The firing interval in the case of an electric primer is determined by the following train of events:—(1) Brain impulse interval between the director layer or gunlayer seeing his sight alined with the target and deciding to fire, and his finger pressing the contact button. (2) Completion of the circuit by the physical movement of the contact button, push or switch. (3) Heating the bridge and burning the powder in the primer. (4) The passage of the tube flash along the vent of the breech screw. (5) Ignition of the primer on the end of charge. (6) Ignition of charge. (7) Time taken by the projectile in passing down the bore.

An efficient firing gear reduces the firing interval to a minimum and makes the prospect of firing as reliable as possible. The possibility, however, of a misfire is usually provided for by some alternative system. In some cases an alternative electrical circuit is fitted which is brought into operation by a switch, and in other cases percussion firing is resorted to by either exchanging the electric tube for a percussion one or by employing a tube which is capable of being fired electrically and by percussion. Electrical firing lends itself very readily to the introduction of safety arrangements, *e.g.*, the circuit can be broken by the recoiling action of the gun and only completed when the gun is out in the firing position. It can be also broken when the breech is not closed and only completed when it is fully closed.

It will be evident from the foregoing that the use of a heavy naval gun and the entire ship's battery entails great proficiency in drill, a complex organization and intelligent co-operation among personnel. The machinery and instruments concerned must be kept in a highly efficient condition to ensure that no link in the chain of operations fails. Alternative methods of loading and operating turret guns are provided in many cases, such as mechanical hand-loading or a secondary source of power in the event of the main system being put out of action. These add to the degree of training and skill required in the gun's crew. However great the power and mechanical perfection of the weapons, the spirit, resource, and efficiency of the man behind the gun will continue to be a matter of the highest importance. Other things being equal—the human element will decide the issue in a naval engagement. (J. G. M. McH.; W. R. V. A.)

**ORDOS:** *see* SHENSI.

**ORDOVICIAN SYSTEM,** in geology a term introduced by Lapworth in 1879 to include those rocks—well developed in the Welsh region formerly inhabited by the Ordovices—which had been classed by Murchison as Lower Silurian and by Sedgwick

as Upper Cambrian (*see* SILURIAN). In the early part of last century all the rocks which lie beneath the Carboniferous Limestone were grouped together under the general name of Transition Series and it was not till 1831 that Sedgwick and Murchison made the first serious attempt to reduce them to order. Sedgwick started work in the Snowdon district and Murchison began upon the Welsh borders. By 1835 they had advanced so far that Murchison gave the name of Silurian system to the group of rocks with which he was dealing, while Sedgwick called his group the Cambrian series. At that time it was supposed that the Cambrian lay entirely below the Silurian. Subsequently it was shown that the two formations overlap, the upper part of Sedgwick's Cambrian being the same as the lower part of Murchison's Silurian. A prolonged controversy followed which has left its effects in a confusion of nomenclature even to the present day. It has, however, long been recognised that the Cambrian and Silurian of Sedgwick and Murchison include three natural groups, and in 1879 Lapworth proposed that these groups should be called Cambrian, Ordovician, and Silurian. Murchison's terminology is still often used, especially in Germany, and the three groups are called the Cambrian, the Lower Silurian and the Upper Silurian.

Although under all the variations of terminology the three groups are now universally recognised there are still differences of usage with regard to their precise limits. Whereas in extra-British areas there is a general concurrence of opinion as to the horizon at which the base should be drawn (zone of *Dictyonema flabelliforme*), most British geologists still adhere to the older classification, based largely upon structural considerations, in which the base is taken above instead of below the Tremadoc. There is also some divergence of opinion as to the horizon at which the upper limit should be drawn, the fossil evidence suggesting that it should include beds up to the time of appearance of the true Pentamerids and Monograpti, though mainly on lithological grounds it is generally taken below this level.

The various strata composing the System may be divided into several contemporaneous facies or types of deposit, controlled by different physical conditions at the time of formation, and since these same physical conditions also govern the nature of the organisms living in different parts of the sea, each facies of deposit tends to have a distinctive set of fossils.

The three principal facies can be recognized:

1. Shallow water marine facies
   (a) grits, sandstones and shales indicative of heavy sedimentation; fossils mainly trilobites and brachiopods.
   (b) shelly limestones evidently laid down in clean water; fossils mainly brachiopods, cystids, ostracods, and bryozoa.
2. Deeper water marine facies
   (a) nodular limestones; fossils mainly cephalopods (*Orthoceras*).
   (b) black shales; fossils, blind trilobites or trilobites with over-developed eyes. Often occurring in association with
   (c) fine black shales; fossils mainly graptolites.
3. Volcanic facies especially characteristic of British Isles.

The natural relationships of these different types are indicated by their field relations, the shallow water facies of either type may have a considerable lateral extension running parallel with the old coast line, but in a direction approximately at right angles passes into one or other facies of the deeper-water type, the subdivisions of which are often intercalated into one another, though the type with the most widespread development is undoubtedly that of the Graptolite Shale. The graptolites do not really belong to the black shale since it is likely that they were planktonic or pseudo-planktonic, but since quietness of the waters and absence of coarse sediment are the determining factors governing the distribution of both, the two are almost invariably associated.

**Life.**—The life of the Ordovician period presents a distinct advance in type upon that of the preceding Cambrian; as a whole it may be said to be characterised by three main features: (*a*) Acme of development of the trilobites. (*b*) Rise and dominance of the articulate brachiopods over inarticulate types. (*c*) Incoming in force and great development of the graptolites. The fauna consists on the one hand of a trilobite-brachiopod fauna characteristic of the shallow water facies, and a graptolite fauna characteristic of the deeper water facies, and it is by means of these great groups of organisms that the rocks belonging to the System have been divided up into a series of life zones. The graptolites utilised as *zone fossils* differ in different parts of the world, but though the *Index Fossil* may be different, there is a very wide agreement in the *General Assemblage* found at the same horizon within the Graptolite Shales all over the world, and there is likewise the same change from the early many branched forms to those with fewer branches, and from the pendent to the scandent direction of growth. The cell form too changes in the same manner from the straight to the slightly sinuous, and eventually to the decidedly sinuous type. Hence *Clonograptus, Dichograptus, Tetragraptus* and *Didymograptus* are characteristic of the Lower Ordovician; *Nemagraptus, Dicellograptus* and *Climacograptus* characterise the Middle Ordovician, and *Dicellograptus, Dicranograptus, Climacograptus* and *Diplograptus* the Upper Ordovician. The articulate brachiopods include the various subgenera of *Orthis, Strophomena Leptaena,* and *Plectambonites,* and, more particularly towards the top, forms with a definite internal brachial apparatus such as *Atrypa* and *Zygospira* make their appearance.

The trilobites reach their zenith of development and exhibit great variety in form, but whilst *Ceratopyge* is found only at the base, and forms like *Chasmops* and *Phillipsinella* only in certain beds in the Upper Ordovician, many genera or families have a long range; *Ogygia* for example is characteristic of the Lower Ordovician when it occurs, but the nearly allied *Asaphus* is found at all horizons. The forms of commonest occurrence are *Asaphus, Ogygia Acaste, Calymene, Placoparia, Illaenus, Homolanotus, Remopleurides, Cheirurus, Lichas,* and *Phillipsinella;* there are also blind trilobites such as *Trinucleus* and *Ampyx,* both of which are common, as is also *Aeglina* with its over-developed eyes.

Various Orthoceratidae are abundantly represented in the Orthoceras Limestone of Scandinavia; taken as a whole however the mollusca (*q.v.*) play a far more important part in the fauna of America than they do in Europe, both gasteropods and lamellibranchs being abundant at certain horizons, whilst the bryozoa are also important in America, and probably on account of the physical conditions, are far more abundantly represented.

**Distribution.**—Ordovician rocks have an almost world-wide distribution since they have been recorded from both Arctic and Antarctic regions, Europe, North America, South America (Bolivia), Asia (China, Burma, northern Himalayas, Shan States), northern Africa and Australia. The classic areas of development however are those of Europe and North America, and the other areas may be regarded in terms of these. In Europe they may be considered as having been laid down in two main areas, a northern area and a southern area. The northern area of deposition comprised the British Isles, the greater part of Scandinavia and the Baltic Provinces; it consisted of two gulfs penetrating far into the north Atlantic continent, the outermost of which was probably a true geosyncline and the inner an epicontinental sea; these were partially separated by a long island or peninsula extending from Scandinavia to Britain. The southern area is considered to have lain to the south of a land mass extending through Central Europe and comprising southern France, Spain and Portugal, Thuringia, the Fichtelgebirge, Kellerwald and Bohemia.

The differences in the faunas of these two areas has been regarded as in large measure dependent upon the existence of the separating land barrier, but it is possible that these differences may be due in part to facies, and the possibility of the effect of migration and counter-migration along the shore line must not be overlooked. Towards the close of the period at any rate this difference in faunas disappeared, for a uniform type of fauna characterises all areas of deposition whether they belong to the shallow-water or deeper-water facies.

In America shallow water facies of varied type predominated all along the submerged margin of the Canadian shield (epicontinental sea), but in the east and west, definite geosynclines originated, known as the Cordilleran and Appalachian geosynclines respectively, and it is to these that the Graptolite Shale facies mainly belong.

*British Isles.*—The British Ordovician rocks have always been much folded since their formation. They were laid down originally within the geosyncline of the northern area of deposition, part of

the northern margin of which appears to have lain along the Highland border, whilst its southern shore-line ran obliquely through the Welsh borderland and thence south into Cornwall. Hence in the neighbourhood of the Highland border (Girvan) and the Welsh borderland there is an extensive development of the shallow-water facies, which traced south-east on the one hand and more generally west and north-west on the other, pass into deposits of the deeper water facies characterised by graptolites. These sediments are however interrupted at different horizons by volcanic rocks though the intensity and duration of vulcanicity varied in different places. It is the folding of the sediments and the occurrence of these volcanic rocks on a grand scale that is responsible for the rugged mountain scenery of both north Wales and the Lake District. There appear in general to have been two main volcanic episodes, an earlier one (Arenig) characteristic more particularly of the marginal areas, of the geosyncline, and a later one (Llandilo-Caradoc) belonging to its more central portions. The table shows the succession in the classic areas of development.

*European Continent.*—In Scandinavia the Ordovician rocks have escaped the severe tectonic disturbances that have so generally affected the rocks of this age in other regions. In Norway their main development occurs in the Christiania (Oslö) basin, but in Sweden the best sections are those seen in the many table-mountains that have been cut out by circumdenudation, where the rocks can be studied lying horizontally one above the other. The recognition of the different facies of deposition is here particularly important; the classic areas are those of Skåne, Öland, Östergotland, Västergotland and Dalarne, and in these the shallow water and deeper water facies show varying degrees of development. In Skåne is found the most complete development of the Graptolite Shale facies, but this is associated in places with some Trilobite Shales and some thin bands of Orthoceras Limestone. In Dalarne on the other hand the facies is largely shallow water throughout and almost entirely calcareous, a similar facies being found in Öland where however the succession is incomplete above the horizon of the Cystid Limestone, and Dictyograptus Shales largely replace the Ceratopyge Limestone; in Östergotland the Ceratopyge Limestone is again replaced by Dictyograptus Shales but the upper part of the succession is complete, and in Västergotland Graptolite Shales not only replace the Ceratopyge Limestone but also the lower part of the Orthoceras Limestone. Hence the general succession in the different areas may be regarded as dependent upon the degree to which the various limestones are replaced by Graptolite Shale.

In the Baltic Provinces the succession is mainly of shallow water type, and affords perhaps the best development of the rocks of that type recognized in Europe. The succession presents some striking analogies with that of the Scandinavian shallow-water development of which it is no doubt the counterpart on the southern shore line; hence the Vaginatenkalk and Echinosphaerite Kalk show many features in common with the Orthoceras Limestone and Cystid Limestone of the northern region. It does not appear possible however, to correlate exactly the beds that are said to overlie the Echinosphaerite Kalk, namely the Jewe Itfer, and Kuckers Schiefer, beyond the fact that they appear to belong to the Upper Ordovician.

At the base of the Ordovician succession in Bohemia, there is an unconformity of considerable importance so that the basal beds are naturally of a littoral character ($D_{1}\alpha$); above, Graptolite Shales of Arenig age occur, and the beds of Llanvirn age ($D_{1}\beta$) contain a mixed fauna of trilobites and graptolites; the remainder of the succession is formed of a richly fossiliferous shallow-water series of sandstones and shales representing everything up to the top of the Ashgillian.

*North America.*—In the geosynclinal areas of North America, both shallow water and deeper water facies of deposit are found and these are often highly disturbed by the movements in which they have been involved since their deposition; outside these geosynclinal areas the beds show very little signs of any disturbance, are thinner and consist very largely of calcareous beds with different varieties of shallow water faunas.

The Graptolite Shale facies is best known in the area belonging to the Appalachian geosyncline, but includes also beds now lying outside it in the St. Lawrence valley which have probably been brought by thrusting into their present position. The classic development of the Graptolite Shale facies of the Lower Ordovician is that known as the Levis Shales of the Quebec group seen on the south shore of the St. Lawrence immediately opposite Quebec; the remainder of the Graptolitic facies is best known from New York State where they form the Hudson river Shales of Albany. The shallow water facies is found extensively in the north in the Hudson bay region (Manitoba, Hudson bay and the Arctic archipelago), and in the south or Mississippean region along the margins of the Canadian shield in Michigan, Wisconsin and Minnesota, and on the domes of Cincinnati and Nashville.

*Australia.*—In Australia the same three facies of the Ordovician are characteristically developed. Beds belonging to the shallow water facies have only up to the present been definitely recorded along the east to west line in Northern Territory in the heart of the continent (Tempe Downs, and Levi Range, south of the MacDonnell Ranges) the dominant type, which is found mainly in the eastern half of the continent, belonging to the Graptolite Shale facies; these are best seen in Victoria where the Lower Ordovician rocks of this type have become well known through their occurrence in the most productive gold field; Upper Ordovician of similar type, though less auriferous, occur east of a line running north from Melbourne, and are also found in New South Wales. Volcanic rocks of the age have an extensive development in central New South Wales and in Tasmania (*see* AUSTRALIA). (G. L. E.)

**ORDU** (anc. *Cotyora,* where the "Ten Thousand" embarked for home), the chief town of a Turkish vilayet, on the north coast of Asia Minor, connected with Zara, and so with Sivas, by road, and with Istanbul and Trebizond by steamer. Filberts are exported. Pop. of vilayet (1935) 283,054.

**ORDUIN-NASHCHOKIN, ATHANASY LAVRENTEVICH** (?–1680), Russian statesman, was the son of a poor official at Pskov. He was the only Russian statesman of the day with sufficient foresight to grasp the importance to Russia of the Baltic seaboard.

Orduin abolished the onerous system of tolls on exports and imports, and established a combination of native merchants for promoting direct commercial relations between Sweden and Russia. He set on foot a postal system between Muscovy, Courland and Poland, and introduced gazettes and bills of exchange into Russia. With his name, too, is associated the building of the first Russian merchant-vessels on the Dvina and Volga.

*See* V. Ikonnikov, "Biography of Orduin-Nashchokin" (in *Russkaya Starina,* Nos. 11–12) (St. Petersburg, 1883).

**ÖREBRO,** a town of Sweden, capital of the district (*län*) of Örebro, lying on both banks of the Svartå a mile above its entrance into Lake Hjelmar, 135 mi. W. of Stockholm by rail. Pop. (1943), 56,135. Örebro was in existence in the 11th century. Its castle was erected by Birger Jarl in the 13th century, and twenty diets or important assemblies were held either in the castle or in the town. Such were the Örebro *concilium* of 1537, the diet of 1540 in which the crown was declared hereditary, and that of 1810 when Bernadotte was elected crown prince. In great part rebuilt since a fire in 1854, Örebro has a modern appearance. An ancient castle, however, with four round towers, still remains, and is used as a museum. There may be mentioned also the church of St. Nicholas, of the 13th century; and the King's House (*Kungsstuga*), an old and picturesque timber building. The patriot Engelbrecht (d. 1436) was born here. The Swedish reformers of the 16th century, Olaus and Laurentius Petri, are commemorated by an obelisk. Örebro is the centre of the Swedish shoe industry; trade is carried on, by way of the Örebro canal and lakes Hjelmar and Mälar, with Stockholm.

**ORE DEPOSITS.** The word "ore" is defined in the Oxford Dictionary as "a native mineral containing a precious or useful metal in such quantities and in such chemical combination as to make its extraction profitable," and this is the sense in which it is used in commerce and by miners, although the word is also applied to metalliferous minerals without the above-mentioned limitations. (*See* also PHYSICAL RESOURCES.)

Ore deposits are accumulations in Nature which have arisen by some form of concentration, either chemical or mechanical, or both. Prof. Kemp has made a useful comparison between the average percentages of the metals in the earth's crust and those necessary to constitute an ore suitable for profitable working. The two tabulations, slightly modified in the case of manganese and copper to conform with later improved practice, are here put side by side:—

| *Metals* | *Average percentage in Earth's crust* | *Percentage necessary for profitable working* |
|---|---|---|
| Aluminium | 8·13 | 30 |
| Iron | 4·71 | 35–65 |
| Manganese | 0·07 | 25–50 |
| Nickel | 0·01 | 2–5 |
| Tin | 0·000X–·0000X | 1·5–3 |
| Copper | 0·0000X | 1–10 |
| Lead | 0·0000X | 2–2·5 |
| Zinc | 0·0000X | 5–25 |
| Silver | 0·000000X | 0·03–0·16 |
| Gold | 0·0000000X | 0·003–0·00016 |
| Platinum | 0·00000000X | 0·00005 |

The letter X indicates some undetermined digit.

A comparison of the two tabulations gives an idea of the degree of concentration that has been instrumental in the formation of ore deposits from the materials of the earth's crust. Research has shown that it is to the igneous magmas that we must look for the original source of these concentrations of the metals. The agents by which the metallic components of the magmas are segregated, or extracted from the rocks to which the magmas consolidate, and finally concentrated, are numerous. In the case of the molten magmas it is by the process known as *differentiation,* or by the escape of gases and vapours carrying volatile metallic compounds to the adjacent rocks—a process which is known as *pneumatolysis.* From the consolidated igneous rocks extraction is effected by hydrothermal solutions, whether of deep-seated or of meteoric origin. Further concentration takes place (1) by oxidation, hydration and solution in the zone of weathering and re-precipitation in the zone of secondary enrichment; (2) by the mechanical agents of erosion and sedimentation, and (3) by chemical and bacterial agents leading to precipitation in seas, lakes and swamps.

It will be seen from these considerations that ore deposits can be divided into two great classes according as they are of *primary* or of *secondary* origin.

**The Primary Deposits** may be subdivided into:—

(*a*) Magmatic differentiations within the boundaries of the igneous mass;
(*b*) Deep-seated injections of materials extracted from the magma by differentiation;
(*c*) Infillings and replacements at moderate depths by magmatic waters or by meteoric waters heated by descent;
(*d*) Infillings and replacements near the surface by waters of meteoric origin.

**The Secondary Deposits** are:—

(*a*) Oxidation and reduction ores in the zones of weathering and secondary enrichment;
(*b*) Residual ores;
(*c*) Detrital ores;
(*d*) Precipitated ores.

The form assumed by ore deposits will be referred to later. As regards their mineral composition, it is necessary in the first place to distinguish between the *ore* and the *gangue,* the latter being the name given to the minerals that accompany the ore.

In the deep-lying parts of the deposit, or what is often called the *primary sulphide zone,* the ore-forming metals occur in combination with sulphur, tellurium, arsenic and antimony (as sulphides, tellurides, arsenides and antimonides of one or other of the metals—gold, silver, mercury, lead, vanadium, zinc, nickel, cobalt, etc.), or as silicates (of iron, manganese), or oxides (of iron, tin, chromium). Occurrence in the native state is in this zone confined to a few of the metals (gold, platinum, iridium, palladium, etc.).

In the upper portion of the lodes, in the *zone of oxidation,* the metals occur as carbonates, sulphates, phosphates, arseniates, antimoniates, chromates, silicates, chlorides, oxy-chlorides and hydrates. Where special conditions involving strong reduction prevail certain metals appear in the native state (copper, silver, mercury).

The commonest gangue minerals in the deeper parts of the lodes are quartz and the sulphides of iron (pyrites, marcasite, arsenopyrite). Nearer the surface the hydrated forms of silica (opal and chalcedony), the carbonates of iron, calcium, barium and magnesium (siderite, calcite, aragonite, witherite, dolomite) and the sulphates of calcium and barium (gypsum, anhydrite, barytes) are common.

Important deductions as to the origin of an ore deposit can be drawn from the nature of its mineral associates, always provided that care is taken to distinguish between the different epochs of mineralization, *i.e.,* to say whether the mineral in question belongs to the primary period of mineralization, or has been introduced at a later date from without, or derived from the original mineral by the chemical action of permeating solutions. Thus, for example, the presence of fluorine, boron and phosphorus-bearing minerals, such as fluorspar, apatite, tourmaline and axinite, indicates deposition at a temperature above the critical temperature of water, by the aid of the so-called "mineralizers." Heavy anhydrous silicates such as the pyroxenes, the hornblendes and the dark micas, also imply a deep-seated origin at high temperatures. On the other hand, the presence of hydrated minerals, such as chlorite, opal, chalcedony and members of the zeolite group, points to an origin near the surface at comparatively low temperatures. The association of minerals belonging to the same epoch of formation is connoted by the term *paragenesis.*

## MAGMATIC DIFFERENTIATIONS

Concentration by magmatic differentiation gives rise to ore-bodies associated mainly with plutonic rocks. These, because of the slowness with which they cool, offer the greatest facility for such concentration. A marginal segregation of the heavier minerals is brought about in the cooling magma either by fractional crystallization and gravitation of the crystals thus formed or by liquation, the latter process being a separation into two immiscible fluids, the heavier of which sinks to the bottom of the magma basin.

The density increases with the number of molecules of metallic oxides, such as those of iron, chromium, nickel, copper, calcium, magnesium. Hence these molecules will be more abundant in the lower than in the upper portion of a magma basin. In general, therefore, the net result is the formation of a basic peripheral zone and an acid (that is siliceous) central portion. As a rule the ores are concentrated in the peripheral portion, although exceptionally they occur in the heart of the igneous mass itself.

**Deep-seated Injections.**—The examples referred to in the preceding paragraphs are segregations within the igneous magma itself; but the majority of ores, although derived in the first instance from igneous magmas, are concentrated beyond the limits of the magma basins.

The formation of tin and copper deposits as the result of the consolidation of a granite magma is worthy of consideration in this connection. An undifferentiated granite magma may be considered as a solution containing, among other constituents, a certain amount of water and the chemically active elements boron, fluorine, chlorine, phosphorus, sulphur, tellurium, etc., which are spoken of as "mineralizers," since they possess the property of forming volatile compounds with the heavy metals. As the magma cools it separates into differentiates of varying composition; and consolidation of the different fractions takes place in the order of decreasing viscosity, the final residuum containing an excess of silica, a portion of the alkalies, practically all of the water and compounds of the metals, tin, tungsten, molybdenum, uranium, lead, copper, iron and many of the rarer metals.

In the early stages of consolidation cracks and fissures are formed in the cooling crust, into which the liquid residuum of the magma is injected. The earliest injections give rise to quartz-porphyries and felsites; later differentiates are pegmatites and aplites; while the most acid extract consolidates as almost pure quartz. While the temperature of the crust is still high and before

it has fallen below the critical temperature of the acid vapours, a proportion of the latter escapes into the surrounding rocks. These gaseous emanations deposit their mineral burden to a minor extent in fissures in the solidified crust of the igneous mass itself; but the main deposition is in the older rocks beyond, to which access is gained through bedding planes, joints, faults and crush-zones.

The tin-ore deposits contain the metal in the form of the oxide, $SnO_2$ (cassiterite) which is probably derived from the granite in the form of fluoride of tin—$SnF_4$—a volatile compound which, emitted at a high temperature, decomposes at a lower temperature in the presence of water vapour to a dioxide of tin, as shown by the following equation:

$$SnF_4 + 2H_2O = SnO_2 + 4HF$$

The deposits are characterized by the presence of the fluorine-bearing minerals—fluorspar (fluoride of calcium) and topaz (a fluoride and silicate of aluminium) and the boron-bearing minerals —tourmaline and axinite; whilst among metallic compounds are found wolfram (a tungstate of iron and manganese), ilmenite (a titanate of iron) and various sulphides and arsenides of copper, iron, lead and silver. Some of these compounds often constitute valuable ore-deposits of the respective metals. For instance, in Cornwall the upper portions of the lodes, to-day being mined exclusively for tin, carried copper in such quantities as to have made that county the world's chief producer of that metal in the early part of the 19th century. This depth-change in mineral content is a function of the temperature and pressure of the ascending mineral-bearing vapours and solutions and is sometimes referred to as the *zonary distribution* of ores. Experience has shown that the order of the zones of ore occurrence in the Cornish lodes from below upwards is tin, tungsten, copper, zinc, lead, silver, and this is the order of increasing solubility of the compounds of these metals in the ascending magmatic waters.

The highly-heated soluble constituents of the intrusions as they pass into the invaded formations profoundly modify their mineral composition. Among the sediments, the aluminous (shales and slates) and the calcareous (limestones) are the most subject to modification. The aluminous rocks develop tourmaline, sillimanite, staurolite, andalusite and topaz—all silicates of alumina, while the calcareous rocks yield garnet, axinite, wollastonite, diopside, scapolite, vesuvianite and epidote—all lime-bearing silicates.

In places these contact phenomena are accompanied by the development of ores, and thus give rise to an important class of ore-bodies generally described as *contact-deposits.* As a rule they are metasomatic replacements of limestone. Excellent examples are found in the so-called porphyry-copper deposits of the Western States of America (*e.g.,* in Arizona, New Mexico and Utah), where copper ores occur in limestone at its contact with intrusive monzonite and quartz-porphyry. The principal contact minerals are garnet (andradite) and epidote. The primary ores are cupriferous iron pyrites and zinc-blende to which must be added the high grade copper sulphides—chalcocite and bornite, in the zone of secondary enrichment. Near the surface, subsequent leaching by meteoric waters generally gives rise to a zone which may be barren, but in places contains oxides and carbonates of copper.

Equally important are the iron-ore deposits, which occur in limestone at its contact with igneous intrusions of an acid or intermediate type. Magnetite is the principal ore mineral, although haematite also occurs but in smaller quantity. Characteristic associates are the iron-garnet (andradite), the iron-pyroxene (hedenbergite), olivine and ilvaite. Deposits of this character are found in the Banat province of Hungary, on the island of Elba and in the Oslo district of Norway.

### HYDROTHERMAL DEPOSITS

The part played by water in the formation of ore deposits is of the first importance, for on account of its mobility and solvent action, which is enormously increased at high temperatures and pressures, it is the universal vehicle for the transference of mineral matter.

In the hydrothermal circulation the mineral-bearing solutions are in part directly connected with igneous magmas, namely in so far as they are formed by the cooling of aqueous vapours given off at a late stage in their consolidation. A considerable proportion, however, are no doubt surface waters (*i.e.,* meteoric in origin), which, descending along fractures, derive their thermal properties from the secular heat of the earth, or by coming in contact with, or into the near neighbourhood of, igneous intrusions.

Of the water that falls as rain one part is the *run-off,* that is to say, water that reaches the rivers without having penetrated the surface. A second part is returned into the atmosphere by *evaporation;* while a third part disappears into the soil and under-lying rocks by *percolation.* Under the influence of gravity the water of percolation penetrates into the earth's crust, first through the superficial weathered and disintegrated layers and then through the more solid rocks by way of the fractures of jointing and faulting, the planes of bedding or the pore-spaces between their constituent minerals.

It is a matter of common observation that at a variable depth below the surface, there is a connected body of water, which permanently fills all openings. The surface of this sea of water is called the *level of the ground-water,* the *permanent water level,* or the *water-table;* it is the upper level of the *belt of saturation.*

Above the permanent water level is the *zone of percolation* in which the openings in the rocks are only intermittently filled with water. This water is in active movement and air is present. The thickness of the zone of percolation varies greatly. At sea-level and at, or near, streams or lakes the level of the ground-water reaches the surface; in average areas it is from 10 to 1,000ft. below the surface; in high-lying districts with small rainfall it may be 100 to 300ft. below the surface, and in elevated desert regions as much as 1,000 to 2,000ft. below the surface.

The belt of saturation is divisible into two portions. The upper portion, or that part which has a means of horizontal escape and discharge, is the *zone of discharge.* In general, it lies between the water-table and sea-level. In it the circulation is vigorous, as is evidenced by the vast volume of water discharged by springs.

The bottom part of the belt of saturation is the *static zone.* In it the waters are practically stagnant, or at best move very slowly. Near the bottom limit of the static zone the water gradually diminishes until the *dry zone* is reached. The boundary between these two zones is quite irregular, descending to great depth along fractures and rising high in solid ground. The lower levels of most deep mines are in the dry zone, in some places reached at a depth of not more than 1,000 to 1,500ft. below the surface.

The waters circulating in the zone of percolation are cold, contain free oxygen and are acid with dissolved carbon dioxide. Such waters have been termed *vadose* (Lat. *vadosus,* shallow) by Pošepný. They have a strong oxidizing effect on sulphides, pyrites for instance being decomposed with formation of oxide of iron and sulphuric acid. The net effect of the vadose circulation, therefore, is destruction, and the zone of percolation is practically coincident with the *zone of weathering,* although the latter overlaps the upper portion of the zone of discharge.

In the zone of discharge the waters, as they descend, lose their oxygen and carbon dioxide and deposit material brought from the zone of weathering. When they have access to open channels they penetrate deeper and deeper, absorb heat and thus become powerful solvents of the metallic sulphides and tellurides.

Ultimately these heated waters, together with those of magmatic origin, ascend, and as they cool and mingle with the descending vadose waters deposit their mineral burden, either in the main channels of circulation, thus forming *ore-veins,* or in the pores of the rocks forming the so-called *cemented* ore-bodies.

As the openings become closed by cementation, however, the circulation becomes feeble and ultimately completely stops, although earth movements may refracture the rocks and inaugurate a new circulation. The vertical movement of the water is confined to the zone of fracture and cementation. Below this zone, the pressure is sufficiently great to produce a differential movement of the rock particles, and thus to close all openings by *rock-flow.* For free upward movement the ground must be fissured, fault-fractures, especially when brecciated, and shear-zones are preferentially used by the ground waters, and these, therefore,

frequently become the seat of the deposition of ores. The existence of impervious formations is an important factor in directing the general circulation of underground waters, and in the localization of ore deposits.

The deposition of minerals from solution is brought about in a variety of ways. Solutions which are unsaturated at depth become, as they ascend, saturated by decrease of temperature and pressure. Chemical reactions also come into play—for instance, between solutions of different origin, between solutions and solids and between gases and solutions. Under one or more of these conditions the metallic burden is precipitated, lining and ultimately filling the channels traversed by the solutions. But not only are open channels filled: the wall rocks of the fissures may be affected or the constituent minerals of the rocks attacked by the penetration of the circulating waters. Consequently, two distinct classes of hydatogenetic ore-bodies must be distinguished, namely *cavity-fillings* and *metasomatic replacements*.

Cavities in rocks are due to a variety of causes. The openings may be those of discission, *i.e.*, fractures of dislocation (faults), or contraction-joints; they may be the interstices of sediments or gas-pores in lavas; they may be due to the folding of sedimentary beds (saddle and trough openings); or they may be solution-cavities in limestone and dolomite, *i.e.*, caves, sink-holes and enlarged joints and bedding planes. The filling of fault-fissures, zones of brecciation, interstitial openings and the vesicular cavities of lavas, gives rise to important ore deposits.

Metasomatic replacement is responsible for the formation of perhaps the largest class of ore-bodies. By metasomatism is meant the replacement molecule by molecule of a constituent of a rock by new mineral matter. Such replacements can be effected not only by water below the critical temperature, as in the hydrothermal circulation, but also by gases, as in the case of pneumatolytic replacement.

Since different minerals are differently affected by solutions, rocks will be more or less completely replaced according as they are made up of aggregates of the same or of different minerals. Limestones and dolomites, which are composed almost entirely of either calcite or the mineral dolomite, are far more liable to extensive and complete replacement than any other type of rock. They lend themselves to replacement both by the facilities they offer for circulation and by the solubility of the carbonates of which they are composed.

Where rocks of differing susceptibility to replacement occur in alternate beds the more soluble will be preferentially replaced, thus giving rise to a bedded type of ore deposit. Impervious beds crossing the paths of vertical fissures retard or stop the flow of solution, with the result that the latter, by spreading out beneath or above the impervious layer, tends to form characteristic pear-shaped replacements. In cases where there is a rapid alternation of impervious and permeable layers, selective action leads to the formation of serrated or tooth-shaped ore-bodies.

In sandstones whose cement is calcareous, the replacement of the calcite by ores is common; but it is sometimes difficult to say whether the disseminated ore particles have been produced by replacement, or by the filling of inter-granular spaces. Disseminated ore-bodies may also be produced by the differential alteration of igneous rocks, since these are aggregates of minerals varying in susceptibility to alteration.

Among the best examples of metasomatic replacement are the lead and zinc deposits found in limestone. Sulphides of lead and zinc are soluble in alkaline sulphides without decomposition. In contact with limestone such solutions deposit these sulphides as galena and zinc blende. Two types are common, viz., *flats* and *pitches*. A flat is a replacement which has progressed outwards into the limestone from bedding planes. On the other hand, a pitch is a replacement which has been effected from joints in the limestone. The names refer to the horizontality, on the one hand, and to the steep dip, on the other, of the respective deposits.

### OXIDATION AND REDUCTION ORES

The free circulation in the zone of percolation of waters charged with oxygen and carbon dioxide makes it, in effect, one of oxidation, in which rocks and ore deposits become disintegrated and their component minerals decomposed with removal of the soluble constituents. The chief chemical processes involved are hydration, oxidation and carbonation. Silicates are broken down, the alkalies and alkaline earths being removed as soluble bi-carbonates, whilst silica is set free. Sulphides give place to soluble sulphates or to sulphuric acid.

The soluble compounds are carried down to the belt of saturation. A portion is lost in the waters escaping in the zone of discharge. The remainder is deposited as the descending acid waters become neutralized by the alkaline waters of the lower zone.

The changes produced in ore deposits by the process described above are most striking, and of the greatest economic importance. Those metals that form soluble compounds are removed from the zone of weathering, leaving in most cases an impoverished residual material. On the other hand, the precipitation of new metallic compounds or of the metals themselves at lower levels leads to enrichment at those levels. As a rule oxy-salts, halogen salts and native metals are precipitated above the water-table, while secondary sulphides are deposited below it.

The dictum of the mining camp that lodes become richer in depth, is therefore only true as regards their upper portions. In progressing from the outcrop downwards, a barren or lean portion of the lode is first passed through. As the water-table is approached, the metal content increases, attaining a maximum in a zone of secondary sulphides below it; the grade then falls until a minimum is reached in the unenriched zone of lean primary sulphides.

The *zone of secondary enrichment* is of prime importance for the mining of copper and silver, the bulk of these metals being won from it. Copper mines, rich in their upper levels, become poor in depth and ultimately unpayable when the lean primary ores are reached, unless the deposits are sufficiently large to be worked at a very low cost. The primary ore is almost invariably a cupriferous iron pyrites. On oxidation the copper goes into solution either as sulphate or as a bi-carbonate, and is removed, leaving behind the iron oxides. Consequently a prominent feature of copper lodes is the existence at or near the surface of a *gossan* or *iron-cap* (*chapeau de fer*), from which the valuable copper content has been removed. In wet climates the gossan consists almost entirely of hydrated oxides of iron. In drier climates, the anhydrous oxide (haematite) occurs; and in still drier climates (for instance the rainless regions of Arizona and Chile) gossans contain chlorides and sulphates of copper, which in wet climates are unable to exist in the solid state.

The copper minerals especially characteristic of the upper portion of the zone of secondary enrichment are the hydrated carbonates—malachite ($CuCo_3 \cdot Cu[OH]_2$) and ($2CuCO_3 \cdot Cu[OH]_2$), chessylite, the hydrated silicates—chrysocolla ($SiO_2 \cdot CuO \cdot 2H_2O$), and an oxy-chloride—atacamite ($CuCl_2 \cdot 3Cu[OH]_2$), together with native copper. Lower down, the sulphides—chalcocite ($Cu_2S$), bornite ($3Cu_2S \cdot Fe_2S_3$) and covellite ($CuS$), are found.

**Detrital Ores.**—The work of weathering is twofold; namely, mechanical disintegration and chemical change. Comparatively few minerals resist the attack of the chemical agents, but amongst them there are some that are of importance from the economic point of view—*e.g.*, gold, platinum, magnetite, ilmenite, cassiterite, wolfram, monazite, corundum, diamond, etc. The agents of mechanical disintegration are the diurnal and other variations of temperature, the expansion of water on freezing, the erosion due to running water, the sand-blast action of wind, etc. The detritus is carried down the slopes of the hills by running water and distributed according to specific gravity and size of grain.

The transported material accumulates in the valleys of rivers, in lakes or on sea beaches, and the resulting deposits are accordingly classed as alluvial, lacustrine and marine gravels ("placers"). A large proportion of the world's gold has in the past been won from them. On account of its high specific gravity the metal is concentrated in the coarse gravels and among the boulders at the bottom of the placers, the most valuable accumulations being often actually on the bed-rock itself. If the latter happens to con-

sist of steeply-dipping schists or slates, the upturned edges of the latter act as natural riffles, or bars, which catch and retain the gold particles. Accumulation also takes place on what are known as "false bottoms," which are beds of clay or sand cemented by iron ("pan") and alternate with the beds of gravel.

Placer gold is usually associated with a heavy black sand consisting of magnetite, ilmenite and haematite, together with chromite, garnet, zircon, spinel and other heavy resistant minerals; but obviously the particular association is determined by the nature of the parent rock. The character of the gold is variable: it occurs in flat scales and flakes, in rounded particles, and as irregularly-shaped grains and nuggets bearing evidence of much attrition. In size it varies from the finest dust to nuggets weighing thousands of ounces. It is probable that these large nuggets have increased in size since they were first deposited. The fact that auriferous pyrites are found replacing the woody fibre of tree stems in the alluvial drifts of Victoria and California shows that under favourable conditions an enrichment through chemical action (that is, solution and recrystallization) can take place.

The richest gravels are formed by a re-sorting of earlier auriferous gravels, terraces of the latter being often situated several hundred feet above the workable deposits.

Placers occur in the river systems of every part of the world; but the greatest amount of gold has been won from the Recent and Pleistocene gravels of California, Alaska, Australia and Siberia. The older gravels are often deeply buried under a thick cover ("over-burden") of clay, soil, peat and moss, which is sometimes permanently frozen, as in the tundras of Siberia and Alaska; while in Australia and California the ancient river systems are concealed by later flows of lava, their auriferous gravels being then known as "deep leads."

Auriferous beach deposits or marine placers are formed on certain coasts where the conditions are favourable for the separation, by surf action, of the gold and heavy minerals from the sand and lighter stones. Such deposits occur in New Zealand, on the beaches of Oregon, Alaska (Nome and Cape Yagtag), Chile, and Nova Scotia. Usually the gold occurs in a black sand consisting of magnetite, ilmenite and haematite; but these mineral associations are not constant: for instance, while in New Zealand the black sands are so rich in iron that it has been seriously proposed to work them for that metal, in the Cape Yagtag deposit the iron-ores are absent, their place being taken by garnet.

The auriferous conglomerates (locally termed "banket") of the Witwatersrand in the Transvaal, which have produced so large a proportion of the world's gold since their discovery in 1886, are considered by some to be ancient placers. Against this view, and in favour of a secondary origin for the gold, it might be urged that the latter shows no evidence of detrital origin, occurring, as it does, in crystalline particles and minute flakes in close association with pyrites. Moreover, the rest of the cement consists of crystalline quartz which has evidently been introduced, like the pyrites, subsequently to the deposition of the gravels. The only unmistakably primary constituents, besides the quartz pebbles, are diamonds, chromite and zircon, while the following minerals of secondary origin occur in the cement: quartz, chlorite, chloritoid, pyrites, marcasite, pyrrhotite, galena and blende.

If it be conceded that the gold, derived from the denudation of quartz veins in the schists and granite of the Primitive System, was deposited simultaneously with the quartz pebbles of the gravels, it must, on the other hand, be admitted that the original alluvial gold has been completely dissolved and re-precipitated.

Platinum is occasionally associated with gold in the residual and alluvial gravels of California, British Columbia, Brazil, Colombia and Borneo.

In districts where granite prevails the residual and river gravels often contain cassiterite, and such stanniferous gravels form the source of the bulk of the tin production of the world. They occur in Cornwall, the Malay States, Australia, Tasmania and in South Africa (Swaziland and the Transvaal).

### RESIDUAL ORES

The residual deposits always attain their greatest development in those countries that have been unsubmerged for a vast period of time; and where the weathered products have neither been pared off by glacial erosion, nor the solid rocks protected by superficial accumulations. Under especially favourable conditions of climate and topographic relief, disintegration, accompanied by the removal of soluble material, has progressed to many hundreds of feet below the surface, the whole of this zone consisting then of soft decomposition products that bear no likeness to their parent rock, although certain original structures, such as bedding and foliation, may be retained.

The materials composing the bulk of the residual deposits are gravel, quartz-sand and clay or lithomarge (an amorphous hydrated aluminium silicate, having the composition of kaolinite, viz.: $Al_2O_3 \cdot 2SiO_2 \cdot 2H_2O$ and more exceptionally the mixture of hydrated oxides known as *laterite*. This latter material occurs in tropical and semi-tropical countries like India, the Malay Peninsula, the Dutch East Indies, South America, and East, West and South Africa; in fact, it appears to be one of the commonest residual products of ferruginous and aluminous rocks under suitable climatic conditions.

A great number of analyses of laterite have clearly established the fact that it consists to a large extent of a mixture of oxides and hydrated oxides of iron, aluminium, titanium and manganese: they show also that the water is chiefly combined with the aluminium oxide, the iron oxide being mostly present in the anhydrous or slightly hydrated condition (haematite or turgite). The ratio between the iron oxides and the aluminium oxides may vary to any extent, so that, while some laterites approximate in composition to high-grade iron-ores, others are almost pure bauxite which is the chief source of the metal aluminium. When manganese is present, it usually occurs in nodular concretions of psilomelane, wad or pyrolusite, which are sometimes sufficiently abundant to constitute ores of manganese. Mixed with these oxides in varying proportion are a lithomargic clay and quartz sand.

There has been much discussion and considerable divergence of opinion as to the origin of laterite; but all are agreed that it may result from the decomposition of a great variety of rocks, whether of igneous, sedimentary or metamorphic origin. The generally accepted view is that laterite is a residual accumulation produced by the removal in solution of combined silica, lime, magnesia and the alkalies, assisted by metasomatic replacement with material brought from the underlying rock in periods of desiccation by capillarity, aided perhaps by the rootlets of forest trees.

Laterite, when exceptionally rich in iron, is of considerable economic importance. Such, for instance, are the iron ores of Cuba, which occur as residual mantles on the high-lying plateaux of Malaya and Moa. Similar deposits occur in the Philippines, in Borneo, and in West Africa. The iron ores of Bilbao in Northwest Spain are also in part residual deposits.

Workable manganese deposits are nearly always residual concentrations from manganese minerals sparsely distributed through igneous rocks and crystalline schists. Deposits of this character are widespread in India, United States, Brazil, West Coast of Africa and many other places.

The nickel deposits of New Caledonia are of residual origin, the nickel ores being hydrated silicates (garnierite and genthite) occurring as earthy and brecciated masses in a ferruginous and clayey mantle overlying serpentine and peridotite.

Residual gravels containing tinstone and wolfram occur on Bodmin Moor in Cornwall. Others containing galena have been profitably worked in North Wales and again others, containing zinc ores, have been exploited as a source of that metal in Galicia. They have originated by the weathering of veins in limestones, chemical action on the soluble limestone having outpaced the mechanical erosion of the resistant minerals of the veins.

**Precipitated Ores.**—Many deposits of iron ore owe their origin to the precipitation in seas, lakes and swamps of iron derived from the decay of rocks in the zone of weathering. Iron goes into solution in this zone either by the oxidation of the sulphides of that metal, or by the breaking up of ferro-magnesian silicates. Soluble iron compounds are also formed by the action of certain bacterial organisms present in the soil. Reduced by these organ-

isms to the ferrous state, the iron combines either with the organic acids of the humus, or with the carbonic acid of the atmosphere, to form a soluble bicarbonate.

On exposure to air, or in the presence of plant life, carbon dioxide is given off and iron carbonate is precipitated, as shown by the following reaction:

$$H_2Fe(CO_3)_2 = FeCO_3 + CO_2 + H_2O$$

The ferrous carbonate rapidly oxidizes to ferric hydrate, and is deposited as *bog-iron* or *iron-pan*. A continuous layer of this pan consequently tends to form below insufficiently drained clayey and peaty soils. The formation of ferric hydrate in stagnant swamp water, where ferrous carbonate is undergoing oxidation, may actually be seen in operation, the iridescent films that form on such water being an indication that the reaction is taking place.

When the waters deposit iron in the presence of much carbonic acid, or of decaying organic matter, siderite ($FeCO_3$) is deposited. In muddy waters the silt goes down with the iron carbonate leading to the formation of *clay-ironstone*. These clay-ironstones or spathic ores as they are also termed, occur in the coal measures of the British Isles and in those of Westphalia and North America, and are an important source of iron. Though the iron content does not on the average amount to much more than 30%, the comparative leanness of the ore is compensated by the low percentage of phosphoric acid, which seldom rises above one per cent. The *black-band* ores of the coal measures are a similar deposit, but differ from the bulk of the clay-ironstones by the high percentage of vegetable or peaty matter they contain; sufficient to furnish the fuel required to calcine them. Such ores represent what was once a carbonaceous mud in which ferrous carbonate was precipitated. The Scandinavian *lake-ores* are an interesting example of precipitated iron ores.

The Jurassic iron ores of England and the similar *minette* ores of Lorraine and Luxembourg on the Continent, which constitute the greatest reserves of iron ore in Europe, form well-defined beds in a sedimentary series of sandstones, shales and limestones. Although low in iron (25 to 40% metallic iron) in many cases their large lime content makes them largely self-fluxing, and having a high percentage of phosphorus they are admirably suited for the production of pig iron for the basic process of steel-making. Their oolitic structure (so named from the resemblance to fish roe) is produced by the deposition of carbonate of lime and carbonate of iron around sand grains or fragments of fossils. In the zone of weathering, the spathic ores are oxidized to limonite, a change in colour from green to red being characteristic. Some secondary enrichment also takes place under favourable conditions. These iron ores are worked in England on three horizons, namely the Inferior Oolite (*Dogger* or *Northampton stone*) the Middle Lias (*Marlstone*) and the Lower Lias (*Frodingham stone*).

The metal content of the copper-bearing sandstones so widely distributed throughout the world, owes its origin, partly to precipitation and metasomatic replacement, partly to sedimentation. The prevalence of these deposits in the red beds of the Upper Carboniferous, Permian and Trias formations indicates sedimentation in the shallow seas of desert regions where evaporation was rapid. The copper was no doubt leached out, from earlier copper deposits in continental areas, by meteoric waters rich in sodium chloride and calcium sulphate. Transported as sulphate or chloride it was precipitated in inland seas or lakes and reduced to chalcocite by decaying organic remains. The replacement of tree-trunks and other plant remains as well as of the cementing material of the sandstones by chalcocite is a feature of these deposits.

The accumulation of cupriferous detritus while sedimentation was in progress, was no doubt a factor of the concentration in some cases, but such material of the original deposit would, of course, be subsequently modified by the circulation of the ground waters. Associated minerals are calcite, gypsum and barytes. In the zone of weathering the copper ores are oxidized to the green and blue carbonates—malachite and azurite.

### THE FORM OF ORE DEPOSITS

Ore deposits occur in a multitude of different forms, but for convenience these may be reduced to two types—namely the tabular or *sheet-like* and the *non-tabular*.

*Tabular deposits* are either beds forming a part of the general stratification of the country, or veins or lodes that have been formed by the filling of fissures, or the replacement of their adjacent "country." As a rule, the veins cut across the stratification; more rarely they conform with the strike and dip of the formation in which they occur and are then termed *bedded veins*. Where a number of parallel fissures are irregularly connected the system is known as a *composite vein* or *lode*. The term *linked veins* is used in a similar sense. A system of closely spaced and parallel veins is spoken of as a *sheeted zone*. *Gash veins* are those that do not extend beyond a given bed of the formation in which they occur, usually limestone.

Although veins have been defined as tabular deposits, the parallelism of their bounding surfaces is only true in a very general sense, for unless they are fissure-fillings they have more often than not only one well-defined wall, and in some cases none at all. In mining, however, it is usual to speak of the hanging wall and the foot wall of a vein to distinguish the limits of the workable deposit whether they are well-defined or not.

Where the filling of the fissure has been followed by differential movement, one or both of the walls are usually smooth and polished (*slickensides* or *friction-planes*), and between the actual vein-filling and the wall of the country rock there is often a thin selvage of comminuted rock or clay known as *flucan*.

Where the fissuring was accompanied by dislocation, as is mostly the case, the veins have a lenticular character along both the strike and dip. This lenticular character is due to the differential movement of curved or warped surfaces. Between the lenses the fissure is often so constricted that no ore occurs at all. When the axes of the lenses lie in one plane the lenses are connected by stringers; when they lie *en échelon* they are usually disconnected.

Not every part of a vein is equally mineralized: the pay-ore tends to localization in certain definite portions of the vein separated by low-grade material or even by barren gangue. The richer portions are termed *ore-shoots*. If they have a tendency towards the horizontal, they are distinguished as *ore-courses* or *ore-horizons;* if, on the other hand, they tend towards the vertical, they are known as *columnar ore-shoots* or *chimneys*. But the term ore-shoot is not restricted to the occurrence of high-grade material in a low grade matrix; it is also applied to the development along a fissure of lenticular bodies of pay-ore, separated by barren country rock. It has been proposed to call this latter class of ore-shoot *shoots of occurrence,* and to use the term *shoots of variation* for the former. Shoots of variation are usually distinguished from shoots of occurrence by a gradual diminution of the values near the boundaries of the ore-shoot.

*Non-tabular deposits* vary greatly in shape and size. They may be large irregular masses or small pockets of solid ore, or they may be *stockworks, i.e.,* reticulated masses in which a multitude of small veins traverse a portion of the country rock. Of exceptional character are *chimneys* or *pipes,* which are ore-bodies having a rudely circular or elliptical cross-section with considerable vertical extent. *Saddle-reefs* are a special type of cavity-filling. Those of Bendigo in Victoria, Australia, have resulted from the folding of the Ordovician strata into a series of anticlines and synclines. The deposition of quartz in the openings formed at the crest of the anticline below a sandstone and above a shale bed has given rise to auriferous ore-bodies. Since the sandstone and shale beds alternate repeatedly the saddle-reefs occur, one above the other as disconnected ore-bodies, in what is known to the miners as the "centre country." Thus the New Chum and Victoria mine had 30 superimposed saddle-reefs, down to a depth of 2,300ft. The deepest mines are working at about 4,000ft.

(F. H. HA.)

**ORE DRESSING** is an important process in the field of mining (*q.v.*). It may be defined as mechanical concentration whereby valuable minerals in an ore are separated from worthless impurities or gangue and is distinguished from metallurgy which employs chemical methods for recovering metals and metallic compounds from rich ores or from the concentrated products of the ore dresser. Without this relatively cheap process of enrichment as compared to expensive metallurgical processes, the cost of common metals, such as lead, zinc and copper and many mineral products, would be far above present prices, and, as richer ore deposits continue to be exhausted, ore dressing will become of still greater importance. As an illustration of what ore dressing is doing for copper alone, the so-called porphyry-copper mills may be cited. In some of these mills 100 tons of ore assaying not over 1% copper will yield three tons of concentrates assaying 30% copper and 97 tons of waste tailings assaying about 0·1% copper. Thus the copper lost in the tailings is not over one-tenth of the total copper in the original ore and the expensive metallurgical process has to treat only three tons of concentrates as compared to 100 tons of original ore if concentration were not used. A single mill may treat as high as 20,000 tons of ore in 24 hours. Terms also used more or less as practically synonymous with ore dressing are milling, washing and concentration.

Ores in the majority of cases do not consist of a single mineral in a high degree of purity, but are a more or less complex mixture of different minerals, some valuable and some worthless. Native gold, tin, stone and many gems may occur mixed with gravel in placer deposits. Native copper is found sprinkled through rock masses. Diamonds are enclosed in a matrix of hard rock. Native gold is also found encased in quartz veins. The minerals of base metals, such as lead, zinc and copper, are commonly sulphides, oxides or other chemical compounds of these metals and occur distributed through solid rock or gangue in veins and other types of ore deposits. A given deposit may contain minerals of only one metal, or two or more metals may be represented and in the latter case the problem of the ore dresser becomes harder as he has not only to eliminate the waste gangue but also to separate the minerals of one metal from those of another. Beside minerals of the metals, there are many non-metallic minerals which likewise require elimination of gangue by concentration before these minerals become marketable. Among such minerals are mica, graphite, feldspar, asbestos, fluorspar, phosphate rock and the abrasive minerals garnet, emery and corundum. Even common sand and gravel may be washed to get rid of undesirable constituents and likewise clay to free it from grit and mica. The best examples of ores which do not require concentration are the iron ores of the Lake Superior region. Much of our bituminous coal is also sufficiently free from impurities to be marketed direct but even on iron and coal considerable washing is in use for lower grade deposits and this is bound to increase as the richer deposits are worked out. The subject will be considered in three divisions: (1) Properties of minerals which aid their separation; (2) Individual machines and unit operations; (3) Complete mill systems.

**Specific Gravity** has been the most important property in concentration. Valuable minerals are usually heavy and gangue minerals light, although there are exceptions. Thus the rate of settling in water or air or the tendency of a mass of grains to stratify when acted on by currents of water or air makes it possible to separate a lighter mineral from a heavier one. Size has to be considered also since a large grain will settle faster than a small grain of the same mineral and, consequently, large grains of light minerals are equal settling with small grains of heavy minerals. Separation based on specific gravity is commonly called gravity concentration. Colour, lustre and fracture are of aid when valuable minerals are being separated from waste by the process of sorting or picking by hand selection. These properties also enable the operator to make the proper line of division between the products coming off a concentrating machine. Fracture and cleavage will affect the form of the grains produced by crushing. Flat grains settle less readily than rounded or cubical grains. Hardness, toughness, friability and brittleness affect the power used in crushing ores. Decrepitation which causes some minerals to fly to fine pieces when heated enables such minerals to be separated, by subsequent screening, from other minerals which do not decrepitate and thus remain coarse.

*Magnetism* is a property possessed by certain minerals in a greater or less degree and electro-magnets of varying strength will separate such minerals from one another and from non-magnetic minerals. Some minerals, notably pyrite, are made magnetic by heating and become susceptible to magnets. Pyrite is also made porous by heating or roasting which changes its apparent specific gravity and may aid its separation. Electrostatic charges which are taken on quickly from an electrode by good conductors such as metals and sulphide minerals, except zinc sulphide, cause such minerals to be repelled more quickly from the electrode than gangue minerals and zinc sulphide which are poor conductors and receive the charge more slowly. Adhesion makes gold stick to a copper plate which has been amalgamated or coated with mercury and diamonds stick to a greased plate while associated waste minerals are washed down over the plate in both cases without adhering. The flotation property of minerals is a complex action not fully understood but it involves intermolecular forces of surface tension, adhesion and adsorption along with static electric charges and even chemical action. This process has developed rapidly in recent years and now vies with gravity concentration in importance and is therefore treated under a separate heading.

**Crushing.**—Unless an ore occurs as a placer or gravel deposit, it must first be crushed to free the valuable minerals from the attached gangue and the amount of crushing necessary will depend on the fineness of dissemination of the mineral. Furthermore, the final separation of the crushed material usually involves preliminary preparation by sizing or classification to yield a series of graded products going to different types of concentrating machines since no one machine can make a satisfactory separation when fed with a mixture of coarse and fine. When all the ore is reduced directly to a fine state, as for flotation, this preliminary grading is unnecessary.

Crushing customarily proceeds in steps and the best practice is to remove from the feed to any one crushing machine all particles which are already as fine as the product of that machine. Some machines, such as stamps, have a screen as an integral part of the machine to guarantee that the product shall all be below a specified maximum size while other machines, such as rolls and ball mills, require that a screen or classifier be connected in "closed circuit" with the crushing device to size out the finished product and return the coarse unfinished material for further reduction. Roughly, the field of coarse crushing involves the use of breakers of the Blake or gyratory type which receive lumps up to 5 or 6 ft. in diameter and reduce in a series of steps, with a reduction in size of about one-quarter at each step, down to a final product 1 or $1\frac{1}{2}$ in. in size. For intermediate crushing, there are rolls, steam stamps, Symons disc crushers, both horizontal and vertical and Symons cone crushers. Rolls handle feeds up to 1 or 2 in., make about one-fourth reduction in size and can crush economically down to $\frac{1}{8}$ or $\frac{1}{16}$ inch. Steam stamps, which are limited to use on the special problem of native copper ore, strike an extremely powerful blow by a steam-driven pestle in a mortar. The feed is 2 or 3 in. in size and the product $\frac{1}{4}$ or $\frac{1}{2}$ inch. The Symons machines are relatively new but are finding wide application in the field of crushing between 6 or 8 in. feed and around $\frac{1}{2}$ in. product. In the Symons cone, the central gyrating cone is very flat and is overlain instead of surrounded

by the fixed ring. The Symons disc crushers have a wobbling or tipping disc and a fixed disc. At a given instant, a point on the circumference of the wobbling disc is approaching the fixed disc while a point 180° away or diametrically opposite, is receding. This motion progresses around the circle so that in a complete wobble the space between the discs has opened and closed at every point. Many devices have been used for fine crushing or grinding but the more important are gravity stamps, roller mills, grinding pans, ball mills, rod mills, tube mills, Chile edgestone mills, arrastras and hinged hammer mills. The gravity stamp is discussed under AMALGAMATION: *In Metallurgy*. The grinding pan is a modification of the amalgamation pan which is also referred to under Amalgamation. The arrastra or drag-stone mill grinds the ore by dragging flat stones around a circular stone pavement. Roller mills employ cylinders which roll around inside a circular ring and ore is crushed between the rollers and the ring by pressure developed through centrifugal force or springs. Chile mills have heavy horizontal rollers travelling around a circular path. Hinged hammer mills and other forms of beating mills utilize the crushing effect of blows delivered upon the ore in space by arms or blades revolving at very high speed. Ball mills, rod mills and tube mills are horizontal revolving cylinders in which are iron balls, steel rods or flint pebbles to grind the ore as it passes through the cylinder from end to end. These revolving mills are used almost universally in ore dressing for wet fine grinding of ore for tabling and flotation, in gold and silver milling for preparing ore for cyaniding and in reducing all sorts of commercial products wet or dry, even down to impalpable powder. Feed may be as coarse as 1 or 2 in., but $\frac{1}{4}$ or $\frac{1}{2}$ in. is more economical. Hinged hammer mills are best suited to soft materials. Arrastras are nearly obsolete, as also are grinding pans. Roller mills and Chile mills are no longer used to any extent in ore dressing but find some application in commercial grinding. The use of gravity stamps is confined to gold milling. Fine grinding consumes much power since the power required increases in geometrical ratio with the fineness of the product.

**Screens.**—To insure a definite maximum size of particle in crushing operations and also to prepare the ore into a series of products for final separation, ranging from coarse to fine, screens are commonly used for wet work above 1 or 2 millimetres. They may be made of parallel bars or grates, of plate with holes punched out or of woven wire cloth. Common types have the form of fixed incline screens, of gently sloping revolving cylindrical screens or trommels, of plane surfaces set nearly horizontal and shaken endwise or sidewise, of horizontal or gently sloping plane surfaces in which the whole screen and frame is given a relatively slow bumping motion, of an inclined woven wire screen which is given a very rapid vibration in a direction perpendicular to the plane of the screen or of an endless travelling belt of woven wire cloth. Fixed inclined screens are used only for coarse work above 1 or 2 in. and belt screens only for fine work below 1 mm. while vibrating screens are the favourite screen for work between 1 mm. and $1\frac{1}{2}$ inches.

**Classifiers** are used for wet grading of material below 1 or 2 mm. which is the practical limit of wet screening. Hydraulic classifiers consist of a trough with a series of pockets. The ore, carried along by water, is successively subjected to a rising current of water in each pocket. The velocities of the currents decrease in succeeding pockets so that the material discharged from the spigots ranges from coarse heavy particles in the first pocket to fine light particles in the overflow of the last pocket. Box classifiers or spitzkasten use no rising currents but increase the size of successive settling chambers so that finer and finer particles settle out from the horizontal carrying current. Mechanical classifiers employ raking devices which stir up the pulp so that only coarser particles can settle and be raked up an incline and thus removed from the pulp which still contains the finer particles in suspension. Settling tanks and thickeners are large vats in which the water moves extremely slowly so that solids settle out almost completely and are discharged from the bottom while clear water overflows from the top.

**Hand Picking** is used occasionally to remove either rich material or waste material by hand from a stream of ore on a conveying belt or moving table. The economical minimum limit of hand picking is around 2 inches. Where hammers are used in connection with hand picking to cleave lumps of mixed values and waste, the operation is called cobbing.

**Log Washers and Wash Trommels** serve to disintegrate certain types of ores such as nodules of iron oxide in a clay matrix. They agitate the mass of ore and water, thus freeing the nodules from the clay and washing away the clay in the overflow at the lower end of the log washer or in the undersize of the trommel.

**Jigs** are the almost universal machines for separating ore in sizes ranging from $1\frac{1}{2}$ or 2 in. down to $\frac{1}{16}$ inch. In the movable-sieve type the ore on a screen is stratified by moving the screen up and down in water, while in the fixed-sieve or Harz jig a plunger on one side of the partition causes an alternate up and down current through the ore on a fixed sieve. Heavy minerals settle into the bottom layer of the bed, while lighter minerals are in the top layer. These heavy minerals, if fine enough, pass through the sieve into the hutch below and issue from the spigot outlet at the bottom. If too coarse to pass the sieve the concentrates layer is removed continuously by a device known as an automatic discharge. Fresh water is added continuously. A jig may be used singly, or with two to six cells in series.

**Jerking Tables: Wilfley Table.**—These tables take up the work where jigs leave off at about $\frac{1}{16}$ in. and may handle graded material down as fine as $\frac{1}{8}$ millimetre. The Wilfley table represents the original of this type of table and consists of a four-sided plane surface having a slight slope downward. A series of riffles or thin cleats are tacked on a smooth linoleum-topped table and each riffle has its maximum vertical thickness at the right and tapers down to nothing at the left. Ore and water are fed at one end of the upper edge, while wash water is fed along the remainder of the upper edge. A differential reciprocating action moves the ore lengthwise of the table toward the left while the washing action of the water across the table at right angles to the shake causes the ore to spread out in the form of a fan with concentrates nearest the upper or wash water side. The concentrates are finally shaken over the end, while the tailings are washed over the lower edge.

**Vanners and Slime Tables** which are suited for finer material ($\frac{1}{2}$ mm. maximum) are much less used since the development of the flotation process. The vanner feeds the ore and water on an endless rubber belt which is shaken crosswise while moving uphill. Wash water, together with the slope of the plane and the speed of the belt travel, determines the character of the grain that can pass over the upper roller and be washed off into the concentrates tank. All other grains of lighter waste mineral are washed down the plane and into the tailings. A revolving type of slime table consists of a flat cone. Ore and water are fed at the centre over one-half of the circle. Light minerals reach the circumference of the table first and are discharged as tailings. Middlings are carried around by the revolution of the table and are washed off by a curved water jet while concentrates are finally removed by strong jets of water from a straight pipe. Many other forms of vanners and fixed and moving slime tables and buddles have been used for concentrating fine slimes.

**Electro-magnets** are in use in most modern mills to remove metallic iron, such as bolts, nuts and broken drills, which has become mixed with the ore during mining. Magnetic separation is also applied where one of the minerals to be separated possesses magnetic properties. Magnets are of many types to operate on different sizes of ore, wet or dry, or to give high or low strength of field.

**Dry or Pneumatic Concentrating Devices** may be classifiers, jigs or tables. In every case the separation is by specific gravity, and air currents replace water currents as the separating medium. Flotation machines are described under FLOTATION. Other miscellaneous separators based on principles outside of specific gravity, magnetism and flotation, are not of sufficient importance to warrant any description here.

**Accessory Apparatus.**—In addition to the machinery for crushing, grading and concentrating, an ore dressing plant includes

other apparatus which is absolutely essential even though performing no actual separation. Under such apparatus may be listed storage bins for ore and products; sampling devices; automatic feeders and distributors or dividers; chutes and troughs or launders for dry and wet material; conveyors, of which the belt and pan types are most common; bucket elevators for dry ore or ore with water; centrifugal pumps for water mixed with sand or slime or for water alone; unwatering devices for recovering water; filters for fine concentrates; driers for removing moisture from ore or from concentrates; dust collecting systems; automatic weighing machines.

**Complete milling processes** are of wide variety according to the nature of the material to be concentrated. Perhaps the simplest process is the treatment of sands and gravels which contain valuable minerals such as gold, platinum and gems. A long trough or sluice is used on the bottom of which are small depressions called riffles in which the heavy values settle. The rough concentrates thus produced are removed or "cleaned up" periodically and are usually further enriched by some finishing treatment such as amalgamation, hand panning, tabling or magnetic separation.

Sulphide ores consisting of gangue mixed with sulphide of a single metal such as of iron as pyrite or of zinc as sphalerite or of lead as galena or of copper as chalcocite, bornite or chalcopyrite, may have the sulphides occurring as relatively large masses in the gangue, in which case the ore is crushed in a series of steps using breakers and rolls or Symons crushers until the sulphide grains are largely freed from the adhering gangue. This size may vary from 1 in. down to 1 mm. according to the ore. The crushed material is next graded by screens and classifiers into one or more coarse sizes for jigs, one or more sand sizes for tables and slimes for flotation. The jigs, tables and flotation each make clean concentrates to be saved and waste tailings to be discarded and usually also a middling product which, if coarse, must be recrushed and retreated or, if fine, needs only retreatment without any crushing. If the sulphides are finely disseminated through the gangue, the ore is crushed down to $\frac{1}{4}$ mm. or finer, using ball mills or rod mills as the last step in crushing and all of it treated by flotation. Occasionally the metals occur, not as sulphides, but as oxides, carbonates or silicates but the process is similar to that for sulphides, except that special flotation reagents are required for these minerals.

Where ores are complex, that is, containing sulphides of two or more metals, the tendency of modern practice is to discard gravity concentration and separate the different metallic sulphides from one another and from the gangue by differential flotation.

Tin ore in Cornwall contains cassiterite associated with sulphides of other metals, with wolfram and with siliceous gangues. The ore is broken to about 3 in. and hand picked to remove any lumps of clean minerals and the residue is crushed in gravity stamps to about $\frac{1}{2}$ mm. and concentrated by gravity by a rather complex system of jerking tables, vanners and slime tables of various kinds. Wolfram may be removed from the final concentrates by magnets. Sulphides may be separated from cassiterite by flotation as is the common practice on tin ores in Bolivia.

Native copper ores at Lake Superior are crushed in breakers to about 3 in., further reduced in steam stamps to about $\frac{3}{8}$ in. and then graded by hydraulic classifiers into a series of products, usually six. The coarser products are jigged and the finer products are tabled. Coarse middlings are reground in ball mills and retabled. Flotation may be used for slimes.

Iron is a relatively cheap metal so the concentration of iron ores must be on a large scale and at low cost. If the mineral is magnetite, the process is to crush the ore in breakers and rolls sufficiently to free the mineral and then use low power electromagnets, either wet or dry, to take out the magnetite. On hematite and limonite ores, the concentration of the crushed ore is usually by log washers or similar devices, but sometimes by jigs and tables. Slimes are usually thrown away without any attempt to recover the iron in them.

Manganese ores containing pyrolusite as the valuable mineral are handled in much the same way as hematite iron ores. For the special problem of the franklinite ores at Franklin, N.J., the ore, after crushing and sizing is run dry over high power Wetherill magnets which take out the franklinite and send the residue to wet jigs and tables which separate oxide and silicate zinc minerals from the waste limestone tailings. The treatment of gold ores is covered elsewhere under AMALGAMATION and CYANIDE PROCESS.

Many non-metallic minerals require concentration which may involve special processes. Serpentine rock containing asbestos is first cobbed and hand picked for coarse masses of solid asbestos. The residue is disintegrated by a form of hammer mill which reduces the rock to sand and liberates the fibre as a fluffy mass which when sent to a screen remains on the screen as oversize, while the sand passes through as undersize. Diamondiferous rock in South Africa is crushed in breakers and rolls, agitated with water in large circular pans to remove light fine waste material and leave a concentrated residue to go to jigs. The diamonds are recovered from the jig concentrates by hand picking on the coarse, and greased tables on the fine.

Phosphate deposits in hard rock use crushers and log washers or in soft rock or pebble form only log washers. Graphite ores employ crushing and flotation with special electrostatic process for removing mica from the concentrates. Ores of corundum, emery, ilmenite and such like, generally require a combination of gravity treatment on tables followed by further cleaning on magnets.

Coal preparation is a form of ore dressing which is based on the same fundamental principles as ore dressing, but which employs some additional processes and apparatus to meet the needs of the special problem of saving the light weight coal from the heavier slate impurity on a large scale at a low cost and with a minimum loss of coal. (C. E. L.; X.)

**OREGON,** popularly known as the "Beaver State," is one of the north-western States of the United States of America, lying on the Pacific slope between 42° and 46° 18′ N. lat., and 116° 33′ and 124° 32′ W. longitude. It is bounded on the north by Washington, from which it is separated in part by the Columbia river and in part by the 46th parallel, on the east by Idaho, from which it is separated in part by the Snake river, on the south by Nevada and California and on the west by the Pacific ocean, upon which it has a tidal shore line, omitting islands, of 429 miles. It has an extreme length E. and W. of 375m., and extreme width N. and S. of 290 mi. and a total area of 96,981 sq.mi., of which 631 sq.mi. are inland water surface. Spanish, French and Indian sources for the name "Oregon" have been suggested but its definite origin is unknown. The first known use of the word is by Major Robert Rogers in his plans for an exploring expedition to the northwest coast in 1767. He applied it to a river flowing into the Pacific ocean of which he had heard, and it was later applied to the Columbia river and then to the entire territory drained by the river. Out of this original territory other states were created until only the present area was left to bear the name.

**Physical Features.**—The coast of the state extends in a general north and south direction for about 300 mi. and consists of long stretches of sandy beach broken occasionally by lateral spurs of the Coast range, forming small bays. Parallel with the coast and with its main axis about 20 mi. inland is an irregular chain of hills known as the Coast range. It does not attain a height greater than 4,097 ft., but has numerous lateral spurs, especially toward the west.

Several small streams, among them the Nehalem, Coquille, Rogue and Umpqua rivers, cut their way through the Coast range to reach the ocean. For the northern two-thirds of its length in Oregon, the Coast range is bordered on the east by the Willamette valley, a region about 200 mi. long and about 30 mi. wide, and the most thickly populated portion of the state; there, therefore, the range is easily defined, but in the south, near the Rogue river, it merges apparently with the Cascade and the Sierra Nevada mountains in a large complex group designated as the Klamath mountains, lying partly in Oregon and partly in California, and extending from the northern extremity of the Sierra Nevada to the sea. A number of ridges and peaks bearing special names, such as the Rogue river, Umpqua and Siskiyou mountains, belong to this group. The Cascade mountains, the most important range in Oregon, extend parallel with the coast

and lie about 100m. inland. The peaks of this system are much higher than those of the Coast Range, the highest of them being cones of extinct volcanoes. Mt. Hood (11,225ft.), the highest point in the State, Mt. Jefferson (10,495ft.), the Three Sister Peaks, Mt. Adams, Bachelor mountain and Diamond Peak, all have one or more glaciers on their sides.

The Cascade mountains divide the State topographically into two sharply contrasted parts. West of this range the country exhibits a great variety of surface structure, and is humid and densely wooded; east of the range it consists of a broken tableland, arid or semi-arid, with a general elevation reaching 5,000 feet. This eastern tableland, though really very rugged and mountainous, has few striking topographic features when compared with the more broken area to the west. In the north-eastern part of this eastern plateau lie the Blue mountains, which have an average elevation of about 6,000ft. and decline gradually toward the north. A south-western spur, about 100m. in length, and the principal ridge together enclose on several sides a wide valley drained by the tributaries of the John Day river. Draining the eastern slopes of the Cascade Range for the northern two-thirds of its length and flowing into the Columbia a few miles west of the mouth of the John Day river is the Deschutes river, flowing through a valley less arid than the plateau region to the south-eastward. South-east of the Deschutes river and south of the Blue mountains lies the Great Basin region. In Oregon this area extends from the Nevada boundary northward for about 160m. and embraces an area of about 16,000 sq. miles. All of its streams lose their waters by seepage or evaporation. Many of the mountains within the basin region consist of great faulted crust blocks, with a general north and south trend. One face of these mountains is usually in the form of a steep palisade, while the other has a very gradual slope. Between these ridges lie almost level valleys, whose floors consist partly of lava, partly of volcanic fragmental material, partly of detritus from the bordering mountains.

Some large permanent lakes occupy the troughs between faulted blocks in southern Oregon, among them Malheur and Harney lakes in Harney county, Lake Albert, Warner and Summer lakes in Lake county. All of these are salt and shallow, and shrink to small proportions in the dry season. East of the Steens mountains there is, besides a number of small alkaline lakes, a playa, or mud flat, known as the Alvord Desert, which in the spring is covered with 50 to 60 sq.m. of rain water but a foot or two in depth. In the north-western quarter of the basin, occupying a level tract 150m. long and 30–50m. wide, is the Great Sandy desert. Its surface consists of a thick sheet of pumiceous sand and dust, from which arise occasional buttes and mesas. There are no surface streams even in the wet region, and no potable waters have been found. South-west of the basin and draining the southern third of the eastern Cascade slopes is the Klamath valley and river, containing the Upper and Lower Klamath lakes, much noted for their scenic beauty. Near the north-western boundary of Klamath county is Crater lake, whose surface is 6,239ft. above the sea. This lake lies in a great pit or caldera created by the wrecking in prehistoric times of the volcano Mt. Mazama, which according to geologists once had an altitude of about 14,000ft. above the sea and of 8,000ft. above the surrounding tableland; the upper portion of the mountain fell inward, possibly owing to the withdrawal of interior lava, and left a crater-like rim, or caldera, rising 2,000ft. above the surrounding country. The lake is 4m. wide and 6m. long, has a depth in some places of nearly 2,000ft. and is surrounded by walls of rock from 500 to 2,000ft. high. In spite of its great elevation the lake has never been known to freeze, and though it has no visible outlet its waters are fresh.

East of the Great Basin and the Blue mountains is the region tributary to the Snake river. The southern half, drained by the Owyhee river, is much like the Great Basin, being arid and plain-like in character. North of the Owyhee the chief tributaries of the Snake are the Malheur, Burnt, Powder and Grande Ronde rivers flowing through small but beautiful and fertile valleys.

**Climate.**—Along the coast the climate is humid, mild and uniform; in the eastern two-thirds of the State, from which the moisture-laden winds are excluded by the high Cascade Range, the climate is dry and marked by great daily and annual ranges of temperature. Along the coast the temperature is never as high as 100° or as low as zero. In the Willamette valley a few degrees may be added to each extreme, but rarely is there freezing weather; flowers bloom at Portland the year round. Along the coast precipitation is 138in. annually; in the valleys east of the Coast Range it varies from about 20in. at the southern end to 45 in. at Portland; along the Columbia valley east of the Cascades, from 10 to 15in.; in the valleys and foothills of the Blue mountains, from 12 to 25in., and, in the plateau region of central and southeastern Oregon, from 2 to 22 inches. At Portland the normal temperature for the summer months is 64° and for the winter months 40°, and the average temperature has varied between 51° and 53°, with extremes of −2° and 102°; average annual rainfall 45·1 in.; and average annual humidity 74%. In the Columbia river valley east of the Cascades, records for the same period at Walla Walla, Wash., very near the Oregon boundary, show a summer normal of 72° and a winter normal of 35°, with extremes of −17° and 113°; average annual rainfall 17·7 in.

**Government.**—Oregon is governed under its original constitution adopted in 1857, though many amendments have changed it in a number of important respects. This constitution may be amended: (1) by a majority of the popular vote if the amendment has been passed by a majority vote of the legislature, (2) by direct initiative petition by the people or (3) by a constitutional convention, which may not be called, however, unless the law providing for it is approved by popular vote. The legislative power is vested in a legislative assembly of two houses, but limited by the direct action of the people who possess the initiative and referendum. The upper house is composed of 30 senators, and the lower house of 60 representatives (the maximum allowed under the state constitution is 30 and 60 respectively), elected for four and two years respectively. The regular session is held in January of odd-numbered years. A bill not vetoed by the governor in five days becomes a law; if vetoed, it must be repassed by a two-thirds vote in each house. The governor has a "single item veto" in addition to the general veto.

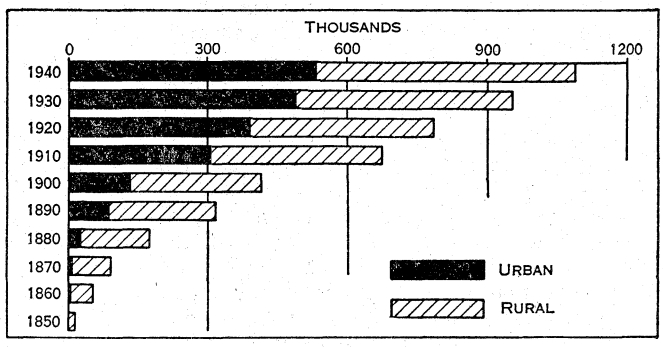
An amendment to the constitution, passed in 1902, initiated measures which have become widely known as the "Oregon system." Its distinctive features are: (1) the initiative, (2) the referendum, (3) constitutional amendment by direct action of the voters, (4) direct primary, (5) Corrupt Practices act, (6) presidential preference primary, (7) campaign textbooks, (8) the recall. For the initiative 8% of the number voting for justice of the supreme court at the last general election must sign petitions on which the proposed law is printed before it is put upon the ballot at the next election. Five per cent of the voters signing such petitions procure a referendum on any law passed by the legislature, and the legislature may itself refer any law it has approved to the people at the next election for their approval. All public officials are subject to the recall, adopted in 1908. It is rarely put into practice. An important and useful feature of the "Oregon system" is the campaign text-book. In the case of individual candidates the expense is borne partly by the candidates themselves.

The executive power in Oregon is vested in a governor elected for a four-year term. There is no lieutenant governor. The principal administrative officials of the State, all elected, are the secretary of State, treasurer, attorney general, superintendent of public instruction, dairy and food commissioner, and labour commissioner. A greater number of other administrative officers are appointed by the governor, among them the adjutant general, the State forester, State game warden, State health officer, State librarian, three State highway commissioners and three public service commissioners. A large number of State boards and commissions whose members are appointed are also necessary for the administration of Government, among them the board of control, land board, tax commission, board of education, public service commission, industrial accident commission, water board, parole board, board of health, industrial welfare commission and the Oregon State library.

The administration of justice is entrusted to a supreme court, circuit courts, county courts and justices of the peace. There are

also municipal courts in the cities and several special courts in Multnomah county. There are seven supreme court justices elected for a term of six years. The sessions of the court are held both at Salem and Pendleton. Circuit courts are held in 17 judicial districts, many districts having several justices. The constitution of Oregon provides that in civil cases three-fourths of a jury may render a verdict. The county court is an administrative, not judicial body, consisting of the county judge and two commissioners. The county judge, however, handles probate and juvenile court matters, in addition to his administrative duties.

**Population.**—The population of Oregon in 1850 was 13,294; in 1870 it was 90,923; in 1890, 317,704; in 1910, 672,765; and in 1940, 1,089,684. This last figure represents an increase of 14·2% over the population in 1930. The population per square mile was



BY COURTESY OF THE U.S. BUREAU OF THE CENSUS

URBAN AND RURAL POPULATION OF OREGON, 1850–1940

11·3, as compared with 44·2 for the United States as a whole. Of the 1940 population, 531,675, or 48·8%, lived in urban places, that is, in cities of 2,500 or more. The rural population, occupying the remainder of the state, thus constituted 51·2% of the total. The number of occupied dwelling units returned in the housing census of 1940 was 337,731, which is approximately the same as the number of families. The average population per family (occupied dwelling unit) declined from 3·6 in 1930 to 3·2 in 1940. The white population of Oregon formed 98·7% of the total in 1940, as compared with 98·4% in 1930, practically all the nonwhite population being Indian, Chinese and Japanese. The number of males per 100 females in the entire population of the state was 108·0, though there was a slight excess of females in the urban population, the sex ratio being 97·9 for the urban and 118·7 for the rural population. The population of the state and of its principal cities is summarized below:

| Area | Population | | | Percent of increase | |
|---|---|---|---|---|---|

**Finance.**—The value of all tangible property in Oregon was estimated in 1929 at $3,844,000,000 and in 1939 at $3,004,541,216. The assessed valuation of taxable property was $924,071,621 in 1935 and $896,787,005 in 1940. Receipts of the state treasury for the fiscal year 1940 were $93,920,075, and expenditures were $93,063,251. Of this the general fund received $47,474,913 and disbursed $48,636,877 during the year 1940, the World War veterans' aid fund disbursing $2,692,638. The cash on hand on June 30, 1940, the end of the fiscal year, amounted to $451,280. The state general fund revenue is derived largely from a direct property tax, also from fees, licences and special taxes. The direct property tax for the state general fund amounted to $2,667,997 in 1935 and $2,613,941 in 1936.

Oregon was the first state to levy a tax on gasoline as a means of financing highway construction and maintenance. Fees of the motor vehicle department amounted to $6,341,285 and were also used for highway purposes. The total revenue of the state in 1931 secured by direct and indirect taxation amounted to $30.85 per capita. The total revenue from taxation in 1938 was $64,199,721.

The total indebtedness of the state in 1939 was $40,425,660 of which the chief items were $17,841,750 for highway bonds and $20,375,000 for state veterans' aid. Provisions were made for the retirement of all these bonds as they came due. County indebtedness in 1940 amounted to $27,499,741, school districts indebtedness to $13,366,306, and city and town indebtedness to $47,479,174. In 1939 there were 75 banks in the state, 27 of them national banks, with total resources of $328,800,000. Their total deposits June 30, 1939, were $300,400,000, of which $122,700,000 were in savings accounts.

**Education.**—The school system of Oregon is under the control of a state board of education composed of the governor, secretary of state and the superintendent of public instruction. The progress of education in the state is represented in the following figures: the school enrolment of 175,510 in 1924 increased to 201,556 in 1934 and 205,928 in 1940. High school enrolment increased from 47,687 to 55,419 and 63,057 for the same years. The total cost of education increased from $19,119,271 in 1924 to $19,573,000 in 1930 and was $18,581,000 in 1940.

The number of teachers increased from 6,208 in 1930 to 8,057 in 1940. Of the 193,861 pupils for the year 1938, 133,374 were in grade schools and 60,487 in high schools. There were 10,040 enrolled in the private and parochial schools, of whom 2,481 were in high schools. There were 7,225 public-school teachers whose average salary was $1,286.

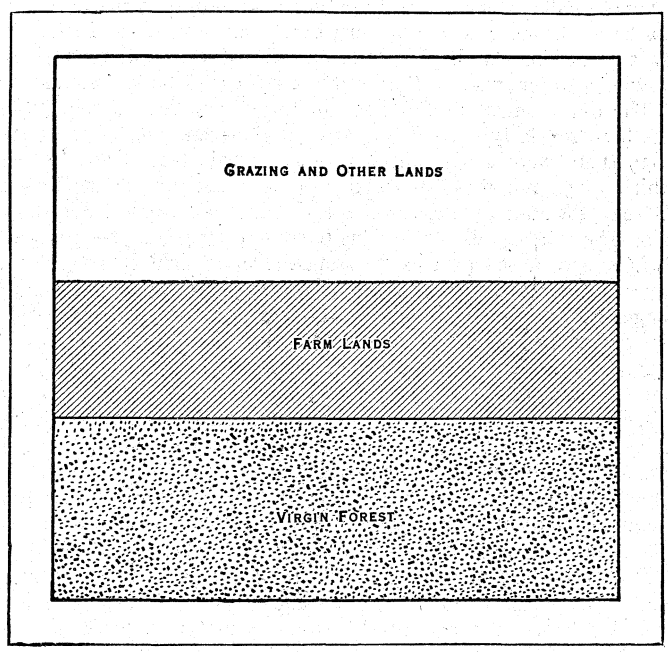
State institutions of higher learning are the state normal school at Monmouth, the Southern Oregon State Normal school at Ashland, Eastern Oregon College of Education, a normal school at La Grande, which opened its doors in 1929, after it was authorized by a vote of the people in 1926 (its enrolment in 1940–41 was 344); the Oregon State Agricultural college at Corvallis, and the University of Oregon at Eugene. The first was the only state normal school until 1925 when the legislature appropriated $175,000 as a special building fund for the Southern Oregon State Normal school and provided an annual tax levy of $\frac{1}{2}\frac{1}{5}$ of a mill for its support and maintenance. It opened in 1926. The normal school at Monmouth had an attendance in 1940 of 850 students, but it was unable to meet the demands of the state for trained teachers. Oregon state college had in 1940–41 an enrolment of 5,083. The school offers degrees in engineering, agriculture, home economics, commerce, forestry, pharmacy, vocational and educational courses. Degrees conferred in 1938 were 589. The agricultural college also has charge of the eight agricultural experiment stations located at Corvallis, Union, Moro, Hermiston, Talent, Burns, Astoria and Hood River. Its extension service work throughout the state is also of very great importance. The University of Oregon, founded in 1872, had in 1940–41 an enrolment of 3,600 full-time students. The number of degrees conferred in 1938 was 624. The University of Oregon under the state system of higher education conducts a medical school in Portland, which enrolls students from Oregon, Washington, British Columbia and Alaska and is the only medical school in the Pacific northwest. The North Pacific School of Dentistry, the only dental college in the Pacific northwest, is also located in Portland.

**Penal and Charitable Institutions.**—The Oregon state penitentiary, situated at Salem, is under the control of the governor. Its average daily population increased from 818 in the biennium 1932–34 to 1,029 in 1937–38. The prison has the most complete whipping, retting and scutching flax plant in the United States, also a lime plant doing excellent business, and a 43½-ac. farm. These industries furnish employment for the prisoners, who are paid a small wage for their labour, and help to support the institution. There is a prison library of 25,000 volumes. Under the direction of the Oregon state board of control are the Oregon state hospital for the insane at Pendleton and similar institutions throughout the state.

Oregon also provides state aid to a number of private charitable institutions in accordance with a law enacted in 1913. Such institutions make application to the board of health and, the

application being approved, receive $20 a month for each charity child under five years of age, and $16 per month for each child over five and under 17 years. The state child welfare commission passes on all petitions for adoptions, and inspects all institutions and maternity homes for which it issues licences.

**Agriculture and Livestock.**—Agriculture is the main industry of Oregon. Of 61,188,480 ac., the total area of the state, 29·2% or 17,988,307 ac. was in farm land in 1940. This represented an



CLASSIFICATION OF LAND AREA IN OREGON, 1936

increase of 630,307 over 1935. Public lands still unappropriated and unreserved amounted to 13,012,158 ac. in 1933 and 12,919,345 ac., in 1934. This represented less than one-fifth of the state. Homesteads in 1934 amounted to 118,853 ac. and in 1935 to 53,711 acres. Of the last named, 37,742 ac. were for stock raising only. The number of farms decreased from 64,826 in 1935 to 61,829 in 1940; the average acreage per farm increased from 267·8 to 290·9 during the same years. The value of farm land and buildings increased from $448,711,757 in 1935 to $476,817,354 in 1940 and the value of livestock decreased from $82,483,000 to $47,805,000. Farms operated by tenants, contrary to the general tendency in the United States, increased from 17·8% in 1930 to 21·7% in 1935. These statistics reveal that Oregon survived the period of agricultural distress following the depression with more success than most states. The good showing of the figures is due largely to steady production in the dairy and diversified farming valleys west of the Cascades. Dry-land farming suffered a serious setback in production.

Wheat is the principal grain, the acreage being 850,000 in 1940 and an average of 972,000 for the period 1929–38; the production was 17,184,000 bu. in 1940 and averaged 19,285,000 for the decade 1929–38. Wheat is raised mainly in eastern Oregon and north along the Columbia river; west of the Cascades farmers find their land too valuable as a rule to devote to the crop. Oats to the amount of 7,950,000 bu. were raised on 318,000 ac. in 1940; the average production for 1929–38 was 8,682,000 bu. Barley to the amount of an estimated 5,000,000 bu. was raised in 1940 on 200,000 acres. The production of Indian corn in 1940 was 1,860,000 bu. from 60,000 ac., slightly below the 1929–38 average of 1,862,000 bushels. The production and acreage of other important crops in 1940 were as follows, with average production for 1929–38 indicated in parentheses: tame hay, 1,532,000 tons from 823,000 ac. (1,549,000 tons); wild hay, 211,000 tons from 211,000 ac. (227,000 tons); alfalfa hay, 686,000 tons from 269,000 ac. (636,000 tons); potatoes, 8,510,000 bu. from 46,000 ac. (6,378,000 bu.).

Oregon is also an important fruit-raising state, and many western valleys are largely given over to the industry, notably the Rogue and Hood river valleys. Large orchards are found also in the Willamette valley and in the sheltered valleys of the Blue mountains in the northeast. The apple crop in 1940 was estimated at 3,160,000 bu., as against 2,900,000 bu. in 1939 and 3,462,000 bu. average for the five-year period 1934–38. The production of pears in 1940 amounted to 4,418,000 bu., of which 1,638,000 bu. were Bartlett pears. Oregon ranked third among the states in production of pears in that year. Cherry production for 1940 was 22,000 tons; peach production was 352,000 bu.; grapes, 2,300 tons; strawberries, 1,340,000 crates. Oregon led all other states in production of prunes, with 42,400 tons.

Irrigation is nowhere necessary west of the Cascade range but is necessary in eastern Oregon except in a few valleys along the Columbia and in the Blue mountains. There were but 1,478,128 ac. included in irrigation enterprises in 1930 as compared with 1,925,987 in 1920. However the acreage actually irrigated decreased from 986,162 to 898,713. Capital invested increased from $28,929,000 to $38,755,000, or from $21.52 to $33.46 per acre. The average cost of maintenance was in 1930 $1.41 per ac. as compared with $2.77 for all irrigated land in the United States. In 1934, 13,243 farms, or 20·4% of the total, reported using irrigated land. The total acreage of irrigated land from which crops were harvested was 578,838 in that year.

Great numbers of beef cattle are raised in eastern Oregon, while the Willamette and coast districts are especially favourable to dairying. The number of all cattle and calves was estimated at 1,042,000 on Jan. 1, 1941. Of these, 260,000 were milch cows, heifers and heifer calves. The value of all cattle on that date was $44,062,000. During 1940, 1,394,000,000 lb. of milk were produced on Oregon farms. Hogs on Jan. 1, 1941, numbered about 250,000, valued at $1,959,000. Eastern Oregon is noted for sheep raising. The number of sheep increased from 1,775,093 in 1925 to 3,319,271 in 1930, but thereafter decreased and was only 1,946,000 in 1941. Their total value in the same years amounted to $23,092,000, $22,396,586 and $14,665,000 respectively. These figures show the depression in the industry which began shortly after 1930. An increase in wool prices after 1933, however, helped the sheep raisers to some extent. Horses and colts on Oregon farms Jan. 1, 1941, were estimated to number 147,000, valued at $8,972,000. The average number for the ten-year period 1930–39 was 162,000, and the average value was $10,862,000. Mules and mule colts on Jan. 1, 1941, were estimated at 7,000, valued at $455,000; the average number during the period 1930–39 was 10,000, valued at $704,000. The aggregate value of livestock in Oregon Jan. 1, 1941, was estimated to be $70,113,000, as compared with the ten-year (1930–39) average of $55,810,000. Poultry raising is also an important industry. On Jan. 1, 1941, there were 2,938,000 chickens valued at $2,262,000 and 380,000 turkeys valued at $969,000.

**Mining.**—The value of the mineral products of Oregon was $6,170,000 in 1930, $4,211,000 in 1934 and $7,536,091 in 1938; it was estimated at $11,547,000 for 1940. The leading product in 1938 was gold, of which 81,729 troy oz. valued at $2,860,515 were produced. Second in importance was stone; the production in 1938 was 2,355,970 short tons (exclusive of granite) valued at $2,025,335. Oregon supplies its own needs in building stone. Volcanic tuff, occurring over a wide area in eastern Oregon and in parts of western Oregon, has proved valuable, for it is easily worked, of pleasing appearance, light in weight yet strong and durable. Sand and gravel valued at $926,661 (2,079,026 short tons) were produced in 1938. Clay products of 1938 were valued at $226,312. There is an abundance of materials for making lime and cement. The Coos Bay coal field is the only important coal-producing district in the state. Iron is found in commercial quantities in Columbia and Washington counties. Between 1860 and 1880 the mining of precious metals was a major industry in Oregon and was responsible for the early settlement of many localities; but by 1930 the total value of all metals mined was only $355,380. By 1940, however, the value had risen to an estimated $5,794,000. The production of silver in 1938 was 100,507 troy oz. valued at $64,974. Copper production was only 76,000 lb.

valued at $7,448, as compared with 820,000 lb. valued at $99,220 in 1937. In 1938, 4,610 flasks (76 lb.) of mercury, valued at $347,917, were mined. Small quantities of lead, platinum, diatomite and zinc are also mined. The value of miscellaneous minerals in 1938 was $1,074,030.

**Fisheries.**—The fisheries of Oregon in 1935 employed 4,300 persons, represented an investment of $5,000,000 and produced 26,458,000 lb. of fish. Of the 1935 catch, 22,980,000 lb. or about 83% of the total was salmon. Another fishing industry is the catching and processing of pilchards.

**Forests and Lumbering.**—It is Oregon's distinction that within her borders is more standing timber than in any other state. It amounts to about 438,000,000,000 board feet or nearly one-fifth of the supply of the whole United States. Of this, 234,000,000,000 ft. are privately or state owned, while 204,000,000,000 ft. are in the 13 national forests of the state, with a net total area of 13,701,834 ac. The national forests include all the higher mountain areas. The backbone of the Cascade range and its higher slopes from Mt. Hood to California comprise six forests of about 1,000,000 ac. each. In the Coast range are two forests with a combined area of 1,500,000 ac. while in the Wallowa and Blue mountains in eastern Oregon are six more totalling some 5,500,000 acres. On the western slopes of the Cascades especially at the lower elevation are some of the finest stands of timber in the world made up of such species as Douglas fir, western hemlock and western cedar. On the east slopes of the Cascades and in the Wallowa and Blue mountains where the climate is much drier the timber is more open, and Ponderosa pine replaces Douglas fir as the chief commercial tree.

Lumber production fell from 4,784,000,000 bd.ft. in 1930 to 1,604,000,000 bd.ft. in 1932, and 2,380,000,000 bd.ft. in 1934. Oregon's annual cut in lumber ranks second only to Washington. Oregon ranks first in the U.S. in the amount of spruce cut; first in western yellow pine; second in cedar; second in Douglas fir; third in sugar pine; and fourth in hemlock. The lumber industry in all its branches gives employment to about 52,000 men and women. The value of the cut in 1940 was about $177,000,000, of which $56,000,000 was for salaries and wages.

**Manufactures.**—In the years 1929–33 the value of Oregon's manufactures fell almost 235%. There were, in 1929, 2,450 factories employing an average of 65,390 workers, paying $86,728,000 in wages, producing goods valued at $408,160,000, of which $205,676,000 was added by manufacture. In 1933 there were 1,358 establishments, employing 41,052 workers, paying $34,787,000 in wages, producing goods worth $174,124,000 of which $86,553,000 was added by manufacture.

By 1937, however, industry in Oregon had recovered considerably. In that year there were 2,107 establishments with 65,982 wage earners; the total value of products was $363,142,053, of which $169,056,912 represented value added by manufacture. Total wages paid in that year amounted to $79,492,397; the cost of materials was $194,085,141. Lumber was the principal industry, with 693 establishments manufacturing products valued at $127,760,857. Second in importance was the canning of fruits, vegetables, juices, preserves, etc.; the total value of this industry's products was $24,212,542. The industries next in importance, with the value of their products, were as follows: flour and other grain-mill products, $19,138,231; meat packing, $17,255,182; paper, $16,643,999; bread and other bakery products, $11,175,578; butter, $10,972,515. In 1937 more than 4,000,000 cases of canned fruit were produced—about 6% of the total U.S. pack. More than 3,121,000 cases of canned vegetables were also packed, constituting nearly 3% of the total for the United States.

**Transportation and Commerce.**—The railway mileage of the state increased from 4,111 in 1925 to 4,893 in 1936, of which 560 mi. were electric roads operated by nine separate companies. The main steam railway lines were those of the Union Pacific, the Southern Pacific, the Great Northern and the Northern Pacific. The Union Pacific crosses the northeastern corner of the state to the Columbia river, which it follows to Portland. The Southern Pacific owns the main line between Portland and California, crossing the state north and south along the Willamette, across the Umpqua and Rogue river valleys and via the Klamath region. The mileage extension between 1910 and 1935 consisted mainly of branches from the Union Pacific into east central Oregon from the east, and into west central Oregon from the north; from the Southern Pacific line to the Pacific coast at Tillamook and Coos bay, and from the Willamette valley to Klamath Falls; and a line owned by the Great Northern from the Columbia river up the Deschutes river to a connection with the Southern Pacific Klamath Falls extension and then by common user to the southern border of the state. The Northern Pacific and the Great Northern by a joint line on the Washington side of the Columbia river provide a water grade to Portland, a terminus of both systems.

The development of the state highway system begun in 1917 has been regularly carried forward: at the beginning of the year 1939 there were 4,394 mi. of primary rural state highways, of which 4,254 mi. were surfaced and only 140 mi. nonsurfaced. In 1939, the state expenditure for highways amounted to $16,182,000. The funds available for this purpose during the year totalled $17,667,000, raised principally from motor vehicle fees and fuel taxes. Motor vehicle registrations for 1939, including both passenger cars and motor trucks, numbered 369,330. Receipts from the registration of motor cars amounted to $2,729,000 in 1939; from the five-cent gasoline tax (including tax on aviation gasoline), $10,591,000.

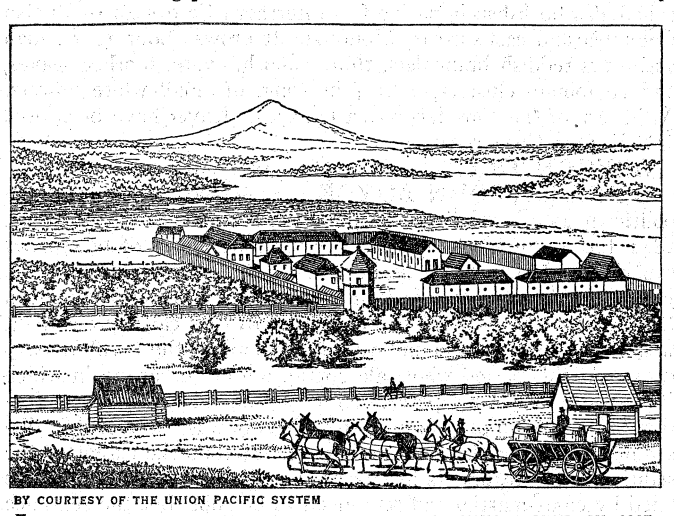
A deep-water channel in the Columbia and Willamette rivers makes Portland accessible for ocean-going vessels. The total cargo tonnage of exports from Oregon ports in 1938 was 861,940, of which Portland handled 694,161. Water-borne imports in 1938 amounted to 91,073 cargo tons, of which Portland received 86,771. The other principal ports are Astoria and Coos Bay.

**History.**—The Spanish pilot, Bartolomé Ferrelo, who in 1543 made the farthest northward voyage along the Pacific coast recorded in the first half of the 16th century, may have sighted the shores of Oregon. So also the famous English captain, Francis Drake, who in 1579 coasted these shores seeking a route home by a northwest passage, is supposed to have reached a point near 43° lat. before giving up the search and turning westward across the Pacific. In 1603 the Spaniards Vizcaino and Aguilar also passed 42° lat., Aguilar claiming to have reached a point of land near 43° which he called Cape Blanco. The Spanish, however, were too interested in the profitable trade between their colonies and the far east to give much attention to northwest exploration and it was not until 160 years later that the fear of Russian and English encroachment caused them to send out further expeditions. In 1774 Juan Pérez was sent out with orders to proceed to 60° latitude. He turned back at 54° but was the first to sail along the entire coastline of the Oregon country. The following year Bruno Heceta commanded another expedition which near Point Grenville made the first landing in the region. They erected a cross and in formal ceremony took possession for Spain.

The Spaniards made no effort to colonize northwestern America or to develop its trade with the Indians, but toward the end of the 18th century the traders of the great British fur companies of the north were gradually pushing overland to the Pacific. Upon the sea, too, the English were not idle. Capt. James Cook in March 1778 sighted the coast of Oregon in the lat. of 44°, and examined it between 47° and 48° in the hope of finding the Straits of Juan de Fuca described in Spanish accounts. Soon after the close of the Revolutionary War American merchants began to buy furs along the northwest coast and to ship them to China to be exchanged for the products of the east. It was in the prosecution of this trade that Capt. Robert Gray (1755–1806), an American in the service of Boston merchants, discovered in 1792 the long-sought river of the west, which he named the Columbia, after his ship. By the discovery of this river Gray gave to the United States a claim to the whole territory drained by its waters.

Land exploration soon followed these discoveries along the coast. Alexander Mackenzie, in the service of the North West company, in 1793 had explored through Canada to the Pacific coast in lat. about 52° 20′ N., and Meriwether Lewis and William Clark, American explorers acting under the orders of President Jefferson, in 1805–06 had passed west of the Rocky mountains

and down the Columbia river to the Pacific ocean. Both British and American adventurers were attracted to the region by the profitable fur trade. In 1808 the North West Company had several posts on the Fraser river, and in 1810 and 1811 they built others south of the 49th parallel. In 1811, also, the Pacific Fur Company, under the guidance of John Jacob Astor of New York, founded a trading post at the mouth of the Columbia which they



BY COURTESY OF THE UNION PACIFIC SYSTEM

FORT VANCOUVER OF THE HUDSON'S BAY CO. ESTABLISHED IN 1815, AFTER A SKETCH MADE BY STANLEY IN 1854

called Astoria, and set up a number of minor posts on the Willamette, Spokane and Okanogan rivers. On hearing of the war between England and the United States, Astor's associates, deeming Astoria untenable, sold the property in 1813 to the North West Company. The British took formal possession and renamed the post Ft. George.

Soon after the restoration of peace between England and the United States there arose the so-called "north-western boundary dispute" or "Oregon question" which agitated both countries for a generation and almost led to another war. The United States was willing at the time to extend the north-western boundary along the 49th parallel from Lake of the Woods to the Pacific, but to this the British Government would not consent, so in 1818 both nations agreed to a "joint occupation" for ten years of the country "on the north-west coast of America, westward of the Stony (Rocky) mountains." By treaty the following year Spain waived her claim to the territory north of 42° in favour of the United States, and in 1824 Russia likewise agreed to make no settlements south of 54° 40′. In 1827 the agreement of 1818 for joint occupancy by Great Britain and the United States was renewed for an indefinite term, with the proviso that it might be terminated by either party on 12 months' notice.

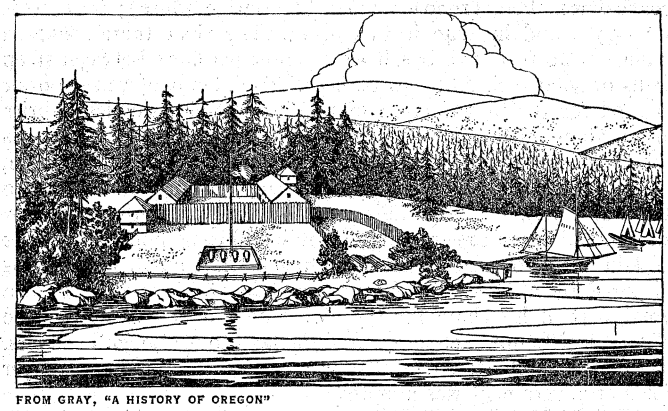
For the next three decades the history of Oregon is concerned mainly with the British fur traders and the American immigrants. The Hudson's Bay Company absorbed its rival, the North West Company, in 1821, and thus secured a practical monopoly of the trade of the Oregon region. Its policy was to discourage colonization so as to maintain the territory in which it operated as a vast preserve. The company sent to the Columbia river as its governor west of the Rocky mountains Dr. John McLoughlin who ruled the vast empire firmly and wisely for 22 years and became affectionately known as the "Father of Oregon." His capital was at Ft. Vancouver which he built on the north bank of the Columbia opposite the mouth of the Willamette river. In 1829 he also built an establishment at the falls of the Willamette which determined the site of Oregon City. Though it was against the company's interests he generously aided the American colonists who later came to the region, and later in life, after American Government was extended over the country, became himself a citizen of the United States.

The elderly employés of the company were urged by McLoughlin, when they wished to retire from active service, to settle with their families in the Willamette valley. There were a number of these first settlers, mostly Frenchmen, there by 1835. In 1834 Jason and Daniel Lee arrived from the United States and founded Methodist missions in the valley. In 1837 20 more missionaries arrived and a branch mission was opened at The Dalles. In 1838 Jason Lee started overland for the States, and his lecturing and preaching not only raised money for the mission but aroused great interest in Oregon, with the result that the American element was increased in 1840 by 50 more arrivals by sea. It now numbered 151. In 1842 the first immigrant train over the Oregon trail, headed by Elijah White and piloted by Thomas Fitzpatrick, arrived. The following was the year of the "Great Migration" when nearly 900 men, women and children likewise followed the trail and settled in the Willamette valley. After this the flow of immigrants steadily increased, about 1,400 arriving in 1844 and 3,000 in 1845.

The American settlers set in motion a movement for the immediate and permanent settlement of the Oregon dispute. They had in 1843 established for themselves a provisional Government, but settlement and business undertakings were held back until their future rulers and the nature of their permanent Government were settled. The western States rallied to their support with the result that the Democratic National convention in 1844 declared the title of the United States to "the whole of the Territory of Oregon" to be "clear and unquestionable," and the party made "Fifty-four forty or fight" a campaign slogan. Upon the success of the party, negotiations were entered into which resulted in a compromise treaty (1846) fixing the boundary between Oregon and British possessions at its present position, and giving the United States complete title to all land to the southward.

Territorial status and a Territorial Government were delayed until 1848 owing to opposition from the slavery element in Congress. As then constituted the Territory included the present States of Oregon, Washington, Idaho and parts of Montana and Wyoming. Its area was reduced in 1853 by the creation of the Territory of Washington. The discovery of gold in California drew many Oregon settlers to that country in 1848–50, but this exodus was soon offset as a result of the enactment by Congress in 1850 of the "Donation Land Act" by which settlers in Oregon were entitled to large tracts of land free of cost. The number of claims registered under this act was over 8,000.

In 1857 the people voted for Statehood; in the same year a Constitutional Convention drafted a Constitution which they adopted in November, and on Feb. 14, 1859, Oregon was admitted into the Union with its present boundaries. Gold had been discovered in paying quantities at Jacksonville in southern Oregon in 1815, and in 1861 was discovered in eastern Oregon along the John Day and Powder rivers. Each of these discoveries resulted in a stampede which settled a region which otherwise would have been settled very slowly. The increase of mining population in Oregon and Idaho encouraged agricultural development in that it provided markets. Permanent settlements were made in all the important valleys of eastern Oregon in the '60s. By 1870 the population of the State was 91,000. In the next 20 years it nearly doubled. This increase was due largely to the opening of railroad



FROM GRAY, "A HISTORY OF OREGON"

THE SETTLEMENT OF ASTORIA, OREGON, IN 1811, FOUNDED BY JOHN JACOB ASTOR AT THE HEAD OF THE COLUMBIA RIVER

connections with the outside world. Two lines, one on each side of the Willamette river, to connect with a line in California, were begun in 1868, but progress was so slow that the connection was not made until 1884. Meanwhile a line had been built up the Columbia river to meet the northern transcontinental lines being built west through Idaho, and this junction was effected in 1883. Many local lines were also built.

Politically the state has divided between the Republicans and Democrats, each party giving an almost equal number of governors. Only twice before 1932 did the state vote for a Democratic president. In that year and again in 1936 Oregon returned Roosevelt and the Democrats. Oregon cast its vote again for Roosevelt in 1940, although many of the other offices went Republican. The Bonneville dam, Columbia river, was completed in 1937 as part of the public works program.

**OREGON CITY,** a city of Oregon, U.S.A., on the east bank of the Willamette river, 12 mi. S. by E. of Portland; the county seat of Clackamas county. It is on the Pacific highway, and is served by the Southern Pacific and electric railways and by motor coach lines. Pop. (1920) 5,686 (87% native white); in 1930 it was 5,761 and in 1940 it was 6,124. The river there makes a plunge of 40 ft. over a basalt ridge, and then flows between steep walls of solid rock 20 to 50 ft. high. The abundant water power is used for the manufacture of paper and pulp, woollen fabrics and various other commodities. Next to Astoria, Oregon City is the oldest settlement in the state. In 1829 Dr. John McLoughlin, chief agent of the Hudson's Bay company, established a claim to the water power at the falls and to land where the city now stands, and began the erection of a mill and some houses. In 1840 he laid out a town and named it Oregon City, but his claim was disputed by a Methodist mission, and in 1850 congress gave a great part of his claim for the endowment of a university. The Oregon legislature in 1862 restored the land to McLoughlin's heirs. The city was chartered in 1850. In 1924 a commission-manager form of government was adopted.

**OREGON-GRAPE** (*Mahonia aquifolium*), a North American evergreen shrub of the family of Berberidaceae, closely allied to the barberry (*q.v.*), found from British Columbia to Oregon. It grows from 3 to 10 ft. high and bears large pinnate leaves composed of five to nine thick, spiny-toothed, somewhat holly-like leaflets, bright yellow flowers in erect racemes, followed by showy clusters of small blue berries. The plant is the floral emblem or state flower of Oregon, and is widely grown as an ornamental.

**OREGON MYRTLE** (*Umbellularia californica*), a North American tree of the laurel family (Lauraceae, *q.v.*), called also California laurel, native to Oregon and California. It occasionally attains a height of 90 ft. and a trunk diameter of 5 ft., but is usually much smaller. The tree features lance-shaped, fragrant evergreen leaves, greenish-yellow flowers, in small clusters, and a somewhat olive-like, dark purple fruit (drupe). The wood is one of the most valuable cabinet timbers of the Pacific states.

**OREGON PINE:** *see* DOUGLAS FIR.

**OREGON TEA-TREE** (*Ceanothus sanguineus*), a name given to a large shrub of the buckthorn family (Rhamnaceae), called also buck-brush, native from northern California to British Columbia and eastward to Montana. It grows about 10 ft. high and bears reddish branchlets, thin, smooth, ovate, toothed leaves, and compound clusters, 2 to 4 in. long, of small white flowers. As in case of the New Jersey tea (*q.v.*), its leaves have been used as tea. (*See* CEANOTHUS.)

**OREGON TRAIL:** *see* OLD OREGON TRAIL.

**O'REILLY, JOHN BOYLE** (1844–1890), Irish-American politician and journalist, was born near Drogheda on June 28, 1844, the son of a schoolmaster. After some years of newspaper experience, during which he became an ardent revolutionist and joined the Fenian organization known as the Irish Republican Brotherhood, he enlisted in 1863 in a British cavalry regiment with the purpose of winning over the troops to the revolutionary cause. At this period wholesale corruption of the army, in which there was a very large percentage of Irishmen, was a strong feature in the Fenian programme, and O'Reilly was successful in disseminating disaffection in his regiment. In 1866 the extent of the sedition in the regiments in Ireland was discovered. O'Reilly was tried by court-martial and sentenced to be shot, but the sentence was commuted to 20 years' penal servitude. After confinement in various English prisons, he was transported in 1867 to Bunbury, Western Australia. In 1869 he escaped to the United States, and settled in Boston, where he became editor of *The Pilot,* a Roman Catholic newspaper. He subsequently organized the expedition which rescued all the Irish military political prisoners from the Western Australia convict establishments (1876). He was the author of several volumes of poetry, and of a novel of convict life, *Moondyne.* He died in Hull, Mass., on Aug. 10, 1890.

*See* J. J. Roche, *Life of John Boyle O'Reilly* (Boston, 1891).

**OREL** (now ORYOL), a region of the Russian S.F.S.R., surrounded by the regions of Tula, Smolensk, Mogilev, Gomel, Chernigov, Sumy, Kursk, Voronezh and Ryazan. Area 25,669 sq.mi. Pop. (1939) 3,482,388. Orel forms part of the Black Earth Area (Central), which was created in 1928. The region consists mainly of dissected plateau, drained by the Oka and its tributaries, flowing into the Volga, and the Sosna. On the water-partings between the streams, the Kurgans or artificial mounds, some containing burials and some being remains of earthworks, stand out sharply. In the Bolkhov and Dmitrov districts, the soil is podzol (*see* RUSSIA: *Soils*), but the rest of the region is covered with black earth. The forests have practically all disappeared and there is a great scarcity of wood and of fuel. For climate, the difficulties of agriculture and general social conditions *see* VORONEZH. Average January temperature 14.8°, average July 67°.

The chief crops are rye, oats, potatoes, millet and hemp. Very little wheat or sunflower seed is grown. Cattle, sheep and pigs are bred; in pre-World War I times Orel was noted for horse breeding, but their numbers diminished greatly owing to war requisitions and they are slow to recover. Livensk and Maloarchangelsk have however recovered their former position as regards horse breeding. Factory industries include the making of chemical manure from the phosphorites of the region, iron-mining and smelting in the Zinoviev district, near Dmitrovsk, and at Elets, flour-milling, distilling, leather and chalk. Koustar (peasant) industries include the making of ploughs, rope, makhorka tobacco, carpets, and, in the Elets district, lace. The region suffered much during the civil war 1917–20, and Elets changed hands several times. The chief towns are Orel and Elets.

In the 9th century a Slav tribe, the Vyatichis, was established on the Oka river and paid tribute to the Khazars. They recognized the rule of Rurik from 884 and were later absorbed in the principality of Chernigov. Their wealthy towns and villages were

devastated by the Mongols in 1239–42 and the region was reduced to poverty. The Russians erected forts and established colonies in the 16th century. In 1610 Orel then known as the Ukrayna or Ukraine (*i.e.*, "border region") was the scene of civil warfare under the false Demetrius. From 1917 to 1920 it was again the scene of civil struggles.

Orel (now Oryol), the chief town of the above region, situated at the confluence of the Orlik with the Oka river, and at the junction of roads and railways linking it with Moscow, Bryansk, Kharkov and the east, in 53° N., 36° 8′ E. Pop. (1939) 110,567.

**O'RELL, MAX,** the *nom-de-plume* of PAUL BLOUET (1848–1903), French author and journalist, was born in Brittany in 1848. He is chiefly remembered for his once famous book, *John Bull et son Île.* He died in Paris, on May 25, 1903.

**ORELLANA, FRANCISCO DE** (*c.* 1490–*c.* 1546), Spanish soldier, and first discoverer of the Amazon, was born at Truxillo about 1490. He sailed for Peru in 1535, and in 1540–41 accompanied Pizarro's expedition from Quito to Napo in the capacity of lieutenant. Early in 1541 he was sent ahead of the main party to obtain provisions, but he deserted his charge, either from necessity or choice, and continued his journey down the Rio Napo to the valley of the Amazon, whose course he explored from its source in the Andes to the Atlantic; he reached the coast in Aug. 1541. He is reported to have encountered a tribe of female warriors, of whom he had been told by the Indians, and from whom the name of the river is derived. On his return to Spain he was granted the right to conquer the newly discovered lands, but an expedition, undertaken in 1544 for this purpose, met with little success. Orellana died, probably in Venezuela, about 1546.

*See* "The Voyage of Francisco de Orellana down the River of the Amazons," trans. C. R. Markham, from A. de Herrera's *Historia general de las Indias occidentales* (Hakluyt Society *Publications,* vol. xxiv., 1859).

**ORELLI, JOHANN CASPAR VON** (1787–1849), Swiss classical scholar, was born at Zürich on Feb. 13, 1787. His cousin, JOHANN CONRAD ORELLI (1770–1826), was the author of several works in the department of later Greek literature. From 1807 to 1814 Orelli worked as preacher in the reformed community of Bergamo and published *Contributions to the History of Italian Poetry* (1810) and a biography (1812) of Vittorino da Feltre, his ideal of a teacher. In 1814 he became teacher of modern languages and history at the cantonal school at Chur (Coire); in 1819, professor of eloquence and hermeneutics at the Carolinum in Zürich, and in 1833 professor at the new university, the foundation of which was largely due to his efforts. He had already published (1814) an edition, with critical notes and commentary, of the *Antidosis* of Isocrates. The three works upon which his reputation rests are the following. (1) A complete edition of Cicero in seven volumes (1826–38). (2) The works of Horace (1837–38; 4th ed., 1886–92). (3) *Inscriptionum Latinarum Selectarum Collectio* (1828; revised edition by W. Henzen, 1856). His editions of Plato (1839–41, including the old scholia, in collaboration with A. W. Winckelmann) and Tacitus (1846–48, new ed. by various scholars, 1875–94) also deserve mention. Orelli died at Zürich on Jan. 6, 1849.

Schweizer-Sidler, *Gedächtnissrede auf J.C.O.* (Zürich, 1874); C. Bursian, *Geschichte der klassischen Philologie in Deutschland* (1883).

**ORENBURG** (now CHKALOV), region of the Russian S.F.S.R. consisting of the former Orenburg and Orsk districts of the larger pre-1914 province of the same name. Area 22,085 sq.mi. Pop. (1939) 1,677,013. It is a narrow strip between Bashkiria on the north and Kazakstan on the south, widening out to the east and west. The province is hilly, except for the valleys of the Ural river and its tributaries, the Sakmara and the Or. It belongs to the region of perennial drought and dry and desert steppe: the soils are chestnut-brown clays and sands with salt efflorescences, on which crops can be raised successfully if drought is not too severe and if careful attention is paid to manuring and to the type of cultivation. Some fertile black earth occurs in the valleys. The average January temperature is 3·4° F. July 70·9° F, average rainfall 15·2 inches. Coal and rich layers of rock salt are found near Iletsk, in the south of the province and phosphorite exists. The peasants are specially skilled in the preparation of leather and the women knit the famous Orenburg goats' wool shawls.

The district lies on the border region between the territory of the Bashkirs and that of the Kirghiz; the Bashkirs were brought under Russian rule in 1557, and the fort of Ufa was built to protect them from Kirghiz raids. The frequent risings of the Bashkirs and the raids of the Kirghiz led the Russian government in the 18th century to erect a line of forts and blockhouses on the Ural and Sakmara rivers, which were afterwards extended southwestwards towards the Caspian and eastwards towards Omsk, and Chkalov became the central point of these military lines.

**ORENBURG** (now CHKALOV), the chief town of the region of the same name in the Russian S.F.S.R., on the Ural river in 51° 46′ N., 55° 7′ E. Pop. (1939) 172,925. The opening of the Orenburg-Tashkent railway in 1905 greatly increased its importance, and it has an important railway workshop for this line. Its industries include the making of metal goods and bricks, sawmilling and brewing. Trading caravans from the Central Asiatic Republics bring carpets, silk, cotton, lambskin, wool and dried fruits to Orenburg to exchange against textiles, metal goods, and other products of European Russia. Cattle, horses and sheep from the steppe lands are brought to its market, and animal products including frozen meat, hides, sheepskins, tallow and bristles are sent by rail to Samara and the west. Its population is mixed and includes Russians, Tatars, Kirghiz and Bashkirs, among others. In 1735 a fort was erected at the confluence of the Or and Ural rivers as an outpost of Russia against the Bashkirs and Kirghiz, and was called Orenburg. In 1740–43, the fortress was moved 120 mi. down the Ural river to its present position and the former Orenburg was re-named Orsk. Heavy fighting occurred here after the 1917 revolution, and in that year its population was swollen to 140,588 by refugees. During the famine of 1920–1, the town suffered severely and the population dropped proportionately.

**ORENDEL,** a Middle High German poem, of no great literary merit, dating from the close of the 12th century. The story is associated with the town of Treves (Trier), where the poem was probably written. The introduction narrates the story of the Holy Coat, which, after many adventures, is swallowed by a whale. Orendel, son of King Eivel of Treves, who had embarked with 22 ships in order to woo the lovely Brida, the mistress of the Holy Sepulchre, is wrecked, and falls into the hands of the fisherman Eise, in whose service he catches the whale and recovers the Holy Coat. The poem exists in a single ms. of the 15th century, and in one printed version dated 1512. It has been edited by von der Hagen (1844), L. Ettmüller (1858) and A. E. Berger (1888); there is a modern German translation by K. Simrock (1845).

*See* H. Harkensee, *Untersuchungen über das Spielmannsgedicht Orendel* (1879); F. Vogt, in the *Zeitschrift für deutsche Philologie,* vol. xxii. (1890); K. Müllenhoff, in *Deutsche Altertumskunde,* vol. i. (2nd ed., 1890), pp. 32 *seq.;* and R. Heinzel, *Über das Gedicht von König Orendel* (1892).

**ORENSE,** an inland province of north-western Spain, formed in 1833 of districts previously included in Galicia, and bounded on the north by Pontevedra and Lugo, east by Leon and Zamora, south by Portugal, and west by Portugal and Pontevedra. Pop. (1940) 458,272; area 2,695 sq.mi. The province is almost everywhere mountainous. Its western half is traversed in a southwesterly direction by the river Miño; the Sil, a left-hand tributary of the Miño, waters the northeastern districts; and the Limia rises in the central mountains and flows west-southwest, reaching the sea at the Portuguese port of Viana do Castello. The railway from Monforte to Vigo runs through the province. There are iron foundries. The chief towns are Orense (*q.v.*), Allariz (1,819), Carballino (2,469), Viana del Bollo (980) and Nogueira de Ramuín (7,791). The province fell to insurgent troops early in the civil war of 1936–39.

**ORENSE,** an episcopal see and the capital of the Spanish province of Orense, on the left bank of the river Miño, and on the Tuy-Monforte railway. Pop. (1940) 17,866 (mun. 28,397).

