The great towns and centres of trade on the banks of the river are Chinkiang at the junction with the Grand Canal; Nanking; An-king; Hankow and Wuchang, Ichang, King-chow; Kwei-chow; Chungking, and Sui-fu.

YANKEE. The term means properly a citizen of New England, but by extension, chiefly by Europeans, it is often used to indicate any native of the United States. The origin of the word is uncertain, but according to a common statement the Massachusetts Indians are reported to have given the name, *Yenkees,* or Yenghees, to the English colonists, the term being a corruption of the word English; or as some think, a corruption of the French word, *anglais,* in which case the word must have originated in Canada, as the early Canadian Indians were the only ones in contact with the French. The British soldiers seem to have used it as a term of reproach for the New Englanders about 1775, who afterwards took up the word and used it in reference to themselves. During the Civil War the southerners used it in a derisive sense to indicate inhabitants of the northern states.

YANKTON, a city of South Dakota, U.S.A., on the high bank of the Missouri river, near the mouth of the James, 1,200 ft. above sea level, and 60 mi. from the S.E. corner of the state; the county seat of Yankton county. It is on federal highway 81 and is served by the Chicago and North Western, the Chicago, Milwaukee, St. Paul and Pacific, and the Great Northern railways, and by motor coach lines to many points. Pop. 6,798 federal census 1940. In 1780 Pierre Durien reached the Indian village then occupying the site of Yankton, and married into the tribe. He guided the Lewis and Clark expedition from St. Louis to Yankton, and in 1811 his son accompanied the Astoria expedition up the river and on to the coast. In 1858 a permanent trading post was established there. The city was laid out in 1859, chartered in 1869, and in 1910 adopted a commission form of government. From 1861 to 1882 it was the capital of the territory of Dakota.

YAOS or **AJAWA,** a Bantu-Negroid people of east-central Africa, whose home is the country around the upper reaches of the Rovuma river, and the north of Portuguese East Africa. They have spread into the territory south of Lake Nyasa and throughout the Shiré districts. They are the tallest and strongest of the natives in the Mozambique country. They were formerly slave traders, but were reduced to submission by the English in 1896.

See Miss A. Werner, *The Natives of British Central Africa* (1906); Sir H. H. Johnston, *British Central Africa* (1897); H. L. Duff, *Nyasaland under the Foreign Office* (1903).

YAP. This island of the Caroline group, formerly owned by Germany, is situated in the Pacific ocean, south of Japan and east of the Philippines, and north of the equator, in lat. 9.35 N., long. 138·15 E. It has an estimated population of 6,652, almost entirely of Malay origin.

The importance of Yap arises from its cable connections, since it is a station on the direct line from the United States to the Dutch East Indies via Guam, while another cable runs from Yap to Shanghai. On May 7, 1919, Japan was given a mandate over the islands north of the equator previously owned by Germany, including Yap. The United States government protested, and asked for a reopening of the subject on the ground that at the Peace conference it had reserved the right to object to exclusive control of the cable landings by Japan and taken the position

that the island should be internationalized for cable purposes. Further, it was contended, the United States, not having ratified the Treaty of Versailles, was not bound by it. The supreme council of the Allies expressed its inability to reopen the matter. The controversy was finally disposed of at the Washington conference, Dec. 12, 1921, by an agreement between the two powers, wherein the United States recognized the Japanese mandate and Japan agreed that the United States should have free access to the island on a footing of entire equality with Japan or any other nation in respect to the Yap-Guam cable and any other cables which might be laid by the United States or its nationals, and also similar rights and privileges in regard to radio-telegraphic service. The United States was also granted free entry and exit for persons and property. The United States senate ratified the convention embodying this agreement March 1, 1922. (See WASHINGTON CONFERENCE.)

YAPOCK: see WATER-OPOSSUM.

YA'QŪBĪ [Aḥmad ibn abī Ya'qūb ibn Ja'far ibn Wahb ibn Wāḍiḥ] (9th century), Arab historian and geographer, was a great-grandson of Wāḍiḥ, the freedman of the caliph Manṣūr. Until 873 he lived in Armenia and Khurasan; then he travelled in India, Egypt and the Maghrib, where he died in 891. His history is divided into two parts. In the first he gives a comprehensive account of the pre-Mohammedan and non-Mohammedan peoples, especially of their religion and literature. For the time of the patriarchs his source is now seen to be the Syriac work published by C. Bezold as *Die Schatzhöhle*. In his account of India he is the first to give an account of the stories of Kalila and Dimna, and of Sindibad (Sinbad). When treating of Greece he gives many extracts from the philosophers (*cf.* M. Klamroth in the *Zeitschrift* der deutschen *morgenländischen Gesellschaft,* vols. xl. and xli.). The second part contains Mohammedan history up to 872, and is neither extreme nor unfair, although he inherited Shi'ite leanings from his great-grandfather.

Edition by T. Houtsma (2 vols., Leiden, 1883). Ya'qūbī's geography, the *Kitāb ul-Buldān,* contains a description of the Maghrib, with a full account of the larger cities and much topographical and political information (ed. M. de Goeje, Leiden, 1892). (G. W. T.)

YAQUI, the best known and sturdiest Indian tribe of Sonora, Mexico. Their language, generally called Cahita by older authors, belongs to the Piman division of the Uto-Aztecan family. The Yaqui were, and in part remain, settled agriculturists, but offered a stubborn resistance to the first Spanish invaders. They gradually came under mission influence, but in the 19th century Mexican encroachments on their lands and water rights led to a series of uprisings which were quelled with difficulty only to flare up anew, and since the final subjugation of the Apache, left the Yaqui the one unsubdued and feared tribe in North America. They pass as the best labourers in Sonora, and several thousand have recently settled in Arizona. They number about 30,000.

YĀQŪT or Y~~~~ (Yāqūt ibn 'Abdallah ur-Rūmī) (1170–1229), Arab geographer and biographer, was born in Greece of Greek parentage, but in his boyhood became the slave of a merchant of Hamah (Hamath), who trained him for commercial travelling and sent him two or three times to Kish in the Persian Gulf. After his master's death he became a bookseller, and he travelled in Persia, Syria, Egypt and visited Merv, Balkh, Mosul and Aleppo. About 1222 he settled in Mosul and worked on his geography, the first draft of which was ready in 1224. After a journey to Alexandria in 1227 he went to Aleppo, where he died in 1229. In his large geography, the *Mu'jam ul-Buldān* (ed. F. Wüstenfeld, 6 vols., Leipzig, 1866–73), the places mentioned in the literature or the stories of the Arabs are given in alphabetical order, with the correct vocalization of the names, an indication whether they are Arabic or foreign and their locality. A sketch of their history and of their monuments follows.

The parts of this work relating to Persia have been extracted and translated by Barbier de Meynard under the title Dictionnaire gto*graphique, historique* et *littéraire* de la *Perse* (1871). Yāqūt wrote a dictionary of geographical homonyms, the *Mushtarik* (ed. F. Wüstenfeld, Gbttingen, 1846). Yāqūt also wrote an important dictionary of learned men, the *Mu'jam ul-Udabā'*. Vol i. has been edited by D. S. Margoliouth, *Irshād al Arib Il* a *Ma'rifat al Adīb* (London, 1908).

YARKAND (Chinese name SOCHE FU), the largest town in one of the two chief oases of the Tarim basin in the dominion of Sinkiang, 38° 25' N. and 77° 16' E., 3,900 ft. above sea level. The oasis lies along several rivers of the southwest part of the Tarim basin and, as these streams come from the glaciers of high Pamir, they are strong and give a good water supply. The Kashgar oasis lies to the northwest and the Khotan oasis (across a desert belt) to the southeast. In the Yarkand oasis irrigation is highly developed and the soil at the foot of the mountains is largely fertile loess, on which wheat, barley, rice, beans, and oil plants are grown, while there are also many fruit orchards. Among the mountains there is good pasture and large herds of camels, yaks, goats, sheep and cattle are kept. Cotton and silk (mulberry) are cultivated to some extent.

Marco Polo visited Yarkand between 1271 and 1275 and Goes went there in 1603. Schlagintweit passed through Yarkand a few days before he was killed at Kashgar in 1857.

The town is surrounded by a great earth wall with towers of Chinese type and has mosques and madrasas (colleges) of great fame, though less well known than those of Bukhara and Samarkand. Estimates of the population, all some years old, vary from 50,000 to 100,000, probably according to the extent to which suburbs have been reckoned with the city. There are several smaller towns in the Yarkand oasis: Tashkurgan on the Pamirs. Yangi-hissar, Posgam, Kargalyk, at the bifurcation of ways to Khotan and Ladakh, Sanju, Tagarchi, Kartchum,, Besh-taryk and Guma. The city is a centre of caravan trade along routes from Cadakh, Khotan, Kansu and Trans-Caspian regions, as well as India and Russia generally. Horses, cotton, skins and leather and leather goods, carpets, silk, etc., are dealt in, and carpets as well as woven stuffs in silk, cotton and wool are made.

YARMOUTH, a seaport town and port of entry, Yarmouth county, Nova Scotia, Canada, on the Dominion Atlantic and Canadian National railways, 218 mi. from Halifax. Pop. (1941) 7,790. Steamers run to Boston, Mass., and to St. John, N.B., and Halifax. Fish and lumber are exported.

YARMOUTH, a port at the western extremity of the Isle of Wight, England, on the Solent, where the estuary of the Yare debouches. Pop. (1931) 948. Steamers connect it with the S.R. at Lymington on the mainland. It appears in the Domesday Survey of 1086 under the name of Ermud.

YARMOUTH (GREAT YARMOUTH), a municipal, county and parliamentary borough, watering-place, and seaport of Norfolk, England (with a small portion in Suffolk), 121 mi. N.E. from London by the L.N.E.R., served also by the M. and G.N.R. Pop. (1938) 53,780. Area 7 sq.mi.

Yarmouth (*Magna* Gernemutha), which lies near the site of the Roman camp of Garianonum, is believed to have been the landing-place of Cerdic in the 5th century. Not long afterward, the convenience of its situation having attracted many fishermen from the Cinque Ports, a permanent settlement was made, and the town numbered 70 burgesses before the Conquest. Henry I placed it under the rule of a reeve. The charter of King John (1208), which gave his burgesses of Yarmouth general liberties according to the customs of Oxford, a gild merchant and weekly hustings. was amplified by several later charters asserting the rights of the borough. In 1552 Elizabeth granted a charter of admiralty jurisdiction, afterward confirmed and extended by James I. In 1668 Charles II incorporated Little Yarmouth in the borough by a charter, which with one brief exception remained in force till 1703, when Anne replaced the two bailiffs by a mayor. In 1943 there were 12 aldermen and 36 councilmen. Yarmouth returned two members to parliament from 1300 to 1868 and one after 1885. Yarmouth claims to be the largest herring port in the world. This trade used to be carried on at an annual fair between Michaelmas and Martinmas.

Yarmouth lies on a long and narrow peninsula of sand between the North sea and the Breydon Water (formed by the rivers Yare and Waveney) and the river Bure. The old town of Great Yarmouth was built chiefly along the east bank of the Yare, but the modern town has extended beyond its ancient walls, of which some

remains exist, to the seashore. On the landward or Suffolk side of the estuary is the suburb of Southtown, and farther south that of Gorleston. The principal features of Yarmouth are the north and south quays, and the straight narrow lanes called "rows," 145 in number, running at right angles to them. The Haven bridge over the Yare between Yarmouth and Southtown, connecting Norfolk and Suffolk, was opened in 1930, replacing one built in 1854. The church of St. Nicholas, founded in 1101 by Herbert Losinga, and consecrated in 1119, was destroyed by incendiary bombs in 1942. It was the largest parish church in England. The town suffered greatly through air raids in World War II, and up to the end of 1941 about 11.500 houses had been damaged.

Yarmouth roads, off the coast, afford excellent anchorage except in E. or N.E. winds. The channel to the quays was made by Joost Jansen, a Dutch engineer, in 1567, and affords a depth at the bar of 12 ft. at low water. The herring industry is the most important. Yarmouth bloaters being famous, but there are numerous malting houses.

See *Victoria County History, Norfolk;* H. Sainden, *History of Great Yarmouth* (1772); C. J. Palmer, *History of Great Yarmouth* (1854); Marlowe, *People end Places in Marshland* (1927)

YARN. The derivation of this word from *"garn,"* a word common to the Scandinavian languages, meaning "guts," is interesting since today "cat-gut," which may be the drawn-out "guts" of the silk-worm, is a well-known commodity; and the same "guts" spun by the silk-worm itself into a fine filament are the basis of the best silk yarn produced. The silk-worm, however, in its "spinning" simply thins-out the silk fluid to a double microscopic strand some 500 to 1,000 yards long, several of which are combined by mechanical means to form a yarn; while the human spinner usually combines a number of much shorter fibres or filaments, also by mechanical means, into a continuous strand often much longer than the 1,000 yards filament of the silk-worm; and this also is spoken of as a yarn.

Materials. — The materials from which yarns are constructed or spun markedly influence the processes of production. In the case of the best silk yarn the worm itself does what is termed the spinning and the later running-together of several of the long silk filaments is not spoken of as spinning but as "throwing." In the case of a typical short fibre — say the cotton fibre ½"–2" long — the spinning process is the binding together of many thousands of cotton fibres into a fine regular, continuous thread — usually spoken of as "yarn." Two or more of these threads or single yarns may be combined together by "twisting" to produce a thicker, stronger yarn. Of the true long fibres there are only two types, the natural silk reeled from the cultivated silk-cocoon and the synthetic artificial silks.

Of the short fibres there are many classes. The longest are the waste silks just mentioned; then come the animal fibres including hairs and wools up to 18" long, short wools down to, say, 2" long and broken-up wool fibres (variously termed shoddy, mungo, extract, flocks, etc., according to their source and manner of breaking up from the virgin wool clothes, knitted garments, etc.) which (it is popularly said) can be spun into yarn if they possess two ends; next come the "stem-fibres" such as flax (producing linen yarn), hemp, jute and china-grass which may vary in length from several inches down to fractions of an inch; lastly come the cotton fibres and cotton wastes often under one inch in length along with which should perhaps be ranked the mineral fibre asbestos, which may be spun into a yarn from which fireproof cloths are woven.

Structures. — Yarn structures may be considered from two points of view. In the first case particular fibres lend themselves only to particular "fibre combinations." Thus long silk filaments can only be "thrown" together with or without "twist." But the twisting of silk filaments is an art in itself. Thus several filaments may be reeled together from separate cocoons and these given a suitable "combining-twist" to produce what is known as singles; then several of these singles may be thrown together with little twist to produce almost a "paralleled-fibre" thread termed "tram," the most lustrous yarn known, or with much twist to produce a strong, fairly lustrous yarn termed "organzine" which is employed as "warp." On the other hand one inch cotton fibres after being drawn into a fairly fine "paralleled sliver" termed a "roving" can only be spun out into a fine thread by means of "supporting twist" which no doubt binds the fibres more or less concentrically in the thread or yarn: this is said to be the true form of spinning — draft (that is, drawing-out thinner) against twist.

Fancy Twists. — These naturally group themselves into three classes, viz., structural twists; colour twists; and structural-and-colour twists. Of the first class the two most important are the knop yarn — in which knops are formed at any required intervals on an otherwise level thread by holding one thread tightly and allowing the second thread to run in slackly to form knops of the required size, after which equal delivery of the two threads for the required length is followed again by the varied delivery to form the knop; and the curl yarn — in which a knop yarn is first formed and then this two-fold yarn twisted, in the opposite direction, with a third thread, this opening out the knops into loops which may be produced at more or less regular intervals or "spaced." *i.e.*, a length of the thread without loops and then a series of loops, which in turn are followed by a length of the thread without loops. Of fancy colour twists the simplest is the corkscrew twist which is formed by first twisting, say, a dark and a light thread in the normal manner and then twisting this two-fold yarn in the reverse direction, with a third dark thread, this producing the special appearance which gives its name to the yarn.

Other Fancy Yarns. — Fancy yarns of an effective character may also be produced with simple modification in the normal carding and spinning processes. Thus "knicker yarns" are produced by throwing little bits of highly coloured material into the last cylinders of the card so that instead of being broken up by carding they are carried forward as "knickers" into the spun thread. "Random yarns" are produced by feeding the card with alternate stripes of dark and light material and taking the condensed slivers off with a zig-zag or moving-laterally doffer which takes sections of the lengths of its slivers from first one and then the other stripes. "Marl yarns" are produced by running two differently coloured slivers together on the roving frame just prior to the worsted spinning process, so that the colours are "regularly irregularly" mixed together.

If on the other hand a very level mixture effect is required dark and light coloured tops are mixed together in the worsted drawing processes, or, better still, the "tops" are printed the required colours in bands and then passed through the worsted drawing processes this producing the extraordinary level mixture effect termed a "melange." Of the simple twofold yarns the best known is the "granderelle" in which a dark and light thread — usually of similar material, but not necessarily so — are finely twisted together as perfectly as possible. Another twofold twist termed a "spiral yarn" is formed by two single threads twisted in opposite directions being combined with twofold twist which necessarily shortens one of the threads by adding twist and markedly lengthens the other by taking out twist. Thus the slack thread "spirals" round the tight thread.

Yarn Effects and Special Properties. — The effects which may be produced by suitable selection of materials and yarn structure may be grouped into three classes, viz., light-reflective effects; form effects, and colour effects. Light reflection from the surface of a woven fabric depends upon the material or materials employed, upon the fibre arrangement in the thread, upon the thread interlacings and upon such modifications as may be introduced in the finishing processes. Thus some wools are lustrous — the Wensleydale wool, for example — and some are opaque and dull — the Down wools. Ordinary cotton is dull, mercerized cotton is lustrous. A lightly twisted net silk yarn ("tram") is the most lustrous yarn known, while a specially hard twisted net silk yarn (crape) is the dullest yarn produced. Tram silk yarn interlaced on the "satin" principle produces the most lustrous fabric and crape silk yarn interlaced on the "crape" principle produces the dullest fabric known.

Merino wool spun on the woollen principle when woven into a normal fabric gives a dull surface but if the fibres are "raised" from the surface and laid parallel in the "finishing" processes then

a brighter fabric may result than that produced from a merino wool spun on the worsted principle in which the fibres are laid parallel in the thread structure only.

The "form" effects will have been appreciated from the descriptions already given of knop, curl, spiral, etc., yarns. These yarns specially coloured as already described offer the designer the opportunity of producing a never-ending array of novel fabrics. Should specially white fabrics be required a "bleached" yarn is employed but it is more usual to bleach the material in the fabric state. Should a yarn which may be spun white but later—either in the yarn or cloth state—dyed two distinct colours be sought for, cotton may be blended with wool in the carding or in the drawing processes, or strands of wool and of cotton may be twisted together and dyed distinctive colours later.

Yarn Counting and Numbering.—The numbering or "counts" of varns, 30's, 40's, So's, etc.—may be explained best by the counting of woollen yarns. The basic weight is the "wartern" of six lb. the "quartern" of the old 24 lb. stone. This appears to have been a convenient weight for the spinners to take away to their homes for hand or "jenny" spinning. If this weight was spun in 1,536 yd.—that is each dram spun out to one yard—it was termed "one skeins." If one dram was spun to 2 yd., it was termed "two skeins"; if to 20 yd., it was "twenty skeins." Later it was found more convenient to deal with the unit weight of 1 lb., so that it has come to be usual to reckon the woollen "skein" as 2j6 yd. and the number of skeins to which a pound of this material is drawn out as the "counts," spoken of as "skeins" in the woollen districts. Thus if 1 lb. is drawn out to 5,120 yards (256×20) the yarn is a "20 skeins." Unfortunately the woollen industry was spread over the whole of the known world before the unifying mechanical era dawned with the result that not only each country but each manufacturing district has adopted its own system of woollen yarn counting. Thus 200, 300, 420 yd. skeins are to be found and there is a still further complication in the United States where in one case the length is fixed and the count or skeins is given by the number of times the unit weight (the grain) is contained in this unit length. This method is that natural to the net silk industry in which the drams per 1,000 yards, or the deniers (or ½ deci-gram) per 450 metres gives the count spoken of as the "deniers."

The cotton spinning industry which started from England adopted from the first a hank (or skein) of 840 yards and the hanks per lb. as the "count" and this has obtained world-wide acceptance. The worsted industry, apparently an off-shoot of the cotton industry, taking a yard instead of a 1½ yard reel has adopted a hank of 560 yards and the hanks per lb. give the count. An attempt is now (1928) being made to adopt a universal system of counting yarns. The kilogram and the kilometre (or gram and metre) are suggested as the universal bases for everything excepting "thrown" silk and artificial silk yarns for which a base length of 500 metres is suggested and the weight of this in decigrams to give the "deniers" or "count."

The yards to which one pound of material may be spun naturally vary with the fineness and nature of the material. Thus cotton has been spun on a commercial basis to 588,000 yd. per lb., linen to 180,000 yd. per lb., worsted yarn to 56,000 yd. per lb., and woollen yarn to 15,000 yd. per lb.; while net silk yarns, if required, may even be thrown finer than the finest cotton.

Sometimes to obtain a fine, straight-fibred thread, wool is spun or twisted with cotton and later the cotton is "carbonized" by acid treatment The reverse process may also be employed. Special note should be made that in twisting threads together the count number of the yarn will be lessened in proportion to the added weight of the thread or threads. Thus two threads of a 40's count twofolded give a 20's count—written 2/40's. There is, however, an exception to this in spun silk yarn in which a 2/40's yarn (often written 40/2) is a 40's but twofold, *i.e.*, two threads of 80's are twisted together giving a folded yarn with 40 hanks (each 840 yd.) to the pound. The twisting of varied count numbers is really simple but mystifying to the uninitiated. Thus a 10's count twisted with a 40's count does not give an intermediate count number (say 25's) but naturally a thicker count than 10's and consequently a lower count number, viz., 8's count; and this is true in whatever denomination the count may be stated—cotton, linen, woollen, worsted, etc. (A. F. B.)

YAROSLAVL, a province of the Russian S.F.S.R., surrounded by those of Tver, Cherepovetz, Vologda, Kostroma, Ivanovo-Vosnesensk and Vladimir. Area 31,705 sq.km. Pop (1926) 1,337,717. Thick deposits of boulder clay, remains of the bottom-moraine of the ice-cap of the Glacial period, cover the Jurassic clays, and patches of Triassic "variegated marls" outcrop in some places, while Upper Carboniferous limestones crop out only in the north-west and towards the east. Coniferous forest, with firs predominating, occupies 39% of the province, and marshes are extensive, especially between the Sheksna and Mologa, and in the Rostov district. Dwarf birch, the Arctic raspberry (*Rubus arcticus*) and *Linnaea* borealis are widespread. The climate is severe, the rivers being frozen 118 to 183 days per annum, average January temperature 6·5° F, average July 61·5° F. The prevailing south-west and west winds make the rainfall heavier than in central Russia.

Of the land free from forest and marsh, only 25% is under plough culture, with rye (36·9%), oats (23·4%) and flax (7.4%). Potatoes, barley, grass, vegetables, chicory and herbs are grown. the latter especially in the Rostov district. Meadow and grassland prevail and the province has a flourishing dairy industry, with exports of butter and cheese. In the years 1926–27 a peat fuel electric station was opened at Liapinsk near Yaroslavl. Bog iron ores, copper sulphate and pottery clay are obtained and there are salt and mineral springs. The principal river is the Volga, which is connected with the Neva by the Mariinsk and Tikhvinsk canals through its tributaries the Sheksna and the Mologa. The Kotorost, flowing from Lake Nero to the Volga, is navigable in spring, and the Kostroma, flowing along the north-eastern boundary, is a channel for the export of timber and peat fuel. Of the rivers, 39% are available for steam navigation; the railway net is poor, and good roads are absent, except for the Moscow-Yaroslavl road. Yaroslavl and Rybinsk (*q.v.*) are the chief towns.

Yaroslavl, the chief town of the above province on the right bank of the Volga, at its confluence with the Kotorost, in 57° 38' N., 39" 50' E. Pop. (1933) 167,300. It is a productive centre with textile factories, and tobacco, leather and lacquer industries. Founded in 1026–36, it was the chief town of the principality from 1218 to 1417, when it was annexed by Moscow. The Uspenskiy cathedral was begun in 1215 and rebuilt 1646–48, and there are remains of 15th and 17th century monasteries.

YARROW, river and parish of Selkirkshire, Scotland. The river, issuing from St. Mary's Loch, flows for 14 mi. E. by N. to the Tweed, which it joins about 3 mi. below the county town. The stream and vale are famous in poetry. Pop. (1931) 459.

YARROW (*Achillea millefolium*), a plant of the family Compositae, also called milfoil, native or naturalized throughout the northern hemisphere. It has white or, rarely, rose-red flowers, borne in flat-topped clusters, and very finely divided leaves. Legend ascribes the discovery of its healing virtues to Achilles, in whose honour it was named. The leaves, anciently in great repute for use in the treatment of wounds, are said to be occasionally so employed in domestic medicine. In lawns it sometimes makes a solid turf, being more resistant to drouth than most lawn grasses. The closely allied *A. ptarmica,* the sneezewort or sneezewort yarrow, so named because of the use of the root for snuff, native to Europe and northern Asia and found in the British Isles, is naturalized in eastern North America.

YARURAN, a small group of tribes of South American Indians, constituting an independent linguistic stock. The Yaruros lived in Venezuela, on the Orinoco river between the Meta and the Capanaparo; in recent times they have spread somewhat further down stream to the Arauca and beyond.

See J. Chaffanjon, *L'Orenoque et la Caura* (Paris, 1889).

YATES, RICHARD (1818–1873), American political leader, born at Warsaw, Kentucky, Jan. 18, 1818. He graduated at the Illinois College at Jacksonville in 1838, was admitted to the bar, and entered politics as a Whig. From 1842 to 1845 and again in 1849 he served in the state House of Representatives. He was a

representative in Congress in 1851–1855, but having become a Republican, was defeated for a third term.

From 1861 to 1865 he was governor of Illinois, and was successful in enlisting troops and in checking the strong pro-Southern sentiment in the state. He was a member of the United States Senate in 1865–71, and was prominent in Reconstruction legislation. He died at St. Louis, Missouri, on the 27th of November 1873. His son Richard (b. 1860) was governor of Illinois from 1901 to 1905.

YAUCO, a prosperous and progressive town situated in the southwestern part of Puerto Rico. Its population by federal census of 1930 was 8,607; 1940, 9.985; the municipal district 1930, 27.787; 1940, 30,533. It is located on the main line of the belt line railroad and on the main highway which connects Ponce with Mayaguez. It is the southern terminus of a newly constructed highway connecting the town with Lares and other northern towns. The largest centre for the manufacture of cane-sugar is in this part of the island at the port of Guánica. This port was the first landing place of the American troops under command of Gen. Miles on July 25, 1898.

YAWS, the name in use in the British West Indies for a contagious inoculable tropical disease, running a chronic course and characterized by a peculiar eruption, together with more or less constitutional disturbance. It is known by various local names in different parts. The name *framboesia* was first given to the disease by Sauvages in 1759 from the likeness of the typical excrescences to a raspberry. Yaws was long thought to be peculiar to the African negro, but a disease the same in every respect has long been known in the East Indies, affecting the Malays rather than the negroes, its chief seats being Amboyna, Ternate, Timor, Celebes, Java and Sumatra. It has been identified by De Rochas and other observers in New Caledonia and Fiji.

The general course of the disease is as follows. In children (who form a Iarge part of the subjects of yaws) there will probably be early rheumatic pains in the limbs and joints, in adults the eruption is often the first sign. The eruption begins as small pimples that have a whitish speck on their tops, grow rapidly and reach some half-inch in diameter. The pustules then break and a thick viscid ichor exudes and dries upon them as a whitish slough and around their base as a yellowish-brown crust. Beneath the slough is the raspberry excrescence or yaw proper, a reddish fungous growth with a nodular surface. The favourite seats of the eruption are the forehead, face, neck, arm-pits, groin, genitals, perinaeum and buttocks. Hairs at the seat of a yaw turn white. In young children or infants the corners of the mouth ulcerate, as in syphilis, and the perineal excrescences resemble condylomata.

Aetiology.—Yaws is a highly contagious disease. It is neither hereditary nor congenital. The disease spreads by contact with previously infected cases, and it has been proved by experiment that infection may be conveyed by flies, carrying infective material from a yaws sore to an ordinary ulcer. The virus must be introduced directly through a breach of the skin or mucous membrane; an attack in childhood gives a large degree of immunity for the rest of life. In 1905 Aldo Castellani demonstrated in yaws the presence of a slender spirillum, which he named the *Spirochaeta pertenuis* or *Spirochaeta pallidula*. It was also experimentally proved by him (1) that the material taken from persons suffering from yaws and containing the *Spirochaeta pertenuis* is infective to monkeys; (2) that when the *Spirochaeta pertenuis* is removed by filtration the material becomes inert; (3) that the injection of blood from the general circulation of a yaws patient gave positive results in monkeys; (4) by means of the Bordet-Gengou reaction it is possible to detect specific yaws antibodies and antigen.

The prophylaxis consists in the segregation of the patients suffering from the disease, the antiseptic dressing of the eruption, the application of a covering to protect it from flies, and the thorough cleansing and disinfection of infected houses and clothing, even the demolition of houses in endemic centres, and finally compulsory notification to the local sanitary authority.

As regards treatment, the malady in a person of good constitution runs its course and disappears in a few weeks. When the eruption is declared, iodide of potassium and arsenic are very beneficial. As external applications, weak lotions of zinc or carbolic acid may be used, and, if the excrescences are irritable, a watery solution of opium. In 7,157 West Indian cases treated in various hospitals there were only 185 deaths, a mortality of 25·8 per thousand (Nicholls).

YAZDEGERD ("made by God," *Izdegerdes*), the name of three Sassanid kings of Persia. (1) YAZDEGERD I., son of Shapur III., 399–420, called "the sinner" by the Persians, was a highly intelligent ruler, who tried to emancipate himself from the dominion of the magnates and the Magian priests. He punished the nobles severely when they attempted oppression; he stopped the persecution of the Christians and granted them their own organization. With the Roman Empire he lived in peace and friendship, and is therefore as much praised by the Byzantine authors (Procop. *Pers.* i. 2; Agath. iv. 26) as he is blamed by the Persians. After a reign of twenty years he appears to have been murdered in Khurasan. (2) YAZDEGERD II., was the son of Bahram V. Gor, 438–457. He persecuted the Christians and Jews, and had a short war with Rome in 441. He tried to extend his kingdom in the East and fought against the Kushans and Kidarites (or Huns). (3) YAZDEGERD III., a grandson of Chosroes II., who had been murdered by his son Kavadh II. in 628, was raised to the throne in 632 after a series of internal conflicts. He was a mere child and never really ruled; in his first year the Arabic invasion began, and in 637 the battle of Kadisiya decided the fate of the empire. Ctesiphon was occupied by the Arabs, and the king fled into Media. Yazdegerd fled from. one district to another, till at last he was murdered at Merv in 651.

The Parsees, who use the old Persian calendar, continue to count the years from his accession (era of Yazdegerd, beginning June 16th, A.D. 632). (ED. M.)

YAZOO CITY, a city of western Mississippi, U.S.A., about midway between Memphis and New Orleans, on the (navigable) Yazoo river; the county seat of Yazoo county. It is on federal highway 49, and is served by the Illinois Central railroad. Pop. 5,244 in 1920 (52% Negroes); 7,258 in 1940 by the federal census. At the eastern entrance to the rich "Delta" between the Yazoo and the Mississippi rivers, it is an important market and shipping point. The city was founded about 1830.

YEAR-BOOK, a term applied to annual summaries either of events throughout the world during the previous year or of general or local progress in some one department of administration, art, science or industry. Examples are *The Britannica Book of the Year, The Statesman's Year-Book, Annual Register, Whitaker's Almanack, The World Almanac,* biographical records like *Who's Who,* genealogical records such as those of Debrett and Burke, and the Continental *Almanach de Gotha,* a scientific and scholastic publication of the type of the *Index Generalis,* and the innumerable specialized economic and industrial publications.

The English legal *Year Books,* described by Pollock as "our glory, for no other country has anything like them," are reports of cases covering the period 1292 to 1534, written in provincial French. Abridgments of these *Year Books* were made by Sir Anthony Fitzherbert in 1516 and by Sir Robert Brooke in 1568. The first systematic printer of them was Richard Pynson, from 1510; the principal publisher, from 1553, was Richard Tottell. In 1863 A. J. Horwood was commissioned by the then master of the Rolls to edit the unpublished *Year Books* of Edward I. This Rolls series was continued by L. O. Pike. The work has been supplemented by Maitland and others working for the Selden Society. The most convenient brief discussions of the *Year Books* are in *Holdsworth's History of English Law* (1903–09), vol. ii., pp. 444–462, and W. C. Bolland's *The Year Books* (1921). They are now thought to have had an official or even semi-official character.

YEAST. The botanist and microbiologist apply the term yeast to a group of plants many of which exhibit a marked ability to change sugar into alcohol and carbon dioxide. The characteristics of the group, which includes hundreds of species, are quite restricted. These, together with discussion of taxonomy,

are given under FUNGI and FERMENTATION. To the layman, untrained in botany, the term yeast suggests the cakes of pressed yeast available in almost every hamlet. The ability of certain yeasts to form carbon dioxide from sugar has caused some of them to be used for leavening bread. For centuries, other species have been used in the making of wine, alcohol, beer, etc.

Yeasts probably have as early origin as the bacteria. Grüss examined some fossil remains of Devonian plants and obtained striking evidence of the existence of budding fungi in this early age. This same investigator on examination of the sediment from a beer jar in Theban tomb of the XIth dynasty (2000 B.C.) isolated a yeast which was named *Saccharomyces Winlocki*. Examination of "beer bread" found among the offerings in other tombs also yielded the same yeast. It is now known that yeasts are widely distributed in nature and that those species concerned in fermentation pass the winter in the soil. They are disseminated by hees, dust and other agents in the spring.

The use of yeast in such fermentatibns as that of bread has made it convenient to have a constant supply of fresh active yeast. While in former days the by-product of certain fermentation industries was used, pressed (or compressed) yeast is now available to those who desire it. To this end the organism is grown in suitable media and the crop harvested when a sufficient crop of cells has appeared. The medium, according to an older method, consists of wort prepared from grains mashed in water. The mash prepared from grains is inoculated with lactic acid bacteria to "sour" it; the acid prevents putrefaction and also serves as food for the yeasts. The clear wort is passed into fermenters where it receives the seed yeast. The temperature is kept constant and rapid growth takes place. The yeast cells are then separated from the fluid in which they have grown by filter presses. They are mixed with starch and pressed into large cakes. These are sent to distributing centres, where they are cut and wrapped in the small size package commonly used in the home. In more recent times, yeast has been cultivated in mineral salt-sugar solutions instead of the wort described above. The cells are also incorporated in corn meal which is pressed into cakes.

Besides the application of yeasts in fermentology, they have been widely heralded as therapeutic agents. Their application to the cure of disease goes back to very early times. Many of the statements on the use of yeasts in this manner rest upon uncontrolled experiments, if indeed they may be called experiments. We are told that the monks used yeast for curing plague and that Hippocrates advised its use in leucorrhea. Since 1917 great interest was aroused by a publication of Hawk, et al. who reported beneficial results in furunculosis, acne vulgaris, constipation and certain other gastro-intestinal and cutaneous diseases.

YEATS, WILLIAM **BUTLER** (1865–1939), Irish author was born at Sandymount near Dublin on the 13th of June 1865. His father J. B. Yeats was a distinguished Irish artist and member of the Royal Hibernian Academy, his mother's family was from County Sligo. Soon after his birth his parents moved to London but his early years were largely spent in Sligo and even when, at the age of nine or ten, he went to school in London he returned to Siigo for his holidays and his early work is full of allusions to its mountains and little lakes, indeed this beautiful county has coloured all his writing. He studied painting for a short time but at the age of twenty-four published his first book of poems *The Wanderings of Oisin* (1889) and from that time forward gave his whole attention to literature. He was now living in London and a member of the group of young writers whose work appeared in *The Yellow Book*. A friend of William Morris and W. E. Henley and a frequent contributor to *The National Observer*, he was one of the founders of the Rhymer's Club and a close friend to Arthur Symons and Lionel Johnson. Years later he published two books, *Reveries over Childhood and Youth* (1915) and *The Trembling of the Veil* (1922)—now brought together in the volume called *Autobiographies—and* in these will be found the history, fascinatingly told, of the first thirty years of his life. In 1892 his first poetic play *The Countess Cathleen* was published; it was followed two years later by another play *The Land of Heart's Desire* and in the previous year appeared his first volume of essays *The Celtic Twilight*. With Edwin J. Ellis he edited the *Works of William Blake* (1893) and also edited *A Book of Irish Verse* (1895). Three books of prose appeared in 1897: *The Secret Rose, The Tables of the Law* and *The Adoration of the Magi;* the last two were published privately but subsequently appeared publicly. By 1897 he had become interested in the formation of an Irish theatre and with the help of Lady Gregory, Edward Martyn and other friends the first performance of the Irish Literary Theatre took place in Dublin in 1899. This Theatre gradually developed, attracting to itself writers such as Mr. George Moore and "A.E." and creating new writers such as J. M. Synge and Mr. Padraic Colum and by 1904 had established itself in the Abbey Theatre of which theatre Yeats was a Director until his death and contributed to its repertory many noble plays in verse and prose. Side by side with playwriting went the writing of lyrics and the rewriting of much of his early work—for he had always been his own harshest critic. After 1897 his most noteworthy volumes of poems are *The Wind among the Reeds* (1899), *Responsibilities* (1914), *The Wild Swans at Coole* (1917), *Later Poems* (1922) and *The Tower* (1927). His literary and critical essays are of importance, they are to be found in the volumes *Ideas of Good and Evil* (1903), *The Cutting of an Agate* (1912), *Per Arnica Silentia Lunae* (1918) and *a* number of witty and profound essays on the art of the theatre now collected into the volume *Plays and Controversies* (1923). The private publication of a philosophic book *A Vision* (1925) must be noted. Owing to his habit of rewriting, versions of his work are many and various and the *Collected Edition* in eight volumes published in 1908 has long ago been superseded. The volumes at present published by Macmillan & Co. are practically a collected edition of the work which he wished to preserve, but in the opinion of many he had discarded or grievously altered many beautiful early poems. His first three plays in prose *Kathleen ni Houlihan* (1902), *The Pot of Broth* (1902) and *The Hour Glass* (1903) are entirely successful stage plays. It is difficult to speak with certainty of the stage success of his verse plays because, owing to the absence of a verse-theatre in England, the number of performances of them has not been large. He hoped in starting the Irish Literary Theatre to found amongst other things a verse-theatre in Ireland and during its early years a number of his verse plays were performed there but later the dramatic genius of Ireland emphatically declared itself to be realistic and not poetic and his dream of a verse-theatre had to be abandoned. But certainly *The Countess Cathleen* has proved itself a very successful stage play, the story is swift and dramatic, the incidents are full of variety, the verse is limpidly clear. The one-act play *The Land of Heart's Desire* (1894) is very popular and frequent performances of it are given by non-professional theatrical companies in England and America. His later plays demand great tragic acting, a demand met by Mrs. Patrick Campbell in her performance in *Deirdre* (1907) when the play showed itself to be of perfect construction and of intense passionate beauty. Given a great tragic actor *The King's Threshold* (1904) is as fine a stage-play as *Deirdre*. Other plays belonging to this period are *The Shadowy Waters* (1900), *On Baile's Strand* (1904) and *The Green Helmet* (1910). By this time he had despaired of finding a verse-theatre and his next play *The Player Queen* was in prose. It is a delightful phantasy and successful on the stage. Later still, influenced by the Japanese, he was to write four curious *Plays for Dancers* (1921) and, in the same mood, *The Cat and the Moon* (1924). Three of these plays have been performed and with success. He found in this unrealistic form freedom from stage conventions and an opportunity for phantasy.

In all probability these plays for dancers will never have popular appeal but to some they will seem the most beautiful work he has done for the stage. Considered as a poet his poetry falls into three periods, the early, the middle and the late. His early poetry was elaborate and richly wrought, influenced in some de-

gree by the Pre-Raphaelites, yet side by side with these possibly over-decorated poems can be found beautiful lyrics as simple as an Irish country ballad. By 1910 he had wearied of elaboration, he had been too much imitated, and he turned and attacked his own "embroideries." He had found, too, a new inspiration, a national one, and *Poems written in Discouragement* (1913) are the result of that inspiration. A year later with the publication of *Responsibilities* the new note in his verse is firmly struck, the last shred of embroidery for embroidery's sake has been discarded and the beauty of these poems is "like a tightened bow." He is struggling with a new, austere method, he has not entirely mastered it but he triumphantly emerges from the contest in his next volume *The Wild Swans at Coole* (1917). This book and each succeeding book mark his third period, the latest volume being *The Tower* (1927). Some poems in these volumes are obscure but only because they are part of his own difficult philosophy; if that be understood the poems are clear. The sweep and range of his art from *The Wanderings of Oisin* to *The Tower* are amazing and it is difficult to think of any other poet writing in English who is so varied and so developed. In 1928 appeared translations of Sophocles' *Oedipus the King* and *Oedipus at Colonus*. They are translations made specially for the Abbey Theatre; they are in prose and aim at simple, effective speech rather than meticulous verbal accuracy, the choruses are in rhymed verse. In 1929 he published a book of verse, *The Winding Stair;* his *Collected Poems* were published in 1933, and *Collected Plays* in 1934. As one of the founders of the Irish Literary Society Yeats had early shown his practical concern with the intellectual life of his country; and it was natural for the Government of the Irish Free State to nominate him in 1922 as one of its first Senators. He was awarded the Nobel Prize for literature for 1923. (L. Ro.)

YELLOWBIRD, a name applied in the United States to the American goldfinch (*Astragalinus tristis*) and to the yellow warbler *(Dendroica aestiva). (See* GOLDFINCH, WARBLER.)

YELLOW FEVER, a specific infective tropical fever, the virus of which is transmitted by a mosquito. The disease occurs endemically in certain limited areas. The area of distribution includes the West Indies, Mexico, part of Central America, the W. coast of Africa and Brazil.

The incubation period of yellow fever is generally four or five days, but may be as short as twenty-four hours. The illness usually starts like any other febrile attack. But there soon occurs a peculiar look of the eyes and face, which is characteristic: the face is flushed, and the eyes suffusedat first and then congested or ferrety, the nostrils and lips red, and the tongue scarlet—these being the most obvious signs of universal congestion of the skin, mucous membranes and organs. There is high fever and albumen will nearly always be found in the urine. After two or three days the temperature falls below the normal; the pulse becomes slow and feeble, the skin cold and of a lemon-yellow tint, the act of vomiting effortless, the first vomit being clear fluid, but afterwards black from admixture of blood. This prostration may end in recovery, with copious flow of urine, which even then is very dark-coloured from the presence of blood or may increase and end in death. Much blood in the vomit and in the stools, together with all other haemorrhagic signs, is of evil omen.

The case mortality averages from 12 to 80%. In Rio in 1898 it reached the appalling height of 94.5%. In cities where it *is* endemic the case mortality is usually lower.

Modern Researches.—The dreaded "vomito negro" which for four centuries claimed more than 50% mortality among its victims, has been relegated to a place of secondary importance since the institution, in 1901, of the anti-mosquito campaign. Since 1910 no epidemic invasion of yellow fever into temperate regions has occurred, and some of the most noted endemic centres in Ecuador, Mexico and Brazil have been freed of the disease, probably forever; no case has been reported in the entire Western Hemisphere for many months. The use of oil for destroying mosquito larvae has now been practically abandoned in favour of placing in the tanks which serve as water supply for houses in the tropics one or two small fish, which eagerly devour the "wrigglers."

Connor, in Guayaquil, first used this method successfully in 1919, and it has since been used in other countries with excellent results. The fish must be of small size and able to withstand handling and transportation. Those chiefly used are the minnows, *Gambusia affinis, Dormitator latifrons* and *Fundulus heteroclitus* and the common "lefa" of South America *(Pygidium piurae* C.) some being top-feeding and others bottom-feeding fish.

Bacteriological **Investigations.**—While the transmitter of the yellow fever germ had been experimentally proved, by the American Army Board under Reed, to be the mosquito, *Aedes aegypti* (formerly known as *Stegomyia fasciata* or *S. calopus),* the microbe which produced the disease had remained unknown until 1918 when a minute spiral organism, subsequently named *Leptospira icteroides,* was isolated from the blood and organs of yellow fever patients, in Guayaquil, Ecuador. Inoculation of cultures of this organism reproduced all the characteristic symptoms and lesions of yellow fever in guinea pigs, marmosets and young puppies. Yellow fever was also transmitted directly to guinea pigs with blood taken from yellow fever patients and the same micro-organism from experimentaiiy infected animals.

Investigations previously conducted by the American Army Board in Havana had demonstrated that the germ of yellow fever could pass through the pores of certain bacteria-proof filters *(see* FILTER-PASSING VIRUSES), and this fact alone had been sufficient to disprove the relation to yellow fever of a dozen or more different bacteria. *Leptospira icteroides,* on the other hand, proved to be a filter-passer and to conform with other well-known characteristics of the yellow fever virus; thermal death-point; transmissibility by *Aedes aegypti;* ability to produce typical fever, extensive haemorrhages into the gastro-intestinal tract, resulting in the "black vomitus" and melaena, severe nephritis, general jaundice and the characteristic changes of liver and kidney (fatty degeneration and necrosis). Another important proof that connects *Leptospira icteroides* with yellow fever is that this micro-organism is killed by the blood serum of persons who have just recovered from yellow fever but not by that of healthy persons or persons recovering from other diseases.

Leptospira icteroides was subsequently isolated from cases of yellow fever in Mexico, Peru and Brazil. It is actively motile, measures 4–9 μ long and 0·2 μ wide and there are two spirals for each micron. The ordinary microscope does not reveal its presence in the living condition, but it is easily seen by means of dark-ground illumination. It grows only on special culture media. The isolation of *Leptospira icteroides* has made it possible to prepare a preventive vaccine, similar in type to that in use for protection against typhoid fever, and a curative serum. While a given locality may be freed from yellow fever by destruction of mosquito larvae, this type of preventive work requires some months. Newcomers meantime are in danger, and protection, even of a temporary nature, is welcome. Injection of a small quantity of killed cultures of *Leptospira icteroides,* as first shown in experimental animals, confers temporary protection from the yellow fever infection, the inoculation taking effect within about two weeks. The results of prophylactic inoculation of 20,000 or more individuals since 1919 indicate that if persons are satisfactorily vaccinated they are protected against yellow fever for about six months. The curative serum has been tried in several hundred cases. When it has been used early in the disease, *i.e.,* before the fourth day of illness, the death-rate has been comparatively small (16% as compared with the usual 50% or more in yellow fever). It is without appreciable benefit when given later in the illness, when the micro-organisms have done irreparable injury to the liver and kidneys.

Since 1925 doubt has been thrown on the causal relationship of *Leptospira icteroides* to yellow fever by discovery of the fact that the common rhesus monkey *(Macacus rhesus)* and to a lesser degree the Indian crowned monkey *(M. Sinicus)* are very susceptible to the disease which may be transmitted to them by the bites of infected mosquitoes or inoculation with blood of a yellow fever patient. Material from such infected animals or from yellow fever cases is without effect upon guinea pigs which are extremely susceptible to L. *icteroides.* Since *L. icteroides* is serologically identi-

cal with L. *icterohaemorrhagia* it is thought probable that the organism described by Noguchi as the cause of yellow fever had been obtained from cases of Weil's disease or possibly from patients with a double infection. Working with a strain of yellow fever isolated in Senegal and rhesus monkeys A. W. Sellards and E. Hindle advanced matters further in favour of a filterable virus theory by showing that like some other filterable viruses yellow fever infective material is unaffected by cold and if frozen will maintain its virulence for at least twelve days.

YELLOW RIVER: *see* **HWANG-HO.**

YELLOWROOT, a small North American shrub (*Xanthorhiza simplicissima* or *Zanthorhiza apiifolia*) of the crowfoot family (Ranunculaceae, *q.v.*) found in woods from western New York to Kentucky and Florida. It has smooth stems, 1 to 2 ft. high, with yellow wood, long yellow roots, parsley-like leaves, and small purplish flowers in slender drooping clusters. It is sparingly planted for ornament. Yellowroot is also applied to the goldenseal *(Hydrastis canadensis)* and goldthread *(Coptis trifolia).*

YELLOWSTONE NATIONAL PARK, a national American public park, the first and most noted of a number of such national reserves set apart by the U.S. Government to preserve, for the benefit and enjoyment of the people, certain regions of extraordinary or unique natural grandeur and impressiveness. Yellowstone National Park includes about 3,350 sq.m.—62 m. long and 54 m. wide—lying largely in the north-west corner of Wyoming but extending a little over 2 m. northward into Montana. National forests surround the park on all sides—the Gallatin, Absaroka and Beartooth to the northward; the Shoshone to the eastward; the Teton and Targhee to the southward; and the Targhee, Madison, and Gallatin to the westward.

A broad volcanic plateau with an average elevation of 8,000 ft. occupies the centre of the park. The park is enclosed on its northern and north-western border by the Gallatin range, a bold picturesque sierra of which Electric peak, elevation 11,000 ft., constitutes the culminating crest. The Teton range, one of the most spectacular features of the northern Rockies, looms high upon the southern horizon, but only its bold spurs and foot-hills enter the park. East of the Tetons stretch the wild Gros Ventre and Wind river ranges well up toward the southern boundary of the park. The majestic Absaroka range, connected at the south with the Wind river range, forms an unbroken barrier along the whole eastern side of the park, its western side and many of its rugged peaks and canyon-grooved mountain masses lying within the park. A confused mass of mountains near the north-eastern part of the park connects the Absaroka with the Snowy range.

The general high elevation of the park is reflected in the climate, the mean annual temperature being considerably lower than that of the surrounding lower areas, and the amount of precipitation, both rainfall and snowfall, higher. At the Yellowstone Park weather station, elevation 6,200 ft., the mean temperature for the year is 38·7° F, ranging from 18·0° F in January to 61·3° F in July. The average annual snowfall at the Yellowstone Park station has been 100·5 in., varying from traces in July and August to 20·6 in. in January. The mean relative humidity varies from 53% at noon to 75% at 6 A.M. The annual percentage of sunshine is 56.

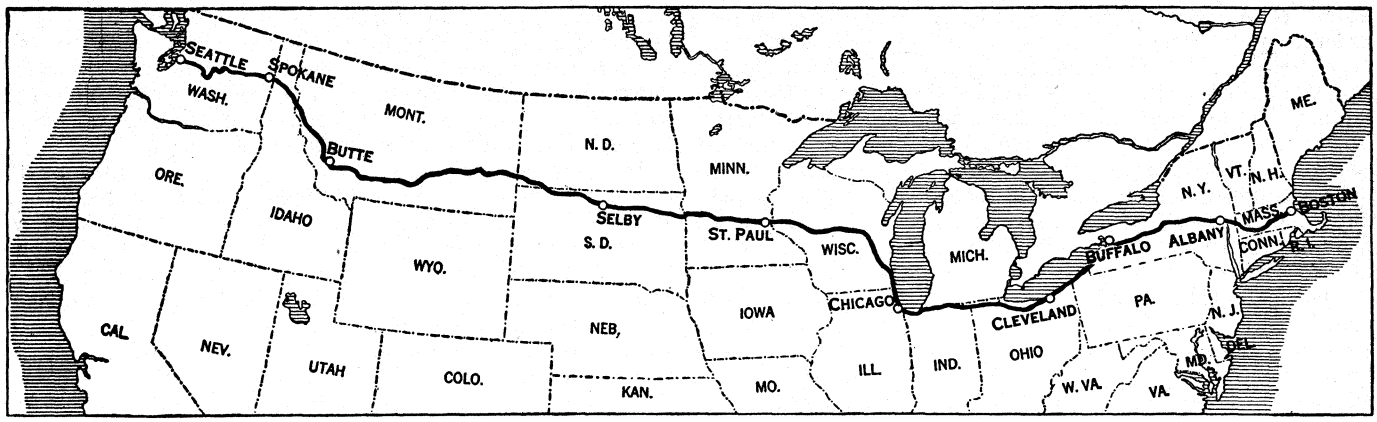
Such climatic conditions favour forest development and the growth of luxuriant grasses together with a varied alpine verdure. The whole of the park lies within the limits of the lodge-pole pine forest characteristic of the high Rockies though the higher slopes of the Absarokas and other high ranges are clothed with belts of spruce-fir forests and the crests of the mountains themselves are above timber line. The lodge-pole pine is a pioneer tree which invades terrain left open by other species, chiefly as the result of forest fires. Sunny, rocky slopes are in places occupied by the Douglas fir. Aspen and Engelmann spruce and a few limber pines are intermingled with the lodge-pole pines. Beautiful intermontane meadows where numerous grasses and sedges carpet the ground, and saxifrages, valerians, cinquefoils, senecios, orchises, betonies, gentians, grass of Parnassus and many other brilliant flowers blossom during the summer are interspersed with the rocky forest-clad ridges, while the banks of many pools, lakes and streams abound- in water-lilies, buttercups, cresses, reeds and rushes. A few salt-loving plants grow about the hot springs and geysers, while in the hot waters issuing from them an interesting series of low plant forms is found.

The native fauna of the park area has been jealously guarded and preserved. Many elk and deer, a few antelope, bison, moose and mountain sheep; bears, foxes, coyotes, even wolves, lynxes and panthers; many species of squirrels, ground squirrels, mice, shrews, gophers, rabbits; the beaver, muskrat, otter, marten, skunk, weasel, badger, wolverene, marmot, mink; and several others less common wander in larger or fewer numbers into or about the park, though most of them may be encountered only in the remoter, less frequently visited, sections of the park. Proportionally as richly numerous and varied as the mammal life, the bird forms include over 200 species, some permanently resident, many only migrant. The streams are well stocked with fish, particularly trout, of which the native redthroat (*Salmo clarkii*) is one of the gamest and most eagerly sought.

Perhaps the most amazing spectacle of the park is its display of over 100 geysers and 4,000 hot springs. The geysers are concentrated in three adjoining groups upon the middle-west side, but hot springs occur everywhere at widely separated points, one steam jet even issuing from the Grand Canyon depths, more than 1,000 ft. below the rim. The most famous geyser is Old Faithful, which may be taken as typical. The regularity of its eruptions, the violence of its explosions, and the grace and beauty of its water column make it one of the most admired of the park geysers. The interval between eruptions averages 65 minutes, the period of eruption lasts 43 minutes, and it throws into the air a column of water from 95 to 130 ft. in height. The Excelsior geyser, which ceased erupting in 1888, hurled aloft a greater volume of water with appalling fury of action. The Giantess geyser, when in action, is far more powerful than Old Faithful, but plays with less regularity, with intervals of nearly three weeks' duration. Another titanic geyser unexpectedly broke forth in 1928 with furious activity. It hurls water in all directions, some columns to a height of 100 feet. Two major eruptions every 24 hours form its schedule, each eruption lasting for three hours or more, with outbursts at 1½ to 20 second intervals.

The Grand Canyon of the Yellowstone is also one of the truly wonderful features of the park. It is a magnificent and picturesque gorge penetrating deep into the volcanic rocks of the park plateau. It presents on a grand scale a remarkable picture of recent canyon cutting by the Yellowstone river, which, leaving Yellowstone lake at its broad outlet, flows northward through an open valley for about 1½ m. and then plunges by two impressive falls, respectively 110 and 312 ft. in height, into the Grand Canyon. The walls of the canyon rise abruptly 800 to 1,100 ft. above the rushing turbulent stream which cuts the gorge. Much of the exquisite beauty and impressive grandeur of the region comes from the brilliantly-coloured canyon walls, with their bizarre bands and stripes of soft pink and salmon to blazing Indian red, deep orange in masses, and yellow and green blotches all gayly intermingled. Yellowstone lake is large—20 m. north to south, and 15 m. east to west—irregular in outline, and wooded to the water's edge.

The first recorded visit to Yellowstone Park was made by John Colter in 1810 when he took refuge there from hostile Indians. His story was wholly discredited, as was the story of the next visitor, Joseph Meek, a trapper who visited the region in 1829. The first description of the Firehole geyser basin was written by Warren Angus Ferres, a clerk in the American Fur Company, between 1830 and 1840, but not until 1852 was the region defined and described in its entirety by Father De Smet, the famous Jesuit missionary, who derived his information from the noted Indian scout and frontiersman, Jim Bridger. The first Government,



THE YELLOWSTONE TRAIL

expedition sent out in 1859 under the command of Capt. W. F. Reynolds, brought bark little authentic information regarding the section, and the reports of private explorers were discredited. Finally the well-equipped expedition under Henry D. Washburn and N. P. Langford, in 1870, established the facts and led to the creation of the Yellowstone National Park.

YELLOWSTONE TRAIL, an American highway leading from Plymouth Rock, on the Atlantic, to Seattle, on Puget sound. It is 3,400 m. long. The roadway is paved or hard from Plymouth to Oshkosh, and improved over most of the rest, with some hard surfacing and pavement to the Pacific. This highway is one of the finest across the United States. It touches Albany and Buffalo, N.Y., Cleveland, O., Chicago, Ill., St. Paul, Minn., Selby, S.D., Butte, Mont., and Spokane, Wash.

YELLOW-THROAT, the name given to a species, with several sub-species, of North American birds of the Passerine family Mniotiltidae, the American wood warblers. The best known is the Maryland yellow-throat *(Geothlypis trichas)* which ranges over the greater part of the United States and southern Canada. About 5 in. long, this bird is olive green above, yellow below; with black forehead and cheeks in the male. Its sub-species the tule yellow-throat *(G. t. scirpicola)* is resident in southern California. The western yellow-throat (G. *t. occidentalis*) is found in south-eastern California and south-western Arizona.

YELLOWWOOD, AMERICAN (*Cladrastis lutea*), a handsome North American tree of the family Leguminosae, called also yellowlocust, gopherwood and virgilia. Though somewhat rare in the wild state, being found only locally in rich soils, chiefly along mountain streams, from North Carolina to Missouri, it is widely cultivated for ornament. It has a short trunk branching into a graceful crown, sometimes rising 50 ft. high, with smooth bark, pinnate leaves, and fragrant, pea-like, white flowers, 1 in. long, borne in loose, drooping clusters, 10 in. to 20 in. long, blossoming in June. The hard strong wood yields a yellow dye.

YEMEN *(Yanzan),* an extensive region forming the south-western portion of Arabia. The limits of power exercised by the various rulers are not clearly defined, but Yemen includes the province of Asir and reaches in the north towards the Hejaz and the Nejd. On the east its limits merge with the desert, while on the south they abut on Hadhramaut. Yemen may be looked upon as possessing three centres: the British protectorate of Aden (*q.v.*) in the south; the domains of the Imam Yahya, whose capital is Sana (*q.v.*) and those of the Idrisi Seyyid Ali Mohammed, whose capital is Sabia (170° 11′ N., 42° 37′ E.), and whose influence stretches down the coast to Hodeida (*q.v.*).

The Imam Yahya is Imam of Yemen proper, and his lands include those abandoned by the Turkish power in 1918 and consequently the limits of his power are in line with those of the Anglo-Turkish boundary of 1902–4 He governs an area of some 75,000 sq.m., with a population between 2,000,000 and 3,000,000.

Ptolemy and the ancient geographers in general include the whole peninsula under the name of Arabia Felix (εὐδαίμων), in which sense they translate the Arabic *Yemen,* literally "right hand." for all Arabia south of the Gulf of Aaaba was to the right from their standpoint of Alexandria; the Mohammedan geographers, however, viewing it from Mecca, confine the term to the regions south of Hejaz, including Asir, Hadhramaut, Oman and part of southern Nejd. Yemen occupies the uptilted edge of a block of ancient land forming Arabia.

The uptilted edge of the old block is known as the Jibal or highlands of Yemen, with an average height of 9,000 ft., though many summits exceed 10,000 ft, *e.g.,* Jebel Manar (10,565 ft.).

The principal town of the Jibal is Ta'iz (pop. about 4,000). It was formerly a large city, and from its position in the centre of a comparatively fertile district at the junction of several trade routes it must always be important. Some 30 m. further north are the small towns of Ibb (6,700 ft.) and Jibla, about 3 m. apart, typical hill towns with their high stone-built houses and paved streets. Manākha produces the best coffee in Yemen. Another group of hill towns lies still further north in the mountain mass between the Wadi Maur and Wadi La'a, where the strongholds of Dhāfir, Afār, Haja and Kaurkabān have long been known for their independence. The last-named was once a city of 20,000 inhabitants, and the capital of a small principality which preserved its independence during the earlier Turkish occupation between 1536 and 1630. The lowland strip of Yemen is known as the Tehama and is hot and generally sterile. The lowland strip is from 20 to 30 m. wide. There are oases, however, near the foot of the mountains, fertilized and irrigated by hill streams and supporting many large villages and towns. The most important of these are Abu Arish, Bet el Fakih and Zubed in the western Tehama, the latter a town of 20,000 inhabitants. Hodeida (*q.v.*) and Aden (*q.v.*) are the only ports of commercial importance, while Mokha is the old centre of the coffee trade. Beyond the crest of the uptilted edge of the old block stretches the third natural region of Yemen — the great desert. As it lies entirely to the east of the high crest, it has a smaller rainfall than the Jibal. Its general character is that of a steppe increasing in aridity towards the east where it merges in the desert, but broken in places by rocky ranges, some of which rise 2,000 ft. above the general level, and which in the Hamdan district north of Sana show evidence of volcanic action. It is intersected by several *wadi* systems, of which the principal are those in the north uniting to form the Wadi Nejrān, in the centre the Wadi Khārid and Shibwān running to the Jauf, and in the south the Wadi Bana and its affluents draining to the Gulf of Aden. The plateau has a gradual fall from the watershed near Yarim, 8,500 ft. above sea-level, to less than 4,000 ft. at the edge of the desert.

The northern part nearly down to the latitude of Sana, is the territory of the Hāshid and Bakil tribes, which never submitted to the Turks. Sa'da is an important town on the old pilgrim road

120 m. N. of Sana, Khaiwan and Khamr. In the north-east, bordering on the desert, is the district of Nejrān, a mountainous country with several fertile valleys including the Wadi Nejrān, Bedr and Habuna, all probably draining north-east to the Wadi Dāwasir. Further south is the oasis of Jauf, a hollow or depression, as its name signifies, containing many villages. It was the focus of the old Minaean and Sabaean kingdoms, known to the ancients through their control of the frankincense trade of south Arabia. Ma'in, identified by Halévy as the seat of the former, is on a hilltop surrounded by walls still well preserved. Mārib, the Sabaean capital, was celebrated for its great dam. The city was abandoned, probably owing to the deterioration of the country through desiccation, which has forced the settled population farther westward, where Sana became the centre of the later Himyaritic kingdom. The Arhab district drained by the Wadi Khārid and Shibwān between Sana and the Jauf is covered with Himyaritic ruins, showing that the land formerly supported a large settled population where, owing to the want of water, cultivation is now impossible. Throughout the whole of Yemen is found the *majil*—a cemented well for the storing of water. These wells have associations with Persian influence in the 6th century A.D.

South of the territory described above are Amran and Shibān on the road leading north from the capital Sana; Dhamar (the seat of an ancient university) and Yarirn are on the road leading south to Aden; and two days' journey to the east is Rada.

The inhabitants of Yemen are settled, and for the most part occupied in agriculture and trade, the conditions which favour the pastoral or Bedouin type found in Hejaz and Nejd hardly existing. The people may be considered under four groups: (1) The Seyyids or Ashrāf, descendants of the prophet, forming a religious aristocracy; (2) the Kabail, or tribesmen, belonging to the Kahtanic or original south Arabian stock, who form the bulk of the population; (3) the trading class, and (4) a mixed group mostly of African descent and including a number of Jews.

In September 1934, in the Treaty between Britain with India, and the Yemen, The Zaidi Imam Yahya ben Muhammed ben Hamid ed Din was acknowledged "King." During the Abyssinian War (1936) Britain made it clear that the Yemen was within the British sphere.

YEN. The monetary unit of Japan. It is divided into 100 sen, each of 10 rin. The yen was legally based on the gold standard in 1897 at a value of ·75 gramme of fine gold. This gave it a mint par of exchange with England of 2s. 0½d. per yen, and with the United States of 49.846 cents per yen. This standard was maintained until the late twenties, when the world-wide financial crisis forced depreciation.

The following table shows, during the post-war period, the changes in the internal purchasing power of the yen, and also its rate of exchange upon New York, this last figure being a measurement of the yen in terms of American cents.

Year	Wholesale price index number	Exchange rate on New York
1920	(July, 1914=100) 273	49·19
1922	,, 206	48·00
1924	,, 217	43·37
1926	,, 188	45·95
1929	(Mar. 1929=100) 100	46·10
1930	86·6	49·10
1932	70·1	28·11
1934	78·2	29·72

During the World War, the yen was maintained at or above parity with the dollar, and at the armistice was consequently in a strong position. Nevertheless, Japan was affected by the world-wide trade boom and currency depreciation, rampant in 1919 and early 1920, and the yen depreciated both internally and against the dollar. It was in Japan that the boom first broke. right at the beginning of 1920, and as for a time the fall in prices (*i.e.,* the recovery in internal purchasing power) in Japan preceded similar movements elsewhere, the strength of the yen on the foreign exchange markets was well maintained. On the other hand the trade depression of 1921 was particularly severe in Japan.

The slow progress towards recovery was interrupted by the earthquake in 1923. The gold standard had to be temporarily abandoned in order to ease the strain on the exchange occasioned by the heavy demands for imports. Prodigious efforts to rehabilitate the yen were checked in 1927 by a series of bank failures. The government, and the Bank of Japan, in undertaking their rescue, were persuaded to postpone the effort to restore the yen to parity. Faced with the necessity of maintaining its foreign trade during world depression the government finally abandoned the gold standard in Dec. 1931 and proceeded in the next two years to reap the profits from yen depreciation. Although the yen was pegged at its reduced value late in 1932 the subsequent decline of sterling brought the yen still lower so that by March 1934 it had lost 64% of its old gold parity. In Dec. 1935 it stood at 28·80 in U.S.A. cents. The high centralization of the banking system in Japan has enabled the government to intercept the profits of currency depreciation by means of its borrowing programme, largely engineered by the Bank of Japan and the Treasury Deposit Bureau. (N. E. C.)

YENISEI (from a Tungus word meaning Great River), a river of Asiatic Russia, rising in Mongolia and flowing into the Arctic Ocean, having a total length of 2,700 m. and a basin extending over a million square miles. It marks a structural boundary of great antiquity in the history of the continent. The western plain, extending from the Urals and covered by quaternary alluvial deposits, with a few isolated remnants of friable Tertiary sandstones, forms, apart from the smaller rivers of the Arctic tundra, a catchment area for the Ob. Near the left bank of the Yenisei there is a slight rise in the plain which deflects a few short tributaries to the Yenisei, but most of its drainage area lies to the right, on the ancient plateau remnant of Angara land, the middle of which forms a watershed, with drainage either to the Arctic, or to the east and west. Thus the Yenisei and the Lena are marginal rivers of an ancient block. Contrasts between the land to the west and that to the east of the Yenisei, north of Krasnoyarsk, are sharp, orographically, geologically, in soil formation and in climate, the winter isotherms curving southward on the higher land. The effects are that the plateau population is scanty, and that the limit of possible cultivation, which from the Urals to long. 50° E. remains considerably north of lat. 60° N., on the plateau lies considerably farther south. North of the Arctic circle, the difference disappears, the whole region being tundra.

Towards the south the plain forms an amphitheatre west of Lake Baikal; within it lie the courses of the Angara, the Stony or Middle Tunguska, the upper courses of the Lower Tunguska and of the Lena. It is bounded by the Archaean masses on the Middle Yenisei, cut off by a fracture along the river between the confluences of the Angara and the Stony Tunguska, and by the pre-Cambrian fold mountains to the south. Bogdanovich supposes that a great inland lake existed in the amphitheatre during the Angara epoch of the Mesozoic. The Yenisei is thus a mountain river of composite character. In Chinese Mongolia it flows through a longitudinal valley at the northern foot of the Tannu-ola; it then cuts through the western Sayan mountains and passes through portions of successive transverse valleys to Krasnoyarsk and its confluence with the Angara. It then flows along the western base of the Archaean range and finally enters the most north-westerly part of the Palaeozoic plateau. The Yenisei is formed by the junction of the Bei-kem and Chua-Kem streams in the Uryankhansk district of Chinese Mongolia, and is known as the Ulukem or Upper Yenisei. It receives the Kemchik river on the left and the town of Kemchik at the junction is much visited by Russian traders, who also have quarters in Krasniy at the junction of the Bei-kem and Chua-kem (or Little Yenisei).

After crossing the frontier it receives the Us on the right bank and there is a Russian settlement at Usinskoe. Eighty-two miles

north of the frontier are formidable rapids, the limit of raft navigation. This part of its course is through coniferous mountain forest, with some meadow land along the banks. Gold, asbestos, salt, coal, magnesia and iron occur in the mountains, but are little worked; the inhabitants are mainly nomad Finno-Tatar hunters, though Russian colonization is slowly spreading. The river now enters a prairie region, with the Abakan draining it on the left and the Tuba on the right. Minusinsk (*q.v.*) lies 8 m. from the confluence of the Abakan and Yenisei; and the Minusinsk black earth region, sheltered by the West Sayan mountains, the Siberian Urals and the Abakan range, is noted for its fertility and its mild climate and has been settled from prehistoric times. Gold and coal are found. Iron is found on the Irba, a tributary of the Tuba. At Novo-Selovsk 55° 5′ N., 91° 16′ E., the Chulim, a tributary of the Ob is only 6 m. distant, but canalization is impracticable owing to difference of level. At Krasnoyarsk (*q.v.*) the railway crosses the river, which here flows through a plain with mountains to the south and west, whose red sandstone and marl have given Krasnoyarsk its name.

South of the Pit mountains (the northern limit of corn growing land), the Angara or Upper Tunguska enters the Yenisei, after flowing 1,100 m. from Lake Baikal. The Selenga and the Angara were probably once united and Lake Baikal is of later formation. A rich gold-bearing region extends from the Angara to the Stony Tunguska, and the Pit enters the Yenisei on the right in this district. The Stony Tunguska, 1,000 m. long, is almost uninhabited, and here the deciduous forest merges into the coniferous. From the Stony Tunguska to Turukhansk is dense coniferous forest, with a few settlements on the right bank mainly. The Bakhta, north of the Stony Tunguska, flows through a marshy, uninhabited country. Above the confluence of the Stony Tunguska, the Yenisei broadens and reefs of rock known as the "Seventy Islands" rise above its waters.

The Lower Tunguska, 2,000 m. long, rising in lat. 57° N., 20 m. from the Lena, winds through a marshy forest country, with no settlements except in its upper course, where the villages are linked with the easily reached Lena. Coal, graphite and asbestos exist, but are not worked. The Turukhan enters from the left and is used by the Samoyedes to link with the Taz. The town of Turukhan, 10 m. from the Yenisei on the delta of the Turukhan, is now derelict and Monastir Turukhan (Troitskoe Monastir) on the right bank has replaced it. The Kureika river enters from the left and is linked with Obdorsk by a western track. There is unworked graphite in the Kureika valley. In lat. 69°–70° N., the scattered larches and birches give way to treeless tundra. There is a Russian trading settlement at Dudinsk, at the confluence of the Dudina and 60 m. E. coal of good quality is found in the Novil mountains, and platinum is reported. A scattered population, descendants of Russian exiles and natives, extends from Dudinsk to the Khatanga river. The Yenisei delta and gulf are not fully explored. The west is low and marshy and the east steep. Fish abound and native fishermen migrate north in summer. Golchikha, a Samoyede village on an island in the delta in 71° 45′ N., 84° E., has steamer communication with Krasnoyarsk and Minusinsk, fish and fur going upstream and corn, meat and manufactured goods downstream. Yenisei navigation is less important than that of the Ob, owing to the scantier population and more difficult environment. In winter the frozen river serves as a good road. At the delta the river is usually frozen from Oct. 30 to June 23; at Turukhansk, from Nov. 11 to June 8, at Krasnoyarsk from Dec. 5 to May 12; and at Minusinsk from Nov. 29 to May 11. There are floods in mid-May and mid-June, and huge blocks of ice collect in and near the mouth after the thaws.

Exploration and Settlement. — The Yenisei was first reached by Cossack bands in 1618 to 1620, who came from the Ob via the portage between the Ket tributary of that river and the Kaz tributary of the Yenisei which is now linked by canal. They met with much opposition from the Tungus and Buriat tribes and it was not till 1648 that the Russians penetrated to Lake Baikal via the Angara river. The exploration of the delta was much delayed, for though English and Russian navigators visited the Kara Sea in the 16th century, the upper course of the river, 6 m. wide near the delta, and with a delta opening into a gulf 40 m. wide, presents great difficulties when the warmer waters from the south undermine the ice and huge ice floes swell up and burst away, forming ice hills sometimes 50 to 60 ft. high on the banks, while the pack ice blocks on the current travel northwards at 20 m. an hour, crashing against one another with deafening reverberations.

After 1853, a wealthy Siberian, Sidoroff, agitated for 20 years to establish links between Europe and the mouths of the Arctic rivers of Siberia and in 1874 an English vessel reached the mouth of the Ob, while Nordenskjold, the famous Swedish explorer, in 1875 entered the mouth of the Yenisei. In 1876 an English vessel reached Kureika on the Yenisei and in the following year Sidoroff reached the delta from Yeniseisk, and sailed to Leningrad. In 1878, the *Fraser* and Express, two ships of Nordenskjöld's "Vega" expedition ascended the Yenisei. A company was formed to establish trade via this route, but was unsuccessful and was dissolved in 1900. The project is now being revived and in 1928 a Kara Sea expedition, consisting of three British and five Norwegian vessels, set out from Hamburg on Aug. 1, sailing via the North Sea, Barents sea, through the Novaya Zemlya islands and the Kara sea to the mouths of the Ob and Yenisei, taking 15,000 tons of agricultural machinery, metals, drugs and coal, to exchange for timber, flax, cow-wool, hides and horsehair, brought down the rivers on barges towed by steamers.

BIBLIOGRAPHY.—Nordenskjöld, *The* Voyage *of the Vega,* 1881; P. Kropotkin, *Orographie de* la *Sibérie* (1905); Suess, *The Face* of *the* Earth, vol. III. (1908), with references to Russian articles, esp. by Obruchev; E. Argand, La *Tectonique de l'Asie* (1922, publ. 1924).

YENISEISK, a town in the Siberian area of the Russian S.F.S.R., in 58° 39′ N., 92° 4′ E., on the right bank of the Yenisei river at an altitude of 285 ft. It is a centre for fur trading and gold mining; pop. (1926) 5,957, about 50% of that in 1913. There is not much wharf accommodation, though there is regular steamer connection to Krasnoyarsk. The river at Yeniseisk is a mile wide and navigation opens about May 19 and closes about Dec. 1. The town was founded in 1618.

YEOMAN, a term meaning, first, a class of holders of land and second, a retainer, guard, attendant or subordinate official. The word appears in M.E. as *3eman, 3oman* and *yeman;* it does not appear in O.E. It is generally accepted that the first part is the same word as the Ger. Gau, district, province, and probably occurs in O.E. as *géa* in *Súðri-géa,* Surrey; *i.e.,* southern district, and other place-names. "Yeoman" thus meant a country-man, a man of the district, and it is this sense which has survived in the special use of the word for a class of landholders.

The extent of the class covered by the word "yeoman" in England has never been very exactly defined. One of the earliest pictures of a yeoman is that given by Chaucer in the Prologue to the Canterbury Tales. Here, represented as a forester, he follows the esquire as a retainer or dependant. The yeomen of later ages, however, are practically all occupied in cultivating the land, although, doubtless from its younger sons, the class furnished retainers for the great lords, men-at-arms and archers for the wars, and tradesmen for the towns. Medley (Eng. *Const. Hist.*) describes the yeomen of the 15th century as representing on the whole "the small freeholders of the feudal manor." Holinshed, in his Chronicle, following Sir T. Smyth (De *republica* Anglorum), and W. Harrison (Description of England), describes them as having free land worth £6 annually, and in times past 40s., and as not entitled to bear arms. They formed the intermediate class between the gentry and the labourers and artisans.

YEOMANRY, the name given to the volunteer mounted troops of the home defence army of Great Britain, ever since their original formation; it indicated that recruiting, organization and command were upon a county basis, the county gentlemen officering the force, the farmers and yeomen serving in its ranks, and all alike providing their own horses. Although the yeomanry was created in 1761, it was not organized until 1794. Under the stimulus of the French War recruiting was easy, and 5,000 men were quickly enrolled. A little later, when more cavalry were needed, the Provisional Cavalry Act was passed, whereby a sort of revived knight-service was established, every owner of ten

horses having to find and equip a horseman, and all who owned fewer than ten, grouped by tens of horses, similarly finding one. A great stimulus to yeomanry recruiting was given by an amending act which was soon passed by which yeomanry cavalry could be substituted for provisional cavalry in the county quota. At the peace of Amiens, the yeomanry was retained, although the provisional cavalry was disbanded. There was thus a nucleus for expansion when Napoleon's threatened invasion (1803–5) called out the defensive powers of the country, and as early as December 1803 there were in England, Scotland and Ireland, 44,000 yeomen. At the same time the limitations as to place of service in Great Britain were abolished.

From the extinction of Chartism to the South African War the history of the yeomanry is uneventful. The strength of the force gradually sank to 10,000. But when it became apparent that mounted troops would play a decisive part in the war against the Boers, the yeomanry again came to the front. Of its 10,000 serving officers and men, 3,000 went to South Africa in newly formed battalions of "Imperial Yeomanry," armed and organized purely as mounted rifles, and to these were added over 32,000 fresh men, for whom the yeomanry organization provided the cadres and training. In 1901 the yeomanry was remodelled; the strength of regiments was equalized on a four squadron basis, fresh regiments were formed and the strength of the force was more than trebled. In 1907 the yeomanry became part of the new Territorial Force.

At the outbreak of the World War in 1914, 53 regiments of yeomanry mobilized. The first to see active service was the Oxfordshire Yeomanry who accompanied the Royal Naval Division in the Antwerp campaign, but it was not until the spring of 1915 that the employment of yeomanry was seen on any considerable scale. In France four regiments of yeomanry were brigaded with regular cavalry in the cavalry corps and proved in every way worthy of this distinction.

Only in the Palestine campaign was opportunity found for the successful employment of large cavalry formations. Fourteen regiments of yeomanry, nine of which had formed part of an improvised dismounted force in Gallipoli, served in the various divisions of the Desert Mounted Corps and contributed very materially to Allenby's success. The actions of Huj and El Mughar following the third battle of Gaza, both executed entirely by yeomanry, provided classic examples of the employment of the mounted attack in mobile warfare. In the spring of 1918 eight of these regiments were grouped into machine gun battalions and sent to France.

One complete infantry division, the 74th, was formed in Palestine in early 1917 entirely from 18 yeomanry regiments, 12 of which had previously seen service in Gallipoli; it was first engaged as a division at the second battle of Gaza, served with considerable distinction till after the capture of Jerusalem and in the spring of 1918 was sent to France and Flanders. The Scottish Horse and Lovat's Scouts Brigade served as infantry in Gallipoli, Macedonia and France and Flanders. The remaining yeomanry regiments were employed as divisional cavalry.

After 1918 much attention was given to the territorial force, and on its reconstruction in 1920 (see TERRITORIAL ARMY) the greater portion of the yeomanry was mechanized. Of the 53 regiments, 25 were converted into units of the Royal Artillery, and 8 into Armoured Car companies of the Royal Tank Corps; one became a regiment of Cavalry Divisional Signals, and another an infantry regiment; while the 1st and 2nd Lovat's Scouts and the Scottish Horse with 14 other regiments were retained for their original purposes. This was the position when the territorials were merged into the regular army in September 1939. (E.F.LA.;X.)

YEOMEN OF THE GUARD, originally "Yeomen of the Guard of (the body of) our Lord the King"—"Valecti garde (corporis) domini Regis"—the title maintained with but a slight variation since their institution in 1485, of a permanent military corps in attendance on the sovereign of England, as part of the royal household, whose duties, now purely ceremonial, were originally those of the sovereign's personal bodyguard. They are the oldest existing body of the kind. The first warrants to individual "Yeomen of the Guard" date from Sept. 16, 1485, immediately after the victory of Henry VII. at Bosworth (Aug. 22.).

The first official recorded appearance of the king's bodyguard of the Yeomen of the Guard was at the coronation of its founder Henry VII. at Westminster Abbey on Oct. 31, 1485, when it numbered 50 members. That number was rapidly increased, for there is an authentic roll of 126 attending the king's funeral in 1509. Henry VIII. raised the strength of the Guard to 600 when he took it to visit Francis I. of France at the Field of the Cloth of Gold (*q.v.*). In Queen Elizabeth's reign it numbered 200. The corps was originally officered by a captain (a post long associated with that of vice-chamberlain), an ensign (or standard-bearer), a clerk of the cheque (or chequer roll, his duty being to keep the roll of every one connected with the household), besides petty officers, captains, sergeants or ushers. In 1669 Charles II. reorganized the Guard and gave it a fixed establishment of 100 yeomen, officered by a captain, a lieutenant, an ensign, a clerk of the cheque and four corporals, which is the present organization and strength. The captaincy is now a ministerial appointment filled by a nobleman of distinction under the lord chamberlain, and the old rank of "corporals" has been changed to "exon," a title derived from "exempt," *i.e.,* exempted from regular regimental duty for employment on the staff. Formerly officers on the active list were given these appointments in addition to their own.

The original duties of the Guard were of the most comprehensive nature. They were the king's personal attendants day and night at home and abroad. They were responsible for his safety not only on journeys and on the battlefield, but also within the precincts of the palace itself. In Tudor times the Yeomen of the Guard alone were entrusted with the elaborate formality of making the king's bed. Another of their duties still retained is the searching of the vaults of the houses of parliament at the opening of each session, dating from the "Gunpowder plot," in 1605, when the Yeomen of the Guard seized Guy Fawkes and his fellow-traitors and conveyed them to the Tower.

The dress worn by the Yeomen of the Guard is in its most striking characteristics the same as it was in Tudor times. It has consisted from the first of a royal red tunic with purple facings and stripes and gold lace ornaments. Sometimes the sleeves have been fuller and the skirts longer. Red knee-breeches and red stockings (white in Georgian period only), flat hat, and black shoes with red, white, and blue rosettes are worn. Queen Elizabeth added the ruff. The Stuarts replaced the ruff and round hats with fancy lace and plumed hats. Queen Anne discarded both the ruff and the lace. The Georges reintroduced the ruff, and it has ever since been part of the permanent dress. Up to 1830 the officers of the Guard wore the same Tudor dress as the non-commissioned officers and men, but under William IV. the officers were given the dress of a field officer of the Peninsular period. The weapons of the Guard are a steel gilt halberd with a tassel of red and gold and an ornamental sword.

The real fighting days of the Guard ended with the Tudor period, but it was only with the final appearance of an English King in battle (Dettingen 1743) that the Guard's function of attending a sovereign on the battlefield ceased. For a brief period during the Georgian era the Guard lost to a certain extent its distinctive military character and a custom crept in of filling vacancies with civilians, who bought their places for considerable sums, the appointments being of great value. William IV. put a stop to the practice, the last civilian retired in 1848, and the Guard regained its original military character. Every officer (except the captain), non-commissioned officer, and yeoman must have served in the Home or Indian army or Royal Marines. They are selected for distinguished conduct in the field, and their pay is looked upon as a pension.

The nickname "Beef-eaters," which is sometimes associated with the Yeomen of the Guard, had its origin in 1669, when Count Cosimo, grand duke of Tuscany, was in England, and, writing of the size and stature of this magnificent Guard, said, "They are great eaters of beef, of which a very large ration is given them daily at the court, and they might be called 'Beef-eaters.' "

In 1509, Henry VIII., envying the magnificence of the body-guard of Francis I. of France, decided to have a noble guard of his own, which he accordingly instituted and called "The Gentlemen Speers." It was composed of young nobles gorgeously attired. In 1539 the guard was reorganized and called "Gentlemen Pensioners," That title it retained till William IV.'s reign, when the corps regained its military character and received their present designation, "The Honourable Corps of Gentlemen-at-Arms."

See *The* History of *the* King's Body Guard of *the Yeomen* of *the* Guard, by Colonel Sir Reginald Hennell, D.S.O., Lieutenant of the Yeomen of the Guard (1904).

YEOTMAL, a town and district of India in Berar. It stands on an elevated plain at about 1,400 feet. The population in 1931 was 20,967. It was formerly the headquarters of the Wun district but in 1905 the new district of Yeotmal was established, the old Wun district being renamed with additions from the district of Basim. Cotton ginning and pressing are the main industries. The town is also the chief trading centre of the district, being connected by a road, 29 miles long, with Dhamangaon on the G.I.P. railway, while a narrow gauge line recently constructed connects it through Darhwa and Karinja with Murtizapur on the main G.I.P. line.

The DISTRICT OF YEOTMAL has an area of 5,219 square miles. Yeotmal is a large cotton producing district, but its upland is less fertile than the average of Berar. The greater part of the district is drained by the Penganga River, which joins the Wardha in the south-east corner. There are large forest reserves in the south and south-east'in which game abounds. There is a considerable aboriginal element of Gonds and Kalams in the wilder portions. The 1931 population was 857,288. There is coal at Pisgaon in the Wun *taluq* near the Wardha River. The climate in the uplands is cool and the rainfall (41″) plentiful.

YEOVIL, a market town and municipal borough in the Yeovil parliamentary division of Somersetshire, England, on the G.W. and S. railways, 127 mi. S.W. of London. Pop. (1938) 20,110. Area 3.5 sq.mi. The town lies on the river Yeo, and is a thriving place, with a few old houses. The town is famous for its manufacture of gloves (dating from 1565). It has also brick works, a brewery, and large engineering works. Its agricultural trade is considerable. Yeovil (Gyoele, *Evill, Ivle,* Yeoele) before the Conquest was part of the private domains of the Anglo-Saxon kings.

YERBA BUENA (*Micromeria* chamissonis). a pleasantly aromatic North American herb of the mint family (Labiatae. *q.v.*), found in woods from British Columbia to southern California. It is a slender perennial, with trailing stems ¼ ft. to 2 ft in length, roundish, short-stalked leaves, ½ in. to 1 in. broad, and delicate, two-lipped, white flowers, borne on hair-like stalks usually singly in the leaf-axils. Medicinal properties were ascribed to it

YERBA MANSA (*Anemopsis californica*), a North American herb of the lizard's-tail family (Saururaceae), found in wet saline places from western Texas to central California and southward to Mexico. It is a perennial with upright stems, ¼ ft. to 2 ft. high, springing from aromatic, creeping rootstalks, and astringent, slightly spicy foliage. The flowers are borne in terminal spikes, ½ in. to 1½ in. long, surrounded at the base by a circle of conspicuous white bracts; the fruit is a capsule, splitting open from the top. The Spanish-Californians used the plant medicinally.

YERBA MATE: see MATÉ.

YERBA SANTA (*Eriodictyon californicum*), a North American balsamic shrub of the water-leaf family (Hydrophyllaceae), native to dry slopes and mountain ridges from south central California to southern Oregon. It grows from 2 ft. to 8 ft. high, bearing narrowly lanceolate leaves, which are very glutinous-resinous above and densely white-woolly below, and bluish or white flowers in loose clusters The Indians and early Spanish settlers made extensive medicinal use of the bitter-aromatic leaves; the Indians also chewed and smoked them.

YERSIN, ALEXANDRE EMILE JOHN (1863–1943), Swiss bacteriologist, was born at Rougemont, Switzerland, on Sept. 22, 1863. and studied at Lausanne, Marburg and Paris. He was associated with Roux in his researches on the diphtheria serum at the Pasteur institute, and then continued his researches in China and Indo-China, where he explored the Mois country. He introduced the culture of rubber into Indo-China. The plague bacillus was discovered by him in Hongkong in 1894, Kitasato simultaneously making the same discovery. The next year Yersin prepared a serum to combat the disease. Under the auspices of the Chinese government a branch of the Pasteur institute was founded by him at Canton. Yersin established a similar institution at Nha Nang, Annam, in the same year, of which he became director. Yersin was awarded le grand prix Leconte by the Paris Académie des Sciences in 1927. He died in Indo-China. March 2, 1943.

YEW (*Taxus* baccata), a tree which belongs to the family Taxaceae (see GYMNOSPERMS), in which the ordinarily woody

FROM COOPER AND WESTALL, "TREES AND SHRUBS OF THE BRITISH EMPIRE" (J. M. DENT & SONS, LTD.)

YEW (TAXUS BACCATA), TWIGS WITH (A) STAMINATE AND (B) CARPELLATE FLOWERS

cone of the pines and spruces is represented by a single seed surrounded by a fleshy berry-like cup. Usually it forms a low-growing evergreen tree of very diverse habit, but generally with dense spreading branches, thickly covered with very dark green linear leaves, which are given off from all sides of the branch, but which, owing to a twist in the base of the leaf, become arranged in two ranks.

The trees are usually dioecious, the staminate flowers being borne on one individual and the carpellate on another. The staminate and the carpellate flowers are placed each separately in the axil of a leaf, and consist of a number of overlapping scales. In the carpellate flower these scales surround a cup which is at first shallow, green and thin (the so-called aril), but which subsequently becomes fleshy and red, while it increases so much in length as almost entirely to conceal the single straight seed. It is clear that the structure of the carpellate flower differs from that of most conifers, from which it is separated in a distinct family, Taxaceae.

The poisonous properties, referred to by classical writers such as Caesar, Virgil and Livy, reside chiefly if not entirely in the foliage. This, if eaten by horses or cattle, especially when it has been cut and thrown in heaps so as to undergo a process of fermentation, is very injurious. As a timber tree the yew is used for cabinet-work and axle-trees, where strength and durability are required. It was once largely used for the English long-bow.

The European yew, T. baccata, is a native of Europe, north Africa, and Asia as far as the Himalayas and the Amur region. The yew is wild in Great Britain, forming a characteristic feature of the chalk downs of the southern counties and of the vegetation of parts of the Lake District and elsewhere. The evidence of fossil remains, antiquities and place-names indicates that it was formerly more widely spread in Europe than at the present day. The varie-

ties grown in the United Kingdom are numerous, one of the most striking being that known as the Irish yew—a shrub with the pyramidal or columnar habit of a cypress.

The yew is a favourite evergreen tree, either for planting separately or for hedges, for which its dense foliage renders it well suited. Its dense growth when pruned has led to its extensive use in topiary work, which was introduced by John Evelyn and became very prevalent at about the beginning of the 18th century.

In the United States and Canada the best known native yews are the American yew or ground-hemlock (T. *canadensis*), a low, straggling shrub rarely over 5 ft. high, found in woods from Newfoundland to Manitoba and southward to Virginia and Iowa, and the western or Pacific yew (T. *brevifolia*), a tree sometimes 50 ft. high, with a trunk diameter of 2 ft., which grows from California to Alaska and eastward to Montana. The hard, heavy, very fine-grained, exceedingly durable wood of the Pacific yew, one of the best woods used by the Indians for making bows, is especially suitable for tool-handles and similar purposes. Two other North American species occur: the Florida yew (*T. floridana*), a rare tree of western Florida, and the Mexican yew (T. *globosa*), found in the mountains of Mexico.

Numerous dwarf forms and leaf-colour variants of the Japanese yew (T. *cuspidata*), a tree sometimes 50 ft. high, native to north-eastern Asia, are planted for ornament.

For further details *see* Elwes and Henry, ***Trees of Great Britain and Ireland*** (1906); *C.* S. Sargent, ***Manual of the Trees of North America*** (1905, new ed. 1933); L. H. Bailey, ***Manual of Cultivated Plants*** (1924); ***G. B.*** Sudworth, "Check List of the Forest Trees of the United States," U.S. ***Dept. Agric. Misc. Cir. 92*** (1927); W. Dallimore and A. B. Jackson, ***Handbook of Coniferae*** (1931).

YEZD, a province and town of Persia. The former is bounded on the west by the province of Isfahan, on the north by Samnan-Damghan, on the east by Khurasan and on the south by Kerman and Fars. Much silk is produced in this district, but not sufficient for the requirements of the looms of Yezd, and quantities are imported from Gilan. Other products are opium, madder, almonds and grain, of which last, however, only one-third of the supply required for local consumption is grown, the surplus requirements being brought from the adjacent province of Khurasan. The eartern part of the province bordering on the Dasht i Lut (desert) is much exposed to moving sands, and cultivation here is very sparse. The revenue of the province amounted in 1926–7 to 2,754,933 krans.

Yezd, the chief town of the province, is situated in 31° 54' N. and 54° 22' E. at an elevation of 4,240 ft., 162 m. S.E. of Isfahan and 192 m. N.W. of Kerman. The population according to one authority was estimated at 60,000 in 1900 while another gives 50,000 only, of whom Zoroastrians or Parsees form a considerable proportion. When the Arabs invaded Persia, the Zoroastrians fled before the persecution of the Muslims towards Yezd and Kerman and they have since remained here. The town, with its narrow, dirty and unpaved streets, is divided into the Shahr i Nau (new town) and Shahr i Kohneh (old), separated by a wall with two gates. There are several mosques, seven colleges and numerous caravanserais. The main building of the old town is the Ark, or citadel, where the governor resides. In the Parsee quarter the streets are wider and cleaner, and the houses better, each having its own garden. The highest and lowest recorded shade temperatures are respectively 106° Fahr. in July and 20° in December. Commercially speaking Yezd occupies an important central position in Persia, whence a number of routes radiate. Passable roads for motors lead to Isfahan and to Kerman, from which latter place Duzdab, at the Indian railhead, and Seistan, are reached by a choice of caravan tracks. There is also an important direct caravan track to Bandar Abbas.

See ***G. N.*** Curzon, ***Persia and the Persian Question*** (1892); ***E.*** G. Browne, ***A year amongst the Persians*** (1893 and 1926); P. M. Sykes, ***Ten thousand miles in Persia*** (1902) and "A Fourth Journey in Persia," *Geogr. J.*, 1902, *XIX.* (P. Z. C.)

YEZIDIS, a religious sect, numbering about 50,000 persons, dwelling chiefly in the neighbourhood of Mosul. Their own name for themselves is Dasni, but they are called by their neighbours Yezidi; the origin of both names is uncertain, but the latter is probably derived from the Persian *Yazdān,* God. Their religion was probably originally an offshoot of Mazdaism, but it has absorbed elements from Christianity and Islam, for they regard Christ as an angel in human form and recognize Muḥammad as a prophet with Abraham and the other prophets, and practise circumcision and baptism. They regard the devil as the creative agent of the Supreme God, and seek to propitiate him as the author of evil; they avoid mentioning his name and represent him by the peacock. Their sacred books have been translated by F. Nau, *Recueil* de textes et de documents sur *les Yézidis* (1918).

YEZO (HOKKAIDO), the most northerly of the five principal islands forming the Japanese empire, the five being Yezo, Hondo, Shikoku, Kyūshu and Formosa. It is situated between 45° 30' and 41° 21' N. and between 146° 7' and 139° 11' E.; its coast-line measures 1,423.32 mi., and it has an area of 30,148.41 sq.mi. On the north it is separated from Sakhalin by Soya Strait (La Pérouse) and on the south from Nippon by Tsugaru Strait. Its northern shores are washed by the Sea of Okhotsk, its southern and eastern by the Pacific Ocean, and its western by the Sea of Japan.

Orography.—The highest mountain in the island is Ishikari-dake (6,955 ft.) and the next in importance is Tokachi-dake (6,541 ft.). Yubari-take in Ishikari has a height of 6,508 ft., and in the province of Kushiro are O-akan-dake (4,470 ft.) and Meakan-take (4,500 ft.). Near Hakodate are two conspicuous volcanic peaks, Komaga-take (3,822 ft.) and Tokatsu-dake (3,800 ft.); and 24 m. from Kushiro (by rail) is a volcano called Atosanobori, or Iwo-zan (sulphur mountain), whence great quantities of first-rate sulphur are exported to the United States. Rishiri, an islet on the extreme N.W., has a peak of the same name rising to 6,400 ft.

Rivers.—Yezo boasts the largest river in the Japanese empire, the Ishikari-gawa, which is estimated to measure 275 m. Its other large rivers are the Teshio-gawa (192 m.), the Tokachi-gawa (120 m.), the Shiribeshi-gawa (88 m.), the Kushiro-gawa (81 m.), the Toshibetsu-gawa (64 m.) and the Yubetsu-gawa (64 m.). The valley of the Ishikari is the most fertile part of the island; the Tokachi is navigable to a point 56 m. from its mouth, but the Teshio has a bar which renders its approach extremely difficult. Nearly all the rivers abound with salmon.

Lakes.—There are no large lakes, the most extensive—Toyako, Shikotsuko and Kushiroko—not having a circumference of more than 25 miles. Lagoons, however, are not uncommon. The largest of these—Saruma-ko in Kitami—is some 17 m. long by 7 wide. It abounds with oysters nearly as large as those for which the much smaller lagoon at Akkeshi is famous, the molluscs measuring about 18 in. in length.

Climate.—The climate differs markedly from that of the main island of Japan, resembling rather the climate of the British Isles, though the winter is longer and more severe, and the atmosphere in the warm season contains a greater quantity of moisture. During five months the country is under snow, its depth averaging about 2 ft. in the regions along the southern coast and more than 6 ft. in the northern and western regions. An ice-drift, setting from the north and working southwards as far as Nemuro, stops all sea trade on the east coast during January, February and March, though the west coast is protected by the warm current of the Kuro-shiwo. Fogs prevail along the east coast during the summer months, and it is not uncommon to find a damp, chilly atmosphere near the sea in July, whereas, a mile inland, the thermometer stands at 80° or go° F in the shade, and magnolia trees are in full blossom.

Fauna.—Tsugaru Strait has been shown to form a line of zoological division. Pheasants and monkeys are not found on the Yezo side of this line, though they abound on Hondo, and, on the other hand, Yezo has grouse and solitary snipe which do not exist in Hondo. The Yezo bear, too, is of a distinct species.

Population.—The island seems to have been originally peopled by a semi-barbarous race of pit-dwellers, whose modern

representatives are to be found in the Kuriles or their neighbours of Kamchatka and Sakhalin. These autochthons were driven out by the Ainu, and the latter, in their turn, succumbed to the Japanese. Yezo and 68 adjacent small islands included in the department of Hokkaido had 2,812,335 people in 1930, largely due to emigration from Japan proper to Yezo. Yezo is divided into ten provinces, the names of which, beginning from the south, are Oshima, Shiribeshi, Ishikari, Teshio, Kitami, Iburi, Hidaka, Tokachi, Kushiro and Nemuro. Of these, Oshima, Shiribeshi and Ishikari are by far the most important. There are only three towns having a large population, viz., Hakodate (197,252), Sapporo (168,576) and Otaru (144,887).

Industries and Products.—Marine products constitute the principal wealth of Yezo. Great quantities of salmon, sardines and codfish are taken. The salmon are salted for export to Nippon and other parts of Japan; the sardines are used as an agricultural fertilizer and the codfish serve for the manufacture of oil. An immense crop of edible seaweed is also gathered and sent to Chinese as well as to Japanese markets. This *kombu,* as it is called, sometimes reaches a length of 90 ft. and a width of 6 in. The herring fishery, too, is a source of wealth, and the canning of Akkeshi oysters as well as of salmon gives employment to many hands. Vast tracts are covered with a luxuriant growth of ash, oak, elm, birch, chestnut and pine, but, owing to difficulties of carriage, this supply of timber has not yet been much utilized.

Communications.—The roads are few and in bad order, but there is a railway which, setting out from Hakodate in the extreme south, runs, via Sapporo and Iwamizawa, to the extreme N. with branches from Iwamizawa, S. to Mororan and E. to Poronai, and from Oiwake N.E. to the Yubari coal-mines. There is also a line W. along the S. coast from Nemuro.

History.—Yezo was not brought under Japan's effective control until mediaeval times. In 1604 the island was granted in fief to Matsumae Yoshihiro, whose ancestor had overrun it, and from the close of the 18th century the east was governed by officials sent by the shôgun, whose attention had been attracted to it by Russian trespassers. In 1871 the task of developing its resources and administering its affairs was entrusted to a special bureau, which employed American agriculturists to assist the work and American engineers to construct roads and railways; but in 1881 this bureau was abohshed, and the government abandoned to private hands the various enterprises it had inaugurated. The modern government departments attend to the development of Yezo in the same way as for the rest of the islands of the Empire. *See* the *Annual Report* of the Japanese Government.

YGGDRASIL, in Scandinavian mythology the mystical ash tree which symbolizes existence, binds together earth, heaven and hell, and is the tree of life, knowledge, fate, time and space. Its three roots go down into the realms—(1) of death, where, in the well Hvergelmer, the dragon Nidhug (Niðhöggr) and his brood are ever gnawing it; (2) of the giants; (3) of the gods, Asgard. Its stem upholds the earth, its branches overshadow the world and reach up beyond the heavens. Honey-dew falls from the tree, and on its topmost bough sits an eagle. G. Vigfusson and York Poweli *(Corpus Poeticum Boreale,* Oxford, 1883) see in Yggdrasil not a primitive Norse idea, but one due to early contact with Christianity.

YIDDISH LANGUAGE4 AND LITERATURE. The word Yiddish is derived from the modern German *Jüdisch Deutsch* or Jewish German. It is the language spoken by the Polish and Russian Jews whose forbears, early in the middle ages, were invited to Poland from the Rhineland, to form a trading class in between the nobles and the serfs. They have kept their Low German tongue, writing and printing it in Hebrew characters to this day. Yiddish, though based on a Low German vocabulary and construction, was cut off from living German, whence its irregularities of grammar and spelling. It continued to absorb Hebrew and Aramaic words and expressions, together with Slav ones, Polish or Russian, and has a few of older Romance origin. The Hebrew and Aramaic came from the Hebrew Bible and its huge commentary the Talmud, which is largely Aramaic (*q.v.*). For the women, notably in the *Tzènah Urènah!* (Heb. "Come out and see!"), there were prayers and legends in Yiddish, or Màmelbshen (class. Heb. *lashòn*="tongue") or *Zhargòn,* in modern Hebrew: *Yehudit*="Jewish" (*s.* Judith), *Yiddit, Zhargòn.* Yiddish is essentially a folk-tongue, it had no written grammar, it eludes all strict grammatical analysis, though efforts are now being made to bring about uniformity in its grammar and spelling in view of its continued existence among the Jews of east Europe

Yiddish Literature is merely the reflection of the segregated, intense Jewish world of Eastern Europe which has been broken up, never to be reconstructed. It enshrines a distinct phase of Jewish history, one which began when the first Jews migrated to Poland from the Rhinelands in the middle ages, and which lately closed in a darkness still hard to penetrate. It is a literature rich in folksongs and tales. A wealth of folk-lore, still in course of discovery, gathered on the long road from Ur of the Chaldees to Pinsk and Minsk, passed into Yiddish from Talmudical and European sources. This legendary material remained common to the Jews of Poland and Germany.

The literature of the latter differed at all times little from that of their Gentile neighbours except for the Hebrew lettering. The Oppenheim collection in the Bodleian library contains many publications of these earlier periods. Across the Polish frontier the literary cleavage between Jew and Gentile was complete. Intercourse with Germany grew ever less. Yiddish literature came to mean one or two chapbooks of legends and the still familiar devotional work for women, the *Tzènah Urènah,* delightful in its renderings of Talmudical traditions.

Early in the 19th century the Haskalah, a movement for the enlightenment of the Jewish masses, initiated in Berlin by Moses Mendelssohn, began to creep across the Russo-Polish frontiers. The young Talmud student deciphered his first German book, frequently the poems of Schiller, in secret and in fear—woe betide him were he found with a volume of secular recreation, and in the tongue spoken by so many heretic Jews! Still he read and then came the wish to express his own feelings in Yiddish, to speak to the people in their every-day language. Lefin translated the Psalms and Ecclesiastes, Linetzki wrote his autobiography, the *Polish Boy,* J. L. Gordon his few powerful verses.

Revival in Russia.—Round the '60s and '70s, when Russian schools and culture were made accessible to Jewish youth, Yiddish literature suffered a decline. After the persecutions of the '80s it took on fresh life. The Jewish people, re-awakened to the fact that they were not Jewish Russians but Russian Jews, said in the words of Peretz: "We also want to bring our sheaf to the universal harvest." The people needed comfort and guidance. Spektor wrote his tales, sweet and simple in style, priceless in observation; Frug, till then a Russian poet, his melodious verse; J. Dienensohn his pathetic *Jossele.* Abramovitch laid aside his fluent Hebrew pen and wrote novels in a rich Yiddish, dealing with evil inside as well as outside the community; I. L. Peretz and "Sholem Alechem," both now dead, wrote abundantly. Peretz produced tales, poems and dramas. The two last have a spectral charm, but his *Stories and Pictures* is his great achievement. "Sholem Alechem," the humourist, is even more of a household word in the humblest home where Yiddish is spoken. His *Tovie der Milchiger* (Tobias the Milkman) is an immortal type. David Frishman is a distinguished critic. Among other later and gifted story-tellers, much of whose work was published in New York, are Sholem Asch, A. Reisin, Libin and Peretz Hirschbein.

Leo Wiener's *History of Yiddish Literature in the 19th Century* (1899), is invaluable to the student. Some English translations are: *Jewish Children* (Sholem Alechem), by Hannah Berman; One *Act Plays from the Yiddish,* by Etta Block; *A Lithuanian Village* (Leon Kobrin), by I. Goldberg, who has also translated the *Haunted Inn* of Peretz Hirschbein and other plays; *Stories* and *Pictures* (I. L. Peretz) and *Yzddish Tales* (20 different authors), by H. Frank. (H. F.)

The United States. — Yiddish literature in America developed under a combination of influences. On the one hand Russian literature — the writings of Tolstoi, Turgeniev, Dostoievski and Chekhov — played a decisive rôle in its growth for the obvious reason that nearly all Yiddish writers came from Russia and it was they who founded the Yiddish press, wrote the plays for the theatres, started weekly and monthly publications.

The distinctive contribution of the United States to Yiddish literature of the world has been the Yiddish language press. During the past four decades Yiddish journalism has swallowed up the ablest writers. There has never been a profitable market for Yiddish books in America on account of the poverty of the Jewish masses. Nine-tenths of the novelists, short story writers, poets, playwrights and critics have been obliged to eke out a livelihood as practising newspapermen. Hence the Yiddish press has been more than a purveyor of news and political comment. The man who has created modern Yiddish journalism is Abraham Cahan. From the founding of the *Jewish Daily Forward* in 1897 Cahan has been guide and mentor of the Yiddish press.

In addition to *The Forward* there are three other dailies in New York, viz., *Jewish Morning Journal, Day-Warheit* and *Freiheit.* The *Morning Journal* (edited by Peter Wiernik) is a conservative paper in politics no less than in religion. The *Day-Warheit* espouses the cause of Jewish nationalism, while *Freiheit* advocates communism. The total circulation of the several papers is in the neighbourhood of 400,000. Among the leading journalists in addition to those already mentioned are Zivion, Hillel Rogoff, Dr. A. Coralnik, M. Olgin, Dr. S. Margoshes, Jacob Fishman. The name of the late Louis E. Miller, one of the founders of *The Forward* and for years editor-publisher of *Warheit* and other publications, must be included in this list. Also S. Yanofsky, long the editor of *Freie Arbeiter Shtimme* (Free Workmen's Voice), an influential literary weekly of anarchist tendencies.

Much of the best modern Yiddish poetry has been written in the United States. Morris Rosenfeld was the most popular and most versatile poet produced in America. He was lyricist, satirist, polemicist. Yehoash, regarded by some as superior to Rosenfeld, was less popular. His poetry is cerebral, much of it obscure. Yehoash wrote magnificent nature poems; he translated Longfellow's "Hiawatha," devoted long years to the translation of the Old Testament from the original Hebrew into Yiddish and was the author of a *Dictionary of Hebraic Elements* in the Yiddish language, a pioneer work. A. Liesin, for years editor of the monthly magazine *Zukunft* (Future) is a poet of great power and originality as well as a foremost publicist. Excellent poetry has also been written by M. Winchevsky, Mani Leib, Rolnik, Joel Slonim, M. L. Halpern, Zisha Landau, Dilon, Nochem Yud.

The earliest writers of short stories were Z. Libin, Jacob Gordin and Leon Kobrin. Libin's career dates from the '90s. His sketches are full of a peculiar humour tinctured with sadness inspired by the hardships of life of the early immigrants. Libin has written extensively for the stage not without success. Kobrin has been a prolific playwright and translator. Gordin's fame rests on the seventy-odd plays which he wrote for the stage during the last 20 years of his life rather than his earlier sketches. He was the reformer of the Yiddish stage in America.

Only two or three of the many plays which David Pinski has written proved successful on the stage, notably *Yekel the Blacksmith* and *The Treasure.* Some of his plays, short stories and a novel have been translated into English. Strongly under the influence of the Russian realists, Z. Levine occupies a unique position as a writer of grim stories unrelieved by humour. Highly esteemed by some critics, his reading public remains limited.

Fifteen or more years ago there emerged a group of young writers who challenged the supremacy of the older men. To-day (1929) their position is being challenged by a still younger group. The most notable of the young writers are Opatosho, Ignatev and Raboi.

Many of the leading writers of Europe have lived in America for shorter or longer periods but have remained distinctly European writers for the most part. None of the sketches or poems which Reisin, for instance, has written in America are equal to his best European work. Asch, who is indubitably one of the two or three greatest living Yiddish writers, is the author of two novels of American life: *Uncle Moses* and *Lederer.* His fame, however, will rest on *Motke Ganef, Kidush Hashem, Gott fun Nekomah* and *Dos Shtetel — all* written in the old country.

