this complex racial fabric was woven on a stout Germanic and Magyar framework.

From the Central we turn to the Entente Powers. France possessed but 60% of the potential man-power of Germany, and this debit balance had forced her to call on the services of practically every able-bodied male. A man was called up at 20, did three years' full-time service, then 11 in the reserve and finally two periods of seven years each in the Territorial Army and Territorial Reserve. This system gave France an initial war strength of some 4,000,000 men, equal to her German rival, but, in contrast, she placed little reliance on the fighting values of reservists. The French command counted only on the semi-professional troops of the first line, about 1,500,000 men, for the short and decisive campaign which they expected and prepared for. Moreover, they assumed a similar attitude on the part of their enemy—with dire result. But this initial surprise apart, a more profound handicap was the lesser capacity of France for expansion, in case of a long war, due to her smaller population—under 40,000,000 compared with Germany's 65 millions. Col. Mangin, later to become famous, had advocated tapping the resources in Africa, the raising of a huge native army, but the Government had considered the dangers to outweigh the advantages of such a policy.

The French general staff, if less technically perfect than that of Germany, had produced some of the ablest military thinkers in Europe, and its level of intelligence could well bear comparison. Unfortunately, in recent years a sharp division of thought had arisen, which did not make for combined action. Worse still the new French philosophy of war in its abstraction with the moral element had become more and more separated from the inseparable material factors. Abundance of will cannot compensate a definite inferiority of weapons, and the second factor, once realised, inevitably reacts on the first. In *matériel*, the French had one great asset in their quick-firing 75 mm. field gun, the best in the world, but its very value had led them to undue confidence in a war of movement and a consequent neglect of equipment and training for the type of warfare which came to pass.

Russia's assets were in the physical sphere, her defects in the mental or moral. If her initial war strength was no greater than that of Germany, her man-power resources were immense and the courage and endurance of her troops were famous. But corruption and incompetence permeated her leadership, her rank and file lacked the intelligence and initiative for scientific warfare—they formed an instrument of great solidity but little flexibility—and her manufacturing resources for equipment and munitions were far below those of the great industrial Powers. This handicap was made worse by her geographical situation, cut off 'from her allies by ice- or enemy-bound seas, and with immense land frontiers. Another radical defect was the poverty of her rail communications, the more essential as she relied for success on bringing into play the weight of her numbers. In the moral sphere Russia's condition was less clear. Her internal troubles were notorious and must be a brake on her efforts unless the cause was such as to prove a crusade-like appeal to her primitive and incoherent masses.

Between the military systems of Germany, Austria, France and Russia there was a close relation, differences of detail rather than of fundamental, and this similarity threw into greater contrast the system of the other great European Power—Britain. Throughout modern times she had been essentially a sea-power, intervening on land through a traditional policy of diplomatic and financial support to Allies, whose military efforts she reinforced with a leaven from her own professional army. This regular army was primarily maintained for the protection and control of the overseas dependencies—India in particular—and had always been kept down to the minimum strength for this purpose. The reason for the curious contrast between Britain's determination to maintain a supreme navy and her consistent neglect, indeed starvation of the army, lay partly in her insular position, which caused her to regard the sea as her essential life-line and main defence, and partly in a constitutional distrust of the army, an illogical prejudice, which had its almost forgotten source in the military government of Cromwell. Small as to size, it enjoyed a practical and varied experience of war without parallel among the Continental armies. Compared with them, its professional handicap was that the leaders, however skilled in handling small columns in colonial expeditions, had never directed large formations in la ***grande guerre.***

Further, the foundations of a general staff had only been laid since the bitter lessons of the South African War, and the interval

was too short, the distractions too great, for this to have been developed to the level of Germany and France. For the progress in organization in the years before 1914, the British army owed much to Lord Haldane, and to him also was due the creation of a second line of part-trained citizens — the Territorial Force. Lord Roberts had pleaded for compulsory military training, but the voluntary principle was too deeply embedded in the national mind for this course to be adopted, and Haldane wisely sought to develop Britain's military effectiveness within the bounds set by traditional policy. As a result, 1914 found England with an expeditionary force of some 160,000 men, the most highly trained striking force of any country — a rapier among scythes, and to maintain this at strength the old militia had been turned into a special reserve for drafting. Behind this first line stood the Territorial Force, which if only enlisted for home defence had a permanent fighting organization unlike the amorphous volunteer force which it superseded. The British army had no special outstanding asset in war armament, but it had developed a standard of rifle-shooting unique among the world's armies.

The reforms by which the army was brought into line with Continental models had one defect, which was accentuated by the close relations established between the British and French general staffs since the Entente. It induced a "Continental" habit of thought among the general staff, and predisposed them to the rôle, for which their slender strength was unsuited, of fighting alongside an Allied army. This obscured the British army's traditional employment in amphibious operations through which the mobility given by command of the sea was exploited. A small but highly trained force striking "out of the blue" at a vital spot could produce a strategical effect out of all proportion to its slight numbers.

The last argument brings us to a comparison of the naval situation, which turned on the balance between the fleets of Britain and Germany. Britain's sea supremacy, for long unquestioned, had in recent years been challenged by a Germany which had deduced that a powerful fleet was the key to that colonial empire which she desired as an outlet for her commerce and increasing population. To the spur of naval competition the British people eventually responded, determined at any cost to maintain their "two-power" standard. If this reaction was instinctive rather than reasoned, its subconscious wisdom had a better foundation than the catchwords with which it was justified, or even than the need of defence against invasion. The industrial development of the British Isles had left them dependent on overseas supplies for food, and on the secure flow of seaborne imports and exports for industrial existence. For the navy itself this competition was a refining agency, leading to a concentration on essentials. Gunnery was developed and less value attached to polished brasswork; warship design and armament were transformed — the "Dreadnought" ushering in a new era, of the all big-gun battleship. By 1914 Britain had 29 such capital ships and 13 building, to the 18 built and nine building, of Germany. Further, Britain's naval strength had been soundly distributed, the main concentration being in the North sea.

More open to criticism, in view of the forecasts of several naval authorities, was her comparative neglect of the potential menace of the submarine. Here German opinion was shown rather by the number building than those already in commission. It is to Germany's credit that though lacking a sea tradition, her fleet an artificial rather than a natural product, the technical skill of the German navy made it a formidable rival to the British ship for ship, and perhaps its superior in scientific gunnery.

But in the first stage of the struggle the balance of the naval forces would affect the issue far less than the balance on land. For a fleet suffers one inherent limitation — it is tied to the sea, and hence cannot strike direct at the hostile nation. The fundamental purpose of a navy is therefore to protect a nation's sea communications and sever those of the enemy, and, although victory in battle may be a necessary prelude, blockade is the ultimate purpose. And as blockade is a weapon slow to take effect, its influence could only be decisive if the armies failed to secure the speedy decision on land, upon which all counted.

The Economic Forces. — In this idea of a short war lay also the reason for the comparative disregard of economic forces. Few believed that a modern nation could endure for many months the strain of a large-scale conflict. The supply of food, of munitions and their manufacture, of funds, were problems only studied on brief estimates. Of belligerents, all could feed themselves save Britain and Germany, and Germany's deficit of home-grown supplies could only be serious in the event of a struggle of years. But Britain would starve in three months if her outside supplies were cut off.

In munitions and other war material Britain's industrial power was greatest of all, though conversion to war production was a necessary preliminary, and all, again, depended on the security of her sea communication. France was weak, and Russia weaker still, but the former, unlike the latter, could count on outside supplies so long as Britain held the seas. As Britain was the industrial pivot of the one alliance, so was Germany of the other. A great manufacturing nation, she had also a wealth of raw material, especially since the annexation of the Lorraine iron-fields after the 1870 war. But the stoppage of outside supplies must be a handicap in a long war, increasing with its duration, and serious from the outset in such tropical products as rubber. Moreover, Germany's main coal and iron fields lay dangerously close to her frontier, in Silesia on the east and in Westphalia and Lorraine on the west. Thus for the Central Alliance a quick decision and an offensive war were more vital than for the Entente.

Similarly, the financial resources were calculated on a short war basis, and all the Continental Powers relied mainly on large gold reserves accumulated specially for war purposes. Britain alone had no such war chest, but she was to prove that the strength of her banking system and the wealth distributed among a great commercial people furnished the "sinews of war," in a way that few pre-war economists had realized.

The Psychological Forces. — If the economic forces were neglected in the war calculations of the Powers, the psychological forces were an unexplored region, except in their purely military aspect. And even here little study had been devoted to the moral element compared with the physical element. Ardant du Picq, a soldier-philosopher who fell in the 1870 war, had stripped battle of its aura of heroic fictions, portraying the reaction of normal men in the presence of danger. Several German critics had described from experience the reality of battle moral as shown in 1870, and had deduced how tactics should be based on the ever-present and balancing elements of fear and courage. At the close of the century a French military thinker, Col. Foch, had demonstrated how great was the influence of the moral element in the higher sphere of command. But only the fringe of the subject had been penetrated. Its civil aspects were untouched, and in the opening weeks of the conflict the general misunderstanding of national psychology was to be shown in the undue muzzling of the Press, followed by the equally stupid practice of issuing communiqués which so veiled the truth that public opinion became distrustful of all official news and rumour was loosed on its infinitely more damaging course. The true value of wisely calculated publicity and the true application of the propaganda weapon was only to be learnt after many blunders.

The Rival Plans. — In this survey the German plan justly takes priority, for not only was it the mainspring which set in motion the hands of the war clock in 1914, but it may even be said to have governed the course of the war thereafter. It is true that outwardly this course from the autumn of 1914 onwards seemed to be of the nature of a stupendous "siege" of the Central Powers, an idea which is incompatible with the terms we have used. But the conception of the Germanic alliance as a besieged party, although true of the economic sphere, suggests a passivity which their strategy contradicts. Although the initial German plan miscarried, even in its failure it dictated the general trend of operations thereafter. Tactically, most of the fighting resembled siege operations, but the actual strategy on land for long erred rather by its disregard of these tactical conditions than by its conformity with them.

The Germans were faced with the problem that the combined

forces of themselves and Austria were decidedly inferior to those of France and Russia. To offset this adverse balance, however, they had a central position and the anticipation that Russia's mobilization would be too slow to allow her to exert serious pressure in the opening weeks. While this assumption might suggest a decisive blow at Russia before she was ready, it was equally probable that she would concentrate her main forces too far back for such a German blow to reach—and the experience of Napoleon was not an example to encourage an advance deep into the interior of Russia, with its vast distances and poor communications. The plan adopted by Germany was, therefore, a rapid offensive against France while holding the Russian advanced forces at bay, and later, when France was crushed, to deal with the Russian army.

But this plan, in turn, was complicated by the great natural and artificial barriers which the French frontier offered to an invader. It was narrow, only some 150 m. across, and so afforded little room for manoeuvre or even to deploy the masses that Germany planned to launch against her foe. At the south-eastern end it abutted on Switzerland, and after a short stretch of flat country known as the Gap of Belfort the frontier ran for 70 m. along the Vosges mountains. Thence the line was prolonged by an almost continuous fortress system, based on Epinal, Toul, Verdun and just beyond the last-named lay not only the frontiers of Luxembourg and Belgium but the difficult Ardennes country. Apart from the strongly defended avenues of advance by Belfort and Verdun, the only feasible gap in this barrier was the Trouée de Charmes between Epinal and Toul, left open originally as a strategic trap in which the Germans could be first caught and then crushed by a French counter-stroke.

Faced with such a mental and physical blank wall, the logical military course was to go round it—by a wide manoeuvre through Belgium. Graf von Schlieffen, chief of the German general staff from 1891 to 1906 conceived and developed from 1895 onwards the plan, by which the French armies were to be enveloped and a rapid decision gained, and as finally formulated it came into force in 1905. To attain its object Schlieffen's plan concentrated the mass of the German forces on the right wing for this gigantic wheel and designedly took risks by reducing the left wing, facing the French frontier, to the slenderest possible size. The swinging mass, pivoting on the fortified area Metz-Thionville, was to consist of 53 divisions, backed up as rapidly as possible by Landwehr and Ersatz formations, while the secondary army on the left wing comprised only nine divisions. Its very weakness promised to aid the main blow in a further way, for if a French offensive pressed them back towards the Rhine, the attack through Belgium on the French flank would be all the more difficult to parry. It would be like a revolving-door—if a man pressed heavily on one side the other side would swing round and strike him in the back. The German enveloping mass was to sweep round through Belgium and northern France and, continuing to traverse a vast arc, would wheel gradually east. With its extreme right passing south of Paris and crossing the Seine near Rouen it would then press the French back towards the Moselle, where they would be hammered in rear on the anvil formed by the Lorraine fortresses and the Swiss frontier.

Schlieffen's plan allowed ten divisions to hold the Russians in check while the French were being crushed. It is a testimony to the vision of this remarkable man that he counted on the intervention of Britain, and allowed for an expeditionary force of 100,000 "operating in conjunction with the French." To him also was due the scheme for using the Landwehr and Ersatz troops in active operations and fusing the resources of the nation into the army. His dying words are reported to have been, "It must come to a fight. Only make the right wing strong."

Unhappily for Germany, if happily for the world, the younger Moltke, who succeeded him, lacked his moral courage and clear grasp of the principle of concentration. Moltke retained Schlieffen's plan, but he whittled away the essential idea. Of the nine new divisions which became available between 1905 and 1914 Moltke allotted eight to the left wing and only one to the right. True, he added another from the Russian front, but this trivial increase was purchased at a heavy price, for the Russian army of 1914 was a far more formidable menace than when Schlieffen's plan came into force. In the outcome two army corps were taken from the French theatre at the crisis of the August campaign, in order to reinforce the Eastern front.

If the fault of the final German plan was a lack of courage, that of the French plan was due to an excess. In their case, also, a miasma of confused thought seemed to creep over the leadership in the years just before the war. Since the disasters of 1870 the French command had planned an initial defensive, based on the frontier fortresses, followed by a decisive counter-stroke. To this end the great fortress system had been created, and gaps like the Trouée de Charmes left to "canalize" the invasion ready for the counter. But in the decade before 1914 a new school of thought had arisen, who argued that the offensive was more in tune with French character and tradition, that the possession of the "75"—a field gun unique in mobility and rapidity of fire—made it tactically possible, and that the alliance with Russia and Britain made it strategically possible. Forgetful of the lessons of 1870 they imagined that *élan* was proof against bullets. Napoleon's much quoted saying that "the moral is to the physical as three to one" has much to answer for; it has led soldiers to think that a division exists between the two, whereas each is dependent on the other. Weapons without courage are ineffective, but so also are the bravest troops without efficient weapons to protect them and their *moral*.

The outcome was disastrous. The new school found in Gen. Joffre, appointed chief of the general staff in 1912, a lever for their designs. Under the cloak of his authority, the advocates of the *offensive à outrance* gained control of the French military machine, and, throwing aside the old doctrine, formulated the now famous, or notorious, Plan XVII. It was based on a negation of historical experience—indeed, of common sense—and on a double miscalculation—of force and place, the latter more serious than the former. Accepting the possibility that the Government might employ their reserve formations at the outset, the strength of the Germany army in the West was estimated at a possible maximum of 68 infantry divisions. The Germans actually deployed the equivalent of 83½, counting Landwehr and Ersatz divisions. But French opinion was and continued to be doubtful of this contingency, and during the crucial days when the rival armies were concentrating and moving forward the French Intelligence counted only the active divisions in its estimates of the enemy strength—a miscalculation by half! If the plan had been framed on a miscalculation less extreme, this recognition does not condone but rather increases its fundamental falsity, for history affords no vestige of justification for a plan by which a frontal offensive was to be launched with mere equality of force against an enemy who would have the support of his fortified frontier zone, while the attackers forswore any advantage from their own.

The second miscalculation, of place, was that although the possibility of a German move through Belgium was recognized, the wideness of its sweep was utterly misjudged. The Germans were expected complaisantly to take the difficult route through the Ardennes in order that the French might conveniently smite their communications! Based on the idea of an immediate and general offensive, the plan ordained a thrust by the 1st and 2nd Armies towards the Saar into Lorraine. On their left were the 3rd Army opposite Metz and the 5th Army facing the Ardennes, which were either to take up the offensive between Metz and Thionville, or, if the Germans came through Luxembourg and Belgium, to strike north at their flank. The 4th Army was held in strategic reserve near the centre and two groups of reserve divisions were disposed in rear of either flank—relegation to such a passive rôle expressing French opinion on the capacity of reserve formations.

Britain's share in this plan was settled less by calculation than by the "Europeanization" of her military organization during the previous decade. This Continental influence drew her insensibly into a tacit acceptance of the rôle of acting as an appendix to the French left wing, and away from her historic exploitation of the

mobility given by sea-power. At the council of war on the outbreak, Lord Roberts, summoned from retirement, advocated the dispatch of the expeditionary force to Belgium — where it would have stiffened the Belgian resistance and threatened the flank of the wheeling German mass. But his was a voice crying in the wilderness, and in any case the British general staff, through Gen. Wilson, had virtually pledged themselves to act in direct co-operation with the French. When the general staffs of the two countries conducted their informal negotiations between 1905 and 1914 they little realized that they were paving the way for a reversal of England's centuries-old policy, for a war effort such as no Englishman had ever conceived.

On the Eastern front, the plans of campaign were more fluid, less elaborately worked out and formulated — although they were to be as kaleidoscopic in their changes of fortune as in the Western theatre. The calculable condition was geographical; the main incalculable, Russia's rate of concentration. Russian Poland was a vast tongue of country projecting from Russia proper, and flanked on three sides by German or Austrian territory. On its northern flank lay East Prussia with the Baltic sea beyond. On its southern flank lay the Austrian province of Galicia with the Carpathian mountains beyond, guarding the approaches to the plain of Hungary. On the west lay Silesia. As the Germanic border provinces were provided with a network of strategic railways whilst Poland, as well as Russia itself, had only a sparse system of communications, the Germanic alliance had a vital advantage, in power of concentration, for countering a Russian advance. But if they took the offensive, the further they progressed into Poland or Russia proper the more would they lose this advantage. Hence their most profitable strategy was to lure the Russians on into position for a counter-stroke rather than to inaugurate an offensive themselves. The one drawback was that such a Punic strategy gave the Russians time to concentrate and set in motion their cumbrous and rusty machine.

From this arose an initial cleavage between German and Austrian opinion. Both agreed that the problem was to hold the Russians in check during the six weeks before the Germans, it was hoped, having crushed France, could switch their forces eastwards to join the Austrians in a decisive blow against the Russians. The difference of opinion was on the method. The Germans, intent on a decision against France, wished to leave a minimum force in the East, and only a political dislike of exposing national territory to invasion prevented them evacuating East Prussia and standing on the Vistula line. But the Austrians, under the influence of Conrad von Hotzendorf, chief of their general staff, were anxious to throw the Russian machine out of gear by an immediate offensive, and as this promised to keep the Russians fully occupied while the campaign in France was being decided Moltke fell in with this strategy. Conrad's plan was that of an offensive north-eastwards into Poland by two armies, protected by two more on their right, further east. Complementary to it, as originally designed, the Germans in East Prussia were to strike south-east, the two forces converging to cut off the Russian advanced forces in the Polish "tongue." But Conrad failed to induce Moltke to provide sufficient German troops for this offensive thrust.

On the opposing side, also, the desires of one ally vitally affected the strategy of the other. The Russian command, both for military and for racial motives, wished to concentrate first against Austria, while the latter was unsupported, and leave Germany alone until later, when the full strength of the Russian army would be mobilized. But the French, anxious to relieve the German pressure against themselves, urged the Russians to deliver a simultaneous attack against Germany, and got the Russians to consent to an extra offensive for which they were neither ready, in numbers, nor organized. On the south-western front two pairs of two armies each were to converge on the Austrian forces in Galicia; on the north-westem front two armies were to converge on the German forces in East Prussia. Russia, whose proverbial slowness and crude organization dictated a cautious strategy, was about to break with tradition and launch out on a gamble that only an army of high mobility and organization could have hoped to bring off.

II. THE CLASH IN THE WEST

The Detonation.--On June 28, 1914, the murder of the Austrian Archduke Francis Ferdinand at Sarajevo set light to a powder trail which within a brief span exploded the European magazine in a series of detonations. Exactly one month later Austria-Hungary declared war against Serbia, whose appeal to her ally and protector led Russia to order a partial mobilization on her southern front. The same day, July 29, an Imperial council at Potsdam decided on war against Russia, and, as a corollary, against France, although hoping to bargain for Britain's neutrality. While the chancelleries of Europe argued at cross-purposes, the military tide swept them off their feet. On July 31 Russia ordered a general mobilization and Germany, taking equivalent steps, sent a 12 hours' ultimatum. Austria, seeking belatedly to temporize, was dragged in the train of her more determined ally. By noon on Aug. 1 a state of war existed between Russia and Germany and next day German troops entered French territory. At 7 P.M. came Germany's ultimatum to Belgium, demanding an unopposed passage. On Aug. 3 Germany's formal declaration of war on France followed, and on Aug. 4 her troops crossed the Belgian frontier, for the sanctity of which England stood guarantor. At midnight, in reply, England also entered the war — while the Belgian populace, rising to resist the German invaders, sounded the death-knell of gladiatorial wars and inaugurated the new warfare of peoples. And coincidently, by Italy's declaration of her neutrality, her refusal to fulfil the alliance with her hereditary enemy — Austria — the artificiality of the political alliance system broke down before the new wave of national feeling which was to characterize the World War.

Invasion of Belgium. — The German advance into France was designed as a methodical sweep, so that unexpected checks should not upset its time-table. Confronted with the fact that the Belgians would resist, a detachment was formed under Gen. von Emmich to clear a passage through the Belgian plain north of the Ardennes, ready for the ordered advance of the main armies concentrating behind the German frontier. The ring fortress of Liége (*q.v.*) commanded this channel of advance, but, after an initial check, a German brigade penetrated between the forts and occupied the town. The interest of this feat is that it was due to the initiative of an attached staff officer, Ludendorff, whose name ere long was to be world-famous. The forts themselves offered a stubborn resistance and forced the Germans to await the arrival of their heavy howitzers, whose destructive power was to be the first tactical surprise of the World War.

The very success of the Belgians' early resistance cloaked the weight of the main German columns and misled the Allies' intelligence. The Belgian field army lay behind the Gette covering Brussels, and even before the Liége forts fell the advanced guards of the German 1st and 2nd Armies were pressing against this line. The Belgians, deprived of support owing to the mistaken French plan and British conformity with it, decided to preserve their army by falling back on the entrenched camp of Antwerp — where its location would at least make it a latent menace to the German communications. The Germans, their passage now clear, entered Brussels on Aug. 20, and on the same day appeared before Namur, the last fortress barring the Meuse route into France. It must be noted that despite the Belgian resistance the German advance was slightly ahead of its time-table.

French Offensive in Lorraine. — Meanwhile, away on the other flank, the French offensive had opened on Aug. 8 with the advance of a force under Gen. Pau into upper Alsace, a move intended partly as a military distraction and partly for its political effect. Soon brought to a halt, it was renewed on the 19th, only to meet with a fresh check. Thereafter the pressure of disasters elsewhere compelled the abandonment of the enterprise and the dissolution of the force — its units being dispatched westward as reinforcements. Meantime the main thrust into Lorraine by the French 1st (Dubail) and and (de Castelnau) Armies, totalling 19 divisions, had begun on Aug. 14 and been shattered in the battle of Morhange-Sarrebourg, Aug. 20 (*see* FRONTIERS, BATTLES OF THE) where the French discovered that the material could subdue the moral, and that in their enthusiasm for the offensive

they had blinded themselves to the defensive power of modern weapons, a condition which was to throw out of balance the whole mechanism of orthodox warfare. Yet it is but fair to add that this abortive French offensive had an indirect effect on the German plan, although this would hardly have been so if a Schlieffen or a Ludendorff had been in charge at German headquarters instead of the vacillating opportunist Moltke. The fact that Moltke had almost doubled the strength of his left, compared with Schlieffen's plan meant that it was unnecessarily strong for a yielding and "enticing" defensive such as Schlieffen had conceived, while lacking the superiority necessary for a crushing counter-offensive. But when the French attack in Lorraine developed and Moltke appreciated that the French were leaving their fortified barrier behind he was tempted momentarily to postpone the right wing sweep and instead seek a decision in Lorraine. This impulse led him to divert thither the six newly formed Ersatz divisions that should have been used to increase the weight of his right wing.

He had hardly conceived this new plan before he abandoned it and, on Aug. 16, reverted to Schlieffen's "swing-door" design. But the princeiy commanders in Lorraine were loath to forfeit this opportunity of personal glory. The Crown Prince Rupprecht of Bavaria, instead of continuing to fall back and draw the French on, halted his 6th Army on the 17th, ready to accept battle. Finding the French attack slow to develop, he planned to anticipate by one of his own. He struck on Aug. 20 in conjunction with the 7th Army on his left, but although the French were taken by surprise and rolled back from the line Morhange-Sarrebourg, the German counter-stroke had not the superiority of strength (the two armies now totalled 25 divisions) or of strategic position to make it decisive. Thus its strategic result was merely to throw back the French onto a fortified barrier which both restored and augmented their power of resistance. Thus they were enabled to despatch troops to reinforce their western flank—a redistribution of strength which was to have far-reaching results in the decisive battle, on the Marne.

With similar disregard of superior authority, the German Crown Prince, commanding the pivotal 5th Army between Metz and Thionville, attacked when he had been ordered to stand on the defensive. The lack of what Col. Foch had termed "intellectual discipline" was to be a grave factor in Germany's failure, and for this the ambitions of "court" generals were to be largely responsible.

The North-West Frontier.—While this "see-saw" campaign in Lorraine was taking place, more decisive events were occurring to the north-west. The attack on Liége awakened Joffre to the reality of a German advance through Belgium, but not to the wideness of sweep. And the sturdy resistance of Liége confirmed him in the opinion that the German right would pass south of it, between the Meuse and the Ardennes. Plan XVII. had visualized such a move, and prepared a counter. Grasping once more at phantoms, the French command embraced this idea so fervently that they transformed the counter into an imaginary coup *de grâce*. Their 3rd Army (Ruffey) and the reserve 4th Army (de Langle de Cary) were to strike north-east through the Ardennes against the rear flank of the Germans advancing through Belgium. The left wing (5th) Army, under Lanrezac, was moved further to the north-west into the angle formed by the Sambre and Meuse between Givet and Charleroi. With the British expeditionary force coming up on its left, it was to deal with the enemy's forces north of the Meuse and to converge on the supposed German main forces in conjunction with the attack through the Ardennes. Here was a pretty picture—of the Allied pincers closing on the unconscious Germans! Curiously, the Germans had the same idea of a pincer-like manoeuvre, with rôles reversed, and with better reason.

The fundamental flaw in the French plan was that the Germans had deployed half as many troops again as the French Intelligence estimated, and for a vaster enveloping movement. The French 3rd and 4th Armies (23 divisions) pushing blindly into the Ardennes against a German centre supposedly denuded of troops, blundered against the German 4th and 5th Armies (20 divisions) and were heavily thrown back in encounter-battles around Virton-Neufchateau. Fortunately the Germans were also too vague as to the situation to exploit their opportunity.

But to the north-west the French 5th Army (13 divisions) and the British (four divisions) had, under Joffre's orders, put their head almost into the German noose. The German masses of the 1st and 2nd Armies were closing on them from the north, and the 3rd Army from the east—a total of 30 divisions. Lanrezac alone had an inkling of the hidden menace. All along he had suspected the wideness of the German manoeuvre, and it was through his insistence that his army had been permitted to move so far north-west. It was due to his caution in hesitating to advance across the Sambre, to the arrival of the British on his left unknown to the German Intelligence, and to the premature attack of the German 2nd Army, that the Allied forces fell back in time and escaped from the trap.

Retreat to the Marne.—The British, after concentrating near Maubeuge, had moved up to Mons on Aug. 22, ready to advance further into Belgium as part of the offensive of the Allied left wing On arrival, however, Sir John French heard that Lanrezac had been attacked on the 21st and deprived of the crossings of the Sambre. Although thus placed in an exposed forward position, he agreed to stand at Mons to cover Lanrezac's left. But next day Lanrezac had word of the fall of Namur and of the appearance of the German 3rd Army (Hausen) on his exposed right flank near Dinant, on the Meuse. In consequence, he gave orders for a retreat that night. The British, after resisting the attacks of six German divisions during the day, fell back on the 24th in conformity with their allies. Not a moment too soon in view of the fact that the rest of the German 1st Army was marching still further westward to envelop their open left flank.

At last Joffre realized the truth and the utter collapse of Plan XVII. Resolution was his greatest asset, and with imperturbable coolness he formed a new plan out of the wreckage. He decided to swing back his centre and left, with Verdun as the pivot, while drawing troops from the right and forming a fresh 6th Army on his left to enable the retiring armies to return to the offensive.

The German Breakdown.—His optimism might have been again misplaced but for German mistakes. The first was Moltke's folly in detaching seven divisions to invest Maubeuge and Givet and watch Antwerp, instead of using Landwehr and Ersatz troops as Schlieffen had intended. More ominous still was his decision on Aug. 25 to send four divisions to check the Russian advance in East Prussia. All these were taken from the right wing, and the excuse afterwards given for this violation of the principle of concentration was that the German command thought that the decisive victory had already been won! Further, the German command lost touch with the advancing armies and the movements of these became disjointed. The British stand at Le Cateau and Lanrezac's riposte at Guise (see FRONTIER, BATTLES OF THE: Le Cateau; Guise) were also factors in checking the German enveloping wing, and each had still greater indirect effects. For Le Cateau apparently convinced the German 1st Army commander, Kluck. that the British army could be wiped from the slate, and Guise led Biilow (2nd Army) to call on the 1st Army for support, whereupon Kluck wheeled inwards, thinking to roll up the French left. The idea of a Sedan was an obsession with the Germans, and led them to pluck the fruit before it was ripe. This premature wheel before Paris had been reached was an abandonment of the Schlieffen plan, and exposed the German right to a counter-envelopment. One further factor must be mentioned, perhaps the most significant of all: the Germans had advanced so rapidly, out-running their time-table, that their supplies failed to keep pace. Thus, in sum, so much grit had worked into the German machine that a slight jar would suffice to cause its breakdown. This was delivered in the battle of the Marne (*q.v.*).

III. THE CRISIS OF THE MARNE

The Abandoned Plan.—Let us trace the sequence of events. The first, highly coloured, reports from the army commands in the battles of the Frontiers had given the German supreme command the impression of a decisive victory. Then the compara-

tively small totals of prisoners raised doubts in Moltke's mind and led him to a more sober estimate of the situation. The new pessimism of Moltke combined with the renewed optimism of his army commanders to produce a fresh change of plan, which contained the seeds of disaster. When, on Aug. 26, the British left wing fell back southwards badly mauled from Le Cateau, Kluck had turned south-westwards again. If this direction was partly due to a misconception of the line of retreat taken by the British, it was also in accordance with his original rôle of a wide circling sweep. And by carrying him into the Amiens-Peronne area, where the first elements of the newly formed French 6th Army were just detraining after their "switch" from Alsace, it had the effect of dislocating Joffre's design for an early return to the offensive—compelling the 6th Army to fall back hurriedly towards the shelter of the Paris defences.

But Kluck had hardly swung out to the south-west before he was induced to swing in again. For, in order to ease the pressure on the British, Joffre had ordered Lanrezac to halt and strike back against the pursuing Germans, and Biilow, shaken by the threat, called on Kluck for aid. Lanrezac's attack, on Aug. 29, was stopped before Biilow needed this, but he asked Kluck to wheel in nevertheless, in order to cut off Lanrezac's retreat. Before acceding Kluck referred to Moltke. The request came at a moment when Moltke was becoming perturbed in general over the way the French were slipping away from his embrace and, in particular, over a gap which had opened between his 2nd and 3rd Armies through the latter having already turned south, from south-west, to help the 4th Army, its neighbour on the other flank. Hence Moltke approved Kluck's change of direction—which meant the inevitable abandonment of the original wide sweep round the far side of Paris. Now the flank of the wheeling German line would pass the near side of Paris and across the face of the Paris defences. By this contraction of his frontage for the sake of security Moltke sacrificed the wider prospects inherent in the wide sweep of the Schlieffen plan. And, as it proved, instead of contracting the risk he contracted a fatal counterstroke.

The decision to abandon the original plan was definitely taken on Sept. 4, and in place of it Moltke substituted a narrower envelopment, of the French centre and right. The 4th and 5th Armies were to press south-east while the 6th and 7th Armies, striking south-westwards, sought to break through the fortified barrier between Toul and Epinal, the "jaws" thus closing inwards on either side of Verdun. Meantime the 1st and 2nd Armies were to turn outwards and, facing west, hold off any counter move which the French attempted from the neighbourhood of Paris.

The Allied Counter.—But such a counter move had begun before the new plan could take effect.

The opportunity was perceived, not by Joffre, who had ordered a continuance of the retreat, but by GalliCni, the military governor of Paris. On Sept. 3 GalliCni realized the meaning of Kluck's wheel inwards, directed Maunoury's 6th Army to be ready to strike at the exposed German right flank, and next day with some difficulty won Joffre's sanction. Once convinced, Joffre acted with decision. The whole left wing was ordered to turn about and return to a general offensive, beginning on Sept. 6. Maunoury was already off the mark on the 5th and as his pressure developed on the Germans' sensitive flank, Kluck was constrained to draw off first one part and then the remaining part of his army to support his threatened flank guard. Thereby a 30 m. gap was created between the 1st and 2nd German Armies, a gap covered only by a screen of cavalry. Kluck was emboldened to take the risk because of the rapid retreat of the British opposite, or rather with their backs, to this gaping sector. Even on the 5th, when the French on either flank were turning about, the British continued a further day's march to the south. But in this "disappearance" lay the unintentional cause of victory. For, when the British retraced their steps, it was the report of their columns advancing into the gap which, on Sept. 9, led Biilow to order the retreat of his 2nd Army. The temporary advantage which the 1st Army, already isolated by its own act, had gained over Maunoury was thereby nullified, and it fell back the same day. By the 11th the retreat had extended, independently or under orders from Moltke, to all the German armies. The attempt at a partial envelopment, pivotting on Verdun, had already failed, the jaw formed by the 6th and 7th Armies merely breaking its teeth on the defences of the French eastern frontier. The attack by Rupprecht's 6th Army on the Grand Couronné, covering Nancy, was a particularly costly failure. It is difficult to see how the German command could have reasonably pinned their faith on achieving as an improvised expedient the very task which in cool calculation before the war had appeared so hopeless as to lead them to take the momentous decision to advance through Belgium as the only feasible alternative.

Thus, in sum, the battle of the Marne was decided by a jar and a crack. The jar administered by Maunoury's attack on the German right flank causing a crack in a weak joint of the German line, and this physical crack in turn producing a moral crack in the German command.

The Pursuit Fails.—The result was a strategic but not a tactical defeat and the German right wing was able to re-knit and stand firmly on the line of the Aisne. That the Allies were not able to draw greater advantage from their victory was due in part to the comparative weakness of Maunoury's flank attack and in part to the failure of the British and the French 5th Army (now under Franchet d'Espérey) to drive rapidly through the gap while it was open. Their direction of advance was across a region intersected by frequent rivers, and this handicap was intensified by a want of impulsion on the part of their chiefs. It seems, too, that greater results might have come if more effort had been made as GalliCni urged, to strike at the German rear flank instead of the front, and to direct reinforcements to the north-west of Paris for this purpose. This view is strengthened by the sensitiveness shown by the German command to reports of landings on the Belgian coast, which might threaten their communications. The alarm caused by these reports had even led the German command to contemplate a withdrawal of their right wing before the battle of the Marne was launched. When the moral effect of these phantom forces is weighed with the material effect—the detention of German forces in Belgium—caused by fears of a Belgian sortie from Antwerp, the balance of judgment would seem to turn heavily in favour of the strategy which Lord Roberts had advocated in vain. By it the British expeditionary force might have had not merely an indirect but a direct influence on the struggle, and might have made the issue not merely negatively but positively decisive.

But, considering the battle of the Marne as it shaped, the fact that 27 Allied divisions were pitted against 13 German divisions on the decisive flank is evidence, first, of how completely Moltke had lapsed from Schlieffen's intention; second, of how well Joffre had re-concentrated his forces under severe pressure; third, of how such a large balance afforded scope for a wider envelopment than was actually attempted. The frontal pursuit was checked on the Aisne before Joffre, on Sept. 17, seeing that Maunoury's attempts to overlap the German flank were ineffectual, decided to form a fresh army under de Castelnau for a manoeuvre *round and* behind the German flank. By then the German armies had recovered cohesion and the German command was expecting and ready to meet such a manoeuvre, now the obvious course.

IV. THE SECOND CRISIS—STALEMATE

Centre of Gravity Shifts.—On the Aisne was re-emphasized the preponderant power of defence over attack, primitive as were the trench lines compared with those of later years. Then followed, as the only alternative, the successive attempts of either side to overlap and envelop the other's western flank, a phase known somewhat inaccurately as the "race to the sea." This common design brought out what was to be a new and dominating strategical feature—the lateral switching of reserves by railway from one part of the front to another. Before it could reach its logical and lateral conclusion, a new factor intervened. Antwerp, with the Belgian field army, was still a thorn in the German side, and Falkenhayn, who had succeeded Moltke, determined to reduce it while a German cavalry force swept across to the Belgian coast as an extension of the enveloping wing in France.

Belgian **Operations.**—We must pause here to pick up the thread of operations in Belgium from the moment when the Belgian field army fell back to Antwerp, divergently from the main line of operations. On Aug. 24 the Belgians began a sortie against the rear of the German right wing to ease the pressure on the British and French left wing, then engaged in the opening battle at Mons and along the Sambre. The sortie was broken off on the 26th when news came of the Franco-British retreat into France, but the pressure of the Belgian army (six divisions) led the Germans to detach four reserve divisions, besides three Landwehr brigades, to hold it in check. On Sept. 7 the Belgian command learnt that the Germans were despatching part of this force to the front in France; in consequence King Albert launched a fresh sortie on Sept. 9—the crucial day of the battle on the Marne. The action was taken, unsolicited by Joffre, who seems to have shown curiously little interest in possibilities outside his immediate battle zone. The sortie led the Germans to cancel the despatch of one division and to delay that of two others to France, but the Belgians were soon thrown back. Nevertheless the news of its seems to have had a distinct moral effect on the German command, coinciding as it did with the initiation of the retreat of their 1st and 2nd Armies from the Marne. And the unpleasant reminder that Antwerp lay menacingly close to their communications induced the Germans to undertake, preliminary to any fresh attempt at a decisive battle, the reduction of the fortress and the seizure of potential English landing places along the Belgian coast.

A Strategic Key.—The menace to Britain, if the Channel ports fell into German hands, was obvious. It is a strange reflection that the British command should have neglected to guard against the danger hitherto, although the first lord of the Admiralty, Winston Churchill, had urged the necessity even before the battle of the Marne. When the German guns began the bombardment of Antwerp on Sept. 28 England awakened, and gave belated recognition to Churchill's strategic insight. He was allowed to send a brigade of marines and two newly-farmed brigades af naval volunteers to reinforce the defenders, while a regular division and cavalry division, under Rawlinson, were landed at Ostend and Zeebrugge for an overland move to raise the siege. Eleven Territorial divisions were available in England, but, in contrast to the German attitude, Kitchener considered them still unfitted for an active rôle. The meagre reinforcement delayed, but could not prevent, the capitulation of Antwerp, Oct. 10, and Rawlinson's relieving force was too late to do more than cover the escape of the Belgian field army down the Flanders coast.

Yet, viewed in the perspective of history, this first and last effort in the West to make use of Britain's amphibious power applied a brake to the German advance down the coast which just stopped their second attempt to gain a decision in the West. It gained time for the arrival of the main British force, transierred from the Aisne to the new left of the Allied line, and if their heroic defence at Ypres, aided by the French and Belgians along the Yser to the sea, was the human barrier to the Germans, it succeeded by so narrow a margin that the Antwerp expedition must be adjudged the saving factor.

Second German Bid **for** Victory.—In the French theatre of operations, the month following the battle of the Marne was marked by an extremely obvious series of attempts by each side to turn the opponent's western flank. On the German side this pursuit of an opening was soon replaced by a subtler plan, but the French persevered with a straight forward obstinacy curiously akin to that of their original plan. By Sept. 24, de Castelnau's outflanking attempt had come to a stop on the Somme. Next a newly formed 10th Army under de Maudhuy tried a little further north, beginning on Oct. 2, but instead of being able to pass round the German flank soon found itself struggling desperately to hold Arras. The British expeditionary force was then in course of transfer northwards from the Aisne, in order to shorten its communications with England, and Joffre determined to use it as part of a third effort to turn the German flank. To co-ordinate this new manoeuvre he appointed Gen. Foch as his deputy in the north. Foch sought to induce the Belgians to form the left of this wheeling mass, but King Albert, with more caution, or more realism, declined to abandon the coastal district for an advance inland that he considered rash. It was. For on Oct. 14, four days after the fall of Antwerp, Falkenhayn planned a strategic trap for the next Allied outflanking manoeuvre which he foresaw would follow. One army, composed of troops transferred from Lorraine, was to hold the expected Allied offensive while another, composed of troops released by the fall of Antwerp and of four newly-raised corps, was to sweep down the Belgian coast and crush in the flank of the attacking Allies. He even held back the troops pursuing the Belgians in order not to alarm the Allied command prematurely.

Meanwhile, the new Allied advance was developing piecemeal, as corps detrained from the south and swung eastwards to form a progressively extended "scythe." The British expeditionary force, now three corps strong, deployed in turn between La Bassée and Ypres, where it effected a junction with Rawlinson's force. Beyond it the embryo of a new French 8th Army was taking shape, and the Belgians continued the line along the Yser to the sea. Although the British right and centre had already been held up, Sir John French, discounting even the underestimate of the German strength furnished by his Intelligence, ordered his left to begin the offensive from Ypres towards Menin. The effort was still-born, for it coincided with the opening of the German offensive, on Oct. 20, but for a day or two Sir John French persisted in the belief that he was attacking while his troops were barely holding their ground. With Foch the delusion persisted still longer, and this failure to grasp the situation was partly responsible for the fact that Ypres was essentially, like Inkerman, a "soldiers' battle." Already, since the 18th, the Belgians on the Yser had suffered growing pressure which threatened a disaster that was ultimately saved by the end of the month through the opening of the sluices and the flooding of the coastal area. At Ypres the crisis came later and was repeated, Oct. 31 and Nov. 11 marking the turning points of the struggle. That the Allied line, though battered and terribly strained, was in the end unbroken was due to the dogged resistance of the British and the timely arrival of French reinforcements. (See YPRES, BATTLE OF, 1914.)

This defence of Ypres is in a dual sense the supreme memorial to the British regular army, for here they showed the inestimable value of the disciplined morale and unique standard of musketry which were the fruit of long training, and here was their tombstone. "From failing hands they threw the torch" to the new national armies rising in England to the call of patriotism. With the Continental Powers the merging of conventional armies into national armies was a hardly perceptible process, because of their system of universal service. But with Britain it was clearly stamped as revolution, not evolution. While the little professional army sacrificed itself as the advanced guard of the nation, the truth of the new warfare of peoples was beginning to come home to the civilian population. Lord Kitchener, a national symbol because of his imperial achievements, had been summoned to the post of war minister, and with a supreme flash of vision had grasped, in contrast to Governments and general staffs alike, the probable duration of the struggle. The people of Britain responded to his call to arms, and like an ever-rising flood the "New Armies" came into being. By the end of the year nearly 1,000,000 men had enlisted, and the British empire had altogether some 2,000,000 under arms. Perhaps Kitchener was wrong in not basing this expansion, from a professional to a national scale, on the existing Territorial foundation. It must be remembered, however, that the Territorial Force was enlisted for home defence and that initially its members' acceptance of a wider role was voluntary. Perhaps, also, he was tardy in recognizing their military value.

The duplication of forces and of organization was undoubtedly a source of delay and waste of effort. Kitchener has also been reproached for his reluctance to replace the voluntary system by conscription, but this criticism overlooks how deeply rooted was the voluntary system in British institutions, and the slowness with which lasting changes can be effected in them. If Kitchener's method was characteristic of the man, it was characteristic of England. If it was unmethodical, it was calculated to impress

most vividly on the British people the gulf between their "gladiatorial" wars of the past and the national war to which they were committed.

While a psychological landmark, the battle of Ypres is also a military landmark. For, with the repulse of the German attempt to break through, the trench barrier was consolidated from the Swiss frontier to the sea. The power of modern defence had triumphed over attack. and stalemate ensued. The military history of the Franco-British alliance during the next four years is a story of the attempts to upset this deadlock, either by forcing the barrier or by finding a way round.

On the Eastern front, however, the greater distances and the greater differences between the equipment of the armies ensured a fluidity which was lacking in the West. Trench lines might form, but they were no more than a hard crust covering a liquid expanse. To break the crust was not difficult, and once broken, mobile operations of the old style became possible. This freedom of action was denied to the Western Powers, but Germany, because of her central position, had an alternative choice, and from Nov. 1914 onwards her command adopted a defensive in France while seeking to cripple the power of Russia.

V. THE RUSSIAN FRONT

Invasion of East Prussia.—In the East the opening encounters had been marked by rapid changes of fortune rather than by any decisive advantage. The Austrian command, emulating their allies in violating the principle of concentration, detached part of their strength in an abortive attempt to crush Serbia. (See SERBIAN CAMPAIGNS.) And their plan for an initial oifensive to cut off the Polish "tongue" was further crippled by the fact that the German part of the pincers did not operate. It was, indeed, being menaced by a Russian pair of pincers instead, for the Russian commander-in-chief, the Grand Duke Nicholas, had urged his 1st and 2nd Armies to invade East Prussia without waiting to complete their concentration, in order to ease the pressure on his French allies. As the Russians had more than a two-to-one superiority, a combined attack had every chance of crushing the Germans between the two armies. On Aug. 17, Rennenkampf's 1st Army (six and a half divisions and five cavalry divisions) crossed the East Prussian frontier, and on Aug. 19–20 met and threw back the bulk (seven divisions and one cavalry division) of Prittwitz's 8th Army at Gumbinnen. On Aug. 21 Prittwitz heard that the Russian 2nd Army (ten divisions and three cavalry divisions) under Samsonov had crossed the southern frontier of East Prussia in his rear, which was guarded by only three divisions. In panic Prittwitz momentarily spoke of falling back behind the Vistula, whereupon Moltke superseded him by a retired general, Hindenburg, to whom was appointed as chief of staff, Ludendorff, the hero of the Liège attack.

Developing a plan which, with the necessary movements, had been already initiated by Col. Hoffmann of the 8th Army staff, Ludendorff concentrated some six divisions against Samsonov's left wing. This force, inferior in strength to the Russians, could not have been decisive, but Ludendorff, finding that Rennenkampf was still near Gumbinnen, took the calculated risk of withdrawing the rest of the German troops, except the cavalry screen, from that front and rushing them back against Samsonov's right wing. This daring move was aided by the absence of communication between the two Russian commanders and the ease with which the Germans deciphered Samsonov's wireless orders to his corps. Under the converging blows Samsonov's flanks were crushed and his centre surrounded. The outcome of this military masterpiece, afterwards christened the battle of Tannenberg (*q.v.*), was the destruction of almost the whole of Samsonov's army. Then receiving two fresh army corps from the French front, the German commander turned on the slowly advancing Rennenkampf, whose lack of energy was partly due to his losses at Gumbinnen and subsequent lack of information, and drove him out of East Prussia. (See MASURIAN LAKES.) As a result of these battles Russia had lost a quarter of a million men and, what she could afford still less, much war material. But the invasion of East Prussia had at least, by causing the despatch of two corps from the West, helped to make possible the French "come-back" on the Marne.

Galician Battles.—Away on the southern front, moreover, the scales had tilted against the Central Powers. The offensive of the Austrian 1st and 4th Armies into Poland had at first made progress, but this was nullified by the onslaught of the Russian 3rd and 8th Armies upon the weaker 2nd and 3rd Armies which were guarding the Austrian right flank. These armies were heavily defeated (Aug. 26–30), and driven back through Lemberg. The advance of the Russian left wing thus threatened the rear of the victorious Austrian left wing. Conrad tried to swing part of his left round, in turn, against the Russian flank, but this blow was parried and then, caught with his forces disorganized by the renewed advance of the Russian right wing, he was forced on Sept. 11 to extricate himself by a general retreat, falling back almost to Cracow by the end of September. (See LEMBERG, BATTLES OF.) Austria's plight compelled the Germans to send aid, and the bulk of the force in East Prussia was formed into a new 9th Army and switched south to the south-west corner of Poland, whence it advanced on Warsaw in combination with a renewed Austrian offensive. (See VISTULA-SAN, BATTLES OF.) But the Russians were now approaching the full tide of their mobilized strength; regrouping their forces and counter-attacking, they drove back the advance and followed it up by a powerful effort to invade Silesia.

The Grand Duke Nicholas formed a huge phalanx of seven armies—three in the van and two protecting either flank. A further army, the 10th, had invaded the eastern corner of East Prussia and was engaging the weak German forces there. Allied hopes rose high as the much-heralded Russian "steam-roller" began its ponderous advance. To counter it the German eastern front was placed under Hindenburg and Ludendorff, who devised yet another master-stroke, based on the system of lateral railways inside the German frontier. The 9th Army, retreating before the advancing Russians, slowed them down by a systematic destruction of the scanty communications in Poland. On reaching its o n frontier, unpressed, it was first switched northward to the Posen-Thorn area, and then thrust south-east on Nov. 11, with its left flank on the Vistula, against the joint between the two armies guarding the Russian right flank. The wedge, driven in by Ludendorff's mallet, sundered the two armies, forced the 1st back on Warsaw and almost effected another Tannenberg against the 2nd, which was nearly surrounded at Lodz (*q.v.*), when the 5th Army from the van turned back to its rescue. As a result, part of the German enveloping force almost suffered the fate planned for the Russians, but managed to cut its way through to the main body. If the Germans were baulked of decisive tactical success, this manoeuvre had been a classic example of how a relatively small force, by using its mobility to strike at a vital point, can paralyse the advance of an enemy several times its strength. The Russian "steam-roller" was thrown out of gear, and never again did it threaten German soil.

Within a week, four new German army corps arrived from the Western front, where the Ypres attack had now ended in failure, and although too late to clinch the missed chance of a decisive victory, Ludendorff was able to use them in pressing the Russians back by Dec. 15 to the Bzura-Ravka river line in front of Warsaw. This set-back and the drying up of his munition supplies decided the Grand Duke Nicholas to break off the see-saw fighting still in progress near Cracow and fall back on winter trench lines along the Nida and Dunajec rivers, leaving the end of the Polish "tongue" in the hands of the enemy. Thus, on the East as on the West, the trench stalemate had settled in, but the crust was less firm and the Russians had drained their stock of munitions to an extent that their poorly industrialized country could not make good.

The Beginning of Air Attack.—The same period witnessed the dawn of another new form of war which helped to drive home the new reality that the war of armies had become the war of peoples. From Jan. 1915, Zeppelin raids began on the English coast and reached their peak in the following winter, to be succeeded by aeroplane raids. The difficulty of distinguishing from the air between military and civil objectives, smoothed the path for a development which, beginning with excuses, ended in a frank

avowal that in a war for existence the will of the enemy nation, not merely the bodies of their soldiers, is the inevitable target.

The Psychological Situation. — The first psychological symptom of the World War, as it seemed to many, was an immeasurable sigh of relief. Had the peoples of Europe sat on the safety-valve too long? The war-weary mind of to-day cannot reconstruct the tension and anxiety, the strain and stress of hope and fear of the long years of the peace that was no peace and yet was not war. It may be read as a revolt of the spirit against the monotony and triviality of the everyday round, the completion of a psychological cycle when the memories of past war have faded, and paved the way for the emergence and revival of the primal "hunting" instinct in man.

This first phase of enthusiasm was succeeded by one of passion, the natural ferocity of war accentuated by a form of mob spirit which is developed by a "nation in arms." The British army was relatively immune because of its professional character, whereas in the German army, the most essentially "citizen," it gained scope because of the cold-blooded logic of the general staff theory of war. With the coming of autumn 1914, a third phase became manifest, more particularly among the combatants. This was a momentary growth of a spirit of tolerance, symbolized by the fraternization which took place on Christmas Day, but this in turn was to wane as the strain of the war became felt and the reality of the struggle for existence came home to the warring sides.

VI. THE EVENTS OF 1915

The Deadlock on Land. — Well before the end of 1914, the reality of the deadlock on the Western front was clear to the Governments and general staffs of the warring countries, and each was seeking a solution. The reaction varied in form and in nature according to the mental power and predisposition of the different authorities. With the Central Powers the opinion of Falkenhayn was the decisive factor, and the impression derived not merely from his critics but from his own account is that neither the opinion nor the direction was really clear as to its object. He was too obsessed with the principle of security at the expense of the principle of concentration, and in his failure to fulfil the second he undermined the foundations of the first.

On his appointment after the Marne reverse, he still adhered to the Schlieffen plan of seeking a decision in the West, but he did not follow the Schlieffen method of weakening his left wing in order to mass on the vital right wing. The October–November attack round Ypres was made largely with raw formations, while war-experienced troops lay almost idle between the Aisne and the Vosges. Col. Groner, chief of the field railways, even went so far as to submit a detailed plan to Falkenhayn for transferring six army corps to the right wing, but it was rejected. When we remember how close to breaking point was the Allied line at Ypres, it can only be said that for a second time the German supreme command saved the Allies. At this juncture, too, Ludendorff was pleading for reinforcements to make his wedge-blow at the Russian flank near Lodz decisive, but Falkenhayn missed the chance by delaying until the Ypres failure had passed from assurance to fact.

Convinced at last of the strength of the Allied trench-barrier, Falkenhayn took the momentous decision to stand on the defensive in the West. But his object in so doing seems to have been vague. His feeling that the war must ultimately be decided in France led him to distrust the value, as he doubted the possibility, of a decision against Russia. Hence while he realized that the Eastern front was the only practicable theatre for operations in the near future, he withheld the necessary reinforcements until forced to do so by the threatening situation of the Austro-Hungarian front. And even then he doled out reserves reluctantly and meagrely, enough to secure success but never in the quantity and the time for decisive victory.

It is to his credit, however, that he realized a long war was now inevitable, and that he set to work to develop Germany's resources for such a warfare of attrition. The technique of field entrenchment was carried to a higher pitch than with any other country, the military railways were expanded for the lateral movement of reserves, the supply of munitions and of the raw material for their manufacture was tackled so energetically and comprehensively, that an ample flow was ensured from the spring of 1915 onwards — a time when the British were only awakening to the problem. Here were laid the foundations of that economic organization and utilization of resources which was to be the secret of Germany's resisting power to the pressure of the British blockade. For the scientific grasp of the economic sphere in war Germany owed much to Dr. Walther Rathenau. a brilliant captain of industry. Germany also pioneered in the psychological sphere, for as early as the autumn of 1914, she launched a vast scheme of propaganda in Asia, to undermine British prestige and the loyalty of Britain's Mohammedan subjects. The defect of her propaganda, its crudeness, was less apparent when directed to primitive people than when applied to the civilized peoples of Europe and America.

The same period witnessed also the one great success for German diplomacy, the entry of Turkey into the war, although this was fundamentally due to a combination of pre-war causes with military events. Since 1909 the country had been under the control of the Young Turk party, to whom traditions, including that of friendship with Britain, were abhorrent. Germany, filled with her own dream of a Germanic Middle East — of which the Baghdad railway was the symbol, had skilfully exploited the opportunity to gain a dominating influence over the new rulers of Turkey. Their leader, Enver Pasha, had been military attaché in Berlin, German instructors permeated the Turkish army, and a definite understanding existed between Germany and the Young Turk leaders as to common military action — urged by the common bond of necessary safeguard against danger from Russia. The arrival of the "Goeben" and "Breslau" reinforced the moral pressure of Wangenheim, the German ambassador, and eventually on Oct. 29 the Turks committed definite acts of war, at Odessa against Russia, and in Sinai against Britain.

Falkenhayn has shown "the decisive importance of Turkey joining in the struggle" — first as a barrier across the channel of munition supply to Russia, and secondly as a distraction to the military strength of Britain and Russia. Under German dictation, Turkey struck as early as mid-December against the Russians in the Caucasus (*q.v.*), but Enver's over-ambitious plan ended in disaster at the battle of Sarikamish. Turkey was no more fortunate in her next venture; to cut Britain's Suez canal artery with the East. The Sinai desert was a check on an invasion in strength, and the two small detachments which got across were easily repulsed, at Ismailia and El Kantara, although allowed to make good their retreat. But if both these offensives were tactical failures, they were of great strategic value to Germany by pinning down large Russian and British forces.

As an offset to Turkey joining the Central Powers, Italy definitely threw over the artificial ties of the old Triple Alliance and joined the Entente. On May 24 she declared war on Austria — her hereditary enemy — although avoiding an open breach with Germany. If her main object was to seize the chance of redeeming her kinsmen in Trieste and the Trentino from Austrian rule, there was also a spiritual desire to reassert her historic traditions. Militarily, however, her aid could not have an early or great effect on the situation, for her army was unready to deliver a prompt blow, and the Austrian frontier was a mountainous obstacle of great natural strength.

Franco-British Plans. — On the Entente side the reality of the trench deadlock produced different and diverse reactions. If the desire to hold on to her territorial gains swayed German strategy, the desire to recover her lost territory dominated French strategy. It is true that their mental and material concentration on the Western front, where lay the main armed force of the enemy, was justified by military tenets, but without any key to unlock the barrier they were merely knocking themselves to pieces. Winter attacks in Artois, on the Aisne, in Champagne and the Woevre afforded costly proof, and against the Germans' skill in trench-fighting Joffre's "nibbling" was usually attrition on the wrong side of the balance sheet As for any new key, the French were singularly lacking in fertility of idea.

Britain's trouble was rather an excess of fertility, or rather an

absence of concentration in choosing and bringing to fruition these mental seeds. Yet in great measure this failing was due to the obscurantism of professional opinion, whose attitude was that of blank opposition rather than expert guidance.

British-inspired solutions to the deadlock crystallized into two main groups, one tactical, the other strategical. The first was to unlock the trench barrier by producing a machine invulnerable to machine-guns and capable of crossing trenches, which would restore the tactical balance upset by the new preponderance of defensive over offensive power. The idea of such a machine was conceived by Col. Swinton in October 1914, was nourished and tended in infancy by Winston Churchill, then first lord of the Admiralty, and ultimately, after months of experiment hampered by official opposition, came to maturity in the tank of 1916.

The strategical solution was to go round the trench barrier. Its advocates — who became known as the "Eastern" in contrast to the "Western" school — argued that the enemy alliance should be viewed as a whole, and that modern developments had so changed conceptions of distance and powers of mobility, that a blow in some other theatre of war would correspond to the historic attack on an enemy's strategic flank. Further, such an operation would be in accordance with the traditional amphibious strategy of Britain, and would enable it to exploit the advantage of sea-power which had hitherto been neglected. In October 1914, Lord Fisher, recalled to the office of first sea lord, had urged a plan for a landing on the German coast. In Jan. 1915, Lord Kitchener advocated another, for severing Turkey's main line of eastward communication by a landing in the Gulf of Alexandretta. The post-war comments of Hindenburg and Enver show how this would have paralysed Turkey. It could not, however, have exercised a wider influence, and it was anticipated by another project — partly the result of Churchill's strategic insight and partly due to the pressure of circumstances.

This was the Dardanelles expedition, about which controversy has raged so hotly that the term just applied to Churchill may be disputed by some critics. This is answered by the verdict of Falkenhayn himself: "If the straits between the Mediterranean and the Black sea were not permanently closed to Entente traffic, all hopes of a successful course of the war would be very considerably diminished. Russia would have been freed from her significant isolation . . . which offered a safer guarantee than military successes . . . that sooner or later a crippling of the forces of this Titan must take place . . . automatically." The fault was not in the conception, but in the execution. Had the British used at the outset even a fair proportion of the forces they ultimately expended in driblets, it is clear from Turkish accounts that victory would have crowned their undertaking.

The cause of this piecemeal application of force and dissipation of opportunity lay in the opposition of Joffre and the French general staff, supported by Sir John French. Despite the evidence of the sequel to the Marne, of the German failure at Ypres, and subsequently of his own still more ineffectual attacks in December, Joffre was still confident of his power to achieve an early and decisive victory in France. His plan was that of converging blows from Artois and Champagne upon the great salient formed by the entrenched German front, to be followed by an offensive in Lorraine against the rear of the enemy armies. The idea was similar to that of Foch in 1918 but the vital difference lay in the conditions existing and the methods employed. A study of the documents conveys the impression that there has rarely been such a trinity of optimists in whom faith was divorced from reason as Joffre, Foch, his deputy in Flanders, and French — albeit the latter's outlook oscillated violently. In contrast the British Government considered that the trench-front in France was impregnable to frontal attacks, had strong objection to wasting the man-power of the new armies in a vain effort, and at the same time felt increasing concern over the danger of a Russian collapse. These views were common alike to Churchill, Lloyd George and Lord Kitchener, who on Jan. 2, 1915, wrote to Sir John French: "The German lines in France may be looked upon as a fortress that cannot be carried by assault and also that cannot be completely invested, with the result that the lines may be held by an investing force while operations proceed elsewhere."

Lloyd George advocated the transfer of the bulk of the British forces to the Balkans both to succour Serbia and to develop an attack on the rear of the hostile alliance. This view was shared by a section of French opinion and, in particular, by Galliéni, who proposed a landing at Salonika as a starting point for a march on Constantinople with an army strong enough to encourage Greece and Bulgaria to combine with the Entente. The capture of Constantinople was to be followed by an advance up the Danube into Austria-Hungary in conjunction with the Rumanians. But the commanders on the Western front, obsessed with the dream of an early break-through, argued vehemently against any alternative strategy, stressing the difficulties of transport and supply and insisting on the ease with which Germany could switch troops to meet the threat. If there was force in their contention, it tended to ignore the experience of military history that "the longest way round is often the shortest way there," and that the acceptance of topographical difficulties bas constantly proved preferable to that of a direct attack on an opponent firmly posted and prepared to meet it.

The weight of military opinion bore down counter-proposals and the Balkan projects were relinquished in favour of a concentration of effort on the Western front. But misgivings were not silenced and at this juncture a situation arose which revived the near Eastern scheme in a new if attenuated form.

The Dardanelles Expedition. — On Jan. 2, 1915, Kitchener received an appeal from the Grand Duke Nicholas for a diversion which would relieve the Turkish pressure on Russia's army in the Caucasus. Kitchener felt unable to provide troops and suggested a naval demonstration against the Dardanelles, which Churchill, appreciating the wider strategic and economic issues, proposed to convert into an attempt to force the passage. His naval advisers, if not enthusiastic, did not oppose the proposal and in response to a telegram the admiral on the spot, Carden, submitted a plan for a methodical reduction of the forts and clearance of the mine-fields. Fisher, while clinging to his own North sea project, strongly advocated a combined naval and military expedition. On Jan. 13, the War Council decided for a naval expedition to "take the Gallipoli peninsula, with Constantinople as its objective." A naval force, mainly of obsolete vessels was got together with French aid, and after preliminary bombardment, entered the straits on March 18. Drift mines, however, caused the sinking of several ships, and the attempt was abandoned.

It is a moot point whether a prompt renewal of the advances would not have succeeded, for the Turkish ammunition was exhausted, and in such conditions the mine obstacle might have been overcome. But the new naval commander, Admiral de Robeck decided against it, unless military aid was forthcoming. Already, a month before, the War Council had determined on a joint attack, and began the despatch of a military force under Sir Ian Hamilton. (*See* DARDANELLES CAMPAIGN.) But as the authorities had drifted into the new scheme, so were they tardy in releasing the necessary troops, and even when sent in inadequate numbers, several more weeks' delay had to be incurred — at Alexandria — in order to redistribute the force in its transports suitably for tactical action. Worst of all, this fumbling policy had thrown away the chance of surprise, which was vital for a landing on an almost impregnable shore. When the preliminary bombardment took place in February only two Turkish divisions were at the straits; this was increased to four by the date of the naval attack, to six when Hamilton was at last able to attempt his landing. For this he had only four British divisions and one French division — actually inferior in strength to the enemy in a situation where the inherent preponderance of defensive over offensive power was multiplied by the natural difficulties of the terrain. His weakness of numbers and his mission of aiding the passage of the fleet compelled him to choose a landing on the Gallipoli peninsula in preference to one on the mainland or on the Asiatic shore; and the rocky coastline limited his possible landing places.

On April 25, he made his spring, at the southern tip of the

peninsula near Cape Hellas and—with Australian and New Zealand troops—near Gaba Tepe, some 1½ m. up the Aegean coast; the French, as a diversion, made a temporary landing at Kum Kale on the Asiatic shore. The troops effected the impossible and made good their lodgment on beaches strewn with barbed wire and swept by machine-guns. But the momentary asset of tactical surprise had passed, the difficulties of supply were immense, while the Turks held the commanding heights and were able to bring up their reserves. The invaders managed to hold on to their two precarious footholds, but they could not expand them appreciably, and the stagnation of trench warfare set in. They could not go on, and national prestige forbade them to go back.

Ultimately, in July, the British Government decided to send a further five divisions to reinforce the seven by now on the peninsula. By the time they arrived the Turkish strength in the region had also risen to 1½ divisions. Hamilton decided on a double stroke—a reinforced blow from Gaba Tepe and a new landing at Suvla bay a few miles north—to sever the middle of the peninsula and secure the heights commanding the Narrows. He deceived the Turkish command and achieved surprise (Aug. 6), but the first biow failed and the second lost a splendid chance by the inexperience of the troops and still more the inertia and fumbling of the local commanders. For over 36 hours, before reserves arrived, only one and a half Turkish battalions barred the path. Energetic new commanders, for whom Hamilton had previously asked, were sent out when the opportunity had passed. The British were once more condemned to hang on to tenuous footholds, and with the autumn rains setting in their trials were increased. The Government had lost faith and were anxious to withdraw, but fear of the moral effect delayed their decision. Hamilton was asked for his opinion, however, and when he pronounced in favour of continuing—in which course he still had confidence—he was replaced by Sir Charles Monro, who immediately declared for evacuation. Kitchener was then sent out to investigate, and on his verdict a withdrawal was sanctioned and carried out from Suvla and Anzac on the night of Dec. 18-19 and from Hellas on that of Jan. 8-9. If the bloodless evacuation was an example of masterly organization and co-operation it was also a proof of the greater ease of such operations in modern warfare. Thus the curtain rang down on a sound and far-sighted conception marred by a chain of errors in execution almost unrivalled even in British history.

The Menace to Russia.—While the British were striving to unlock the back door to Russia, the Germanic Powers were hammering their Russian allies, whose resistance was collapsing in large measure from a lack of munitions which could only be made good by foreign supplies through that locked entrance, the Dardanelles. On the Eastern front, the campaign of 1914 had shown that a German force could count on defeating any larger Russian force, but that when Russians and Austrians met on an equality victory rested with the Russians. Falkenhayn was forced, reluctantly, to despatch German reinforcements as a stiffening to the Austrians, and thus was dragged into an offensive in the East rather than adopting it as a clearly defined plan. Ludendorff, in contrast, had his eyes firmly fixed on the ultimate object, and from now on advocated unceasingly a whole-hearted effort to break Russia. Ludendorff's was a strategy of decision, Falkenhayn's a strategy of attrition.

In the conflict of wills between these two men lies the clue to the resultant strategy of Germany—highly effective, yet not decisive. On the other side the fresh Russian plan embodied the lessons of experience and was soundly conceived, but the means were lacking and the instrument defective. The Grand Duke Nicholas aimed to secure both his flanks solidly before attempting a fresh blow towards Silesia. From January until April, under bitter winter conditions, the Russian forces on the southern flank of the Polish salient strove to gain possession of the Carpathians and the gateways into the Hungarian plain. But the Austrians, with a German infusion, parried their efforts, and the loss was disproportionate to the small gains. The long-besieged fortress of Przemysl (*q.v.*), however, at last fell into their hands on March 22. In northern Poland the Russians were preparing to strike upwards at East Prussia, when they were forestalled by a fresh Ludendorff stroke eastwards towards the frontier of Russia proper. The blow was launched on Feb. 7, over snow-buried roads and frozen swamps, and was distinguished by the envelopment of four Russian divisions in the Augustovo forests. (See MASURIAN LAKES.) Moreover, it extracted the sting from the Russian attack further west.

These moves were, however, merely a "curtain-raiser" to the real drama of 1915. But before turning to this it is necessary to glance at events on the Western front, the importance of which is partly as a signpost to the future and partly because of their reaction on the Eastern front.

The Western Front.—While a way round the trench barrier was being sought in Gailipoli and experiments with a novel key were being carried out in England, the Allied commands in France were trying more orthodox solutions. The most significant was the British attack at Neuve Chapelle (*q.v.*) on March 10. Save as a pure experiment the attempt stood self-condemned. For it was an isolated attempt on a small front with inadequate resources. The arrival in France of several new regular divisions made up from foreign garrisons, of the Indian Corps, and the 1st Canadian Division had brought the British strength up to 13 divisions and 5 cavalry divisions, besides a number of selected territorial battalions. This increase enabled French to divide his forces into two armies and gradually to extend his share of the front. But Joffre was insistent that he should relieve the French of the Ypres salient, which they had taken over in November, and made the intended French attack contingent on this relief. Sir John French considered that he had not sufficient troops for both purposes, and so decided to carry out the attack single-handed. An additional motive was his resentment of the constant French criticisms that the British were not "pulling their weight."

In design, however, the attack, entrusted to Haig's 1st Army, was both original and well thought out. After an intense bombardment of 35 minutes duration on a 2,000 yd. frontage, the artillery lengthened their range and dropped a curtain of fire to prevent the reinforcement of the enemy's battered trenches, which were rapidly overrun by the infantry.

Complete surprise was attained and most of the first positions captured, but when in the second phase, the frontage was extended, the artillery support was inadequate. Further, owing to scanty information and to the two corps commanders waiting upon each other a long pause occurred which gave the Germans five clear hours to organize fresh resistance. Then, too late and mistakenly, the attack was ordered to be pushed "regardless of loss." And loss proved the only result. An underlying factor was that the narrowness of the attack sector made the breach more easy for the defenders to close, although this defect was unavoidable owing to the general shortage of munitions. The British had been slower than the Germans to awaken to the scale of ammunition supply required for this new warfare, and, even so, deliveries fell far behind contract, owing largely to the handicap imposed by trade union rules on the dilution of skilled labour. These could only be modified after long negotiation and the shortage of shells became so obvious in the spring of 1915 as to lead to a public outcry which culminated in the establishment of a Ministry of Munitions, under Lloyd George, to co-ordinate and develop both manufacture and the supply of raw materials. Apart from shells the crudeness and inferiority of all the British trench-warfare weapons compared with those of the Germans, made such a radica! organization overdue, and its urgency was emphasized by the near approach of the time when Britain's new armies would take over the field. If the task was undertaken late, it was carried out with energy and thoroughness, and by 1916 the flow of munitions reached a volume, still expanding, which finally removed any material handicap on the strategy of the British leaders.

The tactical sequel of Neuve Chapelle was less fortunate. It was clear that the small-scale experiment had only missed success by a narrow margin and that there was scope for its development. But the Entente commands missed the true lesson, which was the surprise attainable by a short bombardment that com-

pensated its brevity by its intensity. And only partially did they appreciate that the sector attacked must be sufficiently wide to prevent the defender's artillery commanding, or his reserves closing the breach. Instead, they drew the superficial deduction that mere volume of shell-fire was the key to success. Not until 1917 did they revert to the Neuve Chapelle method. It was left to the Germans to profit by the experience against the Russians in May.

But before that came, the Western front was destined to increase the tally of military blunders. In the first, it was the Germans' turn to find and misuse a new key to the trench deadlock. This was the introduction of gas, and, unlike the British introduction of tanks later, the chance, once forfeited, did not return, owing to the relative ease of providing an antidote. In a local attack in Poland on Jan. 31, the Germans had tried the use of gas-shells, but the experiment had been a failure owing to the nullifying effect of the intense cold. At the next attempt it was discharged from cylinders owing to the failure of the authorities to provide the inventor, Haber, with adequate facilities for the manufacture of shells. Further, the initial disappointment led the German command to place little trust in its value. In consequence, when discharged against the French trenches at Ypres on April 22, there were no reserves at hand to pour through the wide breach it created. *(See* YPRES, BATTLES OF, 1915.) A strange green vapour, a surging mass of agonized fugitives, a 4 m. gap without a living defender—such was the sequence of events. But the heroic resistance of the Canadians on the flank of the breach and the prompt arrival of English and Indian reinforcements saved the situation in the absence of German reserves.

The chlorine gas originally used was undeniably cruel, but no worse than the frequent effect of shell or bayonet, and when it was succeeded by improved forms of gas both experience and statistics proved it the least inhumane of modern weapons. But it was novel and therefore labelled an atrocity by a world which condones abuses but detests innovations. Thus Germany incurred the moral odium which inevitably accompanies the use of a novel weapon without any compensating advantage. *(See* CHEMICAL WARFARE.)

On the Entente side, wisdom would have counselled a period of waiting until their munition supply had grown and the new British armies were ready, but the desire to regain lost territory and the duty of relieving the pressure on Russia, combined with ill-founded optimism to spur Joffre to premature offensives. The German losses were exaggerated, their skill and power in defence underrated, and a series of diffused and unconnected attacks were made. The chief was by the French between Lens and Arras, under Foch's direction, and the earlier experience of failure to make an effective breach in the trench barrier was repeated. The attack was launched on May 9 by d'Urbal's army on a four-mile frontage. It was quickly checked with murderous losses except on the front of Pétain's corps which, thanks to meticulous preparation, broke through to a depth of three miles. But the penetration was too narrow, reserves were late and inadequate and the gap closed. Foch, however, persevered with vain attacks which gained a few acres of ground at excessive loss. Meantime Haig's 1st Army had attacked towards Aubers Ridge simultaneously with the larger French attempt. The plan was to penetrate at two points north and south of Neuve Chapelle, 4 m. apart, the total frontage of the two being $2\frac{1}{4}$ m., and then to converge in exploiting the double penetration. But the Germans, profiting also from the experimental value of Neuve Chapelle, had developed their defences. Thus the attack died away quickly from a surfeit of German machine-guns and an insufficiency of British shells. Under pressure from Joffre the attack was renewed on May 15 on the Festubert sector south of Neuve Chapelle, and continued by small bites until May 27. The larger French offensive between Lens and Arras was not abandoned until June 18, when the French had lost 102,000 men—rather more than double the defender's loss.

The effect of these attacks was, moreover, to convince even the dubious Falkenhayn of the strength of his Western line and of the remoteness of any real menace from the Franco-British forces. His offensive on the Eastern front had already opened. Tactically unlimited, its strategic object was at first only the limited one of relieving the pressure on the Austrian front and, concurrently, reducing Russia's offensive power. Conrad proposed and Falkenhayn accepted a plan which aimed at a rupture of the Russian centre as the best means to this end, and in which the Dunajec sector between the upper Vistula and the Carpathians was selected as offering the fewest obstacles to an advance and best protection to the flanks of a penetration. The break-through was entrusted to Mackensen, whose force comprised the newly formed German 11th Army—strengthened by divisions from the West, and the 4th Austro-Hungarian Army. The Ypres gas attack and a large cavalry raid from East Prussia were initiated to cloak the concentration on the Dunajec river of 14 divisions and 1,500 guns against a front held by only six Russian divisions and lacking rear lines of trenches.

The Dunajec Break-through.—On May 2, after an intense bombardment had flattened the Russian trenches, the attack was launched and swept through with little opposition. The surprise was complete, the exploitation rapid, and despite a gallant stand on the Wisloka river, the whole line along the Carpathians was rolled up, until on May 14 the advance reached the San, 80 m. from its starting point. Defeat almost turned into disaster when this was forced at Jaroslav, but the impetus of the advance had momentarily spent itself and reserves were lacking. A new factor was introduced by Italy's declaration of war against Austria, but Falkenhayn persuaded the Austrian command, with some difficulty, not to move troops from the Russian front, and to maintain a strict defensive on their Italian frontier, which was secured by the mountain barrier. He realized that he had committed himself too far in Galicia to draw back, and that only by bringing more troops from France could he hope to fulfil his object of transferring troops back there, as this could only be possible when Russia's offensive power was crippled and her menace to Austria removed. Strengthened by these reinforcements, Mackensen attacked again in co-operation with the Austrians, retook Przemysl on June 3 and captured Lemberg on June 22, cutting the Russian front into two separated portions.

But the Russians, from their vast man-power resources had almost made good the loss of 400,000 prisoners, and Falkenhayn's anxiety about the stability of his Austrian allies decided him to continue the offensive, although still with limited objects and with one eye on the situation in France. He changed its direction, however, from eastwards to northwards, between the Bug and Vistula, where lay the main Russian forces. In conjunction, Hindenburg was ordered to strike south-east from East Prussia, across the Narew (*q.v.*) and towards the Bug. Ludendorff disliked the plan as being too much of a frontal attack; the Russians might be squeezed by the closing in of the two wings but their retreat would not be cut off. He urged once more his spring scheme for a wide enveloping manoeuvre through Kovno on Vilna and Minsk, but Falkenhayn rejected it, fearing that it would mean more troops and a deeper commitment. The result justified Ludendorff's expectation—the Grand Duke extricated his troops from the Warsaw salient before the German shears could close on him. Falkenhayn, on the other hand considered that Ludendorff had not put his full weight into the attack. *(See* further BREST-LITOVSK, BATTLES OF.)

Nevertheless, 750,000 prisoners had been taken by the middle of August, Poland had been occupied, and Falkenhayn decided to break off large scale operations on the Eastern front. Bulgaria's entry into the war was now arranged and he wished to support the combined attack of Austria and Bulgaria against Serbia, as well as to transfer troops back to meet the French offensive expected in September. Mackensen was sent to the Serbian front and Ludendorff was given a belated permission to carry out his Vilna scheme, with such resources as he had, but as an independent operation.

It began on Sept. 9, Below's Army of the Niemen and Eichhorn's 10th Army forming two great horns which gored their way into the Russian front, the one east towards Dvinsk and the other south-east towards Vilna. The Russians were driven

back in divergent directions and the Germany cavalry advancing between the horns far overlapped Vilna and drew near the Minsk railway. But the German strength was slender, the Russians free to concentrate against this isolated menace, and in face of the stiffening resistance Ludendorff took the wise course of suspending operations. The crux of the situation was that the Russian armies had been allowed to draw back almost out of the net before the long delayed Vilna manoeuvre was attempted; the degree of success attained with such weak forces was confirmation of its practicability and of Ludendorff's claim that a powerful blow delivered while the Russians were deeply enmeshed in the Polish salient might have annihilated the armed force of Russia. She had been badly lamed, but not destroyed, and although never again a direct menace to Germany, she was able to delay the full concentration of German strength in the West for two years, until 1918. Falkenhayn's cautious strategy was to prove the most hazardous in the long run, and indeed to pave the way for Germany's bankruptcy.

Thus, at the end of September, the Russian retreat, after a nerve-racking series of escapes from the salients which the Germans systematically created and then sought to cut off, came to a definite halt on a straightened line, stretching from Riga on the Baltic to Czernowitz on the Rumanian frontier. But the Russian armies had gained this respite at a ruinous price, and their Western allies had effected little in repayment of Russia's sacrifice on their behalf in 1914.

Allied Offensive in the West.—For the Franco-British relief offensive of Sept. 25 had been no more fruitful than its predecessors. The main blow was launched by the French in Champagne (*q.v.*), in conjunction with a Franco-British attack in Artois, on either side of Lens. One fault was that the sectors were too far apart to have a reaction on each other, but a worse was that the command tried to reconcile two irreconcilable factors—they aimed at a break-through but preceded it with a prolonged bombardment which gave away any chance of surprise. Joffre's plan was that the break-through in these two sectors was to be followed by a general offensive on the whole Franco-British front which would "compel the Germans to retreat beyond the Meuse and possibly end the war." The unquenchable optimist! The British attack at Loos (*q.v.*) was undertaken against the opinion of Haig, whose 1st Army had to carry it out. The British resources in artillery were still much less than those of the French, and Haig, after personal reconnaissance, reported that the sector was unsuitable for an attack. But Joffre, with the enchantment that distance lends, declared that it was "particularly favourable ground." Sir John French vacillated as usual, but finally ordered the attempt under pressure from Kitchener. The latter, in this reversal of his own previous attitude was apparently influenced by the grave situation in Russia, as well, perhaps, by his reaction from the disappointment at the Dardanelles. But as he had long since declared his view that the Western front was impassable, it is difficult to see how he could feel that a hopeless offensive there could bring fresh hope to the Russians. Both in Champagne and Artois the attacks penetrated the forward German positions without difficulty, but the delay in bringing reserves forward allowed the German reserves to close the gaps, a task simplified by the narrowness of the attack frontage. The slight gains of ground in no way compensated for the heavy price paid for them—the Allied loss was approximately 242,000 against 141,000 Germans. And if the Allied commands had gained more experience so had the Germans, in the art of defence. The British share in this offensive is, however, notable as marking the appearance in strength of the New Armies; at Loos they were "blooded" and if inexperience detracted from their effectiveness, their courage and driving force were an omen of Britain's power to improvise a national effort comparable with the long-created military machines of the Continent.

The direction of this effort inspired less confidence, and Sir John French gave place to Sir Douglas Haig as commander-in-chief, just as already in September the Russian command had been transferred from the Grand Duke Nicholas, nominally to the Tsar, as a moral symbol, but actually to a new commander-in-chief, Gen. Alexeiev, the newly appointed chief of staff.

The Italian Front, 1915.—Italy's military contribution to the Allied cause was handicapped not only by her unreadiness but by the awkward strategic position of her frontier, difficult for initiating an offensive and hardly more favourable for a secure defensive. The Italian frontier province of Venezia formed a salient pointing to Austria and flanked on the north by the Austrian Trentino, on the south by the Adriatic. Bordering on the Adriatic was a stretch of relatively low ground on the Isonzo front but the frontier then followed the Julian and Carnic Alps in a wide sweep round to the north-west. Any advance eastwards inevitably suffered the potential menace of an Austrian descent from the Trentino upon its rear.

Nevertheless, the eastern front, though difficult enough, seemed to offer more prospect of success, besides threatening a vital part of Austria, than an advance northward into the Alps. When Italy was preparing to enter the war Gen. Cadorna, who assumed command, drew up his plan on this basis of an offensive eastwards and a defensive attitude in the north. The overhanging menace of the Trentino was mitigated by the expectation of simultaneous pressure upon Austria from Russia and Serbia. Rut on the eve of Italy's declaration of war this hope faded, the Russian armies falling back under Mackensen's blows, while the Serbs, despite requests from the Allies, failed to make even a demonstration. This enabled the Austrians to despatch five divisions to the Isonzo from the Serbian front, these being relieved by three newly formed German divisions. Even so there were only some eight divisions in all available to oppose the Italians, who had a numerical superiority of more than three to one.

In order to secure good covering positions on the north a limited advance was made into the Trentino, with success, but another into the north-east corner of the frontier salient—towards Tarvis in the Carnic Alps—was forestalled. This local failure was to have unfortunate results later for it left the Austrians with a good strategic sally port into the Tagliamento valley. Meantime the main Italian advance, by the 2nd and 3rd Armies, had begun at the end of May, but out of their total of 14 divisions only seven were ready. Bad weather increased the handicap, the Isonzo coming down in flood, and the initial advance soon came to a standstill. The Isonzo front crystallized, like the others, into trench warfare. The Italian mobilization, however, was now complete and Cadorna mounted a deliberate attack, which opened on June 23. This first battle of the Isonzo continued until July 7 with little gain to show. A fresh series of efforts after a ten days' pause were hardly more effective, and the front then relapsed into the spasmodic bickering characteristic of trench warfare, while Cadorna made preparations for a new and larger effort in the autumn. When it was launched in October he had a two to one superiority in numbers but was weak in artillery. This defect coupled with the superior experience of the defender rendered the new offensive as barren as its predecessors. It was sustained perhaps too obstinately and when finally broken off on Dec. 5, the Italian loss in the six months' campaign totalled some 280,000—nearly twice that of the defenders, who had shown on this front a fierce resolution which was often lacking when they faced the Russians.

The Conquest of Serbia, Oct., 1915.—While stalemate, although with marked changes beneath the surface, had once more settled in on both the Eastern and Western fronts, the latter months of 1915 witnessed fluid operations elsewhere which were to have an uncalculated influence on the war.

Austria had proved capable of holding the Italians on the Isonzo, and once the Russian danger began to fade under the pressure of the summer offensive, her command was anxious to deal with Serbia conclusively. Austria's attempted invasions in August and September 1914, and again in November, had been brusquely repulsed by Serbian counter-strokes, and it was not pleasant for a great Power, especially one with so many Slav subjects, to swallow such military rebuffs. Her impatience coincided with Falkenhayn's desire to gain direct railway communication with Turkey, hard pressed at the Dardanelles. Throughout the summer the rival coalitions had been bidding for Bulgaria's

support, and in this bargaining the Entente suffered the moral handicap of military failure and the material handicap caused by Serbia's unwillingness to give up any part of Macedonia—of which she had despoiled Bulgaria in 1913. As Austria had no objection to offering territory that belonged to her enemy, Bulgaria accepted her bid. This accession of strength enhanced the chance of a decision against Serbia and in August Falkenhayn decided to reinforce Kövess's Austrian 3rd Army with Gallwitz's German 11th Army from the Russian front. In addition two Bulgarian armies were available. Mackensen was sent to direct the operations. To meet this new threat Serbia, apart from her own relatively small forces, had only a treaty guarantee of Greek aid and promises from the Entente Powers. The first disappeared with the fall of Venizelos, the pro-Ally Greek premier, and the second, as usual, was too late.

On Oct. 6, 1915 *(see* further, SERBIAN CAMPAIGNS) the Austro-German armies attacked southwards across the Danube, with a flanking movement across the Drina on the right. The sturdy resistance of the Serbs in delaying actions, and the natural difficulty of the mountainous country, checked the advance, but before Franco-British reinforcements could arrive, the Bulgarian armies struck westwards into southern Serbia, across the rear of the main Serbian armies. This drove a deep wedge between the Serbs and their allies, moving up from Salonika, and automatically loosened the props of the resistance in the north. With their line bent at both ends until it resembled a vast bow, threatened with a double envelopment, and with their retreat to the south cut off, the Serbian armies decided to retire west through the Albanian mountains. Those who survived the hardships of this mid-winter retreat were conveyed to the island of Corfu, and after being re-equipped and reorganized, joined the Entente force at Salonika in the spring of 1916. The conquest of Serbia, though not, as it proved, of Serbian military power, relieved Austria of danger on her southern frontier, and gave Germany free communication and control over a huge central belt from the North sea to the Tigris. For the Entente this campaign dug a military sump-pit which for three years was to drain their military resources, there to lie idle and ineffective. Yet ultimately that sump-pit was to overflow and wash away one of the props of the Central Alliance.

The Salonika Expedition.—When at the beginning of October the Entente Governments had awakened to Serbia's danger, British and French divisions had been despatched hurriedly from Gallipoli to Salonika, which was the only channel of aid to Serbia—by the railway to Uskub. The advanced guard of this relieving force—which was under the command of Gen. Sarrail—pressed up the Vardar and over the Serbian frontier, only to find that the Bulgarian wedge had cut it off from the Serbians, and it was forced to fall back on Salonika, pursued by the Bulgarians. On military grounds an evacuation of Salonika was indicated, but political reasons induced the Allies to remain. The Dardanelles failure had already diminished their prestige, and by convincing the Balkan States of German invincibility had induced Bulgaria to enter the war and Greece to break her treaty with Serbia. To evacuate Salonika would be a further loss of prestige, whereas by holding on the Allies could check German influence over Greece, and maintain a base of operations from which to aid Rumania, if, as expected, she entered the war on their side. To this end the Salonika force was augmented with fresh British and French divisions, as well as contingents from Italy and Russia, and there also the rebuilt Serbian army was brought. But apart from the capture of Monastir in Nov. 1916, and an abortive attack in April 1917, the Entente force made no serious offensive until the autumn of 1918. Its innocuousness was partly due to the natural difficulties of the country—the chain of mountain ridges which guarded the approach to the Balkans, partly to the feeling of the Allied Governments that it was a bad debt, and partly to the personality of Sarrail, whose conduct and reputation for political intrigues failed to command the confidence and co-operation essential if such a mixed force was to "pull its weight." On their side the Germans were content to leave it in passivity, under guard of the Bulgarians, while they steadily withdrew their own forces for use elsewhere. With gentle sarcasm they termed Salonika their "largest internment camp," and with half a million Allied troops locked up there the jibe had some justification—until 1918. (See further SALONIKA CAMPAIGNS 1915–18.)

The Mesopotamia Expedition to the Fall of Kut.—Nor was Salonika the only "drain" opened in 1915. Mesopotamia was the site of a fresh diversion of force from the centre of military gravity, and one which could only be excused on purely political grounds. It was not, like Salonika and the Dardanelles, begun to relieve a hard-pressed ally, nor had it the justification of the Dardanelles expedition of being directed at the vital point of one of the enemy States The occupation of Mesopotamia might raise British prestige, and it might annoy Turkey, but it could not endanger her power of resistance. Although its origin was sound, its development was another example of "drift," due to the inherent faultiness of Britain's machinery for the conduct of war. (See further MESOPOTAMIA, OPERATIONS IN.)

The oilfields near the Persian gulf were of essential importance for Britain's oil supply, and thus when war with Turkey was imminent, a small Indian force, of one division, was despatched to safeguard them. To fulfil this mission effectively it was necessary to occupy the Basra vilayet at the head of the Persian gulf, in order to command the possible lines of approach.

On Nov. 21, 1914, Basra was captured, but the rising stream of Turkish reinforcements compelled the Indian Government to add a second division. The Turkish attacks in the spring of 1915 were repulsed, and the British commander, Gen. Nixon, judged it wise to expand his footing, for greater security. Townshend's division was pushed up the Tigris to Amara, gaining a brilliant little victory, and the other division up the Euphrates to Nasiriya. Southern Mesopotamia was a vast alluvial plain, roadless and railless, in which these two great rivers formed the only channels of communication. Thus a hold on Amara and Nasiriya covered the oilfields; but Nixon and the Indian Government, inspired by these successes, decided to push forward to Kut-al-Amara, a move which was 180 m. further into the interior but had a partial military justification in the fact that at Kut the Shatt-el-Hai, issuing from the Tigris, formed a link with the Euphrates by which Turkish reserves might be transferred from one river line to the other.

Townshend was sent forward in August, defeated the Turks near Kut, and his cavalry carried the pursuit to Aziziya, half way to Baghdad. Enthusiasm spread to the home Government, anxious for a moral counterpoise to their other failures, and Nixon received permission for Townshend to press on to Baghdad. But after an indecisive battle at Ctesiphon, the growing superiority of the Turkish strength compelled Townshend to retreat to Kut. Here, isolated far from help, he was urged to remain, as several fresh divisions were being sent to Mesopotamia. Kut was invested by the Turks on Dec. 8, 1915, and the relieving forces battered in vain against the Turkish lines covering the approach on either bank of the Tigris. The conditions were bad, the communications worse, the generalship faulty, and at last on April 29, 1916, Kut was forced to surrender. However unsound the strategy which despatched Townshend on this adventure, it is just to emphasize that the actual achievements of his small force in face of superior numbers, with inadequate equipment and primitive communications, and utterly isolated in the heart of an enemy country, wrote a glorious page of British history. When these handicaps are compared with the four to one superiority in number, and highly organized supply system of the force which ultimately took Baghdad, the comparison explains the awe in which Townshend and his men were held by the Turks.

The Home Front 1915.—Perhaps one of the most significant landmarks of the transition of the struggle from a "military" to a "national" war was the formation of a National Ministry in Britain which occurred in May 1915. For the prototype of Parliaments to abandon the deep-rooted party system and pool the direction of the war was proof of the psychological upheaval of traditions. The Liberal prime minister, Asquith, remained, but the real lead began to pass insensibly into other hands, notably those of Lloyd George. Churchill, whose vision had saved the

menace to the Channel ports and made possible the future key to the deadlock, was shelved, as already had been Haldane, the creator of the expeditionary force.

Political changes were general in all countries, and were symptomatic of a readjustment of popular outlook. The early fervour had disappeared and been replaced by a dogged determination which, if natural to the British, was in strange contradiction to popular, if superficial, conceptions of the French temperament.

Economically, the strain had yet to be felt severely by any country. Finance had shown an unexpected power of accommodation, and neither the blockade nor the submarine campaign had seriously affected the food supply. If Germany was beginning to suffer some shortage, her people had more tangible omens of success to fortify their resolution than had their enemies.

VII. FROM VERDUN TO THE ENTRY OF AMERICA

Verdun, 1916.—In 1914 the centre of gravity of the World War had been on the Western front, in 1915 it shifted to the Eastern front, and in 1916 once more moved back to France. Although the Entente had dissipated some of their strength in Salonika and Mesopotamia, the rising tide of England's new armies and of her munition supplies promised the power for an effort far larger in scale than before to break the trench deadlock. Measures had also been taken to keep these new divisions up to strength. By the end of 1915 the British force in France had risen to 36 divisions through the entry into the field of "Kitchener's Army," as well as of the territorial divisions. Although the principle of voluntary enlistment had not yet been abandoned, the method was systematized and based on a national register. This scheme, launched in Oct. 1915, under the aegis of Lord Derby, aimed to reconcile the demands of the army with the needs of industry, calling up men by groups as they were wanted, and taking single men first. But the response among the latter was not adequate to preserve this graduated principle and in Jan. 1916, by the Military Service Act, the voluntary system—system is hardly the correct term—was replaced by conscription.

At the close of 1915 the first serious effort to obtain unity of action between the Allies was made, and a conference of the leaders of the French, British, Belgian and Italian armies, with representatives present from the Russian and Japanese, was held at Joffre's headquarters in December. As a result they adopted the principle of a simultaneous general offensive in 1916 by France, Britain, Russia and Italy. In view of the rawness of the British troops, it was recognized that time must be allowed for training, and that the offensive could not begin before the summer of 1916, although it was hoped to carry out preliminary attacks to wear down the enemy's strength.

But German action was to dislocate this scheme, and only the British share came fully into operation, and not even that into full effect. Falkenhayn was about to fulfil his long-cherished plan for a Western offensive, but with characteristic limitations. Always a believer in the strategy of attrition, he now carried this ruling idea into tactics, and produced the new form of attack by methodical stages, each with a limited objective. In a memorandum to the German emperor at Christmas 1915 he argued that England was the staple of the enemy alliance. "The history of the English wars against the Netherlands, Spain, France and Napoleon is being repeated. Germany can expect no mercy from this enemy, so long as he still retains the slightest hope of achieving his object." Save by submarine warfare, however, England and her army were out of reach, for their sector of the front did not lend itself to offensive operations. "In view of our feelings for our arch-enemy in the war that is certainly distressing, but it can be endured if we realize that for England the campaign on the Continent . . . is at bottom a side-show. Her real weapons here are the French, Russian and Italian armies." He regarded Russia as already paralysed, and Italy's military achievements as unlikely to affect the situation. "Only France remains. France has almost arrived at the end of her military effort. If her people can be made to understand clearly that in a military sense they have nothing tnorc to hope for, breaking-point would be reached, and England's best sword knocked out of her hand." He added that a break-through in mass was unnecessary, and that instead the Germans should aim to bleed France to death by choosing a point of attack "for the retention of which the French command would be compelled to throw in every man they have." Such objectives were either Belfort or Verdun, and Verdun was chosen, because it was a menace to the main German communications, because it offered a salient and so cramped the defender, and because of the moral effect if so renowned a place was lost to France.

The keynote of the tactical plan was a continuous series of limited advances which by their menace should draw the French reserves into the mincing-machine of the German artillery. And each of these advances was itself to be secured from loss by an intense artillery bombardment, brief for surprise and making up for its short duration by the number of batteries and their rapidity of fire. By this means the objective would be taken and consolidated before the enemy could move up his reserves for counter-attack. Although the French Intelligence branch at general headquarters gave early warning of the German preparations, the Operations branch were so full of their own offensive schemes that the warning fell on deaf ears. Further, the easy fall of the Belgian and Russian fortresses had led to a commonly held view that fortresses were obsolete, and Joffre, persuading the French Government to "declass" Verdun as a fortress, had denuded it of guns and troops. The forts were only used as shelters and the trench lines which took their place were inadequate and in poor repair. Yet in the outcome eight months' bombardment was to leave the forts almost undamaged!

At 7.15 A.M. on Feb. 21, the German bombardment began, on a front of 1j m., and progressively trenches and wire were flattened out or upheaved in a chaos of tumbled earth, giving to the countryside a weird resemblance to the surface of the moon. At 4.45 P.M. the German infantry advanced, although the first day only on a $2\frac{1}{2}$ m. front. From then until Feb. 24 the defenders' line east of the Meuse was crumbled away as by the erosion of the tide.

"Operations" still argued that it was only a feint, but Joffre decided to send de Castelnau to discover the true situation and with full powers to act. De Castelnau swung back the right flank but ordered the line of the forts to be held at all costs and entrusted the defence to Pétain, for whose use a reserve army was assembled. Pétain's first problem was not so much defence as supply—the German heavy guns had closed all avenues into the salient except one light railway and the Bar-le-Duc road. While gangs of territorial troops worked night and day to keep this in repair and widen it, Pétain organized the front into sectors and threw in repeated counter-attacks, which, helped by the narrowness of the front, at least slowed down the advance. Falkenhayn sought, somewhat late, to widen the front, and on March 6 the Germans extended the attack to the west bank of the Meuse. But the defence was now stiffening, the numbers balanced, and the immediate thrust to Verdun was checked.

A slight lull followed, and during it the Allies of France made efforts to relieve the pressure on her. The British took over the Arras front from the French 10th Army, their front becoming now continuous from the Yser to the Somme, the Italians made their fifth attack, though in vain, on the Isonzo front, and the Russians hurled untrained masses on the German front at Lake Narocz, near Vilna, once more striking prematurely and gallantly sacrificing themselves to help their Allies. The slight gains were soon lost through a counter-stroke. These efforts did not prevent Falkenhayn pursuing his attrition offensive at Verdun. (See further VERDUN, BATTLES OF.) The advances were slight but they were cumulative in effect, and the balance of loss turned definitely against the defenders. On June 7 Fort Vaux fell, and the German tide crept ever closer to Verdun, seeming to the anxious watchers to resemble the forces of nature rather than of men. And in the Asiago (*q.v.*) region, Conrad had launched his offensive against Italy's Trentino flank.

Brusilov's Offensive.—Again Russia came to the rescue In the spring of 1916 she had 130 divisions, but was woefully short

of equipment, facing 46 German and 40 Austrian divisions. The preparation and reorganization for her intended share in the year's Allied offensive were cut short by the emergency at Verdun and in relief of her French allies she had launched a costly and obstinately prolonged attack at Lake Narocz in March. When it was at last broken off, the preparations for the main offensive were resumed. This was to begin in July, coincidently with the Somme offensive and Brusilov, commanding the south-western front, was ordered to prepare such attacks as he could stage from his own resources as a distraction of the enemy's attention from the main offensive. But the distraction was released prematurely, on June 4, in response to Italy's appeal to Russia to prevent the Austrians reinforcing their Trentino attack. Without warning, because without any special concentration of troops, Brusilov's troops advanced against the Austrian 4th Army near Luck (*q.v.*) and the Austrian 7th Army in the Bukovina, whose resistance collapsed at the first shock. In three days Brusilov took 200,000 prisoners. This last vital effort of the Russian army in the war had important consequences. It stopped the Austrian attack on Italy, already impaired by an Italian riposte. It compelled Falkenhayn to withdraw troops from the Western front, and so abandon his plan for a counter-stroke against the British offensive preparing on the Somme, as well as the hope of nourishing his Verdun attrition process. It led Rumania to take her fateful decision to enter the war on the Entente side, and caused the supersession of Falkenhayn in the supreme command and his replacement by Hindenburg — with Ludendorff, officially styled First Quartermaster-General, as the directing brain.

Although Rumania's entry was the ostensible reason, the underlying one was the fact that Falkenhayn's '(limited" strategy in 1915 had made possible the Russian recovery which stultified the strategy of 1916. Falkenhayn was history's latest example of the folly of half-measures, the ablest and most scientific general — "penny wise, pound foolish" — who ever ruined his country by a refusal to take calculated risks. In 1916 he had turned back westwards to pursue his long cherished goal, and his strategy had faithfully fulfilled the canons of military orthodoxy by taking for its objective the enemy's strongest army and the strongest point of that army's position. It certainly achieved the object of compelling the French to pour their reserves into the Verdun "blood-bath," but did not effect any decisive strategic result. Falkenhayn had rejected Conrad's proposal for a concentration against Italy such as had previously overthrown Serbia. Conrad's reasons had been that such a blow against the "hereditary enemy" would act as a tonic to the Austro-Hungarian forces and that the theatre of war lent itself to decisive results by a thrust southwards from the Trentino against the rear of the Italian armies engaged on the Isonzo. The success attained by the relatively light blow of 1917—Caporetto—lends historical support to his contention. But Falkenhayn was dubious both of the feasibility and value of the plan and was unwilling even to lend the nine German divisions which Conrad asked for to relieve Austrian divisions in Galicia. In default of this aid Conrad persisted in attempting his design single-handed, taking some of his best divisions from Galicia, and thereby exposing their front to Brusilov's advance without obtaining adequate force to achieve his Italian front plan. Falkenhayn's smouldering resentment at this disregard of his views was fanned into flame by the Galician disaster, and he intervened in Vienna to procure the deposition of Conrad. His own fall followed hard on Conrad's heels.

Brusilov's offensive continued for three months with fair success, but reserves were not at hand for immediate exploitation, and before they could be moved down from the north the Germans were patching up the holes. His later efforts were never so dangerous, but they absorbed all the available Russian reserves, and their ultimate loss of 1,000,000 casualties completed the virtual ruin of Russia's military power.

The **Somme.**—Great as was the influence of Brusilov's offensive on German strategy, its effect on the Verdun situation was less immediate, and on June 23 the Germans almost reached the Belleville height, the last outwork of Verdun. Pétain made all ready for an evacuation of the east bank of the Meuse, though to his troops he showed no sign of anxiety, and ever repeated the now immortal phrase, "On les aura!"

But on July 1, the long-planned offensive on the Somme (*q.v.*) began, and from that day on the Germans at Verdun received no new divisions, and their advance died away from pure inanition. Nevertheless, although the Germans at Verdun had fallen short of their object, moral and material, they had so drained the French army that it could play but a slender part in the Allied plan for 1916. The British had now to take up the main burden of the struggle, and the consequence was to limit both the scope and effect of the Entente strategy.

On July 1, after a week's prolonged bombardment, the British 4th Army (recently created and placed under Rawlinson) attacked with 15 divisions on a front of 15 m. north of the Somme, and the French with five divisions on a front of 8 m., mainly south of the river, where the German defence system was less highly developed. The unconcealed preparations and the long bombardment had given away any chance of surprise, and in face of the German resistance, weak in numbers but strong in organization, the attack failed along most of the British front. Owing to the dense and rigid wave formations that were adopted the losses were appallingly heavy. Only on the south of the British front, near Fricourt and Montauban, did the attack gain a real footing in the German defences. The French, with slighter opposition, and being less expected, made a deeper advance.

This setback negatived the original idea of a fairly rapid penetration to Bapaume and Cambrai, and Haig adopted the attrition method of limited advances aimed to wear down the German strength. Rejecting Joffre's desire that he should again throw his troops frontally on the Thiepval defences, the attack was resumed on the southern British flank alone, and on July 14 the capture of the Germans' second position offered the chance of exploitation, which was not taken. From now onward a methodical but costly advance continued, and although little ground was gained the German resistance was seriously strained when the early onset of winter rains suspended operations in November. The effect, however, can be exaggerated, for it did not prevent the Germans withdrawing troops for the attack on Rumania. But in one respect the Somme shed a significant light on the future, for on Sept. 15 the first tanks (*q.v.*) appeared. Their early employment before large numbers were ready was a mistake; losing the chance of a great strategic surprise, and owing also to tactical mishandling and minor technical defects they only had a limited success. Although the higher military authorities lost faith in them, and some urged their abandonment, more discerning eyes realized that here was a key which, when properly used, would unlock the trench barrier. The Somme offensive had a further indirect effect, for its relief to the Verdun pressure enabled the French to prepare counter-strokes, carried out by Mangin's corps on Oct. 24 and Dec. 15, which regained most of the lost ground with small casualties. These economic successes were due to a revival of surprise, to a more elastic use of the limited objective method, and to a high concentration of artillery, with a minimum of infantry, to occupy the defences crushed by the guns.

The Conquest **of** Rumania.— Rumania, sympathetic to the Entente cause, had been waiting a favourable opportunity to enter the war on their side, and Brusilov's success encouraged her to take the plunge. Her command hoped that this success, combined with the Allied pressure on the Somme and at Salonika, would draw off the German reserves. She might have fared better and contributed more if she had taken the decision earlier, when Serbia was still an active force and Russia a real one. The two years of preparation had doubled the numbers of the Rumanian army, but in reality reduced its relative efficiency, for while other armies had developed with experience, Rumania's isolation and the incapacity of her military leadership had prevented the transformation of her army from a militia of "bayonet men" into a modern force. Her 10 active divisions had only a low proportion of machine-guns, 5 of the 13 newly formed divisions had none at all, the artillery was inadequate and the air force negligible. She had only six weeks' supply of ammunition at the start and her allies failed to fulfil their guarantees of supply. Moreover, her

strategical situation was another source of weakness—her territory forming an "L" reversed with the bottom section, Wallachia, sandwiched between Transylvania and Bulgaria, while the length of the frontier was out of all proportion to the depth of the country, with a shortage of lateral railways and the capital within 30 m. of the Bulgarian frontier. Further, she had in the Dobruja, on the other side of the Danube, a "back-yard" strip which offered an easy way of access.

These handicaps were accentuated by the divergent counsels of the Allies. While the British General Staff favoured a southward advance against Bulgaria which might have crushed the latter between the Rumanians and the Salonika army, the Russians urged a westward advance which would, in theory, be in closer co-operation with their own Bukovina advance. The political and moral advantages of a move into Transylvania led the Rumanians to adopt the second course. This has been much criticized, but without sufficient appreciation of the fact that the advance into Transylvania placed the Austro-German command in an awkward predicament, which might easily have been disastrous if the invasion had not been so sluggish. At the outset she had 23 divisions against 7 opposing her, but within a week the enemy would be, and were, able to raise this figure to 15.

The Rumanian advance began, on Aug. 27, with three main columns each of about 4 divisions, moving north-west through the Carpathian passes, the general conception being to pivot on the left and wheel the right up into line facing west when the Hungarian plain was reached. To guard the Danube three divisions were left and three more in the Dobruja, whither the Russians had promised to send two—Rumania's original stipulation had been that a force of 150,000 Russians should be sent.

The slow and cautious advance of the Rumanian columns, hampered by the poverty and destruction of communications, but not by resistance, withheld danger from the five weak Austrian divisions which covered the frontier and enabled their reinforcement by five German and two Austrian divisions. In fulfilment of the other half of the plan, made by Falkenhayn before his fall, four Bulgarian divisions with Austro-German technical troops were to be placed under Mackensen for the invasion of the Dobruja.

While the Rumanian columns were creeping westward into Transylvania, Mackensen stormed the Turtucaia bridgehead on Sept. 5, destroying the three Rumanian divisions which covered the Danube front, and then, with his flank secure, pressed eastwards into the Dobruja. This automatically drew away reserves from, and thereby halted the Rumanian offensive in Transylvania, while Falkenhayn had arrived to take charge. Finding that the Rumanian columns, now at a standstill were dispersed over a zoo-mile front, Falkenhayn concentrated against the southern column which had crossed the Rother Turm Pass, while using smaller forces to hold off the others. Having thrown this column back through the mountains by a convergent manoeuvre in which the Alpine Corps made a so-mile march in three days, Falkenhayn then profited by the despatch of the Rumanian reserves against Mackensen to concentrate his forces against the Rumanian centre column at Brasov (Kronstadt). By Oct. 9 he had driven this back in turn but he missed his greater goal of encircling it, which would have opened for him a clear passage into Rumania. 'The mischance jeopardised the whole German plan and almost saved Rumania, for with all the passes still in their hands. her troops sturdily repulsed all efforts to press through on their heels. A prompt attempt by Falkenhayn to swing further south and force a way by the Vulcan and Szurduk passes was foiled and the beginning of the winter snows was on the point of blocking operations when a concentrated last-hour effort at the same point, Nov. 11–17, broke through. It was the signal for the next move in the German plan. Mackensen had switched his main forces westwards, and on Nov. 23 crossed the Danube close to Bucharest, on which both armies now converged. It fell on Dec. 6, and. despite belated Russian aid, the Rumanian forces were driven north into the upper section of the Rumanian "L." The brilliantly co-ordinated German strategy had crippled their new foe, gained possession of the bulk of Rumania, with its oil and wheat, and gave the Russians another 300 m. of front to hold. Sarrail, at Salonika, had not succeeded in detaining the Bulgarian reserves.

The Capture *of* Baghdad.—The only territorial success that the Entente could show for their year's campaign was away in Mesopotamia—the capture of Baghdad, and this moral token was seized on with an enthusiasm which, militarily, it hardly warranted. The bitter experience of the past had damped the ardour of the British Government, and Sir William Robertson, the new Chief of the Imperial General Staff, was opposed to any further commitments which drained the strength available for the Western front. But Maude, the new commander on the spot, by subtle, if unconscious, steps succeeded in changing this defensive policy into one of a fresh offensive. After thorough reorganization of the Mesopotamian force and its communications, he began on Dec. 12, 1916, a progressive right wheel and extension of his front on the west bank of the Tigris above and below Kut. These methodical trench-warfare operations had placed him ready for a spring across the Tigris at the Turks' line of retreat, which was thus parallel to his front. But despite his four-to-one superiority of force, the failure of his right to pin down the enemy and of his cavalry to cut off their retreat prevented a decisive success. But it led to permission for an advance on Baghdad, and he entered the Mesopotamian capital on March 11, 1917. A series of skilfully conducted operations then drove the Turks into divergent lines of retreat and secured the British hold on the province.

The Advance on Palestine.—Ever since the abortive Turkish attempt to invade Egypt early in 1915, the British had kept large forces there, even when the Dardanelles expedition was crying out for troops. When Gallipoli was evacuated, the release of the Turkish forces threatened a fresh move on Egypt. To anticipate this by gaining command of the Sinai desert, Sir Archibald Murray advanced in the spring of 1916, defeating the Turkish forces, freshly arrived, at Romani, Magdhaba and Rafa. The rate of advance was governed by the time taken in extending a railway and pipe-line (for water) across the desert. This new "Exodus" inspired the British Government to carry out an invasion of Palestine, at as cheap a cost in troops as possible. The towns of Gaza, on the coast, and Beersheba, 25 m. inland, guarded the approach to Palestine. Murray attacked Gaza on March 26, but the attempt fell short when on the brink of success. By nightfall Gaza was practically surrounded but the victorious position was given up bit by bit, not under enemy pressure but on the orders of the executive British commanders, through faulty information, misunderstandings and over-anxiety. Nor did the harm end there for Murray reported the action to the Government in terms of a victory, and without hint of the subsequent withdrawal, so that he was encouraged to attempt, without adequate reconnaissance or fire support, a further attack on April 17–19 which proved a costlier failure against defences now strengthened. (See further PALESTINE, OPERATIONS IN.)

The Capture of **Gorizia.**—The Austrian offensive in the Trentino had interrupted Cadorna's plans for a renewed effort on the Isonzo, but when the former was halted, Cadorna switched his reserves back to the Isonzo. In preparation for this offensive the whole sector from Monte Sabotino to the sea was entrusted to the Duke of Aosta's 3rd Army, under which 16 divisions were concentrated, against six Austrian divisions. Following a preliminary feint near the sea on Aug. 4, the attack opened well two days later. North of Gorizia Capello's corps swept over the long impregnable Monte Sabotino, which guarded the approach to the river, and, crossing the river on the night of Aug. 8, occupied the town. This compelled an Austrian retreat on the Carso sector to the south, but attempts to exploit the success eastward failed against fresh positions of resistance. Three more efforts were made in the autumn and if they imposed a wearing strain on the Austrians they caused greater loss to the attackers. During the year Italians had suffered some 483,000 casualties and inflicted 260,000.

The War **at** Sea, **1915–16.**—Germany's first submarine campaign—associated by Allied opinion with the name of Admiral von Tirpitz, the exponent of ruthlessness—had been a signal failure, both in its meagre results and the disproportionate ethical

damage it did to Germany's cause. A series of Notes exchanged between the American and German Governments, culminated in April 1916 in a virtual ultimatum from President Wilson, and Germany abandoned her unrestricted campaign. The deprivation of this weapon spurred the German navy to its first, and last, attempt to carry out the initial plan on which it had begun the war. On May 30, 1916, the British Grand Fleet left its bases on one of its periodical sweeps through the North sea, but with reason to expect a possible encounter. On May 31, early in the morning, the German High Sea Fleet also put to sea, in the hope of destroying some isolated portion of the British fleet.

For such an encounter the British admiral, Jellicoe, had formulated an outline plan in the early months of the war. Its basis was the cardinal necessity of maintaining the unimpaired supremacy of the Grand Fleet, which he viewed as an instrument not merely of battle but of grand strategy, the pivot of the Allies' action in all spheres, economic, moral and military. Hence while desirous of bringing the German fleet to battle under his own conditions he was determined not to be lured into mine and submarine infested waters.

Early in the afternoon of May 31, Beatty, with his battle-cruisers and a squadron of battleships, after a sweep to the south was turning north to rejoin Jellicoe, when he sighted the German battle-cruisers, five in number. In the initial engagement two of Beatty's six battlecruisers were hit in vital parts and sunk; when thus weakened he came upon the main German fleet under Admiral Scheer. He turned north to lure them into reach of Jellicoe, 50 m. distant, who raced to support him. To describe the intricate and much debated manoeuvres which followed is neither possible nor would it be just within the limits of this article, a strategical and not a tactical survey. Mist and failing light put an end to an indecisive action, which, however, left the British fleet between the German and its bases. During the night Scheer broke through the destroyer guard, and, although sighted, was not reported. Then he slipped safely through a net which Jellicoe dared not draw too close in view of his guiding principle and the danger of torpedo attack.

But if the battle of Jutland (*q.v.*) could be counted a tactical advantage to the Germans, it had no effect on their strategic position. Britain's command of the sea was intact, and the grip on the blockade on Germany unrelaxed. Once more she fell back on submarine warfare, and the first development was an extension of range. In July one of her new large submarine-cruisers appeared off the American coast and sank several neutral ships. In British and Mediterranean waters the pressure began seriously to affect the sea-borne trade and food supplies of the Entente. Various remedies were tried—the most effective being a system of sailing in convoys—but the only truly adequate measure, that of penning the Germans in their bases by close-in minefields, was debarred by Britain's failure to obtain a decisive battle success. But if Britain was feeling the strain of economic pressure, so also was Germany, and her leaders feared that the race between decisive success on land and economic collapse would end against her. The naval authorities declared that a renewal of the "unlimited" submarine campaign, which with her increased numbers could now be far more intense, would bring the Entente to their knees. Accepting this opinion, Ludendorff consented to a step which he had hitherto opposed, and on Feb. 1, 1917, it was inaugurated—with the full realization that it involved the weight of America being thrown into the scales against them.

VIII. THE PENULTIMATE YEAR

Despite incessant provocation for two years, since the "Lusitania" incident, President Wilson had held to his neutral policy, and if his excess of patience angered many of his own people it at least was the means of consolidating American opinion and reconciling it as a whole to intervention in the war. Meantime he strove by speech and by the agency of Col. House—his unofficial ambassador—to find a basis of peace on which the belligerents could agree. This effort was doomed to failure by its misunderstanding of the psychology of the warring peoples and of the fundamental objects for which they were fighting. He was still thinking in terms of traditional warfare, between governmental policies, while the conflict had long since passed into the wider sphere of the struggle of peoples dominated by the primitive instinct of self-preservation.

The declaration of the unlimited submarine campaign brought convincing proof of the futility of these peace hopes and of the reality of the German intentions, and when followed by the deliberate sinking of American ships and an attempt to instigate Mexico to action against the United States, President Wilson hesitated no longer, and on April 6, 1917, America entered the war against Germany.

Her potential force in man-power and material was illimitable but, even more unready than Britain in 1914, it must be long in exerting more than a moral influence, and Germany confidently anticipated that the submarine campaign would take decisive effect within a few months. How near her calculation came to fulfilment the record of 1917 and 1918 bears witness.

The Western Front Campaign of **1917.**—The year 1916 closed in gloom for the Entente The simultaneous offensive on all fronts, planned a year before, had misfired, the French army was at a low ebb, the Russian still lower, the Somme had failed to produce visible results in any way proportional to its cost, and another fresh ally had been overrun. At sea the negativeness of Jutland was a disappointment, and although Germany's first submarine campaign had been abandoned a stronger one was threatened. To offset these debits, the Entente could only show the capture of distant Baghdad and the limited Italian success at Gorizia in August, whose value, however, was mainly as a moral tonic to Italy herself.

Among the Allied peoples and their political representatives there was a growing sense of depression. On the one hand it took the form of dissatisfaction with the conduct of the war and, on the other, of discouragement over the prospects of a victorious conclusion to the war, and a tendency to discuss the possibilities of a peace by negotiation. The first-named tendency was the first to come to a head and was signalized in London, the political mainspring of the Allies, by the replacement of Asquith's Government on Dec. 11 by one with Lloyd George as its chief. The order of precedence in events had a significant effect. For Lloyd George had come into power as the spokesman of a widespread demand for a more vigorous and more efficient prosecution of the war.

The second tendency received an impulse from the German peace move of Dec. 12, after the fall of Bucharest, which proposed an opening of peace discussions. This suggestion was rejected as insincere by the Allied Governments, but it afforded the opportunity of President Wilson, on whose behalf Col. House had long been sounding the belligerent Governments as to the prospects of mediation, to invite these to define their war aims as a preliminary to practical negotiation. The German reply was evasive, the Allied replies were considered by their opponents inacceptable as a basis of discussion, and the tentative peace moves subsided.

But while this wave of depression was surging on the "home-front," the Allied commanders continued optimistic. In November Joffre assembled, at Chantilly, a further conference of the commanders at which it was agreed that the Germans were in great difficulties on the Western front, and that the situation of the Allies was more favourable than it had ever been.

The fighting strength of the British army had grown to about 1,200,000 men, and was still growing. The fighting strength of the French army had been increased by the incorporation of native troops to some 2,600,000, so that, including the Belgians, it was estimated that the Allies disposed of about 3,900,000 men against about 2,500,000 Germans.

Joffre declared that the French army could maintain its strength for one more great battle, but that thereafter it must progressively decline, as France had no longer a sufficient number of men of military age to replace losses. He therefore warned Haig that during the coming year the burden must fall more and more upon the British army. It was also agreed that in view of these factors the relative superiority of the Allies on the Western front would be greater in the spring of 1917 than at any time which could bc

foreseen with certainty. In consequence it was decided to take the earliest opportunity of pressing the advantage gained on the Somme, and to continue the process of exhausting the enemy's reserves as preparation for an effort which should be decisive. An alternative proposal was made by Gen. Cadorna that the French and British should co-operate in a combined thrust from the Italian front against Austria with the object of knocking this "weaker partner" out of the war. But it was rejected by the French and British commanders, despite Lloyd George's espousal of it at the Allied conference held in Rome in January. Their objection was that it involved a fresh diversion of strength away from the main front, where alone, they held, success could have decisive results.

The Entente plan for 1917 was soon to be complicated by changes in the command. French opinion had tired of the meagre results of Joffre's attrition strategy, and the method of the limited objective had fallen into disfavour because of the unlimited losses on the wrong side, which accompanied it without apparent gain. They contrasted the dull course of his strategy with the brilliant results gained by Mangin at Verdun, in the autumn, under Nivelle's direction, and as a result Joffre gave place to Nivelle, who promised a real break-through. His confidence so inspired Lloyd George, the new British prime minister, that Haig was subordinated to him for the forthcoming operations—an arrangement which violated the axiom that a general cannot direct one force while exercising executive command of another. For carrying out a plan essentially audacious, Nivelle had two further handicaps; he failed to convert several of his subordinates to the idea, and he was given less rein by the Government than his predecessor. Again, while Joffre had intimated that the British must take the chief part, Nivelle changed this policy, and in his desire to conserve the glory for France overlooked how severely the French fighting power had been strained. Joffre's plan had been for a convergent attack on the great German salient Lens-Noyon-Reims, first against its west flank and then against its south—the British to attack north of the Somme, including but extending beyond the old battle ground, and the French south of it to the Oise. The attacks were to begin early in February and to be followed by a French main attack in Champagne. Nivelle's change was to ask the British to take over more of the front—south of the Somme—in order to release French troops for the Champagne blow, and as a result the start was postponed a month.

Before it could begin the Germans had dislocated it. Ludendorff's first step had been to set on foot a complete programme for the reorganization and expansion of German man-power, munitions and supplies. While this was developing, he intended to stand on the defensive, hoping that the new submarine campaign would either decide the issue or pave the way for a decisive blow on land when his new reserves of men and material were ready. Anticipating the renewal of the Entente advance on the Somme, he had a new line of defence, of great artificial strength, built across the chord of the arc Lens-Noyon-Reims. Then after devastating the whole area inside the arc, he began a methodical retirement, by stages, to the new line called by the Germans the "Siegfried" and by the Allies the "Hindenburg" line. A consummate manoeuvre, if brutal in application, it showed that Ludendorff had the moral courage to give up territory if circumstances advised it. The British, confronted with a desert, were inevitably slow in pursuit, and their preparations for an attack on this front were thrown out of gear, limiting them to the sector around Arras (*q.v.*), where the front was unchanged.

On April 9 Allenby's 3rd Army opened the spring offensive at this point, taking the long-sought Vimy ridge, but failed to develop its initial success, and continued the attack too long after the resistance had hardened. This costly action was partly prolonged in order to take the pressure off the French. For the French blow between the Somme and the Oise had been stultified by the German retirement, and the main attack on April 16 east and west of Reims (see CHAMPAGNE, BATTLES IN) was a worse fiasco with a dangerous sequel. With a prolonged bombardment giving away any chance of surprise, and without first drawing away the German reserves, the idea of a rapid break-through was doomed to fail. The high hopes that had been raised caused the greater reaction, and the troops were weary of being thrown against barbed wire and machine-guns to no apparent effect. Accentuated by service grievances, mutinies broke out in the French armies, and no less than 16 corps were affected. In these circumstances Nivelle was replaced by Pétain, whose first concern was to restore the shaken morale of the French troops, and for the rest of the year the British bore the brunt of the campaign. Their strength in France was now at its highest—64 divisions, supplied with an abundance of artillery and ammunition. The strain, however, was increased by the failure of Russia to make any effective contribution to the pressure on Germany, owing to the revolution which broke out in March. Haig decided to keep the Germans occupied by carrying out the original plan for an offensive in Belgium, and if the principle was right the method and choice of site were open to criticism.

The initial move was an attack on the Messines (*q.v.*) ridge in order to straighten out the Ypres salient and attract the enemy's reserves. Carried out by the 2nd Army under Plumer, with Harington as chief of staff, it proved a model example of the "limited" attack with success economically gained by able staff work and co-operation between the arms.

It was followed on July 31 by the main attack at Ypres (see YPRES, BATTLES OF, 1917) which, hampered by the heavy rain, was foredoomed by its own destruction of the intricate drainage system of the area. The British command had persevered for two and a half years with the method of a prolonged preparatory bombardment, believing that quantity of shells was the key to success, and that, unlike all the great captains of history, they could disregard the element of surprise. The offensive at Ypres, which was finally submerged in the swamps of Passchendaele in early November, threw into stronger relief than ever before the fact that such a bombardment blocked the advance for which it was intended to pave the way—because it made the ground impassable. The discomfiture was increased by the new German method of defence, which Ludendorff introduced, of thinning the front defences and using the men so saved for prompt local counter-attacks. The defence was built up of a framework of machine-guns distributed in concrete "pill-boxes" and disposed in great depth. On the British side the profitless toll of this struggle in the mud was to some extent mitigated by better staff work when the direction of the attack was handed over to Plumer's 2nd Army.

Three months of dreadful struggle came to an end with the British not appreciably nearer their immediate object of driving the Germans from their submarine bases in the Belgian ports, and if they had worn down the German strength they had worn down their own still more.

The Renaissance of Surprise at Cambrai.—The 1917 campaign in the West closed, however, on a note brighter in promise if not in accomplishment. Appreciating from the first days the futility of using tanks in these Flanders swamps, the Tank Corps headquarters looked around for an area where they could try out a new and different method. The chief general staff officer, Col. Fuller, drew up a project for a large scale raid to scour a canal-enclosed "pocket" near Cambrai (*q.v.*), where the rolling downland lent itself to tank movement. The basic idea was the release of a swarm of tanks without any preparatory bombardment to give warning of the attack. When their hopes at Ypres waned, the British command adopted the scheme, retaining the basic idea, but transforming the operation into a definite offensive with far-reaching aims, for which they had not the resources because of the drain of Ypres. The operation was to be carried out by Byng's 3rd Army with six divisions, and the date was fixed for Nov. 20. Led by nearly 400 tanks, the attack came as a complete surprise, and despite minor checks achieved a penetration far deeper and at less cost than any past British offensive. But all the available troops and tanks were thrown into the first blow, and the higher command failed to give Byng the few reserves they still possessed in time to exploit the success. The cavalry, as always throughout the operations on the Western front, proved

totally unable to carry out this important rôle.

Thus the advance died away, and on Nov. 30 the German army commander, Marwitz, launched a counter-stroke against the flanks of the salient created by the British advance. In the north it was parried, but in the south broke through, and a disaster was only averted by the superb counter-attack, first of the Guards Division and later of a tank brigade. But if Cambrai was a disappointment it revealed that surprise and the tank were the combination by which the trench barrier could be unlocked. Meanwhile Pétain, after overhauling his instrument, the French army, sought to test its readiness for 1918. In August a stroke by Guillaumat's army recovered all the remainder of the ground lost in 1916, and in October Maistre's army flattened the south-west corner of the German front, seizing the Chemin des Dames ridge.

The Collapse **of** Russia.—The temporary breakdown of the French fighting power was not the worst of the troubles which together crippled the Entente offensive in 1917. The collapse, first partial and then complete, of Russia was a loss which even the entry of America into the war could not possibly compensate for many months, and before the balance was restored the Western Allies were to be perilously near the brink of defeat. Russia's enormous losses, due to her own defective machine but incurred in sacrifice for her Allies, had undermined the morale even more than the material endurance of her forces. Revolution broke out in March, superficially against the corrupt ***entourage*** of the tsar, but with more deep-seated moral causes beneath. The tsar was forced to abdicate and a moderate Provisional Government climbed into the saddle, but without reins. This was only a makeshift, and in May another succeeded it, more Socialist in tendency and outwardly led by Kerensky. While clamouring for a general peace and undermining discipline by a system of committee control suitable to a trade union but not to the field of battle, Kerensky imagined he could send troops against the enemy by platform appeals.

Brusilov succeeded Alexeiev in the supreme command, and on July 1 the army gained some initial success against the Austrians, especially in the region of Stanislau, only to stop as soon as real resistance was met, and to crumble directly the Germans counter-attacked. By early August the Russians had been driven out of Galicia and the Bukovina, and it was only policy which halted the Austro-German forces on the frontiers of Russia itself. In September the Germans took the opportunity to practise their new method of attack intended for use in France, and this surprise attack, under Hutier's command, resulted in the capture of Riga. Next month the Bolsheviks under Lenin overthrew the wordy Kerensky, imposed their self-constituted rule on the Russian people and sought an armistice with Germany, which was concluded in December.

Italy's Caporetto Disaster.—The defection of Russia did not end the Entente tale of woe. Each autumn, with demoralizing regularity, Germany had seized an opportunity to eat up one of the weaker Allies. In 1915 it had been Serbia's fate, in 1916 Rumania's, and now it was Italy's turn, or so the Germans intended. Ludendorff's decision, taken in September, was determined by the appeals of the Austrian authorities, who felt that their troops could not endure the strain of another defensive battle on the Italian frontier. In May, Cadorna had attacked once more on the Isonzo front, but an Austrian counter-attack in the Carso sector had retaken part of the small gains. Losses, however, were more nearly balanced than formerly. The question of Allied co-operation on the Italian front was raised afresh without result, but Cadorna, nevertheless, initiated in August an "eleventh battle of the Isonzo." Capello's 2nd Army captured a large part of the Bainsizza plateau, north of Gorizia, but a long sustained effort brought no further success and Cadorna was forced to break off the offensive after four weeks' struggle. But it had so strained the Austrian resistance that, in Ludendorff's words, "it became necessary to decide for the attack on Italy in order to prevent the collapse of Austria-Hungary."

Ludendorff had a difficult problem to solve. Russia had not yet capitulated, the front there was already weakly held for its extent, and the British offensive in Flanders made impossible a large withdrawal of troops from France. All he could spare was his slender general reserve of six divisions, which had already been his instrument in countering the Kerensky offensive and in the Riga coup. His adviser in the strategic design of operations, Lt.-Col. Wetzell, was, however, of opinion that the application of even this small force at a "soft spot" such as was offered by the Tolmino-Caporetto sector, north of the Bainsizza plateau, would suffice to cripple the Italian menace. The result proved him right—the trouble was that it unduly exceeded the most sanguine expectations. On Aug. 29 Waldstatten, of the Austrian general staff, had brought to Ludendorff a scheme for a break-through at Tolmino, followed merely by rolling up the Isonzo front. But this plan was expanded into a more ambitious one without an increase of means. The Germans at Caporetto, like the British subsequently at Cambrai, were to provide an example of the profound strategic error of not "cutting your coat according to your cloth."

On hearing the Austrian proposals Ludendorff sent Gen. Krafft von Dellmensingen, an expert in mountain warfare and commander of the Alpine Corps in the Rumanian campaign, to reconnoitre the ground, and on receiving his report, approved the scheme. The six German divisions with nine Austrian formed the 14th German Army under Otto von Below, with Krafft as chief of staff and guiding brain. These troops were to penetrate the mountain barrier at the north-east corner of the Venetian salient, while Boroevic's two Austrian armies were to advance along the stretch of lower ground near the Adriatic shore. The organization and deployment of the attack in such mountainous country were difficult, but were ably overcome. Guns were brought up mostly by hand and at night; the infantry came up by night marches with all their ammunition and supplies on pack animals. Thanks to skilful precautions and the Italians' limited air reconnaissance, the concentration was undiscovered. On Oct. 24, after four hours' gas shell bombardment and one hour general, the blow was launched and pushed deep down the western slopes of the mountains, imperilling the Italian forces to both south and north. On Oct. 28 Below's van reached Udine, the former Italian general headquarters, and on Oct. 31 the Tagliamento.

Not the least significant feature of this offensive was the way it was prepared by a moral bombardment. Propaganda has been exploited for months as a means of sapping the Italian discipline and will to resist. But its effect can be exaggerated—the most formidable propaganda, as with the French in April, was that supplied by the attrition strategy of the Italian command, which had sickened the troops by its limited results at unlimited cost. Cadorna, too, offset undoubted ability by his lack of touch with and understanding of the fighting troops. Troops already too highly tried were kept too long without relief. Despite warnings of a hostile offensive, he had paid too little heed to Capello's complaints about the defensive suitability of the positions on which the Italian offensive had stopped, and had overruled his desire to forestall the enemy by a flank thrust northwards from the Bainsizza plateau.

But the result also surprised Ludendorff, who, with his slender forces, had not calculated on such distant objectives as were now possible of attainment. Boroevic was slow in following up the Italian right, and Ludendorff tried to switch part of his force to Conrad's army which flanked the north of the Venetian salient, but was foiled by the inadequacy of the rail communications. Even so, Cadorna, with his centre broken through, only saved his wings by a precipitate retreat to the line of the Piave, covering Venice, and on Nov. 9 the whole Italian army was behind this river, except for 250,000 prisoners in the enemy's hands, and nearly twice as many other casualties—killed, missing or sick. The same day Cadorna was superseded in supreme command by Diaz. Italy's allies had begun to rush reinforcements, a British and a French army corps, to her aid, and on Nov. 5 their political and military chiefs arrived at Rapallo for a conference, out of which sprang the Allied Council at Versailles, and ultimately a unified command.

The invaders had outrun their transport, and the resistance of

the Italians, morally braced by the emergency, succeeded in holding the Piave (*q.v.*) in face of direct assaults and strenuous efforts by Conrad to turn their left flank from the Trentino. Here Cadorna's preparations for defence had been long initiated and were well matured. At the beginning of December the British and French, who had been waiting in reserve in case of a fresh breakthrough, moved forward to take over vulnerable sectors. but the attack was only renewed in the north, and on Dec. 19 it came to an end with the snows. If Caporetto seriously damaged Italy, it also purged her, and after an interval of recuperation she was to vindicate herself at Vittorio Veneto.

The Capture of Jerusalem.---Once more a distant theatre of war provided the sole triumph of the Entente cause during the year—this time in Palestine (*q.v.*). The second reverse at Gaza, in April 1917, had led to a change in command, Murray being succeeded by Allenby, who was strong enough and fortunate enough to obtain the adequate force for which Murray had asked in vain. The British Government was anxious for a spectacular success to offset the moral depression of the Nivelle failure and the decline of Russia, and the British general staff desired to dislocate the Turkish attempt to recapture Baghdad by drawing away their reserves.

Allenby took over in July and devoted the first three months to intensive preparations for an autumn offensive, when the season would be suitable. The command was reorganized, the communications developed, and his own headquarters moved forward from Cairo to the front. By complete secrecy and ruses he deceived the Turks as to the main point of attack. The defences of Gaza were bombarded from Oct. 20 onwards, and an attack followed on Nov. 1 to pin the enemy and draw in his reserves. Meanwhile, as a necessary preliminary to the real blow, the inland bastion of Beersheba was seized by a convergent manoeuvre on Oct. 31, a prelude to the decisive attack on Nov. 6, which broke through the enemy's weakened centre and into the plain of Philistia.

Falkenhayn, now in command at Aleppo, had also been planning an offensive, but the better communications of the British had decided the race, and although Falkenhayn tried to stem the tide by a counter-stroke against Beersheba, the breaking of his centre compelled a general retreat. The pursuit was hampered owing to lack of water, but, even so, by Nov. 14 the Turkish forces were driven apart in two divergent groups, the port of Jaffa was taken, and Allenby wheeled his main force to the right for an advance inland on Jerusalem. He gained the narrow hill passes before the Turks could block them, and after a necessary pause to improve his communications, brought up reserves for a fresh advance, which secured Jerusalem on Dec. 9. By the time the winter rains set in the British had expanded and consolidated their hold on the region. As a moral success the feat was valuable, yet viewed strategically, it seemed a long way round to the goal. If Turkey be pictured as a bent old man, the British, after missing their blow at his head—Constantinople—and omitting to strike at his heart—Alexandretta—had now resigned themselves to swallowing him from the feet upwards, like a python dragging its endless length across the desert.

The Conquest of East Africa.—The year 1917 witnessed another overseas success, the clearing of German East Africa, although not the close of the campaign. More than a year elapsed after the rebuff at Tanga before a serious attempt was made to subdue the last German stronghold on the African continent. To spare troops from the main theatres was difficult, and the solution was only made possible by the loyal co-operation of the South African Government. In Feb. 1916 Gen. Smuts was appointed to command the expedition, and formed the plan of a drive from north to south through the difficult interior, in order to avoid the fever-rampant plain on the coast. In conjunction with this central wedge, a Belgian force under Tombeur was to advance eastwards from Lake Tanganyika, and a small British force under Northey was to strike in from Nyasaland in the south-west. The Germans under Lettow-Vorbeck were weak in numbers but handled with masterly skill, and with all the advantages of an equatorial climate, a vast and trackless region—mountainous in parts and covered with dense bush and forest—to assist them in impeding the invader. From Dar-es Salaam on the coast to Ujiji on Lake Tanganyika ran the one real line of rail communication, across the centre of the colony. After driving the Germans back across the frontier and seizing the Kilimanjaro gap, Smuts moved direct on this railway at Morogoro, over 300 m. distant, while he dispatched a force under Van Deventer in a wide sweep to the west to cut the railway further inland and then converge on Morogoro. Lettow-Vorbeck delayed this manoeuvre by a concentration against Van Deventer, but Smuts's direct advance compelled him to hurry his force back, and thus enabled Van Deventer to get astride the railway.

However, Letto-Vorbeck evaded the attempt to cut him off and fell back in September on the Uluguru mountains to the south. The Belgians and Northey had cleared the west, and the net had been drawn steadily closer, confining Lettow-Vorbeck to the south-east quarter of the colony. Early in 1917 Smuts returned to England, and Van Deventer conducted the final operations which ended with Lettow-Vorbeck, avoiding envelopment to the end, slipping across the frontier into Portuguese Africa. Here he maintained a guerrilla campaign throughout 1918 until the general Armistice. With an original force of only 5,000, 5% being Europeans, he had caused the employment of 130,000 enemy troops and the expenditure of £72,000,000.

The Mastering of the Submarine.—The military side of 1917 is thrown into shadow by the naval, or more strictly the economic, side. The vital issue turned on the balance between Germany's submarine pressure and Britain's resistance. April was perhaps the most critical month. The Allies lost nearly a million tons of shipping, 60% British, and although the German navy's promise of victory by the end of the month was proved a miscalculation, it was clear that, ultimately, the continuance of such a ratio of loss must starve the civilian population and automatically prevent the maintenance of the armies. Britain, indeed, had only food enough to sustain her people for another six weeks. The British Government sought to counter the menace by the indirect means of rationing, increasing home production and the expansion of shipbuilding; by the direct means of the system of convoys with naval escorts, and a counter-offensive against the submarine. Aided by new devices to detect the presence of submarines and the use of thousands of patrol craft, this highly organized campaign exacted an ever-rising toll, and by the end of 1917 the menace, if not broken, was at least subdued In this task America's aid became a potent factor long before her military assistance. It embraced her provision of light craft to reinforce the British anti-submarine fleet, her rapidly developed construction of new mercantile ships, and still more her financial aid. By July 1917 Britain had spent over £5,000,000,000, her daily expenditure had risen to £7,000,000, and the burden of financing her Allies as well as her own efforts was straining even her resources, when America's aid came to ease the pressure.

These were the defensive benefits; the offensive were at least as great. No longer was the grip of the naval blockade hampered by neutral quibbles, but instead, America's co-operation converted it into a strangle-hold under which the enemy must soon grow limp, since military power is based on economic endurance. As a party to the war, the United States, indeed, wielded the economic weapon with a determination, regardless of the remaining neutrals, far exceeding Britain's boldest claims in the past years of controversy over neutral rights. The submarine menace, crippled in 1917, was ended to all intents during the early months of 1918. To this conclusion the greatest single contribution was the laying of a mine-barrage by the American navy across the 250 m. wide passage between Norway and Scotland. This was a direct counter to the main submarine operations against the ocean-brought supplies of Great Britain. For the small submarines which carried out the shorter range operations the ports on the Belgian coast had afforded a base unpleasantly close to English shores, but these also were now closed by the daring attacks of Sir Roger Keyes's force on Zeebrugge and Ostend. Yet the removal of the menace should not lead to an

underestimate of its powers for the future. The 1917 campaign was launched with only 148 submarines and from the most unfavourable strategic position. Great Britain lay like a huge breakwater across the sea approaches to northern Europe and the submarines had to get outside through narrow and closely-watched outlets before they could operate against the arteries of supply. And despite these handicaps they almost stopped the beat of England's heart.

The **Air** Offensive.—Another new form of action reached its crest at the same time as the submarine campaign. As the submarine was primarily an economic weapon, so was the aeroplane primarily a psychological weapon. The explosive bullet had virtually ended the Zeppelin raids in 1916, but from early in 1917 aeroplane raids on London grew in intensity until, by May 1918, the air defences were so thoroughly organized that the raiders thereafter abandoned London, as a target, for Paris. If the stoicism of the civil population took much of the sting from a weapon then in its infancy, the indirect effect was serious, interrupting business and checking output in industrial centres, as well as drawing off, for defence, many aircraft from the front. In reply the British formed an Independent Air Force, which carried out extensive raids into Germany during the closing months of the war, with marked effect on the declining morale of the "home front." To relate the action of aircraft in the military sphere is not possible, for it formed a thread running through and vitally influencing the whole course of operations, rather than a separate strategic feature.