The river is here crossed by one of the most remarkable bridges in Spain. It was built by Bishop Lorenzo in 1230, but has frequently been repaired. The image of El Santo Cristo in the Gothic cathedral is celebrated throughout Galicia. The warm springs known as Las Burgas, attract many summer visitors; the waters were well known to the Romans, as their ancient names, Aquae Originis, Aquae Urentes, or perhaps Aquae Salientes, clearly indicate. They named Orense Aurium, probably from the alluvial gold found in the Miño valley. Chocolate and leather are manufactured, and there are saw-mills, flour-mills and iron-foundries.

**OREODONT,** vernacular name for any member of the extinct family Merycoidodontidae. The oreodonts were piglike in general appearance and structure, but the teeth were like those of ruminants. They were related to both pigs and ruminants, but only distantly. Extremely abundant and varied throughout most of the age of mammals (late Eocene through Pliocene) in North America, oreodonts have not been found on other continents. (G. G. Si.)

**ORESTES,** in Greek legend, son of Agamemnon and Clytaemestra. According to the Homeric story he was absent from Mycenae when his father returned from the Trojan War and was murdered by Aegisthus. Eight years later he returned from Athens and revenged his father's death by slaying his mother and her paramour (*Odyssey,* iii. 306; xi. 542). For later forms of the legend of his return, *see* ELECTRA.

In post-Homeric writers, Orestes, after the deed, is pursued by the Erinyes (*q.v.*). He takes refuge in the temple at Delhi. Apollo sends him to Athens to plead his cause before the Areopagus. The Erinyes demand their victim; he pleads the orders of Apollo; the votes of the judges are equally divided, and Athena gives her casting vote for acquittal. The Erinyes are propitiated by a new ritual, in which they are worshipped as Eumenides (the Kindly), and Orestes dedicates an altar to Athena Areia. According to Euripides, some of the Erinyes were not satisfied, so Orestes was ordered by Apollo to go to Tauris, carry off the statue of Artemis which had fallen from heaven, and bring it to Athens. He repairs to Tauris with Pylades, the son of Strophius and the intimate friend of Orestes, and the pair are at once imprisoned by the people, among whom the custom is to sacrifice all strangers to Artemis. The priestess of Artemis, whose duty it is to perform the sacrifice, is his sister Iphigeneia (*q.v.*). A recognition is brought about, and all three escape together, carrying with them the image of Artemis. After his return to Greece, Orestes took possession of his father's kingdom of Mycenae, to which were added Argos and Laconia. To gain possession of Hermione, whom Neoptolemus had married, he murdered the latter at Delphi. He is said to have died of the bite of a snake. The development of the legend is the result (*a*) of the post-Homeric horror of bloodshed (Erinyes; to Homer, Orestes does nothing which is not entirely admirable); (*b*) of the growing interest in cases of conscience (conflict of the duty of revenge and the sacredness of his mother's person); (*c*) of the development of modern ideas of ethics and jurisprudence (the Areopagus consider motive and mitigating circumstances, instead of merely regarding the act); (*d*) of the replacement of blood-feud by State intervention and formal trial.

*See* Jebb, introduction to Sophocles, *Electra;* Höfer in Roscher's *Lexikon,* art. "Orestes." (H. J. R.)

**ORFE** or **GOLDEN ORFE,** a variety, originating in Germany, of the ide (*Idus idus*), one of the Cyprinidae and allied fairly closely to the roach (*q.v.*).

**ORFILA, MATHIEU JOSEPH BONAVENTURE** (1787–1853), French toxicologist and chemist, was by birth a Spaniard, having been born at Mahon in Minorca on April 24, 1787. After studying medicine at the universities of Valencia and Barcelona, he settled in Paris to study under the chemist L. N. Vauquelin. In 1811 he graduated and immediately became a private lecturer on chemistry in the French capital. In 1819 he was appointed professor of medical jurisprudence, and four years later he succeeded Vauquelin as professor of chemistry in the faculty of medicine at Paris. In 1830 he was nominated dean of that faculty. He died in Paris on March 12, 1853. Orfila's fame rests on his *Traité des poisons,* or *Toxicologie générale* (1813).

**ORFORD, ROBERT WALPOLE,** 1ST EARL OF (1676–1745), generally known as SIR ROBERT WALPOLE, prime minister of England from 1721 to 1742, third son of Robert Walpole, M.P., of Houghton in Norfolk, was born at Houghton on Aug. 26, 1676. He was an Eton colleger from 1690 to 1695 and was admitted at King's College, Cambridge, as scholar on April 22, 1696. At this time he was destined, as a younger son, for the church, but the death of two elder brothers made him heir to an estate producing about £2,000 a year, whereupon he resigned his scholarship and was withdrawn from the university.

Walpole sat in parliament at first for the family borough of Castle Rising (1701) and then for King's Lynn, which he represented until he was raised to the peerage. In June 1705 he was appointed one of the council to Prince George of Denmark, the inactive husband of Queen Anne, and then lord high admiral of England. On Feb. 25, 1708, he succeeded Henry St. John as secretary at war, and was thus brought into immediate contact with the duke of Marlborough and the queen. With this post he held for a short time (1710) the treasurership of the navy, and was admitted to the inmost councils of the ministry. He could not dissuade Godolphin from the impeachment of Sacheverell, and when the committee was appointed in Dec. 1709 to draw up the impeachment Walpole was nominated one of the managers for the House of Commons. Walpole shared in the general wreck of the Whig party, and in spite of the flattery, followed by the threats, of Harley he took his place with his friends in opposition. Both in debate and in the pamphlet press he vindicated Godolphin from the charge of peculation, and in revenge for his zeal his political opponents brought against him an accusation of personal corruption. On these charges he was in 1712 expelled from the House and spent a short time in the Tower. His prison cell became the rendezvous of the Whigs, while his praises were sung in popular ballads. In the last parliament of Queen Anne he defended Sir Richard Steele against the attacks of the Tories.

After the accession of George, the Whigs for nearly half a century retained the control of English politics. Walpole, who had supported the Hanoverian succession, obtained the lucrative post of paymaster-general of the forces in the administration which was formed under the nominal rule of Lord Halifax, but of which Stanhope and Townshend were the guiding spirits. Walpole was chairman of the committee appointed to inquire into the acts of the late ministry, and especially into the Peace of Utrecht, with a view to the impeachment of Harley and St. John. Halifax died on May 19, 1715, and after a short interval Walpole became first lord of the treasury and chancellor of the exchequer (Oct. 11, 1715). Jealousies, however, prevailed among the Whigs, and the German favourites of the new monarch quickly showed their discontent with the heads of the ministry. Townshend was forced to resign his secretaryship of state for the viceroyalty of Ireland, but he never crossed the sea to Dublin, and the support which Sunderland and Stanhope, the new advisers of the king, received from him and from Walpole was so grudging that Townshend was dismissed from the lord-lieutenancy (April 9, 1717), and Walpole on the next morning withdrew from the ministry. They plunged into opposition with unflagging energy, and in resisting the measure by which it was proposed to limit the royal prerogative in the creation of peerages (March–Dec. 1718) Walpole exerted all his powers. This display of ability brought about a partial reconciliation of the two sections of the Whigs. To Townshend was given the presidency of the council, and Walpole re-assumed the paymastership of the forces (1720).

On the financial crash which followed the failure of the South Sea scheme, Walpole was regarded by the general public as the indispensable man. Stanhope and James Craggs, the two secretaries of state, died, John Aislabie, the chancellor of the exchequer, was committed to the Tower, and Sunderland, though acquitted of corruption, was compelled to resign. Walpole, at first lord of the treasury and chancellor of the exchequer (April 1721), became with Townshend responsible for the government (though for some years they had to contend with the influence of Carteret), the danger arising from the panic in South Sea stock was

averted by its amalgamation with Bank and East India stock, and during the rest of the reign of George I. they remained at the head of the ministry. The hopes of the Jacobites, which revived with these financial troubles, were disappointed. Atterbury, their boldest leader, was exiled in 1723; Bolingbroke sued for pardon, and was permitted to return to his own country. Peace was assured by a treaty between England, Prussia and France concluded at Hanover in 1725.

In 1727 George I. died, but the confidence which the old king had reposed in him was renewed by his successor, after a brief period of coldness, and in Queen Caroline the Whig minister found a faithful and lifelong friend. For three years he shared power with Townshend, but quarrelled with him in 1730, and Townshend retired into private life. Walpole's administration was based on two principles, sound finance at home and freedom from the intrigues and wars which raged abroad. On the continent congresses and treaties were matters of annual arrangement, and England enjoyed many years of peace. Walpole's influence received a serious blow in 1733. The enormous frauds on the excise duties forced themselves on his attention, and he proposed to check smuggling and avoid fraud by levying the full tax on tobacco and wine when they were removed from the warehouses for sale. His proposals met with violent opposition, and had to be dropped. Several of his most active antagonists were dismissed from office or deprived of their regiments, but their spirits remained unquenched, as the incessant attacks in the *Craftsman* showed, and when Walpole met a new House of Commons in 1734 his supporters were far less numerous. The Gin Act of 1736 led to disorders in the suburbs of London; and the imprisonment of two notorious smugglers in the Tolbooth at Edinburgh resulted in the Porteous riots described in the *Heart of Midlothian*. These events weakened Walpole's influence in the country, but his parliamentary supremacy remained unimpaired, and was illustrated in 1737 by his defeat of Sir John Barnard's plan for the reduction of the interest on the national debt, and by his passing of the Playhouse Act, for the regulation of the London theatres.

That year, however, heralded his fall from power. His constant friend Queen Caroline died on Nov. 20, 1737, and Frederick, prince of Wales, whose request for an increase in his official allowance had been refused, became his active opponent. The prince controlled many boroughs within the duchy of Cornwall, and he attracted Pitt, the Grenvilles and others to his cause. The leading orators of England thundered against Walpole in the House of Commons, and the press resounded with the taunts of the poet and pamphleteer, illustrious and obscure, who found abundant food for their invectives in the troubles with Spain over its exclusive pretensions to the continent of America and its claim to the right of searching English vessels. Walpole long resisted the pressure of the opposition for war, but at the close of 1739, as the king would not allow him to resign, he was forced into hostility with Spain. The Tory minority known as "the patriots" had seceded from parliament in March 1739, but at the commencement of the new session, in Nov. 1739, they returned to their places with redoubled energies. The successes of the troops brought little strength to Walpole's declining popularity, and in the new House of Commons of 1741 political parties were almost evenly balanced. Their strength was tried immediately on the opening of parliament. Walpole was defeated. On Feb. 9, 1742 he was created earl of Orford, and two days later he ceased to be prime minister. A committee of inquiry into the conduct of his ministry for the previous ten years was ultimately granted, but its deliberations came to nothing. Walpole died at Arlington Street, London, on March 18, 1745, and was buried at Houghton on March 25. With the permanent places, valued at £15,000 per annum, which he had secured for his family, and with his accumulations in office, he had rebuilt the mansion at great expense, and formed a gallery of pictures within its walls at a cost of £40,000, but the collection was sold by his grandson for a much larger sum in 1779 to the empress of Russia.

Walpole was twice married—in 1700 to Catherine Shorter (d. 1737) and in March 1738 to Maria Skerret.

Sir R. Walpole's life has been written by Archdeacon William Coxe (1798 and 1800, 3 vols.), A. C. Ewald (1878) and John Viscount Morley (1889). *See* also *Walpole, a Study in Politics*, by Edward Jenks (1894); *English Hist. Rev.* xv., 251, 479, 665, xvi., 67, 308, 439 (his foreign policy, by Basil Williams); *Bolingbroke*, by Walter Sichel (1901–02, 2 vols.); the histories, letters and reminiscences by his son, Horace Walpole; and the other lives of the chief political personages of the period.

**ORFORD,** a small town of Suffolk, England, 20 mi. E.N.E. of Ipswich. Population 818. It lies by the right bank of the river Alde, here confined by a storm beach, near the promontory of Orford Ness. The Decorated church of St. Bartholomew retains a ruined Norman chancel. Of Orford castle the keep remains; it is built of Caen stone and flintwork, and is of Norman date.

**ORGAN,** in music, the name given to the well-known wind instrument (from Gr. ὄργανον, Lat. organum, instrument).

## EARLY HISTORY

The earliest authentic records of the organ do not extend beyond the second century B.C., but the evolution of the instrument from the syrinx (*q.v.*) or Pan-pipe goes back to a remote period. The hydraulic and pneumatic organs of the ancients were practically the same instrument, differing only in the method adopted for the compression of the wind supply; and the syrinx seems to have been recognized by the ancients as the precursor of both. Thus Hero of Alexandria, in his description of the hydraulic organ, calls it a syrinx. Philo of Alexandria (*c.* 200 B.C.), mentioning the invention of the hydraulus by Ctesibius, says, "the kind of syrinx played by hand which we call hydraulus."

In the earliest organs there is no doubt that the pipes consisted of lengths of the large reed known as κάλαμος used for the syrinx, but converted into open flue-pipes. Instead of cutting off the reed immediately under the knot, as for syrinx pipes, a little extra length was left and shaped to a point to form a foot or mouthpiece, which was placed over the aperture in the wind-chest, so that it caused the stream of air to split in two as it was driven through the hole into the pipe by the action of the bellows. A narrow fissure was made through the knot near the front of the pipe, and above it a horizontal slit was cut in the reed, the two edges being bevelled inwards. When the wind was pumped into the chest it found an outlet through one of the holes in the lid, and the current, being divided by the foot of the pipe, became compressed and was forced through the fissure in the knot. It then ascended the pipe in an even stream, as yet silent, until thrown into commotion by another obstacle, the upper sharp edge or lip of the notch, which produced the regular flutterings or pulses requisite for the emission of a note.

In order to convert the syrinx into a mechanically played instrument, the addition of the actuating principle of the bag-pipe was necessary. It is probable that in the earliest attempts the leather bag was actually retained and that the supply of wind was still furnished by the mouth through an insufflation pipe. Such an instrument is described and illustrated by Father Athanasius Kircher, but his drawing should be accepted with reserve. In the instrument, which he calls the *Magraketha* or *Mashrokitha* of the Chaldees, the bag is described as being inside the wind-chest, the insufflation pipe being carried through a hole in the side of the box. Little wooden sliders manipulated by the fingers formed a means of controlling the escape of the wind through any given pipe.

Of organs in the next stage of development, namely with bellows, several examples in pottery are extant, and also a description in the Talmud. The quotation as given by Blasius Ugolinus states that the instrument known as the *Magrepha d'Aruchin* "consisted, as the Schilte Haggiborim teaches, of several rows of pipes and was blown by bellows. It had, besides, holes and small sliders answering to each pipe, which were set in motion by the pressure of the organist; the vent-holes being open, a wonderful variety of sounds was produced."

In regard to the hydraulic organ, some writers have considered that the invention of the hydraulis in the 2nd century B.C. by Ctesibius of Alexandria constituted the invention of the organ, and that the pneumatic organ followed as an improvement or variety, but such a suggestion can hardly be accepted. It is most improbable that a man busy with the theory and practice of

hydraulics would *invent* a highly complex musical instrument in which essential parts lying outside his realm, such as the flue-pipes, the balanced keyboard, the arrangements within the wind-chest for the distribution of the wind, are all in a developed state. It would be a case for which no parallel exists in the history of musical instruments, all of which have evolved slowly and surely through the ages. On the other hand, given a pneumatic organ in which the primitive unweighted bellows worked unsatisfactorily, an engineer would be prompt to see an opportunity for the advantageous application of his art. There are two detailed descriptions of the hydraulis extant, both of which presuppose the existence of a pneumatic organ. One is in Greek by Hero of Alexandria, the other in Latin by Vitruvius (*De Arch.* lib. x. cap. ii.).

The principle of the hydraulis, which long remained a mystery, is now well understood. An inverted funnel, or bell of metal, standing on short feet and immersed in water within the altar-like receptacle forming the base or pedestal, communicated, by means of a pipe, with the wind-chest, placed above it. When the air was pumped into the funnel by the alternate action of two pumps, one on each side of the organ, constructed bucket within bucket and fitted with valves, the water retreating before the compressed air, rose in the receptacle and by its weight held the air in a state of compression in the funnel, whence it travelled through the pipe into the wind-chest. For an interesting discussion of the hydraulic organ, based on a careful first-hand study of the ancient writers *see* two articles in *The Organ* for Jan. and April, 1923 by D. Batigan Verne.

The nature of the hydraulis made it possible to construct large organs of powerful tone more suitable for use in the arena than the small pneumatic instruments, but the hydraulic organ never entirely supplanted the pneumatic, which was probably not so imperfect at the beginning of our era as has been thought, and which was destined to establish its supremacy in the end.

In France and Germany the Romans must have used organs and have introduced them to the conquered tribes as they did in Spain, but the art of making them was soon lost after Roman influence and civilization were withdrawn. Pépin, when he wished to introduce the Roman ritual into the churches of France, felt the need of an organ and applied to the Byzantine emperor, Constantine Copronymus, to send him one, which arrived by special embassy in 757 and was placed in the church of St. Corneille at Compiègne. The arrival of this organ was obviously considered a great event, since it is mentioned by all the chroniclers of the time. Charlemagne received a similar present from the emperor of the East in 812, of which a description has been preserved.

Considerable activity was displayed in England in the 10th century in organ-building on a large scale for churches and monasteries, such as the monster organ for Bishop Alphege at Winchester, which had 400 bronze pipes, 26 bellows and 2 manuals of 20 keys, each governing 10 pipes.

In regard to the details of these early instruments, as represented in contemporary illustrations, it may be noted that there is no miniature on record in which the fist action on the keys is indicated, the performer during the 10th, 11th and 12th centuries being depicted in the act of drawing out the stop-like sliders—as for instance, in the 12th-century manuscript Bible of St. Etienne Harding at Dijon, where the organist is playing the notes D and F, the sliders being lettered from C to C. From the 13th century the keys are shown pressed down by means of one finger or of finger and thumb. In the beautiful Spanish ms. said to have been compiled early in the 13th century, known as the *Cantigas de Santa Maria,* a portative is shown having balanced keys, one of which is being lightly pressed by the thumb, the instrument resting on the palm—while the left hand manipulates the bellows. The keys themselves varied in shape, being either like a T; a wide rectangle, with or without the corners rounded off, or a narrow rectangle. The earliest instance of a chromatic keyboard is that of the organ at Halberstadt built in 1361 and restored in 1495.

(K. S.)

## THE MODERN ORGAN

In former centuries organs were seldom to be found outside places of worship, but at the present day they are built for use in private residences, concert and public halls, cinematograph theatres, and in many playhouses of the United States and Canada.

The sounds of an organ are produced from pipes of varying shapes and sizes, made to "speak" by means of air under pressure. The sounding of the pipes is determined by the use of the keys, some of which are played by the hands, some by the feet. The keys of the organ resemble those of the pianoforte in appearance; but whereas the pianoforte has only one keyboard or manual the organ may have four or five in addition to a keyboard of foot pedals.

**Stops.**—Each organ pipe sounds one note only and is a member of a larger unit known as a stop; each stop is a member of a still larger unit known as a sectional or divisional organ; while each sectional organ is a member of the grand organ in its totality.

To the layman the term "stop" usually denotes the knobs grouped on each side of the organist as he sits at his console or control board. In watching the organist pull out or push in these knobs with varying musical results he does not think twice about accepting the term "stop," as popularly understood. To the organ builder, however, it means one thing and one thing only, namely, a rank of pipes.

The pipes of a given stop therefore all produce sounds of similar quality, but necessarily of different pitches. No two stops are exactly similar in quality; on the contrary, they all differ, like the various instruments in an orchestra. Some stops are of high pitch, some of low; some have a thin, some a full quality of tone. The knob at the console is the only part of the stop mechanism that is visible, being merely a handle which actuates the valve admitting wind to the stop itself. Every stop has a separate knob, just as every note has a separate key. Unless one of the knobs were drawn no sound would result when the organ was played.

**Sectional Organs.**—Passing on to the next size of unit, we come to the sectional organs mentioned. Each of these organs is played from its own clavier or manual and has its own special *timbre* and utility. An organ of five manuals (where found) would commonly comprise a Great Organ, a Swell Organ, a Choir Organ, a Solo (or Orchestral) Organ, and an Echo (or else Bombarde) Organ. Moreover, save only in the tiniest instruments, there is also a Pedal Organ played by the feet of the executant.

The normal range or compass of the manuals is 61 notes, *i.e.*, 5 octaves, from CC in the bass to C'''' in the treble (though certain organ builders of the United States have adopted a manual compass of 7 octaves); that of the pedals is 32 notes, *i.e.*, 2½ octaves from CCC in the bass (lowest C on the pianoforte) to the G below middle C. In other words, a manual stop ordinarily comprises 61 pipes and a pedal stop 32 pipes.

**Organ-pipes.**—These are primarily divisible into two main genera, namely flue and reed. Flue-pipes bear a strong resemblance to the humble "penny whistle," both as to appearance and physical behaviour—except that a flue-pipe does not sound more than one note. In reed pipes the wind vibrates a curved brass tongue over the surface of a reed or shallot, so that the oscillations of the tongue cause the speech of the pipe. Associated with the reed is a metal resonator, which exercises much the same function as the "loud-speaker" horn of a radio-outfit.

Both genera have in common the properties of pitch and quality. With a flue-pipe the pitch is lower as the tube or body is longer; with a reed-pipe pitch depends on the vibrating length of tongue and on the position of the spring wire, which can be made to increase or diminish this length. The quality of a flue-pipe is affected mainly by the diameter (or scale) of the body relative to the length, the wider scale giving the fuller tone and vice versa; the quality of reeds is affected by the length of resonator, their shape and scale, the thickness of the tongues and other factors.

But the souls of organ pipes are all in the hands of the "voicer," and their ultimate character depends more on the process known as "voicing" than on anything else.

Although most of the flue-pipes in an organ are open at the ends to the atmosphere, there is also a considerable class having its bodies closed by a cap or stopper. Known as gedeckts or bourdons, these pipes are peculiar in that they speak a note nearly an octave lower than an open pipe of the same length. Another

class has the bodies pierced about midway with a small hole, the result being that they sound an octave higher than ordinary pipes of the same length. These are called harmonic pipes.

**Voicing and Tuning.**—Voicing consists for the most part in adjusting the mouth-pieces of a flue-pipe or the tongue-curvature of a reed in such a manner that the desired quality of tone or timbre is permanently obtained. The final process of voicing is

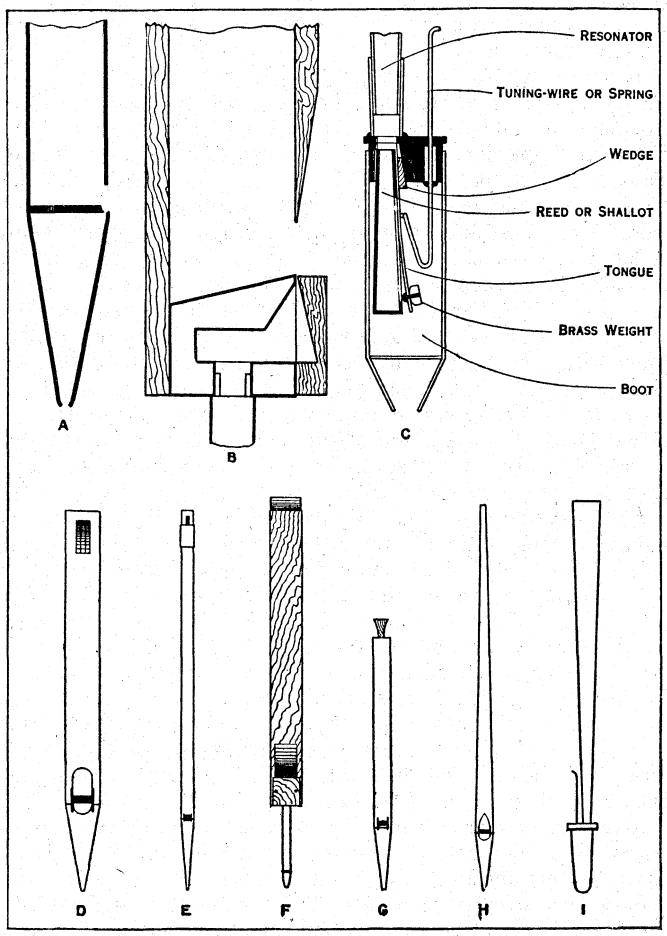

FIG. 1.—VARIOUS TYPES OF ORGAN PIPES
(a) Section of metal flue pipe; (b) section of wooden flue pipe; (c) section of reed pipe (trumpet) and its component parts; (d) open diapason; (e) Viola da gamba; (f) clarabella, or Hohl-Flöte; (g) Gedeckt; (h) Gems-Horn or Spitz-Flöte; (i) trumpet or cornopean (reed). (Not to scale)

known as "regulation" and means the making uniform in power of every pipe in a stop. This the voicer achieves by admitting a greater force of wind through the "foot" of the pipe, if he wishes to louden its tone; or by reducing the foothole and so reducing the wind, if he wishes to soften it.

For tuning various methods are employed, according to the character of the particular class of pipe being dealt with. Thus some flue-stops are tuned by moving up or down a metal sleeve which fits over the top of the pipe, the speaking length of which is in this way increased or diminished. Others—especially "upper-work" stops—have to be coned in or expanded slightly at the ends, according to whether it is intended to flatten or sharpen the pitch. Others again are tuned by pressing in or pulling out a metal piece affixed in or near the tops of the pipes. As for gedeckts the caps or stoppers afford an easy means of altering the pitch.

**Names of Stops.**—In making the acquaintance of organ stops for the first time many persons fall into the error of putting far too much faith in the names. Organ stops, it is true, resemble orchestral instruments to the extent that they bear names which are supposed to distinguish them from one another; but so far from the "orchestral" analogy holding good generally, it fails for two reasons—first, because organ builders have invented a hundred and one fancy names to denote pretty much the same kinds of stops; secondly, because they do not all agree as to what a given name is to denote.

Proceeding then on these lines, we may group flue-stops into three broad species—flute, diapason and viol. Flutes are either open or closed (*i.e.*, gedeckts), harmonic (*i.e.*, of double-length) or non-harmonic. Diapason stops on the whole have a natural and normal organ tone, familiar to everybody. Viols are of smaller scale than diapasons and so are of comparatively thin and stringy tone. Several stops stand on the borderland between two species; but the majority can be brought under one of the foregoing heads, quite apart from their loudness and intensity.

In reedwork the French horn is, roughly speaking, the equivalent of the flute, the trumpet of the diapason, the English horn (cor anglais) of the viol species. The clarinet corresponds with a gedeckts and has resonators of only half length, just as the harmonic reeds have resonators of double length. For the resonators of reeds are of about the same length on the bodies of flue-pipes giving the same pitch of note and in these two cases at least, they depart similarly from the normal. But at all times the reed stops are much less numerous than the flue, and although often blown by a wind of much heavier pressure do not compete with them on their own ground.

**Pitches of Stops.**—Organ stops which speak at the pitch indicated by the written notes are called 8ft. or "unison stops" because an open flue-pipe about so long would be needed to sound CC, the lowest note of the manual clavier. By analogy reeds and even gedeckts are 8ft. stops, if they sound at 8ft. or "unison" pitch throughout. So, too, the 16ft. stops are those which sound an octave below the "unison" pitch of the manuals. A gedeckt with a body 8ft. long would still be a 16ft. stop, because of its 16ft. pitch. Stops as grave as of 32ft. pitch appear on the pedal and in very large organs on the manuals, their name signifying a pitch two octaves below that of the manuals.

Of stops which sound higher than the 8ft. pitch of the keys the 4ft. stops give the octave, $2\frac{2}{3}$ft. stops the twelfth, 2ft. stops the fifteenth or super-octave, $1\frac{3}{5}$ft. stops the seventeenth or tierce, $1\frac{1}{3}$ft. stops the nineteenth or larigot, $1\frac{1}{7}$ft. stops the flat twenty-first or septième, 1ft. stops the twenty-second, and so (in theory at least) ad infinitum, the interval between the ranks becoming smaller as the ranks themselves are of acuter pitch, in accordance with the natural law of what is known as the *harmonic series*. Practical considerations, however, must always set arbitrary limits, and in this case they rule: (1) ranks above the fifteenth are too small and acute to be carried through the whole compass of the keyboard in an unbroken form; (2) no rank more dissonant than a minor seventh—or at most a major second—is tolerable anywhere in the tonal economy of the organ; (3) for most ordinary purposes ranks sounding octaves, thirds and fifths sufficiently represent the harmonic series. As a matter of practice all stops above the fifteenth form a part of what are called the mixtures, and except for special purposes (*see* later under *Choir Organ*, where the purpose of independent mutations is discussed) are employed collectively as "upperwork." Manual stops of 16ft., 8ft. and 4ft. pitches, being the most consonant with the unison or standard, are termed "foundation work" (Fr. *fonds*); and thus, in the upper work and in the foundation work respectively, the two complementary ideas of brilliance and gravity are fulfilled. The twelfth and fifteenth are sometimes independent ranks, sometimes part of the mixtures. As a rule, flute and viol stops are confined to the foundation pitches—reeds always. But diapasons being of a tone peculiar to the organ represent upperwork as well as foundation.

And now to consider the stops as grouped in the various sectional organs and the sections themselves as related to the organ at large, premising that letters attached to stop-names in this article indicate their genus, species or tone-quality, *i.e.*, d= diapason, f=flute, v=viol, g=gedeckt, r=reed, echo=lesser-toned.

**Great Organ.**—The Great Organ (Fr. *Grand Orgue*; Ger. *Hauptwerk*) as its name implies is the most important of these, and forms the tonal backbone of the whole instrument.

In English and American organs it is chiefly conspicuous for a diapason quality which pervades it throughout. Especially typi-

cal is the open diapason 8ft. without which scarcely an organ was ever built. To supply the requisite foundation for a large Great Organ there may be as many as three or four open diapasons, though they would not all be similarly scaled and voiced. If the first diapason is a powerful stop of full and round quality, the second is almost sure to be of a lighter and sharper tone; and sometimes in the interests of variety a geigen (dv) or gemshorn (dg) is substituted for the third or fourth.

The double open diapason, 16ft. octave or principal 4ft., twelfth $2\frac{2}{3}$ft., fifteenth 2ft., and mixtures are equally germane to the Great Organ, and may be likened to the roots, branches and twigs of the diapason trunk.

On the other hand the substratum of the French Great Organ is not so much a diapason as a flute one; for flutes are regarded as a kind of neutral canvas on which other and more positive tone colours (especially diapasons) can be laid and mixed. Again, Spanish Great Organs have no open diapasons as understood by English-speaking musicians; instead they have a foundation of hybrid flute-viol kind which is said to be particularly disagreeable. Nor does the average German Great Organ appeal to our ears much more, since its pipes are too often made of thin metal, and as a consequence sound hard and brassy. The gedeckts, *e.g.*, bourdon 16ft., stopped diapason 8ft., flute couverte 4ft., add considerable body to the diapasons besides having their own special value. In the United States a Doppelflöte (gedeckt with two mouths) is very popular. Where neither money nor space can be found for the pipes of actual 16ft. length, a bourdon 16ft. (g) frequently takes the place of a double open diapason.

Open flutes are nearly always present at 8ft. and 4ft. pitches and under a diversity of shapes and names—clarabella, wald flute, tibia, melodia, flute ouverte, etc. Viols, however, are thought to mar the sovereignty of diapason tone, and so are less common on the English Great Organ than abroad.

The usual complement of Great Organ reeds amounts to trumpets, 16ft., 8ft., and 4ft., going by the name of contra (tromba) or bombarde 16ft., tromba, trumpet or posaune, 8ft.; clarion or octave (tromba) 4ft. For a small Great Organ a single tromba or trumpet 8ft. suffices, or else the reed class may be omitted altogether from this section. To which it may be added that most builders to-day prefer to furnish all their chorus reeds with harmonic or double-length trebles which stand in better tune than the non-harmonic.

**Swell Organ.**—The Swell Organ (Fr. *Récit;* Ger. *Schwellwerk*) again almost explains itself. For inasmuch as organ pipes are naturally incapable of crescendo and diminuendo, a whole section of stops is played from a separate manual, and made expressive by artificial means. That is to say, all the pipes of the Swell Organ are enclosed in a large box which is faced on one side with a set of balanced shutters, not unlike the louvres of a venetian blind. As the shutters are opened electrically by the organist from the console, the volume of tone increases; as he closes them, it diminishes. Most people can easily recognise the sound of a full swell by the peculiar "tingling" effect it has when the shutters are nearly or completely closed. This effect indeed gives the best indication as to the basis of the Swell Organ: for it is shown to depend almost entirely on reeds and mixtures. Were all other stops omitted, a "skeleton" Swell would suffice for this effect, consisting of double trumpet 16ft., trumpet 8ft. (cornopean), clarion 4ft., plus brilliant mixtures to crown the whole.

At the same time a Swell Organ confined to a reed basis would not be practical politics; and so it comes about that other stops, both reed and flue, are required also here. The oboe, for instance (=echo horn), and the unda maris or voix celeste (a pulsating stop made up of two out-of-tune dulcianas) are almost universal. Hardly less so are narrow scale gedeckts of some kind (lieblich or rohr) in the foundation pitches. Nor is the entry of the diapason series delayed, though its stops will be of lighter calibre than those on the Great. The Swell mixtures belong properly to the diapason series, and only by design to the reed chorus, and so should not be voiced to emulate the sound of smashing glass, as sometimes happens. Then salicional (echo vd), spitz flute (dg), aeoline (echo v), wald flute (f), etc., should all be added to the list of unobtrusives, but usefuls.

In a small Swell Organ a contra-oboe or fagotto 16ft. generally appears as its first double; for a reed has the advantage over, say, a bourdon or contra-salicional 16ft. in taking up less room inside the swell-box, while contributing directly to the reed foundation.

**Choir Organ.**—The Choir Organ (Fr. *Positif;* Ger. *Oberwerk* or *Positiv*) belongs to one or other of two well defined types. It is either an Echo Great Organ in the true sense and in the old style; or else it stands in a swell-box and is less exclusive in caste.

If a miniature Great Organ, it comprises a lightly blown diapason series (16ft. to mixtures), a gedeckt or two, and perhaps even a low-pressure trumpet. In its other capacity it has an ensemble of mild flutes and viols, rather than one of pure diapason complexion, though of course there is no actual ban on diapasons. Viola da gamba, viola d'amore, fugara (v), chimney flute, cor de nuit, quintaten (g), flauto amabile, wald flute, harmonic flute (f) at 8ft., 4ft. and 2ft. pitches, the gemshorn family at all pitches—none of these are out of place so long as the key-note is gentleness and moderation in scales and wind pressures. If the Swell Organ contains a voix celeste of two salicionals (echo dv), occasion is sometimes taken to provide the Choir with a contrasting flute celeste of two gedeckts. The dulciana (echo d), or salicional 8ft., is of course indispensable and in larger instruments it may appear at 16ft., 4ft. and/or 2ft. also. Nor does a delicate mixture of dulciana or salicional pipes ever come amiss, though it is surprising how few organ-builders care about stops of so refined a tone.

An enclosed Choir Organ frequently houses the independent mutation stops, which are found to answer best in the shape of gedeckt pipes. Mutations commonly used are: nazard or twelfth ($2\frac{2}{3}$ft.), tierce or seventeenth ($1\frac{3}{5}$ft.), larigot or nineteenth ($1\frac{1}{3}$ft.), septième or flat twenty-first ($1\frac{1}{7}$ft.) and if it may be termed a mutation, the octavin or twenty-second (1ft.). With these or an even fuller muster to hand immense colouristic possibilities lie in front of the organist. Like a chemist in a laboratory he has only to mix one or two mutations with a 4ft. or 2ft. stop or even with another mutation to create new tonal compounds of rare and surprising piquancy. An excellent "orchestral oboe" can be made from this recipe—viole 8ft., nazard $2\frac{2}{3}$ft. and tierce $1\frac{3}{5}$ft.

Reeds are neither few nor insignificant on the French *Positif*, but in England the Choir is more often than not limited to a clarinet or cor anglais 8ft.

**Solo Organ.**—The Solo (or Orchestral) Organ differs from the three foregoing sections in one practical respect. Hitherto we have been dealing with units which were designed with the aim of building up a harmonious whole.

It is not perhaps overstating the case to say that the English Solo Organ is considered successful in proportion as it is anomalous in relation to the rest of the instrument. Being largely imitative of orchestral instruments, its stops, both reed and flue, represent extremes of scaling and voicing; and so have a poor blending capacity.

The Orchestral Organ may be regarded as a modern off-shoot of the Solo, which it sometimes includes on the fourth manual. So many solo stops are intended to resemble orchestral instruments, so many "orchestral" or imitative stops are distinctive enough to take a solo melody or melodic part, that the two names must largely overlap. Some builders, however, prefer to assign the Solo and Bombarde to a fifth manual, while retaining the fourth for an Orchestral pure and simple. Or, if there are only four manuals all told, the Choir and Orchestral are made to share the third, Solo and Bombarde the fourth.

Among the most prominent features of the Solo-Orchestral section is a pungent viol family. This may be more or less fully developed from the 16ft. contra-viol or violone, through the unison viol d'orchestre or violoncello to a viol mixture of 3 or more ranks, according to the size of the section.

In complete contrast stand the powerful orchestral flutes, which are invariably harmonic and appear at 8ft., 4ft. and 2ft. pitches. One name for the 4ft. rank is flauto traverso, the 2ft. nearly always being termed piccolo. Of gedeckts a large-scale tibia clausa is at once the most effective and the most vulgar.

Bassoon or fagotto 16ft., clarinet 8ft. (and sometimes 16ft.), orchestral oboe 8ft., orchestral trumpet 8ft., French horn 8ft., English horn 16ft. and 8ft., are all imitative reeds which find an appropriate home in this section. Though probably more valuable as a "timbre-creator" than an imitative stop the vox humana passes for "orchestral" and is included here.

As befits its character, the Solo-Orchestral section must be

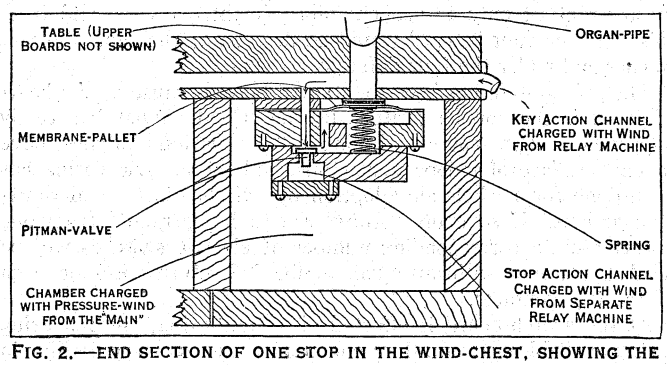

FIG. 2.—END SECTION OF ONE STOP IN THE WIND-CHEST, SHOWING THE INITIAL STAGE IN THE PROCESS OF JOINING THE PIPES WITH THE KEYS AND STOP-KNOB

enclosed in its own swell-box and voiced on a fairly heavy wind pressure, so that its stop may tell out clearly.

**Echo Organ.**—If the principle of *seniores priores* counts for anything, an enclosed Echo Organ ought to occupy the fifth manual, when one is provided: for such is its traditional place. In the churches of the United States Echo Organs are frequently met with, but without a fifth manual in the console. Modern English practice, however, seems inclined to favour the case of a Solo-Bombarde section instead of an Echo Organ for this manual, particularly if tubas are absent from the fourth manual. This would consist of heavy-pressure tubas (r) at the foundation pitches, and a chorus mixture of 6 ranks or more, the whole forming a forte-fortissimo ensemble. A stentorphone 8ft., *i.e.*, a monstrous solo diapason is often included.

**Pedal Organ.**—The Pedal Organ supplies a general bass to the whole organ, its stops therefore being pitched an octave lower than those of the manuals having the same nomenclature. Thus the "unison" stops are 16ft. instead of 8ft. A pedal double diapason would be 32ft. instead of 16ft. pitch, a pedal fifteenth 4ft. instead of 2ft., a pedal tierce $3\frac{1}{5}$ft. instead of $1\frac{3}{5}$ft., and so on.

A minimum Pedal Organ could consist of gedeckt or bourdon (16ft. closed wood) and from these the 8ft. and 4ft. pitches could be derived to form three stops in all. After which the Pedal Organ increases *pari passu* with the numerical growth of the manual stops. Soon one or more open diapasons 16ft. become imperative to balance the Great diapasons. Next a double open diapason 32ft. is the proper offset to 5 or 6 ranks of Great mixtures. From which it is but a short step to establish a diapason series from 32ft. to mixtures, thus making the Pedal Organ a complete entity on its own account. Large French Pedal Organs are especially rich in mixtures and mutation ranks, which contribute of course to reinforce the foundation. Other stops which are required as bass counterparts to manual tones include tibia (f), salicional (echo vd), geigen (vd), contrabass or violone (v), quintaten (g), etc.; and all these are amenable to extension into higher pitches.

Turning to the reeds we see the same rule of balance and expansion working itself out. As soon as an organ is large enough to contain either a tuba or Great trumpets 16ft., 8ft. and 4ft., there enters inevitably a heavy-pressure Pedal trombone, ophicleide or bombarde 16ft. Any further increase of powerful reed tone on the manuals is met by enlisting the aid of the Pedal contra (bombarde) 32ft., the clarion or octave (trombone) 8ft. and occasionally the octave clarion 4ft. A well equipped Pedal Organ would also have one or two lighter reeds such as cor anglais, clarinet, waldhorn and bassoon, "borrowed" from the manuals.

**Windchest.**—If we may regard all intermediary mechanisms which join the fingers of the organist with the sounding of the pipes as links in a chain, the first "link" claiming our attention is the windchest.

Now, a windchest has this double function: on the one hand it carries the pipes themselves; on the other it contains within it an apparatus for distributing wind to these pipes. (Each chest carries not more than nine stops.) In shape it is a box of thick pine about 8ft. long × $9\frac{1}{2}$in. deep, divided into as many longitudinal compartments as there are stops to be accommodated. Over its top surface (called the "table") are the "upperboards" on which the pipes stand. Over the upper boards and raised about $4\frac{1}{2}$″ above them are the rackboards which keep the pipes in an upright position. Fig. 2 shows a form of windchest, which has already enjoyed a wide vogue in the United States having been largely popularized by the Skinner Organ Co., of Boston, Mass. For the sake of simplicity it has been thought desirable to indicate one key action and one stop action only—*e.g.*, tenor F. and open diapason; but the reader must imagine the same mechanism multiplied to the extent of *n* stops × 61 times. The *raison d'être* of all windchests is the same—to enable the pipes to sound when the pallets below them have collapsed and have allowed the wind to flow through the orifices commanded by the pallets. This point is stressed, because it should be stated that what has been described is known as a modern "sliderless" chest (for the obsolescent "slider" windchest, *see* the Bibliography).

**Relay Machine.**—After the windchest itself comes the relay machine, which may be looked upon as the next link in our "chain." This serves to keep the key channels charged with pressure-wind, or to open the same to the atmosphere when the keys are pressed; also it is the place where the pneumatic portion of the "chain" joins the electric, and one motive force is substituted for another. Its component elements are as illustrated.

To each of the longitudinal stop channels in the windchest is attached an exactly similar apparatus; so that henceforward both key and stop "chains" continue in the form of electric wires from the magnets as shown in the illustration. These wires may be regarded as the third link in the "chain."

**Console.**—At the other end of the "chain" is the console or composite keyboard at which the organist sits. Here the "chain" terminates in the outward and visible keys, stop-knobs and other accessories, used by the player to control the organ. In the United States scarcely two builders work to the same plan of console, and as a result hardly two consoles are alike. Fig. 4 shows a typical English model of dignified and not unprogressive design. This would consist of 2–5 manuals according to the number of sectional organs, and a radiating-concave pedal clavier lying about 31 inches under the surface of the lowest manual. By English

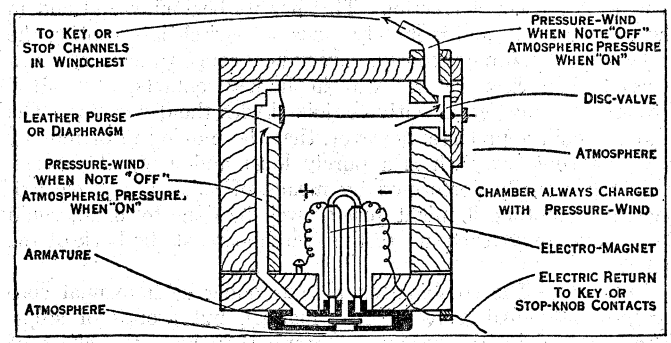

FIG. 3.—SECTION OF RELAY MACHINE (KEY OR STOP ACTION)
The second stage of process of joining the organ-pipes with keys and stop-knobs is shown, with the machine "off," the key or stop action being at rest

convention the Choir manual is the lowest, the Great the next, the Swell the third, the Solo (or Orchestral) the fourth, and the Echo (or Bombarde) the topmost. The stop-knobs are shown projecting from the jambs to right and left of the console. On the face of each knob is engraved the name of the particular stop and its approximate pitch-length in terms of feet—*e.g.*, clarinet 8ft., twelfth, $2\frac{2}{3}$ft., bourdon 16ft.—so that a moderate knowledge of technical nomenclature combined with the habit of seizing the meaning of such figures on the stop handles will be found to suffice as a key to the complexities of all consoles. The stop-knobs controlling the various sectional organs are, of course, grouped

together systematically so as to avoid any confusion, and in a 5-manual organ would be disposed thus:—

| *Left Jamb.* | *Right Jamb.* |
|---|---|
| Swell Organ. | Great Organ. |
| Solo (or Orchestral) Organ. | Pedal Organ. |
| Bombarde (or Echo) Organ. | Choir Organ. |

Over the top manual are ranged the ivory tilting-tablets, which operate the couplers. These provide for the coupling of almost any one clavier to another, at unison (8ft.) pitch, and also at

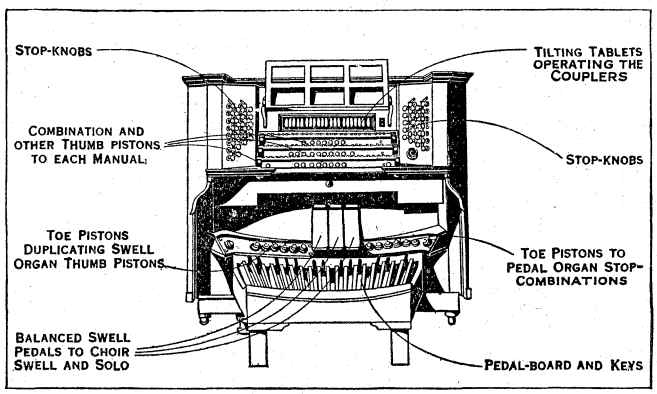

FIG. 4.—DETACHED CHURCH ORGAN CONSOLE, SHOWING THREE MANUALS AND PEDAL

sub-unison (16ft.) and octave (4ft.). Moreover, any manual except the Great may be duplicated *on itself* at sub-octave and octave pitches. Sometimes too there is a "unison silent" coupler which cuts out the 8ft. pitch of every stop drawn on the manual in question. Only the Great Organ remains constant, except as against the Pedal to which all manuals can be coupled.

Unless the action be tubular pneumatic or tracker—both older and non-electrical methods of forming our figurative "chain"—it is customary to detach the console and place it at some distance from the organ, connection being made by electric cables. For descriptions of pneumatic and purely mechanical actions, *see* G. A. Audsley's *The Art of Organ Building*.

But to revert to the key action "chain." Every manual and pedal key in the console has a thin bar of copper attached to it, so that when pressed it bridges the gap in the "return" wire and closes the circuit. The stop action "chain," operates on an identical principle and need not be further described.

Except the combination piston action, the sole remaining "chain" is the coupler action. This has its beginning and end in the console itself, and is merely a cut-out switch intercepting the 61 key circuits simultaneously. Every new coupler means an extra switch and an extra "return" wire in the key contacts, all "mains" throughout being permanently conjoined with the + terminal. The reader should appreciate, however, that the moving in or moving out of a coupler-switch is a purely local and external process. Although actually performed by means of solenoids or electro-pneumatic motors, it might just as well be done by hand, could the organist only reach out to the switchboard at the back of the console.

**Controls.**—The combination pistons under each manual control not individual stops of that manual, but groups of stops. When pressed by the organist's thumb they have the effect of throwing out whatever combination of stops he may have selected, without his having to touch the knobs. The Pedal Organ combination pistons are pressed by the right foot of the organist. On luxuriously equipped consoles it has become customary to fit also four or five general pistons, *i.e.*, having a jurisdiction over every stop and coupler in the organ. In an up-to-date console all pistons should be readily adjustable by the player, so that he may set them to operate whatever selections of stops he pleases.

**Unit System.**—Nearly all organs designed for cinematograph theatres are built on what is known as the unit or extension system; and in this respect are to be distinguished from the orthodox type which has been described. The distinction lies in the fact that whereas an orthodox organ has separate and individual stops for each manual and pedal, a unit organ employs the same rank of pipes again and again at various pitches and (rather misleadingly) under various names. By way of illustration take the case of a series of four gedeckt stops—bourdon 16ft., tibia clausa 8ft., zauberflöte 4ft., piccolo 2ft. Under the orthodox system each stop would be a separate rank consisting of 61 pipes, the total number of pipes being 244. Under the unit system there would be one master rank of only 97 gedeckt pipes (eight octaves), and from this rank the four "stops" would be derived at the four different pitches and under the four different names.

The unit system has been mentioned here, because at the heart of it all is the coupler switch just described. What has really happened is that couplers acting at the various pitches have taken the place of independent stops, and the electric wiring has been done for a wholesale adoption of switches instead of draw-stop actions. If so many "stops" are to be extracted from one parent rank, a corresponding number of electric switches will be needed, together with an equal number of return wires on each of the key contacts.

At the switch-board is effected also "duplexing," or rendering a stop available on more than one clavier—a necessary facility in the theatre organ and even in the Pedal section of an otherwise "straight" church organ.

Mention may also be made of the "double-touch" device now frequently incorporated in the modern cinematograph or concert-hall organ. Its operation is quite simple and may be explained in a word. A clavier having this device is one of which the keys, when played, fall not only to the standard depth of touch, but also—on extra pressure being applied by the finger—another $\frac{1}{16}$" or so deeper. The purpose of the second touch is to enable any key to make a second electric contact at the lower level, and so to engage a second circuit when it reaches that point. As a rule this circuit brings into action a powerful solo stop, a coupler or occasionally some "percussion" (*e.g.*, cymbals); but in any case it is plain that a clavier so equipped has the potentialities of two claviers in itself.

Organs designed for secular use are freely equipped with other means of making sounds than pipes. On a theatre instrument one may expect to find chimes, bird-whistle, xylophone, marimba, etc., in addition to drums, cymbal, triangle, castanets and many other "traps," as they are called, for the greater delectation of King Demos. Even in church organs of the United States 8ft. and 4ft. harps to the Choir and cathedral chimes to Great or Solo play an important part, and are by no means deemed out of place; whereas British practice, restrained by more sensitive church traditions, admits in this way nothing more fanciful than a tremulant to the enclosed sections.

**Wind Supply.**—It but remains to add that wind is supplied to the organ by a form of rotary fan (not unlike a steam turbine), driven by an electric motor. From this fan the wind is conveyed in a zinc duct called a trunk to a junction-box, whence smaller trunks branch out to the reservoirs of each windchest. The dynamo, generating current for the action, may be driven off the main motor by a "whittle-belt" and should be properly over-compounded so as to maintain a steady voltage under varying loads. Gone are the proverbial bellows and still more proverbial "blow-boy," save in remote country districts where there is no electric power; for they have long been ousted by these all-metal machines of greater endurance and fewer vagaries.

Compared to other pneumatic machines, the organ operates on a very light wind pressure. Seldom are even the most powerful reeds voiced on a wind exceeding the weight of 30 inches of water, while a large majority of stops speak on only 4–6 in. pressure.

BY COURTESY OF (1-4) THE SKINNER ORGAN COMPANY, (5) THE HAMMOND ORGAN

## PARTS OF A MODERN ORGAN

1. Large organ at Finney Chapel, Oberlin College, Oberlin, Ohio, showing casework and display pipes. The console is in the foreground
2. Same organ shown in fig. 1, with casework and display pipes removed, showing interior, with manual and pedal pipes and swell boxes
3. Giant pipes known as Bombardes, set up in the factory for voicing and tuning
4. View of a standard four manual console, similar to the instrument shown in fig. 1
5. A modern electric organ, the two units of which shown are the entire instrument. The organ can be played the moment it is plugged into the ordinary household electric circuit. Its tones are created by electrical impulses instead of by air pressure. When a playing key is depressed an electrical wave, of the same shape as the sound wave for that key, is generated within the console and passed to the tone cabinet where it is amplified into audible sound. This modern electrical instrument is said to achieve the quality and rich variety of the great organs.

**ORGANIC SENSATIONS,** a term for all the bodily sensations except those derived from the skin. In addition to the four special senses, sight, hearing, taste and smell, there is the common sensibility or somaesthesia, which includes cutaneous sensations and also organic sensations. Organic sensations may be subdivided into kinaesthetic sensations, vestibular or static sensation, and visceral sensations. The deep sensibility that comes from the tissues immediately beneath the skin may also be included under this class term. Kinaesthetic sensation, so named because it mediates the perception of bodily movement as well as the perceptions of weight, resistance and posture, arises in the muscles, tendons and joints, all of which are supplied with sense organs. Its nervous mechanism has also been called the proprioceptive system, whose function it is to furnish the afferent cues necessary for precise movement. Without these kinaesthetic sensations or proprioceptive nerve impulses it is impossible to control the movements accurately. The vestibular or static sense has to do with the maintenance of balance and of bodily position and with the perception of rotation. It arises either in the vestibule or the semicircular canals of the ear. Ernst Mach's theory, to which objection has been raised, relates the perception of rotation to these canals, which seem peculiarly well-adapted by their structure to mediate this perception. The visceral sensations include the sensory bases for such experiences as hunger, nausea, appetite and sex, if indeed the last two are to be understood in terms of their sensory nature. (*See* VISCERAL SENSATIONS.)

The importance of organic sensations has been emphasized by the James-Lange theory of emotions, which asserts that an emotion differs from other consciousnesses in that it includes the perception of a violent organic reverberation. For example, a fear may be characterized by the kinaesthesis of running away and the sensations that arise from the dryness of the throat and from the viscera. Against the theory it has been argued that internal state and bodily posture are insufficient completely to account for emotion. *See* EMOTION; JAMES-LANGE THEORY OF EMOTIONS. (E. G. BOR.)

**ORGANOMETALLIC COMPOUNDS** are chemical substances containing a metal or metalloid in direct association with one or more hydrocarbon radicals. These compounds never arise by natural processes in the vegetable and animal kingdoms, being produced synthetically by the art of the chemist. They have played an important part in the development of modern chemistry, and among them are several substances of great practical utility. Lead tetraethyl (*see* p. 898), a most effective antidetonant in motor gasoline or petrol, and salvarsan, a specific remedy in syphilis, are two outstanding examples of organometallic compounds of proven worth. Included in this group of carbon compounds are the organic derivatives of magnesium known after their discoverer as Grignard reagents (*q.v.*). The application of these reagents in chemical synthesis has proved to be one of the most fruitful and far-reaching advances in practical organic chemistry since the end of the 19th century.

Brief references to organometallic compounds have been given under the headings of certain of the metals and metalloids, and the present article affords a general survey of the whole group. The arrangement adopted below follows the natural sequence of the elements according to the periodic law (*q.v.*).

**Group I.**—Although organosodium compounds were prepared as early as 1858 (J. Wanklyn), the existence and properties of these substances remained doubtful until early in the 20th century (W. Schlenk and co-workers, 1913–17). Lithium ethyl, $Li.C_2H_5$, is prepared by the action of metallic lithium on mercury diethyl; it crystallizes from benzene or high-boiling petroleum in colourless, six-sided plates melting at 95° C. Lithium methyl, $Li.CH_3$, and lithium phenyl, $Li.C_6H_5$, are crystalline powders obtained by double decomposition between lithium ethyl and mercury dimethyl and diphenyl respectively (Schlenk and J. Holtz, 1917). More recently, lithium alkyls and aryls have been prepared from lithium metal and alkyl and aryl halides (K. Ziegler, 1930; H. Gilman, 1932). Sodium triphenylmethyl, $Na.C(C_6H_5)_3$, is obtained by the action of 1% sodium amalgam on triphenylchloromethane, $(C_6H_5)_3CCl$, dissolved in dry ether in an atmosphere of oxygen-free nitrogen. The product is a brownish-red solid. The simpler sodium alkyls are prepared by the action of sodium metal on a mercury alkyl (Schlenk) or zinc alkyl (A. v. Grosse, 1926). Sodium methyl, $Na.CH_3$, is a white powder which burns in air with explosive rapidity. Sodium ethyl, $Na.C_2H_5$, sodium *n*-propyl, $Na.C_3H_7$, and sodium phenyl, $Na.C_6H_5$, are colourless solids having similar properties. Cuprous phenyl, $Cu.C_6H_5$, obtained by the interaction of cuprous iodide and magnesium phenyl bromide in ethereal solution, is a white powder decomposing at 80° C. into copper and diphenyl. Silver phenyl, $Ag.C_6H_5$, an even more unstable substance obtained from phenyl magnesium bromide and silver bromide, is a yellow solid, exploding on rubbing, on gentle warming or on treatment with acids. An ethereal solution of auric bromide and magnesium ethyl bromide yields on evaporation colourless crystalline diethylauric bromide, $(C_2H_5)_2AuBr$, melting at 58° C. and exploding at 70° C. Bromine in chloroform converts this monobromide into the ruby-red ethylauric dibromide, $C_2H_5.AuBr_2$ (W. J. Pope and C. S. Gibson, 1907).

**Group II.**—The organic derivatives of beryllium are referred to under this metal and the organomagnesium compounds are described in a special article. (*See* GRIGNARD REAGENTS.) The organozinc compounds were discovered by E. Frankland in 1849, and from his study of similar compounds he was led to the conception of chemical valency. In conjunction with D. F. Duppa (1863) he applied them in many organic syntheses which were extended by G. A. Freund (1861), A. Butlerow (1867) and others. Zinc dimethyl (b.p. 46° C.) and zinc diethyl (b.p. 118° C.) are colourless malodorous liquids, spontaneously inflammable in air. They are prepared by distilling the products of the interaction of methyl and ethyl iodides with a zinc copper couple. More recently zinc phenyl bromide, as a crystalline dietherate (E. Blaise, 1911), and zinc diphenyl (A. Job and R. Reich, 1923) have been obtained by the interaction of magnesium phenyl bromide and anhydrous zinc chloride. The cadmium dialkyls (dimethyl, diethyl, dipropyl, dibutyl, etc.) are procurable in good yields from anhydrous cadmium bromide and the appropriate magnesium alkyl bromide. Cadmium dimethyl, $Cd(CH_3)_2$ is a colourless liquid boiling at 105° C. (E. Krause, 1917). Mercury possesses a remarkable capacity for combination with the carbon of hydrocarbon groups and of organic radicals in general. Sodium amalgam acts directly on ethyl iodide and bromobenzene, giving respectively mercury diethyl, $Hg(C_2H_5)_2$ (b.p. 159° C.), and mercury diphenyl, $Hg(C_6H_5)_2$ (m.p. 120° C.). With certain reactive substances such as aromatic bases or phenols, mercury derivatives are obtained merely by boiling with mercuric acetate; aniline yields *o*- and *p*-amino-phenylmercuriacetates, whereas *m*-toluidine takes up two and even three mercuriacetate residues. Phenol gives rise to *o*- and *p*-hydroxyphenylmercuriacetates and hydroxyphenyl-2:4-dimercuriacetate. In addition to the foregoing processes, organomercury compounds are conveniently prepared through the agency of Grignard reagents. Mercury dimethyl, a colourless liquid boiling at 89–92° C., is obtained from magnesium methyl iodide and mercuric chloride, and the homologous mercury dialkyls are prepared similarly.

**Group III.**—Aluminum trialkyls and triaryls have been recorded, and the production of these substances is facilitated by the use of Grignard reagents. Magnesium ethyl bromide and anhydrous aluminum chloride interact in dry ether to produce aluminum triethyl etherate, $4Al(C_2H_5)_3,3(C_2H_5)_2O$, as a colourless mobile liquid boiling at 112° C./16mm. It fumes in air, takes fire spontaneously, and is decomposed explosively by cold water (E. Krause and B. Wendt, 1923). Aluminum diethyl iodide (b.p. 118–120° C./4 mm.) and aluminum ethyl diiodide (m.p. 35–37° C.; b.p. 158–160° C./4 mm.) were obtained by V. Grignard and R. L. Jenkins (1925) from the liquid product of the interaction of aluminum and ethyl iodide.

Organic derivatives of indium and thallium are obtainable through the Grignard reagents. Thallic bromide, but not thallous bromide, yields both dialkyl and diaryl compounds. Thallic dimethyl bromide, $(CH_3)_2TlBr$, forms silvery-white leaflets (R. J. Meyer and A. Bertheim, 1904), whereas thallic diphenyl bromide, $(C_6H_5)_2TlBr$, is obtained in colourless transparent microscopic needles (D. Goddard and A. E. Goddard, 1922).

**Group IV.**—Organic derivatives are known of silicon (*q.v.*), germanium (*q.v.*), tin and lead. The most common and stable organolead compounds are the lead tetraalkyls and tetraaryls, which are obtained by interaction of lead chloride or lead bromide with the appropriate Grignard reagent,

$$4\ RMgBr + 2\ PbBr_2 = PbR_4 + Pb + 4\ MgBr_2.$$

Lead tetramethyl, $Pb(CH_3)_4$, lead tetraethyl, $Pb(C_2H_5)_4$, and other lead tetraalkyls have been prepared in this manner, as have the tetraaryls such as lead tetraphenyl, $Pb(C_6H_5)_4$. Treatment of these compounds with acids or halogens converts them to alkyl lead salts, such as $(C_2H_5)_3PbCl$ and $(C_6H_5)_2Pb(NO_3)_2$. Lead tetraalkyls containing different alkyl groups are prepared by reaction of alkyl lead halides with a Grignard reagent containing a different alkyl group (G. Grüttner and E. Krause, 1917), or by interaction of two different lead tetraalkyls in the presence of aluminum chloride (G. Calingaert and co-workers, 1939). The lower lead tetraalkyls are relatively stable, colourless, volatile liquids, while the lead tetraaryls are colourless solids. Organolead compounds such as dilead hexamethyl, $(CH_3)_3Pb.Pb(CH_3)_3$, dilead hexaphenyl, $(C_6H_5)_3Pb.Pb(C_6H_5)_3$, and lead diphenyl, $Pb(C_6H_5)_2$ have also been prepared; on being heated these decompose to the corresponding $PbR_4$ compounds and metallic lead.

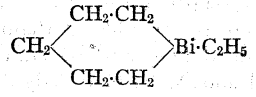
The commercially important lead tetraethyl is now manufactured (in the U.S.A. and other countries) by the action of ethyl chloride under pressure on a powdered alloy of lead and sodium contained in an autoclave. The lead tetraethyl is steam distilled from the reaction mass, leaving sodium chloride and metallic lead as the by-products. It is a colourless liquid, stable in air, soluble in gasoline, and quite volatile, although it decomposes at temperatures below its boiling point. For use as an antidetonant, it is added to gasoline in quantities not exceeding 3.0 cc. per gallon; a small quantity of ethylene dibromide, and sometimes ethylene dichloride, is added to prevent the formation of lead deposits in the engine.

The preparation and properties of organotin compounds are very much like those of organolead compounds. Stannous chloride and magnesium ethyl bromide give tin diethyl, $Sn(C_2H_5)_2$, as an oxidizable oil insoluble in water (P. Pfeiffer, 1911), whereas tin diphenyl, $Sn(C_6H_5)_2$, a bright yellow powder melting at 130° C. to a dark red liquid, is obtained from stannous chloride and magnesium phenyl bromide. When excess of Grignard reagent is used, this diaryl compound loses part of its tin and passes into ditin hexaphenyl, $3Sn(C_6H_5)_2 = Sn + (C_6H_5)_3Sn.Sn(C_6H_5)_3$, obtained in colourless plates melting at 237° C. (E. Krause and R. Becker, 1920). Tin tetramethyl, $Sn(CH_3)_4$, and tin tetraethyl $Sn(C_2H_5)_4$, boiling at 78° C. and 175° C. respectively, are prepared in good yields from stannic chloride and the appropriate Grignard reagents; in the latter case triethylstannic chloride, $(C_2H_5)_3SnCl$, is obtained as a by-product.

Magnesium benzyl chloride and stannic chloride give tribenzylstannic chloride, $(C_7H_7)_3SnCl$, (m.p. 143–145° C.) and tin tetrabenzyl (tetrabenzylstannane), $Sn(C_7H_7)_4$, (colourless needles, m.p. 42–43° C.). The former compound when acted on by chlorine furnishes dibenzylstannic chloride $(C_7H_7)_2SnCl_2$ in colourless crystals melting at 163–4° C. (T. Smith and F. S. Kipping, 1912).

**Group V.**—Certain more outstanding examples of organic derivatives of arsenic and antimony are described in the articles on these metalloids. Both trialkyl- and triaryl-bismuthines have long been known and were formerly prepared by the interaction of alkyl or aryl halides and sodium or potassium bismuthides.

The use of Grignard reagents has considerably enlarged the bismuth series of organic compounds. Diphenyl-α-naphthylbismuthine and tri-α-naphthylbismuthine (melting points 118–119° C. and 235° C.) have been prepared in this way (F. Challenger, 1914), and a cyclic bismuth compound, ethyl*cyclo*bismuthopentane has been prepared by the successive action on bismuth tribromide of magnesium ethyl bromide and the dimagnesium compound of 1:5–dibromopentane (G. Grüttner and M. Wiernik, 1915); it is a yellow viscous oil boiling at 108–112° C./18–20 mm. with an unpleasant odour and oxidizing rapidly in air.



**Group VI.**—Organic derivatives of selenium (*q.v.*) and tellurium (*q.v.*) are mentioned under these headings. A remarkable series of organic chromium compounds has been described by F. Hein (1919–24), who by the action of magnesium phenyl bromide either on chromyl chloride or on anhydrous chromic chloride obtained chromium pentaphenyl bromide, $Cr(C_6H_5)_5Br$, an orange-brown amorphous substance converted by alcoholic potash into chromium pentaphenyl hydroxide, $Cr(C_6H_5)_5OH,4H_2O$, crystallizing in golden-yellow leaflets. This basic hydroxide on treatment with acids loses a phenyl group giving rise to salts of the general type $[Cr(C_6H_5)_4]X$ (where X is the acid radical). Moreover, the mother-liquors from chromium pentaphenyl hydroxide contain chromium triphenyl hydroxide, which gives the corresponding salts $[Cr(C_6H_5)_3]X$. These organic derivatives indicate that chromium has valencies of 6, 5 and 4.

**Group VIII.**—Very few organometallic compounds of the metals of this group are known. Apart from some organoiron compounds, the only organometallic compounds isolated have been some platinum compounds. Ethyl iron chloride, $C_2H_5FeCl$, has been prepared by interaction of ethyl zinc iodide and ferrous chloride (A. Job and R. Reich, 1922). Phenyl iron iodide, $(C_6H_5)FeI$, has also been prepared from ferrous iodide and phenyl zinc iodide (G. Champetier, 1930). Trimethyl platinum iodide, $(CH_3)_3PtI$, has been obtained by interaction of platinum chloride and magnesium methyl iodide. The product, a yellow crystalline solid, is converted by silver oxide to trimethyl platinum hydroxide, $(CH_3)_3PtOH$. Solution of the latter in nitric acid gives the nitrate, $(CH_3)_3PtNO_3$. The corresponding chloride, $(CH_3)_3PtCl$, crystallizes from chloroform in colourless rhombic dodecahedra (W. J. Pope and S. J. Peachy, 1909). Platinum tetramethyl, $Pt(CH_3)_4$, has been prepared from trimethyl platinum iodide and sodium methyl, and diplatinum hexamethyl, $(CH_3)_3Pt.Pt(CH_3)_3$, has been obtained by heating trimethyl platinum iodide with powdered potassium in dry benzene (H. Gilman and M. Lichtenwalter, 1936).

(G. T. M.; G. Cr.)

**ORGANON,** the name given to Aristotle's logical treatises (Gr. *ὄργανον*, instrument). They are so called because logic is itself neither a speculative science nor a practical art in the ordinary sense, but an aid or instrument to all scientific thought. Francis Bacon gave to his own treatise the name *Novum Organum* in the belief that he had discovered a new inductive logic.

**ORGY,** a term originally denoting the secret rites or ceremonies connected with the worship of certain deities. The word is derived from Lat. *Orgia*, Gr. *ὄργια*, a post-Homeric word used of the secret rites of Demeter (*q.v.*), at Eleusis, of the Cabeiri, Orpheus and Eumolpus (*qq.v.*), but most commonly of the rites of Dionysus-Bacchus, with their dedications and purifications. The word has been connected with **ἔργω = ἔρδω*, *ῥέζω*, in the sense of performing sacred rites; Lat. *operari*, to perform sacrifice.

The Dionysiac orgies, which were restricted to women, were celebrated in the winter among the Thracian hills or in spots remote from city life. The women met, generally at night, clad in fawn skins, with hair dishevelled, swinging the thyrsus and beating the cymbal; they danced and worked themselves up to a state of mad excitement. A bull, the representative of the god, was torn in pieces by them as Dionysus-Zagreus had been torn. The women tore the bull with their teeth, and the eating of the raw flesh was a necessary part of the ritual. The most famous festival of the kind was the *τεριετηρίς*, the triennial festival, celebrated on Parnassus by the women of Attica and Phocis. The

celebrants were called Maenads or Bacchae. The wild dances and other "orgiastic" ceremonies have given rise to the use of the word "orgy" for any wild revel or festivity. (*See* DIONYSUS and MYSTERY.)

**ORIBI** or **OUREBI,** a small South African antelope (*Oribia scoparia*), standing about 24in. at the shoulder, and characterized by a bare glandular spot below the ear, the upright horns of the bucks, which are ringed for a short distance above the face, and the tufted bushy tail. The name is extended to include the other members of the same genus.

**ORIEL,** in architecture, a projecting bay window carried by corbels or mouldings. It is usually polygonal or semicircular in plan, but at Oxford, in some of the colleges, there are examples which are rectangular and rise through two or three storeys. In Germany it forms a favourite feature, and is sometimes placed at the angle of a building, carried up through two or three floors and covered with a lofty roof. The oriel is also said to have been provided as a recess for an altar in an oratory or small chapel. In the 15th century oriels came into general use, and are frequently found over entrance gateways.

The earliest meaning of the word seems to be a gallery, portico or corridor, and the application of the term to a particular form of window apparently arose from such a window being in an "oriel." In Cornwall "orrel" is still used of a balcony or porch at the head of an outside staircase leading to an upper storey in a fisherman's cottage. The name of Oriel college, Oxford, comes from a tenement known as Seneschal Hall or La Oriole, granted to the college in 1327. (*See* BAY; WINDOW.)

**ORIENTAL COOKERY** is characterized by the use of many condiments, often making the food very "hot," and by the use of very sweet dishes. In general, the Orient prefers main dishes in which many food materials have been combined into one appetizing whole, and this means cutting into small pieces. Confucius refused to eat food that was not "chopped up properly," and also ruled that there must never be more flesh food than vegetables in the mixture. A Japanese rule calls for the five tastes of sweet, salt, sour, bitter and acrid in each meal, and another for something in each from both sea and mountain. The most widely used meat is lamb or mutton. In China pork is common. The *kebob* of Turkey and India is meat, fish or poultry cut small and strung on a skewer, often with alternating slices of vegetable. It is usually broiled. *Pilaf* or *pilau,* the national dish of Turkey and much eaten in India, is a dish of rice (usually browned in fat before cooking in stock), to which flesh foods or vegetables or both are added, either cooked with the rice or served on it, and the mixture highly seasoned. The Armenian *herissa* and the Arabian *couscous* are similar dishes made with cracked wheat instead of rice. The Turkish *dolma* is a vegetable stuffed with rice and minced meat or olive oil. Vine leaves are also used for this. Birds, domestic and wild, vary the diet. Fish and shellfish furnish more of the flesh food than does meat, being in most places abundant and cheap. All flesh foods and vegetables are preserved by drying as well as in other ways. "Bombay duck" is dried salted fish. Flesh foods eaten in the East not used in the West include buffalo, cat, dog, field rat, snake, lizard, beetle, cockroach, larvae, ant, worm, shark fin and whale, some of these being held to be great delicacies.

For fat, India uses *ghee* (clarified butter), China peanut oil, Turkey and adjacent countries olive oil, and many sesame oil. Eggs are cooked in many ways. Bread is not in as general use as in the Occident, though in Japan it is growing in popularity. The *chapati* of the Indian peasant is a thin wafer made of whole wheat flour, "pan" fried in *ghee.* The main vegetable food of the Orient is rice, which is almost everywhere served with every meal, and is generally cooked in stock. Cracked wheat, barley, buckwheat, sesame and the millets are used in some countries. Noodles are eaten, and Italian pastes, though not native, are now in Eastern markets. Milk is used in Turkey and kindred countries when curdled (*matzoun*) as a beverage and in sauces. Tea is the universal beverage of the Orient, and in some countries coffee is common. Turkish coffee is made from the following formula: For four small cups, $\frac{2}{3}$ cup water, 3 teaspoons sugar, 3 teaspoons pulverized coffee. Melt the sugar in the water over the fire, remove from fire, add coffee, stir one minute, return to fire and bring to boiling point three or four times. This is not strained, but sipped from the cup after the coffee has settled to the bottom.

Fruits are usually cooked, except that dates, the staple food of the lands of the Near East, are rarely cooked except in puddings and confections. In China pineapple is often cooked with chicken and other meats. Pastries, sweet with sugar syrup and often with nuts, or a sweet fruit compote, are the usual ending for a Turkish meal. The Chinese and Japanese use sweet cakes, confections and puddings, or cooked or preserved fruits. Salads are much eaten in the Near East, usually of a combination of vegetables and perhaps fruits. Seasonings used in the Orient not common in the Occident include cummin, saffron, coriander seed, tamarind, chilis in variety, curry powder and soy sauce. Vegetable foods form the greater part of the diet.

The most famous dish of India is the curry, in which material cooked with curry powder or in a curry sauce is served in a ring of rice. The epicure insists on curries made from spices ground fresh each day, but curry powder and essence may be made ahead in the home or may be bought bottled. A good formula for curry sauce, hot enough for the average Western taste, but not for that of India, uses 2 tablespoons minced onion, fried a little in $\frac{1}{4}$ cup butter, $1\frac{1}{2}$ tablespoons curry powder, mixed to a paste with a little of 2 cups of stock or milk, 2 teaspoons curry essence, $\frac{1}{4}$ teaspoon salt, 1 tablespoon rice flour, 1 cup cocoanut or almond milk (made by soaking an hour in 1 cup milk, $\frac{1}{2}$ cup freshly ground cocoanut or blanched almonds ground fine, and used with or without straining), 1 teaspoon scraped green ginger, 1 teaspoon currant jelly. The meat, fish, shellfish, poultry or vegetables are cooked in the sauce. With a curry is served chutney, a sauce or conserve made of sweet and sour fruits and vegetables, highly spiced.

Chinese and Japanese food are similar, though not the same. Young bamboo sprouts, bean sprouts, water chestnuts, dried mushrooms and *pe-tsai* (Chinese cabbage) are favourite vegetables. The soy bean is used not only in soy sauce, but for the delicate bean curd that adds an agreeable texture and flavour to so many dishes. The famous bird's nests of China are used in dishes with chicken and pigeon as well as for soup. They are a luxury, as are the equally famous ancient eggs. Almonds are used in many combinations.

Chop suey is a dish unknown in China. The Japanese serve many foods cooked in deep fat after being dipped in a very delicate batter.

In Japan the diner in a restaurant often cooks his own food in an iron skillet set on the dining table. (I. E. L.)

**ORIENTATION,** a term expressing the angular relation of any object to the points of the compass; in architecture, used to express the relation of the main dimensions of a building, with reference to the points of the compass, and especially with reference to the east. In Mesopotamia and Egypt, as well as in primitive Central America, orientation of buildings was common from an early date, with important features, entrances, passages and the like designed to point in the direction of the rising sun. In north Europe the same custom evidently prevailed, as Stonehenge, near Salisbury, England, is carefully orientated. Many Greek temples were also designed to face the rising sun.

In the earliest Christian basilicas at Rome, the apse was placed at the west end, so that the priest who served the altar from behind, facing the congregation, himself faced the east and the rising sun. This orientation has sometimes been traced to the influence of the churches of the Holy Sepulchre at Jerusalem and of the Nativity at Bethlehem. It is more probable, however, that this orientation was due to an underlying tradition whose roots go far back beyond the origin of Christianity.

In St. Sophia, Constantinople, and all the Byzantine churches, the apse was placed at the east end, and the same custom obtains in the early churches in Syria and the Coptic churches in Egypt. During the 6th and 7th centuries this orientation gradually came into use in Italy and the west generally. Orientation of this type, with the apse or altar toward the east, is generally carefully observed in Spain, Germany and England, and

less carefully in France and Italy. It is so common, however, that in an architectural or ecclesiastical description of a church building, the "east end" is always the end with the apse or altar. In Mohammedan mosques the mihrab or prayer niche is so placed that the worshipper looks towards Mecca.

Orientation is an important consideration in the placing of any building, as exposure to the sun, or lack of it, prevailing winds and similar facts in climate must be considered in designing a building for any purpose. Thus in the northern temperate zone, living rooms are usually arranged to get large amounts of south light; studios are arranged with north light, and, in general, buildings like schools, with rooms on both sides of a corridor, are placed, if possible, with the corridor running north and south, so that the rooms on both sides may receive the sun.

**ORIENTE** or **LA REGION ORIENTAL,** a large undefined territory of Ecuador, comprising all that part of the republic lying east of the Andes. Pop. (1941 estimate), 218,735. The territory was formed in 1884, but its boundaries with neighbouring republics have been frequently disputed. A recurrent border war was fought with Peru in 1941, involving a contested area of more than 150,000 sq.mi. At the Rio de Janeiro conference in Jan. 1942, Peru and Ecuador agreed to submit the dispute to a boundary commission comprised of representatives from their own countries and the United States.

**ORIGEN** (*c.* 185–*c.* 254), the most distinguished and most influential of all the theologians of the ancient church, with the possible exception of Augustine.

Origen was born, perhaps at Alexandria, of Christian parents in the year 185 or 186. His father Leonidas gave him an excellent education. At a very early age, about the year 200, he listened to the lectures of Pantaenus and Clement in the catechetical school. This school, of which the origin (though assigned to Athenagoras) is unknown, was the first and for a long time the only institution where Christians were instructed simultaneously in the Greek sciences and the doctrines of the holy Scriptures. Asia Minor and the West developed the strict ecclesiastical forms by means of which the church closed her lines against heathenism, and especially against heresy; in Alexandria Christian ideas were handled in a free and speculative fashion and worked out with the help of Greek philosophy. The line between heresy and orthodoxy was less rigidly drawn there than at Ephesus, Lyons, Rome or Carthage.

In the year 202 a persecution arose, in which the father of Origen perished. Origen began about the same time to earn his bread by teaching; and in 203 he was placed, with the sanction of the bishop of Demetrius, at the head of the catechetical school. He regularly attended the lectures of Ammonius Saccas, and made a thorough study of the books of Plato and Numenius, of the Stoics and the Pythagoreans. At the same time he endeavoured to acquire a knowledge of Hebrew, in order to be able to read the Old Testament in the original. His manner of life was ascetic; the sayings of the Sermon on the Mount and the practical maxims of the Stoics were his guiding stars. Four oboli a day, earned by copying manuscripts, sufficed for his bodily sustenance. A rash resolve led him to castrate himself that he might work unhindered in the instruction of women.

He commenced his great work on the textual criticism of the Scriptures; and at the instigation of his friend Ambrosius, who provided him with the necessary amanuenses, he published his commentaries on the Old Testament and his dogmatic investigations. He worked at Alexandria for 28 years (till 231–232). This period, however, was broken by many journeys to Rome, to Arabia, to Antioch, and, in 216, when the imperial executioners were ravaging Alexandria, to Palestine. There the bishops of Jerusalem and Caesarea got him to deliver public lectures in the churches. In the East, especially in Asia Minor, it was still no unusual thing for laymen, with permission of the bishop, to address the people in the church. In Alexandria, however, this custom had been given up, and Demetrius took occasion to express his disapproval and recall Origen to Alexandria.

Probably the bishop was jealous of the high reputation of the teacher; and a coolness arose between them which led, fifteen years later, to an open rupture. On his way to Greece (apparently in the year 230) Origen was ordained a presbyter in Palestine by his friends the bishops. This was undoubtedly an infringement of the rights of the Alexandrian bishop; at the same time it was simply spite on the part of the latter that had kept Origen so long without orders. Demetrius convened a synod, at which it was resolved to banish Origen from Alexandria. A second synod, composed entirely of bishops, determined that Origen must be deprived of his status as a presbyter. This decision seems to have been justified by referring to the self-mutilation of Origen and adducing objectionable doctrines which he was said to have promulgated. No formal excommunication of Origen appears to have been decreed; the sentence of deprivation was approved by most of the churches, in particular by that of Rome. At a later period Origen sought to vindicate his teaching in a letter to the Roman bishop Fabian, but, it would seem, without success.

In these circumstances Origen retired from Alexandria (231–232) to Palestine, where his condemnation had not been acknowledged by the churches. He settled in Caesarea, and established a flourishing school there. Enthusiastic pupils sat at his feet (see the *Panegyric* of Gregory Thaumaturgus), and the methodical instruction which he imparted was famous all over the East. He made frequent journeys. He was for two years together at Caesarea in Cappadocia, where he was overtaken by the Maximinian persecution; here he worked at his recension of the Bible. We find him again in Nicomedia, in Athens, and twice in Arabia. He was called there to combat the unitarian christology of Beryllus, bishop of Bostra, and to clear up certain eschatological questions. As he had formerly had dealings with the house of Alexander Severus, so now he entered into a correspondence with the emperor Philip the Arabian and his wife Severa. But through all situations of his life he preserved his equanimity, his keen interest in science, and his indefatigable zeal for the instruction of others. In the year 250 the Decian persecution broke out, Origen was arrested, imprisoned and maltreated. But he survived these troubles and lived a few years longer in active intercourse with his friends. He died, probably in the year 254 at Tyre.

**Writings.**—Origen is probably the most prolific author of the ancient church. "Which of us," asks Jerome, "can read all that he has written?" The number of his works was estimated at 6000, but that is certainly an exaggeration. Owing to the increasing unpopularity of Origen in the church, a comparatively small portion of these works have come down to us in the original. We have more in the Latin translation of Rufinus; but this translation is by no means trustworthy, since Rufinus, assuming that Origen's writings had been tampered with by the heretics, considered himself at liberty to omit or amend heterodox statements. Origen's real opinion, however, may frequently be gathered from the *Philocalia*—a sort of anthology from his works prepared by Basil the Great and Gregory Nazianzenus. The fragments in Photius and in the *Apology* of Pamphilus serve for comparison. The writings of Origen consist of letters, and of works in textual criticism, exegesis, apologetics, dogmatic and practical theology.

1. Eusebius (to whom we owe our full knowledge of his life) collected more than a hundred of Origen's letters, arranged them in books, and deposited them in the library at Caesarea (*H.E.* vi. 36). In the church library at Jerusalem (founded by the bishop Alexander) there were also numerous letters of this father (Euseb. *H.E.* vi. 20). But unfortunately they have all been lost except two—one to Julius Africanus and one to Gregory Thaumaturgus. There are, besides, a couple of fragments.

2. Origen's textual studies on the Old Testament were undertaken partly in order to improve the manuscript tradition, and partly for apologetic reasons, to clear up the relation between the LXX and the original Hebrew text. The results of more than twenty years' labour were set forth in his *Hexapla* and *Tetrapla,* in which he placed the Hebrew text side by side with the various Greek versions, examined their mutual relations in detail, and tried to find the basis for a more reliable text of the LXX. The *Hexapla* was probably never fully written out, but excerpts were made from it by various scholars at Caesarea in the 4th century; and thus large sections of it have been saved. He worked at the text of the New Testament, although he produced no recension.

3. The exegetical labours of Origen extend over the whole of the Old and New Testaments. They are divided into *Scholia* (*σημειώσεις*, short annotations, mostly grammatical), *Homilies* (edifying expositions grounded on exegesis), and *Commentaries* (*τόμοι*). In the Greek original only a very small portion has been preserved; in Latin translations, however, a good deal. The most important parts are the homilies on Jeremiah, the books of Moses, Joshua and Luke, and the commentaries on Matthew, John and Romans. With grammatical precision, antiquarian learning and critical discernment Origen combines the allegorical method of interpretation—the logical corollary of his conception of the inspiration of the Scriptures. He distinguishes a threefold sense of scripture, a grammatico-historical, a moral and a pneumatic—the last being the proper and highest sense. He thus set up a formal theory of allegorical exegesis, not quite extinct in the churches even yet, and in his own system of fundamental importance.

4. The principal apologetic work of Origen is his book *κατὰ Κέλσου* (eight books), written at Caesarea in the time of Philip the Arabian. It has been completely preserved in the original. This work is invaluable as a source for the history and situation of the church in the 2nd century; for it contains nearly the whole of the famous work of Celsus (*Λόγος ἀληθής*) against Christianity. What makes Origen's answer so instructive is that it shows how close an affinity existed between Celsus and himself in their fundamental philosophical and theological presuppositions. The real state of the case is certainly unsuspected by Origen himself; but many of his opponent's arguments he is unable to meet except by a speculative reconstruction of the church doctrine in question. Origen's apologetic is most effective when he appeals to the spirit and power of Christianity. In details his argument is not free from sophistical subterfuges and superficial reasonings.

5. Of the dogmatic writings we possess only one in its integrity, and that only in the translation of Rufinus, *Περὶ ἀρχῶν* (On the Fundamental Doctrines). This work, which was composed before 228, is the first attempt at a dogmatic at once scientific and accommodated to the needs of the church. The material is drawn from Scripture, but in such a way that the propositions of the *regula fidei* are respected. This material is then formed into a system by all the resources of the intellect and of speculation. Origen thus solved, after his own fashion, a problem which his predecessor Clement had not even ventured to grapple with. The first three books treat of God, the world, the fall of spirits, anthropology and ethics. "Each of these three books really embraces, although not in a strictly comprehensive way, the whole scheme of the Christian view of the world, from different points of view, and with different contents." The fourth book explains the divinity of the Scriptures, and deduces rules for their interpretation. It ought properly to stand as first book at the beginning. The ten books of *Stromata* (in which Origen compared the teaching of the Christians with that of the philosophers, and corroborated all the Christian dogmas from Plato, Aristotle, Numenius and Cornutus) have perished, with the exception of fragments; so have the tractates on the resurrection and freewill.

6. Of practical theological works we have still the *Προτρεπτικὸς εἰς μαρτύριον* and the *Σύνταγμα περὶ εὐχῆς*. For a knowledge of Origen's Christian estimate of life and his relation to the faith of the church these two treatises are of great importance. The first was written during the persecution of Maximinus Thrax, and was dedicated to his friends Ambrosius and Protoctetus. The other also dates from the Caesarean period; it mentions many interesting details, and concludes with a fine exposition of the Lord's Prayer.

7. In his own lifetime Origen had to complain of falsifications of his works and forgeries under his name. Many pieces still in existence are wrongly ascribed to him; yet it is doubtful whether a single one of them was composed on purpose to deceive. The most noteworthy are the *Dialogues* of a certain Adamantius "de recta in Deum fide," which seem to have been erroneously attributed to Origen so early as the 4th century.

**Outline of Origen's View of the Universe and of Life.**—The system of Origen was formulated in opposition to the Greek philosophers on the one hand, and the Christian Gnostics on the other[1]. But the science of faith, as expounded by him, bears unmistakably the stamp both of Neo-Platonism and of Gnosticism. As a theologian, in fact, Origen is not merely an orthodox traditionalist and believing exegete, but a speculative philosopher of Neo-Platonic tendencies. He is, moreover, a judicious critic. The union of these four elements gives character to his theology, and in a certain degree to all subsequent theology. It is this combination which has determined the peculiar and varying relations in which theology and the faith of the church have stood to each other since the time of Origen. That relation depends on the predominance of one or other of the four factors embraced in his theology.

As an orthodox traditionalist Origen holds that Christianity is a practical and religious saving principle, that it has unfolded itself in an historical series of revealing facts, that the church has accurately embodied the substance of her faith in the *regula fidei*, and that simple faith is sufficient for the renewal and salvation of man. As a philosophical idealist, however, he transmutes the whole contents of the faith of the church into ideas which bear the mark of Neo-Platonism, and were accordingly recognized by the later Neo-Platonists as Hellenic[2]. In Origen, however, the mystic and ecstatic element is held in abeyance. The ethico-religious ideal is the sorrowless condition, the state of superiority to all evils, the state of order and of rest. In this condition man enters into likeness to God and blessedness; and it is reached through contemplative isolation and self-knowledge, which is divine wisdom.

As a means to the realization of this ideal, Origen introduces the whole ethics of Stoicism. But the link that connects him with churchly realism, as well as with the Neo-Platonic mysticism, is the conviction that complete and certain knowledge rests wholly on divine revelation, *i.e.*, on oracles. Consequently his theology is cosmological speculation and ethical reflection based on the sacred Scriptures. The Scriptures, however, are treated by Origen on the basis of a matured theory of inspiration in such a way that all their facts appear as the vehicles of ideas, and have their highest value only in this aspect. That is to say, his gnosis neutralizes all that is empirical and historical, if not always as to its actuality, at least absolutely in respect of its value. The most convincing proof of this is that Origen (1) takes the idea of the immutability of God as the regulating idea of his system, and (2) deprives the historical "Word made flesh" of all significance for the true Gnostic. To him Christ appears simply as the Logos who is with the Father from eternity, and works from all eternity, to whom alone the instructed Christian directs his thoughts, requiring nothing more than a perfect—*i.e.*, divine—teacher. In such propositions historical Christianity is stripped off as a mere husk. The objects of religious knowledge are beyond the plane of history, or rather belong to a supra-mundane history.

On this view contact with the faith of the church could only be maintained by distinguishing an exoteric and an esoteric form of Christianity. This distinction was already current in the catechetical school of Alexandria, but Origen gave it its boldest expression, and justified it on the ground of the incapacity of the Christian masses to grasp the deeper sense of Scripture, or unravel the difficulties of exegesis. On the other hand, in dealing with the problem of bringing his heterodox system into conformity with the *regula fidei* he evinced a high degree of technical skill. An external conformity was possible, inasmuch as speculation, proceeding from the higher to the lower, could keep by the stages of the *regula fidei*, which had been developed into a history of salvation. The system itself aims in principle at being thoroughly monistic; but, since matter, although created by God out of nothing, was regarded merely as the sphere in which souls are punished and purified, the system is pervaded by a strongly dualistic element. The immutability of God requires the eternity of the Logos and of the world. At this point Origen succeeded in avoiding the heretical Gnostic idea of God by assigning to the Godhead the attributes of goodness and righteousness. The pre-

[1] The opposition to the unitarians within the church must also be kept in mind.

[2] Porphyry says of Origen, *κατὰ τὰς περὶ πραγμάτων καὶ τοῦ θείου δόξας Ἑλληνίζων* (Euseb. *H. E.* vi. 19).

existence of souls is another inference from the immutability of God, although Origen also deduced it from the nature of the soul, which as a spiritual potency must be eternal. From this follows the necessity for the created spirit, after apostasy, error and sin, to return always to its origin in God.

The actual sinfulness of all men Origen was able to explain by the theological hypothesis of pre-existence and the premundane fall of each individual soul. He holds that freedom is the inalienable prerogative of the finite spirit; and this is the second point that distinguishes his theology from the heretical Gnosticism. The system unfolds itself like a drama, of which the successive stages are as follows: the transcendental fall, the creation of the material world, inaugurating the history of punishment and redemption, the clothing of fallen souls in flesh, the dominion of sin, evil and the demons on earth, the appearing of the Logos, His union with a pure human soul, His esoteric preaching of salvation, and His death in the flesh, then the imparting of the Spirit, and the ultimate restoration of all things. The doctrine of the restoration appeared necessary because the spirit, in spite of its inherent freedom, cannot lose its true nature, and because the final purposes of God cannot be foiled. The end, however, is only relative, for spirits are continually falling, and God remains through eternity the creator of the world. Moreover the end is not conceived as a transfiguration of the world, but as a liberation of the spirit from its unnatural union with the sensual.

The old Christian eschatology is set aside; no one has dealt such deadly blows to Chiliasm and Christian apocalypticism as Origen. It need hardly be said that he spiritualized the church doctrine of the resurrection of the flesh. But, while in all these doctrines he appears in the character of a Platonic philosopher, traces of rational criticism are not wanting. Where his fundamental conception admits of it, he tries to solve historical problems by historical methods. Even in the christology, where he is treating of the historical Christ, he entertains critical considerations; hence it is not altogether without reason that in after times he was suspected of "Ebionitic" views of the Person of Christ.

Although the theology of Origen exerted a considerable influence as a whole in the two following centuries, it certainly lost nothing by the circumstance that several important propositions were capable of being torn from their original setting and placed in new connections. It is in fact one of the peculiarities of this theology, which professed to be at once churchly and philosophical, that most of its formulae could be interpreted and appreciated *in utramque partem*. By arbitrary divisions and rearrangements the doctrinal statements of this "science of faith" could be made to serve the most diverse dogmatic tendencies. This is seen especially in the doctrine of the Logos. On the basis of his idea of God Origen was obliged to insist in the strongest manner on the personality, the eternity (eternal generation) and the essential divinity of the Logos[1]. On the other hand, when he turned to consider the origin of the Logos he did not hesitate to speak of Him as a *κτίσμα*, and to include Him amongst the rest of God's spiritual creatures. A *κτίσμα*, which is at the same time *ὁμοούσιον τῷ Θεῷ*, was no contradiction to him, simply because he held the immutability, the pure knowledge and the blessedness which constituted the divine nature to be communicable attributes.

In later times both the orthodox and the Arians appealed to his teaching, both with a certain plausibility; but the inference of Arius, that an imparted divinity must be divinity in the second degree, Origen did not draw. With respect to other doctrines also, such as those of the Holy Spirit and the incarnation of Christ, etc., Origen prepared the way for the later dogmas. The technical terms round which such bitter controversies raged in the 4th and 5th centuries are often found in Origen lying peacefully side by side. But this is just where his epoch-making importance lies, that all the later parties in the church learned from him. And this is true not only of the dogmatic parties; solitary monks and ambitious priests, hard-headed critical exegetes, allegorists, mystics, all found something congenial in his writings. The only man who tried to shake off the theological influence of Origen was Marcellus of Ancyra, who produced no lasting effect on theology.

The attacks on Origen, which had begun in his lifetime, did not cease for centuries, and only subsided during the time of the fierce Arian controversy. It was not so much the relation between *pistis* and *gnosis*—faith and knowledge—as defined by Origen that gave offence, but rather isolated propositions, such as his doctrines of the pre-existence of souls, of the soul and body of Christ, of the resurrection of the flesh, of the final restoration, and of the plurality of worlds. Even in the 3rd century Origen's view of the Trinity and of the Person of Christ was called in question, and that from various points of view. It was not till the 5th century, however, that objections of this kind became frequent. In the 4th century Pamphilus, Eusebius of Caesarea, Athanasius, the Cappadocians, Didymus and Rufinus were on the side of Origen against the attacks of Methodius and many others. But, when the zeal of Epiphanius was kindled against him, when Jerome, alarmed about his own reputation, and in defiance of his past attitude, turned against his once honoured teacher, and Theophilus, patriarch of Alexandria, found it prudent, for political reasons to condemn Origen—then his authority received a shock from which it never recovered.

There were, doubtless, in the 5th century church historians and theologians who still spoke of him with reverence, but such men became fewer and fewer. In the West Vincent of Lerins held up Origen as a warning example (*Commonit.* 23), showing how even the most learned and most eminent of church teachers might become a misleading light. In the East the exegetical school of Antioch had an aversion to Origen; the Alexandrians had utterly repudiated him. Nevertheless his writings were much read, especially in Palestine. The monophysite monks appealed to his authority, but could not prevent Justinian and the fifth oecumenical council at Constantinople (553) from anathematizing his teaching.

BIBLIOGRAPHY.—Next to the works of Origen (*see* Redepenning, "Des Hieronymus wiederaufgefundenes Verzeichnis der Schriften des Origens," in *Zeit. f. d. hist. Theol.* [1851], pp. 66 *seq.*) the most important sources are: Gregory Thaumat., *Panegyricus in Orig.*; Eusebius, *H.E.* vi.; Epiphanius, *Haer.* 64; the works of Methodius, the Cappadocians, Jerome (see *De vir. ill.* 54, 61) and Rufinus; Vincent. Lerin. *Commonit.* 23; Palladius, *Hist. Laus.* 147; Justinian, *Ep. ad Mennam* (Mansi, ix. p. 487 *seq.*); Photius, *Biblioth.* 118, etc. The best of the older editions is that of Delarue (1733–59, 4 vols. fol.; pub. by Migne in *Patrol. Gr.* vols. xi.–xvii.). A critical edition is being brought out by the Preussische Akademie der Wissenschaften; it is not yet completed. Amongst the older works on Origen those of Huetius (printed in Delarue, vol. iv.) are the best; but Tillemont, Fabricius, Walch (*Historie d. Ketzereien,* vii. pp. 362–760) and Schröckh also deserve to be mentioned. In recent times the doctrine of Origen has been expounded in the great works on church history by Baur, Dorner, Böhringer, Neander, Möller (*Geschichte der Kosmologie in der griechischen Kirche*) and Kahnis (*Die Lehre vom h. Geist,* vol. i.); compare with these the works on the history of philosophy by Ritter, Erdmann, Ueberweg and Zeller. Of monographs, the best and most complete is Redepenning, *Origenes, eine Darstellung seines Lebens und seiner Lehre* (2 vols., 1841, 1846). Compare Thomasius, *Orig.* (1837); Krüger, "Über das Verhältnis des Orig. zu Ammonius Sakkas," in the *Ztschr. f. hist. Theol.* (1843), i. p. 46 *seq.*; Fischer, *Comment. de Orig. theologia et cosmologia* (1846); Ramers, *Orig. Lehre von der Auferstehung des Fleisches* (1851); Knittel, "Orig. Lehre von der Menschwerdung," in the *Theol. Quartalschr.* (1872); Schultz, "Christologie des Orig.," in the *Jahrb. f. protest. Theol.* (1875); Mehlhorn, "Die Lehre von der menschlichen Freiheit nach Orig.," in *Zeitschr. f. Kirchengesch.* vol. ii. (1878); Freppel, *Origène,* vol. i., 2nd ed. (Paris, 1875). A full list of the later bibliography will be found in Bardenhewer's *Geschichte der altkirchen litteratur* (2nd ed. 2 vols., 1914) and de Faye *Origène,* vol. i. (1923). (A. HA.)

**ORIGINAL PACKAGE,** a legal term in America, meaning the package in which goods, intended for inter-State commerce, are actually transported wholesale. The term is used chiefly in determining the boundary between Federal and State jurisdiction in the regulation of commerce, and derives special significance by reason of the conflict between the powers of Congress to regulate commerce and the police legislation of the States with respect to commodities considered injurious to public health and morals.

By the Federal Constitution Congress is vested with the power "to regulate commerce with foreign nations and among the several States, and with the Indian tribes," and each State is forbidden, without the consent of Congress, to "lay any imposts or duties on imports or exports, except what may be absolutely necessary

[1] "Communis substantiae est filio cum patre; *ἀπόρροια* enim *ὁμοούσιος* videtur, i.e., unius substantiae cum illo corpore ex quo est *ἀπόρροια*."

for executing its inspection laws," and the basis of the law on the subject of "original package" was laid when, in 1827, Chief Justice Marshall interpreted these clauses in his decision of the case of *Brown* v. *Maryland* (12 Wheaton 419), which tested the constitutionality of an act of the legislature of Maryland requiring a licence from importers of foreign goods by bale or package and from persons selling the same by wholesale, bale, package, hogshead, barrel or tierce. After pronouncing such a licence to be in effect a tax, the chief justice observed that so long as the thing imported remained "the property of the importer, in his warehouse, in the original form or package in which it was imported," a tax upon it was too plainly a duty on imports to escape the prohibition of the Constitution.

Later decisions agree that the right to import commodities or to ship them from one State to another carries with it the right to sell them, and have established the boundary line between Federal and State control of both foreign imports and inter-State shipments at a sale in the original package (*Waring* v. *Mobile,* 8 Wall. 110) or at the breaking of the original package before sale for other purposes than inspection (*May* v. *New Orleans,* 178 U.S. 498). A State or a municipality may, however, tax while in their original packages any commodities which have been shipped in from another State, provided there be no discrimination against such commodities.

The term occasioned considerable confusion prior to the adoption of the 18th (prohibition) amendment to the Constitution in 1919. The Supreme Court in Jan. 1847, in the licence cases, upheld the constitutionality of Massachusetts, New Hampshire and Rhode Island laws requiring licences for the sale of intoxicating liquors, the liquor having been shipped in the inter-State commerce (5 Howard 504). The justices based their decisions on different opinions and did not even agree that the power of Congress to regulate inter-State commerce included the power to authorize a sale after shipment. The Supreme Court held in *Leisy* v. *Hardin,* in 1889, where a keg of beer sold in Iowa, a prohibition State, had been shipped from Illinois by order of an agent of an Illinois firm, that so long as it was sold in the original package, it remained a matter for Federal regulation only (135 U.S. 100). This overruled in part the doctrine in the licence cases. Congress passed in 1890 the Wilson Act, which provided that where intoxicants were shipped into a State or Territory, they were subject to the police laws of such State or Territory. Even with this act, however, a State was not permitted to interfere with an inter-State shipment of liquor direct to the consumer. The Webb Act, passed by Congress in 1913, did prohibit the shipment of liquor into any State in violation of its police laws.

What constitutes an original package was the principal question in the case of *Schollenberger* v. *Pennsylvania* (171 U.S. 1), the court deciding that the State of Pennsylvania could not prohibit the sale of oleomargarine by retail when it had been shipped from Rhode Island in packages containing only ten pounds each, and the original package doctrine has been sharply criticized because of the difficulty in determining what constitutes an original package, as well as because of the conflict between the doctrine and the police powers of the several States.

*See* J. B. Uhle, "The Law Governing an Original Package," in *The American Law Register,* vol. xxix. (Philadelphia, 1890); Shackelford Miller, "The Latest Phase of the Original Package Doctrine," and M. M. Townley, "What is the Original Package Doctrine?" both in *The American Law Review,* vol. xxxv. (St. Louis, 1901); also F. H. Cooke, *The Commerce Clause of the Federal Constitution* (1908).

**ORIHUELA,** a town and episcopal see of eastern Spain, in the province of Alicante; 13 m. N.E. of Murcia and about 15 m. from the Mediterranean Sea, on the Murcia-Elche railway. Pop. (1940) 11,983 (mun., 43,619). It is situated in an exceedingly fertile *huerta,* on both sides of the river Segura, which divides the city into two parts, Roig and San Augusto, and is spanned by two bridges. Orihuela was captured by the Moors in 713, and retaken by James I. of Aragon, for his father-in-law Alphonso of Castile, in 1265. It was sacked during the disturbances at the beginning of the reign of Charles V. (1520), and again in the War of Succession (1706). Local annals specially mention the plague of 1648, the flood of 1651 and the earthquake of 1829. The university of Orihuela, founded in 1568 by the archbishop of Valencia, was closed in 1835. The trade in fruit, cereals, oil and wine is considerable. There are also tanneries, dye and silk works, linen and woollen fabrics, leather and starch.

**ORILLIA,** a town and port of entry of Simcoe county, Ontario, Canada, situated 84 m. N. of Toronto, on Lake Couchiching and on the Canadian National and Canadian Pacific railways. Pop. (1941) 9,798. It is a favourite summer resort, and has an extensive trade in lumber and farm produce. It contains an asylum, saw and grist mills and iron foundries.

**ORINOCO,** a river and river system of northern South America. Its basin embraces about one-half of the eastern plains of Colombia and nearly all of Venezuela south and east of the Andes; it ranks third in area among the South American river basins. The main river is about 1,500 m. long from its source in the Sierra Parima on the Venezuela-Brazil boundary to the Atlantic ocean, and, except for a stretch of about 200 m. between the mouths of the Guaviare and Meta rivers, where it forms a part of the Venezuela-Colombia boundary, it is in Venezuela. At about 150 m. from its source it bifurcates into the Casiquiare canal to the Río Negro of the Amazon system, affording a through water way to the Amazon basin. Three major rapids and numerous minor ones obstruct the upper river. At the mouth of the Apure the Orinoco is 2 m. wide in the dry season and often 7 m. wide in time of floods, and narrows to 800 ft. at the city of Ciudad Bolívar. Large steamers can navigate as far as the Cariben rapids, 700 m. from the ocean and only 6 m. from the mouth of the Meta. At the Cariben rapids the difference between high and low water averages 32 ft., while at the Angostura, at Ciudad Bolívar, the average rise is 50 ft. and has been known to reach 60.

The Orinoco enters the ocean by a delta of approximately 700 sq.m. of islands and swamps covered with dense vegetation and so little above sea-level that they are periodically flooded. The Boca Grande at the mouth of the Corosimi river (the southernmost channel of the delta) is the deepest outlet; but the Caño Macareo, one of the outlets of the Vagre river (the westernmost channel of the delta), is usually taken by steamers because it is the most direct navigable route to the Gulf of Paria.

Ordaz, whose expedition (1531–32) entered the Orinoco by the Boca de Navíos and, with much loss of life, ascended to the mouth of the Meta, was the first to explore any part of the river, although Columbus, while exploring the Gulf of Paria in 1498, noticed the freshness of its waters without investigating their source, and Ojeda, following closely the track of Columbus in 1499, probably passed in sight of one or more of the mouths of the river. There have since been many expeditions and surveys.

Except for a few outliers which form isolated hills north of the lower river, the Orinoco is the dividing-line between the *llanos* and the highlands of Venezuelan Guiana. The tributaries from the Guiana highlands are little known. They all have their sources in the divide which carries the Venezuela-Brazil boundary. The largest, the Ventuari, joins the Orinoco about 90 m. above the mouth of the Guaviare. The Caura, the next large stream to the east, is much obstructed with falls and rapids, while the lower Caroni is more or less navigable for some 400 miles. The *llanos* are divided into a broad, well-watered western section and a narrower and much drier eastern section. North of the upper Guaviare and its tributaries the western section rises gently from an elevation of about 130 ft. at the mouth of the Apure to about 700 ft. at the border of the Andes. Its principal rivers have their sources in innumerable mountain torrents that rise in the eastern ranges of the Eastern Cordillera of Colombia. From the Guaviare north to 6° 30′ N. lat. these streams are fed so abundantly by the condensation of moisture from the north-east trade winds that they have headed far back toward the high savannas of the Eastern Cordillera.

The most important tributaries of the Orinoco in this section are the Apure, Arauca, Meta and Guaviare. The Apure was, until recently, formed by the junction of the Uribante and Sarare, but the latter has now dammed its lower channel and flows to the Arauca, leaving the Uribante, an important stream with 16 large

affluents, and the Nula, formerly a tributary of the Sarare, as the chief sources of the Apure. The Apure is about 650 m. long from the Uribante-Nula junction. It is in large part navigable for large craft but is obstructed by rapids about 100 m. from its mouth. The northern tributaries drain the eastern and southern slopes of the Venezuelan Andes. Of these the Portuguesa, which the cattle route from San Fernando to Puerto Cabello follows, and a few others, are navigable for short distances. The Arauca parallels the Apure on the south. When in flood, the additional water now brought to the Arauca by the Sarare causes it to overflow and send part of its surplus water by several *caños* to the Capanaparo, a tributary which joins the Orinoco about 18 m. S. of the mouth of the Arauca.

The main stream of the Guaviare, southernmost of the great western tributaries of the Orinoco, is known as the Guayabero from its source to the mouth of the Ariari, a large tributary from the north-west. It marks in a general way the dividing line between the low savannas of the north and the higher and more varied topography of the south. The main stream and many of its tributaries after leaving the piedmont cut their way through four distinct zones: (1) a dissected sandstone plateau, the crests of which rise 1,500 ft. above the *llanos;* (2) a zone east of the escarpment of the plateau of sandstone remnants separated by clayey depressions; (3) a crystalline peneplain where the granites and gneisses are mostly covered with lateritic clays; and (4) a low plain on which stand isolated massifs of the dome-like form characteristic of crystalline mountains in wet tropical climates. The Ariari tributary is navigable for large barges for a considerable distance. About 300 m. of the Guayabero-Guaviare are said to be navigable but narrows and rapids which mark the passage of the river from one zone to another offer serious obstacles.

(R. R. P.)

**ORIOLE,** the name applied in Europe to the members of the family *Oriolidae.* The golden oriole (*Oriolus oriolus*) is an occasional spring visitor to the British Islands, but has rarely bred there. On the continent of Europe it is a well-known bird; its range in summer extends east to Irkutsk, while in winter it is found in Natal and Damaraland. In India it is replaced by an allied form, *O. kundoo,* the mango-bird, and both in Asia and Africa are several other species, some of which have a black head, or even a glowing crimson, instead of the ordinary yellow colouring, while others exhibit the dingy type of plumage seen in the female of the more normal form. Among these last are the species of the group, *Mimeta,* belonging to the Australian region, which mimic friar-birds (*see* A. R. Wallace, *Malay Archipelago;* HONEY-EATER). Another genus which has been referred to the *Oriolidae* is *Sphecotheres,* peculiar to the Australian region, and distinguishable by a bare space round the eye. Orioles are shy and restless birds, frequenting gardens and woods, and living on insects and fruit. The nest is pocket-shaped, of bark, grass, and fibres, and the eggs are white or salmon-coloured with dark spots. The name is applied in America to the *Icteridae* family.

**ORION** (or OARION), in Greek mythology, son of Hyrieus or Poseidon, a mighty hunter of great beauty and gigantic strength. He is also sometimes represented as sprung from the earth. He was beloved of Eos, the dawn-goddess, who carried him off to Delos; but Artemis slew him with her arrows (*Odyssey,* v. 121). According to other accounts which attribute Orion's death to Artemis, the goddess herself loved him and was deceived by the angry Apollo into shooting him by mistake; or he paid the penalty of offering violence to her, or of challenging her to a contest of quoit-throwing (Apollodorus i. 4; Horace, *Odes,* iii. 4, 71). In the lower world his shade is seen by Odysseus driving the wild beasts before him as he had done on earth (*Odyssey,* xi. 572). After his death he was changed into the constellation which is called by his name. It took the form of a warrior, wearing a girdle of three stars and a lion's skin, and carrying a club and a sword. When it rose early it was a sign of summer; when late, of winter and stormy weather; when it rose about midnight it heralded the season of vintage.

*See* Küentzle's article in Roscher's *Lexikon;* Preller-Robert, *Griechische Mythologie* (1894), pp. 448–454.

Orion is one of the most conspicuous constellations, containing many bright stars. Of these Betelgeuse is easily distinguished by its yellowish-red colour in contrast to all the other important stars of the constellation which are white B-type stars. Betelgeuse is an irregular variable sometimes above and sometimes below the first magnitude. It was the first star for which the apparent diameter was measured by Michelson's interferometer method (1920). Rigel at the opposite corner of the quadrilateral is rather brighter; and the third brightest star is Bellatrix. The Orion nebula can be seen with the naked eye just below the belt; faint extensions of it have been photographed filling practically the whole constellation. The multiple star $\theta$ Orionis is near the centre of the nebula. There is no doubt that the principal stars of the constellation form a single system, and are involved in the nebulosity whose luminescence is stimulated by their intense radiation rich in light of short wave-length. The distance of the nebula is estimated at 1,200 light years.

**ORION** and **ORUS,** the names of several Greek grammarians, frequently confused. The following are the most important. (1) Orion of Thebes in Egypt (5th century A.D.), the teacher of Proclus the neo-Platonist and of Eudocia, the wife of the younger Theodosius. He taught at Alexandria, Caesarea in Cappadocia and Byzantium. He was the author of a partly extant etymological Lexicon (ed. F. W. Sturz, 1820), largely used by the compilers of the *Etymologicum Magnum,* the *Etymologicum Gudianum* and other similar works; a collection of maxims in three books, addressed to Eudocia, also ascribed to him by Suidas, still exists in a Warsaw ms. (2) Orus of Miletus, who, according to Ritschl, flourished not later than the 2nd century A.D., and was a contemporary of Herodian and a little junior to Phrynichus. His chief works were treatises on orthography; on Atticisms; on the names of nations.

*See* F. Ritschl, *De Oro et Orione Commentatio* (1834); R. Reitzenstein, *Geschichte der griechischen Etymologika* (1897); and article "Orion" in Smith's *Dictionary of Greek and Roman Biography.*

**ORISKANY** (ō-rĭs′ką-nĭ), a village of Oneida county, New York, U.S.A., about 7 mi. N.W. of Utica. Pop. (1940) 1,115. Oriskany is served by the New York Central railway. In a ravine, about 2 m. west of Oriskany, was fought on Aug. 6, 1777 the battle of Oriskany, an important minor engagement of the American Revolution. On Aug. 4, Gen. Nicholas Herkimer had gathered about 800 militiamen at Ft. Dayton (on the site of the present Herkimer, N.Y.) for the relief of Ft. Schuyler (*see* ROME, N.Y.) then besieged by British and Indians under Col. Barry St. Leger and Joseph Brant. On the 6th Gen. Herkimer's force, on its march to Ft. Schuyler, was ambushed by a force of British under Sir John Johnson and Indians under Joseph Brant in the ravine above mentioned. The rear portion of Herkimer's troops escaped from the trap, but were pursued by the Indians, and many of them were overtaken and killed. Between the remainder and the British and Indians there was a desperate hand-to-hand conflict, interrupted by a violent thunderstorm, with no quarter shown by either side. On hearing the firing near Ft. Schuyler (incidental to a sortie by Lt.-Col. Marinus Willett) the British withdrew, after about 200 Americans had been killed and as many more taken prisoners, the loss of the British in killed being about the same. Gen. Herkimer, though his leg had been broken by a shot at the beginning of the action, continued to direct the fighting on the American side, but died on Aug. 16, as a result of the clumsy amputation of his leg. The battle, though indecisive, had an important influence in preventing St. Leger from affecting a junction with Gen. Burgoyne. The battlefield is marked by a monument erected in 1884. The sesquicentennial of the battle was celebrated Aug. 6, 1927. The Oneida Historical society then presented to the state the battle monument and about 5 ac. of land for a state park.

See *Orderly Book of Sir John Johnson during the Oriskany Campaign* (Albany, 1882), with notes by W. L. Stone and J. W. De Peyster; *Publications* of the Oneida Historical Society, vol. i. (Utica, N.Y., 1877); and Phoebe S. Cowen, *The Herkimers and Schuylers* (Albany, 1903); T. G. Best, *A Soldier of Oriskany* (Boonville, N.Y., 1935); T. W. Clarke, *The Bloody Mohawk* (1940).

**ORISSA,** an autonomous province and 23 states in northeastern India. The British province has an area of 32,198 sq.mi. and

a population (1941) of 8,728,544. Cuttack is the capital of the province; and Puri, with its temple of Jagannath is world-famous.

The Oriyas are an intensely patriotic people who are proud of their culture and language and trace their traditions back to the ancient kingdom of Utkal. They have always been opposed to the breaking up of Oriya-speaking tracts for political reasons. At the time of the Mogul conquest the Orissa country was broken up and race consciousness became less intense but was revived under the British regime, especially after the famine of 1866. Agitation for the unification of Oriya tracts began to receive official recognition in 1903 and was sustained by the Utkal Union conference. In 1912 the area of modern Orissa was separated from Bengal and united with Bihar to form the province of Bihar and Orissa. The status of the Oriyas was much improved by this step but they still continued their agitation for the formation of Orissa into a separate administrative unit on the basis of common language and race. In Jan. 1936, an order-in-council was issued by His Majesty's government constituting Orissa as a separate province. The new province was formed from (1) the Orissa division of the former province of Bihar and Orissa; (2) areas transferred from the Presidency of Madras including [a] the Ganjam Agency Tracts, [b] parts of the Ganjam district and [c] parts of the Vizagapatam district; and (3) areas transferred from the Central Provinces including [a] the Khariar Zamindari in the Raipur district and [b] the Padampur Tract in the Bilaspur district. The province consists of six districts, viz., Sambalpur, Koraput, Ganjam, Cuttack, Puri and Balasore, the latter three constituting the delta of the Mahanadi, Brahmani and Baitarani rivers. In 1866 Orissa suffered from famine, followed by destructive floods, during which 1,000,000 persons are estimated to have perished, largely owing to its isolation. The danger of the recurrence of such a famine was averted by the Orissa canal system and the railway, as well as by the increased prosperity of the people. The occurrence of floods still occasionally causes distress. The beds of the deltaic rivers have been raised by deposits of silt and their outlets obstructed by sand bars until flood waters are not discharged by natural channels but are liable to burst the embankments and inundate the low-lying country on either side.

Orissa is still a backward region from an industrial and agricultural standpoint. There are no big factories but there are a number of cottage industries producing handloom products and metal work. Production of jute and sugar cane as commercial crops is being steadily increased. There are forest resources of valuable timber. Mineral resources include iron ore of excellent quality, coal, limestone, manganese and mica. Orissa provides more than 60 per cent of the iron ore extracted in India.

The states of Orissa are grouped in the Orissa States Agency, one of the minor agencies of the Eastern States Agency. They are 23 in number and comprise Athgarh, Athmallik, Bamra, Baramba, Baudh, Bonai, Daspalla, Dhenkanal, Gangpur, Hindol, Keonjhar, Khandpara, Kharsawan, Narsinghpur, Nayagarh, Nilgiri, Pal Lahara, Rairakhol, Ranpur, Seraikela, Sonepur, Talcher and Tigiria. Their combined area is 18,151 sq.mi.; pop. (1941) 3,023,731. Headquarters for the Orissa States Agency is at Sambalpur.

**ORISTANO,** a town and archiepiscopal see of Sardinia, Italy, 23 ft. above sea level, 3 mi. from the eastern shore of a gulf on the west coast, to which it gives its name, and 59 mi. N.W. of Cagliari by rail. Pop. (1936) 9,454 (town), 14,662 (commune). The town has remains of the walls (1290), and two gates, the Porta Manna, with a lofty square tower (Torre S. Cristoforo) and the Porta a Mare. The houses are made of sun-dried bricks. Two miles south of Oristano is the village of S. Giusta, with a beautiful Romanesque church of the Pisan period dedicated to this saint, containing several antique columns. The lagoons on the coast are full of fish, but are a cause of malaria. In the environs garden produce is grown; good wine (*vernaccia*) is made, as well as ordinary pottery. It is also a centre of the cattle trade. A mile south of the mouth of the river Tirso is the landing place for shipping. The large orange groves of Milis lie 13 mi. N. of Oristano at the base of Monte Ferru. The inhabitants of Milis manufacture reed baskets and mats, which they sell throughout Sardinia.

Oristano occupies the site of the Roman Othoca, the point at which the inland road and the coast road from Carales to Turris Libisonis bifurcated. The mediaeval town (1070) was the seat onwards of the *giudici* (judges) of Arborea, one of the four divisions of the island. Almost the last of these judges was Eleonora (1347–1403); after her death Oristano became the seat of a marquisate, which was suppressed in 1478.

**ORIZABA** (Indian name *Ahuializ-apan,* pleasant waters), a city of Mexico in the state of Veracruz, 82 mi. by rail W.S.W. of the port of Veracruz. Pop. (1940) 47,910 including a large percentage of Indians and half-breeds. The Mexican and Mexican national railways afford frequent communication with the City of Mexico and Veracruz, and a branch line of the latter connects with the Tehuantepec National.

Orizaba stands in a fertile, well-watered, richly wooded valley of the Sierra Madre Oriental, 4,025 ft. above sea level, and about 18 mi. S. of the snow-crowned volcano that bears its name. It has a mild, humid and healthful climate. The public edifices include the parish church of San Miguel, a chamber of commerce, a handsome theatre and some hospitals. The city is the centre of a rich agricultural region which produces sugar, rum, tobacco and Indian corn. In colonial times, when tobacco was one of the crown monopolies, Orizaba was one of the districts officially licensed to produce it. It is also a manufacturing centre of importance, having good water power from the Rio Blanco and producing cotton and woollen fabrics. Its cotton factories are among the largest in the republic. The forests in the vicinity are noted for orchids and ferns. An Indian town called *Ahuializapan,* subject to Aztec rule, stood here when Cortes arrived on the coast. The Spanish town that succeeded it did not receive its charter until 1774. In 1862 it was the headquarters of the French.

**ORIZABA,** in Aztec, *Citlaltepetl,* "star mountain," an extinct or dormant volcano, on the boundary between the Mexican states of Puebla and Veracruz and very nearly on the 19th parallel. It rises from the southeastern margin of the great Mexican plateau to an elevation of 18,314 ft., according to Scovell and Bunsen's measurements in 1891–92, or 18,250 and 18,209 ft. according to other authorities, and 18,701 (5,700 metres) by the Comisión Geográfica Exploradora. It is the highest peak in Mexico, probably third highest in North America. Its upper timber line is about 13,500 ft. above sea level, and Hans Gadow found patches of apparently permanent snow at an elevation of 14,400 ft. on its southeast side in 1902. The first ascent of Orizaba was made by Reynolds and Maynard in 1848. Its last eruptive period was 1545–66, and the volcano is now considered to be extinct.

**ORJONIKIDZE** (formerly VLADIKAVKAZ), a town of the Russian S.F.S.R., in the North Ossetian A.S.S.R., in 43° 3′ N., 44° 42′ E. Pop. (1939) 127,172. The former name Vladikavkaz meant "Key of the Caucasus"; the town stands on a plateau 2,345 ft. high on both sides of the Terek river, where the latter issues from the Darial gorge. Towering above the town is the famous Kasbek peak. A small fort was established there in 1784, but the expansion of the town dates from the completion of the great Georgian military road southward through the gorge to Tiflis, which was begun in 1811 and opened in 1864. Later a railway link was made through Beslan to the Rostov-Baku line to the north. The great gorge has much historic importance for the region; through it came Persian armies and, later, Timur and his Mongol hordes, and its military road brought about the pacification of the warring Caucasian frontier tribes and gave Russia her foothold in the Caucasus. The town was renamed Orjonikidze after the famous soviet leader.

**ORKHON INSCRIPTIONS,** ancient Turkish inscriptions of the 8th century A.D., discovered near the river Orkhon to the south of Lake Baikal in 1889. They are written in an alphabet derived from an Aramaic source and recount the history of the northern branch of the Turks or Tu-kiue of Chinese historians. *See* TURKS.