Next to the press the stage has been the most potent cultural influence in the life of the Jewish immigrants. Long under the domination of Shomer, Lateiner and "Professor" Hurwich, it was devoted to the presentation of vapid musical comedies, operettas and blood-curdling melodramas. Jacob Gordin, and after him Libin, Kobrin, Asch, Pinski, Sackler, Gottesfeld and Leiwick, rescued the stage from the doldrums. Asch's *God of Vengeance,* though dealing with life in Warsaw, was first produced in New York and is perhaps the greatest single Jewish drama of modern times. Of plays dealing essentially with American conditions, Leiwick's *Shmattess* (Rags) ranks near the top. In recent years Gottesfeld has written delightful comedies of American life. Peretz Hirschbein's idyllic plays *(Dos Fervorfen Winkel, Grinne Felder,* etc.) have been extremely successful and have vastly enriched the repertoire of the American Yiddish stage. There are approximately 20 Yiddish theatres in the country, fully half of them in greater New York. Second avenue in New York is the Yiddish "Great White Way." (N. Z.)

YLANG-YLANG *(Cananga odorata),* a medium-sized tree of the custard-apnle family (Annonaceae), found in southern India, Java and the Philippines and planted in warm regions for its exceedingly fragrant flowers, which yield the widely-prized perfume of the Pacific islands, known as ylang-ylang among the Malays. The tree has somewhat drooping branches; large, ovate, sharp-pointed leaves; numerous greenish or yellowish flowers, about 2 in. long, and oblong, greenish fruits about 1 in. long. It has been sparingly cultivated in southern Florida.

YO-CHOW-FU, a city in the Chinese province of Hunan standing on high ground east of the outlet of Tung-Ting lake. Population about 20,000. The actual settlement is at Chinling-Ki, a village 5½ m. below Yo-Chow and ½ m. from the Yangtze. From Yo-Chow the cities of Chang Sha and Chang Teh are accessible, for steam vessels drawing 4 to 5 ft. of water, by means of the Tung-Ting lake and its affluents the Siang and Yuan rivers. The district in which Yo-Chow-Fu stands is the ancient habitat of the aboriginal San Miao tribes who were deported into south-west China. The city, which was built in 1371 is about 3 m. in circumference, and is surrounded by a wall. The city was entered by the T'aip'ing rebels in 1853. Yo-Chow-Fu is a collecting centre for native export products and for foreign goods on their way inland. It was opened to foreign trade in 1899.

YODEL, a peculiar kind of singing consisting of alternations of high falsetto notes with ordinary chest tones. It is practised by the Swiss and Tirolese in the singing of their native melodies.

YOGA, "diversion of the senses from the external world, and concentration of thought within" (Sanskrit "yoking"). The Yoga system in Hindu philosophy is a branch of the Sankhya (*q.v.*), but loosely inserted into it is the conception of a personal God, who is indissolubly connected with the subtlest form of matter. Union with him was not the original object of *yoga.* By its practices of hypnotism and self-mortification the Yogi (mod. Jogi) could attain miraculous powers and control of nature itself. Siva (*q.v.*), was essentially the great Yogi.

YOKOHAMA, a seaport of Japan on the west shore of Tokyo Bay, 18 m. south of Tokyo by rail. It stands on a plain shut in by hills, one of which, towards the south-east, terminates in a promontory called Honmoku-misaki or Treaty Point. The temperature ranges from 95° to 43° F, and the mean temperature is 57·7°. The cold in winter is severe, owing to north winds, while the heat is great in summer, though tempered by south-west sea breezes. The rainfall is about 70 in. annually. In 1859, when the neighbouring town of Kanagawa was opened to foreigners under the treaty with the United States, Yokohama was an insig-

nificant fishing village; and notwithstanding the protests of the foreign representatives the Japanese government shortly afterwards chose the latter place as the settlement instead of Kanagawa. Pop. (1940) 968,091. The Japanese government constructed public works, and excellent water was supplied from the Sagamigawa. The foreign settlement has well-constructed streets, but the wealthier foreigners reside south of the town, on the Bluff. The land occupied by foreigners was leased to them by the Japanese government, 20% of the annual rent being set aside for municipal expenses.

The harbour, which is a part of Tokyo Bay, is good and commodious, somewhat exposed, but enclosed by two breakwaters. The average depth in the harbour at high water is about 46 ft., with a fall of tide of about 8 ft. Rice, metal, woollen and cotton goods are the chief imports; and silk, silk goods and tea are the chief exports. The town was almost obliterated by an earthquake in Sept. 1923. Many thousands of its inhabitants were killed, some 80% of the houses were destroyed.

The starting-point of reconstruction was the new railway station on the coast, and the widening of 25 m. of existing streets and the building of 29 m. of new streets was undertaken. Railways have been restored, and plans for their further reconstruction are in hand. During the earthquake about a mile of the breakwater sank 8 ft. and most of the wharves were destroyed. The repair of the docks and harbour has been completed.

YOKOHAMA SPECIE BANK, LTD., THE (*Yokohama Shokin Ginko*). This bank was founded in 1880 with an authorised capital of Yen 3,000,000 with the object of affording financial facilities in respect of the foreign trade of Japan. Subsequently, its capital was increased several times until it stood at Yen 100,000,000, all paid up by December 1920.

The business carried on by the bank consists of (1) foreign exchange, (2) inland exchange, (3) loans, (4) deposits of money and custody of articles of value, (5) discount and collection of bills of exchange, promissory notes and other securities, and (6) exchange of coins. The bank may also buy or sell public bonds, gold and silver bullion, and foreign coins, if so required by the condition of its business. It may also be entrusted with matters relating to foreign loans and with the management of public money for international account.

The head office of the bank is in Yokohama, and there are 44 branches, 7 of which are in Japan and the remainder distributed throughout China, Manchuria, Europe, North and South America, India, Australia and the East Indies. In March 1939, the subscribed and fully paid capital of the bank amounted to Yen 100,000,000, while there was a reserve fund of Yen 138,400,000.

(D. No.)

YOKOSUKA, a seaport and naval station of Japan, on the west shore of Tokyo Bay, 12 m. south of Yokohama. The town is connected by a branch line with the main railway from Tokyo. The port is sheltered by hills and affords good anchorage. The site was occupied by a small fishing village until 1865, when the shogun's government established a shipyard here. In 1868 the Japanese government converted the shipyard into a naval dockyard, and subsequently carried out many improvements. In 1884 it became a first-class naval station. Pop. (1940) 193,358.

YOLA, a native state of British West Africa, forming the major part of the province of Adamawa, Northern Nigeria. In the partition of Africa part of Adamawa fell to Germany and was included in the Cameroons. The British part was known as the province and emirate of Yola. In 1919 the former German part of Adamawa came under British mandate and was incorporated with Yola. In 1926 the name of the province and emirate was changed to Adamawa. By the people the Fula ruler is known as the Lamido of Adamawa. The capital is Yola, a town founded by the Fula conqueror Adama about the middle of the 19th century. The town is situated in 9° 12' N., 12° 40' E. and is built on the left or south bank of the Benue, 480 m. by river from Lokoja. It can be reached by shallow draught steamers when the river is in flood. The Niger Company had trading relations with Yola before the establishment of British administration in Northern Nigeria.

In 1903 an exploring expedition was sent up the Gongola, which coming from the north joins the Benue below Yola, and the navigability of the river for steam launches as far as Gombe at high water was demonstrated. The Gongola valley was in ancient times extensively cultivated and after the establishment of the British protectorate it again became a prosperous agricultural region. Cotton and food crops are cultivated.

Adamawa province has an area of 33,424 sq.m. and a pop. (1926) of 549,137.

See NIGERIA; ADAMAWA, and the *Annual Report* on the Northern Provinces, Nigeria (Kaduna), first issued in 1928.

YOM KIPPUR, Jewish sacred Day of Atonement, supposedly dates back to Moses. Its annual observance on the tenth day of the seventh month, the custom of fasting, and the elaborate ceremonies of supplication all date more directly from the religious revival beginning with Ezra. Some of the scriptural texts are Lev. XVI, XXIII: 26–32, XXV: g, and Num. XXIX: 7–11.

YONGE, CHARLOTTE MARY (1823–1901), English novelist and writer on religious and educational subjects, daughter of William Crawley Yonge, 52nd Regiment, and Frances Mary Bargus, was born on Aug. 11, 1823 at Otterbourne, Hants. She was educated by her parents, and from them inherited much of the religious feeling and High Church sympathy which coloured her work. She lived at Otterbourne all her life, and was one of the most prolific writers of the Victorian era. Her first conspicuous success was attained with *The Heir of Redclyffe* (1853). *The Daisy Chain* (1856, repr. 1911) continued the success. Other popular books include *Heartsease* (1854), *Dynevor Terrace* (1857), *The Young Stepmother* (1861), *The Trial* (1864), and *The Clever Woman of the Family* (1865). She wrote over 120 volumes, including novels, tales, school manuals and biographies, and was for more than 30 years editor of the *Monthly Packet.* She died at Otterbourne on March 24, 1901.

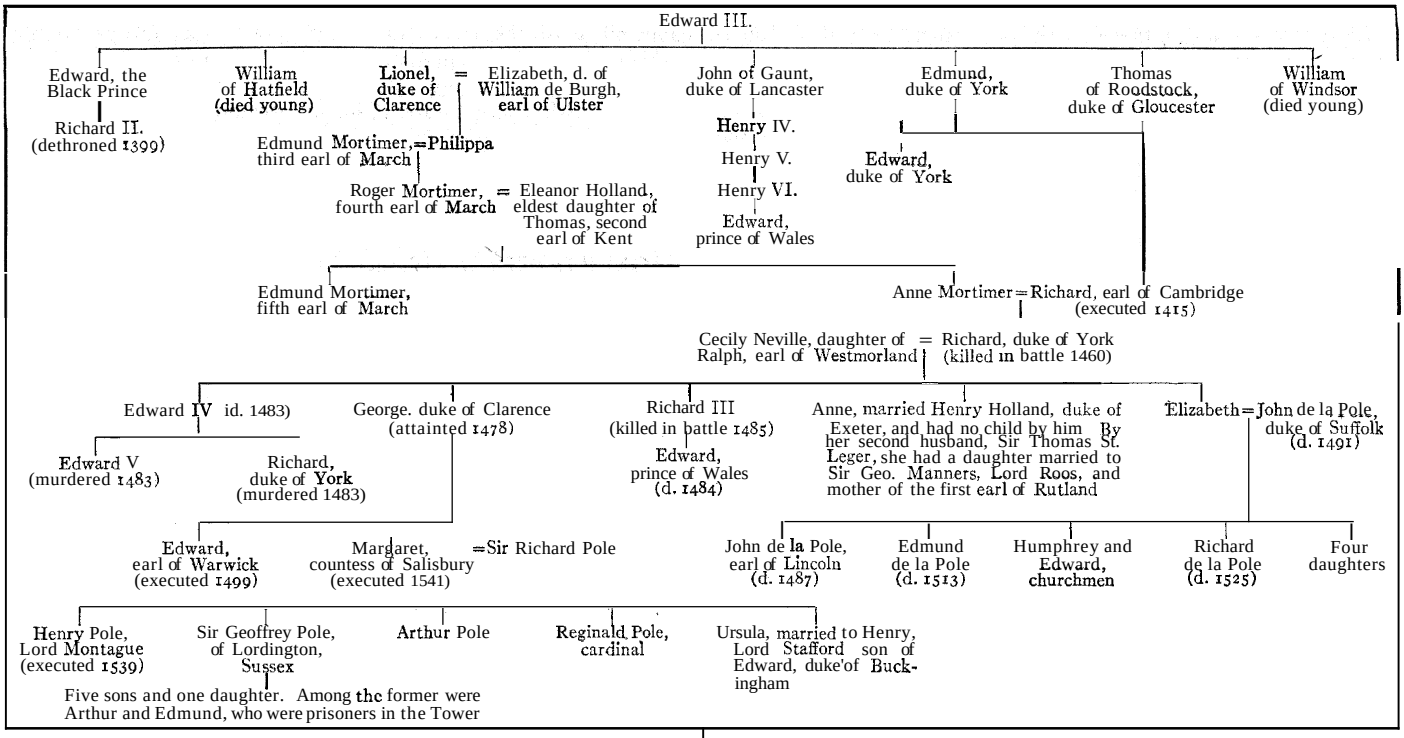
See E. Romanes, *Charlotte Mary Yonge: an Appreciation* (1908); and C. Coleridge, *Charlotte Mary Yonge, her Life and Letters* (1903).

YONKERS, a city of Westchester county, New York, U.S.A., on the east bank of the Hudson river, adjoining New York city on the north and facing the Palisades. It is served by the New York Central and electric railways, motor-bus lines, a ferry to Alpine, N.J., and river steamers. Pop. (1920) 100,176 (26% foreign-born white); 1940 U.S. census 142,598. Yonkers is an important manufacturing city as well as a popular residential suburb. There are many manufacturing establishments in the city.

In the heart of the business district stands the Philipse Manor-hall (built in 1682 and enlarged in 1745), one of the best examples of colonial architecture in America, now maintained as a State museum. In the northern part of the city (Glenwood) are the old Colgate mansion and the home of Samuel J. Tilden. There are many beautiful residential districts, commanding delightful views.

An Indian village (Nappeckameck) stood on the site of Yonkers, at the mouth of the Nepperhan creek, when the Dutch founded New Amsterdam, and the territory was within the "Keskeskick Purchase," acquired from the Indians by the Dutch West India company in 1639. In 1646 it was included in the large grant extending from the Hudson to the Bronx river. made to Adrian van der Donck, the first lawyer and historian of New Netherland. He encouraged settlers to come in, built a saw-mill near the mouth of Nepperhan creek (or Saw-Mill river), and soon the settlement came to be known as De Jonkheer's Land (the estate of the young lord), from which the name of Yonkers was gradually evolved. Later much of the estate passed into the hands of Frederick Philipse, who in 1682 built for his son the manor house mentioned above. This mansion was confiscated in 1779, as the Frederick Philipse of that time was suspected of Toryism. It came into the possession of Yonkers in 1867, and was used as the city hall from 1872 until it was bought by the State in 1908. Early in the Revolution Yonkers was occupied for a time by part of Washington's army and was the scene of several skirmishes. In 1854 the manufacture of elevators was begun in Yonkers by Elisha G. Otis. The village was incorporated in 1855 and in 1872 it became a city.

GENEALOGICAL TABLE OF THE HOUSE OF YORK



YONNE, a department of central France, formed partly from the province of Champagne proper (with its dependencies, Sénonais and Tonnerrois), partly from Burgundy proper (with its dependencies, the county of Auxerre and Avallonnais) and partly from Gâtinais (Orléanais and fle-de-France). It is bounded by Aube on the northeast, Côte-d'Or on the southeast, Nièvre on the south, Loiret on the west and Seine-et-Marne on the northwest. Pop. (1936) 271,685. Area 2,881 sq.mi. The highest elevation (2,000 ft.) is in the granitic highlands of Morvan. The department belongs to the basin of the Seine, except a small district in the southwest (Puisaye), which belongs to that of the Loire. The river Yonne flows through it from south to north-northwest, receiving on the right bank the Cure, the Serein and the Armançon, which water the southeast of the department. Farther north it is joined by the Vanne.

The department is served chiefly by the P.L.M. railway. The canal of Burgundy, which follows the valley of the Armançon, has a length of 57 mi. in the department, that of Nivernais, following the valley of the Yonne, a length of 33 miles. The department constitutes the archiepiscopal diocese of Sens, has its court of appeal in Paris, its educational centre at Dijon and belongs to the district of the VIII army corps. It is divided into 3 arrondissements (37 cantons, 486 communes), of which the capitals are Auxerre, also capital of the department, Avallon and Sens; these with Chablis, Vézelay (*qq.v.*) and St. Florentin are its chief towns. Pontigny has a Cistercian abbey, where Thomas Becket spent two years of his exile, with a 12th century church. Druyes has a 12th-century chbteau. Villeneuve-sur-Yonne has a mediaeval keep and gateways and a church of the 13th and 16th centuries. The Renaissance chbteaux of Fleurigny, Ancy-le-France, Tanlay and the chbteau of St. Fargeau, of the 13th century, rebuilt by Mademoiselle de Montpensier under Louis XIV., are all noteworthy. At St. Moré there are remains of the Roman road from Lyons to Gallia Belgica and of a Roman fortified post. There are many megalithic monuments in the department.

YORCK VON WARTENBURG, HANS DAVID LUDWIG, COUNT (1759–1830), Prussian general field-marshal, was of English ancestry. He entered the Prussian army in 1772, but in 1779 was cashiered for disobedience. Entering the Dutch service, he took part in the operations of 1783–84 in the East Indies as captain. Returning to Prussia in 1785 he was, on the death of Frederick the Great, reinstated in his old service, and in 1794 took part in the operations in Poland. Five years afterwards Yorck began to make a name as commander of a light infantry regiment, being one of the first to give prominence to the training of skirmishers. In 1805 he was appointed to an infantry brigade, and in the Jena campaign played a successful part as a rearguard commander, especially at Altenzaun. He was taken prisoner, severely wounded, at Liibeck. In the reorganization of the Prussian army after the peace of Tilsit, Yorck took a leading part. At first major-general commanding the West Prussian brigade, afterwards inspector-general of light infantry, he was finally appointed second in command to General Grawert, the leader of the auxiliary corps which Prussia was compelled to send to the Russian War of 1812, succeeding to the command on Grawert's retirement. He conducted the advance on Riga with great skill; but his conviction that the French army was doomed led him at last to neutralize the Prussian army by the Convention of Tauroggen (Dec. 30). The step was intensely popular, and although it was officially proposed to court-martial Yorck, he was absolved when the Treaty of Kalisch ranged Prussia with the Allies. During 1813–14 Yorck led his veterans with success at Bautzen, Katzbach, Wartenburg (Oct. 4) and Leipzig (Oct. 18). In France, he distinguished himself at Montmirail and Laon. The storm of Paris was his last fight. In 1821 he was created general field-marshal He had been made Count Yorck von Wartenburg in 1814. He died at his estate of Klein-Öls, the gift of the king, on Oct. 4, 1830.

See Seydlitz, *Tagebuch des Preussischen Armee Korps 1812* (1823); Droysen, *Leben des G. F. M. Grafen Yorck von Wartenburg* (1851).

YORK (HOUSE OF), a royal line in England, founded by Richard, duke of York (*q.v.*), who claimed the crown in opposition to Henry VI. His claim was, perhaps rightly, barred by prescription, the house of Lancaster having then occupied the throne for three generations; it was really owing to the misgovernment of Margaret of Anjou that it was advanced at all. The duke was descended from Lionel, the third son of Edward III., while the house of Lancaster came of John of Gaunt, the fourth son. The claim was derived (see the Table) through females; but this could not reasonably have been objected to after Edward III.'s claim to the crown of France; and the duke's claim was probably supported by the fact that he was descended from Edward III. both through his father and through his mother. (See Table.) The earldom of Ulster, the old inheritance of the De Burghs, had descended to him from Lionel;

the earldom of March came from the Mortimers, and the dukedom of York and the earldom of Cambridge from his paternal ancestry. Moreover, his own marriage with Cecily Neville, though she was but the youngest daughter of Ralph, 1st earl of Westmorland, allied him to a powerful family in the north of England, to whose support both he and his son were indebted.

The reasons why the claims of the line of Clarence had been so long forborne are not difficult to explain. Roger Mortimer, 4th earl of March, was designated by Richard II. as his successor; but he died the year before Richard was dethroned, and his son Edmund, the jth earl, was a child at Henry IV.'s usurpation. Henry took care to secure his person; but the claims of the family troubled the whole of his own and the beginning of his son's reign. It was an uncle of this Edmund who took part with Owen Glendower and the Percies; and for advocating the cause of Edmund Archbishop Scrope was put to death. And it was to put the crown on Edmund's head that his brother-in-law Richard, earl of Cambridge, conspired against Henry V. soon after his accession. The plot was detected. being revealed. it is said, by the earl of March himself, who does not appear to have given it any encouragement; the earl of Cambridge was beheaded

The popularity gained by Henry V. in his French campaigns secured the weak title of the house of Lancaster against further attack for forty years.

Richard, duke of York, seems to have taken warning by his father's fate; but, after seeking for many years to correct by other means the weakness of Henry VI.'s government, he first took up arms against the ill advisers who were his own personal enemies, and at length claimed the crown in parliament as his right. The Lords, or such of them as did not purposely stay away from the House, admitted that his claim was unimpeachable, but suggested as a compromise that Henry should retain the crown for life, and the duke and his heirs succeed after his death. This was accepted by the duke, and an act to that effect received Henry's own assent. But the act was repudiated by Margaret of Anjou and her followers, and the duke was slain at Wakefield fighting against them. In little more than two months, however, his son was proclaimed king at London by the title of Edward IV., and the bloody victory of Towton immediately after drove his enemies into exile and paved the way for his coronation.

After his recovery of the throne in 1471 he had little more to fear from the rivalry of the house of Lancaster. But the seeds of distrust had already been sown among the members of his own family, and in 1478 his brother Clarence was put to death—secretly, indeed, within the Tower, but still by his authority and that of parliament—as a traitor. In 1483 Edward himself died; and his eldest son, Edward V., after a nominal reign of two months and a half, was put aside by his uncle, the duke of Gloucester, who became Richard III. and then caused him and his brother Richard, duke of York, to be murdered.

But in little more than two years Richard was slain at Bosworth by the earl of Richmond, who, being proclaimed king as Henry VII., shortly afterwards fulfilled his pledge to marry the eldest daughter of Edward IV. and so unite the houses of York and Lancaster.

Here the dynastic history of the house of York ends. But a host of debatable questions and pretexts for rebellion remained. The legitimacy of Edward IV.'s children had been denied by Richard III. and, though the act was denounced as scandalous, the slander might still be reasserted. The duke of Clarence had left two children and the attainder of their father could not be a greater bar to the crown than the attainder of Henry VII. himself. Seeing this, Henry had kept Edward. earl of Warwick, a prisoner in the Tower of London. Yet a rebellion was raised in his behalf by means of Lambert Simnel, who was defeated and taken prisoner at the battle of Stoke in 1487. The earl of Warwick lived for 12 years later in confinement, and was ultimately put to death in 1499.

His sister Margaret married Sir Richard Pole (or Poole), and could give no trouble, so that Henry VIII. treated her with kindness. He made her countess of Salisbury, reversed her brother's attainder, created her eldest son, Henry, Lord Montague, and had one of her younger sons, Reginald, carefully educated. (See POLE, REGINALD and POLE, FAMILY.)

YORK, ALBERT FREDERICK ARTHUR GEORGE, DUKE OF (1895–): see GEORGE VI.

YORK, EDMUND OF LANGLEY, DUKE OF (1341–1402), fifth son of Edward III., was born at King's Langley in Hertfordshire on June 5, 1341. He accompanied his father on a campaign in France in 1359, was created earl of Cambridge in 1362, and took part in expeditions to France and Spain. After marrying Isabella (d. 1393), daughter of Peter the Cruel, king of Castile, he was appointed one of the English lieutenants in Brittany, whither he led an army in 1375. A second campaign in Brittany was followed in 1381 by an expedition under his leadership to aid Ferdinand, king of Portugal, against John I., king of Castile; but Edmund shortly returned to England as Ferdinand had concluded an independent peace with John. Accompanying Richard II. on his march into Scotland, he was created duke of York in Aug. 1385, and subsequently on three occasions acted as regent of England. He held a parliament in 1395 and he was again serving as regent when Henry of Lancaster landed in England in 1399. After a feeble attempt to defend the interests of the absent king, York joined the victorious invader; but soon retired from public life. He died at King's Langley on Aug. 1, 1402.

YORK, EDWARD PLANTAGENET, DUKE OF (c. 1373–1415), elder son of the preceding (Edmund of Langley). was created earl of Rutland in 1390. Being a friend of his cousin, Richard II, he became admiral of the fleet, constable of the tower of London and warden of the Cinque Ports. He accompanied the king to Ireland in 1394 and was made earl of Cork; arranged Richard's marriage with Isabella, daughter of Charles VI of France; and was one of the king's helpers in the proceedings against the "lords appellant" in 1397. He became constable of England and obtained the lands in Holderness previously belonging to Thomas of Woodstock, duke of Gloucester, together with other estates and the title of duke of Aumerle or Albemarle. He deserted Richard in 1399, and in Henry IV's first parliament he was denounced as the murderer of Gloucester. He was reduced to his former rank as earl of Rutland, and deprived of his recent acquisitions of land. It is uncertain what share Rutland had in the conspiracy against Henry IV in Jan. 1400, but he was probably not seriously involved. He served as royal lieutenant in Aquitaine and in Wales and became duke of York on his father's death in 1402. He was concerned in the scheme, concocted in 1405 by his sister Constance, for seizing the young earl of March and his brother Roger Mortimer and carrying them into Kales, and h e was imprisoned in Pevensey castle. Released a few months later, he was restored to the privy council and regained his estates. York led one division of the English army at Agincourt, where, on Oct. 25, 1415, he was killed by "much hete and thronggid." He was buried in Fotheringhay church.

YORK, FREDERICK AUGUSTUS, DUKE OF (1763–1827), second son of George III., was born at St. James's Palace on Aug. 16, 1763. At the age of six months his father secured his election to the rich bishopric of Osnabrück. He became a knight of the Bath in 1767, a K.G. in 1771, and was gazetted colonel in 1780. From 1781 to 1787 he lived in Germany. He was appointed colonel of the 2nd horse grenadier guards in 1782, and promoted major-general and appointed colonel of the Coldstream Guards in 1784.

He was created duke of York and Albany and earl of Ulster in 1784, but retained the bishopric of Osnabruck until 1803. On his return to England he took his seat in the House of Lords, where, on Dec. 15, 1788, he opposed Pitt's Regency bill in a speech which was supposed to have been inspired by the prince of Wales. A duel fought on Wimbledon Common with Colonel Lennox, afterwards duke of Richmond, served to increase the duke of York's popularity. In 1791 he married Princess Frederica (b. 1767), daughter of Frederick William II. of Prussia. The princess was enthusiastically received in London, but the marriage was not happy, and a separation soon took place; the princess retired to Ostlands Park, Weybridge, where she died on Aug. 6, 1820.

In 1793 the duke of York was sent to Flanders in command

of the English contingent of Coburg's army. (*See* FRENCH REVOLUTIONARY WARS.) On his return in 1795 the king promoted him field-marshal, and on April 3, 1798, commander-in-chief. He then led the army sent to invade Holland in conjunction with a Russian *corps d'armée* in 1799. From the time of the duke's arrival with the main body of the army, disaster followed disaster until, on Oct. 17, the duke signed the convention of Alkmaar, by which the allied expedition withdrew after giving up its prisoners. Although unsuccessful as commander of a field army the duke devoted himself with the greatest vigour and success to reforms at home until his enforced retirement from the office of commander-in-chief on March 18, 1809. In the proceedings for bribery in connection with Mary Anne Clarke (*q.v.*) the duke was acquitted of having received bribes himself by 278 votes to 196. In May 1811, he was again placed at the head of the army by the prince regent, and rendered valuable services. He died on Jan. 5, 1827, and was buried at St. George's Chapel, Windsor.

A firm friendship existed between the duke and his elder brother, afterwards George IV., and he was also his father's favourite son. He founded the Duke of York's school for the sons of soldiers at Chelsea, and his name is also commemorated by the Duke of York's column in Waterloo place, London.

YORK, RICHARD, DUKE OF (1411–1460), was born on Sept. 21, 1411, the son of Richard, earl of Cambridge. He became duke of York in 1415, and on the death of Edmund Mortimer in 1425 he represented in the female line the elder branch of the royal family. He had been kindly treated by Henry V., and his name appears at the head of the knights made by Henry VI. at Leicester on May 19, 1426. York served in France (1430–31), and in 1432 he obtained livery of his lands and went over to Ireland to take possession of his estates there. In Jan. 1436 he was appointed lieutenant-general of France and Normandy. He showed vigour and capacity, and recovered Fécamp and other places in Normandy. He was not supported cordially by the home Government, and in 1437 applied to be recalled. York returned to England in the autumn of 1437. From this time he attached himself to Humphrey of Gloucester's party, in opposition to the Government under Cardinal Beaufort. By his marriage in 1418 to Cicely, sister of the earl of Salisbury, he allied himself to the rising family of the Nevilles. On July 2, 1440, York was again appointed to the French command. His previous experience made him stipulate for full powers and a sufficient revenue. He did not go to Rouen till June 1441. During his second governorship York maintained the English position in Normandy. Hampered by his political opponents at home, he was recalled in 1446 on the pretext that his term of office had expired.

The death of Humphrey of Gloucester in 1447 made York the first prince of the blood. Suffolk, now Henry's chief minister, found a convenient banishment for a dangerous rival by appointing York to be lieutenant of Ireland for ten years (Dec. 9, 1447). York, however, put off his departure for 18 months.

During his absence Jack Cade's rebellion occurred. In Sept. 1450 York landed in Wales, came to London with an armed retinue and forced himself into the king's presence. He declared that he desired only justice and good government. He took part in the punishment of Cade's supporters, and discountenanced a proposal in parliament that he should be declared heir to the crown. In March 1452 he came once more in arms to London, and endeavoured to obtain Somerset's dismissal. On a promise that his rival should be held in custody he disbanded his men, and, thus outwitted, found himself virtually a prisoner. However, a nominal agreement was concluded, and York accepted the king's pardon. The situation was changed by the birth of a prince of Wales and the king's illness in Oct. 1453. York secured his recognition as protector on March 27, 1454. But at the end of the year the king's sudden recovery brought York's protectorate to an end.

When it was clear that the queen and Somerset would proceed to extremities, York and his friends took up arms in self-defence. Even when the two armies met at St. Albans, York endeavoured to treat for settlement. The issue was decided by the defeat and death of Somerset on May 22, 1455. York used his success with moderation. He became constable of England, and his friends obtained office. This was no more than a change of ministers. But a return of the king's illness in Oct. 1455 made York again for a brief space protector. Henry recovered in Feb. 1456, and at Coventry, in October, the Yorkist officials were displaced. Still there was no open breach. York would not again accept honourable banishment to Ireland, but made no move till the queen's preparations forced him to act. In Sept. 1459 both parties were once more in arms. York protested that he acted only in self-defence, but the desertion of his best soldiers at Ludlow on Oct. 12 left him helpless. With a few followers he escaped to Ireland, where his position as lord-lieutenant was confirmed by an Irish parliament, and he ruled in full defiance of the English government. In March 1460 the earl of Warwick came from Calais to concert plans with his leader. York landed in England on Sept. 8, and marched on London. On reaching Westminster, he took up his residence in the royal palace, and formally asserted his claim to the throne in parliament. A compromise was arranged; Henry was to retain the crown for life, but Richard was to succeed him. On Nov. 8, he was accordingly proclaimed heir-apparent and protector. Early in December, Richard went north with a small force. On Dec. 30, he was hemmed in by a force of Lancastrians at Wakefield. Declaring that he had never kept castle in the face of the enemy, Richard rashly offered battle, and was defeated and slain. His enemies had his head cut off, and set it up on the walls of York adorned with a paper crown.

Richard of York was not a great statesman, but he had qualities of restraint and moderation, and might have made a good king. He had four daughters and four sons. Edmund, earl of Rutland, his second son, was killed at Wakefield. The other three were Edward IV., George, duke of Clarence, and Richard III.

YORK, a county and parliamentary borough, archiepiscopal city, county town of Yorkshire and county in itself, on the L.N.E.R., 188 mi. N.W. of London. Pop. (est. 1938) 100,800; area 10.9 sq.mi. It is situated in the low lying vale of York at the junction of the Ouse with the Foss. It lies at the crossing of the two most important natural routes of the region, the north-south waterway formed by the Ouse and the east-west landway on the York moraine ridge through which the river has cut a gap. The town is thus well above flood level, and at the head of the tidal part of the Ouse before the regulation of the river in the 18th century. The tides are now felt 7 mi. downstream from York. York may have been a British settlement. As Eboracum or Eburacum it was the military capital of Roman Britain, the fortress of Legio IX and later of Legio VI. Victrix being situated near the site of the cathedral on the defensive land between the Ouse and the Foss, a municipality (*colonia*) grew up on the opposite side of the Ouse. The emperor Hadrian visited York in 120 and, according to tradition, the body of the emperor Severus, who died there in 211, was burned on Severus hill near the city. After the death of Constantinus Chlorus, which also took place in York, his son, Constantine the Great, was inaugurated emperor there. In 314, a bishop of York is mentioned together with, and with precedence of, a bishop of London, as present at the council of Arles. Nothing is known of the history of the city from the time the Romans withdrew from Britain in 410 until 627 when King Edwin was baptized there, though two years earlier, Paulinus, the first archbishop, had been consecrated. York became the capital of the Angle kingdom of Northumbria and when in the 7th century Britain was divided into two archiepiscopal provinces, York was made the capital of the northerly one, and still remains the ecclesiastical capital of the northern province which now does not include Scotland. In the years 732 to 766, York became one of the most celebrated places of education in Europe. The Danish kingdom of York was formed from that part of Angle Northum-

bria to the south of the Tees and later, when the country was organized into shires by the West Saxon kings, the remoteness of this region hindered organization which was possible in the south and it became first a vassal state and later one shire. The city was taken by Harold Hardrada in 1066. The fortress built there by William the Conqueror in 1068 was stormed by the men of the north of England who put to death the whole of the Norman garrison. In revenge, the Conqueror burned the town and laid waste the country between the Humber and the Tees. York was an important calling place on the route to Scotland, and several councils were held there by the English kings, the first being that of 1175, when William the Lion, king of Scotland, did homage to Henry II. The Council of the North was established in York in 1537 after the suppression of the Pilgrimage of Grace. During the Civil War, York was garrisoned by Royalists. It was besieged by parliament in 1642 and surrendered after Marston Moor.

York is not mentioned in Domesday survey. The first charter, which is undated, was given by Henry II granting the citizens a merchant guild and all the free customs which they had in the time of Henry I. In 1194 Richard I granted exemption from toll throughout the kingdom and in 1200 King John confirmed the preceding charters and in 1212 granted the city to the citizens at a fee-farm of £160 a year. Richard II conferred the title of lord mayor in 1389, and in 1396 the city was made a county of itself and the burgesses were given power to elect two sheriffs. The town was incorporated in 1464, and in 1473 the citizens were directed to choose a mayor from among the aldermen. As this led to constant disputes, Henry VII arranged that a common council, consisting of two men from each of the more important guilds and one from each of the less important ones, should elect the mayor. The city is governed under a charter of Charles II confirming that of 1464. It was represented in parliament by two members from 1295 to 1918, when the number was reduced to one.

Numerous remains of Roman occupation have been found, including the Multangular tower whose base is of mingled stone and brick work. It was at the western corner of the fortress and formed part of the reconstruction of Constantine in about 300. In 1925 a systematic excavation was undertaken at the eastern corner of the fortress, which had been covered by a mound since Norman times. It proved to be of older date, the earliest finds dating back probably to 71. This corner formed probably the earliest building of the fortress and around it was placed a rampart of clay, surrounded by a wooden palisade. Remains of the clay rampart and some of the post holes of the palisade have been found and in the basement chamber of the corner tower part of the rampart is still visible. The fortress was first girded with a stone wall in'about 105–108 and a fragment of this may be seen. There was possibly some reconstruction in 120. In 180 a great rising against the Romans took place in the north and among other forts York suffered. Great damage was done at the east corner and the old wall had to be rebuilt. Excavations also show that towers were built along the wall, probably at intervals of 45 yards. Remains of a Roman gateway have been found in the northeast rampart.

The cathedral of St. Peter, commonly known as the minster, is in the form of a Latin cross, consisting of nave with aisles, transepts, choir with aisles, a central tower and two west towers. It occupies the site of the wooden church in which King Edwin was baptized by Paulinus on Easter Day 627. Following his baptism, Edwin began to build a church in stone, but it was partly destroyed during the troubles which followed his death, It was repaired but suffered from fire in 741. At the time of the Norman invasion the Saxon cathedral with the archbishop's library perished in the fire by which the greater part of the city was destroyed, the only relic remaining being the central wall of the crypt. It was reconstructed in 1070–1100, but of this building few portions remain. The apsidal choir and crypt were rebuilt in 1154–81, the south transept in 1216–55, and the north transept and central tower in 1228–56. With the exception of the crypt the early English transepts are the oldest portions of the building now remaining. The south transept is the richest and most elaborate in its details, one of its principal features being the magnificent rose window; the north transept contains a famous series of lancet windows called the "Five Sisters," with specially fine glass. The foundation of the new nave was laid in the last years of the 13th century and the work was completed about 1340; the chapter house was built about the same period. The Lady chapel and presbytery were begun in the early Perpendicular style in 1361. The rebuilding of the choir was begun at the same period, but was not completed until about 1400. It is late Perpendicular, with a very fine great east window. During this rebuilding, the whole of the ancient Norman edifice was removed and the only Norman architecture now remaining is the east portion of the crypt of the second period. To correspond with the later alterations the central tower was recased and changed into a Perpendicular lantern tower in 1444. The southwest tower was begun in 1432, and the northwest tower in 1470, and with the erection of this tower, the church was completed as it now stands; it was reconsecrated on Feb. 3, 1472. The woodwork of the choir was burned in 1829 and in 1840 the southwest tower was reduced to a mere shell by fire.

The stained glass, both in the cathedral and in other churches of the city, is famous; its survival may be traced to the stipulation made by the citizens, when surrendering to parliament in the Civil War, that it should not be damaged. During World War I, when some of the most precious mediaeval glass was removed to a position of safety, it was found that owing to the corrosive effect of the atmosphere, it was necessary to clean each quarry; and lead lights now in many instances replace stone mullions. All the 109 stained glass windows were later renovated, including the 13th-century grisaille glass of the "Five Sisters" window, the cost of which was borne by the women of the country as a national memorial to the women of the empire who gave their lives in World War I.

St. Mary's abbey situated in the present museum gardens was founded for Benedictines in 1078; its head ranked as a mitred abbot with a seat in parliament. The principal remains of the abbey are the north wall and the ruins of the church in Early English and Decorated styles, and the principal gateway with a Norman arch. They lie outside the walls near the cathedral. The hospitium, built in the 14th and 15th centuries with its upper part of wood, houses the collection of Roman antiquities.

York also possesses a large number of churches of special architectural interest including All Saints, North street, Early English, Decorated and Perpendicular, with a spire 120 ft. in height; Christ church with south door in Decorated style, supposed to occupy the site of the old Roman palace; Holy Trinity, Micklegate, formerly a priory church, now restored, showing Roman masonry in its walls; St. Denis, Walmgate, with rich Norman doorway and Norman tower arches; St. Margaret's, Walmgate, celebrated for its curiously sculptured Norman porch and doorway; St. Mary the Elder, Bishophill, Early English and Decorated, with brick tower, rebuilt in 1659; St. Mary the Younger, Bishophill, with a square tower in the Saxon style, rebuilt probably in the 13th century; St. Mary, Castlegate, with Perpendicular tower and spire 154 ft. in height, the body of the church dating back to transitional Norman times; St. Martin's-le-Grand, fine Perpendicular; and St. Martin's-cum-Gregory, Early English and Perpendicular.

The ancient city is enclosed by walls dating in part from Norman times, but they are, in the main, of the 14th century. Their circuit is a little over 2 3 mi. and the area enclosed is divided by the river Ouse, the larger part lying on the left bank. On the east for a short distance the Foss takes the place of a wall. The walls are pierced by four principal gates or bars. On the southwest is Micklegate bar, a square tower built over a circular, probably Norman, arch, and with embattled corner turrets on which the heads of traitors were formerly exposed. Bootham bar, the main entrance from the north, also has a Norman arch. Monk bar on the northeast, at one time known as Goodramgate bar. has borne its present name since at least as early as 1370. Malmgate bar retains the barbican which was repaired in 1648.

Of the castle built by the Conqueror. in 1068, in the angle between the Ouse and the Foss, some portions were probably incorporated in Clifford's tower, the shell of which, showing an unusual ground plan of four intersecting circles, rises from an artificial mound. From 1826 to 1936 the castle was used as a prison, but many of the prison buildings have been demolished and others are used as a museum and offices.

St. William's college, near the minster, was founded in 1453 as a college for priests holding chantries in the minster; its restoration as a church house and meeting place for convocation was undertaken in 1906. The Merchant Adventurers hall (1357), a building with half-timbered work, has been restored. York is a great railway centre and has a distinguished railway museum. Damage caused by air raids in World War II included the destruction of the Guildhall (1446) and the church of St. Martin-le-Grand, and injury to St. Peter's and Bootham schools.

The county borough was created in 1888. The division of Yorkshire into three administrative counties has deprived York of its position as a civil capital. The city and the Ainsty (a district on the southwest included in the city bounds in 1449) are, for parliamentary purposes, in the North Riding; for registration purposes in the East Riding; and for all other purposes in the West Riding. The parliamentary borough extends into the East Riding. York is the headquarters of the northern command.

YORK, a town of York county, Maine, U.S.A., on the Atlantic coast, 45 mi. S.W. of Portland; served by motorbus lines connecting with the Boston and Maine railroad. Pop. (1930) 2,532; in 1940 it was 3,283. The town embraces the widely known summer resorts of York Beach and York Harbor and several other villages. The first settlement was made about 1624. In 1641 Sir Ferdinando Gorges made it the borough of Agamenticus, which in 1642 he chartered as the city of Gorgeana. In 1652, when Massachusetts extended her jurisdiction over Maine, it became the town of York. In 1692 most of the houses were destroyed by Indians and the inhabitants killed or taken captive. York was the shire-town of Yorkshire from 1716 to 1735; of the district of Maine from 1735 to 1760 (together with Falmouth, now Portland); and a county seat of York county from 1760 to 1832. In the 18th century York had a considerable trade with the West Indies and along the coast, and as late as the middle of the 19th century it had important fishing interests. Development as a summer resort began about 1873.

YORK, a city of southeastern Pennsylvania, U.S.A., the county seat of York county; on federal highways 30 (the Lincoln) and 111, 90 mi. W. of Philadelphia and 28 mi. S. by E. of Harrisburg. It is served by the Maryland and Pennsylvania, the Pennsylvania and the Western Maryland railways. Pop. (1920) 47,512 (94% native white); 1940 federal census (excluding contiguous boroughs) 56,712. The city's area of 4.1 sq.mi. is built up closely and there are populous industrial districts just outside the corporate limits in several directions. The streets in the central part of the city (laid out in 1741 in a bend of Codorus creek, by a surveyor for the Penns) bear such names as King, Queen, Duke, Princess and George, and the city itself was named after the English York. Penn common was set aside for the public in the original plan. The Quaker meeting house was erected in 1765, and there are several old burying grounds. The building used by Gen. Wayne for his headquarters while recruiting his brigade for the march on Yorktown still stands, in the heart of the city, and in Farquhar park there is a copy of the Provincial court house in which the Continental Congress held its sessions. The city's assessed valuation for 1940 was $48,876,000. Since 1912 it has had a commission form of government. York is the commercial centre of a rich agricultural region, and it has many large and diversified manufacturing industries. In 1936 the product of 226 factories in the city was valued at $67,437,000. Bank debits in 1940 aggregated $295,086,178.

York was the first permanent settlement in Pennsylvania west of the Susquehanna. It was laid out in 1741 in the centre of Springettsbury manor, a tract of 64,000 ac. granted to Springett Penn (a grandson of William Penn) in 1722. The first settlers were chiefly Germans from the Rhenish Palatinate (Lutherans, Reformed, Mennonites and Moravians), with some English Quakers and Scotch-Irish. The village was on the Monocacy road, the main route to the South and the South-west, and grew rapidly. When York county was erected in 1749 it was made the county seat, and by 1754 it had 210 houses and a thousand inhabitants. In 1777, when the British approached Philadelphia, the Continental Congress left the city, and after holding one day's session in Lancaster, crossed the Susquehanna to York and made it the national capital from Sept. 30, 1777, to June 27, 1778. In the old county court-house (built 1754–56 and torn down in 1849) the Congress passed the Articles of Confederation, received the news of Burgoyne's surrender, issued the first national Thanksgiving proclamation, received word from Franklin in Paris that France would aid with money, ships and men, received Von Steuben and Lafayette and commissioned them as major-generals. It was in York that the Conway Cabal was frustrated by Lafayette. Here $1,500,000 in silver, lent by France, was brought in Sept. 1778, and here Benjamin Franklin's printing press, moved from Philadelphia, issued $10,000,000 of Continental money. During the Civil War Confederate troops entered the town on June 28, 1863, and a small Federal force retreated before them. York was incorporated as a borough in 1787 and as a city in 1887.

YORKE, CHARLES (1722–1770), English lord chancellor, second son of Philip Yorke, was born in London on Dec. 30, 1722, and was educated at Corpus Christi college, Cambridge. In 1745 he published a treatise on the law of forfeiture for high treason; in 1746 he was called to the bar. Yorke obtained a sinecure appointment in the Court of Chancery in 1747, and became M.P. for Reigate. In 1751 he became counsel to the East India Company, and in 1756 solicitor-general. He resigned with Pitt in 1761, but in 1762–3 was attorney-general under Lord Bute. Resisting Pitt's attempt to draw him into alliance against the ministry he had quitted, Yorke maintained that parliamentary privilege did not extend to cases of libel; though he agreed with Pitt in condemning the principle of general warrants. Yorke became recorder of Dover in 1764, and in 1765 again became attorney-general in the Rockingham administration. He supported the repeal of the Stamp Act, while urging the simultaneous passing of the Declaratory Act. He drew up the constitution for Quebec. In 1767, Yorke resigned office. In 1770 he was invited by the duke of Grafton to take Camden's seat on the woolsack, but was pledged not to take office with Grafton. However, Yorke yielded to the king's entreaty, met the leaders of the Opposition on Jan. 17, and, overwhelmed with shame, fled to his own house, where he died on Jan. 20. The patent raising him to the peerage as Baron Morden had been made out, but his last act was to refuse his sanction to the sealing of the document.

YORKSHIRE, a north-eastern county of England, bounded by Durham, the North sea, the Humber estuary (separating it from Lincolnshire), Kottinghamshire, Derbyshire, Cheshire, Lancashire and Westmorland. It is the largest county in England. having an area of 6,089.7 sq.mi. and being more than double the size of Lincolnshire, which ranks next to it. In a description of the county it is constantly necessary to refer to its three great divisions, the North (2,127.4 sq.mi.), East (1,172.1 sq.mi.) and West (2,790.2 sq.mi.) Ridings.

Physical Features. — The county of Yorkshire can be divided into four upland tracts separated by lowland areas. These lie in the south-west, north-west, north-east and south-east quadrants of the county respectively. The great Yorkshire plain, drained by the Yorkshire Ouse (*q.v.*), stretches from the river Tees. which forms the northern boundary of the county, through the Vale of Mowbray, Vale of York and Vale of Ouse to the Trent basin in

the south. The Ouse divides the county into an eastern and a western division; whilst the "Aire Gap" separates the north Pennine moors from the south Pennine moors, and on the eastern side the Vale of Pickering separates the north Yorkshire moors from the Yorkshire Wolds. The north Pennine moors, which stretch northwards beyond the limits of the county, form a high moorland tract of Carboniferous limestone and Yoredale beds capped by millstone grit. The rocks have a very small dip eastward but are fractured by a series of faults, the most important being the Craven faults from Kirkby Lonsdale by Ingleton, Stainforth and Linton. There are also inliers of Ordovician and Silurian rocks at Horton and at Sedbergh.

The chief valleys are Teesdale, Swaledale, Wensleydale, Nidderdale, Wharfedale and Airedale. The chief peaks are Mickle Fell (2,591 ft.), Whernside (2,414 ft.), Ingleborough (2,373 ft.), Buckden Pike (2,302 ft.) and Penyghent (2,273 ft.). The "Aire Gap," which forms the gateway between north Lancashire and Yorkshire, has been followed by roads, railways and canals. The south Pennine moors arc formed of millstone grit, which has been arched upwards approximately along the county boundary and the coal measures are preserved along the eastern and western flanks. The uplands are bleak grouse moors in which the feeders of the rivers Aire, Calder and Don, have carved out valleys across the northern portion of the Yorkshire, Derby and Notts coalfield. Between the Yorkshire plain and the Pennines there is a belt of magnesian limestone, which, lying across various members of the Carboniferous, forms a well marked scarp-face toward them in the southern half of the county. The 'country along this belt forms a marked contrast with the districts of Palaeozoic rocks on the west, for the limestone produces a rich soil, the effect of which is seen in a luxuriant vegetation.

On the south the alluvium-filled Vale of Pickering marks the site of an ancient lake and the river Derwent, which drains the vale, has broken its way through the Jurassic ridge of the Howardian hills to reach the Vale of York. In this south-eastern quadrant the chalk forms the Yorkshire Wolds and has a general dip towards the south-east thus forming scarp edges from Flamborough Head, along the south side of the Vale of Pickering and sweeping round in a broad arc toward Market Weighton. This ridge of higher ground is continued southward across the Humber into the Lincolnshire Wolds. The north Yorkshire moors rise immediately from the coast and form cliffs for the most part, whilst to the south of Flamborough Head the cliffs disappear beneath the low-lying drift-covered Holderness. There are several watering-places along the coast; the principal are Redcar, Saltburn-by-the-Sea, Whitby, Robin Hood's bay, Scarborough, Filey, Bridlington and Hornsea. There are numerous mineral springs in Yorkshire, the principal being at Harrogate.

Minerals.— The coal-field in the West Riding is one of the chief sources of mineral wealth in Yorkshire, the most valuable seams being the silkstone, which is bituminous and of the highest reputation as a house coal, and the Barnsley thick coal, the great seam of the Yorkshire coal-field, which is of special value, on account of its semi-anthracitic quality, for iron-smelting and engine furnaces. Associated with the upper coal measures are iron-ores, occurring in the form of nodules. Brick-clay, pottery-clay and fire-clay are also raised, as well as gannister and oil-shale. Middlesbrough is the most important centre of pig-iron manufacture in the kingdom. Lead-ore occurs in the Yoredale beds of the north Pennine moors, and flagstones are quarried in the Yoredale rocks. In the millstone grit there are several beds of good building stone, but that most largely quarried is the magnesian limestone of the Permian series.

Archaeology.— In spite of the importance of the Creswell caves in Derbyshire for Palaeolithic remains, Yorkshire has very little to show until the end of that stage, and remains which belong typologically to this period may actually date from a considerably later period. In this connection we note objects from the Victoria cave, Settle, and from Holderness. Petch has made special studies of the pigmy flints of south Yorkshire and has found large numbers of sites all above the 1,000 ft. contour line. (*See* J. *A.* Petch, *Early* Man *in the District* of *Huddersfield* [Huddersfield, 1924].) Implements of Late Neolithic type are found almost all over the county, and such implements, made of finely chipped flints, are especially characteristic of the district behind Scarborough and the Yorkshire Wolds, which henceforth stands out as an especially important region in prehistoric times. The Yorkshire Wolds are one of the chief regions of Britain for round barrows and Beaker pottery, while remains of the Bronze age abound both here and in the Aire gap. The north Yorkshire moors are in process of detailed study by Elgee. On the moors above Ilkley are interesting traces of an apparently megalithic culture, with large stones decorated with cup and ring markings, supposed swastikas, etc. Three decorated chalk drums from Folkton Wold are important, showing southern and probably Iberian influence. Jet ornaments are another feature. The rarity of Bronze age finds in the central Ouse basin is a noteworthy feature. The Yorkshire Wolds yield abundant evidences of early Iron age finds, and important settlements have been located near Arras and Hessleskar farms, 3 m. E. of Market Weighton. The finds in these regions show affinities with those of the period on the English plain and in north-eastern Gaul.

History.— By Roman times the Vale of York had become important and carried the north road. From Lindum (Lincoln) the main road ran north-west to Danum (Doncaster) and thence to Legiolium and Calcaria (Tadcaster), thence branching off to Eburacum (York, *q.v.*), the Roman capital of the north. The main road continued through the Vale of York from Calcaria past Isurium to Cataractorium (Catterick Bridge) and thence over the Tees to the north.

In the 6th century, an Anglian tribe having seized the promontory at the mouth of the Humber, named by the invaders Holderness, gradually subjugated the East Riding. The earliest settlements were chiefly confined to the rich valley of the Iower Derwent, but the district around Weighton became the sacred ground of the kingdom which was named Deira, and Goodmanham is said to mark the site of a temple. Ella, the first king of Deira, extended his territory north to the Wear, and his son Edwin completed the conquest of the district which was to become Yorkshire. Traces of the "burhs" by which Edwin secured his conquests are perhaps visible in the group of earthworks at Barwick and on the site of Cambodunum, but the district long remained scantily populated. The defeat of Edwin at Hatfield in 633 was followed by a succession of struggles between Mercia and Northumbria for the supremacy over Deira. After the Danish conquest of Deira, Guthrum in 875 portioned the district among his followers, under whose lordship the English retained their lands. Cleveland came under Scandinavian influence, and the division into tithings probably originated about this date, the boundaries being arranged to meet at York, the administrative centre which, by A.D. 1000, had a population of over 30,000. At the battle of Stamford Bridge in 1066 Harold Hardrada, who had seized York, and Earl Tosti were defeated and slain by Harold of England.

For many years after the harrying of the country by the Conqueror all the towns between York and Durham lay uninhabited. In 1138 David of Scotland was defeated near Northallerton in the battle of the Standard. In the barons' wars of the reign of Henry II. Thirsk and Malgeard castles were captured and demolished. Robert Bruce in 1318 destroyed Northallerton, Boroughbridge, Scarborough and Skipton. In 1322 at the battle of Boroughbridge, the rebel barons were defeated by the forces of Edward II. In 1399 Richard II. was murdered in Pontefract castle. In 1408 the rebel forces of the earl of Northumberland were defeated at Bramham moor near Tadcaster. In 1453 a skirmish at Stamford Bridge was the opening event in the struggle between the houses of York and Lancaster; in 1460 the duke of York was defeated and slain at Wakefield; in 1461 the Lancastrians were defeated at Towton. The suppression of the monasteries roused deep resentment in Yorkshire, and the inhabitants flocked to join the Pilgrimage of Grace. On the outbreak of the Civil War of the 17th century, opinion was divided in Yorkshire. Sir William Savile captured Leeds and Wakefield for the king in 1642, and in 1643 Newcastle, having defeated the Fairfaxes at Adwalton moor, held all Yorkshire except Hull. In 1644, how-

ever, the Fairfaxes secured the East and West Ridings, while Cromwell's victory at Marston moor was followed by the capture of York, and in the next year of Pontefract and Scarborough.

On the redistribution of estates after the Norman Conquest, Alan of Brittany, founder of Richmond castle, received the honour of Richmond, and Ilbert de Laci the honour of Pontefract. Earl Harold's estate at Coningsburgh passed to William de Warenne, earl of Surrey, together with Sandal castle, which in the 14th century was bestowed on Edmund Langley, duke of York. Other Domesday landholders were William de Percy, founder of the abbey of Whitby; Robert de Bruce, ancestor of the royal line in Scotland; Roger de Busli; the archbishop of York enjoyed the great lordship of Sherburn, and Howdenshire was a liberty of the bishop of Durham.

The shire court for Yorkshire was held at York, but extensive privileges were enjoyed at various times by the great landowners. In the 13th century the diocese of York included in this county the archdeaconries of York, Cleveland, East Riding and Richmond. In 1541 the deaneries of Richmond were transferred to Henry VIII's new diocese of Chester. Ripon was created an episcopal see by act of parliament in 1836, and in 1888 the area of the diocese was reduced by the creation of the see of Wakefield, now consisting of the archdeaconries of Halifax and Pontefract, while the diocese of Ripon consists of the archdeaconries of Richmond and Leeds. The diocese of York includes the archdeaconries of York, East Riding and Cleveland. The bishoprics of Sheffield and Bradford were created in 1914 and 1919 respectively, the former containing the archdeaconries of Sheffield and Doncaster and the latter those of Craven and Bradford.

The woollen industry began after the Conquest, and historical details may be found under LEEDS, BRADFORD, etc. The time of the American Revolution marked the gradual absorption by Yorkshire of the clothing trade from the eastern counties. Coal appears to have been used in Yorkshire by the Romans, and was dug at Leeds in the 13th century. The early fame of Sheffield as the centre of the cutlery and iron trade is demonstrated by a line in Chaucer. In the 13th century forges are mentioned at Rosedale and at Gisburn. In the 16th century limestone was dug in many parts of Elmet, and Huddlestone, Hesselwood and Tadcaster had famous quarries; Pontefract was famous for its liquorice, Aberford for its pins, Whitby for its jet. Alum was dug at Guisborough, Sandsend, Dunsley and Whitby in the 17th century. Bolton market was an important distributive centre in the 17th century, and in 1787 there were 11 cotton mills in the county.

Architecture.--Of ancient castles Yorkshire retains many interesting examples. The fine ruins at Knaresborough, Pickering, Pontefract, Richmond, Scarborough and Skipton are described under their respective headings. Barden tower, picturesquely situated in upper Wharfedale, was built by Henry de Clifford (d. 1523). Bolton castle, which rises above Wensleydale, is a square building with towers, erected in the reign of Richard II by Richard Scrope; it was rendered untenable in 1647. Of Bowes castle near Barnard castle, there remains only the square keep. Cawood castle, near Selby, retains its gateway tower erected in the reign of Henry VI. Conisborough castle stands by the Don between Rotherham and Doncaster. The ruins of Danby castle are of various dates. Harewood castle in lower Wharfedale contains no portions earlier than the reign of Edward III. The keep of Helmsley castle was built late in the 12th century. Other remains are:—The fortress of Middleham, Mulgrave castle, Ravensworth castle, Sheriff Hutton castle, Spofforth castle, Tickhill castle, Whorlton castle, the fortress of Wressell, the mansions Gilling, Ripley, Skelton and the Elizabethan hall of Burton Agnes.

In ecclesiastical architecture Yorkshire is extraordinarily rich. At the time of the Dissolution there were 28 abbeys, 26 priories, 23 nunneries, 30 friaries, 13 cells, 4 commanderies of Knights Hospitallers and 4 preceptories of Knights Templars. The principal monastic ruins are described under separate headings and elsewhere. These are Bolton abbey (properly priory), a foundation of Augustinian canons; Fountains abbey, a Cistercian foundation, the finest and most complete of the ruined abbeys in England; the Cistercian abbey of Kirkstall near Leeds (*q.v.*); the Cistercian abbey of Rievaulx, and the Benedictine abbey of St. Mary, at York. Separate reference is also made to the ruins of Jervaulz (Cistercian) and Coverham (Premonstratensian) in Wensleydale, and to the remains at Bridlington, Guisborough, Malton, Whitby, Easby near Richmond, Kirkham near Malton, Monk Bretton near Barnsley, and Mount Grace near Northallerton. There are fine though scanty remains of Byland abbey, of Early English date, between Thirsk and Malton. There was a house of Premonstratensians at Egglestone above the Tees near Barnard castle. Other ruins are the Cistercian foundations at Meaux in Holderness, Roche, east of Rotherham, and Sawley in Ribblesdale; the Benedictine nunneries of Marrick, and Rosedale; and the Gilbertine house of Watton in Holderness.

Agriculture and Manufactures.— Nearly 87% of the East Riding was under cultivation in 1939, but of the North and West Ridings only about 60% and 58% respectively. The boulder-clay of Holderness forms the richest soil in Yorkshire, and the chalk wolds, by careful cultivation, form one of the best soils for grain crops. The central plains bear all kinds of crops excellently. Oats are grown in all three ridings, but wheat is the principal crop, though the area planted in the North Riding is less than half that in the east. Barley is extensively grown in the East and North Ridings. The bulk of the acreage under green crops is devoted to turnips and swedes, but potatoes form an important crop, especially in the West Riding. The next crop is sugar beet, grown most in the East Riding, the total acreage in 1939 being 27.158. Liquorice is cultivated near Pontefract. The proportion of hill pasture is greatest in the North Riding and least in the East, and the North and West are among the principal sheep-farming districts in England.

The industrial district of south Yorkshire is situated on the northern half of the Yorkshire, Derby and Notts coalfield. The West Riding is the chief seat of the woollen manufacture of the United Kingdom and has almost the monopoly in the production of worsted cloths. The early development of the industry was in part due to the rearing of sheep on the moors and to the abundance of water-power, while later the presence of coal further established it, but now most of the wool used is imported from abroad. The industry engages the most important towns. Almost every variety of woollen and worsted cloth is produced at Leeds; Bradford is especially concerned with worsted stuffs and alpacas; Batley with shoddy; Huddersfield with fancy goods; Halifax and Dewsbury with carpets and a varied class of woollens; and Keighley with yarns. Linen manufacture is the staple industry of Barnsley, though it is also carried on at Leeds. Cotton spinning is done at Huddersfield and Todmorden. The people of the industrial part of Yorkshire are noted for their singing, and choral societies are numerous, the Leeds festival chorus being one of the greatest in England. The woollen industry flourishes in the soft-water area and gives place to the iron and steel industry south of the Calder valley. Sheffield is especially famous for the finest grades of steel, for heavy machinery, hardware, fine metal work, cutlery and plated goods. The development of the iron ore deposits of Cleveland dates only from the middle of the 19th century. In addition to a large amount raised locally, the smelters of the Middlesbrough district ordinarily import large quantities of ore from Sweden and Spain. The attendant industries such as the production of steel, shipbuilding, etc , also flourish. The chemical industry is important both here and in the West Riding where also a great variety of other industries has sprung up, such as the great leather industry at Leeds, the manufacture of clothing, printing and bleaching, and paper-making. Besides coal and iron ore, much clay, limestone and sandstone are mined. Excellent building stone is obtained in the West Riding. The sea-fisheries are important, the chief fishing ports being Hull, Scarborough, Whitby and Filey. Leeds has become a great business centre and almost a metropolis for the woollen area of the West Riding.

Communication.— Two main lines traverse the county, the L.N.E. line from London, passing through Doncaster, Selby, York, Northallerton, to Durham and the north; the other, the L.M.S. line from London and Derby to Sheffield, Leeds, Skipton, Settle and on to Carlisle. In addition to thcsc there is a perfect network

of lines, the L.N.E. serving for the most part the north and east of Leeds and the L.M.S. the West Riding. The Pennines are crossed by the L.M.S. from Huddersfield to Manchester, Halifax to Todmorden, as well as through the "Aire gap," and by the L.N.E. from Penistone to Manchester, Northallerton to Hawes Junction and across the north-west of the county from Barnard castle to Kirkby Stephen. In the East Riding in 1943 there were 2,204 mi. of county roads and in the West Riding 3.796 mi. A complete system of canals links the centres of the southern West Riding with the sea, east and west.

Population and Administration.-The areas of the three administrative counties of the East, North and West Ridings are 1,150, 2,116 and 2,517 sq.mi. respectively, with populations estimated in 1938 at 184,630, 333,500 and 1,502,523. Wartime population movements reduced the population of the whole county between Sept. 1939 and Feb. 1941, the North and West Ridings by 3% each and the East Riding by 10%. The distribution of the population may be inferred from the table below. The city of York (pop., est. 1938, 100,800) is situated where the three ridings meet in the Ainsty of York. It was formerly independent of the three ridings but now constitutes a wapentake in the West Riding, for civil purposes.

District	Parliamentary divisions, each returning one member	Parliamentary boroughs	Number of members returned by parliamentary boroughs	County boroughs	Municipal boroughs	Urban districts
York City		1	1		..	
West Riding	19	10	24		11	57
East Riding	3	1			3	6
North Riding	4	1	2		4	10
Totals for County	26	13	31	13	18	73

The county and boroughs of Yorkshire return a total of 57 members to parliament. Of the area of the West Riding the south industrial district, considered in the broadest sense as extending between Sheffield and Skipton, Sheffield and Doncaster, and Leeds and the county boundary, covers rather less than one half. Although the three ridings are separate administrative counties, there is but one sheriff for the whole of Yorkshire. The county is divided among the dioceses of York, Ripon, Wakefield, Sheffield, and Bradford with small parts in those of Manchester, Blackburn, Southwell and Durham. York is the seat of the northern archdiocese. The National Trust owned 1,160 ac. in Yorkshire in 1942.

YORKSHIRE ELECTRIC POWER COMPANY. A group of men in the West Riding, interested in the woollen and colliery industries, promoted a bill in 1901 which incorporated The Yorkshire Electric Power company with an authorized share capital of £2,000,000. The concern was vested with powers of supplying over a large area in perpetuity and established at Thornhill, near Dewsbury, a generating station with a capacity of 4,500 kilowatts. A supply was made available in Dec. 1904, but for many years difficulties were experienced in consequence of the conservatism of manufacturers and the opposition of vested interests.

A second generating station was established at Barugh near Barnsley, where electricity is generated by means of surplus coke oven gas. A third station was started in 1927 at Ferrybridge The three stations, which are selected stations under the Electricity Supply Act 1926, have been enlarged from time to time, and in 1939 their combined capacity was 229,000 kilowatts. It is of interest that the system of generation and supply adopted by the company in 1903, viz., 50 cycles, three-phase alternating current. has now become the British national standard.

A large number of collieries in the West Riding and many textile mills and engineering works are now supplied by the company, and in addition over 70 local authorities and other authorized distributors are taking a bulk supply for distribution in the towns and villages. This work has been greatly facilitated by associated companies, Electrical Distribution of Yorkshire Limited, formed in 1905, and the North Lincolnshire and Howdenshire Electricity Company Limited, formed in 1932. The original capital was increased by further acts in 1922 and 1927 to £6,000,000. In 1939 the capital expenditure of the company and its associated distribution companies was over £12,000,000. (L. C. M.; X.)

YORKTOWN, a town and county seat of York county, Virginia. U.S.A.. on York river 10 mi. from its mouth. and about 60 mi. E.S.E. of Richmond. In 1940 the population of Nelson district. which includes Yorktown (pop., 521) was 1,175. It is served by a steamship line. and about 63 mi. distant is Lee Hall, a station on the Chesapeake and Ohio railway. The town is now within the boundaries of Colonial National Historical park. In the main street is the oldest custom-house in the United States, and the house of Thomas Nelson (1738–1789), a signer of the Declaration of Independence. In commemoration of the surrender of Lord Cornwallis in October 1781, there is a monument of Maine granite (100ft. 6in. high) designed by R. M. Hunt and J. Q. A. Ward; its cornerstone was laid in 1881 during the centennial celebration of the surrender, and it was completed in 1883. Yorktown was founded in 1691, as a port of entry for York county. It became the county seat in 1696, and although it never had more than about 200 houses its trade was considerable until it was ruined by the Revolutionary War. In that war the final victory of the Americans and their French allies took place at Yorktown.

Baffled by Gen. Nathanael Greene in his campaign in the Carolinas, his diminished force (fewer than 1,400) sadly in need of reinforcement, and persuaded that the more southern colonies could not be held until Virginia had been reduced, Lord Cornwallis marched out of Wilmington, N.C., on April 25, 1781, arrived at Petersburg, Va., on May 20, and there, with the troops which had been under William Phillips and Benedict Arnold and with further reinforcements from New York, raised his army to more than 7,000 men. Facing him in Richmond was Lafayette, whom Washington had sent earlier in the year with a small force of light infantry to check Arnold, and who had now been placed in command of all the American troops in Virginia. Cornwallis's first attempt was to prevent the union of Lafayette and Gen. Anthony Wayne. Failing in this, he retired down the James in the hope, it is thought, of receiving reinforcements from Gen. Henry Clinton. While Cornwallis was marching from N. Carolina to Virgmia, Washington learned that a large French fleet under De Grasse was to come up from the West Indies in the summer and for a brief period co-operate with the American and French armies. At a conference on May 21 at Wethersfield, Conn., with the French commanders, Washington favoured a plan for a joint attack on New York when De Grasse should arrive. An attack on the British in Virginia was, however, considered. The minutes of the conference with some suggestions from Rochambeau having been sent to De Grasse, he announced in a letter received on Aug. 14 that he would sail for the Chesapeake for united action against Cornwallis. About the same time Washington learned from Lafayette that Cornwallis was fortifying Yorktown. Sir Samuel Hood with 14 ships-of-the-line arrived at the Chesapeake from the West Indies three days ahead of De Grasse, and proceeding to New York warned Admiral Thomas Graves of the danger. Graves took command of the combined fleet, 19 ships-of-the-line, and on Aug. 31 sailed for the Chesapeake in the hope of preventing the union of the French fleet from Kewport, under Count de Barras, with that under De Grasse. He arrived at the Chesapeake ahead of De Barras, but after an encounter with De Grasse alone (September 5), who had 24 ships-of-the-line, he was obliged to return to New York to refit, and the French were left in control of the coast. Leaving only about 4,000 men to guard the forts on the Hudson, Washington set out for Virginia with the remainder of his army immediately after learning of De Grasse's plan, and the French land forces followed. The allied army was transported by water from the head of the Chesapeake to the vicinity of Williamsburg, and on Sept. 28 it marched to Yorktown. Receiving, on the same day, a despatch from Clinton promising relief, and fearing the enemy might outflank him. Cornwallis abandoned his outposts during the following night and withdrew to his inner defences, consisting of seven redoubts and six batteries connected by intrenchments, besides batteries along the river bank

The allies, 16,000 strong, took possession of the abandoned posts and closed in on the town in a semicircle extending from Wormley Creek below it to about a mile above it, the Americans holding the right and the French the left. On the night of Oct. 5–6 the allies opened the first parallel about 600yd. from the British works, and extending from a deep ravine on the north-west to the river bank on the south-east, a distance of nearly two miles. Six days later the second parallel was begun within 300yd. of the British lines, and it was practically completed on the night of the 14th and 15th, when two British redoubts were carried by assault, one by the Americans led by Alexander Hamilton and one by the French led by Lieut.-Colonel G. de Deux-Ponts. On the morning of the 16th Cornwallis ordered Lieut.-Colonel Abercrombie to make an assault on two French batteries. He carried them and spiked 11 guns, but they were recovered and the guns were ready for service again 12 hours later. On the night of the 16th and 17th Cornwallis attempted to escape with his army to Gloucester on the opposite side of the river, but a storm ruined what little chance of success there was in this venture. In grave danger of an assault from the allies, Cornwallis offered to surrender on the 17th; two days later his whole army, consisting of 7,073 officers and men, was surrendered, and American Independence was practically assured. The British loss during the siege was about 156 killed and 326 wounded; the American and French losses were 85 killed and 199 wounded.

In 1862 the Confederate defences about Yorktown were besieged for a month (April 4–May 3) by the Army of the Potomac under Gen. McClellan. There was no intention on the part of the Confederate commander-in-chief, Joseph Johnston, to do more than gain time by holding Yorktown and the line of the Warwick river as long as possible without serious fighting, and without imperilling the line of retreat on Richmond; and when after many delays McClellan was in a position to assault with full assistance from his heavy siege guns, the Confederates fell back on Williamsburg.

See T. N. Page, "Old Yorktown," in *Scribner's Magazine* (Oct. 1881); H. P. Johnston, *The Yorktown Campaign and the Surrender of Cornwallis* (New York, 1881); A. S. Webb, *The Peninsular Campaign* (New York, 1882); J. C. Ropes, *Story of the Civil War, vol.* ii. (1898); and Jean Henri Clos, *The Glory of Yorktown* (Yorktown, 1924).

YORUBA, a people inhabiting the Ilorin and Sokoto provinces of Northern Nigeria and the Abeokuta, Ijebu, Ondo and Oyo provinces, and the Lagos district, of Southern Nigeria, and comprising the following sub-tribes: Abori, Egba-Awori, Ekiti, Eko, Ijebu, Ijesha, Jekri and Oyo. The kingship was at first hereditary but later became elective, and there were numerous ministers, officials, and eunuchs. Each province, town or village also had its chief. They are divided into clans and extended family groups, but have no age-classes except among the Ekiti. Marriage is prohibited between those whose paternal or maternal kinship can be proved. Descent was formerly matrilineal but is now patrilineal, the widows being inherited by the sons, except in the case of their own mothers. The father's property is inherited by the sons, the mother's by the daughters. There are societies of a political and religious character, having secret rites, such as the *Egungun,* Oro, and *Ogboni.* The Yoruba are cultivators, and their religion is animist; they practise divination (Ija).

See P. Amaury Talbot, *The Peoptes of Southern Nigeria* (1926).

YOSEMITE, a deep valley forming a portion of the canyon of the Merced river, a tributary of the San Joaquin river, in central California. It lies due east of San Francisco at a distance of about 150 miles. The floor of the valley is approximately 4,000ft. above sea level, and its walls rise abruptly 3,000 to 4,000ft. to a rolling plateau region culminating in mountain peaks 10,000 to 13,000ft. in altitude. The valley itself is about seven miles long and from half a mile to a mile wide. In addition to its extraordinary form and its enormous monolithic cliffs and domes, it is remarkable for the variety and beauty of its waterfalls and for the enrhanting loveliness of its woods and flowering meadows.

Principal features are the majestic rock forms—El Capitan, Three Brothers, Yosemite Point, Royal Arches, Washington Column, North Dome, Basket Dome, Cathedral Rocks, Cathedral Spires, Sentinel Rock, Sentinel Dome, Glacier Point and the superb Half Dome, which dominates the head of the valley; and the falls of clear, sparkling water which leap into the valley in spring and early summer—Bridalveil, Ribbon, Upper and Lower Yosemite, Illilouette, Vernal and Nevada. The Upper Yosemite fall has a drop of 1,430 feet. Mirror lake, a small body of water at the foot of Half Dome, where Tenaya canyon joins the valley, is famous for its reflections, especially at sunrise, although in recent years its beauty has become impaired by the accumulation of silt and debris brought down by flood and storm. The Happy isles, a little below Vernal fall, provide secluded spots from which to review the dancing rapids of the Merced river.

History.—Yosemite valley was undoubtedly seen in 1833 by members of Captain Joseph Reddeford Walker's party of trappers, but its existence mas not made known to the world until 1851, when Major James D. Savage and members of his Mariposa battalion pursued marauding Indians into their secret refuge. Lafayette H. Bunnell, a young physician who accompanied the party, appears to be the only one of the group who was impressed with the magnificent scenery. He inquired of the friendly Indian guides the name of the place and was informed that it was called after the tribe that occupied it—a name which Bunnell understood to be "Yo-sém-i-ty," meaning "grizzly bear." The following year an Army officer, in writing a report, substituted e for y as the terminal letter, thinking perhaps that the name was of Spanish origin. Later visitors heard the word as "Yo-hám-i-te," or "Yo-hém-it-e." As a matter of fact, the Indians of the valley called the grizzly bear "Oo-hóo-ma-te" or "O-hám-i-te," while a neighbouring tribe called it "00-sob-ma-te" or "Uh-zú-mai-tuh." In a short time the name became established in print in its present form.

The first party to enter Yosemite valley solely for the purpose of viewing its marvels and enjoying its beauties was led by James M. Hutchings in 1855. For more than thirty years Hutchings was identified with the valley, as publicizer, hotelkeeper, and official guardian. An artist, Thomas Ayres, accompanied the 1855 party. Lithographs based on his sketches were published by Hutchings. They were the first representations of Yosemite scenery to reach the public and did a great deal to spread the fame of the valley throughout the world. Until 1874 the only access to Yosemite valley was by horseback or on foot over rough, steep trails. In that year two wagon roads were completed into the valley on the north side, from Big Oak Flat and Coulterville, respectively, and in 1875 the road from Mariposa brought wagons into the valley from the south. In 1907 the Yosernite Valley railroad was completed up the canyon of the Merced river as far as El Portal, where passengers and freight were transferred to stages and wagons for the remaining fifteen miles, an ascent of 2,000 feet. Although the first automobile entered the valley in 1900, it was not until 1913 that motor travel was authorized. Aeroplanes have, on a few occasions, landed on and taken off from the valley floor, but this is now prohibited. Travel to Yosemite has increased from a maximum annual number of visitors in the years up to 1885 of less than 3,000, to 8,850 in 1908, the first year of railroad travel by El Portal, to over 30,000 in 1915, to over 100,000 in 1922, and to over 400,000 annually since 1927. At the present time a large portion of the visitors come in private automobiles, but regular schedules are maintained throughout the year by motor stages connecting with the main railroad lines and with the Yosemite Valley railroad at El Portal. During the summer a stage connects Yosemite with Lake Tahoe and with the Owens Valley stage-lines by way of the Tioga road across the Sierra. Lodges, camps, and a hotel provide a variety of accommodations to the public the year round. In recent years winter travel to Yosemite has attained large proportions.

Geologic History — Thestriking evidence of enormous dynamic forces of nature everywhere visible in Yosemite valley invariably prompts the question: How was the valley formed? The first discussions of this question by scientists developed widely divergent views. Josiah Dwight Whitney, head of the first State Geological Survey of California. proposed the theory that "the bottom of the valley sank donn to an unknown depth, owing to its sup-

port being withdrawn from underneath, during some of those convulsive movements which must have attended the upheaval of so extensive and elevated a chain, no matter how slow we may imagine the process to have been."—The *Yosemite Guide-book,* 1869. It took years to eradicate this explanation from guide-books and other literature of the valley. At a time when Whitney and his pupil Clarence King were making the positive statements that the peculiar formation of the Yosemite was not due to the erosive action of ice and that there was no proof that glaciers had ever entered the valley, a young naturalist who had recently come to California and become enamoured of the orderly and pure beauty of the Yosemite and its surroundings, John Muir, proclaimed with enthusiasm that glacial erosion was, in fact, the key to the whole problem. As time went on Muir's views gained support, others elaborated upon them and modified them, until today the following statement by François E. Matthes. of the U.S. Geological Survey, represents the prevailing opinion: "In neither the Yosemite nor in any other valley of its type is there evidence of any dislocation of the earth's crust. In every one of these valleys, on the other hand, there is abundant proof of powerful glacial action such as Muir recognized. To be sure, the glaciers did not reach down to the foothills, nor did they excavate the canyons in their entirety, as Muir supposed The ice age, it is now clear, was preceded in the Sierra Nevada by iong periods of canyon cutting by the streams in consequence of successive uplifts of the range."—In *Sierra Club Bulletin,* 1938. Geologists of the present century have emphasized the importance of the structure of the rock, and have enormously lengthened the estimates of time involved in the erosion process. Matthes summarizes the theory as follows: "The story of the evolution of the Yosemite valley, then, is a story of several chapters—of successive periods of valley and canyon cutting by the Merced river, induced by successive uplifts of the Sierra Nevada; of vigorous glaciation, several times repeated, during the ice age, the quarrying action of the ice being controlled and guided locally by the varying structure of the granitic rocks and giving rise to exceptionally bold, clean-cut sculptural effects; and finally of a period of dismantling, resulting in greater detail and intricacy of sculpture, the production of slopes of rock waste, and the formation of level valley floors."—Geologic *History of the Yosemite Valley,* 1930.

Yosemite National Park.—Because very largely of the activities of Whitney and his associates of the State Geological Survey, Congress enacted a law in 1864 by which Yosemite valley and the Mariposa Big Tree grove were granted to the State of California with the stipulation that "the premises shall be held for public use, resort, and recreation. . . . inalienable for all time." The grant was accepted by act of the State Legislature in 1866, a step of inestimable value in the development of State and national parks. A second and even more important step was taken when Congress responded to the pleas of John Muir, Robert Underwood Johnson, of *Century Magazine,* and others, and by act of Oct. 1, 1890, reserved and withdrew from settlement a large area of forested and mountainous land surrounding the Yosemite valley grant. There was thus established a national park enclosing within its boundaries a State park. The dual administration continued until 1906, when Congress accepted the recession of the State grant enacted by the California Legislature in 1905. Since that date the entire area has constituted the Yosemite National park, which today, after several changes in boundaries, embraces over 1,100 square miles. From 1891 to 1914 the park was administered during the summer season by troops of United States Cavalry with an officer acting as superintendent. The most important duties during that period were the ousting of bands of sheep from the mountain ranges and the apprehension of poachers. Today, under the administration of the National Park Service, acting through a civilian superintendent, the duties are primarily concerned with making available to the public the opportunities for wholesome recreation and for education in natural history and science.

Most of Yosemite National park lies within the basins of the Merced and Tuolumne rivers. Outstanding features, in addition to Yosemite valley, are Little Yosemite, Merced lake and Lake Washburn at the head of the Merced; Tuolumne meadows, Benson lake, Tilden lake, Jack Main canyon; the canyon of the Tuolumne, with its Waterwheel falls; Hetch Hetchy valley, source of water and hydro-electric power for San Francisco, granted by special act of Congress in 1913; the Mariposa, Merced, and Tuolumne groves of big trees; and a galaxy of mountain peaks, including Lyell (13,090), Dana (13,050), Conness (12,556), Tower Peak (11,704), Cathedral Peak (10,933), Unicorn (10,849), Hoffmann (10,921), Clark (11,506), and Starr King (9,081). The park is crossed by the Tioga road, originally built as a wagon-road for access to mines, now regraded as a transmountain highway.

YOSHIHITO (1879–1926), 123rd emperor of Japan, third son of the Emperor Meiji (Mutsuhito), was born at Tokyo on Aug. 31, 1879. On the eighth anniversary of his birthday the prince was proclaimed heir-apparent. the first and second sons of the emperor Meiji having died in infancy. In Sept. 1887 the prince commenced attending the Peers' school, and on Nov. 3, 1889, entered the Army and was declared imperial crown prince. Two years later he left the school to continue his studies under private tutors. In 1897 he took his seat, in accordance with prescriptive right, in the house of peers. On May 10, 1900, the crown prince married Sadako, fourth daughter of the late Prince Michitaka Kujo, and on April 29, 1901, a son. Hirohito, was born, followed by a second son, Prince Yasuhito Chichibunomiya, on June 25, 1902, and a third, Prince Nobuhito Takamatsunomiya, on Jan. 3, 1905. On July 30, 1912, on the demise of his father, the crown prince ascended the throne, but owing to the national mourning the formal ceremony of enthronement did not take place until Nov. 1914. His reign was proclaimed as the era of Taisho (Righteousness). In the following year a fourth son, Prince Takahito Suminomiya, was born on Dec. 2. Owing to the indifferent health of the emperor, whose life was a constant struggle against disease, his son Hirohito became prince regent on Nov. 25, 1921. The emperor died on Dec. 25, 1926, of heart failure following bronchial pneumonia. The reign of Hirohito, who succeeded his father as emperor, is designated the period of Showa (Light and Peace).

Prince Chichibu (Yasuhito Chichibunomiya) went to England in 1925 and studied at Magdalen college, Oxford. He married Princess Setsuko, the eldest daughter of Ambassador Matsudaira. on Sept. 28, 1928.

YOSHIZAWA, KENKICHI (1874–), Japanese diplomat, was born in Niigata-Ken. He studied English literature for his degree in the Imperial university of Tokyo. He entered the diplomatic service, was consular assistant at Amoz, South China. After two years spent at Shanghai and in London he returned to the Foreign Office in Tokyo, and was sent as secretary to the Legation in Peking. This office he held until, in 1919, he became director of the Asiatic bureau, where his experience of Far Eastern people enabled him to adjust differences between his own country and other oriental Powers. He retained this post until 1923, and was again in Peking in an official capacity when the new Russo-Japanese alliance was broached in 1924. The treaty, though opposed by many Japanese, was signed in Jan. 1925. Yoshizawa was appointed ambassador to France in 1930.

YOUGHAL (pronounced Yawl), a seaport and watering-place of County Cork, Ireland, on the west side of the Blackwater estuary, and on the Cork and Youghal branch of the Great Southern railway, 26¾mi. east of Cork. Pop. (1926) 5,340. Youghal was a settlement of the Northmen in the 9th century, and was incorporated by King John in 1209. The Franciscan monastery, founded at Youghal by FitzGerald in 1224, was the earliest house of that order in Ireland. Sir Roger Mortimer landed at Youghal in 1317. The town was plundered by the earl of Des-

mond in 1579. In 1641 it was garrisoned and defended by the earl of Cork. Sir Walter Raleigh was mayor of Youghal in 1588–89, and is said to have first cultivated the potato here.

YOUNG, ARTHUR (1741–1820), English writer on agriculture and social economy, second son of the Rev. Arthur Young, was born Sept. 11, 1741. After being at a school at Lavenham, he was placed in a mercantile house at Lynn, but showed no taste for commerce. He published, when only 17, a pamphlet *On the War in North America,* and in 1761 went to London to start a periodical, *The Universal Museum.* He also wrote four novels, and *Reflections on the Present State of Affairs at Home and Abroad* in 1759.

In 1768 he published the *Farmer's Letters to the People of England,* in 1771 the *Farmer's Calendar,* which went through a great number of editions, and in 1774 his *Political Arithmetic,* which was widely translated. About this time Young acted as parliamentary reporter for the *Morning Post.* He made a tour in Ireland in 1776, publishing his *Tour in Ireland* in 1780. In 1784 he began the publication of the *Annals of Agriculture,* which was continued for 45 volumes. This work had many contributors, among whom was George III, writing under the nom de plume of "Ralph Robinson." Young's first visit to France was made in 1787. Traversing that country in every direction just before and during the first movements of the Revolution, he has given valuable notices of the condition of the people and the conduct of public affairs at that critical juncture. The famous book *Travels in France* appeared in 2 vols. in 1792. On his return home he was appointed secretary of the Board of Agriculture in 1793. His sight failed, and in 1811 he had an unsuccessful operation for cataract. He died on April 20, 1820. He left an autobiography in ms., which was edited (1898) by Miss M. Betham-Edwards.

YOUNG, BRIGHAM (1801–1877), Mormon leader, born at Whittingham, Vt. (U.S.A.), June 1, 1801. He moved to Mendon, N.Y., in 1829, and three years later joined the newly organized Mormon Church. *(See* MORMONS.) He was appointed an apostle in 1835, played a leading rôle in the removal of the Mormons from Missouri to Illinois, and in 1840 was sent to Liverpool to direct Mormon missionary work in England. There he organized branch missions, established emigrating agencies and began publication of the *Millennia1 Star.* He returned to America two months after the death of the prophet, Joseph Smith (*q.v.*), to take over the leadership of the church. The people of Illinois having demanded the removal of the Mormons, Young was faced with the Herculean task of leading them to a new country where they would be free from interference. After organizing the groups and planning every move in detail, the migration of nearly 5,000 people was gotten under way in 1846. Early in 1847 Young, leading the advance band, reached the valley of Great Salt Lake, and there decided to settle. He founded Salt Lake City, began the cultivation of crops by irrigation and directed the dispersal of the emigrant trains as they arrived. Both in moral and economic realms his word was law and he laid down the policies of the settlement. When the Territory of Utah was organized in 1850 he was appointed governor by President Fillmore and reappointed in 1854. Though not appointed again in 1858 because of his defiance of the United States in the so-called Mormon War, he continued to be the supreme power of the Territory. He encouraged agriculture, developed natural resources, established manufactures, founded Deseret University at Salt Lake City and Brigham Young Academy at Provo, built the Salt Lake Theatre, laid the foundations of the Mormon Temple, and created the Zion's Co-operative Mercantile Institution which grew into the largest institution of its kind in the West. His genius as a leader is generally recognized, the settlement of Utah being one of the best examples of organic colonization in history. He followed the doctrine of plural marriage and at his death at Salt Lake City Aug. 29, 1877, was survived by 17 wives and 47 children.

For bibliography *see* MORMONS.

YOUNG, EDWARD (1683–1765), English poet, author of *Night Thoughts,* son of Edward Young, afterwards dean of Salisbury, was born at his father's rectory at Upham, near Winchester, and was baptized on July 3, 1683. He was educated at Winchester College and New College, and Corpus Christi, Oxford. His first publication was an *Epistle to . . . Lord Lansdoune* (1713). It was followed by a *Poem on the Last Day* (1713), dedicated to Queen Anne; *The Force of Religion: or Vanquish'd Love* (1714), a poem on the execution of Lady Jane Grey and her husband, dedicated to the countess of Salisbury; and an epistle to Addison, *On the late Queen's Death and His Majesty's Accession to the Throne* (1714), in which he made indecent haste to praise the new king. About this time began his connection with Philip, duke of Wharton, whom he accompanied to Dublin in 1717, and with whom he had a lawsuit in 1740; the upshot was that Young was awarded an annuity of £100, but failed to secure a sum of £600 which he claimed. Meanwhile, his plays, *Busiris* and *Revenge,* were produced at Drury Lane in 1719 and 1721. Between 1725 and 1728 Young published a series of seven satires on *Love of Fame, the Universal Passion.*

Young was nearly fifty when he decided to take holy orders. In 1728 he was made one of the royal chaplains, and in 1730 was presented to the college living of Welwyn, Hertfordshire. He married in 1731 Lady Elizabeth Lee, daughter of the 1st earl of Lichfield. *The Complaint,* or *Night Thoughts on Life, Death and Immortality,* was published in 1742, and was followed by other "Nights." He died at Welwyn on April 5, 1765.

Other works by Young are: *The Instalment* (to Sir *R.* Walpole, 1726); *Cynthio* (1727); *A Vindication of Providence . . .* (1728), a sermon; *An Apology* for *Punch* (1729), a sermon; *Imperium Pelagi, a Naval Lyrick . . .* (1730); *Two Epistles to Mr. Pope concerning the Authors of the Age* (1730); *A Sea-Piece . . .* (1733); *The Foreign Address, or The Best Argument for Peace* (1734); *The Centaur not Fabulous; in Five Letters to a Friend* (1755); *An Argument . . . for the Truth of His* [Christ's] *Religion* (1758), a sermon preached before the king; *Conjectures on Original Composition . . .* (1759), addressed to Samuel Richardson; and *Resignation . . .* (1762), a poem.

YOUNG, MAHONRI MACKINTOSH (1877–), American sculptor, painter and etcher, was born at Salt Lake City, Utah, on Aug. 9, 1877. He studied with J. T. Harwood, Salt Lake City, at the Art Students' League, New York city, and in Paris. His works are characterized by simplicity, dignity and breadth of conception, united with exquisite workmanship. He is known chiefly through his statuettes, figures of labourers and cowboys, which exhibit close observation of nature and virile form. Among his best known works are "Man with Pick" in the Metropolitari Museum of Art; the Hopi and Apache groups in the Museum of Natural History, New York city; "A Labourer" and "The Rigger" in the free public library, Newark, N.J.; the "Sea-Gull" monument in Salt Lake City; "Rolling His Own" and "Monument to the Dead" (with Bertram Goodhue), in Paris.

YOUNG, OWEN D. (1874–), American lawyer and business man, was born at Van Hornesville, N.Y., on Oct. 27, 1874. He was educated at St. Lawrence university, N.Y. (A.B., 1894), and Boston university law school (LL.B., 1896). He commenced the practice of law in Boston (1896), being associated with and later a partner of Charles H. Tyler until 1912, when he retired in order to become general counsel for the General Electric Company. In 1913 he was elected vice president in charge of policy and in 1922 was elected chairman of the board of directors. He organized and became chairman of the board of the Radio Corporation of America. He was also a director of the Federal Reserve Bank of New York, General Motors Corporation, the International General Electric Company, and chairman of the American section of the international chamber of commerce. He was a member of President Wilson's second industrial conference, chairman of the committee on business cycles and unemployment appointed by President Harding, and chairman of the American group, international court of arbitration of trade disputes of the international chamber of commerce. In Dec. 1923, he accepted the invitation of the reparations commission to act as a member of the first committee of experts charged with the enquiry into the balancing of the German budget and the stabilizing of the German currency. Their ensuing report was accepted by the commission. He was appointed agent-general for reparations payments *ad interim* on that date, holding the position till Oct. 31, when he resigned. Again by invitation Young became a member of the second committee of experts which met

in Paris in January, 1929, to draw up a plan for the permanent settlement of the reparations problem. Because of the confidence in his ability and fairness felt by the European governments, he was drafted as chairman of the conference against his own desires. When the conference seemed on the verge of collapse in mid-April he offered a compromise which was the basis of final settlement in June. *(See* REPARATIONS AND THE DAWES PLAN.)

YOUNG, THOMAS (1773–1829), English man of science, belonged to a Quaker family of Milverton, Somerset, where he was born on June 13, 1773. At the age of fourteen he was acquainted with Latin, Greek, French, Italian, Hebrew, Arabic and Persian. He studied medicine in London, Edinburgh and Göttingen. In 1797 he entered Emmanuel College, Cambridge, and in 1799 he established himself as a physician in London. Appointed in 1801 professor of physics at the Royal Institution, in two years he delivered ninety-one lectures, which contain a remarkable number of anticipations of later theories. He resigned in 1803. In the previous year he was appointed foreign secretary of the Royal Society of which he had been elected a fellow in 1794. In 1816 he was secretary of a commission charged with ascertaining the length of the seconds pendulum, and in 1818 he became secretary to the Board of Longitude and superintendent of the National Almanac. He died in London on May 10,1829.

Young is best known for his work in physical optics, as the author of a series of researches which did much to establish the undulatory theory of light, and as the discoverer of the principle of interference of light. (See LIGHT and INTERFEROMETER.) He gave the word "energy" its present scientific significance and gave his name to Young's modulus. In 1793 he explained the mode in which the eye accommodates itself to vision at different distances; in 1801 he described the defect known as astigmatism; and in his lectures he put forward the hypothesis, afterwards developed by H. von Helmholtz, that colour perception depends on the presence in the retina of three kinds of nerve fibres which respond respectively to red. green and violet light. In physiology he made an important contribution to haemadynamics in the Croonian lecture for 1808 on the "Functions of the Heart and Arteries." In another field of research, he was one of the first successful workers at the decipherment of Egyptian hieroglyphic inscriptions. Some of his conclusions appeared in the famous article on Egypt which he urote in 1818 for the *Encyclopædia Britannica.*

His works were collected, with a *Life* by *G.* Peacock, in 1855.

YOUNGHUSBAND, SIR FRANCIS (EDWARD) (1863–1942), British soldier, explorer and author, was born at Murree, India, on May 31, 1863, and educated at Clifton and Sandhurst. He entered the army in 1882, and rose to the rank of lieutenant colonel in 1908. In 1886 he crossed the heart of central Asia, by crossing the Muztagh, the great mountain barrier between China and Kashmir. In 1890 he was transferred to the Indian political department, and in 1902 accompanied the British mission to Tibet, sent out to counteract the Russian influence on the dalai lama. The mission was ended by the treaty of Sept. 7, 1904, and Younghusband was made K.C.I.E. in the same year. His work during this period resulted in an extension of the Indian system of triangulation which finally determined the geographical position of Lhasa. He also proved that the Muztagh is the true water-divide west of the Tibetan plateau. Sir Francis returned to England in 1905 and was appointed Bede lecturer at Cambridge, but in 1906 he went to Kashmir as resident, remaining there until 1909. He travelled widely in India, Manchuria, China, Turkistan and South Africa. He was made K.C.S.I. in 1917. Sir Francis died July 31, 1942.

BIBLIOGRAPHY.—*Heart of a Continent* (1896); *Relief of Chitral* (1898); *South Africa of To-day* (1898); *Kashmir* (1909); *India and Tibet* (1912); *Within* (1912); *The Gleam* (1923); *Wonders of the Himalaya* (1924); *But in Our Lives* (1926); *The Epic of Everest* (1927); *The Light of Experience* (1927); *Life in the Stars* (1927); *Coming Country* (1929); *Dawn in India* (1930); *The Living Universe* (1933); *Modern Mystics* (1935); *A Venture of Faith* (1937); *The Sum of Things* (1939); *etc.*

YOUNG MEN'S CHRISTIAN ASSOCIATION, an organization for social and religious work among young men, founded in England in 1844 by George Williams (1821–1905). It grew out of meetings for prayer and Bible-reading which Williams held among his fellow-workers in a dry-goods business in the City of London. Similar associations had been founded earlier in Scotland. The distinctive feature of the movement was the combined interest in social and in religious welfare. It spread rapidly; branches were soon formed in France and Holland, and overseas in the United States, Canada, India and Australia. The first world conference was held in Paris in 1855.

The Y.M.C.A. expanded until, at the end of 1942, it was active in 56 countries, autonomously organized under the world committee at Geneva. There were more than 10,000 associations, employing almost 6,000 executive officers. The membership, according to the latest figures available in 1942, was 1,869,963, of whom 657,241 were boys. In the United States the Y.M.C.A. is usually regarded as a leading community institution, supported by citizens of all opinions. The value of its U.S. property and funds in 1942 was $259,740,300.

During World War II the Y.M C.A.'s of most of the British empire and China were engaged in direct service among the fighting forces, but in the United States the association united with five other agencies under the United Service organizations in performing such service. Throughout the British empire. in China and in many neutral countries, the Y.M.C.A. in 1942 was conducting religious, educational and recreational programs among four to six million prisoners of war.

YOUNGSTOWN, a city of north-eastern Ohio, U.S.A., on the Mahoning river, about equally distant (65 m.) from Cleveland and Pittsburgh; the county seat of Mahoning county. It has a municipal airport; is served by the Baltimore and Ohio, the Erie, the New York Central, the Pennsylvania, the Pittsburgh and Lake Erie and the Lake Erie and Eastern railways, two industrial belt lines, inter-urban trolleys, motor-bus and truck lines; and is on the route of the proposed barge canal from Lake Erie to the Ohio river. Pop. (1920) 132,258 (26% foreign-born white); 1940 federal census 167,720.

The city occupies 34.5 sq.m., lying on both sides of the river, at an altitude of 8j8 ft. at the public square. It is on the watershed between Lake Erie and the Ohio river, and is surrounded by rolling hills. The adjacent country is a fine agricultural region, rich in mineral resources. Youngstown is the centre of the third largest iron and steel district of the country, producing $\frac{1}{6}$ of all the pig iron and $\frac{1}{8}$ of all the steel made in the United States, and using annually more than 8,500,000 tons of iron ore from the Lake Superior mines. Coal comes in over short hauls, and the limestone needed is quarried in the vicinity. The output of the city's industries is valued at more than $425,000,000 annually.

The public square (given in 1802 by the founder of the city) is still the centre of municipal life. Facing it, or near by, are several of the older churches, several banks, stores and office buildings, the Stambaugh memorial auditorium, the Reuben Mc Millan free library (named after the first superintendent of schools), and the beautiful Butler Art institute, of Georgia marble. The parks of the city cover 2,513 ac. The character of the chief occupations is reflected in the preponderance of men in the population (115 males to 100 females in 1920), the very small proportion of women employed (18·5% of all ten years of age and over) and the very small proportion of children 10 to 14 years of age working for wages (2·5% in 1920). The city's assessed valuation for 1940 was $267,000,000. Bank debits for 1940 aggregated $645,643,517.22.

Youngstown was named in honour of John Young (1763–1825) of New Hampshire, who in 1796 bought a tract of land in the Western Reserve, on which the city now stands, from the Connecticut Land Company. The first settlement was made in 1796 by William Hillman. A township government was organized in 1802, the town was incorporated in 1848 and in 1867 it was chartered as a city. In 1876 the county seat was moved from Canfield to Youngstown; in 1879, after litigation, the legality of the change was confirmed. Iron was mined in the vicinity in 1803 by Daniel Eaton, who in 1804 built the first blast furnace north of the Ohio and west of Pennsylvania and in 1826

the first one within the present limits of Youngstown. As late as 1860 the population of the city was only 2,759. By 1880 it had grown to 15,435 and by 1900 to 44,885. The 20th century has been the period of rapid development. Between 1900 and 1920 the population increased threefold, and the area was enlarged in about the same ratio.

YOTJNG WOMENS CHRISTIAN ASSOCIATION, an organization founded in 18jj by two ladies simultaneously. In the south of England Miss Emma Robarts started a prayer union with a purely spiritual aim, and in London Lady Kinnaird commenced the practical work of opening homes and institutes for young women in business. In 1887 the two branches united in the Young Womens Christian association, which seeks to promote the all-round welfare of young women by means of residential and holiday homes, club and rest rooms, classes and lectures, and other useful departments. The association has spread all over the world, and the total membership is over half a million.

See article "Young Women's Christian Association," by Emily Kinnaird, in Hastings' *Encyclopaedia of Religion and Ethics,* vol. xii.

YPRES, JOHN DENTON PINKSTONE FRENCH, 1ST EARL OF (1852–1925), British soldier, was born at Ripple, Kent, on Sept. 28, 1852. The son of a naval officer, he entered the royal navy, in which he served as cadet and midshipman from 1866 to 1870. Joining the militia he passed from this into the army in 1874 and was gazetted to the 19th Hussars. He married Eleanora, daughter of R. W. Selby Lowndes in 1880. He served in the Nile expedition in 1884–5, and commanded his regiment from 1889 to 1893. After two years on the war office staff he commanded a cavalry brigade (1897–9), and on the mobilisation of the expeditionary force for S. Africa in 1899 he was chosen to command the Cavalry Division and was promoted major-general. Pending the assembly of this he served in Natal where he commanded the troops on the field at Elandslaagte and took part in the early combats near Ladysmith, but he proceeded to Cape Colony just before the place was invested. After a few weeks in charge of the force at Colesburg, he led the cavalry during Lord Roberts' advance from Cape Colony, relieved Kimberley, cut off the retreat of Cronje's army, and occupied Bloemfontein. During the subsequent advance into the Transvaal he was in command of the left wing, and at a later stage of the victorious campaign he played a prominent part in the move from Pretoria to Komati Poort. For these services he was given the K.C.B. During most of the second phase of the struggle he was in command of the forces operating against the enemy in Cape Colony, and he was on the conclusion of hostilities promoted lieutenant-general and was given the K.C.M.G.

He commanded at Aldershot from 1902 to 1907, in which year he was promoted general, and he then became inspector-general of the Forces for five years. He was appointed chief of the Imperial General Staff in 1912 and was promoted field-marshal in 1913. In April 1914 he vacated the post of C.I.G.S., owing to military troubles in Ireland in connection with Ulster, but four months later he was chosen to take charge of the Expeditionary Force on the outbreak of the World War, and he commanded the British Army on the Western Front from the outset of the struggle until the end of 1915. The terribly costly and somewhat fruitless advances of this year, culminating in Loos, provoked criticism at the time, and controversy has raged over French's share in them since. He certainly failed signally to harmonise with Kitchener at the War office. He resigned in December of that year, Sir D. Haig taking his place, and he returned to England, to be raised to the peerage as Viscount French of Ypres and High Lake. He then became commander-in-chief in the United Kingdom, and he held that appointment until May 1918, when he was selected to be lord lieutenant of Ireland. This position he occupied under most trying conditions until early in 1921. On resigning he was rewarded with an earldom. He died on May 22, 1925, at Deal Castle, Kent. At the end of the war, Lord French published his personal narrative under the title, *"1914."*

YPRES (Flemish *Yperen*), a town of Belgium in West Flanders, of which it was formerly considered the capital. Population 15,775. It is situated 35 mi. S. of Ostend and 12 mi. W. of Courtrai, on the Yperlée, a small river flowing into the Yser, both of which have been canalized. In the 14th century it ranked with Bruges and Ghent. Its fine Halles or cloth market, with a façade of over 150 yd., was begun in 1201, completed in 1304, and reduced to ruins in World War I. The cathedral of St. Martin dated from the 13th century, with a tower of the 15th century and was also ruined in 1914–18. Jansen, bishop of Ypres and the founder of the Jansenist school, is buried in the cathedral. For four war years (1914–18) the town was the centre of a salient of the British armies and was reduced to ruins, but was later largely rebuilt. The Menin Gate was built as a memorial to missing British soldiers. There are 40 cemeteries within two miles of Ypres.

YPRES, THE BATTLE OF, 1914, is the name given to the heavy but indecisive fighting near Ypres at the close of the "race to the sea" (Oct. 19 to Nov. 22, 1914). It is commonly spoken of as the First Battle of Ypres.

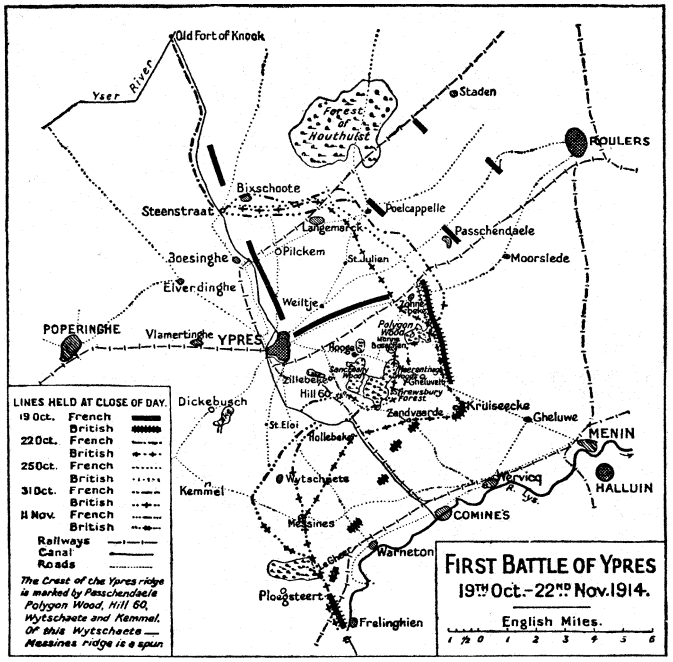
Genesis of the Battle.—When in Oct. 1914 the British Expeditionary Force under F.M. Sir John French left the Aisne front to be transferred to Flanders, its various corps, as they arrived in succession on the left of the Allied line, at once came into contact with the enemy, for each of the two belligerent forces was simultaneously extending its front northwards. Thus the II. Corps (Smith-Dorrien) on Oct. 10 began the "battle of La Bassée," and the III. Corps (Pulteney) and the Cavalry Corps (the 1st and 2nd Cavalry Divisions under Allenby), on Oct. 12–13, the battles of "Armentières" and "Messines." On Oct. 14–15 the IV. Corps (Rawlinson), the Belgian army and a French Marine brigade, falling back from Antwerp, and de Mitry's cavalry corps and two French Territorial divisions, coming up from the west between Ypres and the Belgians, completed the Allied line to the sea. Of this line, the British held the portion from the La Bassée canal to Langemarck, north of Ypres.

The co-ordination of the Allied operations in Flanders was placed by Gen. Joffre in the hands of Gen. Foch, and the general plan now adopted was for the British, supported by the French and Belgians, to advance from the neighbourhood of Ypres, break through the enemy's front, cut off any Germans between the gaps thus made and the sea, and then turn southward to roll up the German line.

The Opening of the Battle.—On Oct. 19, on the arrival behind Ypres of the I. Corps (Haig), Sir J. French sent forward Rawlinson's corps (consisting only of the 7th Division and the 3rd Cavalry Division) towards Menin, and directed Pulteney's and Allenby's corps to move down the Lys on both banks in the same direction. But on the day previous, the 18th, the enemy, with a general plan similar to that of the Allies, had also begun an advance, with a new IV. Army under Duke Albert of Württemberg, on a front from the Ypres-Gheluvelt (Menin) road to the sea. This army consisted of the new XXII., XXIII., XXVI. and XXVII. Reserve Corps composed of young volunteers with 25% of old soldiers and the III. Reserve Corps of three divisions which had besieged Antwerp. Thus, as the German VI. Army, under Crown Prince Rupprecht of Bavaria, south of the IV. Army, also attacked, battle was engaged on the 19th on the whole front from La Bassée to the sea. In the sector between the river Lys and the sea, the German XIX. Corps attacked the left wing of Wilson's division (4th) of Pulteney's corps; four German cavalry corps advanced against Allenby's two cavalry divisions; whilst of the 11 divisions of the German IV. Army, four were sent against Capper's division (7th) and Byng's cavalry division of Rawlinson's corps, two and one-half against the French north of Ypres, and four and one-half against the Belgians.

On Oct. 21, just as Haig's corps, which had been put in on the left of Rawlinson's, was making good progress towards Langemarck, the French on its left fell back before the enemy to the Ypres canal. Haig, with his flank thus exposed to the attack of the XXIII. Reserve Corps, whilst engaged with the XXVI. on his front, had to use his reserve to cover his left, and his advance, thus deprived of any fresh impetus, came to an end. Elsewhere, the British were opposed to at least double their numbers: Capper's division to the XXVII. Reserve Corps, the three British

cavalry divisions to eight German, and Wilson's division to the XIX. Corps. Nevertheless, they managed to hold their line unbroken on the 21st and 22nd. When on Oct. 23 the French IX. Corps (Gen. Dubois) reached Ypres and took over the Zonnebeke–Langemarck sector from Lomax's 1st Division of Haig's corps, a further slight advance was made; but the enemy was in superior numbers and had too much heavy artillery for any deci-



sive success to be obtained. On the 24th Duke Albrecht equally abandoned any hope of a break-through until he could be reinforced; but desultory fighting continued, and on the 26th Capper's division lost the Kruiseecke salient, south-east of Gheluvelt. Meantime, the Belgians had been hard put to it and on Oct. 27 let in the sea at Nieuport to form an inundation in front of their line along the Yser.

The Second German Offensive.--On the same day, the 27th, Gen. von Falkenhayn, the chief of the German general staff, issued instructions for a new attack with increased forces. Six fresh divisions, brought from quiet parts of the line, to form under Gen. von Fabeck, the right of the VI. Army, were on the 30th to take the place of the four cavalry corps and attack Ypres from the south-east for the purpose of breaking through on the front Messines—Gheluvelt, which was held by two of the three cavalry divisions, now all united under Allenby's command, and Capper's division. At the same time, all the German troops north of the La Bassée canal were ordered to make a general attack. The addition of six divisions to the Ypres front gave, excluding cavalry, the Germans 15½ to the French and British six and one-half; but their artillery was even more overwhelming, for Fabeck, apart from what the other German commanders before Ypres possessed, was allotted over 250 heavy and super-heavy guns and howitzers, to which the Allies could only oppose 50, and of these more than half were of old and obsolete patterns.

There was some preliminary fighting on the 29th, when the British lost a little ground near Menin road. On this date, the eve of the second German offensive at Ypres, the line was held from the Lys to Zonnebeke by part of Wilson's division, the cavalry corps and the 7th, 1st and 2nd Divisions, all three since the 27th under Haig, who henceforward commanded in front of Ypres. Thence Dubois's IX. Corps and de Mitry's cavalry corps carried it on to the canal. The greater part of the Allied front maintained its ground on the 30th, but, under the heavy pressure of the six fresh German divisions, Allenby's cavalry divisions and Capper's division were forced back to the Messines-Wytschaete ridge, losing Zandvoorde and Hollebeke. Further danger in this sector was averted by Gen. Dubois, at Haig's request, sending his own reserve of four battalions and three batteries to the assistance of the British cavalry, and Gen. Haig himself despatching first two battalions and later three more, under Maj.-gen. E. Bulfin.