The beginning of 1918 witnessed the development and thorough organization of another psychological weapon, when Lord Northcliffe was appointed director of propaganda in enemy countries, and for the first time the full scope of such a weapon was understood and exploited.

IX. GERMANY'S BID FOR VICTORY

On the Threshold of 1918.—The middle years of the World War had been, in a military sense, a tussle between a lean Hercules and a bulky Cerberus. The Germanic alliance was weaker in numbers but directed by a single head, the Entente stronger in numbers but with too many heads. Owing to their own excessive losses, diffusion of effort and the collapse of Russia, the Entente, at the end of 1917, were faced with the grim fact that the numerical balance had been reversed, and months must elapse before the prospective stream of America's new divisions came to tilt the scales once more in their favour. The emergency paved the way for the creation of a unified command, but it still needed disaster to bring it into being.

At the conference at Rapallo in November, the formation of a Supreme War Council was decided upon, to be composed of the principal ministers of the Allies, with military representatives, and to sit permanently at Versailles. If the fundamental defect was that it merely substituted a formal for an informal committee, a further flaw was that the military representatives had no executive status. In the economic sphere, where deliberation rather than instant action was necessary, it led to a real improvement in the combination of shipping, food and munition resources. Militarily, it was futile, for it set up a dual advisorship—the Versailles representatives on the one hand and the chiefs of the national general staffs on the other. As the menace of the German attack grew closer and with it the need for common action, this advisory body was converted into a military executive committee to handle an inter-Allied general reserve, a fresh compromise which set up a dual control—the commanders-in-chief and the Versailles committee.

If concentration of control was lacking, so also was concentration of force. Since early in November the stream of German trooptrains from East to West had been steadily swelling. When the 1917 campaign opened there had been a proportion of nearly three Allies to two Germans—actually, in March 178 British, French and Belgian divisions against 129 German divisions. But now the Germans had a slight balance and the likelihood of bringing still more. But the Allied statesmen, recalling how often their own offensive had failed with equal or greater superiority of force, were slow to appreciate the gravity of the menace or to respond to the sudden fall in the temperature of military opinion. Nor could they agree to draw reinforcements from the other fronts. The Italians strove against any withdrawal of the Allied contingents from their front, and the French opposed any reduction of the Salonika force. Lloyd George went further and urged an offensive in Palestine, a scheme which was sanctioned on the understanding that no reinforcements went there from France, but which also meant that none came from there to France. Robertson, the chief of the imperial general staff, disagreed both with this Palestine plan and the creation of the Versailles executive committee, and resigned, being succeeded by Sir Henry Wilson. The position was still further weakened by the insistence of Clemenceau, the new French premier, that the British should extend their front south to the Oise. This meant that Gough's 5th Army was dangerously stretched out and took over ill-prepared defences on the very front that Ludendorff was about to strike. Meantime, the German strength had increased to 177 divisions by the end of January, with 30 more to come. The Allied strength, owing to the despatch of divisions to Italy and the breaking up of others owing to the French shortage of drafts, had fallen to the equivalent of 173—counting as double the four and one-half large size American divisions which had arrived. For the French and British had been constrained to follow the Germans in reducing their divisions from 12 to 9 battalions each.

The prolonged pouring of soldiers' lives into the swamps beyond Ypres had led Lloyd George and his cabinet to withhold reinforcements for fear of encouraging fresh squandering. This undoubtedly weakened Haig's initial power of resistance to the German onslaught, yet it is just to point out that it was weakened worse—in quality as well as quantity—by the 400,000 British casualties suffered in the offensive of the later part of 1917. Moreover, we should not forget that the Government had the heavy responsibility of being the trustees for the lives of the nation. The real ground of criticism is that it was not strong enough to make a change in, or place a check upon, a command which it did not trust, while supplying the reinforcements necessary for defence. And for this lack of moral strength the public must share the blame, for they had already shown themselves too easily swayed by clamour against political interference with the generals, and too prone to believe that the politician is invariably wrong on such occasions. The civilian public, indeed, is apt to trust soldiers too little in peace, and sometimes too much in war.

These political handicaps, and their accompanying tendency to work deviously towards what dared not be demanded openly, were also seen in the project for a unified command. The prime minister, indeed, had gone so far in December as to disclaim faith in his own long-sought cure. Instead he sought a palliative in an inter-Allied executive committee, under Foch's chairmanship, which should control a common general reserve of 30 divisions. This scheme was stillborn in face of the opposition of the respective commanders-in-chief, Haig and Pétain. The decisive act came from Haig, who, when called on by Foch for his contribution of seven divisions, replied that he could spare none. He and Pétain united in preferring an arrangement between themselves for mutual support.

When the test came, a week later, this broke down, and Haig then took a foremost part in hastening and facilitating the appointment of a generalissimo, which he had formerly opposed. For the actual breakdown the blame has been commonly thrown upon the French, and there is no question that Haig understood from Pétain on March 24 that if the Germans continued their rapid progress the French reserves would have to be used to cover Paris. But in fairness it is essential to add that, whereas the original compact had only pledged the aid of some six French divisions, Pétain actually sent nine by March 24, and 21 (including four of cavalry) by March 26. If these reinforcements were, perhaps, slower in coming into action than in despatch, it does not affect the fact that the original pledge was amply exceeded. Thus, the fundamental fault would seem to lie

in trusting to an arrangement for such slender support by either Ally.

The German Plan.--On the German side the submarine panacea for victory had been replaced by a military panacea, and hopes were perhaps exaggerated by the unexpected collapse of Russia. But although Ludendorff promised victory in the field, he did not disguise that a Western offensive would be a far harder task than the conquests in the East. He realized also that it would be a race between the effect of Germany's blow and the arrival of American reinforcements, although he hoped to win the race. To secure the rear of his offensive, a definite peace was won from the Bolshevik Government of Russia by a military demonstration, and also forced on Rumania. And to secure if possible the economic base of his offensive the Ukraine was occupied, for its wheat supplies, with little resistance except from Czechoslovak troops, who had formerly been taken prisoners from the Austrian army.

Ludendorff's next problem was to decide his first point of attack. The sector between Arras and St. Quentin was chosen, on the western face of the great salient formed by the German front in France. The choice was governed by tactical reasons—this sector was the enemy's weakest point and the ground offered fewer difficulties than elsewhere—although Ludendorff had in mind the possibility of separating the Allied armies and driving the British back against the Channel coast, too closely penned in to evade the blows. From the experience of the vain Allied attacks Ludendorff had drawn the deduction that "Tactics had to be considered before purely strategical objects which it is futile to pursue unless tactical success is possible." Hence he formulated a strategical plan based on the principle of taking the tactical line of least resistance. Presumably he hoped by firm control to guide these tactical movements to a strategic destination. If so, he failed.

Where did the fault lie? The general view at the end of the war was that the tactical bias had led Ludendorff to change direction and dissipate his strength. That if the Franco-British command had previously erred by aiming at the strategically correct target without enough attention to the tactical difficulties, the German command had followed it with an equal if opposite error by concentrating on tactical success at the expense of the strategical goal. But a closer examination of the German documents since available, and of Ludendorff's own orders and instructions, throws a different light on the question. It would seem, indeed, that the real fault was that Ludendorff failed to carry out in practice the new principle he had adopted in theory; that he either did not grasp or shrank from the full implication of this new theory of strategy. He dissipated too large a part of his reserves in trying to redeem tactical failures and hesitated too long over the decision to exploit his tactical successes. Ludendorff's strategy in the East had been so masterly and so far-sighted that his indecision and short-sight in the West is difficult to explain. Perhaps he himself was feeling the strain of directing so many vast operations; perhaps it was that he missed the strategical insight and balanced view of Hoffmann who, after being at his side throughout the 1914–16 campaigns, had stayed in the East when Ludendorff went to the supreme command. The modern vice of seniority prevented Germany from making the fullest use of the man who perhaps approached nearer to military genius than any other military figure of the war.

In any case the campaign leaves the impression that Ludendorff had neither his former clearness as to the goal, nor quite the same grip on the changing situations. But in the organization of his attacks his powers were at their highest level. Surprise was to be the key by which a gate in the long-locked front was opened. In forging the key gas-shell was to be the main constituent, for Ludendorff had failed to grasp the significance of the tank and neglected to develop it in time. Only in Aug. 1918, when it was used to strike him a mortal blow did he put it in the "urgent" class of war material. The troops were trained in the new infiltration tactics already tested at Riga, and the most thorough arrangements were made for concealing and for exploiting the attacks. The assaulting divisions were to he brought up over night. the masses of artillery brought close to the front line in concealment, and their ranges obtained by methods which did away with preliminary "registration." The bombardment was to be brief but intense, and its surprise effect to be increased by lavish use of gas and smoke shell. Further, while Ludendorff had settled to strike first on the Somme sector, to which blow the code-name "Michael" was given, he also made preparations for successive attacks at other points, which besides being in readiness for the future helped to mystify the enemy. Two were on the British front and one on the French—"St. George I." against the Lys sector, "St. George II." against the Ypres sector and "Bliicher" in Champagne.

The "Michael" attack was to be made by the German 17th, 2nd, and 18th Armies (62 divisions in all) on the 47 m. front Arras-St. Quentin-La Fere, but its main force was intended to be exerted north of the Somme, and after breaking through, the 17th and 2nd Armies were to wheel north-west and press the British army against the coast, while the river and the 18th Army guarded their flank. This plan was radically changed in execution because Ludendorff gained rapid success where he desired it little and failed to gain success where he wanted it most. The attack was launched on March 21 (see ST. QUENTIN, BATTLE OF 1918), and the surprise was helped by an early morning mist. But while the thrust broke through completely south of the Somme, where the defence—but also the attacking force—was thinnest, it was held up near Arras, a check which reacted on all the attack north of the river. Ludendorff, violating his new principle, spent the following days in trying to revive his attack against the strong, and strongly held bastion of Arras, maintaining this direction as his principal line of effort. Meantime he kept a tight rein on the 18th Army which was advancing in the south without serious check from its opponents. As late as March 26 he issued orders which restrained it from crossing the Avre and tied it to the pace of its neighbour, the 2nd, which in turn was held back by the very limited success of the 17th Army near Arras.

Thus we see that in reality Ludendorff was bent on breaking the British army by breaking down its strongest sector of resistance in a direct assault. And because of this obsession he failed, until too late, to throw the weight of his reserves along the line of least resistance south of the Somme. The intended wheel to the north-west might have come to pass if it had been made after passing the flank, and thus being directed against the rear, of the Arras bastion. On March 26 the attack north of the Somme (by the left wing of the 17th Army and the right of the 2nd Army) was visibly weakening as the price of its hard-earned gains. South of the Somme the left of the 2nd Army reached, and was now to be embarrassed by, the desert of the old Somme battlefields—a brake on progress and supply. The 18th Army alone was advancing with unslackened impetus. This situation led Ludendorff to adopt a new plan, but without relinquishing his old. He ordered for March 28 a fresh and direct attack on the high ground near Arras—by the right of the 17th Army and to be followed by a 6th Army attack just to the north between Vimy and La Bassée. But the promising situation south of the Somme led him to indicate Amiens as an additional main objective. Even so, he restrained the 18th Army from pushing across the Avre without further orders! On March 28 the fresh Arras attack was launched, unshielded by mist or surprise, and failed completely in face of the well prepared resistance of Byng's 3rd Army. Only then did Ludendorff abandon his original idea, and direct his main effort, and some of his remaining reserves, towards Amiens. By March 27 the advance had penetrated nearly 40 m. and reached Montdidier, cutting one railway to Paris; by March 30 the German flood was almost lapping the outworks of Amiens. Once the crust was broken, the very elaboration of the methods of control communication built up during three years of static warfare caused the greater flux behind the front. The extent of the retreat was primarily the measure of the loss of control by the British commanders.

Disaster had driven the Allies to an overdue step, and on Haig's appeal and Lord Milner's intervention Foch had teen appointed

on March 26 to "co-ordinate" the operations of the Allied armies. If he had fallen into disfavour owing to the heavy cost of his attacks in Artois during 1915 and the barren fruit of the Somme in 1916, his will-power and energy earned and created confidence. On April 14 he was definitely made commander-in-chief of the Allied armies. But before this a fresh German menace had developed—though not intended as such.

When Ludendorff decided to change his main line of attack to the sector south of the Somme, he diverted reserves thither. But meantime he ordered the 18th Army to mark time for two days. When the attack was renewed in force on March 30 it made little progress in face of a resistance that had been afforded time to harden, helped by the cement of French reserves which were now being poured into the breach. A further effort on April 4 had still less success and Ludendorff, rather than be drawn into an attrition struggle, suspended the attack towards Amiens. With a large part of his reserves holding the vast bulge south of the Somme, Ludendorff turned, if without much confidence and merely as a diversion, to release, on April 9, his "St. George I." attack. (See LYS, BATTLE OF THE, 1918.) Its astonishing early success against a weakened front led him to convert it bit by bit into a major effort. The British were desperately close to the sea, but their resistance stopped the German tide after a 10 m. invasion just short of the important railway junction of Hazebrouck, and an attempt to widen the front towards Ypres was nullified by Haig's swinging his line back just before and by the gradual arrival of French reinforcements. Haig complained strongly that Foch was too slow in sending French reserves northward, but the event justified Foch's reluctance to commit himself thither and his seeming excess of optimism in declaring that the danger was past. Ludendorff had doled out reserves sparingly, usually too late and too few for real success; so apprehensive that his new bulge would become another sack, that after the capture of Kenmel Hill, when opportunity opened its arms, he stopped the exploitation for fear of a counter-stroke.

Thus Ludendorff had fallen short of strategic results; on the other hand he could claim huge tactical successes—the British casualties were over 300,000. The British lion had been badly mauled, and although fresh drafts to the number of 140,000 were hurried out from England and divisions brought back from Italy, Salonika and Palestine, months must elapse before it could recover its offensive power. Ten British divisions had to be broken up temporarily, while the German strength had now mounted to 208, of which 80 were still in reserve. A restoration of the balance, however, was now in sight. A dozen American divisions had arrived in France and, responding to the call, great efforts were being made to swell the stream. Further, Pershing, the American commander, had placed his troops at Foch's disposal for use wherever required. For Germany the sands were running out, and, realizing this, Ludendorff launched his "Blücher" attack between Soissons and Reims, on May 27. Falling by surprise with 15 divisions against seven, it swept over the Aisne and reached the Marne on May 30, where its impetus died away. (See CHEMIN-DES-DAMES, BATTLE OF THE, 1918.) This time the German superiority of force had not been so pronounced as before nor aided by nature's atmospheric cloak. It would seem that the extent of the opening success was due in part to the strategic surprise—the greater unexpectedness of the time and place of the blow—and in part to the folly of the local army command in insisting on the long-exploded and obsolete method of massing the defenders in the forward positions—there to be compressed cannon-fodder for the German bombardment. Pétain's recent instructions for a deep and elastic system of defence had been disregarded. This indeed was an additional form of surprise, for the object of all surprise is the dislocation of the opponent's moral and mind and the effect is the same whether he be caught napping by deception or allows himself to be trapped with his eyes open. Further, the Germans' success on May 27, 1918, deserves study in comparison with their other offensives whose success was almost in mathematical ratio to their degree of surprise. This final year, indeed, read in the light of previous years, affords fresh proof that surprise—or, more scientifically, the dislocation of the enemy's balance—is essential to true success in every operation of war. At the bar of universal history, any commander who risks lives without seeking his preliminary guarantee stands condemned.

But once again Ludendorff had obtained a measure of success for which he was neither prepared nor desirous. The surpriser was himself surprised. The attack had been conceived merely as a diversion, to attract the Allied reserves thither preparatory to a final and decisive blow at the British front in Flanders. But its opening success attracted thither too large, yet not large enough, a proportion of their own reserves. Blocked frontally by the river, an attempt was made to push west, but it failed in face of Allied resistance—notable for the appearance of American divisions at Chateau-Thierry, where they gallantly counter-attacked.

Ludendorff had now created two huge bulges, and another smaller one, in the Allied front. His next attempt was to pinch out the Compiègne "tongue" which lay between the Amiens and Marne bulges. But this time there was no surprise, and the blow on the west side of the "tongue," June 9, was too late to coincide with the pressure on the east. A month's pause followed. Ludendorff was anxious to strike his long-cherished decisive blow against the British in Belgium, but he considered that their reserves here were still too strong, and so again decided to take the line of least tactical resistance, hoping that a heavy blow in the south would draw off the British reserves. He had failed to pinch out the Compiègne "tongue" on the west of his Marne salient; he was now about to attempt the same method on the east, by attacking on either side of Reims. But he needed an interval for rest and preparation, and the delay was fatal, giving the British and French time to recuperate, and the Americans to gather strength. The British divisions previously broken up had now been reconstituted, and as a result of an urgent appeal made to President Wilson in the crisis of March, and the provision of extra shipping, American troops had been arriving at the rate of 300,000 a month since the end of April. The tactical success of his own blows had been Ludendorff's undoing; yielding to their influence, he had pressed each too far and too long, so using up his own reserves and causing an undue interval between each blow. He had driven in three great wedges, but none had penetrated far enough to sever a vital artery, and this strategic failure left the Germans with an indented front which invited flanking counter-strokes.

X. THE FINAL PHASE

The Turning of the Tide.—On July 15 Ludendorff launched his new attack, but its coming was no secret. East of Reims it was foiled by an elastic defence, and west of Reims the German penetration across the Marne merely enmeshed them more deeply to their downfall—for on July 18 Foch launched a long-prepared stroke against the other flank of the Marne salient. (See MARNE, SECOND BATTLE OF THE.) Here Pétain, who directed the operation, turned the key which Ludendorff lacked, using masses of light tanks to lead a surprise attack on the Cambrai method. The Germans managed to hold the gates of the salient open long enough to draw their forces back into safety and straighten their line. But their reserves were depleted, Ludendorff was forced to postpone if not yet to abandon the offensive in Flanders and the initiative definitely and finally passed to the Allies. Foch's first concern was to keep it, by giving the enemy no rest while his own reserves were accumulating. To this end he arranged with Haig, Pétain and Pershing for a series of local offensives, aimed to free the lateral railway communications and to improve the position of the front ready for further operations. To Haig he proposed an attack in the Lys sector, but Haig saw "no advantage in an advance over this flat and marshy region" and suggested instead the Somme area as more suitable and more strategically effective. Already, before the Marne counter-stroke, Rawlinson, commanding the British 4th Army in front of Amiens (*q.v.*), had submitted to Haig a plan for a large surprise attack there, and Foch agreed to this in place of his own proposal. He also placed under Haig the French 1st Army (Debeney) to

extend the attack to the south. Rawlinson's army was doubled, and by skilful precautions the enemy were kept in the dark until, on Aug. 8, the attack was delivered—led by 450 tanks. The blow had the maximum shock of surprise, falling on an opponent who had done nothing to strengthen his position by entrenchments, and south of the Somme the troops of the Australian and Canadian Corps rapidly overran and overwhelmed the German forward divisions. By Aug. 12 when the advance came to a halt through reaching the tangled wilderness of the old 1916 battlefields, if also through lack of reserves, the 4th Army had taken 21,000 prisoners at a cost of only 20,000 casualties. Great, if not fully exploited, as a material success, it was far greater as a moral one.

Ludendorff has said: "Aug. 8 was the black day of the German army in the history of the war. . . . It put the decline of ourfightingpower beyond all doubt. . . . Thewarmustbeended." He informed the emperor and the political chiefs that peace negotiations ought to be opened before the situation became worse, as it must. After July 18 Ludendorff had by no means lost hope and as late as Aug. 2 was ordering preparations for four fresh attacks, inciuding his cherished Flanders design, if on a reduced scale. But after Aug. 8 these dreams vanished. The conclusions reached at a Crown Council held at Spa were that "We can no longer hope to break the war-will of our enemies by military operations" and "the object of our strategy must be to paralyse the enemy's war-will gradually by a strategic defensive." In other words the German command had abandoned hope of victory or even holding their gains, and hoped only to avoid surrender—an insecure moral foundation.

On Aug. 10 Foch issued a fresh directive for the preparation of an "advance" by the British 3rd Army "in the general direction of Bapaume and Peronne." Meantime he wished Haig to continue the 4th Army's frontal pressure, but Haig demurred to it as a vain waste of life and gained his point. Economy of force was henceforth to be added to the advantages of the new strategy now evolved. Thus the momentum of the 4th Army had hardly waned, before the 3rd Army moved. From then on Foch beat a tattoo on the German front, a series of rapid blows at different points, each broken off as soon as its initial impetus waned, each so aimed as to pave the way for the next, and all close enough in time and space to react on each other. Thus Ludendorff's power of switching reserves to threatened spots was stopped, as his balance of reserves was drained.

On Aug. 10 the French 3rd Army had struck to the south; then on Aug. 17 the French 10th Army still farther south; next, on Aug. 21, the British 3rd Army, followed by the British 1st Army on Aug. 26. Ludendorff's order to the troops holding the Lys salient to retire was hastened in execution by the attacks of the reformed British 5th Army, and by the first week in September the Germans were back on their original starting line—the strong defences of the Hindenburg line. And on Sept. 21 Pershing completed the series of preliminary operations by erasing the St. Mihiel (*q.v.*) salient—the first feat of the Americans as an independent army. Pershing had originally intended to make this a stepping stone to an advance towards the Briey coalfields and the eastern end of the Germans' main lateral railway near Metz, but the project was abandoned for reasons that will be referred to later. Thus no exploitation of the success was attempted.

The clear evidence of the Germans' decline and Haig's assurance that he would break the Hindenburg line where the German reserves were thickest, decided Foch to seek victory that autumn instead of postponing the attempt until 1919. All the Allied armies in the West were to combine in a simultaneous offensive.

The Collapse of Bulgaria.— But before it could develop an event occurred in the Balkans which, in the words of Ludendorff, "sealed the fate of the Quadruple Alliance." He had still hoped to hold fast in his strong lines in the West, falling back gradually to fresh lines if necessary, and with his strategic flanks in Macedonia and Italy covered, while the German Government was negotiating for a favourable peace. At the same time there was alarm as to the moral effect of the Western front defeats on the German people, their will-power already undermined by shortage of food, and perhaps also by propaganda.

But on Sept. 15 the Allied armies in Salonika (*q.v.*) attacked the Bulgarian front, which crumpled in a few days. Guillaumat, who had succeeded Sarrail in Dec. 1917, had prepared the plan for an offensive, and when recalled to France in the crisis of July as governor of Paris he won over the Allied Governments to consent to the attempt. His successor in Salonika, Franchet d'Esperey, concentrated a Franco-Serb striking force, under Michich, on the Sokol-Dobropolye sector, west of the Vardar, where the Bulgarians trusted to the strength of the mountain ridges and were weak in numbers. On Sept. 1j Michich attacked and while the British attack at Doiran pinned a large part of the Bulgarian reserves, he broke right through towards Uskub. With their army split into two parts the Bulgarians, already tired of the war, sought an armistice, which was signed on Sept. 29. Franchet d'Esperey's achievement not only knocked away the first prop of the Central Alliance but opened the way to an advance on Austria's rear.

The **Collapse of Turkey.**—The offensive planned for the spring in Palestine had been interrupted by the crisis in France and the consequent withdrawal of most of Allenby's British troops. The depletion was made up by reinforcements from India and Mesopotamia, and by September Allenby was again ready to take the offensive. (See PALESTINE, CAMPAIGNS IN.) He secretly concentrated, on the Mediterranean flank, the mass of his infantry, and behind them the cavalry. In this way he changed a two to one superiority on the general front into four to one at the decisive point. At dawn on Sept. 19 the western mass attacked, rolling the Turks back north-east towards the hilly interior—like a door on its hinges. Through the open doorway the cavalry passed, riding straight up the coastal corridor for 30 m., before swinging east to cut the Turkish communications and close all exits of retreat. Completely trapped, the main Turkish armies were rounded up, while the British cavalry exploited the victory of Megiddo by a swift and sustained pursuit which gained first Damascus and finally Aleppo. Defenceless, and threatened with a direct advance of Milne from Macedonia on Constantinople, Turkey capitulated on Oct. 30.

The First Peace Note.—The capitulation of Bulgaria, convinced Ludendorff that it was necessary to take a decisive step towards securing peace. While he was scraping together a paltry half dozen divisions to form a new front in Serbia, and arranging a meeting with the political chiefs, Foch's grand assaults fell on the Western defences, Sept. 26–28, and the line threatened to crack.

The German supreme command lost its nerve—only for a matter of days, but that was sufficient, and recovery too late. On Sept. 29 they took the precipitate decision to appeal for an armistice, saying that the collapse of the Bulgarian front had upset all their dispositions—"troops destined for the Western front had had to be despatched there." This had "fundamentally changed" the situation in view of the attacks then being launched on the Western front, for though these "had so far been beaten off their continuance must be reckoned with."

This remark refers to Foch's general offensive. The American attack in the Meuse-Argonne had begun on Sept. 26, but had come practically to a standstill by the 28th. A Franco-Belgo-British attack had opened in Flanders on the 28th, but if unpleasant did not look really menacing. But on the morning of the 29th Haig's main blow was falling on the Hindenburg line, and the early news was disquieting.

In this emergency Prince Max was called to be chancellor to negotiate a peace move, with his international reputation for moderation and honour as its covering pledge. To bargain effectively and without confession of defeat he needed, and asked, a breathing space "of ten, eight, even four days, before I have to appeal to the enemy." But Hindenburg merely reiterated that "the gravity of the military situation admits of no delay," and insisted that "a peace offerto our enemies be issued at once."

Hence on Oct. 3 the appeal for an immediate armistice went out to President Wilson. It was an open confession of defeat to

the world, and even before this—on Oct. 1—the supreme command had undermined their own home front by communicating the same impression to a meeting of the leaders of all political parties.

Men who had so long been kept in the dark were blinded by the sudden light. All the forces of discord and pacifism received an immense impulse.

While the German Government was debating the conditions for an armistice and questioning Ludendorff as to the situation of the army for further resistance if the terms were unacceptable, Foch continued his military pressure.

The Final Advance.—The plan agreed upon between Foch and the Allied commanders had been for a series of convergent and practically simultaneous attacks:—

1 and 2. By the Americans west of the Meuse, and by the French west of the Argonne, both in the direction of Mezières—beginning on Sept. 26. (*See* MEUSE-ARGONNE OPERATION.)

3. By the British on the St. Quentin-Cambrai front in the general direction of Maubeuge—beginning on Sept. 27. (See HINDENBURG LINE, BATTLES OF, 1918.)

4. By the Belgian and Allied forces in the direction of Ghent—beginning on Sept. 28.

The general aspect was that of a pincer-like manoeuvre against the vast salient jutting out between Ypres and Verdun. The attack towards Mezières would shepherd that part of the German armies towards the difficult country of the Ardennes and away from their natural line of retreat through Lorraine; it was also dangerously close to the hinge of the Antwerp-Meuse line which the Germans were preparing in rear. The attack towards Maubeuge would threaten the other main line of communication and retreat through the Liège gap, but it had further to go. In these attacks, the Americans had the hardest natural obstacle, the Argonne forest; the British had to face the strongest defences and the heaviest weight of enemy troops.

Pershing's attack, adding surprise to its five to one superiority in numbers, opened well, but lost impetus owing to the difficulties of supply and exploitation in such country. When it was eventually suspended on Oct. 14, after bitter fighting and severe losses, the American army was still far distant from the vital railway. A new force, it was suffering the growing pains which the British had passed through in 1915–16. Pershing's difficulties were enhanced by the fact that he had waived his own proposal for an exploitation of the St. Mihiel success towards Metz in view of Haig's objection to a move which, however promising in its ultimate aim, would diverge from the general direction of the other Allied attacks. Haig desired that Pershing's attack should converge towards his in order more immediately to ease the task of the British troops. Foch's original plan for the general offensive had accordingly been readjusted, and in consequence Pershing had not only a more difficult sector but a bare week in which to prepare his blow. The shortness of time led him to use untried divisions instead of switching the more experienced divisions used at St. Mihiel. But in the outcome, Haig's insistence was proved unnecessary, for the British attack broke through the Hindenburg line before the Meuse-Argonne attack had drawn away any German division from his front.

Haig, by pushing forward his left wing first, facilitated the attack of his right on the strongest section of the Hindenburg line—the Canal du Nord—and by Oct. 5 the British were through the German defence system, with open country beyond. But on this front the attackers were in actually inferior numbers to the defenders, their tanks were used up, and they could not press forward fast enough to endanger the German retreat.

Within a few days the supreme command became more cheerful, even optimistic, when it saw that breaking into the Hindenburg line had not been followed by an actual break-through of the fighting front. More encouragement came from reports of a slackening in the force of the Allies' attacks, particularly in the exploitation of opportunities. Ludendorff still wanted an armistice, but only to give his troops a rest as a prelude to further resistance and to ensure a secure withdrawal to a shortened defensive line on the frontier. By Oct. 17 he even felt he could do it without a rest. It was less that the situation had changed as that his impression of it had been revised. It had never been quite so bad as he had pictured it on Sept. 29. But his first impression had now spread throughout the political circles and public of Germany—as the ripples spread when a pebble has been dropped in a pool.

The combined pressure of the Allied armies, and their steady advance, were loosening the will-power of the German Government and people. The conviction of ultimate defeat, slower to appeal to them than to the army chiefs, was the more forcible when it was realized. And the indirect moral effect of military and economic pressure was accentuated by the direct effect of peace propaganda, skilfully directed and intensively waged by Northcliffe. The "home front" began to crumble later but it crumbled quicker than the battle front.

The Collapse of Austria.—The last Austrian attempt at an offensive on the Italian front, in conjunction with the German assaults in France, had been repulsed on the Piave in June. Diaz waited until conditions were ripe for an offensive in return, until Austria's internal decay was spreading and she was without hope from Germany. On Oct. 24 Cavan's army moved to seize the crossings of the Piave and on Oct. 27 the main attack opened, driving towards Vittorio Veneto (*q.v.*) to divide the Austrians in the Adriatic plain from those in the mountains. By Oct. 30 the Austrian army was split in two and the retreat became a rout, and the same day Austria asked for an armistice, which was signed on Nov. 4.

The Curtain Falls on the Western Front.—Already on Oct. 23 President Wilson had replied to the German requests by a note which virtually required an unconditional surrender. Ludendorff wished to carry on the struggle in hopes that a successful defence of the German frontier might damp the determination of the Allies. But the situation had passed beyond his control, the nation's will-power was broken, and his advice was in discredit. On Oct. 26 he was forced to resign.

Then, for 36 hours, the chancellor lay in coma from an overdose of sleeping draught after influenza. When he returned to his office on the evening of Nov. 3, not only Turkey, but Austria, has capitulated. If the situation on the Western front was felt to be rather easier, Austrian territory and railways were now available as a base of operations against Germany. Several weeks before, military opinion had tended to regard such a contingency, then unrealized, "as decisive." Next day revolution broke out in Germany, and swept rapidly over the country. And in these last days of tremendous and diverse psychological strain the "reddening" glare behind was accentuated by a looming cloud on the Lorraine front—where the renewed American pressure, since Nov. 1, was on a point more sensitive than other parts, where "they must not be allowed to advance if the Antwerp-Meuse line was to be held any longer." If this continued the Rhine and not the frontier would have to be the next line of resistance.

But hourly the revolution was spreading, fanned as peace negotiations were delayed, by the Kaiser's reluctance to abdicate. Compromise with the revolutionaries was the only chance, and on Nov. 9 Prince Max resigned to the Socialist Ebert. Germany had become a republic in outward response to President Wilson's demand and in inward response to the uprising of the German people against the leaders who had led them into disaster. The German fleet had already mutinied when their commanders sought to send them out on a forlorn hope against the British.

On Nov. 6 the German delegates left Berlin to treat for an armistice. Their acceptance of the severe terms was hastened less by existing military events than by collapse of the "home front," coupled with the imminence of a fresh blow. The Allied advance was still continuing, in some parts seeming to gather pace in the last days, but the main German forces had escaped from the perilous salient, and their complete destruction of roads and railways made it impossible for supplies to keep pace with the advancing troops. A pause must come while these communications were being repaired, and thus the Germans would have breathing space to rally their resistance. The advance reached the line Pont à Mousson-Sedan-Mezikres-Mons-Ghent by Nov.

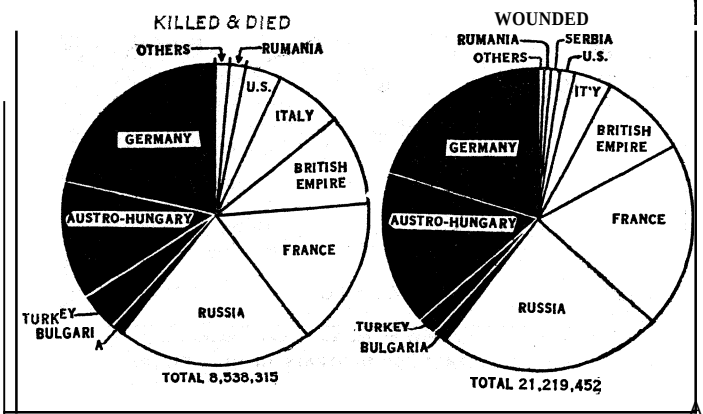
MILITARY CASUALTIES IN THE WORLD WAR. AS ESTIMATED BY THE UNITED STATES WAR DEPARTMENT



11—the line of the opening battles in 1914—but strategically it had come to a standstill.

To meet this situation Foch had concentrated a large Franco-American force, of 28 divisions and 600 tanks, to strike below Metz directly east into Lorraine. The general Allied advance had almost absorbed the enemy's reserves, and now this decisive manoeuvre was to fall on his bared flank. It promised the chance of turning the whole of his new line of defence and if rapidly successful might intercept his retreat. In addition Trenchard's Independent Air Force was about to bomb Berlin, on a scale hitherto unattempted in air warfare. And the number of American divisions in France had risen to 42. Whether this final thrust, intended for Nov. 14, would have solved the hitherto insoluble problem of maintaining the momentum of advance after an initial break-through can never be known. But the attempt was unnecessary. For with revolution at home and the gathering menace on their frontier, the German delegates had no option but to accept the drastic terms of the Armistice, which was signed in Foch's railway-carriage in the Forest of Compiègne at 5 A.M. on Nov. 11, and at 11 o'clock that morning the World War came to an end.

XI. EPILOGUE

Controversy has long raged as to what was the deciding act of the conflict, what were the causes of victory, and, even less profitably, which country won the war.

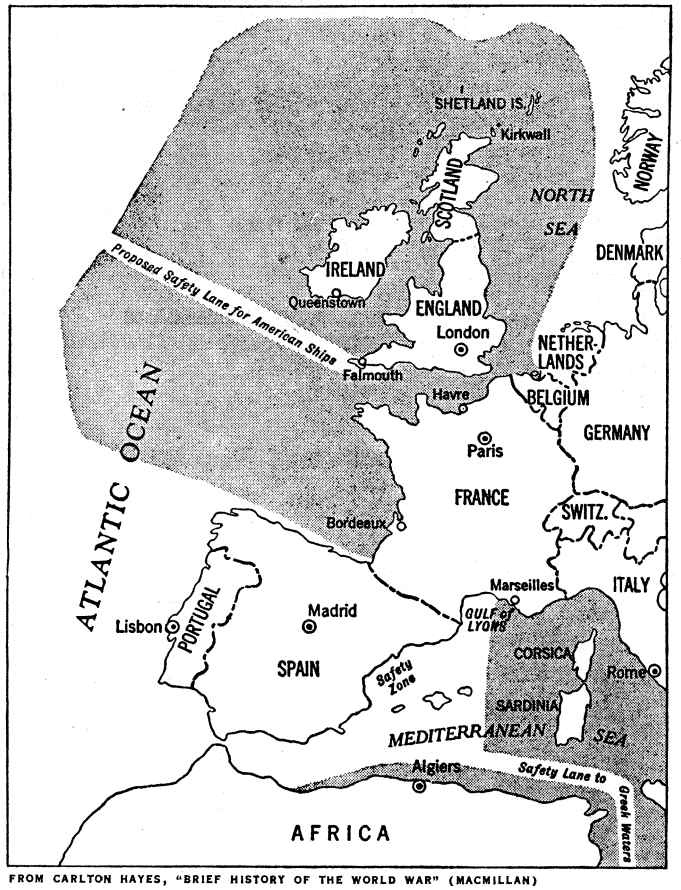
The truth is that no one act, still less one cause, was, or could be, decisive. The Western front, the Balkan front, the tank, the blockade and propaganda have all been claimed as the cause of victory. All claims are justified, none is wholly right. In this new warfare between nations victory is a cumulative effect, to which all weapons—military, economic, and psychological—contribute. Victory comes, and can only come, through the utilization of all the resources existing in a modern nation.

Among the fundamental causes of Germany's surrender the blockade, wielded by the British navy, is seen to assume larger and larger proportions as the fog of war disperses in the clearer light of these post-war years. It was a constructive hold which the Germans were powerless to loosen. Helplessness induces hopelessness, and history attests that loss of hope and not loss of lives is what ultimately decides the issue of war. The intangible all-pervading factor of the blockade intrudes into every consideration of the military situation.

The naval factor again intervenes in the question whether Germany could have avoided capitulation in Nov. 1918 and whether, but for the revolution, her armies could have stood firm on their own frontiers. For even if the German people, roused to a supreme effort in visible defence of their own soil, could have held the Allied armies at bay the end could only have been postponed—because of the grip of sea-power.

But in hastening the surrender, in preventing a continuance of the war into 1919 military action ranks foremost. Hence the success of the Allied armies is chief among the immediate causes of victory. That conclusion does not necessarily, or even naturally, imply that at the moment of the Armistice Germany's military power was broken or her armies decisively beaten. Nor that the Armistice was a mistaken concession. Rather does the record of the last "hundred days," when sifted, confirm the immemorial lesson that the true aim in war is the mind of the hostile rulers, not the bodies of their troops; that the balance between victory and defeat turns on mental impressions and only indirectly on physical blows. It was the shock of being surprised and the feeling that he was powerless to counter potential strategic moves which shook Ludendorff's nerve more than the loss of prisoners, guns, and acreage.

It is even more futile to ask which country won the war; France did not win the war, but unless she had held the fort while the forces of Britain were preparing and those of America still a dream the release of civilization from this nightmare of militarism would have been impossible. Britain did .not win the war, but without her command of the sea, her financial support and her army to take over the main burden of the struggle from 1916



FROM CARLTON HAYES, "BRIEF HISTORY OF THE WORLD WAR" (MACMILLAN)

SAFETY LANES FOR NEUTRALS IN MINE FIELDS

onwards, defeat would have been inevitable. The United States did not win the war, but without their economic aid to ease the strain, without the arrival of their troops to turn the numerical balance, and, above all, without the moral tonic which their coming gave, victory would have been impossible. And let us not forget how many times Russia had sacrificed herself to save her Allies; preparing the way for their ultimate victory as surely as for her downfall. Finally, whatever be the verdict of history on her policy, unstinted tribute is due to the incomparable endurance and skill with which Germany more than held her own for four years against superior numbers, an epic of military and human achievement.

The development of the means and methods of warfare during the struggle are described in the articles: STRATEGY; TACTICS; TANKS; CAVALRY; ARTILLERY; INFANTRY; AIR WARFARE.

The campaigns and battles have received separate and detailed treatment in articles such as the following: ANTWERP, SIEGE OF, 1914; ASIAGO, BATTLE OF, 1916; BELGIUM, INVASION OF, 1914; BREST-LITOVSK, BATTLES OF; CAMBRAI, BATTLE OF, 1917; CAMEROONS, OPERATIONS IN, 1914–16; CAPORETTO, BATTLE OF; CARPATHIANS, BATTLES OF THE; CAUCASUS, CAMPAIGN IN THE; DARDANELLES CAMPAIGN; DUNAJEC-SAN, BATTLES OF THE; EAST AFRICA, OPERATIONS IN; FRONTIERS, BATTLES OF THE; JUTLAND, BATTLE OF.

LEMBERG, BATTLES OF; LODZ, BATTLE OF, 1914; LUCK (LUTSK), BATTLES OF; MARNE, BATTLE OF THE; MASURIAN LAKES, BATTLES OF THE; MESOPOTAMIA, OPERATIONS IN; NAREW, BATTLES OF THE, 1915; NAROCZ, BATTLE OF LAKE; WORLD WAR: *Naval*; PRZEMYSL, SIEGES OF; SALONIKA CAMPAIGNS; SERBIAN CAMPAIGNS; SOMME, BATTLES OF THE; VERDUN, BATTLES OF; VISTULA-SAN, BATTLES OF THE; VITTORIO VENETO; YPRES, BATTLES OF: Battles of 1914; Battles of 1915; Battles of 1917; YSER, BATTLE OF THE; ZEEBRUGGE, ATTACK ON.

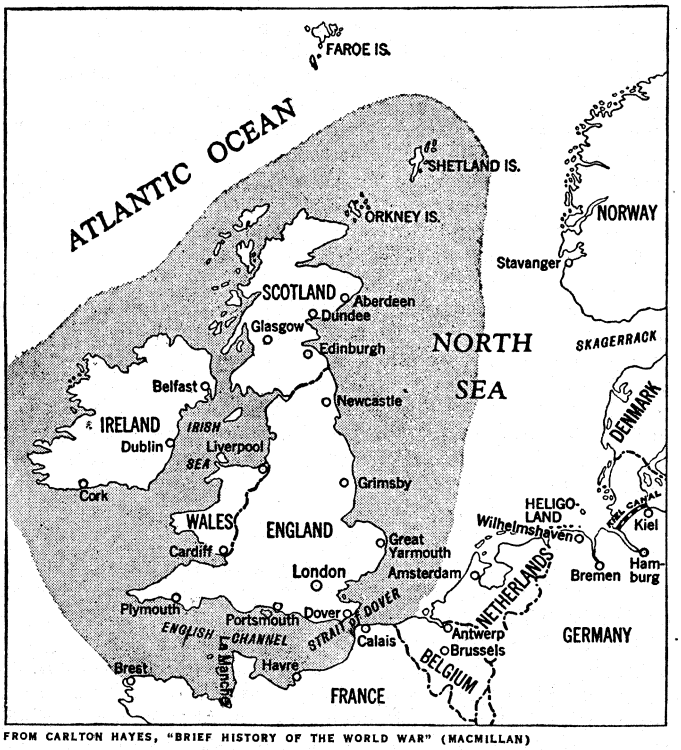
The mechanism of war, the organization of naval, military and air forces, and the scientific aspects of military machinery are also dealt with in such articles as those on ADMIRALTY; AIR FORCES; BALLISTICS; BOMB; BRIDGING, MILITARY; CAMOUFLAGE; CHEMICAL WARFARE; FLAMETHROWER; INTELLIGENCE, MILITARY; MINES, MINELAYING AND MINESWEEPING; MOTOR TRANSPORT, MILITARY; ORDNANCE; PARAVANE; RANGE-FINDERS; SMALL ARMS, THE DEVELOPMENT OF; SUPPLY AND TRANSPORT, MILITARY. (B. H. L. H.)

NAVAL

To follow the worldwide ramifications of naval operations during World War I it is best to consider, year by year, the events in each area. At the outset they covered all the seas of the earth, but as the net was drawn around the Central Powers, the area of naval warfare was gradually reduced to European waters and to the seas around the British Isles. In the end, it was due to the irresistible force of sea power (*q.v.*) that the war was brought to a close.

Preliminary Moves.—In July 1914 in place of the usual summer manoeuvres, a test mobilisation of the British Fleet in Home waters was carried out. The ships of the 2nd and 3rd Fleets, their crews completed from the Reserves, joined the 1st Fleet at Portland on July 16th for exercises in the Channel. On July 23, the day of the Austrian ultimatum to Serbia, the fleets were ordered to disperse. The ships of the and and 3rd Fleets returned to their Home Ports.

The 1st Fleet remained at Portland, the defence flotillas were sent to their stations around the coast, and at the same time



FROM CARLTON HAYES, "BRIEF HISTORY OF THE WORLD WAR" (MACMILLAN)

GERMAN WAR ZONE, FEBRUARY, 1915

the Mediterranean fleet was ordered to concentrate at Malta. On July 29 the 1st fleet left Portland for Scapa Flow, and, by Aug. 2 the 1st and 2nd fleets were at their war stations, the 3rd fleet was on the move,-the defence flotillas were at their posts, and the organisations for taking up auxiliaries and for arming merchant liners were in force. On Aug. 1 the order for general mobilisation was issued, followed next day by the calling up of the naval reserve. Owing to the recent exercise the machinery

of mobilisation worked smoothly and by the morning of Aug. 4 the state of naval readiness around the British Isles was such as to preclude the possibility of surprise before the outbreak of hostilities.

The German High Sea Fleet, which had been visiting Norwegian ports, was recalled. By July 30 all ships had returned to Wilhelmshaven and Kiel and no German ships were sighted by the British Fleet as it passed northward to its war stations.

Distribution of Fleets.—The following table shows the distribution of the British and German Fleets upon the outbreak of hostilities.

	British	German
North Sea and Home Waters

THE NORTH SEA AND CHANNEL 1914

The Commencement of Hostilities.—On the morning of Aug. 4 the Grand Fleet, commanded by Admiral Sir John Jellicoe, left Scapa Flow on the first of its many "sweeps" through the North Sea. Its object was to intercept any German commerce raiders that might put to sea before war was declared. At 11 P.M. that night all ships received the fateful wireless message to "commence hostilities against Germany." For three days the fleet cruised without seeing an enemy and on Aug. 7 returned to Scapa. The 10th Cruiser squadron, drawn from 3rd fleet cruisers, was not yet complete and this shortage of cruisers enabled one raider, the "Kaiser Wilhelm der Grosse," to escape through the cordon. Meanwhile the Harwich Force (Commodore Tyrwhitt) made a search of the Heligoland Bight, which resulted in the sinking of the minelayer "Königin Luise" by the "Amphion." But the German mines had been laid and the "Amphion" ran into them on her return and was sunk. Thus early was first blood drawn upon both sides and Germany showed her intention to disregard, not only the customs of the sea, but her own signature to the Hague convention, by laying mines without warning, in international waters,

The Expeditionary Force.—The decision, on Aug. 5, to send the Expeditionary Force to France threw upon the navy the duty of safeguarding its passage. In the Channel were stationed the 5th, 7th and 8th Battle squadrons (eighteen pre-dreadnoughts) with one French and two British Cruiser squadrons. The Dover Straits were guarded by British and French destroyer and submarine flotillas, and an aerial patrol was established between the North Foreland and Ostend. Further north the Harwich Force patrolled the "Broad Fourteens" to the Dutch coast and the Grand Fleet took up a position in the centre of the North Sea, its cruisers and destroyers spread southward, ready to counter any move of the High Sea Fleet. Several unsuccessful submarine attacks were made upon ships of the Grand Fleet and on Aug. 9, "U. 15" was rammed and sunk by the cruiser "Birmingham" close to the fleet rendezvous. Regardless of the submarine risk, the fleet maintained its watch and from Aug. 15 to 17, when the bulk of the troops were afloat the Heligoland Bight was closely blockaded. Nothing was seen of the German fleet, whose inertness appeared surprising, it not then being realised that the policy of the German High Command was to preserve its fleet and to make only minor attacks with submarines and mines. By Aug. 18 the first four divisions were in France without the loss of a man and five days later the 5th Division was safely across. The enemy made their only appearance on Aug. 18, when two cruisers were sighted but escaped without being brought to action. The safe transport of the main body of troops being complete the Grand Fleet battleships withdrew to the west coast of Scotland, leaving two battlecruisers in the Humber to support the southern force.

Heligoland Bight Action.—To assist the Belgian army in creating a diversion on the German flank a brigade of Royal Marines was sent to Ostend: they landed with difficulty, in bad weather, on Aug. 27–28 from battleships of the Channel Fleet. This force being exposed to a sudden blow from the German Fleet, the Harwich flotillas, supported by battlecruisers and cruisers from the Grand Fleet, made an organised drive towards the German coast on the morning of Aug. 28. The outcome was the battle of the Heligoland Bight (*q.v.*) in which three German light cruisers and a destroyer were sunk and several other ships damaged, whilst the damage to British ships was small. This success in the first serious contact with the enemy at sea, did much to dispel the gloom cast by the retreat of the Allied armies before the German advance.

The shifting of the British army base from the Channel Ports to St. Nazaire, following the retreat from Mons threw a heavy burden upon the navy and especially upon the Admiralty transport service. Ships could no longer be spared for the Ostend diversion and the Royal Marine brigade was withdrawn on Aug 31. The moving of the base began on Sept. 2 and was smoothly and rapidly completed

In the last days of August, German mines, laid in the open

sea off the Humber and Tyne caused the loss of several neutral ships and of the minesweeping gunboat "Speedy." Submarines were active in the North Sea and on Sept. 1, the report that one had entered Scapa Flow caused the Grand fleet to put hurriedly to sea. After sweeping in force to the Skaagerak the fleet returned on Sept. 5 to Loch Ewe to fuel and on that day the British navy suffered its first loss by submarine attack, when the scout "Pathfinder" was sunk by "U. 29."

On Sept. 10, in order to cover the passage of the 6th Division to France, a great sweep was made through the North Sea by the Grand Fleet supported by the Harwich Force and the Channel squadron. The Bight of Heligoland was searched but no German ships were seen excepting several submarines, one of which was rammed by the "Zealandia." On Sept. 12 the British submarines scored their first success when "E. 9" sank the cruiser "Hela" off Heligoland. The High Sea Fleet being known to be escorting troops in the Baltic, the opportunity was taken to give the Grand Fleet a few days rest, the first since war broke out. The fleet arrived at Loch Ewe on Sept. 13: its rest was but a short one for on the 17th it was again sweeping down the North Sea to the Horns Reef following the sinking of the "Cressy," "Hogue" and "Aboukir." These three cruisers were sunk within an hour by a single submarine ("U. 9"). They were steaming in line abreast on the "Broad Fourteens" patrol, having been deprived of their destroyer support by bad weather. The "Aboukir" was hit first and the other two were torpedoed in succession as they closed to pick up survivors. In this disaster 1,400 lives were lost: and orders were given that in future, heavy ships were not to stop to pick up survivors of consorts torpedoed by submarines, nor were armoured ships to be used for patrol or examining merchant ships in submarine waters.

The Fall of Antwerp. — In the closing days of September, the Belgian Government asked for assistance in the defence of Antwerp. Some naval guns were sent and a brigade of Royal Marines reached the city on Oct. 2, followed by two untrained brigades of the newly formed Royal Naval Division. On Oct. 2 the eastern approach to the Dover Straits was closed by a minefield, extending from the Goodwins to Ostend, every publicity being given to its limits. The 7th Division was landed at Zeebrugge on Oct. 7 without loss, in spite of a number of submarine attacks, but this desperate attempt to support the Belgian Army failed. Antwerp surrendered on Oct. 10 and the coast ports fell into the hands of the enemy as the Belgian Army retreated to the line of the Yser. One of the Naval Brigades, in the retreat, was forced across the Dutch frontier and interned. The German pursuit of the exhausted Belgian Army along the coast was stayed by the gallant work of a British flotilla under the command of Rear-Admiral Hood. (See BELGIAN COAST OPERATIONS.) Meanwhile the Harwich Force watching for a move on the part of the Germans, obtained its reward on Oct. 16, when the "Undaunted" and four destroyers met and chased four German destroyers and sank them all. This was the only attempt, apart from submarine activities, by the German navy to interfere on the Belgian Coast at this phase.

Submarine Menace to the Grand Fleet. — The last days of September saw the Grand Fleet at Scapa Flow and from Oct. 2–12 the whole fleet was at sea engaged in safeguarding the passage of the Canadian convoy. On Oct. 7 a German submarine entered Loch Ewe, rendering that place unsafe as a fleet anchorage. The fleet returned to Scapa Flow, where a partial submarine obstruction was in place, on Oct. 12. At this time submarines were active in the vicinity of the northern bases and several attacks were made upon patrolling cruisers. On Oct. 15 the cruiser "Hawke" was sunk with heavy loss off the Aberdeen coast and the next day a submarint was again reported inside Scapa Flow. Knowing that the German fleet was still in the Baltic, Jellicoe decided to seek a safe anchorage to the westward until the submarine defences of Scapa Flow could be made secure. On Oct. 20 he took the fleet to Lough Swilly where it remained until the end of the month, resting and carrying out practices. Meanwhile three British "E" class submarines had entered the Baltic. They were not successful in attacking the German fleet, but their presence caused much anxiety and gave moral support to the Russian fleet.

Loss of the "Audacious." — On Oct. 26, whilst carrying out firing practices off Lough Swilly, the battleship "Audacious" struck a mine. In spite of endeavours to tow her into harbour, she sank some hours later, her crew being saved. The loss was a serious one and came at an unfortunate moment. On that day the Belgian army supported by Hood's flotilla were making their last grim stand upon the Yser (see BELGIAN COAST OPERATIONS) and news of the Grand Fleet so far away might tempt the Germans to strike a blow at Hood before help could reach him. Also war with Turkey hung in the balance and news of a disaster to the Grand Fleet might have affected the issue. Consequently the Government kept the loss secret until the necessity was past.

Lord Fisher. — On Oct. 29 Lord Fisher (*q.v.*) relieved the Marquis of Milford Haven as First Sea Lord. A conference was held at the Admiralty, which Admiral Jellicoe attended, to decide upon future naval policy. On Nov. 2 the British Government declared the whole of the North Sea a prohibited area and warned all neutrals that, unless they adhered to the routes prescribed by the British authorities, they used the area at their own risk. On Nov. 3 a German cruiser squadron appeared off the Suffolk coast in the morning mist, fired a few shells on to the beach at Gorleston and at the old gunboat "Hazard" and retired. The battle squadrons having left Lough Swilly on Nov. 2, remained in the north part of the North Sea whilst a search was made by the battlecruisers and light forces, and returned to Scapa Flow on Nov. 17. The German cruiser "Yorck," on her way home from the Gorleston raid, struck a mine off the Jade River and was sunk. The defences of Scapa Flow were now far enough advanced to give a certain sense of security to the fleet, but between Nov. 23–26, when the fleet was absent in support of aerial operations in the Heligoland Bight, six submarines were sighted close to the base and one ("U. 18") was sunk by the local defence flotilla. Nov. 26 was marked by the loss of the battleship "Bulwark," which blew up at Sheerness owing to accidental ignition of cordite and sank with great loss of life.

The Scarborough Raid. — The Grand Fleet returned to Scapa Flow on Nov. 27 and there followed a month of gales of exceptional violence which delayed the completion of the submarine defences. On Dec. 15 a German force was reported at sea and the 2nd battle squadron and battlecruisers were sent south. The weather was so heavy that some of the light cruisers and destroyers had to be left behind, and to this fact and to the mist, the German force that raided Scarborough and the Hartlepools on Dec. 16, owe their narrow escape. The two towns were bombarded, 120 civilians were killed and over 400 wounded and, after laying mines off the Yorkshire coast, the Germans retired. In the mist and heavy sea a short, indecisive fight took place between the light forces, but the heavy ships, although very close, did not sight one another. The Grand Fleet swept in full force into the Bight on that day and Dec. 17, but the enemy had retired behind his minefields. It returned to Scapa on Dec. 20 and on Christmas Day was again in the Heligoland Bight, supporting an air raid upon Cuxhaven, after which it returned to Scapa on Dec. 27 in a heavy gale.

THE TRADE ROUTES 1914

Germany's oceanic trade was brought to a standstill at the very outset of the war, the approaches to her Home Ports being closed by the British Fleet, and with the cutting of the German cables in the Dover Straits on Aug. 5, she was isolated from the ports of the world. At the outbreak of hostilities there were permanent British squadrons stationed in China, Australia, the East Indies, at the Cape and in the Mediterranean, while the Home fleet protected the all important trade routes of the Atlantic. In August 1914, there was one light cruiser in the South Atlantic and the 4th Cruiser squadron (Craddock), detached from the 1st fleet, was in the West Indies. The 5th Cruiser squadron (Stoddart) was at once dispatched to the mid-Atlantic, between Africa and Brazil, and the ships of the 6th Cruiser squadron were scattered on special escort duties on the Atlantic Routes. The 9th Cruiser squadron (de Rabeck) operated between Finisterre-Azores-Ma-

deira; the 10th Cruiser squadron (de Chair) formed the northern patrol with the Grand Fleet; the 11th Cruiser squadron was stationed off the west coast of Ireland and the 12th Cruiser squadron, supported by a French squadron, guarded the Channel approaches.

Germany was credited with the intention of arming merchant ships as commerce raiders and the small enterprise she displayed in this direction was one of the surprises of the early months of the war. Only five such ships appeared: the "Kaiser Wilhelm der Grosse," which evaded the Grand Fleet, the "Kronprinz Wilhelm" from New York, the "Cap Trafalgar" from the River Plate, the "Cormoran" and "Prince Eitel Friedrich" in China. The "Dresden" and "Karlsruhe," in the West Indies, were the only German cruisers in the Atlantic.

The British 11th and 12th Cruiser squadrons, besides protecting trade, were at first occupied in safeguarding the passage of the Expeditionary Force. De Robeck kept a close watch upon the Spanish ports where some of the 70 interned German ships were suspected of trying to get to sea and arm. None did so and on Aug. 26 the "Highflyer," of his squadron, found the "Kaiser Wilhelm der Grosse" coaling off the African Coast and sank her.

The North Atlantic.— The "Dresden" was at Port au Prince (Haiti) on July 26, and the "Karlsruhe" at Havana on July 28. Both sailed for unknown destinations and Craddock sent the "Berwick" and "Bristol" to locate them, following himself in the "Suffolk." On Aug. 6 the "Suffolk" came upon the "Karlsruhe" engaged in arming the "Kronprinz Wilhelm." The merchant ship made off and the "Suffolk" chased the "Karlsruhe" until dark, when she was headed off by the "Bristol." A short moonlight action ensued, but the German's superior speed enabled him to escape. The "Dresden's" whereabouts were unknown and Craddock, anxious for the safety of the North Atlantic trade, took his squadron to the northern area. Several German ships in New York were expected to attempt to get to sea and arm, but none ventured to move and by Aug. 13 the "Karlsruhe" had been located at Curaçoa and the "Dresden" off Pernambuco. The Admiralty on that day stated that British trade in the North Atlantic was proceeding as usual. Craddock, with his flag now in the "Good Hope," sailed south in search of the two German cruisers. Leaving two French cruisers to watch the West Indies, he searched the Pernambuco and mid-Atlantic areas and then joined hands with Stoddart. By the beginning of September, a number of armed merchant ships had joined the British Cruiser squadrons, which were also reinforced by four old battleships. By this time the North Atlantic was clear of enemy cruisers and owing to the movements of the squadron under von Spee, interest was transferred to the southern part of that ocean, to which Craddock's command was specially allocated.

The "Cap Trafalgar" which left the River Plate on Aug. 22 was found by the "Carmania" on Sept. 14 off Trinidada Island. After spirited action between the two armed merchant ships, the German ship sank and the damaged "Carmania" crawled back to Gibraltar for repairs. With the West Indian cruisers pre-occupied in watching the newly opened Panama Canal, the "Karlsruhe" was successful as a raider until she blew up at sea on Nov. 4; she had several narrow escapes and during her three months' career captured 17 ships.

THE FAR EAST AND PACIFIC 1914–15

When war was declared, Admiral Jerram was at Hongkong completing his mobilisation. With his squadron concentrated on Aug. 12, he destroyed the German wireless station at Yap Island. By Aug. 20 he had established a close watch on Tsingtau. Admiral von Spee was at the Caroline Islands with the cruisers "Scharnhnrst," "Gneisenau" and "Nurnberg." He left on Aug. 6 for Pagan Island, where he was joined on the 12th by the cruiser "Emden," which had slipped out of Tsingtau, on Aug. 7, with supply ships. At Pagan Island von Spee heard of the Japanese ultimatum to Germany. Japan commenced hostilities against Germany on Aug. 22 and Jerram was thus freed to co-operate with the Australian squadron (Admiral Patey) in preventing von Spee from breaking through to the Indian Ocean.

The Fall of **Tsingtau.**—The primary objective of the Japanese was the German stronghold at Tsingtau. As soon as war was declared the port was blockaded by the Japanese Fleet and H.M.S. "Triumph" and Japanese troops were landed on Sept. 2. By Sept. 21 the fortress was invested by land and sea and on the next day, British troops having joined the Japanese, the general attack commenced. Tsingtau held out until Nov. 7 when it surrendered.

The Pacific Expeditions.— The Australian squadron, under Admiral Patey concentrated at Port Moresby on Aug. 7 and, on the 9th, appeared off Rabaul, the government centre of German New Guinea. No German ships were present and after destroying telegraphic communication the squadron sailed to meet the New Zealand Samoa Expedition at Suva. Von Spee's whereabouts being unknown, the presence of the battlecruiser "Australia" with this expedition was necessary. Samoa surrendered on Aug. 30 and Patey sailed to escort the Australian expedition against Rabaul. Little resistance was made to the landings on Sept. 11 and German New Guinea, with the Bismarck Archipelago, capitulated on Sept. 15. Patey's force was thus freed to attend to the Australian and New Zealand convoys, as by this time it was certain that von Spee's destination was South America.

The **"Emden."**—On Aug. 28 the German light cruiser "Emden" entered the Indian Ocean by way of the Molucca Strait and after being nearly found by the British cruiser "Hampshire" on Sept. 4 she made her dramatic appearance off the River Hoogly on Sept. 14. She ranged the Bay of Bengal until Sept. 23, bombarding Madras on the 22nd. Then for a month she cruised in the western approaches to Ceylon, coaling at Diego Garcia. On Oct. 21, after a narrow escape from the "Hampshire" and the armed merchant cruiser "Empress of India," she crossed the Indian Ocean, appearing off Penang on the 28th. There she sank the Russian cruiser "Zhemchug" and the French destroyer "Mousquet," and doubled back round the north of Sumatra. Unable to find her storeships, which had been sunk by the "Yarmouth," she made for the Cocos Islands. There on Nov. 9th, she was brought to action and sunk by H.M.A.S. "Sydney," so ending her remarkably successful raiding career in which she had sunk 15 ships.

Von Spee in the Pacific.— With Japan's entry into the war, von Spee's position in Chinese waters became untenable, and he decided to make for South America. After despatching the "Emden" on her memorable cruise, he sailed east, passing through the Marshall Islands on Aug. 22. Here he detached the "Nurnberg" to Honolulu and sailed himself for Christmas Island. Arriving on Sept. 6, the "Nurnberg" rejoined next day, having cut the British cables at Fanning Island. On Sept. 14 von Spee appeared off Samoa and finding the place already in British hands, again sailed east. By this date Craddock had taken over the command of the South Atlantic and was coming south in search of the "Dresden." Von Spee, after bombarding Tahiti on Sept. 22, visited the Marquesa Islands on Oct. 1 and arrived at Easter Island on Oct. 12. Here he was joined by the light cruisers "Leipzig" from North America and "Dresden" from the Atlantic. On Sept. 15 Craddock was ordered to concentrate his force upon the Falkland Islands and was promised reinforcements. He heard on Sept. 26 that the "Dresden" was off Chile and it was by then certain that South America was von Spee's destination. By Oct. 22 Craddock had collected his ships at the Falkland Islands and he then searched round the Horn, leaving the old and slow battleship "Canopus" to join him through the Magellan Straits. Meanwhile von Spee had arrived off Valparaiso and was cruising off the coast.

Coronel and the Falkland Islands **Battles.**—Craddock, after rounding the Horn, continued his search to the north and sent the light cruiser "Glasgow" into Coronel. Von Spee hearing of her at that port on Oct. 31, turned south to cut her off. Craddock, having heard the "Leipzig's" wireless, was searching for her on his way north. Neither admiral was aware of the proximity of the other until they met on the evening of Nov. 1, and the battle of Coronel (*q.v.*) was fought. The cruisers "Good Hope" and "Monmouth" were sunk and the other British ships made their escape and returned to the Falkland Islands. Von Spee, after

his victory, paid a visit to Valparaiso and then sailed south to St. Quintin Bay, about 300 miles north of the Magellan Straits.

The news of the Coronel defeat created consternation in England and immediate steps were taken to retrieve the position. The battlecruisers "Invincible" and "Inflexible," from the Grand Fleet, were placed under the orders of Admiral Sturdee, who was given a wide commission to seek out and destroy von Spee, wherever he might be, in the South Atlantic or Pacific Oceans. Sturdee left Plymouth on Nov. 11 and concentrated his force at the Abrolhos Rocks on Nov. 26, the same day that von Spee left St. Quintin Bay for the Falkland Islands. Now that von Spee's position was better known four other squadrons were quickly concentrated in order to deal with him. Patey, in the battlecruiser "Australia," with a squadron of British and Japanese ships watched the middle Pacific; a Japanese squadron was concentrated at the Galapagos Islands and the Battlecruiser "Princess Royal" was sent to the West Indies, in case von Spee should attempt to pass the Panama Canal. De Robeck on the African Coast and Stoddart off Montevideo were reinforced with armoured ships, in case von Spee should escape Sturdee, who, after searching the South American Coast, arrived at Port Stanley on Dec. 7 Von Spee rounded the Horn on Dec. 2, delayed for three days to coal from a prize in the Beagle Channel, and arrived off Port Stanley on the morning of Dec. 8. Sturdee put to sea and there followed the battle of the Falkland Islands (*q.v.*) in which the German squadron was destroyed, only one ship, the "Dresden," escaping.

The End of the Cruiser Campaign.—Despite the incessant demands for the protection of troop convoys and support for military expeditions that had so hampered the Admirals in their first duty of commerce protection, the British Navy in the first eight months of the war cleared the German flag from the outer seas. By the end of 1914, only one of the thirteen German cruisers abroad was unaccounted for and of the five armed merchantships only two remained at large. The "Dresden," escaping from the Falkland Islands battle, was hunted and helpless until she was sunk by the "Glasgow" and "Kent" at Juan Fernandez on Mar. 14. The "Kronprinz Wilhelm" (April 8) and "Prinz Eitel Friedrich" (Mar. 12) were interned at Newport News, and the "Königsberg," having been discovered in hiding in the Rufiji River was destroyed on July 11. By the end of Mar. 1915, the Canadian, Australian, New Zealand and Indian armies had been carried overseas, garrisons abroad had been replaced by territorial troops, without the loss of a troopship and naval support had been given to six considerable military operations. This was accomplished with the loss to the Navy upon the outer seas of three cruisers ("Good Hope," "Monmouth" and "Pegasus") and of 62 merchant ships. The German cruisers had caused a loss amounting to less than two thirds of 1% of British seaborne commerce during the period.

THE MEDITERRANEAN 1914

The Goeben and Breslau.—The first duty of the British Mediterranean squadron was to watch the movements of the German cruisers "Goeben" and "Breslau." On Aug. 3, their whereabouts being unknown, Admiral Milne stationed the 1st Cruiser squadron (Troubridge) with destroyers to prevent them entering the Adriatic and sent the battlecruisers "Indomitable" and "Indefatigable" towards Gibraltar to stop them interfering with the transport of Algerian troops or escaping into the Atlantic. At 10.30 A.M. on Aug. 4 the German cruisers, who that morning had bombarded Phillipville, were sighted by the British battlecruisers and were shadowed by them into Messina. On Aug. 5, the situation was complicated by the Italian declaration of neutrality and by Austria not yet being at war with Britain, while the information received by Milne was conflicting. Expecting the Germans to break westward, he placed his force to prevent them escaping from the north of Messina, leaving Troubridge to deny them the Adriatic. On the evening of Aug. 6th the Germans sailed from the south of the Straits, gallantly and skilfully shadowed by the "Gloucester." Troubridge did not bring them to action and when they passed Cape Matapan, the "Gloucester" was recalled from her precarious position. Milne followed into the Aegean on the 9th but was too late to prevent the two German ships entering the Dardanelles on Aug. 10. Their escape was unfortunate as it had a far-reaching effect upon subsequent events in the Near East.

After the safe passage of the Algerian troops the security of the Mediterranean was undertaken by the French fleet, which, using Malta as its base from Aug. 16, established a blockade of the Adriatic. Admiral Carden was appointed to command the reduced British force in the Mediterranean and with it he established a blockade of the Dardanelles. On Nov. 3rd, on Turkey declaring war, he bombarded the outer forts of the Dardanelles as a demonstration. The watch upon the Dardanelles was kept with few ships for the cruisers were called upon to guard the Malta–Port Said route during the passage of troop convoys. It was uneventful, except for the daring exploit of Submarine "B. 11," which on Dec. 13 dived through five rows of mines in the Dardanelles, torpedoed and sank the Turkish battleship "Messudieh" and returned safely.

OVERSEA CAMPAIGNS 1914–15

Togoland and the Cameroons.—A stroke by the Gold Coast forces on the outbreak of war led to the occupation of Togoland and the destruction of the important German wireless station at Kanima. Before the end of August the colony had surrendered and an attack was launched upon the German Cameroons. On Aug. 25 the British cruiser "Cumberland" and the gunboat "Dwarf" left Sierra Leone to attack Duala, followed by the cruiser "Challenger" and the Niger flotilla with a British and French military force. A base was established in the Cameroon estuary and after a month of flotilla warfare, in which the "Dwarf" played a prominent part, the river was cleared of mines and obstructions. The "Challenger" then entered and on Sept. 27 Duala surrendered to a combined naval and military attack. Nine large German steamers, a floating dock and two railway termini were captured. River warfare in support of the military advance inland then developed. The "Cumberland," "Challenger" and French cruiser "Bruix," being required elsewhere, were relieved by the cruiser "Astraea" from the Cape and with the arrival of the old cruiser "Sirius" and the sloop "Rinaldo" in April 1915 a blockade was established to prevent supplies reaching the enemy from the Spanish island of Fernando Po. The colony was, by this time, in Allied hands, but fighting in the hinterland continued for two years.

German South West Africa.—The attack upon this colony, started in Aug. 1914 by the South African Government, was delayed by the Boer revolt, but, the revolt having been suppressed, it was resumed early in 1915. The Union Army, escorted by the battleships "Albion," the "Astraea" and two armed merchant cruisers occupied Walfisch Bay and Swakopmund in January. The "Albion" was then sent to the Dardanelles and the "Astraea" to the Cameroons and, with the exception of some naval armoured cars the campaign became a purely military one. It was brought to a successful conclusion in July 1915 by the surrender of the colony.

German East Africa.—The German cruiser "Konigsberg" was at sea on the outbreak of war and on Aug. 6 she made her only prize in the Gulf of Aden. Two days later, the "Astraea" and "Pegasus" appearing off Dar-es-Salam, the Germans blocked the entrance to the port, but agreed that the ships there should be considered British prizes, and the wireless station was destroyed. The "Konigsberg," her base closed against her, was not heard of until Sept. 20, when she appeared off Zanzibar and finding the "Pegasus" with engines disabled in the roadstead, sank her at her moorings. Admiral Charlton, with the Cape squadron, was, by now, on the "Konigsberg's" trail and she took refuge amidst the swamps of the Rufiji River, where she was located by the "Chatham." On Nov. 1 the East African Expeditionary Force, escorted by the battleship "Goliath" and cruiser "Fox," arrived from India. On Nov, 2 the troops landed at Tanga, under cover of the "Fox," but the attack made two days later was repulsed and the troops were re-embarked.

Following this reverse no serious military operations against the colony were undertaken until early in 1916. The 600 miles of coastline, with its many harbours, remained in the hands of the Germans and it was not until March 1915 that ships

could be spared to establish an efficient blockade. Meanwhile a strict watch had to be kept upon the "Konigsberg" in the Rufiji River and several relief ships slipped through with arms and stores for the colony. On Dec. 14, boats sent in to Dar-es-Salaam to take possession of the prizes, were fired upon and the town was then bombarded and the ships sunk. In the Rufiji River a ship was sunk to block the "Konigsberg" in, but the cruiser was unapproachable until the arrival of shallow draught ships and aeroplanes. On June 3, 191; the small monitors "Severn" and "Mersey" arrived with four seaplanes, and a month was occupied in preparing these craft for their work. On July 6 the first attack was made, the "Konigsberg" was damaged but the monitors were forced to retire. On July 11 the attack was renewed and pressed home by the monitors, and the "Konigsberg" was destroyed.

Persian Gulf and Mesopotamia.—An Indian Division, escorted by the "Ocean," and the sloops "Espikgle" and "Odin" arrived at Bahrein late in October and on the 30th received orders to commence hostilities against Turkey. On Nov. 6, after bombarding Fort Fao at the entrance of the Shatt-el-Arab, the troops landed. Advancing against considerable opposition, supported by the "Espiegle" and "Odin," an entrenched position was established at Abadan by Nov. 10. The force pressed forward supported by the two sloops and Basra was entered on Nov. 22, and a further advance ended on Dec. 9, in the occupation of Kurnah, at the junction of the Tigris and Euphrates. By this rapid and well planned stroke the command of the Persian Gulf and of the outlet from the Persian oilfields was assured.

In December the "Ocean" was withdrawn to the Dardanelles and the flotilla consisted of the "Espikgle" and "Odin," the vessels of the Royal Indian Marine and a number of armed river steamers and launches. In March of 1915 the "Clio" and four armed boats arrived from Egypt and in the late autumn the first of the new "Fly" class gunboats arrived from England.

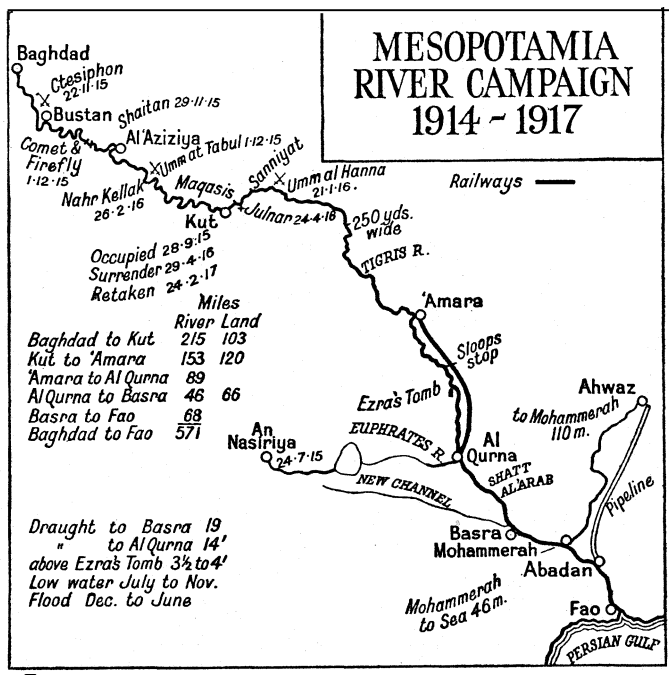

FIG. 1.—MESOPOTAMIA RIVER CAMPAIGN, ENDED ON MARCH 11, 1917

Throughout 1915 the flotilla formed the spearhead of the advance of the Army. It protected the oil pipe line by patrolling the Karun River and in April the Euphrates flotilla assisted in defeating the Turkish attack upon Basra. The remarkable amphibious battle north of Rurnah on May 31, was followed by the dash up the river by the flotilla after the retreating Turks, with General Townshend on board, and the capture of Amara. With the flotilla reinforced by four seaplanes from the Rufiji River, Townshend captured Kut and continued his pursuit of the Turks until he was brought up at Ctesiphon on Oct. 5. The political and military situation in the Near East then led to the illfated attempt upon Baghdad. The naval flotilla consisted of the gunboat "Firefly," the "Comet," two armed launches and four armed horse boats. After the repulse of the army at Ctesiphon, the withdrawal of the river transport was covered by the flotilla with the loss of "Firefly," "Comet" and "Shaitan," which grounded and were abandoned. Townshend reached Kut on Dec. 3, but by the 9th that place was invested and the flotilla was withdrawn down river.

Egypt.—By mid-November 1914, the careers of the "Emden" and "Konigsberg" being ended the Indian Ocean was secure. The British cruisers were ordered homewards and Admiral Peirse, in the battleship "Swiftsure," reached Suez on Dec. 1 and detained in the Canal enough ships to meet the threatened Turkish attack upon Egypt. During December the "Doris" and the Russian cruiser "Askold" made a series of successful raids in the Gulf of Iskanderun and on the Syrian Coast. At the end of January 1915, when the Turkish attack developed, a strong naval force under Peirse's command took up its position in the Canal. The Turks made their attempt on the Canal on February 2 and 3 and were easily repulsed, the Canal traffic being but little interfered with. By Feb. 11, all threat to the Canal having disappeared, Peirse was able to send most of his ships to reinforce Carden's forces at the Dardanelles. A further threat to the Canal in April 1915 was frustrated by the presence of strong British and French naval forces.

HOME WATERS AND THE BALTIC 1915

The Battle of the Dogger Bank.—The year opened with the loss of the battleship "Formidable," which was torpedoed by "U. 24" off the Start on the morning of Jan. 1. In the North Sea the first weeks of January passed quietly, but on the 19th reports of German activity brought the British battlecruisers into the Heligoland Bight. Nothing was seen, but a Zeppelin raid on the East Coast indicated a repetition of the Scarborough raid. The battlecruisers remained concentrated in a position south of the Dogger Bank, supported by the Grand Fleet battleships to the northward. On the morning of the 24th the Germans were sighted and there followed the battle of the Dogger Bank (*q.v.*). The German squadron was driven back to its base with the loss of the cruiser "Blucher" and two battlecruisers badly damaged. Beatty's flagship "Lion" was severely damaged but returned safely to Rosyth. After the Dogger Bank action a change was made in the command of the High Sea Fleet and a policy of extreme caution was initiated. The German fleet put to sea only to cover minelaying operations and always retired behind its minefields on the approach of the enemy. Four of these "one day out and one day back" sorties in March, April and May were threatened by the Grand Fleet in force and the Germans retired.

The Baltic.—In the Baltic the Russian fleet, assisted by a few British submarines, was successful in holding the older ships of the German fleet in check. In June a German attempt to land troops in Courland in support of their army was defeated by the Russian destroyers and on July 2 the German minelayer "Albatross" was driven ashore by the Russian cruisers and the cruiser "Prinz Adalbert" was torpedoed and seriously damaged by the British submarine "E. 9." In August a part of the High Sea Fleet made a serious attempt to force the Gulf of Riga, but on Aug. 19 the battlecruiser "Moltke" was badly damaged by a torpedo from submarine "E. 1." The operations were abandoned and for some time the Baltic was the scene of only minor operations, but, in the closing months of 1915, the German iron trade with Sweden was harassed by British submarines, which sank 14 steamers engaged in the trade and the cruisers "Prinz Adalbert" and "Bremen" and a destroyer.

The Grand Fleet.—Improvements in the British intelligence, especially in directional wireless, gave timely warning of any movements of the German Fleet. By the end of the first quarter in 1915, the Allied flank in Flanders was stabilized, supplies to the army were ensured by the grip of the Dover and Harwich forces upon the narrow seas while the northern bases had been made

practically submarine proof. These factors led to a general redistribution of the British fleet. The Channel fleet was broken up and most of its ships were sent out to the Dardanelles. The Grand Fleet battle squadrons remained at Scapa Flow and Cromarty and the battlecruisers at Rosyth. During the year the Battle fleet swept down the North Sea to the Heligoland Bight no less than 17 times and many other searches were made of the Danish and Norwegian coasts by the battlecruisers and light forces. During one of these cruises "U. 29" was rammed by the "Dreadnought." The British Navy was short of destroyers until the autumn, when the new vessels began to appear. Until then constant calls were made upon the Grand Fleet for destroyers to assist the auxiliary patrol in hunting submarines. The work of the destroyers was incessant and arduous and due to their efficiency the Germans gained no major success with submarine or mine against the British fleet during the year.

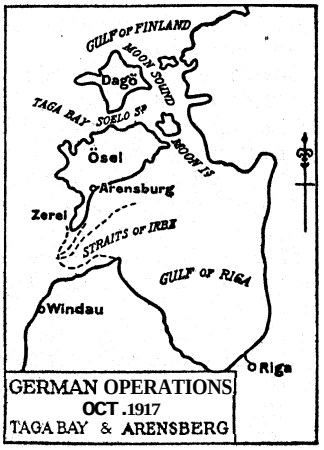

FIG. 2.—MAP SHOWING GERMAN OPERATIONS IN TAGA BAY AND ARENSBERG, OCTOBER, 1917

The northern blockade was maintained with increasing efficiency by the 10th Cruiser squadron, now composed entirely of armed merchant cruisers. The fleet base at Scapa Flow developed into a great training establishment for new personnel. A system of gunnery and other training was organised which brought the many new ships joining the fleet to a state of fighting efficiency in minimum time and new officers and men were trained for the ancillary services all over the world. This year of strenuous work was marked by no outstanding event after the Dogger Bank action and it closed with the disaster to the armoured cruiser "Natal," lost by internal explosion at Cromarty on New Year's eve. During August and September, Zeebrugge and Ostend were several times bombarded by the monitors and other ships of the Dover Patrol, in support of the Allied offensive. The results were inconclusive owing to the difficulties of fire observation and to the fact that the ships, finding themselves outranged by the heavy German shore guns were forced to keep at extreme range.

Submarine Warfare.—By the beginning of 1915 the ocean high-ways had been made safe for commerce, but the narrow seas around the British Isles were becoming unsafe for any traffic. On Feb. 17, 1915, Germany declared these waters to be a "War Zone" and announced her intention of using submarines to sink merchant-ships. Thus commenced the submarine campaign (*q.v.*). In the first quarter of 1915, 38 British ships were sunk by submarines and by Dec. 31 this number was swelled to 259. In the same period 48 ships were sunk by mines and the tonnage loss for the year approached 900,000 tons. For these two forms of warfare against trade Britain was unprepared and the submarine and minelaying tactics of the enemy produced a situation beyond the capacity of the weak and scattered coastal patrol and minesweeping flotillas. Trawlers, drifters, yachts and small steam and motor vessels of all kinds were armed to reinforce the flotillas. By the beginning of 1915, no less than 750 of these craft were in commission and their numbers were rapidly swelled at the opening of submarine warfare. By August 1915 the auxiliary patrol was a complete organization and the coastal waters were divided into twenty-one patrol areas. In each area destroyers and auxiliary craft were employed in submarine hunting, minesweeping, guarding channels, guiding traffic, rescue work and in many other duties. The auxiliary ships were manned by seamen, yachtsmen and fishermen, enrolled in the Royal Naval and Royal Naval Volunteer Reserves. As in days of old, the seafaring population of the country, of all classes, came forward in the hour of need and in its ceaseless watch around the coast until the end of the war, the auxiliary patrol paid a heavy price and rendered to the country service of incalculable value.

THE DARDANELLES CAMPAIGN

Early in 1915 political complications in the Balkans and the Russian wish for an open Dardanelles to ensure munitions supply, made imperative some demonstration of the Allied power in the Eastern Mediterranean. It was decided to attack the Dardanelles, where, since September, Admiral Carden had been keeping a close watch. In the redistribution of the British fleet, after the Falkland Islands battle, Carden was strengthened with a number of the older battleships and cruisers. The French Government offered a squadron and both naval and military aid was promised by Russia in the Black Sea. By the end of February, Carden's force consisted of the battlecruiser "Inflexible," the new battleship "Queen Elizabeth," 16 old battleships (4 French), 20 destroyers (6 French), a flotilla of 35 minesweeping trawlers and a seaplane carrier were on their way, and a varying number of cruisers and submarines were under his orders. Admiral de Robeck was appointed second in command. The Greek Government handed over the Island of Lemnos as an advanced base and Admiral Wemyss was appointed to command it.

From the first the naval view was that any attack upon the Straits by ships could be only a diversion unless it was backed by a strong military expedition. Steps were accordingly taken to send troops to the Aegean, but the situation on the eastern and western fronts caused delay and it was not until Feb. 20, after the first bombardment, that the decision was made to send out five divisions (4 British and 1 French).

The First Bombardment.—Bad weather in January made reconnaissance of the Straits difficult, but enough was done to enable Carden to recommend, on Feb. 15, that a naval bombardment was not a sound operation without a strong military force to consolidate the work of the fleet. But the political situation was critical and Carden was pressed by the War Council to commence operations. Pointing out that no progress could be expected until the minesweepers and seaplanes arrived, Carden decided to bombard the outer forts on the first opportunity. Owing to bad weather this did not occur until the 19th and at 10 A.M. on that day the battleship "Cornwallis" fired the first shot of the campaign at Fort Orkaniye. The forts were hit repeatedly and made no reply, but when the "Vengeance" (flying de Robeck's flag), closed to moderate range she received a hot fire from all guns. Thus early it was proved that long range bombardment of modern earthworks was ineffective unless the

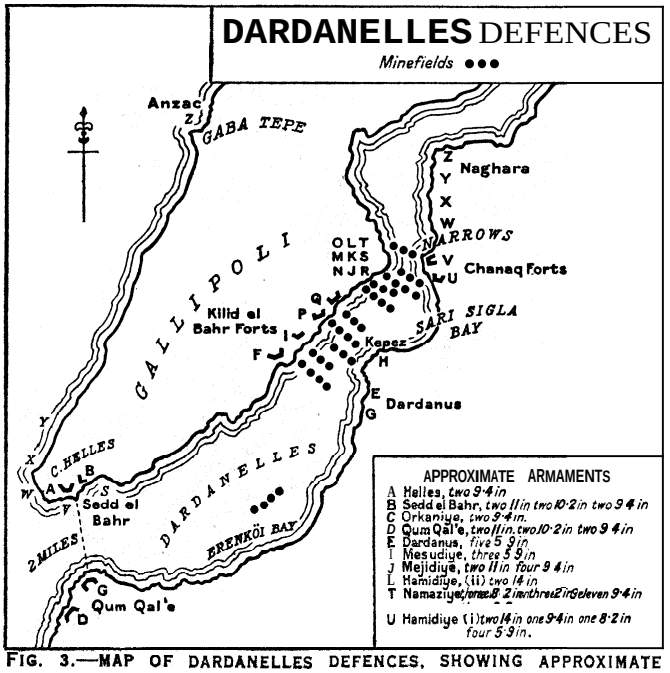

FIG. 3.—MAP OF DARDANELLES DEFENCES, SHOWING APPROXIMATE ARMAMENTS AND POSITION OF MINEFIELDS

ships can close to decisive range and knock out each gun by direct hits. (See NAVAL STRATEGY AND TACTICS.)

Carden was now informed that he was expected to force the Straits without military assistance. On February 25, after a four days gale, a bombardment, commencing at moderate range, was intensified by British and French ships closing in towards the shore. The four outer forts were silenced and the minesweepers began clearing the Straits. Next day, demolition parties, supported by marines landed to complete the destruction of the forts, and the fleet, going as far up the Straits as had been swept, bombarded the inner forts at long range. As before the forts made no reply when hit, but the ships were badly worried by mobile howitzers on each shore, which could not be located. Gales delayed operations for two days and on March 1 and 2 the Narrows were again attacked, with similar results, the ships being constantly hit by an increasing number of hidden howitzers. Each night the minesweepers were driven off by gunfire as they attempted to sweep the minefields off Kephez. On March 3 de Robeck reported that the Straits could not be forced unless one shore or the other were occupied and that no progress was possible without military assistance. This was emphasized on March 4 by the repulse of the demolition parties, showing that the time was past for employing small forces onshore.

As yet, no definite decision had been made as to the scope of any military operations. In spite of the Admiralty's reiterated demands for troops and the doubts of General Birdwood on the spot, that the fleet could force a passage unaided, Lord Kitchener, at the War Office, in his instructions to General Sir Ian Hamilton, on the latter's appointment as commander-in-chief, only contemplated "the employment of military force on any large scale . . . at this juncture. . . . in the event of the fleet failing to get through after every effort has been exhausted." (See W. S. Churchill, The World *Crisis.)* Mr. Winston Churchill, as First Lord, continued to urge the fleet to new efforts and on March 11, Admiral Carden was told "the results to be gained are . . . great enough to justify loss of ships and men if success cannot be obtained without it."

A naval attack was, therefore, planned for March 18, by which time General Sir Ian Hamilton would have arrived. Meanwhile daily bombardments of the forts produced indefinite results and desperate attempts were made nightly without success to sweep up the Kephez minefields. All experience proved that until the mobile guns were suppressed they could prevent minesweeping operations, and until the minefields were cleared ships could not approach to decisive range at which alone they could destroy modern earthworks. On March 16 Admiral Carden's health broke down and he was forced to hand over his command to Admiral de Robeck, who at once proceeded to carry out the attack planned.

The Naval Attack of March 18.—The plan of attack arranged for the four modern ships ("Inflexible," "Queen Elizabeth," "Lord Nelson" and "Agamemnon") to engage the inner forts at 14,000 yards, whilst a British and French division, of four old ships each, alternately pressed home the attack to 10,000 yards, which was the limit of the swept area. Two old battleships on each side were to attempt to keep down the fire of the small guns onshore. The action commenced at 11.30 A.M. on the 18th. Little reply came from the forts, but unseen guns opened a heavy fire. The "Agamemnon" was frequently hit and the "Inflexible" forced out of the line with her forebridge burning. At noon the French division passed through the British line, closed to 10,000 yards and received a hot fire from the forts. The "Gaulois" was forced out of action and the "Bouvet" was heavily hit, but the squadron gallantly held its place and by 1.45 the fire of the forts was slackening. De Robeck then sent the British division in to relieve the French and ordered the minesweepers up to clear the channel. At 2 0 P.M. as the French squadron was steaming out the "Bouvet," struck a mine, blew up and sank in a few minutes, with nearly all hands. The British division engaged the forts with apparent success until 3.0 P.M. when the "Irresistible" struck a mine and sank, her crew being saved. The fire from the forts now became intermittent, but at 4.5 P.M. the "Inflexible" was mined and ten minutes later a similar fate befell the "Ocean." The "Inflexible" reached Tenedos and was beached, but the "Ocean" was abandoned and sank. The ships withdrew just after 6 P.M. and as they did so the forts opened a heavy but inaccurate fire; the attempt to force the Straits thus ended in failure. The forts had been damaged but were not put out of action and the minefields were still intact. The loss to the Allies had been severe: three battleships sunk, three heavy ships badly damaged and others severely handled.

The First Landings.— For political reasons the campaign had to be continued and the failure of the fleet to force the Straits necessitated the landing of an army upon the Peninsula. For this operation the transports were unprepared and the army was concentrated in Egypt to reorganise, a valuable month thus being lost. (See DARDANELLES CAMPAIGN.) Meanwhile the fleet reconnoitred and prepared for the landing and, when the weather permitted, harassed the Turkish reinforcements now crowding on to Gallipoli. Smyrna was strictly blockaded and the Russian fleet was active off the Bosphorus.

By April 23, the transports had reassembled at Mudros and the work of getting into position for the landings commenced, The weather favoured the operation and early on the morning of the 25th, landings were effected on five beaches around Cape Helles and Gaba Tepe (Anzac). At the same time, French troops gained a footing on the Asiatic side and a demonstration was made in the Gulf of Xeros; 18 battleships, 12 cruisers, 29 destroyers, 8 submarines and a host of small craft supported the landing. At each beach, the covering ships went close inshore in support, whilst the attendant ships carried the troops and aided by small craft and boats suited to the particular beach, landed them. Opposition was severe and losses very heavy but by sunset the army was established ashore and the naval parties had the work of organising the beaches well in hand. Thenceforward the campaign became mainly a military one in which the rôle of the Navy was to support the troops by gunfire, to evacuate wounded and to ensure the supply of food, water, stores, munitions and reinforcements to the beaches. This task was an arduous and dangerous one and casualties on the beaches were heavy. The old battleships "Albion" (April 28) and "Prince George" (May 5) were so damaged by gunfire that they had to be docked and on May 13, the "Goliath" was torpedoed by a Turkish destroyer and sank with great loss of life. The appearance of German submarines in the Mediterranean now rendered the position of heavy ships employed off the Peninsula precarious. The "Queen Elizabeth" was ordered home to join the Grand Fleet and the replacement of battleships by monitors and old "bulged" cruisers commenced, but two more battleships were lost: the "Triumph" on May 2; and the "Majestic" on May 27, both torpedoed by "U. 21."

Lord Fisher Resigns.—The War Council decision on May 14 to continue the campaign led to the resignation of Lord Fisher (*q.v.*). This was followed by the reconstruction of the Government and the removal of Mr. Winston Churchill from the office of First Lord of the Admiralty. Throughout the summer months the navy supported and supplied the army on the peninsula, and more troops being sent out, a successful landing was made at Suvla Bay on the night of Aug. 6–7. But neither here nor at the other positions was any appreciable progress made onshore and all idea of forcing the Straits with the fleet was consequently abandoned. Submarines alone could pass the Narrows and of the 12 boats (9 British and 3 French) which made the adventure, 7 were lost. The presence of these vessels in the Marmora, however, produced such alarm as greatly to interfere with the Turkish supplies to the Peninsula.

The Evacuation.— By the end of October the defeat of the Serbian Army and the opening of the Salonika Campaign hastened the decision to withdraw from Gallipoli, and preparations for this difficult operation commenced. Night by night, the vast accumulation of stores were removed and on the night of Dec. 18–19 the troops were withdrawn from Suvla Bay and Anzac under cover of the fleet. So successful was the operation that the Turks knew nothing about it and awoke to find that their enemy had vanished. The more difficult evacuation of the Helles Beaches was accomplished on Jan. 8–9, 1916, without the loss of a man. Little of value was left in the hands of the enemy and

with these two wonderful examples of naval and military co-operation the ill-fated campaign was brought to a close.

HOME WATERS 1916

Heavy weather in January hampered the work of the 10th Cruiser squadron on the northern patrol and caused damage to the submarine defences of Scapa Flow and on the 6th the battleship "King Edward VII.," struck a mine off Cape Wrath and was lost. Scheer succeeded von Pohl in command of the High Sea Fleet in January and he at once adopted more energetic tactics. On Feb. 10 German destroyers appeared on the Dogger Bank and sank the sloop "Arabis," whilst minesweeping. A sweep by the Grand Fleet followed with the usual barren result. During the dark February nights the raider "Moewe" slipped homeward through the blockade after her successful cruise and the "Greif," another raider, in attempting to break out was brought to action by the armed merchant cruiser "Alcantara" on Feb. 29 and both ships were sunk. Cruising constantly during March the Grand Fleet saw nothing of the enemy until March 24–25 when the Harwich Force met a Division of enemy destroyers at night. The German "G. 194" was rammed and sunk by the light cruiser "Cleopatra" and a British destroyer was lost by collision. On April 23 the German fleet put to sea, the battlecruiser "Seydlitz" being forced to return after striking a British mine. Zeppelins raided the East Coast on the night of April 23–4 and at daybreak Yarmouth and Lowestoft were bombarded by the German battle-cruisers. The Harwich Force engaged them and the light cruiser "Conquest" received heavy damage from their fire as they hurriedly retired eastward, reaching their minefields just in time to escape Beatty's battlecruisers. The 3rd Battle squadron (7 King Edward's) was stationed in the mouth of the Thames at the end of April to deal with the coastal raids and on April 26 a heavy mine and net barrage was laid in the Straits by the Dover Patrol. On May 4–5 an aerial attack, supported by the Grand Fleet, was made upon the Zeppelin sheds at Tondern. One Zeppelin was destroyed at sea. Mines were laid off the Horns Reef and Borkum before the fleet returned north.

The Battle of Jutland. — At the end of April, in deference to protests from the United States and other neutrals, the German submarines received orders to cease sinking merchant ships without warning. Scheer thereupon determined to use the submarines thus released in an attempt to trap the British fleet. By May 23, 22 submarines were stationed off the British bases, and the High Sea Fleet was to put to sea on that day in the hope of enticing the Grand Fleet over them. The plan had to be modified as the weather delayed the German fleet until May 30. On that day, following upon reports of unusual activity by the enemy, the Grand Fleet sailed on one of its periodical southerly sweeps. On May 31, after a preliminary action between the rival battle-cruiser forces in which the British suffered heavy losses, the two main fleets met and the battle of Jutland (*q.v.*) was fought. The German fleet after sustaining severe damage and being skilfully extricated from a very dangerous situation: eluded the British fleet at night and retired behind its minefields at daylight on June 1. The Grand Fleet returned to its bases on the and and 3rd of that month.

June 5 was marked by the tragic loss of the "Hampshire," with Lord Kitchener on board, after striking a mine on the Orkney coast.

There were no large fleet movements during June as the High Sea Fleet was repairing its damage after Jutland. All the damaged British ships rejoined the Grand Fleet by the middle of July when a number of exercise cruises took place. In the second week in August, just as before Jutland, an unusual number of submarines were reported in the North Sea. Expecting another move on the part of the High Sea Fleet, Jellicoe swept south in force on August 18. Next morning ten Zeppelins were located stretched across the North Sea. By noon a fleet action appeared imminent, the battle fleets being only 42 miles apart, but warned by the Zeppelins, Scheer turned and made for home, and was soon beyond pursuit. The German battleship "Nassau" was twice torpedoed by a British submarine as the fleet put to sea; the cruisers "Kottingham" and "Falmouth" were torpedoed and sunk; and two submarines were accounted for by the British flotillas during the operation.

During the autumn British squadrons were constantly at sea on observation cruises, while regular British cruiser patrols were established in the North Sea and a submarine patrol was maintained off the German ports. But the German fleet made no move until the night of Oct. 26, when two German destroyer flotillas, working from Zeebrugge, made their first raid on the Dover Straits, sinking two British destroyers and seven drifters and escaping unscathed. On Nov. 5 a division of the German fleet put to sea to help a stranded submarine. The British submarine "J. 1" was waiting and succeeded in torpedoing and damaging the battleships "Kronprinz" and "Grosser Kurfiirst."

Jellicoe, First Sea Lord. — The long winter nights at the end of November enabled the raiders "Moewe" and "Wolf" to break through the blockade. This was annoying but not serious, for it was the submarine which had now become the menace to shipping and exceptional measures were called for to deal with it. At the end of November, therefore, Admiral Jellicoe was appointed First Sea Lord to take over this great task. Admiral Beatty succeeded him in command of the Grand Fleet.

In September war against merchant ships was renewed with ever increasing vigour. During 1916, 436 British merchant ships were lost, totalling 1,250,000 tons. Of these 322 were sunk by submarines, 88 by mines and 26 by raiders, etc. During the year a further 218 merchant ships had been attacked by submarines and had escaped.

THE MEDITERRANEAN 1915–16

The French fleet based upon Malta blockaded the Straits of Otranto watching for the Austrian "Dreadnought" squadron. The latter made no move but the Austrian submarines were active and the battleship "Jean Bart" (Dec. 1914) and the cruiser "Leon Gambetta" were torpedoed and sank. The French admiral withdrew his heavy ships to Malta and kept watch upon the narrow waters of the Adriatic with cruisers and destroyers. In May 1915, after prolonged negotiations as to the distribution and command of the Allied fleets in the Mediterranean, Italy declaredwar against Austria. The Italian fleet, reinforced by 4 British battleships and 4 light cruisers and by 12 French destroyers and 7 submarines became responsible for the Adriatic blockade. The French Admiral remained nominally in command of the Mediterranean, controlling the western basin, whilst naval operations in the Levant were under British control. The Italian battle squadron was based upon Taranto, but it was upon the cruisers, working from Brindisi, that the principal burden devolved. The cruisers '(Dublin" (June 9) and "Giuseppe Garibaldi" (July 18) were torpedoed by Austrian submarines and the latter sank. In September a barrage of British net drifters was placed across the Straits of Otranto, but owing to the depth of water it was not very effective.

The Dardanelles campaign dominated other events in the Mediterranean during 1915 and, with the appearance of German submarines in that sea during the summer, the task of protecting the stream of transports and supply ships became very difficult. In the autumn the almost simultaneous decision to evacuate Gallipoli and to commence the Salonika Campaign (*q.v.*) made demands upon the British transport service which all but stressed its powers to breaking point, and the losses caused by submarines became very serious.

Dedeagatch was bombarded on Oct. 21 and a British squadron was constantly operating at Salonika and on the Bulgarian coast until the end of the war. The collapse of Serbia in November 1915 was followed by an Austrian naval raid upon Durazzo. The raiding force was engaged by the "Dartmouth," "Weymouth" and "Nino Bixio" (Italian), the Austrians escaping with the cruiser "Helgoland" badly damaged and a destroyer sunk. Corfu was occupied as a base for the Serbian army in Jan. 1916 but the subsequent vacillating conduct of Greece did much to hamper the Allies during the Salonika campaign (*q.v.*).

The year 1916 in the Mediterranean was a continual struggle with the German and Austrian submarines, whose use of the

Greek ports and islands called for constant British and French activity around that coast. In December after an Allied force, landed from the fleet, was treacherously fired upon at Athens, a strict blockade of Greece was declared and enforced by the Allies. The British Aegean squadron, which was reinforced at the end of the year by four battleships, kept a close watch upon the Dardanelles and the Syrian coast during 1916.

Overseas Campaigns.--On Feb. 28, 1916, the final surrender of the colony brought the Cameroon Campaign to an end. In East Africa, although the coast was blockaded by the Cape squadron, the coast towns remained in German hands until September 1916. By this time all were occupied and the colony was cut off from the sea. The command of Lake Tanganyika was established by two British motor boats, carried 2,000 miles overland from Capetown, but fighting in the interior continued until after the Armistice. In Mesopotamia, 1916 was a year of pause and preparation for the next campaign. Kut surrendered on April 29 after a gallant naval attempt to relieve the town had failed five days previously.

UNRESTRICTED SUBMARINE WARFARE 1917

After the refusal of the Allies to consider her proffered peace terms at the end of 1916, Germany saw that her fate was sealed unless she could by some means, break the Allies' sea power (*q.v.*). The German High Naval Command was granted its wish and it was proclaimed that, after Feb. 1 submarines would sink all merchant ships on sight and without warning. The commencement of this ruthless campaign (see SUBMARINE CAMPAIGN) was followed by the severance of diplomatic relations between the United States and Germany and on April 6 the United States entered the war against the Central Powers. The German aim was to strike a fatal blow by bringing the Allied, and more especially the British, seaborne trade to a standstill by sinking so many ships as to reduce seriously available tonnage and to make the merchantmen refuse to face the risk of sailing. To some extent this latter was successful at first, in the case of neutral shipping, but British merchantmen continued to put to sea in spite of the heavy toll taken by the submarines. During February and March a weekly average of 23 British ships were lost and in April, the darkest month for British shipping, 196 vessels of nearly 600,000 tons were sunk. These losses were so serious, that, had they continued, success must have ultimately rewarded the German effort.

The Convoy System.—Every known method of protecting shipping at sea was adopted: camouflage (*q.v.*), defensive gun armaments, zig-zag courses in submarine waters and directing traffic along routes patrolled by craft armed with every anti-submarine device were all tried; but still the toll of losses grew. In spite of constant changing of the patrolled routes, by the end of March this system had definitely broken down and the Convoy System (*q.v.*) was adopted. To this there was, at first, much opposition, both from the fleet and from merchant owners and ship masters, and the difficulties appeared insuperable. Chief amongst these was the finding of sufficient escort ships, mainly destroyers, for the convoys. The destroyers from the Grand Fleet and Harwich could not be spared, as the High Sea Fleet was still in being and a menace, and there were but few others. The arrival of an American flotilla at Queenstown and of a Japanese one in the Mediterranean eased the situation: the Admiralty under Jellicoe persevered and by the end of May the Convoy System was in full swing. Its effects were immediate. In the second quarter of 1917 the weekly average losses amounted to over 30 merchant ships: in the third quarter this was reduced to just over 20 and in the last quarter to well below that figure, whilst in 1918 the average weekly loss was under 15. In all, 88,000 ships sailed under convoy during the war with a loss of only one half of 1%. During 1917, 1,134 British ships were sunk by submarines, whilst 841 others were attacked and escaped: 137 were sunk by mines, mostly laid by submarines and 38 by surface craft. The total tonnage loss for the year was over 3,500,000 tons and as a counter to this great loss 75 German submarines were sunk.

VARIOUS OPERATIONS 1917

The Dover Raids.—The German submarine and destroyer bases at Zeebrugge and Ostend were frequently bombarded by the monitors of the Dover Patrol but, although much damage was done, the lock gates and basins were not hit. The mine and net barrage in the Straits was constantly patrolled by destroyers and drifters and German destroyers made several attempts, by night raids on the patrols, to open a way for their submarines into the Channel. On the night of March 17 a German flotilla attacked the patrol, sank the destroyer "Paragon" and damaged the "Llewellyn." On April 20, they were not so successful, for the raiding flotilla was met by the "Swift" and "Broke" and, in the spirited hand-to-hand fight that ensued the German destroyers "G. 42" and "G. 45" were sunk. Thereafter, except for ineffectual sorties on April 26 and May 2, no raid was made upon the Dover Straits for nearly a year. Further north the Harwich Flotilla was constantly on the alert and on Jan. 23, in a night melée with a flotilla off the Dutch coast, the German leader was forced into Ijmuiden badly crippled, another boat was driven back to Zeebrugge and the British destroyer "Simoon" was sunk.

The Scandinavian Convoy.—Although to a great extent covered by the Grand Fleet cruisers and escorted by destroyers, the Scandinavian convoy was open to bold attack by the German surface craft and two such attacks were successful. On Oct. 17 two German light cruisers met this convoy of nine vessels, sank the escorting destroyers "Strongbow" and "Mary Rose" and the ships of the convoy without warning and escaped unscathed. Again on Dec. 12 a German flotilla attacked the convoy and sank the destroyer "Pellew" and four armed trawlers, most of the merchant ships escaping. These two mishaps led to a reorganization of this convoy route and to the strengthening of the escorts.

The Action of November 17.--Owing to delays in the production of mines, the British policy of intensive mining off the entrances to the German ports was not put in force until October. This was followed by a great increase in the German minesweeping service, some of the flotillas having to work as far as 150 miles from Heligoland. In November the Grand Fleet cruisers constantly raided the Bight and the Cattegat and on Nov. 2 the decoy ship "Kronprinz Wilhelm" was sunk in the latter area. On Nov. 17, two British light cruiser squadrons, supported by battlecruisers, attacked the German minesweepers and their covering force in the Bight. A long range action followed, the Germans retiring under smoke-screens to the minefields, when two battleships appeared in support and the British force withdrew. In this indecisive affair the light cruiser "Konigsberg" was heavily hit and one German outpost vessel was sunk and on the British side the light cruiser "Calypso" was hit and her captain killed. On Dec. 23 three destroyers escorting the Dutch convoy steamed into a German minefield off the Maas Lightship and were sunk in quick succession. The Grand Fleet suffered a heavy loss when the battleship "Vanguard," on July 9, was lost st Scapa Flow with nearly all hands, owing to an internal explosion.

At the end of the year Admiral Wemyss relieved Admiral Jellicoe as First Sea Lord and Vice-Admiral Keyes took over the command of the Dover Patrol, in succession to Vice-Admiral Sir Reginald Bacon.

The Baltic in 1917.—A few British submarines operated in the Baltic throughout the year, being employed mainly on reconnaissance work by the Russian Admiral. In October, after Riga was captured by the German Army, an attempt to open up the Gulf of Riga was made by the High Sea Fleet, and a military force was successfully landed on Osel Island. The Straits of Irben were swept but the battleships "Bayern." "Grosser Kurfiirst" and "Markgraf" all struck mines. The Russian battleship "Slava" was sunk but after three German battleships had been attacked by British submarines the naval force was withdrawn, leaving Osel Island in military occupation.

Mesopotamia, 1917.—After many months of preparation, General Maude commenced his advance up the Tigris in Feb. 1917. The army was supported by a flotilla of eight new river gunboats and a number of armed river steamers. Kut was retaken on Feb. 24 and in the heavy fighting that followed the

naval flotilla played a prominent part. The 6-inch and 4-inch guns of the gunboats did much to convert the Turkish retreat into a rout and the British flag was hoisted over Baghdad on March 11. (See MESOPOTAMIA, OPERATIONS IN.)

The Mediterranean, 1917.—Allied naval strategy was centred in the Adriatic during the year, for the French and Italian battle squadrons had to keep a watchful eye upon the Austrian dreadnoughts. But the enemy submarines and not the battleships became the dominating factor and, using the Austrian bases, they operated all over the Mediterranean. Their target was a vast one consisting of the great volume of trade to the East, swelled by troop and supply ships feeding the armies at Salonika (*q.v.*), in Egypt, in Syria (*q.v.*) and in Mesopotamia. The 40-mile Otranto Straits were too deep for mining and were patrolled by 50 British North Sea drifters, supported by British and Italian cruisers and destroyers. Stopping the passage of enemy submarine was a difficult task and the patrols were always open to sudden raids. On May 15 Austrian cruisers and destroyers descended upon the patrols and sank 14 drifters before they were chased back to Cattaro by the cruisers "Weymouth" and "Dartmouth." The latter ship was torpedoed during the action but did not sink.

Owing to separate commands in the different areas, difficulties arose in the co-ordination of the methods of protecting merchant ships from submarines and by the middle of the year the losses in the Mediterranean became very serious. In August a British commander-in-chief was appointed to Malta as the single authority responsible for trade protection in that sea. A convoy system was started, under the escort of British and Japanese destroyers and the toll of losses was gradually reduced. A further co-ordination of naval effort followed the meeting of the Allied Naval Council at Malta in November. During the year a British squadron of two battleships and a number of cruisers cruised in the Levant, watching the Dardanelles and co-operating with the Salonika force. On the Palestine coast, a flotilla of monitors, destroyers and gunboats took an active part in the battles of Gaza (*q.v.*), which led to the fall of Jerusalem (Nov. 11).

THE NORTH SEA AND CHANNEL 1918

During 1918 the mine became predominant as a counter to the submarine and a duel developed between the two weapons. The mine barrage in the Dover Straits was strengthened and with the patrol craft armed with every known anti-submarine device nine submarines were accounted for in that area during the early weeks of the year and it became evident to the German naval command that the passage of the Straits was virtually closed to them. They made two attempts to reopen the Straits. On Feb. 15 a destroyer flotilla raided the patrols at night, sank seven drifters and a trawler and escaped without being brought to action. On March 21 a similar raid was not so fortunate, the German flotilla being met by British destroyers. One German destroyer was rammed and cut in half by the "Botha," another was sunk by gunfire and the Germans were chased into Ostend. The "Botha" was torpedoed but reached Dover safely.

Zeebrugge and Ostend.—This proved to be the last German attempt upon the Straits, but as long as their bases at Zeebrugge and Ostend remained in being, raids were to be expected. As early as 1914, Jellicoe had proposed an attempt to block these places, but it was not until the last months of his time at the Admiralty that active steps were taken to put the plan into execution. Admiral Keyes was appointed to Dover to carry it out. After weeks of secret preparation, the mixed force selected sailed on the afternoon of April 22 to attempt to block the entrances at Zeebrugge and Ostend. (See BELGIAN COAST OPERATIONS.) The flotilla returned to Dover next morning, its mission at Zeebrugge accomplished. At Ostend the blockships failed to find the entrance, but this was remedied a fortnight later, when a volunteer crew took the "Vindictive," of Zeebrugge fame, into Ostend and sank her in the entrance. These two brilliant actions did not entirely block the Flanders Coast bases, but their moral influence was great and they acted as an added inducement to the German submarines to shun the waters of the Dover command and to confine their efforts to gain the open sea to surmounting the lesser perils of the northabout route.

Last Sortie of the German Fleet.—The Scandinavian convoy remained a bait for the High Sea Fleet and on April 23 it put to sea, for the last time in full strength, to try to intercept it. The date was an unfortunate one for the German enterprise for on that day both outward and homeward bound convoys were in the vicinity of the Forth. The British intelligence system, usually efficient, failed this time to warn Beatty that enemy were at sea and the German battlecruisers reached the Norwegian coast at Lat. 60 N. before they were reported. Here the "Moltke" broke down and had to be taken in tow. The German fleet made for home at its best speed; the "Moltke" was torpedoed by Submarine "E. 42" on her way south, but managed to reach her base.

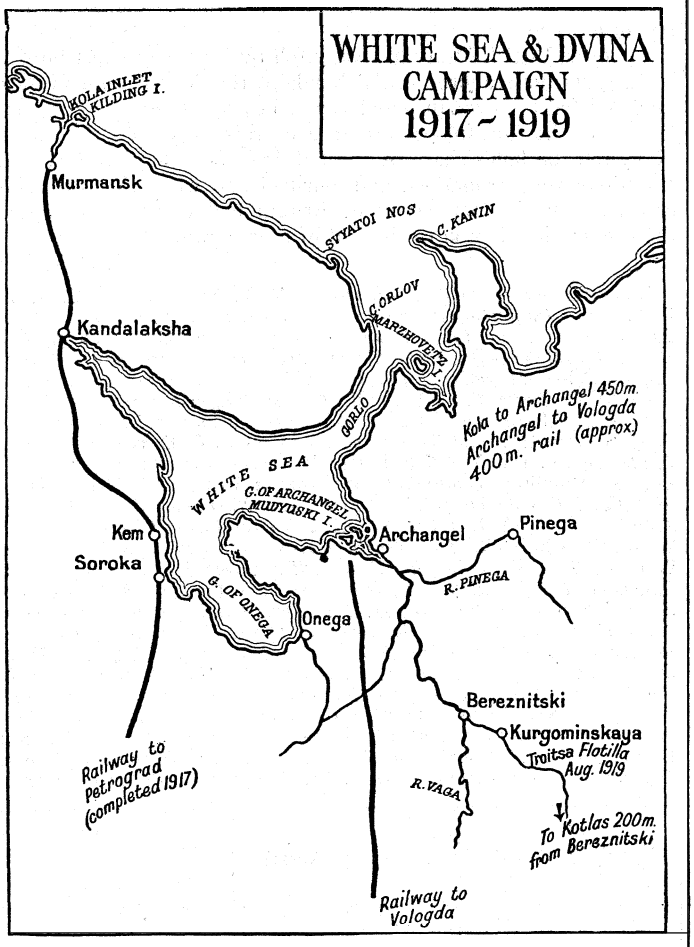
The Northern Barrage.—Frequent raids were made by the British cruisers and destroyers upon the flotillas engaged in clearing ways for the German submarines through the minefields and on April 15, during a raid into the Cattegat, 14 German trawlers were sunk. From the commencement of the British intensive mining policy in the autumn of 1917 until Feb. 1918 over 16,000 mines had been laid in the Heligoland Bight. On Feb. 15 a deep minefield was laid in the Cattegat and the following month saw the beginning of the greatest minelaying operation of the war, the laying of the Northern Barrage. (See MINES AND MINELAYING.) This vast undertaking, the closing by mines of the northern entrance to the North Sea from the Orkneys to the Norwegian coast, involved the laying of over 70,000 mines. The mines were made in the United States and were laid by British and American vessels, escorted by the squadrons of the Grand Fleet, with which for some time an American battle squadron had been working. The Northern Barrage was successful both as a moral deterrent and by the number of submarines destroyed in it.

The End of the Submarine Campaign.—By the middle of 1918 the mastery of the Allies over the submarine was in sight, both from the number destroyed and from the lessening toll they took of merchant ships. In the first nine months of the year over 60 submarines were sunk by the Allied naval forces: the average weekly loss of British merchant ships was over 17 in the first quarter of the year and by the third quarter this figure was reduced to under 11. During 1918, 1,108 submarine attacks were made upon British merchant ships; of these 581 were sunk and 527 escaped, a far higher percentage than hitherto. During 1918 only 8 British ships were lost by mines, a figure that attests the efficiency of the Auxiliary Patrol and Minesweeping services.

On July 19 a naval air raid, supported by the Grand Fleet, was made upon Tondern and a Zeppelin shed was destroyed. In another raid on August 11 made into the Heligoland Bight by cruisers and coastal motor boats, a Zeppelin was brought down and destroyed, but the motor boats suffered heavily from the enemy air craft. These proved to be the last two important operations of the Grand Fleet during the war.

The White Sea, 1918–19.—The closing of the Black Sea and the Baltic brought the northern route to Russia into prominence and vast quantities of munitions and fuel were, in 1917, sent to the ice free port of Murmansk (connected by rail to Petrograd in 1917) and to Archangel, which was open from July to October. When Russia collapsed in 1917 the old battleship "Glory" and the cruisers "Cochrane" and "Amiral Aube" (Fr.) were sent to Murmansk and were followed in May 1918 by the cruiser "Attentive," the seaplane carrier "Narana" and a force of 9,000 troops (2,100 British). The object of the expedition was to prevent Germany using these ports as submarine bases, to keep open supplies and give support to the anti-Bolshevik forces under Kolchak (*q.v.*). Archangel was occupied in August after a spirited duel between the "Attentive" aided by the Narana's seaplanes and the forts, and an advance was made along the railway towards Vologda and up the Dwina river towards Kotlas, the latter being supported by a flotilla, which included a British monitor and a number of local river steamers fitted out as gunboats and motor launches, mostly manned by British crews. Troitsa, 250 miles from Archangel, was occupied

in September, when the flotilla had to retire before the river began to freeze. In April 1919 a British flotilla, which eventually included 6 monitors, 6 river gunboats, minesweepers, and coastal motor boats, 15 seaplanes and a kite balloon, assisted in the attempt to advance to Kotlas, but Kolchak's effort failed and political influences caused the Allied Governments to order a withdrawal from North Russia. The flotilla successfully covered



the re-embarkation with the loss of two small monitors. By the end of Sept. 1919 the evacuation was complete.

The Baltic, 1918.—The British submarine flotilla, working under the orders of the Russian commander-in-chief, was stationed at Helsingfors during the winter of 1917–18. After the break-up of Russia, the Germans advanced upon Melsingfors, and on April 3, 1918, the flotilla of seven boats was taken to sea through the ice and sunk to avoid falling into the hands of the enemy.

The Mediterranean and Black Sea, 1918.—Early on the morning of Jan. 20, the "Goeben" and "Breslau" suddenly reappeared in the Mediterranean. Shadowed down the Dardanelles by two British destroyers, they made for Imbros Island, where they found the monitors "Raglan" and "M. 28" at anchor. The two British ships were soon set on fire and sunk but in rounding the south of the island the Germans met disaster. The "Breslau" struck a mine and sank and the "Goeben" shortly afterwards struck two mines in quick succession. In a sinking condition she crept back into the Straits and was beached in the Narrows. Continuous attacks upon her from the air failed to do material damage and a desperate attempt to torpedo her, made by "E. 14," resulted in the loss of the submarine. Eventually the "Goeben" was towed off and once more made her escape to Constantinople.

The loss of merchant tonnage on the congested traffic lanes of the Mediterranean remained severe and although the unified control of Trade Protection gradually reduced this loss the Mediterranean was one of the chief danger areas on the trade routes until the end of the war. The Otranto barrage, though a deterrent, was unable to close the passage to the German and Austrian submarines and its patrols were always open to sudden raids. On April 22 Austrian destroyers made a descent upon the patrols but were driven off and in June the Austrian dreadnought squadron at last moved out of Pola and sailed for Cattaro with the intention of attacking the barrage. The squadron was attacked by Italian torpedo boats, the dreadnought "Svent Istvan" was sunk, the attack was abandoned and the Austrians returned to Pola. On Oct. 31 the defences of that port were pierced by the Italian mosquito craft and the battleship "Viribus Unitis" was torpedoed and sunk. During the closing months of the war a flotilla of British monitors and small craft were employed on the northern shores of the Adriatic in co-operating with the flanks of the Italian Army in their final struggle with the Austrians.

The Black Sea.—Until the break up of Russia, sporadic fighting took place between the Turko-German naval forces and the Russian Black Sea fleet, in which the Russian dreadnoughts dominated the situation. After the mutiny of the Black Sea fleet, a danger arose that one or more of the battleships might fall into the hands of the Germans as potential fighting units. The Allied Aegean squadron was therefore strengthened in 1918 by 4 French battleships and 2 British dreadnoughts. It was one of the latter ("Superb") that on Nov. 12, 1918 led the Allied fleets up the Dardanelles and subsequently to Constantinople.

THE FINAL PHASE

As the months of 1918 drew on the menace of the submarine waxed less and less and during May, June and July over 600,000 American troops were safely carried across the Atlantic and landed in France. It was the beginning of the end. In August the German Western Front began to crack under the blows of the French and British armies: Austria was breaking up: September saw the Bulgarian front give way and, in October, Germany, racked by internal troubles, was forced to her knees.

Scheer, who had relinquished the command of the High Sea Fleet to von Hipper on being called to Headquarters in August as Chief of the Naval Staff, received orders late in September to be prepared to leave the Flanders Coast. In October the retirement began, hastened from the sea by the ships of the Dover Patrol. Ostend was clear of German troops on Oct. 17 and two days later they were in full retreat from Zeebrugge. Eighteen destroyers and torpedo boats escaped to the Eight but a number of submarines were left behind and blown up.

Mutiny in the German Fleet.—After its futile sortie in April the High Sea Fleet made no move and signs were not wanting that its fighting spirit had departed. As early as May 1917 there had been unrest amongst the personnel and outbreaks of mutiny occurred in the battleships "Westfalen," "Kaiser," "Kaiserin" and "Konig Albert." In the spring and early summer of 1918 further outbreaks called for stern repressive measures. The continued inactivity of the fleet and the withdrawal of the best of its personnel for service in the submarines and in the flotillas, so undermined its morale that when called upon to make a final effort it failed.

Scheer had planned a last raid into the Channel by the whole High Sea Fleet, whilst a concentration of submarines in the North Sea attacked the Grand Fleet on its way south. The submarines were recalled from their war upon commerce at the end of October and were stationed off the Scottish coast, but, when, on Oct. 29, the signal was made to prepare for sea, open mutiny broke out and the fleet refused to sail. From that moment the High Sea Fleet ceased to exist as a fighting machine and the war at sea was over. Most of the crews of the destroyer and submarine flotillas remained loyal until the end and one of the latter inflicted the last casualty of the war upon the British navy when, on Nov. 10, the old battleship "Britannia" was torpedoed off Cape Trafalgar.

The Armistice.—Under the terms of the Armistice, Germany agreed to surrender 10 battleships, 6 battlecruisers, 8 light cruisers, 50 destroyers and all submarines. These terms were enforced without delay and two scenes followed that will be forever memorable in the long sea history of Britain. On Nov. 20, Rear-Admiral Tyrwhitt, with the Harwich flotillas, met the surrendering submarines off the Essex coast and escorted them into Har-

wich. Slowly, the long line of 129 submarines passed into the harbour, watched, in dead silence, by great crowds on either shore. Thus was the greatest menace to Britain's sea power laid to rest. The next day, Nov. 21, Admiral Beatty with the Grand Fleet, met the German Fleet off the Firth of Forth. Between two long lines of British ships the High Sea Fleet steamed to its anchorage below the Forth Bridge and there, at sunset, the German flag was hauled down and was not hoisted again. Thus the proud fleet of Germany surrendered to its enemy, who for over four years had watched and thwarted its every move.

The Peace Terms.—In June 1919 the naval conditions of the Peace terms were signed. They were drastic and reduced Germany at a blow from the position of a great sea power to that of a minor one. The maximum strength of the German navy was fixed at 6 small battleships, 6 cruisers, 12 destroyers, 12 torpedo boats and no submarines, with a personnel not to exceed 15,000 officers and men.

Within two months of the signature, the remaining 8 dreadnoughts with 8 light cruisers and 92 of the latest destroyers and torpedo boats were surrendered, disarmed but with their guns on board, and, within one month, all submarines, either built or building, were either surrendered or broken up.

The disposal of this great array of ships became the subject of delicate discussion between the Allies. Great Britain wanted to destroy them all but France and others wished to add their share to their fleets. The question was partially settled by the Germans themselves, when on June 21, the fleet interned at Scapa Flow, was scuttled. There were at anchor in the war base of the Grand Fleet, 11 battleships, 5 battlecruisers, 8 light cruisers and a number of destroyers. At 10 A.M., by preconcerted signal, the crews opened the valves and the ships began to sink. Only four, the "Baden" (the latest battleship) and three light cruisers remained afloat. This act cost Germany dear, for she had to surrender in place of the battleships, 300,000 tons of floating docks, her remaining five light cruisers and 42,000 tons of floating cranes, etc., in lieu of the destroyers.

Comparative Naval Losses.—The warship losses of the powers engaged are shown in the following table.

		France	Italy	Japan	United States	Russia	Y	Austria	Germany	
									Losses	Surrendered
Dreadnoughts	2*	..	1*	1*	..	2*	..	2	..	18
Pre-dreadnoughts	11*	4	3	..	..	2	1	1	1	..
Battlecruisers	3	..	..	1*	..	..	..	..	1	6
Cruisers	13*	5	1	..	1	2	..	..	6	..
Light cruisers	12	..	2	2	..	..	1	3	17*	23
Destroyers	67	12	8	1	2	20	3	6	66	92†
Submarines	54	14	8	..	..	20	..	14**	199	All

*One lost by accidental internal explosion. †Also 50 of the newest torpedo boats.
**By the peace terms Austria was left without coast line and her navy ceased to exist.

In addition to those shown in the table, Great Britain lost 60 minor war vessels (torpedo boats, sloops, gunboats, monitors, coastal motor boats, etc.), her losses in this type being heavier in proportion than that of the other Allies. British losses of auxiliary vessels totalled 17 armed merchant cruisers and 828 other vessels. This latter figure included 288 colliers and oilers, 246 trawlers and 130 drifters. Submarines accounted for 35% of the loss amongst auxiliary vessels, 28% were sunk by mines and 9% were lost by wreck or fire.

Under the urgent stress of war, science brought about the rapid development of certain new weapons and new methods; the submarine and the mine and their countermeasures; the increased range of the great gun and in the power of explosives; the use of poison gas and the birth of aircraft as fighting machines. Reference to all these matters will be found elsewhere; they were common to all belligerents and did not alter the course of the war at sea. For, upon the sea, history was repeated. Like France and Spain in the wars of the 18th century, Germany found herself, at the outset, in the grip of the blockade of the British Fleet. Isolated from the world and cut off from oversea supplies, she attempted by her submerged blockade, like Napoleon with his Continental System (*q.v.*), to strike a vital blow at Britain's seaborne trade. Like the Continental System, the Submerged Blockade came near to success, but, in the end, under the steady pressure of the Allied navies, it failed. With supplies unlimited the wasteful struggles between the great armies might have been prolonged indefinitely, but with the Central Powers denied their wants by the Allied blockade at sea, whilst the Allied armies received their every need from overseas, there could be but one end.

Upon the British Merchant Navy fell by far the greatest burden of carrying the seaborne trade that kept the Allied armies in the field and fed the civilian populations; heavy indeed was the price it paid in the faithful performance of this duty. To the Royal Navy fell the lion's share of the fighting upon the sea: its great traditions were maintained and glorified and when the Armistice called a halt the two navies of Britain had once again carried the country in triumph to the end of a great war.

BIBLIOGRAPHY

The following list of books, carefully selected from several thousands on the subject, is designed to give the general reader the best information available in book form concerning the World War as regards both its main aspects and the events which were of most importance therein. An effort has also been made to give the names of at least one or two books relating to events in each of the minor theatres or sub-theatres of the War, and where controversial matter still exists references to books on both sides are given.

Books in foreign tongues have been confined to those in French, German and Italian. Where books in several volumes have been published at intervals, the date given is usually that of the last

volume to appear.

WORLD WAR II. On Sept. 1, 1939, the mighty wehrmacht of the third German reich smashed across the borders of neighbouring Poland, and thus began the costliest, bloodiest, most colossal war in the history of man. Whereas the land and air fighting of World War I had been confined largely to the continent of Europe, the second World War embraced all the continents but one — South America; North America became involved in the Aleutians. Almost the whole of Europe was enslaved. Everywhere, even in small neutral countries, men and women were forced to adjust their lives to the hardship and suffering of total war.

Although the war officially began with the invasion of Poland, its roots can be traced back more than 20 years previously. Moreover, it must also be considered that hostilities actually began in 1931, with the Japanese invasion of Manchuria. From what was later known, it became evident that the Japanese conquests in Asia, the Italian invasion of Ethiopia, the Spanish Civil War, were all opening'skirmishes in the tremendous world-wide conflict that began in 1939.

All of these warlike actions followed a logical progression of first, a disregard for treaty obligations, and later, open violation of existing pacts. In each case, the aggression was unopposed by military action on the part of the principal powers. Thus, by a series of retreats before force, the peace-loving world plunged itself into the conflict.

I. CAUSES AND EVENTS LEADING UP TO WAR

The great Eurasian land mass, in the period between World War I and World War II, was a continent seething with hatred and unrest, springing mainly from economic views based on the

"haves and have nots" theory, as well as from racial jealousies and dislocations following World War I. It did not take long for the flame of hope which fired the vision of man after the treaty of Versailles to subside. In Asia, a disunited China fought endless civil wars, piteously bleeding itself to a point where it proved an easy target for the depredations of the Japanese in 1931.

In Europe, the communist revolution in Russia continued for

years to destroy lives and rent the unity of that sprawling country of 172,000,000 souls. England and France, exhausted and sick of war, settled back into a shell of complacency to enjoy for a while the material fruits of the peace they thought they had won. Want and suffering stalked the Balkans and central Europe. Before long, economic depression and social unrest gripped the entire continent. With the rise to power of Benito Mussolini in Italy, and Adolf Hitler in Germany, the stage was set for the enactment of man's greatest tragedy.

Hitler, Appeasement and Munich.—Europe, since the Treaty of Westphalia in 1647, was built upon a precarious keystone known as "the balance of power." To all intents and purposes, the "balance of power" was eliminated when, in 1871, Bismarck united the Germanic peoples under the first reich, and established Germany as a dominant power in Europe. The Treaty of Versailles with its system of guarantees and collective security was an attempt to restore the old theory of "balance of power" in modern dress. The aim of Adolf Hitler and the nazi party was to restore the Bismarckian theory and once again establish Germany as supreme on the continent of Europe.

These two opposing theories clashed in the period leading up to the Munich agreement. The Bismarckian theory, backed by the weight of overwhelming military force, won.

The march of events was rapid. In 1933, when Hitler was appointed chancellor by the aging Von Hindenburg, he quickly succeeded in uniting the German people and moulding them to his purpose. By 1936, the third reich had amassed enough strength to break with the tottering League of Nations and force the annulment of the Treaty of Locarno. Germany and satellite Italy were preparing for war. Even at this time, they had a tremendous military advantage over the other countries of Europe who were still clinging desperately to the hope of peace.

In 1937, Neville Chamberlain succeeded Stanley Baldwin as prime minister of Great Britain. In him was dramatized the tragic policy known as "appeasement." Appeasement was based upon two principles: (1) that the Treaty of Versailles was unjust in its treatment of Germany and Italy, and (2) that if these wrongs were rectified, Germany and Italy would re-enter the League of Nations and resume co-operation with a peaceful Europe. This policy was backed by the public opinion of Britain and France. The people of these countries dreaded another war, and reached out eagerly toward what Chamberlain described as "peace in our time."

Crisis came in Sept. 1938. Germany, after careful preparation, demanded incorporation into the reich of the Teutonic Sudetenland area of Czechoslovakia. The independence of Czechoslovakia —a new nation carved out of Austria-Hungary by the Treaty of Versailles—was guaranteed by pacts with France, and indirectly, Britain, The burning question was: Should the postwar system of collective security be abolished in favour of appeasement?

Czechoslovakia was strong and well armed, a potential "dagger pointed at the heart of Germany." To strip it of the Sudetenland would be to strip it of its defenses, its war industries, its power to resist. The granting of Hitler's demands would mean the loss to Britain and France of a powerful ally on Germany's exposed southeastern flank. Nevertheless, the policy of appeasement won out. Rather than risk war, Chamberlain, in a sudden, dramatic move, communicated with Reichsfuehrer Hitler at Berchtesgaden and Godesberg. Then he flew to meet with Hitler, Mussolini and Premier Daladier of France, at the historic Munich conference. On Sept. 9, 1938, an agreement was signed. The vital Sudetenland areas of Czechoslovakia were sacrificed. In return, Chamberlain came home with an agreement with Hitler that neither side wanted war, and that Germany and Britain would settle all future questions by consultation rather than by military action. This was Chamberlain's "peace in our time."

The Retreat from Munich.—For a brief, fleeting period, the Allied peoples clung to the shaky belief that Hitler was now satisfied, that he had "no further territorial ambitions in Europe," that he was now going to let them go their way in peace. All this was shattered in five days' time—less than six months later.

On March 10, 1939, sudden revolt flared in Slovakia against the Czechoslovak government in Prague. On March 13, thousands of German troops moved into position along the now defenseless borders of Czechoslovakia. On March 14, Czech President Hacha was summoned to Berlin to confer with Reichsfuehrer Hitler. On March 15, Hacha issued a statement placing all of Czechoslovakia under the "protection" of Germany.

Three hours later, Hitler was in Prague.

For the shocked democratic peoples, the dream was over. Illusion was blasted by realization. Germany's plan was more than merely uniting the Germanic peoples. The Czechs were not Teutons. Germany's plan was imperialism and conquest. The nazi hymn, "Today Germany Is Ours; Tomorrow the Whole World," suddenly rang in the ears of the people of Britain and France with more meaning than ever before.

Overnight, "appeasement" became a word despised—a symbol of weakness and failure. Frantically, the democracies began preparations for a war which had already been stalking them for eight years, disguised in a cloak of peace. Appeasement was dead, but the poisons engendered by appeasement still coursed in the veins of the democracies. Britain introduced a limited form of conscription. Plans were drawn up for a partially mechanized army of 19 divisions or 300,000 men. Naval and aeroplane construction was rushed. War orders were placed in the United States. Industrial armament production was speeded up.

In France, the social reforms instituted by the popular front government were revised. Everything, however, was limited because of a peculiar, comforting assurance built up by four years of defensive warfare in World War I, that the defense was supreme in modern conflict, and that behind the indestructible barrier of the Maginot line the democracies could fight a successful limited defensive war for years.

It took the bitter, tragic lesson of 1940 to teach the democracies that there was no such thing as limited war when the enemy was prepared for total war. For France, the lesson came too late.

The War of Nerves.—After Prague, Europe entered on a period characterized by frantic diplomatic jockeying on both sides. For Britain and France, it was an attempt to muster the maximum amount of Allied strength for the coming struggle. For Germany and Italy, it was an attempt to weaken that growing strength, and to strike at the morale and the will to resist of the democratic peoples.

France reaffirmed her alliance with Poland, Britain broke with traditional aloofness toward eastern Europe and signed mutual assistance pacts with Poland and Turkey. Britain also made formal guarantees of the independence of Greece and Rumania. France joined in these commitments. All this was an effort to create a bloc of small, powerful nations, to surround Germany with a periphery of steel and limit further German aggression.

On their own part the axis powers launched an Italian invasion

of Albania, adjoining Greece, on Good Friday. 1939. In addition they kept worrying the great Polish touchstone.

Poland came into the news as early as March 24, 1939, just nine days after the German entry into Prague. On that date Hitler made formal demands on Poland, which he designated as an attempt to bring to an end the oscillation in the relations between Germany and Poland. These demands included the return to Germany of the free city of Danzig, and the right to construct across the Polish Corridor a military highway and railroad between Germany proper and East Prussia. In return, Hitler promised Poland a free zone in Danzig, and a 25-year nonaggression pact which would guarantee the new Polish boundaries as permanent.

Poland, remembering similar promises made to Czechoslovakia and strengthened by the assurances of Britain and France, consistently refused these demands. In the meantime, to back up their nonaggression front with force, Britain and France turned to the one European power which possessed an army capable of challenging Germany on the eastern front. That power was soviet Russia.

In April 1939, the British and French opened negotiations with the soviet government. For months the negotiations dragged on. From day to day it seemed that an agreement was about to be reached, but always some new point arose to delay the settlement. It was reported that Russia demanded a free hand in the Baltic in return for joining the nonaggression front. On the other hand, the Russians were obviously wary of committing themselves, for three reasons: (1) The failure of the Allies to include Russia in the Munich conference; (2) scepticism over the desire and ability of Britain and France to wage war against Germany; and (3) complete disgust at the snail-paced, blundering methods of Chamberlain and the other Allied statesmen, as compared with the lightning axis diplomatic moves.

All this, it must be remembered, was in addition to the traditional Russian reluctance to wage offensive war. The principal Russian objective was to push its own frontiers as far as possible to the west, as a more and more impregnable defensive barrier. War, at this time, on the side of Britain, would not serve this purpose.

Suddenly, without warning, came the blow which shocked the civilized world—the German-soviet nonaggression pact. The announcement came on Aug. 23, 1939, while the Anglo-French-soviet discussions were still in progress. The pact included (1) an agreement, covering a period of ten years, that each country would refrain from acts of aggression against the other, either alone or in combination with other nations; (2) an agreement to consult regarding common interests; and (3) an agreement to adjust by peaceful means any conflicts which might arise between them.

Two days earlier, a betting commissioner would have offered odds of 10,000 to 1 against a *rapprochement* between naziism and its sworn archenemy, communism. Yet, there it was. The Allies had suffered crushing diplomatic defeat. The nonaggression front was irreparably broken. The German-soviet pact was all that Hitler needed to assure him freedom of action. Her eastern flank secured, her enemies in the west weak and bewildered, Germany was now ready to strike.

After a week of intensification of the demands on Poland, plus a vicious propaganda campaign of hate against the Polish people, the German war machine moved across the Polish border at dawn on Sept. 1, 1939. Two days later, Britain and France declared war.

Europe was in flames.

II. THE POLISH CAMPAIGN

The nations taking part in this opening campaign of World War II were Germany, Poland and Russia. Except for ineffective minor Polish cavalry forays into East Prussia, the entire action was fought on Polish soil. The campaign obviously had been well prepared by the German high command, and represented an almost perfect co-ordination of all arms and branches of the service. Even the weather co-operated, as the German tanks rolled forward irresistibly across the hot, dry Polish plains. The military strength developed by Germany in the few years of Hitler dictatorship became evident. The mass of aeroplanes, tanks and armoured units unveiled in the campaign seemed incredible, in view of the supposed shortage of raw materials. The development of air and armoured forces and their tactical employment opened new fields for military thought, and demonstrated the German conception of "lightning war" (blitzkrieg).

Thirty-five days after the opening gun had been fired, Polish resistance was crushed. The Polish campaign will go down in military annals as one of the most brilliant triumphs in the history of German arms.

Objectives.—The primary objective of the German high command was the total destruction of the Polish army. The rapid elimination of Poland as a military factor in the east was considered absolutely necessary, before the Allies could organize sufficiently to bring dangerous pressure to bear in the west. To accomplish this objective all available man power and matériel were hurled into a series of tremendous annihilating drives.

The Polish objective appears to have been a delaying action along the western border while mobilizing her full strength, hoping to hold Germany until Allied pressure in the west and Allied naval action in the north could divert the main German strength to other areas.

Plans.—The German scheme of manoeuvre was a simple double envelopment to be effected by two major groups of armies. The first group, striking from the southwest, was to drive northeast toward Warsaw. The second group, striking from Pomerania and East Prussia, was to drive south toward Warsaw. Thus, the two forces would meet at the Polish capital in a gigantic pincers movement, cutting off all Polish units between Warsaw and the German border and destroying them. The air force was to disrupt Polish mobilization and assist in the advance of the two army groups. Ground action was to be paced by rapid penetration by the armoured forces.

The Polish plan appears to have been a gradual withdrawal from the frontier areas, using covering forces which were to fall back slowly to a strong defense line based on the Vistula-Narew-Bug-San river valleys. This was nothing more than a delaying action, to cover mobilization, in the first phase of the defense scheme. The second phase of Polish defense was to be main resistance on the river line by all available units. Evidently the Poles were counting on the gradual employment of reserves from the eastern part of the country, and the effectiveness of Allied action on Germany's west flank. However, German air action and the rapid advance of the German ground forces, effectively prevented the second phase of the Polish defense scheme from ever taking form.

Forces.—At the outbreak of war, it was estimated that the Germans had close to 1,350,000 men mobilized, including 90 infantry divisions and 9 armoured divisions. By far the greater part of this strength was concentrated on the Polish border, under the command of Col. Gen. Walther Von Brauchitsch. Available for action on the eastern front, the Germans had four air fleets and two special air commands totalling about 6,500 first-line craft in all. German naval superiority in the Baltic was preponderant but took very little part in the campaign. All equipment was new, excellent and well tested in the Spanish Civil War. Commanding the southern group of armies was Col. Gen. Karl Rudolf Gerd von Rundstedt. Col. Gen. Fedor von Bock was the commander in the north. Marshal Hermann Goering commanded the air forces.

