Caught stealing.—A base runner is caught stealing when he is retired at the base ior which he mas trying as the result of a throw by the catcher or pitcher.

Cellar.—Last place in a league.

Change of pace.—A slow ball pitched by a fast-ball pitcher is called a change-of-pace ball or simply a change of pace.

Charley horse.—Injury oi a leg muscle, marked by pain and swelling,

usually the result of a sudden strain on some part of the muscle, tearing some of the fibre bundles.

Cheap, or *Chinese, home* run.—A home run that just clears the outfield barriers Often teams wishing to inrrease the home runs hit by their batsmen will lower the barriers or bring them in closer. Another cheap home run is a normal fly ball that is carried by the wind out of the park.

Choke.—When a batter advances his hands along the bat toward its striking end farther than is customary with the average batter he is said to choke the bat. Some batters choke the bat habitually. Others choke it when they are about to bunt.

Circuit clout.—A home run.

Circus catch.—The capture of a fly ball by a fielder which involves his leaving the ground. He usually rolls over on the ground after catching the ball, like a circus tumbler.

Classic.—(noun) The world series.

Cleanup.—(adj.) Applied to a hit that drives home as many base runners as are on bases at the time, but no fewer than two. Fourth place in the batting order is called the cleanup position and the player batting in that position is the cleanup hitter.

Clinching the pennant.—A team clinches the pennant when it becomes mathematically impossible ior any rival team to win the pennant even if it wins every remaining game on its schedule while the team in first place is losing every remaining game.

Clothesline.—A safe hit to the outfield which travels on a low line without touching the ground or rising more than 10 or 15 ft. above the ground.

Clubhouse lawyer.—A player given to argument on any or all points, particularly matters dealing with the conduct and operation of the team by its manager.

Clutch.—(noun) A crisis in the play of a ball game in which every player is on his mettle, since the iate of the game appears to be hanging in the balance. A player who becomes nervous or jittery or inespert at such point is said to choke up or tighten up in the clutch.

Clutch hitter.—A player very dangerous when he comes to bat in the clutch, that is, at a crisis in the game when a bit can play a vital part in deciding victory and when failure to hit means the almost certain loss of the game. Players are rated as good or bad clutch hitters regardless of batting averages.

Collar.—See Horse collar.

College *try.*—When a player makes a desperate effort to field a batted ball that is hopelessly out of his reach, the attempt is called "giving the old college try" or, simply. "making a college try" for the ball.

Connect.—To hit the ball solidly, as "he connected for a two-bagger."

Cousin.—A pitcher whose deliveries are unusually easy for one batter, as compared with his teammates, is referred to as a cousin of that batter. Similarly, a given team that loses a large majority of its games to another team is known as the latter's cousin.

Cripple.—When the count on a batter is three balls and no strikes, the pitcher is said to be in the hole, meaning that he must try to pitch the next one over the plate, so that the batter does not reach first base on a base on balls. In his efforts to make sure the next pitch is over the plate, the pitcher often fails to use as much speed as on the previous pitches. Such a pitch is known as a cripple.

Crowding the *plate.*—A batter crowds the plate when he stands as close to home plate as permitted by the boundaries of the batter's box and in addition uses a crouching position, leaning forward so that his chin is actually over the top oi the plate's inner margin.

Curtain miser.—The first game of a double-header.

Cut.—(a) Forceful swing at the ball by the batter, whether he hits it or not; also used as a verb, to cut at the ball, with the same meaning; (b) one player's share of a lump sum of extra money won by the team as a whole; (c) a reduction in salary.

Double-header,—Two games played by the same two teams in the same park on the same day ior one admission price.

Double steal.—When two base runners both advance safely to the next base without any batting of the ball occurring during the play, it is called a double steal. The term applies regardless of which two bases are stolen. The most frequent double steal comes with men on first and third. The runner on first steals second, and as the catcher throws unsuccessfully to that base, the runner on third dashes safely to home plate.

DP.—Double play.

Drag.—A batter bunting a ball between the pitcher and the first-base foul line, and starting to run to first base in the act of reaching for the ball with his bat, is said to drag the ball.

Duster.—A bean ball (see above), so-called because the batter, in dodging it, frequently ialls to the ground and usually removes the dust from his uniform beiore resuming his batting position. A pitcher intentionally throwing the ball at the batter to make him dodge (a violation oi the rules) is said to be dusting him off.

Fan.—(noun) A spectator at a ball game, or a person interested in baseball who discusses its events and personalities with others. (verb) To strike out

Find the handle.—To field a grounder; often used in the negative when a fielder is slow in picking up a grounder, "He can't find the handle on the ball."

Foot *in* the *bucket.*—A timid batter with a tendencv to fall away irom the plate as he swings at the pitched ball is said to be batting with one foot in the water bucket, a phrase handed down from days when drinking water came in buckets instead of through the ball park's plumbing system. Every players' bench used to have its own water bucket.

Fungo.—A fly batted to the outfield in fielding practice. The batter holds the bat in one hand, tosses the ball into the air immediately in front of him, takes the bat in both hands and drives the ball high in the air in the direction of an outfielder waiting to catch it. This is known as fungo hitting. The fungo hitter uses a special fungo hat, lighter and thinner than the standard bats used in games. The flies he hits are sometimes called fungo flies, but usually merely fungos.

Garden.—The outfield.

Gonfalon.—The pennant, emblematic of the championship of the league for any given year.

Gopher ball.—A pitch that the batter hits for a home run, derived jocularly from the way the batters "go fer" it, hit it, and then "go fer" a home run.

Go the *route,* or the distance.—To pitch a complete nine-inning game.

Grand *slam.*—A home run with the bases full.

Grandstander.—A player who seems to be showing off, with an eye toward the approval of the spectators rather than concentrating all his attention on the playing of the game.

Grandstand *manager.*—A spectator given to shouting condemnatory expressions at the manager and/or players of the home team during the course of ball games, from his seat in the grandstand or the bleachers.

Grapefruit *league.*—The inter- and intra-league exhibition games played during the course of spring training.

Groove.—(noun) An imaginary line drawn across the middle of home plate irom front to back. A pitched ball that crosses home plate waist high in a plane directly above this line on its way to the catcher is said to be in the groove, though it usually is hit by the bat before reaching the catcher. Also, as a verb, "to groove" means to pitch the ball just where the batter wants it, resulting in a solid hit.

Hall of Fame.—(a) The central court of the baseball museum at Cooperstown. (b) A nontangible "hall" in which a pitcher secures a permanent place for his name by pitching a no-hit game. Sometimes qualified as the "No-Hit Hall of Fame."

Handcuff.—A hard-hit batted ball, which seems to break through the hands of the infielder trying to catch it, is described as handcuffing the infielder.

Hawk.—An outfielder gifted with exceptional speed and keen judgment of the flight oi batted balls, so that he can run far to make catches of long drives.

Hit the dirt.—To slide into a base.

Hook.—A curve pitch.

Horse collar.—A zero opposite a player's name in the hit column of a box score, meaning he made no hits in that game; also such a player is said to "go for the horse collar" or "collar."

Hot corner.—Third base, because batted halls hit toward that point are usually traveling faster than is the case when directed toward any other infielder; also known as far corner.

Hurler.—A pitcher; also called twirler.

In the hole.—(a) A drive that passes to the outfield halfway between two infielders is sometimes described as in the hole between short and third or first and second; (b) see Cripple.

Iron *Man.*—A pitcher of unusual endurance; in early baseball one who pitched and won both games of a double-header. See Rubber arm.

Ivory.—New talent added to a team's personnel from leagues of lower classification or from teams outside organized baseball. The talent scouts of professional teams are also called ivory hunters.

Jug handle.—A sharp-breaking and effective curve pitch.

Keystone.—Second base.

Kick.—(a) A voiced or gestured objection to an umpire's decision; also as verb, meaning to make such a protest; (b) to boot a grounder.

Knocked out *of* the *box.*—When the manager makes a substitution of one pitcher for another at some point during the opposing team's inning at bat and such substitution is made because of heavy hitting by the team at bat, the pitcher taken out of the game is said to be knocked out oi the box.

Lead.—(a) The advantage that one team has over another, either in runs at some point during a game, as a two-run lead, or in games or points in a club standing at some point during a pennant race, as a four-game lead, or a 50-point lead. (b) A base runner takes a lead off a base when he moves two or three steps toward the next base as the pitcher takes his position to pitch to the batter.

Lead-off man.—The first player in a team's batting order.

Loop.—A baseball league or association.

Loose.—Adjective used to describe a pitcher whose delivery is smooth and rhythmic; also to describe any player who preserves his aplomb and effectiveness of operation regardless of how tense or fierce the action oi a game becomes.

Muff.—The failure to hold a fly hall after getting hold of it or touching it with one or both hands.

Nightcap.—The second game of a double-header (see above).

No-hitter.—A game in which one pitcher prevents the opposing team from making a safe hit throughout the entire contest. Games of one or two hits for one of the contesting teams are termed one-hitters, two-hitters, etc., when describing the performance of the pitcher who thus restricted a team's batting efforts. A no-hitter in which no batter walks

or otherwise reaches first base is called a "perfect game."

Noisy strike.—A long fly ball that curves foul.

On deck.—The batter who will follow the man at bat at any given point is known as the man on deck.

Overhand delivery.—A style of pitching in which the pitcher's pitching hand passes his body at a level higher than his head and close to a vertical line drawn irom the tip of his pitching shoulder.

Overrunning a *base.*—A base runner reaching a base but going past it, or being carried past it by the momentum of his body as he slides, is said to overrun the base.

Overthrow.—A throw to a base in an attempt to retire a base runner which is so high that the fielder cannot reach the ball at all, or block its flight enough to prevent its rolling out of control long enough ior one or more base runners to advance one or more bases before control is regained.

Pass.—A base on balls, a "free ticket" to first base ior the batter.

Passed *ball.*—A pitched ball within reach of the catcher which the catcher fails to hold and which rolls iar enough for a base runner to advance at least one base beiore its recovery is scored as a passed ball. It is necessary that one or more base runners advance on the play for it to be scored as a passed ball, which counts as a fielding offense by the catcher, though it is not recorded in the error column of the box score (see Wild pitch).

Pinch hitter.—A player who is substituted for a man going to bat or already in the batter's box but with his turn at bat still unfinished.

Pop.—A pop, pop-up or pop fly is a weakly hit fly that travels steeply off the bat into the air.

Powerhouse.—A long-distance hitter.

Prima donna.—Temperamental player who must be coddled by his manager and teammates in order to perform at top efficiency.

Pull-hitter.—One who tends to drive the ball to the part of the playing field on the same side of home plate as the batter's box in which he is standing; *i.e.,* a right-handed batter who "pulls," hits his hardest drives to leit field; a left-handed pull-hitter drives them to deep right.

Pull the string.—Every time a pitcher oi good speed mixes in a slow ball, or change of pace, he is said to pull the string.

Rabbit ears.—A player, usually a pitcher, who is touchy and quick to flare into a rage. Pitchers and players in general, when the game is going on, give ear only to the voices of their own teammates, their manager and coaches. A player with rabbit ears can be disturbed and his efficiency impaired by comments from the opposing team's bench, from the coaches' boxes, or from the stands.

Rally.—An offensive outburst, usually two or more hits, made by a team that is behind in the score in a late inning of the game, whether or not the outburst is successful in tying or passing the other team.

Relieving a pitcher.—When one pitcher takes the place of another in the course of an inning, the new man is said to relieve the one who is leaving the game.

Rhubarb.—A heated argument resulting from an umpire's decision or rough tactics by a player and usually involving several players, managers and umpires.

Riding the bench.—A substitute player who has not played in his team's line-up for a long succession of games is riding the bench.

Rock.—A boner (see above).

Rookie.—A new player in the league.

Roundhouse.—X slow curve pitch.

Round-tripper.—A home run.

Rubber *arm.*—A pitcher who can pitch often and long without suffering any soreness of his arm or impairment of his pitching strength.

Run-down.—When a base runner is trapped between bases, and players of the fielding team toss the ball back and iorth in their efforts to tag him out beiore he reaches a base saiely, it is described as a run-down. They are running the base runner down.

Srattered hits.—Hits are said to be scattered when they occur in differentinnings of a game so that they are ineffective from the standpoint of scoring runs.

Scribe.—A baseball writer; also reporters and journalists in general.

Seventh-inning *stretch.*—A time-honoured baseball custom dating from the 19th century and in universal practice. As the home team prepares to go to bat in its 7th inning. the spectators stand up and remain standing until the first home batter steps into the batter's box. Fans rooting for the visiting team "stretch" at the start of the first half of the 7th inning. The idea is to bring luck to one's iavoured team.

Shagging flies.—Pregame practice in which a succession oi fungo flies are batted to the outfield for the outfielders to use in gauging the wind direction and speed prevalent produces a scene described as fly shagging. The activity of the outfielders (and also of pitchers and substitutes) is described as shagging flies.

Shake-off.—A pitcher seeing the catcher signaling for a fast ball may want to throw a curve, or vice versa. If so, he shakes his head. This is called giving the catcher the shake-off, or shaking him off.

Shave.—To pitch very closely—as close as a shave—to the batter, often forcing him to retreat from the front of the batter's box.

Shoestring catch—The capture of a fly by a fielder, usually an outfielder, at the level of his shoetop, often after a long run.

Shutout.—A game in which one team iails to score any runs. The opposing pitcher is said to have shut out the team and to have pitched a shutout.