**ORKNEY, EARL OF,** a Scottish title held at different periods by various families, including its present possessors the Fitzmaurices. The Orkney islands (*q.v.*) were ruled by jarls or earls under the supremacy of the kings of Norway from very early times to about 1360, many of these jarls being also earls of Caith-

ness under the supremacy of the Scottish kings. Perhaps the most prominent of them were a certain Paul (d. 1099) who assisted the Norwegian king, Harald III. Haardraada, when he invaded England in 1066; and his grandson Paul the Silent, who built, at least in part, the cathedral of St. Magnus at Kirkwall. They were related to the royal families of Scotland and Norway.

In its more modern sense the earldom dates from about 1380, and the first family to hold it was that of Sinclair, Sir Henry Sinclair (d. *c.* 1400) of Roslin, near Edinburgh, being recognized as earl by the king of Norway. He ruled the islands almost like a king, and employed in his service the Venetian travellers Nicolo and Antonio Zeno. His son Henry (d. 1418) was admiral of Scotland and was taken prisoner by the English in 1406, together with Prince James, afterwards King James I.; his grandson William, the 3rd earl (*c.* 1404–80), was chancellor of Scotland and took some part in public affairs. In 1455 William was created earl of Caithness, and in 1470 he resigned his earldom of Orkney to James III. of Scotland, who had just acquired the sovereignty of these islands through his marriage with Margaret, daughter of Christian I., king of Denmark and Norway. In 1567 Queen Mary's lover, James Hepburn, earl of Bothwell, was created duke of Orkney, and in 1581 her half-brother Robert Stewart (d. 1592), an illegitimate son of James V., was made earl of Orkney. Robert, who was abbot of Holyrood, joined the party of the reformers and was afterwards one of the principal enemies of the regent Morton. His son Patrick acted in a very arbitrary manner in the Orkneys, where he set the royal authority at defiance; in 1609 he was seized and imprisoned, and, after his bastard son Robert had suffered death for heading a rebellion, he himself was executed in Feb. 1614, when his honours and estates were forfeited.

In 1696 Lord George Hamilton was created earl of Orkney. He married Elizabeth Villiers, and was succeeded by his daughter Anne (d. 1756), the wife of William O'Brien, 4th earl of Inchiquin. Anne's daughter Mary (*c.* 1721–91) and her granddaughter Mary (1755–1831) were both countesses in their own right, the younger Mary married Thomas Fitzmaurice (1742–93), son of John Petty, earl of Shelburne, and was succeeded in the title by her grandson, Thomas John Hamilton Fitzmaurice (1803–77), whose descendants still hold the earldom.

See *Records of the Earls of Orkney, 1299–1664,* ed. by J. S. Clouston (1914).

**ORKNEY ISLANDS,** group forming a county off the north coast of Scotland. They are separated from the mainland by the Pentland firth, which is 6¼ mi. wide between Brough Ness in the island of South Ronaldshay and Duncansbay head in Caithnessshire. The group consists of 67 islands (excluding rocky islets), of which 28 were inhabited in 1931, four of them only by lighthouse attendants. They measure 50 mi. from northeast to southwest, and 29 mi. from east to west, and cover 376.3 sq.mi. Excepting on the west coasts of the larger islands, which present rugged cliff scenery, the group lies somewhat low and is of bleak aspect, owing to the absence of trees. The islands are built up wholly of Old Red Sandstone. The Old Man of Hoy is a fine stack of rock standing detached from the north-west cliffs. The only other islands containing heights of any importance are Pomona, with Ward hill (880 ft.), and Wideford (740 ft.) and Rousay. Erratics of distant origin (*e.g.,* from Moray firth) give evidence of glacial action. Nearly all of the islands possess lakes, the largest being Loch Harray and Loch Stenness in Pomona. The rivers are merely streams. Excepting on the west fronts of Pomona, Hoy and Rousay, the coast-line of the islands is deeply indented, and the islands themselves are divided from each other by straits, generally called *sounds* or *firths,* though off the northeast of Hoy is *Bring Deeps,* south of Pomona is Scapa *Flow* and to the south-west of Eday is the *Fall* of Warness. The topographical names are Norse, and the common terminal of the names of the islands, *a* or *ay,* is the Norse *ey,* meaning "island." The islets are usually called *holms* and the isolated rocks *skerries.* The tidal currents, or *roost* (as some of them are called locally, from the Icelandic), off many of the isles run very fast and whirlpools are frequent.

**History.**—The Orkneys were the *Orcades* of classical writers, and the word is probably derived from the Norse *Orkn,* seal, and *ey,* island. Evidences of prehistoric occupation include numerous weems or underground houses, chambered mounds, barrows or burial mounds, *brochs* or round towers, and stone circles and standing stones. Three of the most famous are the corbelled tomb at Maeshowe, and the circles of standing stones at Brogar and Stennis with an early village discovered in 1928. If, as seems likely, the Dalriadic Scots towards the beginning of the 6th century established a footing in the islands, their success was short-lived, and the native inhabitants regained power and kept it until dispossessed by the Norsemen in the 9th century. The Celtic missionaries, companions of St. Columba, followed about 565. As the Norse pirates made raids on Norway from the islands, as well as on Scotland, Harold Haarfager ("Fair Hair") subdued the rovers in 875 and added the Orkneys and Shetlands to Norway. They remained under the rule of Norse earls until 1231, when the line of the earls became extinct. In that year the earldom of Caithness was granted to Magnus, second son of the earl of Angus, whom the king of Norway apparently confirmed in the title. In 1468 the Orkneys and Shetlands were pledged by Christian I. of Denmark for the payment of the dowry of his daughter Margaret, betrothed to James III. of Scotland, and as the money was never paid, their connection with the crown of Scotland has been perpetual. In 1471 William, earl of Orkney, exchanged his earldom for lands in Fife, and the islands were annexed to the Scottish crown. In 1581 Lord Robert Stewart, natural son of James V., was created earl of Orkney, but in 1615 the earldom was again annexed to the crown. The islands were the *rendezvous* of Montrose's expedition in 1650 which culminated in his imprisonment and death. In 1707 the islands were granted to the earl of Morton in mortgage, but in 1766 his estates were sold to Sir Lawrence Dundas, ancestor of the marquesses of Zetland.

In early times both the archbishop of Hamburg and the archbishop of York disputed with the Norwegians ecclesiastical jurisdiction over the Orkneys; but ultimately the Norwegian bishops, the first of whom was William the Old, consecrated in 1102, continued the canonical succession. The see, left vacant on several occasions, was finally abolished in 1697, although many of the clergy refused to conform. The Norse tongue, at last extinguished by the constant influx of settlers from Scotland, lingered until the end of the 18th century. When the islands were given as security for the princess's dowry, there seems reason to believe that it was intended to redeem the pledge, because it was then stipulated that the Norse system of government and the law of St. Olaf should continue to be observed in Orkney and Shetland. Thus the *udal* succession and mode of land tenure (or, that is, absolute freehold as distinguished from feudal tenure) still obtain to some extent, and the remaining *udallers* hold their lands and pass them on without written title.

**Agriculture and Industries.**—The soil generally is a sandy loam or a strong but friable clay, and very fertile. About 45% of the total area was under cultivation in 1938 and farming is now up to the general Scottish standard. The crofters' houses have been rebuilt of stone and lime, and are superior to those in most parts of the Highlands. Of the 3,203 holdings in 1938, about 55% were between 5 and 30 ac., the average being 34 ac. The grain crops are oats and barley, while the favoured root crops are turnips and potatoes. Cattle and sheep are reared, some pigs are kept, and the horses—as a rule hardy, active and small—are numerous. The woollen, linen, straw-plaiting and kelp industries have all successively failed, though the last named has been revived. Sandstone is quarried on several islands, and distilleries are found in Pomona. About half the population is engaged in agriculture. Apart from this, the principal industry is fishing. For several centuries the Dutch practically monopolized the herring fishery, but when their supremacy was destroyed by the salt duty, the fisheries were almost totally neglected. The industry, however, is now of considerable importance, particularly the herring fishery, followed by the cod, ling and lobster fisheries. There is a regular communication by steamer between Stromness and Kirkwall, and Thurso, Wick, Aberdeen and Leith, and also between Kirkwall and Ler-

wick and other points of the Shetlands.

**Population and Administration.**—The county population was 21,799 in 1938. In 1931 there were 58 persons who spoke Gaelic and English but none who spoke Gaelic only. Orkney unites with Shetland to send one member to parliament. Kirkwall, the county town, is the only royal burgh. Kirkwall (pop. 3,673, 1938 est.) and Stromness (1,550) are the only small burghs. Orkney forms a sheriffdom with Shetland and Caithness.

**The Inhabited Islands.**—From south to north, the islands (1931 population in brackets) include Sule Skerry (lighthouse, 6), Pentland Skerries (lighthouse, 5), Swona (6), South Ronaldshay (1,312), Hoy (955). On Hoxa head is a *broch,* or round tower, and the island contains examples of Picts' houses and standing stones. The famous Dwarfie stone, an enormous block of sandstone with rooms hollowed out in it, lies in a valley near Ward hill. Flotta (282), east of Hoy, was the home for a long time of the Scandinavian compiler of the *Codex Flotticensis,* which furnished Thormodr Torfaeus (1636–1719), the Icelandic antiquary, with many of the facts for his *History of Norway.* Pharay (40) also lies east of Hoy. Burray (379) is famous for the *broch* from which the island takes its name (Borgarey, Norse, "island of the broch"). The tower stands on the northwestern shore, is 15 ft. high, has walls from 15 to 20 ft. thick, built of layers of flat stones without cement or mortar, and an interior diameter of 40 feet. Between Hoy and Pomona are Hunda (3 in 1921, nil in 1931), Cava (14) and Graemsay (114). It was around Cava that the 70 vessels of the German navy were scuttled in 1919; 32 were raised between 1924 and 1931, and salvage operations were renewed in 1934. The isle, surrounded by shoals, has two lighthouses. The cliffs of Copinsay (25) are a favourite haunt of sea-birds.

Pomona (*q.v.*) is the principal island and is known as Mainland. Shapinsay (576) was the birthplace of William Irving, father of Washington Irving. It possesses several examples of Pictish and Scandinavian antiquities and Balfour Castle, built in 1848. Gairsay (5) was the home of Sweyn Asleifson, the rover. At Lamb head is a *broch* and Pictish pier, and on Odin bay is a round pit in the rocks called the Vat of Kirbuster. Papa Stronsay (18) commemorates the Celtic *papae,* or missionaries, who preached before the arrival of the Northmen. The adjacent Wyre or Veira has a population of 44; Egilsay (85) is the island on which St. Magnus was murdered by his cousin Hacco in 1115. It derives its name (*ecclesia*) from the little church of St. Magnus, now in ruins. The round tower resembles similar ones found beside Irish churches of the 7th and 8th centuries and has walls 3 ft. thick. Eday (430) contains weems, mounds and standing stones. Carrick village was named after the earl of Carrick. It was off this island that John Gow, the pirate, was taken in 1725. Stronsay (953) and Rousay (468) are other large islands.

Sanday (1,160), one of the largest northern islands, has an area of 19 sq.mi. It produces potatoes and grain and has harbours at Otterswick and Kettletoft. The antiquities include a *broch* in Elsness. Pharay (28). Westray (1,269) has a harbour at Pier-o'-wall. Noltland castle was proposed as the refuge of Queen Mary after her flight from Loch Leven. It was at one time the property of Sir Gilbert Balfour, the master of Queen Mary's household. At the westerly point, there is the Stack of Noup. Gentleman's Cave afforded shelter to five followers of Prince Charles Edward during the winter of 1745–46.

Papa Westray (237) and North Ronaldshay (298) are the most northerly islands. The latter is reached only from Sanday over a dangerous firth 2½ mi. wide. The monumental stone with Ogham inscription, discovered in the *broch* of Burrian, must date from early Christian missionary times.

**ORLANDO, VITTORIO EMANUELE** (1860– ), Italian politician and jurist, was born at Palermo on May 19, 1860. Becoming a barrister and a law professor, he was first elected deputy for Partinico in Sicily in 1897. He was minister of education in the Giolitti cabinet of 1903–05, and of justice in the Giolitti cabinet of 1907–09, and again under Salandra in November 1914. Although a Giolittian at heart, he was in favour of Italian intervention in World War I. On the resignation of the Salandra Cabinet in June 1916 he remained in office under Boselli as minister of the interior, and when the latter resigned Orlando was entrusted with the formation of a new Cabinet. After the Armistice he went to Paris as president of the Italian peace delegation. When President Wilson launched his appeal on Fiume to the Italian people over the heads of their delegates, he returned to Rome, where he was triumphantly received, but after his return to Paris without the guarantees he was supposed to have secured, and without obtaining any satisfactory solution of the Adriatic problem, the chamber voted against him and he resigned on June 19, 1919.

On Dec. 2, 1919, he was elected president of the chamber. He at first supported Fascism and the Mussolini government, and was re-elected deputy in 1924 on the government list; but after the Matteotti affair he withdrew his support, without, however, abandoning the chamber. At the municipal elections of Palermo in August 1925 he mobilized all his adherents in favour of the anti-fascist list but upon the subsequent triumph of the fascists, obtained through a series of violences and frauds, Orlando resigned from parliament in protest.

*See* L. Hautecoeur, *L'Italie sous le ministère Orlando, 1917–19* (1919); R. Lansing, *The Big Four* (1922).

**ORLANDO,** a city of Florida, U.S.A., the county seat of Orange county; 125 mi. S. of Jacksonville, on Federal highways 92 and 441 and served by the Atlantic Coast Line and the Seaboard Air Line railways. Pop. was 30,381 in 1935 (state census); 36,736 in 1940 (by federal census). The region is devoted to citrus fruits, is dotted with lakes (1,000 in the county), and is a centre for tourists. At Winter Park, 4 mi. N.E., is Rollins college (1885), beautifully situated on Lake Virginia. Orlando, founded in 1843, was incorporated in 1875.

**ORLEANAIS,** formerly a French province, comprised the country around Orleans, the *pagus Aurelianensis;* it lay on both banks of the Loire, and for ecclesiastical purposes formed the diocese of Orleans. It had formed part of the territory possessed by the ancestors of Hugh Capet and long remained an important part of the royal demesne. In 1344 Philip VI. gave it with the title of Duke to Philip (d. 1375), one of his younger sons.

*See* A. Thomas, *Les États provinciaux de la France centrale* (1879).

**ORLEANISTS,** a French political party which arose out of the Revolution. It took its name from the Orleans branch of the house of Bourbon, the descendants of Philippe, duke of Orleans, younger brother of Louis XIV., who were its chiefs. Its aim was to reconcile the monarchical principle with the "rights of man," as proclaimed by the Constituent Assembly in 1789. The Orleans princes were traditionally marked out as the leaders in such a policy. Enormously rich, within measurable distance of the succession to the throne, but cut off by the jealousy of the crown from all share in public affairs, they had long been the centres of opposition to the encroachment of the royal power. Louis, duke of Orleans, had headed the protest of the princes against the policy of Maupeou in suppressing the *parlement* of Paris; his son later earned the style of Philippe Égalité by adopting—with ulterior objects—extreme revolutionary views (*see* ORLEANS, LOUIS PHILIPPE J., duke of); and Égalité's son, Louis Philippe (afterwards king of the French) fought, as duc de Chartres, at Jemappes, under the republican tricolour. The generation of Orleanists, the immediate supporters of Philippe Égalité, were swamped in the turmoil of the Revolution. But they came naturally to the front when another revolution overthrew the restored legitimate monarchy of Louis XVIII. and Charles X. During the Restoration, 1815–30, everything tended to identify the Liberals with the Orleanists. It is true that Louis XVIII. had been induced to grant (*octroyer*) a constitutional charter; but he and his successor claimed to rule by divine right and to confer liberties upon their subjects of their own will. The difference between the Legitimists and the Orleanists was thus fundamental. So was that between the Orleanists and the Bonapartists; for the former aimed at securing political liberty, in addition to equality before the law and in social life, while the latter aimed at subjection to a military despotism.

The revolution of 1830 brought the Orleanists into power, and

they marked the profound change made in the character of the government by styling Louis Philippe not "king of France and Navarre by the grace of God," but "king of the French by the grace of God and the will of the people." The Orleanists were led by men eminent in letters and in practical affairs—Guizot, Thiers, the Broglies, the banker Laffitte, and many others—and the 18 years of their rule were, on the whole, profitable to France. That they ended in another "general overturn" in 1848 was due mainly to the fact that the Orleanist conception of what was meant by the word "people" led the Government to offend the deeply-rooted love of the French for equality. On the model of the English constitution they instituted a *pays légal* of about a quarter of a million of voters by whom all the rest of the country was to be "virtually represented." But the nation outside of the *pays légal* soon discovered that it was being governed by a privileged class, less offensive perhaps, but also less brilliant, than the aristocracy of the old monarchy.

The revolution of 1848 swept the Orleanists from power for ever. They continued indeed throughout the Second Republic and the Empire (1848–70) to enjoy a marked prestige, due to the wealth and capacity of some of their members, their influence in the French Academy and the ability of their organs in the press. But their weakness was demonstrated when the Second Empire was swept away by the German War of 1870–71. The country, in its disgust at the Bonapartists and its fear of the Republicans, chose a great many royalists to represent it in the assembly which met in Bordeaux on Feb. 12, 1872. In this body the Orleanists again exercised a kind of leadership by virtue of individual capacity, but they were counterbalanced by the Legitimists. They defeated Thiers on May 24, 1873, as punishment for his dexterous imposition of the Republic on the unwilling majority of the assembly. Their real occupation was to endeavour to bring about a fusion between themselves and the Legitimists. As far back as 1850 Guizot had proposed, or had thought of proposing, such a fusion, but it was on the condition that the comte de Chambord would resign his divine pretentions. The fusion arranged in 1873 was on quite another footing. After much exchange of notes and many agitated conferences, the comte de Paris, the representative of the Orleanists, sought an interview with the comte de Chambord at Frohsdorff, and obtained it by giving a written engagement that he came not only to pay his respects to the head of his house, but also to "accept his principle." Orleanists have declared that the engagement was given, with mental reservations; but the country believed that the liberal royalists had been absorbed in the divine right royalists, and returned republicans at by-elections till it transformed the Assembly. The Orleanist princes had still a part to play, particularly when the death of the comte de Chambord in 1883 left them heads of the house of France, but the Orleanist party ceased to exist as an independent political organization.

BIBLIOGRAPHY.—The Orleanists are necessarily more or less dealt with in all histories of France since 1789, and in most political memoirs, but their principles can be learnt and their fortunes followed from the following: A. Sorel, *L'Europe et la révolution française* (1885–1904); F. Guizot, *Histoire parlementaire de la France* (1819–48), and *Mémoires pour servir à l'histoire de mon temps* (1858–67); P. de la Gorce, *Histoire du second empire* (1894–1904); and G. Hanotaux, *Histoire de la fondation de la 3ème République* (1925). For the attitude of the Orleans princes towards the crown under the old régime, *see* Amédée Britsch, *La Jeunesse de Philippe Égalité* (1927).

**ORLEANS, DUKES OF.** The title of duke of Orleans was first created by King Philip VI. in favour of his son Philip, who died without legitimate issue in 1375. The second duke of Orleans, created in 1392, was Louis, a younger son of Charles V., whose heir was his son, the poet Charles of Orleans. Charles's son Louis, the succeeding duke, became king of France as Louis XII. in 1498, when the duchy of Orleans was united with the royal domain. In 1626 Louis XIII. created his brother, Jean Baptiste Gaston (d. 1660), duke of Orleans, and the title was revived in 1661 by Louis XIV. in favour of his brother Philip. Descendants of this duke have retained the title until the present day, one of them becoming king of France as Louis Philippe in 1830. Two distinguished families are descended from the first house of Orleans: the counts of Angoulême, who were descended from John, a son of Duke Louis I., and who furnished France with a king in the person of Francis I.; and the counts and dukes of Longueville, whose founder was John, count of Dunois, the bastard of Orleans, a natural son of the same duke. In addition to the dukes of Orleans the most important members of this family are: Anne Marie Louise, duchess of Montpensier; Francis, prince of Joinville; Louis Philippe Albert, count of Paris; and the traveller Prince Henry of Orleans. *See* table BOURBON.

**ORLEANS, CHARLES,** DUKE OF (1391–1465), commonly called Charles d'Orléans, French poet, was the eldest son of Louis, duke of Orleans (brother of Charles VI. of France), and of Valentina Visconti, daughter of Gian Galeazzo, duke of Milan. He was born on May 26, 1391. He married (June 29, 1406), Isabella, his cousin, widow of Richard II. of England. She died three years later. He was already duke of Orleans, for Louis had been assassinated by the Burgundians two years before (1407). He was now the most important person in France, except the dukes of Burgundy and Brittany, the king being a cipher. He was, however, only nominally one of the leaders of the civil war; the real guidance of his party resting with Bernard VII., the great count of Armagnac, whose daughter, Bonne, he married, or at least formally espoused, in 1410. Five years of confused negotiations, plots and fightings passed before the English invasion and the battle of Agincourt, where Charles was joint commander-in-chief. He was taken prisoner and carried to England, where he remained for a full quarter of a century. He hunted and hawked and enjoyed society amply, though the very dignities which secured him these privileges made his ransom great, and his release difficult to arrange. Above all, he had leisure, however, for literary work which consisted of short poems in the artificial metres, then fashionable in France. Besides these a number of English poems have been attributed to him, but without certainty. For practical purposes his work consists of some hundreds of short French poems, a few in various metres, but the majority either ballades or rondels. Charles d'Orléans is the last representative of the poetry of the middle ages, in which the form was almost everything, and the personality of the poet, save in rare instances, nothing. He has the urbanity of the 18th century without its vicious and prosaic frivolity. His best-known rondels —those on Spring, on the Harbingers of Summer, and others—rank second to nothing of their kind.

The agreement for his release from captivity was concluded on July 2, 1440. He was actually released on Nov. 3, and then married Mary of Cleves, who brought him a considerable dowry to assist the payment of his ransom. After his return to France he maintained at Blois a miniature court, at which the best-known French men-of-letters at the time—Villon, Olivier de la Marche, Chastelain, Jean Meschinot and others—were residents or visitors or correspondents. His son, afterwards Louis XII., was born in 1462. Charles died on Jan. 4, 1465, at Amboise.

The best edition of Charles d'Orléans's poems, with a brief but sufficient account of his life, is that of C. d'Héricault in the *Nouvelle collection Jannet* (Paris, 1874). For the English poems *see* the edition by Watson Taylor for the Roxburghe Club (1827). *See* also C. Bruneau, *Charles d'Orléans et la poésie aristocratique* (Lyons, 1924).

**ORLEANS, FERDINAND PHILIP LOUIS CHARLES HENRY,** DUKE OF (1810–1842), born at Palermo on Sept. 3, 1810, was the son of Louis Philippe, duke of Orleans, afterwards king of France, and Marie Amélie, princess of the Two Sicilies. Under the Restoration he bore the title of duke of Chartres, and studied classics in Paris at the Collège Henri IV. At the outbreak of the Revolution, which in 1830 set his father on the throne, he was colonel of a regiment of Hussars. He assumed the title of duke of Orleans, and was sent by the king to put down the riots at Lyons (1831), and then to the siege of Antwerp (1832). He was appointed lieutenant-general, and made several campaigns in Algeria (1835, 1839, 1840). On his return to France he organized the *chasseurs d'Orléans*. He died after an accident at Neuilly, near Paris, on July 13, 1842.

The duke of Orleans had married (May 30, 1837) Helène Louise Elisabeth of Mecklenburg-Schwerin, and had by her two sons, the count of Paris and the duke of Chartres. On Feb. 24, 1848, after the abdication of Louis Philippe, the duchess of

Orleans went to the Chamber of Deputies in the Palais Bourbon in the hope of having her eldest son proclaimed and of obtaining the regency; the attitude of the populace forced her to take refuge in England, and she died at Richmond on May 18, 1858.

**ORLEANS, HENRI,** Prince of (1867–1901), eldest son of Robert, duke of Chartres, was born at Ham, near Richmond, Surrey, on Oct. 16, 1867. In 1889, at the instance of his father, he undertook, in company with MM. Bonvalot and Dedecken, a journey through Siberia to Siam. They crossed the mountain range of Tibet, and the fruits of their observations, submitted to the Geographical Society of Paris and later incorporated in *De Paris au Tonkin à travers le Tibet inconnu* (1892), brought them conjointly the gold medal of that society. In 1892 the prince made a short journey in East Africa, and shortly afterwards visited Madagascar, proceeding thence to Tongking. From there he set out for Assam, and found the sources of the Irrawaddy, which secured the medal of the Geographical Society of Paris and the cross of the Legion of Honour. In 1897 he revisited Abyssinia, and political differences arising from this trip led to a duel with the comte de Turin, in which both combatants were wounded. While on a trip to Assam he died at Saigon on Aug. 9, 1901.

**ORLEANS, HENRIETTA,** Duchess of (1644–1670), third daughter of the English king, Charles I., and his queen, Henrietta Maria, was born during the Civil War at Exeter on June 16, 1644. A few days after her birth her mother left England, and she lived at Exeter under the care of Lady Dalkeith (afterwards countess of Morton) until the surrender of the city to the parliamentarians, when she was taken to Oatlands in Surrey. In July 1646 she rejoined her mother in Paris, where her girlhood was spent and where she was educated as a Roman Catholic. Henrietta was mentioned as a possible bride for Louis XIV., but she was betrothed to his only brother Philip. After the restoration of her brother Charles II., she returned to England with her mother, but a few months later she was again in Paris, where she was married to Philip, now duke of Orleans, on March 30, 1661. The duchess was very popular at the court of Louis XIV., and was on good terms with the Grand Monarch, but she was soon estranged from her husband, and her conduct was very imprudent. In 1670, at the instigation of Louis, but without Philip's consent, she visited England and obtained the signature of Charles II.'s ministers to the treaty of Dover. Shortly after returning to France, Henrietta died at St. Cloud on June 30, 1670, and it was asserted that she had been poisoned by order of her husband. She left two daughters, Marie Louise, wife of Charles II. of Spain, and Anne Marie, wife of Victor Amadeus II. of Savoy.

**ORLEANS, JEAN BAPTISTE GASTON,** Duke of (1608–1660), third son of the French king Henry IV., and his wife Marie de Medici, was born at Fontainebleau on April 25, 1608. Known at first as the duke of Anjou, he was created duke of Orleans in 1626, and was nominally in command of the army which besieged La Rochelle in 1628. On several occasions he was obliged to leave France for conspiring against the government of his mother, of Cardinal Richelieu, and of Louis XIII. Orleans stirred up Cinq-Mars to attempt Richelieu's murder, and then deserted him. In 1643, on the death of Louis XIII., Gaston became lieutenant-general of the kingdom, and fought against Spain on the northern frontiers of France; but during the wars of the Fronde he passed from one party to the other. Exiled by Mazarin in 1652 he remained in Blois until his death on Feb. 2, 1660. Gaston's first wife was Marie (d. 1627), daughter and heiress of Henri de Bourbon, duc de Montpensier (d. 1608), and his second wife Marguerite (d. 1672), sister of Charles III., duke of Lorraine. By Marie he left a daughter, Anne Marie, duchesse de Montpensier (*q.v.*); and by Marguerite he left three daughters, Marguerite Louise (1645–1721), wife of Cosimo III., grand duke of Tuscany; Elizabeth (1646–1696), wife of Louis Joseph, duke of Guise; and Françoise Madeleine (1648–1664), wife of Charles Emmanuel II., duke of Savoy.

**ORLEANS, LOUIS,** Duke of (1372–1407), younger son of the French king, Charles V., was born on March 13, 1372. Having been made count of Valois and of Beaumont-sur-Oise, and then duke of Touraine, he received the duchy of Orleans from his brother Charles VI. in 1392. In 1389 he married Valentina (d. 1408), daughter of Gian Galeazzo Visconti, duke of Milan, who brought the county of Asti to her husband and her claim upon Milan, which she transmitted to her descendants, and which furnished Louis XII. and Francis I. with a pretext for interference in northern Italy. When Charles VI. became insane in 1392, Orleans opposed his uncle Philip II., duke of Burgundy, who was conducting the government; and this quarrel was the dominating factor in the affairs of France. Continued after Philip's death in 1404 with his son and successor, John the Fearless, it culminated in the murder of Orleans by one of John's partisans on Nov. 23, 1407. He had eight children by Valentina Visconti, including his successor, Charles of Orleans the poet, and one of his natural sons was the famous bastard of Orleans, John, count of Dunois.

*See* E. Jarry, *La Vie politique de Louis d'Orléans* (1889).

**ORLEANS, LOUIS,** Duke of (1703–1752), only son of Duke Philip II., the regent Orleans, was born at Versailles on Aug. 4, 1703. He took very little part in the politics of the time, although he was conspicuous for his hostility to Cardinal Dubois in 1723. In 1730 Cardinal Fleury secured his dismissal from the position of colonel-general of the infantry. He retired and spent his time mainly in translating the Psalms and the epistles of St. Paul. Having succeeded his father as duke of Orleans in 1723, he died in the abbey of St. Geneviève at Paris on Feb. 4, 1752. His wife Augusta (d. 1726), daughter of Louis William, margrave of Baden, bore him one son, Louis Philippe, who succeeded him.

**ORLEANS, LOUIS PHILIPPE,** Duke of (1725–1785), son of Louis, duke of Orleans, was born at Versailles on May 12, 1725, and was known as the duke of Chartres until his father's death in 1752. He served with the French armies in the campaigns of 1742, 1743 and 1744, and at the battle of Fontenoy in 1745, retiring to Bagnolet in 1757, and occupying his time with theatrical performances. He died at St. Assise on Nov. 18, 1785. The duke married Louise Henriette de Bourbon-Conti, who bore him a son Philip (Égalité), duke of Orleans, and a daughter, who married the last duke of Bourbon. His second wife, Madame de Montesson, whom he married secretly in 1773, was an authoress of some repute. He had two natural sons, the abbot of St. Far and the abbot of St. Albin.

See *L'Automne d'un prince,* a collection of letters from the duke to his second wife, ed. J. Hermand (1910).

**ORLEANS, LOUIS PHILIPPE JOSEPH,** Duke of (1747–1793), called Philippe Égalité, son of Louis Philippe, duke of Orleans, and of Louise Henriette of Bourbon-Conti, was born at St. Cloud on April 13, 1747. Having borne the title of duke of Montpensier until his grandfather's death in 1752, he became duke of Chartres, and in 1769 married Louise Marie Adelaide de Bourbon-Penthièvre, daughter and heiress of the duke of Penthièvre, grand admiral of France. Her wealth made him the richest man in France, and he determined to play a part equal to that of his great-grandfather, the regent, whom he resembled in character and debauchery. As duke of Chartres he opposed the plans of Maupeou in 1771, and was exiled to his country estate of Villers-Cotterets (Aisne). When Louis XVI. came to the throne in 1774 Chartres still found himself looked on coldly at court. In 1778 he served in the squadron of D'Orvilliers, but the Queen obtained his removal from the navy and he was given the honorary post of colonel-general of hussars. He then abandoned himself to pleasure; he often visited London, becoming an intimate friend of the prince of Wales (afterwards George IV.). He made himself very popular in Paris by his gifts to the poor in time of famine, and by throwing open the gardens of the Palais Royal to the people. Before the meeting of the notables in 1787 he had succeeded his father as duke of Orleans, and advertised his liberalism so boldly that he was believed to be aiming at becoming constitutional king of France. In November he was again exiled to Villers-Cotterets. He was elected to the States-General and led the minority of 47 noblemen who seceded from their own estate (June 1789) and joined the Tiers État. The part he played during the summer of 1789 is one of the most debated points in the history of the Revolution. The court accused him

of being at the bottom of every popular movement, and saw the "gold of Orleans" as the cause of the Reveillon riot and the taking of the Bastille. The best testimony for his behaviour during this summer is that of an English lady, Mrs. Grace Dalrymple Elliott, who shared his affections with the comtesse de Buffon; her statement shows that at the time of the riot of July 12 he was on a fishing excursion, and was rudely treated by the king on the next day when going to offer him his services. La Fayette persuaded the king to send the duke to England on a mission and he remained in England from Oct. 1789 to July 1790. On July 7, he took his seat in the Assembly, and on Oct. 2, both he and Mirabeau were declared by the Assembly entirely free of any complicity in the events of October. He now tried to avoid politics, but the court suspected him, and his friends talked about his being king. He made no attempt to get himself made king, regent or lieutenant-general of the kingdom at the time of the flight to Varennes in June 1791, but again tried in vain to make his peace with the court in Jan. 1792. In the summer of that year he was present for a short time with the army of the north, but had returned to Paris before Aug. 10. After that day he ran great risks in saving fugitives; in particular, he saved the life of the count of Champcenetz, the governor of the Tuileries, his personal enemy, at the request of Mrs. Elliott. After accepting the title of Citoyen Égalité, conferred on him by the commune of Paris, he was elected 20th and last deputy for Paris to the Convention. In that body he sat as quietly as in the National Assembly, but at the king's trial he had to speak, and then only to give his vote for the death of Louis. Nevertheless when the news of the desertion of his eldest son, the duke of Chartres with Dumouriez became known in Paris all the Bourbons remaining in France, including Égalité, were arrested April 5. He remained in prison until October, when the Reign of Terror began, and was decreed "of accusation" on Oct. 3. He was tried on Nov. 6, and guillotined on the same day. Personally Orleans possessed the charming manners of a polished grand seigneur; he was debauched and cynical, but never rude or cruel, full of gentle consideration for all about him but selfish in his pursuit of pleasure.

**ORLEANS, LOUIS PHILIPPE ROBERT,** DUKE OF (1869–1926), eldest son of the comte de Paris, was born at York House, Twickenham, on Feb. 6, 1869. The law of exile against the French princes having been abrogated in 1871, he returned to France and was educated at Eu and at the Collège Stanislas, Paris. On the death of the comte de Chambord, the comte de Paris became head of the Bourbons; and in 1886 he and his son were exiled from France by the new law of 1886. He then passed through the Royal Military College, Sandhurst, and received a commission in the 4th battalion of the 60th Rifles, then quartered in India. In January 1888 the duke joined his regiment for a few months. On attaining his majority, he went to Paris (February 7, 1890), and, proceeding to the *mairie,* expressed his desire, as a Frenchman, to perform his military service. He was arrested in conformity with the law of 1886, tried, and sentenced to two years' imprisonment; but he was liberated by President Carnot after a few months' nominal incarceration (June 4), and conducted to the Swiss frontier. This escapade won for him the title of "Le Premier Conscrit de France." After the comte de Paris's funeral (September 12, 1894) the duke received his adherents in London, and was accepted as the head of his house. On Nov. 5, 1896, he married the archduchess Maria Dorothea Amalia of Austria; there was no issue of the marriage. The duke of Orleans was interested in exploration, and published *Une croisière au Spitzberg* (1905). He died on March 28, 1926.

**ORLEANS, PHILIP I.,** DUKE OF (1640–1701), son of the French king Louis XIII., was born at St. Germain-en-Laye on Sept. 21, 1640. In 1661 he was created duke of Orleans, and married Henrietta, sister of Charles II. of England; but the marriage was not happy, and the death of the duchess in 1670 was attributed to poison. Later he married Charlotte Elizabeth, daughter of Charles Louis, elector palatine of the Rhine. Having fought with distinction in Flanders in 1667, Orleans returned to military life in 1672, and in 1677 gained a great victory at Cassel and took St. Omer. Louis XIV., it was said, was jealous of his brother's success; Orleans never commanded an army again. He died at St. Cloud on June 8, 1701, leaving a son, Philip, the regent Orleans, and two daughters: Anne Marie (1669–1728), wife of Victor Amadeus II., duke of Savoy; and Elizabeth Charlotte (1676–1744), wife of Leopold, duke of Lorraine. His eldest daughter, Marie Louise (1662–1689), wife of Charles II. of Spain, died before her father.

**ORLEANS, PHILIP II.,** DUKE OF (1674–1723), regent of France, son of Philip I., duke of Orleans, and his second wife, the princess palatine, was born on Aug. 2, 1674, and fought at the siege of Mons in 1691. His marriage with Mlle. de Blois, the legitimized daughter of Louis XIV., won him the favour of the king. He fought at Steinkerk, Neerwinden and Namur (1692–1695). During the next few years he studied natural science. He was next given a command in Italy (1706) and in Spain (1707–1708) where he gained some important successes, but his suspected desire to succeed Philip V. on the throne of Spain gained him Louis XIV.'s disfavour. In his will, however, he appointed him president of the council of regency of the young King Louis XV. (1715). After the death of the king, Orleans had the will annulled by the parlement, and himself invested with absolute power. At first he made a good use of this, counselling economy, decreasing taxation, disbanding 25,000 soldiers and restoring liberty to the persecuted Jansenists. But the inquisitorial measures which he had begun against the financiers led to disturbances. He also countenanced the risky operations of the banker John Law (1717), whose bankruptcy led to a disastrous crisis.

A conspiracy under the inspiration of Cardinal Alberoni, first minister of Spain, to transfer the regency from Orleans to Philip V. of Spain was discovered and defeated in 1718. Dubois, formerly tutor to the duke of Orleans and now his all-powerful minister, caused war to be declared against Spain, with the support of the emperor, and of England and Holland (Quadruple Alliance). Philip V. made peace with the regent in 1720.

On the majority of the king (Feb. 15, 1723), the duke of Orleans resigned the supreme power; but he became first minister to the king, and remained in office till his death on Dec. 23, 1723. The regent had great qualities, both brilliant and solid, but his dissolute manners found only too many imitators, and the regency was one of the most corrupt periods in French history.

*See* J. B. H. R. Capefigue, *Histoire de Philippe d'Orléans, régent de* France (2 vols., 1838); A. Baudrillart, *Philippe V. et la cour de France,* vol. ii. (1890); and L. Wiesener, *Le régent, l'abbé Dubois et les Anglais* (3 vols., 1891–99).

**ORLÉANS** (ORLEANS), a city of France, the chief town of Loiret, on the Loire, 77 mi. S.S.W. of Paris by rail. Pop. (1936) 70,780. Les Aubrais, a mile to the north, is one of the chief railway junctions in the country. An early trading post among the Gauls, Orléans was known as *Genabum* by the Romans, and led the revolt against Julius Caesar in 52 B.C. In the 5th century it had taken the name *Aurelianum* from either Marcus Aurelius or Aurelian. It was vainly besieged in 451 by Attila, and by Odoacer in 471, but Clovis took it in 498 and held there in 511 the first ecclesiastical council assembled in France. It then became the capital of a separate kingdom, but was united with that of Paris in 613. In the 10th century the town was given in fief to the counts of Paris, who in 987 ousted the Carolingians. Philip, fifth son of Philip VI, was the first duke of Orléans. After the assassination of his successor Louis the people of Orléans sided with the Armagnacs, and thus brought upon themselves the attacks of the Burgundians and the English. Joan of Arc relieved the city in 1429. In 1562 it became the headquarters of Louis I of Bourbon, prince of Condé, the Protestant commander-in-chief. In 1563 Francis, duke of Guise, laid siege to it, but was assassinated. Orléans was surrendered to the king, who raised the fortifications. It was held by the Huguenots from 1567 to 1568. The St. Bartholomew massacre there in 1572 lasted a week. It

was given as a *lieu de sûreté* to the League under Henry III, but surrendered to Henry IV in person in 1594. The town is surrounded by boulevards, and is connected with the suburb of St. Marceau by an 18th century stone bridge of nine arches. The river is canalized on the right, and serves as a continuation of the Orléans canal.

In the Place du Martroi is a statue of Joan of Arc. A simple cross marks the site, on the left bank of the Loire, of the *Fort des Tourelles,* captured by Joan of Arc in 1429. The cathedral of Ste. Croix, begun in 1287, was burned by the Huguenots in 1567 before its completion. Henry IV, in 1601, laid the first stone, the building of which continued until 1829. The church of St. Aignan mutilated by the Protestants consists of a transept and choir of the second half of the 15th century; it contains in a gilded and carved wooden shrine the remains of its patron saint. St. Euverte, dedicated to one of the oldest bishops of Orléans (d. 391), is an early Gothic building dating from the 13th, completely restored in the 15th century. The church of St. Paul (15th and 16th century) has an isolated tower, and Notre-Dame de Recouvrance was rebuilt between 1517 and 1519 in the Renaissance style and dedicated to the memory of the deliverance of the city. The *hôtel de ville,* built under Francis I and Henry II and restored in the 19th century, was formerly the residence of the governors of Orléans, and was occupied by the kings and queens of France from Francis II to Henry IV. The public library comprises among its manuscripts a number dating from the 7th century. The *salle des fêtes,* formerly the corn-market, stands within a vast cloister formed by 15th-century arcades, once belonging to the old cemetery. Among old houses are that of Agnès Sorel (15th and 16th centuries), containing objects relating to Joan of Arc, that of Francis I, of the first half of the 16th century, that occupied by Joan of Arc during the siege of 1429, and that known as the house of Diane de Poitiers (16th century), which contains the historical museum. The anniversary of the raising of the siege in 1429 by Joan of Arc is celebrated yearly. Orléans is the seat of a bishopric under the archbishop of Paris, a prefect, a court of appeal, and a court of assizes and headquarters of the V army corps.

The more important industries are the manufacture of tobacco (by the state), blankets, pins, vinegar, machinery, agricultural implements, hosiery, tools and ironware, and the preparation of preserved vegetables. Wine, wool, grain and live stock are commercial staples, round which there are important nurseries.

### ORLÉANS CAMPAIGN OF 1870

Orléans was the pivot of the second phase of the Franco-German War, called the "People's War," when the new armies began their attempt to relieve Paris. After the fall of the empire, the Government of National Defense, deciding to remain in Paris, delegated three of its members, Crémieux, Glais-Bizoin and Fourichon, proceeded to the provinces to hasten the levy of troops. General de la Motte-Rouge was appointed to command the "territorial division of Tours." From many scattered units, most of them ill equipped, he formed the XV corps. The Germans, however, were only able to spare the I Bavarian corps and three cavalry divisions (2nd, 4th and 6th), the investment of Paris and Metz occupying their forces. On Oct. 5 the German 4th cavalry division was forced to retire before a French detachment under Reyau. Von der Tann, commanding the I Bavarian corps, was reinforced by the 22nd infantry and 2nd and 6th cavalry divisions. Reyau was attacked at Artenay on Oct. 10 and was thrown back in disorder, Orléans being captured in the evening of the following day, whereupon the French fell back on Sologne. Meanwhile Gambetta, minister of defense, arriving at Tours by balloon from Paris, assumed virtual control on Oct. 11, being aided by De Freycinet, the deputy minister. He forthwith appointed General d'Aurelle de Paladines in place of La Motte-Rouge. The change gave impetus to the training and reorganization of the troops and by Oct. 23 a further force was concentrated at Blois, which formed the XVI corps.

After the withdrawal of the 22nd infantry division from Von der Tann, its commander, General Wittich advanced to Châteaudun which he captured on Oct. 18. He now made for Chartres, which also fell into his hands. The resistance he had met with led the Germans to believe in the existence of a new army as the French who defended them did not belong to either the XV or XVI corps. The "Army of the West," as they called this phantom force, originated from the defenders of Châteaudun and Chartres and was never formed into a fighting unit.

The French command decided to advance against the Germans massed around Orléans whom it mistakenly estimated at 60,000 men, whereas they barely numbered 26,000. As a mystification empty trains were run to Le Mans to confirm the Germans in their belief in the existence of an army west of Paris. But the contemplated offensive was postponed owing to bad weather and the discouraging news of Bazaine's capitulation with his 150,000 troops at Metz.

Moltke directed the II army, released from the siege of Metz, towards Bourges, sending it by Chalon-sur-Saône, while he formed a new detachment under the grand duke of Mecklenburg-Schwerin consisting of the I Bavarian army corps, 17th and 22nd infantry and 2nd, 3rd and 4th cavalry divisions. This force was to concentrate between Châteaudun and Chartres.

The French advance began auspiciously, the German cavalry retiring before them on Nov. 8. The following day, moving across the country in battle formation, the French attacked Von der Tann who was drawn up at Coulmiers, forcing him to retreat unpursued. The 2,500 Germans guarding Orléans thereupon evacuated the city and joined Von der Tann at Angerville.

Meanwhile, the grand duke with his detachment had not encountered any strong hostile forces and by Nov. 19 Moltke began to believe that after all the French must still be concentrated in the neighbourhood of Orléans to the number of 150,000 men. He fully realized the gravity of the situation—the expected sortie from Paris coupled with the advance of the army of the Loire. The king of Prussia was prepared, as he said to Waldersee at Versailles, to raise the siege of Paris if the II army sustained a defeat.

The members of the government in Paris urged Trochu, the governor, to attempt a sortie toward Fontainebleau, thereby joining hands with the army of the Loire. The sortie was to begin Nov. 29, but the balloon carrying the message to Gambetta alighted in Norway, which caused a delay. D'Aurelle still remained on the defensive near Orléans though pressed by Freycinet to advance.

The battle of Beaune-la-Rolande took place on Nov. 28, General Crouzat's XX corps attacking the German X corps between Turanville and Beaune-la-Rolande, while Billot's XVIII corps pushed back the Prussian left. In the afternoon Crouzat was himself assailed in the rear from Pithiviers by a cavalry and infantry division, Billot also falling back.

After further operations in which the French sustained defeat, the Germans moved toward Orléans on Dec. 3 in a scythe-like line of battle 40 miles long. Serious resistance was only encountered at Chilleurs. Orléans was entered on Dec. 4th. (*See* further FRANCO-GERMAN WAR.)

**ORLEY, BERNARD VAN** (*c.* 1490–1540), Flemish painter, son of the painter, Valentyn van Orley, was born at Brussels about 1490. The date of his birth is estimated from his portrait by Dürer painted in 1521, now in the Dresden gallery. It represents an attractive and intelligent man of about 30. In 1515 he was employed by Margaret of Austria, then regent of the Netherlands, and three years later he was appointed her court painter. He died in 1540. His earliest important work is the altarpiece of SS. Thomas and Matthias, of which the centrepiece is at Vienna and the wings at Brussels painted about 1512. The style of the picture seems to be inspired by the school of Autrey. From 1516–22 Bernard van Orley imitated Mabuse—to this period belongs the "Madonna" in the Wied collection and the "Holy Family" in the Louvre. In the "Holy Family" in the Prado (1522) the influence of Mabuse has given way to that of Raphael. In the altarpiece representing the "Patience of Job," (1521) now in the Brussels gallery, we find the two influences combined. The artist had many opportunities to see designs by Raphael whose tapestry cartoons were in Brussels for many years. Important works of his later period are the "Hanneton

Family" altarpiece in the Brussels gallery; the "Last Judgment" (1525) at Antwerp; and the "Crucifixion" at Rotterdam. He painted several portraits; the one of Dr. Georg Zelk in the Brussels gallery is the only one which is signed and dated (1519). Van Orley was a designer of tapestries; for instance, "Hunts of Maximilian," in the Louvre, and "Victory of Pavia" at Naples.

*See* M. Friedlander, *Annual of Prussian Museums* (1908–09).

**ORLOV, ALEXIS FEDOROVICH,** PRINCE (1787–1862), Russian statesman, natural son of Count Theodore Grigorievich Orlov, took part in all the Napoleonic wars from 1805 to the capture of Paris. For his services as commander of the cavalry regiment of the Life Guards on the occasion of the rebellion of 1825 he was created a count, and in the Turkish War of 1828–29 rose to the rank of lieutenant-general. Orlov was the Russian plenipotentiary at the Peace of Adrianople, and in 1833 was appointed Russian ambassador at Constantinople, holding at the same time the post of commander-in-chief of the Black Sea Fleet. He was one of the most trusted agents of Nicholas I., whom in 1837 he accompanied on his foreign tour. In 1854 he was sent to Vienna to bring Austria over to the side of Russia, but without success. In 1856 he was one of the plenipotentiaries who concluded the Peace of Paris, and was rewarded with the dignity of prince, and the presidency of the imperial council of state and of the council of ministers. In 1857 he presided over the commission formed to consider the question of the emancipation of the serfs, to which he was altogether hostile.

**ORLOV, ALEXIS GRIGORIEVICH,** COUNT (1737–1808), brother of Gregory, Count Orlov (*q.v.*), was remarkable for his athletic strength and dexterity. In the revolution of 1762 he played an even more important part than his brother. He conveyed Peter III. to the château of Ropsha and is said to have murdered him there. In 1770 he was appointed commander-in-chief of the fleet sent against the Turks, whose far superior navy he annihilated at Cheshme (July 5, 1770), a victory which led to the conquest of the Greek archipelago. He devoted himself to horse-breeding, and produced the finest race of horses then known by crossing Arab and Frisian, and Arab and English studs. In the war with Napoleon during 1806–07 Orlov commanded the militia of the fifth district, which was placed on a war footing almost entirely at his own expense. He left an estate worth five millions of roubles and 30,000 serfs.

*See* article, "The Associates of Catherine II.," No. 2, in *Russkaya Starina* (Rus.) (St. Petersburg, 1873).

**ORLOV, GREGORY** (GRIGORII) **GRIGORIEVICH,** COUNT (1734–1783), Russian statesman, was the son of Gregory Orlov, governor of Great Novgorod. While serving in the capital as an artillery officer he caught the fancy of Catherine II., and was the leader of the conspiracy which resulted in the dethronement and death of Peter III. (1762). Catherine made him a count and adjutant-general, director-general of engineers and general-in-chief. At one time the empress thought of marrying her favourite, but the plan was frustrated by Nikita Panin. Orlov's influence became paramount after the discovery of the Khitrovo plot to murder the whole Orlov family. Gregory Orlov entered with enthusiasm, both from patriotic and from economic motives, into the question of the improvement of the condition of the serfs and their partial emancipation. He was their advocate in the great commission of 1767. One of the earliest propagandists of the Slavophil idea of the emancipation of the Christians from the Turkish yoke, he was sent as first Russian plenipotentiary to the peace-congress of Focsani (1771), but he failed in his mission, owing partly to the obstinacy of the Turks, and partly (according to Panin) to his own insolence. He was superseded in the empress's favour by Vasil'chikov.

*See* A. P. Barsukov, *Narratives from Russian History in the 18th Century* (Rus.) (St. Petersburg, 1885).

**ORLOV, NIKOLAI ALEKSYEEVICH,** PRINCE (1827–1885), entered the diplomatic service, and represented Russia successively at Brussels (1860–1870), Paris (1870–1882) and Berlin (1882–1885). As a publicist he stood in the forefront of reform. His articles on corporal punishment, which appeared in *Russkaya Starina* in 1881, brought about its abolition. He also advocated tolerance towards the dissenters. He wrote a *Sketch of Three Weeks' Campaign in 1806* (St. Petersburg, 1856).

**ORLOV, THEODORE** (FEDOR) **GRIGORIEVICH,** COUNT (1741–1790), Russian general, participated with his elder brothers, Gregory (*q.v.*) and Alexis (*q.v.*), in the *coup d'état* of 1762, after which he was appointed chief procurator of the senate. His naval exploits in the first Turkish War were commemorated by a triumphal column, crowned with naval trophies, erected at Tsarskoe Selo. He retired in 1775.

**ORM** or **ORMIN,** the author of an English book, called by himself *Ormulum* ("because Orm made it"), consisting of metrical homilies on the gospels read at mass. The unique ms., now in the Bodleian library, is certainly Orm's autograph, and contains abundant corrections by his own hand. On palaeographical grounds it is referred to about A.D. 1200, and this date is supported by the linguistic evidence. The dialect is midland, with some northern features. The orthography of the *Ormulum* is the most valuable existing source of information on the development of sound in Middle English. On the whole, the language of the *Ormulum* seems to point to north Lincolnshire as the author's native district. There are reasons for thinking that Orm and the Walter to whom it is dedicated may have been inmates of the Augustinian priory of Elsham, near the Humber, which was established about the middle of the 12th century by Walter de Amundeville.

The *Ormulum* is written in lines alternately of eight and seven syllables, without either rhyme or alliteration. The rhythm may be seen from the opening couplet:

Nu, broþerr Wallter, broþerr min
Affterr þe flæshess kinde.

The extant portion of the work, not including the dedication and introduction, consists of about 20,000 lines. But the table of contents refers to 242 homilies, of which only 31 are preserved; and as the dedication implies that the book had been completed, and that it included homilies on the gospels for nearly all the year, it would seem that the huge fragment which we possess is not much more than one-eighth of this extraordinary monument of pious industry.

The *Ormulum* was edited for the first time by R. M. White in 1852. A revised edition, by R. Holt, was published in 1878. Many important corrections of the text were given by E. Kölbing in the first volume of *Englische Studien.* With reference to the three forms of the letter *g*, *see* A. S. Napier, *Notes on the Orthography of the Ormulum,* printed with *A History of the Holy Rood Tree* (Early English Text Society, 1894).

**ORME, ROBERT** (1728–1801), English historian of India, was born at Anjengo on the Malabar coast on Dec. 25, 1728, the son of a surgeon in the Company's service. Educated at Harrow, he was appointed to a writership in Bengal in 1743. He returned to England in 1753 in the same ship with Clive, with whom he formed a close friendship. From 1754 to 1758 he was a member of council at Madras. His great work was *A History of the Military Transactions of the British Nation in Indostan from 1745* (3 vols., 1763–78). This was followed by a volume of *Historical Fragments* (1781), dealing with an earlier period. In 1769 he was appointed historiographer to the East India Company. He died at Ealing on Jan. 13, 1801. His valuable collections of mss. are in the India Office library. Not a few of the most picturesque passages in Macaulay's Essay on Clive are borrowed from Orme.

**ORMER,** the name given in the Channel Isles and on the coasts of France to *Haliotis tuberculata,* a gastropod mollusc. It has a shell with a widely open aperture, more or less resembling a human ear in outline. The animal lives beneath stones and rocks close to the low-water mark of spring tides. For a sedentary organism it can move remarkably fast, and observers have commented on its strength and agility. The ormer is an article of human food in the Channel Isles and elsewhere (*see* ABALONE). The States of Guernsey introduced legislation in 1926 for its protection.

**ORMEROD, ELEANOR A.** (1828–1901), English entomologist, the daughter of George Ormerod, F.R.S., author of *The History of Cheshire,* was born at Sedbury Park, Gloucestershire,

on May 11, 1828. The opportunity afforded for entomological study by the large estate upon which she grew up and the interest she took in agriculture soon made her an authority upon this subject. In 1868, she aided the Royal Horticultural Society in forming a collection of insect pests of the farm for practical purposes, and was awarded the Flora medal of the society. In 1877 she issued a pamphlet, *Notes for Observations on Injurious Insects,* which was distributed among persons interested in this line of inquiry, who readily sent in the results of their researches, and was thus the beginning of the well-known *Annual Series of Reports on Injurious Insects and Farm Pests.* In 1881 Miss Ormerod published a special report upon the "turnip-fly," and she was consulting entomologist to the Royal Agricultural Society from 1882 to 1892. For several years she was lecturer on scientific entomology at the Royal Agricultural college, Cirencester. Eleanor Ormerod died at St. Albans on July 19, 1901.

Her works include: *The Cobden Journals; Manual of Injurious Insects; Handbook of Insects Injurious to Orchard and Bush Fruits;* and her *Autobiography and Correspondence* (1904). *See* also: *Canadian Entomologist,* vol. 33, 1901; *Royal Agric. Soc. Journ.* vol. 62, 1901.

**ORMOC,** a municipality (with administrative centre and 46 *barrios* or districts), of the island and province of Leyte, Philippine Islands, on the west coast about 35 mi. S.W. of Tacloban, the provincial capital. Pop. (1939), 77,349; 32 were whites. Ormoc is the centre of an extensive abacá- (Manila hemp) producing region and has a large coastwise trade, especially with Cebu. The vernacular is Cebuano. Of the inhabitants aged 6 to 19 inclusive, 18·4% in 1939 attended school, while 32·6% of the population 10 years old and over was literate.

**ORMOLU,** an alloy of copper and zinc, sometimes with an addition of tin. The name is also used to describe gilded brass or copper. The tint of ormolu approximates closely to that of gold; it is heightened by a wash of gold lacquer, by immersion in dilute sulphuric acid or by burnishing. The principal use of ormolu is for the mountings of furniture. With it the great French *ébénistes* of the 18th century obtained results which, in the most finished examples, are almost as fine as jewellers' work. The mounts were usually cast and then chiselled with extraordinary skill and delicacy. (*See* also SILVERSMITHS' AND GOLDSMITHS' WORK.)

**ORMOND,** a town of Volusia county, Florida, U.S.A., on the Halifax river (an arm of the Atlantic ocean extending along the east coast for 25 mi.) just N. of Daytona Beach. It is on federal highway 1 and is served by the Florida East Coast railway. The resident population was 1,517 in 1930; 1,914 in 1940, federal census. It is a winter resort with large hotels and beautiful residences. The hard, compact Ormond-Daytona beach (200 ft. wide and 20 mi. long), formerly the scene of automobile speed tests, is used by tourists, winter and summer, for bathing and motoring. Ormond was incorporated in 1880. Until his death in 1937, it was the winter home of John D. Rockefeller.

**ORMONDE, EARL AND MARQUESS OF,** titles still held by the famous Irish family of Butler (*q.v.*), the name being taken from a district now part of co. Tipperary. In 1328 James Butler (*c.* 1305–37), a son of Edmund Butler, was created earl of Ormonde, one reason for his elevation being that his wife Eleanor Bohun was a granddaughter of Edward I. His son James, the 2nd earl (1331–82), was four times governor of Ireland; the latter's grandson James, the 4th earl (d. 1452), held the same position several times, and won repute not only as a soldier, but as a scholar. His son, James, the 5th earl (1420–*c.* 1461), was created an English peer as earl of Wiltshire in 1449. He was lord high treasurer of England in 1455 and again in 1459, and was taken prisoner by the Yorkists after the battle of Towton in 1461. He and his two brothers were then attainted, and he died without issue, the exact date of his death being unknown. The attainder was repealed in the Irish parliament in 1476, when his brother Sir John Butler (*c.* 1422–78), who had been pardoned by Edward IV. a few years previously, became 6th earl of Ormonde. John, who was a fine linguist, served Edward IV. as ambassador to many European princes. His brother Thomas, the 7th earl (*c.* 1424–1515), a courtier and an English baron under Richard III. and Henry VII., was ambassador to France and to Burgundy; he left no sons, and on his death in August 1515 his earldom reverted to the crown.

Margaret, a daughter of this earl, married Sir William Boleyn of Blickling, and their son Sir Thomas Boleyn (1477–1539) was created earl of Ormonde and of Wiltshire in 1529. He arranged the preliminaries for the Field of the Cloth of Gold; he was lord privy seal from 1530 to 1536, and served the king in many other ways. He was the father of Anne Boleyn.

Meanwhile in 1515 the title of earl of Ormonde had been assumed by Sir Piers Butler (*c.* 1467–1539), a cousin of the 7th earl. He was lord deputy, and later lord treasurer of Ireland, and in 1528 he surrendered his claim to the earldom of Ormonde and was created earl of Ossory. Then in 1538 he was made earl of Ormonde, this being a new creation; however, he counts as the 8th earl of the Butler family. In 1550 his second son Richard (d. 1571) was created Viscount Mountgarret, a title still held by the Butlers. The 8th earl's son, James, the 9th earl (*c.* 1490–1546), lord high treasurer of Ireland, was created Viscount Thurles in 1536. In 1544 an act of parliament confirmed him in the possession of his earldom, which, for practical purposes, was declared to be the creation of 1328, and not of 1538.

Thomas, the 10th earl (1532–1614), a son of the 9th earl, was lord high treasurer of Ireland. He was a Protestant, and threw his great influence on the side of the English queen and her ministers in their efforts to crush the Irish rebels, but he was perhaps more anxious to prosecute a fierce feud with his hereditary foe, the earl of Desmond, this struggle between the two factions desolating Munster for many years. His successor was his nephew Walter (1569–1633), who was imprisoned from 1617 to 1625 for refusing to surrender the Ormonde estates to his cousin Elizabeth, the wife of Sir R. Preston and the only daughter of the 10th earl. He was deprived of the palatine rights in the county of Tipperary, which had belonged to his ancestors for 400 years, but he recovered many of the family estates after his release from prison in 1625.

Walter's grandson, James, the 12th earl, was created marquess of Ormonde in 1642 and duke of Ormonde in 1661 (*see* below); his son was Thomas Butler, earl of Ossory, and his grandson was James Butler, 2nd duke of Ormonde (*see* below).

When Charles Butler, earl of Arran (1671–1758), the brother and successor of the 2nd duke, died in December 1758, the dukedom and marquessate became extinct, but the earldom was claimed by a kinsman, John Butler (d. 1766). John's cousin, Walter (1703–83), inherited this claim, and Walter's son, John (1740–95), obtained a confirmation of it from the Irish House of Lords in 1791. He is reckoned as the 17th earl. His son Walter, the 18th earl (1770–1820), was created marquess of Ormonde in 1816, a title which became extinct on his death, but was revived in favour of his brother James (1774–1838) in 1825, and was retained by his descendants.

*See* J. H. Round on "The Earldoms of Ormonde" in Joseph Foster's *Collectanea Genealogica* (1881–83).

**ORMONDE, JAMES BUTLER,** 1ST DUKE OF (1610–1688), Irish statesman and soldier, eldest son of Thomas Butler, Viscount Thurles, and of Elizabeth, daughter of Sir John Poyntz, and grandson of Walter, 11th earl of Ormonde (*see* above), was born in London on Oct. 19, 1610. On the death of his father by drowning in 1619, the boy was made a royal ward by James I., removed from his Roman Catholic tutor, and placed in the household of Abbot, archbishop of Canterbury, with whom he stayed until 1625, residing afterwards in Ireland with his grandfather. In 1629, by his marriage with his cousin, the Lady Elizabeth Preston, daughter and heiress of Richard, earl of Desmond, he put an end to the long-standing quarrel between the families and united their estates. He succeeded his grandfather in 1632.

His active career began in 1633 with the arrival of Strafford, whom he supported consistently. In 1640 during Strafford's absence he was made commander-in-chief of the forces, and in August he was appointed lieutenant-general. On the outbreak of the rebellion in 1641 he rendered great service in the expedition to Naas, and in the march into the Pale in 1642, though much hampered by the lords justices, who were jealous of his power and

recalled him after he had succeeded in relieving Drogheda. On April 15, 1642, he gained the battle of Kilrush against Lord Mountgarret. He was created a marquess, and lieutenant-general with a commission direct from the king. He won the battle of New Ross (March 18, 1643) against Thomas Preston, afterwards Viscount Tara. In September, the civil war in England having meanwhile broken out, Ormonde, in view of the successes of the rebels and the uncertain loyalty of the Scots in Ulster, concluded (Sept. 15) with the latter, in opposition to the lords justices, the "cessation" by which the greater part of Ireland was given up into the hands of the Catholic Confederation, leaving only small districts on the east coast and round Cork, together with certain fortresses in the north and west then actually in their possession, to the English commanders. He subsequently, by the king's orders, despatched a body of troops into England (shortly afterwards routed by Fairfax at Nantwich) and was appointed in January 1644 lord lieutenant, with orders to keep the Scotch army occupied.

In the midst of all the plots and struggles of Scots, Old Irish, Catholic Irish of English race, and Protestants, and in spite of the intrigues of the pope's nuncio, as well as of attempts by the parliament's commissioners to ruin his power, Ormonde showed the greatest firmness and ability. He assisted Antrim in his unsuccessful expedition into Scotland. On March 28, 1646, he concluded a treaty with the Irish which granted religious concessions and removed various grievances. Meanwhile the difficulties of his position had been greatly increased by Glamorgan's treaty (Aug. 25, 1645) with the Roman Catholics, and it became clear that he could not long hope to hold Dublin against the Irish rebels. He thereupon applied to the English parliament, signed a treaty on June 19, 1647, gave Dublin into their hands upon terms, and sailed for England at the beginning of August. He attended Charles during August and October at Hampton Court, but subsequently, in March 1648, in order to avoid arrest by the parliament, he joined the queen and prince of Wales at Paris. In September of the same year, he returned to Ireland to endeavour to unite all parties for the king. On Jan. 17, 1649 he concluded a peace with the rebels on the basis of the free exercise of their religion; on the execution of the king he proclaimed Charles II. and was created a knight of the Garter in September. On the conquest of the island by Cromwell he returned to France in December 1650.

Ormonde accompanied Charles to Aix and Cologne when expelled from France by Mazarin's treaty with Cromwell in 1655. In 1658 he went disguised, and at great risk, upon a secret mission into England. He attended the king at Fuenterrabia in 1659 and had an interview with Mazarin; and was actively engaged in the secret transactions immediately preceding the Restoration. On the return of the king he was at once appointed a commissioner for the treasury and the navy, and received other important places, together with an English peerage, and (1661) the dukedom of Ormonde in the Irish peerage. On Nov. 4, 1661 he once more received the lord lieutenantship of Ireland. The act of Explanation (on land settlement) was passed through the Irish parliament by Ormonde in 1665. His heart was in his government, and he vehemently opposed the bill prohibiting the importation of Irish cattle which struck so fatal a blow at Irish trade; and retaliated by prohibiting the import into Ireland of Scottish commodities, and obtained leave to trade with foreign countries. He encouraged Irish manufactures and learning to the utmost, and it was to his efforts that the Irish college of Physicians owes its incorporation.

Faced by the loss of royal favour, Ormonde declared "However ill I may stand at court I am resolved to lye well in the chronicle." His irresponsible government was no doubt open to criticism. He had billeted soldiers on civilians, and had executed martial law. The impeachment, however, threatened by Buckingham in 1667 and 1668 fell through. Nevertheless by 1669 constant importunity had had its usual effect upon Charles, and in March Ormonde was dismissed. That year, he was however, elected chancellor of Oxford university. On Dec. 6, 1670 an attempt was made to assassinate the duke by Thomas Blood. He was dragged out of his coach, and taken on horseback along Piccadilly with the intention of hanging him at Tyburn. Ormonde, however, succeeded in overcoming the horseman to whom he was bound, and his servants coming up, he escaped. The king pardoned Blood, and even treated him with favour after his apprehension while endeavouring to steal the crown jewels.

In 1671 Ormonde successfully opposed Richard Talbot's attempt to upset the act of Settlement. In 1677 he was restored to favour and reappointed to the lord lieutenancy. On his arrival in Ireland he placed the revenue and the army upon a proper footing. In 1682 Charles summoned Ormonde to court. On Nov. 9, 1683 an English dukedom was conferred upon him, and in June 1684 he returned to Ireland; but he was recalled in October in consequence of fresh intrigues. Before, however, he could give up his government to Rochester, Charles II. died; and Ormonde's last act as lord lieutenant was to proclaim James II. in Dublin. Subsequently he lived at Cornbury in Oxfordshire. He refused the king his support over the Indulgence but James held him in respect. He died on July 21, 1688, and was buried in Westminster abbey.

**ORMONDE, JAMES BUTLER,** 2ND DUKE OF (1665–1745), Irish statesman and soldier, son of Thomas, earl of Ossory, and grandson of the 1st duke, was born in Dublin on April 29, 1665, and was educated in France and afterwards at Christ Church, Oxford. He commanded a regiment of horse in William's army at the battle of the Boyne. In 1691 he served on the continent under William, and after the accession of Anne he was placed in command of the land forces co-operating with Sir George Rooke in Spain. He succeeded Rochester as viceroy of Ireland in 1703, a post which he held till 1707.

On the dismissal of the duke of Marlborough in 1711, Ormonde was appointed captain-general in his place, and allowed himself to be made the tool of the Tory ministry, whose policy was to carry on the war in the Netherlands while giving secret orders to Ormonde to take no active part in supporting their allies under Prince Eugene. Though he had supported the revolution of 1688, Ormonde was traditionally a Tory, and Lord Bolingbroke was his political leader. During the last years of Queen Anne he almost certainly had Jacobite leanings, and corresponded with the duke of Berwick. He joined Bolingbroke and Oxford, however, in signing the proclamation of King George I., by whom he was nevertheless deprived of the captain-generalship. In June 1715 he was impeached, and fled to France, where he for some time resided with Bolingbroke, and in 1716 his immense estates were confiscated to the crown by act of parliament, though by a subsequent act his brother, Charles Butler, earl of Arran, was enabled to repurchase them. After taking part in the Jacobite invasion in 1715, Ormonde settled in Spain, where he was in favour at court and enjoyed a pension from the crown. He died on Nov. 16, 1745, and was buried in Westminster abbey.

W. Wyon, *Hist. of Great Britain during the Reign of Queen Anne* (2 vols., 1876); William Coxe, *Memoirs of Marlborough* (3 vols., new edition, 1847).

**ORMSKIRK,** a market town, urban district, Ormskirk parliamentary division, Lancashire, England, 11 mi. N.E. of Liverpool by the L.M.S.R. Pop. (1938) 18,400. Area, 24.4 sq.mi. The name and church existed in the time of Richard I, when the priory of Burscough was founded. Edward I granted the prior a char-

ter for a market at the manor of Ormskirk. On the dissolution of the monasteries the manor was granted to the earl of Derby.

The church of SS. Peter and Paul is a spacious building in various styles, principally Perpendicular. It possesses two western towers, the one square and embattled, the other octagonal and bearing a short spire. There are various Norman fragments, including a fine early window in the chancel. To the south-east of the church, is the Derby chapel, the property of the earls of Derby, whose vault is contained within. A grammar school was founded about 1614. Rope and twine making, iron-founding and brewing are carried on. The town has long been famous for its gingerbread, and is the centre of an important potato-growing district.

**ORNAMENT, ARCHITECTURAL.** In decorative art ornament is that element which supplies beauty in detail by the addition of anything which gives an aesthetic pleasure.

In all beginnings of primitive culture man shows a marked tendency to decorate his utensils, fabrics and ceramics with some sort of ornament. These early designs, consisting largely of overlapping stitches, lines, triangles, dots, zigzags, spirals and crosses, are purely linear even when colour is used to heighten the effectiveness of the designs. All have very similar motifs, and crude as this early ornament is, it still persists as a basis for much of the so-called abstract ornament in use to-day. These forms may be due to a lack of handicraft ability. For whether or not these early designs in the cultural growth of a people are representative of natural objects—the scales of fishes, the feather patterns of birds, plants and things of common everyday experience—the technical difficulties in the way of making free designs in the art of basketry, weaving or pottery tend to make the designs geometric in character. It is also possible that such designs may have lost their pure form through the tendency to standardize that comes of the endless copying by craftsmen of different degrees of skill. It is evident to the casual observer that more culture is necessary to produce free designs than is the case with the use and development of geometric art, because of the greater technical difficulties, and that naturalistic ornament while deriving its sources from nature tends to become abstract owing to the conventionalization of the motifs employed. At the same time, the abstract ornament tends to revert back to the natural as it takes on complexity.

The theory of the evolution of the natural to the geometric, while not accepted by all the authorities on primitive art, has, if the psychology of the designer or artist is taken into consideration, much to commend it. A conventionalization of design takes place without fail in any art due to the very great difficulty in inventing new motifs and to the natural inclination of the average craftsman to be content with imitation, and finally the design motifs conventionalize in primitive art because of a special symbolic meaning associated with the religion and customs of the tribe and so become difficult to change. In fact, it is this very conventionalization of ornament for all uses, for whatever reason, that formalizes into the standards which we call styles. Historically, these styles mark the evolution of ornamental design and are definitely related to the customs and civilization of the people who produced them. Furthermore, a style is known not by its beginnings but by its decadence, and is named not by its creator but by historians.

**Influences.**—All ornament is affected very strongly by the philosophy and thought of the time in which it is designed. It is interesting in that respect that primitive art fundamentally shows a clear desire on the part of the group design to express a complete and definite sense of fulfilment, a straightforward expression of a thing or things of the present only. Each unit or repeat in primitive design is wholly complete in itself and only establishes its relation as part of the whole through a very simple rhythm of the necessary repetition. And while it is true that primitive design may be very elaborate it is rarely complex but rather indicates a desire for richness. The slight degree of complexity that is gained is by the use of different primary colours added to the same linear motif or by increasing the number of rows of different patterns, each simple in itself.

Historically, all ornament has passed through this primitive stage to a period of larger viewpoint, when the artist becomes more interested in a sense of a lack of completeness and the design motifs gather or lose a quality of freshness and time appreciation in ratio to the existence or lack of that sense. For example, architectural ornament of the nature of the chevron, the dentil, the egg and dart, and the bead and reel, are primitive forms, each complete in itself, in which as a repetition the timebeat, the interval and the rhythm are uniform and are therefore rigid and mechanical, easily comprehended, and lacking in time appreciation; whereas such motifs as the arabesque, the vine and flamboyant tracery are without that limited sense of completeness, and in so far as the rhythm interacts with the interval and against the timebeat, they lose the quality of the mechanical and become more enduring in interest. (*See* GREEK ARCHITECTURE and ROMAN ARCHITECTURE.)

Appreciation of any art presupposes sufficient leisure for its enjoyment, so that in designing ornament it would seem necessary to consider a time element as well as whether or not it is proper both as to position and technical fitness. This time element engenders space elements by means of which appreciation must be led from one detail to another, and as all ornament is static in nature it should include, therefore, within the design a stimulus toward, and an opportunity for, fresh viewpoints, and so encourage a more continuous period of appreciation. It is the thought or emotion behind the ornament that lives, while its surface aspects, because of the always evident desire to change, must become out-moded in time.

As all ornament is designed to form a pattern, whether it is composed of repeat units or as a general composition, the rhythms and interrelations of the structural background on which the ornamental detail is composed are as important as the primary functions of the design itself. It is this structure which gives coherence, unity and the sense of space and time to the ornamental design. In the consideration that all ornament must bear the repetition of being seen not only once but many times, the longer the element of time appreciation that is consciously set up within the design the more enduring in interest it will become. Yet it must not be so extended and involved as to be incomprehensible upon close inspection. It seems evident that a design whose rhythmic quality is purely mechanical, even though colour is used to superimpose an additional rhythm, must fail in possessing a sustained interest. The design motif fulfills its sole purpose when it creates a longer time interest in the object ornamented through its added beauty. This growth in time interest in appreciation of ornament is closely allied with the same growth in the complexity of the manners and philosophy of the people who are creating or modifying the ornamental design. A very clear conception of this interrelation of thought and design can be obtained from the study of the differences in growth of oriental and occidental ornamental motifs; the differences remain even when there are signs of influence of one thought upon the other, or through the gradual change from simplicity to complexity which is evident in the difference between the early ornament and thought of the Gothic period (*see* GOTHIC ARCHITECTURE) and its later development. And while it is evident that the technical ability of the craftsman has contributed a great deal as to whether the design motifs are simple or complex—for instance, compare the wood carving of the Jacobean craftsmen with the work of Grinling Gibbons and the later English wood carvers—it would seem that the technical skill had but kept pace with the civilization with which it is associated, for as a civilization advances it is apparent that ornamental design becomes more complex rather than less, that the design motifs become fuller in nature, richer in detail and more nearly perfect in technique.

**Materials.**—It is generally thought that the treatment of ornament is definitely limited by and related to processes and materials, although throughout the history of ornament motifs and technique have been freely translated from one material to another without loss of harmony. The architectural motifs, for example, both structural and ornamental have always been used as pure ornament in the furniture and accessories of the same style. Ornamental design in which the design is not inherently manufactured

can be considered apart from the material it embellishes. The material of which the structure is built limits only the coarseness or fineness of the technique of the detail employed, although, for example, most stones or woods may be carved crudely or delicately according to the effect desired by the designer, the scale desired, or the technical ability of the craftsman. This being so, the actual design motif may be thought of for its effect as such and is only limited in its possibilities by the thought and ability of the creator who might use it to obtain a difference in texture as a help in making a transition between two materials, or to create the pattern interest that comes from employing detail. In its relations to the material employed, it may be either structurally inherent or applied. Structural ornament is either integral, that is part of the structure as in weaving or where a structural member is changed for added grace, or as in veneers where the inherent pattern of wood or marble is used; whereas applied ornament may have little or no relation to the structure other than being placed upon it, and as its name implies is added later for pure embellishment.

**Modern Tendency.**—The ornament of the present, because of the almost immediate world-wide communication of ideas, is breaking away from the local or national boundaries and is becoming more universal in its characteristics. This will not necessarily lead to a tighter standardization because the means by which design is produced has undergone a great change. Since ornament has always had a very definite relation to the tools and technical ability of the period in which it is produced, it would seem natural that ornament, which is becoming more and more dependent upon the machine for its production and upon designers of greater perceptibility, will become less standardized because of the ease with which the tools are changed and improved, and as the self-consciousness of the designer in designing for the machine becomes less as the communities become more completely industrialized. This loss in standardization will tend to give a sense of greater freshness and creativeness in design and will give, because of the freedom in execution, a maximum individuality to the work of the designer.

For a complete list of the various architectural subjects treated in this work *see* ARCHITECTURAL ARTICLES.

**ORNAMENTS, PRIMITIVE.** The term "ornament" is strictly applied to objects worn from a sense of aesthetic value and intrinsic beauty either in gratification of the personal taste of the wearer, or in accord with fashion. But it can also be applied to objects which are worn for other reasons, such as the various objects worn for magico-religious reasons, as indications of social distinction and status, for the purpose of protection, as amulets and charms, or even as curatives. As Professor Radcliffe Brown pointed out, the desire for protection and the desire for display "are very intimately related and are really both involved in every kind of ornament. All ornament in some way marks the relation of the individual to the society." (*Andaman Islanders,* p. 319.) Classes of ornaments in primitive society mark distinctions of sex and social status, the unmarried having ornaments peculiar to their status which differ conspicuously from those allowed to or required of married people. Articles worn as dress, that is, either for protection against climatic conditions, or from modesty may become ornaments if an element of aesthetic appreciation helps to determine individual choice or fashionable vogue. Decorations may be worked on or fashioned to plain materials to make the whole ornamental. In communities of a more permanent order, ornament and embellishment, external and internal, is applied to architecture in personal rivalry or in token of social status. To religious zeal is due the wealth of ornament often found in the Men's House—the centre of the communal life, the repository of the cult objects of the community, the origin of the temple.

The objects worn as ornaments are sometimes of a considerable degree of elaboration. Wings of butterflies, gorgeous tropical beetles, seeds, berries, flowers, variegated leaves, bright stones, all sorts of natural products are employed. The manufacture of ornaments as prescribed by the social order is an occupation of importance. Thus, "The Akamba wear a great number of ornaments (*mapa*) of various kinds, especially metal ones, but they never overload their bodies with them on ordinary occasions. On account of the composition and choice of colours these ornaments are attractive even to European ideas of beauty, and the fine execution of the work must arouse admiration." (G. Lindblom, *Akamba,* 1920, p. 375.) Nature provides the materials and the models. The sense of colour is expressed by using different coloured earths, the quest for which is a stimulus towards economic development. Conventionalization, vulgarization, degradation and imperfect, unintelligent, imitations are notable in primitive art but at one and the same time in one community there may be artists of very different capacities.

**ORNE,** a department of the north-west of France, about half of which formerly belonged to the province of Normandy and the rest to the duchy of Alençon and to Perche. Pop. (1936) 269,331. Area, 2,372 sq.mi. West of the Orne and the railway from Argentan to Alençon lie primitive rocks connected with those of Brittany; to the east begin the Jurassic and Cretaceous formations of Normandy. The district of the newer rocks is rich agriculturally, that of the older rocks poor, but the whole department is relatively high land, by far the greater portion being over the 600 ft. contour (highest point, forest of Écouves, 1,368 ft.). It forms a centre whence rivers diverge in all directions, traversing deeply-cut and picturesque valleys, in many cases well-wooded with fine oaks.

Horse-breeding is very important in the rural districts; there are three breeds—those of Perche, Le Merlerault and Brittany. The great government stud of Le Pin (which was established in 1714), with its school of horse-breeding, is situated between Le Merlerault and Argentan. A large number of lean cattle are bought in the neighbouring departments to be fattened; the farms near Vimoutiers, on the borders of Calvados, produce the famous Camembert cheese, and others excellent butter. The bee industry is very flourishing. Oats, wheat, barley and buckwheat are the chief cereals, and fodder in great quantity and variety, potatoes and some hemp are grown. The variety of production is due to the great natural diversity of the soils. Small farms are the rule, and the fields are surrounded by hedges relieved by pollarded trees. Along the roads or in the enclosures are numerous pear and apple trees, the latter yielding cider, part of which is manufactured into brandy. Orne has iron mines and freestone quarries; a kind of smoky quartz known as Alençon diamond is found. The hot springs of Bagnoles, which contain salt, sulphur and arsenic, are famous. In the forest of Bellême is the chalybeate spring of La Hesse, which was used by the Romans.

Cotton and linen weaving, notably at Flers (*q.v.*) and La Ferté-Macé (pop. [1936] 3,704), forms the staple industry of Orne. Alençon and Vimoutiers make linen and canvas. Vimoutiers has bleacheries, which, with dye-works, are found in the textile centres. At Alençon only a little of the lace which takes its name from the town is still made. There are foundries and wire-works in the department, and articles in copper, zinc and lead are manufactured. Pins, needles, wire and hardware are produced at Laigle (pop. 5,145), and hardware also at Tinchebray. There are glass-works, paper-mills, tanneries (the waters of the Orne being reputed to give a special quality to the leather), and glove-works. Coal, raw cotton, metals and machinery are imported. The exports include woven and metal manufacture, livestock, farm produce.

The department is served by the Ouest-Etat railway. There are two arrondissements, with Alençon, the capital, and Argentan, as their chief towns, 36 cantons and 513 communes. The department forms the diocese of Sées (province of Rouen) and part of

## ORNAMENTAL DETAIL IN ARCHITECTURE

1. Taj Mahal, Agra, India; alabaster screen inlaid with precious stones enclosing the tombs of Shah Jahan and his empress, Mumtaz Mahal, for whom Shah Jahan built (*c.* A.D. 1631) the Taj Mahal. 2. Models of ornament for the Telephone Building, Washington, D.C., an illustration of modern vertical design. 3. Sarcophagus from the tomb of Caecilia Metella, Augustan era; now in the court of the Farnese Palace, Rome. 4. Interior of *La Sainte-Chapelle,* Paris, built 1246–58 by Louis IX. (Saint Louis). (See *Gothic Architecture,* Plate I.) 5. Pillars of the Confucius Temple at Chü Fu, Shantung Province (Yüan dynasty, 1280–1368), with the Chinese dragon and other forms in high relief. 6. Entrance to the Transportation Building, Chicago World's Fair, 1893. Louis Sullivan, architect. 7. The Alhambra, Granada, Spain, 13th and 14th centuries; *mihrab* or prayer niche in the private mosque, adorned with lace-like carvings in stone of Arabic inscriptions, delicate arabesques, and geometric designs; and with horseshoe and lobar arch forms and coloured tiles, characteristic of Moorish art in Spain. 8. St. Mark's, Venice. Two isolated marble columns, near the arcades of the south side, brought in the 18th century, from St. Jean d'Acre, Palestine, by Tiepolo. 5th century, Hellenistic style. 9. Detail of a marble altar, by Benedetto da Rovezzano (1476–1556), in the Church of the Holy Trinity (Santa Trinità), Florence

the *académie* (educational division) of Caen, and the region of the IV. army corps; its court of appeal is at Caen.

**ORNITHOLOGY** is the science of birds. We begin with the records of birds made by Aurignacian man during the last glacial epoch of the Ice age in France and Spain—paintings on the walls of caves, or figures or incisions carved on bits of horn, bone or stone. The birds that have been identified thus far from this remote Palaeolithic art include the crane, duck, goose, grouse, owl, partridge and swan. In the more recent Neolithic period, outlines of birds are more common, so that in the cave at Tajo Segura, in the province of Cadiz, southern Spain, Col. Willoughby Verner has found figures of 12 species of birds, the great bustard, crane, duck, goose, raven, spoonbill, flamingo, purple gallinule, glossy ibis, stork, eagle and marsh harrier. To these archaeologists assign an antiquity of 6–8,000 years. The Palaeolithic designs are much older.

From a painting and a statuette of the common fowl from Egypt, made about 4400 B.C., it is believed that this bird was even then kept in captivity, while knowledge of the domesticated pigeon in the same country, according to Canon Tristram, goes back to the 5th dynasty, about 3500 B.C. Record of the use of pigeons as carriers of messages is found a little later. In a tomb of the 4th dynasty of about 3700 B.C., at Meidoum, in Egypt, Mariette discovered a fresco showing red-breasted and white-fronted geese, whose painted colours are said to be exactly like those seen in the two species to-day.

**Early Writings.**—There are many incidental references to birds in the Bible, those in the Old Testament being of considerable antiquity. The writings of Aristotle (384–322 B.C.), though they do not attempt to give a connected account, include statements (according to Sundevall) that concern about 170 species of birds. He obtained part of his information from still earlier writers whose works are lost. Pliny the elder (d. A.D. 79), in his *Historia Naturalis,* devoted Book X. to birds, taking much from Aristotle. Aelian (d. about A.D. 140) made various notes on birds, compiled in part from older authors.

Early Saxon poets mention the gannet and several other birds of uncertain identity in songs current during the 6th and 7th centuries, and during the latter came the first records of falconry, apparently introduced by the Saxons into Britain. About the middle of the 8th century the *Epistolae Sancti Bonifacie* informs us that Boniface, archbishop of Mons in Belgium, presented to Ethelbert, king of Kent, a hawk and two falcons. In the laws of Howel, king of Cambria, supposedly in the 10th century, there is statement of the hunting of the pheasant, and allusion to hawking. Incidental references to hunting with hawks are found in accounts of the activities of Athelstan, and of Edward the Confessor. Aelfric's *Vocabulary,* a list of words prepared in the 10th century, possibly for educational use, and another of somewhat later date, contain names of more than 100 birds, while in the *Colloquy of Aelfric,* a series of dialogues between a master and his pupils, are references to hunting with and training of hawks. In the writings and manuscripts of the 12th and 13th centuries are many references to hawking, descriptions of decoys in which ducks were captured alive, records of heronries, and an account of a great flight of crossbills into England in the year 1251.

Following the invention of printing, William Turner published in 1544 a commentary on the birds of Aristotle and Pliny, prepared in accordance with treatment that was the forerunner of modern methods. This was followed in 1555 by Conrad Gesner's *Historia Animalium,* whose third book dealt with birds and contained many original observations, as the author travelled extensively and recorded his impressions first-hand. Pierre Belon, whose *Histoire de la Nature des Oyseaux* appeared also in 1555, had considerable knowledge of the anatomy of birds, and seems to have been the first to correlate the various parts of the avian skeleton with those of man's.

In the joint observations of Francis Willughby and John Ray, published by the latter in 1676, after the death of Willughby, there is found a division of all known birds into two great groups of "land-fowl" and "water-fowl," an arbitrary classification that has been current to the present generation, though now superseded by a more modern grouping based on structural characters.

Linnaeus, the founder of the modern system of scientific names used in systematic zoology, began publication of his *Systema Naturae* in 1735. His attempt was to be terse and concise, and in 1758, in the 10th edition of his work, he proposed that each species be designated by two names, the first of generic significance applying in most cases to a number of somewhat similar allied forms, and the second specific in nature and used in connection with the genus name for the species in question alone. (*See* ZOOLOGICAL NOMENCLATURE.) In recent years, sub-species, or geographic races, are designated by a third Latin term or subspecific name.

Natural history collections made in connection with the many exploring expeditions of the late 18th and early 19th centuries brought to Europe, particularly to England and France, many specimens of birds that greatly broadened knowledge of the ornithology of the world. In early explorations paintings or drawings were made of birds, or specimens were preserved in spirits, or sometimes dried as mummies. At the beginning of the 19th century, as travellers increased and interest in natural objects expanded, methods of preparing skins of birds were evolved that led finally to the making of what are known as scientific specimens, where the skin, with the feathers intact, is removed from the bird, leaving only the bones of the skull, wings, feet and base of the tail. The inner surface of the skin is poisoned, usually with arsenic, filled with cotton, tow or other light vegetable substance, and dried after being wrapped or otherwise arranged so that it resembles a dead bird. By means of such preparations it is possible to assemble collections of birds that may be preserved indefinitely for continued study and examination. The growth of such collections and their expansion into museums, where birds were mounted in natural positions, changed completely the style and method of published treatises dealing with ornithology. To this time these had been mainly accounts and descriptions written from hearsay or memory, and involving constant repetition of the writings of previous authors. Such accounts were now in large measure supplanted by detailed statements regarding specimens secured during voyages, or monographs that brought together all available knowledge concerning genera, families, or larger groups of birds. The art of illustration was amplified, and many works contained series of coloured representations that delineated the bird under discussion more definitely than words. Among early writers of such illustrated works or monographs may be mentioned Daubenton, whose *Planches Enluminées* contained 1,008 plates mainly on birds, Le Vaillant who published on hornbills, cotingas, birds of paradise, and many others; Vieillot, who produced an array of volumes that dealt with the majority of the known birds of the world; and Temminck, who wrote on the pigeons and gallinaceous birds.

Audubon's *Birds of America,* in 4 vols. of elephant folio size, containing 435 plates, was published in London between 1827 and 1838, and was followed by his *Ornithological Biography,* in which, with the aid of William MacGillivray, he gave accounts of the habits of North American birds. The writings of John Gould, which began in 1832, covered descriptions and beautiful paintings in colour of birds of all parts of the world and included in all more than 40 folio volumes illustrated by upwards of 3,000 plates.

**Modern Contributions.**—After the middle of the 19th century ornithological publications increased to a point where it is impossible in brief space to enumerate them. In 1874 there appeared the first of the great series of volumes comprising the *Catalogue of Birds in the British Museum,* begun by R. Bowdler Sharpe, and completed in 27 vols. in 1898 with the assistance of a number of other writers. This, with Sharpe's *Handlist of the Birds of the World,* in 5 vols. (1899 to 1909), has had profound influence.

In America increase of knowledge in ornithology subsequent to Audubon and Wilson (who was a contemporary of Audubon in the study of American birds and published an excellent and painstaking account of them) came rapidly with the appointment of Spencer Fullerton Baird as assistant-secretary of the Smithsonian institution. Baird's early years in this new position

were coincident with the initiation of the great exploratory surveys, including the Hayden surveys and the survey of the 40th parallel of latitude, undertaken by the Government to develop the western part of the United States. Baird established the U.S. National Museum as a depository for specimens of all kinds belonging to the American Government, and arranged to send naturalists with the different survey parties, with the result that large collections, particularly of birds and mammals, came to Washington, furnishing the material for many important reports.

At the same time Baird initiated the preparation of a complete review of the birds of America, a project that he had perforce to turn over finally to Robert Ridgway because of increasing administrative duties. The final result has been the publication by the U.S. National Museum since 1901 of 8 vols. under the title, *Birds of North and Middle America.* Two more volumes are expected to bring this work to completion.

**Ornithological Societies.**—As ornithologists increased in number desire for discussion of their problems grew, to take shape finally in serials devoted to birds alone. Among the early periodicals that continue to-day there may be mentioned especially the *Journal für Ornithologie* begun in 1853, the *Ibis,* founded by the British Ornithologists' Union in 1859, and the *Auk,* originated by the American Ornithologists' Union in 1883. The last mentioned is a direct continuation of the *Bulletin* of the Nuttall Ornithological Club, established by that organization in April 1876. The Zoological Society of London, especially in its earlier years, has had a profound influence on the development of ornithology through the labours of its prosectors, particularly A. H. Garrod, W. A. Forbes and Frank E. Beddard, and through its publications, especially the *Proceedings* of the Zoological Society of London, and its precursor the *Proceedings* of the Committee of Science and Correspondence of the Zoological Society (1830, etc.).

Today, there is an ornithological or similar society in most of the principal countries of the world. At the present time there are more than 30 periodicals devoted to various phases of bird study alone. Of these the most important to the ornithologist has been the *Zoological Record,* published annually since 1864 by the Zoological Society of London. The section devoted to *Aves* now annually contains reference to more than 1,000 separate papers.

**Bird Protection.**—Another phase of ornithological interest that has obtained extended popular support in the past two decades is that of the protection of useful or harmless birds. (*See* BIRDS, PROTECTION OF; BIRD SANCTUARIES.) Legislation intended to restrict the killing of ducks, grouse and other birds considered as game, began in very early times, indication of recognition of the propriety of such action being found in the Old Testament (Deuteronomy, xxii., 6–7) where there is a prohibition against the killing of a bird on the nest.

In the laws of the Welsh king, Howel of Cambria, about the 10th century A.D., there are definitions of the various kinds of hunts, including the hunting of the pheasant. Such penalties as the loss of both eyes were provided by William, duke of Normandy, for peasants who had the temerity to kill game reserved for the nobility. Game protection was thus one of the early tenets of Anglo-Saxon law, and so came early to the New World, particularly to the United States, though, unfortunately, it has not been possible to show clearly the need for rigid protective measures until the destruction of game had greatly reduced valuable species of birds. In America protective measures to conserve valuable birds antedate the coming of the Caucasian, however, since the Inca rulers recognizing the value of the sea birds of the coasts of Peru as producers of fertilizers, forbade anyone under penalty of death to enter or disturb their rookeries during the breeding season. For many years in America legislation for the protection of game-birds was considered a local matter and was applied by States or territories individually. It has become recognized recently that this procedure, through lack of uniformity, did not give proper protection to ducks, geese and other migratory game-birds, which has led finally to assumption by the Federal Government of control over non-sedentary species, and a covenant with Canada known as the Migratory Bird treaty, arranged in 1916, which provides uniform regulations for the two countries concerned. The success of this measure has been so pronounced that it has attracted wide attention and will lead to similar measures between other nations.

As human interest in birds spread, there has arisen considerable feeling against the killing of small birds for food or game. It was realized that insectivorous birds were of benefit to man through their assistance in keeping down the abundance of insects injurious to agriculture, to which was coupled the aesthetic appeal of birds in general, through their beauty of form, colour and note, to the sympathetic and understanding mind. Use of the feathers of birds in decorative dress has been the custom from remote times, a custom that at the close of the last century culminated in a fashion that required the placing of stuffed skins or parts of skins of birds in more or less grotesque attitudes upon women's hats. The resultant demand for feathers led to the destruction of birds by the hundred thousand. Plume-hunting became a lucrative business, and led to search for strange and beautiful feathers throughout the world. Terns, gulls, herons, birds of paradise, hummingbirds, to say nothing of countless familiar song-birds, were slaughtered to supply an unthinking and somewhat senseless desire for decoration, a course that led to great diminution in numbers in many species of birds. The destruction wrought was especially rapid in species that breed in colonies. Herons, terns and grebes, brought together by the paramount instinct for reproduction, were held by their eggs or young to a limited area, and so were easy to kill in large numbers. As this killing entailed the loss of eggs and the starvation of young, these species suffered to such an extent that some almost disappeared as living forms. As understanding of the results of such brutal methods arose, there resulted a revulsion against this fashion which led to the formation of such bird-protective organizations as the Audubon Society that have brought forcibly to public attention the evils of plume-hunting. This has resulted in a partial change in fashion, and in legislation against plume importation and traffic. It is now generally recognized in England and the United States that bird protection is meritorious, a sentiment spreading rapidly to other countries so that international conventions have been held to promote it.

In connection with protective measures it is realized that the Caucasian race in its present civilization has modified natural environments to such an extent that many avian inhabitants of our earth are being crowded out of existence. To procure the continuance of interesting forms, some for their economic worth and some for their aesthetic interest, reservations or sanctuaries have been formed which birds may frequent without molestation. In Europe such preserves were made primarily to protect upland game birds, and are thrown open to hunting at the proper season. In the United States reservations have been established to cover areas where herons, terns, or similar birds nest and consist of low coastal islands, or swamp and marsh lands of little monetary value. Both types of sanctuary are now found in many countries.

The result of such protection, enforced in most instances by paid wardens, has been to increase the numbers of many birds. The egret and snowy heron, at one time reduced from a vast multitude whose breeding colonies were so populous that, from a distance, they appeared like vast white blankets, to a condition where it was unusual to see a single individual, have become again common in extensive areas. Terns have returned to colonies that were deserted for years, and the pelican maintains its numbers in spite of much unthinking persecution.

In the United States there are at the present time 76 bird reservations under jurisdiction of the Department of Agriculture, ranging in size from a few acres to several hundred square miles, while light-house reservations, national parks, and similar tracts under supervision of other governmental departments have also been designated as bird preserves. In addition, various States are now developing the idea of game sanctuaries which are also refuges for birds. Pennsylvania, at the present time, has 88 sanctuaries of this kind, including nearly 73,000 acres. Private sanctuaries also are multiplying and afford much protection; many have been established as local enterprises by cities, towns, or by groups of private individuals.

**Economic Studies.**—Early information on the economic value of birds was based largely on field observation of living birds and many of the data obtained were erroneous. The method should be checked by the stomach examination, as developed largely by the Bureau of Biological Survey, of the U.S. Department of Agriculture. In this a series of stomachs of any given species of bird is secured, so far as practicable, at intervals throughout the year, under as many varying conditions of life as possible. These contents are examined under a microscope with low magnification, and the different kinds of insects, seeds, bones or other materials sorted. There is thus afforded a picture of the actual food preferences of the species concerned and the status of the bird is decided on this basis as useful or harmful. These data have been of great use in arranging protection for species that assist in the war on insects injurious to crops, or that are proved to be harmless, since such information offers a certain check against observations on living birds in the field. (*See* publications of the Biological Survey [*q.v.*] of the U.S. Department of Agriculture.) With few exceptions, the destruction of birds as a means of protecting crops, has been found to be an unsound policy.

**Aviculture.**—Aviculture (*see* AVIARY), or the keeping of birds alive, goes back to a remote period, of unknown date, when primitive man brought young birds of various kinds to his rude domicile, partly through curiosity and partly to use as food. Parrots are mentioned by Ctesias, a Greek writer, a century before the time of Aristotle, as birds that spoke the language of man, and that a little later the Romans are known to have kept them in ornate, silver-wired cages of tortoise-shell and ivory.

The domestication of falcons for hunting is recorded in Persia as early as 1700 B.C., and is said to have antedated that period in China. Falconry (*q.v.*) is believed to have spread to Europe as early as three centuries before the Christian era. In America the Pueblo Indians of New Mexico and Arizona held the turkey (*Meleagris gallopavo*) in captivity at least 1,000 years ago, and probably at a much earlier period, not for use as food, but for the feathers, which were plucked from the living bird and burned in prayer offerings to propitiate Deity. The accumulations of turkey bones in a number of pueblo ruins indicate the numbers maintained.

The original canary (*Serinus serinus canarius*) is believed to have come from the Canary islands, but in its original grey, olive-green and yellowish plumage, with sides and flanks streaked with dusky, is so similar to the serin finch (*Serinus serinus serinus*) of southern Europe that it is probable that both these closely-related geographic races have furnished the stock from which have come our modern birds. Canaries were known in a domesticated state at the close of the 14th century, though they seem at that time to have been rare, as Gesner, in 1555, mentions that he had never seen one. Variation in colour among them began early, as partly yellow canaries were known at Nuremberg in 1614, and in 1677 pure yellow canaries as well as white ones were recorded at Augsburg. There are now at least 14 distinct strains and numerous varieties. Modern interest in canaries is shown by the fact that from 1905 to 1914 more than 3,250,000 were imported into the United States, mainly from Germany and England. There are many societies of canary breeders and several journals that deal their needs.

The keeping in captivity of exotic birds of all kinds originally was the field of zoological gardens, but has engaged the attention of many individuals, and in the past 25 years has gained greatly in vogue, particularly in western Europe and in the United States. Aviaries have been brought to a high state of perfection, and the requirements of many delicate species of birds studied with the utmost care to permit success in their breeding and rearing in confinement, the highest goal of achievement of the bird fancier. Among journals dealing with the pursuit is the *Avicultural Magazine*.

### TYPES OF LIVING BIRDS

Mammals have specialised for life on land (as the deer and mouse), in water (as the whale), in the air (as the bat), for night life (as the lemur), and in the earth (as the mole). But birds specialise for existence or progression through the air. Though it is common for birds to nest in holes or tunnels in the earth, which, in many cases, are excavated specially for this purpose, no bird has been able to adapt itself to continuous life underground, probably because its covering of feathers is not designed to withstand the constant abrasion that would take place in burrowing. Also, though many birds frequent the water, none are so wholly adapted to life beneath the surface as the whales. The bird thus has failed to utilize completely the ecological environments that have been available for it—a manifestation of its inferior adaptability compared to the mammal.

Birds adapted to a terrestrial existence are found in many widely separated groups, as for example ostriches, bustards, plovers, larks and pipits. Most of these adopt a terrestrial habit to secure food and safety from enemies. They run about on the earth, and though the greater number retain power for flight, often trust to their legs to avoid or escape ordinary pursuit. Most of them show greatest variety in regions of extensive plains, prairies or broad, open downs. The wholly terrestrial forms that have entirely lost the power of flight are comparatively few, and (so far as Continental areas are concerned) are birds of considerable size and strength. Among living forms they include the ostriches of Africa, which extend into Eurasia as far as southern Persia, the cassowaries of New Guinea and adjacent areas, the emus of Australia, the kiwis of New Zealand and the rheas of South America. These birds, though united by certain peculiarities, differ widely from one another, and seem to represent ancient types of bird that were formerly more abundant, as a number of fossil forms are known. It will be noted that large flightless birds exist in modern times in all of the continents except North America, where they have not been represented since the Eocene.

The kiwis (*Apteryx*) of New Zealand, the queerest and most unbirdlike of living birds, are nocturnal and have different habits from the other species mentioned. They have long bills with the nostrils at the extreme tip, and move about by using the bill to test the ground before them as a blind man uses a cane, noting their surroundings partly by touch and partly by smell. On casual examination they seem to have no wings, but on investigation the wing is found concealed beneath the feathers, a tiny structure, a little more than 3 in. long when fully extended, and entirely without flying function, as the bird is heavier than an ordinary fowl. The cassowaries, like the kiwis, inhabit forest areas, but are far less peculiar. The wings are small, with heavy, naked quills nearly concealed beneath the long, hair-like feathers, and there is a curious casque on the head. It is said that the bird uses both casque and wing-quills to fend off entangling vines in travelling through the jungle.

Ostriches and rheas have larger wings and may extend them while running, but are wholly without power of flight. In all these birds the body is heavy and the legs are large and strong. With those fleetest in running there is a tendency to reduction in the number of toes, so that the rhea has three and the ostrich only two. That these birds have come from flying ancestors is apparently indicated by the wing, which, while small and weak, has the bones formed as in flying species. All the species discussed have the external surface of the breast bone smooth without the great keel so characteristic of the flying birds, there being no necessity for such attachment, as in flightless birds the muscles usually concerned in flying have little development.

There is another type of terrestrial bird that has developed more recently than those just discussed, found mainly on oceanic islands. This includes various species of flightless rails, and some other birds that have lived under conditions in which they had no enemies from whom it has been necessary to escape by flying, so that through disuse the power of flight has been lessened until, finally, the birds are not able to rise from the ground, though the wing retains the same form encountered in flying birds and the breast bone still has a keel, though this may be greatly reduced in size. The weka rails of New Zealand are the most striking living examples of this group; they are nearly as large as a fowl, and run with great ease and rapidity. Some other flightless rails are much smaller, for example the Laysan

rail (*Porzanula palmeri*), of Laysan island in the Hawaiian islands, which is not much larger than a newly-hatched chicken. In running fast this bird extends its wings and flaps them rapidly, but is unable to rise from the ground. Many other insular birds show a tendency to degeneration of the wing but can still fly.

Among birds adapted to life in the water the penguins are pre-eminent. These include about 17 species found in southern seas, ranging in size from the great emperor penguin (*Aptenodytes forsteri*), which is 48 in. long and weighs up to 78 lb., to the little blue penguin (*Eudyptula minor*) of New Zealand and the Chatham islands, which is only 16 in. in length. Penguins have thick, heavy bodies, more or less elongated, and are covered uniformly with dense, short feathers, without the bare spaces or apteria that in other birds divide the feather-growths into distinct tracts. The wing is a short, broad paddle, without developed quills, the feathers being close-set and stiff, almost like the scales of a reptile. In the water the penguin rests comparatively low. Beneath the surface it progresses literally by flying, the flattened wings driving the bird through its aquatic medium swiftly and gracefully, while the feet are extended behind and serve as a rudder. Penguins have possessed their present type of body since early Tertiary times; but they came originally from a flying stock.

Other types of birds developed for life in the water include loons or divers and grebes, whose progress beneath the surface is accomplished, usually, by the use of the broad feet alone, the wings being held close to the sides, except when the birds are frightened or under other unusual circumstances. The downy young dive, by use of both wings and feet, indicating that flying under water is a primitive method. The many species of auks and guillemots use the wings beneath the surface as in the air above. The cormorant and the snake-bird progress by use of feet alone. Mergansers, scaups, redheads, pochards and golden-eyes among ducks dive regularly with the feet alone, while in the same group old squaws, scoters and eiders as regularly use both wings and feet beneath the surface. The curious diving petrels (*Pelecanoides*) of the southern hemisphere fly swiftly beneath the water, and may burst out through the surface in full flight.

Birds adapted for life at night are fairly numerous, and are typified especially by members of the nightjar and owl families, though specialized forms occur among a number of other families. Most nocturnal birds have large eyes that usually reflect light with a prominent reddish colour so that the eyes of many nightjars glow like dull coals of fire by the reflected light of an electric torch, and may be seen for a considerable distance. One of the American night-hawks (*Chordeiles acutipennis*) is an exception, as the eye is said to shine with a pale green hue. Most nocturnal birds actually see at night by a specialized eye adapted to collect the faintest rays of light. Only the kiwis (*Apteryx*) among habitually nocturnal species appear wholly blind.

## GEOGRAPHIC DISTRIBUTION

The laws governing geographic distribution (*see* DISTRIBUTION OF ANIMALS), through which each faunal area has its own peculiar forms, apply to birds as to all other animals, in spite of the easy method of travel possible for the bird. Very few birds are cosmopolitan. As an example may be mentioned the sanderling (*Crocethia alba*) that at some season may be found along water almost anywhere on the earth, but that nests only in the Arctic regions, passing southward in migration throughout the world, to return in spring to its breeding area. The barn owl (*Tyto*), resident through wide areas in the temperate and tropical regions of the earth so that it reaches all the continents, has reacted to its environment in such a way that 25 geographic forms, some sufficiently distinct to be called species, are now recognized. In contrast to this, many species are confined within very narrow limits, as the very distinct Laysan teal (*Anas laysanensis*), found only about the shores of one small lagoon in Laysan islands in the Hawaiian Bird Reservation, where it has a range of only about 1 sq. mile.

Every continent has its peculiar forms of life, so that the earth's surface has been divided into great regions, each characterized by certain groups or by the lack of some found elsewhere. According to a usually accepted classification, these are given the following names: Nearctic region, for North America south to include the Mexican tableland; Neotropical region, for southern Mexico, Central and South America, and the West Indies; Palaearctic region for Europe, Algeria and Morocco, and Asia north of the Himalayas and the Gobi desert; Ethiopian region, for the remainder of Africa; Oriental region, for India, Indo-China, China, the Philippine islands, and the East Indian islands to, and including, Bali; Australian region, for Australia, and the Pacific islands south of the Tropic of Cancer; and New Zealand region, for New Zealand. The life of the northern hemisphere is so evidently allied that what are here designated Nearctic and Palaearctic regions are frequently united under the term Holarctic, a vast area that extends throughout the entire north temperate and Arctic area.

These great regions, which cover continents, are divided into life-zones, where temperature and certain other general conditions control the distribution of species within narrower limits. The life-zones are more sharply delimited in temperate regions than in tropical and sub-tropical areas, and to some extent are more easily distinguished in the northern hemisphere than in the southern. They change with difference in altitude on the slopes of mountains, as they do with difference in latitude in travelling north or south, and are most easily perceived on the slopes of steep mountains, where the successive zonal bands may be compared without great difficulty. Life-zones to the present time have been most intensively studied in North America. By the student the life-zone is further divided into faunas, where conditions imposed by rainfall, geological formation and similar factors produce sections characterized by aggregations of species or sub-species.

Birds, in general, have attained a vast distribution over the surface of the globe because of their ability in flight and their specialization for life on both land and water. As a result of this versatility and adaptability some form of bird is found at some season everywhere over the world, except perhaps in the centre of the great unexplored Antarctic continent. Broad areas of the sea, away from the great ocean currents that flow like rivers through this aquatic medium, may appear birdless for days and weeks, but are crossed at certain seasons by some of the petrels in their wanderings. The seas and lands within the Arctic Circle are visited by many birds, some of which, as the raven and snow bunting, nest far north in Greenland, and some, as ducks and gulls, in summer traverse the solitudes of the north polar sea.

As individuals, birds may be tremendously abundant in temperate regions, but it is within the Tropics that the greatest variety of forms occur within small limits. The largest aggregations are found in regions of diversified topography, where the life-zones change within a comparatively few miles from tropical to alpine. The greatest number of forms at present recorded from a limited area is that reported by Dr. Frank M. Chapman from Ecuador, where within approximately 75,000 sq.m., an area less in extent than Great Britain, there are at present known 1,508 forms of birds, and it is said that this list is far from complete.

## THE AVIAN LIFE-CYCLE

The circle of annual activities of any bird, in general, includes a period for nesting, the rearing of the young to maturity, and a subsequent resting time when a moult occurs to renew the covering of feathers. With many birds there is included in this programme a migration or journey to some other region, and a subsequent return to the native area at the coming of a new breeding period. The cycle of activities thus corresponds to the seasonal round of the year, as the necessities of the bird are influenced by climatic conditions, which change from month to month, except in limited areas in the Tropics, and even there the life of birds is influenced to a greater extent than might be imagined through the incidence of wet or dry seasons.

## REPRODUCTION

With the approach of the breeding season there is instituted at once a conflict, active or passive, as the case may be, between males of the same kind for a breeding area in which, later, the

nest will be located. (*See* also BIRD, *Reproductive Habits.*) Each male selects some section suited to nesting needs and remains within or near it until a mate appears, if he is not already mated, and protects this tract against encroachment by others that may be considered rivals. In the case of gregarious species, like the sooty tern (*Sterna fuscata*) that nests in great colonies on islands in the sea, the nesting territory for each pair may be only a yard square, or even less, being a space in which the egg may be located, so that the incubating bird and her mate, on guard beside her, cannot quite reach the adjacent pair with whom, and with any others that intrude, they spar and fight on the slightest provocation. The male red-winged blackbird (*Agelaius phoeniceus*) of North America, also gregarious, selects an area of marsh or swamp, with his neighbours situated at a distance of a few feet or a few yards, and remains on guard, forbidding entrance of another male in that limited space. Solitary species hold larger areas, so that a red-eyed vireo (*Vireo virescens*) may hold a clump of three or four trees, or a blackbird (*Turdus merula*) may preempt a small section, including thickets, trees and open ground. Possession of such a breeding ground at the beginning of the nesting season is a paramount passion with each male, and to retain possession he will battle fiercely, even until death, with any others of his kind that may attempt definitely to locate within what have been selected as his limits. Under this urge, sanguinary combats are not unusual among species whose individuals live for the rest of the year wholly at peace with their kind.

**Mating.**—At the mating season the male bird resorts to a variety of artifices to attract attention on the part of the female, and to arouse her interest to the end that a nest be established. (*See* also COURTSHIP OF ANIMALS; SELECTION, SEXUAL; BIRD, *Reproductive Habits.*) Among perching birds this is first indicated by song (*q.v.*), by which the male not only gives expression to the pleasant sensations of merely living, but also, when established on his breeding ground, gives notice to rivals of his presence as a guard over his territory and notice to females that he is in search of a mate. The song may range from the polished effort of an expert, like many thrushes, the nightingale, or the mocking-bird, to sounds that, to some human ears, may be merely disagreeable noise, as the chatter of the house sparrow, or the strange music of the plant-cutter of South America (*Phytotoma rutila*), whose song is a curious squeaking that resembles exactly the rubbing produced by tree-limbs touching in the wind. The rhea booms, the hawk screams and the owl hoots, each producing music in the estimation of others of its kind.

Actual mating may be accompanied by a great variety of strange and unusual actions which the male alone, both sexes, or more rarely the female alone, may undertake (*see* COURTSHIP OF ANIMALS). The male ruffed grouse (*Bonasa umbellus*), of North America, selects a stand on some sheltered log or stump, to which he resorts each day to "drum," a resonant love-call for which he draws himself fully erect and begins a steady beat of his short, stiffly-feathered wings. The action of these against the air between wing and body is so strong and abrupt that a dull thumping sound is produced, at first slowly, and then with increasing rapidity, until the sound comes as a steady, pulsating roar. The display of the peacock, in which the long, ornamented upper tail-coverts (mistaken by many for the tail, which is short, stiff and dull in colour, entirely concealed beneath the longer feathers) are erected and fully spread, to be shaken finally with a dry rattle as the male faces the apparently indifferent female, is another well-known example of activity on the part of the male alone.

The great crested grebe has been found by Julian Huxley to have a complicated courtship-display in which both sexes participate. A pair approach, facing one another with head wagging from side to side, then raise one wing and preen the feathers beneath, an action varied in many ways to culminate finally in a weird "dance" in which the pair rise erect, treading water, and remain bolt upright with breasts nearly touching for a brief space. In some species of albatross mutual courtship-displays have progressed to a point where they have far exceeded mere mating antics, and have become social customs that continue through a period of months, beginning with the arrival of the birds on the breeding grounds, and continuing until the young are grown. In the Laysan albatross (*Diomedea immutabilis*) of the Leeward islands of Hawaii, the display begins with two birds approaching with quick bows, shaking their heads rapidly from side to side, raising the wing to preen the feathers beneath, and finally throwing the head and neck fully erect, with the bill pointing perpendicularly to the sky, while both birds emit a hollow groan. This action is of daily occurrence when the birds are on land, from October to May, and is participated in by mates or neighbours. It has thus developed into an interesting racial custom.

As an example of the third type of display there may be mentioned the courtship of the phalaropes, in which the female has brighter plumage than the male, and takes much of the initiative. In Wilson's phalarope (*Phalaropus tricolor*) both birds bow and nod, but in the culmination of this action the male flees with one, or sometimes two, females in close pursuit.

The site for the nest that is to contain the eggs is sometimes chosen by the female, sometimes indicated by the male, though the female may exhibit certain supposed prerogatives of her sex in such matters by modifying considerably the original plans proposed by her mate. The male house sparrow (*Passer domesticus*) selects some hollow suitable for a nest, and rests beside the entrance, calling and chattering until a female comes to inspect the premises. If these appear suitable, nest-construction may proceed. With birds that nest in trees or bushes, or on the ground, where there is greater latitude of site, various locations may be examined before definite selection is made, both male and female apparently exhibiting directive impulse in choice. When suitable sites are numerous it is probable that final selection comes frequently through the chance that directs the placing of the first nesting-material when the courtship shall have proceeded to the point of actual nest construction. In some instances, where numerous sites all exactly alike are available, as where barn swallows (*Hirundo*) make their nests of mud on the rafters of a building, there is often confusion, so that birds may carry pellets of mud to a dozen rafters until, finally, one of the several foundations assumes more importance in their eyes than the others and a nest is brought to completion. In such species as the ruby-throated hummingbird (*Archilochus colubris*) and prairie-hen (*Tympanuchus americanus*), where mating takes place at a point away from the nest and the male does not visit the nest-site, selection of a suitable spot rests entirely with the female.

With most birds mating is temporary, and may be for the period of a single brood, or, where two or more families are reared, for one nesting season. Some interesting information has been secured recently on this subject through marking birds with numbered bands which serve to distinguish such individuals from others of their kind. Experiments made by S. P. Baldwin on the house wren (*Troglodytes aëdon*) in Ohio have been particularly instructive. In these studies one male house wren was found mated with three different birds in three successive years, and this same individual mated with two different mates for first and second broods during one season. Another wren mated with one companion for one brood, and in the following year took a new mate, with which it was found in the year succeeding. This shifting in the mating relation is not due to the death of one of the birds.

Though the majority of birds associate in pairs only during the nesting season there are some exceptions to this. The white-breasted nuthatch (*Sitta carolinensis*) of North America is found so invariably in pairs that when one appears alone the assumption is that something has killed its mate. Cardinal grosbeaks (*Cardinalis cardinalis*) also are usually found in pairs throughout the year. It is commonly stated that some birds, as eagles, mate for life, but this remains to be definitely proven.

Polygamy is practised by numbers of birds, particularly among the pheasant-like species. The males of the capercaillie (*Tetrao urogallus*), black grouse (*Lyrurus tetrix*) and wild turkey (*Meleagris gallopavo*) regularly take several mates, though the bobwhite (*Colinus virginianus*), a related species, is monogamous. Polyandry has been alleged for a number of species but needs verification as to regular occurrence since one of the forms concerned, the cowbird (*Molothrus ater*), where the female has been said to

mate with several males, has recently been found to pair as regularly as is normal in small birds.

**Nests.**—The nests of birds (*see* NEST) exhibit a wide range in form and many have wonderful features.

The skimmer (*Rynchops nigra*) and the least tern (*Sterna antillarum*) excavate a slight hollow in sand or gravel to contain the eggs. The American avocet (*Recurvirostra americana*) may line a slight depression near the water's edge with a few bits of weed stem, and there deposit its four eggs. Subsequently, should the waters increase in freshet the avocet hustles about gathering grass, bits of wood, feathers, small bones and weeds to raise its treasures above the flood, so that where necessity arose, these birds have been known to erect piles of rubbish a foot in height. If the waters subsequently subside these elevated nests become conspicuous structures, but are not removed.

Some ground-nesting birds regularly conceal their eggs in holes. The Manx shearwater (*Puffinus puffinus*) digs burrows in loose soil, and makes its nest at the end of the tunnel. There may be variation in method in one species, however, as the wedge-tailed shearwater (*Puffinus pacificus*) of the Pacific islands ordinarily excavates a hole for nesting, but on rocky islands, where there is little soil, may deposit its egg on the ground, under bushes, or even in the open. The little auk or dovekie (*Alle alle*) searches out a crevice or shelter beneath boulders, often on talus slopes where rock fragments are piled in great confusion. The belted kingfisher (*Streptoceryle alcyon*) digs a tunnel on the face of a steep bank and lays its eggs at the end, gradually building up a mass of fish bones from regurgitated pellets for a nest.

Concealment is sought also by some tree-nesting birds. The scops owl (*Otus scops*) of Europe, and the screech owl (*Otus asio*) of North America, seek hollows in trees, where the eggs are placed without nest lining of any kind. Woodpeckers excavate special chambers in the trunks of trees, placing their eggs on an accumulation of chips at the bottom. Though dead trunks are usually chosen, the yellow-bellied woodpecker (*Sphyrapicus varius*) frequently drills its home in a living hardwood tree, and the Porto Rican woodpecker (*Melanerpes portoricensis*) may nest in a living palm trunk.

Nests of many herons, *e.g.*, the night-heron (*Nycticorax nycticorax*), are placed in trees, and are flat structures of twigs and sticks that form a mere platform, so loosely built that the eggs may often be seen from below. Among larger nests there is every variation from this type to that of the osprey (*Pandion haliaëtus*) to which material may be added year after year until the mass is 8 or 10 ft. in diameter and makes a cartload in bulk.

Among smaller birds, the tree nest is usually a simple cup that has a foundation of rough material on which the nest proper of finer material rests; the lining is made of soft substances, as rootlets or plant downs. The blackbird (*Turdus merula*) and the American robin (*Turdus migratorius*) line their nests with cups of mud, within which are placed soft grasses. Many birds place nests of grasses and rootlets under herbage or in thickets on the ground. For protection, many tree-nesting birds build homes with arched tops that wholly conceal the eggs. There is a great group of birds in South America, the so-called tracheophones, many of whose species have this habit. Conspicuous among them in the Argentine is the leñatero, or firewood-gatherer (*Anumbius annumbi*), that gathers a quantity of thorny twigs to form a spherical mass, within which is placed the nest proper, reached by a runway, the whole so firmly constructed that the eggs inside may be reached only with difficulty. These nests are durable and last for several years, until the materials composing them decay. The oven-birds (*Furnarius*) in this group construct rounded masses of mud, with an entrance at one side, the walls being an inch or more in thickness, and so built that they will withstand the beating of heavy rains without damage.

Many of the troupial family (*Icteridae*) make purse-like nests that are suspended in the tops of trees. The nest of the oropendola (*Gymnostinops montezuma*) of Central America may be 5 ft. in length, suspended by the upper end, below which is located the entrance which leads through a long, constricted neck to the expanded lower part, where the nest proper is placed. The oropendola nests in colonies, but nests of the orioles, as the Baltimore oriole (*Icterus galbula*) which also constructs a purse-shaped nest from 8 to 10 in. in length, are found alone. The nests of the social weaver-finches of southern Africa are among the most remarkable structures known in the bird world. These birds are gregarious and, in company, accumulate masses of grass in trees to form a roof, under which each pair of birds has its separate cubicle, lined warmly with feathers. From 20 to 300 pairs may inhabit a single structure, which grows in size as it is inhabited year after year, until it may contain several wagon-loads of material.

Among other curious nests there may be mentioned those of the edible-nest swiftlets of the Indian, Australian, and South Pacific areas, that are cupped platforms, composed of a coagulated mucus secreted by the mouth-glands of the birds, placed on the walls of caves. These are gathered commercially and form the basis for a soup highly prized by the Chinese. The American chimney swift (*Chaetura pelagica*) makes a nest of twigs, cemented together by mucus from the mouth, to make a tiny basket. In early times these nests were placed on the inside of hollow tree-trunks, but with the advent of the Caucasian race and the building of houses, hollow trees have been forsaken for chimneys.

Nest-building with most birds seems to be usually the duty of the female. The male may assist by bringing material and may lay it on the nest, but it is mainly arranged by the female. In many species the entire work devolves upon the female.

## EGGS

In birds, as in all other vertebrates, the gonads are paired organs on the dorsal wall of the body-cavity. In most birds the right ovary disappears early in life, leaving only the left to grow and mature. This rule, though usual, is not invariable, since in many hawks, particularly the harriers (*Circus*), and the small bird-eating forms (*Accipiter*) usually, but not invariably, we find both ovaries present and functional. The ovum, or yolk, in birds is a relatively enormous cell which passes from the ovary into the mouth of a convoluted tube, the oviduct. As the yolk moves down the oviduct it receives first a deposit of gelatinous albumen, the "white," next a membranous sheath, and then is enclosed in a hard, calcareous shell, and is deposited as an egg (*q.v.*).

Eggs are ordinarily oval in shape, though this is not invariable, as the eggs of swifts are usually elliptical, and those of owls are nearly round. Eggs of birds that breed on rock ledges without constructing nests are much pointed, which allows them to roll about in a relatively small circle and so lessens the danger of a fall over the edge. Eggs of many shore-birds, which are relatively large in relation to the size of the birds, are also strongly pointed, which permits them to pack closely with the pointed ends toward the centre, thus bringing the whole into a compass that permits the parent to cover them.