Gheluvelt, Oct. 31.—Matters, however, became more serious on the 31st, when, after a heavy bombardment, a convergent attack of five German divisions and three brigades on Haig's three divisions broke the line on a two battalion front at Gheluvelt, despite the desperate resistance of the 1st Battalion of the Queen's, which was annihilated. Elsewhere the front held, but at Messines part of the village was lost, and immediately south of the Menin road the line was pushed back. The situation was critical, and just at this time the staffs of Lomax's and Monro's divisions of Haig's corps were nearly all killed or disabled by a shell that struck Hooge Chateau.

A counter-attack ordered by Brig.-gen. H. Landon (3rd Brigade) drove back the Germans who had advanced from Gheluvelt along the Menin road; the village itself was recovered owing to the stout defence of the 1st South Wales Borderers north of the break. who held on to the park and chateau to the north of the village until a determined counter-attack of the 2nd Worcestershires initiated by Brig.-gen. C. Fitzclarence (1st Brigade) recaptured it; whilst south of the road a third counter-attack by the 2nd Royal Sussex, 1st Northamptonshire, and and Gordon Highlanders, under the orders of Maj.-gen. E. Bulfin, regained all the ground that had been lost there, and more. At night, however, a retirement was made to a selected line east of Gheluvelt.

French Reinforcements.--On Nov. 1 the Germans continued to attack, and Messines was lost by Allenby's cavalry corps, but the French XVI. Corps (32nd, 39th and 43rd Divisions under Gen. Grossetti) arriving to relieve the cavalry, greatly strengthened the defence. Wytschaete and the rest of the ridge, however, were lost by the French next day. The Allied line was now held by the British and French alternately: from the Lys to opposite Messines by the British; thence as far as the Ypres-Comines railway by the French; thence along the front of Shrewsbury forest and Polygon wood to Zonnebeke by Haig's three divisions; and thence to the canal, by the French again; and this rematned the distribution until the end of the battle. During Nov 3, 4 and 5 the German attacks somewhat died down; a composite division of Smith-Dorrien's II. Corps (under Maj.-gen. F. W. D. Wing) and the French 11th Division reinforced the Allies. But this assistance was counter-balanced by three out of five German divisions on the Belgian front being brought down against Ypres.

The Final German Effort.—The German supreme command now decided to attack the haunches of the Allied salient round Ypres from the north-east and south-east. Four more divisions, including a composite one of the Guard Corps, and the 4th (Pomeranian), one of the best in the whole army, were despatched to the sector with more heavy artillery. On the 4th, Crown Prince Rupprecht was given a definite order to break through south-east of Ypres, and whilst this offensive was in preparation to continue attacks all along the line, and the Duke of Wiirttemberg was ordered to move against the north-east part of Ypres. During the 6th, 7th, 8th and 9th the Germans managed to make a little progress at several points; they gained Le Gheer on the edge of Ploegsteert wood, and Zwarteleen near Hill 60, barely 2m. from Ypres; but elsewhere they were repulsed with heavy loss, and Grossetti's corps recovered ground lost between Wytschaete and St. Eloi. On the 10th, after a long and desperate defence, Dixmude (13m. north of Ypres) was lost by the Belgians, and a very heavy attack was delivered against the French on the north-east and north of Ypres which gained a small amount of ground.

The Prussian Guard Attack on Nov. 11.—On Nov. 11 at 6:30 A.M., on a dark and misty morning, the German artillery opened a terrific fire, increasing in intensity as 9 A.M. approached, at which hour the German infantry, under cover of the mist, advanced to the assault on the Lys-Polygon wood front. The British were weary with three weeks' continuous fighting without reliefs, the French nearly as tired. But, in spite of the German numerical superiority—23 divisions to 9½, with cavalry in about the same proportion—the Allied line resisted the enemy's repeated assaults except at two places—just north of the Menin canal,

where a detachment of Dubois's IX. Corps was driven back, and just north of the Menin road. South of and across this road, where the German 4th Division and Winckler's Guard Division attacked, a front of about 2m., stood Wing's composite division of Smith-Dorrien's II. Corps, its battalions so weak that it was about the strength of a brigade, the 2nd K. O. Scottish Borderers on the right, then the 2nd R. Irish Rifles, 1st Gordon Highlanders, 1st Cheshire, 2nd Bedfordshire, 1st Lincolnshire, 1st Northumberland Fusiliers, 4th Royal Fusiliers, and 2nd Duke of Wellington's. North of the road was Fitzclarence's brigade of the 1st Division (the 1st Scots Guards, 2nd Cameron Highlanders and 1st Black Watch), 800 men in all, with the 1st King's of Monro's division in Polygon wood beyond them. By the mere weight of the advance of the German 2nd Guards Brigade (six battalions of the 1st and 3rd Foot Guards Regiments), the front and support lines of Fitzclarence's three Scots battalions were overwhelmed. The attack passed over them, but fire from the 1st King's in Polygon wood, from three strong points (small defended posts with all-round defence) which formed Fitzclarence's third line of defence, and from various battalion headquarters in farms put in a state of defence, then held the Germans up and took heavy toll of them. About 400 or 500, however, pressed on into the Nonne Bosschen (wood), only to be met by the point-blank fire of Haig's field artillery in action beyond it; and the rifle-fire of some artillery men and engineers, including cooks and grooms, hastily collected. The final discomfiture of the German Guards was completed by a counter-attack of the 2nd Oxfordshire and Buckinghamshire through the Nonne Bosschen.

The Close of the **Battle.**—On the next day, Nov. 12, the weather began to break and become wintry; nevertheless, on this and the following days the Germans made several further attacks against the French in the Wytschaete area and against Wing's division south of the Menin road. These did not alter the situation, and the fighting then died down, and both sides set about completing their defences. With the end of the First Battle of Ypres, on the 22nd, open warfare ceased, and the operations of siege warfare, so-called trench warfare, begun on the Aisne in September, prevailed along the whole western front.

Opposed to more than double its own numbers, the British Expeditionary Force had held its own by sheer good shooting and superior training, and the skilful use by Gen. Sir Douglas Haig of his very small reserve. But such heavy losses had been incurred in the five weeks' battle and in the fighting at La Bassée and Armentières, which went on during the same period, that of the original British Expeditionary Force of fully trained officers and men very few remained, and for the future the empire was dependent on three divisions from overseas garrisons, on Territorial and New Army divisions, and dominion troops.

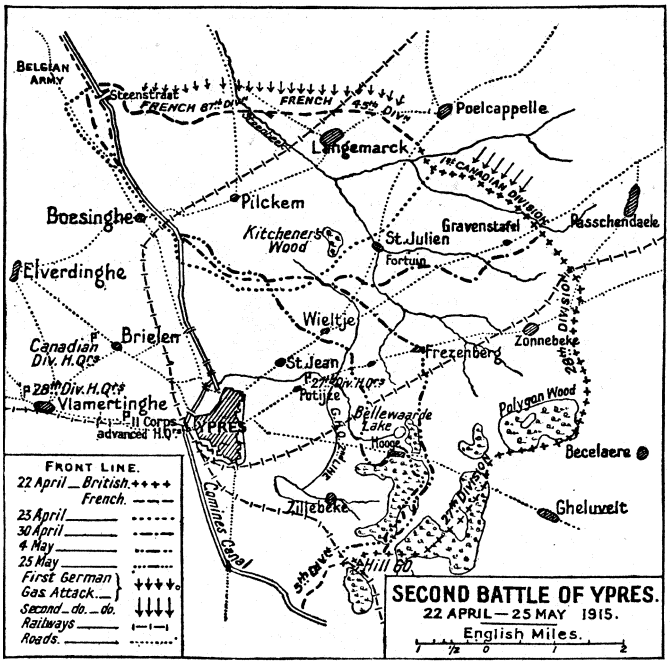
YPRES, THE BATTLES OF, 1915, commonly called the second battle of Ypres, comprise the period of severe fighting that took place in front of Ypres beginning on April 22 with the first gas attack and continuing to May 25, 1915. It resulted in heavy casualties and considerable loss of ground round the town of Ypres, the base of the Allied salient, measured along the Ypres canal, being reduced from 8m. to 5½m., and its maximum depth from 6m. to 23 miles.

Phases of the Battle.—For the purposes of general description, the battle is best divided into five phases (see sketch map): (1) the first German attack on April 22 against the French, resulting in the loss of the Pilckem area; (2) the second attack on April 24 against the Canadian Division, resulting in the loss of the St. Julien-Gravenstafel area; (3) the fruitless British counter-attacks; (4) the British withdrawal to the Frezenberg line, abandoning the Zonnebeke area; and (5) the renewed German attacks (Frezenberg-Bellewaarde), resulting in further loss by the British of a narrow belt of ground.

The Situation Before the Battle.—During the winter of 1914–15 the German Supreme Command had decided to carry out an offensive against Russia in 1915, and to stand on the defensive in the western theatre, leaving only sufficient troops there to hold the line. No general attack at Ypres was contemplated. It was, however, desired to try a new weapon, gas, thoroughly in the field, and the Ypres front was selected for the purpose on the advice of the German meteorological experts. Duke Albrecht of Wiirttemberg commanding the IV. Army, which held



the sector from the Comines-Ypres canal to the coast, proposed to turn the use of gas to local advantage, to improve his position. If he could obliterate the Ypres salient and drive the Allies beyond the canal, he would deprive them of a bridgehead which gave them facilities for attack. The duke's forces consisted of the XV. Corps, the four new Reserve Corps, XXVII., XXVI., XXIII. and XXII., and two Ersatz and two *Landwehr* brigades which had fought at the first battle of Ypres. The Marine Division guarded the Belgian coast.

The Allied line from the Comines canal northward was held by part of the 5th Division (Morland), as far as Hill 60; the 27th Division (Snow); the 28th Division (Bulfin); and the 1st Canadian Division (Alderson). The last three formed the II. Corps (Plumer) of the II. Army (Smith-Dorrien). The 27th and 28th Divisions had been formed of troops from Indian and overseas garrisons, but, having suffered heavily from the winter conditions in Flanders, contained in April a considerable proportion of partially trained reinforcements. The Canadian Division had reached England in Oct. 1914, and had embarked for France in Feb. 1915. After being in the line at Neuve Chapelle, it had, between April 1j and 17, relieved French troops covering Ypres. The front defences taken over by the II. Corps were poor, but there was a well-developed back line known as "the G.H.Q. Line." The left of the Canadians extended as far as the Ypres—St. Julien—Poelcappelle road, beyond which were two French divisions under Gen. Putz: the 45th Division, which had arrived on April 16, containing nine newly raised Zouave battalions and three battalions of African natives, these latter being in the line; and the 87th Territorial Division, a division of elderly reservists.

The First Gas Attack.—On April 22, after an afternoon of comparative quiet, suddenly at 5 P.M. a yellowish cloud—now known to have proceeded from chlorine gas released from cylinders in the trenches—was seen to form on the German front opposite the African troops and French Territorials. It blew slowly towards them, whilst the German artillery opened with every kind of gun, firing on the French troops with shrapnel and bombarding all the villages in the salient and the town of Ypres with high-explosive shell. The French infantry in the line fled beyond the canal, leaving their artillery to be captured, abandon

ing a large area of ground and entirely exposing the British left flank (*see* sketch map). Fortunately for the Allies, the enemy had begun his attack so late in the afternoon that in the dusk he did not discover his immense success. Content with having secured Pilckem ridge and establishing outposts beyond it, about 7.30 P.M., according to plan, as it is asserted, but more probably in consequence of the stout defence put up by various small Canadian detachments, the Germans ceased any attempt to push into the gap, except at Steenstraat.

Gen. Plumer and his divisional commanders hurried what available troops they had to cover the gap, and when Gen. Putz in the course of the evening informed Gen. Smith-Dorrien that he meant to counter-attack at 4.30 A.M., and requested that the British should assist, arrangements were made to co-operate. But no movement of the French took place, nor were they in the succeeding days able to make any serious effort to recover the ground they had lost on the eastern bank of the canal.

Several counter-attacks were made by the British on April 23 to regain the ground lost by the French. They were carried out by the Canadians, the 13th Infantry Brigade, and Geddes's detachment—a temporary formation composed of six battalions of the 27th and 28th Divisions—without avail. The forces were too small, and there was not sufficient artillery or ammunition to support them. The Germans did no more than repel the counter-attacks on the 23rd, but from the 24th onward proceeded to follow two objectives: first to roll up the flank of the British line, aiming to get behind the troops still in position; secondly, to increase their gains across the canal near Steenstraat and separate the Belgians from the French and British. By the division of their forces, they failed to achieve either purpose.

The Second Gas Attack.--On April 24, at 4 A.M., the enemy released gas against the front of the 2nd and 3rd Canadian Brigades. In spite of having only extemporized means of protection (handkerchiefs, linen bandoliers, etc., dipped in water), they held fast for a time, but the enemy, after breaking in at one place, enlarged his gains, and the 3rd Canadian Brigade was gradually forced back, involving in the retirement through St. Julien the troops on the new left flank that had been built up. Gen. Snow, the only divisional general who had his headquarters east of the canal, at Potijze, took charge of the defence, and such reserves as could be hurried up were eventually placed by Gen. Plumer under his command, as communication across the canal between the headquarters of the other commanders and their troops was constantly interrupted. Although the Germans were driven out of St. Julien by a counter-attack of two battalions of the York and Durham Infantry Brigade of the Northumbrian (Territorial) Division, another large piece of the salient was lost, and after further German attacks on the 25th, Gravenstavel was abandoned, and the British line ran from the original left of the 28th Division past St. Julien, almost due west to the canal.

The British Counter-Attacks.—Counter-attack after counter-attack was now made by fresh troops hurried up to Ypres, the 11th Infantry Brigade (4th Division), the Lahore Division and the Northumberland Infantry Brigade (Northumbrian Division) with assistance on the left from the French. All were without success; they found the enemy well entrenched, and their only result was heavy casualties. In the operations of April 26, when some of the French 45th Division co-operated on the left of the Lahore Division, the Germans opened a few gas cylinders in defence, and hroke the attack; whilst on the 27th gas shelling alarmed the African natives and caused them a second time to retreat in panic.

The position of the British troops in the narrow salient, projecting 6m. in front of Ypres and only some 3m. across was obviously untenable, as it was surrounded on three sides by the enemy and subject to constant bombardment. Gen. Smith-Dorrien proposed to withdraw to a line nearer Ypres. In consequence, however, of Gen. Foch's protests and promises that the French would regain the ground they had lost, and of the political desirability of not abandoning any more Belgian territory if it could be avoided, Sir John French agreed to leave his troops in their exposed position for some days longer. Gen. Joffre, having in preparation his great offensive which was to begin on May 9, near Arras, was not disposed to allow Gen. Foch to employ any more troops near Ypres; and the French attacks languished.

The Withdrawal from the Apex of the Salient.—When on May 1 the French infantry in a projected attack failed to leave their trenches, all hope of their recovering ground came to an end, and Sir John French directed Gen. Plumer, who by his orders was now in special charge of the operations near Ypres, to begin the retirement to the Frezenberg line, abandoning a zone some 2m. deep. This retirement was carried out with complete success by the infantry brigades of the 27th, 28th and 4th (which had replaced the Canadian) Divisions in the line on the nights of May 1–2, 2–3, and 3–4. The French now held the 1½m. of the left of the new semicircle round Ypres.

The Renewed German Attacks.—All hope of obtaining victory by gas attacks having disappeared, as the Allies were prepared for them, the Germans now tried by sheer weight of artillery to drive the British off their new position. After finally getting possession of Hill 60 on May 5–6, they made carefully prepared attacks on May 8 and on May 24. In spite of splendid defence and desperate British counter-attacks, in which the 4th, 2jth, 28th, and Northumbrian Divisions and the Cavalry Corps troops were engaged, the enemy, dominating the situation with heavy artillery, gained a small amount of ground. Meanwhile, on the night of May 15–16, he had been compelled by the French to abandon his position on the western bank of the canal. On May 2j, after the II. Corps had established itself on a strong line, the Germans brought the battle to a close.

The total British losses in the Ypres and Hill 60 fighting were 2,150 officers and 57,125 other ranks, the total killed being 10,519. The German losses on the Allied front were returned at 860 officers and 34,073 other ranks.

See "Military Operations, France and Belgium, 1915," History of *the Great War based on Official Documents*, vol. i., with a bibliography (1927); Palat, *Grande Guerre sur le front Occidental*, vol. ix. (1922); M. Schwarte, Der *deutsche Landkrieg*, vol. ii. (1923). The French and German official accounts are not yet available. but official information furnished in advance is included in the British account. (J. E. E.)

YPRES, BATTLES OF 1917. Almost continuous fighting took place in the Ypres-Yser region during many weeks in the summer and autumn of 1917, but the operations as a whole may be said to have consisted of two distinct phases. First came the brilliantly successful combat, lasting a few hours, which has come to be known as the battle of Messines. Then, after a lull, there came to be launched immediately north of the scene of the Messines victory a series of attacks at short intervals which lasted four months. This was not a battle, but rather a campaign, with the fighting more defined than the purpose—of the nature familiar in the military annals of Flanders and the Low Countries generally. Like its German forerunners of 1914 and 1915, it achieved little except loss—in which, again, it repeated the earlier history of this theatre of war. So fruitless in its results, so depressing in its direction was this 1917 offensive, that "Passchendaele" has come to be, like Walcheren a century before, a name of ill-omen and a synonym for military barrenness.

An offensive in this sector had formed part of Haig's original contribution to the Allied plan for 1917. Its actual inauguration had been postponed by the unfortunate turn of events elsewhere. When the ill-success of the opening offensive in the spring at Arras (*q.v.*) and in Champagne (*q.v.*) was followed by the threatened collapse of the French army as a fighting force, Haig's "first-aid" treatment was to allow the British offensive at Arras by the III. Army to continue for some weeks longer, with the general object of keeping the Germans occupied, and with the local object of reaching a good defensive line. When successive thrusts, against an enemy now fully warned and strengthened, failed to reach this line, Haig decided to transfer the main weight of this effort northward to Flanders, as he had originally intended. His loyalty to his Allies and his acute sense of the common interest, inspired him to press on with an offensive policy.

It is right to emphasise that in May Haig's opinion of the policy to pursue was reinforced by the Prime Minister, Lloyd George, who, having committed himself to the Nivelle gamble for victory

was equally ardent to continue the offensive. It is true, however, that on cooler reflection he subsequently tried in vain to check the policy which he had countenanced.

British Objectives.—The aim was the occupation of the whole of the belt of high ground which extends from a point about three miles north of Armentières, to near Dixmude. It rises some 100 to 150 ft. above the great Flanders plain, and reaches a height of over 200 ft. at some points. In the spring of 1917 its southern portion enclosed to a great extent the Ypres salient, although the Allies' trenches gave them possession of the lower slopes of their side of the high ground. Farther to the north the enemy held the whole of the high ground. The general plan of operations was to begin at the southern end and to work thence northwards. The capture of the high ground was to be followed by an advance in the coast district. But the axis of the attack diverged from, instead of converging on, the German main communications, so that an advance could not vitally endanger the security of the enemy's position in France.

But, worse still, the Ypres offensive was doomed before it began—by its own destruction of the intricate drainage system in this part of Flanders. The High Command had persevered for over two years with the method of a prolonged preparatory bombardment, believing that quantity of shells was the key to success. The offensive at Ypres, which was finally submerged in the swamps of Passchendaele in October, threw into stronger relief than ever before the fact that such a bombardment blocked the advance for which it was intended to pave the way—because it made the ground impassable.

THE BATTLE OF MESSINES

The preliminary move is known as the Battle of Messines, and its purpose was to gain the high ground about Messines and Wytschaete as a flank bastion for the subsequent advance from Ypres. For while in German possession it gave the enemy complete observation of the British trenches and forward battery positions, enabled them to command the British communications up to the Ypres salient, and to take in enfilade, or even in reverse, the trench positions therein. General Plumer and his II. Army, who had been acting as wardens of the Ypres front for two years, had been selected to carry out this operation, while the V. Army under General Gough had been transferred from the Somme to hold the line north of the II. Army. Preparations for the undertaking had begun nearly a year before although their real development dated from the winter. Thus when Haig asked Plumer, on May 7, when he would be ready to deliver the attack Plumer was able to say, "a month from to-day," and to keep his promise.

Messines was to be a strict siege operation, the capture of a fortified salient at the minimum cost of lives by the maximum substitution of mind (care in preparation) and material for manpower. Mines, artillery, gas and tanks all contributed. But a contrary wind curtailed most of the scheme of gas projection, and the effect of the mines and artillery was so overwhelming that the tanks were hardly needed. On the centre corps front alone, of about three miles, a total of 718 guns and howitzers, 192 trench mortars, and 198 machine-guns was concentrated.

For the defence of this salient the Germans depended on two separate trench systems coinciding in trace with its arc, the more advanced one pushed down the forward slope of the high ground while the rear one followed its crest; they had also constructed two chord positions, stretching along the base of the salient on the reverse slope. The troops of the II. Army detailed for the enterprise were, from right to left, the II. Anzac Corps, with the Australian 4th Division in support, the IX. Corps with the 11th Division in support, and the X. Corps with the 24th Division in support. There were thus nine divisions in front line and three in support. The fact that the attack would converge against a salient increased its chances, but it complicated the staff, troop, and artillery organization of the attack. For the sectors of each attacking corps were of varying depths, and contracted more and more in width up to the final objective which was the chord of the arc forming the salient. As, however, it was a siege operation, without any attempt at exploitation or a break-through, it was easier to avoid the congestion which had occurred at Arras (*q.v.*). The problem was further simplified by the plan of allotting sectors so that five of the divisions had sectors of equal breadth from front to rear, while the four which filled the interstices had smaller tasks. Further, when the main ridge was captured, fresh troops were to "leapfrog" through to gain the final Oosttaverne line across the base of the salient. The first bombardment and "wire-cutting" began on May 21, were developed on May 28 and culminated in a seven days' intense bombardment, mingled with practice barrages to test the arrangements. The loss of surprise did not matter at Messines as it was a purely "limited" attack.

At 3.10 A.M. on June 7 the nineteen mines--one only had previously been blown by the enemy—were exploded, wrecking large portions of the Germans' front trenches. Simultaneously the barrage fell. When the débris and shock of the mines subsided, the infantry advanced and within a few minutes the whole of the enemy's front line system was overrun, almost without opposition. Resistance stiffened as the penetration was deepened, but the training of the infantry and the efficiency of the barrage enabled continuous progress to be made, and within three hours the whole crest of the ridge was secured.

The New Zealand Division had cleared the intricate fortifications of Messines itself—here the pace of the barrage was regulated to 100 yards in fifteen minutes instead of the general pace of 100 yards in three minutes. The garrisons of Wytschaete and the White Chateau held out for a time, but the first village was captured after a fierce struggle by troops of the 36th (Ulster) and 16th (Irish) Divisions in a combined effort—a feat of symbolical significance. Perhaps the most difficult sector was that of the 47th (London) Division, which had not only to overcome the highly fortified position of the White Chateau but had the Ypres-Comines canal as an oblique interruption across its line of advance. The Londoners, however, overcame both and by 10 A.M. the objective of the first phase was reached along the whole attacking line. While it was being consolidated, over forty batteries were moved forward to support the next pounce.

At 3.10 P.M. the reserve divisions and tanks "leap-frogged" through and within an hour almost the whole of the final objective was captured. Some 7,000 prisoners had been taken, apart from dead and wounded. The success had been so complete that only feeble counter-attacks were attempted that day. When the expected general counter-attack was launched on the whole front on the morrow, it failed everywhere against defences that had been rapidly and firmly organized, and in the recoil yielded the British still more ground.

THE MAIN OFFENSIVE

A long pause now occurred while preparations for carrying out the rest of Haig's programme were being completed. Although Plumer's victory of June 7 had put an end to the enemy overlooking Ypres from the south, the Germans still, in a measure, dominated the place from the east, from the north-east and from the north. Thus the preparations could not be concealed and the Germans knew that they were being made. The plan at the outset was that, while the II. Army stood fast, the V. Army under Gough on its left with the French I. Army still further to the left, should attack the enemy front from near Hooge to north of Steenstraat on the Yser canal.

Nearly two months passed before the preparations for the main advance were completed. This gave the Germans, amply warned, time to make counter-preparations of characteristic thoroughness and ingenuity. Having learnt by experience that a continuous system of trenches did not offer a satisfactory form of defence unless there was abundant underground cover, and realizing that the waterlogged soil of Flanders handicapped the creation of subterranean galleries, they had established a system of numerous disconnected trenches and strong points, arranged in depth rather than in breadth, together with numbers of concrete blockhouses armed with machine-guns. As their front line near Ypres had been in existence since 1915, they trusted to the old system to meet the first shock of attack, and it was rather in the

later offensive operations that the Allies found themselves confronted with these new defensive devices. A further new asset was the introduction of mustard gas which the Germans used to cause serious interference with the attackers' artillery.

On July 22 the bombardment opened, by 2,300 guns, to continue for ten days, until on July 31 the infantry advanced on a fifteen-mile front to the accompaniment of torrential rain. On the left substantial progress was made, Bixschoote, St. Julien, and the Pilckem Ridge being gained, and the line of the Steenbeke reached But in the more vital sector round the Menin road the attack was repulsed.

The second blow, on Aug. 16, was a diminished replica of the first in its results. The left wing was again advanced across the shallow depression formed by the little valley of the Steenbeke and past the ruins of what had been Langemarck. But on the right, where alone an advance might have a strategic effect, a heavy price was paid for nought, and even the tally of prisoners shrank to a mere two thousand. Nor did men feel that the enemy's skilful resistance and the mud were the sole explanation of their fruitless sacrifice. Severe complaints against the direction and staff work were general, and their justness seemed to receive recognition when Haig extended the II. Army's front northward to include the Menin road sector, and thereby entrusted to Plumer the direction of the main advance towards the ridge east of Ypres.

It was a thankless task at the best, for the experience of war attested the futility of pressing on in places where failure had already become established, and it seemed heavy odds that the laurels earned by Messines must become submerged in the swamps beyond Ypres. Yet, in the outcome, the reputation of Plumer and the II. Army staff, headed by Harington, was enhanced—less because of what was achieved in scale than because so much more was achieved than could reasonably have been expected.

Bad weather and the need for preparation delayed the resumption of the offensive until Sept. 20, but that morning the II. Army attack, on a four-mile front, achieved success in the area of previous failure—on either side of the Menin Road. Fractions of six divisions, the 19th, 39th, 41st, 23rd, 1st and 2nd Australian advanced at 5.40 A.M.; by 6.15 A.M. the first objective was gained almost unopposed, and, with the exception of one or two strong points, the third and last objective was gained soon after midday, and the counter-attacks were repulsed by fire. A fresh spring on Sept. 26, and another on Oct. 4—the last a larger one on a six-mile front, by troops of the 37th, 5th, 21st, and 7th Divisions, the 1st, 2nd, and 3rd Australian Divisions, and the New Zealand Division—gained possession of the main ridge east of Ypres, with Gheluvelt, Polygon Wood, and Broodseinde, despite torrents of rain, which made the battlefield a worse morass than ever. On each occasion the majority of the counter-attacks had broken down under the British fire, a result which owed much to the good observation work of the Royal Flying Corps and the quick response of the artillery. Some 10,000 prisoners were swallowed in the three bites, and this frightened the enemy into modifying his elastic tactics and strengthening his forward troops—to their increased loss.

As a result of the operations begun on June 7 the crest of the long belt of high ground overlooking the Flanders plain had now, after four months of intermittent fighting, been secured from Messines northwards to within a few hundred yards of the Ypres-Roulers railway. And yet, regarding this Flanders offensive as a whole, the work was in reality only begun. The Houthulst forest, with the long line of high ground forming the quadrant of a circle beyond it, was still in the enemy's hands. Until the ridge had been secured to the vicinity of Staden it would be premature to embark upon the second part of the general scheme of operations—an attack on the German positions along the coast between Nieuport and Ostend, for which the IV. Army under General Rawlinson had been assembled on the extreme left.

Unhappily, the Higher Command decided to continue the pointless offensive during the few remaining weeks before the winter, and thereby used up reserves which might have saved the belated experiment of Cambrai (*q.v.*) from bankruptcy. Having wasted the summer and strength in the mud, where tanks foundered and infantry floundered, they turned in November to dry ground—where a decisive success went begging for lack of reserves.

At Ypres minor attacks on Oct. 9 and 12 advanced the line a trifle, and then, after an interval, a combined attack by the V. Army and the French was tried, with small result, on Oct. 22. On Oct. 26 the II. Army, in torrents of rain, as usual, made a fresh effort, which was less successful than before, owing to the exhaustion caused by pushing forward over a morass and to the fact that the mud not only got into and jammed rifles and machine-guns but nullified the effect of the shell-bursts. The trials of the attackers were augmented by the enemy's increasing use of mustard gas, and by his renewed adoption of his tactics of holding the bulk of his troops well back for counter-attack. Thus when, on Nov. 4, a sudden advance by the 1st Division and 2nd Canadian Division gained the empty satisfaction of occupying the site of Passchendaele village, the curtain was at last rung down on the pitiful tragedy of "Third Ypres." It was the long-overdue close of a campaign which had brought the British armies to the verge of 'exhaustion, one in which had been enacted the most doleful scenes in their history, and for which the only justification evoked the reply that, in order to absorb the enemy's attention and forces the Higher Command had chosen the spot most difficult for the defender and least vital for the attacker.

(B. H. L. H.)

YPSILANTI or HYPSILANTI, the name of a family of Phanariot Greeks claiming descent from the Comneni. ALEXANDER YPSILANTI (1725–1805) was dragoman of the Porte, and from 1774 to 1782 hospodar of Wallachia. He was again appointed hospodar just before the outbreak of the war with Austria and Russia in 1790. He allowed himself to be taken prisoner by the Austrians, and was interned at Briinn till 1792. Returning to Constantinople, he fell under the suspicion of the sultan and was executed in 1805. His son CONSTANTINE (d. 1816), who had joined in a conspiracy to liberate Greece and, on its discovery, fled to Vienna, had been pardoned by the sultan and in 1799 appointed by him hospodar of Moldavia. Deposed in 1805, he escaped to St Petersburg, and in 1806, at the head of some 20,000 Russians, returned to Bucharest, where he set to work on a fresh attempt to liberate Greece. His plans were ruined by the peace of Tilsit; he retired to Russia, and died at Kiev. He left five sons, of whom two played a conspicuous part in the Greek war of independence.

ALEXANDER YPSILANTI (1792–1828), eldest son of Constantine Ypsilanti, accompanied his father in 1805 to St. Petersburg, and in 1809 received a commission in the Imperial Guard. He fought with distinction in 1812 and 1813, losing an arm at the battle of Dresden. He was one of Alexander's adjutants at the congress of Vienna. In 1820, on the refusal of Capo d'Istria to accept the post of president of the Greek *Hetairia Philike,* Ypsilanti was elected, and in 1821 he placed himself at the head of the insurrection against the Turks in the Danubian principalities. With other Greek officers in the Russian service he crossed the Prath on March 6, announcing that he had the support of a "great power." There followed a series of humiliating defeats, culminating in that of Dragashan on June 19. Eventually he crossed the frontier into Austria in the hope of finding an asylum. He was immediately thrown into prison, where he remained for seven years. He died at Vienna on Jan. 31, 1828.

DEMETRIOS YPSILANTI (1793–1832), second son of Prince Constantine, fought as a Russian officer in the campaign *of* 1814, and in the spring of 1821 went to Morea, where the war of Greek independence had just broken out. In January 1822 he was elected president of the legislative assembly; but retired early in 1823. In 1828 he was appointed by Capo d'Istria commander of the troops in East Hellas. He succeeded, on Sept. 25, 1829, in forcing the Turkish commander Aslan Bey to capitulate at the Pass of Petra, which ended the active operations of the war. He died at Vienna on Jan. 3, 1832.

See the works cited in the bibliography of the article **GREEK** INDEPENDENCE, WAR OF, especially the *Δοκίμιονἱστορικὸν* of J. Philemon.

YPSILANTI (ĭp-sĭ-lăn′tĭ), a city of Washtenaw county, Michigan, U.S.A., on the Huron river, 713 ft. above sea-level,

30 mi. W. by S. of Detroit. It is on federal highway 112 and state highway 17 and is served by the New York Central railway and numerous truck and bus lines. The population was 7,413 in 1920 (83% native white) and was 12,121 in 1940 by the federal census. It is the seat of Michigan State Normal college (1849) and Cleary college (1883) with combined enrolment of 2,300. The city's assessed valuation for 1940 was $10,349,550 and the output of its 21 diversified manufacturing plants was valued at $4,140,000. Ypsilanti was laid out in 1823 and named after the Greek patriot. It was incorporated in 1832 and chartered as a city in 1858.

YPURINAN, a small group of tribes of South American Indians, forming an independent linguistic stock. The Ypurinas (Hypurinas) live in western Brazil, on the upper Purus and Acre rivers. They are forest rather than river Indians.

See W. Chandless, "Notes on the Tapajos, Purus and Aquiry" (J. Roy. Geog. *Soc.* vol. xxxvi., xxxix.); J. B. Steere, "Narrative of a visit to Indian Tribes of the Purus River, Brazil" (U.S. *Nat.* Museum, *Rep.* 1901).

YSAŸE, EUGÈNE (1858–1931), Belgian violinist, was born at Liége in 1858, where he studied with his father and under R. Massart, at the Conservatoire, until he was fifteen; he had some lessons from Wieniawski, and later from Vieuxtemps. In 1879 Ysaÿe played in Germany, and next year acted as leader of Bilse's orchestra in Berlin; he appeared in Paris in 1883, and for the first time in London at a Philharmonic concert in 1889. He was violin professor at the Brussels Conservatoire from 1886 to 1898, and instituted the celebrated orchestral concerts of which he was manager and conductor. Ysaye first appeared as conductor before a London audience in 1900, and in 1907 conducted Fidelio at Covent Garden. The sonata concerts in which he played with Raoul Pugno (b. 1852), the French pianist, became very popular in Paris and Brussels, and were notable features of several London concert seasons. As a violinist he ranks with the finest masters of the instrument, with extraordinary temperamental power as an interpreter. During the war he went to America, and for some time conducted the Cincinnati orchestra. He has received many orders and decorations, including the Legion of Honour. His compositions include *Poème élégiaque* for violin and orchestra and other pieces for violin, violoncello, etc. Ysaÿe died May 12, 1931. His brother THEOPHILE YSAŸE (1865–1918), pianist and composer, was born at Verviers in 1865. He studied at Liége and in Berlin, and finally in Paris under César Franck.

YSER, a small coastal river, 78 km. long, of which 50 km. are in Belgian territory. It is famous as marking the point, in the World War (1914–18), at which the German advance towards Calais and the English coast was checked. On Oct. 10, 1914, the Belgian army, after being forced to evacuate Antwerp and Ghent, retreated on the Yser; on the 16th the battle of the Yser began, and the Allied troops fought desperately for 15 days. Eventually, assisted by the floods which, beginning on Oct. 29, reached Dixmude by Nov. 2, the allies succeeded in establishing themselves in an impregnable position on the left bank of the Yser.

YSER, BATTLE OF THE. On Oct. 10, 1914, the Belgian field army encamped on the west bank of the Ghent-Terneuzen canal (see ANTWERP, SIEGE OF). The British Naval Division, which had embarked at St. Gilles-Waes, regained Dunkirk except two battalions, which were cut off, and passed into Holland; the French Fusilier Marine Brigade, half of the British 7th Division and the 4th Belgian Brigade were holding Ghent and had repulsed an attack on that city by the 1st Res. Ersatz Brigade. Information had been received that a Bavarian cavalry division had advanced towards Deynze exploring between the Schelde and the Lys; that a column of 20,000 men had passed through Courtrai and Menin and that the German IV. Cavalry Corps was holding the region Tourcoing-Ypres-Poperinghe. The only way for the Belgian army to baffle the threat of envelopment on a large scale was an immediate march to the coast. It was decided to transport all the forces without delay to the region of Ostend-Thourout-Dixmude-Furnes, the infantry by rail, the artillery and transport by road, under the protection of all the cavalry and Rawlinson's Corps.

Plans of Opposing Commanders.—The "race to the sea" had in the meantime caused the Western Front to extend to La Bassée. The British army had been withdrawn from the region of the Aisne and was beginning to detrain west of Lille. A few French divisions, taken from other sectors, were given the same destination. It seemed to Gen. Joffre that the moment had come for bringing about the much-desired envelopment of the German right wing by a concentric offensive against Lille. The British army, the Belgian army and some French reinforcements would constitute, it was believed, under the high command of Gen. Foch, an ensemble capable of securing a decisive victory. Unfortunately, the assembling of the Allied troops by means of the Paris-Calais and Paris-Hazebrouck railways would take time. On the other hand, it was necessary to take in account that the Beseler Army Group would not fail to follow the Belgians.

The mission of the Belgian army was once again that of gaining time. The king, anxious to keep his left wing resting on the sea, and to preserve at all costs a fragment of national territory from invasion, thought best to entrench the army on the river Yser and the Ypres canal.

Events soon proved the wisdom of this decision. The British II. and III. and Cavalry Corps were stopped at the Lys by the German IV., VII. and XIII. Corps; Rawlinson's Corps found Menin in the hands of the XIX. Corps. Beseler's troops now entered Bruges and Ostend. It was known that numerous detrainments were taking place west of Brussels and that a new German IV. Army had installed its headquarters at Ghent. In fact Falkenhayn, the new chief of the German general staff, had anticipated the Allies' projects and like them, considered the moment for a decisive victory to have arrived.

With four new army corps, composed mainly of volunteers, the XXII., XXIII., XXVI. and XXVII. Res. Corps, Beseler's group and the artillery park from the siege of Antwerp, Prince Albert of Wurttemberg was charged to proceed to the Yser with his right resting on the sea, in order to attack in flank and in rear the Allied left, whose front the VI. Army was engaging between Arras and Armentières. Falkenhayn considered that: "The conquest of the coast was the sole means of frustrating the war of blockade which England contemplated and of retaliating through our destroyers, submarines, aeroplanes and Zepplins. . . . If we succeeded in driving the enemy out of the Yser valley and pursuing him at the point of the sword, there was no doubt that, having replenished our ranks and our stores, we should be in a condition to overthrow the western front."

Thus the Belgian army, which had only just moved into position in the general Allied line, found itself in focus for a new battle. It occupied a front of 40 km., from the sea to Boesinghe, with $4\frac{1}{2}$ divisions and $1\frac{1}{2}$ divisions in reserve behind the centre. The cavalry division was operating with de Mitry's French Cavalry Corps, east of the forest of Houthulst. On the army's right a French territorial division extended as far as Ypres and Rawlinson's Corps had entrenched itself along the line Passchendaele-Gheluvelt.

Opening of the Battle.—The battle commenced on the 18th with an attack by Beseler's corps (4th Ersatz and 5th and 6th Reserve Divisions) between the sea and Keyem. The Belgian outposts were only driven back after desperate fighting and the enemy did not even reach the Yser. On the morning of the 19th Ronarch's Marine Brigade and the 5th Division debouched from Dixmude on the flank of the III. Res. Corps. Beerst and Vladsloo were retaken; but the intervention of the XXII. Corps, coming from Thourout, and the XXIII. coming from Cortemarck, foiled the counter-attack. By the 20th the fighting had become general all the way from the sea to Gheluvelt between the Duke of Wiirttemberg's $5\frac{1}{2}$ divisions on the one hand and the Belgian army, de Mitry's Cavalry Corps and Rawlinson's Corps on the other. After 48 hours of obstinate fighting the Belgian positions remained practically unchanged.

The attack of the 4th Ersatz Division on Nieuport had failed, partly on account of the flanking fire from Admiral Hood's flotilla; while that of the XXII. Corps against the bridgehead at Dixmude had been checked by Meiser's Brigade. But in the night

of the 21st–22nd the 6th Reserve Division made a surprise crossing of the Yser in the Tervaete salient and threw over 2½ battalions to the west bank. Concentrated artillery fire prevented the division from making any progress on the 22nd, but a gallant counter-attack, in which four battalions of grenadiers and carabineers faced death with superb indifference, broke down completely under their machine-gun fire, owing to the exposed nature of the ground. The following night the Germans passed a second regiment into the bend without, however, extending their ground.

On the 24th, the whole of the III. Reserve Corps and half of the 44th Reserve Division, covered by a bombardment from 10 heavy howitzer batteries and 150 field guns, broke through the front at St. Georges-Tervaete, only to find the Belgians deployed behind the Nieuport-Dixmude railway embankment, together with the French 42nd Division which had arrived in the meantime.

Finding themselves checked in this direction, the Germans renewed their attack on Dixmude. After a four hours' bombardment (in which 21 and 42 cm. howitzers were employed amongst others) which turned the town into a mass of burning ruins, the 43rd Reserve Division delivered its assault at midnight, driving its guns through the middle of—and even in advance of—its infantry. In spite of a threefold attempt it was completely repulsed by the 12th Belgian Regiment, assisted by some French companies of marines. A new attack on the night of the 25th–26th met with the same fate.

Opening of the Nieuport Sluices.—The battle had been in progress for eight days. Over a total of 48,000 rifles the losses amounted to 15,000 in all ranks. Many guns had been put out of action, by excessive use of rapid fire; the munitions were nearly exhausted, the men at the end of their tether. Neither the British nor the French, both hard pressed at Bixscoote, Langemarck and Zonnebeke, were able to send reinforcements. Having no reserves, the Belgian commander decided to call in the sea to his assistance.

On the 26th and 27th all the pioneers were set to stop up the 22 culverts of the Nieuport-Dixmude railway embankment so as to prevent the liberating tide from invading the Belgian positions. On the 27th at dawn a first attempt by the sluice of the Furnes canal, at high tide, failed to yield an effective result. Fresh attempts on the 28th and 29th proved that the inflow of water from this canal was too slight and too slow. Actually, another sluice, that of the Noordvaart, promised a larger delivery but as it lay in No Man's Land its utilization appeared hazardous. Fortunately, the Germans—also being weary—remained relatively quiet during that time. On the 29th, however, their artillery blazed forth again, and it seemed that a new attack was imminent. The Belgian command, acting on information from a waterman named Geeraert, determined on an audacious *coup*. During the night a party of pioneers opened the Noordvaart sluice under the noses of the enemy. Driven by a strong gale the sea water rushed through in a flood. At dawn on the 30th, the three divisions of Beseler's corps attacked along the line of the railway, taking possession finally of Ramscapelle and Pervyse; but the drains were now overflowing; the flooded meadows soon made it impossible for the Germans to advance or even to stay; no alternative was left to them but a hasty retreat. The battle of the Yser was won and the left flank of the Allies definitely saved. Checked along the coast line, the Germans moved the weight of their attack farther inland and made their desperate assault on Ypres. The Belgian army, in scrupulous observance of the spirit of the obligations of neutrality, had, from Aug. 4 to Oct. 31, 1914, gloriously defended its honour, paying the price with its blood and also with the loss of practically the whole of its territory. (Ser also YPRES, THE BATTLE OF, 1914.)

(R. VAN O.; X.)

YSTAD, a seaport of Sweden on the S. Baltic coast, in the district (*län*) of Malmohus, 39 mi. E S.E. of Malmö by rail. Pop. (1943) 11,537. Two of its churches date from the 13th century. Its artificial harbour, which admits vessels drawing 19 ft , is freer from ice in winter than any other Swedish Baltic port.

YTTERBIUM, a rare metallic element (symbol Yb, atomic number 70, atomic weight 173·5), of the rare-earth group, was first separated by Marignac in 1878. In 1907 G. Urbain split paleoytterbium into neoytterbium and lutecium. Von Welsbach also, independently, separated Marignac's ytterbium into its two component elements. The new ytterbium he named aldebaranium. The name ytterbium is reserved by most chemists for that portion of the mixture exhibiting the main characteristics of Marignac's element. Ytterbium is almost identical with lutecium in its properties. It possesses a very characteristic spectrum and has a higher magnetic susceptibility than lutecium. (See RARE EARTHS.)

(C. J.)

YTTRIUM, a metallic element (symbol Y, atomic number 39, atomic weight 89·0), belonging to the rare-earth group, was discovered by Gadolin in 1794 and further purified by Mosander in 1843. Only a few workers have prepared absolutely pure yttrium compounds. The common impurities are small amounts of holmium and erbium. The purity of yttrium compounds can best be determined by measuring the magnetic susceptibility, which for the oxide should be $-0{\cdot}12\times10^{-6}$. Traces of erbium and holmium cause the magnetic susceptibility to become strongly positive. Yttrium is one of the commoner rare earths found in the minerals gadolinite, xenotime, euxenite, etc. It may be separattd from all others except erbium by the fractional crystallization of the bromates. The erbium may then be removed by boiling the nitrate solution with sodium nitrite, when the yttrium is the last to be precipitated. Yttrium oxide, Y_2O_3, is pure white and is rapidly attacked by most acids giving colourless solutions which show no absorption spectrum The spark spectrum is very characteristic and strong. The pure metal has never been prepared. (See RARE EARTHS.)

(C. J.)

YUAN SHIH-K'AI (1859–1916), Chinese statesman, was born at Hsiang Cheng, a member of a family belonging to the smaller landed gentry of the province of Honan. His first important post was in Korea, where, as Imperial Resident and the trusted lieutenant of the Viceroy Li Hung-chang, he strove by adroit diplomacy to preserve China's shadowy suzerainty over the Hermit Kingdom and to check the steadily increasing ascendancy of Japan. After the Chino-Japanese war (1894–95) he held office as judicial commissioner, with military functions, under the viceroy Li, in Chihli, where he brought the troops to a remarkable standard of efficiency.

In Aug. 1898, the emperor Kuang Hsii, hoping to secure Yuan's services in support of his scheme to seize and imprison the empress dowager, summoned him to a special audience at the Summer Palace The subsequent *coup d'état* by the empress dowager, which removed the emperor from the throne and replaced him under severe tutelage, owed its success to Yuan's betrayal of the emperor's confidence and to his active support of the conservative Manchu party. To the end of his unhappy career, the emperor never forgave Yuan's treachery, and on his death-bed (Nov. 1908) bade his brother, Prince Chun, see to it that he should not go unpunished.

Yuan received from the empress dowager the governorship of Shantung as reward for his services. In the summer of 1900, on the outbreak of the Boxer rising, he maintained order and protected foreigners throughout his jurisdiction He had no sympathy with the empress dowager's anti-foreign policy. Afrer the signature of the peace protocol (Peking 1901), as the aged Li Hung-chang desired to be relieved of further duty, Yuan was appointed to act in his place as viceroy of Chihli At Li's death (Dec. 1901) the appointment was made substantive. Yuan now held the highest office in the gift of the Throne; at the same time he was made a Junior Guardian of the heir apparent. A month later the Yellow Jacket was conferred upon him, together with the appointments of consulting minister to the Government council and director general of the northern railway. In the foilowing year he became a minister of the army reorganization council. During the five years of his viceroyalty, he raised and equipped six divisions of troops, greatly superior in every way to those of the Peking firld force or the best provincial levies. But his rapid rise to place and power aroused much jealousy, and, in 1907, a cabal

against him, led by his old rival, the ex-Boxer Tatar general Tieh Liang, persuaded the empress dowager to transfer him from the Tientsin viceroyalty to the capital. He was made grand councillor and president of the Board of Foreign Affairs, which post he held until the death of the dowager and the emperor in Nov. 1908.

For a month after the death of the "Old Buddha," rumours were rife in the north concerning the regent, Prince Chun's, vindictive intentions with regard to Yuan. But he merely deprived Yuan of office (Jan. 2, 1909) and ordered him into retirement at his native place in Honan. But on the outbreak of the revolution the regent, by an edict of Nov. 14, 1911, appointed him viceroy of Hunan and Hupeh, with a mandate to proceed south with his foreign-drilled troops and put an end to the insurrection. Yuan clearly foresaw and declared that if the monarchy were overthrown, the result would be chaos, "amidst which all interests would suffer and for several decades there would be no peace." Thus his avowed policy was to preserve a limited monarchy, pledged to systematic and practical reforms. Had he been loyally served by his representative, Tang Shao-yi, in the negotiations with the revolutionary leaders at Shanghai, above all, had he received the support which he was entitled to expect in the shape of a foreign loan, he might have won. As it was, he continued to fight on, practically single-handed, against the forces of disruption, until Feb. 1912 when the terrified Manchu court decided to abdicate. Within two days of the issue of the abdication edict (Feb. 12), the southern revolutionaries, on the initiative of Sun Yat-Sen, exemplified the "unbroken continuity of immemorial tradition" in China by inviting him to stand for the presidency of the republic.

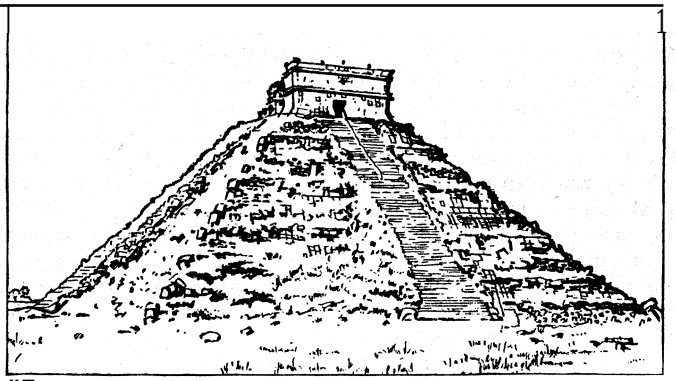
Yuan made a virtue of necessity, and on March 12 took the oath of office as president. Nevertheless he continued to uphold the principles which he had publicly proclaimed in justification of his defence of the monarchy, and to insist upon maintenance of the continuity of the classical tradition of government and the preservation of the Confucian system. He was willing for a time to pay lip-service to the republican formulas, but his actions proved clearly that he had no sympathy with Canton.

In the summer of 1913, a "war to punish Yuan" was started in the south by Sun Yat-Sen, Huang Hsing and other malcontents, but Yuan, having by this time secured a foreign loan and the moral support of the Powers, had no difficulty in retaining the venal "loyalty" of the chief military commanders in the provinces; the Cantonese insurrection came, therefore, to a swift and inglorious end. But Yuan dissolved and proscribed the Kuomin tang, and with it made an end of its farce of parliamentary government and representative institutions.

The movement for the restoration of the throne organized by Yuan's adherents, began to take shape in the autumn of 1915. The leaders of the movement failed especially to perceive the danger created by Japan's 21 demands (May 1915), and to realize that the active opposition of the Japanese Government would in all probability be fatal to Yuan's ambitions. In October the State council referred the question of the monarchy to the provinces. The result (a foregone conclusion) was a practically unanimous vote in favour of Yuan's accession. Meanwhile, however, the Japanese minister at Peking, supported by his British and Russian colleagues, had made friendly representations to the Chinese Foreign Office, deprecating the restoration of the monarchical system at this juncture. But on Dec. 12 the monarchy was proclaimed and the enthronement ceremony fixed for Feb. 9, 1916. A week after this announcement, an insurrection, led by one of Yuan's own nominees, broke out in Yiinnan. The movement spread rapidly, one province after another declaring its independence. On Jan. 22 Yuan announced the postponement and the establishment of the monarchy. Towards the end of April he consented, while retaining the presidency, to surrender all civil authority to the cabinet, under the premiership of Tuan Chi-jui. He died on June 6, 1916. With him passed the last of the great viceroys of the old regime.

YUCATAN, a peninsula of Central America, which includes in its area of 55,400 sq m. the States of Campeche and Yucatan and the territory of Quintana Roo in Mexico, plus small parts of British Honduras and Guatemala. The natural boundary of the peninsula on the south is formed in part by the ridges extending across northern Guatemala, the line terminating in the east at the lower part of Chetumal bay, and in the west at Laguna de Terminos. From this base the land extends north and slightly east between the Gulf of Mexico and the Caribbean sea in nearly rectangular form for about 280 m., with a mean breadth of about zoo m., and a coast-line of 700 miles.

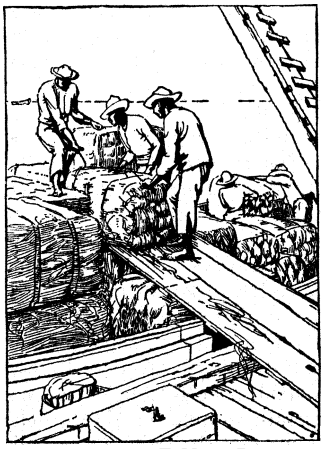
Physical Features. — The coast on the north and west is low, sandy and semi-barren. The outer shore-line on the north for nearly zoo m. consists of a narrow strip of low sand dunes, within



"THE CASTLE" AT CHICHEN ITZA, CAPITOL OF THE ANCIENT MAYA CIVILIZATION. SHOWING A CEREMONIAL TEMPLE ON TOP OF THE GREAT MOUND

which is a broad channel terminating to the east in a large lagoon. There are a number of openings through the outer bank and several small towns or ports have been built upon it. The eastern coast consists of bluffs, indented with bays and bordered by several islands, the larger ones being Cozumel (where Cortés first landed), Cancum. Mujeres and Contoy. There is more vegetation on this coast?and the bays of Chetumal, Espiritu Santo, Ascencion arid San Miguel (on Cozumel island) afford good protection for shipping. It is, however, sparsely settled and has little commerce except in henequén, and in chicle, the basis for chewing gum.

The peninsula is almost wholly composed of a bed of coralline and porous limestone rocks, forming a low tableland, which rises gradually toward the south until it is merged in the great Central American plateau. It is covered with a layer of thin, dry soil, through the slow weathering of the coral rocks.



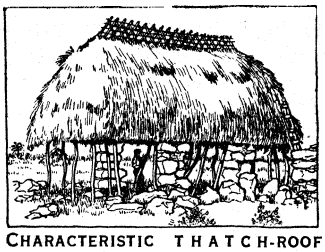
LOADING SISAL AT PROGRESO, YUCATAN, FOR SHIPMENT TO AN AMERICAN CORDAGE FACTORY

The climate of Yucatan is hot and dry and the absence of high mountainous ridges to intercept the moisture-bearing clouds from the Atlantic gives it a limited rainfall. The temperature ranges from 75° to 98° F in the shade, but the heat is modified by cool sea winds which prevail day and night throughout the greater part of the year. The atmosphere is also purified by the fierce *temporales,* or "northers," which occasionally sweep down over the Gulf and across this open region. The dry season lasts from October to May, the hottest months appear to be in March and April, when the heat is increased by the burning of the corn and henequén fields.

All the northern districts, as well as the greater part of the Sierra Alta, are destitute of large trees; but the coast-lands on both sides towards Tabasco and British Honduras enjoy a sufficient rainfall to support forests containing the mahogany tree, several valuable cabinet woods, vanilla, logwood and other dye-woods. Logwood forests fringe all the lagoons and many parts of the seaboard. which are flooded during the rainy season. The chief cultivated plants are maize, the sugar-cane, tobacco, cotton, coffee and

especially henequén, which produces the so-called "sisal hemp."

History.—The modern history of Yucatan begins with the expedition of Francisco Hernandez de Cordova, a Spanish adventurer settled in Cuba, who discovered the east coast of Yucatan in Feb. **1517,** when on a slave-hunting expedition. He followed the coast round to Campeche, but was unable to penetrate the interior. In 1518 Juan de Grijalva followed the same coast, but added nothing to the information sought by the governor of Cuba. In 1519 a third expedition, under Hernando Cortés, the conqueror of Mexico, came into collision with the natives of the island of Cozumel. In **1525** the inland part of the peninsula was traversed by Cortés during an expedition to Honduras. The conquest of the peninsulawas undertaken in 1527 **by** Francisco de Montejo, who encountered a more vigorous opposition than Cortés had on the high plateau of Anáhuac. In 1549 Montejo had succeeded in establishing Spanish rule over barely one-half of the peninsula, and it was never extended further. The Spaniards found here the remains of a high aboriginal civilization which had already entered upon decline. There were deserted cities falling into ruins, and others, like Chichen-itza, Uxmal and Tuloom, which were still inhabited by remnants of their former Maya populations. (For details of the Maya civilization see CENTRAL AMERICA: Archaeology and Ethnology; also CHRONOLOGY: *Maya* and Mexican.



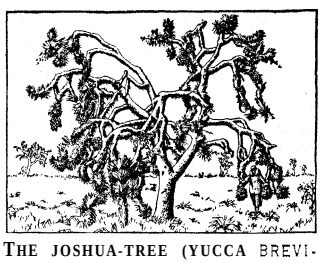
CHARACTERISTIC THATCH-ROOF DWELLING OF THE POORER CLASS IN YUCATAN

Since the Spanish conquest, the Mayas have clung to the semi-barren, open plains of the peninsula, and have more than once revolted. They seceded in **1839** and maintained their independence until **1843.** In **1847** another revolt followed, and the Indians were practically independent throughout the greater part of the peninsula until near the beginning of the Diaz administration. In 1910 there was another revolt with some initial successes, such as the capture of Valladolid, but then the Indians withdrew to the unknown fastnesses of Quintana Roo.

The Mexican State of Yucatan occupies the northern part of the Yucatan peninsula, and is bounded east and south by the territory of Quintana Roo, and south and west by the State of Campeche. Its population in 1930 was **386,096** or a density of **25.96** per square mile. The capital is Merida.

Quintana Roo was separated from the State of Yucatan in 1902 and received **a** territorial government under the immediate supervision of the national executive, but its few remaining Indian tribes (pop. in 1930, **10,227** or 0·52 per sq.m.) are practically independent.

YUCCA, a genus of the family Liliaceae (*q.v.*), containing about **30** species. The plants occur in greatest frequency in Mexico and the south-west United States, extending also into Central America, and occurring in such numbers in some places as to form straggling forests. They have a woody or fibrous stem, sometimes short, and in other cases attaining a height of 30 ft. to **40** ft., and branching at the top into a series of forks. The leaves are crowded in tufts at the ends of the stem or branches, and are generally stiff and sword-shaped, with **a** sharp point, sometimes flaccid and in other cases fibrous at the edges. The numerous flowers are usually white, bell-shaped and pendulous, and are borne in much-branched terminal panicles. The three-celled ovary is surmounted by a short thick style, dividing above into three stigmas, and ripens into a succulent berry in some of the species, and into a dry three-valved capsule in others. The flowers are fertilized entirely through the agency of certain moths. (See POLLINATION and YUCCA-MOTH.)



THE JOSHUA-TREE (YUCCA BREVIFOLIA), A TREE YUCCA OF THE SOUTHWESTERN DESERTS OF THE UNITED STATES, SOMETIMES 35 FT. HIGH

A coarse fibre is obtained by the Mexicans from the stem and foliage, which they utilize for cordage, and in the south-east United States the leaves of some species, under the name "bear-grass," are used for seating chairs, etc. The fruits of some species are cooked as food, and the roots of others contain a saponaceous matter used in place of soap.

Some 15 species of Yucca are native to the United States; of these nine attain the stature of small trees. Among the best known are the Spanishdagger (Y. *aloifolia*), the moundlily (Y. *gloriosa*) and the bear-grass or Adamsneedle (Y. *filamentosa*), of the south Atlantic and Gulf coast, all of which are planted for ornament. Among the most conspicuous are the Joshuatree (Y. brevifolia), sometimes 35 ft. high, and the Mohave yucca (Y. *schidigera*), **8** ft. to 15 ft. high. An almost stemless species (Y. *Whipplei*), called mission bells and Quixote-plant, which rears a stout flower-stalk, **12** ft. to 15 ft. high, bearing an immense cluster, **3** ft. to 6 ft. long, of fragrant, creamy-white, drooping bell-shaped flowers, is a strikingly handsome plant of the southern California chaparral (*q.v.*). The western Spanish-bayonet or Datil yucca (*Y. baccata*), found from New Mexico to California, bears a dark purple edible fruit.

YUCCA-MOTH, the name given to a genus of moths, *Pronuba,* the various species of which are each adapted to a separate species of the yucca (*q.v.*). The moth emerges at the time of opening of the yucca flowers, which frequently remain open only for a single night. The female moth rolls together a ball of pollen, flies to another flower, lays four or five eggs in the pistil and inserts the pollen mass in the opening thus formed. Each larva, on hatching from the egg, requires about 20 seeds of the yucca plant as food. As the plant produces some **200** ovules, this leaves about 100 seeds over to perpetuate the plant. The yucca can be fertilized by no other insect. The larva of the yucca-moth can only live on its own species of yucca.

YUCHI, an Indian tribe, formerly on the Savannah river in Georgia and South Carolina to the number of 3,000–4,000, constituting **a** separate linguistic stock. They gradually joined the Creek confederacy and about 500, mixed with white and negro blood, survive in the Creek area in Oklahoma. Their culture was marked by traits of Muskogi type.

See **F. G. Speck,** *Anthr. Publ. Mus. Univ. Penn.,* i. (1909).

YUDENICH, NIKOLAI NIKOLAEVICH (1862–1933), Russian soldier, was born July **18, 1862.** He entered the army in **1879,** and from **1887** to 1902 served on the general staff. In 1902 he became **a** regimental commander, in 1905 a general, an assistant chief of staff in 1907 and a chief of staff in 1913. At the beginning of the World War he commanded the II. Turkistan Corps, and was soon placed in command of all the military forces in the Caucasus, a post which he held till the arrival of the Grand Duke Nicholas in 1915. In March 1917 he resumed command, but further advance was rendered impossible by the increasing disorganisation of the Russian army. In 1919 Yudenich led anti-Bolshevik forces in an attempt against Petrograd (Leningrad). This venture was a failure, and Yudenich retired.

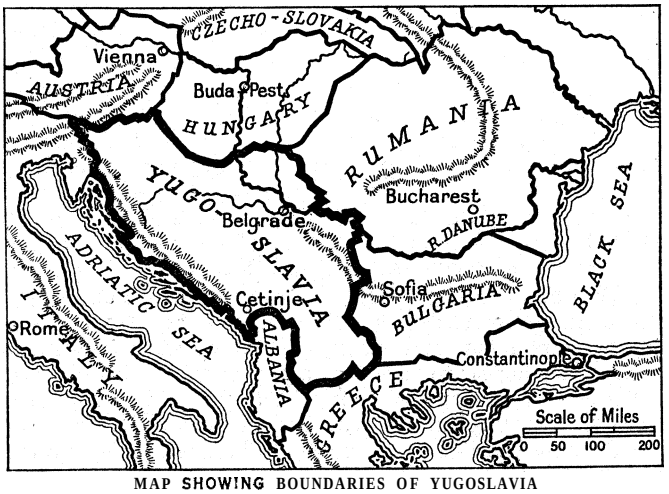
YUE-CHI or **YUEH-CHIH,** the Chinese name of a central Asiatic tribe who ruled in Bactria and India, are also known as Kushans (from one of their subdivisions) and Indo-Scythians (*q.v.*). They appear to have been a nomad tribe, inhabiting part of the present Chinese province of Kan-suh, and to have been driven W. by Hiung-nu (*q.v.*) tribes of the same stock. They conquered a tribe called the Wusun, who lived in the basin of the Ili river, and settled for some time in their territory (**c.** 175–140 **B C.**). They then attacked another tribe known as Sakas (*q.v.*) and drove them to Persia and India. For about twenty years it would seem that the Yue-Chi were settled in the country between the rivers Chu and Syr-Darya, but here they were attacked again by the Hiung-nu, their old enemies, with whom was the son of the defeated Wusun chieftain. The Yue-Chi then occupied Bactria (*q.v.*), and little is heard of them for a hundred years. During this period they became a united people, having previously been a confederacy of five tribes, the principal of which, the Kushans (or Kwei-Shwang), supplied the new national name.

The chronology of this invasion and of the history of the

Kushans in India is uncertain; available evidence seems to show that a king called Kozulokadphises, Kujulakasa or Kieu-tsieu-k'io (? A.D. 45–85) united the five tribes, conquered the Kabul valley and annihilated the remnants of Greek dominion. He was succeeded, possibly after an interval, by Ooemokadphises (Himakapisa or Yen-kao-tsin-tai), who completed the annexation of N. India. Then followed Kanishka (*?c.* A.D. 123–53), who is celebrated throughout eastern Asia as a patron of the Buddhist church and convener of the third Buddhist council. He is also said to have conquered Kashgar, Yarkand and Khotan. His successors were Huvishka and then Vasudeva, who may have died *c.* A.D. 22**j**. After Vasudeva's reign the power of the Kushans gradually decayed, and they were driven back into the valley of the Indus and N.E. Afghanistan. Here, according to Chinese authorities, their royal family was supplanted by a dynasty called Ki-to-lo (Kidara), who were also of Yue-Chi stock, but belonged to one of the tribes who had remained in Bactria when the Kushans marched to India. The subsequent migration of the Kitolo S. of the Hindu Kush was due to the movements of the Jwen-Jwen, who advanced W. from the Chinese frontier. Under this dynasty a state known as the Little Kushan kingdom flourished in Gandhbra (E. Afghanistan) about A.D. 430, but was broken up by the attacks of the Hûnas.

Stein, Vincent Smith, Sylvain Levi, E. H. Parker and others in the *Journal of the Royal Asiatic Society, Asiatic Quarterly,* etc.

YUGOSLAVIA, a convenient name for the Serb, Croat, and Slovene state (*Kraljevina Srba, Hrvata, i Slovenaca*), which originated at the end of 1918 by the union of parts of the former Austro-Hungarian empire with Serbia and, at a slightly later date, with Montenegro. The declared basis of the union was ethnic, the desire 'being to group together all the South Slavs (Yugoslavs), though the actual frontiers represent a series of compromises. The inhabitants are mainly South Slav, but the new kingdom is, nevertheless, one of the most heterogeneous of the post-war states of Europe. Serbs constitute over one-third of the total population, and outnumber any other single element. But the Serbia of 1918 was not a unit, its frontiers having undergone notable changes since the outbreak of the Balkan wars. The Catholic Croats of Croatia-Slavonia and Dalmatia, the next largest group, number



MAP SHOWING BOUNDARIES OF YUGOSLAVIA

over three millions, but surpass the Serbs of Serbia both in culture and economic development. Serbia—or, more accurately, the Serbs of Beigrade, the only large town in the old kingdom—is however quite definitely the dominant partner.

The predominance of the Serbs of Belgrade is due both to political and geographical causes. Among the former we have to note that Belgrade, the capital of the old Serbian state as it is of the new Yugoslav one, possessed all the advantages of the presence of an organized national administration. No other part of the new state—apart from the small kingdom of Montenegro—had had any experience of complete self-government. Even when associated with numerical preponderance and military strength this might not have ensured concentration of power at Belgrade, had it not been for the outstanding position of the town at the convergence of great highways.

Divisions.—Yugoslavia has an area of 95,558 sq.mi., with a population in 1931 of 13,934,038, and an estimated population on Jan. 1, 1940, of 15,703,000. It is made up of the following 7 areas: (1) the Serbia of the treaty of Bucharest (1913) with some minor modifications; (2) the Montenegro of 1912; (3) Bosnia and Hercegovina; (4) Dalmatia, without the town of Zara and the islands of Lagosta and Pelagosa; (5) Croatia-Slavonia, without Fiume but with some minor additions; (6) Slovenia; (7) the Voyvodina or Duchy.

Of these the first two were independent South Slav states, Serbia having had its area nearly doubled and its population increased by one-half as the result of the Balkan wars. In both the Cyrillic alphabet is used, and the majority of the people belong to the Eastern or Orthodox church. But the new territories in the south, obtained by Serbia as the result of the Balkan wars, contain a considerable Muslim element, both in Old Serbia and in Macedonia. Bosnia and Hercegovina, nominally Turkish till the Austro-Hungarian annexation in 1908, had been administered by the Austro-Hungarian government since 1878. There is a large Muslim element in the population, Bosnia being the most northerly Muslim outpost in Europe.

Dalmatia was a purely Austrian province, with a mainly Catholic population. Italian influence was, however, strong in the coastal towns, particularly in Zara, which has been assigned to Italy. The Catholic Slavs of Dalmatia use the Latin alphabet and thus technically rank as Croats. Croatia-Slavonia (capital Zagreb) was formerly attached to Hungary, its port, Fiume, forming the chief Hungarian sea-outlet. To the Croatia-Slavonia which is included in Yugoslavia were added the commune of Kastav, on the peninsula of Istria to the west of Fiume, the island of Krk (Veglia), and a small area (Medjimurje) between the Mur and the Drava, with a Croat population. The port of Fiume, after long negotiation, went to Italy. Slovenia, the land of the Slovenes, is a name which has been given to a part of prewar Austria inhabited by Slovenes and now attached to Yugoslavia: there has, however, never been a Slovene state since the early Middle Ages, and Slovenia is made up of fragments of former Austrian provinces. Thus it includes southern Styria, with the town of Maribor (Marburg), the greater part of Carniola, with the town of Ljubljana (Laibach), and a few communes only of Carinthia. To these has been added a small area (Prekmurje) north of the river Mur, formerly attached to Hungary but containing a Slovene population. The Slovenes are predominantly Catholics and highly westernized. Finally, the Voyvodina is similarly composed of scraps of territory, brought together because of the composition of the population and without any physical unity of its own. It includes the southern and often swampy part of the Hungarian plain, and both from the ethnic and the religious standpoint the population is exceedingly mixed. The Slav majority is due primarily to the flight of Balkan Serbs before the advancing Turk, for such low-lying lands were as a rule avoided by the early Slav settlers, who preferred wooded and hilly country. The considerable German and Magyar groups mostly owe their origin to a deliberate process of colonization, the Germans particularly having done much to drain and make habitable the swampy lands. The Rumanian element is due to migration from the hilly country to the east, especially during the 18th century. Many of the Slavs, particularly towards the east, belong to the Orthodox Church, while Catholics are in a majority to the west. There is also a Protestant element (German and Magyar).

The lands included are a part of the Baranja, the Mesopotamian area in the angle between the Danube and the Drava, the remainder of the Baranja being still attached to Hungary; the greater part of the Bačka, the area between the Danube and the Lower Tisa, the smaller part remaining Hungarian; the western part of the Banat, or area east of the Lower Tisa, the eastern part

being attached to Greater Rumania. The Voyvodina in this sense includes the town of many names now officially called Subotica (Ger. *Theresiopel,* Magyar *Szbadka*), a market town and a considerable centre of communication for the plain. Subotica (100,058) is the third largest town of the new kingdom.

Regional Division.—It has to be noted that while the lands briefly described above are those which were united together to form Yugoslavia, they ceased to exist as units. By a decree promulgated by the ministerial council in 1922, Yugoslavia was divided into 33 *oblasti* or regions, on a basis which has been stated to show "strong religious and political party influences"; which may be interpreted as meaning that they were intended to ensure Serb predominance. It is noteworthy that the old administrative or political river frontiers were sometimes preserved in the regions; as for example with the Drina (where it separated Bosnia and Serbia) and the Sava (where it separated Bosnia and Slavonia), and there they isolated from each other groups of different religious and political sympathies. But the old political frontier of the Danube was disregarded to allow the oblast of Belgrade to extend into the eastern part of the Bačka which had a considerable Orthodox element as well as many Catholics, and also into a part of the Banat where there was a similar mingling of creeds The remainder of the Banat was included in a region (Podunavska or Danube) which also extended across the Danube. Here the solidly Orthodox element in that part of the oblast which lay in Serbia more than counter-balanced the Catholics which were intermixed with the Orthodox in the formerly Hungarian region on the left bank of the Danube.

Population.—The 1931 census showed that 10 million of the 13,934,038 inhabitants of Yugoslavia spoke Serbo-Croat, and over 1 million the Slovene language. Thus Serbs, Croats and Slovenes constitute together about 85% of the total population. The largest minority group is the German-speaking one, numbering over half a million. Most of the Germans inhabit the Voyvodina where they form about 23% of the population of that heterogeneous territory. There they live in compact agricultural colonies as well as forming a considerable part of the town population. The remainder live for the most part in Croatia-Slavonia and in Slovenia. In the latter area they are mainly urban. The Magyar-speaking element is only slightly less than the German-speaking one, and the Magyars constitute nearly the same percentage of the population in the Voyvodina as do the Germans. There they occur particularly in the neighbourhood of the river Tisa, often in compact groups. Elsewhere they occur chiefly in Croatia-Slavonia. The third considerable minority element is formed by the Albanian-speaking peoples. These are not much inferior to the Hungarians in numbers, and their proximity to the independent kingdom of Albania in Old Serbia and Serbian Macedonia gives a possibility of irredentist propaganda. Albanians are practically limited to this part of Yugoslavia. There are also about $\frac{1}{4}$ million Rumanian-speaking people, of whom the majority live in the Timok region of Serbia, or more accurately, between the river Timok, the Danube and Upper Mlava. Rather more than $\frac{1}{4}$ million people are registered as speaking Slav languages other than Serbo-Croat or Slovene. These include a certain number of Czechoslovaks in the Voyvodina and Croatia-Slavonia.

The density of pop. (1921) is highest in the Voyvodina (181 per sq. m.), a fact which reflects the productivity of this fertile agricultural region, well fitted for the growth of cereals. In Slovenia (169) and Croatia-Slavonia (162) the density is not greatly inferior. Here the causes are not only the presence of productive lands but the considerable degree of development of the economic resources, associated with marked urbanization. While Serbia has but one large town, and outside of that town has a population mainly of peasants, occupations in Croatia and Slovenia are diverse, mining and manufacturing having made a good deal of progress. Serbia as a whole has a density (111 per sq. mile) lower than that of Dalmatia (126), but the figure is reduced by the fact that the lands added in 1913 are undeveloped and thinly-peopled. In Bosnia and Hercegovina and particularly in barren Montenegro the density is low. For the whole kingdom the density is (1931) 145·8 per square mile.

Frontiers.—Yugoslavia is of trapezoidal shape, the long axis having a N.W.-S.E. direction. The south-eastward extension is narrowed by Albania, which separates Old Serbia and Serbian Macedonia from the Adriatic. The national seaboard extends from the river Fiumara, on which stands the Italian port of Fiume, to the river Bojana, which forms the frontier with Albania. Owing to the numerous islands and peninsulas, the latter with long bordering channels, the coast has a total length of nearly 1,000 miles.

Of the four sides of the trapezium the northern one abuts, from west to east, on Austria, Hungary and Rumania. Strategically it is the weakest of all the frontiers, but this means that there is easy communication with the adjacent states and with Central Europe in general. The Hungarian section (353 m.) of this frontier is the longest, and is traversed by the most important lines of rail. The Austrian frontier (160 m.) is short but is again traversed by important railway lines. The Rumanian section (337 m.) falls into two parts, the old Danube frontier with Serbia and the new one in the Banat.

To the east Yugoslavia marches with Bulgaria, and this frontier (283 m.) is strategically the strongest of all. Strategic changes have been made in the old Serbo-Bulgarian frontier in four places. In the north, in the Timok region, a slight rectification had for its object the affording of greater protection to the railway which follows the Timok valley from Knjaževac and Zaječar to Negotin and thus to the Danube below the obstacle of the Iron Gate. Formerly this railway was close to the frontier. The other changes have been made in the region of Caribrod, where the Niš-Sofia railway line crosses the frontier; to the east of Vranje; and in the Strumica region.

To the south the frontier with Greece (152 m.) remains that agreed upon between Greece and Serbia in 1913. The Albanian part (277 m.) of the western frontier is similarly in essentials that laid down by the Conference of Ambassadors at London in 1913.

The north-western frontier with Italy (132 m.) has only been settled with a considerable degree of difficulty, particularly in the Fiume region, where only the small port of Baros with the delta region remains to Yugoslavia. The frontier is not drawn on a linguistic basis, large numbers of Croats and Slovenes being included within the borders of enlarged Italy.

Within these boundaries Yugoslavia has an extreme range in latitude of from 41°–47° N., and in longitude of from about 14°–23° E.

Communications.—A section of the main European highway passes through Belgrade, branching at Niš for Constantinople and Salonika respectively. Thus the new state had not to improvise a national system from the cut fragments of routes which converged on centres outside the national territories, for a main trunk line was already present.

In the northern area Yugoslavia obtained in the first place that part of the Belgrade-Budapest route which runs via Novi Sad to Subotica. This section was already linked to an important east-west trunk line, with many branches, which follows broadly the Sava valley. Thus Zagreb (185,581) the second city of the kingdom, lying in the Sava valley, had direct connection with Belgrade (266,849), as had also Ljubljana farther west. Zagreb was also connected, if by a somewhat difficult route, to the Hungarian port of Fiume, and directly to Budapest. Ljubljana (79,056) had similarly railway connections both to Fiume and to Trieste and directly to Vienna through Maribor.

Further, southern Hungary had an excellent system of waterways, and just as Belgrade was linked to the Hungarian railway net because of its position, so also that position makes it the centre of the waterways. Navigation is possible on the R. Sava to Sišak, south-east of Zagreb; on the Danube; on the Tisa; and on the Drava as far as Barcs on the left or Hungarian bank of the river. In addition the Voyvodina contains a number of canals, constructed to function both as means of irrigation and as waterways. Again, the navigable Sava receives a number of powerful tributaries from forested Bosnia, well fitted for floating timber.

Conditions are different in Bosnia where Austrian policy in railway construction was determined by political motives. It was not to Austria's interest to facilitate communication between

Turkish lands and Bosnia, and there is not even now any railway through what used to be the *sanjak* of Novipazar. From Skoplje in Serbian Macedonia a railway runs towards Novipazar, but this line ends "in the air" at Mitrovica. Again, since the Bosnians, whether Muslims or not, are Slavs, it was contrary to Austria's interest to permit of any direct connection being made between Serbia and Bosnia. A possible route does, however, occur between the Morava valley and Sarajevo (78,173). The Morava has a large left-bank tributary, the Western or Serbian Morava, which flows in a generally west-to-east direction, and opens up a line of communication into western Serbia. A Serbian railway was built from the Belgrade-Niš route along this valley line, which ended blindly at Užice, near the Serbian-Bosnian frontier. Within Bosnia feeders of the River Drina made it easy to construct a line from Sarajevo of similar direction. This line, however, stopped at Višegrad, a short distance from the frontier. By filling up the Užice-Višegrad gap Yugoslavia was able to connect Sarajevo to the main Belgrade-Niš line. Further, there is a connection from Paraćin on that line to Zaječar in the Timok valley, already mentioned. Since the Zaječar line runs down to the Danube near Negotin there is thus a transverse connection from Sarajevo to the navigable section of the Danube below the Iron Gate and thus to the Black sea.

Sarajevo was linked to Austria by a line through the Bosnia valley which joined the Sava valley trunk-line at the town of Brod. The Austrians also connected Sarajevo with the Dalmatian coast by a narrow-gauge line, which has a rack-and-pinion section and is quite unsuited for heavy traffic. It was largely a tourist line, Austria having done much to develop the Dalmatian coast as a tourist resort.

During the Austrian period Dalmatia may be said broadly to have had no railways of any account apart from this line. The multitude of small ports made coastal traffic easy, and the population is chiefly centred in the towns on the fertile parts of the shore—for the coast is not uniformly productive. Dalmatia was not effectively linked with the interior, and without such links there was no hope of finding outlets on the national seaboard. The problem has not yet been solved, despite a certain amount of railway construction. During the post-war period when feeling ran high between Italy and Yugoslavia all sorts of obstacles were put in the way of Italian coastal steamer services, and since Yugoslavia found it impossible to organize an effective national service, trade and the revival of tourist traffic were seriously hampered. Such facts are of importance because they give reasons for the intensity of the political feeling between Serbs and Croats, and the danger of a policy so centralized at Belgrade as to be out of touch with local needs. Railway construction in Dalmatia has led to the two ports of Sebenico (Šibenik) and Spalato (Split) being connected via Knin and Gospic to Ogulin on the main route between Zagreb and Fiume. A branch line from Knin goes by a very indirect route via Prijedor to the main Sava valley line. Even if it were possible to build a number of railway lines between Dalmatian ports and the interior, the long and expensive haul would complicate their use. Further, the ports are not equipped for dealing with heavy traffic. It would appear, therefore, as though Yugoslav maritime trade must continue to use foreign ports, especially Salonika, where there is a Free Zone, and Fiume.

NATURAL REGIONS

Three great types of land-forms are represented in Yugoslavia:—(1) the western mountain belt which is a continuation of the Alpine folding; (2) the Danubian plains, or Pannonian basin of Austrian geographers, with their southern hilly rim; (3) the much disturbed belt of country, with alternating hills and small plains, separating the western mountains from the crust-block of old rocks which forms the core of the Balkan peninsula; this is best called the Morava-Varder depression, from the great valley which traverses it from north to south. Speaking broadly, we may say that (1) includes the Slovene lands, the western and south-western part of Croatia-Slavonia, Dalmatia, a large part of Bosnia, Hercegovina and Montenegro. The extreme eastern edge of the Slovene lands, the eastern part of Croatia-Slavonia, the northern part of Bosnia and Serbia, with the whole of Voyvodina, fall into (2), while a large part of Serbia is included under (3).

Of these three types, however, the mountain belt in particular is too complex to be regarded as a unit. In the first place the mountains of the north-west show some striking contrasts to the Dinaric Alps which margin the west coast of the Balkan Peninsula proper. The former are made up of the Julian Alps (Terglav, 9,400 ft.), the Karawanken, the Steiner Alps (Grintovec, 8,395 ft.) and some smaller ranges, all with a general west to east direction. This means that the intervening valleys open towards the Danubian plains. North of the Rarawanken lies the valley of the Upper Drava, of which, however, only a comparatively small part lies in Yugoslavia. The river may be said to emerge from the mountain to the plain section at the town of Maribor. Between the Karawanken and the Julian Alps lies the roughly parallel Upper Sava valley, of which a larger part falls within the state. Here the considerable (25 m. by 6 m.) basin in which lies the town of Ljubljana may be said to mark the end of the mountain section.

Farther south the mountain belt differs greatly in character. The fold-lines take on a south-easterly direction, parallel to the coast-line, and three distinct zones can be recognized. The coastal ranges have been largely submerged beneath the sea to form the chain of islands and the characteristic peninsulas. Here, particularly in the islands and occasionally in narrow strips on the mainland, there are areas with a considerable depth of fertile soil, enjoying a Mediterranean type of climate, despite the blasts of the bora, or cold northerly wind. Water occurs in the form of springs, often of great force, with, on the mainland, rivers which sometimes mingle their waters with the sea within a mile or two, or even a few hundred yards, of their sources in the limestones, but occasionally reach a considerable length. This coastal belt, with its characteristic products, form a distinct natural region, and is separated by steep limestone cliffs or hills from the barren karst behind. The karst area of massive limestones extends from Carniola, south of the Ljubljana basin, through western Croatia, the interior of Dalmatia, a part of western Bosnia, the greater part of Hercegovina and western Montenegro to the Albanian frontier. It includes ridges such as the Great and Little Kapela and the Velebit, the Uskok Mts. west of Zagreb and other hilly areas, with intervening basins and depressions of varying sizes, much of the surface being below 2,000 ft. above sea-level.

Farther inland, however, especially to the south, in Bosnia, the extreme east of Hercegovina and eastern Montenegro, the elevation increases notably, outstanding heights being Durmitor (8,234 ft.) in north-west Montenegro and Majlić (7,840 ft.) on the frontier between Montenegro and Hercegovina. This elevated area is the Planina region of the Slavs, planina being the precise equivalent of alp (mountain pasture) in the Alps proper. In the Planinas or high mountain region then, upland pastures and forests re-appear.

The Five Natural Regions.—We may therefore recognize five natural regions in Yugoslavia, falling into three groups. Of these (1) the Pannonian basin in the wide sense is by far the most important economically, and with it may be associated (2) the Slovene Alps, which are linked to it by the Drava and Sava valleys. (3) The Morava-Vardar depression forms a unit by itself. In the west, despite the difficulties of communication (4) the coastal belt may be associated with (5) the Dinaric karst and mountain belt.

1. **The Pannonian Basin.**—This obtains its name from the old Roman province of Pannonia, the name being applied by geologists to a great depression between the Alps on the west and the Transylvanian Mts. on the east which was flooded by water during the Tertiary period. The water was finally drained off by the Danube as it cut its way through the encircling mountain rim by the gorge which forms the Iron Gate. Northwards the plain left by the ebbing of the waters extends beyond the limits of Yugoslavia; southwards, beyond the plain which fringes the Sava-Danube, it gives place to an undulating platform which seems to represent the shore of the old lake. This hill country forms part of northern Bosnia and northern Serbia, extending in the latter country southwards to the hills west of Niš, notably the Jastrebac and Kopaonik ranges.

That part of this productive Tertiary hill country which extends

eastwards from the Kolubara to the Morava and is bounded to the south by the valley of the Western Morava, forms the Sumadija of the Serbs and constituted the heart of modern Serbia. Originally thickly forested — Sumadija means forest — the woods have been largely cleared except on the island-like mountains of older rock, such as Rudnik, which rise from the general surface. In Bosnia, however, much of the original woodland remains.

The whole region, including plains, river valleys, hill country and isolated mountains and uplands, constitutes economically the most important part of the state, and has a considerable variety of resources. In Serbia the characteristic occupation is mixed farming carried on by peasants on small holdings. The cereals include maize, wheat, barley and oats. A great variety of vegetables is grown for local use, and there are numerous orchards, the characteristic plum being accompanied by all the usual temperate fruit-trees. Local advantages of climate and soil account for certain special crops, such as tobacco (especially near Užice in the valley of the Western Morava); the vine for table grapes or wine in the more sheltered areas, especially near Smederevo in the Morava valley and in the lower Timok valley; sugar beet in the Morava valley; flax, especially in the Drina and Kolubara valleys; mulberry for silkworm-rearing in the Morava valley, and so on. Of stock animals the pig is particularly important but cattle and horses are reared, with many sheep on the uplands.

In the Voyvodina conditions are broadly similar, but cereal production, especially of wheat, is more important, and the farming is of a more advanced type. There is a correspondingly greater development of the industries using local raw material, such as flour-milling, sugar-extraction, brewing and distilling, rope-making from local hemp, the making of linen and silk goods, etc., and as a consequence towns are more numerous and larger. The greater variety of the surface in Croatia-Slavonia, again, brings certain modifications. Orchards are numerous, and to the plums, vines, apples, pears, etc., of Serbia are added walnuts and chestnuts. Stock-rearing is extensively practised, and the fact that there are large forested areas results in a great development of industries based on wood and wood products.

The part of Bosnia included within the region may be said to resemble a more backward Serbia. Maize is the most important cereal, and since there has been less clearing for agriculture here extensive and valuable forests remain. As in Serbia the plum is by far the most important fruit-tree.

2. The Slovene Alps. — The essential features of this region have been described. From the economic standpoint it has to be noted that, on account of the limited amount of arable land, there is not only no surplus of cereals, such as is found in (1), but an actual deficiency, so that additional supplies have to be obtained especially from Slavonia, Bačka and the Banat. On the other hand the well-organized dairying industry permits of a considerable export of dairy products. Ljubljana and Maribor are not only centres of this trade but also of a number of minor industries similarly dependent on the extensive rearing of live stock, such as meat-packing, the making of margarine, soap, candles and so forth. Further, the valleys and the margins of the basins yield fruit, including walnuts and chestnuts, the vine, especially in the Drava valley where Maribor carries on a considerable trade in wine of good quality, as well as small fruits.

Forests are not only extensive but include both conifers and such hardwoods as beech, oak, chestnut, etc, and industries dealing with timber are important. Since water-power is abundant and coal also occurs, while the forests are widely distributed, many of the industries are of old standing and of the small, scattered type rather than commercialized undertakings The products, notably furniture, show the influence of localized skill and tradition and had a ready sale in the old Austria-Hungary. Minerals, in addition to coal, are of some importance, though many of the industries based upon them have suffered from the drawing of the new frontiers.

3. The Morava-Vardar Depression. — This not very appropriate name may be given to the region which extends from the southern margin of the Sumadija to the Greek frontier. It is traversed by a series of basins strung along the Morava and Vardar systems, and affording a continuous route from north to south. Structurally the region is remarkably complex, for it represents the zone of weakness where the fold-mountains of the west and north-east abut upon the central crust-block of the peninsula. Instead of the continuous and extensive depression which gave rise to the Pannonian basin to the north, earth movements were limited and localised, producing numerous small basins, originally flooded by water but now largely drained by river action. These basins are floored by soft deposits and are in consequence fertile, containing arable land. With them alternate great mountain masses, such as the Kopaonik, Golja, Crna Gora, Šar and others. The Crna Gora marks the limit between Old Serbia or Raška to the north and Serbian Macedonia (see MACEDONIA) to the south.

Among the more important rivers may be noted the Nišava, a right-bank tributary of the Morava which allows of the passage of the railway from Niš to Sofia and Constantinople. The Toplica, a left-bank tributary of the Morava, drains a very fertile valley. The long stream of the Ibar has a small headstream, the Sitnica, which drains a part of the productive Kosovo polje, or plain of the blackbirds, with the town of Priština. The Ibar itself passes through a wide valley containing the towns of Mitrovica and Raška and enters the western Morava. In a side valley to the west lies the town of Novipazar, which is extremely "Turkish" in appearance and has a large Muslim element.

As regards resources the arable plains and basins produce a considerable variety of crops, becoming more and more southern in type as the Greek frontier is approached. The mountains and uplands allow for a notable development of the live stock industry, the area in earlier days having furnished a considerable part of the meat supplies of Constantinople, to which the sheep could be driven by successive stages. Finally the mineral resources are considerable, especially round Skoplje, Veles and Kumanovo. Coal, copper, silver-lead, chrome ore, iron and antimony all occur.

Among the products of the live stock industry is wool of good quality, particularly from the sheep reared on the eastern uplands. This forms the basis of the celebrated carpet industry of Pirot, in the upper Nišava valley, the carpets being noted for their excellent colours and designs. Round Lake Dojran the camel is present.

The crops of Old Serbia are generally similar to those of the Sumadija, but in Macedonia they are more varied. Thus the Bregalnica valley near Kočane is famous for its rice fields and near Štip for opium poppy yielding a high percentage of opium, exported from Salonika. In the Strumica valley farther south cotton, rice, sesame, tobacco, with much fruit and a variety of other crops, all occur. Gevgeli, the frontier station on the Skoplje-Salonika line, is famous for its silk production and silk factories.

4. The Coastal Belt. — The general geographical interest of this region far exceeds its economic one. Even the name is somewhat deceptive, for parts of the coast are as barren and arid as the karst lands of the interior. Characteristic Dalmatian landscapes are best seen in such areas as the Riviera of the Seven Castles, which stretches from Spalato to Trau (Trogir), forming a narrow, fertile strip about 10 m. in length, watered by short, spring-fed streams and backed and sheltered by bare and waterless limestone hills; or round Ragusa, one of the most perfect examples of the Mediterranean city-state in miniature. The olive grows round Spalato, but olive oil is imported from Italy.

The coastal belt is for the most part unsuited to cereals, which are grown in the poljen of the interior. But the marshy area round the mouth of the river Narenta forms an exception to the general statement. Wine is made and exported largely to France to be mingled with locally-produced kinds. Special products of some interest are the liqueur maraschino, distilled from cherries at Spalato and Sebenico (Sibenik); insect powder made from locally-grown and wild pyrethrum, and a variety of substances obtained from the aromatic plants of the maquis. Among the last rosemary (especially from the islands of Lesina [Hvar] and Lissa [Vis]), sage and noble laurel may be named. Apart from the shrubs, wood is rare.

Minerals are not very important, but large beds of cement-stones occur near Spalato and form the basis of a considerable industry using the water-power of the short river Jader, which

gushes out of the limestone near by. The water power of the river Kerka near Sebenico and of the river Cetina near Almissa (Omiš) is also used for such industries as the making of calcium carbide and cyanamide. These industries were mainly established with Italian capital. Fishing is of some importance, especially on the islands, where Lissa has a canning industry. The catch includes tunny, sardines, mackerel and crabs and lobsters.

5. **The** Dinaric Karst and **Mountain** Region.—If the coast of Dalmatia is apt to be estimated too highly, precisely the reverse is true of this region which is less unproductive than it appears at first sight. From the human standpoint the contrasts are very striking, for if Ragusa and Spalato are western and Latin, with many evidences of a great past, towns like Sarajevo, Mostar, Trebinje and Cetinje are thoroughly eastern in appearance, and the rural population is in many ways highly primitive and backward. The area owes its Slav population to the Turkish advance, to the same cause, that is to say, as that which led ultimately to the decay of the coastal towns. The Slavs of the interior fled, at various times, before the advancing Turk, and were constrained to occupy and use poor land.

Montenegro is particularly well fitted for livestock rearing because of the appearance of schists in the mountain belt which lies east of the Zeta valley. There is a better and more permanent water supply and a richer growth of grass there.

Cereals, especially maize, with wheat and barley, tobacco and wine are, produced in the depressions of the mountain region.

HISTORY

The Adriatic Dispute at **Paris.**—At the Paris Conference there was from the first a deadlock in the Adriatic dispute. (*See* SERBIA.) Clemenceau and Lloyd George found themselves between two irreconcilable standpoints—between Sonnino, who claimed the literal fulfilment of their treaty pledges, with the addition of the port of Fiume, and Wilson, who refused all cognizance of the secret treaties and regarded them as abrogated by the Allies when they accepted his successive Notes as the basis of the Armistice. The three Western Powers were in the impossible position of judges in a dispute to which one was a party, while two were accessories. On Feb. 11, 1919, the Yugoslavs offered to submit the whole dispute to the arbitration of President Wilson, and on April 16 to leave the settlement of frontiers to a plebiscite.

But these proposals were rejected by the Italians, who even withdrew for a time from Paris; and Wilson's public manifesto on the Adriatic question (April 23) so far from improving matters, actually stiffened Italian resistance. The problem was left unsolved during the final stages of the negotiations on the German treaty, and was still being postponed when, on Sept. 12, D'Annunzio and his Arditi, with official Italian connivance, seized Fiume and proceeded to create a *fait accompli.* On Dec. 9, 1919, the Supreme Council made a definite proposal to Italy on the basis of a slight modification of the so-called "Wilson Line," Fiume as a buffer State, a special régime in Zara, Valona in full sovereignty and an Italian mandate in Albania.

Late in April the Yugoslavs consented to direct negotiations with Italy, but the Nitti cabinet fell before any decision could be reached, and it was not till Nov. 12, 1920, that the Treaty of Rapallo was signed. By it Italy acquired a frontier considerably farther east than the Wilson line, the watershed of the Julian Alps as far as Snježnik (Monte Nevoso), almost all Istria with Abbazia and Volosca, and a narrow strip of shore connecting it with Fiume, which was to become an independent unit under the League of Nations, while the Croat suburb of Sušak was to remain in Yugoslavia and the Baroš Port was added as an outlet for Yugoslav trade. Zara became a free city under Italian sovereignty, but as a tiny island isthmus without hinterland or islands. Italy renounced all claim to Dalmatia, and of all the islands retained only Lussin and Cherso. Special linguistic and other privileges were assured to the tiny Italian minority in the Dalmatian towns, but no corresponding charter was granted to the 400,000 to 500,000 Slovenes and Croats annexed to Italy. One practical result of the treaty was that Italy tacitly abandoned the cause of King Nicholas and accepted as inevitable Montenegro's incorporation in Yugoslavia. Unhappily Italy allowed the treaty to remain a dead letter as regards Fiume, which was firmly held by D'Annunzio's irregulars, to the utter ruin of its trade and prosperity. The final liquidation of the Adriatic dispute was postponed till Jan. 27, 1924, when Mussolini and Pašić (Pashitch) concluded the so-called "Pact of Rome" guaranteeing the Peace Treaties of St. Germain, Trianon and Neuilly and promising neutrality if either should be attacked by a third party. A supplementary agreement recognized Italy's annexation of Fiume, but left to Yugoslavia the Baroš Harbour and also a free commercial zone in Fiume itself, with proper railway access.

The New Frontiers.—In five other directions also the regulation of the new frontiers was a slow and difficult process.'

1. The frontier between Yugoslavia and Rumania rests on a decision of the Peace Conference, published on June 13, 1919. Rejecting equally the frontier fixed by the secret treaty of 1916, under the terms of which Rumania entered the war, and the line up to which the Serbs had been allowed to occupy after the Armistice, the Allies divided the Banat on a mainly ethnographic basis. At the last moment they drove two awkward salients into Rumanian territory, in order to include Vršac and Bela Crkva in Yugoslavia, thereby blocking the railway outlet of Timişoara and Arad towards the Danube at Bazias.

2. The regulation of the Austro-Yugoslav frontier was decided according to a plebiscite supervized by an inter-Allied Commission at Klagenfurt. After a keen contest between rival Slovene and Pan-German propagandists, voting took place in Oct. 1920 and resulted in a majority of 12,747 for Austria in Zone A (the more southerly section in dispute), whereupon Zone B also was automatically assigned to Austria.

3. By the Treaty of Neuilly (Nov. 27, 1919), Bulgaria was forced to cede to Yugoslavia (a) the Strumnica salient, which threatened the Vardar railway from the east, (b) the district of Kočana and the Bregalnica and (c) the town and district of Tsaribrod, which places Sofia strategically at the mercy of her neighbour.

4. The Albanian frontier remained in suspense till 1921, when the Supreme Council sanctioned the line laid down by the Council of Ambassadors in the winter of 1913, thus putting an end to the disreputable design favoured in some quarters of an Italo-Yugoslav "deal" on the lines of "Scutari for Fiume."

5. The frontier with Hungary was the last to be regulated. By the Treaty of Trianon the Banat (save a small Magyar triangle opposite the city of Szeged) was divided between Rumania and Yugoslavia, while the latter received the whole Bačka (except Baja and district), part of the Baranya (forming the angle between Drave and Danube) and the Medjumurje (between Drave and Mur). Thus, in order to secure the town of Subotica (Szabadka) with its large Bunjevac (or Catholic Serb) population, she was allowed to annex not less than 250,000 Magyars.

Internal Politics.—So long as these vital frontier disputes were outstanding, the Government hesitated to hold new elections, and the new united parliament rested on a highly irregular basis, the Serbian mandates having actually expired in June 1914, and the delegates from most of the new provinces owing their positions to membership in the numerous revolutionary committees which sprang up in Oct. 1918. The chaotic party conditions slowly crystallized into a keen struggle between the Radicals, who still possessed the best party machine and stood for a narrowly Serbian as opposed to a Yugoslav programme, and the new Democratic party, which absorbed most of the Opposition groups in Serbia, the old Serbo-Croat coalition of Croatia and the Slovene Liberals. Jn Aug. 1919 Protić was replaced by Davidović, the Democratic

leader, but at the elections to the Constituent Assembly (November 1920) no party secured an absolute majority. Pašić again became premier in January 1921, and was able to steer through parliament a new Constitution on extreme centralist lines. This caused immediate ill-feeling, and drastic measures "for the defence of the state," including the annulment of the mandates of the 53 Communist Deputies.

Having broken openly with the Democrats, Pašić formed a purely Radical cabinet. Davidović replaced him in 1924, but soon after Pašić resumed power, supported by Pribičević. Radić, meanwhile, had been making political visits to Western Europe, Vienna and Moscow. In 1925 he suddenly recognised the constitution, dynasty and army, and entered the Government, but withdrew his support the next year. After a long deadlock, a Government coalition was formed in 1927 between the Radicals, Democrats, Slovenes, Clericals and Muslims. Radid and Pribičević united to organise among the Prečani (former subjects of Austria-Hungary) a campaign against centralist inefficiency and corruption. This was waged with increasing violence until on June 20. 1928, a Montenegrin Radical Deputy named Puniša Račić fired in the Skupština on the Croat Deputies, mortally wounding Stephen Radid and killing his nephew and a colleague outright. The Croats withdrew to Zagreb. Efforts to find a new Parliamentary modus proved unavailing.

The coup d'ktat of January 1929.—On January 6, 1929, King Alexander suspended the Constitution and established a personal dictatorship with the declared objects of improving administration, eliminating corruption and inefficiency and bringing about national unity. When those objects had been achieved, constitutional life — it was expressly promised — should be restored. The King's first premier was General Živković, commander of the Royal Guard, and the cabinet included both Serbs and Croats.

Considerable administrative and financial reforms were at first introduced. The King's most important measures were, however, those promulgated on October 3, 1929. The official name of the State was changed from the Serb-Croat-Slovene kingdom to Yugoslavia; and the historic subdivisions vanished altogether, the country being re-partitioned into 9 "Banovinas," called after their main rivers, and generally arranged (except in the case of the Drave Banovina, which corresponded to the old Slovenia) so as to strengthen the centralist elements. The Governors of the Banovinas were appointed by the Crown.

These steps were highly unpopular in Serbia itself, but the more obvious discontent was in Croatia, where it was fanned by the numerous arrests and political trials, including that of M. Maček, Radić's successor. Many Croat leaders—extremists and some moderates — fled abroad. Other political leaders from all parties were interned. The dictatorial regime continued throughout 1930. On September 3, 1931, a new Constitution was promulgated, but existing repressive measures remained in force, voting was open and no parties or other associations resting on a basis of religion, race or district were allowed. The opposition urged their adherents to boycott the elections, which returned a parliament mostly composed of Serbs, nearly all men quite unknown to the public. In fact, although General Živković retired from the premiership on April 4, 1932, the civilian ministers who succeeded him (Dr. Marinković, M. Srskić and M. Uzunović) were all representatives of the King's strongly personal and centralist policy, the "Yugoslav" tendency of which was still incomprehensible to most of the public. The widespread discontent was fostered by great economic difficulties, due mainly to the world crisis and to the fall in prices of agricultural produce; and by rumours of corruption in Government circles.

Foreign Policy.—In foreign affairs the King remained faithful to the policy of the Little Entente, strengthened by the signature in 1933 of its new Organisation Pact. Certain differences of policy were, however, to be noted in Yugoslavia's very friendly attitude towards Germany, which caused it to be widely believed that she would not oppose the Anschluss of Austria to Germany, preferring German influence in Austria to Italian. For the rest, Yugoslav foreign policy was pacific, and the King himself made notable and very successful endeavours after 1930 to improve relations with Bulgaria. He was unable to secure Bulgaria's participation on the Balkan Pact, signed in February, 1934, under which Rumania, Yugoslavia, Greece and Turkey mutually guaranteed each other's Balkan frontiers; but he brought about a genuine rapprochement with Bulgaria, whose capital he courageously visited in 1934. Relations with Italy and Hungary remained strained.

The Assassination of the King.—On October 9, 1934, King Alexander visited France, and on arriving at Marseilles, was assassinated by a Macedonian émigré. The assassins had had some connections in Italy and particularly Hungary, and relations with those two countries became increasingly difficult. A worse conflict was averted by the mediation of the League of Nations. The effect was greatly to strengthen the feeling of national unity. King Alexander's heir was his son, Peter II.; but the regency was entrusted to a Council of Three, consisting of Alexander's cousin, Prince Paul, and two Croats, Dr. Stanković and Dr. Perovid. It was hoped that the centralist regime would now be relaxed, but although a few concessions were made, M. Uzunovid kept in the main to the old centralising policy. His successor M. Yevtić, began with some concessions to the Croats, but the elections held in May 1935, although the opposition was allowed to contest them, proved a disappointment to those who expected a real change of methods. A new cabinet under M. Stoyadinovid made certain further concessions; but the situation remained unsatisfactory.

THE STRUGGLE FOR YUGOSLAVIA

The Royal Dictatorship. — The royal coup d'état of Jan. 6, 1929, by which the constitution had been suspended and parliament dissolved, had pursued one aim: to overcome the difficulties inherent in the fact that Yugoslavia was a heterogeneous state made up of three main elements of population, the Serbs, the Croats and the Slovenes, who though closely related by descent and language were different in their national temperament and in their historical traditions. King Alexander despaired of the effort to work out by patient parliamentary means a modus vivendi which would establish an ever more intimate relationship between the different constituent groups of the triune kingdom of the Serbs, Croats and Slovenes. Instead of that, he wished to force the amalgamation of the three elements in a united and unitarian Yugoslav kingdom, regarding himself as the great unifier of the southern Slavs. The new division of the kingdom into nine banovinas, named after rivers and following entirely geographic lines, was to obliterate the historical lines of division. Their names were: Dravska, Savska, Vrbaska, Primorska, Drinska, Zetska, Dunavska, Moravska and Vardarska. But King Alexander's experiment could be carried on only against the dissatisfaction of large parts of the population. The Serbs, by temperament and tradition a deeply democratic people, politically highly conscious and vocal, a nation of small independent sturdy peasants, protested against the dictatorial methods involved in the coup d'état. The Croats, by their history a much more peaceful and tractable people but sharing in the democratic attitude peculiar to the awakened Balkan peasantry, resented the dictatorial form of the regime and, even more, the attempt to divest them of their character as a separate nationality with its own deeply ingrained cultural traditions, and were afraid that the new regime would perpetuate the predominance of Belgrade instead of creating a more flexible federal constitution for which they had hoped.

The years of the dictatorship were, therefore, years of tension and trouble. King Alexander, in his plans for the new national state, looked to the fascist dictatorships for some idea as to how to strengthen national unity. Among others he accepted the idea of creating official youth organizations to inspire the young people with the spirit of national unity and loyalty to his regime. The famous athletic organization, the Sokol, or "falcon," which had been established among the Yugoslavs after the Czech example, on a voluntary basis of democratic patriotism. was to be incorporated officially into the new state. Like all other parties, the Croat Peasant party led by Dr. Vladimir Maček had been dissolved, but terrorist actions in Croatia led to the persecution and trial for sedition of Dr. Maček and some of his collaborators. He and most of his codefendants were acquitted. The internal tension mas heightened by a threat of war with Italy, by corresponding military preparations and by the growing economic crisis which reached Yugoslavia in 1930 and made itself severely felt in all agrarian countries of southeastern Europe.

It was not only Croatian discontent which caused concern; it was also the discontent of the Macedonians in those parts of Serbia which had been annexed after the Balkan War in 1913. The revolutionary Macedonian organization kept alive the unrest in the provinces bordering on Bulgaria. The Yugoslav government tried hard to improve relations with Bulgaria. Bulgarians are southern Slavs like the Serbs

and the Croats, an agrarian democratic people, and there is much feeling of kinship among them. There have been repeated efforts for a union of all southern Slavs, but the rivalry between the Bulgarian and the Yugoslav royal houses made such a union impossible, though undoubtedly it would have been in the common interest and welcomed by the population. But in the years following 1930 serious attempts were made to arrive at a reconciliation between the two branches of the southern Slavs who in the last decades had been estranged by several wars between them and by their mutually exclusive claims to Macedonia with its inextricably mixed population groups.

On Sept. 3, 1931, King Alexander proclaimed a new constitution, which formally put an end to the existing dictatorship. But this constitution retained all the decisive powers in the hands of the king, strengthened the tendency toward centralization, and thus was far from satisfactory to the democratic and autonomist aspirations of the different parts of the population. It was accused of being a mere screen for the continuation of the royal dictatorship. The new constitution recognized the rights of the three official languages of the kingdom, Serb, Croat and Slovene, guaranteed the individual liberties and freedom of religion and of the press, but it did not allow the formation of any parties on ethnic or regional bases, and so made the formation of the Croat Peasant party and similar parties impossible. The electoral law of Sept. 12 made certain the victory of the government candidates, who represented the National Yugoslav party, a unitarian group somewhat aspiring to become the only Yugoslav party, like the Fascist party in Italy. But the deep democratic traditions and the proud sense of independence of the Serbs never allowed the transformation of the regime into anything approaching a fascist dictatorship. Demands for the restoration of a true democratic and representative government did not cease but gained in momentum, and were coupled with demands for the establishment of a federal state in which the different ethnic and regional groups would enjoy a large autonomy. This discontent led on April 4, 1932, to the resignation of the cabinet of Gen. Živkovif, who as the king's man had headed the Yugoslav cabinet after the coup d'état of 1929. He was followed by a number of civilians, who, however, continued to be straw men for the king's will. None of them lasted for more than a few months; first Dr. Voyislav Marinković, then Dr. Milan Srškić tried to include in their cabinets as many representatives of the Croats and of the Slovenes as possible, but that in no way reconciled the Croats. On May 30, 1932, bombs were thrown at the king's palace and at other points in Belgrade, and Croat nationalists carried on guerrilla warfare against Serbian authorities. Communist agitation and financial difficulties caused by the poor crops and the decline in foreign trade complicated the situation. On Nov. 14 an executive committee of a coalition formed of Serbian democratic opposition and Croatian Peasant leaders issued a manifesto demanding a return to democracy.

The new parliament elected under the new constitution did not meet with any favourable response. According to the constitution the parliament consists of two houses. The members of the senate were elected for six years, half of them to be re-elected every three years, and a corresponding number to be nominated by the king Only citizens over 40 years of age can become senators. The chamber of deputies or Skupština was elected by public and verbal elections, in which every male citizen of over 21 years could participate. The lack of secrecy and the verbal character of the vote, however, gave the authorities complete control over the election results. Deputies were elected for a period of four years, one for every 50,000 inhabitants. At the elections held on Nov. 8, 1931, all deputies elected organized themselves into one party adhering to the government policies.

Meanwhile, with the accession of Hitler to power in Germany, the situation of the Little Entente, to which Yugoslavia belonged together with Czechoslovakia and Rumania, had become more critical. Incidents in Dalmatia had again aroused the spectre of a conflict with Italy; a proposed customs union between Italy and Albania had increased Yugoslavia's fears. There were even rumours current that the three "revisionist" powers, Italy, Germany and Hungary, might unite to divide Yugoslavia, Rumania and Czechoslovakia among themselves. Italian influence was very strong in Hungary and Bulgaria, and all that was felt as a threat to Yugoslavia who tried to rely partly upon her understanding with the Little Entente and with the newly formed Balkan Entente, comprising Turkey, Greece, Rumania and Yugoslavia —but partly also upon a rapprochement with Germany against which apparently Yugoslavia felt no aversion. Some Yugoslav circles were of the opinion that the German domination of Austria might be more advantageous to Yugoslavia's security than Italy's preponderant influence there.

To counteract the economic crisis, a number of new trade agreements were concluded in 1933, and an effort was made to implement the political co-operation of the Little Entente by economic co-operation. In spite of the growing seriousness of the international situation, the internal tension between Croats and the government showed no relaxation, though Croat and Serb leaders collaborated in their demands for the restoration of democracy.