Sidearm delivery.—A pitching style in which the pitcher's arm extends laterally from his shoulder in the act of pitching the ball toward home plate, his hand keeping at about the level of his shoulder through the thron-ing action.

Skipper.—The manager; also called the pilot.

Slide.—A base runner approaching a base on a close play on which it is necessary for him to beat the ball and at the same time retain contact with the base aiter reaching it uses a slide to achieve his double purpose. The runner usually flings his body in the direction of the bag. feet first, aiming to stab the bag with one foot and to keep that foot in contact with the bag until his forward impetus expends itself. Some prefer the head-first slide, in which the runner dives face down toward the bag, usually not directly at it, but passing it within reach of one arm, so that his fingers clutch some part of the bag. This not only affords a better grasp of the object but also gives him more chance of eluding the tag of the fielder. Conversely, in sliding head first the runner does not have the advantage oi his spikes, whose points iorm a hazard for a fielder guarding the bag when the play is close.

Slugger.—A batter who hits long drives.

Slump.—A losing streak (see below); a continued period of ineffectual batting or pitching.

Southpaw.—A left-handed pitcher.

Spray *hitter.*—A batsman who hits to all fields.

Streak.—A number oi successive victories, defeats, hits, etc.

Stuff.—A pitcher whose fast ball is effective against opposing batters is said to have a lot of stuff. Curves, knuckle balls, screwballs, etc., are classified together as slow stuff.

Switch-hitter.—A player able to bat either right- or left-handed.

Take charge guy.—A player who, by reason oi lending vocal support to his teammates or by stimulating others through his own excellent play, is a team leader.

Taking a *pitch.*—A batter is said to take a pitch when he makes no effort to swing or to bunt a ball pitched past him to the catcher.

Tally.—A run. (verb) To score a run.

Tee *off.*—Against a pitcher without much ability, or against a good pitcher when he has weakened, the batters are able to take full swings at the ball without waiting to gauge its speed or its degree of deviation irom the straight trajectory. This lusty swinging is called teeing off when it results in long drives.

Texas leaguer.—A weakly hit fly that drops safe for a hit within a zone too far beyond the infield for the nearest infielder to catch it before it falls to earth and too close to the infield for the nearest outfielder to reach it before it falls.

Thrower.—Term used to describe a pitcher who does not have too much of a repertoire.

Time.—When a player or manager requests the umpire to stop the game for discussion, substitution or equipment change.

Trapped ball.—\ fly or line drive caught by a fielder just after touching the ground for the first time and before rebounding more than an inch or two off the ground is said to be trapped by the fielder.

Triple-header.—Three games played by the same two teams in the same park on the same day, with admission charged only once; virtually unheard of in major league competition.

Triple *steal.*—When all three bases are occupied, and the man on third steals home, the other runners advancing to third and second bases respectively, without the ball having been hit by the hatter, it is called a triple steal, even though no play is made on two of the base runners in question.

Twin bill.—A double-header, two games for one admission.

Twinight twin bill or double-header.—A double-header in which the first game starts about 2½ hours beiore sunset, the second under artificial lighting. The twinight double-header may also be divided into two games for which separate admissions are required.

Twirler.—A pitcher.

Two o'clock hitter.—A player who hits long hard drives during batting practice but bats weakly in the ball game; in reference to earlier times when games started at 3 o'clock rather than the present 1:30.

Waivers.—When a club in organized baseball wishes to send a player to a club in another league, it must first obtain permission to do so from all the other clubs in its same classification. The other clubs are asked to waive claim to the player. If any club refuses to waive claim, the club owning the player's contract may either call off the deal and keep the player or it may make a deal with one of the clubs in its own league, transferring the player to such club. It may also, without making any special arrangement, hand over the player to the club refusing to waive claim, to the lowest ranking club among those refusing to waive claim, ii more than one club reiuses. There is a fixed price in each league that must be paid by the club obtaining a player by this waiver method. The player is said to be sent by club A to club B on waivers.

Walk.—(noun) A base on balls, (verb) A batter receiving a base on balls "walks"; also used transitively, as "the pitcher then walked the next two batters."

Waste pitch.—In a situation where the pitcher has two strikes and no balls on the batter, the pitcher may deliberately throw a "ball" hoping the hatter will misjudge it, swing, miss and thus strike out.

Whiff.—To swing and miss. In giving the number of strikeouts recorded by a pitcher in a game it may be said he "whiffed" so many.

Whitewashing.—A team that is held scoreless throughout a game is said to receive a whitewashing.

Wild pitch.—A pitched ball that strikes the ground before reaching the catcher or that is so high or so wide of its mark that the catcher cannot reach it. In scoring, it is necessary for a base runner to advance on such a pitch before it can be marked into the records. It is not a wild pitch, no matter how far the ball rolls, when there are no base runners on bases or when, with one or more runners on bases, none of them advances at least one base.

Wild throw.—A thrown ball that misses its mark so widely that the fielder cannot catch it in time to make the play.

Windup.—The preliminary swinging of the pitcher's arms as he prepares to make his pitch to the plate With base runners on one or more bases, the pitcher dispenses with his windup, starting his pitch from a stationary position by merely drawing back his arm and throwing the ball, pivoting on one foot. In the windup, he rocks back and forth once or twice, with the ball in his bare hand, rotates the pitching arm in the shoulder socket at least once. then brings both hands together above his head, before starting the actual pivoting and drawing back oi the pitching arm for the throw.

Yannigans.—The substitutes or scrub that form a team used to play the regulars of a team during spring training.

BASEDOW, JOHANN BERNHARD (1723–1790), pioneer reformer of the Prussian state educational system, was born in Hamburg on Sept. 11. 1723. In 1753 he was appointed professor of philosophy in a Danish academy, but his unorthodox religious views caused his dismissal. After a similar experience at Altona, he abandoned theology and, inspired by Rousseau's *Émile*, he turned to educational reform. In 1768 he published *An Address to Philanthropists and Men of Property on Schools and Studies and Their Influence Upon the Public Welfare*, and asked for subscriptions to enable him to produce a textbook and to organize a model school.

Basedorv rvas not an original thinker; his views, based on Comenius, Locke and Rousseau, were described in his *Book of Method for Fathers and Mothers of Families and of Nations* (1771). *The Elementary Work (Elementarwerk;* 1774), which sold widely, stressed the use of pictorial illustrations in teaching. His next venture, the establishment of a model school, the Philanthropinum, at Dessau, attracted many able teachers. However, they found difficulty in working with a man of such violent and unstable temperament, and in 1784 Basedow severed his connection with the Philanthropinum. He died at Magdeburg on July 25, 1790, the school surviving until 1793.

The enthusiasm on the continent of Europe for this type of institution may be likened to that which accompanied the Charity movement in England. Philanthropinums sprang up everywhere and drew the attention of Kant and Goethe. Some writers believe that Pestalozzi was indebted to Basedow.

BASEL (BASLE; Fr. BÂLE), a canton of northwestern Switzerland, is traversed by the Jura and watered by, among other rivers, the Birs and the Ergolz, both left-bank tributaries of the Rhine. From 1803 to 1814 the canton was one of the six "directorial" cantons of the confederation. Since 1833 it has been divided into two half-cantons with independent constitutions. *(See* SWITZERLAND.)

The half-canton of Basel-Stadt, or Bâle-Ville, includes Basel city and two villages north of the Rhine. It has an area of 37 sq.km. (14 sq.mi.) and a population (1960) of 225.588, mainly German-speaking and Protestant. The cantonal constitution dates from 1889.

The enactment of any law by parliament can be made subject to a referendum, which requires 1,000 signatures. To justify the handing in of an initiative with a view to the enactment of any law or revision of the cantonal constitution, 2,000 signatures are required.

The other half-canton is Basel-Land, or Bble Campagne, which is divided into four administrative districts and comprises 74 communes, its capital being Liestal. It has an area of 428 sq.km. (165 sq.mi.) and a population (1960) of 148,282, nearly all German-speaking. The cantonal constitution dates from 1892. The obligatory referendum applies to all laws, and a demand from 1,500 citizens is sufficient to initiate laws or a revision of the cantonal constitution.

Each canton division sends one member to the state council. Together they contribute 12 representatives (on the basis of the 1950 census) to the national council. These, with the executive, are all elected by a direct popular vote for the term of four years. For industries and bibliography, *see* BASEL (town).

BASEL (BASLE; Fr. BÂLE), the capital of the Swiss half-canton of Basel-Stadt (with which it is virtually coextensive), lies on the Rhine where the French, German and Swiss frontiers converge. Situated between the French Vosges to the northwest, the German Black Forest to the north-northeast and the Swiss Jura mountains to the south, Basel stands at the entrance to the Swiss Rhineland. Pop. (1960) 206,746.

The Rhine, bending northward, divides the town into two parts. Klein-Basel, lying to the north, is the Rhine port and industrial section where are the buildings of the Swiss Industrial fair and the German railway station, while Gross-Basel, south of the river, is the commercial and cultural centre. The two sectors are linked by six bridges, the most recent of which, the St. Alban-Brucke, was completed in 1955. Dominating the town from a terrace high above the south bank of the Rhine is the Munster, built of red sandstone with a roof brightly tiled in patterns of green and yellow. Consecrated in 1019, it was a cathedral until 1528 and is now an abbey church. There are several statues and bas-reliefs on the west front. The building is a mixture of Romanesque and Gothic styles. The most interesting features of the interior are the pulpit (1486), elaborately carved from a single block of stone, and a monumental slab, on one of the pillars, to Erasmus, who is buried there. Beside the church is the Pfalz, a terrace giving a view northward and northeastward into Germany, the Black Forest mountains being conspicuous.

BY COURTESY OF THE SWISS NATIONAL TOURIST OFFICE

THE MARKET PLACE AT BASEL, SWITZ.. ON THE NORTH SIDE OF THE RHINE RIVER. THE RATHAUS, OR COUNCIL HOUSE. ON THE LEFT WAS BUILT IN THE 16TH CENTURY AND RESTORED IN THE EARLY 20TH CENTURY

Nearby is the public art gallery (Kunstmuseum, 1936) which has fine collections of works by Conrad Witz, Hans Holbein the Younger and Arnold Bocklin, along with a superb collection of 20th-century art. Close by are the old buildings of the university, now housing the zoological faculty. The church of St. Martin, a short distance farther on, is the oldest religious foundation in Basel. The Historical museum occupies the former 14th-century Franciscan church in Barfusser Platz; it also contains a collection of historical art. To the north on the market square is the late Gothic Rathaus (1504–14, one modern wing), with a red-painted façade and decorated with shields of the 18th-century cantons. Several former guild houses are on the Freie Strasse, Basel's main thoroughfare, running southeast from the Markt Platz. Just south of the Historical museum is the art gallery (Kunsthalle) for temporary art exhibitions. The St. Jakob monument is at the end of St. Jakobs Strasse; it commemorates the battle of St. Jakob in 1444, when 1,500 Swiss. of whom only 6 survived, opposed a French army of 30,000 under the dauphin: later Louis XI. Three of the medieval gates remain, the St. Alban gate, to the east of the city (north of the St. Jakob monument), the St. Johann's gate to the west, and the 14th-century Spalen (St. Paul's) gate, one of the finest medieval city gates in Europe. Close by the Spalen gate are the new university buildings in Peters Platz, completed in 1939. Northward is the new civic hospital, completed 1946, near the Dominican church which is now used by the Old Catholics. The Botanical gardens, also on Peters Platz, adjoin the university library, which has over 1,000,000 volumes and contains manuscripts of Martin Luther, Erasmus. Zwingli and Melanchthon, and of the acts of the great ecumenical council of 1431–49 (see BASEL, COUNCIL OF).

Basel is an important communications centre. It is one of the nodal points of the railways of Europe and through trains to most European countries can be seen in its station, from Oslo and Stockholm in the north, Rome and the Spanish frontier in the south, and Amsterdam and the Channel ports in the northwest to Istanbul and Athens in the southeast. It is an equally important river port, and great river barges trade with other ports on the Rhine or take goods for export overseas from Rotterdam. Regular air services operate from the international airport at Blotzheim, 8 mi. N.W. of the city, in French territory.

While Basel is a distributing centre for foreign trade it is also a major industrial city. Its chemical industries, which are the most important in Switzerland, manufacture dyestuffs, perfumes. drugs and other products. The Swiss Industries fair, first held in Basel in 1917 and now an annual event taking place in April, established the city's status as cne of the chief financial and commercial centres in Switzerland and one of the first in Europe.

Originally a Celtic settlement of the Rauraci, the name Basilia first seems to have been applied to a Roman fortification mentioned by the emperor Valentinian I in A.D. 374. At the beginning of the 5th century the bishop of Augusta Rauracorum moved his see there, and under the secular power of succeeding bishops the prestige of the town steadily increased. In 1460 the University of Basel, the first in Switzerland, was founded by Pius II, who had been in Basel for the ecumenical council. Trade increased, having been stimulated by the presence of the council, and the wealthy burghers and the town guilds gradually supplanted the secular influence of the church. In 1501 Basel was admitted into the Swiss confederation. With the presence of Erasmus at the university, the town became one of the chief centres of the Reformation movement in Switzerland, the bishop retiring in 1528 to Porrentruy. A new bishopric was finally established at Solothurn (Fr. Soleure) in 1828. The Counter-Reformation brought skilled workmen as refugees from other parts of Europe, and by the 18th century political power was in the hands of the trade guilds which tended to favour the city at the expense of the rural districts. In 1831 the rural part of the canton revolted, proclaimed its independence the following year, and in 1833 was organized into the half-canton of Basel-Land, the city forming that of Basel-Stadt. For the area, population and government of the two divisions see BASEL (canton).