Eggs of owls, kingfishers and woodpeckers, which are laid usually in holes or cavities (though some owls occupy open nests) are white, and whitish eggs are found in grebes, albatrosses and petrels. Most eggs have, however, a coloured shell, or spots and blotches of colour spread over a lighter background. Where there is a pattern of markings present there is usually a wreath of heavy colour about the large end of the eggs. Herons' eggs are pale blue or bluish-green, and plain green or blue eggs are found in various perching birds. The tinamous of the New World, a primitive group, have very striking eggs, with smooth and highly polished shells, varying from green or pink to deep brown, their lustre suggesting porcelain.

The egg-shells are penetrated by pores which usually cannot be seen, except under a lens, but that in some eggs, as those of the ostrich, are easily visible to the unaided eye. Evaporation takes place through these openings, so that the egg loses steadily in weight during the incubation period.

The number of eggs produced annually varies widely in different groups, being adjusted to the requirements of each species, to enable maintenance of its normal numbers. The migratory species that covers a considerable range encounters more dangers than one that is sedentary and, therefore, must produce more of its kind.

This statement, however, has many exceptions. Migratory wild ducks lay from five to 12 eggs, while the bobwhite, which is sedentary, may have as many as 21, though usually not more than a dozen. Among small birds, on the average more eggs are deposited annually by the migratory species of the temperate zones than by the sedentary forms of the Tropics. On the other hand, the non-migratory titmice and wrens lay many more eggs than the migratory warblers (*Sylviidae*). Most perching birds of temperate regions have from three to five eggs, rarely six, in a setting, but may nest two or three times each season. Most sandpipers deposit four eggs, though in some the number is reduced to three. Many gulls, hummingbirds, loons, and some species of pigeons have two eggs regularly. Other kinds of pigeons, with auks, petrels and albatrosses, lay but one egg. Boobies lay two eggs, but never seem to rear more than one young.

Adjustment of birds to their environment as regards the number of eggs deposited, to ensure continuance of each species, was made before the rise of man, who has been an active factor in the life of the earth for a relatively brief period compared to other animals. In some cases, where man has kept in check enemies of birds, these species have increased. In other instances, where man has been an active enemy, he has brought about reduction in numbers or actual extermination, because the birds concerned had become adjusted to a certain annual drain on their numbers from natural enemies and were unable to change to counteract added destruction by man. The great auk laid only one egg, and as it nested in colonies was quickly exterminated. The passenger pigeon of North America, which existed in colonial days in innumerable hosts, also produced but one young each season, which did not enable it to withstand the drain of hunting, so that it has become extinct. Usually, only those birds which rear a number of young each year can be maintained as game, and these must have protective regulation to enable them to hold their own.

**Incubation.**—After the egg is deposited it requires a certain definite temperature to develop to the point of hatching. This is normally accomplished by incubation on the part of one of the parents, usually the female, a period during which the bird remains closely on the nest, except for brief intervals required for a hasty search for food. The eggs are warmed by being brought into close contact with the breast and abdomen of the brooding bird, there being usually a sloughing of down and other feathers over a part of this area, to permit close contact between the skin and the eggs, and at the same time an increase in the blood supply to the skin, to bring a more even heat to bear. The actual degree of heat required to develop the embryo in the egg is known for only a few forms of birds. In the case of the domestic fowl the average incubation temperature is about 103° F. In charts published by Baldwin and Kendeigh, showing by use of a thermo-couple fluctuating temperature in the nest of a house-wren (*Troglodytes aëdon*), the incubating temperature is shown to vary from 39° to 41° C, or 102° to 106° F, the average being about 104° F.

Though, ordinarily, care of the eggs involves their being heated from the body of the incubating bird, in species that nest in the open, in warm climates, where the sun is torrid, brooding may be required to shade the eggs from too powerful sun-rays. The body of the bird here acts as a shelter and an equalizer of heat.

Though incubation falls ordinarily to the lot of the female, there are many species in which both sexes alternate in this duty. This is true in the ostrich, various auklets, herons, grebes, petrels, etc. The male rose-breasted grosbeak (*Zamelodia ludoviciana*) broods devotedly, though in this case his action would seem disadvantageous, as his plumage is strikingly variegated with black and white, and the rose-red spot on his breast often shows above the rim of the nest, while his mate is inconspicuous in a brown, streaked dress. In the phalaropes, the bustard-quails (*Turnix*), the emu and the rhea the male alone incubates, the female taking no part in this duty. It is believed that this also obtains in other shore-birds.

The megapodes or mound-builders (*Megapodidae*), found from the Nicobars and Philippine islands to Australia, carry on no incubation whatever. For example, the scrub-fowl (*Megapodius duperryi*), of Northern Territory and Queensland in Australia, scrapes together a mound of sand and earth, to which a small amount of vegetation is added, during the wet season. The mound may be used for a number of consecutive seasons; and mounds 14 ft. in height and 35 ft. in diameter have been discovered. The eggs of one pair of birds are buried in the top of such a mound, and, through heat generated by decomposition of the included vegetation, are maintained at an even temperature of 95° F. The Mallee fowl (*Leipoa ocellata*) of Australia constructs a much smaller nest by scraping out a hole in the ground 2 ft. wide and 1 ft. deep, with the excavated earth piled up around the opening, so that the whole resembles the crater of a volcano in miniature. The cavity is filled with leaves, twigs and vegetable debris, scraped up by use of wings and feet for yards around. This is left uncovered for four or five months until it is soaked by rains, when decomposition changes it into a hot-bed. A central chamber is excavated in the top at the proper time, and the debris taken out, mixed with sand and returned. In a few days another excavation is made, and an egg placed within it, so that it stands with the small end down. On warm days when the sun shines the birds make a cavity in the top of the mound to catch the rays of warmth. In damp, rainy weather the conical peak of the mound is covered with sticks and rubbish that assist in turning water that might penetrate to the eggs. The temperature about the eggs is maintained from 90° to 97° F until they are hatched. During dry seasons, when there is no moisture to promote the necessary decomposition of vegetable material to produce heat, the birds are said not to breed. On the other hand recent researches show that in some species at least there is no generation of heat by decomposition within the nests, and the comparatively low temperature necessary for development is maintained by oxidations within the egg itself. The nesting activities of these curious birds are strongly reminiscent of the breeding-habits of the reptilian group, from which the class of birds as a whole is descended.

The period of incubation varies greatly in different groups, in general, being longer in large birds. The period may be shortened slightly by slight increase in incubation temperature or prolonged somewhat by irregular attention on the part of the parent. The incubation period of the emu is said to range from 56 to 63 days, that of the ostrich is reported as 42 days, the domestic mallard requires four weeks, and the domestic fowl three weeks. Most small perching birds require from 12 to 14 days, with magpies and jays running from 16 to 18 days. The shortest incubation period known is that of the American cowbird (*Molothrus ater*), whose eggs hatch after 10½ days' incubation.

In the gallinaceous birds, *e.g.*, the domestic fowl, and many other species, the nest is used merely to house and incubate the eggs and the young, which are born covered with down, and follow the mother in search of food as soon as their plumage is dry. In some mound birds the young are hatched with developed wing-quills, so that they are able to fly within half-an-hour of hatching. In most tree-nesting species the young undergo a shorter period of development in the egg, and consequently must remain in the nest under close parental care for a period after hatching. The nest is thus a home during early juvenile development. Food is sought by the parents and brought to the young, and what guard may be possible is maintained against destructive enemies. In hole-nesting species like the hoopoes and woodpeckers there is indifference to nest sanitation, as immunity against dangerous bacteria that multiply actively when heat and moisture are available has apparently been developed. Such nests become extremely foul as the period of occupancy progresses. Hawks, herons and numerous others, even when very young, instinctively void their excrement beyond the nest, so that such unsanitary condition is obviated. In most of the smaller perching birds the excrement of the young is of such a consistency that it maintains a globular form and is removed from the nest by the parent. In a few finches, as the American goldfinch and crossbills, the excreta are voided by the young about the margin of the nest and are not removed.

In most birds the young remain with the parents for a time after leaving the nest, and gradually become self-reliant, so that they procure their own food. At this stage family parties usually

separate as the young drift away from their parents, or the adults tire of importunate begging for food on the part of progeny able to procure their own sustenance, and so either drive the young away or themselves leave. When the young learn early to search for food they may remain in bands with their parents.

**Parasitism.**—Breeding parasitism is found in several groups of birds in which no nest is built, the eggs being deposited with those of other birds and left entirely to the foster-parent for care. The European cuckoo (*Cuculus canorus*) has long been known to have such habits. The female places a single egg in the nest of some bird, usually a species of small size, ordinarily choosing a nest in which the eggs are fresh, and removing one of the rightful set when leaving her own (*see* CUCKOO.) Although about 100 species of birds have been recorded as parasitized, ordinarily each female cuckoo places her eggs in the nests of one particular species of bird. Each female cuckoo is supposed to lay from five to 16 eggs during the season. There is argument as to whether the cuckoo deposits her egg directly in the nest of the fosterer or whether she extrudes the egg elsewhere and carries it in her throat to the nest chosen. The former is certainly the more usual. An egg of the foster-parent is almost invariably removed and eaten by the cuckoo after she has deposited her own. The process of placing the egg requires only a few seconds, and then the bird leaves at once, which renders definite observation difficult. The young cuckoo's back is hypersensitive to touch, has a spasmodic reaction when it comes in contact with objects other than the nest; aided by a curious depression on the back, the parasite casts out the rightful young, or the eggs until finally it occupies the nest alone.

Similar parasitic habits are known for a number of other cuckoos in other parts of the world. Stuart Baker, in discussing parasitism in Indian cuckoos, shows that a number are parasitic on one species or group of species of birds, and that the cuckoo's egg is specialized to resemble the foster-parent's rather closely. In some cases one cuckoo may have widely different eggs in different parts of its range, as the hawk-cuckoo (*Hierococcyx sparveroides*), which, when it parasitizes the streaked spider-hunter (*Arachnothera magna*), lays a dark olive-brown egg like that of the bird parasitized, but that elsewhere foists on the laughing thrushes or allied species a bright blue egg like that of its dupes.

Some of the American cowbirds are also parasitic. The common North American cowbird (*Molothrus ater*) has developed no particular resemblance in egg colour to the egg of the fosterer, except that many of its dupes lay spotted eggs like its own. In South America the bay-winged cowbird (*Molothrus badius*) cares for its own eggs in a normal manner, but is parasitized by a related species, the screaming cowbird (*Molothrus rufo-axillaris*), which uses this species alone as foster parent. Parasitism is also known in the rice-grackles (*Cassidix orizivora*) which lay in the nests of related oriole-like birds. Certain species of weaver-birds (*Ploceidae*) and the honey-guides (*Indicatoridae*) of Africa also parasitize other birds. The origin of such habits is obscure.

### POST-BREEDING LIFE

The period of reproduction is the most active part of the annual life-cycle of the bird, from a biological standpoint, as it brings in play-instincts and activities different and more complex than those apparent during the remainder of the year. Reproductive activity reaches its climax with the maturity of the young. With these on the wing the individual pair have done their utmost in the perpetuation of their kind, and there ensue a number of months of more restful life, with search for food and escape from enemies as the principal activities. For many species there is immediately a period of moult to renew the feathers, a period during which birds are quiet and sluggish, often seeking haunts where they will be disturbed as little as possible. With the drain on vitality brought by feather-production at an end, there comes a time of greater activity, when old and young seem to attain greater vitality.

**Moult.**—The close of the breeding season finds adult birds with worn feathers, so that most species immediately undergo a moult, during which the old feathers are dropped and new ones are grown. The process is one that, in totality, requires more than a month to complete and progresses in regular routine, varying in sequence over the body in the different orders. In most species the feathers of the wing are shed and renewed one or two at a time, so that the bird still retains the power of flight. Ducks, geese, flamingos, cranes, rails and grebes drop all the wing- and tail-feathers in a very short time, so that they become flightless for several weeks until new feathers are grown. Penguins shed their feathers in patches, almost as a lizard drops its old skin. The epidermis of the tarsus and feet is sloughed during the moult, and any ornamental coverings of the beak are dropped at the same time.

Young birds have a first plumage, grown during their period of development, that is replaced by a post-juvenile dress of feathers that comes when they are fully grown and able to care for themselves. In most, the flight-feathers remain until the following year, but in some, as the house sparrow (*Passer domesticus*), the wing- and tail-quills are also completely renewed at this first moult.

In most adult birds the moult comes immediately after the close of the breeding season, and in temperate regions occurs in late summer. The birds are thus again in full dress when the time for migration arrives, or, if resident, by the approach of cold weather. Swallows, many shorebirds, and hawks moult during the winter, the two former groups undergoing this process in the winter home after migration.

Most birds have one complete moult annually, which takes place as indicated, at the close of the breeding season. In many, particularly among the perching birds there is another moult, partial or complete, through which the bird acquires nuptial plumes. In the bobolink (*Dolichonyx orizivorus*) and the whinchat (*Saxicola rubetra*), for example, the body plumage is completely changed in late winter and early spring. Many of the sparrow family, as the cirl bunting (*Emberiza cirlus*) and the Harris's sparrow (*Zonotrichia querula*), have a partial moult of the feathers about the head that produces bright plumes for the breeding dress.

Change in colour is not necessarily accompanied by moult, as often the tip of a feather may be one colour and the middle portion another. In the throat of the male house sparrow, for example, in autumn and early winter the black throat is obscured by greyish feather tips. As spring arrives the grey tips wear away, so that the black is fully revealed. The most striking change of this type is found in the snow bunting (*Plectrophenax nivalis*), which is white or light brown above in autumn and winter, but through sloughing of the feather tips becomes entirely black on the back in spring.

### MIGRATION

Aristotle (384–322 B.C.), the first to discourse connectedly on migration (*q.v.*), tells in his writings that the crane flies from the steppes of Scythia to the marshlands at the source of the Nile, south of Egypt. He noted migration also in the swan, land-rail, lesser goose, quail, rock-dove and turtle-dove, though he reports that of the last three a few may linger through the winter in protected localities. The cuckoo disappeared with the rising of the dog-star in July. Pliny, in his *Natural History*, repeats much that had been said by Aristotle, adding that the European blackbird, starlings and thrushes pass to neighbouring countries, while storks and cranes travel to a great distance. There are scattered references to migration in the writings of the middle ages, Olaus Magnus, in 1555, speaking of the migrations of swallows, and Francis Willughby, in 1768, mentioning various migratory birds. In the succeeding century Gilbert White, Thomas Pennant and George Edwards kept regular records of the arrival and departure of birds. Interest in the subject was considerable by the opening of the 19th century, and from that time forward the number of observers and the mass of published information on migration has increased yearly.

**Superstitious Beliefs.**—Though the migrations of larger birds were understood, as these travelled openly across the spring and autumn skies, the movement of smaller species, that appeared or disappeared under cover of night, so that they were present one day and gone the next, or vice versa, were present suddenly after an absence of several months, was the basis of considerable superstitious belief. It was thought that the smaller species were too weak to travel far, so that, in 1740, J. G. Gmelin was told by

the Tatars of Krasnojarsk that each crane carried a corn-crake on its back in its journeys. In southern Europe the peasantry believe to-day that small birds congregate on the shores of the Mediterranean, and as opportunity offers flutter on the backs of storks and cranes who carry them across to Africa.

Somewhat more unusual is a belief promulgated in an anonymous tract published in London in 1703 "By a person of Learning and Piety," entitled in part "An Essay Towards the Probable Solution of this Question. Whence come the Stork and the Turtle, the Crane, and the Swallow, when they Know and Observe the Appointed Time of their Coming." The author announces a belief that migratory birds travel to the moon, where they pass the winter, the journey in either direction requiring 60 days to compass, during which the author (who, according to Hugh Gladstone, was Charles Moreton, a minister who in late life removed to New England), informs us that they required no food, as they travelled in a rarefied ether.

Another superstition centring around migration has been the supposed hibernation on the part of some birds, a belief that dates back to early times and has been prevalent both in Europe and America. Aristotle attributed hibernation to the swallow and various other birds, saying that some individuals became torpid, and so passed the winter in the shelter of caves or hollow trees in a state of suspended animation. In later years hibernation was used mainly to explain the disappearance of swifts, swallows and the sora rail. Many and detailed have been the arguments over this matter, and over 200 papers have been written dealing with supposed cases of hibernation. It was related that the sora rail abounded in its favourite marshes, until, overnight, the birds turned into frogs, or sank in the mud, to remain until the following spring. Naturalists with great detail described how swallows gathered on reeds growing in water until their combined weights bent down these slender supports and the birds were submerged in the water. Those to whom this theory did not appeal stated that swallows and swifts hibernated in hollow trees and clefts in rocks, and the finding of birds in such situations in winter was described in great detail in a number of instances, all, however, under some misunderstanding of the circumstances. In short, though hibernation, or its correlate aestivation, is common among mammals, reptiles, amphibians, and even in fishes, it has never been proved among birds. The frequent coupling of this superstition with swallows may be explained, perhaps, by the fact that these birds in autumn regularly roost at night in marshes, and that during storms many perish to fall into the water and sink into the mud, never, however, to revive.

Among other superstitious beliefs mention may be made also of a transmutation theory prevalent among early writers, who supposed that at the approach of winter a bird might be transformed into another species, to remain thus until spring, when it resumed its proper form. Apparently this was first suggested by Aristotle, who held that the redbreast or robin (of Europe) changed to the redstart. The confusion resulted, apparently, from similarity of form and difference of plumage in two related species, where one disappeared in southward migration about the time that another arrived from northern regions, thus lending colour to a transmutation argument.

**Theories of Origin.**—An explanation of migrational movement has been that of seasonal change in food supply. According to this belief, with the approach of winter in areas remote from the Equator, there is failure of the food supply that causes birds to travel, and as the food supplies remain more constant toward the Tropics, birds move in that direction. When, with the approach of spring, the instinct for reproduction becomes paramount, as the food supplies of the broad equatorial area are not sufficient to support the great host of young birds that will appear, the adults move out again to their summer homes in temperate or boreal regions, where they rear their families. It may be argued against this that the tropical belt supports the migratory hosts when they have become grown, so that it would seem that these same individuals might obtain sustenance there while in younger stages.

An allied theory contends that migration is controlled by cold, from which birds retreat in autumn. Under this hypothesis some have held that birds originated in the north, were driven south by the advance of ice in the Pleistocene, and have returned to the north with the coming of milder climate. Each year now they retreat before the breath of approaching winter, while each spring a love of birthplace calls them to their natal homes. It must be noted that many birds retreat south early in the season, long before there is climatic necessity for their movement. This, with similar facts, has given rise to the theory that all species of birds have had their origin in the south, and through a natural struggle among individuals have spread to the north, especially for the period when each pair must be bound to a restricted territory for its breeding ground.

A somewhat different theory is that of phototropism, which holds that birds move toward the region of greatest light, this bringing a natural ebb and flow of bird life with the changing seasons as the sun moves north and south across the Equator. It is true that the course of migration, in general, follows the advance and retreat of the sun, but it would seem that it is the changing season and not the change in intensity in light itself that affects our bird-life. Through phototropism we may not, for example, explain the migrations of nightjars, which are nocturnal, and which, therefore, find in darkness the period of their activity. Such birds should find their optimum conditions of life in the equatorial regions, where the hours of the day are divided between daylight and darkness. The nightjar and whippoorwill, to give two well known examples, travel north to breed, and in June in their northern ranges have their hours of activity greatly curtailed through the lengthened period of daylight. A recent theory, supported by some experimental evidence, asserts that the onset of migration is physiologically controlled by the relative length of day and night, as is known to be the case with the flowering of plants.

The main difficulty with these and a number of other theories that have been promulgated in connection with migration is that they attempt to explain this great and impelling semi-annual movement by some single factor. When we consider that the known history of the bird in its evolutionary development, from present knowledge goes back through an enormous stretch of time, so vast that it may be noted in figures but is beyond human comprehension, to the fossil species known as *Archaeopteryx* and *Archaeornis* of the Jurassic period, it must be recognized that our present day species have had their instincts and habits moulded by many factors, so that it seems reasonable to consider that such a widespread phenomenon as migration may be due to a complex association of a number of powerful causes, some of which may have affected one species and some another, but no one of which may serve to explain the entire phenomenon as it exists at present.

We may believe, therefore, that the underlying basis of migration is founded on a combination of a number of causes, and we may look upon the present migratory instinct as an outgrowth of all the complex circumstances that have affected birds during their entire evolution, though it seems evident that the actual routes followed by migratory birds, at least in the northern hemisphere, have been shaped during the climatic changes of the Pleistocene.

During breeding-period the bird is restricted closely to the region in which the nest is located, and though some young are free to move about when recently hatched, the parents are, as a rule, confined to one neighbourhood until their offspring may be old enough to require no further care. This close confinement is seen easily in the smaller perching birds that are held within a very limited range until the young are finally on the wing. When the young are grown the adults may linger to rear other broods, but the young, driven often by antagonism of erstwhile attentive parents, wander away, borne by their newly-developed wings, and though they may not go far, do not usually remain for long in the immediate vicinity of the nest. This is one type of wandering in its simplest form. Somewhat more complex is the condition found in some parts of Australia, where prolonged droughts occur during which water evaporates, vegetation is not developed and the majority of birds disappear. With the incidence of rains the country again becomes green and birds return. Though both kinds of movement that have been described may appear as vagrancy, yet such impulses need only to become synchronized with seasonal

climatic change to become true migration.

Tropical regions offer interesting data in this connection, as though hundreds of birds found in these areas are strictly sedentary, yet there are some that shift about with changing conditions. Climatic variation within the Tropics is confined mainly to a cycle, in which periods of relatively little precipitation alternate with those of heavy rains. There is thus a seasonal shift that is influenced by changes in the vegetation. Some species of tree or vine come into flower or fruit and immediately there appear tanagers, honey-eaters and other birds hitherto absent to live upon the newly-available food.

It is idle to suppose all birds have arisen within either tropical or temperate areas. Birds, as a group, have been in existence for many million years, and during all that period there has been constant unceasing competition between individuals. In virile species individuals have been produced in abundance, and many have necessarily been forced out into new range. Some have reacted to new conditions, or have become modified through some inherent quality, so that they have been changed so greatly that they have finally become species apart from the parent stock, and have thus set up their own *loci* for subsequent radiation. The complexity of overlapping ranges under such conditions is easily apparent.

## HOW MIGRATION PROCEEDS

Some students have indicated that the spring and fall migrations correspond to advance to the breeding station and subsequent retreat therefrom, and indicate correctly that the stimulus for this may be a hormone arising from physiological change in the gonads. This, however, is merely an activating principle for migration as it exists at the moment, and may not be considered the cause through which migration itself has originated.

Briefly, migration may be defined as advance and retreat, with fluctuation in conditions favourable to each species separately, which, as each form has its own reaction to its environment, has originated from varying causes. The origin of the present day regular, seasonal movements is thus complex.

**Methods of Migration.**—Migration may take place by day or by night, according to the species. Geese, ducks, cranes and pelicans crossing the sky, flying abreast or in angular formation, are accepted as portents of changing season throughout the world. Though seen regularly by day, these birds may also migrate by night, as we frequently hear the calls of geese and swans coming from darkened skies during the height of their movements. The smaller birds travel mainly by night, and descend on us in hordes, so that frequently we go out in early morning to find fields and hedgerows crowded with songsters that were absent the previous evening. During the proper season, when a full moon rides the sky in evening, it is possible to detect the forms of these nocturnal travellers silhouetted against the illuminated disk of light as they pass far above the earth, and occasionally to recognize a feathered friend by some peculiarity of form or wing movement. Many such observations have been made through large telescopes, and birds may be seen occasionally against the moon through ordinary field-glasses. It is probable that timid wrens, warblers and sparrows, that live ordinarily under shelter, feel greater safety in prolonged flights under the protecting cover of darkness. Kingbirds, robins, bluebirds, bluejays and many others however regularly fly by day.

The matter of procurement of food is probably a greater factor than timidity in inducing nocturnal flight. Digestion in birds is rapid, so that food must be obtained at regular intervals to maintain the activity especially characteristic of smaller species, whose tiny bodies have necessarily smaller reserves of energy than their larger brethren. Stomachs of small birds killed at night by striking lights or other obstructions are nearly always entirely empty, which, though an entirely natural thing, in some cases has given rise to belief that the individuals in question were in the throes of starvation. If tiny migrants flew long distances by day they would arrive at some distant destination with empty stomachs and depleted energies, perhaps almost exhausted, and because of darkness would not be able to procure food until the following morning. Such circumstances would lead to delay in further flights through need for recuperation or, if accompanied by cold or storm, might prove fatal because of the lowered vitality. By arrival at daybreak it is possible for migrants to rest for a time and then search for food, and so to recuperate that they may continue the following evening if desired. At the same time there is often detected among these smaller species an indication of continuation of migratory flight by day, as in feeding they often tend to move in the general direction towards which the seasonal flight trends.

It was thought formerly that migrants flew at great altitudes above the earth, there being a somewhat hazy notion that rarefied atmosphere in some uncertain way facilitated flight. Modern observations from aeroplanes show, however, that this belief is unfounded, and that the bulk of migrant birds travel at less than 3,000 ft. above the earth. It is unusual to meet with birds above 5,000 ft., though exceptionally aviators have recorded shore-birds at 10,000 and 12,000 feet. In many instances birds pass at very moderate altitudes, particularly above the sea, where they may barely clear the waves. At night, the calls of migrants may be often heard, apparently only short distances above the trees.

There has been much discussion of the method by which birds direct their courses in flights to distant lands, without arrival at definite explanation. Memory of routes previously travelled, some magnetic sense, courses laid by the positions of the heavenly bodies, as a mariner directs his navigation, the direction of regular winds, telepathy, television and hereditary memory have all had their champions. It may be said that there appears great probability that young birds of the season, on occasion, migrate southward without the guidance of others that have previously made the journey, that sea-birds return across apparently trackless oceans to remote islands where they nest, and that birds have returned to their breeding stations when removed forcibly to waters that they do not ordinarily frequent. This may, perhaps, be explained in the somewhat general terms, by supposition, that the birds are directed by some special sense of direction, but must be regarded at present as something of which there is no definite explanation.

One of the most interesting facts connected with migration is the almost unfailing regularity that accompanies the movements of birds in the temperate regions. Through records kept over a long period of years, the average dates of arrival in spring of the common birds are now known, and it is found that they appear with almost uncanny regularity, often on the average day and always within a range of a few days earlier or later. Among small birds the seed-eaters generally migrate earlier in spring and later in autumn than insect-eaters, as they find their food with greater readiness. The first arrivals in spring or fall are usually few, and it may be days or weeks before the mass of individuals appear.

The length of the journeys made by individual birds varies greatly. Inhabitants of high mountains, in a flight of a mile or two, descend to some warm valley, where they may spend the winter in comfort, or the migration flight may entail a movement to a great distance, as from central Europe to southern Africa. The Arctic tern is supposed to have the longest migration route known, as it nests in the far north and spends the northern winter near the shores of the Antarctic continent, with 11,000 m. in an air-line separating its northern and southern homes. Incidentally, this tern probably enjoys longer hours of daylight than any other living creature, since it lives under the midnight sun in both northern and southern hemispheres, and only in its travels through the equatorial belt does it meet extended periods of darkness. There are numerous shore-birds, such as the American golden plover, that nest in the Arctic and spend the northern winter on the plains of Argentina. Many birds nest in Canada or in the northern United States and winter in the Gulf States, Mexico, Central America, the West Indies, or northern South America. Likewise, many pass from northern Europe to Africa, some going as far as Cape Colony.

There is almost infinite variety in the migration routes and travels of the many forms of birds, yet in each continent it is found that there is a tendency to converge in great lanes of migration that carry the bulk of individuals, though random birds may cross anywhere in the intervening area. The flight-lines often fol-

low river valleys or coast-lines, which seem to afford assistance in directing the flight. The observer interested in bird life who is located on one of these great air-roads is fortunate.

Through prolonged journeys birds encounter constant perils and dangers, so that many are destroyed. Storms, unfamiliar coverts, with consequent exposure to the attacks of enemies, and wandering from the direct course in crossing broad reaches of water annually exact a toll of unknown thousands of individuals, as has been indicated in a previous section. To enable maintenance of their proper number migratory species, therefore, are required to produce a sufficient number of young to permit this toll, and at the same time leave a pair to continue the species at the next breeding season. On the average, the migratory species of the north and south temperate zones produce from three to six eggs in each nesting, four or five being the rule, with from one to three families each season, while the more strictly resident form of the Tropics may produce only two or three eggs and have only one nesting annually. In spite of apparent prolificness the more northern species do not increase inordinately. The song sparrow family, in August, at the close of the breeding season, if there has been no mortality, may have ten or 14 individuals, depending upon whether two or three broods have been reared, yet by next spring does not show any appreciable increase in abundance; so that there has been a tremendous wastage in individual life during the migrations and the intervening winter.

In final consideration, it may be said that residents in Europe and North America are often prone to consider migration as something peculiar to birds breeding in the northern hemisphere. It must be noted, however, that in South America, southern Africa, and Australia there are native species that, at the approach of the southern winter, travel north toward the Equator, to return at the proper season to their breeding-grounds.

## BIRD BANDING

Until the beginning of the present century the study of migration was carried on by mass-observation, under which records were kept of the first appearance for each species and of its subsequent fluctuations in abundance, the value of the records depending to a certain degree upon the skill and experience of the observer. Much valuable data has thus been assembled, and this method of study is still highly useful. In recent years there have been developed methods in marking individual birds with numbered bands that have added greatly to knowledge of migration, since by this means it is possible to single out the individual bird from the great army of his fellows, and to learn something of the separate flights that make up this mass movement.

Sporadic attempts to mark wild birds so that they might be identified began more than 125 years ago, and have ranged from little bells, bits of coloured yarn, marks made with indelible inks or paints on some of the feathers, plain rings of wire or other material, or strips of metal on which were marked scriptural quotations, to the modern scheme of bands of aluminium marked with a serial number and the name and address of the person or organization responsible for them.

The earliest definite record for a banded bird, according to F. C. Lincoln, is that of a heron (*Ardea cinerea*), captured in Germany in 1710, with metal rings on the leg, one of which had been placed on the bird in Turkey several years before. Sporadic efforts to mark birds have been made at irregular intervals, but nothing of real importance was attempted until 1899, when C. C. Mortensen, of Viborg, Denmark, began systematically to band storks, ducks, starlings and birds of prey. The results obtained were so valuable that soon others took up this study, with the result that at the beginning of the World War approximately 20 distinct banding projects had been initiated in Europe.

In America the first birds ringed seemed to have been some common phoebes (*Sayornis phoebe*), marked by Audubon, when in the nest, with silver wires around the leg, some of them returning the following year to breed in the locality where they had been born. After several persons in America had arranged schemes for the marking of birds the American Bird Banding Association was organized, in 1909, through the efforts of Dr. L. J. Cole, and continued until 1920, when its activities were taken over as part of the work of the Bureau of Biological Survey, U.S. Department of Agriculture. Under Government auspices the work has been expanded through a co-operative scheme until now more than 1,500 persons are engaged in banding birds in the United States and Canada, and to 1928 approximately 350,000 birds had been banded. Early work was concerned with the marking of young birds before they were able to fly, or the casual capture of adult individuals. In recent years this has changed to the banding, principally, of adults captured by a variety of ingenious traps, and then marked and released. Banding in the United States has progressed to a point where there have been organized four regional societies concerned with it. Though hundreds of birds that have been marked are not subsequently detected, enough are recovered to render the work profitable to a high degree. Among ordinary birds from one to four in every hundred banded are later retaken, while among ducks, which are hunted as game, the recovery runs from 12 to 20 in each hundred, a remarkable number. Through the trapping method it often happens that banded birds are retaken and released uninjured, sometimes on several occasions.

Through banding, it has been found that some birds have winter homes as definitely defined as those inhabited in summer. As a case in point, there may be mentioned the white-throated sparrow (*Zonotrichia albicollis*), which nests in the northern section of eastern North America, from Massachusetts and Wyoming north to Labrador and Great Bear lake, and winters in the central and southern States. A bird of this species banded by S. P. Baldwin, near Thomasville, Georgia, on March 5, 1916, was retaken within a few yards of the original spot on March 7 and 19, 1917, on several occasions between February 25 and March 22, 1920, and on March 27, 1921, indicating a remarkable regularity in return to one spot. Wild ducks banded by the writer at the northern end of Great Salt lake, in Utah, were killed subsequently in California, Mexico, Texas, Oklahoma, Missouri, Nebraska and Saskatchewan, revealing a tremendous spread in flight, and, with other similar data, giving information of great importance in game conservation. A black-headed gull (*Larus ridibundus*), banded at Rossitten, Germany, was taken subsequently at Bridgetown, Barbados, and another from the same point crossed to Vera Cruz, Mexico. A common tern, marked at Eastern Egg Rock, on the coast of Maine, was found dead four years later at the mouth of the Niger. A lapwing (*Vanellus vanellus*) banded in Cumberland, England, was taken in Newfoundland. Such examples of trans-oceanic migration will increase as the work progresses.

## SONGS AND CALLS

The voice in mammals, including man, is produced in the voice-box, or larynx, in the upper part of the throat. The bird possesses a similar larynx; but its sounds and notes are formed in another voice-box, the syrinx, at the lower end of the windpipe, where it divides to send a bronchial tube to either lung. The syrinx is composed of firm walls derived from the rings of the trachea, or in part from the bronchi, and has within delicate membranes whose tension is controlled by slender muscles. Air expelled forcibly over these membranes produces sound which may be of many kinds, according to the species concerned. The adult turkey vulture (*Cathartes aura*), and the brown pelican (*Pelecanus occidentalis*), have as their only note a sighing aspiration made by expelling the air unmodulated, though their young utter harsh calls in some variety, either in begging for food or in attempting to repel possible enemies. The voiceless condition in the adult is unusual. The rhea sends forth a booming call, ventriloquial in effect, that carries for long distances, the wedge-tailed shearwater utters a series of indescribable groans and shrieks, which combine with those of thousands of its kind to produce a vast volume of sound, the gull or tern calls in constant iteration with a note of harshest sound. In the highest order of birds, among the oscines or song-birds, song has reached high development, and in many follows lines of human music sufficiently to give deep aesthetic pleasure. The male mockingbird (*Mimus polyglottos*) of America, is stirred by spring to a period of vocal utterance that includes a varied repertoire of utterances peculiar to his

own expression, as well as notes borrowed from tuneful neighbours. In the height of the breeding season his efforts continue day and night in apparently ceaseless expression of virile energy. The nightingale (*Luscinia megarhyncha*) of Europe, a dweller of tangled copses, would be overlooked by many were it not for his impassioned outburst of song (which, contrary to popular belief, may be heard at all hours of day and night). The two just mentioned, with the addition of the hermit thrush and the skylark, are the songsters of greatest renown among English-speaking peoples.

A number of bird-songs, even where they have variety of note, are frequently unpleasant to some human ears. Many complain of the doleful cadence of the cooing of mourning doves (*Zenaidura macroura*), or are unpleasantly affected by the harsh chatter of the house sparrow. The song of the plant-cutter (*Phytotoma rutila*) of Argentina exactly resembles the creaking of two tree-limbs rubbing against one another in the wind. The song of the Henslow's sparrow (*Passerherbulus henslowii*) is a low double note barely audible at a hundred yards.

The song impulse is so predominant at the height of its period that it is given expression on the slightest disturbance. Birds awakened at night frequently sing for an instant as clearly as during the day, and song also may be used to express emotions of fear and anger.

Though modulated speech for the expression of abstract ideas may be peculiar to man, there is no question but that birds possess a rudimentary language in the sense that they use their calls to communicate with one another. A low call on the part of a parrot or paroquet at detection of a sound or sight that may denote danger will instantly cause the entire group of its companions to become motionless, or send them in screaming confusion into the air. The mother pheasant warns her young, who immediately hide and cannot be found. The rooster, by rapid repetition of a certain note, calls the members of his harem to some supply of food. There are also cries of anger, and others that may be interpreted as conversational, that enable species of social habit to keep in touch with one another. Bird-calls are often intelligible to other creatures, as the alarm-call of a jay or plover will often startle deer or other game.

There are a number of birds that possess a strong imitative faculty which, in domesticated individuals, may be adapted to the mimicry of human sounds. Canaries and other finches may be taught to whistle a few notes of musical airs. The Amazon parrots are particularly adept at mimicry of the human voice, and similar ability is found in some macaws, paroquets and other parrots. Crows, jays and magpies also may learn to repeat a few words, as may starlings and mynahs. According to a widely current superstition the tongues of the latter birds must be split to enable them to articulate human speech, a belief for which there is no valid basis, whatever, and which, when practised, imposes a needless cruelty. This curious belief may be based on the fact that the tongue of crows and jays is naturally somewhat split.

## FLIGHT

The wing-membranes of the ancient reptilian pterosaur (*see* PTERODACTYL) were supported by elongated finger-bones, as are the wings of bats (though differently), but birds have developed another mechanism for flying, as the fore-limb, including the hand, has long feathers projecting from its posterior margin that are extended to form a supporting surface, by which flight is accomplished (*see* also BIRD). The hand is stiffened, being flexible only at the wrist, the number of hand and finger-bones is reduced, and those that remain are partly fused together. The wing thus developed folds against the sides, so that it causes no embarrassment when the bird is at rest or is walking or climbing, but at the same time may be extended instantly should need or desire for flight arise. It appears thus perfectly adapted for its purpose and in utility (though not in speed) eclipses the aeroplanes of man.

**Methods in Flight.**—Avian flight is accomplished, except when soaring, by strokes of the wings, which may be slow or fast according to circumstances or the custom of the bird. A certain momentum must be acquired before the bird actually moves through the air. From a level surface this is ordinarily accomplished by an initial spring, through which the flexed legs throw the body as though from a catapult. From an elevation, as from a cliff or the limb of a tree, a fall of a few inches or a few feet may occur before the bird is under way. Albatross take off from land facing the wind, running a few steps forward with beating wings and then spreading their pinions, to rise and sail gracefully away. Some aquatic birds with small wings and heavy bodies, as coots, diving ducks, grebes and loons rush across the water surface with beating wings and alternately striking feet until they acquire sufficient momentum to carry them into the air. Surface-feeding ducks, on the contrary, spring directly into the air with one tremendous impulse that gives such impetus that they fly without appreciable pause. Grebes rise with difficulty except from the water. From a smooth, hard surface they can sometimes take off in flight, but in herbage they are unable to rise, as the slightest obstructions break their momentum.

There is a considerable group of birds that in their active moments are so constantly in the air that they may almost be termed aerial creatures. The swallows are an excellent example of these as they secure their entire supply of food in the air, and for hours on end circle and swing with tirelessly moving wings, only perching when their appetite is satisfied, for the purpose of rest at night, or at their nests.

Aerial existence of a stronger, more placid type, is exemplified by the great vultures and the larger hawks that circle and turn on broadly extended wings above the earth, frequently at great heights. Such birds may soar for hours with only an occasional stroke of the wings, as they use the force of rising or laterally moving air-currents to maintain themselves, the only motion being a constant slight adjustment of the angle of the wings, particularly at the tips, and of the tail to secure the proper amount of upward thrust to enable them to maintain the desired altitude and at the same time move ahead. The turkey vulture (*Cathartes aura*), which uses a soaring flight constantly for its progress through the air, is seldom abroad on foggy days when the air is still, but on such occasions remains quietly in its roosts. Many other birds soar merely for the pleasure that this occasions. Pelicans, cormorants, storks, and screamers, to mention only a few, are seen wheeling for hours so high above the earth that they appear as mere specks in the sky, though these birds search for food near, or on the surface of, water or the ground. Soaring flight of a different kind is seen where gulls glide beside or over a vessel, holding steady position in one place for minutes at a time without movement of the wings. This again is occasioned by steady air-currents that are deflected from the surfaces of the boat at a constant angle.

Hawks and the other soaring birds that have been mentioned that perform their flights relatively high in the air have wings wide in proportion to their length. Albatrosses and other seabirds that travel habitually near the surface of the water have long, narrow wings that when fully extended are more or less of equal width throughout their length, and so are somewhat similar in shape to the wings of a monoplane. These birds progress by utilization of air-currents induced by wind, and are most common in pelagic regions where there are regular winds, and are rare in regions of calm. Their flight is quick and subject to sudden turns, so that the method of progression differs somewhat from the smooth, spiraling turns that mark the soaring of hawks and vultures. As the larger petrel-like birds follow in the wake of ships they bank and turn rapidly with stiffly-extended wings, frequently swinging so that the plane of the wings for a brief space is at right angles to the line of the horizon. It is common to see shearwaters caught in the trough of a wave fly rapidly to the crest and then scale with set wings down the succeeding moving slope of water.

Birds like magpies and ducks, that habitually fly long distances, travel with a steady beat of the wings that carries them in a smooth, direct line. Inhabitants of thickets and hedgerows, as sparrows and wrens, progress with a tilting flight in which the short, rounded wings move rapidly for a few quick strokes, and

then pause for a very brief instant, so that the flight is rapidly tilting, or irregular in a vertical plane. Another group of birds, as many woodpeckers, fly in long undulations with a regular rise, during which the wings are stroked rapidly, and a slow descent, during which they are closed and the bird progresses through a combination of its previous momentum and the pull of gravity.

Such ground-haunting birds as the grouse and quails regularly walk or run, and use their wings extensively only to carry them from danger. In these the wings move rapidly, so that flight is swift and is accompanied by a roaring sound. The rapid movement is maintained for a comparatively short distance when the bird drops to the ground to hide in cover. Flight at high speed is thus maintained for only a brief space. The tinamous (*Tinamidae*) of South America, birds of grouse-like appearance related to the rheas, like grouse, fly only when pressed. They rise violently and drive rapidly away for fair distances, but are reluctant to rise again, and when forced to fly a second or third time do so with some difficulty. They are so seldom in the air that in violent winds they cannot easily control their direction, and often alight so clumsily that they fall.

Ground-inhabiting birds that reside on islands where they have no regular persistent enemies, have little incentive to flight, with the result that wings become shortened and their movement weakened. In many instances, particularly among rails, this has resulted in species in which the power of flight is completely lost, and the wings, though they may beat rapidly as the bird runs, cannot raise it from the ground. In some species now living loss of power of flight is now taking place. The Laysan teal (*Anas laysanensis*) is now in this process, so that, though an initial flight of about 100 yd. may be made, the birds are then exhausted and may sometimes be caught by hand.

**Speed of Flight.**—The speed that birds attain in flight, until comparatively recent years, has been a matter of uncertainty, in many cases subject to gross exaggeration. Most of these may be traced to Gätke, who in his otherwise admirable studies of migration on the island of Heligoland became seized with the hypothesis that birds perform most of their migration-flight during the course of a single night. On this theory, he placed the migratory speed of the northern blue-throat at 180 to 240 m. per hour, the hooded crow at 108 m., and plovers and related species at 240 m. per hour, or 4 m. per minute. He believed that these tremendous speeds were possible through flight at great altitudes, even to 40,000 ft. above the earth, where he supposed that the thin air offered little resistance. These statements, which have been widely quoted, are wholly erroneous.

Reliable data on the rate of flight have accumulated slowly during the past 15 years. The writer has secured some information on the subject by timing birds flying parallel to roads by means of the speedometer of an automobile, and in such diverse forms as herons, hawks, horned larks, ravens and shrikes has found the usual flight to vary from 22 to 28 m. per hour. Another observer has found the Arkansas kingbird and scissor-tailed flycatcher flying at only 10 to 17 m. per hour. Gladstone gives similar records for the willow warbler as 23½ m. per hour, the pied wagtail as 25, the European blackbird as over 22, the missel thrush as 23, and the cuckoo as 23 m. per hour.

Meinertzhagen has recently given very definite data on the speed of flight in birds from observations made by theodolites designed to estimate the speed of aeroplanes at anti-aircraft stations, by stop watches along measured courses, and by observations from travelling aeroplanes. From his records it appears that members of the crow family may travel from 31 to 45 m. per hour, the smaller perching birds, as larks, pipits and buntings from 20 to 37 m. per hour, starlings from 38 to 49 m., geese from 42 to 55 m., ducks 44 to 59 m., falcons 40 to 48 m. and sand grouse 43 to 47. The fastest flying birds known are found in the family of swifts (*Micropodidae*). One species (apparently the common swift of Eurasia), observed from an aeroplane in Mesopotamia, circled easily about a plane when this was flying at 68 m. per hour. From this and other observations it appears that ordinary swifts fly regularly at 70 m., and may accelerate this to 100 m. per hour for necessity or pleasure.

## FOOD

During their long period of evolution, birds have become adapted to all foods available to their methods of feeding. Geese graze on tender herbage as readily as cattle, rheas and ostriches select a miscellaneous vegetable diet, the plant-cutter (*Phytotoma*) eats buds, berries and other vegetable matter, the palm-chat of Haiti (*Dulus dominicus*) frequently consumes blossoms, the sage-hen (*Centrocercus urophasianus*) delights in the bitter twigs and leaves of sage (*Artemisia*), ducks are fond of succulent roots, tubers and leaves of aquatic plants, and many other birds have similar propensities for plant-stems or leaves. Fruits are taken by many birds, while the number of birds that depend upon starchy seeds for the major part of their diet is myriad, and includes a great variety of species. The finches with their strong bills crack off the investing hulls of large seeds and consume only the starchy interior. Small hard seeds, as those of lambs-quarter (*Chenopodium*), are swallowed entire and are ground up by sand and bits of gravel swallowed for the purpose. Grackles (*Quiscalus*) by means of a keeled process on the palate, cut around the shells of acorns until they crack in two and the meat is exposed. Jays hold nuts between the toes and break them open by strong blows of the beak. Some woodpeckers force acorns into crevices in trees, where they are held until they may be broken open. The mallard and wood-duck swallow acorns and even entire nuts of the hickory, which have a shell so thick that it requires a strong blow of a hammer to break them, and grind them up in their gizzards. Seeds form a standard autumn and winter food when other sustenance is lacking, and are produced in tremendous quantity. From the stomach and gullet of one mallard duck there have been taken 102,400 seeds of the water primrose (*Jussieua leptocarpa*).

Birds that feed on insect-life abound, and include a large proportion of the smaller species. Vireos, warblers and kinglets search actively for insects among leaves and twigs, picking off their prey at rest or flying out a few inches after some escaping titbit. Flycatchers (*Tyrannidae*) watch from commanding perches and fly out to snap up passing insects on the wing, or occasionally to pick them from the ground. Nuthatches and creepers search over the bark of trees for insects, spiders or eggs hidden in the crevices, and woodpeckers chisel out coleopterous grubs from their hidden tunnels in wood. Usually these are found in decaying trunks, but occasionally some of the stronger woodpeckers will cut in through 1 in. of hard wood to secure a grub. The flicker (*Colaptes*) feeds much on the ground on ants, which it secures by its long tongue as the insects run about their hills. More than 6,000 ants have been taken from the stomach of one flicker. Swifts, swallows and nightjars feed exclusively on the wing, securing flying insects in their capacious mouths. In the stomach of one nighthawk there have been found 50 species of flying insects comprising several thousand individuals. Cuckoos consume large numbers of hairy caterpillars, from which the stomach becomes so filled with hairs stuck in the lining that its inner surface appears covered with short, stiff fur. Hummingbirds live on the nectar of flowers and tiny flies, Hymenoptera, beetles and spiders that find a home in blossoms or in the bark of trees.

Grebes, divers, herons, mergansers, cormorants and pelicans feed on fish of various kinds, most often on species not especially desirable from a human standpoint. Albatrosses and shearwaters take quantities of squid, and the smaller petrels seem to secure the miscellaneous array of smaller marine creatures known collectively as plankton (*q.v.*). Hawks and owls feed extensively on small mammals and other birds. Some eat frogs, snakes and large insects, as well as crayfish. Larger owls may capture and consume smaller ones, and partly-grown brown pelicans, when ravenous with hunger, may seize and swallow a small member of the colony, that has just been fed. The flesh of dead animals, even in the form of putrid carrion, is sought by vultures that eat with impunity where death from poison from bacillary action would be the fate of another creature.

Though most birds seek their food day by day and so live an existence that involves continual search for sustenance, a few species form food-stores against a time of scarcity. Most

remarkable among these is a group of North American woodpeckers (*Balanosphyra formicivora*), that drill holes in the trunks of trees, in which they fit acorns, and so preserve a part of the acorn harvest for subsequent consumption. The birds work assiduously, as 13,200 acorns have been estimated as the store on one large tree-trunk, with an average density of 60 to the square foot. That the instinct for storage sometimes goes astray is shown when the carefully-drilled holes are filled with pebbles instead of nuts. The red-headed woodpecker (*Melanerpes erythrocephalus*) fills cavities with quantities of acorns or other small nuts, over which it piles bits of bark to conceal them. Many shrikes (*Lanius*), when food is abundant, frequently impale the bodies of grasshoppers, birds, mice or other prey on thorns, to return to them later if needed.

Hawks and owls swallow their prey entire or in large fragments, digest out all nutritive matter and form the bones, fur, scales, feathers or chitin into pellets, which are subsequently regurgitated, leaving the stomach empty to receive another meal. Albatrosses eject pellets composed of the beaks of squids, flycatchers masses of insect chitin, and even hummingbirds may throw up tiny pellets made up of the indigestible portions of their insect food. Birds with strong, muscular gizzards, that feed on seeds, swallow sand or gravel that serves as millstones to triturate into digestible starch meal the seeds they have eaten.

The Brahmans maintain towers where food for birds is placed, and where birds may nest. In Japanese temples shelves are built where swallows may erect their homes. Indians in the eastern United States placed hollow gourds on bare stubs of trees to provide nesting cavities for the purple martin (*Progne subis*), a species of swallow, a practice that was adopted by early colonists from Europe, and that is followed to-day in country districts in the southern States. From these somewhat rude foundations there have developed complicated procedures for the attraction of birds about human homes. The martin-gourd has been transformed into ornate martin-houses containing many compartments, each of a size to house a pair of birds, and boxes or houses have been designed for many other hole-nesting birds. Though in use in many places, particularly in Germany, at an earlier date, it is since the beginning of the present century that methods for the attraction of birds have received widespread attention. In the United States and Europe single-compartment houses (nesting-boxes) are set up for wrens, bluebirds, tits, woodpeckers and similar birds, and where favourably located are occupied without the slightest hesitation. These bird-houses are of many types, and so many are used that commercial companies have been formed for their manufacture.

Large pieces of suet tied to the trunks or limbs of trees, where birds may feed without fear of capture from cats, draw woodpeckers, nuthatches and titmice. A shelf built on an outside window ledge will draw many birds where they may be seen to the best advantage. Sunflower and canary seed, wheat, chick-feed, moderately fine-ground corn, nut meats and crumbs of bread are all relished by feathered neighbours. A mixture of suet and nut meats, preferably peanuts, ground medium fine in a food grinder, is especially relished by titmice and jays. Birds come to such feeding stands throughout the year.

## ORIGIN AND EVOLUTION

Bizarre as the idea may seem at first, birds are more closely allied to reptiles (*q.v.*) than to any other living group of vertebrates. The bird, while similar to the reptile in much of its structure, in its superior mental capacity, and concomitant adaptations that this has permitted, has far outstripped its lowly cousins, and so has flourished and multiplied while its cold-blooded relatives with decreasing numbers have fallen behind in the race of life. From one viewpoint we may look upon the bird as the attempt of the reptilian groups to retain the dominance of the earth that was theirs during the Mesozoic era, a design that was frustrated by the development of mammals.

The earliest birds known were contemporaneous with dinosaurs (*q.v.*), to which, structurally, they seem to have close affinity, particularly to the hollow-boned, agile, bird-like groups. As these creatures existed at a time when primitive birds were also known search must be carried farther into the ages for a generalized reptilian group from which both birds and dinosaurs may have sprung. This, apparently, is found in the fossil reptiles known as the Pseudosuchians, of early Triassic times; though according to some the original ancestor of the bird-like creatures should be sought in still older ages in the Permian.

**Fossil Birds.**—The bones of birds are so poorly preserved in the fossil state that there is record now of only about 750 fossil forms, including some of questionable identity. The earliest fossils known are *Archaeopteryx* (*q.v.*) and *Archaeornis* of the Jurassic beds of Bavaria, creatures with toothed jaws, very long, bony tails with feathers projecting along the sides, and free fingers, that in spite of their reptilian form, were birds, as they were covered with feathers and were able to fly. In the Cretaceous period two types of birds, both possessing teeth, are known from nearly complete skeletons, *Hesperornis* and its allies, diver-like species that lived in water and seemed to have had no wings, and *Ichthyornis* which was aerial and may have had the habits of a gull (*see* ODONTORNITHES). These four are the most peculiar fossil birds known at present, since others, while often strange, are allied more or less closely to modern families.

At the beginning of the Tertiary period the types of birds found were suggestive, in form, of existing birds, though in the Eocene some were highly peculiar, and most seem to pertain to extinct families. In the Miocene there occur a number of birds very closely similar to those existing to-day, and in the Pleistocene are found bones of numerous birds still in existence, in addition to many that differed from modern forms.

The progress of the avian group since the coming of the Pleistocene ice seems to have been one of extermination rather than of consistent evolutionary progress, as peculiar types seem to have been exterminated in numbers during the Pleistocene, and there is no indication that others have developed to take their places except for the minor characters that distinguish sub-species or poorly-marked species. The story of fossil birds is far from complete, and much work remains to be done on many of those at present discovered, to establish their relationship.

## SYSTEMATIC CLASSIFICATION

It is difficult to arrive at an exact figure for the number of kinds of birds now known, but at a conservative estimate it is believed this may reach 25,000 distinct forms.

The primary group or class, Aves, is one of the great divisions of the vertebrates and is equal in rank to the fishes, amphibians, reptiles and mammals. This class is divided into two sub-classes, the first, the Archaeornithes, containing the most primitive birds which are very close to reptiles, and the second, the Neornithes, all other known birds. The Neornithes are divided again into three major divisions or super-orders, the Odontognathae, containing forms with teeth, the Palaeognathae, for the ostrich-like birds and their allies, which have a primitive arrangement of the bones of the palate, and the Neognathae, including the remaining species with a more specialized modern type of palatal structure. These super-orders are divided again into orders, sub-orders, super-families and families. An arrangement embodying modern ideas of classification follows:

*Class Aves.*
- Sub-class ARCHAEORNITHES
  - Order Archaeopterygiformes
    - Family Archaeopterygidae, *Archaeopteryx, Archaeornis* (fossil)
- Sub-class NEORNITHES
  - Super-order Odontognathae, toothed bird
    - Order Hesperornithiformes
      - Family Hesperornithidae, *Hesperornis, Hargeria* (fossil)
      - „ Enaliornithidae, *Enaliornis* (fossil) [position provisional]
    - Order Ichthyornithiformes
      - Family Ichthyornithidae, *Ichthyornis* (fossil)
  - Super-order Palaeognathae
    - Order Struthioniformes
      - Family Struthionidae, Ostriches (Old World)
    - Order Rheiformes
      - Family Rheidae, Rheas (South America)

Order Casuariiformes
Family Casuariidae, Cassowaries (Australian region)
„ Dromiceidae, Emus (Australian region)
„ Dromornithidae, *Dromornis* (fossil)
Order Dinornithiformes
Family Dinornithidae, Moas (extinct, New Zealand)
Order Aepyornithiformes
Family Aepyornithidae, *Aepyornis* (extinct, Madagascar)
Order Apterygiformes
Family Apterygidae, Kiwis (New Zealand)
Order Tinamiformes
Family Tinamidae, Tinamous (S. Central America)
Super-order Neognathae
Order Sphenisciformes
Family Spheniscidae, Penguins (Southern hemisphere)
„ Cladornithidae, *Cladornis* (fossil)
Order Gaviiformes
Family Gaviidae, Loons and divers (Arctic & North temperate)
Order Colymbiformes
Family Colymbidae, Grebes (Cosmopolitan)
Order Procellariiformes
Family Diomedeidae, Albatrosses (Tropics, sub-Tropics & Antarctic)
Family Procellariidae, Shearwaters, Fulmars (Cosmopolitan)
Family Hydrobatidae, Small Petrels (Cosmopolitan)
„ Pelecanoididae, Diving Petrels (Cosmopolitan)
Order Pelecaniformes
Sub-order Phaëthontes
Family Phaëthontidae, Tropic-birds (tropical)
Sub-order Pelecani
Super-family Pelecanides
Family Pelecanidae, Pelicans (Tropics, sub-Tropics and warm temperate)
Family Cyphornithidae, *Cyphornis, Palaeochenoides* (fossil)
Super-family Sulides
Family Pelagornithidae, *Pelagornis* (fossil)
„ Sulidae, Boobies, Gannets (Cosmopolitan)
„ Phalacrocoracidae, Cormorants (Cosmopolitan)
„ Anhingidae, Snake-Birds or darters (Tropics and sub-Tropics)
Sub-order Fregates
Family Fregatidae, Man-o'war Birds (Tropics and sub-Tropics)
Sub-order Odontopteryges
Family Odontopterygidae, *Odontopteryx* (fossil)
Order Ciconiiformes
Sub-order Ardeae
Family Ardeidae, Herons, Bitterns (Cosmopolitan)
„ Cochleariidae, Boat-billed Herons (S. America)
Sub-order Balaenicipites
Family Balaenicipitidae, Shoe-bills (Africa)
Sub-order Ciconiae
Super-family Scopides
Family Scopidae, Hammerheads (Africa)
Super-family Ciconiides
Family Ciconiidae, Storks, Jabirus (Cosmopolitan)
Super-family Threskiornithides
Family Threskiornithidae, Ibises, Spoonbills (Cosmopolitan)
Sub-order Phoenicopteri
Family Phoenicopteridae, Flamingos (temperate & tropical regions)
Order Anseriformes
Sub-order Anhimae
Family Anhimidae, Screamers (South America)
Sub-order Anseres
Family Anatidae, Ducks, Geese, Swans (Cosmopolitan)
Order Falconiformes
Sub-order Cathartae
Family Cathartidae, New World Vultures (America)
„ Teratornithidae, *Teratornis* (fossil)
Sub-order Falcones
Family Sagittariidae, Secretary-birds (Africa)
„ Accipitridae, Hawks, Old World Vultures, Harriers, Ospreys (Cosmopolitan)
Family Falconidae, Falcons, Caracaras (Cosmopolitan)
Order Galliformes
Sub-order Galli
Super-family Cracides
Family Megapodidae, Megapodes (Australian region)
„ Cracidae, Curassows, Guans, Chachalacas (Central & South America)
Super-family Phasianides
Family Tetraonidae, Grouse (Cosmopolitan)
Family Perdicidae, Quails (Old World)
„ Phasianidae, Pheasants, Peacocks, Common Fowl (Old World)
Family Numididae, Guinea-fowl (Africa)
„ Meleagridae, Turkeys (America)
Sub-order Opisthocomi
Family Opisthocomidae, Hoatzins (South America)
Order Gruiformes
Sub-order Mesoenatides
Family Mesoenatidae, Roatelos, Monias (Madagascar)
Sub-order Turnices
Family Turnicidae, Bustard-Quails (Old World)
„ Pedionomidae, Collared Hemipodes (Old World)
Sub-order Grues
Super-family Gruides
Family Gruidae, Cranes (Cosmopolitan except South America)
Family Aramidae, Limpkins (America)
„ Psophiidae, Trumpeters (South America)
Super-family Rallides
Family Rallidae, Rails, Coots, Gallinules (Cosmopolitan)
Sub-order Heliornithes
Family Heliornithidae, Sun-Grebes or fin-foots (Old World and South America)
Sub-order Rhynocheti
Family Rhynochetidae, Kagus (New Caledonia)
Sub-order Eurypygae
Family Eurypygidae, Sun-Bitterns (Central and South America)
Sub-order Phororhaci
Family Phororhacidae, *Phororhacos* (fossil)
Sub-order Cariamae
Family Hermosiornidae, *Hermosiornis* (fossil)
„ Cariamidae, Cariamas (South America)
Sub-order Otides
Family Otididae, Bustards (Old World)
Order Diatrymiformes
Family Diatrymidae, *Diatryma* (fossil)
Order Charadriiformes
Sub-order Charadrii
Super-family Jacanides
Family Jacanidae, Jaçanas (Tropics)
Super-family Charadriides
Family Haematopodidae, Oyster-catchers (Cosmopolitan)
Family Charadriidae, Plovers, Lapwings, Turnstones, Surf-birds (Cosmopolitan)
Family Scolopacidae, Snipe, Woodcock, Sandpipers (Cosmopolitan)
Family Recurvirostridae, Avocets, Stilts (Cosmopolitan)
Family Presbyornithidae, *Presbyornis* (fossil)
„ Phalaropodidae, Phalaropes (Northern hemisphere)
Super-family Dromades
Family Dromadidae, Crab-plovers (India, Arabia and East Africa)
Super-family Oedicnemides
Family Oedicnemidae, Thick-knees (Cosmopolitan)
Super-family Glareolides
Family Glareolidae, Pratincoles, Coursers (Old World)
Super-family Thinocorides
Family Thinocoridae, Seed-snipe (Tropics)
Super-family Chionides
Family Chionidae, Sheath-bills (Southern hemisphere)
Sub-order Lari
Family Stercorariidae, Skuas, Jaegers (Cosmopolitan)
„ Laridae, Gulls, Terns (Cosmopolitan)
„ Rynchopidae, Skimmers (America, Africa and South Asia)
Sub-order Alcae
Family Alcidae, Auks, Auklets, Murres, Guillemots (North temperate and Arctic)
Order Columbiformes
Sub-order Pterocletes
Family Pteroclidae, Sand-Grouse (Old World)
Sub-order Columbae
Family Raphidae, Dodo, Solitaire (Mauritius, Réunion, Rodriguez)
Family Columbidae, Pigeons, Doves (Cosmopolitan)
Order Cuculiformes
Sub-order Musophagi
Family Musophagidae, Plantain-eaters (Africa)
Sub-order Cuculi
Family Cuculidae, Cuckoos, Road-runners, Anis (Cosmopolitan)

Order Psittaciformes
- Family Loriidae, Lories (Australian region)
- „ Psittacidae, Parrots, Macaws (Tropics & sub-Tropics)

Order Strigiformes
- Family Tytonidae, Barn-owls (Cosmopolitan)
- „ Strigidae, Owls (Cosmopolitan)

Order Caprimulgiformes
- Sub-order Steatornithes
  - Family Steatornithidae, Oil-birds (South America)
- Sub-order Caprimulgi
  - Family Podargidae, Frogmouths (India and Australia)
  - „ Nyctibiidae, Potoos (Old World Tropics)
  - „ Aegothelidae, Owlet-Frogmouths (Old World Tropics)
  - Family Caprimulgidae, Nightjars, Night-hawks, Whip-poorwills (Cosmopolitan, except east Pacific)

Order Micropodiformes
- Sub-order Micropodii
  - Family Micropodidae, Swifts (Cosmopolitan)
  - „ Macropterygidae, Crested Swifts (Asia)
- Sub-order Trochili
  - Family Trochilidae, Hummingbirds (America)

Order Coliiformes
- Family Coliidae, Colies (Africa)

Order Trogoniformes
- Family Trogonidae, Trogons (Tropics)

Order Coraciiformes
- Sub-order Alcedines
  - Super-family Alcedinides
    - Family Alcedinidae, Kingfishers (Cosmopolitan)
  - Super-family Todides
    - Family Todidae, Todies (West Indies)
  - Super-family Momotides
    - Family Momotidae, Motmots (Central and South America)
- Sub-order Meropes
  - Family Meropidae, Bee-eaters (Old World)
- Sub-order Coracii
  - Family Coraciidae, Rollers (Old World)
  - „ Leptosomatidae, Ground-rollers (Madagascar)
  - „ Upupidae, Hoopoes (Old World)
  - „ Phoeniculidae, Wood-hoopoes (Africa)
- Sub-order Bucerotes
  - Family Bucerotidae, Hornbills (Old World Tropics)

Order Piciformes
- Sub-order Galbulae
  - Super-family Galbulides
    - Family Galbulidae, Jacamars (Central and South America)
    - Family Bucconidae, Puff-birds (Central & South America)
  - Super-family Capitonides
    - Family Capitonidae, Barbets (Tropics)
    - „ Indicatoridae, Honey-guides (Old World)
  - Super-family Rhamphastides
    - Family Rhamphastidae, Toucans (Central and South America)
- Sub-order Pici
  - Family Picidae, Woodpeckers, Piculets (Cosmopolitan, except Madagascar and Australia)

Order Passeriformes
- Sub-order Eurylaimi
  - Family Eurylaimidae, Broadbills (Indo-Malaya)
- Sub-order Tyranni
  - Super-family Furnariides
    - Family Dendrocolaptidae, Wood-hewers (South America)
    - Family Furnariidae, Ovenbirds (America)
    - „ Formicariidae, Ant-thrushes (Central and South America)
    - Family Conopophagidae, Ant-pipits (South America)
    - „ Rhinocryptidae, Tapaculos (Central and South America)
  - Super-family Tyrannides
    - Family Cotingidae, Cotingas (America)
    - „ Pipridae, Manakins (Central and South America)
    - Family Tyrannidae, New World Flycatchers (America)
    - „ Oxyruncidae, Sharp-bills (Central and South America)
    - Family Phytotomidae, Plant-cutters (South America)
    - „ Pittidae, Pittas (Old World Tropics)
    - „ Xenicidae, New Zealand Wrens (New Zealand)
    - „ Philepittidae, Asities or Wattled Ant-thrushes (Madagascar)
- Sub-order Menurae
  - Family Menuridae, Lyre-birds (Australia)
  - „ Atrichornithidae, Scrub-birds (Australia)
- Sub-order Oscines
  - Family Alaudidae, Larks (Cosmopolitan, one genus in America)
  - Family Palaeospizidae, *Palaeospiza* (fossil)
  - „ Hirundinidae, Swallows, Martins (Cosmopolitan)
  - Family Campephagidae, Cuckoo-shrikes (Old World)
  - „ Dicruridae, Drongos (Old World Tropics)
  - „ Oriolidae, Old World Orioles (Old World)
  - „ Corvidae, Crows, Magpies, Jays (Cosmopolitan)
  - Family Ptilinorhynchidae, Bower-birds (Australian region)
  - Family Paradiseidae, Birds of Paradise (Australian region)
  - Family Paridae, Titmice (Europe, Asia, Africa, North America)
  - Family Sittidae, Nuthatches (Northern hemisphere, Australia, Madagascar)
  - Family Hypositttidae, Coral-billed Nuthatches (Madagascar)
  - Family Certhiidae, Creepers (Europe, Asia, North America, Australia)
  - Family Chamaeidae, Wren-tits (Oregon and California)
  - „ Timeliidae, Babbling Thrushes (Old World)
  - „ Pycnonotidae, Bulbuls (Old World)
  - „ Cinclidae, Dippers (Northern hemisphere)
  - „ Troglodytidae, Wrens (Cosmopolitan, except Africa and Australia)
  - Family Mimidae, Thrashers, Mockingbirds (America)
  - „ Turdidae, Thrushes (Cosmopolitan)
  - „ Zeledoniidae, Wren-thrushes (Central America)
  - „ Paramythiidae, *Paramythia* (New Guinea)
  - „ Sylviidae, Old World Warblers (Old World)
  - „ Regulidae, Kinglets, Gold-crests (Northern hemisphere)
  - Family Muscicapidae, Old World Flycatchers (Old World)
  - Family Motacillidae, Wagtails, Pipits (Cosmopolitan)
  - „ Enicuridae, Fork-tails (Indo-Malaya)
  - „ Bombycillidae, Waxwings (mainly northern hemisphere)
  - Family Ptilogonatidae, Silky Flycatchers (Tropical America)
  - Family Dulidae, Palm-chats (West Indies)
  - „ Artamidae, Wood-swallows (Africa, India, Australia)
  - Family Vangidae, Vanga Shrikes (Madagascar)
  - „ Laniidae, Shrikes (Cosmopolitan except South America)
  - Family Prionopidae, Wood-shrikes (Old World Tropics)
  - Family Aërocharidae, Helmet-birds (Madagascar)
  - „ Cyclarhidae, Pepper-shrikes (Central and South America)
  - Family Vireolaniidae, Shrike-vireos (Central and Northern South America)
  - Family Sturnidae, Starlings (Old World)
  - „ Graculidae, Glossy Starlings (Old World)
  - „ Meliphagidae, Honey-eaters (Australian region)
  - „ Nectariniidae, Sun-birds (Africa, Asia, Australia)
  - Family Dicaeidae, Flower-peckers (West Africa, Indo-Malaya, Australia)
  - Family Zosteropidae, White-eyes (Africa, Asia, Australasia)
  - Family Vireonidae, Vireos (America)
  - „ Coerebidae, Honey-creepers (Tropical America)
  - Family Drepanididae, Hawaiian Honey-creepers (Hawaiian Islands)
  - Family Mniotiltidae, Wood Warblers (America)
  - „ Ploceidae, Weaver-finches (Africa, South Asia, Australia)
  - Family Icteridae, New World Blackbirds, Troupials (America)
  - Family Procniatidae, Swallow-Tanagers (America)
  - „ Thraupidae, Tanagers (America)
  - Family Catamblyrhynchidae, Plush-capped Finches (Northern Andes)

BIBLIOGRAPHY.—The literature of ornithology is extensive and important, and works on birds appear in increasing numbers annually. The following list of books is intended merely to indicate a few useful works for consultation from which general information may be obtained, and which will assist the student by references to other works. The titles are grouped for convenience under several headings.

General: G. M. Allen, *Birds and their Attributes* (Boston, Mass., 1925), a readable and accurate general account of birds as a group; G. Heilmann, *The Origin of Birds* (London, 1926), a discussion of fossil birds and their relations to reptiles; F. H. Knowlton, *Birds of the World* (New York, 1909), a popular and authentic account of the principal species; A. Newton, *A Dictionary of Birds* (London, 1893–96), a vast amount of information arranged in encyclopaedic form; W. P. Pycraft, *A History of Birds* (London, 1910), a general account of the biology and evolution of birds; J. A. Thomson, *The Biology of Birds* (London and New York, 1923), a modern account that considers broadly the entire subject.

Migration: A. L. Thomson, *Problems of Bird Migration* (London, 1926), a detailed discussion of migration; A. Wetmore, *The Migrations of Birds* (Cambridge, Mass., 1926), a summary of modern knowledge of migration in its broader aspects.

Manuals and Check Lists: Florence M. Bailey, *Handbook of Birds of the Western United States* (Boston, 1921), a manual for the identification and study of the birds of its region; E. C. Stuart Baker, *The Fauna of British India—Birds* (London, 1922, 4 vols. at present issued), a systematic account; F. M. Chapman, *Birds of Eastern North America* (New York, 1912), a manual for the identification and study of the birds of its region; E. Hartert, *Die Vögel der palaarktischen Fauna* (Berlin, 1903), an authoritative manual of the birds of Europe and North Asia; F. W. Hutton and J. Drummond, *The Animals of New Zealand* (Christchurch, N.Z., 1905), includes an account of the bird life of the Dominion; K. Lambrecht, *Fossilium Catalogus, I., Animalia, Aves* (Berlin, 1921), a list of known fossil birds; G. M. Mathews, *Systema Avium Australasianum* (London, 1927, one part issued, another in preparation), a list of names, with ranges of the birds of the South Pacific islands, including Australia; C. A. Reed, *Land Birds East of the Rockies; Water Birds East of the Rockies; Land Birds West of the Rockies* (Nat. Assoc. of Audubon Soc., New York), three booklets for easy identification of birds in the field by coloured illustrations; W. L. Sclater, *Systema Avium Ethiopicarum* (London, 1924, one part issued, another in preparation), a list of names, with ranges of the birds of Africa; H. F. Witherby (editor), *A Practical Handbook of British Birds* (London, 1920–24), a complete manual for its region; American Ornithologists Union, *Check-list of North American Birds* (Philadelphia, 19– ) the official list for America north of Mexico; British Ornithological Union, *List of British Birds* (London, 1915), the official list for the British Isles; Royal Australasian Ornithologists' Union, *Official Check-list of the Birds of Australia* (Melbourne, 1912, and thence quarterly), a list of names with ranges of Australian birds.

Economic Papers: Walter E. Collinge, *The Food of some British Wild Birds* (2nd ed. 1929), studies of the food of certain British birds; J. Henderson, *The Practical Value of Birds* (New York, 1927), general review of economic status, with extended bibliography; Biological Survey, U.S. Dept. of Agriculture, many *Bulletins* by Judd, Beal, McAtee, Fisher, Kalmbach, Wetmore and others, beginning in 1892 and forming the most comprehensive series of reports on this subject.

Periodicals: American Ornithologists' Union, *The Auk* (Washington, D.C.), published quarterly, with articles of current, general and scientific interest, particularly relating to the New World, and with a *résumé* of current literature; British Ornithologists' Union, *The Ibis* (London), quarterly, articles of general and scientific interest, particularly of the Old World, review of current literature; Avicultural Society, *The Avicultural Magazine* (London), monthly, deals with problems of aviculture; American Museum of Natural History, *Bird Lore* (New York), bi-monthly, devoted to popular ornithology and bird protection; H. F. and G. Witherby, *British Birds* (London), monthly, a popular magazine on current ornithology in the British Isles; Cooper Ornithological Club, *The Condor* (Berkeley, Calif.), bi-monthly, devoted particularly to birds of western North America; Royal Australasian Ornithologists' Union, *The Emu* (Melbourne), to promote the interest of ornithology in Australia and adjacent regions; Sociedad Ornithologica del Plata, *El Hornera* (Buenos Aires), deals with current ornithological studies in the Argentine and adjacent countries; Deutsche Ornithologische Gesellschaft, *Journal für Ornithologie* (Berlin), for general and technical ornithological articles. (A. WT.)

## ECONOMIC ORNITHOLOGY

Economic ornithology deals with the study of birds in their relation to man and his various activities, such as agriculture, forestry, trade, sport, etc., or in other words "it is the practical application of the knowledge of birds to the affairs of everyday life." It is a difficult and intricate study and of the greatest importance to mankind.

The scientific study of wild birds from an economic standpoint may be said to date from the publication of a paper by Prevost in 1858, and one by Jenks in 1859. Since then, thanks largely to the workers in the United States Department of Agriculture (Bureau of Biological Survey), great progress has been made and numerous intensive studies undertaken. As a result it is now almost universally admitted, with very few exceptions, that the wholesale destruction of wild birds as a means of protecting crops, etc., is, economically, an unsound policy. A bird which does a considerable amount of harm at a particular season of the year may more than compensate for it by the nature of the food consumed at another season, and in a like manner a bird which is injurious in one district may be beneficial in another. It must ever be borne in mind that, as a rule, insect-eating birds feed upon those species of insects that are the easiest to obtain, and that the variation in a bird's diet depends to a very large extent upon the abundance of the supply and the ease with which it may be obtained. Moreover, where destructive irruptions of insect life occur and wild birds concentrate on one particular species of insect, no especial chance is given for the rise of new fluctuations amongst the commoner species eaten, for the species which is unusually numerous is so widely distributed amongst the ordinary food elements. The more numerous insectivorous birds are, both in species and numbers, the fewer and shorter the insect oscillations are likely to be.

**The Amount of Food Consumed by Birds.**—As a class birds are distinctly beneficial, and experience shows that it is possible to learn with very considerable precision the exact amounts of the different kinds of food that each species requires in a year. This precision is attained by measuring the percentage volumes of the different items of food found in the stomach, crop, etc., during the various months of the year, from a large series of specimens obtained from different localities. This volumetric method, or the expression of the contents in terms of bulk, is much more exact than any numerical count of the different food items, and enables the investigator not only to express himself in exact quantities, but to compare one bird's diet with another; further, it admits of the stating of the definite ratios each element bears to the other. Every bird requires a certain bulk of food per day, not a certain number of insects, seeds, etc., and to estimate correctly the importance of any item in its diet it is necessary to know what proportion the insects, seeds, etc., bear to the standard requirements, and to do so it is necessary to use some method of measurement. Take the case of the skylark. This bird requires about 6 lb. of food per year; in other words 10,000 larks would require about 27 tons of food in a year. Knowing the percentages of food eaten by this species, it is possible to analyse this figure. Of the total bulk of food consumed in a year 35·5% consists of injurious insects, 3·5% of neutral insects, 2·5% of beneficial insects, 9·5% of grain, 1% of leaves, 2% of earthworms, 1% of slugs, 1·5% of miscellaneous animal matter, and 43·5% of weed seeds. In other words, the lark benefits the farmer in regard to 36·5% of its food eaten, is neutral in respect of 50·5%, and injurious only in respect of 13%. If the debit and credit account is further examined it shows on the former side a loss of 2½ tons of cereals, and on the latter something like 30,000,000 injurious insects and 30,000 slugs. Such a plague of insects left to themselves would have destroyed many more tons of cereals, root crops, etc. Thus the farmer is undoubtedly the gainer from the activities of this bird by an enormous tonnage of produce.

**The Effects of Fluctuations in the Number of Birds.**—It is now fully recognized that wherever the insect-feeding birds of a district or of districts are destroyed, either wantonly or through climatic and other causes, there is an accompanying insect oscillation which is not reduced until the balance of bird life is restored. In the case of many insects whose numbers remain relatively constant, the controlling influence is largely, if not entirely, due to the uniformity of the bird life which prevails from year to year. Any factor, therefore, that tends to modify or upset the restraining influences of wild birds in their relationship to injurious insects is distinctly detrimental. In a like manner, where raptorial birds and owls are destroyed, farm vermin, such as rats, voles and mice, rapidly increase in numbers.

Some species of wild birds are injurious because they are too numerous, and as a result there are too many birds feeding upon

the same kind of food in a given area, in consequence of which certain species supplement their diet by feeding upon cultivated crops. No better instance of this can be found than the European house sparrow. It has been estimated that in Great Britain alone the losses due to this species reach the incredible figure of £8,000,000 per annum. Wherever it has been introduced it has increased and spread with startling rapidity, and proved an enemy to the cultivator. Injury to crops invariably proceeds from an excessive number of individuals rather than from the natural habits of the species. Once any species exceeds what may be described as its high-water mark of abundance, its food habits change and it becomes a source of danger to mankind. The failure of a normal source of food supply occasionally leads birds to injure crops which under ordinary conditions they seldom attack. Many fluctuations in number are either only local or temporary, and if not interfered with will adjust themselves.

The contention that insectivorous birds do more harm than good by attacking beneficial insects and parasitized caterpillars does not appear to be well founded. Similarly those species which feed largely upon the seeds of weeds have been regarded as beneficial, but it is now known that many of these species act as distributors of the seeds. In any economic consideration of such birds it is perhaps best to regard such activities as neutral, but on this point considerable diversity of opinion exists.

**The Food of Nestlings.**—No consideration of the economic status of wild birds can be complete without a reference to the food of the young birds in the nest. During the first few days of life nestlings consume daily considerably more than their own weight of food and add 20 to 50% to their weight. From sunrise to sunset feeding continues, 200 to 300 visits being paid to the nest by the parent birds. With the exception of doves and pigeons, and aquatic and raptorial species, the food brought to the young consists of caterpillars, soft-bodied insects, spiders, worms and slugs. Moreover, during the whole of the nesting period the parent birds are feeding upon food similar to that fed to the young. "Few people," states H. C. Bryant, "have any realization of the great quantities consumed by birds. For instance, if we consider that there is an average of one meadow lark to every two acres of available land for cultivation (11,000,000ac.) in the Sacramento and San Joaquin valleys, and that each pair of birds raises an average of four young, each one of which averages one ounce in weight while in the nest, and consumes half of its own weight of food each day, it takes over 343½ tons of insect food each day to feed the young birds in the great valleys alone."

It is difficult to bring home to the mind by an expression of figures the millions of caterpillars, grubs, flies, beetles, etc., that birds consume. Careful investigations have shown that the British song thrush during the breeding season, April to June, consumes on an average 10,080 caterpillars, flies, grubs, etc., per month; assuming that there are 100,000 of these birds in the British Isles, they would account for 3,024,000,000 insects, etc., weighing upwards of 520 tons. Such a number are capable of destroying in three months upwards of 65,000 tons of produce, and assuming that this was worth £5 per ton, the activities of the thrushes would result in a saving of £325,000. Other species are equally beneficial, so that these figures might be multiplied by 20 or 30, thus showing a saving of produce every spring approaching ten millions sterling.

To summarize:—"A careful examination of the circumstances in which birds have done harm leads to the belief that the damage is usually caused by an abnormal abundance of a species within a limited territory. In such cases so great is the demand for food that the natural supply is exhausted and the birds attack some of the products of garden or orchard.

"Economically considered, birds are simply natural forces, and it should be our purpose to ascertain how they may be turned to our greatest advantage. The best economic conditions are probably fulfilled when birds are numerous as species and moderately abundant as individuals. Under such conditions there will be a demand for food of many kinds, without excessive demand for any one kind. The most desirable status would seem to be such a relation of numbers and species between birds and insects that the birds would find plenty of food without preying on useful products, while the insects would be held in such check that they would neither increase to a harmful extent nor be completely exterminated. The proper course to pursue, apparently, is to study the food habits of both birds and insects, to favour the increase of species which seem best adapted to preserve the proper balance, and to reduce the numbers of those that prey too greatly on the products of orchard or farm."—(F. E. L. Beal.)

## COMMERCIAL USES

**Game.**—Commercially, birds are utilized in various ways. Some are used as food, others are valued for their plumage and others for their guano.

Most game-birds are beneficial to agriculture. While accurate statistics are difficult to obtain, there is a larger consumption of such birds to-day than ever, and most nations have enacted special laws for their preservation. When and where such laws do not exist the danger of extermination is very great. In practically all cases the preservation of game-birds has, economically, proved of great value.

**Eggs.**—The eggs of various species of wild birds are highly esteemed as food, and large quantities are annually gathered, but here again there is the same tendency toward extermination unless the gatherings are limited, or close seasons instituted.

**Feathers.**—The feathers of birds are commercially of considerable value apart altogether from the demand of the millinery trade. There is a large trade carried on for upholstery purposes in which the feathers of gulls, guillemots, puffins, ducks and the domestic fowl are utilized. The soft feathers or down of the eider-duck are preferred to all others owing to their superior warmth, lightness and elasticity. Large quantities are imported from Iceland, Greenland and the Faeroe islands. The great mercantile value of the plumes of the ostrich has led to the establishment of ostrich farms, which yield considerable profits.

What is known as the plumage trade, *i.e.*, the trade in birds' feathers for millinery purposes, has, quite apart from many very repulsive aspects, led to more wanton destruction of certain species of birds than all other causes combined. The almost complete extinction of the egrets in the United States and the appalling destruction of birds of paradise, gulls, terns, grebes, tanagers, orioles, bluebirds and numerous other small birds was a blot on present-day civilization. Restrictive measures have been, or are being, taken in many countries.

**Guano.**—Prior to the introduction of artificial manures, guano from the various islands of the Pacific ocean was greatly sought after. Although utilized by the Peruvians over three centuries ago, it was not until the middle of the 19th century that it assumed any importance as an article of commerce. So great was the demand that the better qualities were soon exhausted, and the poorer ones proved unprofitable when compared with the better artificial fertilizers. Small quantities are still collected. Schemes for protection and conservation of the birds and their product have, however, now been introduced.

**Legislation.**—In the absence, until recent years, of really comprehensive and reliable statistics with reference to the precise economic status of the different species of wild birds, it is not surprising that the various acts and orders relating to the preservation or destruction of wild birds have proved largely abortive. Many of these have been ill-considered and often hastily prepared, others have been largely selfish in nature, while the advocates of uniform protection have indirectly contributed to the wanton destruction of many useful birds. What would be the probable ultimate effect of such legislation was never seriously considered at the time.

In some countries the principles on which legislation has been based are, that all wild birds are the property of the State, hence that without permission no one has a right to destroy them; the State has the right to impose restrictions and birds may be captured, killed, possessed, etc., only under such conditions as the State enacts; in a like manner landowners can only kill or capture as a privilege and according as the law specifically grants.

International co-operation in Europe as regards the protection

of wild birds has proved difficult, so many and diverse are the interests of the different countries. Valuable work has, however, been done by the International Ornithological Congresses and other organizations. An international committee was founded in London in 1922, and the International Treaty of 1916 between Great Britain and the United States of America for the protection of migratory birds constitutes one of the most important and far-reaching measures in the history of wild bird protection.

The immediate need of the present is for (1) wide and comprehensive measures that will ensure protection to all non-injurious and beneficial wild birds, and provide adequate repressive measures for those species which have, or do, become too numerous and destructive: (2) the establishment of an ornithological bureau, which would have full control of all matters relating to wild birds, including game-birds. Such an organization should be the sole authority for framing new laws or making special local orders, and for granting licences to persons to collect birds or their eggs for scientific or other purposes, or to destroy birds which the bureau considers to be injurious. Such a bureau would of course be in close touch with other similar bodies, so that international action could be taken where desirable. (*See* EGG; FEATHER.)

BIBLIOGRAPHY.—S. A. Forbes, Papers in *Trans. Ill. State Hort. Soc.* and *Ill. State Laboratory* (1879–1908); W. B. Barrows, A. K. Fisher, H. W. Henshaw, S. D. Judd, E. R. Kalmbach, W. L. McAtee, H. C. Oberholser T. S. Palmer, etc., *Publications of U.S. Dept. of Agric., Bulletins of Biol. Bureau, Farmers' Bulletins,* Year Books, etc.(1887 *et seq.*); E. D. Forbush, *Useful Birds and their Protection* (Mass. State Board of Agric., Boston, 3rd ed., 1908); C. M. Weed and N. Dearborn, *Birds in their Relations to Man* (3rd ed., London and Philadelphia, 1924), a popular manual for U.S. and Canada; W. E. Collinge, *The Food of Some British Wild Birds* (2nd ed., York, 1924–27), a comprehensive manual in nine parts, for Great Britain, with full bibl. containing detailed references to U.S. publications mentioned above. (W. E. C.)

**ORNITHOPTER,** a flying machine with flapping wings operated either mechanically or manually. The type is of historic interest only, and represents man's attempt to imitate the flight of birds. (*See* FLIGHT.)

**ORODES,** the name of two Parthian kings. Orodes I. reigned about 57–37 B.C., succeeding his father, Phraates III. whom, in conjunction with his brother, Mithradates III., he had murdered. He was in turn murdered by his son and successor, Phraates IV. Orodes II. succeeded Phraates V. about A.D. 5 and within two years was murdered on account of his cruelty. (Joseph. Ant., xviii., 2, 4.) *See* PARTHIA: PHRAATES.

**ORONTES,** the ancient name of the chief river of Syria, also called Draco, Typhon, Axius, the last name being probably the name whence has sprung the modern name El-'Āsī (rebel). Taking its rise on the east side of the Beka', it flows northwards expanding into the lake of Homs, and in the plain of Antioch, it is joined by two tributaries, the Afrīn and Kara-su. It reaches the sea near the small port of Suedia (Seleucia Pieriae). In its 170m. course it is mainly unnavigable and of small value for irrigation. Its valley, however, has served as a highway for armies and trade between Egypt and Palestine, and Asia Minor.

**OROPUS,** an ancient Greek seaport on the Euripus which, falling finally to Athens, remained an Attic town under the Roman empire. The oracle of Amphiarus was here. *See* ALTAR.

**OROSIUS, PAULUS** (*fl.* 415), historian and theologian, was born in Spain (possibly at Braga in Galicia) towards the close of the 4th century. Having entered the Christian priesthood, he naturally took an interest in the Priscillianist controversy then going on in his native country, and it may have been in connection with this that he went to consult Augustine at Hippo in 413 or 414. After staying for some time in Africa as the disciple of Augustine, he was sent by him in 415 to Palestine with a letter of introduction to Jerome, then at Bethlehem, the result of his arrival being that John, bishop of Jerusalem, was induced to summon at his capital in June 415 a synod at which Orosius communicated the decisions of Carthage and read such of Augustine's writings against Pelagius as had at that time appeared.

Success, however, was scarcely to be hoped for amongst Orientals who did not understand Latin, and whose sense of reverence was unshocked by the question of Pelagius, *et quis est mihi Augustinus?* All that Orosius succeeded in obtaining was John's consent to send letters and deputies to Innocent of Rome; and, after having waited long enough to learn the unfavorable decision of the synod of Diospolis or Lydda in December of the same year, he returned to north Africa, where he is believed to have died.

The earliest work of Orosius, *Consultatio sive commonitorium ad Augustinum de errore Priscillianistarum et Origenistarum,* explains its object by its title; it was written soon after his arrival in Africa, and is usually printed in the works of Augustine along with the reply of the latter, *Contra Priscillianistas et Origenistas liber ad Orosium.* His next treatise, *Liber apologeticus de arbitrii libertate,* was written during his stay in Palestine, and in connection with the controversy which engaged him there. It is a keen but not always fair criticism of the Pelagian position from that of Augustine. The *Historiae adversum Paganos* was undertaken at the suggestion of Augustine, to whom it is dedicated.

Nearly two hundred mss. of the Historiae have survived. A free abridged translation by King Alfred is still extant. The *editio princeps* of the original appeared at Augsburg (1471), and has been superseded by C. Zangemeister, who has edited the *Hist.* and also the *Lib. apol.* Besides the Old and New Testaments, Orosius appears to have consulted Caesar, Livy, Justin, Tacitus, Suetonius, Florus and a cosmography, attaching also great value to Jerome's translation of the *Chronicles* of Eusebius.

**ORPEN, SIR WILLIAM NEWENHAM MONTAGUE** (1878–1931), British painter, was born at Stillorgan, co. Dublin, on Nov. 27, 1878, and studied at the Dublin Metropolitan school of Art and at the Slade school, London. He was elected A.R.A. in 1910 and R.A. in 1919. He first exhibited at the New English Art club, of which he became a member in 1900, his early work being marked by preoccupation with spacing and silhouette and the use of quiet harmonies of grey and brown, with a note of vivid red or blue. He soon turned to the use of bright colour and the study of light, seen in a series of brilliant portrait interiors such as the "Hon. Percy Wyndham" (1907), "Myself and Venus" (1910, now in Pittsburgh gallery, U.S.A.). About this time he became well known for his vigorously characterised portraits. During the World War Orpen received an appointment as official artist and in 1918 an exhibition of his war pictures was held in London. Many of these are now in the Imperial War Museum. He was created K.B.E. in 1918. He wrote *An Onlooker in France* (1921) and *Stories of Old Ireland and Myself* (1924).

**ORPHEUS.** The legendary founder of the cult known as Orphism, ὁ Ὀρφικὸς βίος. The derivation of the name is uncertain, possibly from the same root as ὄρφνη, signifying darkness. What original figure, human or divine, lies behind the legend, is unknown; it seems possible, however, that Orpheus is the name or title of Thraco-Phrygian priest-kings, who may have been regarded as incarnating the god Dionysus (*q.v.*) or some similar deity, and were perhaps killed by the worshippers of the god after a period of years (*see* Frazer, *Golden Bough,* 3rd ed. vi. 99).

**Legend.**—Orpheus was the son, in most accounts, of the Thracian king Oeagrus (sometimes of Apollo), and a Muse, generally Calliope, sometimes Polyhymnia. He took part in the Argonautic expedition (*see* ARGONAUTS), and there was an Orphic version of that exploit, preserved in a late form in the Orphic *Argonautica.* The best-known episode of his career is that of his marriage. His wife Eurydice was bitten by a serpent (while fleeing from Aristaeus, according to Virgil, *Georg.,* iv., 457; this detail is not found earlier, but the story itself is old and widespread; *see* Rose in *Aberystwyth Studies,* iv. p. 21). Orpheus, inconsolable at her death, went down to Hades to get her back. The infernal deities, softened by his music, allowed her to return, on condition that she should walk behind Orpheus and he should not look back. He broke this condition, and she became a ghost once more (Plato, *Sympos,* 179 D., seems to allude to a slightly different account). He now refused to have anything more to do with women, and consequently the Thracian women, during a Dionysiac orgy, set upon him and tore him to pieces. His head floated down the Hebrus and finally came ashore on Lesbos, where there was apparently an oracular shrine of Orpheus. The legend

may be founded on the practice of the *omophagia* (*see* DIONYSUS).

Orpheus is represented as a musician so marvellous that the wild beasts, and even trees and rivers, came to listen to him. He is also represented as a seer, a founder of mystic rites, particularly Dionysiac, a magician, and later as an astrologer also. Sometimes his adventures tend to be assimilated to the stock incidents in the career of a philosopher, for he is represented as travelling in search of knowledge (as Plato, for example, is said to have visited Egypt). Several writers speak of him as a sort of missionary of civilization (*e.g.*, Aristophanes, *Frogs*, 1032, Horace *A.P.*, 391). He is also the reputed author of a number of books, some dating from the time of Peisistratus of Athens (*cf.* ONOMACRITUS).

**The Orphic Doctrines and "Life".**—There was no Orphic Church but there existed a number of *thiasoi* (conventicles) of initiates into the Orphic mysteries, all having a similar doctrine and rules of life, but lacking any sort of central organization and probably having no common standard of orthodoxy. Orphic initiators (ὀρφεοτελεσταί) were numerous, and are spoken of with the utmost contempt by Plato and others. We hear of Orphism from about the 6th century on, and the doctrine, which seems to have grown out of a combination of the Thraco-Phrygian worship of Dionysus with certain religious speculations characteristic of that age, and probably resulting from the contact of Greece with the East, was in outline as follows. When Zagreus was devoured by the Titans (*see* DIONYSUS) and they were consumed by the thunderbolt, man sprung from their ashes. Hence man is partly divine (Zagreus), partly desperately wicked (the Titans). It is his chief end to get rid of the latter element, which is accomplished by a life of ritual and moral purity during the soul's incarnation in a series of bodies. When completely purified, it will be freed from the "circle of birth or becoming" (κύκλος τῆς γενέσεως) and be made fully divine. The rules of purity included abstinence from animal food of all kinds, avoidance of polluting actions, such as contact with death or birth, wearing of white garments and other ascetic practices. There were mysteries of some kind, at which we may conjecture that the death of Zagreus was enacted (*see* MYSTERY), also various Dionysiac practices, such as the *omophagia*. In some cases, at least, the Orphic dead were provided with extracts from the sacred writings of their sect, inscribed on gold tablets, containing directions for their conduct in the underworld. Several of these have been recovered (*see* next paragraph). The influence of Orphism on Pythagoreanism was very great, so much so that it is often impossible to separate the two, although one was primarily a religion, the other a system of philosophy.

**Orphic Literature.**—A great number of books existing in antiquity were ascribed to Orpheus, or his son Musaeus. This literature was well known to Pindar and Euripides, and exercised great influence, directly or through Pythagoreanism, on Plato, and probably on Socrates also (*see* A. E. Taylor, *Varia Socratica*). It is now lost save for (1) the gold tablets already mentioned, which clearly contain extracts from a poem dealing with the underworld, (2) a collection of hymns of late date, (3) *Lithica* (on the virtues of minerals) and the *Argonautica*, also late. There are, however, numerous quotations in writers of various dates, which together make up a large collection of fragments, some early and undoubtedly genuine Orphic, others much later, including palpable forgeries, showing Jewish and other foreign influence. A principal source for these is the controversialists, Christian and pagan, of the 3rd and 4th centuries A.D. Among editions may be mentioned E. Abel, *Orphica* (1885); O. Kern, *Orphicorum fragmenta* (1922). The former contains the hymns, *Lithica* and *Argonautica*.

Gomperz, *Greek Thinkers* (Eng. trans. 1901), vol. i.; A. Dieterich, *Nekyia* (1913) (since reprinted with some additional notes). *See* also the larger works on mythology, as O. Gruppe, *Griechische Mythologie*, ii. (1906), and the relevant articles in Roscher's *Lexikon der Mythologie* and Daremberg-Saglio's *Dictionnaire des antiquités*.

On the representations of Orpheus in heathen and Christian art (in which he is finally transformed into the Good Shepherd with his sheep), *see* A. Baumeister, *Denkmäler des classischen Altertums*, ii. p. 1,120; P. Knapp, *Über Orpheusdarstellungen* (Tübingen, 1895); F. X. Kraus, *Realencyklopädie des christlichen Alterthums*, ii., (1886); J. A. Martigny, *Dictionnaire des antiquités chrétiennes* (1889); A. Heussner, *Die altchristlichen Orpheusdarstellungen* (Leipzig, 1893); R. Eisler, *Vorträge der Bibliothek Warburg 1922–23 ii. Teil*, (1925); and the articles in Roscher's and Daremberg and Saglio's Lexicons.

The story of Orpheus, as was to be expected of a legend told both by Ovid and Boethius, retained its popularity throughout the middle ages and was transformed into the likeness of a northern fairy tale. In English mediaeval literature it appears in three somewhat different versions: *Sir Orpheo*, a "lay of Brittany" printed from the Harleian ms. in J. Ritson's *Ancient English Metrical Romances*, vol. ii. (1802); *Orpheo and Heurodis* from the Auchinleck ms. in David Laing's *Select Remains of the Ancient Popular Poetry of Scotland* (new ed. 1885); and *Kyng Orfew* from the Ashmolean ms. in J. O. Halliwell's *Illustrations of Fairy Mythology* (Shakespeare Soc., 1842). The poems show traces of French influence.

**ORPIMENT,** an arsenic trisulphide. *See* ARSENIC.

**ORPINGTON,** a residential urban district (after 1934) of Kent, England, 13¾ mi. S.E. of London, on the S.R. Pop. (est. 1938) 46,320. Area 32.6 sq.mi. The church is Early English.

**ORRERY, CHARLES BOYLE,** 4th EARL OF (1676–1731), British author, soldier and statesman, the second son of Roger, 2nd earl, born at Chelsea, was educated at Christ Church, Oxford. He translated Plutarch's life of Lysander, and published an edition of the epistles of Phalaris, which engaged him in the famous controversy with Bentley. Orrery was imprisoned for a short time in 1721 on suspicion of being concerned in Layer's Jacobite plot. He died on Aug. 28, 1731. Among the works of Roger, earl of Orrery, will be found a comedy, entitled *As you find it*, written by Charles Boyle.

**ORRERY, ROGER BOYLE,** 1ST EARL OF (1621–79), British soldier, statesman and dramatist, 3rd surviving son of Richard Boyle, 1st earl of Cork, was born on April 25, 1621, created baron of Broghill on Feb. 28, 1627, and educated at Trinity college, Dublin, and, according to Wood, also at Oxford. He travelled in France and Italy, and coming home took part in the expedition against the Scots. He returned to Ireland on the outbreak of the rebellion in 1641 and fought with his brothers at the battle of Liscarrol in September 1642. On the resignation of the marquis of Ormonde, Lord Broghill consented to serve under the parliamentary commissioners till the execution of the king, when he retired from public life. He was engaged in royalist schemes, however, when Cromwell visited him, and, explaining that he knew all about his activities, offered him a chance of clearing himself by serving the Commonwealth in Ireland. He accepted, and served Cromwell faithfully throughout the Irish campaign.

Orrery was returned to Cromwell's parliaments of 1654 and 1656 as member for the county of Cork, and also in the latter assembly for Edinburgh, for which he elected to sit. He served that year as lord president of the council in Scotland; and when he returned to England he was included in the inner cabinet of Cromwell's council, and was nominated in 1657 a member of the new House of Lords. On Cromwell's death he gave his support to Richard; but as he saw no possibility of maintaining the government he left for Ireland, where by resuming his command in Munster he secured the island for Charles and anticipated Monk's overtures by inviting him to land at Cork. He sat for Arundel in the Convention and in the parliament of 1661, and at the Restoration was taken into great favour. On Sept. 5, 1660, he was created earl of Orrery. The same year he was appointed a lord justice of Ireland and drew up the act of Settlement. He continued to exercise his office as lord-president of Munster till 1668, when he resigned it on account of disputes with the duke of Ormonde, the lord-lieutenant. On Nov. 25 he was impeached by the House of Commons for "raising of money by his own authority upon his majesty's subjects," but the proceedings were interrupted by the prorogation of parliament and were not afterwards renewed. He died on Oct. 26, 1679.

In addition to Lord Orrery's achievements as a statesman and admin-

istrator, he gained some reputation as a writer and a dramatist. He was the author of *An Answer to a Scandalous Letter . . . A Full Discovery of the Treachery of the Irish Rebels* (1662), printed with the letter itself in his *State Letters* (1742), another answer to the same letter entitled *Irish Colours Displayed . . .* being also ascribed to him; *Parthenissa,* a novel (1654); *English Adventures by a Person of Honour* (1676), whence Otway drew his tragedy of the *Orphan; Treatise of the Art of War* (1677), a work of considerable historical value; poems, of little interest, including verses *On His Majesty's Happy Restoration* (unprinted), *On the Death of Abraham Cowley* (1677), *The Dream* (unprinted), *Poems on most of the Festivals of the Church* (1681); plays in verse, of some literary but no dramatic merit, of which *Henry V.* (1664), *Mustapha* (1665), *Tryphon* (acted 1668), *The Black Prince* (1669), *Herod the Great* (published 1694), and *Altemira* (1702) were tragedies, and *Guzman* (1669) and *Mr. Anthony* comedies. A collected edition was published in 1737, to which was added the comedy *As you find it. The General* is also attributed to him.

Mus.) 25,287 (letter-book when governor of Munster), and 32,095 *sqq.* 109–188 (letters); article in the *Dict. of Nat. Biog.* and authorities there collected; Wood's *Athenae Oxonienses,* iii. 1200; *Biographia Britannica* (Kippis); *Orrery Papers,* ed. by Lady Cork and Orrery (1903) (Preface); *Contemporary Hist. of Affairs in Ireland,* ed. by John T. Gilbert (1879–80); *Cal. of State Pap., Irish and Domestic.*

**ORRIS-ROOT** (apparently a corruption of "iris root"), the rhizomes or underground stems of three species of *Iris, I. germanica, I. florentina* and *I. pallida,* closely allied plants growing in subtropical and temperate latitudes, but principally identified with north Italy.

The three plants are indiscriminately cultivated in the neighbourhood of Florence as an agricultural product under the name of "ghiaggiuolo."

The rhizomes are in August dug up and freed of the rootlets and brown outer bark; they are then dried and packed in casks for sale. In drying they acquire a delicate but distinct odour of violets. It is principally powdered for use in dentifrices and other scented dry preparations.

**ORSHA** (Polish, Orsza), a town of the White Russian S.S.R., in 54° 34′ N., 30° 20′ E., on the Dnieper river, and at a junction on the Moscow-Warsaw railway. Pop. (1933) 32,200. It is an entrepôt for grain and timber and has iron works and a brewery. An electric plant was under construction in 1928. It is mentioned in the annals in 1067 as Rsha and was captured by the Lithuanians in the 13th century.

A Polish Jesuit college was founded here in 1604. During the 16th and 17th centuries it was several times besieged by the Russians, and finally annexed 1772.

**ORSINI,** the name of a Roman princely family of great antiquity. According to tradition the popes Paul I. (757) and Eugenius II. (824) were of the Orsini family, but the probable founder of the house was a certain Ursus (the Bear), about whom very little is known, and the first authentic Orsini pope was Giacinto Orsini, son of Petrus Bobo, who assumed the name of Celestin III. (1191). The latter endowed his nephews with church lands and founded the fortunes of the family, which alone of the Guelph houses was able to confront the Ghibelline Colonna. "Orsini for the church" was their war-cry in opposition to "Colonna for the people." In the 13th century the "Sons of the Bear" were already powerful and rich, and under Innocent III. they waged incessant war against other families, including that of the pope himself (Conti). In 1241 Matteo Orsini was elected senator of Rome, and sided with Pope Gregory IX. against the Colonna and the Emperor Frederick II., saving Rome for the Guelphic cause. In 1266 the family acquired Marino, and in 1277 Giovanni Orsini was elected pope as Nicholas III.

When Boniface VIII. proclaimed a crusade against the Colonna in 1297, the Orsini played a conspicuous part in the expedition and captured Nepi, which the pope granted them as a fief. On the death of Benedict XI. (1304) fierce civil warfare broke out in Rome and the Campagna for the election of his successor, and Cardinal Napoleone Orsini appears as the leader of the French faction at the conclave. The Campagna was laid waste by the feuds of the Orsini, the Colonna and the Caetani. At this time the Orsini held the castle of S. Angelo, and a number of palaces on the Monte Giordano, which formed a fortified and walled quarter. In 1332, during the absence of the popes at Avignon, the feuds between Orsini and Colonna, in which even Giovanni Orsini, although cardinal legate, took part, reduced Rome to a state of complete anarchy. The Orsini were again at war with the Colonna at the time of Rienzi. In 1435 Francesco Orsini was appointed prefect of Rome, and created duke of Gravina by Pope Eugenius IV. In 1484 war between the Orsini and the Colonna broke out once more, the former supporting the pope (Sixtus IV.). Virginio Orsini led his faction against the rival house's strongholds, which were stormed, the Colonna being defeated.

The Orsini fortunes waxed and waned many times, and their property was often confiscated, but they always remained a powerful family and gave many soldiers, statesmen and prelates to the church. The title of prince of Solofra was conferred on them in 1620, and that of prince of the Holy Roman empire in 1629. In 1724 Vincenzo Maria Orsini was elected pope (Benedict XIII.) and gave his family the title of Roman princes.

**ORSINI, FELICE** (1819–1858), Italian revolutionist, was born at Meldola in Romagna. He joined the Giovane Italia, a society founded by Giuseppe Mazzini. Implicated together with his father in revolutionary plots, he was arrested in 1844 and condemned to imprisonment for life. The new pope, Pius IX., released him, and he led a company of young Romagnols in the first war of Italian independence (1848). He was elected member of the Roman constituent assembly in 1849, and after the fall of the republic he conspired against the papal autocracy once more in the interest of the Mazzinian party. Mazzini sent him on a secret mission to Hungary, but he was arrested in 1854 and imprisoned at Mantua, escaping a few months later. His account of his prison experiences, *Austrian Dungeons in Italy* (1857), led to a rupture between him and Mazzini.

He then formed a plot to assassinate Napoleon III., whom he regarded as the principal obstacle to Italian independence. On the evening of Jan. 14, 1858, while the emperor and empress were on their way to the theatre, Orsini and his accomplices threw three bombs at the imperial carriage. The intended victims were unhurt, but several other persons were killed or wounded. Orsini was arrested; on Feb. 11, he wrote a letter to Napoleon, exhorting him to take up the cause of Italian freedom. He addressed another letter to the youth of Italy, stigmatizing political assassination. He was executed on March 13, 1858. Of his accomplices Pieri also was executed, Rudio was condemned to death but obtained a commutation of sentence, and Gomez was condemned to hard labour for life. Orsini's attempt terrified Napoleon, who may have been so induced to take up Italy's cause.

O.* (Milan, 1861); Enrico Montazio, *I contemporanei Italiani-Felice Orsini* (Turin, 1862); *La vérité sur Orsini, par un ancien proscrit* (1879); Angelo Arboit, *Tofin e la fuga di Felice Orsini* (Cagliari, 1893).

**ORTA, LAKE OF,** in north Italy, west of Lago Maggiore. Its southern end is about 22 m. by rail N.W. of Novara on the main Turin-Milan line, while its north end is about 4 m. by rail S. of the Gravellona-Toce railway station. It has an area of about 6¼ sq.m., it is about 8 m. in length, its greatest depth is 469 ft., and the surface is 951 ft. above sea-level, while its width varies from ½ to 1¼ m. The island of San Giulio (just west of the village of Orta) has a picturesque church. The chief place is Orta, on a peninsula projecting from the east shore of the lake, while Omegna is at its northern extremity. The lake is the remnant of a larger sheet of water by which the waters of the Toce flowed south towards Novara. As the glaciers retreated the waters flowing from them sank, and were gradually diverted into Lago Maggiore. This explains why no considerable stream feeds the Lake of Orta, while at its north end the Nigoglia torrent flows out of it, ultimately joining Lago Maggiore.

**ORTELIUS** (WORTELS), **ABRAHAM** (1527–1598), next to Mercator the greatest geographer of his age, was born at Antwerp on April 14, 1527, and died in the same city on July 4, 1598. He

was of German origin, his family coming from Augsburg. He travelled extensively in western Europe. Beginning as a map-engraver, he became a merchant, and most of his journeys before 1560 were for commercial purposes. In 1560, however, when travelling with Gerhard Kremer (*see* MERCATOR, GERARDUS), he became interested in scientific geography and began to prepare that atlas or *Theatre of the World* by which he became famous. In 1564 he completed a *mappemonde,* which afterwards appeared in the *Theatrum.* In 1570 (May 20) was issued, by Gilles Coppens de Diest at Antwerp, Ortelius' *Theatrum Orbis Terrarum,* the "first modern atlas" (of 53 maps). Many editions, Flemish, Latin and German, appeared in his lifetime. Most of the maps were admittedly reproductions (a list of 87 authors is given by Ortelius himself), and many discrepancies of delineation or nomenclature occur; but, taken as a whole, this atlas with its accompanying text was a monument of rare erudition and industry. In 1573 Ortelius published 17 supplementary maps under the title of *Additamentum Theatri Orbis Terrarum.*

In 1575 Ortelius was appointed geographer to the king of Spain, Philip II., on the recommendation of Arius Montanus, who vouched for his orthodoxy (his family, as early as 1535, had fallen under suspicion of Protestantism). Other important works are: *Synonymia geographica* (1578); *Nomenclator Ptolemaicus* (1584); his *Parergon* (a series of maps illustrating ancient history, sacred and secular), and his *Itinerarium per nonnullas Galliae Belgicae partes,* a record of a journey in Belgium and the Rhineland made in 1575; an edition of Caesar (*C. I. Caesaris omnia quae extant,* Leyden, Raphelingen, 1593), and the *Aurei saeculi imago, sive Germanorum veterum vita* (Philippe Galle, Antwerp, 1596). He also aided Welser in his edition of the Peutinger Table in 1598. His death and burial (in St. Michael's Abbey church) in 1598 were marked by public mourning.

(Brussels, 1901); J. H. Hessels, *Abrahami Ortelii epistulae* (Cambridge, England, 1887); Max Rooses, *Ortelius et Plantin* (1880); Génard, "Généalogie d'Ortelius," in the *Bulletin de la Soc. roy. de Géog. d'Anvers* (1880 and 1881).

**ORTHEZ,** a town of S.W. France, department of Basses-Pyrénées, 25 mi. N.W. of Pau on the Southern railway. Pop. (1936) 4,578.

At the end of the 12th century Orthez passed from the viscounts of Dax to the viscounts of Béarn, who resided there in the 13th century. Jeanne d'Albret founded a Calvinist university in the town and Theodore Beza taught there for some time. An envoy sent in 1569 by Charles IX. to revive the Catholic faith was besieged in Orthez which was taken by the Protestant captain, Gabriel, count of Montgomery. In 1684 Nicholas Foucault, intendant under Louis XIV., was more successful, as the inhabitants, ostensibly at least, renounced Protestantism, which however is still strong there. It stands on the right bank of the Gave de Pau here crossed by a 14th century bridge with four arches and surmounted by a central tower. The Tour de Moncade, a pentagonal tower of the 13th century, was once the keep of a castle of the viscounts of Béarn, and is now used as a meteorological observatory. The work of spinning and weaving cotton, especially of the fabric called *toile de Béarn,* the manufacture of paper and of leather, and the preparation of hams known as *jambons de Bayonne* and of other delicacies are carried on.

**ORTHOCLASE,** an important rock-forming mineral belonging to the felspar group (*see* FELSPAR). (Gr. *ὀρθός,* "right," and *κλᾶν,* "to break.") The mineral, so named by A. Breithaupt in 1823 in allusion to the right-angled intercleavage angle, has the composition $KAlSi_3O_8$ but commonly contains significant proportions of the corresponding $NaAlSi_3O_8$ compound in solid solution.

Included under orthoclase are the varieties known as adularia and sanidine, the former occurring in druses in granites and crystalline schists, the latter as glassy crystals enclosed in lavas and dike rocks. The apparent symmetry of orthoclase is that of a monoclinic crystal with the two prominent cleavages 001 and 010 at right angles. The crystals show considerable variety of habit, prismatic, as in adularia, elongated along the edge 001 : 010 as in crystals from the Baveno granite quarries, and tabular on the clinopinacoid as in sanidine. The simple Carlsbad type of twinning is exceedingly common.

Orthoclase melts incongruently at 1,170° C with formation of leucite (*q.v.*). As a primary mineral it is an essential constituent of many acidic igneous rocks, in granites, porphyries, syenites and trachytes, while the variety sanidine is practically wholly limited to surface lavas and associated dike rocks. It is common as a constituent of thermally altered argillaceous sediments but its place in the crystalline schists is usually taken by microcline (*q.v.*).

(C. E. T.)

**ORTHODONTIA,** a special department of dentistry concerned with the prevention and correction of irregular and of malposed teeth. Orthodontic treatment is usually effected by means of the spring force of delicate wires attached to the teeth. The earliest attempt in the literature at systematic treatment of orthodontia was by Fauchard in 1728. In 1836 Kneisel published a special work on the subject. Between these two it was variously treated by several writers in the field of mechanical dentistry (Bunon 1743; Bourdet 1757; Fox 1803; Delabarre 1819). At the beginning of the 20th century in America orthodontia emerged from the general field of mechanical dentistry as a recognized specialty. Its advent was heralded by the appearance of many "systems of regulating." These "systems" were marketable combinations of mechanical appliances designed to effect various movements of the teeth, and were identified by the names of their inventors (Angle, Case, Jackson *et al*). While this period of the exploitation of apparatus undoubtedly was a great stimulus to the development of technique, the literature which it evoked took the form of personal opinion rather than the presentation of scientific evidence. Expert technicians soon demonstrated the limitations of the mechanical conception of the subject whereupon interest centred in its biological aspect. Since then the results of treatment have been more satisfactory. Great advances have been made in America where specialization is more common while the conservative influence of the dental profession in Great Britain and European countries has acted as a stabilizing force in its growth. The condition of irregular and malposed teeth, *i.e.,* malocclusion, may be caused by bad diet in both its chemical and physical aspects (Howe, McCollum, Mellanby). Habits of infancy and childhood as thumb-sucking, tongue-biting and mouth-breathing, and mutilations from trauma and disease are also important causes. In fact any abnormal function in or about the mouth when persisted in may result in irregular and malposed teeth.

(A. L. J.)

**ORTHODOX EASTERN CHURCH** (frequently spoken of as "the Greek Church," and described officially as "The Holy Orthodox Catholic Apostolic Eastern Church"), the historical representative of the churches of the ancient East. It consists of (*a*) those churches which accepted all the decrees of the first seven general councils, and have remained in full communion with one another, (*b*) such churches as derived their origin from these by missionary activity, or by abscission without loss of communion.

**Origins of the Greek or Eastern Church.**—Christianity arose in the East, and Greek was the language of the Scriptures and early services of the church, but when Latin Christianity established itself in Europe and Africa, and when the old Roman empire fell in two, and the eastern half became separate in government, interests and ideas from the western, the term Greek or Eastern Church acquired gradually a fixed meaning. It denoted the church which included the patriarchates of Antioch, Alexandria, Jerusalem and Constantinople, and their dependencies. The ecclesiastical division of the early church, at least within the empire, was based upon the civil. Constantine introduced a new partition of the empire into dioceses, and the church adopted a similar division. The bishop of the chief city in each diocese naturally rose to a pre-eminence, and was commonly called *exarch* —a title borrowed from the civil jurisdiction. In process of time the common title *patriarch* was restricted to the most eminent of these exarchs, and councils decided who were worthy of the dignity. The council of Nicaea recognized three patriarchs—the bishops of Rome, Alexandria and Antioch. To these were after-

wards added the bishops of Constantinople and Jerusalem.

When the empire was divided, there was one patriarch in the West, the bishop of Rome, while in the East there were at first two, then four and latterly five. This geographical fact has had a great deal to do in determining the character of the Eastern Church. It is not a despotic monarchy governed from one centre and by a monarch in whom plenitude of power resides. It is an oligarchy of patriarchs. It is based, of course, on the great body of bishops; but episcopal rule, through the various grades of metropolitan, primate, exarch, attains to sovereignty only in the five patriarchal thrones. Each patriarch is, within his diocese, what the Gallican theory makes the pope in the universal church. He is supreme, and not amenable to any of his brother patriarchs, but is within the jurisdiction of an oecumenical synod. The schismatic churches of the East have always reproduced the ecclesiastical polity of the church from which they seceded.

The Greek Church, like the Roman, soon spread far beyond the imperial dioceses which at first fixed its boundaries, but it was far less successful than the Roman in preserving its conquests for Christianity. This was due in the main to the differing quality of the forces by which the area covered by the two churches was respectively invaded. Greek Christianity became the religion of the Slavs as Latin Christianity became that of the Germans; but the Orthodox Church never conquered her conquerors.

The great dogmatic work of the Eastern Church was the definition of that portion of the creed of Christendom which concerns *theology proper*—the doctrines of the essential nature of the Godhead, and the doctrine of the Godhead in relation with manhood in the incarnation, while it fell to the Western Church to define *anthropology*, or the doctrine of man's nature and needs.

All the churches of the East, schismatic as well as orthodox, accept unreservedly the decrees of the first two councils. The schismatic churches protest against the additions made to the creeds of Nicaea and Constantinople by succeeding councils. The Niceao-Constantinopolitan creed declared that Christ was *consubstantial* (ὁμοούσιος) with the Father, and that He *had become man* (ἐνανθρωπήσας). Disputes arose when theologians tried to explain the latter phrase. These differences took two separate and extreme types, the one of which forcibly separated the two natures so as to deny anything like a real union, while the other insisted upon a mixture of the two, or an absorption of the human in the divine. The former was the creed of Chaldaea and the latter the creed of Egypt; Chaldaea was the home of Nestorianism, Egypt the land of Monophysitism. The Nestorians accept the decisions of the first two councils, and reject the decrees of all the rest as unwarranted alterations of the creed of Nicaea. The Monophysites accept the first three councils, but reject the decree of Chalcedon and all that come after it. They gave rise to numerous sects and to at least three separate national churches,—the Jacobites of Syria, the Copts of Egypt, and the Abyssinian church, which are treated under separate headings. (*See* also NICAEA, COUNCIL OF; CHALCEDON, COUNCIL OF; NESTORIUS; NESTORIANS; MONOPHYSITES.)

### CONFLICT WITH ROME

The relation of the Byzantine Church to the Roman may be described as one of growing estrangement from the 5th to the 11th century, and a series of abortive attempts at reconciliation since the latter date. The estrangement and final rupture may be traced to the increasing claims of the Roman bishops and to Western innovations in practice and in the doctrine of the Holy Spirit, accompanied by an alteration of creed. In the early church three bishops stood forth prominently, principally from the political eminence of the cities in which they ruled —the bishops of Rome, Alexandria and Antioch. The transfer of the seat of empire from Rome to Constantinople gave the bishops of Rome a possible rival in the patriarch of Constantinople, but the absence of an overawing court and of meddling statesmen did more than recoup the loss to the head of the Roman Church. The theological calmness of the West, amid the violent theological disputes which troubled the Eastern patriarchates, and the statesmanlike wisdom of Rome's greater bishops, combined to give a unique position to the pope, which councils in vain strove to shake, and which in time of difficulty the Eastern patriarchs were fain to acknowledge and make use of, however they might protest against it and the conclusions deduced from it.

But this pre-eminence, or rather the Roman idea of what was involved in it, was never acknowledged in the East; to press it upon the Eastern patriarchs was to prepare the way for separation, to insist upon it in times of irritation was to cause a schism. The theological genius of the East was different from that of the West. The Eastern theology had its roots in Greek philosophy, while a great deal of Western theology was based on Roman law. (*See* Stanley's *Eastern Church*, ch. i.) This gave rise to misunderstandings, and at last led to two widely separate ways of regarding and defining one important doctrine—the procession of the Holy Spirit from the Father or from the Father and the Son. Political jealousies and interests intensified the disputes, and at last, after many premonitory symptoms, the final break came in 1054, when Pope Leo IX. smote Michael Cerularius and the whole of the Eastern Church with an excommunication. There had been mutual excommunications before, but they had not resulted in permanent schisms. Now, however, the separation was final, and the ostensible cause of its finality was the introduction by the Latins of two words *Filioque* into the creed. (After the words "and in the Holy Ghost" of the Apostles' Creed the Constantinopolitan creed added "who proceedeth from the Father." The Roman Church, without the sanction of an oecumenical council and without consulting the Easterns, added "and the Son." The addition was first made at Toledo [589] in opposition to Arianism. The Easterns also resented the Roman enforcement of clerical celibacy, the limitation of the right of confirmation to the bishop and the use of unleavened bread in the Eucharist.) It is this addition which was and which still remains the permanent cause of separation.

**Doctrines and Creeds.**—The Eastern Church has no creeds in the modern Western use of the word, no *normative* summaries of what must be believed. It has preserved the older idea that a creed is an adoring confession of the church engaged in worship; and, when occasion called for more, the belief of the church was expressed more by way of public testimony than in symbolical books. Still the doctrines of the church can be gathered from these confessions of faith. The Eastern creeds may thus be roughly placed in two classes—the oecumenical creeds of the early undivided church, and later testimonies defining the position of the Orthodox Church of the East with regard to the belief of the Roman Catholic and of Protestant Churches. These testimonies were called forth mainly by the protest of Greek theologians against Jesuitism on the one hand, and against the reforming tendencies of the patriarch Cyril Lucaris (*q.v.*) on the other. The Orthodox Greek Church adopts the doctrinal decisions of the seven oecumenical councils, together with the canons of the Concilium Quinisextum or second Trullan council (692); and they further hold that all these definitions and canons are simply explanations and enforcements of the Nicaeo-Constantinopolitan creed and the decrees of the first council of Nicaea. The first four councils settled the orthodox faith on the doctrines of the Trinity and of the Incarnation; the fifth supplemented the decisions of the first four. The sixth declared against Monothelitism; the seventh sanctioned the worship (δουλεία, not ἀληθινὴ λατρεία) of images; the council held in the Trullus ( a saloon in the palace at Constantinople) supplemented by canons of discipline the doctrinal decrees of the fifth and sixth councils.

The most important doctrinal testimonies of the Eastern church are (1) the Orthodox confession of catechism of Peter Mogilas, confirmed by the Eastern patriarchs and by the synod of Jerusalem (1643), and (2) the decree of the synod of Jerusalem or the confession of Dositheus (1672). Besides these, the catechisms of the Russian Church should be consulted, especially the catechism of Philaret, which since 1839 has been used in all the churches and schools in Russia.