The Polish army never had time to complete its mobilization. During the campaign, Poland was unable to place more than 500,000 men in the field. This figure included 30 infantry divisions, 1 cavalry division, 11 separate cavalry brigades, 12 regiments of heavy artillery and 1 partially organized armoured division. There were virtually no modern tanks, and a pronounced weakness in heavy artillery, antitank and antiaircraft guns. Other equipment ranged from fair to poor, with the exception of that of the cavalry units. The air force totalled no more than 800 planes, many of them obsolete. The Polish commander in chief was Marshal Edward Smigly-Rydz. Gen. Bortnowski commanded the northern

army group, Gen. Kutrzeba and Gen. Rommel the central group, and Gen. Casimir Sosnkowski the southern group.

Operations.—Hostilities began at 5:45 A.M., Sept. 1, 1939. Simultaneously, strong German forces struck across the border from Pomerania, East Prussia, Bohemia, Moravia and Slovakia. On the north, the Pomeranian army crossed the Polish frontier at Chojnice, and struck out in the direction of Chelmno and the Vistula river, where it made a junction with the German army advancing south from East Prussia. The Polish commander, Gen. Bortnowski, fought successive actions on the Netze, Brahe and Vistula river lines, but finally was forced to retire beyond the Vistula. For a while the East Prussian army had been halted by stubborn Polish resistance, but by the end of the first week, Danzig and the entire northwestern corner of Poland was in German hands. German forces were already in the vicinity of Warsaw, though slowed by prepared Polish defenses.

In the meantime, von Bock's southern armies struck across the frontier at three points, and with amazing speed smashed through the Jablonica pass. By Sept. 2, von Bock was in the vicinity of Teschen. In rapid succession, Czenstochowa, Kattowitz and Cracow, the principal southern city, were occupied. German mechanized spearheads ranged far ahead of the main forces, disorganizing Polish resistance with the bewildering rapidity of their advances. These mechanized forces were reported at Kielce on Sept. 5, at Piotrkow on Sept. 6, and north and west of Lodz on the 7th. In addition, they were operating far to the north against Polish units retreating from Posen. More than anything else, the quick-striking armoured columns hastened the crumbling of Polish resistance. By the end of the first week of war, the southern group of armies was in a position to commence joint action with the northern group, against the Polish forces defending Warsaw.

Everything favoured the Germans. The weather was hot and dry, enabling the German mechanized forces to sweep irresistibly across the flat terrain. The Poles bravely but foolishly resorted to combat on open grcund, rather than withdrawing to a position defense on the Vistula river line. The Germans never lost the initiative. They adhered to their timetable of conquest with remarkable accuracy.

Another crushing factor was the German air force. In the air, the German purpose was threefold: (1) to destroy Polish communications, thus disrupting troop and supply movements and preventing mobilization; (2) to destroy Polish air power; and (3) to destroy Polish industry and other military objectives behind the lines. In four days, practically all of these objectives were accomplished. By Sept. 2, the few main highways and north-south rail lines had been knocked out. By Sept. 3, Polish air bases had been eliminated and the Polish air force blasted from the skies. By Sept. 4, Polish factories as far to the east as Lwow were blazing from German bomb hits. Warsaw and the other leading Polish cities were methodically being pounded into ruins.

In the second week of the campaign, the Polish forces under Generals Kutrzeba and Bortnowski launched a counterattack against the left flank of the German southern army group. This mas an obvious attempt to gain time to prepare for a defense of Warsaw. It succeeded in halting the Germans only temporarily, however. In the south, Sandomierz, at the junction of the San and Vistula rivers, was taken. In the north, Gen. von Keuchler's East Prussian army swung eastward and on Sept. 10, crossed the Narew river. The Poles fell back for the defense of Warsaw. The northern and southern German army groups were now joined. The main Polish forces were virtually surrounded and cut off from hope of reinforcement and supplies. All communication lines had been wrecked by the effective work of the German Luftwaffe.

The Poles, however, were still counting on a heroic resistance around Warsaw and a retreat to the favourable defensive terrain of the marshy, mountainous eastern section—when the fatal blow struck. A Russian invasion force crossed the eastern Polish frontier. This sealed the doom of the Polish armies. Polish will to resist was crushed. On Sept. 18, Russian and German forces met at Brest-Litovsk. Warsaw bravely withstood a destructive siege until Sept. 27. The fortress of Modlin fell one day later. On Oct. 5, all resistance ceased when the city of Lublin capitulated to the Germans. The campaign was over. Europe had had its first taste of blitzkrieg.

Summary.—The German campaign in Poland was unquestionably one of the most brilliant of all time. It was characterized by long and careful planning, perfect co-ordination of all arms and branches of the service and exceptional espionage and sabotage activity behind the enemy lines. In less than 15 days of serious fighting, the Germans had wiped out a nation almost equal to itself in size. About 700,000 Polish prisoners were taken, in addition to 40,000 horses, 1,600 guns, 8,000 machine guns and a quantity of other valuable equipment. Practically the entire Polish air force of 800 planes was destroyed. Against this, the German losses, as announced by Reichsfuehrer Hitler on Oct. 6, were 10,572 dead, 30,322 wounded and 3,400 missing.

From a military point of view, the rapid Polish defeat was attributable to three main factors: (1) the failure of the strong central Polish forces to launch an offensive into Germany or against the flanks of the advancing German armies; (2) the failure of this same central Polish army to withdraw, in time, to the Vistula-Narew-Bug-San river line, thereby allowing itself to be virtually surrounded; and (3) lack of Allied support.

The primary German objectives were thus accomplished in the briefest major campaign the world had yet seen. The Polish army was destroyed. The Polish nation had lost its identity. The eastern front had been liquidated. With the annexation of eastern Poland, Russia apparently was satisfied. Germany was now free to turn its attention to the west.

As for Poland, its soldiers fought bravely and well. The siege of Warsaw was an epic of human courage and endurance. The Polish leadership, however, was not equal to the ability of its soldiers and its people. The Polish army command made one mistake after another, first, in overestimating its own strength and in underestimating the strength of the enemy; second, in trying to defend the open border regions instead of falling back in time to the strong river defense line; and third, in completely neglecting the time element and the blistering pace at which the German mar machine was geared to operate. Poland was out of the war before Poland had even organized to fight.

III. THE "PHONY WAR" PHASE
(Sept. 3, 1939–May 10, 1940)

The Western Front.—On Sept. 3, 1939, two days after the German invasion of Poland, Britain and France declared war on Germany. For the 35 days of the Polish campaign, and for approximately eight months afterward, the western front settled down to a period of strange, unbroken quiet. It was during this period that the defensive theory flourished more than ever before, and fattened the complacency and limited-war complex of Britain and France. It was also during this period that newspapers and statesmen the world over took to calling World War II the "phony war" and "sitzkrieg."

Indeed it was strange. The two mightiest systems of fortifications ever developed faced each other across the length of the Franco-German frontier. For miles back from the border, the Maginot line of the French and the Westwall of the Germans (also called the Siegfried or Limes line) bristled with supposedly impregnable, concrete and steel casemates. In the Maginot line, the French had concentrated the cream of their fortress troops, heavily reinforced by regular army units. In the Westwall, the Germans used landwehr, or fortress troops, plus battle-tried veterans thrown in after the victorious Polish campaign. Both lines were armed with the most destructive weapons ever devised. Yet for nine months nothing happened. Not a single major engagement developed along the entire frontier. Night after night. patrols clashed in the no man's land between the two systems of fortifications. Minor actions flared in the Saar valley, along the Moselle, through the Bienwald forest, and around the towns of Saarbrucken, Sierck, Bliescastel, Perl and Wissembourg. But that was all. The communiqués became a monotonous repetition. Each day it was "no activity," "usual inactivity," or "nothing to report."

And so it went throughout the winter and early spring of 1939-1940. Little by little, the war faded from the front pages of the newspapers. Only the war at sea attracted attention and, at the end of November, the conflict between Russia and Finland came to the fore.

The Finnish-Russian Winter War.—This was an unexpected struggle which appeared to be wholly unrelated to the major conflict in western Europe. Later evidence proved to the contrary, but at the time, the action was characterized as a simple, clear-cut act of aggression by soviet Russia against its small northern neighbour.

After the partition of Poland, Russia had forced nonaggression pacts on the three Baltic states, Lithuania, Latvia and Estonia. In effect, these nonaggression pacts amounted to the incorporation of the little countries into the soviet union, a development which actually took place several months later. At the time, it appeared as if Russia had taken this action in accordance with secret clauses of the German-soviet nonaggression pact of Aug. 23, 1939. Now we know differently. The Russian people were exercising their implacable defensive instinct, making a tremendous effort to extend their defensive frontiers as far as possible against the one enemy they knew could menace them, Germany. The "realists in the Kremlin" foresaw the startling events of 1941 and, although their methods wcrc tinged with cruelty, evidently they were providing for the defense of their homeland, which they knew someday had to come.

On Oct. 7, 1939, the soviet government made demands on Finland, similar to those made on the Baltic countries. Specifically, Russia wanted certain islands in the Gulf of Finland as a protecting screen for the great Russian naval base at Kronstadt, a foothold at Hangoe on the southern coast of Finland and cessions of territory which would strengthen the vulnerable defenses of Leningrad.

Negotiations proceeded in deadlock until Nov. 30, 1939, when the Russians opened hostilities by bombing the Finnish capital. Helsinki. This was the beginning of a terrible winter campaign, fraught with suffering for both sides, and fought at times in temperatures of nearly 60° below zero. Finland had a total of 330,000 men to throw into the struggle against an overwhelming estimate of 450,000 first-line troops plus considerable reserves for the Russians. In addition, the small Finnish air force and navy were no match for the soviets. The Finns. however, had the advantages of well-organized interior communication lines, and an easily defensible terrain consisting of marshes, lakes and trackless forests, reinforced by a strong system of defense works in the south known as the Mannerheim line.

At first, the Russians made easy inroads from Kandalaksha, Murmansk and Kem, advancing by sheer weight of numbers. Then it became evident that although a well-planned Russian battle campaign had been drawn up by an efficient general staff, the plan was being carried into operation by another, greatly inferior Russian general staff. The Finns fought valiantly and skilfully, with utter disregard for the numerical superiority of the enemy. During December, their highly mobile forces won a series of spectacular victories over the Russians. On Dec. 12, it became apparent that the Finnish 2nd corps had inflicted a severe defeat on Russian forces attempting to flank the Mannerheim line north of Lake Ladoga. On Dec. 19, a ski-mounted division of the Finnish 1st corps threw the Russians back in an engagement which came to be known as the battle of Salla. On December 21, the most impressive victory of all was scored when one division of the Finnish 2nd corps smashed a strong Russian column which had advanced as far as Suomussalmi in a drive across the narrowest part of Finland to the Gulf of Bothnia.

Through the month of Jan. 1940, the Finns continued to score local successes and hold the Russians at bay. The main Russian effort was directed at the Mannerheim line. In the air, Russian bombing planes inflicted heavy damage on towns and bases in south Finland. The Finns, however, were winning the campaign and their heroic efforts attracted the sympathy and admiration of the entire world.

Then, toward the end of Jan. 1940, a great change became apparent in the Russian conduct of the campaign. General Gregory M. Stern. was recalled from his post in the far east and put in charge of operations. Fresh, well-equipped Russian troops made their appearance on the fighting fronts. Air attacks were now concentrated on communication lines and military objectives, instead of cities. But most important of all, there was a complete change in Russian tactics. Instead of spreading out along the whole front, the full weight of the Russian attack was hurled at the Mannerheim line. Enormous concentrations of fire and heavy aerial bombardment were laid down on the fortifications. Constant attacks were made by a combination of mechanized forces and infantry, which punched holes in the defenses and spread out fanwise to take other positions from the rear. This was blitzkrieg in the German style. In less than six weeks, it had broken the back of the Finnish resistance.

An armistice, with Germany as the intermediary, was signed on March 13, 1940. The terms of the peace gave Russia everything it had asked for—and more. The entire Karelian isthmus, including the fortified zone and the city of Viipuri, passed into Russian hands. A strip of territory north of Lake Ladoga was granted to the Russians, together with a long-term lease on the Hangoe naval base. In addition, the Russians obtained rights of passage across the Petsamo district and an agreement to construct a railroad across Finland, connecting the Leningrad-Murmansk line with the Gulf of Bothnia.

Thus ended a campaign which was the most puzzling of the war. For more than a year and a half after hostilities had ceased, the world was still asking itself questions. Why had Russia attacked Finland? Was it merely to keep up with the pace of aggression set by co-partner Germany? Why had Russia risked prestige by waging war in midwinter, using inferior troops? Was Germany with Russia, or against Russia? Why had Hitler allowed this campaign? Why did Hitler act as an intermediary in the peace negotiations and hold off the Allies from sending aid to Finland?

These questions were answered in part eighteen months later—when Hitler's legions again struck to the east.

IV. PRELUDE TO THE STORM

Western Europe, in the meantime, mas going through the last stages of lassitude in the so-called "phony war" phase. After the interesting but distant furor of the Russian-Finnish War had died away, Britain and France settled back again to a period of waiting. The theory that time was working on their side was still supreme in the minds of the democratic leaders. They still believed that Hitler could not win a long war, that he had to risk everything in one all-out attack and that the defensive magnificence of the Maginot line and the Belgian fortifications could shatter anything Hitler could throw against it.

One thing the democratic leaders did not take into consideration was the effect that this psychology would have on their people. Actually, Hitler, the great master of mass psychology, had much more efficiently prepared the morale and economy of the German people for a long war. For Germany, the change-over from peace to war involved no more than a minor increase in previous conditions and restrictions. On the other hand, the economies of Britain and France were totally disrupted by the war. Men were torn away from their civilian occupations to serve in the armed forces of their nations. They wanted action—to tackle an unpleasant job, to finish it off as quickly as possible and then to go home. Instead, they were put to work building fortifications and digging ditches. The same thing happened at home. Instead of the terrible bombing of cities they had been taught to expect, the people went through night after night of uneventful, irksome blackout. The people of Britain and France had finally been aroused—but there was nothing for them to do. Before long, both nations were caught in that deadly psychological vise known as boredom!

It was during this period that powerful peace efforts began to sweep Europe. Obviously these efforts were German-inspired. At that time, nothing would have suited Hitler's purpose more than a negotiated peace based on his rapid conquest of Poland. To all

intents and purposes, such a negotiated peace would have been tantamount to a military victory. In connection with this, certain American and Allied leaders expressed interest in moves to bring the conflict to an end. All such efforts failed, however, principally because the British and French peoples were sufficiently aroused to demand the final destruction of Hitlerism and its constant threat to their security and happiness.

Suddenly, toward the end oi March. there were signs that the calm was about to be broken. Observers noted that great decisions were being made inside Germany. Rumours grew that the Allies were going to take action to stop the passage of iron ore from Norway to Germany. In France, the Daladier government gave way to the more vigorous government of Paul Reynaud. On March 18, 1940, the world was stirred by the announcement of the first Hitler-Mussolini conference at the Brenner pass. On March 25, the British destroyer '(Cossack" violated Norwegian territorial waters and rescued several hundred British merchant seamen from the German prison ship "Altmark." On April 7, the British began laying mines inside the Norwegian three-mile limit. "What does it all mean?" the world asked. A few days later the world knew.

V. THE NORWEGIAN CAMPAIGN
(April 9, 1940-June 10, 1940)

Striking with all the savage ferocity that characterized the Polish campaign, the German war machine launched an offensive against neutral Denmark and Norway at dawn on April 9, 1940. By midafternoon of the same day, all of Denmark had been occupied, and the government of that country had capitulated to the Germans. Denmark merely served as a springboard to the north. The main action of this campaign was fought in Norway, with German, British, Norwegian and some French forces taking part.

Objectives.—In the popular mind, the principal issue of this campaign was the control of the iron ore route from Narvik, in northern Norway. This was an outstanding factor, but actually the stakes were much higher. First and foremost, the entire action was a test of Allied war strength, a probing finger put out by the German high command to determine the extent to which the Allies were prepared to fight total, dynamic war in the west. Secondary German objectives were (1) to prevent the Allies from seizing Scandinavia as a base from which to attack north Germany, and (2) to secure air and submarine bases for themselves, as near as possible to Britain and the vital Allied shipping lanes.

The Allied objectives are not immediately clear. Perhaps Britain was contemplating the seizure of Norway for operations against Germany, but certainly when the Germans attacked, the plan was far from the point of execution. Once the action began, the Allied objective appears to have been one of defense—to hold as much of Norway as possible against the time when future offensive operations could be undertaken.

Plans.—The German plan of action was a brilliant combination of intrigue and military astuteness. The Norwegian government and population had been sown with German agents and Norwegian traitors. It was even reported that Germans who had been taken into Norwegian homes during the evacuation of children in World War I were sent back to Nonvay for "fifth column" activity. Weeks before the campaign began, merchant ships with holds crowded with German soldiers were sent into Norwegian ports. Corrupt Norwegian officials had been bribed and promised high positions in the "new order." At the zero hour, all these forces were to strike at once, seizing the main cities and military objectives, and holding beach-heads for the landing of heavy seaborne and air-borne reinforcements from Germany. The full force of the German *Luftwaffe* was to be thrown into the air over the Skagerrak to clear a water passage for German troop transports, and to counter British naval superiority in the narrow straits.

The British plan of action was limited by the elements of surprise and unpreparedness. It included immediate naval and air operations to hamper the German occupation, and the landing of expeditionary forces on the Norwegian coast. The plan appears to have envisaged a junction with the Norwegian army in a joint effort to wipe out the German landing parties, while the royal navy and air force cut off reinforcements and supplies from Germany. Apparently the British were planning to outfit Narvik, the great iron ore port, as a landing base for a British expeditionary force.

Forces.—In the first week of the campaign, the Germans used no more than 25,000 men to effect landings and seize control of the nerve centres of the country. Later, these units were reinforced until they totalled more than 100,000. The German equipment was excellent. They were able to land heavy artillery, mortars, antiaircraft guns, even a considerable amount of mechanized equipment. Perhaps the greatest factor in the campaign, however, was the overwhelming air superiority available to the Germans. Every air base in Norway was in their hands. From these, and auxiliary bases in Denmark and northern Germany, probably two full air fleets were employed in the action.

It is doubtful if the Norwegians were ever able to mobilize more than 30,000 men, most of whom were stationed in the less-important, far northern sectors. The British, moreover, landed forces totalling only 12,000 men. The Nonvegian equipment was poor and obsolete. Because of the German air superiority, the British were unable to get heavy artillery or mechanized equipment ashore, and their own scattered air units were forced to operate from improvised landing fields or from bases in Scotland, across the North sea. As David Lloyd George characterized it, this was the first tragic example of the Allies fighting a campaign with "too little and too late."

Operations.—The Germans struck in the early dawn of Tuesday, April 9, 1940. While Denmark was being occupied, simultaneous actions flared up and down the length of the long Norwegian coast. Oslo, the capital, was taken in one day. German warships slipped into Oslo fjord, German planes flew over the city and German troops poured from the holds of innocent-looking merchant vessels which had been moored in the harbour. Norwegian coastal batteries opened up, sinking the German cruiser "Karlsruhe" and severely damaging the cruiser "Bluecher," which sank later after hitting a mine. This was the only serious resistance. In a few hours the city flew the nazi flag.

The same thing happened at Bergen, Trondhjem, Stavanger and Narvik, the other principal cities. Sabotage, espionage and treachery worked with marvellous efficiency. The Norwegian army was racked by confusion. Orders were bungled. Officers surrendered their troops without fighting. All communication lines were in German hands. With methodical precision, the Germans seized every military establishment in the country.

There were reports of naval engagements in the Atlantic, the North sea and the Skagerrak; and the Allies claimed the sinking of several German troop transports. In a clash between the 32,-ooo-ton British battle cruiser "Renown" and the 26,000-ton German battleship "Scharnhorst," the "Scharnhorst" was damaged, but escaped behind a smoke screen. At Narvik, an indecisive engagement took place between British and German destroyer flotillas.

At the end of the first week, the British landed expeditionary forces at Andalsnes and Namsos in central Norway, and at Karvik in the north. Small forces of French Alpine troops were included in this force. The Allies made a valiant attempt to push inland and join the Norwegian army in engaging the Germans. The cause, however, was hopeless—made so by the overwhelming German air superiority. British warships had been forced to withdraw from the narrow waters of the Skaggerak. German reinforcements were pouring into the country by the tens of thousands. The *Luftwaffe* effectively prevented the landing of Allied reinforcements and heavy equipment. As a result, on May 3, 1940, Allied troops withdrew and left south and central Norway to the invader. The British continued operations at Narvik for more than a month. A destroyer squadron, led by the grand old battleship "Warspite" wiped out the German naval units stationed there. Early in June, Narvik fell to the Allies, but the taste of victory was short lived. The Allies were withdrawn a few days later when the debacle in France required their recall. The campaign came to an end on June 10, 1940.

Summary.—The Norwegian campaign was another brilliant, easy triumph of German arms. Once again the Germans demonstrated to the world that perfect co-ordination of all arms of the service is an absolute necessity in successful total war. German intelligence and espionage were superb. The air force and the mechanized forces co-operated magnificently. Even skilled mountain troops were used to flank Allied positions in the rugged terrain of central Norway. All of the German objectives were accomplished. They had secured themselves against the possibility of an Allied attack from Scandinavia. They had established much-needed air and submarine bases directly on the north Atlantic. They had retained control of iron ore shipments from Narvik. All this was accomplished at the cost of extremely light casualties, announced officially as 1,300 dead.

By far the most significant aspect of the campaign, however, was the blow to Allied prestige and the exposure of Allied weakness. Norway had lost her independence in less than a month. The British government was shaken to its foundations. On May 10, 1940, Neville Chamberlain was forced to resign, and Winston Churchill, the first lord of the admiralty, was appointed prime minister in his place. At last England had a leader who understood the situation. But it was too late to avert the disaster. Hitler now had the information he wanted. The Norwegian experiment was an unqualified success. The Allies had revealed themselves as weak, internally divided and pitifully unprepared. On May 10, the very day Winston Churchill assumed office, the nazi armies struck again.

VI. THE BATTLE OF WESTERN EUROPE

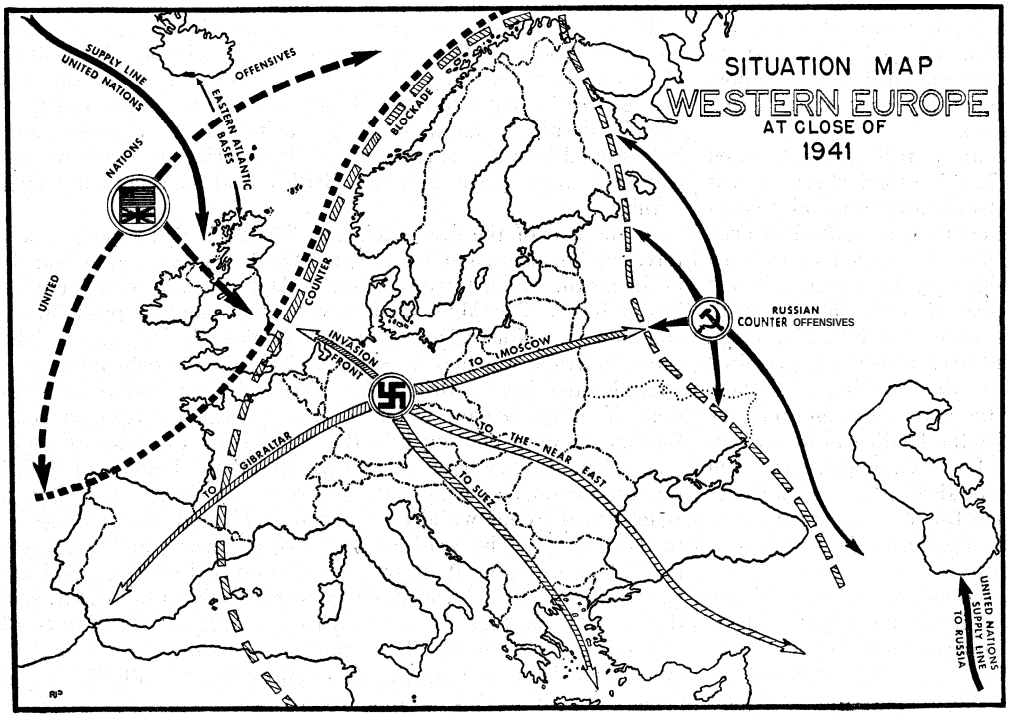
(May **10, 1940-June** 25, **1940)**

In the bloody dawn of May 10, 1940, the curtain rose on the main act of the great European tragedy. Poland and Norway had been trial performances-dress rehearsals to test enemy strength and to try out new weapons and methods. This was the principal event—the tremendous clash of titans toward which Europe had been rushing for nine years. The battle of western Europe was the most colossal since the great Allied offensive of **1918.** In it participated the armies of Germany, Italy, Britain, France, Holland and Belgium—an aggregate of some **4,000,000** men. The action was fought on a line extending from the North sea to the Mediterranean. When the smoke of battle had died away, the face of Europe was completely altered. Holland, Belgium and Luxembourg had ceased to exist as nations. France, called the greatest military power on earth. was smashed. Her mighty armies were broken, two million of her soldiers captives. Britain had reeled back, battered and bleeding, to the protecting fortress of her own island. Never, in so short a space of time, had such a far-reaching military decision been reached.

Objectives.—The objectives in this campaign are simple to catalogue. For Germany, it was the annihilation of Allied military power. For the Allies, it was the annihilation of German military power. Holland and Belgium fought defensively for their homelands, with the long-range objective of helping Britain and France smash the enemy. For Italy, the objective was one of territorial annexation, and an impressive military display to assure a favoured place at the expected peace conference.

Plans.—The German plan of attack was based on the well-known "von Schlieffen plan," originated by Alfred von Schlieffen, chief of the German general staff from 1891 to 1907. This plan was designed before World War I as the most effective method of delivering a quick knockout blow to France, by means of an attack through the Low Countries. In World War II such an attack would filter through the main Allied defenses, outflanking and by-passing the powerful Maginot line. The broad strategy of the von Schlieffen plan was this: A great German army of 2,000,000 men was to be thrown into battle on the western front, with only small forces left to face the enemy in the east (in this case, Russia, still neutral and at peace). The left flank of the western army was to act defensively, holding the French along the heavily fortified Rhine and Moselle frontiers (the Maginot line and the Westwall). The right flank was to wheel about in a great many-pronged southward advance, smashing through the Low Countries into northern France. This route of invasion would follow the easiest road into the heart of France—the flat coastal plain along the shores of the North sea and the English channel.

To counter this expected German thrust, the Allies relied on supposedly impregnable defense positions in depth to absorb the main shock of the German advance until a crushing Allied counteroffensive could be organized. The Netherlands' fortifications consisted mainly of lines based on her "water defenses," which were essentially flooded areas in the path of the enemy. Belgium had an extensive system of defensive fortifications running along the left bank of the Meuse river as far as Liége, and from Liége to Antwerp along a formidable artificial defensive barrier known as the Albert canal. France, of course, had the Maginot line, extending from Switzerland to the comer of France where the Belgian, French and German frontiers came together. There were two glaring weaknesses in this defense scheme: (1) A wide gap existed between the Dutch and Belgian fortifications, making possible the flanking of the Belgian positions if the Netherlands fell; and (2) the Maginot line did not extend to the sea, leaving the vital Franco-Belgian border relatively unprotected, if the Belgian line were flanked or breached.



In addition to this, another vital defect in the Allied defense scheme must be emphasized. That was indecisiveness. Before the German attack, the British and the French faced a serious problem. With the French-Belgian frontier relatively without defenses, and with Belgium stubbornly clinging to neutrality, it could not be decided whether the British-French forces should (1) hold in strength along the Belgian frontier, or (2) advance to the assistance of the Belgians and the Dutch. providing of course, the Low Countries decided to resist and showed some ability to hold the Germans until help

arrived. The matter was still under discussion when the Germans struck. As a result, the decision to advance was hastily made, and the British-French forces moved out of their positions with a fatal lack of preparation. There were scarcely any provisions for adequate reserves and the skilful employment of air power. Thus the Allies themselves left a weakly-defended gap on the north flank of the Maginot line which later proved to be their undoing.

Forces.—It is estimated that the Germans used 150 divisions of all types in the invasion of the Low Countries. This included 12 armoured divisions, plus special field services of various kinds. Assisting the invasion, Germany used approximately 6,000 planes, with adequate reserves to maintain this figure as constant. As usual, German equipment was of the best, with the cream of German man power and production being thrown into action for the supreme test.

Of France's army of 2,700,000 men, approximately 400,000 were available to assist the Low Countries at the start of the campaign, but before the curtain dropped on the battle of France, virtually every man had seen battle. Although French equipment was generally good, in some instances it was obsolete and untested. The French air force was comparatively small, relying on major assistance from the royal air force of Britain. Between them, the Allies could muster no more than 6 armoured divisions, inferior in equipment and fire power to the German *Panzer-divisionen.*

The British expeditionary force in France numbered 350,000 men. This army was well equipped, well trained and supported by a considerable air force. The B.E.F. was, perhaps, the most powerful factor on the side of the Allies up through the tragic days of Dunkirk. British planes proved superb in air battle. British production, however, was unable to match German efforts, and by the end of the campaign, lack of replacements reduced the effectiveness of the royal air force to a minimum. In addition, the independent R.A.F. demonstrated a definite lack of experience in co-operating with the ground forces. It had been trained to act alone, and thus found itself far behind the Germans in this important phase of the tactics of modern warfare. Another factor which handicapped the British toward the end of the campaign was that many of their planes were forced to operate from distant bases in the British Isles.

Belgium and the Netherlands added a total of 900,000 men to the Allied front, most of them ill armed and ill equipped. The joint air strength of the two countries numbered approximately 900 planes, of which less than half were modern combat machines. The principal contribution of the Low Countries was extreme valour, which, unfortunately, in itself has never proved sufficient to win a modem military campaign.

The Battle of the Netherlands.—The German attack on the Low Countries was launched simultaneously against the Netherlands and Belgium. Both drives were component parts of the one great offensive. However, for the purpose of clarity, this survey will consider the Dutch and Belgian phases separately, especially since the Dutch army was defeated and ceased to be a factor early in the battle.

At dawn on May 10, 1940, the Germans attacked across the Dutch border at several points. In the first few hours of battle, it became apparent that at least five spearheads were smashing into the country, all converging on the principal cities of Amsterdam, Rotterdam and The Hague. The most powerful ground attack struck across Limburg toward Maastricht, aimed directly at the immense gap between the Belgian-Dutch defense lines. This drive succeeded almost immediately. As a result, the bulk of the Dutch army was isolated from all reinforcement from the south.

At the same time that these ground attacks were launched, two innovations in modern warfare were thrown into the battle with startling success: (1) The fifth column, used so successfully in Norway, completely paralyzed much of the Dutch defense effort. The hand of the saboteur, the secret agent and the traitor was felt at vital points throughout the country; (2) Parachute troops and air-borne infantry, co-operating with the fifth column, completed the destruction of the country from within. In the first few hours of conflict, parachute troops, guided by undercover agents stationed at the points of landing, did enormous damage to the Dutch resistance. Every air field was taken and held until reinforcements arrived by transport plane. Every principal city was occupied by these aerial invaders while the main German armies were still miles away. Communications were severed, bridges were blown up, and before long the bewildered Dutch army found itself surrounded by the enemy on all sides. All this was accompanied by the most intensive air bombardment the world had yet seen. Sections of Rotterdam were literally levelled to the ground.

For five days, the valiant Dutch put up brave resistance, but on May 15, realizing the futility of further bloodshed, General Henri Gerard Winkelman surrendered the bulk of his armies to the Germans. Only scattered units remained to fight with the Belgians, the French and the English, south of the Scheldt river.

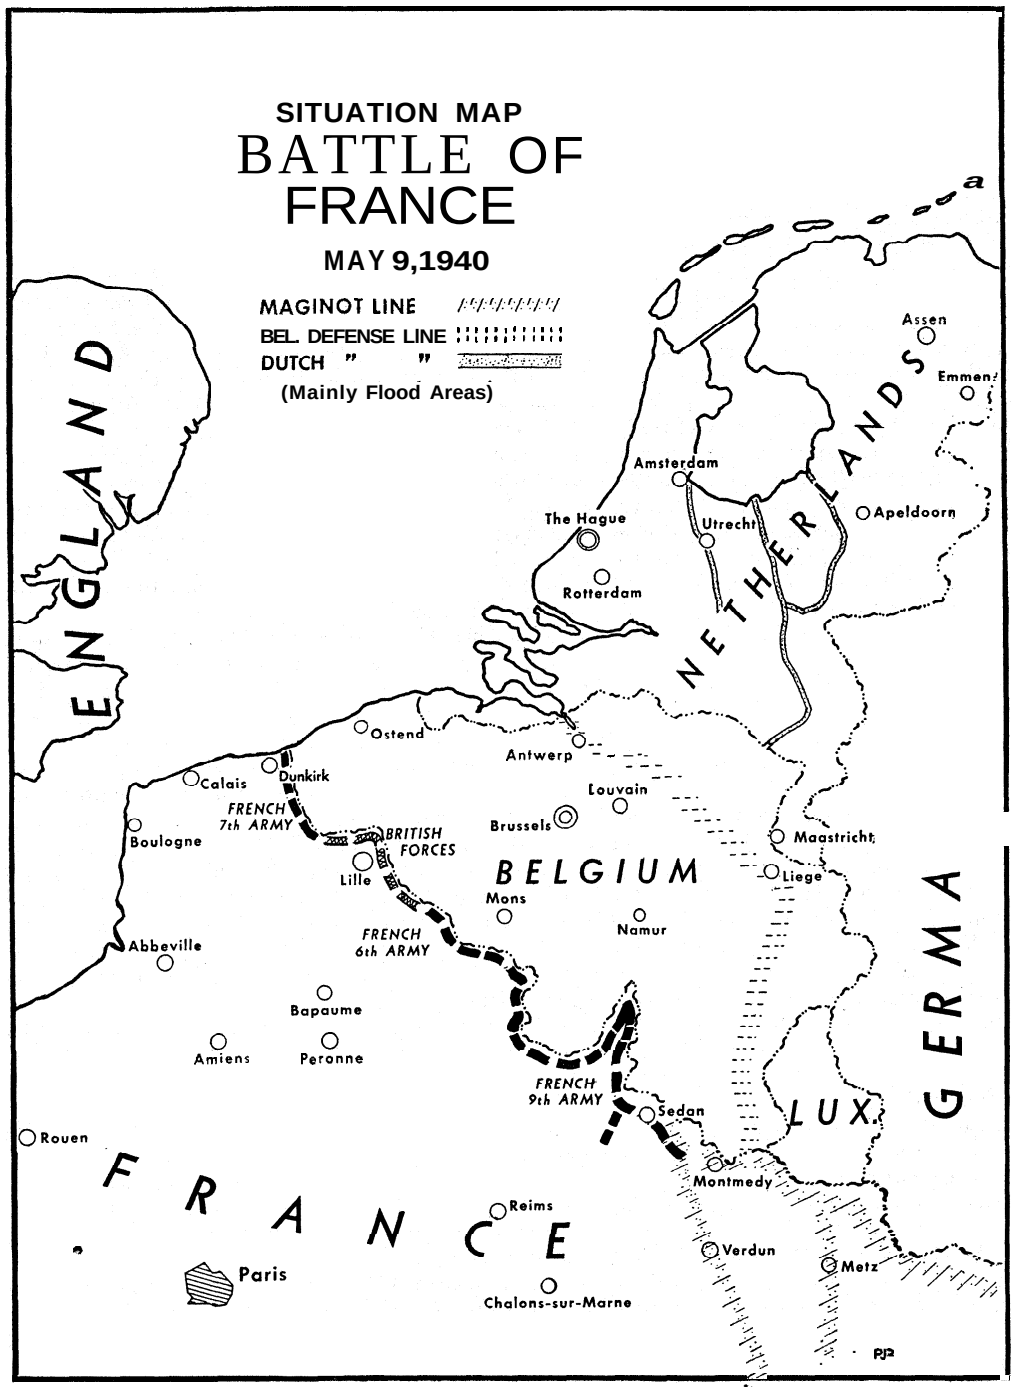
The Battle of Flanders.—No sooner had the Germans launched their first attacks across the Belgian border on May 10 than the British and French troops moved out of their prepared positions in northern France, and advanced to meet the enemy and assist their Belgian allies. This operation included the first of many blunders. from the effects of which the Allies never recovered. The wisdom of the advance itself cannot be questioned, but the tactical deployment of these forces with the absence of adequate reserves was a serious error.

With the advancing Allied forces went the French 9th army, under the command of General Andre Corap. The 9th army had been assigned to protect the comer of France where the Maginot line fortifications came to an end. Believing that the area was sufficiently covered by the crack Belgian Chasseurs Ardennais division, Corap moved his 9th army north from the vicinity of Sedan, leaving only small holding forces behind to reinforce the Belgians. In a sudden devastating blow, an entire German corps was thrown at the lightly-defended Sedan sector. The Germans smashed through into France, almost unhindered. The French 9th army fell back to repair the damage, but it was too late. Engaged in the rear by these same German break-through forces, and on the flank by other strong German units, the French 9th army was hopelessly beaten. The enemy poured into France in a flood which was never dammed.

In Belgium, the Germans had swept past the Liége forts, breached the Albert canal at several points and engaged an Allied army which included almost the whole of the British expeditionary force, the whole of the Belgian army, and two French armies—totalling more than 1,000,000 men. The position of this entire force was endangered by the German break-through at Sedan, and at other weakly defended places in the Allied defense line. The lack of Allied reserves to meet these break-throughs, plus German pressure on the Franco-Belgian border, appeared to bring about an Allied withdrawal.

From Sedan. German mechanized units crossed the Oise and raced down the valley of the Somme. These mechanized units were supported by ground divisions and aided by devastating German air attacks. As they advanced to the sea, the Germans turned north and south against the Allied flanks, threatening to disrupt supplies. In a few days, the panzer divisions reached the English channel at Abbeville. The huge Allied army in Belgium mas cut off from communication with the main armies in France by a thin, yet tenuous, enemy line stretching from Sedan to the sea. The rapidity of these events, plus the deadly German air attacks along the entire front, caused demoralization and confusion in the Allied ranks. Cohesion was lost, and counteraction by the Allies was ineffective.

The Belgian cities of Louvain, Antwerp and Brussels fell to the Germans inside the "Flanders pocket," and the Allies withdrew to the Dyle river line. A German crossing of the Meuse and the Sambre farther south, forced a further retirement from the Dyle river. At this point, the Allies were faced with being cut off from sea communication by a German double-envelopment drive, the south wing of which would come up from Abbeville, the north wing down from Antwerp. There was only one thing to do and Viscount Gort and General Blanchard, the Allied commanders, did it. It was to strike at the yet-thin German line from Sedan



to Abbeville in an attempt to break through and join forces with the main Allied armies in France. A strong offensive was consequently launched from north of the Scarpe toward Cambrai and Bapaume. This was one of the most crucial moves of the war. On it hung the fate of Belgium, France, even Britain itself. It was the only means by which the shattered Allied armies could reorganize to meet further German attacks

Little by little the gap between Bapaume and Péronne grew smaller. In the face of the fierce Allied offensive, the gap was narrowed from 30 miles to 18 miles, to 12. The British-French pressure from the north had some effect, but the broken French armies south of the Somme were not equal to the task. For two days the intense struggle continued. Then, the southern French armies sank back, exhausted. The effort was in vain. The Bapaume-Péronne gap was never closed. The Allies had lost their last chance to stave off defeat.

In the meantime, Maxime Weygand was recalled from the near east to replace Maurice Gustave Gamelin as the French commander in chief. His principal task was to organize forces to stem the tide, and gain time for the organization of a co-ordinated defensive front. In the face of the demoralization of the Allied forces, and the lack of sufficient air and ground strength, this was difficult. At the same time, Weygand had to imbue the commands with new methods of overcoming the German air and tank attacks, which had been so disastrous in the preceding engagements.

On the battle front, German superiority was now making itself painfully felt. The royal air force was depleted, and the French air force all but shot out of the skies. Never had the *Luftwaffe* operated with more effectiveness. Planes acted as artillery for the advancing German mechanized columns, blasting great holes in the Allied defense positions. Planes bombed Allied communication lines day and night, destroying the great channel ports, and disrupting Allied troop movements, which were still being conducted on a 1918 scale. Planes strafed and bombed civilians, causing them to rush headlong onto the highways, blocking them for military use. Parachute troops devastated whole sections of the French countryside, adding to the great stream of refugees choking the roads to the south. Air-borne infantry helped seize Allied airports. Planes were playing the greatest part in the shattering of French morale.

Despite all this, toward the end of May, General Weygand almost accomplished a miracle. He gathered troops from all over France, from the Maginot line and the Italian border. He strengthened the Aisne-Somme line. He even concentrated a force of 30 divisions at Rethel for an offensive up the Meuse valley to relieve the Allied forces in the Flanders pocket. However, it was to no avail. After the main French forces had fallen back across the Somme, even Weygand's efforts could not avert the inevitable. It was impossible for the French to muster adequate man power, equipment and especially morale, to meet the Germans on anywhere near equal terms. Thus, as early as the middle of May, all was already lost.

It was at this point that the death knell of the Allied forces in Flanders was sounded, when in the early morning of May 28, 1940, King Leopold of the Belgians suddenly surrendered his entire army to the Germans. The pros and cons of this surrender have been discussed time and time again, but only history can determine the righteousness of the action. In a single move, the north flank of the Allied armies was swept away by the Belgian capitulation, leaving the Allied position virtually surrounded and indefensible. However, the position of the Allies and the Belgians was already desperate. The British, French and Belgians had been fighting unceasingly against heavy odds for nearly three weeks. After the surrender of the Dutch, the Belgians, on the

north, had been bearing the brunt of the German attacks. To avoid disaster, the Allies had been forced to conduct one withdrawal after another. Finally they found themselves with their backs to the channel. Their supply facilities were too limited to maintain their forces. It was this lack of supply that made the position almost helpless. It is therefore possible that two decisions were made independently, but at approximately the same time—(I) The decision of the Belgians to surrender, and (2) The decision of the British and the French to evacuate the British expeditionary force by sea.

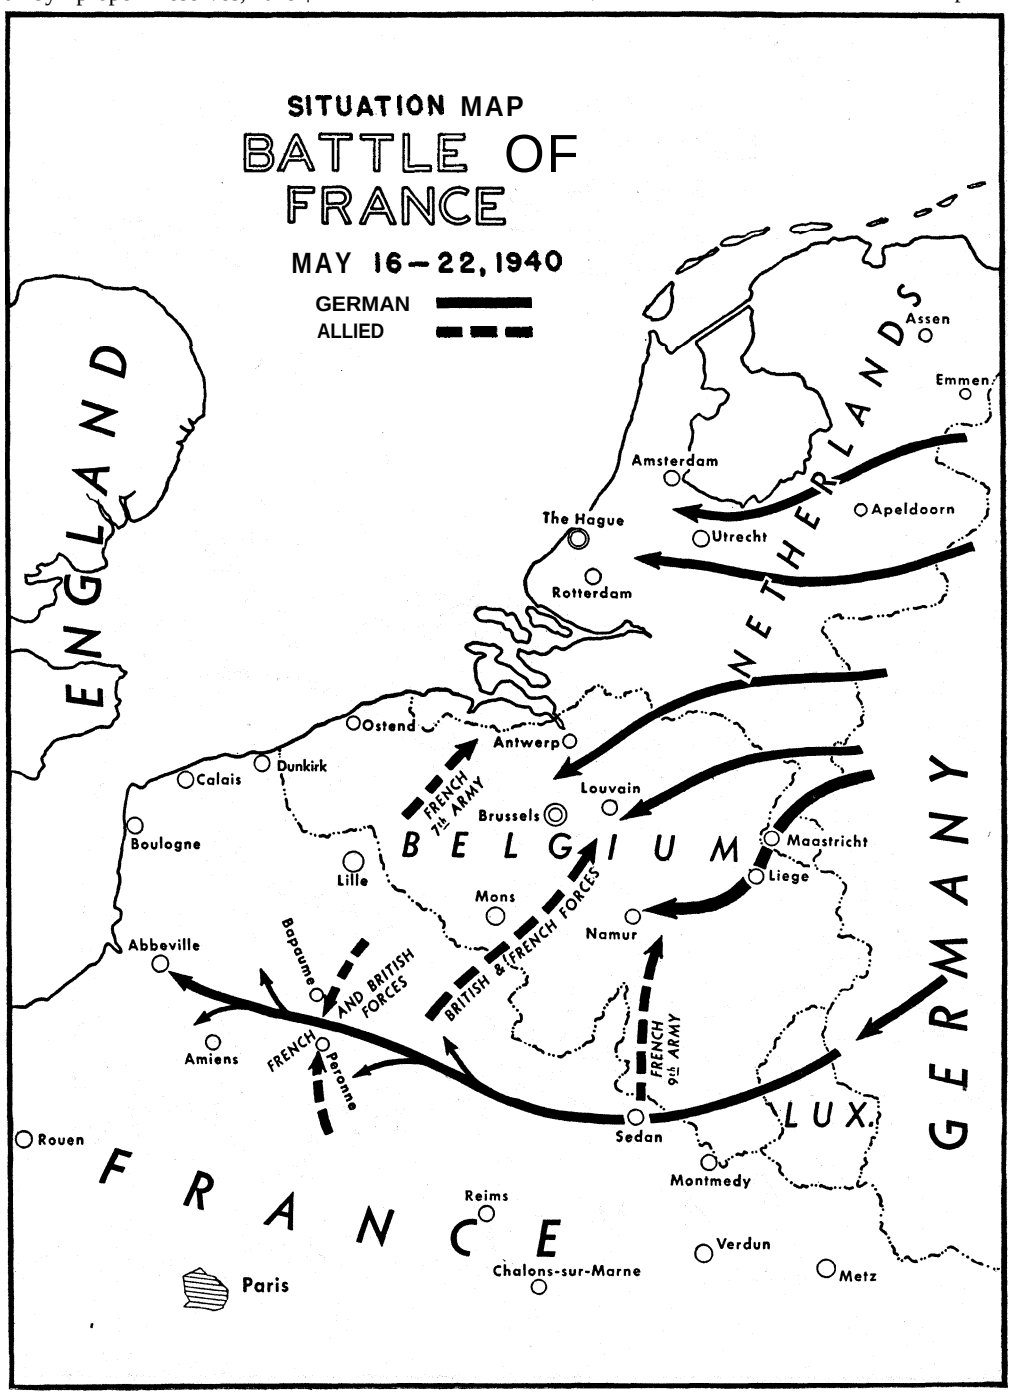
Thus, a phase in the battle of Flanders was over, with the Allies suffering crushing defeat. German operations had been conducted on a brilliant scale; German air-ground co-operation had been almost perfect. However, Allied failure can be traced to one further fact—indecisiveness. First, indecisiveness about advancing to meet the enemy in Belgium, until after the Germans had actually attacked, resulted in their finally doing so without adequate preparations. Unprotected by proper reserves, the Allied southern flank was then turned. When this happened, indecisiveness again paralyzed the Allied effort. They delayed their decision to withdraw until it was too late. An earlier decision to withdraw might have permitted the Allies to use their whole force south of the Somme, in an action similar to the successful defense of the Marne in World War I.

As for the Germans, a special tribute must be paid to the excellence of their supply system. As the main forces of the Germans moved down from the north, crushing first the Dutch, then the Belgian and Allied armies, not once did the German lines of supply break down. Particularly remarkable was the German feat in advancing and supplying large forces through the narrow space of the Bapaume-Péronne gap, following the break-through into France. Seldom has military history seen such an effective solution to such a great problem of supply and maintenance.

The Evacuation of Dunkirk.—After the Belgian surrender, and the Allied decision to evacuate, one phase of the Battle of Flanders yet remained to be fought. Defiantly, the British army fell back on Dunkirk, the one channel port still in Allied hands. Fierce rear-guard actions by the remaining French units covered their retreat. History must not forget the part played by these valiant Frenchmen. All hope for themselves gone, knowing instinctively that their own country was lost, they unflinchingly shed their blood that their British comrades might escape to face the enemy once again.

Dunkirk is still looked upon by military experts as a miracle. The British imperial general staff doubted that 25% of the B.E.F. could be saved; yet 330,000 men (including Frensh, Dutch and Belgians) were taken off the bloody beaches of Dunkirk. This was a victory for the people of Britain. From the British coast across the channel, every available boat, from fishing smacks to private yachts set out for Dunkirk. Destroyers, transports, tugboats, ferries—they all took part in the evacuation. Women, sometimes even children, piloted the rescue boats. Under a veritable hail of German bombs and bullets, this motley fleet shuttled back and forth until every possible man was safe in Britain. For the first time, the weather came to the aid of the Allies, as a continuing dense fog blanketed the operations from beginning to end. Every British plane was thrown into the fight; London was stripped of its aerial defenses; but control of the air over Dunkirk was wrested from the Germans just long enough to accomplish the miracle.

With Dunkirk, the disastrous Battle of Flanders ended in a brief flash of glory for the Allies. But the brilliance of the successful evacuation could not hide the fact that the British had suffered a terrible defeat, that Britain itself was in dire peril.



England had no army. The B.E.F. had been saved, but all of its equipment had been left behind. There were no tanks, no heavy guns. Britain was helpless in the face of an all-conquering foe who stood just a few miles across the open water of the English channel.

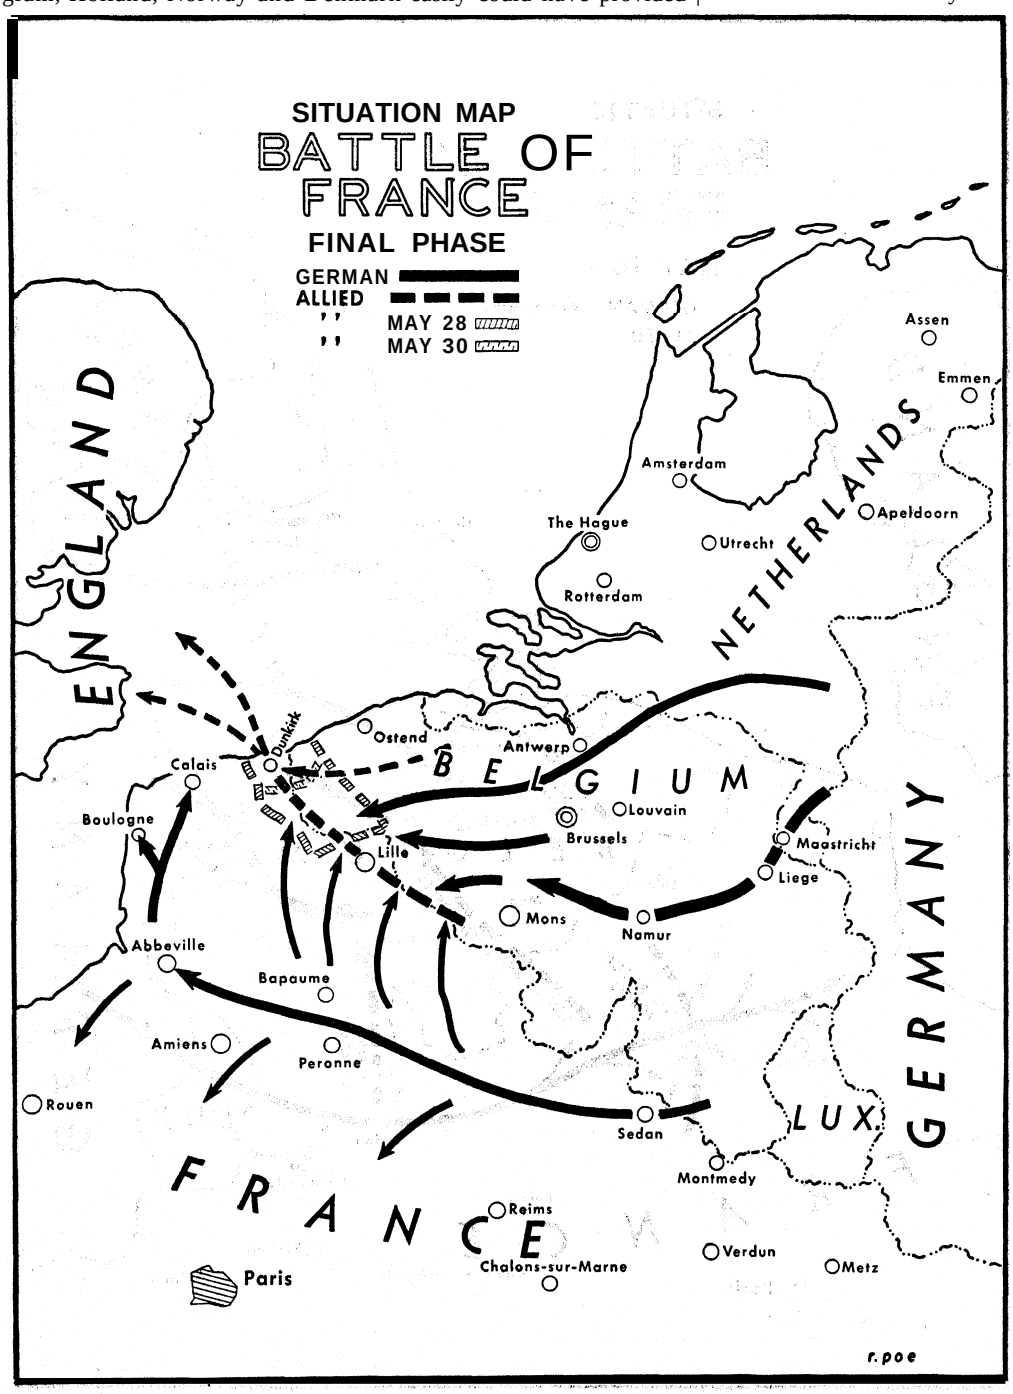
Fortunately for Britain, the Germans turned south to mop up France.

We still do not know the reasons impelling the Germans to turn on France instead of finishing off England, but certainly this was one of the most vital decisions of the war—possibly the one decision on which the entire outcome may hinge. It is the opinion of most military experts that while a part of the German armies was engaged in mopping up France, the major forces should have immediately prepared and attempted the invasion of Britain. The British had but few air units left and little ground armament. The greatly superior German air force should have been able to handle the British fleet; and the harbours of France, Belgium, Holland, Norway and Denmark easily could have provided enough small boats to carry an overwhelming invasion force. However, we do not know all the facts, and in this case, too, it is only proper to let history decide.

The Battle of France.—The final phase of the great battle for western Europe opened at 4:00 A.M., Wednesday, June 5, 1940. While the Germans were engaged in pursuing the British to Dunkirk, General Weygand had built a defense line hinging on the Maginot line at Montmèdy, and following roughly the line of the Aisne and Somme rivers. Defending this line, Weygand had no more than 60 French divisions. Only one British division remained in action, anchoring doun the extreme western flank of the French positions. Opposing these forces, the Germans had at least 100 divisions, probably 130 to 140. The entry of Italy into the war threw several more divisions into the battle on the side of the axis.

The Germans, following their familiar pattern, opened with heavy artillery barrages and murderous bombing assaults on the French lines. Then they thrust mechanized spearheads across the Somme, from Laon to the sea. For a brief period the French seemed to be holding. Bringing up hundreds of their famous World War I 75's, they deployed them in great depth and masses, fired point blank at the German tanks, and managed to smash one attack after another. The gesture was gallant, but futile. Cohesiveness and morale were gone. The German mechanized divisions found the few weak spots they needed, smashed through; and the deadly routine of Poland was repeated. Spearheads fanned out behind the French positions, disrupting communications and forcing retreats. On June 8, the Germans crossed the Aisne. A few hours later, Roye, on the Avre and Noyon, on the Oise, had been taken. Farther west, the Germans crossed the Seine at Amiens, and the entire French left flank was forced to fall back to the Bresle. Here the French held but once again it was to no avail. *Panzerdivisionen* were operating far to their rear at Forges-les-Eaux on the Seine. The French retreated again, to a line stretching from Chemin-des-Dames to the sea. They were dangerously near Paris.

On June 10, 1940, Italy, with her total war strength of some 60 divisions, entered the war on the side of Germany, but it made no difference to the final outcome. For months, a neutral Italy had immobilized large masses of French troops on the southern border On June 10, the Germans forced another crossing of the Seine near Rouen, and converged on Paris from the Aisne and Oise sectors. Up till now, Weygand almost miraculously was holding his armies together in fairly orderly retreat. On June 10 Paris was evacuated, and the French set up a new defense on the Loire It was with the fall of Paris that the French resistance showed signs of com-



plete deterioration. And small wonder. With thousands of French prisoners in German hands; with German mechanized and air forces smashing their communications from the rear; with millions of pathetic refugees impeding their retreat, it is difficult to see how the French managed to put up effective resistance as long as they did.

On June 14, the Germans took Reims and Chalôns-sur-Marne. A day later, the mighty fortress of Verdun, symbol of an unyielding defense in 1914, fell after less than six hours of assault. This indicated the crumbling of the French armies. The end was near. The fall of Verdun put the Germans at the rear of the storied Maginot line. In a few short hours, the great bastion which was to have stemmed the nazi tide from all of western Europe, was rendered useless. Evacuation of the Maginot line began almost immediately after the German capture of Verdun. It had not been built to fight an enemy at its rear!

In the meantime, the French government had moved to Tours, and then to Bordeaux. On June 14, the day of the fall of Verdun, Premier Paul Reynaud proclaimed the helplessness of the situation. Two days later, he resigned. He was replaced by the aged Marshal Henri Phillipe Petain, victor of Verdun in World War I. The very day that Pétain assumed office, the last French defense line on the Loire was cracked. The tragedy was entering on its final scene. The onrushing Germans split the main French armies and penetrated the Rhone valley. On June 17, the 84-year-old Pétain "with a broken heart" asked for honourable terms of armistice. On June 21, while the fighting continued, Adolf Hitler presented his harsh terms in the same railway car at Compiègne where the Armistice of Nov. 11, 1918, had been signed. The following day, the French delegates signed the German terms, and then opened negotiations for an armistice with the Italians. With fighting still in progress and with isolated French units still resisting heroically, the French and the Italians worked out the terms of their armistice in the Villa Incisa, 12 miles from Rome. On June 24, 1940, the Franco-Italian armistice was signed. Six hours later, at 12:35 A.M., June 25, 1940, the battle for western Europe came to an end. For France, the war was over.

The **Franco-German** and Franco-Italian Armistices.— The terms of the German and Italian armistices were strikingly similar in content, and had as their common objective, the utter subjugation of France and its elimination as a dominant power on the continent of Europe. In addition to stripping France of practically all its continental defenses, the treaties called for the military occupation of more than half the area of the country, with the French people themselves paying the cost of the occupation—an estimated 3,000,000 francs per day. The Germans occupied the entire west coast of France, and all the territory north of a line running from the Swiss border near Geneva, through Dole, Chblons-sur-Sabne, Moulins, Vierzon, to 20 km. east of Tours and thence southerly to St. Jean-Pied-de-Port on the Spanish border. This was considerably more territory than the Germans had taken by military conquest at the time the armistice was signed. In contrast, the Italians occupied no more than the relatively small area their troops had conquered up until the cessation of hostilities on June 25. The French agreed to demilitarize the nearby Toulon naval base and an area 50 km. wide west of the line marking the farthest point of Italian advance.

Other articles of the armistice agreements called for the demilitarization within 15 days of the great French naval bases of Bizerta, Ajaccio and Oran, and the demilitarization of certain fortified colonial areas in French North and East Africa. To administer the occupied territories, armistice commissions were provided for in several articles of both the German and Italian treaties. In addition, a great many of the arrangements were detailed. placing French trade, communications and merchant shipping under direct axis control. France was specifically forbidden to render any form of assistance to Britain for the remainder of the war. All French prisoners of war were to remain in axis hands. Axis prisoners mere to be released immediately, however. In article XIII, the French were required to maintain in good order all property to be delivered to Germany, and to provide all labour necessary for the repairing of docks, railroads and other facilities to be used by the Germans. Article XIX (German), concerning prisoners of war, also provided for the return to Germany of all German refugees in France named by the German government.

By far the most provocative provision of the armistices was article VIII (German) and article XII (Italian), which called for the concentration, demobilization and disarmament, at French ports, of all French naval vessels. This provoked a bitter storm of protest in Britain, which had agreed to the French surrender, only if the French fleet were put under British control. The direct result of this French concession to the axis was violent British military action involving the seizure of all French vessels in British-controlled waters which reached its tragic climax in the British attack on French fleet units in the harbour of Oran (see The *War* at Sea). Later, to allow the French to protect themselves against British attacks, the axis permitted the French fleet to remain mobilized.

This and other controversies rising out of the armistice terms, caused a breach between the British and French governments which was never healed.

Aftermath **of** the Fall of France.— It is not exaggeration to say that the collapse of France, in less than eight weeks of active fighting, shook the entire world. The effects of this cataclysm which brought all the democracies to the very brink of disaster, were immediately felt in every corner of the globe.

In Europe, the spirit of France was crushed. The people of what was once the continent's strongest land power, walked about in dazed, hopeless dejection. This attitude spread to the government, and soon it became apparent that France was too weak, too crushed even to maintain firm holds on her own colonies. The government—by then functioning at the city of Vichy—became honeycombed with collaborationists; and under the guidance of Pierre Laval, vice-premier in the Pétain cabinet, the republic was abolished in favour of a totalitarian regime. Pétain was named chief of state. The masses were inarticulate, but among most of the ruling politicians, the order of the day was "co-operation" with the German conquerors.

In eastern Europe, repercussions of the French collapse were felt within a week of the armistice. With Franco-British guarantees now proved worthless, Rumania was literally torn asunder. Russia demanded the annexation of Bessarabia and northern Bucovina. Rumania acceded, but turned to Germany for further protection. This was to no avail. At a "consultation" a few weeks later, Hitler ceded most of Rumanian Transylvania to Hungary, and the Rumanian Dobruja to Bulgaria. This was Hitler's reward for two good little axis satellites. It served to bring them closer into the axis camp.

Spain, in the meantime, became closer knit to the axis by virtue of the gentle pressure of German armies on her northern border. The economic position of Germany and Italy was greatly improved by the conquest of France, and practically all of Europe's Atlantic coastline was now a huge network of air and submarine bases stretching in an arc about the British Isles. The direct result of this was a tremendous increase in British shipping losses. Experts put the average monthly loss for Britain at 325,000 tons in the latter months of 1940. In addition to a German frontal assault, Britain also faced the prospect of starvation by blockade.

In the far east, French collapse immediately galvanized Japan into action. French Indo-China was forced to stop all traffic into Free China, and thousands of Japanese "inspectors" (wearing full field packs and well schooled in such intricacies as close-order drill). poured into the French colony to "inspect" the railroads for violations of this agreement. As an appeasement measure, Britain also closed the Burma road to China-bound supplies. On Sept. 27, 1940, Japan became a full-fledged member of the axis by signing the tripartite pact in Berlin.

In America, the United States stirred uneasily at the news of France's fall, and issued a warning to all European powers that transfer of European colonies in the western hemisphere to non-American nations would not be tolerated. In the near east and Africa, unrest and indecision wracked the still-unconquered

French Colonial armies. Late in Aug. 1940, British Somaliland, no longer protected by the French forces in neighbouring French Somaliland, fell easy prey to a powerful Italian invasion.

The greatest and most unexpected aftermath of the fall of France, however, was the refusal of Britain to give up the fight, and the subsequent air struggle which was named "The Battle of Britain" by Prime Minister Winston Churchill.

VII. THE BATTLE OF BRITAIN

Never in the history of the world has a people responded so magnificently to national crisis as did the British people in the dark days following the French debacle of June, 1940. Fate saved the British Isles after Dunkirk, when the conquering Germans made the mistake of turning away from helpless England to concentrate on wobbling France instead. After that, the British Isles were saved by the British people.

In the last days of June, when France was reeling to final defeat, the picture looked utterly hopeless. England had practically nothing but her bare hands with which to fight the greatest military power on earth. Some members of Britain's ruling class wanted to make peace with Hitler then and there. But Britain's common people, and their great spokesman, Winston Churchill, would not allow it. If they had only their bare hands with which to fight—fight with their bare hands they must. At last the common people understood what they were fighting for. The issue became for them something more than the incomprehensible ideologies of naziism and democracy. It took Dunkirk to do it, but now they realized the slavery and starvation which a Hitler victory would bring to them and to the entire civilized world. Free men were now fighting to retain their individual freedom.

Three days after Dunkirk, factories began to hum, thousands rushed to take up arms. Home guards set about the task of building defenses against parachute troops and sea-borne landings. For 15 and 16 hours a day, men and women sweated over machines, working to the point of exhaustion, forging the sinews of a new army to be built on the ashes of the old. Tanks and planes rolled from the factories in an unprecedented stream. This was truly a miracle comparable to Dunkirk. In a few short weeks, Britain was fighting with bare hands no longer.

On June 19, just after France asked for an armistice, the Germans struck the first major blow at Great Britain. At first 100 planes a day dropped their bombs on British cities. Soon it was 200 planes; before long, nearly a thousand. Britain was extremely vulnerable to air attack. Its enemies controlled a long line of air bases from Norway to Spain, some of them just a few minutes away from Britain's most vital industrial areas. Yet, with ever increasing strength, the British struck back. Each night bomber formations of the R.A.F. set out for Germany and German-occupied territory to blast away at military objectives there. The air war swelled in intensity. Both sides were soon dropping their bombs on open cities, killing civilians by the hundreds. "Military objective" became a hollow phrase, meaning roughly, every square inch of enemy territory that could be reached with high explosive and incendiary bombs.

Britain, in the meantime, had become a veritable fortress. The world was thrilled by the sight of a nation of nearly 50,000,000 people under heroic siege. The beaches, the moors of England became a tangled mass of fortifications. Every possible landing was protected with barricades, and a close network of defensive positions grew up from Land's End to John o' Groat's. Thousands of foreign refugees and persons of doubtful loyalty were thrown into concentration camps, to eliminate any possibility of a fifth column. Everywhere men in uniform waited grimly for the approach of the foe.

The German plan appeared to be this: (1) Systematic bombing of British cities and military objectives to destroy morale and the will and power to resist invasion; (2) Destruction of the British sea lanes by bombing and submarine attack, to shut Britain off from supplies and reinforcements from America and the empire; (3) Destruction of the royal air force and all royal air force bases by bombing attack, to allow a combination sea-borne and air-borne invasion to land on Britain, unhindered; (4) Finally, after this preparatory softening-up, actual invasion of the British Isles by parachute troops, air infantry and regular army units transported in specially built barges assembled on the French, Dutch, Belgian and Norwegian coasts.

The plan never succeeded of execution. In the cities, the people of Britain merely buried their dead, shook their fists at the foe and returned to work. In the air, the royal air force refused to be shot out of the skies. Fighting at odds of five and six to one, the R.A.F. waged one of the most magnificent underdog battles in history. And it won. By the end of August, it was reported that 1,000 German planes were raking Britain in a single day. All parts of England and Wales were raided, and many points in Scotland, but the principal German effort was directed at London. On August 21, however, the R.A.F. destroyed no less than 200 enemy aircraft. For days, similar enemy losses were reported. This broke the back of the German offensive. Gradually the bombing attacks slackened.

What caused the British success in beating off the Germans? It can be attributed to three main factors: (1) Although outnumbered, the British fighter planes were superior to the Germans' in almost all technical characteristics, *i.e.,* speed, fire power, manoeuvrability; (2) The British planes were operating with interior lines of communication and out of home bases; thus short-range fighters could be refueled and used over and over again; (3) Indirect American assistance in the form of planes, armaments, shipping, manufactures and food was by this time making itself potverfully felt.

Nov. 14 marked the opening of a new phase of the battle of Britain. With a terrific, concentrated raid on Coventry, using more than 500 planes in this single operation, the Germans began the wholesale, wanton destruction of British cities. For ten and a half hours, incendiaries and high explosive bombs were rained on Coventry, a Midlands industrial city, virtually levelling it to the ground. Coventry suffered a civilian death toll mounting into the hundreds. In the next few weeks, Southampton, Sheffield, Bristol, Birmingham and Liverpool underwent the same horror. The climax was reached on Dec. 29, with a terrible incendiary attack on the city of London. By the end of 1940, the bombings had taken a staggering civilian toll—23,081 killed, 32,296 wounded. But by the end of 1940, the will of the people of Britain to resist was unbroken and they were cemented more firmly than ever before.

Moreover, the royal air force was gaining in strength and striking power. The German invasion fleet on the shores of occupied Europe was smashed time and time again in a series of destructive R.A.F. attacks. German air and submarine bases from Bergen to Bordeaux were blasted incessantly. Night after night, the R.A.F. avenged the German bombings by striking deep into Germany and across the Alps into Italy. The Ruhr, Berlin, Bremen, Mannheim, Danzig, Pilsen, Turin, Genoa and Milan all felt the devastating power of the R.A.F. Following the big raid on the city of London, Bremen was subjected to three terrible incendiary attacks in reprisal. The British had a limited number of planes, and they had to fly farther to reach their targets, but apparently they caused considerable damage to military objectives, preferring to strike at industrial facilities and transportation centres rather than open cities.

As 1941 began, the direct German bombing attacks on Britain gradually lessened. The German armies turned away from the shores of the English Channel to prepare a new blow to the southeast. For the time being the Battle of Britain was over. Nazi Germany had suffered its first defeat—at the hands of the British people.

VIII. THE END OF 1940

As the black year 1940 drew to its close, there were signs all over the world that the struggle was soon going to spread. In the far east, Japan moved troops from south China, continued to make demands on French Indo-China, and was obviously preparing to strike southward. In America, the United States was swinging steadily to the side of Great Britain. Supplies were being rushed to Britain—although still carried in British ships,

and still on a "cash-on-the-barrelhead" basis. The election of Franklin D. Roosevelt for a third term as president was taken as a sign that the people were willing to go all-out in an effort to aid Critain. Congress passed the Selective Service act, calling for the conscription of an army with a potential strength of 4,000,000 men. Important changes were made in the army and navy commands. And the attitude of the people became consistently more menacing against Germany and Italy. (See also WAR ORGANIZATIONS, U.S.)

The Balkans and the near east seethed with unrest, murder and political intrigue. In Europe and Africa, two active conflicts were already raging—the Anglo-Italian war in Egypt and Libya, and the Italian invasion of Greece.

IX. THE GREEK-ITALIAN WAR

On Oct. 28, 1940, Italy, in an obvious attempt to keep pace with axis partner, Germany, launched an unprovoked invasion of Greece from neighbouring Albania. At the time, it was not clear whether this was a private Italian venture, or a segment of the axis general plan of war. Later history has proved that the Greek invasion was an independent effort on the part of Mussolini to impress Hitler with Italian initiative and strength. It also became apparent that Italy expected little more than token resistance from the Greeks. The whole venture proved a miserable failure, however, and Hitler had to rescue his pompous ally from the snow and muck of Albania in the German Balkan campaign of April 1941.

When the attack began, Greece's army numbered no more than 150,000 ill-equipped men, with about 600,000 untrained reserves. Its air force consisted of about 200 planes, and its navy was tiny and obsolete. Despite these relatively insignificant forces, from the very outset the Greek resistance was surprisingly good. As the campaign progressed, considerable British air support, plus a lot of supplies and ground reinforcements, stiffened the Greeks until an amazing victory was almost within their grasp.

For the first few days, the Italians attacked indifferently. Then realizing the strength of the Greek opposition, major Italian units were thrown in, and advances were made all along the Greek-Albanian frontier. The most powerful thrust was in the direction of Salonika. The fighting took place on the most difficult terrain in all Europe, where the wild, mountainous battle ground proved of immeasurable value to the Greeks.

At the end of the first week, the Italian drive began to slow down. Soon afterwards it came to a complete standstill. It was then that British reinforcements began to pour into Greece. Air bases were set up on the Greek islands, and soon British bombers were ranging over the cities of southern Italy. At the end of ten days, it became evident that the Italian preparations for the Greek campaign were exceedingly incomplete. The Greeks launched a counterattack, which did not end until the Italian armies had been shattered and thrown far back into Albania. In less than a month, not an Italian soldier remained on Greek soil. At the end of November, Koritza, the main Italian base in Albania, fell to the Greeks. Two weeks later, Argyrokastro, Porto Edda and other important Albanian bases were in Greek hands. British and Greek planes blasted the two remaining Albanian ports of Durazzo and Valona. Italian cities were subjected to a merciless bombing from bases only 300 miles away. The British and Greek navies literally swept the Strait of Otranto of Italian ships. The veteran Italian chief of staff, Marshal Pietro Eadoglio, retired. Italy was humbled and degraded in the eyes of the world and her axis partner, Germany.

This was the situation when the German drive into the Balkans wiped away the stigma, and re-established axis supremacy in southeastern Europe.

X. THE NORTH AFRICAN CAMPAIGN

Beginning at the end of 1940, the axis-British struggle for the control of north Africa seesawed back and forth through the early months of 1941 and into the beginning of 1942. The campaign can be divided into three distinct phases, all of which when viewed in retrospect must be considered as part of one continuing operation. This was the longest single campaign of the war, and the issue was still in doubt as 1941 drew to its close.

First Phase, Sept. *20,* 1940–March 31, 1941.—The nations engaged in the north African campaign during these months included Italy, Britain and Germany. In addition to the British force from England, other Allied units included Moslem Indian troops, New Zealand and Australian forces, South Africans and native and colonial troops from French Equatorial Africa, under control of the Free French government. The action during the first three months was confined principally to the Egyptian and Libyan coastal area and the operations were mainly the result of air and ground forces, assisted by some naval activity along the Mediterranean shores.

Objectives.—The British objective was to drive the Italians back from western Egypt, to continue the attack to the west along the Libyan coast and to destroy the Italian Libyan armies. Secondary objectives included the capture of additional Mediterranean air and naval bases for future operations against axis supply lines and the Italian mainland, and security for the Suez Canal. The Italian objectives appeared to be, first, destruction of British military power in north Africa by the taking of Alexandria and the Suez Canal; and later, the logical assumption of the defensive to protect Libya and the gains made in Egypt.

Plans.—The British plan of operations appears to have been a straightforward advance to discover the principal Italian opposition followed by a rapid "pincer" or encircling manoeuvre and the swift destruction of the enemy forces. The plans included the co-ordinated action of all arms in the air and on the ground, combined with naval action from coastal waters by units of the British Mediterranean fleet. Considerable attention had been given to Italian defensive works and elaborate plans existed for the siege and reduction of any extensive defensive positions.

The Italian plans do not appear to have been either well prepared or, if prepared, followed in sufficient detail to warrant extensive examination. Plans for the preparation of defensive works appear to have been elaborate and well executed in so far as the actual locating and construction of works were concerned. No general plan for wide-scale defensive operations along the whole Italian position appears to have existed.

Forces.—In Dec. 1940, it was estimated that the Italian forces in north Africa numbered close to 250,000. In addition the Italian army had a minimum of 300–350 planes. Armoured forces included both medium and light tanks, while other mechanized equipment included light weapon carriers. All arms were represented, with extensive motor transportation. It is estimated that only small Italian naval forces were available for coastal operations in this phase of the campaign.

British forces numbered approximately 100,000 mixed troops. No official figures indicate the total planes available, but it is calculated that not more than 100 aircraft were in action during the campaign. Adequate service troops were available to maintain engineer and water-supply needs. In the Mediterranean, the British fleet was well prepared to join in supporting action co-ordinated with air and ground operations.

Operations.--On or about Sept. 20, 1940, Marshal Rodolfo Graziani launched his main attack across the Libyan desert. Within a few days he penetrated as far as Sidi Barrani, 70 mi. inside the Egyptian frontier. Here he stopped. Apparently he was consolidating his position for a further drive on Matruh, Alexandria and the Suez canal. However, months passed without the Italians moving toward the east.

Suddenly, on Dec. 9, the British struck westward. Two days later they had reoccupied Sidi Barrani. Striking with a powerful force of mechanized troops, they shattered the Italian armies, took some 40,000 prisoners, and by Dec. 16. had retaken Sollum. On Jan. 3, 1941, the British launched the first attack of the new year against the Italian stronghold at Bardia. This Italian defensive position was held by 45,000 troops and estimated as a formidable obstacle to attack. However, the operations began with severe British air and naval attacks ranging as far to the west as Castel Benito and Tripoli. On Jan. 3, the British ground forces attacked with Australian shock troops. One by one the

concrete fortifications were smashed. On Jan. 5, the Italian flag was lowered and Bardia was in British hands. In two and a half days British forces had advanced from Matruh and Sidi Barrani, launched an attack against a formidable defensive position, defeated a superior Italian garrison and captured the city of Bardia. About 45,000 more were added at Bardia to the growing list of Italians in British hands.

The next British objective was the defended Italian position at Tobruk, about 70 mi. west of Bardia. Ground operations began with prompt organization and dispatch of columns west and south from Bardia to take up encircling positions around the city of Tobruk. Overhead the air forces undertook the bombardment of Gazala, Derna, Tobruk, and Tripoli on the African coastline, while long-range bombing missions were carried out against Taranto, Palermo and Naples. Two weeks after the fall of Bardia the attack on Tobruk opened with a feint assault, followed by a principal assault. The attack was successful, and several gaps were opened in the outer circle of fortified defenses. Troops poured through these openings and advanced eight miles to the city. Planes and naval units smashed at the defenders. The combined British efforts resulted in the fall of the city of Tobruk within 24 hours. About 25,000 prisoners were added at Tobruk to the large numbers of the Italian Libyan army already captured. The result of the British victory added a third large Italian base and port along the African coast for future British use.

The next Italian position some miles west of Tobruk was Derna —not a heavily fortified city. No rigid defense lines had been constructed similar to those which had characterized the defense at Bardia and Tobruk. The British expected that Derna would be deserted. Reports indicate that the British plan was to continue the westward push, and that the Derna action was to be a secondary assignment to a small force. In fact, Derna was well defended by 10,000 well-equipped Italian troops. The battle was short but intense. Italian air and ground forces, tanks and artillery fought stubbornly. Despite this, however, reinforced British units took the town on Jan. 30. A few thousand prisoners were added to the already staggering total in British hands. The balance of the Italian garrison withdrew in the direction of Bengasi.

British forces quickly consolidated their position in Derna, and resumed the push toward Bengasi. The British plan of operations included the concentration of forces for the main pressure from the east, combined with a pincer movement from the south. On Feb. 9, the British reported, "Bengasi is in our hands." Retreating Italian forces from Bengasi met heavy resistance from the British pincer column moving up from the south and west. About 20,000 prisoners were taken. After the fall of Bengasi, small British units continued the drive as far as El Agheila, a distance of 170 mi., where they remained as weak holding forces until the start of the second phase of the campaign.

Second Phase, *March* 31–April 30, 1941.—Simultaneous with the attack on the Balkans, the axis launched a vigorous offensive against the British in north Africa. The same nations which engaged in the first phase of the north African campaign also took part in the second phase. Germany, ho ever, which played a minor role in the early campaign, assumed command of the axis operations in this phase. Late in March, it became apparent when the British drive bogged down at El Agheila, that large German forces were reaching Africa by air and water transport. The move was accomplished by heavy bombing attacks on the British Mediterranean base of Malta, and by British naval and military preoccupation in other theatres, notably the Balkans. On March 30, the axis struck a series of heavy blows, the full force of which the British were unable to withstand.

Objectives.—The principal axis objective was to regain the ground lost during the first phase, and to secure a favourable area for future operations to the east. The British objective appeared to be wholly defensive—the protection of gains already made, and the protection of the west flank of the Suez.

Plans.—The axis plan appeared to be the concentration of mechanized forces, including armoured scout cars, motorcycle troops, reduced-size panzer or armoured forces, tanks and motorized infantry. These ground forces were supported by adequate combat aviation. Following the transportation and concentration of these forces, the plan consisted of a rapid advance to the east to overrun the British garrison. It appeared that the axis plan was to avoid moving forces along the coastal areas, where they would be subject to British naval attacks. All plans included unity of command and continuous co-ordination of all air and ground units. The British plan was a stubborn defense of all areas gained in the first British campaign. Reduced forces were to defend fortified positions, with naval assistance from coastal waters and such air assistance as was available. The extent of the plan appeared to include increase in existing forces by the addition of units released from operations on Ethiopia, and the prompt creation of a strong defensive position immediately within or along the Egyptian-Libyan frontier. In all cases, the British plan was to protect the west flank of the Suez canal. Apparently the plan did not include unified command of all forces available for operations.

Forces.—Various estimates were made of the size of the German and Italian forces engaged in the campaign. Early estimates indicated German strength at 30,000 including small Italian forces. In addition, an estimated reserve of an equal number was reported in the vicinity of Tripoli. No final figures were available but it appeared unlikely that the combined axis forces, exclusive of reserves, numbered more than 35,000 during actual operations. British forces were far inferior in numbers to the axis forces. The commanding general in Africa at a later date attributed axis gains to the reduced numbers of the British in Libya and Egypt. Demands made upon the British for the campaign in the Balkans were announced as the reasons for the reduction of the north African forces.

Operations.—The campaign opened with lightning speed when axis mechanized forces struck to the east against the most advanced British stronghold at El Agheila. On March 24 this position fell and the axis columns pushed on to the east. On April 1, Marsa-el-Brega and Agedabia were captured, and on April 4 Bengasi was evacuated by the British and occupied by the axis forces. British reports claimed that there were no losses in completing the successful withdrawal from Bengasi. Three days later it appeared that the British plan was to withdraw to the east, perhaps to Egypt. On April 7, Derna was captured and valuable water supplies lost. On the same day an axis raiding party captured three general officers and some 2,000 retreating British forces near Mechili about 50 mi. southwest of Derna. It was not clear at this time that the axis forces were moving on a broad front, but the extent of the raids made south of the coast jeopardized the British withdrawal. By April 8, axis forces were continuing to advance toward Tobruk and on the 9th it appeared that Tobruk was in danger. By the 13th the fortified position at Tobruk had been encircled and the British positions to the east were in difficulties. Axis columns swept beyond Tobruk and captured Bardia, Ft. Capuzzo near the Libyan frontier, and Sollum across the Egyptian border. It is estimated that one Australian division and one mechanized brigade, both reduced in numbers, were holding the fortified position at Tobruk. It was apparent that the British could still provision or withdraw this garrison by naval forces controlling the water route to the port. The factor of risk in regard to relative strength of air forces made the position difficult to defend. By April 15, it became apparent that the force of the axis drive had been extended and the British forces were holding east of Sollum. British naval and air forces launched attacks against axis columns along the coast. Axis reports indicated that these attacks were repulsed. Around April 16, British reinforcements began to arrive from Ethiopia and defensive positions east of Sollum were strengthened. During the next ten days, British naval and air units attacked the axis base at Tripoli, and launched numerous air attacks along the coast. By April 22, it appeared that Germany had consolidated areas gained, and adopted defensive positions west of Sollum, while continuing to besiege Tobruk. On April 26, the axis forces launched a sudden raid east of Sollum, and advanced as far as Bugbug. British forces withdrew in the direction of Sidi Barrani, and appeared ready to fall back to prepared positions as far to the

east as Matruh. When axis forces suddenly withdrew to the west, the British counterattacked in that direction. A second axis raid met this counterattack and pushed the British some 25 mi. east of Sollum. By April 30, the situation appeared to have been stabilized. Until the third phase began, action was confined to sporadic raids between the defensive positions, with minor naval forays along the coast.

Concerning the operations in the second phase of the campaign, General Sir Archibald P. Wavell, British commander in north Africa, was quoted hy the press in the following comment:

> Our conquests in Cyrenaica were left to be held by a garrison of partly trained and partly equipped troops. I made a miscalculation there.
>
> I didn't expect the enemy to counterattack until the end of April at the earliest, by which time I hoped to have back at least part of a seasoned Indian division from Italian East Africa, and to have completed the equipment of troops left in Cyrenaica, which consisted of a British armoured brigade, an Australian division and an Indian motor brigade. All of these were short of equipment, transport and training.
>
> Unfortunately, the enemy attacked at least a month before I had expected it possible.

Third Phase, *Nov.* 18–Dec. 31, 1941.—After a lull of several months, during which both sides seemed to be gathering strength and waiting for favourable weather, the British suddenly struck back at the axis forces on Nov. 18, 1941. Thus began the third phase of the north African campaign, which was still in progress at the end of 1941.

Objectives.--In the main, the long-range British objectives were essentially the same as those which guided the first British drive into Libya in Jan. 1941. The axis objective was fundamentally one of defense—to fight a delaying action against the superior enemy forces until sufficient reinforcements arrived from Europe to allow resumption of the offensive against the British. The exigencies of the Russian campaign had weakened the Germans to an extent where they had had to delay plans for an offensive of their own.

Plans.—The British plan of action appears to have been an attempt to utilize superior numbers of troops, superior air power and an equality in mechanized equipment, to smash the enemy in a series of encircling movements and head-on tank battles. Instead of driving along the sea-coast, as in the first phase of the north African campaign, the British struck in strength from several points further south, sending out advanced mechanized columns in an effort to split the enemy forces into smaller groups for eventual destruction in frontal battles. An important part of the plan of action was the use of the royal navy to prevent any sea-borne reinforcement of the axis units, and to attack axis-held ports from adjoining coastal waters. Thus, this was to be a land-sea-air offensive, with co-ordination of all three arms of the service.

The axis plan of action was to exact as heavy a toll as possible from the British personnel and mechanized equipment, and then, upon the addition of axis reinforcements, to launch a counter-offensive into western Egypt.

Forces.—It was estimated that in Nov. 1941, the British forces in north Africa numbered approximately 85,000 troops. These included three armoured divisions of approximately 3,000 tanks, many of them of U.S manufacture. The British air strength numbered no more than 150 planes at any one time.

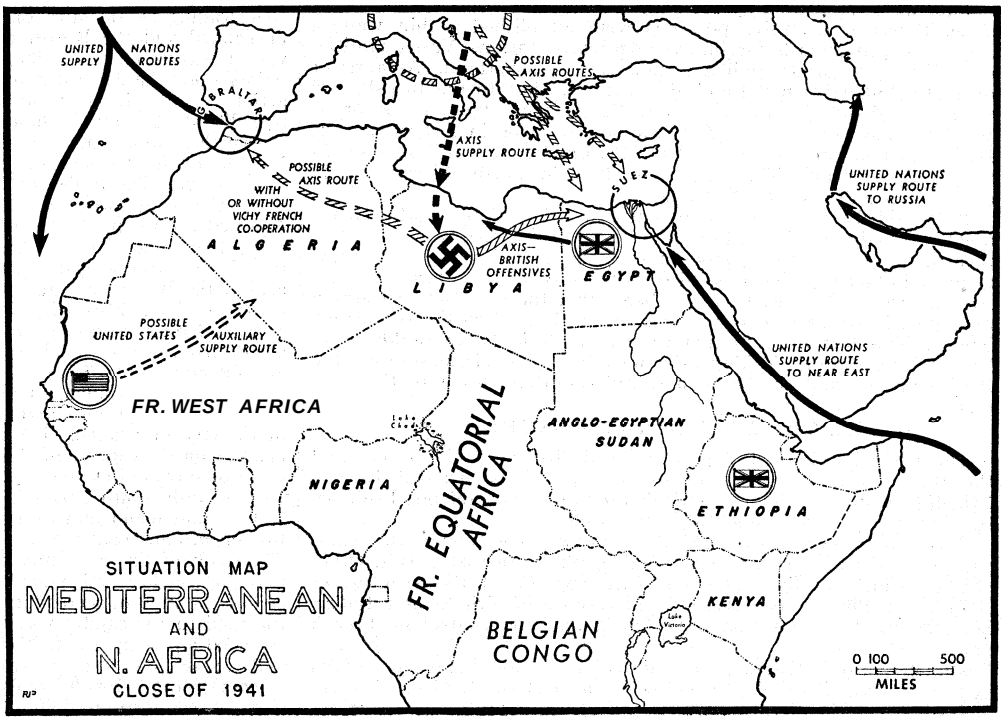
The axis forces numbered approximately 55,000 with three reduced-size panzer divisions. The axis had no naval support, and the total of axis planes engaged never numbered more than 90 to 100.

Operations.—The operations in this phase of the war began on Nov. 18, 1941, when the British, after long months of preparation, attacked in force across the Egyptian-Libyan frontier. Contrary to expectations, the attack came from five points, well to the south of the coastal towns of Bardia and Sollum. The first of these columns curved around to invest the axis stronghold of Sidi Omar, just across the border. Another struck out southward through the desert. The main columns, however, swung north after crossing the border, in an attempt to reach the sea and trap large axis forces in Sollum, Bardia, Gambut, Fort Capuzzo and Rezegh. At the same time empire forces in Tobruk, consisting principally of Indians, Australians and Poles, launched an attack from that besieged town, with the object of smashing through the rear of the enemy lines and re-establishing contact with their own troops. The royal air force struck heavily against axis airdromes and fortifications, as well as the Italian ports of Naples, Brindisi, Messina and Tripoli; while the royal navy carried out bombardments of enemy land installations all along the Libyan coast.

The advance was rapid. On Nov. 24, 1941, the British claimed the capture of Fort Capuzzo. Bardia and Gambut. The driving empire forces pushed westward toward besieged Tobruk, and a great tank battle developed at Sidi Rezegh. The British claimed control of the air in the middle eastern theatre, and German attempts to bring in reinforcements from Europe by towed glider planes, as in the Cretan campaign, were smashed.

For three days heavy fighting continued in the Rezegh area. On Nov. 27, 1941, the British announced that contact had been made with the Tobruk garrison. The bulk of the axis forces were caught in a pocket between Rezegh, Tobruk and the sea. The only axis offensive action, a diversion raid across the Egyptian border, had in the meantime been driven back. The British capture of Gialo oasis, far to the south, was also confirmed.

On Nov. 28, 1941, the second phase of the battle of Rezegh began. The axis forces trapped by the thin British line between Rezegh and Tobruk, launched a strong attack in an attempt to break free. Heavy fighting continued for several days, with German reinforcements moving up to join the battle from the west. On Dec. 3, 1941, by taking Rezegh, Zaafran and Bir el Hamid, the axis forces once again assumed control of the corridor south of Tobruk. Tobruk itself was again isolated. The British were



compelled to withdraw to a defense line extending from south of Rezegh to Fort Capuzzo. Bardia and Gambut were retaken by the axis, and the Sollum area remained firmly in axis hands. The initiative was with the axis during this period. The British appeared to be in the process of reorganization.

On Dec. 6, 1941, the British began the third phase of the battle of Rezegh with an attack in the vicinity of El Duda. Heavy losses in men and equipment were reported on both sides. On Dec. 10, 1941, it became evident that the British had won a victory, when the axis announced a general withdrawal of its units to the west of Tobruk. Except for scattered pockets of axis resistance, the area between Tobruk and Bardia was now under British control. Gambut and El Adem were reoccupied by the British.

Then began a systematic pursuit by the empire forces of the retreating axis units. On Dec. 11, 1941, the German high command admitted defeat in north Africa. Bardia and Sollum were still in axis hands, but they were isolated, miles behind the rapidly moving fighting front.

The axis withdrawal to the west continued, with the British maintaining contact in close pursuit. Axis losses were severe, as the retreating columns split into two bodies and fought unsuccessful rear-guard actions at Mechili and in the area southeast of Derna. On Dec. 20, 1941, Derna fell. The pursuit continued along the coast. On Dec. 25, 1941, the British took Bengasi without a fight. The main axis forces had destroyed the town and retreated to the south. British units, in the meantime, had driven across Cyrenaica and reached the Gulf of Sirte southwest of Agedabia, thus cutting off the main route of axis retreat into Tripolitania. As 1941 drew to its close, the main bodies of the British and axis forces were engaged in battle in the region of Agedabia. The final issue, however, remained to be determined.

Summary of the North African Campaign.— In the first phase of the north African campaign, the British attained practically every objective. To all intents and purposes, the Italian army in Libya had been crushed and eliminated as a threat to the Suez Canal. In addition, new air and naval bases had been secured by Britain, in a plan of operation which could be characterized by one word—pursuit. The principal tactical achievement was the development of unified command within the British forces. All operations on land, and the bulk of the naval and air assistance appeared to be under the control of a single commander. The completion of this early action in north Africa increased the prestige of the British forces, and resulted in prompt reinforcements for the British armies in Greece and east Africa.

In the second phase, this sapping of British strength in north Africa proved almost fatal. In two weeks, axis forces stiffened by strong German reinforcements drove the British out of the positions they had gained in eight weeks of hard fighting. Bengasi, Derna, Bardia and Sollum were recaptured by the axis. Tobruk was encircled and under siege. Powerful defensive positions were established within western Egypt as springboards for future offensive operations. Vast quantities of British and former Italian equipment were captured. As a result of all this, valuable naval and air bases were lost to the British, and with reduced British forces in western Egypt facing superior axis forces, the west flank of the Suez Canal appeared to be in serious danger. However, Tobruk still held, and the British fleet was still supreme in the Mediterranean. The British position in north Africa was in danger, but still capable of strong defense.

In the third phase, it was apparent that British forces had been reorganized and re-equipped to conduct open mechanized warfare in this theatre. The addition of modern mechanized and motorized equipment and other supplies received from the U.S., counted heavily in the British success. It must be remembered that the bulk of the German mechanized and air forces were engaged in the eastern theatre against Russia. This factor meant that the axis units in Libya could expect little reinforcement. Taking advantage of these circumstances, the British opened and conducted a skilful campaign, up until the close of 1941.

XI. THE EAST AFRICAN CAMPAIGN

The campaign in east Africa involved British empire forces and the Italian armies. The scene of the operations included Eritrea, British Somaliland, French Somaliland, Italian Somaliland, Ethiopia, the Anglo-Egyptian Sudan and Kenya Colony.

Operations.—For the British, the principal objective in this campaign was the elimination of the Italian armies in east Africa. Other objectives included the protection of the Suez Canal, the recapture of British Somaliland, the invasion and capture of Eritrea and Italian Somaliland, the restoration of Ethiopia and the control of French Somaliland.

The Italian objective was to retain control of all Italian possessions in east Africa and to adopt an offensive against the British, wherever and whenever the situation would permit. A desirable objective for offensive action was the Suez canal.

Plans.—The result of the operations indicates that the general plan adopted by the British was to cut off the western area of Eritrea, cut off the southern area of Italian Somaliland, then to converge forces within Ethiopia, find the main opposition and destroy it.

The Italian general plan included the defense in strength of positions in Eritrea, principally in the vicinity of Cheren, combined with defense along the Juba river in Italian Somaliland, the protection of the railroad from Addis Ababa to the coast, and the defense of the capital, if that became necessary. Apparently no Italian naval action could be planned. It also appears that no definite plan of operations was made for the resumption of offensive action outside of the area under Italian control.

Forces.—The British forces included large numbers of Indian troops, described as Moslems, in addition to colonial forces from Egypt, the Anglo-Egyptian Sudan, and Kenya Colony. Some Australian, New Zealand and South African forces participated. And in addition to British ground forces, units of the royal air force and the British fleet took part in operations. No reports were available as to the total number of all forces. It appears that the British were superior in numbers to the Italians in Eritrea, and it is estimated that the total of British strength was approximately 40,000. In other theatres, principally in the Kenya, Italian Somaliland, and southern Ethiopian operations, the British forces were smaller and an estimate of total strength approximates 30,000. Equipment appears to have been excellent. Motor transportation operating in rugged terrain had to he in good condition, and a considerable quantity had to be available for replacement of losses. Mountain artillery was employed, and some motorized guns and weapons carriers as well as armoured scout-car units were used. Air action for observation and bombing was reasonably superior to the Italian.

Italian forces in all operations varied in strength depending upon the location of the action. In the north, in Eritrea, it is estimated that Italian strength did not exceed 35,000 of all arms. In Ethiopia larger forces of approximately 50,000 were known to be engaged. Outpost garrisons near Lake Tana, west of Addis Ababa, and near the Kenya border were estimated at 15,000 total. In Italian Somaliland, reports indicate that around 10,000 organized troops were engaged in defense. An estimate of total Italian strength indicates approximately 110,000 total, although it is not believed that all forces took part in the operations. A considerable percentage of Italian strength was represented by the native Ethiopian forces. Some 30,000 to 40,000 of these had been organized and trained by the Italians. These are considered as additional forces to the estimated total for Italian troops. At the beginning of the campaign, Italian equipment appeared to be excellent in artillery and in motor transportation. During operations, however, no ieplacements could be secured, and both supplies and equipment suffered as a result. Large numbers of captured weapons indicated that old equipment had been put into use and that the modern equipment had been lost or worn out. Some Italian air forces operated, but no information was available on the condition of equipment used or the numbers involved.

Operations.—During the last week of Jan., 1941, British forces operating out of Kassala in the Anglo-Egyptian Sudan invaded Eritrea and advanced to the town of Biscia, at the western end of the railroad leading to Massawa on the seacoast. Italian defense lines were outflanked and the British captured the railway terminus. This invasion was combined with simultaneous patrol action from several points along the Anglo-Egyptian Sudan frontier into Ethiopia. Patrol action was also begun from Kenya Colony into Ethiopia and Italian Somaliland. During the first week in February, the British forces in the north advanced from Biscia to Agordat, an important city at the junction of the Addis Ababa highway with the railroad to the seaport of Massawa. The Italian defense was light and after a short engagement, the main forces retreated into the mountains and the British captured the town. About 1,500 prisoners were taken and some animals. It became apparent at this time that the British plan to use native Indian troops had been wise. The Indian forces fought well against the Italians and it appeared that their advance was welcomed by the natives. Meanwhile in the south, a small force from Kenya embarked on small schooners and motorboats and made a successful attack from the sea against Ras Chiamboni on the coast of Italian Somaliland. Some Nigerian troops were reported in this action. Border raids continued on all fronts. Late in February, the action on the north continued and the British besieged a large Italian force in the city of Cheren. The British plan to cut off Eritrea was dependent on the capture of this important centre. Elaborate plans mere made to surround the defenses and a stiff engagement was anticipated. In the south, south African troops pushed along the coastal roads in Italian Somaliland and captured Chisimaio on the Indian ocean. In this operation, small naval units, including air forces, lent assistance. The result of this operation gave these forces an opportunity to prepare for further action against the capital, Mogadishu. Before the end of the month, a crossing had been made over the Juba river and the road to the capital was open to the invaders. After two days of extended marching, the British forces reached and captured Mogadishu and Italian Somalilrnd was lost to Italv. The British claimed about 9,000 prisoners. Small forces secured the capital and columns were sent to the north to join other forces invading Ethiopia from the

southeast. The result of these operations realized one of the British objectives, the separation of the southern Italian colony from Ethiopia. Considerable satisfaction was evident, due to the fact that British Somaliland, still in Italian control, was less than half the size of the most recent British capture of Italian Somaliland.

During the first three weeks of March, invading British columns from Kenya joined forces with British troops operating north from Dolo in Italian Somaliland and captured Neghelli in southern Ethiopia. These columns prepared to move to the north against the capital, Addis Ababa. Larger British forces which had invaded Ethiopia from Italian Somaliland succeeded in reaching Jijiga about 50 mi. east of Harar. This operation opened the way to attack against the important capital-to-the-sea railroad which joined the highway running north from Harar. In the north, Cheren still held out against the British pressure. It became apparent that ground forces alone could not succeed against stubborn Italian defenses. Plans were made to secure co-operation from the royal air force. In the Gulf of Aden, British naval units succeeded in attacking and recapturing the capital of British Somaliland, Berbera. While the main area of this colony was still under Italian control this action assisted ground forces operating in Ethiopia by keeping Italian troops engaged to the east.

In the last week of March the city of Cheren in Eritrea fell. The British plan to secure air co-operation had proved to be successful. The air operations broke the defense strength of Italians and ground forces were able to move forward and capture the city. It was estimated that 30,000 Italians had been engaged in this operation. The bulk of the main forces retreated to the vicinity of the capital, Asmara, and to the south into Ethiopia. The British continued to advance with the object of completing the operation and securing control over all of Eritrea. Naval forces moved in closer from the Red sea and tightened the blockade around Massawa on the coast. In Ethiopia, the city of Harar fell on the same day Cheren was captured in the north. Italian resistance at Marda pass near Harar had been light and the British forces moved rapidly to Diredawa on the railroad The capture of Diredawa broke the rail connection between the capital and the coast, and forced the Italian troops to move to the west toward Addis Ababa.

Early in April, the main Italian resistance collapsed on all fronts. In the north the British captured Asmara and occupied the port of Massawa. The control of Eritrea was completed and large British forces had invaded Ethiopia moving south through Aduwa. The capture of Aduwa, scene of the Italian debacle in 1896, was accomplished by British forces hurrying to complete the operations to the south around Addis Ababa. These forces had advanced rapidly and reports indicate that the movement was made at the rate of 2S mi. per day. The bulk of the main Italian forces retreated to the mountains. The Italian commander, the Duke of Aosta, with a force of about 40,000 including some 30,000 native Ethiopian troops, took up a defensive position near Amba-Alagi. Peace terms were offered by the British but were refused and the converging British forces joined at Addis Ababa and completed the main operations. The principal objectives of the campaign had been accomplished and complete control was won when the remaining Italian forces surrendered during the second week of May.

Summary.—The successful conclusion of the east African campaign resulted in considerable gains for the Allies. The principal objective, the elimination of the main Italian armies in east Africa, had been accomplished. Eritrea, Ethiopia and Italian Somaliland had been won from Italy. British Somaliland had been recaptured. Along the Red sea, the Gulf of Aden and the east African coast, Britain had secured the ports of Massawa, Berbera and Mogadishu and controlled the port at Jibuti in French Somaliland. The Suez canal was secured from southern attack. The British naval operations from the Indian ocean to the Suez were rendered secure from Italian attack. Large British forces in Kenya and the Anglo-Egyptian Sudan could be released for duty in other theatres. A considerable number of prisoners had been taken and some useful supplies of ammunition, guns and other weapons secured. Politically, the British gained considerable prestige and the return of the emperor, Haile Selassie, to the control of Ethiopia augured well for the future. British naval and air units had managed to get and give co-ordinated aid when and where needed. Although unity of command had not been tried, the results had been satisfactory and the operations successful.

On the Italian side the results had been disastrous. Large forces had been captured and considerable supplies destroyed or lost. The colonies had passed out of Italian control and practically all Italian identity in east Africa seemed to disappear. The success won by Italian arms against Ethiopia and the dream of African empire appeared to vanish with the defeats suffered at the hands of the Allies. The axis cause had lost a valuable area of operations and now faced Allied forces in Africa which were refreshed by victory and strengthened by the release of forces from east Africa.

XII. THE BALKAN CAMPAIGN

The nations engaged in the Balkan campaign during 1941 included Italy, Germany, Hungary, Rumania, Yugoslavia, Bulgaria, Greece and the British empire. For the most part all operations were confined to air and ground activities with the exception of initial naval escort and convoy duty by units of the British fleet and the later naval and air engagements at the close of the campaign. The decisive actions were the result of air and ground combat.

Objectives.—The German objective in this campaign was to deny the land area of the Balkan peninsula to British forces and to secure a route leading to the area occupied by main British armies in the eastern Mediterranean. This action no doubt included future steps For the capture of the strategic island of Crete. Secondary objectives included the rescue of Italian forces engaged in cumbersome combat with Greece, the elimination of Greece as a British ally, the reduction of potential opposition in Yugoslavia, the extension of the German political and military control in Rumania and Bulgaria, and the addition of all available supplies and sources of supplies for future German war needs.

The Greek forces already engaged in major warfare with Italian forces sought to defend their home front and to secure an area for future attack in company with British allies.

The British objective in compliance with treaty guarantees was to support the Greek efforts against Italian aggression, and to secure a European land base for future use in resuming an offensive against Germany.

Plans.—The German plan of operations appeared to have been a simple advance to the southeast and south seeking to strike the main British and Greek forces and destroy them. In detail this basic plan included the political control of Rumania and Bulgaria to secure an advance base of operations, the separation uf Yugoslavia from Greece and the destruction of the Slav forces. In addition, Germany sought to unite her forces with Italian forces in Albania by an advance west from Bulgaria.

The British and Greek forces, limited because of the results of the Italian campaign, and because of necessary requirements for African defenses, adopted a purely defensive plan. Only limited British air and ground forces were available. The whole British effort appeared to be more a compliance with treaty provisions than a determined attempt to seek decisive results. The number of British troops engaged suggested a token force, The plan included *a* defense along the Bulgarian border coupled with renewed attacks to the west against Italy and the addition of strong resistance in the north by Yugoslavia. The Yugoslavian forces were committed to adoption of the defense of the frontier, but could not be counted upon to enter into any co-ordinated plan of joint British and Greek campaign.

Forces.—The forces involved are estimated approximately as follows: Yugoslavia, 550,000 including 15–20 divisions, 500–700 planes, without adequate reserves of trained man power or modern supplies; Greece, approximately 300,000 including 1j divisions with less than roo planes operated by British and some Greek aviators. For the most part, the bulk of these forces were engaged in Albania and less than 30% could be expected to assist the British during the German campaign; British troops were estimated at 5 divisions, approximately 100,000, including about 150 planes and small naval craft in support. These actual and potential allies combined presented approximately 1,000,000, with more than 50% of the total represented by the Yugoslavian forces as yet untried in battle and subject to the serious danger of national disorders within the home front.

The German forces in the Balkan area since early in January had been increased to approximately 550,000. The German system of assigning specially designed task forces had been carefully carried out in the creation of this Balkan army Air and ground forces were placed under responsible commanders charged with specific missions under a single supreme commander responsible for the whole campaign. In addition, the Germans could count upon increased assistance as soon as the Italian forces in Albania resumed the offensive and a union of forces could be made.

Operations.—The initial moves made by Germany were launched from Bulgaria against Yugoslavia. These forces sought to separate the Yugoslav forces in the southeast from those to the north One German column overran the small Croatian divisions along the frontier and reached the valley of the Vardar river. At this point the German column split into two parts, one part continuing to the west and southwest to join Italian forces in Albania, the other part turning south through the Vardar valley in the direction of Salonika. Other German columns invaded Yugoslavia from the Struma valley west towards Skoplje, through the Dragoman pass towards Nish, southwest from Rumania toward Belgrade and in the north across the frontier towards the cities of Ljubljana and Zagreb. Along the Bulgarian-Greek border, German forces invaded southward toward Salonika. Success in northern Yugoslavia was assured by the capture of the principal cities of Ljubljana, Zagreb and Belgrade. Political dissension resulted in the establishment of a separate Croat state, and weakened the potential strength of Yugoslavian resistance. In the southeastern part of Yugoslavia strong resistance was overcome in the Vardar valley, and Serbian forces were separated from the Greeks In Greece, Salonika was captured and eastern Thrace cut off from the remaining Greek and British forces. Junction was made between German and Italian columns on the sixth day of the invasion when advance elements met in the vicinity of Struga. Specially trained and equipped mountain troops were used by Germany. In all instances, German armoured forces operating with close and continuous air support, drove Allied forces to the south, overran defensive positions all along the British-Greek front, and meanwhile threatened rear area installations by

heavy air bombing attacks.

Between April 6 and April 8, the initial German attacks succeeded in separating the Yugoslav forces from the Greek forces along the Bulgarian frontiers. This defeat resulted in opening an approach for German columns directly to the Monastir gap at the approximate junction of the Albanian, Yugoslavian and Greek frontiers, and also at the centre of the first British-Greek defensive position. It appears that this gap at Monastir was lightly defended by small Greek forces. Main Greek forces were engaged with Italian troops to the west in Albania. Main British forces were engaged with German columns to the east in Thrace. This disposition of Allied forces had been made dependent upon the ability of the Yugoslavs to delay the initial advances of the German columns operating in the direction of the Vardar river.

On April g the British forces, principally made up of Australians, reinforced the Greek garrisons in the Monastir gap area. By April 11 it was evident that this position was untenable and during the period April 11–14 the defensive action was withdrawn first to a line running to the west from Mt. Olympus. When the flank and rear of this line was threatened, a second withdrawal was made to an area around Thermopylae, Here the New Zealand forces held the right (east) and the north of the line, while the Australians held the left (west) flank. For a period of about one week, British forces had been required to fight without substantial assistance from the Greeks. On April 21 the Greek forces capitulated in the west. The result was that large German forces were released for attack against the British position.

During the period April 22 to April 24, the British forces fought a stubborn defense in the vicinity of Thermopylae. The German control of the air and the constantly increasing strength of armoured and mechanized forces made the British position hopeless. The British plan for evacuation was carried out successfully but with considerable loss. During the hours of darkness on April 24–26, the British reported that 19,000 troops had been evacuated from the port of Megara, west of Athens. On the third night, 16,000 were evacuated. Further evacuation was less successful, although small forces were cleared near Peloponnesus where more than 700 were rescued. At the close of the campaign, British claims indicated that from all sources about 45,000 had been evacuated from the area. By May 1 the major hostilities had ended and minor actions consisting of local guerrilla warfare in remote Albanian and Yugoslavian mountain districts, and mopping up actions along beaches and within scattered villages were continuing. Later in 1941, however, the guerrilla attacks in Yugoslavia forced the Germans to move in several divisions to maintain their hold on the country.

Summary.—The Balkan campaign began on April 6, 1941 and major operations were completed in about three weeks ending with the British evacuation by May 1, 1941. Results indicate that the German objectives were achieved in all particulars, while the British and Greek forces, as well as the Yugoslav troops, suffered complete defeat. For Yugoslavia the results of two-day combat found the effective defensive power of the nation scattered and the organized forces rapidly disappearing. Political weakness had prevented unified action and revolts within the state precluded the adoption of a strong defense. The military operations were brief, but according to nazi reports more than 300,000 Serbian prisoners had been captured. It is difficult to estimate results alone in the light of military values. The Yugoslav capacity to resist had disappeared. No organized army existed to defend the country. The area occupied afforded Germany not only strategic security, but also specific if limited supplies of raw materials, control over all available industrial potentials, and considerable booty in the form of modern war equipment. Yugoslavia lost control of the Adriatic coast line to Italy, and faced the necessity of supporting both Italian and German occupation forces controlling all military objectives within the state. On all fronts, military, political and economic, the Yugoslavs lost national identity.

Greece lost heavily in the Balkan campaign. After months of valiant defense against Italy, and at times approaching the possibility of victory over this invader, Greece was overrun by strong German invasion forces. Germany claimed more than 200,000 Greek prisoners and considerable war equipment. Along with Yugoslavia bewildered within and rapidly defeated from without; Bulgaria, overrun without resistance and weakened by failure to achieve unity; and Rumania, long since subject to nazi control; the small, unified, defiant Greek nation, whose brave struggle had won the praise of democratic peoples and the support of the British, fell before superior force despite valiant efforts to resist.

The British lost the great opportunity to secure a base on the continent from which future attacks might be launched against Italy and Germany. The loss of an ally, Greece, was secondary in military importance so far as strength in numbers and equipment was concerned. This loss was of primary importance so far as the strategic value of the Greek land and sea areas was concerned. In addition, the unstable character of the governments in Rumania, Bulgaria and in Yugoslavia, all subject to the control of the most powerful invader. might have been swung to the side of the Allies if the British had been able to repulse and eventually advance northward against Germany.

The official British reports on the campaign claimed no more than 60,000 as a total for the forces involved in the campaign. The British claimed about 45,000 had been evacuated indicating over-all losses of about 25% in man power. Of this potential loss, the German claims indicated approximately 9,000 British had been taken as prisoners.

British naval losses were admitted to include a destroyer, an escort vessel and four transports. This indicates about 30,000 tons. Considerable armoured equipment was lost, and although claimed to be destroyed before falling into German hands, all abandoned equipment was lost for British use. British available air forces had been small and the relatively few planes in action had been destroyed or withdrawn.

Germany claimed over 500,000 prisoners, 500,000 rifles, 1,000 guns, thousands of machine guns, vehicles and large amounts of ammunition. More than 300,000 tons of shipping constituted the German report of Allied losses in naval and air warfare. Germany admitted losses of 300 officers and 5,000 men killed, wounded or missing in action.

The military action appears to indicate the following factors contributing to German success:

a. Concentration of well-balanced task forces-even including specially prepared mountain troops—adequate in strength and equipment, trained and organized for a particular mission and operating under a single commander.

b. Close and continuous co-ordination of all air-ground operations.

c. Battlefield mobility and the rigid adherence to the single over-all mission—the relentless pursuit, encirclement and ruthless destruction of the main forces of the enemy.

British failure is indicated by:

a. Lack of adequate strength and subsequent inability to organize a co-ordinated defense.

b. Lack of equipment, particularly in air forces.

c. Inadequate naval strength, permitting replacements of men and materials.

XIII. THE CAMPAIGN IN CRETE

The German conquest of Crete was accomplished during the period May no–June 1, 1941. A military analysis of the campaign indicates that the outstanding military development was the employment of air forces in this operation. Reports indicate that this was the first occasion in military history of the transportation, supply and support of a full-sized expeditionary force by air. The nations involved in this campaign include Germany, Italy, the British empire and Greece.

Objectives.—The German army sought to secure a land base in the Mediterranean for air operations against Allied fleet operations, against land bases and sea bases in north Africa and the Suez canal, and in support of axis land operations in Libya. Secondary objectives included the denial of a land base to the British for air operation against German-controlled oil fields in the Balkans, and against axis fleet operations along the island route from the Black sea to the Adriatic; the opportunity to further political pressure on Turkey to join the axis powers; the establishment of air control over the Mediterranean and the establishment of a base for any future military operations in the near east.

The British objectives in this campaign appear to have been the defense of the island of Crete in order to deny the site to the axis powers, and the retention of the military advantages which the island afforded the British and their allies.

Plans.—The German plans were based upon a principal reliance on their air forces to accomplish the objectives of this campaign. Early in May the German armies had completed the conquest of the Balkans. Adequate ground forces existed and supplies were considered ample for an attack against Crete. Naval forces were entirely inadequate. The final plan included an air attack against the royal air force to establish air superiority, the air operations against the royal navy to overcome naval superiority, air transportation of land forces to the theatre of operations, air support for landing forces and an air combat force to secure success for land operations.

The outstanding element of this German plan was that all operations were placed under a single responsible commander. This meant that air, land and naval forces were to be employed as one man decided. This contrasts somewhat with the absence of a unified command in the British plan described below.

The British plans for the defense of the island of Crete included the disposition of ground forces to protect the airfields and to protect the naval base at Suda bay. The British plan indicates that the defense was based upon maximum dispersion of available ground forces to defend likely areas of German attack, coupled with some reliance on small air forces and the limited employment of superior naval strength when operations permitted such use. It must be emphasized that all British plans were subject to the independent actions of the three separate and separated British land, air and naval commanders. These commanders were located in Cairo in Egypt. Only during a part of the operations was the naval commander with the fleet in the Mediterranean. The air force commander was in Cairo reorganizing air forces and taking instructions from the air ministry in London. Although General Freyberg directed ground operations in Crete, the principal ground force commander was similarly in Cairo, reorganizing the British army in north Africa, with the highest headquarters located in London.

Forces.-German forces have been estimated as follows from various British reports covering the operations:

	Approximately
Parachute division	5,000
Air infantry troops	5,500
Mountain division	5,000
	15,500

An over-all estimate of the German strength indicates a grand total of approximately 18,000. The equipment of these forces is reported to have included light artillery and some motorcycle transportation. Reports of operations by German light tanks were not confirmed. It is likely that the Germans employed commandeered transportation secured after making successful landings. The outstanding characteristic of the German forces was the number of aircraft employed. Various estimates have been based upon published reports of the operations. An approximate figure indicates that the Germans used about 1,500 planes of all classes including gliders. About 50% of this total represented transports. The balance included fighters and bombers in about equal proportions. This composition of the German forces and the organization of the air equipment represented an advantage over the British defense organization and equipment.

The British reports of the operations indicate that the original garrison was approximately one brigade of around 3,500. In addition, there were some Greek detachments of snialler size. Following the evacuation of Allied forces from Greece, large numbers were added to the original garrison. These troops included the Australian, New Zealand, British and Greek forces which had been engaged in that campaign and some marine and naval units which had successfully evacuated these troops. From various sources the size of the defense forces at the opening of the Crete campaign is estimated as follows:

British forces including New Zealand, Australian and marine troops	23,000
Colonial troops including Crete and near east	4,000
Greek forces	10,000
Approximate total	37,000

It must be remembered in any consideration of this estimate that these forces did not represent organized combat troops. In equipment these forces were sadly lacking essential items required for defense. Heavy artillery, tanks, transportation, barbed wire, tools for hasty fortifications, harbour defense installations all were limited in amounts. The outstanding contrast between the British forces in Crete and the German forces was the size of the air forces. No authorized statement of totals was available but from reliable sources it is believed that the British had less than 50 planes in Crete during the operations. Some of these planes had been in the Balkan campaign, some were stationed in Crete and a few were reported to have operated from British airfields in Egypt. Reports of operations clearly indicate great inferiority in air forces. Naval forces were superior in strength to German and Italian naval units. Reports indicate that during operations. the British fleet lost six vessels and suffered damage to several more naval units. No totals were given but, in effect, the relative naval strengths of the opponents show far greater superiority for the British.

Operations.—The initial phase of the German operations included the concentration of German men and materiel at selected sites along the Greek coast and on Italian-controlled bases. Bomber and fighter planes were assembled at Greek aiifields at Meneidi, Eleusis, Argos, Attica, the Peloponnesus, Italian Rhodes and the Aegean islands. The actual full-scale combat operations were preceded by extensive air reconnaissance and two or three days of heavy bombing against Crete antiaircraft defenses. (During the course of these initial actions, the Germans sought to find the extent and strength of the British air forces, the amount of opposition to expect from air bases and antiaircraft defenses in Crete and the extent and strength of any British naval forces.) The result of this initial phase was that the Germans established air superiority, discovered the size of resistance in Crete and reduced naval resistance in Suda bay. The actual objectives on the island of Crete were the airfields in Maleme, Retimo and Herakleion. In addition to these objectives, the marine base at Suda bay was another important target.

The German landing attack was reported as beginning early in the morning of May 20, 1941. The actual landing of parachute troops was preceded by several hours of intensive air bombing attack and machine-gun attack by low-flying planes. These attacks succeeded in forcing defenders inside defensive positions and opened the way for parachute landings. About 2,000 parachute troops were dropped near airfields in the vicinity of Maleme. In addition to parachute troops, air-borne infantry was landed from towed gliders. These gliders, carrying 12 men each, were towed by transport planes. Each transport plane towed two or sometimes three loaded gliders. Gliders were landed on level stretches of ground along beaches or near airport sites. Gliders were reported to be about 50 ft. in length with a wing span of 80 ft. It appears that none was equipped with a motor although there were reports of outboard motors for use after making landings in harbours. Armament consisted of one machine gun mounted on the wing. All men carried in the glider landed with full equipment and small infantry supporting weapons (light mortars, machine guns) were carried with them. (The use of gliders was a novelty, but it is not believed to have been extensive enough to affect the results of the action.)

Parachute troops appeared to follow the normal procedure observed in other German actions oi this type. Personnel and supplies were dropped in chutes of varying colours. The release of parachutes was begun close to the ground, reported heights ranged about 300 ft. Casualties were reported to be heavy when landings were attempted close to defensive positions. Other landings more distant from prepared defenses were more successful. By morning of the first day, the parachute and glider troops had landed and succeeded in capturing the Maleme airfield. The result of this success was that larger forces were landed by transport planes on the captured airport. Thus the first objective, capture of a landing site, had been accomplished in daylight hours. Late in the afternoon of the first day (May 20) additional parachute landings were made near airfields in the vicinity of Retimo and Herakleion. Estimates indicate that about 4,000 such troops were dropped in these actions. These operations were not successful and British defenses succeeded in retaining the airfield objectives. The principal result of the German action here was that without actually capturing air landing sites, the German forces prevented British troops from moving to the east to the aid of the garrison at Maleme. Later German action of ground forces moving eastward from Suda bay resulted in the loss of Retimo and Herakleion by the British.

On May 21 and 22, continued German action at Maleme succeeded in driving the British to prepared positions near Galatas. Overhead, both day and night, the air combat forces continued relentless bombing attacks on known defenses. Meanwhile the parachute forces discovered and notified air forces of the location of other land and air defenses. Superiority in the air, and the capture of the air landing site, permitted the landing of mountain division forces. The objective was to clean up British defenses in the western part of the island and then drive to the east in the direction of Suda bay. Reports on these air landings indicate that motorcycle detachments were included in the air-borne troops and also that light antiaircraft and antitank batteries were landed at this time. All German operations were successful, the western end of the island was cleared of opposition, and preparations were made to begin a strong offensive from the Maleme area to the east in the direction of Suda bay.

On May 23 and May 24, German operations began along the western coast against the British fleet. The objective of the British fleet was to prevent naval landings by the Germans. The results of the German and Italian attempts to land by water-borne transport were disastrous. No official figures are available, but the British reported success in preventing the landings and achieved the principal objective of the British fleet. It followed, of course, that the British fleet had taken a decided risk by exposing naval units without adequate air protection to attack by superior German air forces. The result of the inevitable German-British air-naval engagement was disastrous for the British. Six naval vessels were admitted to have been lost and a great percentage of the British fleet engaged in these operations was severely damaged. The decision was finally reached that the naval forces could not continue to operate against superior air force and the fleet was withdrawn on May 23.

These air and naval operations permitted the Germans to continue land operations against defense forces unable to secure naval or air combat assistance. Meanwhile, German action alone had resulted in the destruction of nearly all the British air forces available. Another decision to withdraw was made, and the few remaining British planes were ordered to return to Egyptian bases. Complete isolation resulted for the besieged British forces in Crete. On May 27, Canea fell. On the same day, a small Italian force, estimated as a regiment, landed by boat at Sitia in the eastern end of the island. The next day this force began to move in the direction of Herakleion. All the British defense was now at the mercy of superior forces. Around Canea, the British began to withdraw to the south coast to effect an evacuation from Sphakia. German forces pushed to the east to Suda bay and to Retimo. Junction was made at Retimo, and later at Herakleion, with the parachute forces landed in these areas earlier. Pursuit of the British forces continued to the south and considerable fighting took place in the mountains north of Sphakia. The main British forces succeeded in retreating from the island, although air attacks on naval units resulted in the loss of several transports. By June 1, 1941, the loss of Crete was conceded, and German and Italian forces continued to consolidate gains and mop up the remaining isolated and weak resistance on the island.

Summary.—German losses reported by the government admit a total of 5,893. British forces lost 12,920 while successfully evacuating 14,580, Germany claimed over 12,000 British prisoners. The brief operations secured for Germany all of the objectives of the campaign. A land base had been secured in the Mediterranean for operations against the British fleet and in north Africa. The oil fields of the Balkans were made more secure against Allied air attacks, and axis shipping from the Black sea to the Adriatic was less vulnerable to both air and naval attack. Turkey was forced to reconsider political action in relation to the axis, and Germany had secured a potential base of operations for future military action in the near east. In the tactical field, Germany had attempted and succeeded in organizing and launching the first all-air-controlled invasion of a land base de-

fended by superior land and naval forces. Once again it was proved that air forces can defeat naval forces inadequately supported in the air.

The British had lost a valuable position in the Mediterranean from which her fleet and land bases in Egypt were vulnerable to attack. British air forces were denied desirable sites for air attack against axis-controlled shipping. Political prestige was lost, in so far as the near east and Turkey were concerned.

The air invasion consisted principally of air-borne ground forces prepared to fight on land with the co-ordination of air support. Most important was the element of surprise, both as to the time of attack and the method to be employed. A military analysis cannot fail to emphasize that a paramount lesson of this campaign was the German organization of a task force equipped with adequate means to accomplish a specific job, all forces within it being under a single responsible commander.

XIV. THE NEAR EAST

The nations involved in the campaign in the near east included Vichy France, Free France, the British, Germany, Italy and Russia. In addition to these nations, the states of Palestine, Trans-Jordan, Syria, Iraq and Iran were the scenes of the operations and participated in the action.

Objectives: General.—The principal British objectives in all military operations in this area included the denial of the area to any axis forces. This objective included the security of the east flank of the Suez canal and the whole British position in the eastern Mediterranean. Additional objectives included the control of the Vichy-dominated government and armed forces in Syria; the control of the governments in Iraq and Iran; the security of oil supplies in this area; the control of the Trans-Iranian railway from the Persian gulf to the Caspian sea; the protection of the area across the routes to the Suez and to India; the extension of political pressure toward Turkey in regard to the Allied cause; and the extension of British prestige generally in the near east.

The axis objectives were principally concerned with securing control of the governments in Syria, Iraq and Iran in order to assure themselves of the vast near eastern oil fields and to facilitate further moves toward Suez or to the east.

Syria sought to retain its form of government operating under an agreement made between Vichy France and Germany signed in May 1941.

Iraq and Iran hoped to retain independence and to maintain a neutral status in regard to the axis and the Allies. Iran particularly hoped to be free from Russian intervention. Both states resented Allied or other control of the oil and other resources within their borders.

Iraq.—The Iraqi government was unstable during the early months of 1941. As a result of a revolt within the state a pro-axis premier took charge of the principal government powers including control of the armed forces. An early British agreement with Iraq permitted British forces to occupy certain sections of Iraq. The change in government leadership rendered the agreement void and increased the risk of essential German control. Despite attempts to reconcile political disagreements and reach a peaceful solution, hostilities began in May 1941.

Plans.—The axis plan apparently included the establishment of rear bases in Greece, the Aegean sea and the Italian island of Rhodes, while establishing advance bases in Syria and if possible in Iraq. Air transportation seemed to be the principal means relied upon for all movements to the near east. Action in Iraq appeared to be a prelude to action in Syria.

The British plan included attack upon all axis bases by air from Egypt and the near east, combined with fleet action along the Syrian coast and ground action in Iraq. The Iraq action was considered a necessary preliminary to operations in Syria.

The Iraqi plan was not immediately clear. It appeared to include the defeat of British forces within the border coupled with joint action with German forces whenever the new Iraqi government secured control over sizable groups of Iraqi armed forces.

Operations.—Axis forces established rear bases for air operation in Greece, the islands of the Aegean sea, and in Italian Rhodes. Advance bases were established within Syria at Aleppo, Palmyra and Damascus. Air and naval forces mined the eastern and southern coastal waters off Cyprus. The British royal air force began operations by bombing the rear bases and the forward bases of the axis forces. Germany replied by bombing Alexandria and the Suez canal, and followed up these attacks by bombing British forces at the Iraqi airport of Habbaniya and establishing an advanced airbase in the vicinity of Mosul. The British had already sent forces from Libya and Egypt to Palestine and Trans-Jordan. A large British column was formed and Iraq was invaded in the direction of Habbaniya. At this airport, British forces, already in possession by virtue of the earlier but disputed Iraq-British agreement, had been surrounded by Iraq troops and bombed by German air forces. The British column succeeded in making the relief of the besieged troops and drove the Iraqi forces eastward to Feluja. The Iraqi troops had resisted stubbornly at this point and flooded the area between the Euphrates and Tigris rivers, preventing the uninterrupted advance of the British on the city of Baghdad. Meanwhile German officers were organizing Iraqi troops for an attack on Basra in the south, while German air forces continued to hold Mosul, and conlinued air attacks on all British forces. The British royal air force attacked motor convoys of ground forces moving from Syria in the direction of Iraq. The British fleet occupied bases at the head of the Persian gulf and moved north and attacked Basra. After three weeks of scattered air and ground action the Iraqi rebel government fled to Iran. The collapse of all Iraqi resistance followed promptly. German forces withdrew from Mosul and Basra while Iraqi troops surrendered at Baghdad. The operations closed with the British forces in complete control of all Iraq.

Summary.—Within three weeks British forces had succeeded in defeating a rebellious army in the neighbouring state of Iraq, denied the area to the axis powers and secured the land area and the natural resources of the country. Iraq lost complete control of her own future, at least for the duration of the war, and suffered slight but apparently unnecessary casualties.

Syria.—The existence of axis officials in Syria, particularly those members of the armistice commission, resulted in' a growing-control by Germany over the Syrian government, the armed forces and the productive wealth of the state. Within the armed forces the majority appeared to favor the Vichy French government and to oppose the Free French organization. Axis activities within the state established the risk to the Allied positions in the near east. Operations resulting from the military actions in Iraq led to the opening of hostilities in Syria.

The British plan of operations included a land invasion of Syria from Palestine, Trans-Jordan and Iraq. In addition the royal air force was to attack axis air forces and French garrisons resisting the invasion. Meanwhile, the British fleet operating in the eastern Mediterranean was to be employed against the seaports to assist the land attacks.

The axis plan of operations appeared to be limited to air action plus the activities of many German nationals who were already in the country co-operating with the French army of the Levant.

British forces included Arabs, British, Scots, Anzacs, Canadians, Sikhs and Gurkha Indians and the Free French forces under General De Gaulle. The Vichy forces of the French army of the Levant included Senegalese, Annamites, Algerians, Moroccans, Lebanese and regular French troops. The total of British forces has been variously estimated as three to five divisions plus native troops and Free French forces. British equipment was considered excellent and included considerable artillery, tanks, armoured vehicles and about four hundred planes. Axis air forces were inferior in numbers and the number of troops appeared small and were apparently unorganized. Within the British forces, consideration had to be given to the Arabians' tribal feelings in regard to the holy city of Damascus as well as additional consideration to the possible loss of Vichy-controlled naval units to Germany if the French army of the Levant was too severely handled. All forces were mixed and this factor affected the conduct of the operations.

Operations.—On June 8, British forces invaded Syria from Palestine in the direction of Beirut on the coast, from Trans-Jordan through the mountains in the direction of Damascus, and from Iraq in the direction of Deir Ez-Zor and toward Aleppo. In the southwest the columns moving north toward Beirut joined at the ancient city of Tyre. Australian forces led the attack to Sidon from Tyre and succeeded in capturing the city. Strong French resistance resulted in the recapture of Sidon, and not until the British fleet bombed French positions from coastal waters could the British counteroffensive succeed in taking Sidon a second time. As these columns moved to the north the fleet continued to operate against French ports and against French columns moving along the coastal highways. Beirut fell after combined action by the ground forces moving north from Sidon and from the vicinity of Kisswe south of Damascus.

Farther to the east, British forces moved to the capture of the town of Kisswe and after four days of strenuous resistance captured the stronghold and moved north to besiege Damascus.

In the north, two columns separated by about 100 mi, moved simultaneously from the Iraq frontier toward the objectives of Aleppo and Palmyra. The northern column of Arabian troops continued to push toward Aleppo and toward the coastal city of Latakia. The southern column moving through Deir Ez-Zor swung to the south to capture Palmyra. Success at Latakia in the north would assist the fleet in the defense of Cyprus. Success at Palmyra would open the route to Tripoli through the city of Homs.

As the ground operations continued, the royal air force continued operations against obstacles holding up the advance. That action continued to effect necessary co-operation. It must be recorded that the limited axis intervention in these operations, the division of loyalties within the French army of the Levant, the precarious loyalties and tribal customs of some of the native forces and the mixed character of the Allied forces, all contributed to the final results of the military action. After 33 days of combat, the campaign ended on July 10 when an armistice was declared and hostilities ceased. Four days later, on Bastille day, the formal treaties were signed.

Summary.—In less than five weeks the British had succeeded in the invasion of Syria and the defeat of armed resistance within that territory. Reports indicated that the Syrian losses were about 9,000

casualties while the Allied losses totalled about 1,500. By terms of the treaty, French prisoners were released and repatriation granted to those who requested it. Of a total of around 33,000 French forces it mas reported that approximately 14,000 were repatriated to France. The British secured rights to occupy Syria for the duration of the war and this permission included control of war materials and public utilities.

Iran.—In April 1941, the state of Iran made an agreement with Germany which permitted large numbers of German specialists to enter the country to assist in the operation of oil wells and the operation of pipe lines. This country produced an estimated 78,000,000 barrels of oil annually. Pipe lines ran to the Persian gulf and extensive oil wells were in operation near the Caspian sea and the Iraq border. Just to the west of the Iran border pipe lines from Kirkuk in Iraq ran to Syria and Palestine. To the east are Afghanistan and Baluchistan, doorways to the British empire in India. The Trans-Iranian railroad connects the Caspian sea with the Persian gulf. To the north are Russia and Turkey. Late in August, Russia was engaged in war with Germany, and Turkey was still a doubtful neutral. German infiltration into Iran had continued despite frequent protest by the Allies. The British decided to take action and opened hostilities at the end of the month. The nations involved in this campaign included Germany, Iran, Russia and the British.

The axis objective appeared to be the maintenance and extension of growing controls over the Iran government and the natural resources of the country. The British objective was to further Allied control in the near east and deny the axis access to oil and to a position for future attack. The Iran government apparently wanted to retain its independence, be free from both Russian and British interference and continue friendly relations with Germany.

No organized axis forces participated in the campaign. Apparently all axis action mas confined to the operations of axis representatives in control of oil industries and possibly control of railroads. The Iranian army had an estimated strength of about 200,000 including reserves. Equipment was not complete and in some cases far from modern. Operations mere so limited that it is doubtful if more than a few hundred men were in action. Small naval patrol boats comprised the navy.

British forces were smaller in numbers than the Iranian forces. But here again operations were limited and only small British land forces were required. British naval forces were far superior to the Iranian naval units.

The Russian forces outnumbered all other contestants. Apparently three to four divisions were assembled for operations. Air forces appeared numerous but few were actually engaged in operations.

Operations.—Russian forces in the north moved south on either side of the Caspian sea. In the northwest one column captured Tabriz as the second column moved south along the seacoast toward Pahlavi. To the east of the Caspian, another column captured Bandar Shah, the northern terminus of the Trans-Iranian railroad.

On the first day of hostilities, red bombers flew over the capital city, Tehran, dropped bombs, and within a few hours orders had been issued by the Iranian government to cease firing. In the west the British invaded Iran from Iraq, captured an oil field near the border, and drove toward Kermanshah. British naval forces defeated the tiny Iranian navy, sank several axis merchantmen and landed forces at Bandar Shahpur, the southern terminus of the Trans-Iranian railroad at the head of the Persian gulf. These forces moved rapidly to the north and captured oil refineries at Abadan. British forces concentrated in Baluchistan were not required for operations. Hostilities ceased within an estimated 80 hr. after they began. Iranian resistance was easily overcome.

Summary.—Within a few hours the Allies had established control over Iran. For the British the victory provided a controlled route for supplies to Russia and brought Russia closer to the Allied camp. German infiltration into Iran had been eliminated and the way was open to establish an Allied line south of the Caspian if the Germans crossed the Dnieper. Germany lost an opportunity to secure a base for future operations against Russia and the British and realized that axis intervention in the near east had been progressively eliminated. Iran lost her independence and faced the occupation by Russian and British forces for the duration of the war.

Russia secured a valuable supply route to the south and the Persian gulf. In addition the ties were strengthened between Russia and the Allies, and an area was secured for possible resistance against the axis if operations to the north required a new defense.

Summary of Near East.—The Allies, operating with mixed forces, had secured Iran, Syria and Iraq from the axis or axis-controlled governments. Large areas were occupied, rich in oil and affording valuable sources of raw materials for war. Allied prestige was increased in the east. The route to India was secure. The Russian left flank was supported and a supply route assured to the Persian gulf. The right flank of the Suez had been secured and England's position in the eastern Mediterranean strengthened.

XV. THE RUSSIAN CAMPAIGN

The nations involved in this campaign included Germany, Finland, Hungary, Rumania, Italy and Russia. The areas of the countries of Latvia, Lithuania, Estonia and Poland were included in the war zone. The period of time covered by this analysis of the campaign begins on June 22, 1941 and covers the six months to the end of the calendar year.

Objectives.—The principal objective of the Germans and their allies appears to have been the elimination of the Russian armed forces. The German nation sought security in the east to permit freedom of action to the southeast, the south, the southwest or the west. Success for Germany would result in the acquisition of the industrial areas of Russia west of the Urals, insure vast additional stores of grains and foodstuffs, open the way to the oil supplies in the near east and Russia, encompass the rich agricultural areas of the Ukraine and the Donetz basin and furnish materials for continuing the war for an indefinite period. Strategically, the elimination of the Russian forces and the occupation of large areas of Russia would result in surrounding China with axis forces both to the east and to the west. Also, this success would bring the axis closer to the near east and to the road to India. It appears that Finland sought the return of the areas lost to Russia in the recently completed war. Other German allies had individual motives which looked toward the acquisition of territory lost to Russia or the gain of new territories to extend the power of the invaders. Adolf Hitler, the German leader, claimed that the security of the German state and of all Europe depended upon the defeat of Russia, and the elimination of the threat by Russia to extend the system of bolshevism throughout the world.

The Russian objective appears to have been the defense of the homeland. It followed that the objective included the defeat of the German and other invading forces, and the eventual destruction of the nazi and axis system in Europe.

Plans.—Terrain, geography, racial hatreds, time and the weather, were considerations included within the German plans for the conduct of operations in this campaign. Germany was familiar with the terrain on which the operations would take place. The areas in Latvia. Lithuania, Estonia and Poland were areas in which both Germany and Russia had manoeuvred on former occasions. The large plains to the east; the area covered by the Pripet marshes; the river systems; the road nets leading to the north to Leningrad, to the east to Moscow, to the southeast to Rostov; the supplementary rail nets leading to these centres and to the ports in the Baltic and on the Black and Caspian seas; these were terrain features which were the subject of continuous examination by the German high command. The geography of the area of the campaign found Russia far removed from outside sources of supply. So far as the geography is concerned, the factor of great distances marked this campaign distinctly. On the initial combat front, the opposing forces faced each other along a line equal in length to the entire United States-Canadian border. On the north flank, national hatreds smouldered within Latvia, Lithuania, Estonia and Finland, each a nation which had recently lost territory to Russia. In the south, Rumania had lost a valuable area to the Russian state. Within Russia the nucleus of a revolt existed in the disaffected group representing and supporting the Ukrainian republic. All these groups could be counted upon to fight against the Russian national objectives. The time factor demanded that the German objectives be accomplished at the earliest possible date and at the expense of the minimum effort. The weather forecast indicated that the Germans could count on approximately three months of reasonably good weather.

All these considerations undoubtedly were weighed carefully by the German high command before the opening of hostilities. It appears that the estimate made by Germany as to the duration of the campaign was a masimum of four months, with some reasonable expectations that success might be secured in three months or even less. It appears that the tactical plan was to include the familiar pattern of the "keil" and "kessel" method of attack, in which a wedge is driven into the enemy line to create a gap which allows large motorized and mechanized forces to rush through and to cut off and encircle and destroy the armed forces trapped by this operation. All operations on the ground were to be preceded by large-scale air attacks to gain air superiority over the Russians. The first objectives of the attack were to be Leningrad on the north and the port facilities on the Baltic, Moscow in the centre, Rostov and the Ukraine in the south. The Finnish plans appear to have been a deliberate ground attack across the frontier over the areas recently lost to Russia, and assistance to German forces to the south of Finland with the possible acquisition of control of the Russian ports on the Baltic.

The Russian plans for the campaign included a defense in depth along the frontiers facing Finland and Germany as well as Rumania in the south. This plan of defense was adopted with a view of the assumption of the offensive whenever the situation would permit. The Russian form of defense included a strong resistance in great depth around large, as well as small, centres of population. In addition, the Russians developed the plan of the destruction of supplies and the deliberate burning and blowing up of buildings and utilities whenever the German advance threatened these installations. As the campaign progressed over the first six months, the Russians in December adopted a strong offensive plan which included the pursuit of the retreating Germans and the initiation of relentless attacks 17-henever the opportunities were available. In all plans made by the Russian forces, the assistance of the civilian population was considered as a military factor. Russia has always classified the armed

forces as the People's army, and for defense purposes has considered the civilian population available for guerrilla warfare and for siege defense.

Forces.—The potential strength of the Russian army has been estimated as 10,000,000 men. This figure does not indicate clearly the maximum total initially available for front line use, or the final total engaged during the period covered by this analysis. Russia has considerable man power, and under the demands of a long war could probably orgznize, train and equip for combat, several million men.. It is not known definitely how many men were engaged at the opening of the campaign. The total was likely below 2,000,000.

As the campaign continued over several months, it is likely that the Russian forces increased in numbers, and it is possible that at the close of the year Russia had some 4,000,000 men in uniform at the front. In equipment the Russian foices appeared to have ample supplies of moderately good types of modern design. In the air, Russian planes were not superior to the German planes but there were large numbers of these and they continued to engage in operations despite admittedly high losses. In mechanized equipment the Russians appeared to have large amounts of vehicles of all classes although it was admitted that they did not compare with the superior German types in operation. In artillery and in smaller field guns, the Russians were well equipped and most of the equipment appeared to be excellent. Small arms and supplies of ammunition appeared to be excellent. In organization the Russians were unwieldy and lacked the flexibility of modern armies in combat. After the Russian-Finnish campaign there was an attempt to reorganize the forces to approach the modern balance between artillery and infantry in the combat forces. However, in defensive warfare, the larger Russian organizations in the field were considered to have adequate strength to offer continued resistance to attack by the modern German columns. In addition, the Russian plan for active defense called for heavy counterattacks limited in extent and suited to the larger Russian type of organization. All Russian forces were well equipped to conduct protracted resistance in isolated groups against German advances. In addition, the Russian civilian population was armed in many instances and prepared to engage in guerrilla warfare.