BIBLIOGRAPHY.—*Urkundbuch der Stadt Basel,* 11 vol. (1890–1910); P. O. BASEL, CONFESSION OF, which gives in 12 articles a moderate statement of Reform doctrine, was drafted in 1531 by Oecolampadius, compiled in fuller form by Oswald Myconius, and adopted by the Basel city authorities in 1534 and shortly afterward by the city of Muhlhausen in Alsace. It must be distinguished from the First Helvetic Confession, which is sometimes called the Second Confession of Basel *(see* HELVETIC CONFESSIONS). It held its place in the Church of Basel till 1872, when its use was discontinued.

For text, *see* H. A. Niemeyer. *Collectio Confessionum in ecclesiis reformatis publicatarum,* pp. 78–122 (1840). *See* also Schaff, *Creeds of the Evangelical Protestant Churches,* 5th ed. (1887).

BASEL, COUNCIL OF, a council of the church, was called by Pope Martin V a few weeks before his death in 1431 to fulfill a pledge made at the Council of Constance. It met at a time when the church was profoundly shaken by the intellectual and social crisis that characterized the transition from the medieval to the modern world, and when the prestige of the papacy had been weakened by the Great Schism (1378–1417), the need for reform and the persistent attempts to make the general councils of the church superior to the pope. Two major problems occupied the council: the Hussite heresy and wars: and the question of papal supremacy. *(See* also CONSTANCE, COUNCIL OF.)

Ever since the Council of Constance had condemned John Huss for heresy, Bohemia had been torn by demands for "reform"—a movement that became identified with Czech nationalism. Before the council met! Martin V had sent Giuliano Cardinal Cesarini to preach and organize a crusade in Germany against the Czech Hussites. The crusaders, however, were decisively beaten at Domazlice (Taus), Xug. 14, 1431; and Cesarini, who had been named to preside over the council, sought to achieve peace through it.

The council was determined to control negotiations with the Hussites and to ignore papal wishes. Three hundred Hussites came to Basel in Jan. 1433 to plead their cause, and, on failing to win over the council, returned to Prague with legates of the council for further discussion. There: in Nov. 1433, the Compactata of Prague were agreed to, whereby peace was to be restored and ecclesiastical censures against the Hussites removed. The Hussites were authorized to administer the chalice to the laity in Holy Communion, on the condition that they accept the faith and discipline of the church. It was further agreed that the clergy could retain as their own property what they received as gifts or inheritance but would be only administrators of church property. But the peace was soon broken, and years of civil war in Bohemia followed. *(See* also HUSSITES.)

News of the breach of the peace reached Basel just as the council learned that Pope Eugenius IV (1431–47), the successor of Martin V, ordered the council to transfer itself to Ferrara, Italy. This was the turning point in the long conflict between the council and the pope as to the ultimate authority in the church. Already in Dec. 1431 Eugenius IV had issued a bull dissolving it. The council in reply re-enacted on Feb. 15, 1432, the decree of Constance, declaring that it was the pope's duty to obey a general council and the council's to punish him if disobedient. No council could be dissolved or transferred without its own consent. The men at Basel insisted that Eugenius withdraw the decree of dissolution and threatened him until he finally yielded. On Feb. 5, 1434, a bull was read to the council in which Eugenius said that the decree of dissolution was null: that all his censures against the council were annulled and that it should continue its work and reform the papacy. Encouraged by the surrender, the council declared that it received its power directly from God and that the pope was bound to obey it. It arrogated to itself the judicial, administrative and executive functions of the pope and then cut off papal revenue. But all this vindictive legislation was voted by a council at which only 20 bishops and 13 abbots of the whole church were in attendance.

The conflict between the pope and council eventually was over-

come when the problem of reunion with the Greek Church became a possibility. The Greeks preferred to deal with the pope rather than the council. Aware of the declining prestige of the council, due to its excesses, and of the preference of the Greeks to meet in Italy, the pope in Sept. 1437 ordered the council to transfer its sessions to Ferrara, and in Jan. 1439, because of a plague at Ferrara, to Florence, where the union with the Greeks was proclaimed on July 6. 1439. Many of the bishops at Basel accepted and moved to Ferrara, but the die-hards remained at Basel as a rump council. (See FERRARA-FLORENCE, COUNCIL OF.)

When this rump suspended Eugenius he excommunicated its members (Feb. 15, 1438). The council in a session with only seven bishops present declared Eugenius deposed and elected in 1439 as his successor a layman, the duke of Savoy. Amadeus VII, who took the name Felix V. The next ten years of this rump council are important only because the princes used it to strengthen their control over the churches in their own territories. Thus Charles VII of France, against the will of the pope, accepted in the Pragmatic Sanction of Bourges (1438) the reform decrees of a council the pope had recently excommunicated. The king had regulated church affairs in France without papal authorization. In Germany likewise the princes used the decision of Basel to gain control of church property and ecclesiastical principalities, although to get them they had to recognize papal supremacy over a council.

On the death of Eugenius IV in 1447 his successor, the great humanist pope Nicholas V, gently but firmly brought about the abdication of Felix V and an end to the rump Council of Basel in April 1449.

See Philip Hughes, *A History of the Church,* vol. iii (1947); Ludwig von Pastor, *History of the Popes From the Close of the Middle Ages,* vol. 1, 2nd ed. (1899). (J. A. CT.)

BASHAN, a country often cited in the Old Testament and important also in the Roman empire, lying mainly in the Der'a mohafazet in the south of modern Syria. Approximately it extended westward to the edge of the plateau of Hauran; southward to the Yarmuk river or perhaps a few miles farther to the mountains of Gilead; eastward to the black volcanic Jebel Druze or sometimes perhaps into those mountains; and northward to Mt. Hermon on the Lebanon border. Bashan was the northernmost of the three ancient divisions of eastern Palestine (Moab, Gilead, Bashan). It is a tableland, between 1,600 and 2,300 ft. in height, well watered and very fertile. In the Old Testament Bashan was proverbial for the richness of its pasture. and in the writings of the prophets it also is coupled frequently with thickly forested areas such as Lebanon and Carmel, the cedars of Lebanon and the oaks of Bashan being mentioned together (Isa. ii, 13; Ezek. xxvii, 5–6). In New Testament times, when it comprised the districts of Gaulanitis and Batanaea, Bashan was one of the great granaries of the Roman empire.

The chief towns of Bashan to which reference is made in the Old Testament are as follows. Ashtaroth, one of the two capital cities of King Og (Deut. i, 4), usually identified with Tell Ashtarah. 21 mi. E. of Lake Tiberias (the Sea of Galilee): Edrei, Og's other capital (Deut. i, 4), identified with Der'a, about 27 mi. E. of Gadara and about 22 mi. N.W. of Bozrah; Golan (Deut. iv, 43). one of the cities of refuge, north of the Yarmuk, perhaps at Sahem Al Jaulan, about 17 mi. E. of the Sea of Galilee: and Salchah (Salecah. Deut. iii, 10), near Edrei, perhaps at Salkhad, 35 mi. E. of Edrei. Bozrah (*q.v.;* named Bostra by the Romans) was an important Nabataean and Roman city. Bashan contained the district of Argob (Deut. iii, 4 ff.), where Israel took 60 fortified cities besides many unwalled villages, from Og

In Numbers xxi, 33 ff. it is related that the Israelites defeated Og at his frontier city Edrei and took his land. The territory of Bashan was assigned to the half-tribe Manasseh (Deut. iii, 13). It was one of Solomon's administrative districts (I Kings iv, 13). and was smitten by Hazael (II Kings x, 32–33). In the 2nd century B.C. Judas Maccabee, in a victorious campaign against the armies of the Seleucid generals and their native allies, penetrated to Bozrah. From 84 to 81 B.C. Bashan was under the rule of Alexander Jannaeus of Judaea, but the land to the east belonged to the Nabataeans (*q.v.*). The Roman conquest of the area began when Pompeius and his legions drove the Nabataeans southward (64 B.C.), and Bozrah and Salchah became the northernmost Nabataean towns. Herod the Great, who had conducted war in this region (32 B.C.), was made its ruler by Augustus. By means of fortresses and a garrison of 3,000 legionaries he maintained a precarious peace and by proclaiming freedom from taxation attracted an ample population. Herod's son Philip succeeded to a tetrarchy comprising Gaulanitis, Batanaea, Trachonitis and Auronitis (4 B.C.), which later passed to Herod Agrippa I (A.D. 37–44). In A.D. 106 Trajan brought the whole Nabataean kingdom under the empire in creating the province of Arabia with Bostra (Bozrah) as capital (see ARABIA. ROMAN PROVINCE OF). Bozrah eventually became the ecclesiastical capital of the Hauran (cathedral built in 512) and as a trading centre was second only to Damascus. By 635 Damascus had fallen to the Muslims and thereafter Bashan's prosperity declined. The crusaders made two expeditions to Bozrah, in 1113 and 1119. For later history see SYRIA; DRUZE.

See D. Baly, *The Geography of the Bible* (1957). (E. D. GR.)

BASHI-BAZOUK, the conventional English spelling of the Turkish baski-bozuq, a word meaning "whose head is turned, broken, spoiled" and, by extension, "leaderless, unattached." Originally describing the homeless beggars who reached Istanbul from the provinces of the Ottoman empire, it was later applied to all Muslim subjects not members of the armed forces and so came to mean "civilian." Finally it was applied to units of irregular volunteers (both infantry and cavalry) attached to the army but under independent officers and providing their own weapons and horses. These forces became notorious for indiscipline, plunder and brutality. They appeared at the end of the 18th century and fought in Egypt against Napoleon. During the Crimean War the allied generals made fruitless attempts to discipline them. Their excesses during the Russo-Turkish War of 1877–78 at last forced the Ottoman government to abandon their use. (A. D. A.)

BASHKIR, a Turkic people settled in the eastern part of European U.S.S.R., between the Volga and the Urals, and beyond the Urals. The Bashkir numbered over 840,000 in 1939 and had increased to 983,000 in 1959. Their territory forms the Bashkir Autonomous Soviet Socialist Republic of the Soviet Union. They are classified in the northwest or Kypchak branch of the Turkic language family, together with the Tatars of the Volga, Kazakhs, and others.

Bashkirs are mentioned in Arabic sources of the 10th century and after. They were originally nomadic pastoralists, together with their Turkic congeners. Their stock consisted of horses, sheep and, to a lesser extent, cattle and goats. The horses are small but powerful; the mare's milk is made into kumys, a fermented drink. Sheep are raised for wool, skins and meat, and are not milked; cattle are milked. At one time the Bashkirs bred camels. During the 19th century, through pressure of Russian colonists and colonial policy, the Bashkirs settled, gave up nomadizing and developed a primary dependence on agriculture for support. This is the case today; pastoralism plays a subordinate role in their economy.

In settling down they established themselves in fixed villages with houses of earth, sun-dried brick or logs. They were formerly divided into patrilineal clans and tribes. These groups bore names that are remembered today, but have lost most of their social significance: formerly the Bashkirs were organized, reckoned kinship. ran their affairs, sought help and regulated disputes within these clan and tribal structures. They do so no longer. The village and collective farm are the key social structures today. The religions of the Bashkir are Islam and the Eastern Orthodox rite.

See S I Rudenko, *Bashkiry* (1955). (L. K)

BASHKIR AUTONOMOUS SOVIET SOCIALIST REPUBLIC (BASHKIRSKAYA AVTONOMNAYA SOVETSKAYA SOTSIALISTICHESKAYA RESPUBLIKA; also BASHKIRIA), an autonomous republic of the Russian Soviet Federated Socialist Republic, U.S.S R.. lies in the southern Urals and Urals foreland, covering an area of 55,444 sq.mi.

Physical Geography.— In the eastern part of the republic are the parallel ranges of the Urals, the major range being the Cral-tau. These ranges in general decrease in height southward. The highest peaks are Mt. Yaman-tau (5,374 ft.) and Mt. Iremel (5.203 ft.). The Belaya river (*q.v.*) flows south-southwest for 882 mi. between these ranges in a narrow, steep-sided valley, and then swings west before taking a sharp bend to the north, to flow through a broad, terraced valley that separates the mountainous east irom the rolling hills of the Belebei upland in the vest. In the north, bet een the Belaya and the Urals and drained by the Ufa, the chief tributary of the Belaya, is the ancient Ufa plateau. The mountains are heavily forested, largely with conifers and birch, while the foreland areas are open steppe, interspersed with "islands" of mainly deciduous forest, with birch, aspen, linden, oak and maple. In the valleys of the foreland are wide flood-plain meadows. Soils range from the thin mountain soils and the gray forest soils of the Ufa plateau to the *chernozem* ("black earth") of the Belebei upland and the clays of the flood plains. The climate is severely continental, much affected by the cold Siberian air masses. In late spring and summer the southern parts of the republic suffer from the scorching *sukhovey* winds from east and south, which bring droughts. Rainfall varies from 12 to 15 in. in steppe areas to 25 in. in the mountains.

Minerals.—The region is rich in minerals. The largest oil deposits of the Urals, part of the Second Baku (*q.v.*), occur around Kaltasy, Tuymazy. Shkapovo and Belebei in the west and Ishimbai on the middle Belaya. Natural gas is obtained in these areas. Iron ore is mined at Zugazin in the mountains, manganese near Beloretsk and Tavtimanovo, copper at Buribai and Sivai in the southeast, bauxite at Pervomayski in the northeast, gold in the southeast around Buribai and Baymak (Baimak), lignite around Yermolayevo and Mayachnoye in the south and salt near Sterlitamak on the Belaya.