The Tragedy of Marseilles. — In the internationally tense situation the French foreign minister, Louis Barthou, one of the most agile of French statesmen, tried to re-establish closer ties between France and her eastern allies, and especially to arrange for an understanding between Yugoslavia and Italy. On Ort. 9, 1934, King Alexander landed in Marseilles, where he was greeted by M. Barthou. On their way through the streets of the French port they were both assassinated. It was proved that the assassination had been inaugurated by a Croat revolutionary organization under Dr. Ante Pavelić, the head of the terrorist Ustashi, and his fellow worker Sladko Kvaternik. A French court sentenced them to death in absentia for the murders. Both were living in Italy, where apparently they were on the best of terms with the fascist government. The Ustashi movement also had a training farm at Janka Puszta in Hungary near the Yugoslav border, where the terrorists were trained and educated in fascist principles. The Yugoslav government charged that the Hungarian government had been aware of this activity and had supported it.

The eleven-year-old son of King Alexander, Peter II, became king under the regency of his uncle Prince Paul, as chief regent, with Dr. Radenko Stanković, a Slovene, and Dr. Ivo Perović, a Croat, as members of the regency council. All three had been appointed by the late king in his last will.

The death of the king introduced a more conciliatory spirit into the administration, but the new cabinet under Bogoljub Yevtid was in no way ready to accept the demands of the opposition. New elections in May 1935, did not change the composition of the parliament. The Croats refused to collaborate.. In 1936 Milan Stojadinovif became prime minister. He tried to alleviate the economic crisis by diversification of agriculture and industrialization of the country. The basis for a heavy industry was not lacking, as sufficient ore was found in the country. But the most important event under the new cabinet consisted in the attempt to reorient Yugoslavia's foreign policy. Mr. Stojadinovif was favourably inclined toward the fascist dictatorships. Thus the ties binding the countries of the Little Entente were loosened, and especially cordial relations were established with National Socialist Germany.

Toward a Serb-Croat Understanding. — On Sept. 15, 1937, Dr. Maček met with the leaders of the Serb Radical party, the Serb Democratic party and the Serb Agrarian party at Zagreb, the Croatian capital. His own party. which represented the overwhelming majority of the Croat people, and the three Serb parties, which could speak for the overwhelming majority of the Serb people, reached complete agreement and demanded the abolition of the semidictatorial constitution, free elections to a constituent assembly which would elaborate the new constitution and finally the formation of a coalition ministry containing representatives of all major parties. Thus the foundation was laid for a Serb-Croat understanding. But the government of Stojadinovid did not wish to reintroduce democracy, the more so because it knew that the Serbs and the Croats were for complete and close co-operation with the democratic peoples, while Mr. Stojadinović followed more and more openly a policy of close collaboration with the Rome-Berlin Axis. As a result of this policy he in no way opposed Germany's annexation of Austria, though this act brought the German army to the borders of Yugoslavia. He trusted Mr. Hitler, who solemnly pledged the inviolability of Yugoslavia's frontiers. Nor did the Yugoslav government help its nominal ally Czechoslovakia when Germany threatened that country. The sympathies of the Yugoslav population were outspokenly and enthusiastically for Czechoslovakia, hut the government did not heed popular opinion and pursued unflinchingly its pro-National Socialist policy, which also helped to establish the economic domination of Germany in Yugoslavia.

The year 1937 saw also much agitation of the Orthodox church against a proposed concordat of the government with the Roman Catholic church. The patriarch of the Orthodox church died during the controversy.

The year 1938 was marked by continued co-operation between the Croats and the Serbs. Dr. Maček visited Belgrade on Aug. 14. Both peoples were united in their demands for democracy and in their opposition to a profascist foreign policy. Meanwhile Prime Minister Stojadinovif visited Italy and Germany and was everywhere most warmly received. His policy led also to a rapprochement with Hungary and Bulgaria. On Dec. 11, 1938, new elections were held, in which all opposition parties, Serbian and Croation, joined in a common front against the government. The government succeeded in receiving a slight majority of votes. The only outright fascist party, the Zbor, received only 30,310 votes, or less than 1% of the votes cast. The great triumph of the opposition at the polls indicated the instability of the regime. In spite of all the pressure exercised by the government and in spite of the method of open and oral ballots, the government succeeded in getting—according to its own official figures which were subject to doubt--only 1,643,783 votes as against 1,364,524 for the opposition.

4s a result, Stojadinovif resigned on Feb. 4, 1939. He was followed by Dragisha Cvetković. Minister of foreign affairs in the cabinet was Aleksander Cincar-Markovič; minister of war was Gen. Milutin Nedić. The new government mitigated the pro-Axis course in foreign policy in agreement with public opinion, though the sympathies of the foreign minister were known to be profascist. Rut a serious attempt was made to solve the Croat-Serb problem. After long negotiations, agreement was reached on Aug. 25, 1939. Two of the banovinas, Savska, and Primorska, were united into a single administrative unit called Banovina Croatia, comprising about one-fifth of the total area of the state and having a population of 4,500,000 or about a third of the country. Croatia was to enjoy a large autonomy and to

have its own Diet at Zagreb. Mr. Šubašić was appointed ban of autonomous Croatia. These measures were regarded as only the first step toward the complete reconstruction of Yugoslavia, the autonomous constitution of further units and the reintroduction of parliamentary democracy based upon free elections as the centre of the government. The outbreak of European war in the fall of 1939 postponed the realization of these plans.

Yugoslavia and the War.—With the outbreak of the war, the Yugoslav government proclaimed its neutrality. In the new cabinet which had been formed as a result of the Serb-Croat agreement the premiership and the foreign office had remained in old hands, but Dr. Maček had entered the cabinet as vicc-premier and five other Croats had joined it. As the year 1940 developed, the government, in spite of the outspoken sympathies of the large majority of the people, showed tendencies toward a rapprochement with the growing power of National Socialist Germany. Meanwhile efforts were made to strengthen the Serb-Croat understanding On Jan 14, 1940, Prince Paul visited Zagreb officially, a new electoral law for the Yugoslav Skupština and the Croatian Diet (the Sabor) was drawn up providing for elections by secret ballot. The hopes which democratic circles put upon the conference of the Balkan Entente, which was convened at the beginning of February in Belgrade, were futile. Efforts to establish closer co-operation between the four Balkan nations for resistance to any fascist aggression were not realized, partly as a result of the attitude of Yugoslavia, whose foreign minister, under the influence of Italy, showed himself unco-operative. At the end of February Dr. Maček accused the Ustashi organization, which was working from Italy, of a number of terrorist bombing incidents in Croatia. Milan Stojadinović, the former dictator, well known for his fascist leanings, was temporarily arrested during 1940. A strong group led by the minister of war Gen. Nedić and by Lazar Markovid favoured a decisively antifascist stand, but they were opposed by the Slovene Catholics under the leadership of Father Anton Korošec, the minister of education, who sympathized with Italy and her fascist and anti-Semitic policy. Some energetic measures were taken against the small actively fascist group, the Zbor, and its leader Dmitri Lyotić, the president of the powerful co-operative movement, hut when Gen. Nedić in Nov. 1940 demanded an active policy against the fascist forces in Albania he was forced to resign and old Gen. Petar Pesić took his place. Meanwhile the foreign minister arranged for a closer understanding with Hungary, and at the end of 1940 the Hungarian foreign minister visited Yugoslavia. On Feb. 26, 1941, Yugoslavia's foreign minister arrived in Budapest, to sign the friendship pact with Hungary.

The occupation of Rumania by German troops had completely dissolved the Little Entente and removed one of the cornerstones of the Balkan Entente. The adherence of Hungary, Rumania and Bulgaria to the Axis pact forced Yugoslavia to choose finally between adherence to the Axis, for which the prime minister and the foreign minister seemed disposed, backed by the prince regent, and resistance to Germany, if possible in co-operation with Greece and Turkey. The inner disagreement and tension did not allow Yugoslavia to follow any clear-cut course. She did not definitely join the Axis, because the opposition of the freedom-loving, proud and democratic people was too strong; she did not make the necessary preparations for successful resistance either diplomatically or militarily because the "appeasement element" was too strong in the cabinet and in certain influential circles. The premier and the foreign minister visited Germany, and the negotiations lasted for several weeks. Hitler's demands and offers were reported to be Yugoslavia's adherence to the Axis, the prohibition of all antifascist and anti-Axis agitation in Yugoslavia (which of course amounted to a suppression of democratic freedom), the opening up of Yugoslavia's railroads for the transport of German war materials, a guarantee of the inviolability of Yugoslav territory and finally the promise of territorial expansion at the expense of Greece. Some of the ministers, including Lazar Marković, resigned in protest against any agreement with Germany which would definitely bind Yugoslavia to the Axis and the so-called "new order." The negotiations lasted for the whole month of March, with conflicting reports as to the strength of the two opposed factions in Yugoslavia. Finally yielding to a German ultimatum, the Yugoslav government on March 22 decided to sign, and on March 25 the Yugoslav prime minister and foreign minister affixed their signatures in Vienna to ihe Axis pact.

But two days later, on March 27 in the early morning hours, the Serb people and parts of the army who had remonstrated against the surrender to fascist pressure, overthrew the government, under the leadership of the chief of Yugoslav aviation, Gen. Dusan Simović, who became prime minister. King Peter II assumed the government amid unprecedented scenes of public rejoicing on the part of the Serb people, who saw their liberty and their honour saved. Under Gen. Simović, Dr. Vladimir Maček continued as vice-premier. Regent Paul fled to Greece, and the former premier and foreign minister were arrested. There was no doubt that the coup was a result of an overwhelming popular determination among the Serbs, a real popular uprising backed by a large majority of the army. But the enthusiasm among the Croats was much less. They had neither the fiery tradition of liberty nor that of military prowess which the Serbs possessed, and the Croatian lowlands were the first to be exposed to any German invasion.

The heroic move on the part of the Serbs had come in a certain way too late. They had decided to make a last stand for their liberties rather than submit to the Axis, but they did it at a time when they were practically surrounded on all sides by German troops, which had by then occupied Hungary, Rumania and Bulgaria, as well as Austria, so that the Yugoslav army had to defend almost all the long frontier. The preceding government, inclined to appeasement, had not prepared the army and the mobilization sufficiently. Some of the most urgently needed material was lacking, the dispositions for a coming struggle werr incomplete. Like most of the other countries who found themselves threatened by Germany, Yugoslavia entered the fight too late, after having lost all strategic outposts beyond her frontiers, insufficiently prepared because large parts of influential circles had refused to believe in the seriousness of the threat. A few days passed amid the greatest excitement. The Yugoslav cabinet tried desperately to maintain peace and liberty. Finally on April 10, 1941, the German army struck from several directions, especially from Bulgaria, and was supported in its efforts by the Italian army, and even by the Hungarian army (in spite of the treaty of everlasting peace and friendship which had been concluded only a very few weeks before) and the Bulgarian army. Against the immense superiority in men and materials, the Yugoslav army, in spite of courageous resistance, succumbed within two weeks.

Meanwhile the Ustashi ucdcr the leadership of Dr. Ante Pavelić had seized power in Croatia and proclaimed it an independent state. Sladko Kvaternik became prime minister. The new state was quickly organized according to strictly fascist pattern. On May 17 members of the new Croatian government came to Rome and the restoration of a Croatian kingdom, whose last king Zvonimir had died in 1089, was proclaimed. The new flag of Croatia consists of three broad stripes, red, white and blue, and superimposed upon them a shield of checkered red and white squares. The 41-year-old cousin of the king of Italy, the Duke of Spoleto, was named King Aimone I of Croatia. Italy was to guarantee the independence and integrity of the new kingdom, which is bound to her in a 25-year pact similar to that between Slovakia and Germany. A permanent economic mission under Count Giuseppe Volpi di Misurata was established for Croatia

The important parts of the Dalmatian coast were annexed by Italy, especially the land around Fiume, Zara, Split, all the Dalmatian islands and the Gulf of Cattaro. Giuseppe Bastianini was named Italian governor of Dalmatia, to reside in Zara. The population of the newly annexed territory is 90% Croat.

The former Slovenia has been divided up outright between Germany, which took the northern and eastern half, and Italy, which took the southwestern part as the new "Province of Ljubljana," whose inhabitants, belonging entirely to the Slovene nationality, would enjoy a certain autonomy.

As regards the rest of Yugoslavia, no definite arrangements had been made (May 1941). Montenegro was probably to become a part of Italy, Hungary and Bulgaria were to annex large parts of former Yugoslav territory, and the rest, where an indescribable terrorism was exercised by the Germans and where the capital Belgrade was wantonly and ruthlessly destroyed, was to form a Serbia much in the same position as that to which Poland had been reduced.

(H. Ko.)

DEFENCE

The first shots in the World War were fired by Austrian guns bombarding Belgrade on July 29, 1914. After a gallant resistance the Serbian army was overpowered by its Northern adversaries in October 1915, and forced into a disastrous retreat across Albania as the result of a sudden blow struck from the right rear by the old adversary Bulgaria. After being reconstituted in Greek territory (Corfu) the Serbian troops joined the Allied army at Salonika, and those troops formed the nucleus of the Yugoslavian army of to-day. In October 1918, when the resistance of the central powers was on the point of collapse and the Bulgarians had already thrown up the sponge, the Serbian army numbered 63,050 combatants, with a ration strength of 110,550. It was organized in 6 infantry divisions and one of cavalry, with 289 field guns. Its battle casualties had exceeded 331,000, a figure which included 45,000 killed and over 133,000 wounded in action. Such was the war record of the Serbian troops in what was later the army of Yugoslavia.

Present-Day Army: Recruitment and Service.—The territory of the Serbs, Croats and Slovenes is divided into 5 army areas, each of these containing 3 or 4 divisional areas subdivided into military districts. Military service is obligatory for all physically fit citizens between the ages of 21 and 40 with the active army and subsequently with the reserve up to the age of 50. With the sanction of the cabinet, the war minister can also call up youths of ages from 18 to 20 and all men under jj years. Service with the colours is for 18 months from the year in which the 21st birthday falls.

Yugoslavia is divided into areas for 16 infantry and 3 cavalry divisions. The infantry divisions include also artillery, while the cavalry divisions include horse artillery. On the whole there were in 1939, 53 infantry regiments, 10 cavalry regiments and 33 artillery regiments. In addition there were independent heavy artillery formations and pioneer and engineering regiments. The budget for the year 1939–40 comprised a sum of 2,928,166,000 dinars for army and navy.

In Yugoslavia the ministry of war controls the army, the air force and the navy.

The Yugoslav air force in 1939 counted 8 regiments with 48 squadrons and 2 hydroplane regiments with 7 squadrons. The small navy, destined exclusively for coastal defence, comprised 1 cruiser, 1 flotilla leader, 3 destroyers, 6 torpedo boats, 8 motor torpedo boats, 4 submarines and 35 different auxiliary units. (X.)

ECONOMIC AND FINANCIAL POSITION

Agriculture and Livestock. — Agriculture occupies about 80% of the total population of Yugoslavia. The different provinces vary greatly in climate, soil, configuration and methods of cultivation. The coastal districts and the high Karst land immediately behind them are mountainous and often barren, and present great difficulties of communication. The most fertile districts are the Voivodina (Banat and Bačka), Slavonia and northern Serbia (especially the Mačva, Morava and Timok districts) and portions of Croatia, Slovenia and Bosnia. The principal crops are maize and wheat (40% of both being produced in the Voivodina), sugar beet, hemp and hops (also in the north), opium (in Macedonia) and tobacco (chiefly in Macedonia and Hercegovina). Other important crops are beans, potatoes, flax, clover and lucerne.

Areas Sown and Productions in 1938

Crop	Acreage	Tons
Wheat	5,262,393	3,029,037
Barley	1,026,235	421,259
Rye	627,178	227,102
Oats	894,051	326,526
Maize	6,801,742	4,755,873
Vines	540,264	4,672,157*

*Hectolitres

Admirable wines are produced in Dalmatia and Hercegovina in Syrmia (of the Hungarian type) and along the Danube in Serbia (Smederevo). The fruit industry is important, notably in the Sumadija district of Serbia and in the east of Bosnia. In an average year some 750,000 tons of fresh plums are produced, and 40,000 to 50,000 tons of dried plums and pulp are exported. There were eight sugar factories, two state-owned, the rest in the hands of foreign banks and companies.

In 1938 there were in Yugoslavia 1,264,470 horses, 142,323 mules and asses, 4,267,339 cattle, 10,137,357 sheep, 3,450,884 pigs and 1,890,386 goats. The forests cover 7,500,000 hectares of land, of which all save 2,000,000 is old forest. Timber is a main article of export, Italy, Egypt and the Levant being the best customers. The most important state forests are in Bosnia, beech, fir and oak being the commonest trees. The Slavonian oak (known abroad as "Austrian oak") is valuable and of high quality. In Serbia 60% of the forests are beech. At Teslić there is a wood-distilling factory, which is the largest in Europe, and produces methylated spirit, alcohol, formaldehyde and acetone.

Mining and Mineral Resources. — The mineral resources of Yugoslavia have for the most part lain idle since Roman and mediaeval times, but offer very great possibilities. Iron ore of good quality occurs in enormous quantity and near the surface at Ljubija, in Bosnia, where it is mined by the state mining authorities and sold for exportation. Another iron mine worked by the state exists at Vareš, in Bosnia, and is worked in conjunction with a coal mine and iron-smelting establishment and the ironworks at Zenica. The metallurgical works here are on a primitive scale, their production being pig iron and small castings. The ironworks at Jesenice (Slovenia), which have a capacity of 70,000 tons per annum, produce bar iron, iron and steel sheets, steel rails up to 22 kilograms per metre (as used on the Bosnian narrow-gauge railways), rolled iron, drawn iron and wire nails. Bar iron is manufactured at Store, near Celje, in Slovenia; steel and steel springs at Guštanj, on the Maribor-Klagenfurt railway, and highly silicated foundry iron is produced at Sopusko in Slovenia. Large deposits of brown coal and lignite occur in many parts of Yugoslavia, but there is no coking coal. Copper is produced at Bor and Majdanpek in Serbia.

In 1938 the output of iron ore was 606,884 metric tons, of copper ore 762,066 metric tons and of lead-zinc ore 882,892 metric tons. Of chrome ore 58,470 metric tons were produced, and of brown coal and lignite 5,737,193 metric tons.

Principal exports in 1939, valued in thousands of dinars

	1938	1939
Eggs	157,455	160,313
Wheat	208,811	375,101
Cattle	74,865	107,659
Maize	480,873	99,082
Swine	376,954	484,161
Fresh meat	236,589	282,521
Timber	676,275	853,198
Copperore	406,062	441,428

Foreign Trade. — The total exports in 1939 amounted to 5,521,187,370 dinars — the principal items being shown in the table in the first column. The chief countries of destination are shown in the table below.

Chief countries of destination

Country	Value in thousands of dinars	
	1938	1939
Germany	1,813,864	1,762,003
Great Britain	485,133	366,698
Czechoslovakia	398,361	769,203
Belgium	336,843	348,304
Italy	324,297	583,516
United States	255,860	280,736
Hungary	215,377	289,246
Greece	130,250	135,382
Netherlands	108,788	103,388
Switzerland	83,741	167,529

Imports during 1939 amounted to 4,757,381,947 dinars, the most important items being cotton and cotton goods (690,740,000 dinars), iron and iron goods (576,461,000 dinars), wool and woollen goods (415,169,000 dinars) and machinery (388,303,000 dinars). Germany took first place on the list of countries supplying Yugoslavia's imports.

Revenue and Expenditure. — For the year 1939–40, the expenditure was estimated at 12,942,000,000 dinars. and the revenue at the same figure. The principal sources of revenue were (in millions of dinars): direct taxes, 3,025; indirect taxes, 2,304; state enterprises, 4,253; monopolies, 2,215; and various, 44.

The Yugoslav dinar was originally equal to a franc. On May 8, 1931, a stabilization loan was concluded in Paris to help in the legal stabilization of the dinar. As a result the dinar was stabilized at a value of 26.5 mg. of gold, or 11 dinars corresponding to 1 gold franc, 100 dinars to $1.76 in gold.

Public Debts.—On July 1, 1939, the public external debt of Yugoslavia comprised the most various items, partly prewar debts, going as far back as 1888, war debts to the British government, to the United States and to the French government, and finally postwar debts. The internal debt amounted on April 1, 1939, to 8,613,000,000 dinars. (H. Ko.)

YUKON, the largest river in Alaska, and the fifth largest in North America. With its longest tributaries not in Alaska, the Lewes and the Teslin (or Hootalinqua), its length is about 2,300 mi. in the form of a great arc, beginning in the Yukon district of British Columbia, near the Pacific ocean, and ending at the Bering sea coast. Its catchment area is about 330,000 sq.mi., more than one-half of which lies in Canada. The Lewes river rises in Lake Bennet, or, more accurately speaking, Lake Lindeman, on the northern slope of the coast range just over the Dyea pass up from Lynn canal (at the head of Chatham strait). It flows north through a chain of lakes with connecting streams until it is joined by the Hootalinqua about 30 mi. below the last of these lakes (Lebarge). Its confluence with the Pelly river, at Selkirk, Yukon district, about 120 mi. due east of the Alaskan-Canadian boundary, forms the headwaters of the Yukon proper. Flowing thence north-west, the Yukon turns abruptly to the south-west near Ft. Yukon, Alaska, on the Arctic Circle, and continues nearly at right angles to its former course to a point south of the head of Norton sound, where it turns again and flows in a north-west direction, emptying into the sound from its south shore.

The Yukon valley comprises four sub-provinces, or physiographic divisions, called the "Upper Yukon," "Yukon flats," "Rampart region" and "Lower Yukon." The "Upper Yukon" valley is about 450 mi. long and from 1 to 3 mi. broad, and is flanked by walls rising to the plateau level from 1,500 to 3,000 ft. above the stream. In this part of its course the Yukon receives from the south the Selwyn river (about 40 mi. below the junction of the Lewes and Pelly rivers); from the west the White river (about 60 mi. below the Selwyn); from the north the Stewart river (about 10 mi. below the White), one of the largest tributaries of the Yukon; from the east the Klondike river (near 64° N. lat.); from the west Forty-mile creek (about 40 mi. above the Alaskan-Canadian boundary line), and many other smaller streams. The "Yukon flats" flank the river for about 200 mi. and are from 40 to 100 mi. wide. Here the stream varies in width from 10 to nearly 20 mi., and involves a confused network of constantly changing channels. Here, too, the river makes its great bend to the south-west, and its channels are constantly changing. The "flats" are monotonous areas of sand bars and low islands, thickly wooded with spruce. The principal tributaries here are the Porcupine river (an important affluent, which enters the main stream at the great bend about 3 mi. N. of the Arctic Circle); the Chandlar river, also confluent at the great bend, from the north, and, near the west edge of the flats, the Dall river, also

from the north. The "Rampart region" begins near 66° N lat., where the "flats" end abruptly, and includes about 110 m. of the valley, from 1 to 3 m. wide, and extending to the mouth of the Tanana. No large tributaries are received in this part of the river. At the west edge of the Ramparts the Yukon receives the Tanana river, its largest tributary lying wholly within Alaska. The Tanana valley is about 450 m. long, nearly parallel to the Yukon from about due west of its head waters to the great bend, and drains about 25,000 square miles. Its sources lie in the glaciers on the north slopes of the coast, or St. Elias range, and it receives many tributaries. The Lower Yukon includes that portion between the ramparts and the sea, a stretch of about 800 m. At the mouth of the Tanana (which enters the main stream from the south) the gorge opens into a lowland from 15 to 20 m. wide. Along the north-west boundary of the valley are low mountains whose base the Yukon skirts, and it continues to press upon its north bank until the delta is reached. The valley is never less than 2 or 3 m. and the river has many channels and numerous islands; it has walls nearly to the head of the delta, though about 100 m. above the delta the south wall merges into the lowland coastal plain; the relief is about 1,000 feet. The Yukon delta begins near 63° N. lat. Here the main stream branches into several channels which follow north or north-west courses to Norton sound The northernmost of these channels is the Aphoon pass. and the most southerly is Kwikpak pass; their outlets are about 75 m. apart on the coast, and from 40 to 50 m. from the head of the delta. Between them is a labyrinth of waterways, most of the intervening land being not more than 10 ft. above low tide.

The Yukon river is unique among rivers, in that it rises within 15 m. of tidal waters in the Dyea inlet on the Pacific coast, whence it flows in a north-westerly direction nearly 1,000 m., just crossing the Arctic Circle, where it turns south-west through the middle of Alaska, and then flows more than 1,200 m. until it reaches the ocean within sight of which it rose; for we may properly call Bering sea a part of the Pacific ocean. This grand stream is also surprising in the length of navigation way it gives in proportion to its length, for less than 15 m. N. from where its tiniest streamlets trickle from the crest of Dyea pass lies Lake Bennet, whose head is the true beginning of steamboat navigation on this noble stream. From the starting-point of those same streamlets one can look down on other streamlets beginning their steep descent of the Dyea pass to the waters of the Lynn canal. The nearest harbour for ocean-going vessels is a poor one at St. Michael's island, about 60 m. north-east of the delta; here freight and passengers are transferred to flat-bottomed river steamers. These enter the delta and the river by the Aphoon pass, which is about 4 ft. deep at mean low water, the current varying from 1½ to 4 m. an hour The Lemes is navigable as far as White Horse rapids, which with Miles cañon obstruct the river for a few miles. Above them the stream is again navigable to its source, about 100 m. beyond. The White pass and Yukon railway from Skagway to White Horse (111 m) overcomes these obstructions, however, for traffic and travel The Stewart river, seldom less than 150 yd. wide, is navigable by light-draught steamers to Frazer falls, a distance of nearly 200 miles. The Tanana is navigable for about 225 m. to the mouth of the Chena, and above the mouth of the Chena it again becomes navigable for more than 250 m., including its principal upper tributary, the Nebesna. The Koyukuk, the second largest tributary, entering the Yukon about 600 m. up from its mouth, is navigable for 570 m. (Camden). Altogether the Yukon proper with its principal tributaries embraces more than 3,500 m of navigable waters The system is open to navigation from May until September

Cantwell, R C S., *Report of the Operations of the U S Revenue Steamer Nunivak on the Yukon River Station, Alaska, 1899–1901* (Washington); W. Ogilvie, *Early Days on the Yukon* (Ottawa); A. H. Brooks, "The Geography and Geology of Alaska," *U S. Geol. Survey, Doc. No. 201* (Washington, 1906).

YUKON TERRITORY, the most westerly of the northern territories of Canada, bounded south by British Columbia, west by Alaska, north by the Arctic ocean and east by the watershed of Mackenzie river. It has an area of 205,346 sq.mi. (excluding water). The territory is chiefly drained by the Yukon river and its tributaries, though at the southeast corner the head aters of the Liard river, flowing into the Mackenzie, occupy a part of its area. The margins of the territory are mountainous, including part of the St. Elias range with the highest mountains in Canada at the southwest corner, Mount Logan (19,850 ft.) and Mount St. Elias (18,008 ft.), and the north extension of the Rocky mountains along the south and northeast sides; here, however, not very lofty. The interior of the territory is high toward the southeast and sinks toward the northwest and may be described as a much dissected peneplain with low mountains to the south. The most important feature of the hydrography is the Yukon (*q.v.*) and the rivers which flow into it. The Klondike gold mines are reached by river boats coming down 460 mi. from White Horse, the terminus of the White Pass railway, 111 mi. long, from Skagway on an inlet of the Pacific. The Trans-Canada Airlines have branch services to the Yukon from Edmonton. The Alaska-Canada highway of 1942 connects railhead at Dawson Creek, B.C., with the Yukon and Alaska.

Before the discovery of gold on the Forty Mile and other rivers flowing into the Yukon the region was inhabited only by a few Indians, but the sensational finds of rich placers in the Klondike (*q.v.*) in 1896 brought in a vigorous population centred in the mines and at Dawson, which was made the capital of the newly constituted Yukon territory. With the decline of the gold-mining industry, the population decreased from 27,219 in 1901 to 4,157 in 1921, with 4,914 (males 3,153) in 1941. The Yukon is administered by an appointed (dominion) commissioner and a Territorial Council of three, elected for three years from the Dawson, White Horse and Mayo districts. Law and order are enforced by members of the Royal Canadian Mounted Police. The Yukon is represented in the dominion parliament by one member in the house of commons. Placer gold, originally the principal output, is now quite subordinate to lode mining. Gold output, 1941, 70,939 fine oz. The Yukon has also been a steady producer of silver and in 1940 yielded 2,259,343 fine oz., mostly from Keno and Galena Hills, in the Mayo district. A concentrator has been installed at Keno Hill. The wide distribution of the ores of gold, copper, silver and lead indicate enormous mining possibilities. Coal, of which there are large reserves, is being mined. Large game and fur-bearing animals abound.

Though so near the Pacific the Yukon territory has a rigorous continental climate with very cold winters seven months long, and delightful sunny summers. Owing to the lofty mountains to the west the amount of rain and snow is rather small, and the line of perpetual snow is more than 4,000 ft. above sea-level, so that glaciers are found only on the higher mountains; but the moss-covered ground is often perpetually frozen to a depth of 100 or 200 ft. Vegetation is luxuriant along the river valleys, where fine forests of spruce and poplar are found, and the hardier grains and vegetables are cultivated with success.

YUMA, a city near the south-western corner of Arizona, U.S.A., on the Colorado river, at the mouth of the Gila river; it is the county seat of Yuma county. It is on Federal highway 80; has a municipal airport; and is served by the Southern Pacific and the Yuma Valley railways. Pop. (1940) 5,325.

YUMAN, a speech stock of American Indians, named from the Yuma tribe, living about the lower Colorado river and occupying a distinctly desert habitat. The groups that belong are the Havasupai, Walapai and Yavapai of the mountains of western Arizona; the Mohave (*q.v.*), Yuma, Kamia and Cocopa (*q.v.*) in the Colorado river bottomlands; the Maricopa (q v.), Halchidhoma, Kohuana, Halyikwamai, once on the river but driven out and the remnants, except the Maricopa. lost to tribal identity; the Diegueño to the rear of San Diego in California; and the Akwa'ala, Yukiliwa, Cochimi and other groups known under varying local names in Mexican California. Of these tribes, the most advanced were those on the Colorado, who have changed little since their discovery by Alarcon in 1540. They have always been warlike and turbulent, but chiefly among one another. They are agricultural, marking the north-western frontier in the continent of the native practice of maize farming. They make pottery but no basketry. They are divided into totemic patrilineal clans

YUNCAN, a group of tribes of South American Indians, forming an independent linguistic stock. The Yuncas (known also as Chimus and Muchic) occupied originally the arid coastal region of northern Peru comprised within the valleys of Trujillo, Chicama, Jequetepeque, Lambayeque and Morope; later, by conquest, they extended the area controlled north as far as Tumbez and southward to Chancay. In the 15th century they were conquered, after stubborn resistance, by the Incas and their territory included within the Inca empire. Their most important centre was the great city of Chan Chan (Gran Chimu), which was situated near the present Trujillo.

The Yuncas were a city-dwelling, agricultural people with highly developed agriculture, growing manioc, maize and sweet potatoes. While the houses of the poorer people were doubtless of reeds and matting or thatch, the better dwellings and all the important structures were built of sun-dried brick. The temples were stepped pyramids, raised on high platforms, and containing burial chambers within. Some of the palaces were decorated with elaborately executed stucco relief patterns in geometric style derived from textiles, and reminiscent of the stone mosaics of Mitla in Mexico. The Yuncas were wide traders along the coast, using reed and log balsas or rafts, and constructed regular harbour works at their ports. They were expert textile makers and raised cotton for the purpose; were very skilful workers in gold, of which great amounts have been excavated by treasure-hunters; and were also makers of very fine pottery, of which three sequent styles may be distinguished. They would appear to have had a rather elaborate social and governmental organization, with kings or chiefs of considerable power. In their religion they venerated the moon more than the sun (in contrast to their Inca conquerors), and also held sea deities in high esteem.

Uhle, "Die Ruinen von Moche," *J. Soc. Americanistes de Paris, (ms.)* vol. x., pp. 95–119; A. L. Kroeber, "The Uhle Collection from Moche," *Univ. of California, Pub. Amer. Arch. Ethnol.,* vol. xxi., pt. 5.

YUNNAN (*i.e.,* Cloudy South), a south-west province of China, bounded north by Szechwan, east by Kwei-chow and Kwang-si, south by Burma and the Lao tribes, and west by Burma and Tibet; area 123,540 sq. miles. The population is variously estimated at four to 12 millions, a recent and probable estimate being between eight and 12 millions. The inhabitants include many races beside Chinese, such as Shans, Lolos and Maotsze. The Musus, in north-west Yunnan, once formed an independent kingdom which extended into East Tibet. Some of the inhabitants are nominally Muslim. The west and north-west have high mountain ranges and deep gorges of the Kinsha-kiang (upper Yangtze-Kiang), the Mekong and the Salween; the ridges have peaks over 16,000 ft. high, the slopes are often heavily forested, population is small, communications are bad, and a journey from Yunnan Fu to Bhamo, via Têng-yueh (505 m.) takes nearly four weeks. The south-east includes the upper basin of the Songkoi or Red river, and of the Pata-ho (upper Si-kiang); the former becomes navigable near Man-hao, just before it leaves Yunnan for Tongking. This region has rich valleys and open, undulating country. The north-east, near the Yangtze-Kiang's right bank, is not very high, though higher than Kwei-chow, over the border, but it is deeply dissected and sparsely peopled. There are a few lakes, especially near the capital, Yunnan Fu. The mean monthly temperature of Yunnan Fu varies from 47° F in December to 69° F in July, the warm season being April to August and the rainy season March to August, with the maximum in June (13·34 in.). The total annual fall is 37 to 38 inches.

Besides Yunnan Fu, the capital, the province contains 13 prefectural cities, several of which—Teng-ch'uen Fu, Ta-li Fu, Yung-ch'ang Fu, Ch'u-siung Fu and Lin-gan Fu, for example—are situated in the valley plains. Mengtsze, Szemao and Momein (or Têng-yueh) are open to foreign trade. Yunnan Fu is connected by railway (1910) with Tongking. The line, which starts from Haiphong, runs, in Yunnan, via Mengtsze hsien (a great commercial centre), to the capital. Several important roads intersect the province; among them are:—(1) The road from Yunnan Fu to Bhamo in Burma via Ta-li Fu (12 days), Têng-yueh Chow or Momein (eight days), and Manwyne—beyond Ta-li Fu it is a difficult mountain route. (2) The road from Ta-li Fu North to Patang via Li-kiang Fu, which thus connects West Yunnan with Tibet. (3) The ancient trade road to Canton, which connects Yunnan Fu with Pai-sê Fu, in Kwang-si, on the Canton West river, a land journey which occupies about 20 days. From this point the river is navigable to Canton.

Yunnan, long independent, was subdued by Kublai Khan, but was not finally incorporated in the empire until the 17th century. It was the principal centre of the great Mohammedan rebellion, which lasted 16 years and was suppressed in 1872.

See H. R. Davies, *Yunnan, the Link between India and the Yangtze* (Cambridge, 1909); *A.* Little, *Across Yunnan* (London, 1910); Rev. J. M'Carthy, "The Province of Yunnan," in *The Chinese Empire* (London, 1907); L. Richard, *Comprehensive Geography of the Chinese Empire* (Shanghai, 1908).

YUN-NAN-FU, the capital of the province of Yiin-nan, China, about 500 m. by rail N.N.W. of the port of Hai-Gong, Tongking. The town is centrally placed at a focus of ways within the province. The plain in the neighbourhood of the city is fertile and well populated and Yiin-nan-Fu is said to have about 45,000 inhabitants. Originally the surrounding district was known as the "land of the southern barbarians" and the city is surrounded by fortified walls some 6½ m. in circuit. The city has a strong Mohammedan colony and was almost reduced to ruin by the Mohammedan rising in 1855. The rise to prosperity was slow, but the opening in 1910 of the railway from Tongking, built by the French, gave a fresh impetus to commerce. The copper works are important and there is a mint at Yiin-nan-Fu. Silk and leather goods are made while English cotton fabrics are imported as well as raw cotton from Burma.

YURIEV: *see* TARTU.

YUROK, a tribe on the lower Klamath river, asserted but also disputed to be of Algonkin speech lineage, is perhaps the nuclear group of the north-west California Indian culture, the principal others being the Hokan Karok upstream from them, the Athabascan Hupa (*q.v.*) of Trinity, the Chilula of Redwood, the Tolowa of Smith river; and the Algonkin (?) Wiyot of Humboldt bay. The Yurok once numbered about 2,400 in more than 50 small villages; 500 remain.

YURUCAREAN, a small group of tribes of South American Indians, constituting an independent linguistic stock. The Yurucares live in Bolivia on the eastern slopes of the Andes and the lowlands along the Chaparé, Isiboro and Securé rivers, tributaries of the Mamoré. They are a tall, well-built folk, slightly lighter in colour than the Quechua of the highlands, who gave them the name by which they are known, signifying "white men." Their dress consisted of a poncho-like garment, without sleeves, of bast, decorated with geometric patterns, printed by means of large wooden dies. The Yurucares are sedentary agriculturalists and hunters, living in open thatched shelters.

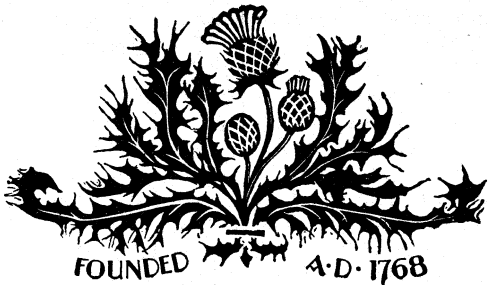
See A. D'Orbigny, *L'Homme Americain* (Paris, 1839); L. E. Miller, The "Yurucare Indians of Eastern Bolivia" *(Geog. Review,* 1917, pp. 450–464).

YUSAFZAI, a large group of Pathan tribes, originally immigrants from the neighbourhood of Kandahar, which includes those of the Black Mountain, the Bunerwals, the Swatis, the people of Dir and the Panjkora valley, and also the inhabitants of the Yusafzai plain in Peshawar district of the North-West Frontier Province of India. Three sections of the tribe, the Hassanzais, Akazais and Chagarzais, inhabit the W. slopes of the Black Mountain, and the Yusafzai country extends to the Utman Khel territory.

YVERDON (1,437 ft.), a town in the canton of Vaud, Switzerland, and on the south-western corner of Lake Neuchatel, at the mouth of the Thible. It is situated on the site of the small Roman town of Eburodunum. Population (1941) 10,856, French-speaking and mostly Protestant. At the beginning of the 19th century its castle was the home of Pestalozzi's school. It has an historical museum and several industries. It is a well-known spa with warm and sulphurous springs.

YVES, SAINT, OF BRITTANY (1253–1303), was born in 1253 at Kermartin, near Tréguier, Brittany. His father was Héloury, seigneur of Kermartin. and his mother Azou de Quenquis. In 1267 he went to Paris to study law, and ten years later to Orléans to study canon law. On returning to Brittany he was appointed ecclesiastical judge under the archdeacon of Rennes. In 1285 he was ordained priest and appointed first to the parish of Trédrez, and afterwards to Louannec, where he died on May 19, 1303. He was buried in the cathedral of Tréguier, and was canonized by Clement VI. in 1347. As a lawyer and judge he was famed for his rectitude and wisdom and for his zeal in defending the cause of widows and orphans. His feast is celebrated on May 19. He is the patron saint of lawyers for he was "advocatus et non latro, res miranda populo" (a lawyer and not a thief, a marvel to the people).

YVETOT, a town of north France, in the department of Seine-Inférieure, 24 mi. N.W. of Rouen on the railway to Le Havre. Pop. (1936) 6,565. Cotton goods and hats are made; also trade in agricultural products. The lords of Yvetot bore the title of king from the 15th till the middle of the 16th century, their petty monarchy being popularized in one of Béranger's songs. In 1592 Henry IV here defeated the troops of the League.



Z This letter together with Y was adapted by the Romans from the Greek alphabet after the conquest of Greece for use in Greek words borrowed or transliterated. It was the seventh letter of the Greek alphabet and had the form Ⅰ or Ⅼ. It was not taken over by the Latins from the Chalcidic alphabet with the rest of the letters as the sound it represented did not occur in Latin. Its place in the alphabet was filled by the letter G adapted from C to represent the voiced velar stop. The letter corresponded to Semitic Ⅰ *(zain).*

The minuscule letter has generally retained the form of the majuscule, though in certain hands the form ȝ has developed.

The sound represented by the letter in Greek is not precisely known. It was, at least in certain cases, a double sound and probably varied in separate dialects as well as in different words between *z, i, zd, dz,* or *di.* In Latin it was probably the voiced fricative corresponding to *s* and this value it has retained till modern times. (B. F. C. A.)

ZABERN: *see* SAVERNE.

ZABRZE: *see* HINDENBURG.

ZACATECAS, a State of Mexico. Its area is 28,125 sq.m., pop. (1930) 459,074. It belongs wholly to the great central plateau of Mexico, with an average elevation of about 7,700 feet. The State is somewhat mountainous, being traversed in the west by lateral ranges of the Sierra Madre Occidental, and by numerous isolated ranges in other parts—Mazapil, Norillos, Guadalupe and others. There are no large rivers, only the small headstreams of the Aguanaval in the north, and of the Guazamota, Bolanos and Juchipila in the west, the last three being tributaries of the Rio Grande de Santiago. As the rainfall is light this lack of streams suitable for irrigation is a drawback to agriculture. The climate is dry and generally healthy, being warm in the valleys and temperate in the mountains. The agricultural products are cereals, sugar and maguey; the first depends on the rainfall which often fails altogether, the second on irrigation in the lower valleys, and the latter doing best in a dry climate on a calcareous soil with water not far beneath the surface. A natural product is *guayule,* a shrub from which rubber is extracted. The chief industry of Zacatecas, however, is mining for silver, gold, mercury, capper, iron, zinc, lead, bismuth, antimony and salt. Its mineral wealth was discovered soon after the conquest, and some of its mines are among the most famous of Mexico, dating from 1546. The State is traversed by the Mexican Central and the Mexican National railways. Its manufactures are limited chiefly to the reduction of mineral ores, the extraction of rubber from *guayule,* the making of sugar, rum, mescal, pulque, woollen and cotton fabrics, and some minor industries of the capital. The capital is Zacatecas, and the other principal towns are: Sombrerete, pop. (1930) 5,056; an important silver-mining town 70 m. north-west of the capital (elevation 8,430 ft.); Villa Garcia, pop. (1930) 7,674; Concepcion, 6,028; Tlaltenago, 5,086; and the more rapidly growing silver-and-copper-mining centre at Fresnillo with 16,188 inhabitants in 1930.

ZACATECAS, a city of Mexico, capital of the State of Zacatecas, 442 m. by the Mexican Central railway north-west of Mexico City. Pop. (1930) 18,800. It is built in a deep, narrow ravine, 8,050 ft. above sea-level, with narrow, crooked streets climbing the steep hillsides, and white, flat-roofed houses of four and five storeys overtopping each other. The city is well drained and has a fine aqueduct for its water supply. The cathedral is an elaborately carved red-stone structure with unfinished towers and richly decorated interior. Overlooking the city from an elevation of 500 ft. is the Bufa Hill, which is crowned by a chapel and is a popular pilgrimage resort.

Zacatecns was founded in 1546 and was built over a rich vein of silver discovered by Juan de Tolosa in the same year. This and other mines in the vicinity attracted a large population, and it soon became one of the chief mining centres of Mexico. It was made a city in 1585 by Philip II.

ZACCONI, LUDOVICO, Italian musical theorist, was born about the middle of the 16th century at Pesaro, the years of his birth and death being unknown. He made his home in Venice, where he became an Augustine monk and was appointed maestro di cappella at the church of his Order. After a short time spent in the service of Wilhelm, duke of Bavaria in 1592, and a longer period in Vienna with the archduke Charles, he returned in 1619 to Venice. Zacconi's fame is based on a single monumental work, the *Prattica di musica utile et necessaria si al compositore . . . si anco al cantore* (2 pts., Venice, 1596 and 1619). It is one of three standard theoretical works of the Polyphonic period, the others being the *Dodecachordon* of Glaureanus and the *Musicae activae Micrologus* of Ornithoparcus; Zacconi's work, being the latest of the three, treats of the methods of the ripest period of the Polyphonic school.

Complete copies of the *Prattica di Musica* are in the British Museum and the Royal College of Music, London. *See* the article by W. S. Rockstro in Grove's *Dictionary of Music;* also *F.* Batielli, *Un musicista pesarese nel seccolo* xvi. (1905) and *Notizie su la vita e le opere di L. Zacconi* (1912); *H.* Kretzschmar, *Ludovico Zacconi's Leben auf Grund seiner Autobiographie* (1910).

ZACHARIAE VON LINGENTHAL, KARL SALOMO (1769–1843), German jurist, was born on Sept. 14, 1769, at Meissen in Saxony, the son of a lawyer, and was educated there and at Leipzig university. He was professor of law at Wittenberg (1798), and at Heidelberg from 1807 till his death on March 27, 1843. In 1820 he was member for his university in the new parliament of Baden, and in 1831, after the revision of the constitution, for the district of Heidelberg. Throughout his parliamentary career he was a strong conservative, and it was the growth of liberalism that induced him to retire in 1829, and devote himself entirely to juridical work. The German universities still had their old jurisdiction in legal questions of international importance, and Zachariae had referred to him such points as the claim of Sir Augustus d'Este to the dukedom of Sussex, and the dispute about debts due to the elector of Hesse-Cassel, confiscated by Napoleon. He was ennobled in 1842.

His writings deal with almost every branch of jurisprudence, and relate to Roman, Canon, German, French and English law. The first book of much consequence which he published was *Die Einheit des Staats und der Kirche mit Rucksicht auf die Deutjche Reichsverfassung* (1797), a work on the relations of church and State, with special reference to the constitution of the empire. In 1805 appeared *Versuch einer allgemeinen Hermeneutik des Rechts;* and in 1806 *Die Wissenschaft der Gesetzgebung,* an attempt to find a new theoretical basis for society in place of the opportunist politics which had led to the French Revolution. This basis he seemed to discover in something resembling Bentham's utilitarianism. Zachariae's last work of importance was *Vierzig Bücher vom Staate* (1839–42), to which his admirers point as his enduring monument. It has been compared to Montesquieu's *L'Ésprit des lois,* and covers no small part of the field of Buckle's first volume of the *History of Civilization.*

For an account of Zachariae and his works, *see* Robert von Mohl, *Geschichte u. Literatur der Staatswissenschaften* (1855–58), and Charles Brocher, K. S. *Zachariae, sa vie et ses oeuvres* (1870); also his biography in *Allgem. Deutsche Biographie* (vol. *44)* by Wilhelm Fischer, and Holtzendorff, *Rechts-Lexicon, Zachariae von Lingenthal.*

His son, KARL EDUARD ZACHARIAE (1812–1894), also an eminent jurist, was born on Dec. 24, 1812, and studied at Leipzig, Berlin and Heidelberg. Having made Roman and Byzantine law his special study, he visited Paris in 1832 to examine Byzantine mss, went in 1834 to St. Petersburg (Leningrad) and Copenhagen for the same purpose, and in 1835 worked in the libraries

of Brussels, London, Oxford, Dublin, Edinburgh and Cambridge. In 1837 he went in search of materials, to Italy and the East, visiting Athens, Constantinople and the monasteries of Mount Athos. Having a taste for a country life, and none for teaching, he gave up his position as extraordinary professor at Heidelberg, and in 1845 bought an estate in the Prussian province of Ssxony. He died on June 3, 1894.

For a list of Zachariae's works, see *Allgem.* Deutscke *Biogr.*

ZACHARIAS, ST., pope from 741 to 752, was a Greek by birth, and appears to have been on intimate terms with Gregory III., whom he succeeded (November 741). Contemporary history dwells chiefly on his great personal influence with the Lombard king Luitprand, and with his successor Rachis; it was largely through his tact in dealing with these princes in a variety of emergencies that the exarchate of Ravenna was rescued from becoming part of the Lombard kingdom. A correspondence, between Zacharias and St. Boniface, the apostle of Germany, is still extant, and shows how great was the influence of this pope on events then passing in France and Germany; he encouraged the deposition of Childeric, and it was with his sanction that Boniface crowned Pippin as king of the Franks at Soissons in 752. Zacharias is stated to have remonstrated with the emperor Constantine Copronymus on the part he had taken in the iconoclastic controversy. He died on March 14, 752, and was succeeded by Stephen II.

The letters and decrees of Zacharias are published in Migne, *Patrolog. lat.* lxxxix. **p.** 917–960.

ZAGAZIG (Zaḳāzīk), a town of Lower Egypt, capital of the province of Sharkia. Pop. (1937) 59,793. It is built on a branch of the Fresh Water or Ismailia canal, and on the Al-Mo'izz canal (the ancient Tanitic channel of the Nile), and is 47 m. by rail N.N.E. of Cairo. Situated on the Delta in the midst of a fertile district, Zagazig is a great centre of the cotton and grain trade of Egypt. It has large cotton factories and the offices of numerous European merchants. About a mile south of the town are the ruins of Bubastis (*q.v.*). .

ZAGHAWA: see NUBA.

ZAGHLUL, SAAD (1860–1927), Egyptian patriot, came of fellahin stock in the district of Ibian, Gharbia Province. He was educated at the village school and at the university of El Azhar, in Cairo. In 1880. he became editor of the *Official* Journal. Later he was nominated a Moawin under the Ministry of the Interior and eventually became Chief of the Contentieux for the province of Giza. Involved in the Arabi revolt, he was one of the many notables detained on the occupation of Egypt by British troops in 1882. In 1884 he began to practise at the bar, and in 1893 became a judge in the native court of appeal. He became Minister of Education in 1906, and in 1910 Minister of Justice. At the Ministry of Justice he made a charge of corruption against the Khedive Abbas Hilmi, and was asked (1912) by Lord Kitchener to resign. Zaghlul's evidence was insufficient, but he was thought to have been fundamentally justified, and his fierce opposition to British domination was undisguised from that time onwards. He then became vice-president of the Legislative Assembly.

On the signing of the Armistice (Nov. 1918) Zaghlul, who had for long been considered the principal spokesman of the Nationalist party, appealed to the Residency in Cairo for the recognition of Egyptian independence, basing his demand on President Wilson's self-determination policy and the British proclamation defining the status of the other countries liberated from Turkish rule by the World War. His proposal that he, with other representative Nationalists, should visit London to press their views was refused by the Government, and his attitude was so hostile that he and three others were arrested on March 8, 1919 and deported to Malta. This was the signal for a murderous outbreak in Egypt and serious disturbances (see EGYPT: *History*). Zaghlul and his friends were later released by Lord Allenby, and a special mission under Viscount Milner was sent to Egypt in Nov. 1919 to report on the situation.

Zaghlul returned to Egypt early in 1921, where he represented the extreme Nationalist party in opposition to the more moderate ministry under the presidency of Adly Pasha. At the end of the year, when trouble again broke out in Egypt, Zaghlul was arrested once more and deported, first to Aden and then to the Seychelles. In Sept. 1922 he was transferred to Gibraltar, whence he was released on April 4, 1923, on the grounds of ill-health. After the promulgation of the new constitution, martial law was abolished and Zaghlul was free to return to Egypt. He was enthusiastically received, and in the elections of Jan. 1924 his supporters gained an overwhelming majority. Yehia Ibrahim Pasha resigned and Zaghlul formed a ministry. Conversations to secure a settlement between England and Egypt took place in London (Sept. 25—Oct. 3) between Zaghlul and Ramsay Macdonald; Zaghlul refused to modify his intransigent attitude, and no agreement was reached. On Nov. 19, 1924 Sir Lee Stack, the Sirdar, was assassinated and Zaghlul was forced to resign. Nevertheless he became president of the new Chamber of Deputies. From that time the history of Zaghlul Pasha is the history of Egypt (*q.v.*).

Zaghlul died at Cairo on Aug. 23, 1927. His health had long been failing, but he was to the end the life and soul of Egyptian nationalism.

ZAGHOUAN, a small town of Tunisia, French North Africa, 35 mi. S. of Tunis by rail, 275 ft above sea-level Pop. (1936) 4 100. It occupies the site of an ancient town (perhaps Onellana) of which nothing remains but a monumental entrance gate. Below the rocky mass known as the Djebel Zaghouan (over 4,000 ft.) are the openings which were used for the Roman aqueduct of Carthage; they were directed into an oval basin, behind which was a hemicycle roo ft. wide; in the centre of the curve stood the temple of the protecting nymph or divinity.

ZAGREB, the capital of Croatia-Slavonia, Yugoslavia (German, *Agram*), lies on the Sava, with a background of mountains and surrounded by vineyards and country houses. Pop. (1931) 185,581. In 1910 it was only 79,083, but the influx of officials and business men after the formation of the state of Yugoslavia more than outweighed the exodus of Magyars and Germans. Zagreb is the second city of Yugoslavia and its commercial and financial centre, with many important trade associations. It was also the headquarters of one of the five army provinces. The older part of the town, with narrow, winding streets, contains the 15th century Gothic cathedral and the bishop's palace, while the newer part, with wide streets, open squares, a park and botanical gardens, contains the business and industrial quarters. Here too are the palace of justice, the South Slavonic academy, the university, a synagogue, and a Protestant church. Roman Catholic schools and churches are numerous, and there is also a School of Music. Tobacco, leather, linen, carpets, war material, hats and caps, boots, paper, chemicals, varnish and oil-colours are made.

Modern excavations have shown that a settlement existed at Zagreb in Roman times, and though the Croats probably built a town there in the 7th century, the first written record of the city occurs in 1093 when King Ladislaus of Hungary made it the see of a bishop. The older part of Zagreb, known as the Kaptol, contains the bishop's palace and the 15th century Gothic cathedral surrounded by the towers of the 11th century fortress. In 1242 a walled town, now called the Upper Town, arose on a neighbouring hill, and was raised to the rank of a royal free town by King Bela of Hungary.

For centuries a bitter feud raged between the Kaptol and the Upper Town, until these rivals were forced to join hands against the Turks.

Zagreb, already the political centre of Croatia-Slavonia, was selected as the capital in 1867. It suffered severely from earthquakes in 1880 and 1901. It became the home of an aristocracy and a seat of culture on a level with more famous European centres.

It was also the centre of the Yugoslav movement before 1918, and in that year a national assembly met there and proclaimed Croatia's adhesion to the kingdom of the Serbs, Croats and Slovenes. Soon, however, serious differences arose between Croat national aspirations for autonomy and Serb tendencies toward centralization. Zagreb became the seat of the Croat autonomists. When in April 1941, after the partition of Yugoslavia, an independent Croatia was created, Zagreb became its capital.

ZAHAROFF, SIR BASIL (1849–1936), financier and politician, was born in Mughla, Anatolia, of Greek parents, on October 6, 1849. Little is known of his early years except that he was educated in London and Paris. In fact a veil of mystery enshrouded most of his life. He was reputed to be one of the world's richest men, his fortune being built up from munition plants, shipbuilding, oil and other enterprises. He exerted a strong if indirect influence during World War I and at the Paris conference, being a close friend and political adviser of Lloyd George, Venizelos, Clemenceau and Briand. During this period he extended very considerable financial aid to the British and French governments, and later was honoured by these countries for his war services. He is said to have given Greece $2,500,000 a year during the Balkan War, and half that sum during World War I. To the American Near East Relief fund for refugee relief projects in Greece he contributed several thousand pounds and he gave 1,000,000 francs to France for the "save the franc fund." He established chairs of aviation at the universities of Paris, Petrograd, and London and endowed the Marshal Foch professorship of French literature at Oxford university and the Field-Marshal Haig chair of English literature at Paris university. He died Nov. 27, 1936.

ZAHN, ERNST (1867–), Swiss novelist and poet, was born at Zürich on Jan. 24, 1867. Long associated with his father in the management of the railway restaurant at Goschenen, at the entrance to the St. Gotthard tunnel, he became in turn councillor, judge and president of the diet of Canton Uri; but he has latterly devoted himself wholly to literature. His first book was *Kämpfe* (Zurich, 1893), a romance; his most popular novel is *Lukas Hochstrassers Haus* (Stuttgart and Leipzig, 1907). Other notable volumes are: *Blancheflur* (Stuttgart, 1924), *Frau Sixta* (Stuttgart, 1926), and two collections of short stories, *Helden des Alltags* (Stuttgart, 1906) and *Das Licht* (Stuttgart, 1912). *Herrgottsfäden* (Stuttgart, 1901), dealing with the St. Gotthard tunnel, has been translated into English under the title of Golden Threads (1908).

See a study by H. Spiero, *Ernst* Zahn (Stuttgart, 1927).

ZAILA or **ZEILA,** a town on the African coast of the Gulf of Aden, 124 mi. S.W. of Aden. Zaila is the most western of the ports of British Somaliland. Pop. (1933) about 5,000 Somali, Arabs, Indians, Greeks, Jews and a few British. The town has the sea on three sides; landward the country is unbroken desert for some fifty miles.

Zaila owed its importance to its proximity to Harar, the great entrepôt for the trade of southern Abyssinia. The trade of the port received, however, a severe check on the opening (1902) of the railway to Harar from the French port of Jibuti, which is 35 mi. N.W. of Zaila. Some trade with Harar survived, and about 10% of the imports and 15% of the exports of British Somaliland pass through Zaila.

ZAÏMIS, ALEXANDER (1855–1936), Greek statesman, was born in Athens Oct. 28, 1855, and came of a family of politicians. Entering public life rather from duty than ambition, Zaïmis became the "utility man" of Greek politics; thus he was first appointed prime minister in Oct. 1897, to clear up the aftermath of the disastrous Graeco-Turkish War. Resigning in 1899, after having accomplished that task, he again became premier after the "Gospel Riots" had caused the fall of Theotokes in Nov. 1901, but succumbed to the majority which supported his uncle, Deliyannes, in 1902. In Sept. 1906 he was appointed high commissioner of the Powers in Crete, a post which he held until 1911. In 1913 he was appointed governor of the National Bank. He became premier for the third time in Oct. 1915, but returned to the Bank after a month's office, emerging, however, to resume the premiership in June 1916. He became for the fifth time premier in 1917, and announced to King Constantine the decision of the three Protecting Powers that he must abdicate. He then retired again to the National Bank, but was removed on the restoration of King Constantine. After the king's second abdication, Sept. 1922, Zaïmis refused a sixth premiership, and was talked of as a possible president. On Dec. 4, 1926, he became premier of an Oecumenical Government of three republican ex-premiers and the two Royalist leaders, and remained at the head of the two coalition cabinets, which succeeded it in Aug. 1927 and Feb. 1928. From 1929 to 1935 he was president of the Greek Republic. (W. M.)

ZAIMUKHT, the name of a small Pathan tribe who inhabit the hills between the Miranzai and Kurram valleys.

ZAIRE, a Portuguese variant of a Bantu word (*nzari*) meaning river, a name by which the river Congo was formerly known. In the 16th and 17th centuries the powerful native kingdom of Congo possessed both banks of the lower river, and the name of the country was in time given to the river also. Until, however, the last quarter of the 19th century "Zaire" was frequently used to designate the stream. It is so called by Camoens in the Lusiads. (See CONGO, river.)

ZAISAN ("Noble"). (1) A lake of Asiatic Russia, situated in a valley between the Altai range on the north-east and the Tarbagatai on the south, at an altitude of 1,355 feet. Its area is 707 sq.m., and its surface is dotted with islands; it is 60 to 65 m. long and 10 to 20 m. wide and receives the drainage of ten rivers, including the Black Irtysh and the Kendyrlyk; the White Irtysh forms the north-western outlet of the lake. Roach, perch, carp, trout, nyelma and sterlet abound during the fishing season, May to August. The lake has a depth of 50 ft. and is navigable for steamers; and barges ascend-the Black Irtysh into Mongolia.

(2) A town in the Kazakstan A.S.S.R., in 47° 32′ N., 84" 56' E., situated on a route into Mongolia, at an altitude of 2,200 feet. It lies south-east of Lake Zaisan and south of the Black Irtysh. Population 8,130. Its tanning and leather industry is important and it is a centre for trade between Kazakstan and Mongolia. Topolni Mis, on Lake Zaisan, acts as a port for it.

ZAKOPANE, a town of Poland in the province of Cracow, situated amid superb scenery in the heart of the Tatra mountains; a great health resort both in summer and winter; the most frequented holiday resort of Polish tourists and rock climbers. It has important thermal springs. The town lies 1,000 metres above sea-level and has an alpine climate. Pop. (1931) 17,703. Zakopane was occupied by Germany in Sept. 1939.

ZALEUCUS, of Locri Epizephyrii in Magna Graecia (*fl. c.* 660 B.C.), Greek lawgiver, is said to have been the author of the first written code of laws amongst the Greeks. The story has some familiar features. The Locrians were distressed at their own lawlessness; they commissioned Zaleucus a slave, to draw up a code, and he did so under divine inspiration. The code was a severe one of the Draconic type which remained unchanged for centuries. The story ends with the episode (cf. Charondas) of the lawgiver committing suicide on discovering that he had inadvertently broken one of his own laws.

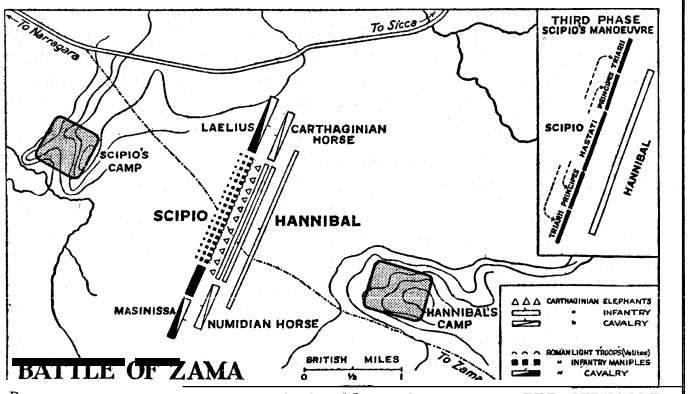
See Bentley, Dissertation on the *Epistles* of *Phalaris;* F. D. Gerlach, *Zaleukos,* Chavondas, Pythagoras (1858); G. Busolt, *Griechische Geschichte* (1885–1904).

ZALMOXIS or ZAMOLXIS, a semi-mythical social and religious reformer, regarded as the only true god by the Thracian Getae. According to Herodotus (iv. 94), the Getae, who believed in the immortality of the soul, looked upon death merely as going to Zalmoxis. It is probable that Zalmoxis is Sabazius, the Thracian Dionysus or Zeus; Mnaseas of Patrae identified him with Cronus. In Plato (Charmides, 158 B) he is mentioned with Abaris as skilled in the arts of incantation. No satisfactory etymology of the name has been suggested.

ZAMA, BATTLE OF, 202 B.C. One of the most decisive battles in military history in its military result, Zama ranks above any, save perhaps Waterloo, for its decisive effect on the course of world history. For the defeat of Hannibal, the first and only true defeat in his career, left Carthage naked, and her surrender put an end to the long struggle between Rome and Carthage (see PUNIC WARS) for the mastery of the Mediterranean World.

The prologue to Zama had been the invasion of Africa by Scipio (*q.v.*), almost in defiance of the Roman senate which wished him instead to attack Hannibal, who still stood unconquerable in Southern Italy. In Africa Scipio's brilliant series of victories over less formidable generals had forced Carthage to sue for peace before Hannibal could answer the summons of recall. But while the peace negotiations were being conducted in Rome, Hannibal landed at Leptis, whereupon the Carthaginians broke the

truce, and Scipio's military position was gravely compromised—isolated on hostile soil and with part of his force detached to assist his ally Masinissa in securing his new kingdom of Numidia. Instead of awaiting Hannibal near Carthage, Scipio cut himself off from his base and marched on a divergent path into the interior. Security lies often in calculated audacity, and an analysis of the military problems makes it highly probable that his march inland



PLAN OF THE BATTLE OF ZAMA, 202 B.C., END; THE STRUGGLE BETWEEN ROME AND CARTHAGE FOR MASTERY OF THE MEDITERRANEAN WORLD

up the Bagradas valley was aimed, by its menace to the rich interior on which Carthage depended for supplies, to force Hannibal to push west to meet him instead of north to Carthage. By this clever move he threatened the economic base of Carthage and protected his own, also luring Hannibal away from his military base—Carthage. A complementary purpose was that this line of movement brought him progressively nearer to Numidia, shortening the distance which Masinissa would have to traverse with his expected reinforcement of strength.

It had the intended effect, for the Carthaginians sent urgent appeals to Hannibal to advance towards Scipio and bring him to battle, and within a few days he marched west, and arrived by forced marches at Zama. He then sent out scouts to discover the Roman camp and its dispositions for defence—it lay some miles farther west. Almost coincidently Masinissa arrived with 6,000 horse and 4,000 foot, and Scipio then broke up his camp and moved to a fresh site near the town of Narragara, his position being well chosen tactically, and having water "within a javelin's throw." Hannibal also moved his camp forward to meet him.

A parley between the two commanders led to no result, and both thereupon prepared to decide the issue by arms. The dispositions made by the rival leaders have several features of note. Scipio placed his heavy Roman foot—he had probably two legions—in the centre; Laelius with the Italian cavalry on the left wing; and on the right wing Masinissa with the whole of the Numidians, horse and foot. The heavy infantry were drawn up in the normal three lines: first, the *hastati;* then the *principes;* and finally, the *triarii.* But instead of adopting the usual chequer formation, with the maniples of the second line opposite to and covering the intervals between the maniples of the first line, he ranged the maniples forming the rear lines directly behind the respective maniples of the first line—thus forming wide lanes between each two cohorts.

The Carthaginian had eighty elephants, more than in any previous battle, and in order to terrify the enemy he placed them in front of his line. Supporting them, in the first line, were the Ligurian and Gallic mercenaries, intermixed with Balearic and Moorish light troops. In the second line were the Carthaginian and African levies, their combined strength probably exceeding that of the first line. Finally, Hannibal's own troops from Italy formed the third line, held back more than 200 yards distant from the others, in order evidently to keep it as an intact reserve. On the wings Hannibal disposed his cavalry, the Numidian allies on the left and the Carthaginian horse on the right. His total force was probably in excess of 50,000, perhaps 55,000. The Roman strength is less certain, but if we assume that each of Scipio's two legions was duplicated by an equal body of Italian allies, and add Masinissa's 10,000, the complete strength would be about 36,000.

The battle opened, after preliminary skirmishing, with Hannibal's order to the drivers of the elephants to charge the Roman line. Scipio promptly countered by a blast of trumpets along the whole line. The strident clamour so startled and terrified the elephants that many of them at once turned back on their own troops. This was especially the case on the left wing, where they threw the Numidians, Hannibal's best cavalry wing, into disorder just as they were advancing to the attack. Masinissa seized this golden opportunity to launch a counter-stroke, which inevitably overthrew the disorganized opponents. With Masinissa in hot pursuit, they were driven from the field, and so left the Carthaginian left wing exposed. The remainder of the elephants wrought much havoc among Scipio's *velites,* caught by their charge in front of the Roman line. But the foresight that had provided the "lanes" and laid down the method of withdrawal was justified by its results. For the elephants took the line of least resistance, penetrating into the lanes rather than facing the firm-knit ranks of the heavy infantry maniples. Once in these lanes the *velites* who had retired into the lateral passages, between the lines, bombarded them with darts from both sides. Their reception was far too warm for them to linger when the door of escape was held wide open. While some of the elephants rushed right through, harmlessly, and out to the open in rear of the Roman army, others were driven back out of the lanes, and fled towards the Carthaginian right wing. "It was at this moment that Laelius, availing himself of the disturbance created by the elephants, charged the Carthaginian cavalry, and forced them to headlong flight. He pressed the pursuit closely. as likewise did Masinissa." Both Hannibal's flanks were thus stripped bare.

In the meantime the infantry of both armies had slowly advanced on each other, except that Hannibal kept his third line back At first the Gauls and Ligurians had the balance of advantage, through their personal skill in skirmishing and more rapid movement. But the Roman line remained unbroken, and the weight of their compact formation pushed the enemy back despite losses. Another factor told, for while the leading Romans were encouraged by the shouts from the rear lines, coming on to back them up, Hannibal's second line—the Carthaginians—failed to support the Gauls, but hung back in order to keep their ranks firm. Forced steadily back, and feeling they had been left in the lurch by their own side, the Gauls turned about and fled. When they tried to seek shelter in the second line they were repulsed by the Carthaginians, who deemed it essential to avoid any disarray which might enable the Romans to penetrate their line. In a short time the relics of the first line had dispersed completely, or disappeared round the flanks of the second line. The latter. however, showed their fighting quality by thrusting back the Roman first line—the *hastati.* In this they were helped by a human obstacle, the ground encumbered with corpses and slippery with blood, which disordered the ranks of the attacking Romans. Even the *principes* had begun to waver when they saw the first line driven back so decisively, but their officers rallied them, and led them forward in the nick of time to restore the situation. This reinforcement was decisive. Hemmed in, because the Roman formation produced a longer frontage and so overlapped their line, the Carthaginians were steadily cut to pieces. The survivors fled back on the relatively distant third line, but Hannibal continued his policy of refusing to allow the fugitives to mix with and disturb an ordered line.

The curtain now rose on what was practically a fresh battle. The Romans "had penetrated to their real antagonists, men equal to them in the nature of their arms, in their experience of war, in the fame of their achievements. . . ." Livy's tribute is borne out by the fierceness and the long uncertain issue of the subsequent conflict, which refutes the suggestion that Hannibal's "Old Guard" was but a shadow of its former power—in the days of Trasimenus and Cannae. The Romans had the moral advantage of having routed two successive lines, as well as the cavalry and elephants, but they had now to face a compact and fresh body of probably 24,000 veterans, under the direct inspiration of Hannibal. And no man in history has shown a more dynamic personality in infusing his own determination in his troops. The Romans, too, had at last

a numerical advantage, not large, however—the forces were "nearly equal in numbers" according to Polybius—and in reality still less than it appeared. For while all Hannibal's third line were fresh, on Scipio's side only the *triarii* had not been engaged, and these represented but half the strength of the hastati or principes. Further, the velites had been so badly mauled that they had to be relegated to the reserve, and the cavalry were off the field, engaged in the pursuit. Thus it is improbable that Scipio had at his disposal for this final blow more than 18,000 or 20,000 infantry, less the casualties these had already suffered.

His next step is characteristic of the man—of his cool calculation even in the heart of a battle crisis. He sounded the recall to his leading troops, and then, in face of an enemy at hardly more than a bow-shot distance, he not only reorganized his troops but reconstructed his dispositions. His problem was this: against the first two enemy lines the Roman formation, shallower than the Carthaginian phalanx and with intervals, had occupied a wider frontage, and so enabled him to overlap theirs. Now, against a body double the strength, his frontage was no longer, and perhaps less, than Hannibal's. His appreciation evidently took in this factor, and with it two others. First, that in order to concentrate his missile shock power for the final effort it would be wise to make his line as solid as possible and this could be done because there was no longer need for or advantage in retaining intervals between the maniples. Second, that as his cavalry would be returning any moment there was no advantage in keeping the orthodox formation in depth and using the *principes* and *triarii* as a direct support and reinforcement to his front line. The blow should be as concentrated as possible in time and as wide as possible in striking force rather than a series of efforts. He, therefore, made his hastati close up to form a compact centre without intervals. Similarly he closed each half of his principes and triarii outwards, and moved them forward to extend the flank on either wing. He now once more overlapped the hostile front. The rôle of Scipio's infantry in the final phase was to fix Hannibal's force ready for the decisive manoeuvre to be delivered by the cavalry. For this rôle violence and wideness of onslaught was more important than sustenance. Scipio made his redistribution deliberately and unhurriedly—the longer he could delay the final tussle, the more time he gained for the return of his cavalry. It is not unlikely that Masinissa and Laelius pressed the pursuit rather too far, and so caused an unnecessary strain on the Roman infantry and on Scipio's plan. For Polybius tells us that when the rival infantries met, "the contest was for long doubtful, the men falling where they stood out of determination, until Masinissa and Laelius arrived providentially at the proper moment." Their charge, in the enemy's rear, clinched the decision, and though most of Hannibal's men fought grimly to the end, they were cut down in their ranks. Of those who took to flight few escaped.

The completeness of the victory left no room for a strategic pursuit, but Scipio did not linger in developing the moral exploitation of his victory. An immediate move on Carthage achieved its object, a bloodless capitulation.

ZAMBEZI, the fourth in size of the rivers of Africa, and the largest of those flowing eastwards to the Indian ocean. Its length (taking all curves into consideration) is about 2,200 m. The area of its basin, according to Dr. Bludau, is 513,500 sq.m., or rather less than half that of the Nile. The main channel is clearly marked from beginning to end. The river takes its rise in 11° 21′ 3″ S., 24° 22′ E. The source lies in British territory in a depression of an undulating country 5,000 ft. above the sea, covered with bracken and open forest. The water, like that of all the rivers of the neighbourhood, issues from a black marshy bog. Eastward of the source the water-parting between the Congo and Zambezi basins is a well-marked belt of high ground, falling abruptly north and south, and running nearly east and west between 11° and 12° S.

The Upper River.—The infant Zambezi, after pursuing a south-westerly course for about 150 m., turns more directly south and, receives on either side numerous small tributaries. A few miles above Kakengi (in 12° 24′ S.), the Zambezi, narrow, picturesque and tortuous, suddenly widens from 100 to 350 yd. Below Kakengi are a number of rapids ending (13° 7′ S.) in the Suapuma cataracts. At this point the river flows tumultuously through a rocky fissure.

The first of its large tributaries to enter the Zambezi is the Kabompo, a left-hand affluent. It joins the main stream in 14° 26′ S. A little lower down (in 14° 18′ S.) the Zambezi receives from the west the waters of a much larger stream than the Kabompo, namely, the Lungwebungu. The land, from 5,000 ft. at the source, falls gradually to 3,600 ft. at Kakengi—a distance of 220 m. From this point until the Victoria Falls are reached—500 m.—the level of the Zambezi basin is very uniform, the fall being in this distance 600 ft. only. Twenty-miles below the confluence of the Lungwebungu the country becomes flat, and in the rainy seasons is largely covered by floods. From the east the Zambezi continues to receive numerous small streams, but on the west is without tributaries for 150 m., when the great river formerly misnamed the Chobe, but known to the natives as Kwando or Linyante, joins it (in 17° 47′ S.).

The Middle **Zambezi.**—The Victoria Falls are reached some 60 m. below the Kwando confluence. The surrounding country is formed of horizontal flows of basic lavas, which are traversed by two well marked sets of joints. Along these the river, following an extremely angular course, has eroded a great caiion, about 400 ft. deep and in many places, with vertical sides. (See Victoria Falls.) Into the cañon the river plunges over a vertical wall of rock. The narrow gorge can be traced more or less continuously along its course for about 40 miles. The middle course of the river may be said to extend for 800 m. below the Victoria Falls to the Kebrabasa Rapids, where the Zambezi crosses the great East African escarpment, and enters the coastal belt.

The Lower River.—The lower Zambezi—400 m. from Kebrabasa Rapids to the sea—presents no obstacles to navigation save the shallowness of the stream in many places in the dry season. This shallowness arises from the different character of the river basin. Instead of, as in the case of the middle Zambezi, flowing mainly through hilly country with well-defined banks, the river traverses a broad valley and spreads out over a large area. Only at one point, the Lupata Gorge, 200 m. from its mouth, is the river confined between high hills. Here it is scarcely 200 yd. wide. Elsewhere it is from 3 to 5 m. wide, flowing gently in many streams. The river-bed is sandy, the banks are low and reed-fringed. At places, however, and especially in the rainy season, the streams unite into one broad swift-flowing river. About 100 m. from the sea the Zambezi receives the drainage of Lake Nyasa through the river Shiré. On approaching the ocean, which it reaches in 18° 50′ S. the Zambezi splits up into a number of branches and forms a wide delta. Each of the four principal mouths—Milambe, Kongone, Luabo and Timbwe—is obstructed by a sand-bar.

Mileage of Navigable Water.—As a highway into the interior of the continent the Zambezi, like all other large African rivers, in greater or less degree, suffers on account of the bar at its mouth, the shallowness of its stream, and the rapids and cataracts which interrupt its course. Nevertheless its importance to commerce is great, as the following recapitulation of its navigable stretches will show: (1) From the sea to the Kebrabasa Rapids, 400 m. (2) From Chikoá (above Kebrabasa) to within 140 m. of the Victoria Falls, 700 m. (3) From the rapids above the Victoria Falls to the Katima Molilo Rapids, 100 m. (4) Above the Gonye Falls to the Supuma cataract, 300 m. (5) Above the Supuma cataract, 120 m. Thus for 1,620 m. of its course the Zambezi is navigable for steamers with a draught up to 28 in.

Several of the Zambezi affluents are also navigable for many miles. The Lungwebungu, which enters the upper river, is navigable for a long distance, thus supplying communication with the extreme north-west corner of the Zambezi basin. Parts at least of the Luena, Kafukwe, Loangwa and the Kwando tributaries are also capable of being navigated. The Shiré is also navigable for a considerable distance. The sum of such navigable reaches within the Zambezi basin as exceed 100 m. is nearly 4,000 m.

Exploration of the River.—The Zambezi region was known to the mediaeval geographers as the empire of Monomotapa and

the course of the river, as well as the position of Lakes Ngami and Nyasa, were filled in with a rude approximation to accuracy in the earlier maps. These were probably constructed from Arab information. The first European to visit the upper Zambezi was David Livingstone in his exploration from Bechuanaland between 1851 and 1853. Two or three years later he descended the Zambezi to its mouth and in the course of this journey discovered the Victoria Falls. During 1858–60, accompanied by Dr. (afterwards Sir) John Kirk, Livingstone ascended the river by the Kongone mouth as far as the Falls, besides tracing the course of its tributary, the Shiré, and discovering Lake Nyasa. For the next 35 years practically no additions were made to our knowledge of the river system. In 1889 the entrance of vessels from the sea was much facilitated by the discovery by D. J. Rankin of the Chinde channel north of the main mouths of the river. Major A. St. Hill Gibbons and his assistants, during two expeditions, in 1895–96 and 1898–1900, ably continued the work of exploration begun by Livingstone in the upper basin and central course of the river. Of non-British travellers Major Serpa Pinto examined some of the western tributaries of the river and made measurements of the Victoria Falls (1878).

See David and Charles Livingstone, *Narrative of an Expedition to the Zambesi and its Tributaries* (1865); *A.* de Serpa Pinto, How I *Crossed Africa* (1881); D. J. Rankin in *Proc. R.G.S.* (March 1890); *A.* Sharpe, *ibid.* (December, 1890); H. S. Bivar, "Curso medio do Zambeze," *B.S.G. Lisboa,* vol. xxiv. (1906); G. W. Lamplugh in *Geo. Jnl.,* vol. xxxi. (1908); F. Coillard, *On the Threshold of Central Africa* (London, 1897), and A. St. H. Gibbons, *Africa from South to North through Marotseland* (2 vols., London, 1904). (F. R. C.)

ZAMBOANGA, a municipality (with administrative centre and 60 *barrios* or districts) and capital of Zamboanga province, and an important port of entry, of Mindanao, Philippine Islands, situated at the south extremity of the Zamboanga peninsula on Basilian strait. Pop. (1939) 131,455, of whom 69,066 were males and 204 were white. A native settlement had long existed on the site when the Spanish town was founded in 1635. It soon became a centre for Spanish activity in their long contest with the Moros. Its climate is said to be cooler than that of Manila. The surrounding forests contain valuable timber, and the agricultural products include palay (rice), copra, abacb (Manila hemp), sugar, tobacco and sweet potatoes. There was a flourishing trade until the Japanese invasion of Dec. 1941, as the shipping facilities were good and exports of copra and abacb were extensive. There is a meteorological station, a modern water system and an electric lighting plant. Of the inhabitants aged 6-19 inclusive, 26.8% were reported in 1939 as attending school, and 40.2% of the population 10 years old and over was reported as literate. (C. S. L.)

ZAMIA, a genus of cycads which comprise about 30 species of small fern-like plants, native to tropical and sub-tropical America. They have a turnip-like, mostly underground stem surmounted by a crown of leaves, 1 ft. to 2 ft. long, surrounding large fruiting cones. The crushed stems yield starch used for food, after washing to extract an alkaloid. Two species, Z. *floridana* and *Z. pumila,* known as coontie or comfort-root, occur in southern Rorida.

ZAMINDAR or **ZEMINDAR,** an Indian landholder (from Persian *zamin*-"land"). In official usage the term is applied to any person, whether owner of a large estate or cultivating member of a village community, who is recognized as possessing some property in the soil, as opposed to the ryot (*q.v.*), who is regarded as having only a right of occupancy, subject in both cases to payment of the land revenue assessed on his holding.

ZAMINDAWAR, a district of Afghanistan, situated on the right bank of the Helmund river to the north-west of Kandahar, bordering the road which leads from Kandahar to Herat via Farah. Zamindawar is a district of hills, and of wide, well populated and fertile valleys watered by important affluents of the Helmund. The principal town is Musa Kala. which stands on the banks of a river of the same name, about 60 mi. N. of Girishk. The whole of this region is a well-known hotbed of fanaticism, the headquarters of the Achakzais, the most aggressive of all Durani tribes.

ZAMORA, an inland province of Spain, one of the three into which the former province of León was divided in 1833 bounded W by Portugal and Orense, N. by León, E. by Valladolid, S. by Salamanca. Pop. (1939 est.) 292,554; area 4,097 sq. mi. Zamora is traversed from east to west by the river Duero or Douro (*q.v.*); the Tormes also skirts the southwestern boundary for some 25 miles. Except in the northwest, where it is entered by two outlying ridges of the Cantabrian mountains, the Sierra de la Culebra and Sierra de Peña Negra, the surface is a level or slightly undulating plateau; its lowest point is 1,070 ft. Its plains, especially the valley of the Esla, yield much grain and pulse; wine and flax are also produced; and on the higher grounds many merino sheep and goats are reared. Three railway lines, from the north, south and east, traverse the province and meet at the city of Zamora.

Other towns include Benavente and Toro. Spanish nationalists occupied Zamora in 1936.

ZAMORA, an episcopal city. and the capital of the Spanish province of Zamora; on the right bank of the river Duero (Douro), and at the junction of railways from Salamanca, Medina del Campo and Astorga. Pop. (1940) 28,198. In the early period of the Christian re-conquest Zamora was a place of considerable strategic importance. Ferdinand I. of Castile and Leon in 1061 gave it to his daughter Doña Urraca. After his death in 1065 his son Sancho II. disputed possession with Urraca and laid siege to the city, but without success, although the famous Cid Ruy Diaz de Bivar was among his warriors. Zamora became subject to Alphonso VI. in 1073. Zamora occupies a rocky height overlooking the Duero, a little below its confluence with the Valderaduey. The river is crossed by a fine 14th-century bridge of sixteen pointed arches. The citadel of Zamora dates from the 8th century. The small but beautiful Romanesque cathedral, one of four 12th-century churches, was completed about 1175.

ZAMOYSKI, JAN (1541–1605), Polish statesman, was the son of Stanislaw, Castellan of Chelm, and Anna Herburtowna, a noble Polish lady. After completing his education at Paris, Strasbourg and at Padua, where as rector of the academy he composed his celebrated work De senatu *romano* (Venice, 1563), he returned home in 1565, one of the most consummate scholars and jurists in Europe, and at once entered politics. He played a leading part, after the the death of Sigismund II., in remodelling the Polish constitution and procuring the election of Henry of Valois. After the flight of that prince Zamoyski seems to have aimed at the throne himself, but quickly changed his mind and supported Stephen Báthory, whose election he prepared and whose foremost counsellor he became. Appointed chancellor on May 1, 1576, immediately after the coronation, as *wielki hetman,* commander-in-chief, in 1580, Zamoyski strenuously supported Stephen during his long struggle with Ivan the Terrible. He also enabled the king in 1585 to bring the traitorous Samuel Zborowski to the scaffold. On the death of Stephen, the Zborowski recovered their influence and did their utmost to keep Zamoyski in the background. At the election diet of July 9, 1587, however, Zamoyski triumphed over his rivals, and rejecting an offer from the Habsburgs of the title of prince, with the Golden Fleece and 20,000 ducats, procured the election of Sigismund of Sweden, son of Catherine Jagiellonica (Aug. 19). The opposite party immediately elected the Austrian Archduke Maximilian, but Zamoyski routed and captured the archduke at Byczyna (Jan. 24, 1588).

From the first there was a certain coldness between the new king and the chancellor, Sigismund desiring an alliance with the Habsburgs, which Zamoyski feared. Friction became acute when Sigismund appointed an opponent of Zamoyski vice-chancellor, and made other ministerial changes which limited his authority; though ultimately, with the aid of his partisans and the adoption of such desperate expedients as the summoning of a confederation to annul the royal decrees in 1592, Zamoyski recovered his full authority. In 1595 Zamoyski, in his capacity of commander-in-chief, at the head of 8,000 veterans dethroned the anti-Polish hospodar of Moldavia and installed in his stead a Catholic convert, George Mohila. On his return he successfully sustained in his camp at Cecora a siege by the Tatar khan. Five years later (Oct. 20, 1600) he won his greatest victory at Tirgoviste, over Michael the Brave, hospodar of Walachia and Moldavia. But

beyond securing the Polish frontier Zamoyski would never go. He refused to wage war with Turkey even under the most favourable circumstances, nor could he be drawn into the Holy League against the Ottomans in 1600, making conditions for Poland's co-operation which her allies could not possibly accept. Statesman though he was, Zamoyski cannot, with all his genius and valour, be called a true patriot. Sigismund was undoubtedly right when he attempted to reform the Polish constitution in 1605 by strengthening the royal power and deciding all measures in future by a majority of the diet. These reforms Zamoyski strenuously opposed. The last speech he delivered was in favour of the anarchic principle of free election. He died suddenly at Zamosc, June 3, 1605.

ZANESVILLE, a city of south-eastern Ohio, U.S.A., the county seat of Muskingum county; on the Muskingum river at the mouth of the Licking, 55 mi. E. of Columbus. It is on Federal highways 40 and 22; and is served by the Baltimore and Ohio, the New York Central, the Pennsylvania, the Wheeling and Lake Erie and motorbus and truck lines and river packets to Parkersburg and Pittsburgh. Pop. (1920) 29,569; (1930) 36,440; (1940) it was 37,500. The city lies on both sides of both rivers, at an altitude of 700 feet. A "Y" bridge (the only one of the type in the United States) crosses the Muskingum, its two arms running on either side of the Licking. The present concrete structure (erected 1901) replaced a covered wooden bridge of the same plan which had stood for 68 years. Zanesville is one of the principal centres in the country for the manufacture of clay products, notably encaustic and mosaic tile, art pottery and stoneware. Other important manufactures are cement, glass containers, bottles, steel products, cast-iron radiation and electric transformers. In 1935 the product of 44 factories was valued at $17,038,390. There were a few pioneers on the site of the city of Zanesville when "Zane's Trace" was cut through from Wheeling (under an act of Congress of 1796) by Ebenezer and Jonathan Zane and Ebenezer's son-in-law, John McIntire, who received for this service three sections of land. Jonathan Zane and McIntire chose their sections at the point where the new road (now the national highway) crossed the Muskingum river. The town was planned in 1800, incorporated in 1814 and in 1850 was chartered as a city. It was made the county seat when Muskingum county was created in 1804, and from Dec. 1810, until May 1812, it was the capital of the State. Zanesville was an important station on the old national road. The population was 9,229 in 1860.

ZANGWILL, ISRAEL (1864–1926), Jewish man of letters, was born in London on Feb. 14, 1864. His early childhood was spent in Plymouth and at Bristol, where he received his first schooling. He was in his ninth year when his parents settled in Spitalfields, and he entered the Jews' Free School, where eventually ne became a teacher, working at the same time for his university degree. He had written a clever fantastic tale entitled *The Premier and the Painter* with Louis Cowen, when he gave up teaching for journalism. He founded and edited *Ariel, The London Puck,* and did much miscellaneous work on the London press. He made his literary reputation with a novel, *The Children of the Ghetto* (1892), which was followed by *Ghetto Tragedies* (1893); *The Master* (1895); *Dreamers of the Ghetto* (1898); *The Mantle of Elijah* (1901); and other tales and novels of great interest dealing with Jewish life. *Children of the Ghetto* was produced as a play in New York with success in 1899, and has since been extensively played both in English and Yiddish. He was greater as a playwright than as a novelist, and did admirable work both in light comedy and in serious plays. *Merely Mary Ann* (Duke of York's, 1904) and *Too Much Money* (1917) represent his lighter gift; *The Melting Pot* (1908), *The War God* (1911) and *The Next Religion* (1914), banned by the censor, all deal with serious social problems. Zangwill was an outstanding personality in the Jewish world. He was at one time president of the Jewish Territorial Organization for the Settlement of Jews within the British Empire, and later an advocate of the Zionist movement. He died on Aug. 1, 1926.

ZANTE (anc. *Zacynthus*), southernmost of the Ionian Islands, west of Greece, 25 mi. long, about 12 broad, and 64 mi. round, with an area of 277 sq.mi., and a population in 1928 (last census before World War II) of 40,492. Zante lies 8 mi. S. of Cephalonia, forming with it, Leucas and Ithaca a crescent-shaped group, the crest of a submerged limestone ridge facing the Gulf of Patras. Zante is of somewhat irregular oval shape, indented by a deep inlet at its south end. A wide fertile central plain is skirted on the west by bare limestone hills 1,000 to 1,200 ft. high, which fall gently landwards, but with steep sea cliffs culminating northwards in Mount Skopos (ancient *Elatos,* 1,600 ft.). On the east the plain is also limited by a low ridge. These hills are still densely clothed to the summit with olives, figs, myrtles, laurels, oranges, aloes, vines and other sub-tropical plants. The central plain is an almost continuous stretch of gardens and vineyards, with a few cornfields and pastures. The peculiar dwarf vine, the "currant" (from Corinth) of commerce, is the staple export of Zante, as of the neighbouring mainland: it grows to 3 ft., begins to yield in seven years and lasts a century. Earthquakes are frequent and at times disastrous. During recent times the most destructive were those of 1811, 1820, 1840 and 1893. Other volcanic indications are the oil springs on the coast, and in the bed of the sea near Cape Skinari on the north, and especially the bituminous wells in a swamp near the coast village of Chieri, mentioned by Herodotus (iv. 195). These still yield pitch.

Zante, capital and seaport, on the east side, with a population of 11,609, occupies the site of ancient Zacynthus, said to have been founded, like the neighbouring citadel of Psophis, by Zacynthus, son of Dardanus, a legendary Arcadian chief.

Traditionally Zacynthus belonged to Ulysses, king of Ithaca, and was peopled by settlers from Achaea or Arcadia. It figures occasionally in history as a base for belligerents. Thus during the Peloponnesian War and again in 374 B.C. the Athenians used it; in 357 it was the headquarters of Dion on his expedition against Syracuse; in 217 it was seized by Philip V of Macedon. The Romans captured it in 211, but restored it temporarily to Philip; in 191, to keep it out of the hands of Greek powers, they annexed it themselves. In 86 it was raided by Mithradates' admiral Archelaus. Under the Roman Empire, Zante was included in the province of Epirus. In the 11th century it passed to the Norman kings of Sicily; after the Fourth Crusade it belonged at various times to the despots of Epirus, the emperors of Constantinople, and the Orsini counts of Cephalonia. After remaining from 1357 to 1482 in the hands of the Tocco family it became a Venetian possession. In 1797 it was ceded to France. and after a short occupation by the Russians was brought under British protection; in 1864 it was ceded with the other Ionian islands to Greece. In 1941, during World War II, it was occupied by Italy.

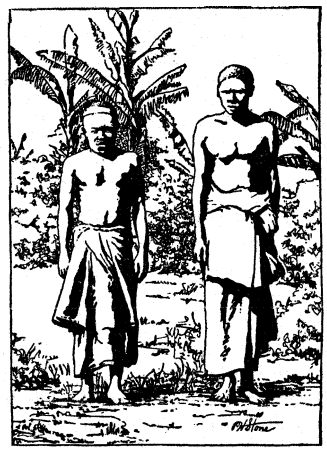
The long Venetian occupation is reflected in the appearance, character, and to some extent even the language and religion of the Zantiots. Nearly all the aristocracy claim Venetian descent; most of the upper classes are bilingual, speaking both Greek and Italian; and a considerable section of the population are Roman Catholics Even the bulk of the people, although mainly of Greek stock, form in their social usages a connecting link between the Hellenes and the western nations.

See B. Schmidt, *Die Insel Zakynthos* (Freiburg, 1899).

ZANZIBAR, a sultanate and British protectorate of East Africa. The sultanate, formerly of much larger extent *(see* p. 935, *History)* is now reduced to the islands of Zanzibar and Pemba, some adjacent islets and the nominal sovereignty of a strip of coastland—10 m. deep—forming the protectorate of Kenya *(see* KENYA COLONY). The islands of Pemba and Zanzibar have a collective area of 1,020 sq.m. and a population (1931 census), of 235,428; Zanzibar island, 137,741; Pemba island, 97,687.

Topography. — The island of Zanzibar lies at a mean distance of 20 m. from the mainland, between 5° 40' and 6° 30' S. Pemba (*q.v.*) to the north, and the more distant Mafia (to the south), form with Zanzibar an independent geological system, resting on a foundation of coralline reefs, and constituting a sort of outer

coast-line, which aimost everywhere presents a rocky barrier to the Indian ocean. All three are disposed parallel to the mainland, from which they are separated by shallow waters, mostly under 30 fathoms, strewn with numerous reefs dangerous to navigation, especially in the Mafia channel opposite the Rufiji delta. (Mafia island is now part of Tanganyika Territory) Some 6 m. N. of Zanzibar and forming part of the coral reef is the small, densely-wooded island of Tumbatu. Its inhabitants are excellent sailors.



BY COURTESY OF THE AMERICAN BOARD OF FOREIGN MISSIONS
SWAHILI NATIVES OF ZANZIBAR

Zanzibar island is 47 m. long and 20 m. broad at its greatest breadth. It has an area of 640 sq. miles. The island, called Unguja in Kiswahili, is not exclusively of coralline formation, several heights of reddish ferruginous clay rising in gentle slopes 400 to 450 ft. in the centre, and to double that height in the north. The forests which formerly covered the island have largely disappeared; the eastern half is now mostly covered with low scrub The western part is noted for the luxuriance of its flora.

The great heat and excessive moisture of the atmosphere render the climate trying to Europeans. The year is divided into two seasons, according to the direction of the monsoons. The north-east monsoon sets in about the end of November, the south-west monsoon in April. The "hot season" corresponds with the north-east monsoon, when the minimum readings of the thermometer often exceed 80° F. In June to September the minimum readings drop to 72°, the mean annual temperature being about 80°. Rain falls in every month of the year. December, April and May are the rainiest months, August to October the driest. The average annual rainfall (18 years' observations) is 65 inches. (In 1859 as much as 170 in. were registered.)

Inhabitants.—On the east side of Zanzibar island the inhabitants, a Bantu-speaking race of low development, probably represent the aboriginal stock. They are known as Wahadimu and are noted as good fishermen, cattle raisers and skilled artisans. In the west, and especially in the capital (for which, see below), the population is of an extremely heterogeneous character, including full-blood and half-caste Arabs, Hindus, Goanese, Parsis, Persians, Baluchs, Swahili of every shade, and representatives of tribes from many parts of East Africa. The Arabs number about 16,500; the Indians and other Asiatics 14,000. The whites number (1931) 278. Besides the port of Zanzibar there are no large towns. Chuaka is a health resort facing the Indian Ocean.

Economic Conditions. — Up to about the end of the 19th century Zanzibar was the entrepôt for all the trade of East Africa, from Somaliland in the north to the Zambezi in the south. Its modern development dates from the occupation of the islands by the Muscat Arabs about 1830. Under the Seyyid Said the cultivation of the clove, now the staple product of both Zanzibar and Pemba, was made compulsory. But Zanzibar depended on its active transit trade in ivory, slaves, cotton goods and rice. Many merchants from India settled in Zanzibar and—apart from the traffic carried on by dhows with Arabia and the Persian gulf—trade fell largely into their hands, the Indian rupee becoming the standard currency. In 1872 a great cyclone destroyed the clove plantations in Zanzibar; a calamity which led the people of Pemba to grow cloves on a large scale. The Zanzibari, however, set about replanting, and in ten years the output exceeded the figures of 1872. In 1873 the highly profitable slave trade was declared illegal, though illicitly it was carried on for the next 25 years. Domestic slavery continued and it was by slave labour that the clove and other *shambas* (plantations) were worked by their Arab proprietors. In 1897 the legal status of slavery was abolished and slavery in the sultanate finally ceased in 1907. Many Arabs failed to adapt themselves to the new conditions and their shambas passed into the hands of natives; while in time the bulk of the labour was done by negroes from the mainland, chief among them the Wanyamwezi. Rates of pay are high, and in poor seasons profits are precarious, but with Government help, such as a bonus on bearing trees, free storage and better transport, the clove industry has continued to develop. Zanzibar and Pemba produce about 90% of the world's crop of cloves. All land suitable for cloves being under cultivation, the planting of the coconut received a new impetus, and in 1928 there were over 3,500,000 trees in the two islands. And, in spite of the competition of Mombasa, Tanga and Dar-es-Salaam, Zanzibar retained the local distributing trade. It is well served by many shipping lines, giving direct communication with Europe, India and South Africa.

The average clove crop for the 20 years ending 1924 was 512,000 fraslas; the crop for 1926–27 was over 825,000 fraslas. (A frasla equals 35 lb. avoirdupois.) For copra the average yield for ten years ending 1923 was 534,000 fraslas; in 1924 the yield was the highest recorded, being 988,000 fraslas. The copra, however, is generally of poor quality. Prices for cloves varied greatly; from 17·12 rupees per frasla in 1912–13 to 13·19 rupees in 1926–27; in 1896 the price had been 4.34 rupees. Imports consist mainly of cotton piece-goods, rice and other foodstuffs.

The loss of part of the transit trade was shown, not so much in any actual decrease in tonnage entering the port, which tvas 2,638,000 gross in 1927, as in the growth of the trade of the mainland ports, especially Mombasa. Imports were valued at £1,103,000 in 1913, at £2,223,00 in 1924, and at £1,771,000 in 1927. Exports in 1913 were valued at £1,048,000; in 1924, at £2,286,000; and at £1,828,000 in 1927. These figures include Government imports. Trade is mostly with India, Tanganyika and Great Britain. The chief source of revenue is the customs. Revenue increased from £275,000 in 1913 to £589,000 in 1923, and was £540,000 in 1927. Expenditure in 1913 was £248,000; in 1923, £480,000; and in 1927, £622,000.

Administration. — The virtual, if not the titular head of the administration is the British resident. There is an executive council of which the sultan is president, and a legislative council, over which the resident presides and on which sit nominated unofficial members. Mohammedan law is administered for Arabs and natives in the sultan's court. There is a British court for British and foreign subjects and for all cases where one of the parties is a non-native. Similar arrangements prevail in the area (the Kenya Protectorate) leased by the sultan on the mainland. Decrees of the sultan are binding when counter-signed by the resident.

HISTORY

From the earliest times of which there is any record the African seaboard from the Red sea to an unknown distance southwards was subject to Arabian influence and dominion. Egyptians, Chinese and Malays also appear to have visited the coast. At a later period the coast towns were founded or conquered by Persian and Arab Mohammedans who, for the most part, fled to East Africa between the 8th and 11th centuries on account of the religious differences of the times, the refugees being schismatics. Various small states thus grew up along the coast, Mombasa seeming to be the most important. These states are sometimes spoken of as the Zenj empire, though they were never, probably, united under one ruler. Kilwa (*q.v.*) was regarded as the capital of the "empire." The seaboard itself took the name of *Zanquebar* (corrupted to Zanzibar by the Indian traders), the Bilad ez-Zenj, or "Land of the Zenj" of the Arabs, a term which corresponds to the Hindu-bar, or "land of the Hindu," formerly applied to the west coast of India. By Ibn Batuta, who visited the coast in 1328, and other Arab writers the Zenj people are referred to in a general way as Mohammedan negroes; and they are no doubt still represented by the Swahili or "coast people," in whose veins is a large admixture of Asiatic blood. The Zenj "empire" began to decline soon after the appearance of the Portuguese in East African waters at the close of the 15th century. To them fell in rapid succession the great cities of Kilwa with its 300 mosques (1505), Mombasa the "Magnificent" (1505), and soon after Malindi and Mukdishu the "Immense" (Ibn Batuta). The Portuguese rule was troubled

by many revolts, and towards the end of the 16th century the chief cities were ravaged by the Turks, who came by sea, and by the Zimbas, a fierce negro tribe, who came overland from south of the Zambezi. On the ruins of the Portuguese power in the 17th century was built up that of the Imams of Muscat. Over their African dominions the Imams placed *valis* or viceroys, who in time became independent of their overlord. In Mombasa power passed into the hands of the Mazrui family. The island of Zanzibar, conquered by the Portuguese in 1503–08, was occupied by the Arabs in 1730, and in 1832 the town of Zanzibar, then a place of no note, was made the capital of his dominions by the Sayyid Said of Muscat, who reconquered all the towns formerly owing allegiance to the Imams, Mombasa being taken by treachery in 1837. On the death of Said in 1856 his dominions were divided between his two sons, the African section falling to Majid, who was succeeded in 1870 by his younger brother Bargash ibn Said, commonly known as sultan of Zanzibar. At that time besides the islands of Zanzibar, Pemba and Mafia, the sultan's dominions extended along the East African coast from Cape Delgado northwards to and including some of the Somali ports, with an undefined extension inland. Bargash, however, lived to witness the dismemberment of his dominions by Great Britain, Germany and Italy (see AFRICA) and in March, 1888, left to his successor, Sayyid Khalifa, a mere fragment of the territories over which he had once ruled. The mainland territories were divided, Italy acquiring the northern part, Great Britain the central part (now the Kenya protectorate) and Germany the southern part (now Tanganyika Territory) as well as Mafia island. The division was first by lease; subsequently Germany and Italy purchased the sovereign rights in their respective areas. The Sayyids Majid and Bargash acted largely under the influence of Sir John Kirk (*q.v.*) who from 1866 to 1887 was consular representative of Great Britain at Zanzibar. Had an offer by Bargash been accepted the whole of his mainland dominions would have been leased to a British company in 1877. By Sir John's efforts a treaty for the suppression of the slave trade in the sultanate was concluded in 1873.

British Protectorate.--On Nov. 4, 1890, what was left of the sultanate was proclaimed a British protectorate, in conformity with conventions by which Great Britain on her part ceded Heligoland to Germany and renounced all claims to Madagascar in favour of France. On the death of the then sultan, Sayyid Hamoud bin Thwain, in Aug. 1896, his cousin, Sayyid Khalid, proclaimed himself sultan, and seized the palace. The British Government disapproved, and to compel Khalid's submission the palace was bombarded by warships. Khalid fled to the German consulate, whence he was removed to German East Africa, and Hamoud bin Mohammed, brother of Hamoud bin Thwain, was installed sultan by the British representative (Aug. 27, 1896). The Government was reconstituted under British auspices in Oct. 1891, when Sir Lloyd Mathews was appointed prime minister, a title afterwards changed to first minister. In 1897 after a long agitation the legal status of slavery was abolished, compensation being given to the slave owners, mostly Arabs, who had used slave labour for the clove plantations. In 1913 the control of the protectorate was transferred to the Colonial Office. At first the British agent and consul general in Zanzibar also administered the East Africa Protectorate (Kenya colony). This arrangement ceased in 1904; the Colonial Office (in 1913) made the governor of the East Africa Protectorate high commissioner for Zanzibar, local affairs being entrusted to a British resident, who took over the functions of first minister. But the governor had little time to spare for the sultanate and the office of high commissioner was abolished in 1925. Since then the British resident has been directly responsible to the Colonial Office. An advisory council was created but was replaced in 1926 by a nominated legislative council.

Although the administration was controlled by the British resident the sultan continued to exercise much authority. Sayyid Khalifa bin Harud (born 1879), who became sultan in 1911, was a great-nephew of Bargash. He worked in full agreement with the British and as the leading Muslim prince in East Africa his moderating influence did much to steady Muslim opinion in that part of Africa during the World War. The most dramatic incident of the war, for Zanzibar, was the sinking of the ancient British cruiser "Pegasus" by the German cruiser "Konigsberg" on Sept. 20, 1914, the "Pegasus" being at the time at anchor in Zanzibar roadstead, undergoing repairs. During the War, in 1917, the Sayyid Khalid, who had lived in German East Africa since his attempt to seize the throne, surrendered to the British. He was deported to St. Helena, but in 1921 was allowed to live in Mombasa, where he died in 1927.

(F. R. C.)

ZANZIBAR, an East African seaport, capital of the island and sultanate of the same name, in 6° 9′ S., 39° 15′ E. Population about 60,000. The town is situated on the western side of the island 26 m. N.E. of the mainland port of Bagamoyo. Zanzibar is built on a triangular-shaped peninsula, about 1½ m. long, which runs from east to west, forming a safe and spacious roadstead, with a minimum depth of water exceeding five fathoms. Harbour improvements were made, leisurely, between 1920 and 1929 which included a concrete wharf 800 ft. long, where ships can load and unload; 700 ft. of quay frontage for dhow traffic; and a clove depot and goods sheds. Viewed from the sea, the town—which has a thoroughly oriental aspect—presents a pleasant prospect with its mosques, white, flat-topped houses, barracks, forts and round towers. For the most part, Zanzibar consists of a labyrinth of narrow streets. Characteristic of the streets are the carved and massive wooden doors, whose blackness contrasts with the white stone of the houses, and the bright red of the acacias in the garden enclosures. The bazaar is a great centre of attraction. The Anglican cathedral (built 1873–79), a semi-Gothic coral building, occupies the site of the old slave market, which was closed in 1873. The Roman Catholic cathedral is a fine building in the Renaissance style.

The motley population of Zanzibar—the chief elements are Arab, Indian and negro—is indicative of the commercial importance of the city. Its geographical position made it the key of East Africa from Cape Guardafui to Delagoa Bay. "When you play on the flute at Zanzibar" (says an Arab proverb) "all Africa as far as the lakes dances." The Americans were the first among white merchants to realize the possibilities of the port, and a United States consulate was established as early as 1836. The name Merikani, applied to cotton goods and blankets on the east coast, is a testimony to the enterprise of the American trader. The city was the headquarters of the Arabs who ravaged East Africa for slaves and ivory during the major part of the 19th century, and was described by Henry Drummond in *Tropical Africa* (1888) as a "cesspool of wickedness oriental in its appearance, Mohammedan in its religion, Arabian in its morals." Nevertheless, Zanzibar in those days was the focus of all exploring and missionary work for the interior. Pop. (1931) 45,276.

ZAPARAN, a group of tribes of South American Indians forming an independent linguistic stock. The Zaparos live in the region of the Peruvian-Ecuadorian border, on the Curary and Napo rivers and the lower Aguarico. They are a tall, robust people, rather light in skin colour, with prominent noses and are said sometimes to have blue eyes. The men wear a tree-bast poncho-like garment, ornamented with painted designs. The women wear only a small fringed apron. Their houses are merely thatched shelters with no sides. Their weapons are bows, spears and blowguns, poison being used on the darts for the latter and for their arrows. They depend mainly on hunting and fishing for food, although growing some sweet potatoes and bananas.

See A. Simpson, "Notes on the Zaparos," *Journ. Anthrop. Inst. Gr. Brit. and Ire.* vol. vii., pp. 502–510; G. Osculati, *Explorazione delle Regioni Equutoriali etc.* (Milano, 1854); Reinburg, "Folkore amazonien," *J. Soc. Americanistes de Paris* (n.s.) vol. xiii. pp, 11–17.

ZAPOROZHE (formerly Alexandrovsk), a town of the Ukrainian S.S.R., in 47° 51′ N., 35° 10′ E., on the left bank of the

Dnieper river. Pop. (1933) 192,400. Its name means "beyond the rapids," and it is situated south of the falls on which the Dnepropetrovsk hydraulic station is being constructed (1928). Plans are in hand for widening the river so as to permit steamers to reach the town from the Black sea. There is a motor factory and five factories produce agricultural machinery; the town is also a railway junction. Zaporozhe is opposite to Khortitsa Island, a former camp of the Zaporozhian Cossacks and kurgans (tumuli) are numerous in the district.

ZAPOTEC, a south Mexican nationality, the most important of a group comprising also Mixtec and half a dozen other peoples, all speaking tonal languages, and occupying a territory roughly coterminous with the state of Oaxaca. The population in this area of the so-called Zapotecan family, of which the Zapotec proper held the south-eastern part, is still overwhelmingly Indian in blood and largely native in speech. The ancient Zapotec were an important people, who probably served as intermediaries of culture between the Maya and the Nahua, but also developed traits of their own. They excelled in finely modeled figure jars of pottery. Their calendar appears to have been that of the Maya and Aztec; their glyphs have not been read. Two important groups of ruins in Zapotec territory lie at Monte Alban and at Mitla. The former, which appear to be the earlier, comprise terraces and pyramids on a hill, and inscribed stelae and tablets. Mitla has long stone buildings, sunken or on low platforms, with stone columns, veneers of stone cut into geometric patterns, and pictographic frescoes. The population speaking Zapotec numbered 231,000 in 1895; that speaking idioms of Zapotec family, about 450,000.

ZARA, a town on the east coast of the Adriatic, formerly the capital of Dalmatia but now attached to Italy, and included in Venezia Giulia. Italian territory includes an adjacent belt with a total area of 42 sq mi., and a population of 20,055. of whom 12.838 lived within the town in 1936. Zara in this sense forms a small enclave on the coast of the Yugoslav *oblast* of Split. The town is placed on the north-west end of a small, low-lying peninsula separated by the Canale di Zara from the islands of Ugliano and Pasman. It is about 73 m. N.W. of Split and about 92 m. N. of E. from Ancona, with which it is connected by steamer. The space between the peninsula on which the town stands and the adjacent mainland forms a natural, deep-water harbour, the entrance to which was in Venetian times blocked by a chain. Surrounded on three sides by the sea the town was rendered still more secure, after its capture by the Venetians in 1409, by the digging of a deep ditch on the fourth side, so as to convert the tip of the peninsula into an island. When the fortifications were reconstructed by Sanmicheli in the 16th century, a gate, the Porta di Terraferma, was erected to guard the single entrance across the ditch on the landward side.