German forces were estimated to have been around 3,000,000 at the opening of the campaign. It is very likely that these German forces outnumbered the Russians in the first few weeks of the operations. Later estimates of both forces are extremely unreliable due to the conflicting claims made by each side as to the losses suffered as the result of action. It appears that the Russians gradually increased the numbers engaged while the Germans maintained around 3,000,000 total during the first six months of combat. German equipment was generally considered superior in all respects at the opening of the campaign. In the air, Germany had the finest combat aviation seen in operation during any of the campaigns of this war. Mechanized equipment was far superior to the opponent's. Late reports had it that the German government sought clothing for men at the front, but these reports indicate a failure to plan for a long campaign rather than a basic fault in the type of armament available for combat.

A comparison of forces indicates that the Russians had less than 100 divisions available along the front at the opening of the campaign. This total was probably increased to around 175-180 divisions during the first six months. Germany probably had 120 divisions at the start of operations and the Finns, with German assistance, had another 16-20 divisions in the north. To these totals of German and allied strength must be added the size of several air fleets, and the accompanying supply and administrative services. All totals shown are subject to considerable doubt, as figures were not available to neutral observers during the early months.

Operations.—The campaign opened when German forces crossed the frontier and German planes bombed Russian defenses early (3:00 A.M.) on the morning of June 22, 1941. First reports were incomplete. It appears that the operations to the close of June involved three principal areas of attack. On the north, German columns advanced through East Prussia in the direction of Vilna and Leningrad. In the centre, German columns advanced on a broad front in the direction of Bialystok, Minsk, Smolensk and Moscow. On the south the direction of advance was toward Kiev in the Ukraine. On June 23, Brest-Litovsk was captured. In a few days, the advance along the centre resulted in a German manoeuvre which surrounded large Russian forces in the Bialystok and Minsk areas. Meanwhile German and Finnish forces crossed the Finnish frontier and launched attacks along the Karelian isthmus and in the direction of Murmansk and Kandalaksha. Smaller forces were concentrated along the frontier opposite Petrozavodsk and north of Lake Ladoga. On the Russian-Rumanian frontier, Russian forces attacked to the southwest, the German-Rumanian forces succeeded in crossing to the east bank of the Prut river. The German attacks along the entire front were made along the familiar pattern of large-scale air attacks, followed by large mechanized attacks combined with motorized units. The German advance was rapid and the fighting around Bialystok and Minsk severe. Russian forces appeared to be offering strong resistance despite the success of German columns in breaking through and surrounding large groups along the extended Russian front.

During the month of July the German forces continued to advance against strong Russian resistance on all sectors of the front. On the Finnish front General von Falkenhorst, in cbmmand of German and Finnish forces, advanced on Kandalaksha and captured Salla on July 10. Farther south on the Finnish front, combined German and Finnish columns drove forward toward Petrozavodsk and to the southeast along the Karelian isthmus. The capture of Petrozavodsk would result in cutting the Murmansk-Leningrad railroad. During the month, the reports of these operations were obscure, but it appeared that the Finns advanced steadily against growing Russian resistance. This advance seriously threatened the Russian right, north flank. On the north central front. German columns continued to advance in the direction of Leningrad and the Gulf of Riga. Large Russian forces were trapped in the vicinity of Tallinn. Other Russian forces were heavily engaged in the defense of the islands of Oesel and Dagoe in the Gulf of Riga. At the end of the month, Russian forces were engaged in bitter defensives against combined German-Finnish-Rumanian-Italian and Hungarian arms all along the extended front lines. In the centre, the Germans had advanced from Bialystok, in the direction of Smolensk, and captured the city on the 14th. Russian forces had withdrawn to the Vyazma area, and also were concentrated in the Rogachev area and near Gomel. In this area, fighting had been severe during the entire month, and several counter-attacks had been launched by the Russians against the southern flanks of the German columns advancing toward Smolensk, and after its capture, advanced to the east. By Aug. 1, Germany had reached a line generally along the Vitebsk-Orsha and Mogilev sector while the Russian forces had in many cases remained behind to fight heavy rear guard actions which proved costly to the German armies. On the south, the Germans penetrated deeply into the Ukraine from the northwest in the direction of Kiev, and from the southwest in the direction of Balta and Odessa. During the period July 14 to July 17 in this sector, German columns approached closely to Kiev while Hungarian and German forces advanced more than 60 mi. across the former Russian-Polish frontier. Rumanian forces captured Kishinev, the capital city of Bessarabia. In the south, German columns were north and south of Kiev at the close of the month as the other allied forces continued to make advances through Bessarabia. Reports of large air and tank battles were made regularly by both sides and it is likely that these were of considerable importance. During the month of August, reports continued to indicate German advances all along the front. On the Finnish front it was reported that two large Finnish-German forces under the command of General von Falkenhorst had been increased in size and had received additional equipment including planes. These forces continued a steady and deliberate advance to the east and on Aug. 15 captured Sortavala. On the south General Mannerheim was in command, and his forces continued their attacks along the Karelian isthmus and to the southeast around Lake Ladoga. Viipuri was captured toward the close of the month, and the front apparently became stabilized temporarily about roo mi. northeast of Leningrad. In the Leningrad srea, German forces under General von Leeb continued to push forward to clear up the situation around this city, and to reduce Russian resistance in the Tallinn area. Novgorod was captured on 4ug. 16, and a few days later the German motorized columns cut the Leningrad-Moscow railroad, about 75 mi. southeast of the city. Throughout the month, heavy fighting took place around the suburbs of the city of Leningrad. On the central front, generally described as the Moscow front, German forces were commanded by General von Bock. In this area the German forces met strong resistance east of Smolensk and to the south in the Gomel area. Strong German attacks drove the Russians out of Gomel toward the close of the month and the central German columns advanced to the east. Russian counterattacks were reported throughout the entire month against these German forces, and it appeared that the German advances were appreciably slowed down. On the southern front, the German forces under General von Rundstedt and the Rumanian forces under Antonescu continued the advance into the Ukraine and along the shores of the Black sea. Early in August the Odessa-Cherkasy railroad was cut by German armoured forces operating in this area. As a result of this action, large Russian forces were compelled to withdraw in the direction of the Crimean peninsula. German columns drove to the east in the direction of Kirvoi Rog, and to the south between Odessa and Nikolayev. On Aug. 1j, Germany claimed the capture of Kirvoi Rog and also announced that German forces had advanced north of Nikolayev. Late in the month Odessa was surrounded and the Russians suffered heavy losses as a result of German attacks on convoys trying to evacuate forces from the city. On the 26th Dnepropetrovsk was captured and it appeared that the Crimean peninsula would be cut off from the mainland. All along the extended front from Murmansk to the Crimea, the Germans and their allies had advanced to the east during this month of August. Russian resistance had increased and Russian forces which had been encircled by German columns had refused to surrender and were continuing to offer serious resistance to capture or destruction. The Finnish front was not completely quiet but it appeared to be stabilized temporarily. Leningrad was under heavy and persistent attack and the Germans claimed that Tallinn had been evacuated by Russia with heavy losses. The German claims were indicative of complete as-

surance that the final victory was a matter of a short delay. It remains true, however, that throughout the month the claims of both sides were considered exaggerated and it was difficult to be convinced that a final outcome of the struggle was imminent.

September proved to be a costly month for all forces engaged. Russia had serious losses, not alone in man power, but also in vital areas. Viipuri was lost to General Mannerheim, and it appeared that continued advances would be made by the German and Finnish forces in the southern Finnish theatre. Such an advance would threaten Moscow from the northwest.

There were some signs that a separate peace might he made with Finland, but these indications never became the subject of report from official sources.

Leningrad had been completely surrounded, and to the west Russia had lost Tallinn in Estonia. On the central front, strong German drives pushed the Russians to the east despite spirited defense. Some German forces on the right flank of the central group turned to the south to assist in the encirclement of Kiev in the Ukraine.

Farther south, strong German columns attacked Kiev from the south and the southeast and besieged the city, the third largest in Russia. It appeared at first that the capture of this important centre would result in extensive losses of men and equipment, but the Russians claimed that they were able to withdraw large forces to the east. East of the city, the retiring Russian forces were engaged by the Germans, and severe losses were inflicted.

The new direction of the German drive threatened Kharkov. Meanwhile, along the Black sea and the Sea of Azov, Odessa was still besieged and the Crimean peninsula cut off from the mainland. German attacks continued on this area and particularly upon the naval base at Sevastopol, and the eastern exit leading to Rostov.

It was expected that the Germans would increase the tempo of the attacks in order to seek a decision before the advent of full winter weather.

In October, the German government announced a final drive on Moscow to end the war before the close of the year. Early in the month, Russian counterattacks began in the Leningrad area. Throughout the entire month, the German forces before this city appeared to be on the defensive frequently, and appeared to be unable to attack successfully and capture the city. In the Moscow area Vyazma fell on Oct. 13. and within a few days the Russian government announced a state of siege in Moscow. German columns approached within 60 mi. of the city. On the Finnish front, strong attacks were launched in the Lake Ladoga region, and both the Russians and the invaders suffered severe losses. On the southern front Odessa was captured, and in the Ukraine Stalino and Taganrog fell. The German advance on the central front continued and on Oct. 24, the leading elements were reported within 37 mi. of the capital city. On Oct. 25, Kharkov was taken and German columns moved forward rapidly to Rostov. By Nov. 1, it became apparent that despite these advances the speed of the German drives had slowed down. It was also expected that renewed drives would be initiated. In the Crimea the capital city, Simferopol, was captured and the naval base at Sevastopol besieged. Air attacks upon Russian shipping in the Black sea continued to take heavy toll of lives and continued to disrupt the Russian plans for the defense of this area. German columns moved to the east toward Rostov and claimed the capture of that city. On the Moscow front, furious engagements with large losses on both sides found the Germans along the line Kalinin-Klin-Moshaisk-Maloyaroslavetz-Tula on Nov. 25. Moscow was in serious danger of capture. In the south, at the close of November, the Germans had withdrawn from Rostov to the west, and it appeared that they would go on the deiensive in this area. Late in November the attacks on the city of Moscow were resumed.

December marked the limit of the eastern advance of the German forces. Russia rallied, and with the aid of reserves of both men and supplies stopped the German assault. Some German attacks were made along all fronts during the month, but the principal German action was defensive and at times the Russian attacks took on the character of a pursuit. Around Dec. 15 the German forces began a general withdrawal to the west. This may have been an action which had been the result of a previously made plan to occupy a selected defensive position. It wds not clear as the year closed whether the withdrawal was such a strategic decision or the result of spirited Russian attacks. Along the entire Moscow front, the Russian forces continued to launch heavy attacks at the close of the year. On the 29th, the Russians claimed the recapture of Kerch and Theodosia. On all fronts the Russians appeared to have adopted an extensive offensive which promised to be serious for the safety of the German position if it remained unchecked. The year ended on a hopeful note for the Russian nation; the greatest armed force on the continent had launched a determined attack lasting some six months and had failed to take the principal objectives of that attack. In addition, the Russians had not only stopped this attack, but had adopted the offensive and it appeared that unless the Germans built up a heavy defensive without delay, the Russians would be able to drive the invaders out of the country.

Summary.—It appears that the German armies and their allies employed all known modern means to overcome the Russian armed forces. The announced plans of the German armies contemplated an early decision. The results of the first six months indicate that these plans were not accomplished. It appears that the method of mass defense used by the Russians, the enormous distances involved, and above all the willingness on the part of all Russians, both in and out of uniform, to resist, combined to prevent the German success.

In this campaign, the great German transportation system broke down for the first time. The great distances and the weather contributed to make it more and more difficult to supply the German columns as they advanced deeper into the vastness of the country. Thus the value of the German air and mechanized forces was reduced, and the Russians were given valuable time to establish their own industry and supply facilities out of range of the Germans, beyond the Urals. This was one of the major factors of the campaign and, indeed, the entire war.

As for the Russians, the wisdom of their strategical conception cannot be overemphasized. Their avoidance of major engagements on the frontiers, their tactics of drawing the Germans deeper into Russia until supply difficulties and winter blunted the enemy's weapons, all were masterpieces of military tactics.

At the end of 1941, Russia still remained a potent force in the east. Germany was not free to engage in any adventure of great consequence elsewhere on the continent so long as Russia remained undefeated. The strength of German forces available for another operation was decreased as a result of the Russian campaign. The spread of the war in December brought other powers into the conflict and made more serious the failure of the German armies to attain their Russian objectives.

XVI. DIPLOMATIC DEVELOPMENTS DURING 1941

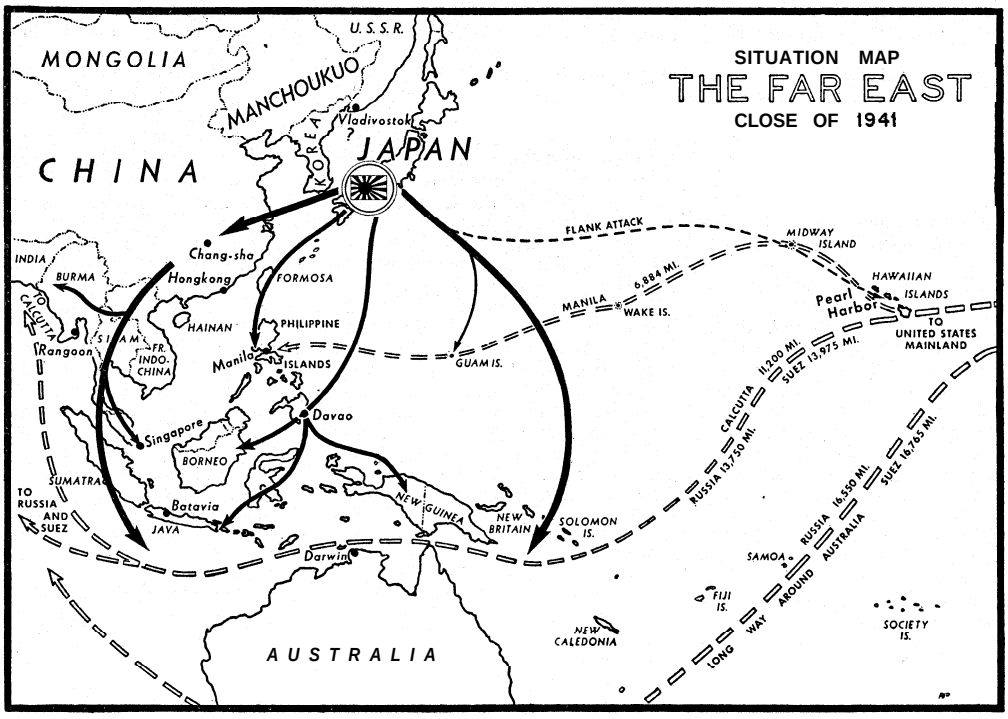
The Spread of the War.—During 1941, the main diplomatic action concerned the Balkans, Vichy France, Russia, Turkey, Japan and the United States. In most cases, diplomatic action constituted a prelude to military action. In Yugoslavia, the overthrow of the pro-axis government of Dragisha Cvetkovitch by pro-Ally General Dushan Simovitch led to the outbreak of the Balkan campaign. Early in June, a sudden coolness in German-soviet relations was followed by a German ultimatum demanding territorial and economic concessions, and the opening of hostilities on June 21. Turkey maintained the delicate seesaw of her relations between the Allies and the axis, although late in the year, the acceptance of American lend-lease aid caused a definite swing in the direction of the United Nations camp. Spain, Sweden and Vichy France continued to struggle desperately to appease the axis, and at the same time to retain as much of their territory and integrity as possible.

It was in the United States, however, that the most momentous events took place. With the conclusion of the Battle of Britain, a tremendous wave of sympathy for Britain and her Greek allies swept through the country. A Gallup poll in January indicated that 68% of the population believed that American security was linked with a British victory. It was then that a bitter, prolonged fight broke out between the "non-interventionists" (isolationists) on the one hand, and the followers of President Roosevelt's preparedness policies on the other. The non-interventionists, led by Charles A. Lindbergh, Senator Burton K. Wheeler and the "America First Committee," insisted that Roosevelt was plunging the country into war, and that all energy should be devoted toward increasing US. military and naval effectiveness and that limitations should be placed on the shipment of war materials to the nations combatting Hitler. The fight spread to the floors of congress, where for two months debate raged on the passage of the lend-lease act, known as the Barkley-McCormack bill, H.R. 1776, in the official archives. The bill was passed on March 11, 1941, and constituted America's first active participation in the war. It provided for: (1) the immediate transfer of existing war supplies to Britain, and all other nations fighting the axis, and (2) the establishment of the United States as "the arsenal of Democracy." Two days later, the house of representatives voted an enabling act of $7,000,000 000 to put lend-lease into effect.

In the meantime. Roosevelt had sent Harry Hopkins as his personal envoy to Britain, and Col. William J. Donovan on a secret mission to Europe, Africa and the near east. Wendell Willkie, the defeated Republican presidential candidate in 1940, also made a widely-publicized fact-finding trip to England. On February 9, Winston Churchill tied America and Britain closer together with a historic speech in which he said, "Give us the tools, and we will finish the job."

At the end of March, in a sudden dramatic move, the government ordered the seizure of 300.000 tons of axis shipping tied up in United States ports. This involved 28 Italian, 2 German and 35 Danish vessels—and evoked fierce protest from Germany and Italy. America was moving closer toward active participation in the war.

In April, Italy suddenly closed her consulates in Newark and Detroit. A stream of lend-lease supplies was by this time flowing across the Atlantic to Britain. On May 21, the first open act of aggression against the United States took place when the "Robin Moor." a merchant vessel, was torpedoed in the south Atlantic. On June 16, to curb espionage activity, the United States ordered the closing of all German consulates and agencies by July 10. A similar request was handed to the Italian ambassador, ordering the closing of Italian consulates and agencies by July 1;. A few days



later, the axis retaliated by closing American consulates in Germany and Italy. Shortly afterwards, the German and Italian consular officials were on their way home in the U.S. army transport, "West Point." The break was near.

On July 7, American troops landed in Iceland and the United States announced that she was taking over the protection of Greenland and Iceland for the duration of the war. By this time, America and Britain had promised full support to Russia in her war with Germany, and quantities of American supplies were pouring into the soviet union by way of Murmansk and Vladivostok. Britain was beginning to look toward American entry in the war, and British General Wavell called for an A.E.F. to be sent to Europe. On July 23, 1941, Japan suddenly seized bases in French Indo-China, with the concurrence of Vichy France. The United States and Britain immediately applied economic sanctions to Japan, cutting her off from vital tin, rubber, oil and steel, and beginning the deterioration of Anglo-Japanese and American-Japanese relations.

In August, President Roosevelt sent Harry Hopkins to Moscow, and opened the Basra route of supplies to Russia. Early in the month, in a momentous meeting at sea, President Roosevelt conferred with Prime Minister Churchill and evoked the Atlantic Charter. This historic document consisted of the following eight points: (1) there would be no territorial or other aggrandizement by the United States or Britain; (2) in the future, territorial changes would be by self-determination only; (3) every people would have a right to choose its own government; (4) there would be freedom of trade after the war; (5) there would be improved and more equalized standards of existence after the war; (6) there would be freedom from fear and want; (7) there would be freedom of the seas; and (8) the use of force in international relations would forever be abandoned.

On Sept. 4, a German submarine fired a torpedo at the American destroyer, "Greer," in the waters off Iceland and missed. One week later, President Roosevelt issued orders to the navy to "shoot first" at axis sea raiders. Shortly afterwards, the navy instituted full-Cedged convoys as far as Iceland. Allied sinkings correspondingly tcok a big drop. On October 17, the new U.S. destroyer "Kearney" was torpedoed 350 mi. southwest of Iceland. One day previous, in Japan, the comparatively moderate cabinet of Prince Konoye fell. It was replaced by the war-hungry government of General Tojo. With Konoye out the brakes were now released. The military group mas in full power in Japan, demanding that "the orient be purged of the United States."

With these two events—the deliberate torpedoing of the "Kearney," and the ascension of the Japanese militarists—the United States faced its greatest crisis since World War I. Obviously America was being squeezed from both ends of the axis. From this point on, the road ran downhill to war.

On Oct. 27 in a Navy day address, President Roosevelt answered the axis by saying "Damn the torpedoes; full speed ahead!" Up until that time, 11 American-owned ships had been sunk. An undeclared sea war now raged, and ship sinkings increased, but all signs pointed to the fact that the north Atlantic was being swept clear of axis submarines.

The first week in November saw the march of events approaching landslide proportions.

The United States and the axis clung to peaceful relations by a shred. Maxim Litvinov was appointed soviet ambassador to the United States, presaging close co-operation between America and the Union of Soviet Socialist Republics.

Japan demanded that the United States withdraw unconditionally from the far east to allow a final solution of the "China incident."

Finally Saburo Kurusu was sent to Washington to discuss "the possibilities for a peaceful settlement."

The second week in November, congress repealed the Neutrality act by a vote of 212 to 194. This provided for the arming of U.S. merchant ships, and allowed U.S. vessels to sail into any part of the world. The situation became more and more tense. Kurusu arrived in Washington, and began an endless series of conferences with the state department. Japan demanded (1) no obstruction of the Japanese effort in China, (2) the lifting of the Anglo-American blockade, and (3) no spread of the European war to east Asia. These terms were irreconcilable with the American basic demands. While desiring peace, America insisted on the territorial and political integrity of China, and was determined to prevent further Japanese aggression. In the midst of the negotiations, a tremendous number of Japanese troops were landed in French Indo-China. The United States demanded to know the reason for this move. Japan replied that the troops were in limited numbers, and were to be used in punitive actions against south China. The negotiations continued at a stalemate.

Then, without warning, on the peaceful Sunday morning of Dec. 7, 1941, the blow struck. The United States was at war.

XVII. THE FAR EAST

During the greater portion of 1941, the undeclared far eastern war between Japan and the nationalist government of China continued, apparently apart from the European conflict. The Japanese, with the concurrence of the Vichy government of France, took over important bases in French Indo-China and, later, to all intents and purposes, completed the investment and occupation of that rich dominion. In China itself, the Japanese operations were limited to minor campaigns in Hunan province, and to extensive aerial activity. Continuous heavy bombing attacks were made on Chungking, the capital of nationalist China, and on the Burma road, which was becoming increasingly important as a supply route from the United States and Great Britain.

Then, on Dec. 7, 1941, in the midst of peace discussions with the United States, Japan struck at widely separated vital points. Japanese bombing planes scored heavily in a surprise attack on Pearl Harbor, the great United States base, nearly 4,000 miles to the east of Japan. At the same time, Japanese naval forces attacked Guam, Midway and Wake—U.S. island stepping stones in the line of communications to the far east; and Japanese troops launched a series of invasion moves against Hongkong, Thailand, Malaya and the Philippine islands of Luzon and Mindanao.

In one day, the European and far eastern conflicts had merged into one world war. The United States, Great Britain, the Netherlands East Indies, the British dominions and several Latin-American nations entered the war against Japan. A few days later, Germany and Italy, together with their satellite nations, came in on the side of Japan. All over the globe, the lines were now sharply drawn.

Japan's first blows were effective. At Pearl Harbor, the United States suffered heavy losses in damage to land and naval installations. One battleship, one target ship, three destroyers. and one mine layer were lost, together with many aircraft. Guam fell and a short time later Wake was occupied, after a gallant stand by a small defending garrison of 400 United States marines. On Christmas day, 1941, Hongkong surrendered to the Japanese after relentless pressure for more than two weeks. Thailand capitulated almost immediately, and Japan used that country as a base of operations against Malaya. In Malaya the Japanese moved swiftly. The British air base at Kota Bharu fell, and soon afterwards, Penang, the big naval base commanding the Straits of Malacca, on the west coast of Malaya. The Japanese then began a systematic advance down both sides of the Malayan peninsula. At the end of the year, Ipoh had been taken, and Kuantan and Kuala Lumpur were threatened. Sizable landings had also been made on the Dutch island of Sumatra, and in British North Borneo and Sarawak.

Possibly the heaviest Japanese blows were struck in the Philippines. Landing some 200,000 troops at several beach-heads on the island of Luzon, the Japanese converged rapidly on Manila. The fall of that capital appeared imminent at the close of the year, although the small defending forces of United States and Filipino troops seemed capable of further resistance for some time. The occupation of the island of Mindanao was completed by the Japanese against comparatively weak resistance.

As the year 1941 ended, the air and naval iorces of the Netherlands East Indies and the United States had done appreciable damage to Japanese warships and transports, but on the whole, the Allies were still gathering strength for defensive and offensive action in the far east.

XVIII. THE WAR AT SEA

World War II up to Jan. 1, 1942 had seen conflict on the suriace, under the surface and above the suriace of nearly all the ocean highways travelled by the ships of all the nations of the world.

Sea power, the predominant iorce in determining so many of the great struggles in history, still remained a vital and unsolved problem. In the great world conflict between dictatorships and democracies. the democracies controlled the seas, although they were subject to severe challenge in the Atlantic and in the far east at the close of 1941. The British empire, with a powerful fleet, had strong naval forces based upon the British Isles, the Mediterranean sea—both in the east and in the west—and at Singapore in the far east. Other additional strong units were operating along west African shores covering routes to south Airica and to India, as well as additional forces operating along the Red sea and Suez routes. The British had approximately 20,000,000 tons of merchant shipping when the war began in 1939. From various countries defeated by Germany she acquired additional tonnage available outside the European continent. Purchases frorn neutrals and her own shipbuilding program increased the grand total available for the prosecution of the war. Estimates place the grand total tonnage at about 26,000,000 tons. In these respects, naval strength and merchant tonnage, the British had a decided advantage in the conduct of the war at sea. In addition, the royal navy was operating with an efficient air arm, which, as the war progressed, proved itself to be absolutely vital and essential to all large-scale fleet operations.

The British plan of operation included the protection first of the mainland of the home country, and with this, the protection of the merchant fleet bringing war supplies to the home front and to oiher fronts. It followed that the converse action for the British naval iorces was the denial of free access to the merchant shipping lanes of the world to the opponents; and whenever the opportunity arose, direct naval action against enemy naval forces, and the support of the empire land and air forces in operations against the enemy.

The circumstances of World War II contrast sharply with those of World War I in so far as the war at sea is concerned. In World War II, Italy was an axis partner and had to he dealt with in the Mediterranean sea and in the Red sea and Suez areas. Japan was an enemy and seriously threatened the security of the empire in the far east. While the Dutch East Indies were allies, the source of vital supplies in this area and the security of the commonwealth of Australia and of New Zealand became new responsibilities of the British naval forces. In addition, British naval bases in the far east at Hongkong and at the formerly friendly ports controlled by the French were in Japanese hands. The area to be denied to the enemy by blockade was enormously increased. Germany controlled the western European coastline from Narvik to Spain. From a hundred land bases for planes and dozens of excellent harbours for suriace raiders and submarines the enemy could launch strong and continuous attacks against the blockade forces and against the merchant shipping lanes. The Vichy French government was in a doubtful position in so far as the eventual control and use of the remainder of the defeated French fleet was concerned.

To the naval craft and suriace raider and the ever-present submarines had been added the powerful effect of the air arm. Geography, air power, the loss of allies, increased demands for supplies . . . these appeared to be the principal characteristics of the conduct of the war at sea for the British in World War II.

The axis powers, increased late in 1941 by the addition of the Japanese, had considerable strength for the conduct of warfare at sea. If Germany was short on battleships, she had considerable strength in submarines and employed available new Atlantic bases to full capacity. Italy had a Mediterranean fleet which might be defeated before the Mediterranean mould be free for the movement of vital Supplies of men and materials. In the far east, Japan had a powerful fleet not fully tested in modern warfare, but demanding the full attention of the British and United States forces engaged in that theatre. To all this axis naval strength must be added the new and powerful air arm which appeared to he more useful to the axis than to the Allies so far as the development until the close of the year 1941 indicated.

Naval Action During 1939 **and** 1940.—From the close of the Polish campaign on Oct. **j,** 1939, up until the German invasion of Norway, the war at sea constituted the major action in the struggle between Germany and the Allies. Independent German surface raiders and submarines played havoc with Allied merchant shipping, while the overwhelming Allied surface strength maintained a ring of steel around Germany's sea outlets and engaged German naval units wherever they could be met.

Early in the war, the British aircraft carrier "Courageous" was sunk by submarine attack at sea, and shortly afterwards a German undersea craft nosecl its way inside Scapa Flow naval base and sent the anchored 29,150-ton battleship "Royal Oak" to the bottom. On Nov. 23, 1939, the British armed merchant cruiser "Rawalpindi" met the German pocket battleship "Deutschland" and was destroyed in a gallant action which saw her firing her feeble six-inch guns at the enemy until decks were awash.

On Dec. 13, 1939, the first decisive engagement of the war took place when another German pocket battleship, the "Admiral Graf Spee," was attacked by three British cruisers, the "Ajax," the "Exeter" and the "Achilles," off the coast of Uruguay. Deploying themselves with extreme skill, the less-powerfully armed British cruisers damaged the "Admiral Grai Spee" which ran for Montevideo harbour and then scuttled itself on Dec. 17, supposedly on orders from Hitler. In the meantime, further British successes were announced by the government in London.

Up until the Norwegian campaign, at least 40 German submarines were sunk, one-tenth of the German merchant marine had been destroyed or captured and the rest driven irom the seas.

In the Norwegian campaign, sea power again played a major part. On April 8, the British destroyer "Glowworm" was sunk by two German destroyers while engaged in laying mines off the coast of Norway. On the day the campaign began, the German cruisers "Karlsruhe" and "Bluecher" were destroyed by Norwegian coast defenses, and shortly afterwards, the German battleship "Scharnhorst" was damaged in a long-range action with the British battle cruiser "Renown." During the violent running action in the Skagerrak and Kattegat, several German transports were reported sunk. The battle of Narvik was fought in two separate engagements. On April 10, 1940, a flotilla of British destroyers swept into Narvik harbour to engage strong German destroyer forces there. Two British destroyers were lost and two others damaged in this action, while the German losses were one destroyer sunk, three destroyers badly damaged and seven supply ships sunk. After breaking contact with the enemy, the British withdrew. Some days later, however, they reappeared, this time escorting the battleship "Warspite." The "Uarspite" slashed its way into the harbour, all guns blazing. The remaining German units were wiped out. In the last days of the Norwegian campaign, the British and French lost several small units and the aircraft carrier "Glorious."

During the battle of western Europe, sea power played a less important role, except in the historic evacuation of Dunkirk (see *The Battle* of Flanders). It was after the fall of France that the greatest naval engagement, up until that time, was fought. When the French began to demobilize their fleet in accordance with the Franco-German and Franco-Italian armistices, the British took over all French naval vessels in British ports. At the same time they requested Admiral Marcel-Bruno Gensoul to accept internment or surrender for a considerable French squadron based at Oran in Algeria. Gensoul refused, and on July 3, 1940, a British fleet under Vice-Admiral Somerville opened fire. The French losses were heavy. The battleship "Bretagne" was sunk, and the battleships "Provence" and "Dunkerque" were severely damaged and driven ashore. In addition, the destroyer "Mogador" was damaged. The battleship "Strasbourg" managed to escape with an escort of five destroyers and reached Toulon, but only after several hits were scored on it by units of the British fleet air arm.

During the week of July 20, 1940, units of the British and Italian fleets closed in action off the island of Crete in the Mediterranean. The principals in this clash were the Italian cruiser "Bartolomeo Colleoni," known as the fastest warship in the world, and the Australian cruiser "Sydney." In an engagement which consisted mostly of pursuit, the "Bartolomeo Colleoni" was overtaken by the "Sydney" and sunk. A few weeks later, British planes discovered an important part of the Italian fleet in the inner harbour of Taranto. Striking by the light of a full moon, British "Swordfish" torpedo planes launched a devastating attack shortly afterwards, sinking one 35,000-ton Italian battleship and damaging two 23,600-ton battleships, two cruisers and two supply ships.

Further damage was done to Italian naval strength by innumerable attacks on Mediterranean convoys by British surface craft, planes and submarines.

During the Italo-Greek war, the British fleet steamed unimpeded through the Strait of Otranto and bombarded Valona, on the Albanian coast, with 100 tons of shells.

The battle of the Atlantic continued to he the most vital theatre of sea combat throughout the year, as Britain fought desperately to maintain her life lines from America and the empire. On Nov. 5, an epic of the sea was written when-a 38-ship British convoy, protected only by the armed merchant cruiser "Jervis Bay," was attacked by the powerful German pocket battleship, "Luetzow." The "Jervis Bay" heroically committed suicide by engaging the "Luetzow" with her six-inch guns until she was blasted into a flaming, sinking wreck. In the meantime, however, 32 of the 38 ships oi the convoy escaped.

Such actions characterized the supreme British effort in the battle of the Atlantic.

Naval Action During 1941.—During 1941 the battle of the Atlantic, the battle of the Mediterranean and the battle of the far east were the leading events in naval warfare. In the battle of the Atlantic, Germany announced a war zone including the British Isle:: and Iceland and extending to the three-mile limit around Greenland and south to the French coast. From the western coastline of Europe, German attacks were launched against the British naval forces. The object of these attacks was to cut the vital lines of supply bringing war materials to the British. A secondary, but included, objective was to reduce the strength of the British naval forces whenever opportunity permitted. Surface raiders ranged throughout the north and south Atlantic waters, attacking and sinking merchant ships, avoiding, if possible, any action with naval forces. Submarines in large numbers, frequently on individual missions, but often in packs of six or more, slipped through blockade lines to wait for their prey along the shipping routes to the British Isles. Overhead the large seaplanes carried death and destruction to both ships and crews by bombing raids against supply ships and by acting as scouts for the submarine packs waiting for the kill. Reports indicate that, during 1940, British weekly losses were around 70,000 tons due to this type of war at sea. In Jan., 1941, the British claimed a new low in shipping losses when they put the total for one seven-day period at 37,000 tons. Losses increased in February and in March, 1941, a new high was reached when figures released by the British admitted a total of tonnage lost for one week at 148,000. Shortly afterwards the British admiralty announced that totals would not be published in the future, and it appeared the Germans had begun to succeed in the war at sea in the Atlantic.

The introduction of the convoy system, the acquisition by the United States of new bases in the north Atlantic, the improvement of antiaircraft defense within the British Isles, the prompt destruction of German naval units seeking battle and the wide extension of British air power in offensive action against German bases on the continent resulted in the reduction of these shipping losses. In addition, both the British and the United States shipyards established new records for speed in turning out new units for the maintenance of vital supply lines. These factors helped during the period from April to Dec. 1941, when the entrance of Japan into the conflict introduced the possibility of serious change. All British and United States forces removed from the Atlantic to the far east would reduce the effectiveness of their joint resistance against Germany in the Atlantic area. At the dose of the year 1941 the war at sea in the far east had not developed sufficiently to warrant an analysis of these effects.

On May 27, 1941, the German battleship "Bismarck" was sunk in the north Atlantic after a spectacular naval engagement with units of the British fleet. Reports indicate that the German battleship left the Norwegian coast from a naval base at Bergen on May 22, crossed the north Atlantic to the vicinity of Greenland and was sighted by British naval forces near Iceland on May 23. Apparently the objective of the "Bismarck" was to attack and destroy British naval units operating merchant-ship convoys in these waters. On May 24, British and German naval forces engaged in battle in this area. The scene of the first action was in the body of water known as the Denmark strait between Iceland and Greenland. The "Bismarck" was slightly damaged during this encounter. However, the British battle cruiser "Hood" was sunk and the "Prince of Wales" damaged. The "Bismarck" disengaged from this combat and the pursuit was undertaken by several units of the British home fleet. Air attacks were delivered by planes based on the aircraft carrier "Victorious" before all sight of the "Bismarck" was lost. On the morning of May 26, an American-built naval patrol plane with the British fleet sighted the "Bismarck" en route to the shelter of the French coast. Several large British units, as well as other vessels, closed in for battle. Torpedo bombers from the carrier, "Ark Royal," severely damaged the "Bismarck" and the battleship was forced by this action to reduce its speed. Destroyer units launched attacks which rendered the enemy steering action useless, and the warships "Rodney" and "King George V" silenced the "Bismarck" guns. On the morning of the 27th, the British vessel "Dorsetshire" sank the "Bismarck" off the French coast by torpedo attack. This engagement in the war at sea indicated the two principal types of naval action in modern warfare. The first was the ship-versus-ship action during which the battle cruiser "Hood" was lost and the "Bismarck" damaged. The second was the discovery and the attack upon the "Bismarck" by patrol and torpedo planes. The first type of action is the classical tradition of naval warfare. The second is coniparatively new, and while at this time not decisive, the air action contributed considerably to the final destruction of the opponent. The loss of the battle cruiser "Hood" was a severe blow to the British. However, the loss of the new battleship "Bismarck" represented a greater loss of strength to the German fleet in comparison between the relative strengths of the two navies. No decisive answer had been made to the erroneous but persistent question of the battleship versus the aeroplane.

The balance of the war at sea in the Atlantic was concerned with the operation of convoys, the occasional excursion on raids against the European coast and protection of the home front and coast lines against invasion.

In the Mediterranean sea the British were faced with a different, but equally important, task in the war at sea. The British control of Gibraltar and of the Suez was essential to the conduct of the war. These entrances into the Mediterranean had to be in British hands if the Italian naval forces were to be denied the use of the Atlantic and if the British were to continue to use this area as a supply route for the home front. The narrow channel between Sicily and Tunisia, about go miles in width, offered the Italians opportunities to launch attacks upon forces moving along the east-west routes between Gibraltar and the Suez. This geographical factor meant that the whole Mediterranean area was divided into two theatres of action. In the western theatre the fall of France meant the loss of Toulon, Corsica, Bizerte, Algiers and Oran as naval bases for joint British and French use. It will be recalled that the existence of France and Italy as allies during World War I made all these circumstances aids to the British rather than danger zones. Far from controlling this area, the British faced a constant struggle to maintain themselves in the war in the Mediterranean sea.

In Jan., 1941, the British aircraft carrier "Illustrious" was crippled by air attacks, while the cruiser "Southampton" was so badly damaged by an air attack it was beyond salvage value and was sunk. In this action, at least one destroyer, the "Gallant," was seriously damaged. These attacks from the air were launched in the narrow channel between Sicily and Tunisia. The fact that they could be launched and could result in such extensive damage indicated the strong challenge to continued British use of the east-west route through the Mediterranean.

In February, the British fleet made raids along the eastern Adriatic coastline off the shores of Albania and also attacked the naval base at Genoa. Earlier raids had already been made against the base at Taranto in 1940. These raids were combined with air attacks to reduce the possibilities of continued Italian naval action.

In March, the British fleet engaged a strong Italian force in the vicinity of Cape Matapan. These Italian forces, moving east in two columns, approached the island of Crete from the west. The British forces moving west from Alexandria and Suda bay in Crete attacked the southern column of the Italian force. One Italian battleship, the "Vittorio Veneto," was badly damaged, three heavy cruisers were lost and two destroyers were also sunk. The British reports indicated no losses in this action. This engagement went far toward establishing the British control in the eastern Mediterranean.

During the Libyan campaigns and also during the campaigns in Greece and Crete, the various elements of the British fleet took part. These actions were not considered to be limited solely to naval forces and are described in the analysis of the military operations.

In the far east the war at sea was confined for the most part to occasional surface-raider attacks upon shipping, and to the limited action of the Japanese naval units against stray Chinese merchant vessels. These circumstances obtained until the entrance of Japan into the war in December. The Japanese war at sea was not confined alone to the operation of naval units. The attacks upon Pearl Harbor in the Hawaiian group, and upon Guam, Midway and Wake islands were combined naval and air actions. In addition, the attacks upon the Philippines, upon the Malayan coast and the East Indies were the result of combined action. The most spectacular naval action was the result of the engagement between the British battle cruiser "Repulse" and the British battleship "Prince of Wales" with Japanese air forces. Without adequate air protection these vessels were attacked and sunk by Japanese air forces. This action appeared to be the only outstanding plane versus ship operation during the pear in the war at sea.

In considering the old question of the plane versus the battleship, this action should prove at least one point, which is that the question in itself is irrelevant. Battleships without adequate air support are subject to attack and destruction. It follows that there must be unity of command wherever air and other units are employed in the same action. These forces are complementary in their efforts and must be balanced and controlled as the separate instruments in an orchestra and harmonized and led by a single conductor.

XIX. THE WAR IN THE AIR

Every major air action during 1939, 1940 and 1941 supported the belief that air power is essential to the conclusion of all decisive operations in modern warfare. However, although during the principal military campaigns air power played a decisive role in co-ordinated operations with ground and naval forces, air warfare over England and the continent did not in itself produce decisive results. The conclusion to be drawn appears to be that the surface forces, both ground and naval, cannot secure decisive results without securing equality, or temporary superiority, in the air. In Britain, and also on the continent, air forces alone had been unable to secure decisive results. This necessity for adequate air strength acting in concert with other forces in the conduct of operations is further dependent upon the adoption of unity of command. These are not new lessons of warfare. The number of operations in the war in the air and the magnitude of World War II emphasize their importance.

Aside from the use of air forces in the separate campaigns discussed under military operations, the principal war in the air was concerned with the battle of Britain and the subsequent opening of the battle

of Germany. Early in the year 1941, Lord Beaverbrook, the British minister for air, stated in effect that Britain had more aeroplanes of every type in operation than ever before in her history. During Jan., 1941, the British made the first mass air raid on German bases on the continent. After Dec. 29, 1940, when German air raids over London had been most severe, the axis planes appeared to have reduced the number and the intensity of their attacks. Britain meanwhile had adopted the oifensive and was gradually extending the radius of distant attacks on Germany. The lull in German attacks continued in February and many estimates were made as to the disposition and probable employment of the German air forces. Some British estimates placed the German air force combat-plane strength at 19,000 ships. A United States estimate suggested that Germany had about 18,000 first-line planes, with another 18,000 for replacement, available for attack on England. No large-scale attack of this character developed during the year 1941.

It was apparent that the British plan for the conduct of the battle of Britain in 1940 had been changed for 1941. In 1940 the British had fought savagely to maintain air equality over the islands and to attempt occasional air raids over the channel. Now the British extended offensive air action in attempts to destroy invasion bases and to reach far inland to destroy the German capacity to concentrate and support a large-scale invasion. In addition, the British extended the use of the air arm to assist naval and ground forces in some of the operations in the Mediterranean. It was reported that British parachute troops had been dropped in southern Italy during February. In March the British claimed extensive air raids over the continent as far to the east as Cracow. The loss of life due to air raids over Britain dropped to a new low of 1,500 per month compared with the tragic high figure of some 6,900 for the month of Sept. 1940. It appeared that the British air strength had increased to warrant full support of the new British plan for the conduct of the war in the air during the early months of 1941.

During April, furious German air raids began again over widespread areas in England. Despite heavy losses, these raids continued during April and May. In mid-June, after a period of relative quiet, the British initiated the first of their large-scale daylight raids over the channel coast and the German bases. The opening of the German war against Russia and the acquisition of the Iceland base by the United States combined to offer new opportunities to the British in the conduct of the war in the air. New supplies and ships could be expected from the United States. German air forces would be engaged in the Russian war. Britain swiftly improved its air equipment, developed its air defense and air offense tactics and launched repeated attacks against the continent. In July Germany launched no reprisal raids. Scattered German attacks were made over England during August and September. During September, the German air forces appeared to be concentrating on shipping, both along the sea lanes and also against the ports of entry on the coast. British claims in October 1941, indicated that the Germans were dropping large land mines which might have caused the extensive damage to Coventry and to other English towns in earlier raids. The intensity of the British raids over the continent continued during the balance of 1941. Ports were bombed, industrial areas were destroyed, Berlin was under frequent attack and at times both the British and the Russian forces combined in launching raids over the German cities. The full extent of the British raids had to be reduced during a part of November because of poor weather, and also because the German antiaircraft defenses had been improved. This increased resistance resulted in heavy losses of pilots and planes for a short period during this month.

The year 1941 closed with the British definitely equal in strength, and frequently superior in strength, to the German air forces. Complete air superiority appears to be an impossibility. Temporary air superiority may be secured for a short period of time and as a result of large concentrations for operations frequently resulting in large losses of men and materials. Regardless of the excellence of the modern air defenses, some planes will get through to launch at least minor attacks which are not designed to bring about decisive results.

The war in the air developed within the German air forces a system of close co-ordination with ground and naval forces. Unity of command appeared to be the rule. While a separate air force existed in Germany, complete co-ordination appeared to be secured at all times. The British developed a satisfactory type of plane detection for use during day and night, organized fighter commands and coastal commands of great strength and flexibility, and despite occasional heavy losses, adopted extensive offensive actions over the continent. British air co-operation with ground and naval forces was erratic, but showed improvement.

Considerable improvement could be expected as soon as the principle of unity of command in operations became the rule instead of the exception. (H. A. DR.)

XX. WAR IN THE PACIFIC, 1942–43

The Japanese attack on Pearl Harbor extended World War II, theretofore confined to the continents of Europe and Africa, to the western hemisphere, Asia, Australia and Oceania—the entire globe.

At the outset of this global conflict, the axis powers had the advantages of interior positions, shorter supply lines, better-trained and larger armies, and total mobilization of their peoples in the war effort. As a counterbalance to their inferior military position in Dec. 1941, the United Nations had one great and definite advantage: the virtually limitless industrial potential of the United States, whose giant production iacilities were harnessed to the war effort immediately after Japan's new aggression in the Pacific.

This aggression started on Dec. 7, 1941, when Tokyo's war lords set in motion a synchronized land, sea and air blitzkrieg in an effort to make all Asia tributary to Japan. Among their objectives were conquest of Malaya and Burma on the Asiatic mainland, and the countless islands in the southwest Pacific. A summary of Japanese military operations in Asia and the southwest Pacific follows:

1. Malaya. — The immediate goal of the Japanese campaign in Malaya was the capture of Singapore, keystone of British naval power in the far east. As long as this mighty base remained in Allied hands, the combined Anglo-American fleets could prevent Nippon's projected moves to the south. The British command in Malaya based its strategy on the assumption that should war start, Singapore would become the chief Allied base from which the Anglo-American fleet would seize the initiative to strike at the Japanese heartland itself. This strategy was severely jolted by the Pearl Harbor attack. An even more serious blow to Singapore itself was the sinking on Dec. 10, 1941, of the "Prince of Wales" and the "Repulse," the loss of which deprived the fortress of its chief weapons for offensive operations. As a result, the great British naval base was stripped of its power almost overnight and reduced to a land base of dubious defensive strength.

The Japanese opened their drive with invasions of both the western and eastern shores of Malaya. Operating from bases in Thailand, one Japanese column struck across the Kra isthmus, severing communications between Malaya and Burma. Another force landed on the east coast at Kota Bharu, a few miles south of the Thai frontier, capturing the airfield there on Dec. g, 1941. Simultaneous with the land attacks, Japanese bombers severely damaged the principal Malayan airfields, destroying more than half of the R.A.F. aircraft, which were surprised on the ground. The Japanese thus rapidly won air superiority at a low cost and then intensified their drives down both coasts. British efforts to stem the Japanese torrent were unsuccessful. By Jan. 15, 1942, the British imperial armies had been thrown out of Kuala Lumpur and Port Swettenham and all British hopes of holding any portion of the mainland vanished. Australian and British troops retreated rapidly toward Singapore and on Jan. 31, they crossed the Straits of Johore and blew up the causeway linking Singapore island with the mainland behind them.

Numbering about 60,000 men, the British army was exhausted by seven weeks of constant fighting. After a week's respite, the Japanese force, estimated at 100,000 men, swarmed across the Straits of Johore and overran the Singapore defenses. On Feb. 15, the British surrendered unconditionally. The Japanese, who reduced the "impregnable" fortress of Singapore in two weeks, had won one of the most impressive victories in their history.

2. The Battle of the Philippines. — The paralyzing blow dealt to American naval power at Pearl Harbor, Dec. 7, 1941, immobilized the United States Pacific fleet and dashed all hopes of getting reinforcements and supplies to the Philippines. As a result of this attack and the destructive raids on the American airfields in the Philippines, Japan immediately won both air and naval supremacy. Now practically immune from aerial or naval attack, the Japanese started to invade the Philippines and poured troops onto the island of Luzon. By the end of Dec. 1941, two large Japanese armies, which had been landed on Luzon, were converging on Manila in a move to encircle the defending American-Filipino units. Gen. MacArthur, however, eluded the trap, evacuated Manila, which fell on Jan. 2, 1942, and withdrew to the rugged and difficult terrain of the Bataan peninsula. Although MacArthur's armies were outnumbered by five to one, they held the Japanese at bay on the Bataan battleground for three months.

But 12 weeks of constant fighting with no air support and against heavy odds exhausted the American-Filipino army. Gen. Wainwright, who replaced MacArthur after the latter was sent to Australia, held firm until March 31 when Japanese infantry covered by shell-fire from warships offshore, forced a breach in the Bataan lines. Waves of Japanese shock troops poured through the crumbling defenses and on April g, the Japanese overran the entire Bataan sector.

Of Wainwright's entire force of 43,000, some ***36,000*** were captured, killed or wounded in this battle. Wainwright with a force of 7,000 soldiers, marines and sailors and some 3,000 civilians escaped from Bataan and fled to Corregidor. This island fortress, however, was completely cut off from outside aid. Japanese units stormed the "Rock" and took it in an all-out assault on May ***6***. With the fall of Corregidor the Japanese had conquered the last principal point of resistance in the Philippines, although American and native guerrillas still fought in the remote islands.

3. Netherlands Indies. — In the carefully designed pattern of Japan's strategy to establish a "co-prosperity sphere" in Asia, the East Indies were a major objective. This rich archipelago possessed abundant oil, rubber, quinine, copra, spices, coffee, rice, timber and other tropical products. Japan launched its invasion of the outer rim of the East Indies archipelago on Dec. 17, 1941, with landings on Sarawak, a British protectorate in northwestern Borneo. The Japa-

nese then invaded Tarakan, Dutch island and oil refining centre off the east coast of Borneo, and the Minahassa peninsula of Celebes. Both areas fell under their control by mid-January 1942. After securing a foothold on Celebes, the Japanese troops struck to the east and landed on New Guinea, New Britain and the Bismarck archipelago on Jan. 23. They seized Rabaul in New Britain and Kavieng in New Ireland, thus winning strategic bases on the eastern perimeter of the East Indies. Their efforts to drive a wedge through the centre were temporarily halted when an Allied naval force smashed a large convoy in the Strait of Makassar, sinking at least one-third of the Japanese ships, Jan. 24–26.

Despite this setback, the Japanese continued their infiltration southward, occupying strategic points on Borneo and Celebes, and by Feb. 12 they had won complete control of the Strait of Makassar and established airfields within bomber range of Surabaya. The Japanese then invaded the southern tip of Sumatra, separated by a narrow neck of water from Java itself, and on Febr 20, they occupied Portuguese Timor. With the fall of Bali on Feb. 23, Java was completely encircled in the jaws of a Japanese vise. The Japanese then proceeded to mop up Dutch forces on Sumatra, Borneo and Celebes.

At this critical point, the American and Dutch commands decided to risk their combined fleets in a desperate gamble to break the enemy ring around Java. On Feb. 27, a small Allied fleet challenged a large convoy of Japanese troopships escorted by strong naval detachments in the Java sea. After a two-day running battle, nearly the entire Allied force was destroyed. This staggering defeat sealed the doom of Java. The enemy convoy got through safely and the Japanese invaded Java on the night of Feb. 28. Batavia fell on March 5 and the defenses of Bandoeng collapsed two days later. By March 10, Surabaya had fallen and virtually all resistance in Java had ceased. The Japanese claimed that 98,000 Allied troops, including about 5,000 American, British and Australians, were taken prisoner on Java.

4. Burma. — The Japanese invasion of Burma did not get under way until five weeks after the Pearl Harbor attack. Although the position of Burma was a potential threat to the Japanese flank in Malaya, the British were unable to mass enough men and material to exploit this situation. When it became evident to the Japanese that their forces in Malaya were adequate to bring that campaign to a successful conclusion, they turned the bulk of their reserve divisions in Thailand against Burma.

On Jan. 15, 1942, a Japanese land column moving from Thailand struck across the frontier, penetrating Tenasserim province, the narrow "appendix" of southern Burma. Another column crossed into central Burma and drove toward the Salween river area north of Moulmein. Their common objective was to converge on Rangoon. British opposition to these drives was weak. British regulars fought with skill and courage but the colonial levies and native troops, wanting in experience and morale, could not cope with the superior jungle tactics of the Japanese. By Jan. 31, the southern column drove up the Gulf of Martaban, occupied Moulmein, and effected a junction with the army to the north. Both forces then broke the British defense line on the Salween and occupied Rangoon on March 8.

The fall of Rangoon jeopardized the Allied hold on the Burma road over which flowed the major portion of Allied war supplies to China. The Chinese, whose appeals to participate in the fighting were hitherto ignored, were now "allowed" to share in the defense of Burma. But the delay was fatal and liaison between the British and Chinese was faulty. The Japanese armies, functioning swiftly and smoothly, were quick to exploit this chaotic situation and drove ahead with great rapidity. One Japanese column reached Lashio, the Burma road terminus, on April 28; another entered Mandalay on May 1. The British fled to India, their retreat covered by the Chinese armies, and Burma fell to the Japanese.

Indications that the British were preparing a full-dress offensive for the reconquest of Burma were seen in the appointment of Lord Louis Mountbatten in Aug. 1943 as supreme Allied commander for southeast Asia.

5. Battles of the Coral Sea and Midway. — On May 4, 1942, U.S. carrier-based planes attacked a Japanese task force headed toward New Caledonia and New Hebrides and opened a naval battle unique in history in that it was the first major sea engagement fought entirely by planes based on aircraft carriers. Surface ships of the opposing forces apparently never came within gun range of each other and the only broadsides fired were at attacking planes. This unusual contest ended on May 7 in a Japanese defeat. The American bombers had repulsed the Japanese force, sinking seven warships, including a carrier, and several transports. American losses were a carrier and two other vessels.

The American forces scored another great naval victory a month later at the battle of Midway, June 4–7, when both land and carrier-based planes repulsed a Japanese naval armada of some 80 ships that attempted to attack the island. When this engagement ended after four days of furious fighting between rival air forces, the Japanese armada limped to its home bases, minus four aircraft carriers, two cruisers and three destroyers which had been sunk by the American bombing and torpedoplanes. U.S. losses were a carrier and a destroyer. The battle of Midway, which was similar to the Coral sea battle in that it was almost exclusively an air action, was a decisive victory since it halted a major Japanese effort to capture Midway and Hawaii.

6. New Guinea. — New Guinea and the nearby islands of New Britain, New Ireland and the Solomons held a prominent position in Japanese strategy as stepping stones for a possible thrust into Australia and as bases from which Japanese warships could attack U.S. convoys bearing war supplies to the far east.

The first enemy thrust into this island cluster was launched on Jan. 23, 1942, when Japanese transports landed troops on New Britain, New Ireland and the Solomons. The invaders rapidly consolidated their newly won positions, repaired harbours and constructed airfields. The Japanese then invaded New Guinea, landing troops on March 8 at Salamaua, Lae and Finschhafen, small neighbouring ports on the island's northeast coast. After seizing Buna and Gona, two tiny shore settlements farther down the coast, a Japanese column drove inland and was less than 3; mi. from Port Moresby, chief Allied base on New Guinea's southern coast by Sept. 1942.

But these advance units had pushed ahead too quickly for their slower-travelling supply carriers. Australian forces took advantage of the precarious Japanese position with a surprise offensive launched on Sept. 25. Gen. MacArthur, who planned the tactics for this campaign, was determined not to commit the error of over-extending his supply lines. His forces pressed forward cautiously and drove the Japanese back to their north coast bases. Thousands of American soldiers then joined the Australians and aided by a smoothly functioning land-and-air transport system, the combined armies closed in on Buna and Gona. The Australians captured Gona on Nov. 24, while the Americans took Buna on Dec. 1;. Both forces then mopped up enemy units still holding out in nearby Buna Mission. On Jan. 22, 1943, the Allies captured Sanananda Point, thus closing the first phase of the New Guinea campaign, in which a Japanese army estimated at 15,000 men was virtually annihilated. Allied casualties were approximately half that figure.

In an attempt to redress their weakening position in New Guinea, the Japanese dispatched a dozen troop transports, protected by a destroyer flotilla, into the Bismarck sea. Allied scouting planes, however, sighted the convoy as it sneaked along the New Britain coast and a huge force of Allied bombers attacked and destroyed the entire Japanese convoy of 10 warships and 12 transports. Some 15,000 Japanese aboard the vessels met their death either by drowning or by the murderous strafing from Allied planes. The battle of the Bismarck sea, March 2–5, 1943, was a decisive victory of land-based aeroplanes over warships.

These successes in New Guinea and the simultaneous victories in the Solomons gave the Allies a firm foothold in the southwest Pacific islands. On June 30, 1943, the Allies opened a major offensive in both New Guinea and the Solomons to extend their grip on the island chain circling Australia's north coast. In New Guinea, an Allied amphibious force landed at Nassau bay in an offensive aimed at Salamaua and Lae. Two months later another amphibious unit landed behind both of these Japanese bases and the enemy garrisons in this area were completely landlocked. The Allies then launched a drive which resulted in the capture of Salamaua, Sept. 12, and Lae, Sept. 16, 1943.

The capture of Salamaua and Lae enabled the Allies to extend the target area of their long-range fighter planes and to give more adequate protection to their troops battling along New Guinea's northern coastline. Meanwhile, medium and long-range bombers continued to hammer the New Guinea bases of Sattelberg, Wewak and Madang, facilitating the Australian drive that resulted in the occupation on Oct. 2, 1943, of Finschhafen. Capture of this stronghold gave Gen. MacArthur complete control of the Huon Gulf and provided him with new airfields closer to the Japanese base of Rabaul on New Britain island. In the Japanese-held outer island defenses in the southwest Pacific, Rabaul was second only to Truk in importance.

Rabaul was then hammered incessantly by Allied air raiders. Their objectives were (1) destruction of Japanese airpower in the vast New Guinea-Solomons zone of operations and (2) the cutting of Japanese supply lines. On Oct. 12, 1943, an Allied air fleet attacked the base in force, destroying at least 177 planes and sinking or damaging 123 ships and harbour craft. Continuing throughout the autumn of 1943, the raids on Rabaul were so effective that an estimated 500 Japanese aircraft were destroyed between Oct. 12 and 30.

7. The Solomon Islands. — On Aug. 7, 1942, United States marines landed in the southern Solomon islands in the first genuine Allied offensive in the Asiatic theatre of operations after the outbreak of war. Protected by air and naval barrage, a division of marines rapidly secured a beachhead on Guadalcanal island, captured an almost completed Japanese airfield there, and seized the smaller islands of Tulagi, Gavutu and Tanombogo.

The marines won their initial footholds with relative ease and at low cost in casualties, but the Japanese did not intend to relinquish their grip on the Solomons without a struggle. On the night of Aug. 8–9, a Japanese cruiser force slipped into the channel between Guadalcanal and Tulagi, caught Allied naval patrols off guard, and sank four cruisers. The Japanese then launched a spirited land, sea and air offensive to dislodge the marines from the Solomons. Although the marines clung tenaciously to their Guadalcanal beachhead, Japan's numerical superiority in men and ships began to tell. By mid-October, Japanese forces landed in broad daylight for the first time on Guadalcanal, only 15 mi. from the American lines, and toward the end of the month

the position of the marines became critical. Although they had received small reinforcements of regular army troops, replenishment of supplies was uncertain in view of the constant Japanese naval and air patrol.

In November, the Japanese launched a land and sea offensive to smash the American grip on Guadalcanal. This drive reached its climax in the naval battle of the Solomons, Nov. 13–15. After three days of violent fighting, the Japanese were decisively defeated and the crisis had passed. The American ground force then launched an offensive which drove the Japanese out of Guadalcanal by Feb. 10, 1943.

By June 30, four months after conquest of Guadalcanai, the Allies opened a new offensive to destroy Japanese forces in the Solomons and New Guinea. While Gen. MacArthur's troops pressed forward on the New Guinea coast, the American forces under Adm. Halsey's command invaded new island groups in the Solomons north of Guadalcanal. The Americans quickly seized Trobriand and Woodlark islands, wiped out the Japanese garrison on Rendova and then crossed over to nearby New Georgia island where they established secure beachheads under protection of a barrage from shore and naval guns. The Munda air base on New Georgia was the immediate American objective. Capture of this important base would give them an airfield from which to attack Japanese strongholds at Rekata bay, Bougainville and the great base at Rabaul, New Britain.

The battle for control oi the Munda air base followed closely the pattern of fighting on Guadalcanal. The Japanese fleet attempted to block the American offensive but was soundly thrashed in the two battles of Kula gulf, July 6 and July 12. While warships, shore batteries and bombers laid down a heavy curtain of fire over the enemy lines, the American forces inched their way toward the Munda air strip. Japanese resistance was stubborn in the initial phases of the New Georgia campaign, but weakened under the constant pressure brought to bear by the attacking force. By Aug. 5, the Americans seized the coveted air strip. A few disorganized Japanese units, all that was left of the Munda garrison, fled to the hiils. On Aug. 26, the Allies announced that the Japanese had fled from Bairoko Harbour, their last foothold on New Georgia.

Bitter fighting then ensued for possession of another island cluster—Xrundel, Kolombangara, Vella Lavella and Santa Isabel. After clamping a tight air and sea blockade to the approaches of these isles, American troops cleared all enemy forces from them by Oct. 15.

After the conquest of the central Solomons, Adm. Halsey lost no time in preparing an invasion of the northern Solomons where the bull; of Japanese strength was concentrated. The airdromes of Kieta, Kahili, Buin on Bougainville and the airfield on Buka were systematically plowed by Allied bombers, and when Japanese air power was regarded as sufficiently weakened, American marines landed on Oct. 27, on tiny Mono and Stirling islands in the Treasury group. The following day, a larger force invaded Choiseul, but the Japanese withdrew rapidly without giving battle.

The Choiseul landing set the stage for a larger operation—the invasion of Bougainville, where the Japanese at one time reportedly had a garrison of 40,000 men. On Oct. 31, a force of U.S. marines landed at Empress Augusta bay on Bougainville. Here Japanese resistance was strong and the marines had to battle desperately for 10 days before they could announce that they had a clear claim to the disputed coastal strip. Slowly, the Americans widened the beachhead and by mid-November, the marines were solidly entrenched on Bougainville. Similar in purpose to the New Guinea drive, the Allied objective behind the Bougainville offensive was to win new airfields and move closer to Kabaul. Construction of an airfield at Empress Augusta bay would move the right wing of Allied air forces 200 mi. nearer to Rabaul. The success of Allied operations in both New Guinea and the Solomons opened the way for an attack farther north to flank Truk island, Japan's major naval base in the south Pacific. The hub and heart of a concentric system of island bases, Truk was the Japanese equivalent of Pearl Harbor and guarded the Pacific sea lanes to the Japanese mainland. In a more intended apparently to neutralize the effectiveness of both Truk and Rabaul, a larger force of U.S. marines launched a successful but bitterly contested invasion of Makin, Tarawa and Apamama atolls in the Gilbert Islands, Nov. 20, 1943.

8. **China.**—After Pearl Harbor, war supplies that normally would have gone to the Chinese armies mere siphoned off to the Allied forces desperately striving to halt the Japanese tide of conquest in the Pacific. The Chinese thus could make no basic changes in their strategy to fight a grim war of attrition, but their stubborn fighting spirit continued to be a great contribution to the Allied cause. Their refusal to admit defeat niter five years of war compelled the Japanese to tie up at least one-third of their forces in China. Despite their lack of equipment, China's armies proved at the battle of Changsha in Jan. 1942, that they could still win battles on a shoestring. In this engagement, Chinese armies repulsed a mechanized Japanese force of 100,000 men-that attempted to lay siege lo this Chinese bastion astride the Hankow-Nanking railway. The Japanese lost an estimated 57,000 casualtiesin this ill-starred operation. But Chinese elation over the victory at Changsha was dampened by the fall of Burma which gave Japan control of the Burma road and virtually isolated China; the few alternate roads to India were mere camel paths in comparison.

In May 1942, ths Japanese started an offensive designed to eliminate American airfields which, they believed, were in the still unconquered provinces of southeastern China. They occupied some important cities in the initial phases of this drive but were later forced to relinquish most of them to counterattacking Chinese armies.

In 1943, the Chinese were still faced with a desperate supply problem. Although they had reoccupied many areas formerly held by the enemy, their arms and equipment were running dangerously short. One cheering prospect, however, was the extensive activity of the U.S. bomber force which ranged far and wide over China to hammer Japanese military objectives.

9. Battle for the Aleutians. — In June 1942, a Japanese force invaded the outermost islands of the Aleutian chain, the first enemy landing on North American soil. The assault on the Aleutians was launched simultaneously with the abortive Japanese naval attack on Midway Island. While the Midway operation ended in failure, the Aleutian invasion was temporarily successful.

The Japanese opened their Aleutian drive on June 3, when carrier-based planes raided Dutch Harbor, an American naval post on Unalaska island. Enemy forces then landed on Attu, Agattu and Kiska islands. The United States made no serious effort to dislodge the Japanese during 1942, as it appeared unlikely that the enemy could extend its conquest to the Alaskan mainland. However, a substantial force of U.S. warships, submarines and planes constantly harried the Japanese when the weather over the fog-bound islands would permit and in October the invaders abandoned Agattu.

The United States decided in 1943 to clear the Aleutians and on Jan. 12, established a base on Amchitka island, only 70 mi. from Kiska. Four months later, on May 11, American ground forces landed on barren Attu island and annihilated the entire Japanese garrison there after a 19-day battle.

American planes and warships then softened Kiska, the largest and most important island, with furious air and naval bombardments. A strong force of American and Canadian troops landed on Kiska on Aug. 15. They met no opposition as all the Japanese had evacuated the island some time before rather than run the risk of annihilation.

XXI. THE RUSSIAN THEATRE OF WAR

In Jan. 1942, the Russian armies were on the offensive all along a snowbound battlefront 2,000 mi. long. The Germans, who had seriously underestimated the Red army's fighting ability and the quality and quantity of its equipment, were not prepared for a winter campaign. The reich's mechanized war machine stalled in the first snows while the Russian army was adapted for winter fighting. The German retreat, however, was not a rout, but a deliberate withdrawal to a winter line. which had been decided upon after the reich command recognized that a winter offensive was impossible. The invaders, holding the bulk of their territorial gains, established an elaborate system of "hedgehog" defenses, behind which a railway network constituted their supply routes to the rear. The key points in this defense system were generally the railway junction cities interconnecting German lines from Leningrad to the Black sea.

The big Russian offensive started in Nov. 1941. The German armies which had occupied Rostov, gateway to the Caucasus, were thrown out of the city by Marshal Timoshenko's forces. This successful operation was followed by similar Red army offensives all along the front. By March 1942, the Russians had reconquered about 100,000 of the 500,000 sq.mi. they had yielded to the nazis and had inflicted on the wehrmacht its first major defeat in World War II.

But as the winter wore on. German resistance wore down the power of the Russian offensive, and by March 15, the Red army advance had virtually ceased. The German hedgehog system had successfully absorbed the shock of the soviet drives, and an important chain of rail centres running from Velikie Luki, on the north, to Kharkov, on the south, were still in German hands.

In the summer of 1942, the Germans were poised for a new offensive. Hitler's principal objective was the Caucasus, whose rich oil fields produced over 80% of Russia's total output of crude oil. Move no. 1 in the Nazi grand strategy for conquest was a heavy attack on Russian forces holding Kerch and Sevastopol in the Crimea, potential threats to the German southern flank. German troops overran Kerch on May 23, and two weeks later, they opened a massive assault against Sevastopol, which had been under land siege since Nov. 1941. Although the defenders of Sevastopol fought back with incredible ferocity, German and Rumanian forces stormed this Soviet citadel on July 1 and mopped up the remnants of the Russian garrison.

While the fighting in Sevastopol was still underway, Hitler opened his drive to the Caucasus attacking in great force in June 1942. German tank columns split Russian lines on the Donets river southeast of Kharkov and bludgeoned their way east to the Volga and south into the Caucasus. On July 27, German armoured divisions operating below the Don bend had marched into Rostov. These armies then fanned southward into the Caucasus, seizing railway junctions, ports and naval bases. Although the Russians fought a stubborn delaying action, and skilfully avoided encirclements, they were unable to halt the German armoured columns. By Oct. 1, the Germans were in control of a great triangular-shaped segment of the Caucasus and were in possession of the oil city of Maikop. At this critical stage of the campaign. fierce Russian counterattacks halted the German push into the Caucasus and thwarted the nazi strategy to march straight through to Baku before winter.

Meanwhile, Russian armies to the north in the big Don bend refused to give battle in this area, which was a natural pocket and therefore adaptable to panzer tactics, and withdrew toward Stalingrad. By mid-August, the Germans were in complete possession of the Don bend and moved in on Stalingrad. The reich strategy was to capture the city, sever the last Russian rail link with the Caucasus, separate the Russian armies in the Caucasus from those in the north and prevent the Russians from using the Volga for river traffic. For the final onslaught against Stalingrad the Germans massed an estimated 40 divisions, strongly bolstered by tank units and a huge air fleet. The Russians, deciding to make a firm stand behind Stalingrad's protective chain of fortifications, depended on their great quantity of heavy artillery to repel the invaders.

The Germans opened a massive plane-tank assault on Stalingrad's outer defenses in late August. Dive-bombers poured tons of explosives on the defense belt. Tanks bludgeoned their way through softened spots in the city's defenses and were followed up by droves of infantry units. Sheer weight of numbers finally enabled the Germans to conquer several districts on both the north and south sides of the city. The luftwaffe deluged the city with bombs. Few buildings were left standing, but the defenders fighting with unprecedented stubbornness held their ground and stopped the Germans in their tracks by the end of October. Thus, the German summer offensive of 1942 was brought to a halt at Stalingrad and failed in its main purpose--destruction of the Red army and the conquest of the Caucasus.

On Nov. 22, 1942, the Russians again launched a great winter counter-offensive. The Red army broke through many strongly fortified points in the German winter line and by Feb. 2, 1943, they had either killed or captured the entire nazi garrison of 330,000 men trapped in the Stalingrad area. Driving ahead on a great front extending from Moscow to the towering Caucasus mountains, the Russians relentlessly pounded the tired wehrmacht. The Red army recaptured the German hedgehog points of Velikie Luki, Kursk and Kharkov and had cleared the entire Caucasus, save for a small German bridgehead on the Kuban peninsula. In March, the Russian armies in the Kharkov sector had over-extended their supply lines and counterattacking Germans recaptured Kharkov on March 14, and Belgorod a week later. Heavy rains then slowed down military operations. After conclusion of their winter drive of 1942-43, the Russians had reconquered 185,000 sq.mi. of territory.

The German armies launched their third major offensive of the war on the eastern front on July 5, 1943. They attempted to pierce the Russian defenses along a 165-mi. front running from Orel through Kursk and to Belgorod. But the Red army, which had achieved parity with the wehrmacht in planes, tanks and guns, stopped the German offensive and developed a powerful counterdrive of its own on July 12.

The Russians opened their offensive, aimed at the German fortified base of Orel, with a tremendous artillery barrage that crushed the German defenses. Russian tank columns then spearheaded a general advance and by Aug. 5 the German strongholds of Orel and Belgorod fell to the Russians. By Oct. 1, the Russians had retaken Bryansk, Smolensk, Kharkov (the fourth time this city had changed hands) and scores of other cities, and were crowding the nazis all along a 600-mi. front from Smolensk on the north to the Sea of Azov. The Germans, driven back to the Dnieper river, were desperately fighting to prevent the Red army from crossing the stream and surging toward the frontiers of Poland and Rumania.

By Oct. 1943, the reconquest of the Ukraine by the soviet armies was within sight. The battered German forces were in retreat and their vaunted Dnieper line was broken in an early test of strength. Nevertheless, the German retreat was not a rout and the wehrmacht armies retired in good order. The German strategy was to fall back to a shorter line which the high command hoped to hold without excessive strain on dwindling reserves, already dangerously drained by three years of titanic battle in Russia.

On the other hand, Russian strategy was to attack continuously and give the enemy forces no rest. Stalin's major objectives were (1) to destroy the nazi armies and (2) to drive them from soviet soil.

By Oct. 15, Russian spearheads had crossed the Dnieper at several points. Great battles were in progress for possession of Melitopol, Dnepropetrovsk, Perekop and Kiev. Melitopol was taken by the Russians on Oct. 23, Dnepropetrovsk fell two days later, and on Nov. 1, the Red army seized Perekop, thus bottling up a large German force in the Crimea. The fighting for Kiev was furious, hut the Russians finally stormed into the city on Nov. 6. Standing on the left bank of the Dnieper, Kiev is the gateway to a corridor, flanked by the Pripet marshes on the north and the Carpathian mountains on the south, leading directly to the heart of central Europe. Its capture was a grave blow to the Germans, and Russian occupation on Nov. 13 of the railway hub of Zhitomir brought the Red army to within 60 mi. of the old Polish frontier. Determined to cork up the corridor leading to Poland, the Germans launched strong counterattacks.

The Russians, their lines overextended, prudently retired, and the nazis recaptured Zhitomir on Nov. 19. Despite this temporary setback, the Russians continued to bludgeon their way through German defenses in neighbouring sectors.

Both German and Russian casualties in the first two years of fighting were heavy. In June 1943, the Russians claimed that their own losses in dead and wounded were 4,200,000 and put German casualties in dead and captured at 6,400,000. In November, the Russians asserted that the Germans had lost an additional 2,700,000 casualties in the four months of fighting that started with the Russian offensive in July 1943. German claims of Russian casualties, issued periodically by the reich propaganda ministry, soared extravagantly. One German claim placed Russian losses at 20,000,000 men dead, wounded or captured.

XXII. AIR WAR OVER EUROPE

In early 1942, the R.A.F., strengthened by increased production and by aircraft sent from the United States, launched a sustained aerial offensive on the reich. The first R.A.F. raids of importance in 1942 were destructive bombardments in March of industrial targets in the Paris suburb of Billancourt and nearby Poissy. Intensifying their air offensive, R.A.F. bombers hammered objectives in axis Europe with great frequency. The length of the air raids was extended, more bombers participated in night attacks and there was an increasing proportion of heavy bombers to fighters. The R.A.F. concentrated on mass attacks on a single target rather than disperse its bomber strength over scattered objectives.

Examples of the destructive power of mass bombings were the R.A.F. raids on Luebeck and Rostock. On March 26, R.A.F. planes shattered the Baltic port of Luebeck with 340 tons of bombs in a three-hour raid. A month later, British bombers devastated the port of Rostock, in four successive night raids, virtually razing the city with 800 tons of bombs.

The R.A.F.'s offensive in 1942 reached its peak on May 30 when 1,130 planes of all types dropped 3,000 tons of bombs on Cologne. Forty-eight hours later, an armada of 1,036 planes bombed Essen, home of the famous Krupp armaments works, setting huge fires in the industrial regions circling the city. Although less spectacular, many of the raids on German cities in the late summer and fall of 1942 were nearly as effective in destructive power as the Cologne and Essen raids.

The participation of the United States air force in the aerial offensive against Germany and the occupied countries widened the scope and variety of Allied raids. The R.A.F. bombers concentrated on night mass bombings while the Flying Fortresses and Liberators were initially employed for daylight precision raids.

By the summer of 1943, the combined Allied air force based in England rained an ever-increasing tonnage of explosives on war plants, railway centres and other vital military objectives in Germany and occupied Europe. Flights of 700 planes, or more, sweeping over the channel to strike at axis targets were nearly a daily—or nightly—occurrence. Britain alone was producing more planes than the reich and in the 20-month period from Jan. 1942 to July 1943, the U.S. produced 110,000 planes, the greater part of which was sent to the European theatre of war. The once mighty luftwaffe, now helplessly outnumbered, was fighting for its very life as one of the major objectives in Allied air strategy was destruction of the German air force.

Chief target of the American and British bombers was the Ruhr valley, industrial arsenal of the reich. Allied bombers hit the cities of the Ruhr with terrible force. More than 1,000 ac. of Diisseldorf were devastated in a single raid on June 11, 1943. The giant Krupp munitions works in Essen were paralyzed by repeated Allied aerial blows. Bombs rained with monotonous regularity on Cologne, Dortmund, Stuttgart, Miilheim, Krefeld, Duisburg and Hamm. During a 30-day period in May and June 1943, the R.A.F. alone unloosed 10,000 tons of bombs on the heart of the Ruhr area. This terrific pounding had such a tremendous effect that an estimated 3,000,000 persons fled from the Ruhr valley.

The Allied raids were not confined exclusively to the Ruhr. Industrial and military establishments throughout axis Europe were battered by Allied raiders. Long-distance bombers struck objectives as far distant as Trondhjem in Norway and Crete in the Mediterranean. Industrial cities in Italy were also heavily bombed. Russian air fleets from bases to the east hammered East Prussian targets while American Flying Fortresses repeatedly raided the U-boat shipyards and ports of Kiel, Bremen, Emden, Wilhelmshaven, Flensburg and Lorient.

The great summer offensive was climaxed by the raids on Hamburg, which started July 24. R.A.F. and U.S. bombers subjected the city to eight raids in six days. At least 8.000 tons of bombs were dropped on Hamburg during this period. The city was left in ashes and Swedish dispatches reported that thousands had been killed in the raids.

An Allied announcement that similar bombing expeditions were in store for Berlin, led nazi authorities to evacuate all those residents of the capital considered nonessential to the war effort. In the late summer, the R.A.F. night bombers had delivered three heavy blows on Berlin. In each raid, 1,000 or more tons of bombs rocked the German capital. Berlin was now getting a bitter dose of the treatment handed out to London in the battle of Britain in 1940, but the British night fliers had to go longer distances and their losses to enemy planes and antiaircraft guns were heavy. From the start of the war through June 1943, announced British losses over Europe were 5,736 planes.

The autumn of 1043 saw one of the greatest aerial offensives in history underway. The Allied aim was to destroy or cripple German industry and to compel Germany to divert planes from the Russian

front, thus easing pressure on the Red army. To what degree bombing had crippled German production was not fully known, but reich war plants certainly had been hurt. Proof of this, according to some Allied air chiefs, was the fact that Hitler was compelled to withdraw many planes from Russia to protect the home front against Allied air attack. Another factor indicating full German awareness of the grave threat in the Allied aerial offensive was the conversion of some reich bomber plants to production of fighters needed to ward off invading bombers. But the fighter command suffered heavy losses and they were unable to check the Allied air fleets, which, in the month of July alone, dropped 26,000 tons of bombs on Germany.

As it was compelled to cope with growing Allied air power throughout the entire European war zone, the luftwaffe was spread thin and completely lost its potency as a blitzkrieg weapon. By the fall of 1943, it was both quantitatively and qualitatively inferior to Allied air power. During the winter of 1940–41, the total of all types of combat planes in the German air force was estimated at 6,600. Thirty months later, however, the number of combat aircraft in the luftwaffe was reported to total only 4,100 planes. Of this force, about 2,000 were based in airfields in northwestern Europe and Germany, another 1,200 operated on the Russian front and 900 were employed in the Mediterranean sector. On the western front alone, the Allied air force outnumbered the Germans in combat craft two to one. In view of the enormous Allied air superiority, the luftwaffe was compelled to fight a defensive delaying war with steadily decreasing numbers. Nevertheless, it was still an efficient and dangerous instrument for destruction and carried a deadly sting. On Oct. 14, German combat planes were credited with the major share of shooting down 60 of a large formation of Flying Fortresses that raided Schweinfurt in Germany. German fighter squadrons generally took a substantial toll of attacking bombers, and Allied losses of 20 to 40 bombers on daylight raids were not uncommon. Accurate antiaircraft fire also took a heavy toll of R.A.F. night bombers. Heavy R.A.F. casualties were suffered during a raid on Berlin Aug. 23, 1943, when 58 British bombers were shot down.

Called on to develop defensive measures to balance top-heavy Allied air superiority, the Germans introduced a radio-controlled rocket-propelled glider bomb. First reported in action in the Italian campaign by Allied officers, the new rocket-bomb was towed by mother craft at high altitudes and then released toward the target, steered by remote control radio, this spectacular missile was reported as very deadly in effect.

Notwithstanding the improvement of the German air defenses, Allied air power grew to huge proportions by Dec. 1943. The air offensive over Germany and occupied European countries was terribly destructive, as attested by the R.A.F. night raids on Berlin in late November. On one raid alone, more than 2,500 tons of bombs were cascaded over the German capital. Between Nov. 18, 1943, and Jan. 20, 1944, Berlin was bombed 11 times. More than 15,000 tons of explosives fell on the city during this period. Many sections were completely obliterated and the material damage was believed to have been immense. By the end of 1943, the Allied air forces had become offensive weapons of such great destructive power that the German raids on Coventry and London were avenged twentyfold. In the three-month period beginning Oct. 1, 1943, and ending Dec. 31, 1943, the R.A.F. dropped 39,500 tons over targets in western Europe in 41 day raids and 56 night operations. During this same period, the U.S. army air force unloaded 25,203 tons of bombs over military objectives in the same area in 38 day raids.

XXIII. WAR IN AFRICA

In Jan. 1942, the British imperial armies were moving across the desert sands of Cyrenaica in a drive which had started on Nov. 18, 1941, from Es Sollum, a British base on the Cyrenaican border. British tank columns pursuing Marshal Erwin Rommel's German-Italian armies, had gone beyond the port of Derna. But the drive bogged down in mid-Jan. 1942, at Cyrenaica's western borders. A successful German counteroffensive drove the British forces back across the Cyrenaican coastal hump to a point 70 mi. west of Tobruk, before the advance of the Afrika Korps was halted at the El Gazala-Bir Hacheim line. Here a stalemate developed, during which both armies consolidated their positions and brought up reinforcements. Suddenly Rommel hurled his Afrika Korps against the British lines on May 26. In the first 15 days of fighting the British held their ground behind their fortified line. In an attempted counterattack, a British column of 300 tanks plunged ahead recklessly into a German ambush. When night fell on June 13, the British had lost all but 70 of their tanks.

Rommel never gave the British an opportunity to redress this error. His Afrika Korps smashed quickly ahead, rolled up the British line and on June 21 occupied Tobruk and captured its garrison of 25,000 British imperials. Axis panzer divisions then chased the British across the Egyptian frontier. On July 1, however, the Afrika Korps was stopped at El Alamein, only 70 mi. short of Alexandria. By the end of July, the balance of the forces had become too even for either antagonist to launch an offensive with any real hope of success.

During the lull that followed Rommel's big drive, the British strengthened their defenses on the El Alamein line. Countless Allied convoys poured supplies into Egypt and American planes joined the R.A.F. in the African desert. After the British had massed a huge air fleet, a powerful tank army and a large number of divisions at El Alamein, they launched their offensive on Oct. 23, 1942. The British 8th army, under command of Gen. Sir B. L. Montgomery, struck with such force that the main axis lines collapsed and Rommel had lost half of his tank force, a large part of his air support and more than half of his manpower. By Nov. 7, his shattered armies were in full retreat.

As Rommel fled before the 8th army in Egypt, a large force of British and American troops landed in Morocco and Algeria on Nov. 8, 1942, and opened a new front in Africa. Led by Gen. Dwight D. Eisenhower of the U.S. army, this Allied force quickly subdued the Vichy-French armies and sped toward Tunisia. The Allied military plan was to squeeze Rommel in a pincers movement and drive him out of Africa. To avoid this trap, Rommel rapidly evacuated Tripolitania and in late Jan. 1943, took up positions behind the Mareth line (a defense system on the Tunisia-Tripoli border built by the French before World War II) where he received fresh reinforcements. His armies were now placed, virtually back-to-back, on both the eastern and western frontiers of Tunisia.

Both Allied forces then attacked the embattled axis army, but the Afrika Korps fought back bitterly, considerably slowing the progress of the Allies. In February, the Allied armies in western Tunisia, consisting of American, British and French forces gradually pressed the Germans back. In eastern Tunisia, the veteran 8th army breached the Mareth line in late March. As the German defenses crumbled, Gen. Rommel was recalled to Berlin and was replaced by Gen. Jürgen von Arnim.

Pinned down in the narrow Tunisian corridor, with little room for manoeuvre, the Germans were gradually but steadily pushed back to the sea. On April 7, the British 8th army joined with Allied divisions of the west. Both forces combined for a final blow. American and British aircraft knocked out uhat few enemy planes were left in Tunisia and destroyed airdromes and bridges. On May 7, an American army entered Bizerta and a British army occupied Tunis. By May 12, all axis resistance in Tunisia had ended and Gen. von Arnim had surrendered.

A minor sideshow to the main African battle was the conquest of Madagascar. In May 1942, the British, fearing that the Vichy government had secretly agreed to give Madagascar to the Japanese, invaded the island. After a six-month campaign, the Vichy forces surrendered and the British took possession of Madagascar.

XXIV. THE ITALIAN CAMPAIGN

After the conquest of North Africa, Allied military activities were aimed at clearing the narrow Mediterranean channel between Tunisia and Sicily, in preparation for an invasion of Europe via the Italian back door. The first steps in this direction were the bombings of Pantelleria, Lampedusa and Linosa, three stepping-stone islands in the narrow strait. The Italian garrison of more than 10,000 men on Pantelleria, bombed for 19 straight days, surrendered on June 11. A day later, Lampedusa capitulated and on June 13 Linosa gave up.

The capture of these stepping-stones paved the way for an attack on Sicily. As a prelude to invasion, Allied aircraft softened the island's airfields and communications with intensive raids. The actual invasion started on July 10, 1943, when an armada of about 2,500 ships set out for the southern shores of Sicily. Under cover of a heavy air and naval barrage, thousands of American, British and Canadian troops swarmed ashore before dawn. Gen. Eisenhower was in command of the Allied operations in Sicily.

By July 12, the Allied forces were solidly established on Sicilian beachheads. The U.S. 7th army., led by Gen. George S. Patton, Jr, controlled 70 mi. of the south coast. The British 8th army, under Gen. Montgomery, had won a go-mi. stretch of the east shore and Canadian marines attached to the 8th army had won a foothold in-between.

Both Allied forces then drove forward. The U.S. armies raced swiftly westward and by July 22 had captured Palermo, capital 3f Sicily, and had cut off Italian troops on the western half of the island from German armies on the eastern half. Although British progress up the narrow coast road to Catania was slowed by bitter German resistance, 8th army units marched into Catania on Aug. 5. The loss of Catania deprived the Germans of their eastern anchor and American, British, Canadian, French and Moroccan troops squeezed the axis armies back toward Messina, the port closest to Italy. Unable to halt the fierce Allied drive, the Germans evacuated what troops they could from Messina to the Italian mainland, and on Aug. 17, American forces captured Messina, thus ending the campaign of Sicily in 39 days.

Italian morale was badly shaken by the Sicilian invasion and the first bombing of Rome on July 19. After the resignation of Premier Mussolini, July 25, Gen. Eisenhower offered peace terms to Marshal Pietro Badoglio, new premier, but the latter was not able to persuade his German allies to leave Italy—a basic condition of the offer. As a result Allied air forces resumed their destructive raids on Italian cities and an estimated 3,000,000 Italians fled from the urban centres to havens in the countryside.

The invasion of Italy proper started Sept. 3 when the British 8th trmy crossed the narrow Strait of Messina. They met no resistance from the Italians, as on the same day, Marshal Badoglio had agreed on terms to cease fighting. Five days later, on Sept. 8, he accepted Gen. Eisenhower's terms for unconditional surrender under which the Italians agreed to give up their fleet to the Allies. Hitler, however,

was determined to hold on to Italy. German troops poured into the country and rapidly brought northern and central Italy, including Rome, under their control. While British armies were advancing northward from the Italian boot, the Allied 5th army, comprising both British and American forces, landed on Sept. 9 at Salerno where they established a bridgehead. The Germans, who had anticipated this operation, nearly succeeded in wiping out this post. The Allies, however, held on grimly and after eight days of heavy fighting, succeeded in pushing the Germans back toward Naples. By Sept. zo, the British armies from the south had effected a junction with the Allied 5th army under Lt. Gen. Mark W. Clark. The 5th army captured Naples Oct. 1; German garrisons had evacuated Sardinia, and French units which landed on Corsica, Sept. 14, had conquered the entire island by Oct. 5.

The Italian front stabilized rapidly after the fall of Naples. The battle line, about 125 mi. long, stretched across the breadth of Italy from the Tyrrhenian sea to the Adriatic. The German strategy of fighting a delaying action was aided by the rugged mountainous terrain and the torrential autumn rains that mired Allied mechanized equipment. By Oct. 10, 1943, the Allied 5th army, holding the western section of the front, had crossed the Volturno river, but was limited to short advances by strong German resistance. The British 8th army, holding the eastern section, was also slowed by stiff opposition. Both Allied armies could only crawl ahead at a snail's pace under heavy mortar and artillery bombardment. Systematic Allied air raids on key railroads in northern Italy were effective, but failed to halt the Germans from pouring reinforcements into Italy and in autumn 1943, German strength in Italy and the neighbouring Balkans was estimated at 40 divisions.

By Dec. 1943, it was evident that the wehrmacht, while lacking sufficient manpower and material to wrest the initiative from the Allies, nevertheless were able, at least temporarily, to thwart Allied plans for a rapid war of movement. Excellent German entrenchments and defenses limited Allied operations to localized engagements and the trench warfare that was a characteristic of fighting in 1914–18 became the predominant mode of battle in the Italian campaign in late 1943. But the Allies ended this stalemate on Jan. 22, 1944, with a surprise landing in considerable force at Nettuno, a small port 30 mi. below Rome on the Tyrrhenian sea. Elements of the Allied 5th army quickly established a beachhead and quickly thrust out spearheads to cut the Appian Way to the west. Caught off guard by the manoeuvre, the Germans were unable to offer serious resistance to the invaders until 48 hr. after the Nettuno bridgehead had been established. By the end of January, the German position in both central and southern Italy was seriously threatened, and there were reports that the nazis were preparing to evacuate Rome.

Of some assistance to the Allied cause were the Italian guerrilla armies operating behind German lines in central and northern Italy. Their activity was restricted, however, by the smallness of their numbers and the geographical limitations of the territory in which they operated. The Badoglio government's declaration of war against Germany on Oct. 13, 1943, brought few recruits to the guerrilla armies as the majority of the Italian soldiery, dispirited by three years of fruitless warfare, simply left the armed-force; to return to civilian life.

A resurgence of activity among the guerrilla armies in the Balkans, notably Yugoslavia, attended the Allied invasion of Italy. Upon the surrender of the Badoglio government, the Yugoslav guerrillas swarmed through the Dalmatian coastal area and in the early fall of 1943, they had driven the Germans from Split, Susak, Senj and other important ports. Other guerrilla detachments had fought their way into Fiume, Trieste and Idria, and Germany was compelled to strengthen its garrisons in Yugoslavia, depleted by the defection of the Italians. As the guerrillas lacked equipment and arms, they were frequently forced to abandon their gains at the first sign of any serious show of nazi strength. But their vigorous burst of activity forced Hitler to maintain troops in the Balkans badly needed elsewhere. The strength of the Yugoslav effort, however, was sapped by the bitter factionalism that frequently flared into open civil war between rival guerrilla forces. The Chetniks, led by Gen. Draja Mikhailovitch, numbered between 25,000 and 50,000 men, and supported King Peter. They were enemies of the Partisan armies of Gen. Josip Brozovitch, or Broz, known as Drug (Comrade) Tito, who rejected Peter and wanted to establish a democracy in Yugoslavia. The Partisans numbered upwards of 150,000 troops, were far more effective as a military force and carried the brunt of the fighting against the axis armies.

Deep-seated differences between democratic and royalist elements also caused fratricidal struggles between guerrilla forces in Greece. As in Yugoslavia, periodic outbursts of civil war among Greek guerrillas were exploited by the Germans and prevented establishment of a cohesive anti-axis front. The E.D.E.S. (Greek National Democratic army) fought spirited battles against a rival guerrilla army, the E.L.A.S. directed by the Greek Front of National Liberation. The E.L.A.S. faction charged that the E.D.E.S. group, which leaned toward King George, had attempted to negotiate an armistice with the German occupation authorities. The E.L.A.S., representing elements further to the political left, were believed pledged to a policy of ousting King George and establishing a constitutional democracy. The fighting between the two Greek bands became so bitter that Gen. Sir Henry Maitland Wilson, commander of the British 9th army, ordered both sides to cease quarrelling and present a united front against the German occupation forces.

Another front was opened in the Mediterranean in Sept. 1943, when British forces tried to seize the Dodecanese Islands strung off the coast of Turkey. Control of these islands would give the Allies excellent air bases for operations against nearby Rhodes and Crete, held by the Germans, and would provide potential springboards for an invasion of the Balkans via the Aegean. The initial British invasion efforts were successful and on Sept. 21, a British communiqué said that the isles of Cos, Leros and Samos had been won. Although taken by surprise, the Germans struck back with speed and efficiency. In operations recalling the airborne invasion of Crete in May 1941, German parachutists, aided by warplanes and naval craft, successively invaded the three islands and completely reconquered them by Nov. 22. The short-lived Dodecanese campaign was a clear-cut victory for German arms and a setback to British military prestige in the near east.

XXV. BATTLE OF THE ATLANTIC

The defense of convoys from U-boat attack was the great problem of the battle of the Atlantic in 1942. The intensity of the U-boat drive was evidence that Germany, aware of the increasing importance American factories would play in the war, was determined to choke off the flow of American war supplies to England, Russia and Africa. Nazi undersea raiders began their campaign against coastwise shipping on the unprotected eastern shores of the United States in Jan. 1942, extended it to mid-ocean and took an ever-increasing toll of Allied shipping. By April, it was estimated that sinkings on the Atlantic coast alone matched or outstripped the building of new ships.

The establishment of convoys, in the summer of 1942, it was generally believed, resulted in a substantial reduction of sinkings in the western Atlantic. But losses in the middle Atlantic, the Gulf coast, the Caribbean and along the route to Murmansk increased at an alarming rate. By the end of the year, a reliable source said that Allied merchantmen were being destroyed at the rate of 1,000,000 dead-weight tons a month.

In 1943, the entire picture had changed. The big shipbuilding program of the United States was beginning to show results and partially offset submarine casualties. The new Allied convoy defense system, extending air cover for convoys from offshore waters to mid-Atlantic by use of both land-based VLR (very long range) bombers and aircraft escort carriers, sharply curtailed shipping losses. In the autumn of 1943, Prime Minister Winston Churchill declared that no Allied merchantmen were sunk in the North Atlantic in the four months ending Sept. 18, 1943. The Germans, however, resumed their submarine campaign before winter and Allied leaders cautioned against over-optimism, warning that the battle of the Atlantic was not yet won.

WORM, a term used popularly to denote almost any kind of elongated, apparently limbless creature, from a lizard, like the blindworm, to the grub of an insect or an earthworm. In old usage it sometimes denoted a mythical dragon. The word "worm" is applied to many objects resembling the animals in having a spiral shape or motion, as the spiral thread of a screw, or the spiral pipe through which vapour is passed in distillation (*q.v.*). As a term of disparagement and contempt the word is also used of persons, from the idea of wriggling or-creeping on the ground, partly, too, perhaps, with *a* reminiscence of Genesis iii. 14. Linnaeus applied the Latin term Vermes to the modern zoological divisions, Mollusca, Coelenterata, Protozoa, Tunicata, Echinoderma (*qq.v.*), as well as to those forms which modern zoologists recognize as worms. As a matter of convenience the term Vermes is still employed, for instance, in the International Catalogue of Zoological Literature and the Zoological Record, to cover a number of worm-like animals. In systematic zoology, however, the use of a division Vermes has been abandoned, as it is now recognized that many of the animals that even a zoologist would describe as worms belong to different divisions of the animal kingdom. The so-called flatworm (Platyhelminthes, *q.v.*), including the Planarians, the Flukes (see TREMATODES), and Cestodes (see TAPEWORMS) are no doubt related. The marine Nemertine worms (see NEMERTINEA) are isolated. The thick-skinned round worms, such as the common horseworm and the threadworms (see NEMATODA), together with the Nematomorpha (*q.v.*), the Chaetosomatida, the Desmoscolecida and the Acanthocephala (*q.v.*), form a fairly natural group. The Rotifera (*q.v.*), with possibly the Kinorhyncha (*q.v.*) and Gastrotricha (*q.v.*), are again isolated. The remaining worms are probably all coelomate animals. There is a definite Annelid group (see ANNELIDA), including the Archiannelida, the bristleworms of which the earthworm (*q.v.*) is the most familiar type, the My-

zostomida Hirudinea (see LEECH) and the armed Gephyreans (see ECHIUROIDEA). The unarmed Gephyreans (see GEPHYREA) are now separated from their former associates and divided into two groups of little affinity, the Sipunculoidea (*q.v.*) and the Priapuloidea (*q.v.*). The Phoronidea and the Chaetognatha (*q.v.*) are also isolated.

Mention is made under TAPEWORMS of the worms of that species inhabiting the human body as parasites. Another common human parasite is *Ascaris lumbricoides* or round worm, found chiefly in children and occupying the upper portion of the intestine. (See NEMATODA.)

The threadworm or *Oxyuris vermicularis,* also a Nematode, is a common parasite infecting the rectum.

WORM, a screw which touches tangentially and which rotates a toothed wheel (the worm-wheel), and gives a very smooth drive. Among many other uses it is largely applied to the transmission of power from electric motors, and to the axles of road vehicles. Ball or roller bearings are fitted to the shafts. to take the journal running, and the end thrust, and, in good practice, the worm and wheel are submerged in an enclosed oil-bath. The worm is best made of steel, hardened and ground accurately on the threads, and the wheel of phosphor-bronze. In order to save expense, it is usual to make the wheel in the shape of an annular ring, and bolt it to an iron hub or rim. If increase in speed of rotation of the wheel is required for a given speed of worm, the latter is made with double or triple threads instead of a single helix. What is termed a *drop-worm* is extensively employed in machine-tools and other machines. Its bearings are hinged so that when the limit of desired travel has been reached, an automatic knock-off device allows the worm to fall out of mesh with the wheel.

A conveyor worm is a helix surrounding a shaft (see CONVEYORS IN MASS PRODUCTION). A worm condenser consists of a coil of piping (see CONDENSER).

WORMS, a city of Germany, in the Land of Hesse. It is situated on the left bank of the Rhine, 25 mi. S. of Mainz, 20 mi. N.W. of Heidelberg and 9 mi. by rail N.W. of Mannheim. Pop. (1939) 50,157.

History.—Worms was known in Roman times as Borbetomagus, which in the Merovingian age became Wormatia. The town had before Caesar's time become the capital of a German tribe, the Vangiones. Drusus is said to have erected a fort here in 14 B.C. In 413 the emperor Jovinus permitted the Burgundians under their king Guntar or Guntiar to settle on the left bank of the Rhine between the Lauter and the Nahe. Here they founded a kingdom with Worms as its capital. Adopting Arianism they came into conflict with the Romans, and under their king Gundahar or Gundicar (the Gunther of the *Nibelungenlied*) rose in 435 against the Roman governor Aetius, who called in the Huns against them. The destruction of Worms and the Burgundian kingdom by the Huns in 436 was the subject of heroic legends afterwards incorporated in the *Nibelungenlied* (*q.v.*) and the Rosengarten (an epic probably of the late 13th century). Worms was rebuilt by the Merovingians, and became an episcopal see. first mentioned in 614, although a bishop of the Vangiones had attended a council at Cologne as early as 347. There was a royal palace from the 8th century, and in it the Frankish kings, including Charlemagne, occasionally resided.

Under the German kings the power of the bishops of Worms gradually increased. Otto I granted extensive lands to the bishop, and in 979 Bishop Hildbold acquired comital rights in his city. Burchard I (bishop, 1000–25) destroyed the castle of the Franconian house at Worms, built the cathedral and laid the foundations of the subsequent territorial power of the see. There were frequent struggles between the bishops and the citizens, who espoused the cause of the emperors against the church, and were rewarded by privileges which fostered trade. The city retained its freedom until 1801, in spite of the bishops, who ruled a small territory south of the city, on both sides of the Rhine, and resided at Ladenburg near Mannheim till 1622.

The city of Worms was frequently visited by the imperial court. The concordat of Worms closed the investiture controversy in 1122. The "perpetual peace" (*ewiger Landfriede*) was proclaimed by the emperor Maximilian I at the diet of 1495, and Luther appeared before the famous diet of 1521 to defend his doctrines in the presence of Charles V. Four years later, Worms formally embraced Protestantism, and religious conferences were held there in 1540 and 1557. It suffered severely during the Thirty Years' War. The French under Mélac burned the city almost entirely in 1689, and it only fully recovered from this blow in recent years. Thus the population, which in its prosperous days is said to have exceeded 50,000, had sunk in 1815 to 6,250.

By the treaty of Worms in 1743 an offensive alliance was formed between Great Britain, Austria and Sardinia. The city was annexed to France at the peace of Lunéville in 1801, together with the bishop's territories on the left bank of the Rhine. The remaining episcopal dominions were secularized in 1803 and given to Hesse-Darmstadt, which acquired the whole by the Vienna congress in 1815.

Antiquities.— Some parts of the ancient walls and towers still remain. The cathedral of SS. Peter and Paul ranks beside those of Spires and Mainz among the noblest Romanesque churches of the Rhine. This basilica, built of red sandstone, with a choir at each end, has an imposing exterior. Only the ground plan and the lower part of the western towers belong to the original building consecrated in 1110; the remainder was mostly finished by 1181, but the west choir and the vaulting were built in the 13th century, the elaborate south portal was added in the 14th century, and the central dome has been rebuilt. The baptistery contains five remarkable stone reliefs of the late 15th century. The church of Our Lady (*Liebfrauenkirche*) is a handsome Gothic edifice outside the town, finished in 1467. The principal Protestant place of worship is the Trinity church, built in 1726. Second in interest to the cathedral is the church of St. Paul, also in the Romanesque style, and dating from 1102–16, with a choir of the early 13th century, cloisters and other monastic buildings. This church has been converted into a museum. The late Romanesque church of St. Andrews is not used. The old synagogue, an unassuming building erected in the 11th century and restored in the 13th, is completely modernized.

The Jewish community of Worms claims to be the most ancient in Germany and to have existed continuously since the very early Christian era, though the earliest authentic mention of it occurs in 588.

The old Bischofshof, in which the most famous Diet of Worms (1521) was held. has been replaced. The Luginsland is an old watch-tower of the 13th century. The Lutherplatz contains a group of statuary commemorating the Protestant reformers and their forerunners. Extensive burial-grounds, ranging in date from neolithic to Merovingian times, have been discovered near the city.

Worms is the centre of a vine-growing country. The manufactures include patent leather, machinery, cloth, chemicals, paints. cork, furniture, slates, etc.

Worms possesses a good river harbour, and carries on a considerable trade by water.

WORMSEED, the name given to various plants whose seeds are used as vermifuges. Among the best known is the Levant wormseed (Artemisia santonica), from whose dried flower-heads is extracted the drug santonin, very efficacious in expelling round worms.

The American wormseed (*Chenopodium anthelminticum*). calledalso Mexican tea, yields wormseed oil, an officinal vermifuge (See ARTEMISIA; CHENOPODIUM.)

WORMWOOD, the popular name for any aromatic herb of the genus *Artemisia,* a member of the family Compositae. The best known is *A. absinthium,* one of the ingredients of absinthe. It grows from 1 to 3 ft. high and is silkily hairy; the leaves are small and much cut, and the flowers are small yellow hemispherical heads among the leaves at the end of the branches. It is a native of Europe, grows in waste places in the British Isles, is widely naturalized in eastern North America, and is cultivated for use in domestic medicine. *A. pontica* is Roman wormwood;

A. stelleriana, a dusty miller, is sometimes called beach wormwood, etc. (See MUGWORT.)

WORSHIP (*i.e.,* "worth-ship"), honour, dignity, reverence, respect. The word is used in a special sense of the service, reverence and honour paid, by means of devotional words or acts, to God, to the gods, or to hallowed persons, such as the Virgin Mary or the saints, and hallowed objects, such as holy images or relics. It must, however, be borne in mind that the Roman Catholic Church distinguishes three kinds of worship: (1) *latria,* the worship due to God alone (from Gr. λατρεία, service, esp. the service of the gods, worship), and (2) *hyperdulia,* the worship or adoration due to the Virgin Mary as the Mother of God (from Gr. ὑπέρ, above, and δουλεία, service) and (3) *dulia,* that due to the saints.

The public service of God in church is known as "divine worship" or "divine service."

WORSTED MANUFACTURE. Straightness of fibre is the essential feature of worsted yarn. Originally, hand-twisting and the use of long fibres made for straightness of fibre, but necessity for machine volume production has made complicated the machinery used in operations preceding spinning. The manufacture of worsted yarn in the United States rests basically on two systems: the English and the French. They are rarely found in the same mill. The former more adequately processes the longer and coarser wools, the latter is more suitable for medium and short wools (23 in. or less). The basic drawing and combing principles are similar in both systems, although the machinery used differs. The English system necessitates fewer operations, produces more and is used more in the United States. The French system is more expensive and produces a softer, finer and less hairy yarn. The differences appear at first in the woollen carding. Ordinarily the wool is first scoured, dried and prepared by dusting, shaking and teasing. It is then ready to be carded (exceptionally long wools such as mohair are fed into sheeter gill boxes for straightening and disentanglement—a process of five or six operations which takes the place of carding; these long wools are not generally prepared in the United States). After carding, the usual operations are backwashing, gilling, combing, drawing, spinning, finishing and weaving.

Carding.—Worsted carding straightens, parallelizes, cleans and blends the fibres, so as to make a sliver of uniform quality, thickness and weight. This uniformity is necessary for a yarn of strength and fineness; hence great care is exercised. Long fibres must be whole, short ones must not curl up even though they are later combed out. Extraneous substances must be removed since they interfere with the operations. Worsted carding, unlike woollen carding, is done on one long card. In the United States three different types of cards are used: (1) single-cylinder with four licker-ins, (2) double-cylinder with two licker-ins and dividers, (3) double cylinder with burr breast workers and strippers; the latter card is preferred for all systems. Metallic cards are available that have no licker-ins and increase production.

Modern cards are divided into three parts, feeding, carding and delivery, and consist primarily of sets of rollers moving in different directions at varied speeds. Automatic feeders have spiked lattices that pull loose wool from hoppers at a regular pace to be beater combed and form a uniform sliver; these are adjustable to form any sliver weight. The spikes deposit the wool on an apron whence it passes onto the card covering which opens and uniformly deposits the wool on an automatically weighing feed apron and from there it moves to the card proper. The latter has feed rolls, licker-ins (breast works), main cylinders, fancies and doffers. The feed rolls, inserted with saw tooth wire or intersecting rings and pins, control the feeding of stock. Three feed rollers and a brush or wire stripper suffice for even fine wool. The licker-ins or breast works are the chief stock opening machinery. Cylindrical in shape, from 20 to 30 inches in diameter, they are studded with garnet wire and angular flattened saw teeth to keep burrs, etc., on top so that bladed beaters can remove them. For the removal of burrs the United States mills use a chemical treatment or burr breast works set close to high speed revolving burr knives; in England a burr crusher is also used. When the wool is freed of burrs and opened up it passes onto cylinders and strippers for carding. Thence it passes to the fancies and doffer dickeys, which latter, facing and running against the doffer, are small cylinders covered with flexible-tooth card clothing for raising any stock missed by the beater comb. The stock is delivered from the card by any one of four types of heads depending on the type of wool used, (1) can coiling, (2) railway balling, (3) centre balling, (4) side drawing balling; the object of all these heads is to put the sliver in a convenient form. The centre balling head is generally used in the United States.

Backwashing.—There being concealed impurities not removed by scouring and numerous impurities acquired in preparing or carding (such as oil, dust or dirt) the carded (or sheeter gilled mohair) wool is backwashed. Backwashing always just precedes combing. Many balls or cans of card slivers are fed to the back-

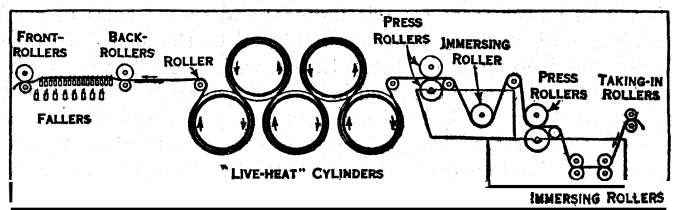


FIG. 1.—SECTIONAL VIEW OF BACKWASHER

washing machine at once. These machines have from one to four bowls for washing and have can or hot air dryers. Coloured slivers get no more than four bowl washings—white slivers get three or less. The bowls contain olive or olein soap full of suds; at least one bowl contains warm rinsing water to which is added, on occasion, blueing or ammonia. The slivers are squeezed and then dried; in the United States a hot air dryer is preferred. Because backwashing and drying tend to make the fibre brittle, wool oil is added at this point. Some simple machinery is used, usually, in the United States, being a series of rollers over an oil pan.

Gilling (preparing).—After backwashing, drying and oiling the slivers pass into a giller to be combed out by steel pins

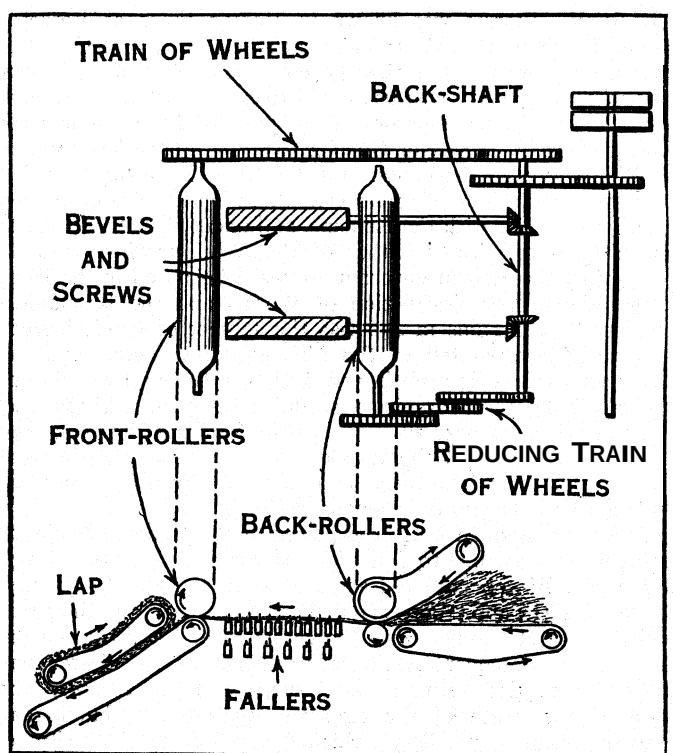

FIG. 2.—PLAN AND SECTION OF A PREPARING BOX

and to be straightened by other pins. The sliver is delivered from the gill boxes faster than it enters, the ratio of delivery to speed of entering is termed the draft, The sliver enters be

tween rollers and passes over strong steel pins (fallers) which move in the same direction as the sliver but at a faster rate, giving a combing and straightening action. The wool is then passed through delivery rollers to calender rollers (to prevent any bunching) and into a can (or from the delivery rollers to an apron for coiling). There are various types of mechanical drafts in gill boxes—front, back and total. The front (delivery) rollers move faster than the fallers and the fallers move faster than the back (entering) rollers. The ratio of surface speed of the front rollers to the fallers is the front draft; the ratio of the fallers to the back rollers is the back draft, and that of the back rollers to the front rollers is the total draft. These drafts, differing with different types of wool and gilling operations, are important. There is also a material draft which is the weight per unit of the sliver entering the back rollers compared with the sliver weight leaving the front rollers. The mechanical ratio is the product of multiplying the surface speed of all the increasing rollers divided by the product of the surface speeds of all the decreasing rollers Today, the rollers (back and front) are fluted spirally to grip but not break the fibres and keep them straight; obviously these flutes affect the draft. In the English system a simple measuring device is used in the gill box to keep the length of the slivers uniform. Usually, particularly in the English system, two more gillings may occur; these additional gillings vary from the first gilling only in the number of teeth per faller and the speed of the rollers. They present an opportunity for thickening the sliver and making it more uniform in weight and stock by doubling (doubling is merely the combining of different slivers into one, the combined slivers are then thinned out in the gill boxes and the result is a more uniform sliver).

Combing.—The purpose of combing is to eliminate short fibres of a given length as well as to further straighten the fibres and eliminate impurities. There are four types of combs, the Noble, Lister, Holden (square motion) and French (rectilinear). The first two are used in the English system and the latter two in the French system.

(a) *The English* System.—In the United States the Noble circular comb, imported from England, is most widely used. It is most productive and has a good length of fibre range. The Lister comb, while used somewhat, requires longer fibres and gives a smoother, straighter yarn. Preparation varies—the Noble comb has a ball winder attachment which makes a tight ball out of four slivers, each ball weighing about 20lb., 18 of these balls fill a Noble comb. The Lister comb takes the wool in long slivers much as a gill box does. The Noble comb, requires a good deal of moisture in the wool; this is left in from backwashing and by having the humidity high where the work is done. Rings of pins of varied number and sizes are used in Noble combing, the size and number depending on the wool used. Very important is the dabbing of the wool into the pins; the dabbers being of varied types, the most common is an Indian hog bristle brush. The dabbing must coincide with the rotating of the cylinders which separates the long wool. The drawing-off rollers are set close to the pins, and draw the long fibres from them. The delivery rollers are fluted and covered with leather which cushions the roller flutes and delivers the newly made twisted sliver to a sliver funnel. The sliver funnel takes the twist out and deposits the sliver in a coiling can. Generally speaking, about 9% of the combed wool is noil. One carding machine supplies one comb, and one backwash machine supplies three combs.

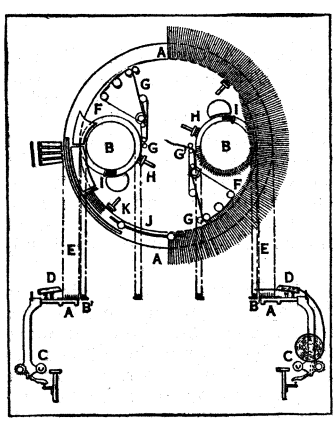

FIG. 3.—PLAN AND SECTION OF NOBLE COMB

Top Gilling.—To furnish a good English system worsted top two more gillings are given after combing; these are to insure uniformity of blend, weight, and length, to keep the fibres straight and to add water. The first of these gillings is like the backwash gilling except that the faller pins are finer. The condition of the latter is most important. The sliver is delivered into cans (or balls) in uniform lengths; usually many slivers are joined to form a heavy well blended sliver that will not break. Water is added, between the front and calender rollers, to compensate for evaporation—oil is added for dyed slivers. The second gilling box differs from the first in that it turns out a weighed definite length ball of worsted top which is made on a balling head. The sliver, as it leaves the front rollers, is passed over a straightening plate which evens up the fibres, and thence to a folder which folds the sliver over on itself whence it is wound onto a ball As each top is produced it is weighed and checked. The top is then stored in moist cellars for settling.

(b) The *French* System.—The Heilman comb is used in the French system. It is good for long and short wools (and rayon staple fibre), is nearly as productive as the Noble comb, occupies much less room, uses 20% of the power, and needs only half of the supervision—it is a straight comb. It is fed by groups of slivers (8) placed side by side The wool, drawn off in tufts, is pressed into slivers and passes through feed rolls and a feeding gill onto nipper jaws that hold the sliver while it is combed by a circular comb which has 18 pin bars with needles of varying density. As the nippers open another comb comes over the uncombed part of the sliver, and as the drawing off rollers remove the wool it is completely combed. A brush removes the noil from the combs while the usable wool is being delivered in overlapping tufts onto an apron and thence to a can. Burrs are removed by special blades.

Recombing.—This is done on special occasions, usually where dyed slivers are used because dyeing often causes the fibres to curl. Often it is used where blending of different coloured slivers is desired although such blending is reputedly best done in the gill boxes.

Drawing.—The theory of drawing in the English and French systems is to create a fine roving that can be spun into an even yarn. Drafting is used to thin out the sliver, doubling to make it uniform, and care is exercised to continue straightness and parallelism of the fibres. All systems use drafting rollers and a winding up of the reduced sliver. In the United States the English, French and cone systems are generally used. The English system is used on long coarse lustre and crossbred wools; the French system on unoiled tops of short fine wools, of from 1½in. to 4in.; and the cone system uses oiled tops. A fourth system is

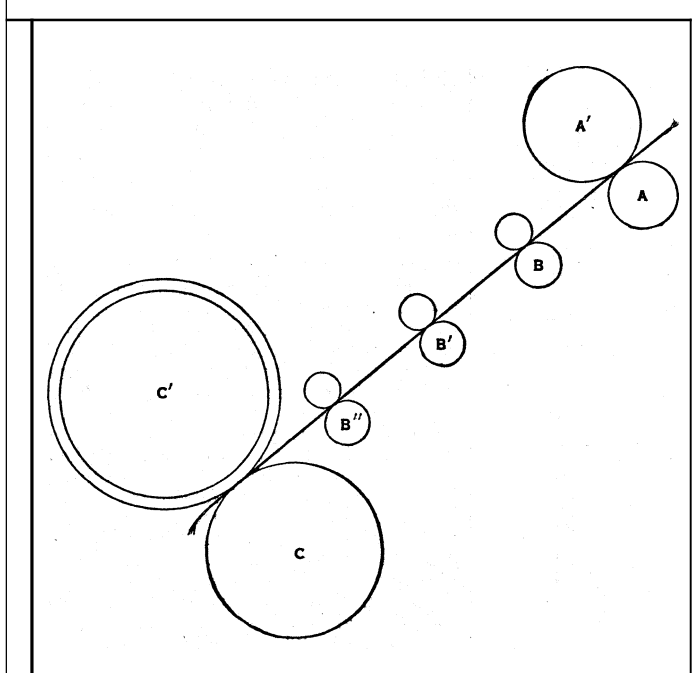

FIG. 4.—SECTIONOF WOOL DRAWING ROLLERS

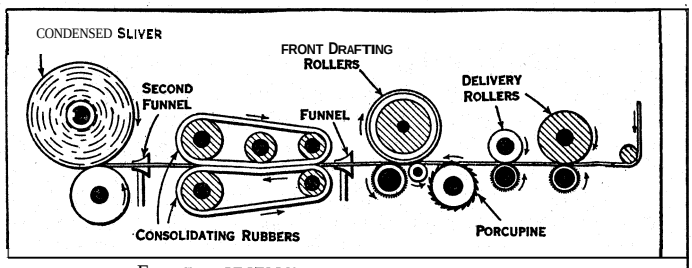

FIG. 5.—SECTION OF FRENCH DRAWING-BOX

patented by an English organization and combines the English and French systems, allowing oiled tops to be used on the French system. In the United States there are approximately twice as many mills using the English system as the French.

(a) The English System.-The English system can be used on almost any type of wool, although not so readily on the short fine Merino and crossbred stocks. An oiled top is essential, no other moisture is necessary. Drawing requires five to nine operations. Gilling, drawing, finishing, reducing, and roving are employed. Usually there are two or three gilling operations and from three to five drawing operations; the finer the wool is the more operations are necessary. The gilling machines are similar to and finer than the backwash gilling machines. The last gilling operation, however, is in a spindle gill which imparts a twist to the sliver making it a slubbing and feeds the slubbing onto a wooden spool (bobbin) by a "flyer." It is essential that the exact amount of strengthening twist be given. The slubbing now moves on to the drawing frames which are similar to the spindle gilling machines except that they are reduced in size. The drawing machines double, reduce, twist, and package (wind on spools) the slubbing; the draft exceeds the doubling in order to reduce the thickness of the slubbing. The drawing machine feed rolls are placed four high to get a sufficient hold on the slubbing, the carrier rollers are steel (top rollers are wood) and the delivery rollers are fluted cast iron (top rollers are leather covered). Finishers are in reality types of drawing boxes. The reducers and rovers number from one to three and are similar to drawing boxes set with fast moving spindles. Recently American mills have turned to ring rovers which permit great spindle speed at lower costs, although requiring a great deal of figuring due to twisting difficulties. Whereas slivers are figured in weight at ounces per ten yards, rovings and slubbings, being finer, are figured at drams per 40 yards: It can be readily perceived that careful calculating must be used in determining the draft and doubling so that the required weight rover is produced. As the slubbing and rover become finer the bobbin sizes decrease.

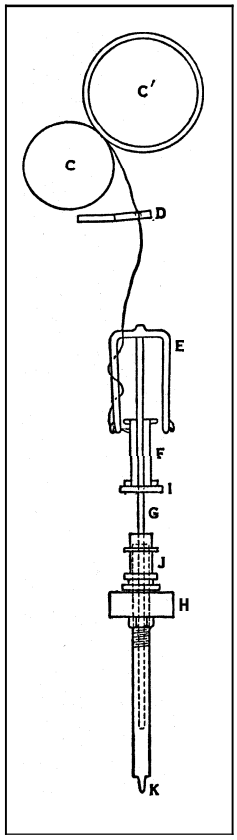

FIG. 6.—SECTION OF FLYER SPINDLE

(b) *The French* System.—The French system requires more operations (9 to 11) than the English and is more costly. It differs from the latter in that no real twist is imparted to the slubbing, drafting is always of four and is gauged by mechanical means, moisture is necessary; there are only two bobbin sizes; the slubbing or sliver is quickly reduced; the yarn produced is of short stock, smooth, soft and extremely fine, and the gill boxes are intersecting. The intersecting gill boxes have two sets of fallers, one over the other, and the teeth intersect each other and withdraw alternately, thus giving the sliver a double faller action. Three slivers are combined into one in the gill box. They are delivered by fluted delivery rolls and calender rolls through a false twisting funnel onto a balling head. These balling heads can be made to give two types of bobbin deliveries, either a single or double meche (one or two slubbings to the bobbin). The French drawing machines vary in fineness of operation, and hold the slubbing and roving together by rubbing rather than twisting. Doubling, drafting, condensing and winding are the main operations as in the English system. The machines have a "porcupine" roller which is studded with steel pins angled back and away from the rotation curve. The wool moves over the porcupine, which moves faster than the back rollers but slower than the front rollers, and the short fibres are controlled by the porcupine as the front rollers pull the long fibres. The slubbing passes onto leather aprons covering fluted revolving rollers which have a horizontal motion and rub the slubbing into a compact strand. The roving is then wound on bobbins by passing through a modern slubbing guide.

Cone Drawing.— Cone drawing follows closely the English system, it is costlier but permits of greater production and is widely used in the United States. The main difference is that the slubbing is wound onto the English system bobbin by being dragged around while the bobbin is free to move; as the bobbin gets filled it becomes more difficultto wind and the slubbing must be twisted hard to withstand the strain; in the cone system the bobbin is driven independently of the spindle and flyer and there is a constant tension on the slubbing that makes for a uniform and accurate twist on the roving with a consequent more even roving. Bobbins are larger and production greater, and since the twist is less the roving is softer and more like the French roving.

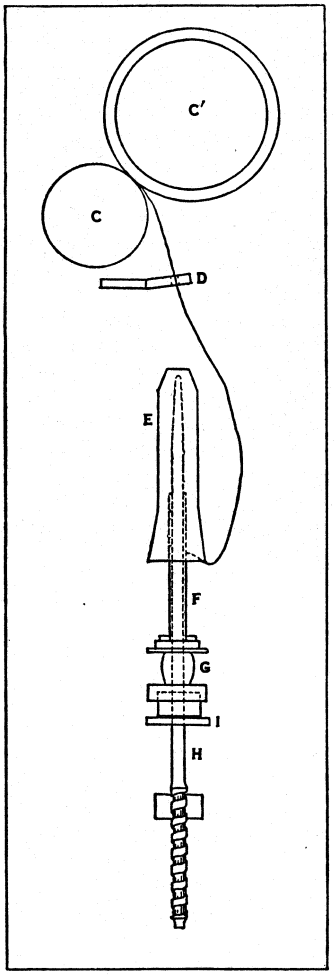

FIG. 7.—SECTION OF CAP SPINDLE

Patented Drawing. — This new English method does away with the English system drawing frames and substitutes the pin control method, thereby using short hair stock as well as long hair stock. It can be used with the English system roving and spinning sets and it can take oiled or dry tops or a blend of both. Since great competition is being given the English system by the French system in America, mills using the former are putting in the patented drawing machines to get the French soft roving without replacing their roving and spinning machinery.

Spinning.— Having obtained the roving by any one of the systems described, the next step is to spin the roving into yarn. There are four methods of spinning—flyer, cap, ring and mule. The English system uses ring, cap and flyer spinning. While most American mills using the English system use cap spinning there is a definite trend toward ring spinning. Flyer spinning is used on mohairs and carpet wools. About 85% of the American mills operating under the French system use mule spinning although ring spinning is increasing. In all systems there are three steps to spinning: (1) final drafting, (2) twisting the roving, (3) packaging—these are continuous operations except in worsted mule spinning.

Flyer Spinning.— Invented by Richard Arkwright in 1769 and known in England as the "throstle," the flyer spinner gives its yarns smoothness and lustre. The flyer frame is similar to the English system drawing frame with front, back and carrier rollers to thin the roving. The flyers which impart the twist are at the top of spindles, revolving at 2,500 to 3,000 revolutions per minute. The yarn is automatically wound onto bobbins or tubes. Production is low, but the flyer is necessary for spinning mohair acd does a good job. The yarn is laid on the bobbins in horizontal layers by use of friction drag—automatic doffing is common. Amount of twist depends on the speed of the flyer.

Cap Spinning.— Invented by Charles Danforth, an American, in 1828, cap spinning is the most common spinning method used in the United States for English system worsteds. The spindles are stationary and the method of inserting twist and the bobbin winding differ from the flyer frames. The bobbin rotates at 6,000 to 9,000 r.p.m. by the lifting of a tube fitted with a whorl which is placed over the spindle; a twist is imparted to the yarn as the bobbin revolves and the spindle and cap do not. Weaknesses of this system are roughness and hairiness of yarn due to the great speed. Calculating the amount of twist

is complicated; the number of twists varies according to type of wool, from 3 to 20 per inch, equalling the number of revolutions of the bobbin per inch of delivery.

Ring Spinning.—Recently the use of ring spinning, formerly used for cotton has become widespread in the worsted field. The benefits of this type of spinning are quality yarns at low cost. The most prominent feature is the large size of the bobbin which holds many times that held by the ordinary one. Very few knots are found in the yarn and it is superior to cap spun yarn. The yarn is fed through an eye, and onto a traveller which is dragged around a ring, lubricated to reduce friction, which in turn is fastened to a stationary ring rail. The yarn goes at right angles from the traveller to the bobbin. The bobbin motion inserts the twist and the traveller runs slower than the bobbin to ensure tension. Spindle speed is variated to compensate for loss of tension due to the filling up of the bobbin, hence the smaller the bobbin load the greater the spindle speed.

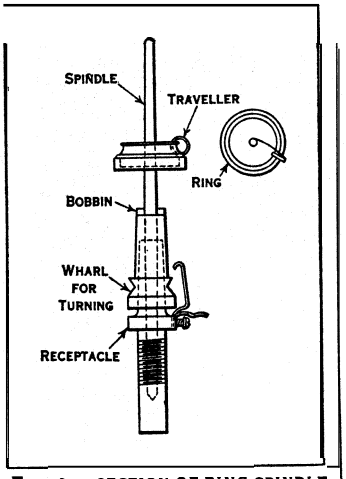

FIG. 8.—SECTION OF RING SPINDLE

Mule Spinning.—Mule spinning, being replaced in the United States by ring spinning, produces an exceptionally fine, soft yarn with short wools. The operations are performed intermittently rather than continuously, and the process is used only in the French system. Twist is put into the flat yarn by using cylinder driven tapered spindles on a carriage which runs about five feet. When the carriage reaches the end of its run the yarn is completed and removed from the top of the spindles; the carriage then travels back and the yarn is again wound on the bobbin.

Doubling, etc.—It is often necessary to double or further thicken the yarns; this is done on the spinning frames. Similarly, fancy twists are often desired and these are imparted by numerous attachments on ring frames. Since yarns are available in many forms, spools, bobbins, etc., the buyer has a broad choice.

Weaving, Finishing.—The principles of weaving apply generally to worsted weaving (*see* WEAVING) except in a few cases. Generally, the processes used in finishing worsteds are similar to those used in woollens except that the worsted is more nearly a completed fabric when it leaves the looms; hence though similar operations are required for finishing they are more lightly applied and the change from the unfinished to the finished worsted is not so noticeable. Worsteds may be crossed with other fabrics to form hybrids; generally the usages are increasing. (*See* also WOOLLEN MANUFACTURE.)

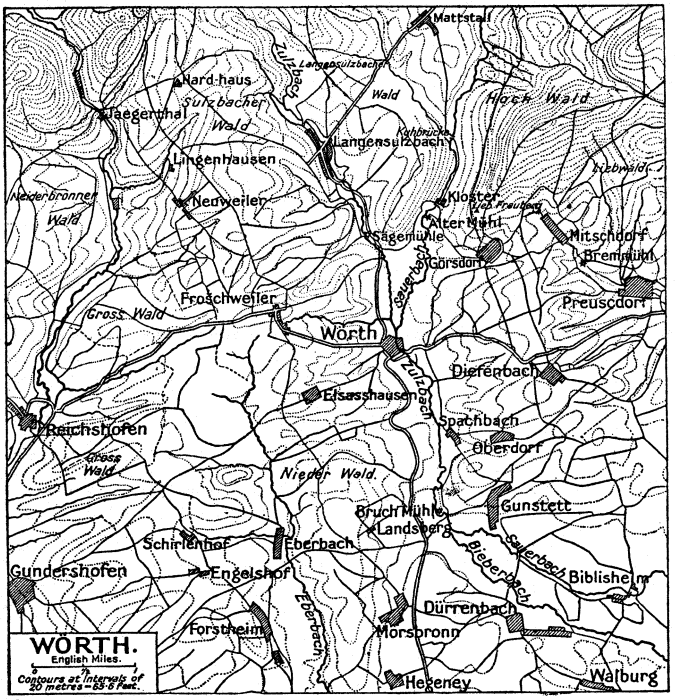
WORTH, CHARLES FREDERICK (1825–1895), the famous dressmaker, was born at Bourne, Lincolnshire, in 1825 and was sent to London as an apprentice to Swan & Edgar, drapers. In 1846, he went to Paris, without capital or friends, and after 12 years in a wholesale silk house he began business as a dressmaker in partnership with a Swede named Dobergh. He won the patronage of the empress Eugénie, and, through her, of fashionable Paris. After the Franco-German War Worth continued the business with his two sons John and Gaston—both naturalized Frenchmen. For more than 30 years he set the taste and ordained the fashions of Paris.

WÖRTH, a village of Alsace, on the Sauer, 6mi. N. of Hagenau, which gives its name to the battle of Aug. 6, 1870, fought between the Germans under the crown prince of Prussia and the French under Marshal MacMahon. The battle is also called Reichshoffen and Froschweiler. Pop. (1936) 1,141.

The events which led up to the engagement, and the general situation on the 6th are dealt with under FRANCO-GERMAN WAR. During Aug. 5 the French concentrated in a selected position running nearly north and south along the Sauer Bach on the left front of the German III Army, which was moving south to seek them. The position is marked from right to left by Morsbronn, the Niederwald, the heights west of Worth and the woods north-east of Froschweiler. East of the Sauer the German III Army was moving south, when their cavalry found the French position about noon. Thereafter the German vedettes held the French under close observation. while the latter moved about within their lines and as far as the village of Worth as if in peace quarters.

About 5 P.M. some horses were being watered at the Sauer, when a sudden swoop of the enemy's hussars drove the party back to camp. The alarm was sounded, tents were struck and the troops fell in and remained under arms until the confusion died down, when orders were sent to fall out, but not to pitch the tents. The army there bivouacked, and but for this incident the



SCENE OF BATTLE BETWEEN THE FRENCH AND GERMANS AUG. 6, 1870

battle of the next day might not have been fought. A sudden storm broke over the bivouacs, and when it was over, many of the men, wet and restless, broke out of camp and went into Wörth, which was unoccupied, though Prussians were only 300yd. from the sentries. These fired, and the officer commanding the Prussian outposts, hearing the confused murmur of voices, ordered up a battery, and as soon as there was light enough dropped shells into Wörth. The stragglers rushed back, French lines were again alarmed, and batteries on their side took up the challenge.

The Prussian guns, as strict orders had been given to avoid all engagement that day, soon withdrew and were about to return to camp, when renewed artillery fire was heard from the south and presently also from the north. In the latter direction, the II Bavarian Corps had bivouacked along the Mattstall-Langensulzbach road with orders to continue the march if artillery were heard to the south. This order was contrary to the spirit of the III Army orders, and, moreover, the V Prussian Corps to the south was in ignorance of its having been given.

The outpost battery near Worth was heard, and the Bavarians at once moved forward. The leading divisional commander, anxious to prove his loyalty to his new allies—his enemies in 1866—ordered his troops to attack, giving the spire of Fröschweiler, which was visible over the moods, as the point of direction. The French, however, were quite ready and a furious fusillade broke out, which was multiplied by the echoes of the forest-clad hills out of all proportion to the numbers engaged. The Prussian officers of the V Corps near Diefenbach, knowing nothing of the orders the Bavarians had received, were amazed; but when about 10.30 A.M. their comrades were seen retiring, part in disorder, the corps commander, Kirchbach, decided that an effort must be made to relieve the Bavarians. He communicated his intention of attacking to the XI Corps (Bose) on his left and asked for all available assistance. A report was also despatched to the crown prince at Sulz, 5mi. away.

Meanwhile the XI. Cbrps had become involved in an engagement. The left of the V. Corps' outposts had over night occupied Gunstett and the bank of the Sauer, and the French shortly after daylight on the 6th sent down an unarmed party to fetch water. As this appeared through the mist, the Prussians naturally fired upon it, and the French General Lartigue (to whose division the party belonged), puzzled to account for the firing, brought up some batteries in readiness to repel an attack. These fired a few rounds only, but remained in position as a precaution.

Hearing the firing, the XI. Corps' advanced guard, which had marched up behind in accordance with the general movement of the corps in changing front to the west, promptly came up to Spachbach and Gunstett. In this movement across country to Spachbach some bodies appear to have exposed themselves, for French artillery at Elsasshausen suddenly opened fire, and the shrapnel bursting high, sent showers of bullets on to the house roofs of Spachbach, in which village a battalion had just halted. The major in command thereupon ordered the march to be resumed, and as he gave the order, his horse ran away with him towards the Sauer. The leading company, seeing the battalion commander gallop, moved off at the double, and the others of course followed. Under the impression that they were intended to attack, they deployed and crossed the river. By this time the French outposts lining the edge of the Niederwald, were firing heavily. The line of smoke was naturally accepted by all as the objective, and the German companies with a wild rush reached the edge of the wood.

A similarly unpremeditated encounter had happened at Gunstett and both sides brought up reinforcements. The Prussians, with all their attention concentrated on the wood in their front, and having as yet no superior commanders, soon exhibited signs of confusion, and thereupon Gen. Lartigue ordered a counter attack towards the heights of Gunstett, when all the Prussians between the Niederwald and the Sauer gave way. The French followed with a rush, and, fording the Sauer opposite Gunstett, for a moment placed the long line of German guns upon the heights in considerable danger. At this crisis a fresh battalion arrived and attacked the French on one flank whilst the guns swept the other. The momentum of the charge died out, and the French retired.

In the centre the fight had been going badly for the V. Corps. As soon as Kirchbach's 84 guns between Dieffenbach and Spachbach opened fire the French disappeared from sight. There was no longer a target, and, perhaps to compel his adversary to show himself, Kirchbach ordered four battalions to cross the river. These, however, were overpowered and driven back by infantry fire. But, once more, the dashing counter-attack of the French was thrown into confusion by the Prussian shell fire, and as the French fell back the Prussian infantry, now reinforced, followed them up (about 1 P.M.). The commander-in-chief of the German III. Army (the crown prince Frederick) now appeared on the field and ordered Kirchbach to stand fast until the pressure of the XI. Corps and Wiirttemberg Division could take effect against the French right wing. The majority of these troops had not yet reached the field. Bose, however, seeing the retreat of the troops of the V. Corps, had independently determined to renew the attack against the Niederwald, and had ordered Schkopp's brigade, which was then approaching, to join the troops collecting to the east of Gunstett. Schkopp, however, seeing that his present line of advance led him direct on to the French right about Morsbronn and kept him clear of the confusion to be seen around Gunstett, disregarded the order and continued to advance on Morsbronn. This deliberate acceptance of responsibility really decided the battle, for his brigade quietly deployed as a unit and compelled the French right wing to fall back.

To cover the French retreat Michel's brigade of cavalry was ordered to charge. Without reconnoitring or manoeuvring for position, the French cavalry rode straight at the first objective which offered itself. Hence the charge was costly and only partly successful. However, the Prussians' attention was sufficiently absorbed while the French infantry rallied for a fresh counter-stroke. This was made, about 1.20 P.M., with the utmost gallantry, and the Prussians were driven back. But the counter-attack soon came under the fire of the great artillery mass above Gunstett, and Bose having at length concentrated the main body of the XI. Corps in the meadows between the Niederwald and the Sauer, the French had to withdraw. Their withdrawal involved the retreat of the troops who had defended Niederwald all day.

By 3 P.M. the Prussians were masters of the Niederwald and the ground south of it on which the French right wing had originally stood, but they were in indescribable confusion after the prolonged fighting in the dense undergrowth. Before order could be restored came another fierce counterstroke. As the Prussians emerged from the northern edge of the wood, the French reserves suddenly came out from behind the Elsasshausen heights, and striking due south drove the Prussians back. It was a grave crisis, but at this moment Schkopp, who throughout all this had kept two of his battalions intact, came round the north-west corner of the Wald, and these fresh battalions again brought the French to a standstill. Meanwhile Kirchbach, seeing the progress of the XI. Corps, had ordered the whole of his command forward to assault the French centre, and away to the right the two Bavarian corps moved against the French left, which still maintained its original position in the woods north-east of Froschweiler.

MacMahon, however, was not beaten yet. Ordering Bonnemains' cavalry division to charge by squadrons to gain time, he brought up his reserve artillery, and sent it forward to case-shot range to cover a final counter-stroke by his last intact battalions. But from his position near Froschweiler he could not see into the hollow between Elsasshausen and the Niederwald. The order was too late, and the artillery unlimbered just as the counter attack on the Niederwald alluded to above gave way before Schkopp's reserve. The guns were submerged in a flood of fugitives and pursuers. Elsasshausen passed into the hands of the Germans. To rescue the guns the nearest French infantry attacked in a succession of groups, charging home the bayonet with the utmost determination. Before each attack the Prussians immediately in front gave way, but those on the flanks swung inwards, and under this converging fire each French attempt died out, the Prussians following up their retreat. In this manner, step by step, in confusion which almost defies analysis, the Prussians conquered the whole of the ground to the south of the Froschweiler-Worth road, but the French still held on in the village of Froschweiler itself and in the woods to the north of the road, where throughout the day they had held the two Bavarian corps in check with little difficulty. To break down this last stronghold, the guns of the V. and XI. Corps, which had now come forward to the captured ridge of Elsasshausen, took the village as their target; and the great crowd of infantry, now flushed with victory but in the direst confusion, encouraged by the example of two horse artillery batteries, which galloped boldly forward to case-shot range, delivered one final rush which swept all resistance before it.

The battle was won and cavalry only were needed to reap its consequences, but the Prussian cavalry division had been left behind without orders and did not reach the battlefield till late at night. Under cover of darkness the French escaped, and on the following day the cavalry division was quite unable to discover the direction of the retreat.

MacMahon received no support from the neighbouring French troops (*see* FRANCO-GERMAN WAR). The battle was won by overpowering weight of numbers. The Prussian general staff were able to direct upon the field no fewer than 75,000 infantry, 6,000 cavalry and 300 guns, of which 71,000 rifles, 4,250 sabres and 234 guns came into action against 32,000 rifles, 4,850 sabres and 101 guns on the French side. The superiority of the French chassepot to the needle guns may reasonably be set against the superior number of rifles on the German side, for though the Germans were generally, thanks to their numbers, able to bring a converging fire upon the French, the latter made nearly double the number of hits for about the same weight of ammunition fired, but the French had nothing to oppose to the superior German artillery, and in almost every instance it was the terrible shell fire which broke up the French counter attack. All of these attacks were in the highest degree honourable to the French army, and many came nearer to imperilling the ultimate success of the Germans than

is generally supposed even by students of military affairs.