History.— The Bashkirs are a Turkic people, former steppe nomads who settled there under the khanate of the Golden Horde. The area passed to Russia after the overthrow of the Kazan khanate by Ivan the Terrible in 1552. In 1574 the Russians founded Ufa and thereafter began colonization of the area, dispossessing the Bashkirs. This led to many uprisings of the Bashkirs, which were severely repressed. In the second half of the 18th century copper and iron working began, the first copper-smelting works being set up in 1745 and the first iron works 14 years later. Fuel demands began to make heavy inroads into the forests. In 1919 the Bashkir Autonomous Republic was set up, among the first such republics in the Soviet Union. Only after the Revolution did the Bashkirs acquire a written language. (*See* also BASHKIR.)

Population.— The population in 1959 was 3,335.000, the majority of whom were Russians. In 1959 there were 948,000 Bashkirs in the whole R.S.F.S.R., mostly, one may suppose, living in the Bashkir republic. Thirty eight per cent (1,279.000) of the population were urban. The most important of Bashkiria's 14 towns are Cia (*q.v.*), the capital and cultural centre (546,000), Sterlitamak (111,000), Oktyabrski (65,000), Salavat (60,000) and Beloretsk (59,000). There are also 29 settlements of town type.

Economy.— Agriculture is most important in the Belaya valley and the foreland area. Nearly two-thirds of the sown area is under spring wheat. In the mountains and the north, rye and oats predominate. hlaize (corn), flax, sugar beet, potatoes and sunflowers are also grown. Market gardening is well developed around Ufa and Sterlitamak. Stock rearing is important, especially in the Crals. There are more than 1.000.000 head of cattle and nearly 2,500.000 sheep and goats. Bashkiria is famous for its breed of horses. Beekeeping, a traditional Bashkir occupation, is nidespread.

Among industries the first place is taken by the production. refining and processing of petroleum. A network of pipelines links the oil fields of the republic and of the neighbouring Tatar X.S.S.R. with the refineries of Ufa, Ishimbai and Salavat. After 1955 Bashkiria produced more oil than Baku. The main iron and steel centres are Beloretsk, specializing in steel cables and wire, and Tirlyanski for sheet steel. Engineering products of the republic include machine tools and equipment for the oil industry and mining, motor engines. electric cables and lamps, telephones and typewriters. The chemical industry is fast expanding. using oil and gas by-products and local salt. In the mountains the timber industry is important. the logs being rafted down to sawmills at Ufa. Sterlitamak and elsewhere on the Belaya. Much veneer is produced; Ufa makes furniture and matches and Krasny Klyuch, paper. Most of the power of Bashkiria is from electric plants using coal and oil; large power stations are located in Ufa, Sterlitamak and Ishimbai. As yet the considerable hydroelectric potential of the Ural area is little developed, but in the 1960s a hydroelectric station was constructed at Pavlovka on the Ufa. The main artery of communication is the Kuibyshev-Chelyabinsk railway through Ufa, one of the major trans-Ural routes. From Ufa a branch line follows the Belaya valley through Sterlitamak as far as Tyulgan. Motor roads link Ufa with Kazan and Orenburg and another connects Sterlitamak to Beloretsk and Magnitogorsk.

(R. A. F.)

BASHKIRTSEFF, MARIE (full name MARIYA KONSTANTINOVNA BASHKIRTSEVA) (1860–1884), Russian painter and author of a remarkable autobiographical journal kept in French irom the age of 12 until 11 days before her death, was born of noble parentage, Nov. 23 (new style; 11, old style), 1860, near Poltava (Ukraine). She spent most of her life in Paris, where her mother settled in 1870 after parting from her husband. Precocious. gifted and soundly educated in the classics, modern languages and the arts: she became a cultivated society woman. Forced to abandon training as a singer because tuberculosis affected her voice. and driven by vanity and ambition to become famous: she developed as an artist of marked talent. Her naturalist paintings of everyday subjects—*e.g.*, "Le hleeting" in oils and a portrait in pastel, both now in the Musée du Luxembourg, Paris—promised a successful career. However, she died in Paris, Oct. 31, 1884. Determined that her name should survive, she had written a preiace to her *Journal*—an autobiography of sensitive immaturity written with sincerity and unusual candour—anticipating its posthumous publication (2 vol., 1887; Eng. trans. 1890). Its novelty, perception and subtle self-analysis caused a sensation. Translated into several languages, it has a place in the history of autobiography.

BASHŌ: see MATSUO BASHŌ.

BASIC ENGLISH. The need for a simple form of English to be used as a second or international language, or as a first step to wider English, has long been clear. But it was not till Winston Churchill (The Second *World* War, vol. v, 1952, pp. 571, 587–588), with the support of Franklin D. Roosevelt (The Roosevelt Letters, vol. iii, 1952, pp. 500–501), put forward the argument for Basic English in Sept. 1943, that the general public became interested in its future.

Basic was designed between 1926 and 1930 to give the learner an equal chance of exchanging ideas with learners in other countries. But it may have a further value which is frequently overlooked—as an instrument of thought and an apparatus for recording the latest discoveries of science. The question commonly put at this point by those who have never seen so limited a word list in operation is: And how would *that* be said in Basic? The answer may come as a surprise: for what they have been reading so far is normal Basic prose. But as a complete account of the system is given, in Basic, in The ABC of Basic English, this article may now be continued in the full vocabulary of standard English.

The 850 words that this B(ritish) A(merican) S(cientific) I(nternationalj C(ommercial) auxiliary medium comprises were selected to cover the requirements of everyday communication. with the minimum of grammatical and structural addenda: the system is so constructed that these words work as a team with

the minimum of overlapping and irregularity; and the minor restrictions imposed on those familiar with the usages of wider English demand the minimum adjustment consistent with intelligibility to a learner who has been willing to spend 30–50 hours on a systematically graded course such as that provided by *Basic Step by Step*. The background from which these minima emerged must be briefly indicated, if the difficulties attaching to any form of systematic simplification are to be understood.

Background. — Though a dictionary of the English language may contain in a single volume as many as 100,000 entries, or may run to upward of 500,000 (according to its philological or historical standards and the range of scientific nomenclatures included), there are not more than 60,000 "words" with which anyone but a specialist is likely to be concerned. But of these 60,000 at least 20,000 are of frequent occurrence in school textbooks or in 'reading matter regarded as suitable for the young; n-hich implies that an acceptance of the 14,652 to be found in the works of Shakespeare alone would add considerably to such an educational ration.

The vocabulary barrier that separates the man of letters from the man of science or helps to isolate the literate thousands from the near-illiterate millions is constantly increasing; and the foreigner who elects to use English as his second language may waste several years on a smattering of phrases and idioms which would hardly qualify him to act as a commissionaire. Moreover, this arbitrary fraction of the language of his choice may deviate widely from that acquired by learners in other parts of the world, whereas what Churchill envisaged as "an aid to the building up of our new structure for preserving peace" was a truly basic nucleus, "a medium, albeit primitive, of intercourse and understanding" with a universal appeal for those who realize that "the Empires of the future are the empires of the mind."

One way of constructing a universal language is to make an inventory of the sorts of entities or referents for which a notation is required and then to devise suitable symbols or mords defined to cover the charted field. This was the method adopted by Wilkins in his pioneer work on a *Universal Character* (1668), and a similar analysis, though in terms of "ideas," was projected by Leibniz as a *characteristica universalis*. Alternatively, existing languages may be used as a start and their vocables or the meanings attributed to them may be matched, taking the fundamental, "parts of speech" from the grammars based on a formal analysis of vocabularies and structure. Unfortunately, the grammars in question have been based largely on one another, and ultimately on those derived from early attempts to summarize the peculiarities of Latin—in the ages when the truth was supposed to be discoverable by a verbal approach. "Here is the first distemper of learning," wrote Francis Bacon, "when men study mords not matter"; but insofar as any existing language has proved itself effective for both international and scientific communication, it is likely to contain the elements necessary for an auxiliary medium if the right selection can be achieved.

Basic was therefore the result of combining both methods of approach. At the practical level of pointing and gesture, there are three chief kinds of referents for which names are required: objects, acts and directions. These are represented by the nouns, verbs and prepositions, and to them may be added qualities, without deciding where the various sorts of adjectives that name the qualities should be regarded as pointing, when sensations and feelings have been distinguished from their causes or correlates in the external world. The orthodox grammatical account of the elements was content to list these four "parts of speech" almost on an equality with four others: pronouns, conjunctions, adverbs and interjections; though for several centuries confusion was caused by a miscellaneous tribe of "particles," a sort of residuary star dust collected from the verbal firmament; which was not finally dissipated till Horne Tooke explained (1786–98) the nature of abbreviation (on a dubious etymological ideology) and prepared the way for Jeremy Bentham's analysis of fictions (1813–21).

Thus it was possible in the Basic selection to distinguish four types of words that name concrete referents, each with its fictional analogues, and four types of abbreviation, which, with a minimum of rules for derivatives and syntactic order, complete the system. Of the 850 mords in the Basic vocabulary, 600 are names of things or events (nouns), 150 are names of qualities or properties (adjectives) and the remaining 100 put the system into operation.

Structure of the System. — The principles of Word Economy relevant to any language with a fully developed verb system are outlined in *Basic English and Grammatical Reform*, where the distinction between the small group of words that name the primary operations and the much larger group that cover both an operation and a direction is illustrated by examples of its application in Basic. By retaining only 15 of the primary group, together with *be* and the auxiliaries *may* and *will*, about 4,000 common English verbs can be eliminated. These 15 verb forms and the pronouns follow the paradigms by which "correct" English has so far been prevented from regularizing itself as pidgin; and almost the only other grammatical rules are those for the five sets of affixes (for plurals, comparison, the formation of adjectives and nouns by means of the *-er, -ing* and *-ed* suffixes, the adjectival prefix *un-*, and the adverbial suffix *-ly*), which follow the normal English procedure. Secondary senses, compounds and the 250 Basic idioms listed in The *Basic Words* are related to root uses in The ABC and *The Basic Teacher*. Word order, where it does not correspond with that of gesture language, is specified and illustrated by model routines.

The numerals, the calendar, currencies and the various units of measurement are treated, like proper and geographical names or similarly capitalized titles, as part of the Basic system, though not listed as full learning items. In addition there are about 50 common words, at the level of *radio, hotel* or *club*, which are now universally understood, and the list is likely to grow very rapidly as tribal and geographical barriers are eliminated and the world of telecommunications and aeronautics continues to contract. This contraction and the diffusion of English during the past four centuries have led to the international acceptance of a wide range of general and technical terms which Basic can be used to operate. So an occasional explanation or footnote serves to make clear such other words as may be introduced for any special purpose or subject matter. But in scientific and technical fields, Basic becomes an instrument for bringing into action the international, terminologies and nomenclatures of science. A short defining glossary may sometimes suffice to link the specialist with his Basic interpreter, but with 100 words for science in general and 50 for any of its main branches (a total vocabulary of 1,000), the standard of exposition and abstract in *Basic* for *Science* and its companion volumes can readily be achieved.

Methods **of** Teaching. — The units of any language are collected for convenience of reference in a dictionary. These units are words, which may be (1) the names of things, or referents of any sort, about which information is conveyed to a reader; and (2) any other separable parts of the sentences by which that information is conveyed. The letters that make up the words in a dictionary are marks on paper, and the words, or groups of such marks, serve as signs for the reader who interprets them. So language is not essentially speech, whatever the origin of words may have been; and those who define it primarily in terms of speech for particular purposes will find that the "breath groups" and "phonemes" elicited by their analysis constitute a very unsatisfactory basis for further linguistic education. The spoken form of language is still of great importance insofar as writing, typewriting and printing have not taken the place of talking. But the sounds made for conversational purposes are not essential to the interpretation of the written or printed characters by which thought and feeling are recorded, information is conveyed and knowledge is increased.

If freedom from nord magic, from the power of language to mislead and distract, is ever to be won, an understanding of how words work is necessary. Such an understanding will enable clearer thinking, more intelligent writing and less mechanical talking and reading. Fluency with current phrases and idioms has too long been a classroom ideal. and one of the merits claimed for Basic is that it can be used to awaken what may be called the

"linguistic conscience" and to remove difficulties that the old grammars and logics failed to illumine.

A reform of the technique of language learning appropriate to systematically graded material does not, however, imply the acceptance of a lower standard of training for speech than that attained by so-called modern methods. At the level where mass illiteracy can be alleviated by community singing or filmstrips, the memorizing of a few hundred Basic words and phrases may help merely to extend the field for verbal and emotive propaganda. But if more than this is desired, the drill and practice required for conversational fluency can best be provided at a stage when confidence has been established by the gradual substitution of words for the signs by which travelers have succeeded in dealing with concrete situations throughout the ages. For a restricted vocabulary in which more than 60% (514) of the 850 words are monosyllables, irregularities of pronunciation are correspondingly limited, and the rules given in *Word-Stress and Sentence-Stress* are a Basic contribution to phonetics by which a proper attention to the sounds of the dictionary items can be effectively supplemented. In this as in other respects, teachers who add to, or subtract from, the system by arbitrary deviations deprive the learner of much of its practical and educational value.