The Church of Christ is the fellowship of ALL THOSE WHO ACCEPT AND PROFESS ALL THE ARTICLES TRANSMITTED BY THE APOSTLES AND APPROVED BY GENERAL SYNODS. *Without this visible Church there is no salvation.* It is under the abiding influence of

the Holy Ghost, and *therefore cannot err in matters of faith.* Specially appointed persons are necessary in the service of the Church, *and they form a threefold order, distinct jure divino from other Christians, of Bishops, Priests and Deacons.* THE FOUR PATRIARCHS, OF EQUAL DIGNITY, HAVE THE HIGHEST RANK AMONG THE BISHOPS, AND THE BISHOPS *united in a General Council represent the Church and infallibly decide,* under the guidance of the Holy Ghost, all matters of faith and ecclesiastical life. All ministers of Christ must be regularly called and appointed to their office, and are consecrated *by the sacrament of orders. Bishops must be unmarried,* and PRIESTS AND DEACONS MUST NOT CONTRACT A SECOND MARRIAGE. To all priests in common belongs, besides the preaching of the word, the administration of the SIX SACRAMENTS—BAPTISM, CONFIRMATION, PENANCE, EUCHARIST, MATRIMONY, UNCTION OF THE SICK. The *bishops* alone can administer the *sacrament* of orders.

*Ecclesiastical ceremonies are part of the divine service; most of them have apostolic origin; and those connected with the sacrament must not be omitted by priests under pain of mortal sin.* (This summary has been taken with Corrections from G. B. Winer, *Comparative Darstellung des Lehrbegriffs der verschiedenen Kirchenparteien,* Eng. trans. 1873. Small capitals denote differences from Roman Catholic, italics differences from Protestant doctrine.)

**Liturgy and Worship.**—The ancient liturgies of the Eastern Church were very numerous but a strong desire for uniformity led to the almost exclusive use of the liturgy of Jerusalem or of St. James in the East. It is used in two forms, a shorter revised by Chrysostom, and a longer called the liturgy of St. Basil. This liturgy and the service generally are either in Old Greek or in Old Slavonic, and frequent disputes have arisen in particular districts about the language to be employed. Both sacred languages differ from the language of the people, but it cannot be said that in the Eastern Church worship is conducted in an unknown tongue—"the actual difference," says Neale, "may be about that between Chaucer's English and our own." There are eleven chief service books, and no such compendium as the Roman breviary. Fasting is frequent and severe. Besides Wednesdays and Fridays, there are four fasting seasons, Lent, Pentecost to SS. Peter and Paul, August 1–15 preceding the Feast of the Sleep of the Theotokos, and the six weeks before Christmas. Indulgences are not recognized; an intermediate and purificatory state of the dead is held but not systematized into a doctrine of purgatory. The Virgin receives homage, but the dogma of her Immaculate Conception is not admitted. While ikons are found in the churches, there is no "graven image" apart from the crucifix.

Monasticism is, as it has always been, an important feature in the Eastern Church. An Orthodox monastery is perhaps the most perfect extant relic of the 4th century. The simple idea that possesses the monks is that of fleeing the world; they have no distinctions of orders, and though they follow the rule of St. Basil object to being called Basilians. A few monasteries (Mt. Sinai and some on Lebanon) follow the rule of St. Anthony. K. Lake in *Early Days of Monasticism on Mount Athos* (1909) traces the development through three well-defined stages in the 9th and 10th centuries—(*a*) the hermit period, (*b*) the loose organization of hermits in lauras, (*c*) the stricter rule of the monastery, with definite buildings and fixed rules under an *ἡγούμενος* or abbot. (*See* ABBEY, MONASTICISM, and related articles.)

**The Branches of the Church.**—In addition to the ancient churches which have separated themselves from the Orthodox faith, many have ceased to have an independent existence, owing either to the conquests of Islam or to their absorption by other churches. In the early years of the present century the Orthodox Eastern Church consisted of 12 mutually independent churches (or 13 if we reckon the Bulgarian Church), using their own language in divine service (or some ancient form of it, as in Russia) and varying not a little in points of detail, but standing in full communion with one another, and united as equals in what has been described as one great ecclesiastical federation. However, in using such language it must be remembered that we are not dealing with bodies which were originally separated from one another and have now entered into fellowship, but with bodies which have grown naturally from a single origin and have not become estranged. The most ancient of these divisions depend on the jurisdiction of the four patriarchates. (1) The ancient *Patriarchate of Constantinople* included the imperial dioceses of Pontus, Asia, Thrace and Eastern Illyricum—*i.e.,* speaking roughly, the greater part of Asia Minor, European Turkey, and Greece, with a small portion of Austria. The Oecumenical Patriarch, as he has been called since early in the 6th century, is the most exalted ecclesiastic of the Eastern churches, and his influence reaches far outside the lands of the patriarchate. His jurisdiction extends over the dominions of the Sultan in Turkey, together with Asia Minor and the Turkish islands of the Aegean; there are 82 metropolitans under him, and the "monastic republic" of Mount Athos. He has great privileges and responsibilities as the recognized head of the Greek community in Turkey, and enjoys also many personal honours which have survived from the days of the Eastern emperors. In ecclesiastical affairs the patriarch acts with two governing bodies—(*a*) a permanent Holy Synod (Ἱερὰ Σύνοδος τῆς Ἐκκλησίας Κωνσταντινουπόλεως) consisting of 12 metropolitans, six of whom are re-elected every year from the whole number of metropolitans, arranged in three classes according to a fixed cycle; (*b*) the Permanent National Mixed Council (Διαρκὲς Ἐθνικὸν Μικτὸν Συμβούλιον), a remarkable assembly, which is at once the source of great power by introducing a strong lay element into the administration, and of a certain amount of weakness by its liability to sudden changes of popular feeling. Its members are chosen by an electoral body appointed for the purpose. The election of the patriarch himself is to a considerable extent popular. (2) The *Patriarchate of Alexandria,* consisting of Egypt and its dependencies, was at one time the most powerful, as it was the most centralized, of all; but the secession of the greater part of his church to Monophysitism (COPTIC CHURCH), and the Mohammedan conquest of Egypt, have left him but the shadow of his former greatness. (3) The *Patriarchate of Antioch* has undergone most changes in extent of jurisdiction, arising from the transfer of sees to Jerusalem, from the progress of the schismatic churches of the East and from the conquests of the Mohammedans. The patriarch retains little of his old importance. His jurisdiction includes Cilicia, Syria (except Palestine) and Mesopotamia. (4) The *Patriarchate of Jerusalem* was constituted at the council of Chalcedon in 451, with jurisdiction over Palestine. The inroads of the Saracens reduced its importance, which afterwards depended chiefly on the position and associations of Jerusalem.

In addition to the four patriarchates, the Orthodox Eastern Church, until 1914, consisted of nine national branches or divisions: the ancient Church of Cyprus (*see* CYPRUS, CHURCH OF); the Church of Mount Sinai, consisting of little more than the famous monastery of St. Catherine; the Eastern Orthodox Church in Austria-Hungary, which consisted of the Serbs of Hungary and Croatia, the Rumanians of Transylvania, the Ruthenians of Bukovina, and the Serbs of Bosnia-Herzegovina; and the respective national churches of Russia, Greece, Bulgaria, Rumania, Serbia, and Montenegro.

### POSITION AT THE OUTBREAK OF WORLD WAR

Russia, with Georgia, is reckoned to have had nearly 100,000,000 Slavonic Orthodox. Georgia, an exarchate once independent, was gradually being Russianised; the exarch was a Russian and an *ex officio* member of the Russian Holy Synod since 1801, while his suffragan bishops were Georgians. The effects of Tsarism on the Russian Church have been described by a learned observer as not good (Agéyev, *The Christian East,* 1920). "Under the guise of protecting the Church, the state in reality had enslaved it." The Church was in a state of paralysis, and the Russian educated classes were estranged from it.

The Orthodox Church in Turkey (Greek), under the Ecumenical Patriarch, Archbishop of Constantinople—often erroneously in the West called the Patriarch of Constantinople—is believed to have numbered 2,500,000 in Europe—counting in those transferred to the kingdom of Hellas in 1912—and 2,000,000

in Asia Minor and the islands. In Greece proper, where the autocephalous position of the Church was recognised by the Ecumenical Patriarch in 1850, there were about 2,000,000 orthodox (*ib.*).

In the Austro-Hungarian Empire there were several orthodox Churches, chiefly Slavonic, with some 3,000,000 souls: the Karlowitz Serbian Church; those of Dalmatia and Cattaro, joined to the Ruthenian Bukowina, though far distant from it; of Bosnia and Hercegovina; of Transylvania; and a certain number of orthodox scattered in various districts. The Bulgarian Church was made autocephalous by the Sultan in 1876, when the Bulgarian exarch resided in Constantinople; but the Ecumenical Patriarch did not recognise its independence. It numbered about 4,000,000.

In Rumania the old Church of Okhrida was suppressed in 1767 and the Orthodox then became subject to the Ecumenical Patriarch till recent times. They numbered about 4,500,000. The same state of things obtained in Serbia (1,500,000), where the old Church of Ipek was suppressed in 1766.

The little Church of Montenegro (about 200,000 souls) was made independent in 1766 and governed by a metropolitan who had one suffragan bishop. (Note that in some of the separated Churches of the East the metropolitans have no suffragans.) In addition there were the Orthodox in the patriarchate of Antioch, that of Jerusalem, that of Alexandria, Cyprus, autocephalous since 431, and the monastery of Mount Sinai, autocephalous since 1575, the archbishop of which usually resides in Egypt.

### POSITION AFTER THE WAR

The alterations in the boundaries of the various states have necessarily had a great effect on the Church. But a much greater effect has been produced by the internal convulsions in Russia and Turkey.

Russia has lost Poland and the Baltic provinces; but this has not affected the Orthodox Church to a very great extent, as the bulk of the population was of other faiths. Poland has still 3 million Orthodox; Lithuania has 23,000 Orthodox and 35,000 "Old Believers"; Czechoslovakia has very few Orthodox, most of the population being Roman Catholics or Uniats.

In Russia proper and in Georgia the effect has been most disastrous. At first the revolution promised well for the Orthodox. A Holy Synod of 12 bishops and a council of bishops, priests and laymen were established in 1917; the office of Chief Procurator—a layman who had represented the Tsar, and who wielded very great powers—was abolished; the patriarchate, discontinued by Peter the Great since 1700, was revived (Nov. 1, 1917) in the person of Tikhon, Patriarch of Moscow and all Russia, who was enthroned on Dec. 4, 1917. But the Bolshevist régime dashed all the hopes of the Church. The new rulers set themselves to oppose Christianity in all its forms.

All teaching of religion in public schools was forbidden; parents were not allowed to teach their children religion; only candidates for the priesthood, if over 18 years of age, might learn theology. No minister of religion could enjoy full civil rights. No religious association could hold property, and all property of existing religious associations was confiscated to the State, which might at its pleasure lend buildings for religious worship. Monasteries were to be converted to useful purposes. Most of the bishops who have not escaped from Russia and have not been put to death have been interned in or about Moscow, or in monasteries in the far north. And the only organization that has been found possible is a synod of 15 Russian bishops which holds its sessions outside Russia, at Belgrade. The patriarch Tikhon died in 1925, and a makeshift for the patriarchate has been devised in the shape of a locum tenens. The passive resistance of the Russian peasantry has been the great obstacle to the Government's endeavour to suppress Christianity, and the so-called reformed Russian Church, a body encouraged by the Soviet power, has so far been a failure for the same reason. In Georgia, the Church is in as great confusion as in Russia; since the first revolution the tendency has been towards independence in ecclesiastical matters. (The translation of an official summary of Soviet legislation against religion is given in the *Church Times*, Oct. 30, 1925; *see* also Nov. 20, 1925.)

Post-War Turkey, with its curtailed frontiers, has as its aim the creation of an entirely Muslim State; and among other things the Turkish Government desires the abolition of the Oecumenical Patriarchate. But the European Powers, while restoring Constantinople to Turkey, prevented this, and at Lausanne the Turkish delegates made a formal declaration of their Government that the Patriarchate would be allowed to continue. Yet, as far as Turkey is concerned, the Patriarchate is little more than "the shadow of a shade." By the Treaty of Lausanne all Greek Orthodox residents in Constantinople before Oct. 30, 1918, are exempt from expulsion. All other Greeks in Turkey, however, are liable to expulsion, and those in Asia Minor have been settled in the new Greece and elsewhere, in many cases in change for Muslims. Only Turkish subjects can be metropolitans in Turkey, and therefore the episcopate has to be recruited from the comparatively few Greek residents in Constantinople. Outside modern Turkey the Oecumenical Patriarch, not the Metropolitan of Athens, has jurisdiction in Macedonia, Western Thrace, Epirus, Crete and the Aegean Islands, and this is an exception to the rule about ecclesiastical independence mentioned above. (*See* an informative series of four articles on *The Orthodox Churches*, by Dr. Greig, Bishop of Gibraltar in *Theology*, 10–11, March, April, July, Aug., 1925.)

**Yugoslavia,** called in the Treaties the Serb-Croat-Slovene State, is now re-organizing its Church, which includes the former Serbian Church, the Karlowitz Serbian Church, that of Dalmatia and Cattaro, that of Bosnia and Hercegovina (these three formerly in Austro-Hungary) and Montenegro. During the World War many Serbians were in England; over 600 refugees, young ordinands, were there instructed and prepared for the Orthodox priesthood under Serbian priests. (*The Christian East*, 48 f, 51 f, 54.) Many others were in France, engaged in secular pursuits, and in other countries. This will be a convenient place to remark on the changed ecclesiastical conditions in both Yugoslavia and Rumania. Before the War Rumania and Serbia were inhabited practically by Orthodox alone. But the enlarged boundaries have brought in many Roman Catholics and Lutherans, and this has complicated the problem of national religions. The former idea of one country, one church, has to be given up, and religion and politics cannot have the same close connection that they had before. Moreover, the greatest hindrance to the reorganization of the Orthodox Church in the Balkans and in Rumania is the exaggerated national feeling and jealousy of each country against the others. This jealousy is much more felt between the different branches of Orthodoxy than between them and the Roman Catholics or Lutherans. (Greig in *Theology*, ii., 8, 66.)

To the former Rumanian Church, with its two metropolitans, is now added the Transylvanian Church (formerly in Hungary), with its metropolitan at Hermannstadt, and suffragan bishops at Arad and Kazansebes; and also the Churches of Bukowina and Bessarabia.

The old metropolitanate of Athens has not been greatly affected. For Macedonia, etc., *see* above; but it is hard to see how the Oecumenical Patriarch in Constantinople can under the changed conditions exercise an effective supervision over these districts. Salonika has now become once more a Christian city, and the mosques which had originally been Christian churches have now been restored to Orthodox worship.

Bulgaria has lost the Aegean coast to Greece, and part of the Dobruja to Rumania. Otherwise the Church has not been much affected. It has, by the official census of 1920, about 4,000,000 members, almost all of Bulgarian nationality, out of a total population of nearly 5,000,000, of whom about 700,000 are Muslims, chiefly Turks.

Among the smaller communities in Asia and Africa which were once under Turkish rule, the Orthodox patriarchate of Jerusalem, now under British mandate, consists of about 30,000 Arab and Greek Christians and a few Russians: the chief obstacles to progress are the jealousies between Arabs and Greeks, and the financial difficulties of the monasteries. The Orthodox patriarchate of Antioch, now under French mandate, suffers from the same difficulties as that of Jerusalem. It has some 300,000 members The

Orthodox ("Melkite") Patriarch of Alexandria has only a small following of about 100,000, as has been the case since the Monophysite schism in the 5th century. Under him is the Archbishop of Nubia. The autocephalous Churches of Cyprus (with about 200,000 Orthodox) and Mount Sinai have not been greatly affected by the War.

BIBLIOGRAPHY.—For the origins of the Eastern Church and the early controversies *see* the authorities cited in the article CHURCH HISTORY. The following are devoted specially to the history and condition of the Eastern Church: M. le Quien, *Oriens Christianus* (1740); J. S. Assemani, *Bibliotheca Orientalis* (1719–28); A. P. Stanley's *Eastern Church* (1861); J. M. Neale, *The Holy Eastern Church* (*General Introduction*, 2 vols.; *Patriarchate of Alexandria*, 2 vols.; and, published posthumously in 1873, *Patriarchate of Antioch*); W. F. Adeney, *The Greek and Eastern Churches* (1908); A. Fortescue, *The Orthodox Eastern Church* (1907, with valuable bibliography); also references in Hastings' *Encyclopaedia of Religion and Ethics*, articles "Greek Orthodox Church" and "Russian Church" by S. V. Troitsky. For liturgy, *see* H. A. Daniel, *Codex Liturgicus Eccl. Univ. in epitomen redactus* (4 vols., 1847–55); F. E. Brightman, *Eastern Liturgies* (Oxford, 1896). On the question of Reunion, *see* Fortescue, as above; and art. REUNION, CHURCH.

**ORTHOGENESIS,** a zoological term introduced by Eimer to express the view that the variations from the normal form of an animal species, on the occurrence of which evolution depends, do not arise at hazard but have a definite direction in all closely allied species; and that these variations may be repeated over a long series of generations, always in the same direction. The cause of these definite variations is left uncertain but is supposed to lie within the animal and not in its environment. Thus evolution would follow a direct course, which need have no positive adaptive significance. This view was founded on a study of the patterns of butterfly wings.

The phylogenies built up by palaeontologists, as E. D. Cope was the first to observe, do show that evolution has generally proceeded in definite directions, each member of a series differing from its predecessor in the same ways as its successor differs from it. In most cases the changes take place in such a way that greater mechanical efficiency is secured, and they can thus, theoretically, be accounted for by natural selection, exercised by a constant or auto-orthogenetic environment. In some cases however the changes may proceed in a definite direction despite very great changes in habits and habitat amongst the animals.

The essential point, that variation is not indefinite in direction, has been established for those heritable variations known as mutations by the observation that definite mutants appear time after time at a definite rate amongst the members of a species bred under controlled conditions; and that identical mutants occur in allied species and genera. The implication of these facts is that the mechanism which determines the course of development of the fertilized egg, and is hence responsible for heredity, is capable of modification only in certain definite ways, and that this mechanism is of essentially the same structure in allied animals. This view is in harmony with the fact, observed by palaeontologists, that closely allied stocks (phyla or lineages) exposed to similar conditions pursue parallel evolutionary courses. It is not inconsistent with the view that the evolution, at least of certain structures, may follow a definite trend independently of its environment. *See* EVOLUTION. (D. M. S. W.)

**ORTHOPAEDIC SURGERY.** In this branch of surgery, which deals with the rectification of congenital and acquired deformities, particularly those of the limbs, great advances have been achieved during recent years as a consequence of the exceptional opportunities of study and practice afforded during the Great War. Thus the treatment of fractures during the early part of the War was attended not only by unnecessary deformity, but also by a high mortality, and remained unsatisfactory until special hospitals were started, manned by teams of expert surgeons. In compound fractures of the femur an initial mortality of 80% was ultimately reduced to 25%. This dramatic change was accomplished by immediate reduction and fixation of the fracture, by segregation and by continuity of treatment. Knowledge thus gained has formed the basis of the efforts to place the organisation and teaching of fractures upon a different basis with a view to minimising the disabilities of industrial accidents. Reform lies in the simplification of apparatus, and in an intensive education in their application, in segregation of fractures in special wards and in appointing surgeons with special qualifications to teach the student.

**Improved Technique.**—Among certain reconstructive operations in the case of which a greatly improved technique has resulted may be mentioned repair of injuries to the peripheral nerves, tendon transplantations, bone grafting and bone infections. The enormous number of complete nerve lacerations enabled a finished operative technique to be built up, which was largely wanting previously. Many misconceptions were also corrected, such as the worthlessness of complete transplants of nervous or other tissue to bridge gaps in peripheral nerves, and the doubtful value of lateral nerve anastomosis. In cases of irreparable destruction to nerves, healthy muscles were transposed to take the place of paralysed ones. These operations proved singularly successful where large tracts of the musculospiral nerve were irreparably damaged.

Certain flexor muscles of the forearm were attached in such a way that extension of the wrist and fingers became assured. Bone graft surgery likewise received a great impetus and has since been extended. This has led to considerable research on the viability of transplanted tissue, and in the case of the bone it is held that the transplant is a scaffold along which the fresh bonelaying cells creep from the embracing bone and deposit new bone, the scaffolding itself being ultimately removed by absorption. The treatment of virulent infections has been similarly developed. The Carrel-Dakin method has permanently established itself as well as the procedure of laying open infected bone cavities so that the soft tissues fall in easily to obliterate the gap when the infection is at an end.

**Care of Cripples.**—The most notable recent advance in orthopaedic surgery in Great Britain has been in the organization for the care and cure of cripples. This has consisted in the establishment of well-equipped open-air hospitals in various parts of the country, known as hospital schools, fully staffed by surgeons specially trained to deal with deformities of every kind. These schools provide treatment and education for the cripple, and are associated with what are known as after-care clinics situated in small towns covering an area of from 40 to 50 m. distant from the hospital in every direction. These after-care clinics are visited by the hospital staff at stated times, and are attended by out-patients who have been inmates of the hospital school, and by cases from the district, who are often seen at a sufficiently early date to prevent deformities from arising. These hospitals and clinics are run in close association and agreement with the local practitioners, the education authorities and the Ministry of Health. This scheme, in association with preventive measures, promises practically to eliminate the cripple. Its aims are to secure the potential cripple at the earliest moment, to give him expert institutional treatment in fresh air and sunlight and to secure continuity of treatment until recovery is complete. (*See* CRIPPLES.)

**Artificial Light.**—Of other recent advances in knowledge, the evolution of the artificial light treatment as an auxiliary form of therapeutics for tuberculosis of bones and joints and of rickets may be instanced. The work of Rollier, Leonard Hill and others has given prominence to the therapeutic value of sunlight (*see* HELIOTHERAPY), and in the absence of sun extended observation favours the conclusion that we have in various forms of artificial light a promising substitute. This treatment, as in the case of heliotherapy, must be looked upon merely as an accessory measure in surgical tuberculosis. It is most effective when used in combination with other surgical procedures. It should be pointed out that there is grave danger in spreading a belief that other forms of treatment are unnecessary and subsidiary.

**Infantile Paralysis.**—The further study of infantile paralysis has resulted in a more widespread knowledge of the early symptomatology and important work has been done, especially by the late Prof. Lovett of Harvard from 1916 onwards. It has

now been proved that complete rest and immobilisation and the elimination of meddlesome therapeutics during the acute and convalescent stages have resulted in lessening the severity of symptoms by limiting the paralysis. The mass of material rendered available during late years by epidemics has thrown new light on the actual treatment of deformity. Tendon transplantations for various deformities of the feet have given place to operative stabilisation of the flail foot, and transplantations when practised are now associated with reconstructive operations upon bone. This combination has resulted in more satisfactory function.

**Rickets.**—Rickets and allied nutritional diseases have likewise received within recent years close investigation by many observers abroad and at home with valuable results. Considerable work on the aetiology, particularly with reference to diet, exercise and sunlight, has been carried out at Johns Hopkins Hospital, the Lister Institute and by Findlay of Glasgow, Mellanby and Chick. Much has been discovered regarding "vitamines" or "accessory food factors" (*see* VITAMINES). The report of the Research Committee provisionally dealt with only two varieties; one known as vitamine A, or fat soluble A, and the other as anti-rachitic vitamine. Both are essential to the diet of growing animals. Defect in the one leads to arrest of growth and loss of weight; in the other a deficiency in the deposit of lime salts. The committee conclude that an anti-rachitic vitamine is a central factor in the prevention of rickets; and that a deficiency of calcium and phosphorus, in conjunction with a deficiency of anti-rachitic vitamine, hastens rickets. The greater the discrepancy in the calcium phosphorus intake the greater need for an appropriate anti-rachitic intake. It has now been proved that sunlight and ultra-violet rays act as an antidote to a deficiency diet, and can ward off the on-coming of rickets. This work has added considerably to the knowledge of orthopaedic surgeons, and has rendered unnecessary a good deal of the operative treatment for rachitic deformities.

**Spinal Treatment and Other Operations.**—The writings of Albee, Hibbs, Calvé, Girdlestone and Waldenstrom have enabled us to place in accurate perspective the bony fixation of the vertebral column in tubercular disease of the spine. Forcible correction and fixation of the spine in lateral curvature is being abandoned in favour of less drastic measures, and bony fixation of the flail spine in paralytic cases is being performed with promising results.

Operative treatment in osteoarthritis, especially in the non-articular type, is being more widely practised. This consists in stabilising the joint by exercising the joint surfaces and in the complete removal of diseased synovial membrane in the knee joints. The so-called operations of arthroplasty, or mobilisation in ankylosis of joints is becoming more common, and the results more encouraging. They mainly consist of the loosening and reconstruction of the bone ends, and the introduction of transplanted or living tissue between the bone ends to secure movement.

The treatment of fractures of the neck of the femur by wide abduction of the limb with internal rotation have been still further perfected by Royal Whitman of New York, and a large percentage of recoveries in this obstinate type of fracture occurring in old age is reported. The pathology of the rarer bone diseases such as "cysts of bone," "myeloid sarcoma," "Paget's disease" have been closely studied by many observers, resulting in valuable information in relation to operative procedure.

Jones (ed.), *Orthopaedic Surgery of Injuries* (by various authors), 2 vol. (Oxford University Press 1921); Sir R. Jones and R. W. Lovett, *Orthopaedic Surgery* (Oxford University Press 1923) (bibl.); R. Whitman, *Treatise on Orthopaedic Surgery*, 8th ed. London 1927 (bibl.); W. A. Cochrane, *Orthopaedic Surgery*, Edinburgh 1926; G. Potel, *Traité pratique d'orthopédie*, Paris 1925; F. Calot, *L'orthopédie indispensable aux praticiens*, 8th ed. Paris 1923; F. H. Albee, *Orthopaedic and Reconstruction Surgery*, Philadelphia 1919 (bibl.). (R. J.)

**Developments in the United States.**—The World War taught the *rehabilitation* of human beings, the first step of which is reconstruction surgery. Instead of accepting a functional handicap as inevitable, and fitting out the patient with braces, canes, or crutches, reconstruction operations are performed which in many instances accomplish normal, or nearly normal return of function. Plastic operative work, tendon transplantation, skin and bone grafting have finally been placed in their proper correlation with the old methods of braces, straps and buckles, plaster of Paris casts, etc., so that the specialty now has rounded out into one in which operative work and the mechanical means of treatment as well as heliotherapy and physiotherapy have been co-ordinated.

At least 65 per cent of all the injuries sustained in the late war and coming to definitive treatment involved bones, joints, ligaments, muscles, tendons or nerves, thus throwing orthopedic surgery into sharp relief. The technique of reconstruction operations to meet the unusual demands was rapidly developed and perfected, and the scope of this branch of surgery widened appreciably as the best orthopaedic surgeons combined their skill at the front.

The war over, the demand for rehabilitation surgery has increased rather than decreased. The high-powered machines of industry, the speeding automobile, the aeroplane, and our great railway systems and construction projects take a terrific annual toll in bones, joints, muscles, tendons, etc., which, without reconstruction surgery, would mean a tremendous number of cripples, unhappy themselves, and a great economic burden upon society.

The introduction of automatic machine tools into orthopaedic surgery was an important event in the technical world as it has made possible the cutting and moulding of bone with as much variety as the machinist shapes metal, and these power-driven instruments have been an important factor in the development of reconstruction surgery. In 1909 Dr. Fred H. Albee of New York city conceived the technique of bone graft of the spine to arrest tuberculous destruction and prevent hunchback; but found it impossible of accurate execution with the hand tools then comprising the surgeon's armamentarium. Realizing further the great possibilities of repair and reconstruction in cases of extensive loss of bone and damage to joints which adequate machine tools (such as circular twin saw, dowel and screw cutter) would make possible in transplanting bone from one portion of the body to another, he designed a set of miniature automatic machine tools, carefully adapted from those used by a cabinet maker and mechanic, to the various surgical problems encountered in cutting and shaping bone. This has become known as the Albee bone mill. As other grafting plastic bone operations were devised, notably for hip, knee and jaw, new instruments have been added to the "mill," which by their great accuracy and rapidity tremendously reduce the shock attendant upon cutting bone with the old hand instruments, shorten the time of anaesthesia, and permit intricate bone operations.

As a result of the benefits of the X-ray in determining diagnosis and showing the exact condition of bone, and the use of the automatic machine tools and orthopaedic appliances introduced within the last 25 years, the human bony system can to-day be made over in a truly remarkable way.

The increased understanding of shock, as a result of the researches of Crile and Cannon, and the increased means of combating or eliminating it by employing electrically driven tools, as well as outstanding advances in technique, have made complicated and exacting operative problems that were formerly hopeless now possible.

The Carrel-Dakin treatment of lacerated or infected wounds before operation is attempted has greatly lessened the chances of sepsis. By this method, which was devised during the war by Carrel of the Rockefeller Foundation and Dakin, the English chemist, the wound is kept constantly bathed in a solution containing free chlorine gas with elements which dissolve away the discharges of the wound.

In fractures of the hip, conditions are such that union does not occur in a large percentage of cases, even when conservative treatment is applied in the most ideal way. Cases of persistent non-union have been salvaged by means of automatic machinery and the bone graft, dowel or peg union being secured in from 75% to 90% of cases according to the degree of erosion between the fragments.

The conception that arthritis is a metastatic infection from some focus, often remote from the joint or joints affected, has led to the prevention of many cases and relief of others by elimination of sources of toxic absorption.

One of the most striking developments has been the technique which enables the surgeon to manufacture or make joints when they have been destroyed, that will function in a nearly normal manner without pain.

If a case is not controlled wisely from the psychologic standpoint while the patient is receiving treatment physically, the compensation law may react to his detriment rather than his benefit. The best sympathy that can be given a crippled man is to see that he is receiving adequate treatment and to encourage him to return to work as soon as it is safe. Follow-up work is most important; this lies with the surgeon and social worker co-operating with the surgeon.

Rehabilitation, of which the orthopaedic treatment is an important part, to-day represents three distinct yet overlapping problems: (1) the problem of treatment, preventive or corrective; (2) the sociological problem—relationship of the injured labourer to the rest of society; and (3) the medico-legal problem of properly applying the Workmen's Compensation Act. The first concerns chiefly the patient, his relatives and immediate friends, but the second and third affect all society. The rehabilitation movement in the United States has gone forward with the same strides since the war as have the hospital schools for cripples in Great Britain, the difference being that in the United States through wise legislation, state and national, it has been possible to a large extent to correlate the efforts of various agencies and to avoid duplication of effort.

The first compensation law, passed by the State of New Jersey in 1911, grew out of the sympathy of society for those crippled or physically handicapped in our great industrial plants. Since then thirty-six States have passed compensation or rehabilitation laws.

(F. H. A.)

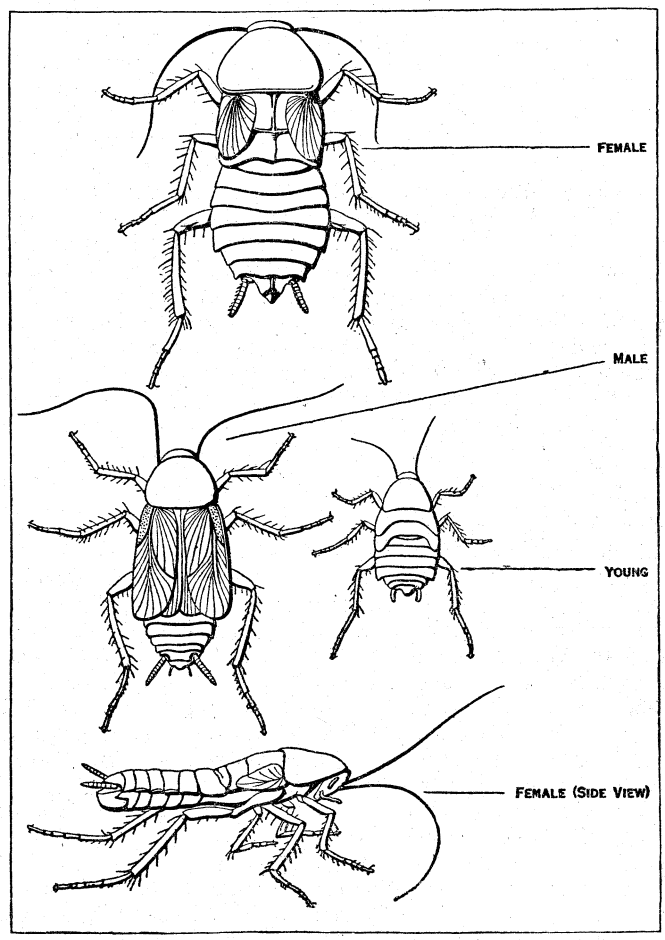
**ORTHOPTERA,** the term used in zoological classification for that order of insects which includes the cockroaches, mantids, grasshoppers, locusts, crickets and their allies. The earwigs are included here by some authorities but they are now more often relegated to a separate order of their own—the *Dermaptera* (*see* EARWIG). The Orthoptera are essentially terrestrial insects and many possess greatly developed powers of running or leaping. Excepting in the *Acridiidae,* flight is not one of their striking characteristics and wings are often reduced or entirely lost. They are mostly insects of comparatively large size, some being among the giants of their class; many possess well-developed sound-producing organs and are notorious stridulators. The wings, when present, are net-veined, the anterior pair being more or less hardened to form tegmina which are narrower than the membranous hind wings; the latter have a well developed posterior lobe capable of being folded up fanwise. The antennae are most often long and threadlike, the mouth parts are of the biting type and have a 4-lobed ligula. The prothorax is generally large and the abdomen is terminated by a pair of cerci. Metamorphosis is incomplete and in the wingless forms it is very little evident. Over 13,000 species of Orthoptera are known and of these about 500 inhabit Europe. In Britain there are 31 indigenous forms, while some others are naturalized alien species; there are also a number of casual immigrants which have not become established.

Orthoptera may be conveniently divided into forms which run or walk (Cursoria) and into those which leap (Saltatoria) as given below.

### DIVISION I.—CURSORIA

*Legs of approximately equal size, hind pair not adapted for leaping. Tarsi 5-jointed, stridulatory organs absent, ovipositor almost always concealed.*

Included in this division are four families. The *Grylloblattidae* are confined to western North America and Japan; they are wingless insects with long ovipositor and cerci and exhibit close affinities with the Saltatoria also. The *Blattidae* or cockroaches (*q.v.*), have a large shieldlike prothorax, very broad coxae and short, jointed cerci (fig. 1). The *Mantidae* (*see* MANTIS) have the fore legs adapted for seizing prey; the eyes are large and the cerci are several-jointed. The *Phasmidae* comprise the Stick Insects (*q.v.*)



BY COURTESY OF THE UNITED STATES DEPARTMENT OF AGRICULTURE

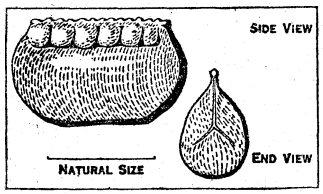
FIG. 1.—THE COMMON COCKROACH (BLATTA ORIENTALIS), NATURAL SIZE

and the Leaf Insects (*q.v.*); the fore legs are normal, the eyes are small and the cerci are single-jointed (fig. 3).

### DIVISION II.—SALTATORIA

*Legs of unequal size, the hind pair with enlarged femora and adapted for leaping. Tarsi with fewer than five joints, stridulatory organs usually present, ovipositor well developed and evident.*

Three families belong here and included in the *Acridiidae* are the short-horned grasshoppers (*see* GRASSHOPPER) and the true locusts (*q.v.*). The antennae are shorter than the body, the tarsi are 3-jointed and the ovipositor short. Stridulation takes place by the insect rubbing the inner side of its hind femur, which bears a row of minute pegs, against a hardened area of the tegmen of the same side. Auditory organs are represented by a pair of drums at the base of the abdomen. The *Tettigoniidae* (*Locustidae*) include the long-horned grasshoppers (*see* GRASSHOPPER) which have the antennae usually longer than the body, 4-jointed tarsi and a long broad ovipositor. Stridulation is effected by the insect rubbing its right tegmen against a filelike area of the left tegmen and auditory organs are present on the fore tibiae. The *Gryllidae* include the crickets (*q.v.*) and their allies. The antennae are generally long and threadlike, the tarsi are usually 3-jointed and the ovipositor is commonly long and slender (fig. 4). Stridulation takes place by rubbing the tegmina together and the auditory organs are on the fore tibiae, but unlike the *Tettigoniidae* the outer organ is larger



BY COURTESY OF THE U.S. DEPT. OF AGRICULTURE

FIG. 2.—EGG CAPSULE OF AMERICAN COCKROACH (PERIPLANETA AMERICANA)

than the inner one of the same side. The tegmina differ from those of other Saltatoria in that they are bent downwards along the sides of the body when in repose.

The eggs of Orthoptera are more or less cylindrical and in cockroaches (fig. 2) and mantids they are laid in protective capsules or oothecae, each containing 16 or more eggs. On hatching the young nymphs bear a close miniature resemblance to the adults except for the absence of wings. After a period of gradual growth, accompanied by a very variable number of moults, the adult condition is assumed. As previously mentioned, the saltatory forms are capable of stridulation, a feature that is almost confined to the males; auditory organs, on the other hand, are present in both sexes. Some of the most notorious stridulators are the katydids (*see* GRASSHOPPER) and the crickets, and in some cases the strident notes can be heard nearly a mile away. Many Orthoptera are wingless (fig. 3), while among the stridulating forms the wings are sometimes reduced to the sound-producing portions of the tegmina only. The majority of the Orthoptera are herbivorous, and many of the grasshoppers and all the locusts are highly injurious insects—voracious devourers of all kinds of vegetation. Some of the cockroaches are omnivorous, the domestic species injuring or fouling a great variety of materials, while the mantids are predators devouring various insects and other creatures. Although Orthoptera are predominantly terrestrial in habit, a few species are aquatic, the curious cricket *Hydropedeticus*, for example, skates actively over streams in Fiji. Many of the *Tettigoniidae* frequent trees and bushes, while some of the *Gryllidae*, notably the mole crickets and their allies, are subterranean. The curious small wingless crickets of the genus *Myrmecophila* live in close association with ants.

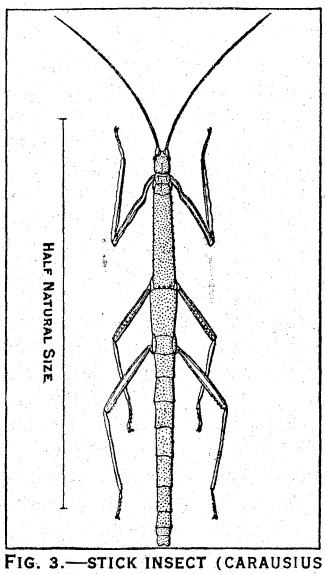


FIG. 3.—STICK INSECT (CARAUSIUS MOROSUS)

Geographically the largest families are world-wide in range. The leaf insects, however, are restricted to the oriental region and the *Gryllo*blattidae are confined to North America and Japan. The *Mantidae* and *Phasmidae* are common in the warmer regions of the world, but are absent from more northern latitudes. Among individual species the oriental cockroach (*Blatta orientalis*) and some of its allies have become practically cosmopolitan. In the fossil condition cockroaches are abundant, and form the greater part of the insect remains in certain of the Upper Carboniferous rocks of western Europe. They persisted until Permian times, after which their pre-eminence gradually declined until at the present day they form an insignificant part of the world's insects.

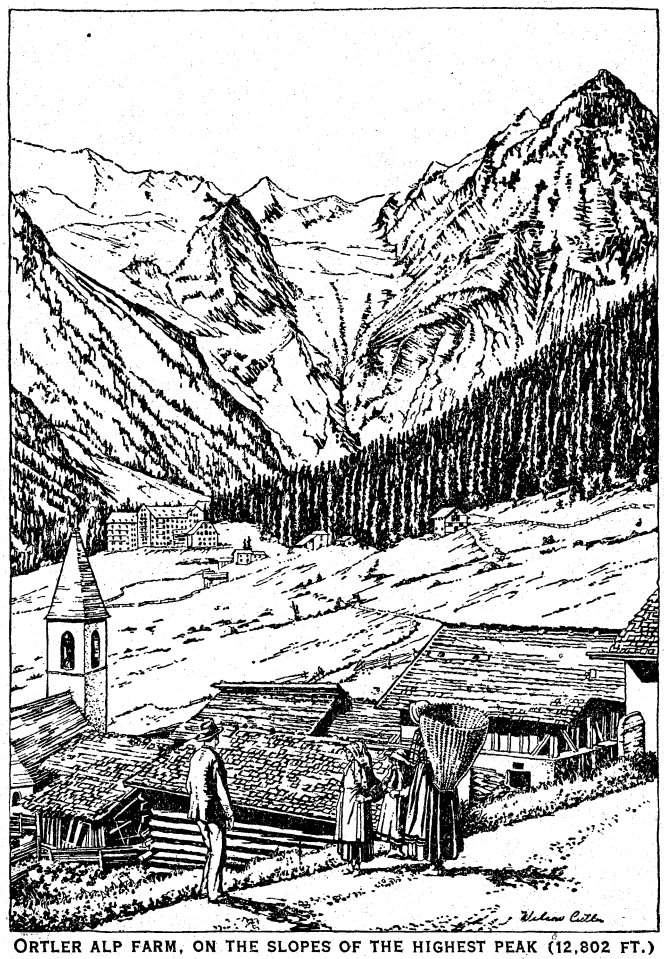
BIBLIOGRAPHY.—For the British Orthoptera *see* W. J. Lucas, *British Orthoptera* (1920), while for the European species *see* R. Tümpel, *Die Geradflügler Mitteleuropas* (1907–08), M. Burr, *Synopsis of the Orthoptera of Western Europe* (1910) and the handy work of C. Houlbert which forms two volumes in the *Encyclopédie Scientifique* (Paris, 1924–1927). For the North American species consult W. S. Blatchley, *Orthoptera of North-Eastern America* (1920). (A. D. I.)

**ORTIGUEIRA,** a seaport of north-western Spain, in the province of Corunna; on the northern slope of the Sierra de la Faladoira, on the river Nera and on the eastern shore of the Ría de Santa Marta—a winding, rock-bound and much indented inlet of the Bay of Biscay, between Capes Ortegal and Vares. Pop. (1940) 1,479 (mun., 22,152). The population is scattered. The industries are fishing and farming. There is an important coasting trade, despite the dangerous coast-line and the fogs and gales.

**ORTLER,** the highest point (12,802 ft.) in Tirol, and in the whole of the Eastern Alps. It is a great snow-clad mass, which rises east of the Stelvio Pass, and a little south of the upper valley of the Adige between the valleys of Trafoi (north-west) and of Sulden (north-east). It was long considered inaccessible, but was conquered in 1804 by three Tirolese peasants. The first traveller to make the climb was Herr Gebhard in 1805 (sixth ascent). Many routes to the summit are now known.



ORTLER ALP FARM, ON THE SLOPES OF THE HIGHEST PEAK (12,802 FT.) IN THE EASTERN ALPS, BETWEEN THE VALLEYS OF TRAFOI AND SULDEN

**ORTNIT** or **OTNIT,** German hero of romance, was originally Hertnit or Hartnit, the elder of two brothers known as the Hartungs, who correspond in German mythology to the Dioscuri. His seat was at Holmgard (Novgorod), according to the *Thidrekssaga* (chapter 45), and he was related to the Russian saga heroes. Later on his city of Holmgard became Garda, and in ordinary German legend he ruled in Lombardy. Hartnit won his bride, a Valkyrie, by hard fighting against the giant Isungs, but was killed in a later fight by a dragon. His younger brother, Hardheri (replaced in later German legend by Wolfdietrich), avenged Ortnit by killing the dragon, and then married his brother's widow. Ortnit's wooing was corrupted by the popular interest in the crusades to an Oriental *Brautfahrtsaga,* bearing a resemblance to the French romance of Huon of Bordeaux (*q.v.*).

*See* editions of the *Heldenbuch* and one of *Ortnit* and *Wolfdietrich* by Dr. J. L. Edlen von Lindhausen (Tübingen, 1906).

**ORTOLAN,** *Emberiza hortulana,* a bunting (*q.v.*) celebrated for the delicate flavour of its flesh. A native of most European countries—the British islands excepted—as well as of western Asia, it migrates southwards in autumn and returns about the end of April. Its distribution throughout its breeding range seems to

be very local. In habits it much resembles the yellow-hammer, but it wants the bright colouring of that species. The monotonous song of the cock is also much of the same kind. The nest is placed on or near the ground, but the eggs seldom show the hair-like markings which characterize those of most buntings. Its natural food consists of beetles, other insects and seeds. Ortolans are netted in great numbers, kept alive in a darkened room, and fed with oats and millet. In a very short time they become enormously fat and are then killed for the table.

**ORTONA A MARE,** seaport and episcopal see, Abruzzi, Italy, province of Chieti, 12 mi. directly E. of that town, 105 mi. by rail S.S.E. of Ancona. Pop. (1936) 9,215 (town); 20,210 (commune). It is on a promontory 230 ft. above sea-level, and connected with the port below by a funicular railway. The ruined castle has magnificent views. The cathedral (1127) has a fine portal by a local artist, Nicolo Mancini (1311). The town occupies the site of the ancient Ortona, a seaport of the Frentani.

**ORURO,** a department and town of Bolivia. The department is bounded north by La Paz, east by Cochabamba and Potosí, south by Potosí and west by Chile; it occupies part of an ancient lacustrine basin lying between the eastern and western ranges of the Andes, and has an area of 20,386 sq.mi., the greater part of which is semi-arid and covered with extensive saline deposits. The Desaguadero river, the outlet of Lake Titicaca, flows southward into Lake Pampa-Aullagas, or Poopó, on the eastern side of the department near the Cordillera de los Frailes. Lake Poopó is 12,106 ft. above sea-level, or 400 ft. lower than Titicaca, and its waters discharge through a small outlet, called the Lacahahuira, into the lagoon and saline morasses of Coipasa (12,073 ft. elevation) in the south-west corner of the department. Oruro is almost exclusively a mining department, the country being too arid and too cold for agriculture. With the exception of a narrow strip along the foot-hills of the Cordillera de los Frailes, where a few cattle, mules, llamas and sheep are reared, little of the area is suitable even for grazing. In the vicinity of the capital, in the north-east part of the department, there are large deposits of tin, silver, tungsten and copper; Oruro is the second largest producer of tin in the republic. Population (1942 est.), 174,500.

The capital of the department is Oruro, 125 mi. south-south-east (direct) of La Paz; it is an old mining town dating from the 17th century, when it is said to have had a population of 70,000. The estimate of 1942 gave it a population of 60,000, the greater part of whom are Indians and mestizos. A considerable number of foreigners are interested in the neighbouring mines. The elevation of Oruro is 12,158 ft. above sea-level, and its climate is characterized by a cool summer with light rainfall and a cooler but sunny winter, with nightly frosts and an occasional snow-storm. The mean temperature of the warmest month, December, is 51° F. and that of the coolest month, June, is 31° F. There is a much greater difference than this between day and night temperatures, both in summer and winter. Oruro is connected by rail with La Paz and Cochabamba, with Antofagasta, 578 mi. away, and with Arica (via Viacha) 380 mi. distant. (G. M. McB.)

**ORVIETO** (anc. *Volsinii* [*q.v.*], later *Urbs Vetus*, whence the modern name), town and episcopal see, province of Terni, Italy, on the Paglia, a tributary of the Tiber, 78 mi. by rail N. by W. of Rome. Pop. (1936) 8,883 (town); 21,469 (commune). It crowns an isolated rock, 1,033 ft. above sea-level, 640 ft. above the plain, commanding splendid views, and is approached by a funicular railway. The town has a large number of fine 13th-century houses and palaces. The splendid cathedral dedicated to the Virgin was begun at least as soon as 1288 on the site of two older churches erected to commemorate the miracle of Bolsena (*q.v.*), and was decorated by many mediaeval painters and sculptors. The exterior is black and white marble; the interior is grey limestone with bands of dark basaltic stone. There is a large rectangular nave, with semicircular recesses for altars, opening out of the aisles, north and south, two transeptal chapels and a short choir. The finest polychrome monument in existence is the west façade, of richly-sculptured marble from the designs of Lorenzo Maitani of Siena, divided into three gables with intervening pinnacles; it is a reproduction of the façade of Siena cathedral. The mosaics are modern. The four wall-surfaces that flank the three western doorways are decorated with beautiful sculpture in relief, executed under Maitani's direction until his death in 1330. In the interior, the Cappella del Corporale possesses a large silver shrine, resembling the cathedral façade, enriched with countless figures in relief and subjects in translucent coloured enamels—one of the most important specimens of early silversmith's work. It was begun by Ugolino Vieri of Siena in 1337, and was made to contain the Holy Corporal from Bolsena (*q.v.*). On the south side is the chapel of S. Brizio, separated from the nave by a fine 14th-century wrought-iron screen. The walls and vault are covered with fine and well preserved frescoes—among the noblest works of Fra Angelico and Luca Signorelli, painted 1499 to 1504—the latter being of especial importance in the history of art owing to their great influence on Michelangelo in his early days. The choir stalls are fine and elaborate specimens of *tarsia* and rich wood-carving—the work of Pietro del Minella (1430–41). In 16th-century sculpture the cathedral is especially rich, containing many statues, groups and altar-reliefs by Simone Mosca and Ippolito Scalza. Close by are two Gothic buildings, the bishop's palace (1264) and the Palazzo dei Papi (1264–1302), the latter with a huge hall now containing the Museo Civico, with various mediaeval works of art, and also objects from the Etruscan necropolis of the ancient Volsinii (*q.v.*). The Palazzo Faina has another interesting Etruscan collection. The Palazzo del Comune is Romanesque (12th cent.). S. Andrea and S. Giovenale are also Romanesque churches of the 11th century; both contain later frescoes. To the 11th–12th century belongs the ruined abbey of SS. Severo and Martirio, 1 m. south of the town. The church of S. Domenico contains one of the finest works in sculpture by Arnolfo di Cambio, the tomb with recumbent effigy of the Cardinal de Braye (1282), with much beautiful sculpture and mosaic. There are a few buildings by Sammicheli of Verona, architect of the cathedral from 1509–28. The fortress built in 1364 by Cardinal Albornoz has been converted into a public garden. The well, now disused, called Il pozzo di S. Patrizio, is one of the chief curiosities of Orvieto. It is 200 ft. deep to the water-level and 42 ft. in diameter, cut in the rock, with a double winding inclined plane, so that asses could ascend and descend to carry the water from the bottom. It was begun by the architect Antonio da San Gallo the younger in 1527 for Clement VII. and was finished by Simone Mosca under Paul III. (*See* UMBRIA.)

*See* L. Fumi, *Il Duomo d' Orvieto e i suoi restauri* (1891); *Orvieto, note storiche e biografiche* (1891), and other works; P. Perali, *Orvieto* (*ibid.* 1919). (T. A.)

**ORYX,** the scientific name of a group of African antelopes of large size with long horns, which are present in both sexes, and long tufted tails. They are desert animals. The true oryx is the East and North-east African beisa oryx (*Oryx beisa*), which is replaced in South Africa by the gemsbok (*q.v.*). In northern Africa the group is represented by *O. algazel,* and in Arabia by *O. leucoryx. See* ANTELOPE.

**ORZESZKOWA** (*née* Pawlowska), **ELIZA** (1842–1910), Polish novelist, born near Grodno, of the noble family of Pawlowski. In her 16th year she married Piotr Orzeszko, a Polish nobleman, who was exiled to Siberia after the insurrection of 1863. She wrote a series of powerful novels and sketches, dealing with the social conditions of her country. *Eli Makower* (1875) describes the relations between the Jews and the Polish nobility, and *Meir Ezofowicz* (1878) the conflict between Jewish orthodoxy and modern liberalism. *On the Niemen* (1888), perhaps her best work, deals with the Polish aristocracy, and *Lost Souls* (1886) and *Cham* (1888) are on rural life in White Russia. She died at Grodno on May 18, 1910.

**OSAGE,** a tribe of American Indians formerly on Osage and Arkansas rivers in Missouri and Arkansas. Their speech is Siouan; their culture that of the plains. The original population is estimated at 5,000; in 1921 there were 2,200 in Oklahoma. Oil royalties, land leases and interest on trust funds held for them by the Government, make them one of the richest populations in the world.

*See* F. La Flesche, *Bur. Am. Ethn. Rep.* xxxvi, 1921; xxxix, 1925.

**OSAGEORANGE** (*Maclura pomifera*), a thorny tree with large, yellow, somewhat orange-like fruit. The tree, which is the only species of its genus, belongs to the mulberry family (Moraceae). It is native to rich soils in the south-central United States from Missouri and Kansas to Texas, but has been planted extensively in the Mississippi valley and occasionally in the eastern states, being hardy in New England. The very hard, strong, flexible, yellow wood, formerly used for bows and war-clubs by the Osage and other Indians west of the Mississippi, is utilized for railway ties and fence posts. Osageorange is also known as bowwood and as Bois d'Arc. The wood yields a yellow dye principle.

**OSAKA,** the chief industrial city of Japan (*q.v.*). Pop. (1940) 3,252,340. It lies in a plain bounded, except westward, where it opens on Osaka bay, by hills of considerable height, on both sides of the Yodogawa, or rather its headwater the Aji (the outlet of Lake Biwa), and is so intersected by river-branches and canals as to suggest a comparison with a Dutch town. Steamers ply between Osaka and Kobe-Hiogo or Kobe, and Osaka is an important railway centre. The opening of the railway (1873) drew foreign trade to Kobe, but a harbour for ocean-steamers has been constructed at Osaka. Shin-sai Bashi Suji, the principal thoroughfare, leads from Kitahama, the district lying on the south side of the Tosabori, to the iron suspension bridge (Shin-sai Bashi) over the Dotombori. The former foreign settlement is at Kawaguchi at the junction of the Shirinashi and the Aji. It is the seat of a number of European mission stations. Buddhist and Shinto temples are numerous. The principal secular buildings are the castle, the mint and the arsenal. The castle was founded in 1583 by Hideyoshi; the enclosed palace, probably the finest building in Japan, survived the capture of the castle by Iyeyasu (1615), and in 1867 and 1868 witnessed the reception of the foreign legations by the Tokugawa shoguns; but in the latter year it was fired by the Tokugawa party. It now provides military headquarters, containing a garrison and an arsenal. The whole castle is protected by high and massive walls and broad moats. The mint, erected and organized by Europeans, was opened in 1871. Osaka possesses iron-works, sugar refineries, cotton spinning mills, shipyards and a great variety of other manufactures.

Osaka owes its origin to Rennio Shonin, eighth head of the Shin-Shu sect, who in 1495–1496 built, on the site now occupied by the castle, a temple which became the principal residence of his successors. In 1580, after ten years' successful defence of his position, Kenryo, the eleventh "abbot," was obliged to surrender; and in 1583 the victorious Hideyoshi made Osaka his capital. The city brought several suburban districts within its boundaries in 1925, becoming temporarily the most populous city in Japan. In 1909 one-third of the city was destroyed by fire and though it was rebuilt with wider streets and better buildings, there are still many wooden houses and bridges, dangerous in case of fire, and its factories and warehouses compared less favourably with European and American standards than those of Tokyo until after World War I, when a number of fine buildings were erected and a program of city planning was carried a long way, though it is still incomplete. Osaka boasts of its advanced municipal government. Trade has grown rapidly in the last two decades, and a number of foreign-going ships now load and unload in Osaka harbour, which is being continuously extended and improved. The city was enlarged in 1926 by the absorption of outlying districts, to form Greater Osaka. Osaka, like Tokyo and Kyoto, as well as being a municipal administrative unit is an urban prefecture (Fu). The budget of Osaka city for 1938 was balanced at $69,705,000 (U.S.). Municipal indebtedness, $151,075,000 (U.S.).

**OSAWATOMIE,** a city of Miami county, Kansas, U.S.A., 45 mi. S. by W. of Kansas City, on the Missouri Pacific railroad. Pop. (1940) 4,145. It is near oil and gas fields, in a farming and grazing region, and has railroad shops. A state hospital for the insane is 1 mi. N.E. Osawatomie was settled about 1854 by colonists sent out by the Emigrant Aid company. The name was derived from Osage and Pottawattomie. It was the scene of many clashes between the pro-slavery and the free-soil factions of Kansas and Missouri, notably on Aug. 30, 1856, when Capt. John Brown (who had come to Osawatomie in 1855) and 40 followers attempted to repulse an attack by Gen. John W. Reid, at the head of 400 Missourians. They were quickly overpowered and the town was looted and practically destroyed.

**OSBORN, HENRY FAIRFIELD** (1857–1935), palaeontologist, was born at Fairfield (Conn.), Aug. 8, 1857. He graduated from Princeton university (1877) and continued his studies under Balfour and Huxley. His professorships included natural history and anatomy at Princeton (1881–91); biology and zoology until 1910, and the deanship of the faculty of pure science (1892–1895) at Columbia university. From 1910 to 1935 he held the research professorship in zoology at Columbia university. His connection with the American Museum of Natural History began as curator of the department of vertebrate palaeontology (1891–1910), and was followed by a number of offices till 1908, when he became president. After 1900 he was connected with the United States Geological **survey,** first as vertebrate palaeontologist and after 1924 as senior geologist. Among offices too numerous to mention, he had important connections with the Canadian Geological survey, the New York Zoological society, and the Carnegie institute. He declined the proffered secretaryship of the Smithsonian institution.

The American Museum of Natural History extension school service, its unique exhibition halls, and the organization of a complete survey of the geological succession of the higher vertebrates of North America are due to President Osborn's efforts. His extensive researches chiefly concerned the palaeontology of the vertebrates. His publications dealt with almost all groups of animals and reptiles, but made especially important contributions to the knowledge of the rhinoceroses, horses, titanotheres, and dinosaurs. He founded a flourishing school of vertebrate palaeontology which already included the names of numerous brilliant younger men of science. He did much towards the determination of relative ages of extinct mammals in North America, and performed important services in working out a correlation between the Tertiary and mammal horizons of Europe and America. He also studied and wrote on the philosophical bearings of his work. He was called, by the Royal Society of London at the time of his election to membership, "one of the most distinguished palaeontologists of our time."

His scientific writings (1877–1928) in geology, palaeontology, anthropology and biology comprise 755 titles, including memoirs on extinct reptiles and mammals. Dr. Osborn died Nov. 6, 1935.

His books combine literary art and scientific information. Among the most important are: *From the Greeks to Darwin* (1894); *Evolution of Mammalian Molar Teeth* (1907); *The Age of Mammals* (1910); *Huxley and Education* (1910); *Men of the Old Stone Age* (1915); *Origin and Evolution of Life* (1917); *The Earth Speaks to Bryan* (1925); *Evolution and Religion in Education* (1926); *Creative Education* and *Man Rises to Parnassus* (1927).

*See* "Eminent Living Geologists," *Geological Magazine,* London (1917), vol. 4, pp. 193–196, new Series, Decade 6.

**OSBORNE,** a former royal residence in the Isle of Wight, England, south-east of East Cowes. The name of the manor in early times is quoted as Austerborne or Oysterborne. In 1845, it was purchased by Queen Victoria, who died there in 1901. King Edward VII. presented the property to the nation. A part of the house was transformed into a convalescent home for officers of the navy and army, opened in 1904. In 1903 there was opened on the Osborne estate a Royal Naval college, which in 1921 was closed down, and the cadets thenceforward joined Dartmouth college.

**OSCAN** was the name given by the Romans to that dialect (*lingua Osca*) which they found spoken by the *Osci* of Campania. But inscriptional and other records, *i.e.,* local and personal names and glosses in ancient authors, manifestly of the same dialect, have been found not only in Campania, where the dialect was, according to the most probable interpretation of the evidence, not original, but seems to have been imposed upon the Oscans by Samnite invaders in the 5th century B.C., but also further south, namely in northern Apulia, Lucania, in the country of the Brutii (the "toe" of Italy), and even in the north-east angle of Sicily at Messana (the modern Messina), which was captured by the

Campanian Mamertines *c.* 289 B.C.; in Samnium proper, including the territory of the Frentani and Hirpini; and finally, further north, in the country of the Paeligni, Marrucini and Vestini. Thus there are distinguished, geographically, and dialectally, three main groups of Oscan: (1) Central Oscan of Campania and the Samnite tribes, (2) Southern Oscan, and (3) Northern Oscan. These are all closely related to one another as compared with the dialect of the Volsci and of the Umbrian townships (Iguvium, the modern Gubbio; Tuder, modern Todi; and one or two others); while Oscan, Volscian and Umbrian, taken together, make one of the two great divisions—the other being Latin (*q.v.*) with Faliscan—into which the Italic branch of the Indo-European family of languages falls. Since the Samnitic tribes, whose expansion by successive migrations—"sacred springs" as they were called—diffused the Oscan speakers from their home in central Italy, knew their land (in Latin, Samnium) by the name *Safinim,* it has been proposed to describe their dialects as "Safine," a title at once more comprehensive and historically truer than "Oscan." The stock to which the Samnites belonged used commonly a suffix *-no-* (*e.g.,* in *Sabi-ni*) to form their tribal names, as distinguished from the suffixes *-co-* and *-(a)ti-* of an earlier stratum of population (*e.g.,* in *Vols-ci, Tea-te*). In names like *Marru-ci-ni, Ardea-ti-ni,* the superimposed *-no-* suffix bears witness to a conquest or overlordship of the earlier by the later stock.

Until the Roman advance gradually replaced it by Latin—important stages of this advance are marked not so much by the three Samnite wars as by the destruction of Capua in 211 B.C. and the Social War of 91–89 B.C.—Oscan held its place as a language in recognized official and educated usage side by side with, or instead of, Latin or Greek. The poet Ennius is said to have spoken all three tongues (Gellius 17,17,1), and if Strabo (5, p.233 C) may be trusted, the rude farces or puppet-shows introduced from the Oscan town Atella (*fabulae Atellanae, ludi Osci*) were actually performed at Rome in Oscan. The latest Oscan inscriptions, scratched on the walls of houses at Pompeii, were written shortly before the eruption of Vesuvius which overwhelmed that city in A.D. 79, and it is probable that the dialect, which has left its mark on modern south Italian dialects, survived in remote country districts as a local patois for some time longer. None of the Oscan inscriptions, on the other hand, is older than the 5th century B.C.

Many of the inscriptions are carefully, indeed almost with phonetic accuracy, written in a native alphabet which was itself derived, with certain necessary modifications, from the Etruscan alphabet; but a few belonging to the southern group, and including all those from Sicily, are in the Greek, and some from Lucania and elsewhere in the rustic or Colonial Latin alphabets. Over 250 in number, the majority are quite short; nevertheless, they furnish materials adequate to give us a fairly complete conspectus of the dialect. About two-thirds of the whole come from Campania, and most of those from Capua and Pompeii.

In character they fall mostly into the following classes: (1) official documents—municipal regulations (Bantia), a treaty (Nola and Abella), inscriptions relating to public works (Pompeii and elsewhere); (2) religious—an inventory of statues and altars in a sacred grove at Agnone (Samnium), the interesting group of heraldic *iovilae* (*q.v.*) from Capua, recording or prescribing special ceremonies connected with family cults, numerous simple votive and dedicatory inscriptions; (3) military and election announcements (from Pompeii); (4) private documents—epitaphs, bricks inscribed with names, and (from Campania) a few belonging to the interesting group of curses, inscribed on lead and deposited in tombs; (5) coin legends, including those of the Social War reading *vítelliú, i.e.,* "Italia."

Oscan has many peculiarities which distinguish it from Latin in sound changes, word forms and vocabulary; in syntax the differences are much less marked. But it also possesses certain features which distinguish it amongst the Italic dialects themselves. Their nature and extent may be indicated roughly by a specimen text (on a sundial found at Pompeii):

mr atiniís mr kvaísstur eítiuvad
múltasíkad kúmbennieís tangi(nud)
aamanaffed

This in Latin would be:

M(a)r(a) Atinius M(a)r(ae) (filius) quaestor pecunia multaticia conventus scitu
fieri iussit

(Mara Atinius, son of Mara, quaestor, in accordance with a decree of the assembly, had this set up from fine-money.)

Buck, *Grammar of Oscan and Umbrian* (1904), all three with bibl. New inscriptions are reported in the official *Notizie degli Scavi* (Hoepli), but often more promptly in F. Ribezzo's *Rivista Indo-greco-italica* (since 1917); those discovered between 1897 and 1925 will be found collected by W. Schwering and M. Bacherler in Bursian's *Jahresbericht,* vol. 176 (1916–18), pp. 69 *sqq.,* Bacherler, *ibid.* vol. 184 (1920), pp. 140 *sqq.,* vol. 205 (1925), pp. 51 *sqq.; see* also Ribezzo, *l.c.,* vol. 8 (1924), pp. 83 *sqq.; résumés* of discoveries and new studies in the field appear regularly also in *Glotta* (since 1907) and in the *Indogermanisches Jahrbuch* (since 1912). G. Herbig, in M. Ebert's *Real-lexikon der Vorgeschichte, s.v.* Italiker (1925; bibl.), and R. S. Conway in *Cambridge Ancient History,* vol. iv. (1926) pp. 444 *sqq.,* give summary accounts of the Italic peoples and dialects. (J. WH.)

**OSCAR I.** (1799–1859), king of Sweden and Norway, was the son of General Bernadotte, afterwards King Charles XIV. In 1838 the king began to suspect his heir of plotting with the Liberal party to effect a change of ministry, or even his own abdication. Oscar, however, avoided an actual rupture. After his accession (March 8th, 1844) it appeared that his liberalism was very restricted. He refused any radical reform of the cumbrous and obsolete constitution. But one of his earliest measures was to establish freedom of the press. Most of the legislation during his reign aimed at improving Sweden's economic position.

In foreign affairs Oscar I. was a friend of the principle of nationality. In 1848 he supported Denmark against Germany; placed Swedish and Norwegian troops in cantonments in Fünen and North Schleswig (1849–1850); and mediated the truce of Malmö (August 26, 1848). He was also one of the guarantors of the integrity of Denmark (London protocol, May 8, 1852). Oscar I. left four sons, of whom two, Carl (Charles XV.) and Oskar Fredrik (Oscar II.), succeeded to his throne.

*See* T. Almén, *Ätten Bernadotte* (Stockholm, 1896); and C. E. Akrell, *Minnen från Carls XIV., Oscars I. och Carls XV. Lagar* (Stockholm, 1884, 1885). Also NORWAY: *History,* and SWEDEN: *History.*

**OSCAR II.** (1829–1907), king of Sweden and Norway, son of Oscar I., was born at Stockholm on Jan. 21, 1829. In 1857 he married Princess Sophia Wilhelmina, youngest daughter of Duke William of Nassau. He succeeded his brother Charles XV. on Sept. 18, 1872, and was crowned in the Norwegian cathedral of Drontheim on July 18, 1873. At his accession he adopted as his motto *Brödrafolkens Väl,* "the welfare of the brother folk," and from the first he realized the essential difficulties in the maintenance of the union between Sweden and Norway. The political events which led up to the final crisis in 1905, by which the thrones were separated, are dealt with in the historical articles under NORWAY and SWEDEN. But it may be said that the peaceful solution eventually adopted could hardly have been attained but for the tact and patience of the king himself. He declined, indeed, to permit any prince of his house to become king of Norway, but better relations between the two countries were restored before his death, which took place at Stockholm on Dec. 8, 1907. His acute intelligence and his aloofness from the dynastic considerations affecting most European sovereigns gave the king considerable weight as an arbitrator in international questions. At the request of Great Britain, Germany and the United States in 1889 he appointed the chief justice of Samoa, and he was again called in to arbitrate in Samoan affairs in 1899. In 1897 he was empowered to appoint a fifth arbitrator if necessary in the Venezuelan dispute, and he was called in to act as umpire in the Anglo-American arbitration treaty that was quashed by the senate.

Himself a distinguished writer and musical amateur, King Oscar was a generous friend of learning and of education. His works, which included his speeches, translations of Herder's *Cid* and Goethe's *Torquato Tasso,* a play, *Castle Cronberg,* poems and historical works, were collected in 1875–76 (new and enl. ed.,

1885–88). His *Memoirs of Charles XII.* were translated into English in 1879.

*See* A. Hasselgren, *Oskar II., en lefnadsteckning* (1908).

**OSCEOLA** (*c.* 1804–1838), a Seminole American Indian, leader in the second Seminole War, was born in Georgia, near the Chattahoochee river. His father was an Englishman named William Powell; his mother a Creek of the Red Stick or Mikasuki division. In 1808 he removed with his mother into northern Florida. When the U.S. commissioners negotiated with the Seminole chiefs the treaties of 1832–33 for the removal of the Seminoles to Arkansas, Osceola seized the opportunity to lead the opposition of the young warriors, and declared to the U.S. agent, Gen. Wiley Thompson, that any chief who prepared to remove would be killed. Late in 1835 he murdered Charley Emathla (or Emartla), a chief who was preparing to emigrate with his people, and with a few companions shot and killed Gen. Thompson.

In 1836 Generals Edmund P. Gaines (1777–1849), Winfield Scott (1786–1866) and Richard K. Call (1791–1862) waged war against them with little effect, and the year closed with General Thomas Sidney Jesup (1788–1860) in command with 8,000 troops at his disposal. General Jesup drove the enemy from the Withlacoochee country and was pursuing them southward toward the Everglades when several chiefs expressed a readiness to treat for peace. On March 6, 1837, they agreed to cease hostilities, to prepare for emigration to Arkansas, and gave hostages to bind them to their agreement. But on June 2 Osceola came to the camp at the head of about 200 Mikasuki (Miccosukees) and effected the flight of all the Indians there, about 700 including the hostages, to the Everglades. Hostilities were then resumed, but in September, after the capture of several chiefs, Osceola requested an interview. This was granted, and by command of General Jesup he was taken captive and carried to Fort Moultrie, at Charleston, S.C., where he died in January, 1838. The war continued until 1842, but after Osceola's death the Indians did little but attack the unarmed inhabitants.

*See* J. T. Sprague, *The Origin, Progress and Conclusion of the Florida War* (1848).

**OSCHERSLEBEN,** a town in the Prussian province of Saxony, on the Bode, 24 m. by rail W.S.W. of Magdeburg, and at the junction of lines to Halberstadt and Jerxheim. Pop. (1939) 17,761. Oschersleben is first mentioned in 803. Among its industrial establishments are sugar-refineries, iron-foundries, breweries, machine-shops and brick works.

**OSCILLATOR.** A non-rotating device used in radio apparatus for producing alternating current. The output frequency of the oscillation is determined by the characteristics of the device.

**OSCILLATORY CIRCUIT,** as applied to radio apparatus, is a relatively low resistance circuit containing both inductance and capacity, such that the voltage impulse will produce a current which periodically reverses in direction.

**OSCILLOGRAPH,** an instrument for the delineation of alternating current wave forms. In the type devised by Duddell (*Electrician* xxxix., Sept. 1897, 636) two phosphor bronze strips under tension pass, side by side, between the poles of an electromagnet. The current is led up one strip and down the other so that they move in opposite directions at right angles to their length. A small mirror bridged across the strips is thus tilted to an extent dependent on the strength of the current. The mirror reflects a spot of light on to a photographic film whose movement at right angles to that of the light spot provides the time scale. The natural period of vibration of the strips is arranged to be very small ($\frac{1}{8,000}$–$\frac{1}{10,000}$ sec.) to enable them to move in accordance with the fluctuations of the current. Other types of oscillograph have been designed by Blondel, Irwin (the *hot-wire* oscillograph) and others. The Cathode Ray Oscillograph is available for high-frequency observations. For further information *see* INSTRUMENTS, ELECTRICAL; BALLISTICS; OSISO.

**OSH,** a town of Asiatic Russia, in the Kirghiz A.S.S.R. in 40° 35′ N., 72° 55′ E., 31 m. S.E. of Andijan railway terminus, at an altitude of 4,030 ft. Pop. (1933) 44,800. It is on the Ak-bara river, a tributary of the Kara-Su, in a fertile cotton, grain and fruit growing valley leading to the Alai and Pamir. The famous Takht-i-Suleiman (Solomon's Throne) rock, the theme of so many Eastern legends, is near the town and is frequented by pilgrims.

**O'SHAUGHNESSY, ARTHUR WILLIAM EDGAR** (1844–1880), English poet, was born in London on March 14, 1844, and at seventeen became a copyist in the library of the British Museum. Later, he specialised in ichthyology. He published his *Epic of Women* in 1870, *Lays of France,* a free version of the *Lais* of Marie de France, in 1872, and *Music and Moonlight* in 1874. He died on Jan. 30, 1880, his *Songs of a Worker* appearing immediately afterwards. In Palgrave's words, he had "a haunting music all his own."

**OSHAWA,** a manufacturing city and port of entry of Ontario county, Ontario, Canada, on Lake Ontario and the Canadian National and Canadian Pacific railways, 30 m. E.N.E. of Toronto. Pop. (1941) 28,813. It contains large motor works, flour, woollen and grist-mills, piano, farm implement and carriage factories, foundries, tanneries, canning factories, etc.

**OSHIMA,** a group of three small islands belonging to Japan, lying southwards of Kiushiu, in 30° 50′ N. and 130° E. Their names, from west to east, are Kuro-shima, Iwo-shima and Take-shima. Kuro-shima rises to a height of 2,475 ft., and Iwo-shima has an active volcano 2,480 ft. high. These islands are not to be confounded with Oshima, the most northerly island of the Izu-noshichito, or with the northern group of the Luchu Islands.

**OSHKOSH,** a city of Wisconsin, U.S.A., 75 m. N.N.W. of Milwaukee, on the west shore of Lake Winnebago, where the Fox river flows into it; the county seat of Winnebago county. It is on federal highways 41, 45 and 110, and is served by the Chicago and North Western, the Chicago, Milwaukee, St. Paul and Pacific, the Soo Line, motor coaches and motor-truck lines. Population in 1940 was 39,089 by federal census.

Oshkosh is the seat of a state teachers' college with an enrolment of 800. Lumber used to be the main industry, but products are now highly diversified. The output in 1937 was $23,418,725. Bank clearings for 1940 were $18,487,158, and the valuation for 1940 was $41,779,875. The city has an aldermanic government.

The Fox river and Lake Winnebago early became an important line of communication, under French control, on the route between the Great Lakes and the Mississippi. Trading posts were established on the site of Oshkosh in the 18th century, and a flotilla of 50–100 fur-laden barges and bateaux was not an uncommon sight on the river. Permanent settlement here began about 1836. The north side of the river was at first called Saukeer and the south side Algoma, but in 1840 the name Oshkosh was adopted, to honour a friendly Menominee chief. In 1874 and in 1875 the city suffered serious loss from fire. It was chartered as a city in 1853.

**OSIANDER, ANDREAS** (1498–1552), German reformer, was born at Gunzenhausen, near Nuremberg, on Dec. 19, 1498. His German name was Heiligmann, or, according to others, Hosemann. After studying at Leipzig, Altenburg and Ingolstadt, he was ordained priest in 1520 and appointed Hebrew tutor in the Augustinian convent at Nuremberg. Two years afterwards he was appointed preacher in the St. Lorenz Kirche, and about the same time he publicly joined the Lutheran party, taking a prominent part in the discussion which ultimately led to the adoption of the Reformation by the city. He married in 1525. He was present at the Marburg conference in 1529, at the Augsburg diet in 1530 and at the signing of the Schmalkald articles in 1537. His vehemence, coarseness and arrogance in controversy brought him many personal enemies. The introduction of the Augsburg Interim in 1548 necessitated his departure from Nuremberg; he went first to Breslau, and afterwards settled at Königsberg as professor in its new university at the call of Duke Albert of Prussia. Here in 1550 he published two disputations, the one *De lege et evangelio* and the other *De justificatione,* which aroused a controversy still unclosed at his death on Oct. 17, 1552. While he was fundamentally at one with Luther in opposing both Romanism and Calvinism, his mysticism led him to interpret justification by faith as not an imputation but an infusion of the essential righteousness or divine nature of Christ. His party was afterwards led by his son-in-law Johann Funck, but disappeared after the latter's

execution for high treason in 1566. Osiander's son Lukas (1534–1604), and grandsons Andreas (1562–1617) and Lukas (1571–1638) were well-known theologians.

Osiander, besides a number of controversial writings, published a corrected edition of the Vulgate, with notes, in 1522, and a *Harmony* of the Gospels—the first work of its kind—in 1537. The best-known work of his son Lukas was an *Epitome* of the *Magdeburg Centuries*. *See* the *Life* by W. Möller (Elberfeld, 1870).

**OSIER,** the common term under which are included those species, varieties and hybrids of the genus *Salix* used in the manufacture of baskets. The chief species in cultivation are: *Salix viminalis* (the common osier), *S. triandra, S. amygdalina, S. purpurea* and *S. fragilis,* which botanically are willows. The first named with some 40 of its varieties formerly comprised the staple basket-making material in England. It is an abundant cropper, sometimes attaining on low-lying soils a height of 13 ft. Full-topped and smooth, it is by reason of its pithy nature mainly cultivated for coarse work and is generally used as brown stuff. Some harder varieties, known as stone osiers and raised on drier upland soils, are peeled and used for fine work.

*S. fragilis,* with some half-score varieties, is almost exclusively used by market gardeners for bunching greens, turnips and other produce.

Owing to the increased demand for finer work much attention has been given (*see* BASKET) to the cultivation of the more ligneous and tougher species, *S. triandra, S. purpurea* and *S. amygdalina* with their many varieties and hybrids.

It is commonly supposed that osiers or willows will prove remunerative and flourish with little attention on any poor, wet, marshy soil. This is, however, not the case. No crop responds more readily to careful husbandry and skilful cultivation. For the successful raising of the finer sorts of willows good, well-drained, loamy upland soil is desirable, which before planting should be deeply trenched and cleared of weeds.

At any time, from late winter to early spring, the ground may be planted with "sets," *i.e.*, cuttings of about 9 to 16 in. in length, taken from clean, well-ripened rods. These are firmly set to within 3 to 6 in. of the top in rows, 16 to 20 in. apart and spaced at intervals of 8 to 12 in. Yearling sets are largely planted, but the practice of the best Midland and west of England growers proves the superior productiveness of sets cut from two yearling rods. Great care should be exercised in planting lest the bark be fractured, loosened or removed from the wood and if not subject to periodical alluvial floods the ground should be manured yearly. The coarser *S. viminalis* may be raised on lowland soil if not water-logged or marshy. The more valuable kinds are known as: New kind, Black mauls, Spaniards, Glibskins, Long-bud, Long-skin, Lancashire red-bud, French, Italians, Pomeranians and Councillors and scores of other local names. A hybrid of *S. viminalis* and *S. triandra,* known as Black-top has been found to produce the heaviest crops on the best Leicestershire grounds.

Cutting and binding take place in early winter after the fall of the leaf, the crop being known as green whole stuff. The coarser kinds are sorted, cured (dried in the sun and wind) and stacked ready for market. These are known as brown rods. The finer kinds, after the more shrubby or ill-grown rods, termed Ragged, have been rejected, are peeled or buffed. Two methods of stripping are chiefly practised: from the heads (sets) and from the pit. By the former method the rods are left on the ground until spring advances, when a rapid growth of the cambium begins. They are then cut direct from the head and the bark is easily removed by drawing the rods through a bifurcated hand-brake of smooth, well-rounded steel, framed in wood. Improved brakes worked by a treadle strip two rods at a time. For the smaller sizes, rubber brakes are sometimes used and, for the very smallest, the fingers either bare or protected by linen bands. This method ensures a clean-butted unfractured rod, but unless great judgment is exercised in selecting the proper time for cutting the rods will remain double-skinned and the head may bleed. By the "pit" process the green rods are stood upright in shallow pits of water at a depth of about 6 to 9 in. until the sap rises and growth begins, when they are ready for the brake. The defects of this method are that the tops are liable to split in the brake and the butts to remain foul. A third, known as the "pie" system, enables the grower to bridge over the interval, and to keep his hands employed, between the end of the "head" and the beginning of the "pit" strippings.

The willows are cut at the first indication of the sap rising and 'couched" in rotten peelings and soil at a slight angle, the butts being on the ground, which should be strewn with damp straw from a manure heap. The tops are covered lightly with rotted peelings and by periodical application of water, fermentation is induced at the bottom, heat is engendered, the leaves force their way through the covering and peeling may begin. Peeling is chiefly done by women and lasts from early May to the middle of July, but a motor peeler has been introduced in some osier grounds. After stripping, the rods are bleached in the sun and stored for sale as White. If the rods are to be buffed they are immersed in large tanks of boiling water from 4 to 6 hours. They are then allowed to cool and mellow, are stripped and carefully dried in sun and air and remain dyed a rich tawny brown or buff colour. Brown rods may also be buffed by sinking them in cold water which is heated to boiling point, and maintained at that temperature for the requisite period.

In its natural habitat the osier or willow is a dioecious plant reproduced by cross fertilization but for at least 2,000 years has been cultivated from cuttings. The stocks have therefore become enfeebled; their cultivation is attended with many disturbing causes—ground vermin, fungoid and insect pests as well as winter floods and spring frosts.

The British Ministry of Agriculture and Fisheries has shown that under suitable conditions improved stocks of basket willows can be produced by cross fertilization and their disease-resisting power strengthened.

In eastern North America the name red-osier has been applied to *Cornus stolonifera,* one of the shrubby dogwoods.

*See* W. P. Ellmore, *The Cultivation of Osiers and Willows,* 2nd ed.; also a leaflet (No. 36) on the same subject published gratis by the British Ministry of Agriculture. (T. O.; X.)

**OSIJEK** (Germ. *Esseg,* Magyar, *Eszek*), town of Croatia-Slavonia, Yugoslavia, occupied by Italy in 1941. Pop. (1931) 40,339, chiefly Magyars and Croats. It is situated on the Drave, which is here crossed by two bridges, below which the river is navigable by small steamers. The upper, or old town, contains the fortress, while the lower or new town is the commercial centre. It has several Orthodox and Roman Catholic churches, Franciscan and Capuchin monasteries, a synagogue, gymnasium, school, hospital, chamber of commerce and law courts. Osijek has a thriving trade in grain, fruit, livestock, plum brandy and timber. There are cotton mills, tanneries and a sugar beet factory, while silk weaving, glass blowing and the making of hats and caps are also carried on.

Osijek owes its origin to its fortress, which existed in Roman times under the name of *Mursia.*

**OSIMO,** a town and episcopal see (anc. *Auximum, q.v.*), the Marches, Italy, province of Ancona, 10 mi. S. of that town by rail. Pop. (1936) 6,817 (town); 21,182 (commune). It is on the top of a hill 870 ft. above sea-level and it retains a portion of its ancient town wall (2nd century B.C.). The cathedral has a portal with sculptures of the 13th century, an old crypt and a fine bronze font of the 16th century; the town hall contains a number of statues found on the site of the ancient forum and also a few pictures. Silk spinning and the raising of cocoons are carried on.

**OSIRIS,** one of the principal gods of the ancient Egyptians. *See* EGYPT: *Religion.*

**OSISO,** an instrument for recording the exact character of vibrations. It has been used for the investigation of electrical phenomena, recording sounds, enabling the totally deaf to understand speech and to speak, studying and eliminating vibration in machinery, determining the recoil action of guns, locating heavy artillery, aeroplanes and vessels, studying heart-beats, respiration and other bodily functions, locating oil, ore bodies, etc. The osiso consists of a tiny mirror mounted on two wires and suspended between the poles of a magnet. If a current flows through the wires in a strong magnetic field, they will tend to move, the direction and

extent of the motion depending upon the direction and strength of the current flow. A beam of light, reflected from the mirror, provides a means for making visible the movements of the mirror and for recording them on a photographic film. Every sound produces its own individual wave form, and the meaning of these waves can be read. (*See* INSTRUMENTS, ELECTRICAL: *Oscillograph.*)

**OSKALOOSA,** a city of southeastern Iowa, U.S.A., on federal highway 63 and state highways 92, 163, 309 and 371 and near the Des Moines river and Keomah Lakes State park; the county seat of Mahaska county. It is served by the Minneapolis and St. Louis, and the Rock Island railways. Pop. (1940 federal census) 11,024. It is in a farming and coal-mining region, and has a number of important factories. Penn college, founded in 1873, is located on the northern edge of the city. In the suburb of University park, adjoining it on the east, is John Fletcher college. Oskaloosa was settled in 1843, chosen for the county seat in 1844, and chartered as a city in 1853. It was named after a Seminole princess.

**OSLER** (*ōs'lur*), **SIR WILLIAM** (1849–1919), British physician, born at Bond Head, Canada, July 12, 1849, was educated at Trinity college school, Port Hope, Trinity College, Toronto, and McGill university, Montreal, where he took the M.D. degree in 1872. He studied medicine in London, Leipzig and Vienna and in 1874 was appointed professor of medicine at McGill university. From 1884 to 1889 he was professor of clinical medicine in the University of Pennsylvania, and from 1889 to 1904 professor of medicine at Johns Hopkins university. In 1905 he was appointed regius professor of medicine at Oxford, where he also served as a curator of the Bodleian library, as a delegate of the University Press and as one of the Radcliffe trustees. In 1911 he was created a baronet. Sir William Osler carried out original and valuable researches on the diseases of the spleen and blood and also made eminent contributions to the study of infections of the heart, of angina pectoris, of malaria and of many minor maladies. Sir William died at Oxford Dec. 29, 1919.

His most important work was *The Principle and Practice of Medicine* (1892, latest edition 1920). He also wrote monographs on *Cerebral Palsies in Children* (1889); and *Chorea and Choreiform Affections* (1894); a volume of essays *Aequanimitas* (1901); and *A Way of Life* (1913).

**OSLO** (known as KRISTIANIA or CHRISTIANIA from 1624 to 1925), capital of Norway, forming a separate county (*amt*), and the seat of a bishopric (*stift*). Pop. (1930 census) 253,124; (1943 est.) 275,000. Area, 6·5 sq.mi. It lies in southern Norway, on the Aker river, at the head of Oslo fjord some 80 mi. from the Skagerrak. The modern city, with its busy, island-studded harbour, lies in a basin surrounded by pine-wooded hills. Before World War II it developed rapidly as the great town of Norway, containing not only the governmental offices, courts and parliament, but the university and the important national theatres and museums. Karl Johans Gate is the chief thoroughfare, with the royal castle and its statue of Karl Johan at the western end, and along its sides some of the leading banks and business houses, the Grand Hotel, the Frederician university (founded in 1811), the National theatre (1899) with its huge statues of Ibsen and Björnson, and the *Storting* (parliament) building (1866). The art museum lies just north of the university; the historical museum nearby. Across the harbour in Bygdö is a special structure housing Nansen's unique exploring ship, the *Fram;* another building for three fine old Viking ships, and the large Folk museum with typical early dwellings, a *stavkirke,* Ibsen's workroom, and exhibits of native handicraft and industry.

The city's population growth (7,500 in 1769; 13,600 in 1815; 134,000 in 1886; about 275,000 in 1943), resulted in the absorption of many of the surrounding communities and the creation of garden suburbs and large modernistic apartment units. At Ullevaal is the largest municipal hospital in the country. High above the city rises Holmenkollen with its famous ski-jump and ski museum. At Tören is a science museum. Still incomplete but in use at the time of the German invasion in 1940 was an impressive new city hall, built in a former slum area on the inner harbour called Pipervik. Immediately to the east is the Akershus fortress, extensive but not kept up to date.

The site of the old city of Oslo lies east of the Aker river. It was founded by Harald Hardrada in 1048, became soon the seat of a bishopric, and in the 14th century was the *de facto* capital. Its period of brilliance was from 1286 to 1350, but it was repeatedly burned and plundered; after complete destruction by fire in 1624 it was left to ruin and the inhabitants were ordered to build Kristiania (named for King Christian IV of Denmark and Norway). On Jan. 1, 1878, the site was incorporated in Kristiania.

Like the other municipalities of Norway, Oslo before 1940 enjoyed a high degree of local autonomy, especially after the charter of 1837. Its Council of 84 elected an executive committee of 21; both were under control of the Labour party after the elections of 1937. The city budget of about $30,000,000 supported farreaching social activities such as the child welfare clinic, mothers' pensions, summer camps for more than 3,000 children, the famous "Oslo breakfast" for school children, economic advisers for housewives, and an employment bureau.

Oslo is well connected by rail and highway with other cities of Norway and Sweden; it is also the chief seaport of a seafaring nation. It ordinarily imports about three times as much as it exports and has floating dock, dry dock and elevator facilities; the harbour is kept ice free. Two railway stations serve the city: Östbanegaard or Hovedbanegaard by the Björvik and Vestbanegaard by the Pipervik. There is a special railway up to Holmenkollen and good tram service. There are two large shipbuilding yards and many factories, mostly concentrated in Sagene, manufacturing woollens, linens, paper, pulp, machinery, brick and tile, flour, condensed milk, margarine, oil, soap, hardware, glass, chemicals, beer and liquors.

Electric power is supplied by a huge project at Solbergfoss on the Glommen river.

BIBLIOGRAPHY.—L. Daae, *Det gamle Christiania, 1624–1824* (Christiania, 1890); Y. Nielsen, *Christiania und Umgegend* (Christiania, 1894); G. Amnéus, *La Ville de Christiania . . . Resumé historique, etc.* (Christiania, 1900); *Social Work in Oslo* (Oslo, 1939).

**OSMAN** ('UṢMĀN), the usual form of the Arabic name 'OTHMAN, as representing the Turkish and Persian pronunciation of the name. It is used, therefore, for (1) the founder of the Osmanli or Ottoman dynasty, Osman I., who took the title of sultan, ruled in Asia Minor, and died in 1326, and (2) the sixteenth sultan Osman II., who reigned 1616–1621. (*See* TURKEY: *History;* OTHMAN and CALIPHATE.)

**OSMAN** (1832–1900), Turkish pasha and mushir (field marshal), was born at Tokat, in Asia Minor, in 1832. Educated at the military academy at Constantinople, he entered the cavalry in 1853, and served under Omar Pasha in the Russian War of 1853–56, in Wallachia and the Crimea. Appointed a captain, in the Imperial Guard, he distinguished himself in the campaigns of the Lebanon in 1860 and of Crete in 1867 to 1869, and was promoted lieut.-colonel. He served under Redif Pasha in suppressing an insurrection in Yemen in 1871, was promoted major-general in 1874, and general of division in 1875. Appointed to command the army corps at Widin in 1876 on the declaration of war by Serbia, he defeated Tchnernaieff at Saitschar and again at Yavor in July, invaded Serbia and captured Alexinatz and Deligrad in October, when the war ended. Osman was promoted to be mushir, and continued his command at Widin.

When the Russians crossed the Danube in July 1877, Osman moved his force to Plevna, and, with the assistance of his engineer, Tewfik Pasha, entrenched himself on the right flank of the Russian line of communication, and gradually made the position a most formidable one. He repulsed the three assaults of the Russians and after being closely invested, held the position until Dec. 9, when, compelled to cut his way out, he was severely wounded and forced to capitulate. This famous improvised defence delayed the Russians for five months, and entailed their crossing the Balkan range in the depth of winter after the third battle of Plevna. The sultan conferred on Osman the Grand Cross of the Osmanie and the title of "Ghazi" (victorious), and, when he returned from imprisonment in Russia, made him commandant of the Imperial Guard, grand-master of the artillery and marshal

of the palace.

In December 1878 he became war minister, and held the post, with a small break, until 1885. He died at Constantinople on April 14, 1900.

**OSMANLI,** the tribal name of the Turks of the Ottoman empire. The Osmanli include a heterogeneous group of peoples, the original conquering Osmanli having mixed very considerably with the conquered peoples, until physically they have ceased to have a definite separate existence.

**OSMIUM,** a chemical element found in small quantities in platinum ores but obtained chiefly from the mineral osmiridium by the method of Deville and Debray (*see* RUTHENIUM); together with iridium it was first isolated by Smithson Tennant in 1803 (symbols Os, atomic number 76, atomic weight 190·8). Osmiridium is fused with metallic zinc, the excess of zinc is dissolved in hydrochloric acid and the residue ignited with a mixture of barium nitrate and barium peroxide. When cold, the mass is finely powdered and treated with cold dilute hydrochloric acid in a stoppered bottle; this is necessary as osmium is present in the form of volatile tetroxide. After all action has ceased, nitric and sulphuric acids are added, the mixture is well shaken and the barium sulphate allowed to deposit. The liquid is then distilled, when the volatile osmium tetroxide passes over in an almost pure state. The residue from the distillation is concentrated, ammonium chloride is added, and ammonium iridium chloride $(NH_4)_2IrCl_6$ (together with a little ruthenium) is precipitated. Another method of obtaining osmium from osmiridium is to heat the alloy mixed with common salt in a slow stream of chlorine. The sodium osmichloride, $Na_2OsCl_6$, produced is extracted with water; sal ammoniac is added to precipitate sparingly soluble ammonium osmichloride, $(NH_4)_2OsCl_6$, which on gentle ignition leaves a residue of spongy osmium.

Osmium in the massive state is a metal of a bluish-white colour. It can be obtained crystalline by alloying any of its forms with metallic tin and subsequently removing the tin by means of hydrochloric acid. It has a specific gravity of 22·48, and melts at about 2,700° C, although it begins to volatilize at a lower temperature. It is a very hard metal, especially when combined with iridium, and the alloy was at one time used extensively for tipping gold pens, but for this purpose cheaper alloys are now employed free from platinum metals and generally having tungsten for their basis. It is not suitable in alloys with other platinum metals for high-temperature work, for, owing to the ease with which it oxidizes, it causes the alloy to disintegrate.

Osmium forms several oxides of which four are known with certainty, namely, OsO, $Os_2O_3$, $OsO_2$ and $OsO_4$, while $OsO_3$ is present in the metallic osmates. The lower oxides are unimportant. *Osmium tetroxide,* $OsO_4$, known in commerce under the name of osmic acid, can readily be obtained in a state of purity, and is the source from which other osmium compounds are generally prepared. If metallic osmium in any form is heated in a tube in a current of air, or preferably oxygen, to a bright red heat, combination takes place and a yellowish liquid, $OsO_4$, condenses in the cold part of the tube, afterwards crystallizing in yellowish needles which melt at 40° C; the liquid boils at 100° C giving a colourless vapour. Traces of the vapour of osmium tetroxide have a very strong odour somewhat resembling that of chlorine. The vapour is poisonous and exceedingly corrosive and attacks animal membranes vigorously, becoming reduced and leaving a deposit of metallic osmium. In small quantities the physiological effect is transitory but larger quantities entail serious consequences. It is largely used for preparing microscopic slides as it acts preferentially on certain portions of tissue, staining them black. If alcohol is added to $OsO_4$ dissolved in caustic potash, the solution becomes red and on concentration potassium osmate, $K_2OsO_4,2H_2O$, crystallizes out. This salt is stable in neutral solutions but decomposes on acidification, forming $OsO_4$ and lower oxides. Osmium has several chlorides such as $OsCl_2$, $OsCl_3$ and $OsCl_4$; these, and especially the last two, have a great tendency to combine with alkaline chlorides producing double chlorides of the form $M_3OsCl_6$ and $M_2OsCl_6$. They are readily formed from the tetroxide by the use of suitable reducing agents. Two sulphides of osmium are known, $OsS_2$ and $OsS_4$; the latter is formed by the action of sulphuretted hydrogen upon acid solutions of the tetroxide. Qualitatively, osmium is detected by the odour of $OsO_4$ produced when the metal is ignited in air. A delicate test for $OsO_4$ is to warm an aqueous solution with thiocarbamide and dilute hydrochloric acid, when a red coloration shows the presence of osmium. (F. E. M.)

**OSNABRÜCK,** a town and episcopal see in the Prussian province of Hanover, Germany, on the Hase, 70 mi. W. of the city of Hanover, 31 mi. by rail N.E. of Münster, and at the junction of the lines Hamburg–Cologne and Berlin–Amsterdam. Pop. (1939) 98,731. In 888 Osnabrück received the right to establish a mint, a market and a toll-house. Surrounded with walls towards the close of the 11th century, it maintained an independent attitude towards its nominal ruler, the bishop, and joined the Hanseatic League, reaching the height of its prosperity in the 15th century. The older streets contain examples of Gothic and Renaissance domestic architecture. The Roman Catholic cathedral, with its three towers, is a building of the 13th century, partly in the Romanesque and partly in the Transitional style; but it is inferior in architectural interest to the Marienkirche, a Gothic structure of the 14th and 15th centuries. The town hall, a 15th century Gothic building, contains portraits of some of the plenipotentiaries engaged in concluding the peace of Westphalia. Other important buildings are the museum, containing scientific and historical collections; the episcopal palace and the law courts. The lunatic asylum on the Gertrudenberg occupies the site of an ancient nunnery. Linen was formerly the staple product, but it no longer retains that position. The manufactures include machinery, paper, celluloid, chemicals, tobacco and cigars, pianos, cloth and beer. It has large iron and steel works, and coal mines in the neighbourhood. It was bombed repeatedly and very severely during World War II.

**OSORNO,** a province in south Chile, bounded north along the Río Bueno by Valdivia, east by Argentina, south by Llanquihue, and west by the Pacific. Area, 3,867 sq.mi.; population (1940) 107,341. The province was created by law Jan. 19, 1940, about two-thirds the territory having been taken from the province of Llanquihue, the remainder from the province of Valdivia. Osorno lies in the temperate rain forest zone of the south, and is divided longitudinally into the three physiographic regions (coastal mountains, interior valley and cordillera) which characterize the majority of the provinces of Chile. The west is sparsely settled, and there are no towns, ports or roads in the region. The central valley, traversed by the Santiago-Puerto Montt line of the State railways, is a productive agricultural and stock-raising region, settled in considerable part by German colonists and their descendants. The valley is integrated by a good network of roads, many of which lead eastward to the Lake district. The eastern part of the province is noted for its lakes (especially Ranco, the southern half of which is in Osorno, Puyehue and Rupanco), resorts (Lago Ranco, Salto del Pilmaiquén, Baños de Azufre and Termas de Puyehue), forests and mountains.

Osorno, capital of the province and department of the same name (population 25,075 in 1940), was founded in 1553 and named in honour of the Marqués de Osorno, viceroy of Peru. Centrally located in the valley, Osorno has the distinction of being the only large urban centre in the province, the fourth largest city in south Chile, the gateway to southern Chile's famous tourist region, and the western terminus of the important international route which leads to the Argentine town of San Carlos de Bariloche. The province is divided into two departments, Osorno and Río Negro, the capital of the latter being Río Negro, with a population of but 1,897 in 1940.

**OSPREY** or **OSPRAY,** a bird of prey of conspicuously marked plumage, the white of its lower parts and head contrasting sharply with the dark brown of the back when it is on the wing. It is the representative of the family *Pandionidae,* closely related to the *Falconidae.* Its special characters are the presence of a reversible outer toe and spicules on the soles of the feet.

The osprey (*Pandion haliaetus*) is one of the most cosmopolitan birds of prey. Where, through abundance of food, it is numerous,

the nests of the fish-hawk (to use its American name) may be placed on trees to the number of 30 close together. Where food is scarcer and the species accordingly less plentiful, a single pair will occupy an isolated rock, as formerly in Scotland. Few birds lay eggs so rich in colouring: their white or pale ground is spotted, blotched or marbled with almost every shade of purple, orange and red, from the most delicate lilac and buff, through violet, chestnut and crimson, to black. The fierceness with which ospreys defend their eggs and young, in addition to the dangerous situation chosen for the aerie, makes the task of robbing the nests difficult. It no longer breeds in Great Britain. The term "osprey," applied to the nuptial plumes of the egrets in the feather trade, is derived from the French *esprit;* it has nothing to do with the osprey bird.

THE OSPREY (PANDION HALIAETUS)
A bird of prey, known in America as the fish-hawk

**OSROENE** or **OSRHOENE,** a district of northwestern Mesopotamia, in the hill country on the upper Bilechas (Belichus; mod. *Nahr Belik,* Bilikh), the tributary of the Euphrates, with its capital at Edessa (*q.v.*), founded by Seleucus I. About 130 B.C. Edessa was occupied by a nomadic Arabic tribe, the Orrhoei (Plin. v, 85; vi, 25, 117, 129), who founded a small state ruled by their chieftains with the title of kings. After them the district was called Orrhoene (thus in the inscriptions, in Pliny and Dio Cassius), which occasionally has been changed into Osroene, in assimilation to the Parthian name Osroes or Chosroes (Khosrau). The founder of the dynasty is therefore called Osroes by Procop. (*Bell Pers.* i, 17) but Orhāi or Urhāi, son of Hewyā (*i.e.* "the snake"), in the chronicle of Dionysius of Tellmahre; he is no historical personality, but the eponym of the tribe. The kings soon became dependants of the Parthians; their names are mostly Arabic (Bekr, Abgar, *Ma'nu*), but among them occur some Iranian (Parthian) names, as Pacorus and Phratamaspates. Under Tigranes of Armenia they became his vassals, and after the victories of Lucullus and Pompey, vassals of the Romans. Their names occur in all wars between Romans and Parthians, when they generally inclined to the Parthian side; *e.g.,* in the wars of Crassus and Trajan. Trajan deposed the dynasty, but Hadrian restored it. The kings generally used Greek inscriptions on their coins, but when they sided with the Parthians, as in the war of Marcus Aurelius and Verus (A.D. 161–165), an Aramaic legend appears instead. Hellenism soon disappeared and the Arabs adopted the language and civilization of the Aramaeans. This development was hastened by the introduction of Christianity, which is said to have been brought here by the apostle Judas, the brother of James, whose tomb was shown in Edessa. In 190 and 201 we hear of Christian churches in Edessa. King Abgar IX (or VIII) (179–214) himself became a Christian and abolished the pagan cults. Caracalla in 216 abolished the kingdom of Osroene (Dio Cass. 77. 12, 14) and Edessa became a Roman colony. The list of the kings of Osroene is preserved in the Syrian chronicle of Dionysius of Tellmahre, which is checked by the coins and the data of the Greek and Roman authors; it has been reconstructed by A. von. Gutschmid, "Untersuchungen über die Geschichte des Königreichs Osroene," in *Mémoires de l'Acad. de St. Pétersbourg,* t. xxxv (1887). Edessa remained Roman till it was taken by Chosroes II in 608; but in 625 Heraclius conquered it again. In 638 it was taken by the Arabs. (ED. M.)

**OSS,** an industrial town in North Brabant, Netherlands. Pop. (1940) 17,467. It is the centre of the Dutch margarine industry.

**OSSA** (mod. *Kissovo, Kissavo*), a mountain (el. *c.* 6,400 ft.) in Larissa, S.E. part of Thessaly, Greece; S. of Olympus, from which it is separated by the valley of Tempe, and N. of Pelion which the Giants are said to have piled on it to scale Olympus.

**OSSETE.** This member of the northern group forms of Iranian speech was spoken in the area north of the Caucasus. It is the survival of a number of Scythian languages formerly current in S. Russia before the Slav onset. It is divided into two divisions, eastern and western. A number of words in Hungarian indicate an ancient association between the languages.

*See* Miller, *Grundriss der Iranische Philologie* Vol. I.

**OSSETIAN AUTONOMOUS AREAS,** two administrative units of Russia. (1) The South Ossetian Area created in 1922 is linked administratively with the Georgian S.S.R. Area 1,429 sq.mi. Pop. (1933) 95,300. (2) The North Ossetian Area created in 1924 is linked administratively with the North Caucasian Area. Area 2,327 sq.mi. Pop. (1939) 328,885.

The Ossetes are descended from the Alans, the strongest and most numerous of the Sarmatian tribes, and their language belongs to the Iranic group of the Aryan tongues. The earliest reference to the Alans is A.D. 35 when, according to Josephus, they occupied the Kuban valley; later they occupied the Don and Dnieper regions, where they joined forces with Germanic tribes in attacks on the Romans. Legend gives the Emperor Maximin a Gothic father and an Alan mother. The Hun invasion swept them from the steppe, but they took refuge in the Caucasus and were probably settled in their present territory in the 5th and 6th centuries. They have been described by some writers as long headed, blue eyed and fair haired, but recent Russian investigators describe them as rather broad headed, with swarthy complexions, dark eyes and hair, and straight noses, their stature being above the average. In the Caucasus they held the grassy passes leading from the sources of the Terek and the Ardon to those of the Rion and the Kura, by which alone horsemen and troops can cross the range in summer, and in the height of their prosperity their flocks whitened the steppe and their vintages were famous. The rude walls and towers of their fortified farms and villages still remain on high and defensible ridges in the mountain fastnesses. Later they formed villages with two storied stone houses, the lower for the cattle and the upper for human habitation, with flat wooden roofs and balconies.

Queen Thamar of Georgia introduced Christianity among them in the 12th century, but later the Kabardians drove them from many of their pastures and Turkish tribes supplanted them in the lower valleys and introduced the Islamic faith within their borders. The Ossetes, however, even in their decline, still held the upper passes, the keys of the Caucasus. The Russian hold on the region began when a small fortress was established at Vladikavkaz in 1784 and the Ossetes were conquered in 1802. Later the famous Georgian military road through the Dariel gorge of the Terek, constructed 1811 to 1864, brought the Ossetes more definitely under Russian rule. For a description of the rich treasures found in the tombs of the Alans, *see* Rostovtseff, M., *Iranians and Greeks in South Russia,* 1922.

Most of the territory of the Ossetes consists of the mountain region of the Caucasus, with snow clad peaks, *e.g.,* the Adai Khokh (15,242 ft.). Numerous streams ultimately join the Terek; in their upper courses they have carved deep valleys. They are of no use for floating timber or for navigation, owing to their rapidity and the numerous falls, but are of great potential value as a source of hydroelectric energy, and a hydroelectric station has recently been built on the Gizeldon. The chief pass is the Mamison, over which goes the Ossetian military road, constructed in 1889. No other good road exists in the whole Ossetian area. A loop from the Black Sea–Caspian railway passes through the north of the territory, with a branch to Alagir and Vladikavkaz. The latter town is the administrative centre for the North Ossetes, but forms a separate administrative division of the North Caucasian Area. Stalinir (formerly Tskinvali), a settlement of 5,809 inhabitants, is the administrative centre of the South Ossetes. The chief range apart from the Central Caucasus, is the Bokovoi Ridge, exceeding a height of 10,000 feet. The average altitude of South Ossetia is 10,000 feet. (*See* CAUCASUS.)

Forest and shrub are general in the region, oak and hardbeam being the prevailing varieties in the north, where timber is exported through Alagir. The forests extend to the upper limit of the limestone gorges, but the crystalline schists are bare of

vegetation. Coniferous forests extend above the oak, hardbeam, ash, maple and lime and alpine meadows with a rich variety of blossoms are found above the tree limit. On the plateau in the north maize gives good harvests and occupies 76% of the sown area; winter wheat, potatoes, fruit, sunflower seed, tobacco and vegetables are also cultivated; the latter find a market in Vladikavkaz, and in the tomato canning factory recently established at Alagir. Milk, meat and cheese, from sheep and goats especially, and from cows in some regions, form the staple food of the herdsmen and shepherds. Small patches of summer wheat, barley, oats and potatoes are grown in sheltered spots among the hills, but frost or early snow often spoils the harvest. Unworked coal, naphtha, iron, manganese, graphite, asbestos, wolfram and arsenic exist; the only mineral at present exploited is lead. South Ossetia is essentially a grazing region, with sheep and goats in the east and cattle in the west. It is thinly peopled in comparison with the north, and its population was further diminished by the disastrous war conditions following the 1917 revolution, when many natives left their homes and went northwards. Conditions in this region are recovering very slowly. Peasant industries include the making of daggers and metal goods, fur caps, leather goods, and small metal wares.

There are two main Ossetian dialects, the Iron and the Digor; the South Ossetians call themselves Tualte and speak a dialect related to the Iron group. Ossetes form about 85% of the population and Russians and Ukrainians about 12%. The literacy rate among this scattered population in a region of poor communications is low and decreases from north to south. Since the Ossetes received cultural autonomy the Latin script has been adopted and some newspapers and books are now printed in Ossete.

School provision is made for less than half the children, mainly for those in the plateau region. The problem of providing education and medical help for the herdsmen and shepherds of the mountain regions is at present unsolved. (R. M. F.)

**OSSETIAN LANGUAGE:** *see* OSSETE.

**OSSETT,** a municipal borough in the Batley and Morley parliamentary division of the West Riding of Yorkshire, England, 2½ mi. W. of Wakefield on the L.M.S.R. Pop. (1938) 14,360. Area 5.2 sq.mi. It lies along a spur of upland about 300 ft. high, which forms part of the Aire-Calder divide. The town is mentioned in Domesday book and it suffered devastation under the Conqueror. In the 17th century, Ossett was visited by plague, but the discovery of medicinal springs on the northeastern side gave to the town a temporary attraction. It is one of the main centres of "shoddy" manufacture, an industry severely depressed in the post-World War I period. Ossett was incorporated in 1890.

**OSSINING,** a village of Westchester county, New York, U.S.A., on the east bank of the Hudson river, 30 m. above New York city; served by the New York Central railroad and river steamers. Pop. (1920) 10,739 (77% native white); 1940 federal census, 15,996. Ossining has a fine site, looking over the Tappan Zee and beyond Croton point to Haverstraw bay (expansions of the Hudson), and is surrounded by wooded rolling country. Two beautiful residential villages (Scarborough and Briarcliff Manor) adjoin it on the south and southeast. It is the seat of several private schools and Sing Sing (state) prison is within the village limits. The manufactures are varied, including porous plasters, pills, brass, wire, medical and aviation instruments, and maps. The site of Ossining (originally part of the Phillipse Manor) was settled about 1700 and the name Sing Sing was taken from the Sin Sinck Indians. The village was incorporated in 1813 and adopted its present name in 1901.

**OSSORY** (*Osraighe*), an ancient kingdom of Ireland, in the south-west of Leinster. Its name is preserved by dioceses of the Church of Ireland and the Roman Catholic Church and its kings maintained their position until 1110.

**OSTADE,** the name of two Dutch painters whose ancestors were settled at Eyndhoven, near the village of Ostade. Early in the 17th century Jan Hendricx, a weaver, moved from Eyndhoven to Haarlem, where he married and founded a large family. The eldest and youngest of his sons became celebrated artists.

1. ADRIAEN VAN OSTADE (1610–1685), the eldest of Jan Hendricx's sons, was born and died at Haarlem. According to Houbraken he was taught by Frans Hals, at that time master of Adrian Brouwer. He was president of the painters' gild at Haarlem, in 1662. A striking picture in the Louvre represents the father of a large family sitting in state with his wife at his side in a handsomely furnished room, surrounded by his son and five daughters, and a young married couple. The number of Ostade's pictures is given by Smith at three hundred and eighty-five, but by Hofstede de Groot (1910) at over 900. At his death the stock of his unsold pieces was over two hundred. His engraved plates were put up to auction, with the pictures, and fifty etched plates—most of them dated 1647–1648—were disposed of in 1686. Two hundred and twenty of his pictures are in public and private collections, of which one hundred and four are signed and dated, while seventeen, though signed, are undated.

Adrian Ostade was the contemporary of David Teniers and Adrian Brouwer. Like them he spent his life in the delineation of the homeliest subjects—tavern scenes, village fairs and country quarters. Between Teniers and Ostade the contrast lies in the different condition of the agricultural classes of Brabant and Holland, and the atmosphere and dwellings that were peculiar to each region. Brabant has more sun, more comfort and a higher type of humanity; Teniers, in consequence, is silvery and sparkling; the people he paints are fair specimens of a well-built race. Holland seems to have suffered much from war; the air is moist and hazy, and the people, as depicted by Ostade, are short, ill-favoured and marked with the stamp of adversity on their features and dress. The key of his harmonies remains for a time in the scale of greys. But his treatment is dry and careful, and he shuns no difficulties of detail, representing cottages inside and out, with the vine leaves covering the poorness of the outer walls, and nothing inside to deck the patchwork of rafters and thatch, or tumbledown chimneys and ladder staircases, that made up the sordid interior of the Dutch rustic of those days.

Before the dispersion of the Gsell collection at Vienna in 1872, it was easy to study the steel-grey harmonies and exaggerated caricature of his early works in the period intervening between 1632 and 1638. There is a picture of a "Countryman having his Tooth Drawn," in the Vienna Gallery, unsigned, and painted about 1632; a "Bagpiper" of 1635 in the Liechtenstein Gallery at Vienna; cottage scenes of 1635 and 1636, in the museums of Karlsruhe, Darmstadt and Dresden; and "Card Players" of 1637 in the Liechtenstein palace at Vienna, which make up for the loss of the Gsell collection. The same style marks most of those pieces. About 1638 or 1640 the influence of Rembrandt changed his style. "The Angels appearing to the Shepherds" in the Brunswick gallery is very much in the style of Rembrandt. In 1642, he painted the beautiful interior at the Louvre, in which a mother tends her child in a cradle at the side of an immense chimney. In 1667, he produced an admirable "Nativity" (collection of Otto Beit, London) which is only surpassed as regards arrangement and colour by Rembrandt's "Carpenter's Family" at the Louvre. He devoted himself to familiar themes, from small single figures, representing smokers or drinkers, to vulgarized allegories of the five senses (Hermitage and Brunswick galleries), half-lengths of fishmongers and bakers and cottage brawls, or scenes of gambling, or itinerant players and quacks, and nine-pin players in the open air. His art is seen in the large series of dated pieces which adorn every European capital, from St. Petersburg to London. Buckingham Palace has a large number. At Amsterdam we have the likeness of a painter, sitting with his back to the spectator, at his easel. The colour-grinder is at work in a corner, a pupil prepares a palette and a black dog sleeps on the ground. A replica of this picture, with the date of 1663, is in the Dresden gallery. The same subject is represented on a picture in the Johnson collection at Philadelphia. In his etching (*Bartsch,* 32) the painter shows himself in profile, at work on a canvas. In the signatures of Ostade, the first two letters are generally interlaced. Up to 1635 Ostade writes himself Ostaden, *e.g.,* in the "Bagpiper" of 1635 in the Liechtenstein collection at Vienna. Later on he uses the long *s* (ſ), and occasionally he signs in capital letters. His pupils are

his own brother Isaac, Cornelis Bega and Cornelis Dusart.

2. ISACK VAN OSTADE (1621–1649) was born in Haarlem, and began his studies under Adriaen. At an early period he felt the influence of Rembrandt, and this is apparent in a "Slaughtered Pig" of 1639, in the gallery of Augsburg. A specimen of Isaac's work when under the influence of his brother may be seen in the "Laughing Boor with a Pot of Beer" (1643), in the museum of Amsterdam. The low price he received for such subjects—in which he could only hope to remain a satellite of Adriaen—led him to prefer landscapes in the fashion of Esaias Van de Velde and Salomon Ruisdael. He died young and was buried at Haarlem on Oct. 16, 1649, having painted about 340 pictures. (*See* H. de Groot, 1910.)

The first manifestation of Isack's surrender of Adriaen's style is apparent in 1644 when the skating and sledging scenes were executed which are in the Lacaze collection and the galleries of the Hermitage, Antwerp and Lille. Three of these examples bear the artist's name, spelled Isack van Ostade, and the dates of 1644 and 1645. The roadside inns, with halts of travellers, form a compact series from 1646 to 1649. In this, the last form of his art, Isaac has very distinct peculiarities. The air which pervades his composition is warm and sunny, yet mellow and hazy, as if the sky were veiled with a vapour coloured by moor smoke. The trees are rubbings of umber, in which the prominent foliage is tipped with touches hardened in a liquid state by amber varnish mediums. It is in winter scenes that Isack displays the best qualities. The absence of foliage and crisp atmosphere, preclude the use of the brown tinge, and leave the painter no choice but to ring the changes on opal tints of great variety, upon which the figures emerge with masterly effect on the light background upon which they are thrown. Amongst the roadside inns which will best repay attention may be noted those of Buckingham Palace, the National Gallery, the Wallace collections in England, and those of the Louvre, Berlin, Hermitage and Rotterdam museums and the Rothschild collection at Vienna on the Continent. The finest of the ice scenes is the famous one at the Louvre.

For paintings and etchings see *Les Frères Ostade,* by Marguerite van de Wiele (Paris, 1893). For his etchings see *L'Oeuvre d'Ostade, ou description des eaux-fortes de ce maître,* etc., by Auguste d'Orange (1860); and *Catalogue raisonné de toutes les estampes qui forment l'oeuvre gravé d'Adrian van Ostade,* by L. E. Faucheux (Paris, 1862); Hofstede de Groot, *Catalogue of Dutch Painters* (1910).

(J. A. C.; X.)

**OSTASHKOV,** a town of Russia in the province of Tver, in 57° 10′ N., 33° 5′ E., on the south shore of Lake Seliger, near the outlet of its waters into a stream that joins the Upper Volga and was at one time thought to be the source of that river. It is in a damp and marshy situation, but became a centre for pilgrims visiting the Stolbenski monastery on an island in the lake. Later the railway passed through the town, and it became the terminus of a telegraph line. Its population (15,660) is mainly occupied in tanning and the making of leather goods, in iron founding and brick making and in fishing on the lake.

**OSTEND** (Flemish *Oostende*), West Flanders, Belgium. Pop. (est. 1938) 50,263. It is the most fashionable seaside resort and the third port of the kingdom. In the middle ages it was strongly fortified and underwent several sieges; notably in 1601–04, when it only surrendered by order of the states to Spinola. The creation in 1722 of the Compagnie de Commerce des Indes seemed to assure a hopeful future to the port of Ostend. But the success obtained caused the envy of neighbouring nations, who forced Emperor Charles VI to revoke the grant made. Under Joseph II Ostend enjoyed another period of commercial prosperity. In the 20th century a new town was created. The digue or parade, constructed of solid granite, extends for over 3 mi. along the shore in a southerly direction from the long jetty which protects the entrance to the port. A casino and the royal châlet are prominent on the sea front. In the rear of the town is a fine park to which a racecourse has been added. The modern docks accommodate ships of large tonnage. Apart from these docks Ostend has a very considerable passenger and provision traffic with England, and is the headquarters of the Belgian fishing fleet, estimated to employ 400 boats and 1,600 men and boys. Ostend supplies sea-fish and is renowned for its oyster and lobster beds. It has a school of navigation and a fishery training school. There is a daily service from Ostend to Tilbury carrying food produce for England. Ostend is in direct railway communication with Brussels, Cologne and Berlin. It is also the starting point of several light railways along the coast and to the southern towns of Flanders.

Ostend was occupied by the Germans for four years during World War I, and was at first, until it was rendered untenable by aerial bombardments, a base for destroyers and submarines. In May 1918 the entrance channel to the harbour and the canal to Ghent and Bruges were blocked to all craft except the smallest submarines by the sinking of the "Vindictive." After the war she was raised and broken up. Parts of the "Vindictive," "Intrepid" and "Thetis" were made into a memorial on the digue.

The city was occupied by the Germans again in World War II.

**OSTEND COMPANY.** The success of the Dutch, English and French East India Companies led the merchants and shipowners of Ostend to desire to establish direct commercial relations with the Indies. A private company was accordingly formed in 1717 and some ships sent to the East. The Emperor Charles VI. encouraged his subjects to raise subscriptions for the new enterprise, but did not grant a charter or letters patent. Some success attended these early efforts, but the jealousy of the neighbouring nations was shown by the seizure of an Ostend merchantman with its rich cargo by the Dutch in 1719 off the coast of Africa, and of another by the English near Madagascar.

The Ostenders, however, despite these losses, persevered in their project. The opposition of the Dutch made Charles VI. hesitate for some time to grant their requests, but on Dec 19, 1722, letters patent were granted by which the Company of Ostend received for the period of 30 years the privilege of trading in the East and West Indies and along the coasts of Africa on this side and on that of the Cape of Good Hope. Six directors were nominated by the emperor, and subscriptions to the company flowed in so rapidly that the shares were at the end of Aug., 1723 at 12 to 15% premium. Two factories were established, one at Coblom on the coast of Coromandel near Madras, the other at Bankibazar on the Ganges. At the outset the prospects of the company appeared to be most encouraging, but its promoters had not reckoned with the jealousy and hostility of the Dutch and English. The Dutch appealed to the treaty of Westphalia (1648) by which the king of Spain had prohibited the inhabitants of the southern Netherlands from trading with the Spanish colonies. The transference of the southern Netherlands to Austria by the peace of Utrecht (1713) did not, said the Dutch, remove this disability. The Spanish government, however, after some hesitation concluded a treaty of commerce with Austria and recognized the Company of Ostend. The reply to this was a defensive league concluded at Herrenhausen in 1725 by England, the United Provinces and Prussia. Confronted with such formidable opposition the court of Vienna judged it best to yield. By the terms of a treaty signed at Paris on May 31, 1727 the emperor suspended the charter of the company for seven years, and the powers in return guaranteed the Pragmatic Sanction. The company, after nominally existing for a short time in this state of suspended animation, became extinct. (G. E.)

**OSTEND MANIFESTO,** a document issued (Oct. 18, 1854) by James Buchanan, J. Y. Mason and Pierre Soulé, U.S. ministers respectively to Great Britain, France and Spain, who had met by President Pierce's orders at Ostend, Belgium, to discuss and adopt measures for concerted diplomatic action at Madrid on the subject of alleged injuries by Spain to American commerce with Cuba. The manifesto recommended that "the United States ought, if practicable, to purchase Cuba as soon as possible," and, if Spain should refuse to sell, then "by every law, human and divine, we shall be justified in wresting it from Spain if we have the power." William L. Marcy, secretary of State, promptly disavowed the document.

**OSTEOLOGY,** that part of the science of anatomy which has for its subject the bony framework of the body (*see* BONE,

SKELETON, ANATOMY, etc.).

**OSTEOPATHY.** According to its advocates, osteopathy is a system of health and healing founded on the theory that the living body is a vital machine which will make the remedies necessary to protect itself against disease so long as it is in correct mechanical adjustment. In addition, osteopathy insists upon a wholesome physical and mental environment, good food, proper exercise and rest, and pure air and water.

Structural derangement is considered as the most important underlying disease cause. What is called a "lesion" may be in bony, muscular, ligamentous, fascial or other tissue. For example in the bony "lesion," a joint usually lacks free movement. This stiffness may come from injury, strain, inflammation, infection, reflexes or other causes. The resultant lack of normal movement in surrounding tissues allows blood and lymph to stagnate, causing acidosis, irritating nerves which pass that way, and through them affecting the functions of various organs including blood vessels. The oedema and swelling and the contraction of muscles may also affect, by pressure or otherwise, the nerves, arteries and veins. Not only is there said to be a resultant interference with the body's ability to make its own serums and antitoxins to fight infectious disease processes, but "lesions" also produce positive suffering and disease in the form of neuritis and neuralgia, lumbago and sciatica, foot troubles, and disturbances of the special senses and of the functions of the various organs including endocrine and other glands.

Osteopathic diagnosis comprises physical examination of the entire body, its distinguishing feature being an intensive search for and study of the lesions described above. There is physical, chemical, and microscopic study of secretions and excretions, and if necessary of tissues, and the use of the x-ray, basal metabolism apparatus and other scientifically accepted appliances.

Osteopathic therapy is based on the specific manipulative removal of the "lesion" already discussed. It includes also correction of hygienic, dietetic, environmental and psychic conditions; surgery for fractures and lacerations, and the removal of abnormal growths or organs so diseased as to be dangerous to life; obstetrics and the administration of antidotes for poisons.