The losses of the Germans were 9,270 killed and wounded and 1,370 missing, or 13%; those of the French were about 8,000 killed and wounded, and perhaps 12,000 missing and prisoners, representing a total loss of about 41%.

WORTHING, a municipal borough and seaside resort mainly in the Horsham and Worthing parliamentary division of Sussex, England, 61 mi. S.W. from London by the S. railway. Pop. (est. 1938) 59,080. Area, 13.5 sq.mi. It has a fine marine parade and a promenade pier, and there is a long range of firm sands. The mother parish of Worthing is Broadwater, the church of which, 1 mi. N. of Worthing, is a cruciform building, and a fine example of transitional Norman work. A Roman villa, evidence of a pottery works, and a "mile-stone," have been discovered here. The town was incorporated in 1890. A modern and important industry is the raising of flowers and fruit, especially tomatoes, in glass houses. A new town hall was opened in 1933 and the corporation owns over 1,000 ac. of downlands, besides a marine estate and public gardens. During World War II 3,000 houses uere damaged in the German air raids of 1940–41. The area of the borough was more than doubled in 1929, and portions of the parishes of Findon and Sompting were added in 1933.

WORTHINGTON-EVANS, SIR LAMING (1868–1931), British statesman, was born Aug. 23, 1868. In 1910 he was elected Conservative M.P. for Colchester, and in 1918 for the Colchester division of Essex, which he represented in succeeding parliaments. In 1916 he entered the Coalition government as parliamentary secretary to the ministry of munitions. He left the ministry of munitions in 1918 to become minister of blockade, and afterwards filled the following offices under Lloyd George and Baldwin: minister of pensions, 1918–20; minister without portfolio, 1920–21; secretary for war, 1921–22; postmaster-general, 1923–24; and again secretary for war, 1924–29. He wrote books on company law. He died Feb. 14, 1931.

WOTTON, SIR HENRY (1568–1639), English author and diplomatist, son of Thomas Wotton (1521–1587) and grandnephew of Nicholas Wotton, was born at Bocton Hall in the parish of Bocton or Boughton Malherbe, Kent. He was educated at Winchester school and at New college and Queen's college, Oxford. At Oxford he was the friend of Albericus Gentilis and of John Donne. While at Queen's he wrote a play, Tancredo, which has not survived, but his chief interests appear to have been scientific. About 1589 Wotton went abroad, probably in preparation for a diplomatic career, and his travels appear to have lasted for about six years. At Altdorf he met Edward, Lord Zouch, to whom he later addressed a series of letters (1590-93) which contain much political and other news. These (*Reliquiae* Wottonianae, pp. 585 et *seq.* 1685) provide a record of the journey. He travelled by way of Vienna and Venice to Rome, and in 1593 spent some time at Geneva in the house of Isaac Casaubon. Wotton returned to England in 1594, and in 1595 was admitted to the Middle Temple. While abroad he had provided Robert Devereux. second earl of Essex, with information, and he now entered his service as one of his agents or secretaries to supply intelligence of affairs in Transylvania. Poland, Italy and Germany. Wotton was not actually involved in Essex's downfall, but he left England, and within 16 hours of his patron's apprehension he was safe in France, whence he travelled to Venice and Rome. In 1602 he was resident at Florence, and a plot to murder James VI of Scotland having come to the ears of the grand duke of Tuscany, Wotton was entrusted with letters to warn him of the danger, and with Italian antidotes against poison. As "Ottavio Baldi" he travelled to Scotland by way of Norway. He remained three months at the Scottish court, retaining his Italian incognito. He then returned to Florence, but on receiving the news of James's accession hurried to England. James knighted him, and offered him the embassy at Madrid or Paris; but Wotton, knowing that both these offices involved ruinous expense, desired rather to represent James at Venice. He left London in 1604 accompanied by Sir Albertus Morton, his half-nephew. as secretary, and William Bedell, the author of an Irish translation of the Bible, as chaplain.

Wotton spent most of the next twenty years, with two breaks (1612–16 and 1619–21), at Venice. He helped the Doge in his resistance to ecclesiastical aggression, and was associated with Paolo Sarpi, whose history of the Council of Trent was sent to King James as fast as it was written. In 1611 Caspar Schoppe, whom Wotton had offended, wrote a scurrilous book against James entitled Ecclesiasticus, in which he fastened on Wotton a saying which he had incautiously written in a friend's album years before. It was the famous definition of an ambassador as an "honest man sent to lie abroad for the good of his country." Wotton was at the time on leave in England, and made two formal defences of himself, one a personal attack on his accuser addressed to Marcus Welser of Strasbourg, and the other privately to the king. He seems to have won back James's favour by obsequious support in parliament of his claim to impose arbitrary taxes on merchandise. In 1614 he was sent to the Hague and in 1616 he returned to Venice.

In 1620 he was sent on a special embassy to Ferdinand II. at Vienna, to do what he could on behalf of James's daughter Elizabeth, queen of Bohemia. Wotton's devotion to this princess, expressed in his exquisite verses beginning "You meaner beauties of the night," was sincere and unchanging. At his departure the emperor presented him with a jewel of great value, which Wotton received with due respect, but before leaving the city he gave it to his hostess, because, he said, he would accept no gifts from the enemy of the Bohemian queen. After a third term of service in Venice he returned to London early in 1624 and in July he was installed as provost of Eton College. This office did not relieve him from his pecuniary embarrassments, and he was even on one occasion arrested for debt, but he received in 1627 a pension of £200, and in 1630 this was raised to £500 on the understanding that he should write a history of England. He did not neglect the duties of his provostship, and was happy in being able to entertain his friends lavishly. His most constant associates were Izaak Walton and John Hales. A bend in the Thames below the Playing Fields, known as "Black Potts," is still pointed out as the spot where Wotton and Izaak Walton fished in company. He died at the beginning of December 1639 and was buried in the chapel of Eton College.

Sir Henry Wotton was not an industrious author, and his writings are very small in bulk. Of the twenty-five poems printed in *Reliquiae* Wottonianae only 15 are Wotton's. But of those 1j two have obtained a place among the best known poems in the language, the lines already mentioned "On his Mistris, the Queen of Bohemia," and "The Character of a Happy Life."

During his lifetime he published only *The Elements* of *Architecture* (1624), which is a paraphrase from Marcus Vitruvius Pollio, and a Latin prose address to the king on his return from Scotland (1633). In 1651 appeared the *Reliquiae Wottonianae,* with Izaak Walton's *Life.* An admirable *Life and Letters,* representing much new material, by Logan Pearsall Smith, was published in 1907. *See* also *A.* W. Ward, *Sir Henry Wotton, a Biographical Sketch* (1898).

WOUND, a solution in the continuity of the soft parts of the body. Contused wounds, or bruises, are injuries to the cellular tissues in which the skin is not broken. In parts where the tissues are lax the signs of swelling and discoloration are more noticeable than in the tenser tissues. The discoloration is caused by haemorrhage into the tissues (ecchymosis), and passes from dark purple through green to yellow before it disappears. If a considerable amount of blood is poured forth into the injured tissues it is termed a haematoma. The treatment of a bruise consists in the application of cold lotion, preferably an evaporating spirit-lotion, to limit the subcutaneous bleeding. The haemorrhage usually becomes absorbed of its own accord even in haematomata, but should suppuration threaten an incision must be made and the cavity aseptically evacuated.

Open wounds are divided into incised, lacerated, punctured and gunshot wounds. Incised wounds are made by any sharp instrument and have their edges evenly cut. In these wounds there is usually free haemorrhage, as the vessels are cleanly divided

Lacerated wounds are those in which the edges of the wound are torn irregularly. Such injuries occur frequently from accidents with machinrry or blunt instruments, or from bites by animals. The haemorrhage is less than from incised wounds, and the edges may be bruised. *Punctured* wounds are those in which the depth is greater than the external opening. They are generally produced by sharp-pointed instruments. The chief danger arises from puncture of large blood-vessels, or injury to important structures such as those in the thorax and abdomen. The great danger of all open wounds is that pathogenic micro-organisms will be introduced at the time of injury.

The treatment of incised wounds is to arrest the bleeding (see HAEMORRHAGE), cleanse the wound and its surroundings, removing all foreign bodies (splinters, glass, etc.), and obtain apposition of the cut surfaces. This is usually done by means of sutures or stitches of silk, catgut, silkwormgut or silver wire. If the wound can be rendered aseptic, incised wounds usually heal by first intention. In lacerated wounds there is danger of suppuration, sloughing, erysipelas, while if soil, particularly cultivated and heavily manured soil, be carried into the tissues during the injury there is risk of gas-gangrene, malignant oedema or tetanus. These wounds do not heal by first intention, and there is consequently considerable scarring. The exact amount of time occupied in the repair depends upon the presence or not of septic material, as lacerated wounds are very difficult to cleanse properly. Carbolic acid lotion should be used for cleansing, while torn or ragged portions should be cut away and provision made for free drainage. It is not always possible to apply sutures at first, but the wound may be packed with antiseptic gauze, and later, when a clean granulating surface has been obtained, skin-grafting may be required. In extensive lacerated wounds, especially in conjunction with comminuted fractures, amputation of a limb may be called for. Punctured wounds should be syringed with carbolic lotion, and all splinters and foreign bodies removed. The location of needles and other bodies opaque to the rays is facilitated by the use of the Rontgen rays; the wound can then be packed with gauze and drained. If a large vessel should have been injured, the wound may have to be laid open and the bleeding vessel secured. Should paralysis indicate that a large nerve has been divided, the wound must also be laid open in order to suture the injured structure.

It is only possible here to mention some of the special characteristics of *gunshot* wounds. A remarkable collection, largely added to during the World War, is contained in the Museum of the Royal College of Surgeons of England and smaller collections are to be found in some other great centres. With the modern small-bore rifle of high velocity, machine guns and Lewis guns the aperture of entry is small and the aperture of exit larger and more slit-like. There is usually but little haemorrhage. Should no large vessel be torn, and should no portion of septic clothing be carried in, the wound may heal by first intention. Such bullets may be said to disable without killing. They may drill a clean hole in a bone without a fracture, but sometimes there is much splintering. Abdominal wounds may be so small that the intestine may be penetrated and adhesions of neighbouring coils of intestine cover the aperture. Martini-Henry bullets make larger apertures, while soft-nosed or "dum-dum" bullets spread out as soon as the bullet strikes, causing great mutilation and destruction of the tissues. Shell wounds cause extensive lacerations. Small shot may inflict serious injury should one of the pellets enter the eye. In gunshot wounds at short distance the skin may be blackened owing to the particles of carbon lodging in it. The chief dangers of gunshot wounds are haemorrhage, shock and the carrying in of septic material or clothing into the wound.

WOUWERMAN, PHILIP (1619–1668), Dutch painter of battle and hunting scenes, was born at Haarlem, where he was baptised on May 24, 1619. He learned the elements of his art from his father, Paul Joosten Wouwerman, a painter from Alkmaar. He then became a pupil of Frans Hals and probably of J. Wynants and of Pieter Verbeek, a painter of horses. He became a member of the guild of painters at Haarlem in 164.2, and there he died on May 19, 1668. About 800 pictures were enumerated in John Smith's Catalogue *raisonné* (1840) as the work of Philip Wouwerman, and in C. Hofstede de Groot's enlarged *Catalogue*, vol. ii. (1909), the number exceeds 1,200; but probably many of these are the productions of his brothers Pieter (1623–1682) and Jan (1629–1666), and of his many other imitators. His authentic works are distinguished by great spirit and are infinitely varied, though dealing recurrently with cavalry battle-pieces, military encampments, cavalcades, and hunting or hawking parties. He is equally excellent in his vivacious treatment of figures, in his skilful animal painting, and in his admirable and appropriate landscape backgrounds. Horses were his favourite study, and a white horse is generally introduced. Three different styles have been observed as characteristic of the various periods of his art. His earlier works are marked by the prevalence of a foxy-brown colouring, and by a tendency to angularity in draughtsmanship; the productions of his middle period have greater purity and brilliancy; and his latest and greatest pictures possess more of force and breadth, and are full of a delicate silvery-grey tone.

See H. de Groot, Catalogue of Dutch Painters (1909).

WRAITH, a general term in popular parlance for the appearance of the spirit of a living person. (See "Phantasms of the Living," under PSYCHICAL RESEARCH.)

WRANGEL, FRIEDRICH HEINRICH ERNST, COUNT VON (1784–1877), Prussian general field marshal, was born at Stettin, on April 13, 1784. He entered the Prussian army in 1796 and distinguished himself in the campaigns against Napoleon. He was in command of the 13th Division, with headquarters at Miinster, in Westphalia, in 1834, when riots occurred owing to differences between the archbishop of Cologne and the crown, and the determination and resolution with which he treated the clerical party prevented serious trouble. He was promoted lieutenant-general, received many honours from the court, enjoyed the confidence of the Junker party, and commanded successively at Konigsberg and Stettin. In 1848 he commanded the II. Corps of the German Federal army in the Schleswig-Holstein campaign, was promoted general of cavalry, and won several actions. In the autumn he was summoned to Berlin to suppress the riots there. As governor of Berlin and commander-in-chief of the Mark of Brandenburg (appointments which he held till his death) he proclaimed a state of siege, and ejected the Liberal president and members of the Chamber. Thus on two occasions in the troubled history of Prussian revival Wrangel's uncompromising sternness achieved its object without bloodshed. In 1856 he was made a field marshal. At the age of eighty he commanded the Austro-Prussian army in the war with Denmark in 1864. The prestige of his name, and the good work of his subordinates, made the campaign a brilliant success. After the capture of Diippel he resigned the command, was created a count, and received other honours. In 1866 "Papa" Wrangel assisted in the Bohemian campaign, but without a command on account of his great age. He took a keen interest in the second reorganization of the cavalry arm 1866–1870, and in the war with France in 1870–71. He died at Berlin on Nov. 2, 1877.

See supplement to *Militär. Wochenblatt* (1877), and lives by von Koppen and von Maltitz (Berlin, 1884).

WRANGEL, KARL GUSTAV VON (1613–1676), Swedish soldier, was descended from a family of Estonian origin, branches of which settled in Sweden, Russia and Germany. His father, Hermann von Wrangel (1587–1643), was a Swedish field marshal in Gustavus Adolphus's wars. Karl Gustav was born near Uppsala on Dec. 23, 1613, and at the age of twenty distinguished himself as a cavalry captain in the war against the Army of the League. Three years later he was colonel, and in 1638 major-general, still serving in Germany. In 1644 he commanded a fleet at sea, which defeated the Danes at Fehmarn on the 23rd of October. In 1646 he returned to Germany as a field marshal and succeeded Torstensson as commander-in-chief of the Swedish army in Germany, which post he held during the last three campaigns of the Thirty Years' War. Under Wrangel and Turenne the allied Swedish and French armies marched and fought in Bavaria and Wiirttemberg. At the outbreak of a fresh Polish

war in 1655 Wrangel commanded a fleet, but in 1656 he was serving on land again and commanding, along with the Great Elector of Brandenburg, in the three days' battle of Warsaw. In 1657 he invaded Jutland and in 1658 passed over the ice into the islands and took Kronborg. In 1657 he was appointed admiral and in 1664 general of the realm, and as such he was a member of the regency during the minority of Charles XI. But his last campaign was unfortunate. Commanding, ineffectively owing to his broken health, in the war against Brandenburg, he was recalled after his stepbrother Waldemar, Freiherr von Wrangel (1647–1676), had been defeated at Fehrbellin. He died at Rügen on July 5, 1676.

WRANGEL, PETER NICHOLAIEVICH, BARON (1878–1928), Russian general, was born at St. Petersburg (Leningrad) on Aug. 1 j, 1878, of a noble family of Swedish descent. After experience in the ranks of the horse guards and as a mining engineer in Siberia, he served as an officer in a Cossack regiment, transferring after the Russo-Japanese War to the horse guards as a captain. During the World War he commanded successively a squadron. a regiment and a division of Cossacks. He was one of the first officers to join Kaledin against the Bolsheviks. After Kaledin's suicide Wrangel allied himself to Alexeyev and Denikin, distinguishing himself particularly by his defence of Tsaritsyn in the summer of 1919. On April 4, 1920, after Denikin's retreat, Wrangel was appointed commander-in-chief of the volunteer army. He was in Constantinople when the summons came. He arrived in the Crimea to find a force completely disorganized. In a very short space of time he had turned it into an effective force with which he held the Bolsheviks in check, and indeed made some advance. But after the signing of a peace treaty between Poland and the Bolsheviks the tide turned. On Nov. 15 Sebastopol was lost and the evacuation of the army carried out. Wrangel embarked with about 130,000 refugees, who were dispersed in the Balkans and other parts of Europe. He kept a staff for some time in Belgrade, from which centre he tried to organize the settlement of his soldiers. After a time he took a post as mining engineer in Brussels, where he died on April 25, 1928.

WRANGEL ISLAND, in the Arctic sea, 85 m. N.E. of Cape Billings, eastern Siberia, extends between 176° W. and 179° E. in about 71° N. It is 80 m. long and 18–30 m. wide and has an area of about 2,000 sq.miles. The mountainous interior rises to 2,500 ft. in Berry Peak, but there is much low land on the south and north. Shoals and sandspits project to sea on the north and south-west. The west and east coasts are steep and lofty. The small Rodgers harbour is on the south-east. There are no true glaciers. Tundra covers many parts. Polar bears and foxes are numerous. Walrus and seals frequent the shores. In summer there are duck, geese, gulls and other birds. Driftwood is abundant. Mammoth tusks have been found. No minerals of value occur. Herald island lies 40 m. E. of Wrangel island. It is 5 m. long and goo ft. high. The shores are mostly steep. There are no resources. Both islands are generally surrounded by pack-ice. Hunters do not visit them and there has never been a native population. Reports of land seen to the north by natives of eastern Siberia were investigated by F. von Wrangel in 1824, but he failed to reach the island. In 1849 Captain H. Kellett, R.N., discovered and landed on Herald island, from which he reported lands to the west, Plover and Kellett's Lands, thought to be parts of an Arctic continent. Commander J. Rodgers, U.S.N., landed on Herald island in 1855, and the American whaler T. Long sailed along the south of Wrangel island and gave it its name in 1867. The first certain record of landing is by Capt. C. L. Hooper, U.S.N., in 1881. The same year Captain R. M. Berry, U.S.N., explored the island and dispelled the idea of extensive land in that region. Russians first landed in 1911 when the "Taimir" and "Vaigach" erected a beacon. The survivors of V. Stefansson's "Karluk" lived on the island from March to Sept. 1914 *(see* ARCTIC REGIONS) ; in 1921 Stefansson sent another party of five under A. Crawford to establish a Canadian claim by occupation in view of the use of the island as a base in transpolar aerial trade routes. The party perished through accident with the exception of the Eskimo seamstress. In 1923 a party of Eskimos under an Alaskan trapper was established with the same end in view, but Russia, laying stress on a claim made in 1916, removed the colony in Aug. 1924 and shortly afterwards brought 50 Chuckhee to form a settlement under Soviet officials. The Soviet flag was also hoisted on Herald island in 1926. The colony was visited by Russian aeroplanes in 1927. These claims were not officially disputed by Britain, Canada or the United States.

(R. N. R. B.)

WRASSE, a name given to the fishes of the family *Labridae.* They are abundant in the tropical zone, less so in the temperate, and disappear altogether in the Arctic and Antarctic. Their body is compressed, like that of a carp, and covered with smooth scales; they possess one dorsal fin only, the anterior portion of which consists of numerous spines. Many wrasses are recognized by their thick lips, the inside of which is sometimes curiously folded. The dentition consists of strong conical teeth, of which some are larger than others. But the principal organs with which they crush shell-fish, and other hard substances are the solid and strongly-toothed pharyngeal bones. of which the lower are coalesced into a single flat triangular plate. All wrasses are surface fishes. Rocky parts of the coast overgrown with seaweed are their favourite haunts in the temperate, and coral-reefs in the tropical seas. Some 450 species of wrasses (including parrot-fish, *q.v.*) are known, chiefly from the tropics.

Of the British wrasses the ballan wrasse (*Labrus maculatus*) and the striped or red or cook wrasse (L. *mixtus*) are the most common. The goldsinny or corkwing *(Crenilabrus melops)* is much more frequent on the southern coasts of England and Ireland than farther north. It rarely exceeds 10in. in length. The commonest American species is the tautog.

WRECK, a term which in its widest sense means anything without an apparent owner that is afloat upon, sunk in, or cast ashore by the sea; in legal phraseology, it has a narrower meaning. Formerly an appreciable source of revenue to the Crown, afterwards a valuable addition to the income of a landowner on the sea-coast, wreck has almost within modern times ceased to be a perquisite of either, or to enrich the casual finder at the expense of its rightful owner.

History. — The general rule in the civilized maritime countries of Europe was that the right to wreck belonged to the sovereign, and formed part of the royal revenue. This was so under the Roman, French and feudal law; and in England the common law set out in the statute *De praerogativa regis* (17 Edw. II., 1324) provided that the king has wreck of the sea, whales and sturgeons taken in the sea and elsewhere within the kingdom, except in certain places privileged by the king. This right, which it is said had for its object the prevention of the practice of destroying the property of the shipwrecked, was, however, gradually relaxed; and the owner of wreck was allowed to recover it if he made claim to it, and gave proof of his ownership within a certain time —fixed at a year or a year and a day alike by a decree of Antonine the Great, the feudal law, the general maritime law, the law of France and English law. Early in the 1 jth or at the close of the 14th century, it became usual for the Crown to grant to the lord-admiral by his patent of appointment, amongst other *proficua et commoditates* appertaining to his office, wreck of the sea; and when, early in the reign of Henry VIII., vice-admirals of the coast were created, the lord-admiral by patent under his own hand delegated to them his rights and duties in the several counties, including those in connection with wreck. He did not, however, part with the whole of his emoluments; his vice-admirals were required to render an account of the proceeds of wreck, and to hand over to him a part, usually one-half, of their gains. This system lasted until 1846 when an act (9 & 10 Vict. c. 99) was passed forbidding the vice-admirals to intermeddle with wreck, and it required the receivers of droits of admiralty to receive all wreck from the finders and to detain it for 12 calendar months; at the end of that period it was to be sold and the proceeds carried to the credit of the consolidated fund. The

ancient law by which the unfortunate owner was deprived of his property, if no living thing escaped from the wreck, had during the 16th and 17th centuries been gradually but tacitly relaxed; it required, however, a decision of Lord Mansfield and the king's bench in 1771 to settle the law definitely that, whether or no any living creature escaped, the property in a wreck remains in the owner. In Scotland it seems that the same law had been laid down in 1725, and there are indications that upon the continent of Europe there had before this date been a relaxation of the old law in the same direction. In the 17th century working salvors established the right to a lien upon property saved as a security for adequate remuneration of their exertions in saving it; and if the vice-admirals restored to its owners wreck that had come to their hands, they did so only upon payment of extravagant demands for salvage, storage, and often legal expenses. Stories of wilful wrecking of ships and of even more evil deeds are probably exaggerations, but modern research has authenticated sufficient abuses to show that further legislation was necessary to regulate the taking possession of wreck and ships in distress by "sea-coasters." Previously to the passing of the Act of 1846 the only substantial protection against plunder which owners of a wrecked ship could get was to apply to the admiralty judge for a commission enabling them or their agents to take possession of what came ashore, but to obtain such a commission took time and cost money, and before the commissioners arrived at the scene of the wreck a valuable cargo would have disappeared and been dispersed through the country. Plunder of wrecks was common, and the crowds that collected for the purpose set law at defiance. The vice-admirals, even if they had been able, did little to protect the ship wrecked. Many of the vice-admirals' accounts of the 17th and following centuries are extant. Most of them are for trifling sums, but occasionally the amounts are considerable. At the close of the 17th century the vice-admirals were required to make affidavits as to the amount of their gains; in 1709 20 of them swore that their office was worth less than £50 in the year.

The right of the warden of the Cinque Ports to wreck was derived from charters granted to the ports by Edward I. and his successors; many other seaports enjoyed a similar right under early charters. It would seem that these rights were of some value, for in 1829 the little towns of Dunwich and Southwold litigated at a cost of £1,000 the question whether a tub of whisky picked up at sea belonged to the admiralty jurisdiction of the one town or the other; and the town of Yarmouth is said to have spent no less than £7,000 upon a similar question. The Municipal Corporations Act of 1833 put an end to all dealings with wreck by local admiralty courts, except those of the Cinque Ports.

Grants of wreck to individuals are earlier than those to towns. Even before the Conquest it seems to have been not unusual for grantees from the Crown of lands adjoining the sea to get the franchise of wreck included in their grants. The lords of counties palatine had *wreccum maris* within their areas as part of their *jura* regalia, but yet inferior lords might prescribe for wreck belonging to their several manors within a county palatine.

From early times a distinction was made in English law between wreck cast ashore and wreck that is floating or sunken below low-water mark. Wreck proper, or common law wreck, ejectum *maris,* is what is cast by the sea upon the shore; for "nothing shall be said to be *wreccum maris,* but such goods as are cast or left upon the land" (Sir H. Constable's Case, 1599, 5 Rep. 106), and this belonged to the king jure coronae, and was dealt with by the common law. Floating and sunken wreck belonged to the Crown as inter regalia, but was granted to the lord-admiral *jure regis.* Even when the office of lord high admiral is in abeyance, and the duties are performed by commissioners, as now, these rights are distinguished from the other royal revenues as belonging to the Crown in its office of admiralty, or, as they are commonly known, droits (*q.v.*) of the Admiralty. From early times the lord-admiral tried to usurp, and there are several instances of his actually usurping jurisdiction over wreck proper; and in the reign of Richard II. special statutes (which were only declaratory of the common law) were passed for the purpose of confining his jurisdiction to its proper limits. Droits are flotsam, jetsam, lagan, derelict. In Lord Coke's words, flotsam is "when a ship sinks or otherwise perishes, and the goods float on the sea"; jetsam is "when goods are cast out of a ship to lighten her when in danger of sinking, and afterwards the ship perishes"; and ligan, or lagan, is "when heavy goods are, to lighten the ship, cast out and sunk in the sea tied to a buoy or cork, or something that will not sink, in order that they may be found again and recovered." Derelict is a ship or cargo, or part of it, abandoned by its master and crew sine *spe recuperandi* et sine animo revertendi. "None of these goods," adds Coke, "which are so called, are called wreck so long as they remain in or upon the sea; but if any of them by the sea be put upon the land then they shall be said to be wreck" (Sir H. Constable's Case, 1599, 5 Rep. 106; and 2 Inst. 167). Contrary to the opinion of Hale, Lord Stowell held that what is found anywhere derelict on the seas is acquired beneficially for the sovereign, if no owner shall appear. It seems that this was also Coke's view (2 Inst. 168).

The provisions of the Merchant Shipping Act, 1894, mentioned below, upon the subject of droits of admiralty are not clear. In practice the only droits of the admiralty that are commonly dealt with are anchors that have been slipped or parted from in heavy weather. In the Downs and other roadsteads these are "swept" for by creepers towed over the sea bottom, and in former days sweeping for anchors was a common industry. In the Downs large sums have been made after gales in this way. In the 17th century it became customary to obtain from the Crown grants of the right to fish for sunken wreck and treasure not only upon English coasts but all over the world.

The method of dealing with wreck outside territorial waters (which does not come within the scope of the act) is governed by the previous general law relating to droits of admiralty. The Board of Trade, and receiver-general, in its instructions to receivers, directs that wreck picked up at sea out of the limits of Great Britain, or brought to it by British ships, is to be taken possession of by the receiver and held by him on behalf of the owners, or, if the owners do not claim it, on behalf of the Crown. Derelict ships picked up at sea outside territorial limits and brought into British ports must be delivered to the receiver and kept by him until the owner can be found (but not longer than a year and a day). Wreck picked up out of territorial limits by a foreign ship need not be interfered with by the receiver, unless upon application by a party interested.

Although a ship on board which, or by means of which a man was killed, might be a deodand (*q.v.*), yet qua wreck she was not subject to forefeiture as deodand.

Present British Law.—The Merchant Shipping Act, 1894, contains the whole of the existing statute law upon the subject of wreck within the territorial waters of Great Britain, and under the Sea Fisheries Act, 1883, it applies to fishing boats. For its purposes wreck includes jetsam, flotsam, lagan and derelict, found in or on the shores of the sea or any tidal water. The term does not extend to a barge adrift in the Thames, nor a raft of timber adrift; it must be the hull, cargo or appurtenances of a vessel.

The provisions of the Merchant Shipping Act dealing with wreck are of a detailed and administrative character and are concerned with the duties of the Board of Trade, receivers of wreck, finders of wreck and other matters. They will be found in part IX. of the act and are included in ss. 510–537.

The owner of a wrecked ship, sunk by his negligence in a navigable highway, so as to be an obstruction to navigation, if he retains the ownership of her, is liable in damages to the owner of any other ship which without negligence runs into her, unless he has taken steps to indicate her position, or the harbour authority at his request has undertaken to do so. He may, however (whether the sinking was due to his negligence or not), abandon the ship, and can thus free himself from any further liability in respect of her. If he abandons her to any other person—*e.g.*, an underwriter—who pays for her as for a total loss, that person does not become liable for her unless he takes possession or control in any way. Harbour authorities generally have under the Merchant Shipping Act, 1894, or by local statute, as they have by the general Harbours, Docks and Piers Clauses Act, 1847 (if incor-

porated in their own act), the power of removing the wreck in such a case, and recouping themselves for their expenses from its proceeds. The general act also gives a personal right of action against the owner for any balance of expense over the value of the wreck; but if the owner has abandoned it, and no one else has taken it, neither he nor anyone else is liable. A particular or local act (as *e.g.,* one of the State of Victoria) may, however, fasten this liability on the person who is owner at the time when the ship is wrecked, and then he cannot free himself of it. A harbour authority is not obliged to remove a wreck because it has power to do so, unless it takes dues from vessels using the harbour where the wreck lies, or in some way warrants that the harbour is safe for navigation, in which case it is under an obligation to do so. Further statutory provision is now made in this respect by the Merchant Shipping Act, which empowers harbour authorities to raise, remove or destroy (and meantime buoy or light), or to sell and reimburse themselves out of the proceeds of any vessel or part of a vessel, her tackle, cargo, equipment and stores, sunk, stranded or abandoned in any water under their control, or any approach thereto, which is an obstruction or danger to navigation or lifeboat service. They must first give due notice of such intention, and must allow the owner to have the wreck on his paying the fair market value. The act gives similar powers to lighthouse authorities, with a provision that any dispute between a harbour and lighthouse authority in this respect is to be determined finally by the Board of Trade.

By an Act of 1896 it is now the duty of the master of a British ship to report to Lloyd's agent, or to the secretary of Lloyd's, any floating derelict ship which he may fall in with at sea. By the Merchant Shipping Convention Act, 1914, a master must on finding a wreck communicate with the shore. But the operation of the act was suspended by order in council till Jan. 1, 1929. It will supersede previous acts when it comes into force. Under the Merchant Shipping Act it is a felony to take wreck found in territorial limits to a foreign port, and it is punishable by fine to interfere with a wreck. The receiver has power, by means of a search warrant from a justice, to search for wreck which he has reason to believe is concealed. By the law of Scotland plundering wreck is punishable at common law; and in England and Ireland it is a felony to plunder or steal any wreck or part thereof, to destroy any wreck or part thereof, to prevent or impede any person on board a wreck from saving himself, and to exhibit any false signal with the intent of endangering any ship, or to do anything tending to the immediate loss or destruction of a ship for which no other punishment is provided.

WREN, SIR CHRISTOPHER (1632–1723), English architect, the son of a clergyman, was born at East Knoyle, Wiltshire, on Oct. 20, 1632; he entered at Wadham College, Oxford, in 1646, took his degree in 1650, and in 1653 was made a fellow of All Souls. While at Oxford Wren distinguished himself in geometry and applied mathematics, and Newton, in his *Principia,* p. 19 (ed. of 1713), speaks very highly of his work as a geometrician. In 1657 he became professor of astronomy at Gresham College, and in 1660 was elected Savilian professor of astronomy at Oxford. It is, however, as an architect that Wren is best known, and the great fire of London, by its destruction of the cathedral and nearly all the city churches, gave Wren a unique opportunity. Just before the fire Wren was asked by Charles II. to prepare a scheme for the restoration of the old St. Paul's. In May 1666 Wren submitted his report and designs (in the All Souls collection). for this work; the old cathedral was in a very ruinous stake, and Wren proposed to remodel the greater part, as he said, "after a good Roman manner," and not, "to follow the Gothick Rudeness of the old Design." According to this scheme only the old choir was left; the nave and transepts were to be rebuilt after the classical style, with a lofty dome at the crossing—not unlike the plan eventually carried out.

In September of the same year (1666) the fire occurred, and the old St. Paul's was completely gutted. From 1668 to 1670 attempts were being made by the chapter to restore the ruined building; but Dean Sancroft was anxious to have it wholly rebuilt, and in 1668 he had asked Wren to prepare a design for a wholly new church. This first design, the model for which is preserved in the South Kensington Museum, is very inferior to what Wren afterwards devised. In plan it is an immense rotunda surrounded by a wide aisle, and approached by a double portico; the rotunda is covered with a dome taken from that of the Pantheon in Rome; on this a second dome stands, set on a lofty drum, and this second dome is crowned by a tall spire. But the dean and chapter objected to the absence of a structural choir, nave and aisles, and wished to follow the mediaeval cathedral arrangement. Thus. in spite of its having been approved by the king, this design was happily abandoned—much to Wren's disgust; and he prepared another scheme with a similar treatment of a dome crowned by a spire, which in 1675 was ordered to be carried out. Wren apparently did not himself approve of this second design, for he obtained the king's permission to alter it as he liked, without showing models or drawings to any one, and the actual building bears little resemblance to the approved design, to which it is superior in almost every point.

Wren's earlier designs have the exterior of the church arranged with one order of columns; the division of the whole height into two orders was an immense gain in increasing the apparent scale of the whole, and makes the exterior of St. Paul's very superior to that of St. Peter's in Rome, which is utterly dwarfed by the colossal size of the columns and pilasters of its single order. The present dome and the drum on which it stands, masterpieces of graceful line and harmonious proportion, were very important alterations from the earlier scheme. As a scientific engineer and practical architect Wren was perhaps more remarkable than as an artistic designer. The construction of the wooden external dome, and the support of the stone lantern by an inner cone of brickwork, quite independent of either the external or internal dome, are wonderful examples of his constructive ingenuity. The first stone of the new St. Paul's was laid on June 21, 1675; the choir was opened for use on Dec. 2, 1697; and the last stone of the cathedral was set in 1710.

Wren also designed a colonnade to enclose a large piazza forming a clear space round the church, somewhat after the fashion of Bernini's colonnade in front of St. Peter's, but space in the city was too valuable to admit of this. Wren was an enthusiastic admirer of Bernini's designs, and visited Paris in 1665 in order to see him and his proposed scheme for the rebuilding of the Louvre. Bernini showed his design to Wren, but would not let him copy it, though, as he said, he "would have given his skin" to be allowed to do so.

After the destruction of the city of London Wren was employed to make designs for rebuilding its fifty burnt churches, and he also prepared a scheme for laying out the whole city on a new plan, with a series of wide streets radiating from a central space. Difficulties arising from the various ownerships of the ground prevented the accomplishment of this scheme.

Among Wren's city churches the most noteworthy are St. Michael's, Cornhill; St. Bride's, Fleet Street, and St. Mary-le-Bow, Cheapside, the latter remarkable for its graceful spire; and St. Stephen's, Walbrook, with a plain exterior, but very elaborate and graceful interior. In the design of spires Wren showed much taste and wonderful power of invention. He was also very judicious in his expenditure; he did not fritter away his limited resources in an attempt to make the whole of a building remarkable, but devoted it chiefly to one part or feature, such as a spire or a rich scheme of internal decoration. Thus he was in some cases, as in that of St. James's, Piccadilly, content to make the exterior of an almost barnlike plainness.

Wren's buildings were very numerous. Among the principal

ones are:—the Custom House, the Royal Exchange, Marlborough House, Buckingham House, and the Hall of the College of Physicians—now destroyed; others which exist are—at Oxford, the Sheldonian theatre, the Ashmolean museum, the Tom Tower of Christ Church, and Queen's College chapel; at Cambridge, the library of Trinity College and the chapel of Pembroke, the latter at the cost of Bishop Matthew Wren, his uncle. The western towers of Westminster Abbey are usually attributed to Wren, but they were not carried out till 1735–1745, many years after Wren's death, and there is no reason to think that his design was used. Wren (D.C.L. from 1660) was knighted in 1673, and was elected president of the Royal Society in 1681. He was in parliament for many years, representing Plympton from 1685, Windsor from 1689, and Weymouth from 1700. He occupied the post of surveyor of the royal works for fifty years, but by a shameful cabal was dismissed from this office a few years before his death. He died on Feb. 26, 1723, and is buried under the choir of St. Paul's; on a tablet over the inner north doorway is the well-known epitaph—*Si monumentum requiris, circumspice*. At the bi-centenary of his death on Feb. 26, 1923, a memorial service was held in St. Paul's Cathedral.

For further information the reader should consult the *Parentalia*, published by Wren's grandson in 1750, an account of the Wren family and especially of Sir Christopher and his works; also the two biographies of Wren by Elmes and Miss Phillimore; Milman, *Annals of St. Paul's* (1868); and Longman, *Three Cathedrals dedicated to St. Paul in London* (1873), pp. 77 *seq.* See also Clayton, *Churches of Sir C. Wren* (1848–1849); Taylor, *Towers and Steeples of Wren* (London, 1881); Niven, *City Churches* (London, 1887), illustrated with fine etchings; A. H. Mackmurdo, *Wren's City Churches* (1883); A. Stratton, *The Life, Work and Influence of Sir Christopher Wren* (1897); Lena Milman, *Sir Christopher Wren* (1908). The proceedings and publications of the Wren Society, incl. the vol. of drawings (1923); Sir Laurence Weaver K.B.E., *Sir Christopher Wren* (1923); *Letters (Tom Tower) to Fell, Bishop of Oxford* (Oxford, 1923); and the bi-centennial memorial volume published by the Royal Institute of British Architects (1923). In the library of All Souls at Oxford are preserved a large number of drawings by Wren, including the designs for almost all his chief works, and a fine series showing his various schemes for St. Paul's Cathedral. (J. H. Mi.)

WREN, the popular name for birds of the Passerine family Troglodytidae, of which the best known is Troglodytes troglodytes, the little brown bird with its vigorous song and its short tail cocked on high, that braves the winter of the British islands, and even of the European continent, and figures largely in folklore. In St. Kilda, isolation has brought about the evolution of a distinct sub-species.

The better known forms in the United States are the house-wren, common in the eastern states but in bad odour for its egg-eating proclivities; the winter-wren, remarkable for its resonant and brilliant song; the Carolina wren, also a fine singer; and the marsh-wren, besides the cactus-wrens and the cañon-wrens of the western States.

Wrens have the bill slender and arched: their food consists of insects, larvae and spiders, but they will also take any small creatures, such as worms and snails, and occasionally eat seeds. The note is shrill. The nest is usually a domed structure of ferns, grass, moss and leaves, lined with hair or feathers, and from three to nine eggs are produced, in most of the species white.

The headquarters of the wrens are in tropical America, but they reach Greenland in the north and the Falkland Islands in the south. Some genera are confined to the hills of tropical Asia, but Troglodytes, the best known, ranges over North and South America, Asia and Europe.

The Troglodytidae by no means contain all the birds to which the name "wren" is applied. Several of the *Sylviidae* bear it, especially the little golden-crested wren (see Goldcrest), and the group forming the genus Phylloscopus (see Warbler), habitual summer visitants. The largest P. sibilatrix, is called the wood-wren. The willow-wren P. trochilus, is in many parts of Great Britain the commonest summer bird, and is the most generally dispersed. The third species, P. collybita, is the chiffchaff.

WRENCH: see Spanner.

WRESTLING, a sport in which two persons strive to throw each other to the ground. It is one of the most primitive and universal of sports. Upon the walls of the temple-tombs of Beni Hasan, near the Nile, are sculptured many hundreds of scenes from wrestling matches, depicting practically all the "holds" and "falls" known at the present day, thus proving that wrestling was a highly developed sport at least 3,000 years before the Christian era. The description of the bout between Odysseus and Ajax in the 23rd book of the Iliad, and the evolutions of the classic Greek wrestlers, tally with the sculptures of Beni Hasan and Nineveh. The sport, in an organised and scientific form, may have been introduced into Greece from Egypt or Asia, though Greek tradition ascribed its invention and original rules to the legendary hero, Theseus. In Homer's celebrated description of the match between Ajax and Odysseus the two champions wore only a girdle, which was, however, not used in the classic Greek games. Neither Homer nor Eustathius, who also minutely depicted the battle between Ajax and Odysseus, mentions the use of oil, which, however, was invariably used at the Olympic games, where wrestling was introduced during the 18th Olympiad (about 704 B.C.). Wrestling contests for boys were added later. The Greek wrestlers, after the application of the oil, were rubbed with fine sand, to afford a better hold.

Wrestling was a very important branch of athletics in the Greek games, since it formed the chief event of the pentathlon, or quintuple games. (See Games, Classical.) All holds were allowed, even strangling, butting, and kicking. Crushing of the fingers was used, especially in the pancration, a combination of boxing and wrestling. Wrestlers were taught to be graceful in all their movements, in accordance with the Greek ideas of aesthetics. There were two varieties of Greek wrestling, the πάλη ὀρθή, or upright wrestling and the ἀλίνδησις (κύλισις, *lucta volutatoria*) which included ground wrestling after the contestants had fallen, the struggle continuing until one acknowledged defeat. This was the variety employed in the pancration, and was an "all in" struggle, no "fouls" being recognised. The upright wrestling was very similar to the catch-as-catch-can style, though leg holds were infrequent. In this, three falls out of five decided a contest; a variation of this style was that in which one of the contestants stood within a small ring and resisted the efforts of his adversary to pull or push him out of it. Other local varieties existed in the different Greek states. The most celebrated wrestler of ancient times was Milo of Croton (c. 520 B.C.), who scored thirty-two victories in the different national games, six of them at Olympia. Greek athletic sports were introduced into Rome in the last quarter of the 2nd century B.C., but they never attained to the popularity they had enjoyed in Greece.

Among the Teutonic peoples wrestling, as a method of fighting as well as a form of athletic recreation, was always practised; how popular it had become as a sport during the middle ages is proved by the frequent references to the historic personages notable for their skill in the art, and still more so by the voluminous literature on the subject which appeared after the invention of printing, the most celebrated work being the Ringer-Kunst of Fabian von Auerswald (1539). Albrecht Dürer made 119 drawings illustrating the different holds and falls in vogue in the 15th and 16th centuries; while Romeyn de Hooge provided 71 similar illustrations for Nicolas Petter's *Worstel-Kunst* (1674). The holds and throws shown singularly resemble those used in the Greek games, even to certain brutal tricks, practically identical with grips and locks included in modern Ju-Jutsu.

In Switzerland and some of the Tirolese valleys a style of wrestling flourishes under the name of *schwingen* (swinging). The wrestlers wear *schwinghosen* or wrestling breeches, with stout belts, on which the holds are taken. Lifting and tripping are prevalent, and the first man down loses the bout. In Styria wrestlers stand firmly on both feet with right hands clasped. When the word is given, each tries to pull or push the other from his stance, the slightest movement of a foot sufficing to lose. In Russia, belt wrestling, and in Iceland, the glima, are popular styles. Both require the wearing of a kind of harness about the loins and thighs, and otherwise are similar to schwingen. In the Balkan states, the favourite style is catch-as-catch-can.

The popularity of wrestling has survived in many Asiatic

SOME OF THE HOLDS USED IN WRESTLING

(A) Double leg hold, (B) Chancery back heel, (C) Side chancery, (D) Cross buttock and waist hold, (E) Near leg hold and arm lock, (F) Waist lock secured from rear and breaking the hold, (G) Ready to secure fall with waist hold secured from front, (H) Fall imminent from waist lock, (J) Leg hold and inside back-heel, (K) Half Nelson and further leg hold, (L) Referee's hold, (M) Full Nelson, (N) Threequarter Nelson, (O) Quarter Nelson, (P) Half Nelson

countries, particularly in Japan, where the first match recorded took place in 23 B.C., the victor being Sukune, who has ever since been regarded as the tutelary deity of wrestlers. In the 8th century the emperor Shômu made wrestling one of the features of the annual harvest "Festival of the Five Grains," the victor being appointed official referee and presented with a fan bearing the legend, "Prince of Lions." In 858 the throne of Japan was wrestled for by the two sons of the emperor Buntoku, and the victor, Koreshito, succeeded his father under the name of Seiwa. Imperial patronage of wrestling ceased in 1175, after the war which resulted in the establishment of the shogunate, but continued to be a part of the training of the *samurai* or military caste. About 1600, professional wrestling again rose to importance, the best men being in the employ of the great *daimios* or feudal nobles. It was, nevertheless, still kept up by the samurai, and eventually developed into two separate systems, the national style called Sumo, and that peculiar and scientific combination of wrestling and self-defence known as ju *jutsu* (*q.v.*), the purpose of which is to disable an adversary. The national championships were re-established in 1624, when the celebrated Shiganosuke won the honour, and have continued to the present day. The Japanese (Sumo) wrestlers place great reliance upon weight, some of the champions scaling 300 lb. and upwards; and as a result of highly specialised methods of physical training, they are generally of huge bulk and great strength, although surprisingly light on their feet. They form a guild which is divided into several ranks, the highest being composed of the *joshiyori*, or elders, in whose hands the superintendence of the wrestling schools and tournaments lies. The badges of the three highest ranks are damask aprons richly embroidered. The wrestling takes place within a ring 12 ft. in diameter, the wrestlers being naked but for a loin cloth; and each contest is preceded by certain preliminaries of a quasi-religious significance. At the command of the referee the wrestlers crouch with their hands on the ground and watch for an opening. The contests are usually of brief duration. The method is very similar to that of the modern catch-as-catch-can style, except that touching the ground with any part of the person, the feet excepted, after the first hold has been taken, loses the bout. To step or be forced outside the actual wrestling circle is equivalent to losing a fall.

Indian wrestling resembles that of Japan in the great size of its champions and the number and subtlety of its attacks, called *penches*. It is of the "loose" order, the men facing each other nude, except for a loin-cloth, called chaddi, and manoeuvring warily for a hold. Both shoulders placed on the ground simultaneously constitute a fall, which is seldom gained without much ground wrestling. It is highly scientific, though including many tricks that Western rules exclude as "fouls."

In Great Britain wrestling was cultivated at a very early age, both Saxons and Celts having always been addicted to it, with the men of Cornwall always holding a special eminence; and English literature is full of references to the sport. On St. James's and St. Bartholomew's days special matches took place throughout England, those in London being held in St. Giles's field, whence they were afterwards transferred to Clerkenwell. The Lord Mayor and his sheriffs were often present on these occasions, but the frequent brawls amongst the spectators eventually brought these public matches into disrepute. English monarchs have not disdained to patronise the sport, and Henry VIII. is known to have been a powerful wrestler.

Cumberland Style.—This style prevails chiefly in the north of England (except south Lancashire) and in the south of Scotland. In this the wrestlers stand chest to chest, each grasping the other with locked hands round the body, his chin on the other's right shoulder. The right arm is below and the left above the adversary's. When the hold has been firmly taken the umpire gives the word and the bout proceeds until one man touches the ground with any part of his person except his feet, or he fails to retain his hold, in either of which cases he loses. If both fall together, the one who is underneath, or first touches the ground, loses. If both fall simultaneously side by side, it is a "dog-fall," and the bout begins anew. The different manoeuvres used to throw the adversary are called "chips," the most important being the "back-heel," in which a wrestler gets a heel behind his opponent's opposite heel, from the outside, and forces him over backwards; the "outside stroke," in which, after a sudden twist of his body to one side, the opponent is struck with the edge of the opposite foot on the outside of the ankle; the "hank," or locking a leg and lifting the opponent with a sudden turn to the right, so that both fall together, but with the opponent underneath; the "inside click," the locking of an opposite leg applied after jerking the opponent forward, the pressure then being straight back; the "outside click," a back-heel applied by the defender as he is on the point of being lifted from the ground—it prevents this and often results in oversetting the opponent; the "cross-buttock," executed by turning the left hip under the opponent's body, throwing the leg across both his and striking backwards, while partially lifting and throwing him forward; the "buttock," in which the hip is thrust still further under the opponent, who by the action of the arms is thrown right over one's back; the "hipe" or "hype," executed by lifting the opponent off his feet, and while carrying him to the right or left, placing the opposite knee under one of his legs and raising it as high as possible before throwing him sideways to the ground; the "swinging hype," in which the opponent is lifted and swung nearly or quite round before the knee stroke is made; and the "breast stroke," which is a sudden powerful twist, first to one side, then the other, followed by a throw. There is but a single "foul'—direct kicking.

West Country Style.—In the Cornwall and Devon or "West Country" style the wrestlers wear stout, loose canvas jackets, the hold being anywhere above the waist or by any part of the jacket, though any manipulation of the jacket collar to strangle an opponent is forbidden. A fall is gained when both hips and a shoulder, or both shoulders and a hip (three points), touch the ground simultaneously. A throw that does not secure a fall is a "hitch." Ground wrestling is forbidden, and a man, when he feels himself falling, will try to turn and land on his side or chest. Many of the "chips" used by Cumberland and Westmorland wrestlers are possible in this style, with slight differences of execution required by the different method of taking hold and under other names—"forehip" (cross-buttock); "inside lock" (hank), etc. More distinctive throws are the "heave," and the "flying mare," a chip of universal use in which the opponent's wrist is grasped with the opposite hand, the upper part of the same arm by the other hand, the back turned and the captured limb drawn across a shoulder, over which the opponent is vigorously shot forward. Until comparatively recently there was a difference between the styles of Cornwall and Devon, the wrestlers of the latter county having worn heavily soled shoes, with which it was legitimate to kick the adversary's shins.

Catch-as-catch-can.—The Lancashire style, generally known as "catch-as-catch-can," is practised in Lancashire, throughout Great Britain generally, and is the most popular style in the United States, Canada, Australia, Switzerland and some other countries. It is the legitimate descendant of the ancient Greek upright wrestling combined with ground struggling, but minus the "all-in" freedom the Greeks permitted, and undoubtedly is representative of the wrestling of the middle ages. A fall is gained when both shoulders of one wrestler touch the ground together, and very seldom are falls registered from standing throws. This necessitates most contests being completed while struggling on the ground or mat. Much of this ground work is admittedly very skilful. No kicking, striking, or other foul practices are permitted, but theoretically every hold is legitimate. Exceptions are made of strangle holds or others designed to cut off an opponent's breathing, also grips or forms of attack causing acute pain or intended to force the defender to roll on his shoulders to avoid injury by dislocation or fracture. The style contains practically all the manoeuvres known to other methods with many peculiar to itself; and because of its freedom and opportunity for the display of strategy, skill, and strength, is, when upstanding wrestling and tripping—the very essence of wrestling—are not neglected, the most preferable.

In Scotland a combination of the Cumberland and Westmor-

WRESTLING MATCH IN JAPAN

Japanese wrestlers struggling in a 12 ft. ring. Contests are usually of brief duration. Great reliance is placed upon weight, some champions scaling 300 lb. and upward. After taking the initial hold whichever contestant touches the ground with any part of his person, except his feet, loses the match. A cloth around the loins is the only covering for the body

Iand and catch-as-catch-can styles is sometimes practised, the contest commencing in the first named style and continued on the ground if a direct fall on both shoulders does not result from a throw.

In Ireland, the national style is called "collar and elbow" (practised in America also), from the holds taken by the two hands, and first down, any part (in America, any three points) is loser.

Graeco-Roman Style.—The style chiefly affected by the continental European wrestlers is the Graeco-Roman (so-called, though it bears almost no resemblance to classic wrestling), which arose about 1860, and is a product of the French wrestling schools. It is a very restricted style, neither tripping nor any hold below the hips being allowed, the result being that the bouts consist chiefly of ground struggling. When no time limit is enforced, contests are usually tediously long. British and American wrestlers, accustomed to their own freer styles, seldom compete under Graeco-Roman rules. These, however, of late years have been revised by the governing body of international wrestling, the International Amateur Wrestling Federation (inaugurated 1921). with the result that the character and quality of this style of wrestling have greatly altered and improved. The pre-eminence that French wrestlers formerly held has been transferred to the Scandinavian countries. The Finnish wrestlers show a marked advance. Finland shared with Sweden the wrestling championships at the Olympic games of 1912, held at Stockholm, repeated the success at Antwerp in 1920, and won four of the six weights at Paris, in 1924. A wide distribution of the honours in 1928 was followed by a decided victory for Sweden in 1932 with 77 points to 47 for Finland and 30 for the U. S. A.

Wrestling in the Olympic Games.—The popularity of wrestling as an amateur sport has received a considerable development through the institution of the modern Olympic games, as is proved by the increase in the number of nations entering competitors at this quadrennial athletic festival. In 1908, when the games were held in London, 1j nations were represented (Graeco-Roman and catch-as-catch-can styles); at the games of 1924, 2; countries sent competitors. In 1914, the permanent inclusion of catch-as-catch-can (free style) wrestling in the standard programme was secured by Great Britain, and since then this style has made great progress, the nations entering for these competitions in 1924 numbering 11 as compared with the five at the games of 1908; with an increase to 15 for the games of 1928 at Amsterdam. In 1924, Japan, Turkey, and Egypt were represented for the first time, with results indicating that the Western styles of wrestling are being well studied throughout the East. The International Amateur Wrestling Federation has fixed the number of championship weights at seven for the catch-as-catch-can style and six for the Graeco-Roman Under authority of the I. A. W. F., European (amateur) championships in both styles have been instituted and are decided annually (except in the year when an Olympiad takes place); and numerous international matches are disputed every year, leading to a higher development of the sport and a marked increase in public interest, which will be yet further extended if the proposal to bring the two styles within one code of rules is carried into effect.

In Great Britain, apart from the professional tournaments organised by local associations in the northern and western counties, it seems probable the sport would have disappeared altogether but for the exertions of the National Amateur Wrestling Association. This organisation has kept the sport alive by the promotion (the years of the World War excepted) of annual championships at various weights in the Cumberland and Westmorland and catch-as-catch-can styles.

THE UNITED STATES

Wrestling in America is considered second in importance to boxing in the category of sports of a bodily combat nature. Although professional wrestlers attract greater audiences than amateurs, the participation of college and athletic club performers has perhaps brought the sport into more popular favour. In professional contests, as with amateurs, the catch-as-catch-can style of wrestling is preferred to the Graeco-Roman style.

Among heavyweights, Frank Gotch is considered the peer of all time because of the science he imparted to the game. As undisputed world's champion he successfully defended his title against Hackenschmidt in 1908; Mahmont, the Turk, in 1911; Hackenschmidt again in 1912; and in many other contests, and retired undefeated. In the following years there were many so-called championship matches, but no contestant won a clear title to a world's championship. Ben. F. Roller of Seattle won the American Championship in 1912 by defeating C. Cutler of Chicago, after the latter had beaten Ordeman in Minneapolis. After Americus had defeated Beel, Roller won from Americus at Springfield in 1913. Ed. ("Strangler") Lewis defeated Roller in New York in 1915 and Earl Caddock in 1921. Munn beat Lewis in Kansas City in 1923; Stanislaus Zbyszko defeated Munn in Philadelphia in 1924; Joe Stecher beat Zbyszko in 1925; Lewis defeated Stecher in 1928; Gus Sonnenberg defeated Lewis in Boston in 1929, winning the world's championship. Rival authorities have been unable to agree on rules; as many as six "champions" in 1933 were reduced to but two by 1934, Jim Londos in New York and Don George in New England, with no hope for a final issue. Meanwhile among the amateurs in 1934 Ralph Teague, Okla., held the National A.A.U. heavyweight championships, while H. T. Snowden, Yale, held the Eastern Intercollegiate championship.

Among lightweights, George Bothner is often acclaimed the greatest in the world. He defeated such top-notchers as Tom Riley, of England, holder of the Lonsdale belt, in 1899; Jack Harvey in 1901; Ed. O'Connell in 1903; Higashi, the Japanese, in 1905; Will Bingham, champion of England, in 1907; Pierre Colosse, the 390-lb. champion of France, in 1915; and others.

The National Collegiate Association controls amateur wrestling in the colleges, a set of rules being formulated by H. R. Reiter, Lehigh university, chairman of the rules committee. Amateur wrestling is under the jurisdiction of the Amateur Athletic Union of the United States and all bouts are contested under its rules. Besides various sectional, state and city championships, held annually, wrestling meets are staged by various organizations in all parts of the U.S. (J. B. P.)

WREXHAM (Welsh *Gwrecsam,* in the Anglo-Saxon Chronicle *Wrightesham*), a market town and municipal borough of Denbighshire, Wales, 12 mi. S.W. of Chester, with stations on the G.W.R. & L.N.E.R. Pop. (1938) 25,740, largest in North Wales. Area 4.6 sq.mi. Wrightesham was of Saxon origin, and lying east of Offa's Dyke, was yet reckoned in Mercia. It was given (with Bromfield and Yale, or *Iâl*) by Edward I to Earl Warenne. St. Giles's church is of the 14th, 15th and 16th centuries, with a panelled tower; the interior is Decorated. West of the tower is the tomb of Eliugh or Elihu Yale (1721), first donor of Yale university. The Wrexham tower in the memorial quadrangle at Yale is a copy of the tower of Wrexham church. Wrexham is the seat of the Roman Catholic bishop of Menevia, whose diocese includes all Wales except Glamorganshire. With the development of the north Wales coalfield in the 19th century Wrexham grew in importance and has interests in the by-product industries. It was incorporated in 1857.

WRIGHT, SIR ALMROTH EDWARD (1861–), British bacteriologist, was born at Middleton Tyas, Yorks., on Aug. 10, 1861. He was educated at Dublin university, subsequently obtaining his scientific and medical training at the Universities of Leipzig, Strasbourg and Marburg. In 1887 he became a demonstrator of pathology at Cambridge, in 1889 a lecturer in physiology at Sydney, and from 1832 to 1902 professor at the army medical school at Netley, being then appointed professor of experimental pathology in the University of London. He was in addition principal of the institute of pathology and research at St. Mary's hospital. He was knighted and elected F R.S. in 1906.

Sir Almroth Wright became prominent by his researches in parasitic diseases. He introduced anti-typhoid inoculation and did much valuable work on the preparation of other vaccines and

toxins. He carried out many important experiments in bacterial infection and in measuring the protective matter of human blood. He acted as consulting physician to the army in France from 1914–1919 and was in 1919 created K.B.E. He was a member of many learned societies and received numerous British and foreign awards and honours including the gold medal of the Royal Society of Medicine in 1920. He published a short treatise on *Anti-Typhoid Inoculation* (1904), *Principles of Microscopy* (1906) and *Studies in Immunisation* (1909) besides many papers. In 1913 appeared *The Unexpurgated Case against Woman Suffrage* which provoked much discussion. *(See* IMMUNITY.)

WRIGHT, CARROLL DAVIDSON (1840-~gog), American statistician, was born at Dunbarton, N.H., on July 25, 1840. Paying his way by teaching, he became a lawyer although his studies were interrupted by service in the Civil War, in which he advanced from private to colonel and assistant adjutant-general in the Shenandoah valley campaign. In 1872–73 he served in the senate of Massachusetts, and from 1873 to 1888 he was chief of the Massachusetts bureau of statistics of labour. He was U.S. commissioner of labour from 1885 to 1905. Avoiding polemics, he directed the energies of the national bureau into investigation of the economic conditions surrounding labour and study of the methods for promoting the welfare and uplift of the working classes. He was a persistent advocate of the principle of collective bargaining and of the sliding-scale method of wage adjustment. In 1902 he was chosen president of Clark college, Worcester, Mass., where he was also professor of statistics and social economics from 1904 until his death on Feb. 20, 1909. Among his works of general interest are *The Industrial Evolution of the United States* (1895), *Outline of Practical Sociology* (1899), *Some Ethical Phases of the Labor Question* (1902) and *The Battles of Labor* (1906).

See the article on him by S. N. D. North (Amer. Statist. Assoc., *Pub.*, new ser. 86, 1909) and the bibliography (*ibid.*, 87, Sept., 1909).

WRIGHT, ORVILLE (1871–), American inventor, was born at Dayton, Ohio, on Aug. 19, 1871. He early became associated with his brother, Wilbur (*q.v.*), in the bicycle repair business, and from the first shared his interest in mechanical flight. Shop experiments led to the development of a power driven heavier-than-air machine which was piloted by Orville Wright on its first successful flight made on Dec. 17, 1903 at Kitty Hawk, N.C. Further experiments led to the development of an aeroplane which established a new record on Sept. 12, 1908 by remaining in the air one hour and 15 minutes. An accident on Sept. 17 terminated his experiments for that year but on July 27 and 30, 1909, his demonstrations at Ft. Meyer, Va., satisfied the tests, and secured the acceptance of his machine by the U.S. Government. Numerous demonstrations made in Europe during 1908 and 1909 caused many honours to be bestowed on the two brothers. In Dec. 1928, the 25th anniversary of the first successful flight was celebrated at Kitty Hawk.

WRIGHT, SILAS (1795–1847), American political leader, was born at Amherst, Mass., on May 24, 1795. He graduated at Middlebury college, Vermont, in 1815, was admitted to the bar in 1819, and began practice at Canton, in northern New York. He was appointed surrogate of St. Lawrence county in 1820, and was successively a member of the state Senate in 1824–26, a member of the national House of Representatives in 1827–29, comptroller of the state in 1829–33, U.S. senator in 1833–44, and governor of New York in 1844–46. During his public life he had become a leader of the Democratic party in New York, Martin Van Buren being his closest associate. He was an influential member of the so-called "Albany regency," a group of Democrats in New York, including such men as J. A. Dix and W. L. Marcy, who for many years virtually controlled their party within the state. He died at Canton on Aug. 27, 1547.

The best biography is that by J. D. Hammond, *Life and Times of Silas Wright* (Syracuse, *N.Y.*, 1848), which was republished as vol. iii. of that author's *Political History of New York*.

WRIGHT, WILBUR (1867–1912), American inventor, son of Milton and Susan Catharine (Koerner) Wright, was born near Millville, Ind., on April 16, 1867. When Wilbur Wright was one month old his father was elected editor of the official organ of the Church of the United Brethren in Christ, necessitating moving his family to Dayton, O.; and eight years later he was elected a bishop of that denomination requiring other changes of residence. As a result Wilbur Wright received his education in the public schools of Dayton, Ohio, Richmond, Indiana, and Cedar Rapids, Iowa. Just when he was expecting to enter college, an accident, while playing in a game of ice hockey, disabled him for some six or eight years for active work. These years of poor health he devoted to the care of his invalid mother and to assisting his father in legal matters connected with the church. In 1890 he joined his brother, Orville, who was publishing a small weekly newspaper.

Experiments in Gliding.—Reading of the experiments of Otto Lilienthal in Germany, Wilbur and his brother became intensely interested in gliding as a sport. Lilienthal's experiments were suddenly ended in 1896 by his death, resulting from an accident due to insufficient control of the equilibrium of his glider. Lilienthal had balanced his machine by shifting the weight of his body. The brothers, believing this method incapable of expansion to meet the requirements of flight, set about to develop a more effective system. They developed a system in which the centre of gravity remained constant and the equilibrium was maintained by varying the air pressures on different parts of the machine through adjustments of the angles of the wings and auxiliary surfaces. This system, patented by them, is now generally known as aileron control.

Although Wilbur and his brother had taken up aeronautics merely as a sport, their chief interest soon turned to its more scientific aspects. Having found in their experiments that the existing scientific data was almost altogether untrustworthy, they cast it all aside and began investigations of their own, using methods which avoided many of the errors in the work of their predecessors. In 1901 they set up a small wind tunnel in their work-shop at Dayton in which they made measurements of the lift and drag of a great number of different-shaped aerofoils at angles from zero to 45 degrees. The results derived from this tunnel so stimulated their interest that often they worked into the early hours of the morning. Measurements also were made to determine the position of the centre of pressure on cambered surfaces and to determine the effect on the lift and drag when one surface was placed above another or when one surface followed another.

The First Motor-driven Aeroplane.—With this mass of data in their possession they thought it now possible to predict from calculation the performance of a flying machine; they thought they could design a machine which would require not over one-half to one-fourth of the power that would have been necessary for any of the earlier proposed machines. Accordingly in Oct. 1902, they began the design of a motor-driven aeroplane. When completed the machine including the pilot weighed 750 lb. and was propelled by a four cylinder petrol motor of 12 horse power. Tested at Kitty Hawk, N.C., on Dec. 17, 1903, the machine carrying a man made four sustained free flights. The longest of these had a duration of 59 seconds and a speed of 30 m. an hour. This machine is now exhibited in the Science museum at South Kensington, London.

Experiments were continued in 1904, but it was not until Sept. 1905, that they learned to avoid the "tail-spin" in making short turns. The flights then rapidly increased in length, and on Oct. 5 Wilbur Wright flew for 38 min. over a small circular course covering a distance of 24 miles. Believing the machine now to be developed to a stage of practical usefulness, the Wrights spent several years in finding a market for the invention. Wilbur Wright went to Europe in 1908 to make the tests required in the sale of the French rights to a syndicate. While there, his flights at Le Mans and Pau, France and at Rome, attracted world-wide attention and the kings of England, Spain and Italy went to see them. In recognition of his pioneer work he received many honours and medals in European countries and in America.

During the last three years of his life he served as president of the Wright Company, which had taken over the patent rights for

America. Much of this time he devoted to upholding the Wright aeroplane patents in law courts of America and Europe. He died of typhoid fever at Dayton, O., on May 30, 1912. (O. W.)

WRIST, in anatomy, the carpus or carpal articulation in man, the joint by which the hand is articulated with the forearm *(see* ANATOMY: *Superficial and Artistic;* and SKELETON: *Appendicular*).

WRIT, in law, is a species of formal order from the Crown or a delegated officer to an inferior officer or to a private person, enjoining some act or omission. The word represents the Latin *brevis* or *breve* (sometimes Englished into "brief" in the older authorities), so called from its "shortly" expressing the intention of the framer (*quia breviter et paucis verbis intentionem proferentis exponit*).

History.—The writ in English law still occupies a very important position, which can scarcely be understood without a sketch of its history. The whole theory of pleading depended in the last resort upon the writ, the plaintiff's claim simply expanding its terms.

The *breve* can be traced back as far as Paulus (about A.D. 220), who wrote a work *Ad edictum de brevibus,* cited in the Vatican Fragments, § 310. In the *Corpus iuris* the word generally means a note-book or list. The *interdictum* of Roman law sometimes represents the writ of English law; *e.g.,* there is considerable likeness between the Roman *interdictum de libero homine exhibendo* and the English writs of *habeas corpus* and *de hontine replegiando.* From Roman law the *breve* passed into the *Liber feudorum* and the canon law, in both in a sense differing from that at present borne by the writ of English law. The *breve testatum* of the *Liber feudorum* was an instrument in writing evidencing the transfer of land.

The *breve testatum* in England developed into the deed of grant; in Scotland into the charter, and later into the disposition. In canon law *breve* or *brevilegium* denoted a letter from the pope, sealed with the seal of the fisherman and less formal than a bull. In old English ecclesiastical law a brief—still named in one of the rubrics of the Book of Common Prayer—meant letters patent to church-wardens or other officers for the collection of alms. (For counsel's brief *see* BRIEF.)

The origin of the writ is disputed, but its development was clearly influenced by both Anglo-Saxon and Norman law before the Conquest. The Anglo-Saxon contribution appears in the shape of diffuse royal charters, which were used to express the king's commands or wishes. Next, the form of these charters was infected by royal letters employed primarily for the publication of new laws, which were communicated by such letters to the shire-moots and, presumably, to the hundred-moots and important persons. These documents, cross-bred between charter and writ, show progress, but fall far short of the pure writ, which was concise, secular, practical and implicit with power. Writ-charters similar to those in England existed in Normandy before the Conquest. After that event, the chancery, or royal office which in England framed the king's orders, had some counterpart in Normandy, which did the like. The exact stages by which the writ disembarrassed itself of the charter element are not certain, but at any rate the process was a rapid one. The distinction between the two is known to have existed as early as 1071. The growth of a more robust Central Government hastened the separation, and in Glanvill's book (1187–89) not only are many writs included, but the idea has become so common that the author does not take the trouble to explain it. The writ, as thus developed, was of supreme importance in the growth of law and government. From the latter part of the 13th century to the early 18th century, if a man had no legal remedy he had no legal right. Without a writ he could not, in general, begin an action, and if there were no writ that covered his complaint he had no remedy. Nor was the writ confined to the initiation of litigation. It was also a machine for hosts of executive acts which never passed to the law courts at all. The chancery from which writs were issued was styled *officina brevium,* or "writ-shop." Writs had to be paid for, though occasionally poor men might get them free. Nor did Magna Carta c. 40, make any difference in this respect. except to forbid prohibitive charges for writs in common form ("de cursu," or "of course"). At first new writs could be used freely, but in the Provisions of Oxford, 1258, the chancellor swore that he would seal no writs except those "of course" without the command of the king and his council; and the statute of Westminster II, 1285, while it recognized the power of the chancery clerks to make writs for cases similar (*in consimili casu*) to those already covered by existing writs, impliedly forbade them to create new writs, that being the province of parliament. But this statute did not seriously hamper the chancery, for the clerks showed great dexterity in varying existing writs to meet new circumstances.

Collections of writs were made at an early period. They were entitled *Registra Brevium,* and the oldest one extant is dated 1227. These collections were unofficial, though of course the writs embodied in them originated in the chancery. For three centuries *Registrum Brevium* continuously multiplied in copies and swelled in bulk. The mss. of it are at present beyond computation. Their number and increasing length testify to the industry of the chancery and to the striking import of the writ as one of the modes of keeping law and government reasonably abreast of the needs of the community. *Registrum Brevium* was first printed in 1531. After that it practically ceased to grow, for it was being outgrown by the law itself, which needed something more elastic.

The chief reason why the writ fell into the background as an agency in the growth of our law is that the centre of gravity in legal procedure shifted from the writ to the plaintiff's written "declaration," which specified the details of his claim. It was this rather than the writ which came to determine the form of action. The correct form of action was vital to success in litigation. If the plaintiff chose the wrong one, he was, in general, without a remedy. True, a selection of the wrong writ was, even till the 19th century, equally disastrous, but then, in most cases, it had ceased to be compulsory on a plaintiff to begin his action by an original writ, though its existence was always assumed. There were many other ways in which litigation could be begun, and there is reason to think that they were usually preferred to the original writ, which was neither cheap nor convenient. The transference of energy from the writ to the declaration was a gradual process. So long as the pleadings in an action were oral, the writ must of necessity have attracted to itself all the weight which the written word carries as against the spoken word. But by degrees litigants adopted the practice of exchanging written pleadings. This was well recognized in the 16th and 17th centuries, though the seeds of it are traceable some time before. The multiplicity of writs and of other devices for commencing a common law action was remedied with respect to personal actions by the Uniformity of Process in Personal Actions Act, 1832 (2 Will. IV. c. 39), which substituted for these methods a simple, uniform, writ of summons. Further amendments were made in 1833, by 3 and 4 Will. IV. c. 27, s. 36, which abolished writs in real actions with the exception of those relating to dower, *quare impedit,* and ejectment, and by 3 and 4 Will. IV. c. 42, in connection with the writs of debt and of detinue. The Common Law Procedure Act, 1852, s. 3, dispensed with the need of mentioning any form of action in the writ on a personal action, and the Judicature Acts, 1873–75, contain the complete remodelling of procedure under which English civil law is administered in the Supreme Court of Judicature. The Rules of the Supreme Court, 1883, made in pursuance of this legislation, now require every action in the High Court to be commenced by a writ of summons, indorsed with a statement of the nature of the claim made, or of the relief or remedy required in the action. The writ, therefore, nowadays differs considerably in form from its ancient predecessor. And an equally striking distinction is to be found in its much narrower scope as compared with the writs of *Registrum Brevium.* They dealt with almost every conceivable matter of executive government as well as with legal procedure. But now the province of writs has shrunk to the institution of litigation except in the realm of constitutional law, where writs still issue for the election of members to the House of Commons and for the attendance of individual members in the House of Lords. Elsewhere, more

convenient methods of expressing the will of the executive have ousted the writ; such are Orders in Council, Royal Proclamations, Letters Patent, and regulations made by various Government departments.

The writ, though issuing from the king's chancery, did not, where it was concerned with litigation, necessarily direct the trial of the question in the king's court. In whatever court it was returnable, it frequently called in the aid of the sheriff as executive officer. In such cases, it was either addressed to him or, if addressed to the party alleged to be in default, it concluded with a threat of constraint by the sheriff in the event of disobedience, generally in these terms, *et, nisi feceris, vicecomes de N. faciat ne amplius clamorem audiamus pro defectu iustitiae.* If the writ was returnable in the county court or the lord's court, the sheriff or the lord sat as the deputy of the king; he did not sit by virtue of his own inherent jurisdiction. The writ was not necessary for the initiation of proceedings there or before the justices in eyre.

There are several divisions of writs (excluding those purely financial and political), the most important being that into original and judicial, the former (tested in the name of the king) issued to bring a suit before the proper court, the latter (tested in the name of a judge) issued during the progress of a suit or to enforce judgment. The nature of a third class, *magistralia,* is an unsolved puzzle. Bracton regarded them as writs which were capable of variation in order to meet the plaintiff's grievance; Coke considered them to be a variety of original writs which generated actions upon the case. Possibly the later writers attached more technicality to Bracton's expressions than they were meant to bear, and in any event the use of *magistralia* for purposes of classification was of little import by the time that *Registrum Brevium* was printed, for the primary division there is only twofold, original and judicial.

No ms. register known to the author of this article contains even this twofold division. Coke and other authorities mention numerous other divisions, but those which have been named appear to be the principal, of writs.

Writs* of *Historical Interest.*—*A great number of the older writs are now obsolete. The details relating to them can be found in the printed *Registrum Brevium* and in Sir Anthony Fitzherbert's "New Natura Brevium," a work of the highest authority which ran into 18 editions, or reprints, between 1534 and 1794. Some of these ancient writs had such a great influence on the history of English law that they need brief descriptions here. The *Prerogative writs* are treated in the paragraph on "Writs at the present day"; historically they had a large share in securing the administration of justice, and the personal freedom of the subject. In the domain of private law, the *writ of right (breve de recfo)* was styled by Fitzherbert "the highest writ in law," and *Registra Brevium* invariably commence with it. It was employed for the recovery of real estate. The principle that no man need answer for his freehold without a royal writ was laid down in Henry II.'s reign. This compelled everyone who demanded freehold land from another person to obtain a writ, in effect the writ of right, if he were asserting title to the land. The insistence on the writ of right had political significance, for it furthered the centralization of justice. The procedure upon it became intolerably clumsy and tedious, and this led first to its disuse and finally to its abolition. No writ had wider effect than the *writ of trespass.* In origin, the word '(trespass" covered nearly every wrongful act or default, whether it be what we should now call a crime or a tort. In that sense, it is traceable as early as John's reign, but the writ of trespass did not become a writ "of course" until the latter part of Henry III.'s reign, just after the conclusion of the Barons' war. Very likely it was one of the agencies in clearing up the litter of disorder left by civil strife. The action which the writ of trespass *vi et armis* originated was quasi-criminal. It was aimed at serious and forcible breaches of the king's peace. Though it was begun by the injured individual, it ended in the punishment of the defendant as well as in compensation to the plaintiff. It was more popular than the "appeal of felony" because the same precision in pleading was not required and the trial was not by the detested method of battle. Its scope was also wider, and damages were obtainable. Later, trespass developed on one side into misdemeanours (now one branch of criminal law) and on the other into the law of torts, or civil injuries. In the 14th and 15th centuries, statutes often fixed the action of trespass as an appropriate remedy for the offences created by them, because criminal "appeals" were falling into disuse, there was no organized police, the judges were often corrupt, except in the central courts, and were not always pure even there. The three chief kinds of the writ of trespass *vi et armis,* were for assault and battery, for injury to land *(quare clausum fregit),* and for taking away goods *(de bonis asportatis).* The writ could therefore be employed by any landholder for the recovery of damages done to his possession, but not, at first, for the recovery of possession itself. This extension was not recognized till the middle of the 15th century, and it resulted in the writ of trespass, *de ejectione firmae,* which appears first as a remedy enabling the termor, or lessee for years, to sue anyone who had ejected him, whether his lessor or another person, and then becomes the best remedy of the ejected freeholder. He borrowed this "action of ejectment" from the termor, because his own proprietary and possessory remedies had become so inadequate. *A* cloud of legal fictions veiled the borrowing, but in spite of the duration of some of these till the Common Law Procedure Act, 1852, the action of ejectment was greatly superior to the dilatory remedies which it thrust in the background. The law of torts, as it is now called, also owes a heavy debt historically to writs of *trespass upon the case,* which were adaptations of the writ of trespass made to meet special cases. The same object was achieved by means of the statute of Westminster II, 1285 *(supra),* for the clerks of the chancery were required by it to issue modified writs *in consimili casu.* It is not clear whether writs of trespass upon the case ought, as a matter of history, to be regarded as springing from this statute or as of independent origin. Certainly, in later law, the sources seem to be distinct. However that may be, trespass upon the case, or "case," was an excellent machine for redressing most civil injuries, nor have judges ceased to speak of "action on the case" even at the present day. Nor was its influence confined to the law of torts. The most notable offshoot of "case" was the variety of it styled *assumpsit,* which became the general form of action by which damages could be recovered for breach of a contract not made under seal. If one undertook *(assumpsit)* to do something and did it ill, he was liable. Gradually it was held that even if he did nothing, he was still liable. This was recognized very early in the 16th century, and the shaping of this action of *assumpsit* by the judges of this and the succeeding century resulted in the curious spectacle of an action upon contract modelled upon an action of pure tort.

Freedom from unwarrantable arrest or imprisonment of the person was secured by the writs *de odio et atia, de homine replegiando, de manucaptione* and *mainprise.* These have long been superseded by the more efficient writs of *habeas corpus,* though, it may be added, these latter also are themselves of very ancient origin.

Writs at the Present Day.—The vast majority of writs at the present day deal with the initiation, progress, or results of litigation; but purely administrative writs still exist, such as those for summoning representatives to parliament, or for assembling an ecclesiastical convocation. Writs are now issued from the central office of the Supreme Court, which was created by the Supreme Court of Judicature (Officers) Act, 1879, and thereby absorbed the Crown office of the Queen's Bench Division. The Crown office is an institution of the greatest antiquity, and the clerk of the Crown in Chancery has important duties relating to parliamentary writs, which are noticed below. Some writs require the Great Seal, *e.g.,* those for summoning new parliaments; writs of summons in actions are under the seal of the court, and are tested in the name of the lord chancellor, but writs issuing from the Crown office side are tested in the name of the lord chief justice of England. Instead of the Great Seal, the Crown Office Act, 1877, allows wafer great seals made on embossed paper, wax, wafer, or any other material, in accordance

with rules drawn up by a committee of the Privy Council, to be attached to documents authorized by such rules to be thus validated. As to writs connected with litigation, the commonest type is the writ of summons which originates a civil action in the High Court of Justice. Indeed, it is now the only way in which such an action can be commenced. It is a formal document by which the king commands the defendant to "enter an appearance" within eight days, if he wishes to dispute the plaintiff's claim, and notifying him that, in default, judgment will be signed against him. It must be indorsed with a statement of the nature of the claim made. It may be issued either from the central office of the Supreme Court in London, or from one of the district registries which exist in many of the large provincial towns. Issue consists in taking two copies of the proposed writ to the writ department of the central office or to a district registry, signing one copy and paying 30s., whereupon the official impresses a 30s. stamp on the signed copy, files it, stamps the other with a "seal," and hands it back to the applicant. This then becomes the writ in the action. Technical defects in the writ are no longer fatal, for the plaintiff can amend them with the leave of the practice master in the King's Bench Division or of the chief clerk of the writ in the Chancery Division. Bracton's statement nearly 700 years ago, *non potest quis sine brevi agere,* is true of procedure in the High Court even now, but the great difference between the writs of his day and those of our own is the elasticity of claim which the latter allow. We are not limited to a certain number of actions, each with its appropriate writ, to be chosen rightly at the plaintiff's peril; the writ is always the same except for its indorsement, and, in effect, any claim which it is probable that the courts will enforce can be indorsed on it. If the plaintiff lose his case, it will be either because he has not evidence to support it, or because he fails to satisfy the requirements of the substantive law, and not because he has selected the wrong form of writ. After issue of the writ, it must be served on the defendant. This is done by showing him, or his solicitor, the original, and then leaving with either of them a correct copy of it. As a rule, the writ cannot be served on a Sunday. The entry of appearance by the defendant does not involve his personal presence. This, and all other proceedings on the writ, prior to the trial of the action, can be, and usually are, conducted on behalf of the parties by their respective solicitors. The officials who deal with these preliminary proceedings are the masters of the Supreme Court. No leave for the issue of the writ is necessary, unless the defendant be out of England, or the plaintiff seek to join on his writ causes of action for the joinder of which leave is required. Proceedings in the county court, in which most civil actions for claims of small amount are tried, are begun by the entry of a plaint, followed by a summons to the defendant.

Besides the writ commencing an action, there are others which facilitate it, or give efiect to its result. Attendance of witnesses is secured by the writ of *subpoena.* Redress for contempt of court may be effected by writ of *attachment.* The writs employed for the execution of judgment against an unsuccessful defendant are *fieri facias* against his goods, *elegit* against his lands, *possession* for the recovery of land adjudged to be the plaintiff's, and *delivery* or *attachment,* or *sequestration* for the recovery of any property other than land or money. The writ of attachment also applies where a judgment directs the performance of any specific act other than the payment of money, *e.g.,* the removal of a nuisance, or requires anyone to abstain from doing a thing; and the writ of sequestration also extends to cases in which a person wilfully disobeys an order or judgment which directs him to pay money into court or to do any other act within a limited time; the writ enables his property to be seized.

The *prerogative writs* deserve special notice both for their historical interest and their practical utility. They are extraordinary remedies issued upon cause shown in circumstances where the ordinary legal remedies are inapplicable or inadequate. The most important of those now in use are *certiorari, habeas corpus, mandamus, procedendo,* and *prohibition.* They usually issue from the Crown office side of the central office of the Supreme Court, and, in general. they are not obtainable as a matter of course. Some probable cause must be shown why such extraordinary remedies should be invoked. A rule *nisi* is issued in the first instance by the court calling upon the party to whom the writ is addressed to show cause why he should not comply with the writ. If he shows sufficient cause, the rule is discharged, otherwise it is made absolute and the party must obey the writ. But in urgent cases, the rule may be made absolute from the first in some of the writs, *e.g., habeas corpus.* The writ of *certiorari* proceeds from a superior court and directs an inferior court, whether civil or criminal, to transmit to the superior court the record of proceedings pending before the inferior court, in order to ensure speedier and better justice to the applicant for the writ. Its object is to give relief against inconvenience arising from the likelihood that the lower court will not dispose of the case as effectually as will the superior. The procedure by this writ must be distinguished from appeals by dissatisfied litigants. These come after judgment, whereas *certiorari* generally deals with cases still pending and, even where it is used for the purpose of getting a conviction quashed, it does not enable the superior court to review the case on its merits, but to deal with some matter like lack of jurisdiction. There are several writs of *habeas corpus,* but the best known variety is the *habeas corpus ad subiiciendum,* which provides for the personal freedom of the subject. *(See* HABEAS CORPUS.) *Mandamus* directs a person, a corporation, or an inferior court of judicature, within the king's dominions, to do some particular thing which appertains to the office or duty of any of them. *(See* MANDAMUS.) The writ of *procedendo* is a possible sequel to *certiorari,* for it applies where the superior court considers it expedient or necessary to restore the record to the inferior court whose proceedings are in question. The writ commands the lower court to proceed with the case. The writ of *prohibition* forbids an ecclesiastical or inferior temporal court to continue proceedings therein in excess of its jurisdiction or in contravention of the laws of the land. *(See* PROHIBITION.) Another prerogative writ has taken the place of the writ *de excommunicato capiendo;* this is *de contumace capiendo* for compelling persons duly cited to appear in the ecclesiastical courts and for enforcing compliance with their orders and punishing contempts in the face of such courts. As to writs relating to the assembly of parliament, the king, on the advice of the Privy Council, issues a proclamation expressing the royal pleasure to call a new parliament and announcing an Order in Council to the lord chancellor to issue the necessary writs on the authority of the proclamation. In practice, the clerk of the Crown in Chancery does not receive direct authority from the chancellor for the issue of the writs, but regards the proclamation itself as sufficient for that purpose. Parliament must meet at any time not less than 20 clear days after the proclamation. Individual writs of summons are sent to those who are entitled to sit in the House of Lords; but 'for the election of members to the House of Commons the writs are sent to the returning officers of the various constituencies. The writs of summons issued to peers of the United Kingdom are of historical note, for adjudication of disputed peerage claims has often centred in the validity or scope of the writ. Even now, though such a peerage is invariably created by letters patent, these are accompanied by a writ of summons, and it rests with the committee for privileges of the Rouse of Lords to decide whether the writ is valid, or indeed whether it can be issued at all; a familiar recent instance was their refusal to issue the writ to a peeress in her own right (*Viscountess Rhondda's Claim,* Law Reports [1922] 2 Appeal Cases, 339).

Scotland. — "Writ" is a more extensive term than in England. Writs are either judicial or extrajudicial, the latter including deeds and other instruments — as, for instance, in the Lord Clerk Register (Scotland) Act, 1879, and in the common use of the phrase "oath or writ" as a means of proof. In the narrower English sense both "writ" and "brieve" are used. The brieve was as indispensable a part of the old procedure as it was in England, and many forms are given in *Regiam Maiestatem and Quoniam Attachiamenta.* It was a command issued in the king's name, addressed to a judge, and ordering trial of a question stated therein. It was drawn by the writers to the signet, originally

clerks in the office of the secretary of State. Its conclusion was the will of the summons. In some cases, proceedings which were by writ in England took another form in Scotland. For instance, the writ of attaint was not known in Scotland, but a similar end was reached by trial of the jury for wilful error. Most proceedings by brieve, being addressed to the sheriff, became obsolete after the institution of the court of session, when the sheriffs lost much of that judicial power which they had enjoyed to a greater extent than the English sheriff. *(See* SHERIFF.) An English writ of execution is represented in Scotland by diligence, chiefly by means of warrants to messengers-at-arms under the authority of signet letters in the name of the king. The only brieves in practical use are those for serving a tutor-at-law, for kenning to the terce, and for cognition of insane persons. The two former are rare; the third was substituted by the Court of Session (Scotland) Act, 1863, for the old brieves of furiosity and idiotry. Other kinds of brieve have been superseded by simpler procedure, *e.g.*, the brieve of service of heirs, representing the older *breve de morfe antecessoris*, by a petition to the sheriff under the Titles to Land Consolidation (Scotland) Act, 1868, and the brieve of perambulation by action of declarator. Writs *eo nomine* have been the subject of much modern legislation. The writs of *capias, habeas, certiorari* and extent were replaced by other proceedings by the Exchequer Court Act, 1856. The writs of *clare constat*, resignation and confirmation (whether granted by the Crown or a subject superior) were regulated by the Titles to Land Act *(supra)*. By the same act Crown writs are to be in the English language and registered in the register of Crown writs. Writs need not be sealed unless at the instance of the party against whom they are issued. Writs of progress (except Crown writs, writs of *clare constat* and writs of acknowledgment) were abolished by the Conveyancing (Scotland) Act, 1874. The *clare constat* writ is one granted by the Crown or a subject superior for the purpose of completing title of a vassal's heirs to lands held by the deceased vassal.

(P. H. W.)

United States.—The system of original writs seems never to have obtained in the United States. From the earliest colonial times actions were begun by the issuance of a writ of summons directed to a sheriff or constable, briefly setting forth the character of the claim, and directing that official to summon the defendant. This writ of summons as distinguished from the early English chancery writs was a judicial and not an executive writ. Its issuance was simply a means for securing the presence of the defendant before the court, not as in England giving the court jurisdiction to hear the particular claim. The form of the writ of summons followed in the main the old English writ, briefly stating the cause of action. Probably because of this similarity, despite the absence of original writs, the common law forms of action continued to survive in the United States. Until the adoption of procedural reforms by the codes during the middle of the 19th century, they persisted with all their common law vigour. Under the codes there is usually but one form of action, which is begun by the issuance of a summons prepared by the plaintiff's attorney and sewed by any one not a party to the suit. The summons is brief, does not disclose the nature of the action, though a copy is commonly attached to and served with the summons.

Writs in the Federal courts are by Act of Congress to be tested in the name of the chief justice of the United States. By State law writs in the State courts are generally bound to be in the name of the people of the State, in the English language, and tested in the name of the chief justice of the State. The common law prerogative writs such as *mandamus*, prohibition, *certiorari, quo warranto* and *habeas corpus* are well known in the United States. The Constitutions or statutes of the several States confer upon their courts power to issue these writs. The cases in which they may issue are generally governed by statute, and the courts issue them as a matter of sound discretion and not as a matter of right. In trying questions of title to real property, writs of entry and other real actions, which before the settlement of the colonies had become nearly obsolete in England, were until the middle of the 19th century the common remedies in the U.S. courts. They were, however, stripped of the cumbrous feudal appendages which made them intolerable in England. The action of ejectment begun by summons in the manner of any personal action has now supplanted them. Two prerogative writs have much importance in the Federal courts. These are the writ of error (now abolished in England) and the writ of *certiorari*. From 1879 until 1914, writ of error was the only means by which a decision of a State court could be reviewed in the Supreme Court of the United States. In that year *certiorari* was added as another method for review, having been available since 1891 as a method for revie ing decisions of the inferior Federal courts in the Supreme Court. In 1928 the writ of error was abolished and appeal substituted in its place. The writ of assistance has its interest in constitutional history. Before the War of Independence it was issued to revenue officers to search premises for smuggled goods. It was on this writ that it was first contended in 1761 that a colonial court had jurisdiction to examine the constitutionality of a legislative Act authorizing the issue of the writ. *(See Qziincy's Massachzisetts Rep.*, app., I. 520.)

(J. M. LA.)

BIBLIOGRAPHY.—For the history of the writ see *Registrum Brevium* and Sir Anthony Fitzherbert, *La nouvelle Natura Brevium* (1534 or 1537; Eng. trans., 1652, 9th ed., 1794), both noticed above; *Natura Brevium*, which changed its name to *Old Natura Brevium* after Fitzherbert's book was published; it exists in a great number of editions, the earliest of which is about 1516, the last 1584; *Novae narrationes; Articuli ad novas narrationes; Returna Brevium;* Simon Theloall, *Le digest des briefs originals* (1579); *Thesaurus brevium (c.* 1661); *R.* Brownlow, *Brevia judicialia* (1662); *Officina brevium* (1679); Sir E. Coke, *Institutes* (1628, many later editions); C. Dufresne du Cange, "Brevis" in *Glossarium* (Leyden, 1688; best ed. Henschel 1840–1850); G. Booth, *Real Actions* (1701); *W.* Tidd, *Practice* (1790–97); *H.* J. Stephen, *Pleadings* (1824; 7th ed., 1868); R. J. and A. B. Comer, *Practice of the Crown Side* (1844); M. M. Bigelow, *History of Procedzire in England* (1880); *F.* Pollock and F. W. Maitland, *History of English Law before the time of Edward I.* (1895); W. S. Holdsworth, *History of English Law* (1903, etc., especially vols. ii. and iii.); W. S. McKechnie, *Magna Carta* (1905; 2nd ed., 1914); T. A. Street, *Foundations of Legal Liability*, vol. iii. (1907); F. W. Maitland, *Equity, also the Forms of Action at Common Law* (edit. *A. H.* Chaytor and W. J. Whittaker, 1909); also *Collected Papers*, vol. ii. (edit. H. A. L. Fisher, 1911); W. Stubbs, *Select Charters* (9th ed., 1913); P. H. Winfield, *Chief Sources of English Legal History* (1925); and E. Jenks on "Prerogative Writs" in *The Yale Law Journal* (April 1923).

For current law, there is no book which deals with writs both exclusively and completely. Taken in the aggregate, the following books cover the topic: *The Annual Practice;* W. G. Clay, *The Law and Practice relating to Writs of Summons* (1894); F. H. Short and F. H. Mellor, *Practice on the Crown Side of the King's Bench Division* (2nd ed., 1908); E. R. Daniell, *Chancery Practice* (8th ed., S. E. Williams and F. Guthrie Smith, 1914), and *Chancery Forms* (6th ed., *R.* White, F. E. W. Nicholls and H. G. Garrett, 1914); T. E. May, Baron Farnborough, *Parliamentary Practice* (13th ed., T. L. Webster, 1921); W. B. Odgers, *Pleading and Practice* (10th ed., 1926); Aldusop, *Judicial Writs and Process* (1895); and *see* "Writ" in index to the Earl of Halsbury, *The Laws of England* (31 vols., 1907–17, with supplement, 1910, etc.).

(P. H W.)

WRITERS TO THE SIGNET, in Scotland, a society of law agents who, along with others, correspond to solicitors in England. They were originally clerks in the secretary of State's office and prepared the different writings passing the signet. They have no charter but are usually considered a corporation by long custom; they have office-bearers and are members of the College of Justice.

WRITING. The earlier history of writing is dealt with in the articles ALPHABET, PALAEOGRAPHY, PICTOGRAPHY. The subject of the present article is handwriting in its common uses in Europe since the period when the invention of printing superseded its employment for the making of books.

Speaking broadly, the ordinary handwritings of modern Europe result from the competition and interaction of two contrasted forms of script which existed side by side in most countries for many generations, and which still maintain an independent existence in Germany. These are the Italian, or Roman, and the national, not very accurately called Gothic, current hands. In England the most important type of native current hand was known in the 16th century as Secretary. The acute stage of the rivalry here may be said to last from about 1480 till the reign of Charles I., whose own hand is not a bad example of the compromise which shows the resultant of the tao forces. Endymion Porter's hand

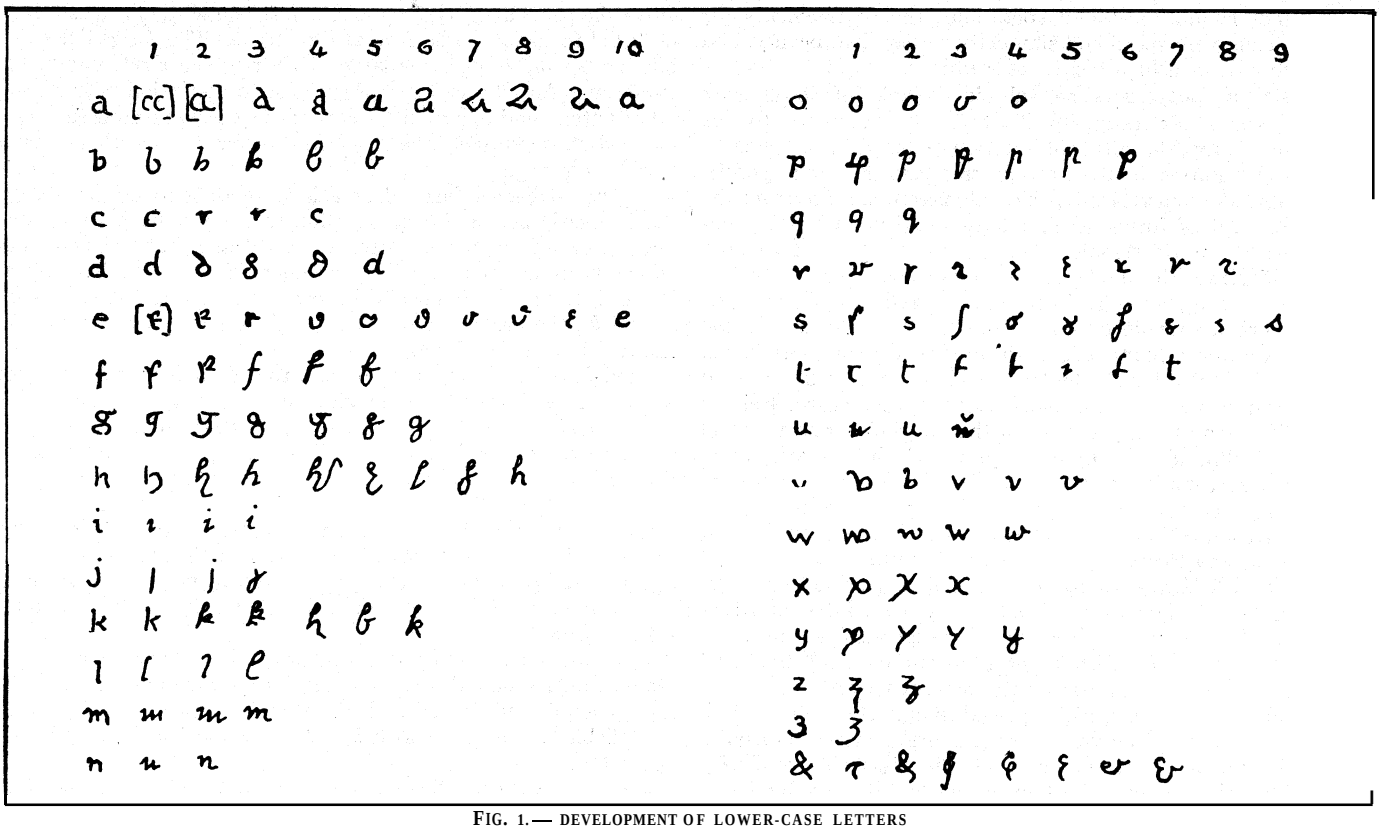

FIG. 1.— DEVELOPMENT OF LOWER-CASE LETTERS

gives an even better specimen.

The Italian Hand.— The great and singular achievement of the Italian renaissance in the matter of hand writing, the creation or revival of what is known as humanistic script (see art. PALAEOGRAPHY) might seem, since that hand was properly a book-hand, to lie outside our present subject. This, however, would not be altogether true. If the type used in this Encyclopaedia follows so closely the forms of letters evolved 11 centuries ago that a Latin book printed in it would have been easily read by a scholar of Charlemagne's court, it is because the Caroline hand set up a standard of legibility and simplicity from which other beautiful scripts were felt to fall away. As cheapened and, as it were, stereotyped by its adoption for printing, it has retained the same compelling power in a higher degree. To make one's hand "as plain as print" has been and is an aim the effects of which recur again and again in the history of writing. Before, however, it could have any direct influence on ordinary handwriting the humanistic script had to submit to certain changes, the general tendency of which can be gathered by comparing the printers' Roman with the printers' Italic type. This more cursive type of Italian script is seen in the hand of Petrus Carmelianus, tutor to the children of Edward IV., which serves also to show that the script had made its way into England before 1483.

Its rapid spread in England, perhaps, owed something to Royal patronage, for although Henry VIII. did not write it himself, he had it taught to his children, but through the 15th and first half of the 16th centuries a very large proportion of educated Englishmen both could and did write both in Italian and Secretary hand.

The different uses to which men put the two hands indicate that the superior legibility of the Italian was recognized, for in a letter or tract written mainly in Secretary it is common practice to write sub-headings, proper names, foreign words and the like in Italian script, in fact to use it much as we do italic print or leaded type.

Before we compare the merits and defects of the Italian current script with the fully-developed Secretary hand it is necessary to say something further concerning the scripts from which the latter had evolved.

Sources of Secretary Hand.— A critical study of the development of popular current script in England in the 14th–15th century is still a desideratum. Insufficient attention seems to have been paid to the needs which it rose to meet. Collections of specimens of writing from the beautiful book-hands of monastic scriptoria, or the workshops of artist-illuminators fail to illustrate it, and so, to a great degree, do collections of official writings from the administrative offices of State, written by clerks trained in their particular departments, a conservative class given to a professional pride in writing unlike the general public. Secretary hand, it is true, is considerably influenced by a type of script used in the chancery for documents intended to be read by laymen, an example of which may be taken from a formulary of Henry IV. It was influenced likewise by a type of vernacular book-hand, of which a specimen may be taken from a mid-15th century ms. of Occleve's poems. And it was influenced also by a form of script the origin of which seems to be French or Flemish, though it was popular in England. An illustrative example is from a book which was written in France for presentation by the earl of Salisbury to Queen Margaret at or immediately after her marriage to Henry VI. in 1445.

This is apparently the script known to French writers of the time as "lettres bastardes," to indicate its intermediate position between the stiff precision of the "lettres de forme" of the most expensive mss. and informal current or court hand called "lettre de cour." In the main, however, "Secretary" derives from none of these styles so much as from the styleless writing of the ordinary man of the 14th century, and its first beginnings are to be seen as soon as the need for any large amount of writing by the ordinary man began to be felt. Many circumstances combine to fix this at about the 50 years 1260–1310. Great monasteries began late in Henry III.'s reign to keep elaborate court-rolls and account-rolls of their manors. Changes in land tenure under Edward I. led to a vast output of deeds dealing with little bits of land. A little later allusions to the "paper of the market" show a new and cheap writing material fostering the growth of ephemeral business records. And lastly, legal documents were coming to be written in French and English, and by persons unskilled in the elaborate system of abbreviations which learned Latinists had devised to

shorten their labour. In these conditions, the requirements for a popular hand were speed and simplicity rather than beauty, and even at the cost of a high degree of legibility.

Analysis of Letters.—The subjoined table of lower case alphabets (fig. 1) is meant to illustrate, by reference to the numerals at the top, the forms of letters mentioned in the remarks which follow. Forms in brackets do not belong to our period, but are alluded to historically. The alphabets are far from exhaustive as a list of forms admissible or usual in 15th–18th century hands, and the facsimiles should be studied to supplement them and illustrate the mode of use of the letters. In what follows Secretary and Italian hands will be referred to as *Sec.* and *It.*

a. The normal form in both *Sec.* and It. is a^5. Formed in one stroke, its greater rapidity caused it to displace the Carolingian (or printer's) a (a^3) though the latter with its variant a^4 survived in some legal as well as book hands; a^5 may be regarded either as a simplification of a^3, by neglect of the top hook, or as a revival of the precaroline a^2 (the earlier type of which was a^1), which had never been completely driven out by a^3. a^5–a9 are characteristic 16th–17th century forms developed from an overhead fore-link, but often used initially and where no link was needed; a^7 indeed, has ceased to function as a link altogether and become a senseless flourish like the long up-stroke often prefixed to initial *m*; a^8, a not very common form, has received a good deal of attention from its occurrence in one of the Shakespeare signatures.

b. b^1 is the normal *It.*, with b^2 and b^3 as variations, b^4 the usual *Sec.* form, developing at an early date into the modern b^5.

c. c^2 made in one stroke, had replaced in *Sec.* the mediaeval c^1, in which the downward curve was written first and the horizontal top added afterwards. It thus avoided the disastrous similarity of c^1 and t^1, which makes the two letters as often as not indistinguishable in mediaeval documents. But it became too like an ill-formed e (e^3 or e^7). *It.* did good service in restoring the simple curve (c^4), the ultimate victory of which was assured.

d. Of the two forms d^1 and d^2, about equally frequent in 12th century use, d^2 had gradually driven out d^1 in 15th century England, and, with the addition of a loop for after-link, established itself in *Sec. it.* partially reintroduced d^1, and the two forms have been alternatives ever since. In the 16th century the ambiguity of d^4 with the e^4 of *Sec.* more than counterbalanced the ambiguity of d^5 with *cl.* d^3 is an abnormal, but not rare, form of d^2 fore-linked and written the wrong way round.

e, the letter of most frequent occurrence, whether in Latin or the vernacular, has perhaps undergone more changes than any other. The early mediaeval e^1 is formed in three pieces, beginning with the downward curve; e^2 is a modification written in two motions. The gradual development of the characteristic *Sec.* form e^6 through the stages e^4 and e^5 was the work of the 14th century. Its ambiguity with d^4 was perhaps the cause of a marked tendency in the 16th century to lift the pen before forming the final loop (as in e^8), or to reduce the loop to its smallest size as in e^7. In well-formed *It.* it had practically the modern shape e^{10}, but English writers show a strong inclination to revert to other forms. (See, for example Plate Ib line e in the same plate. 1, *quietness,* where the second e exactly resembles c^3, and d, where Elizabeth prefers the *Sec.* e^6, whereas Burleigh uses something resembling e^2.) The eventual victory of e^{10} was assured in the 17th century, though e^6 lingered on well into the 18th, and not only in legal hands. Final e, like final *s,* is always specially liable to slurring. The epsilon form e^9 occurs fairly often from Elizabethan *It.* onwards, but is somewhat indicative of academic education.

f in *Sec.* is analogous in formation to e, starting with the middle of the shaft downwards and completing the top in one or two motions, f^1 and f^2. The *It.* f^3 is a simple two-piece letter, but needs adaptation to make it current. If the fore-link was added on the r, and the after-link on the *l,* as in f^4, it is too like h^7 and s^6. The difficulty is eventually solved by the form f^5.

g, rather a complicated letter throughout the middle ages, tending continually to diverge from, and return to the figure-of-8 form of the minuscule, never attained in *Sec.* a form of satisfactory simplicity. In g^1 and g^2 after writing the *y* part of the letter the pen was carried far to the left below the line, and must be lifted to make the horizontal top-stroke. The *It.* g^3 links well but the bottom loop, made large and far to the right, was rather cumbrous. An alternative g^5 was liable to confusion with h^7 and other letters, and many 16th–17th century writers used the complicated g^4. Eventually the modern g^6 begins to take shape about Charles I.'s reign.

h. The mediaeval form h^1 as a letter ending to the left below the line early acquired a curved link to carry it back to the line in the form of the *Sec.* h^2, often extended in Elizabethan use into an overhead link as in h^4. Even without this, it was a long letter, in which the angles tended to become slurred into the shapes h^5, h^6 and h^7, the last being too close to f^4 and s^6. The *It.* h^3 easily changed into the modern h^8.

i and *j* need little comment, except that their distinctive use for the vowel and consonant (though a few mediaeval instances may be found) is an innovation belonging rather to the history of printing than of writing, and was little observed even by printers till the 17th century. Previous to this, lower case j occurs as the last rather than the first of two or more *i*'s coming together, especially in numerals, as xiij., and in Latin words like *conijcio.* Dotting of these letters, though well known to mediaeval scribes and obviously useful to distinguish *i* from a part of *m, n,* or *u,* was also not an obligatory process in good writing till the printer set the example.

k, if not much wanted in Latin or Italian is common in Germanic tongues and the continental form k^1 competed with the more complicated *Sec.* k^2 and k^3. More current shapes k^4 and k^5 were liable to confusion with h and b, and k^6 is a natural development.

l, m, *n,* nearly identical in ordinary *Sec.* and *It.* forms, need no comment, and of

o we need only remark the ambiguity of the negligently formed o^3, with open loop, and e^6 and e^7.

p has the characteristic form p^1 in Elizabethan *Sec.,* later slurred into p^6, resembling x^1. The *It.* p^2, in the effort to write it currently sometimes took the form @, but a simpler change, by slight opening of the loop, led through p^4 to p^5.

q needs no comment, but

r is another letter of complicated history, and an illustration of the way in which alternative forms have arisen and maintained themselves for centuries. The modern alternatives r^7 and r^8 have a story reaching back more than a thousand years, the latter originating in the ligature of the uncial letters OR in the shape ꝛ and thence introduced into minuscule writing, particularly in the common Latin genitive termination orum, written as (ꝯ), but admissible anywhere where *r* follows o. From about the 12th

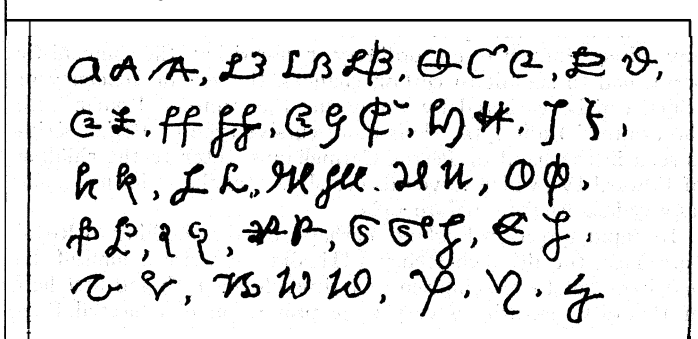

FIG. 2.—SOME FORMS OF CAPITAL LETTERS

century the use of this 2-shaped *r* was extended to cases where it followed the letters *p* and b, the last curve of which is similar to that of o. In the course of the 13th century the analogy of the masculine orum seems to have brought the a-shaped *r* into the feminine arum, and in the 14th and 15th century it slowly creeps in after *i,* e, *u* and other letters, and last of all as an initial. Normally however, when not following o the form r^2 (with longer or shorter shaft) is retained in English as well as *It.* hands until early in the 16th century, when a short horizontal stroke on the line is introduced, making the typical *Sec.* form r^1. From the

short-shafted variety of r^2 is developed r^6, and from the 2-shape r^3 come r^4, and r^5, all characteristic of 16th-17th century hands. Several other varieties could be noted if space allowed.

s is another letter of two forms (s and f) the use of which in writing as in print (until about 1800) depended on the position of the letter in a word. From aesthetic motives apparently scribes of the 10th–12th century gradually discarded the use of the minuscule or long *s* in a final position and substituted the short or uncial s, which was slowly modified first into a shape like a Greek final sigma s then into something like a medial sigma *σ*, *viz.*, s^4 or s^5. The use of s^4 in an initial position is one of the earliest signs of the popular current hand of about 1300. In Italy the current hand, abandoning the minuscule long *s* of the formal humanistic script, reverted to the old Roman cursive s^3, which it used along with the uncial short s^2. We have therefore in Elizabethan hands the four forms s^1–s^4 in regular use medially or initially together with the final forms s^5 or s^2. The addition of fore- and after-links convert s^2 and s^3 into s^7 and s^6 respectively, but in 17th century hands the one is often shortened or the other lengthened so as to become hardly distinguishable. Slurring of the upper loop converts s^2 into s^8, but the further development into the modern s^9 is scarcely recognized as a copybook form till the 18th century.

t in the regular mediaeval shape t^1 had been barely distinguished from c^1. The writers of *Sec.* therefore, influenced, perhaps, by the form in Bastard hand, preferred t^3, while t^2 is the normal It. In cursive writing and especially in a final position, where slurring is most prevalent, it took the shapes t^4, t^5, and t^6. t^7 is the later development of its medial use.

u needs little comment, except that a practice of distinguishing it from *n* by adding a curved mark over it, u^3, is a fairly sure sign, if not of German or Netherlands, then of Scottish influence.

With regard to the use of *u* and v the case is similar to that of *i* and *j*. Until about 1600, *v* is merely the initial form of the letter written medially as *v*. *v*, *w*. v^1 v^2, w^1 w^2 are the *Sec.* forms.

x. The *Sec.* form x^1 closely resembles p^6; x^2 is the usual It., but x^3 occurs before 1600.

y, *z*. y^1 is the *Sec.* form. *z* nearly always has a tail.

Of the two surviving extra letters of the Anglo-Saxon (runic) alphabet, the thorn þ disappears about the beginning of our period (*circ.* 1460), being replaced by y in the abbreviations y^e and y^t for the and that. yok survives a little longer but is often written like *z*.

The last line of our table shows a few forms of the ampersand, or abbreviation for and (or et). Of other abbreviations common in Elizabethan English few will give much trouble to the reader. The stroke above the line for m or n, *r* above the line in such words as your (yo^r) and after *aft^r*, *p* for per or par, and the stroke above for *i* in the termination cion (our tion), *e.g.*, devocon, deserve notice, as also the sweeping curve for es or *s*, as in the words lands and ends in the example of Burleigh's hand.

Capital letters have so many forms depending on individual taste, that a detailed analysis in the space at command would be impossible. The very small selection given includes some of the Elizabethan forms which are most different from modern usage. For bibliography see CALLIGRAPHY.

WROUGHT IRON: see IRON AND STEEL.

WRYNECK, a bird, Jynx torquilla, so called from its way of writhing its head and neck. It is a summer visitant to most parts of Europe, generally arriving a few days before the cuckoo, and is often known as "cuckoo's leader" and "cuckoo's mate."

The unmistakable note of the wryneck is merely a repetition of what may be syllabled que, que, que, many times in succession, rapidly uttered at first, but gradually slowing and in a continually falling key. This is only heard during a few weeks, and for the rest of the bird's stay in Europe it seems to be mute. It feeds mainly on insects, especially on ants. It is larger than a sparrow with beautifully variegated plumage of black, brown, buff and grey. The wryneck lays its translucent white eggs on the bare wood of a hole in a tree, and it is one of the few wild birds that can be induced to go on laying by abstracting its eggs day after day, and thus upwards of forty have been taken from a single hole—but the proper complement is from six to ten. When disturbed on the nest, the female writhes and hisses like a snake. As regards Britain, the bird is most common in the south-east, its numbers decreasing rapidly towards the west and north.

Other species of the genus are found in various parts of Africa. The wrynecks (see WOODPECKER) form a subfamily *Jynginae* of the *Picidae,* from the more normal groups of which they differ in coloration and in having the tail-quills not stiffened to serve as props as in the climbing Picinae.

WRY-NECK (Lat. *Torticollis*), a congenital or acquired deformity, characterized by the affected side of the head being drawn downwards towards the shoulder together with deviation of the face towards the sound side. There are various forms. (1) The congenital, due to a lesion of the sterno-mastoid muscle. (2) The rheumatic, due to exposure to a draught or cold. This is commonly known as "stiff-neck." (3) The nervous or spasmodic, the result of (a) direct irritation of the spinal accessory nerve or its roots, or (b) the result of cerebral irritation. Many cases are also due to hysteria and some to spinal caries. When wry-neck is congenital, massage and manipulation may be tried and some form of apparatus. Failing this, division of the muscle surgically may be practised. In the spasmodic forms, anti-neurotic treatment is recommended. In rheumatic torticollis the spasm is usually overcome by the application of hot compresses and appropriate anti-rheumatic treatment.

WUCHANG: see HANKOW.

WUCHOW, a treaty port in the province of Kwang-si, China, situated on the left bank of the Sikiang at its junction with the Fu or Kwei-kiang (Cassia) river. It is 220 m. above Canton and the river is navigable the whole distance for vessels drawing up to 8 ft. of water. The situation of Wuchow makes it the natural distributing centre between Kweichow, Kwang-si and Canton. The imports from Canton consist chiefly of cotton and cotton goods, kerosene oil, woollens, etc., while sugar, various oils, hides and aniseed are the chief exports. During summer floods the water pent up by the gorges rises 50 or 60 ft. at Wuchow. In consequence of the variation of river level the principal offices and shops are built upon pontoons which are moored alongside the river bank. The native population is estimated at 65,000. It was opened to foreign trade in 1897 and has telegraphic communication with Hong Kong and Shanghai.

WUHU, a city in the province of An-hwei, China, about 1 m. from the south bank of the Yangtsze-Kiang, with which it is connected by a straggling suburb. It is about 50 m. above Nanking. It is connected by canals with Ning-kwo Fu, T'ai-p'ing Hien, Nan-ling Hien and Ching Hien, the silk districts in the neighbourhood of the two last cities being within 50 m. of Wuhu. There is much coal in the country around. The principal exports are rice, cotton, wheat, tea, furs and feathers. The population is estimated at between 120,000 and 175,000. It was marked out as a treaty port as early as 1858, but was not opened to trade until 1877. A general foreign settlement was opened in 1905, and there has been a great increase in its prosperity during the 20th century.

WULFENITE, a mineral consisting of lead molybdate, $PbMoO_4$, crystallizing in the hernimorphic-tetartohedral class of the tetragonal system. Crystals usually have the form of thin square plates bevelled at the edges by pyramidal planes. They have a brilliant resinous to adamantine lustre, and vary in colour from greyish to bright yellow or red: the hardness is 3, and the specific gravity 6.7. Small amounts of calcium are sometimes present isomorphously replacing lead. The mineral occurs in the oxidation zone of veins containing lead and molybdenum. Good yellow crystals come from Bleiberg in Carinthia and bright red ones from Arizona. The mineral has been produced on a commercial scale, as an ore of molybdenum, at the Mammoth mine, Arizona.

WULFHERE (d. 675), king of the Mercians, a younger son of King Penda, was concealed for some time after his father's death in 655, but in 658 or 659, when the Mercians threw off the supremacy of Oswio, king of Northumbria, Wulfhere became king He did much to spread Christianity inside and outside his kingdom. In 657 he gained Lindsey from Northumbria, and he was successful against Wessex, extending his borders in all directions.

Wulfhere married Eormenhild, a daughter of Erconberht, king of Kent, and was succeeded by his brother Aethelred. His only son, Coenred, became king in 704, in succession to Aethelred, and his daughter, St. Werburga or Werburh, was abbess of Ely.

See Bede, *Historia ecclesiastica*, edit. *C*. Plummer (Oxford, 1896); and J. R. Green, *The Making* of *England* (1897–99).

WULFSTAN, archbishop of York from 1003 until his death in May 1023, and also bishop of Worcester (1003–16), is generally held to be the author of a remarkable homily in alliterative English prose. Its title, taken from a ms., is *Lupi sermo ad Anglos, quando Dani maxime prosecuti sunt eos, quod fuit anno 1014.* It is an appeal to all classes to repent in the prospect of the imminent day of judgment, and gives a vivid picture of the the desperate condition of England in the year of King Aethelred II.'s flight (1014). Of the many other homilies ascribed to Wulfstan very few are authentic. Subsequent legislation, especially that of Canute, bears clear traces of his influence.

See the edition of his homilies by A. Napier (Berlin, 1883); the same writer's *Über die Werke des altenglischen Erzbischofs Wulfstan* (Gottingen dissertation, 1882), and his paper in *An English Miscellany* (Oxford, 1901, pp. 355 f.); also A. Brandl in H. Paul's *Grundriss der germanischen Philologie* (2nd ed., 1901–09), ii., pp. 1110–1112.

WULFSTAN, ST. (c. 1012–1095), bishop of Worcester, born at Little Itchington near Warwick and educated in the monastic schools of Evesham and Peterborough, became a monk at Worcester, and schoolmaster and prior in the cathedral monastery there. Chosen bishop of Worcester in 1062, he accepted with some reluctance, and was consecrated at York in September. Wulfstan submitted to William the Conqueror, and helped to check the rebellious barons during the revolt of 1075. He was equally loyal to William II. in his struggle with the Welsh. Wulfstan's relations with his ecclesiastical superiors were not so harmonious, and at one time both Lanfranc of Canterbury and Thomas of York unsuccessfully demanded his removal. He died on Jan. 18. 1095. In 1203 he was canonized by Pope Innocent III. By his preaching at Bristol Wulfstan is said to have put an end to the kidnapping of English men and women and selling them as slaves. He rebuilt the cathedral church of Worcester, and some parts of his building still remain. Lives of St. Wulfstan by Hemming and Florence of Worcester are in H. Wharton's *Anglia sacra* (1691). *See* also E. A. Freeman, *Norman Conquest* (1867–79).

WUNDT, WILHELM MAX (1832-I~ZO), German physiologist and philosopher, was born on Aug. 16, 1832 at Neckarau, in Baden. He studied medicine at Tubingen, Heidelberg and Berlin, and in 1857 began to lecture at Heidelberg. In 1864 he became assistant professor there, and in 1866 was chosen to represent Heidelberg in the Baden Chamber, but soon resigned. In 1875 he became professor of philosophy at Leipzig, where he founded an institute for experimental psychology, the precursor of many similar institutes. The list of Wundt's works is long and comprehensive, including physiology, psychology, logic and ethics. He died near Leipzig on Aug. 31, 1920.

WUNTHO, a native state of Upper Burma annexed by the British and incorporated in the district of Katha in 1892. When the British annexed Upper Burma in 1885 the state became a refuge for rebels. Finally in 1891 it broke into open rebellion, the sawbwa was deposed, and a force of 1,800 troops under General Sir George Wolseley occupied the town of Wuntho and reduced the state to order.

WU PEI-FU (1873–1939), Chinese general, was born in Shantung. He joined the Third Army Division, commanded by Tsao Kun, distinguished himself in several minor campaigns, and was rewarded by Tsao Kun in 1916 with the command of a division. By 1917 he was the Peking Government's chief bulwark against the Monarchists, Sun Yat-sen's independent republic at Canton and the ambitions of Marshal Chang Tso-lin, the governor general of Manchuria. Sun Yat-sen was not in a position to take the offensive, but Chang Tso-lin invaded Chihli in the spring of 1922 and, being defeated by the forces of Wu Pei-fu, launched another attack in 1924. Wu Pei-fu was defeated in a great battle near Tientsin in Oct. and fled, after which he remained in retirement at Yochow.

WUPPERTAL, Germany: *see* BARMEN; **ELBERFELD.**

WÜRTTEMBERG, a *Land*, and a component State of the German Reich, forming a tolerably compact mass in the south-west angle of Germany. In the south it is cleft by the long narrow territory of Hohenzollern, belonging to Prussia; and it encloses several small enclaves of Baden and Hohenzollern, while it owns some small exclaves within the limits of these two states. It lies between 47" 34' 48″ and 49° 3j' 17" N., and between 8° 15′ and 10° 30' E. Its greatest length from north to south is 140 m.; its greatest breadth is 100 m.; its boundaries, almost entirely arbitrary, have a circuit of 1,116 m.; and its totalarea is 7,530 sq.m. It is bounded on the east by Bavaria, and on the other three sides by Baden, with the exception of short distances on the south, where it touches Hohenzollern and the lake of Constance.

Physical Features. — The undulating fertile terraces of Upper and Lower Swabia may be taken as the characteristic parts of this agricultural country. The usual estimates return one-fourth of the entire surface as "plain," less than one-third as "mountainous," and nearly one-half as "hilly." The average elevation above the sea-level is 1,640 ft.; the lowest point is at Bottingen (410 ft.), where the Neckar quits the country; the highest is the Katzenkopf (3,775 ft.), on the Hornisgrinde, on the western border.

The chief mountains are the Black Forest (*q.v.*) on the west, the Swabian Jura or Rauhe Alb stretching across the middle of the country from south-west to north-east, and the Adelegg Mountains in the extreme south-east, adjoining the Algau Alps in Bavaria. The Rauhe Alb or Alp slopes gradually down into the plateau on its south side, but on the north it is sometimes rugged and steep, and has its line broken by isolated projecting hills. The highest summits are in the south-west, viz., the Lemberg (3,326 ft.), Ober-Hohenberg (3,312 ft.) and Plettenberg (3,293 ft.). To the south of the Rauhe Alb the plateau of Upper Swabia stretches to the lake of Constance and eastwards across the Iller into Bavaria. Between the Alb and the Black Forest in the north-west are the fertile terraces of Lower Swabia, continued on the north-east by those of Franconia.

About 70% of Wiirttemberg belongs to the basin of the Rhine, and about 30% to that of the Danube. The principal river is the Neckar, which flows northward for 186 m. through Wiirttemberg to join the Rhine, and with its tributaries the Rems, Kocher, Jagst, Ens, etc., drains 57% of the country. The Danube flows from east to west across the south half of Wurttemberg, a distance of 65 m., a small section of which is in Hohenzollern. Just above Ulm it is joined by the Iller, which forms the boundary between Bavaria and Wurttemberg for about 35 m. The Tauber in the north-east joins the Main; the Argen and Schussen in the south enter the lake of Constance. The lakes of Wurttemberg, with the exception of those in the Black Forest, all lie south of the Danube. The largest is the Federsee (1 sq.m.), near Buchau. About one-fifth of the lake of Constance is reckoned to belong to Wiirttemberg. Mineral springs are abundant; the most famous spa is Wildbad, in the Black Forest.

The climate is temperate, and colder among the mountains in the south than in the north. The mean temperature varies at different points from 43" to 50° F. The abundant forests induce much rain, most of which falls in the summer.

Population. — The population of the four divisions (*Kreise*) into which the kingdom was divided is shown below:—

Division (*Kreis*)	Area in sq.m.	Pop. 1900	Pop. 1933	Density 1933
Neckar	1,285	745,669	~~1,035,951~~	806·1
Black Forest (Schwarzwald)	1,844	509,258	620,476	336·4
Jagst	1,984	400,126	430,202	216·8
Danube (Donau)	2,417	514,427	609,313	252·0
Total	7,530	12,169,480	12,695,942	358·0

The population in 1939 was 2,907,131, being particularly dense in the Neckar valley. The people of the northwest belong to the Alamannic stock, those of the northeast to the Franconian, and those of the centre and south to the Swabian.

The largest towns in the kingdom are Stuttgart (with Cannstadt), Ulm, Heilbronn, Esslingen, Reutlingen, Ludwigsburg,

Goppingen, Gmiind, Tübingen, Tuttlingen and Raverisburg.

Agriculture. — Wiirttemberg is essentially an agricultural State; 64% of its total area is under cultivation, while 31% is under forest. It possesses rich meadowlands, cornfields, orchards, gardens, and hills covered with vines. The chief agricultural products are oats, spelt, rye, wheat, barley, hops. To these must be added wine (mostly of excellent quality), peas and beans, maize, fruit, chiefly cherries and apples, beets and tobacco, and garden and dairy produce. Of live stock, cattle, sheep and pigs are reared in considerable numbers, and attention is paid to horse-breeding.

Mining. — The salt industry was developed at the beginning of the 19th century. The iron industry is of great antiquity, but it is hampered by the absence of coal. Other products are granite, limestone, ironstone and fireclay.

Manufactures. — Linen, woollen and cotton fabrics are made at Esslingen and Goppingen, and paper at Ravensburg, Heilbronn and other places in Lower Swabia. The manufacturing industries assisted by the government developed rapidly during the later years of the 19th century, notably metal-working, especially such branches of it as require exact and delicate workmanship. Of particular importance are iron and steel goods, locomotives (Esslingen), machinery, motor-cars, bicycles, small arms (in the Mauser factory at Oberndorf), all kinds of scientificandartisticappliances, pianos (at Stuttgart), organs and other musical instruments, photographic apparatus, clocks (in the Black Forest), electrical apparatus, and gold and silver goods. There are also extensive chemical works, potteries, cabinet-making workshops, sugar factories, breweries and distilleries. Water-power and petrol largely compensate for the lack of coal.

Commerce. — The principal exports are cattle, cereals, wood, pianos, salt, oil, leather, cotton and linen fabrics, beer, wine and spirits. The chief commercial cities are Stuttgart, Ulm, Heilbronn and Friedrichshafen. The book trade of Stuttgart, called the Leipzig of South Germany, is very extensive.

Communications. — In 1939 Wurttemberg had 802 mi. of full gauge railways. The Neckar, the Schussen and the lake of Constance are all navigable for boats; the Danube begins to be navigable at Ulm. The roads of Wiirttemberg are fairly good; the oldest of them are Roman.

Government. — The republican constitution of Sept. 25, 1919, provided for a Landtag of 80 members elected for 4 years by universal suffrage. This was superseded after 1933 by a totalitarian regime in the hands of Wilhelm Murr, a national socialist district leader (*Gauleiter*) and federal governor (*Reichsstatthalter*) appointed by Hitler.

For administrative purposes the country is divided into the City of Stuttgart, 62 districts (Oberamter), and 1,887 communes (Gemeinden).

Religion. — At the census of 1933 the various creeds numbered as follows: — Protestants, 1,810,000; Roman Catholics, 839,678; Jews, 10,023; and others 34,826. At the head of the Evangelical (Protestant) Church stands a president, who with a church council is responsible for its administration. The Roman Catholic Church is subject to the bishop of Rottenburg, in the archdiocese of Freiburg.

Education. — The higher branches of learning are provided in the university of Tubingen, in the technical high school (with academic rank) of Stuttgart, the veterinary high school at Stuttgart, the commercial college at Stuttgart, and the agricultural college of Hohenheim. There are gymnasia and other schools in all the larger towns, while every commune has a school. There are numerous schools and colleges for women. There is also a school of viticulture at Weinsberg.

HISTORY

Origins. — The origin of the name Wiirttemberg is uncertain. Early forms of it are Wirtenberg, Wirtembenc, Wirtenberc, Wirtemberg and Würtemberg. In 1806 Württemberg was adopted as the official spelling.

As far as we know, the first inhabitants of the country were the Celts, and then the Suebi. In the 1st century AD. the Romans included it in the area defended by the *Limes Germanicus* (*q.v.*) Early in the 3rd century the Alamanni drove the Romans beyond the Rhine and the Danube, but in their turn they were conquered by the Franks under Clovis, the decisive battle being fought in 496. In the 9th century it was incorporated with the German duchy of Swabia.

The duchy of Swabia was ruled by the Hohenstaufen family until the death of Conradin in 1268, when a considerable part of it fell to the count of Wurttemberg, the representative of a family first mentioned about 1080, a certain Conrad von Beutelsbach, having called himself after his ancestral castle of Wurttemberg. The earliest count about whom anything is known is Ulrich, who ruled from 1241 to 1265. Under his sons, Ulrich II. and Eberhard I., and their successors the power of the family grew steadily. Eberhard (d. 1325) doubled the area of his county and transferred his residence from Wurttemberg to Stuttgart. His successors all added something to the area of Wiirttemberg. The lands of the family were several times divided, but in 1482 they were declared indivisible and were united under Count Eberhard V. In 1495 the county was raised to the rank of duchy.

The long reign (1498–1550) of Duke Ulrich I., who succeeded to the duchy while he was still only a child, was a most eventful period for the country. His extortions excited a rising known as that of the arme *Konrad* (poor Conrad) and in 1514 by the treaty of Tübingen the people undertook to pay the duke's debts in return for various political privileges, which in effect laid the foundation of the constitutional liberties of the country. A few years later Ulrich quarrelled with the Swabian league, and its forces expelled him and sold his duchy to the Emperor Charles V. Charles handed over Wiirttemberg to his brother, the German king, Ferdinand I., but discontent caused by the oppressive Austrian rule, disturbances in Germany leading to the Peasants' War and commotions aroused by the Reformation gave Ulrich an opportunity to recover it. Aided by Philip, landgrave of Hesse, and other Protestant princes, he fought a victorious battle against Ferdinand's troops at Lauffen in May 1534, and then by the treaty of Cadan he was again recognized as duke, but was forced to accept his duchy as an Austrian fief. He now introduced the reformed doctrines and proceeded to endow Protestant churches and schools throughout his land. Ulrich's connection with the league of Schmalkalden led to another expulsion, but in 1547 he was reinstated by Charles V., although on somewhat onerous terms.

Ulrich's son and successor, Christopher (1515–68), completed the work of converting his subjects to the reformed faith. He introduced the system of church government known as the Grosse *Kirchenordnung*. Frederick I. (1557–1608) by paying a large sum of money, induced the emperor Rudolph II. in 1599 to free the duchy from the suzerainty of Austria. Thus once again Württemberg became a direct fief of the empire. Under the reign of the next duke, John Frederick (1582–1628), Wiirttemberg suffered severely from the Thirty Years' War. His son and successor Eberhard III. (1614–74) plunged into the war as an ally of France and Sweden in 1633, but after the battle of Nordlingen in 1634 the duchy was occupied by the imperialists and he himself was for some years an exile. He was restored by the peace of Westphalia to a depopulated and impoverished country. During the reign of Eberhard IV. (1676–1733), Wurttemberg suffered from French invasions.

Alexander, who became duke in 1733, embraced the Roman Catholic faith. His favourite adviser was the Jew Suss Oppenheimer, and it was thought that master and servant were aiming at the suppression of the diet and the introduction of the Roman Catholic religion. The sudden death of Charles Alexander in March 1737 put an abrupt end to these plans, and the regent, Charles Rudolph, had Oppenheimer hanged.

Frederick Eugene (d. 1797) educated his children in the Protestant faith. Thus when his son Frederick II. became duke in 1797, the ruler of Wurttemberg was again a Protestant and the royal house adhered to this faith since that date. During Frederick Eugene's short reign the French invaded Wiirttemberg, compelled the duke to withdraw his troops from the imperial army and to pay a sum of money.

French Wars*——Frederick II (1754–1816) took part in the

war against France against the wishes of his people, and when the French again invaded and devastated the country he retired to Erlangen, where he remained until after the conclusion of the peace of Lunéville in 1801. By a private treaty with France (March 1802) he ceded his possessions on the left bank of the Rhine, receiving in return nine imperial towns, among them Reutlingen and Heilbronn, and some other territories, amounting altogether to about 850 sq.m. and containing about 124,000 inhabitants. He also accepted from Napoleon the title of elector. In 1805 Wiirttemberg took up arms on the side of France, and by the peace of Pressburg in Dec. 1805 the elector was rewarded with various Austrian possessions in Swabia and with other lands in the neighbourhood. On Jan. 1, 1806, Frederick assumed the title of king and abrogated the constitution.

In 1806 he joined the Confederation of the Rhine and received further additions of territory containing 160,000 inhabitants; a little later, by the peace of Vienna in Oct. 1809, about 110,000 more persons were placed under his rule. In return for these favours Frederick joined Napoleon in his campaigns against Prussia, Austria and Russia. After the battle of Leipzig he deserted the French emperor, and by a treaty made with Metternich at Fulda in Nov. 1813 secured the confirmation of his royal title and of his recent acquisitions of territory, while his troops marched with those of the allies into France. In 1815 the king joined the Germanic Confederation. He died on Oct. 30, 1816.

The new king. William I., granted a new constitution in Sept. 1819. A democratic constitution, proclaimed during the revolution of 1848, was abrogated as soon as the movement had spent its force and the constitution of 1819 was restored.

Charles I. (1823–1891) succeeded his father William as king in July 1864. In 1866 Wurttemberg took up arms on behalf of Austria, but three weeks after the battle of Koniggratz her troops were decisively beaten at Tauberbischofsheim, and the country was at the mercy of Prussia. The Prussians occupied the northern part of Wurttemberg and peace was made in August 1866; Württemberg paid an indemnity of 8,000,000 gulden and concluded a secret offensive and defensive treaty with her conqueror.

On the outbreak of the Franco-Prussian War in 18 jo its troops took a creditable part in the battle of Wörth and in other operations of the war. In 1871 Wurttemberg became a member of the new German empire, but retained control of her own post office, telegraphs and railways. She had also certain special privileges with regard to taxation and the army. On Oct. 6, 1891, King Charles died suddenly, and was succeeded by his cousin William II. (b. 1848), who continued the policy of his predecessor. The reform of the constitution continued to be discussed, and the election of 1895 was memorable because of the return of a powerful party of democrats.

Later Politics.—Between 1900 and 1910 the political history of Wiirttemberg centred round the settlement of the constitutional question. The constitution was revised in 1906. No further changes were made until Oct. 1918, when the Weizsacker ministry, which held office during the War, resigned, and revolution broke out on Nov. 9. For two days the direction of affairs was exclusively in Socialist hands, but on Nov. 11 a coalition was formed, from which the Spartacists were excluded, and representatives of the bourgeois parties admitted. The king abdicated on Nov. 30. The Spartacist rising of Jan. 1919, had its echo in Wurttemberg chiefly in the form of industrial disturbances, after which the Independent Social Democrats left the ministry. A new republican constitution was adopted in 1919, but this (see above) was superseded in 1933 by a national socialist regime.

Owing to the relatively happy economic balance in Württemberg between agriculture and industry, the country suffered less from the economic crisis after World War I, and was less afflicted with violent partisan politics than were most other parts of Germany.

WURTZ, CHARLES ADOLPHE (1817–1884), French chemist, was born at Wolfisheim, near Strasbourg. When he left the Protestant Gymnasium at Strasbourg in 1834 he studied medicine, and in 1839 was appointed "Chef des travaux chimiques" at the Strasbourg faculty of medicine. In 1845 he became assistant to J. B. A. Dumas at the École de Médecine, and in 1849 lectured on organic chemistry in his place. In 1852 Wurtz was appointed to the combined chairs of organic chemistry and of mineral chemistry and toxicology at the faculty of medicine. In 18;; he became the first occupant of the chair of organic chemistry which he had induced the government to establish at the Sorbonne. He died in Paris on May 10, 1884.

Wurtz's first published paper was on hypophosphorous acid (1842), and the continuation of his work on the acids of phosphorus (1845) resulted in the discovery of phosphorus oxychloride, as well as of copper hydride. But his original work was mainly in the domain of organic chemistry. Investigation of the alkyl isocyanates (1848) led him to the discovery of the amines (1849), and later (1851) the compound ureas. In 1855 he showed that the combination between two hydrocarbon radicles could be brought about by the action of sodium on the alkyl iodides; this important reaction is known by his name. About the same time he reached the conclusion that glycerin is a body of alcoholic nature formed on the type of three molecules of water, as common alcohol is on that of one, and was thus led (1856) to the study of the glycols, bodies similarly related to the double water type. The oxidation of the glycols led him to homologues of lactic acid, and a controversy about the constitution of the latter with H. Kolbe resulted in a better understanding of the relations between the hydroxy- and the amino-acids. In 1867 Wurtz prepared neurine synthetically by the action of trimethylamine on glycol-chlorhydrin, and in 1872 he discovered aldol, pointing out its double character as at once an alcohol and an aldehyde. In addition reference may be made to his work published from 1865 onwards, on abnormal vapour densities. While on the olefines he noticed that a change takes place in the density of the vapour of amylene hydrochloride, hydrobromide, etc., as the temperature is increased, and in this he saw a powerful argument in favour of the view that abnormal vapour densities, such as are exhibited by ammonium chloride or phosphorus pentachloride, are to be explained by dissociation.

From 1852–72 Wurtz published in the *Annales* de *chimie et de physique* abstracts of chemical work done out of France. The publication of his great *Dictionnaire de chimie pure et applique'e,* in which he was assisted by many other French chemists, was begun in 1869 and finished in 1878; two supplementary volumes were issued 1880–86, and a second supplement was completed in 1908. Among his books are *Chimie médicale* (1864), *Leçons Cltmentaires de chimie moderne* (1867), *Théorie des atomes dans la conception du monde* (1874), *La Thtorie atomique* (1878), *Progrès de l'industrie des matières colorantes artificielles* (1876) and *Traitt de chimie biologique* (1880–85).

For his life and work, with a list oi his publications, *see* Charles Friedel's memoir in the *Bulletin de la Société Chimique* (1885); also A. W. von Hofmann in the *Ber. deut. chem. Ges.* (1887), reprinted in vol. iii. of his *Zur Erinnerung an vorangegangene Freunde* (1888).

WÜRZBURG, a university town and episcopal see of Bavaria, Germany, capital of the province of Lower Franconia, situated on the Main, 60 mi. by rail S E. from Frankfort and at the junction of main lines to Bamberg and Nürnberg. Pop. (1939) 108,617. The site of the Leistenberg was occupied by a Roman fort, and was probably fortified early in the 13th century. *Wircebirgum* is the old Latin form of the name of the town; *Herbipolis* (herb town) first appears in the 12th century. The bishopric was probably founded in 741, but tbe town appears to have existed in the previous century. About the 12th century the bishops had ducal authority in Eastern Franconia. Quarrels broke out between the bishops and the citizens, and, after long struggles, the citizens submitted in 1400. Several imperial diets were held in Wiirzburg,

chief among these being the one of 1180 when Henry the Lion was placed under the ban. By the peace of Lunéville the bishopric was secularized, and in 1803 Würzburg passed to Bavaria. The peace of Pressburg in 1805 transferred it to Ferdinand, formerly grand-duke of Tuscany, who joined the confederation of the Rhine and took the title of grand-duke of Würzburg. In 1815 the congress of Vienna restored Würzburg to Bavaria. The bishopric of Würzburg at one time embraced an area of about 1,900 sq.m. and had about 250,000 inhabitants. A new bishopric of Würzburg was created in 1817.

An ancient stone bridge (1474–1607), 650 ft. long and adorned with statues of saints, and two modern bridges connect the two parts of the town on each side of the river. On the Leistenberg stands the fortress of Marienberg, which from 1261 to 1720 was the residence of the bishops. Many of the houses are interesting specimens of mediaeval architecture; and the numerous old churches recall the fact that it was long the capital of an ecclesiastical principality. The principal church is the imposing Romanesque cathedral, a basilica with transepts, begun in 1042 and consecrated in 1189. The four towers, however, date from 1240, the (rococo) façade from 1711–19, and the dome from 1731. The transepts terminate in apses. The exterior was restored in 1882–83. Other interesting buildings are the Marienkapelle, the Haugerstifts church, the Neumünster church, the church of St. Burkhard, the palace, formerly the residence of the bishops and grand-dukes of Würzburg, and the Julius hospital, and the town hall dates in part from 1456. Walter von der Vogelweide is buried in the cloisters adjoining the Neumünster church.