History **and** Progress. — It is with this educational aspect of language that those responsible for the origination and development of the Basic movement have been chiefly concerned. So long ago as 1892, Karl Pearson, in *The Grammar of Science,* had envisaged a fundamental "study of the right use of language, the clear definition and, if needful, invention of terms—*Orthology.*" The Orthological institute (founded by C. K. Ogden [*q.v.*]), a research organization to focus attention on just such a study of the uncharted borderlands of linguistics and psychology, came formally into being in 1927; and Basic (1930) was the most encouraging outcome of its initial undertaking. Orthology, thus generalized to cover the entire "normative science of symbols," has little in common with any of the subsequent interpretations of what the French linguist Michel Bréal (1897) called "Sēmantics"; its historical relations being rather with the less publicized "Semeiotic" of C. S. Peirce and the "Significs" of Lady V. Welby (projected in the 11th edition of the *Encyclopedia Britannica*). The advantages of a new diagrammatic technique, elaborated for lexicological purposes as "panoptic conjugation," made it unnecessary to rely on the cruder frequency methods still in favour with certain compilers of textbooks.

Less than ten years later, the institute had representatives in more than 30 countries and over 100 books in, or about, Basic had appeared under its auspices. The outbreak of World War II crippled the organization. that had been built up, and during the entire period of paper rationing only a very small number of the prewar publications could be kept in print. It was therefore impossible without further facilities to meet the demand created by the support of Winston Churchill in 1943; and these facilities mere not yet provided. In April 1947, however, the Basic English foundation was established as a Charity trust under English law with a small maintenance grant from the British government, and a program which included the training of teachers and the preparation of further Basic publications was undertaken for the trustees by members of the institute's staff.

The foundations of a practical world language have been laid, but much work still remains to be done. The original objective for Basic will not have been attained until a complete range of picture material has rendered the teaching method independent of verbal exposition in other languages. The verbal exposition itself may be regarded as fragmentary until a standard radio course and text can be offered from any station in at least 30 of the world's most familiar tongues. As a supplement to such courses and an incentive to the reader to treat his second language as more than a temporary expedient, two Basic libraries, general and scientific, each of 1,000 volumes with the original and the Basic parallel, could be produced and kept up to date. Though several million Basic books have been acquired by learners in all parts of the world such projects will require substantial endowment if the progress of "debabelization" is to be accelerated.

See also PIDGIN; UNIVERSAL LANGUAGE.

BIBLIOGRAPHY.—C. K. Ogden, *Basic English,* 9th ed. (1944), includes "A Short Guide to Basic English" written in Basic; *The Basic Words, The ABC of Basic English* and *Basic Step by Step* further explain the system; *Basic English and Grammatical Reform* covers the research background (detailed in *Psyche,* vol. viii–xiii) while *Basic English versus the Artificial Languages* replies to the animadversions of Esperantists and others; *The General Basic English Dictionary* gives the Basic definitions of 20,000 common English words and a further 20,000 of their uses. *The Basic Teacher* by *L. W.* Lockhart is a complete graded course for translation into the main European languages; and "The Basic Way" is similarly graded for class use in India, Africa and the middle east. *Basic for Science* is supplemented by *Basic for Economics, Basic for Geology, A Basic Astronomy, The Growth of Science* and other Basic presentations of scientific material. *See* also *Basic Science Dictionary* (1962). The complete *Bible in Basic English* was published in 1949. The Basic list also includes, along with *A General History* and school editions of works by Plato, Shakespeare, Shaw and Marryat, versions of *Treasure Island, Pride and prejudice* and *The Time Machine.* (*C. K. O.*)

BASIL, SAINT, THE GREAT (*c.* 330–379), one of the great Cappadocian Fathers (with Gregory of Nyssa and Gregory of Nazianzus; *qq.v.*), famous for his organization of Greek monasticism. Born at Caesarea Mazaca in Cappadocia (modern Kayseri, Turk.), he came from a family which included the saintly Macrina, his sister, and his brothers Gregory of Nyssa and Peter, bishop of Sebaste. Educated at Athens with Gregory of Nazianzus, he became a rhetoric teacher like his father Basil; but he was soon converted to a monastic way of life through the influence of Macrina. She had organized a monastic community on the family property at Annesi in Cappadocia; and Basil, after visiting the various anchoretic groups in Egypt and Syria about the year 357, founded another settlement near his sister's, for which apparently he composed his *Longer* and *Shorter Rules.* Ordained priest about 364 by Eusebius, he succeeded him as bishop of Caesarea in 370, and thereafter his primary efforts were engaged in ecclesiastical business and in the suppression of heresy. Tenaciously upholding the doctrine of Nicaea, he opposed the Arianism of Valens, attacked Sabellianism and wrote against Eunomius and Apollinaris of Laodicea. His appointment of his younger brother Gregory as bishop of Nyssa was for a time an occasion for regret; and it was not until after Basil's death that Gregory's true worth as an ecclesiastical ruler and mystical theologian could fully emerge.

Basil has been called a Roman among the Greeks because of his penchant for organization and conservatism in contrast with the speculative tendencies of the Eastern Church. His strict orthodoxy in Trinitarian theology was matched by his moderation and common sense in the direction of the consecrated men and women under his care. With these he constantly opposed all ascetical excesses, urging the importance of works of charity and obedience to a spiritual director. He was one of the first Greek Fathers to take a firm stand on the value of pagan literature in the education of Christian youth. Indeed, the Greeks seem to have had a greater problem with their pagan literature than the Latin Fathers had with theirs; the problem of adaptation was much more keenly felt in the east than in the west. Basil's classic solution. put forward in his *Address to the Youth* (sermon 22), is sometimes called the theory of the honeybee: for he insists that pagan literature must not be condemned in principle: rather Christians must, like,the bee, select what is to their profit and reject what is inacceptable to the Christian point of view.

Basil was not so profound or original as his brother Gregory; it was really Gregory who gave a deep philosophical and mystical direction to the sound monastic structure erected by Basil. Basil's genius lay rather in his administrative talent and in his ability to grasp clearly the ideals of the growing church in a realistic fashion. This may be seen in his energetic efforts to have the Nicaean doctrine accepted at the council of Constantinople in 381, as well as in his dispute with Pope Damasus over the Meletian schism. The hostels and hospitals he supported on the outskirts of Caesarea are proof of his practical spirituality.

Of an extensive ascetical corpus the most important works are the *Longer* and *Shorter Rules* and the *Moralia;* of the theological,

the treatises *On the Holy Spirit* and *Against Eunomius* and the *Commentary on the Six Days of Creation* (Hexaemeron). But the most interesting part of his literary remains is the great collection of letters (over 300 are authentic), which offer a vivid picture of his daily life and work. His feast day is June 14.

For the text the reader must still rely on the edition by J. Garnier and P. Maran, 3 vol. (1721–30; 2nd ed. by L. de Sinners, 1839), reprinted by J. P. Migne, *Patrologia Graeca,* vol. 29–32 (1857). There are, however, many improved editions, for example, of the letters by R. J. Deferrari in the Loeb Library. 4 vol. (1926–34); of the treatise *On the Holy Spirit* by B. Pruche, *Sources chrétiennes,* 17 (1947); and of the *Commentary on the Hexaemeron* by S. Giet, *Sources chrétiennes,* 26 (1950). For selected works in English translation, *see* B. Jackson, *Nicene and Post Nicene Fathers,* vol. viii (1895); W. K. L. Clarke, *The Ascetic Works of St. Basil* (1925); Sister Agnes Clare Way, *Letters,* in *The Fathers of the Church,* vol. xiii and xxviii (1951, 1955), and Sister Monica Wagner, *Ascetical Works,* vol. ix (1950). For the manuscripts, *see* S. Y. Rudberg, *Etudes sur la tradztion manuscrite de S. Basile* (1953).

BIBLIOGRAPHY.—Y. Courtonne, *Saint Basile et l'hellénisme* (1934) and *D.* Amand, *L'Ascèse monastique de Saint Basile* (1949) for bibliographies; M. M. Fox, *The Life and Times of St. Basil the Great as Revealed in His Works* (1939); *W.* K. L. Clarke, *St. Basil the Great: a Study in Monasticisnz* (1913). (H. Mu.)

BASIL I (d. 886), Byzantine emperor from 867 to 886, founder of the Macedonian dynasty which lasted till 1056, was of peasant origin and probably of Armenian descent, although his family had been settled in Macedonia. While still a young man, he was employed in the imperial stables in Constantinople. His good looks and physical prowess gained him the favour of the reigning emperor, Michael III, who ultimately made him his chamberlain. With Michael's connivance, in 865, Basil assassinated the powerful Caesar Bardas, the emperor's uncle. In 866 he was crowned co-emperor, and in 867 he was powerful enough to have Michael assassinated and then to take over complete control of the government. He adapted himself in a remarkable manner to his imperial position, and in the period of recovery that followed he played an important role, continuing the policies of the Amorian dynasty. Among his greatest achievements was the inauguration of legal reform. During his own reign two small manuals, the *Procheiron* and the *Epanagoge,* appeared, but the great codification planned was not ready until the reign of his successor, Leo VI; this was the Basilica (*q.v.*), a collection of 60 books in Greek, which formed the basis of the medieval Byzantine legal system.

In his ecclesiastical policy Basil had succeeded to the quarrel between Photius (*q.v.*) and Ignatius, to some extent involving a clash between the more liberal and the stricter tendencies in the Orthodox Church; the pope also had been drawn in, and for a time relations between Rome and Constantinople had been broken off. Basil tried to conciliate Rome and also to win support at home by reinstating the former patriarch Ignatius in place of Photius, who was excommunicated at the ecumenical synod held in Constantinople in 869–870. Though the schism was ended, bitter feeling remained because the young Bulgarian kingdom, disappointed at Rome's failure to grant a metropolitan, turned to Constantinople and was once and for all brought within the sphere of the Orthodox Church, being granted its own archbishop together with other special privileges. Byzantine influence thus was assured there as elsewhere in the Balkans where Greek missionaries were at work. At Constantinople Photius was restored to the patriarchate on the death of Ignatius in 877; but no "second schism" with Rome occurred, and at the synod of 879 he was recognized by Rome.

Abroad, Basil continued a successful war in the east against the Arabs, raiding as far as the Euphrates; his policy foreshadowed the planned attacks on the eastern frontier that were to be so notable a feature of the following century. He waged war on Arab pirates in the Adriatic and elsewhere; he attempted to consolidate his position in southern Italy and eventually had some success in re-establishing Byzantine authority in its southern Italian provinces, though he failed to drive the Arabs from Sicily. His achievement was the more remarkable in view of his antecedents, for he not only added to the prestige of the empire but demonstrated a fine appreciation of the age-long traditions of imperial office.

Dvornik, *Les Slaves, Byzance et Rome au IXe siècle* (1926) and *The Photian Schism* (1948); *G.* Ostrogorsky, *History of the Byzantine State* (1956); Albert Vogt, *Basile Ier, empereur de Byzance* (1908). (J. M. Hy.)

BASIL II BULGAROCTONUS ("the Bulgar-slayer") (c. 958–1025), Byzantine emperor from 976 to 1025, son of Romanus II and Theophano and great-great-grandson of Basil I, was crowned co-emperor in April 960. On their father's death (963) he and his younger brother and co-emperor, Constantine, were still minors, and the senior emperor was first Nicephorus II Phocas, their stepfather, then John I Tzimisces. On the death of John I (Jan. 10, 976) Basil and Constantine reigned without a colleague, though Constantine always remained in the background. The administration was at first in the hands of their great-uncle, the eunuch Basil the Chamberlain. Basil II waited and watched without interfering until in 985 he was strong enough to inaugurate his independent rule with the downfall of the Chamberlain. During this time the throne was endangered by the respective ambitions of two generals from powerful families, Bardas Sclerus and Bardas Phocas, who were not finally crushed until 989. During 988 Basil had the help of a Russian contingent, which remained in Byzantine service and became famous as the Varangian guard. Vladimir of Kiev was rewarded for this timely aid with marriage to Basil's sister Anna, on condition that the Kievan state adopted Christianity.

Basil made ruthless war upon the system of immense estates that had grown up in Asia Minor and elsewhere, which Romanus I had endeavoured to check. He sought to protect the lower and middle classes.

Basil gained some successes against the encroachments of the Fatimites in Syria (995–996); but his most important work in the east was the annexation of the greater part of Armenia. He created in those highlands a strongly fortified frontier, which, if his successors had been capable, might have proved an effective barrier against the invasions of the Seljuk Turks. The greatest achievement of the reign was the complete subjugation of Bulgaria. After the death of John Tzimisces (who succeeded in reducing a considerable part of the Bulgarian kingdom), the power of Bulgaria had been restored by the tsar Samuel, who extended his rule along the Adriatic coast and imposed his lordship on Serbia. War was renewed in 996 and continued till 1014, when the Bulgarian army suffered an overwhelming defeat. Basil blinded 15,000 prisoners, leaving a one-eyed man to every 100 to lead them to their tsar, who fainted at the sight and died two days later The Bulgars were finally subdued by 1018 and to some extent conciliated by Basil II's statesmanlike settlement of the country and the church. Basil also hoped to regain authority in southern Italy, where the Byzantine provinces were reorganized as a catapanate. He was planning to send a naval expedition to recover Sicily from the Arabs when he died on Dec. 15, 1025.

Basil's reign marked the highest point of the power of the Eastern Roman empire since Justinian I. Building on the foundations of his Amorian and Macedonian predecessors, he dedicated himself unsparingly to the laborious duties of ruling, and he devoted himself to breaking the powerful opposition of the great magnates. He was a ruthless general and a great statesman, but without the usual Byzantine interest in learning or culture. He was unmarried.