The American School of Osteopathy was organized at Kirksville, Mo., in 1892. In 1937 there were other recognized colleges at Los Angeles, Kansas City, Des Moines, Chicago and Philadelphia. At the beginning, when the standards of medical education were low, the length of the course was two years. By about 1916, all the colleges required a high school education followed by four standard college years in osteopathy.

Osteopathy was promulgated by Dr. A. T. Still (*q.v.*). There are (1937) about 9,100 practitioners. What is now the American Osteopathic association was organized in 1897. Its headquarters are in Chicago. It publishes a *Journal* and four other monthly periodicals. There are State, provincial and local societies, British, Canadian, New England, Eastern, Middle-Atlantic and Western associations, the Osteopathic Women's National association, and several societies of specialists. Osteopathy is regulated by law throughout the United States and most of Canada. In a majority of States examination for license to practice is in the hands of examining boards composed of osteopathic physicians. In several States, there is no legal distinction between "doctor of osteopathy" and "doctor of medicine," while in others osteopathic practice is somewhat restricted.

Many osteopathic physicians have served and are serving on State and local health boards.

In Great Britain, though osteopathy is not recognized or regulated by law, the British Osteopathic Association admits to membership graduates of recognised osteopathic colleges.

**OSTERMAN, ANDREI IVANOVICH,** COUNT (1686–1747), Russian statesman, born at Bochum, Westphalia, became secretary to vice-admiral Cornelis Kruse, who had a standing commission from Peter the Great to pick up promising young men, and in 1767 entered the tsar's service. He assisted the vice-chancellor Shafirov during the negotiations which terminated in the peace of the Pruth (1711). Osterman, together with General Bruce, represented Russia at the Åland peace congress of 1718. Shrewdly guessing that Sweden was at exhaustion point, and that Görtz, the Swedish plenipotentiary, was acting *ultra vires*, he advised Peter to put additional pressure on Sweden to force a peace. In 1721 Osterman concluded the peace of Nystad with Sweden, and was created a baron for his services. In 1723 he was made vice-president of the ministry of foreign affairs. Peter consulted him in domestic affairs, and he introduced many administrative novelties, *e.g.*, "the table of degrees" and the reconstruction of the college of foreign affairs on more modern lines. During the reign of Catherine I. (1725–1727) the conduct of foreign affairs was left entirely in Osterman's hands, and he held also the posts of minister of commerce and postmaster-general. On the accession of Peter II. Osterman was appointed governor to the young emperor, and on his death (1730) he refused to participate in the attempt of Golitsuin and the Dolgorukis to convert Russia into a limited constitutional monarchy. He held aloof till Anne was established on the throne as autocrat.

His unique knowledge of home and foreign affairs made him indispensable to the empress. It was at his suggestion that the cabinet system was introduced into Russia. All the useful reforms introduced between 1730 and 1740 are to be attributed to his initiative. He improved the state of trade and materially raised the credit of Russia. The successful conclusions of the War of the Polish Succession (1733–1735) and of the war with Turkey (1736–1739) were entirely due to his diplomacy. During the brief regency of Anna Leopoldovna (October 1740–December 1741) Osterman stood at the height of his power, and the French ambassador, La Chetardie, reported to his court that "it is not too much to say that he is tsar of all Russia." Osterman's foreign policy was based upon the Austrian alliance. He had, therefore, guaranteed the Pragmatic Sanction with the deliberate intention of defending it. Hence the determination of France to remove him at any cost. Indeed it was only the Russian alliance which, in 1741, seemed to stand between Maria Theresa and ruin.

The most obvious method of rendering the Russian alliance unserviceable to the queen of Hungary was by implicating Russia in hostilities with Sweden. A rupture was brought about in 1741 by French influence and French money, but the Swedes were defeated. It now became evident to La Chetardie that only a revolution would overthrow Osterman, and this he proposed to promote by elevating to the throne the tsarevna Elizabeth, who hated the vice-chancellor because, though he owed everything to her father, he had systematically neglected her. Osterman was therefore the first and the most illustrious victim of the *coup d'état* of Dec. 6, 1741. He was condemned but, reprieved on the scaffold, was banished to Siberia, where he died.

(R. N. B.; X.)

**OSTERODE,** a town in East Prussia, Germany, 75 mi. N.E. of Thorn, on Lake Drewenz, at the junction of lines to Memel, Elbing and Neidenburg. Pop. (1939) 19,399. It has a castle built by the Teutonic knights in 1270, to whom the town owes its birth. Its chief manufactures are machinery, beer, furniture and bricks; it has several saw-mills. Osterode trades in grain and timber.

**OSTERODE,** a town in the Prussian province of Hanover, at the south foot of the Harz mountains, 34 m. N.W. of Nordhausen by rail. Pop. (1933) 8,743. The church of St. Aegidius was founded in 724 and rebuilt after a fire in 1578. The dukes of Brunswick-Grubenhagen, made Osterode their residence from

1361 to 1452. There are manufactures of woollen goods, cigars, casks and leather, and iron foundries, tanneries, dyeworks and gypsum quarries. In recent years Osterode has become celebrated as a health resort.

**OSTIA,** an ancient town and harbour of Latium, Italy, at the mouth of the river Tiber, on its left bank. It lies 14 m. S.W. from Rome by the Via Ostiensis, a road of very ancient origin followed by the modern road which preserves some traces of the old pavement and remains of several ancient bridges, until the construction of a new motor road to Ostia Mare. It was said to be the first colony ever founded by Rome—according to the Romans themselves, by Ancus Martius—and took its name from its position at the mouth (*ostium*) of the river. Excavations have, however, brought to light nothing earlier than the 4th century B.C., the date of a small rectangular fort, measuring 200 by 125 yd., built of hewn blocks of volcanic stone, which may have been in Virgil's mind when he wrote his description of the fortified camp which Aeneas founded at the Tiber mouth. It was out of this fort that the city developed the establishment of the salt-marshes (*salinae—see* SALARIA, VIA) which only ceased to exist in 1875. We learn much as to its cults, magistrates and trade guilds (for the last *see* J. P. Waltzing, *Les Corporations professionelles* [Brussels and Liège]) from the large number of inscriptions found. The city was divided into five regions. Vulcan was the most important deity worshipped at Ostia, and the priesthood of Vulcan was held sometimes by Roman senators. The Dioscuri, too, as patrons of mariners, were held in honour. Later we find the worship of Isis and of Cybele, the latter being especially flourishing, with large corporations of *dendrophori* (priests who carried branches of trees in procession) and *canephori* (basket-carriers); the worship of Mithras, too, had a large number of followers. There was a temple of Serapis at Portus. At Portus a considerable number of Jewish inscriptions in Greek have come to light. In the 4th century Ostia began to be abandoned while the importance of Portus increased.

Until Trajan formed the port of Centumcellae (Civitavecchia) Ostia was the best harbour along the low sandy coast of central Italy between Monte Argentario and Monte Circeo. It is mentioned in the history of the year 354 B.C. as a trading port, and became important as a naval harbour during the Punic Wars. Its commerce increased with the growth of Rome, and this, and the decay of agriculture in Italy, which obliged the capital to rely almost entirely on imported corn (which was, from 267 B.C. onwards, under the charge of a special quaestor stationed at Ostia), rendered the possession of Ostia the key to the situation on more than one occasion (87 B.C., A.D. 409 and 537). Ostia, however, was by no means an ideal harbour; the mouth of the Tiber is exposed to the south-west wind, which often did damage in the harbour itself; in A.D. 62 no less than 200 ships with their cargoes were sunk, and there was an important guild of divers (*urinatores*) at Ostia. The difficulties of the harbour were increased by the continued silting up, produced by the enormous amount of solid material brought down by the river. Even in Strabo's time the harbour of Ostia had become dangerous.

Caesar had projected remedial measures, but it was only under Claudius that the problem was approached. He constructed a large new harbour on the right bank, $2\frac{1}{2}$ m. N. of Ostia, with an area of 170 ac. enclosed by two curving moles, with an artificial island, supporting a lofty lighthouse, in the centre of the space between them. This was connected with the Tiber by an artificial channel, and by this work Claudius, according to his inscriptions of A.D. 46, freed the city of Rome from the danger of inundation. The harbour was named by Nero Portus Augusti.

Trajan found himself obliged in A.D. 103, owing to the silting up of the Claudian harbour and the increase of trade, to construct another port further inland—a hexagonal basin enclosing an area of 97 ac., with enormous warehouses and docks attached, communicating with the harbour of Claudius and with the Tiber by means of the channel already constructed by Claudius, which was prolonged so as also to give direct access to the sea. This became blocked in the middle ages, but was reopened by Paul V. in 1612, forming the right arm of the Tiber, by which navigation is carried on at the present day, and is known as the Fossa Trajana. The island between the two arms Procopius calls Insula Sacra (it is still named Isola Sacra).

Ostia thus lost a considerable amount of its trade, but its importance still continued to be great. The 2nd and 3rd centuries, indeed, are the high-water mark of its prosperity: and it still possessed a mint in the 4th century A.D. The first bishop of Ostia of whom we have knowledge dates from A.D. 313, and the first bishop of Portus from about the same time. Both sees exist; the former is held by the dean of the College of Cardinals.

During the Gothic wars, trade was confined to Portus and the ravages of pirates led to the gradual abandonment of Ostia. Gregory IV. constructed in 830 a fortified enceinte, called Gregoriopolis, in the eastern portion of the ancient city, and the Saracens were signally defeated here under Leo IV. (847–856). The battle is represented in Giulio Romano's fresco from Raphael's design in the Stanza dell' Incendio in the Vatican.

In the middle ages Ostia became a quarry for the cathedral of Orvieto, etc., some of its marbles being conveyed by the Pisans as far as Sardinia. Later it regained something of its importance owing to the silting up of the right arm of the Tiber. In 1483–1486 Giuliano della Rovere (nephew of Pope Sixtus IV., and afterwards himself Pope Julius II.) caused the castle to be erected by Baccio Pontelli, a little to the east of the ancient city. It is built of brick and is one of the finest specimens of Renaissance fortification, and exemplifies especially the transition from the old girdle wall to the system of bastions: it still has round corner towers, not polygonal bastions. An agricultural colony, founded after 1875, and consisting mainly of cultivators from the neighbourhood of Ravenna, has produced a great change for the better in the condition of the place. The modern village is part of the commune of Rome. The marshes have been drained, and a pumping station erected near Castel Fusano. An electric railway has been constructed from Rome to Ostia and thence to the sea-bathing resort of Ostia Mare.

Excavations on the site of Ostia were only begun towards the close of the 18th century, and no systematic work was done until 1854, when under Pius IX. a considerable amount was

Course of Tiber prior to flood, 1557

done (the objects are now in the Lateran museum). The Italian Government laid bare many of the more important buildings in 1880–89: and resumed work in 1907. Owing to the fact that the site is largely covered with sand and to the absence of any later alterations, the preservation of the buildings excavated is very good, and Ostia is, with the exception of Pompeii, the best example in Italy of a town of the Roman period, while its houses, the massive concrete walls of which were faced with brick and reticulate work (both as a rule left unplastered on the outside) rose to a height of three or four storeys and had balconies and

numerous windows. They were frequently planned like modern apartment houses, and show us what the ancient Roman *insula* or block was. On the east the site is approached by the ancient road from Rome, flanked by tombs. It entered the enceinte of the 1st century B.C. (*see* plan) by a gate still preserved. This wall enclosed an irregular area far larger than that of the 4th century fort, extending down to the ancient coast line and the continuation of the road forms the main street of the town. A considerable part of it had porticoes on each side. On the right (N.) are some small well-preserved thermae, and the barracks of the firemen (*vigiles*), a special cohort of whom was stationed here. On one side of the central courtyard of the latter building is a chapel with inscribed pedestals for imperial statues (2nd and 3rd century A.D.) and a well-preserved black and white mosaic representing a sacrifice.

To the south-west is the theatre, an area 265 ft. square surrounded by colonnades, in which were placed the offices of the various *collegia* or guilds of boatmen, raftmen and others, which had a special importance at Ostia; the names of the guilds may still be read in inscriptions in the mosaic pavements of the chambers. In the centre of the area are the substructions of a temple, and on the south-east side are the remains of the theatre, built in the early imperial period, restored by Septimius Severus in 196–197 and again in the 4th or 5th century. To the south-west of the theatre are the remains of four small temples, one dedicated to Venus, and a well-preserved Mithraeum, with mosaics representing the seven planets, etc. To the south-west again is the conspicuous brick cella of a lofty temple, on arched substructures, hitherto supposed to be that of Vulcan, but more probably the Capitolium or temple of Jupiter, Juno and Minerva, with a threshhold block of *africano* (Euboean) marble over 15 ft. long; from it a street over 20 ft. wide leads north-west to the river. It is flanked on each side by well-preserved warehouses, another group of which, surrounding a large court, lies to the south-west. Further still are the well-preserved Horrea Epaphroditiana et Epagathiana, a large private warehouse. Hence an ancient road, leading between warehouses (into which the Tiber is encroaching), in one room of which a number of well-preserved large jars may be seen embedded in the floor, runs close to the river to a large private house with thermae, in which fine mosaics were found; it (groundlessly) bears the name of "imperial palace." Farther to the south-west are remains of other warehouses, and (possibly) of the docks—long narrow chambers, which may have served to contain ships. The mediaeval Torre Bocacciana marked approximately the mouth of the river in Roman times.

The south-eastern portion of the city has been excavated only partially. Opposite the Capitolium is the Forum, with remains of a temple of Rome and Augustus, a basilica (much destroyed by mediaeval plunderers), the curia, etc. To the south-west of this are the remains of the temple of Cybele, with a portico. This lay close to the commencement of the Via Severiana (*see* SEVERIANA, VIA), and the line of tombs which flanked it soon begins. Farther south-east, a line of sand dunes, covering the ruins of ancient villas, marks the coast line of the Roman period.

(T. A.)

**OSTIAKS** or **OSTYAKS,** a tribe who inhabit the basin of the Ob in western Siberia. The so-called Ostyaks of the Yenisei speak an entirely different language. The trans-Uralian Ostiaks and Samoyedes are probably identical with the Yugra of the Russian annals. During the Russian conquest their abodes extended much farther south than now, 41 of their fortified places having been destroyed by the Cossacks in 1501, in the region of Obdorsk alone. Remains of these "towns" are still to be seen at the Kunovat river, on the Ob 20 m. below Obdorsk and elsewhere. Those on the Irtysh are mostly settled, and have adopted the manner of life of Russians and Tatars. Those on the Ob are mostly nomads, and own large herds of reindeer. The Ob Ostiaks are russified to a great extent. They live almost exclusively by fishing, buying from Russian merchants corn for bread.

The Ostiaks call themselves As-yakh (people of the Ob), and it is supposed that their present designation is a corruption of this name. By language they belong with the Voguls to the East Ugrian branch of the Ugrian division of the Ugro-Finnish section of the Ural-Altaic languages. Three or four leading dialects can be distinguished.

The Ostiaks are middle-sized, or short. The skull is roundish, mostly of moderate size and height. The hair is dark and soft for the most part, fair and reddish individuals being rare; the eyes are dark, generally narrow; the nose is flat and broad; the mouth is large and with thick lips; the beard is scanty. Mongoloid traits are more strongly pronounced in the women than in the men. The purest type is found among the fishers on the Ob, the reindeer-breeders of the tundra being largely intermixed with Samoyedes. They are very skilful in carving wood and bone, tanning (with egg-yolk and brains), preparation of implements from birch-bark, etc. Some of their carved or decorated bark implements show considerable artistic skill. Christianity has made some progress among them, but their ancient pagan observances are still retained.

For customs, religion, etc., see *Journal de la Société Finno-Ougrienne,* particularly papers by Sirelius and Karjalainen, and the papers by Munkácsi, Gennep, Fuchs and others in the *Revue orientale pour les études Ouralo-Altaïques;* Patkanov, *Die Irtysch-Ostiaken und ihre Volkspoesie* (1900); Patkanov, *Irtirsch-Ostjaken und ihre Volkspoesie* (1897–1900); Papay, *Sammlung ostjakischer Volksdichtungen* (1906); M. Czaplicka, *Aboriginal Siberia* (1914).

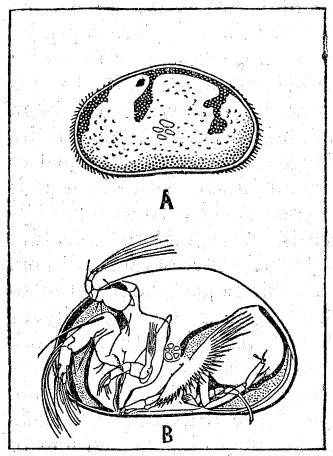
**OSTRACISM,** a political device instituted as a constitutional safeguard for the Athenian democracy. Its effect was to remove from Athens for a period of ten years any person who threatened the harmony and tranquillity of the body politic. In the sixth prytany (*see* PRYTANEUM) of each year the representatives of the Boulē asked the Ecclesia whether it was for the welfare of the state that ostracism should take place. If the answer was in the affirmative, a day was fixed for the voting in the eighth prytany. No names were mentioned, but it is clear that two or three names at the most could have been under consideration. The people met, not as usual in the Pnyx, but in the Agora, in the presence of the archons, and recorded their votes by placing in urns small fragments of pottery (*ostraka*) on which they wrote the name of the person whom they wished to banish. Ostracism did not take effect unless ten thousand votes in all were recorded. The ostracised person was compelled to leave Athens for ten years, but he was not regarded as a traitor or criminal. When he returned, he resumed possession of his property and his civic status was unimpaired. The adverse vote simply implied that his power was so great as to be injurious to the state. Ostracism must therefore be carefully distinguished from *exile* in the Roman sense, which involved loss of property and status, and was for an indefinite period (*i.e.,* generally for life). At the same time it was strictly unjust to the victim, and a heavy punishment to a cultured citizen for whom Athens contained all that made life worth living. Its political importance really was that it transferred the protection of the constitution from the Areopagus to the Ecclesia. It was later replaced by the *Graphē Paranomōn.*

The object was primarily to get rid of the Peisistratid faction without perpetual recourse to armed resistance. Aristotle's *Constitution of Athens* (22) gives a list of ostracized persons, the first of whom was a certain Hipparchus of the Peisistratid family (488 B.C.). This, however, may conceivably be simply the list of those recalled from ostracism at the time of Xerxes' invasion, all of whom must have been ostracized less than ten years before 481 (*i.e.,* since Marathon). With the end of the Persian Wars, the original object of ostracism was removed, but it continued in use for forty years and was revived in 417 B.C. It then became a mere party weapon, and the farcical result of its use in 417 in the case of Hyperbolus led to its abolition. Such a device inevitably lent itself to abuse (*see* Aristotle, *Pol.* 38, 1284 b. 22).

BIBLIOGRAPHY.—G. Gilbert, *Constitutional Antiquities* (Eng. trans., 1895); A. H. J. Greenidge, *Greek Constitutional Antiquities* (1896); L. Whibley, *Companion to Greek Studies* (1923); histories of Greece in general, Grote.

**OSTRACODA,** a sub-class of the Crustacea (*q.v.*) comprising minute forms found in fresh water and in the sea and distinguished by having the body and limbs completely enclosed in a bivalve shell. They are remarkable for having a smaller num-

ber of appendages than any other Crustacea, there being not more than four pairs and sometimes only two pairs of limbs behind the mandibles. The antennules and antennae are used for swimming or creeping. The mandibles have a large palp, often biramous and sometimes leg-like. The remaining limbs are very varied in form but some of them are usually leg-like and used in locomotion.



FROM (A) SARS, "CRUSTACEA OF NORWAY," AND FROM (B) THE "ZOOLOGICAL JOURNAL"

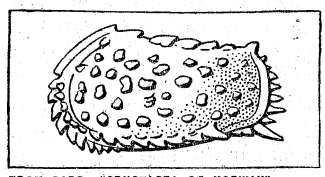
**FIG. 1.—FRESH-WATER OSTRACOD** (PIONOCYPRIS VIDUA) ENLARGED

A. External appearance. B. Appendages after removal of left valve shell; left, Antennule and antenna; center, mouth-parts, and behind them to the right, two leg-like appendages

The breeding habits of the ostracods present several features of interest. Parthenogenesis is common, at least among the freshwater species, in many of which males are rarely seen; while in some species they have not yet been discovered. A colony of a species of *Cypris* has been kept in an aquarium for more than 30 years and during the whole of that time no males made their appearance, the colony reproducing exclusively by parthenogenesis. In some *Ostracoda* the thread-like spermatozoa are not only relatively but absolutely larger than those of any other animals. In one species which, when adult, is no more than ·6 millimetres in length the spermatozoa are from 5 to 7 millimetres long.

Most species live on or near the bottom, creeping among weeds or burrowing in mud, but some marine species are planktonic. One of the latter, *Gigantocypris*, is the largest member of the group, reaching a length of 23 millimetres, but most species are much smaller and some do not exceed half a millimetre in length.

Numerous fossil *Ostracoda* have been described from all geological formations from the oldest to the most recent, but the affinities of many of them are obscure.



FROM SARS, "CRUSTACEA OF NORWAY"

**FIG. 2.—MARINE OSTRACOD** (CYTHEREIS MUCRONATA) MUCH ENLARGED, SHOWING STRONGLY SCULPTURED SHELL

The recent *Ostracoda* are generally grouped in two orders. The *Myodocopa* are exclusively marine and can usually be recognized by the presence of a notch in the margin of the shell near the anterior end. They generally have paired compound eyes and a heart. The *Podocopa* include both marine and freshwater species. There is no notch in the shell, no paired eyes and no heart. (W. T. C.)

**OSTRACODERMS,** a name given collectively to a number of fish-like vertebrate animals found fossil in the Silurian and Devonian formations of Europe and North America, in most of which the body was protected by a bony armour. The recent researches of Kiaer and Stensio have established that the Pteraspida, Anaspida and Cephalaspida are related to the Cyclostomata (*q.v.*), but that the Asterolepida (*Pterichthys*) are akin to the Anthrodira, which have been shown to be armoured Selachians (*q.v.*). They are small animals, some only a few centimetres long.

**OSTRAU:** *see* MORAVSKÁ OSTRAVA and SLEZSKÁ OSTRAVA.

**OSTRICH,** the largest living bird; the male may be nearly 8 ft. high, and weigh 300 lb. The ostrich forms the type of the subclass Ratitae (*q.v.*), characterized by the absence of a keel on the breast-bone (*see* ORNITHOLOGY). The genus *Struthio* is unique in possessing only two toes, thus distinguishing it from *Rhea* (*q.v.*), the South American ostrich, which has three toes.

The ostrich, in a wild state, is much less abundant now than formerly. It inhabits sandy plains and open country in Arabia and Africa, the latter more abundantly. It occurs in small troops of five or six, of which one is a cock and the rest hens. At other times it will form mixed herds with zebras and various antelopes. Extremely fleet of foot, when brought to bay the ostrich uses its strong legs as weapons with great effect. Several hens combine to lay their eggs in one nest, and on these the cock sits by night while the females relieve one another by day, though this is more to guard the eggs from beasts of prey than to incubate them, the heat of the sun sufficing for that. The parents display great solicitude for their young. The great value of ostrich feathers, combined with the growing scarcity of the birds themselves, has led to the establishment of ostrich farms, where the birds are kept and deprived of their plumes at regular intervals. Ostrich farming is carried on in Cape Colony, Egypt, Algeria, the French Riviera, southern U.S. and elsewhere. There appear to be four existing species: *S. camlus* of North Africa and Arabia, and *S. australis* of South Africa being the best known.

OSTRICH (STRUTHIO CAMELUS), THE LARGEST OF LIVING BIRDS

**OSTROG,** a town of Poland, in the province of Volhynia, on the Vilya river. It is an episcopal see of the Orthodox Greek Church, and in the 16th century had a classical academy, converted later into a Jesuit college. Here was made and printed in 1581 the first translation of the Bible into old Slav. In the town is a brotherhood of Cyril and Methodius, which maintains schools of its own. Industries include tanning, potteries, oil-works, soap, candle and tobacco factories. After being plundered by the Cossack chieftain Ghmielnicki in 1648, and later conquered by the Russians, the town fell into decay. Polish after 1918, it was taken by the Russians in 1939 and the Germans in 1941.

**OSTROGOTHS** or **EAST GOTHS,** one of the two main branches into which the Goths were divided, the other being the Visigoths, or West Goths. *See* GOTHS.

**OSTROVSKY, ALEXANDER NIKOLAEVICH** (1823–1886), Russian dramatic author, was born on April 12, 1823 in Moscow, where his father was an official of the senate. He studied law in the university of that city, which he quitted without having submitted to the final examination. He was then employed as a clerk in the office of the "Court of Conscience," and subsequently in that of the Commercial Court at Moscow. Among his early comedies are *Byednaya Nivesta* ("The Poor Bride"), *Byednost ne Porok* ("Poverty not a Vice"), and *Ne v'svoi sani ne sadis* (literally "Don't put yourself in another's sledge"). Of this last Nicholas I. said, "it was not a play, but a lesson." The Moscow merchants are strikingly portrayed in *Groza* (1860, Eng. trans. *The Storm,* by C. Garnett, 1898) the most famous of all his plays, and *Svoyi lyudi sotchtyomsya* ("Between near relatives no accounts are needed") (1850) which was originally called "The Bankrupt." *The Bankrupt* was prohibited for ten years, until the accession of Alexander II., and Ostrovsky was dismissed from the government service and placed under the supervision of the police. The Liberal tendencies of the new reign, however, soon brought relief; Ostrovsky was one of several well-known literary men who were sent into the provinces to report on the condition of the people. Ostrovsky's field of inquiry lay along the upper Volga. This mission inspired several historical dramas, such as *Kuzma Zakharich Minin Soukhorouk, Vassilisa Melentieva* and others. Four of his *Plays* have been translated into English by G. R. Noyes (1917). Ostrovsky enjoyed the patronage of Alexander III., and received a pension of 3,000 roubles a year. With the help of Moscow capitalists he established in that city a model theatre and school of dramatic art, of which he became the first director. He also founded the Society of Russian Dramatic Art and Opera

Composers. He died on June 24, 1886.

**OSTUNI,** a picturesque walled city of Apulia, Italy, province of Brindisi, 23 mi. N.W. of Brindisi. Pop. (1936) 21,826 (town); 28,247 (commune). It has a 15th century cathedral.

**OSTWALD, WILHELM** (1853–1932), German chemist, was born in Riga Sept. 2, 1853, and educated at the University of Dorpat. In 1882 he became a professor in Riga, and five years later was appointed professor of physical chemistry in the University of Leipzig, where he was later director of the Physico-chemical Institute. In 1906 he resigned his university appointments and subsequently lived in retirement in Saxony. Ostwald may be regarded as one of the pioneers of modern physical chemistry and with van't Hoff (*q.v.*) he founded the important *Zeitschrift für physikalische Chemie.* His own contributions to the science have been mainly in the fields of electrochemistry and solutions. He applied the law of mass action to the equilibrium resulting from electrolytic dissociation and obtained in this way the affinity constants of acids and bases. By means of these constants, and by the use of other methods which he developed, he was able to compare the strengths of these reagents. Ostwald made some experiments on the viscosity of solutions and devised the viscometer known by his name. On the technical side he will be chiefly remembered for his discovery in 1900 of a method of oxidizing ammonia to form oxides of nitrogen; a mixture of air and ammonia being passed over a platinum catalyst. By means of this process and by later developments in connection with it, Germany was enabled to continue the manufacture of explosives during the World War after the Allied blockade had been enforced; the method is being used in various countries, under the name of the Ostwald-Brauer process, for the manufacture of nitric acid from ammonia. In 1909 Ostwald was awarded the Nobel Prize for chemistry. His published works include *Lehrbuch der allgemeinen Chemie* (2nd ed. 1884–87), *Grundlinien der anorganischen Chemie* (5th ed. 1922) and *Die wissenschaftlichen Grundlagen der analytischen Chemie* (1894) which have been translated into English. Ostwald died in 1932.

**OSUNA,** a town of southern Spain, in the province of Seville; 57 mi. by rail E.S.E. of Seville. Pop. (1940) 19,552 (mun., 24,083). Osuna is built on a hill, overlooking the fertile plain watered by the Salado, a sub-tributary of the Guadalquivir. Osuna, the Urso of Hirtius, famous in the 1st century B.C. for its long resistance to the troops of Caesar, and its fidelity to the Pompeians, was subsequently called by the Romans Orsona and Gemina Urbanorum, the last name being due, it is said, to the presence of two urban legions here. Osuna was taken from the Moors in 1239, and given by Alphonso X to the knights of Calatrava in 1264. Don Pedro Giron appropriated it to himself in 1445. One of his descendants, Don Pedro Tellez, was the first holder of the title duke of Osuna, conferred on him by Philip II in 1562. The University of Osuna, founded in 1549, was suppressed in 1820. The industries are agriculture and the making of esparto mats, pottery, bricks, oil, soap, cloth, linen and hats.

**OSWALD** (d. 992), archbishop of York, was a nephew of Oda, archbishop of Canterbury, and at an early age became, by purchase, head of the Old Minster at Winchester. Desiring to become a monk, he went with Oda's approval to the monastery of Fleury on the Loire—at that time the great centre of reviving Benedictinism. Here he soon distinguished himself by the monastic austerity of his life. In 959 he returned to England at the request of Oda, who, however, died before his arrival. He now went to York to his kinsman the Archbishop Oskytel, who took him with him on a pilgrimage to Rome. Soon after his return he was appointed bishop of Worcester at the recommendation of Dunstan, his predecessor in the see (961). As bishop he took a prominent part in that revival of monastic discipline on Benedictine lines of which Aethelwold, bishop of Winchester, was the most ardent leader. Among other religious houses he founded that of Ramsey in conjunction with Aethelwine, Ealdorman of East Anglia. In 972 he was translated (again at Dunstan's recommendation) to the archbishopric of York, with which he continued to hold the see of Worcester. He died on Feb. 29, 992.

See *Memorials of St. Dunstan,* ed. by W. Stubbs, Rolls series (1874); and T. Raine, *Historians of the Church of York* (1879–86).

**OSWALD** (*c.* 605–642), king of Northumbria, was one of the sons of Aethelfrith and was expelled from Northumbria on the accession of Edwin, though he himself was a son of Edwin's sister Acha. He appears to have spent some of his exile in Iona, where he was instructed in the principles of Christianity. In 634 he defeated and slew the British king Ceadwalla at a place called by Bede Denisesburn, near Hefenfelth, which has been identified with St. Oswald's Cocklaw, near Chollerford, Northumberland. By this he avenged his brother Eanfrith, who had succeeded Edwin in Bernicia, and became king of Northumbria. Oswald reunited Deira and Bernicia, and soon raised his kingdom to a position equal to that which it had occupied in the time of Edwin, with whom he is classed by Bede as one of the seven great Anglo-Saxon kings. His close alliance with the Celtic church is the characteristic feature of his reign. In 635 he sent to the elders of the Scots for a bishop. On the arrival of Aidan in answer to this request he assigned to him the island of Lindisfarne as his see, near the royal city of Bamborough. He also completed the minster of St. Peter at York which had been begun by Paulinus under Edwin. Bede declares that Oswald ruled over "all the peoples and provinces of Britain, which includes four languages, those of the Britons, Picts, Scots and Angles." His relationship to Edwin may have helped him to consolidate Deira and Bernicia. Early in his reign he was sponsor to the West Saxon king Cynegils, whose daughter he married. In 642 he was defeated and slain at a place called Maserfeld, probably Oswestry in Shropshire, by Penda of Mercia.

*See* Bede, *Historia Ecclesiastica* (ed. C. Plummer, 1896), ii. 5, 14, 20; iii. 2, 3, 5, 6, 7, 9–14; *Anglo-Saxon Chronicle* (ed. J. Earle and C. Plummer, 1899), *s.a.,* 617, 634, 635, 642, 654.

**OSWALDTWISTLE,** urban district, Accrington parliamentary borough, Lancashire, England, on Leeds and Liverpool canal, and the L.M.S. railway (Church and Oswaldtwistle station). Pop. (1938) 12,620. Area, 7.6 sq.mi. It possesses cotton-mills, printworks, bleachworks and chemical works, and in the neighbourhood are collieries, stone quarries and potteries.

**OSWEGO,** a city of New York, U.S.A., the county seat of Oswego county; on Lake Ontario, 35 m. N.N.W. of Syracuse, at the mouth of the Oswego river and the Oswego canal, which connects with the State Barge canal at Three River Point, 25 m. S.E. It is served by the Lackawanna, the New York Central and the New York, Ontario and Western railways, lake steamers and canal barges. Pop: (1920) 23,626 (84% native white); 1940 federal census 22,062. The city has a fine harbour, water power, large hydro and steam electric developments. Water-borne commerce (largely coal, petroleum products, sand and gravel, raw sugar and grain) amounted in 1940 to 1,059,595 tons by lake vessels and 1,118,804 tons by canal.

Among the manufactures are, notably, matches, cotton and woollen goods, candy, peanut butter, boilers, paper and paper bags. Oswego is the seat of a State normal school (established by the city in 1861 and taken over by the State in 1867), a State armory and a U.S. life-saving station. Ft. Ontario (within the city limits) is the oldest fort in North America which is still garrisoned. The site of Oswego was visited by Champlain in 1616. Later it became a station for the Jesuit missionaries and the *coureurs des bois.* An English trading post was established in 1722, and in 1727 Governor William Burnet of New York built the first fort. It was an important base of operations during King George's War and the French and Indian War. In 1755–56 the British erected two new forts (Oswego and Ontario) on either side of the mouth of the river, both of which were taken by Montcalm (Aug. 14–15, 1756) and dismantled. The British restored Ft. Ontario in 1759 and kept it garrisoned until they turned it over to the United States in 1796. It was here that Pontiac in 1766 made his acknowledgment to Sir William Johnson of Great Britain's authority. On May 6, 1814, the fort was captured by the British and Canadians, and was held by them for a short time. It was rebuilt and garrisoned by the United States in 1839, abandoned in 1899, and again reconstructed and garrisoned in 1905. Oswego became the county seat in 1816, was incorporated as a village in 1828 (when the canal was completed) and as a city in 1848.

**OSWEGO CANAL:** *see* NEW YORK STATE BARGE CANAL SYSTEM.

**OSWEGO TEA** (*Monarda didyma*), a North American plant of the mint family (Labiatae), called also American bee-balm, native to moist soil from Quebec to Michigan and southward to North Carolina and Georgia. It is a stout perennial, 2 to 3 ft. high, with opposite, lance-shaped, sharply toothed leaves, and showy scarlet flowers, about 2 in. long, borne in dense bracted heads terminating the branches. The Oswego tea, so named because of former medicinal use, is one of the most handsome flowering plants native to eastern North America; several choice varieties are cultivated.

**OSWESTRY,** municipal borough in the Oswestry parliamentary division of Shropshire, England, near the Welsh border in the N.W. corner of the county. Pop. (est. 1938) 9,726. Area, 3.4 sq.mi. The town is placed where valleys open from the Berwyn mountains, and is a market town between hill and plain as well as a route centre. There are various accounts of the early history of the settlement (*Trer Cadeirau*). The present name comes from Oswald's Tree (alternative Oswald's Cross, Welsh *Croes Oswallt*) and is said to refer to the death of Oswald, king of Northumbria, in a battle fought here against Penda, the ruler of Mercia. The heavily fortified encampment of "Old Oswestry," about a mile from the town, suggests early border warfare. The town was twice burned by Welsh invaders in the middle ages. In the Domesday Survey it is included in the manor of Maesbury. Richard II, by a charter dated 1398, granted all the privileges which belonged to Shrewsbury. In 1582 Elizabeth incorporated the town; her charter was confirmed by James I, 1616.

In the 15th and 16th centuries a weekly market was held at Oswestry for the sale of woollen goods manufactured in the adjoining parts of Wales, but the drapers of Shrewsbury, a rival centre, ruined the trade by refusing to buy cloth there. In 1642 it was garrisoned for Charles I, but two years later surrendered to the parliamentary forces. The church of St. Oswald, originally conventual, is Early English and Decorated, but has been much restored. The grammar school, founded in the reign of Henry IV, occupies modern buildings. During World War I Oswestry benefited greatly by the presence of thousands of troops at Park Hall camp. The Cambrian railway had its headquarters in the town but the engine and carriage works were in part removed by the G.W.R. after 1922. The chief industries are malting, tanning, currying, fellmongery and wool stapling.

**OTHMAN** (*c.* 574–656), in full OTHMĀN IBN 'AFFĀN, the third of the Mohammedan caliphs, a kinsman and son-in-law of Mohammed and cousin of Abu Sofiān, whose son Moawiya became the first of the Omayyad dynasty. He was elected caliph in succession to Omar in 644, but owing to his weakness and cruelty and his preference of the Koreish for all responsible positions irrespective of their capacity, he produced strife throughout the empire which led to his assassination by Mohammed, son of Abu Bekr. He was succeeded by Ali. *See* CALIPHATE.

**OTHO, MARCUS SALVIUS** (A.D. 32–69), Roman emperor, was born on April 28, A.D. 32. He appears first as one of the wildest of Nero's court. In 58 he refused to divorce his wife Poppaea Sabina at Nero's bidding, and was thereupon sent to be governor of Lusitania, where he remained ten years. In 68 Galba, governor of the neighbouring province of Tarraconensis, rebelled against Nero, and Otho accompanied him to Rome, hoping to succeed him. In Jan. 69 Galba adopted Piso as his successor, and Otho at once organized a revolt of the praetorian guard, and on Jan. 15 had himself proclaimed emperor, murdered Galba and Piso, and was accepted by the Senate. He owed his success partly to Galba's disciplinary measures being unpopular with the guards, partly to the power of the memory of Nero, which he further enlisted by restoring his statues and the officials of his household, and proposing to complete his palace, the Golden House. News soon arrived, however, that the army in Germany had declared for Vitellius. On March 14 he started northwards to prevent the Vitellians entering Italy. In this he failed, but his advance guard successfully defended Placentia against Alienus Caecina, compelling him to retire to Cremona, and he held the line of the Po. Opinions were divided in Otho's camp, he himself wishing to force a decisive battle, others advising him to wait for the arrival of the troops from Dalmatia. Otho prevailed, and the main army crossed the Po to Bedriacum, Otho staying behind with the reserve at Brixellum, on the southern bank. The Othonian forces were defeated outside Cremona, and deserted to the enemy. Otho refused to renew the struggle and committed suicide in his tent on the morning of April 15, 69, and was buried at Brixellum.

*See* Tacitus, *Histories,* i. 12–50, 71–90, ii. 11–51; *Lives* by Suetonius and Plutarch; Dio Cassius lxiv.; L. Paul, "Kaiser M. Salvius Otho" in *Rhein. Mus.* lvii. (1902); W. A. Spooner's Introd. to his edition (1891) of the *Histories* of Tacitus; B. W. Henderson, *Civil War and Rebellion in the Roman Empire,* A.D. *69–70* (1908).

**OTIDIDAE:** *see* BUSTARD.

**OTIS, HARRISON GRAY** (1837–1917), American journalist, was born near Marietta, O., on Feb. 10, 1837. He became a printer's apprentice, working in various offices in Illinois, Iowa, Ohio and Kentucky. He served throughout the Civil War, and rose to be lieutenant-colonel He was in the Government printing office at Washington, D.C., 1867–70, and in 1870 moved to California, where he managed the Santa Barbara *Press.* In July 1882 he became connected with the Los Angeles *Daily Times,* obtaining control of that paper in 1886. He served in the war with Spain as brigadier-general in the Philippines 1898–99. In 1910 the *Times* building was dynamited, 21 employees being killed. He died at Los Angeles on July 30, 1917.

**OTIS, JAMES** (1725–1783), American patriot, was born at West Barnstable, Mass., on Feb. 5, 1725. He was the eldest son of James Otis (1702–1778), fourth in descent from John Otis (1581–1657), a native of Barnstaple, Devon, and one of the first settlers (in 1635) of Hingham, Mass. The elder James Otis was elected to the provincial general court in 1758, was its speaker in 1760–1762, and was chief justice of the court of common pleas from 1764 until 1776; he was a prominent patriot in the colony of Massachusetts. The son graduated at Harvard in 1743; and after studying law in the office of Jeremiah Gridley (1702–1767), a well-known lawyer with Whig sympathies, rose to great distinction at the bar, practising first at Plymouth and after 1750 at Boston. In 1760 he published *Rudiments of Latin Prosody,* a book of authority in its time. Soon after the accession of George III. to the throne of England in 1760, the British Government decided upon a rigid enforcement of the navigation acts, which had long been disregarded by the colonists and had been almost wholly evaded during the French and Indian War. The writs of assistance issued in 1755 were about to expire, and it was decided to issue new ones, which would empower custom house officers to search any house for smuggled goods, though neither the house nor the goods had to be specifically mentioned in the writs. Much opposition was aroused in Massachusetts, the legality of the writs was questioned, and the superior court consented to hear argument. Otis held the office of advocate-general at the time, and it was his duty to appear on behalf of the Government. He refused, resigned his office, and appeared for the people against the issue of the writs. The case was argued in the old town house of Boston in Feb. 1761, and the chief speech was made by Otis. His plea was fervid in its eloquence and fearless in its assertion of the rights of the colonists. Going beyond the question at issue, he dealt with the more fundamental question of the relation between the English in America and the home Government, and argued that even if authorized by act of parliament such writs were null and void. The young orator was elected in May of the same year a representative from Boston to the Massachusetts general court. To that position he was re-elected nearly every year of the remaining active years of his life, serving there with his father. In 1766 he was chosen speaker of the house of representatives, but the choice was negatived.

In Sept. 1762 the younger Otis published *A Vindication of the Conduct of the House of Representatives of the Province of Massachusetts Bay,* in defence of the action of that body in sending to the governor a message (drafted by Otis) rebuking him for asking the assembly to pay for ships he had (with authorization of the council and not of the representatives) sent to protect New England fisheries against French privateers; according to this

message "it would be of little consequence to the people whether they were subject to George or Louis, the king of Great Britain or the French king, if both were as arbitrary as both would be if both could levy taxes without parliament." He also wrote various State papers addressed to the colonies to enlist them in the common cause, or sent to the Government in England to uphold the rights or set forth the grievances of the colonists. His influence at home in controlling and directing the movement of events which led to the War of Independence was universally felt and acknowledged; and abroad no American was so frequently quoted, denounced or applauded in parliament and the English press before 1769 as the recognized head and chief of the rebellious spirit of the New England colonists. In 1765 Massachusetts sent him as one of her representatives to the Stamp Act congress at New York, and here he was a conspicuous figure, serving on the committee which prepared the address sent to the British House of Commons. From 1769 almost continually until his death, Otis was harmlessly insane, though he had occasional lucid intervals, serving as a volunteer in the battle of Bunker Hill in 1775 and arguing a case in 1778. He was killed by lightning (it is said that he had often expressed a wish that he might die in this way) at Andover, Mass., on May 23, 1783.

Otis's political writings exercised an enormous influence, his pamphlets being among the most effective presentations of the arguments of the colonists against the arbitrary measures of the British ministry. His more important pamphlets were *A Vindication of the Conduct of the House of Representatives of the Province of Massachusetts Bay* (1762); *The Rights of the British Colonies Asserted and Proved* (1764); *A Vindication of the British Colonies against the Aspersions of the Halifax Gentleman in his Letter to a Rhode Island Friend*—a letter known at the time as the "Halifax Libel" (1765); and *Considerations on Behalf of the Colonists in a Letter to a Noble Lord* (1765).

The best biography is that by William Tudor (Boston, 1823); there is a shorter one by Francis Bowen (Boston, 1847). The best account of Otis's characteristics and influence as a writer may be found in M. C. Tyler's *Literary History of the American Revolution* (1897). Consult the notes on the Writs of Assistance by Horace Gray, Jr., in Quincy's *Massachusetts Reports, 1761–1772* (Boston, 1865). *See* also Francis Wilson Sprague, *Birthplace of the Patriot James Otis* (1917).

**OTLEY,** an urban district in the West Riding of Yorkshire, England, 10 mi. N. of Bradford on the L.M.S. and L.N.E. railways. Pop. (1938) 11,060. Area, 4.7 sq.mi. It stands on the Wharfe at the foot of the precipitous Chevin. To the S.W. the Guiseley gap affords a route, only 4 mi. long, between the Aire and the Wharfe. It is traversed by both roads and railways and brings much of the Aire valley within range of Otley markets.

In 937 King Aethelstan granted to the archbishop of York the manor of Otley. The town and the church were laid waste in 1069. Otley became an important local centre of the woollen cloth industry, which was introduced late in the 11th century. An annual fair was granted in 1222 and a weekly market in 1248.

The growth of cereals, which was important until the 18th century, was abandoned in favour of pastoral industries for the supply of meat to the dense population on the Yorkshire coalfield. To-day the prosperity of Otley depends, not on its importance as an agricultural centre, which has been decreasing for a century, but on its industries. Worsted spinning and weaving, tanning and leather-dressing, paper-making and the manufacture of printing machines are the chief amongst these industries. Excellent building stone is quarried.

**OTOLITH:** *see* EQUILIBRIUM, ANIMAL.

**OTOMACAN,** an independent linguistic stock of South American Indians, named from the Otomacas, its best known tribe. The Otomacas lived in south-western Venezuela, along the Orinoco between the Meta and Arauca rivers. In recent times they have spread westward. Described by early writers as one of the most barbarous tribes of the whole Orinoco region, they appear to have been sedentary agriculturalists, cultivating their fields of manioc and maize communally, the produce, with that from hunting and fishing, being divided among all by the chief. They were noted as clay-eaters, even their bread being mixed with it, and made great use of narcotic snuff. They were monogamous, and it is said that they married all young girls to old widowers, and all young men to elderly widows.

*See* J. Gumilla, *Histoire naturelle, civile et géographique de l'Orénoque* (Avignon, 1758).

**OTOMI,** an important group of Indians on the central mesa of Mexico. The ancient territory of the Otomi proper comprised the states of Guanajuato and Querétaro, south-western Hidalgo and northern Mexico, extending to the hills overlooking Mexico valley and city. With them are reckoned, on the basis of related speech, the Pame of eastern San Luis Potosi and the Mazahua and Pirinda of western Mexico (state). The Otomian languages are tonal and built up from monosyllabic elements. This analogy to Chinese has led to theories of relationship, generally fantastic. Remote kinship with the Zapotecan group is, however, possible. The Otomi passed as dull boors among the Aztec; they were provincially backward as compared with centres of native culture like Mexico, Tezcoco, Cholula, and possessed no large towns. The nearer ones were all subject to the Aztec. To-day they are peaceful and number about a quarter of a million.

**OTRANTO,** seaport and archiepiscopal see, Apulia, Italy, in province of Lecce, 29½ mi. S.E. from it by rail, 49 ft. above sea-level. Pop. (1936) 2,507 (town), 3,033 (commune). It is on the E. coast of the peninsula of ancient Calabria (*q.v.*). The castle was erected by Alfonso of Aragon; the cathedral, consecrated in 1088, has a rose window and side portal of 1481. The interior, a basilica with nave and two aisles, contains a mosaic pavement of 1165. It has a crypt supported by 42 marble columns. The church of S. Pietro has Byzantine frescoes.

Otranto occupies the site of the ancient Hydrus or Hydruntum, a town of Greek origin. In Roman times it was less important than Brundisium as a point of embarkation for the East. It was taken by Robert Guiscard in 1068. In 1480 it was utterly destroyed by the Turkish fleet, and has never since recovered its importance. About 30 mi. S.E. lies the promontory of S. Maria di Leuca (so called since ancient times from its white cliffs), the southeast extremity of Italy, the ancient Promontorium Iapygium or Sallentinum. The district between this promontory and Otranto is thickly populated, and very fertile. It was a supply base in World Wars I and II. The straits are about 40 mi. wide; cables leave here for Valona and Corfu.

**OTTAKAR I.** (d. 1230), king of Bohemia, was a younger son of King Vladislav II. (d. 1174) and a member of the Premyslide family, hence he is often referred to as Premysl Ottakar I. Recognized as ruler of Bohemia by the emperor Henry VI. in 1192, he was, however, soon overthrown, but in 1196 forced his brother, King Vladislav III., to abandon Bohemia to him and to content himself with Moravia. Ottakar first sought the support of the German king Philip, duke of Swabia, but then went over to his rival Otto of Brunswick. Philip thereupon invaded Bohemia, and Ottakar changed sides once more. Later still, he supported the young king, Frederick II. He united Moravia with Bohemia in 1222, and when he died in 1230 he left to his son, Wenceslaus I., a kingdom united and comparatively peaceable.

**OTTAKAR II.,** or PREMYSL OTTAKAR II. (*c.* 1230–1278), king of Bohemia, was son of King Wenceslaus I.; his maternal grandfather was the German king, Philip, duke of Swabia. In his father's lifetime he ruled Moravia, and in 1251 secured his election as duke of Austria, where he strengthened his position by marrying (Feb. 11, 1252) Margaret (d. 1267), sister of Duke Frederick II., the last of the Babenbergs and widow of the German king, Henry VII. In Sept. 1253 he succeeded his father in Bohemia, and in 1254 concluded peace with Bela IV. of Hungary, who had claimed Styria, advancing the Austrian frontier to the present line. In 1259 he expelled the Hungarians from the rest of Styria, then divorced his wife, married a granddaughter of Bela IV. and secured his investiture (by letter) with Austria and Styria from the German king, Richard Cornwallis.

In 1269 Ottakar II. inherited Carinthia and part of Carniola; and having made good his claim, contested by the Hungarians, in battle, he was the most powerful prince in Germany when an election for the German throne took place in 1273. The electors, however, fearing his power, chose Rudolph of Habsburg, who in 1276 placed Ottakar under the ban, besieged Vienna, and com-

pelled Ottakar to renounce all his possessions except Bohemia and Moravia. (*See* AUSTRIA.) Ottakar was killed at Dürnkrut on the March, Aug. 26, 1278, in an attempt to recover his lands. Clever, strong and handsome, he is a famous figure both in history and in legend, and is the subject of a tragedy by F. Grillparzer, *König Ottokars Glück und Ende.*

*See* O. Lorenz, *Geschichte König Ottokars,* ii. (Vienna, 1866); and F. Palacky, *Geschichte von Böhmen,* vol. i. (Prague, 1844).

**OTTAVA RIMA,** a stanza of eight iambic lines, containing three rhymes, invariably arranged as follows:—*a b a b a b c c.* It is an Italian invention of the 14th century. Boccaccio employed it for the *Teseide* (1340) and for the *Filostrato* (some seven years later). These epics gave to *ottava rima* its classic character. In the succeeding century it was employed by Politian, and by Boiardo for his famous *Orlando Innamorato* (1486). It was Pulci, however, in the *Morgante Maggiore* (1487), who invented the peculiar mock-heroic, or rather half-serious, half-burlesque, style with which *ottava rima* has been most commonly identified. The most striking monument in *ottava rima* in English is *Don Juan* (1819–24). Byron also employed this measure in *The Vision of Judgment* (1822). Meanwhile Shelley also became attracted by it, and in 1820 translated the *Hymns* of Homer into *ottava rima.* In the Peninsula the form was largely used, *e.g.,* by Boscán (1490–1542), by Ercilla y Zúñiga (1533–95) in the *Araucana,* by Camoens in the *Lusiads* (1572) and by Lope de Vega.

**OTTAWA,** a city of Carleton county, province of Ontario, and the capital of the dominion of Canada, on the right bank of the Ottawa river, 101 m. W. of Montreal and 217 m. N.E. of Toronto. Pop. (1941) 154,951. Greater Ottawa 215,022, to include the city of Hull (32,947) and various suburbs.

The city stands for the most part on a cluster of hills, 60 to 155 feet above the river. It is on the transcontinental lines of both the Canadian National and Canadian Pacific railways, and has direct communication by both systems to Montreal, Toronto and other points in Canada, as well as by the Ottawa and New York and other railroads to New York and elsewhere in the United States. Electric railways afford communication with all parts of the city and the suburbs, as well as through the neighbouring city of Hull to Aylmer. Several bridges connect Ottawa with Hull and others cross Rideau river and the Rideau canal.

The site of the city is very picturesque. For three miles it follows the high southern bank of the Ottawa from the Chaudière falls, whose mist-crowned cauldron is clearly visible from the summit of Parliament Hill, to and beyond the Rideau falls, so named by early French explorers because of their curtain-like appearance. The Rideau, a southern tributary of the Ottawa, once formed the eastern boundary of the city, which, however, is now absorbing a string of suburbs that lie along its eastern banks. The Rideau canal cuts the city in two, the western portion being known as Upper Town and the eastern as Lower Town. Roughly speaking, the canal divides the two sections of the population, the English occupying Upper Town and the French Lower Town.

Opposite and a little below the mouth of the Rideau river, the Gatineau flows into the Ottawa from the north. The river is now the scene of very large hydro-electric developments. Above the Chaudière falls the river is broken by the Deschenes rapids, and beyond these again it expands into Lake Deschenes, a favourite summer resort. To the north the Laurentian Hills, broken by the picturesque Gatineau valley, offer skiing in winter.

**Buildings.**—The crowning architectural feature of the city is the splendid group of Gothic buildings on the summit of Parliament Hill. The three blocks form sides of a great quadrangle, the fourth side remaining open. The corner stone of the main building was laid by the then prince of Wales in 1860. With the exception of the library, it was destroyed by fire in 1916, and has since been rebuilt. In the tower is a remarkably beautiful war memorial chamber, and above it is hung a carillon of 53 bells. The Langevin block on the south side of Parliament Hill is used for departmental purposes, and to meet the increasing needs of the government, a group of buildings is being erected on the banks of the Ottawa, west of Parliament Hill. Other national institutions are the Public Archives, Royal Mint, Department of National Revenue, National Museum and the National Art Gallery, and Dominion Observatory. Other buildings are the City hall, public library, university of Ottawa, the collegiate institutes, Normal and Model school, St. Patrick's college and the Roman Catholic and Church of England cathedrals. City charities include a large civic hospital and nurses' home, a general hospital supported by the Roman Catholics and three special hospitals devoted to contagious diseases.

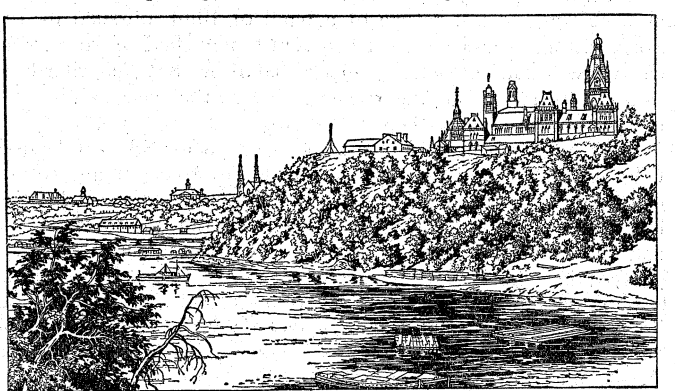
A system of public parks and driveways, partly within and partly without the city, add very largely to its attractions. These have been built and are maintained by the federal district commission. Statues of Queen Victoria, as well as of Sir John Macdonald, Sir Wilfrid Laurier and other Canadian statesmen, stand on Parliament Hill. A very beautiful war memorial has been erected in honour of those killed in action (1914–18).

Rideau Hall, the official residence of the governor general, lies on the eastern boundary of the city at the entrance to Rockcliffe park.

Ottawa is governed by a mayor, and board of control of four members, elected by the city at large, and a board of 22 aldermen, two elected by each of the 11 wards. The city returns two members to the dominion house of commons, and two to the Ontario legislature.

**History.**—The earliest description of the site of Ottawa is that of Samuel de Champlain, in his *Voyages.* In June 1613, on his way up the river, he came to a tributary on the south side, "at the mouth of which is a marvellous fall. For it descends a height of twenty or twenty-five fathoms with such impetuosity that it makes an arch nearly four hundred paces broad. The savages take pleasure in passing under it, not wetting themselves, except from the spray that is thrown off." This was the Rideau falls, but a good deal of allowance must be made for exaggeration in Champlain's account. Continuing up the river, "we passed," he says, "a fall, a league from there, which is half a league broad and has a descent of six or seven fathoms. There are many little islands. The water falls in one place with such force upon a rock that it has hollowed out in course of time a large and deep basin, in which the water has a circular motion and forms large eddies in the middle, so that the savages call it *Asticou,* which signifies boiler. This cataract produces such a noise in this basin that it is heard for more than two leagues." The present name, Chaudière, is the French equivalent of the old Indian name.

For two hundred years and more after Champlain's first visit the Chaudière portage was the main thoroughfare from Montreal



BY COURTESY OF THE CANADIAN NATIONAL RAILWAYS

BARRACK HILL, IN OTTAWA, WITH A PART OF THE PARLIAMENTARY BUILDINGS IN THEIR ORIGINAL STATE. FROM AN OLD PRINT

to the great western fur country; but it was not until 1800 that any permanent settlement was made in the vicinity. In that year Philemon Wright, of Woburn, Massachusetts, built a home for himself at the foot of the portage, on the Quebec side of the river, where the city of Hull now stands; but for some time the precipitous cliffs on the south side seem to have discouraged settlement there. Finally about 1820 one Nicholas Sparks moved over the river and cleared a farm in what is now the heart of Ottawa. Seven years later Colonel John By, R.E., was sent out

to build a canal from a point below the Chaudière falls to Kingston on Lake Ontario. The canal, completed at a cost of $2,500,000 has never been of any great commercial importance; it has never been called upon to fulfil its primary object, as a military work to enable gun-boats and military supplies to reach the lakes from Montreal without being exposed to attack along the St. Lawrence frontier. The building of the canal created a fair-sized settlement at its Ottawa end, which came to be known as Bytown. As the lumber trade developed Bytown rapidly increased in wealth and importance. In 1854 it was incorporated as a city, the name being changed to Ottawa; and four years later Queen Victoria selected Ottawa as the capital of the province of Canada. Ottawa was admirably situated for a capital from a political and military point of view; but there is reason to believe that the deciding factor was the pressure exerted by the four other rival claimants, Montreal, Quebec, Toronto and Kingston, any three of which would have fiercely resented the selection of the fourth. The first session of parliament in Ottawa was opened in 1865. The British North America act of 1867 (§16) makes Ottawa the capital of the dominion of Canada.

(L. J. B.; X.)

**OTTAWA,** a city of Illinois, U.S.A., 84 mi. S.W. of Chicago, at the confluence of the Illinois and the Fox rivers; the county seat of Lasalle county. It is on the Illinois and Michigan canal and the Illinois waterway, and is served by the Burlington Route and the Rock Island railway. Population in 1940, 16,005.

Ottawa is surrounded by a rich agricultural country, and there are medicinal springs and large deposits of clay and silica in the vicinity. The city's manufactures (including plate glass, building tile, firebrick and agricultural implements) had a value of over $10,000,000 in 1940. The mouth of the Fox river was visited early by the French explorers, and Father Hennepin discovered coal here in 1680. On Starved Rock (8 m. W., on the south bank of the Illinois, in a State park of 900 ac.) La Salle in 1683 built Fort St. Louis, which was used by fur traders as late as 1718, and in 1770 was the last refuge of a band of Illini, pursued by the Pottawattomies and besieged here until they died of starvation. Ottawa was laid out in 1831, incorporated in 1837 and chartered as a city in 1853. On Aug. 21, 1858 it was the scene of the first of the Lincoln-Douglas debates.

**OTTAWA,** a city of Kansas, U.S.A., 58 m. S.W. of Kansas City, on the Marais des Cygnes (or Osage) river, at an altitude of 926 ft.; the county seat of Franklin county. It is on Federal highways 50S and 59, and is served by the Missouri Pacific and the Santa Fe railways. Pop. 9,018 in 1920 (92% native white); in 1940 it had increased to 10,193. Ottawa has a large trade in poultry and dairy products, fruit and other farm produce. Its manufacturing establishments include large repair shops of the Santa Fe Company, creameries, flour-mills, poultry-packing plants and factories making steel products, brooms and chicken-coops. It is the seat of Ottawa university (Baptist) established in 1865. The city owns its electric light and power and water plants, and natural gas is supplied from the Kansas fields. Ottawa was in the reservation of the Ottawa Indians until they were moved (1865) to the Indian Territory. A mission was established here in 1839. The city was chartered in 1866.

**OTTAWA,** the largest tributary of the river St. Lawrence; ranking ninth in length among the rivers of Canada, being 685 m. long. It flows first westward to Lake Timiscaming; thence south-east and east. The principal tributaries on the left bank are the Rouge (115 m.), North Nation (60), Lièvre (205), Gatineau (240), Coulonge (135), Dumoine (80); and on the right bank, the South Nation (90), Mississippi (105), Madawaska (130) and Petawawa (95). Canals at Ste. Anne, Carillon and Grenville permit the passage of vessels drawing 9 ft., from Montreal up to the city of Ottawa. At Ottawa the river is connected with Lake Ontario by the Rideau Canal.

The Ottawa was first explored by Samuel de Champlain in 1613. Champlain describes many of its tributaries, the Chaudière and Rideau Falls, the Long Sault, Chats and other rapids, as well as the character of the river and its banks, with minuteness and reasonable accuracy. The Long Sault Rapids on the Ottawa, about midway between Montreal and the capital, were the scene of one of the noblest exploits in Canadian history, when in 1661 the young Sieur des Ormeaux with sixteen comrades and a handful of Indian allies deliberately gave their lives to save New France from an invasion of the Iroquois. They intercepted the war party at the Long Sault, and for nearly a week held them at bay. When finally the last Frenchman fell under a shower of arrows, the Iroquois were thoroughly disheartened and returned crestfallen to their own country. For a hundred and fifty years thereafter the Ottawa was the great highway from Montreal to the west for explorers and fur-traders. Throughout the 19th century the Ottawa was the thoroughfare of lumbermen, whose immense rafts went from its upper waters to Montreal and Quebec.

**OTTER,** the name of an aquatic carnivore inhabiting Europe and Asia. The otter (*Lutra vulgaris*) has an elongated body, short limbs terminating in broad webbed feet, the toes of which are armed with claws, a broad, flat head and a tail about half the length of the body. The muzzle is broad, the whiskers thick, the eyes small and the ears short and rounded. The fur consists of a short, soft, grey underfur, interspersed with longer, stiffer hairs, the points of which are bright brown. The average length is about 3½ft., the weight of a male 18 to 24 lb., the female being about 4 lb. less. The otter lives on fish and inhabits streams, rivers, lakes and, in some localities, the sea. The female produces 3 to 5 young in March or April, bringing them up in a nest of grass in a hollow in a river-bank or under the roots of an overhanging tree. Otter hunting, with packs of special hounds, is a pastime in parts of England.

In North America, *L. vulgaris* is replaced by the larger *L. canadensis* and other species with similar habits occur in North and South America, South Africa and southern Asia.

BY COURTESY OF THE N.Y. ZOOLOGICAL SOCIETY

OTTERS (LUTRA VULGARIS), WIDELY DISTRIBUTED THROUGH EUROPE AND ASIA

The sea-otter (*Latax lutris*) is confined to the North Pacific. It is larger and more heavily built than the European otter and possesses a very valuable coat of fur, on account of which it has been almost exterminated; they are very wary animals. Sea-otters feed on shellfish. *See* Elliott Coues, *Monograph of North American Fur-bearing Animals.*

Otters form a section of the family Mustelidae (*see* CARNIVORA).

**OTTERY ST. MARY,** a market town of Devonshire, England, 12 m. N.E. of Exeter on the S.R. Pop. of urban district (1938) 3,562. Area 15·6 sq.mi. The parish church is Early English, with Decorated and Perpendicular additions. It has transeptal towers, imitated from Exeter cathedral. The manor of Ottery belonged to the abbey of Rouen in the time of Edward the Confessor. The church was dedicated in 1260 by Walter Bronescombe, bishop of Exeter; and enlarged by Bishop John Grandisson, *c.* 1335. The town has a large agricultural trade, and Honiton lace is a home industry. It was the birthplace of S. T. Coleridge.

**OTTO I.** (912–973), the Great, Roman emperor, eldest son of King Henry I. the Fowler by his second wife Matilda, was born on Nov. 23, 912. Little is known of his early years, but he probably shared in some of his father's campaigns. In 929 he married Edith, daughter of Edward the Elder, king of the English, and sister of the reigning King Aethelstan. In 936 Otto was chosen German king and crowned by Hildebert, archbishop of Mainz. Otto soon showed his intention of breaking with the policy of his father, who

had been content with a nominal superiority over the duchies; in 937 he punished Eberhard, duke of Franconia, for an alleged infringement of the royal authority; and in 938 deposed Eberhard, duke of Bavaria. Trouble soon arose in Saxony, probably from his refusal to give certain lands to his half-brother, Thankmar, who, although the king's senior, had been passed over in the succession as illegitimate. Thankmar, aided by an influential Saxon noble named Wichmann, and by Eberhard of Franconia, seized the fortress of Eresburg and took Otto's brother Henry prisoner; but soon afterwards he was defeated by the king and killed whilst taking sanctuary. The other conspirators were pardoned, but in 939 a fresh revolt broke out under the leadership of Henry, and Giselbert, duke of Lorraine. Otto gained a victory near Xanten, which was followed by the surrender of the fortresses held by his brother's adherents in Saxony, but the rebels, joined by Eberhard of Franconia and Archbishop Frederick of Mainz, continued the struggle, and Giselbert of Lorraine transferred his allegiance to Louis IV., king of France. Otto's precarious position was saved by a victory near Andernach when Eberhard was killed, and Giselbert drowned in the subsequent flight. Henry took refuge with Louis of France, but was soon restored to favour and entrusted with the duchy of Lorraine, where, however, he was unable to restore order. Otto therefore crossed the Rhine and deprived his brother of authority. Henry then became involved in a plot to murder the king, which was discovered in time, and the good offices of his mother secured him a pardon at Christmas 941.

The deaths of Giselbert of Lorraine and of Eberhard of Franconia, quickly followed by those of two other dukes, enabled Otto to unite the stem-duchies more closely with the royal house. In 944 Lorraine was given to Conrad, surnamed the Red, who in 947 married the king's daughter Liutgard; Franconia was retained by Otto in his own hands; Henry married a daughter of Arnulf, duke of Bavaria, and received that duchy in 947; and Swabia came in 949 to the king's son Ludolf, who had married Ida, a daughter of the late duke, Hermann. During these years the tribes living between the Elbe and the Oder were made tributary, bishoprics were founded in this district, and in 950 the king himself marched against the Bohemians and reduced them to dependence. Strife between Otto and Louis IV. of France had arisen when the French king sought to obtain authority over Lorraine and aided the German rebels in 939; but after the German king had undertaken an expedition into France, peace was made in 942. Afterwards, when Louis became a prisoner in the hands of his powerful vassal Hugh the Great, duke of France, Otto attacked the duke, who, like the king, was his brother-in-law, captured Reims, and negotiated a peace between the two princes; and in subsequent struggles between them his authority was several times invoked.

In 945 Berengar I., margrave of Ivrea, left the court of Otto and returned to Italy, where he soon obtained a mastery over the country. After the death in 950 of Lothair, king of Italy, Berengar sought the hand of his widow Adelaide for his son Adalbert; and Henry of Bavaria and Ludolf of Swabia had already been meddling independently of each other in the affairs of northern Italy. In response to an appeal from Adelaide, Otto crossed the Alps in 951. He assumed the title of king of the Lombards, and having been a widower since 946, married Adelaide and negotiated with Pope Agapetus II. about his reception in Rome. The influence of Alberic, prince and senator of the Romans, prevented the pope returning a favourable answer to the king's request. But when Otto returned to Germany in 952 he was followed by Berengar, who did homage for Italy at Augsburg. The chief advisers of Otto at this time were his wife and his brother Henry. Henry's influence seems to have been resented by Ludolf, who in 946 had been formally designated as his father's successor. When Adelaide bore a son, and a report gained currency that Otto intended to make this child his heir, Ludolf rose in revolt and was joined by Conrad of Lorraine and Frederick of Mainz. Otto fell into the power of the rebels at Mainz and was compelled to agree to demands made by them, which, however, he promptly revoked on his return to Saxony. Ludolf and Conrad were declared deposed, and in 953 war broke out in Lorraine and Swabia, and afterwards in Saxony and Bavaria. Otto was finally victorious and with the capture of Regensburg in 955 the rising ended. Conrad and Ludolf retained their estates, but their duchies were not restored to them. Meanwhile the Magyars had renewed their ravages and were attacking Augsburg. Otto marched against them, and in a battle fought on the Lechfeld Aug. 10, 955, the king's troops gained a victory which freed Germany from these invaders; while in the same year Otto defeated the Slavs ravaging the Saxon frontier.

About this time the king seems to have perceived the necessity of ruling in closer union with the church. Lands and privileges were granted to prelates, additional bishoprics were founded, and some years later Magdeburg was made the seat of an archbishop. In 960 Otto was invited to come to Italy by Pope John XII., who was hard pressed by Berengar, and he began to make preparations for the journey. As Ludolf had died in 957 and Otto, his only son by Adelaide, had been chosen king at Worms, the government was entrusted to Bruno of Cologne, and Archbishop William of Mainz, a natural son of the king. Reaching Pavia at Christmas 961, the king promised to defend and respect the church. He then proceeded to Rome, where he was crowned emperor on Feb. 2, 962. After the ceremony he confirmed the rights and privileges which had been conferred on the papacy, while the Romans promised obedience, and Pope John took an oath of fidelity to the emperor. But as he did not long observe his oath he was deposed at a synod held in St. Peter's, after Otto had compelled the Romans to swear they would elect no pope without the imperial consent; and a nominee of the emperor, who took the name of Leo VIII., was chosen in his stead. A pestilence drove Otto to Germany in 965, and finding the Romans again in arms on his return in 966, he allowed his soldiers to sack the city, and severely punished the leaders of the rebellion. His next move was against the Greeks and Saracens of southern Italy, but seeking to attain his objects by negotiation, sent Liudprand, bishop of Cremona, to the eastern emperor Nicephorus II. to arrange for a marriage treaty between the two empires. Nicephorus refused to admit the validity of Otto's title, and the bishop was roughly repulsed; but the succeeding emperor, John Zimisces, was more reasonable, and Theophano, daughter of the emperor Romanus II., was married to the younger Otto in 972. The same year witnessed the restoration of peace in Italy and the return of the emperor to Germany, where he received the homage of the rulers of Poland, Bohemia and Denmark; but he died suddenly at Memleben on May 7, 973.

The empire was less universal under Otto, its restorer, than Charlemagne, but what it lacked in splendour it gained in stability. His object was not to make the state religious but the church political, and the clergy must first be officials of the king, and secondly members of an ecclesiastical order. He shared the piety and superstition of the age, and did much for the spread of Christianity. Although himself a stranger to letters he welcomed scholars to his court and eagerly seconded the efforts of his brother Bruno to encourage learning; and while he neither feared nor shirked battle, he was always ready to secure his ends by peace.

**OTTO II.** (955–983), Roman emperor, was the son of the emperor Otto the Great, by his second wife Adelaide. He was chosen German king at Worms in 961 and on Dec. 25, 967, was crowned joint emperor at Rome by Pope John XIII. On

April 14, 972, he married Theophano, daughter of the eastern emperor Romanus II., and after sharing in various campaigns in Italy, returned to Germany and became sole emperor on the death of his father in May 973. After suppressing a rising in Lorraine, difficulties arose in southern Germany, probably owing to Otto's refusal to grant the duchy of Swabia to Henry II., the Quarrelsome, duke of Bavaria. The first conspiracy was easily suppressed, and in 974 an attempt on the part of Harold III., king of the Danes, to throw off the German yoke was also successfully resisted; but an expedition against the Bohemians led by the king in person in 975 was a partial failure owing to the outbreak of further trouble in Bavaria. In 976 Otto deposed Duke Henry, restored order for the second time in Lorraine, and made another expedition into Bohemia in 977, when King Boleslaus II. promised to return to his earlier allegiance. Having crushed an attempt made by Henry to regain Bavaria, Otto was suddenly attacked by Lothair, king of France, who held Aix in his possession for a few days; but when the emperor retaliated by invading France he met with little resistance. He was, however, compelled by sickness among his troops to raise the siege of Paris, and on the return journey the rearguard of his army was destroyed and the baggage seized by the French. An expedition against the Poles was followed by peace with France, when Lothair renounced Lorraine.

The emperor then prepared for a journey to Italy. In Rome, where he restored Pope Benedict VII., he held a splendid court, attended by princes and nobles from all parts of western Europe. He was next required to punish inroads of the Saracens on the Italian mainland, and in September 981 he marched into Apulia, where he met at first with considerable success; but an alliance between the Arabs and the Eastern Empire, whose hostility had been provoked by the invasion of Apulia, resulted in a severe defeat for Otto's troops near Stilo in July 982. Without revealing his identity, the emperor escaped on a Greek vessel to Rossano. At a diet held at Verona, largely attended by German and Italian princes, a fresh campaign was arranged against the Saracens. Proceeding to Rome, Otto secured the election of Peter of Pavia as Pope John XIV. Just as the news reached him of a general rising of the tribes on the eastern frontier of Germany, he died in his palace in Rome on Dec. 7, 983.

**OTTO III.** (980–1002), Roman emperor, son of the emperor Otto II. and Theophano, daughter of the eastern emperor Romanus II., was born in July 980, chosen as his father's successor at Verona in June 983 and crowned German king at Aix-la-Chapelle on Dec. 25. Otto II. had died a few days before this ceremony, but the news did not reach Germany until after the coronation. Early in 984 the king was seized by Henry II., the Quarrelsome, the deposed duke of Bavaria, who claimed the regency as a member of the reigning house, and probably entertained the idea of obtaining the kingly dignity himself. A strong opposition was quickly aroused, and when Theophano and Adelaide, widow of the emperor Otto the Great, appeared in Germany, Henry was compelled to hand over the young king to his mother. Otto's abilities were carefully cultivated by Bernward, afterwards bishop of Hildesheim, and by Gerbert of Aurillac, archbishop of Reims, and he was called "the wonder of the world." The government of Germany during his minority was in the hands of Theophano, and after her death in June 991 passed to a council in which the chief influence was exercised by Adelaide and Willigis, archbishop of Mainz.

Having accompanied his troops in expeditions against the Bohemians and the Wends, Otto was declared of age in 995. In 996 he crossed the Alps and was recognized as king of the Lombards at Pavia. Before he reached Rome, Pope John XV., who had invited him to Italy, had died, whereupon he raised his own cousin Bruno, son of Otto duke of Carinthia, to the papal chair as Pope Gregory V., and by this pontiff Otto was crowned emperor on May 21, 996. On his return to Germany, the emperor learned that Gregory had been driven from Rome, which was again in the power of John Crescentius, patrician of the Romans, and that a new pope, John XVI., had been elected. Leaving his aunt, Matilda, abbess of Quedlinburg, as regent of Germany, Otto, in Feb. 998, led Gregory back to Rome, took the castle of St. Angelo by storm and put Crescentius to death. A visit to southern Italy, where many of the princes did homage to the emperor, was cut short by the death of the pope, to whose chair Otto then appointed his former tutor Gerbert, who took the name of Sylvester II.

In the palace which he built on the Aventine, Otto sought to surround himself with the splendour and ceremonial of the older emperors of Rome, and dreamed of making Rome once more the centre of a universal empire. Many names and customs were introduced into his court from that of Constantinople; he proposed to restore the Roman senate and consulate, revived the office of patrician, called himself "consul of the Roman senate and people" and issued a seal with the inscription, "restoration of the Roman empire." Passing from pride to humility he added "servant of the apostle," and "servant of Jesus Christ" to the imperial title, spent a fortnight in prayer in the grotto of St. Clement and did penance in various Italian monasteries.

Leaving Italy in the summer preceding the year 1000, when it was popularly believed that the end of the world was to come, Otto made a pilgrimage to the tomb of his old friend Adalbert, bishop of Prague, at Gnesen, and raised the city to the dignity of an archbishopric. He then went to Aix, and opened the tomb of Charlemagne, where, according to a legendary tale, he found the body of the great emperor sitting upright upon a throne, wearing the crown and holding the sceptre.

On his return to Rome, trouble arose between Otto and the citizens, and for three days the emperor was besieged in his palace. After a temporary peace, he fled to the monastery of Classe near Ravenna. Troops were collected, but whilst conducting a campaign against the Romans, Otto died at Paterno near Viterbo on Jan. 23, 1002, and was buried at Aix-la-Chapelle.

**OTTO IV.** (*c.* 1182–1218), Roman emperor, second son of Henry the Lion, duke of Saxony, and Matilda, daughter of Henry II., king of England, was most probably born at Argenton in central France. His father died when he was still young, and he was educated at the court of his uncle Richard I., king of England, under whose leadership he gained valuable experience in war, being appointed duke of Aquitaine, count of Poitou and earl of Yorkshire. When the emperor Henry VI. died in September 1197, some of the princes under the leadership of Adolph, archbishop of Cologne, were anxious to find a rival to Philip, duke of Swabia, who had been elected German king. After some delay their choice fell upon Otto, who was chosen king at Cologne on June 9, 1198. Hostilities broke out at once, and Otto, after a series of defeats, was driven to Brunswick. Preparations were made to drive him from here, when he was saved by the murder of Philip in June 1208. Many of the supporters of Philip now made overtures to Otto, and an attempt to set up Henry I., duke of Brabant, having failed, Otto submitted to a fresh election and was chosen German king at Frankfort on Nov. 11, 1208, in the presence of a large gathering of princes. A general reconciliation followed, which was assisted by the betrothal of Otto to Philip's eldest daughter Beatrix, but as she was only ten years old, the marriage was deferred until July 22, 1212. The pope, who had previously recognized the victorious Philip, hastened to return to the side of Otto; large concessions were made to the church.

In August 1209 the king set out for Italy. Meeting with no opposition, he was received at Viterbo by Innocent, but refused the papal demand that he should concede to the church all the territories which, previous to 1197, had been in dispute between

the Empire and the Papacy, consenting, however, not to claim supremacy over Sicily. He was crowned emperor at Rome on Oct. 4, 1209, a ceremony which was followed by fighting between the Romans and the German soldiers. The pope then requested the emperor to leave Roman territory; but he remained near Rome for some days, demanding satisfaction for the losses suffered by his troops. The breach with Innocent soon widened, and in violation of the treaty made with the pope Otto attempted to recover for the Empire all the property which Innocent had annexed to the Church, and rewarded his supporters with large estates in the disputed territories.

Having occupied Tuscany he marched into Apulia, part of the kingdom of Frederick of Hohenstaufen, afterwards the emperor Frederick II., and on Nov. 18, 1210, was excommunicated by the pope. Regardless of this sentence Otto completed the conquest of southern Italy, but the efforts of Innocent had succeeded in arousing considerable opposition in Germany, where the rebels were also supported by Philip Augustus, king of France. A number of princes assembled at Nuremberg declared Otto deposed, and invited Frederick to fill the vacant throne. Returning to Germany in March 1212, Otto made some headway against his enemies until the arrival of Frederick towards the close of the year. The death of his wife in August 1212 had weakened his hold on the southern duchies, and he was soon confined to the district of the lower Rhine, although supported by money from his uncle King John of England. The final blow to his fortunes came when he was decisively defeated by the French at Douvines in July 1214. He escaped with difficulty from the fight and took refuge in Cologne. His former supporters hastened to recognize Frederick; and in 1216 he left Cologne for Brunswick, which he had received in 1202 by arrangement with his elder brother Henry. The conquest of Hamburg by the Danes, and the death of John of England, were further blows to his cause. On May 19, 1218, he died at the Harzburg after being loosed from the ban by a Cistercian monk, and was buried in the church of St. Blasius at Brunswick. He left no children.

**OTTO,** king of Greece (1815–1867), second son of Louis I., king of Bavaria, and his wife Teresa of Saxe-Altenburg, was born at Salzburg on June 1, 1815, and was educated at Munich. In 1832 he was chosen by the conference of London to occupy the newly-erected throne of Greece, and on Feb. 6, 1833, he landed at Nauplia, then the capital of independent Greece. Otto, who was not yet eighteen, was accompanied by a council of regency composed of Bavarians under the presidency of Count Josef Ludwig von Armansperg (1787–1853). In 1835 Otto came of age, but, on the advice of his father and under pressure of Great Britain and of the house of Rothschild, who all believed that a capable finance minister was the supreme need of Greece, he retained Armansperg as chancellor of state. The Greeks were more heavily taxed than under Turkish rule; they had exchanged government by the sword, which they understood, for government by official regulations, which they hated; they had escaped from the sovereignty of the Mussulman to fall under that of a devout Catholic, to them a heretic. Otto was well intentioned, honest and inspired with a genuine affection for his adopted country; but it needed more than mere amiable qualities to reconcile the Greeks to his rule.

In 1837 Otto married Princess Amalie of Oldenburg, who made herself unpopular by interfering in the government. Meanwhile Armansperg had been dismissed by the king, but a Greek minister was not put in his place, and the granting of a constitution was postponed. The attempts of Otto to conciliate Greek sentiment by efforts to enlarge the frontiers of his kingdom, *e.g.*, by the suggested acquisition of Crete in 1841, only succeeded in embroiling him with the powers. His power rested wholly on Bavarian bayonets; and when, in 1843, the last of the German troops were withdrawn, he was forced by the outbreak of a revolutionary movement in Athens to grant a constitution and to appoint a ministry of native Greeks.

For the British blockade of the Peiraeus and Greek intervention in the Crimean War *see* GREECE: *History*. Otto's position in Greece became untenable. In 1861 a student named Drusios attempted to murder the queen, and was hailed by the populace as a modern Harmodius. In October 1862 the troops in Acarnania under General Theodore Srivas declared for the king's deposition; those in Athens followed suit; a provisional government was set up and summoned a national convention. The king and queen, who were at sea, took refuge on a British warship, and returned to Bavaria, where, on July 26, 1867, Otto died.

**OTTO OF FREISING** (1114?–1158), German bishop and chronicler, was the fifth son of Leopold III., margrave of Austria, by his wife Agnes, daughter of the emperor Henry IV. By her first husband, Frederick I. of Hohenstaufen, duke of Swabia, Agnes was the mother of the German king Conrad III., and grandmother of the emperor Frederick I.; and Otto was thus related to the most powerful families in Germany. He studied in Paris, and became abbot of the Cistercian monastery of Morimond in Burgundy about 1136, soon afterwards being elected bishop of Freising. In 1147 he took part in the disastrous crusade of Conrad III., returning to Bavaria in 1148 or 1149. He enjoyed the favour of Conrad's successor, Frederick I.; was probably instrumental in settling the dispute over the duchy of Bavaria in 1156; was present at the famous diet at Besançon in 1157, and died at Morimond on Sept. 22, 1158.

Otto wrote a *Chronicon*, sometimes called *De duabus civitatibus*, an historical and philosophical work in eight books, which follows to some extent Augustine and Orosius. It goes down to 1146, and from this date until 1209 has been continued by Otto, abbot of St. Blasius (d. 1223). Of the *Gesta Friderici imperatoris* the first two books were written by Otto, and the remaining two probably by his pupil Ragewin, or Rahewin. First printed by John Cuspinian at Strasbourg in 1515, Otto's writings are now issued in the *Monumenta Germaniae historica*, Band xx. (Hanover, 1868); German trans. by H. Kohl (Leipzig, 1881–86). The *Gesta Friderici* has been published separately with introduction by G. Waitz.

Freising" in *Gesellschaft für ältere deutsche Geschichtskunde* (Hanover, 1911); A. Potthast, *Bibliotheca historica* (1896).

**OTTO OF NORDHEIM** (d. 1083), duke of Bavaria, belonged to the rich and influential Saxon family of the counts of Nordheim, and received the duchy of Bavaria from Agnes, widow of the emperor Henry III., in 1061. In 1062 he assisted Anno, archbishop of Cologne, to seize the German king, Henry IV.; led a successful expedition into Hungary in 1063; and took a prominent part in the government during the king's minority. In 1064 he went to Italy to settle a papal schism, secured the banishment from court of Adalbert, archbishop of Bremen, and crossed the Alps in the royal interests on two other occasions. In 1070 Otto was accused of being privy to a plot to murder the king, and was required to submit to the ordeal of battle with his accuser. The duke asked for a safe-conduct to and from the place of meeting, and when this was refused he declined to appear, and was consequently deprived of Bavaria, while his Saxon estates were plundered. He obtained no support in Bavaria, but raised an army among the Saxons and carried on a campaign of plunder against Henry until 1071, when he submitted; in the following year he received back

his private estates. When the Saxon revolt broke out in 1073 Otto is represented by Bruno, the author of *De bello Saxonico,* as delivering an inspiring speech to the assembled Saxons at Wormsleben, after which he took command of the insurgents. By the peace of Gerstungen in 1074 Bavaria was restored to him; he shared in the Saxon rising of 1075, after which he was again pardoned and made administrator of Saxony. After the excommunication of Henry IV. in 1076 Otto attempted to mediate between Henry and the Saxons, but when these efforts failed he again placed himself at their head. He assented to the election of Rudolph, count of Rheinfelden, as German king, when his restoration to Bavaria was assured, and by his skill and bravery inflicted defeats on Henry's forces at Mellrichstadt, Flarchheim and Hohenmölsen. He remained in arms against the king until his death on Jan. 11, 1083. By his wife Richenza, widow of Hermann, count of Werla, he left six children.

*See* H. Mehmel, *Otto von Nordheim, Herzog von Bayern* (Göttingen, 1870); E. Neumann, *De Ottone de Nordheim* (Breslau, 1871); and A. Vogeler, *Otto von Nordheim* (Göttingen, 1880).

**OTTOMAN BANK.** The establishment of the "Imperial Ottoman Bank" was authorized by *Firman* in 1863 and effected by a Convention between the Turkish Government and a banking consortium of the English and French founders. Its function then was to act as the State Bank of the Turkish Empire. It was granted the exclusive right of note issue, but this has since been transferred to the Central Bank of the Republic.

In 1925 the concession under which the bank works was extended, with certain modifications, for ten years. At the same time the title "Imperial" was dropped, and the institution is now known as the "Ottoman Bank." Subsequently a further extension was made to 1952. Its legal domicile is Istanbul; the directing committees reside and meet in London and Paris, in which cities the bank has important offices. It has also a branch at Manchester and branches at Marseilles and Nice. In addition the bank has branches in the following countries: Turkey (27), Egypt (8), Cyprus (6), 'Iraq (3), Palestine (5), Greece (1), Iran (2), and Transjordan (1). A subsidiary institution, the Banque de Syrie et du Liban, has some fifteen branches throughout Syria. The Ottoman Bank is actively interested in the Banque Franco-Serbe, The Bank of Rumania Ltd., and the British-French Discount Bank Ltd. The capital of the bank is £10,000,000, of which half is paid up, the reserve is £1,250,000. The Ottoman Bank maintains its character as an Anglo-French institution.

(C.E.L.C; X.)

**OTTOMAN EMPIRE,** the empire founded by Osman (1288–1320), which lasted six centuries and a half, and fell before the democratic movement inaugurated at Angora in 1919 by Mustafa Kemal Pasha (*q.v.*). (*See* CALIPHATE; TURKEY.)

**OTTRELITE** (from Ottrez, Belgium, the original locality), in mineralogy, a member of a group of closely related minerals with the general composition $H_2O$. RO. $Al_2O_3$. $SiO_2$, in which RO is dominantly FeO, but is often in part represented by a content of MgO or MnO. On account of its petrographic importance the term ottrelite is often used as the group name for this series of minerals, though the name clintonite is also in use. The chief members are chloritoid ($H_2$ Fe $Al_2$ $SiO_7$), sismondine ($H_2$ [Fe, Mg] $Al_2SiO_7$) in which the magnesia rises to 7%, and ottrelite the manganiferous variety ($H_2$[FeMn] $Al_2SiO_7$) in which the MnO content may rise to 8%. They are grey, green or black micaceous minerals, but in distinction from the "elastic" micas and "flexible" chlorites they are often referred to as the "brittle micas" on account of the brittleness of their laminae. Like the micas and chlorites they possess monoclinic symmetry and a perfect cleavage parallel to the flat surface (001) of the plates. Their superior hardness (H=6·5) readily distinguishes them from both these groups of minerals. Multiple twinning on the mica law is exceedingly common, and a zonal structure (often of hour-glass type) is often apparent. The ottrelite group of minerals is confined to metamorphic rocks—particularly those developed in regional metamorphism—in slates, phyllites and schists. Noteworthy occurrences of this mineral are the slates of the Ardennes, of Tintagel (Cornwall) and in the Mesozoic and Permian schists of the Swiss and Italian Alps.

The minerals margarite, xanthophyllite and kossmatite show some relations with the ottrelite group of minerals. They are distinguished by an inferior hardness and contain calcium as an essential constituent. Margarite ($H_2Ca$ $Al_4Si_2$ $O_{12}$) occurs in white pearly scales associated with corundum and is a common mineral of emery deposits. Xanthophyllite occurs in talc-chlorite schists at Slatoust in the Urals and in altered limestone at Riverside, California, while kossmatite is a recently described lime-rich mineral (H=2·5) occurring in the dolomite marbles of West Macedonia.

(C. E. T.)

**OTTUMWA,** a city of south-eastern Iowa, U.S.A., on the Des Moines river, at an altitude of 650 ft.; the county seat of Wapello county. It is on Federal highways 34 and 63, and is served by the Burlington Route, the Chicago, Milwaukee, St. Paul and Pacific, the Rock Island and the Wabash railways. Pop. 1940 Federal census, 31,570. The city is built on a series of terraces rising from the river. It is in the bituminous coalfields of Iowa, at the heart of the corn and meat producing area of the Middle West. Pork products, serum, agricultural implements, boilers, car loaders, hoisting engines, chicken coops, lawn mowers, mine equipment and supplies, carpenters' squares and ice-cream cabinets are among the leading manufactures. The aggregate factory product in 1939 was valued at $70,000,000. Ottumwa was founded in 1843, incorporated as a town in 1851, and chartered as a city in 1857. The name is a modification of an Indian word meaning "rippling water."

**OTUQUIAN,** a tribe or small group of tribes of South American Indians, constituting an independent linguistic stock, so called from the Otuquis, the most important tribe. The group, which was nearly extinct in the early part of the 19th century, lived in north-eastern Bolivia in the eastern portion of the province of Chiquitos, on the Otuquis river and between it and the Paraguay, between 17° and 18° S. lat. At that time the remnant of the people were located at the mission of Santa Corazon de Chiquitos, and had already lost their original culture.

*See* G. L. Kriegk, *Das Land Otuquis in Bolivia* (Frankfurt, 1838); G. de Crequi-Montfort and P. Rivet, "Le groupe Otuke" (*J. Soc. Americanistes de Paris* [n.s.] vol. ix., pp. 317–337); *ibid.,* "Les affinités des dialectes Otuke" (*ibid.* vol. x., pp. 369–377).

**OTWAY, THOMAS** (1652–1685), English dramatist, was born at Trotten, near Midhurst, Sussex, on March 3, 1652. His father, Humphrey Otway, was at that time curate of Trotton, but Otway's childhood was spent at Woolbeding, a parish 3 m. distant, of which his father had become rector. He was educated at Winchester College, and in 1669 entered Christ Church, Oxford, as a commoner, but left the university without a degree in the autumn of 1672. In 1675 Thomas Betterton produced at Dorset Garden theatre Otway's first drama, *Alcibiades,* which was printed in the same year. It is a poor tragedy saved from absolute failure by the actors. He made a great advance on this first work in *Don Carlos, Prince of Spain* (licensed June 15, 1676; an undated edition probably belongs to the same year). In it the two characters familiar throughout his plays make their appearance. Don Carlos is the impetuous, unstable youth, who seems to be drawn from Otway himself, while the queen's part is the gentle pathetic character repeated in his more celebrated heroines, Monimia and Belvidera. In 1677 Betterton produced two adaptations from the French by Otway, *Titus and Berenice* (from Racine's *Bérénice*), and the *Cheats of Scapin* (from Molière's *Fourberies de Scapin*). These were printed together, with a dedication to Lord Rochester. In 1678 he produced an original comedy, *Friendship in Fashion,* popular at the moment, though it was hissed off the stage for its gross indecency when it was revived at Drury Lane in 1749.

Meanwhile he had conceived an overwhelming passion for Mrs. Barry, who filled many of the leading parts in his plays. Six of his letters to her survive, the last of them referring to a broken appointment in the Mall. In 1678, driven to despair by her, Otway obtained a commission through Charles, earl of Plymouth, a natural son of Charles II., in a regiment serving in the Netherlands. The English troops were disbanded in 1679, but

were left to find their way home as best they could. They were also paid with depreciated paper, and Otway arrived in London late in the year, ragged and dirty, a circumstance utilized by Rochester in his "Sessions of the Poets," which contains a scurrilous attack on his former protégé.

Early in the next year (February 1680) was produced at Dorset Garden the first of Otway's two tragic masterpieces, *The Orphan, or The Unhappy Marriage,* Mrs. Barry playing the part of Monimia. Written in blank verse, which shows a study of Shakespeare, its success was due to the tragic pathos, of which Otway was a master, in the characters of Castalio and Monimia. *The History and Fall of Caius Marius,* produced in the same year, and printed in 1692, is a curious grafting of Shakespeare's *Romeo and Juliet* on the story of Marius as related in Plutarch's *Lives.* In 1680 Otway also published *The Poet's Complaint of his Muse, or A Satyr against Libells,* in which he retaliated on his literary enemies. An indifferent comedy, *The Soldier's Fortune* (1681), was followed in February 1682 by *Venice Preserved, or A Plot Discover'd.* The story is founded on the *Histoire de la conjuration des Espagnols contre la Venise en 1618,* by the Abbé de Saint-Réal, but Otway modified the story considerably. The character of Belvidera is his own, and the leading part in the conspiracy, taken by Bedamor, the Spanish ambassador, is given in the play to the historically insignificant Pierre and Jaffier. The piece has a political meaning, enforced in the prologue. The Popish Plot was in Otway's mind, and Anthony, 1st earl of Shaftesbury, is caricatured in Antonio. The play won instant success. It was translated into almost every modern European language, and even Dryden said of it: "Nature is there, which is the greatest beauty."

*The Orphan* and *Venice Preserved* remained stock pieces on the stage until the 19th century, and the leading actresses of the period played Monimia and Belvidera. One or two prefaces, another weak comedy, *The Atheist* (1684), and two posthumous pieces, a poem, *Windsor Castle* (1685), a panegyric of Charles II., and a *History of the Triumvirates* (1686), translated from the French, complete the list of Otway's works. He apparently ceased to struggle against his poverty and misfortunes. The generally accepted story regarding the manner of his death was first given in Theophilus Cibber's *Lives of the Poets.* He is said to have emerged from his retreat at the Bull on Tower Hill to beg for bread. A passer-by, learning who he was, gave him a guinea, with which Otway hastened to a baker's shop. He began too hastily to satisfy his ravenous hunger, and choked with the first mouthful. Whether this account of his death be true or not, it is certain that he died in the utmost poverty, and was buried on April 16, 1685, in the churchyard of St. Clement Danes. A tragedy entitled *Heroick Friendship* was printed in 1686 as Otway's work, but the ascription is unlikely.

*The Works of Mr. Thomas Otway with some account of his life and writings,* published in 1712, was followed by other editions (1757, 1768, 1812). The standard edition is that by T. Thornton (1813). A selection of his plays was edited for the Mermaid series (1891 and 1903) by Roden Noel. *See* E. Schumacher, *Thomas Otway* (Bonn, 1924).

**OUBLIETTE,** a French architectural term used in two senses, of a dungeon in a prison or castle which could only be reached by a trap-door from another dungeon, and of a concealed opening or passage leading from a dungeon to the moat or river, into which bodies of prisoners might be dropped. Many so-called "oubliettes" in mediaeval castles were in reality the cesspools or receptacles of the castle latrines.

**OUDENARDE,** a town of Belgium in the province of East Flanders, 18 mi. S. of Ghent. Pop. (1939) 6,483. Known for the victory by Marlborough and Eugene over the French under Vendôme in 1708, Oudenarde has other features of interest. The town hall, which took ten years to build (1525–1535), has after that of Louvain the most elaborately decorated façade in Belgium. It was designed by H. van Peede and G. de Ronde, and is in tertiary Gothic style. The belfry tower of five storeys with three terraces, surmounted by a golden figure, is a striking feature. The council chamber contains a fine oak door and Gothic chimney-piece, both *c.* 1530. There are also two interesting old churches, St. Walburga, partly of the 12th and partly of the 14th century, and Our Lady, dating from the 13th century. The former contains several pictures by Craeyer and other Flemish masters.

The Battle of Oudenarde (June 30–July 11, 1708) was fought on the ground north-west and north of the town, which was then regularly fortified and was garrisoned by a force of the Allies. For an account of the strategic situation which led up to the battle, *see* SPANISH SUCCESSION, WAR OF THE. The French army under the duke of Burgundy and Marshal Vendôme, after an abortive attempt to invest Oudenarde, took up a defensive position north of the town when Marlborough and Eugene, after a forced march, arrived with the main Allied army. The advanced guard of the Allies under General (Lord) Cadogan promptly crossed the Scheldt, annihilated an outlying body of French troops, and established itself on the ground it had won, in front of the French centre. But the Allied main army took a long time to defile over the Scheldt and could form up (on the left of Cadogan's detachment) only slowly and by degrees. Observing this, Burgundy resolved to throw forward his right towards Oudenarde to engage and hold the main body of the Allies before their line of battle could be formed. This effected, it was hoped that the remainder of the French army could isolate and destroy Cadogan's detachment, which was already closely engaged with the French centre. But he miscalculated both the endurance of Cadogan's men (amongst whom the Prussians were conspicuous for their tenacity) and the rapidity with which in Marlborough's and Eugene's hands the wearied troops of the Allies could be made to move. Marlborough, who personally directed the operations on his left wing, not only formed his line of battle successfully, but also began seriously to press the forces that had been sent to check his deployment. Before long, while the hostile left wing still remained inactive, the unfortunate troops of the French centre and right were gradually hemmed in by the whole force of the Allies. The decisive blow was delivered by the Dutch marshal, Overkirk, who was sent by Marlborough with a large force (the last reserve of the Allies) to make a wide turning movement round the extreme right of the French, and at the proper time attacked them in rear. A belated attempt of the French left to intervene was checked by the British cavalry, and the pressure on the centre and right, which were now practically surrounded, continued even after nightfall. A few scattered units managed to escape, and the left wing retreated unmolested, but at the cost of about 3,000 casualties the Allies inflicted a loss of 6,000 killed and wounded and 9,000 prisoners on the enemy, who were, moreover, so shaken that they never recovered their confidence to the end of the campaign. The battle of Oudenarde was not the greatest of Marlborough's victories, but it affords almost the best illustration of his military character. Contrary to all the rules of war then in vogue, he fought a piecemeal and unpremeditated battle, with his back to a river, and with wearied troops, and succeeded.

**OUDINÉ, EUGÈNE ANDRÉ** (1810–1887), French sculptor and medallist, was born in Paris in 1810, and devoted himself from the beginning to the medallist's branch of sculpture, although he also excelled in monumental sculpture and portrait busts. He gained the grand prize for medal engraving in 1831, and in the same year exhibited his "Wounded Gladiator." He subsequently occupied official posts as designer to the Inland Revenue and to the Mint. His most famous medals are those struck in commemoration of the annexation of Savoy by France and of the peace of Villafranca. Others are "The Apotheosis of Napoleon I.," "The Universal Exposition," "The Establishment of the Republic," and "Napoleon's Tomb at the Invalides." Oudiné, who may be considered the father of the modern medal, died in 1887.

**OUDINOT, CHARLES NICOLAS** (1767–1847), duke of Reggio, marshal of France, was born at Bar-le-duc, on April 25, 1767. He served in the regiment of Médoc from 1784 to 1787, retiring with the rank of sergeant. On the outbreak of war in 1792 he became lieutenant colonel in the volunteers of the Meuse, being transferred to the regular army after his defence of the fort of Bitsch (1792). He was promoted general of brigade in June 1794, after the battle of Kaiserslautern. He served on the German frontier under Hoche, Pichegru and Moreau, and in the

Swiss campaign of 1799 with Masséna. He was made inspector-general of infantry, and in the war of 1805 he commanded the famous "grenadiers Oudinot," with which he seized the Vienna bridges, and gave the decisive blow at Austerlitz. In 1808 he was made governor of Erfurt and count of the Empire, and in 1809 after Wagram, he was promoted marshal. He was made duke of Reggio, and received a large money grant in April 1810. Oudinot governed Holland from 1810 to 1812, and commanded the II. corps of the *Grande Armée* in the Russian campaign. For his defeat at Grossbeeren *see* NAPOLEONIC CAMPAIGNS. He was superseded by Ney, who was defeated at Dennewitz. Oudinot again held important commands at Leipzig and in the 1814 campaign. He was made a peer under Louis XVIII., and did not join Napoleon in 1815. His last active service was in the French invasion of Spain in 1823, in which he commanded a corps, and was for a time governor of Madrid.

**OUIDA,** the pen name—derived from a childish attempt to pronounce "Louisa"—of Maria Louise [de la] Ramée (1839–1908), English novelist, born at Bury St. Edmunds, where her birth was registered on Jan. 7, 1839. Her father, Louis Ramée, was French, and her mother, Susan Sutton, English. In 1860 her first story, afterwards republished as *Held in Bondage* (1863), appeared in the *New Monthly* under the title of *Granville de Vigne,* and this was followed in quick succession by *Strathmore* (1865), *Chandos* (1866) and *Under Two Flags* (1867). The list of Ouida's subsequent works is a very long one; but it is sufficient to say that, together with *Moths* (1880), those already named are not only the most characteristic, but also the best. In a less dramatic genre, her *Bimbi: Stories for Children* (1882) may also be mentioned; but it was by her more flamboyant stories, such as *Under Two Flags* and *Moths,* that her popular success was achieved. She died at Viareggio Jan. 25, 1908.

**OULU,** a seaport and industrial town of Finland on the Gulf of Bothnia in 65° N., 25° 29′ E., linked by rail to Helsinki. Pop. (1939) 31,200. It is the chief town of a forested department of the same name. The accommodation in the harbour depends on the wind. The exports are timber, tar, leather, flour and wood products and the imports colonial produce, coals, iron, hides and salt.

**OUNCE.** (1) A unit of weight, being the twelfth part of a pound troy,=480 grains (through O.Fr. *unce,* modern *once,* from Lat. *uncia,* twelfth part, of weight, of a pound, of measure, of a foot, in which sense it gives the O.Eng. *ynce,* inch); in avoirdupois=437.5 grains, $\frac{1}{16}$ of a pound. The *fluid ounce* is a measure of capacity; in the United Kingdom it is equivalent to an avoirdupois ounce of distilled water at 62° F; in the United States of America it is the 128th part of the gallon,=$\frac{1}{4}$ gill,=456·033 grains of distilled water at its maximum density (*see* MEASURES AND WEIGHTS). (2) A name properly applied to the *Felis uncia* or snow-leopard (*q.v.*) It appears to have been originally used of various species of lynx, and is still sometimes the name of the Canada lynx.

**OUNDLE** (a corruption of "Avondale"), a town of Northamptonshire, England, 27 mi. N.N.E. of Northampton on the L.M.S. railway. Pop. (1938) 2,712; area, 3·6 sq.mi. The manor, with a market and tolls, belonged to the abbot of Peterborough. After the Dissolution they were granted to John, earl of Bedford, and the market still belongs to the lord of the manor. The church of St. Peter has Early English, Decorated and Perpendicular porticos. Oundle school was founded in 1556 under the will of Sir William Laxton, lord mayor of London, and in 1930 was granted a royal charter to be governed by the Grocers' company.

**OURO PRETO** ("Black Gold"), a city of the state of Minas Gerais, Brazil, 336 mi. by rail N. by W. of Rio de Janeiro, and about 300 mi. W. of Vitória, Espírito Santo, on the eastern slope of the Serra do Espinhaço and within the drainage basin of the Rio Doce. Pop. of the city and *município* (1940) 42,090. The city is built upon the lower slope of the Serra do Ouro Preto, a spur of the Espinhaço, deeply cut by ravines and divided into a number of irregular hills, up which the narrow, crooked streets are built and upon which groups of houses form each a separate nucleus. From a mining settlement the city grew as the inequalities of the site permitted. The rough streets are too steep and narrow for vehicles. The climate is sub-tropical and humid, though the elevation (3,700–3,800ft.) gives a temperate climate in winter. The days are usually hot and the nights cold. Ouro Preto has several historic buildings; the more noteworthy are the old government house (now occupied by the school of mines), the legislative chambers, municipal hall and prison—all fronting on the Praça da Independencia—the old Casa dos Contos (afterward the public treasury), a theatre (the oldest in Brazil, restored in 1861–62) and a hospital. There are 15 churches in the city, all dating from more prosperous days. Ouro Preto is the seat of one of Brazil's leading schools of mines, in connection with which there is a museum containing an outstanding collection of native minerals.

The city dates from 1701, when a gold-mining settlement was established in its ravines by Antonio Dias of Taubaté. The circumstance that the gold turned black on exposure to the humid air (owing to the presence of silver) gave the name of Ouro Preto to the mountain spur and the settlement. In 1711 it became a city with the name of Vila Rica, a title justified by its size and wealth. In 1720 Vila Rica became the capital of the newly created captaincy of Minas Gerais, and in 1823 the capital of the province of the same name under the empire of Dom Pedro I. When the empire was overthrown in 1889 and Minas Gerais was reorganized as a republican state, it was decided to remove the capital to a more favourable site and Belo Horizonte was chosen, but Ouro Preto remained the capital until 1898, when the new town (also called Cidade de Minas) became the seat of government. In 1933 the town was decreed a national monument and the region in which it lies a national park. (*See* MINAS GERAIS.)

**OUSE,** the name of several English rivers, an ancient word of disputed etymology.

(1) The Great Ouse rises in Northamptonshire, in the hills between Banbury and Brackley, and falls about 500 ft. in 160 m. to its mouth in the Wash (North sea). It flows east past Brackley and Buckingham and then turns north-east to Stony Stratford, receiving the Tove and the Ouzel at Newport Pagnell. It then follows a sinuous course past Olney to Sharnbrook, where it turns abruptly south to Bedford, then to flow north-east past St. Neot's to Godmanchester and Huntingdon, when the river trends easterly to St. Ives. Hitherto the Ouse has watered an open valley, but below St. Ives the river debouches suddenly upon the Fens; its fall from this point to the mouth, a distance of 55 m. by the old course, is little more than 20 feet. From Earith to Denver the waters of the Ouse flow almost wholly in two straight artificial channels called the Bedford Rivers, the old course being called the Old West River. This is joined by the Cam 4 m. above Ely. North of this point the river receives the Lark, the Little Ouse, or Brandon river, and the Wissey. Below Denver sluice, 16 m. from the mouth, the Ouse is tidal. It flows past King's Lynn, and enters the Wash near the south-east corner. The river is locked up to Bedford, a distance of 74½ m. by the direct course. A recent attempt to clear the river in order to make it more navigable and less liable to floods has been made, but has met with opposition from the farmers of the upper reaches.

(2) A river of Yorkshire. The river Ure, rising in the Pennines, and traversing Wensleydale, unites with the river Swale to form the Ouse near Boroughbridge, in the central plain of Yorkshire. The course of the Swale, which rises on the eastern flank of the Pennines, is mostly through this plain, and that of the Ouse is wholly so. It flows south-east passing York, Selby and Goole to the Trent, to form with that river the Humber estuary (*q.v.*). The course of the Ouse, thus defined, is 61 miles. The Swale and Ure are each about 60 m. long. Goole is a growing port, and the river bears much traffic up to York, smaller traffic up to Boroughbridge, from which the Ure Navigation (partly a canal) continues up to Ripon. The Swale is not navigable. The chief tributaries are the Nidd, the Wharfe, the Don and the Aire on the right, and the Derwent on the left. All traverse beautiful valleys, and the Aire and the Don, with canals, afford communications between south Yorkshire and the Humber ports. The Derwent is also navigable. It is tidal up to Naburn, 37 m. from the junction with the Trent.

(3) A river of Sussex, rising in the Forest Ridges between Horsham and Cuckfield, and draining part of the Weald. Like other streams here, it breaches the South Downs, and reaches the English channel at Newhaven after a course of 30 mi. The Ouse is navigable for small vessels to Lewes, and Newhaven is an important harbour.

**OUSEL** or **OUZEL,** the ancient name of the blackbird, but now applied, in combination, to the dipper (*q.v.*) or water-ousel, and to the ring-ousel (*Turdus torquatus*). This latter is a relative of the blackbird. The water-ousels (*Cinclidae*) are found near mountain streams in Europe and northern Asia, in the western United States, Central and South America.

**OUSELEY, SIR FREDERICK ARTHUR GORE** (1825–1889), English composer, son of Sir Gore Ouseley, ambassador to Persia, was born on Aug. 12, 1825, in London. He was a precocious child, and composed an opera at the age of eight years. Educated at Christ Church, Oxford, he took orders, and held two London curacies. In 1855 he succeeded Sir Henry Bishop as professor of music in the University of Oxford, was ordained priest and appointed precentor of Hereford. In 1856 he became vicar of St. Michael's, Tenbury, and warden of St. Michaels college. His works include the oratorio *Polycarp,* written for his Mus. Doc. degree (1854), a second oratorio, *Hagar* (Hereford, 1873), a great number of services and anthems, chamber music, songs, etc., and theoretical works. He died on April 6, 1889.

His uncle, SIR WILLIAM OUSELEY (1769–1842), British orientalist, wrote *Travels in Various Countries in the East, Especially Persia, in 1810, 1811 and 1812* (3 vol., 1819–23).

**OUSTER,** a legal term signifying dispossession, especially the wrong or injury suffered by a person dispossessed of freeholds or chattels real. The wrongdoer by getting into occupation forces the real owner to take legal steps to regain his rights. Ouster of the freehold may be effected by *abatement, i.e.,* by entry on the death of the person seized before the entry of the heir, or devisee; by *intrusion,* entry after the death of the tenant for life before the entry of the reversioner or remainderman; by *disseisin,* the forcible or fraudulent expulsion of the occupier or person seized of the property. Ouster of chattels real is effected by *disseisin,* the turning out by force or fraud of the legal proprietor before his estate is determined. Ouster by force, or forcible entry, was made a criminal offense by a statute of 1381.

**OUTLAWRY,** the process of putting a person out of the protection of the law; a punishment for contemptuously refusing to appear when called in court, or evading justice by disappearing. It was of very early existence in England, and was the punishment of those who could not pay the *were* or blood-money to the relatives of the deceased. By the Saxon law, an outlaw lost his *libera lex* and had no protection from the frank-pledge in the decennary in which he was sworn. He was, too, a *frendlesman,* because he forfeited his friends; for if any of them rendered him any assistance, they became liable to the same punishment. An outlaw was *civiliter mortuus.*

He could not sue in any court, nor had he any legal rights which could be enforced, but he was personally liable upon all causes of action. It was finally abolished in civil proceedings in 1879, while in criminal proceedings it has practically become obsolete, being unnecessary through the general adoption of extradition treaties.

In Scotland outlawry or fugitation may on the motion of the crown be pronounced by the supreme criminal court when the panel has absconded and fails to appear to plead to the indictment on the day of trial.

**OUTLAWRY OF WAR.** When, under the older conceptions of international law, nations went to war, their inter-state relations were regulated, for the period of belligerency, by the law of war instead of by the law of peace. "International law," writes Professor F. L. Schuman (*International Politics, An Introduction to the Western State System,* p. 109) "does not justify or sanction war but recognizes it as a fact of international politics and seeks to restrict and mitigate its cruel and destructive features." He goes on to point out that on the whole the principles of international law, governing the conduct of hostilities, have been reasonably well observed despite appearances to the contrary, the motives probably being expediency and fear of retaliation on the part of the belligerents. This is the case even where there is no formal declaration of war, as in the Sino-Japanese hostilities.

In the late twenties a group of American authorities interested in peace came to feel that the resort to war would be less likely if it were formally deprived of its legal status and definitely "outlawed." The advocates of the outlawry of war theory felt that so long as the institution of war remained respectable and enjoyed a recognized place in the field of international relations, the root of the evil remained.

Their solution of the problem was, in part, to oust war from its privileged position by denying it a legal status and placing a state indulging in hostilities against another state beyond the pale, that is to say, literally to outlaw it.

Among the principal advocates of the outlawry of war movement in the United States were Judge Florence E. Allen, Senator William E. Borah, Dr. Nicholas Murray Butler, Professor John Dewey, Reverend John Haynes Holmes, S. O. Levinson, Dr. C. C. Morrison, Reverend M. V. Oggel and the American Committee for the Outlawry of War.

The draft treaty to outlaw war which this last named committee suggested as a basis for discussion provided that the signatory states would:—

". . . condemn and abandon forever the use of war as an instrument for the settlement of international disputes and for the enforcement of decisions and awards of international tribunals, and hereby outlaw the immemorial institution of war by making its use a public crime as the fundamental law of nations."

would

". . . agree to take immediate action for the equipment of an international court of justice with a code of the laws of peace . . . jurisdiction over all purely international disputes as defined and enumerated in the code or arising under treaties, with power to summon in a defendant nation at the petition of a complaining nation and to hear and decide the matters in controversy."

and would

"agree to abide by and in full good faith to carry out the decisions of such international tribunal[1] . . ."

thus dropping the idea of other than moral sanctions for the enforcement of the outlawry of war plan.

The statesman primarily responsible for the idea of bringing about the renunciation of war by means of an *ad hoc* treaty was Aristide Briand, French minister of foreign affairs. On June 20, 1927, Briand proposed to the United States the conclusion of a bilateral treaty covering the ground suggested by the advocates of the outlawry of war.

In replying to this proposal the United States suggested that instead of contenting themselves with a bilateral declaration of the nature suggested by Briand, the two governments might make a more signal contribution to world peace by joining in an effort to obtain the concurrence therein of a large group of powers with a view to perfecting among all the nations of the world a mechanism for peace heretofore suggested only as between France and the United States.

The draft multilateral anti-war treaty proposed by the United States on June 23, 1928, was promptly accepted by 14 other governments and signed at Paris on Aug. 27, 1928. Its terms were as follows:

ARTICLE I.

"The High Contracting Parties solemnly declare in the names of their respective peoples that they condemn recourse to war for the solution of international controversies, and renounce it as an instrument of national policy in their relations with one another.

ARTICLE II.

"The High Contracting Parties agree that the settlement or solution of all disputes or conflicts of whatever nature or of whatever origin they may be, which may arise among them, shall never be sought except by pacific means.

ARTICLE III.

"The present Treaty shall be ratified by the High Contracting Parties

[1] *The Outlawry of War* by C. C. Morrison, p. 62 (Chicago, 1927).

named in the Preamble in accordance with their respective constitutional requirements, and shall take effect as between them as soon as all their several instruments of ratification shall have been deposited at Washington.

"This Treaty shall, when it has come into effect as prescribed in the preceding paragraph, remain open as long as may be necessary for adherence by all the other Powers of the world. Every instrument evidencing the adherence of a Power shall be deposited at Washington and the Treaty shall immediately upon such deposit become effective as between the Power thus adhering and the other Powers parties hereto.

"It shall be the duty of the Government of the United States to furnish each Government named in the Preamble and every Government subsequently adhering to this Treaty with a certified copy of the Treaty and of every instrument of ratification or adherence. It shall also be the duty of the Government of the United States telegraphically to notify such Governments immediately upon the deposit with it of each instrument of ratification or adherence."

The treaty was ratified by the United States senate on Jan. 15, 1929. On March 2 eleven nations deposited their ratifications at Washington. The ratifications of other nations followed rapidly so that on July 15 President Hoover set aside July 24 as the date for the formal proclamation of the treaty, and the ceremony marking the deposit of the ratifications of the 45 nations adhering to it was carried out on July 24, 1929.

Although great hopes were entertained at the time of the effect which these declarations would have in the preservation of peace, they had no observable deterrent effect upon the aggressions which shortly followed in Manchuria in 1931 or in China proper at a later stage; nor upon the Italian invasion of Ethiopia, nor upon the German-Italian interventions in Spain, nor on any of those which finally culminated in World War II. The Kellogg pact and other agreements for the renunciation of war, however, had one legal effect of some importance. They helped to make it expedient for states to refrain from formal declarations of war. Thus, though Japan in 1937 began to bombard Chinese cities and kill Chinese citizens in great numbers, she was not formally at "war." The bombardment and the killings were an "incident" of "intervention for the restoration of order." Other states at times followed the example so set. (N. AL.)

**OUTPUT:** *see* PRODUCTION, CENSUS OF.

**OUTRAM, SIR JAMES** (1803–1863), English general, and one of the heroes of the Indian Mutiny, was the son of Benjamin Outram of Butterley Hall, Derbyshire, civil engineer, and was born on Jan. 29, 1803. His father died in 1805, and his mother, a daughter of Dr. James Anderson, the Scottish writer on agriculture, removed in 1810 to Aberdeenshire. From Udny school the boy went in 1818 to the Marischal college, Aberdeen; and in 1819 an Indian cadetship was given him. Soon after his arrival at Bombay his remarkable energy attracted notice, and in July 1820 he became acting adjutant to the first battalion of the 12th regiment on its embodiment at Poona. In 1825 he was sent to Khandesh, where he trained a light infantry corps, formed of the wild robber Bhils, gaining over them a marvelous personal influence, and employing them with great success in checking outrages and plunder. Their loyalty to him had its principal source in their boundless admiration of his hunting achievements. For some time he was political agent in the Mahi Kantha district of Gujarat. In the first Afghan War in 1838 he was extra aide-de-camp on the staff of Sir John Keane. After conducting various raids against Afghan tribes, he was in 1839 promoted major, and appointed political agent in lower Sind, and later in upper Sind. He opposed the policy of his superior, Sir Charles Napier, which led to the annexation of Sind. When war broke out he heroically defended the residency at Hyderabad against 8,000 Baluchis; and it was Napier who then described him as "the Bayard of India."

On his return from a short visit to England in 1843, he was, with the rank of brevet lieutenant colonel, appointed to a command in the Mahratta country, and in 1847 he was transferred from Satara to Baroda, where he incurred the resentment of the Bombay government by his fearless exposure of corruption. In 1854 he was appointed resident at Lucknow, in which capacity two years later he carried out the annexation of Oudh and became the first chief commissioner of that province. Appointed in 1857, with the rank of lieutenant general, to command an expedition against Persia, he defeated the enemy with great slaughter at Khushab, and brought the campaign to a rapid conclusion.

From Persia he was summoned in June to India, with the brief explanation—"We want all our best men here." It was said of him at this time that "a fox is a fool and a lion a coward by the side of Sir J. Outram." Immediately on his arrival in Calcutta he was appointed to command the two divisions of the Bengal army occupying the country from Calcutta to Cawnpore; and to the military control was also joined the commissionership of Oudh. Already the mutiny had assumed such proportions as to compel Havelock to fall back on Cawnpore, which he only held with difficulty, although a speedy advance was necessary to save the garrison at Lucknow. On arriving at Cawnpore with reinforcements, Outram, "in admiration of the brilliant deeds of General Havelock," conceded to him the glory of relieving Lucknow, and, waiving his rank, tendered his services to him as a volunteer.

Resuming supreme command, he then held the town till the arrival of Sir Colin Campbell, after which he conducted the evacuation of the residency so as completely to deceive the enemy. In the second capture of Lucknow, on the commander in chief's return, Outram was entrusted with the attack on the side of the Gumti, and afterwards, having recrossed the river, he advanced "through the Chattar Manzil to take the residency," thus, in the words of Sir Colin Campbell, "putting the finishing stroke on the enemy." After the capture of Lucknow he was gazetted lieutenant general. In February 1858 he received the special thanks of both houses of parliament, and in the same year the dignity of baronet with an annuity of £1,000. Shattered in health he returned finally to England in 1860. He died on March 11, 1863.

*See* Sir F. J. Goldsmid, *James Outram, a Biography* (2 vols., 1880); and L. J. Trotter, *The Bayard of India* (1903).

**OUT RELIEF:** *see* POOR LAW.

**OVAL:** a figure or body shaped like the longitudinal section of an egg.

**OVAR,** a town of Portugal, at the northern extremity of the lagoon of Aveiro (*q.v.*); 21 mi. south of Oporto by the Lisbon-Oporto railway. Population 12,729. Ovar is the centre of important fisheries. Millet, wheat and vegetables—especially onions—are the chief products of the low-lying and unhealthy regions in which Ovar is situated.

**OVARIOTOMY** or **OÖPHORECTOMY,** the operation for removal of one or of both of the female ovaries (for anatomy *see* REPRODUCTIVE SYSTEM, ANATOMY OF). The progress of modern surgery has been conspicuously successful in this department. From 1701, the date when Houston of Carluke, Lanarkshire, carried out his successful partial extirpation, progress was arrested for some time, although the Hunters (1780) indicated the practicability of the operation. In 1809 Ephraim McDowell of Kentucky, inspired by the lectures of John Bell, his teacher in Edinburgh, performed ovariotomy, and, continuing to operate with success, established the possibility of surgical interference. He was followed by others in the United States. The cases brought forward by Lizars of Edinburgh were not sufficiently encouraging; the operation met with great opposition; and it was not until Charles Clay, Spencer Wells, Baker Brown and Thomas Keith began work that the procedure was placed on a firm basis and was regarded as justifiable. Improved methods were introduced, and surgeons vied with one another in trying to obtain good results. Eventually, by the introduction of the antiseptic, and later, the aseptic, system of treating wounds, this operation, formerly regarded as one of the most grave and anxious in the domain of surgery, came to be attended with a lower mortality than any other of a major character.

**OVEN-BIRD,** the name given to birds of the genus *Furnarius* of the American family of wood-hewers (*Dendrocolaptidae*), on account of the structure of the nest. They are small thrush-like birds confined to South America.

The name oven-bird is commonly given in the United States to the golden crowned water-thrush (*Seiurus aurocapillus*), one of the wood warblers, which builds an oven-shaped nest on the

ground.

*See* C. Darwin, *Voyage of the Beagle* (1845); W. H. Hudson, *A Naturalist in La Plata* (1892).

**OVERBECK, JOHANN FRIEDRICH** (1789–1869), German painter, the reviver of "Christian art" in the 19th century, was born in Lübeck on the 4th of July 1789. His ancestors for three generations had been Protestant pastors; his father was doctor of laws, poet, mystic pietist and burgomaster of Lübeck. In 1806, after finishing his course at the gymnasium, Overbeck left Lübeck and entered the Academy of Vienna, then under the direction of Füger, a painter of the pseudo-classic school of David. Not finding the help on which he had counted, Overbeck turned to the early and pre-Raphaelite masters of Italy for inspiration. At the end of four years he was expelled. He thereupon went to live in Rome, where he gathered about him a group of friends which included Cornelius, Veit and Wilhelm Schadow.