At the end of the 10th century Zara passed for the first time under Venice. For four centuries it was bandied about from Venice to Hungary and back again. Finally, in 1409 it was sold by the King of Hungary to the Republic and remained Venetian till the Republic ceased to exist. It was then ceded to Austria, passed temporarily into French possession, forming part of the short-lived Illyrian kingdom, till in 1814 the French were driven out and it remained Austrian till the end of the World War. Its transference to Italy, when the rest of Dalmatia became Yugoslav, was justified by the large Italian element in the population and the continuity of Latin culture and speech.

Of the churches one of the oldest is the secularized S. Donato, probably dating from the early 9th century, and recalling S. Vitale at Ravenna. The cathedral dates from the 13th century and its treasury contains some good examples of Dalmatian silver work.

See T. G. Jackson, *Dalmatia, the Quarnero and Istria* (1887) and G. Dainelli. La *Dalmazia* (with atlas, *1918).*

ZARHON, a mountain in Morocco, altitude 3,600 feet, 9½ m. N. of Meknes; it is covered with olive-trees and vines, and has numerous villages; it is one of the most picturesque and smiling regions of Morocco. On the flanks of the Zarhon is the town Mulai Idris Zarhoon, so called after Mulai Idris I., the founder of the Moorish empire, who was buried there in A.D. 791. The whole town is considered as a sanctuary. Not far from Mulai Idris are the ruins of the Roman town of Volubilis (Oulili). *See* L. Chatelain, *Les fouilles de Volubilis* (Casablanca, 1915).

ZARIA, a province occupying a central position in the Northern Provinces of the British protectorate of Nigeria. It has an area of 23,695 sq.m. and a population (1926) of 1,031,567. The province was enlarged in 1926 by the transference to it of the Ratsina emirate from Kano province *(see* KATSINA). The province, of which a great portion consists of open rolling plains, is watered by the Kaduna affluent of the Niger and its many tributaries, and is generally healthy. There is an area of high land (2,000 ft. and over) in the centre of the province which in the south consists of parksland—"orchard brush." In the north the country is more open and becomes semi-desert where the Katsina emirate adjoins the French Niger colony. The chief towns are Zaria, the capital of the emirate, 87 m. S.W. of Kano, and Kaduna, the capital of the Northern Provinces. Both Zaria and Kaduna are in direct railway communication with Kano, Lagos and Port Harcourt, the Western and Eastern railways of Nigeria having their junction at Kaduna. There is also a railway from Zaria to the Bauchi tin-fields, and another railway goes N.W. from Zaria towards Sokoto. There are over 1,000 m. of motor roads in the province. Cotton is very extensively grown.

The ancient state of Zaria, also called Zeg-Zeg by the geographers and historians of the middle ages, was one of the original seven Hausa states. It suffered all the fluctuations of Hausa history, and in the 13th and early 14th centuries seems to have been the dominating state of Hausaland. At later periods it submitted in turn to Kano, Songhoi and Bornu. At the end of the 18th century it was an independent state under its own Mohammedan rulers, but, like the rest of northern Hausaland, it was conquered in the opening years of the 19th century by the Fula. It remained a Fulani emirate up to the period of the British occupation of Nigeria. The emir of Zaria professed friendliness to the British, and in March 1902 the province was taken under British administrative control. It was found that, notwithstanding his friendly professions, the emir of Zaria was intriguing with Kano and Sokoto, then openly hostile to Great Britain, while he continued to raid for slaves and to perpetrate acts of brutal tyranny and oppression. He was deposed in the autumn of 1902, and after the Sokoto-Kano campaign of 1903, which assured the supremacy of Great Britain in the protectorate, another emir, Dan Sidi, was appointed to Zaria.

ZARLINO, GIOSEFFO (1517–1590), Italian musical theorist, surnamed from his birthplace ZARLINUS CLODIENSIS, was born at Chioggia, Venetia, in 1517 (not 1540, as Burney and Hawkins say). Studying in his youth for the Church, he was admitted to the minor orders in 1539 and ordained deacon in 1541 at Venice; but he soon devoted himself entirely to the study of music under the guidance of Adrian Willaert, then choirmaster at St. Mark's. Willaert, dying in 1562, was succeeded by Cipriano di Rore, on whose removal to Parma in 1565 Zarlino was elected choirmaster. Though now remembered chiefly as the earliest advocate of a system of equal temperament for fretted and keyed instruments and for his invaluable contributions to the theory of music, he was both a practical musician and a composer. His printed works consisted of a volume entitled *Modulationes Sex Vocum* (Venice, 1566) and a few motets and madrigals scattered through the collections of Scotto and other contemporary publishers, but he also produced and superintended the public performance of some important pieces in the service of the republic. The only example we possess of his compositions on a grand scale is a ms. mass for four voices, in the library of the Philharmonic Lyceum at Bologna. He died at Venice on Feb. 14, or, according to some Feb. 4, 1590.

Zarlino's first theoretical work was the *Istitutioni Armoniche* (Venice, 1558; reprinted 1562 and 1573). This was followed by the *Dimostrationi Armoniche* (Venice, 1571; reprinted 1573) and by the *Sopplimenti Musicali* (Venice, 1588). Finally, in a complete edition of his works published shortly before his death Zarlino reprinted these three treatises, accompanied by a *Tract on Patience,* a *Discourse on the True date of the Crucifixion of Our Lord,* an essay on *The Origin of the Capuchins,* and the *Resolu-*

tion of Some Doubts Concerning *the* Correction of the *Julian* Calendar (Venice, 1589).

The *Istitutioni* and *Dimostrationi Armoniche* deal, like most other theoretical works of the period, with the whole science of music as it was understood in the 16th century. The earlier chapters, treating chiefly of the arithmetical foundations of the science, differ but little in their line of argument from the principles laid down by Pietro Aron, Zacconi, and other early writers of the Boeotian school; but in bk. ii. of the *Istitutioni* Zarlino boldly attacks the false system of tonality to which the proportions of the Pythagorean tetrachord, if strictly carried out in practice, must inevitably lead.

Again, Zarlino was in advance of his age in his classification of the ecclesiastical modes. These scales were not wholly abolished in favour of our modern tonality in the 17th century. Eight of them, it is true, fell into disuse; but the mediaeval Ionian and Hypo-ionian modes are absolutely identical with the modern natural scale of C; and the Aeolian and Hypo-aeolian modes differ from our minor scale, not in constitution, but in treatment only. Mediaeval composers, however, regarded the Ionian mode as the least perfect of the series and placed it last in order. Zarlino thought differently and made it the first mode, changing all the others to accord with it. His numerical table, therefore, differs from all others made before or since, prophetically assigning the place of honour to the one ancient scale now recognized as the foundation of the modern tonal system.

These innovations were violently opposed by the apostles of the monodic school. Vincenzo Galilei led the attack in a tract entitled *Discorso Intorno* alle *Opere di* Messer *Gioseffe* Zarlino, and followed it up in his famous *Dialogo,* defending the Pythagorean system in very unmeasured language. It was in answer to these strictures that Zarlino published his *Sopplementi.*

ZAUSCHNERIA, in botany, a genus of North American plants of the evening-primrose family (Onagraceae), comprising several species native to California and adjacent Mexico. They are low, slightly shrubby perennials, with small narrow or ovate leaves and large scarlet, fuchsia-like flowers. *Z. californica,* known as California fuchsia and Mexican balsamea and found on mountain slopes, is planted in flower gardens.

ZEALAND (Dan. *Sjaelland*), the largest island of the kingdom of Denmark 2,636 sq.mi. in area, lying between Fyn (11 mi. distant) on the west, and southern Sweden (only 3 mi. distant at the sound) on the east. The surface is undulating, but little above sea-level, and the outline very irregular. On the island are the old cathedral city of Roskilde, the Danish capital, Copenhagen, and the historic port of Helsingfors (Helsinki). Pop. (1940) 1,406,232. (See DENMARK.)

ZEBRA, the name for the African striped members of the horse tribe. The true or mountain zebra (Equus zebra) maintains a precarious foothold in the mountainous region of Cape Colony and also inhabits Angola. It stands about 4ft. at the shoulder, with fairly long ears, a tail scantily clothed with hair, and a short mane. The ground colour is white and the stripes, absent only on the abdomen and inside of the thighs, are black. The lower part of the face is brown. The stripes on the haunch do not reach the median dorsal stripe and there are a number of short stripes between the two. These are absent in Burchell's zebra (E. burchelli), which is a larger animal with smaller, more completely white ears, a longer mane and a fuller tail. Burchell's zebra extends from the plains north of the Orange river to north-east Africa. The ground-colour of the body is pale yellowish-brown, the stripes. which in the southern individuals do not extend on to the limbs and tail, dark brown or black. Grant's zebra (E. b. granti) is the northern, completely striped race which lacks the characteristic "ghost" stripes between the main ones. Grévy's zebra (E. grevyi) inhabits Abyssinia and Somaliland and is distinguished by its enormous ears and numerous, narrow, black stripes. The species known as quagga (*q.v.*) is now extinct. Zebras occur in large herds and are one of the staple articles of diet of the lion. Their stripes result in a camouflage effect, causing them to fade away against the background, particularly at night, when they principally feed. Zebras can be trained for driving and riding, but only with difficulty. (See HORSE.)

GRÉVY'S ZEBRA (EQUUS GREVYI) DISTINGUISHED BY ITS BLACK STRIPES AND ASS-LIKE EARS

ZEBU (Bos *indicus*), an Indian species of ox, characterized by light colour and a hump. The sacred bulls of India belong to this species, which is used for draught work, and supplies milk. In Texas it is crossed with domestic cattle. (*See* CATTLE.)

ZEBULON, a tribe of Israel, named after the sixth son borne by Leah to Jacob (Genesis xxx. 20). The fertile territory occupied by the tribe lay roughly north-east of the plain of Jezreel, but the boundaries between it and the neighbouring territories of Naphtali, Asher and Issachar are ill-defined. The somewhat obscure text of Genesis xlix. 13 seems to imply that at one time Zebulon extended to the sea-coast and marched with Phoenician territory. The tribe appears to have furnished valiant warriors, and receives special mention in the Song of Deborah for its martial exploits (Judges v. 14, 18).

ZECHARIAH, the eleventh in order of the "minor prophets" of the Old Testament. He was associated with Haggai (*q.v.*) in stimulating the re-building of the temple at Jerusalem, begun in 520 (Ezra iv. 24) and completed in 516 (Ezra vi. 15). A previous attempt made by returned exiles in 537 (Ezra i. 1 seq., iii. 1 sqq.) seems to have been checked by local opposition and not renewed owing to economic pressure. In 520, however, the political disturbances of the Persian empire (of which the Jewish community in Palestine was a negligible part) were interpreted by these two prophets as a sign that the Messianic expectations were now to be realized, and that the "Day of Yahweh" was at hand. Haggai gave the first impulse to the new attempt; two months later, Zechariah joined him in encouraging the faint-hearted. His prophecies, exactly dated in 520 (i. 1, 7) and 518 (vii. 1), are to be found in the first eight chapters of the book now bearing his name. Their central feature is a series of "night-visions" (i. 8, iv. 1), intended to show Yahweh's immediate and effective intervention on behalf of His people. They are arranged with literary art in connected sequence, beginning with the vision of horsemen who report that the expected Messianic crisis has not yet come (i. 11, cf. Hagg. ii. 21 seq.), and culminating in the vision of Yahweh's war-chariots despatched to execute His vengeance upon the heathen, especially on Babylonia (vi. 8). The six intervening visions (all the eight are ascribed to a single night) reveal in succession' four horns, representing the heathen powers of the four quarters of the earth, cast down by four craftsmen (i. 18–21), a man with a measuring line, whose narrow ideas of the future city are replaced by the conception of a city without walls because of its great extent, to which Yahweh's protection will be a wall of fire (ii. 1–5), the formal acquittal and restoration of 'Joshua the high-priest, representing the community (iii. 1 seq.), the seven-branched lampstand, representing Yahweh's watchful eyes, with two olive-trees, representing Joshua and Zerubbabel (iv. 1–14, but see the commentaries), the flying roll which brings its ubiquitous curse on evil-doers (thieves and false-swearers), and so cleanses the land of moral evil (v. 1–4), the woman carried off in an ephah, representing the removal of guilt (v. 5–11). These visions are now prefaced by a call to repentance and the promise of forgiveness (i. 2–6), in which Zechariah's appeal to "the former prophets" (like the detail of an interpreting angel in the visions themselves) reminds us that the great prophetic period (8th–6th centuries) lies in the past, and that the conception of revelation itself has lost something of its original simplicity and spontaneity.

The "night-visions" are followed, two years later (vii. 1), by a divine oracle which directs that the fasts kept throughout the exile should now become festivals (viii. 18 seq.). The enquiry which led to the oracle (vii. 3) is made the occasion of warning against the externality of fasting, of appeal for true conduct, and of an idyllic picture of the happiness of the coming Mes-

sianic age (note especially viii. 4, 5). In this happy future the prophet expected that Zerubbabel would be the Messiah, and the bringing of an offering of gold and silver from Jews in Babylon led Zechariah to crown him symbolically in the name of Yahweh (vi. 9–15; *see* the commentaries for the original text). The darkness that falls on Jewish history with the completion of the second temple suggests that these words and deeds may have thrust Zerubbabel into a dangerous political prominence, leading to his removal by the Persian authorities, and the eclipse of Messianic expectations.

The remainder of the present book of Zechariah (ix.–xiv.) is of an altogether different character, and is now generally admitted to belong to a period later than the Persian (as indeed the direct reference to Greece in ix. 13 implies). This portion of the book is divided by the titles in ix. 1, xii. 1. ("The burden of the word of Yahweh"), into two distinct collections, each of which it seems necessary to divide again, so that we have four groups of prophecies, distinguished by their subject-matter. The first (ix.–xi. 3) deals with the recovery of Palestine by Yahweh's victories over Syria, Phoenicia and Philistia (ix. 1–8), the coming of the Messianic king to the restored and victorious Israel (ix. 9–17), the overthrow of the (foreign) "shepherds" or rulers, and the gathering of exiled Israelites (x. 1–12), closing with a figurative dirge over the fall of these "shepherds" (xi. 1–3). The second group (xi. 4–17, with the misplaced xiii. 7–9) describes the rejection of the prophet, representing a worthy shepherd, and the accursed doom of a worthless one, a purified third of the people alone remaining. The third (xii., xiii. 1–6) pictures an attack of the nations upon Jerusalem, in which Judah is first a foe and then a victorious friend to the mother city; this is followed by elaborate mourning for an unnamed martyr (xii. 10, R. V. mg.), and the cleansing of Jerusalem from idolatry and *prophecy.* The fourth division (xiv.) describes the delivery of Jerusalem from the heathen, that it may become the metropolis of religion for all the world. The last two of these divisions are of a markedly eschatological character, and even the first two could be so regarded (so Sellin). These writings are perhaps the most obscure of the Old Testament, chiefly because we have no sufficient clue to the historical allusions, such as the cutting off of three shepherds in one month (xi. 8), the pierced martyr (xii. 10) and the antagonism of Judah and Jerusalem (xii. 2, xiv. 14). By some scholars these chapters have been brought down as late as the Maccabean age, the events of which are supposed to explain these and other allusions. But the fact is that we are almost wholly ignorant of Jewish history during the earlier part of the Greek period (from 331 B.C.), to which these writings might equally well belong.

ZEDEKIAH, son of Josiah, and the last king of Judah (2 Kings xxiv. 17 *sqq.;* 2 Chron. xxxvi. 10 *seq.).* He was appointed king by Nebuchadrezzar after the capture of Jerusalem (597 B.C.) and held his position under an oath of allegiance. After three years he began an intrigue with Moab, Edom, Ammon, Tyre and Sidon, and it is possible that he was summoned to Babylon to explain his conduct. Nevertheless, relations were maintained with Egypt and steps were taken to revolt. The Babylonian army laid siege to Jerusalem in 588 B.C., and a vain attempt was made by Pharaoh Hophra to cause a diversion. After six months a breach was made in the city, Zedekiah was captured and taken to Nebuchadrezzar at Riblah. His sons were killed, and he was blinded and carried to Babylon in chains where his predecessor, Jehoiachin was already a captive.

ZEEBRUGGE, ATTACK ON: see BELGIAN COAST OPERATIONS.

ZEEHAN, a town of Montagu county, Tasmania, 225 m. N.W. of Hobart, on the Little Henty river. It is a railway centre and focus of the silver-lead mining of the neighbourhood.

ZEELAND, the most southerly North sea maritime province of the Netherlands, consists mainly of six deltaic islands between the Grevelingen (the southern sea-exit of the Waal-Maas) and De Hont or Western Schelde sea-channel, together with a strip of the Flanders mainland lying south of De Hont. Belgium borders it on the south; the Dutch provinces of North Brabant, east, and South Holland, north, are its other neighbours. It is 707 sq.m. in area, and of the other ten Dutch provinces only Utrecht is smaller. Very little of its entire surface is above sea-level. Formed of the accumulated alluvium from the great rivers and with little natural protection against the encroaching waves, its life has been marked by inundation catastrophes and by the long, slow winning back of territory in the lee of successive ranks of many miles of artificial dikes. (See HOLLAND: *Dikes.)*

Above a gateway of the old mint of the counts of Holland in Middelburg a sculptured lion of Zeeland rises through stone waves and his "Luctor et emergo" is one of the most apposite of the provincial mottoes. Its pop. (est. 1938) 254,565, is, with the exception of Drente, the lowest of any province in Holland. However, its fertile soil favours the cultivation of cereals, wheat, rye and barley and of root crops. Its famous black and white cattle and dairy produce are important exports.

The constituent islands are Walcheren to the south-west with North Beveland and South Beveland in close proximity to the east. North of the fairly wide waterway Ooster Schelde, which at the eastern end has the significant name of Verdronken (Drowned) Land, are Schouwen-en-Duiveland (westward), and the smaller Tholen and still smaller St. Philipsland. All the islands preserve archaic customs and costumes. Walcheren, though not the largest island, is the most densely populated and nearest to England with which Flushing (Vlissingen), its largest town, has regular passenger and mail boat services via Harwich and Queenborough. Flushing (pop. 21,716) is not only a sea and canal port, but also a gay resort. It is the railhead for the line which in 1866 first crossed the great railway dam between Walcheren and South Beveland and now runs to Roosendaal (North Brabant) the great railway junction for Belgium, Germany and north Holland. The ship canal from Flushing divides Walcheren into two unequal parts and passes Middelburg en route for Veere, while steam trams connect Flushing and Middelburg with Domburg. Domburg is a small seaside resort built over and round a much older settlement with civic rights dating back to the 13th century; in addition, numerous Roman antiquities found locally suggest a still earlier origin. South-west of Domburg is the famous Westkapelle dike. Middelburg, the capital of the province, is but little smaller than Flushing. It is and has long been the real focus of Dutch life in Zeeland and has many interesting buildings.

The small industries of Walcheren include ship-building, distilling, brewing and spinning, but it deservedly ranks as the flower garden of Zeeland; in latter days it is cultivating a great variety of products from hemp to the opium poppy and its orchards are important. South Beveland and its small neighbour North Beveland are even more important for fruit which, in their case, is largely exported as jam. South Beveland has suffered much from inundations, particularly in the south-west; here, during the 16th century, the island of Borsselen was submerged but has been gradually recovered. North Beveland, destitute of ship canal or railway has no large settlements; it is intensively cultivated and shares with Schouwen and South Beveland an important oyster-breeding industry, Yerseke on the north-east coast of South Beveland being particularly famed. Goes (pop. [1930] 9,124) is the largest town of North Beveland, Schouwen contains the greatest amount of elevated land in Zeeland and the well-wooded tract along the western seaboard introduces a less usual scenic feature. The former natural seaway between Schouwen and Duiveland has been closed by the damming of the Dykwater but a canal still follows its line. On this is the old port of Zierikzee which has probably retained more of its mediaeval features than any other Zeeland town,

In the north of Schouwen is Brouwershaven, established as a port by the brewers and wine merchants of Middelburg. Here the English supporters (under Jacquelin of Bavaria) were defeated by the troops of Philip of Burgundy. St. Philipsland is rather inaccessible and has little of interest; Tholen, only little easier of approach, has on its east coast a small ancient circular town of the same name, noted for oysters and onions. In the still smaller village of St. Maartensdÿk little remains of its once mighty 14th-century castle—the home of the Borsseles—but the village church contains a tomb of Floris van Borssele. Stavenisse on the west coast is modern and ugly. The strip of Zeeland-Flanders gives the Dutch command of both banks of the Lower Schelde. Here the busiest town is Terneuzen at the sea-end of the canal (1825–27), running due south to Ghent; south-east of it lies Axel, formerly fortified but now noted only for the peculiar costumes of its peasant women. Zeeland played an important role in the battle of Holland in May 1940, as it was able to hold out for about 10 days longer than the other provinces in the battle against the German invaders. Most of its capital, Middelburg, was destroyed by enemy bombing. (W. E. WH.; X.)

ZEEMAN, PIETER (1865–1943), Dutch physicist, was born at Zonnemaire, Zeeland, on May 25, 1865. He studied at Leyden, where he was successively assistant in physics (1890–94), *Privat-dozent* (1894–97) and lecturer (1897–1900). In 1900 he was appointed professor of physics at Amsterdam, and in 1908 director of the Physical institute in that city. Zeeman's best known work in physics is the so-called Zeeman effect (*q.v.*), the splitting up of spectral lines in a magnetic field, which he discovered in 1896. The theoretical explanation was first given by Hendrik Antoon Lorentz soon after the effect was observed. The phenomenon has been used by astronomers for the detection of magnetic effects at the surface of the sun. Later Zeeman worked on the propagation of light in moving media. He made observations in water, quartz and flint; the bodies were given an oscillatory motion and instantaneous photographic methods were applied, the exposure being made when the velocity was at a maximum. The results of these observations are collected in Archives *Néerlandaises* des Sciences Exactes (vol. x, 1927). Zeeman was a member of many learned societies and was the recipient of many awards, including the Nobel prize, which he won jointly with Lorentz in 1902. He was the author of several books on magneto-optics, which were translated into English and German. He died in Amsterdam, Oct. 9, 1943.

ZEEMAN EFFECT, named after its discoverer, is the term used to describe the phenomena produced in spectroscopy (*q.v.*) by a magnetic field. When a substance, which emits a line spectrum, is placed in a strong magnetic field, every line is split up into several components each of which has a characteristic change of frequency and characteristic polarization and intensity. Magnetism produces many curious effects in matter (change of electrical resistance, "Hall" effect, etc.), but the Zeeman effect has an importance immensely greater than the rest because it has proved to be one of the most powerful means of discovering the nature of the forces in the atom. The first indication of a connection between light and magnetism was due to Faraday, who discovered the magnetic gyration of light in 1845; *i.e.,* when plane polarized light goes through transparent matter in a magnetic field the plane of polarization is rotated. With extraordinary insight he conjectured that there ought to be a corresponding effect in the emission of light, and almost the last experiment of his life was to seek for it. He failed to detect it since the technique both of spectroscopes and of magnetic fields was insufficiently developed, but modern theory entirely bears out the correctness of his conjecture. In 1896 Zeeman made a similar attempt and was successful. When a source of light, such as a metallic arc, was placed between the poles of a powerful electromagnet, the lines of its spectrum were split into components, some displaced to the red and some to the blue, and each of these was polarized in a characteristic way.

The experimental study of the Zeeman effect calls for little comment. Even in the strongest magnetic fields available (say 30,000 gauss) the extreme components into which a line is split are never more than about 1 A. U. apart, and there may well be a dozen or so components between them, so that it is not only necessary to have a powerful magnet, but also a spectroscope of high resolving power. The consequent difficulties are very great, but are not peculiar to the Zeeman effect. The polarizations of the various components are shown by the ordinary methods used for polarized light, and their intensities by means of an opaque wedge according to the usual photometric practice, and only one point calls for comment. Light passing through a diffraction grating has its intensity differently affected according as it is polarized along or across the lines of the grating, and this might entirely vitiate the comparison of the intensities of lines polarized in these two ways. The difficulty is avoided by the use of a quartz plate, which rotates the planes of polarization so that both types are at 45° to the lines of the grating. It was only after this was done that it was found possible to obtain correct values for the intensities, with important consequences for the general theory of spectra.

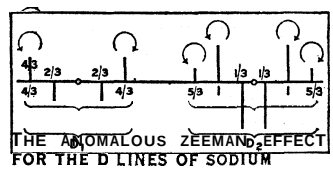
The Normal Zeeman Effect.—Almost immediately after Zeeman had made his discovery, Lorentz showed how it would fit into the classical electric theory. His explanation has been superseded in the light of later knowledge, but it still furnishes a convenient description of the simpler features of the effect. It explains what is called the "normal effect," though, as so often happens with scientific nomenclature, it turns out that the normal effect is of rather rare occurrence and is not in fact the most primitive type. Lorentz supposed that the atom contains an electron which describes free vibrations about a centre. The restraining force is proportional to the distance from the centre and is the same for all directions, so that the free period is independent of the orbit of the electron. Such an electron will emit light of its own frequency and with polarization completely determined by its orbit. When there is no external magnetic field the orbits of the various atoms in the source are orientated at random, and their average effects give unpolarized light.

When an electron is placed in a magnetic field, it experiences a force at right-angles to the direction of the field and also at right-angles to its line of motion, and this force is to be superposed on the other forces acting on the electron. The effect is most conveniently described by Larmor's theorem which asserts that the field is equivalent to a rotation. This means that the actual motion of the electron in the field is the same as the apparent motion it would have without the fleld, but now as seen by an observer who is himself rotating at a suitable speed about an axis in the direction of the magnetic force. The angular velocity of the Larmor rotation is $eH/2mc$, where H is the strength of the field, e and m the charge and mass of the electron and c the velocity of light. Compared to ordinary standards this is a very high speed even for quite weak fields (for the earth's magnetic field is about a million rotations a second), but it is much smaller than the speed with which it is to be compared, the electron's motion in the atom.

The equivalence of magnetism and rotation is true whatever other forces may act on the electron. In our case the effect can best be seen by considering three special types of orbits; the general motion is merely a superposition of these. The first is a motion along the line of the magnetic field, and this is evidently unaffected by the rotation. The others are circular motions, both in a plane perpendicular to the field, but in opposite directions. The Larmor rotation must be added to one of these, and subtracted from the other. If the original frequency was v there will now be three frequencies, v and $\nu \pm eH/4\pi mc$, and we conclude that the magnetic field will split one line into three. Moreover each of the three will have a characteristic polarization, associated with the corresponding motion of the electron. These polarizations vary according to the position of the observer, and are most easily described by saying that the light-vector (electric force) behaves like the perspective view that the observer has of the motion of the emitting electron. Thus the light of frequency v corresponds to the electron vibrating along the line of the field Viewed from anywhere it appears to describe a straight line, and so the associated light is plane-polarized. From the poles (in the

direction of the magnetic field) the electron will appear motionless, and so no light is emitted in this direction, At the equator the apparent motion is a maximum and the light is polarized with vector in the same direction as the field; for this reason the component is called *parallel.* Next consider one of the circular motions; on the same principle it emits circularly polarized light towards the poles, and plane-polarized light towards the equator where the electron's motion is seen edgewise. From the direction of its polarization at the equator this component is called *perpendicular.* One of the first tasks of Zeeman was to examine the light in the polar direction, for, by finding whether the bluer component gives right- or left-handed circularly polarized light, it is possible to fix the sign of the Larmor rotation, and so to determine the sign of the electron's charge *e.* Once this is done it is most convenient to observe the effect from the equator, since in that direction all three components are plane-polarized, and this is much more convenient for investigation.

The Anomalous Zeeman Effect.—The experiments on some spectral lines (in particular on the chief cadmium lines which are used as fundamental standards of wave-length) entirely bore out Lorentz's theory and gave a measure of e/mc, which in magnitude and sign was in agreement with the value determined for free electrons. This result, however, proved to be quite exceptional; nearly all lines were found to give much more complicated splitting and this in many different ways, which are collectively referred to as the *anomalous Zeeman effect.* There are usually many more than the three lines of Lorentz's theory, and often none in the positions predicted by it; but the scale of the pattern is still proportional to the magnetic force and the polarizations still fall into the three classes described, the central ones being *parallel* and the outer *perpendicular* of the two types. Moreover the displacement always bears a simple numerical ratio to that given by the simple theory. The general rules are very complicated and we may be content to describe a single example, the yellow lines, D_1 and D_2, of sodium. These two lines break up into 4 and 6 components respectively, in the manner shown in figure. This is the simplest case of the anomalous effect, and theory now shows it to be the most primitive effect of all, much more so than the normal Lorentz triplet.



THE ANOMALOUS ZEEMAN EFFECT FOR THE D LINES OF SODIUM

The anomalous Zeeman effect is connected with another important phenomenon, called the Paschen-Back effect after its discoverers. As the magnetic field is increased, the components get further apart, and for a strong enough field those of D_1 and D_2 ought to overlap one another. This does not occur, but a complicated rearrangement takes place; some lines weaken in intensity and disappear, others melt together and finally, when the magnetic field is very strong indeed, a totally new pattern is observed in the form of a *single* Lorentz triplet. A trace of the original two lines remains, in that each component has a fine structure and is not a simple line. The actual transition to the Paschen-Back effect cannot be observed for the D-lines, because it would need quite unattainable strengths of field, but it is safely inferred from the behaviour of other lines of the same type which are originally much closer together. Though we have only described one particular example, it is universally true that in very strong fields every *multiplet* of a spectrum is replaced by a single Lorentz pattern.

The disentangling of the very complicated patterns was made possible by the quantum theory of spectra, according to which there is a spectrum of *levels* underlying the spectrum of lines. Every line is given in frequency by the difference in "height" between two levels, and the levels have much simpler characteristics than the lines. The analysis was worked out with the help of quasi-dynamical models, and its result was to express the displacement, polarization and intensity of every line algebraically in terms of the *quantum numbers* which describe the two associated levels. (*See* QUANTUM THEORY.) From this analysis it emerged that in the atom there are two kinds of system, one of which exhibits the Larmor rotation, while the other shows a rotation just twice as great. By the interaction of the two systems it is possible to explain both the anomalous Zeeman effect and the Paschen-Back effect. For some time the existence of this doubled rotation was mysterious, but it was finally traced to the electron itself; the electron in addition to its electric charge is a magnet and rotates in the magnetic field with twice the Larmor speed. Even this is not the last word, for it has been shown that it is only possible to make a picture of electrical phenomena which rigorously reconciles the quantum theory with the theory of relativity by endowing the electron with magnetism in just the way required for the Zeeman effect. Einstein's conception of relativity was developed to explain a totally different category of phenomena, and it is one of the most remarkable syntheses in the history of physics that it should be possible to make it responsible for the intricacies of the Zeeman effect.

We have described the most interesting aspect of the Zeeman effect, and need only touch on a few others. There is the *inverse Zeeman effect* where light is absorbed by matter in a magnetic field; this follows exactly the same rules as the direct effect Faraday's magnetic gyration (*see* LIGHT) is another aspect of the same thing. The theory of the effect is still very incomplete for band spectra, and indeed for some classes of line spectra. In conclusion we may refer to a more practical use to which the Zeeman effect has been put: by its means it is known that there are very powerful magnetic fields in sun-spots, and also that the sun as a whole has a magnetic held like the earth.

For the magnetism of the electron, original papers must be consulted, of which there arc a long series, culminating in P. A. M. Dirac, "The Quantum Theory of the Electron," in *Roy. Soc. Proc. A.* (1928).

(C. G. D.)

ZEITZ, a town in the extreme south of the Prussian province of Saxony, Germany, on the Weisse (White) Elster, 28 mi. by rail S S.W. of Leipzig on the line to Gera, and with branches to Altenburg and Weissenfels. Pop. (1939) 36,131. Zeitz is an ancient place of Slavonic origin. From 968 till 1028 it was the seat of a bishopric, afterwards removed to Naumburg, and styled Naumburg-Zeitz. In 1564 the last Roman Catholic bishop died, and his dominions were thenceforward administered by princes of Saxony. From 1653 till 1718 Zeitz was the capital of the dukes of Saxe-Zeitz. It thereafter remained in the possession of the electors of Saxony until 1815, when it passed to Prussia.

ZELLER, EDUARD (1814–1908), German philosopher, was born at Kleinbottwar in Württemberg on Jan. 22, 1814, and educated at the University of Tübingen and under the influence of Hegel. In 1840 he was *Privatdozent* of theology at Tubingen, in 1847 professor of theology at Bern, in 1849 professor of theology at Marburg, migrating soon afterwards to the faculty of philosophy as the result of disputes with the Clerical party. He became professor of philosophy at Heidelberg in 1862, removed to Berlin in 1872, and retired in 1895. His great work is his *Philosophie der Griechen* (1844–52). He was one of the founders of the *Theologische Jahrbücher,* a periodical which acquired great importance as the exponent of the historical method of David Strauss and Christian Baur. Like most of his contemporaries he began with Hegelianism, but later he saw the necessity of going back to Kant in the sense of demanding a critical reconsideration of the epistemological problems which Kant had made but a partially successful attempt to solve. None the less his merits as an original thinker are far outshone by his splendid services to the history of philosophy, in spite of the fact that his view of Greek thought is somewhat warped by Hegelian formalism. He died on March 19, 1908. Among his other works are: *Platonische Studien* (1839); *Gesch. d. christlich. Kirche* (1898); *Gesch. d. deutsch Philos. seit Leibniz* (1873, 1875); *Staat und Kirche* (1873); *Über Bedeutung und Aufgabe d. Erkenntniss-Theorie* (1862); *Über teleolog. und mechan. Naturerklarung* (1876); *Philosoph. Aufsätze* (1887).

The *Philosophie der Griechen* was translated into English (2 vols., 1881) under the editorship of S F. Alleyne. The *Philosophie* appeared in an abbreviated form as *Grundriss d. Gesch. d. Griech. Philos.* (1883; 5th ed. 1808); Eng. trans by Alleyne and Evelyn Abbott (1866), under the title, *Outlines of the Hist. of Gk. Philosophy.*

ZEMARCHUS (*fl.* 568), Byzantine general and traveller. The Turks, by their conquest of Sogdiana in the middle of the 6th century, gained control of the silk trade which then passed through Central Asia into Persia. But the Persian king, Chosroes Nushirvan refused to allow the old commerce to continue, and the Turks in 568 sent an embassy to Constantinopie to form an alliance with the Byzantines and "transfer the sale of silk to them." The offer was accepted by Justin II., and in Aug. 568, Zemarchus the Cilician, "General of the cities of the East," left Byzantium for Sogdiana. The embassy was under the guidance of Maniakh, "chief of the people of Sogdiana," who had himself come to Byzantium to negotiate the "Roman alliance." On reaching the Sogdian territories the travellers were offered iron for sale, and solemnly exorcised; Zemarchus was made to "pass through the fire" (*i.e.*, between two fires), and strange ceremonies were performed over the baggage of the expedition. The envoys then proceeded to the camp of Dizabul (or rather of Dizabul's successor, he having just died) "in a hollow encompassed by the Golden Mountain," apparently in some locality of the Altai. They found the khan surrounded by astonishing barbaric pomp—gilded thrones, golden peacocks, gold and silver plate and silver animals, hangings and clothing of figured silk. They accompanied him some way on his march against Persia, passing through Talas or Turkistan in the Syr Darya valley.

Near the river Oēkh (Syr Darya?) he was sent back to Constantinople with a Turkish embassy and with envoys from various tribes subject to the Turks. Halting by the "vast, wide lagoon" (of the Aral sea?), Zemarchus sent off an express messenger, one George, to announce his return to the emperor. George hurried on by the shortest route, "desert and waterless," apparently the steppes north of the Black sea; while his superior, moving more slowly, marched 12 days by the sandy shores of "the lagoon"; crossed the Emba, Ural, Volga and Kuban (where 4,000 Persians vainly lay in ambush to stop him); and passing round the western end of the Caucasus, arrived safely at Trebizond and Constantinople. For several years this Turkish alliance subsisted, while close intercourse was maintained between Central Asia and Byzantium; but from 579 the friendship rapidly began to cool. All this travel does not seem to have corrected the misapprehension that the Caspian was a gulf of the Arctic ocean.

Yule, Cathay, clx.–clxvi. (Hakluyt Society, 1866); L. Cahun, Introduction *à l'histoire de l'Asie*, pp. 108–118 (1896); C. R. Beazley, Dawn of Modern Geography, i. 186–189 (1897). (C. R. B.)

ZEMGALS, GUSTAV (1871–1939), president of the republic of Latvia (1927–30), was born in Courland on Aug. 12, 1871. Educated in Riga, he studied law at the University of Moscow. Up to the time of his election as president of the republic he was a well known lawyer and notarius publicus in Riga, and took an active part in the Co-operative movement. He was vice-president of the Latvian National Council in 1918, and this council was recognized by the Western European Powers as being the legitimate representative body of the Latvian nation. It was he who proclaimed the independence of Latvia on Nov. 18, 1918, in the absence of Monsieur Tschakste, the president of the Latvian National Council.

He was elected president of the republic of Latvia for three years on April 8, 1927, in succession to the late J. Tschakste, the first president of the republic of Latvia. President Zemgais was elected by a great majority, receiving about 80 votes out of a possible 100 in the Latvian parliament. He held office until April 8, 1930, when he was succeeded by Albert Kviesis. He enjoyed remarkable popularity among all classes of the population, as he was keenly interested in the life and the progress of the people of the country. He was a member of the Constituent Assembly of Latvia and had a seat in the first parliament (Saeima). He was lord mayor of Riga and was minister of war from 1921–23. He died Jan. 7, 1939.

ZEMUN, a town of Croatia-Slavonia, Yugoslavia (German *Semlin*), on the Danube opposite Belgrade. Pop. (1931) 28,083, the majority being Serbs. Zemun is the seat of an Orthodox bishop; but most of the inhabitants are Roman Catholics. Zemun has an important transit trade in grain, fruit, livestock and timber. On a hill overlooking the Danube are the ruins of the castle of Hunyadi Janos, who died here in 1456. Until 1881 the town belonged to the military frontier of Austria-Hungary. In April 1941, the town passed under German occupation.

ZENÁGA, a Berber tribe of southern Morocco who gave their name to Senegal, once their tribal home. With other tribes under Yusef bin Tashfin, they crossed the Sahara and gave the Almoravide dynasty to Morocco and Spain. The Zeirid dynasty which supplanted the Fatimites in the Maghrib and founded the city of Algiers was also of Zenága origin. The Zenaga dialect of Berber is spoken in southern Morocco and on the banks of the lower Senegal, largely by the negro population.

ZENATA or ZANATÀ, a Berber tribe of Morocco in the district of central Atlas. Their tribal home seems to have been south of Oran in Algeria, and they early claimed an Arab origin, though the Arabs called them descendants of Goliath, *i.e.*, Philistines or Phoenicians (Ibn Khaldun, vol. iii. p. 184 and vol. iv. p. 597). They were formerly a large and powerful confederation, and took a prominent part in the history of the Berber race. The Beni-Marin and Wattasi dynasties of Zenata origin, reigned in Morocco from 1213 to 1548.

ZEND-AVESTA, the original document of the religion of Zoroaster (*q.v.*), still used by the Parsees as their bible and prayer-book. The name "Zend-Avesta" has been current in Europe since the time of Anquetil Duperron (c. 1771), but the Parsees themselves call it simply Avesta, *Zend* (*i.e.*, "interpretation") being specially employed to denote the translation and exposition of a great part of the Avesta which exists in Pahlavi. The origin and meaning of the word "Avesta" (or in its older form, *Avistāk*) are alike obscure; it cannot be traced further back than the Sassanian period. The term is now applied both to the collection of writings and also to the language in which they are composed. The Avesta is a work of but moderate compass (comparable, say, to the Iliad and Odyssey taken together), but no single manuscript gives it in entirety.

Contents.—As we now have it, the Avesta consists of the following parts:—

1. The Yasna, the principal liturgical book of the Parsees, in 72 chapters (*hāiti, hā*), contains the texts read by the priests at the solemn yasna (Izeshne) ceremony, the general sacrifice in honour of all the deities. The arrangement of the chapters is purely liturgical, although their matter in part has nothing to do with the liturgical action. It falls into three sections of about equal length:—(a) The introduction (chap. 1–27) consists mainly of invocations. Yet it includes some interesting texts, *e.g.*, the *Haoma* (Hom) Yasht (9, 11) and the ancient confession of faith (12), which is of value as a document for the history of civilization. (b) The Gāthās (chap. 28–54) contain the discourses, exhortations and revelations of the prophet, written in a metrical style and archaic language. The Gāthās proper, arranged according to the metres in which they are written, fall into five subdivisions (28–34, 43–46, 47–50, 51, 53). Between chap. 34 and chap. 43 is inserted the so-called Seven-Chapter Yasna (*haptanghciiti*), a number of small prose pieces not far behind the Gāthās in antiquity. (c) The so-called Later Yasna (*Aparō Yasnō*) (chap. 5–72) consists mainly of invocations. Special mention ought to be made of the Sraosha (*Srōsh*) Yasht (57), the prayer to fire (62), and the great liturgy for the sacrifice to divinities of the water (63–69).

2. The *Vispered*, a minor liturgical work in 24 chapters (karde), is alike in form and substance completely dependent on the Yasna, to which it is a liturgical appendix. The name Vispered, meaning "all the chiefs" (*vispē ratavō*), has reference to the spiritual heads of the religion of Ormuzd, invocations to whom form the contents of the first chapter of the book.

3. The Vendidad, the priestly code of the Parsees, contains in 22 chapters (fargard) a kind of dualistic account of the creation (chap. 1), the legend of Yima and the golden age (chap. 2), and in the bulk of the remaining chapters the precepts of religion with

regard to the cultivation of the earth, the care of useful animals, the protection of the sacred elements, such as earth, fire and water, the keeping of a man's body from defilement, together with the requisite measures of precaution, elaborate ceremonies of purification, atonements, ecclesiastical expiations and so forth. Yet in spite of an exaggerated casuistry the whole of Zoroastrian legislation is subordinate to one great point of view: the war—preached without intermission—against Satan and his noxious creatures, from which the whole book derives its name; for "Vendīdād" is a modern corruption for *vī-daēvō-dātem*—"the anti-demonic Law." The three concluding chapters are devoted to sacerdotal medicine.

4. The *Yashts, i.e.,* "songs of praise," except those inserted in the Yasna, form a collection by themselves. They contain invocations of *separate* Izads, or angels, number 21 in all, and are of widely divergent extent and antiquity. The great Yashts—some nine or ten—are impressed with a higher stamp, and represent the religious poetry of the ancient Iranians. They resemble the Rig-Veda hymns, and are a rich source of mythology and legendary history. Side by side with full, vividly coloured descriptions of the Zoroastrian deities, they frequently interweave, as episodes, stories from the old heroic fables. The most important of all, the 19th Yasht, gives a consecutive account of the Iranian heroic saga in great broad lines, together with a prophetic presentment of the end of this world.

5. The *Khordah Avesta, i.e.,* the Little Avesta, comprises a collection of shorter prayers designed for all believers—the laity included—and adapted for the various occurrences of ordinary life.

There are also a considerable number of fragments from lost books, *e.g.,* the *Nīrangistān,* as well as quotations, glosses and glossaries.

The Larger Avesta and the Twenty-one Nasks.—In its present form, however, the Avesta is only a fragmentary remnant of the old priestly literature of Zoroastrianism. Native tradition, carrying us back to the Sassanian period, tells of a larger Avesta in 21 books called *nasks* or *nosks,* as to the names of which we have several more or less detailed accounts, particularly in the Pahlavi Dīnkard (9th century A.D.) and in the Rivāyats. From the same sources we learn that this *larger* Avesta was only a part of a yet more extensive *original* Avesta, which is said to have existed before Alexander. But even of the remains of the Avesta, as these lay before the author of the 9th century, only a small residue has survived to our time. Of all the nasks one only, the 19th, has come down on us intact—the Vendidad.

It would be rash summarily to dismiss this old tradition of the 21 nasks as pure invention. The number 21, being a sacred number, points, indeed, to an artificial arrangement of the material. In the enumeration of the nasks we miss the names of the books we know, like the Yasna and the Yashts. But we must assume that these were included in such or such a nask, as the Yashts in the 17th or *Bakān* Yasht; or, it may be that other books, especially the Yasna, are a compilation extracted for liturgical purposes from various nasks. Further, the author of the Dīnkard appears to have had before him the text of the nasks, or at all events of a large part of them: for he expressly states that the 11th nask was entirely lost, so that he is unable to give the slightest account of its contents. And, besides, in other directions there are numerous indications that such books once really existed. The numerous other fragments, the quotations in the Pahlavi translation, the many references in the *Bundahish* to passages of this Avesta not now known to us, all presuppose the existence in the Sassanian period of a much more extensive Avesta literature than the mere prayer-book now in our hands. The existence of a larger Avesta, even as late as the 9th century A.D., is far from being a mere myth, and we may well believe the Parsees themselves, when they affirm that their sacred literature has passed through successive stages of decay, the last of which is represented by the present Avesta.

Origin and History.—While all that Herodotus (i. 132) has to say is that the Magi sang "the theogony" at their sacrifices, Pausanias is able to add (v. 27. 6) that they read from a book. Hermippus, in the 3rd century B.C., is said by Pliny to have explained the doctrine which Zoroaster had composed in 20 times 100,000 verses. According to the Arab historian, Ṭabari, these were written on 12,000 cow-hides, a statement confirmed by Mas'ūdī, who further says that the book consisted of 21 parts, and that Zartusht, who invented "the writing of religion," wrote it in Old Persian. These assertions sufficiently establish the existence and great bulk of the sacred writings. Parsee tradition adds a number of interesting statements as to their history. According to the Dīnkard, there were two copies, of which one was burned, while the second came into the hands of the Greeks. One of the Rivāyats relates how after the villainy of Alexander, several high-priests collected all the fragments that could be found. As to this re-collection and redaction of the Avesta the Dīnkard gives various details. One of the Arsacid kings, Vologeses (I. or III.?), ordered the scattered remnants of the Avesta to be carefully preserved and recorded, and under several of the Sassanian kings in the 3rd and 4th centuries the new redaction was completed.

The Avesta, as we now have it, belongs to the Sassanian period, but it cannot be said to be of Sassanian origin. From the remnants and heterogeneous fragments at their disposal, the diasceuast or diasceuasts composed a new canon from the materials of the old. In point of detail, it is now impossible to draw a sharp distinction between that which they found surviving and that which they themselves added or revised. It may reasonably be supposed, not only that they constructed the external framework of many chapters, and also made some additions of their own, but also that they fabricated anew many formulae and imitative passages on the model of the materials at their disposal. All the grammatically correct texts, together with those portions of the Avesta which have intrinsic worth, the Gāthās and greater Yashts, especially the metrical passages, are indubitably authentic and taken *ad verbum* from the original Avesta. Opinions differ greatly as to the precise age of the original texts. According to some, they are pre-Achaemenian; according to Darmesteter's former opinion, they were written in Media under the Achaemenian dynasty; according to some, their source must be sought in the east, according to others, in the west of Iran. But it is more correct to say that the Avesta was worked at from the time of Zoroaster down to the Sassanian period. Its oldest portions, the Gāthās, proceed from the prophet himself. This conclusion is inevitable for every one to whom Zoroaster is an historical personality. The rest of the Avesta, in spite of the opposite opinion of orthodox Parsees, does not even claim to come from Zoroaster. As the Gāthās now constitute the kernel of the most sacred prayer-book, viz., the Yasna, they were the nucleus of a religious literature.

The Avesta now in our hands is but a small portion of the book as restored and edited under the Sassanians. The larger part perished under the Mohammedan rule and under the more barbarous tyranny of the Tatars, when through conversion and extermination the Zoroastrians became a mere remnant. The understanding of the older Avesta texts began to die away at an early period. The need for a translation and interpretation became evident; and under the Later Sassanians the majority of the books, if not the whole of them, were rendered into the current Pahlavi. For the interpretation of the older texts the Pahlavi is of great value where they are concerned with the fixed, formal statutes of the church. But when they pass beyond this narrow sphere, as particularly in the Gāthās, it becomes defective and unreliable. The Parsee priest, Neryosangh, subsequently translated a portion of the Pahlavi version into Sanskrit.

The manuscripts of the Avesta are, comparatively speaking, of recent date. The oldest is the Pahlavi Vispered in Copenhagen, dated 1258. Next come the four manuscripts of the Herbad Mihirāpān Kaī Khusro at Cambay (1323 and 1324), two Vendidads with Pahlavi in London and Copenhagen, and two Yasnas with Pahlavi in Copenhagen and Oxford. The earliest mss. are the best, though careful 17th and 18th century transcripts come from Kirman and Yazd in Persia.

The first European scholar to direct attention to the Avesta was Hyde of Oxford, in his *Historia Religionis Veterum Persarum eorumque Magorum* (1700), which, however, failed to awake any

lasting interest in the sacred writings of the Parsees. The merit of achieving this belongs to the enthusiastic orientalist Anquetil Duperron, the fruit of whose prolonged stay in India (1755–61) and his acquaintance with the Parsee priests was a translation (certainly very defective) of the Zend-Avesta. The foundation of a scientific exegesis was laid by Burnouf. The interpretation of the Avesta is one of the most difficult problems of oriental philology. Up to the present no kind of agreement has been reached by conflicting schools, even upon some of the most important points. Opinion is divided also as to the significance of the Avesta in the literature of the world. Upon the whole, the Avesta is a monotonous book. The Yasna and many Yashts in great part consist of formulae of prayer which are as poor in contents as they are rich in verbiage. The book of laws *(Vendidad)* is characterized by an arid didactic tone; only here and there the legislator clothes his dicta in the guise of graceful dialogues and tales, or of poetic descriptions and similitudes; and then the book of laws is transformed into a didactic poem. Nor can we deny to the Yashts, in their depiction of the Zoroastrian angels and their presentment of the old sagas, a certain poetic feeling, at times, and a pleasant diction. The Gāthās are quite unique in their kind. As a whole, the Avesta, for profundity of thought and beauty, stands on a lower level than the Old Testament. But as a religious book—the most important document of the Zoroastrian faith, and the sole literary monument of ancient Iran—the Avesta occupies a prominent position in the literature of the world. At the present day its significance is decidedly underrated. The future will doubtless be more just with regard to the importance of the book for the history of religion in general and even of Christianity. (For works on the theology of the Avesta *see* ZOROASTER.)

EDITIONS.—*Zend-Avesta,* ed. by N. L. Westergaard (Copenhagen, 1852–54), complete; F. Spiegel, *Avesta* (Vienna, 1853–58), only Vendidad, Vispered and Yasna, but with the Pahlavi translation; K. Geldner (Stuttgart, 1886–96). Translations.—Anquetil Duperron, *Zend-Avesta, Ouvrage de Zoroastre* (Paris, 1771); Fr. Spiegel (Leipzig, 1852–63), both completely antiquated. *Avesta* traduit par C. de Harlez, ed. 2 (Paris, 1881); *The Zend-Avesta, Part I. Vendidad, Part II. Sīrōzahs, Yashts and Nyāyish,* tr. by J. Darmesteter, *Part III. Yasna, Vispered,* etc., by L. H. Mills (Oxford, 1880–87), in the *Sacred Books of the East; Le Zend-Avesta,* traduction nouvelle par J. Darmesteter (Paris, 1892–93) (*Annales du Musée Guimet*).

ZENITH TELESCOPE, a form of telescope specially devised for the accurate determination of the latitude of a station. It is used both in geodetic surveys and also at fixed stations for measuring the variation of latitude. The usual form of instrument consists of a telescope which can be clamped at any angle to a vertical axis and rotated about the vertical. Two stars of known declination δ_1 and δ_2 are chosen which transit within a few minutes of one another, the one north and the other south of the zenith at nearly equal zenith distances. If ϕ is the latitude the respective zenith distances are $\delta_1-\phi$, north and $\phi-\delta_2$ south, so that the small difference between them is $\delta_1+\delta_2-2\phi$. Settings of a micrometer wire are made on each star in turn, the telescope being of course rotated from the north to the south direction between the two observations: the small distance that the wire has to be moved measures the quantity $\delta_1+\delta_2-2\phi$ and hence determines ϕ. This method, known as the Talcott method, depends on securing accurate rotation about the vertical; usually delicate spirit levels attached to the telescope are used todetermine the correction for imperfect fulfilment of this condition. In a floating zenith telescope devised by B. Cookson and now employed for latitude variation at Greenwich observatory, rotation about the true vertical is obtained by floating the whole instrument in mercury. The observations are made photographically; the trails of the pair of stars are shown close together on the plate, and the distance between them (equivalent to $\delta_1+\delta_2-2\phi$) is measured with a suitable micrometer.

ZENO, East Roman emperor from 474 to 491, was an Isaurian of noble birth. Of his early life nothing is known; after his marriage to Ariadne, daughter of Leo I., in 468 he became patrician and commander of the imperial guard and of the armies in the East. In 471 he procured the assassination of Ardaburius, the Goth, who had tried to occupy in the East the position held by Ricimer in the West. In 474 Leo I. died after appointing as his successpr Leo the son of Zeno and Ariadne; Zeno, however, succeeded in getting himself crowned also, and on the death of his son in the same year became sole emperor. In the following year, in consequence of a revolt fomented by Verina in favour of her brother Basiliscus, he was compelled to take refuge in Isauria, where he was obliged to shut himself up in a fortress. The growing misgovernment of Basiliscus ultimately enabled Zeno to re-enter Constantinople unopposed (476); his rival was banished to Phrygia, where he soon afterwards died. The remainder of Zeno's reign was disturbed by numerous other less formidable revolts. Since 472 the aggressions of the two Ostrogoth leaders Theodoric had been a constant source of danger. In 487 he induced Theodoric, son of Theodemir, to invade Italy and establish his new kingdom. Zeno is described as a lax and indolent ruler, but he seems to have administered ably the finances of the empire. In ecclesiastical history the name of Zeno is associated with the *Henoticon* or instrument of union, promulgated by him and signed by all the Eastern bishops, with the design of terminating the Monophysite controversy.

See J. B. Bury, *The Later Roman Empire* (1889), i. pp. 250–274; E. W. Brooks in the *English Historical Review* (1893), pp. 209–238; W. Barth, *Der Kaiser Zeno* (Basel, 1894).

ZENOBIA (Gr. Ζηνοβία), queen of Palmyra, one of the heroines of antiquity. Her native name was Septimia Bathzabbai, a name also borne by one of her generals, Septimius Zabbai. This remarkable woman, famed for her beauty, her masculine energy and unusual powers of mind, was well fitted to be the consort of Odainatti (see ODAENATHUS) in his proud position as Dux Orientis; during his lifetime she actively seconded his policy, and after his death in A.D. 266-267 she not only succeeded to his position but determined to surpass it and make Palmyra mistress of the Roman Empire in the East. Wahaballath or Athenodōrus (as the name was Graecized), her son by Odainath, being still a boy, she took the reins of government into her own hands. Under her general-in-chief Zabda, the Palmyrenes occupied Egypt in A.D. 270, not without a struggle, under the pretext of restoring it to Rome; and Wahab-allath governed Egypt in the reign of Claudius as joint ruler with the title of βασιλεύς (king), while Zenobia herself was styled βασιλίσσα (queen). In Asia Minor Palmyrene garrisons were established as far west as Ancyra in Galatia and Chalcedon opposite Byzantium, and Zenobia still professed to be acting in the interests of the Roman rule.

When Aurelian became emperor in 270 he quickly realized that the policy of the Palmyrene queen was endangering the unity of the empire. It was not long before all disguises were thrown off; in Egypt Wahab-allath began to issue coins without the head of Aurelian and bearing the imperial title, and Zenobia's coins bear the same. The assumption marked the rejection of all allegiance to Rome. Aurelian instantly took measures; Egypt was recovered for the Empire by Probus (close of 270), and the emperor himself prepared a great expedition into Asia Minor and Syria. Towards the end of 271 he marched through Asia Minor and, overthrowing the Palmyrene garrisons in Chalcedon, Ancyra and Tyana, he reached Antioch, where the main Palmyrene army under Zabdā and Zabbai, with Zenobia herself, attempted to oppose his way. The attempt, however, proved unsuccessful, and after suffering considerable losses the Palmyrenes retired in the direction of Emesa (now Homs), whence the road lay open to their native city.

The queen refused to yield to Aurelian's demand for surrender and drew up her army at Emesa for the battle which was to decide her fate. In the end she was defeated, and there was nothing for it but to fall back upon Palmyra across the desert.

Thither Aurelian followed her in spite of the difficulties of transport, and laid siege to the well-fortified and provisioned city. At the critical moment the queen's courage seems to have failed her; she and her son fled from the city to seek help from the Persian king, they were captured on the bank of the Euphrates, and the Palmyrenes, losing heart at this disaster, capitulated (A.D. 272) Aurelian seized the wealth of the city but spared the inhabitants; to Zenobia he granted life; while her officers and advisers, among whom was the celebrated scholar Longinus, were put to death. Zenobia figured in the conqueror's splendid triumph at Rome, and by the most probable account accepted her fall with dignity and closed her days at Tibur, where she lived with her sons the life of a Roman matron. A few months after the fall of Zenobia, Palmyra revolted again; Aurelian unexpectedly returned, destroyed the city, and this time showed no mercy to the population.

Among the traditions relating to Zenobia may be mentioned that of her discussions with the Archbishop Paul of Samosata on matters of religion. It is probable that she treated the Jews in Palmyra with favour; she is referred to in the Talmud, as protecting Jewish rabbis (Talm. Jer. *Ter.* viii. 46 b).

The well-known account of Zenobia by Gibbon *(Decline and Fall,* i. pp. 302–312 Bury's edition) is based upon the imperial biographers *(Historia Augusta)* and cannot be regarded as strictly historical in detail.

See A. P. Caussin de Perceval *Essai sur l'hist. des Arabes,* ii. 28 f., 197 f. (3 vols., 1847–48); Tabari, i. 757 f. *See* further PALMYRA.

(G. A. C.; X.)

ZENOBIUS, a Greek sophist, who taught rhetoric at Rome during the reign of Hadrian (A.D. 117–138). He was the author of a collection of proverbs in three books, still extant in an abridged form, compiled, according to Suïdas, from Didymus of Alexandria and Lucillus of Tarrha. Zenobius is also said to have been the author of a Greek translation of Sallust and of a birthday poem (γενεθλιακόν) on Hadrian.

Editions by T. Gaisford (1836) and E. L. Leutsch-F. W. Schneidewin (1839), and in B. E. Miller, *Mélanges de littérature grecque* (1868); *see* also *W.* Christ, *Griechische Literaturgeschichte* (1898).

ZENODOCHIUM (Gr. ξενοδοχεῖον, ξένος, stranger, guest, δέχεσθαι, to receive), the name given by the Greeks to a building erected for the reception of strangers.

ZENODOTUS, Greek grammarian and critic, pupil of Philetas (*q.v.*) of Cos, was a native of Ephesus. He lived during the reigns of the first two Ptolemies, and was at the height of his reputation about 280 B.C. He was the first superintendent of the library at Alexandria and the first critical editor (διορθώτης) of Homer, in his recension of whom he undoubtedly laid a sound foundation for future criticism. Having collated the different mss. in the library, he expunged or obelized doubtful verses, transposed or altered lines, and introduced new readings. He divided the Homeric poems into books (with capitals for the *Iliad,* and small letters for the *Odyssey),* and possibly was the author of the calculation of the days of the *Iliad* in the Tabula Iliaca. He also lectured upon Hesiod, Anacreon and Pindar. He is further called an epic poet by Suidas.

There appear to have been at least two other grammarians of the same name: (1) Zenodotus of Alexandria, surnamed ὁ ἐν ἄστει; (2) Zenodotus of Mallus, the disciple of Crates, who like his master attacked Aristarchus.

See F. A. Wolf, *Prolegomena ad Homerum,* s. 43 (1859 ed.); H. Diintzer, *De Zenodoti studiis Homericis* (1848); A. Romer, *Über die Homerrecension des Zenodotus* (Munich, 1885); F. Susemihl, *Geschichte der griechischen Literatur in der Alexandrinerzeit,* i. p. 330, ii. p. 14; J. E. Sandys, *Hist. of Class. Schol.* (1906).

ZENO OF ELEA, son of Teleutagoras, born probably towards the beginning of the 5th century B.C. The pupil and the friend of Parmenides, he sought to recommend his master's doctrine of the existence of the One by controverting the popular belief in the existence of the Many. In virtue of this method of indirect argumentation he is regarded as the inventor of "dialectic," that is to say, disputation having for its end not victory but the discovery of truth

In Plato's *Parmenides,* Socrates, "then very young," discusses with Parrnenides and Zeno, "a man of about forty," But it may be doubted whether such a meeting was chronologically possible Plato's account of Zeno's teaching *(Parmenides,* 128 *seq*), however, is presumably accurate. In reply to those who thought that Parrnenides's theory of the existence of the One involved inconsistencies, Zeno tried to show that the assumption of the existence of a plurality of things in time and space, carried with it more serious inconsistencies. In early youth he collected his arguments in a book, which. according to Plato, was put into circulation without his knowledge.

Of the paradoxes used by Zeno to discredit the belief in plurality and motion, eight survive in the writings of Aristotle and Simplicius. They are commonly stated as follows: (1) If the Existent is Many, it must be at once infinitely small and infinitely great—infinitely small, because its parts must be indivisible and therefore without magnitude; infinitely great, because, that any part having magnitude may be separate from any other part, the intervention of a third part having magnitude is necessary, and that this third part may be separate from the other two the intervention of other parts having magnitude is necessary, and so on *ad infinitum.* (2) In like manner the Many must be numerically both finite and infinite—numerically finite, because there are as many things as there are, neither more nor less; numerically infinite, because, that any two things may be separate, the intervention of a third thing is necessary, and so on *ad infinitum.* (3) If all that is is in space, space itself must be in space, and so on *ad infinitum.* (4) If a bushel of corn turned out upon the floor makes a noise, each grain and each part of each grain must make a noise likewise; but, in fact, it is not so. (5) Before a body in motion can reach a given point, it must first traverse the half of the distance; before it can traverse the half of the distance, it must first traverse the quarter; and so on *ad infinitum.* Hence, that a body may pass from one point to another, it must traverse an infinite number of divisions. But an infinite distance (which the paradox does not distinguish from a finite distance infinitely divided) cannot be traversed in a finite time. Consequently, the goal can never be reached. (6) If the tortoise has the start of Achilles, Achilles can never come up with the tortoise; for, while Achilles traverses the distance from his starting-point to the starting-point of the tortoise, the tortoise advances a certain distance, and while Achilles traverses this distance, the tortoise makes a further advance, and so on *ad infinitum.* Consequently, Achilles may run *ad infinitum* without overtaking the tortoise. (This paradox is virtually identical with [5], the only difference being that whereas in [5] there is one body, in [6] there are two bodies, moving towards a limit. The "infinity" of the premise is an infinity of subdivisions of a distance which is finite; the "infinity" of the conclusion is an infinity of distance.) (7) So long as anything is in one and the same space, it is at rest. Hence an arrow is at rest at every moment of its flight, and therefore also during the whole of its flight. (8) Two bodies moving with equal speed traverse equal spaces in equal time. But, when two bodies move with equal speed in opposite directions, the one passes the other in half the time in which it passes it when at rest. These paradoxes are probably properly regarded as dilemmas advanced in refutation of specific doctrines attributed to the Pythagoreans.

Great as was the importance of these paradoxes of plurality and motion in stimulating speculation about space and time, their direct influence upon Greek thought was less considerable than that of another paradox—strangely neglected by historians of philosophy—the paradox of predication. We learn from Plato *(Parmenides,* 127 *D)* that "the first hypothesis of the first argument" of Zeno's book above mentioned ran as follows: "If existences are many, they must be both like and unlike (unlike. inasmuch as they are not one and the same, and like, inasmuch as they agree in not being one and the same [Proclus, *On the Parmenides,* ii. 143]). But this is impossible; for unlike things cannot be like, nor like things unlike. Therefore existences are not many."

When in the second decade of the 4th century the pursuit of truth was resumed, it was plain that Zeno's paradox of predication must be disposed of before the discussion of the problems of knowledge and the problem of being could be resumed, Accordingly, in bk 7 of the *Republic,* Plato directs the attention

of studious youth primarily, if not exclusively, to the concurrence of inconsistent attributes; and in the ***Phaedo,*** 102 B–103 A, taking as an instance the tallness and the shortness simultaneously discoverable in Simmias, he offers his own theory of the immanent idea as the solution of the paradox. Simmias, he says, has in him the ideas of tall and short. Again, when it presently appeared that the theory of the immanent idea was inconsistent with itself, and moreover inapplicable to explain predication except where the subject was a sensible thing, so that reconstruction became necessary, the Zenonian difficulty continued to receive Plato's attention. Thus, in the ***Parmenides,*** with the paradox of likeness and unlikeness for his text, he inquires how far the current theories of being (his own included) are capable of providing, not only for knowledge, but also for predication, and in the concluding sentence he suggests that, as likeness and unlikeness, greatness and smallness, etc., are relations, the initial paradox is no longer paradoxical; while in the *Sophist,* Zeno's doctrine having been shown to be fatal to reason, thought, speech and utterance, the mutual *κοινωνία* of *εἴδη* which are not *αὐτὰ καθ' αὐτά* is elaborately demonstrated.

In all probability Zeno did not observe that in his controversial defence of Eleaticism he was interpreting Parmenides's teaching anew. While Parmenides had recognized, together with the One, which is, and is the object of knowledge, a Many, which is not, and therefore is not known, but nevertheless becomes, and is the object of opinion, Zeno plainly affirmed that plurality, becoming and opinion are one and all inconceivable. In a word, Parmenides's tenet "The Ent is, the Non-ent is not," was with Zeno a declaration of the Non-ent's absolute nullity. Thus, just as Empedocles developed Parmenides's theory of the Many to the neglect of his theory of the One, so Zeno developed the theory of the One to the neglect of the theory of the Many. With the severance of its two members Eleaticism proper, the Eleaticism of Parmenides, ceased to exist.

ZEOLITES, a family of minerals consisting of hydrated silicates of alumina with alkalis or alkaline earths or both. The water they contain is readily lost, and before the blowpipe it is expelled with mtumescence; hence the name zeolite, from the Greek *ζεῖν* (to boil) and *λίθος* (a stone). In some other characters, as well as in their origin and mode of occurrence, they have points in common. Several species have been distinguished, of which the following are the more important:—

Heulandite Group	Heulandite	$H_4CaAl_2(SiO_3)_6+3H_2O$.
	Brewsterite	$H_4(Sr, Ba, Ca)Al_2(SiO_3)_6+3H_2O$.
	Epistilbite	$H_4CaAl_2(SiO_3)_6+3H_2O$.
Stilbite Group	Wellsite	$(Ba, Ca, K_2)Al_2Si_3O_{10}+3H_2O$.
	Philipsite	$(K_2, Ca)Al_2(SiO_3)_4+4H_2O$.
	Harmotome	$H_2(K_2, Ba)Al_2(SiO_3)_5+5H_2O$.
	Stilbite	$CaAl_2(SiO_3)_6+6H_2O$.
	Gismondite	$CaAl_2(SiO_3)_4+4H_2O$.
	Laumontite	$H_4CaAl_2Si_4O_{14}+2H_2O$.
Chabazite Group	Chabazite	$(Ca, Na_2)Al_2(SiO_4)_2+4H_2O$, etc.
	Gmelinite	$(Na_2, Ca)Al_2(SiO_3)_4+6H_2O$.
	Levynite	$CaAl_2Si_3O_{10}+5H_2O$.
	Analcite	$NaAl(SiO_3)_2+H_2O$.
Natrolite Group	Natrolite	$Na_2Al_2Si_3O_{10}+2H_2O$.
	Mesolite	$(Ca, Na_2)Al_2Si_3O_{10}+2H_2O$.
	Scolecite	$CaAl_2Si_3O_{10}+3H_2O$.
	Edingtonite	$BaAl_2Si_3O_{10}+3H_2O$.
	Thomsonite	$(Na_2, Ca)Al_2(SiO_4)_2+2\frac{1}{2}H_2O$.

Some of the chemical formulae given above are only approximate, since in some species the composition varies between certain limits and can be best expressed by the isomorphous mixing of different molecules. They are all readily decomposed by hydrochloric acid, usually with the separation of gelatinous silica. By the action of various reagents several substitution products have been prepared artificially: thus, crystallized products, in which the alkalis or alkaline earths are replaced by ammonium or silver, etc., have been obtained.

The zeolites are often beautifully crystallized, and belong to several crystal-systems. The crystals usually show evidences of twinning, and when examined in polarized light they frequently exhibit optical anomalies and a complex structure. The hardness (3·5–5·5) and specific gravity (2·0–2·4) are comparatively low, and so are the indices of refraction and the double refraction.

The water of zeolites presents many points of interest. Laumontite loses water on exposure to air, and the crystals soon crumble to powder unless they are kept in a moist atmosphere. All the zeolites lose a portion of their "water of crystallization" in dry air (over sulphuric acid), and a considerable portion at a temperature of 100° C, increasing in amount to 200° or 300°; the actual amount lost depending not only on the temperature, but also on the tension of aqueous vapour in the surrounding atmosphere. In some species the remaining water is expelled only at a red heat, and is therefore to be regarded as "water of constitution." With the progressive loss of water there is a progressive change in the optical characters of the crystals. When a partially dehydrated and opaque crystal is exposed to moist air the water is reabsorbed, the crystal becoming again transparent and regaining its original optical characters. Not only may water be reabsorbed, but such substances as ammonia, hydrogen sulphide and alcohol may be absorbed in definite amounts and with an evolution of heat. The water of zeolites may therefore be partly driven off and reabsorbed or replaced by other substances without destroying the crystalline structure of the material, and it would thus seem to differ from the water of crystallization of most other hydrated salts.

Zeolites are minerals of secondary origin and in most cases have resulted by the decomposition of the felspars of basic igneous rocks: in fact their chemical composition is somewhat analogous to that of the felspars with the addition of water. Nepheline and sodalite are often altered to zeolites. They usually occur as crystals lining the amygdaloidal and other cavities of basalt, melaphyre, etc. Usually two or more species are associated together, and often with agate, calcite and some other minerals. Less frequently they occur in cavities in granite and gneiss, and in metalliferous veins (*e.g.,* harmotome); while only exceptionally are they primary constituents (*e.g.,* analcite) of igneous rocks. Several species have been observed in the Roman masonry at the hot springs of Bourbonne-les-Bains: and phillipsite has been dredged from the deep sea. (L. J. S.)

ZEPHANIAH, the ninth of the minor prophets in the Bible. His ancestry is traced to his great-grandfather Hezekiah, who may, in spite of 2 Kings xx. 18, xxi. 1, be the well-known king of Judah (*c.* 720–690). This would agree fairly with the title (i. 1) which makes the prophet a contemporary of King Josiah (c. 637), and this in turn appears to agree (a) with the internal conditions (i. 4–6, cf. 2 Kings xxiii. 4, 5, 12) which, it is held, are evidently earlier than Josiah's reforms (621); (b) with the denunciation of the royal household, but not of the (young) king himself (i. 8, iii. 3); (*c*) with the apparent allusion in ch. i. to the invasion of the Scythians (perhaps *c.* 626), and (d) with the anticipated downfall of Assyria and Nineveh (ii. 13, 612 B.C.).

Although one single leading motive runs through the book of Zephaniah there are abrupt transitions which do not depend on modern subjective considerations of logical or smooth thought, but are material and organic changes representing different groups of ideas. The instruments of Yahweh's anger (ch. i.) are not so real or prominent on the political horizon as, for example, in Isaiah, Jeremiah or Habakkuk. The Scythian inroad and its results for Judah and Philistia are less important when it is observed that the doom upon Philistia, the vengeance upon Moab and Ammon, and the promises for Judah (ch. ii.), belong to a large group of prophecies against certain historic enemies (Edom included) who are denounced for their contempt, hostility and intrusion. The prophecies are in large measure associated tradition-

ally with the fall of Jerusalem, and to some such calamity, and not to the inroad of the Scythians, the references to the "remnant" and the "captivity" refer. The anticipation of future events is of course conceivable in itself; but the promises (in ch. ii.) *presuppose* events other and later than those with which the Scythians were connected. On the other hand, a prophecy relating to Scythians may have been re-shaped to apply to later conditions, and on this view it is explicable why the indefinite political convulsions should be adjusted to the exile and why the gloom should be relieved by the promise of a territory extending from the Mediterranean to the Syrian desert (ii. 7, 9). After a period of punishment (*cf.* book of Lamentations) Yahweh's jealousy *against* the semi-heathen Judah has become a jealousy *for* his people, and we appear to move in the thought of Haggai and Zechariah, where the remnant are comforted by Yahweh's return and the dispersed exiles are to be brought back (*cf.* Zech. i. 14–17, viii. 2–17). But in ch. iii. other ideas are manifest. Israel's enemies have been destroyed, her own God Yahweh has proved *his* loyalty and has fulfilled *his* promises, but the city remains polluted (*vv.* 1–7, *cf.* Isa. lviii. *seq.;* Malachi). Once more doom is threatened, and once more we pass over into a later stage where Yahweh has vindicated *his* supremacy and Zion is glorified. Instead of the realities of history we have the apocalyptical feature of the gathering of the nations (v. 8); the thought may be illustrated from Zech. xii. 1.–xiii. 6, where Jerusalem is attacked, purged and delivered, and from Zech. xiv. where the city is actually captured and half the people are removed into captivity (*cf.* Zeph. iii. 11 purging, 1 j removal of the enemy, 18–20 return of the captivity). The goal is the vindication of Israel and of Israel's God, and the establishment of universal monotheism (ii. 11, iii 9 *seq.).* The foe which threatened Judah has become the chastiser of Ethiopia and Assyria (ii.) and the prelude to the golden age (iii., *cf.* Ezek. xxxviii. *seq.*).

If Jer. iv. 5–vi. 30 originally referred to the Scythians, it has been revised to refer to the Chaldeans; also in Ezek. xxxviii. *seq.* a northern foe becomes associated with the great world-judgment. Also, in Isaiah and Zechariah, notably, older and later *groups* of prophecies are preserved, whereas here the new preludes and new sequels suggest that the original nucleus has passed through the hands of writers in touch with those vicissitudes of thought which can be studied more completely elsewhere. It is not to be supposed that the elimination of all later passages and traces of revision will give us Zephaniah's prophecies in their original extent. In fact the internal religious and social conditions in i. 4-6 or iii. 1–4 do not compel a date before Josiah's reforms. The doom of Cush is still in the future in Ezek. xxx. 4; and if the impending fall of Nineveh (ii. 13) implies an early date, yet it is found in writings which have later additions (Nahum), or which are essentially later (Jonah, *cf.* Tobit xiv. 4 [LXX.], 8, 10, 15); cf. also the use of Assyria for Babylon (Ezra vi. 22) or Syria (Zech. x 10). Historical references in prophecies are not always decisive (Ezek. xxxii., for example, looks upon Edom and Sidon as dead), and while the continued revision of the book allows the presumption that the tradition ascribing its inception to the time of Josiah may be authentic, it is doubtful how much of the original nucleus can be safely recognized.

ZEPHYRINUS, ST., bishop of Rome from about 198 to 217, succeeded Victor I. The controversies on doctrine and discipline that marked his pontificate are associated with the names of Hippolytus and of Calixtus, his principal adviser and afterwards his successor.

ZEPHYRUS, in Greek mythology, the west wind, son of the Titan Astraeus and Eos, the dawn. He was the husband of Chloris, the goddess of flowers, by whom he had a son, Carpus, the god of fruit (Ovid, *Fasti,* v. 197).

See also FLORA; HARPIES; HYACINTHUS.

ZEPPELIN, FERDINAND, COUNT VON (1838–1917), German airship inventor, was born at Constance, Baden, on July 8, 1838. He was educated for the army and received a commission at the age of 20. He served, as a volunteer, in the Federal army during the American Civil War and whilst in America made his first balloon ascent. Returning to Germany he saw active service in the Austrian War of 1866 and in the Franco-German War of 1870. In 1891 he retired from the army with the rank of general and thenceforth devoted his energies to the study of aeronautics. In 1900 he built an airship, which rose from the ground and remained in the air for 20 minutes, but was wrecked in landing. In 1906 he made two successful flights at a speed of *30* m. an hour, and in 1907 attained a speed of *36* miles. From that time onwards his airship construction made steady progress and many Zeppelin airships took part in the World War, though with heavy losses under attack. (*See* AIRSHIP.) He died at Charlottenburg on March 8, 1917.

See *Eine Festgebe zu seinem 75. Geburtstag von Luftschiffbau Zeppelin* (Stuttgart, 1913).

ZERBST, a town of Germany, in the *Land* of Anhalt, situated on the Nuthe, 11 mi. N.W. of Dessau and 27 mi. S.E. of Magdeburg by railway. Pop. (1939) 23,725. Zerbst is an ancient town, mentioned in 949, which in 1307 came into the possession of the Anhalt family. It is still surrounded in part by old walls and bastions. It contains five churches, one of which (St. Nicholas), built in 1446–88, is a good example of the late Gothic style as developed in Saxony, with its spacious proportions, groined vaulting, and bare simple pillars. The town hall dates from about 1480, but it was disfigured by additions in the beginning of the 17th century. The palace (1681–1750) has been used as a depository of archives since 1872. There are several quaint old houses, with high gables, in the market-place, in the middle of which stand a Roland column, of about 1445, and a bronze figure known as the *Butterjungfer* (butter-girl), of uncertain origin and meaning. There were here formerly a Franciscan monastery, with fine cloisters, founded in 1250, a Cistercian nunnery of 1214, and an Augustinian monastery of 1390, a hospital since 1525.

ZERMATT, a mountain village (5,315 ft. above sea-level) at the head of the Visp valley and at the foot of the Matterhorn, in the canton of the Valais, Switzerland. It has about 960 permanent inhabitants, German-speaking and Roman Catholics. It is $22\frac{1}{4}$ mi. by rail from Visp in the Rhône valley, and there is also a railway from Zermatt past the Riffel inns to the very top of the Gornergrat (10.289 ft.). Formerly Zermatt was called "Praborgne," and this name is mentioned in the Swiss census of 1888. Its originally Romance population seems to have been Teutonized in the course of the 15th century, the name "Matt" (now written "Zermatt," *i.e.,* the village on the meadows) first occurring at the very end of that century.

See E. Whymper, *Scrambles* in *the Alps (1871).*

ZERO, the figure *0* in the Arabic notation for numbers meaning nought, or cipher. The Sanskrit name for the figure was *śūnya* (void), and this term passed over into Arabic as *aṣ-ṣifr,* or *ṣṣifr.* The old Latin writers on arithmetic translated or transliterated the Arabic word as *zephyrum;* this in Ital. took on such forms as *zeuero, zepiro,* and became contracted to *zero,* borrowed by F. *zéro,* whence it came late into English. The Spanish form *cifra,* more closely resembling the original Arabic, gave O.Fr. *cifre,* mod. *chiffre,* also used in the sense of monogram, and English "cipher" which is thus a doublet. Although no character for zero is found in India before the 9th century, there is literary evidence for the belief that it was known much earlier. in the Maya inscriptions in Central America there appears a character for zero, but only in connection with the calendar.

ZEROMSKI, STEPHEN (1864–1925), Polish novelist, poet and dramatist, was born at Strawczyn on Nov. 14, 1864. Banished from Poland by the Russian Government early in his life, he first attracted attention by a collection of tragic tales entitled *The Ravens and the Crows are Picking us to Pieces* (1895, Eng. trans. 1906). In the publication of *The Homeless* (1900) Zeromski supplied a generic name for all his Polish heroes. His pessimistic philosophy finds expression in the novel *Aryman takes Revenge* (1904), while the triumph of evil over good is vividly treated in *The Story of Sin* (2 vol., 1906) describing the slow and terrible

downfall of a woman of culture. In his epic poem Ashes (2 vol., 1904) he delineates the minds of the Polish people after the Partition and their efforts to liberate their country by serving in the Napoleonic legions. During the World War Zeromski published his great trilogy The Fight *with* Satan — The Conversion of *Judas* (1916), The Blizzard (1918), *Charitas* (1919) — a kind of epilogue and synthesis of his previous work and at the same time an autobiography of his own life. After the achievement of national independence, Zeromski wrote his drama, The Broken Spell (1924) in which the hero dedicates himself to the services of a resuscitated Poland. He died on Nov. 20, 1925.

See S. Brzozowski, *O* Stefan Zeromski (Warsaw, 1905); W. Jampolski, Stefan Zeromski, the Spiritual Leader of the Race (Lwów, 1918).

ZETKIN, KLARA (1857–1933), German communist, was born on June 5, 1857, at Wiederan, Saxony, and educated at the university of Paris, becoming a school teacher. She presently became editor of *Gleichheit,* the organ of the Social Democratic Party for women. Klara Zetkin was a member of the Communist Party from its foundation in 1919, and was one of its most fiery orators. She became a member of the Reichstag in 1920.

ZETLAND, 2ND MARQUESS OF: see RONALDSHAY, LAWRENCE JOHN LUMLEY DUNDAS.

ZEUGLODON, the name of a genus of extinct toothed whales from Eocene deposits. These remains, of an animal up to 40ft. long, are the oldest known fossils of the order Cetacea (*q.v.*).

ZEUS, the Greek counterpart of the Roman god, Jupiter (*q.v.* for the etymology of the name). It is probable that Zeus had already been conceived as a personal and pre-eminent god by the ancestors of the leading Hellenic tribes before they entered the peninsula, which became their historic home. In the first place, his pre-eminence is obviously pre-Homeric; for Homer attests for us the supremacy of Zeus in his day, say 950 B.C.; and appreciating how slow was the process of religious change in the earlier period, we shall believe that the god had won this position long before the Homeric age. In the next place, we cannot trace the origin of his worship back to any special stock or particular locality; his unquestionable association with Olympus and Thessaly is only what we should expect, seeing that many at least of the Greeks must have entered Greece that way.

To appreciate the Homeric Zeus, we must distinguish the lower mythologic aspect of him, in which he appears as an amorous and capricious deity lacking often in dignity and real power, and the higher religious aspect, in which he is conceived as the all-father (see GREEK RELIGION). In fact, later Greek religion did not advance much above the high-water mark of the Homeric, although the poets and philosophers deepened certain of its nobler traits. But Homer we now know to be a relatively late witness in this matter. Yet traces of a pre-deistic and animistic period survived here and there; for instance, in Arcadia we find the thunder itself called Zeus (Ζεὺς κεραυνός) in a Mantinean inscription, and the stone near Gythium in Laconia, on which Orestes sat and was cured of his madness, evidently a thunder-stone, was named itself Ζεὺς καππώτας, which must be interpreted as "Zeus that fell from heaven" (Pausan iii. 22. 1.); we here observe that the personal god does not yet seem to have emerged from the divine thing or divine phenomenon.

The day is now past when scholars could discover in the ritual of Zeus Lukaios (see LYCAON), or the Dipolia, the cult of a wolf —or ox-totem — somehow blended with Zeus; but certainly a characteristic of his earliest ritual was human sacrifice. We find it again in the story of the house of Athamas and in the worship of Zeus Laphustios ("Zeus the Glutton"), of Thessaly (Herod. vii. 197), and other examples are recorded. The cruel rite had ceased in the Arcadian worship before Pliny wrote, but seems to have continued in Cyprus until the reign of Hadrian. It was found in the worship of many other divinities of Hellas in early times, and no single explanation can be given that would apply to them all. A hypothesis favoured by Frazer, that the victim is usually a divine man, a priest-king incarnating the god, may be well applied to the Athamantid sacrifice and to that of King Lycaon; for he derives his name from the divinity himself, and according to one version (Clemens, *Protrept* p. 31 P.) he offers his own child; and the legend presents one almost unique feature, which is only found elsewhere in legendary Dionysiac sacrifice, the human flesh is eaten, and the sacrifice is a cannibalistic-sacrament, of which the old Mexican religion offers conspicuous example. Yet it is in this religion of Zeus that we see most clearly the achievement of progressive morality; Zeus himself punishes and abolishes the savage practice.

We can now consider the special attributes of the anthropomorphic god. His character and power as a deity of the sky, who ruled the phenomena of the air, so clearly expressed in Homer, explains the greater part of his cult and cult-titles. More personal than Ouranos and Helios — with whom he has only slight associations — he was worshipped and invoked as the deity of the bright day (*Amarios*), who sends the rain, the wind and dew (*Ombrios, Huetios, Ourios*), and such a primitive adjective as *diipetēs* applied to things "that fall from heaven," attests the primeval significance of the name of Zeus. But the thunder was his most striking manifestation, and no doubt he was primevally a thunder-god, (Keraunios, Astrapaios). Much of his ritual was weather-magic; the priest of Zeus Lukaios in time of drought, was wont to ascend Mt. Lycaeum and dip an oak-bough in a sacred fountain, and by this sympathetic means produce mist (Pausan. viii. 38, 3). A god of this character would naturally be worshipped on the mountain-tops, and that these were very frequently consecrated to him is shown by the large number of appellatives derived from the names of mountains. But probably in his earliest Hellenic period the power of Zeus in the natural world was not limited to the sky. A deity who sent the fertilizing rains would come to be regarded as a god of vegetation, who descended into the earth and whose power worked in the life that wells forth from the earth in plant and tree. Homer calls the god of the lower world Zeus *Katachthonios* (Iliad, ix. 457), and the title of Zeus Chthonios, which was known to Hesiod, occurred in the worship of Corinth (Hesiod, *Works* and Days, 456; Pausan. ii. 2, 8).

A glimpse into a very old stratum of Hellenic religion is afforded us by the records of Dodona. A Dodonean liturgy has been preserved which, though framed in the form of an invocation and a dogma, has the force of a spell-prayer — "Zeus was and is and will be, O great Zeus: earth gives forth fruits, therefore call on Mother Earth" (Pausan. x. 12, 10). Zeus, the sky-god, is seen here allied to the earth-goddess, of whom his feminine counterpart, Dione (*q.v.*), may have been the personal form. And it is at Dodona that his association with the oak is of the closest. His prophet-priests, the Selloi, "with unwashed feet, couching on the ground" (Homer, Iliad, xvi. 233), lived about the sacred oak. which may be regarded as the primeval shrine of the Aryan god, and interpreted its oracular voice, which spoke in the rustling of its leaves or the cooing of its doves. Zeus, we may believe, long remained at Dodona such as he was when the Hellenic tribes first brought him down from the Balkans, a high god supreme in heaven and in earth.

We may also believe that in the earliest stages of worship he had already acquired a moral and a social character. The Homeric view of him as the all-father is a high spiritual concept, but one of which many savage religions of our own time are capable. The family, the tribe, the city, the simpler and more complex organisms of the Hellenic polity were specially under his care and direction. In spite of the popular stories of his amours and infidelities, he is the patron-god of the monogamic marriage, and his union with Hera (*q.v.*) remained the divine type of human wedlock.

He was also the tutelary deity of the larger organization of the phratria; and the altar of Zeus Phratrios was the meeting-point of the phrateres, when they were assembled to consider the legitimacy of the new applicants for admission into their circle (Demosth. Contra Macartatum, 1078, i.).

His religion also came to assist the development of certain legal ideas, for instance, the rights of private or family property in land; he guarded the allotments as Zeus Klarios (Pausan. viii. 53, 9), and the Greek commandment, "thou shalt not remove thy neighbour's landmark," was maintained by Zeus Horios, the god of boundaries, a more personal power than the Latin Iuppiter Terminus (Plato, Laws, 842 E).

His highest political functions were summed up in the title Polieus, a cult-name of legendary antiquity in Athens, and frequent in the Hellenic world.

His consort in his political life was not Hera, but his daughter Athena Polias. He sat in her judgment court ἐπὶ Παλλαδίῳ, where cases of involuntary homicide were tried (Corp. Inser. Attic. iii. 71 and 273). With her he shared the chapel in the council-hall of Athens dedicated tc them under the titles of Boulaios and *Boulaia,* "the inspirers of counsel," by which they were worshipped in many parts of Greece (Antiphon vi. p. 789; Pausan. i. 3. 5; cf. Corp. Inser. Attic. iii. 683). The political assembly and the law-court were consecrated to Zeus Agoraios, and being the eternal source of justice he might be invoked as *Dikaiosunos* "The Just." As the god who brought the people under one government he might be worshipped as *Pandemos* (Corp. Inser. Attic. iii. 7); as the deity of the whole of Hellas, he became Panhellenios, perhaps about the time of the Persian wars, when thanksgiving for the victory took the form of dedications and sacrifice to "Zeus the Liberator" *Eleutherios* (Simonides, *Frag.* 140 [Eergk] ; Strab. 412). Finally, in the formulae adopted for the public oath, where many deities were invoked, the name of Zeus was the master word.

It remains to consider briefly certain moral aspects of his cult. The morality attaching to the oath, so deeply rooted in the conscience of primitive peoples, was expressed in the cult of Zeus Horkios, the god who punished perjury (Pausan. v. 24. 9). The whole history of Greek legal and moral conceptions attaching to the guilt of homicide can be studied in relation to the cult-appellatives of Zeus. The Greek consciousness of the sin of murder, only dimly awakened in the Homeric period, and only sensitive at first when a kinsman or a suppliant was slain, gradually expands till the sanctity of all human life becomes recognized by the higher morality of the people; and the names of Zeus *Meilichios,* the dread deity of the ghost-world whom the sinner must make "placable," of *Zeus* Hikesios and Prostropaios, to whom the conscience-stricken outcast may turn for mercy and pardon, play a guiding-part in this momentous evolution.

But it was in the poets and philosophers that this evolution attained its end. Most of them were believers in a supreme power, present always and everywhere, and some of them—Empedocles, Aeschylus, Plato—gave to this supreme power the name of Zeus. "Zeus, whosoever he is.—if this name be pleasing unto him, by this name do I call him,—weighing all things in the balance, nought can I conjecture save only Zeus." (Aeschylus, *Agamemnon,* 160 et seq.; cf. frag. 70, Naucks 2nd ed.). He is the spirit of the world, the law of the universe, the universal reason, and all other gods are only parts or manifestations of him (cf. Diog. Laert. vii. 147). Moreover, as we may see from the "hymn" of Cleanthes (frag. 48), and from St. Paul's quotation from it or Aratus (Acts xvii., 28—Arat., phaen. 5), he was conceived by the Stoics as the father of the human race, who "alone of mortal things that live and move upon the earth" were created in his image.

ZEUXIS, one of the best known Greek painters, flourished about 420–390 B.C., and described himself as a native of Heraclea, probably the town on the Black Sea. He was, according to one account, a pupil of Demophilus of Himera in Sicily, the other statement being that he was a pupil of Neseus of Thasos. Afterwards he appears to have resided in Ephesus. His known works are—

1. Zeus surrounded by Deities.
2. Eros crowned with Roses.
3. Marsyas bound.
4. Pan.
5. Centaur family.
6. Boreas or Triton.
7. Infant Heracles strangling the serpents in presence of his parents, Alcmena and Amphitryon.
8. Alcmena, possibly identical with 7.
9. Helena at Croton.
10. Penelope.
11. Menelaus.
12. Athlete.
13. An old Woman.
14. Boy with grapes.
15. Grapes.
16. Monochromes.
17. Plastic works in clay.

In ancient records we are told that Zeuxis, following the initiative of Apollodorus, had introduced into the art of painting a method of representing his figures in light and shadow, as opposed to the older method of outline, with large flat masses of colour for draperies, and other details, such as had been practised by Polygnotus and others of the great fresco painters. The new method led to smaller compositions, and often to pictures consisting of a single figure, on which it was more easy for the painter to demonstrate the various means by which he obtained perfect roundness of form. The effect would appear strongly realistic, as compared with the older method, and to this was probably due the origin of such stories as the contest in which Zeuxis painted a bunch of grapes so like reality that birds flew towards it.

ZHITOMIR or **JITOMIR,** a town in the Ukrainian S.S.R., in 50° 19′ N., 28° 40′ E., on the Teterev river, a left bank tributary of the Dnieper, and at the terminus of a branch railway from Berdichev. The opposition to private trade has diminished its former prosperity as a Jewish merchant city and its population (1926) was 69,465 as against 80,787 in 1900. There are iron-smelting works, and a brewing industry, in connection with which a hop fair is held in early September. Its position on the road west from Kiev gave it early importance and it dates back to the time of the Scandinavian Askold and Dir (9th century). The Tatars plundered it in the 13th, 14th and 17th centuries. In 1320 it became part of Lithuania, but was afterwards annexed by Poland and when the Cossacks rose against their chief Bogdan Chmielnicki (1648) they sacked the town. Russia occupied it, along with the rest of the Ukraine, in 1778.

ZHOB, a valley and river in the north-east of Baluchistan, India. The Zhob is a large valley running from the hills near Ziarat first eastward and then northward parallel to the Indus frontier, till it meets the Gomal river at Khajuri Kach. Its importance is due to its being the shortest route between the North-West Frontier Province and Quetta; it dominates all the Pathan tribes of Baluchistan by cutting between them and Afghanistan. Up to the year 1884 it was practically unknown to Europeans, but the Zhob Valley Expedition of that year opened it up, and in 1889 the Zhod Valley and Gomal Pass were taken under the control of the British Government. The Zhob Valley was the scene of punitive British expeditions in 1884 and 1890. In 1890 Zhob was formed into a district or political agency, with its headquarters at Fort Sandeman. It was much disturbed during the third Afghan war of 1919. The district has an area of 9,626 sq.m.; pop. (1921) 56,668, mostly Pathans of the Kakar tribe.

See A. W. C. McFall, With the Zhob Field Force (1895); R. Bruce, Forward *Policy* (1900); T. H. Holdich, Indian Borderland (1901); Zhob District Gazetteer.

ZHUKOVSKY, VASILI ANDREYEVICH (1783–1852), Russian poet, born in the government of Tula, on Jan. 29, 1783, was the earliest of the Russian poets of the golden age of Russian poetry, and a precursor of Pushkin. The volume of his original work is small, consisting of a few beautiful lyrics and elegies. His greatest work was the opening up of the knowledge of English and German poetry in Russia by a series of translations. Briickner (Gesch. *v. Russ. Lit.)* calls him "the most original translator in the world's literature." He began by a translation of Gray's *Elegy;* he went on to the more famous poems of the English romanticists, and it has been asserted that in some cases his versions have greater poetic power than their originals. He turned Fouque's *Undine* into Russian verse. His last great work was a version of the Odyssey (1847). Zhukovsky was tutor to Alexander II., and he used his favour at court to help both Pushkin and Gogol. His last years were spent in Germany, and he died at Baden-Baden in 1852.

ZIEM, FELIX FRANÇOIS GEORGE PHILIBERT (1821–1911), French painter, was born at Beaune (Côte d'Or) in 1821. He studied at the art school of Dijon, where he gained the grand *prix* for architecture. In 1839 he went to Rome and

from 1845 to 1848 travelled in the south of France, Italy and the East, where he found the glowing sunlight and the rich colour peculiarly suited to his temperament. Many of his paintings are in American private collections, but two of his finest pictures, "The Doge's Palace in Venice" (1852), and a marine-painting, are at the Luxembourg museum, and a "view of Quai St. Jean, Marseilles" at the Marseilles gallery.

See *Félix Ziem,* by *L.* Roger-Milks *(Librairie de* Part, Paris).

ZIETEN, HANS JOACHIM VON (1699–1786), Prussian general-field-marshal, began his military career as a volunteer in an infantry regiment. In 1741 Frederick the Great made him colonel of the newly formed hussar regiment, and his promotion was rapid. He served with distinction in the first Silesian War, and still more in the second. His hussars, reorganized in the short interval of peace, were considered the best of their arm in Europe. Zieten fought the brilliant action of Moldau Tein almost on the day he received his commission as major-general. In the next campaign he led the famous *Zietenritt* round the enemy's lines to deliver the king's order to a distant detachment. When the Seven Years' War broke out in 1756 Zieten had just been made lieutenant-general. At Reichenberg and Prag he held important commands. At the disastrous battle of Kolin (June 18, 1757) his left wing of cavalry was the only victorious corps of troops, while at Leuthen he was brilliantly successful. Almost the only error in his career of battles was his misdirection of the frontal attack at Torgau, but he redeemed the mistake by his brilliant assault on the Siptitz heights. At the peace, he retired, and died in 1786.

ZIGGURAT, in architecture, a common temple form in Chaldea and ancient Babylonia and Assyria, which consists either of a stepped pyramid or of a somewhat similar shape in which the flat terraces of the ordinary stepped pyramid are replaced by an inclined plane ascending spirally from the ground to the summit. Ziggurats were usually great mounds of sun-dried brick with the exterior walls faced with a coating of burned, glazed brick or tile. On the summit there was frequently a shrine to the deity to whom the temple was erected. It is probable that the ziggurat form originated in the attempt to obtain high observatories from which the stars, so important in Chaldean religion and magic, might be observed.

ZIGZAG, in architecture and the decorative arts, an ornament formed by a succession of chevrons. It usually takes the shape of a band, changing direction at points equidistant from each other by angles usually acute, in such a manner that alternate segments are parallel to each other. The zigzag is one of the most primitive ornamental forms, both on pottery and in textiles. In Egyptian work it is frequently used for tomb ceilings and walls, evidently imitating matting or cloth decorations. Its most important architectural use is in some of the Romanesque styles, especially the Norman work in France and England.

ZIMBABWE, a Bantu name, probably derived from the two words *zimba* ("houses") and *mabgi* ("stones"), given to certain ruins in south-east Africa. The mediaeval Portuguese applied it as a generic term for the capital of any considerable chief and to several distinct places. From about 1550 onwards the Zimbabwe generally referred to by Portuguese writers was at a spot a little north of the Afur district, not far from the Zambezi. Before this the capital of the Monomotapa was situated much farther south, and it may plausibly be identified with the extensive ruins near Victoria (Mashonaland), now generally called Zimbabwe.

These ruins, discovered by Adam Renders in 1868 and explored by Karl Mauch in 1871, became well known to English readers from J. T. Bent's account of the *Ruined Cities of Mashonaland.*

The explorations conducted in 1905 proved that the mediaeval objects were necessarily contemporaneous with the foundation of the buildings, and that there was no super-position of periods of any date whatsoever. The plan and construction of Zimbabwe are by no means unique, and this site only differs from others in Rhodesia in respect of the great dimensions and the massiveness of its individual buildings. It may therefore be dated to a period not earlier than the 14th or 15th century AD., and attributed to the same Bantu people the remains of whose stone-fenced *kraals* are found between the Limpopo and the Zambezi.

The three distinct, though connected, groups of ruins at Zimbabwe are commonly known as the "elliptical temple," the "acropolis," and the "valley ruins." The first is doubly misnamed; it is not a temple and its contour is too unsymmetrical to be described properly as elliptical. It is an irregular enclosure over 800ft. in circumference, with a maximum length of 292ft. and a maximum breadth of 220ft., surrounded by a dry-built wall of extraordinary massiveness. This wall is in places over 30ft. high and 14ft. wide, but is erratic in outline and variable in thickness. On the south and south-east, the wall is decorated by a row of granite monoliths beneath which runs a double line of chevron ornament. The interior has been much destroyed by the ravages of gold-seekers and amateur excavators. The scheme was a combination of such a stone *kraal* as that at Nanatali with the plan of a fort like those found about Inyanga. The only unique feature is the occurrence of a large and a small conical tower at the southern end.

The "Acropolis" is a hill rising 200ft. to 300ft. above the valley, fortified with the minutest care and with extraordinary ingenuity. The principles of construction, the use of stone and cement, are the same as in the '(elliptical" *kraal;* there is no definite plan, the shape and arrangement of the enclosures being determined solely by the natural features of the ground. Between this and the "elliptical" *kraal* are the "valley ruins," consisting of smaller buildings, perhaps the dwellings of traders who bartered the gold brought in from distant mines. Zimbabwe was probably the distributing centre for the gold traffic carried on in the middle ages between the Monomotapa and the Mohammedans of the coast.

Journal* (1906). *See* also Mauch's report in *Ausland* (1872), which is of bibliographical interest; Bent's *Ruined Cities of Mashonaland* (1892); *R.* N. Hall, *Great Zimbabwe* (1905); *Prehistoric Rhodesia* (1909).

ZIMMERMANN, ARTHUR (1859–1940), German diplomat was born May 8, 1859, at Frankenstein. After having been vice-consul at Shanghai and acting consul in 1900 at Tientsin, he entered the Foreign Office in 1902 and rose by 1910 to be a director of the political section. In 1911 he was appointed under-secretary, and in Nov. 1916 secretary of state in succession to Von Jagow. In this capacity he addressed to America the note of Jan. 31, 1917, on the subject of U-boat warfare. He was also the author of the invitation of Jan. 19, 1917, to Mexico to enter into alliance with Germany and to sound Japan as to her willingness to co-operate. For Mexico the price of this alliance was to be the American States of New Mexico, Texas and Arizona. This proposal, which was sent through the medium of Von Eckhardt, the German minister to Mexico, was intercepted in America and President Wilson was in a position to publish it on March 1, 1917. The disclosure was one of the primary causes resulting in America's declaration of war upon Germany. Zimmermann retired on Aug. 5, 1917, shortly after the resignation of Bethmann Hollweg.

ZINC, a metallic chemical element (symbol Zn, atomic number 30, atomic weight 65·38). Zinc as a component of brass had currency in metallurgy long before it became known as an individual metal. The word zinc (in the form *zinken*) was first used by Paracelsus, who regarded it as a bastard or semi-metal; but the word was subsequently used for both the metal and its ores. Moreover, zinc and bismuth were confused, and the word *spiauter* (the modern spelter) was indiscriminately given to both these metals. In 1597 Libavius described a "peculiar kind of tin" which was prepared in India, and of which a friend had given him a quantity. From his account it is quite clear that this metal was zinc, but he did not recognize it as the metal of calamine. It is not known to whom the discovery of isolated zinc is due; but we do know that the art of zinc-smelting was practised in England from about 1730. The first continental zinc-works were erected at Liége in 1807.

Occurrence — Zinc does not occur free in nature, but in combination it is widely diffused. The chief ore is zinc blende, or sphalerite *(see* BLENDE), which generally contains, in addition to zinc sulphide, small amounts of the sulphides of iron, silver and

cadmium. It may also be accompanied by pyrites, galena, arsenides and antimonides, quartz, calcite, dolomite, etc. It is widely distributed, and is particularly abundant in Germany (the Harz, Silesia), Austro-Hungary, Belgium, the United States and in England (Cumberland, Derbyshire, Cornwall, North Wales). Second in importance is the carbonate, calamine (*q.v.*) or zinc spar, which at one time was the principal ore; it almost invariably contains the carbonates of cadmium, iron, manganese, magnesium and calcium, and may be contaminated with clay, oxides of iron, galena and calcite; "white calamine" owes its colour to much clay; "red calamine" to admixed iron and manganese oxides. Calamine chiefly occurs in Spain, Silesia and in the United States. Of less importance is the silicate, $Zn_2SiO_4{\cdot}H_2O$, named electric calamine or hemimorphite; this occurs in quantity in Altenburg near Aix-la-Chapelle, Sardinia, Spain and the United States (New Jersey, Pennsylvania, Missouri, Wisconsin). Other zinc minerals are willemite (*q.v.*), Zn_2SiO_4, hydrozincite or zinc bloom, $ZnCO_3{\cdot}2Zn(OH)_2$, zincite (*q.v.*) or red zinc ore, ZnO, and franklinite, $3(Fe,Zn)O{\cdot}(Fe,Mn)_2O_3$.

Production. — Until about 1833 the supply of zinc was almost entirely obtained from Germany, but in this year Russia began to contribute about 2,000 tons annually to the 6,000 to 7,000 derived from Germany. Belgium entered in 1837 with an output of about 2,000 tons; England in 1855 with 3,000; and the United States in 1873 with 6,000 tons. The last country now produces about one-third of the world's supply. The present state and general trend of the industry is shown by the following statistics for output of smelter and electrolytic zinc (in metric tons) for the chief producing countries and for the world's production.

Tear	1933	1935	1937
U.S.A.	278,669	381,591	505,212
Belgium	137,300	181,740	225,579
Canada	83,412	135,645	143,964
Poland	82,705	84,606	107,174
Australia	54,822	68,752	70,869
France	51,958	47,443	60,427
Germany*	50,867	123,198	163,200
United Kingdom*	41,717	61,433	63,138
World output	983,000	1,332,000	1,621,000

*Some secondary metal included. "Minerals Yearbook 1938," U.S. Bureau of Mines.

Properties. — Zinc is bluish white, with a high lustre when fractured. It fuses at 419° C and under ordinary atmospheric pressure boils at 918° C. Its vapour density shows that it is monatomic. The molten metal on cooling deposits crystals belonging to the hexagonal system, and freezes into a compact crystalline solid, which may be brittle or ductile according to circumstances. If zinc be cast into a mould at a red heat, the ingot produced is laminar and brittle; if cast at just the fusing-point, it is granular and sufficiently ductile to be rolled into sheet at the ordinary temperature. According to some authorities, pure zinc always yields ductile ingots. Commercial "spelter" always breaks under the hammer; but at 100° to 150° C it is susceptible of being rolled out into a very thin sheet. Such a sheet, if once produced, remains flexible when cold. At about 200° C, the metal becomes so brittle that it can be pounded in a mortar. The specific gravity of zinc cannot be expected to be perfectly constant; according to Karsten, that of pure ingot is 6.915, and rises to 7·191 after rolling. The coefficient of linear expansion is 17×10^{-6} between 20° and 100°. The specific heat is 0·0929 from 18° to 100°. Compact zinc does not tarnish much in the air. It is fairly soft, and clogs the file. If zinc be heated to near its boiling-point, it catches fire and burns with a brilliant light into its powdery white oxide, which forms a reek in the air (lana *philosophica*, "philosopher's wool"). Boiling water attacks it appreciably, but slightly, with evolution of hydrogen and formation of the hydroxide, $Zn(OH)_2$. A rod of perfectly pure zinc, when immersed in dilute sulphuric acid, is so very slowly attacked that there is no visible evolution of gas; but, if a piece of platinum, copper or other more electro-negative metal be brought into contact with the zinc, it dissolves readily, with evolution of hydrogen and formation of the sulphate. The ordinary impure metal dissolves at once, the more readily the less pure it is. Cold dilute nitric acid dissolves zinc as nitrate, with evolution of nitrous oxide. At higher temperatures, or with stronger acid, nitric oxide, NO, is produced besides or instead of nitrous oxide. Zinc is also soluble in soda and potash solutions, but not in ammonia.

Applications. — Zinc is largely used for "galvanizing" iron, sheets of clean iron being immersed in a bath of the molten metal and then removed, so that a coat of zinc remains on the iron, which is thereby protected from atmospheric corrosion. For the same purpose zinc may be sprayed on to other metals, or it may be deposited electrolytically. It is also a constituent of many valuable alloys; brass, Muntz-metal, pinchbeck and tombac are examples.

Zinc forms only one oxide, ZnO, from which is derived a well-characterized series of salts. It is chemically related to cadmium and mercury, the resemblance to cadmium being especially well marked; one distinction is that zinc is less basigenic. Zinc is capable of isomorphously replacing many of the bivalent metals, *e.g.*, magnesium, manganese, iron, nickel, cobalt and cadmium, in certain salts.

Zinc Oxide, ZnO, is manufactured for paint by two processes — directly from the ore mixed with coal by volatilization on a grate, and by oxidizing the vapour given off by a boiling bath of zinc metal. The oxide made by the latter method has generally a better colour, a finer texture, and a greater covering power. It is an infusible solid, which is intensely yellow at a red heat, but on cooling becomes white. This at least is true of the oxide produced from the metal by combustion; that produced from the carbonate, if once made yellow at a red heat, retains a yellow shade permanently. Crystalline zinc oxide is obtained by heating the nitrate, or by heating the chloride in a current of steam. It is insoluble in water, but dissolves readily in all aqueous acids, with formation of salts. It also dissolves in aqueous caustic alkalis, including ammonia, forming "zincates" [*e.g.*, $Zn(OK)_2$]. Zinc oxide is used in the arts as a white pigment (zinc white); it has not by any means the covering power of white lead, but offers the advantages of being non-poisonous and of not becoming discoloured in sulphuretted hydrogen. It is used also in ointments, as a polish for glass, and in dental cements.

Zinc Hydroxide, $Zn(OH)_2$, is prepared as a gelatinous precipitate by adding a solution of any zinc salt to pure aqueous caustic potash. It is a white powder, is insoluble in water, but soluble in excess of alkali and in acids.

Zinc Peroxide, obtained from zinc sulphate and barium peroxide, or by electrolysis of neutral zinc chloride solutions in the presence of hydrogen peroxide, is a valuable antiseptic, being odourless and non-irritant; it is much used for skin troubles under various proprietary names (*e.g.*, dermogen), and as produced commercially contains about 50% of ZnO_2 together with hydroxide and moisture.

Zinc chloride, $ZnCl_2$, is produced by heating the metal in dry chlorine gas, or by heating a mixture of zinc sulphate and sodium chloride. It condenses as a white translucent mass, boiling at about 700°. Its vapour density at 900° C corresponds to $ZnCl_2$. It is extremely hygroscopic and is used in synthetical organic chemistry as a condensing agent. It dissolves in a fraction of its weight of even cold water and in any proportion of boiling water, forming a syrupy solution. A solution of zinc chloride is easily produced from the metal and hydrochloric acid; it cannot be evaporated to dryness without considerable decomposition of the hydrated salt into oxychloride and hydrochloric acid, but it may be crystallized as $ZnCl_2{\cdot}H_2O$. A concentrated solution of zinc chloride converts starch, cellulose and a great many other organic substances into soluble compounds; hence the application of the fused salt as a caustic in surgery and the impossibility of filtering a strong $ZnCl_2$ solution through paper. (See CELLULOSE.) The solution is also used as a flux in soldering.