BIBLIOGRAPHY.—P. Charanis, "The Monastic Properties and the State in the Byzantine Empire," *Dumbarton Oaks Papers,* no. 4 (1948); G. Ostrogorsky, *History of the Byzantine State* (1956); *G.* Schlumberger, *L'Epopée byzantine,* vol. i–ii (1896–1900). (J. M. Hy.)

BASILAN ISLAND, an island that makes up a part of the province of Zamboanga del Sur, Republic of the Philippines. (*See* ZAMBOANGA.) Pop. (1960) 156,046. Area 433 sq.mi. Until 1948 it was politically a part of Zamboanga City, but is separated from the city and the Zamboanga peninsula of Mindanao by Basilan strait, a five-mile channel with strong tidal currents. The island and nearby small isles became the chartered city of Basilan in

1948. Most of the island consists of rugged or rolling forested uplands with several peaks of more than 2,000 ft. Large lumber mills have operated on Basilan for at least a half century. The soil is more fertile than in most of Mindanao. Lying close to the equator, it is south of the typhoon belt and has a truly tropical rain-forest climate.

The natives are the Yakans, descendants of early Papuan settlers who were converted to Islamism during the 14th century. Unlike the Moros of Jolo and Zamboanga, they are not beach dwellers and fishermen but live on higher lands and make their living by agriculture. As more land is cleared by the lumber companies, Christian Filipinos from the Visayan Islands migrate to Basilan in considerable numbers.

Basilan differs from most of the Philippines in that it has a higher percentage of plantation agriculture, with rubber dominating. Other crops are coconuts, rice, corn, abaci (Manila hemp), coffee, cacao, pepper and bananas. Rubber, which has been grown on Basilan since 1911, is processed into crude rubber on the plantations and sold to Manila rubber factories. The University of the Philippines owns a 10,000-ac. land grant on the northern coast of the island. The principal towns are Isabela and Lamitan, both on the north coast. (AN. C.)

BASILDON, an urban district and New Town in the Billericay parliamentary division of Essex, Eng., 25 mi. E.N.E. of London by road and rail. The name of the urban district (constituted in 1934) was Billericay until 1955 when, because of the new town within it, it was changed to Basildon. It includes the four townships of Billericay, Laindon, Pitsea and Wickford. Pop. (1961) 88,459. Area 42.2 sq.mi.

Except for 288 ac. in Thurrock, the whole of BASILDON NEW TOWN lies within the urban district of Basildon; its area, designated in 1949, is 7,834 ac. and its population in 1956 was 37,000. Formerly an agricultural area, the depression in the farming industry and the building of the railway led to the splitting up of the land for building.

After World War I a great many people from London settled in the district. This resulted in the "rural slum" villages of Pitsea, Vange, Old Basildon, Laindon, Langdon Hills and Lee Chapel, all of which are included in the area of the new town. Building and engineering operations began in 1951. The main industries are light engineering, chemical and joinery works, milk bottling, printing and the making of clothes and carbon black.

BASILIAN FATHERS (PRIESTS OF THE COMMUNITY OF ST. BASIL; C.S.B.), a congregation founded in France in 1800 and now established chiefly in Canada; the mother house is at Toronto. The Basilian Fathers' work is primarily educational; they operate the Pontifical Institute of Medieval Studies and five colleges. See ORDERS AND CONGREGATIONS, RELIGIOUS.

BASILICA, in the Roman Catholic Church, is a canonical title given to certain churches which are thereby endowed with special privileges. There are major basilicas, which have the holy door and papal altar, and minor basilicas, which have precedence over all churches except cathedrals.

In architecture, basilica is a word frequently used in Latin literature to designate a large, roofed building dedicated to public use. Markets. courthouses, covered promenades and meeting halls were all occasionally so known. Little by little the word was limited to buildings of a more or less definite form, having a central area, aisles or galleries at the sides and a raised platform, sometimes apsidal. These elements, nevertheless. are not constant. the Basilica Julia in Rome having no apse and that at Timgad no aisles. The basilica was usually in a forum (Basilica Julia, Trajan's basilica, the basilica at Pompeii). For what a Roman architect considered a normal basilica one may consult Vitruvius v, 1–4 and vi, 3–9.

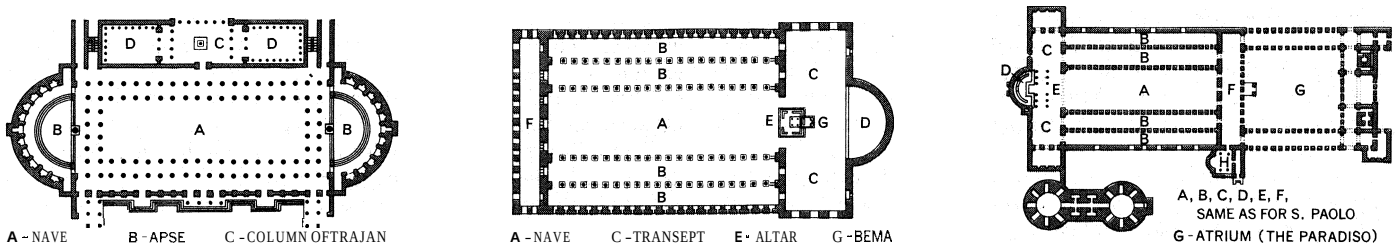
The earliest basilica known is that at Pompeii, which dates, probably, from the 2nd century B.C. It shows an already highly developed form in which the aisle runs entirely around the central area. The raised platform appears as an alcove, screened by columns, at the end opposite the entrance. This seems the normal plan for the larger basilicas. The basilica begun by Maxentius and completed by his successor. Constantine, is. however. of an entirely different type. There the attempt was made to dispense with the colonnades and to concentrate the supports into a few enormous piers, which carry the three bays of the groined vault over the central area and at the same time furnish the dividing line between the bays of the lower side aisles. It was the application to the basilica problem of the type of construction and decoration developed in the great halls of the Roman baths.

Besides these large basilicas there were many smaller examples. In some of these, as in the basilica of the palace of Domitian on the Palatine hill, the type comprising a nave with aisles at the sides only and an apse at the end had appeared. It was this type that the early Christians adopted for their churches, possibly because similar halls, in large private houses, had been used for Christian worship prior to the Edict of Toleration. It would appear that, in the earliest examples, side aisles were frequently lacking. After the time of Constantine, however, the existence of side aisles was universal, and was perhaps due to the fact that they were included in the three enormous basilicas—those of St. Peter, S. Paolo and St. John Lateran—which he built. The church of Sta. Maria Maggiore, dating in its present form from the early 5th century, is similar to its three predecessors. In the Constantinian basilicas another unit, the transept (*q.v.*), made its appearance, and the cross-shaped plan thus developed became the controlling plan of the larger Christian churches in the west throughout the middle ages.

In the typical early Christian basilica the nave (*q.v.*) was separated from the side aisles by borders of columns which carried either arches or an entablature. In the later basilicas these columns! having been taken from older pagan buildings, frequently had misfit capitals. Above the entablature or arches rose the blank wall behind which were the side aisle roofs. This wall continued up as a clerestory and was pierced with a row of either square or arched windows. The nave roof was of timber, sometimes with exposed beams and sometimes with a rich, panelled wooden ceiling. carved and gilded. Side aisles (see AISLE) were either single or double, and occasionally of two stories, the upper serving as a gallery for women. The side aisle ceilings, with the roof immediately above, were usually as low as the columns would permit; but in old St. Peter's. Rome, the inner aisles were much higher than the outer, which were vaulted. The apse (*q.v.*) opened from the nave by a great arch known as the triumphal arch.

Occasionally, when there were transepts, another triumphal arch separated the transept from the nave. A narthex (*q.v.*), or vestibule, extended the entire width of nave and aisles, frequently open at the front with a colonnade. In addition to these general elements, there was frequently a transept, usually without aisles, at the extreme end. At the entrance end, in addition to the narthex, there was often a court or atrium (*q.v.*), surrounded by either colonnades or arcades. After the 10th century a campanile (*q.v.*), round or square, of great simplicity and usually very high, was added.

Such a building was basically simple; the exterior design was crude to the point of being barnlike, although there were occasional exceptions: old St. Peter's at Rome had a facade richly covered with mosaic, and S. Lorenzo, Rome, has a handsome colonnade across the front. After the fall of Rome the interiors likewise showed architectural poverty, all sorts of pagan Roman fragments being put together in meaningless and incoherent jumbles. All, however, possessed interior interest and an inherent beauty due largely to the richness of their furniture and ornamentation. The decorative scheme showed that the feeling for colour and texture increased as the purely architectural sense decayed, and the development of a technique of glass mosaic offered great opportunities for impressive effects. The lower portions of the walls were usually sheathed in coloured marbles which were frequently of rich design around the apse. Above the arches or entablatures of its flanking columns the nave wall was sometimes completely covered with mosaic; where this was absent. painting of similar character doubtless existed. The church of Sta. Maria Antiqua, at the base of the Palatine hill, shows many examples of such painting.



PLANS FOR THREE BASILICAS OF ROME: (LEFT) TRAJAN, 1ST CENTURY; (CENTRE) S. PAOLO OUTSIDE THE WALLS. 4TH CENTURY: (RIGHT) OLD ST. PETER'S. 4TH CENTURY

The climax of the decorative scheme was the triumphal arch and the mosaic of the dome of the apse. There is no formula for these decorations. They vary from the Byzantinesque figures of Sta. Maria in Trastevere to the rich spirals of the vine of S. Clemente. They are always full of complete symbolism. The furniture consisted of a choir screen with one or two ambones *(see* AMBO), the clergy seats and the bishop's throne in the apse, and the altar, with a baldachin (*q.v.*) or canopy above it. All this furniture was as lavishly ornamented as possible. Its framework was usually of white marble, in which were inserted plaques and roundels of dark marble and bands of mosaic, gold, red and green. Frequently the floor was also rich with marble and mosaic (*q.v.*) of this type. known as *opus Alexandrinum.*

Although the basilica is primarily characteristic of Rome, there are many examples elsewhere. In addition to the one at Parenzo, the basilica of S. Apollinare Nuovo, erected by Theodoric at the beginning of the 6th century and that of S. Apollinare in Classe 50 years later, both at Ravenna, are particularly noteworthy. In the east, the great church of St. Simeon Stylites in Syria is of modified basilica type. The church of the Nativity at Bethlehem is a basilica, as is also the church of St. John Studios in Constantinople, but the finest example in the Eastern empire was St. Demetrius at Thessalonike (Salonika). Owing, however, to the example set by Justinian's great church of Hagia Sophia at Constantinople, the basilica form gradually passed out of use in the Eastern Church. Few remains exist of the earliest churches built in the north and west of Europe. England shows occasional fragmentary ruins, such as the foundation of the 4th-century basilica at Silchester.

Romanesque rebuilding everywhere except in Italy destroyed these early churches, yet the basilica type left an ineradicable stamp on all church building that succeeded and the basilica plan, with its nave, aisles and apse, became, with the development of vaulting, and the changes necessitated by it, the typical church building of the Western Church. *See* GOVERNMENTAL ARCHITECTURE; RELIGIOUS ARCHITECTURE; ROMAN ARCHITECTURE. (T. F. H.)

INTERIOR OF BASILICA OF S. APOLLINARE IN CLASSE. RAVENNA, ITALY, 6TH CENTURY

BASILICA, the name of a code of law, drawn up in the Greek language at the end of the 9th century, with a view to putting an end to the uncertainty that prevailed throughout the Eastern Roman empire regarding the authorized sources of the law. This uncertainty had been brought about by the conflicting opinions of the jurists of the 6th century as to the proper interpretation to be given to the legislation of the emperor Justinian, from which had resulted a system of teaching that had deprived that legislation of all authority, and the imperial judges were at a loss to know by what rules of law they were to regulate their decisions. There has been considerable controversy about the part that the emperor Basil I (*q.v.*) took in framing the new code. There is, however, no doubt that he abrogated the ancient laws, which had fallen into desuetude, and the more probable opinion is that he caused a revision to be made of those laws that were to .continue in force and divided them into 40 books. This code of laws was subsequently enlarged to 60 books by his successor, Leo the Philosopher (Leo VI, *q.v.*).

No perfect manuscript has been preserved of the text of the Basilica, and the existence of any portion of the code seems to have been ignored by the jurists of western Europe until the important bearing of it upon the study of the Roman law was brought to their attention by Viglius (*q.v.*) in his preface to his edition of the Greek *Paraphrase of Theophilus,* published in 1533. A century, however, elapsed before an edition of the 60 books of the Basilica, so far as the manuscripts then known to exist supplied materials, was published in seven volumes, by Charles Annibal Fabrot, under the patronage of Louis XIII of France. A newly restored and far more complete text of the 60 books of the Basilica was published at Leipzig in six volumes (1833–70). edited by K. W. E. and G. E. Heimbach. The great bulk of the code was an obstacle to the multiplication of copies of it, while the necessity for them was in a great degree superseded by the publication from time to time of synopses and enchiridions of its contents, composed by the most eminent jurists, of which a very full account will be found in the *Histoire* du *droit byzantin,* by I. A. Mortreuil, published in Paris in 1846.

BASILICATA (LUCANIA), a region of southern Italy comprising the provinces of Potenza and Matera. Area 3,856 sq.mi., pop. (1961) 648,085. It falls into a western mountainous section, dominated by the Lucanian Apennines, and an eastern section of low hills and wide valleys, while along the Ionian sea the sand and clay hills overlook narrow coastal plains. The extinct volcano of Mt. Vulture (4,354 ft.) stands isolated from the Apennines in the north.