A university was founded at Würzburg in 1403, but it only existed for a few years. The present university was founded by Bishop Julius in 1582. Here W. K. Röntgen discovered the "Röntgen rays" in 1896. Würzburg was long the Jesuit stronghold in Germany, and the Roman Catholic theological faculty attracted large numbers. The university in 1938 had about 150 on its teaching staff and was attended by 1,500 students.

Würzburg is surrounded by vineyards, which yield some of the best wine in Germany. Its principal industries are the manufacture of tobacco, furniture, machinery, scientific instruments and railway carriages. It has also breweries, and produces bricks, marmalade, pianos, sugar, malt and chocolate.

See S. Göbl, *Würzburg, Ein Kulturhistorisches Städtebild* (Würzburg, 1896); F. X. von Wegele, *Geschichte der Universität Würzburg*, (Würzburg, 1882); *Geschichte des Bischofstums Würzburg* (Würzburg, 1899–1901).

WURZEN, a town of Germany in the *Land* of Saxony, on the Mulde, 15½ mi. by rail E. of Leipzig on the main line (via Riesa) to Dresden. Pop. (1939) 19,755. Wurzen was founded by the Sorbs, and was a town early in the 12th century, when the bishop of Meissen founded a monastery here. In 1581 it passed to the elector of Saxony. It has a cathedral dating from the 12th century and a castle, at one time a residence of the bishops of Meissen and now utilized as law courts.

WYANDOTTE, a city of Wayne county, Michigan, U.S.A., on the Detroit river and the Dixie highway, 8 m. S. by W. of Detroit. It is served by the Detroit and Toledo Shore line, the Detroit, Toledo and Ironton, the Michigan Central and the New York Central railways. The population was 13,851 in 1920 (29% foreign-born white), 28,368 in 1930, 30,618 in 1940, by federal census. Beneath the city, from 790 to 1,200 ft. deep, lie four vast salt beds (from 25 to 90 ft. thick) containing originally more than 400,000,000 tons. Limestone also is abundant. Chemical plants which convert the salt into soda ash, caustic soda, bicarbonate of soda, and other products, and make bleaching powders out of the limestone, are the city's principal manufacturing industries. Many of the passenger boats plying the Great Lakes were built in the Wyandotte shipyards. Wyandotte was settled in 1820, incorporated as a village in 1854, and as a city in 1866.

WYANDOTTE CAVE, a cave in Crawford county, southern Indiana, U.S.A., 38° 14′ N. lat. and 86° 18′ W. longitude. It is but one of the many caves of southern Indiana dissolved and eroded in the relatively pure, massive, horizontally bedded Mississippian limestones that extend southward into the cave-bearing regions of Kentucky and Tennessee. Like Mammoth cave of Kentucky, Wyandotte cave owes its early history to the demand for nitre for gunpowder in the War of 1812, the nitrate industry beginning in that year and terminating in 1817. The environs of the mouth of the cave afford a scene of sedate quiet, the narrow valley of the Blue river stretching across from the entrance to Greenbrier mountain, with its sharp conical crest and steep slopes, belted with massive cliffs of rock and set with tapering cedars. The entrance is about 200 ft. above Blue river. The cave has been as accurately mapped as cave conditions permit, but the aggregate length of its passages can only be estimated, for some have not been explored; the total probably exceeds 25 miles. The "old cave" constitutes that portion of the cave discovered before 1850. In that year the new cave was discovered, a long extension with many passages and chambers that add materially to the beauty and interest of the cave. The mouth of the old cave is 20 ft. wide and 6 ft. high. One hundred feet within the entrance the gallery widens into a spacious corridor known as Faneuil Hall, whence issues the Columbian Arch, a semi-cylindrical tunnel 75 ft. long, which in turn opens into Washington Avenue, a grand passageway, 275 ft. long, 30 ft. wide, and 40 ft. high. This passage terminates in a low gallery which expands into Banditti Hall, the common entry into both the old and new caves. The old cave ends in the Senate Chamber, an imposing rotunda like, but not quite so large as, Rothrock's cathedral with its magnificent Wallace's Grand Dome rising above Monument mountain, beyond Rothrock's Straits in the new cave.

The Senate Chamber, one of the most picturesque features of Wyandotte cave, is a vast elliptical amphitheatre, 145 ft. long and 56 ft. wide, converging upward to a gigantic dome. In the centre of the chamber a mass of fallen rock constitutes Capitol Hill, 32 ft. high, out of the centre of which rises the grandest spectacle of the cave—the massive, fluted column of satin-spar, or calcite, known as the "Pillar of the Constitution." Quite cylindrical, 25 ft. in diameter, this majestic column of spectral white calcite extends from the peak of Capitol Hill to the centre of the dome far above. Tiny streamlets of water trickle down its fluted sides, evaporating and leaving their burdens of calcium carbonate crystallized upon the ever-growing column. A relatively sparse cave fauna and a few evidences of Indian activity are found in the cave. The temperature of the cave is uniformly 53° F and the air is sweet and pure.

See list of 22 titles referring to Wyandotte and other Indiana caves given on pp. 210–212, of the 21st *Annual Report* of the Department of Geology and Natural Resources of Indiana (1896). (W. E. E.)

WYANT, ALEXANDER H. (1836–1892), American artist, was born at Port Washington (O.), on Jan. 11, 1836. He was a pupil of Hans Gude in Carlsruhe, Germany. A trip with a government exploring expedition in the west of America undermined his health and he painted mainly in the high altitudes of the Adirondack mountains. He was elected a full member of the National Academy of Design, New York, in 1869 and died in New York city on Nov. 29, 1892. His fame was deferred until after his death.

WYAT, SIR THOMAS (1503–1542), English poet and statesman, elder son of Henry Wyat, or Wiat, afterwards knighted, and his wife Anne, daughter of John Skinner of Reigate, Surrey, was born at Allington Castle, near Maidstone, Kent, in 1503. His father (1460–1537) belonged to a Yorkshire family, but bought Allington about 1493. He was an adherent of the Lancastrian party, and was imprisoned and put to the torture by Richard III. The family records (in the possession of the earl of Romney) relate that during his imprisonment he was saved from starvation by a cat that brought him pigeons. At the accession of Henry VII. he became knight of the Bath (1509), knight banneret (1513) and held various offices at court. His son, Thomas Wyat, was admitted at St. John's College, Cambridge, when about twelve years of age, took his B.A. degree in 1518, and proceeded M.A. in 1522. An early marriage with Elizabeth Brooke, daughter of Lord Cobham, proved unhappy, for a letter from the Spanish ambassador Chapuys to Charles V. (Feb. 9, 1542) speaks of her having been repudiated by her

husband. As early as 1516 Wyat was server extraordinary to the king, and in 1524 he was at court as keeper of the king's jewels. He was one of the champions in the Christmas tournament of 1525. His father had been associated with Sir Thomas Boleyn as constable of Norwich Castle, and he had thus been early acquainted with Anne Boleyn. He appears to have been generally regarded as her lover. He was employed on missions to Francis I. (1526), to the papal court (1527), and from Rome was sent to Venice. From 1528 to 1530 he was acting as high marshal at Calais.

During the foilowing years he was constantly employed in Henry's service, and was apparently high in his favour. He was, however, sent to the Tower in 1536, perhaps because it was desired that he should incriminate the queen. His father's correspondence with Cromwell does not suggest that his arrest had anything to do with the proceedings against Anne Boleyn, but the connection is assumed (Letters and Papers of Henry VIII. vol. x. No. 919) in the letters of John Hussey to Lord Lisle, deputy of Calais. Nicholas Harpsfield makes a circumstantial statement (Pretended Divorce . . . Camden Soc. p. 253) that Wyat had confessed his intimacy with Anne to Henry VIII. and warned him against marrying her; but this, in view of his continued favour, seems highly improbable. He was released after a month's imprisonment, and in the autumn of that year took part in the suppression of the Lincolnshire rising. In March 1537 he was knighted, and a month later was sent abroad as ambassador to Charles V. In 1538 he was joined by Edmund Bonner, then a simple priest, who wrote to Cromwell (2nd Sept. 1538) a long letter (Petyt MS. 47, Middle Temple; first printed in the Gentleman's Magazine, June 1850) in which he accused Wyat of disloyalty to the king's interests, and of many personal slights to himself. So long as Cromwell ruled no notice was taken of Bonner's allegations. He was recalled in April 1539, but later in the same year he was employed on another embassy to the emperor. After Cromwell's death Wyat's enemies renewed their attacks, and he was imprisoned (Jan. 17, 1541) in the Tower on the old charges, with the additional accusation of treasonable correspondence with Cardinal Reginald Pole. He was released at the intercession of the queen, Catherine Howard, on condition that he confessed his guilt and took back his wife, from whom he had been separated for fifteen years, on pain of death if he were thenceforth untrue to her (see Chapuys to Charles V., March 1541). He received a formal pardon on March 21, and received during the year substantial marks of the king's favour. In the summer of the next year he was sent to Falmouth to meet the ambassadors of the emperor. The heat brought on a fever to which he succumbed at Sherborne, Dorset, on Oct. 11. A Latin elegy on his death was written by his friend John Leland, "Naenia in mortem Thomae Viati equitis incomparabilis"; and Henry Howard, earl of Surrey, celebrated his memory in some well-known lines beginning "Wyat resteth here, that quick could never rest," and in two sonnets.

Wyat's work falls readily into two divisions: the sonnets, rondeaus, and lyric poems dealing with love; and the satires and the version of the penitential psalms. The love poems probably date from before his first imprisonment. A large number were published in 1557 in Songes and Sonettes (*Tottel's* Miscellany). Wyat's contributions number 96 out of a total of 310. These have been supplemented from mss. He was the pioneer of the sonnet in England. Wyat wrote in all thirty-one sonnets, ten of which are direct translations of Petrarch. The sentiment is strained and artificial. Wyat shows to greater advantage in his lyrical metres, in his epigrams and songs, especially in those written for music[1], where he is less hampered by the conventions of the Petrarchan tradition, to which his singularly robust and frank nature was ill-fitted. Wyat wrote three excellent satires—"On the mean and sure estate," dedicated to John Poins, "Of the Courtier's Life," to the same, and "How to use the court and himself." They are written in terza *rima* and in form and matter owe much to Luigi Alamanni. In the "Penitential Psalms" each is preceded by a prologue describing the circumstances under which the psalmist wrote, and the psalms themselves are very freely paraphrased, with much original matter from the author. They were published in 1549 by Thomas Raynald and John Harrington as Certayne *Psalmes . . . drawen* into *English meter* by Sir *Thomas* Wyat Knyght.

None of Wyat's other poems were printed until fifteen years after his death, in Songes and Sonettes. There are editions of his Works by G. F. Nott (1816); of the Songes and Sonnettes by E. Arber (1870); and of the Poems (2 vols.) by A. K. Foxwell (1913). See A. K. Foxwell, Study of Wyat's Poems (1911). See also Brewer and Gardiner, Letters and Papers of *Henry* VIII. (especially from 1534 to 1542).

[1] One of the most musical of the pieces printed in his works, however, "The Lover complayneth the unkindnes of his Love," beginning "My lute, awake," is sometimes attributed to George Boleyn, Lord Rochford (see E. Bapst, Deux Gentilshommes *poètes* de la *cour de Henri* VIII., p. 142).

WYAT, SIR THOMAS (THE YOUNGER) (d. 1554), English conspirator, son of the preceding, was over 21 in 1543, but the date of his birth is uncertain. He is said to have accompanied his father on his mission to Spain, and to have been turned into an enemy of the Spaniards by the menaces of the Inquisition. In 1542 he inherited the family property of Allington castle and Boxley abbey on the death of his father.

In 1554 he joined with the conspirators who combined to prevent the marriage of Queen Mary with Philip, the prince of Spain. On January 22, 1554, he summoned a meeting of his friends at his castle of Allington, and the 25th was fixed for the rising. On the 26th Wyat occupied Rochester, and issued a proclamation to the county. Lord Abergavenny and Sir Robert Southwell, the sheriff of Kent, were deserted by their men, who either disbanded or went over to Wyat. A detachment of the London train-bands sent against him by Queen Mary, under the command of the duke of Norfolk, followed their example. The rising now seemed so formidable that a deputation was sent to Wyat by the queen and council to ask his terms. He insisted that the Tower should be surrendered to him, and the queen put under his charge. The insolence of these demands caused a reaction in London, where the reformers were strong and were at first in sympathy with him. When he reached Southwark on Feb. 3, he found London Bridge occupied in force, and was unable to penetrate into the city. He was driven from Southwark by the threats of Sir John Brydges (or Bruges), afterwards Lord Chandos, who was prepared to fire on the suburb with the guns of the Tower. Wyat now marched up the river to Kingston, where he crossed the Thames, and made his way to Ludgate with a part of his following. Some of his men were cut off. Others lost heart and deserted. His only hope was that a rising would take place, but the loyal forces kept order, and after attempting to force the gate Wyat surrendered.

He was brought to trial on March 15, and could make no defence. Execution was delayed, in the hope that in order to save his life he would conipromise the queen's sister, the Princess Elizabeth. He was executed on April 11, and on the scaffold expressly cleared the princess of all complicity in the rising. His estates were afterwards partly restored to his son George, the father of the Sir Francis Wyat (d. 1644) who was governor of Virginia in 1621–26 and 1639–42.

See G. F. Nott, Works of Surrey and *of* Sir Thomas Wyat (1815); and Froude, History of England.

WYCHERLEY, WILLIAM (c. 1640–1716), English dramatist, was born about 1640 at Clive, near Shrewsbury, where for several generations his family had been settled on a moderate estate of about £600 a year. Like Vanbrugh, Wycherley spent his early years in France, whither, at the age of fifteen, he was sent to be educated in the very heart of the "precious" circle of Mme. de Montausier, on the banks of the Charente. This lady effected the first of his successive conversions from Protestantism to Catholicism. Later at Oxford, Bishop Barlow reclaimed him, and under James II. he returned to Catholicism once more. In fact, the deity he worshipped was the deity of the "polite world" of his time—gentility. Moreover, as a professional fine gentleman, at a period when, as the genial Major Pack says, "the amours of Britain would furnish as diverting memoirs, if well related, as those of France published by Rabutin, or those of Nero's court writ by Petronius," Wycherley was obliged to be a loose liver.

As a fellow-commoner of Queen's College, Oxford, Wycherley lived (according to Wood) in the provost's lodgings, being entered as "Philosophiae Studiosus" in July 1660. And he does not seem to have matriculated or to have taken a degree. He left Oxford and settled in the Inner Temple; but not, naturally, to engage seriously in the study of the law. Pleasure and the stage were alone open to him, and probably early in 1671 was produced, at the Theatre Royal, *Love* in a *Wood*. It was published the next year. With regard to this comedy Wycherley told Pope that he wrote it the year before he went to Oxford. But we need not believe him: the worst witness against a man is mostly himself. To pose as the wicked boy of genius has been the foolish ambition of many writers, but on inquiry it will generally be found that these inkhorn Lotharios are not nearly so wicked as they would have us believe. It is not so much that, as Macaulay insists, "the whole air and spirit of the piece belong to a period subsequent to that mentioned by Wycherley," but that "the whole air and spirit of the piece" belong to a man—an experienced and hardened young man of the world—and not to a boy who would fain pose as an experienced and hardened young man of the world. The real defence of Wycherley against his foolish impeachment of himself is this, that Love *in* a Wood, howsoever inferior in structure and in all the artistic economies to *The* Country Wife and The Plain Dealer, contains scenes which, not for moral hardness merely, but often for real dramatic ripeness, are almost the strongest to be found amongst his four plays. The play was dedicated to Charles II.'s mistress, the duchess of Cleveland, whose favours Wycherley forthwith enjoyed. His fortune as a dramatist was made. Voltaire (in his Letters on the *English* Nation) has a picturesque description of the duchess's visits to Wycherley's chambers in the Temple.

Whether Wycherley's experiences as a naval officer, which he alludes to in his lines "On a Sea Fight which the Author was in betwixt the English and the Dutch," occurred before or after the production of Love in a *Wood* is a point upon which opinions differ, but on the whole we are inclined to agree with Macaulay, against Leigh Hunt, that these experiences took place not only after the production of Love in a *Wood* but after the production of The *Gentleman* Dancing *Master,* in 1673. We also think, with Macaulay, that he went to sea simply because it was the "polite" thing to do so—simply because, as he says in the epilogue to The Gentleman Dancing Master "all gentlemen must pack to sea."

This second comedy was published in 1673, but was probably acted late in 1671. It is inferior to Love in a Wood. In The Relapse the artistic mistake of blending comedy and farce damages a splendid play, but leaves it a splendid play still. In The *Gentleman* Dancing Master this mingling of discordant elements destroys a play that would never in any circumstances have been strong—a play nevertheless which abounds in animal spirits, and is luminous here and there with true dramatic points.

It is, however, on his two last comedies—The Country Wife and *The* Plain Dealer—that must rest Wycherley's fame as a master of that comedy of repartee which, inaugurated by Etheredge, and afterwards brought to perfection by Congreve and Vanbrugh, supplanted the humoristic comedy of the Elizabethans. The Country *Wife,* produced in 1672 or 1673 and published in 1675, is so full of wit, ingenuity, animal spirits and conventional humour that, had it not been for its motive, it would probably have survived as long as the acted drama remained a literary form in England. So strong, indeed, is the hand that could draw such a character as Marjory Pinchwife (the undoubted original not only of Congreve's Miss Prue but of Vanbrugh's Hoyden), such a character as Sparkish (the undoubted original of Congreve's Tattle), such a character as Horner (the undoubted original of all those cool impudent rakes with whom our stage has since been familiar), that Wycherley is certainly entitled to a place alongside Congreve and Vanbrugh.

Scarcely inferior to The Country Wife is The *Plain* Dealer, produced probably early in 1674 and published three years later,—a play of which Voltaire said, "Je ne connais point de comédie chez les anciens ni chez les moderns où il y ait autant d'esprit." This comedy had an immense influence, as regards manipulation of dialogue, upon all subsequent English comedies of repartee, and he who wants to trace the ancestry of Tony Lumpkin and Mrs. Hardcastle has only to turn to Jerry Blackacre and his mother, while Manly (for whom Wycherley's early patron, the duke of Montausier, sat), though he is perhaps overdone, has dominated this kind of stage character ever since.

It was after the success of The Plain *Dealer* that the turning-point came in Wycherley's career. The great dream of all the men about town in Charles's time, as Wycherley's plays all show, was to marry a widow, young and handsome, a peer's daughter if possible—but in any event rich, and spend her money upon wine and women. While talking to a friend in a bookseller's shop at Tunbridge, Wycherley heard The Plain Dealer asked for by a lady who, in the person of the countess of Drogheda, answered all the requirements. An introduction ensued, then love-making, then marriage—a secret marriage, probably in 1680, for, fearing to lose the king's patronage and the income therefrom, Wycherley still thought it politic to pass as a bachelor. But the news reached the royal ear, and Wycherley lost the royal favour for ever. He never had an opportunity of regaining it, for the countess seems to have really loved him, and Love in a Wood had proclaimed the writer to be the kind of husband whose virtue prospers best when closely guarded at the domestic hearth. Wherever he went the countess followed him, and when she did allow him to meet his boon companions it was in a tavern in Bow Street opposite to his own house, and even there under certain protective conditions. In summer or in winter he was obliged to sit with the window open and the blinds up, so that his wife might see that the party included no member of a sex for which her husband's plays had advertised his partiality. She died, however, in the year after her marriage and left him the whole of her fortune. But the title to the property was disputed; the costs of the litigation were heavy—so heavy that his father was unable (or else he was unwilling) to come to his aid; and the result of his marrying the rich, beautiful and titled widow was that the poet was thrown into the Fleet prison. There he remained for seven years, being finally released by the liberality of James II.—a liberality which, incredible as it seems, is too well authenticated to be challenged. James had been so much gratified by seeing The Plain Dealer acted that, finding a parallel between Manly's "manliness" and his own, such as no spectator had before discovered, he paid off Wycherley's execution creditor and settled on him a pension of £200 a year. Other debts still troubled Wycherley, however, and he never was released from his embarrassments, not even after succeeding to a life estate in the family property. In coming to Wycherley's death, we come to the worst allegation that has ever been made against him as a man and as a gentleman. At the age of seventy-five he married a young girl, and is said to have done so in order to spite his nephew, the next in succession.

Wycherley wrote verses, and, when quite an old man, prepared them for the press by the aid of Alexander Pope, then not much more than a boy. But, notwithstanding all Pope's tinkering, they remain contemptible. Pope's published correspondence with the dramatist was probably edited by him with a view to giving an impression of his own precocity. The friendship between the two cooled, according to Pope's account, because Wycherley took offence at the numerous corrections on his verses. It seems more likely that Wycherley discovered that Pope, while still professing friendship and admiration, satirized his friend in the Essay on Criticism. Wycherley died on Jan. 1, 1716, and was buried in the vault of the church in Covent Garden.

Wycherley's complete works were edited by M. Summers in 4 vols. (Nonesuch Press, 1924). *See* C. Perromat, *William* Wycherley, sa vie, son oeuvre (1921). (T. W.-D.; X.)

WYCLIFFE (or WYCLIF), **JOHN** (c. 1320–1384), English reformer, was born, according to John Leland, at Ipreswel (evidently Hipswell), in Yorkshire[1]. The Wycliffes were connected

[1]The form of spelling of the name Wycliffe adopted in this article is that of the village Wycliffe-on-Tees, from which Leland says that he "drew his origin" (*Collectanea* ii. 329); it is also preferred by the editors of the Wycliffe Bible, by Milman and by Stubbs. "Wyclif" has the support of Shirley, of T. Arnold and of the Wyclif Society; while "Wiclif" is the popular form in Germany.

with Balliol College, Oxford, which had been founded by their neighbours, the Balliols of Barnard Castle; John Wycliffe went there, and some time after 1356 was elected master. Confusion with contemporaries makes it not easy to trace his Oxford life; it has been said that he was a fellow of Merton College in 1356. In 1361 he accepted the living of Fillingham in Lincolnshire. In the same year a "John de Wyclif of the diocese of York, M.A." was a suppliant to the Roman Curia for a provision to a prebend, canonry and dignity at York (Cal. of *Entries* in the *Papal* Registries, ed. Bliss, Petitions, i. 390). This was not granted, but Wycliffe received instead the prebend of Aust in the collegiate church of Westbury-on-Trym. In 1365 one "John de Wyclif" was appointed by Simon Islip, archbishop of Canterbury, to the wardenship of Canterbury Hall, which the archbishop founded for a mixed body of monks and secular clergy, and then filled exclusively with the latter. In 1367, his successor, Simon Langham, replaced the intruded seculars by monks. The displaced warden and fellows appealed to Rome, and in 1371 judgment was given against them. The question of the identity of the warden of Canterbury Hall with the reformer is still a matter of dispute. It may have been referred to by Wycliffe himself (De *ecclesia*, cap. xvi. pp. 370 sq.), and was assumed by the contemporary monk of St. Albans (Chron. *Angl.* "Rolls" ser. p. 115) and by Wycliffe's opponent William Woodford (*Fasc. Zizan.* p. 517), who found in Wycliffe's resentment at this treatment the motive for his attacks on the religious orders; it has likewise been assumed by a series of modern scholars, including Loserth (*Realencyklopädie*, 1908 ed., vol. xxi. p. 228, § 35), who only denies the deductions that Woodford drew from it. Dr. Rashdall, following Shirley, brings evidence to show that the Wycliffe of Canterbury Hall was the same person as the fellow of Merton, this being the strongest argument against the identification of the latter with the reformer.

Long before Wycliffe had become a power outside Oxford his fame was established in the university. He was acknowledged supreme in the philosophical disputations of the schools, and his lectures were crowded, but it was not until he was drawn into the arena of the politico-ecclesiastical conflicts of the day that Wycliffe became of world-importance. It has been assumed that this happened first in 1366, and that Wycliffe published his Determinatio *quaedam* de dominio supporting parliament in refusing the tribute demanded by Pope Urban V.; but Loserth has shown that this work must be assigned to a date some eight years later. Wycliffe, in fact, for some years to come had the reputation of a good "curialist." Had it been otherwise, the pope would scarcely have granted him (January 1373) a license to keep his Westbury prebend even after he should have obtained one at Lincoln (Cal. *Papal* Letters, ed. Bliss and Twemlow, iv. 193). Moreover, it is uniformly asserted that Wycliffe fell into heresy after his admission to the degree of doctor (*Fasc. Ziz.* p. 2), and the papal document above quoted shows that he had only just become a doctor of theology, that is in 1372.

But Wycliffe's tendencies may already have called attention to him in high places as a possibly useful instrument for the anti-papal policy of John of Gaunt and his party. On the 7th of April 1374, he was presented by the crown to the rectory of Lutterworth in Leicestershire, which he held until his death; and on the 26th of July he was nominated one of the royal envoys to Bruges to confer with the papal representatives on the long vexed question of "provisions" (*q.v.*). He may have been attached to this mission as theologian—a proof that he was not yet considered a persona *ingrata* at the Curia. His name stands second, next after that of the bishop of Bangor, and he was paid at the princely rate of twenty shillings a day. The commission was appointed because of repeated complaints from the Commons; but the king was interested in keeping up the papal system of provisions and reservations, and the negotiations were practically fruitless.

After his return Wycliffe lived chiefly at Lutterworth and Oxford, making prolonged visits to London, where his fame as a popular preacher was established. It is from this period that dates the development of his systematic attack on the established order in the church. It was not at first the dogmatic, but the political elements in the papal system that provoked his censure. The negotiations at Bruges had strengthened his sympathy with the anti-curial tendencies in English politics from Edward I.'s time onwards, and a final impulse was given by the attitude of the "Good Parliament" in 1376; in the autumn of that year he was reading his treatise on civil lordship (De *civili* dominio) to his students at Oxford. Of its propositions some, according to Loserth, were taken bodily from the 140 titles of the bill dealing with ecclesiastical abuses introduced in the parliament; but it may perhaps be that Wycliffe inspired the bill rather than the bill Wycliffe. For the first time he now publicly proclaimed the doctrine that righteousness is the sole indefeasible title to dominion and to property, that an unrighteous clergy has no such title, and that the decision as to whether or no the property of ecclesiastics should be taken away rests with the civil power.

If the position at which Wycliffe had now arrived was originally inspired, as Loserth asserts, by his sympathy with the legislation of Edward I., *i.e.*, by political rather than theological considerations, the necessity for giving to it a philosophical and religious basis led him to criticism of the doctrinal standpoint of the church. As a philosopher Wycliffe was no more than the last of the conspicuous Oxford scholastics, and his philosophy is important in so far as it determined his doctrine of *dominium*, and the direction in which his political and religious views were to develop. In the controversy between Realism and Nominalism he was on the side of the former, though his doctrine of universals showed the influence of Ockham and the nominalists. To Wycliffe the doctrine of arbitrary divine decrees was anathema. The will of God is his essential and eternal nature, by which all his acts are determined; God created all things in their primordial causes, as genera and species, or else in their material essences, *secundum rationes* absconditas *seminales* (ibid. p. 66). The world is therefore not merely one among an infinity of alternatives, but is the only possible world; it is, moreover, not in the nature of an eternal emanation from God, but was created at a given moment of time—to think otherwise would be to admit its absolute necessity, which would destroy free-will and merit. Since, however, all things came into being in this way, it follows that the creature can produce nothing save what God has already created. This leads to predestination and free-will. Wycliffe takes a middle position. God does not will sin, for He only wills that which has being, and sin is the negation of being; He necessitates men to perform actions which only become right or wrong through man's free agency. All human lordship is derived from the supreme overlordship of God and is inseparable from it, since whatever God gives is part of himself. But, in giving, God does not part with the lordship of the thing given; whatever lordship the creature may possess is held subject to due service to the supreme overlord. Thus, as in feudalism, lordship is distinguished from possession. Property is the result of sin; Christ and his apostles had none. The service by which lordship is held of God is righteousness and its works; it follows that the unrighteous forfeit their right to exercise it, and may be deprived of their possessions by competent authority.

The question follows as to what this authority is, and this Wycliffe sets out to answer in the *Determinatio* quaedam de dominio and the De *civili* dominio. Briefly, his argument is that the church has no concern with temporal matters at all, that for the clergy to hold property is sinful, and that it is lawful for statesmen (*politici*)—who are God's stewards in temporals—to take away the goods of such of the clergy as no longer render the service by which they hold them. That the church was actually in a condition to deserve spoliation he refused to affirm; but his theories fitted in too well with the notorious aims of the duke of Lancaster not to rouse the bitter hostility of the endowed clergy.

Hitherto Wycliffe had made no open attack on the doctrinal system of the church. Early in 1377, however, Archbishop Sudbury summoned him to appear before the bishop of London, and on Feb. 19 Wycliffe made his appearance at St. Paul's, accompanied by the duke of Lancaster, by Lord Percy, marshal of England, and by four doctors of the four mendicant orders. Before Wycliffe could open his mouth, the court was broken up by a rude brawl between his protectors and Bishop Courtenay,

the affair developing into a general riot.

Wycliffe had escaped for the time, but probably before this his enemies had set their case before the pope; and on the zznd of May five bulls were issued by Gregory XI., condemning eighteen of Wycliffe's "conclusions." All the articles but one are taken from his *De civili dominio*. The bulls truly stated Wycliffe's intellectual lineage; he was following in the error of Marsilius of Padua; and the articles laid against him are concerned entirely with questions as to how far ecclesiastical censures could lawfully affect a man's civil position, and whether the church had a right to hold temporal endowments. The bulls were addressed to the archbishop of Canterbury and the bishop of London, the university of Oxford, and the king. The university was to send Wycliffe to the prelates, who were to examine the truth of the charges and to report to the pope, Wycliffe being meanwhile kept in confinement. The execution of the papal bulls was impeded by three separate causes—the king's death on the 21st of June; the tardy action of the bishops, who enjoined the university to make a report: and the unwillingness of the university to admit the pope's right to order the imprisonment of any man in England. The convocation of the university merely directed Wycliffe to keep within his lodgings at Black Hall for a time.

As soon as parliament met in the autumn of 1377, Wycliffe was consulted by it as to the lawfulness of prohibiting that treasure should pass out of the country in obedience to the pope's demand. Wycliffe's affirmative judgment is contained in a state paper still extant; and its tone is plain proof that his views on the main question of church and state had the support of the nation. He had laid before this same parliament his answer to the pope's bulls, with a defence of the soundness of his opinions. His university, moreover, confirmed his argument; his tenets, it said, were orthodox though their expression might admit of a wrong interpretation. Early in 1378 Wycliffe appeared at Lambeth Palace to clear himself before the prelates who had summoned him. A more cautiously worded defence was laid before the council; but its session was rudely interrupted, not only by a crowd of citizens, but also by a messenger from the princess of Wales enjoining them not to pass judgment against Wycliffe; and thus a second time he escaped. Meanwhile his "protestatio" was sent on to Rome, but before any further step could be taken Gregory XI. died.

In the autumn of this year Wycliffe was once more called upon to prove his loyalty to John of Gaunt, who had violated the sanctuary of Westminster by sending armed men to seize two squires who had taken refuge there. One of them was murdered, together with a servant of the church. The bishop of London excommunicated all concerned in the crime (except only the king, his mother and his uncle), and preached against the culprits at Paul's Cross. At the parliament held at Gloucester in October, in the presence of the legates of Pope Urban VI., Wycliffe read an apology for the duke's action, pleading that the men were killed in resisting legal arrest. The paper, which forms part of the *De ecclesia*, maintains the right of the civil power to invade the sanctuary to bring escaped prisoners to justice.

The schism in the papacy, owing to the election of Clement VII. in opposition to Urban VI., accentuated Wycliffe's hostility to the Holy See and its claims. He did not object to a visible head of the church so long as this head possessed the essential qualification of righteousness. It was later that Wycliffe definitely branded the pope, *qua* pope, as Antichrist. (*See* vol. ii. of the *Sermones*. Book iii. of his *Opus evangelicum* is entitled *De Antichristo*.) Wycliffe's criticism of the established order and of the accepted doctrines he now determined to carry into the streets. For this purpose he instituted "simple" priests to preach his doctrines throughout the country; and, secondly, he translated the Vulgate into English, with the aid of his friends Nicholas Hereford and John Purvey. (*See* BIBLE, ENGLISH.) This version of the Bible, and still more his numerous sermons and tracts, established Wycliffe's position as the founder of English prose writing.

Wycliffe had been on good terms with the friars, whose ideal of poverty appealed to him but he had come to recognize that all organized societies within the church were liable to the same corruption, while he objected fundamentally to a special standard of morality for the "religious." His itinerant preachers were meant to supplement the services of the church by religious instruction in the vernacular, and among them were men who held or had held respectable positions at Oxford. The common people were rejoiced by their plain and homely doctrine which dwelt chiefly on the simple "law" of the gospel, while they no doubt relished the denunciation of existing evils in the church. The feeling of disaffection against the rich and careless clergy, monks and friars was widespread but undefined. Wycliffe turned it into a definite channel.

In addition, Wycliffe was appealing to the world of learning in a series of Latin treatises, which followed each other in rapid succession, and collectively form his *summa theologiae*. J. Loserth, in his paper "Die Genesis von Wiclifs Summa Theologiae" (*Sitzungsber. der k. Akad. der Wissensch.*, Vienna, 1908, vol. 156) gives proofs that the *Summa* was written to provide weapons in the controversies of the time. During the years 1378 and 1379 Wycliffe produced his works on the truth of Holy Scripture, on the church, on the office of king, on the papal power. The *De officio regis* is practically a declaration of war against the papal monarchy, an anticipation of the theocratic conception of national kingship as established later by the Reformation. (See *De officio regis* ed. *A. W.* Pollard and Charles Sayle, from Vienna mss. 4514, 3933, Wyclif Soc. 1887—cap. vi. p. 119.) Wycliffe now passed from an assailant of the papal to an assailant of the sacerdotal power. In 1379 or 1380 Wycliffe began a formal public attack on what he calls the "new" doctrine in a set of theses on the Eucharist propounded at Oxford. (1381 is the date given in Shirley's edition of the *Fasciculi Zizaniorum*. F. D. Matthew, in the *Eng. Hist. Rev.* for April 1890, v. 328, proves that the date must have been 1379 or 1380.) There followed sermons, tracts, and, in 1381, his great treatise *De eucharistia*. Finally, at the close of his life, he summed up his doctrine in the *Trialogus*.

The language in which he denounced transubstantiation anticipated that of the Protestant reformers; it is a "blasphemous folly," philosophically it is nonsense, since it presupposes the possibility of an accident existing without its substance; it overthrows the very nature of a sacrament. Yet the consecrated bread and wine are the body and blood of Christ, for Christ himself says so (*Fasc. Zizan.* p. 11*j*); we do not, however, corporeally touch and break the Lord's body. which is present only *sacramentaliter, spiritualiter et virtualiter*—*as* the soul is present in the body. The real presence is not denied; what Wycliffe "dares not affirm" is that the bread is after consecration "essentially, substantially, corporeally and identically" the body of Christ. His doctrine approximates to the Lutheran doctrine of consubstantiation, as distinguished from the Zwinglian teaching accepted in the xxviii. Article of Religion of the Church of England.

The theologians of the university were at once aroused. The chancellor, William Barton, sat with twelve doctors (six of whom were friars), and solemnly condemned the theses. Wycliffe appealed, not to the pope, but to the king. But the lay magnates, who were perfectly ready to help the church to attain to the ideal of apostolic poverty, shrank from the responsibility of supporting obscure propositions, which involved undoubted heresy and the pains of hell. John of Gaunt hastily sent a messenger enjoining the reformer to keep silence. The rift thus created between Wycliffe and his patrons in high places was widened by the Peasants' Revolt of 1381, the result of which was to draw the conservative elements in church and state together.

With the Peasants' Revolt it has been supposed that Wycliffe had something to do. One of its leaders, John Ball, when condemned, confessed that he learned his subversive doctrines from Wycliffe. We have, however, not only the repeated testimony of Rnyghton that he was a "precursor" of Wycliffe, but also documentary evidence that he was excommunicated in 1366, long before Wycliffe exposed himseif to ecclesiastical censure. Wycliffe's communistic views are theoretical and confined to his Latin scholastic writings. They could not reach the people directly. Possibly his followers translated them in their popular discourses, and thus fed the flame that burst forth in the rebellion.

In the spring after the Revolt his old enemy, William Courtenay, who had succeeded the murdered archbishop Sudbury as archbishop of Canterbury, resolved to stamp out Wycliffe's crowning heresy. He called a court of bishops, theologians and canonists at the Blackfriars' convent. This proceeding was met by a manifestation of university feeling on Wycliffe's side. The chancellor, Robert Rygge, though he had joined in the condemnation of the theses, stood by him, as did also both the proctors. The Council decided that out of 24 articles extracted from Wycliffe's works, ten were heretical and fourteen erroneous. The reply of the chancellor was to deny the archbishop's jurisdiction within the university, and to allow Philip Repington, disciple of Wycliffe, to preach before the university. The chancellor and proctors were now summoned to appear before the Blackfriars' court on the 12th of June. Though they were, with the majority of regent masters at Oxford, on the side of Wycliffe, the main question was for them one of philosophy rather than faith, and they made formal submission to the authority of the Church.

Wycliffe himself remained at large and unmolested. That his strength among the laity was undiminished is shown by the fact that an ordinance passed by the House of Lords alone, in May 1382, against the itinerant preachers was annulled on the petition of the Commons in the following autumn. The reformer, however, was growing old and now occupied himself in writing numerous tracts and two of his most important works. The *Trialogus* is a summing up of his arguments and conclusions on philosophy and doctrine. It was the most influential of all Wycliffe's works, and was the first to be printed (1525). All the only four known complete mss. of the work, preserved in the Imperial Library at Vienna, are of Hussite origin. The note of both the *Trialogus* and of the unfinished *Opus evangelicum*, Wycliffe's last work, is their insistence on the "sufficiency of Holy Scripture."

In 1382, or early in 1383, Wycliffe was seized with a paralytic stroke. On the 28th of December 1384, he had a final stroke, from the effects of which he died on the New Year's eve. He was buried at Lutterworth; but by a decree of the council of Constance, May 4, 1415, his remains were ordered to be dug up and burned, an order which was carried out, at the command of Pope Martin V., by Bishop Fleming in 1428.

A sober study of Wycliffe's life and works justifies a conviction of his complete sincerity and earnest striving after what he believed to be right. When he conceives the Church as consisting exclusively of the righteous, he may seem to have gone the whole length of the most radical reformers of the 16th century. And yet, powerful as was his influence in England, his doctrines in his own country were doomed to become ior a century and a half the creed only of obscure sectaries. (*See* LOLLARDS.) It was otherwise in Bohemia, whither his works had been carried by the scholars who came to England in the train of Richard II.'s queen, Anne of Bohemia. Here his writings were eagerly read and multiplied, and here his disciple, John Huss (*q.v.*) raised Wyclitie's doctrine to the dignity of a national religion. Extracts from the *De ecclesia* and the *De potestate Papae* of the English reformer made up the greater part of the *De ecclesia* of Huss, *a* work for centuries ascribed solely to the Bohemian divine, and for which he was condemned and burnt. It was Wycliffe's *De sufficientia legis Christi* that Huss carried with him to convert the council of Constance; of the fiery discourses now included in the published edition of Wycliffe's *Sermones* many were likewise long attributed to Huss. Finally, it was from the *De eucharistia* that the Taborites derived their doctrine of the Lord's Supper, with the exception of the granting of the chalice to the laity. To Huss, Luther and other continental reformers owed much, and thus the spirit of the English reformer had its influence on the reformed churches of Europe.

BIBLIOGRAPHY.—The documentary materials for Wycliffe's biography are to be found in John Lewis's *Life and Sufferingsof J. Wiclif* (new ed., Oxford, 1820), which contains a valuable appendix; Foxe's *Acts and Monuments*, vol. iii., ed. 1855, with app.; Forshall and Madden's preface to the Wycliffe Bible, p. vii. note, Oxford, 1851; W. W. Shirley's edition of the *Fasciculi Zizaniorum*, a collection of contemporary documents (1858); and H. T. Riley's notices in the appendices to thr *Second* and *Fourth Reports* of the Historical Manuscripts Commission. The narrative of a monk of St. Albans published under the title of *Chronicon Angliae*, by Sir E. Maunde Thompson (1874), and in a modified version in Walsingham's *Historia Anglicana* (ed. H. T. Riley, 1863, 1864). Knyghton's chronology in *De eventibus Angliae* is faulty (ed. J. R. Lumby, 1889–95). There are valuable notices in the *Eulogium historiarum* (vol. iii., ed. F. S. Haydon, 1863), in the *Chronicle* of Adam of Usk (ed. E. M. Thompson, 1876), and in the continuations of Higden. The controversial works of Wodeford and Walden are important, but must be used with caution.

Of modern biographies that by *G.* V. Lechler (*Johann von Wiclif und die Vorgeschichte der Reformation*, 2 vols., Leipzig, 1873; partial Eng. trans., by P. Lorimer, 1878, 1881 and 1884) is by far the most comprehensive. Shirley's introduction to the *Fasciculi Zizaniorum*, and F. D. Matthew's to his edition of *English Works of Wyclif hitherto unprinted* (1880), as well as Creighton's *History of the Papacy*, vol. i., 1882, and Sir H. C. Maxwell Lyte's account in his *History of the University of Oxford* (1886), contain valuable criticism. *See* also Mr. R. L. Poole, *(Illustrations of the History of Mediaeval Thought*, 1884); J. Loserth (*Hus und Wiclif*, Prague, 1884; also Eng. trans.). G. M. Trevelyan, *England in the Age of Wycliffe* (London, 1899); Oman, *History of England 1377–1485* (London, 1906); W. W. Capes, "History of the English Church in the 14th and 15th Centuries," in *Hist. of the Eng. Church*, ed. Stephen and Hunt (London, 1900); J. Loserth's article "Wiclif," in Herzog-Hauck, *Realencyklopädie* (3rd ed., 1908), xxi., pp. 225–227; H. B. Workman, *John Wyclif* (1926).

Wycliffe's works are enumerated in a *Catalogue* by Shirley (Oxford, 1865). Of his Latin works only two had been published previous to 1880, the *De officio pastorali*, ed. G. V. Lechler (Leipzig, 1863) and the *Trialogus*, ed. Lechler (Oxford, 1869). Under the auspices of the Wyclif Society the following have been published.—Polemical *Tracts*, ed. R. Buddensieg (2 vols., 1883); *De civili dominio*, vol. i. ed. R. L. Poole, vols. ii.–iv., ed. J. Loserth (1885–1905); *De composicione hominis*, ed. R. Beer (1884); *De Ecclesia*, ed. Loserth (1886); *Dialogus sive speculum ecclesiae militantis*, ed. A. W. Pollard (1886); *Sermones*, ed. Loserth, vols. i.–iv. (1887–90); *De officio regis*, ed. A. W. Pollard and C. Sayle (1887); *De apostasia*, ed. *M.* Dziewiclri (1889); De *dominio divino*, ed *R.* L. Poole (1890); *Quaestiones. De ente praedicamentali*, ed. R. Beer (1891); *De eucharistia tractatus major*, ed. Loserth (1893); *De blasphemia*, ed. Dziewicki (1894); *Logica* (3 vols., ed. Dziewicki, 1895–99); *Opus evangelicum*, ed. Loserth (4 vols., 1898), parts iii. and iv. also bear the title *De Antichristo; De Simonia*, ed. Herzberg-Frankel and Dziewicki (1898); *De veritatae sacrae scripturae*, ed. R. Buddensieg (3 vols., 1905); *Miscellanea philosophica*, ed. Dziewicki (2 vols., 1905) (vol. i. has an introduction on Wycliffe's philosophy); *De potestate papae*, ed. Loserth (1907).

For his works in English see *Select English Works*, ed. *T.* Arnold (3 vols., 1869–71), and *English Works hitherto unprinted*, ed. F. *D.* Matthew (1880). *The Wicket* (Nuremberg, 1546; reprinted at Oxford, 1828) is not included in either of these collections. (R. L. P.; X.)

WYCOMBE (commonly HIGH WYCOMBE, officially CHEPPING WYCOMBE), a municipal borough in Buckinghamshire, England, 26½ mi. N.W. of London by the G.W. railway, but also served by the L.N.E. railway. Pop. (1938) 33,940. Area 11 sq.mi. The town and district of High Wycombe is the centre of the cane- and rush-seated chair industry. Other furniture is also made, besides paper and postage stamps. Wycombe (Wicumbe, Chepyng) appears to have been settled from very early times. There is evidence of Bronze Age occupation, while in 1929 was unearthed a quantity of human bones and skulls thought to be analogous in type to that of the skull found at Engis, in the Meuse Valley, in 1833, suggesting that a similar race of long-headed men had existed in the Wycombe locality. There are various British remains, including an encampment, but the many traces of Roman settlement indicate that there was an important station here. In Domesday the manor only is mentioned, but the borough existed in the time of Henry II, though it was not chartered until 1558.

WYE, a river of England; famous for beautiful scenery. It rises on the eastern slope of Plynlimmon, close to the source of the Severn. Its length is 130 mi. Running at first S.E. it passes Rhayader and receives the Elan, in the basin of which are the Birmingham reservoirs. It then receives the Ithon (left) and after Hay reaches a level of 250 ft., 55 mi, from its source, 2,000 ft. high. As it enters Herefordshire it bends E. to reach Hereford. It soon receives the Lugg, which, augmented by the Arrow and the Frome, joins from the north. The course now becomes sinuous; and the valley narrows nearly to Chepstow. It passes Monmouth, where it receives the Monnow on the right, and finally Chepstow, 2 mi. above its junction with the Severn estuary. The river is navigable for small vessels for 15 mi. up from the mouth on high tides, The average spring tide is 38 ft. at Chepstow,

and the average neap tide is 28½ ft. The scenery is finest between Rhayader and Hay in the upper part, and from Goodrich, below Ross, to Chepstow in the lower, the second being the portion which gives the Wye its fame.

The name of Wye belongs also to two smaller English rivers—a tributary of the Derbyshire Derwent and a tributary of the Thames, watering a valley of the Chilterns.

WYMAN, JEFFRIES (1814–1874), American scientist, born in Chelmsford, Mass., Aug. 11, 1814. He graduated at Harvard in 1833, and in 1837 also received his medical degree there. He began medical practice in Boston and became a demonstrator of anatomy at Harvard, but in 1843 he went to Europe for a short period of study at London and Paris. Cpon his return he was for four years professor of anatomy and physiology at Hampton-Sidney College, Richmond, Va., and was then recalled to Harvard as Hersey professor in anatomy. He began the task of building a museum of comparative anatomy at Harvard, one of the first in the United States, and travelled widely in search of specimens, his trips ranging along the Atlantic coast from Labrador to Florida, and including expeditions to Europe, to Guiana, and, notably, up the La Plata, Uruguay and Parana rivers and across the pampas and Andes to Santiago, Chile. In 1866 he was made a trustee of the museum of archaeology and professor of archaeology and ethnology on the George Peabody foundation. His scientific papers embrace a wide range of studies, including human, comparative and microscopic anatomy, physiology, paleontology and ethnology. Especially notable were his papers on "Observations on the Crania" (Proc. of *Boston Soc.* of *Nat. Hist.,* 1868), on the nervous system of the bullfrog and the changes undergone during metamorphosis (*Smithsonian Institution Contributions,* 1852), the first account of the osteology of the gorilla (*Memoirs, Boston Soc.* of *Nat. Hist.,* 1847), and "Unusual Methods of Gestation in Certain Fishes" (*Silliman's Journal*). He died at Cambridge, Mass, Sept. 4, 1874.

There is a memoir and complete bibliography of his writings in the *Biographical Memoirs, Nat.* Acad. of Science, vol. 2 **(1886).** His colleague, Oliver Wendell Holmes, wrote a biographical sketch in the Atlantic Monthly (Nov. **1874).**

WYMONDHAM (pronounced *Windham*), urban district (1935) in Norfolk, England, 10 mi. S.W. of Normich by L.N.E.R. Pop. (1938) 5,121. Area 17.1 sq.mi. The church of St. Mary the Virgin, on the outskirts, was attached to a Benedictine priory, founded in the 12th century as a cell of St. Albans abbey by William de Albini. In 1448 this foundation became an abbey. The nave is Norman with a massive triforium, surmounted by a Perpendicular clerestory and a beautiful wooden roof. The north aisle is Perpendicular, and has a fine rood screen. At the west end there is a Perpendicular tower. In the centre of the town is a half-timbered market cross (1616), with an octagonal upper chamber.

WYNAAD, highland tract, south India, forming part of Malabar district, Madras. It consists of a table-land amid the west Ghats, 60 m. long by 30 m. broad, with an average elevation of 3,000 feet. A large amount of British capital was sunk during the decade 1876–86 in gold mines in the district. It had still earlier been a coffee-planting district, but more tea is now grown. Cardamoms are also produced in large quantities.

WYNDHAM, SIR CHARLES (1837–1919), English actor, was born in Liverpool on March 23, 1837, the son of a doctor. He was educated abroad, at King's college, London, and at the College of Surgeons and the Peter street anatomical school, Dublin. Early in 1862 he made a first appearance in London as an actor. In that year he went to America, volunteered during the Civil War and became brigade surgeon in the Federal army, resigning in 1864 to appear on the stage in New York with John Wilkes Booth. Returning to England, he played at Manchester and Dublin in various pieces. He reappeared in London in 1866 as Sir Arthur Lascelles in Morton's *All* that Glitters is not Gold, but his great success at that time was in F. C. Burnand's burlesque of Black-eyed Susan, as Hatchett, "with dance." This brought him to the St. James's theatre, where he played with Henry Irving in *Idalia*; then with Ellen Terry in Charles Reade's *Double Marriage,* and Tom Taylor's *Still Waters Run Deep.* He had a great success as Charles Surface, his best part for many years. In 1876 he took control of the Criterion theatre. Here he produced a long succession of plays, notably a number of old English comedies, and among modern plays, The Liars, The Case *of* Rebellious *Susan* and others by Henry Arthur Jones; his most famous part was in David *Garrick.* In 1899 he opened his new theatre, called Wyndham's. In 1902 he was knighted. From 1885 onwards his leading actress was Miss Mary Moore (Mrs. Albery), who became his partner in the proprietorship of the Criterion and Wyndham's theatres, and of his New theatre, opened in 1903; and her delightful acting in comedy made their long association memorable on the London stage. Wyndham died in London on Jan. 12, 1919.

WYNDHAM, GEORGE (1863–1913), British politician and man of letters, was born Aug. 29, 1863, the eldest son of Percy Scawen Wyndham, and grandson of the first Lord Leconfield. His mother was Madeline Caroline Frances Eden, daughter of Sir Guy Campbell, bart., and through her he was great-grandson of Lord Edward Fitzgerald, the Irish rebel. He was educated at Eton and Sandhurst, obtained a commission in the Coldstream Guards in 1883, and served through the Suakin campaign of 188;. He left the army in 1887, married Sibell Mary, daughter of the 9th Earl of Scarborough, widow of Earl Grosvenor. He became private secretary to A. J. Balfour, at the time Irish Secretary, and in 1889 entered Parliament as Conservative member for Dover, a seat which he retained till his death.

After serving, from 1898–1900, as financial secretary to the war office, he was appointed in 1900 chief secretary for Ireland. His early work in Ireland met with general approval He developed enormously the Conservative policy of land purchase; and the act which he carried in 1903 for that end was the most comprehensive measure of the kind ever submitted to Parliament. He hoped to arrange a form of local government which should sufficiently meet Nationalist demands, and with this in view appointed in 1902 an eminent Anglo-Indian, Sir Antony (afterwards Lord) MacDonnell to the under-secretaryship. The Unionist party, both in Ireland and in England, became suspicious of the tendencies of his administration, and he was driven in 1905 to resignation. He never held office again, but was active in support of tariff reform and woman suffrage; he was a keen critic of Haldane's army reforms, and threw himself vigorously into the "Diehard" campaign against the Parliament Bill in 1911.

He was also a man of letters. Here his genius was stimulated by his friendship for W. E. Henley, who dedicated a book to "George Wyndham, soldier, courtier, scholar." His principal published work was an edition of Shakespeare's *Poems* (1898); but he wrote also on North's *Plutarch* and *Ronsard.* The Admirable Crichton of his day, handsome and debonair, he was keen alike on field sports and the arts, a working railway director and an efficient colonel of yeomanry, the pet of society and the recipient of honorary distinctions from several universities. On June 8, 1913, at the comparatively early age of 50, he died in Paris.

See his Life and Letters, ed. J. W. Mackail and Guy Wyndham (2 vols., **1925).**

WYNDHAM, SIR WILLIAM, BART. (1687–1740), English politician, was the only son of Sir Edward Wyndham, Bart., and a grandson of William Wyndham (d. 1683) of Orchard Wyndham, Somerset, who was created a baronet in 1661. Educated at Eton and at Christ Church, Oxford, he entered parliament in 1710 and became secretary-at-war in the Tory ministry in 1712 and chancellor of the exchequer in 1713. He was closely associated with Lord Bolingbroke, and he was privy to the attempts made to bring about a Jacobite restoration on the death of Queen Anne; when these failed he was dismissed from office In 1715 the failure of a Jacobite movement led to his imprisonment, but he was soon set at liberty. Under George I. Wyndham was the leader of the opposition in the House of Commons, fighting for his High Church and Tory principles against Sir Robert Walpole. He was in constant communication with the exiled Bolingbroke, and after 1723 the two were actively associated in abortive plans for the overthrow of Walpole. He died at Wells on June 17, 1740. Wyndham's first wife was Catherine, daughter of Charles Seymour, 6th duke of Somerset. By her he had two sons, Charles,

who became 2nd earl of Egremont in 1750, and Percy, who took the name of O'Brien and was created earl of Thomond in 17j6.

The Wyndham Family.—Sir John Wyndharn, a Norfolk man, was knighted after the battle of Stoke in 1487 and beheaded for high treason on May 2, 1502. He married Margaret, daughter of John Howard, duke of Norfolk, and his son Sir Thomas Wyndham (d. 1521), of Felbrigg, Norfolk, was vice-admiral of England under Henry VIII. By his first wife Sir Thomas was the father of Sir John Wyndham, who married Elizabeth, daughter of John Sydenham of Orchard, Somerset, and founded the Somerset branch of the family, and also of Sir Edmund Wyndham of Felbrigg, who was sheriff of Norfolk at the time of Robert Ket's rebellion. By his second wife Sir Thomas was the father of the seaman Thomas Wyndham (c. 1510–53), an account of whose voyage to Morocco in 1552 is printed in Hakluyt's Voyages.

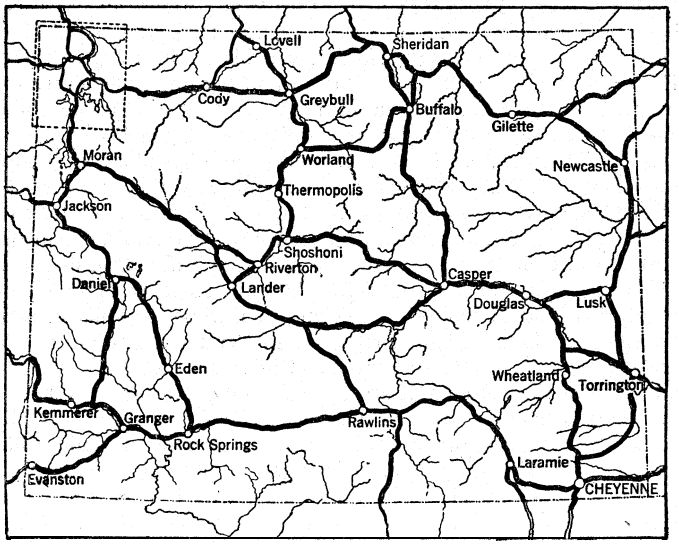
The Wyndhams are also connected through a female line with the family of Wyndham-Quin, which holds the earldom of Dunraven. Valentine Richard Quin (1752–1824), of Adare, county Limerick, was created Baron Adare on the union with England in 1800, and earl of Dunraven and Mount-Earl in 1822. His son, the 2nd earl (1782–1850), married Caroline (d. 1870), daughter and heiress of Thomas Wyndham of Dunraven castle, Glamorganshire, and took the name of Wyndham-Quin. Their son, the 3rd earl (1812–71), who was created a peer of the United Kingdom as Baron Kenry in 1866, was a well-known man of science, especially interested in archaeology and in Celtic antiquities. His son, Windham Thomas Wyndham-Quin (1841–1926), the 4th earl. served in the Abyssinian campaign and the South African War. He was under-secretary for the Colonies in 1885–87, and was a great figure in Irish politics, as chairman of the Irish Land conference (1902) and president of the Irish Reform Association; he was also prominent as a yachtsman, competing for the America's cup (see YACHTING) in 1893 and 1895. He died on June 14, 1926.

WYNTBUN, ANDREW OF (?1350–?1420), author of a long metrical history of Scotland, called the *Orygynale Cronykil* of Scotland, was a canon regular of St. Andrews, and prior of St. Serf's in Lochleven. He wrote the Chronicle at the request of his patron, Sir John of Wemyss, whose representative, Mr. Erskine Wemyss of Wemyss Castle, Fifeshire, possesses the oldest extant ms. of the work. The subject is the history of Scotland from the mythical period (hence the epithet "original") down to the accession of James I. in 1406. The earlier books are of no historical value, but the later have in all outstanding matters stood the test of comparison with contemporary records. The philological interest is great, for few works of this date, and no other of like magnitude, are extant in the vernacular.

The text is preserved in eight mss., of which three are in the British Museum, the Royal (17 D. xx.), the Cottonian (Nero D. xi.) and the Lansdowne (197); two in the Advocates' library, Edinburgh (19, 3, 3 and 19, 2, 4), one at Wemyss castle (*u.s.*); one in the university library at St Andrews, and one, formerly in the possession of the Boswells of Auchinleck, now the property of John Ferguson, Duns, Berwickshire. The first edition of the Chronicle (based on the Royal ms.) was published by David Macpherson in 1795; the second by David Laing, in the series of "Scottish Historians" (Edin., 1872). Both are superseded by the elaborate edition by Amours for the Scottish Text Society (1906).

WYOMING, popularly known as the "Equality" state because it was the pioneer in woman suffrage, is one of the central-western states of the United States of America, and is situated between 104° 3′ and 111° 3′ long. W. and 41° and 45° N. lat. It is bounded north by Montana, east by South Dakota and Nebraska, south by Colorado and Utah, and west by Utah, Idaho and Montana. Including Yellowstone park (area 3,114 sq.mi.), Wyoming has an area of 97,914 sq.mi., of which 408 sq.mi. are water surface. Over Yellowstone park, however, the United States has exclusive jurisdiction and control. East and west the state has an extreme length of 367 mi., and north and south an extreme breadth of 277 miles. In shape it is an exact rectangle. Its mean elevation is 6,700 ft. above sea level and in this respect it is exceeded only by Colorado The name "Wyoming," originally bestowed upon the Wyoming valley in Pennsylvania, is a corruption of a word of the Delaware Indians meaning "upon the great plain" It is not known who first applied it to the State.

Physical Features.—The great plains in Wyoming have an elevation of from 5,000 to 6,000 ft. over much of the State, and consist of flat or gently rolling country, barren of tree growth, but often covered with nutritious grasses, and possessing a soil rich in the mineral elements necessary for plant life which it produces abundantly when it receives sufficient moisture. Erosion buttes



MAP SHOWING THE MAIN ROADS IN WYOMING

and mesas occasionally risk as picturesque monuments above the general level of the plains, and in the vicinity of the mountains the plains strata, elsewhere nearly horizontal, are bent sharply upward and carved by erosion into "hogback" ridges. These features are well developed about the Big Horn mountains, an outlying range of the Rockies which boldly interrupts the continuity of the plains in north-central Wyoming.

Notwithstanding high elevations in both the northern and southern portions of the State, the low central portion makes a distinct break in the continuity of the northern and southern ranges of the Rockies, giving a broad relatively low pass through which went the Oregon and Overland trails in the early days and later the Union Pacific railway. In this central region the plains are interrupted by minor mountain groups, volcanic buttes and lava flows. In the north-east are outlying spurs of the Black hills, the Little Missouri buttes and the Devil's Tower, the latter a prominent erosion remnant of volcanic intrusion. The higher levels of the Big Horn range have been modified by local glaciation, giving glacial cirques, alpine peaks and many mountain lakes and waterfalls. Several small glaciers still remain about the shoulders of Cloud Peak (13,165 ft.), the highest summit in the range. The various ranges in the north-western part of the State form some of its most magnificent scenery. A vast portion of this has been set aside as Yellowstone National park, but areas in the Absarokas east of the park are also considered beautiful. Just south of the park, the Teton mountains rise abruptly from Jackson's Hole to elevations of 10,000 and 11,000 feet. They are an imposing landmark and were hailed by all emigrants of the Oregon Trail as a welcome sign that they were approaching Pacific waters. In the famous Wind River Range farther south-east are Gannett Peak (13,785 ft.), the highest point in the State, and Fremont Peak (13,720 ft.).

In addition to the hot springs of the Yellowstone region, mention should be made of large hot springs (about 135° F) at Thermopolis and Saratoga.

Drainage.—About two-thirds of the State is drained by branches of the Missouri river, the most important being the Yellowstone, Big Horn and Powder rivers flowing north and the Cheyenne and North Platte flowing east. The Green river, a branch of the Colorado drains the south-western part of the State. The Snake river, flowing into the Columbia, heads in the southern part of Yellowstone park and flows south-west through the beauti-

ful valley known as Jackson's Hole into Idaho. Along the western border the Bear river takes its course a short distance, draining ultimately into the Great basin. Southwest of the centre of the state is an area with no outward drainage, the streams emptying into desert lakes.

Wild Life.—Wyoming still abounds in wild life and game animals. The game population of the state in 1940 was officially estimated at 165,000 animals, including 35,000 elk, 60,000 mule deer, 35,000 antelope, 3,500 moose, 1,500 black bear, 450 grizzly bear and 2,400 bighorn sheep. The kill in 1940 according to the report of the state game and fish commission was: elk, 5,405; deer 5,564; antelope 3,267; mountain sheep 19; bear 51; and moose 44. About 27,583,000 fingerlings and fry were planted in 1939–40 in Wyoming waters.

Climate.—It is difficult to generalize about Wyoming's climate, since the varied and rugged topography makes corresponding local variations. Precipitation for the state averages 13.89 in. annually, but it varies from about 6 in. in the lower Big Horn basin, Sweetwater county and lower Wind river valley, the driest portions, to 35 in. in the mountains bordering on Yellowstone park. In the agricultural region of the southeastern counties the average annual rainfall is 15.20 in. East of the continental divide about 70% of the precipitation occurs between April and September. The cool summer months of the mountain regions lower the average temperature of the state materially. The annual mean for the valleys is 46° F. and for the mountains 36°. The average of 85 stations, well distributed over the state, gives a day average for July of 81° and a night average of 47°. Day temperature for January averages 32° and night 7°. The portion of the state west of the divide has a lower average and longer winters than that east of the divide. The cold spells are not severe for their chilling effect is modified by the normally low humidity.

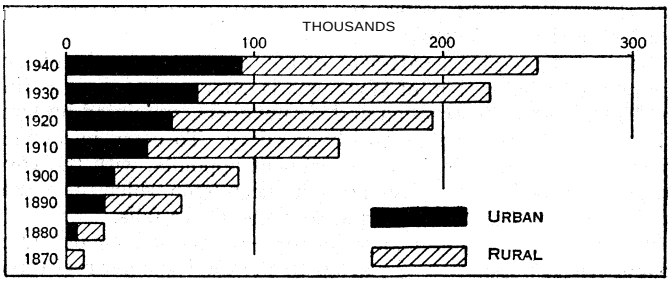
Government.— The legislature is composed of a senate and a house of representatives. Each county elects one senator for each 11,000 inhabitants or major portion thereof, and one representative for every 4,150 inhabitants or major portion thereof, though each county has a right to one senator and representative regardless of its population. New apportionments are made after each federal and state census, the state census occurring in every year that ends with a five. In 1941 there were 27 senators and 56 representatives. The regular sessions of the legislature meet in Cheyenne on the second Tuesday in January every odd-numbered year and may continue 40 days. The governor has the power to veto any bill, but if upon reconsideration it is repassed by a two-thirds majority in each house it becomes a law without the governor's signature. The governor may veto any item in the appropriations bill. Special laws are not to be passed where a general one may be made applicable.

The chief executive officer is the governor. There are only four other elective executive officers, the secretary of state, auditor, treasurer and superintendent of public instruction. These men not only direct their own departments but some, together with appointed officers, act on many executive boards, such as the state board of charities and reform, state land commission, state fiscal board, state board of pardons, state farm loan board, state board of supplies, state historical board, etc. An unusually large number of the executive officers are appointed by the governor and are responsible to him. Among them are a state examiner, a state engineer, two inspectors of coal mines, a state geologist, the attorney-general, four water superintendents for the four irrigation districts of the state, three live stock commissioners and three sheep commissioners, five members of the state highway commission, three members of the board of equalization, state land commissioner, five members of the state board of health, the members of the board of agriculture, the commissioner of law enforcement, and the commissioner of labour and statistics, etc.

The supreme court of Wyoming has three justices who are elected by the voters for a term of eight years. Two terms of supreme court are held annually, one in April and the other in October. A special term can be held when two justices so vote. There are seven district courts. A regular term is held yearly in each, and special terms may be called in any district by the presiding judge. Each of the seven district judges is elected by his district for a six-year terin. The counties are also divided by the county commissioner into judicial districts for which the voters of the district elect a justice of the peace. Incorporated towns and cities have municipal courts and police justices.

Every citizen of the United States over 21 years of age who has lived in Wyoming one year and in the county where he is to vote 60 days and in the election district ten days, who can read the constitution of the state, and who is not insane, an idiot or a person convicted of infamous crimes (unless restored to his civil rights) has the right of suffrage.

Population.— The population of Wyoming in 1870 was 9,118; in 1890 it was 62,555; in 1910, 145,965; and in 1940, 250,742. This last figure represents an increase of 11.2% over the population in 1930. The population per square mile, which was only 0.9 in 1900, had risen to 2.6 in 1940, as compared with 44.2 for the United States as a whole. Of the 1940 population, 93,577, or 37.3%, lived in urban places, that is, in cities and towns of 2,500



BY COURTESY OF THE U.S. BUREAU OF THE CENSUS

URBAN AND RURAL POPULATION OF WYOMING: 1870–1940

or more. The rural population, occupying the remainder of the state, thus constituted 62.7% of the total. The number of occupied dwelling units returned in the housing census of 1940 was 69,357, which is approximately the same as the number of families. The average population per family (occupied dwelling unit) declined from 4.0 in 1930 to 3.6 in 1940. The white population of Wyoming formed 98.4% of the total in 1940, as compared with 98.1% in 1930. The number of males per 100 females in the entire population of the state was 117.4, the sex ratio being 105.6 for the urban population and 125.1 for the rural population. The population of the state and of its principal cities is summarized for recent censuses in the following table:

Area	Population			Percent of increase	
	1940	1930	1920	1930–40	1920–30
The State	250,742	225,565	194,402	11.2	16.0
Urban	93,577	70,097	57,095	33.5	22.8
Rural	157,165	155,468	137,307	1.1	13.2
Percent urban	37.3	31.1	29.5	..	..
Principal cities:					
Cheyenne	22,474	17,361	13,829	29.5	25.5
Casper	17,964	16,619	11,447	8.1	45.2
Laramie	10,627	8,609	6,301	23.4	36.6
Sheridan	10,529	8,536	9,175	23.3	−7.0

Finance.— The assessed valuation of taxable property in Wyoming in 1926 was $457,760,169, in 1935 $300,022,218, and in 1940 $330,022,618. The figure for 1935 was the lowest taxable valuation of the state since the year 1919. There are 478 units of government in Wyoming that levy general property taxes, the state, 23 counties, 79 cities and towns and 375 school districts. In addition, there are drainage and irrigation districts that levy special assessments. For state purposes, property taxes are limited to 4 mills on the dollar of assessed valuation (generally 60% of true valuation), except for support of state educational and charitable institutions and payment of state debt. In 1935 a 2% excise tax was initiated on retail sales of all tangible personal property including services by carriers, telephone and telegraph, public utilities, municipal and private, and places of amusement. This sales tax became a principal source of state revenue. Another important source of revenue has been the wholesaling of liquor. For the two years ending Sept. 30, 1940, sales and use taxes returned $3,464,306.96; the Wyoming liquor com-

mission (liquor wholesaling) revenues were $1,196,700.83; state property taxes returned $1,154,732.17; insurance taxes returned $360,557.41 (from a levy of 2½% on the premiums received by insurance companies); inheritance taxes returned $66,870.53 (basic 2% tax with exemption of $10,000); and automobile taxes returned $55,434.05. The property tax levy declined from $1,269,176 in 1934 to $617,000 in 1936, and to $495,852.75 in 1940 as the levy was changed from 4·13 mills to 2 mills to 1·5 mills.

Each person between the ages of 21–50 is subject to a $2 school poll tax. A state tax of 4 cents per gallon is levied on all gasoline used or sold for domestic consumption.

The report of the state treasurer for the biennium ending Sept. 30, 1940, showed total receipts of $29,342,596.89 and total disbursements of $27,560,756.39. This was a decline from the biennium ending Sept. 30, 1936, when the receipts totalled $36,861,241 and disbursements totalled $31,320,989.

The bonded debt of Wyoming Sept. 30, 1940 was $3,878,000. Of this total $2,800,000 represented state highway bonds, and $623,000 represented bonds issued for the construction of buildings at the University of Wyoming.

Education. — The department of education, which administers the public school system of Wyoming, is composed of the superintendent of public instruction and six members, appointed by him, who serve for six years and without salary. To carry into effect their plans and decisions the department appoints, with the governor's approval, a commission of education upon which the actual work of travelling, inspection and correspondence falls.

The total school attendance in 1939–40 was 56,199 out of a school census population of 72,283. Of the total number registered in 1940, 39,917 were enrolled in the elementary schools of the state, and 16,282 in the secondary schools. High school enrolment has increased steadily, from 11,164 in 1930. The average daily attendance in the public school system during 1939–40 was 47,234. The average number of days schools were in session, exclusive of holidays, in the school year 1939–40 was 172. An effort to improve the rural schools, begun in the 1920s, has borne fruit. Improved equipment and facilities have been introduced. Buses bring most of the rural enrolment to school. In 1939–40, 644 bus routes were maintained, and 13,650 pupils were carried daily.

Like many other western states, Wyoming received, upon its admission to the union, a grant from the federal government of one-sixteenth of the land within its borders for school purposes. Income from the sale of this land is to be held in a permanent school fund, only the interest of which may be used, with any proceeds which may come from leasing the land. Royalties from oil, coal and other minerals on these lands also go into this fund; and in addition 5% of all receipts for federal lands sold within Wyoming's borders. This permanent fund increased from $3,153,516 in 1920 to $18,872,125 in 1932 and to $20,830,897.35 in 1940; and its income available for use in the school year 1939–40 was $802,108.75. When oil and other minerals are obtained from federal lands within the state, the U.S. government pays to Wyoming certain royalties on such minerals, 50% of which is distributed to the school districts of the state, upon the basis of the number of teachers and drivers of school buses. The continuing royalty on oil is a welcome supplement to the amount secured by direct taxation. Government royalties distributed among the school districts in the school year 1939–40 amounted to $321,790.20.

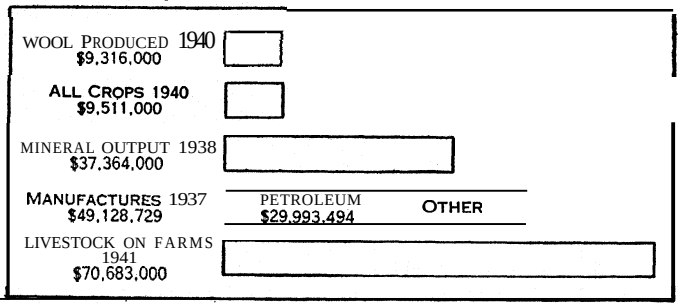
School expenditures in 1939–40 totalled $6,877,676.85. Of this amount, $197,262.77 was for the salaries and expenses of superintendents; $212,273.69 for the salaries of principals and supervisors; $496,851.08 for the salaries of high school men teachers; $527,173.33 for the salaries of high school women teachers; $1,198,511.20 for the salaries of grade and special teachers; and $654,586.42 for the salaries of rural teachers. In 1939–40 there were 2,805 teachers employed in the Wyoming schools: 652 men and 2,153 women.

An equalization fund was established in 1935 to equalize educational opportunity. The plan is to enable schools to maintain the minimum program established by law. Up to 1940 a total of $1,325,541.77 was received into the fund, of which $1,314,373.30 was distributed. The sections of the state which were most affected by drought and grasshoppers received the largest shares in the funds available.

The University of Wyoming, the only institution of higher learning in the state, is at Laramie. The university had a 1940 fall-quarter enrolment of 2,110, the highest in its history, and a faculty of 160. The legislature granted a sum of $1,055,500 for the biennium, 1941–42. This appropriation included as principal items $760,000 for the main university; $104,000 for agricultural extension; $90,000 for new equipment; $50,000 for the state experiment farms; $25,000 for athletic improvements. Although the university opened its doors in 1887, most of the buildings are comparatively new. A new liberal arts building was completed in 1936, a new student union building in 1939, and a new women's dormitory in 1941. The university was granted a charter of Phi Beta Kappa in 1940. The main library contains 104,397 volumes in addition to pamphlets. The Rocky Mountain Herbarium, largest and most representative collection of plants of the central Rocky mountain region, is also at the university.

Penal and Charitable Institutions. — The Wyoming state penitentiary is at Rawlins and in 1941 had 285 inmates. A dairy and poultry farm, an excellent garden, a shirt factory, and a rug and blanket-weaving plant furnish occupation for the prisoners and pay the major share of the expenses. The state hospital for the insane is at Evanston. In 1941 it had 675 patients, 410 men and 265 women. The hospital has grown rapidly since it was opened with 8 patients in 1889. The sailors' and soldiers' home, with 26 inmates in 1941, is at Buffalo. There is a state training school for feeble-minded children at Lander with an enrolment of 400 in 1941. The industrial institute for delinquent boys is at Worland (1941 enrolment, 74), and that for girls is at Sheridan (1941 enrolment, 65). At both these institutions there are extensive grounds where gardening and agriculture are practised. A children's home at Casper takes care of 105 children. At Rock Springs there is a general state hospital providing medical care and surgical attention for the public, and in connection with which a nurses' training school is maintained. Big Horn hot springs and Saratoga hot springs are owned by the state and are free for public use. Appropriations were made and the contract let in 1926 for a state tuberculosis sanitarium at Basin. The sanitarium in 1941 had a bed capacity of 33. All these institutions are under the supervision of the state board of charities and reform, composed of the governor, secretary of state, treasurer, auditor and state superintendent of public instruction. These officials also constitute the board of pardons. Besides the state institutions there is the Cathedral home for children at Laramie, a private institution which operates under an annual permit from the state board to which it is responsible. The deaf and blind are cared for at state expense in schools of the neighbouring states.

Agriculture. — Of the 62,460,160 ac. of land area of Wyoming almost half was privately owned in 1938. The 12 national forests in the state included a gross area of 9,116,786 ac. and a net area of federal ownership of 8,644,163 ac. Government withdrawals of oil, coal and phosphate lands included in 1940 3,158,296 ac. more. According to the state board of equalization, the following acreages and values were recognized for assessment purposes in



COMPARATIVE VALUE OF IMPORTANT PRODUCTS

1940: suburban lands, 14,555 ac. valued at $37.14 per ac.; irrigated first-class lands, 338,897 ac. valued at $31.65 per ac.;

irrigated second-class lands, 373,938 ac. valued at $20.74 per ac.; uncultivated lands with water rights, 262,680 ac. valued at $14.93 per ac.; irrigated pasture lands, 258,292 ac. valued at $8.18 per ac.; dry farm lands, 752,089 ac. valued at $4.31 per ac.; grazing lands, 23,346,848 ac. valued at $1.51 per ac.; coal lands, 81,232 ac. valued at $11.20 per ac.; timber lands, 41,442 ac. valued at $6.12 per ac.; mineral lands, 27.640 ac. valued at $8.34 per ac.; and waste and bog lands, 107,918 ac. valued at $1.03 per ac. (values almost the same as those used in 1936).

Livestock and land values reached their peak in 1929; then agriculture suffered severe depression from which it recovered slowly. In 1930 there were 824,000 head of cattle valued at $45,688,003. By 1935 there were 858,000 cattle valued at only $14,554,304. In 1940 there were 836,000 cattle valued at $19,000,000. Sheep in 1930 numbered 3,417,460 head. In 1940 there were 3,114,000 sheep.

The Federal Grazing administration, under the Taylor Grazing act as amended in 1936, organized five grazing districts within Wyoming to prevent soil deterioration and overgrazing.

The number of farms increased from 16,011 in 1930 to 17.487 in 1935; but according to the 1940 census of agriculture the figure was down to 15,018 farms, representing a 6.2% decrease since 1930. The 1940 census of agriculture gives 28,025,979 ac. for all land in farms and gives the value of farms (land and buildings) as $158,971,294.

Crop Production. — Hay is the leading crop both in acreage and in value, the principal types being alfalfa and wild hay. In 1940 the alfalfa crop totalled 598,000 tons and the wild hay crop amounted to 207,000 tons. Second crop in importance was wheat. In 1935 the wheat yield was 2,706,000 bu. By 1940 the yield had increased to 3,320,000 bu. with an average yield of 33 bu. per ac. The corn yield in 1940 was 1,930,000 bu. Goshen, Laramie, Campbell, Platte and Crook, in order, were the leading corn-growing counties. Sugar-beet production rose from 525,000 tons in 1935 to 634,000 tons in 1940. Bean production also increased, the total in 1940 being 605,000 cwt. as compared with only 460,000 cwt. in 1939. The largest increase in 1940 over 1939 was in the production of alfalfa seed, the total in 1940 being 104,000 bu. as compared with 68,000 bu. in 1939. The potato crop in 1940 was 2,400,000 bu., also a substantial increase in comparison with the figure of 1,620,000 bu. for 1939. The 1940 production of oats was 2,915,000 bu. Rye production in 1940 totalled 168,000 bu, and barley production amounted to 1,838,000 bu. in the same year. The figure for 1940 rye production represents an increase of 5% over the 1939 production; and the 1940 figure for barley represents an 18% increase over the 1939 figure.

Livestock. — The extensive grazing lands of Wyoming, with insufficient rainfall for profitable cultivation, have favoured livestock raising since territorial days. Stockmen have been leaders in territorial and state politics. In the 1870s and 1880s cattle were most important, and cattlemen were dominant. After the 1890s sheep were of great importance. In 1890 there were more cattle than sheep, somewhat more than 1,000,000 of each. In 1940 there were 3,114,000 sheep and only 836,000 cattle. The old antagonism betneen cattlemen and sheepmen has broken down, and many leading stockmen have both cattle and sheep.

Wyoming has long ranked among the leading states in wool production, her output reaching 38,400,000 lb. in 1910. In 1920 and 1921 she held first place among the states, third in 1922, 1923 and 1924, second in 1925. Later, she generally came after Texas and Montana. The yield in 1934 was 33,212,000 lb. and the yield in 1940 was estimated at 33,000,000 lb. Hogs have not been very numerous in Wyoming, there being 49,000 in 1939 In the same year there were 137,000 horses.

Dairying. — In 1939, 66,000 Wyoming cows valued at $3,828,000 produced $3,081,000 in cash farm milk income. The amount of milk produced was 32,000,000 gal.. slightly less than the output of 32,879,000 gal. in 1929. Production of creamery butter totalled 2,709,000 lb. in 1939; cheddar cheese, 826,000 lb., and ice cream, 209,000 gal.

Chickens are raised on 85% of Wyoming farms. In 1940 farm income included $1,273,000 from eggs; $756,000 from sale of chickens; and $100,000 from the sale of baby chicks. In 1940, 312,000 turkeys valued at $583,000 were raised in Wyoming. In 1929 there were 233,016 turkeys, but they were valued at $672,636.

Mining. — Wyoming's most important mineral resources, coal, petroleum and phosphate, are of the bulky sort and their development was long retarded by inadequate transportation facilities. The value of all mineral products in 1909 was $10,572,188; in 1919, $41,928,788; in 1929, $51,237,000 and in 1934, $27,640,000. During these latter years mining fell from its place as the leading Wyoming industry.

Foremost in value is petroleum. Capt. Bonneville reported oil springs near Lander as early as 1832. Oil from such springs was used by the early trappers as liniment, and by the overland emigrants for wagon grease. In 1883 and 1884 the first three wells were drilled near Lander, but lack of transportation facilities made it impossible to market the product on a paying basis. Not until production leaped from 187,000 bbl. in 1911 to 1,572,000 bbl. in 1912 did Wyoming become an important oil-producing state. From 1912 to 1916 the rate of increase was about 1,000,000 bbl. annually. By 1920 production amounted to 16,831,000 bbl.; by 1921 to 19,333,000 barrels. After intensive developments in the Salt Creek district production leaped again from 26,715,000 bbl. in 1922 to 44,785,000 bbl. in 1923. Then the wells began to give out; in 1929 production fell to 19,314,000 bbl., and by 1935 to 13,650,000 bbl. The value of this output during the years 1923, 1924, 1931 and 1934 was respectively $48,900,000, $48,600,000, $11,120,000 and $10,550,000. Of the 1934 production 6,520,000 bbl. came from the Salt Creek district 40 mi. north of Casper. Oregon Basin, Big Muddy, Frannie and Lost Soldier, the next most important oil districts, were producing between 880,000 bbl. and 1,605,000 bbl. each. The construction of a pipe-line in 1924 from the Salt Creek and Teapot Dome fields across Nebraska and Kansas to Freeman, Mo., a distance of 700 mi., enabled the petroleum from Wyoming to enter into competition with oil from the mid-continent fields. The development of its petroleum resources kept Wyoming in a fairly prosperous condition during the years immediately after the war of 1914–18, when depression was general in other industries. Royalties contributed millions of dollars to the state treasury, thereby lessening the taxation burden throughout the state. Oil fields and oil towns furnished a good market for labour and for agricultural produce. In its petroleum output Wyoming in 1939 ranked ninth among the states with 21,417,000 bbl. The committee on petroleum reserves of the American Petroleum institute estimated the state's proved oil reserves at 306,000,000 bbl., thus placing Wyoming tenth among the states in reserves. Deeper drilling and extensions in the Lance Creek field made possible the increased output in the period after 1935. Lance Creek displaced Salt Creek as the leading producer in 1939. In 1940 Wyoming's production included 20,465,457 bbl. of oil and 29,828,909 cu.ft. of natural gas.

Next to petroleum, coal is the most important mineral in the state. Coal-bearing formations underlie about 60% of its area. The largest area known to contain workable coal lies east of the Big Horn mountains and extends from Douglas northward to the boundary, an area of 15,000 sq. miles. Coal mining, however, is carried on in every county of the state, the largest production at present being from the mines of the Union Pacific railway near Rock Springs. The coal is all of the bituminous or sub-bituminous variety. The US. geological survey estimates Wyoming to contain over 1,076,000,000,000 tons of coal.

This amounts to about one-seventh of the coal resources of the nation. The output of the coal mines rose from 5,971,000 short tons in 1922 to 6,705,000 short tons in 1929. Production in 1940 was 5,387,621 short tons with an assessed valuation of $10,516,068.

The copper output, valued at $642,213 in 1916 and $553,605 in 1917, mostly from the Encampment district, was worth no more than $280 in 1934 and by 1940 no copper was produced. Gold production rose temporarily after the raising of the purchase price by the United States treasury in 1933; in 1935 3,715 fine oz. were produced, valued at $130,025; but by 1939 production was down

to 583 fine oz. Other mineral production, 1939, included 1,893,612 short tons of sand and gravel valued at $781,283; 252,170 short tons of stone valued at $346,018; 58,911 short tons of raw clay valued at $246,562. Miscellaneous mineral production, 1939, including 275,995 long tons of iron ore, was valued at $1,605,743.

Forests and Lumber.— There are 12 national forests in Wyoming with a gross area of 9,116,786 ac. and a net area of federal ownership of 8,644,163 ac. These forests are all high up in the back country, rugged and remote. About 60% of the timber stand is lodge-pole pine, used mostly for railroad ties. The next most abundant varieties are the Englemann spruce and Alpine fir, which displace the lodge-pole pine at between 8,000 and 9,000 ft. above sea level. In addition to these main types, there are the Douglas fir and limber pine, both restricted in their distribution to favoured localities, the Douglas fir between the lodge-pole-spruce line, especially on moist north slopes, and the limber pine on exposed rocky sites rising toward the timber line, where it usually takes the frontier stand. The timber cut in 1919 was 25,876,000 board feet; in 1929, 26,000,000 board feet; in 1937, 58,000,000 board feet. There is very little cut except in the national forests where it is supervised by the forest rangers. The forests also pastured 125,000 head of cattle and horses, and 575,000 head of sheep for the farmers and ranchers living in the valleys below.

Manufactures.— Except for petroleum refining, manufactures are of little importance in Wyoming, most of them being local in character and dependent on local products for their raw material. In 1937 there were 235 establishments, employing 3,795 workers, paying $5,219,000 in wages, and manufacturing products valued at $40,129,000, of which $16,101,000 was added by manufacture. Of the total value of products $29,993,494 represented the output of 22 oil refineries employing 1,169 men and paying $2,117,522 in wages. Other important industries and the value of their products in 1937 were: bread and other bakery products, $1,419,501; printing and publishing of newspapers and periodicals, $1,013,946; lumber and timber products, $1,359,445; flour and grain-mill products, $841,887; butter, $1,076,855. There were three wholesale meat-packing establishments employing 35 men in 1937.

Transportation.— Wyoming was fortunate in being in the path of the Union Pacific, the first transcontinental railway, which crossed it in 1869. Branches, however! were slow in building, and they are still few, the aim of most railways being to reach Pacific coast connections rather than local development. This handicap has been offset somewhat by good roads and the use of motor vehicles. There were 1,993 mi. of railway in the state in 1940, the Chicago, Burlington and Quincy system leading with 683 mi., the Union Pacific following with 593 mi. The total valuation of the railroads for taxation purposes in 1940 was $76,873,101, of which $41,350,125 was the valuation of the Union Pacific.

Highways.— In 1940 there were 3,863 mi. of state highway in Wyoming. Wyoming had spent $86,620,151 since the creation of the state highway department in 1917 to create this road system. By 1934, 82.2% of the state highway mileage had been completed to a gravel-surface standard. The 1934 legislation made available sufficient revenue to complete the remaining 17.8% within the ensuing ten years. During the biennium 1938–40 the highway department disbursed $9,866,350.18. One-half of the highway fund comes from the federal government, which matches state appropriations. The state highway income consists of 37½% of the oil and mineral royalties, the fees for licences, and a tax of 4¢ a gal. on gasoline. There were 94,249 motor vehicle registrations in 1940.

HISTORY

Wyoming contains land from all four of the principal annexations which made up the territory of the United States west of the Mississippi river. Except for a small portion in Carbon and Albany counties, the land east of the continental divide was acquired from France by the Louisiana Purchase of 1803. The remaining portion formed the northern tip of the Texas annexation in 1854. The north-western corner of the State, drained by the Snake river into the Columbia, formed a part of the old "Oregon Country," held jointly by the United States and Great Britain until the British relinquished their claims in the treaty of 1846. The portion of the State drained south-west into the Colorado river or into the Great Basin was secured by the Mexican cession of 1848.

Exploration— There are legends of Spanish exploration of Wyoming, but so far they are unconfirmed by documentary evidence. Verendrye, a French explorer, coming overland from the Saskatchewan river, may also have reached the State's borders in 1743, but the vagueness of his journals makes it impossible to determine the fact with certainty. John Colter, a member of the Lewis and Clark expedition who left that body on their homeward trip and plunged back into the wilderness as a free trapper, is the first white man known definitely to have entered the State. Doubtless there were similar wanderers before him whose tales are forever lost. Colter trapped to the east and south of Yellowstone park, and finally, in 1807, crossed that wonderland itself and brought to the world the first news of its strange phenomena. Four years later an expedition of more than 50 men, commanded by Wilson Price Hunt and bound overland to the mouth of the Columbia to begin the American fur trade in that region, entered north-eastern Wyoming, proceeded south and west around the Big Horn mountains, up the Big Horn and Wind rivers, across the divide by Sherman pass, and on by the Snake river valley into Idaho. In 1812 several of the same party, led by Robert Stuart, returned over a more southern route, discovering, it seems almost certain, the famous South pass, through which the Oregon and California trails were later to pass, and exploring for the first time the valleys of the Sweetwater and Platte rivers.

Period of Trappers and Traders.— In the following years a number of free trappers and employees of the various St. Louis fur companies trapped in eastern Wyoming but not until the spring of 1824 was the continental divide again crossed, this time by Thomas Fitzpatrick, leading a detachment of William Henry Ashley's fur traders across to new grounds. Fitzpatrick is usually given the credit for the discovery of South pass, and was the first to make it known. After 1824 several hundred traders crossed it each year, the annual rendezvous of the Americans being held on the other side of the divide, either in the valley of the Green river or in Jackson's Hole. The rendezvous was a colourful frontier gathering of Indians, fur traders and company employees for the purpose of meeting the pack trains of the company and exchanging the furs for next year's supplies. Hundreds of tents and tepees would dot the river bottoms during the frontier's one great social event. In 1834 Ft. Laramie was built by the traders at the confluence of the Laramie and North Platte rivers in eastern Wyoming, and it served as a centre for the fur trade until 1849 when the U.S. Government purchased it to use as a military post for the protection of emigrants.

Overland Emigration through Wyoming began in 1842 when Fitzpatrick piloted the first train over the Oregon trail. Movements increased steadily during the next few years, and in 1847 they were swelled by the Mormon emigration which followed the Oregon trail over the pass and then branched south-west past Ft. Bridger, built by James Bridger on Black's Fork.

The first rush to California came in 1849, the "Forty-niners" following the Oregon trail through Wyoming, and branching south-west after they entered Idaho. The first stage-coach line, over this route, a monthly service to Salt Lake City, started in 1851. In 1858 a daily line from Atchison to San Francisco was travelling the trail. In 1860 the famous Pony Express was established. In 1861 the first telegraph line to the Pacific was constructed across Wyoming along this route.

Indian Hostilities.— In 1862, however, Shoshone and Sioux depredations were so constant that it became necessary to move the stage line to a southern route nearly parallel with the present Union Pacific railway. Government troops were detailed to protect the stage stations, emigrant trains and freighting trains. Indian hostilities increased in 1863, 1864 and 1865 and came to a climax in 1866, known as "the bloody year on the plains." That year Government troops were constantly on the move, and there were numerous engagements in which many soldiers were lost. In attempting to keep open the Bozeman road, a cut-off from Ft. Laramie to the gold mines of Montana, Col. Fetterman and his entire company of 80 men were surprised and massacred. War with the Sioux continued until peace was made in 1868 with their chief, Red Cloud.

Permanent Settlement.— The Union Pacific railway commenced to build across the State in 1867 and pushed rapidly forward. Cheyenne and Laramie were founded at this time. In order to protect and govern new settlements along the railway the Territory of Wyoming was organized in 1868, though territorial officials were not appointed until 1869. At the first territorial legislature, held in Cheyenne in Dec., 1869, women of Wyoming were given the right to vote at all elections. This right

was confirmed by an equal suffrage clause in the State Constitution drawn up in 1889. Wyoming was the pioneer State of the United States, and perhaps of the world, to grant woman suffrage. Gold discoveries in the South pass region in 1867 and 1868 brought additional settlers to the new territory. The first land office was opened in Cheyenne in 1870 and the first homestead entry completed in 1871.

Rise of Cattle Industry.—But Wyoming did not at first prove attractive to homesteaders except in the best valleys along the Union Pacific. Instead it was discovered that the bunch and buffalo grass of the plains made excellent feed for cattle. Not only did they fatten on it in the summer, but the thick ripe bunches, retaining all their nutritious food elements, penetrated the thin snows of the wind-swept plains, enabling the herds to live and thrive all winter without extra food or care. Also cattle could be grazed at a distance from the railroad and when ready for market transported themselves. Soon great herds were on the way north from the overstocked ranges of Texas, cowboys driving them up the "long trail" to the tune of:

> Whoopee ti yi yo. git along little dogies,
> For you know Wyoming will be your new home,

and other trail songs. By the late '70s the ranges of Wyoming were well stocked. Herds increased rapidly and almost without expense. Only a "home ranch" for headquarters was necessary, and the herds ranged far and wide on the public domain. Once or twice a year they were rounded up, the calves branded, and the steers for market cut out from the herd and started on the "drive." The cattle industry sprang suddenly into full bloom in Wyoming and declined almost as suddenly because the cattlemen overreached themselves. The ranges were so overstocked that there was no longer grass left for winter feeding. Thousands upon thousands of cattle perished during severe and long-continued storms of the winters of 1886, 1887 and 1888 so that many "cattle barons" were financially ruined while others were left with only a shadow of their former herds. Disease also broke out among the herds and brought down the market price to less than one-half what it had been.

Cattle War of 1892.—Finally railroads, long blocked by Indian troubles, now pushed forward again, breaking up the ranges, and bringing in the settlers. Stockmen were long bitter against these "nesters." True, stockmen did not own the range, but they had been there first, and most of them would have purchased their lands had not the homestead law forbidden them to do so. Besides, the stockmen felt the land was fit in many districts only for grazing. They were not only inhospitable to the settlers but in many instances took active measures to drive them out of the country. A movement of this sort was the famous Johnson county cattle war of 1892 when more than 50 armed men entered Johnson county in a body against the settlers and small cattle owners, some of whom they branded as "rustlers," while the settlers organized to resist them. Only two lives were sacrificed, owing to the intervention of troops from Ft. McKinney at a decisive moment. It was one of the last struggles of the industry to keep its prestige. After that many big owners were forced out of business, and the country divided up among men with smaller outfits, who took no chances, but cut the hay in the bottom lands for winter feed. Thus began that combination of farming and stock-raising which still prevails and seems best fitted for the State.

Rise of Sheep Raising.—With decline of cattle-raising, sheep-raising began to increase. The first large herds reached the State in the latter '80s. A long feud was also waged between the cattlemen and the sheepmen, for the sheepmen tried to force their way into ranges already occupied. Cattlemen claimed that cattle would not go where sheep had grazed, and that the sheep destroyed the range and polluted the water-holes. An imaginary "deadline" was drawn by the cattlemen beyond which sheep must not go. Herders violated this arbitrary law at their own peril, for the annals of Wyoming record many cases where camps were burned and herds and herders both killed. As the sheepmen grew stronger these persecutions ceased, and when it was found that sheep were fully as profitable as cattle, public opinion sided with the sheepmen. In politics the Republicans more frequently dominated until the Democrats under Roosevelt won the State (1932, 1936, 1940).

BIBLIOGRAPHY.—The most important official State reports are the biennial ones of the treasurer, secretary of State, commissioner of public lands and farm loans, State geologist, board of equalization, department of education, board of charities and reform; the bulletins of the University of Wyoming and the Wyoming state historical department; the yearly bulletin of the state department of agriculture; bulletins of the state geologist, bulletin No. 17 being a *Bibliography and Index of Wyoming Geology 1823–1916*. Miscellaneous Circular No. 28 of the U.S. dept. of agriculture deals with the *National Forests of Wyoming* (1927). For history and government: H. H. Bancroft, *History of Nevada, Colorado and Wyoming* (1890); C. G. Coutant, *History of Wyoming*; G. R. Hebard, *History and Government of Wyoming* (1919); Charles Lindsay, *The Big Horn Basin* (1932). F. Beard (ed.), *Wyoming from Territorial Days to the Present* (1933); John Clay, *My Life on the Range* (1924); A. H. Dixon and C. O. Downing, *Civil Government of Wyoming* (1926); Noel J. Breed, *The Early Developnzents of the Wyonzing Country, 1743–1853* (1928); *Wyoming* (American Guide Series, WPA, 1941); *Reports* of U.S. bureau of the census (A. T. L.)

WYOMING VALLEY, a valley on the north branch of the Susquehanna river, in Luzerne county, Pennsylvania, U.S.A. The valley, properly speaking, is about 3½m. wide and about 25m. long, but the term is sometimes used historically to include all of the territory in the north-east of the State once in dispute between Pennsylvania and Connecticut. In Connecticut the Susquehanna Land Company was formed in 1753 to colonize the valley, and the Delaware Land Company was formed in 1754 for the region immediately west of the Delaware river. The rights of the Six Nations to all this territory were purchased at Albany (N. Y.), by the Susquehanna Company in 1754, but the work of colonization was delayed by the Seven Years' war. A few colonists settled at Mill Creek in 1763, but were attacked on Oct. 15 and driven away by the Indians. The five original towns of Wilkes-Barré (*q.v.*), Kingston, (*q.v.*), Pittston (*q.v.*), Hanover and Plymouth were founded by the company early in 1769.

In the meantime the Six Nations (in 1768) had repudiated their sale of the region to the Susquehanna Company and had sold it to the Penns. Settlers from Pennsylvania had arrived and taken possession of the block-house and huts at Mill Creek in Jan. 1768. The conflict which followed between the Pennsylvania and the Connecticut settlers is known as the first Pennamite-Yankee War. Although defeated in the early stages of the conflict, the Yankees finally gained the ascendancy and terminated the war in the battle of "Rampart Rocks" on Dec. 25, 1775. The General Assembly of Connecticut, in Oct. 1776, gave the valley the status of a county (Westmoreland county).

As the War of Independence came to a close the old trouble with Pennsylvania was revived. A court of arbitration appointed by the Continental Congress met in Trenton (N.J.), in 1782, and on Dec. 30 gave a unanimous decision in favour of Pennsylvania. The refusal of the Pennsylvania Government to confirm the private land titles of the settlers, and the arbitrary conduct of her agent, Alexander Patterson, resulted in 1784 in the outbreak of the second Pennamite-Yankee War. Treachery and harsh treatment by the Pennsylvania officers created a strong public opinion in favour of the Yankees, and the Government was compelled to adopt a milder policy. Patterson was withdrawn, the disputed territory was erected into the new county of Luzerne (1785), the land titles were confirmed (1787), and Col. Timothy Pickering (*q.v.*) was commissioned to organize the new county and to effect a reconciliation. The trouble was again revived by the repeal in 1790 of the confirming act of 1787 and by a subsequent decision of the U.S. circuit court, unfavourable to the Yankees, in the case of *Van Horn* v. *Dorrance*. All of the claims were finally confirmed by a series of statutes passed in 1790, 1802 and 1807. Since 1808, mainly through the development of its coal mines (see PITTSTON, PA.), the valley has made remarkable progress both in wealth and in population.

For a thorough study of the early history of Wyoming Valley, *see* O. J. Harvey, *A History of Wilkes-Barré*.

WYON, THOMAS (1792–1817), English medallist, was born at Birmingham. He was apprenticed to his father, the chief engraver of the king's seals, and studied at the Royal Academy, London. He became probationary engraver to the Mint in 1811,

and engraved his medal commemorative of the peace, and his Manchester Pitt medal. In 1815 he was appointed chief engraver to the Mint. His younger brother, Benjamin Wyon (1802–1858), his nephews, Joseph Shepherd Wyon (1836–1873) and Alfred Benjamin Wyon (1837–1884), and his cousin, William Wyon (1795–1851), were also distinguished medallists.

WYRE FOREST, the remains of an ancient forest in south-eastern Shropshire and northwestern Worcestershire. It lies on high ground southwest of the Severn river and contains some fine scenery. It forms the southern portion of the Severn valley coal-fields. Wyre Forest station is on the G.W.R. three miles north-west of Bewdley.

WYSPIAŃSKI, STANISLAW (1869–1907), Polish painter and dramatist, was born in Cracow in 1869. His paintings reveal a genius for dramatic construction, but the loss of the use of his hand forced him to turn to writing. *Wesele* (The Wedding) is usually regarded as his greatest work and has a high place in Polish literature. The three tragedies *A Warsaw Song, Lelewel* and *November Night* constitute a vivid and powerful portrayal of the November revolution of 1830. In these plays and in *The Legion, Deliverance* and *The Acropolis* he gives voice to the national aspirations of his countrymen and concentrates on the causes of weakness in his nation which put off the hour of its delivery. *The Curse* and *The Judges* are concerned with the lot of the peasants, their ignorance and passions and the pathos of their lives. They adapt the form of the Greek tragedies, the people of the village forming the chorus which comments on the actions of the principal characters. *Boleslas the Bold, The Church on the Rock, King Casimir* are historical dramas. Wyspiański seems to have felt prophetically the approach of a stormy era of war and sacrifice which his people must prepare to meet. The World War greatly increased his influence and Polish drama of recent times has remained under his spell.

WYSS, JOHANN (1781–1830), Swiss author, was born on Mar. 13, 1781, at Bern, where in 1806 he became professor of philosophy and later chief librarian of the University. He was a collector of Swiss tales and folklore, writing *Idyllen und Erzählungen aus der Schweiz* (1815–22), and editing the 15 volume collection *Alpenrose* (1811–30). He is better remembered, however, as the author of *Der Schweizerische Robinson* (1812–13), first translated into English in 1820 as *The Swiss Family Robinson* and appearing in many editions since. He is also the author of the Swiss National hymn, "Rufst du, mein Vaterland?" He died at Bern on Mar. 31, 1830.

WYTHE, GEORGE (1726–1806), American jurist, was born in the county of Elizabeth City, Va., in 1726. He had little formal schooling but was well taught by his mother and was admitted to the Virginia bar in 1757. He was elected to the house of burgesses in 1758 and as such in 1764 was placed on a committee to prepare petitions to the King and both houses of Parliament against the threatened Stamp Act. Wythe drew up the petition to the House of Commons in such strong language that it required considerable modification before it could be sent. In 1775 he was sent to the Continental Congress where he remained to sign the Declaration of Independence. In 1776 he was appointed with Jefferson and Pendleton to make the laws of Virginia more appropriate for an independent State, an important work which required three years to complete. In the meantime he was an important member of the constitutional convention in Virginia. He was a member of the Federal constitutional convention in 1787, and, in the following year, of the Virginia convention which ratified it.

In 1777 Wythe was appointed a judge of the court of chancery, and in 1786 when the court was reorganized he was made sole chancellor of the State, which position he held until his death. He was one of the first judges to lay down the principle *(Comth.* v. *Catron,* 1782) that *a* court can annul a law deemed to conflict with the constitution, a doctrine which became of tremendous importance as applied by his pupil, John Marshall (*q.v.*). From 1770 to 1789 he also held a professorship of law at William and Mary College, one of the first such chairs in the United States, but his increasing duties as chancellor forced him to relinquish it. He continued a private school at Richmond afterward. Wythe's influence as a teacher probably constituted his most lasting service to the nation. Besides the great chief justice, Marshall, two presidents, Thomas Jefferson and James Monroe, were numbered among his pupils, and Henry Clay was for four years clerk of his court. Wythe died at Richmond, Va., on June 8, 1806. His *Decisions* were published in 1795 (2nd. ed. with memoir, 1852).

Thomas Jefferson prepared a sketch found in his *Writings* (Monticello ed., vol. i., 1904). *See* also L. S. Herrink, "George Wythe," in *John P. Branch Historical Papers,* vol. iii. (1912).

WYTTENBACH, DANIEL ALBERT (1746–1820), German-Swiss classical scholar, was born at Bern on Aug. 7, 1746. He studied Greek under Heyne at Gottingen, and dedicated his first work to Ruhnken, who wrote that he had not expected to find in Germany such knowledge of Greek and such critical powers. Heyne recommended him to Ruhnken and Valckenaer, and in 1770 he went to Leyden. He obtained a professorship in 1771, and began his *Bibliotheca Critica,* which continued to appear for about 30 years. He became professor of Greek at the Athenaeum at Amsterdam in 1785. He edited the *Moralia* of Plutarch for the Clarendon Press, the second portion of which underwent strange adventures during the war between Holland and Great Britain, and was eventually found at Hamburg. The book was finished in 1805. He went to Amsterdam in 1799 on Burmann's death and published his charming *Vita Ruhnkenii* (Leyden, 1799). During his last years he became nearly blind. His only important work was his edition of the *Phaedo,* and he died of apoplexy on Jan. 17, 1820.

Hemsterhuis, Valckenaer, Ruhnken and Wyttenbach, more than any others after Bentley, laid the foundations of modern Greek scholarship. The precise study of grammar, syntax and style, and the careful criticism of texts by the light of the best manuscript evidence, were upheld by these scholars in the Netherlands when they were almost entirely neglected elsewhere on the Continent, and were only pursued with partial success in England.

WYVERN, WIVERN or **WYVER,** the name of an heraldic monster, with the forepart of a winged dragon and the hind part of a serpent or lizard *(see* HERALDRY). The earlier spelling of the word was *wiver* or *wivere*; *O.E. wyvre;* O.Fr. *wivre,* mod. *givré.* It is a doublet of "viper," with an excrescent *n,* as in "bittern," M.E. *bitore.*

X In both the eastern and western Greek alphabets a form X or + occurred, but it had a different value in each. In the western it was used to represent the double sound ks, with which value it passed into Latin and came down to modern times. In the eastern or Ionic alphabet it had the value of the unvoiced velar aspirate *(kh)*. We have insufficient evidence to determine the exact nature of the connection between the forms in both alphabets or the origin of either. It is possible that the western X with the value of modern X was descended from the same stem as Semitic ⌶ (samech), which is otherwise represented in the Greek alphabet only by its name transferred to another letter. It is, however, far from certain that this is so, and were it the case the value of the letter in the cast would not be accounted for. Certain facts tend to show that the letter was regarded as one in spite of its difference of value in the two alphabets. In the Lydian alphabet a form + occurs, whose value cannot always be determined, though it appears in some cases to be that of *p*. The letter was probably in use in the Asianic alphabet from which the Greeks derived their own representing a sound that did not occur in Greek. (B. F. C. A)

XANTHIC ACID (xanthogenic acid), an organic acid named from the Greek *ξανθός*, yellow, in allusion to the bright yellow colour of its copper salt. The salts of this acid, $C_2H_5O{\cdot}CS{\cdot}SH$, are formed by the action of carbon disulphide on the alcoholates, or on alcoholic solutions of the caustic alkalis. Ethyl xanthic acid, $C_2H_5O{\cdot}CS{\cdot}SH$, obtained by the action of dilute sulphuric acid on the potassium salt at 0° C, is a colourless oil which is very unstable, decomposing at 25° C into carbon disulphide and alcohol. The potassium salt crystallizes in yellow needles and is formed by shaking carbon disulphide with a solution of caustic potash in absolute alcohol. On the addition of cupric sulphate to its aqueous solution it yields a yellow precipitate of cuprous, xanthate. Potassium xanthate is used in indigo printing and also as an antidote for phylloxera. Other alcoholic solutions yield similar xanthates, and cellulose xanthate serves in the production of viscose silk.

XANTHIPPE, the wife of Socrates (*q.v.*). Her name has become proverbial in the sense of a nagging, quarrelsome woman. Attempts have been made to show that she has been maligned, notably by E. Zeller ("Zur Ehrenrettung der Xanthippe," in his Vortrage *und Abhandlungen*, i., 1875).

XANTHONE, in organic chemistry, a compound containing a ring system (formula I.) similar to that present in many of the natural colouring matters (See ANTHOCYANINS AND ANTHOXANTHINS; CHEMISTRY, Organic: Heterocyclic Division.)

(I.)  (II.) 
It is dibenzo-γ-pyrone, $C_{13}H_8O_2$, and crystallises in needles which melt at 173–174° C, boil at 250° C and are volatile in steam. Its yellow solution in concentrated sulphuric acid has a blue fluorescence. Xanthone is prepared by dehydrating phenyl salicylate (salol) or 2:2'-dihydroxybenzophenone with concentrated sulphuric acid. Euxanthone (1:7-dihydroxyxanthone, formula II.) is the colour principle in Indian yellow obtained from the urine of cows fed on mango. In this dye the euxanthone is partly free and partly present as the calcium or magnesium salt of euxanthic acid (a combination of euxanthone and glycuronic acid) crystallising in yellow needles (m.p. 237° C). Euxanthone is prepared synthetically by condensing resorcinol with quinolcarboxylic acid.

Gentisein, a trihydroxyxanthone, of which the methyl ether (gentisin) is contained in the gentian root, dyes mordanted cotton in bright yeliow shades and has been synthesised from phloroglucinol and quinolcarboxylic acid.

XANTHUS (mod. Giiniik), an ancient city of Lycia, on the river Xanthus (Eshen Chai) about 8 m. above its mouth. It was besieged by the Persian general Harpagus (546 B.C.), when the acropolis was burned and all the inhabitants perished (Herod. i. 176). The city was afterwards rebuilt; and in 42 B.C. it was besieged by the Romans under M. Junius Brutus. It was taken by storm and set on fire, and the inhabitants perished in the flames. The ruins lie on a plateau, high above the left bank of the river. The nearest port is Kalamaki, whence a tedious ride of three to four hours round the edge of the great marsh of the Eshen Chai brings the traveller to Xanthus. The whole plan of the city with its walls and gates can be discerned. The well-preserved theatre is remarkable for a break in the curve of its *auditorium*, which has been constructed so as not to interfere with a sarcophagus on a pedestal and with the "Harpy Monument" which still stands to its full height, robbed of the reliefs of its parapet (now in the British Museum). In front of the theatre stands the famous stele of Xanthus inscribed on all four sides in Lycian and Greek. Behind the theatre is a terrace on which probably the temple of either the Xanthian Apollo or Sarpedon stood. The best of the tombs—the "Payava Tomb," the "Nereid Monument," the "Ionic Monument" and the "Lion Tomb"—are in the British Museum, as the result of Sir Chas. Fellows's expedition; only their bases can be seen on the site. A fine triple gateway, much polygonal masonry, and the walls of the acropolis are the other objects of most interest.

See O. Benndorf and G. Memann, *Reisen in Lykien und Karien* (1884). (D. G. H.)

XAVIER, FRANCISCO DE (1506–1552), Jesuit missionary and saint, commonly known in English as St. Francis Xavier snd also called the "Apostle of the Indies." He was the youngest son of Juan de Jasso, privy councillor to Jean d'Albret, king of Navarre ,and his wife, Maria de Azpilcueta y Xavier, sole heiress of two noble Navarrese families. He was born at his mother's castle of Xavier or Xavero, at the foot of the Pyrenees and close to the little town of Sanguesa, on April 7, 1506, according to a family register, though his earlier biographers fix his birth in 1497. Following a Spanish custom of the time, which left the surname of either parent optional with children, he took his mother's name. In 1524 he went to the university of Paris, where he entered the College of St. Barbara, then the headquarters of the Spanish and Portuguese students, and in 1528 was appointed lecturer in Aristotelian philosophy at the Collège de Beauvais. In 1530 he took his degree as master of arts. He and the Savoyard Pierre Lefèvre, who shared his lodging, had already, in 1529, made the acquaintance of Ignatius of Loyola—like Xavier a native of the Spanish Basque country.

Ignatius succeeded, though in Xavier's case after some opposition, in gaining their sympathy for his missionary schemes (see LOYOLA, ST. IGNATIUS OF); and they were among the company of seven persons, including Loyola himself, who took the original Jesuit vows on Aug. 15, 1534. They continued in Paris for two years longer; but on Nov. 1j, 1536, they started for Italy, to concert with Ignatius plans for converting the Muslims of Palestine. In Jan. 1537 they arrived in Venice. As some months must dlapse before they could sail for Palestine, Ignatius determined that the time should be spent partly in hospital work at Venice and later in the journey to Rome. Accordingly, Xavier devoted himself for nine weeks to the hospital for incurables, and then set out with eight companions for Rome, where Pope Paul III. sanctioned their enterprise. Returning to Venice, Xavier was ordained priest on Midsummer Day 1537; but the outbreak of war between Venice and Turkey put an end to the Palestine expedition, and the companions dispersed for a 12 month's home mission work in the Italian cities. Nicolas Bobadilla and Xavier

betook themselves first to Monselice and thence to Bologna, where they remained till summoned to Rome by Ignatius at the close of 1538.

Ignatius retained Xavier at Rome until 1541 as secretary to the Society of Jesus. (See JESUITS for the events of the period 1538–41.) Meanwhile John III., king of Portugal, had resolved on sending a mission to his Indian dominions, and had applied through his envoy, Pedro Mascarenhas, to the pope for six Jesuits. Ignatius could spare but two, and chose Bobadilla and a Portuguese named Simão Rodrigues for the purpose. Rodrigues set out at once for Lisbon to confer with the king, who ultimately decided to retain him in Portugal. Bobadilla, sent for to Rome, arrived there just before Mascarenhas was about to depart, but fell too ill to respond to the call made on him.

Mission in the East Indies. — Hereupon Ignatius, on March 15, 1540, told Xavier to leave Rome the next day with Mascarenhas, in order to join Rodrigues in the Indian mission. Xavier complied, merely waiting long enough to obtain the pope's benediction, and set out for Lisbon, where he was presented to the king, and soon won his entire confidence, attested notably by procuring for him from the pope four briefs, one of them appointing him papal nuncio in the Indies. On April 7, 1541, he sailed from Lisbon with Martim Alfonso de Sousa, governor designate of India, and lived amongst the common sailors, ministering to their religious and temporal needs, especially during an outbreak of scurvy. After five months' voyage the ship reached Mozambique, where the captain resolved to winter, and Xavier was prostrated with a severe attack of fever. When the voyage was resumed, the ship touched at Malindi and Sokotra, and reached Goa on May 6, 1542. Exhibiting his brief to D. João d'Albuquerque, bishop of Goa, he asked his permission to officiate in the diocese, and at once began walking through the streets ringing a small bell, and telling all to come, and send their children and servants, to the "Christian doctrine" or catechetical instruction in the principal church. He spent five months in Goa, and then turned his attention to the "Fishery Coast," where he had heard that the Paravas, a tribe engaged in the pearl fishery, had relapsed into heathenism after having professed Christianity. He laboured assiduously amongst them for 15 months, and at the end of 1543 returned to Goa.

At Travancore he is said to have founded no fewer than 45 Christian settlements. It is to be noted that his own letters contain, both at this time and later on, express disproof of that miraculous gift of tongues with which he was credited even in his lifetime, and which is attributed to him in the Breviary office for his festival. Not only was he obliged to employ interpreters, but he relates that in their absence he was compelled to use signs only.

He sent a missionary to the Isle of Manaar, and himself visited Ceylon and Mailapur (Meliapur), the traditional tomb of St. Thomas the apostle, which he reached in April 1544, remaining there four months. At Malacca, where he arrived on Sept. 25, 1545, he remained another four months, but had comparatively little success. While in Malacca he urged King John III. of Portugal to set up the Inquisition in Goa to repress Judaism, but the tribunal was not set up until 1560. After visiting Amboyna, the Moluccas and other isles of the Malay archipelago, he returned to Malacca in July 1547, and found three Jesuit recruits from Europe awaiting him. About this time an attack upon the city was made by the Achinese fleet, under the rajah of Pedir in Sumatra; and Xavier's early biographers relate a dramatic story of how he roused the governor to action. This story is open to grave suspicion, as, apart from the miracles recorded, there are wide discrepancies between the secular Portuguese histories and the narratives written or inspired by Jesuit chroniclers of the 17th century.

Voyage to Japan. — While in Malacca Xavier met one Yajiro, a Japanese exile (known to the biographies as Anger, Angero or Anjiro), who fired him with zeal for the conversion of Japan. But he first revisited India and then, returning to Malacca, took ship for Japan, accompanied by Yajiro, now known as Paul of the Holy Faith. They reached Kagoshima on Aug. 15, 1549, and remained in Japan until Nov. 20, 1551. (See JAPAN.) On board the "Santa Cruz," the vessel in which he returned from Japan to Malacca, Xavier discussed with Diogo Pereira, the captain, a project for a missionary journey to China. He devised the plan of persuading the viceroy of Portuguese India to despatch an embassy to China, in whose train he might enter, despite the law which then excluded foreigners from that empire. He reached Goa in Feb. 1552, and obtained from the viceroy consent to the plan of a Chinese embassy and to the nomination of Pereira as envoy. Xavier left India on April 25, 1552, for Malacca, intending there to meet Pereira and to re-embark on the "Santa Cruz."

Voyage to China. — The story of his detention by the governor (officially styled captain) of Malacca — a son of Vasco da Gama named Alvaro de Ataide or Athayde — is told with many picturesque details by F. M. Pinto and some of the Jesuit biographers, who have pilloried Ataide as actuated solely by malice and self-interest. Ataide appears to have objected not so much to the mission as to the rank assigned to Pereira, whom he regarded as unfit for the office of envoy. The right to send a ship to trade with China was one for which large sums were paid, and Pereira, as commander of the expedition, would enjoy commercial privileges which Ataide had, ex *officio*, the power to grant or withhold. It seems doubtful if the governor exceeded his legal right in refusing to allow Pereira to proceed; in this attitude he remained firm even when Xavier, if the Jesuit biographers may be trusted, exhibited the brief by which he held the rank of papal nuncio, and threatened Ataide with excommunication. (See R. S. Whiteway, Rise of *the Portuguese* Power *in* India [London, 1898], appendix A. The question is complicated by the fact that the *Sixth* Decade of Diogo do Couto, the best contemporary historian of these events, was suppressed by the censor in its original form, and the extant version was revised by an ecclesiastical editor.) On Xavier's personal liberty no restraint was placed. He embarked without Pereira on July 16, 1552. After a short stay at Singapore, whence he despatched several letters to India and Europe, the ship at the end of Aug. 1552 reached Chang-chuen-shan (St. John Island) off the coast of Kwang-tung, which served as port and rendezvous for Europeans, not then admitted to visit the Chinese mainland.

Xavier was seized with fever soon after his arrival, and was delayed by the failure of the interpreter he had engaged, as well as by the reluctance of the Portuguese to attempt the voyage to Canton for the purpose of landing him. He had arranged for his passage in a Chinese junk, when he was again attacked by fever, and died on Dec. 2nd, or, according to some authorities, Nov. 27, 1552. He was buried close to the cabin in which he had died, but his body was later transferred to Malacca, and thence to Goa, where it still lies in a magnificent shrine. (See J. N. da Fonseca, *An* Historical and Archaeological ***Sketch*** of Goa, Bombay, 1878.) He was beatified by Paul V. in 1619 and canonized by Gregory XV. in 1621.

Achievement. — In appearance Xavier was neither Spanish nor Basque. He had blue or grey eyes, and fair hair and beard, which turned white through the hardships he endured in Japan. That he was of short stature is proved by the length of the coffin in which his body is still preserved, less than 5 ft. 1 in. (Fonseca, *op. cit.* p. 296). Many miracles have been ascribed to him; an official list of these, said to have been attested by eye-witnesses, was drawn up by the auditors of the Rota when the processes for his canonization were formed, and is preserved in manuscript in the Vatican library.

The contention that Xavier should be regarded as the greatest of Christian missionaries since the 1st century A.D. rests upon more tangible evidence. His Jesuit biographers attribute to him the conversion of more than 700,000 persons in less than ten years; and though the figures are absurd, the work which Xavier accomplished was enormous. He inaugurated new missionary enterprises from Hormuz to Japan and the Malay archipelago, leaving an organized Christian community wherever he preached; he directed by correspondence the ecclesiastical policy of John III. and his viceroy in India; he established and controlled the Society of Jesus in the East. Himself an ascetic and a mystic, to whom things spiritual were more real than the visible world, he had the strong common sense which distinguished the other Spanish mystics, St. Theresa, Luis de Leon or Raimon Lull. This quality

is nowhere better exemplified than in his letters to Gaspar Baertz (Barzaeus), the Flemish Jesuit whom he sent to Hormuz, or in his suggestions for the establishment of a Portuguese staple in Japan. Supreme as an organizer, he seems also to have had a singularly attractive personality, which won him the friendship even of the pirates and bravos with whom he was forced to consort on his voyages.

Modern critics of his work note that he made no attempt to understand the oriental religions which he attacked, and censure him for invoking the aid of the Inquisition and sanctioning persecution of the Nestorians in Malabar. He strove, with a success disastrous to the Portuguese empire, to convert the Government in Goa into a proselytizing agency. Throughout his life he remained in close touch with Ignatius of Loyola, who is said to have selected Xavier as his own successor at the head of the Society of Jesus. Within a few weeks of Xavier's death, indeed, Ignatius sent letters recalling him to Europe with that end in view.

(K. G J.)

BIBLIOGRAPHY.—Many of the authorities on which the biographies of Xavier have been based are untrustworthy, notabiy the *Peregrinaçam* of *F. M.* Pinto (*q.v.*). Xavier's extant letters, supplemented by a few other 16th century documents, outweigh all other evidence. A critical text of the letters, with notes, bibliography and a life in Spanish, will be found in *Monumenta Xaveriana ex Autographis vel ex Antiquioribus Exemplis collecta,* vol. i. (Madrid, 1899–1900), in *Monumenta Historica Societatis Jesu.* For translations, *H.* Coleridge, *The Life and Letters of Saint Francis Xavier* (2 vols, 1872) is useful. There are numerous old and uncritical biographies; best and earliest are O. Torsellino (Tursellinus) *De vita Francisci Xaverii, libri sex* (Antwerp, 1596); Eng. trans. T.F., *The Admirable Life of Saint Francis Xavier* (Paris, 1632) and João Lucena, *Historia da Vida do Padre Francisco de Xavier* (Lisbon, 1600), *J.* M. Cros, *St. François de Xavier, sa vie et ses lettres* (2 vols., Toulouse, 1900), embodies the results of long research. *See* K. G. Jayne, *Vasco da Gama and his Successors,* ch. xxv. to xxxii. (1910); Otis Carey, *A History of Christianity in Japan* (2 vols., 1909); E. A. Stewart, *Life of St. Francis Xavier* (1917); A Bellessort, *Saint François Xavier* (1917); F. Apalategui, *Empresas y viajes apostolicás de San Francisco Xavier* (1920).

XENIA, a city of south-western Ohio, U.S.A., the county seat of Greene county; 16 m. S E. of Dayton, near the Little Miami river. at an altitude of 910 feet. It is served by the Baltimore ana Ohio and the Pennsylvania railways, and buses. Pop. (1930) 10,507; (1940) 10,633. It is the trade centre of a rich farming and stock-raising district; the seat of the Ohio Soldiers' and Sailors' Orphans' home; and an important manufacturing city, making rope, twine and cordage, monuments, furniture and various other commodities. About 3m. N.E. is Wilberforce University for Negroes (1856). Xenia was laid out in 1803, incorporated as a town in 1808 and as a city in 1870. It has a city-manager form of government.

XENOCRATES, OF CHALCEDON (396–314 B.C.), Greek philosopher and rector of the Academy from 339 to 314 B.C., removed to Athens in early youth. He became the pupil of the Socratic Aeschines, but presently joined himself to Plato, whom he attended to Sicily in 361. Upon his master's death (347 B.C.), in company with Aristotle he paid a visit to Hermias at Atarneus. In 339, Aristotle being then in Macedonia, Xenocrates succeeded Speusippus in the presidency of the school. On three occasions he was member of an Athenian legation, once to Philip, twice to Antipater. Soon after the death of Demosthenes in 322, resenting the Macedonian influence then dominant at Athens, Xenocrates declined the citizenship offered to him at the instance of Phocion, and. being unable to pay the tax levied upon resident aliens, was sold, or on the point of being sold, into slavery. He died in 314, and was succeeded by Polemon, whom he had reclaimed from a life of profligacy. Besides Polemon, the statesman Phocion, Chaeron, tyrant of Pellene, the Academic Crantor, the Stoic Zeno and Epicurus are alleged to have frequented his lectures.

Xenocrates's earnestness and strength of character won for him universal respect. Wanting in quickness of apprehension and in native grace, he made up for these deficiencies by a conscientious love of truth and an untiring industry. Less original than Speusippus, he adhered more closely to the letter of Platonic doctrine. and is accounted the typical representative of the Old Academy. With Plato Xenocrates postulated ideas or numbers to be the causes of nature's organic products, and derived these ideas or numbers from unity (which is active) and plurality (which is passive); but unlike Plato, he took for his principles arithmetical unity and plurality, and accordingly identified ideal numbers with arithmetical numbers. In thus reverting to the crudities of certain Pythagoreans, he laid himself open to the criticisms of Aristotle, who, in his *Metaphysics,* recognizing amongst contemporary Platonist~three principal groups—(I) those who, like Plato, distinguished mathematical and ideal numbers; (2) those who, like Xenocrates, identified them; and (3) those who, like Speusippus, postulated mathematical numbers only—has much to say against the Xenocratean interpretation of the theory, and in particular points out that, if the ideas are numbers made up of arithmetical units, they not only cease to be principles, but also become subject to arithmetical operations. Xenocrates's theory of inorganic nature was substantially identical with the theory of the elements propounded in the *Timaeus,* 53 C seq. Nevertheless, holding that every dimension has a principle of its own, he rejected the derivation of the elemental solids—pyramid, octahedron, icosahedron and cube—from triangular surfaces, and in so far approximated to atomism. Moreover, to the tetrad of simple elements—viz., fire, air, water, earth—he added ether. His cosmology was also drawn almost entirely from the *Timaeus.*

Soul is a self-moving number, derived from the two fundamental principles, unity and plurality whence it obtains its powers of rest and motion. It is incorporeal, and may exist apart from body. The irrational soul, as well as the rational soul, is immortal. The universe, the heavenly bodies, man, animals, and presumably plants, are each of them endowed with a soul. Xenocrates identifies the universe and the heavenly bodies with the greater gods, and reserves a place between them and mortals for the lesser divinities. Xenocrates appears to have recognized three grades of cognition, each appropriated to a region of its own—viz., knowledge, opinion and sensation, having for their respective objects supra-celestials or ideas, celestials or stars, and infra-celestials or things. Of his logic we know only that with Plato he distinguished τὸ καθ' αὐτό and τὸ πρὸς τι, rejecting the Aristotelian list of ten categories as a superfluity.

Valuing philosophy chiefly for its influence upon conduct, Xenocrates bestowed especial attention upon ethics. He wrote much upon this subject; but the indications of doctrine which have survived are scanty. Things are goods, ills or neutrals. Goods are of three sorts—mental, bodily, external; but of all goods virtue is incomparably the greatest. Happiness consists in the possession of virtue, and consequently is independent of personal and extraneous advantages. The virtuous man is pure, not in act only, but also in heart. To the attainment of virtue the best help is philosophy; for the philosopher does of his own accord what others do under the compulsion of law. Speculative wisdom and practical wisdom are to be distinguished.

Xenocrates was not in any sense a great thinker. His metaphysic was a travesty rather than a reproduction of that of his master. His ethic had little which was distinctive. But his austere life and commanding personality made him an effective teacher, and his influence, kept alive by his pupils Polemon and Crates, ceased only when Arcesilaus, the founder of the so-called Second Academy, gave a new direction to the studies of the school.

Griechen* (Leipzig, 1875), ii. 1; F. W. A. Muliach, *Frag. Philo. Graecorum* (Paris, 1881), iii., and Überweg, *Grundriss der Gesch. der Philosophie,* Bd. *I.* (1926).

(H. JN.; X.)

XENON, a very rare gas occurring to the extent of one part in about 20 million parts of the atmosphere (*q.v.*). Xenon (symbol Xe, atomic number 54, atomic weight 130·2), was isolated in 1898 by Sir W. Ramsay and M. W. Travers who liquefied it at −109° C and solidified it at −140° C.

XENOPHANES of Colophon, the reputed founder of the Eleatic school of philosophy, is supposed to have been born in the third or fourth decade of the 6th century B.C. An exile from his Ionian home, he resided for a time in Sicily, at Zancle and at Catana, and afterwards established himself in southern Italy, at

Elea, a Phocaean colony founded in the 61st Olympiad (536–533). In one of the extant fragments he speaks of himself as having begun his wanderings 67 years before, when he was 25 years of age, so that he was not less than 92 when he died. His teaching found expression in poems, which he recited rhapsodically in the course of his travels. In the more considerable of the elegiac fragments which have survived, he ridicules the doctrine of the migration of souls (xviii.), asserts the claims of wisdom against the prevalent athleticism, which seemed to him to conduce neither to the good government of states nor to their material prosperity (xix.), reprobates the introduction of Lydian luxury into Colophon (xx.), and recommends the reasonable enjoyment of social pleasures (xxi.). Of the epic fragments, the more important are those in which he attacks the "anthropomorphic and anthropopathic polytheism" of his contemporaries. According to Aristotle, "the first of Eleatic unitarians was not careful to say whether the unity which he postulated was finite or infinite, but, contemplating the whole firmament, declared that the One is God." Whether Xenophanes was a monotheist, whose assertion of the unity of God suggested to Parmenides the doctrine of the unity of Being, or a pantheist, whose assertion of the unity of God was also a declaration of the unity of Being, so that he anticipated Parmenides is a question about which authorities differ.

Of Xenophanes's utterances about (1) God, (2) the world, (3) knowledge, the following survive: (1) "There is one God, greatest among gods and men, neither in shape nor in thought like unto mortals. . . . He is all sight, all mind, all ear (*i.e.*, not a composite organism). . . . Without an effort ruleth he all things by thought. . . . He abideth ever in the same place motionless, and it befitteth him not to wander hither and thither. . . . Yet men imagine gods to be born, and to have raiment and voice and body, like themselves. . . . Even so the gods of the Ethiopians are swarthy and flat-nosed, the gods of the Thracians are fair-haired and blue-eyed. . . . Even so Homer and Hesiod attributed to the gods all that is a shame and a reproach among men—theft, adultery, deceit and other lawless acts. . . . Even so oxen, lions and horses, if they had hands wherewith to grave images, would fashion gods after their own shapes and make them bodies like to their own. (2) From earth all things are and to earth all things return. . . . From earth and water come all of us. . . . The sea is the well whence water springeth. . . . Here at our feet is the end of the earth where it reacheth unto air, but, below, its foundations are without end. . . . The rainbow, which men call Iris, is a cloud that is purple and red and yellow. (3) No man hath certainly known, nor shall certainly know, that which he saith about the gods and about all things; for, be that which he saith ever so perfect, yet doth he not know it; all things are matters of opinion. . . . That which I say is opinion like unto truth. . . . The gods did not reveal all things to mortals in the beginning; long is the search ere man findeth that which is better."

There is very little secondary evidence to record. "The Eleatic school," says the Stranger in Plato's Sophist, 242 D, "beginning with Xenophanes, and even earlier, starts from the principle of the unity of all things." Aristotle, in a passage already cited, Metaphysics, A5, speaks of Xenophanes as the first of the Eleatic unitarians, adding that his monotheism was reached through the contemplation of the οὐρανός. Theophrastus (in Simplicius's Ad *Physica*, 5) sums up Xenophanes's teaching in the propositions, "The All is One and the One is God." Timon (in Sext. Empir. *Pyrrh.* i. 224), ignoring Xenophanes's theology, makes him resolve all things into one and the same unity. The demonstrations of the unity and the attributes of God, with which the treatise De *Melisso, Xenophane* et Gorgia (now no longer ascribed to Aristotle or Theophrastus) accredits Xenophanes, are plainly framed on the model of Eleatic proofs of the unity and the attributes of the Ent, and must therefore be set aside.

The wisdom of Xenophanes, like the wisdom of the Hebrew Preacher, showed itself, not in a theory of the universe, but in a sorrowful recognition of the nothingness of things and the futility of endeavour. His theism was a declaration not so much of the greatness of God as rather of the littleness of man. His cosmology was an assertion not so much of the immutability of the One as rather of the mutability of the Many. Like Socrates, he was not a philosopher, and did not pretend to be one; but, as the reasoned scepticism of Socrates cleared the way for the philosophy of Plato, so did Xenophanes's "abnormis sapientia" for the philosophy of Parmenides.

XENOPHON, Greek historian and philosophical essayist, the son of Gryllus, was born in Athens about 430 B.C. As the description of the Ionian campaign of Thrasyllus in 410 (*Hellenica*, i. 2) is clearly derived from Xenophon's own reminiscences, he must have taken part in this campaign, and cannot therefore have been less than 20 years of age at the time. He belonged to an equestrian family of the deme of Erchia. It may be inferred from passages in the Hellenica that he fought at Arginusae (406 B.C.), and that he was present at the return of Alcibiades (408 B.C.), the trial of the Generals and the overthrow of the Thirty. Early in life he came under the influence of Socrates, but an active career had more attraction for him. In 401 B.C., being invited by his friend Proxenus to join the expedition of the younger Cyrus against his brother, Artaxerxes II. of Persia, he at once accepted the offer. It held out the prospect of riches and honour, while he was little likely to find favour in democratic Athens, where the knights were regarded with suspicion as having supported the Thirty. At the suggestion of Socrates, Xenophon went to Delphi to consult the oracle; but his mind was already made up, and he at once proceeded to Sardis, the place of rendezvous. Of the expedition itself he has given a full and detailed account in his Anabasis, or the "Up-Country March." After the battle of Cunaxa (401 B.C.), in which Cyrus lost his life, the officers in command of the Greeks were treacherously murdered by the Persian satrap Tissaphernes, with whom they were negotiating an armistice with a view to a safe return. The army was now in the heart of an unknown country, more than a thousand miles from home and in the presence of a troublesome enemy. It was decided to march northwards up the Tigris valley and make for the shores of the Euxine, on which there were several Greek colonies. Xenophon became the leading spirit of the army; he was elected an officer, and he it was who mainly directed the retreat. Part of the way lay through the wilds of Kurdistan, whera they had to encounter the harassing guerrilla attacks of savage mountain tribes, and part through the highlands of Armenia and Georgia. After a five months' march they reached Trapezus (Trebizond) on the Euxine (Feb. 400 B.C.). At Cotyora he aspired to found a new colony; but the idea, not being unanimously accepted, was abandoned, and ultimately Xenophon with his Greeks arrived at Chrysopolis (Scutari) on the Bosporus, opposite Byzantium. After a brief period of service under a Thracian chief, Seuthes, they were finally incorporated in a Lacedaemonian army which had crossed over into Asia to wage war against the Persian satraps Tissaphernes and Pharnabazus. Xenophon, who accompanied them, captured a wealthy Persian nobleman, with his family, near Pergamum, and the ransom paid for his recovery secured Xenophon a competency for life.

On his return to Greece Xenophon served under Agesilaus, king of Sparta, at that time the chief power in the Greek world. With his native Athens and its general policy and institutions he was not in sympathy. At Coroneia (394 B.C.) he fought with the Spartans against the Athenians and Thebans, for which his fellow-citizens decreed his banishment. The Spartans provided a home for him at Scillus in Elis, about two miles from Olympia; there he settled down to indulge his tastes for sport and literature. After Sparta's crushing defeat at Leuctra (371 B.C.), Xenophon was

driven from his home by the people of Elis. Meantime Sparta and Athens had become allies, and the Athenians repealed the decree which had condemned him to exile. There is, however, no evidence that he ever returned to his native city. According to Diogenes Laertius, he made his home at Corinth. The year of his death is not known; all that can be said is that it was later than 355 B.C., the date of his work on the *Revenues of Athens*.

The *Anabasis* (composed at Scillus between 379 and 371 B.C.) is a work of singular interest, and is brightly and pleasantly written. Xenophon, like Caesar, tells the story in the third person. His description of places and of relative distances is very minute and painstaking. The researches of modern travellers attest his general accuracy. It is expressly stated by Plutarch and Diogenes Laertius that the *Anabasis* was the work of Xenophon, and the evidence from style is conclusive. The allusion (*Hellenica*, iii. 1, 2) to Themistogenes of Syracuse as the author shows that Xenophon published it under an assumed name.

The *Cyropaedia*, a political and philosophical romance, which describes the boyhood and training of Cyrus, hardly answers to its name, being for the most part an account of the beginnings of the Persian empire and of the victorious career of Cyrus, its founder. The *Cyropaedia* contains, in fact, the author's own ideas of training and education, as derived conjointly from the teachings of Socrates and his favourite Spartan institutions. It was said to have been written in opposition to the *Republic* of Plato. A distinct moral purpose, to which literal truth is sacrificed, runs through the work. For instance, Cyrus is represented as dying peacefully in his bed, whereas, according to Herodotus, he fell in a campaign against the Massagetae.

The *Hellenica* written at Corinth, after 362 B.C., is the only contemporary account of the period covered by it (411–362 B.C.) that has come down to us. It consists of two distinct parts; books i. and ii., which are intended to form a continuation of the work of Thucydides, and bring the history down to the fall of the Thirty, and books iii.–vii., the *Hellenica* proper, which deal with the period from 401 to 362 B.C., and give the history of the Spartan and Theban hegemonies, down to the death of Epaminondas. There is, however, no ground for the view that these two parts were written and published as separate works. There is probably no justification for the charge of deliberate falsification.' It must be admitted, however, that he had strong political prejudices, and that these prejudices have influenced his narrative. He was a partisan of the reactionary movement which triumphed after the fall of Athens; Sparta is his ideal, and Agesilaus his hero. Hardly less serious defects than his political bias are his omissions, his want of the sense of proportion and his failure to grasp the meaning of historical criticism. The most that can be said in his favour is that as a witness he is at once honest and well-informed. For this period of Greek history he is, at any rate, an indispensable witness.

The *Memorabilia*, or "Recollections of Socrates," in four books, was written to defend Socrates against the charges of impiety and corrupting the youth, repeated after his death by the sophist Polycrates. The work is not a literary masterpiece; it lacks coherence and unity, and the picture it gives of Socrates fails to do him justice. Still, as far as it goes, it no doubt faithfully describes the philosopher's manner of life and style of conversation. It was the moral and practical side of Socrates's teaching which most interested Xenophon; into his metaphysical speculations he seems to have made no attempt to enter: for these, indeed, he had neither taste nor genius. Moving within a limited range of ideas, he doubtless gives us "considerably less than the real Socrates, while Plato gives us something more." It is probable that the work in its present form is an abridgement.

Xenophon has left several minor works, some of which are very interesting and give an insight into the home life of the Greeks.

The *Oeconomics* (to some extent a continuation of the *Memorabilia*, and sometimes regarded as the fifth book of the same) deals with the management of the house and of the farm, and presents a pleasant and amusing picture of the Greek wife and of her home duties. There are some good practical remarks on matrimony and on the respective duties of husband and wife.

In the essays on horsemanship (*Hippikē*) and hunting (*Cynegeticus*), Xenophon deals with matters of which he had a thorough knowledge. In the first he gives rules how to choose a horse, and then tells how it is to be groomed and ridden and generally managed. The *Cynegeticus* deals chiefly with the hare, though the author speaks also of boar-hunting and describes the hounds, tells how they are to be bred and trained, and gives specimens of suitable names for them.

The *Hipparchicus* explains the duties of a cavalry officer. He dwells at some length on the moral qualities which go to the making of a good officer, and hints very plainly that there must be strict attention to religious duties.

The *Agesilaus* is a eulogy of the Spartan king, who had two special merits in Xenophon's eyes: he was a rigid disciplinarian, and he was particularly attentive to all religious observances. We have a summary of his virtues rather than a picture of the man himself.

The *Hiero* works out the line of thought indicated in the story of the Sword of Damocles. It is a protest against the notion that the "tyrant" is a man to be envied, as having more abundant means of happiness than a private person.

The *Symposium*, or "Banquet," to some extent the complement of the *Memorabilia*, is a brilliant little dialogue in which Socrates is the prominent figure. He is represented as "improving the occasion," which is that of a lively Athenian supper-party, at which there is much drinking, with flute-playing, and a dancing-girl from Syracuse, who amuses the guests with the feats of a professional conjurer. Socrates's table-talk runs through a variety of topics, and winds up with a philosophical disquisition on the superiority of true heavenly love to its earthly or sensual counterfeit.

There are also two short essays, attributed to him, on the political constitution of Sparta and Athens, written with a decided bias in favour of the former, which he praises without attempting to criticize. Sparta seems to have presented to Xenophon the best conceivable mixture of monarchy and aristocracy. The second is certainly not by Xenophon, but was probably written by a member of the oligarchical party at Athens shortly after the beginning of the Peloponnesian War.

In the essay on the *Revenues of Athens* (written in 355 B.C.) he offers suggestions for making Athens less dependent on tribute received from its allies. Above all, he would have Athens use its influence for the maintenance of peace in the Greek world and for the settlement of questions by diplomacy, the temple at Delphi being for this purpose an independent centre and supplying a divine sanction.