Zinc chloride solution readily dissolves the oxide with the formation of oxychlorides, some of which are used as pigments, cements and for filling teeth in dentistry. A solution of the oxide in the chloride has the property of dissolving silk, and hence is employed for removing this fibre from wool.

Zinc sulphide, ZnS, occurs in nature as blende (*q.v.*), and is artificially obtained as a white precipitate by passing sulphuretted hydrogen into a neutral solution of a zinc salt. It dissolves in mineral acids, but is insoluble in acetic acid.

Zinc **sulphate,** $ZnSO_4+7H_2O$, or white vitriol, is prepared by dissolving the metal in dilute sulphuric acid, concentrating, and cooling the solution. The hydrated salt crystallizes out on cooling, forming colourless orthorhombic prisms, usually small and needle-shaped. They are permanent in the air. According to Poggiale, 100 parts of water dissolve respectively of ($7H_2O$) salt, 115·2 parts at 0°, and 653.6 parts at 100°. At 39° C the crystals lose one, and at 100° six of their molecules of water; the remaining molecule goes off at 250°. The anhydrous salt, when exposed to a red heat, breaks up into oxide, sulphur dioxide and oxygen. An impure form of the salt is prepared by roasting blende at a low temperature. In the arts it is employed in the preparation of varnishes, and as a mordant for the production of colours on calico. A green pigment known as *Rinmann's* green is prepared by mixing 100 parts of zinc vitriol with 2·5 parts of cobalt nitrate and heating the mixture to redness, to produce a compound of the two oxides. Zinc sulphate, like magnesium sulphate, unites with the sulphates of the potassium metals and of ammonium into crystalline double salts, $ZnSO_4{\cdot}R_2SO_4+6H_2O$, isomorphous with one another and with the magnesium salts.

Zinc Carbonate, $ZnCO_3$, occurs in nature as the mineral calamine (*q.v.*), but has never been prepared artificially, basic carbo*nates,* $ZnCO_3{\cdot}xZn(OH)_2$, where x is variable, being obtained by precipitating a solution of the sulphate or chloride with sodium carbonate; the basic salt is used as a pigment.

Of zinc phosphates we notice the minerals hopeite, $Zn_3(PO_4)_2{\cdot}4H_2O$, and tarbuttite, $Zn_3(PO_4)_2{\cdot}Zn(OH)_2$, both found in Rhodesia.

Analysis. — From neutral solutions of its salts zinc is precipitated by sulphuretted hydrogen as sulphide, ZnS—a white precipitate, soluble, but by no means readily, in dilute mineral acids, but insoluble in acetic acid. In the case of the acetate precipitation is quite complete; from a sulphate or chloride solution the greater part of the metal goes into the precipitate; in the presence of a sufficiency of free HCl the metal remains dissolved; sulphide of ammonium precipitates the metal completely, even in the presence of ammonium salts and free ammonia. The precipitate, when heated, passes into oxide, which is yellow when hot and white after cooling; and, if it be moistened with cobalt nitrate solution and re-heated, it exhibits a green colour after cooling.

Zinc may be quantitatively estimated by precipitating as basic carbonate, which is dried and ignited to zinc oxide. It may also be precipitated as zinc ammonium phosphate, NH_4ZnPO_4, which is filtered on a Gooch crucible and dried at 105°. Volumetric methods have also been devised.

PHARMACOLOGY AND THERAPEUTICS

Zinc chloride is a powerful caustic, and is prepared with plaster of Paris in the form of sticks for destroying warts, etc. The salt is a corrosive irritant poison when taken internally. The treatment is to wash out the stomach or give such an emetic as apomorphine, and, when the stomach has been emptied, to administer demulcents such as white of egg or mucilage. Numerous other salts of zinc, used in medicine, are of value as containing this metal. Certain others are referred to in relation with the important radical contained in the salt. Those treated here are the sulphate, oxide, carbonate, oleate and acetate. All these salts are mild astringents when applied externally, as they coagulate the albumen of the tissues and of any discharge which may be present. In virtue of this property they are also mild haemostatics, tending to coagulate the albumens of the blood and thereby to arrest haemorrhage. *Lotio Rubra,* the familiar "Red Lotion," a solution of zinc sulphate, is widely used in many catarrhal inflammations, as of the ear, urethra, conjunctiva, etc. There are also innumerable ointments.

These salts are extensively employed internally especially in the treatment of the more severe and difficult cases of nervous disease. The sulphate is an excellent emetic in cases of poisoning, acting rapidly and without much nausea or depression. For these reasons it may also be given with advantage to children suffering from acute bronchitis or acute laryngitis. See also Zinc peroxide (above).

ZINC PRODUCTION

The United States is the principal producer of both zinc ore and spelter. The Joplin area in Missouri has long been the principal mining region, but large deposits are worked in the Upper Mississippi region, Franklin Furnace (New Jersey) and, since the application of improved methods of zinc concentration, in the western States. Australia is next to the United States as a zinc producer, most of the ore being obtained from the Broken Hill district (New South Wales). Tasmania also has important deposits and occurrences are known in Australia.

In Canada, the most important deposits of the metal occur in British Columbia and Quebec, these two provinces sharing practically the whole of the Canadian production in the proportions of four-fifths and one-fifth respectively. The principal countries in Europe participating in the zinc industry are Germany, Italy, Poland and Spain. For many years Germany ranked second only to the United States. Her most important deposits were in Upper Silesia, which yielded about three-fourths of the total German production. Before the World War the European industry was almost wholly controlled by the German zinc convention.

In Italy the chief mines now worked are in Sardinia, though occurrences of ore are found in Lombardy, Piedmont and Tuscany. During the post-War period Poland produced more zinc ore than any other European country, her richest mines being situated in Silesia; her exports in 1923 amounted to 80,000 long tons. In Spain the chief zinc-mining centres are in the provinces of Santander and Murcia. The ores of Santander are mainly calamine, while those of Murcia are principally blende and galena. Mention should be made of the zinc-ores mined in the United Kingdom. These are almost invariably blende associated with galena, and occur chiefly in North Wales, the north of England, the Isle of Man and at Dumfries in Scotland.

In the following table the production of zinc in the principal countries of the world is set out for the three years, 1918, 1923 and 1925.

	Long Tons		
	1918	1923	1925
United States	462,435	455,745	511,559
Australia	9,444	41,153	45,698
Canada	11,227	26,972	34,358
Germany	232,000	39,400	57,705
Italy	1,169	3,622	6,374
Poland	..	90,000	112,507
Spain	15,644	10,746	140,300
United Kingdom	50,000	33,000	42,000
Belgium	9,096	144,677	179,130
France	18,052	48,541	70,000
Japan	39,203	13,671	14,000*
Netherlands	..	16,185	20,778
Yugoslavia	..	2,400	2,196†
Sweden	..	1,194	4,598
Norway		3,722	6,698

ZINCITE, a mineral consisting of zinc oxide (ZnO), crystallizing in the hemimorphic-hemihedral class of the hexagonal system. Distinct crystals are of rare occurrence; they have the form of a hexagonal pyramid terminated at one end only by a basal plane. There is a perfect cleavage parallel to the basal plane, and usually the mineral is found as platy foliated masses. The blood-red colour and the orange-yellow streak are characteristic features. The hardness is 4.5, sp.gr., **5.6.** Some manganese is usually present replacing zinc. It is known only from Sterling Hill and Franklin Furnace in Sussex county, N.J.

ZINDER, a town on the northern margin of the central Sudan. Pop. 6,000. It forms part of the French colony of the Niger, of which the capital, at first Zinder, was in **1926** moved to Niamey. Its ruler was formerly subordinate to Bornu, but with the decline of that kingdom shook off the yoke of the sultan, and on the conquest of that country by Rabah (*q.v.*) seems to have maintained his independence. The country of which Zinder is the capital is known as Damerghu. It is semi-fertile, and supports considerable numbers of horses and sheep, besides troops of camels. By the Anglo-French agreement of June **1898** it was included in the French sphere. The explorer Cazemajou was assassinated there in **1897,** but the town was occupied in July **1899,** after a slight resistance. A French post (named Fort Cazemajou) was built outside the town on a mound of huge granite blocks. Zinder was the first point in the Sudan reached by F. Foureau after his great journey across the Sahara *via* Air in **1899.** Subsequently Commandant Gadel, from his headquarters at Zinder, mapped and pacified the surrounding region, and sent out columns of *meharistes* (camel-corps) which occupied the oasis of Air and Bilma in 1906. Zinder is a large and fine town surrounded with high earthen walls, very thick at the base and pierced with seven gates.

(1901); E. Arnaud and M. Cortier, *Nos Confins Sahariens* (Paris, 1908); C. Jean, *Les Touareg du Sud-Est* (Paris, 1909).

ZINGARELLI, NICCOLO (1752–1837), Italian composer, mas born at Naples on April **4,** 1752, the son of Riccardo Tota Zingarelli, a singing-master and soloist. His first dramatic work, *I quattro Pazzi*, was produced at the conservatorio in **1768.** He then gave violin lessons for a time, but in 1781 produced his first opera, *Montesuma*, at the San Carlo and afterwards in Vienna, where it was highly commended by Haydn. He finally settled in Milan, with introductions to the viceregal court, and over a period of eleven years produced a series of operas for the Scala, an oratorio of the Passion, and several cantatas. In **1789** he went to Paris to write an opera for the Académie royale de musique. This work, *L'Antigone*, for which Marmontel provided the libretto, was performed on April **30,** 1790, but Paris was no place for Zingarelli during the Revolution, and he fled into Switzerland and returned to Milan early in 1791.

In **1792** he won the appointment, by open competition, of master of the chapel at the cathedral. He first achieved an international reputation by a series of comic operas, beginning with *La Secchia rapita* in 1793. His finest work was, however, *Romeo and* Juliet, played at the Scala in **1796.** From 1794–1804 Zingarelli was master of the chapel at Loreto, and during this time, although he also wrote operas, he was chiefly inspired to compose sacred music, contributing largely to the enormous collection of manuscript works, the property of the church, known as the *Annuale di Loreto.* In 1804 he went to Rome as master (maestro di capella) of the Sistine chapel and in 1805 produced one of his most successful works, "The Destruction of Jerusalem," which held the stage for five years. His last opera, *Berenice*, received a hundred consecutive performances.

At the "Ring of Rome" celebrations, when Napoleon ordered a Te Deum to be sung in Rome, Zingarelli's principles did not allow him to undertake the performance, and on his refusal he was arrested and brought before the emperor in Paris. But Napoleon at once released him and provided him with a pension. Zingarelli's post in Rome had been taken by Fioravanti, but in **1813** he was appointed director of the Real Collegio di Musica at Naples and in **1816** maestro di cappella at the cathedral. Zingarelli's gift for melody was remarkable. He was a deeply religious man and was rigorous in his exclusion of secular music from church performances. He died in **1837.**

ZINGIBERACEAE, a family of monocotyledonous plants, chiefly tropical, characterized by its irregular flowers. The various parts of the plants are usually more or less aromatic. Forty genera and about 900 species are recognized. Among the economic species are ginger (*q.v.*) (*Zingiber officinale*), cardamoms (*q.v.*) (*Elettaria cardamomum* and *Amomum cardanzomum*), grana-paradisi (*Aframomum*) and turmeric (*q.v.*) (*Curcuma longa*), the latter used in making curry powder. Various species of *Alpinia, Hedychium, Phaeomeria* and other genera are cultivated for ornamental purposes. *See* K. Schumann, "Zingiberaceae," *Pflanzenreich*, 20 (iv 46): 1–459, **fig. 1–52** (1904).

ZINNIA, a genus of the family Compositae, containing about a dozen species of tender annual or perennial herbs or undershrubs, found wild from the southern United States and Mexico to Chile. The numerous single and double garden forms are mostly derived from *Zinnia elegans*, and grow about 2 ft. high, producing flowers of various colours, the double ones being about the size of asters, and very handsome. The colours include white, yellow, orange, scarlet, crimson and purple. Zinnias do best in a rich deep loamy soil, in a sunny position. They should be sown on a gentle hotbed at the end of March and planted out only after settled warm weather.

ZINOVIEV, GRIGORY EVSEEVICH (1883–1936), Russian politician, was born in Sept. **1883** at Elisavetgrad (Zinovievsk). He studied chemistry and later law at Bern. He was a revolutionary before he was **20,** and in 1903 met Lenin. He was head of the Bolshevik party in Bern and during 1903–4 started Bolshevik propaganda in South Russia. Apart from his activities abroad, he came into prominence in Russia during 1906–8 as a member of the Bolshevik St. Petersburg committee of the R.S.D P., by his organization of the attempted Kronstadt rising after the dispersal of the first Duma, his editorship of the Bolshevik paper *Vpered* (Forward), and of *The Social Democrat*, the central organ of the party. In 1908 he was arrested and imprisoned but was released. He went abroad and did not return until the revolution in 1917. During these nine years Zinoviev worked hard for his party. He was a member of the central committee, co-editor of the principal Bolshevik publications, and representative of the party at the Copenhagen congress of the International. In **1912** he went with Lenin to Galicia to control from the nearest possible point the growing labour movement in Russia. In Galicia he founded the foreign bureau of the central committee, which guided the party work in Russia and the activities of the Bolshevik group in the Duma. Zinoviev edited with Lenin *Against the Tide*, a work of propaganda against World War I; and at the Zimmerwald conference (1915) they began to organize the Communist International. On the outbreak of the March revolution **(1917)** they returned to Russia and began to prepare the way for the revolution. Zinoviev was co-editor of *Pravda* and, after its suppression, of *The Proletarian* and *The Worker*. He thus became one of the leading figures in Russia. In 1919 he was elected president of the Communist International, and after the death of Lenin in 1924 was one of the most zealous upholders of pure "Leninism." Eut in **1926** he was expelled from the political bureau, and in 1927 from the Communist party. He was readmitted in 1929; but in Jan. 1935 he and Kamenev (q*v.)* were exiled for counter-revolutionary activities. On Aug. **25, 1936,** convicted of high treason together with Kamenev and **14** others. he was shot. His alleged letter to English communists was a factor in the British general election of Oct. 1924.

ZINOVIEVSK: see KIROVO-UKRAINSKOYE.

ZINZENDORF, NICOLAUS LUDWIG, COUNT OF ZINZENDORF AND POTTEYDORF (1700–1760), German religious and social reformer, was born on May 26, 1700, at Dresden Both

his parents belonged to the Pietist circle, and the lad had Philipp Jakob Spener for his godfather. His school days were spent at Halle amidst Pietist surroundings, and in 1716 he went to the University of Wittenberg, to study law and fit himself for a diplomatic career. Three years later he was sent to travel in Holland, in France, and in various parts of Germany. During a lengthened visit at Castell he fell in love with his cousin Theodora; but her mother objected to the marriage, and Theodora married Count Henry of Reuss. Zinzendorf took this rebuff as a call to special work for God, and he now resolved to settle down as a Christian landowner, spending his life on behalf of his tenantry at Berthelsdorf. His intention was to carry into practice the Pietist ideas of Spener.

The "band of four brothers" (Rothe, pastor at Berthelsdorf; Melchior Schaffer, pastor at Gorlitz; Francis von Wattewille, a friend from boyhood; and himself) set themselves to create a revival of religion. From the printing-house at Ebersdorf large quantities of books and tracts, catechisms, collections of hymns and cheap Bibles were issued; and a translation of Johann Arndt's True *Christianity* was published for circulation in France. Zinzendorf seems to have doubted the wisdom of Spener's plan of not separating from the Lutheran Church, and began to think that true Christianity could be best promoted by free associations of Christians, which in course of time might grow into churches with no State connection. Zinzendorf offered an asylum to a number of persecuted wanderers from Moravia *(see* MORAVIAN BRETHREN), and built for them the village of Herrnhut on a corner of his estate of Berthelsdorf. The refugees who came to this asylum (between 1722 and 1732—the first detachment under Christian David) from various regions where persecution raged, belonged to more than one Protestant organization. Zinzendorf devoted himself to them.

Gradually Zinzendorf was able to organize his refugees into something like a *militia Christi,* based not on monastic but on family life. He established a common order of worship in 1727, and soon afterwards a common organization, which has been described in the article MORAVIAN BRETHREN. He travelled widely on behalf of the Moravians, visiting America in 1741–42 and spending a long time in London in 1750. Missionary colonies had by this time been settled in the West Indies (1732), in Greenland (1733), amongst the North American Indians (1735); and before Zinzendorf's death the Brethren had sent from Herrnhut 'missionary colonies to Livonia and the northern shores of the Baltic, to the slaves of North Carolina, to Surinam, to the negro slaves in several parts of South America, to Travancore in the East Indies, to the Copts in Egypt and to South Africa.

In 1752 Zinzendorf lost his only son, Christian Renatus, whom he had hoped to make his successor; and four years later he lost his wife Erdmute, who had been his counsellor and confidante in all his work. Zinzendorf remained a widower for one year, and then (June 1757) contracted a second marriage with Anna Nitschmann. He died on March 9, 1760, leaving John de Wattewille, who had married his eldest daughter Benigna, to take his place at the head of the community.

See A. G. Spangenberg, *Leben des Grafen von Zinzendorf* (Barby, 1772–75); L. von Schrautenbach, *Der Graf v. Zinzendorf* (Gnadau, 1871; written in 1782, and interesting because it gives Zinzendorf's relations to such Pietist rationalists as J. K. Dippel); F. Bovet, *Le Comte de Zinzendorf* (1860; Eng. trans. *A Pioneer of Social Christianity,* by T. A. Seed, 1896); B. Becker, *Zinzendorf im Verhältniss z. Philosophie u. Kirckenthum seiner Zeit* (Leipzig, 1886); H. Romer, *Zinzendorf's Leben und Werken* (Gnaudau, 1900), and other literature mentioned under MORAVIAN BRETHREN.

ZION, a city of Lake county, Illinois, U.S.A., on Lake Michigan, 45 m. N. by W. of Chicago. It is served by the Chicago and North Western and the Chicago, North Shore and Milwaukee railways. Pop. 5,580 in 1920, 20% foreign-born white, and was in 1940, 6,555 by the federal census. It is the centre of a fruit-growing, truck-gardening and dairying district, and has a variety of manufacturing industries. Zion City (as it was called at first) was founded in 1901 by John Alexander Dowie (*q.v.*) to be the headquarters of the "Christian Catholic Apostolic Church in Zion." It was chartered as a city in 1902.

ZION, originally the name of the Jebusite stronghold at Jerusalem captured by David (2 Samuel **v.).** This was probably on the southern part of the eastern hill. Above it was built the temple, and later the name was extended to the whole hill. Finally it became a synonym for the city of Jerusalem, whose inhabitants are personified as "the daughter of Zion." *See* JERUSALEM.

ZIONISM is the lineal heir of the attachment to Zion which led the Babylonian exiles under Zerubbabel to rebuild the Temple, and which flamed up in the heroic struggle of the Maccabees against Antiochus Epiphanes.

During the middle ages, though the racial character of the Jews was being transformed by their Ghetto seclusion, the national yearning suffered no relaxation. The nationalist spirit of the mediaeval Jews is sufficiently reflected in their liturgy, and especially in the works of the poet, Jehuda Halevi.

The strength of the nationalist feeling was practically tested in the 16th century, when a Jewish impostor, David Reubeni (c. 1530), and his disciple, Solomon Molcho (1501–1532), came forward as would-be liberators of their people. Throughout Spain, Italy and Turkey they were received with enthusiasm by the bulk of their brethren. In the following century the influence of the Christian Millennarians gave a fresh impulse to the national idea. Menasseh ben Israel (1604–1657) co-operated with English Millennarians to procure the resettlement of the Jews in England as a preliminary to their national return to Palestine. In 1666 a leader appeared at Smyrna, in the person of a Jew named Sabbatai Sebi (1626–1676), who proclaimed himself the Messiah. The news spread like wildfire, and despite the opposition of some of the leading rabbis, the Jews everywhere prepared for the journey to Palestine. Throughout Europe the nationalist excitement was intense. Even the downfall and apostasy of Sabbatai were powerless to stop it. The bulk of the people refused for a whole century to be disillusioned.

The reaction arrived in 1778 in the shape of the Mendelssohnian movement. The growth of religious toleration, the attempted emancipation of the English Jews in 1753, and the Judeophilism of men like Lessing and Dohm, showed that a new era was at hand. Moses Mendelssohn (1729–1786) sought to prepare his brethren for their new life as citizens of the lands in which they dwelt, by emphasizing the spiritual side of Judaism and the necessity of Occidental culture. His efforts were successful. The nationalist spirit showed signs of yielding before the hope or the progress of local political emancipation. In 1806 the Jewish Sanhedrin convened by Napoleon virtually repudiated the nationalist tradition. The new Judaism, however, had not entirely destroyed it. It had only reconstructed it on a different foundation. Mendelssohnian culture, by promoting the study of Jewish history, gave a fresh impulse to the racial consciousness of the Jews. From this race consciousness came a fresh interest in the Holy Land. It was an ideal rather than a politico-nationalist interest—a desire to preserve and cherish the monuments of the ancient national glories. It took the practical form of projects for improving the circumstances of the local Jews by means of schools, and for reviving something of the old social condition of Judea by the establishment of agricultural colonies. In this work Sir Moses Montefiore, the Rothschild family, and the Alliance Israélite Universelle were conspicuous. More or less passively, however, the older nationalism still lived on—especially in lands where Jews were persecuted—and it became strengthened by the revived race consciousness and the new interest in the Holy Land. Christian Millennarians also helped to keep it alive. Lord Ashley, afterwards Lord Shaftesbury, Col. Gawler, Walter Cresson, the United States consul at Jerusalem, James Finn, the British consul, Laurence Oliphant and many others organized and supported schemes for the benefit of the Jews of the Holy Land on avowedly Restoration grounds. Another vivifying element was the re-opening of the Eastern Question and the championship of oppressed nationalities in the East by the Western Powers. In England political writers were found to urge the re-establishment of a Jewish State under British protection as a means of assuring the overland route to India (Hollingsworth, *Jews in Palestine,* 1852). Lord Palmerston was not unaffected by this idea (Finn,

Stirring Times, vol. i pp. 106–112), and both Lord Beaconsfield and Lord Salisbury supported Laurence Oliphant in his negotiations with the Porte for a concession which was to pave the way to an autonomous Jewish state in the Holy Land. George Eliot's *Daniel Deronda,* which appeared in 1876, was a striking illustration of the sympathy with which Jewish national aspirations were regarded by cultivated western minds.

In the middle of the 19th century, Zionism, or what the next generation of Jews was to know as Zionism, was already being preached in western Europe by Moses Hess (1812–1875) and in eastern Europe by Hirsch Kalischer (1795–1874) and Perez Smolenskin (1842–1885). A powerful impetus was given to the movement by the rise and spread of anti-Semitism, which, in one form or another, began to harass the Jews and embitter their lives in nearly every part of Europe. In Russia it reached its climax in 1882, when murder and pillage raged unchecked through the Jewish pale of settlement. It was in this fateful year that the immediate precursor of Theodor Herzl, the founder of the Zionist organization, appeared in the person of Leo Pinsker of Odessa (1821–1891), whose "auto-emancipation" was a plea for the solution of the Jewish problem by the re-establishment of a Jewish nation living its own life on Jewish soil. The "back to Zion" movement soon began to assume a practical form. A society known as *Choveve Zion* ("Lovers of Zion") was formed for the purpose of promoting Jewish colonization in Palestine.

A new chapter opened in 1896 with the publication of a pamphlet entitled *The Jewish Stafe* by Theodor Herzl (*q.v.*). In his "Jewish state" he elaborated in detail a scheme for the establishment of an autonomous Jewish commonwealth in Palestine under the suzerainty of the sultan. This scheme secured a large amount of popular support throughout Europe and in 1897 the first international Zionist congress met at Basle. The congress established the Zionist Organization for the purpose of giving effect to the following program: "Zionism strives to create for the Jewish people a home in Palestine secured by public law. The congress contemplates the following means to the attainment of this end: (1) The promotion on suitable lines of the colonization of Palestine by Jewish agricultural and industrial workers. (2) The organization and binding together of the whole of Jewry by means of appropriate institutions, local and international, in accordance with the laws of each country. (3) The strengthening and fostering of Jewish national sentiment and consciousness. (4) Preparatory steps towards obtaining government consent where necessary to the attainment of the aim of Zionism."

In 1901 and again in 1902 Dr Herzl had audiences with the sultan, Abdul Hamid, but the negotiations led to nothing. He now sought from the British government a grant of territory on an autonomous basis in the vicinity of the Holy Land, which would provisionally afford a refuge and a political training-ground for persecuted Jews. A site was suggested in the Sinai peninsula, but owing to the waterless character of the country the project was given up. Then Joseph Chamberlain suggested the uninhabited highlands of the East Africa Protectorate, and in 1903 the British government made the Zionist Organization a provisional offer of an area of 6,000 sq.mi. in the Guas Ngishu plateau. This offer was warmly appreciated as a mark of British goodwill, but it gave rise to sharp differences of opinion between a minority who urged its acceptance and a much larger body of Zionists who were alarmed at any suggestion of the diversion of Zionist energies from Palestine. In the end the project was shelved by the seventh Zionist congress (1905).

Meanwhile Zionism had suffered an irreparable blow by the death of Dr. Herzl (1904). He was succeeded by David Wolffsohn, a banker of Cologne. The movement was further shaken by the dissensions which followed the rejection of the East African project. Israel Zangmill led an influential minority which combined with certain non-Zionist elements to found a rival organization under the name of the ITO (Jewish Territorial Organization) with a view to taking over the East African offer or establishing an autonomous place of refuge elsewhere. On the other hand, the Zionist Organization had now dedicated itself irrevocably to Palestine, and under the auspices of Wolffsohn fresh negotiations were opened with the Porte. These, however, were rendered hopeless by the Turkish revolution, which postulated a united Ottoman nationality, and resolutely set its face against any extension of the racial and religious autonomies under which the integrity of the empire had already severely suffered.

A Zionist bibliography has been published by the Federation of American Zionists. Besides the works already cited in the body of this article, *see,* on the early nationalist movement Graetz, *Geschichte der Juden,* under the heads of the various pseudo-Messiahs and their adherents. Jewish agricultural colonies will be found discussed very fully in *The Jewish Encyclopedia,* vol. i pp. 240–62. For early Zionist projects see *Publications of the American Jewish Historical Society,* No. 8, pp. 75–118; Laurence Oliphant, *Land of Gilead;* Mrs. Oliphant, *Life of Laurence Oliphant,* pp. 168 *et scq.* The Zionist movement since 1895 is fully recorded in its official organ, *Die Welt* (Vienna). For proceedings of the congresses *ree* the *Official Protocols* published for each year by the society "Erez Israel" of Vienna; also Herzl, *Der Baseler Congreys* (Vienna, 1897). On the movement generally, *see* Herzl's *Zionistische Schrijten,* edited by Dr. Leon Kellner; *Ten Years of Zionism* (Cologne, 1907); Nordau, *Zionism, Its History and Its Aims* (1905); J. de Haas, *Zionism, Jewish Needs and Jewish Ideals;* also articles by I. Zangwill in *Cosmopolis* (Oct. 1897), *Contemporary Revzew* (Oct. 1899) and *Fortnightly Review* (April 1910); Dr. Gaster in *Asiatic Quarterly Review* (Oct. 1897); H. Bentwich in *Ntneteenfh Century* (Oct. 1897), and *Fortnightly Review* (Dec. 1898); Reich in *Nineteenth Century* (Aug. 1897); Lucien Wolf, "The Zionist Peril," *Jewish Quarterly Review* (Oct. 1904). On the ITO *see* pamphlets and leaflets published by the Jewish Territorial Organization; also the *Report of the Commission on Cyrenaica* (1909). (L. W.; X.)

LATER PERIOD

As the prospects of obtaining a charter from the sultan gradually receded, sharp differences of opinion developed within the Zionist ranks. The "practical" Zionists, who included most of the Zionist leaders in Russia, pressed for an immediate start to be made in Palestine. The "political" Zionists, whose strength was in western and central Europe, still clung to the charter as an essential prerequisite, protesting that Zionist resources should not be dissipated on petty colonization. The "practical" Zionists won their first important success in 1908, when a Zionist agency was established at Jaffa. The political field was not abandoned, but the movement now began to throw itself more and more vigorously into the actual settlement of Jews on the soil of Palestine. For this purpose its main financial instrument was the Jewish National fund, uhich in 1914 owned property in Palestine to the value of £144,000, as compared with £35,000 in 1909 and £11,000 in 1907, when its active operations began. The marked quickening of the pace which dates from 1910 reflects the change in the direction of Zionist policy, though the resources of the movement were still small in comparison with those which were lavished upon the Jewish settlements in Palestine by Baron Edmond de Rothschild. It was Baron Edmond who came to the assistance of the struggling colonists in 1883, and it was due mainly to him that a number of Jewish agricultural colonies were already in existence in Palestine when his efforts began to be supplemented by those of the Zionist Organization. In 1914 Palestine had a Jewish population of about 90,000, including about 13,000 settlers in 43 agricultural colonies. The total number of Jewish immigrants between 1882 and 1914 has been estimated at about 45,000. In the period immediately before World War I, the Zionist Organization showed a growing tendency to interest itself in the revival of Hebrew culture in Palestine as well as in the settlement of Jews on the land. In 1913 the eleventh Zionist congress, while approving an ambitious program of rural colonization, also resolved that steps should be taken towards the early establishment in Jerusalem of a Hebrew university.

The outbreak of World War I, followed almost immediately by the intervention of Turkey on the side of the Central Powers, brought Zionist work in Palestine to a standstill. A new world was in the making, and it was now at least conceivable that the Zionists might secure something like the charter on which they had originally staked their hopes. Political Zionism was again in the ascendant. The initiative was taken by a group of Zionists in Great Britain, headed by Dr. Chaim Weizmann of Manchester university. The Zionists now proposed that Great Britain should make it part of its policy to provide in the peace settlement for the establishment in Palestine of a national home for the Jews.

The **Balfour** Declaration. — Meanwhile, a new situation was developing in the eastern theatre of war, and a British conquest of Palestine was becoming a possibility of the near future. At the same time, the hour of decision was approaching in the United States, where there was a Jewish population of over 3,000,000, while Russia, where the Jews were still more numerous, was steadily drifting into chaos. A declaration in favour of Zionism would help to rally Jewish opinion throughout the world to the side of the Allies. Further, the settlement in Palestine of a Jewish population attached to Great Britain by ties of interest and sentiment might well be of value in guaranteeing the permanent security of the approaches to the Suez canal. To these practical motives was added a genuine desire to contribute towards the solution of the Jewish problem, in which British statesmen had shown themselves sympathetically interested long before the war.

All these considerations played their part in bringing the British government into closer relations with the Zionist leaders. With Sir Mark Sykes as the principal intermediary, an exchange of views began in Feb. 1917, with the result that on Nov. 2 the foreign secretary, Mr. Balfour, wrote to Lord Rothschild:—

"Dear Lord Rothschild—I have much pleasure in conveying to you on behalf of His Majesty's Government the following declaration of sympathy with Jewish Zionist aspirations, which has been submitted to and approved by the Cabinet: 'His Majesty's Government view with favour the establishment in Palestine of a national home for the Jewish people, and will use their best endeavours to facilitate the achievement of this object, it being clearly understood that nothing shall be done which may prejudice the civil and religious rights of existing non-Jewish communities in Palestine or the rights and political status enjoyed by Jews in any other country.' I should be grateful if you would bring this Declaration to the knowledge of the Zionist Federation."

The Balfour Declaration, as it has come to be called, was the act of Great Britain, but it was issued with the knowledge and concurrence of the Allied Powers. France formally associated itself with the declaration in Feb. 1918, and Italy in the following May. As for the United States, President Wilson had personally intervened to make it clear that he would welcome a British pronouncement in favour of Zionism, and soon after the declaration was issued, he publicly expressed his satisfaction. In 1922 resolutions associating the United States with the policy embodied in the declaration were unanimously adopted by both houses of congress.

British Mandate for Palestine. — In Dec. 1920, the proposed terms of the Palestine mandate were submitted by the British government to the League of Nations for confirmation by the council. There was a succession of unforeseen delays, but a slightly modified draft was eventually approved by the council at its meeting in London on July 24, 1922. A few weeks earlier, the British government had issued a statement of British policy in Palestine, in which it interpreted the Balfour Declaration as meaning, "not the imposition of a Jewish nationality upon the inhabitants of Palestine as a whole, but the further development of the existing Jewish community, in order that it may become a centre in which the Jewish people, as a whole, may take, on grounds of religion and race, an interest and a pride." The mandate came into full operation on Sept. 29, 1923. In its final form, it recites the Balfour Declaration in the preamble, and includes among its provisions various articles dealing with Jewish immigration.

Zionism at Work. — The return to normal conditions was marked by the San Remo decision of April 1920, which was followed by the establishment in Palestine of a civil administration in the following July. Subject to the general control of the government, the Zionist Organization was for the first time in a position to bring in immigrants and to purchase land. Between 1918 and 1936 about 280,000 Jews immigrated to Palestine, of whom 61,854 entered in 1935. During the same period there were about 30,000 Jewish emigrants, of whom about 25,000 were post-war settlers, leaving a net immigration of about 255,000. The Jewish population, which was about 95,000 in 1914, was reduced during the war to about 55,000. It was returned at 84,000 at the census of Oct. 1922, was officially estimated at 108,000 in March 1925, and had risen to nearly 400,000 at the end of 1936. The area of land in Jewish possession rose from 177 sq.mi. in 1914 to 545 sq.mi. in 1936, and the total Jewish population of the rural areas from 13,000 to 90,000. With the exception of about 30 sq.mi. of state and waste lands, all the land acquired after World War I was bought, often at inflated prices, in the open market, and in addition to the heavy expenditure in which they have thus been involved, the Jewish National fund and other Jewish bodies have had to sink large amounts of capital in improvements, including in particular the drainage of marshes. There has been a considerable increase, which has been particularly marked since 1924, in the Jewish population of Jerusalem and Haifa. In the neighbourhood of Jaffa, the Jews have built up the rapidly expanding urban settlement of Tel Aviv, which had in March 1937 a population of 140,000, as compared with 13,000 in Dec. 1922, and 2,000 in Aug. 1914. The rapid growth of the towns is connected with the industrial development of Palestine, which in turn is largely due to the influx of private Jewish capital. In 1933 it was estimated that since 1920, 4,055 industrial enterprises had been established in Palestine, representing in the aggregate an investment of £4,500,000, which was predominantly Jewish. An important factor in the industrial and general development of Palestine is the Palestine Electric corporation, which has been largely financed from Jewish sources and which is supplying Jaffa and Haifa with electric light and power.

Education, — Since World War I, the Jewish organizations have largely extended the scope of their educational work in Palestine. At the end of 1935 they controlled 492 schools of various grades and categories with 51,314 pupils. Public health work on a large scale is done by the Hadassah Medical organization, the Jewish National council and other Jewish bodies. A Jewish technical institute was opened at Haifa in Feb. 1925 and the Zionist Organization also maintains an agricultural institute at Tel Aviv.

In April 1925, Lord Balfour formally inaugurated the Hebrew University of Jerusalem, consisting, in its first stages, of three research institutes, devoted respectively to chemistry, microbiology and tropical medicine, and Jewish and oriental studies.

In all these institutions the language is Hebrew, which has already become the Jewish vernacular in Palestine and is the mother-tongue of the whole of the new generation. (L. ST.; X.)

ZIONISM 1929–39

The Unrest of 1929.—Jewish immigration to Palestine had reached its first peak in 1924–25, to fall off sharply immediately thereafter. The following years witnessed large Jewish unemployment in Palestine and an emigration surpassing the number of immigrants. In 1929, at the Zionist congress at Zurich, a Jewish Agency composed of Zionists and non-Zionists was formed with strong American participation. At the same time the long smouldering Arab discontent with Zionism and with the British policy supporting it came to a head in violent outbreaks. Religious agitation had centred for some time around the respective Jewish and Mohammedan rights of the western wall (the Wailing Wall) of the Herodian Temple. But what had started as a religious conflict soon became a national conflict, Christian Arabs uniting with the Mohammedans. The new revolt surpassed by far the former open outbreak of Arab discontent in 1921. The British government sent out a commission of inquiry. Its report thought the disturbances caused by the Arab fear of a Jewish majority and of dispossession of their land. A British White Book on Oct. 20, 1930, accepted the recommendations of the commission regarding restrictions of immigration and land purchase. It was violently attacked by the Zionists and was reinterpreted in a way favourable to Zionist aspirations in a letter by the prime minister, Ramsay MacDonald, to the president of the Zionist Organization, Dr. Weizmann. on Feb. 13, 1931.

The New Prosperity and the New Unrest. — The wave of anti-Semitism rising in Germany with Hitler's advent to power and its spread to neighbouring countries increased rapidly Jewish immigration to Palestine after 1934. Most of the new immigrants came from Poland and Germany; some brought considerable capital with them, which they invested in new industries and in building developments, especially in Tel Aviv and Haifa. The highest official figure for Jewish immigration in Palestine in any single year was reached in 1935 with 61,854. Tel Aviv grew in population to more than 150,000, and the number of Jews in the whole of Palestine was estimated at 500,000, or a third of the country's total population. Yet it was this growing realization of Zionist hopes which increased the fears and resentment of the Arab population. The unrest which the events of 1936 provoked in the whole near east expressed itself in a revolu-

tion of the Palestine Arabs against Zionism and Great Britain, which assumed serious proportions and surpassed by far the preceding Arab revolts, not only in duration and scope but also in leadership and in the support which it found in all Arab countries, including Egypt.

The outbreak occurred in April 1936. Material damages and loss of human life were great. The British government dispatched in Nov. 1936 a royal commission under the chairmanship of Earl Peel to Palestine which reported in July 1937. In its findings it expressed great sympathy for Zionist aspirations and a warm recognition of the splendid Zionist achievements, but stressed at the same time the genuine character of Arab nationalism and of Arab fears. Palestine was an A mandate like Iraq or Syria and the inhabitants were thus entitled to democratic self-government and felt their expectations frustrated by Zionism. The aspirations of Zionism and of the Arabs being, as the commission declared, mutually exclusive and irreconcilable, it suggested the partition of Palestine into a smaller Jewish state which would comprise the fertile plains along the Mediterranean shore and the land of Galilee, while the Arabs would receive the hills and the deserts of the interior. Both states should be made independent and should enter into treaty relations with Great Britain which would retain Jerusalem and Bethlehem and a strip of land connecting these cities with the sea as a mandated territory. The Zionist congress meeting in Zurich in 1937 accepted, though reluctantly, the principle of partition but expreised the hope for a larger Jewish share. The Arabs opposed the idea of partition and were supported by the whole Arab world and its governments which made the issue of the future of the Palestinian Arabs one of the strongest causes uniting the Arab world.

New violence flared up in the summer of 1937 and was met this time by very strong government measures. The leading Arab committee was outlawed, its members deported or imprisoned, while its recognized leader, the mufti of Jerusalem, fled abroad. Military courts were instituted and vast military operations for the control of the country undertaken. Nevertheless the revolt continued unbroken during 1938 and gained even in intensity, especially after Zionist extremists, the Revisionists, resorted to terrorist acts of retaliation. By the fall of 1938, in spite of all the energetic countermeasures of the government and the large number of Arab victims, great parts of the country were under rebel control, who took over the functions of government; cities like Hebron, Bethlehem and Ramallah were in their hands and all normal traffic throughout the country was suspended. The revolt began only to subside in 1939.

During these years the development of Zionism had been affected in various ways by the events in the country. A heavy crisis in the citrus industry, the spread of the disorders, the political uncertainty, all that combined to create, after a period of great prosperity, a period of relative economic depression. Jewish immigration was reduced to about 12,000 yearly. Nevertheless, partly with the help of the government, the number of Jewish unemployed was kept small. Political attention was centred largely in London and in the United States, where the active sympathy of wide and influential circles was enlisted for Zionism. Meanwhile a commission appointed by the government under the chairmanship of Sir John Woodhead to report on the proposed partition submitted its report in Oct. 1938. Its members could not agree on any definite proposal. Under these circumstances the government declared in Nov. 1938 that it would drop the partition scheme and try to promote an understanding between the Arabs and the Zionists by direct negotiations in London.

By the beginning of 1939 the British government met in London with delegates of the Jewish Agency and of the Arabs. The case of the latter was supported with certain vigour by delegates from Egypt, Iraq and Saudi Arabia who proposed an independent Arab Palestine with full minority rights for the Jewish national home. Thus no common ground between Zionist and Arab aspirations could be found. The proposals made by the government in March 1939 were rejected by both sides. The British government saw itself now forced to suggest a solution of its own in its White Paper of May 17, 1939, which rejected the idea of a Jewish state as contrary to British obligations to the Arabs, and foresaw an independent Palestine which would safeguard the essential interests of Arabs and Jews alike. This independent state should come into existence after a transitional period of ten years. Meanwhile a Jewish immigration of 75,000 should be allowed over the next five years, while after that further Jewish immigration would depend upon Arab agreement. Measures for the regulation of the sale of land were also introduced. These British proposals were rejected by the Arabs and by the Zionists. The Jews in Palestine answered with a general strike and their more radical elements resorted to terrorism. Meanwhile immigration of Jews went on, often illegally. The Zionist congress at Geneva in the summer of 1939 voiced a protest against any restriction of Jewish immigration and against the policy expressed in the statement of May 1939.

World War II, which broke out in Sept. 1939, threw its shadow over Palestine, especially after Italy's entry into the war. As in World War I, the future of Palestine seemed again open for international deliberations, and the attention of Zionist circles was devoted to enlisting public opinion, especially in the United States, for a Zionist solution of the Palestinian and of the Jewish problem.

ZIRCON, a mineral composed of zirconium silicate, sometimes used as a gem stone. It is believed that the name comes from the Arabic *zargun,* and is essentially the same as "jargoon," the name given to certain varieties of zircon. The mineral crystallizes in the tetragonal system, generally in combinations of square prisms and square pyramids (figs. 48 and 49, CRYSTALLOGRAPHY). It is isomorphous with cassiterite and rutile, and like these may form geniculated twins. There is no distinct cleavage, and the mineral breaks with a conchoidal fracture. The hardness is about 7.5. The specific gravity has a very wide range, extending from 4.0 to rather more than 4.7, being thus greater than that of any other gem stone. Rarely colourless, zircon is usually brown or red, sometimes orange, yellow, green or blue, and occasionally parti-coloured or zoned. While common zircon is opaque, the gem varieties are transparent.

The effect of heat on zircon is remarkable. Most coloured zircons, exposed to a high temperature, either change or lose their colour, but this loss is attended by a gain in brilliancy. The "Matura diamonds" of Ceylon are zircons which have been thus artificially decolorized. Certain zircons when heated in a Bunsen-flame glow with an orange incandescence, while others may emit an orange glow when ground on a copper wheel fed with diamond dust. Some zircons when heated undergo remarkable changes in specific gravity and refractive indexes, and the suggestion has been made that there are at least three modifications of zirconium silicate. Zircon is used as a source of zirconia in various preparations, for incandescent gas mantles, etc. It was in this mineral that zirconia was originally discovered by M. H. Klaproth in 1789. while it has been found to contain small amounts of hafnium.

When fit for use as a gem stone it is often known as "noble" or "precious zircon." The red and orange stones are termed hyacinth (*q.v.*) and jacinth, while those of all other colours, as also the colourless transparent zircons, are called jargoons (*q.v.*). The gem varieties are found in detrital deposits, especially in Ceylon, New South Wales, Queensland and Siam, with sapphire, etc.

Zircon is an accessory constituent of many rocks, especially granite, and it forms an important constituent of the zircon-syenite of Norway. Being but little subject to alteration, it is common in secondary deposits, as in auriferous and other sands, occurring usually in small characteristic crystals.

ZIRCONIUM, a metallic chemical element, so called from the identification of its oxide, zirconia, by Klaproth (1789) in the mineral zircon (symbol Zr, atomic number 40, atomic weight 91.2). It was first isolated by J. J. Berzelius in 1824, who heated potassium zirconifluoride. K_2ZrF_6, with potassium and obtained an iron gray powder, which was, however, impure.

Preparation. — Preparation of the pure metal is difficult, owing to the facility with which zirconium combines with hydrogen, oxygen, nitrogen, boron, carbon and silicon and forms alloys with such metals as aluminum and magnesium. Specimens containing more than 99·6% of zirconium were obtained by pressing the impure metal into rods which could be used as electrodes. When an electric arc was struck across such electrodes in an atmosphere of hydrogen or ammonia under 11 mm. pressure, the metal of the positive electrode fused and fell in iron gray drops on the negative electrode. This procedure is allied to the method for obtaining pure zirconium by heating its hydride or nitride in *vacuo.* By electrical heating of zirconium tetrachloride with sodium in an evacuated bomb; ductile metal mas produced which when fashioned into rods gave a shiny surface on burnishing and a similar product was obtained in the reduction of zirconia by metallic calcium. Pure zirconium is deposited on a heated tungsten filament when the vapour of zirconium iodide is passed over the filament. Colloidal zirconium has been obtained by dialysis of the reduction product of potassium zirconifluoride with potassium. The melting point of zirconium has been variously given as 1,530° C. and 1,700° C. Its specific gravity is 6.4.

COMPOUNDS

Ferrozirconium (20% Zr), employed as a scavenger in steel castings, is made by heating zirconia and ferric oxide with aluminium in graphite crucibles. The addition of about 0·34% of zirconium to armour plating steel containing 3% of nickel adds to the tensile strength of the metal.

Hydrofluoric acid, even when dilute, hot concentrated sulphuric acid and aqua regia attack zirconium energetically, whereas hydrochloric and nitric acids dissolve it very slightly. It is oxidized on fusion with alkali hydroxides or nitre. At red heat zirconium reduces boric oxide, silica, titania and metallic oxides such as chromic oxide. Its great affinity for oxygen explains the employment of zirconium and its alloys as cleansing agents (scavengers for oxygen and nitrogen) in metallurgy. The commercially important zirconium minerals are (1) baddeleyite (brazilite), the native zirconia found in large quantities in Brazil (São Paulo and Minas Geraes); (2) zirkelite, a mixture of brazilite with zircon silicates, also found in Brazil; (3) zircon, $ZrSiO_4$, mined in Colorado. Following on their discovery of hafnium (*q.v.*) Coster and Hevesy report (1923) that most zirconium ores contain very appreciable quantities of this new element, the amount rising in certain instances to 10 or 20%.

Crystallised zirconia, ZrO_2, is obtained in colourless quadratic crystals by heating zirconium tetrafluoride with boric oxide. Owing to its refractory character and high melting point (given as 2,653±10° C or as 3,000° C) it has been recommended for furnace linings, crucibles, muffles and pyrometer tubes. It has also been used in enamels and in porcelain and opaque glasses. The first incandescent mantles made by **A. v.** Welsbach consisted principally of zirconia but this oxide is now superseded by thoria and ceria. In the Nernst lamp the incandescent body is chiefly zirconia (85%) with yttrium oxides (15%). Zirconium tetrafluoride, ZrF_4, obtained by heating zirconia with ammonium fluoride in highly refracting crystals, dissolves in water to form the hydrate, $ZrF_4,3H_2O$, and combines with alkali fluorides to yield several types of double fluorides employed in the isolation of the metal by reduction with potassium or sodium. The commonest type is exemplified by the potassium salt, K_2ZrF_6.

Zirconium tetrachloride, prepared by passing chlorine saturated with the vapour of carbon tetrachloride over zirconia heated in a silica tube at 600° C, is a white crystalline sublimate volatilising at 300° C and hydrolysed by water to zirconyl chloride, $ZrOCl_2$, which forms a crystalline octahydrate. Zirconium sulphate, $Zr(SO_4)_2,4H_2O$, forms colourless crystals prepared by dissolving zirconia in concentrated sulphuric acid and diluting slightly with water. It is also regarded as a zirconyl acid sulphate, $[ZrO(SO_4)_2]H_2,3H_2O$.

Other Salts.—Many other zirconyl salts are known including the nitrate which crystallises from aqueous solutions as $ZrO(NO_3)_2,2H_2O$. Zirconium tetra-acetylacetone, $Zr\{CH(CO.CH_3)_2\}_4,10H_2O$, obtained by the interaction of zirconyl nitrate, acetylacetone and aqueous sodium carbonate, crystallises from alcohol or acetylacetone in anhydrous colourless prisms melting at 193–195° C. When zirconium tetrachloride reacts with acetylacetone, benzoylacetone or dibenzoylmethane in anhydrous media, compounds are obtained of the general formula $[ZrDk_3]Cl$, where Dk is the univalent diketone radical (G. T. Morgan and A. R. Bowen, 1924).

Zirconium carbide, ZrC, a hard metallic substance, produced from zirconium and carbon in the electric furnace (H. Moissan and Lengfeld, 1896) is used as an abrasive and for cutting glass. A mixture of this carbide (90%) with ruthenium (10%) has been suggested as a filament for incandescent lamps.

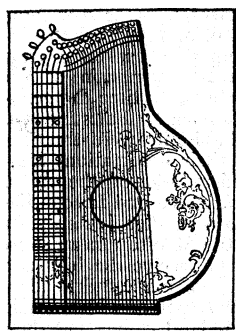
(G. T. M.)

ZITHER, a name applied in modern Germany to the ancient cithara (*q.v.*), to the cittern (*q.v.*), and to a derived instrument which is a kind of psaltery, consisting of a shallow, horizontal sound-chest with strings stretched above it which are plucked and thrummed, with plectrum and fingers, by the performer. (*See* illustration.) Zithers, which are made in various sizes, are the favourite instruments of the peasants in the Swiss and Bavarian highlands, and are sometimes heard also in the concert halls in Germany. The *Streichzither,* or bowed zither, is another variety of the instrument. There are four strings corresponding to those of the violin or viola, but the tone is nasal and glassy.



FROM GROVE. "DICTIONARY OF MUSIC" (MACMILLAN)

THE ZITHER. OR CITHARA, AN ANCIENT MUSICAL INSTRUMENT HAVING 36, 38 OR 42 STRINGS

ZITTAU, a town of Germany, in the extreme south-east of the Land of Saxony, on the left bank of the Mandau, near its confluence with the Neisse, by rail 48 mi. E.S.E. of Dresden and at the junction of lines to Reichenberg, Hermsdorf, Gorlitz, Oybin and Lobau. Pop. (1939) 38,271. Zittau is of Wendish origin (Chytawa is its Wendish name), and was made a town by Ottocar II. of Bohemia. It was one of the six towns of the Lusatian League (1346), at which period it belonged to Bohemia. It suffered severely in the Hussite wars and in the Thirty Years' War.

ZIWAR, AHMAD PASHA (1864–), G.C.M.G. (1925), Egyptian statesman, was born at Alexandria on Nov. 14, 1864, the son of Ziwar Bey. He was educated at the college of Lazarists, Alexapdria, and at the Jesuit university of St. Joseph, Beirut. He studied law at Aix-en-Provence, and held office as supreme judge at the Cairo court of appeal from 1899 to 1913, when he became governor of Alexandria. From 1918 to 1924 he held various government offices, being for a time minister of education and also minister plenipotentiary in Rome.

At the end of 1924 Ziwar Pasha formed a ministry in succession to the Zaghlul ministry, which had been compelled to resign in November after the murder of Sir Lee Stack. Ziwar Pasha reestablished good relations with Great Britain and took action to prevent political agitation among young students. He also came to an agreement with the British government on the rights of Egypt in the waters of the Blue Nile. In the elections of February-March, 1925 the parties opposed to Zaghlul obtained a very small majority of 6, and Ziwar Pasha then formed a coalition cabinet, which proved to be short-lived, for the new chamber immediately chose Zaghlul as its president. Ziwar Pasha thereupon immediately resigned and advised the king to dissolve parliament. But the elections had to be postponed owing to the need of framing a new electoral law. Ziwar withdrew his resignation, and continued to direct the government. He spent some months in Europe, and on his return proceeded to reconstruct his cabinet. Ziwar resigned on June 5, 1926.

ŽIŽKA, JOHN (c. 1376–1424), Bohemian general and Hussite leader, was born at Trocnov in Bohemia. He lost an eye in the civil wars under Wenceslaus IV. Connected with the court from his youth, he held the office of chamberlain to Queen Sophia. The Hussite movement first brought him into prominence. When a temporary armistice was concluded between the partisans of King Sigismund and the citizens of Prague, Žižka joined the advanced Hussites at Tabor, helped to organize the new military community and became one of the four "captains of the people" (*hejtmane*) at its head. On receiving an appeal from the citizens of Prague to help against Sigismund, king of the Germans and king of Hungary, who had invaded Bohemia, claiming the crown as the heir of his brother Wenceslaus, the Taborites marched to Prague and on July 14, 1420, largely through Žižka's heroism, repulsed an attack by Sigismund's forces, on their position on the Vitkov hill, where the suburb of Žižkov now stands, forcing Sigismund to raise the siege. On Aug. 22, 1420, the Taborites left Prague and returned to Tabor.

Žižka was now engaged in constant, and invariably successful, warfare with the partisans of Sigismund, particularly with the powerful Romanist, Ulrich of Rosenberg. At the meeting of the Estates of Bohemia and Moravia at Caslav (June 1, 1421), Žižka was elected member for Tabor to the provisional government. He summarily suppressed some disturbances by the

Adamite sect, continued his campaigns against the Romanists and adherents of Sigismund, and, having captured a small castle near Litoměřice (Leitmeritz), retained possession of it—the only reward for his great services that he ever received or claimed. According to Hussite custom, he gave the biblical name of "Chalice" to this new possession, and henceforth adopted the signature of "Žižka of the Chalice." In 1421, while besieging the castle of Rábi, he lost the use of his remaining eye. Though now totally blind, he retained his command, and on Jan. 6, 1422, severely defeated Sigismund at Nebovid, Kutna Hora, and again at Německy Brod (Deutschbrod) on Jan. 10. Early in 1423 internal dissensions among the Hussites led to civil war. Žižka, as leader of the Taborites, defeated the men of Prague and the Utraquist nobles at Hořic on April 27, and when the armistice of Konopist (June 24) was followed by renewed civil war, he once again defeated the Utraquists, under Borek, at Strachov, near Králové Hradec (Aug. 4, 1423).

Žižka now made a brilliant, although unsuccessful attempt to invade Hungary, which was under the rule of his old enemy King Sigismund. In 1424, civil war having again broken out in Bohemia, Ziika decisively defeated the Praguers and Utraquist nobles at Skalic (Jan. 6), and at Malesov (June 7). In September he marched on Prague, but on the 14th of that month peace was concluded between the Hussite parties who agreed to make a combined attack on Moravia, part of which was still held by Sigismund's followers. Žižka was given the command, but before reaching the frontier, he died of the plague at Pribyslav (Oct. 11, 1424).

See Count Lützow, *Bohemia: an Historical Sketch (1896)*; Louis Léger, *Jean Žižka* in *"Nouvelles études Slaves," deuxième série (1886).*

ZLATOUST, a town in the Uralsk Area of the Russian S F. S.R., 1,925 ft. above sea-level on the Ai, a tributary of the Ufa river, in 55° 10′ N , 59° 40' E., on the Ufa-Chelyabinsk railway. Population 99,272. The town has smelting works and manufactures machinery; there is a meteorological and magnetic observatory.

ZLOTY, post-war monetary unit of Poland. Following the collapse of the Polish mark, instituted immediately after the World War, the zloty was substituted in 1924. It was then made equivalent to the gold franc, at a parity of 25.22 zlotys to the pound sterling, and was backed partly by gold and gold exchange, and partly by other forms of security. Events soon showed that the new currency had been introduced before the country was ready to support it, and during 1925 and 1926 renewed depreciation set in. In 1927 a second attempt at stabilization was made. A foreign stabilization loan was issued, and the proceeds used to give a gold exchange backing to the new zloty, the value of which was fixed at 43.38 to the £1 sterling; in 1938 it fluctuated between $24\frac{1}{4}$ and $26\frac{3}{4}$ to the £1. *(See* CURRENCY.)

ZNAIM: *see* ZNOJMO.

ZNOJMO (*Znaim*), in Moravia, on the Dyje. A settlement is believed to have existed here from prehistoric time. The present town was founded in 1226 on the site of the old capital, destroyed in 1145. Lying at the junction of old granites and tertiary strata Znojmo manufactures clay products and stoneware. It is also famous for its extensive fruit and vegetable farms, which supply bottling factories. Among its old buildings are a 12th century Romanesque castle chapel (the Heiden-Tempel) a 14th century Gothic church and a 15th century town hall with Gothic tower (250 ft). Population 24,952, mostly German.

ZOBEIR RAHAMA (1830–1913), Egyptian pasha and Sudanese governor, came of the Gemaab section of the Jaalin, and was a member of a family which claims descent from the Koreish tribe through Abbas, uncle of Mohammed. He was the most energetic and intelligent of the Arab ivory and slave traders who about 1860 established themselves on the White Nile and in the Bahr-el-Ghazal. Nominally a subject of Egypt, he raised an army of several thousand well-armed blacks and became a dangerous rival to the Egyptian authorities. At the height of his power Zobeir was visited (1871) by Georg Schweinfurth, who found him "surrounded with a court which was little less than princely in its details" (Heart of *Africa,* vol. ii., chap. xv.). In 1869 an expedition sent from Khartum into the Bahr-el-Ghazal was attacked by Zobeir and completely defeated, its commander being slain. Zobeir represented that he was blameless in this matter, received a "pardon," and was himself appointed governor of the Bahr-el-Ghazal, where he was practically independent. In 1873 he attacked the sultan of Darfur, and the khedive Ismail gave him the rank of bey and sent troops to co-operate. After he had conquered Darfur (1874), Zobeir was made a pasha, but he demanded the governor-generalship of the new province, and went to Cairo in the spring of 1876 to press his title. The Egyptian authorities prevented his return, though he was allowed to go to Constantinople at the outbreak of the Russo-Turkish War. In 1878, however, his son Suleiman, having got possession of the Bahr-el-Ghazal, defied the authority of General Gordon, the new governor-general. Gordon sent Romolo Gessi against Suleiman and his ally Rabah (*q.v.*), who was subdued after an arduous campaign and executed.

During the campaign Zobeir offered, if he were allowed to return to the Sudan, to restore order and to pay a revenue of £25,000 a year to the khedive. Gordon declined this help, and subsequently, for his instigation of the revolt, Zobeir was condemned to death, but the trial was a farce, the sentence was remitted, and he remained at Cairo, now in high favour with the khedival court. In March 1884, Gordon, who had been sent to Khartum to effect, if possible, the relief of the Egyptian garrisons in the Sudan, astonished Europe by requesting that Zobeir, whose son he had overthrown and whose trade he had ruined, should be sent to Khartum as his successor. Zobeir, described by Sir Reginald Wingate, who knew him well, as "a quiet, far-seeing, thoughtful man of iron will—a born ruler of men" (*Mahdiism and the Egyptian Sudan,* book v.), might have been able to stem the mahdist movement. But to reinstate the notorious slave-dealer was regarded in London as too perilous an expedient, even in the extreme circumstances then existing, although Colonel Stewart (Gordon's companion in Khartum), Sir Evelyn Baring and Nubar Pasha in Cairo, and Queen Victoria and Mr. Gladstone, all favoured such a course. In March 1885 Zobeir was arrested in Cairo by order of the British government for treasonable correspondence with the mahdi and other enemies of Egypt, and was interned at Gibraltar. In August 1887 he was allowed to return to Cairo, and after the reconquest of the Sudan was permitted (1899) to settle in his native country. He established himself on his estates at Geili, some 30 m. N. of Khartum, where he died on Jan. 5, 1913.

See GORDON, CHARLES GEORGE, and the authorities there cited.

ZODIAC, in astronomy and astrology, a zone of the heavens within which lie the paths of the sun, moon and principal planets (ὁ ζωδιακὸς κύκλος from ζῴδιον "a little animal"). It is bounded by two circles equidistant from the ecliptic, about 18 degrees apart; and it is divided into 12 signs, and marked by 12 constellations. These 12 constellations, with the symbols of the signs which correspond to them, are as follows:—

Aries, the Ram	♈	Libra, the Balance	♎
Taurus, the Bull	♉	Scorpio, the Scorpion	♏
Gemini, the Twins	♊	Sagittarius, the Archer	♐
Cancer, the Crab	♋	Capricornus, the Goat	♑
Leo, the Lion	♌	Aquarius, the Water-carrier	♒
Virgo, the Virgin	♍	Pisces, the Fishes	♓

In the technical sense of the word the 12 "signs" are geometrical divisions 30 degrees in extent counting from the position of the sun at the vernal equinox. In the time of Hipparchus the signs corresponded fairly closely with the constellations; that is to say, the first sign (called Aries) corresponded with the constellation Aries. Owing to precession there is now a discrepancy amounting to the breadth of a whole sign, so that the sign Aries is occupied by the constellation Pisces. *(See* CONSTELLATION.)

ZODIACAL LIGHT, a faint illumination of the sky, surrounding the sun and elongated in the direction of the ecliptic on each side of the sun. It is lenticular in form, brightest near the sun, and shades off by imperceptible gradations, generally becoming invisible at a distance of 90° from the sun. Until a recent

time it was never observed except in or near the zodiac; hence its designation. The most favourable time for evening observation in the northern hemisphere is during the months of February and March. In the tropics, where the ecliptic is nearly perpendicular to the horizon, it may be seen after the end of twilight on every clear evening, and before twilight on every clear morning, unless blotted out by moonlight. It then presents a nearly vertical wedge-shaped form, the base of which extends 15° or 20° on each side of the point at which the ecliptic intersects the horizon. The point of the wedge is quite indefinite, the extremely diffuse light gradually fading into invisibility at a height which may range from 50° to 70° or even more, according to the keenness of the observer's vision.

It is clear that the light proceeds from a region surrounding the sun, lenticular in form, the axis of the lens being nearly perpendicular to the ecliptic, while the circumference extends at least to the orbit of the earth. The hypothesis which best explains all the phenomena is that the light is that of the sun reflected from an extremely tenuous cloud of particles having the form and extent described, and becoming more and more tenuous as the earth's orbit is approached until, immediately outside the orbit, it fades into complete invisibility. It has been shown by Fath that the spectrum is identical with that of sunlight.

Intimately connected with the zodiacal light is the *Gegenschein,* or counter-glow, a faint illumination of the sky in the region opposite the sun, which may generally be seen by a trained eye when all the conditions are favourable. The Milky Way renders it invisible during the months of June, July, December and January. Its light is so faint and diffuse that it is impossible to assign dimensions to it, except to say it covers a region of several degrees in extent. Barnard, the most successful observer, assigns diameters of 5° or even 10° or more. The explanation is uncertain.

ZOFFANY, JOHANN (1733–1810), British painter, whose father was architect to the prince of Thurn and Taxis, was born in Frankfort-on-Main. He ran away from home at the age of 13 and went to Rome, where he studied art for nearly 12 years. In 1758 he left for England, and after undergoing some hardships was brought into fashion by royal patronage, and in 1769 was included among the foundation members of the Royal Academy. He went to Florence in 1772 with an introduction from George III. to the grand duke of Tuscany, and remained until 1779. He lived (1783 to 1790) in India, executing some of his best-known paintings; but the last 20 years of his life were spent in England. He died in 1810 and was buried in Kew churchyard.

ZOG 1, AHMED (1895–), King of the Albanians, was head of the Zogolli, one of the four ruling families of the Mati district and was educated at a military school at Monastir and in Constantinople. He first distinguished himself as a supporter of the prince of Wied in 1914. During the World War he fought for the Austrians. He became minister of the interior (Jan–Nov. 1920), and organized resistance to the Yugoslav incursions during the autumn. He was commander-in-chief of the national forces under the "Sacred Union" cabinet (Oct.–Dec. 1921), and again distinguished himself against the Yugoslavs. As minister of the interior in Djafer Ypi's cabinet (Dec. 1921–Dec. 1922), he suppressed a serious insurrectionary movement in March 1922, and disarmed the lowlanders. Becoming prime minister, Dec. 1922, he governed with ability, pursuing a sound anti-irredentist and constructive policy. Towards the end of 1923 he was accused by the Democratic party of obstructing various progressive and agrarian reforms. Following an attempt upon his life he resigned in Feb. 1924, but his influence remained. A revolt against him and his colleagues took place in June, and he sought refuge in Yugoslavia. But skilfully turning to his advantage Yugoslavian policy, he returned to Albania in Dec. 1924 and ousted his successor, Archbishop Fan Noli. His election as president of the Albanian republic on Feb. 1, 1925, ushered in a period of internal tranquillity. He was proclaimed king at Tirana on Sept. 1, 1928. On April 27, 1938, he married Countess Geraldine Apponyi of Hungary; a son being born to them on April 5, 1939. Three days later, on the Italian occupation of Albania, the King and Queen became exiles *(See* ALBANIA.) (J. Sw.)

ZOÏLUS (*c.* 400–320 B.C.), Greek grammarian of Amphipolis in Macedonia. Zoi'lus appears to have been at one time a follower of Isocrates, but subsequently a pupil of Polycrates. Zoi'lus was chiefly known for the acerbity of his attacks on Homer (which gained him the name of Homeromastix, "scourge of Homer"), chiefly directed against the fabulous element in the Homeric poems. Zoi'lus also wrote against Isocrates and Plato, who had attacked the style of Lysias of which he approved. The name Zoi'lus came to be generally used of a spiteful critic.

See U. Friedländer, *De Zoilo aliisque Homeri Obtrectatoribus* (Königsberg, 1895); J. E. Sandys, *History of Classical Scholarship* (2nd ed. 1906).

ZOISITE (named after Baron Zois who first observed it), a rock-forming mineral of the composition of $HCa_2Al_3Si_3O_{13}$, crystallizing in the rhombic system. Crystals are usually prismatic, deeply striated parallel to their length and have a perfect 010 cleavage. Two varieties are optically distinguishable; in α-zoisite the plane of the optic axes is parallel to the cleavage (010), while in β-zoisite it is normal to this plane. The resemblance to the monoclinic clinozoisite of the same chemical composition (*see* EPIDOTE) is revealed when the crystallographic orientation of zoisite is adjusted so that the plane of cleavage is basal (001) and the zone of elongation and striation the b axis. The colour of the mineral is white or grey, but a manganiferous variety (thulite) is pink and pleochroic. The hardness is 6·5 and the sp.gr. 3.3.

Zoisite is characteristically a product of dynamic metamorphism and is an essential constituent of saussurite, the zoisite of this aggregate being derived from the anorthite molecule of plagioclase. It is chiefly developed in crystalline schists.

Thulite occurs with blue vesuvianite at Telemarken in Norway and with withamite gives the red colour to the well known *porfido rosso antico* or hornblende-porphyrite of Djebel Dokhan in Egypt. Zoisite has not been prepared synthetically. (C. E. T.)

ZOLA, EMILE EDOUARD CHARLES ANTOINE (1840–1902), French novelist, was born in Paris on April 2, 1840, his father being an engineer, part Italian and part Greek, and his mother a Frenchwoman. The father seems to have been an energetic, visionary man, who, dying while his only son was a little lad, left to his family no better provision than a lawsuit against the municipality of the town of Aix. It was at Aix, which figures as Plassans in so many of his novels, that the boy received the first part of his education. Thence he proceeded, in 1858, to Paris. His first book, *Contes à Ninon,* appeared on Oct. 24, 1864, and attracted some attention, and in Jan. 1866 he determined to abandon clerking and take to literature. Vigorous and aggressive as a critic, his articles on literature and art in Villemessant's paper *L'Événement* created a good deal of interest. So did the gruesome but powerful novel, *Thérèse Raquin* (1867). Meanwhile, with characteristic energy, Zola was projecting something more important: the creation of a world of his own, like that of Balzac's *Come'die Humaine*—the history of a family in its various ramifications during the Second Empire. The history of this family, the Rougon-Macquart, was to be told in a series of novels containing a scientific study of heredity—science was always Zola's *ignis fatuus*—and a picture of French iife and society. The first novel of the series, *La Fortune des Rougon,* appeared in book form at the end of 1871. It was followed by *La Curée* (1874), *Le Ventre de Paris* (1874), *La Conquête de Plassans* (1875), *La Faute de l'Abbé Mouret* (1875), *Son Excellence Eugène Rougon* (1876)—all books unquestionably of immense ability, and in a measure successful, but not great popular successes. Then came *L'Assommoir* (1878?), the epic of drink, and the author's fortune was made. Edition followed edition. He became the most discussed, the most read, the most bought novelist in France—the sale of *L'Assommoir* being even exceeded by that of *Nana* (1880) and *La Débâcle* (1892). From the *Fortune des Rougon* to the *Docteur Pascal* (1893) there are some 20 novels in the *Rougon-Macquart* series, the second half of which includes the powerful novels *Germinal* (1885) and *La Terre* (1888). In 1888 Zola departed from his usual vein in the idyllic story of *Le Rêve.* Zola also wrote a series of three romances on cities. *Lourdes, Rome, Paris* (1894–98), novels on the "gospels"

of population (*Fécondité*) and work (Travail), a volume of plays, and several volumes of criticism.

Zola played a very important part in the Dreyfus affair, which convulsed French politics and social life at the end of the 19th century. At an early stage he came to the conclusion that Dreyfus was the innocent victim of a nefarious conspiracy, and on Jan. 13, 1898, with his usual intrepidity, he published in the Aurore newspaper, in the form of a letter beginning with the words *J'accuse,* a terrible denunciation of all those who had had a hand in hounding down that unfortunate officer. Zola's object was a prosecution for libel, and a judicial inquiry into the whole *affaire,* and at the trial, which took place in Paris in February, a fierce flood of light was thrown on the case. The chiefs of the army put forth all their power, and Zola was condemned. He appealed. On April 2, the Cour de Cassation quashed the proceedings. A second trial took place at Versailles, on July 18, and without awaiting the result Zola, by the advice of his counsel and friends and for reasons of legal strategy, abruptly left France and took refuge in England. Here he remained in hiding, writing *Fécondité,* till June 4, 1899, when, immediately on hearing that there was to be a revision of the first Dreyfus trial, he returned to Paris.

On the morning of Sept. 29, 1902, Zola was found dead in the bedroom of his Paris house, having been accidentally asphyxiated by the fumes from a defective flue. He received a public funeral, at which Captain Dreyfus was present. Anatole France delivered an impassioned oration at the grave. At the time of his death Zola had just completed a novel, *Vérité,* dealing with the incidents of the Dreyfus trial. A sequel, Justice, had been planned, but not executed. Zola's literary position would have more than qualified him for the French Academy. He was several times a candidate in vain. (F. T. M.)

See Emile Zola, Novelist and Reformer (1904), giving a full account of his life and work, by E. A. Vizetelly, who translated and edited many of his works in English; also P. ZOLLVEREIN, a certain form of Customs Union, but denoting specially the system in force among the German states between 1819 and 1871 (see CUSTOMS UNION, TARIFFS, and GERMANY: History). The name is the Ger. *Zoll,* toll, customs, and *Verein,* union.

ZONARAS, JOANNES (JOHN), Byzantine chronicler and theologian, flourished at Constantinople in the 12th century. Under Alexius I. Comnenus he held important official positions, but in the succeeding reign he retired to Hagia Glykeria (one of the Princes' Islands), where he reluctantly yielded to the pressure of his friends to compose a profane history. This work, Ἐπιτομὴ Ἱστοριῶν (compendium of history), in eighteen books, extends from the creation of the world to the death of Alexius (1118). Zonaras is chiefly valuable for preserving in his work the first twenty-one books of Dio Cassius (Zon. 7–8).

Complete edition in Migne, Patrologia Graeca, cxxxiv. cxxxv. cxxxvii. Translation in Cary's Dio *Cassius,* Loeb Classical Library.

ZONE, EQUISIGNAL, a term in radio denoting the region in which the two distinctive signals from an equisignal radio beacon (*q.v.*) are received with equal intensity.

ZONING. The zoning of cities has had considerable influence on their architecture and on the preservation of their amenity. As practised in modern times it is a new movement and is still in the experimental stage.

Zoning in **Europe.**—What has come to be called zoning in English-speaking countries had its first inspiration and derived its name from the building regulations applied in Central Europe before 1909. Since 1875 German and Swedish cities have applied zoning regulations to the zones around their built areas, with a view to controlling the heights and densities of buildings in town extensions. The effect of the German laws, and of the fairly rigid control exercised under them, has been to procure a greater spaciousness and uniformity of development than would have occurred under ordinary building regulations.

When the Town Planning Act was passed in England in 1909, it had for its general object the control of the development of land likely to be used for building purposes. In so far as it provided for regulation of heights, densities and uses of buildings it related primarily and almost solely to entirely new building development. The fact that it is so limited has prevented it from being an effective instrument in procuring architectural control. But part of its object is to provide such control over new developments. Section 59 (2) in the original Act of 1909 was as follows:

"Property shall not be deemed to be injuriously affected by reason of the making of any provisions inserted in a town planning scheme, which, with a view to securing the amenity of the area included in the scheme or any part thereof, prescribe the space about buildings or limit the number of buildings to be erected, or prescribe the height or character of buildings, and which the Ministry of Health, having regard to the nature and situation of the land affected by the provisions, consider reasonable for the purpose."

It is noteworthy that the purpose for which the restrictions in an English scheme are imposed is to secure the "amenity of the area." For the reason given, the law has not influenced the redevelopment of built-upon areas. Being primarily intended to regulate residential buildings it has had little effect also on the architecture of other buildings. It has introduced into England a spacious type of development for the cottages of the working classes. On the whole, it has improved cottage architecture and introduced a better arrangement and grouping of buildings.

In town planning schemes public authorities may take power to approve or disapprove the elevation of, and the materials to be used in, buildings. For the purpose of exercising this power the authority must constitute a special advisory committee of those members of which one shall be an architect nominated by the Royal Institute of British Architects.

Zoning in the United States.—Contrary to what has happened in England zoning in the United States has been too limited in its application to undeveloped areas and has been chiefly applied to areas already built upon.

In New York zoning has exercised a greater influence on architecture than in any other city. New York was the first city in the western continent to impose zoning regulations. Its Zoning Resolution was passed in 1916 and had for its object the restriction of the height and hulk of buildings and the regulation of their uses. It did not directly attack the problem of density, except by restricting height and bulk.

New York was zoned just when the steel frame and the elevator had begun to have a profound influence on building and architecture (*q.v.*). During the 12 years since the passing of the Act (1916–28) enormous changes have taken place in the city, and an extensive rebuilding programme has been carried out.

The zoning law in New York is intended to relieve street congestion, for, other things being equal, it is obvious that such congestion is directly proportionate to the bulk of the buildings flanking the street. The Paris law limits the straight vertical height to 20 metres; above that, additional storeys must remain within the arc of a circle of fixed radius. The London regulations permit of 80 ft. vertical height and two supplementary storeys which must remain behind a sloping line of 75 deg. from the horizontal. In New York the vertical height is now determined by the width of the street, but varies according to the "zone" or district in which the given property is situated. These districts are classified as follows: "One-time" districts, "one-and-one-half-time" districts, "two-time" districts and "two-and-one-half-time" districts. That is to say, the straight vertical height may be equal to the width of the street in residence zones; it may be one-and-one-half times the width of the street in certain residence and business zones; twice the width in the principal business centres and two-and-one-half times in the Wall Street financial section. For the purpose of the law, no street is considered less than 50 ft. or more than 100 ft. wide. Additional storeys above the vertical

height must remain back of a line drawn from the centre of the street through a point on the top front of the vertical height.

The salient feature of New York is its towers, and it was considered wise, in framing the zoning law, to permit the erection of a tower, which may rise to an indefinite height (limited only by structural possibilities and economic conditions), upon 25% of the total lot area. This has resulted in a very surprising and interesting form of architecture (*q.v.*). In Paris certain buildings of a monumental nature, either religious or governmental, may exceed the height limit. In London, towers purely for architectural embellishment but not for human occupancy, may pass the legal height. In New York no restriction is made as to occupancy of the tower provided that the building remains within the given "envelope." Furthermore, the so-called "dormer" permit allows certain portions of the front of each building to rise slightly in excess of the maximum vertical height to give variety of outline. Above this the buildings are usually stepped back, forming a pyramidal series of terraces which vie with the storeyed magnificence of the hanging gardens of Babylon. The law has produced two other interesting results: first, the virtual elimination of interior light courts, these being cut in the side in order to preserve a base for the central tower; second, the tendency to assemble larger and larger plottage so that the 25% tower will be large enough to warrant construction of a great number of tower storeys.

The example of New York has been followed in hundreds of American cities, where no part of city planning has been so popular as zoning. No effect of zoning has impressed itself on the public consciousness more than its effect on the architectural treatment of buildings.

The important needs in connection with the further development of zoning, as a means of promoting art and amenity in connection with city building, whether directly owing to extended power under restrictive legislation, or indirectly by further use of existing powers, are: the inclusion of zoning as part of comprehensive city plans so that it will deal constructively with building expansion and reconstruction of complete urban areas comprising all parts of a city or a region; the further extension of zoning in regard to restriction of density, parallel with further strengthening of provisions in regard to heights and uses, so as to secure more light and air in buildings, a better display of buildings and less congestion on adjacent streets than at present. Further restriction on height should be based on the principle that the primary need is to obtain adequate spaces about buildings of all heights, and not to obtain lower buildings as an object in itself. (*See* also TOWN AND CITY PLANNING.)

ZOOLOGICAL GARDENS (ZOOLOGICAL PARKS), institutions in which wild animals are kept in captivity. The first zoological garden of which we have information was founded in China by the first emperor of the Chóu dynasty, who reigned about 1100 B.C. This was called the "Intelligence Park," and appears to have had a scientific and educational object. The ancient Greeks and Romans kept in captivity large numbers of leopards, lions, bears, elephants, antelopes, giraffes, camels, rhinoceroses and hippopotami, as well as ostriches and crocodiles, but these were destined for slaughter at the gladiatorial shows. In later times royal persons and great feudal magnates frequently kept menageries of wild animals, aviaries and aquaria, and it is from these that the modern public gardens have taken their origin. Henry I. (1100–35) established a menagerie at Woodstock, Oxfordshire, England. This was transferred to the Tower of London apparently in the reign of Henry III., and kept up there until at least 1828. Philip VI. had a menagerie in the Louvre at Paris in 1333, Charles V. maintained collections at Conflans, Tournelles and in Paris, and Louis XI. formed a menagerie at Plessis les Tours in Touraine, which after his death was re-established at the Louvre in Paris and enlarged by collections obtained in North Africa. It was destroyed by Henry III. Henry IV. had a small collection, which included an elephant. Louis XIII. kept some animals at Versailles, whilst his son Louis XIV. founded the famous "Ménagerie du Parc" at Versailles, which received many animals from Cairo, was maintained for over a century, and furnished much valuable material to French naturalists and anatomists. It gradually decayed, however. and was almost extinguished by the mob in 1789. In 1793, the Paris museum of natural history was re-established by law, and Buffon's idea of attaching to it a menagerie was carried out; the latter, as the collection in the Jardin des Plantes, still survives. In Germany the elector Augustus I. founded a menagerie at Dresden in 1554. In the New World, according to Prescott, King Nezahualcoyotl had zoological gardens at Tezcuco in Mexico in the middle of the 15th century, whilst in the next century Cortes found aviaries and fishponds at Iztapalapan, and Montezuma II., emperor of Mexico in the beginning of the 16th century, maintained large collections of animals.

Africa.—The zoological gardens at Giza, Cairo, a government institution, are beautifully laid out and particularly rich in African animals. The Khartum zoological gardens are free to the public and are under the control of the municipality, but the collection of animals is under the game preservation department. The Transvaal zoological gardens at Pretoria are a government institution.

America, North.—The zoological park at Bronx Borough, New York, opened in 1899, is one of the largest in the world. It is controlled by the Zoological Society of New York, with representatives of the municipality of the City of New York, is financed largely out of municipal funds, and is open free to the public five days a week. The park occupies nearly gooac. and contains many fine buildings, but its special feature is a series of spacious enclosures for large herds of bison and deer. The national zoological park at Washington (D.C.), was founded by Congress in 1889–go "for the advancement of science and the instruction and recreation of the people." The site was purchased by the United States Government, and all the expenses come from national funds, the management being vested in the Smithsonian Institution. The park consists of about 265ac. of undulating land with natural woods and rocks, traversed by a gorge cut by Rock Creek, a small tributary of the Potomac. The zoological gardens in Fairmount park, Philadelphia, resemble the gardens of the Zoological Society of London. They are controlled by the Zoological Society of Philadelphia, founded in 1859 and recognized as the oldest zoo in America. Outstanding open barless cage zoos are Chicago-Brookfield. Detroit, St. Louis, and Cincinnati.

America, South.—The zoological gardens at Buenos Aires are supported by the municipality. At Para, Brazil, is a good collection attached to the Museum Goeldi, and there are less important collections at Rio de Janeiro, Lima and Bahia.

Asia.—There are many small collections in different parts of Asia, but the only garden of great interest is at Alipore, Calcutta, supported chiefly by gate-money and a donation from the Government, and managed by an honorary committee. It was established in 1875 by the government of Bengal.

Australia and New Zealand.—There are zoological gardens at Melbourne (founded 1857), Adelaide, Sydney and Perth, and small gardens at Wellington, New Zealand.

Europe.—There are a large number of zoological gardens in Europe, but those of real importance are not numerous. The garden and large menagerie of the Royal Zoological Society of Antwerp were founded in 1843, and have been well maintained. The gardens of the Zoological Society of London in Regent's park, founded in 1826, extend to only about 35ac., but the collection, if species and rare animals be considered rather than the number of individuals, has always been the finest in existence. It has been a pioneer in modern methods, such as radiant heat, artificial sunlight and adequate ventilation. In 1931 it opened an open air "Zoo" of nearly 500ac. at Whipsnade in the Chilterns, 30m. from London. The Royal Zoological Society of Ireland, founded in 1830, maintains a fine collection in the Phoenix park at Dublin, and has been specially successful in the breeding of lions. The Bath, Clifton and West of England Zoological Society owns zoological gardens, well situated on the edge of Clifton Downs. The new zoological park near Edinburgh occupies an extensive and beautiful site and has specialized in open air displays. The Zoologisk Have at Copenhagen, founded in 1859, con-

tains a good collection, with a specially well-designed monkey-house. At Lyons and at Marseilles in France there are beautifully situated gardens with small collections, in each case owned and controlled by the municipalities. In Paris there are two well-known gardens. That of the Jardin des Plantes founded in 1793, is under the control of the museum authdrities. It is open free to the public and generally contains a good collection of mammals. The larger and better known Jardin d'Acclimatation in the Bois de Boulogne is owned and conducted by a private company, but since the World War has fallen into decay. Germany contained in 1914, 20 zoological gardens, most of which have recovered prosperity since the World War. The great Gardens, Berlin, was founded in 1844, and belongs to a private company. The collection is extremely good. The gardens at Cologne, founded 1860, contain many interesting features, in particular one of the finest aviaries in Europe. The gardens of the Zoologiczl Society of Hamburg, founded in 1863, contain a fine collection and display many ingenious devices for the housing of the animals. More recently C Hagenbeck constructed a remarkable zoological park at Stellingen, the first zoo to carry out completely the barless type cage construction in the years 1904–06. The best-known gardens in Holland are at Amsterdam, owned by the society "Natura Artis Magistra." Besides the menagerie, founded in 1838, the society owns a fine aquarium The garden at Rotterdam is of high interest.

MANAGEMENT OF ZOOLOGICAL GARDENS

Supply of Animals.—A certain number of wild animals are born in captivity and from time to time the possession of a successful stock enables one collection to supply many others. At one time London was able to supply many Continental gardens with giraffes. and Dublin and Antwerp have had great successes with lions, whilst antelopes, sheep and cattle, deer and equine animals are always to be found breeding in one collection or another. But wild animals have to be obtained to replenish the stock. The conditions of success are that the wild creatures should be obtained as young as possible, kept in their native localities until they have become accustomed to man and to such food as they can be given at their ultimate destinations.

Area and Site.—The areas occupied vary from about 300ac. (New York) to about 8ac. (Clifton, England). In the larger gardens, however, the greater part of the space is engaged by a few extensive enclosures for numerous herds of herbivorous animals. With regard to situation, the ideal would be to have the collection placed in the open country, far from centres of population. But as menageries are supported for the public and in most cases by the public, such a site is impractical, and if the soil, drainage and exposure are reasonably good, experience shows that a thriving collection may be maintained near a large town.

Hygiene.—The first requisite is strict attention to cleanliness. A collection of animals must be compared with public institutions such as barracks or infirmaries. There must be an abundant supply of fresh air and of water, and a drainage system as complete as possible. The buildings should be constructed on the most modern hospital lines, with smooth walls and rounded corners, so that complete cleansing and disinfecting is possible. Sunlight is even more important than warmth and the London zoological society has led the way in the use of glass transparent to ultra-violet rays, and of powerful electric light when there is no sun. New arrivals should be quarantined, until it is certain that they are in a satisfactory condition of health.

Feeding.—The food must be as varied as possible, and special attention should be given to the frequency and quantity of the supply. It is important that no more should be supplied at a time than is necessary, as most animals rapidly foul their food, and except in a few special cases, wild animals are peculiarly liable to the evil results of stale or putrid substances. Quantities can be learned from experience, and from watching individual cases; frequency varies within very wide limits, from reptiles which at most may feed once a week and fast for long periods, to the smaller insectivorous birds which require to be fed every two or three hours, and which in the winter dark of northern latitudes must be lighted up once or twice in the night to have the opportunity of feeding. Knowledge of the habits of animals and experience are the best guides. Many authorities attempt to restrain visitors from feeding the animals in their charge, but such a restriction, even if practicable, is not all gain, for animals in captivity are less inclined to mope, and are more intelligent and tamer. if they become accustomed to regard visitors as pleasant sources of tit-bits. (See also AVIARY; AQUARIUM.)

ZOOLOGICAL NOMENCLATURE is the system on which names are given to the various divisions of the animal kingdom. Those divisions range from the great branches or Phyla, through Classes, Orders, and Families, with occasional intermediate groupings, down to Genera and Species. For the meanings of those terms, see ZOOLOGY. It can hardly be said that any system governs the names of categories higher than Families; essentially the existing system relates to genera and species. The system arose in response to three needs: first, to have a name intelligible in all countries; second, to fix on a single name for each kind or species of animal, and thus to avoid the confusion due either to the application of the same name to quite different kinds, or to a multiplicity of names for a single kind (there are 136 English names for the salmon and sea-trout); third, to provide names for the many thousands of newly-discovered species existing now or in past ages, and without a name in any language.

The binary system of nomenclature now in use for animals was first consistently employed in Linnaeus, *Systema* Naturae, ed. x. (1759). To meet difficulties that arose later, a code of rules, drawn up by H. E. Strickland and a committee, was accepted by the British Association for the Advancement of Science in 1842, and held the field till 1881. Increasing difficulties then led to the promulgation of other codes by various societies and individuals, until the consequent diversity of practice forced the need for agreement on the notice of the International Congress of Zoology (Paris, 1889), and it requested R. Blanchard to report. The difficulties not having been overcome, the third congress (Leyden, 1895) appointed an international commission with C. W. Stiles as secretary. This eventually submitted a unanimous report at Berlin (1901); the rules were adopted and published by the congress (1902). At subsequent congresses, down to that in Budapest (1927), slight amendments have been made, and the rules as they now stand have been separately issued by the Biological Society of Washington. A series of "opinions" delivered by the Commission, interpreting the rules and applying them to doubtful cases, has been published by the Smithsonian Institution, Washington.

The basis of the rules is the law of priority: "The name of a genus or species can only be that name under which it was first designated." Nearly all the other rules lay down the conditions to which the application of this law must conform. Since the rigid application of the law would sometimes lead to confusion, and since the Commissioners sometimes cannot agree whether an author has conformed to the conditions or no, the congress has decided that in rare cases the rules may be suspended and an arbitrary decision given.

The chief difficulty has been that of deciding precisely for what genus or species an author proposed a certain name. Only when an author gives a differential diagnosis, and fixes on a single specimen (holotype) as the standard of his new species, or a single species (genotype) as the standard of his new genus, can subsequent workers be sure of his meaning. These practices are now followed by every competent systematist, and the International Congress has decided that no generic or specific name published after Dec. 31, 1930, shall be valid unless it is accompanied by an adequate descriptive diagnosis and, in the case of a generic name

by the unambiguous designation of a genotype.

Modern practice constructs family names by adding *idae* to the root of the name of a contained genus, and sub-family names by adding *inae, e.g.,* Felidae and Felinae from *Felis.* The name of a subgenus is placed in () after the generic name, e.g., *Vanessa (Pyrameis) cardui.* A subspecies is denoted by a second trivial name added to the specific name, e.g., *Rana esculenta marmorata.* Trivial names are written with a small initial letter; generic and subgeneric, with a capital initial. A proper name following the trivial name is that of the first proposer of that name; if his name be in (), it indicates that by him the species was placed in some other genus, e.g., *Psittacus linnaei* (Wagler).

ZOOLOGICAL REGIONS. Zoological distribution, also known as zoo-geography, is the science dealing with the distribution of animals over the surface of the globe. It is concerned not only with present conditions but also with those of former geological periods and with the mode in which the present arrangement has arisen. The study of the present distribution of animals may be of two extreme types, whose fields overlap. It is possible to investigate the details of the occurrence of a species in a small district, relating the facts discovered not only to the physical and chemical conditions of its environment but also to its neighbours both plant and animal. Such a study (still very undeveloped) is called ecology (*q.v.* and *see* also DISTRIBUTION OF ANIMALS). On the other hand, it has long been known that it is possible to divide the land of the world into regions separated from other land masses either entirely, as in the case of Australia and New Zealand, or very nearly, as in the case of Africa. Such regions may possess characteristic faunas and the investigation of the nature of these and an elucidation of the resemblances and differences which they present, form the subject matter of that aspect of zoological distribution dealt with here.

To those early naturalists who believed in the independent creation of all the species of animals, their irregular distribution over the world must either have presented no problem or have been inexplicable. When, however, Charles Darwin showed that the existing distribution received a ready explanation on the theory of the evolutionary origin of species, and that its details might be used to throw light on the mechanism that had brought about evolution, the whole subject acquired a new interest and within a few years the main lines of the accepted division of the world into zoological regions were established by P. L. Sclater and his followers.

The differences which separate the faunas of the zoological regions are not dependent on climate or temperature. For example, the mammal fauna of North America is, on the whole, very similar to that of northern Asia and Europe, whilst the faunas of Patagonia and Australia, which present a similar range of climatic conditions, differ completely not only from those of the northern areas but also from each other. Furthermore, the mammal fauna of South America is a unit, although that continent stretches throughout the Tropics and into the Antarctic regions of Tierra del Fuego. Thus the factors which have led to the distribution of existing animals into regions are not discoverable in present day conditions but must lie in the past, and they can only be discovered by an investigation of the history of the animals which composed the fauna, and of the changes in the distribution of land and water, which have taken place during geological time.

The zoo-geographical regions at present recognized are as follows:—

1. Palaearctic, including Europe with Iceland; Asia, including Japan, north of the Himalayas and of the Yangtze-kiang watershed; Persia and Asia west of the Indus; and Africa north of the Sahara, including the Azores.

2, Nearctic, comprising the whole of America north of Mexico.

Geological Time Scale

Tertiary or Cainozoic Period	Recent system Pleistocene system Pliocene system Miocene system Oligocene system Eocene system
Secondary or Mesozoic Period	Cretaceous system Jurassic system Triassic system
Primary or Palaeozoic Period	Permian system Carboniferous system Devonian system Silurian system Ordovician system Cambrian system
Archaean	

These two regions are conveniently grouped as Holarctica.

To the south of Palaearctica lie two distinct regions, each a peninsula projecting from the great northern land mass into the wide seas of the southern hemisphere. They are:

3. The Ethiopian region, comprising the whole of Africa south of the Sahara, with Madagascar and the Mascarine islands.

4. The Oriental region, comprising India and Ceylon, Siam and southern China, and the Malay archipelago.

Bearing a somewhat similar relation to the Nearctic region is:—

5. The Neotropical region, comprising the whole of America from Mexico southward, and the Antilles.

Finally more isolated than any is:—

6. The Australasian region, including Australia with Tasmania and New Guinea, New Zealand and the islands of the Pacific.

Many minor modifications of these regions have been suggested which, although they may be useful, especially in the study of certain groups, are not of great significance. Max Weber has grouped these six regions into three main realms, as follows:—

1. Arctogaea comprising Holarctica, the Ethiopian and Oriental regions.

2. Neogaea, comprising the Neotropical region.

3. Notogaea, comprising the Australian region.

This arrangement has the merit of emphasizing the distinctness of the two last faunas.

NOTOGAEA AND NEOGAEA

Notogaea.—Notogaea is by far the most distinct of the three realms. That portion of the area which alone is inhabited by mammals (New Guinea, Australia and Tasmania) is the home of the only monotremes which are known; *Proechidna* restricted to New Guinea, and *Echidna* and *Ornithorhynchus* in the other two areas. The great bulk of the other mammals are marsupials belonging to the two great divisions Polyprotodonta and Diprotodonta. Polyprotodont marsupials still exist in South America in several genera of the Didelphidae, and one species (the Virginian opossum) extends northwards into Canada. The other group, the Diprotodonta, have no representatives outside Notogaea. *Coenolestes* from South America, which was at first regarded as a diprotodont, has now been shown by a complete investigation of its anatomy to be nothing but a peculiarly modified didelphid. The only eutherian mammals found in Notogaea are rodents and bats, together with a pig in New Guinea, the native dog or dingo in Australia, and man himself throughout the realm. There is every reason to believe that the pig and dog were introduced by man and may be disregarded in considering the earlier history of the region. The bats present no special features; some of them indeed belong to forms with a world-wide range. The rodents on the other hand are often of peculiar genera not found elsewhere, but are all members of the Muridae, which have unusual powers of dispersal.

Thus Notogaea so far as its mammal fauna is concerned is remarkable not only for the presence of many animals entirely peculiar to it, but also by the absence of all representation of the higher eutherian orders. There are no insectivores, carnivores, edentates, ungulates or primates, orders whose members are to be

found in all other regions. The absence of these forms receives a simple and complete explanation if Notogaea has been separated from all other land-masses since a period which preceded the evolutionary development of these orders, or indeed of the basal eutherian stem from which they arose. Existing palaeontological evidence suggests that this period cannot have been later than the end of the Cretaceous times, and may be pushed back at least as far as the end of the Lower Cretaceous if certain Mongolian discoveries be correctly interpreted.

The Australian polyprotodonts form a series, the more primitive of which are small mammals of insectivorous and commonly

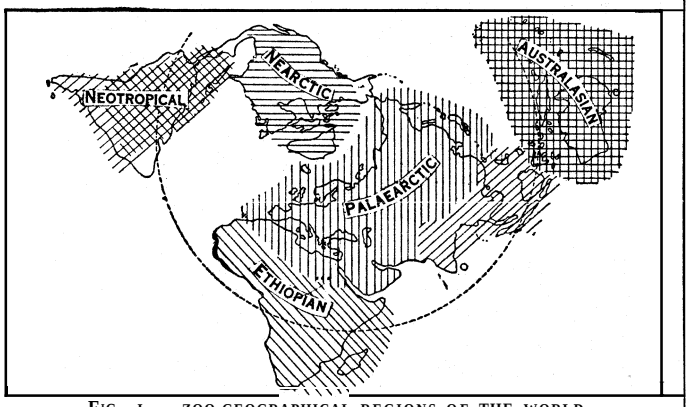

FIG. 1.— ZOO-GEOGRAPHICAL REGIONS OF THE WORLD

arboreal habits. These forms have their headquarters in Australia, in which the majority of forms are found, but some of them extend on into New Guinea and into the Aru and neighbouring islands. From this primitive group have arisen forms (*Myrmecobius*), which have very small teeth and are committed to a diet of ants; others (the bandicoots), which are in part herbivorous, although they certainly also eat animal food. One of them is a little hopping animal, superficially recalling the jerboas. On the other hand there is a series of forms which become progressively more and more highly specialized for a carnivorous diet, resulting finally in *Thylacinus*, an animal as large as the collie-dog, capable of killing and eating sheep. Other representatives of the Polyprotodonta occur in South America and as far north as Canada, but these belong to two living families, one which is closely similar to the native cats of Australia, whilst the other represents an aberrant side-branch of South American origin, which parallels superficially the Diprotodonta. During early Tertiary times, opossums similar to those now living in North America ranged over North America and Europe, and a perfectly typical member of the same family is known from the Upper Cretaceous rocks of the United States. Thus the possession in common of Polyprotodonta by Arctogaea and Neogaea on the one hand and Notogaea on the other, does not necessarily imply that these realms were connected with one another after the end of the Cretaceous. The fact that the polyprotodonts of Notogaea have radiated into such diverse forms whilst those of Arctogaea are restricted essentially to one type, may be explained by the absence of the competition of eutherian mammals in one case, and its presence in the other.

The diprotodont marsupials are peculiar to Notogaea. The diprotodonts as a group are herbivorous. The most primitive family, that of the phalangers, contains many animals all essentially arboreal in habit, varying in size from that of a mouse to that of a cat. They take in Australia much the same place that is occupied by the squirrels and monkeys in other parts of the world, and they often present, as in the development of a flying or rather gliding habit, a remarkable parallel to certain squirrels and to the flying "lemur" *Galeopithecus*. One interesting derivative of the phalangers is the koala or native bear, a large animal which lives entirely on the leaves of the eucalyptus trees. From the same group has arisen the wombat, a large, very powerfully-built, burrowing animal, strictly herbivorous in habit, with a remarkable dentition paralleling that of the larger rodents such as the capybara, in its adaptations. Finally the kangaroos and their allies form a very distinct group of terrestrial animals fitted by their elongated hind-legs and long tail for a progression by a series of jumps. Their dentition is so arranged as to allow them to crop grass as do the artiodactyls and as they occur in large numbers in relatively open country, they are similar to this group in their general diet and habits.

Thus the Australian marsupials have experienced an adaptive radiation which has fitted them for most of the modes of life known amongst eutherian mammals and the fact that no diprotodont, either living or extinct, is known from any other part of the world, is a clear indication that the evolution of the group took place in Australia and that it was made possible by the absence of the competition of higher mammals.

It should be possible to establish the truth of the above view by studies of the Australian fossil marsupials. At present, however, except for a single specimen, which is clearly a diprotodont marsupial, and probably a phalanger, from the Upper Miocene of Wynyard, Tasmania, no pre-Pleistocene mammals are known. The Pleistocene mammals include an interesting human skull presenting the characters of the living Australian aborigines, the dingo, some rodents of Australian type and a very large series of marsupials, including representatives of extinct animals. It is an interesting feature that in Pleistocene time the large carnivorous Tasmanian wolf and Tasmanian devil, at present restricted to Tasmania, occurred widely spread in Australia, and it is customary to attribute their disappearance on that continent to competition with the dingo, that animal having never reached Tasmania.

The large carnivorous marsupial, *Thylacoleo* found in Pleistocene deposits all over Australia is remarkable in that it is related not to the carnivorous polyprotodonts but to the otherwise exclusively herbivorous diprotodonts. Of this order several gigantic forms are found, a kangaroo, *Macropus titan*, perhaps 12 feet in height, *Diprotodon* and its allies, not closely related to any living forms, but as large and heavily built as a rhinoceros, and the giant wombat *Phascolonus*, which attained a similar size Thus what little is known of their fossil history emphasizes still more the peculiarity of the Australian marsupials.

It is clear that man did not arise in Australia and that he is as certainly an immigrant into that continent as he is in those Pacific islands, where the date and manner of his coming are recorded. From the occurrence of a fossil human skull in the Pleistocene of Queensland, we know that the human immigration took place as early as Pleistocene times, and from the fact that this skull belongs to the species *Homo sapiens*, which is not known in the early or indeed the middle Pleistocene, it follows that the human immigration was in late Pleistocene times.

With the exception of a rat, of the genus Mus, the Australian rodents belong to genera not found else here, but all are members of the family Muridae, which is not geologically ancient. It is certain that they represent the result of the evolution in *situ* of some immigrant form, but it is impossible to determine the time at which their introduction took place: it is, however, exceedingly unlikely that it was earlier than the Pliocene. The absence of larger eutherian mammals shows that they cannot have entered over a continuous land-bridge but must have crossed by some other mode not available to larger forms. On the other hand, one at any rate, of the diprotodont marsupials of Australian origin has migrated out of the region, *Phalanger* itself being found in Timor and even as far as Celebes. It also must have crossed by some accidental mode of transport, for which, being arboreal it is peculiarly well fitted.

Neogaea.—The mammal fauna of Neogaea, that is of South America, is less peculiar than that of Notogaea. It contains no monotremes but there are many living marsupials, the most abundant being the opossums of the family Didelphidae; the other forms, belonging to two genera of which *Coenolestes* is the more important, have ancestors in the Miocene deposits of South America and were certainly evolved in that region and have never spread beyond it. Except for certain shrews in Central America, no insectivores are found on the South American continent, but one peculiar family. the Solenodontidae, is restricted to certain islands of the West Indies. It belongs to the sub-order Zalambdodonta, which has living representatives in Africa and Madagascar and

has been found fossil in a perfectly typical form in the Basal Eocene of North America. The most characteristic South American mammals are, however, the "edentates" belonging to the group Xenarthra. These fall into three groups, the sloths, the ant-eaters and the armadillos, none of which, except for the occurrence of an armadillo in Texas, is now living outside the region. The rodents of South America, which are numerous, belong in the main to peculiar families; the cavis, chinchillas and agoutis are not found elsewhere, whilst another important group, the octodonts are represented by forms both in South America and in Africa. There are also representatives of the Myomorpha and tree-porcupines. The Carnivora include dogs, bears and cats, together with many raccoons peculiar to the area. The perissodactyls are represented only by the tapir, whilst the artiodactyls include the peccaries and Llamas which are peculiar to South America, together with certain deer related to North American forms. The Primates are represented by the group Platyrrhina which is restricted to South America, and by man.

It is clear from this account that the South American mammal fauna is sharply marked off from all others by the possession of groups of animals peculiar to it, but that it is linked with the North American fauna by the presence of deer, bears, cats and dogs. The condition of South America differs from that of Australia in the increased number and variety of those animals which may be regarded from the existence of their relatives elsewhere, as immigrants into an area which has long been separated. The abundance and varied nature of those mammal groups peculiar to South America, such as the Xenarthra and Platyrrhina, would suggest that these animals had undergone their evolution in isolation as had the Australian marsupials. It is possible to test the truth of this idea by an investigation of the fossil history of these and other forms, and in South America, unlike Australia, it is possible to do this not only for one horizon but for the whole Tertiary period.

In Pleistocene times South America was inhabited by a fauna far more varied in character and including much larger animals than those now living there. Of the groups which appear to be of South American origin, the Xenarthra were represented not only by armadillos of moderntype, but also by the giant armoured glyptodonts and the enormous ground-sloths; each of these groups being sufficiently varied to be divided into three families. The rodents are of the same types as those now living and the Platyrrhina are present. Extinct groups of hoofed mammals are found, falling within the Notoungulata and including most varied animals. There are the following sub-orders: *Typotheria,* the Pleistocene form being an animal about as large as a pig with a gnawing dentition; and *Toxodontia,* with a skull two feet in length and a dentition not unlike that of the typotheres; and the order Litopterna with one Pleistocene form about as large as a camel but possibly of aquatic habits.

Living alongside these autochthonus animals were carnivores including not only the ancestors of those forms which still exist but also a sabre-toothed tiger, *Smilodon;* and a bear, *Arctotherium,* now extinct. The perissodactyls include horses, in part belonging to the modern genus *Equus,* and in part to four extinct genera. Proboscidea are represented by several forms less advanced in structure than true elephants and commonly referred to as mastodons.

Thus except that it is richer both in the number of groups represented and in the size of the individuals, the Pleistocene fauna of South America resembles the recent one in that it contains a mixture of mammals which had originated *in situ* with immigrants from the north. When we pass backwards to Miocene times, as represented in the Santa Cruz beds, we find an even fuller and more varied representation of the true South American groups, and a complete absence of those which we had assumed to be immigrants. It is natural to believe that the continents of North and South America became connected by a land-ridge sometime between the Miocene and the Pleistocene, and the truth of this conclusion is established by the fact that giant ground sloths and glyptodonts first appear in the North American fauna in Pliocene times.

The mammal fauna of the Miocene of South America contains the following elements. The marsupials include not only opossums essentially of modern type, but also a variety of carnivorous animals closely similar to the Tasmanian wolf, but some like *Borhyaena,* greatly exceeding that animal in size. Relatives of the living *Coenolestes* occur. There is an animal *Necrolestes,* which is supposed to be an insectivore related to the Zalambdodont golden moles of South Africa. All the rodents, which are extremely numerous and varied, belong to the South American families of tree-porcupines, cavies, chinchillas and agouties. There are a few unmistakable platyrrhine monkeys. Amongst the edentates, no representatives of the living sloths and ant-eaters have been found, probably because these animals are restricted to tropical forests and the known mammal fauna is that of the more open, less well watered and considerably colder plain. The armadillos are very varied; the glyptodonts, small compared with their descendants of Pleistocene times, to some extent bridge the gap between the normal armadillos from which they sprang and the later glyptodonts. The ground-sloths, of relatively small size, include the ancestors of the later forms and the three families into which these creatures are divided can already be recognized. The Notoungulata include an immense range of animals adapted to very varied habits. The Typotheria, then small forms which filled the place occupied at present by rabbits, fall into three distinct families, whilst the Toxodontia include an abundance of forms smaller than their Pleistocene successors. The Entelonychia include a remarkable animal, *Homalodontotherium,* with stilted fore-legs and digging claws. The Litopterna, another extinct family represented by a single type in Pleistocene times included forms which parallel the horses in the reduction of the toes in foot and hand to one. Yet another extinct order, Astrapotheria, includes gigantic creatures unlike any other forms.

This then is the true fauna of Neogaea, made up entirely of animals which arose within the area and whose evolutionary history can to some extent be traced in still earlier Tertiary horizons. It includes three groups which have been believed to have had relatives in other parts of the world. These are *Necrolestes,* originally described as an insectivore, but really of uncertain affinities. *Coenolestes* and its allies supposed to be diprotodont marsupials but which are certainly aberrant didelphids; and the carnivorous marsupials such as *Borhyaena,* which present a remarkxble resemblance to the Tasmanian wolf. It has been held by many writers that these forms are indeed closely allied and that their occurrence in such widely separated localities is to be explained by the former existence of a practicable land-bridge over the Antarctic continent. Additional evidence in support of this view will be discussed at a later stage in this article, but it seems on the whole most probable that *Borhyaena* represents the result of a course of evolution starting from a didelphid which has been remarkably parallel to the independent process which produced *Thylacinus* from a dasyurid stock.

MODERN ARCTOGAEA

The remaining realm, Arctogaea, is much more extensive and less compact than those which we have considered, and it is most convenient to begin its discussion by a consideration of the existing distribution of animals in the various regions of which it is composed.

Nearctic Region.--Covering as it does the whole of North America except the lowlands of Mexico, the Nearctic region exhibits extreme variations in geographical qualities. In the extreme north there is a completely snow-covered arctic area, to the south of which there is a continuous belt of coniferous forest extending from Alaska to New England. In the extreme south lies the Sonoran region which has a warm temperate climate and is largely composed of great tree-less plains, although at the mouth of the Mississippi it includes much forest, and in California passes into deserts where the day temperature may be extraordinarily high, reaching in the Mohave desert 120° F.

In the Arctic zone there are polar bears, arctic foxes, musk oxen, reindeer, lemmings and arctic hares, all of these animals extending round the North Pole over the northern lands of Asia

and Europe as well as those of North America.

The wooded region includes shrews and the American moles among insectivores; the Canadian porcupine, chipmunks, musk-rats, woodchucks, lemmings, beavers and tail-less hares amongst rodents. The carnivores are represented by pumas and lynx, the grey wolf, foxes, bears, otters, skunks, raccoons, wolverines, marten. weasels and the American badger. The artiodactyls are

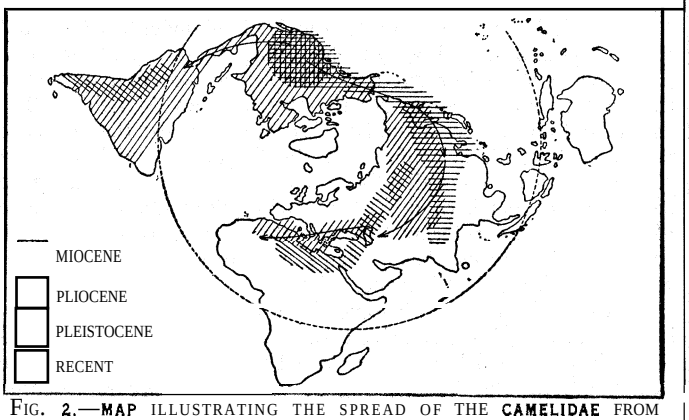

FIG. 2.—MAP ILLUSTRATING THE SPREAD OF THE CAMELIDAE FROM THEIR EVOLUTIONARY HOME IN NORTH AMERICA

deer of types found in Asia and in Europe—the wapiti, moose and woodland reindeer; mountain sheep, and the peculiar Rocky Mountain goat; bison extremely close to those of Europe, and in certain regions the American deer.

The Sonoran region of the south includes opossums and armadillos, which are immigrants from South America. American types of shrews and moles represent the Insectivora. The rodents include prairie dogs, pocket gophers, cotton rats and kangaroo rats, true and flying squirrels, whilst ground squirrels and rabbits occur throughout the region. Amongst the Carnivora are pumas, lynx, bears, American badgers, raccoons, skunks, coyotes, timber wolves, etc. The characteristic artiodactyls are pronghorned antelopes, plains bison, and American deer, together with peccaries. The region is characterized by the absence of all perissodactyls, Proboscidea. and Primates, of "edentates" and marsupials (other than the few immigrants from South America), of antelopes, true pigs and hippopotami.