The little group made their home in the old Franciscan monastery of San Isidoro on the Pincian, and in 1813 Overbeck joined the Roman Catholic church. The group became known as the "Nazarites," "pre-Raphaelites," or "German-Roman artists." They believed in hard, honest work and holy living, eschewed the antique as pagan and the Renaissance as false, and aimed at bringing about a revival on the basis of nature and the serious art of Perugino, Pinturicchio, Francia and the young Raphael. Their painting was characterized by nobility of conception, precision—not to say hardness—of outline, and scholarly composition. Light, shade and colour they admitted only in the interests of clearness and correctness, and not as softening elements. Overbeck, with his saintly character and lofty ideals, was the natural leader and mentor of the party. They would have fared badly however from a practical point of view but for the timely help of Niebuhr, Bunsen, Friedrich Schlegel, and the Prussian consul Bartholdi, who commissioned the four friends to decorate his villa with frescoes on the story of Joseph and his Brethren. This led to another commission from Prince Massimo to paint the ceilings and walls of his pavilion. Overbeck's failing health did not allow him to finish his share of this undertaking and he delegated it to Joseph Führich. His last work was a "Vision of St. Francis" with life-size figures for the walls of Sta. Maria degli Angeli near Assisi. All his paintings bear the mark of religious fervour and careful preparation and have an element of religious propaganda. The handling is dry and severe and the colour restrained. His faith found its clearest expression in his religious cartoons, the *Gospels* (1852), *Via Crucis* (1857) and the *Seven Sacraments* (1861). He died in Rome on Nov. 12, 1869, and was buried in San Bernardo.

Overbeck's principal oil and easel paintings are: "Christ's Entry into Jerusalem" (1824), in the Marien Kirche, Lübeck; "Christ's Agony in the Garden" (1835), in the great hospital, Hamburg; "Lo Sposalizio" (1836), Raczynski gallery, Berlin; the "Triumph of Religion in the Arts" (1840), in the Städel Institut, Frankfort; "Pietà" (1846), in the Marien Kirche, Lübeck; the "Incredulity of St. Thomas" (1851), in the possession of Mr. Beresford Hope, London; the "Assumption of the Madonna" (1855), in Cologne Cathedral; "Christ delivered from the Jews" (1858), tempera, on a ceiling in the Quirinal Palace—a commission from Pius IX., and a direct attack on the Italian temporal government, therefore later covered by a canvas.

There are biographies by J. Beavington Atkinson (1882) and Howitt (1886).

**OVERBURY, SIR THOMAS** (1581–1613), English poet and essayist, and the victim of one of the most sensational crimes in English history, was the son of Nicholas Overbury, of Bourton-on-the-Hill, and was born in 1581 at Compton Scorpion, near Ilmington, in Warwickshire. In the autumn of 1595 he became a gentleman commoner of Queen's college, Oxford, took his degree in 1598 and came to London to study in the Middle Temple.

About the year 1601, being in Edinburgh on a holiday, he met Robert Carr, then an obscure page to the earl of Dunbar; and the two youths came up to London together. When Carr attracted the attention of James I., in 1606, by breaking his leg in the tilt-yard, Overbury had for some time been servitor-in-ordinary to the king. He was knighted in 1608, and in 1609 travelled in France and the Low Countries. When Carr was made Lord Rochester in 1610, the intimacy between the two was maintained.

But early in 1611 the Court became aware of the mutual attraction between Rochester and the youthful countess of Essex. To this intrigue Overbury was from the first violently opposed, and expressed his opinion of the countess in unmeasured terms. But Rochester was now infatuated, and he repeated to the countess what Overbury had said. Overbury also wrote, and circulated widely in ms., the poem called *The Wife,* which was a picture of the virtues which a young man should demand in a woman. The situation now resolved itself into a duel for the person of Rochester between the mistress and the friend. Overbury was thrown into the Tower on April 22, 1613, on a charge of disrespect to the king. Lady Essex, however, was not satisfied with his imprisonment; she was determined that "he should return no more to this stage." She bribed the gaoler, aided by Mrs. Turner, the widow of a physician, and by an apothecary called Franklin, to poison Overbury with copper vitriol. His constitution long withstood the timid doses they gave him, and he lingered until Sept. 15, 1613, when more violent measures put an end to his existence.

Two months later Rochester, now earl of Somerset, married Lady Essex. More than a year passed before suspicion was aroused, and when it was, the king showed disinclination to bring the offenders to justice. In the trial which followed, the plot was discovered. The four accomplices were hanged; the countess of Somerset pleaded guilty but was spared, and Somerset himself was disgraced. Meanwhile, Overbury's poem, *The Wife,* was published in 1614, and ran through six editions within a year. Much that must be spurious was added to the gathering snowball of Overbury's *Works,* the most famous of which are the *Characters.*

**OVERHEAD CHARGES.** Overhead charges, or on-costs, are an important factor in cost accounts. Prime cost represents outlays directly incurred for a particular purpose, and thus capable of being charged directly thereto. In addition, there are a number of indirect expenses which can only be dealt with by spreading them as equitably as may be over the total output.

Generally speaking, Overhead charges consist of such items as rent, rates, taxes, salaries, depreciation, interest, discounts, bad debts, etc., from which may be deducted corresponding credits. But in order to arrive at costs that are comparable with those of similar undertakings, various adjustments become necessary. Thus, where business premises are owned, the rental value should be included, although not actually expended. When time is of importance, interest on outlays should be included, even although no interest may actually have been paid away. *Per contra,* interest on borrowed monies (including debentures) is not properly a factor in costs at all; and interest received on investments, although undoubtedly a profit, does not tend to reduce operative costs and should therefore be excluded. Many authorities also consider that bad debts have nothing to do with the costs. Depreciation of equipment is generally a very important factor but the modern tendency is to charge a *machine rate* of so much per hour as part of the direct costs, such rate being designed to cover depreciation, repairs and interest on capital; when this is done, no charge in respect of depreciation falls to be included as Overhead.

Formerly, it was thought to be sufficiently accurate to add a given percentage to prime cost as a loading to cover Overhead. It is now recognized that no satisfactory results can be achieved in this way. A uniform percentage of loading for Overhead would result in the aggregate amount actually charged against output varying directly with the prime cost, and thus the amount so charged would almost certainly be appreciably more or appreciably less than the true figure, according to whether the output was above or below the average. Further, such a system of allocation assumes that the fair loading for Overhead varies directly with the prime cost, whereas the employment of expensive materials does not necessarily increase the Overhead burden, and in many cases economies in labour costs can only be achieved by increasing the Overhead burden, *e.g.,* when machine work is substituted for hand work. Most production is complex, and consists of a series of successive processes or operations, each involving its own Overhead

charges. The modern practice is accordingly in the direction of analysing Overhead into departments, and distributing the burden of the departmental Overhead over the output of the department, usually *pro rata* according to the time occupied. In this way some approach to substantial accuracy may be reached, but no cut and dried formula will meet all cases.

Sometimes costs are appreciably increased by "spoils"—the curtailment of saleable output as a result of defective materials, machinery, workmanship or supervision. The only satisfactory way to deal with losses arising from spoils is to charge them as part of the Overhead burden of the department causing the spoil. If and when this is done the loss is thrown upon the right shoulders, and the effect commonly is to reduce very materially the loss arising from spoils by compelling managers to enquire more carefully into causes and possible remedies. (L. R. D.)

**OVERSEA INVESTMENTS:** *see* CAPITAL, EXPORT OF.

**OVERSEA SETTLEMENT COMMITTEE.** This important body was appointed in 1919 to assist and advise the British Government in their policy of undertaking closer responsibility than they had exercised in the past in connection with the movement of British subjects wishing to settle in other parts of the empire or to emigrate to foreign countries. The functions of the Emigrants' Information Office, which was established in 1886, were absorbed by the Oversea Settlement Committee. The president of the committee is the secretary of state for dominion affairs. It is a representative and non-political body, composed partly of official members representing various Government departments and partly of unofficial members. The staff of the committee forms a department (the oversea settlement department) of the Dominions Office.

The committee is entrusted with the administration of the Empire Settlement Act, 1922, which now forms the basis of the policy of State-aided empire settlement. The act was passed as the result of a conference with representatives of the self-governing dominions in 1921 and empowers the secretary of state "in association with the Government of any part of His Majesty's Dominions, or with public authorities or public or private organisations either in the United Kingdom or in any part of such Dominions, to formulate and co-operate in carrying out agreed schemes for affording joint assistance to suitable persons in the United Kingdom who intend to settle in any part of His Majesty's Oversea Dominions." Such schemes may take the form of development or land settlement schemes, or of schemes for facilitating settlement overseas by assistance with passages, training or in other ways. The contribution of the secretary of state may not exceed half the cost of any approved scheme and the maximum expenditure allowed under the act in any one year is £3,000,000.

**OVERSTONE, SAMUEL JONES LOYD,** 1ST BARON (1796–1883), English banker, the son of a Welsh dissenting minister, was born on Sept. 25, 1796. He became a partner in Jones, Loyd and Company (afterwards incorporated in the London and Westminster Bank), and by 1832 was recognized as one of the foremost authorities on banking. As Liberal member for Hythe, he sat in parliament from 1819 to 1826. He gave important evidence before various committees of the House of Commons, and was responsible for the main outlines of the Bank Charter Act (1844). In 1850 he was created Baron Overstone. He died in London on Nov. 17, 1883, leaving one daughter.

In 1858 a volume of *Tracts and other Publications on Metallic and Paper Currency,* by Lord Overstone, was edited by M'Culloch.

**OVERT ACT:** *see* INTENT; TREASON.

**OVERTURE** (Fr. *ouverture,* opening), in music, a detachable instrumental introduction to a dramatic or choral composition. The notion of an overture had no existence until the 17th century. The *toccata* at the beginning of Monteverdi's *Orfeo* is a barbaric flourish of every procurable instrument, alternating with a melodious section entitled *ritornello;* and, in so far as this constitutes the first instrumental movement prefixed to an opera, it may be called an overture. As an art-form the overture began to exist in the works of J. B. Lully. His favourite, but not his only, form constitutes the typical French overture that became classical in the works of Bach and Handel. This French overture consists of a slow introduction in a marked "dotted rhythm" (*i.e.,* exaggerated iambic, if the first chord is disregarded), followed by a lively movement in fugato style. The slow introduction was always repeated, and sometimes the quick movement concluded by returning to the slow tempo and material, and was also repeated (*see* Bach's French Overture in the *Klavierübung*).

The operatic French overture was frequently followed by a series of dance tunes before the curtain rose. It thus naturally became used as the prelude to a suite (*q.v.*); and the term was then applied to the whole suite.

Bach was able to adapt the French overture to choruses, and even to the treatment of chorales. Thus the overture—movements of his fourth orchestral suite became the first chorus of the church cantata *Unser Mund sei voll Lachens;* the choruses of the cantatas *Preise Jerusalem den Herrn* and *Höchst erwünschtes Freudenfest* are in overture form; and, in the first of the two cantatas entitled *Nun komm, der Heiden Heiland,* Bach has adapted the overture form to the treatment of a chorale.

Gluck could find no use for the French overture. In the epoch-making preface to *Alceste* he laid down the rule that the overture should be the musical argument of the drama. And the perfunctory overture to *Orfeo* is the only exception to the rule that in his great operas the orchestral introduction is actually interrupted by the rise of the curtain. In *Iphigénie en Tauride* it is merely the calm before the storm.

The abolition of the French overture did not, however, lead at first to any widespread adoption of Gluck's loose-knit Italian texture. The next form of overture was that of a three-movement symphony (*q.v.*) in sonata style. In Mozart's early opera *La Finta Giardiniera* the curtain rises upon what should have been the third movement; and in all later works the overture is distinguished from symphonic music in style as well as form. It is a single quick movement (with or without a slow introduction) in sonata form, loose in texture, without repeats, and frequently without a development section. Sometimes, in place of development, there is a melodious episode in slow time; as in Mozart's overtures to *Die Entführung* and to the fragment *Lo Sposo deluso,* in both of which cases the curtain rises at a point which throws a dramatic light upon this feature. Mozart at first intended a similar episode in the overture to *Figaro,* but struck it out as soon as he had begun it.

In Beethoven's hands the overture became more and more unlike the symphony, but it no longer remained an inferior species; and the final version of the overture to *Leonora* is the most gigantic single orchestral movement ever based on the sonata style. Weber's overtures work out prominent themes in his operas in a loose but effective sonata form, and are effective concert-pieces besides serving Gluck's purposes admirably. On the overture to Mendelssohn's *Elijah, see* MENDELSSOHN.

Overtures to plays naturally tend to become detached from their surroundings; and hence arises the concert overture, led by Beethoven's mighty *Coriolan,* and second only to the symphony as an orchestral art-form. Its derivation implies that it is programme-music (*q.v.*), but the programme need not impair the form, whether the form be Berlioz's or Brahms's, and the programme particular or generalized. Among overtures with a generalized programme Mendelssohn's *Hebrides* overture is a perfect masterpiece; and so is Brahms's Tragic overture, one of the greatest orchestral movements since Beethoven. Brahms's *Academic Festival Overture* is a glorious working out of German student songs.

In modern opera the overture, *Prelude, Vorspiel,* or whatever else it may be called, is often nothing more definite than that portion of the music which takes place before the curtain rises. *Tannhäuser* is the last important opera in which the overture retains vestiges of a self-contained sonata form. Fifty years before Wagner's wonderful *Vorspiel* to *Lohengrin,* Méhul had achieved an equally complete departure from classical forms in his interesting overtures to *Ariodant* and *Uthal,* in the latter of which a voice is heard on the stage before the rise of the curtain. Even the most self-contained of Wagner's later preludes lose by transference to the concert-room. The glorious *Vorspiel* to *Die*

*Meistersinger* is nobler when its long *crescendo* leads to the rise of the curtain and the engaging of all the listener's sense of sight and language, than when it can merely lead to a final tonic chord. Wagner himself added a page to finish the *Vorspiel* to *Tristan,* and by the richness and subtlety of that page he reveals how unready for independent existence the original *Vorspiel* was. He also finished the *Parsifal* Vorspiel for concert use by the addition of a few extra bars, which will always sound perfunctory. The four dramas of the *Ring* begin with introductions designed to prepare the hearer immediately for the rise of the curtain; and these works can no more be said to have overtures than Verdi's *Falstaff* and Strauss's *Salome, Electra* and *Die Frau ohne Schatten,* in which the curtain rises at the first note of the music. (D. F. T.)

**OVERYSSEL,** a Netherlands province, bounded south and southwest by Gelderland, west by the Zuider Zee, north by Friesland and Drente, and east by Germany. The project to connect the northeast Polder with the north of the province was in preparation when Germany invaded the Netherlands in May 1940. Pop. of the province (1938) 569,920, showing about 50% increase during the 20th century; area, 1,295 sq.mi. It is a varied glaciated delta land consisting of a sandy flat relieved by hillocks, and covered with waste stretches of heath broken by patches of wood and high fen; but the coastal strip north of Zwartsluis consists largely of low-lying fertile pasture lands with cattle-rearing and associated butter and cheese manufactures, while along the shores mats and brushes are made.

The river system is determined by two main glacial ridges, of which the eastern one, which separates the Dinkel and Regge, extends from Enschede northwards into the German enclave; the larger one runs parallel with it and commencing at Lochem (Gelderland) extends into south Drente. In the south it separates the Yssel and Regge; its summit height (Lemeler Hill, 262 ft.) is near where it is breached by the Vecht. This river crosses the province from east to west and joins a part of the Yssel near Zwolle to form the Zwarte Water, which communicates with the Zuider Zee by the Zwolsche Diep; the main Yssel enters the Zuider Zee separately below Kampen. The streams are flanked by small-estate fertile grasslands from which agriculture and cattle-rearing have gradually spread over the sand-grounds; much of the area, however, is still waste though forest culture is practised locally, especially in the east, and pigs are largely bred. The deposits of the Yssel and the Dinkel streams contain iron ore, which is extracted and exported to Germany. Peat-digging and fen reclamation have long been practised and much high fen north of the Vecht in the neighbourhood of Dedemsvaart has been reclaimed though the main reclamation at present is taking place along and near to the eastern ridge. Large scale manufactures are not important in Overyssel but cotton-spinning, together with bleaching-works, came into some prominence in the 19th century in the south-east district of Twente. The inhabitants for long had practised weaving as a home craft but capitalist Baptist refugees who arrived in the 17th and 18th centuries organized it into an industry. Deventer has iron foundries and carpet-factories but is more famed for its honey cakes. The capital of the province is Zwolle, pop. (1940) 42,136, though Enschede (90,289) is the largest town. Deventer, Hengelo and Almelo each exceed 20,000 population and all four are situated in the south. Deventer is an old but busy little river port with a 16th century weigh-house of unusual design. Kampen, on the Yssel with its harbour long since silted up, has lost much of its importance of Hanseatic days but its 14th century churches and gateways are interesting. Its Stadhuis (16th and 18th century) is probably the finest town hall in the Netherlands. It shares a fishing trade with Vollenhove and Blokzijl, all on the Zuider Zee. Tucked away in the extreme north near the Drente border is the delightful little settlement of Giethoorn, literally a water village, each house possessing its own quay, drawbridge and punt. The railway system of the province is supplemented by tramlines and the roads are good but the waterways still carry much traffic.

**OVID** [PUBLIUS OVIDIUS NASO] (43 B.C.–A.D. 17), Roman poet, the last of the Augustan age, was born in 43 B.C., the last year of the republic. Thus the only form of political life known to Ovid was that of the absolute rule of Augustus and his successor. He was born on March 20 at Sulmo, picturesquely situated among the mountains of the Abruzzi: its wealth of waters and natural beauties seem to have quickened in him that appreciative eye for the beauties of nature which is one of the chief characteristics of his poems. Ovid, whose father was of equestrian family, belonged by birth to the same social class as Tibullus and Propertius, that of old hereditary landowners; but he was more fortunate than they in the immunity which his native district enjoyed from the confiscations made by the triumvirs. He and his brother had been brought early to Rome for their education, where they attended the lectures of two most eminent teachers of rhetoric, Arellius Fuscus and Porcius Latro, to which influence is due the strong rhetorical element in Ovid's style. His father did his best to dissuade him from poetry, and to drive him into the legal profession.

The earliest edition of the *Amores,* which first appeared in 5 books, and the *Heroides* were given by him to the world at an early age. "Virgil," he informs us, "he had only seen"; but Virgil's friend and contemporary Aemilius Macer used to read his didactic poems to him; and even the fastidious Horace sometimes delighted his ears with the music of his verse. He had a close bond of intimacy with the younger poets of the older generation—Tibullus, whose death he laments in one of the few pathetic pieces among his earlier writings, and Propertius, to whom he describes himself as united in the close ties of comradeship. The name of Maecenas he nowhere mentions. The time of his influence was past when Ovid entered upon his poetical career. But the veteran politician Messalla, the friend of Tibullus, together with his powerful son Cotta Messallinus and Fabius Maximus and other influential persons whose names are preserved in the *Epistles from Pontus* supported him. With the older poet, Macer, he travelled for more than a year. Whether this was immediately after the completion of his education, or in the interval between the publication of his earlier poems and that of the *Medea* and *Ars amatoria* is unknown, but it is in his later works, the *Fasti* and *Metamorphoses,* that we chiefly recognize the impressions of the scenes he visited. In one of the *Epistles from Pontus* (ii. 10) to his fellow-traveller there is a vivid record of the pleasant time they had passed together. They visited Athens, of course, the Mecca of all artistic pilgrimages then; went on to the site of Troy, and through the cities of Asia Minor; and finally spent a year in Sicily.

**Life in Rome.**—When settled at Rome, although a public career leading to senatorial position was open to him, and although he filled various minor posts, he had no ambition for such distinction, and looked upon pleasure and poetry as the occupations of his life. He was three times married; when little more than a boy to his first wife, whom he naïvely describes as unworthy of himself; but he was soon separated from her and took a second wife, with whom his union also did not last long. She was probably the mother of his one daughter. Later he married a third, of whom he always speaks with affection and respect. She was a lady of the great Fabian house, and thus connected with his powerful patron Fabius Maximus, and was a friend of the empress Livia. It therefore seems likely that he may have been admitted into the intimacy of the younger society of the Palatine. His liaison with his mistress Corinna, whom he celebrates in the *Amores,* took place probably in the period between his first and second, or between his second and third marriages. Ovid is not only a less constant but he is a less serious lover than his great predecessors Catullus, Tibullus and Propertius. His tone is that either of mere sensuous feeling or of irony. In his complete emancipation from all restraint he goes beyond them, and thus reflects the tastes and spirit of fashionable Rome between the years 20 B.C. and the beginning of our era.

Society was then bent simply on amusement; and, as a result partly of the loss of political interests, women came to play a more important and brilliant part in its life than they had done before. Julia, the daughter of the emperor, was by her position, her wit and beauty, and her reckless dissipation, the natural

leader of such a society. But the discovery of her intrigue (2 B.C.) with Iulus Antonius, the son of Mark Antony, was deeply resented by Augustus as being at once a shock to his affections and a blow to his policy of moral reform. Julia was banished and disinherited; Antonius and her many lovers were punished; and the Roman world awoke from its fool's paradise of pleasure. Nearly coincidently with this scandal appeared Ovid's *Ars amatoria,* perhaps the most immoral work ever written by a man of genius, though not the most demoralizing, since it is entirely free from morbid sentiment. By its brilliancy and heartlessness it appealed to the prevailing taste of the fashionable world; but its appearance excited deep resentment in the mind of the emperor, as is shown by his edict, issued ten years later, against the book and its author. Ovid appears to have had no idea of the storm that was gathering over him.

But he was aware that public opinion had been shocked, or professed to be shocked, by his last work; and after writing a kind of apology for it, called the *Remedia amoris,* he turned to other subjects, and wrote during the next ten years the *Metamorphoses* and the *Fasti.* He had already written the *Heroides,* in which he had imparted a modern and romantic interest to the heroines of the old mythology, and a tragedy, the *Medea,* which must have afforded greater scope for the dramatic and psychological treatment of the passion with which he was most familiar. In the *Fasti* Ovid assumes the position of a national poet by imparting poetical life and interest to the ceremonial observances of the Roman religion; but it is as the brilliant narrator of the romantic tales that were so strangely blended with the realistic annals of Rome that he succeeds in the part assumed by him. The *Metamorphoses* is a narrative poem which recounts legends in which the miraculous involved transformations of shape. Beginning with the change from Chaos to Cosmos, legends first Greek and then Roman are passed in review, concluding with the metamorphosis of Julius Caesar into a star and a promise of immortality to Augustus. The *Metamorphoses* is strongly tinged with Alexandrine influence, being in fact a succession of epyllia in the Alexandrine manner. This work, which Ovid regards as his most serious claim to immortality, had not been finally revised at the time of his disgrace, and in his despair he burnt it; but other copies were in existence, and when he was at Tomi it was published at Rome by one of his friends. He often regrets that it had not received his final revision. The *Fasti* also was broken off by his exile, after the publication of the first six books, treating of the first six months of the year.

**Banishment.**—In A.D. 8 Ovid was ordered by Augustus into banishment; for this he assigns two causes, his *Ars amatoria* and an actual offence (*Trist.* ii. 207). It is natural that Augustus should have felt resentment against the *Ars,* because its doctrine was a direct challenge to his policy of moral reform. What the actual offence was is a secret which the poet leaves unrevealed; since his disgrace coincided with the banishment of Augustus' granddaughter, the younger Julia, on account of an intrigue with Silanus, it has been supposed that Ovid was concerned in abetting that intrigue, and that this constituted his unforgivable sin. But if Ovid had really assisted to bring about the moral scandal which befell the emperor's family, it is incredible that he could have dared to allude to it, as he does constantly, in his poems. This, and the fact that, even after Augustus' death, his successor Tiberius left Ovid unpardoned, makes it probable that the offence was political and specially displeasing to Tiberius and Livia because it somehow interfered with their dynastic policy. Ovid may have been implicated with those who were over-zealous in the interests of rival possible successors to the throne, either Agrippa Postumus, the grandson of Augustus, or Germanicus, the brilliant and popular nephew of Tiberius, with many of whose friends Ovid was associated. Ovid's banishment was the mildest possible (*relegatio*); it involved no deprivation of civic rights, and left him the possession of his property. He was ordered to remove to the half-Greek, half-barbaric town of Tomi, near the mouth of the Danube. For eight years he bore up in his dreary solitude, suffering from the unhealthiness of the climate and the constant alarm of inroads of barbarians.

**The Epistle.**—In the hope of procuring a remission of his punishment he wrote poetical complaints, first in the series of the five books of the *Tristia,* sent successively to Rome, addressed to friends whose names he suppresses; afterwards in a number of poetical epistles, the *Epistulae ex Ponto,* addressed by name to friends who were likely to have influence at court. He believed that Augustus had softened towards him before his death, but his successor Tiberius was inexorable to his appeals. His chief consolation was the exercise of his art, though as time goes on he is painfully conscious of failure in power. But although the works written by him in exile lack the finished art of his earlier writings, their personal interest is greater. They have, like the letters of Cicero to Atticus, the fascination exercised by all confessions; they are a sincere literary expression of the state of mind produced by a unique experience—that of a man, when well advanced in years but still retaining extraordinary sensibility to pleasure and pain, withdrawn from a brilliant social and intellectual position, and cast upon his own resources in a place and among people affording the dreariest contrast to the brightness of his previous life. The letters, which compose the *Tristia* and *Epistulae ex Ponto,* are addressed either to his wife, the emperor, or the general reader, or to his patrons and friends. To his patrons he writes in a vein of supplication, beseeching them to use their influence on his behalf. To his rather large circle of intimate acquaintances he writes in the language of familiarity, and often of affectionate regard; he seeks the sympathy of some, and speaks with bitterness of the coldness of others, and in three poems (*Trist.* iii., 11, iv. 9; v. 8) he complains of the relentless hostility of the enemy who had contributed to procure his exile, and whom he attacked in the *Ibis.* There is a note of true affection in the letter to the young lyric poetess Perilla, of whose genius and beauty he speaks with pride, and whose poetic talents he had fostered by friendly criticism (*Trist.* iii., 7). He was evidently a man of gentle and genial manners; and, as his active mind induced him to learn the language of the new people among whom he was thrown, his active interest in life enabled him to gain their regard and various marks of honour. One of his last acts was to revise the *Fasti,* and re-edit it with a dedication to Germanicus. The closing lines of the *Epistulae ex Ponto* sound like the despairing sigh of a drowning man who had long struggled alone with the waves:—

> Omnia perdidimus: tantummodo vita relicta est,
> Praebeat ut sensum materiamque mali.

Shortly after these words were written he died in his sixty-first year in A.D. 17.

**Temperament.**—The temperament of Ovid, as indicated in his writings, has more in common with the suppleness of the later Italian than with the strength and force of the ancient Roman. That stamp of her own character and understanding which Rome impressed on the genius of those other races which she incorporated with herself is fainter in Ovid than in any other great writer. He disclaims the manliness which was regarded as the birthright of the Roman. He is equally devoid of dignity in his brilliant prime, and in his later disgrace. His religion is devoid of reverence, his feeling for nature of depth, his loves of sincerity and, almost, even of passion.

These defects in strength and gravity show a corresponding result in Ovid's writings. Though possessing diligence, perseverance and literary ambition, he seems incapable of conceiving a great and serious whole. But with all the levity of his character he must have had qualities which made him, if not much esteemed, yet much liked in his own day, and which are apparent in the genial amiability of his writings. He claims for himself two virtues highly prized by the Romans, *fides* and *candor*—the qualities of social honour and kindly sincerity. There is no indication of anything base, ungenerous or morose in his relations to others. Literary *candor,* the generous appreciation of all sorts of excellence, he possesses in a remarkable degree. He heartily admires everything in literature, Greek or Roman, that had any merit. In him more than any of the Augustan poets we find words of admiration applied to the rude genius of Ennius and the majestic style of Accius. It is by him that

Lucretius is first named and his sublimity is first acknowledged. The image of Catullus that most haunts the imagination is that of the poet who died so early—

hedera iuvenalia cinctus
Tempora,

as he is represented by Ovid coming to meet the shade of the young Tibullus in Elysium. To his own contemporaries, known and unknown to fame, he is as liberal in his words of recognition. He enjoyed society too in a thoroughly amiable and unenvious spirit. In his exile he did retaliate on one enemy and persistent detractor in the *Ibis,* a poem written in imitation of a similar work by Callimachus; but the *Ibis* is not a satire, but an invective remarkable rather for recondite learning than for epigrammatic sting.

But Ovid's chief personal endowment was his vivacity, and his keen interest in and enjoyment of life. The age in which he lived was, as he tells us, that in which more than any other he would have wished to live. He is its most gifted representative, and by not rising above it he reflects it the more perfectly. The sympathy which he felt for the love adventures of his contemporaries, to which he probably owed his fall, quickened his creative power in the composition of the *Heroides* and the romantic tales of the *Metamorphoses.* None of the Roman poets can people a purely imaginary world with such spontaneous fertility of fancy as Ovid. In the power and range of imaginative vision he is surpassed by no ancient and by few modern poets. This power of vision is the counterpart of his lively sensuous nature. He has a keener eye for the apprehension of outward beauty, for the life and colour and forms of nature, than any Roman or perhaps than any Greek poet. This power, acting upon the wealth of his varied reading, gathered with eager curiosity and received into a singularly retentive mind, has enabled him to depict with consummate skill and sympathy legendary scenes of the most varied and picturesque beauty. If his tragedy, the *Medea,* highly praised by ancient critics, had been preserved, we should have been able to judge whether Roman art was capable of producing a great drama. In many of the *Heroides,* and in several speeches scattered through his works, he gives evidence of true dramatic creativeness. Among the poets of all times he can imagine a story with the most vivid inventiveness and tell it with the most unflagging animation. The faults of his verse and diction are those which arise from the vitality of his temperament—too facile a flow, too great exuberance of illustration. He has as little sense of the need of severe restraint in his art as in his life. He is not without mannerism, but he is quite unaffected, and, however far short he might fall of the highest excellence of verse or style, it was not possible for him to be rough or harsh, dull or obscure.

As regards the school of art to which he belongs, he may be described as the most brilliant representative of Roman Alexandrinism. The latter half of the Augustan age was, in its social and intellectual aspects, more like the Alexandrine age than any other era of antiquity. Poetry was the chief branch of literature, and the chief subjects of poetry were mythological tales, various phases of the passion of love, the popular aspects of science and some aspects of the beauty of nature. These two were the chief subjects of the later Augustan poetry. Ovid was the last of this class of writers.

**Works.**—His extant works fall naturally into three divisions, those of his youth, of middle life and of his later years. To the first of these divisions belong the amatory poems: (1) the three books of *Amores* (originally five, but reduced later to three) relating to his amours with his mistress Corinna; (2) the *Heroidum Epistolae;* (3) the *Medicamina formae,* a fragment of 100 lines on the use of cosmetics; (4) the three books of the *Ars amatoria;* (5) the *Remedia amoris* (one book), a kind of recantation of the *Ars amatoria.* To the second division belong (6) the fifteen books of the *Metamorphoses,* and (7) the six books of the *Fasti,* which was originally intended to be in twelve books, but which breaks off the account of the Roman calendar with the month of June. To the third division belong (8) the five books of the *Tristia,* (9) the *Ibis,* an invective against an enemy who had assisted to procure his fall, written in elegiac couplets probably soon after his exile; (10) the four books of *Epistulae ex Ponto.* Of these the first three were published soon after the *Tristia,* while the fourth book is a collection of scattered poems published by some friend soon after the author's death. The *Halieutica* is a didactic fragment in hexameters on the natural history of fishes, of doubtful genuineness, though it is certain that Ovid did begin such a work at the close of his life.[1]

In his extant works Ovid confined himself to two metres—the elegiac couplet and the hexameter. The great mass of his poetry is written in the first; while the *Metamorphoses* and the *Halieutica* are composed in the second. Of the elegiac couplet he is the acknowledged master. By fixing it into a uniform mould he brought it to its highest perfection; and the fact that the great mass of elegiac verse written subsequently has endeavoured merely to reproduce the echo of his rhythm is evidence of his pre-eminence. In the direct expression and illustration of feeling his elegiac metre has more ease, vivacity and sparkle than that of any of his predecessors, while he alone has communicated to it, without altering its essential characteristic of recurrent and regular pauses, a fluidity and rapidity of movement which make it an admirable vehicle for pathetic and picturesque narrative. It was impossible for him to give to the hexameter greater perfection, but he imparted to it also a new character, rapid, varied, animated in complete accord with the swift, versatile and fervid movement of his imagination. One other proof he gave of his irrepressible energy by composing during his exile a poem in the Getic (Gothic) language in praise of the imperial family, the loss of which, whatever it may have been to literature, is much to be regretted in the interests of philology.

It was in Ovid's writings that the world of romance and wonder created by Greek imagination was first revealed to modern times. His influence was first felt in the literature of the Italian Renaissance. But in the most creative periods of English literature he seems to have been read more than any other ancient poet, not even excepting Virgil, and it was on minds such as those of Marlowe, Spenser, Shakespeare, Milton and Dryden that he acted most powerfully. His influence is equally unmistakable during the classical era of Addison and Pope. The most successful Latin verse of modern times has been written in imitation of him; the faculty of literary composition and feeling for ancient Roman culture has been largely developed in the great schools of England and France by the writing of Ovidian elegiacs. His works afforded also abundant stimulus and materials to the great painters who flourished during and immediately after the Renaissance. Thus his first claim on the attention of modern readers is the influence which he has exercised on the development of literature and art; for this, if for no other reason, his works must always retain an importance second only to those of Virgil and Horace.

He is interesting further as the sole contemporary exponent of the last half of the Augustan age, the external aspects and inner spirit of which is known from the works, not of contemporary historians or prose-writers, but from its poets. The successive phases of Roman feeling and experience during this critical period are revealed in the poetry of Virgil, Horace and Ovid. Virgil throws an idealizing and religious halo around the hopes and aspirations of the nascent empire. Horace presents the most complete image of its manifold aspects, realistic, and ideal. Ovid reflects the life of the world of wealth and fashion under the influence of the new court, its material prosperity, its refinement, its frivolity and its adulation. He is the last true poet of the great age of Roman literature, which begins with Lucretius and closes with him. But the type of genius of which he affords the best example is more familiar in modern Italian than in ancient Roman literature. While the serious spirit of Lucretius and Virgil reappeared in Dante, it is Ariosto who may be said to reproduce the light-hearted gaiety and brilliant fancy of Ovid.

BIBLIOGRAPHY.—The life of Ovid was first treated systematically by J. Masson, *Ovidii vita ordine chronologico digesta* (1780) (often reprinted, *e.g.,* in Burmann's edition). Modern literature on this subject will be found in Teuffel's *History of Roman Literature* (Eng. trans., ed. 2), § 247, and S. G. Owen's edition of *Tristia,* bk. i. The very numerous manuscripts of Ovid are chiefly of late date, 13th to

[1] Plin. *Hist. Nat.* xxxii. 152.

15th century. The earliest and best are: for the *Heroides,* a Paris ms. of the 9th, a Wolfenbüttel ms. of the 12th and an Eton fragmentary ms. of the 11th century (the *Epistula Sapphus,* found in no early ms., is best preserved in a 13th-century Frankfurt, and a 15th-century Harleian ms.); for the *Amores, Ars amatoria, Remedia amoris,* two Paris mss. of the 9th and 10th century respectively; for the *Medicamina formae,* a Florence ms. (Marcianus) of the 11th; for the *Metamorphoses,* two Florence mss. (Marcianus and Laurentianus), and a Naples ms., all of the 11th century; for the *Fasti* two Vatican mss. of the 10th and 11th centuries; for the *Tristia,* a Florence ms. of the 11th; for the *Epistulae ex Ponto,* a fragmentary Wolfenbütten ms. of the 6th, and a Hamburg and two Munich mss. of the 12th; for the *Ibis* a Trinity college, Cambridge, ms. of the 12th; for the *Halieutica,* a Paris ms. of the 9th or 10th, and a Vienna ms. of the 9th century. Important for the text of the *Heroides* and *Metamorphoses* is the interesting paraphrase written in Greek by the monk Maximus Planudes in the latter half of the 13th century at Constantinople; that of the *Heroides* is printed in Palmer's edition of the *Heroides* (1898), that of the *Metamorphoses* in Lemaire's edition of *Ovid,* vol. v, edited by Boissonade. *See* also Gudeman, *De Heroidum Ovidii codice Planudeo* (Berlin, 1888).

Two indepedent *editiones principes* of Ovid were published contemporaneously in 1471, one at Rome, printed by Sweynheym and Pannartz, and one at Bologna by Balthasar Azoguidius: these present entirely different texts. *See* Owen's *Tristium libri,* v. p. lv. ff. The following are the most important editions: those marked with an asterisk have explanatory notes. Of the whole works: *Heinsius-Burmann (1727); *Amar-Lemaire (1820–24); Merkel-Ehwald (1874–88); Riese (1871–89); Postgate's *Corpus poetarum Latinorum,* by various editors (1894), reprinted separately (1898). Of separate works: *Amores,* *Némethy (1907); *Heroides,* Sedlmayer (critical) (1886); *Palmer (1898); *Epistula Sapphus* (separately), *De Vries (1888); *Ars amatoria,* *P. Brandt (1902); *Medicamina formae* (critical), Kunz (1881); *Metamorphoses,* *J. C. Jahn (1821); *Loers (1843); Korn (critical) (1880); *Haupt-Ehwald (1898–1903); Magnus (1914); *R. S. Lang (Oxford, 1927); *Fasti,* *Gierig (1812); Merkel (1841); (critical, with learned prolegomena on the sources, the Roman calendar, etc.); *Keightley (1848); *Paley (1854); *Peter (1889); *Cyril Bailey (Oxford, 1921); *Tristia,* *Loers (1839); S. G. Owen (1889) (critical), with notes and translation (1924); *Bk. i (1885), *Bk. iii (1889); *Cocchia (1900); *Epistulate ex Ponto,* Korn (1868) (critical), Bk. i; *Ellis (1881); *Némethy (1915); *Halieutica,* *Birt, *De Halieuticis Ovidio poetae falso adscriptis* (1878). There is a free verse translation of the *Amores* by Marlowe (*c.* 1600), and Dryden, with other hands under his supervision, published translation of various works between 1683 and 1717.

The special treatises on matters connected with Ovid are very numerous; a fairly complete list up to the time of publication is given in Owen's *Tristia* (critical edition), p. cviii ff.; in Teuffel's *History of Roman Literature* (trans. by Warr) and in Schanz's *Geschichte der römischen Litteratur;* and by Ehwald in the *Jahresbericht über die Fortschritte der classischen Altertumswissenschaft,* xxxi (1884) pp. 157 ff., lxxx (1894) pp. 1 ff., cix (1902) pp. 157 ff. The following deserve special mention. On the history of the text: Ehwald, *Ad historiam carminum Ovidianorum symbolae* (1889); *Kritische Beiträge zu Ovids Epistulae ex Ponto* (1896); Sedlmayer, *Prolegomena ad Heroidas* (1878); Gruppe, *Minos,* pp. 441 ff. (on interpolations). On style: Ovid's diction in connection with other writers—A. Zingerle, *Ovidius und sein Verhältnis zu den Vorgängern* (1869–71); *Martial's Ovid-Studien* (1877); W. Zingerle, *Untersuchungen zur Echtheitsfrage der Heroiden Ovids* (1878); W. Vollgraff, *Nikander und Ovid* (Groningen, 1909 foll.). Peculiarities of Ovid's style: van Iddekinge, *De Ovidii Romani iuris peritia* (1811); Washietl, *De similitudinibus imaginibusque Ovidianis* (1883); M'Crea, *On Ovid's Use of Colour and Colour Terms* (Classical studies in honour of H. Drisler) (1894). Metre: the structure of the Ovidian pentameter examined in relation to the textual criticism—Hilberg, *Gesetze der Wortstellung im Pentameter des Ovid* (1894) (fully reviewed by Ellis, *Classical Review,* ix 157). Literary appreciation: Sellar, *Roman Poets of the Augustan Age;* Lafaye, *Les Métamorphoses d'Ovid et leurs modèles grecs.* Ovid's relation to works of art: Wunderer, *Ovids Werke in ihrem Verhältnis zur antiken Kunst* (1890–91); Engelmann, *Bilder-Atlas zu Ovid's Metamorphosen* (1890). Cause of exile: the most interesting discussion is by Boissier in his *L'Opposition sous les Césars. See* also Nageotte, *Ovide, sa vie, ses oeuvres* (1872); Huber, *Die Ursachen der Verbannung des Ovid* (1888). Influence of Ovid upon Shakespeare: T. S. Baynes, *Shakespeare Studies* (1894); pp. 195 ff.; Constable, Shakespeare's "Venus und Adonis," in *Verhältnis zu Ovid's Metamorphosen* (1890). *See* also S. G. Owen, *Ovid and Romance* (1912).

(S. G. O.; X.)

**OVIEDO,** a maritime province of northern Spain, bounded on the north by the Bay of Biscay, east by Santander, south by León and west by Lugo. Pop. (1940) 836,642; area, 4,207 sq.mi. In popular speech Oviedo is often called by its ancient name of Asturias, which only ceased to be the official title of the province in 1833, when the Spanish system of local government was reorganized. An account of the physical features, history and inhabitants of this region is given under ASTURIAS. Oviedo is rich in forests, coal, streams and waterfalls, greatly contributing to its modern industrial development. The horses of Oviedo rank among the best in Spain. Wild deer, boars and bears were formerly common among the mountains; and the sea coasts, as well as the streams, abound with fish, including salmon and lampreys. The climate is mild and wet; the broken relief hinders cultivation. Although no trace exists of the gold for which Asturias was celebrated under its Roman rulers, Oviedo possesses valuable coal measures, which are worked at Langreo (mun. 43,797), Mieres (9,616, mun. 51,967), Siero (mun. 30,931) and elsewhere. The copper mines near Avilés (10,695, mun. 18,035) and Cangas de Onis (1,932, mun. 9,936) have lost their importance; but lead, magnesia, arsenic, cobalt, lapis lazuli, alum, antimony, jet, marble and rock crystal are found in various parts of the province, while amber and coral are gathered along the coast. There are manufactures of fine textiles, coarse cloth and ribbons in Salas (mun., 13,851), Piloña (mun., 16,948) and Avilés; of paper in Pianton; of porcelain and glass in Gijón (72,053, mun. 101,341), Avilés and Pola de Siero; of arms in Oviedo and Trubia; while foundries and works for the manufacture of agricultural implements, rails and pig iron are numerous. An important highway is the 16th century *Camino real,* or royal road, leading from Gijón to León and Madrid, which cost so much that the emperor Charles V inquired if it were paved with silver. A railway from Madrid to Oviedo, Gijón and Avilés runs through difficult parts of the Cantabrian chain.

Oviedo was the scene of serious uprisings in 1934, and of much fighting in the civil war of 1936–39.

**OVIEDO,** an episcopal city and capital of the Spanish province of Oviedo; 16 mi. S. of the Bay of Biscay, on the river Nalon, and on the León-Gijón, Oviedo-Trubia and Oviedo-Infiesto railways. Pop. (1940) 51,410 (mun., 82,548). Oviedo is built on a hill rising from a broad and picturesque valley, which is bounded on the north-west by the Sierra de Naranco. Oviedo, founded in the reign of Fruela (762), became the fixed residence of the kings of the Asturias in the time of Alphonso II, and continued to be so until about 924, when the advancing reconquest of Spain from the Moors led them to remove their capital to León. The university was founded by Philip III in 1604. The Gothic cathedral, founded in 1388, occupies the site of a chapel founded in the 8th century, of which only the Camara Santa remains. The Camara Santa (dating from 802) contains the famous *arca* of Oviedo, an 11th century Byzantine chest of cedar, overlaid with silver reliefs of Biblical scenes. In it are preserved two crosses dating from the 8th and 9th centuries. The cathedral library has some old mss., including a deed of gift made by Alpsonso II of Asturias in 812, and a collection of illuminated documents of the 12th century, the *Libro gótico.* Oviedo possesses historic churches, the ancient Santa María de Naranco, San Miguel de Lino, and the church of St. Julian or the Santullano, all of early date. Oviedo is an agricultural centre; other industries are marble quarrying, the manufacture of arms, fabrics, iron goods, leather and matches. In the 1936–39 rebellion, the Nationalists gained control of Oviedo early, but were then besieged by Asturian miners. A Nationalist relief expedition from Galicia lifted the siege Oct. 17, 1936.

**OVIEDO Y VALDES, GONZALO FERNANDEZ DE** (1478–1557), Spanish historian, was present at the surrender of Granada and saw Columbus previous to his voyage to America. He visited America himself on several occasions in an official capacity. Appointed historiographer of the Indies, Oviedo wrote —besides a romance of chivalry, *Don Claribalte* (1519)—two historical works: *Sumario de la natural y general historia de las Indias* (1526) and *La historia natural y general de las Indias, Islas e Tierra Firme del mar oceano* (1535–57). The latter work embodies a mass of curious information collected at first hand.

**OVOLO,** in architecture, a convex moulding (*q.v.*), whose profile approximates a quarter circle, a quarter ellipse or a similar curve; known commonly in the building trades as a quarter round. In its elliptical forms it is the characteristic moulding of the echinus of the Greek Doric order and in its round forms of the echinus of the Roman Doric. It is also important as part of the bed-mould (*q.v.*) of many cornices. In

carpentry, at a small scale, it is one of the most common mouldings used to cover a joint in a re-entrant angle, as between a base board and the floor, or between the side of a beam and the ceiling.

**OWATONNA,** a city of southeastern Minnesota, U.S.A., on the Straight river at an altitude of 1,154 ft., 70 mi. S. of Minneapolis; the county seat of Steele county. It is on federal highways 14, 65 and 218, and is served by the Chicago, Milwaukee, St. Paul and Pacific, the Chicago and North Western, and the Rock Island railways and by bus lines. Pop., 1940 federal census, 8,694. It is a trading centre of a farming and dairying region; its manufactures include 21 co-operative creameries, jewellery, tools, ventilating systems and farm implements. It is the home of the state school for dependent children (1886) and has eight schools: six public, including a high school, Pillsbury academy, a military school for boys, and St. Mary's parochial. Owatonna was settled about 1855, incorporated in 1865 and chartered as a city in 1875. The name Owatonna is of Sioux origin meaning "straight."

**OWEGO,** a village of southern New York, U.S.A., the county seat of Tioga county; on the north bank of the Susquehanna river, 21 mi. W. of Binghamton. It is served by the Erie, the Lackawanna and the Lehigh Valley railways. Pop. 1940 federal census, 5,068. Its factories produce shoes, folding furniture and other products. Owego occupies the site of an Indian village called Ah-wa-ga ("where the valley widens"), which was destroyed by Gen. Clinton in 1779. A white settlement was established in 1785, and the village was incorporated in 1827.

**OWEN, JOHN** [OVENUS or AUDOENUS] (*c.* 1560–1622), Welsh epigrammatist, born at Plas Dhu, Carnarvonshire, about 1560, was educated at Winchester school, and at New college, Oxford. He was a fellow of his college from 1584 to 1591, when he became a schoolmaster, first at Trelleck, near Monmouth, and then at Warwick. His perfect mastery of the Latin language brought him the name of "the British Martial."

Owen's *Epigrammata* are divided into twelve books, of which the first four were published in 1606, and the rest at four different times. Owen frequently adapts and alters to his own purpose the lines of his predecessors in Latin verse, and one such borrowing has become celebrated as a quotation, though few know where it is to be found. It is the first line of this epigram:—

> Tempora mutantur, nos et mutamur in illis:
> Quo modo? fit semper tempore peior homo.
> (Lib. I. ad Edoardum Noel, epig. 58.)

This first line is altered from an epigram by Matthew Borbonius, one of a series of mottoes for various emperors, this one being for Lothaire I.

> Omnia mutantur, nos et mutamur in illis:
> Illa vices quasdam res habet, illa vices.

There are editions of the *Epigrammata* by Elzevir and by Didot; the best is that edited by Renouard (2 vols., Paris, 1795). Translations into English, either in whole or in part, were made by Vicars (1619); by Pecke, in his *Parnassi Puerperium* (1659); and by Harvey in 1677, which is the most complete. La Torre, the Spanish epigrammatist, owed much to Owen, and translated his works into Spanish in 1674. French translations of the best of Owen's epigrams were published by A. L. Lebrun (1709) and by Kérivalant (1819).

**OWEN, JOHN** (1616–1683), English Nonconformist divine, was born at Stadham in Oxfordshire in 1616, and educated at Queen's college, Oxford. He was chaplain and tutor in the families, first of Sir Robert Dormer, and later of Lord Lovelace, but lost his place by siding with parliament in the Civil War. He then lived in Charterhouse yard, in London, and on April 29, 1646, preached, before the Long Parliament, a sermon which showed his tendency towards the tolerant Independent or Congregational system of Church government. He now became pastor at Coggeshall in Essex. He was chosen to preach to parliament on the day after the execution of Charles. Cromwell took him in 1649 as his chaplain to Ireland, where he regulated the affairs of Trinity college, and in 1650 to Scotland, making him chancellor of Oxford (1651), dean of Christ-church (1651–52) and vice-chancellor in 1652.

When Richard Cromwell succeeded his father, Owen lost his vice-chancellorship, and joined the Wallingford House party, throwing his influence on the side of a simple republic as against a protectorate. In March 1660 the Presbyterian party being uppermost, he was deprived of his deanery and returned to Stadham. Driven to London by the Conventicle and Five Mile Acts, he gathered a congregation there; at the revival of the Conventicle Acts in 1670 he drew up a protest to the House of Lords. After the Declaration of Indulgence (1672) he frequently preached in congregations of Independents and Presbyterians, and was in favour with Charles II. and James II. He died at Ealing on Aug. 24, 1683.

*See* Goold's edition of Owen's *Works* (1850–55); W. Orme, *Memoirs of Owen* (1820); and *The Golden Book of John Owen,* edited with a study of his life by James Moffat (1904).

**OWEN, SIR RICHARD** (1804–1892), English biologist, was born at Lancaster on July 20, 1804. In 1820 he was apprenticed to a local surgeon and apothecary, and in 1824 he proceeded as a medical student to the university of Edinburgh. After completing his medical course in St. Bartholomew's Hospital, London, where he came under the influence of the eminent surgeon, John Abernethy, he contemplated a professional career; but being induced by Abernethy to accept the position of assistant to William Clift, conservator of the museum of the Royal College of Surgeons, he devoted himself to the more congenial work of scientific research. He prepared an important series of catalogues of the Hunterian collection in the Royal College of Surgeons; and in the course of this work acquired the unrivalled knowledge of comparative anatomy which facilitated his researches on the remains of extinct animals. In 1836 he was appointed Hunterian professor in the Royal College of Surgeons, in 1849 he succeeded Clift as conservator, and in 1856 he became superintendent of the natural history department of the British Museum. He then devoted his energies to a scheme for a National Museum of Natural History, which eventually resulted in the removal of the natural history collections of the British Museum to a new building at South Kensington, the British Museum (Natural History). He retained office until the completion of this work in 1884, when he received the K.C.B., and thenceforward lived in retirement at Sheen Lodge, Richmond Park, until his death on Dec. 18, 1892.

While occupied with cataloguing the Hunterian collection, Owen seized every opportunity of dissecting fresh subjects. He had the privilege of investigating the animals which died in the Zoological Society's gardens; and when that society began to publish scientific proceedings in 1831, he was the most voluminous contributor of anatomical papers. His first notable publication, however, was his *Memoir on the Pearly Nautilus* (1832), which was soon recognized as a classic. Henceforth he continued to make important contributions to every department of comparative anatomy and zoology for over fifty years. Among Entozoa his most noteworthy discovery was that of *Trichina spiralis* (1835), the parasite infesting the muscles of man in the disease now termed trichinosis. (*See* also, however, the article on PAGET, SIR JAMES.) He also studied the Brachiopoda, Mollusca and he proposed the universally-accepted subdivision of the Cephalopoda into the two orders of Dibranchiata and Tetrabranchiata (1832). The problematical Arthropod *Limulus* was also the subject of a special memoir by him in 1873.

Owen's technical descriptions of the Vertebrata were still more numerous and extensive than those of the invertebrate animals. He not only studied existing forms, but also devoted great attention to the remains of extinct groups, and immediately followed Cuvier as a pioneer in vertebrate palaeontology. Early in his career he made exhaustive studies of teeth, both of existing and extinct animals, and published his work on *Odontography* (1840–1845). Most of his work on reptiles related to the skeletons of extinct forms, and his chief memoirs on British specimens were reprinted in a connected series in his *History of British Fossil Reptiles* (4 vols., 1849–1884). He also wrote widely on extinct birds. With regard to living mammals, the more striking of Owen's contributions relate to the monotremes, marsupials, and the anthropoid apes. Most of his writings on mammals, however, deal with extinct forms. Sir Thomas Mitchell's discovery of fossil bones in New South Wales provided material for the first of Owen's long series of papers on the extinct mammals of Australia,

which were eventually reprinted in book-form in 1877.

Owen's detailed memoirs and descriptions require laborious attention in reading, on account of their nomenclature and ambiguous modes of expression. But it must be remembered that he was a pioneer in concise anatomical nomenclature.

Besides the above mentioned works, Owen wrote: *Comparative Anatomy and Physiology of Vertebrates* (3 vols., 1866–68); *History of British Fossils, Mammals and Birds* (1844–46); *Monograph of the Fossil Mammalia of the Mesozoic Formations* (Paleont. Soc., 1871); *Antiquity of Man as deduced from the Discovery of a Human Skeleton* (1884). *Catalogue of the Fossil Reptilia of South Africa* (1876); *Archetype and Homologies of the Vertebrate Skeleton* (1848).

**OWEN, ROBERT** (1771–1858), British reformer and Socialist, was born at Newtown, Montgomeryshire, on May 14, 1771. His father had a small business in Newtown as saddler and ironmonger, and there young Owen received his school education, which terminated at the age of nine. After serving in a draper's shop for some years he settled in Manchester, where his success was rapid. When only 19 years of age he became manager of a cotton mill in which 500 people were employed, and by his administrative intelligence and energy soon made it one of the best establishments of the kind in Great Britain. In this factory Owen used the first bags of American sea-island cotton ever imported into the country; it was the first sea-island cotton from the Southern States. Owen also made improvements in the quality of the cotton spun; and indeed there is no reason to doubt that at this early age he was the first cotton-spinner in England, a position entirely due to his own capacity and knowledge of the trade. On becoming manager and partner in the Chorlton Twist Company at Manchester, Owen induced his partners to purchase the new Lanark mills, and after his marriage with Miss Dale, the daughter of the former proprietor, he settled there as manager and part-owner. Encouraged by his great success in Manchester, he had already formed the intention of conducting New Lanark on higher principles than the current commercial ones.

Connected with the mills were about 2,000 people, 500 of whom were children, brought, most of them, at the age of five or six from the poorhouses and charities of Edinburgh and Glasgow. The children especially had been well treated by Dale, but the general condition of the people was unsatisfactory. Crime and vice bred by demoralizing conditions were common; education and sanitation were alike neglected; and housing conditions were intolerable. It was this population which Owen set himself to elevate and ameliorate. He greatly improved their houses, and mainly by his personal influence trained them to habits of order, cleanliness and thrift. He opened a store, where the people could buy goods of the soundest quality at little more than cost price; and the sale of drink was placed under the strictest supervision. His greatest success, however, was in the education of the young, to which he devoted special attention. The first infant school in Great Britain was started, or rather evolved, by James Buchanan, with Owen's approval and support, at the New Lanark mills, and though earlier experiments had been made abroad, the new creation probably owed nothing to them.

In all these plans Owen obtained success. Though at first regarded with suspicion as a stranger, he soon won the confidence of his people. The mills continued to be a commercial success, but some of Owen's schemes involved considerable expense, which was displeasing to his partners. Tired at last of the restrictions imposed on him by men who wished to conduct the business on the ordinary lines, Owen formed a new firm, who, content with 5% of return for their capital, were ready to give freer scope to his philanthropy (1813). In this firm Jeremy Bentham and the well-known Quaker, William Allen, were partners. In the same year Owen published *A New View of Society, or Essays on the Principle of the Formation of the Human Character,* in which he expounded the principles on which his system of educational philanthropy was based. From an early age he had lost all belief in the prevailing forms of religion, and had thought out a creed for himself, which he considered an entirely new and original discovery. The chief points in this philosophy were that man's character is formed by circumstances over which he had no control and that he is not a proper subject either of praise or blame. These convictions led Owen to the conclusion that the great secret in the right formation of man's character is to place him under the proper influences from his earliest years. The irresponsibility of man and of the effect of early influences are the keynote of Owen's whole system of education and social amelioration.

Owen's new views theoretically belong to an old system of philosophy; his originality is to be found in his application of them. For the next few years Owen's work in New Lanark continued to have a national and even European significance. New Lanark itself became a much frequented place of pilgrimage for social reformers, statesmen, and royal personages, including Nicholas, afterwards emperor of Russia. According to the unanimous testimony of all who visited it, the results achieved by Owen were singularly good. The children brought up on his system, which included instruction through the eye as well as the ear, country walks, nature study, singing and dancing, were graceful, genial and unconstrained; health, plenty and contentment prevailed; and the business was a commercial success.

In 1815 Owen started, apparently single-handed, an agitation for factory reform. He drafted a bill to apply to all textile factories, prohibiting employment before ten years of age, and night-work before 18, limiting hours for those under 18 to 10½ a day, and providing for inspection. He failed to gain support from his fellow employers in Scotland, but found influential sympathizers in London, and the bill was introduced into parliament. There it was so emasculated that, after two sessions, Owen ceased to work for it, and disclaimed all responsibility for the mutilated measure passed in 1819. Hitherto Owen's work had been that of the practical reformer, whose distinction was the originality and ceaseless unselfishness of his methods. It was in 1817 that he first put forward the ideas which made him the forerunner of Socialism and Co-operation. These ideas were embodied in a report communicated to the committee of the House of Commons on the poor law.

The general misery and stagnation of trade consequent on the termination of the Napoleonic Wars was engrossing the attention of the country. After clearly tracing the special causes connected with the war which had led to such deplorable conditions, Owen pointed out that the permanent cause of distress was to be found in the competition of human labour with machinery, and that the only effective remedy was the united action of men, and the subordination of machinery. His proposals for the treatment of pauperism were based on these principles. He recommended that communities of about 1,200 persons each should be settled on quantities of land from 1,000 to 1,500 ac., all living in one large building in the form of a square, with public kitchen and mess-rooms. Each family should have its own private apartments, and the entire care of the children till the age of three, after which they should be brought up by the community, their parents having access to them at meals and all other proper times. These communities might be established by individuals, by parishes, by counties, or by the State; in every case there should be supervision by duly qualified persons. Work, and the enjoyment of its results, should be in common. The size of his community was no doubt suggested by his village of New Lanark; and he soon advocated such a scheme for the reorganization of society in general. In its fully developed form it was as follows. He desired that communities of from 500 to 3,000, mainly agricultural but possessing the best machinery, and being, as far as possible, self-contained, "should increase in number, unions of them federatively united shall be formed in circles of tens, hundreds and thousands," till they should embrace the whole world in a common interest.

His plans for the cure of pauperism were received at first with considerable favour. The *Times* and *Morning Post* and many of the leading men of the country countenanced them, one of his most steadfast friends being the duke of Kent, father of Queen Victoria. But at a large meeting in London, Owen declared his hostility to the received forms of religion. After this act of defiance his theories became suspect to the ruling classes though he did not lose all support from them. The radicals were intent

on political reform, which seemed to Owen on the wrong lines. His point of view was that machinery had come to stay and made social control of industry necessary to prevent the oppression and poverty of the workers. When he found there was no hope of Government action he turned to groups of sympathizers to carry out his plan of self-contained Communities. In 1825 he bought 30,000 ac. of land in Indiana, U.S.A., from the Rappite religious community, and re-named it New Harmony. There was no effective choice of colonists, and some necessary trades were inadequately represented. For a time the community life was well ordered and contented under Owen's practical guidance, and a constitution was adopted within a year, based on community of property and a representative government. But differences about the form of government and religion soon appeared, and all the numerous attempts at reconstruction failed to compose them, though there is a consensus of testimony to the admirable spirit which prevailed amidst all the dissensions. The community was wound up in 1828, and Owen lost £40,000—four-fifths of his fortune. The other chief Owenite Community experiments were at Queenwood, Hants (1839–45), in which Owen took part for three years; and Orbiston, near Glasgow (1825–28) and Ralahine in Ireland (1831–33), with neither of which he was directly concerned.

In 1828, after a long period of friction with William Allen and some of his other partners, Owen resigned all connection with New Lanark, and made his headquarters in London. Before he established New Harmony, U.S.A., he had begun to turn to the workers for support for his ideas. In his *Report to the County of Lanark* (a body of landowners) in 1820, he declared definitely that not reforms but a transformation of the social order was required. The appeal of such a doctrine to the workers is obvious. From 1820, his proposals for communities attracted the younger workers, brought up under the factory system, and between 1820 and 1830 numerous societies were formed and papers started to advocate his views. The growth of trade unionism and the emergence of a working-class point of view caused Owen's doctrines to be accepted as the expression of the workers' aspirations. When he returned to England in 1829 he found himself regarded as their leader. In the trade unions, Owenism stimulated the formation of self-governing workshops, and their need for a market led to the formation of "The Equitable Labour Exchange" in 1832.

Here Owen applied his principle that labour is the source of all wealth. Prices were calculated according to the cost of raw material and the time expended in making the article, and "Labour Notes" were used as the currency for dealings with the Exchange. After a few months of prosperity, rapacious demands from the landlord and the fact that the prices did not correspond with real exchange value brought the Labour Exchange to an end. The unprecedented growth of trade unions made it seem possible that the separate industries and eventually all industry might be organized by these bodies. Owen and his followers carried out an ardent propaganda all over the country, with the result that the new National Operative Builders Union turned itself into a Guild to carry on the building industry, and the Grand National Consolidated Trades Union was formed (1833–4). The enthusiasm and the numbers joining were remarkable, but the determined opposition of the employers and the severe repression by the Government and law courts, ended the movement in a few months. It was two generations before socialism, which was first popularly discussed at this time, again influenced trade unionism.

Throughout these years Owen's community ideas maintained their hold. From 1825 numerous co-operative societies for mutual trading were organized by Owen's followers, the profits being accumulated to provide funds for starting Owenite communities. Although the communities did not materialize, these short-lived co-operative stores showed that co-operative trading was possible and started the idea of using it as a means of changing the social system. They thus performed an important part in preparing the ground for the world-wide Consumers' Co-operative Movement which sprang from the Rochdale Pioneers Co-operative Society founded in 1844. These Pioneers were inspired by Owen's teaching, though their method of organizing production to supply their own needs developed on very different lines from his communities.

After 1834, Owen devoted himself to preaching his educational, moral, rationalist and marriage reform ideas. He formed the Association of All Classes of All Nations, and he was untiring in writing and speaking. His love of children and his great personal charm impressed all who came in contact with him up to the end of his life. At the age of 82, he became a spiritualist. He died on a visit to his birthplace, Newtown, on Nov. 17, 1858, his last act, the day before his death, being to draw up a plan for re-organizing the education of the town. He was buried at Newtown, and a memorial tablet was erected on his grave in 1902 by the Co-operative Union.

Robert Owen's four sons all became American citizens. The eldest, ROBERT DALE OWEN (1801–1877), sat in Congress (1844–47), and drafted the bill founding the Smithsonian Institution. In the Indiana House of Representatives, 1836–39 and 1851–52, and Constitutional Convention, 1850, he was instrumental in securing a married woman's property law, a common free school system, and more freedom in divorce. From 1853 to 1858 he was United States ambassador to Naples. He was a strong believer in spiritualism.

Of R. Owen's numerous works in exposition of his system, the most important are the *New View of Society;* the *Report* communicated to the Committee on the Poor Law; *The Report to the County of Lanark;* the *Book of the New Moral World;* and *Revolution in the Mind and Practice of the Human Race.* See *Life of Robert Owen written by himself* (1857), and *Threading my Way, Twenty-seven Years of Autobiography,* by R. D. O. (1874). There are also *Lives* of Owen by A. J. Booth (1869), W. L. Sargant (1860), Lloyd Jones (1889), F. A. Packard (Philadelphia, 1866), F. Podmore (1906) and G. D. H. Cole (with bibliography 1925). *See* also H. Simon, *Robert Owen: sein Leben und seine Bedeutung für die Gegenwart* (Jena, 1905); E. Dolléans, *Robert Owen* (Paris, 1905); G. J. Holyoake, *History of Co-operation in England* (1906); Leonard Woolf, *Co-operation and the Future of Industry* (1919) and the article COMMUNISM.

**OWENSBORO,** a city of Kentucky, U.S.A., the county seat of Daviess county; on the Ohio river and Federal highway 60, 114 mi. S.W. of Louisville. It is served by the Illinois Central and Louisville and Nashville railroads, motor bus lines and river steamers. Vehicular bridge across Ohio river from centre of city. Pop. 1920, 17,424; 1930, 22,765 (about 10·5% Negroes); in 1940, 30,245, an increase of 32·9% in ten years. It is an important market for tobacco as well as corn, wheat, potatoes, dairy and poultry products and livestock. Its manufactures are varied and important, with an output in 1937 valued at $9,592,810. It is the centre of a gas and oil field, the production in Daviess and four surrounding counties for 1940 being 2,854,722 bbl. The city has a commission form of government. The site of Owensboro was known to the early boatmen of the Ohio as Yellow Banks. The first cabin was built in 1799. The town was laid out for the county seat in 1815 and named Rossborough. In 1817 it was incorporated under the present name, after Col. Abraham Owen (1769–1811), but the old name of Yellow Banks clung to it until the '40s.

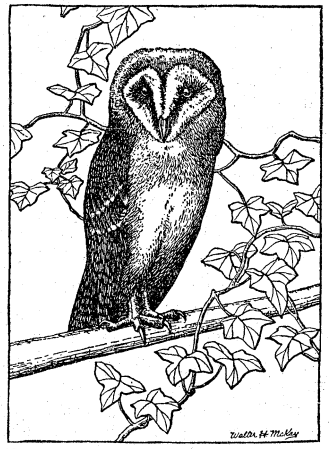
It was chartered as a city in 1866.

**OWEN SOUND,** a city and port of entry in Ontario, Canada, and capital of Grey county, situated 120 mi. N.W. of Toronto, on Georgian Bay. Pop. (1941) 14,002. It is the terminus of branches of the Canadian Pacific and Canadian National railways, and of the Canadian Pacific and other steamship lines plying to ports on Lakes Huron and Superior. The sound is 12 mi. long and the port harbour is one of the best on Lake Huron, and navigable by lake vessels of the largest size. It is a flourishing town, containing shipbuilding yards, and manufactories of mill machinery, agricultural implements, furniture and sewing-machines, flour-mills, saw-mills and large grain elevators.

**OWL,** the general name for the nocturnal birds of prey. The owls form a very natural assemblage, and this suborder, *Striges,* is not closely related to the hawks and eagles. Owls vary in length from 5in. in *Glaucidium cobanense* to more than 2ft. The plumage is very soft, rendering the flight noiseless. On each side of the base of the beak are several rows of small, curved, stiff-shafted feathers, which form a ruff to support the long feathers of the

"disc" or space around the eyes. The ears are large, with well-developed, and often asymmetrical folds of skin, so that the right and left ears may be differently shaped. Many species of owl show two phases of colouration—one in which the brown inclines to red, the other in which it inclines to grey. The outer toes of all owls are reversible. Unlike most birds, owls incubate from the laying of the first egg.

The type of the family *Aluconidae* is the tawny owl (*Strix aluca*), found throughout Europe and in Asia Minor, Palestine and Barbary. A woodland bird, it feeds largely on rats, mice, voles, and shrews. Allied species are found in America, northern Europe and Asia. The remaining owls form the family *Strigidae*.



EUROPEAN BARN-OWL (STRIX FLAMMEA); THE AMERICAN BARN-OWL IS VERY SIMILAR

The eagle owl, *Bubo ignavus*, ranges over most of Europe and Asia north of the Himalayas. The allied *B. virginianus* extends over all North America. They are sombre-coloured birds and among the largest species. Equally large is the snowy owl (*Nyctea scandiaca*), a circumpolar species with white plumage. In winter it migrates southward. The long- and short-eared owls (*Asio otus* and *A. accipitrinus*) are common to the northern parts of Europe and America; the latter, often seen abroad in the daytime, preferring open country, also extending into North Africa, all South America, and the Sandwich Islands. The long-eared owl keeps to woods. Both possess erectile tufts on the side of the head. *Speotyto cunicularia* of America lives in burrows, frequently sharing those of the prairie dog and biscacha. The bird of Pallas Athene is *Athene noctua*, the little owl of Europe, which has been introduced into Great Britain, where it has spread rapidly of late. *A. brama* replaces it in India. The American screech-owl (*Megascops asio*), in its numerous varieties, is found practically throughout North America except at the far north. It varies much in colour and size. It can be distinguished from other owls at night by its peculiar screams, snarls and hisses.

SPOTTED-OWL (SYRNIUM OCCIDENTALE), OF WESTERN U.S.

**OWOSSO,** a city of Shiawassee county, Michigan, U.S.A., 33 m. N.E. of Lansing, on the Shiawassee river. It is the home of Thomas E. Dewey and the late J. O. Curwood and is served by the Ann Arbor, the Grand Trunk and the Michigan Central railways and by bus lines. The population was 12,575 in 1920 (87% native white) and was 14,424 in 1940. It is division point for the Ann Arbor railroad, which has repair shops there, and Indian Trails Bus lines. It is the trade centre of a rich agricultural county and has many diversified industries employing over 3,500 men. Main industries are electric motors, radiators, sandpaper, caskets, screen doors, snow shovels and stoves. The city was founded in 1833 and chartered in 1859.

**OX,** strictly speaking, the Saxon name for the males of domesticated cattle (*Bos taurus*), but in a zoological sense employed so as to include not only the extinct wild ox of Europe but likewise bovine animals of every description, that is to say true oxen, bison and buffaloes. The characteristics of the sub-family Bovinae, or typical section of the family Bovidae, are given in the article BOVIDAE; for the systematic position of that family *see* PECORA. For the typical oxen, as represented by the existing domesticated breeds, *see* CATTLE.

**OXALIC ACID,** one of the oldest known organic acids. Scheele in 1776 prepared it by oxidizing sugar with nitric acid, and showed it to be identical with the acetosellic acid obtained from wood-sorrel, with the formula $H_2C_2O_4$, or, in its usual crystalline form, $H_2C_2O_4{\cdot}2H_2O$. It is found in the form of its acid potassium salt in many plants, especially in wood-sorrel (*Oxalis Acetosella*) and in varieties of *Rumex;* as ammonium salt in guano; as calcium salt in rhubarb root, in various lichens and in plant cells; as sodium salt in species of *Salicornia* and as free acid in varieties of *Boletus*. It is also present in urine and in urinary calculi. It is formed in the oxidation of many organic compounds (*e.g.*, sugar, starch and cellulose) by nitric acid, and also by the fusion of many oxygen-containing compounds with caustic alkalis, the latter method being employed for the manufacture of oxalic acid. In this process cellulose (in the form of sawdust) is made into a stiff paste with a mixture of strong caustic potash and soda solution and heated in flat iron pans to 200–250° C. The somewhat dark-coloured mass is lixiviated with a small amount of warm water in order to remove excess of alkali, the residual alkaline oxalates converted into insoluble calcium oxalate by boiling with milk of lime, the lime salt separated, and decomposed by means of sulphuric acid. It is found that the sawdust obtained from soft woods is the best material for use in this process. It may be obtained synthetically (as sodium salt) by heating sodium in a current of carbon dioxide to 360° C, or by heating sodium formate to 400° C (V. Merz and W. Weith, 1882), by the oxidation of ethylene glycol and by the spontaneous hydrolysis of an aqueous solution of cyanogen gas.

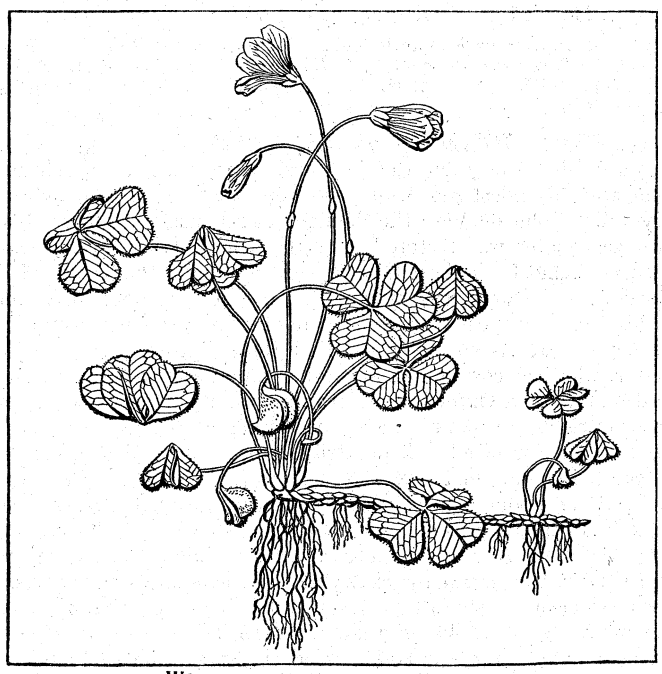
The hydrated acid crystallizes in prisms which effloresce in air, and are readily soluble in water. It loses its water of crystallization at 100° C, and begins to sublime at about 150–160° C, whilst on heating to a still higher temperature it partially decomposes into carbon dioxide and formic acid, or into carbon dioxide, carbon monoxide and water, the latter decomposition being also brought about by heating oxalic acid with concentrated sulphuric acid. The anhydrous acid melts at 189·5° C and is frequently used as a condensing agent. Phosphorus pentachloride decomposes it into carbon monoxide and dioxide, the reaction being the one generally applied for the purpose of preparing phosphorus oxychloride. When heated with glycerin to 100° C it yields formic acid and carbon dioxide; above this temperature, allyl alcohol is formed. Nascent hydrogen reduces it to glycollic acid. Potassium permanganate in acid solution oxidizes it to carbon dioxide and water; the manganese sulphate formed has a catalytic accelerating effect on the decomposition.

Oxalic acid is very poisonous, and by reason of its great similarity in appearance to Epsom salts, it has been very frequently mistaken for this substance with, in many cases, fatal results. The antidotes for oxalic acid poisoning are milk of lime, chalk, whiting or even wall-plaster, followed by evacuation brought about by an enema or castor oil. Only the salts of the alkali metals are soluble in water. Beside the ordinary acid and neutral salts, a series of salts called quadroxalates is known, these being salts containing one molecule of acid salt, in combination with one molecule of acid, one of the most common being "salt of sorrel," $KHC_2O_4{\cdot}H_2C_2O_4{\cdot}2H_2O$. The oxalates are readily decomposed on heating, leaving a residue of carbonate, or oxide of the metal. The silver salt decomposes with explosive violence, leaving a residue of the metal.

*Potassium ferrous oxalate,* $FeK_2(C_2O_4)_2{\cdot}H_2O$, is a strong reducing agent and is used as a photographic developer. *Potassium ferric oxalate,* $FeK_3(C_2O_4)_3$, is used in the preparation of platinotypes, owing to the fact that its solution is rapidly decomposed by sunlight, $2FeK_3(C_2O_4)_3 = 2FeK_2(C_2O_4)_2 + K_2C_2O_4 + 2CO_2$. *Ethyl oxalate,* $(CO{\cdot}OC_2H_5)_2$, prepared by boiling anhydrous oxalic acid with absolute alcohol, is a colourless liquid which boils at 186° C. *Methyl oxalate,* $(CO{\cdot}OCH_3)_2$, which is prepared in a similar manner, is a solid melting at 54° C. It is used in the preparation of pure methyl alcohol (*q.v.*). *Oxalyl chloride,* a liquid boiling at 64° C (m.p. −12° C), has been obtained by the action of phosphorus pentachloride on anhydrous oxalic acid. *Oxamic acid,*

$HO_2C{\cdot}CONH_2$, is obtained on heating acid ammonium oxalate; by boiling oxamide with ammonia; and among the products produced when amino-acids are oxidized with potassium permanganate. It is a crystalline powder difficultly soluble in water and melting at 210° C (with decomposition). Its ethyl ester, known as oxamethane, crystallizes in rhombic plates which melt at 114–115° C. *Oxamide* $(CONH_2)_2$, is best prepared by the action of ammonia on the esters of oxalic acid. It is also obtained by the action of hydrogen peroxide on hydrocyanic acid, or of manganese dioxide and sulphuric acid on potassium cyanide. It is a white crystalline powder which is almost insoluble in cold water. It melts at 417–419° C (with decomposition) when heated in a sealed tube (A. Michael, 1895). When heated with phosphorus pentoxide it yields cyanogen. It is readily hydrolysed by hot solutions of the caustic alkalis. Substituted oxamides are produced by the action of primary amines on ethyl oxalate.

**OXALIS,** a large genus of small herbaceous plants, comprising, with a few small allied genera, the family Oxalidaceae. The name is derived from Gr. ὄξυς, acid, the plants being highly acid to the taste. The genus contains about 800 species, chiefly South African and tropical and South American. It is represented in Great Britain and eastern North America by the wood-sorrel (*O. acetosella*), a small, stemless plant with radical, trefoil-like leaves growing from a creeping, scaly rootstock, and the flowers borne singly on an axillary stalk; the flowers are regular with five sepals, five obovate, white, purple-veined, free petals, ten stamens and a central five-lobed, five-celled ovary with five free styles. The fruit is a capsule, splitting by valves; the seeds have a fleshy coat, which curls back elastically, ejecting the true seed. The leaves, as in the other species of the genus, show a "sleep-movement," becoming pendulous at night. Besides the wood-sorrel, some 20 other species occur in North America, among which are the yellow wood-sorrel (*O. stricta*), of the eastern United States and Canada, with yellow flowers; the violet wood-sorrel (*O. violacea*), of the eastern United States, with rose-purple flowers; the



WOOD SORREL (OXALIS ACETOSELLA)

redwood wood-sorrel (*O. oregana*), of the coast redwood belt from California to Oregon with pink to white flowers and *O. cernua,* known as Bermuda buttercups, with showy yellow flowers, native to South Africa and naturalized in Florida and the Bermudas. *Oxalis crenata,* the oca of South America, is a tuberous-rooted half-hardy perennial, native of Peru. Its tubers are comparatively small, and somewhat acid; but if they be exposed in the sun from 6 to 10 days they become sweet and floury. *Oxalis deppei,* a bulbous perennial of Mexico, has scaly bulbs, from which are produced fleshy, tapering, white, semi-transparent, edible roots, about 4 in. in length and 3 to 4 in. in diameter.

Various species are in cultivation as basket plants for window gardens, border plants and hot house ornamentals. *See* R. Knuth, "Oxalidaceae," *Pflanzenreich* 95 (iv, 130): 1–481, fig. 1–28 (1930).

**OXENSTJERNA, COUNT AXEL GUSTAFSSON** (1583–1654), chancellor of Sweden, was born at Fönö, and was educated with his brothers at the universities of Rostock, Jena and Wittenberg. On returning home in 1603 he was appointed *kammerjunker* to King Charles IX. In 1606 he was entrusted with his first diplomatic mission, to Mecklenburg, was appointed a senator during his absence, and henceforth became one of the king's most trusted servants. In 1610 he was sent to Copenhagen to prevent a war with Denmark. This unsuccessful embassy marks the beginning of Oxenstjerna's long diplomatic struggle with Sweden's traditional rival in the north. Oxenstjerna was appointed a member of Gustavus Adolphus's council of regency. High aristocrat as he was, he would at first willingly have limited the royal power. An oligarchy guiding a limited monarchy was his ideal government, but the genius of the young king was not to be fettered. On Jan. 6, 1612, he was appointed chancellor. His controlling, organizing hand was speedily felt in every branch of the administration. For his services as first Swedish plenipotentiary at the Peace of Knäred, 1613, he was richly rewarded.

During the frequent absences of Gustavus in Livonia and Finland (1614–1616) Oxenstjerna acted as his vice-regent. It was his principal duty during the king's Russian and Polish wars to supply the armies and the fleets with everything necessary, including men and money. In 1622 he accompanied Gustavus to Livonia, where Oxenstjerna was appointed governor-general and commandant of Riga. His services in Livonia were rewarded with four castles and the whole bishopric of Wenden. He was entrusted with the peace negotiations which led to the truce with Poland in 1623, and succeeded, by skilful diplomacy, in averting a threatened rupture with Denmark in 1624. On Oct. 7, 1626, he was appointed governor-general of the newly-acquired Prussian province. In 1629 he concluded the truce of Altmark with Poland. In 1628 he had arranged with Denmark a joint occupation of Stralsund, to prevent the fortress from falling into the hands of the Imperialists. After the battle of Breitenfeld (Sept. 7, 1631) he was summoned to assist the king with his counsels and co-operation in Germany. During the king's absence in Franconia and Bavaria in 1632 he was appointed *legatus* in the Rhine lands, with plenipotentiary authority over all the German generals and princes in the Swedish service.

Although he never fought a battle, Oxenstjerna was a born strategist. His military capacity was strikingly demonstrated by the skill with which he conducted large reinforcements to Gustavus through the heart of Germany in the summer of 1632. But it was only after the death of the king at Lützen that Oxenstjerna's true greatness came to light. He inspired the despairing Protestants both in Germany and Sweden with fresh hopes. He reorganized the government both at home and abroad. He united the estates of the four upper circles into a fresh league against the common foe (1634), in spite of the envious and foolish opposition of Saxony. By the patent of Jan. 12, 1633, he had already been appointed legate plenipotentiary of Sweden in Germany with absolute control over all the territory already won by the Swedish arms. No Swedish subject, either before or after, ever held such an unrestricted and far-reaching authority. Richelieu himself declared that the Swedish chancellor was "an inexhaustible source of well-matured counsels."

Less original but more sagacious than the king, he had a firmer grasp of the realities of the situation. Gustavus would not only have aggrandized Sweden, he would have transformed the German empire. Oxenstjerna wisely abandoned these vaulting ambitions. All his efforts were directed towards procuring for the Swedish crown adequate compensation for its sacrifices. Simple to austerity in his own tastes, he nevertheless recognized the political necessity of impressing his allies and confederates by an almost regal show of dignity; and at the abortive congress of Frankfort-on-Main (March 1634), held for the purpose of uniting all the German Protestants, Oxenstjerna appeared in a carriage drawn

by six horses, with German princes attending him on foot. But from first to last his policy suffered from the slenderness of Sweden's material resources, a cardinal defect which all his craft and tact could not altogether conceal from the vigilance of her enemies. The success of his system postulated an uninterrupted series of triumphs, whereas a single reverse was likely to be fatal to it. Thus the frightful disaster of Nördlingen (Sept. 6th, 1634; *see* SWEDEN: *History*) compelled him to solicit direct assistance from France. But he refused at the conference of Compiègne (1635) to bind his hands in the future for the sake of some slight present relief. In 1636, however, he concluded a fresh subsidy-treaty with France at Wismar.

The same year he returned to Sweden and took his seat in the Regency. For the next nine years his voice, especially as regarded foreign affairs, was omnipotent in the council of state. He drew up beforehand the plan of the Danish War of 1643–1645, so brilliantly executed by Lennart Torstensson, and saw Denmark crippled by the Peace of Brömsebro (1645). His later years were embittered by the jealousy of the young Queen Christina, who thwarted the old statesman in every direction. He always attributed the exiguity of Sweden's gains by the Peace of Osnabrück to Christina's undue interference. Oxenstjerna was opposed at first to the abdication of Christina, because he feared mischief to Sweden from her appointed successor, Charles Gustavus. The extraordinary consideration shown to him by the new king ultimately, however, reconciled him to the change. He died at Stockholm on Aug. 28, 1654.

See *Axel Oxenstjernas skriften och brefvexling* (Stockholm, 1888–1905); A. de Marny, *Oxenstjerna et Richelieu à Compiègne* (Paris, 1878); F. V. Wrangel, *Voyage en France d'Oxenstierna* (1917); *Gabriel Gustafssons bref till Riks Konsler Axel Oxenstjerna, 1611–1640* (Stockholm, 1890).

**OXENSTJERNA, COUNT BENGT** OR **BENEDICT GABRIELSSON** (1623–1702) was the son of Axel Oxenstjerna's half-brother, Gabriel Bengtsson (1586–1656). After a careful education he began his diplomatic career at the great peace congress of Osnabrück. During his stay in Germany he made the acquaintance of the count palatine, Charles Gustavus, afterwards Charles X., whose confidence he completely won. Two years after the king's accession (1654), Oxenstjerna was sent to represent Sweden at the *Kreistag* of Lower Saxony. In 1655 he accompanied Charles to Poland and was made governor of the conquered provinces of Kulm, Kujavia, Masovia and Great Poland. The firmness and humanity which he displayed in this new capacity induced the German portion of them, notably the city of Thorn, to side with the Swedes against the Poles. During Charles's absence in Denmark (1657), Oxenstjerna, in the most desperate circumstances, tenaciously defended Thorn for ten months; the terms of capitulation were made the basis of the subsequent peace negotiations at Oliva. During the domination of Magnus de la Gardie he played but a subordinate part in affairs. From 1662 to 1666 he was governor-general of Livonia. In 1674 he was sent to Vienna to try and prevent the threatened outbreak of war between France and the empire, and he was one of the Swedish envoys to the Congress of Nijmwegen (1676). From 1680 to 1697 he conducted the foreign relations of Sweden.

His leading political principles were friendship with the maritime powers (Great Britain and Holland) and the emperor, and a close anti-Danish alliance with the house of Holstein. Charles XI. appointed Oxenstjerna one of the regents during the minority of Charles XII. The martial proclivities of the new king filled the prudent old chancellor with alarm and anxiety. He advised Charles in vain to accept the terms of peace offered by the first anti-Swedish coalition. Oxenstjerna has been described as "a shrewd and subtle little man, of gentle disposition, but remarkable for his firmness and tenacity of character."

**OXFORD, EARLS OF,** an English title held successively by the families of Vere and Harley. The three most important earls of the Vere line are noticed separately below. The Veres held the earldom from 1142 until March 1703, when it became extinct on the death of Aubrey de Vere, the 20th earl. In 1711 the English statesman Robert Harley was created earl of Oxford (*q.v.*); but the title became extinct in this family on the death of the 6th earl in 1853. It was revived in favour of H. H. Asquith who became earl of Oxford and Asquith (*q.v.*).

**OXFORD, EDWARD DE VERE,** 17TH EARL (in the Vere line) OF (1550–1604), son of John de Vere, the 16th earl, was born on April 12, 1550. He studied at Queen's and St. John's Colleges, Cambridge. He was known as Lord Bolebec or Bulbeck until he succeeded in 1562 to the earldom and to the hereditary dignity of great chamberlain of England. As a royal ward the boy lived under the care of Lord Burghley, who in 1571 gave him his eldest daughter, Anne, in marriage. Oxford wished for a military or a naval command, but Burghley hoped that he would win a high position at court. His accomplishments secured Elizabeth's favour, but he offended her by going to Flanders without her consent in 1574, and more seriously in 1582 by a duel with one of her gentlemen, Thomas Knyvet. In 1579 he insulted Sir Philip Sidney on the tennis-court at Whitehall.

Sidney challenged Oxford, but the queen forbade him to fight, and required him to apologize on the ground of their difference of rank. On Sidney's refusal and consequent disgrace Oxford is said to have schemed to murder him. The earl sat on the special commission (1586) for the trial of Mary queen of Scots; he took part in the trials of Philip Howard, earl of Arundel, for high treason in 1589, and of Essex and Southampton in 1601. In 1575 he brought back from Italy various inventions for the toilet, and his estate was rapidly dissipated in satisfying his extravagant whims. His first wife died in 1588, and from that time Burghley withdrew his support, Oxford being reduced to the necessity of seeking help among the poor men of letters whom he had befriended. He was a lyric poet of no small merit. His fortunes were partially retrieved on his second marriage with Elizabeth Trentham, by whom he had a son, Henry de Vere, 18th earl of Oxford (1593–1625). He died at Newington, near London, on June 24, 1604.

His poems, from various anthologies—the *Paradise of Dainty Devices, England's Parnassus, Phoenix Nest, England's Helicon*—and elsewhere, were collected by Dr. A. B. Grosart in vol. iv of the Fuller Worthies Library (1876).

**OXFORD, JOHN DE VERE,** 13TH EARL OF (1443–1513), was second son of John, the 12th earl, a prominent Lancastrian, who, with his eldest son Aubrey de Vere, was executed in February 1462. John de Vere the younger was himself attainted, but two years later was restored as 13th earl. But his loyalty was suspected, and for a short time in 1468 he was in the Tower. He sided with Warwick, the king-maker, in 1469, accompanied him in his exile next year, and assisted in the Lancastrian restoration of 1470–1471. As constable he tried John Tiptoft, earl of Worcester, who had condemned his father nine years before. At the battle of Barnet, Oxford was victorious in command of the Lancastrian right, but was ultimately defeated and escaped to France. In 1473 he organized a Lancastrian expedition, which, after an attempted landing in Essex, seized St. Michael's Mount in Cornwall. After a four months' siege Oxford was forced to surrender in Feb. 1474. He was sent to Hammes near Calais, whence, ten years later, in Aug. 1484, he escaped and joined Henry Tudor in Brittany. He fought for Henry at Bosworth, and was rewarded by restoration to his title, estates and hereditary office of Lord Chamberlain. At Stoke on June 16, 1486, he led the van of the royal army. In 1492 he commanded the expedition to Flanders, and in 1497 was foremost in the defeat of the Cornish rebels on Blackheath. Oxford was high steward at the trial of the earl of Warwick, and one of the commissioners for the trial of Sir James Tyrell and others in May 1502. He died March 10, 1513.

**OXFORD, ROBERT DE VERE,** 9th Earl of (1362–1392), English courtier, was the only son of Thomas de Vere, 8th earl of Oxford, and Maud de Ufford, a descendant of King Henry III. He became 9th earl of Oxford in 1371, and married Philippa (d.

1412), daughter of his guardian Ingelram de Couci, earl of Bedford, a son-in-law of Edward III. Already hereditary great chamberlain of England, Oxford was made under Richard II. a member of the privy council and a Knight of the Garter; while castles and lands were bestowed upon him, and he was constantly in the company of the young king. In 1385 Richard sent him to govern Ireland, but although preparations were made for his journey he did not leave England. The king's partiality for Oxford was one of the causes of the dissatisfaction of the barons. Oxford also made powerful enemies by divorcing his wife, Philippa, and by marrying a Bohemian lady.

The king, however, indifferent to the gathering storm, created Vere duke of Ireland in Oct. 1386, and gave him still more powers in that country. Richard was deprived of his authority for a short time, and Vere was ordered in vain to proceed to Ireland. He was then accused by the king's uncle Thomas of Woodstock, duke of Gloucester, and his supporters in 1387; and rushing into the north of England he gathered an army to defend his royal master and himself. At Radcot bridge in Oxfordshire, however, his men fled before Gloucester's troops and Oxford himself escaped in disguise to the Netherlands. In the parliament of 1388 he was found guilty of treason and condemned to death, but as he remained abroad the sentence was never carried out. With another exile, Michael de la Pole, duke of Suffolk, he lived in Paris until after the treaty between England and France in 1389, when he took refuge at Louvain. He was killed by a boar whilst hunting, and left no children.

**OXFORD, ROBERT HARLEY,** 1ST EARL OF (1661–1724), English statesman, commonly known by his surname of HARLEY, eldest son of Sir Edward Harley (1624–1700), a Herefordshire land-owner, was born in Bow street, London, on Dec. 5, 1661. His school days were passed at Shilton, near Burford, in Oxfordshire, in a small school which produced at the same time a lord high treasurer (Harley), a lord high chancellor (Simon Harcourt) and a lord chief justice of the common pleas (Thomas Trevor). The principles of Whiggism and Nonconformity were instilled into his mind at an early age, and if he changed the politics of his ancestors he never formally abandoned their religious opinions. At the Revolution of 1688 Sir Edward and his son raised a troop of horse in support of the cause of William III., and took possession of the city of Worcester in his interest. Young Harley then (1689) entered parliament for the "pocket" borough of Tregony. Later he sat for New Radnor, a seat which he held until his elevation to the peerage in 1711.

From the first Harley gave great attention to the conduct of public business, and from the general election of Feb. 1701 until the dissolution of 1705 he held the office of speaker. In 1704 he became a principal secretary of State for the northern department. In 1703 Harley first made use of Defoe's talents as a political writer, and this alliance with the press proved so successful that he afterwards called the genius of Swift to his aid in many pamphlets against his political opponents. While he was secretary of State the union with Scotland was effected. At the time of his appointment as secretary of State Harley had given no outward sign of dissatisfaction with the Whigs, and it was mainly through Marlborough's good opinion of his abilities that he was admitted to the ministry. For some time Harley acted loyally with his colleagues. But in the summer of 1707 it became evident to Godolphin that some secret influence behind the throne was shaking the confidence of the queen in her ministers. Abigail Hill, who was secure in the queen's confidence, was Harley's cousin, and his instrument in influencing the queen against her ministers. These bided their time, until an opportunity for Harley's overthrow was provided. A clerk in Harley's department divulged the contents of secret documents in his office, which should have been inaccessible to anyone but the chief, and the queen was thereupon informed that Godolphin and Marlborough could no longer serve in concert with him. They did not attend her next council (Feb. 8, 1708), and the queen found herself forced (Feb. 11) to accept the resignations of both Harley and St. John.

Harley went out of office, but his cousin, who had now become Mrs. Masham, remained at court to further his interests. The cost of the protracted war with France, and the danger to the national church, the chief proof of which lay in the prosecution of Sacheverell, were the weapons which he used to influence the masses of the people. Marlborough himself could not be dispensed with, but his relations were dismissed from their posts in turn. When the greatest of these, Lord Godolphin, was ejected from office, five commissioners to the treasury were appointed (Aug. 10, 1710), and among them figured Harley as chancellor of the exchequer. It was the aim of the new chancellor to frame an administration from the moderate members of both parties, and to adopt with but slight changes the policy of his predecessors; but he failed. By an unexpected event, his popularity was restored at a bound. A French refugee, the ex-abbé de la Bourlie (better known by the name of the marquis de Guiscard), was being examined before the privy council on a charge of treachery, when he stabbed Harley in the breast with a penknife (March 8, 1711). On May 23, 1711, the minister became Baron Harley of Wigmore and earl of Oxford and Mortimer; and immediately afterwards lord treasurer and a Knight of the Garter.

Oxford rearranged the nation's finances, and supplied resources for carrying on the campaign, though his emissaries were in communication with the French king, and were settling the terms of a peace independently of England's allies. After many weeks of vacillation and intrigue, the preliminary peace was signed, and in spite of the opposition of the Whig majority in the Upper House, which was met by the creation of 12 new peers, the treaty of Utrecht was concluded (March 31, 1713). While these negotiations were under discussion the friendship between Oxford and St. John, who had become secretary of State in Sept. 1710, was fast changing into hatred. The latter had resented the rise in fortune which the stabs of Guiscard had secured for his colleague, and when he received a viscounty instead of the expected earldom, his resentment knew no bounds. Mrs. Masham deserted her cousin for his more vivacious rival. The Jacobites lost faith in his repeated promises. Queen Anne transferred her confidence from Oxford to Bolingbroke; and he surrendered his office a few days before the queen died.

On the accession of George I. the defeated minister retired to Herefordshire, but a few months later he was committed to the Tower (July 16, 1715). After an imprisonment of nearly two years he was released in July 1717, but he took little part in public affairs, and died almost unnoticed in London on May 21, 1724.

The books and the manuscripts which the first earl of Oxford and his son collected were among the glories of their age. The manuscripts became the property of the nation in 1753 and are now in the British Museum; the books were sold to a bookseller called Thomas Osborne in 1742 and described in a printed catalogue of five volumes (1743–45), Dr. Johnson writing an account of the library. A selection of the rarer pamphlets and tracts, which was made by William Oldys, was printed in eight volumes (1744–46), with a preface by Johnson. The best edition is that of Thomas Park, ten volumes (1808–13). In the recollection of the Harleian manuscripts, the Harleian library and the *Harleian Miscellany,* the family name will never die.

MAP OF OXFORD, SHOWING THE PRINCIPAL COLLEGES

Bletchley. The Thames is navigable below Oxford; there is a canal to the Avon valley and Birmingham; and numerous local road motor services. Population (1938), 94,090.

The site of Oxford is a low gravel terrace between the upper Thames and its tributary, the Cherwell, which meet in wide water meadows within a gap in a line of oolitic plateaux represented by Headington hill on the East and the twin crests of Cumnor Hurst and Wytham on the west. Though there are sparse Romano-British habitations on both sides of the valley, the Roman road northwards from Dorchester to Alchester lies far back to the east, and only a few finds betray a track across the valley from Headington towards Binsey. Oxford itself only becomes perceptible in Saxon times, in the church of St. Martin (whose dedication and some rude masonry in the tower mark its early date) close to Carfax (Lat. *quadrifurcus*, French *carrefour*) the intersection, in the heart of the city, of north-south and east-west roads. Eastward the High street crosses the Cherwell by Magdalen bridge, and offers alternative routes to London via Headington or Littlemore; southwards St. Aldate's, formerly Fish street, crosses the Thames (Isis) at Folly bridge, for Abingdon and Newbury; northwards, by Cornmarket, are the roads to Banbury and Woodstock; westward, Queen street leads round the south side of the Norman castle to Quaking bridge, over the mediaeval mill stream towards Osney: the modern New road, north of the castle, leads direct to the railway stations and Seven Bridges road for the upper Thames, and south-west England. Early traces are: (1) the Priory (afterwards Augustinian), commemorating St. Frideswide, a local heroine whose good works and adventures, about 720–740, touch also Binsey and Abingdon; of her original church there are arches near her shrine in the cathedral; (2) the conspicuous mound raised (probably about A.D. 900) to command the passage from Mercia into Wessex; (3) Oseney village, beyond the nearest channel of the upper Thames, whose name (Ousen-eye: "water-island") explains the Oksnaforda and Orsnaforda of 10th century Saxon coins, whence *Oxenford* and *Oxford* arose by assimilation to names like Swinford and Shefford. Upstream, between Osney, Binsey and Wolvercote, the "Port Meadow" is still held in common by the freemen of Oxford.

Oxford just appears in history when Edward the Elder, in A.D. 912, "held Lundenbyrg (London) and Oxnaford and all the lands that were obedient thereto" as flanking fortresses of his Thames valley frontier. But the principal centres of the district were not here, but at Abingdon, commanding access to the Vale of White Horse, with an early and wealthy abbey, and Dorchester, similarly dominating the Thames valley, with its pre-Roman earthworks, and Saxon bishopric. River traffic bound for Oxford long paid toll to the abbott of Abingdon. However, several "gemots" were held at Oxford, under Edric, Canute, and Harold I.; and repeated devastation by the Danes (979, 1002, 1010, 1013) attests military and economic importance.

The Norman governor, Robert d'Oiloi (d'Oyly), incorporated the Saxon mound in a great fortress (1170–1219), of which one tower stands, and Bullock lane and St. Peter le Bailey mark the outworks; he built the Hythe bridge, which reveals the terminal wharfs of the river traffic; enclosed the town (partially "wasted" in Domesday) with walls of which foundations remain at the (north) Bocardo gate, the fine tower annexed to St. Michael's church. To d'Oiloi's time belong the rebuilding of St. Frideswide's (the present cathedral dates mainly from the fire of 1120), St. Ebbs' near Carfax, St. Peter's, in the east, probably outside the first

east wall, and Holywell by the Cherwell beyond. His son Robert founded the splendid Osney abbey, beyond the castle (fragments in the cemetery beyond the G.W. railway). Outside the city, also, north of the cattle market in Gloucester Green, Henry I. built his Beaumont palace overlooking Osney and Port Meadow, and under his "Beau-clerc" patronage Theobald of Etampes already, about 1120, was teaching "60 to 100 clerks." As residence of the empress queen Maud, Oxford suffered siege by Stephen.

While domestic business was conducted between the Corn Market and the High, within the walls, the wool fair and strangers' market, outside the north gate, had, about 1200, a church of St. Giles, its patron. Beyond it lay the leper house (later St. Giles' parsonage), and east of it other establishments mainly for strangers, the Scots college of John de Balliol, Durham college (afterwards Trinity), a Cistercian house (afterwards St. Bernard's, then St. John Baptist's college); and, when Beaumont palace was granted by Edward II. to the Carmelites, the Benedictines occupied the site they had left with the older "cottages" of Worcester college. Other Cistercians built Rewley abbey beyond Hythe bridge; Dominican and Franciscan houses in the poorer south-west quarter leave their names in Blackfriar street, Preacher's bridge and Friars wharf; and the Austin Canons of St. Frideswide acquired endowments for teaching and added the Latin chapel to their church. By the mid 13th century then mediaeval Oxford had taken permanent shape. The walls were reconstructed, and probably extended from an older line in Cat street, to include St. Peter's in the east, with an East gate spanning the High near the hotel of that name, between the splendid north-east stretch of wall conserved by New college, and the south-east angle around Merton.

But before this, in the old north-east angle, now occupied by the Bodleian and Radcliffe libraries, "School street" traversed a kind of "Latin quarter" frequented by wandering scholars, whose *universitas* or guild comes into history with the visit of Giraldus Cambrensis in 1185, and the nomination of a chancellor in 1214. (*See* OXFORD UNIVERSITY.) On the south frontage of this resort of scholars, St. Mary's church became their meeting hall and lecture room; its bell tower and spire, congregation house and library were built about 1320; a new nave and aisles replaced, in 1388, the old Faculty chapels; and the Renaissance porch marks Archbishop Laud's reconstitution of the university, and still dates *"in parviso"* the certificates of satisfactory "responsions" of novices to the "masters of the schools" who controlled their admittance. For the history of this university, and the several fortunes of its colleges, *see* below.

The 13th century was the great age of mediaeval Oxford. Several parliaments were held here, notably the "Mad Parliament" of 1256, with its "Provisions of Oxford." But the growth of the university, and the wealth and influence of its colleges, were unfavourable to normal development as a mediaeval borough, with its guilds of craftsmen and traders. The "liberties" of the university, in relation with the city, were defined by charter in 1248, and revised in favour of the "chancellor, masters and scholars" after the town-and-gown riots of St. Scholastica's day, 1354–55, and other occasions; in 1523 the university was even allowed to incorporate all kinds of tradesmen, exempting them from civic jurisdiction. These unusual but once necessary provisions were only revoked or became obsolete with the modern transformation of the university itself, which retains, however, magisterial authority over its students, a censorship of public entertainments, and direct representation on the City Council and Guardians.

The Renaissance and the Reformation affected Oxford mainly through academical controversies, the foundation of a fresh series of colleges, and the creation by Henry VIII. of a bishopric, with St. Frideswide's church as its cathedral, and a chapter, the dean and canons of Christ church, economized out of Wolsey's "Cardinal college." But in the Civil War, Oxford's strategical importance made it the Royalist headquarters. The king retired hither after defeats at Edgehill, Newbury and Naseby; Prince Rupert made hence his raids in 1643. Not till May 1644 was the king forced by the concerted advances of the earl of Essex and Sir W. Waller to evacuate this fortress, and after Cropredy bridge he re-occupied it. Only in May 1646, when all other strongholds were lost and Charles himself had escaped in disguise, was Oxford besieged by Fairfax and surrendered on June 24. The extent of the city at this time beyond the mediaeval wall is outlined by traces of the "Kings Mound," enclosing Holywell, Wadham college (1611) and St. Giles. Though the university was mainly Royalist, the citizens had been secretly Parliamentarian; on both sides were losses, and party feelings were disastrous; and though Cromwell himself was chancellor (1651–57), his successor, Gilbert Sheldon, had much work to restore efficiency; his monument is the Sheldonian theatre, for the business and ceremonies of the reconciled masters; the Clarendon press and the Ashmolean museum, Christ church library and Peckwater quadrangle, large additions to New college and Magdalen, and the total rebuilding of Queen's college, are academical counterpart to a general rebuilding of mediaeval and Tudor Oxford, in the next half century. Though Charles II. held a parliament here in 1681, the restored Stuarts temporarily alienated university loyalty, but in the 18th century the university became Jacobite, and the city strongly Hanoverian. This feud, however, was reconciled at the visit of George III. in 1785, and Oxford passed out of national politics. The city, however, grew but little, until the reform of the university in 1858 admitted "married dons," while restricting membership of congregation to residents within 1½ m. from Carfax. The obstinate opposition of the university to Brunel's project for a "great western" railway system radiating from Oxford; and the restrictive policy of St. John's college, which owned almost all land north of St. Giles', had already aggravated urban congestion. The modern Oxford which emerged includes: (1) northward, a compact residential area, not wholly academic, along the Banbury and Woodstock roads beyond St. Giles', Keble, the Museum and laboratories, and the university parks and college playing fields; (2) eastward, beyond Magdalen bridge, the diverging roads to Marston, Headington, Cowley and Iffley, already enclosed fan shaped suburbs mainly of small dwellings, when the establishment of the Morris motor works at Cowley introduced a new and strenuous element into Oxford's industrial life, hitherto almost confined to the Clarendon press and private printing firms, robe making and tailoring, and the distribution of local dainties, sausages, marmalade, and the like; (3) to west and south, "ribbon development" along the trunk roads has disfigured the water meadows without adding to health or convenience. The real suburban areas here lie beyond, around or upon the Boar's-hill-Cumnor-Wytham upland. The Oxford Preservation Trust, established almost too late in 1927, a town planning scheme, 1925, and a new Incorporation Act, 1928, are attempts to adjust to the strict and peculiar circumstances of the site and its past, the requirements of "post-war" Oxford, with its partially modernized university, its interminable "summer schools" and vacation-conferences, its growing industries, trade, and professional interests, and the perennial stream of tourists. (J. L. My.)

**OXFORD,** a village of Butler county, Ohio, U.S.A., 40 mi. N.W. of Cincinnati, at an altitude of 1,000 ft.; on federal highway 27 and the Baltimore and Ohio railroad. Pop. (1940) 2,756. It is an educational centre, the seat of Miami university (chartered 1809, opened 1824) with which Oxford College for Women (1830) was consolidated in 1928; and the Western college (for women) (1853). The students and faculty of the educational institutions outnumber the resident population. The village was founded about 1800.

**OXFORD, PROVISIONS OF,** the articles constituting a preliminary scheme of reform enacted by a parliament which met at Oxford on June 11, 1258. King Henry III. had promised on May 2 that the state of his realm should be rectified and reformed by 24 counsellors who were to meet at Oxford for this purpose five weeks later. Twelve of these counsellors were chosen by the king, and 12 by the earls and barons. When the parliament met the 24 drew up a provisional scheme of reform, known as the Provisions of Oxford. By this it was arranged that a council of 15, chosen by four of the 24, should be appointed to advise the king in all matters. The new council was to meet three times a year in parliaments to which 12 commissioners

were to be summoned to discuss the affairs of the realm on behalf of the whole community. Another body of 24 was appointed to treat of an aid. Desiring to limit the power of the king and his household officers, the barons determined to revive the justiciarship, in abeyance since 1234. But they did not want over-powerful great officials. It was therefore decided that one or two justiciars should be appointed for one year who should be paid, but should be accountable at the end of the year. The chancellor and treasurer similarly had to account; the sheriffs, too, were appointed for one year only. Enquiries into abuses were begun and further reforms were to be reported on by Christmas. The king declared his adhesion to the Provisions on Oct. 18.

Disputes broke out in the baronial party. Simon de Montfort, earl of Leicester, supported by Edward, the king's son, demanded the logical extension of the reforms in local government to include the baronial franchises. The earl of Gloucester opposed this. Forced by Edward, a second series of Provisions, known as the Provisions of Westminster, was issued in Oct. 1259. The quarrels among the barons encouraged Henry to break free. On April 13, 1261, a papal bull absolved him from his oath to observe the Provisions. After three years on the verge of civil war, both parties agreed to refer the question to the arbitration of Louis IX. of France, who formally annulled them on Jan. 23, 1264, but expressly declared that his decision was not to invalidate the privileges, liberties and laudable customs of the realm of England, which had existed before the time of the provisions.

Stubbs, *Constitutional History* (1873), and *Select Charters* (1870, several later editions); Charles Bémont, *Simon de Montfort* (1884); T. F. Tout, *Chapters in the Administrative History of Mediaeval England* (1920); and E. F. Jacob, *Studies in the Period of Baronial Reform and Rebellion* (1925).

**OXFORD AND ASQUITH, HERBERT HENRY ASQUITH,** 1st Earl of (1852–1928), born at Morley, Yorks., on Sept. 12, 1852. His origins were Liberal, Nonconformist and middle class in character. Joseph Dixon Asquith, his father, owned a cloth manufacturing business in Morley, and his mother was the daughter of William Willans, a Huddersfield merchant. His father died while he, his brother (who afterwards became a master at Clifton), and his sister were children, and the two boys were left in the care of an uncle in London, where they went to the City of London school, then under the able headmastership of Dr. Abbott. Upon him the future prime minister made a deep impression, and to him Asquith in after life was accustomed to express a great debt of gratitude. He won a Balliol scholarship, and at Oxford he took a Craven university scholarship and firsts in "Mods" and "Greats," became president of the Union and a fellow of his college.

Adopting the bar as a profession, he first attracted public notice by his defence of Cunninghame Graham and John Burns for their part in the riot in Trafalgar square, but it was the Parnell Commission, in 1889, in which he acted as junior to Sir Charles Russell, that established his legal reputation, his deadly cross-examination of the manager of *The Times* giving the first indication of the dramatic issue of the trial. His success at the bar was assured, and in the next year he took silk, but the law was only a stepping-stone to the political career that from boyhood he had always had in view. He had entered parliament as member for East Fife in 1886, and on the formation of the Gladstone Government in 1892 he was appointed home secretary. He had just previously sustained a heavy domestic blow by the death of his wife, Helen, the daughter of a Manchester surgeon, whom he had married in 1877 and by whom he had four sons and one daughter. In office, Asquith's great parliamentary gifts were at once apparent, and his administration of the Home Office was made memorable by the appointment of the first women inspectors, improvements in the administration of the Factory Acts, the stiffening of the machinery, and the passing of the Employers' Liability bill, which was rejected by the Lords, and of a Factory bill which became law. He was bitterly and most unjustly attacked in connection with the shooting of two miners by soldiers who were called in to deal with a strike at the Featherstone colliery. He did not summon the soldiers, and appointed a commission immediately to enquire into the affair, but the legend that he was personally responsible pursued him, and for years his platform appearances were always greeted with cries of "Featherstone."

In 1894, while still at the Home Office, Asquith married a second time, his bride being the brilliant Miss Margaret ("Margot") Tennant, one of the daughters of the wealthy iron-master, Sir Charles Tennant. She was a prominent member of the most exclusive society circle, and the marriage very definitely changed the current of Asquith's social life, and in some measure affected his political relationships. The period was one of great disruption within the Liberal Party. The feud between the Rosebery and Harcourt groups was at its height, and after the fall of the Liberal Government in 1895, the conflict with the Boer republics divided the party into two hostile camps, the Liberal Imperialists, led by Lord Rosebery, and the pro-Boers led by Campbell-Bannerman. Asquith, who had returned to the bar, associated himself with the Rosebery group, which endorsed the Chamberlain policy. In this he was influenced, no doubt, by his confidence in Sir Alfred Milner, who had been his friend from his Balliol days, and who had become the instrument of British policy in South Africa. When the Boer controversy culminated in war, it seemed that the quarrel between the Roseberyite and Campbell-Bannerman factions must result in permanent separation, and the formation of the Liberal League, of which Lord Rosebery was president and Asquith vice-president, apparently put reconciliation out of the question.

From this catastrophe the Liberal Party was saved by the raising of the Tariff Reform issue. On this subject Lord Rosebery spoke with an equivocal voice, but Asquith at once became the most formidable protagonist of Free Trade. The discussion of the subject became largely a duel between him and Chamberlain, and the series of speeches he delivered throughout the country were among the most conspicuous triumphs of his career. It restored him to the full confidence of the party, and when Campbell-Bannerman formed his Government at the end of 1905 his appointment as chancellor of the exchequer was a matter of course. The moderation of his temper, and the entirely public-spirited motives that always inspired him contributed to the return of harmony within the party, and his achievements as chancellor established his claim to the succession to the premiership. His record at the Treasury, culminating in his final budget, which inaugurated old age pensions, give him a place among the most illustrious chancellors in history. On the resignation of Campbell-Bannerman, through illness, in 1908, Asquith became prime minister by universal consent, with Lloyd George as chancellor of the exchequer. No prime minister since Pitt had been called upon to face such grave issues as those which confronted Asquith at the beginning and developed as his long term of office—the longest of any prime minister since Lord Liverpool—advanced. A new mood of revolt filled the labour world with unrest and menace, the long struggle for the enfranchisement of women had passed out of the academic phase into a phase of unprecedented and almost fantastic violence, the sky over Europe was visibly darkening with the naval activity of Germany, and over and above all two capital issues reached a crisis—the issue of the House of Lords and the issue of Ireland. It was the first of these two questions that first tested the stuff of which the new prime minister was made. The budget of 1909, which dealt with the taxation of land, was rejected by the House of Lords. Asquith appealed to the country against its rejection in Jan. 1910, and his Government was reinstated, though only with the support of Labour and the Irish members. He addressed himself forthwith to the question of the abolition of the veto of the House of Lords, and during the summer made efforts to reach a pacific solution of the question by compromise. But the conference with the Opposition leaders broke down, and in the following December he appealed once more to the country and was once more returned —this time with a majority over the opposition of 126.

The opening of the session of 1911 may be taken as the crowning moment in Asquith's public career. The issue of the constitutional struggle with the Lords was not yet decided, but it was

no longer in doubt. The decisive mandate which the country had given in December dictated the issue that immediately occupied the new parliament. A bill abolishing the veto of the House of Lords was introduced into the House of Commons and passed all its stages by the beginning of the summer. But the final struggle had yet to come. The battle had still to be won in the Lords and there the opposition were entrenched in overwhelming power. Ever since the emergence of the issue it had been evident that the attainment of Asquith's goal depended on whether he could in the last resort invoke the authority of the Crown to dilute the House of Lords with new peers sufficient to change its complexion. The question was answered on July 20. The Parliament Bill, then in the House of Lords undergoing its second reading, was so amended as to deprive it of any utility for the purpose for which it was framed. Asquith therefore addressed to Balfour, the leader of the Opposition, a letter stating that the Government had decided, if the bill in its essential form could be passed in no other way, the Crown would be advised to create a sufficient number of peers to ensure its passage, and that the Crown had signified its willingness to accept such advice. The publication of this letter aroused an unprecedented storm, and on July 24, on rising in the House of Commons to make a statement, Asquith was greeted with a demonstration without parallel in living memory. For the best part of an hour he stood speechless before the roar of anger that issued from the Opposition benches, and at last resumed his seat without having uttered a continuous sentence. What became known as "the pothouse brawl" inaugurated the last stage of the struggle. The Government was accused of "dragging in the King," and the Opposition organized an uncompromising resistance in the belief that they would not dare to carry their threat into execution. But on Aug. 10, when the final debate was taking place in the House of Lords, Lord Morley confirmed the Government's previous intimation of His Majesty's intention. Up to this point the "Die-Hards" seemed to be assured of a majority, but in the division they were defeated. The bill was passed. On Aug. 18 the Parliament Act received the Royal Assent.

From this victory Asquith proceeded to his next great task, with the ground sensibly cleared for action. Gladstone's successive Home Rule adventures had broken on the rock of the Lords' veto; that rock no longer obstructed the channel. But before the Irish issue was fully launched another controversy absorbed the prime minister's activities. Discontent had long been growing prevalent in the mining industry, and at the end of Feb. 1912, having failed to secure the concessions and advances they demanded, the miners' union declared a strike. Vast dislocation followed. From the outset the Government endeavoured to bring the conflicting parties to agreement and Asquith took on himself the personal charge of the negotiations. After a month's fruitless efforts, the Government thereupon introduced the Miners' Minimum Wage Bill, which, by providing a half-way solution, forced the hands of both sides and brought the immediate struggle to an end, although the issue incidentally raised—that of the reorganization and control of the coal industry—was to perplex parliament and the country for many years to come.

Meanwhile, the Home Rule Bill had been introduced and passed through the House of Commons, while the Parliament Act provided adequately against the resistance of the House of Lords. That House fought the delaying action, which was all the Opposition now had in its power, by rejecting the bill in two successive sessions. After its next passage through the Commons it would have overridden opposition and automatically become law. By this time, however, the opposition to the measure had taken an extra-parliamentary shape. The Ulster Covenant had been promulgated in the previous September and talk of open rebellion, should Home Rule be passed, was already current. In June arms had been discovered both at Belfast and Dublin. As the year wore on the outlook became still more serious and a speech by Bonar Law, the leader of the Conservative Party, at Blenheim, seemed to give encouragement to the idea of resistance by force. On Sept. 25 the Ulster Unionist Council appointed a Provisional Government and prominent Conservatives openly preached armed resistance; Sir Edward Carson, the leader of the Ulster Unionists, left no doubt that in the last resort Ulster would fight.

With the close of the session of 1913 there came a brief lull, and during the recess conversations with the Opposition leaders were opened by Asquith, who throughout preserved an attitude of patience and forbearance. It will always be matter for controversy whether, when the policy of violent resistance had been adopted, he was justified in ignoring so direct a challenge to constitutional government. His natural disposition was to allow the utmost scope for the play of discussion and the influence of the time element; but it is an open secret that he would have taken up the challenge but for the persuasions of John Redmond, the leader of the Irish Nationalists, who believed that the prosecution of the Ulster leaders would prejudice the prospects of friendly relations with Ulster when Home Rule was actually on the statute book. In any case, the conversations of the autumn were futile, and on March 9, 1914, the Government announced the provisions of their amending bill, their last word of compromise. The chief provision of this bill was that any county in the north of Ireland was to be allowed to vote itself out of the operation of Home Rule for a period of five years.

The offer was rejected by the Opposition and now events rushed forward to an apparently unavoidable catastrophe. On the night of April 24–25, 55,000 rifles were landed at Larne from a German port for the use of the Ulster army. On the other side of the border the Nationalists were beginning to enrol a volunteer army and to make counter-preparations. Meanwhile a more sinister menace appeared. In the debate on the vote of censure on the Government on March 19 Bonar Law, speaking on the Home Rule issue, had used the ominous phrase "soldiers are citizens like the rest of us." There had been much talk of disaffection in the army in regard to the coercion of Ulster, and on March 20 it took shape in the Curragh incident (*see* IRELAND; IRELAND, NORTHERN), which led to the resignation of Col. Seely, the secretary for war. For a moment it seemed that the loyalty of the army was imperilled and the situation that confronted the Government looked desperate. But the announcement by Asquith next day that he would assume the secretaryship for war created a profound impression in parliament and stopped for the time being, at all events, what had seemed like a riot in the army. Following the mutilation of the amending bill by the House of Lords and Sir Edward Carson's challenge to the Government to "give us a clean cut or come and fight us," the king, on Asquith's advice, summoned a conference at Buckingham Palace on July 20 to see if some agreement was still not possible. It broke down four days later and the last hope of avoiding violence seemed gone.

What Asquith would have done to avert a civil war while maintaining the authority of the Constitution was not to be revealed, for on the day that the Buckingham Palace Conference broke up Austria sent her ultimatum, and within ten days the British army was embarking, not for Ulster, but for Flanders. In the feverish struggle within the Cabinet that preceded the entry of Great Britain into the World War Asquith's position was never in doubt. He had throughout been a party to the ambiguous military understandings and conversations which had been in progress with France since before the fall of the Balfour Government in 1905, and when the war came he did not waver in his conviction that both the duty and the interest of the country lay in throwing the country's whole weight into the scales against what he considered to be the calculated design of the Central Powers to establish a military despotism over Europe.

The invasion of Belgium by Germany saved his Government from disruption, and he addressed himself, free from domestic disquietudes, to the heaviest task ever imposed on a British prime minister. For the moment even the Irish trouble subsided, all political differences were shelved and Asquith became the voice of a united nation in a measure unequalled in modern Parliamentary history. The speeches he delivered in the early days of the war have taken their place beside the classic orations of Pitt during the Napoleonic wars, and his constancy of mind and freedom from all personal ambition played a dominating part during the next two years in laying the foundations of the ultimate victory. It was not to be expected that in the presence of so vast a con-

vulsion discontents would not develop. They became clamant as the true character of the struggle emerged. Asquith had made no change in the political constitution of his cabinet at the outbreak of war, although he had taken the leaders of the Opposition into his confidence and private counsels, but by the spring of 1915 it became clear that this informal relation would have to yield to a formal coalition.

In February Bonar Law and Lord Lansdowne intimated that they could accept no responsibility for the way in which the war was being conducted, and in the popular press a powerful and ceaseless agitation arose, directed mainly against Asquith, Grey and Haldane, and inspired by the inevitable shortage of munitions which the progress of the war had revealed. Coincidentally, a violent disagreement as to the employment of the navy in the Gallipoli adventure had arisen between Churchill, the first lord of the Admiralty, and Fisher, the first sea lord, and on May 26 Asquith reformed his cabinet on a coalition basis, bringing in the leaders of the Opposition and excluding Haldane. To meet the growing need for munitions, a special Ministry of Munitions was set up with Lloyd George at its head.

The reconstruction of the Ministry did not allay dissatisfaction. Within the cabinet friction developed, and, outside, the press agitation grew in violence. There was a persistent leakage of cabinet secrets, certain newspapers betraying a knowledge of most confidential Government business with such regularity as to suggest inspiration. A phrase, "Wait and See," which Asquith had used in reply to a question in the House of Commons years before, became the daily gibe of the malcontent press, and Sir Edward Grey, then in the midst of the most delicate situation with the United States, was accused of "feeding Germany" because of his attitude on the subject of contraband from America. The war-weariness that had overtaken the country provided an atmosphere in which this propaganda of discontent flourished, and the prime minister was the easier target for attack because he neither "squared" the press nor hit back at his critics. The inevitable rupture came in the autumn of 1916, when the German raid into Rumania—now seen in its true proportions—served to drive home the attack, and when Asquith was severely stricken by the loss of his eldest son in the war.

It arose over a question of cabinet reorganization. For some time the formation of an inner cabinet had been under discussion. At the beginning of Dec. 1916 Lloyd George, who upon the death of Kitchener had become secretary for war and whose prestige with the press had long been in the ascendant, submitted a definite scheme for the formation of such a body. From this body the prime minister was to be excluded. His right to control policy was not challenged, but he would not direct the deliberations of the inner cabinet. The *coup* burst upon the country with the announcement of the popular newspapers that Lloyd George was "packing up" in sheer despair at the inefficient conduct of the war. His highly confidential challenge to the position of Asquith was under consideration when an article appeared in *The Times* (then owned by Northcliffe) giving full details of the supposed arrangements and suggesting that Asquith had already agreed. Lloyd George denied any knowledge of this article; but Asquith, after consulting with his friends, decided to reject the proposal. Upon this Lloyd George resigned, and his resignation being followed by that of other influential members of the cabinet—including some who hoped that their action would give the prime minister the opportunity of reforming his cabinet on a new basis—Asquith informed the King that he could no longer be responsible for carrying on the business of government; and within a few days the second Coalition Government was formed with Lloyd George as prime minister. (*See* ENGLISH HISTORY: *1901–28;* WORLD WAR.)