The *Apology*, Socrates's defence before his judges, in the general opinion of modern critics is not a genuine work of Xenophon, but belongs to a much later period.

The editions of Xenophon's works, both complete and of separate portions, are very numerous, especially of the *Anabasis;* only a selection can be given here. Editio princeps (1516, incomplete); E. C. Marchant (1900–1912, in the Clarendon Press *Scriptorum Classicorum Bibliotheca*). *Anabasis:* J. F. Macmichael (1883); C. W. Krüger and W. Pökel (1888); W. Gemoll (1899). *Cyropaedia:* G. M. Gorham (1870); L. Breitenbach (1875); A. Hug (1883); F. Hertlein and W. Nitsche (1886); H. A. Holden (1887–90). *Hellenica:* L. Breitenbach (1874–84); R. Büchsenschütz (1880–91); O. Keller (1890); G. E. Underhill, *Commentary on the Hellenica* (i.-vii., 1900). *Memorabilia:* A. R. Cluer (1880); R. Kuhner (1882); L. Breitenbach (1889); J. Marshall (1890). *Oeconomicus:* H. A. Holden (1895); C. Graux and A. Jacob (1886). *Hiero:* H. A. Holden (1888). *Agesilaus:* R. W. Taylor (1880); O. Guthling (1888). *Resp. Lacedaem.:* G. Pierleoni (1905). *Resp. Athenienszum:* A. Kirchhoff (1874); E. Belot (1880); H. Müller and Strubing (1880); E. Kalinka (1913). *Cynegeticus:* G. Pierleoni (1902). *Hippikē:* Tommasini (1902). *Reditus Athen.:* A. Zurborg (1876). *Scripta Minora:* L. Dindorf (1888). There is a good English translation of the complete works by H. G. Dakyns (1890–94), and of the *Art of Horsemanship* by M. H. Morgan (U.S.A., 1890). Of general works bearing on the subject may be mentioned: G. Sauppe, *Lexilogus Xenophonteus* (1869); A. Croiset, *X., son caractère et son talent* (1873); *I.* Hartmann, *Analecta Xenophontea* (1887) and *Analecta Xenophontea Nova* (1889); *C.* Joel, *Der echte und der Xenophonteische Socrates* (1892); Lange, X., *sein Leben, seine Geistesart und seine Werke* (1900). *See* also GREECE: *Ancient History*, § "Authorities," and works quoted; J. B. Bury, *Ancient Greek Historians* (1909). Bibliographies in Engelmann-Preuss, *Bibliotheca Scriptorum Classicorum* (i., 1880) and in

C. Bursian's *Jahresbericht (c., 1900) by* E. Richter. (E. M. WA.)

XERXES (the Greek form of the Pers. *Khshayārshā;* Old Testament *Ahasverus, Akhashverosh—i.e.,* Ahasuerus [*q.v.*]—with wrong vocalization and substitution of y for v, instead of *Akhshavarsh;* in Aramaic inscriptions and papyri from Egypt the name is written *Khshai'arsh*), the name of two Persian kings of the Achaemenid dynasty.

1. XERXES I., son of Darius I. and Atossa, the daughter of Cyrus the Great, and therefore appointed successor to his father in preference to his eldest half-brothers, who were born before Darius had become king (Herod. vii. 2 f.). After his accession in October 485 B C. he suppressed the revolt in Egypt which had broken out in 486, appointed his brother Achaemenes as satrap and "brought Egypt under a much heavier yoke than it had been before" (Herod. vii. 7). His predecessors, especially Darius, had not been successful in their attempts to conciliate the ancient civilizations. This probably was the reason why Xerxes in 484 abolished the "kingdom of Babel" and took away the golden statue of Bel (Marduk, Merodach), the hands of which the legitimate king of Babel had to seize on the first day of each year, and killed the priest who tried to hinder him[1]. Therefore Xerxes does not bear the title of "King of Babel" in the Babylonian documents dated from his reign, but "King of Persia and Media," or simply "King of countries" (*i.e.,* of the world). This proceeding led to two rebellions, probably in 484 and 479; in the Babylonian documents occur the names of two ephemeral kings, Shamash-irbā and Tarziya, who belong to this time. One of these rebellions was suppressed by Megabyzus, son of Zopyrus, the satrap whom the Babylonians had slain[2].

Darius had left to his son the task of punishing the Greeks for their interference in the Ionian rebellion and the victory of Marathon. From 483 Xerxes prepared his expedition with great care: a channel was dug through the isthmus of the peninsula of Mount Athos; provisions were stored in the stations on the road through Thrace; two bridges were thrown across the Hellespont. Xerxes concluded an alliance with Carthage, and thus deprived Greece of the support of the powerful monarchs of Syracuse and Agrigentum. Many smaller Greek states, moreover, took the side of the Persians ("Medized"), especially Thessaly, Thebes and Argos. A large fleet and a numerous army were gathered. In the spring of 480 Xerxes set out from Sardis. At first Xerxes was victorious everywhere. The Greek fleet was beaten at Artemisium, Thermopylae stormed, Athens conquered, the Greeks driven back to their last line of defence at the Isthmus of Corinth and in the Bay of Salamis. But Xerxes was induced by the astute message of Themistocles (against the advice of Artemisia of Halicarnassus) to attack the Greek fleet under unfavourable conditions, instead of sending a part of his ships to the Peloponnesus and awaiting the dissolution of the Greek armament[3]. The battle of Salamis (Sept. 28, 480) decided the war. (*See* SALAMIS.) Having lost his communication by sea with Asia, Xerxes was forced to retire to Sardis; the army which he left in Greece under Mardonius was in 479 beaten at Plataea (*q.v.*). The defeat of the Persians at Mycale roused the Greek cities of Asia.

Of the later years of Xerxes little is known. He sent out Sataspes to attempt the circumnavigation of Africa (Herod. iv. 143), but the victory of the Greeks threw the empire into a state of languid torpor, from which it could not rise again. The king himself became involved in intrigues of the harem (cf. Herod. ix. 108 ff.—compare the late Jewish novel of *Esther,* in which a remembrance of the true character of the king is retained) and was much dependent upon courtiers and eunuchs. He left inscriptions at Persepolis, where he added a new palace to that of Darius, at Van in Armenia, and on Mount Elvend near Ecbatana; in these texts he merely copies the words of his father. In 465 he was murdered by his vizier Artabanus (*q.v.*) who raised Artaxerxes I. to the throne.

2. XERXES II., son and successor of Artaxerxes I., was assassinated in 424 after a reign of forty-five days by his brother Secydianus or Sogdianus, who in his turn was murdered by Darius II. (*q.v.*).

See Ctesias, *Pers.* 44; Diod. xii., 64, 71, and the chronographers; neither of the two ephemeral kings is mentioned in the canon of Ptolemy nor in the dates of Babylonian contracts of this time.

The name XERXES was also borne by a king of Armenia, killed about 212 B.C. by Antiochus the Great (Polyb. viii. 25; Johannes Antiochenus, p. 53; his name occurs on copper coins); and by a son of Mithradates the Great of Pontus (Xppian, *Mithr.* 108, 117). (ED. M.)

XINCA, a group of about 10,000 Indians living in southern Guatemala along the Rio de los Esclavos, including most of the departments of Santa Rosa and Jutiapa. They were first encountered by the Spaniards under Pedro de Alvarado in 1524 and were finally subdued two years later by Pedro Portocarrero. On account of their stubborn resistance many of them were branded and sold as slaves, whence the name of the river that cuts their territory. The Xinca may be the remnants of an ancient population which preceded the Maya and Nahua. The Maya regarded the Xinca as barbarians, a feeling very generally entertained in Guatemala to-day.

See D. G. Brinton, *On the Xinca Indians of Guatemala* (American Philosophical Society, *Proceedings,* Philadelphia, 1884); Walther Lehmann, *Zentral-Amerika,* 1 Teil, ii. Band (1920).

XIPHILINUS, JOANNES, epitomator of Dio Cassius, lived at Constantinople during the latter half of the 11th century A.D. He was a monk and the nephew of the patriarch of Constantinople of the same name. (Migne, *Patrologia Graeca,* cxx.) The epitome (ἐκλογαί) of Dio which was prepared by order of Michael Parapinaces (1071–78), comprises books 36–80, the period included being from the times of Pompey and Caesar down to Alexander Severus. Book 70 appears to have been missing in his copy, while in books 78 and 79 a mutilated original must have been used. Xiphilinus divided the work into sections, each containing the life of an emperor. He omitted the name of the consuls and hence sometimes falls into chronological errors. The epitome is valuable as preserving the chief incidents of the period for which the authority of Dio is wanting.

See J. Melber's Dio in Teubner series; C. Wachsmuth, *Einleitung* in *das Studium der alten Geschichte* (1895); W. Christ, *Geschichte der griechischen Literatur* (1898).

XOSA, a group of Bantu-speaking peoples occupying the eastern half of the Cape Colony. They comprise a large number of independent tribes, each governed by a chief assisted by councillors. Their subsistence is derived from a combination of cattle-keeping with agriculture. Socially they are organized into patrilineal exogamous clans. Marriage is polygamous and involves the payment of a bride-price; and both the sororate and the levirate are practised. Ancestor-worship is the main form of religious cult, and both magic and witchcraft play a strong part in the lives of the people.

See A. Kropf, *Das Volk der Xosa-Kaffern,* 1889.

X-RAYS, NATURE OF. X-rays, or Rontgen rays, is the name given to the radiations which, in the general spectrum of electromagnetic waves, occur after ultra-violet rays as we pass towards the shorter wave lengths. It is difficult to define the region exactly. As is well known the visible spectrum extends from the wave lengths of the extreme red (about $0{\cdot}8\mu$) to the furthest violet (about $0{\cdot}4\mu$), next follows the ultra-violet and then a region is reached where the absorption of the radiation by all kinds of matter becomes very great.

It is in the region of 1,000 Ångstrom units (or, to use other units, $0{\cdot}1\,\mu$, or 10^{-5} centimetre), that we may place the beginning of the X-rays, but we must remember that the radiations in the ultra-violet series of hydrogen are undoubtedly the terms of an X-ray series (the K series) of this gas. At the short wave length end we may regard the K rays of uranium, or more exactly the K

[1] Herod. i. 183, by Ctesias changed into a plundering of the tomb of Belitanas or Belus: *cf.* Aelian, *Var. Hist.* 13, 3; Aristobulus *ap.* Arrian vii. 17, a, and Strabo xvi., p. 738.

[2] Ctesias, *Pers.* 22; his legendary history is transferred by Herodotus, iii. 150 ff., to the former rebellion against Darius.

[3] *See* G. B. Grundy, *Great Persian War* (1901), and in criticism W. W. Tarn, "The Fleet of Xerxes," in *Journal of Hellenic Studies* (1908), 202–234; also Macan's notes on Herod. iv.-vi. (1895), and authorities for PLATAEA, SALAMIS.

discontinuities of this element, as marking the limit of a region of radiations intimately connected with the electronic structure of the atom and from that point the gamma rays begin (*i.e.*, for wave-lengths less than $\frac{1}{10}$ of an Angstrom unit). *(See* RADIATION.)

The quantum theory (*q.v.*) establishes a correspondence between each radiation of given wave-length and a certain number of volts, and when the radiations are excited by an electric discharge it is necessary that the potential of this discharge should be at least equal to this voltage. The visible and the ultra-violet radiations then correspond to just a few volts while the X-rays range from some hundred volts to more than a hundred thousand volts; to excite the gamma rays it would be necessary to employ a potential of several millions of volts.

In this wide interval are found rays the properties of which vary in a continuous manner as a function of the wave length. The Bragg-Peirce law which expresses the progressive and regular character of the absorption of a radiation in terms of the atomic number of the absorbing element appears to be valid throughout a region which extends at ieast from 10^{-2} Å to 10 Å, and probably much beyond in the short wave length direction.

Towards the end of the year 1895 Professor Rontgen, in his laboratory at Würzburg, in Bavaria, carried out experiments on the electric discharge through rarefied gases. The experiments of Crookes had at that time attracted a great deal of attention to this branch of physics. Rontgen had covered his discharge tube with black paper and placed a phosphorescent screen near it to see if a new radiation penetrated through the paper. Not only did the screen commence to fluoresce but also a new radiation was disclosed in a neighbouring room through a closed door. It is said that a foreign scientist visiting the German physicist some years later asked "what did you think then?" and he replied "I did not think, I experimented."

The history of the discovery of the X-rays by Röntgen is described under RÖNTGEN, WILHELM KONRAD VON.

The extraordinary penetrative qualities of X-rays were the object of the first researches, while the attempts to discover in them optical properties, analogous to those of the radiations of ordinary light, received a check, so much so that for a long time even their undulatory nature was in doubt. It was necessary to wait until the experiments of Laue, Friedrich and Knipping in 1912 to find, in the passage of X-rays through crystalline media, a remarkably fruitful method, which by demonstrating that the new radiations show, like light, the phenomena of interference and of diffraction, enabled the wave length to be determined and at the same time the different kinds to be separated. Between these two dates, 1895–1912, the study of Rontgen rays had made great advances, thanks especially to the work of Barkla on the secondary rays which they excite by falling on different bodies, and that of Whiddington on the excitation of X-rays by means of cathode rays of increasing velocities.

One of the first and most important results to which the study of X-rays led was the discovery that their passage through gases rendered the latter conductors of electricity. It was found later that this effect was in reality due to the ionisation which the fast moving electrons ejected from the atoms produce along their paths. The new radiations showed themselves capable of producing a considerable effect on photographic plates, a phenomenon also very probably due to a secondary action.

These two effects allow us to estimate the intensity of X-rays by measuring the ionisation current produced or the degree of blackening of photographic emulsions.

In addition, X-rays produce a certain number of chemical actions and the well-known phenomenon of luminescence in many substances. To-day barium platinocyanide and calcium tungstate are most commonly employed, either as fluorescent screens for visual observation, or as intensifiers to shorten photographic exposures.

All these remarkable properties have attracted keen attention; but what actually gives X-rays a place apart in the realm of Physics, is that by revealing simple general laws of very wide application in natural philosophy they yield us information concerning the interior parts of atoms, much better than do the other radiations.

It is the laws of X-rays which have most effectively helped to clarify the ideas of modern physicists on the structure of atoms. The study of Rontgen rays is so closely bound up with these conceptions that it is necessary to outline the latter at this point.

As a result of the theories of Sir Ernest Rutherford and Niels Bohr the atom of an element of atomic number N (that is to say in the Nth place in the natural order of the elements) is regarded as composed of a nucleus possessing a total positive charge equal to N times the elementary charge surrounded by a swarm of N electrons distributed in a certain manner around it. *(See* also ATOMS.) We understand, especially from the ideas of Bohr, that these electrons may be divided into several classes, characterised by the work which must be expended to extract from the atom an electron of a certain class. In conformity with the quantum theory we may define for each of these electronic levels a frequency ν_p related to the work W_p necessary to extract the electron from the atom by the relation—

$$\nu_p = \frac{W_p}{h}.$$

We denote by the letters K, L, M, etc., successive levels proceeding outwards from the nucleus. This being premised it is convenient to recall that the fundamental hypotheses of Bohr's theory are as follows:—

A spectral line is emitted by an atom when an electron passes from one level to another which is nearer the nucleus, *e.g.*, from the M to the K level, and this spectral line (which is emitted with an energy hv) possesses a frequency v defined by—

$$\nu = \nu_K - \nu_M.$$

Conversely the transport of an electron from one level to another further from the nucleus, *e.g.*, from K to M, would correspond to the absorption of energy of a definite frequency; in the case of luminous radiation, this is called a resonance absorption; but as we shall see later, this process does not, in general, appear to be realised with X-rays.

When an electron is removed from one level it seems nearly always to be taken right out of the atom, which corresponds, in the case in which the first level is, for example, the L level, to a transport of an electron from this level to infinity with absorption of a wave of frequency ν_L which would be:—

$$\nu_L = \frac{W_L}{h}.$$

It is only by the absorption of energy of a frequency at least equal to ν_L that an electron of the L ring may be extracted from the atom. In passing through this frequency the incident radiation will suddenly become susceptible to a new mechanism of absorption and we ought to find a sudden rise in the curve of its absorption coefficient.

Bohr's theory enables us to predict the lines of a spectrum, when the various levels are stated. Among all these lines we may consider separately those which have the same final level, because their manifestation is conditioned by the same initial phenomenon: the existence of a vacant position in this level. Experiment shows that these lines actually have their origin in a uniform mechanism and form a natural group, a "series" of lines which will bear the name of the final level. If an exciting radiation, falling on a small portion of matter which contains a large number of atoms, is capable of ejecting an electron from the K ring of a number of them, it is natural to suppose that in some of the atoms, for example, the space will be filled up by an electron coming from the L ring with emission of the line α; the vacancy thus created on the L ring will be filled at the expense of the M ring with the emission of the line α_L. In other atoms it will be an electron from the M ring that will jump directly to the K ring emitting the line β_K and so on.

The emission of the series is, then, a statistical phenomenon resulting from events which occur in a large number of perturbed

atoms and the intensity of a line measures the probability of the particular combination of levels to which it corresponds.

Consider for an instant the higher terms of a series whose initial levels belong to the outer regions of the atom. They will have frequencies approaching the critical frequency of their final levels and their existence will depend on the real or virtual state of the outer initial levels. The series will thus be more numerous for the elements of high atomic weight, in which the levels occupied by electrons are themselves more numerous. External actions, chemical action, forces of cohesion, etc., which modify the surface levels, will likewise influence the higher terms of the series.

In fine it is by the lines close to the critical discontinuity that the influences of outside agents will be manifest. These lines may thus share with the lines of the luminous spectrum certain properties which will be absent in the lines arising from inner levels, the latter being practically independent of outside influences.

With the help of the preceding considerations we may describe in a summary and general way the properties of X-rays from the point of view of their emission and of their absorption by matter.

Emission.— For X-rays to be emitted there must be a vacant place among the electrons of the atomic layers, and this phenomenon occurs in the following cases:—

1. When the atom is ionised by collisions with other atoms or molecules, if these collisions are sufficiently intense. It is such collisions which give rise to the X-rays of very long wave-length in gaseous discharge tubes, and which also, by reason of the thermal agitation at very high temperatures, give rise to rays of shorter wave-length such as those which are met with in the hot stars.

2. When the atom has absorbed a primary radiation which has removed an electron by the action of the photoelectric effect *(see* below). The atom then returns to its normal state with emission of rays of greater wave length than those of the exciting radiation; this is the most general case of secondary radiation. On irradiating a body with X-rays of frequency greater than of its K absorption discontinuity it is caused to emit the complete series of its normal X-rays.

3. When the atom is ionised as a result of a collision with fast electrons, it is then necessary, as shown by the experiments of Duane and Hunt and of Webster, for the energy of the exciting electron to be greater than the quantum $h\nu$ of the discontinuity which characterises the level whence the atomic electrons are removed; it is this process which takes place in the X-ray tubes. A tube which has been evacuated, contains an anticathode of the element the rays of which it is desired to obtain. If the tube contains a little residual gas, electrons of the cathode stream strike the anticathode and by their collision cause the emission of X-rays; their number, however, is difficult to regulate and their speed ill-defined. A better result is obtained by employing a tube with an incandescent cathode of the Coolidge type. *(See* RÖNTGEN RAYS: *Applications.)* Such an incandescent filament serving as a cathode emits electrons of which the speed is a function of the applied voltage and the number a function of the temperature of the filament, *i.e.,* on the magnitude of the heating current. We thus have a known number of electrons of known energy.

The characteristic rays taken as a whole (*i.e.,* the K series, L series, M series, etc.) do not constitute the total radiation emitted from a target when it is subjected to the bombardment of a stream of electrons. There is, in addition, a continuous spectrum, more pronounced in the case of the elements of high atomic number, which is quite different in nature from the characteristic rays. The commencement of this spectrum, on the high frequency side, is abrupt and corresponds to the energy of the exciting cathode rays, as given by the quantum relation. That is to say, the highest frequency emitted, $h\nu_{max}$, is connected with the potential V applied to the tube by the formula

$$h\nu_{max} = eV$$

where e represents the electronic charge and h Planck's constant.

The examination of the distribution of the intensities as a function of the wave-length in the continuous spectrum shows that after this abrupt beginning, the intensity increases with increase of wave-length and passes through a pronounced maximum. There is a certain analogy with the well known curve which represents the emission of radiation by a black body; a fact which has not failed to attract attention. When the radiation is measured in various azimuths with respect to the exciting pencil of cathode rays, the position of the beginning of the spectrum remains invariable, but the intensity distribution is found to be modified. In accordance with theoretical predictions, the proportion of the high frequencies is much greater in the direction of the cathode rays.

The mechanism of the production of this continuous background still remains obscure. Attempts were made in the first place to find in it the radiation which the electromagnetic theory predicts in the case when an electron undergoes a change in its velocity but we have a very imperfect acquaintance with the laws of decrease of velocity of the fast electrons when they penetrate into matter. It is certain that the old classical theories are not sufficient and that it is necessary to introduce the idea of quanta. The recent experiments of Davisson and Germer, G. P. Thomson, etc., confirming the conceptions of the wave mechanics, have thrown new light on the behaviour of the electrons when they travel through an obstacle. In this way will be found perhaps a satisfactory explanation of the experimental data concerning the continuous spectral background of the Rontgen rays.

Absorption.— The best known property of X-rays, which has attracted wide attention to this type of radiation, is their ability to penetrate substances quite opaque to ordinary light, but it must not be thought that all X-rays are equally penetrating. Their absorption depends in a simple and general way on the wave-length of the rays and on the atomic number of the absorbing body; the higher the frequency of the rays and the lower the atomic number of the absorbing body, the greater will be the transparency. Certain rays are able to penetrate several centimetres of steel while others are stopped by a few millimetres of air.

The study of the gradual diminution of intensity undergone by a beam of X-rays in passing through matter has shown that it depends on two different causes. On one hand the presence of atoms of matter in the path of the beam causes a scattering of a fraction of the latter in all directions in space; on the other hand, the same atoms are capable of absorbing quanta of the incident radiation while undergoing a more or less intense ionisation.

The first phenomenon has been called "scattering" and may be effected moreover in two very different ways, with which we shall have to deal later. The second phenomenon is that of absorption properly so called; let us recall first how we may represent it on the Rutherford-Bohr model. Several groups of electrons exist in the atom and to remove an electron of any group from the atom, a definite amount of energy must be supplied. When the atom is placed in a radiation of frequency ν, or when it is bombarded by quanta $h\nu$, the electrons whose energy of ejection is less than $h\nu$ may in certain favourable cases be ejected from the atom by the absorption of a quantum. Experiments have up to now always indicated that quanta of radiant energy are absorbed as a whole; if then a quantity of energy W_n is necessary to remove an electron of the nth class, the latter will leave the atom after an absorption of a quantum $h\nu > W_n$ and with kinetic energy

$$\tfrac{1}{2}mv^2 = h\nu - W_n.$$

This is Einstein's law of photoelectricity. After the departure of the electron, the atom remains in an abnormal ionised state; we know that it is then in a condition to emit one of the lines of the series characterised by the spectral term $\frac{W_n}{h}$.

The phenomenon of absorption can thus be viewed in two different aspects according as attention is directed to the diminished intensity of the resulting X-ray beam or to the modifications produced by it in the state of the matter irradiated. The first point of view, to which we will keep in the following paragraphs, corresponds to the study of the law of absorption; the second leads to an examination of the photoelectric effect itself, that is

to say the expulsion of electrons by the absorption of quanta of radiation, and is the subject of a later paragraph.

Let us consider solely the diminution in intensity of a beam of X-rays of wave length λ passing through an element of atomic number N; the intensity of the beam after having passed through a thickness x of the absorbing material, is related to the initial intensity by the relation

$$I_x = I_0 \epsilon^{-\tau x}.$$

The absorption is said to follow the exponential law. The quantity τ, *i.e.*, the coefficient of total absorption, is the sum of two other quantities a and μ, the first of which expresses the effect of scattering and the second that of the true absorption. The scattering, and therefore the coefficient a, varies but little with the atomic number, while on the other hand the absorption, and the coefficient μ increase rapidly with N. This difference in the variations of the two phenomena permits their contributions to the total diminution in intensity to be separated; in particular, for dense materials and X-rays of the more normal wave-lengths, scattering is practically negligible in comparison with absorption, thereby simplifying the study of the latter. It seems natural to introduce besides the coefficient μ of the exponential law, the coefficient μ/ρ of absorption per unit mass, where ρ denotes the density of the absorbing material, and the coefficient of atomic absorption μ_{at} related to the preceding by the atomic weight of the absorbing body and Avogadro's number.

In 1914 Bragg and Peirce showed that apart from the discontinuities, the quality μ/ρ approximately followed a law of the form

$$\frac{\mu}{\rho} = C\lambda^3 N^3.$$

The coefficient C assumes a new value at each discontinuity.

Numerous experimental researches have confirmed this result, but the values of the powers of λ and of N, though certainly in the neighbourhood of 3, have not yet been accurately established. If we consider the absorption per atom, the preceding law becomes

$$\mu_{at} = AX^3 N^4.$$

Each time one of the critical values ν_n of the frequency is passed through, in the direction of increasing frequency, the coefficient A undergoes a sudden increase. It attains its maximum value when the quantum of the radiation is greater than the energy required to remove one of the K electrons from the absorbing atom. Richtmeyer found for fairly heavy elements the value

$$A_k = 2{\cdot}29 \times 10^{-2}$$

when λ is expressed in centimetres, while Windgardh found

$$2{\cdot}44 \times 10^{-2}.$$

Bragg's law gives the variation of the coefficient μ_{at} only between the discontinuities, but we can also represent the whole of the curve by a single mathematical formula. We may consider each one of the absorption mechanisms, which come successively into play as the frequency increases, as contributing a term in $\lambda^3 N^4$ to the value of μ_{at} and write

$$\mu_{at} = \Sigma a_n \lambda^3 N^4$$

the summation extending over all groups of electrons whose "extraction work" is less than the quantum of the incident radiation. The sum Σ thus increases by one term each time the frequency passes one of the critical values ν_n. It is evident that

$$A_K = a_K + a_{L_I} + a_{L_{II}} + a_{L_{III}} \ldots$$

$$A_{L_I} = a_{L_I} + a_{L_{II}} + a_{L_{III}} \cdots \ldots$$

It is very instructive to consider the ratio of the values of μ_{at} on the two sides of a discontinuity; this is termed the "absorption jump." The K jump has been carefully studied, especially by Allen. According to him, its value for different elements is:

	Mo (42)	Ag (47)	Tu (74)	Pb (82)
$\delta_K =$	7·4	7·1	4·7	3·9

Other writers give, it is true, slightly different figures; for example, for silver, Stoner and Martin give $\delta_K = 6{\cdot}7$ and Richtmeyer $\delta_K = 6{\cdot}6$. One thing however is certain, the K jump diminishes as the atomic number increases. This shows that the Bragg-Peirce law cannot be rigorously true, at least so far as the factor N^4 is concerned; for if it were we should have:

$$\delta_K = \frac{A_K \lambda_K^3 N^4}{A_{L_I} \lambda_K^3 N^4} = \frac{A}{A_{L_I}} g = \text{const.}$$

and this is contrary to experience.

L. de Broglie and A. H. Kramers have put forward interesting theories to predict the values of the absorption coefficients and jumps and, although we cannot regard their arguments as rigorous, have obtained results which are confirmed at least approximately by experiments.

When a continuous spectrum is analysed by means of crystal diffraction after having passed through an absorbing screen, absorption bands are found beginning abruptly and extending towards the high frequencies. The K band is single, the L band triple whilst the M and N bands exist in still greater numbers.

Bohr's simple scheme predicted one band for each series; Sommerfeld's theory, at least in its original form, predicted only two L bands; we shall not deal with the more complicated theories by means of which attempts have been made to explain the observed phenomena. (*See* the article on the spectroscopy of X-rays by M. Siegbahn.)

Photoelectric Effect.—The absorption of X-rays by the atoms of matter is accounted for by the removal of an electron which leaves the atom with kinetic energy $h\nu = W_n$, where ν is the frequency of the absorbed radiation, and W_n is the work required for the removal of the electron. It follows that if heterogeneous radiation falls on a body, each wave-length included in the spectrum of the incident beam will be able to excite all those levels whose "extraction work" is less than its own particular quantum. Further, the characteristic rays of the irradiated body will appear as a result of the return to their normal state of the excited atoms and these radiations will act in their turn on the material of the screen to produce in it the same phenomena. We ought therefore, to observe a large series of groups of electrons, each group of corpuscles having an energy which can be expressed by a relation of the form $h\nu_p - W_q$, in conformity with Einstein's expression.

Experiments have confirmed this point of view entirely; by irradiating secondary radiators with X-rays and analysing in a magnetic field the streams of electrons produced, actual corpuscular spectra are obtained, an electronic analogy as it were, of the X-ray spectra, which yield information both as to the incident radiations and the levels of the atoms irradiated.

The photoelectric effect of X-rays can also be demonstrated by the "Cloud method" of C. T. R. Wilson. In a gas through which a beam of X-ray passes, the sinuous paths of the electrons ejected from certain atoms can be seen and photographed. In this case the phenomenon is visible for a single atom and a large number of interesting observations can be made, such, for example, as an estimation of the initial directions of the velocities of the ejected electrons.

It is thus seen that the conductivity created in the gas by X-rays results from the pairs of ions separated by the photoelectrons along their trajectory and is not a direct effect of the incident rays. Observations of the details of the phenomenon have led to the discovery that the secondary X radiation is often absorbed by the emitting atom itself and photoelectrons emerge directly (Auger effect). Several phenomena moreover, seem definitely to indicate that the radiation has a greater tendency to be absorbed by the actual atom which has emitted it than by others, and it would be of great interest to know the laws of this internal absorption.

Wilson's method enables us equally well to determine the initial direction of the velocity of the ejected electrons and to make a

comparison, either with the direction of the incident beam, or with the state of the polarisation of the latter.

In spite of the difficulty of the measurements, the fact emerges from the experiments that the electron possesses a component of velocity in the direction of propagation of the rays, and that the magnitude of this component increases with the frequency as if a certain quantity of momentum passed from the wave to the corpuscle. It seems to be equally well established that the electrons have a tendency to emerge following the direction of the electric vector of the polarised wave.

The initial velocities do not however possess a unique direction but are distributed more or less closely about a mean value; the theories of Bubb, and of Auger and Perrin, especially the latter, are interesting attempts to explain the experimental results.

Diffraction of X-rays.—The analysis of light by means of optical gratings is accomplished by allowing it to fall on a series of fine lines engraved on glass or metal, the gratings consisting of from 50 to 1,000 lines per millimetre. For radiations of wave-length a thousand times shorter, such as X-rays, it would be necessary to employ lines correspondingly more closely drawn (that is, if it was desired to follow exactly the same method, for we shall see that the artifice of "grazing incidence" enables optical gratings to be used in the study of X-rays). It is for this reason that the natural gratings afforded by crystals with their regular alignments of molecules suggested themselves.

Crystals are in fact regarded as composed of piles of equidistant planes, in which the atoms, or molecules, are distributed in a regular manner and form the intersections of a lattice system. To take a simple case, for example potassium chloride, if we suppose that the atoms of chlorine and potassium are placed at the intersections of a cubic lattice each atom will act as a diffracting centre. The effect of the whole, due to the interferences of all the elementary waves issuing from each atom, can be easily calculated.

The German physicist, von Laue, and his collaborators, Friedrich and Knipping, first succeeded in 1912 in obtaining in this way the phenomena of crystal diffraction. Von Laue gave the theory of it and Sir William Bragg showed that the diffracted rays could be considered as reflected regularly at the different planes of the crystal lattice provided that their wave-length satisfied the relation:

$$n\lambda = 2d\sin\theta$$

where n is any integer, d the spacing between the lattice planes parallel to the plane considered, and θ the angle made by the incident ray with this plane.

It is thus seen that a heterogeneous beam of X-rays, on passing through a crystalline medium, will give a series of beams whose positions can easily be predicted beforehand, and which will furnish a diagram of spots on a photographic plate placed perpendicular to the incident beam. The arrangement of these spots reflects the symmetry of the crystal employed.

If, on the other hand, we imagine a single crystalline face and cause the angle of incidence θ to vary, we shall obtain reflected rays which will correspond to the different wave lengths present in the initial beam and will consequently furnish a true spectrum thereof.

We shall not deal further with this branch of spectroscopy which will form the subject of a special section (see below), but we must mention here the fundamental law discovered by Moseley in 1913 and which can be expressed as follows:

The X-ray spectra of all the elements are built up on a common model; the frequencies ν of their homologous lines, expressed as a function of the atomic number N of the elements, follow the law:

$$\sqrt{\nu} = aN - b.$$

It is well known how Bohr's theory accounts for this relation, one of the most important in physics, since it expresses the unity of structure of the different atoms by pointing to the gradual and regular change in their emission lines as one runs over the entire list of the elements. It will be noticed that Moseley's law is an expression of regular increase, and is not a periodic relation such as applies to the less fundamental properties of the elements of the Mendeleyev series. This distinction arises because the majority of the other properties of the elements, *e.g.*, chemical and physical, depend upon the outer electrons of the atom, while X-ray spectra, especially the highest frequency series of the heavy elements, are governed by the electrons nearest the nucleus.

It goes without saying that the Laue diagrams furnish a most valuable means of study in the investigation of crystal structures and in general, of the different regular arrangements in which atoms and molecules may exist in material media. In this way a new method of investigation has been made available for crystallographic study.

Employing the formula $n\lambda = 2d\sin\theta$ Sir William Bragg has evaluated d by making a simple assumption regarding the arrangement of the atoms at the intersections of the crystalline lattices in the very simple cubic crystals of KCl, NaCl, etc., and then using the molecular mass and the number of atoms in a gram molecule (Avogadro's number). The estimation of the frequencies by the method based on photoelectric effect and Einstein's equation and above all the production of X-ray spectra by means of ordinary optical gratings utilising grazing incidence, have definitely established the validity of the reasoning originally used to obtain the absolute value of d. We shall simply mention that d is $2{\cdot}814 \times 10^{-8}$ cm. for sodium chloride, and may increase to about 100×10^{-8} cm. for the distance between the regular stratifications presented by the layers of long chain fatty acids.

To obtain diffraction effects with X-rays it is not essential to employ crystals of large dimensions. Finely powdered crystals (and even micro-crystalline structures, such as those offered by metal sheets) give rise no longer to diagrams of spots, but to more or less clearly defined circles. Even homogeneous liquids furnish diffuse halos under certain conditions, the theory of which, still somewhat uncertain, introduces the mean distances between the molecules.

For the first approximation theories of the diffraction of X-rays by arrangements of atoms assume the latter to be stationary, though they are, of course, continually displaced by thermal agitation. It is not impossible to allow for this complication, and one is led to the conclusion that the temperature does not modify the position of the spots, but diminishes their intensity in relation to that of the adjacent continuous background. Experiment has confirmed these predictions at least quantitatively.

The intensity of crystalline diffraction, its distribution among the spectra of the different orders, the variation of the effects with the degree of perfection of the crystals and the study of the distribution of the electrons in the atoms by means of these data have all given rise to interesting researches which it is impossible to outline here, but which constitute a new chapter in physical chemistry.

Scattering of **X-rays.**—It is a general property of light to be re-emitted by the bodies on which it falls; the rays forming an incident pencil are re-distributed in space and until recently it was admitted, without question, that their wave-length underwent no modification.

The classical theory of the scattering of X-rays has been given by Sir Joseph Thomson. It led to a prediction of the distribution of the intensities of the scattered rays in different azimuths with relation to the incident beam and to their state of polarisation. To a first approximation these predictions have been verified by experiment, as Barkla in particular has shown.

Scattering by an atom is supposed to be due to the forced vibrations of the electrons of this atom. When the distance between these electrons is great in comparison with the wave-lengths, the total intensity scattered is the sum of the intensities due to each electron, but matters become complicated if the wave-length is comparable with the dimensions of the atoms. Debye thus explained the intense scattering of soft X-rays and showed how we pass gradually to Thomson's results for high frequencies.

The fundamental phenomena of diffraction of X-rays by crystalline media has been explained on the basis of the classical theory of scattering, and the iatter has great success to its credit, but it is nevertheless certain that it is insufficient,

A. H. Compton has in fact discovered a very important phenomenon, that there are in reality two kinds of scattering[1], one which takes place without a sensible change of wave length and the other in which the scattered ray has a lower frequency than that of the incident ray. The increase of wave length is then a function of the angle of scattering θ following the formula $\lambda_\theta - \lambda_0 = 2\frac{h}{m_0 c}\sin^2\frac{\theta}{2}$ where h is Planck's constant, m_0 the mass of the electron and c the velocity of light—it will be noted that $\lambda_\theta - \lambda_0$ is independent of λ.

Compton and Debye have given a very interesting quantitative theory of this phenomenon based on the fact that the energy of the incident quantum is divided into two parts, one represented by the scattered radiation and the other by kinetic energy communicated to the scattering electron. The conservation of energy and the conservation of momentum are assumed between the atoms of radiation and the scattering electron (it is known from Einstein's work that a quantum of radiation hv possesses a quantity of momentum $\frac{h\nu}{c}$).

Experiment has confirmed this theory remarkably. In particular the existence of the recoil electrons having velocities in accordance with the predictions of Compton and Debye has been demonstrated by the cloud method of C. T. R. Wilson.

We have there one of the most striking examples of the success of the corpuscular theories of light; certain particulars are however still far from clear; the electrons always behave as though quite free (or firmly bound when the scattering takes place without change of wave-length) and many points concerning the fundamental mechanism of scattering still remain obscure.

We shall mention two further experiments which Wilson's method has rendered possible and which illustrate very well these phenomena of the propagation of light in quanta.

The first is due to C. T. R. Wilson: a beam of X-rays, while passing through an expansion chamber, falls on a copper "target," and we are then able to find on the same photographic plate the trajectory of a photoelectron ejected from the copper and a little further on in the gaseous mass that of another photoelectron ejected from an atom of the gas by the fluorescent X-rays of the copper due to the first phenomenon. We cannot more directly watch the transference of energy by discrete entities.

A second experiment has been carried out by Compton and Simon: a beam of X-rays experiences scattering by an atom of gas with change of wave-length and expulsion of a recoil electron whose trajectory is recorded in the form of a "fish track"; the tangent of the angle which the trajectory makes initially with the direction of the beam can be calculated. At the same time there is a chance that the scattered quantum may be absorbed in the vicinity and furnish a photoelectron; the origin of the trajectory of this photoelectron joined to the origin of the fish track will furnish the angle of scattering, so that all the geometrical elements necessary for the verification of the Compton-Debye theory can be obtained on the one plate. Experiment has shown, that to a first approximation at least the verification is satisfactory.

Physical Optics of X-rays.—For many years it seemed impossible to establish physical optics for X-rays, but Laue's discovery, establishing their diffraction, gave rise to a new view, which lead to a recognition for these radiations of an extension of the principal properties presented by luminous radiations.

Bragg's formula—

$$n\lambda = 2d\sin\theta$$

appeared, at the outset, quite rigorous, but the very precise experiments of Siegbahn and his collaborators showed that it was not so. Ewald pointed out that this divergence is explained by supposing a refraction of the waves in the crystalline medium with an index

$$\mu = 1 - \delta \quad \text{with} \quad d = \frac{Ne^3}{2\pi m \nu^2}$$

N being the number of electrons per unit volume and ν the frequency. This gives for the index of refraction a value just a few thousandths less than unity; in passing from air into the crystal an incident ray undergoes a perceptible refraction and in certain cases a total reflection.

A. H. Compton has proved experimentally the existence of this total reflection and Siegbahn has succeeded in obtaining an actual prismatic spectrum of X-rays. The index undergoes a sudden variation when an absorption discontinuity is passed through.

The phenomenon of total reflection with grazing incidence has been utilized by Compton and Doan and by Thibaud to obtain X-ray spectra using ordinary optical gratings (gratings having even no more than 200 lines to the millimetre can be used).

Several physicists, and in particular Haga, had originally tried to obtain diffraction of X-rays by means of a fine slit, but the rays employed were of too short a wave-length to produce a perceptible effect. Holweck using radiation of the order of 100 Angstrom units succeeded'in demonstrating diffraction by a slit and specular reflection on a metallic mirror.

The very small difference separating the index of refraction of X-rays from unity renders any attempt to appiy the ordinary processes of polarisation by reflection very difficult and up till now, the phenomenon of double refraction has not been found. Theory indicates however, that scattering may furnish a method of obtaining linearly polarised radiation. Barkla first showed that a scattering body, composed of a light element, gives rise to a radiation which is practically free from secondary fluorescent radiation. On examining this radiation scattered in a direction at right angles to the incident beam, polarised rays ought to be obtained, but the polarisation thus obtained, while being perceptible, is very incomplete. Much better results are obtained, as was done by Mark and Szilard, by using crystal diffraction so that the diffracted ray makes a right angle with the incident radiation.

Conclusive Remarks.—X-rays certainly play an important part in stellar physics. It must not be forgotten in fact that at a given temperature the radiation in thermal equilibrium, or black body radiation, has a definite composition in which the very high frequency radiations are only present in any considerable quantity at very high temperatures. This condition is very probably realised in the hot stars in which the atoms are practically always in a state of intense ionisation such as is never found in terrestrial phenomena.

The discovery and study of X-rays has had an especially important influence on the development of Physics. It was the properties of conducting gases which led to the discovery of electrons and to that of the radioactive bodies; the diffraction of Röntgen rays by crystals has given new life to crystallography and the study of the whole of the fine structure of matter, at the same time that it enabled X-ray spectra to be obtained. The last through Moseley's law have rendered the unity of structure of the chemical elements indisputable and supplied to the Bohr atom its strongest support.

It is the high frequency of Röntgen rays which brings out more clearly the rôle of light quanta, renders Einstein's law on the photoelectric effect the more easily verified and which permitted the discovery of the Compton effect to be made. Röntgen rays afford ground particularly favourable to the birth of new ideas in the theories of radiation; ideas which will one day lead to the reunion in the same synthesis of the undulatory and corpuscular aspects of radiation. (DE BR.)

APPLICATION

X-rays were discovered in the fall of the year 1895 by Professor Wilhelm Konrad Röntgen, professor of physics in the University of Wurzburg, Bavaria. The discovery was the result of a somewhat extensive research concerning the passage of an electric current in an evacuated tube. This subject had received attention for many years and X-rays had unquestionably been produced, though not recognized, by very many investigators. Probably the first person actually so to produce X-rays was William Morgan in the year 1785.

The first recognition of the new rays occurred semi-accidentally: Rontgen happened to notice that when he passed an electric discharge through his tube some crystals of barium-platinocyanide

[1] It is known that Raman has quite recently found evidence of a change in wave-length in the case of scattering of ordinary light by liquids.

which were in the vicinity became brilliantly fluorescent, although the visible light from the tube was completely screened by black paper. He also found that various substances placed between the tube and a card on which barium-platinocyanide crystals were spread cast a shadow. Rontgen named these new rays, "for the sake of brevity," X-rays. The most striking attribute of the new rays was that they had the power of penetrating objects which were opaque to ordinary light and consequently their potential value in the realm of medicine was immediately recognized. In fact, some four days after the discovery was known in America, X-rays were successfully used to locate a bullet embedded in the calf of a patient's leg.

The tube with which Rontgen made his discovery bears very little resemblance to a modern X-ray tube; it was, in fact, the commonly used glass bulb called the Crookes tube, in which the cathode stream, instead of being directed on to a metal plate, now called the target, was directed from the cathode or negative electrode on to the glass wall of the tube and produced X-rays at the place of impact.

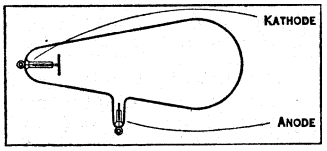

FIG. 1.—TYPE OF VACUUM TUBE WITH WHICH RÖNTGEN DISCOVERED X-RAYS

The earliest form of electrical generator to operate the vacuum X-ray tube was the induction coil, which in Rontgen's time was of a very primitive pattern. The discovery of X-rays, however, gave a great stimulus to the development of this piece of apparatus and comparatively soon afterwards mammoth induction coils were constructed having an electric potential of many thousands of volts and capable of giving electric sparks of 1 or even 2 ft. in length.

X-ray Tubes.---One of the earliest experimenters with X-rays, Sir Herbert Jackson, introduced the "focus" tube some two months after Rontgen's discovery. In this tube the cathode stream was "focussed" by means of a concave negative electrode on to a small area of a metal target which was mounted in the centre of the bulb. The actual focussing of the cathode stream, however, was not a new thing, as it had been demonstrated by Sir William Crookes some 20 years previously to show the heating effect of the cathode stream. The X-ray tube introduced by Sir Herbert Jackson has remained the standard type of tube for over 30 years, except that refinements and modifications have been added from time to time to legislate for ancillary developments. The early tubes depended for their operation upon the presence of a certain amount of residual gas, which became ionized and so provided the electrons constituting the cathode stream. Such tubes, known as gas tubes, are still in use and have many advantages.

To provide for the gradual absorption of the residual gas which takes place during operation various devices have been introduced from time to time whereby small fresh supplies of gas can be introduced into the bulb. A common form of such a regulator, as

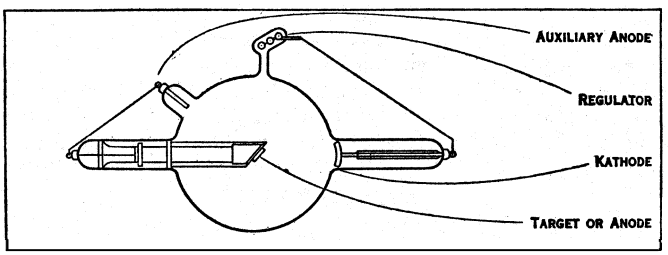

FIG. 2.—ORDINARY "GAS" X-RAY TUBE

it is called, consisted of a small piece of mica mounted in a small auxiliary tube and arranged so that the mica could be heated, the effect of which was to drive out a little air from between the layers of mica, which passed into the main bulb. In 1898 the self-regulating X-ray tube was introduced. Heated regulators were made automatic in operation by attaching wires to the regulator terminals, which could be placed quite near to the main terminals of the tube. As the gas in the X-ray tube becomes less its resistance to the passage of the current increases, and finally it arrives at a condition where it is easier for the discharge to jump from the main terminal to the regulator wire than to pass through the tube. The passage of the current through the regulating substance releases a little gas which passes into the main bulb, the resistance of which is lowered, and the discharge once more passes normally through the X-ray tube. In the early tubes platinum was generally used as the target because of its very high melting point.

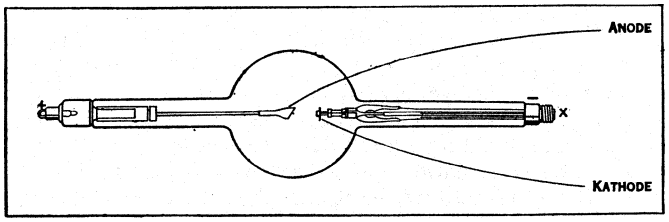

FIG. 3.— DIAGRAM OF THE STANDARD COOLIDGE X-RAY TUBE

In 1913 a new type of X-ray tube was introduced by Dr. W. D. Coolidge, of Schenectady, U.S.A. Its advent was the result of a considerable amount of work that had been done on thermionics by many investigators, notably Fleming and Richardson. The new tube is entirely independent of residual gas and depends upon the evaporation of electrons from an incandescent filament to form the cathode stream. The target of the Coolidge tube is of massive tungsten. The use of this highly desirable metal in the form of a massive target followed the valuable work done by Dr. W. D. Coolidge on the metallurgy and hot working of metallic tungsten.

Another form of hot cathode X-ray tube was invented about the same time by Lilienfeld in Germany, in which the electrons were produced in a reservoir and "boosted" by an auxiliary high tension circuit through a small hole communicating with the main portion of the tube, where they were taken in hand by the main high tension circuit and shot across to the target. By virtue of its extreme simplicity of operation, however, the Coolidge tube enjoys great popularity.

Still another type of hot cathode tube is the "Metalix," introduced by Philips of Holland; a novel feature of this tube is that it is cylindrical and narrow in shape and a large portion of the tube is made of metal. The X-rays emerge only from a comparatively small opening either at the end or in the centre. The tube is, therefore, self "protecting" and does not require the heavy and complicated tube boxes which safety of operation demands for other types of tube.

Hot cathode X-ray tubes operate at saturation voltage, and the penetrating power and X-ray intensity, which depend upon voltage and current, are adjustable and controllable independently; a state of affairs which it is impossible to realize in the older "gas" X-ray tubes.

Electrical Apparatus.— Although the induction coil is still used to provide the high tension electricity to operate X-ray tubes, it has largely been supplanted by the more consistent piece of apparatus known as the high tension transformer. The voltage delivered by such generators in common use for X-ray work may be anything from 60,000 to 250,000 volts. The normal voltage for medical and surgical radiography is about 100,000. X-rays for the treatment of disease, however, are required at 250,000 volts and even more.

The type of voltage normally yielded by a static high tension transformer is what is known as alternating; in other words, the current passes first in one direction and then in the other, the duration of each impulse being very small (there are about 100 such impulses per second in the usual type of X-ray transformer). Such an alternating supply is unsuitable for the generation of X-rays. The voltage impulses must all be in the same direction, consequently arrangements have to be made to suppress or reverse one set of impulses. The device generally employed for this purpose is a switch, the contacts of which revolve in harmony with the voltage impulses of the transformer as it is rotated by a motor run synchronously with the electrical pulsations. The electrical connections of this switch or commutator are so arranged that only current in one direction is allowed to pass through the X-ray tube. Another method of "rectification," as it is called, is by

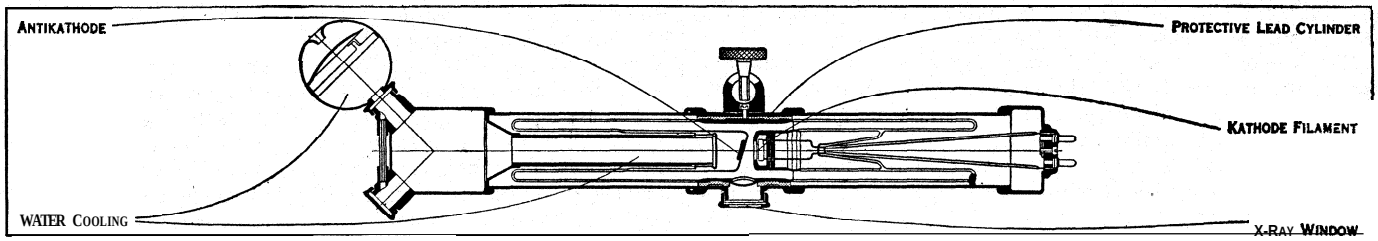

FIG. 4.—DIAGRAM OF THE METALIX X-RAY TUBE

means of large thermionic valves.

A transformer and rectifying device such as we have outlined produces what is known as a pulsating voltage. This is because each little voltage impulse grows in strength and dies away, and as it is only a portion at the maximum that is utilized in an X-ray

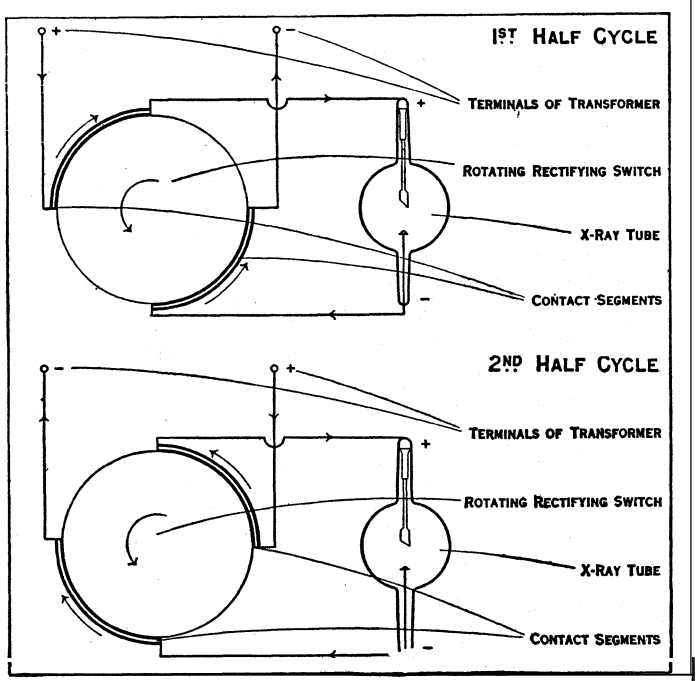

FIG. 5.— DIAGRAMS SHOWING THAT THE CURRENT IN THE X-RAY TUBE IS ALWAYS IN THE SAME DIRECTION EVEN THOUGH THE POLARITY AT THE TRANSFORMER TERMINALS IS CONTINUALLY CHANGING

tube it follows that each impulse of current is followed by an interval of no current. There is another type of X-ray transformer so arranged that certain electricity storers or condensers, as they are called, are connected in the circuit in such a way that they discharge a current during each of these intervals and so produce a constant or \continuous voltage. The latter type of transformer is in fairly general use for the purpose of X-ray treatment and also for the radiography of metals.

DEVELOPMENTS

Nature and Properties.— X-rays have the power of penetrating materials which are opaque to ordinary light. This property was immediately appreciated by Rontgen. Another property, which in fact led to their discovery, is that they cause certain chemicals, for example barium-platinocyanide, to fluoresce; in other words, to emit visible light. This property is made use of in the familiar X-ray fluorescent screen, which is a piece of cardboard or other material covered with fine crystals of a suitable salt. Any object placed between the source of the X-rays and the screen thro s a sharp shadow on the brilliantly glowing surface. X-rays affect a photographic plate in exactly the same way as does ordinary light, the only difference being that they act equally well whether the plate is wrapped or unwrapped. They have certain other chemical properties; for example, they cause iodine to be freed from a solution of iodoform in chloroform. They have also certain biological effects which are very imperfectly understood and form the subject of extensive research.

One of the most important properties possessed by X-rays is their power to change a non-conducting gas into an electrical conductor. It is known as the power of ionization. Like light, X-rays may be polarized and they may be diffracted by a crystal, the latter being a property of the greatest importance inasmuch as it forms the basis of the modern science of crystal analysis.

Early Applications.— The power of X-rays to penetrate opaque objects depends very largely upon the density of the material, It was very soon realized for example that flesh was more transparent to the rays than bone, and consequently it was possible to see the bones in the body. This fact was immediately recognized as being of the utmost importance and it was at once ordered by the German minister of war that the subject should be investigated from the point of view of its possible service to military surgery.

We said that the penetrability of a substance is governed by its density, but by April 1896 it had been determined that the X-ray absorbing power of a chemical element depended upon its atomic weight, which is a much more accurate statement.

During the first few weeks after Rontgen's discovery reports were received from all over the world recording the great value of the new rays. The extraction of a bullet from a patient's leg had been facilitated by their use even though it had moved some five inches from the entrance wound. In Paris the rays had been used to diagnose a diseased thigh bone and in Berlin to watch the growth of new bone following a fracture. The technique developed rapidly and by the end of Feb. 1896 the method was in comparatively general use. Twenty minutes was the average time of exposure required to obtain a radiograph of an arm in 1896. In 1928 the exposure necessary for this purpose is a small fraction of a second and the result is of course infinitely better. In May 1896 the first exclusive X-ray periodical appeared in England. It was called the Archives of *Skiagraphy,* and the first number recorded an X-ray cinematograph film 40 ft. long showing the movement of a frog's leg.

By 1897 systematic work was in progress on the biological effects of X-rays. This work had been stimulated by the early appearance of X-ray dermatitis or skin disease which had attacked various experimenters during the year 1896. It was very soon found that the action of the rays on physiological tissue was by no means consistent, some cells being stimulated by irradiation to rapid growth, others being killed and disintegrated. It was also observed that some cells exhibited much greater sensitiveness to the rays than others. These early experiments engendered the hope that X-rays would prove to be a powerful agent in the destruction of harmful bacteria in the human body—a hope that has, unfortunately, not been realized.

In 1897 Dr. Morton, of New York, obtained a remarkable radiograph of an entire and fully clothed adult body. The entire skeleton was shown and the total exposure was only 30 minutes. Noticeable among the very early medical applications of X-rays were their trial in the treatment of cancer and tuberculosis.

Although non-medical applications of X-rays are very largely a modern development, yet early in the history of the subject many such applications were suggested and even tried. One interesting application was suggested in the year 1899; it was called the "Izambard" process of printing by X-rays. A number of sheets of sensitized paper were to be piled up and the copy, which was to be prepared with an ink which was semi-opaque to X-rays, placed on the top, the whole mass was then to be radiographed. Experiments with the method showed that a block of paper some two inches in thickness could be successfully radiographed with-

out undue distortion. There are obvious disadvantages about the suggestion which caused it to be abandoned.

The radiography of metals was recognized as an important future use of X-rays as early as Feb. 1896, when Prof. A. W. Wright, of Yale university, radiographed a metallic weld and revealed a fracture which was not apparent to the eye. The very limited power of an X-ray tube prevented the development of this work for many years, but, as we shall see, it was to become hardly less important than the medical and surgical aspects. The examination of coal for impurities and ash was another early application which was to be revived some 30 years later in a more practical manner. (Kemp, *Colliery Guardian*, pp. 539-541, Feb. 29, 1924.) A short list of the various applications of X-rays which were actually tried during the time immediately following the discovery is of prophetic interest in view of our later and more systematized knowledge of the subject. They had been used to detect the adulteration of flour and sugar with sand and chalk, and in connection with the general subject of food adulteration the relative X-ray transparency of various foodstuffs was measured by Herr. W. Arnold in Germany. Other applications were:—

To detect pearls in pearl oysters;
To distinguish between real and artificial gems;
To discover the contents of postal parcels;
To recognize explosives and contraband in baggage;
To examine the insulation in electric cables.

USE IN MEDICINE

The extraordinary value of Rontgen's discovery has been nowhere more in evidence than in medicine. Although the biological effects of the rays are so little understood, it seems to be quite clear that physiological cells react to X-rays in different ways and certain organs in the body respond much more readily than others. X-rays are a most efficient cure for ringworm, yet the treatment must be exercised with great caution because of the sensitiveness of the hair follicles to the rays, the action of which may produce baldness. During the World War 1914–1918 this depilatory property was taken advantage of in a singularly ingenious manner. Tissue which was normally hair-bearing was first treated by X-rays, and it was then possible to use it for grafting in plastic surgery. Generally speaking, it has been found that X-rays in small doses tend to stimulate biological activity, while large doses tend to destroy such cells. It has been said that X-rays have a specially selective action on cancer cells and certainly their value in the treatment of cancer has been amply demonstrated. Some Interesting investigations concerning the effect of X-rays on biological tissue have been published by Dr. W. Moppett, of Sydney, Australia (Moppett, *Australian Medical Journal*, vol. i. 15, April 11, 1925), who shows that the difference in the biological action of X-rays of slightly different wavelength is considerable.

The use of X-rays for the treatment of cancer and other tumours in the human body has raised a scientific question of great difficulty concerned with the accurate measurement of dosage. This is a matter of great complexity, as so many important factors are involved. Not only must the X-rays be known with great accuracy, both with regard to their quality (wave-length) and their quantity (intensity), but the intensity must be measured at the exact spot where the rays are intended to operate. A unit of X-ray intensity has been defined as that quantity of X-rays which would produce an ionization current of one electro-static unit in each cubic centimetre of air. Methods of measuring intensity have been various. Some methods seek to transform the energy of an X-ray beam into heat energy and measure it with delicate thermopiles; but the most precise method is to utilize the ionizing properties of the rays and to measure the ionization produced in a given quantity of gas. A rough-and-ready method which finds considerable favour with the medical profession, is to observe the change in colour produced in "pastilles" of barium-platinocyanide by the rays. The colour produced by any particular X-ray intensity is compared with a standard. The information so obtained, however, is not absolute but only relative. Another method of measuring X-ray intensity has been developed by Fiirstenau, which depends upon the property possessed by X-rays of causing the element selenium to change its electrical resistance; but here again the results are only relative.

The use of X-rays as a curative agent has increased enormously since their value was first recognized in medicine, and their importance in this sphere is no longer second to their great value in medical and surgical diagnosis. In this branch they are not only used to examine bones and the coarser structures of the body, but the technique has so improved that the circulatory and respiratory systems are now investigated systematically by radiographical methods. By the administration of an opaque "meal" which usually consists of a barium salt in a palatable form, complicated processes of digestion may be studied by the physician as they proceed.

The question of localization of foreign bodies and foci of disease has received a considerable amount of attention and has developed into a high state of accuracy. The work was first carried out by the late Sir James Mackenzie Davidson, who developed ingenious geometric methods of localization. Stereoscopic X-ray pictures are also used in this connection and, when viewed in a suitable holder or stereoscope, afford a remarkably graphic method.

Another application of X-rays which is now in universal use is concerned with dentistry. By the development of small flexible apparatus and small X-ray tubes it has been possible so to commercialize these units that most dentists possess one as part of their ordinary equipment and the diagnosis of the condition of the roots of teeth has, by the help of X-rays, become a matter of absolute precision. Yet another practical biological application is to be found in veterinary practice, where X-rays have been shown to have considerable value. The Royal Army Veterinary Corps in England possess a specially designed installation which is in constant use.

MODERN INDUSTRIAL APPLICATIONS

The industrial applications of X-rays fall mainly into two divisions, the first being radiography or the photographic method. Under this heading we will also consider the visual examination by means of a fluorescent screen, which has obvious advantages over the photographic method in many instances. The second main division is concerned with the more difficult technique known as X-ray crystal analysis. We will consider these two spheres of usefulness in sequence

In the first place it is in the science of engineering that X-rays have been shown to have the most important place. Engineering materials are constantly a source of weakness. Flaws and cracks in castings are always liable to occur and very often are only discovered when expensive machining has been done; they may then have to be scrapped and the work is wasted. If X-rays could be used to examine all castings immediately they would be universally employed, but unfortunately there is a limiting thickness of metal beyond which X-rays cannot penetrate. In the year 1928 this limiting thickness is about 5 in. of steel. Metal ingots and castings below this thickness are all capable of X-ray inspection although, owing to the complicated shape of many castings, their examination by X-rays is not always a practical thing. The illustrations give some idea of what a radiograph of a casting looks like. The white lines and patches indicate that in these places the metal departs from its normal homogeneity. (Plate I., fig. 9.) They represent flaws, either blowholes, inclusions, or cracks.

A certain number of patches or cracks may occur in a casting and still not be serious enough to entail its rejection. The actual significance of the X-ray picture in terms of mechanical strength is a matter for experience in interpretation. The positions and dimensions of metallic flaws may be calculated with great accuracy by stereoscopic methods. Interpretation is very quickly learnt by engineers and the radiograph becomes an infallible guide as to the soundness of material.

The faults to which castings are so liable demand continuous research in the actual process of casting various metals, and here again X-rays have become a most valuable adjunct to the conventional methods. The castings produced by a certain method

X-RAY DIFFRACTION OF IRON AS IT PROGRESSES FROM THE INGOT TO ONE OF THE FINAL PROCESSES IN MANUFACTURE

1. Piece of ingot of typical cast structure photographed by the usual Laue procedure. The grains are quite large and have been very much strained in cooling
2. Thin bar from the continuous mill showing a considerable reduction in grain size, and amount of strain, as evidenced by the smaller and more uniform spots. The fine radial streaks near the center show the presence of some fragmentation of grains. The slight tendency towards the appearance of groups of spots on the central band indicates the beginnings of a preferred orientation of grains
3. Very fine grained structure of nicely oriented crystals in highly cold rolled iron. The absence of individual spots proves the smallness of the crystals, while the large spots on the various rings show the cubic iron crystals to be, to a very considerable extent, arranged in the sheet with a cube face parallel to the surface of the sheet and a face diagonal parallel to the roiling direction
4. The thoroughly annealed sheet, heat treated after the severe cold roil, is shown completely re-crystallized into slightly strained grains of quite uniform size. No crystal fragments are present and the preferred crystal orientation caused by the cold rolling has completely disappeared, leaving a structure with practically no directional properties

are radiographed and weak places noted, the technique is then suitably modified and the resulting castings again radiographed and so on. Among the castings and forgings that are at present radiographed on a service routine scale are those for gun carriages, aeroplane parts, locomotive parts, high pressure steam installations, and expensive steel cylinders, together with many others of specialized importance. The method is in general use in America and installations are in use for the same purpose in the factories and dockyards of the British Government.

Metallic welding affords another wide field of X-ray usefulness. All welding is liable to faults and even the best methods depend very largely upon the skill and care of the individual workman. There is no method save X-rays of testing a weld without destroying it. The illustrations show the sort of X-ray pictures yielded by good and bad welds. As a result of an extensive experience it is customary at Woolwich to estimate the mechanical strength of a weld by a mere examination of the radiograph.

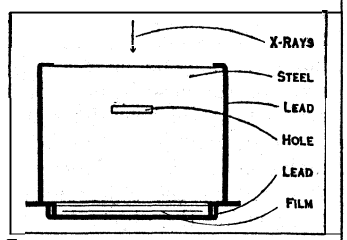

FIG. 6.— DIAGRAM ILLUSTRATING METHOD OF SCREENING TO ELIMINATE SCATTERED RADIATION

Another X-ray application has its main expression in the inspection of assembled articles, such as fuzes, where the finished product depends for its proper functioning on the completeness and correct assembly of its internal components. In such cases elaborate and expensive systems of inspection are often necessary. In many instances X-rays afford an accurate method of performing such a check. The inspection departments of the British Government have specially designed X-ray equipment for routine use in suitable cases.

Wooden structures, such as aeroplane spars, also offer a suitable field for X-ray application. Worm holes, resin pockets, and graining may be determined with great exactness.

A striking example of the value of X-rays was experienced in the World War, when strange ammunition of unknown content was radiographed before being cut up for examination, thereby avoiding all risk of accident.

In the course of a research on glued joints it was necessary to determine the disposition of the glue. By adding a small percentage of a heavy salt to the glue, thereby rendering it opaque to X-rays, the dispersion of the glue in the joint was shown with clearness in a radiograph. Motor tyres may be examined by X-rays to determine the position of the internal canvas or cords. Electric insulating materials, such as ebonite and built up paper materials, may be examined for the presence of impurities and electrically conducting particles. Abrasive wheels have been examined for cracks, and fireclay pots used in the manufacture of glass have been inspected for the presence of harmful metallic impurities. X-rays have also been used by Customs authorities to investigate the contents of sealed packages. Real pearls may be distinguished from imitation by X-rays because the real pearl emits a visible fluorescence under the action of the rays. Diamonds, which are very transparent to X-rays, may be distinguished from imitations, which as a rule are much more opaque. The use of X-rays to demonstrate the fit of shoes and boots is now *a* familiar sight in a boot shop. The exact measurement of the fit of screw threads is a matter that has given rise to a good deal of difficulty; X-rays are now being used for this purpose with remarkable success.

Dr. Heilbron, of Amsterdam, conducted some very remarkable and beautiful experiments with X-rays on pictures painted by old masters. The pigments of modern painters are in general much less opaque to X-rays than those used many years ago. Dr. Heilbron was able to produce X-ray evidence of extraordinary alterations having been made to some pictures. One picture examined by Dr. Heilbron was by Cornelis Engelbrechtsen, where the X-ray picture showed the figure of a vested priest which had been covered at a later date by the painted portrait of a woman. This hidden feature of the original painting had been undiscovered for 400 years. Another picture, a representation of the Madonna by Geertgen van St. Jans, was shown by the X-ray picture tc have originally included an infant in the arms of the figure, which had subsequently been painted out. Many other pictures were examined with most interesting and striking results.

The development of X-ray apparatus has resulted in the production of small and portable equipments for various purposes, among which may be mentioned a set for the use of plumbers and builders to enable them to locate the position of wires and pipes in the walls and floors of buildings. The rays have also been used to detect metallic corrosion in slabs of ferro-concrete. From the examples that have been quoted it will be realized that it is difficult to imagine an industry where X-rays will not ultimately prove of service. Such unlikely specimens as chocolates, golf balls, and even elephants have been subjected to the process with useful results. The biological properties of X-rays have been pressed into industrial service in that they have been used to sterilize tobacco and cigars, and experiments have been carried out to discover whether they could be usefully employed to destroy certain harmful larvae in packing cases required for transhipment of sensitive materials.

The second main sphere of industrial X-rays depends upon the fact that, when suitable technique is employed, the constituent atoms and molecules which form a crystal reflect X-rays in a perfectly definite and regular manner, producing what is known as an X-ray spectrogram.

Different materials, when suitably excited, produce different and characteristic X-rays, consequently X-rays may be used as a method of chemical analysis. The method affords a very reliable qualitative test, and considerable work has been done in developing it as a more practical system of quantitative analysis. In certain cases X-ray chemical analysis has advantages over the conventional method, for example in certain mixed salts it is impossible by ordinary chemical methods to say how the tiny crystals of the mixture are made up. Each element, however, yields its own characteristic X-ray wave-lengths under suitable stimulus, and therefore accurate information as to the constitution of a chemical mixture may be obtained by an examination of what is called an emission spectrogram. Impurities in materials may also be detected by the same technique.

It was due to the fact that each element emits characteristic X-rays that the missing element of atomic No. 72 was discovered in 1923 by Coster and Hevesy of Copenhagen[1] and called by them Hafnium, out of compliment to the place of its discovery (Hafnia was the old name for Copenhagen). Scientific considerations led these investigators to examine the X-ray spectra yielded by certain minerals, and in the course of their investigations they discovered spectrum lines of the frequency known to be characteristic of the missing element. (See HAFNIUM.)

Practical applications of X-ray spectroscopy should be mentioned; but it is to be borne in mind that this aspect of the work was of much later development than radiography and involves a much more specialized knowledge, therefore it is practised chiefly in physical laboratories. Although many of the results have the greatest value in industry, yet the method, by reason of its specialized character, has not the same general use as radiography.

All substances of a crystalline nature are suitable specimens for X-ray spectroscopic investigation, for example the investigation of the minute structure of cellulose by X-rays has had the greatest value in the textile and explosive industries.

In metallurgy this particular use of X-rays has achieved universal recognition as a method of investigating the structure of metals in a way that is quite impossible by any other agency. By reason of the limiting value of the wave-lengths of visible light, there is a degree of smallness beyond which no microscope will ever be of value; X-ray spectroscopy, on the other hand, enables crystal structure to be studied with great accuracy. The effect of heat treatment of steels is a subject in which X-rays have considerable contributory value. The change in crystal structure in metals consequent upon mechanical treatment, such as rolling, may be shown by the differences produced in the resulting X-ray

[1] *Nature*, vol. iii. p. 79 (Jan. 1923).

spectrogram. The study of strain in metals is greatly facilitated by the use of X-ray spectroscopy, inasmuch as any condition resulting in the alteration of atomic structure may show itself in properly prepared X-ray spectrograms. The method has also been of assistance to the metallurgist in his study of metallic alloy systems.

Interesting work has been done on the examination of pivots by X-rays. By reason of their structure many materials have

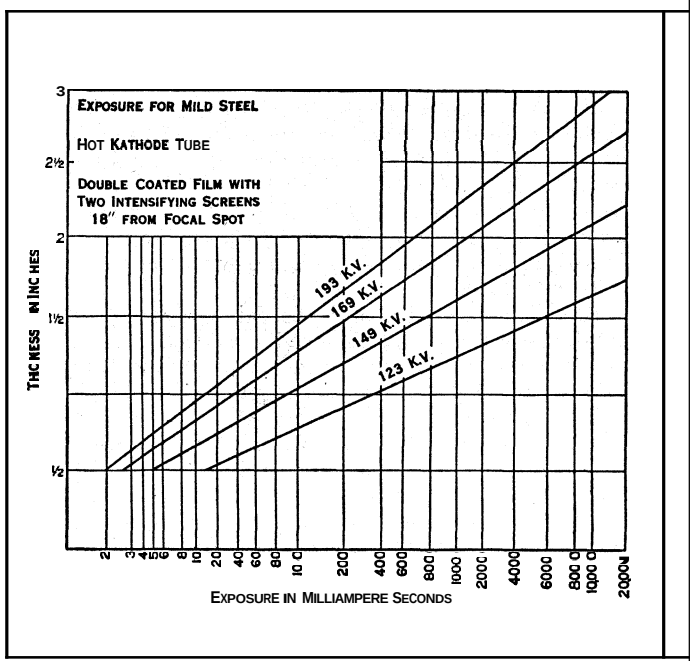

FIG. 7.—SPECIMEN OF PRACTICAL EXPOSURE CHART

much greater strength on one or two points on their surface than on others. The diamond, for example, may function perfectly as a pivot if the right spot is chosen to bear the strain. This particular spot depends upon the direction in which the constituent carbon particles are arranged. The regularity of arrangement that characterizes the diamond results in the formation of certain cleavage planes (or planes of maximum weakness), and a study of the arrangement of the carbon atoms in any particular diamond by X-rays will enable the experimenter to select that particular spot, with regard to these planes, most able to withstand wear. Explosives may be subjected to this special method of analysis in order to study the effect of atomic arrangement on their explosive properties, and their general sensitivity and stability; and also to detect impurities which may manifest themselves in the course of preparation or storage.

RADIOGRAPHIC TECHNIQUE

It is well to remember that radiography is the production of a shadow picture. The shadows exist in the picture because X-rays are absorbed to different degrees by different media. If we were to radiograph a perfectly homogeneous piece of muscle or steel we should obtain a photographic plate quite uniformly blackened because the X-ray absorption would be quite uniform. The absorption of X-rays by any material depends, firstly, upon the material itself—in general the higher its atomic weight the more absorbent it is—and, secondly, upon the penetrating power or wave-length of the X-rays. The latter condition depends, generally speaking, on the voltage which is applied to the terminals of the X-ray tube. Thus, remembering the first condition, lead is more absorbent than iron, iron more than aluminium, and aluminium more than organic substances such as flesh. At the same time, if we use an X-ray tube having a tungsten target the X-rays will be more penetrating when generated by 200,000 volts than at 100,000 volts, and so on. If a beam of X-rays of suitable penetrating power is passed through an object of varying thickness or varying composition the emerging rays (which affect the photographic plate) will have different intensities corresponding to the variations in the object and the result will be a mixture of shadows of varying degrees of intensity. For example, a hidden cavity in a piece of metal means that the total thickness of the material is less at that particular place, and the X-ray absorption will also be less; therefore we shall obtain more intense X-rays in that area, resulting in a darker patch on the negative. If, instead of a photographic plate, we are using a fluorescent screen, we shall see a brighter patch on the screen corresponding to the more intense radiation.

Unfortunately, of the energy represented by the X-rays that fall on the photographic film only a very small fraction (less than 1%) has any photographic effect, the remainder simply passes through the emulsion without affecting it. The photographic effect, however, may be increased by the use of suitable intensifying screens that absorb more of the rays and in consequence emit actinic rays which reinforce the photographic image.

When an object is radiographed only a part of the incident radiation emerges, a large amount is absorbed and, as we say, scattered by the object itself. Not only is the radiation scattered inside the object but also at all its surfaces; and if this general scatter, which may be likened to a fog, reaches the photographic film its effect will be to produce photographic fogging and so destroy much of the valuable detail of the picture. One of the most important points, therefore, in radiographic technique is, first, to suppress all the X-rays coming from the tube except, those which pass directly through the specimen to the photographic film and, secondly, to arrange that those rays which are scattered by the surfaces of the specimen itself shall be prevented as far as possible reaching the photographic emulsion.

The first condition is usually realized by enclosing the X-ray tube in a box made of a highly absorbent material; by reason of its high atomic weight, combined with its comparative cheapness, metallic lead is usually adopted for this purpose. The box is fitted with an adjustable aperture or diaphragm to control the size of the emergent X-ray beam.

There are many methods of realizing the second condition and the choice is governed by the character, shape, and size of the object to be radiographed. For medium sized objects it is often convenient to protect all the surfaces by sheet or powdered lead, and to protect the film in the same way. The diagram will illustrate the general method employed. When the object has very irregular edges it may be convenient to use a wax impregnated with lead or other heavy element. Another method is to immerse the specimen in a liquid having about the same coefficient of absorption as the specimen. In order to obtain good radiographs it is very necessary to centre the focal spot of the X-ray

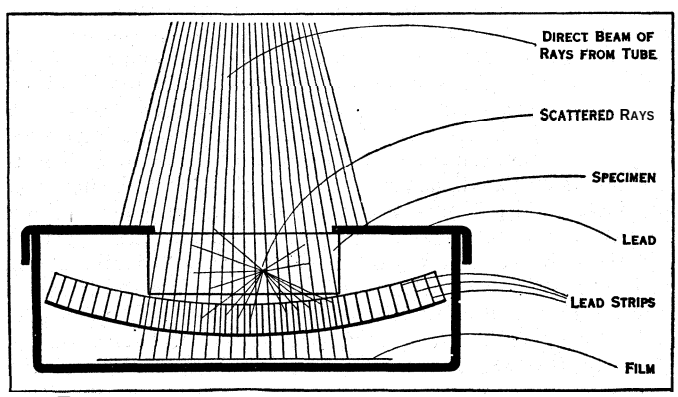

FIG. 8.— DIAGRAM ILLUSTRATING USE OF A GRID DIAPHRAGM

tube target over the middle or most important part of the object. The rays must fall nearly perpendicularly on the film, as obliquity of the rays will result in distortion and consequent loss of detail in the image.

The question of the correct exposure conditions is one of the most troublesome factors in successful radiography and calls for a great deal of experience, for it is not easy to reduce it to any general or simple rule which will fit all cases. The quantity of X-rays obtained from a tube is measured by the number of milliamperes of current passing through the tube, and exposure

is usually expressed in terms of the product of milliampères and time, as milliampère seconds. Both the intensity and the quality of the X-rays govern exposure, and the latter also depends, therefore, upon the voltage impressed on the X-ray tube. If we wish to obtain a radiograph of a substance easily penetrable by X-rays, such as an arm, we should use a voltage of say 70,000 volts; but, on the other hand, if we wished to radiograph a thick mass of steel we should have to employ a voltage from 200,000 volts upwards. The diagram shows a typical exposure chart which has been worked out under practical conditions for mild steel.

Something has been said about the difficulty of overcoming the bad effect of scattered X-rays on a radiograph when such scattering occurs at the surfaces and edges of the specimen, and also in the surrounding medium, but the scattering which occurs *inside* the specimen has also a most deleterious effect. Much of this scattering is lost by absorption in the specimen but a great deal of it will emerge and affect the photographic emulsion, and as by its very nature it has no definite direction it will cast no definite shadow but it will merely produce a general fog. The manner in which technique seeks to overcome this difficulty is by the use of what is known as a grid. This piece of apparatus has many different forms but the principle involved is always the same. By the interposition of suitably disposed absorbing surfaces between the specimen and the film, the radiation which has not a suitably defined direction is absorbed and so prevented reaching the photographic emulsion. The diagram illustrates the general method of arrangement and shows the effect of the absorbing strips. It is obvious that the use of such a grid will result in an image of the strips appearing in the photographs as a series of lines. Although in some cases this may not detract from the value of the radiograph, yet in others it may be very undesirable. In the majority of such grids provision is made to overcome this difficulty by arranging for the system of absorbing surfaces or grids to travel across the film during the exposure at a uniform speed and in a direction at right angles to the length of the grids. Thus each part of the film is covered in turn for the same time by each grid so that no shadow results. The use of these grid diaphragms for all radiography, both medical and industrial, has become universal practice and the consequent improvement in general results is very striking.

X-ray Protection. — With the increasing application of X-rays to problems of industry the question of protection of the operator has become even more important than hitherto. X-rays are known to have serious effects upon the health of those who are exposed to their action. Fortunately it is possible, by careful design of plant, entirely to eliminate this risk. In most countries expert committees have been appointed whose business it is to lay down regulations governing the type and amount of protection that shall be used for any particular design of X-ray installation, and prospective users will be well advised to employ an expert consultant to design and certify the safety of installations required for all special purposes. The presence of high tension electric wires produce certain chemical effects in the atmosphere of the room in which they are installed. This necessitates somewhat elaborate ventilation systems to provide for a complete and frequent change of the atmosphere. Here again the expert should be consulted. If X-ray apparatus is carefully designed and the rules for its operation scrupulously adhered to, there need be no anxiety concerning the dangers of the rays. The lamentable loss of health and even of life that has been recorded among X-ray operators is, to a certain extent, due to the fact that the technique was new and in course of development, and it was quite impossible then to foresee many of the injurious effects that have now become well known. *See* RADIOTHERAPY; RADIOLOGY; X-RAY TREATMENT. (E. V. P.)

X-RAYS AND CRYSTAL STRUCTURE. The idea of a regular, underlying structure has always been at the back of scientific studies of crystals. It is suggested by their very appearance, and it becomes almost a necessity to explain the regularities of the laws of the arrangements of the external faces, and the physical properties of the crystals. Christiaan Huygens, in the 17th century, first put forward the idea that a crystal was essentially a regular piling of atoms or molecules similar on a minute scale to a pile of shot or to the blocks of the Great Pyramid. It was not until the beginning of the 19th century, however, that the Abbé Hauy gave it a firm mathematical footing. (*See* CRYSTALLOGRAPHY.)

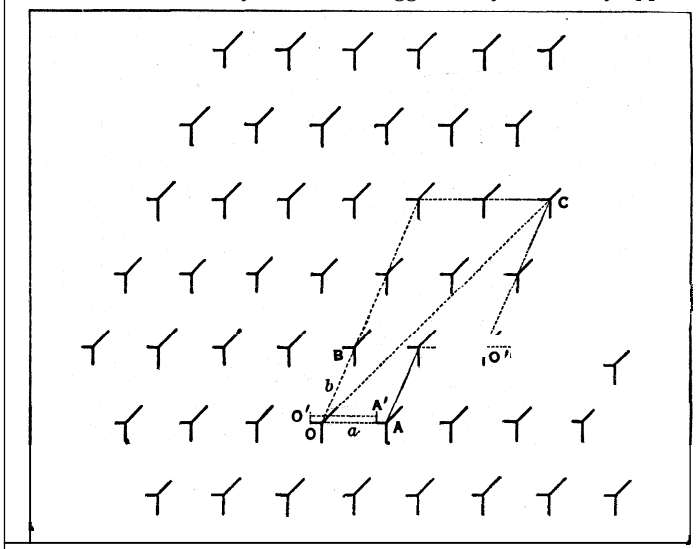

FIG. 1A

PART I. THE **ANALYSIS OF STRUCTURE**

The idea implicit in Haüy's work was that crystals consist of a regular ordering of exactly similar molecules in three dimensions.

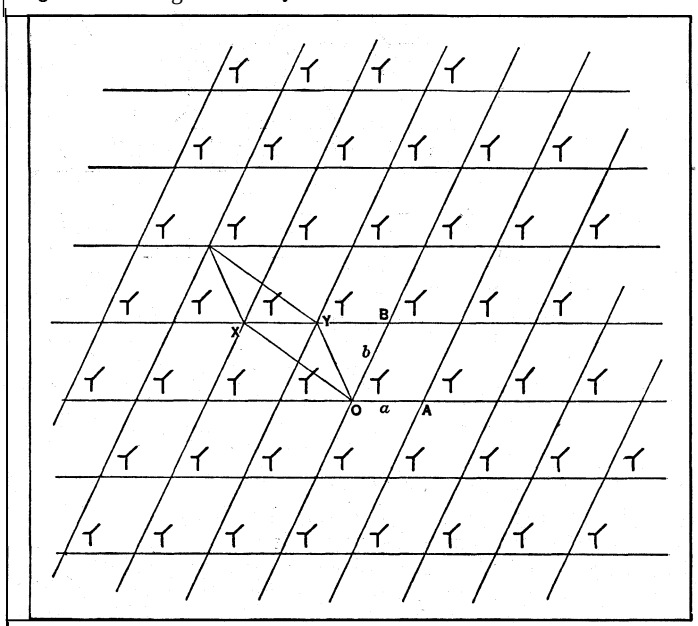

FIG. 1B

This is easiest to understand from its two dimensional analogue. In fig. 1A a set of similarly oriented identical patterns is shown, repeated, supposedly indefinitely. **A** certain movement **O–A** takes me from a point O of one pattern to a corresponding point **A** in

another. Now an exactly similar movement O'A' would take me from any point of the pattern to the corresponding point, or from any point in any pattern O'' to a corresponding point on another A''. Similarly, the different movement O–B may be seen to have the same property. They are the so-called translations of the crystal. Now we can easily see that any translation O–C can be made up of a succession of translations 0–A and O–B, so that 0–A and O–B may be taken as the primitive translations or the axes a, b of the crystal. All the points derived in this way make up the

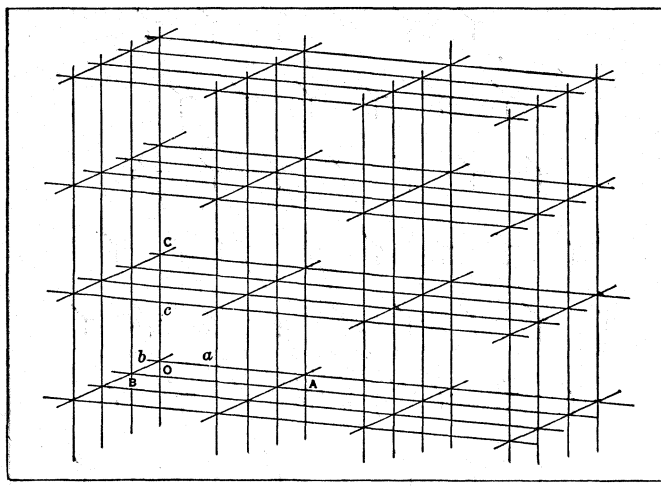

FIG. 2

lattice and by drawing lines parallel to the axes (fig. 1B) we define the cell of the crystal, the contents of all cells being identical. Of course, we might have chosen another set of axes, OX, OY instead, but the lattice is completely determined in either case by the lengths of the axes and the angle between them, and the whole crystal by the lattice and by the co-ordinates of each point in a single cell, referred to its axes as units. To extend this to three dimensions, we simply have to take another axis *c*, not in the plane of a–b, and the cells become parallelopipeds, extending in space in all directions. (See fig. 2.)

Symmetry.— Now there are other ways than translations in

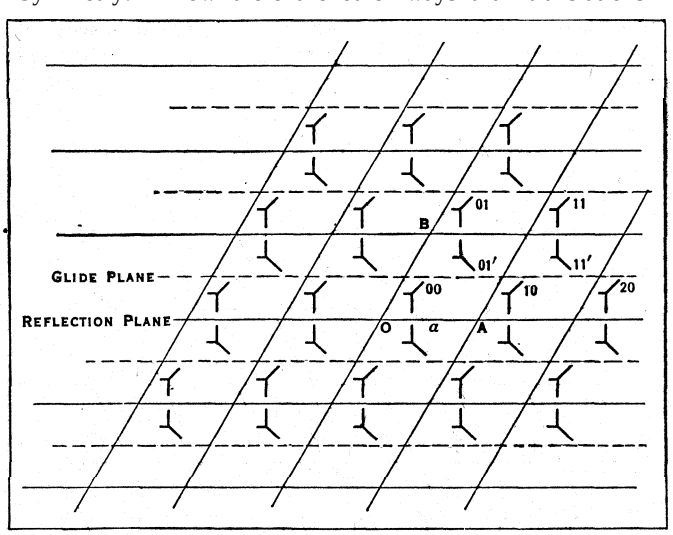

FIG. 3A

which identical patterns may appear. For instance, in fig. 3A each pattern is accompanied by its reflection in the plane **0–A**, imagined perpendicular to the plane of the paper; or in ***fig.*** 3B, by the two other patterns made by turning it about a three-fold axis through O. In fig. 3C we see both of these together. It is only necessary to specify the positions of one of the asymmetric patterns in the cell, and the nature of the symmetry, to define the crystal as completely as before. The elements of symmetry permitted in space lattices are essentially those of crystallography, that is, two, three, four and six-fold axes, centres of symmetry, reflection planes and axes of the second sort. (See **CRYSTALLOGRAPHY.**) But there is the important condition that all axes must be translations and all planes lattice planes, and in addition, there are glide planes and screw axes. In fig. 3A we have the two rows of patterns (marked $\frac{01'\ 11'}{00\ 10\ 20}$), each of which can be seen to be a reflection of the other in a plane, but which has also been moved on a half translation of the cell. This is called a glide plane re-

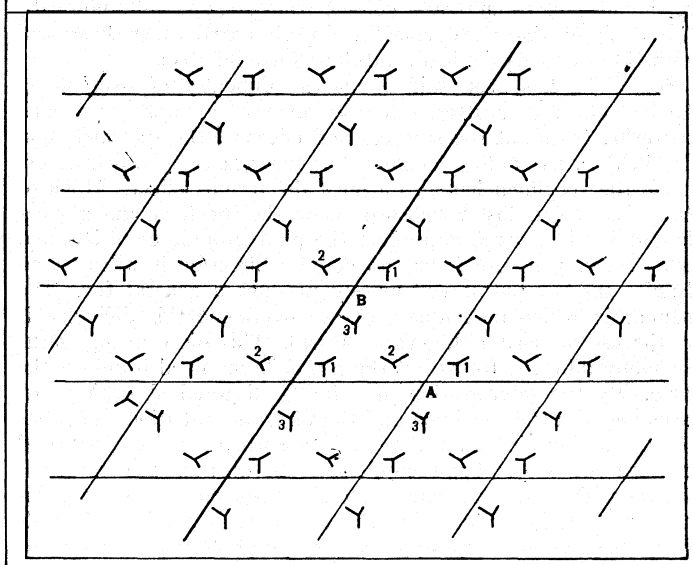

FIG. 3B

flection. An ordinary axis of symmetry is a pure rotation, but screw axes move the pattern a fraction ($\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{3}$ or $\frac{1}{6}$) of the lattice translation, parallel to the axis in each operation, so that at the end of a complete turn the pattern has moved through one translation, *e.g.*, three-fold screw axes perpendicular to the paper are shown in fig. 19. Screw axes may be right or left handed. In nature they are familiar as phyllotaxy, the arrangement of leaves on a stem.

The considerations of symmetry give us an ultimate method of classifying any regular arrangement of patterns in space. First we can divide the lattices into the fourteen types of Bravais

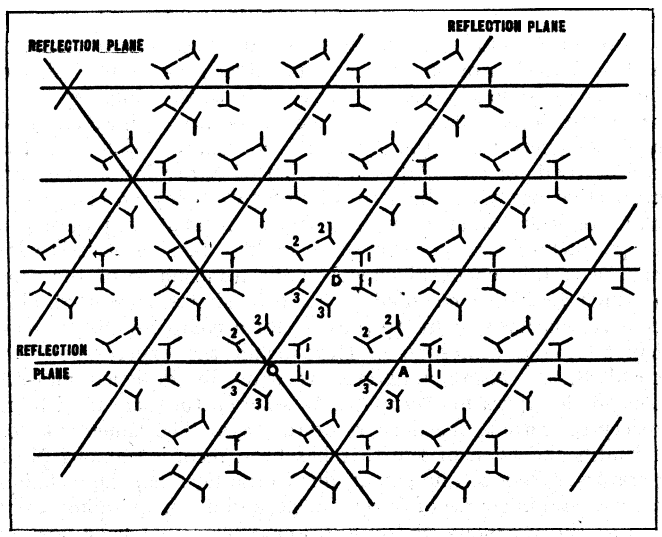

FIG. 3C

(*1811–1863*). (See fig. 4.) The seven systems of symmetry, cubic, tetragonal, hexagonal, rhombohedral, orthorhombic, monoclinic and triclinic, give rise to the simple lattices (i.) Γ_r, (iv.) Γ_t, (vi.) Γ_h, (vii.) Γ_{rh}, (viii.) Γ_o, (xii.) Γ_m, (xiv.) Γ_{tr}. But besides these there exist a number of face centred lattices [where the primitive translation is not from corner to corner of a rectangular face but to its midpoint]; one face centred (ix.) Γ_o', (xiii.) Γ_m', or all face centred (iii.) Γ_r'', (xi.) $T_o\Gamma''$. Lastly, there are the **three**

body centred lattices [where the primitive translation is to the centre of a rectangular parallelopiped rather than to its opposite corner]; (ii.) Γ_r', (v.) Γ_t', (x.) Γ_o''.

Next, we can divide the symmetry further, according to the nature of the axes and planes and the presence or absence of centres of symmetry into the thirty-two crystal classes. (*See* CRYSTALLOGRAPHY.) But the existence of glide planes and screw axes permits of still further divisions inside each class, and for each variety of lattice possible in that class. If these two are specified, the complete inner symmetry or space group of the crystal is given. The determination of the two hundred and thirty possible space groups was begun by Sonchke (1842–1897) and finished by Schoenflies, Fedorow and Barlow at the beginning of the present century.

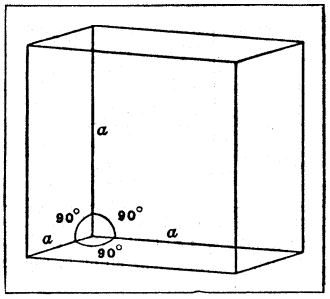

FIG. 4.—(I.) SIMPLE CUBIC LATTICE Γ_r equal axes of length ("a" at right angles)

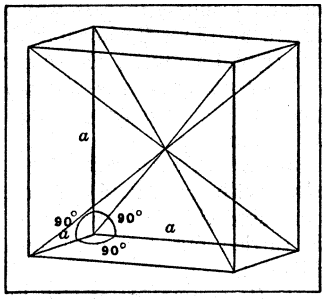

FIG. 4.—(II.) BODY CENTRED CUBIC LATTICE Γ_r' (equivalent point in centre of cube)

Laue's Discovery.—But though the geometrical frame-work for the complete description of crystal structure had thus been worked out, there remained no way of applying it, for it was impossible to determine either the nature of the lattice, the existence of screw axes and glide planes or even the size of the cell, much less the positions of the atoms in it. Yet the labour of the mathematicians was not wasted. Soon after they were concluded, there was a controversy as to the nature of X-rays. Some maintained they were corpuscular and others that they were waves analogous to light. However, no one had then succeeded in diffracting them with a grating. (*See* LIGHT.) This seemed to show that if they were waves, their wave lengths must be much less than that of visible light, 10^{-5} cm. Now early in 1912 it occurred to von Laue, then a young physicist at Munich, who was in touch with the Crystallographic School of Groth, that the lattices of crystals, of which the little that was known indicated a periodicity of 10^{-8} cm., were of the right order to act as a grating for X-rays, and, if they were waves, to diffract them in definite directions. Friedrich and Knipping carried out the experiment of passing a narrow beam of X-rays through a crystal with a photographic plate behind it. The experiment was strikingly successful. The plate was covered with a regular pattern of spots, which was what von Laue had predicted. This experiment gave the key both to the nature of X-rays and the structure of crystals.

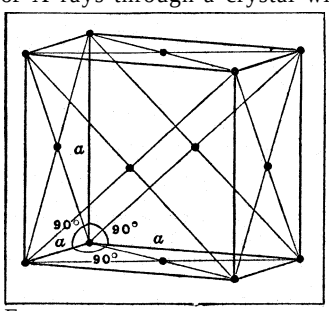

FIG. 4.—(III.) FACE CENTRED CUBIC LATTICE Γ_r'' (equivalent point at centres of cube faces)

The Braggs' First Crystal Analyses.—The new discovery aroused immediate interest. In England it was taken up by Sir William Bragg and his son, W. L. Bragg, who in the same year determined the first crystal structures, those of rock salt and zinc-blende; and at the same time developed a method of analysis which was to be the basis of all further work. The way in which they accomplished the double task of determining the wave lengths of X-rays and the structure of crystals is told in their classic book, "X-rays and Crystal Structure." Here we will simplify it by assuming from the start that we can produce X-rays of single wave length λ (most easily from the fluorescent radiation of metals such as iron, copper and rhodium. *See* X-RAYS, NATURE OF).

Bragg's Law.—The action of X-rays on crystals is best dealt with as selective reflection from crystal planes. If a set of planes be drawn through corresponding points in a crystal (see fig. 5A), not necessarily in any relation to the superficial faces, these will be a constant interval apart. This is the spacing of the plane d_{hkl}; ([hkl] are the Millerian indices, that is, the reciprocals of the fractional intercepts on the axes. *See* CRYSTALLOGRAPHY). If a train of waves falls on such a set of planes p (see fig. 6) at glancing angle θ, each plan will reflect a small part of the wave train regularly and let the rest through to the next plane. Now, in general, the reflected wave trains from successive planes will be out of phase with each other, will interfere and no reflection will result. (*See* LIGHT: *Interference.*) But if the path distance of the wave passing from plane to plane is a multiple of the wave length A, all the reflected waves will be in phase and the train as a whole will be reflected by the crystal. This occurs when and only when

$$\sin\theta = n\lambda/2d.$$

This is the fundamental relation of crystal analysis known as "Bragg's Law." The integer n is the so-called order of the reflection. Thus the same plane will reflect at angles $\theta_1, \theta_2 \ldots \theta_n$, where $\sin\theta_1 = \frac{\lambda}{2d}$ $\sin\theta_2 = \frac{2\lambda}{2d} \ldots \sin\theta_n = \frac{n\lambda}{2d}$ for the same wave length. The higher the order or the smaller the spacing, the larger the angle of reflection. No plane whose spacing is less than half the wave length reflects at all. It is only necessary to measure θ, the angle at which X-rays of known wave lengths are reflected by a crystal, to know the spacing of its lattice planes.

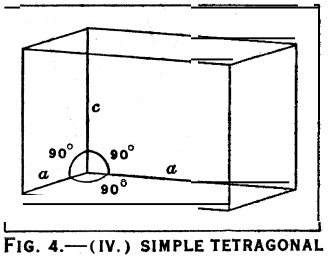

FIG. 4.—(IV.) SIMPLE TETRAGONAL LATTICE Γ_t (two equal axes "a" and "c" all at right angles)

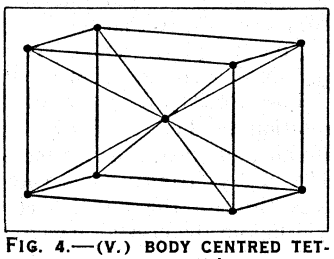

FIG. 4.—(V.) BODY CENTRED TETRAGONAL LATTICE Γ_t' (equivalent point in the centre of cell)

But X-rays are able to give much more information than this. Consider a crystal with two scattering points in the cell of scattering Powers A and B. (*See* fig. 5B.) Wave trains scattered from the A and B plane are now out of phase and necessarily interfere. If the B planes are xd from the A's, the resulting intensity of the nth order of reflection will be proportional to $(A+B\cos 2\pi nx)^2+B^2\sin^2 2\pi nx$. If, for instance, B was half way between two A's, $x=\frac{1}{2}$, this would become $(A+B)^2$ for the even orders and $(A-B)^2$ for the odd. The even orders would be strong and the odd weak, and these would vanish if A and B were equal, and the plane in this case is said to be halved. A crystal with more scattering points gives rise to a more complicated expression but it should be clear that the intensity of reflection is both an indication and a check on the positions of the scattering centres inside the cell.

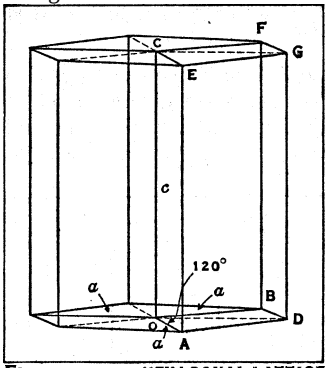

FIG. 4.—(VI.) HEXAGONAL LATTICE Γ_h (Three equal axes "a" at 120° and another "c" at right angles to them)

The chief experimental methods are therefore devised for a double purpose. Firstly, to find the glancing angles for the X-rays reflected by the different planes of the crystal, and secondly, to measure the intensity of the X-rays reflected. There are four chief experimental methods.

In the Bragg ionisation spectrometer (see fig. 7) the X-rays from the tube inside the lead box pass through the two slits

which limit them to a narrow beam, and meet the crystal mounted to rotate about a vertical axis. The reflection beam is received in an ionisation chamber, in which there is an absorbing gas such as methylene iodide, producing ions which charge the electroscope. The crystal and chamber are moved to record each reflection. Their angular position gives the glancing angle, while the ionisation current is a measure of the intensity. The Bragg spectrometer undoubtedly provides the most thorough method, but it is slow in action and suitable only for large crystals, so that methods depending on the photographic action of X-rays have also been developed.

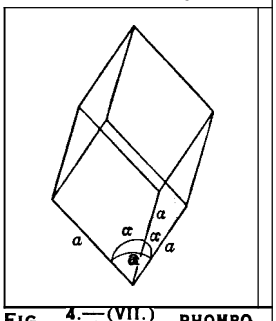

FIG. 4.—(VII.) RHOMBOHEDRAL LATTICE Γ_{rh}
Three equal axes (a) marking an angle (α) with each other

The Rotation Method.—For the rotation method originally due to de Broglie, an apparatus like fig. 8 is used The X-rays from a tube (not shown) pass through the fine barrel aperture and fall on the crystal, which is rotated uniformly on the spindle, driven by the motor, As each crystal plane comes into a reflecting position, the reflected ray registers on the photographic plate, producing a pattern such as shown in fig. 9. Each plane reflects four times per revolution, giving the photograph a symmetrical appearance. From the position of the spot on the plate, the spacings or the indices of the planes can be calculated. An important property of the rotation method is that if the crystal is rotated about a translation a of the lattice, all the reflected rays lie on a set of cones of angles ϕ_n where $\sin\phi = \frac{n\lambda}{\alpha}$ these cones intersect the plate in hyperbolae called layer lines *(see* fig. g) and their distance apart is the best measure of the true axes of the crystal. It can be seen from the photograph that the spots are of very different intensities. These are usually estimated by eye, as strong, medium, weak, etc., so that the method is definitely inferior in this respect to the ionisation spectrometer.

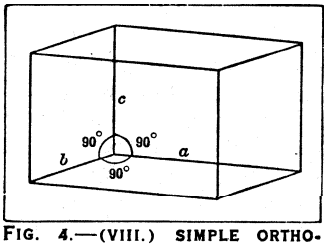

FIG. 4.—(VIII.) SIMPLE ORTHORHOMBIC LATTICE Γ_o
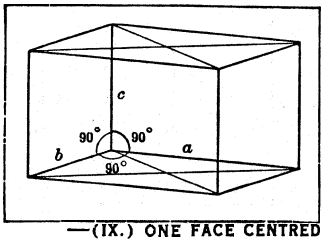
Three unequal axes a, b, c, at right angles

The Powder Method.—In the powder method, due to Debye and to Hull and Scherrer, a crystalline powder is used instead of a single crystal, depending on the fact that among so many grains some will be in the exact position to reflect Consequently from the central beam diverge a set of cones each corresponding to the reflection from a single plane and forming circular rings on a plate *(see* fig. 10A) or so-called Debye curves on a film bent round a cylinder *(see* fig. 10B). Unfortunately, many planes often have the same or nearly the same spacings, which causes them to be confused and limits the method to simple crystals. However, as it is the only method for substances which cannot be obtained as single crystals, it is very useful, particularly for metals.



—(IX.) ONE FACE CENTRED ORTHORHOMBIC LATTICE Γ_o' as (viii.) but with an equivalent point at the centre of one pair of faces

The Laue Method.—This depends on a different principle from the first three. Here the crystal is kept fixed, and a beam of white X-rays, that is with wave lengths ranging from between ·25 to ·5 A. (Angstrom units $=10^{-8}$ cm), is passed through it, usually parallel to a crystallographic axis, The apparatus used is the same as before *(see* fig. 8) For a great number of planes there will always be some wave length which is right for reflection and a spot is formed, the position of which depends only on the angular position of the reflecting plane. Thus the Laue method gives no information as to spacing. But, as can be seen from the photographs *(see* figs. 11a and 11b) it gives an excellent picture of the symmetry of the crystal and also of the relative intensities of a great number of reflecting planes.

Plainly, though any one of these methods but the last could be and has been used alone for crystal analysis, it is much better to use all to amplify and check each other's results. In this way we arrive at the experimental data for crystal analysis; *the spacings* and *intensities of the X-ray reflections of a number of planes of known indices.*

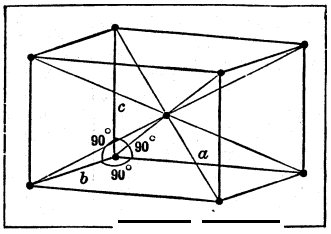


FIG. 4.—(X.) BODY CENTRED ORTHORHOMBIC LATTICE Γ_o'' as viii. but with an equivalent point in centre of cell

Stages in Structure Analysis.—With these data the actual analysis divides into two parts. It is carried out schematically as follows:

1. *Determination of* **Cell** *Size.* The lengths of the three axes, *a*, b, *c,* are found from rotation photographs or from the spacing of planes given by the formula

$$d_{hkl} = \frac{1}{\sqrt{\left(\frac{h^2}{a^2} + \frac{k^2}{b^2} + \frac{l^2}{c^2}\right)}}$$

for orthogonal crystals. For monoclinic and triclinic crystals it is more complicated and here the angles between the axes are usually obtained from the external crystal form. It is easiest to use the pinacoid spacings (100) (010) (001), which give the axes directly, but these may be halved, so for the true cell, one general plane (hkl) at least must be taken.

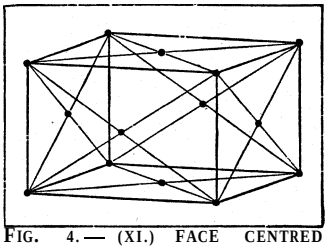

FIG. 4.—(XI.) FACE CENTRED ORTHORHOMBIC LATTICE Γ_o''' as (viii.) but with equivalent points in centres of all six faces

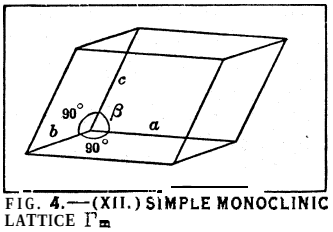

FIG. 4.—(XII.) SIMPLE MONOCLINIC LATTICE Γ_m
Two axes a and c making an angle β with each other and one axis b perpendicular to both of them

2. *Determination of the number of molecules per cell.* If *D* is the density of the crystal, and V its volume in cu A. ($V = abc$ for an orthogonal cell), then the cell will contain Z molecules of molecular weight M, where $Z \times M \times 1{\cdot}66 = D \times V$. ($1{\cdot}66 \times 10^{-24}$ gm. being the weight of an atom of hydrogen.)

3. *Determination of the Lattice Type.* This is done by means of the halvings of planes of the type (hkl). In simple iattices there are no inner regularities and all kinds of planes appear, whereas in centred lattices, certain planes are inter-spaced identically so that they do not reflect in odd orders and are said to be halved. A halving when h+k is odd will, for instance, indicate an *a c* face-centred lattice Γ_m' *(see* fig. 4 [xiii.])

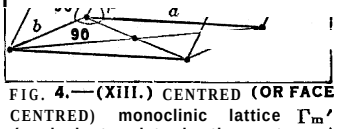

FIG. 4.—(XIII.) CENTRED (OR FACE CENTRED) monoclinic lattice Γ_m' (equivalent points in the centres of [a. b] faces)

4. *Determination of Space Group.* It is first necessary to know the crystal class. This must be done by the methods of ordinary crystallography Laue photographs are useful in detecting axes, but unfortunately, X-ray methods cannot distinguish directly between crystals with or without a centre of symmetry. Next, screw axes and glide planes can be detected, for the former cause all orders of the plane normal to it to disappear except that corresponding tc a multiple of the screw translation—e.g, in quartz, owing to the trigonal screw axis, perpendicular to the *c* plane, only

the third, sixth, ninth, etc., orders of this plane reflect. Glide planes, on the other hand, halve whole sets of planes of the type *(hko)*, where $h+k$ is odd. Space groups are usually found by the use of tables, of which those of Astbury and Yardley and Wyckoff are most used. They are denoted by a complex symbol, such as D^4_{6h}, where D_{6h} stands for the symmetry class and ^{4} is the ordinal number in a space group table, usually that of Schoenflies.

Once the space group is known and the number of molecules per cell, the symmetry of the individual molecule follows, which is in general lower than that of the crystal. Further, the conditions of symmetry fix the positions of the atoms within certain limits. If we designate the co-ordinates of the atom, referred to the axes a b c as u v *w*, the so-called parameters of the atom, then the symmetry conditions may fix the values of *u v w* within certain limits. If there are very few atoms of a particular kind in the cell, *u* v *w* may become o o o or 1/2 1/2 1/2, that is, the atom must be at a corner or in the centre of a cell. Or two parameters may be fixed, o o *v*, fixing the atom anywhere on the c axis; or o v w, fixing it anywhere in the a plane. However, it is only in the simplest cases that the symmetry positions fix all the atomic positions. Usually, a set of independent parameters are left undetermined, which may be only one, as in graphite, or twenty or more as in a silicate. The difficulty of fixing parameters leads to many crystals being left at this stage, but though it is indirect, the fixing of parameters by means of intensity considerations is far the most interesting part of crystal analysis.

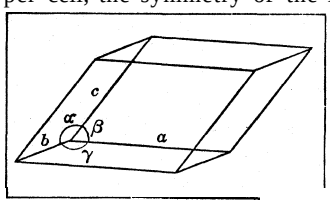

FIG. 4.—(XIV.) TRICLINIC LATTICE Γ_{tr}
Three unequal axes a, b, c, inclined at angles α, β, γ, to each other

The method consists in assuming certain values for the parameters and calculating from these the theoretical intensity of reflections from a set of planes. These are compared with the observed intensities, and the process repeated by trial and error, until the theoretical and observed intensities agree within the errors of the experiment. In many ways this method resembles the solution of a cross-word puzzle. The cell and space group provide the square and the pattern, the atoms the letters and the intensities the clues.

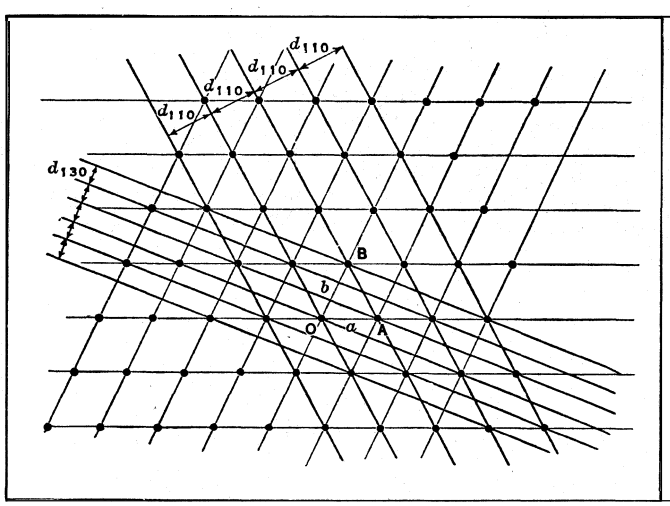

FIG. 5A

Atomic Structure Factors.—The amplitude of the reflection from the plane *(hkl)* of a crystal which has *n* atoms per cell with the parameters $u_1\ v_1\ w_1,\ u_2\ v_2\ w_2,\ \ldots\ u_n\ v_n\ w_n$ is given by

$$C_{(\theta)} \sum_{1 \ldots n} F_{(r\theta)}\, e^{2\pi i (hu_r + kv_r + lw_r)}.$$

C_θ is the J. J. Thomson formula for the scattering from a single electron, which depends only on the angle of scattering 8. $F_1, F_2, \ldots F_n$ are the so-called structure factors of the different atoms. If the atoms scattered as points, $F_r = Z_r$ the total number of electrons in the atom. Actually, the electrons are diffused in space, so that their scattered radiations interfere, making F fall off very rapidly with the angle 8, particularly for light atoms. Structure factor curves giving F_θ can be found experimentally for each kind of atom or calculated from the wave mechanics distribution of electricity in the atom, as has been done by Pauling arid Hartree. The exponential terms simply allow for the phase difference of the different atomic centres for the reflection of the plane *(hkl)*. The observed intensity, before comparison with the calculated, must itself be corrected for absorption of the X-rays in the crystal, which is complicated by the fact that the very reflections of the X-rays increase the absorption differently for each plane. Corrections must also be made for temperature effects, as the atoms in a crystal vibrate more at higher temperatures, which reduces the reflection intensity

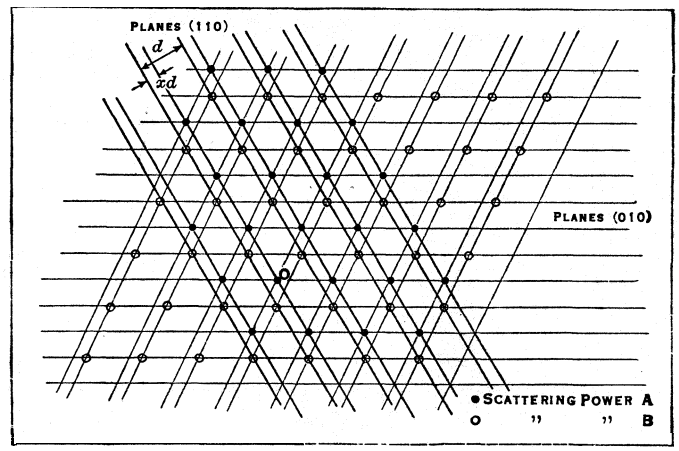

FIG. 5B

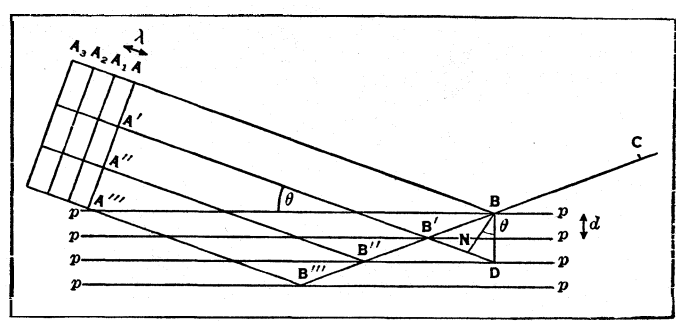
The calculation and comparison of intensities is a lengthy but straight-forward process, but the assigning of parameters is like solving a geometrical problem and always depends, in part, on intuition. Gradually, however, as more and more structures are being worked out, probable arrangements of atoms can be seen more easily, particularly by the use of the ideas of atomic diameters and co-ordination numbers *(see* Part II.). It was by the use of these that Pauling and West successfully and independently predicted the structure of topaz $Al_2SiO_4F_2$. But however the parameters are obtained, good intensity agreement absolutely confirms the structure as correct because the slightest change of atomic position causes such changes in intensity distribution between the different reflections as to wholly upset the agreement.



FROM BRAGG, "X-RAYS AND CRYSTAL STRUCTURE" (G. BELL & SONS)

FIG. 6

This completes our account of the methods of crystal analysis as far as the positions of the atoms are concerned. Unfortunately, to illustrate it with even a single example, would exceed the length of this article, and the reader must be content with the results of the analysis given in Part II. Strictly, however, merely to know the position of the centres of the atoms in a crystal, is only the beginning of a real knowledge of their structure. A complete knowledge must also include a quantitative account of the forces by which the crystal is held in equilibrium and of the dynamics of the crystal when it is acted on by mechanical or electrical

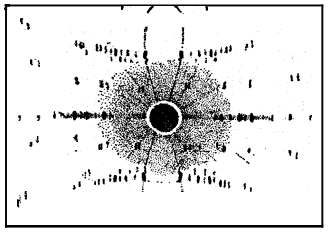
FIG. 8.— APPARATUS FOR ROTATION AND LAUE PHOTOGRAPHS ETC.

crystal analysis is only beginning, but already the work of Born, Landé, Leonard Jones, Joffé and several others has accounted quantitatively for the mechanical properties of simple ionic crystals, particularly of the rock salt type.

PART II. THE STRUCTURES OF CRYSTALS

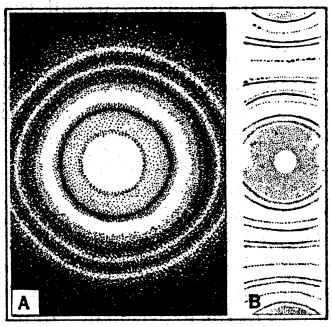
Crystal Chemistry.— By the methods outlined above, the structures of an ever increasing number of crystals have been worked out every year (1926 for instance, produced over three hundred papers on the subject) yet the field is so immense and the difficulties of analysis so considerable, that we can still only deal satisfactorily with the simpler types of crystal structure. Already, however, owing to the work of Sir William and W. L. Bragg, of Fajans, Wasatsjerna, Pauling and above all, V. M. Goldschmidt, we can put forward a theory of the mode of crystal construction which can be used to predict unknown structures, and structures and properties of new substances.



BY COURTESY OF J M ROBERTSON

FIG. 9.—ROTATION PHOTOGRAPH

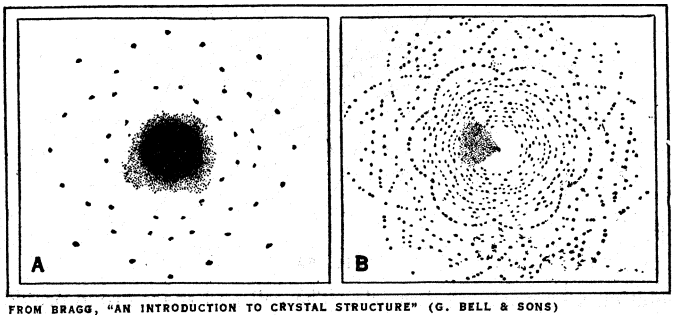
To understand the essence of this theory of crystal chemistry, we must start not from the crystal but from the atom. The most convenient form in which to represent the atom for this purpose is by Schrodinger's wave mechanics. Here each atom is pictured as a nucleus of positive electricity, surrounded by shells of diffuse negative electricity, growing denser towards the centre. Each shell corresponds to a set of Bohr orbits with the same chief quantum number in the classical quantum mechanics. These electron shells serve in the first place to give the atom a finite size (*see* fig. 12). This does not mean that the atom is a rigid sphere of definite radius. The wave mechanics atom must be considered as having a definite degree of compressibility and deformability. The chemical and crystallographic properties of an atom depend partly on the size but more on the character of its outer shell of electrons.



FROM BRAGG, "X-RAYS AND CRYSTAL STRUCTURE" (G. BELL & SONS)

FIG. 10.— POWDER PHOTOGRAPH OF (A) ALUMINIUM, (B) GOLD. (AFTER THE ORIGINAL PHOTOGRAPHS OF HALL AND DEBYE & SCHERRER)

Certain arrangements of electrons (2, 8, 18, 32 for chief quantum numbers 1, 2, 3, 4) have their inner quantum numbers so balanced that they are in a condition of minimum energy and so are physically stable and without external electric fields. These arrangements occur in the inner shells of most elements (but not in the iron, palladium, platinum or rare earth groups) but only the



FROM BRAGG, "AN INTRODUCTION TO CRYSTAL STRUCTURE" (G. BELL & SONS)

FIG. 11.—LAUE PHOTOGRAPH OF: (A) ROCK SALT, (B) BERYL

elements of the inert gas group have stable outer shells with 8 electrons. The other elements tend to fall into two groups. Those with one, two, or rarely up to four or five electrons more than the next lower stable grouping are the metals. They all tend to ionize, that is, to lose these spare electrons and assume a more stable configuration, acquiring a positive charge as a result; thus a sodium atom with eleven electrons loses one readily to become a singly charged sodium ion Na^+, with ten electrons in the configuration of the rare gas neon. The non-metallic type of atom is, on the other hand, one, two or three electrons short of the number required to

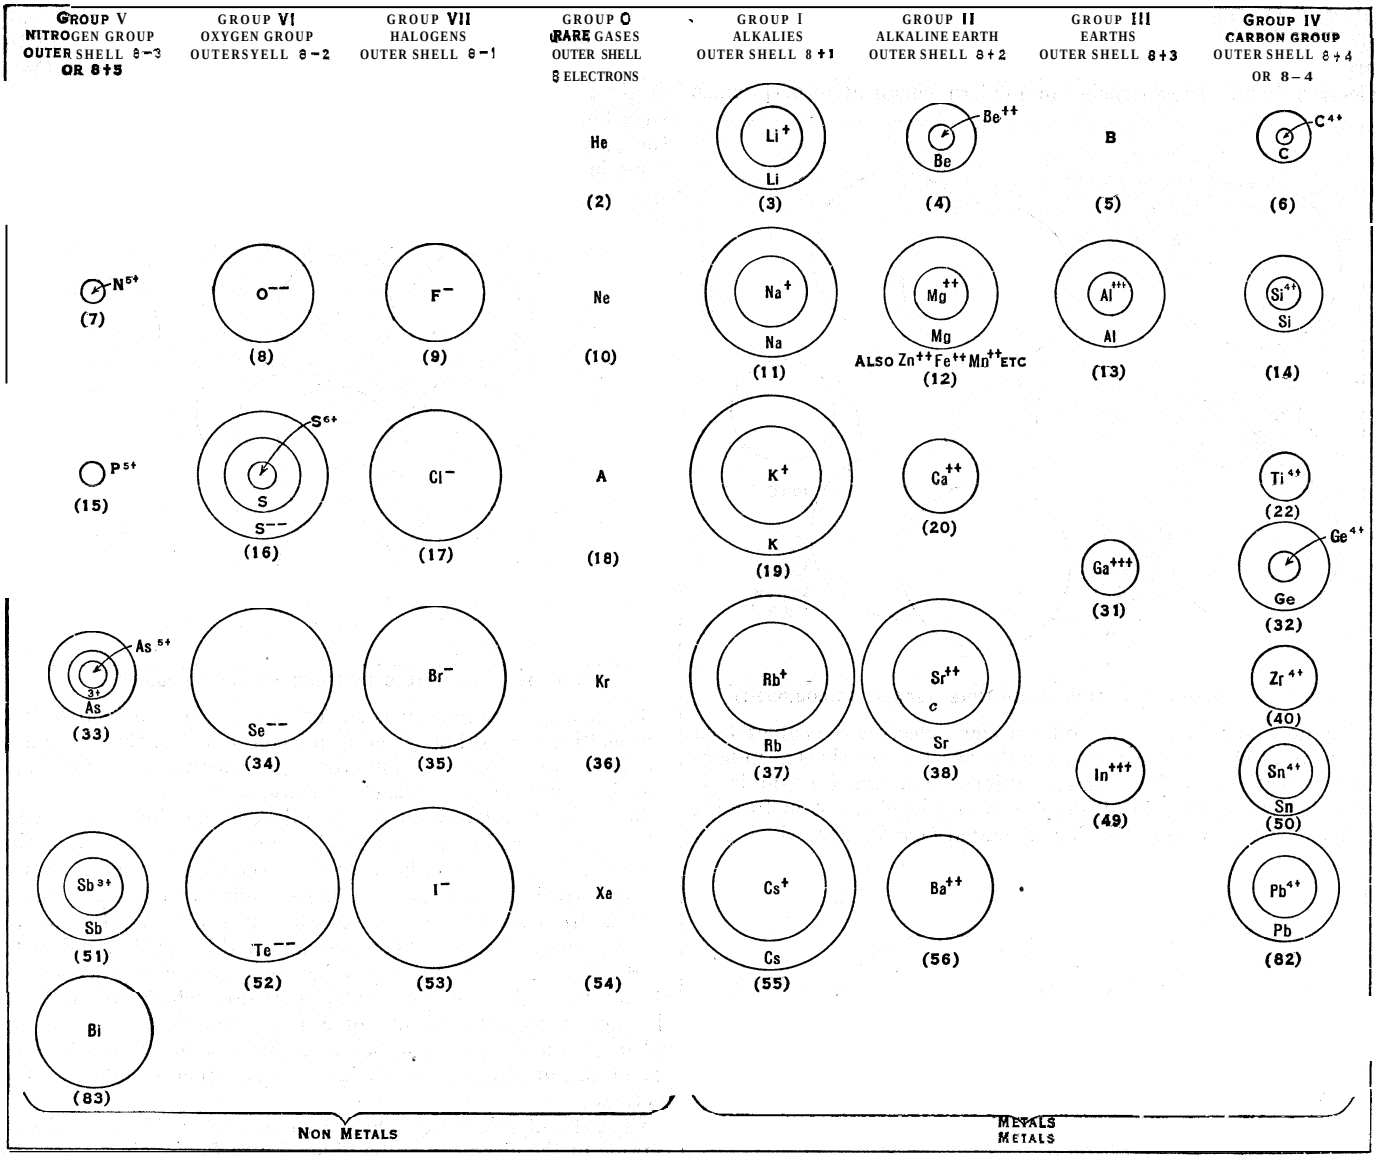


FIG. 12. — APPROXIMATE ABSOLUTE SIZES OF ATOMS AND IONS, INNER CIRCLES IN METALS AND OUTER IN NON-METALS SHOW THE IONIC STATE; NUMBERS IN () ARE ATOMIC NUMBERS (SCALE 50,000,000:1)

form the next stable configuration and tends to take up extra electrons to complete the shell, acquiring a negative charge in the process.

Isolated atoms and ions only exist at temperatures and pressures such as we find in stars and vacuum tubes. Under normal conditions they are always found combined We know four such types of combination. These are called the heteropolar or ionic, the homopolar, the molecular and the metallic.

Ionic Combination. — Two ions such as Na^+ and Cl^- will attract each other with a force $\frac{e^2}{r^2}$ where r is the distance between them, and there will be an equilibrium when this force balances the repulsive force existing between their outer shells at close quarters. It is this repulsive force that gives the atoms their finite size. It is also electrical in origin but much more complex and expressible in such terms as $-\frac{c}{r^9}$. In the presence, however, of more Na^+ and Cl^- ions, it is easy to see that $\overset{+}{Na}\overset{-}{Cl}$ will become

$$\overset{+}{Na}\overset{-}{Cl} \quad \overset{-}{Cl}\overset{+}{Na} \qquad \text{and then} \qquad \overset{+}{Na}\overset{-}{Cl}\overset{+}{Na} \quad \overset{-}{Cl}\overset{+}{Na}\overset{-}{Cl} \quad \overset{+}{Na}\overset{-}{Cl}\overset{+}{Na}$$

and so on in three dimensions, each positive ion being surrounded by as many negative ions as possible and building up a crystal of rock salt (*see* fig. 13). Ions are of very different sizes (*see* fig. 12) and when a small, highly charged positive ion such as Be^{++} is close to a large, diffuse ion S^{--}, it not only attracts it but distorts its structure, attracting the electron shell and repelling the nucleus This is called polarisation. Polarisation is particularly effective when the negative ion is unsymmetrically surrounded by positives, as in layer lattices (*see* fig. 29). A polarised heteropolar attraction can in this way build up a complex ion, such as $(Mg^{++}O_4^{--})^{6-}$.

Homopolar Combination. — In homopolar combination, two or more atoms with incomplete electron shells make up for their lack of stability by sharing electrons, thus achieving a completeness of outer shell for the combination which cannot exist for the individual. The simplest case is hydrogen Individual hydrogen atoms, each with its one electron, are highly reactive because a one quantum shell is complete with two electrons, as in helium. Consequently two hydrogen atoms H combine to form the stable hydrogen molecule H_2, which spectrally and in many other ways resembles helium. In a similar way, by the sharing of a balanced pair of electrons, are formed the diatomic molecules F_2, O_2, N_2 of the non-metallic elements. An atom can share electrons with more than one other atom. Oxygen sharing electrons with two hydrogens forms the unsymmetrical water molecule $H\diagup O \diagdown H$, or carbon and two oxygens to form the symmetrical carbon diox-

ide O-C-O. The process, which can be extended indefinitely to form more and more complicated molecules, particularly those of organic chemistry (where the carbon atom possessing four two-electron bonds [co-valencies in modern chemical terms] which

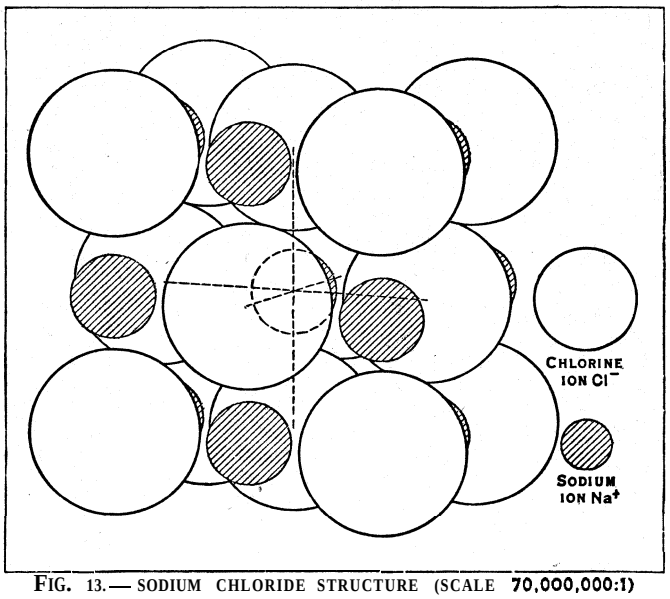

FIG. 13.— SODIUM CHLORIDE STRUCTURE (SCALE 70,000,000:1)

bring its outer shell from four to eight electrons) enables long chains of atoms to be formed as in the paraffins, or rings as in benzene derivatives. This reaches its ultimate limit when the linking is extended indefinitely in all directions and results, not in forming a molecule, but a crystal such as diamond (see fig. 23), which may

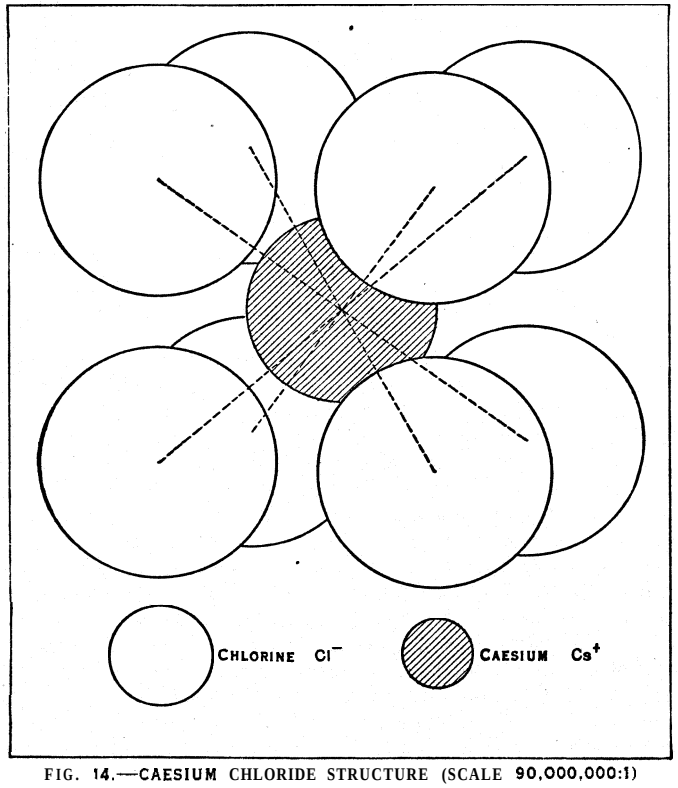

FIG. 14.—CAESIUM CHLORIDE STRUCTURE (SCALE 90,000,000:1)

be considered as one solid molecule. But homopolar bonds can also build up complex ions, such as the ammonium ion NH_4^+ with its ten electrons, which has the same relation to the neutral molecule CH_4 as the sodium ion Na^+ has to neon; or the series of negative ions ClO_4, SO_4, PO_4 and SiO_4.

Molecular Combination.— Between electrically neutral atoms and molecules which also have completed outer shells, there still exists a type of residual attraction which may be called molecular. In the simplest case of an inert gas atom, this residual attraction is only effective at very close distances and consequently, except at the lowest temperatures, the substance remains a gas. But at such temperatures it solidifies in a state of equilibrium between the attractive and repulsive forces, both probably due to distortions in the electronic structure. Very similar is the attraction

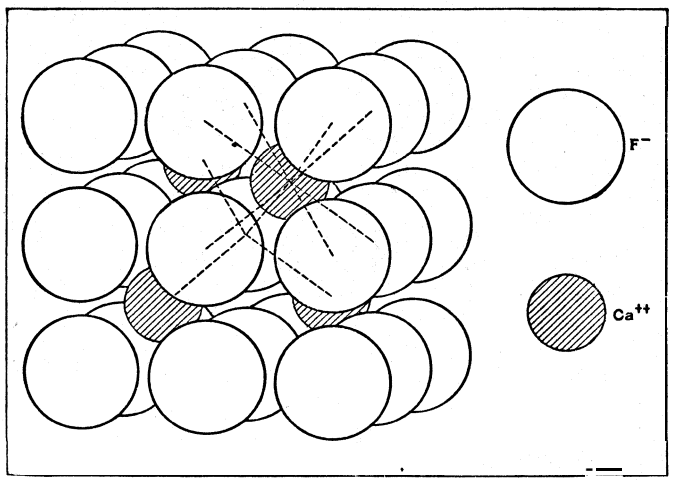

FIG. 15.— FLUORITE STRUCTURE (SCALE 60,000,000:1)

between non-polar molecules such as O_2 which also tend to have low melting points, but when a molecule is polar, that is, acts as an electric dipole or multipole, these poles attract others of opposite sign, with forces approaching those of ionic crystals.

Metallic Combination.— Metallic combination occurs when all the atoms tend easily to lose electrons. The positive ions thus formed cohere together, held by the electron gas, produced from the discarded electrons now no longer bound to particular atoms.

It is from such knowledge of the units of crystal structure, that is, atoms, simple and complex ions and molecules, and of the kind of forces holding them together, that we can see the physico-chemical meanings of the crystal structures which are found by the quite independent means of X-rays. But the process is two-sided. At the same time we learn from the structure much of the chemical and physical properties of atoms inaccessible by other methods.

Crystallised substances, that is to say, all solids with the exception of the glasses, may be divided into four main classes: the

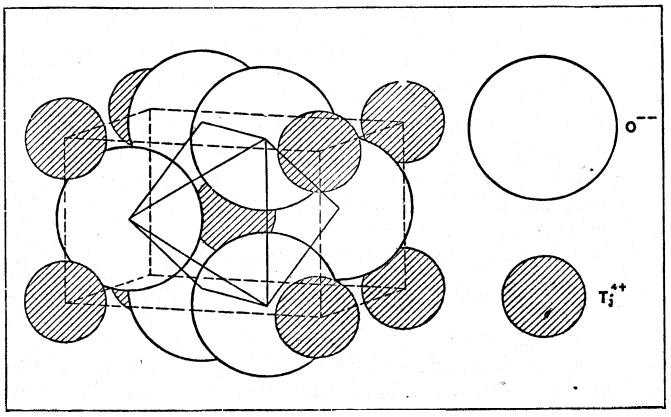

FIG. 16.— RUTILE STRUCTURES (SCALE 60,000,000:1)

ionic, the adamantine, the molecular and the metallic; and three prominent intermediate classes: the silicates, the layer lattices and the metalloids. The leading properties of these classes are shown in Table I.

Ionic Crystals.— These have been more studied than any of the other classes because the simple Coulomb electrical forces holding them together lead to simpler structures, of which it is sometimes possible to give a quantitative explanation. The first law of formation for ionic crystals was stated by Goldschmidt as follows:

Crystal type	Crystal units	Type of binding	Characteristic properties				Typical Crystals
			Optical	Electrical	Thermal	Mechanical	
Ionic	Simple and complex ions	Electrical attraction between ions of opposite signs, weak to moderate polarisation	Transparent, absorption: in visible (colour) if present is due to atoms; in short infra red is due to complexions; in long infra red is due to crystal lattice. Refractivity due to negative ions	Moderate insulators, in high fields conduct by transfer of ions. When polarisation is slight they dissolve with ionisation in ionising solvents (water); when stronger they are insoluble	Fairly high melting point, ionisation occurs in liquid and vapour	Hardness increasing with higher ionisation Tendency to fracture by cleavage	NaCl fig. (13) CaF_2 (15) $CaCO_3$ (21) K_2SO_4 $(NH_4)_2PtCl_6$ (20)
Silicate	O^{--} or F^- ions Si^{4+} or Be^{2+} or Al^{3+} and other positive ions				Very high melting points, glasses formed on cooling of melt	Very hard with tendency to cleave or fracture conchoidally	Olivine Mg_2SiO_4 (22) Cyanite Al_2SiO_5 Garnet $R''_3\,R'''_2Si_3O_{12}$ Spinel Al_2MgO_4 Corundum Al_2O_3
Adamantine	Atoms of the fourth group and groups on either side of it	Homopolar bonds throughout or strongly polarized ionic binding	Transparent with high refractivity or opaque metalloidal	Diamond is a perfect insulator. The others conduct metalloidally Very insoluble	Very high melting points with tendency to vapourise except in more metalloidal	Very hard Hardness less for metalloidal types	Diamond C (23) Zinc Blende ZnS Wurtzite ZnS (24) Carborundum CSi
Molecular	Inert gas atoms Non polar and polar molecules	Van der Waal's forces or residual electric fields between molecular poles	Transparent optical properties due to molecules and similar to gas and liquid phases	Insulators except when very polar; soluble in non-ionising (molecular) solvents except when polar	Melting point very low with neutral atoms, rises with heavier molecules and polar molecules	Very soft, hardness increasing with polarity of molecules. Deformation plastic	Argon A (31) CO_2 (25) Ice H_2O (18) Paraffins C_nH_{2n+2} (26) Calomel Hg_2Cl_2 (27)
Layer	Strongly polarising and easily polarised ions	In layers. Homopolar or polarised ionic Between layers hlolecular	As Adamantine	Various. Similar both to molecular and adamantine	Various. Similar both to molecular and adamantine	Cleaving readily in layers which are soft and flexible	Graphite C (28) CdI_2 (29)
Metallic	Positive ions and electron gas	Electrical attraction between positive ions and electron gas?	Opaque (due to free electrons) with selective reflectioninin-fra red	Conductors conductivity inversely proportional to number of free electrons Soluble in acids where H^+ ions absorb free electrons	Moderate to very high melting points. Long liquid interval	Moderate hardness increased by alloying Elastic but yield by glide plane slipping when overstressed	Copper, Iron (30) Iron, Sodium (31) Zinc (32)
Metalloidal	Jletalatomsand atoms of the sulphur and arsenic type	Mixture of homopolar ionic and metallic binding	Opaque metallic or transparent with high refractivity and colour	Medium to bad conductors Soluble only with decomposition	Tendency to vapourise or decompose at high temperatures	Moderately hard to soft. Properties a mixture of those of other types	Nickel Arsenide NiAs Fahlerz R''_2SbS_3 Pyrites FeS_2 (33)

"The crystal structure of a substance is determined by the size and polarisation properties of its components, which may be atoms, ions or atomic groups."

The size of an ion is, after its charge, its most important property. It varies very greatly for different ions. In fig. 12 is shown the size of a number of ions and atoms which illustrates their dependence on atomic number and charge. It can be seen that the size of a positive ion in the same group increases with the atomic number, while in the same series for positive ions, it decreases markedly with increasing charge, which acts by tightening the whole structure. Rut in negative ions, the increased size due to the repulsion of the extra electrons is counteracted by the greater fields they find themselves in, and consequently doubly charged negative ions are never greater than and sometimes smaller than singly charged. The way in which the increased charge tightens the structure is shown by the fact that in KCl, where both ions have eighteen electrons, the interatomic distance is 3·14 A; whereas in CaS, also with eighteen electrons each, but with quadruple electrostatic force, the corresponding distance has shrunk to 2.84 A.

The way in which atomic diameter influences structure can be seen from the simplest ionic structure of the type AX, with equal numbers of ions of opposite signs. The simplest of these is the structure of rock salt *(see* fig. 13), where sodium and chlorine ions occupy alternate corners of a cubic lattice. The co-ordination number is 6:6, that is, each sodium has six chlorine neighbours and vice versa. Actually, the chlorine ions are so large compared to the sodium that they form an octahedron that encloses it almost completely. Simple geometry shows that this can only be the case if R_A (radius of positive ion) : R_X (radius of negative ion) $< \cdot 73$. This relation holds for all halides of the alkaline metals with the exception of the chloride, bromide and iodide of caesium where the ratios $R_A:R_X$ are ·91, ·84 and 75 respectively. Now these last three are the only alkaline halides which do not belong to the sodium chloride type but to the caesium chloride type. *(See* fig. 14.) Here the co-ordination number is 8:8 and there is, so to speak, more room for the larger caesium ion inside the cube of chlorine ions. Where $R_A:R_X$ is very small, the factor of polarisation comes in, and the structure becomes adamantine or molecular.