Palaearctic Region.—The Palaearctic region greatly resembles the Nearctic in the general character of its mammalian fauna. It contains no monotremes, marsupials, edentates, hyracoids, Proboscidea, or Primates over the greater part of its area, though representatives of the last three groups occur in the Mediterranean region, which forms a transition between the Palaearctic and the Ethiopian regions. The following groups of animals are common to Palaearctic and Nearctic areas:—hares and picas, beavers. marmots, susliks, voles and lemmings; martens and weasels, wolverines, brown bears, wolves and foxes; elk, reindeer, wapiti, bison, big-horned sheep and musk ox either in identical or closely allied species. On the other hand the Palaearctic area includes certain wild sheep, goats, saiga antelope, chamoix, many peculiar deer, camels and true pigs, which are not known in America. It possesses also a number of horses and asses, though no other perissodactyls. The desmans and some other insectivores are peculiar to the Old World, as are the dormice, hamsters and jerboas amongst the rodents, and the tiger and panda amongst the carnivores.

Africa'.—The fauna of Africa is on the whole strikingly unlike that of the Palaearctic region, and the intervening Mediterranean area does comparatively little to bridge the gap. The mammal fauna is remarkable in that it includes a great variety of species and probably a greater number of individuals of large animals than that of any other region. There are no monotremes or marsupials. The aard-vark and the pangolin (*Manis*) are curious forms, often classified as edentates, but probably not closely related to one another nor to the South American forms included in that order. The Insectivora include amongst the Zalarnbdodonta the golden moles and the Potamogalidae known from no other regions of the world, and also the elephant shrews and the Macroscelididae, representative of a group, the Menotyphla, of which the other forms are the tree-shrews of the Malayan sub-region. There are many peculiar rodents, jumping hares *(Pedetes)*, mole-rats (*Bathyergidae*), crested rats (*Lophiomys*) and cane-rats, together with many members of the Muridae and true hares. The Carnivora include true dogs, the hunting dog (*Lycaon*) and the long-eared fox *(Otocyon)*, spotted hyaenas and the Manhaar jackal *(Proteles)*, etc. There are several mongooses and civets. The cats are represented by the lion, leopard and cheetah in addition to very numerous smaller forms; ratels, zorillas and otters represent the Mustelidae. There are elephants belonging to the sub-order Loxodon, and hyraxes, of two genera which spread northwards into Syria but are otherwise exclusively Ethiopian. The perissodactyls are represented by zebras and wild asses, together with two species of rhinoceroses. Amongst the artiodactyls there are found true pigs together with the forest and wart-hogs. The hippopotamus is widely distributed throughout the region, whilst a dwarf form is restricted to the west coast in the neighbourhood of Liberia. The Giraffidae, including true giraffes and okapis, are restricted to the region; the chevrotains of the genus *Dorcatherium* are similar to those found in Malaysia. Deer are completely absent but the hollow-horned ruminants include not only buffaloes but also an extraordinary number of peculiar genera of antelopes. Sheep and goats penetrate into the region only in the mountains of Abyssinia.

The Primates of the Ethiopian region include lemurs belonging to two groups, the Lemuriformes, which are restricted to Madagascar and the Lorisiformes, which do not occur there but are represented by the galagos and pottos, allied to animals living in the Oriental region. Monkeys belonging to the two sub-families of Cercopithecinae and Semnopithecinae occur throughout the forested regions. The most characteristic members of the latter are the typical baboons with short tails and elongated muzzles; these animals are terrestrial in habit and usually live in large tribes; they are at present confined to Africa and Arabia. The dense forests of western equatorial Africa are the home of the giant apes, the chimpanzee and gorilla, which are restricted to the region.

Oriental Region.—The Oriental region proper includes the whole of India except the Punjab, Ceylon, Malaysia and the Malay archipelago, including Java, Sumatra and Borneo, but not Celebes, which forms a transition with Notogaea. The region contains no monotremes or marsupials. The "edentates" are represented by the single genus *Manis*. The Zalambdodont insectivores are unrepresented, whilst the dilambdodonts include as special forms *Gymnura* and *Hydromys* which are essentially spineless hedgehogs, and a variety of shrews of the genus *Soriculus*. The Menotyphla are represented by tree-shrews, *Tupaia* and *Ptilocercus*. Galaeopithecus represents a distinct order. The rodents include amongst many forms of wide distribution certain endemic genera of which the flying squirrels are perhaps the most striking. The carnivores include lions, leopards, tigers, cheetahs and many smaller cats; bears, wolves, foxes and dholes; striped hyaenas, civets and mongooses. The perissodactyls include a single horse. two species of rhinoceroses belonging to different genera to those which occur in Africa, and a tapir restricted to the forests of the Malayan sub-region. Pigs belonging to several species, and chevrotains of the genus *Tragulus* are not found elsewhere. There are certain deer belonging to genera peculiar to the region, a few antelopes, ,the nilghai and black buck, also many and unusual forms of oxen, the buffalo, the gaour, and in Celebes alone the very primitive form, *Anoa*. In the mountains the tahr *(Cerorus)*, gorals and takin are curious forms whose relatives are to be met with in the Palaearctic region and possibly in the Rocky Mountain goat of North America. Two groups of lemurs occur within the area, the Lorisiformes, including the slender and slow lorises; and the Tarsiiformes with the single living genus, *Tarsius*. Semnopitheces and cercopitheces are widely distributed, though baboons are absent from this region.

The gibbons *(Hylobates)* are found only in the Malayan sub-region and the orang occurs in Borneo.

ANCIENT ARCTOGAEA

Inspection of the foregoing lists which represent the existing fauna of the various zoo-geographical regions, will show that although they are distinct from one another and mingle only incompletely in the transition regions, certain animals such as the tapirs, may occur in widely separated areas not now connected by a practicable land-bridge. The whole distribution of these mammals is inexplicable on the basis of the present distribution of land, water and mountain ranges; it can only be understood in the light of the history of the evolution of mammals, now known through the work of three generations of palaeontologists in very considerable detail. Perhaps the simplest method of explaining this history is to take the mammalian orders in succession and discuss the time and place of origin of their more important families and genera.

Monotremata.—It is clear that the monotremes are a group of very ancient origin, probably Triassic, but that the existing forms are highly specialised and closely related to one another. The only fossil forms known are Pleistocene and belong to the existing genera.

Marsupialia. — Polyprotodont marsupials of the family Didelphidae occur in the Upper Cretaceous of North America. Their remains are found in Eocene, Oligocene and Miocene of North America and Europe and they have inhabited South America throughout the Tertiary. The South American carnivorous borhyaenids appear to be autochthonous, whilst the Australian dasyurids have no relatives outside Notogaea. The pseudo-diprotodonts, the coenolestids, are represented in South America from the Oligocene to the present day, and have no other relatives. The true diprotodonts have always been Australian; *Wynyardia* from the Middle Miocene of Tasmania is the oldest known form.

Edentata.—The group Edentata includes three completely distinct orders which have probably no close relationship with one another. These are the Xenarthra, the Tubulidentata and the Pholidota. The earliest certainly known members of the Xenarthra occur in the Colpodon beds of South America, perhaps Oligocene, and in the Notostylops beds of the Eocene. Very important is the occurrence in the Lower and Middle Eocene of North America of animals *(Metacheiromys)* which are plausibly regarded as aberrant armadillos without body armour. In the Basal Eocene and in the Lower and Middle Eocene of West and North America there occur animals, the Ganodonta, which may be ancestral to the Gravigrada, the giant ground sloths. If these relationships be substantiated it will follow that North and South America were connected by a land-bridge at the beginning of Tertiary time. It is none the less certain that the later evolution of the Xenarthra took place in an isolated South America not again connected with the northern hemisphere until Pliocene times.

The Tubulidentata include only the single genus *Orycteropus*, which on grounds of its comparative anatomy is probably of ungulate derivation. Extinct species of this genus, or of one closely allied, occur in Pontian (Lower Pliocene) rocks in Persia, Samos, Greece and the south of France, but no earlier forms are certainly known, a humerus from the Oligocene of France being not really determinable.

The Pholidota, including the genus *Manis*, are represented as fossils only by certain very doubtfully determined fragments from the European Oligocene and Miocene.

Insectivora.—The order Insectivora includes a large number of forms only distantly related to one another. The Menotyphla at present represented by the elephant shrews of Africa and the tree-shrews of Malay, probably also covers a number of forms whose remains are found in Europe, Mongolia, and North America in rocks of various ages from the Basal Eocene into the Oligocene. It must be admitted however, that the evidence on which these forms are referred to the group, is very slender.

The Zalambdodontidae including the solenodons of the Antilles, *Potamogale* and the golden moles of Africa, together with the Madagascan tenrecs include not only a perfectly characteristic skull from the Basal Eocene of North America but other forms extending as high as the Oligocene. *Xenotherium* from the Oligocene of North America is supposed to be a golden mole, and *Necrolestes* from the Upper Miocene of Patagonia has also been placed in the neighbourhood of that group; in neither case however is the systematic position quite certain. At any rate the group is of such antiquity that its members have had the whole Tertiary period in which to wander over the world and may hence reach any part of it which has been connected by land within that period.

The remaining insectivores, the Dilambdodonta, are first found in the Lower Eocene; the living families are of comparatively modern introduction. The erinaceoids first appear in the Oligocene of Europe, North America and Mongolia. The shrews and moles have a similar distribution, whilst the primitive family of lepticids is confined to the Oligocene and Eocene of North America. Thus the Dilambdodonta appear originally to have been of northern origin, occurring throughout the whole of Arctogaea and entering the southern peninsulas at some late period. *Galeopithecus* has perhaps ancestors in the Eocene of North America and of Europe.

Carnivora. — In Basal Eocene times Europe and North America were inhabited by primitive carnivores belonging to sub-orders the majority of which were not related to any living form. These extinct groups, the Acreodi and pseudo-Creodi, are represented in Europe, Mongolia, and North America in the Eocene and Oligocene, and one or two members of the latter group reached northern Africa in Oligocene times. One form at any rate lived on in India to the Miocene but none ever reached South America. The ancestors of the true carnivores, which fall within the family Miacidae, occur in Basal Eocene and Eocene rocks in Europe, Mongolia and North America. From this family there arose a whole series of forms from which the civets (Viverridae), raccoons (Procyonidae), dogs (Canidae) and Mustelidae arose.

The Viverridae are represented in the Eocene of Europe although not in that of America. They have a long history in the European Tertiary and appear in the Upper Miocene and later deposits of northern India: from a viverrid stock the Hyaenidae seem to have originated. The first forms known, both of the existing genus itself and of the intermediate genus *Ictitherium*, occur in the Pontian Lower Pliocene fauna, which stretches with minor modifications in its character from China to Portugal: no member of the group reached America.

The mustelids first appear in exceedingly similar forms of weasels in the Oligocene of Europe, Mongolia and North America. During its later history the group appears to have been European and North American, the otters and badgers being Old World and occurring in late Miocene or Pontian times in the Oriental region.

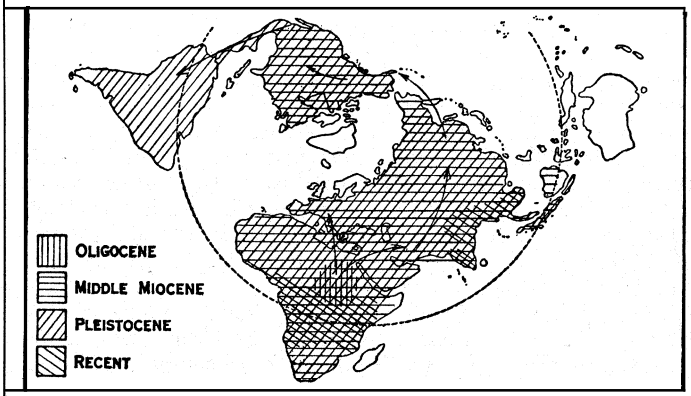

FIG. 3.— MAPILLUSTRATING THE SPREAD OF THE PROBOSCIDEA FROM THEIR ORIGINAL HOME IN AFRICA

The Canidae (dogs) have a long, very elaborate and still incompletely understood evolutionary history both in the Old and New Worlds. One interesting feature is an early separation of the dhole-like dogs from the others, dating from Oligocene times. The Oligocene forms of this group are entirely North American, but a single member at any rate seems to occur in the Upper Miocene of Europe. The living representatives are

South American, African and Oriental, regions which were certainly not inhabited by members of this group until late Tertiary times.

The Procyonidae are first represented by Lower Miocene forms in North America, and no members of the group appear to have reached Mongolia or Europe. An apparent exception is provided by two animals, *Aelurus* (the panda), now living in the Himalaya, first known from Upper Pliocene deposits in west Europe, and *Aeluropus* (the giant panda), living in Tibet, found fossil in the Pleistocene of Burma. The ancestry and affinities of these forms are however still uncertain.

The amphicyonine dogs, which are represented in the Oligocene of North America, occur during. Miocene times in both Europe and North America; from this group the Ursidae (bears) appear to have arisen, *Ursavus* being from the Middle Miocene of France and possibly related forms occur in Europe, India, China and North America. They first appear in South America in Pleistocene times.

The Felidae (cats) belong to two independent groups, the Machaerodontinae (sabre-tooth cats) and the Felinae (true cats). Both families occur in the Oligocene of North America and Europe, and their descendants are found in these localities at every horizon between that and the Pleistocene. At this stage the former became extinct, whilst the latter has living representatives in both sub-regions. The Middle Miocene of central Africa contains the remains of a feline, and the Oriental region has been inhabited by both sabre-tooth and true cats since Miocene times. Cats of both types first appear in South America in Pliocene deposits. The group appears to be of northern origin and to have colonised the southern projections of Arctogaea during the Miocene at a time when many migrations were taking place.

The Proboscidea first appear in Upper Eocene rocks in Egypt as a small animal, *Moeritherium,* uhich presents the first traces of their characteristic specialisations. In the Lower Oligocene of Egypt this animal is still found and is there accompanied by its descendant *Palaeomastodon.* This genus gave origin to the later Proboscidea, its immediate descendants being included under the somewhat vague term "mastodon." Mastodons appear in the Lower Miocene of North Africa, Baluchistan and Europe and by Mid-Miocene times had reached China and North America. Subsequently in Upper Pliocene times mastodons of special type migrated southwards and lived on into Pleistocene times in South America.

The true elephants arose from the mastodons, and their earliest representatives are found in the Pliocene of India. Thence they migrated outwards, reaching Europe in the Pliocene and North America in Pleistocene times, but they never reached South America.

All the Holarctic members of the order died out at the end of Pleistocene times, one of them, the mammoth, which became adapted to Arctic conditions, living along the front of the great ice-cap which covered northern Europe and North America, until the ice finally disappeared, perhaps about 8000 B.C.

Hyracoidea.—The Lower Oligocene rocks of Egypt which contain the remains of *Palaeomastodon* yield also several genera of large hyracoids. The next representatives of this order are very small animals found in Middle Miocene rocks near Victoria Nyanza, and in South West Africa. In the Lower Pliocene Pontian fauna of Samos and Pikermi near Athens, they are rarely represented by a very large form. The existing animals are Ethiopian, except for a few individuals found in Syria and Arabia. The order thus appears to have arisen and carried out its evolution in Africa. The Lower Oligocene of Egypt also contains the remains of two orders, the Barytheria and Embrithopoda, no representatives of which are found elsewhere. Its fauna is therefore very isolated and contains only certain creodonts and anthracotheres of northern origin.

Notoungulata.—This extinct order of herbivorous mammals was until recently known only from South America, where it exhibits a number of evolutionary series. Most of these series can be traced upwards from the Eocene (Notostylops beds) of Patagonia into the Miocene or Pleistocene, although it has to be recognised that most of such series are only approximate. A single lower jaw of a member of this order has been found in the Lower Eocene of North America, and more abundant remains of a different genus occur in rocks (the Gashato beds in Mongolia) whose age is not certainly known but is probably Basal Eocene. This animal appears to be the most ancient member of the family yet discovered, and suggests that the group was of northern origin, although its later evolution took place entirely in Neogaea.

Condylarthra.—The Basal Eocene of North America contains numerous remains of small animals which appear to represent a primitive group from which other ungulates have arisen. The descendants of some of these forms lived on into the Lower Eocene and in a modified form, as the Amblypoda, even to the Upper Eocene. These latter forms had their headquarters in North America, but a single representative of them, of Upper Eocene age, has been found in Mongolia. The Basal and Lower Eocene of Europe contain a few animals which are probably condylarthrans, and the earliest Eocene members of the Litopterna (a group restricted to South America) are essentially identical in structure. Thus this group gives a further indication of the uniformity of the Basal Eocene fauna throughout the Palaearctic region, and of the probable derivation of the South American fauna from members of this widespread group of animals, which, becoming isolated about the beginning of Tertiary time, and not being exposed to the competition of the northern groups, carried on an adaptive radiation, leading to the evolution of many very peculiar groups.

Perissodactyla.—Perissodactyls first appear at the bottom of the Lower Eocene in Europe and North America as small animals, presenting a very uniform structure and including the ancestors of the half-dozen families into which the group becomes divided.

The first of these, the Equidae (horses), is represented in North America at every stage of the Tertiary from the Lower Eocene to the Pleistocene. The remains of these animals provide the longest and most complete evolutionary series known; certain peculiarities, however, show that it is not entirely genuine but is built up from a series of forms constantly migrating into the area from northern Asia. It is therefore very remarkable that no remains of horses have been found below the Lower Pliocene in Mongolia and China. Horses extremely similar to those of North America, but forming a less complete evolutionary series, are found in Lower, Middle and Upper Eocene rocks in western Europe, and this region possesses the only representatives of a small group, the palaeotheres, which, derived from a horse-stock, reached a large size and very peculiar structure as early as the Cpper Eocene, becoming extinct in Lower Oligocene times.

No representatives of the true horses are found in Europe in the Oligocene, and the single form, *Anchitherium,* which occurs in the Middle and Upper Miocene, belongs to an aberrant group of forest animals which is also represented from the Middle Miocene to the Lower Pliocene in North America and in the Lower Pliocene of China. Only in the Lower Pliocene Pontian fauna from China to Portugal and in India, do we again meet with typical members of the horse family in individuals of the genus *Hipparion.* The living genus Equus, which is not a descendant of *Hipparion,* appears suddenly in the Upper Pliocene of India and western Europe. South America received its horses in Pliocene times from North America, the peculiar genera of that continent having arisen from a North American Pliocene genus.

The Tapiridae have a probable ancestor in the Lower Eocene of North America and unquestionably ancestral tapirs occur in the Oligocene of Europe and North America. The group appears to have survived in North America until Pleistocene times, reaching South America after the two continents became connected in the Pliocene. In Europe and Japan a Lower or Middle Miocene form is known, and the living genus is represented in Upper Miocene and Lower, Middle and Upper Pliocene deposits. A gigantic form twice the size of the existing ones occurs in the Pleistocene of China. No representatives of this family appear

to have been discovered in the Tertiary rocks of India, but it is clear that the existing Bornean form must have reached that region from the Palaearctic region.

The lophiodonts, a group allied to the tapirs but restricted to Eocene and Oligocene times, include cursorial forms, and occur not only in North America and Europe but also very abundantly in Mongolia.

The rhinoceroses present a very complicated evolutionary story not yet fully understood. One primitive group of animals, the amynodonts, somewhat hippopotamus-like in their adaptations, occur in Eocene and Oligocene rocks in Europe, Mongolia, Burma and North America. The cursorial hydracodonts are known only from the Eocene and Oligocene of North America and Mongolia, whilst their associates of such genera as *Diceratherium* occur both in Europe and North America. The evolution of the more normal rhinoceroses is still so little understood that it is impossible to discuss their migration; it is however clear that creatures essentially ancestral to the living Sumatran rhinoceroses occur widely spread in the Upper Pliocene and Pleistocene of Europe, in association with forms allied to the African rhinoceroses. The living Indian rhinoceros has apparently been derived from forms present in that area in Pliocene times. One remarkable extinct rhinoceros, *Elasmotherium*, found in the Lower Pleistocene of Russia and Siberia, and very rarely in Germany, has an ancestor in the Pliocene of China.

The Titanotheriidae is a small family of perissodactyls whose first representatives are found at the top of the Lower Eocene of North America. They underwent a very rapid evolution in that continent, soon attaining a gigantic size and a very highly specialised character. In the Middle Eocene of Transylvania a single lower jaw has been found. In the Upper Eocene of Mongolia typical members of American genera of similar age are to be found; fragments of very nearly allied animals have been described from Upper Eocene rocks in Burma, and in the Lower Oligocene of North America and Mongolia their remains are abundant. A few fragments have occurred in presumably Oligocene rocks in Eastern Europe, but none have been found in the thoroughly explored deposits of this age in western Europe.

The only remaining group of perissodactyls, the chalicotheres, has a possible ancestor in the Middle Eocene of the United States. It then occurs in the Oligocene both of Europe and North America, is found in Middle Miocene times in India, and is a member of the Pontian fauna of southern Europe. It occurs in the Pleistocene of Central Africa after it had died out in other parts of the world.

The history of the Perissodactyla is of very great importance for the study of geographical distribution as so many fossil forms of the group are well known that relationships existing between the various members can be established with greater certainty than is the case in any other order of mammals. Furthermore many of its members were strange looking animals whose abundant and unmistakable fossil remains make the evidence with regard to its distribution during past times of peculiar reliability. Judging solely from the perissodactyls, it would appear that in Lower Eocene times Europe, Mongolia and North America formed a continuous land-surface, presenting such a variety of vegetation as to allow of the free passage of forest as well as of plain animals. In Upper Eocene times Europe became partially separated from North America, so that certain groups, the palaeotheres and the titanotheres, which are swamp and forest forms, were unable to migrate freely from one region to the other. Horses however still occurred in very similar forms in the two regions. In Oligocene times this differentiation of fauna became exaggerated, the two areas becoming completely separated from one another. The intense earth movements of Miocene times so altered the geography of the world as to re-unite the Palaearctic and Nearctic regions and many forms are common to the two regions at this period. In the succeeding Lower Pliocene rhinoceroses are very abundant and varied in the Palaearctic and Oriental regions, whilst they are much more seldom found in America. Oligocene Africa had no perissodactyls but by mid-Miocene times a rhinoceros had reached that continent. South America was colonized by horses and tapirs in Upper Pliocene times, but no member of the group ever reached Notogaea.

Artiodactyla.—General discussion of the past distribution of the artiodactyls is rendered difficult by the uncertainty which exists as to the classification of that group.

In the Lower Eocene of North America and Europe occur the most primitive forms, and their successors in the Middle and

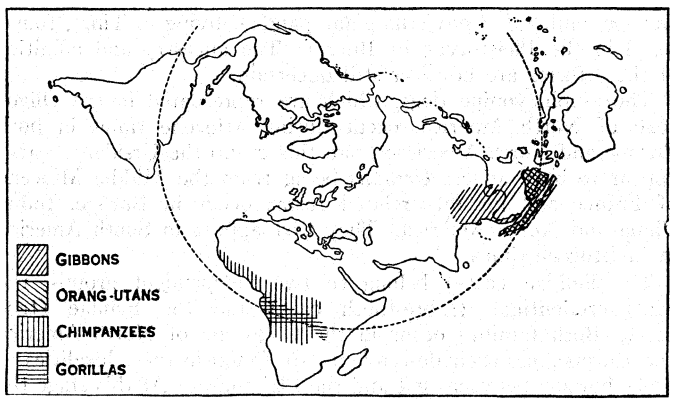

FIG. 4.— MAP OF THE WORLD SHOWING THE PRESENT DISTRIBUTION OF THE GREAT APES

Upper Eocene are similar in these two regions, but in Upper Eocene times certain special groups make their appearance which are restricted to one or other of the two continents. In North America the ancestors of the camels are found at this time and the entirely American family of the oreodonts is represented. In Europe the Anoplotheriidae take the place of these latter forms, and the long-lived family of the Anthracotheriidae appears as small animals.

In the Oligocene the descendants of all these groups are found and a strange creature *Elotherium*, resembling a gigantic long-legged pig, is represented by very similar forms from both sides of the Atlantic. In this period both in Europe and North America there are peccary-like creatures, and perhaps true pigs in Europe: the anthracotheres reached America at this time but only one of the very large number of European and Indian genera ever reached that continent.

In the Lower Miocene in Europe and Baluchistan there was an amazing variety of anthracotheres ranging from forms as small as a sheep to great creatures as big as a hippopotamus. The last representative of the anthracotheres occurs in rocks of probable Upper Pliocene age in India and Tunis.

It is quite possible that the hippopotamus arose from the anthracotheres. The animal is clearly of Oriental origin, reaching north Africa and Europe in the Upper Pliocene, and being widespread over Java, India, Europe, Africa and Madagascar in Pleistocene times.

The camels carried out the whole of their evolution in North America in which they are now extinct. They first left that continent in Lower Pliocene times, a large member of the group occurring in the Lower Pliocene of China, and in India in rocks perhaps of somewhat later date. The llamas reached South America in the Pliocene and a llama-like form survived in North America into Pleistocene times.

The higher artiodactyls (Pecora) are represented in the Upper Eocene of Europe and North America by small animals resembling the existing tragulines. This group of primitive artiodactyls includes one animal *Archaeomeryx* from the Upper Eocene of Mongolia, which is the earliest known form capable of being regarded as a direct ancestor for the Pecora. In Oligocene deposits in Europe, and in Lower Miocene times in Europe and North America occur the remains of animals which are more certainly deer. Deer have a continuous representation in both continents from that time to the present day but the earlier American forms appear to be related to the Virginian deer and its allies, the typical genera being of Asiatic and European origin. The antelopes and their allies first appear in the Lower Miocene of Europe, and the group appears to be definitely of Old World origin. It is abun-

dantly represented in the Pontian fauna from China to Spain and is now the most conspicuous element in the Ethiopian region. Antelopes first appear in North America in the Upper Miocene, but are extremely rare there. The history of the group is however still uncertain. The true oxen are clearly derivatives of the antelopes, and the earliest known and most primitive forms occur in the Lower Pliocene of India: they reached Europe in Upper Pliocene times and America only in the Pleistocene. The ancestry of the goats and sheep is still uncertain but the first definite members of the group appear in the Pliocene of India. In North America from the Middle Miocene to the present day there occurs a distinct family of Pecora, the Antilocapridae, represented now only by the prong-horned antelope. No member of the group has ever been found elsewhere.

According to Pilgrim, the earliest known relative of the giraffe is found in the Lower Miocene of Baluchistan. in the Lower Pliocene the group is represented by very varied forms, some gigantic, some indistinguishable from the living giraffes and others nearly similar to the okapi. These occur throughout the entire distribution of the Pontian fauna from China, Persia, South Russia, Samos and Pikermi. Their remains are not found in German deposits of the same age. No fossil giraffes are known from Africa, the only continent at present inhabited by the family, nor did any member of the group ever reach North America.

Primates. — The lowest division of the Primates, the Lemuroidia, is first recognised with certainty in rocks of Lower Eocene age in North America and Europe. These remains belong to two very distinct groups, the Lemuriformes, with a complete dentition and a comparatively elongated face, and the Tarsiiformes, in which the tooth-row is shortened, the eyes are large, the olfactory region and face very small, and the lower jaws meet in front at an acute angle. Representatives of these two groups are found in the Middle and Upper Eocene in Europe and America, and both continue in the Oligocene of Europe, but disappear at this period in North America. The two groups are then unknown in the northern hemisphere, but the Lemuriformes reappear in the Pleistocene of Madagascar in a most varied series of forms, and the Tarsiiformes are represented by the single living genus *Tarsius* in the East Indies. Nothing is certainly known of the remaining group of lemurs. the Lorisiformes, but it is conceivable that *Pronictycebus* from the Upper Eocene of France represents their ancestor.

The higher Primates fall into two completely separate divisions: the platyrrhine and catarrhine apes respectively. Of these the platyrrhines are first found in the Miocene of Patagonia, and none of them occur outside that continent. The first catarrhine is *Parapithecus* from the Egyptian Oligocene, a primitive form presenting distinct points of resemblance to the tarsioids. Associated with this animal is *Propliopithecus*, which is beyond question a member of the highest family, the anthropoid apes. The earliest members of the lower families of Old World apes occur in the Lower Pliocene throughout the range of the great Pontian fauna. Their distribution presents one or two points of interest, e g., the typical baboon is known from the Pleistocene of India, and another strange form closely allied to the living gelada has been found in the east African Pleistocene. The giant apes have a more complete representation as fossils. a fact which is remarkable when the relative rarity of the living groups is taken into account. *Pliopithecus* from the Middle and Upper Pliocene of Europe appears to be essentially an ancestor of the gibbons, whilst the genus *Dryopithecus* has a wide distribution in Europe and Asia in the Middle Miocene and in somewhat later rocks. The closely allied *Sivapithecus* has been claimed as a human ancestor but really presents no definite evidence of such affinities. From *Dryopithecus* and its immediate allies the living giant apes certainly arose. and such evidence as exists is consonant with the view that man also came from the same stock.

CONDITIONS OF DISTRIBUTION

The outline of the history of land-mammals contained in the preceding pages shows that the present distribution of a mammal may tell us nothing whatsoever about the place of its origin, or the time at which it came into its existing habitat. All the great land-masses of the world except Australia and Madagascar have been continuous with one another at some time during the Tertiary period and representatives of all the higher orders have been enabled to cross the bridges between them. The fact that each continent none the less has a distinctive fauna, is due to the extinction which has overtaken the members of every group in some portions of its former range, the differences in the period at which the union of the continents took place, and the peculiarities in the geographical conditions of the bridges which made them available to certain forms whilst they could not be crossed by others. The geographical conditions which may act as barriers to the free migration of mammals are very varied. A wide strait of sea cannot be crossed by most mammals but there is evidence that certain creatures have in fact reached islands by some rare and casual mode of distribution not available to most forms.

Madagascar. — Perhaps the best evidence of the possibility of such transference is afforded by Madagascar. Taking the Pleistocene and recent faunas of that island together, we find that it is inhabited by very many genera of lemuriform lemurs, varying in size from animals no bigger than a squirrel to a form with a skull more than a foot in length. Although all the living and the majority of the extinct forms are strictly arboreal some of the larger lemurs were terrestrial and even perhaps aquatic in their habits. There is however no doubt that all these forms despite their very varied appearances are extremely closely related and that they may all have arisen from a form resembling *Leinur* itself.

The only other important element in the Madagascan fauna is the group of many genera included in the zalambdodont insectivores. All these belong to the single family Centetidae and may have arisen from a single form. The carnivores are represented by a few genera of Viverridae, all extremely peculiar in their structure; the largest and most interesting is the fossa, an animal whose true relationships are obscure. There is another viverrid, *Eupleres,* with very small widely-separated teeth like those of an insectivore, and finally there is a much more typical viverrid, perhaps belonging to *Viverrus* itself. The rodents are included in the single family Nesomyidae, peculiar to the island. The only other forms are bats. including the fruit-bat *Pteropus* not found in Africa, a pig of the genus *Potamochoerus* and a pigmy hippopotamus now extinct.

This fauna is clearly quite different from that of any other part of the world and gives a sound basis for the establishment of Madagascar as an independent region. We know that *Hippopotamus* only came into existence about at the end of the Miocene times and that it first reached Africa in the Pliocene: it is therefore clear that it must be a relatively recent immigrant. If it had crossed over a land-bridge it would necessarily have been accompanied by those other elements of the African fauna which live in close association with it. We should in fact expect to find in Madagascar representatives of those antelopes which live in the forests or swamps which border rivers. the Cape buffaloes and elephants, true monkeys, and an assemblage of carnivores which prey upon them. The complete absence of such forms implies that the hippopotamus did not cross on dry land and it is probable that it reached Madagascar by swimming. The pig is also a water-loving form and may also have swum across. It is clear from their many peculiarities that the viverrids have lived longer in Madagascar: they cannot have crossed on land because of the absence of any associates, and it is most improbable that they swam. The lemurs represent a group well established in Eocene times and their wide radiation again implies a long residence. Finally the centetids are known to have existed in North America in the Basal Eocene. Neither group could have crossed land-bridges without bringing with them other forms, so that it seems clear that they were transported by some other method, the only plausible suggestion is that they crossed on rafts of tangled vegetation washed down from the great rivers, fore-runners of the Limpopo and Zambezi, which drained Africa throughout Tertiary times.

Madagascar, in the absence from its fauna of most ungulates and carnivores, is representative of all those islands which have never been connected with the great northern land-masses during Tertiary times. Of such "oceanic islands" the next largest is New Zealand, which possesses no mammals whatsoever except two bats, each the sole representative of a peculiar genus. New Caledonia and most of the Pacific islands are of the same type, whilst the islands of the Malay archipelago have a fauna derived from that of Asia, modified by the occasional influx of a few marsupials from the Australian region.

The foregoing discussion will have shown that only when the history of the animals involved is known in detail, is it possible to interpret an existing geographical distribution, and as this condition is only fulfilled in the case of the mammals and there imperfectly, it is unnecessary to discuss the distribution of other groups in detail. There are, however, certain features of general interest presented by individual members of other groups.

Birds.—Amongst the birds, the large cursorial and flightless forms belonging to the Ratitae, are represented by the emus and cassowaries of Notogaea, the rheas of South America and the ostrich of Africa and Arabia. Extinct ostriches were abundant in Pleistocene times in China and Mongolia, and have been found in the Upper Tertiary of India and the Lower Pliocene of Samos, in association with that great fauna which we have seen to include the ancestors of the living African animals. In addition, in the Pleistocene of Madagascar, there is a series of birds *(Aepyornis)* one of which is the largest known bird, standing some 12 ft. high, with an egg with a capacity of 2 gal. A similar group of forms, very variable as to size and proportions, lived in New Zealand long enough to be hunted by the Maoris, and filled in that island the rôle more normally assumed by ungulates. The occurrence of these giant flightless birds in continental areas is interesting because flightless representatives of other groups are generally restricted to islands where they were not exposed to the attacks of carnivorous mammals: of such forms the most familiar is the dodo, probably allied to the pigeons, which formerly lived in Mauritius, whilst a similar form occurred in Rodriguez. The Chatham islands were inhabited by a whole series of flightless rails.

Reptiles.—The reptiles present an example of a group of animals whose distribution is limited by temperature. The body-temperature is not uniform, but varies with the surroundings and is kept slightly above them by muscular activity. As the rate of the heart-beat alters with the temperature, being greatest when warm and becoming very slow as freezing point is approached, it is clear that reptiles can only exhibit much activity in warm climates. In most reptiles an egg, similar to that of a bird, is laid in the ground and incubated not by the warmth of the mother's body but by the sun or by decaying vegetation. As development proceeds at a negligible rate at low temperatures, reptiles are only capable of reproducing their kind within a belt of the earth's surface where the summer temperature is fairly high. The British Isles are very nearly at the extreme northern limit of reptile existence, and are inhabited by very few forms; the mud tortoise, *Emys*, which lives in Belgium, being incapable of maintaining itself in England. Even within this belt the distribution of certain forms is restricted to the warmer regions. The crocodiles, for example, are in the main tropical, although they reach as far north as the Mississippi in North America and the Yellow river in China.

Amphibia.—The distribution of Amphibia presents some interesting and puzzling features. The Gymnophiona, probably the most archaic group, are strictly confined to the Tropics and occur in the Neotropical, Ethiopian and Oriental regions. The Urodela, a very ancient group, are not now represented in Notogaea, an area which it seems certain they must once have reached. They are at present most abundant and varied in the temperate zone of eastern Asia and North America. The distribution of frogs cannot be intelligently discussed owing to our lack of knowledge of the history of the group.

Freshwater Fishes.—The distribution of freshwater fish does not fall easily into the zoo-geographical regions established for the mammals, a fact which is remarkable because the bony fish are in the main a Cretaceous and Tertiary group. The most archaic of living vertebrates, the lung-fish *Neoceratodus*, now lives solely in two small rivers in southern Queensland, but remains of the same genus have been found in the Pleistocene of South Australia. *Ceratodus* itself is a Triassic form found widely spread all over the world in fresh-water deposits. It is clear that the present restricted distribution has resulted from the extinction of this fish over the greater portion of its former range. The other two dipnoans, *Lepidosiren* of South America and *Protopterus* of tropical Africa, are very closely related to one another, but differ materially from *Ceratodus*. A specimen of *Protopterus* has been found in the Oligocene of Egypt, proving that the group is an ancient one, and its present distribution must depend on factors incapable of analysis. *Polypterus* and its close relative *Calamoichthys*, which are the much modified descendants of the Palaeozoic Palaeoniscidae, are now restricted to tropical Africa, but isolated scales perhaps of the same type occur in the Eocene of Egypt. The sturgeons, belonging to a group which first appears in the Lower Jurassic, are remarkable for their restriction to the temperate waters of the northern hemisphere, where are found all the members of the two existing families. That the only two other living ganoids, the bowfin and the garfish, live in temperate parts of North America, and that both are known from the Eocene of Europe, shows yet again how present distribution may give no clue to former extent of range.

One peculiar family of bony fish, the cichlids, extraordinarily abundant in the great lakes of equatorial Africa, is represented in equal numbers in tropical America, a phenomenon which with the similar distribution of lungfishes and octodont rodents has led to a belief that South America and Africa were connected by a land-bridge until late in Tertiary times. The distribution of mammals makes this view untenable, and when the fossil history of the cichlids comes to be known, it will probably be found either that they once occurred in the northern hemisphere or that the African and American forms are not really closely related. It is impossible to deal in this article with the distribution of invertebrates but the matter is dealt with in the articles dealing with individual groups.

Marine Animals.—The distribution of marine animals depends on many factors. To a considerable extent it is controlled by temperature, many marine forms being capable of life and reproduction only within a narrow range of temperature variation. The seas may be divided into the open oceans and the shallow waters into which detritus derived from the land is carried by rivers.

In the ocean, animals may inhabit three regions; they may live in the surface layers *(40* fm.) to *a* depth where the light intensity becomes negligible and growths of plants is no longer possible: or they may inhabit the mid-waters (roughly 40–2,000 fm.) depending ultimately for their food-supply on the remains of dead animals and plants from the surface: or they may live on the ocean bottom even at depths approaching *3,000* fathoms. The fauna of the sea-bottom lives under remarkably uniform conditions; light is absent, the temperature is not far above freezing point, all the food which reaches this region has fallen from the surface of the sea and the bottom is usually soft mud. The abyssal fauna is nearly uniform over the whole world: it includes the great majority of known species of the primitive hexactinellid sponges, and most of the phyla of the animal kingdom are represented, often by forms peculiar in structure and belonging to groups restricted to deep water. Although a more detailed study shows that species and genera may range over only comparatively small areas of the ocean floor, the abyssal fauna is nevertheless remarkably distinct from all others, nearly all its members being recognizable as such at sight.

The free-swimming fauna of the mid-water includes certain radiolarians and medusae. The Crustacea are represented by many forms of prawns, usually bright red in colour, and by a gigantic ostracod. The Mollusca include pteropods and cuttle-fish, but the most abundant forms are fish, very characteristic in their possession of light-producing organs, their black, and in

shallower water, silvery colour, and the presence of very large or excessively small eyes.

The pelagic fauna of the surface layers of the ocean, consists mainly of transparent animals of delicate structure; it includes the foraminiferan *Globigerina* and many radiolarians, innumerable representatives of the dinoflagellates, some brilliantly phosphorescent, medusae and the floating siphonophores, familiar as

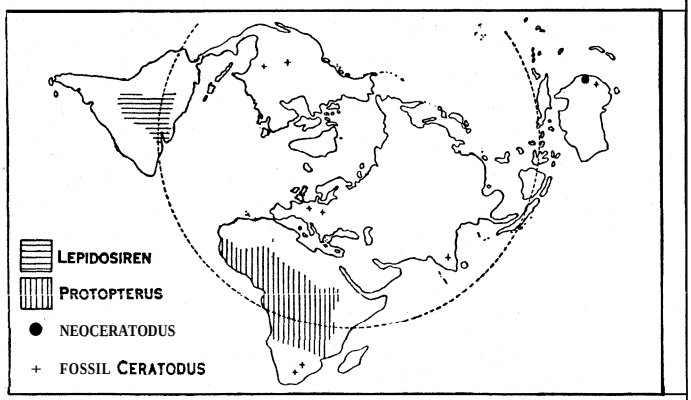

FIG. 5. MAP OF THE WORLD SHOWING THE PRESENT DISTRIBUTION OF THE DIPNOI AND THE PLACES OF EXTINCT MEMBERS OF THE GENUS CERATODUS

the "Portuguese man-of-war." The arrow-worm *Sagitta* is often abundant and certain polychaet worms are of universal occurrence. The Crustacea include immense numbers of copepods, usually very small forms living on diatoms. Other small Crustacea belonging to the Ostracoda are plentiful, whilst of the higher Crustacea, the schizopods may form a large proportion of the catch. The pelagic molluscs belong largely to the pteropods: lamellibranchs are absent and gastropods represented by a few special forms. Cephalopods probably form an important element in the pelagic fauna and tunicates belonging to the appendicularians, salps and *Pyrosoma* occur abundantly. The oceanic surface fishes include forms allied to the herrings, with many representatives of the mackerels, flying-fishes and gar-fishes.

The distribution of those animals living near the coast depends very largely on local features such as the nature of the bottom, the salinity, the acidity of the water, the temperature and temperature range, the nature of the currents, and other factors which can only be determined in each individual case. It is therefore impossible to deal with them in this article, but an account will be found in the article DISTRIBUTION OF ANIMALS.

In the foregoing account it has been assumed that the great continents have been stable in the sense that they contain within themselves great areas, such as Mongolia, Eastern Canada, West Australia and South and Central Africa, which have been dry land for a period vastly greater than that within which the adaptive radiation and distribution of the mammals has taken place. The truth of this assumption is abundantly demonstrated by geological observations, but the further belief that these old land masses have always occupied the same positions with respect to one another and to the poles has been seriously questioned by A. Wegener.

Wegener holds that in Upper Carboniferous times the whole of the dry land of the world was concentrated into one great continent, subdivided to some extent into independent areas by shallow seas, but essentially continuous. The south pole lay within this land mass in what is now Portuguese West Africa.

The present continents have arisen from this mass by an actual horizontal displacement, the present coasts, or more accurately the margins of the continental shelfs which face one another across the Atlantic and Indian oceans having formerly been in actual contact. By such drift not only have the Americas become torn away from the western coast of Europe, Africa and Antarctica and Asia from its eastern coast, but the island festoons, New Zealand, the Antilles, Madagascar, etc., have been detached from the neighbouring coast of a continent. These great movements naturally produced great pressures on those continental margins which lay in the direction of motion, and led to the uprising of the coastal mountain ranges which are a marked feature of the earth's morphology.

The continental drift did not take place freely, the large land masses twisted round with respect to one another and became deformed, so that their margins in many cases no longer fit accurately, and small land bridges between the continents persisted long after the main masses had become widely separated.

This remarkable view has been accepted by some geologists and has a great mass of geological evidence behind its basal assumption.

Wegener was first led to the investigation of its possibility by a consideration of the evidence from the distribution of animals for the former existence of a land bridge between Africa and Brazil. Wegener's view has the very great merit of explaining simply the remarkable facts of the distribution of that peculiar flora, the Glossopteris flora, which in South America, the Falkland Islands, South Africa, Madagascar, India and Australia occurs in late Carboniferous and Permian rocks. usually in association with boulder clays and other evidences of an ice-bound land and arctic climate. It accounts satisfactorily for the occurrence of the little fresh-water reptile Mesosaurus in Brazil and South Africa, and for similarities in the Triassic reptilian faunas of those regions and the extreme resemblance between the land and shallow sea faunas of North America and Europe in Carboniferous times.

But a continuation of these and other land bridges into late Tertiary times which has been suggested on the evidence of the present distribution of land snails, earthworms and similar groups, seems to be negatived by the distribution of mammals, where, as W. D. Matthew has shown, the existing distribution of land masses together with a few former land bridges, such as that which connected Asia and America through the Aleutian Islands, are sufficient to account for all the observed facts. The evidence of mammals far outweighs in value that of every other group, because for them alone have we any considerable knowledge of the history of the individual groups. (D. M. S. W.)

ZOOLOGY, the science which is concerned with the study of animals. Its scope embraces all conceivable modes of study, not only of individual animals, but of entire faunas and of the relation of animals with one another, with plants and with the non-living environment.

The number of animals, both living and extinct, which has been investigated is very great, perhaps approaching two million separate forms. It is, therefore, necessary to provide every different kind of animal with a name by which it can be recognized by zoologists in all countries, and to establish a classification by which the name of any animal may be determined.

The more obvious and easily discovered characters which distinguish animals from one another are those of their external appearance; body shape, nature of appendages, sense organs, character of the skin and its derivatives, colour and size, enable the ordinary man to identify the animals with which he is brought into contact, either as enemies, or as the objects of his sports and the source of his food supplies, or from the interest of their attractive appearance and habits.

The earliest attempts to name and classify animals were based exclusively on these characters, and the smaller divisions of a classification are still necessarily founded on them.

But it soon became obvious that, from external appearance alone, it was impossible to provide a key to the whole animal kingdom, and zoologists were driven to a study of the internal structure of animals.

The necessary beginning of such studies is an investigation of the anatomy of individual animals. The French anatomists of the 18th century published a series of works, each dealing with the anatomy of a single specified individual, and disclaimed any belief that the facts that they recorded would necessarily be true for any other individual, even though it was apparently of the same kind.

Anatomical investigations of this character were carried out at first entirely by dissection of the animal's carcass with knives, scissors and other implements, a technique which, in skilful hands, can yield an astonishing amount of accurate information, but which is necessarily incapable of revealing many structures, either because they are too small to be seen or otherwise undiscoverable. The progress of anatomy has depended very largely on advances in methods of investigation.

The most important of all such is that which came from the introduction of the microscope. The possibility of magnifying an animal at once greatly extended the scope of zoology, because it enabled the structure of very small animals to be investigated and, indeed, revealed an immense variety of forms, previously unknown because they were too small to be seen with the naked eye. At the same time microscopical examination showed that the organs of which an animal was composed were themselves complex, each consisting of a variety of tissues themselves constructed of smaller units, the cells. Work along all these lines is still continuing; each year sees the publication, though in decreasing numbers, of accounts of the structure of additional animals, and corrections of former accounts of anatomical detail, so that zoologists have now reliable accounts of the structure of an immense number of animals from all regions of the animal kingdom.

These accounts are, in part, based on dissection, but in most cases depend on microscopical investigations made by many methods. The fact that the cells which compose animals, and the various substances of which they are formed, have different chemical and electrical affinities for dyes, makes it possible to differentiate between them by staining animals. or parts of animals, before subjecting them to microscopical examination. 'The application of this method was made possible by the discovery of processes by which an'animal may be cut into a series of slices, sections often only one-hundredth of a millimetre thick. From a study of such a series of sections it is possible to reconstruct the whole anatomy of a microscopic animal in very great detail. But in many cases the object of such investigations is not to discover the anatomy of a whole animal, but to describe the fine structure of some one organ, such as an eye or ear, elucidating the arrangement of the cells of which it is composed. For such studies the term histology (*q.v.*) has been introduced. They only acquire significance when they are linked up with concurrent physiological investigations, so that an attempt can be made to relate the observed structures with the function that they subserve during the animal's life.

From histology has sprung the science of cytology (*q.v.*), which is devoted to the discovery and elucidation of the visible structures within cells themselves. These researches have proved to be of such great significance for zoology in general that they will be referred to in later portions of this article.

It very soon became clear, largely, in all probability, through the investigations of the anatomy of man, that, within certain limits, the structure of all individuals of any particular kind of animal was the same. It then became possible to compare the structures of different animals with one another, and thus to gain an understanding of the nature of their differences.

Comparative anatomy has gradually led zoologists to the conclusion that the variations in structure which occur amongst animals are not haphazard in their nature, but that they are systematic, so that every animal conforms to one of a very limited number of fundamental plans of structure. There is, for example, a single pattern underlying the structure of two animals differing superficially so greatly as a fish and a bird, or a sea cucumber and a starfish. On this fundamental basis all kinds of variations may be imposed, so that the animals which exhibit them may be fitted for life under most varied conditions.

CLASSIFICATION BY STRUCTURE

Thus it is possible to draw up a classification of the animal kingdom based entirely on resemblances of structure. But any such process involves a deliberate choice from the great number of separate characters visible in an animal of certain structures as those on which weight shall be placed in judging its position in the classification. This process involves extended comparisons between widely differing animals, structures which are widely distributed through the animal kingdom being used for the discrimination of the more fundamental groups, whilst those which are less widely spread serve for the establishment of smaller divisions. Though very simple in principle, this process of zoological classification is difficult in practice, requiring much judgment in those who are devoted to it,

The difficulties are of many different kinds; they may arise from the necessity of drawing arbitrary lines of division in nearly continuous series of forms, or they may depend on the existence of gaps in the series so large that the structures of the animals that they separate may differ so greatly that there is a real difficulty in discovering whether or not a comparison is possible.

It was to meet difficulties of the latter type that the science of morphology (*q.v.*) came into existence.

The classifications of the animal kingdom drawn up by zoologists before 1859 endeavoured to give a strictly objective representation of the facts of animal structure and of the structural relationships of animals to one another. The resulting series of groups, each included in others of higher order, was devoid of all symmetry and of all evidence of plan. It was unintelligible to men who believed that the whole system, in all its detail and complexity, had arisen at the fiat of a Creator. But the real nature of this classification at once became clear with the resuscitation by Darwin of the theory of evolution (*q.v.*) and its universal acceptance. The natural classification of animals, though founded on the resemblances in structure, is really of the nature of a genealogical tree, expressing the actual blood relationships between animals, a tree imperfect, not only from failure of analysis of the available evidence, but also from the gaps and breaks which necessarily exist in it from the fragmentary nature of our knowledge of extinct animals.

Thus a classification drawn up on evolutionary lines necessarily takes account of time; it cannot be expressed by a linear arrangement, or even on a surface, but involves at least a third dimension.

This tree, representing as it does the branching out of the animal kingdom during the Iong course of evolution, itself dependent not only on the intrinsic properties of living matter but also on the local peculiarities of the inorganic environment, is necessarily devoid of obvious symmetry; it includes branches tentatively put forth which, after a longer or shorter period, proved unsuccessful, as well as those which survive to-day.

This conception altered the whole meaning of the classificatory groups; instead of regarding them as having a real existence, as permanent and sharply marked categories, zoologists realized that they were of human origin, representing little more than a convenient mode of expressing definite conceptions of relationships.

The group names which are now in use are in order of ascending scope, species, genus, family, super-family, sub-order, order, class and phylum. It is believed by many zoologists that the smallest group, the species (*q.v.*), differs somewhat in its nature from the others. **A** species may be defined as a group of individual animals, whether alive or dead, which agree with one another in their structure, within close but variable limits, and are capable of breeding together. In the nature of the case it is impossible to give any general quantitative expression to the permissible amount of variation, and, in practice, the determination of the limits of a species depends on the judgment of the taxonomist. The second part of the definition, the possibility of breeding from any two individuals of the species of different sexes, cannot be extensively used because many animals will not, in fact, breed in captivity, although under natural conditions they would be fertile, and because the vast majority of species are only known from the dead specimens preserved in museums.

Darwin's conception of the mode of origin of species was that by some one or more of different processes, under the control of natural selection, a group of individuals of a species and their descendants gradually diverged from the normal type, until by the slow accumulation of changes they came to differ so greatly from it in their structure that they were, in most cases, no longer fertile with the original type of individual, and presented morphological characters sufficiently distinct to acquire specific status. On this hypothesis of its origin it is clear that a species is an artificial group, in that no two observers will draw the line which separates it from the parent species at the same point. At the same time, if only the living representatives of the new and the parent species be considered, the groups may appear completely discrete.

Modern work on genetics, the investigation of the nature of

heredity (*q.v.*), has suggested that the initiation of a new species may depend, not on a continuous process of change, in which the stages may be of infinitely small magnitude, but on a discontinuous variation, in which each change is a definite step, even if a very small one, and the individual which exhibits it differs from its parents in every cell of its body from the moment of its formation. Such definite steps may, in some cases, be found to depend on a modification, presumably of a chemical nature, in a particular structure, a gene, in a chromosome of one or both of the germ cells from whose fusion the new individual arose.

If such a view of the nature of evolution be true, it is clear that a species is a natural group, in that it begins at a definite place and time by a definite event; that, like Athena, it sprang fully developed from its parent.

What little evidence exists suggests, however, that few species are actually distinguished from their parent species by their possession of a single mutant character, that, in general, they must have arisen by the accumulation in one individual of a number of such mutations (*q.v.*). Indeed, in certain cases the differences between two species, although they may be supposed to arise from modification of the chromosomal mechanism, appear to depend, not on the change of individual genes, but on much grosser events, such as the fragmentation of the chromosomes themselves.

Genus. — The term genus indicates a sub-division of the animal kingdom which includes one or more species. Its limits, except in so far as they are made certain by the existence of a considerable morphological gap between one species and its neighbour, are entirely arbitrary, depending on the judgment of the writer.

It is evident that the doubt as to the real existence of genera is of the same character as that which occurs in the case of species; indeed, in this case it seems certain that the single term covers two quite independent classes of groups. It may imply that the group of species included within the genus have all arisen from a single species, which itself presented the generic characters, having, by evolution, come to differ in structure from its own parents and from sister species to a greater extent than species within a genus usually do. It is probably this conception which is usually present in the minds of taxonomists. But palaeontologists in general hold a very different view of the nature of a genus. It is widely believed by them that evolution has been to a large extent orthogenetic, that is, that all the species which fall within a small group pursue parallel evolutionary courses, so that, as time goes on, their members exhibit changes of structure which are df similar nature in all, although they have been independently acquired. To the group made artificially to include all the allied species which are in the same stage of evolutionary advance it is customary to apply the term genus. A group so defined differs from that which is ordinarily understood by the name, in that its members have not arisen from a single species, itself capable of inclusion within the genus.

The accepted scientific name of a species is a binomial phrase consisting of the generic name, which is placed first, and a trivial name proper to the species. The whole compound is the specific name. The terms employed should be formed from Latin or Greek roots, and the whole is regarded as Latin, so far as the termination, and agreement between the adjectival trivial and nominal generic name are concerned. (See ZOOLOGICAL NOMENCLATURE.)

The Sub-Family. — The next highest group, the sub-family, includes a group of genera, held together by structural resemblances. Its name is always made by adding to the root of the name of one of the genera included in it, the termination *-inae*.

Sub-families are grouped into families, whose names, formed as are those of sub-families, are characterized by the termination *-idae*.

Neither of these groups has a definite connotation, each, except in so far as it is bounded by morphological gaps between neighbouring genera, gaps which depend on our very incomplete knowledge of fossil forms, is of the nature of an artificially circumscribed assemblage.

Families. — Families are grouped into orders, and orders into classes, divisions of the animal kingdom which usually include large numbers of species, held together by the common possession of very fundamental structures.

The primary division of the animal kingdom is into phyla. Each phylum is sharply characterized by the possession of a plan of structure in the adult which is peculiar to it, differing from that proper to every other phylum in such ways that it is, in general, incapable of derivation from any other. As the adult structure of an animal represents a condition finally arrived at, at the end of a developmental history which begins with a single fertilized egg cell or zygote it necessarily follows that in certain fundamental features, at any rate, the modes of development of all the members of a phylum will agree with one another and differ from those of representatives of other phyla. This is indeed the case, but there do exist resemblances in the early development between members of different phyla which have led zoologists to discuss the possibility of relationship between one phylum and another of a kind which must have existed in the early stages of evolution, at a time when the first fundamental branching out of the animal kingdom took place.

Thus a study of animal development (see EMBRYOLOGY) is necessary for the establishment of a natural classification.

The labours of zoologists have now resulted in the establishment of a classification of animals, based entirely on morphology, which is unlikely to be seriously modified in its broad outlines by further work. The minor classification, into orders and smaller groups, is still disputed, although even here the differences between taxonomists lie more largely in the minor points of the grade to which a group belongs, or the position of its boundaries, than in a real clash of opinion as to mutual relationships.

This classification makes it possible for any competent zoologist to determine an animal, which is unknown to him, at any rate so far as its family or genus is concerned. It is thus of immense practical value, not only to the pure, academic zoologist, but also to those whose work has a direct economic bearing. The first thing which has to be done in an attempt to control an injurious insect is to discover its name, because only when this is known is it possible to find out whether the pest is imported or of local origin, and whether it is known and controlled in other parts of the world.

National museums exist in order that they may play the part of dictionaries, ensuring the accurate determination of all animals which may prove of interest either scientifically or commercially.

DIVISIONS OF THE ANIMAL KINGDOM

The primary division of the animal kingdom is into two groups, one including all those animals whose body is composed of a single cell, the other all those whose body is built up from many cells. (See CELL; CYTOLOGY.)

The first group, usually regarded as a phylum, the. Protozoa (*q.v.*), may be defined as including all animals in which the body, when fully developed, consists of a single cell which carries out all the activities of a living animal; or of a colony of cells, exhibiting either no differentiation, or, in certain cases, distinguished from one another by the setting apart of one or more cells for reproductive purposes.

The group is very extensive, and the animals included within it vary extremely in size and in structure. The single cells which compose the entire bodies of most of its members may be far more elaborately organized than any of the cells of higher animals; they may contain one or many nuclei, and these nuclei may present a differentiation of function.

The cytoplasm may itself possess an elaborate structure, including contractile myonemes, fibrillae and neuroid fibrils which control locomotary activities. It may possess a definite food track and permanent contractile vacuoles for excretion and the control of the water content of the organism. Indeed, it is far from improbable that some Protozoa are the degenerate descendants of multicellular animals.

The life history of Protozoa is often very elaborate, and the group exhibits many stages in the development of a sexual mode of reproduction, from such simple cases as those in Ciliata. where

two identical feeding individuals come into association and exchange nuclei, to a fully developed sexuality where a large egg is fertilized by a small mobile spermatozoa as in the malarial parasite. It is, in fact, known that in some cases these gametes undergo a process of maturation of which the essential part is a halving of the number of chromosomes in the nucleus by a meiosis identical in principle with that which occurs in all multicellular animals.

The multicellular animals, or Metazoa, are distinguished from Protozoa by the fact that their bodies are composed of a number of cells, which are not equipotent, but differ from one another in structure, function and origin. Each of these cells is associated with others of the same kind so as to form a tissue, and the tissues fulfil definite functions in the life of the animal of which they form a part. A Metazoan animal is an individual, a unit whose cells are subordinated to the whole. Unlike the cells of Protozoa, they are not, in general, capable of a complete independent existence, and cannot, unless they be germ cells, reproduce the whole body of which they form a part.

Thus the Metazoan body exhibits a differentiation, its separate functions being performed by definite cells or congeries of cells, whilst the diverse functions of a Protozoan are carried out by differentiated portions of an undivided mass of cytoplasm.

It follows, as a necessary concomitant of the cellular differentiation of a Metazoan body, that all such animals must undergo a definite course of embryonic development whereby, by repeated cell division and differentiation of the cells so formed, the adult body arises from the single cell, the zygote or fertilized egg cell in which the individual begins its existence. With very rare exceptions, all clearly secondary, all Metazoa reproduce sexually, the male and female gametes, the spermatozoa and ova. being formed in definite organs, the gonads, and possessing markedly divergent characters. The ovum is always relatively large, possesses some food reserves, and is the only functional cell of four formed by the last two divisions of the process of maturation. The spermatozoan is a small cell, in which the cytoplasm is found only in very small amount, and the food reserve is only large enough to enable it to swim for the short period which is necessary to reach an ovum. It always possesses some locomotor apparatus and is usually of uniform and very characteristic structure.

The Metazoa fall into two divergent branches of very different importance. The group Parazoa includes only the sponges (*q.v.*), whilst the equivalent group of Enterozoa includes the remainder of the animal kingdom.

A Parazoan is an animal which, when adult, is permanently fixed to a substratum. Its body is composed of tissues which provide it with an external surface, and surround a cavity usually very complex and often irregular in shape, through which a current of water is caused to pass by the activity of the flagella borne by the cells which surround it. The cavity of a sponge, the canal system, is always in communication with the sea by inhalant and rxhalant openings; the latter are oscula, the former differ in their morphological nature in different sponges.

Some part of the canal system is always lined by an epithelium composed of cells, choanocytes. which possess a single flagellum, whose base arises within a cup formed by an extremely delicate protoplasmic membrane which projects from the free surface of the cell. This collar can be retracted, and serves in some way, not yet understood, to affect the current of water caused by the lashing of the flagellum.

These collar cells are found only in Parazoa amongst the Metazoa, but identical cells form the bodies of a group of Protozoa, the Choanoflagellata. The collar cells not only serve to maintain the current of water, which, passing continuously through a sponge, brings to it its food and oxygen, but are the actual nutritive mechanism, engulfing food particles and digesting them. From them also arise the gametes. The remainder of a sponge consists of an external epithelium, protective in nature and an intervening mesoglosa containing cells of many different types and skeletal elements of varied nature.

During the development of a sponge the cells which, in the adult, are collar cells, form an external layer and serve for the locomotion of the free swimming embryo, whilst all the other cells of the body, including those which form the external surface of the adult, lie internal to them, often as a compact mass. (See INVERTEBRATE EMBRYOLOGY.)

The Enterozoa form a complete contrast to the Parazoa. They present many grades of structural complexity, of which the lowest is that presented by the members of the phylum Coelenterata (*q.v.*), from which all the others have ultimately been derived. The primitive Enterozoan has a body consisting of a sac, whose cavity, the archenteron, or primitive gut, opens to the exterior by a single aperture, through which food enters and the faeces are expelled; it thus combines the functions, and, indeed, probably gave origin to both mouth and anus.

The body-wall of a primitive Enterozoan consisted of two epithelia placed back to back, their cells being attached to a basement membrane common to both.

The epithelium which lines the single cavity is the endoderm; its cells are primitively concerned only with food. carrying out the processes of digestion, assimilation and food transport, and also giving rise to the germ cells.

The outer layer, the ectoderm, is that part of the animal which is brought into direct contact with the environment; it is responsible for protection, locomotion, the perception and capture of food, respiration and the excretion of nitrogenous waste products. In it arises the nervous system and sense organs which are necessary for the adjustment of the animal's behaviour to external circumstances. During the development of such an animal, the endoderm arises from cells which at no time lie external to those which compose the ectoderm.

The complexity of structure which may be built up on so simple a plan as that of a Coelenterate is very considerable, but cannot approach that which is, in fact, found amongst Metazoa. The first step in further evolution was the addition of a further layer of cells, the mesoderm, not necessarily epithelian in arrangement, between the ectoderm and endoderm.

In the majority of Coelenterates the basement membrane, which lies between these two primitive epithelia, becomes greatly thickened as a mesoglosa, into which cells wander chiefly, if not exclusively, from the ectoderm. In one living group of animals (the Ctenophora) this migration takes place precociously, so that a special mass of cells, derived from the embryonic ectoderm, is set apart as a mesoderm. From this the whole musculature of the adult arises.

All the Enterozoa we have so far considered possess no cavity other than the archenteron, the gonads being masses of cells, derived ultimately from the endoderm, which lie in pockets in free communication with the primitive gut. The next stage in development involves the separation of these pockets from the gut, either by an actual pinching off or by a migration of the cells which will form the gonad into the mesoderm and their subsequent arrangement into a vesicle. The independent cavity so formed is held to be the beginning of the coelom. This cavity, whatever its extent, is a morphological entity, independent of the enteron or true gut, and of the bloodspaces and of all other cavities, including that of the blastocoel, which is formed during early embryonic life by the separation of the first formed cells, or blastomeres. Part at least of the mesoderm arises from the walls of the coelom in all animals which possess that structure. (See EMBRYOLOGY.)

The presence of a coelom, even if it be no more extensive than the cavity of a gonad, thus enables us to divide all Enterozoa into two groups or grades, the Acoelomata and the Coelomata.

The establishment of the coelom, by isolating the gonads, and the increasing importance of the mesoderm, made the problem of the nutrition of the whole animal more difficult. In the Acoelomata food transport was carried out by the development of canals along which food particles could be transported by ciliary currents throughout the body. This mechanism is replaced in all higher animals by a blood vascular system, consisting of canals or spaces through which a fluid can he caused to travel to every

part of the animal. This fluid, in its passage through the vessels which lie on the wall of the gut, becomes charged with food substances in solution, and is capable of giving them up to any organ which requires them.

By its mere presence as a circulating fluid which passes through the whole body and is not itself actively metabolic, the blood must serve as a carrier of oxygen, even though a poor one. Its respiratory function becomes far more important in higher animals with the introduction of respiratory pigments, carried by the blood, capable of forming easily dissociated compounds with oxygen.

The same factors which led to the introduction of a vascular system were responsible for the initiation of a definite excretory system, at first in the form of a system of tubes, of ectodermal origin, ending blindly in a hollow cell with a bunch of cilia lying in the cavity. Subsequently, when the coelom became an extensive cavity surrounding the gut, these primitive tubes, the nephridia, became connected with it, usually through the intervention of other structures, the coelomoducts, whose primary function was the transmission of the gametes to the exterior.

The classification which results from the application of these and other criteria is as follows:—

ANIMALIA

Grade A. Phylum 1. Protozoa (*q.v.*)
- Class 1. Rhizopoda
  - Sub-class 1. Sarcodina
  - ,, 2. Heliozoa
  - ,, 3. Foraminifera
  - ,, 4. Radiolaria
- Class 2. Mastigophora
  - Sub-class 1. Flagellata
  - ,, 2. Choanoflagellata
  - ,, 3. Dinoflagellata
  - ,, 4. Cystoflagellata
- Class 3. Infusoria
  - Sub-class 1. Ciliata
  - ,, 2. Suctoria
- Class 4. Sporozoa
  - Sub-class 1. Telosporidia
  - ,, 2. Neosporidia

Grade B. Metazoa

Branch Parazoa
- Phylum 2. Porifera (see SPONGES)
  - Class 1. Hexactinellida
  - ,, 2. Calcarea
  - ,, 3. Tetraxonida
  - ,, 4. Myxospongida

Branch Enterozoa
- Phylum 3. Coelenterata (*q.v.*)
  - Class 1. Hydromedusae
  - ,, 2. Scyphomedusae
  - ,, 3. Anthozoa
    - Sub-class 1. Alcyonaria
    - ,, 2. Zoantharia
- Phylum 4. Ctenophora (*q.v.*)
  - Sub-class 1. Tentaculata
  - ,, 2. Nuda
- Phylum 5. Platyhelmia
  - Class 1. Turbellaria
  - ,, 2. Trematoda (flukes)
  - ,, 3. Cestoda (tapeworms)
  - ,, 4. Temnocephaloida
- Phylum 6. Nemertina (*q.v.*)
- ,, 7. Nemathelmia
  - Class 1. Nematoda (*q.v.*) (round worms)
  - ,, 2. Chaetosomatida
  - ,, 3. Desmoscolecida
  - ,, 4. Nematomorpha (*q.v.*)
- Phylum 8. Chaetognatha (*q.v.*)
- ,, 9. Acanthocephala (*q.v.*)
- ,, 10. Rotifera (wheel animalcules)
- ,, 11. Chaetopoda (see ANNELIDA)
  - Class 1. Archiannellida
  - ,, 2. Polychaeta
  - ,, 3. Oligochaeta (earthworms, etc.)
  - ,, 4. Hirudinae (leeches)
  - ,, 5. Myzostomida
  - ,, 6. Echiuroidea
- Phylum 12. Arthropoda (*q.v.*)
  - Class 1. Onychophora
  - Class 2. Chilopoda
  - ,, 3. Diplopoda
  - ,, 4. Pauropoda
  - ,, 5. Symphyla
  - ,, 6. Hexapoda or Insecta (see INSECT, ENTOMOLOGY)
  - ,, 7. Arachnida (*q.v.*)
  - ,, 8. Trilobita
  - ,, 9. Crustacea (*q.v.*)
  - ,, 10. Tardigrada
  - ,, 11. Linguatulida
- Phylum 13. Mollusca (*q.v.*)
  - Class 1. Solenogestres
  - ,, 2. Amphineura (chitons, etc.)
  - ,, 3. Gastropoda (snails, etc.)
  - ,, 4. Scaphopoda (tusk shells)
  - ,, 5. Lamellibranchiata (bivalves)
  - ,, 6. Cephalopoda (squids, octopuses, etc.)
- Phylum 14. Polyzoa (*q.v.*)
  - Class 1. Endoprocta
  - ,, 2. Ectoprocta
- Phylum 15. Phoronidea
- ,, 16. Gephyraea (*q.v.*)
  - Class 1. Sipunculida
  - ,, 2. Priapuloida
- Phylum 17. Brachiopoda (*q.v.*) (lamp shells)
- Phylum 18. Echinoderma (*q.v.*)
  - Division Pelmatozoa
    - Class 1. Cystida
    - ,, 2. Blastoidea
    - ,, 3. Edrioasteroidea
    - ,, 4. Crinoidea (sea likes)
  - Division Eleutherozoa
    - Class 1. Stelleroidea (starfish, brittle stars)
    - ,, 2. Echinoidea (sea urchins)
    - ,, 3. Holothuroidea (sea cucumbers)
- Phylum 19. Chordata (*Vertebrata*)
  - Sub-phylum Hemichorda (*q.v.*)
    - Class 1. Enteropneusta
    - ,, 2. Pterobrachiata
  - Sub-phylum. Urochorda
    - Class Tunicata (*q.v.*) (sea squirts, etc.)
  - Sub-phylum. Cephalochorda (see AMPHIOXUS)
    - Class Cephalochorda
  - Sub-phylum. Craniata
    - Class 1. Cyclostomata (*q.v.*) (lampreys, hagfish, etc.)
      - Sub-class 1. Cephalaspidomorpha
      - ,, 2. Pteraspidomorpha
    - Class 2. Pisces (*see* FISHES)
      - Sub-class 1. Chondrichthyses (cartilaginous fish)
      - ,, 2. Osteichthyses (bony fish)
    - Class 3. Batrachia or Amphibia (*q.v.*)
    - ,, 4. Reptilia (*q.v.*)
    - ,, 5. Aves (see BIRD, ORNITHOLOGY)
    - ,, 6. Mammalia (*q.v.*)
      - Sub-class 1. Prototheria (Monotremata)
      - ,, 2. hlultituberculata
      - ,, 3. Triconodonta
      - ,, 4. Metatheria (Marsupialia)
      - ,, 5. Eutheria (Placentalia)

The following small groups should perhaps be regarded as phyla:
- Phylum 20. Archaeocyathea
- ,, 21. Mesozoa (*q.v.*)
- ,, 22. Gastrotricha (*q.v.*)

This classification of the animal kingdom is of importance because it establishes the possibility of an evolutionary explanation; it is, in fact, in its mixture of irregularity and system, exactly what would be expected if the animal kingdom owed its nature to a chain of contingencies stretching back to the beginning of life on the earth.

A zoological classification drawn up in the way which has been described, rests only on evidence of one kind, it depends on morphological resemblance alone, and no extension of observations to a consideration of new structures can materially contribute to its justification.

Palaeontology (*q.v.*), by bringing in the new element of time, affords a real confirmation of some parts of the classification, even though, in essence, the nature of the evidence it employs is the same as that used by taxonomists who work only with animals which are still extant.

MULLER'S THEORY AND ITS CONSEQUENCES

One principle, which, though no longer regarded as a satisfactory causal explanation of a great class of facts, has led to much invaluable zoological work, in the theory formulated by Fritz Muller, that every animal, in its growth from the egg to the adult condition, passes in turn through stages which recapitulate its evolution from a primitive form, or in other words, that ontogeny (the individual development) repeats phylogeny (the development of race).

The attempt to apply this principle led zoologists to investigate in great detail the embryology and later development of some one or more members of each of the greater groups, and to make especial efforts to obtain evidence about the life history of those animals, which were believed to be of exceptional interest because they stood near to the points of branching of the phylogenetic tree.

These studies, though they can scarcely be said to have been successful in their primary intention, formed the foundation of new developments in morphology, and provided a great mass of facts, which were in themselves of the highest interest, and in many cases have given information of great evolutionary importance. (See EMBRYOLOGY.) But embryology was already a separate branch of study before the formulation of the biogenetic law; it arose or was revived during the Renaissance, became of absorbing interest with the introduction and steady improvement of the microscope and of appropriate technical methods, and has entered on a new lease of life from the application to it of experimental methods.

Cytology (*q.v.*), the science which is concerned with cells, began with the microscopists of the late 17th and 18th centuries. Their work, and that of those who succeeded them, led zoologists to the conception that the bodies of all animals (and plants) are either composed of a single mass of living matter, or are composed of a great number of such units, each independent from, though influenced by its neighbours.

The fact that nearly every Metazoan is, when it first becomes an independent individual, a single cell, renders it certain that an investigation of the structure and other properties of cells must form the basis of any fundamental study of development.

The early recognition by the botanist, Robert Brown, that each cell contained a body, the nucleus, which had a definite shape, and was clearly marked off from the surrounding liquid substance of the cell, and the even earlier discovery of the existence of a streaming of cell substance in plants, and of the formation and migration of food vacuoles in Protozoa, led to attempts to investigate the morphology of cells. Such researches became much easier when methods of fixing (*i.e.*, killing by coagulating the proteins they contained) and staining cells were invented, and the vast majority of the many thousands of papers on cytology which exist are founded on materials which have been subjected to such treatment.

The greatest single discovery made by cytologists was that of mitosis or karyokinesis, an elaborate mode of multiplication of cells by division into two, which is found in very nearly the same form in all Metazoa and higher plants and in many Protista. Details of this process will be found in the article CYTOLOGY. Its importance lies in the fact that it ensures a qualitatively and quantitatively exact division of the nucleus between the two daughter cells. Mitosis commences with the formation within the nucleus of a long, tangled thread, along which are placed masses of a substance, chromatin, recognized by the intense stain it takes from such basic dyes as haematoxylin. This thread contracts and breaks up into short lengths, chromosomes, which are present in pairs, with the exception that one of them may either differ from its partner in appearance or lack one altogether.

Subsequently, the membrane which separates the nucleus from the surrounding cytoplasm disappears and the chromosomes are set free. Meanwhile, two small granules, the centrosomes, have placed themselves at opposite poles of the cell, and by their activities have altered the nature of the cytoplasm which surrounds them, so that it acquires a radially arranged structure. These rays, proceeding from the neighbourhood of the two centrosomes, meet and form a spindle of threads to which the chromosomes become attached. Each chromosome then splits longitudinally, the halves which result being drawn to the opposite poles of the spindle. From these two aggregates of half chromosomes, two new nuclei are formed and the cytoplasm of the cell is divided into two parts, one associated with each nucleus.

It is believed, on the strong though indirect evidence of genetics, and on the basis of certain experiments on developing animals (see EXPERIMENTAL EMBRYOLOGY), that by this process the daughter cells receive nuclei which are exactly identical with one another and with the parent nucleus.

As all the divisions by which the cells which compose the body of a Metazoan are formed, are of this kind, it follows that the nucleus of any one cell in such an animal is the exact equivalent of that of every other cell, and that the differences which actually exist between such cells depend either on the position which they hold in the body, that is to the influence of their neighbours, or of the outer environment, or to the character of the cytoplasm they received at some cell division.

This conception at once shows the importance of an examination of the cytoplasm. Examination of living cells taken from the body of a Metazoan seldom reveals any structures except drops of fat, yolk spheres and similar non-living substances stored in the cell for future use. But by the application of special methods of fixation and staining and a careful use of solvents, it is possible to find in all cells several classes of bodies whose behaviour suggests that they are actual portions of that mechanism on which the life of the cell depends. In a few fortunate cases these structures can actually be seen in living cells, and are thus probably not, as has been suggested, merely artificial products of the long process of preparation by which they are usually made visible. Thus the cytoplasm of a cell is so complex that it can possess a definite morphology, which might, in part, provide an explanation of the diversity of cells which have been derived from a single source.

It is clear that the most favourable material on which to test such a hypothesis is the segmenting egg of a marine Metazoan, because there the whole process of cell division, and of the gradual differentiation of cells can be watched under the microscope in living material.

In such animals as the sea urchin Echinus, the egg consists of a surface membrane, which surrounds a liquid cytoplasm within which the nucleus floats a little excentrically. In most cases there is no visible evidence that any part of the cytoplasm differs from any other part. This cell, after fertilization divides repeatedly, and the cells which are formed appear to be all exactly similar up to the time when 64 of them are present. At this stage the embryo is a sphere with a wall one cell thick surrounding a liquid-filled cavity. The arrangement of the cells is clearly haphazard, they owe their mutual positions to sliding movements, which, in other cases, can be shown to depend on the ordinary laws of surface tension. But in time this sphere of cells exhibits polarity, one end of it tucks itself within the other, and the animal acquires anterior and posterior ends. Is this polarity the result of an invisible polarity present in the egg or not?

The egg of a mollusc or of a polychaet worm usually presents as little evidence of structure as that of an Echinoid, but its development is of very different type. In either case the first division produces two cells which may differ from one another visibly. The second cleavage divides each of these into equal parts, whilst the third is unequal, separating small micromeres from the poles of the large megameres. These cells do not lie in tiers, the quartette of micromeres is so disposed that each one lies in the groove between two megameres. Although this position is that which would naturally be reached by sliding of cells under the forces of surface tension, it does not, in fact, arise in that way, but is predetermined by the direction of the axes of the spindles which bring about the mitoses of the third cleavage.

Thus, in this case it is certain that something within the egg determines both the character and position of the individual blastomeres. Indeed, the fate of each cell in such an embryo is ab-

solutely determined; it will form a definite structure or part of a structure in the adult.

The fact that, in certain cases at any rate, the fate of a blastomere may be determined from the time of its origin, led to attempts to discover the mechanism which lies hidden in its parent cell. Such a mechanism may involve a localization of definite substances, recognizable by chemical means. If substances which determine the fate of a blastomere be present in definite parts of its parent, it should be possible to remove them artificially, and thus inhibit the development of those characters for whose appearance they are responsible.

The simplest case is that of a separation of the first two blastomeres; if this be done each will develop independently of the other. In some cases a complete embryo of half the normal size will develop from each, in others a complete half-sized embryo from one, and one incomplete by the absence of certain parts from the other, whilst, in a few cases, half an embryo arises from each, the individual blastomeres segmenting as if the other were actually present.

Thus it seems certain that the cytoplasm of a fertilized egg may actually possess a structure which determines the course of its further development. But this predetermination of the fate of a cell by its structure can only be partial; it can be tested by experiments on regeneration (*q.v.*).

If, for example, the leg of a newt be amputated, the cut end of the stump rapidly heads over, and a small white conical accumulation of cells appears at its extremity; this grows in such a way that it eventually attains exactly the size and structure of the part of the leg which was originally cut off. In such a case it is clear that cells which, in an unmutilated animal, would never have formed part of a limb, have not only been stimulated to grow out, either by the effect of the wound or by the removal of the inhibiting influence of a complete leg, but have been compelled by a control exercised by some structure or structures in the rest of the animal, to do so in such a way as to acquire a definite structure.

Regeneration experiments, suitably designed, may throw much light on the whole problem of the control of development; but allied to them are others in which, instead of allowing normal regeneration to take place, part of the animal is transplanted to a new situation, where it is exposed to the control of a new environment, and should, if capable of modification, take on a structure appropriate to its new position.

Of these experiments the most important are those which have been carried out on the embryos and larvae of Amphibia. It has been discovered that fragments of one amphibian embryo implanted in another will grow even if the two belong to different species or even genera. This fact enables implants of a larva whose cells appear black to be grafted on to larvae whose cells are white. In this way it is possible to follow with great certainty the fate of the implanted fragment. These experiments have shown that the greater part of the surface of a newt's gastrula is indifferent, a set of cells which, if left in their natural position, would become part of the skin covering an external gill, may, if transplanted, become part of the brain or form the retina of an eye. Continued exploration by this method has shown that only one small region, that of the dorsal lip of the blastopore, has its fate determined; it is an organizer, which, if introduced into any Urodele blastula into which it becomes incorporated, will determine the establishment of an embryo whose parts stand in a definite relation to it. (*See* EXPERIMENTAL EMBRYOLOGY.)

But this organizer can be seen to arise from a particular part of the cytoplasm of the fertilized egg, the grey crescent, a structure which appears at fertilization at a point immediately opposite to that at which the spermatozoan enters.

It has then to be considered whether it is the entrance of the spermatozoan which establishes a structure in the fertilized egg or whether such a localization exists in the unfertilized but ripe ovum. Evidence on this point may be sought by two methods: An attempt may be made to destroy any structure the unfertilized ovum possesses by making use of the difference in specific gravity which exists between the cytoplasm and its inclusions, either by merely inverting the egg or by the more powerful forces which are available in a centrifuge. The eggs with their contents so rearranged may be fertilized immediately, and an attempt made to correlate any abnormalities presented by the embryos resulting from such fertilizations with the displacements which may be observed by cytological methods in eggs similarly treated. As a control, eggs which have been fertilized must be subjected to exactly the same treatment. An easier, though much more indirect mode of investigation is through genetics.

VARIATION

No two animals, even belonging to the same brood, are alike; whilst exhibiting a close similarity to their parents and to one another, each will differ from all others either to a small extent or even very considerably in one or many respects. The investigation of the nature and causes of these variations, and of the extent to which they are passed on from one generation to the next, forms a most important part of the science of zoology. It is clear, even on a cursory investigation, that variations may be either of such a kind that they form a continuous series connecting one extreme of structure within the species with the other, or may represent definite steps between which no intermediates can be faund. This distinction between continuous and discontinuous variation is one of the greatest importance for a clear understanding of the problems at issue.

Very many discontinuous variations are meristic; the change in the number of rays in a fish's fin or of vertebrae in its vertebral column is necessarily carried out by steps between which there are no conceivable intermediates. But similar discontinuities may occur in characters which might be expected to vary continuously; there is, for example, no series of intermediates connecting the black coat of a melanic jaguar with the normal spotted pattern. It has long been known, from observation of domesticated animals, that such sports appear sporadically without obvious cause, and that they make their appearance fully developed. Precision has been added to these old observations by long-continued breeding experiments, notably those carried out with the fruit fly Drosophila. These have shown that discontinuous variations (*q.v.*), mutations, arise continuously, that the same mutation appears independently again and again and does so at a uniform rate, differing from that at which other mutations occur. The number of observed mutations in this form is very large; it already exceeds 400. These mutations, although they affect most profoundly some one structure, actually alter many apparently unassociated parts of the animal. They may produce such gross modifications of structure that the resulting mutant is non-viable and dies at some definite point of the life history, or they may have so small an effect that only long experience will enable an observer to recognize their existence. They may even produce no visible effect in individuals bred under normal conditions.

There are certain experiments which seem to show that the rate of appearance of mutations may be greatly increased by exposing the animals to X-rays.

Some of the mutations which appear in the species Drosophila melanogaster, which has been most fully investigated, are repeated in exactly the same form in the other species of the genus, and analogy with plants, and the character of the variations which exist in other groups of animals, such as the rodents and land snails, suggest that similar mutations must be capable of arising in all the species included within large groups such as families.

Furthermore, the same part of the animal may, in some cases, be caused to vary in the same direction by a number of independent mutations, whose effects may be cumulative when they are present together in a single individual. In such a case the extreme conditions may be connected by a series of intermediates, each a distinct step, which may be so small that an appearance of continuous variation may exist.

It is, therefore, most difficult to decide whether any apparently continuous variation is truly such, or whether it is not more justly interpreted as the result of a large series of small steps. This difficulty is increased by the fact that the external conditions

under which its development has taken place affect to some degree the character of every adult animal. That modifications in structure through use do take place is obvious. The highly-developed arm muscles of a blacksmith clearly owe their size to continuous exercise. But the influence of the environment may show itself in much more subtle ways. A single egg of a bee may develop either into a worker or a queen, castes which exhibit great morphological differences, according to the food that it is given and the size of the cell in which it is housed The brine shrimp Artemia assumes very different forms if it is grown in water of different salinities.

The effect of such variations. which are induced by the action of the environment during the life of a single animal, will be to hide the clear-cut steps which theoretically exist in a series of variates differing by small mutations.

It is, therefore. impossible by mere inspection to decide whether or not an apparent case of continuous variations is truly such. It may represent congenital variation or it may merely depend on "acquired" variations. As the greater part of the variahility which is observable in a population appears continuous, it is necessary to have methods which will allow its character to be recorded, so that it may be studied.

As the problem is one which is concerned with a population, this method must be statistical. The first step in any such investigation is to determine the character, the variation of which is to be recorded, and to decide how it is to be expressed in numerical terms. In such a case as the height of man, or the length of any of his parts, measurements in any units with a determined accuracy are possible, but if the character be a mental one, or is concerned with colour, the only possible procedure is to break up the whole range of variation into a series of arbitrary stages. The masses of figures wnich result from the measurement of a great number of individuals may then be arrayed by grouping together all those individuals who, in respect to the character under investigation, fall between two definite numerical points. If, now, the numbers of individuals within each of these groups be entered on a graph, whose coordinates are the number of individuals and the magnitude of the variant character, it will usually be found that these points lie in a curve, which has a maximum height at some definite value and reaches the base line at values which represent the extreme variations. Such a curve usually conforms to a definite shape, which can be expressed by an equation, and the whole of whose qualities can be determined from two expressions The character of this curve, that of normal variation, implies that the variations which it records are due to chance events. If they be constrained in any way, either by external circumstances or by a tendency to division of the population into groups, the curve will be distorted and give evidence of the condition.

The statistical study of animal populations has become an independent discipline, biometry, of great value in the investigation, not only of such problems as those which are presented by fishery investigations, but also in relation to the government of human population.

The variations which occur within the limits of a species, defined as a mutually fertile group of animals, are of very great importance because they provide the raw material on which evolution is based. Only such variations as are heritable, that is, can be handed on from parent to offspring, can be of any value in bringing about the divergencies in structure on which evolution depends.

It is thus necessary to consider individually the possibility, and the mode, of inheritance of the three classes of variations which we have recognized.

LAMARCK'S THEORY

The problem of the "inheritance of acquired characters," that is, of the possibility or the reverse of the transmission to his offspring of a variation from the normal mode of a species which an individual owes, not to anything innate in the fertilized egg from which he himself arose, but to the influence of the environment, either directly exercised or represented by a reaction on the part of the animal, has claimed the attention of leading zoologists since Lamarck postulated it as an essential part of his theory of evolutionary mechanism.

This hypothesis was based on the belief that every animal tends to change its structure and habits during its individual existence in such ways that it becomes better fitted for life under the conditions to which it is subjected. If the characters so acquired be transmitted to its offspring, which in turn become adaptively modified, there will in time arise a group of individuals differing "specifically" from the original progenitor. 'Thus the acquired characters whose inheritance was postulated were of the special character of "direct adaptations" to definite environmental conditions, and represent special responses of the animal. Unfortunately, the reliable evidence in favour of such inheritance is extremely scanty, and no case is of exactly the nature required by Lamarck.

A number of zoologists have conducted experiments to test the possibility of the hereditary transmission of the results of injury. The vast numbers of experiments, made unintentionally by breeders, in the cropping of the ears and tails of dogs and other domestic animals, and the similar operations on man. have yielded negative results. Deliberate experiments of the same kind have been equally unsuccessful. But it may be argued that the reaction of the animals to such mutilation, involving merely the formation of a new skin over the wound, are not comparable to those which result in a direct adaptation.

Very few attempts have been made to alter the character of an animal by changing its environment, and to test the heritability of the modifications. Experiments on the desert mouse, Peromyscus, give no positive results, and a series of experiments claiming to establish such a transmission in the case of Amphibia and reptiles is under very grave suspicion, and has not yet been repeated.

The most satisfactory experiments are of an entirely different type. During the latter part of the 19th century it was observed that, in certain districts, South Lancashire, West Yorkshire, Northumberland, North Kent, in England, in some of the industrial districts of Germany, and near Pittsburgh, U.S.A., some moths were gradually changing their appearance. The change consisted in the occurrence of melanic individuals, in which the wing pattern became obscured by a nearly uniform black coloration. Such types were at first rare, but they gradually increased in number to such an extent that the original types of some of the species can no longer be found in some of these areas. It is quite certain that this occurrence of melanism is causally connected with the industrialization of the areas in which it is found, because, in country districts, the original wild type remains unaccompanied by the black forms. The change was formerly accounted for by a natural selection of the favoured melanics, but the origin of the variation was left unexplained.

Dr. Heslop Harrison has attempted to discover the cause of this melanism by a series of experiments based on the suggestion that it is induced by the direct action on the animal, or on its contained germ cells, of the mineral salts which are deposited from smoke on all the food plants in industrial areas. These experiments were carried out, in part, with a moth which had never been known in a melanic form, and consisted in feeding the caterpillars on clean food as a control, on plants collected in a smoky, "melanic" area, and on plants artificially infiltrated with manganese or lead salts. During the course of the experiments melanic individuals appeared amongst the moths resulting from the larvae which had been fed on the contaminated food, and their descendants, although fed on clean food, still exhibited the melanism whose inheritance conformed to the Mendelian type.

It is to be noted that this melanism was fully developed at its first appearance, and that, although it represents a reaction of the animal to the chemical agent applied, it has not been shown, and it is most improbable that this reaction is of any value to the individuals which present it. Thus the primary postulate of Lamarck is not met. Furthermore, it is not certain that this melanism is an "acquired character" in the ordinary meaning of that term. It is, perhaps, more probable that it results from a direct action of the metal ions on the germ cells, and that hence the original melanic individuals possessed that character from their initiation at fertilization, and would have displayed it even if they

had been fed throughout on untreated food.

Indeed, it is perhaps legitimate to regard this case as a parallel to the effect of X-rays in increasing the rate of production of mutations in Drosophila. These experiments, though they have every appearance of reliability, require confirmation, because the number of cases in which melanism has been induced is very small. There is, therefore, no single case in which an inheritance of an "acquired character" of the type which is required by a Lamarckian explanation of evolution can be proved to have occurred.

MENDELISM

Such variations as those which we have described as discontinuous, which arise fully formed by mutation, seem always to be heritable, and to be handed on from parents to offspring in accordance to definite laws, those of Mendelian or alternate inheritance. *(See* HEREDITY.) These laws were first formulated by Gregor Mendel, abbot of Brünn, in 1865, as the result of experiments in the hybridization of garden plants, but they remained unappreciated until 1900.

The typical Mendelian experiment involves the selection of two individuals which differ by a single definite character and are members of lines which breed true for this character. These individuals are then crossed and the character of all the resulting first hybrid generation (f 1) examined. It will in all cases be found that the whole f 1 generation is uniform with respect to the character under consideration, and that in nearly all cases it resembles one or other of the parents and does not exhibit a blend of their peculiarities. The character which appears in the first hybrid generation is said to be dominant, that which is hidden recessive. The whole of the individuals of the f 1 generation are allowed to mate at random, and the resulting second hybrid generation f 2 examined. It is found that the recessive character has reappeared in them, and that the individuals displaying it form one quarter of the whole. Thus the factor, whatever it be, which, when present in the fertilized egg, causes the appearance of the recessive character, must have been present in the individuals of the f 1 generation, uncontaminated by the simultaneous presence of that which causes the production of the dominant character. The complete fusion of the reproductive cells which occurs at fertilization, and the nature of the cell divisions which form part of the development of the animal, make it clear that all ordinary cells throughout the body of the hybrid will contain the factor for both dominant and recessive characters.

The nature of the phenomenon of segregation, the reappearance of both parental types in the second hybrid generation, can be investigated by breeding each member of that generation with its like. It is then found that recessive individuals bred together never produce dominants, rendering it clear that they do not contain the factor for the production of that character. The individuals which possess the dominant character are of two kinds; one-third of them, when bred with their like, produce only dominants, the other two-thirds produce dominants and recessives in a three to one proportion.

This occurrence receives a complete explanation if, in the process of formation of the gametes, each receives either the factor for the production of the dominant or that for the recessive character, but not both, that is, that the gametes are "pure" with respect to these characters.

The observed ratio of dominant to recessive individuals in the f 2 second hybrid generation can only occur if the original hybrids produce equal numbers of the two kinds of gametes, and the mating of these gametes is entirely haphazard.

It follows, therefore, that the individuals which are produced in the experiment are of two kinds, those which produce only one sort of gamete, either dominant producing or recessive, which are hence called homozygous, and those which produce equal numbers of the two types of gametes, the heterozygous form. Furthermore, the morphology of the individuals presenting the dominant character will not enable us to distinguish the homozygous from the heterozygous animals.

It is thus essential to distinguish between the phenotype, the appearance of an animal, and the genotype, its constitution, as determined by that of the gametes from whose fusion it arose. The simplicity of this explanation of the Mendelian ratio soon led zoologists to look for structures of the germ cells which would provide a suitable mechanism.

The fact that, in such a case as that which we have considered, it is immaterial which parent exhibits the dominant character, suggests that it is very improbable that this mechanism lies in the cytoplasm, because the amount of extra nuclear material contributed to the zygote by most Metazoan spermatozoa is extremely small in amount, although it seems to include a representation of most cell organs. Attention is thus directed to the nucleus. From the fact that the only permanent or more accurately, persistently recurring structures within the nucleus are the chromosomes, and that the number of these bodies is constant in all members of a species, it is clear that either the number of chromosomes in the nucleus of the gametes is half that in body cells, or that after fertilization the number in the zygote nucleus is in some way halved. In fact, in animals and plants both mechanisms may be found, but that which is universal in Metazoa is the reduction of the number in the gamete nucleus.

A full amount of the details of the process by which this result is reached will be found in the article CYTOLOGY; the fundamental phenomenon is that during the first stage of a division of a germ cell the chromosomes which compose a pair come together and lie side by side, so accurately adjusted to one another that they present the appearance of a single longitudinally split chromosome. In many cases the original chromosomes then split longitudinally, so that the nucleus appears to contain a number of threads, each composed of four chromosomes lying side by side. The number of such threads is necessarily half that of the chromosomes present during the division of an ordinary cell of the animal. *(See* CYTOLOGY.)

By two divisions which follow rapidly on one another, the four elements which build up each of these threads (paired chromosomes) become distributed into four cells, which, in the case of the male, are all functional spermatozoa, whilst in the female three are functionless, whilst the fourth is a mature or ripe ovum.

When fertilization takes place the nuclei of the ovum and spermatozoan swell up, become exactly similar in size and character, and chromosomes appear within them. From the nature of the process of maturation it is clear that each will contain only half the number present in the normal body cell. These nuclei then fuse, and the chromosomes present in them neither fuse, nor are they united in pairs, but each becomes attached to the spindle, splits longitudinally and is separated into two halves at the first cleavage division which immediately follows. Thus each cell of the new individual contains two complete sets of chromosomes, one derived from its female, the other from its male parent. The accuracy of this statement has been confirmed by observation of special cases in which one or more of the chromosomes of one of the parents is visibly different from the corresponding chromosome of the other.

When gametes come to be formed it is apparent that each will receive a single complete set of chromosomes, a haploid group, and that this group need not be purely maternal or paternal in nature, but will owe its constitution to chance, certain chromosomes coming from one and the rest from the other parent.

This process of gamete formation and fertilization obviously affords a mechanism which will completely account for the observed facts of a simple case of Mendelian heredity, if the factors which determine the development of the alternative characters lie in a chromosome.

Furthermore, it should follow that, in a cross involving two pairs of Mendelian characters, one of two things must happen. If the factors involved lie in the same chromosome the two characters will stick together in heredity, if they lie in different chromosomes, each should be inherited independently of the other, and the phenotypic nature of the individuals of the f 2 second hybrid generation will be determined by chance. Innumerable cases of each kind are now known.

In the case of Drosophila it has been shown that there are four groups of mutations, which are linked together in their inheritance.

These linkage groups differ very greatly in size. One includes only three mutant genes, two include about 80 each, whilst the fourth includes more than 200. If the linkage be dependent on the situation of the factors which produce these mutations in the same chromosome, it should follow that Drosophila should have a haploid number of four chromosomes. This is the case, and the individual chromosomes differ in length much as do the linkage groups.

Thus there is a very great probability that the factors which determine Mendelian heredity lie in the chromosomes. It remains to determine their distribution. It is clear from the fact that many mutations may co-exist in the same individual without interference, that the factors determining them are discrete entities; to them is given the name gene. It was observed first in Drosophila, and since in other animals and plants, that the linkage between genes which lie in the same chromosome is not absolute, that in a certain definite proportion, differing for every two mutations considered, a process which is called "crossing over" occurs; that is, genes which, as they lie in the same chromosome, should enter a single gamete, do not do so. This has been explained by a fracture of the chromosome involved between the two genes, and a reunion of its parts, not with each other, but with appropriate fraginents of the homologous chromosome when the two lie side by side during the process of maturation. By arguments based on this hypothesis it has been shown that all the unexpected occurrences in the heredity of the mutations of Drosophila can be accounted for if the genes have a linear and fixed distribution along the chromosomes. Indeed, maps of the chromosomes of this animal, showing the location of each gene have been published.

The genes whose existence has been established in this way have many peculiar properties. They are extremely small bodies; their centres need be no more than four protein molecules apart, so that they must be composed of so small a number of molecules that the ordinary laws of physics and chemistry, which are statistical statements applicable only to bodies containing great numbers of molecules, need not necessarily be accurately followed by them.

The genes are clearly capable of growth and division, because many hundreds or thousands of cell divisions lie between the original zygote nucleus and the gametes which ultimately arise from it. They are individual, and extremely stable because they must persist throughout long evolutionary chains. Nevertheless, they must be capable of such modification as is necessary to cause the appearance of a mutation. It is possible that they owe this power to their minuteness. Thus genes present many of the characters of living organisms, in at least as high a degree as cells themselves. It has, in fact, been suggested that they are similar to the elements of the viruses which are responsible for many diseases.

It now remains to consider the possibility of a hereditary transmission of continuous variations. We have already seen that-it is not certain that any such exist, and a consideration of the nature of any conceivable hereditary mechanism rather suggests that they do not. It is certain that the whole mechanism which determines the course of development exists in the fertilized egg. in part in the nucleus, in part certainly in the cytoplasm. Any congenital variation must result from some change in this mechanism, and such change must, in the end, be of a "chemical nature," including under that head all modifications of the relationship of the molecules with each other. But such changes must, in an ultimate analysis, be definite steps, not connected with one another by intermediates. Thus it is difficult to believe in the existence of true heritable continuous variations.

The only possible mode of investigating the inheritance of an apparently continuous variation is a statistical one. Two individuals which differ from one another are crossed and their offspring bred together, either with or without selective mating. The character under investigation is measured in the original parents and in all their descendants, and by an appropriate technique mathematical expressions of their resemblance to the original parents and to each other can be established. The results so obtained may be of very great value in discussions of the probable course of change of a population, which is the basis of evolution. But the mode by which these results are obtained is such that they can tell us nothing about individuals; they are applicable only to population. (See BIOMETRY.)

These results are probably not much less valuable for their special purpose if the variation considered be indeed dependent on a large number of genes, each exhibiting a Mendelian inheritance, and not truly continuous. The existence of this condition may be suggested by the fact that, if it obtains, the first hybrid generation will exhibit a smaller range of variation than that of the population of which the original parents were members, and that a long-continued course of inbreeding will much reduce the variability of the resulting population.

ANIMAL ECOLOGY

The aspects of zoology which we have so far considered are morphological in their outlook; in them it is form and not function which is the centre of interest. Even the development of genetics has led to the explanation of observed differences of structure by an inferred structure in chromosomes. But from the very beginning of zoology a different point of view has been adopted hy some investigators. To the common man the activities of an animal are far more interesting than its structure, and professional zoologists, after an interval of half a century, are recognizing the justification for his belief. Thus a steadily increasing, though still small proportion of zoological research is devoted to physiology (*q.v.*), to the study of animal function. Such studies may, as in the recent remarkable developments of muscle physiology, be carried out without any reference to observed structural parts, but sooner or later, and in most cases from their beginning, they have to be brought into relation with morphology.

Animals are alive, and they live in a world presenting a wide range of variation of conditions, both inorganic and organic. The study of the relations between an animal and its environment, which is called bionomics or ecology (*q.v.*), is that proper to the field naturalist; it must be based on observation of natural conditions, interpreted by experiments designed to eliminate or evaluate the many factors which are involved. Such studies were first made an integral part of the science of zoology by Darwin. It is curious and unfortunate, though understandable, that whilst the reactions of Darwin's work on morphology and taxonomy were immediate and salutary, those studies which formed the main part of his life work were neglected by professed zoologists in general, and their further developments rapidly became fantastic because little or no attempt was made to test the validity of the innumerable hypothetical explanations of "observed" facts which were enunciated.

It has always been known that the distribution of animals over the world is not uniform; every schoolboy is aware that kangaroos are found only in Australia, and that the sea coast is inhabited by many birds which are seldom or never found inland. Study of this irregular distribution can be carried out in two ways; the fauna of some one natural area may be compared with that of others, or the detailed distribution of the animals within a small area may be discussed.

The results of the first type of investigation are fully treated in the article ZOOLOGICAL REGIONS. They are of interest from the light that they shed on the course of evolution, especially in regard to the migrations of animals and the existence of evolutionary centres. The value of these conclusions depends entirely on the extent to which the taxonomic divisions which are recognized, and the relationship of animals which are implied ir them, are true representations of fact.

It is apparent that the existing distribution of animals cannot be accounted for on a basis of the geography of to-day, and a study of zoo-geographical regions necessarily leads the student into the perilous fields of palaeogeography. The results reached by an investigation of the distribution of the larger groups of animals must be shown to be consistent with one another; and with the distribution of land, water and mountain chains in past time which may be inferred from geological evidence. The only method of controlling the accuracy of the conclusions which are reached lies in palaeontological evidence, which gives definite information, even although partial, about the distribution of many

animals in the various periods of geological time.

Bionomics, or ecology (*q.v.*), is a study of a very different kind, still largely undeveloped, but capable of becoming of the highest importance, not only to theoretical zoology, but to those who are engaged in the commercial exploitation of animals and plants, and to all men who are exposed to the risk of infection by animal-borne diseases.

It is obvious that every animal is so far fitted for life that it is capable of maintaining itself under certain conditions. The field naturalists of the period before Darwin had observed that many structures of animals, even if very grotesque, played a definite part in their lives, and they reached the conclusion that every part and peculiarity of an animal had a definite function, being designed by the Creator to render service to the animal in that state of life in which it lived. This belief was at once seized on by theologians, as evidence of the existence of a beneficent Creator. Lamarck and Darwin both accepted the zoological aspect of these views, and the latter brought to their support a vast mass of observations drawn either from his own world-wide observations or from the reports of other writers. (See EVOLUTION; ADAPTATION.) But both Lamarck and Darwin rejected the idea that these "adaptations," whereby an animal was specially fitted for life in a definite environmental niche, were the result of deliberate design; each put forward a theory which purported to explain how they could here arise under the action of intelligible forces during the course of evolution.

The Lamarckian explanation, which has already been referred to, requires an inheritance of acquired characters of a kind which cannot be proved to occur, and has never met with any general acceptance.

Darwin's theory of natural selection provides, at the least, a complete formal explanation of all, or nearly all, evolution. But it still rests on an insecure basis. Darwin was the first zoologist to realize that an incredibly small proportion of all the animals which are born on the globe survive to maturity. The world population of herrings has probably been sensibly constant for a very long period, although each individual female herring lays many millions of eggs during its lifetime. Of these millions only a few individuals reach maturity and breed in their turn. The remainder die at some early stage, most of them serving as food for other animals. Darwin enquired whether the animals which survived were in any way different from those which perished; appealing to the facts of variation, which he collected for the first time, he claimed that it is obvious that, in general, the survivors will owe their escape to the fact that they were better fitted in some way or ways for life under the conditions to which they were subjected. That this view expresses a general truth can scarcely be doubted, but it is unsatisfactory that only very few (about 17) attempts have ever been made to establish its truth in individual cases, and to measure the intensity of the selection which is so exercised.

Having established the existence of a natural selection, Darwin proceeded to discuss whether or not the variations which secured the survival of the selected individuals would be inherited by their offspring. He appealed to the experience of breeders of domesticated animals, and thus, for the first time, brought the study of heredity into zoological science.

The evidence of breeders, imperfect though it was, justified Darwin in claiming that the favourable variations of the animals spared by natural selection would be passed on to their descendants. If, then, these in turn varied and new favourable variations were selected, the process would be repeated, with the result that after many generations the stock under consideration would have changed so as to become much better adapted to the conditions under which it lived. The knowledge of heredity which we now possess shows nothing which invalidates Darwin's postulates, and his doctrine is still available.

Darwin and his followers applied this conception to the explanation of a vast series of curious structures in animals and plants, and introduced subsidiary hypotheses such as that of sexual selection (*q.v.*) to explain special groups of cases. But only in very few of these many cases was any attempt made to show by direct observation and experiment that a structure did, in fact, fulfil the function for which it was supposed to be adapted. In many cases the suggested explanation became so far fetched as to be grotesque, with the result that a number of living zoologists have come to disbelieve in the existence of adaptation as an important phenomenon, and to have a contempt for those who still discuss it. Nevertheless, the existence of such evolutionary series as those of the horse and many others shows that a steady improvement of the mechanism of limbs has taken place as an adaptation to some special type of locomotion. And no zoologist who has any extended acquaintance with animals under their natural conditions can doubt that each is, in fact, very well fitted for the life it leads. Of late years the pendulum of opinion has been swinging back towards an essentially Darwinian position.

It is clear that any study of the relations existing between an animal and its environment must begin with an evaluation of the properties of the latter. Many circumstances make it more easy to express the conditions of a body of water, and especially of the sea, in figures, than those of a land area, and it is hence not surprising that the science of oceanography (*q.v.*—*see* also FISHERIES) was founded and has been developed by zoologists.

The earliest studies of the sea from this special standpoint by Edward Forbes showed that in the temperate zone the sea floor could be divided into regions on a basis of depth, and that each of these zones was inhabited by a characteristic group of animals. Forbes's zones, the littoral, laminarian, continental shelf, continental slope and abyssal regions, have been further subdivided by later work, and on them has been superposed a subsidiary grouping according to animal communities, which depends ultimately on the nature of the bottom. But in all these investigations the character of the sea water itself has been supposed to be constant. In fact, it varies in nature from season to season, and in some regions from day to day, even locally from hour to hour.

The more important qualities of the sea from a biological standpoint are its mean temperature and the daily and seasonal range in temperature; the amount of suspended matter and its chemical nature and physical state; the concentration of salts in solution, the amount and relative proportions of the ions of calcium, magnesium, potassium and sodium present; the concentration of hydrogen ions and the extent to which changes of such concentration is hindered by buffering; the absolute amounts of phosphates, nitrates, silica, and perhaps other substances present; the amount and the character of absorption of light which it effects; its viscosity and the amount of oxygen and carbon-dioxide in solution. All these qualities can be determined by physical and chemical measurements and definitely recorded in figures. They have been so studied, intensively and at regular intervals in those areas such as the seas off the west European coast and some of those off Canada and the United States where fisheries are important, and more generally by the great series of expeditions, of which the first and greatest was that of H.M.S. "Challenger," devoted to the study of the ocean and its life all over the world.

Variations in these qualities may affect animals either directly or through the plants, diatoms and peridinians, which form the basis of all marine life. Plants require for their growth carbon-dioxide, water, phosphates and nitrates, in addition to other elements which are always present in the sea in adequate amount; from these materials they can form the living protoplasm of their bodies and build up reserve stores of food. This process involves an expenditure of energy which plants, and plants alone, can obtain from sunlight. Thus variation in light intensity and duration will directly alter the amount of plant growth and thus determine the amount of animal life which can exist in any body of sea. But in British waters the total amount of plant life is determined, not by an insufficiency of daylight, but by the exhaustion of the stock of phosphates and nitrates in solution in the sea.

The penetration of light through sea water is so poor that no effective growth of plants is possible at a greater depth than some 40 fathoms. Thus all animal life below this depth is dependent on food which is carried down from the surface layers of the ocean. This transference is effected either by animals which migrate through a definite belt of water or by the slow descent of dead animals and plants.

But variations in the quality of sea water may affect animals much more directly. Temperature seems to be the limiting factor for very many animals; it may act in many ways. A high temperature may produce irreversible changes in the physical state of the protoplasm, either of some one organ or of an animal as a whole, or it may disorganize its controlling mechanism. Low temperatures may slow down the rate of living to such an extent that growth becomes impossible. These effects may be exerted on any part of the life history; reproduction may become impossible at a temperature at which the adult lives successfully.

Any change of the concentration of salts in the sea, by altering the osmotic pressure it exerts, directly affects all animals whose surface has the properties of a semi-permeable membrane, because changes in it lead either to abstraction of water from the animal or absorption of water by it at a rate which may become too great to be coped with. The efficiency of such changes as a bar to dispersion is shown by the very small fauna of brackish water.

Variations in the concentration of metallic ions may affect animals by destroying the physico-chemical mechanism on which the maintenance of its surface depends, or by rendering the processes of fertilization and cleavage impossible. The hydrogen ion concentration produces similar, though more intense effects. Variations in the amount of oxygen available clearly modify the activities of all animals, because the whole of their metabolism is based on a series of oxidizations and reductions. The real nature of the relationship between any animal and its environment can only be discovered by experiment. The factors involved are so numerous that it is evident that the problem can never be solved by observation of the natural occurrence of the species. Only by varying the conditions of the medium, one at a time, and observing the effects of these changes, not only on the whole animal at each stage of its life history, but also on its isolated organs, will it become possible to appreciate the real nature of the correlation which undoubtedly exists between the organism and its surroundings.

One of the most fundamental parts of this relationship is that which concerns food. Although every animal is ultimately dependent on plants for its nutrition, it may feed on other animals and be connected only by a food-chain with the basal source. The first step is thus to trace as fully as possible the series of forms involved in this chain. which can only be done by long-continued observation. The next is to work out the action of the feeding mechanism, so as to determine to what extent the animal is restricted to food of definite size or nature. Then it becomes important to investigate how far the food which actually enters the mouth can be made useful, which involves a study of the digestive enzymes, and of the conditions under which they will act. Finally, the problems of absorption and transport of food must be considered. The next stage is to add precision to the facts so learnt by determining the amount of food which can be collected and digested under definite conditions, and, so far as is possible, the mode of its utilization, whether for maintenance, general activities or for growth.

The respiratory mechanisms of the animal are necessarily involved in such studies; they may be dealt with in the form of the gross requirements of the animal over a period, or the detailed use of oxygen varying with such circumstances as exposure during an intertidal period may be determined.