The mainstay of the economy is agriculture: most of it, however, is characterized by low yields. Wheat and rye are the principal cereals; sheep, goats and pigs the farm animals. New crops introduced in the eastern and coastal areas include tobacco, vegetables, sugar beet and flowers. Dairy and beef cattle are raised in increasing numbers. In the early 1960s, except for olive presses and flour mills, industry was nonexistent, though natural gas was discovered around Matera. Potenza, the administrative centre. and Matera (*qq.v.*) are the only cities of any size. The main railroad line of the Basilicata links Naples and Battipaglia in the

northwest through Potenza with Taranto to the east, connecting also with the Ionian railroad (Taranto-Reggio di Calabria). Local lines radiate from Potenza and from Matera in several directions and bus services reach all of the villages of the region.

During medieval times Basilicata was first under Lombard rule, controlled by the duke of Benevento and, later, of Salerno; after an interval of Byzantine control, the Normans took over and made Melfi the capital of one of their important dominions. Until the fall of the Hohenstaufen, Basilicata played a significant part in the affairs of southern Italy; afterward, passing through Angevin and Spanish hands, it remained part of the kingdom of Naples, until reunited with Italy in 1860. The region was coextensive with Potenza province until the establishment of Matera province in 1927. See also LUCANIA. (G. KH.)

BASILIDES (2nd century A.D.), one of the most celebrated of the Gnostics, probably a pupil of Menander in Antioch. was teaching in Alexandria at the time of the Roman emperors Hadrian and Antoninus Pius (second quarter of the 2nd century). Very little is known of his life. Clement of Alexandria says he claimed to have received a secret tradition from Glaucias, interpreter of Peter; according to Hippolytus the apostle Matthias communicated to him secret sayings *(logoi apocryphoi)* he had heard from Jesus Christ. He wrote a "gospel" and a commentary on it in 24 books, entitled *Exegetica.* Clement quotes several passages from the 23rd book, dealing with the problem of suffering. Basilides also composed psalms and odes of which nothing remains. The statements about Basilides' system given by Clement and Origen contradict those of Hippolytus and Irenaeus, so it is impossible to get a clear idea of his doctrine. It is also impossible to determine the sources from which he drew. There is certainly influence of Platonism, of other Gnostic systems and of the New Testament, but much remains obscure. The theory that the doctrine of Basilides was influenced by Buddhism seems improbable.

Basilides had many disciples, among whom was his son Isidorus, and the sect he founded still existed in Egypt in the 4th century. His followers were the first to keep the day of Christ's baptism on Jan. 6 or 10, celebrating it with an all-night vigil.

BASILISCUS (d. 477), usurping Eastern Roman emperor (475–476), was the brother of Verina, wife of the emperor Leo I (457–474). He was given supreme command in 468 of a vast Eastern Roman force designed to expel the Vandals from Africa. Because of his incompetence it was totally defeated by the Vandal leader Gaiseric while still at sea off Mercurium, the modern Cape Bon; but Verina procured for Basiliscus the emperor's pardon. When the reigning emperor Zeno (474–491) was driven from Constantinople in Jan. 475, Basiliscus ascended the throne. As emperor he favoured Monophysitism and aroused opposition by his decree against the Council of Chalcedon. During his reign a disastrous fire in Constantinople destroyed much of the city and many famous works of Greek art. When Zeno returned to the capital in Aug. 476, Basiliscus was exiled to Cappadocia and was there beheaded. (E. A. T.)

BASILISK, a name now applied—because of a certain fanciful resemblance to the legendary monster called basilisk, or cockatrice (*q.v.*)—to an American genus of lizards *(Basiliscus,* family Iguanidae). These lizards are characterized by the presence, in the males, of an erect crest on the head, on the back and at the base of the long tail. *Basiliscus basiliscus* reaches the length of one yard; its colours are green and brown, with dark crossbars, while the crest is reddish. This omnivorous animal is abundant on the banks of rivers and streams of Central America and Mexico. The lizards lie upon the branches of bushes overhanging the water, into which they plunge at the slightest alarm. They may dive to the bottom, or, more remarkably, dash across the surface of the water in a semierect position propelled by rapid strokes of their hind limbs, with a shower of spray rising on each side. (K. P. S.; X.)

DOUBLE-CRESTED BASILISK (BASILISCUS PLUMIFRONS)

BASIN, THOMAS (1412–1491), French bishop and historian, notable for his opposition to Louis XI, was born at Caudebec in Normandy. He studied at Paris, at Pavia and at Louvain, traveled in Hungary and took part in the Council of Basel before returning to teach canon law at Caen. In 1447 he became bishop of Lisieux. After the French recovery of Normandy, he served Charles VII faithfully and was appointed one of the royal counselors. His refusal to support the revolt of the dauphin Louis was the cause of the latter's bearing him a grudge when he became king as Louis XI. Having joined the League of the Public Weal against Louis in 1465. Basin had to go into exile and renounce his bishopric. In 1474, however, Pope Sixtus IV made him titular archbishop of Caesarea. Basin died at Utrecht in the Netherlands on Dec. 3, 1491.

Basin's principal work, a history of the reigns of Charles VII and Louis XI, written between 1471 and 1487 in a style imitating that of the classical historians, is valuable as his testimony on his times but is marred to some extent by his dislike for Louis XI. From the 17th century to the 19th it was regarded as the work of a priest of Liège, whose name Amelgard is only Basin's pseudonym. Basin's other works include a memorandum composed for the rehabilitation of Joan of Arc (1453) and a justification of himself against Louis XI's accusations (1473–74). There are editions of the history by J. Quicherat, with a summary in French, four volumes (1855–59); and by C. Samaran, with French translation (1933–). (MI. M.)

BASIN, in geology, a broad shallow trough or syncline, a structure in the bedrock, not to be confused with a physiographic river basin, although the two may coincide. Some of the better-known geological basins are the southern Michigan basin of gently downwarped Paleozoic rocks, the Wind river and Big Horn basins in Wyoming. largely filled with early Tertiary continental deposits after downwarping of their Mesozoic and Paleozoic rocks and accompanying uplift of bordering mountain ranges, the London basin, a shallow trough of Tertiary, Cretaceous and Jurassic rocks, the Paris basin of strata of the same systems, and the numerous coal basins of England. Lakes may occupy basins that have been caused by the removal in solution of some of the more soluble constituents (rock salt, etc.) in the underlying strata; occasionally lake basins have been formed directly by crustal movements or by collapse of volcanic cones. (L. W. P.)

BASINGSTOKE, a municipal borough in the Basingstoke parliamentary division of Hampshire, Eng., 47 mi. W.S.W. of London by road. Pop. (1961) 25.940. The town is by-passed by the Great Southwest road on the northeast side of the London gap, where the chalk down land diminishes and provides an open way between the London and Hampshire basins. The neighbouring downs are rich in prehistoric remains and there are traces of Roman occupation; Silchester (*q.v.*), the Roman Calleva Atrebatum, lies 6 mi. to the north. Basingstoke, of very old foundation, appears in Domesday Book as a royal manor with three mills and a market. Charters were granted from 1227 and medieval grants of fairs were confirmed by charters of incorporation in 1623 and 1641. In the early 17th century there was a considerable cloth industry which later died out but was re-established in the 20th century.

The parish church of St. Michael is mainly Late Perpendicular; the public museum contains comprehensive local exhibits. At Queen Mary's school (before 1852 the Holy Ghost school) Gilbert White was a pupil. By Basing village are the remains of the

Elizabethan Basing house, famous for its prolonged defense (1643–45) against the parliamentarians. Once Basingstoke was primarily a market town, and it still contains half-timbered houses round the market square, but industries were established, chiefly agricultural machinery, commercial vehicles, precision tools and instruments, leather, clothing, mineral water and drugs; market gardens still flourish. The Basingstoke canal to Weybridge was opened in the 1790s but was filled in after losing its trade to the railways.

BASKERVILLE, JOHN (1706–1775), English printer and inventor of a type of rare distinction, was born at Wolverley, Worcestershire, Jan. 28, 1706. He became a writing master at Birmingham, but in 1740 established a japanning business, the profits from which enabled him to experiment in type founding. He set up a printing house and in 1757 published his first work, a *Virgil* in royal quarto, followed in 1758 by a famous edition of Milton. Appointed printer to Cambridge university, he undertook editions of the Bible and the Prayer Book. He published a singularly beautiful *Horace* in 1762; the success of a second edition (1770), in quarto, encouraged him to issue a series of quarto editions of Latin authors. He died at Birmingham, Jan. 8, 1775.

The bold quality of Baskerville's print derived from his use of a highly glossed paper and from his invention of a really black ink. But his typography was much criticized in England, and after his death his types were purchased by the French dramatist Beaumarchais. Their subsequent history is uncertain, but in 1917 the surviving punches and matrices were recognized and in 1953 they were presented to Cambridge university. Baskerville type has been revived, its clarity and balance making it a good type for continuous reading. *See* also PRINTING TYPE; TYPOGRAPHY.

BASKET, a container made by hand by interlacing or coiling and sewing vegetable fibres (twigs, roots, canes, grasses or other materials). The word is of unknown origin; it does not occur in Teutonic or Romance languages, nor does it appear in English before the 13th century. Basketry is a convenient though ill-defined term including actual baskets, wattlework. matting and ornamental plaitwork made by hand without the aid of a frame or loom.

An ancient craft, basketmaking may be considered one of Neolithic man's contributions to culture history. Some of the techniques employed in Egyptian basketwork 5,000 years ago are still widely used in Africa, Among historic primitive peoples women are usually the basketmakers However, in Borneo and among the Indians of British Guiana men are skilled at this craft.

Basketmaking is a manual operation that cannot be imitated by machinery. Containers of pottery, wood, metal, cloth or plastic have largely replaced baskets among civilized peoples. They rarely make coiled baskets. The twining technique used by the ancients in building fences, fish weirs and house walls survives in the construction of such common .household articles as wastebaskets, bread and laundry baskets and wicker furniture.

PRIMITIVE BASKETRY

Basketmaking is one of the oldest and most nearly universal crafts of primitive man. Yet it may never be possible for archaeologists to determine the antiquity and early distribution of this craft in some parts of the world, because the vegetable fibres from which baskets are made are perishable materials. Nevertheless, numerous prehistoric examples have been preserved in arid sands, dry caves and under other favourable conditions in both hemispheres. In the Americas basketmaking developed before the potter's craft. Specimens have been discovered in several early Indian sites in the Great Basin west of the Rocky mountains. Basket-yielding cultural level II at Danger cave near Wendover, Utah, has been dated by radiocarbon methods about 7000 B.C. At Huaca Prieta on the coast of Peru several varieties of tained baskets said to be at least 5,000 years old were unearthed. The name Basket Maker has been given to a simple hunting and collecting culture of the period *c.* AD. 1–700 in the southwestern United States because fine cooking, storage and burden baskets were distinctive products of that culture.

In the near cast mud impressions of plain weave mats reveal the existence of basketry at Jarmo, Iraq, in the period 5270–4630 B.C. A radiocarbon test of corn found in basket-lined granaries in the sands of the oasis of Fayum, Egypt, yielded the date 4784–3929 B.C. The first evidence of basketry in Europe appears about 2500 B.c., in the form of carbonized fragments in both coiled and twined techniques made by the Swiss Lake Dwellers. Examples of early Bronze Age baskets, dating about 2000 B.C.. have been recovered in the British Isles. Apparent impressions of basketry weaves were found on pottery of a late Keolithic Chinese culture (Yangshao) of about 3000 B.C.

That basketmaking appears in rudimentary as well as in early stages of civilization is indicated by the fact that in historic times baskets of high quality were produced in some of the world's most backward areas. Such culturally unsophisticated peoples as the Tasmanians, the Andaman Islanders, the Yahgans of Tierra del Fuego and the Seri of Lower California were skillful basketmakers. Pomo Indian women of northern California gained the reputation of the world's most expert hasketmakers. Kot only was their coiled basketry more complicated than any made in the old world but their twined basketry was remarkable for its fineness and evenness of weave. Yet Pomo Indians grew no crops. They made a living by hunting, fishing and gathering acorns and other wild plant foods in season.

Uses.—Basketry has served a wide variety of religious and secular functions through the ages. A votive stone in the Louvre commemorating the building of the temple of Ningursu in Lagash portrays the Sumerinn priest-king Ur-Nina (*c.* 3000 B.C.) carrying a basket of mortar on his head. Countless basketloads of earth were carried by prehistoric Indians of eastern United States in building burial and effigy mounds and high earthen platforms for their temples. According to tradition the first Christian church in Britain was a rude, thatch-roofed structure having walls of wickerwork, erected at Glastonbury in Somerset in the 1st century A.D.

Primitive peoples have used basketry in house construction and furnishing (for walls. roofs. doors. partitions, rugs, chairs, hammocks and mattresses), as household utensils (for preparing, cooking and serving foods and for storing food, clothes, trinkets and jewels), in transport (rush balsas, mat rafts, and sails, carrying and collecting baskets, cradles and coffins), in hunting and fishing (corrals. traps, fish weirs, dip nets. creels, bait baskets), as clothing (hats, collars, capes, skirts, arm bands. belts, footgear), in wariare (shields. helmets. hotly armour) and as musical instruments (rattles and drums). They also have made gambling trays, cult symbols and ceremonial bowls of basketry. The Ovimbundi Negroes of Africa interweave marks into large conical baskets used to measure quantities of corn, meal or beans.