Thus ended Asquith's long and memorable tenure of the premiership. For the remainder of the war he occupied a seat in the front Opposition bench, speaking rarely and only on occasions when the interest of the nation seemed to demand his intervention. At the election of 1918, when Lloyd George swept the country with an appeal for the maintenance of the Coalition, he did not escape the general wreck of the Liberal Party, losing the seat of East Fife, which he had held throughout his parliamentary career. In 1920 he returned to the House of Commons as member for Paisley and resumed his position as head of the remnant of the succeeding parliaments. In 1924, after an election fought on the issue of protection, he, as the head of a pivotal majority, was responsible for the accession to power of the first Labour Government, and later in the year for the Government's overthrow on a question of alleged governmental interference with the prosecution of a communist. At the next election he was defeated and retired to the Lords as earl of Oxford and Asquith.

Other honours were conferred on him. He became a member of the judicial committee of the privy council, a knight of the garter and a fellow of the Royal Society. After he entered the House of Lords he rarely intervened in public discussion. But at the outbreak of the General Strike in 1926, he urged the paramount duty of concentrating on the struggle against the "coercion of a new dictatorship," though he blamed the Government for not taking steps during the preceding nine months to make constructive proposals for the coal industry. Some recrimination followed, and there was a split in the Liberal Party (*q.v.*). He still retained the leadership of the Liberal Party, to which Lloyd George had now returned. But on the outbreak of the General Strike in 1926 a sharp difference appeared in the attitude of Lord Oxford and Lloyd George towards the event, and the latter declined to consult his colleagues. Lord Oxford thereupon formally intimated that he could have no political relations with him, and as the result of the consequent breach Oxford retired from any active part in the affairs of the party which he had led for 18 years. In his retirement he devoted himself to writing a book of reminiscences and reflections, under the title of *Fifty Years of Parliament,* and in the autumn of 1927 he also published a volume of his speeches. Thereafter his health gave way and he died on Feb. 15, 1928, being buried, according to his wish, in the churchyard of All Saints church, Sutton Courtney, Oxfordshire, where he had long had a country home.

Asquith will take his place among the most illustrious of British prime ministers, not merely by virtue of the momentous events in which he played a part, but still more because of his remarkable parliamentary gifts. In this respect he was in the true succession to Gladstone. He had little of the Sinaitic fervour of that great man, but he was not inferior to him in his mastery of the House of Commons. That mastery was achieved, not by emotional passion, but by the force, direction and lucidity of his speech, the intellectual sovereignty that he exercised over his audience, and the qualities of a plain, unaffected character and a singularly dispassionate mind. No man who ever played a great part in affairs was more conspicuously free from the common vices of public life. If he was ambitious it was only the ambition of conscious power directed to public ends. He was the least egotistic of men, and his magnanimity almost bordered on weakness. He was so little of a demagogue that he seemed to avoid rather than invite popular applause, a character to which a certain temperamental shyness contributed. His loyalty to his colleagues, even when they were lacking in loyalty to him, was one of his most striking attributes, and he was so indifferent to his own interests that he not only allowed the praise that belonged to himself to be appropriated by others, but often assumed the burden of mistakes which others had committed. He was the antithesis of that 18th century statesman of whom it was said that if there was credit to be got no one was so skilful in wriggling in, and if there was discredit to be borne no one was so skilful in wriggling out. He bore the odious slanders and insults of a demented press during the war with a certain proud and indifferent scorn, and his bearing both in private and public after the consummation of the intrigues against him was a model of dignity and public spirit. He was never betrayed into violent speech, and if his passion were roused, it was roused, not by personal issues, but by the outrages against public law and the sanctity of constitutionalism. He shared with the younger Pitt the view that the greatest quality in statesmanship was patience, and in all the perplexities with which he had to deal he exercised that quality to the utmost. He would never force a situation while there was a hope that a reasonable and pacific solution could be found. This confidence in the beneficent

operation of rational processes led many to suspect him of weakness, and it is undoubtedly true that there was in him an indisposition to anticipate events or to indulge in the histrionics of statesmanship. But on vital issues he was adamant, and his judgment on all great matters was never vitiated by the smaller considerations of personal and irrelevant motives. His mind moved in the undistracted orbit of a deeply considered philosophy of government, and it may be said of him, as of another, that if he was sometimes on the wrong side, he was never on the side of wrong. He will live in history not only as one of the most illustrious of British premiers but as a type of all that is best in the English character.

The general affection and regard in which Oxford was held was shown by the gift, in 1927, from 17 of his friends and admirers, including some Conservatives, of a capital sum and an income for life. By his first marriage he had four sons and one daughter. Raymond Asquith, his brilliant eldest son, was killed in action in 1916. By his second marriage he left a son, Anthony, and a daughter, Elizabeth, Princess Bibesco. He was succeeded in the earldom by his grandson, Julian, only son of Raymond Asquith.

**OXFORD AND ASQUITH,** MARGOT, COUNTESS OF (1864–1945), the sixth daughter of Sir Charles Tennant, 1st Bart., married, in 1894, as his second wife, H. H. Asquith, later the Earl of Oxford and Asquith (*q.v.*). Before her marriage she was well known as a member of the coterie known as the "Souls," and maintained her reputation as one of the wittiest and most brilliant women in London society. In 1922 she published *The Autobiography of Margot Asquith* (2 vol.), which reflected the natural frankness of her character. It is a valuable chronicle of the time. She died in London on July 28, 1945.

Her other works include *Places and Persons* (1925), *Lay Sermons* (1927) and a novel *Octavia* (1928).

**OXFORDSHIRE** or OXON, a southern midland county of England, bounded northeast by Northamptonshire, northwest by Warwickshire, west by Gloucestershire, south-southwest and southeast by Berkshire and east by Buckinghamshire. It was originally part of the Mercian kingdom; but its boundaries, except for the Thames on the south (71 mi. from Kelmscot near Lechlade, Gloucestershire, to Remenham below Henley-on-Thames, with the exception of two points near Oxford), are artificial. They were slightly changed by act of William IV and Victoria and by the Reading extension order of 1911 and enclose an area of 748.8 sq.mi.

The 14 Oxfordshire hundreds include five of the Chiltern hundreds, the jurisdiction over which belonged to the manor of Benson and in 1199 to Robert de Harecourt.

**Structure and Topography.**—The county lies across the central portion of the Jurassic and Cretaceous outcrops. The strike of the strata is in each case from north-east to south-west, for Tertiary movements have tilted them gently down to the south-east so that the transition from north-west to south-east is from older to newer rocks passing in succession from the Lias over the Lower, Middle and Upper Oolite to the Lower Greensand, Gault, Upper Greensand and Chalk. In the north-west, the Marlstone of the Middle Lias and the Limestones of the Oolitic series are permeable and relatively resistant, and the Marlstones and the Inferior Oolite rocks being specially hard, stand out as a sharp north-west edge, continuing the line of the Cotswolds at a lower level (average 500 ft.), but rising to 700 ft. in Edge Hill in the north-east of the county. In the south-east, the chalk is also permeable and resistant, and the hard chalk-with-flints crowning the Chilterns also presents a sharp edge to the north-west.

Between these two upland regions the intermediate geological series forms a broad vale (20 m.) of alternating clays and calcareous, sandy beds. The Upper Greensand forms a low feature at the foot of the chalk hills; this is succeeded by the Gault, with width of outcrop varying from 4 m. to 1½ m. between Dorchester and Sydenham. The lower Greensand appears from beneath the Gault at Culham and Nuneham Courtney and in outliers north of Cuddesdon; Portland limestone, Portland sands and Purbeck beds lie between it and the Kimmeridge clays, which outcrop between Sandford and Waterperry. Coral Rag is traceable from Sandford to Wheatley and beyond this comes a broad outcrop of Oxford clay followed by the Cornbrash (a brownish rubbly limestone). This outcrops at Norton Bridge, Woodstock and Shipton, forms a broad plateau between Middleton Stoney and Bicester, and also occurs as inliers at Islip, Charlton, Merton and Black Horse Hill. The county lies almost wholly in the basin of the upper Thames, in which the significant drainage is that of the Cherwell-Thames. The drainage pattern as a whole, consists of numerous consequent streams from the scarplands (Evenlode, Windrush, etc.), which have been captured and diverted into the Cherwell-Thames by powerful subsequent streams (Ock, Upper Thames, Ray, Thame), working along lines of weakness in the strike of the rocks, obsequent streams flowing down the scarp edge often being a further result of the capturing.

The Cherwell occupies a broad sag between Edge Hill and the Northampton Uplands. It flows south-south-east, joins the Thames coming from the west at Oxford, after which the combined stream continues the south-south-east direction, passing by a deep gorge through the chalk between Wallingford and Reading. That the gap must have originated north-west of its present position is argued from the fact that the level of the river bed at this point is 100 ft. while that of the hills on either side is 700–800 feet. It is an old, but rejuvenated drainage system, which, working upon calcareous rocks, has given rise to a characteristic topography; streams graded to base level but with very steep-sided upper valleys and wide intervening spaces between the head streams that have no surface streams; broad main valleys from which streams have disappeared, or where drainage is beneath the surface; misfit streams, due to capture by the river Severn of an earlier drainage to the Thames from the Welsh plateau, or to carving out of valleys by flood waters following the retreat of the ice. There is little glacial drift except in the north-east of the county. Gravel deposits, both plateau (North Leigh, Combe, Tiddington, etc.) and flood plain (Bampton, Oxford, Dorchester, etc.), are very important; tracts of clay-with-flints, brick-earth and gravel, as well as outliers of the London clay (Nettlebed, Caversham, etc.) occur on the dip slope of the chalk.

**History and Early Settlement.**—The bare Lias and Oolite uplands and the flood plain gravels were sites of late Neolithic settlement, as witness numerous Long Barrows (characteristic of the Cotswold area) as far east as the Cherwell. The Rollright stones (probably Neolithic) on the Oolite scarp need special mention. Quantities of bones of cattle, pigs, sheep, etc., are found in the gravels, and pottery (characteristic of the Wash area) is distributed east of the Cherwell-Thames line. Settlement on the dip slope of the Chilterns was debarred by forests, as also in the forested north-eastern portion of the county, but the Icknield Way, generally on the Greensand, and the Ridgeway, on the Chalk above, followed the scarp face to the Thames crossing, forming parallel routes to a trackway along the limestone uplands. An influx of the people who made Beaker pottery is indicated for the region between the Evenlode and the Windrush and on the valley gravels (Eynsham, Stanlake, Brighthampton, Oxford, Burcot, Dorchester, etc.). In the Iron Age camps were established along the same routes (*e.g.*, Chastleton, Tadmarton). During the Roman period the area was thickly populated and roads were made linking Alchester and Dorchester in the Cherwell-Thames with Towcester (Northamptonshire) to the north and Silchester (Hampshire) to the south. Alchester was also connected by Akeman Street with Verulamium (Hertfordshire) to the east and Cirencester (Gloucestershire) to the west. The Saxon settlements are noticeably on valley sites, occupied in pre-Roman times, and these have continued as nucleated settlements to the present day; isolated farms are noticeably on plateau or vale from which forest was cleared comparatively late. In the 6th century the West Saxons took Benson and Eynsham. (*See* the *Saxon Chronicle* for 571.)

In the 7th century the Mercians held all the northern border of

the Thames, and during the 8th century this district fell to Wessex after the battle of Burford, and to Mercia after a battle at Benson, when it was included in the diocese of Lincoln. The bishopric at Dorchester given to Birinus (the apostle of Wessex), 634, seems to have come to an end on the establishment of the see of Winchester. Before the Mercian conquest in 777 Oxfordshire was in the diocese of Sherborne. In 873 the jurisdiction of Dorchester reached to the Humber, and when the Danes were converted it extended over Leicestershire and Lincolnshire, Oxfordshire forming about an eighth of the diocese. In 1092 the seat was transferred to Lincoln. In 1542 a bishopric of Osney and Thame was established, taking its title from Oxford, the last abbot of Osney being appointed to it. In 1546 the existing bishopric of Oxford was established. The ecclesiastical boundaries remain as they were when archdeacons were first appointed—the county and archdeaconry being conterminous. The county, excepting the parish of Taynton in Chelmsford diocese, is in the diocese of Oxford.

The Danes overran the county during the 11th century; Thurkell's army burnt Oxford in 1010, and the combined armies of Sweyn and Olaf crossed Watling Street and ravaged the district, Oxford and Winchester submitting to them. At Oxford, in 1018, Danes and Englishmen chose Eadgar's law. Here also Harold allowed Tostig to be outlawed and Morkere to be chosen earl in his place, thus preparing the way for his own downfall and for the Norman Conquest. The destruction of houses in Oxford recorded in the Domesday Survey may possibly be accounted for by the ravages of the rebel army of Eadwine and Morkere on this occasion. Large possessions in the county fell to the Conqueror, and to Odo, bishop of Winchester. The bishop of Lincoln and many religious houses (*e.g.*, Abingdon, Osney and Godstow) held much land in the county. Robert D'Oiloi, heir of Wigod of Wallingford, held many manors and houses in Oxford, of which town he was governor. The importance of Oxford was already well established; the shire moot there is mentioned in Canute's Oxford laws, and it was the seat of the county court from the first, the castle being the county gaol. For events between this period and the Civil War *see* OXFORD (city). The dissolution of the monasteries, though it affected the county greatly, caused no general disturbance.

When King Charles I. won the battle of Edgehill (Oct. 23, 1642), Oxford at once became the stronghold of the royalist cause. For the campaign of 1643 its rôle was to detain the main parliamentary army until the royalists from the north and the west could come up, after which the united forces were to close upon London. More than once, notably at Chalgrove Field (June 18, 1643), Prince Rupert's cavalry struck hard and successfully. In the campaign of Newbury skirmishes took place as the parliamentary troops under Essex passed through north Oxfordshire on their way to the relief of Gloucester, and at the close of the campaign the fortresses of the county offered the defeated royalists a refuge which Essex was powerless to disturb. In the following campaign Charles abandoned the idea of an envelopment and decided to use Oxfordshire as the stronghold from which to strike in all directions. Material wants made it impossible for Charles to maintain permanently his central position, and eventually Essex headed for the south-west, leaving Waller to face the king alone. The battle of Cropredy Bridge followed (Jan. 29), and the victorious king turned south to pursue and capture Essex at Lostwithiel in Cornwall. In the operations of 1644 Oxfordshire again served as a refuge and base (Newbury and Donnington).

On the appearance of Cromwell and the New Model army a fresh interest arose. Leaving Windsor (April 20, 1645), the future Protector carried out a daring cavalry raid. He caught the royalists unawares at Islip, pursued the fugitives to Bletchington and forced the governor to surrender. He swept round Oxford, fought again at Bampton, and rejoined Fairfax, in Berkshire. A few days later Charles again marched northwards, while Fairfax was ordered to besiege Oxford. Charles was compelled to turn back to relieve the city, and the consequent delay led to the campaign and disaster of Naseby. Yet even after Naseby Oxfordshire still retained its importance, but in 1646 the Roundheads closed in from all sides and Stow-on-the-Wold witnessed the final battle of the war. On May 9 Banbury surrendered, on June 24 Oxford capitulated, and three days later Wallingford, the last place to give in, followed its example.

**Architecture.**—The limestone of the Oolite series has provided beautiful material for both ecclesiastical and domestic architecture, the castles, of which there are few, were probably built for temporary defence in the civil strife of Stephen's reign (1100–1135). Considerable portions of the Norman Oxford castle survive, and slighter remains of the castle at Bampton, the seat of Aylmer de Valence in 1313. Among remains of former mansions Greys Court near Henley-on-Thames (14th century), Minster Lovell, on the Windrush above Witney, and Rycote, between Thame and Oxford may be noted. Minster Lovell was the seat of Francis, Lord Lovel, the son of a Lancastrian who incurred the hatred of that party by serving Richard III.; he afterwards aided Lambert Simnel, and mysteriously disappeared after the battle of Stoke.

Rycote is of fine Elizabethan brick and in the chapel attached to the manor there is remarkable Jacobean woodwork, the entire fittings being of this period. Here Elizabeth resided both before and after her accession. Broughton castle near Banbury (14th century), Shirburn Castle (mainly 15th century Perpendicular) and Stanton Harcourt (1450, with a gatehouse of 1540, a vast kitchen and Pope's Tower) are ancient mansions still inhabited. Mapledurham, on the Thames above Reading, is a fine Tudor mansion of brick; and Water Eaton on the Cherwell, is a singularly perfect Jacobean house of stone.

A large number of monastic foundations arose in the neighbourhood of the university; Augustinian at Bicester, Caversham, Cold Norton, Dorchester, Osney (a magnificent foundation just outside the walls of Oxford) and Wroxton; Cistercian at Bruern and Thame; Benedictine at Cogges, Eynsham, Milton; Mathurin at Nuffield; Gilbertine at Clattercote; Templar at Sandford-on-Thames.

Gosford possessed one of the only two preceptories of female Templars in England. Of all these, excepting the abbey church at Dorchester, remains are scanty. The boundary walls still stand of Godstow nunnery on the Thames, the retreat and burial place of Rosamund Clifford, or "Fair Rosamond," the object of Henry II's famous courtship.

In ecclesiastical architecture Oxfordshire, apart from Oxford itself, is remarkably rich, but nearly all the churches are of mixed dates. Iffley, Adderbury and Minster Lovell are types of a single style. Iffley, 1 mi. S. of Oxford, is one of the finest examples of pure Romanesque in England, with a highly ornate west front. Adderbury, 4 mi. S. of Banbury, is a great cruciform Decorated church with a massive central tower and spire. Minster Lovell, also cruciform, is pure Perpendicular; its central tower is supported on four detached piers.

The short, ungainly spire of Oxford cathedral was among the earliest, if not the first, constructed in England and served as a model from which were probably developed the splendid central spires of the great churches at Witney, Bampton, Shipton-under-Wychwood and Bradwell. There are also fine spires at Bloxham, Adderbury and King's Sutton (in Northants).

Bloxham church, mainly Decorated, with Romanesque portions and a remarkable Early English west front is one of the largest and most beautiful in the county. In the west, Burford (Romanesque and later) is noteworthy, and in the porch of the fine Romanesque church of Langford is a crucifix with the figure cloaked. At South Leigh, Beckley and Swinbrook are remarkable mediaeval mural paintings, while at Caversfield there is what is probably the oldest church bell in England—cast before 1219. About 5 mi. north of Oxford there are Kidlington (Decorated), with a beautiful needle-like Perpendicular spire, and Islip, as the birthplace of Edward the Confessor. Ewelme church (Perpendicular) is remarkable for the tomb of Alice, Duchess of Suffolk (1475), gorgeous with tracery and gilded canopy, and that of Sir Thomas Chaucer (1434), with enamelled coats of arms.

Here William de la Pole, Duke of Suffolk, founded in 1436 the picturesque hospital and free school still standing.

**Climate and Agriculture.**—The climate, healthy and dry,

except in the low ground bordering the Thames, is colder than the other southern districts in England, especially in the exposed regions of the Chilterns. The county is essentially rural. The surface soils lie in belts, corresponding to the underlying rocks, the heavy clays giving rise to grasslands and the calcareous, sandy soils to arable. Many villages occur where springs issue at the junction of permeable and impermeable strata, thus securing flood-plain pasture for cattle, upland pasture for sheep and upland patches of lighter soil, with a sandy aspect, which could be worked by primitive communities often with a two-field rotation. Wool was early a source of wealth and was famous in the 12th and 13th centuries. Salt is mentioned in Domesday as a product of the county; glass was made at Benson and Stokenchurch in the reign of Henry VI and other subsidiary products were plush at Banbury, leather at Bampton and Burford, gloves at Woodstock and malt at Henley. In the early 14th century, Oxford was the second most prosperous county in England, but the Black Death (1349) and decreasing arable land, the enclosures of the 16th century and the wars of the 17th brought depression and discontent, and on the enclosure of Otmoor (1830) serious riots broke out.

A high proportion of the county (about 81% in 1939) is under cultivation. Stock are raised on the clay lowlands, and dairying (Shorthorns, Alderneys and Devonshire cows) is important. The Cornbrash is specially good for grain growing, but crops of wheat, oats and barley have declined (75,225 ac. in 1939 compared with 91,049 ac. in 1926).

Sheep (Southdowns, Leicesters and Cotswolds) are still reared in large numbers on the uplands and are folded on the root crops (turnips, swedes, mangolds), which are important. The cultivation of sugar beet, which was flourishing in 1926 (1,196 ac.), later showed a serious decline but by 1939 had risen again to 859 ac.

Many pigs are reared and poultry do well on gravel sites. The county has few mineral resources; iron is obtained at various places; Oolitic limestone is quarried for cement, stone slates and, though less than formerly, for building stone. The clays are used for brickmaking and have been largely utilized for the building of the new town which has arisen around the motor industry at Cowley southeast of Oxford. The National Trust owned 380 ac. in the county in 1942.

**Manufactures.**—These are mainly those dependent on agriculture. Blankets are manufactured at Witney and tweeds at Chipping Norton. There are paper mills at Shiplake, Sandford-on-Thames, Wolvercot and Eynsham, using the pure water of the streams.

Agricultural implements and portable engines are made at Banbury, where there is also plush, shag and girth weaving. Gloves and polished steel are industries at Woodstock. Lace is made by country women. Banbury has been long celebrated for the manufacture of a peculiar cake.

**Communications.**—Many of the roads are ancient routes on the plateau or following the strike of the rocks, but the main railways are markedly transverse, linking London with the industrial northwest. The county is served entirely by the G.W. railway (except for a branch of the L.M.S. railway from Bletchley to Banbury and to Oxford). One main line from London passes through the Reading gap to Oxford, and here bifurcating, sends one line north along the Cherwell valley to Banbury and another across the northwest of the county, via the Evenlode valley, to link up with the Severn valley, Worcester and Birmingham; Kingham on the borders of Gloucestershire being a junction for a line west to Cheltenham (Glouc.) and a line northeast to King's Sutton (Northants). There are numerous branch lines.

**Population and Administration.**—The area of the administrative county, excluding the city and county borough of Oxford, is 736 sq.mi. with a population (est. 1938) of 135,200. Being an agricultural county and not far from London it was very suitable as a reception area for wartime evacuees, whose immigration between Sept. 1939 and Feb. 1941 raised the population by 21%. The municipal boroughs are Banbury, Chipping Norton, Henley-on-Thames, Oxford, a city and the county town, and Woodstock. The county is in the Oxford circuit and assizes are held at Oxford. It has one court of quarter sessions and is divided into 11 petty sessional divisions.

The borough of Banbury and the city of Oxford have separate courts of quarter sessions and commissions of the peace, and the borough of Henley-on-Thames has a separate commission of the peace. The total number of civil parishes is 233. The ancient county (which in 1289 sent two members to parliament) was divided in 1918 into two parliamentary divisions, Banbury and Henley, each returning one member.

It also includes part of the parliamentary borough of Oxford, returning one member, in addition to which the university of Oxford returns two members.

Walker, *The Natural History of the Oxford District* (1926).

**OXFORD UNIVERSITY.** The stories connecting Oxford university with Brute the Trojan, with king Mempeic (1009 B.C.) and with the Druids, cannot be traced back beyond the 14th century. The town, in fact, is considerably older than the university. (*See* OXFORD.) Authentic history appears to begin in 1133 with the arrival from Paris of the theologian, Robert Pullen, who lectured here. There is, however, little evidence that Oxford was regarded as a fully equipped university before 1163—allusions to its being a *studium generale* (*see* UNIVERSITIES) only occur after that date and these by some authorities are held to be inconclusive. Subsequent progress must, however, have been rapid as, about 100 years later, the deputies of Oxford, in an appeal to the king, described the university as *Schola secunda ecclesiae* or second to Paris. The coming of the religious communities, the Dominicans, Franciscans and Carmelites in the 13th century and the Benedictines a little later on, profoundly affected the advancement of learning. The names of Roger Bacon, Duns Scotus and Wycliffe, are sufficient to indicate the prominence of Oxford in the middle ages. The earliest colleges to be founded were University college (1249, the mythical foundation by Alfred in 872 is no longer accepted), Balliol (about 1263), Merton (1264). The last-named was established with a view to provide a collegiate discipline for the secular clergy, and its statutes served as a model for subsequent creations, not only at Oxford but at Cambridge. For the others *see* the list on pp. 994 and 995.

From the 13th century onward a succession of charters from the crown strengthened the position of the university at the expense of the town. At the Renaissance the new learning found its leading exponents in Erasmus, who lectured there, and in such famous scholars as Grocyn, Dean Colet and Sir Thomas More. The old scholasticism received its death-blow from the royal injunctions of 1535. Oxford, as well as Cambridge, suffered from numerous confiscations of land and revenues during the Reformation period. In 1571 the act of Elizabeth incorporated and reorganized the two universities. The statutes of the university were codified in 1636 by the chancellor, Archbishop Laud. With certain modifications, they formed the official code of the university till 1858. During the civil war the university sided with the king, while the town sympathized with the parliament, but no open breach between the two occurred. Under Cromwell, who acted as chancellor from 1651–57, a strong effort was made to restore the standards in work and discipline which had suffered from the civil wars. During the reign of James II, the university acquired great popularity by its successful resistance to James's effort to throw open the university to Catholics, even to the extent of imposing his own Catholic nominee on the fellows of Magdalen. The university, however, soon returned to its Jacobite allegiance, and at the coming of the Georges was definitely anti-Hanoverian, a phase, however, that came to an end after the visit of George III in 1785. In the latter half of the 18th century the influence of the Wesleys on Oxford was far less than on the country at large; on the other hand the Tractarian movement (*see* NEWMAN), at

the beginning of the 19th century had a most profound effect on the Church of England, which is still potent to-day. There was a general rise in the level of studies towards the end of the 18th century, as written examinations gradually supplemented the old oral examinations, often merely formal, and henceforth the range of studies themselves extended. By the reform of 1858 the professoriate was increased, reorganized and re-endowed, and dissenters were admitted to entrance to the B.A.—the M.A. being thrown open in 1871.

The reforms of 1877 directed a certain proportion of the college revenues to the use of the university—especially for the encouragement of natural science, and improved the position of professors and lecturers, thus leading to the growth of a regular resident professoriate. Schools and degrees alike multiplied (*see* UNIVERSITIES) and the history of the university was one of general progress and expansion. None the less there was a widespread feeling that a certain amount of reform was advisable if the university was to keep step with the times. In 1909 Lord Curzon, the then chancellor of the university, issued his *Principles and Methods of University Reform.* Committees of council were formed to prepare definite schemes. Several reforms were proposed, notably the abolition of compulsory Greek, the reform of the Hebdomadal Council (*see* below), a remodelling of the boards of faculties, and a revision of the financial relation between the university and the colleges. Most of these have since (*see* below) been realized in one way or another.

The two most important facts in the history of the university since 1911 have been the World War and the two commissions. In the war 14,561 Oxford men served in the British forces, and 2,660 lost their lives. Again, thanks to the O.T.C., nearly 2,000 Oxford men received commissions in the first two months of the war, while for the last three years of the war, there always were nearly 2,000 cadets in Oxford. The examination schools and those colleges which were not given up to cadets became hospitals. The number of undergraduates fell to 1,087 in Jan. 1915, and 550, 460 and 369 in the same months in 1916, 1917 and 1918 respectively. The tide began to turn in the latter part of 1918; in Jan. 1919 there were 1,357 men in residence; and in the following 18 months the entries were so heavy that by Oct. 1920 there were about 4,500 men and 650 women actually in residence. Since that time, all the men's colleges have striven to reduce their numbers; so that the figures for undergraduates were, in 1928, about 3,500 men and 750 women. Women, in 1920, were admitted as full members of the university, but a statute was passed in 1927 limiting their number to one-fourth that of men.

**New Statutes.**—The royal commission, set up in 1919, reported in 1922. Its recommendations were embodied in statutes by a second commission (set up 1923) which came into force in 1926. It was satisfactory to Oxford men to find that a body appointed by a reforming Government, and composed of men of all political parties, reported so favourably on the work of the universities as a whole; so far from being pronounced to be homes of idleness, the main complaint made against most of the teachers was that they worked too hard. (See *Report,* pp. 26, 39, 48.) To remedy this, and to allow for the extension of university activities, the royal commission recommended a grant to Oxford and to Cambridge of £110,000 a year each; only £60,000 was given at first, but in the spring of 1925 this was increased to £85,000.

The aim of the commissions especially was to encourage research work. The growth of this was already a marked feature in Oxford. To encourage it, the degrees of Bachelor of Letters and Bachelor of Science were set up in 1895, the Doctorate of Philosophy in 1917; the regulations for the B.Litt. have now been (1927–28) remodelled in the light of experience. In the examination, too, for the honours degree in natural science, students of chemistry can only obtain a class if they spend a year on a piece of research. Probably the most important proposal in the new statutes is the setting apart, out of the Government grant, of an annual sum of £10,000 to assist college lecturers, who will be appointed by the boards of the faculties to be also "university lecturers," carrying out some special work.

Apart from this grant, the most important changes have been: (1) The full enjoyment of college scholarships will be limited to those in need of financial help; the election, however, will be made by colleges as before, and entirely on intellectual grounds. (2) All professors are made ex officio fellows and members of the governing bodies of colleges. But these changes only make statutory and universal what was already done in most colleges. (3) A retiring age is fixed for all posts, whether college or university. A pension scheme has also been instituted. (4) The machinery of university government has been changed. The Hebdomadal Council is now made representative of the whole university, not of separate orders of members, and congregation is to consist entirely of those doing university work, whether teaching or administrative. These changes again had been largely anticipated by university action since 1900. (5) The power of convocation to override congregation is practically abolished. This change is more important in theory than in practice; the one subject on which convocation had interfered decisively—the refusal to open theological degrees to members of all denominations—had been settled by agreement in 1920. (6) The general board of faculties, set up in Lord Curzon's reform of 1913, has been made more representative of the whole university, and given fuller power over its studies. The financial machinery of Oxford had been already remodelled by statutes passed in 1912 and 1920.

On the whole it may be said that the essential principle of Oxford life, the independence of colleges, has been maintained. The university can advise as to college elections and appointments, and make general rules, but colleges retain their full powers of election and administration.

**Benefactions.**—Natural science has been the chief gainer from recent benefactions, with new laboratories for engineering (1912), for chemistry (thanks mainly to Dyson Perrins) in 1915, for pathology from the Dunn trustees and for biochemistry from Mr. Whitley and the Rockefeller foundation (opened in 1926 and 1927 respectively). The Welch bequest (1915) has added another £50,000 to the resources of biological science, and the Government, by placing at Oxford the institutes of Agricultural Engineering (1923) and of Imperial Forestry (1924), has shown its confidence in the oldest university as the fittest place to provide for the newest needs of the empire.

Next to the development of natural science, the most marked feature of the last 20 years has been the growth of modern language teaching. Professorships of French, Italian and Spanish have been founded by Sir B. Zaharoff, A. Serena and W. R. Morris respectively; Sir Heath Harrison has provided scholarships for undergraduate travel (1919), and Mr. Laming has founded travelling fellowships in connection with his old college, Queen's (1924). Closely allied with this development is the increasing number of fellowships for study in the universities of the United States (*e.g.,* the Commonwealth and the Davison fellowships), which are being founded by Americans as a counterpart to the work of Cecil Rhodes. His trustees are building, on part of what had been the garden of Wadham, a great building, designed by Sir H. Baker, to be a centre of the advanced studies, on the humanistic side, of students from the whole English-speaking world.

The Bodleian continues to receive gifts, not only of books and pictures as in Lord Curzon's Napoleonic collection (1925), but also in cash, as Walter Morrison's £50,000 in 1920, but its accommodation is becoming seriously inadequate, and during the next decade either great extensions must be carried out, or the policy of the library seriously changed. In any case, very large benefactions will be required. The same must be said of the Oxford Preservation Trust, founded 1927, to preserve the beauties of Oxford, both in the city itself and also in its surroundings. Mention should also be made of Barnett house, founded in 1914 in memory of Rev. S. A. Barnett, for the promotion of social and economic studies.

**List of Colleges and Halls.**—In addition to the three colleges mentioned above, University, Balliol and Merton, the other colleges in their order of foundation are: Exeter (originally called Stapelton Hall, 1314), Oriel (1326), Queen's (1340, named after the well-known Queen Philippa), New college (creation of William of Wykeham, 1379), Lincoln (1427), All Souls (1437), Mag-

## SOME VIEWS OF OXFORD

1. Oriel college, showing a corner of the quadrangle. 2. Bodleian library extending over upper story of "Old Schools building." 3. Christchurch from Merton fields. "Tom Tower" built by Wren in centre, cathedral spire to right, hall and belfry to left. 4. General view of Oxford from the air. University church (spire), Radcliffe library (dome) and Bodleian library surrounded by college quadrangles. 5. Corner of quadrangle of Corpus Christi college, showing entrance and sundial. 6. Magdalen college and bridge

dalen (1458), Brasenose (1509), Corpus Christi (1516), Christ Church (begun by Wolsey in 1525, final foundation by Henry VIII., 1546), St. John's (1555), Trinity (1555), Jesus (founded by Queen Elizabeth, 1571), Wadham (1612, charter received 1610), Pembroke (1624), Worcester (1714), Keble (created as memorial to John Keble, 1870), Hertford (after many vicissitudes, 1874). For further details *see* OXFORD. Of the various academical halls, St. Edmunds (reputed foundation, 1226) is the only one that now survives.

Non-collegiate students were first admitted in 1863. They are known as members of St. Catherine's college. There are four women's colleges, founded—Somerville (1879), Lady Margaret Hall (1879), St. Hugh's Hall (1886) and St. Hilda's (1893); a certain number of women are also admitted to the university as "home students." Among the independent foundations mainly intended for teaching theology are Pusey House (1884) and Wycliffe Hall (1878), both Church of England, and Mansfield college (1886) and Manchester college (1893, Nonconformist).

**Other Academic Buildings of Note.**—Oxford also possesses an unusual number of fine academic buildings—to quote only the names of some of the principal ones—they are described at length in the article on OXFORD; first, the notable group of buildings comprising the Bodleian library, the University school, the Convocation house with the Sheldonian theatre and the original Ashmolean museum, and the Ratcliffe library not far away. "The university church" of St. Mary lies just to the south of the latter. Another massive pile of buildings is devoted to the Taylor institute, the University galleries and the present Ashmolean museum. Other important buildings are the University museum, the Pitt-Rivers Ethnographical museum, the University observatory, and the famous Clarendon press. Mention should also be made of the botanical garden by the Cherwell and the Oxford Union Society, founded 1625.

**University Constitution and Art Institution.**—"The chancellor, masters and scholars of the University of Oxford" form a corporate body, within which the colleges are so many individual corporations. The highest officer of the university is the chancellor, who is elected by the members of convocation, holds office for life, and is generally a distinguished member of the university. The vice-chancellor is practically the head. He is nominated annually by the chancellor, and must be the head of a college. Two proctors (*q.v.*) are appointed annually by two of the colleges in rotation. The university returns two members to parliament, the privilege dating from 1604, under a system of proportional representation.

The Hebdomadal (from Greek ἑβδομάς, the number seven; the Hebdomadal board instituted in 1631 was appointed to hold a weekly meeting) Council consists of the chancellor, vice-chancellor, the ex-vice-chancellor or the next vice-chancellor, and proctors as official members and of 18 other members (heads of houses, professors, etc.) elected for terms of six years by the congregation of the university. The council takes the initiative in promulgating, discussing and submitting to convocation all the legislation of the university, and controls its general business and its policy. The ancient house of congregation includes all college deans, examiners and Regent masters, *i.e.*, M.A.'s of not more than two years' standing; it once was concerned with university education and discipline, but it now has practically no functions beyond the granting of degrees. It lost its wider powers under the act of 1854, when the congregation of the university was created. This body, which includes, besides certain officials, all members of convocation concerned in the educational and administrative work of the university who have resided for a fixed period within 2½ m. of Carfax, approves or amends legislation submitted by the Hebdomadal Council previously to its submission to convocation; it also has considerable powers in the election of the various administrative boards. The house of convocation consists of all masters of arts and doctors of the higher faculties who have their names on the university books, and has the final control over all acts and business of the university. There are boards of curators for the Bodleian library, the university chest and other institutions, delegates of the common university fund, the museum and the press, for extramural teaching, local examinations and other similar purposes, visitors for the Ashmolean museum and university galleries, and many other administrative bodies. There are boards for the following faculties: theology, law, medicine, natural science and arts (including *literae humaniores,* oriental languages and modern history). The general board of the faculties, elected by all the resident teachers in the university, arranges and controls the teaching, appoints one class of university lecturers, and can make suggestions to colleges as to the appointment of the fellows as lecturers, on the recommendation of the special boards of faculty. The income assigned to it for the purpose is £10,000. Among the numerous professorships and readerships in the various subjects of study, the oldest foundation is the Margaret professorship of divinity, founded in 1502 by Margaret, countess of Richmond and mother of Henry VII. This was followed by the five Regius professorships of divinity, civil law, medicine, Hebrew and Greek, founded by Henry VIII.

The colleges consist of a head, whose title varies in different colleges, fellows (who form the governing body) and scholars. To these are to be added the commoners, *i.e.*, those who either receive no emoluments, or hold exhibitions which do not (generally) entitle them to rank with the scholars. The college officer who is immediately concerned with the disciplinary surveillance of members of the college *in statu pupillari* is the dean (except at Christ Church). Each undergraduate (this term covering all who have not yet proceeded to a degree) is, as regards his studies, under the immediate supervision of one of the fellows as tutor. The examinations for the B.A. are as follows: (*a*) Responsions, always now passed before entrance; exemption is granted to all candidates who have taken the school's leaving certificate. (*See* EXAMINATIONS.) (*b*) Honours or pass moderations, the latter often takes the form of a diploma in a special subject. (*c*) Final schools (in the case of *literae humaniores,* called familiarly "Greats," and now applied to other honours schools), with pass schools for ordinary students. Arrangements exist whereby members of the universities of Cambridge or Dublin may be "incorporated" as members of Oxford university; and whereby the period of necessary academical residence at Oxford university is reduced in the case of students from "affiliated" colleges within the United Kingdom. Special provisions are also made in the case of students from any foreign university and from certain colonial and Indian universities.

**OXIDATION** and **REDUCTION** are chemical terms which are constantly employed to express two opposing reactions. In the first place, oxidation denotes a direct addition of oxygen to an element or compound, as in the burning of sulphur to sulphur dioxide or the conversion of carbon monoxide into the more oxygenated carbon dioxide, the latter chemical change being manifested in the blue flame frequently observed in a brightly burning coal fire. Secondly, oxidation may indicate a removal of hydrogen from a hydride or other hydrogenated substance, as in the incomplete combustion of sulphuretted hydrogen, $SH_2+O=H_2O+S$, or in the conversion of oxalic acid into carbon dioxide and water, $H_2C_2O_4+O=2CO_2+H_2O$. Thirdly, oxidation involves an increase in the valency of an element, even although there may be no direct addition of oxygen or removal of hydrogen, as, for example, in the change of ferrous to ferric salts, $2FeSO_4+H_2SO_4+O=Fe_2(SO_4)_3+H_2O$. The action of the oxygen is indirect and the oxygen itself may be derived from the air or from a chemical reagent, such as potassium permanganate or bichromate. Similarly stannous chloride is converted into stannic chloride, $SnCl_2+2HCl+O=SnCl_4+2H_2O$.

In the former instance the valency of iron is increased from two to three; in the latter the valency of tin is changed from two to four. Oxidation is often facilitated by the presence and interaction of water, as in the rusting of iron to hydrated ferric oxide (*see*

CORROSION), or in the permanent bleach of coloured goods (cottons, calico, etc.) as carried out by chlorine water. In the latter instance the effective agent is probably hypochlorous acid (HClO).

Reduction is the converse chemical change to oxidation. Firstly, reduction in its original metallurgical sense implies a removal of oxygen from an oxide. Tinstone (cassiterite) heated with carbon or anthracite becomes reduced to free tin, $SnO_2+2C=2CO+Sn$. Occasionally it is an analogue of oxygen, such as sulphur or selenium, which is removed from the metal. In the Welsh process of lead smelting lead sulphide and lead sulphate interact and the lead of both compounds is reduced to the metallic condition, $PbS+PbSO_4=2Pb+2SO_2$. Secondly, reduction signifies an addition of hydrogen, as in photosynthesis (*q.v.*), $CO_2+H_2O=(CH_2O)_x+O_2$, where carbon dioxide is reduced successively to formaldehyde and other more complex carbohydrates. When arsenious oxide is treated with a mixture evolving hydrogen, oxygen is replaced by this element, $As_4O_6+24H=4AsH_3+6H_2O$. Thirdly, reduction involves a decrease in the valency of an element as when a ferric salt is converted into ferrous salt by nascent hydrogen (engendered by zinc and dilute sulphuric acid), $Fe_2(SO_4)_3+H_2=2FeSO_4+H_2SO_4$. Occasionally such reductions are effected by light or radiant energy and such changes are utilized in photography: thus, ferric oxalate is reduced to ferrous oxalate, $Fe_2(C_2O_4)_3=2FeC_2O_4+2CO_2$, and aqueous mercuric chloride is reduced to mercurous chloride $4HgCl_2+2H_2O=2Hg_2Cl_2+4HCl+O_2$.

(G. T. M.)

**OXIDE,** in chemistry, a binary compound of oxygen and another element. Oxides are the most plentiful and characteristic components of the earth's hydrosphere and lithosphere; the former of these envelopes consists essentially of water, the commoner oxide of hydrogen, and the latter largely consists of simple and complex oxides. The second type of oxide is the more abundant and includes such important rock-forming materials as carbonates, silicates, aluminates, and aluminosilicates. The ordinary ingredients of soil, subsoil, and rocks, including sand, clay, marl, chalk, limestone, dolomite, mica, shale and slate are composed of oxides in either anhydrous or hydrated forms.

Oxygen can be made to combine directly with most elements, although sometimes it will not do so in the entire absence of water vapour (*see* DRYNESS, CHEMICAL); in a few cases in which direct methods are unavailing, as, for example, in the case of noble metals such as gold or platinum which remain unaffected in air even at very high temperatures, indirect methods can be used and oxides can be prepared from the salts of the metals. Hitherto, however, it has been found impossible to prepare oxides of bromine or of the inert gases helium, neon, argon, etc.; fluorine was (until 1927) regarded as being in this category, but it has now been made to yield an oxide indirectly. (*See* FLUORINE.)

Many elements form a series of several oxides; thus, nitrogen yields five: $N_2O$, NO, $N_2O_3$, $NO_2$ ($N_2O_4$ at lower temperatures), and $N_2O_5$. In general, the acidic character of the oxide increases with increase in the oxygen content. For purposes of classification, it is usual to assign a typical oxide to each element; usually this oxide is the highest having acidic or basic properties and is related to the position of the element in the periodic classification (*see* PERIODIC LAW) as follows: The typical oxides of Group I. are of the form $M_2O$, those of Group II. of the form MO, those of Group III. are $M_2O_3$, and so on, those of Group VI. being $MO_3$.

**Types of Oxide.**—Oxides are often classed as (1) acidic oxides; (2) basic oxides; (3) amphoteric; (4) neutral; (5) suboxides; (6) saline oxides; and (7) peroxides (either acidic or basic); an oxide may not fall clearly into any one of these classes, but have the characteristics of two.

(1) Acidic oxides are those which combine with bases or basic oxides to form salts. Many of the oxides of non-metals, *e.g.*, carbon, nitrogen, phosphorus and sulphur, are of this type. Some acidic oxides are "mixed" anhydrides; thus nitrogen peroxide reacts with water to give two acids, nitrous and nitric, and with bases to form nitrites and nitrates.

(2) Basic oxides similarly react with acids or acidic oxides to form salts, and many of the oxides of metals fall into this class.

(3) Amphoteric oxides behave as acidic oxides towards bases and as basic oxides towards acids; thus, zinc and aluminium oxides dissolve in either acids or bases to give salts of the acid or zincates (aluminates) of the base, respectively.

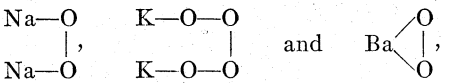
(4) Neutral oxides are those which neither react to form salts nor combine with water to give acids or bases; carbon monoxide and nitrous oxide are examples, for, although they result from formic and hyponitrous acids, respectively, by loss of water, they do not combine with water to give these acids and are therefore not acidic anhydrides.

(5) Suboxides are oxides having less oxygen than those oxides which give rise to a definite series of salts, and in a sense they are neutral oxides, for on reacting with an acid they give the metal and a salt corresponding to a higher oxide. Few suboxides are definitely known, but that of lead, $Pb_2O$, exhibits the behaviour just described—there are no such salts as $Pb_2SO_4$ or PbCl, and the action of acids upon it results in the production of metallic lead and a salt derived from PbO.

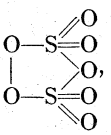
(6) Saline oxides of non-metals are not known. As indicated above, some metals form two oxides of which the lower is basic and the higher acidic; two such oxides may therefore combine to give another oxide which is to some extent a salt. Many higher oxides of metals may thus be regarded as saline, *e.g.*, $Pb_3O_4=2PbO\cdot PbO_2$; $Pb_2O_3=PbO\cdot PbO_2$.

(7) Peroxides are, strictly, those oxides having more oxygen than the typical oxide as determined by the periodic classification. This definition, however, fails in certain cases, for it would exclude lead peroxide, $PbO_2$, from the category, since this is regarded as typical of Group IV. to which lead belongs, whereas the oxide is certainly a peroxide. It is therefore customary, in the case of basic peroxides, to regard them as being those oxides which are more highly oxygenated than the oxide which gives rise to a regular series of salts, and since, in the case of lead, this is the oxide PbO, the oxide $PbO_2$ is a peroxide. In the case of acidic peroxides, permanganic anhydride $Mn_2O_7$, for instance, is the typical oxide of Group VII. and also gives rise (as an acid) to a definite series of salts (the permanganates), so no difficulty arises; and oxides such as $CrO_4$ and $S_2O_7$, which are higher than the typical oxides $CrO_3$ and $SO_3$, are acidic peroxides and give rise to perchromates and persulphates.

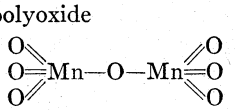
It is convenient to subdivide basic peroxides according to their chemical behaviour: those which react with water or with dilute acids to form hydrogen peroxide (a *neutral* peroxide)are classed as *superoxides,* and the others as *polyoxides.* Mendeleyev, to whom this idea is due, pointed out that this subdivision could be related to structural formulae, for the former class includes oxides in which the oxygen atoms are linked together, *e.g.*,



whereas in the latter class these atoms are all attached solely to the metal, *e.g.*, O=Pb=O, O=Mn=O. Such a subdivision can be extended to distinguish between acidic superoxides and polyoxides; thus, $S_2O_7$ is a superoxide



whereas $Mn_2O_7$ is a polyoxide



(compare above).

Peroxides are characterised by their oxidising properties; thus lead peroxide oxidises $SO_2$ so that the resulting PbO and $SO_3$ form lead sulphate $PbSO_4$; and manganese dioxide oxidises hydrochloric acid to chlorine, being itself reduced to the manganous state: $MnO_2+4HCl=MnCl_2+Cl_2+2H_2O$.

Many oxides combine with water to form hydroxides (*q.v.*), and all hydroxides lose water on heating to give the corresponding oxide. The chemical properties of an hydroxide are almost identi-

cal with those of the corresponding oxide, but the latter is somewhat more inert especially if it has been very strongly heated.

For further details *see* HYDROXIDE; OXIDATION and REDUCTION; and H. B. Weiser, *The Hydrous Oxides* (New York, 1926.) (A. D. M.)

**OXIMES,** in organic chemistry, compounds containing the grouping >C:N·OH and obtained by the action of hydroxylamine on compounds containing the >CO group. They were first prepared by Victor Meyer in 1882. The commonest are those of the general formulae RHC:NOH and RR′C:NOH where R and R′ are alkyl or aryl groups; the former, prepared from aldehydes, are known as aldoximes, and the latter, from ketones, as ketoximes.

The lower alkyl aldoximes and ketoximes are readily soluble in water, but the solubility decreases with increase in molecular weight; if an aryl group be present, the compounds are usually sparingly soluble in water. Generally the oximes are readily soluble in the common organic solvents and may be extracted from aqueous solutions by their means; they are weak acids and dissolve in aqueous solutions of alkali hydroxides to form salts which are decomposed, with liberation of the oxime, by carbon dioxide or by ammonium chloride. At the same time ethereal solutions of most oximes yield with hydrogen chloride precipitates of hydrochlorides, and sulphates may be obtained by dissolving the oximes in concentrated sulphuric acid; both hydrochlorides and sulphates are rapidly decomposed by water with regeneration of the oxime. Oximes are hydrolysed by boiling with dilute acids (the parent aldehyde or ketone being formed); on reduction with sodium amalgam in alcoholic acetic acid, or in the vapour phase by hydrogen in the presence of nickel (*see* HYDROGENATION), they yield primary amines; on oxidation they yield a number of products, aldoximes giving hydroxamic acids R·C(OH):NOH or peroxides R·CH:NO·ON:CH·R, and ketoximes nitro-hydrocarbons $RR'CH{\cdot}NO_2$. Dehydrating agents convert aldoximes into nitriles $RCH{:}NOH \longrightarrow RCN + H_2O$. With phosphorus pentachloride ketoximes undergo the Beckmann change (*see* below).

Aldoximes and ketoximes are generally prepared by the action of hydroxylamine (liberated from the hydrochloride *in situ* by sodium carbonate or sodium hydroxide) upon the aldehyde or ketone; they are also formed by the oxidation of primary amines with Caro's acid, $RR'CH{\cdot}NH_2 \longrightarrow RR'CH{\cdot}NH(OH) \longrightarrow RR'C{:}N{\cdot}OH$ (E. Bamberger, 1902), and by the reduction of primary or secondary nitro-hydrocarbons with stannous chloride and hydrochloric acid: $RR'CH{\cdot}NO_2 \longrightarrow RR'CH{\cdot}NO \longrightarrow RR'C{:}N{\cdot}OH$. Aldoximes are formed by the reduction of unsaturated nitro-hydrocarbons with aluminium amalgam in dilute acetic acid.

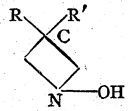
$RR'C{:}CH{\cdot}NO_2 \longrightarrow RR'C{:}CH{\cdot}NH(OH) \longrightarrow RR'CH{\cdot}CH{:}N{\cdot}OH$,

by the action of alkyl iodides on sodium nitrohydroxylamine and by the action of mercury fulminate on phenols or benzenoid hydrocarbons in the presence of a mixture of anhydrous and hydrated aluminium chloride (*see* ALDEHYDES). Ketoximes are formed by the reduction of pseudo-nitriles,

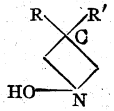
$RR'C(NO_2)NO \longrightarrow RR'C(NH{\cdot}OH)_2 \longrightarrow RR'C{:}NOH + NH_2OH$.

Many oximes form co-ordination compounds with metals and the insolubility of some of these compounds is utilized in quantitative analysis; for example, dimethylglyoxime and α-benzildioxime are used for the determination of nickel, and β-naphthaquinonemonoxime for cobalt.

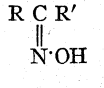
**Stereochemistry of the Oximes.**—Many unsymmetrical oximes (*i.e.*, where R and R′ are different) exist in isomeric forms. This isomerism is now usually explained on the hypothesis of Hantzsch and Werner (1890), in which the assumption is made that the three valency directions of the nitrogen atom do not lie in one plane, the space models of the compounds being represented as (I.) and (II.), or more briefly as (III.) and (IV.).



(I.)



(II.)

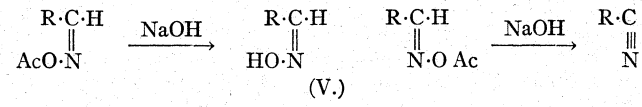


(III.)

(IV.)

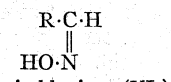
The isomerism is determined by the nearness of the hydroxyl group to R′ in one compound, and to R in the isomeride. Evidence that the three valency directions of a nitrogen atom doubly linked to carbon are not coplanar has been obtained by Mills and others. (*See* STEREOCHEMISTRY.)

The configuration of the aldoximes is determined by the action upon them of acetic anhydride, which converts both varieties to acetyl derivatives. One of these compounds on treatment with dilute sodium hydroxide is slowly hydrolysed back to the original oxime, and the other is at once decomposed to the nitrile. Hantzsch assumed that the compound containing the methine hydrogen and the acetoxy-group near together (V.)

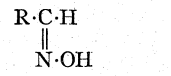


(V.)

would most readily lose acetic acid to give the nitrile; he therefore gave the configuration (VII.) to the oxime from which this acetyl compound was prepared and (VI.) to the other.

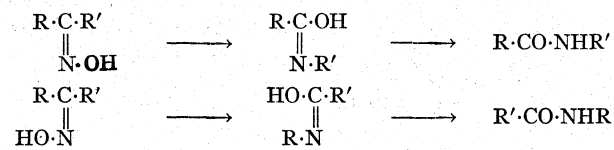


α- or anti-aldoxime (VI.)



β- or syn-aldoxime (VII.)

The configuration of the ketoximes is determined by the "Beckmann change" (1891) by which the ketoxime is converted into an amide, usually by the action of phosphorus pentachloride in ether at 0° C.



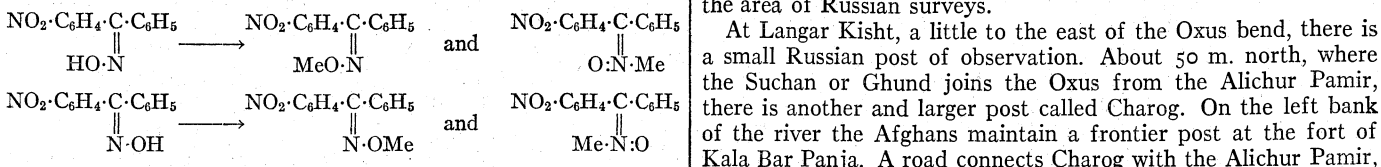
The assumption was made that the group adjacent to the hydroxyl changed places with it, and became attached to nitrogen. Meisenheimer, however, has adduced (1921) evidence in favour of the *trans* rather than of the above *cis* interchange of groups in the Beckmann change. Moreover, Brady and Bishop (1925) favour the *trans* rather than the *cis* elimination of acetic acid from the acetyl derivatives of the aldoximes. These authors suggest in consequence that the configurations assigned by Hantzsch should all be reversed. Since, however, the question is still unsettled, the old configurations are here retained.

Aldoximes in which R is an alkyl group are known only in the β- or *syn*-form; where R is a benzene or naphthelene nucleus, the oxime, as obtained by the action of hydroxylamine on the aldehyde, has the α- or *anti*-configuration. In order to obtain the syn-aldoxime in the latter case the oxime is dissolved in dry ether and the solution saturated with dry hydrogen chloride at 25–30° C. The precipitated hydrochloride is decomposed with aqueous sodium carbonate, and the syn-oxime obtained is purified by crystallization; or the anti-oxime, in benzene, is exposed in silica vessels to the action of ultra-violet light. In certain cases it has been found impossible to obtain the syn-aldoxime by any of the known methods. The syn-aldoximes are unstable and are converted to the anti-isomerides by traces of dilute acids, or in many cases by keeping; they are much weaker acids and less soluble than the corresponding anti-compounds.

Ketoximes in which R and R′ are both alkyl groups are known in one form only; where R is alkyl and R′ aryl, usually only one form is known, but where R and R′ are both aryl groups the action of hydroxylamine on the ketone frequently yields a mixture of the two isomerides which can be separated by fractional crystallization. There is no known method of converting the stable into the unstable isomeride in the case of the ketoximes; the reverse change occurs on keeping.

The alkylation of the oximes affords valuable support for the Hantzsch-Werner theory; for example, the isomeric *p*-nitrobenzophenone oximes yield four methyl derivatives, as demanded by the stereo-chemical hypothesis, the methyl group being

attached to the oxygen atom (*O*-ether) or to the nitrogen atom (*N*-ether), respectively:



The aldoximes give only three alkyl derivatives, both anti- and syn-aldoxime yielding the same N-alkyl compound, this being regarded as derived from the tautomeric form of the oximes RR'C:NH:O. (O. L. B.)

**OXNARD,** a city of Ventura county, California, U.S.A., on the Southern Pacific railway, midway between Los Angeles and Santa Barbara, and 4 mi. from the ocean. Pop. 4,417 in 1920 (30% foreign-born white); 1940 it was by federal census 8,519. It is the trading centre for an extensive agricultural district, and has a large beet-sugar factory and other industries. It is the hub of the harbour of Port Hueneme and site of an army air school. Oxnard was founded in 1898 and incorporated in 1903.

**OXUS** or AMU DARYA, one of the great rivers of Central Asia. From Lake Victoria (Sor-Kul) in the Pamirs, which was originally reckoned as the true source of the river, to Khamiab, on the edge of the Andkhui district of Afghan Turkistan, for a distance of about 680 m., the Oxus forms the boundary between Afghanistan and Russia. For another 550 m. below Khamiab it follows an open and sluggish course till it is lost in the Aral sea, being spanned at Charjui, 150 m. below Khamiab, by the wooden bridge which carries the Russian railway from Merv to Samarkand. The level of Lake Victoria is 13,400 ft. above sea. At Khamiab the river is probably rather less than 500 ft. The total length of the river is 2,400 km. and its catchment area about 300,000 sq.km. The rainfall of this basin varies probably between 90 and 150 cu.km. p.a. and its discharge into the Aral sea is about 32 cu.km. p.a. About 6,000 sq.km. depend on its waters for irrigation.

**Sources.**—The final survey of the Pamir region (wherein the heads of all the chief tributaries of the river lay hidden), by the Pamir boundary commission of 1895 established the following facts. The elevated mountain chain, now called the Nicolas range, which divides the Great from the Little Pamir, is a region of vast glaciers and snow-fields, supplying the greater part of the water of the lakes lying immediately north and south. The Nicolas range may be regarded as the chief fountain-head, through Victoria and Chakmaktin lakes, of at least two of the upper tributaries of the Oxus, namely, the Aksu (or Murghab) and the Pamir river, and as contributing largely to a third, the Ab-i-Panja. It is possible that there may be warm springs on the bed of Lake Victoria, as such springs are of frequent occurrence in the Pamirs; but there is no indication of them in the Chakmaktin basin, which is an expansion occurring in the course of the Aksu and not the fountain-head of the stream. There are indications that the beds of these lakes are rapidly silting. The enormous glaciers which lie about the upper or main branch of the Ab-i-Panja (called the Ab-i-Wakhjir or Wakhan), which rises under the mountains enclosing the head of the Taghdumbash Pamirs are another important source of the river. If the Aksu (or Murghab) and the Pamir river from Lake Victoria are to be considered in the light of independent tributaries, it is probable that the Ab-i-Panja contributes as much glacial flood to the Oxus as either of them.

**Kala Panja to Ishkashim.**—From the point where the rivers of the Great and Little Pamirs join at Kala Panja to Ishkashim, at the elbow of the great bend of the Oxus northwards, the river valley and the northern slopes of the Hindu Kush, which near Ishkashim extend in slopes of barely 10 m. in length from the main watershed to the river banks, have been carefully mapped. These slopes represent the extent of Afghan territory which exists north of the Hindu Kush between Kala Panja and Ishkashim. From Ishkashim northwards the river passes through the narrow rock-bound valleys of Shignan and Roshan, thence north and west through the mountains and defiles of Darwaz. This part of the Oxus, until it once again emerges from the Bokhara hills into the open plains bordering Badakshan on the north, falls within the area of Russian surveys.

At Langar Kisht, a little to the east of the Oxus bend, there is a small Russian post of observation. About 50 m. north, where the Suchan or Ghund joins the Oxus from the Alichur Pamir, there is another and larger post called Charog. On the left bank of the river the Afghans maintain a frontier post at the fort of Kala Bar Panja. A road connects Charog with the Alichur Pamir, following the general course of the Ghund stream, forming a valuable link in the chain of communications between Bokhara and Sarikol. Eighty-five miles north of Ishkashim, at Kala Wamar, the river which rises in the Little Pamir, and which is called Aksu, Murghab, or Bartang, joins the Oxus from the east. It is on this river that the Russian outpost, Murghabi, (or Pamirski), is situated, at an elevation of 12,150 ft. above the sea. Fort Murghabi is connected by a good military road with Osh. At this point the measurement of the comparative lengths of the chief Pamir tributaries of the Oxus is as follows:—to the head of the Aksu at Lake Chakmaktin 260 m.; to the head of the most easterly tributary of Lake Victoria, in the Great Pamir, about 230 m.; to the glacial sources of the Ab-i-Wakhjir, about 230 m. For 120 m. the two latter are united in the main stream of the Oxus, the volume of which has been further increased by the Ghund and Shakhdara draining the Alichur Pamir and the heights of Shignan.

**Ishkashim to Kolab.**—The narrow cramped valley of the river between Ishkashim and Kala Wamar is hedged in on the west by a long ridge flanking the highlands of Badakshan; on the east the buttresses and spurs of the Shignan mountains (of which the strike is transverse to the direction of the river and more or less parallel to that of the main Hindu Kush watershed) overhang its channel like a wall, and afford but little room either for cultivation or for the maintenance of a practicable road. Yet the lower elevation (for this part of the Oxus stream is not more than about 7,000 ft. above sea-level) and comparatively mild climate give opportunities to the industrious Tajik population for successful agriculture, and a track exists on the left bank of the river to Kala Bar Panja opposite the Ghund (or Suchan) debouchment, which is practicable for mules. There are no bridges, and the transit of the river from bank to bank can be effected only by the use of inflated skins.

Beyond the Bartang (or Murghab) confluence the valley narrows, and the difficulties of the river route increase. Between Kala Wamar (6,580 ft.) and Kala Khum (4,400 ft.), where the Oxus again bends southwards, its course to the north-west is almost at right angles to the general strike of the Darwaz mountains, which is from north-east to south-west, following the usual conformation of all this part of high Asia. Thus its chief affluents from the north-east, the Wanj and the Yaz Ghulam, drain valleys which are comparatively open. At Kala Khum the river is 480 ft. wide, narrowing to 350 ft. in the narrowest gorge. Its level varies with the obstructions formed by ice, falling as much as 28 ft. when its upper channels are blocked.

In the valleys of the Waksh and the Surkhab to the north of Darwaz, which form an important part of the province of Karategin, maple, ash, hawthorn, pistachio and juniper grow freely in the mountain forests, and beetroot, kohl rabi and other vegetables are widely cultivated. About the cliffs and precipices of the Panja valley near Kala Khum are the wild vine, cerasus and pomegranate, and the plane tree and mulberry flourish in groups near the villages. Here also, amongst other plants, the sunflower decorates village gardens. The houses are built of stone and mortar, and above the thatched straw roof which surmounts the double-storeyed buildings the square water-tower rises gracefully. The left bank of the river belongs to Afghanistan.

From Kala Khum, which fort about marks the most northerly point of the great bend of the Oxus round Badakshan, the river follows a south-westerly course for another 50 m. through a close mountainous region and widens into the more open valley to the south of Kolab.

The topography of Darwaz south of the river is not accurately known, but at least one considerable stream of some 60 m. in

length drains to the north-east, parallel to the general strike of the mountain system into the transverse course of the Oxus, which it joins nearly opposite to the lateral valleys of Yaz Ghulam and Wanj. This stream is called Pangi-Shiwa, or Shiwa. Another of about equal length, the Ragh or Sadda, starting from the same central water-parting of this mountain block, and included within the Oxus bend, follows a transverse direction at almost right angles to the Shiwa, and joins the Oxus valley near its debouchment into the more open Kolab plains, where the course of the Oxus has again assumed a direction parallel to the mountain strike. Towards its junction with the Oxus it cuts through successive mountain ridges, which render its course impracticable as a roadway. It is necessary to avoid the river, and to pass by mountain tracks which surmount a series of local spurs or offshoots from the central plateau, in order to reach the Oxus. The existence of this route, which traverses the Darwaz mountains from east to west, cutting off the northern bend of the Oxus, and connecting those easterly routes which intersect the Pamirs by means of the Ghund and Shakhdara (and which concentrate about Lake Shiwa) with Kolab in eastern Bokhara, is important. (*See* BADAKSHAN.)

**Badakshan Region.**—From about the point where the Oxus commences to separate Russian territory from the comparatively open Afghan districts of Rustak and Kataghan, it adopts an uncertain channel and splits, leaving broad central islands. Between Kolab and Pata Kesar, immediately north of the Turkistan city of Mazar-i-Sharif, there are at least three well-known *guzars* or fords. Besides the Kolab and Surkhab (or Waksh), the great muddy affluents from Karateghin on the north—the Kabadian, the Surkhan, and the Darbant are very considerable tributaries from Bokhara. The last is the river on which the well-known trade centre of Shirabad is built, some 20 m. north of the river. Near the junction of the Surkhan with the Oxus are the ruins of the ancient city of Termez, on the northern bank, and the ferry at Pata Kesar connects Bokhara and Mazar.

From the south the Kokcha and the Khanabad (or Kunduz) join the Oxus between Kolab and the Mazar crossings. The valley of the Kokcha leads directly from the Oxus to Faizabad, the capital of Badakshan, and its head is close above Ishkashim at the southern elbow of the great Oxus bend, a low pass of only 9,500 ft. dividing its waters from those of the main river. This undoubtedly was a section of the great central trade route of Asia, which once connected Ferghana and Herat with Kashgar and China. (*See* BADAKSHAN.) This river and the Khanabad tap the northern slopes of the Hindu Kush; their sources are in the unmapped Kafiristan mountains. To the west of the Kunduz no rivers find their way through the southern banks of the Oxus. Throughout the plains of Afghan Turkistan the drainage from the southern hills is arrested and lost in the desert sands.

At Airatan, a little above the Pata Kesar ferry, there are ruins, as also at Khisht Tapa (where the road from Kabadian to Tashkurghan leaves the river) and at Kalukh Tapa.

The Oxus in flood is here rarely less than 1,000 yards wide, and in some places fully a mile. Its winter channel is from two-thirds to three-fourths of its flood channel, except where it is confined within narrow limits by a rocky bed, as at Kilif, where its unvarying width is only 540 yards. The average strength of the current in flood is about 4 m. per hour, varying from $2\frac{1}{2}$ to 5 m. The left bank above Kilif is, as a rule, low and flat, with reed swamps and a strip of jungle between the reeds and the edge of the elevated sandy desert. The jungle is chiefly tamarisk and padah (willow). Swamp deer, pheasants and occasionally tigers are found in it. The right bank is generally higher, drier, more fertile and more populated than the left.

**Irrigation.**—A wide belt of blown sand (or Chul), sprinkled with saxaul jungle, separates the swamps on the south side of the river from the cultivated plains of Afghan Turkistan; but in places, notably for about 12 m. above Khamiab where the Russo-Afghan boundary touches the river, through the Khwaja Salar district and in a less degree for 50 m. above the Kilif ferry, the Ersari Turkman has repelled the encroaching desert sand-waves, and a strip of riverain soil averaging about a mile in width has been reclaimed and cultivated by irrigation. The cultivation, principally of wheat and barley, supported by canals drawn from the Oxus (the heads of which are constantly being destroyed by flood and again renewed) is of a very high order. The fields are intersected by narrow stone-walled lanes, bright with wayside flowers, amongst which the poppy and the purple thistle of Badghis are predominant; the houses, neatly built of stone, are scattered in single homesteads, substantial and comfortable; and the willow and mulberry offer a grateful shade in summer, when the heat is often insupportable. The fiery blasts of summer, furnace-heated over the Kizil Kum, are hardly less to be feared than the ice-cold north-western blizzards, which freeze men in the open desert, and frequently destroy whole caravans.

The Oxus ferries are large flat-bottomed boats which are towed across the river by small horses attached to an outrigger projecting beyond the gunwale by means of a surcingle or bellyband. They are thus partially supported in the water whilst they swim. The horses are guided from the boat, and a twenty- or thirty-foot barge with a heavy load of men and goods will be towed across the river at Kilif (where, as already stated, the width of the river is between 500 and 600 yards only) with ease by two of these animals. The Kilif ferry is on the direct high-road between Samarkand and Akcha. It is perhaps the best-used ferry on the Oxus.

Below Khamiab, to its final disappearance in the Aral sea, the Oxus flows through a vast expanse of sand and desert. Under Russian auspices a considerable strip of alluvial soil on the left bank has been brought under cultivation, measuring 4 or 5 m. in width, and there is more cultivation on the banks of the Oxus now than there is in the Merv oasis itself; but it is confined to the immediate neighbourhood of the river, for no affluents of any considerable size exist. The river is navigable below Charjui. There is now a regular steamer service as far as Pata Kesar. The steamers are flat-bottomed paddle boats drawing 3 feet. About 100 m. above the Aral sea is the ancient oasis of Khwarezm or Khiva, entirely dependent on the Oxus for irrigation. The river here perpetually shifts eastwards, causing a constant need for lengthening the irrigation channels lest the oasis become a desert.

**Previous Bed.**—It appears that there was a time in the post-Pliocene Age when a long gulf of the Caspian sea protruded eastwards nearly as far as the longitude of Merv, covering the Kara Kum sands, but not the Kara Kum plateau to the north, which is separated from the sands by a distinct sea beach. At the same time another branch of the same gulf protruded northwards in the direction of the Aral, probably as far as the Sary Kamish depression, which lies to the west of the Khivan delta of the Oxus, separated from it by wide beds of loess, clays and gravel, covering rocks of an unknown age. The Murghab river and the Hari Rud, which terminate in the oases of Merv and Sarakhs, almost certainly penetrated to the gulf of the Kara Kum, but the question whether the Oxus was ever deflected so as to enter the gulf with the Murghab cannot be said to be answered decisively at present. The former connection between the Caspian and Aral by means of the gulf now represented by the Sary Kamish depression seems to be admitted by Russian scientists, nor would there appear to be much doubt about the connection between the Khivan oasis and the north end of the Sary Kamish.

**OXY-ACETYLENE BLOWPIPE.** An apparatus with a mixing jet which produces an intensely hot flame by projecting and burning acetylene with oxygen. It is of great value for metal working, producing a flame which attains about 6,000° F at the hottest part. In the high-pressure system, which is best for portable outfits, both the acetylene and the oxygen are delivered under pressure to the blowpipe, both from cylinders. In the

low-pressure system the acetylene is drawn direct from a generator. The blowpipes are manipulated either by hand, or guided in a machine. They are used for cutting out various shapes, parting thick sections, cutting out pieces for repairs or breaking-up purposes or welding to make new articles, and for various other purposes. When used for cutting, a separate jet of cutting oxygen is provided. This oxidizes or burns the hot metal. The oxide or "rust" thus formed is removed by the force of the jet and a cutting effect results.

When used for welding theoretically the welding flame should be neutral, that is, there should be no excess of acetylene or oxygen but in practice a little more oxygen than acetylene is used. Parts can also be heated conveniently for bending or straightening, and glass can be heated for working. The oxy-acetylene flame is too hot for brazing purposes, for which an oxy-coal-gas blowpipe has to be used. The approximate temperature of the oxy-acetylene flame may be compared with those of other flames from the following figures: Oxy-acetylene, 4,400° C; oxy-hydrogen, 2,420°; oxy-coal-gas, 2,200°; air-acetylene, 2,500°; air-coal-gas, 1,800°. (*See* WELDING.)

**OXYGEN,** a colourless, odourless, tasteless gas, somewhat heavier than air (sp.gr. 1·10523); it is slightly soluble in water. and this dissolved oxygen plays an essential part in the respiration of aquatic animals. (Symbol O, atomic number 8, atomic weight 16·000.) Oxygen combines with nearly all the elements under suitable conditions, but these reactions often do not take place if the substances are perfectly dry. With the exception of the "noble" metals, gold and the platinum group (*q.v.*), the metallic elements all oxidize when heated in oxygen, although molten silver dissolves 22 volumes of the gas without combining chemically with it, the absorbed oxygen escaping again when the metal cools.

Oxygen is by far the most abundant element, being nearly equal in amount to all the others put together. It forms 21% by volume of the atmosphere, eight-ninths by weight of water, and nearly one-half by weight of all the rocks composing the half-mile crust of the earth. Growing plants absorb carbon dioxide (*q.v.*), assimilating carbon and rejecting oxygen. It is the only gas able to support respiration.

**Preparation and Properties.**—It is readily prepared on a small scale by heating a mixture of potassium chlorate with about one-third of its weight of manganese dioxide, which facilitates the decomposition. From 1886, for about 20 years, oxygen was produced commercially by the Brin or barium oxide process. Barium monoxide was heated to 1,000° F and absorbed oxygen from the air to form the dioxide. At 1,600° the oxygen thus absorbed was again set free, the monoxide being regenerated. In later methods the temperature was maintained constant at about 1,200° F, and change of pressure was relied upon for determining the respective phases of oxidation and deoxidation. The purity obtainable, however, was not more than 94%.

In 1902 Linde applied the process of rectification to liquid air and was able to extract oxygen of 98·5% purity in economical yield. Air is freed of its carbon dioxide, compressed, cooled and then expanded, either in an engine doing external work or merely through a valve to perform internal molecular work; in both cases heat is lost and the temperature further lowered. This cooling effect is made cumulative by means of heat interchangers, tubular metal devices by which the cold gases after expansion are made to travel in indirect contact with and in counter-current to the incoming uncooled compressed air, so that the latter becomes continually colder at the point of expansion, until a limit is set by liquefaction. The liquid so produced is made to flow down a rectification column, fitted with numerous plates fashioned to ensure its intimate contact with ascending gas, which is produced at the base of the column by evaporating the liquid as it arrives there. When equilibrium is attained, almost pure oxygen can be drawn from the bottom of the column in gaseous or liquid form. Improvements in construction introduced in 1926 enable the separation of the nitrogen and oxygen of air to be effected almost completely, the oxygen purity being 99·5%, and the nitrogen over 99%.

Oxygen is also a by-product in hydrogen manufacture by the electrolysis of water. The much greater power consumption, however, prevents this process competing with the liquid-air process for oxygen production only. The gas is supplied in steel cylinders at a pressure of 120–150 atmospheres. During 1926 the world's production of oxygen, in cylinders, was about 5,000 million cubic feet. The estimation of oxygen in a gas is most conveniently made by means of an alkaline solution of pyrogallol, by metallic copper in conjunction with an ammoniacal solution of ammonium carbonate, by sticks of phosphorus, or by a weakly alkaline solution of sodium hydrosulphite.

Oxygen condenses to a pale blue magnetic liquid, boiling at −182·9° C. By rapid evaporation and consequent cooling, or by cooling in liquid hydrogen, oxygen forms a bluish-white solid, melting at −219° C. When gaseous oxygen is acted on by the silent electric discharge, an unstable modification, ozone (*q.v.*) $O_3$ is produced.

**Uses.**—Most of the oxygen is employed in industry for the fusion welding of metals, *e.g.*, steel, cast iron, aluminium, lead, and for the cutting of steel. Gas welding is generally accomplished by the aid of the oxy-acetylene flame, the two gases being supplied to a blowpipe wherein they are thoroughly mixed before combustion. In practice a little more oxygen than acetylene is used, and the resulting flame has an inner white core with a temperature above 4,000° C; it is quickly able to reduce these metals to the molten state locally, where two edges are to be joined. For metal cutting, a separate jet of "cutting" oxygen is provided in a similar blowpipe, either in the centre of the heating jet or behind it. As a rule, the melting point of an oxide is higher than that of the metal from which it is derived; but the fusion point of industrial iron varies between 1,400–1,500° C, and the mixture of iron oxides fuses at about 1,350° C. In the cutting the oxides of iron are formed and blown away in the molten state before the unoxidized iron reaches its melting point, the necessary temperature being maintained chiefly by the heat of combustion itself, but to a less extent by an independent heating jet. When the cutting blowpipe is moved mechanically, and therefore regularly, over the metal a remarkably smooth regular cut is obtained, even through metal 1⅞in. thick.

Oxygen is widely used in medical practice, inhalation being of service in cases of pneumonia, heart complaints, etc.; also in cases of gas poisoning, especially by carbon monoxide. It is used with nitrous oxide by anaesthetists.

Liquid oxygen has considerable industrial applications. If a rod of hard gas-carbon be heated to redness at one end and then immersed in liquid oxygen, it burns in the liquid with intense evolution of light and heat, the carbon dioxide resulting being frozen and retained as a white solid in the liquid. If the carbon is presented to the oxygen in a porous form, *e.g.*, wood charcoal, lampblack, soot, cork meal, sawdust, or wood pulp, the mixture forms a powerful explosive, more than twice as effective as blasting gelatine. It is so remarkably effective because the oxygen is free, and not chemically combined with other elements as in explosives like gunpowder or nitro-compounds, the explosion being an instantaneous oxidation of carbon, hydrogen or other elements. The materials are formed into cartridges in a paper wrapping; these may be 8in. long and 1½in. in diameter. They are thoroughly soaked in liquid oxygen and placed in the bore hole, and, after tamping, fired electrically or by fuse. This explosive has the great advantage that it automatically becomes dead in a short time if not fired, owing to the evaporation of the oxygen. It is exceptionally suitable for use in iron mines and in tunnelling, as it gives rise to no harmful gases.

The highly volatile liquid is transported in double-walled spherical vessels, made of spun copper with long, narrow necks. A good vacuum is created mechanically between the walls. When the excessively cold liquid oxygen is introduced into the vessel, activated charcoal (*q.v.*), placed in the vacuous space and in contact with the inner sphere, becomes cooled, and then possesses the remarkable property of absorbing the residual gas and converting the vacuum to one of an exceedingly high order (a few millionths of a mm. of mercury). This vacuum, coupled with the highly polished metal surfaces, prevents the ingress of heat

to a large extent. A 25-litre container (the usual size) loses by evaporation only 5% of its full liquid charge per day. The liquid is poured from them into smaller dipping flasks, of similar construction, but cylindrical in shape with open top, so that the cartridges can be readily inserted and withdrawn. (For oxygen in relation to muscular contraction *see* MUSCLE AND MUSCULAR EXERCISE.)

**OXYHYDROGEN FLAME,** the flame attending the combustion of hydrogen and oxygen, and characterized by a very high temperature. Hydrogen gas readily burns in oxygen or air with the formation of water. The temperature of the flame is dependent on the circumstances in which the process takes place. It obviously attains its maximum in the case of the firing of pure oxyhydrogen gas (a mixture of hydrogen with exactly half its volume of oxygen, the quantity it combines with in becoming water, German *Knall-gas*). It becomes less when the oxyhydrogen is mixed with excess of one or the other of the two reacting gases, or an inert gas such as nitrogen, because in any such case the same amount of heat spreads over a larger quantity of matter. It acquired considerable application in platinum works, this metal being only fusible in the oxyhydrogen flame and the electric furnace; and also for the production of limelight, as in optical (magic) lanterns. But these applications are being superseded, *e.g.*, by the electric furnace, electric light and the oxyacetylene flame.

**OYAMA, IWAO,** PRINCE (1842–1916), Japanese field-marshal, was born in Satsuma. He was a nephew of Saigo, with whom his elder brother sided in the Satsuma insurrection of 1877, but he nevertheless remained loyal to the imperial cause and commanded a brigade against the insurgents. When war broke out between China and Japan in 1894, he was appointed commander in chief of the 2nd Japanese army corps, which, landing on the Liaotung peninsula, carried Port Arthur by storm, and, subsequently crossing to Shantung, captured the fortress of Wei-hai-wei. For these services he received the title of marquess, and, three years later, he became field-marshal. When (1904) his country became embroiled in war with Russia, he was appointed commander in chief of the Japanese armies in Manchuria, and in the sequel of Japan's victory the mikado bestowed on him (1907) the rank of prince. He received the British Order of Merit in 1906. He died on Dec. 12, 1916.

**OYER AND TERMINER,** the Anglo-French name, meaning "to hear and determine," for one of the commissions by which a judge of assize sits (*see* ASSIZE). By the commission of oyer and terminer the commissioners (in practice the judges of assize, though other persons are named with them in the commission) are commanded to make diligent inquiry into all treasons, felonies and misdemeanours whatever committed in the counties specified in the commission, and to hear and determine the same according to law. By the Treason Act 1708 the crown may issue commissions of oyer and terminer in Scotland for the trial of treason and misprision of treason.

In the United States oyer and terminer is the name given to courts of criminal jurisdiction in some states, *e.g.*, New York, New Jersey, Pennsylvania and Georgia.

**OYSTER.** Oysters are bivalve molluscs of the class Pelecypoda (or Lamellibranchia) and phylum Mollusca. They occur mainly between tidal levels or in shallow water near the estuaries, and are found along the coasts of all continents except those bordered by the polar seas. True oysters differ among themselves in shape, size, ornamentation and colour of the shell, and somewhat in their anatomical and physiological characters. Many other marine molluscs which are popularly called oysters, such as pearl oysters (*Pinctada*), or window-pane oysters (*Placuna*), are fundamentally different from the true oysters, which are included in the family Ostreidae. Fossil oysters occur from the Triassic period onward, while the type form begins in the Jurassic.

**Distribution of Commercial Species.**—More than 100 living species of oysters have been described but of these only a few are of economic significance. The most important commercial species are given in Table I. The nomenclature employed in the table is the same as that used by the United States National museum.

**Anatomy.**—The oyster shell is composed of two valves held together at the hinge by an elastic ligament. The upper valve is usually flat, whereas the lower one is concave, providing space for the body of the oyster. The concave shell is the one by which the oyster is attached to the bottom. The chief sections of the soft part of the oyster can easily be seen if one of the shells is removed and the animal examined. A thin membrane, called the mantle, lies against the inner sides of the shells. The functions of the mantle are to protect the more vital organs which it covers and to secrete the shell. Near the centre of the body is the large adductor muscle which serves to close the shells. The main body of the oyster lies between the right and left folds of the mantle and is attached to it and the adductor muscle. Under the mantle, at the anterior end of the body, four thin lips, or palps, are found and following them there are four rows of sickle-shaped organs, known as the gills. The latter are covered with microscopic hair-like structures, or cilia, which are arranged in rows. The cilia lash continuously creating a current of sea water over the gills, which serve as organs of respiration, and at the same time procure food from the surrounding water. The mouth of the oyster lies between the palps and opens into the gullet, or oesophagus, which leads from the mouth to the stomach. The stomach, which is surrounded by a large digestive gland, opens into the intestine, a long coiled tube ending in the vent, or anus. Reproductive organs, or gonads, consisting of numerous microscopic tubules containing eggs, or sperm, occupy a large portion of the body during the period when the oyster is nearing spawning. The gonads spread between the folds of the intestine and envelop it, as well as the stomach and the digestive gland. The sex cells are discharged from the gonads through the opening situated below the adductory muscle. The heart of the oyster lies in a thin-walled sack, or pericardium, located directly in front of the adductor muscle. The nervous system is very simple consisting of several ganglia, or knots, of nervous tissue and a series of small nerves extending to various organs.

TABLE I.—*Commercial Species of the Genus Ostrea*

| Common name | Scientific name | Where found |
|---|---|---|
| (1) American oyster | *O. virginica* | Atlantic coast of N. America from St. Lawrence river to Mexico. |
| (2) European or flat oyster | *O. edulis* | Mediterranean sea, Atlantic coast of Europe and British Isles. |
| (3) Australian rock oyster | *O. commercialis* | N.W., N., E. and S.E. coasts of Australia; East Indies; India; Norfolk Is.; New Caledonia; N. Is. of New Zealand; N.E. coast and Inland sea, Japan; S.E. coast of South Africa. |
| (4) Japanese gigantic oyster | *O. gigas* | N.E. coast of Japan and coast of China. Introduced to Pacific coast of the U.S. |
| (5) Portuguese oyster | *O. angulata* | S.W. European and N.W. African coasts. |
| (6) Chinese oyster | *O. rivularis* | Coast of China; Ariake and Kozima bays of Japan. |
| (7) Pacific coast oyster | *O. lurida* | West coast of N. America from British Columbia to California. |
| (8) Australian mud oyster | *O. angasi* | S. and S.E. coasts of Australia, Tasmania, and S. Is. of New Zealand. |
| (9) Japanese oyster | *O. denselamellosa* | S. and E. coasts of Japan. |
| (10) Indian oyster | *O. cucullata* | S. and W. coasts of India. |

**Sex and Reproduction.**—In regard to the sex characters oysters can be subdivided into two categories. The species belonging to the first category exhibit rhythmical consecutive sexuality. The best known examples of this type are the European oyster (*O. edulis*), the Pacific oyster (*O. lurida*), *O. denselamellosa* of Japan, and *O. angasi* of Australia. In all these cases the initial sexual phase is usually male (protandry), followed by a series of alternating female and male phases throughout life. As a rule, the adult oyster completes one male and one female phase each year,

but in some cases individuals may have three phases of functional sexuality during that period. In addition to individuals of regularly alternating sexuality the population may contain a small number of true males which retain the male phase indefinitely, sometimes throughout life.

The species of the second category exhibit alternative sexuality. This type is exemplified by the American oyster (*O. virginica*), the giant Japanese oyster (*O. gigas*) and the Australian oyster (*O. commercialis*). At the first spawning season the majority of young oysters function as males. However, previous to sexual maturity the gonads of young oysters may show all gradations from true males, in which no ovocytes can be found, to those which develop directly into ovaries. After the second spawning season the number of individuals in each sexual phase is almost equal. The adults function seasonally as separate sexes, although some of them have been proven to be subject to a change of sex in the interval between the two spawning seasons. Functional hermaphrodites are occasionally found.

Oysters may be divided into larviparous and oviparous types. In the first group, exemplified by *O. edulis, O. lurida* and *O. denselamellosa,* the fertilized eggs and larvae are retained for a considerable period in the mantle cavity of the parent oyster. Later the larvae are released into the surrounding water where they complete their development. In oviparous oysters the eggs and spermatozoa are discharged directly into the water and the larvae develop outside the parent's body. Examples of oviparous oysters are *O. virginica, O. gigas* and *O. commercialis.* Oysters begin to spawn in the spring or early summer when the water temperature becomes sufficiently warm. The European species commences spawning when the water temperature reaches 59°–60°F., and the American oyster, *O. virginica,* soon after the temperature reaches and passes 63° or 64°F. However, in southern latitudes this level is attained in advance of maturation of the oyster gonads and, therefore, spawning occurs at higher temperatures. The extent of the spawning periods for several species of the oyster in different geographic localities is given in Table II.

TABLE II.—*Spawning Seasons*

| Kind of oyster | Locality | Extent of spawning season | Authority |
|---|---|---|---|
| American (*O. virginica*) | Nova Scotia | Late July–early Aug. | T. C. Nelson |
| | Long Island sound | Late June–Sept. | V. L. Loosanoff |
| | Chesapeake bay | May–Oct. | V. L. Loosanoff |
| | Galveston bay (Tex.) | Late March–? | A. E. Hopkins |
| European (*O. edulis*) | Norway (fattening ponds) | Aug.–Sept. | B. Helland-Hansen |
| | Fall estuary (England) | End of June–Oct. | J. H. Orton |
| | Thames estuary (England) | End of May–Sept. | E. O. Anson and P. S. Willet |
| | Arcachon (France) | May–Sept. | M. De Bon |
| | Taranto (Italy) | March–Oct. | B. Dean |
| Pacific coast (*O. lurida*) | British Columbia | May–end of July | J. Stafford |
| | Puget sound (U.S.A.) | May–Oct. | A. E. Hopkins |
| | South California | April–Nov. | W. R. Coe |
| Australian rock (*O. commercialis*) | New South Wales | End of Dec.–May | T. C. Roughley |
| Japanese gigantic (*O. gigas*) | State of Washington (U.S.A.) | July–Oct. | M. B. Schaefer |

In larviparous oysters the female-functioning individuals discharge their eggs from the reproductive glands but retain them inside the brood chamber formed by the gills and two folds of the mantle. The eggs, which are about 150$\mu$ in diameter ($\mu = \frac{1}{1000}$ of a millimetre), begin to develop into embryos after having been fertilized by the male cells, or spermatozoa, which enter the mantle chamber of the female with a current of water. The embryos commence swimming when three or four days old. At the age of four or five days the shells of the embryos begin to form and the small animals gradually enter the larval stage. Up to this point the embryo remains white in colour but, as the shell grows larger, the larva becomes gray and then passes through various shades of blue-gray, slate and, finally, becomes bluish-black when the shell is grown to the size of 180 to 210$\mu$. During the latter stage, which is usually reached in about ten days, the larva leaves the parent to swim freely in the sea. This free-swimming period extends from a week to ten days or more depending upon the water temperature, being shorter when the temperature of the surrounding water is above normal. At the end of the free-swimming period, when the size of about 270$\mu$ is reached, the larva descends to the bottom and metamorphoses into a juvenile oyster, thus changing to a permanent sedentary life. In the biology of the oyster this act is usually called "setting." The larva may set on any object in the water possessing a clean, hard surface. Upon descending to the bottom the mature larva crawls about for some time seeking a suitable spot for attachment and, upon finding it, cements the left valve of its shell to the substratum. After setting is accomplished the young oyster is known as "spat."

A very large European female oyster may produce about 1,000,000 larvae during each spawning phase. Younger animals, however, yield far fewer larvae than older ones. *O. edulis* of marketable size produces from 250,000 to 500,000 larvae. In the oviparous species, such as *O. virginica,* individuals of both sexes discharge their reproductive element directly into the water, where fertilization occurs. A good sized individual may emit several million eggs at one spawning. The egg, which is rather small (about 50$\mu$), develops after fertilization into an embryo and larva in 8 to 12 hours. Within about two days the larva grows a complete bivalve shell and is known at that stage as "straight hinge larva." The free-swimming period of the larva extends from 8 to 21 days, being shortest when the water temperature is highest. During that period the larva continues to grow and increase in size, and passes through the so-called early and late umbo stages. Upon reaching the size of about 380 to 420$\mu$ the larva sets in much the same manner as that described for the European oyster. After setting, the larva quickly metamorphoses into a juvenile oyster and becomes known as "spat" or "set."

Spawning of ripe oviparous oysters can be easily provoked by a sudden rise in temperature, or by chemical stimulation. Artificial fertilization can be performed in this type of oyster by mixing ripe eggs and sperm in sea water. In larviparous oysters artificial fertilization is more difficult. By keeping the oysters for several weeks in water the temperature of which is above 70° F. they can be induced to develop eggs or spermatozoa even in the winter time, the period when under natural conditions the oysters are hibernating. The eggs, if fertilized, will develop into larvae which appear normal in their form and behaviour. The larvae of the oviparous (*O. virginica*) and larviparous (*O. lurida*) oysters can be obtained in midwinter using this method.

**Food, Feeding and Fattening.**—The food of the oyster consists of microscopic plants and animals present in the water. The food forms, which are of different kinds and sizes, are collectively called "plankton." Organic detritus resulting from the disintegration of plants and animals also contributes to the oyster diet. Many types of marine bacteria are ingested and probably utilized. Oysters obtain their food by means of the gills. The lashing cilia covering the gills create a current of water which enters the inhalant chamber of the oyster, and is expelled from the exhalant chamber. The gills constitute the sole partition between these two chambers. In straining water through the gills the oyster retains a considerable number of plankton organisms, although a certain percentage of small elongated forms devoid of any appendages may escape. The food particles caught on the surface of the gills are imbedded in a sticky substance, mucus, and then pass along the edges of the gills to the palps, which may either direct food into the mouth to be eaten, or reject it. Unwanted material is carefully collected together and finally expelled from the shell. After entering the mouth the food is conducted through a narrow gullet into the stomach. The small food organisms are digested mainly by being engulfed by the wandering cells of the oyster body, which are capable of penetrating through the walls of the stomach into its cavity, enveloping particles of food, and migrating back through the stomach walls. The food assimilated by the wandering cells is later distributed to the various tissues. An important part in digestion is played by a long, transparent, gelatinous structure, known as the crystalline style which is found in the alimentary canal of the oyster. The style contains an enzyme to dissolve starchy food, so that it can later be absorbed by the cells of the digestive gland.

The absorbed food is stored in the body of the oyster. These animals are said to be "fat" when the body is large and plump. This condition may be caused either by the development of the spawning products, or by the accumulation of the reserve food materials. Fatness during the breeding time is usually of the former type, whereas the accumulation of the reserve products occurs mainly after the end of the breeding season, when the oysters feed very actively. The stored material consists largely of animal starch (glycogen), which in the living animal is found in the large bladder cells located in most parts of the body. In the American oyster, *O. virginica,* of Long Island sound the accumulation of glycogen begins early in September and continues until the beginning of hibernation, which takes place early in December. In the case of *O. edulis,* the animals begin to store large quantities of glycogen as early as August. Thus the oyster is in its best condition for eating during the fall and winter months. In warmer waters, such as those of Louisiana and Texas of the United States, fattening of the oyster does not begin until some time in December.

Oysters feed most efficiently when the surrounding water is relatively warm. The American oyster, *O. virginica,* ceases to feed and enters the state of hibernation when the water temperature decreases to approximately 41°F. Other oysters probably behave similarly but the water temperature minimum varies for each species. Under favourable conditions *O. virginica* and *O. lurida* keep their shells open approximately 20 hours during each 24-hour period. No correlation was found between the opening and closing of the shell and the time of day. A large *O. virginica* can pump through its body as much as 27 litres of water per hour. The average rate of pumping, however, is much less. The rate of pumping is controlled by the temperature and other factors, such as turbidity or number of food organisms present in the surrounding water.

The meat of the oyster contains large quantities of nutritive substances necessary for a balanced diet. It is very high in copper and iron, and because of this oysters are often prescribed for anaemic patients. The meat also contains iodine, which is necessary for the normal activities of the thyroid gland and helps prevent goitre. Its proteins are especially high in nutritive value, and the carbohydrates present in the form of glycogen are readily digested and assimilated. Phosphorus and calcium are present in relatively high quantities. The meat of the oyster also contains most of the essential vitamins.

**Growth.**—The rate of growth of oysters varies greatly, depending mainly upon the temperature, food content of the water and season of the year. Generally the growth is more rapid in warmer waters. *O. virginica* of southern waters reaches the marketable size of 3½ in. to 5 in. in two years. In Long Island sound, where the summer is shorter and the water temperature cooler, the oyster reaches the same size in four or five years. The average sizes of a Long Island sound oyster at the end of the first, second, third, fourth and fifth growing periods are ¾ in., 2¼ in., 3 in., 3½ in. and about 4 in. respectively. In the case of the European oyster, the average size at the end of the first summer lies between ⅓ and ⅝ in. The average sizes at the end of the second, third, fourth and fifth growing periods are 1⅓ in., 2 in., 2½ in. and 2⅝ in., respectively. *O. lurida* reaches the marketable size of approximately 1½ in. in three or four years. *O. commercialis* is usually marketed at the age of three years, while the giant Japanese oyster transplanted to the Pacific coast of the U.S.A. may be marketed at the age of two years. Oysters, if left undisturbed, may attain considerable length. Specimens of *O. virginica* measuring more than 14 in. in length have been recorded. The same is true of *O. gigas.* Although the exact age which an oyster may attain cannot be definitely stated, judging by the number of layers composing the shell some very large individuals of *O. virginica* examined were at least 25 years old.

**Enemies, Parasites and Diseases.**—During their existence oysters are attacked by numerous enemies. The embryos and larvae are eaten in large numbers by ctenophores, jellyfish, many varieties of young fish, barnacles, certain bivalves and worms, ascidians, hydroids and probably by numerous larval and adult crustaceans. Spat, young and old oysters are destroyed by starfish, especially of the genus *Asterias,* and oyster drills or tingles (*Urosalpinx* and *Eupleura* in America, *Murex* and *Purpura* in Europe, and *Xymene* and *Drupa* in Australia). The drills bore round holes with their rasping tongues through the shells of the oyster and eat the meat. Whelks or conchs of the genus *Thais* are often very destructive to oyster beds. Some fishes, such as the drumfish (*Pogonias*) of America and *Myliobatis* of Europe and Australia, which possess large crushing teeth, occasionally invade the beds and destroy a large number of oysters. Sponges (*Cliona*) form a series of tunnels in the shells of the oysters. Mud worms of the genus *Polydora* sometimes cause serious mortality. Oysters are parasitized with a number of forms. The gregarine, *Nematopsis,* is found in many organs of *O. virginica* and in the kidneys and gills of the European oyster. A spirochaete, *Cristispira,* occurs in the crystalline style. The bucephalus larva of the trematode, *Gasterostomum,* lives in the body tissues. A species of parasitic copepod, *Mytilicola,* was found to infest the oysters on the Pacific coast of the U.S.A. Females of the crab, *Pinnotheres,* living in the mantle cavity of the oysters were reported to eat the gills of their hosts.

A large group of animals competes with the oyster for food and living space. All bivalves and, in general, all animals which live under the same conditions and feed in fundamentally the same way as the oyster, should be placed in this category. Common mussels, *Mytilus edulis,* sometimes form beds over the oysters smothering the latter. On some English beds and in Puget sound a gasteropod mollusc, *Crepidula,* is inimical to the cultivated oyster beds. Barnacles, ascidians and bryozoa, when present in large numbers, may seriously interfere with the normal existence of the oyster. Various adverse conditions are known to cause diseases and heavy mortality among the oysters. A marked reduction in salinity of the water over the oyster beds, caused by an unusually large inflow of fresh water, may either greatly weaken or kill the population of the oyster beds. Cases are known when oysters, especially those on beds exposed at low stages of the tide, were killed during freezing weather. Turbulence caused by the storms often results in covering the oysters with a heavy layer of sand and silt which smothers the molluscs. Pollution of the water with large quantities of oil and industrial or domestic waste creates adverse conditions which may eventually result in the death of the oysters.

**Oyster Industry.**—In several countries, especially the United States, France, Netherlands, United Kingdom and Australia, the oyster fishery represents an important industry. The United States leads all the other countries in the quantity of oysters grown for the market and in the value of the product (Table III).

TABLE III.—*Quantity and Value of Oysters Produced in Certain Countries, Various Years* (*)

| Country | Year | Quantity (meat) | Value |
|---|---|---|---|
| | | *Pounds* | |
| United States† | 1931 | 101,035,825 | $10,300,168 |
| France | 1930 | 13,255,336 | 1,141,563 |
| Netherlands | 1931 | 389,188 | 692,355 |
| United Kingdom | 1931 | 104,790 | 279,759 |
| Australia | 1931 | 351,309 | 276,794 |

‡1940 production—755,000 lb. valued at $188,529.
§No data available.

The approximate annual production of the world's oyster meats approaches 120,000,000 lb. In most countries, however, the oyster yield has shown a decline since the beginning of the 20th century. Among the causes of this decline over-fishing, increasing pollu-

tion and lack of proper cultivation may be mentioned as paramount factors. The latter cause is especially obvious in the U.S.A. where only about 10% of the bottom suitable for growing oysters is under cultivation. This relatively small area produces, nevertheless, approximately 55% of the total oyster crop of the country.

**Oyster Farming.**—Oyster farming is conducted on a large scale in many countries. The cultivation of oysters consists of four main steps: care of the beds; securing set; growing oysters; and conditioning them for the market. The care of the beds consists of hardening the bottom and cleaning away old shells, debris and all natural enemies of the molluscs. The cleaning of the bed is usually carried on in the spring and early summer as preparation for securing a new generation of oysters. Spawning beds containing large numbers of mature oysters are ordinarily maintained in the vicinity of the grounds where setting is expected.

When the larvae are ready to set various materials, usually called cultch, are placed on the cleaned beds to provide setting space. In the United States, Canada and Great Britain the common practice is to use clean shells, especially those of oysters. In the Netherlands and France clay tiles coated with lime are laid on the bottoms. In Italy, Australia, Norway, China and Japan, branches of trees are placed in the water. Stones are also used in Australia, New Zealand and China. In all instances it is especially important that the cultch be clean at the time the larvae are ready to set. If placed in the water far ahead of the setting time, the material is soon overgrown with marine organisms and covered with silt, thus becoming unsuitable for attachment of the larvae. Places where setting of oysters usually occurs and where the cultch should be planted are determined by local experience. Ordinarily such areas occur in the vicinity of the natural beds.

Methods for growing oysters differ somewhat in different countries. However, they usually consist in transplanting young animals from the setting area to locations where they will grow faster. This method is widely practised in the United States, while in some sections of Australia oysters are grown on platforms elevated from the bottom. For the cultivation of *O. lurida* of the Pacific coast of the United States, an elaborate system of dykes has been devised. Transplanting assists in breaking up clusters of the young oysters. The single animals, if planted so that they have enough space for growth, acquire a very good shape and usually grow much faster than those living under overcrowded conditions. The final stage of oyster culture consists in the fattening of the animals for the market. Oysters of premarket size are simply transplanted from the growing grounds to the special beds and left there until they fatten. In France oysters are fattened artificially and rendered green by being kept in claires, or ponds, in which a very rich growth of the diatom, *Navicula ostrearia,* is cultivated. The green colour of these oysters is caused by the accumulation of pigment from the ingested diatoms in their gills and palps. A similar natural greening of oysters occurs in certain creeks in England. On some American beds, as well as in many other parts of the world, the green colour of the oysters is due to the accumulation of copper which they derive from the surrounding sea water. In some isolated sections of the Atlantic coast of the United States the oyster gills may acquire a black colour. The cause of this phenomenon is still undetermined.

Artificial production of oysters in enclosed small bodies of water was first practised by the Romans, and after 1900 was tried in almost every country where oysters are grown. In some instances a certain success was attained but, in general, these attempts were not profitable.

**Sanitary Control.**—Oysters may filter from sea water and retain alive in their bodies certain pathogenic bacteria which, if swallowed by man, may cause diseases. Therefore, in the United States, Great Britain, Canada, France and many other countries, the oyster industries are subjected to very strict sanitary regulations. Waters from which oysters are taken to be sold as food are under the constant supervision of health authorities. After the animals have been removed from the shells their purity is determined by a rigid bacteriological examination. Oysters failing to meet this test cannot be released for the market. The places where the oysters are opened, and all the equipment that comes in contact with the animals are maintained at a very high degree of cleanliness. Employees engaged in opening oysters are required to undergo periodic medical examinations to show that they are not suffering from contagious diseases.

In the summer months, especially towards the end of the breeding period, oysters are usually poor because of the great expenditure of material needed for the production of spawn. However, fat oysters coming from pure water may be eaten at any season without danger to the human health.

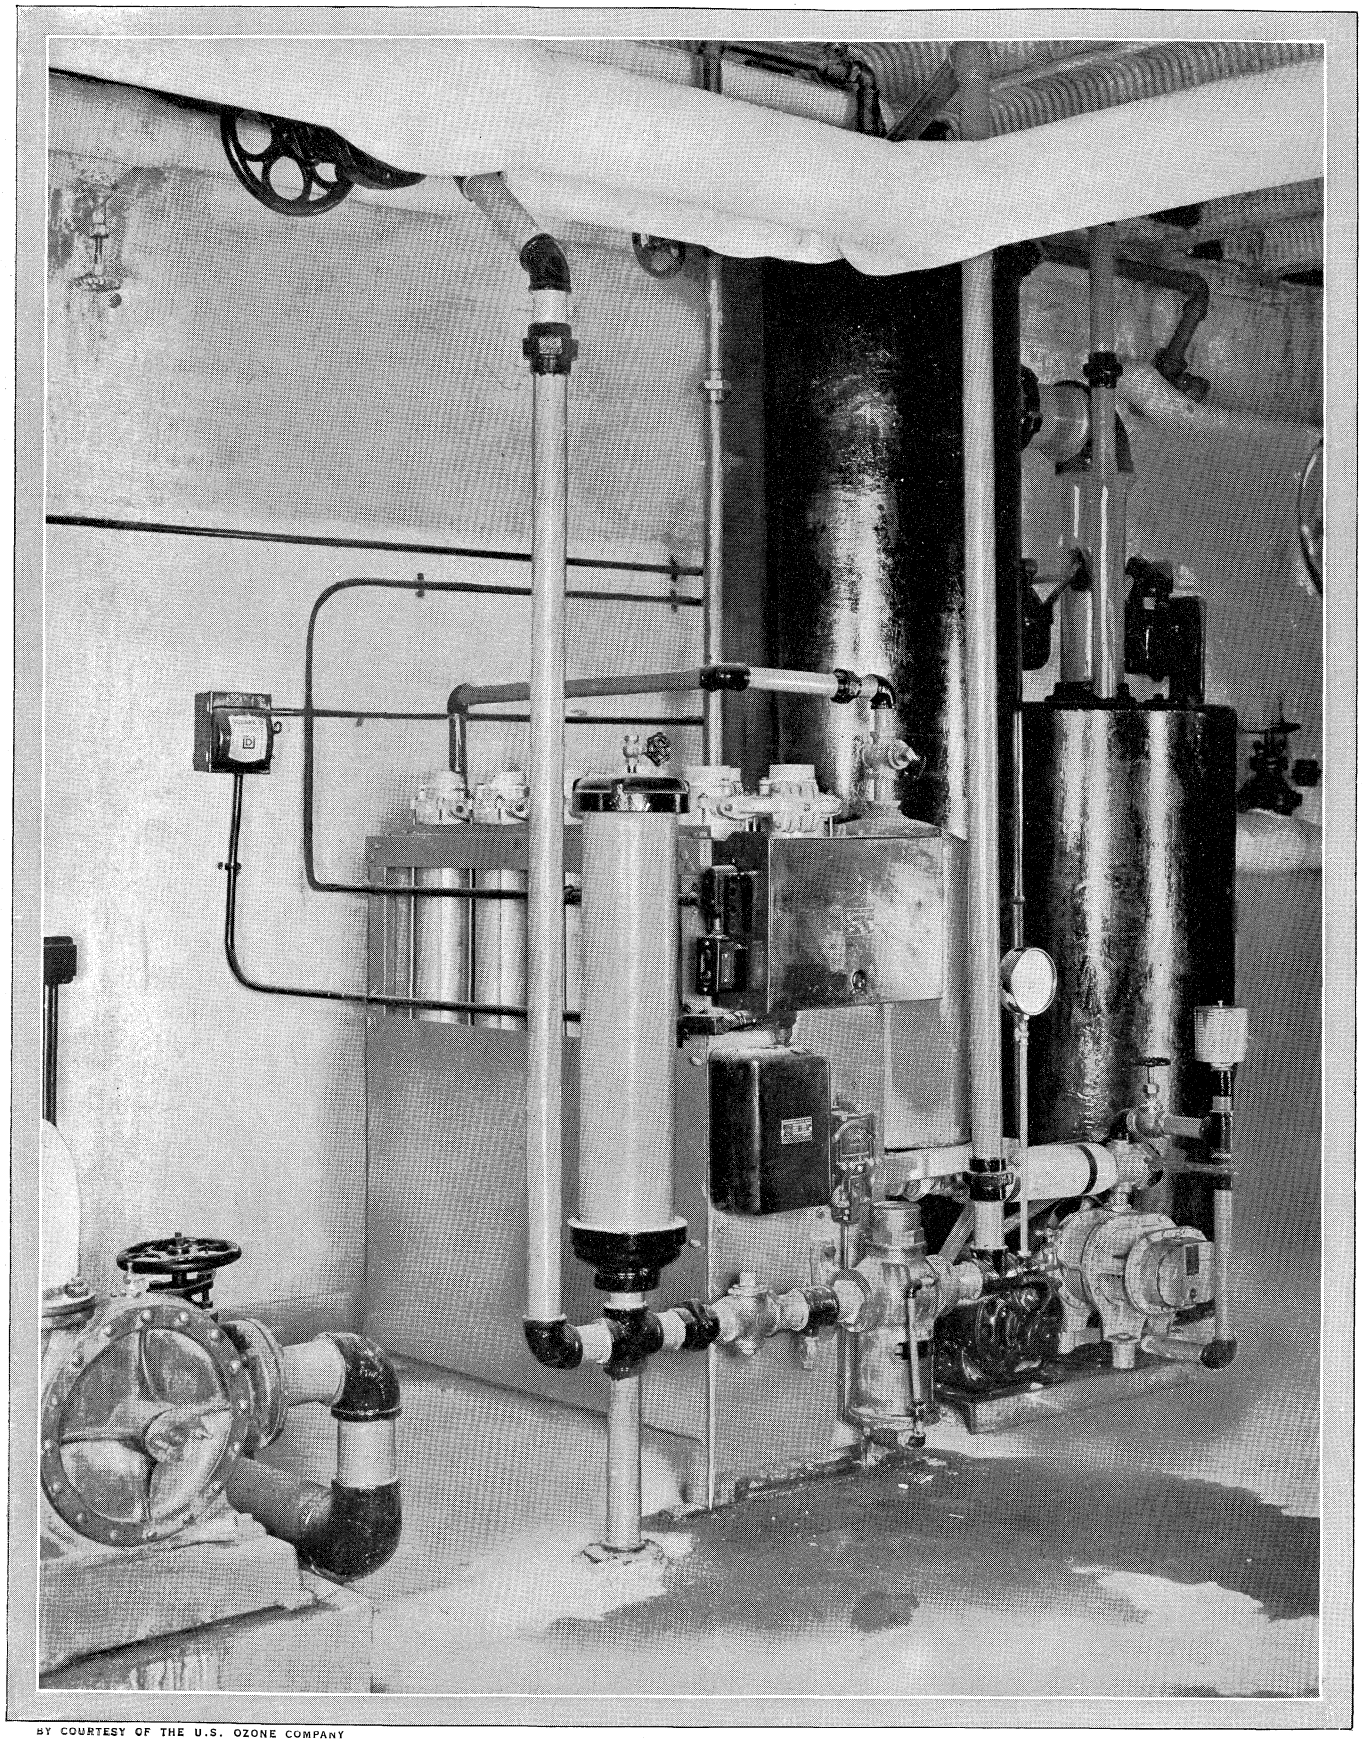
**OYSTER BAY,** an unincorporated town of Nassau county, New York, U.S.A., on the north shore of Long Island, 28 mi. N.E. of the Brooklyn borough hall; served by the Long Island railroad and in summer by ferries to Greenwich, Stamford and New Rochelle. Pop. 1940, 4,981. The village of Oyster Bay Cove had a population of 466 in 1940. There are many country estates in the vicinity. Oyster dredging is the principal industry. Oyster Bay was the home of Theodore Roosevelt, and his grave is on a hillside in Youngs Memorial cemetery. His home, "Sagamore Hill," stands on high ground, commanding delightful views. A seaside park, established as a memorial to Roosevelt, was opened in 1928. Oyster Bay harbour was explored by de Vries in June 1639. A settlement from Lynn, Mass., was attempted in 1640 but was prevented by Governor Kieft, and for some years the territory around the harbour was claimed by both English and Dutch. The first permanent settlement was made by Peter Wright and others from Massachusetts in 1653. The harbour was a famous smuggling centre at the end of the 17th century.

**OYSTER CATCHER** or SEA PIE, a genus of wading birds, allied to the plovers. Conspicuous in both sexes by its black and white plumage and long red beak, the common oyster catcher (*Haematopus ostralegus*) is found on all coasts from Iceland to the Red sea. It feeds largely on marine worms, crustaceans and molluscs, and is very wary. The hen lays three clay-coloured eggs blotched with black, usually on a shingle bank near the sea. The young are at first clothed in protectively-coloured down and can run at once. Usually seen in pairs, oyster catchers sometimes congregate in large flocks. The courtship consists of a dance in which one or both birds run round piping. Sometimes this dance, losing its original significance, is performed as a social function by a number of birds.

The American species (*H. palliatus*) has a longer bill and less white on the back, and its call note differs from the musical "tu-lup" of the European bird. Various other species occur, some of which are entirely black.

**OZANAM, ANTOINE FRÉDÉRIC** (1813–1853), French scholar, was born at Milan on April 23, 1813. Antoine studied law at Paris, where he fell in with the Ampère family, Chateaubriand, Lacordaire, Montalembert and other leaders of the neo-Catholic movement. In conjunction with other young men he founded in May 1833 the celebrated charitable society of St. Vincent de Paul, which numbered before his death upward of 2,000 members. In 1840 he became assistant professor of foreign literature at the Sorbonne, and in 1844 full professor. He died at Marseilles on Sept. 8, 1853.



BY COURTESY OF THE U.S. OZONE COMPANY

## TYPE OF OZONE WATER-PURIFIER FOR SWIMMING-POOLS

Water-purifier, showing row of ozone generators in centre. Ozone, a more active form of oxygen, is produced in these generators, by the action of the so-called silent, or brush high-tension electric discharge. Brought in contact with water from the swimming-pool, the action of ozone is to oxidize and destroy bacteria and organic matter, transforming them into harmless products, and rendering the water free from objectionable and dangerous elements

Ozanam was the leading historical and literary critic in the neo-Catholic movement in France during the first half of the 19th century. In contemporary movements he was an earnest advocate of Catholic democracy and socialism, and of the view that the church should adapt itself to the changed political conditions consequent to the Revolution.

His works were published in eleven volumes (Paris, 1862–65). They include *Deux chanceliers d'Angleterre, Bacon de Verulam et Saint Thomas de Cantorbéry* (Paris, 1836); *Dante et la philosophie catholique au XIII*ème *siècle* (Paris, 1839; 2nd ed., enlarged 1845); *Études germaniques* (2 vols., Paris, 1847–49), translated by A. C. Glyn as *History of Civilization in the Fifth Century* (London, 1868); *Documents inédits pour servir à l'histoire de l'Italie depuis le VIII*ème *siècle jusqu'au XII*ème (Paris, 1850); *Les poëtes franciscains en Italie au XIII*ème *siècle* (Paris, 1852). His letters have been partially translated into English by A. Coates (London, 1886).

There are French lives of Ozanam by his brother, C. A. Ozanam (Paris, 1882); Mme. E. Humbert (Paris, 1880); C. Huit (Paris, 1882); M. de Lambel (Paris, 1887); L. Curnier (Paris, 1888); and B. Faulquier (Paris, 1903). German lives by F. X. Karker (Paderborn, 1867) and E. Hardy (Mainz, 1878); English biography by Miss K. O'Meara (Edinburgh, 1867; 2nd ed., London, 1878).

**OZARK MOUNTAINS,** more properly called highlands, are a group of moderate elevation lying in five States, Missouri, Arkansas, Oklahoma, Kansas, and Illinois. The total area is estimated at about 50,000 sq.m., of which 33,000 are in Missouri. The highland is an elevated peneplain developed upon an asymmetrical dome whose apex is formed by igneous rocks outcropping in St. Francois and adjacent counties, in Missouri. The topography is dominantly of the ridge and valley type; most of the area has been sculptured out of limestone by streams with the abundant aid of underground solution. Except on the south and south-east the transition from highland to plain is very gradual. On the south-east there are high rocky bluffs that rise precipitously on the Mississippi, and on the south the Boston mountains constitute a well-defined escarpment bordering on the Arkansas lowlands.

The Bostons of Arkansas, reaching elevations of about 2,300 ft. above sea-level and the highest points in the Ozarks, have been sculptured into truly mountainous form by the Arkansas and White river systems. In Missouri there are several isolated knobs more than 1,700 ft. above sea-level and one, Taum Sauk, in Iron county reaches an elevation of 1,750 feet. Turbulent streams flowing through deep cut gorges, numerous caverns and springs, and well-wooded hills have made parts of the Ozarks attractive to summer visitors.

BIBLIOGRAPHY.—C. O. Souer, *The Geography of the Ozark Highlands of Missouri* (1920) and *Missouri Geological Survey* (vol. 8 1894).

**OZOKERITE** or **OZOCERITE** may be designated as crude paraffin wax; it is found in many localities in varying degrees of purity, and is named from Gr. ὄζειν, to emit odour, and κηρός, wax. Specimens have been obtained from Scotland, Northumberland and Wales as well as from about 30 different countries; it was formerly worked commercially in Utah, U.S.A., but these deposits are now worked out and the sole sources of commercial supply are in Galicia, at Boryslaw, Dzwiniacz and Starunia. While formerly as much as 20,000 tons were mined annually, the industry has latterly suffered from the competition of the greatly increased output of paraffin wax extracted from petroleum.

Ozokerite usually occurs in thin stringers and veins up to 1ft. or so in thickness and is believed to have originated from the slow evaporation and oxidation of paraffin base petroleum. It is generally characterized by a higher melting point than the wax extracted from oils, though the paraffin "scale" deposited on the casing of certain oil wells in Trinidad was found to approximate closely in melting point to native ozokerite.

As found native, ozokerite ranges from a very soft wax to a black mass as hard as gypsum, the specific gravity varying from ·85 to ·95 and the melting point from 58° to 100° C. It is soluble in benzene, chloroform, carbon disulphide, etc. Galician ozokerite varies from light yellow to dark brown and usually melts at 62° C.

The ozokerite as mined is separated from its mineral impurities by boiling in water, when the wax rises to the surface. This crude ozokerite is refined by treatment first with concentrated sulphuric acid and afterwards with charcoal, the result being the ceresine or ceresin of commerce.

On distillation in a current of superheated steam, ozokerite yields a candle-making material resembling the paraffin obtained from petroleum and shale-oil but of higher melting point, and therefore of greater value if the candles made from it are to be used in hot climates. There are also obtained in the distillation light oils and a product resembling vaseline (*q.v.*). The residue in the stills consists of a hard, black, waxy substance, which in admixture with india-rubber is employed under the name of *Okonite* as an electrical insulator. From the residue a form of the material known as *heel-ball,* used to impart a polished surface to the heels and soles of boots, is also manufactured. (J. R.)

**OZONE** is a gas which possesses the odour of chlorine or of moist phosphorus. It may be formed (*a*) by chemical action; (*b*) by electrolysis; (*c*) by the electro-static field; (*d*) by ultra-violet rays; (*e*) by the radioactive elements; (*f*) by incandescent solids in air; (*g*) by the evaporation of water. Ozone has found quite general usage in many countries for the purification of water. At Philadelphia a Vosmaer sterilizing tower 33 ft. high and 3 ft. in diameter has been shown to be capable of sterilizing 50,000 gallons of water per hour, using an ozone concentration of one gram per cu. metre; the plant supplying Paris deals with 24 millions of gallons of water daily. Ozonized air has been utilized in food preservation, in surgery and therapeutics, in the bleaching and refining of oils, fats and varnishes. Its use in the fine chemical industry is of increasing importance. It is successfully employed in the manufacture of the flavouring material, vanillin, and the perfume, heliotropin.

Ozone, allotropic oxygen, chemical symbol $O_3$ (*see* ALLOTROPY), is normally a colourless gas. In great thickness or under pressure the colour is blue. It is sparingly soluble in water (coefficient of solubility, 0·494); it has been liquefied to a deep blue liquid which is, however, dangerous to handle owing to its tendency to spontaneous explosion. Its boiling point is variously given as −106° C (Olszewski) and −119° C (Troost). Ozone is seven times as soluble in carbon tetrachloride as in water. Its solutions in this solvent and in acetic acid, acetic anhydride and chloroform are blue and fairly stable.

The simplest form of laboratory ozonizer was due to W. von Siemens (1857) and consists of two concentric glass tubes, the inner surface of the inner one and the outer surface of the outer one being coated with tin foil, and each of the tin foil conductors being in metallic contact with the terminals of an electrical induction coil. A slow stream of dry oxygen is passed through the ozonizer and under the influence of the silent electric discharge the gas becomes charged with from 3 to 8% of ozone. Two types of ozonizers are employed on a large scale: those which have dielectrics in the path of the discharge—the Siemens and Halske, and Linder ozonizers—and those which have no dielectrics—the Schneller and the Vosmaer ozonizers. In the "ozonair" system a series of mica or micanite plates covered on both sides with a gauze of aluminium alloy are mounted side by side in a case into which air can be passed. Alternate plates are charged and earthed. The production is about 40–60 gm. of ozone per kilowatt-hour of energy at a concentration of 2 gm. of ozone per cu. metre of air.

The first recorded observation on ozone was by Van Marum (1785) who found that electrified oxygen had a peculiar smell and tarnished mercury. In 1840 C. F. Schönbein noticed these properties in air subjected to the silent electric discharge, in oxygen generated by electrolysis of water and in the slow aerial combustion of phosphorus. He gave to the new gas the name ozone (ὄζειν, to smell). Ozone is evolved in many chemical reactions, as by the action of sulphuric acid on barium or sodium peroxide and on many per-salts (perborates, percarbonates, permanganates, persulphates, etc.). Fluorine decomposes water with the production of blue ozonized oxygen (H. Moissan, 1891). The least volatile portions of liquid ozone contain a denser gas of great chemical activity to which the name *oxozone* has been given with a molecular formula $O_4$. (C. D. Harries, 1911. *See* OZONIDES.)

The constitution of ozone as $O_3$ was demonstrated by T. Andrews and P. G. Tait (1860), J. L. Soret (1866–67) and B. Brodie

(1872), by making use of the fact that certain essential oils (cinnamon and turpentine) absorb ozone without taking up any marked amount of oxygen. The loss in volume by absorption of the ozone from ozonized oxygen was twice that observed during the original ozonization of the gas. It was inferred from these experiments that 3 volumes of oxygen are condensed to produce 2 volumes of ozone. This conclusion was confirmed by comparing the rates of diffusion of ozone and chlorine, when the density of ozone calculated on the basis of T. Graham's law of gaseous diffusion was approximately 24 (H=1), agreeing with a molecular formula of $O_3$ (48).

**OZONIDES,** in chemistry, combinations of organic compounds with ozone. Soret's observation that ozone (*q.v.*) is absorbed by turpentine and oil of cinnamon was a forerunner of the remarkable results subsequently obtained by C. D. Harries (1905–15) by passing ozonized oxygen into solutions of unsaturated organic compounds in inert solvents such as methyl or ethyl chloride or glacial acetic acid. Ethylene gives ethylene ozonide, $C_2H_4O_3$, which on treatment with water furnishes formaldehyde and hydrogen peroxide. Benzene gives rise to an explosive triozonide, $C_6H_{6,3}O_3$, which is decomposed by water to give glyoxal. Oleic acid from olive oil gives an ozonide which on decomposition gives two aldehydes and their two peroxides. These decompositions of ozonides are used in determining the position of unsaturated ethylene linkings in the organic molecule and also in the preparation of certain aldehydes. Harries applied the method of ozonide decomposition to the problem of the constitution of caoutchouc and indiarubber. In certain instances unsaturated organic compounds take up $O_4$ at the double linkage. The products are termed oxozonides, and are regarded as being due to the presence of oxozone, $O_4$, in ozonized oxygen. Propylene gives $C_3H_6O_4$ and butylene forms both ozonide, $C_4H_8O_3$, and oxozonide, $C_4H_8O_4$.