The mode of transport of oxygen, its storage and the power that an animal possesses of incurring an oxygen debt, all form parts of such investigations. Indeed, the physiology of the chosen animal must be studied as a whole. When this has been done, not for one but for many animals, a science of comparative physiology will become possible; it will be parallel to comparative anatomy, based on evolution, and devoted to an understanding of the changes which have taken place in physiological activities, changes which must always have been such that the animals in which they were exhibited were workable wholes at every stage. Even with our present exceedingly scanty knowledge, the possibility of such a comparative physiology has become clear.

The chemical relationship which exists between many respiratory pigments, including haemoglobin, the colouring matter of red blood, and cytochrome, a respiratory pigment found in all cells of all plants and animals, points the way to many further investigations. But physiological investigations of a different kind are equally valuable. Cells, whether they compose the whole body of a Protozoan or are units in that of a Metazoan, hare a physiology some parts of which can be determined. As cells come into contact with one another and with their surroundings only through their surface, it is evident that any knowledge of the nature and peculiarities of that surface will be of value in the solution of such problems as those presented by the process of cleavage and of histogenesis. The factors which are involved in the ordinary process of cell division, those which determine the position of the spindle and the movements of the chromosomes can clearly only be investigated by physiological methods.

An understanding of the mechanism which underlies the attainment of a definite structure at the end of development involves chemical and physical researches. Only certain special parts of this story have so far proved attackable. Fertilization (*q.v*), the most fundamental point in all Metazoan development, can be analysed. Its effects are twofold; it causes the first of a great series of cell divisions to take place, and it brings together in a single individual, qualities which have existed separately in two

It is certain, from the morphological studies of cytologists and geneticists, that the second effect is brought about by the fusion of the cytoplasms and nuclei of the two gametes, and the resulting regainment of a diploid set of chromosomes. It might be supposed that the last occurrence was responsible for the initiation of cleavage, but it has been shown that it is possible to cause cleavage to begin, and even to continue to maturity, by a variety of chemical and physical treatments, and that the artificially parthenogenetic individuals so formed may retain a haploid number of chromosomes. (See PARTHENOGENESIS.)

Thus the way is cleared for an investigation of the first effect in isolation; by physiological investigations it can be shown to involve a change in the character of the cell membrane which makes it permeable, and begins an active metabolism, and other changes in the cytoplasm which lead to the development of asters and a spindle.

Thus fertilization is multifold; some of its effects can be brought about by non-living agents, whilst others require a living cell. It will clearly be possible to investigate the mode of action of genes, and thus to gain a new line of attack on the problems of development. The most promising point for such an attack is on the determination of sex, which has been shown to be controlled in normal cases by a balance between the actions of one special pair of chromosomes, and the remainder. But in a few cases the sex of an animal may be changed long after the nuclear character has been fixed at fertilization. The physiological mechanisms which are involved are still unknown, though clearly open to investigation.

Finally, the ductless glands, and especially the thyroid, have been shown to exercise a control over the development of an animal. Unless their secretions be present at the right time and in adequate amount, the whole process of development may stop or be diverted, the remainder of the mechanism failing to act.

Thus physiological investigations are those which seem likely to add most to the content of zoology in the future. They will, however, do so not in isolation, but when brought into contact with morphology and ecology and with a study of the natural conditions of life of the animals on which they are carried out. One particular group of such studies, those of "Animal behaviour" (see PSYCHOLOGY, COMPARATIVE) is of the greatest potential value, not only because its subject is of vital importance in all bionomics, but also because of its great influence on psychology.

It seems evident that the success of such animals as the sparrow and starling, the rabbit and grey squirrel, which, introduced by man into new localities, have there developed into pests, is due as much to their "mental" characters, to morale, as to any special favourable qualities of their structure and general physiology.

ECONOMIC IMPORTANCE OF ZOOLOGY

Finally, it is necessary to say a few words about the economic importance of zoology. The breeding of domestic animals is a

great industry, after the rearing of food plants, the largest and most widespread that there is. It has been extraordinarily successful in producing breeds of sheep, cattle and horses, fitted for all conditions and uses. But its methods have been purely empirical, and consequently thus necessarily slow and wasteful in application.

It is certain that the application of modern genetics to animal breeding will lead to advances as great as those which have already been effected in the establishment of new races of cultivated plants. (See ANIMAL BREEDING; BREEDS AND BREEDING.)

The damage that animal pests, especially insects, do to crops, amounts perhaps to more than a hundred million pounds a year. These ravages can only be controlled by methods laid down by zoologists. The establishment of these methods depends on a full investigation of the life history and habits of the pest, and of all the factors in its surroundings which influence it. Climatic conditions, distance from water, alternative sources of food, the efficiency and mode of application of poisons, parasites and diseases of the pest, and animals that prey on it, have all to be investigated by the ordinary methods of bionomical research. (See ENTOMOLOGY: Economic Entomology.)

Fisheries (*q.v.*) present many problems, variations of the catch from season to season, the extent to which the breeding stock is becoming depleted, new fishing grounds, the possibility of artificial culture are all problems of the greatest complexity which fall within the province of the zoologist.

The control of insect-borne diseases of man must rest on measures determined by zoologists, and their work may touch human affairs even more directly. (See PARASITOLOGY.) The results of a differential fertility of different sections of a nation's population, and of a mixing of races are things of the greatest importance to Governments, and should receive their attention to a much greater extent than they in fact do. But they can only be investigated by men who include zoology in their equipment, whether they be biometricians or followers of some other school. (See BIOMETRY; EUGENICS; POPULATION.)

The purpose of this article is to indicate, very imperfectly, the interrelationships of the various types of study which are included under the wide heading of zoology. Each is more fully explained in a separate article, to which reference should be made.

The more important of these are:—The articles dealing with the separate phyla and other groups; PROTOZOA; SPONGES; COELENTERATA; PLATYHELMINTHES; NEMERTINEA; NEMATODA; ANNELIDA; ARTHROPODA; MOLLUSCA; POLYZOA; BRACHIOPODA; VERTEBRATA; CYTOLOGY; HISTOLOGY; EMBRYOLOGY; HEREDITY; EVOLUTION, ORGANIC; PALAEONTOLOGY; ZOOLOGICAL REGIONS; ECOLOGY, ANIMAL; MORPHOLOGY; BIOMETRY; PHYSIOLOGY; ANIMAL BEHAVIOUR. ZORILLA, the name of several African carnivorous mammals, allied to the badger (*Taxidea*), but lightly built and long tailed, superficially resembling skunks. They comprise the genera *Ictonyx* and *Poecilictis*. (See CARNIVORA.)

ZORN, ANDERS (1860–1920), Swedish artist, was born at Mora, in the province of Dalecarlia, Sweden, on Feb. 18, 1860. He began his artistic career as a water-colourist, adopting the style and tastes of Egron Lundgren under whom he studied. He became well-known in Sweden through the exhibition in 1880 of a small girl's head, entitled "Mourning," now in the National Museum, Stockholm. An increasing reputation brought him orders for many portraits and he earned the means to travel. His first trip to Spain greatly advanced his work through contact with vivid colourings in nature and in life. In the three years following he maintained a studio in London and afterwards travelled in eastern Europe and in Algiers. These years saw the best of his water-colours, such as "Our Daily Bread," "Gipsy Forge," "Caique Rower," "Algiers Harbour," "Lapping of the Waves," "En première," "The Fish Market at St. Ives" and "Rositi Mauri." From 1887 to 1893 he lived chiefly in Paris, though making long visits to Sweden in the summer. In these years he took up oil painting. Also he abandoned the realist manner and became primarily an impressionist and colourist. In 1893 he made his first visit to the United States as Swedish commissioner accompanying that country's art exhibit at the Columbian Exposition in Chicago. He made six subsequent trips, and painted portraits of many American millionaires as well as of Cleveland, Taft, Roosevelt, Hanna, Hay and others. After 1896 he began to spend more of his time in Mora, where he loved and encouraged the Dalecarlian peasant life and customs. He died there on Aug. 22, 1920.

As a painter Zorn is an excellent example of the matured impressionistic group. He won renown for his characteristic and picturesque portraits in which, owing to his sensitive study of values, he gives proper play to light and half-tones. In addition to millionaires. international celebrities, and members of royal families, he painted red-cheeked Swedish girls, country peasant women, and old artisans at their work, and some of his best pictures, such as the studies of his mother in "Mona," of the watchmaker "Djos Mats," the smith "Bosl Anders," and the fiddler "Hins Anders," belong in the latter categories. He loved the nude, especially the play of water on or around the body. "Naked," "After Bathing," "En premibre," "Renaissance," "By Lake Siljan," "Improvised Bath," and "Mother and Daughter" are among the best of these. In later years he turned more and more to Dalecarlian peasant subjects of which should be mentioned "Midsummer Dance," "Dance at Gopsmor," "Vallkulla," "Early Christmas Service" and "Watering the Horses."

Zorn's status as an etcher is still in controversy between those who would rank him among the masters and those who feel he has been over-rated. He learned the art from his fellow-countryman, Axel Haig, in 1882, but did not do important work in the medium until 1889. At his best, especially in the series of etched portraits of Renan, Anatole France, Proust, Rodin and Verlaine in France, of the Scandinavians Strindberg and Carl Larsson, of Grover Cleveland, Henry Marquand and Senator Mason in America, of the old artisans of Mora in "Djos Mats," "An Old Soldier," and "Vicke," and in "Mona" and "The Toast," he shows genius of the highest sort. Of his nudes "Early Morning," "My Model and My Boat," "Edo," "Precipice," "Wet," "Sappho," all enjoyed favour, but he pursued the theme until it became monotonous, and many of his later plates were quite common in conception. Zorn also won fame as a sculptor, one of his most popular pieces in Sweden being the statute of Gustavus Vasa at Mora (1901). The "Faun and Nymph," "Morning Bath" and "Broken Pitcher" also show his high ability in this field.

Asplund, *Anders Zorn: his Life and Work* (1921); *The Etchings of Anders Zorn*, introduction and notes by E. M. Lang (1923): *Anders Zorn* (1923) in Modern Masters of Etching series.

ZORNDORF, a village of Prussia, Germany, in the Oder valley, N.E. of Ciistrin. It is famous as the scene of a battle in which the Prussians under Frederick the Great defeated the Russians under Fermor, on Aug. 25, 1758 (see SEVEN YEARS' WAR).

ZOROASTER, the founder of the national religion of the Iranian people from the time of the Achaemenidae to the close of the Sassanian period. The name (Ζωροάστρης) is the corrupt Greek form of the Iranian *Zarathustra* (new Persian, *Zardushi*). Its signification is obscure. Zoroaster was famous in antiquity as the founder of the wisdom of the Magi. His name occurs first in a fragment of Xanthus (29), and in the Alcibiades of Plato (i. p. 122), who calls him the son of Oromazdes. Occidental writers sometimes call him a Bactrian, sometimes a Median or

Persian (*cf.* Jackson, Zoroaster, 186). According to Pliny (*Nat. Hist.* vii. 15), he laughed on the very day of his birth—a statement found also in the *Zardusht-Nāma*—and lived in the wilderness upon cheese (xi. 97). Plutarch speaks of his intercourse with the deity, and compares him with Lycurgus and Numa (*Numa*, 4). Dio Chrysostom, Plutarch's contemporary, declares that neither Homer nor Hesiod sang of the chariot and horses of Zeus so worthily as Zoroaster, of whom the Persians tell that, out of love to wisdom and righteousness, he withdrew himself from men, and lived in solitude upon a mountain. The mountain was consumed by fire, but Zoroaster escaped uninjured and spoke to the multitude (vol. ii. p. 60). Plutarch, drawing partly on Theopompus, speaks of his religion in his *Isis* and *Osiris* (cc. 46–47). He gives a faithful sketch of the doctrines, mythology and dualistic system of the Magian Zoroaster.

Agathias remarks (ii. 24), with truth, that it is no longer possible to determine with any certainty when he lived and legislated. "The Persians," he adds, "say that Zoroaster lived under Hystaspes, but do not make it clear whether by this name they mean the father of Darius or another Hystaspes. But, whatever his date, he was their teacher and instructor in the Magian religion, modified their former religious customs, and introduced a variegated and composite belief."

He is nowhere mentioned in the cuneiform inscriptions of the Achaemenidae, although Darius and his successors were Zoroastrians. The Avesta, our principal source for the doctrine of Zoroaster, is comparatively reticent; on the subject of his person and his life with regard to his date it is, naturally enough, absolutely silent. The 13th section, or Spend Nask, which was mainly consecrated to the description of his life, has perished; while the biographies founded upon it in the 7th book of the *Dinkard* (9th century A.D.). the Shdh-Ndma, and the *Zardusht-Nāma* (13th century) are full of wonders and fabulous histories and miraculous deliverances.

The personality of Zoroaster is historic, but in the later Avesta, and in writings of more recent date, he is presented in a legendary light and endowed with superhuman powers. At his appearing all nature rejoices (Yasht, 13, 93); he enters into conflict with the demons and rids the earth of their presence (*Yasht*, 17, 19); Satan approaches him as tempter to make him renounce his faith (Vendidad, 19, 6).

The Gāthās alone within the Avesta claim to be the *ipsissima verba* of the prophet, and are expressly called "the Gāthās of the holy Zoroaster" (*Yasna*, 57, 8), his actual expressions in presence of the assembled congregation, the last genuine survivals of the doctrinal discourses with which—as the promulgator of a new religion—he appeared at the court of King Vīshtāspa.

The person of the Zoroaster in these hymns is a mere man, standing always on the solid ground of reality, whose only arms are trust in his God and the protection of his powerful allies. He had to face forms of outward opposition, the unbelief and lukewarmness of adherents, even his own misgivings as to the truth and final victory of his cause. The range of the emotions which find their immediate expression in these hymns is wide and the whole breathes originality, is psychologically accurate and just, so that in the Gāthāṣ we have the beginnings of the Zoroastrian religion. They give no historical account of the life and teaching of their prophet, but are general admonitions, asseverations, solemn prophecies, directed to the faithful or to the princes, and are generally dialogues with God and the arch-angels, whom he repeatedly invokes as witnesses to his veracity with many allusions to personal events which later generations have forgotten. Their extent is limited and their meaning is frequently dubious and obscure.

The Person **of the** Prophet.—As to his birthplace the testimonies are conflicting. According to the Avesta (*Yasna*, 9, 17), Airyanem Vaējō, on the river Dāitya, the old sacred country of the gods, was the home of Zoroaster. There on the river Dāreja, if the passage (Vend., 19, 4) is correctly interpreted, stood the house of his father; and the *Bundahish* (20, 32 and 24, 15) says expressly that the river Dāreja lay in Airan Vej, on its bank was the dwelling of his father, and that there Zoroaster was born. According to the *Bundahish* (29, 12), Airan Vej was situated in the direction of Atropatēne, and consequently Airyanem Vaējō is generally identified with the district of Arrān on the river Aras (Araxes), close by the north-western frontier of Media. Other traditions make him a native of Rai (Ragha, Πάγαι). According to *Yasna*, 19, 18, the *zarathushtrōtema*, or supreme head of the Zoroastrian priesthood lived in Sassanian times, in Ragha. The Arabic writer Shahrastānī endeavours to reconcile the two traditions by the theory that his father lived at Atropatēne, while the mother was from Rai. In his home he is said to have enjoyed the celestial visions and the conversations with the arch-angels and Ormazd mentioned in the Gāthās. There, too, according to *Yasht*, 5, 105, he prayed that he might convert King Vīshtāspa. He then appears to have quitted his native district. On this point the Avesta is wholly silent; an obscure passage (Vasna, 53, 9) intimates that he found an ill reception in Rai. Finally, in the person of Vīshtāspa, a prince resident in east Iran, he gained the powerful protector and faithful disciple of the new religion whom he desired—after almost superhuman dangers and difficulties, which the later books depict in lively colours. In the epic legend, Vīshtāspa was king of Bactria; in the later Avesta he became a half-mythical figure, the last in the series of heroes of east Iranian legend. In the Gāthās he appears as a quite historical personage; to his power and good example the prophet is indebted for his success. In Yasna, 53, 2, he is spoken of as a pioneer of the doctrine revealed by Ormazd. In the relation between Zoroaster and Vīshtāspa lies the germ of the state church which afterwards became subservient to the dynasty and sought its protection from it.

Among the grandees of the court of Vīshtāspa were two brothers, Frashaoshtra and Jāmāspa, both, according to the later legend, vizirs of Vīshtāspa. Zoroaster's wife, Hvōvi, was the daughter of Frashaoshtra, and the husband of his daughter, Pourucista, was Jāmāspa. The rôle of intermediary was played by the pious queen Hutaosa. Apart from this, the new prophet relies especially upon his own kindred (*hvaētush*). His first disciple, Maidhyōimāongha, was his cousin: his father was, according to the later Avesta, Pourushaspa, his mother Dughdōvā, his great-grandfather Haēcataspa, and the ancestor of the whole family Spitama, for which reason Zarathushtra usually bears this surname. His sons and daughters are repeatedly spoken of. His death is nowhere mentioned in the Avesta; in the *Shāh-Nāma* he is said to have been murdered at the altar by the Turanians in the storming of Balkh.

As to the date of Zoroaster; King Vīshtāspa has no place in any historical chronology, and the Gāthās give no hint on the subject. According to the Arda Vīrāf, 1, 2, Zoroaster taught some 300 years before the invasion of Alexander. Assyrian inscriptions relegate him to a more ancient period. Eduard Meyer (see Ancient Persia), conjecturally puts the date of Zoroaster at 1000 B.C., with Duncker (Geschichte des Altertums, 4, 78). This may be too high: but, in any case, Zoroaster belongs to a prehistoric era. Probably he belonged to the old school of Median Magi, and appeared first in Media as the prophet of a new faith, hut met with sacerdotal opposition, and turned his steps eastward. In the east of Iran the novel creed first acquired a solid footing, and subsequently reacted with success upon the West.

Zoroastrianism.—Zoroaster taught a new religion rooted in the old Iranian—or Aryan—folk-religion, of which we can form some representation by comparison with the religion of the Veda. The Aryan folk-religion was polytheistic. Worship was paid to popular divinities, such as the war-god and dragon-slayer Indra, to natural forces and elements such as fire, but the Aryans also believed in the ruling of moral powers and of an eternal law in nature. On solemn occasions the inspiring drink soma (haoma) was consumed by the devout. Numerous coincidences with the Indian religion survive in Zoroastrianism, side by side with astonishing diversities.

In the Avesta the evil spirits are called *daēva* (Modern Persian div), while the Aryans of India gave the name of diva to their good spirits, the spirits of light. An alternative designation for deity in the *Rig-Veda* is *asura*. In the later hymns of the *Rig-*

Veda and in later India, only evil spirits are called *asuras,* while in Iran the corresponding word *ahura* was, and is, the designation of God the Lord. Ahura indicates the more sublime and awful divine character, for which man entertains reverence and fear: *daēva* denotes the kind gods of light, the anthropomorphic deities. Zoroaster elevated the conception of the Ahura, and he degraded the daivas (*daēvas*) to the rank of malicious powers and devils. In one *Ahura,* he concentrated the whole of the divine character, and conferred upon it the epithet of "the wise" (mazdiio). The Wise Lord (Ahurd Mazdiio — later *Ormazd*) is the primaeval spiritual being, the All-father, who was existent before ever the world arose. From him that world has emanated, and its course is governed by his foreseeing eye. His guiding spirit is the Holy Spirit, which wills the good: yet it is not free, but restricted, in this temporal epoch, by its antagonist and own twin-brother (Yasna, 30, 3), the Evil Spirit (angrd mainyush, Ahriman), who in the beginning was banished by the Good Spirit by means of the famous ban contained in Yasna, 45, 2, and since then drags out his existence in the darkness of Hell as the principle of ill. In the Gāthās the Good Spirit of Mazda and the Evil Spirit are the two great opposing forces in the world, and Ormazd himself is to a certain extent placed above them both. Later the Holy Spirit is made directly equivalent to Ormazd; and then the great watchword is: "Here Ormazd, there Ahriman!" The very dadvas are only the inferior instruments, the corrupted children of Ahriman, from whom come all that is evil in the world. The *daēvas,* attacked by Zoroaster as the enemies of mankind, are still, in the Gāthās, the perfectly definite gods of old popular belief — the idols of the people. Zoroaster regarded them as spurious deities, and their priests and votaries as idolaters and heretics. In the later, developed, system the dadvas are the evil spirits in general, and their number has increased to millions. Some have names; and among them the old Aryan divinities emerge here and there, *e.g.,* Indra and Nāonhaitya. With some, of course, such as the god of fire — the connection with the good deity was indissoluble. Other powers of light, such as Mitra the god of day (Iranian Mithra), survived in popular belief till the later system incorporated them in the angelic body. The authentic doctrine of the Gāthās had no room either for the cult of Mithra or for that of the Haoma. Beyond the Lord and his Fire, the Gāthās only recognize the archangels and certain ministers of Ormazd, who are personifications of abstract ideas. The essence of Ormazd is Truth and Law (*asha* = Vedic rta): this quality he embodies, and its personification (though conceived as sexless) is always his constant companion. The essence of the wicked spirit is falsehood: and falsehood, as the embodiment of the evil principle, is more frequently mentioned in the Gāthās than Ahriman himself.

Zoroaster says that he had received from God a commission to purify religion (Yasna, 44, g) from the grossly sensual elements of dadva worship. This self-contained theory of the universe and logical dualistic principle were destined to terminate in monotheism. Later sects sought to rise from it to a higher unity in other ways. Thus the Zarvanites represented Ormazd and Ahriman as twin sons proceeding from the fundamental principle of all — Zrvana Akarana, or limitless time.

Ethically, too, the new doctrine stands on a higher plane, and represents, in its moral laws, a superior civilization. It is the religion of the settled grazier and the peasant, while the ruder *daēva*-cult holds its ground among the uncivilized nomadic tribes, who sacrificed the cow, the gift of Ormazd to man, a sacred animal.

The Doctrine of Zoroaster may be summarized as follows:—

At the beginning of things there existed the two spirits who represented good and evil (Yasna, 30, 3). Both spirits possess creative power, which manifests itself positively in the one and negatively in the other. Ormazd is light and life, and creates all that is pure and good — in the ethical world of law, order and truth. His antithesis is darkness, filth, death and produces all that is evil in the world. Until then the two spirits had counterbalanced one another. The ultimate triumph of the good spirit is an ethical demand of the religious consciousness and the quintessence of Zoroaster's religion.

The evil spirit with his wicked hosts appears in the Gāthās much less endowed with the attributes of personality and individuality than does Ahura Mazda. Within the world of the good Ormazd is Lord and God alone. In this sense Zoroastrianism is often referred to as the faith of Ormazd or as Mazdaism. Ormazd in his exalted majesty, the ideal figure of an Oriental king has in conjunction with himself a number of genii — for the most part personifications of ethical ideas. These are his creatures, his instruments, servants and assistants. They are comprehended under the general name of *ameshā spentā* ("immortal holy ones") and are the prototypes of the seven amshaspands of a later date. These are — (1) Vohu Manō (εὔνοια), good sense, *i.e.,* the good principle, the idea of the good, the principle that works in man inclining him to what is good; (2) Ashem, afterwards Ashem Vahishtem (Plutarch's ἀλήθεια), the genius of truth and the embodiment of all that is true, good and right, upright law and rule — ideas practically identical for Zoroaster; (3) Khshathrem, afterwards Khshathrem Vairim (εὐνομία), the power and kingdom of Ormazd, which have subsisted from the first but not in integral completeness, the evil having crept in like tares among the wheat: the time is yet to come when it shall be fully manifested in all its unclouded majesty; (4) Ārmaiti (θοψία), due reverence for the divine, *verecundia,* spoken of as daughter of Ormazd and regarded as having her abode upon the earth; (5) Haurvatāt (πλοῦτος), perfection; (6) Ameretāt, immortality. Other ministering angels are Gēush Urvan ("the genius and defender of animals"), and Sraosha, the genius of obedience.

As soon as the two separate spirits (cf. *Bundahish,* 1, 4) encounter one another, their creative activity and at the same time their permanent conflict begin. The history of this conflict is the history of the world. All creation divides itself into that which is Ahura's and that which is Ahriman's.

In the soul of man is the object of the war. Man is a creation of Ormazd, who therefore has the right to call him to account. But Ormazd created him free in his determinations and in his actions, wherefore he is accessible to the influences of the evil powers. Man takes part in this conflict by all his life and activity in the world. By a true confession of faith, by every good deed, word and thought, by continually keeping pure his body and his soul, he impairs the power of Satan and strengthens the might of goodness, and establishes a claim for reward upon Ormazd; by a false confession, by every evil deed, word and thought and defilement, he increases the evil and renders service to Satan.

The life of man falls into two parts — its earthly portion and that which is lived after death. The lot assigned to him after death is the result and consequence of his life upon earth. On the works of men here below a strict reckoning will be held in heaven (according to later representations, by Rashnu, the genius of justice, and Mithra). All the thoughts, words and deeds of each are entered in the book of life as separate items — all the evil works, etc., as debts. Wicked actions cannot be undone, but in the heavenly account can be counterbalanced by a surplus of good works. Only in this sense can an evil deed be atoned for by a good deed. Of a real remission of sins the old doctrine of Zoroaster knows nothing, whilst the later Zoroastrian Church admits repentance, expiation and remission. After death the soul arrives at the *cinvatō peretu,* or accountant's bridge, over which lies the way to heaven. Here the statement of his life account is made out. If he has a balance of good works in his favour, he passes forthwith into paradise (Gar6 *demāna*) and the blessed life. If his evil works outweigh his good, he falls finally under the power of Satan, and the pains of hell are his portion for ever. Should the evil and the good be equally balanced, the soul passes into an intermediary stage of existence (the *Hamēstakāns* of the Pahlavi books) and its final lot is not decided until the last judgment. This court of reckoning is called *āhā.* The course of law cannot be turned aside by sacrifice, nor by the grace of God.

In the Gāthās Zoroaster speaks usually in general terms of the divine commands and of good and evil works, of the renunciation of Satan, adoration of Ormazd, purity of soul and body, and care of the cow. Ceremonial worship is hardly mentioned. The Gāthās contain revelations concerning the last things and the future lot, whether bliss or woe, of human souls, promises

for true believers, threatenings for misbelievers, and Zoroaster's firm confidence as to the future triumph of the good

Zoroaster believed that the calling of a prophet took place precisely when it did with special reason. It was, he held, the final appeal of Ormazd to mankind at large. The fulness of time was near, the kingdom of heaven was at hand. Through the whole of the Gāthās runs the pious hope that the end of the present world is not far distant. He himself hopes, with his followers, to live to see the decisive turn of things, the dawn of the new and better aeon. Ormazd will summon together all his powers for a final decisive struggle and break the power of evil for ever; by his help the faithful will achieve the victory over their detested enemies, the *daēva* worshippers. Thereupon Ormazd will hold a general ordeal. Forthwith begins the one undivided kingdom of God in heaven and on earth. This is called, sometimes the good kingdom, sometimes simply the kingdom. Here the sun will for ever shine, and all the pious and faithful will live a happy life, which no evil power can disturb, in the eternal fellowship of Ormazd and his angels. Every believer will receive as his guerdon the inexhaustible cow and the gracious gifts of the Vohu Manō.

Later Development.— For most of the people Zoroaster's doctrine was too abstract. In the later Avesta are Mithra and popular divinities like the angel of victory, Verethraghna, Anāhita (Anāitis), the goddess of the water, Tishrya (Sirius), and other heavenly bodies, invoked with special preference. The Gāthās know nothing of the belief in the *Frauashi,* or guardian angels of the faithful. *Fravashi* properly means "confession of faith," and when personified comes to be regarded as a protecting spirit.

With the new teaching arose a widely spread priesthood (*āthravanō*) who systematized its doctrines, organized and carried on its worship, and laid down the minutely elaborate laws of the Vendidad for the purifying and keeping clean of soul and body, such as the numerous ablutions, bodily chastisements, love of truth, beneficial works, support of comrades in the faith, alms, chastity, improvement of the land, arboriculture, breeding of cattle, agriculture, protection of useful animals, as the dog, the destruction of noxious animals, and the prohibition either to burn or to bury the dead. These are to be left on the appointed places *(dakhmas)* and exposed to the vultures arid wild dogs. In the worship the drink prepared from the *haoma* (Indian *soma)* plant had a prominent place. Worship in the Zoroastrian Church was devoid of pomp; it was independent of temples. Its centre was the holy fire on the altar. The fire altars afterwards developed to fire temples. In the sanctuary of these temples the various sacrifices and high and low masses were celebrated. As offerings meat, milk, show-bread, fruits, flowers and consecrated water were used. The priests were the privileged keepers and teachers of religion. They only performed the sacrifices (Herodotus, i. 132), educated the young clergy, imposed the penances; they in person executed the ceremonies of purification and exercised a spiritual guardianship and pastoral care of the laymen. Every young believer in Mazda, after having been received into the religious community by being girt with the holy lace, chose a spiritual guide *(ratu).*

In eschatology a change took place. The last things and the end of the world are relegated to the close of a long period of time (3,000 years after Zoroaster), when a new Saoshyant is to be born of the seed of the prophet, the dead come to life, and a new incorruptible world begins.

Zoroastrianism was the national religion of Iran, and was professed by Turanians as well. The worship of the Persian gods spread to Armenia and Cappadocia and over the whole of the Near East (Strabo, xv. 3, 14; xi. 8, 4; 14, 76). Of the Zoroastrian Church under the Achaemenides and Aeracides little is known. After the overthrow of the dynasty of the Achaemenides a period of decay set in. Yet the Aeracides and the Indo-Scythian kings as well as the Achaemenides were believers in Mazda. The national restoration of the Sassanides brought new life to the Zoroastrian religion and long-lasting sway to the Church. Protected by this dynasty, the priesthood developed into a completely organized state church, which employed the power of the state in enforcing strict compliance with the religious law-book hitherto enjoined by their unaided efforts only. The head of the Church (Zarathushtrōtema) had his seat at Rai in Media and was the first person in the state next to the king. The formation of sects was at this period not infrequent (cf. MANICHAEISM). The Mohammedan invasion (636), with the persecutions of the following centuries, mas the death-blow of Zoroastrianism. In Persia itself only a few followers of Zoroaster are now found (in Kerman and Yezd). The PARSEES (*q.v.*) in and around Bombay hold by Zoroaster as their prophet and by the ancient religious usages, but their doctrine is a pure monotheism.

ZORRILLA, JOSE (1817–1893), Spanish poet and dramatist, was born at Valladolid and read law at the University of Toledo, but after a year of idleness there, he fled to Madrid and started a paper which was suppressed by the Government. He then fell into great poverty, but was brought into notice by an elegiac poem, declaimed at Larra's funeral in Feb. 1837. His *Cantos del trovador* (1841), a collection of national legends versified with infinite spirit, secured for the author the place next to Espronceda in popular esteem. National legends also supply the themes of his dramas, though in this department Zorrilla somewhat compromised his reputation for originality by adapting older plays which had fallen out of fashion. For example, in *El Zapatero* y *el Rey* he recasts *El montañés Juan Pascual* by Juan de la Hoz y Mota; in *Don Juan Tenorio* he adapts from Zamora's *No hay denda que no se pague, y Convidado de piedra,* and from the elder Dumas's *Don Juan de Marana* (which itself derives from *Les âmes du purgatoire* of Prosper Mérimée). But his rearrangements usually contain original elements, and in *Sancho Garcia,* El *Rey loco,* and *El Alcalde Ronquillo* he apparently owes little to any predecessor. In 1855 he emigrated to Mexico where he was protected by the Emperor Maximilian. He returned in 1866 to find himself a half-forgotten classic. His old fertility was gone, and new standards of taste were coming into fashion. He was always poor, and for some 12 years after 1871 he was in the direst straits. A small pension secured him from actual want in his old age, and the reaction in his favour became an apotheosis. In 1889 he was publicly crowned at Granada as the national laureate.

ZOSIMUS, bishop of Rome from March 18, 417 to Dec. 26, 418, succeeded Innocent I. and was followed by Boniface I. For his attitude in the Pelagian controversy, *see* PELAGIUS. He took a decided part in the protracted dispute in Gaul as to the jurisdiction of the see of Arles over that of Vienne, but without settling the controversy.

ZOSTEROPS, a genus of birds inhabiting various parts of the Old World and especially common in Australia and New Zealand. In New Zealand, the most familiar species (*Z. caerulescens*) is called white-eye or blight-bird, the last an allusion to its clearing the fruit-trees from blight.

ZOUAVE, the name given to certain infantry regiments in the French Army. The corps was first raised in Algeria in 1831 with one and later two battalions, and recruited solely from the Zouaves, a tribe of Berbers, dwelling in the mountains of the Jurjura range *(see* KABYLES). In 1838 a third battalion was raised and the regiment thus formed was commanded by Lamoricière. Shortly afterwards the formation of the *Tirailleurs algériens,* the Turcos, as the corps for natives, changed the enlistment for the Zouave battalions, and they became, as they

now remain, a purely French body. Three regiments were formed in 1852, and a fourth, the Zouaves of the Imperial Guard, in 1854. The Crimean War was the first service which the regiments saw outside Algeria. There are now six regiments, of three battalions each, stationed in North Africa.

The Papal Zouaves were formed in defense of the Papal states by Lamoricière in 1860. After the occupation of Rome by Victor Emmanuel in 1870, the Papal Zouaves served the government of national defense in France during the Franco-Prussian War, and were disbanded during the siege of Paris.

ZOUTPANSBERG, a district forming part of the Low Veld of the northern Transvaal. It is, for the most part, low-lying undulating country, bounded on the north by the Limpopo river. The principal hills are the Zoutpansberg, which consist of three parallel ranges, which are due to the dislocation of Waterberg rocks with strike faults. Copper is mined at Messina, near the Limpopo, and gold has been found at several places. Owing to its isolation and malaria, the district has been little developed, and the population was regarded as typical "backveld Boers." A railway has been built, linking Messina with the Transvaal system, and with Lourenço Marques.

ZUCCARELLI, FRANCESCO (1702–1788), Italian painter, was born at Pitigliano in Tuscany, and studied in Rome under Morandi, and Nelli. He was a foundation member of the Royal Academy and had the patronage of royalty and of many wealthy English collectors, for whom he executed his principal works—generally landscapes with classic ruins and small figures. A large number of them are at Windsor Castle.

ZUCCARO, the name of two Italian painters.

I. TADDEO ZUCCARO (1529–1566), one of the most popular painters of the so-called Roman mannerist school, was the son of Ottaviano Zuccaro, an almost unknown painter at St. Angelo in Vado, where he was born in 1529. He was employed by popes Julius III. and Paul IV., by Della Rovere, duke of Urbino, and other patrons. His best frescoes were a historical series painted on the walls of a palace at Caprarola, built for Cardinal Alessandro Farnese, for which Taddeo also designed rich decorations in stucco relief after the style of Giulio Romano and other pupils of Raphael. Nearly all his paintings were in fresco, very large in scale, and often in chiaroscuro. He died in Rome in 1566.

II. FEDERIGO ZUCCARO (*c.* 1539–1609) was in 1550 placed under his brother Taddeo's charge in Rome, and worked as his assistant; he completed the Caprarola frescoes. Federigo was perhaps the most popular artist of his generation. Probably no other painter has ever produced so many enormous frescoes crowded with figures on the most colossal scale, extravagant in attitude. His first work of this sort was the completion of the painting of the dome of the cathedral at Florence in 1579; the work had been begun by Vasari but left unfinished at his death. Federigo was recalled to Rome by Gregory XIII. to continue in the Pauline chapel of the Vatican the scheme of decoration begun by Michelangelo during his failing years, but he left Italy owing to a quarrel with members of the papal court. He visited Brussels, and there made a series of cartoons for the tapestry-weavers. In 1574 he went to England, where he received commissions to paint the portraits of Queen Elizabeth, Mary, queen of Scots, Sir Nicholas Bacon, Sir Francis Walsingham, Lord High Admiral Howard and others. Federigo was soon recalled to Rome to finish his work on the vault of the Pauline chapel. In 1585 he accepted an offer by Philip II. of Spain to decorate the new Escorial at a yearly salary of 2,000 crowns. He returned to Rome in 1588 and there founded in 1595, under a charter confirmed by Sixtus V., the Academy of St. Luke, of which he was the first president. Its organization suggested to Sir Joshua Reynolds the plan for the English Royal Academy.

He also wrote on art, see *L'Idea* de' *Pittori, Scultori,* ed *Architetti* (Turin, 1607), and two volumes (Bologna 1608) describing his visit to Parma and a journey through central Italy. He died at Ancona in 1609.

ZUG, the smallest undivided canton of Switzerland, is centrally situated. Of its 92.6 sq.m., 83.6% are productive, forests covering 29·1 sq. miles. Of the unproductive area, 12·6 sq.m. are covered by lakes, 2.8 by the Aegeri See (wholly within the canton), and the balance by part of the Lake of Zug. The pear-shaped Rossberg mass, with its central summit (Wildspitz, 5,193 ft.) thrusts its pointed end (Zugerberg, 3,261 ft.) north-north-west into the canton. Its steep western flanks fall to the Lake of Zug, the less steep eastern slopes descend to the basin and waters of the Aegeri See. Still eastwards, the land rises to the Hohe Rone mass (4,055 ft.) near its eastern boundary. From Aegeri a gorge carries the river Lorze to the low land at the north end of the Zugerberg, round which it curves to enter the lower end of the Lake of Zug. The Lorze leaves this lake slightly west of its point of entrance and flows north-north-west, over fertile lowlands, to its junction with the river Reuss—the latter stream forming the north-west boundary of the canton. Zug thus holds a strategical position at the entrance to the higher land. Railways connect the capital both with Lucerne and with Ziirich, while lines running along the shores of the Lake of Zug join at the Arth-Goldau station of the St. Gotthard railway. (See SCHWYZ.) An electric railway connects Zug and Oberaegeri; $2\frac{3}{4}$ m. distant, on the south-east of the lake, is Morgarten, the site of the great victory of the Confederates over the Habsburgs (1315). In 1941 the population was 36,744; in 1930, 34,395, of whom 32,897 were German-speaking, 1,001 Italian-speaking, and 294 French-speaking, while 29,211 were Catholics, 5,015 Protestants, and 46 Jews. Since 1928 the canton has formed part of the diocese of Basle. All towns are small. Zug (pop. 12,316) is the largest; north of it is Baar, and west-north-west is Cham, which are merely large villages. The canton forms a single administrative district and contains 11 communes. By the Constitution of 1814 the "Landsgemeinde," or primitive democratic assembly, which had existed since 1376, became an electoral body to choose a cantonal council. In 1848 the remaining functions of the Landsgemeinde were abolished.

The 1873–76 Cantonal Constitution was largely replaced by the present one in 1894.

The legislature (Kantonsrat) of 78 deputies has one member to every 450 inhabitants, and the seven members of the executive (Regierungsrat) are elected directly by popular vote.

The earlier history of the canton is closely linked with that of its capital, Zug (see below); subsequently violent disputes about the distribution of the French pensions took place (1728–38). In 1798 its inhabitants opposed the French, and during the period of the Helvetia republic it was one of the districts of the huge canton of the Waldstatten, but became a separate canton again on the fall of the republic (1803). As one of the six Catholic cantons, it joined the Sonderbund (1845) and shared in the war of 1847. In 1848, and again in 1874, it voted against the acceptance of the proposed Federal Constitution.

ZUG, capital of the Swiss canton of that name, a picturesque little town at the N.E. corner of the lake of Zug, and at the foot of the Zugerberg (3,255 ft.), which rises gradually, its lower slopes thickly covered with fruit trees. Pop. (1941) 12,316, mainly German-speaking and Roman Catholic.

The town, first mentioned in 1240, is called an *oppidum* in 1242, and a *castrum* in 1255. In 1273 it was bought by Rudolph of Habsburg from Anna, the heiress of Kyburg. After this it was governed by a bailiff, appointed by the Habsburgs, and a council, and was much favoured by that family. Several country districts (Baar, Menzingen, and Aegeri) had each its own "Landsgemeinde" but were governed by one bailiff, also appointed by the Habsburgs; these were known as the "Aeusser Amt," and were always favourably disposed to the Confederates. On the 27th of June 1352 both the town of Zug and the Aeusser Amt entered the Swiss Confederation; but in September, 1352, Zug had to acknowledge its own lords again, and in 1355 to break off its connection with the league. About 1364 the town and the Aeusser Amt were recovered for the league by the men of Schwyz, and from this time Zug took part as a full member in all the acts of the league. In 1379 the German king Wenceslaus exempted Zug from all external jurisdictions, and in 1389 the Habsburgs renounced their claims, reserving only an annual payment of twenty silver marks, and this came to an end in 1415. In 1385 Zug joined the league of the Swabian cities against Leopold of Habsburg,

and shared in the victory of Sempach. Between 1379 (Walchwil) and 1477 (Cham) Zug had acquired various districts in her own neighbourhood, principally to the north and the west, which were ruled till 1798 by the town alone as subject lands. At the time of the Reformation Zug clung to the old faith and was a member of the "Christliche Vereinigung" of 1529. In 1j86 it became a member of the Golden League.

ZUG, LAKE OF, one of the minor Swiss lakes, north of that of Lucerne. It is formed by the Aa, which enters the ,southern extremity of the lake. The Lorze enters at its northern end, but 1¼ m. further W. issues from the lake to pursue its course towards the Reuss. The lake has an area of about 1j sq.m., is about 9 m. long, 23 m. wide, and has a maximum depth of 650 ft., while its surface is 1,368 ft. above sea-level. Most of the lake is in the canton of Zug, but 3¾ sq.m. at the southern end is in Schwyz, while ¾ sq.m., to the N. of Immensee is in Lucerne.

ZUHAIR [Zuhair ibn Abi Sulmā Rabi' a ul-Muzani] (6th century), one of the six great Arabian pre-Islamic poets. Of his life practically nothing is known save that he belonged to a family of poetic power; his stepfather, Aus ibn Hajar, his sister, Khansā, and his son, Ka'b ibn Zuhair, were all poets of eminence. He is said to have lived long, and at the age of one hundred to have met Mohammed. His home was in the land of the Bani Ghatafān. His poems are characterized by their peaceful nature and a sententious moralizing. One of them is contained in the *Moallakāt.*

As a whole his poems have been published by W. Ahlwardt in his *The Diwans of the six Ancient Arabic Poets* (London, 1870); and with the commentary of al-A'lam (died 1083) by Count Landberg in his *Primeurs arabes* (Leiden, 1889). (G. W. T.)

ZUIDER ZEE (Zoi'dur zā), a shallow gulf, penetrating far into the northern Netherlands, communicating with the North Sea but almost cut off from it at low water by the Frisian islands (Texel, etc.) and the sandbanks of the Wadden Zee. It is probable that in the middle ages the coast line to the north of the Zuider Zee was an almost continuous series of dunes, but, before the 14th century the Zuider Zee acquired something of its present form. The greater part of the water-covered area has a depth of less than 1jft. at low water. An area of over 12,000ac. of rich land was reclaimed from Lake Y in the neighbourhood of Amsterdam, at the time of the building of the North Sea ship canal in the middle of the 19th century, by the construction of a sea-dike and locks cutting off Amsterdam-from the Zuider Zee. The earliest plans for reclaiming the Zuider Zee date from the 17th century but it was not until 1918 that the sanction of the Netherlands legislature was obtained to the carrying out of a vast scheme of reclamation commenced in 1920. (See COAST PROTECTION AND LAND RECLAMATION; HOLLAND.) (N. **G. G.**)

The Zuider Zee originally covered an area of about 3,570 square kilometres. When drained. there will remain a fresh-water lake covering 1,450 square kilometres. The reclaimed land, divided into four polders by the new lake (to be called Yssel Lake), and the mouths of the Amstel and the Yssel, will cover an area of almost 2,112 square kilometres. Of this land, 1.950 sq km, will consist of exceedingly fertile soil. To render this drainage possible, the Zuider Zee had to be separated from the North Sea by a dike, completed in 1932 at a cost of £10½ millions. The dike is 29 3 kilometres long. and six metres high above the water level. The top is only two metres in width. On the inside berm, however, there will be room for a road 17 metres wide, over which a double-track railway will run. The dike will be equipped with 30 discharge sluices, each 10 metres wide and five metres deep. Further, there will be two locks, respectively 10 and 6 metres wide. These sluices and locks will maintain communication between the Yssel Lake and the North Sea. It is hoped that the north-western polder, covering an area of 220 sq.km., will be completed at the same time as the dike and that all four polders will be in exploitation by 1958.

ZULA, a small town near the head of Annesley Bay on the African coast of the Red Sea. Ruins in its vicinity are supposed to mark the site of the ancient emporium of Adulis ('Αδουλὶς, 'Αδουλεί), the port of Axum (*q.v.*) and chief outlet in the early centuries of the Christian era for the ivory, hides, slaves and other exports of the interior. Cosmas Indicopleustes saw here an inscription of Ptolemy Euergetes (247–222 B.C.); and it is conjectured that the town may have been the Berenice Panchrysus of the Ptolemies.

In 1857 an agreement was entered into by Dejaj Negusye, a chief of Tigré, in revolt against the Negus Theodore of Abyssinia, to cede Zula to the French. Negusye was defeated by Theodore, and the commander of a French cruiser sent to Annesley Bay in 1859 found the country in a state of anarchy. No further steps were taken by France to assert its sovereignty, and Zula, with the neighbouring coast, passed nominally to Egypt in 1866. Zula was the place where the British expedition of 1867–68 against Theodore disembarked, Annesley Bay affording safe and ample anchorage for the largest ocean-going vessels. The road made by the British from Zula to Senafé on the Abyssinian plateau is still in use. The authority of Egypt having lapsed, an Italian protectorate over the district of Zula was proclaimed in 1888, and in 1890 it was incorporated in the colony of Eritrea (*q.v.*).

ZULOAGA, IGNACIO (1870–), Spanish painter, was born at Eibar in the Basque country on July 26, 1870, the son of the metal-worker and damascener Placido Zuloaga, and grandson of the organizer and director of the royal armoury in Madrid. He was intended for an architect, and to this end was sent to Rome, where he at once followed his strong impulse to become a painter. After six months' work he completed his first picture, which was exhibited at the Paris Salon of 1890. Continuing his studies in Paris, he was strongly influenced by Gauguin and Toulouse-Lautrec. But his true style developed after his return to Spain, when he had studied the work of Velazquez, Zurbaran, El Greco and Goya. His own country was slow in acknowledging the young artist whose strong, decorative, rugged style was the very negation of the aims of such well-known modern Spanish artists as Fortuny, Madrazo and Benlliure. It was in Paris, and then in Brussels and other continental art centres, that Zuloaga was first hailed by the reformers as the regenerator of Spanish national art and as the leader of a school. He is now represented in almost every great continental gallery.

Two of his canvases are at the Luxembourg, one at the Brussels Museum ("Avant la Corrida"), and one ("The Poet Don Miguel") at the Vienna Gallery. The Pau Museum owns an interesting portrait of a lady, the Barcelona Municipal Museum the important group "Amies," the Venice Gallery, "Madame Louise"; the Berlin Gallery, "The Topers." Other examples are in the Budapest, Stuttgart, Ghent and Posen galleries and in many important private collections.

A fully illustrated account of the artist and his work, by M. Utrillo, was published in a special number of *Forma* (Barcelona, 1907).

ZULULAND, a country of south-east Africa, forming the north-eastern part of the province of Natal, in the Union of South Africa. The "Province of Zululand," as it was known from 1898 to 1910, lies between 26° 50′ and 29° 15′ S. and 30° 40′ and 33° E. The country has an area of 10,427 sq.m., and in 1921 the natives numbered 250,829 and the white inhabitants 3,98j. Zululand includes, in the north, the country of the Ama Tonga, Zaambauland and other small territories not part of the former Zulu kingdom, and stretches north from the lower Tugela to the southern frontier of Portuguese East Africa. It is bounded on the south-east by the Indian ocean, on the north and north-west by the Utrecht and Vryheid districts of Natal, and by Swaziland. For an account of the physical features, geology, climate, flora, fauna and general geography see under NATAL and SOUTH AFRICA, UNION OF.

Although incorporated in Natal, much of Zululand is held as native reserves Besides a small settlement of Dutch farmers, large sugar plantations have been developed under European control in the last sixty years. Crown reserves of land for native use are still considerable though much reduced. European influence has, however, modified native life, but the tribal organization continues, with its elaborate system of laws regulating the inheritance of personal property (which consists chiefly of cattle). Complexity arises from the practice of polygamy and the exchange of cattle made upon marriage. The social organization is almost patriarchal.

(*X.*)

HISTORY

At what period the Zulu (one of a number of closely allied septs) first reached the country to which they have given their name is uncertain; they were probably settled in the valley of the White Umfolosi river at the beginning of the 17th century, and they take their name from a chief who flourished about that time. By certain shipwrecked Europeans they were described as very proud and haughty, careful in the preparation of food, very cleanly in person and keeping strict watch over their women. That was in 1756. At the close of the 18th century the Zulu were an unimportant tribe, numbering a few thousands only. At that time the most powerful of the neighbouring tribes was the Umtetwa (mTetwa or Aba-Tetwa), which dwelt in the country north-east of the Tugela. Its ruler was a chief who had had in early life an adventurous career and was known as Dingiswayo (the Wanderer). He divided the young men of his tribe into *impis* (regiments), and the Umtetwa became a formidable military power. In 1805 he was joined by Chaka (Tshaka, born *c.* 1783), the son of the Zulu chief Senzangokona; on the latter's death in 1810 Chaka, through the influence of Dingiswayo, was chosen as ruler of the Ama-Zulu, though not the rightful heir. About 1812 Dingiswayo was captured and put to death by Zwide, chief of the Undwandwe clan.

Chaka and **Dingaan.**—After Dingiswayo's death the Umtetwa army then placed themselves under Chaka, who not long afterwards conquered the Undwandwe. By the incorporation of these tribes Chaka made the Zulu a powerful nation. He strengthened the regimental system adopted by Dingiswayo and perfected the discipline of his army. A new order of battle was adopted—the troops being massed in crescent formation, with a reserve in the shape of a parallelogram ready to strengthen the weakest point. This order of battle was not, however, entirely new to the Bantu and probably Chaka's greatest innovation was the introduction of the stabbing assegai. At the same time the size of the shield was increased, the more completely to cover the body of the warrior. Military kraals were formed for the warriors.

Chaka had but two ways of dealing with the tribes with whom he came in contact; either they received permission to be incorporated in the Zulu nation or they were attacked. In the latter case the only persons spared were young girls and growing lads. About 1820, after the Zulu had conquered Natal, Mosilikatze (properly Umsilikazij, a general in the Zulu army, having incurred Chaka's wrath by keeping back part of the booty taken in an expedition, fled with a large following across the Drakenberg. Mosilikatze was not of the Zulu tribe proper, and he and his followers became known as the Matabele. Chaka's own dominions coincided almost exactly with the limits of Zululand and Natal.

Chaka seems to have first come into contact with Europeans in 1824, when he was visited by F. G. Farewell and a few companions To them he made a grant of the district of Port Natal. Chaka, who was cured of a wound by the skill of one of Farewell's companions, showed himself friendly to Europeans. He wished to send an embassy to England, but the Cape Government turned back his envoy. Again Chaka sent chiefs to Cape Town, but before their arrival he had been murdered (Sept. 23, 1828) at a kraal on the Umvote, about 50 miles from Port Natal. Chaka was a victim to a conspiracy by his half-brothers Dingaan and Umthlangana, while a short time afterwards Dingaan murdered Umthlangana and made himself king.

Bloodstained as had been Chaka's rule, that of Dingaan appears to have exceeded it in wanton cruelty. In 1835 Dingaan permitted the British settlers at Port Natal to establish missionary stations in the country in return for a promise made by the settlers not to harbour fugitives from his dominions. In 1836 American missionaries were also allowed to open stations; in Nov. 1837 Dingaan received Pieter Retief, the leader of the first party of Boer immigrants to enter Natal. The story of Retief's mission, the massacre of the Boer leader and the fighting which followed is told in the article NATAL. In the result Dingaan's army was totally defeated on Dec. 16, 1838 ("Dingaan's Day"), by a Boer force under Andries Pretorius. A year later he was overthrown, the Boers in Natal (Jan. 1840) supporting his brother Mpandc (usually called Panda) in rebellion against him. Dingaan passed into Swaziland in advance of his retreating forces, and was there murdered, while Panda was crowned king of Zululand by the Boers.

Panda and **Cetewayo.**—When in 1843 the British succeeded the Boers as masters of Natal they entered into a treaty with Panda, who gave up to the British the country between the upper Tugela and the Buffalo rivers, and also the district of St. Lucia bay (which, however, was not then occupied). Less war-like than Chaka and Dingaan, Panda remained throughout at peace with the Government of Natal. Bishop Schreuder, a Norwegian missionary long resident in Zululand, gave Sir Bartle Frere the following estimate of the three brothers who successively reigned over the Zulu:—"Chaka was a really great man, cruel and unscrupulous, but with many great qualities. Dingaan was simply a beast on two legs. Panda was a weaker and less able man, but kindly and really grateful, a very rare quality among Zulus. He used to kill sometimes, but never wantonly or continuously." In 1856 war broke out between two of Panda's sons, Cetewayo and Umbulazi, who were rival claimants for the succession. A battle was fought between them on the banks of the Tugela in Dec. 1856, in which Umbulazi and many of his followers were slain. The Government of Natal in 1861 obtained the formal nomination of a successor to Panda; and Cetewayo was appointed. Panda died in Oct. 1872 and Cetewayo succeeded in 1873.

Border disputes with the Transvaal Boers were fairly frequent during Panda's reign. The Boers had obtained from Panda in 1854 a cession of the Utrecht district; in 1860 they tried to get from the king a road to the sea at St. Lucia bay. In 1861 a quarrel arose between Cetewayo and another of his brothers, Umtonga (who had been originally designated by Panda as his successor). Umtonga fled to Utrecht; Cetewayo offered the Boers a strip of land if they would surrender his brother. This they did on condition that Umtonga's life was spared. The Boers got their strip of land and beaconed it off in 1864. When, however, in 1865 Umtonga fled to Natal, Cetewayo declared that he had lost his part of the bargain, for he feared that Umtonga might be used to supplant him. He thereupon caused the boundary beacons to be removed and put forward a claim to certain lands north of the Pongola, ceded by the Swazi to the Lyndenburg Boers in 1855, on the ground that the Swazi were the vassals of the Zulu and had no right to part with any of their territory.

Cetewayo's Rule.—Such was the position when by his father's death Cetewayo (*q.v.*) became absolute ruler of the Zulu. As far as possible he revived the military methods of his uncle Chaka. His rule over his own people was tyrannous. By Bishop Schreuder he was described as "an able man, but for cold, selfish pride, cruelty and untruthfulness worse than any of his predecessors." The tension between Cetewayo and the Transvaal over border disputes continued and when in 1877 Great Britain annexed the Transvaal the disputes were transferred to the new owners of the country. A commission appointed by the lieutenant-governor of Natal reported in July 1878, and found almost entirely in favour of the Zulu on the boundary disputes. Sir Bartle Frere, then high commissioner, thought the award "one-sided and unfair to the Boers" (Martineau, *Life of* Frere, ii. xix). Frere, moreover, was convinced that it was necessary in the interests of South Africa that the power of Cetewayo be curtailed. In furtherance of this general plan a British resident was to be accepted. These demands were made to Zulu deputies on Dec. 11, 1878, a definite reply being required by the 31st of that month.

The Zulu War.—Cetewayo returned no answer, and in Jan. 1879 a British force under Gen. Thesiger (Lord Chelmsford) invaded Zululand. Chelmsford had a force of 5,000 Europeans and 8,200 natives; Cetewayo an army of fully 40,000 men. Chelmsford divided his force into three columns—their entry was unopposed—which were to converge on Ulundi, the royal kraal. On Jan. 22 the centre column (1,600 Europeans, 2,500 natives), which had advanced from Rorke's Drift. was encamped near Isandhlwana; on the morning of that day Chelmsford moved out with a small force to support a reconnoitring party. After he had left, the camp, in charge of Col. Durnford, was surprised by a Zulu army nearly 10,000 strong. The British were overwhelmed and almost every man killed, the casualties being 806 Europeans (more

than half belonging to the 24th regiment) and 471 natives. The reconnoitring party returned to find the camp deserted; next day they retreated to Rorke's Drift, which had been the scene of an heroic and successful defence. After the victory at Isandhlwana several impis of the Zulu army had moved to the Drift. The garrison stationed there, under Lieuts. Chard and Bromhead, numbered about 80 men of the 24th regiment, and they had in hospital between 30 and 40 men. Late in the afternoon they were attacked by about 4,000 Zulu. On six occasions the Zulu got within the entrenchments, to be driven back each time at the bayonet's point. At dawn the Zulu withdrew, leaving 350 dead. The British loss was 17 killed and 10 wounded.

In the meantime the right column under Col. Pearson had reached Eshowe from the Tugela; on receipt of the news of Isandhlwana most of the mounted men and the native troops were sent back to Natal, leaving at Eshowe a garrison of 1,300 Europeans and 65 natives. This force was hemmed in by the enemy. The left column under Col. Evelyn Wood, which had advanced from Utrecht. found itself obliged to act on the defensive.

News of Isandhlwana reached England on Feb. 11 and on the same day about 10,000 men were ordered to South Africa. The first troops arrived at Durban on March 17. On the 29th a column under Chelmsford, consisting of 3,400 Europeans and 2,300 natives, marched to the relief of Eshowe, entrenched camps being formed each night. On April 2 the camp was attacked at Ginginhlovo, the Zulu being repulsed. Their loss was estimated at 1,200, while the British had only two killed and 52 wounded The next day Eshowe was relieved. Wood, who had been given leave to make a diversion in northern Zululand, on March 28 occupied Hlobane (Inhlobane) mountain. The force was, however, compelled to retreat owing to the unexpected appearance of the main Zulu army, which nearly outflanked the British. There were 100 casualties among the 400 Europeans engaged. At midday next day the Zulu army made a desperate attack, lasting over four hours, on Wood's camp at Kambula; the enemy—over 20,000 strong—was driven off, losing fully 1,000 men, while the British casualties were 18 killed and 65 wounded.

By the middle of April nearly all the reinforcements had reached Natal, and Chelmsford reorganized his forces. The 1st division, under Maj.-gen. Crealock, advanced along the coast belt and was destined to act as a support to the 2nd division, under Maj.-gen. Newdigate, which, with Wood's flying column, an independent unit, was to march on Ulundi from Rorke's Drift and Kambula. Owing to difficulties of transport it was June before Newdigate was ready to advance. On the 1st of that month the prince imperial of France (Louis Napoleon), who had been allowed to accompany the British troops, was killed while out with a reconnoitring party. On July 1 Newdigate and Wood had reached the White Umfolosi, in the heart of the enemy's country. On the 4th they crossed the river, the force numbering 4,200 Europeans and 1,000 natives. Within a mile of Ulundi the British force, formed in a hollow square, was attacked by a Zulu army numbering 12,000 to 15,000. The battle ended in a decisive victory for the British, whose losses were about 100, while of the Zulu some 1,500 men were killed (see ULUNDI). Sir Garnet Wolseley had been sent out to supersede Chelmsford and reached headquarters on July 7.

Cetewayo's Downfall.—After Ulundi the Zulu army dispersed, most of the leading chiefs tendered their submission, and Cetewayo became a fugitive. On Aug. 27 the king was captured and sent to Cape Town. His deposition was formally announced to the Zulu, and Wolseley drew up a new scheme for the government of the country. The Chaka dynasty was deposed and the Zulu country portioned among 11 Zulu chiefs, John Dunn, a white adventurer, and Hlubi, a Basuto chief, who had done good service in the war. A resident was appointed who was to be the channel of communication between the chiefs and the British Government. This arrangement was productive of much bloodshed and disturbance, and in 1882 the British Government determined to restore Cetewayo to power. In the meantime, however, blood feuds had been engendered between two chiefs of the royal house, Usibepu (Zibebu) and Hamu, and the tribes who supported the ex-king and his family. Cetewayo's party (who became known as Usutus) suffered severely at the hands of the two chiefs, who were aided by a band of white freebooters. When Cetewayo was restored Usibepu was left in possession of his territory, while Dunn's land and that of the Basuto chief (the country between the Tugela and the Umhalatuzi, *i.e.,* adjoining Natal) was constituted a rcscrve. Before very long this new arrangement proved as futile as had Wolseley's. A collision soon took place; Usibepu's forces were victorious and, on July 22, 1883, led by a troop of mounted whites, he made a sudden descent upon Cetewayo's kraal at Ulundi, which he destroyed, massacring such of the inmates of both sexes as could not save themselves by flight. The king escaped, though wounded, into the reserve; he died in Feb. 1884.

Cetewayo left a son, Dinizulu, who sought the assistance of some of the Transvaal Boers against Usibepu, who was defeated and driven into the reserve. These Boers, led by Lukas Meyer, claimed as a reward for their services the greater and more valuable part of central Zululand. On May 21 the Boer adventurers had proclaimed Dinizulu king of Zululand; in August following they founded the "New Republic." carved out of Zululand. The British Government intervened, and in Dec. 1884 took formal possession of St. Lucia bay, caused the Boers to reduce their territorial demands, and in its truncated form recognized the New Republic—which was in 1888 incorporated in the Transvaal and has since 1903 formed the Vryheid division of Natal.

Zululand Annexed.—Seeing that peace could be maintained between the Zulu chiefs only by the direct exercise of authority the British Government annexed Zululand in 1887 and placed it under a commissioner responsible to the governor of Natal. In the following year Dinizulu rebelled. After a sharp campaign (June–Aug. 1888), the Usutu losing 300 killed in one encounter, Dinizulu fled into the Transvaal. He surrendered to the British in November; in April 1889 he and two of his uncles were found guilty of high treason and were exiled to St. Helena.

Under the administration of Sir Melmoth Osborn, the commissioner, and his successor Sir Marshal Clarke, and the district magistrates, the Zulu became reconciled to British rule.

At the close of 1897 Zululand, in which Tongaland had been incorporated, was handed over by the imperial Government to Natal. In 1898 Dinizulu was allowed to return and was made a "government induna." Officially one of several chiefs he was, in fact, regarded by most of the Zulu as the head of their nation.

In 1905 a poll tax of £1 on all adult males was imposed by the Natal legislature; this tax was the ostensible cause of a revolt in 1906 among the natives of Natal. Bambaata, the leader of the revolt, fled to Zululand. After a hard campaign the rebellion was crushed by July 1906. In all some 3,500 Zulus were killed and about 3,000 taken prisoners, the majority of them being released in 1907. (See further, NATAL: History.) Zululand remained, however, in a disturbed condition, and a number of white traders and officials were murdered. Dinizulu had been accused of harbouring Bambaata, and in Dec. 1907 the Natal Government felt justified in charging him with high treason, murder and other crimes. A military force entered Zululand and Dinizulu surrendered without opposition He was brought to trial in Nov. 1908 and in March 1909 was found guilty of harbouring rebels. The more serious charges against him were not proved. Sentenced to four years' imprisonment, he was released on the establishment of the Union in 1910 by Gen. Botha, who had in his early days been one of the founders of the "New Republic." Dinizulu was settled on a farm in the Transvaal, where he died in Oct. 1913.

There had been no disturbance of public order since 1907 and European influence gradually modified native life. In 1905 the coast belt had been opened up to white planters for the cultivation of sugar cane and from 1922 onward the cultivation of cotton was also undertaken. Most of the country remained, however, a native reserve and the tribal system continued. The Zulu sense of nationality remained strong, and though the rivalry between the Usutu and Gsibepu parties continued most of the Zulu desired a paramount chief of the house of Chaka—and in the view of competent European residents in Zululand the appointment of such a chief would have been for the benefit of the people. Zulu opinion was shown at a great indaba held at Eshowe in June,

1925, in honour of the prince of Wales when 40,000 Zulus assembled. On that occasion Dinizulu's son Solomon, though officially of no higher rank than the other chiefs, was selected to address the prince as the spokesman of the nation.

ZUMALACARREGUI, TOMÁS (1788–1835), Spanish Carlist general, born at Ormaiztegui, Navarre, Dec. 29, 1788. In his youth he served under Gaspar de Jauregui, one of the minor guerrillero leaders. He then entered the army, but was disgraced for his support of Don Carlos.

Appointed commander-in-chief in Navarre by Don Carlos, he escaped from Pamplona on the night of Oct. 29, 1833, and took command the next day in the Val de Araquil of the few hundred ill-armed and dispirited guerrilleros that constituted his whole force. In a few months Zumalacárregui had organized the Carlist forces into a regular army. Whether as a guerrillero leader, or as a general conducting regular war in the mountains, he proved unconquerable. By July 1834, he had made it safe for Don Carlos to join his headquarters. The pretender, bigoted and narrow-minded, was afraid of Zumalacárregui's personal influence with the soldiers, and Zumalacárregui was hampered by the intrigues of the court. Yet by June 1835 he had made the Carlist cause triumphant to the north of the Ebro: had he been allowed to march on Madrid, he might well have put Don Carlos in possession of the capital. He reluctantly obeyed the order to besiege Bilbao, was wounded in the leg on June 14, 1835, attended by Don Carlos's physicians, and died on June 24, 1835—not without suspicion of poison.

ZUMPT, the name of two German classical scholars. KARL GOTTLOB ZUMPT (1792–1849) was born on April 1, 1792 in Berlin, and died at Karlsbad on June 25, 1849. He was professor of Latin literature at Berlin University. His chief work was his *Lateinische Grammatik* (1818). He edited Quintilian's *Institutio oratoria* (1831), Cicero's *Verrines* and *De officiis* (1837), and Curtius. He also published *Annales veterum regnorum et populorum* (3rd ed. 1862), a work in chronology down to A.D. 476, and other antiquarian studies. His nephew, AUGUST WILHELM ZUMPT (1815–1877), was born on Dec. 4, 1815, at Konigsberg, and died on April 22, 1877, and was professor in the Friedrich Wilhelm Gymnasium. He is known chiefly in connection with Latin epigraphy, his papers on which (collected in *Commentationes epigraphicae*, 2 vols., 1850–54) brought him into conflict with Mommsen. His works include *Monumentum Ancyranum* (with Franck, 1847) and *De monumento Ancyrano supplendo* (1869); *Studia Romana* (1859); *Das Kriminalrecht der rom. Republik* (1865–69); *Der Kriminalprozess der rom. Republik* (1871); editions of Namatianus (1840), Cicero's *Pro Murena* (1859) and *De lege agraria* (1861). Ihne incorporated materials left by him in the 7th and 8th vols. of his *Römische Geschichte* (1840).

ZUNI, a native town on the Zuni river, an affluent of the Little Colorado, in western New Mexico, sole remnant of a Pueblo population of wholly distinct speech and unknown origin. First seen by Niza in 1539; the then seven Zuni towns were entered by Coronado in 1540 after the storming of Hawikuh, one of the chief of them. A mission was established in 1629; in 1670 Hawikuh was destroyed by the Apache; in 1680, on the outbreak of the Pueblo rebellion, only three towns remained, at one of which, Halonawa, the reconquered Zuni population was concentrated around a mission, now in ruins. About this rose the congested pueblo in tiers up to four and five stories of masonry. The population was 2,252 as of Jan. 1, 1941, the largest resident population of any Pueblo. Like the other pueblos, the Zunis have maintained much of their traditional customs and religion. While their culture is thus closely bound up with soil and seasons, their government is on an elective democratic basis. The Zuni ritual best known to non-Indians is the Shalako dance, a house-blessing ceremony held annually in December.

(1883–96), *Zuñi Folk Tales*, 1901, *Zuñi Breadstuff* (Indian Notes and Monographs, vol. viii., 1920); A. L. Kroeber, *Am. Mus. Nat. Hist. Anthr. Pap.*, vol. xviii. (1917); E. C. Parsons, *Am. Anthr. Ass. Mem.*, vol. iv. (1917).

ZUNZ, LEOPOLD (1794–1886), Jewish scholar, was born at Detmold in 1794, and died in Berlin in 1886. He was the founder of what has been termed the "science of Judaism," the critical investigation of Jewish literature, hymnology and ritual. His *Gottesdienstliche Vortrage der Juden, i.e.*, lays down principles for the investigation of the Rabbinic exegesis (Midrash, *q.v.*) and of the prayer-book of the synagogue.

Zunz's other principal works are *Synagogale Poesze des Mittelalters* (1855); and *Literaturgeschichte der Synagogalen Poesie* (1865, supp. vol. 1867).

ZURBARAN, FRANCISCO DE (1598–?1669), Spanish painter, was born at Fuente de Cantos in Estremadura, and baptized on Nov. 7, 1598. His parents belonged to the agricultural labouring class, but, discovering their son's talent, sent him at the age of 16 to study under a painter called Diego Perez Villanueva; he then worked under Juan de Roélas at Seville. He soon developed an independent realistic style, with solid modelling, and strongly contrasted light and shade, and acquired the name of the "Spanish Caravaggio." A series of "Scenes from the life of St. Peter" and a great altarpiece painted for the cathedral at Seville in 1625 established his reputation and in 1629 he was nominated town painter of Seville. Other important works of the early period are four pictures representing "Scenes from the Life of St. Buenaventura" now in the Louvre, Berlin, and Dresden museums; "the Vision of Alonso Rodriguez" (1630 in the Academy, Madrid) which is, perhaps, his masterpiece; the grand altarpiece representing "the Apotheosis of St. Thomas of Aquinas" (1631, Seville museum); to the year 1629 belong the series of pictures out of the Merced Calzada, representing scenes from the life of S. Pedro Molaxo (Seville Cathedral and Prado Madrid). The paintings in the monastery of Guadelupe were executed ten years later. Through his friendship with Velasquez he was nominated "Painter to the king" in 1638. It was, however, not until 1650, that he moved to the capital where he was commissioned to decorate a room of the palace of Buenretiro with the "Labours of Hercules." Of this series only four panels (now in the Prado) were completed. The date of Zurbaran's death is unknown. He was still alive on Feb. 28, 1664, when he was called upon to value some paintings at Madrid. Other important works of the master are at Seville, Cadiz, Jerez and in the museums of Budapest, London, in the Gardner collection, Boston, and with the Hispanic Society, New York, and elsewhere.

Zurbaran's principal pupils were Martinez de Granadille, Bernabe de Ayala, and the brothers Polanco. In the 19th century Courbet, who, like Zurbaran, was a son of the soil, professed a great admiration for the Spaniard's works in the Louvre and, to some extent, formed his style thereon.

ZURICH, the canton of north-eastern Switzerland and which ranks officially first in the Confederation. Its total area is 667.4 sq.m., of which the high proportion of 90·4% is reckoned as "productive" (forests, 184·9 sq.m., and vineyards 4.6 sq.m., the latter showing a rapid decrease during the 20th century, and now ranking much below Valais [*q.v.*]). Of the rest, 27.8 sq.m. are occupied by lake waters, chiefly part of the Lake of Zürich, but wholly within the canton are the Lakes of Greifen (3¼ sq.m.) and Pfäffikon (1¼ sq.m.). The canton, though not one of the ancient three, joined the Confederation in 1351. Its irregularity of shape arises from its continued growth, up to 1803, by the additions of acquisitions made by the capital. As far back as 1362 the

whole of the lower part of the lake was added, and by the purchase of Winterthur (1467) from the Habsburgs, it reached the Rhine. To-day it extends from its enclave in Baden, on the right bank of the Rhine (above the Thur junction to below the Toss junction) to some 8 m. S.W. of Pfaffikon See. It consists essentially of shallow river valleys draining Rhinewards and separated from one another by north-west to south-east ridges. The most important valley is that of the Linth, which expands into the Lake of Zurich and is continued as the Limmat; the ridge to the east is low and then successively eastwards are the valley of the river Aa-Glatt, which flows through the Greifen See; a higher ridge separating it from the more gorge-like Toss valley, and finally the highest ridge along the east boundary separating the Toss from the Toggenburg (*q.v.*). On the last ridge, Hornli reaches 3,727 feet. West of the Lake of Zurich is the strikingly parallel valley of the Sihl, bounded farther west by the Albis range, with Albishorn (3,012 ft) as its highest point. All the valleys are occupied by railway lines and the Limmat (Zürich to Baden) carried the first line opened (1847) in Switzerland From the town of Ziirich standard lines and mountain railways radiate in all directions; of the latter, one (south-west) is for Uetliberg (2,864 ft.) the north buttress of the Albis range and one (north-east) is for Zurichberg (2,285 ft.), on the ridge between the Limmat and the Glatt. Pop. (1941) 671,714.

In 1930 the population was 617,706, of whom 585,501 were German-speaking, 17,192 Italian-speaking, 9,350 French-speaking, and 1,716 Romansch-speaking, while there were 458.307 Protestants, 141,568 Catholics and 6,081 Jews. The capital of the canton is Zurich (pop. 1941, 333,829), but Winterthur (59,192) is the only other considerable town. Uster (10,588), east of Greifen See, is an industrial town, while Thalwil (7,943))Horgen (9,358) and Wadenswil (9,501), all on the western shore of the Lake of Ziirich, are of note as industrial centres. Though the land is highly cultivated, yet the canton is essentially a great manufacturing area, especially of machinery and railway rolling-stock. Silk weaving and cotton weaving are widely spread, and the products of the former industry have a large foreign market. The canton is divided into 11 administrative districts containing 186 communes. In 1869 the cantonal Constitution was revised, and no material changes have been made since. There is an executive (*Regierungsrat*) of seven members and a legislature (Kantonsrat) of 180 deputies (distributed among the electoral circles on a population basis, which varies from census to census). Each body holds office for four years and is elected by a method making use of the principle of proportional representation. The compulsory referendum exists, and all laws and all financial decisions involving a total sum over 250,000 frcs., or an annual sum of 20,000 frcs., must be submitted to a popular vote. Any 5,000 voters can employ the "initiative" to force the government to submit to the people any legislative or constitutional matter. Both members of the Federal *Ständerat* and the 28 members of the Federal *Nationalrat* are elected simultaneously by a popular vote and hold office for three years. (*See* SWITZERLAND.) (W. E. WH.)

ZURICH, the capital of the Swiss canton of the same name (Fr. Zurich; Ital. *Zurigo;* Lat. Turicum). It is the most populous, the most important, and on the whole the finest town in Switzerland, and till 1848 was practically the capital of the Swiss Confederation. In 1941, after an extension of boundaries (1934), its population was 333,829. In 1930 it was 249,820, and with its suburbs 309,541. Of the city's population 160,621 were Protestants, 75,291 Roman Catholics and 5,742 Jews, while 230,209 were German-speaking, 6.633 French-speaking, 8,850 Italian-speaking, and 1,082 Romansch-speaking.

Zurich is built on both banks of the Limmat as it issues from the lake of Zurich, and also of its tributary, the Sihl. That portion of the town which lies on the right bank of the Limmat is called the "Grosse Stadt" and that on the left bank the "Kleine Stadt." Till 1893 the central portion of the town on either bank of the Limmat formed the "city" and ruled the outlying communes or townships that had sprung up around it. But at that time the eieven outer districts (including Aussersihl, the workmen's quarter on the left bank of the Sihl) were incorporated with the town. Much land has been rescued from the lake, and is the site of fine quays, stately public buildings, such as the Civic Theatre and the Concert Hall, and splendid private villas. The older quarters are still crowded; but the newer quarters which stretch up the slope of the Zurichberg (above the right bank of the Limmat) have broad streets and fine buildings.

There were numerous pile dwellings on the sides of the lake and Zurich was a pre-Roman settlement, probably an "oppidum." About the middle of the first century A.D. a Roman "castellum" and customs station existed on the Lindenhof.

Of the old buildings the finest and most important is the Gross Munster (or Propstei), on the right bank of the Limmat. This was originally the church of the king's tenants, and in one of the chapels the bodies of Felix, Regula and Exuperantius, the patron saints of the city, were buried. The present building was erected at two periods (*c.* 1090–1150 and *c.* 1225–1300), the high altar having been consecrated in 1278. The towers were first raised above the roof at the end of the 15th century and took their present form in 1779. The chapter consisted of twenty-four secular canons; it was reorganized at the Reformation (1526), and suppressed in 1832. On the site of the canons' houses stands a girls' school (opened 1853), but the fine Romanesque cloisters (12th and 13th centuries) still remain. There is a curious figure of Charlemagne in a niche on one of the towers; to him is attributed the founding or reform of the chapter. On the left bank of the Limmat stands the other great church of Zurich, the Frau Munster (or Abtei), founded for nuns in 853, by Louis the German. The high altar was consecrated in 1170; but the greater part of the buildings are of the 13th and 14th centuries.

Of the other old churches may be mentioned St. Peter's, the oldest parish church, though the present buildings date in part from the 13th century only (much altered in the early 18th century), and formerly the meeting-place of the citizens; the Dominican church or Predigerkirche (13th century), in the choir of which the cantonal library was stored after 1873; the church of the Austin friars (14th century), now used by the Old Catholics, and the Wasserkirche. The last-named church is on the site of a pagan holy place, where the patron saints of the city were martyred; after 1631 it housed the Town Library. In 1916 the various libraries were united into a central library of some 700,000 books, 12,000 mss. including letters of Zwingli, of Bullinger and his friend Lady Jane Grey, of Schiller, etc. This is near the Predigerkirche which is now the repository of the archives of Zurich. The building itself was erected from 1479 to 1484, and near it is a statue of Zwingli, erected in 1885. The existing town hall dates from 1698, while the gild houses were mostly rebuilt in the 18th century. One of the most magnificent of the newer buildings is the Swiss National Museum, which was opened in 1898, and contains a wonderful collection of Swiss antiquities of all periods and art treasures of all kinds.

The town is noted for its numerous clubs and societies, and is the intellectual capital of German-speaking Switzerland. The University of Ziirich (see below) ordinarily has students of many nations and is housed in new buildings with several outlying institutes. It was opened in 1833, no doubt as a successor to the ancient chapter school at the Gross Munster, said to date back to Charlemagne's time, and hence called the Carolinum, which was reorganized at the Reformation and suppressed in 1832. The Federal Polytechnic school, opened in 1855, is one of the best known institutions of its type and had more than 2,000 students in 1941. Near it is the observatory (1,542 ft.). There are excellent primary and secondary schools and many institutions for special branches of education, *e.g.,* music, silk-weaving, etc. The Pestalozzium, with educational exhibits and Pestalozzi's study, occupies a new building near the Urania bridge.

The position of Ziirich as a meeting-point of international trade gives it a cosmopolitan character. Cotton spinning, furniture-making, the manufacture of machinery, the electrical industry and the silk industry are leading activities. The silk-weaving industry flourished in Zurich in the 12th and 13th centuries, but disappeared about 1420; it was revived by the Protestant exiles from Locarno (1555) and by the Huguenot refugees from France (1682 and 1685). Ziirich is the banking centre of Switzerland.

History.—The earliest inhabitants of the future site of Zurich were the lake dwellers. Later, the Helvetii (a Celtic tribe) had a settlement on the Lindenhof, where the Romans established a custom station. The Romans called it Turicum. The district was later occupied by the Alamanni.

The beginnings of the mediaeval town of Zurich date from the 9th and 10th centuries. In the 13th century Zurich was already an important imperial city; in the 16th century she became the centre of the Swiss Reformation and in modern times, though she lost the dominion over the country-side, she remained the capital of the canton and developed as a commercial, industrial intellectual and educational centre of the first importance.

Three stages in the constitutional development of the town may be distinguished. First comes the city's fight for freedom from foreign powers. The burghers were originally under the rule of a Reichsvogt, the representative of the emperor (who had a castle on the Lindenhof), but they obeyed also the orders of the abbess of the Fraumunster, a Benedictine convent (endowed in 853 by the Emperor Louis the Pious) which had acquired extensive rights and privileges over the people who had settled round about it. When the council of the abbess, which was composed of the noblemen and rich merchants of the town, became the trusted representation of the townspeople, power actually passed from the abbey to the town (13th century). The Reichsvogtei, which had been in the hands of the most powerful dynasty in the country, was in the same period entrusted to some nobleman of the town and was later (1400) bought off altogether from the emperor. Thus the city had acquired independence.

The second stage is characterized by the struggle for admittance of the craft guilds to a share with the patricians in the government of the town. Naturally, in the age of industrial develcpment and of democratic tendencies in the towns, the guilds tried to secure for themselves a share in the city's councils. They found a leader in Rudolf Brun, a nobleman, who after being elected burgomaster introduced a new constitution (1336) which divided the functions of government between the patricians (the *Con*stajel) and the representatives of the 13 guilds. The *Constafel* still retained a privileged position; the head of the *Constafel* was to be the burgomaster, and in the Little Council the Constafel members alone were invested with the functions of government.

In 1393, however, power passed from the Little Council into the hands of the Great Council (about zoo members) and the guild members got the majority on the Little Council with a title to have the burgomaster chosen out of their own ranks. From the 13th to the 15th century Zurich fought for the possession of a considerable dominion—the Zurich country district (which later became the canton). For a long time the town hesitated between a pro-Habsburg and a pro-Swiss policy. Brun had induced his followers to join in the Swiss League, which was then (1353) only beginning to develop. When, by purchase or right of succession, Zurich had become the ruler of the adjoining lake district, she came in conflict with the territorial aspirations of Schwyz. The "Old Zurich War" (1436–50) broke out between Ziirich and all the other members of the Swiss League; Zurich, however, had the assistance of Austria, the old enemy of the League. The war ended with the defeat of Ziirich who gave up the Austrian alliance. The authority of the Swiss League was much strengthened. In 1467 Zurich enlarged her dominion by acquiring from the Habsburgs the town of Winterthur. Zurich gained the military leadership in the League under her great burgomaster Hans Waldmann, who led the Swiss to victory in the Burgundian war at Morat (1476). He also fought with the gild masters against the Constafel party. A true adventurer by nature, he was a great reformer, did much to strengthen the administration of the town against the Church and the country districts, and helped to make Zurich a great commercial centre.

Another great figure, but of an entirely opposite character, was Huldreich Zwingli (*q.v.*), the leader in the Swiss Reformation. He obtained quite an exceptional influence over the decisions of the council. Zurich was later to become the capital of a reformed Swiss League and for the realization of this aim he renewed the fight against the conservative Forest districts of the Swiss League. This war ended again with defeat for Zurich and it deprived the whole Evangelical party in Switzerland for nearly two centuries of its preponderant position.

The fight of the country districts for the grant of equal political rights with the burghers of the ruling class marks the third stage in the history of Zurich. Originally the people in the country had retained a number of political privileges, which had been confirmed by the town herself and in the Reformation period were even enlarged. In the 17th and 18th centuries, however, there was a tendency to limit the privileges of burghership to the actual holders. The reserved rights of the country population were disregarded, the administration centralized, the country ruled solely by deputies from the town. The Great Council came to be mainly chosen by a small committee of members actually sitting in the Council and each gild had the right to fill by itself the seats becoming vacant by decease of its members. Trade was a privilege of the burghers alone. A country man was not allowed to have a business of his own; he could only work in the pay of a burgher as his employee. Some particular crafts were altogether reserved to the townspeople; an attempt was even made to deprive the town of Winterthur of its flourishing silk trade.

Occasional opposition from the country folk was severely punished. In 1794 some inhabitants of Stafa (a rich village on the lake) claimed the restoration of their old privileges (Stäfner articles), but it was not until 1798, when the Helvetic Republic was founded, that political and economical liberty was extended to the country districts. In 1803 certain privileges of the town were restored by giving the town proportionally a much larger representation in the new council than the country. Under the cantonal constitution of 1814 matters became even worse, for the town with about 10,000 inhabitants had 130 representatives in the Great Council, while the country districts with about 200,000 inhabitants had only 82. Reaction lasted till 1830, when a great popular meeting at Uster proposed a radical reform to abolish inequality between town and country. The democratic reform was accepted by the majority of the voters. The following period has rightly been called the "Regeneration Period"; administration was completely reorganized, the school-system reformed and crowned by the establishment of a cantonal university. The last great change in the cantonal constitution occurred in 1867–69, when the rights of the legislative council were reduced in favour of a more truly democratic system. The cantonal Government was to be elected by the people, the power of parliament was reduced by the people's privilege of referendum (*i.e.* the right to accept or reject bills proposed by parliament) and initiative (*i.e.* the right to propose bills of its own).

A particular task fell yet on the city proper: the assimilation of the new population which—owing to the rapid development of the town—had by far outgrown the number of the old privileged class and had partly settled in the outlying districts. The town began to open her schools to the newcomers and then facilitated the entrance into burghership. The work was crowned by the incorporation into the town of 11 outlying districts in 1893. A further expansion of 1934 in which a number of other suburbs uere incorporated brought the city's area to within the size of some of the biggest European cities.

(M. SI.)

Ziirich University *(see* UNIVERSITIES) was founded in 1833. Its buildings are nearly all new, with modern equipment, among the most outstanding being its central university library, and its clinics for diseases of the eye, ear and throat. The language of the university is German, and there are faculties of evangelical theology, law and political sciences, medicine and dentistry, veterinary medicine, science and letters. It has made important developments in bacteriology and hygiene, and in the study of living oriental languages and in the thought and history of Islam. Though during World War I and immediately afterwards its numbers fluctuated considerably, its usual attendance is about 1,600 regular students and joo non-matriculated. In 1919 it received 1,274,052 fr. for the Julius Claus Foundation for social anthropology racial hygiene. (A. L. WI.)

ZURICH, LAKE OF, a Swiss lake, extending south-east of the town of Ziirich. Its basin was formed by glacial erosion and it shows interesting phases of damming by moraines. The river Linth flows into it and the Limmat out of it. Its area is about 34 sq.m., extreme length 25 m., greatest breadth 23 m., greatest depth 469 ft., surface 1,342 ft. above sea level. The greater portion is in the canton of Zurich, but $8\frac{3}{4}$ sq.m. S.E. is in Schwyz, and 4 sq.m. N.E. in St. Gall. The great dam of masonry, carrying the railway line and motor road from Rapperswil to Pfäffikon, cuts off the extreme eastern part of the lake and is passed only by small boats; steamers do not go beyond the dam, as the part beyond is shallow. West of this dam is the island of Ufenau, where in 1523 Ulrich von Hutten took refuge and died. Zurich stands at the north end of the lake. On the west shore are Thalwil, Horgen, Wadenswil, Richterswil, Pfaffikon, and Lachen. On the opposite shore are Meilen (near which the first lake dwellings were discovered in 1853–54), Stäfa, and Rapperswil, the castle of which shelters a Polish museum. Schmerikon and Uznach are near the eastern end.

ZUTPHEN or ZUTFEN, a town in the province of Gelderland, Holland, on the right bank of the Ysel at the influx of the Berkel, and a junction station 18 mi. N.N.E. of Arnhem by rail. Pop. (1940) 21,490. In the middle ages it was the seat of a line of counts, which became extinct in the 12th century. Having been fortified, the town stood several sieges, specially during the wars of freedom waged by the Dutch, the most celebrated fight under its walls being the one in September 1586 when Sir Philip Sidney was mortally wounded. Taken by the Spaniards in 1587, Zutphen was recovered by Maurice, prince of Orange, in 1591, and except for two short periods, one in 1672 and the other during the French Revolutionary Wars, it then remained a part of the United Netherlands. German troops occupied it in World War II.

The most important building is the *Groote Kerk* of St. Walpurgis, which dates from the 12th century and contains monuments of the former counts of Zutphen, and other objects of interest. The chapter-house contains a pre-Reformation library which includes some valuable mss. and *incunabula.* There are some remains of the old town walls. The place has an active trade, especially in grain and in the timber floated down from the Black forest by the Rhine and the Ysel; the industries include tanning, weaving, and oil and paper manufactures. About 3 mi. to the north of Zutphen is the agricultural colony of Nederlandsch-Mettray, founded by a private benefactor for the education of poor friendless boys in 1851. At 3 mi. distance, in the picturesque "Achterhoek," are the mediaeval castles of Ruurloo and Vorden.

ZUTUHIL, an Indian tribe inhabiting the territory south of Lake Atitlan in Guatemala. Their tongue, one of the "metropolitan" Maya dialects, is spoken to-day in Atitlan, San Pedro la Laguna, San Lucas Tolimán, and San Antonio Suchitepéquez. They number about 14,000.

The part the Zutuhil played in the wars with the Quiché and Cakchiquel is described in the annals of those tribes, which make it clear that the Zutuhil were only slightly less powerful than these enemy neighbours, and they appear never to have been completely subdued. The Zutuhil capital was picturesquely located above Lake Atitlan. Near by stood a strongly fortified position, reduced by the Spaniards under Pedro de Alvarado in 1525 only with the greatest difficulty. To-day the Zutuhil work, often under a system of peonage, on the big coffee estates. Their costumes, of local cotton covered with embroidery, are noted for their brilliant colours.

ZWEIBRÜCKEN, a town of Germany, in the Bavarian Palatinate, on the Schwarzbach, and on the railway between Germersheim and Saarbrücken. Pop. (1939) 33,430.

Zweibrucken ("two bridges") is the Latin *Bipontinum;* it appears in early documents also as *Geminus Pons,* and was called by the French *Deux-Ponts.* The independent territory was at first a countship, half of which Count Eberhard sold in 1385 to the count palatine of the Rhine, holding the other half as his feudatory. Louis (d. 1489) founded the line of the dukes of Zweibriicken which became extinct in 1731, when the duchy passed to the Birkenfeld branch. At the peace of Lunéville Zweibriicken was ceded to France; on its reunion with Germany in 1814 the greater part of the territory was given to Bavaria, the remainder to Oldenburg and Prussia. Zweibrucken was known to scholars for its early editions of the Greek and Latin classics. Its war factories were bombed in World War II.

ZWICKAU, a town of Germany, in the *Land* of Saxony, situated on the left bank of the Zwickauer Mulde, 41 mi. S. of Leipzig and 20 mi. S.W. of Chemnitz on the main line of railway Dresden-Hof and at the junction of several other lines. Pop. (1939) 85,484.

Zwickau is of Slavonic origin, and is mentioned in 1118 as a trading place. Zwickau was an imperial possession, but was pledged to Henry the Illustrious, margrave of Meissen. It passed to the electors of Saxony, as successors of the margraves of Meissen. The discovery of silver in the Schneeberg in 1470 brought it much wealth. The Anabaptist movement of 1525 began at Zwickau under the inspiration of the "Zwickau prophets." Robert Schumann (*q.v.*) was born here.

Among the nine churches, the Gothic church of St. Mary (1451–1536 and restored 1885–91) is remarkable. Other noteworthy buildings are the town-hall of 1581, with the municipal archives, including documents dating back to the 13th century and an autograph ms. of the works of Hans Sachs, and the late Gothic *Gewandhaus* (cloth merchants' hall), built 1522–24 and now in part converted into a theatre. The manufactures of Zwickau include spinning and weaving, machinery, chemicals, porcelain, paper, glass, dyestuffs, wire goods, aluminum, lacquer. embroidery, stockings and curtains. The adjacent coalfield has only been actively worked since 1823, during which time the population has increased more than tenfold.

ZWINGLI, HULDREICH (1484–1531), Swiss reformer, was born on Jan. 1, 1484, at Wildhaus in the Toggenburg valley, St. Gall, Switzerland. He came of a free peasant stock, his father being *amtmann* of the village; his mother, Margaret Meili, was the sister of the abbot of Fischingen in Thurgau. His uncle, Bartholomew Zwingli, afterwards *dekan* or *superintendent* of Wesen, had been elected parish priest of Wildhaus. He went to school at Wesen, then at Basle, and finally at Berne, where his master, Heinrich Wolflin, inspired him with an enthusiasm for the classics. In 1500 he was sent to the university of Vienna to study philosophy. He then returned to Basle, where he graduated in the university and taught classics in the school of St. Martin's church. At twenty-two Zwingli was ordained by the bishop of Constance and elected parish priest of Glarus. The ten years which Zwingli spent at Glarus laid the foundations of his work as a reformer. He there began the study of Greek that he might "learn the teaching of Christ from the original sources," and gave some attention to Hebrew. He read also the older Church Fathers and his skill in

the classics led his friends to hail him as "the undoubted Cicero of our age." He entered into correspondence with Erasmus, and received a somewhat chilling patronage; whilst the brilliant humanist, Pico della Mirandola (1463–94), taught him to criticize Catholic doctrine. His first publications, which appeared as rhymed allegories, were political rather than religious; they were directed against the Swiss practice of hiring out mercenaries in the European wars. In 1521 he prevailed upon the authorities of the canton of Zurich to renounce the practice altogether. Especially did he oppose alliances with France; but the French party in Glarus was strong, and it retaliated so fiercely that in 1516 Zwingli was glad to accept the post of people's priest at Einsiedeln. He dated his arrival at evangelical truth from the three years (1516–19) which he spent in this place. There he studied the New Testament in the editions of Erasmus and began to found his preaching on "the Gospel," which he declared to be simple and easy to understand.

Reform Propaganda. — Zwingli began to preach "the Gospel" in 1516, but a contemporary says that he did it so cunningly *(listiglich)* that none could suspect his drift. He began his work without saying much about corruptions in the Roman Church, and it was his political denunciation of the fratricidal wars into which the pope, not less than others, was drawing his fellow-countrymen, that first led to rupture with the papal see. Three visits which he had paid to Italy as army chaplain opened his eyes to the worldly character of the papal rule, and he began to attack at Einsiedeln the superstitions which attended the great pilgrimages made to that place. Zwingli denounced the publication of plenary indulgence to all visitors to the shrine. When in August 1518 the Franciscan monk Bernardin Samson appeared in Switzerland with a commission to sell indulgences, Zwingli persuaded the council to forbid his entrance into Zurich.

Zwingli now became (1518) people's priest at the Great Minster of Ziirich. In the beginning of 1519 he began a series of discourses on St. Matthew's Gospel, the Acts of the Apostles, and the Pauline epistles; and with these it may be said that the Reformation was fairly begun in Zurich. His correspondence of this year shows him jealous of the growing influence of Luther. He claimed to have discovered the Gospel before ever Luther was heard of in Switzerland. Towards the end of September he fell ill with the plague; his illness sobered his spirit and brought into his message a deeper note than that merely moral and common-sense one with which, as a polite humanist, he had hitherto been content. He began to preach against fasting, saint worship and the celibacy of priests. People were found eating flesh in Lent, and the bishop of Constance accused them before the council of Zurich. Zwingli was heard in their defence and the accusation was abandoned. His first Reformation tract, April 1522, dealt with this subject: *Von Erkiesen und Fryheit der Spysen.* The matter of the celibacy of the clergy was more serious. Zwingli had joined in an address to the bishop of Constance calling on him no longer to endure the scandal of harlotry, but to allow the priests to marry wives, or, at least, to wink at their marriages. Pope Adrian VI. interfered and asked the Zurichers to abandon Zwingli, but the reformer persuaded the council to allow a public disputation (1523), when he produced sixty-seven theses and vindicated his position so strongly that the council decided to uphold their preacher and to separate the canton from the bishopric of Constance. Thus legal sanction was given in Zurich to the Reformation. In 1522 Zwingli produced his first considerable writing, the *Architeles,* "the beginning and the end," in which he sought by a single blow to win his spiritual freedom from the control of the bishops, and in a sermon of that year he contended that only the Holy Spirit is requisite to make the Word intelligible, and that there is no need of Church, council, or pope in the matter.

Victory of Reform. — There was a strong opposition to the Reformation, especially in the five Forest Cantons: Lucerne, Zug, Schwyz, Uri and Unterwalden; and the Zurichers felt it necessary to form a league in its defence. They were especially anxious to gain Berne, and Zwingli challenged the Romanists to a public disputation in that city. The pleadings began on Jan. 2, 1523 and lasted nineteen days. Zwingli and his companions undertook to defend the following propositions: —

(1) That the Holy Christian Church, of which Christ is the only Head, is born of the Word of God, abides therein, and does not listen to the voice of a stranger; (2) that this Church imposes no laws on the conscience of people without the sanction of the Word of God, and that the laws of the Church are binding only in so far as they agree with the Word; (3) that Christ alone is our righteousness and our salvation, and that to trust to any other merit or satisfaction is to deny Him; (4) that it cannot be proved from the Holy Scripture that the body and blood of Christ are corporeally present in the bread and in the wine of the Lord's Supper; (5) that the mass, in which Christ is offered to God the Father for the sins of the living and of the dead, is contrary to Scripture and a gross affrontto the sacrifice and death of the Saviour; (6) that we should not pray to dead mediators and intercessors, but to Jesus Christ alone; (7) that there is no trace of purgatory in Scripture; (8) that to set up pictures and to adore them is also contrary to Scripture, and that images and pictures ought to be destroyed where there is danger of giving them adoration; (9) that marriage is lawful to all, to the clergy as well as to the laity; (10) that shameful living is more disgraceful among the clergy than among the laity.

The result of the discussion was that Berne was won over to the side of the reformer. He had maintained that the congregation, and not the hierarchy, was the representative of the Church; and he sought to reorganize the Swiss constitution on the principles of representative democracy so as to reduce the disproportionate voting power of the Forest Cantons.

On April 2, 1524 the marriage of Zwingli with Anna Reinhard was publicly celebrated in the cathedral. In August of that year Zwingli printed a pamphlet in which he set forth his views of the Eucharist. They proved the occasion of a conflict with Luther which was never settled, but more attention was attracted by Zwingli's denunciation of the worship of images and of the Roman doctrine of the mass. These points were discussed at a fresh congress where about 900 persons were present, and where Vadian (Joachim von Watt, the reformer of St. Gall) presided. It was decided that images are forbidden by Scripture and that the mass is not a sacrifice. Images were removed from the churches, and many ceremonies and festivals were abolished. Zurich was threatened with exclusion from the union, and she began to make preparations for war.

Divergence from Luther. — At this point the controversy between Luther and Zwingli became more serious. In March 1525 Zwingli brought out his *Commentary on the True and False Religion.* He declined to accept Luther's teaching that Christ's words of institution required the belief that the real flesh and blood of Christ co-exist in and with the natural elements. He declared that Luther was in a fog, and that Christ had proclaimed that by faith alone could His presence be received in a feast which He designed to be commemorative and symbolical. The landgrave of Hesse brought the two Reformers together in vain at Marburg in October 1529, and the whole Protestant movement broke into two camps. At home the long-felt strain between opposing cantons led at last to civil war. In February 1531 Zwingli himself urged the Evangelical Swiss to attack the Five Cantons, and on Oct. 10 there was fought at Kappel a battle, disastrous to the Protestant cause and fatal to its leader. Zwingli, who as chaplain was carrying the banner, was struck to the ground, and was later despatched in cold blood. His corpse was quartered by the public hangman, and burnt with dung by the soldiers. A great boulder, roughly squared, standing a little way off the road, marks the place where Zwingli fell. It is inscribed, "'They may kill the body but not the soul': so spoke on this spot Ulrich Zwingli, who for truth and the freedom of the Christian Church died a hero's death, Oct. 11, 1531."

Zwingli's theological views are expressed succinctly in the sixty-seven theses published at Zurich in 1523, and at greater length in the *First Helvetic Confession.,* compiled in 1536 by a number of his disciples[1]. They contain the elements of Reformed as distinguished from Lutheran doctrine. As opposed to Luther, Zwingli insisted more firmly on the supreme authority of Scripture, and broke more thoroughly and radically with the mediaeval Church. Luther was content with changes in one or two fundamental doctrines; Zwingli aimed at a reformation of government

[1] P. Schaff, *Creeds of the Evangelical Protestant Churches,* p. 211

and discipline as well as of theology. Zwingli held that there should be no government in the Church separate from the civil government which ruled the commonwealth. All rules and regulations about the public worship, doctrines and discipline of the Church were made in Zwingli's time, and with his consent, by the council of Zurich, the supreme civil authority in the State. This was the ground of his quarrel with the Swiss Anabaptists, for the main idea in the minds of these greatly maligned men was the modern thought of a free Church in a free State. Like all the Reformers, he was strictly Augustinian in theology, but he dwelt chiefly on the positive side of predestination — the election to salvation — and he insisted upon the salvation of infants and of the pious heathen. His most distinctive doctrine is perhaps his theory of the sacrament, which involved him and his followers in a long and, on Luther's part, an acrimonious dispute. He held that the Eucharist was not the *repetition* of the sacrifice of Christ, but the faithful *remembrance* that that sacrifice had been made once for all. His theological opinions were set aside in Switzerland for the somewhat profounder views of Calvin. The publication of the Zurich Consensus (*Consensus Tigurinus*) in 1549 marks the adherence of the Swiss to Calvinist theology.

Zwingli's most important writings are—Von *Erkiesen und Fryheit der Spysen* (April 1522); Dp *Canone Missae Epichiresis* (September 1523); *Commentarius de Vera et Falsa Religione* (1525); *Vom Touf, vom Wiedertouf, und vom Kindertouf* (1525); *Ein klare Unterrichtung* vom *Nachtmal Christi* (1526); *De Providentia Dei* (1530); and *Christianae Fidei Expositio* (1531). For a full bibliography *see* **G.** Finsler, *Zwingli-Bibliographie* (Zurich, 1897).

Works.—Collected editions, 4 vols. (Ziirich, 1545, 1581); by M. Schuler and Joh. Schulthess, 8 vols. (Ziirich, 1828–42, with "supplementorum fasciculus," 1861); by E. Egli and G. Finsler in "Corpus Reformatorum" (Berlin, 1905 *sqq*).

Liver. — *0.* Myconius (1532); H. Bullinger's *Reformationsgeschichte* (ed. Hottinger and Voegli, 1838); J. M. Schuler (1818); R. Christoffel (1857, Eng. tr. by J. Cochran, Edinburgh, 1858); J. C. Mbrikofer, 2 vols. (Leipzig, 1867–69); R. Stahelin, 2 vols. (Basle, 1895–97); S. M. Jackson in *Heroes of the Reformation* (New York and London, 1901); Proi. Egli's articles in Hauck-Herzog's *Realencyklopadie für prot. Theologie u. Kirche*, and *Zwingliana*, published at Zurich.

S. M. Jackson's book gives a chapter on Zwingli's Theology by Prof. F. H. Foster, and also iull details of further information on the subject, together with a list of modern English translations of Zwingli's works.

ZWOLLE, the capital of the province of Overysel, Holland, on the Zwarte Water, and a junction station 24½ m. N.E. of Harderwyk. Pop. (1939), 42,136. It is the centre of the whole northern and eastern canal systems, and by means of the short canal, the Willemsvaart, which joins the Zwarte Water and the Ysel, has regular steamboat communication with Kampen and Amsterdam. Three miles from Zwolle, on the Agnietenberg, once stood the Augustinian convent in which Thomas à Kempis spent the greatest part of his life. Zwolle has a considerable trade by river, a large fish market and the most important cattle market in Holland after Rotterdam.

ZYGADENUS, a genus of plants of the lily family (Liliaceae, *q.v.*), containing about 12 species, all North American except one found in Siberia. They are smooth perennial herbs, springing mostly from coated bulbs, with erect stems, usually ½ ft. to 4 ft. high, very narrow leaves and conspicuous flowers in terminal clusters. Some 10 species occur in the United States and Canada. The smooth zygadene (*Z. elegans*), with greenish flowers, is found from New Brunswick to Alaska and southward to New Mexico. The poisonous zygadene or death camas (*Z. venenosus*) with yellow flowers, occurs in the north-western and Pacific States.

ZYGOTE, the biological term for the fertilized egg or ovum. (*See* FERTILIZATION; EMBRYOLOGY.)

WATER COLOURS BY WINSLOW HOMER

Top. "Tornado—Bahamas." Bottom. "Shooting the Rapids." Winslow Homer (1836–1910), an American artist well known as a painter of landscape and genre pictures in oil, was equally distinguished for his water colours, of which two are here reproduced. They are good examples of his sure, vigorous brush work, and the directness and economy of his method

couver, which became a port for ocean vessels.

In 1818 Great Britain and the United States reached an agreement whereby they were to hold the Oregon territory in "joint occupation" for ten years. This agreement was renewed again in 1827 for an indefinite term, with the proviso that it might be terminated by either party at 12 months' notice. By 1841 a considerable number of American settlers arrived in the region south of the Columbia, arid immigration over the Oregon trail was still greater in the pears immediately following. But north of the river the Hudson's Ray company discouraged American settlement, believing that the final decision of the Oregon controversy would make the Columbia river the boundary line between the two nations. Certainly north of the river the company seemed to have the prior claim. In 1832 they built Nisqually House on Puget sound. They had large farms near Nisqually and on Cowlitz Prairie. They raised cattle enough to supply their settlers and shipped butter, cheese and beef to Sitka and other places. At the same time there was not a successful American settlement north of the Columbia. Yet in 1846 Great Britain agreed to accept the 49th parallel as the boundary and Washington became part of the United States. The Hudson's Bay company were paid $650,000 for the developments they already had made in the territorq.

Having that a delegation of Indians from the Pacific Northwest had visited St. Louis in Sept. 1831 and had requested "black robes" and the "Book," the Methodists and the American Board sent missionaries to the region. Dr. Marcus Whitman in 1836 located his station at Waiilatpu, near the present town of Walla Walla. Two Catholic secular priests, Fathers Blanchet and Demers, came in 1838 in response to a call from the Canadian elements among the fur traders. To familiarize the Indians with the history of the church, a chart on a long board, the Catholic ladder, was devised. The immediate needs of the growing white population for spiritual ministrations and samaritan services compelled all the clergy, much against their wishes, to neglect the native. Out of this situation arose complications culminating in the Whitman massacre of Nov. 1847 which spelled disaster for all denominations.

Of their own initiative the Oregon settlers set up a provisional government in 1843 There were not many settlers north of the Columbia to participate in this legislation, but such as there were, were under this government until the United States congress passed the Oregon bill in 1848, providing for the usual territorial administration. Five years later (1853) the Oregon region was divided and Washington acquired its present name and a separate territorial organization. The boundary ran along the Columbia river to the 46th parallel and thence east to the crest of the Rocky mountains. Washington did not assume its present shape until the territory of Idaho was created in 1863. Isaac I. Stevens became the first governor. After his arrival he at once set to work to extinguish by purchase the Indian titles to land, and a series of treaties were held with all the tribes. Delay by the government in ratifying them and failure of goods promised therein to be delivered to the Indians merely added to the irritation caused by the whites' trespassing. Between 1855 and 1859 there were many complicated Indian campaigns and a number of sharp engagements which resulted in the partial subduing of the natives.

The first permanent American settlement was made at Turnwater on Puget sound in 1845. Two miles away a town named Smithfield was begun in 1847. Later the name was changed to Olympia, and the place became the capital of the territory and state. Ft. Steilacoom and Port Townsend were settled in 1850, Seattle in 1851, Bellingham and Tacoma in 1852. The Indian wars prevented settlement in eastern Washington until 1858 when a crowd of homeseekers and miners swarmed into the region, concentrating largely around Colville where the mines attracted attention. Gold discoveries on the Fraser river drew many farther east, and a settlement began to grow up around Ft. Walla Walla. After gold was discovered in the Clearwater region of Idaho (then still Washington territory), Walla Walla became the outfitting point, and the brisk trade soon developed a lively city. In 1872 the first settlement at Spokane Falls was made, the nucleus of the city of Spokane. Supplying the mines in British Columbia, Idaho, Montana, Oregon and California with grain, meat, lumber and other needed articles proved lucrative business for the territory. Rapid growth in wealth and population led to agitation for statehood, and a constitution was adopted in 1878, but congress declined to pass an enabling act. The completion of the Northern Pacific railway in 1883 brought another period of swift increase in population. Statehood was finally granted in 1889. Trade along the Pacific coast became active after the Kiondike gold discoveries of 1897. As outfitting and supply points the sound cities especially benefited from this activity, and at this time a period of bitter rivalry began between them for dominance in the trade of the sound. The Alaska-Yukon exposition was held at Seattle in 1909, and its success helped that city and benefited the state as well.

In politics Washington has been Republican in national elections except in 1896 when it was carried by a fusion of Democrats and Populists, in 1912 when it was carried by the Progressives for T. Roosevelt, and in 1916 for Wilson; also in 1932, 1936 and 1940 F. D. Roosevelt and the Democrats swept the state, in the latter elections with the New Deal as the issue. The Democrats also won control of the governorship and the U.S. senate seats in 1932 and 1936, but in 1940 a Republican governor was elected.

WASHINGTON, a city and the capital of the United States of America, coterminous with the District of Columbia, on the northeast bank of the Potomac river at the head of tide and navigation, 40 mi. S.W. of Baltimore, 135 mi. S.W. of Philadelphia. and 226 mi. S.W. of New York city. Land area, 61 sq.mi. Population in 1800, 14,093; in 1850, 51,687; in 1900, 278,718; in 1930, 486,869; and in 1940, 663,091. Of the 1940 population, 28.6% were nonwhite, mainly Negro. There were only 91.1 males per 100 females.

Climate.—The climate of Washington is characterized by frequent periods of high humidity, occasional periods of oppressive heat in summer and moderately mild winters. The mean winter temperature (December, January and February) is 35° F. and the mean summer temperature (June, July and August) 75°; the mean of the winter minima is 27°, and the mean of the summer maxima 84°.

Extremes range, however, from the absolute maximum of 106° to an absolute minimum of −15°. There is an average annual precipitation of 42.2 in., which is evenly distributed.

Communications.—Five railways enter the city: the Pennsylvania, the Baltimore and Ohio, the Southern, the Chesapeake and Ohio and the Richmond, Fredericksburg and Potomac Steamboats ply daily from the foot of Seventh street to Alexandria, Mt. Vernon, Old Point Comfort and Norfolk, and at Old Point Comfort there is a connection with boats sailing for New York city.

The street railways, with underground trolley in the urban district, are supplemented by buses. Army, naval and commercial airports provide for planes.

Industries.— The city's manufactures and commerce are of little importance. Only government manufactures and manufactures for local consumption are at all large.

Education.—Washington is one of the leading educational centres of the United States. It is here that the Army War college is situated. The public school system, under the control of a board of education appointed by the supreme court judges of the District of Columbia, embraces kindergartens, primary, grammar. junior high, high, a business high school, manual training, normal and night schools. The Army Medical school is situated here George Washington university, in the vicinity of the White House, is a nonsectarian institution (chartered by act of congress in 1821 as "The Columbian College in the District of Columbia";