If we pass to the next simpler series, AX_2, a similar situation occurs. Where $R_A:R_X$ is greater than ·73, the structure is of the fluorite type. *(See* fig. 15.) Here the co-ordination number is 8:4, the calcium ions being surrounded by a cube of eight fluorine ions, just as the caesium by the chlorines. A great number of compounds belong to this type, which includes the chlorides of the alkaline earths and the oxides of zirconium, thorium and uranium. If $R_A:R_X$ lies between ·73 and ·41, a structure is formed

analogous to rock salt. This is the rutile structure. (See fig 16.) Here the co-ordination number 6:3 cannot be satisfied in the cubic system and the octahedron of oxygen ions is placed on its

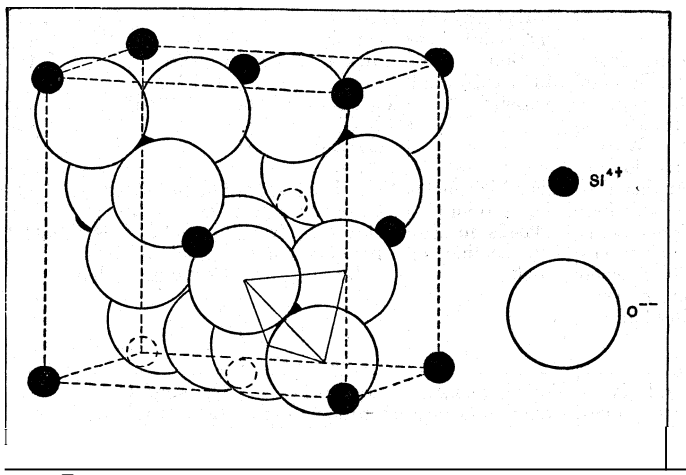

FIG. 17.—CRISTOBALITE STRUCTURE (SCALE 60,000,000:1)

side in a tetragonal structure. The two other forms of TiO_2, anatase and brookite, are also built with the same co-ordination but with the octahedra distorted and differently placed. A great number of substances belong to the rutile structure. The fluorides

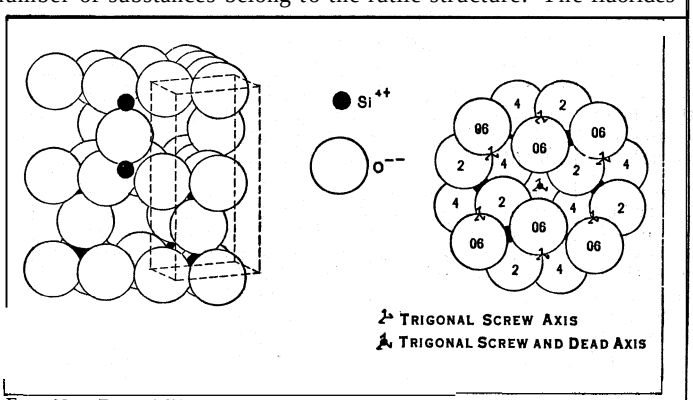

FIG. 18.—TRIDYMITE STRUCTURE. FIG. 19.---QUARTZ PERPENDICULAR TO THE TRIGONAL AXIS THE NUMBERS 0246 FOR THE O^{--} ATOMS AND 135 FOR THE Si^{4} ATOMS REFER TO DEPTHS BELOW PLANE OF PAPER (SCALE 30,000,000:1)

of Mg., Mn., Co., Fe., Ni., Zn. and the dioxides of Mn., Mo., Sn., W. and Pb., as well as several others.

When. $R_A:R_X$ lies between ·41 and ·22, the co-ordination number is 4:2, which is approaching an adamantine structure. This is the

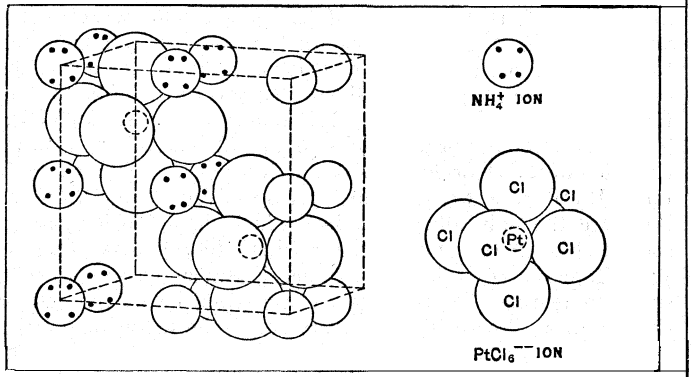

FIG 20.— AMMONIUM HEXACHLOROPLATINATE STRUCTURE (SCALE 30,000,000:1)

case for the different forms of silica, SiO_2, Cristobalite, Tridymite and Quartz. These are shown in figs. 17, 18 and 19. Though apparently different, these structures have the essential point in common that they are built from silicon ions completely surrounded by four oxygens in a tetrahedron. Each oxygen is shared between two tetrahedra and the different forms of structure are merely due to different arrangements of these tetrahedra. Thus the polymbrphism of silica is not due to any change in the molecule.

So far we have dealt only with crystals with simple ions, but those with complex ions are essentially similar. When the ion is

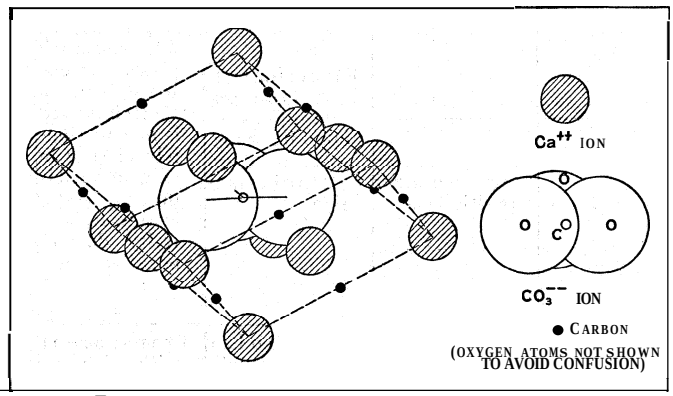

FIG. 21.— CALCITE STRUCTURE (SCALE 50,000,000:1)

approximately spherical, as is ammonium NH_4^+, or highly symmetrical as $Ni(NH_3)_6^{++}$, $PtCl_6^{--}$ it can take its place in a crystal exactly like a simple ion of the same size. Ammonium, NH_4^+, is practically indistinguishable in its compounds from Rb^+. Such

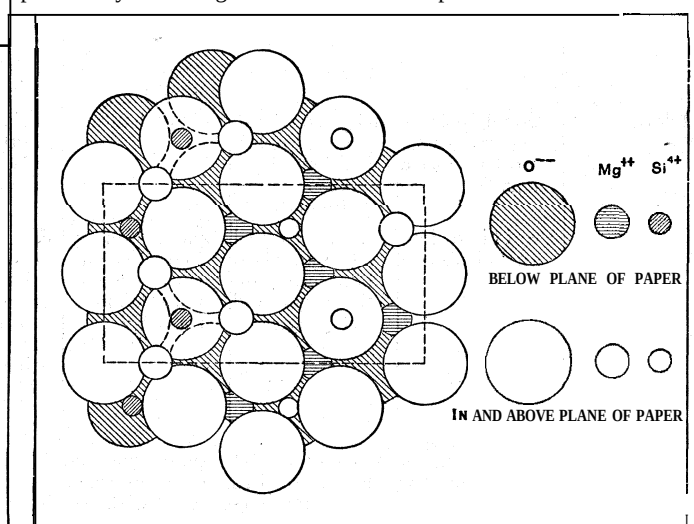

FIG. 22.— OLIVINE Mg_2, S. O_4 (SCALE 40,000,000:1)

a compound as $(NH_4)_2$ $(PtCl_6)$ (see fig. 20) is, except for its larger size, essentially the same as fluorite. When the compound ion is not nearly spherical, loss of symmetry results. In the case of calcite (see fig. 21), for instance, the ions are arranged very much as in rock salt, but owing to the flatness of the CO_3^{--} ion, one trigonal axis is shortened, leading to a rhombohedra1 crystal. A number of crystals, such as $FeCO_3$ and $NaNO_3$, belong to the calcite class. With ions of the type BX_4, such as BF_4^-, ClO_4^-, SO_4^{--}, PO_4^{---}, the structures are of even lower symmetry, though in all of these the tetrahedral arrangement of oxygen atoms is maintained.

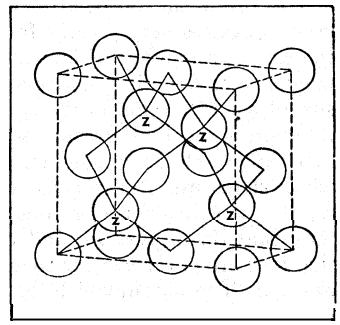

FIG. 23.— DIAMONDSTRUCTURE; IF ATOMS MARKED Z ARE REPLACED BY ZINC AND THE REMAINING BY SULPHUR, ZINCBLENDE STRUCTURE IS GIVEN (SCALE 50,000,000:1)

Silicates.—There are a great number of ionic crystals which are neither of the simple ionic or complex ionic types, which may be grouped together as a silicate type, though not all contain silicon. The structure of the silicates are complex but, as W. L Bragg has shown, they consist essentially of oxygen ions in a close-packed arrangement, either cubic or hexagonal (See figs.

31 and 33.) These ions are held together by strongly charged metallic ions, which occupy the spaces between them. In the tetrahedral spaces are found the smallest and most highly charged ions Si^{++} Be^{++}. In the octahedral spaces larger ions with smaller charges, such as Ti_4^+, Al^{3+}, Mg^{++}, Fe^{++}. Still larger ions, such as Ca^{++} Na^+ or K^+, introduce distortions into the structure. The

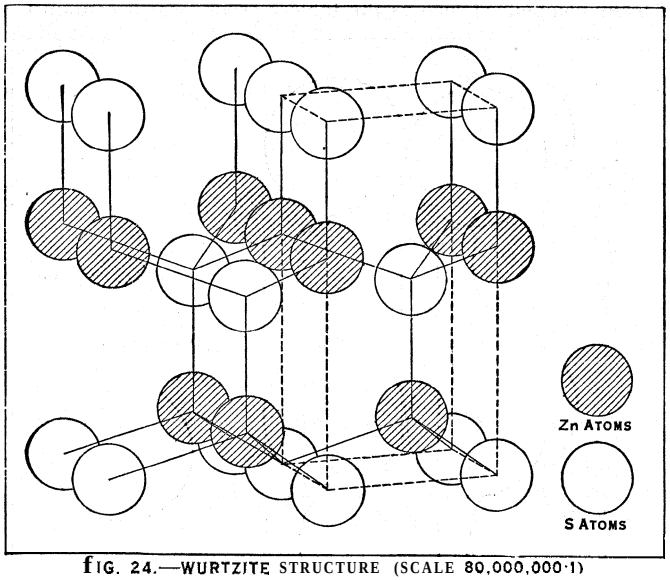

FIG. 24.—WURTZITE STRUCTURE (SCALE 80,000,000·1)

symmetry of the silicates adjusts itself to fit these ions with the minimum distortion, which leads to large and complicated cells, generally of low symmetry. One of the simplest of these olivine Mg_2SiO_4 is shown in fig. 22. Other silicates of known structure include cyanite Al_2SiO_5, phenacite Be_2SiO_4, beryl $Be_3Al_2Si_6O_{18}$ and

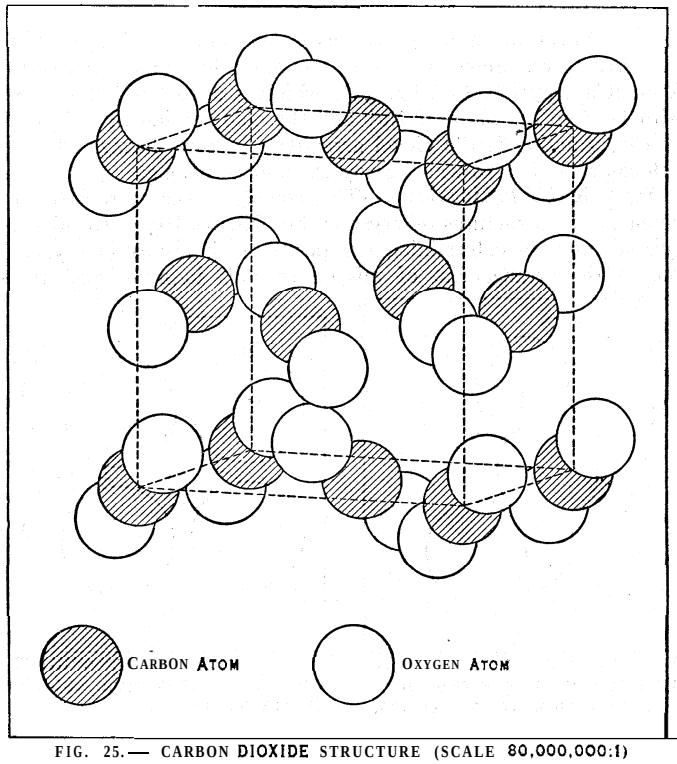

FIG. 25.— CARBON DIOXIDE STRUCTURE (SCALE 80,000,000:1)

the garnets $R_3''R_2'''$ Si_3O_{12}. Two non-silicate types are also built from close-packed oxygens, the corundum type Al_2O_3, including haematite Fe_2O_3 and $MgTiO_3$, and the spinel type Al_2MgO_4, including magnetite Fe_2FeO_4 and Ag_2MoO_4.

Adamantine Crystals.—In adamantine crystals the forces binding the whole crystal together are homopolar, so it may be considered that they are single molecules. The typical adamantine crystal is the diamond (*See* fig. 23.) Here each carbon is joined to four others (co-ordination 4:4) by a homopolar electron sharing bond in a tetrahedral fashion, alternate tetrahedra pointing in opposite directions. If we replace alternate carbon atoms with zinc and sulphur, we arrive at the zinc blende structure, which is typical for adamantine compounds. Such compounds are chiefly found in the fourth group of the periodic table and in compound5 between elements of the neighbouring groups on either side. For Instance, we have

Compound	GaGe	GaAs	ZnSe	CuBr	
Atomic Numbers	32 32	31 33	30 34	29 35	
Interatomic dist.	2·43	2·435	2·45	2.46	A

all with diamond structure It should be noticed that here, unlike the case of KCl and CaS, there is little change in interatomic distance. Another 4:4 is represented by Wurtzite (see fig 24), the other form of zinc sulphite. The relations and the distances of neighbouring atoms are the same in both cases, but in Wurtzite, the symmetry is hexagonal instead of cubic. The three form-, of carborundum represent a compound diamond-Wurtzite structure.

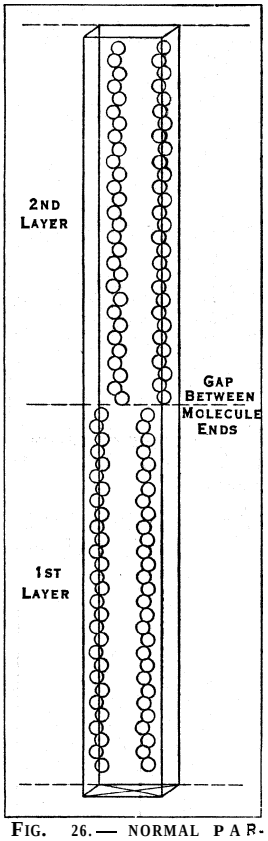

FIG. 26.— NORMAL PARAFFIN STRUCTURE (ONLY C ATOMS SHOWN) (SCALE 14,000,000:1)

Molecular Crystals.—In molecular crystals, the units of structure are neutral atoms or molecules, and as the forces are so much weaker, the determining factor is the shape of the molecules. The most ideally simple cases are the crystals of the inert gases, which are cubic close-packed. (*See* fig. 30.) The similar structures are found for symmetrical molecules such as CH_4, SnI_4 and more or less distorted for molecules N_2, O_2, I_2, NH3 or CO_2 (see fig. 25), none of which are strongly polar. Another simple case is when the molecules are long, straight structures, such as those of the paraffins. (Fig. 26). Here they lie together like bundles of sticks, forming loosely connected layers. A study of compounds with benzene rings: benzene, naphthalene, hexamethylbenzene, shows that this ring of carbon atoms has a real existence and is probably plane, while studies of structures with quadruply substituted carbon atoms as tetraphenyl methane shows that the carbon bonds are arranged almost tetrahedrally.

If a molecule possesses unbalanced electrical poles, these arrange themselves in the crystal so as to neutralize each other as much as possible, either by polymerising or forming pseudionic crystals; thus ice formed from the strongly polar $_+H\overset{\overset{-}{O}}{\diagdown\diagup}H_+$ has tridymite structure (see fig. 18), in which each oxygen is surrounded by four hydrogens, or calomel $\overset{-}{Cl}\overset{+}{Hg}\overset{+}{Hg}\overset{-}{Cl}$ (see fig. 27), in which the mercury atoms are surrounded by chlorines.

Layer Crystals.—A small but very interesting class are the layer crystals, in which the forces binding the atom extend only in two dimensions, forming large sheets which are held together by weaker molecular forces. The typical layer lattice is that of graphite. (See fig. 28.) Here the sheets are hexagons of carbon atoms, bound together in 3:3 co-ordination, 1·42 A, apart while the layers bound molecularly are 3.4 A apart. Another example is cadmium iodide. Here the polarisation of the large iodide ions prevents the normal ionic fluorite structure. To this type belong the hydroxides $Ca(OH)_2Mg(OH)_2$ and the sulphides ZrS_2, SnS_2.

Metals.—Metallic crystals differ from the previous classes by the presence of free electrons, the attraction between which and the positive ions gives the structure its stability. The basis of the

structure of pure metals and alloys is one of close packing, but the radii of atoms in metals are much greater than those of the corresponding ions in ionic crystals. (*See* fig. 12.) The pure metals have very simple structures: face centred cubic for Cu, Al, Feγ (*see* fig. **30**); body centred cubic for Na, Feα, Feδ (see fig. **31**) and close packed hexagonal cubic for Mg, Zn, W (see fig. 32). Several metals have phases with different structure. Iron, for instance, between the temperatures 1100° and 1425°, has a face centred cubic structure. Both above and below this temperature, its structure is body centred. Manganese has two forms with very complicated cubic structures, and tin, at low temperatures (grey tin) is like diamond, while at ordinary temperatures (white tin) it has a distorted diamond structure.

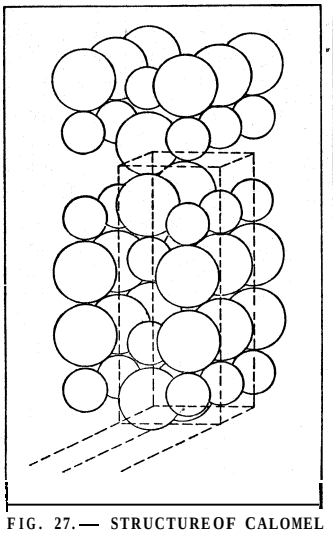

FIG. 27.— STRUCTURE OF CALOMEL Hg_2Cl_2 (SEE FIG. 1) (SCALE 30,000,000:1)

Our knowledge of the real constitution of alloys is immensely furthered by X-rays. They are essentially of two types, solid solutions and compounds. In solid solutions, the atoms of one metal are replaced by another, distributed by chance throughout its structure. This is shown by an X-ray pattern similar to the pure metal but with a different size of cell. In inter-metallic compounds on the other hand, the atoms of the different metals have definite positions similar to those in ionic compounds, such as CuZn, which is like CsCl but usually more complicated, with a tendency to large cells of high symmetry. δ Bronze $Cu_{31}Sn_8$, for instance, has a cell of side 17·9 **A.** and **416** atoms. The laws of combination in metallic compounds are quite different from those of ordinary chemistry, but seem to depend on electron numbers.

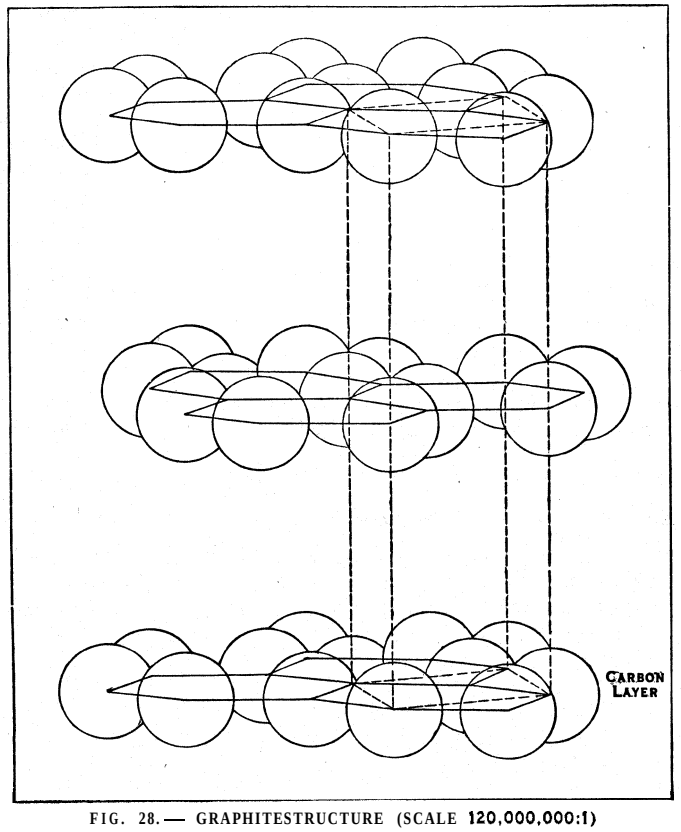

FIG. 28.— GRAPHITE STRUCTURE (SCALE 120,000,000:1)

Metalloidal Crystals.— There are a number of substances which show resemblances to both metallic, adamantine and ionic crystals They may be roughly classed together as metalloidal These include the semi-metals Se, Te, As, Sb, Bi and a great number of simple and complex arsenides, antimonides, sulphides, selenides, etc. They resemble the metals in having free or looseiy bound electrons, which makes them in a lesser degree opaque and conducting, and also by the complexity and indefinite composition of many compounds such as the fahlerz group, which contain Cu,

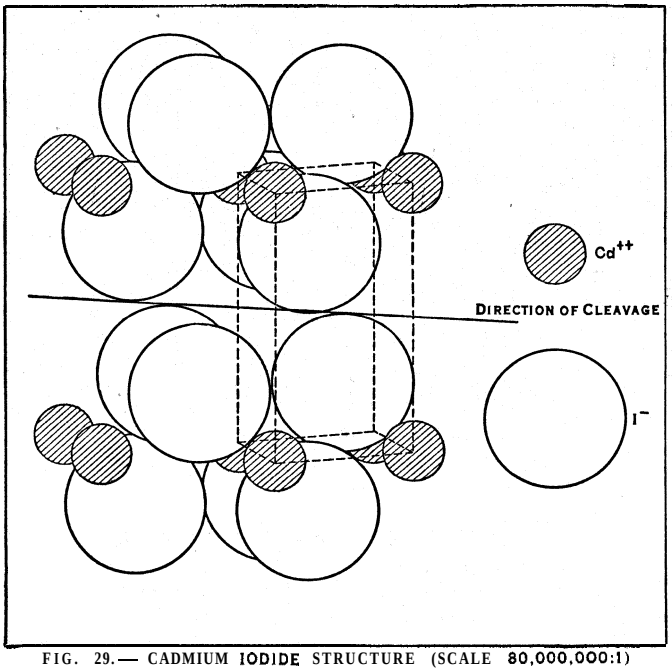

FIG. 29.— CADMIUM IODIDE STRUCTURE (SCALE 80,000,000:1)

Ag, Hg, Pb, Fe, As, Sb+S, in varying proportions. The structures, however, are much less close-packed and resemble adamantine structures. Some, however, are more like ionic structures. Typical are pyrites (see fig. 33), which is a rock salt structure with Fe^{++} in the place of Na^+ and the complex ion S_2^{--} in that of Cl^-. Another is the nickel arsenide structure, hexagonal with 6:6 co-ordination, to which many substances belong.

Technical Applications.— This completes the systematic account of the structures of crystals, but X-rays have proved useful, not only in determining the positions of atoms in crystals, but of the arrangement of minute crystals in materials. It is possible by means of X-rays to find the position of the crystal axes of crystals far too small to be seen microscopically and to study their arrangement in relation to the properties of the material. This has been done in textiles, ceramics and metals.

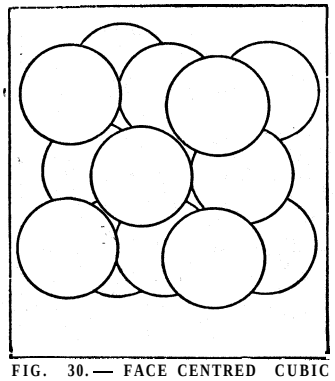

FIG. 30.— FACE CENTRED CUBIC STRUCTURE OF γ IRON AND COPPER AND OF ARGON (SCALE 60.000.000:1)

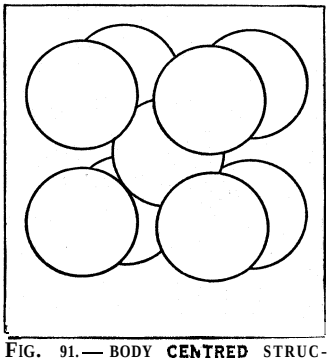

FIG. 91.— BODY CENTRED STRUCTURE OF a IRON (OR SODIUM) (SCALE 60,000,000:1)

Apart from their hardness, the chief mechanical property of metals is that of neither fracturing nor cleaving when overstressed, but deforming by the slipping of atoms along the glide planes, with consequent increase in hardness. This enables metals to be successfully worked, rolled, drawn, etc. Pure metals form

glide planes very easily, but the presence of another metal in solid solution interferes with the regularity of the lattice and makes gliding much more difficult, thus increasing hardness. The effect of alloying is greater, the more highly charged the alloying ion. Carbon has more effect, for instance, on iron than the same amount of cobalt. A piece of metal when cast has its small crystals of which it is composed oriented at random towards each other. On rolling or drawing. the crystals are not only elongated but they tend to take up positions with some crystallographic axis in the direction of the rolling. This is shown on a Debye diagram by the splitting up of the uniform rings into patches indicative of these preferred directions. On heating a rolled or a drawn metal, it recrystallises and the random orientation of the particles is restored. But at the same time, the hardness is lost. The explanation of these processes of hardening and annealing is being energetically sought, largely by X-ray methods, and already this has led to important technical results. It is clear that the practical importance of X-ray analysis has only begun to be felt and will, in time, prove to be of immense significance.

X-RAY **TREATMENT** *(see* RADIOLOGY; RADIOTHERAPY). The X-rays are used extensively in medical treatment. They are valuable in many forms of skin disease, particularly those of a chronic character. They have a favourable influence upon enlargements of the lymphatic glands, of the spleen and of the thyroid gland. They give useful palliative effects in certain forms of malignant disease, and some permanent cures of cancerous conditions have been obtained by their use. In rodent ulcer, which presents features allied to cancer, there is no doubt of the efficacy of X-ray treatment for bringing about a complete cure in the majority of cases, provided that the disease has not advanced too deeply into the tissues.

The idea of using X-rays in the treatment of disease arose from recognition of the injurious effects which followed prolonged application of the rays for diagnostic purposes. Many early workers with X-rays noted the production of an inflammation of the skin, or a falling out of the hair over parts which had been subjected to X-rays, and Leopold Freund, of Vienna, has stated that his first attempts to utilize X-rays in treatment were made in 1896 to cure a hairy mole and were prompted by what he had read of such occurrences. A definite action of the rays upon the skin having been observed, their employment in the treatment of skin diseases followed as a natural corollary. Amongst the earliest investigators of the possible therapeutic effects of X-rays the names of Schiff, Freund, Kienböck, Holtzknecht, Sjogren and Stenbeck may be mentioned. In Great Britain C. R. C. Lyster, Sir Malcolm Morris, E. Dore and J. H. Sequeira were amongst the earliest investigators.

Therapeutic Dosage.—For operating successfully with an agent capable of producing decidedly harmful effects when given in large doses it is necessary to have a method of measurement, and the need for this quickly became apparent when X-rays were used for treatment. The results of X-ray photography had already shown that the tubes employed were capable of emitting radiations of varying powers of penetration, and that the tubes were by no means constant in this respect; and the question whether highly penetrating rays or rays of feeble penetration were to be preferred for therapeutic use became the subject of much discussion. It is now recognized that the choice depends upon the object of the treatment. So too the problem of measuring the quantity of rays emitted by a tube during a given time began to call for a solution. In 1901 Benoist designed an apparatus by which the quality of the rays emitted by a tube at any moment could be determined, and in 1902 Holtzknecht brought out the first quantitative device, a chromo-radiometer, which enabled the dose administered to a patient to be observed, and recorded for future guidance. Holtzknecht also drew up a scale of units by means of which the indications of his apparatus could be interpreted. The units of Holtzknecht are still used to express the dosage of X-rays, though his apparatus has been superseded. Holtzknecht's method of measurement consisted in observing the change of colour in certain pastilles when exposed to X-rays, and his apparatus consisted of a scale of tints, and a number of pastilles of a yellow tint which acquired a green colour during exposure. The composition of these was kept a secret, but analysis revealed in them the presence of potassium sulphate combined with celluloid or gelatine. The pastilles were laid upon the surface under treatment, and their change of colour was compared at intervals with the scale of standard tints.

Quantitative Measurement.—It was next thought that under suitable conditions the measurement of the current passing through the X-ray tube might serve as a guide to the quantity of X-rays emitted by the tube, but, although this is the case to a certain extent, the method of quantity measurement employed almost universally in X-ray treatment was that devised by Sabouraud and Noiré, and used with signal success by them in an enormous number of cases of ringworm, in which disease measurement of dose is of the most critical importance, for the following reason. The cure of ringworm by X-rays requires that all the hair of the affected region shall be caused to fall out, but, nevertheless, it is necessary for obvious reasons that the hair should grow again after the disease has disappeared. Now if the dose of X-rays be insufficient the hair does not come out and no cure results, while if the dose be too great the hair comes out but does not grow again; and the margin of safety is quite a narrow

one. The method of Sabouraud and Noiré which proved itself reliable for such critical measurements of dosage as are required for ringworm treatment, has to-day the universal acceptance of all X-ray workers for other forms of superficial X-ray treatment, although the use of their pastilles has certain disadvantages, notably that they react ill to highly penetrating or "hard" rays.

Sabouraud's pastilles consist of small disks of platino-cyanide of barium. This chemical compound has a bright yellow-green colour when freshly prepared, and changes through gradations of yellow to a brown colour when exposed to X-rays. The pastilles are supplied in a book with which a permanent tint of colour is supplied, to indicate the colour change in the pastille which corresponds with a quantity of X-rays equal to the maximum dose which the healthy skin will stand without inflammatory consequences. This is often spoken of as a "pastille dose." As the amount of irradiation needed to produce the change of colour is considerable, the salt is fixed, during the treatment, at a point halfway between the source of the rays and the skin surface under treatment. During an exposure the chemical salt, in the form of a small disk of the material on cardboard, is adjusted in the required position by means of a pastille holder, and it is examined at intervals during the course of the exposure, until it has reached the required tint. When in the holder the pastille must be protected from light, and should have a piece of metal as a backing.

In X-ray treatment some protection of the surrounding healthy parts is usually necessary. With this object various methods of shielding were devised, either covering the patient by impermeable materials, or enclosing the tube in an impermeable box with suitable windows for the passage of the pencil of rays which is to fall upon the part under treatment.

Effect on Tissues.—The effect of the rays on healthy tissues is in the main a destructive one, but some of the cells of the tissues are more sensitive to the rays than are others; and this permits of a selective effect being obtained, with the destruction of some cells and not of the whole tissue. Young cells, and actively growing cells, are the most susceptible, and for this reason it is possible to influence the glands of the skin and the papillae of the hairs with a dose which will not destroy the skin itself. The art of successful working with X-rays is based upon a careful adjustment of the dose so as to secure a selective destruction of the morbid elements, and to avoid wholesale damage to the part treated. The effects of excessive doses of X-rays is to produce an inflammation which may result in painful sores which obstinately refuse to heal for many weeks or months. In the case of "soft" rays a quantity up to double that of the usual maximum or pastille dose may be employed in urgent cases without risk of any serious inflammation. In the treatment of ringworm the exact pastille dose must not be exceeded or the fall of the hair is likely to be followed by permanent baldness.

The distance of the skin surface from the centre of the tube must be known, and the pastille arranged in place accordingly. Fifteen centimetres is a usual distance, and at this distance a tube working with a current of a milliampere should give the full therapeutic dose or "pastille dose" in about 15 minutes. In general X-ray treatment it is quite usual at the present time to proceed by the method of full doses at rather long intervals. From the experience obtained by Sabouraud in numerous cases of ringworm it has been found that a full dose must not be repeated until a month has elapsed.

Treatment of Abnormal Growths.—A great amount of work has been done with X-rays for the treatment of cancer, but it is now recognized that the X-rays do not cure a cancer, although they are of value for the relief of pain. Diminution of size in cancerous growths has frequently been observed, and in some instances sarcomatous tumours have completely disappeared under X-ray treatment. Sooner or later, however, the cancer or sarcoma returned either in the original site or elsewhere, and the patient died of the disease. How far the use of intensely hard X-rays produced by currents of some 150 KV, as in the Erlangen method of treating cancer, will prove effective, is doubtful.

X-ray treatment is of service for the treatment of enlarged "strumous" glands in the neck. When these glands are in the early stages, and there has not been any softening or breaking down of the gland tissue, the application of X-rays, a few times repeated in moderate doses, will determine the subsidence of the enlargement and may effect a complete cure.

In the massive glandular enlargements of lymphadenoma a great reduction of the tumours can be brought about by heavy doses of X-rays, but the results are to give a symptomatic rather than a real cure, for fresh glandular growths take place internally, and the usual course of the disease is not fundamentally modified

So too in leukemia, the symptom of excessive abundance of white cells in the circulating blood can be surprisingly altered for the better by X-rays, but generally without real cure of the underlying condition. The effect appears to be due to a direct destructive action upon the leucocytes of the blood.

The use of X-rays in fibroid tumours of the uterus has been advocated, particularly in France and in Germany. The action of the rays seems to be in part due to their influence upon the activity of the ovaries and in part to a direct effect upon the growing fibroids themselves, causing decrease of activity, relief of symptoms and reduction of the tumours. Not all varieties of fibroid are suitable for this kind of treatment. (H. L. J.)

XYLENE, the name given to certain hydrocarbons, the dimethylbenzenes, of which three forms exist with the same formula, $C_6H_4(CH_3)_2$ (see ISOMERISM); they occur in the light oil fraction of the coal tar distillate, but cannot be separated by fractional distillation owing to the closeness of their boiling points. The mixture can be separated by shaking with sulphuric acid, whereupon the ortho- and meta- compounds are sulphonated, the para- compound remaining unattached. The ortho and meta acids may be separated by crystallization of their salts or sulphonamides. The principal constituent of the light oil is meta-xylene, which is successively nitrated and reduced to commercial m-xylidine, (4-amino-1:3-xylene). From para-xylene a similar base, *p*-xylidine (2-amino-I:4-xylene), is prepared. Both xylidines are employed in colour making. Keta-xylene is also used in making artificial musk which is trinitro-*tert*.-butyl-*m*-xylene. (See PERFUMES.) Ortho-xylene is obtained from ortho-bromotoluene, methyl iodide and sodium as a colourless mobile liquid boiling at 142°, melting at −28°, and having a specific gravity of 0·8932 at 0°. Meta- or iso-xylene, the most important isomeride, has been obtained from Borneo petroleum (see TOLUENE), or by distilling with lime mesitylenic acid, $C_6H_3(CH_3)_2CO_2H$, an oxidation product of mesitylene, $C_6H_3(CH_3)_3$. Meta-xylene boils at 139°, melts at −54°, and has a specific gravity of 0·8812 Para-xylene obtained when camphor is distilled with zinc chloride, is best prepared from para-bromotoluene or dibromobenzene, methyl iodide and sodium.

The three xylenes are oxidized by nitric acid to the corresponding coluine acids. Further oxidation leads to ortho-, meta (iso)-, and para (tere)-phthalic acids. (See PHTHALIC ACIDS.)

XYLOPHONE, a small musical instrument, consisting of a graduated series of bars of wood, which are struck by a hammer.

XYSTUS, Greek term for the covered portico of a gymnasium.

X Y Z CORRESPONDENCE, the letters which when made public in 1798 nearly involved France and the United States in war. By orders of the French Directory fully a thousand U. S. vessels had been stopped on the high seas for examination. President Adams sent three commissioners, C. Pinckney, Marshall and Gerry, to France to negotiate a treaty which would do away with this annoyance. The commissioners were met in France by three agents who demanded a large sum of money before the Directory would receive the commission and also notified the commission that France would expect a loan from the United States if satisfaction of any other kind was to be given. The commissioners upon rejecting these overtures were ordered out of France. Their report was published at once in the United States and in it the French agents were labeled X, Y and Z, from which the correspondence took its name. The United States increased its army and navy, and hostilities were actually begun, when Talleyrand disavowed any connection with the agents and agreed to receive any minister the United States might send.

Y The 25th letter of the modern alphabet dates only from Roman days in its present position. The Latin alphabet as adapted from the Chalcidic and Etruscan ended with **X**. The two final letters **Y** and **Z** were introduced after the conquest of Greece for use in Greek words transliterated and borrowed. **Y** was the form taken by the letter *upsilon* in the Ionic alphabet, which by the time of the Roman conquest had become generally used in Greece. The letter in the western or Chalcidic alphabet was in the form **V** in which form it had passed into Latin with the vocalic value of *u* and the consonantal value of modern English *w*. In the Greek κοινή based upon Attic the letter **Y** had the value of French *u* or German *ü*. This sound was unknown in the Latin language, and if pronounced in borrowed Greek words passed quickly into that of *i*.

In Old English and Middle English the letter was frequently used in place of *i*, e.g., in words such as *cyng*. In modern English its value is identical with that of *i* both long and short, its most frequent use being perhaps as final in the adverbial termination (e.g., *widely, strongly*). In addition it represents a palatal spirant most frequently when initial (*e.g.*, in words such as *yacht, yoke, young*). (B. F. C. A.)

YABLONOI or **YABLONOVOI** ("Apple Mountains"), known to the Mongols as *Dynze-Daban*, a range of the eastern part of Asiatic Russia. The range is really the eastern slope of a narrow north-north-east extension of the Malkan horst, which rises from eruptive rocks near Kiakhta. The Ingoda river flows along the foot of the range, which is 5–6,000 ft. above sea-level, the highest point being Mount Sokhondo, near the Mongolian frontier. The descent of the Yablonoi to the trough of the Ingoda is 800 to 1,000 ft. and the slope is mainly rocky débris, with scattered patches of forest. The scarp cuts across the Archaean rocks, which strike to the east-north-east; all the horsts and ridges lying to the east of the Yablonoi are thus cut through by the Ingoda-Shilka valley, their waters flowing across the grain of the country in their course towards the Khingan range. The Yablonoi slope is part of the watershed between the Arctic-flowing and the Pacific-flowing streams and it also forms the boundary between the Siberian and the Daurian flora. The trans-Baikal railway crosses the range at 3,137 ft. above sea-level.

YA-CHOW-FU, a city near the western borders of Szechwan, China in 30° N., 103° E. Population about 30,000. It is situated on the banks of the river Ya where tea is grown. The city is walled and is about 2 m. in circumference. It is first mentioned during the Chow dynasty (1122–255 B.C.).

YACHT, a light and comparatively small vessel, propelled by means other than oars. The term is now limited to vessels used for pleasure, or for racing purposes. For sailing yachts *see* YACHTING. Since 1840 power yachts have been increasingly used, especially as long distance cruising became a favourite pastime of the rich. The earliest power yachts were paddle boats, but the paddle was in time abandoned entirely in favour of the screw. For many years steam auxiliaries were the fashion. As a rule they were built with such a small beam that some canvas was necessary for steadying purposes. Of these cruiser yachts perhaps the highest development was reached in the "Valhalla," a ship rigged auxiliary with triple expansion engines of 1,490 tons Thames Measurement, built in 1892. The purely steam yacht developed steadily and during the last decade of the nineteenth century there was a boom in such construction, particularly for owners in the United States. Conspicuous among the big yachts built during this period were the "Valiant" of 1893, 2,184 tons, the "Lysistrata" of 1900, 2,082 tons, and the "Mayflower," 1,844 tons which was for a time the official yacht of the President of the United States.

The internal combustion engine was used for pleasure purposes at sea from the early days of the 20th century, almost as soon as it became practical on land, but to begin with it was in small craft only. For some years before the war the size of yachts propelled by petrol engines, either as full power or as an auxiliary, was increasing steadily and when war broke out the first Diesel-engined yachts were under construction.

After the war the full-powered motor yacht of considerable tonnage, with either Diesel or semi-Diesel machinery, established itself in popular favour in the place of the steam yacht, very few of the latter type having been built of recent years.

The "Nourmahal" of 2,001 tons, the "Savarona" of 1,833, and the "Warrior" of 1,245 tons are typical of the big modern motor yachts, while engines have been installed for auxiliary purposes in yachts of every size, from the 1,195-ton "Flying Cloud" built for the Duke of Westminster to small cruisers of three and four tons. The new cruiser yacht without auxiliary power is, in fact, now the exception and it has even been found necessary to draw up rules forming racing classes of auxiliaries.

YACHTING, the sport of racing in yachts and also the pastime of cruising for pleasure in sailing, steam, or motor vessels. Yacht racing dates from the beginning of the 19th century; for, although there were sailing yachts long before, they were but few, and belonged exclusively to princes and other illustrious personages. During the reign of Elizabeth a pleasure ship was built (1588) at Cowes (Isle of Wight), so that the association of that place with the sport goes back a very long time. In 1660 Charles II. was presented by the Dutch with a yacht named the "Mary," until which time the word "yacht" was unknown in England. He was fond of sailing, for he designed a yacht of 25 tons called the "Jamie," built at Lambeth in 1662, as well as several others later on. In that year the "Jamie" was matched for £100 against a small Dutch yacht, under the duke of York, from Greenwich to Gravesend and back, and beat her, the king steering part of the time—apparently the first record of a yacht match and of an amateur helmsman.

The first authentic record of a sailing club is in 1720, when the Cork Harbour Water Club, now known as the Royal Cork Yacht Club, was established in Ireland, but the yachts were small. Maitland, in his *History of London* (1739) mentions sailing and rowing on the Thames as among the amusements then indulged in; and Strutt, in his *Sports and Pastimes* (1801), says that the Cumberland Society, gave yearly a silver cup to be sailed for near London. The boats usually started from Blackfriars bridge, went up the Thames to Putney, and returned to Vauxhall, being no doubt, mere sailing boats and not yachts or decked vessels. From the middle to the end of the 18th century yachting developed very slowly: although matches were sailed at Cowes as far back as 1780, very few yachts of any size, say 35 tons, existed in 1800 there or elsewhere. In 1812 the Royal Yacht Squadron was established by 50 yacht owners at Cowes and was called the Yacht Club, altered to the Royal Yacht Club in 1820.

EARLY TYPES OF YACHT

Early English Yachts.—Among the earliest of which there is any record were the "Pearl," 95 tons, built by Sainty at Wyvenhoe near Colchester in 1820, for the marquess of Anglesey, and the "Arrow," 84 tons, originally 61 ft. 9½ in. long and 18 ft. 5¼ in. beam, built by Joseph Weld in 1822, which for many years remained a racing yacht, having been rebuilt and altered several times. The Thames soon followed the example of the Solent and established the Royal Thames yacht club in 1823, the Clyde founding the Royal Northern yacht club in 1824, and Plymouth the Royal Western in 1827. In this year the Royal Yacht Squadron passed a resolution disqualifying any member who should apply steam to his yacht. In 1830 one of the largest cutters ever constructed was launched, viz., the "Alarm," built by Inman at Lymington for Joseph Weld of Lulworth Castle, from the lines of

a famous smuggler captured off the Isle of Wight. She was 82 ft. on the load-line by 24 ft. beam, and was reckoned of 193 tons, old measurement, in which length, breadth and half-breadth (supposed to represent depth) were the factors for computation. Some yachtsmen at this time preferred still larger vessels and owned square-topsail schooners and brigs like the man-0'-war brigs of the day, such as the "Waterwitch," 381 tons, built by White of Cowes, in 1832, for Lord Belfast, and the "Brilliant," barque, 493 tons, belonging to J. Holland Ackers, who invented a scale of time allowance for competitive sailing. In 1834 the first royal cup was given by William IV. to the Royal Yacht Squadron. In 1836 the Royal Eastern yacht club was founded at Granton near Edinburgh; in 1838 the Royal St. George's at Kingstown and the Royal London; in 1843 the Royal Southern at Southampton and the Royal Harwich; in 1844 the Royal Mersey at Liverpool and the Royal Victoria at Ryde. The number of vessels kept pace with the clubs—the 50 yachts of 1812 increasing nearly tenfold before the middle of the century.

First Alteration in Type.—In 1848, after J. Scott Russell had repeatedly drawn attention to the unwisdom of constructing sailing vessels on the "cod's head and mackerel tail" plan, and had enunciated his wave-line theory, Mare built at Blackwall an entirely new type of vessel, with a long hollow bow and a short after-body of considerable fulness. This was the iron cutter "Mosquito," of 59 ft. 2 in. water-line, 15 ft. 3 in. beam, and measuring 50 tons. Prejudice against the new type of yacht being as strong as against the introduction of steam, there were no vessels built like the "Mosquito," with the exception of the "Volante," 59 tons, by Harvey of Wyvenhoe, until the eyes of English yachtsmen were opened by the Americans three years later. About this period yacht racing had been gradually coming into favour in the United States. (See below.) John C. Stevens, who played a leading part in the development of boats for pleasure sailing and racing in the United States, commissioned George Steers of New York, builder of the crack pilot schooners, to construct a racing schooner to visit England in the year of the great exhibition, and the result was the "America" of 170 tons. She crossed the Atlantic in the summer of 1851, but failed to compete for the Queen's cup at Cowes in August, although the club for that occasion threw the prize open to all the world, as her owner declined to concede the usual time allowance for difference of size. The members of the Yacht Squadron, not wishing to risk the reproach of denying the visitor a fair race, decided that their match for a cup given by the club, to be sailed round the Isle of Wight later in the same month, should be without any time allowance. The "America" entered and competed against 15 other vessels. The three most dangerous competitors being put out through accidents, the "America" passed the winning-post 18 minutes ahead of the 47-ton cutter "Aurora," and won the cup; but, even if the time allowance had not been waived, the American schooner yacht would still have won by fully a couple of minutes. The prize was given to the New York Yacht Club and constituted a challenge cup, called "the America's cup," for the yachts of all nations, by the deed of gift of the owners of the winner. (See below for a complete account of these races.)

The First Great Era of Yacht Racing.—Between 1870 and 1880 there were some very notable additions to the racing fleet, including the schooners "Gwendolin," "Cetonia," "Corinne," "Miranda" and "Waterwitch"; the large cutters "Kriemhilda," "Vol au Vent," "Formosa," "Samoena" and "Vanduara," a cutter built of steel; the 40-tonners "Foxhound," "Bloodhound," "Myosotis" and "Norman"; the 20-tonners "Vanessa" (Hatcher's masterpiece), "Quickstep," "Enriqueta," "Louise" and "Freda"; and the yawls "Florinda," "Corisande," "Jullanar" and "Latona." The "Jullanar" may be noted as a specially clever design. Built in 1874 from the ideas of Bental, an agricultural implement maker of Maldon, Essex, she had no dead wood forward or aft, and possessed many improvements in design which were embodied and developed by the more scientific naval architects, G. L. Watson, William Fife, Jr., and others in later years. Lead, the use of which commenced in 1846, was entirely used for ballast after 1870 and placed on the keel outside.

No fewer than 400 matches took place in 1876, as against 63 matches in 1856, with classes for schooners and yawls, for large cutters, for 40-tonners, 20-tonners and 10-tonners. The Yacht-Racing Association, established in 1875, drew up a simple code of laws for the regulation of yacht races, which was accepted by the yacht clubs generally. The association adopted the rule for ascertaining the size or tonnage of yachts which had been for many years in force, known as the Thames rule; but in 1879 they altered the plan of reckoning length from that taken on deck to that taken at the load water-line, and two years later they adopted an entirely new system of calculation.

The Plank-on-edge.—These changes led to a decline in yacht-racing, the new measurement exercising a prejudicial effect on the sport, as it enabled vessels of extreme length, depth and narrowness, kept upright by enormous masses of lead on the outside of the keel, to compete on equal terms with vessels of greater width and less depth, in other words, smaller yachts carrying an inferior area of sail. The new type was known as the "lead mine" or plank-on-edge type.

Dixon Kemp in 1887 induced British yachtsmen to abandon the system of measuring yachts by tonnage and to adopt a new system of rating them by water-line length and sail area. The new system contained no taxes or penalties upon beam or depth nor upon "over all" length. The only factors measured were the water-line and the area of the sails. All the old tonnage rules taxed the length and the breadth. This change of the system measurement crushed the plank-on-edge type completely.

Revival of Yacht-racing Under Length and Sail Area Rule.—Yachtsmen were greatly pleased with the broader and lighter types of yachts that designers began to turn out under the length and sail area rule. They were more comfortable and drier in a seaway than the old vessels. The first large cutters built with considerable beam were "Yarana" and "Petronilla" in 1888, and in 1889 the first of Lord Dunraven's Valkyries was a vessel that was much admired. Then in 1890 "Iverna," a handsome clipper-bowed cutter owned by Mr. Jameson, came out and raced against "Thistle."

The Second Great Era in Yachting.—The seasons following 1892 are identified with the big cutter racing. The revival under the length and sail area rule had so far extended to "Iverna." "Tarana," "Petronilla," and "Valkyrie I." being built in the first class, but then there had been a pause of some years during which large numbers of 40-raters, 20-raters and the Solent classes had been built. Just when the critics were declaring that in the future no yachtsmen would build a class racer larger than a 40-rater (60 ft. L.W.L. with 4,000 sq.ft. of sail), the prince of Wales (afterwards Edward VII.) gave an order for the cutter "Britannia," while Lord Dunraven built "Valkyrie II.," A. D. Clarke "Satanita" and Peter Donaldson "Calluna"; and in this same season (1893), an American yachtsman took the Herreshoff yacht "Navahoe" over the Atlantic. Yacht designing and building now became a science demanding the highest tax upon the skill and ingenuity of the naval architect. The cutter "Valkyrie II." visited the United States in 1893, but Lord Dunraven's vessel was beaten by the "Vigilant." Curiously enough, when the crack Herreshoff cutters "Navahoe" and '!Vigilant" visited the British Isles they were severely beaten by the British yachts. During the years that followed the '(Britannia" held a wonderful record.

Some other famous racing yachts which were built under the length and sail area rule were "Ailsa" (1895), "Isolde," "Caress," "Audrey," "Niagara," and the "Norman."

It was evident that a skimming-dish of "Britannia's" or "Isolde's" rating would have no cabin accommodation or head room, and that the evolution of such type would be as bad for the sport as the development of the old plank-on-edge had been in 1885. It seemed strange that whilst the old tonnage rule had evolved the plank-on-edge ten years previously, the sail area measurement now evolved a plank-on-side, balanced by a fin. The fact was that designers had solved the problem. The rule measured only the length and the area of canvas. Taking the length of the vessel on the water-line as constant, then the vessel with the smallest possible weight could be driven with less sail at the same

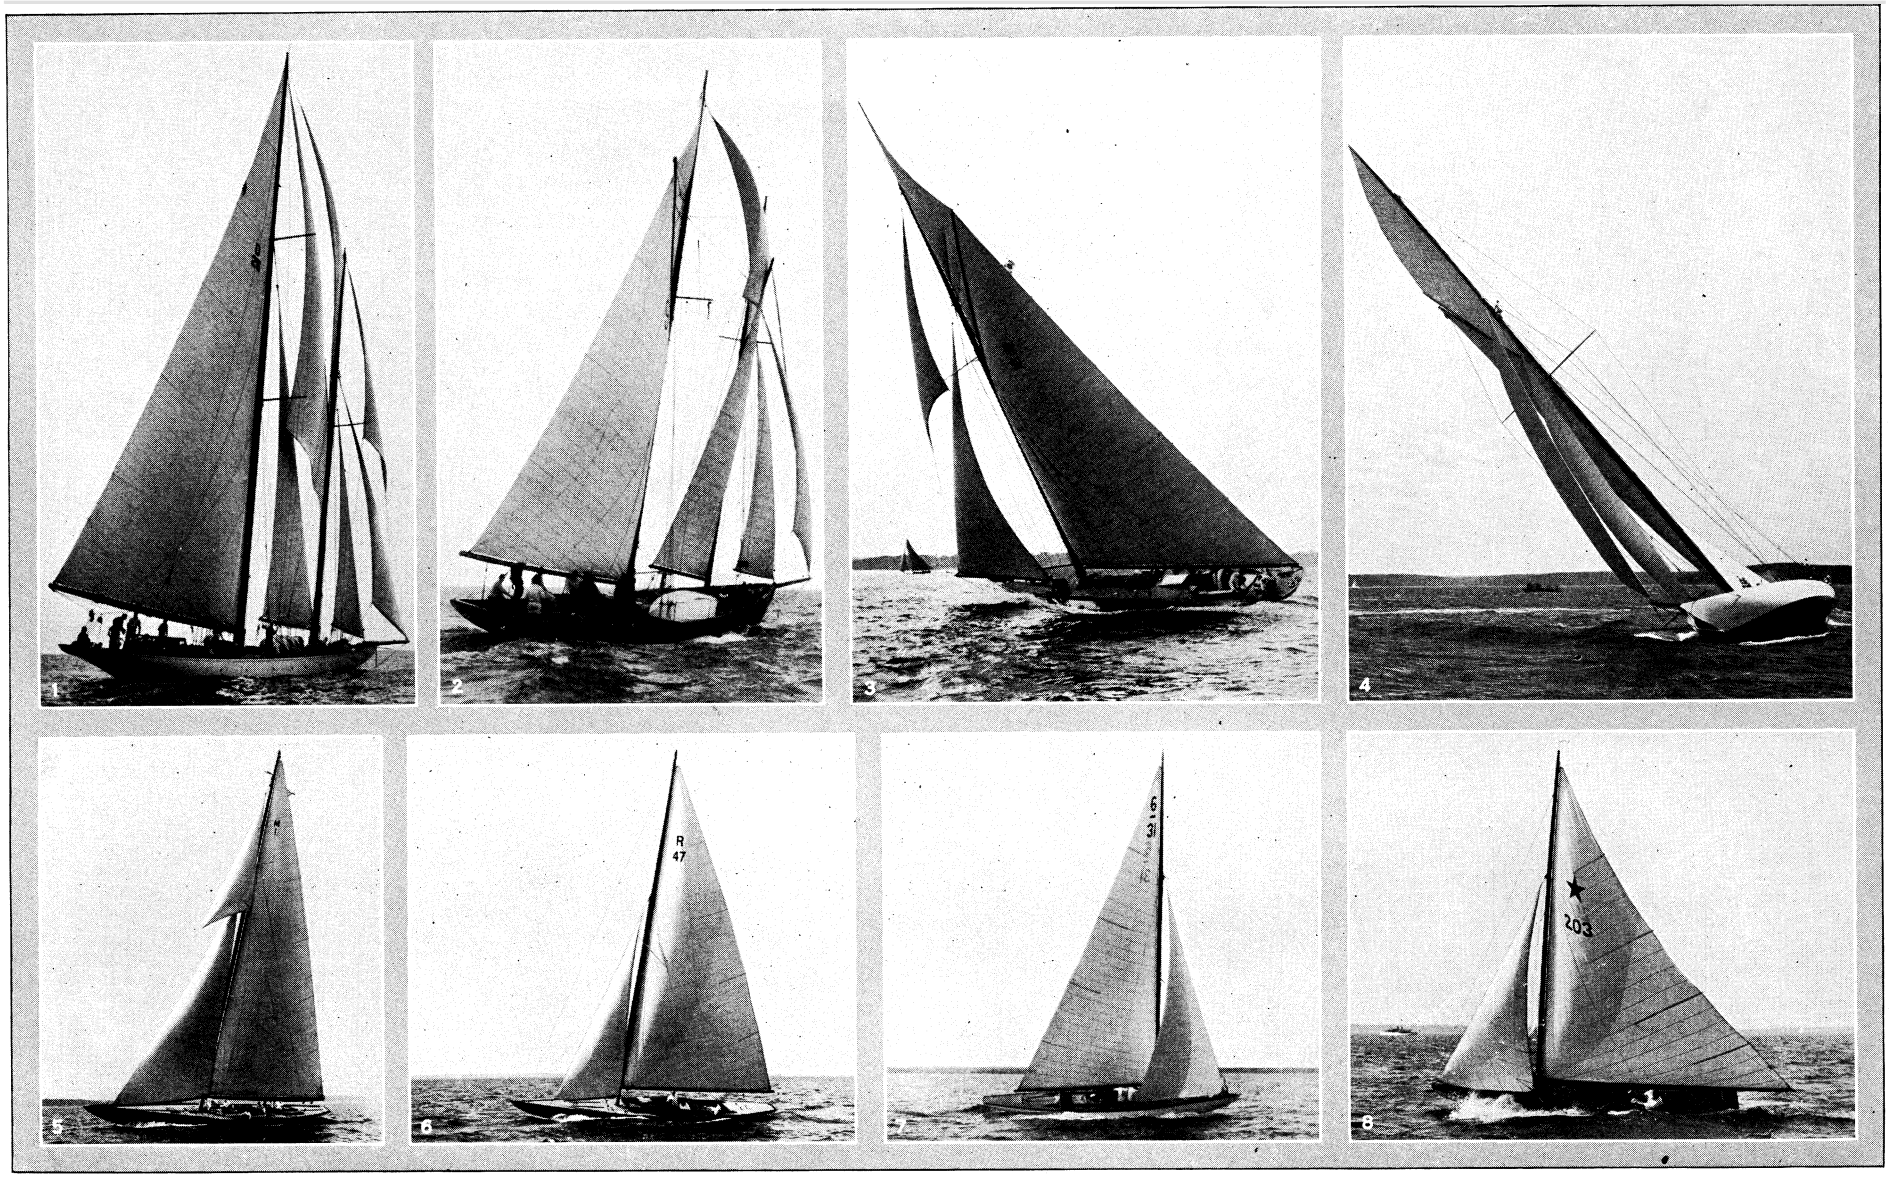
SOME AMERICAN ONE–DESIGN CLASS YACHTS

1. Start of the Seawanhaka schooners at the Larchmont regatta in 1928. Designed by Cox and Stevens, 16 of these boats were turned out at the same time in 1925, principally for racing on Long Island Sound. They are 56'6" overall, 38' waterline and 12' beam. 2. The "Banzai," a 30' class boat of the New York Yacht Club designed by N. G. Herreshoff and representative of a famous class of one-design boats built in America 25 years ago



PHOTOGRAPHS, MORRIS ROSENFELD

FAMOUS AMERICAN YACHTS

1. The 88′ schooner yacht "Advance" with staysail rig. One of the most successful types turned out, designed by Burgess. Swasey and Paine
2. The "Malabar 9," designed by John G. Alden. Typical of large fleet of small ocean cruising schooners
3. One of the New York Yacht Club 40′ class hard on the wind. A type of yacht designed by Herreshoff
4. The "Resolute," America's Cup Defender (1920), in a fresh breeze. Starboard rail awash
5. "Prestige," a class M. sloop turning to windward
6. Speedy little class R. Sloop with sheets down. Popular type of yacht
7. The "Frieda," American six metre class of the type designed by Clinton H. Crane
8. Star class yacht in brisk going. Largest one design class ever promoted, over 600 built and raced in various parts of the world

speed as vessels with greater weight and greater sail. This solution of the problem was not apparent to designers from 1880 to 1885, because of the difficulty of obtaining stability. From 1880 to 1885 stability was obtained by means of very heavy keels. In 1895 the stability was obtained by means of a light piece of lead placed at the bottom of a deep steel fin.

The First Linear Rating Rule.—To endeavour to check the tendency to build skimming-dishes the Yacht-Racing Association introduced in 1896 a new system of measurement which was proposed by R. E. Froude. The novelty of the system consisted of a tax upon the skin girth of the yacht, whereby a vessel with hollow midship section was penalized by her girth being measured round the skin surface. Froude's first system of rating began on Jan. 1, 1896. and ended at the close of the year 1900. The measurement of the yacht was obtained by the following formula:—

$$\frac{\text{Length L.W.L.} + \text{beam} + \frac{3}{4}\text{skin girth} + \sqrt{(\text{sail area})}}{2} = \text{linear rating.}$$

This rule partially failed in its object. It was hoped that the skin-surface measurement would prevent the fin-bulb type being successful, but Froude and his colleagues had under-estimated the possible developments of exaggerated pram bows, immense scow-shaped shoulders and stern-lines, all of which could be introduced into the skimming-dish type with great success. So, notwithstanding the small premium on displacement this rule contained, the dishes could still beat the full-bodied yachts.

The Second Linear Rating Rule.—This rule, also suggested by Froude, was introduced on Jan. 1, 1901. The Y.R.A. agreed to fix this rule for a period of seven years. The object of the rule was to ensure a big-bodied vessel. The formula was:—

$$\frac{\text{Length} + \text{breadth} + \text{girth} + 4\bar{d} + \sqrt{(\text{sail area})}}{21} = \text{linear rating.}$$

Now the novelty of this rule was the new tax $\bar{d}$. This $\bar{d}$ represents the difference in feet between the measurement of the girth of the yacht's hull taken round the skin surface and the girth at the same place measured with a string pulled taut. This measurement is taken $\frac{6}{10}$ the distance from the fore end of the water-line. It is easy to see that in a full-bodied yacht $\bar{d}$ = a small unit, whilst in a hollow-bodied yacht d = a larger unit. Four times $\bar{d}$ being taken, it followed that hollow-bodied yachts were heavily penalized. This ingenious $\bar{d}$ measurement was evolved by Alfred Benzon, a Danish scientist and yachtsman.

Class Racing, Handicapping and Cruiser Racing, Yacht racing may be subdivided under these three heads. Yacht racing by rating measurement or tonnage, when either the first yacht to finish is the winner, or the yacht saving her time by a fixed scale of time allowance in proportion to the rating of the vessel and the length of the course, is called class racing, and it obviously tends to encourage the fastest possible vessel under the current rating rule to be produced. It has always been regarded as the highest form of the sport. It is naturally, however, the most expensive form, because only the most up-to-date and perfectly equipped vessels can keep in the first flight.

From time to time, chiefly from about the years 1884 and 1885 onwards, handicaps framed according to merits have been fashionable amongst yachtsmen. They were originally devised to afford amusement and sport to out-classed racers and cruisers. Owing to the expense of class racing, handicap racing thrived greatly during the period of the first and second girth rules. During these periods, too, the third style of yacht racing came into vogue, namely, cruiser racing; either very fast cruisers were built specially for the purpose of handicap racing, or a number of yachts of exactly similar design were built specially to the owner's orders for the purpose of racing in a class together. The fast handicap cruisers had the great advantage over class racers from 1896 up to 1906, inasmuch as they were much more strongly built. "Valdora" (107 tons), "Brynhild" (160 tons), "Leander," "Namara," "Rosamond," "Merrymaid" and many others were yachts of the former type.

Yachts Built Under the Second Linear Rating Rule.—Few large vessels were built expressly for racing under this rule; indeed the Fife 65-footer "Zinita" (1904) was the only light-scantling yacht of any importance. However, two very handsome first-class vessels were constructed to the rule: "White Heather I." by Fife in 1904, and "Nyria" by Nicholson in 1906; they were some 12 ft. shorter than the great cutters of "Britannia's" year and altogether smaller, having less beam and draught and some 1,700 sq.ft. less sail area. The growing dissatisfaction of yacht-owners at the extreme light scantling of modern racing yachts was strongly demonstrated by the fact that both "White Heather I." and "Nyria" were specially ordered to be of heavy scantling, and they were classed A1 at Lloyd's. They were therefore of the semi-cruiser type. "Nyria," however, was the extreme type of a yacht of her period in shape, although heavy in construction.

The First International Rules Introduced.—In April 1904 B. Heckstall Smith drew the attention of German, French and British yachtsmen to the fact that the yacht measurement rules (then different in the various countries) were generally due to terminate about the end of 1907, and suggested that many advantages would accrue if an international rule couid be agreed upon. The Yacht-Racing Association agreed to take the matter up, and at two international conferences, held in London in January and June 1906, an international rule of yacht measurement and rating was unanimously agreed to by all the nations of Europe. America alone refused to attend the conference. R. E. Froude, a nephew of the historian, struck the keynote of the object of the conference by a statement that the ideal yacht should be a vessel combining "habitability with speed." Old plank-on-edge types under the tonnage rules were habitable but slow. Skimming-dishes attained the maximum speed, but were uninhabitable. A good form was attained in 1901 with "Magdalen," but since that year the bane of light construction had become harmful to yachting. Hence the conference aimed at a rule which would produce a yacht combining habitability with speed. They adopted a form of linear rating comprising certain penalties upon hollow midship section (*i.e.*, Benzon's $\bar{d}$ tax) and also upon full pram bows. The following was adopted as the rule by which all racing yachts in Europe were rated:—

$$\frac{L + B + \frac{1}{2}G + 3\bar{d} + \frac{1}{3}\sqrt{S} - F}{2} = \text{rating in linear units, } i.e., \text{ either feet or metres.}$$

Where L = length in linear units.
" B = extreme beam in linear units.
" G = girth in linear units.
" $\bar{d}$ = girth difference in linear units.
" S = sail area in square units.
" F = freeboard in linear units.

The length L for the formula was the length on the water-line, with the addition (1) of the difference between the girth, covering-board to covering-board, at the bow water-line ending, and twice the freeboard at that point, and (2) one-fifth of the difference between the girth, covering-board to covering-board, at the stern water-line ending, and twice the freeboard at that point. The additions (1) and (2) penalize the full overhangs and the bow overhang in particular. The girth, G, was the chain girth measured at that part of the yacht at which the measurement is greatest, less twice the freeboard at the same station, but there were certain provisions allowing the measurement of girth generally to be taken 0.55 from the bow end of the water-line. The girth difference, $\bar{d}$ in the formula, was the difference between the chain girth, measured as above described, from covering-board to covering-board, and the skin girth between the same points, measured along the actual outline of the cross-section.

For racing the yachts were divided into 11 classes. Class A for schooners and yawls only, above 23 metres (75.4 ft.) of rating, with a time allowance of four seconds per metre per mile. All the yachts in this class were classed A1 at Lloyd's. In racing, yawls sailed at their actual rating and schooners at 12% less than their actual rating. The other classes were ten separate classes for single masted vessels only in which there was no time allowance whatever.

Racing Yachts All Built to Fixed Scantlings.—Under the international rule the old trouble of ultra-light scantling in

racing yachts was completely abolished, for all yachts were obliged to be built under the survey and classed with one of the classification societies—Lloyd's Register of British and Foreign Shipping, Norsk Veritas, Germanischer Lloyd, or Bureau Veritas; and yachts of the international cutter classes so built were classed R, denoting that their scantlings are as required for their respective rating classes. The international rule for measurement and classification fixing the scantlings was introduced on Jan. 1, 1908; England, Germany, France, Norway, Sweden, Denmark, Austria-Hungary, Belgium, Holland, Italy, Spain, Finland, Russia and the Argentine Republic agreed to adopt it until Dec. 31, 1917. England adopted the new system a year before it formally became international.

The new rule produced the type of yacht desired—a vessel combining habitability with speed. Amongst the handsomest examples were the German emperor's schooner "Meteor" (1909), and the schooner "Germania" (1908), 400 tons or 31½ metres measurement, Class A, both built by Krupp's at Kiel. German designed, German built and German rigged and manned, they demonstrated the wonderful strides made by Germany in yachting. A few years before there were not a dozen smart yachts in Germany, and, indeed, the Kaiserlicher Yacht Club at Kiel was only founded in 1887. The "Germania" holds the record over the old "Queen's course" at Cowes, having in 1908 sailed it a quarter of an hour faster than any other vessel. Her time over the distance of about 47 to 48 nautical miles was 3 hours 35 min. 11 sec., or at the rate of 13·1 knots. In 1910 Herreshoff built in America a wonderful racing schooner of A class for the international rules called the "Westward," and in the races this clipper sailed at Cowes she proved the most weatherly schooner ever built.

The success of the international rule was remarkable. The following is a list of the racing yachts built under it in all countries from its foundation in 1907 to the outbreak of war in 1914.

Class in metres	Length in feet	Number of yachts built
23	75'4	3
19	62.3	6
15	49·2	19
12	39'4	35
10	32.8	54
9	29·5	25
8	26·2	174
7	23·0	86
6	19·7	328
5	16·4	41
Total	..	771

This total does not include the big schooners of Class A, such as "Meteor IV.," "Meteor V.," "Germania," "Waterwitch," "Westward" and "Margherita," enormous vessels of 400 tons, and a number of small yachts built in Scandinavia and neutral countries early in the war, from 1915 to 1917, when the first international rule came to an end. There were thus upwards of 800 yachts built to this rule for international racing.

Much of the finest racing in the whole history of yachting took place from 1908 until 1914. The International Yacht Racing Union was established under the chairmanship of the British Yacht Racing Association and consisted of all the European nations and the Argentine Republic. British yacht building was flourishing, German yachting was at its zenith under the Kaiser. International regattas on a big scale were held at Spithead in 1911, at Kiel in 1912, at Le Havre in 1913, and in the Oslo fjord in 1914. America was attracted to European yachting, and in 1910 an American racing schooner came to Europe, the "Westward," 323 tons, designed and built by Herreshoff. She started in 11 races and won them all. Sir Thomas Lipton's 23-metre cutter "Shamrock" remained the best British cutter during these seasons.

The End of the First International Rule.—The yachting season of 1912 was notable for the appearance of a new 15-metre yacht, the "Istria," designed on novel lines by C. Nicholson for Sir Charles Allom, and the first of a series of yachts by the same clever designer which quickly began to defeat the purpose of the international racing rule. In 1912 and 1913 his great schooner "Margherita" and the cutters "Istria," "Pamela," "Paula III." and others were of most undesirable type, but so efficient as racers that they outsailed the yachts of all other designers.

The Second International **Rule.**—*The Present Rules 1920–28.*—On the eve of Cowes week, 1914, the war put an end to all yacht racing. The pastime was only revived in 1919–20, after much difficulty, by the Yacht Racing Association. At the end of the war the Scandinavian nations purchased nearly all the best British racing yachts. The cost of building new yachts was prohibitive and the high wages of sailors raised the running expenses to nearly treble the pre-war rate. At the instance of the Y.R.A. the International Yacht Racing Union was reformed and a new rating rule was adopted in 1920. It was essential, in framing the second or present international rule, (1) to keep in view Froude's ideals of combining "habitability and speed" in the new racing yachts, and (2) to keep in view the economy of labour in working the yachts, *i.e.*, to reduce the area of canvas utilized to propel the hull. The object was to try to produce a habitable vessel of say 20 to 25 tons displacement, which, instead of requiring enormous sails to drive the hull, and which would thus need a crew of say eight men to work her, to produce a racing yacht with a hull that could be driven with one-third less canvas and a crew of only four men. The international conferences of 1919, 1924 and 1926 framed two separate rules, one for yachts up to 12-metres and another for yachts above 12-metres. These are as follows:—

Part I. For classes of 6-, 8-, 10- and 12-metres:

$$\frac{L+\frac{1}{4}G+2d+\sqrt{S}-F}{2\cdot5}=\text{rating.}$$

Part II. For yachts above 12-metres:

$$\frac{L+\sqrt{S}-F}{2\cdot3}=\text{rating.}$$

L = the "sailing length" being the length L.W.L. (length on waterline) with certain additions, including measurements of the length of the overhangs at the bow and stern, and also the fullness or girth of the said overhangs.

G = the chain girth.

d = the difference between the skin and chain girths, but not taken round the bottom of the keel.

S = the sail area.

F = the freeboard.

A limit in each rule was placed upon draught of water and height of masts or sail plans.

By far the most important innovation, however, in both rules was a limit upon the displacement of the yacht in proportion to her length. For many years there had been a "limit" or "penalty" upon the displacement of yachts in America. In 1919–20 the International Yacht Racing Union of Europe adopted the American limit upon displacement. Under sec. 8 it is explained how, in the year 1895, the lack of displacement of the skimming dish fin and bulb raters killed the original English length and sail area rule, there being, of course, no limit upon the *minimum* displacement then permitted. These new international rules are, in effect, nothing more nor less than length and sail area rules *plus* the all-important addition of a limit upon the minimum displacement. This is an actual fact, because L and S are the predominant factors of the rules, and the G, d and F amount to a very trifling percentage of the total. Now the minimum limit placed upon displacement in both Parts I. and II. of the present international rule is:

$$\text{Displacement in tons shall not be less than } \frac{(0\cdot2\text{ L.W.L. in ft.}+0\cdot5\text{ ft.})^3}{35}$$

It will be found this gives a minimum weight or displacement of about 3¼ tons to a 6-metre yacht of about 22 ft.; a weight of about 21 to a 12-metre yacht of 42 ft. and about 107 tons to a 23-metre yacht of 75 feet.

All the yachts below 12 metres have to be classed for scantlings R at Lloyd's and all those above 12 metres A1 at Lloyd's.

The **Bermudian** Rig.—A direct outcome of the new inter-

national rule has been the evolution of the Bermudian rig (*q.v.*).

The Development of Yachting Since the War.—Owing to the increased cost of the sport, the progress of yachting from 1919 until the present time has been gradual. For a few years class racing for new yachts under the international rule has been chiefly confined to the smaller classes of 12 metres and under. A 6-metre yacht built in 1914 cost about £500, and in 1928 she cost about £1,100. The 75-foot or 23-metre "White Heather" and "Shamrock," built in 1907 and 1908, cost about £9,000 or £9,500. The new 23-metre yachts "Astra" and "Cambria," built in 1928, cost between £24,000 and £25,000. It is, therefore, not a matter for surprise that yachtsmen now cruise and race in yachts of smaller tonnage than in former times. Notwithstanding the cost of building, an enormous number of racing yachts have been built to the second international rule from 1920 to 1928, as is shown by the following table:

Class in metres	Length in feet	Number of yachts built
. . . . .	75	3
. . . . .	39·3	24
10	32·8	20
8	26.2	60
6	19·7	200
Total	..	307

These yachts have been built in Great Britain, Scandinavia, America, France, Italy, Belgium, Holland and Spain. The British 23-metres (built in 1928) are the "Astra," built by Nicholson for Sir Mortimer Singer, and the "Cambria," by Fife, for Sir William Berry. The most famous 12-metres have been the "Vanity," built by Fife for J. R. Payne, and the "Norisca," built by Johan Anker at Oslo.

Great contests for the British-American Cup were sailed in the years 1921–22, –23 and –24 between "teams" of British and American 6-metre yachts. Each country was represented by four selected yachts to form its team. Two contests were sailed in America and two in Britain, and the British won the rubber after many exciting and close races. William Fife the Scottish designer showed his superiority with "Polly," "Reg," "Betty" and "Zenith," and Frederick Stephen, another eminent Scottish yachtsman, designed and built his own yacht, "Coila III.," and competed with great success in these sporting races. Under the second international rule, however, no individual country has carried off the palm. Norway, Sweden and America have shared the honours with Britain. For the first time in the history of yachting it appears that yacht designers are unable to make certain of defeating an old yacht, under the rules, with a new vessel.

The King's Yacht "Britannia."—Encouragement has been given to the pastime of yacht racing since the war by the King's taking the lead in the sport in British waters and re-fitting the old cutter "Britannia" for racing. This yacht, designed by G. L. Watson, and built in the year 1893 has a hull form very similar to that fostered and developed by the new rating rules of 1920. The chief difference between the "Britannia's" hull form and that of modern yachts being that the latter have greater freeboard, and are consequently able to develop higher speed when pressed by fresh wind. The form of modern yachts is also somewhat more elongated and more easily driven in light winds. Nevertheless, with the aid of a small handicap allowance in her favour, the "Britannia" has been raced with much success from 1920 to 1928. She is of larger tonnage than "Astra," "Cambria," "Shamrock," "White Heather," "Lulworth" or "Nyria," and she has been re-rigged with stronger and more substantial gear than most of her newer opponents. Consequently, although not so fast for her size, she has often won many races on her merits in the heavy weather which occurs during the summer round the British coast. The King has personally won many famous races with "Britannia" against the modern yachts, in what is known by sailors as "Britannia's weather." The "Britannia" has thus had two distinct careers. First, from 1893 to 1897, and second, from 1920. No other vessel in the world has won so many prizes or sailed so many races. The following is her complete record:

Year	Number of starts	Number of first prizes	Number of other prizes	Total
1893 to 1922 .	202	151	37	188
1923 . .	26	11	11	22
1924 . .	19	7	5	12
1925 . .	36	6	6	12
1926 . .	23	4	7	11
1927 . .	24	8	8	16
1928 . .	34	9	10	19
1930 . .	26	5	5	10
1931 . .	20	6	7	13
1932 . .	32	9	14	23
1933 . .	39	12	12	24
1934 . .	27	3	7	10
1935 . .	26	0	0	0
	625	231	129	360

The Speed of Sailing Yachts.—It may be said that the speed of sailing yachts of normal dimensions varies according to the square root of their length. In judging the speed of modern yachts a comparison thereof is usually made through the "rating measurement." A yacht of 20-metres or 65.6 rating length, in a strong wind can maintain a maximum speed of about 12 knots. The time allowance in seconds per mile between yachts of different "sizes," "ratings" or "lengths," is usually found by the formula:

$$\frac{2{,}160}{\sqrt{r}} - \frac{2{,}160}{\sqrt{R}}$$

where R is the rating length of the large yacht and r that of the smaller yacht.

It is interesting to recall some old records of speed over courses inside the Isle of Wight.

Date	Yacht	Distance	Time	Remarks
1858	The Arrow	45 miles	4 h. 19 m.	Cutter. Same Cutter vessel.
1872	The Arrow	50 ,,	4 h. 40 m.	Same Cutter vessel.
1872	Kriemhilda	58 ,,	4 h. 37 m.	Cutter.
1883	Marjorie	50 ,,	4 h. 26 m.	Cutter.
1883	Samoena	50 ,,	4 h. 15 m.	Cutter.
1885	Lorna	50 ,,	4 h. 14 m.	Yawl.
1885	Irex	50 ,,	4 h. 7 m.	Cutter.
1870	Egeria	50 ,,	4 h. 27 m.	Schooner.
1875	Olga	50 ,,	4 h. 25 m.	Schooner.
1879	Enchantress	50 ,,	4 h. 18 m.	American schooner.
1902	Meteor	47 ,,	3 h. 50 m.	American schooner.
1908	Cicely	46 ,,	3 h. 43 m.	British schooner.
1908	Shamrock	47 ,,	4 h. 0 m.	British 75 ft. L.W.L.
1908	Germania	47 ,,	3 h. 35 m.	German schooner.

The First Contest for the America's Cup.—The international trophy was originally a cup given by the Royal Yacht Squadron at Cowes, Isle of Wight, on Aug. 22, 1851, for a race open to all yachts, with no time allowance of any kind, the course being "round the Isle of Wight, inside the No Man's buoy and Sand Head buoy and outside the Nab." Fifteen vessels took up their stations off Cowes and started from moorings. In the table following are the names of the competitors.

Yacht	Rig	Tons	Owner
Beatrice . .	Schooner	161	Sir W. P. Carew.
Volante . .	Cutter	48	Mr. J. L. Craigie.
Arrow . .	Cutter	81	Mr. T. Chamberlayne.
Wyvern . .	Schooner	205	The duke of Marlborough.
Ione . .	Schooner	75	Mr. A. Hill.
Constance	Schooner	218	The marquis of Conyngham.
Gipsy Queen .	Schooner	160	Sir H. B. Hoghton.
Alarm .	Cutter	193	Mr. J. Weld.
Mona .	Cutter	82	Lord Alfred Paget.
		170	Messrs.
. .			
. .	schooner	392	Mr. G. H. Ackers.
Bacchante	Cutter	80	Mr. B. H. Jones.
Freak .	Cutter	60	Mr. W. Curling.
Eclipse	Cutter	50	Mr. H. S. Fearon.
	Cutter	47	Mr. T. Le Marchant.

The fleet started at 10 o'clock. Abreast of Ventnor the American schooner was a mile ahead of "Aurora," which was the last British craft to keep her in sight in a thick haze that blew up from the south-west late in the afternoon. At the Needles the wind dropped until it was very light, and the "America" was then some 6 m. ahead of "Aurora," the time being about 6 P.M. The finish was:—

America (winner)	8.37 P.M.	Aug. 22
Aurora	9.38 P.M.	Aug. 22
Bacchante	9.45 P.M.	Aug. 22
Eclipse	9.48 P.M.	Aug. 22
Brilliant	1.20 A.M.	Aug. 23
Bacchante	1.29 A.M.	Aug. 23

The "America" was built at New York by the firm of George and James R. Steers for the special purpose of competing with British yachts. The principal dimensions of the "America" were: tonnage 171; length over all 94 ft.; on the keel 82 ft.; beam 22 ft. 6 in.; foremast 79 ft. 6 in.; mainmast 81 ft. (with a rake of 29 in. to the foot in each mast); hollow bowsprit 17 ft. out board only; foregaff 24 ft.; maingaff 28 ft.; mainboom 56 ft. She was ballasted with pig-iron; 21 tons of the iron were permanently built into the vessel and the rest stowed inside. Below deck she was comfortably fitted for the living accommodation of the owner, guests and crew, and a cockpit on deck was a feature that few English yachts of the period possessed.

The cup won at Cowes by the "America," although not originally intended as a challenge cup, was afterwards given to the New York Yacht club by the owner of the "America" as a challenge trophy and named the "America's cup." In 1887 the sole surviving owner of the cup, George L. S. Schuyler, attached to the trophy a deed of gift which sets forth the conditions under which all races for the cup must take place. In brief the conditions are: (1) That the races must be between one yacht built in the country of the challenging club and one yacht built in the country of the club holding the cup. (2) That the size of the yachts, if of one mast, must be not less than 65 ft. L.W.L. and not more than go ft. L.W.L. If of two-masted rig not less than 80 ft. L.W.L. and not more than 115 ft. L.W.L. (3) The challenging club must give ten months' notice of the race, and accompanying the challenge must be sent the name, rig and the following dimensions: length L.W.L.; beam and draught of water of the challenging vessel (which dimensions shall not be exceeded), and as soon as possible a custom-house registry of the vessel. (4) The vessel must proceed under sail on her own bottom to the place where the contest is to take place. For results of subsequent contests *see* table, p. 870.

HOW A YACHT IS SAILED

The method and principle upon which a yacht race is sailed may be described in a way easily understood by any landsman. The course is usually a triangle or a square. Suppose the starting and finishing line is between the two mark boats XY (fig. 1); and suppose the start to be in an easterly direction. Suppose also the direction of the wind to be north. Then the course would be from the starting line round the marks or buoys placed at B, C, D, A, and back to finish across the line XY. The start of a yacht race is at a fixed hour, say 11 A.M. Two signal guns are fired, one at 10.55 to prepare, and the other at 11 A.M. to start. During the five minutes interval between the guns, the yachts may sail about anywhere they like, "jockeying," so as to try to get into the best position as the second gun fires. The object of the steersman is to sail his yacht across the line XY at full speed immediately after the starting gun has fired.

The first leg of the course is easterly, from the line XY to the point B. This is sailing at right-angles to the wind and is called "reaching." The yacht sailing from XY to B is said to be "reaching on the port tack" because the wind is blowing upon her "port" or left hand side. When reaching, the sails are trimmed as in fig. 2. The next course is from B to C. This is dead before the wind and is called "running." When the wind is dead aft, or nearly so, and the yacht is running before it, the balloon sail called the spinnaker is set. The spinnaker must be taken in before the yacht gets to C. When running, the sheets are eased right off as in fig. 3. The third course is from C to D, this is again reaching, as from A to B, but the yacht is now "reaching on the starboard tack" because the wind is blowing upon her "starboard" or right hand side (fig. 4).

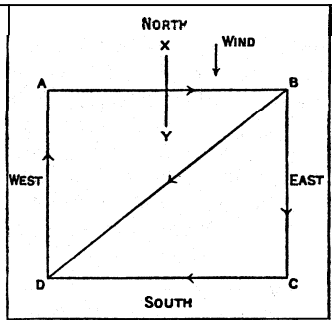


FIG. 1.—DIAGRAM OF THE COURSE OF A YACHT RACE

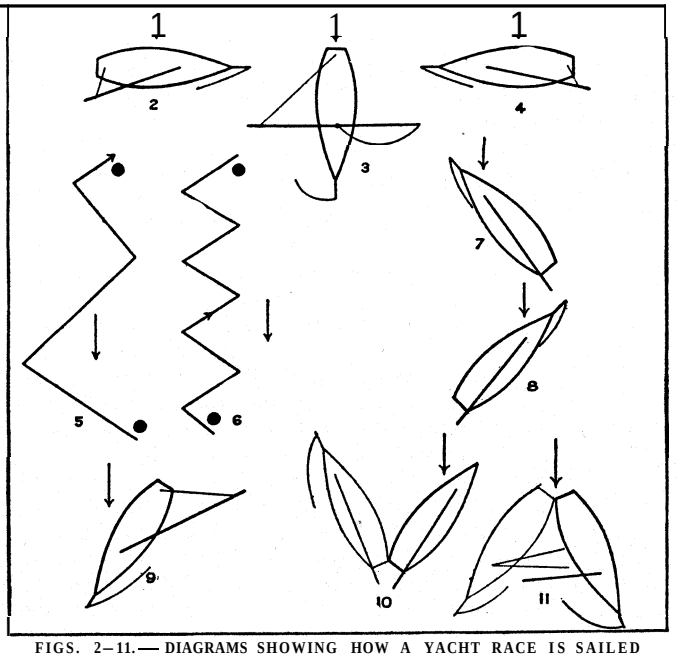
The yacht having reached to D, now has to sail from D to A. This is absolutely dead against the direction of the wind. The yacht cannot sail dead against the wind but only at an angle of rather less than 45° from it. The yacht, therefore, has to "tack to windward," or "turn to windward," making a zig-zag course. She may either make long tacks (fig. 5), or short tacks (fig. 6), whichever method will take her quickest from D to A. This turning to windward is the greatest test of the yacht's ability, and also of the ability of the helmsman. Much more distance and time may be gained or lost during the zig-zag than at any other period of the race. When sailing to windward the sheets are hauled very close. In fig. 7 the yacht is close hauled on the starboard tack, and in fig. 8 she is close hauled on the port tack. Having arrived at A, the course is next a reach on the port tack, with the wind on the left side, from A to the finishing line XY. As the bowsprit of the winning yacht crosses the finishing line, her winning gun is fired. A gun is usually fired for the first three yachts in a race. If the course had been a triangular course from the start to BD, A and back to the finish, then the leg of the course BD would have been at



FIGS. 2–11.— DIAGRAMS SHOWING HOW A YACHT RACE IS SAILED
2. Reaching on Port tack. 3. Running. 4. Reaching on Starboard tack. 5 & 6. Course tacking to windward. 7. Starboard. 8. Port tack. 9. "A Quartering Wind." 10. Tacking. 11. Gybing

an angle "between running and reaching." To sail off the wind from B to D in this manner is called "a free reach" or "a quartering wind," or to sail with "wind on the quarter." This is the fastest point of sailing, appreciably faster than running with spinnaker before the wind. With a quartering wind the sheets are trimmed as in fig. 9. A yacht is said to "tack" when she changes her course from port tack to starboard tack, or vice versa, when sailing towards the wind. Similarly, she is said to "gybe" when she changes her course from port tack to starboard tack, or vice versa, when sailing "off" or away from the wind. The boom in "tacking" and

LARGE EUROPEAN YACHTS

1. A three masted topsail schooner yacht with the wind over her quarter. In this rig square yards are carried on the foremast
2. A schooner yacht close hauled on the wind off Cowes, Isle of Wight, yachting centre of the south coast of England

"gybing" passes from one side to the other, as in figs. 10 and 11. Yachts are not allowed to collide during the five minutes interval between the guns before the start or during the race. Those overtaking must keep out of the way of those which are being overtaken. Those with the wind on their left (port) side must keep out of the way of those with the wind on their right (starboard) side. When, also, two vessels find themselves converging, the yacht which is to windward must keep clear. When rounding or passing marks at the corners of the course or other obstructions, the outside yachts must give the inside yachts room, and no yacht must hit or touch any of the marks or buoys marking the course. The length of the course varies with the size of the competing yachts. Large yachts sail twice round a course of 20m.—a distance of 40 miles. Small craft may sail a course of 6 or 8 miles.

THE UNITED STATES

Early History.—Organized yachting and yacht-racing in America began about 1840 with the formation of the first yacht or boat clubs for the promotion of pleasure-boating and the racing of yachts for sport. While a number of boats had been built in the Gnited States and used solely for pleasure-sailing previous to that date, and hence could be classed as yachts, they were few in number, and in type they were more or less similar to the commercial or fishing craft of the same size in the locality in which they were to be used. The country, at that time, was too new and the people along the seaboard too busy in developing the trade and commerce of the newly formed States, and in opening up the land, to allow either the leisure or the means for the development of pleasure-boating.

Yachts had been used in both Great Britain and Holland since the 17th century, and in the history of the Dutch Colony of New Amsterdam, which later became the English Colony of New York, there is mention of a yacht, or boat built for pleasure-boating. named the "Onrust" (Restless), which is claimed to be the first decked vessel built in America. She was about 44ft. in length and followed the characteristics and proportions of the Dutch boats used in Holland. It is probable that this craft was used also for commercial purposes when not used for pleasure-sailing. While the "Onrust" was spoken of as a yacht, there is no authentic data relating to other yachts, or to the sport of racing boats, before the beginning of the 19th century. Except for the "Onrust," the earliest mention of a boat used exclusively for pleasure in New York waters was of a zo-ft. sail-boat owned by John C. Stevens, named the "Diver," and built some time prior to 1809. The name of Stevens is one intimately connected with the development of yachting in America for many years.

On the New England coast, where the population was largely seafaring, there was built in 1801, for Captain George Crowninshield, a wealthy shipowner and merchant, a large sloop of 22 tons called the "Jefferson," which her owner used largely as a yacht until the War of 1812, when she was fitted out as a privateer and took several prizes. Later she was sold into the fisheries. Following this venture, Crowninshield had built in 1816 a vessel called "Cleopatra's Barge," intended solely for pleasure-cruising, and so luxuriously fitted and furnished as to entitle her to rank as a yacht even according to present standards. The builder of this boat was Retire Becket, a well-known ship-builder of Salem, Mass. In her, Crowninshield made a pleasure-voyage to the Mediterranean and back in 1816–17, probably the first American yacht to go abroad. "Cleopatra's Barge" was 83ft. long on the water, 23ft. breadth of beam, and her tonnage was 191 tons.

It was in New York harbour, however, that most of the early yachting was done, and the first comprehensive attempt made to develop boats for pleasure-sailing and for racing. In this development the Stevens family, of which John C. Stevens was one of four brothers, played a leading part. Inheriting a love of the sea and mechanical tastes, they did much experimenting, and built successively larger yachts, following the "Diver" and the "Trouble." From 1830–40, sailing and racing boats for pleasure became common among men of means, and a good sized, though mixed, fleet of boats was to be found in New York waters.

Organized Yachting.—It was not until yacht clubs were organized, bringing together those who were interested in the sport, that yachting and racing began to develop along lines that tended to make it a popular pastime, or that yacht design began to show much improvement. As early as 1811 the Knickerbocker Boat Club of New York was formed, but it died the following year. After several other clubs, both in New York and Boston. had been formed and had died, the New York Yacht Club was organized on July 30, 1844, aboard John C. Stevens' new schooner-yacht "Gimcrack," anchored off the Battery. Among its original members were most of the leading yachtsmen of New York. and it was the first club that survived. Today it is, in point of age and prestige, the foremost yacht club in America, and much of the development of yachting can be traced to the influence of the club itself, or its members. Five years later the Southern Yacht Club, of New Orleans, was organized, followed in 1854 by the North Carolina Yacht Club, and in 1857 by the Brooklyn Yacht Club. but for 20 years the New Uork Yacht Club was representative of American yachting and was the forerunner of the many yacht clubs that sprang up after the Civil War (1861–65) in all parts of the country wherever there was pleasure-sailing, until in 1937 there were over 700 organized yacht clubs in the United States and Canada.

Development **of** Design.—At the time of the formation of the New York Yacht Club, and for many years thereafter. the designing of yachts was not pursued as a science. Most of the yachts were turned out by local builders, working by "rule-of-thumb," each builder having his own particular fad or fancy for some particular type or model, these models being influenced largely by the environment and water conditions. With the shoal waters of the Atlantic coast, American yachtsmen as a whole preferred broad, shoal centreboard craft, with great initial stability, which enabled them to carry a large spread of sail without a great amount of ballast. These boats were very fast in smooth water. The centreboard was an adaptation of the leeboards of Holland, but was lowered through the keel instead of over the side.

On New York waters, therefore, under the stimulus of the New York Yacht Club, a large fleet of light draft centreboard yachts soon made its appearance, the boats being modelled by such noted builders as J. B. Van Deusen and "Pat" McGiehan, or such well-known boat sailors as Phil and Joe Ellsworth, or the Van Buskirks. These men had practical experience, but little technical knowledge of designing, and little real development was made during this period, it being an easier matter to rely on beam for stability and great sail area for speed, rather than on refinement of design. In New England, also, the centreboarder was becoming the popular type when speed was the consideration. All of the yachts of the period were then built on the accepted theory of full bow and fine, easy run, or the "cod's head and mackerel tail" principle, and design had not progressed as far as in England. Even very large yachts were centreboarders. In 1845 John C. Stevens built the "Maria," a sloop 92ft. in length, which proved very fast.

During the winter of 1850–51, George Steers modelled for a syndicate of six American yachtsmen, headed by John C. Stevens, and all members of the New York Yacht Club, a schooner of about 170 tons to go to England in the summer of 1851 and race there at the time of the world's fair of that year. The yacht, named the "America," won the Hundred Guinea Cup at Cowes. In 1857 the surviving owners presented the Cup to the New York Yacht Club to be held as a perpetual challenge cup for friendly competition between foreign countries. Under its new name, the America's Cup became the most coveted yachting trophy in the world. Sportsmen from England and Canada have ventured forth with challenging

*Remeasured. †Disqualified for fouling Defender. ‡Withdrew on crossing line. §Carried away topmast, withdrew. ¶Throat halyard rendered on winch drum, withdrew.

yachts, but, as the chart above reveals, with no success.

In 1876, the advocates of the shoal-draft boat were given a rude jolt when the new 140-ft. centreboard schooner "Mohawk," built for Commodore W. T. Garner, of the New York Yacht Club,

was capsized off Staten Island, drowning her owner and several guests. She was lying at anchor with her sails up and sheets made fast when she was struck by a squall, heeled down on her beam ends, where she filled and sank. A few years after the "Mohawk" disaster Cary Smith turned out the sloop "Mischief," called a "compromise sloop," a centreboard boat, but deeper than the "skimming dishes," with more shape, and relying not alone on beam for stability. "Mischief," 67ft. long, successfully defended the America's Cup in 1881 against the Canadian centreboard challenger "Atalanta." That same year there arrived in New York from Scotland a little cutter that was to exert a powerful influence on the future of yacht design in America, and that strengthened the growing band of yachting enthusiasts who were looking for something better in design than the wide, shoal centreboarders. This was the "Madge," designed by George L. Watson, a young British designer, and owned by James Coats, of Paisley, who had recently lived in America. "Madge" was a typical British cutter, 46ft. long over all, 38½ft. on the water, and only 7ft. gin. beam. She was shipped to New York That first summer she won nearly d her races against the crack centreboarders, most of iheni being won without calling on her time allou'ance. The success of the "Madge" put centreboard advocates on the defensive.

The discussion was still acute when the next challenge for the America's Cup was received, in 1885, from the British yacht "Genesta," a typical narrow cutter. There was much difference of opinion in America as to what type to build to meet the challenger; but a group of Boston yachtsmen, less committed to shoal draft than those around New York, went to a young Boston naval architect, Edward Burgess, and commissioned him to design a large sloop to defend the cup. Burgess was familiar with the cutter type, recognized its good points, and also knew the centreboard boats as they had developed around Cape Cod. Discarding all tradition, he decided to strike out in a radical way and design a yacht that to him appeared best suited to the conditions to be met, and combining the best points of the cutter with the wider beam and shoaler hull of the centreboard sloops. The result was the "compromise cutter," "Puritan," 81ft. long on the water. On this length, "Puritan" had a beam of 22½ft., draft of 8ft. Sin., and a centreboard. She had the plumb stem of the cutter and was deep enough to get a beautifully modelled underbody. "Puritan" proved most successful, beating the shoal-draft defender built in New York handily and defeating the cutter "Genesta," the challenger.

These victories made Burgess the most successful designer in America, and the type originated by him grew rapidly in popularity and soon became the recognized American type. "Puritan" was followed in the next two years by the "Mayflower" and the "Volunteer," both by Burgess and each a successful defender of the America's Cup. Unfortunately, Burgess died in 1891, at the height of his career, and while still a comparatively young man.

The year that Burgess died, Nathanael G. Herreshoff, of Bristol, R.I., had turned out a yacht that focussed the attention of American yachtsmen on the plant at Bristol, owned by him and his brother, John B. Herreshoff, and that was destined again to revolutionize yacht design and to bring fame to American yachts and to the Herreshoff family, which had been building boats on Narragansett bay since Civil War days. This yacht was "Gloriana."

When the next challenge for the America's Cup (1893) was received from the Royal Yacht Squadron, Herreshoff designed the successful defender, the sloop, "Vigilant," 85ft. on the water. While practically a keel boat, she carried a centreboard, which worked through a slot in the lead keel. After the "Vigilant," N. G. Herreshoff designed the successive defenders for the America's Cup up to and including the contest in 1920, when the "Resolute" successfully defended, and Herreshoff became the foremost yacht designer in America, for either large or small yachts.

By 1930, N. G. Herreshoff had retired and the defender that year, "Enterprise," was designed by W. Starling Burgess, a son of Edward Burgess who designed the defenders of 1885, 1886 and 1887. The "Rainbow," successful defender of 1934, was also designed by W. Starling Burgess. When the 1937 defender was built, a young designer. Olin J. Stephens, was called upon to collaborate with Burgess, and the result of their collaboration, "Ranger," was the fastest Class J yacht that had been built up to that time.

The Scow Type and the Seawanhaka Cup.—On certain waters of Canada, notably the St Lawrence river, and on the lakes of Minnesota and Wisconsin, where conditions are not suited to keel boats, the Universal Rule is not used, and in these localities the scow type has been developed to a very high state. These boats are extremely flat, drawing but a few inches, having two bilge boards instead of one centreboard, double rudders, and are sailed without ballast. On a reach they are exceedingly fast, and it is claimed that the larger boats sometimes attain a speed as high as 25 mi. per hour in a strong breeze and smooth sea. They are usually sailed in 28-ft , 32-ft. and 38-ft. classes.

The contests for the Seawanhaka Cup between 1895 and 1912 did much for the development of the scow type. This trophy was put up by the Seawanhaka-Corinthian Yacht Club, of Oyster Bay, in 1895, for international competition between small yachts, when the first race was sailed against an English challenger, "Spruce III," a "half-rater." The following year the cup was won by the Royal St. Lawrence Yacht Club of Canada, with an extreme scow named the "Glencairn." A long series of races followed between U.S., Canada, Great Britain and several European countries.

Recent Development of Yacht Design.—During the World War there was very little yacht building in America, and no marked development in design. But following the readjustment period there was a marked increase in interest in all forms of yachting, and larger fleets were to be seen at the principal regattas than previously. In this development the small yacht predominated, due somewhat to the greatly increased cost of running large sailing craft, and to the fact that yacht-racing was making a strong appeal to those who wanted to handle their own craft. Therefore, the smaller racing classes were promoted, principally the 31-rating (Class P), 25-rating (Class Q) and 20-rating (Class R) classes, and numerous one-design classes. About 1927 several International Rule Classes made their appearance in the United States, the most popular being the 6-Metre and 12-Metre Classes.

One-Design Classes.—As early as the late '90s several racing classes in which the boats of each class were identical in design were formed, and proved popular, both because the boats were, theoretically, of equal speed, and because there was considerable economy in building many boats exactly alike at one time. Some of the earlier of these one-design classes were the Newport 30-ft. class of fin-keel sloops, and the 70-ft. class of large sloops, both designed by Herreshoff. There followed, then, a great demand for such classes of yachts of one design. Among the important one-design racing classes in the first third of the 20th century are:

Class	Load water line	Designer
	Feet	
Bar Harbor 31-footers	31	Herreshoff
New York Yacht Club 90-ft. class	30	"
New York Yacht Club 90-ft. class	50	"
New York Yacht Club 40-ft. class	40	"
Larchmont O class	38	Wm. Gardner
Seawanhaka Schooner class	38	Cox & Stevens
Class S One-design	20½	Herreshoff
Victory class	21	Wm. Gardner
Interclub class	19	C. D. Mower
Star class (over 1,500 boats have been built to this class)	16	Wm. Gardner
Marblehead-Beverly (M-B) class	17½	Frank C. Paine
International One-designs	21¾	B. J. Xas
10-metreclass.	36	Burgess & Morgan
8-metreclass	30	"
And many smaller classes under 20-ft. water line length		

The North American Yacht Racing Union.—Legislation affecting yacht-racing, the rules under which yachts were raced, and measurement rules, up to about 1900, had been in the hands of individual yacht clubs, or local yacht-racing organizations composed of a number of clubs in the same locality. There was thus great lack of uniformity in different sections of the country. At the time of the agitation for a new measurement rule to supersede the "length-and-sail-area" rule, the New York Yacht Club took the lead and called a conference of yachting organizations of the

Atlantic coast and the Great Lakes to find out what was wanted and to bring about uniformity by getting the other sections to adopt the new rule (the Universal Rule) that was then being formulated. This was a step forward, but the conference was not permanent in character, and there was no real governing body on yachting affairs in America. To remedy this situation, there was formed in 1925 a union of most of the local yacht-racing associations, and a number of prominent yacht clubs, the guiding spirits in the matter being Clifford D. Mallory and Commodore W. A. W. Stewart, of the Seawanhaka-Corinthian Yacht Club. This organization, called the North American Yacht Racing Union, was the first permanent legislative and governing body of national scope in America, and through it both the racing and measurement rules have been standardized, and an appeals body for its members formed. In 1927 delegates from this union met with delegates of the International Yacht Racing Union, in London, to bring about closer co-operation internationally in yachting affairs. Sensing the value to the sport of international racing, the Union recognized, in addition to the Universal Rule of Measurement, the International Rule used in European countries, with the result that several international classes such as the 6-Metre, 8-Metre, and 12-Metre were built and became popular here.

Cruising Yachts.—The development of cruising yachts in America has followed in a general way the development of the racing type. While no measurement rule had to be considered in their design, it was natural that in hull design the boats should take the same characteristics as the racing craft, especially as they were sailed on more or less protected waters, or along the coast where harbours were frequent. However, shortly after the World War, several designers, notably John G. Alden and William H. Hand, Jr., developed a type of small seaworthy yacht for cruising, embodying many of the characteristics of the New England fishing schooners. These boats were good offshore cruisers, and they quickly became popular, and were soon taking part successfully in long distance and ocean races, such as the one from New London to Bermuda, while several boats of this design, from 50 to 55ft. long over all, made the Atlantic passage with safety and comfort.

Ocean Racing.—Long distance racing along the coast, and ocean races, have been, until recently, more popular among American yachtsmen than among those of the European yachting nations. The first trans-Atlantic race was sailed in 1866, between three American schooners, in the month of December, one of them being a centreboarder, and the others keel yachts. These schooners were the "Henrietta," "Fleetwing" and "Vesta," the first winning in the fast time of 13 days 21 hours and 45 minutes. The greatest ocean race ever sailed was in 1905, when 11 large yachts raced from Sandy Hook to Land's End, England, two British yachts, one German, and the rest American. It was won by the American three-masted schooner "Atlantic" in 12 days 4 hours 1 min., for the course of 3,013 miles, still the record in 1937.

About 1905 ocean racing in small yachts was inaugurated by the late Thomas Fleming Day to demonstrate that small boats, properly designed, built and handled, could keep the sea with safety. He inaugurated the race from New York to Bermuda, and later, one to Havana for power craft. After the War the Bermuda Race was revived and is now sailed every two years. It has grown in popularity and between 1930 and 1936 from 35 to 40 small yachts sailed in every race, A special type of ocean racing yacht has been developed as a result, largely due to the success of "Dorade" and "Stormy Weather," designed by Olin J. Stephens. These new yachts are both seaworthy and fast. The Cruising Club of America has been largely instrumental in fostering this type of racing. On the Pacific coast the principal ocean race, for which a permanent cup has been put up, is one from the California coast to Honolulu, Hawaiian Islands, a distance of about 2,200 miles. This is sailed every two years. In 1928 a trans-Atlantic race from New York to Spain was sailed, with nine entries. In 1931 a race from the United States to Plymouth, England, brought out 10 entries under 72 feet in length and was won by "Dorade," only 39 feet long on the water, which made the phenomenal time of 17 days 2 hours. In 1935 a race from Newport to Norway was won by the "Stormy Weather," 40 feet on the water, over a course of 3118 miles in 19 days 5 hours.

It is toward the development of the sailing yacht that American yachtsmen have devoted most of their energy and effort.

(H. L. ST.)

YAHGAN, an Indian tribe, now almost extinct, who occupy the south coast of Tierra del Fuego and the adjacent islands southward to Cape Horn. Hence they are the southernmost people in the world. That they have lived in the same region for many centuries is attested by great middens which cover their camping places. Yahgan life before the European settlement was extremely simple. In spite of the cold climate their chief garment was a single seal or other skin, which they wore on the windward shoulder. Their houses were usually small domed affairs of saplings covered with bark and grass or seal-skins. Their canoes, peculiar for their high pointed ends and a fireplace amidships, were constructed of the bark from a beech tree. Their manufactures included baskets of several weaves, harpoons, spears, shell necklaces and simple tools. Their diet embraced shellfish, seal, whale, various birds, a few berries and several kinds of fungi. The Yahgan had no organized tribal life or recognized leaders. Each family, often including several wives, was a law unto itself, wandering at will and rarely camping in one place for more than a few days. At times, groups of relatives would assemble to perform elaborate initiation ceremonies for both the boys and the girls, who were forced to undergo various privations, to have their courage tested by masked apparitions, and to learn the tribal lore. It has been asserted that the Yahgan have no religion. However, they believe in evil spirits, who must be propitiated by their medicine men, and they also reverence a supreme God. Their mythology is surprisingly rich.

THE WILD YAK (POËPHAGUS GRUNNIENS)

YAK, the wild (and domesticated) ox of the Tibetan plateau; a species allied to the bison group. The yak, *Poëphagus grunniens,* is one of the largest of oxen, characterized by the growth of long shaggy hair on the flanks and under parts of the body and the well-known bushy tail. The wild species is black in colour. Domestic yaks are often black and white, and small-sized breeds exist. The magnificent half-tamed animals kept by the natives of the elevated Rupsu plateau, south of the Indus, afford the only means of transport by this route between Ladak and India. But even these are inferior to the wild yak, which stands nearly 6ft. at the shoulder and is confined to the arid plateau of Tibet.

DOMESTICATED YAK (POËPHAGUS GRUNNIENS)

YAKIMA (yăk′ĭmą), a city of south-central Washington, U.S.A., on the Yakima river, at an altitude of 1,065 ft.; the county seat of Yakima county. It is on federal highways 97 and 410; has a municipal airport of 360 ac.; and is served by the Northern Pacific and the Union Pacific railways, and by electric interurban and motor-coach lines. Pop. 1940 by federal census 27,221 (92% native white). Yakima is the metropolis of a productive region of diversified agriculture, formerly asage-brush desert, which owes its prosperity to reclamation by federal and private projects with 500,000 ac. under irrigation and an additional 72,000 ac. under construction. Apples and other fruits are leading crops, but potatoes, green vegetables, livestock, grain, hay and dairy products are also important. The ten-year average of farm and industrial products shipped out of Yakima county amounts to 48,000 carloads, valued at $38,000,000. The county has cold-storage facilities with a capacity for 12,000 carloads, and manufacturing industries including lumber

1. Yaksas, or deities, spouting lotus rhizome and flowers, and as Atlantes (Sāñcī 1st cent. B.C.). 2. Yaksi, or dryad, under a tree (1st cent. A.D.—Museum of Fine Arts, Boston). 3. Chāndī Yaksi (2nd cent. B.C.—Indian Museum, Calcutta). 4. Gangita Yaksa (2nd cent. B.C.—Indian Museum, Calcutta). 5. Yaksas Atlantes forming capital of column supporting arch of gate (Sāñcī 50 B.C.). 6. Yakṣa spouting lotus rhizome and flowers (from Bharhut 2nd cent. B.C.—Indian Museum, Calcutta). 7. Assamukhi Yakṣī (Bodhgaya 100 B.C.). 8. Kubera Yakṣa (1st–2nd cent. A.D.—Archaeological Museum, Mathurā). 9. Yaksi carrying food and water (1st–2nd cent. A.D.—Archaeological Museum, Mathurā). 10. Yaksa under tree (1st–2nd cent. A.D.—Archaeological Museum, Mathurā)

and canneries produce over 90 different commodities having an output during 1939 valued at $10,150,000. Bank clearings in 1940 totalled $57,975,277. The Central Washington District fair is held at Yakima annually in September. Ten miles south of the city is the northern border of the Indian reservation, and the entrance to Rainier national park is 50 mi. N.W. The city was incorporated in 1886 under the name of North Yakima. In 1900 the population was 3,154, and this increased to 14,082 by 1910. "North" was dropped from the name in 1917.

YAKṢAS. The Sanskrit designation *Yakṣa,* of uncertain derivation, is applied upon occasion to practically every Indian deity, and even to the Buddha, in an honorific sense. Later, in sectarian and especially in Buddhist literature, the Yaksas are represented in the interests of edification either as devoted assistants and defenders of the faith, or as inferior beings of an ogre type. More generally we may say that Yaksas are supernatural beings, deities of varying rank, who have once been men, and will be reborn again on earth. Generally speaking benevolent, they are closely connected with vegetation, human fertility and wealth; they are essentially tree spirits, others being more like gnomes; they possess magic powers, especially that of concealment.

The cult of Yaksas seems to have been at one time the dominant aspect of popular religion in India; it may be described as an early form of devotional Hinduism, perhaps going back to a period in history contemporary with the Vedas. In the Atharva Veda and in certain Upaniṣads the Brahman itself is called "a great Yaksa," and the indwelling spirit in Man a "self-like Yaksa." The individual Yaksas are for the most part local and tutelary deities; the Śākyas, for example, worshipped the Yakṣa Śākyavardhana. "He who prospers the Śākyas." Other Yakṣas are the guardian angels (*ārakkhadevatā*) of individuals. Others called Guhyakas are earth spirits who function as the bearers of vehicles and as supporters of buildings, like Atlantids. The chief of the Yaksas is Kubera or Vaiśramaṇa, who is mentioned already in the Atharva Veda, and is best known as the great king who is regent of the north, where are his heaven, palaces and groves. He is essentially a god of wealth; his chief symbols are a lotus and a conch represented as fountains of money; as a tree-spirit he is associated with the banyan (see Plate, fig. 8). Another great Yaksa is his generalissimo, Manibhadra. A group of 28 Yaksa kings is mentioned in more than one place, but the total number of Yakṣas mentioned in the literature is very large. Many have come to be regarded as local manifestations of higher Brahmanical deities, especially Śiva. Kāmadeva, the god of love, belongs appropriately to the Yakṣa class; his symbol, the makara (mythical crocodile), represents the waters, or rather an essence in the waters, identical with the sap of trees, the water of life (*amṛta*).

YAKUB KHAN (1849–1923), ex-amir of Afghanistan, son of the amir Shere Ali, was born in 1849. He showed great ability at an early age, and was made governor of Herat by his father, but broke into open rebellion against him in 1870, and was imprisoned in 1874 in Kabul. However, when Shere Ali in 1878 fled before the British, he handed over the government to Yakub, who, on his father's death in the following February, was proclaimed amir, and signed a treaty of peace with the British at Gandamak. He agreed to receive a British resident, and was in turn to receive a subsidy and support against foreign attack But in September of the same year his revolted troops attacked the British residency, and the resident, Sir Louis Cavagnari, and his staff and suite were cut to pieces. This outrage was instantly avenged, for in October Earl (then Sir Frederick) Roberts with a iarge force defeated the Afghans on the 6th and took possession of Kabul on the 12th. Yakub Khan thereupon abdicated, took refuge in the British camp, and was sent to India on Dec. 13. He died at Dehra in the United Provinces on Nov. 1 j, 1923.

YAKUTSK, an A.S.S.R. of Asiatic Russia formed in 1922, stretching from the Siberian area on the west to the Far Eastern area on the east, and from the Arctic ocean on the north to about lat. 54° N., where it is again bordered by the Far Eastern area. It covers about 4,000,000 sq.km. and is therefore almost equal in size to European Russia, but its total population in 1926 was roughly 278,800.

The region is the least explored in Russia, and has a tragic history of disaster overtaking many scientists whose efforts to investigate this inhospitable region have given us what information is available. A geological expedition sent out to the Aldan watershed by the Soviet Government in 1926 nearly perished of starvation and records that the price of salt was 4 grammes of gold for 400 grammes of salt and that meat cost 30 to 40 grammes of gold per kg. In 1927 the National Academy of Science organised a further expedition which proposes to remain for five years' investigation of various districts in Yakutsk.

Physical Features.— Much of Yakutsk is occupied by the basin of the Lena (*q.v.*). The Lena forms the eastern marginal river to that ancient block along the edge of which the Yenisei (*q.v.*) flows in the west. It flows in a true valley of erosion of very great age and is not confined by mountains except near its mouth, where the Khara-ulakh range, a spur of the folded mountains of the Verkhoyansk arc, rises on its right bank and deflects its course, while subsidiary fold lines affect the lower courses of the Olenek and the Anabar to the west. To the north lies a broad tundra belt sloping to the Arctic, from which. ise four domes of basic eruptive rock.

Climate.— The soils of the republic are not favourable to cultivation; a broad belt south of the Arctic consists of dry clayey, stony tundra soil, merging southwards into forest tundra soil and then into the ash coloured alkali forest soils of the south, while there are belts of silty bog soils on the mountains. Along the banks of the Lena and Olekma, are strips and patches of fertile alluvial soils. The climate is severe and extreme, and Verkhoyansk (67° 50′ N., 133° 50′ E.) has the greatest annual range of temperature in the world; its average January temperature is −59° F., absolute minimum −94° F., average July temperature 60° F., absolute maximum 93° F. The fact that this cold pole lies so far east shows that the Atlantic has much more moderating influence than the Pacific, the latter being shut off by mountains, and also having strong prevailing off-shore winds. The change of temperature between the seasons is sudden and there is a drop of 40° F. between October and November. At Yakutsk in lat. 62° 1′ N., winter is still extremely long and severe. The average January temperature is −46° F. and the river is frozen from Nov. 12 to June 10 in most years.

Occupations.— The Skoptsi, an exiled religious sect, settled in Yakutsk in the '60s of the 19th century and introduced agriculture in the neighbourhood of Olekminsk and Yakutsk. The clean, well-built Skoptsi villages are in striking contrast to the dirty Yakutsk settlements. Barley occupies 53%, spring rye 27% and wheat 11% of the grain harvest. Potatoes, turnips and cabbages thrive and cultivation is slowly spreading in the alluvial patches of the Lena and Aldan, though the disturbed post-1917 conditions have temporarily checked progress. The limit of cultivation here extends to 63·5° N. and during 1898–1917 the sown area was trebled, many of the Yakuts sowing patches of grain.

Meadowland is important, and 725,000 tons of hay were raised in 1925–26. Cattle and horse breeding is successful as far north as Yakutsk; both horses and cattle are short, long-haired and very hardy. The milk yield is small, but of good quality. There are no sheep or pigs. Cattle-breeding would be much improved by better attention to winter quarters and food: the animals are crowded in insanitary huts, and plague often spreads.

North of this agricultural region is the region of the nomad reindeer breeders, relying entirely on their herds, while in some regions there is no reindeer-breeding and the natives rely on fish.

Ivory.— An important product is mammoth ivory, of which 25 tons were exported in the year 1926. The mammoth (*Elephas primigenius*) existed in comparatively recent times in great numbers in the polar region of Siberia and entire carcasses, with

flesh, skin, fur and congealed blood in the veins have been found in the region. Mammoth ivory is mentioned by Pliny and its existence was known to the Russians in 1582.

Mines.—Gold is the main product of the republic, realising about 8,000,000 roubles in 1925–26. It has been known to the Russians since the mid-19th century, when it was worked in the Olekma mines, now abandoned. The Aldan mines, re-opened in 1923, produced about 280,000 oz. of gold that was registered in 1925–26 and much contraband was probably also raised. The gold here is easily worked, being on or near the surface, but there are great difficulties of transport and the miners are often unable to procure the necessities of life. In 1914 a fresh source at Nyukhinsk was discovered and is now being successfully exploited.

Iron ore is worked in an entirely primitive way and smelted by the Yakuts to make hunting knives. They were capable smiths long before the coming of the Russians. Coal of recent origin and poor quality extends over a belt of 1,200 m. north and south of Yakutsk, but is little used. There is an area of curative mud on the Lena river with a high percentage of iron and aluminium, and a health resort is planned. Sulphur springs exist in many places, especially near Parsheva, and jasper and carneol are found below Zhigansk, where there is iron, coal and platinum. Spars, amber, graphite, gypsum, crystal and emerald are reported, but unworked.

Population.— The Yakuts are a Turkic branch of the Ural-Altaic stock and their language closely resembles that of the Turks. A Yakut grammar by Boethlingk was published in 1851. They are thirk set, brachycephalic, with dark eyes and hair, narrow foreheads, broad noses and long narrow eyes.

The Yakuts form 85% of the population, and the Russians, mainly in the Aldan mining region and in Yakutsk, form 11%. There are also Chinese and Koreans in the mining district. Half the population of the republic live in or near Yakutsk. In former times *brodyagi* or escaped convicts were a great terror in the district. and there has been much intermixture with Russian exiles, convicts and traders.

The Tungus are another branch of the Ural-Altaic group, as are the Lamuts. The Yukaghir are a Palaeo-Siberian tribe, mainly found now between the Kolyma and Indigirka rivers and occupied in hunting and fishing. They are very short, with yellow or brown complexion, dark eyes and hair, and scanty beards. They are fast dying out, especially since the advance westwards of the Chukchee has lessened the number of wild reindeer. The latter tribe is spreading westward from the Far Eastern Area (*q.v.*).

YAKUTSK, a town of Asiatic Russia, the administrative centre of the Yakutsk A.S.S.R., situated 2 m. from the river Lena, here 9 to 11 m. wide, on its left bank, in 62° 5′ N., 129° 4′ E. Pop. (1926) 10,513. The alluvial soil on which it is built is frozen all the year round, but thaws to a depth of 3 or 4 ft. in summer, when the streets become quagmires. Many mud huts exist, though there are some brick houses, and the schools, churches and official buildings are of brick; some wooden houses are built on high platforms as a protection against the June floods, when the ice breaks on the river, which remains open till November. Winter sledge tracks radiate from the town to the Sea of Okhotsk, Vilyuisk, the Kolyma and to Irkutsk (1,165 m.). There are no good roads. There is telegraphic communication, but it frequently breaks down, especially in spring and autumn, when the roads are impassable and repair of the lines is impossible. Efforts are being made to establish air communication with the town and so lessen its isolation. Between the town and the Aldan are meadow lands with sandy sub-soil and scattered clumps of birch, willow and spruce. The fort was founded in 1632, and the town later became a centre for the trade in furs, mammoth ivory, reindeer hides and cattle. The policy of education in the vernacular is being encouraged.

YALE UNIVERSITY, the third oldest institution of higher education in the United States, situated at New Haven, Conn. In 1700 the needs of New England in the way of higher education were supplied by Harvard college, at Cambridge. Massachusetts Bay Colony was naturally the chief patron of Harvard, but Connecticut bore her full share in support of the enterprise. The two commonwealths, however, diverged to some extent in their theological and political development and there arose the desire for a separate college in Connecticut. The first distinct traces of this scheme appear in the early summer of 1701, in the neighbourhood of New Haven. The Rev. James Pierpont (Harvard, 1681), minister of the New Haven church, was the chief promoter.

WREXHAM TOWER. MEMORIAL QUADRANGLE, AT YALE UNIVERSITY. DESIGNED ON THE LINES OF WREXHAM CHURCH IN WALES. WHERE ELIHU YALE. FIRST DONOR TO THE COLLEGE, IS BURIED

The General Court of the Colony met at New Haven on Oct. 9, 1701, and a charter was granted (probably on Oct. 16) "for the founding, suitably endowing, and ordering a Collegiate School within his Majesty's Colony of Connecticut." The founders chose the Rev. Abraham Pierson of their number as rector of the Collegiate school and it was at his parsonage in Killingworth that the first scholar sought admission in March 1702.

The school continued at Killingworth, with the annual commencements at Saybrook, until the death of Rector Pierson on March 5, 1707. From 1707 to 1716, although the commencement exercises were held annually at Saybrook, the students resided in the several towns where their tutors were established. It was not until a gift of nearly 1,000 volumes of great value was secured by Jeremiah Dummer, the agent for Connecticut at London, that a building for the school became necessary. After much argument it was decided to establish the institution at New Haven. A cargo of gifts for the Collegiate school, from Elihu Yale, former governor of Ft. St. George, Madras, India, and a native of Boston, including, besides books, East India goods which were sold in Boston for £562.12s., led the trustees to use the name Yale college at the first commencement (1718) in the completed college building.

President Clap secured the passage in 1745 of a new charter which legalized the name "Yale College" and in general provided a more explicit and liberal statement of powers and privileges conferred in 1701 and 1723. The organization of a College Church in 1757 provoked much criticism and revived the struggle to bring the college under the control of the legislature.

The charter drawn up by President Clap is still in force. In 1792 the governor and lieutenant governor of the State and six senior State senators were made *ex officio* members of the cor-

poration. In 1872 the six senators were replaced by six graduates, chosen by the alumni. The act authorizing the name Yale university was passed in 1887.

The curriculum of the college changed but little before the administration of Timothy Dwight the Elder (1795–1817), who expanded the usefulness of the college by the organization of professional schools. Benjamin Silliman, Sr. (1779–1864), was appointed to the first chair in chemistry, mineralogy and geology in the United States in 1802. In 1810 a medical department was established, and the theological and law departments were organized in 1822 and 1824.

Under the administration of Theodore Dwight Woolsey (1846–71) graduate courses were organized in 1846 and the Graduate school (under the title Department of Philosophy and the Arts) was established the following year. The degree of Doctor of Philosophy was first conferred in the United States by Yale in 1861. In 1847 courses in applied chemistry were offered and in 1852 instruction in engineering. Two years later these courses were distinguished as a separate section with the title "Yale Scientific School," which was changed in 1863 to "Sheffield Scientific School" in appreciation of the assistance of Mr. Joseph E. Sheffield, of New Raven, who endowed the school in 1860. From 1863 to 1892 this school was also the State college of agriculture and applied arts. The School of Fine Arts, established through the generosity of Augustus R. Street, was opened to students in 1869, the first of its kind to come within the scope of any university. The elective system of instruction in Yale college was substituted for the fixed curriculum in 1876.

During the presidency (1886–99) of Timothy Dwight, grandson of the former President Dwight. the institution more than doubled in resources, faculty and student enrolment. The School of Music was established in 1894, and its resources have been augmented through the patronage of Joseph Battell, Albert Arnold Sprague and his daughter, Mrs. Elizabeth Sprague Coolidge.

An outstanding feature of the administration of Arthur Twining Hadley (1899–1921) was the development of the university idea co-ordinating the various schools and departments. The School of Forestry, the oldest forest school in continuous operation in the United States, was founded in 1900, as the result of the gifts of James W. Pinchot and his family.

Under President James Rowland Angell (1921–37) the university expanded rapidly. A School of Nursing was established in 1923 by a gift from the Rockefeller foundation; in 1924 endowment was provided by Edward S. Harkness for a department of drama and a university theatre; the Institute of Human Relations was organized in 1929; and in 1932 the School of Engineering was re-established. In 1937 Pres. Angell resigned and was succeeded by Charles Seymour. The establishment in 1933 of residential colleges, designed to regain for undergraduates in a large university the educational and social advantages inherent in small groups of students, is the most important recent development at Yale. This was made possible by gifts from a Yale graduate, Edward S. Harkness. There are nine colleges (Berkeley, Branford, Calhoun, Jonathan Edwards, Pierson, Saybrook, Timothy Dwight and Trumbull), each providing accommodations for from 160 to 200 undergraduates during the last three years of the course The Master of each college lives in a house attached to the college quadrangle. He is assisted in the work and life of the college by a group of faculty members who are Fellows of the college and have their studies and, if unmarried, their living quarters in the quadrangle. The blaster and Fellows assist in guiding the undergraduate in his choice of courses, in his supplementary reading, and in general preparation for the examinations at the end of senior year.

The board of trustees, called the Yale corporation, consists of the president of the university, the governor and lieutenant governor of Connecticut, ten Fellows known as the successors of the original trustees, and six graduates elected for six-year terms. The corporation has five administrative officers, the president, provost, secretary, treasurer and associate treasurer and controller. The general administration of each school of the university is in the hands of a dean and a board of professors on permanent appointment, subject to the approval of the corporation. The teaching in the university is divided among 40 departments of study which serve the various schools. All members of these departments who are of professorial grade are grouped in four divisions: language, literature and the arts; history and the social sciences; mathematics and the natural sciences; and engineering. Courses of study in candidacy for degrees in course are offered in eleven schools: Yale College, Sheffield Scientific School, School of Engineering, Graduate School, School of Medicine, School of Law, Divinity School, School of the Fine Arts, School of Music, School of Forestry, School of Nursing.

The course of study in Yale College is designed to provide for substantial mastery of some one field of liberal arts together with an intelligent acquaintance with allied subjects. The Sheffield Scientific School provides for concentration in the principal fields of science, and the School of Engineering offers training in chemical, civil, electrical and mechanical engineering and metallurgy. In addition to preparation for the practice of medicine the School of Medicine offers courses leading to degrees in public health. The School of the Fine Arts offers four professional courses, architecture, drama, painting and sculpture, in which lectures are combined with technical practice. The School of Music admits those who intend to become musicians by profession, or to enter the field of musical criticism and literature of music. The curriculum of 32 months in the School of Nursing is open to women graduates of approved colleges and leads to the degree of Master of Nursing. Properly qualified women are admitted to all schools except the undergraduate schools and the School of Forestry.

The University library, including departmental collections, had a total (1936) of over 2,500,000 volumes and pamphlets. Besides gifts in the early years of the college, particular mention should be made of the Aldis collection of American *belles Eettres,* the Elizabethan Club library of Shakespeare qnartos and folios, the Henry R. Wagner collection of British and Irish economic and historical tracts, the William S. Mason collection of Benjamin Franklin and the Ezra Stiles manuscript diaries and itineraries. Other important collections are the Penniman library of education, the William A. Speck collection of Goetheana, the Albert S. Wheeler Roman law library, the Lowell Mason music library, the Frederick S. Dickson collection of Fielding's works, the Scandinavian library of Count Riant, the Curtius and Seymour libraries of classical literature, the Robert von Mohl library of political science, the Edward M. House collection of historical papers and the J. Sumner Smith Russian library. Among its rare volumes the library has a copy of the Gutenberg 42 line Bible.

The collections of the Gallery of Fine Arts include the Jarves collection of Italian primitives (13th to 17th centuries); the Trumbull collection of paintings and miniatures; the Rebecca Darlington Stoddard collection of Greek vases; *objects discovered at Gerasa and Dura-Europos;* the Mabel Brady Garvan collection of American arts and crafts; and the Achelis, Herr, and Callender collections of prints. The collections of the Peabody museum (1866) embrace the major fields of natural history.

The Yale university press was founded in 1908 for the publication of works having permanent interest and value. Since 1926 the Yale university press has published the *Yale Review* (1892), a national quarterly owned by the university. The university also publishes the *American Journal of Science* (1818), the oldest scientific publication in the United States, founded by Prof. Benjamin Silliman. The publications which are under the direction of students are the *Yale Law Journal; Yale Literary Magazine* (founded in 1836), the first undergraduate publication in the country; the *Yale Daily News* (1878), the oldest daily; the *Yale Record,* a humorous monthly; and the *Yale Scientific Magazine.*

In 1936 there were 865 officers and instructors and 732 assistants in instruction and administration. The students registered as candidates for degrees numbered 5,096; of this total 3,057 were undergraduates and 1,939 students in the graduate and professional schools. There were also 397 students who were not enrolled as candidates for degrees or certificates. The buildings number about 100. Connecticut hall (1752), a four-storey brick

building with gambrel roof, called South Middle college, is the only building remaining from the 18th century. The university funds on June 30, 1936, amounted to $99,993,785.21 ($21,181,302.17 in 1918), exclusive of land and buildings valued at $70,000,000 and of funds and property amounting to $1,082,488.30 held by the Sheffield trustees. The total income in 1935–36 was $6,769,371.46.

In 1936 there were 31,003 living degree holders and 11,906 non-graduates, the majority resident in the North Atlantic division, but other sections of the country were well represented, as well as foreign countries. The division according to occupations shows a preponderance in the fields of law, education, medicine, ministry, engineering, banking, industry and commerce.

YALU, BATTLE OF THE. This was the opening battle on land of the RUSSO-JAPANESE WAR, and is described under that heading. Fought on May 1, 1904, by Gen. Kuroki's I. Army, advancing from Korea, the Japanese success was a valuable moral tonic and created a profound impression in Europe.

YAM, a term usually applied to the tubers of various species of *Dioscorea* of the monocotyledonous family Dioscoreaceae. These are plants with thick tubers (generally a development of the base of the stem), from which protrude long, slender, annual climbing stems, bearing alternate or opposite, entire or lobed leaves and unisexual flowers in long clusters. The flowers are generally small and individually inconspicuous, though collectively showy. Each consists of a greenish, bell-shaped or flat perianth of six pieces, enclosing six or fewer stamens in the male flowers, and surmounting a three-celled, three-winged ovary in the female flowers. The ovary ripens into a membranous capsule, bursting by three valves to liberate numerous flattish or globose seeds. The species are natives of the warmer regions of both hemispheres.

D. *sativa* and D. alata are the species most widely diffused in tropical and subtropical countries. D. *esculenta,* grown in India, Cochin China and the South Sea islands, is one of the best kinds. D. *batatas,* the Chinese yam, or Chinese potato, is hardy in Great Britain, but the great depth to which its enormous tubers descend renders its cultivation unprofitable. It has deeply penetrating, thick, club-shaped, fleshy roots, full of starch (about 13% of the fresh weight) which when cooked acquire a mild taste like that of a potato; they grow 3 ft. or upwards in length, and sometimes weigh more than 1½ lb. The plant grows freely in deep sandy soil, moderately enriched. The tubers of D. *alata* sometimes weigh roo lb. Most of the yams contain an acrid principle, which is dissipated in cooking. The only European species is D. *pyrenaica,* a native of the Pyrenees, a remarkable instance of a species growing at a long distance from all its congeners. In North America there is a single native species, D. *villosa,* called wild yam-root or colic-root. This is found from Rhode Island to Ontario and Minnesota and southward to Florida and Texas, but is of no economic value. True yams must not be confounded with the sweet potato, *Ipomoea batatas.* "Moist-fleshed" varieties of sweet potato are often erroneously called yams in the United States. True yams are rarely grown in the United States, and then only in the southernmost part.

For the history of the yam, and its cultivation and uses in India, *see* G. Watt, *Dictionary of the Economic Products of India,* iii. (1890).

YAMA, in Vedic Hindu mythology the twin of his sister Yami, and with her the first human pair. Yama is king of the dead, and later, their judge. The word is Sanskrit for "twin."

YAMAGATA, ARITOMO, PRINCE (1838–1922), Japanese field-marshal, was born in Choshu. He began life as an ordinary samurai and rose steadily in reputation and rank, being created a count in 1884, a marquess in 1895 (after the war with China) and a prince in 1907 (after the war with Russia). He twice held the post of premier, and was the leader of Japanese conservatism, being a staunch opponent of party cabinets. He died at Odawara on Feb. 1, 1922.

YAMAMOTO, TATSUO, BARON (1856–), Japanese statesman, was born in Oita-ken, and educated at Keio. After some time in a business career he entered in 1890 the Bank of Japan of which he was appointed director and then governor (1898–1903). In 1910 he became governor of Hypothec Bank of Japan. He was made minister of finance in 1911–1912, minister of agriculture and commerce in 1913–1914, and again in 1918–1922. At that time he belonged to the Seiyukai Party, but in 1924 he seceded and established a new party, Seiyuhonto, with Tokonami, as leader, becoming himself the adviser to the party. When the Kenseikwai and Seiyuhonto parties united to form the Minseito, in 1927, he became adviser to the new party. He was made crown member of the house of peers in 1903, created baron in 1920, and was minister for home affairs (1932–34).

YAMBOL, a town of Bulgaria, on the river Tunja, 49 m. W. of Burgas by rail, and an important corn growing centre. Pop. (1934) 25,125. In the town are the remains of old fortifications, and the ruins of a fine mosque. Yambol is first mentioned in the 11th century, when it was known by the Byzantines as Hyampolis.

YAMETHIN, a town and district in the Mandalay division of Burma. The town has a station on the railway 275 m. N. of Rangoon on the main line to Mandalay. It is an important centre of trade with the Shan States. The district lies between the Shan States and the Meiktila, Magwe and Toungoo districts and comprises the Sittang valley in the centre, the Pegu Yomas on the west and the forested Shan hills on the east. Area, 4,196 sq.m.; pop. (1931) 390,820, showing an increase of 67,631 in the decade. The staple crop is rice, which is irrigated from tanks and canals. Millets and oil-seeds are grown in the north, where drought has more than once caused distress. Besides the chief town, Pyinmana and Pyawbwè, both also on the railway, carry on an active trade with the Shan States. Pyinmana has a forest school, and from Pyinmana a branch railway now crosses the forested Pegu Yomas to the Magwe district.

YANCEY, WILLIAM LOWNDES (1814–1863), American political leader, son of Benjamin Cudworth Yancey, lawyer of South Carolina, was born in Warren county, Ga., on Aug. 10, 1814. He attended Williams college for one year, studied law at Greenville, S.C., and was admitted to the bar. He was elected in 1841 to the State house of representatives, became State senator in 1843 and in 1844 was elected to the national House of Representatives to fill a vacancy, being re-elected in 1845. In 1846 he resigned his seat, and devoted himself to the resistance of anti-slavery aggression. In 1848 he secured the adoption by the State Democratic convention of the so-called "Alabama Platform," declaring that it was the duty of Congress not only to allow slavery in all the territories but to protect it, that a territorial legislature could not exclude it, and that the Democratic Party should not support for president or vice president a candidate not openly opposed to the exclusion of slavery from the Territories. When the Democratic convention in Baltimore refused to incorporate his ideas into the platform, Yancey with one colleague left the convention. He opposed the Compromise of 1850, and went so far as openly to advocate secession. In 1858 he advocated the appointment of committees of safety, the formation of a league of united southerners, and the repeal of the laws making the African slave-trade piracy. He attended the Charleston convention of the Democratic Party in April 1860, and again demanded the adoption of his ideas. Defeated, he again left the hall, followed by the delegates of Alabama, Mississippi, Louisiana, South Carolina, Florida, Texas and two of the three delegates from Delaware. On the next day the Georgia and a majority of the Arkansas delegation withdrew.

In the Baltimore convention of the seceders he advocated the nomination of John C. Breckinridge, and made a tour of the country on his behalf. When the South seceded, he delivered the address of welcome to Jefferson Davis on his arrival at Montgomery, but declined a place in President Davis's cabinet. On March 31, 1861, he sailed for Europe as the head of a commis-

sion sent to secure recognition of the Confederate government, but returned in 1862 to take a seat in the Confederate senate. On account of his failing health, he left Richmond early in 1863, and on July 27 died at his home near Montgomery.

Soc., Reprint* No. 14 (1904).

YANG-CHOW-FU, a city in the province of Kiangsu, China, formed of the two distinct cities of Kiang-tu and Kanch-'uan. Population about 100,000. The walls are between 3 and 4 mi. in circumference. It was the ancient capital of the Yang kingdom. It possesses an early historical connection with foreigners for Marco Polo ruled over it for three years by appointment from Kublai Khan (?1282–85). It is a cultural and literary centre rather than an industrial or commercial city.

YANGTZE KIANG (Yahng-ts-Ke-ahng), the principal commercial river of China. This river, the length of which is estimated at some 3,000 miles, is known as the Yangtze by Europeans throughout its course, but among the Chinese this term indicates only the last three or four hundred miles where it flows through a region known in ancient times as "Yang." The ordinary official name for the whole river is Ch'ang Kiang or Ta Chiang, meaning the "long river" or the "great river." Popularly in the upper reaches every section has its local name. As it enters China it is known as the Kinsha Kiang (river of golden sand) and farther down as the Pai-shui Kiang; in Szechuan after its junction with the Min it is for some distance called the Min-kiang.

The beginnings of the river are somewhat indefinite but may be located in the high and difficult country between Tibet, Sinkiang and Kuku-nor. The river flows in a southeasterly direction not far removed from some of the headwaters of the Hwang-ho. Proceeding southeastward the Yangtze follows one of those narrow longitudinal valleys separated from one another by lofty ridges that mark the bending southward of the eastern extensions of the Himalayan folds against the older core of southeast China. At Batang in this section of the course the river is 8,540 ft. above sea level. Its entrance into China proper is marked by bends in its course as it bursts through lines of weakness in the sides of the corridor valleys. The river then begins a long southwest to northeast course through the Red basin of Szechuan. As the Yangtze cuts across the longitudinal valleys it receives many tributaries (flowing in parallel valleys), all naturally on the left-hand bank. At Wa-Wu in Szechuan the height of the river is 1,900 ft. above sea level, a fall of about 8 ft. per mile from Batang. Through the Red basin of Szechuan the Yangtze flows at first with fairly low banks, but towards the east it becomes deeply encased and the rapids are many and dangerous. This is due to the fact that Szechuan is tilted down against the upthrust of the fault line of the west and thus the river cuts with ease through its western half but gets through on the east by means of deep gorges. (See SZECHUAN.) At Chungking, where the Kialing enters on the left, the river is only 630 ft. above sea level. After receiving the Wu-kiang on the right the river enters deep gorges and emerges at Ichang (130 ft. above sea level). In its subsequent course the river skirts the north side of the old land block of southeast China. Here the physical features are mostly set north-northeast to south-southwest or west-northwest to east-southeast. The Yangtze follows these directions alternately in successive sections. Below Ichang it is in the Hupeh basin, the Han flows in from the northwest and the basin focuses on Hankow (*q.v.*).

From Ichang to the sea, a distance of 1,000 miles, the fall of the river is exceedingly small, being as far as Hankow at the rate of 2½ inches and from Hankow to the mouth at the rate of little more than 1 inch per mile. The last 200 miles of the Yangtze course are practically a dead level.

The drainage area in Szechuan and below is about 650,000 sq.mi., of which more than four-fifths lie above Hankow. The period of low water is from December to March. Melting snows in Tibet together with the summer monsoon cause an annual rise in the river of from 70 to 90 ft. at Chungking and from 40 to 50 ft. at Hankow. The mean volume of water discharged into the sea is estimated at 770,000 cu.ft. per second and the quantity of sediment at the mouth at 6,428 million cu.ft. per annum.

The Yangtze forms a commercial highway of first class importance. Except in winter low water, vessels of between 5,000–6,000 tons can reach Hankow. Sandbanks between Hankow and Ichang make navigation more difficult and above Ichang the gorges add to the dangers. But on the whole the Yangtze as a highway is the collecting and distributing centre of half the commerce of all China. Various "agreements" between China, Britain and other powers from 1898 have given Britain political influence over most of the Yangtze basin.