The sizes. shapes and to some extent the weaves were determined by the baskets' intended uses. Some Pomo Indian women made toys of almost perfect symmetry little Larger than ½ in. in diameter. The Vakwanyama of southern Angola. on the other hand. wove grain storage baskets five feet high. Openwork weaves in cradles and burden baskets provide needed strength with little weight. Honever, the greatest triumph of the primitive basketmaker was the perfection of the watertight container. Hupa Indians of California made a pot-shaped cooking basket so closely twined that they could boil soup or acorn mush in it simply by dropping hot stones into the liquid. Other peoples made them watertight by lining or coating their surfaces with waterproofing materials. Thus Admiralty Islanders store coconut oil in large basketry jars coated with crushed *Parinarium* nuts which harden and set into a firm, impervious mass.

Materials. — Basketmaking materials vary from place to place depending upon the availability of wild plants and the preferences of craftsmen. In tropical and semitropical regions palms have been most extensively employed. African Negro tribes use palmyra and raffia palms. Coconut palm leaf baskets are common in Oceania. The world-renowned Panama hat is woven from carefully selected. boiled and sun-dried leaves of the native species *Carludovica palmata* in Ecuador, Colombia, Central America and

10. Twined wallet from the Aleutian Islands
11. Pomo Indian twined basket

Jamaica. The abundance of single rod coils of rattan in Malaysian basketry reflects the ready availability of rattan in that area. Pandanus and bamboo also are widely used in the tropics.

A greater variety of plants arc used by peoples of the temperate zones. In 1902 the botanist Frederick V. Coville identified 87 plants employed by North American Indians in making and colouring baskets. Some of these plants, such as reeds. rushes and sedges. flourish in marsh areas in many parts of the world and have been widely used since early times.

Esparto grass. tall and wiry, was a favourite fibre of ancient man in the Mediterranean region. Baskets of this material were found in the tomb of Tutenkhamon and in the Murcielagos cave in Spain. In arctic and subarctic regions grass is the primary material. For about 1,000 years Aleutian Islanders have woven closely twined baskets from wild rye grass which is abundant in their locality, selecting strong young blades. By control of curing methods Aleut women can produce a range of colours from green through light yellow to white. The Yahgans, southernmost people in the world, employed three or four stems of coarse grass as the foundation element for their unique halfhitch coiled baskets.

Cultivated plants have also furnished some materials. The ancient Egyptians made baskets of wheat straw, the Swiss Lake Dwellers employed flax stems. and the Iroquois Indians of New York wove simple masks of corn husks.

Plaited Work.—All basketwork is either plaited (or woven) or coiled. Plaited basketry is made by the crossing of two or more sets of elements. called (by analogy with weaving) warp and weft. When the warps are indistinguishable by rigidity or direction, both sets of elements may be called wefts.

The main varieties of plaited work are: (1) Check, in which the warp and weft pass over and under each other singly in the familiar over-one-under-one checkerboard pattern. This includes wattlework. in which the warp stakes are planted in the ground and the weft branches bent in and out between them. (2) Twilled, in which each weft passes over and then under two or more warps. Diagonals are formed by the regular progression of the weft element one to the right (or left) on each successive movement around the basket or across the mat. (3) Wrapped, in which flexible wefts are wrapped around each warp in passing. (4) Twined, in which two or more wefts pass alternately in front of and behind each of the warps, crossing them obliquely. Twining with two or three wefts is technically "fitching" or "waling," respectively. In wrapped-twined, "bird cage" or latticework, the foundation consists of both horizontal and vertical elements, often rigid, at the crossings of which the weft or wefts may be twined or wrapped. (5) In hexagonal work the wefts, instead of being horizontal and vertical, are worked in three directions, forming in open work hexagonal spaces, in close work six-pointed stars. The well-known *anyam gila* or "mad weave" of Malacca is a more complicated hexagonal weave in which the wefts are doubled back, not simply interlaced in the flat.

Coiled Work.—A sewing rather than a weaving technique, coiled work consists in sewing a spiral foundation of twigs, cane, grass or other material securely in a flat or ascending coil. An awl (or needle if the foundation is grass) is used to make the holes through which the wrapping is passed.' The commonest varieties of coiled work are: (1) Simple oversewn coil—each stitch passes over the new coil and pierces a portion of the coil below; (a) iurcate coil—the new stitch splits the stitch in the preceding coil, producing a forked effect superficially suggestive of crochet; (b) bee-skep coil—the stitches are spaced widely apart and are not in direct contact with stitches in the preceding coil. (2) Figure of eight (or Navaho), in which the stitch is worked in a figure of eight, passing behind, up and over and down in front of the new coil; then behind, down and out and under the preceding coil. (3) "Lazy squaw," in which the long stitch passes over two coils at once. The sewing passes in front, up and over the new coil, winding round it one or more times, then it passes behind and down under the preceding coil and up over the new coil, completing the characteristic long stitch. (4) Crossed figure of eight (or knot stitch). The stitch passes in front, up and over the new coil. and behind, down and under the preceding coil. as in the long stitch of the "lazy squaw," but the sewing is next brought out between the two coils, to the right of the last long stitch, which it crosses, giving the appearance of a knot. (5) Cycloid or single-element work, consists of coils, usually of cane, looped into each other. Although this may be grouped with coiled work, it has no foundation. This technique is especially characteristic of the Malay area.

In both plaited and coiled work decorative patterns sometimes are made by overlaid wefts: often of contrasting shades or colours,

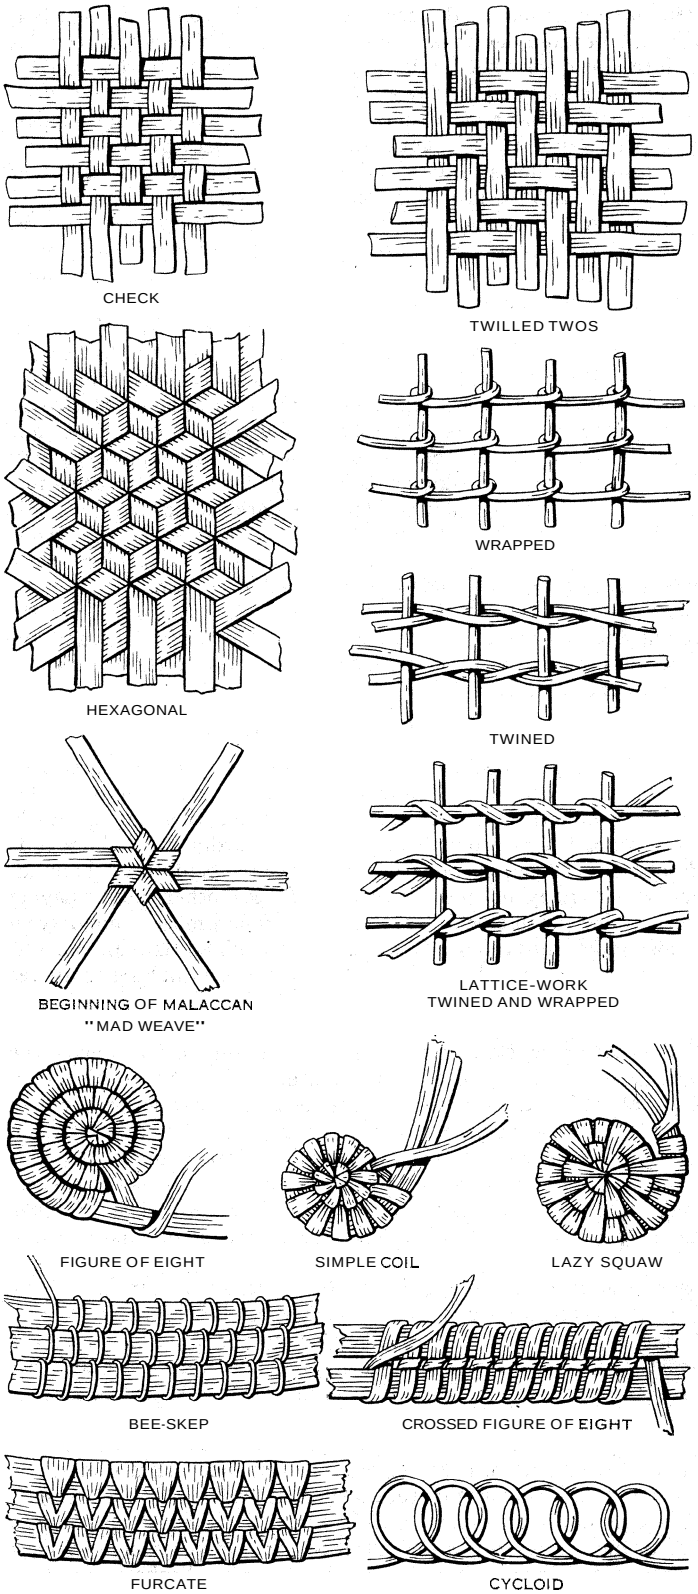

FIG. 1.—MAIN VARIETIES OF PLAITED AND COILED WORK USED IN THE CRAFT OF BASKETRY

which appear only on the surface. The imbricated basketry of the Indians of the American northwest (Washington and British Columbia) is an ingenious example. The surface weft is doubled back before being stitched to the coil, and the coil stitch is concealed under it.

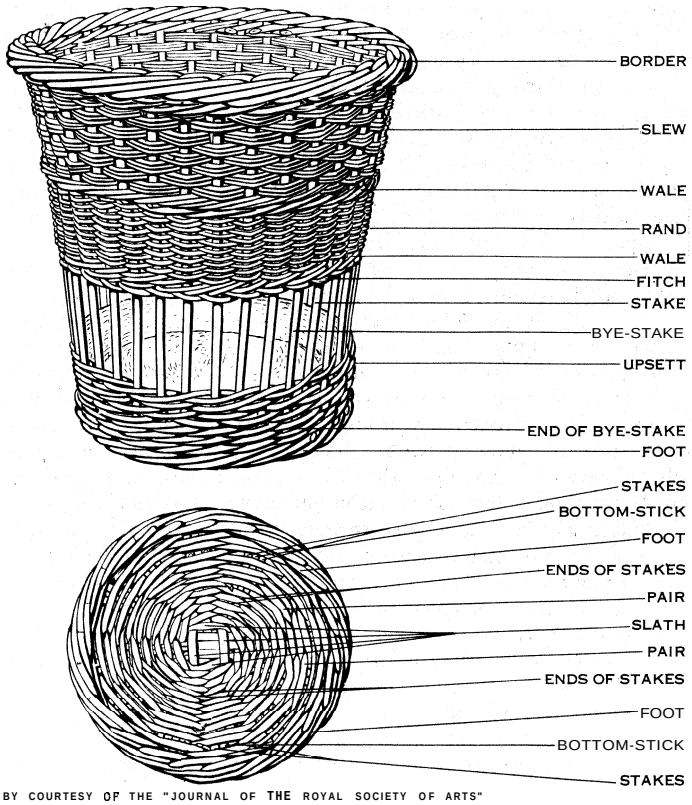
Decoration and Design.—Skilled basketmakers take pride in the closeness and evenness of their sewing or weaving as well as in the over-all balance and symmetry of their finished products. Intricate designs are evidence of the maker's manipulative skill. The introduction of designs into coiled basketry is especially difficult because the maker must have the entire design in mind before she begins her work. Once the basket is started she can make no changes. Copying an old basket is the easiest and surest way of obtaining good results. In woven basketry the medium also places limitations upon design forms. Because the elements cross one another at angles and at regular intervals, designs tend to be straight-lined geometric ones—steps, diamonds, zigzags, triangles and hollow squares. Life forms, rarely attempted in designs on old baskets, were encouraged by the tourist trade. Some primitive basketmakers give naturalistic names to their geometric designs. Thus the Chitimacha Indians of Louisiana call a meandering line "worm track," a black spot in the centre of a white cross "blackbird's eye," small chevrons "mouse tracks" and a diamond-shaped motif "little fish." These Indians achieved a four-colour effect by dyeing some of the canes black (black walnut), some yellow (a certain root). some red (another root) and leaving other canes in their natural colour. Vegetable dyes have been widely used. Striking effects are also obtained by using materials of contrasting colours. Thus the dark redbud-bark triangles on Pomo burden baskets stand out from light sedge root backgrounds. Some peoples decorated baskets by attaching shells, beads or feathers to them. This added decoration might completely conceal the basketry material itself. Examples are the handsome feathered gift baskets of the Pomo Indians and the cowrie shell-decked baskets made by Negroes of the Cameroons and northern Nigeria.

MODERN BASKETRY

Basketmaking declined as a common craft in the first half of the 20th century. The demand for cheaper containers led to the production of substitutes for baskets that can be made more quickly and economically of wood, cardboard, light metals or plastics. Also, the relatively low wages paid to basketmakers forced many of these craftsmen to seek other, better-paying work. The professional basketmaker is found most commonly in industrially undeveloped regions where skilled labour remains relatively cheap. In industrial areas basketmaking survives primarily as an employment for physically handicapped craftsmen or as a hobby for amateurs.

Basketmaking skill was a matter of family pride among the mountain white population of Kentucky and North Carolina. After World War II, however, their basketry production declined sharply. Many members of the older generation of craftsmen died, while the younger persons accepted more remunerative employment. In some sections of the rural south Negro basketmakers offer their wares for sale at roadside stands. The Cherokee Indians of North Carolina have been among the most active basketmakers in the United States. A high proportion of the baskets sold in the United States, however, are imported. Many florists' baskets are woven in Europe (especially Germany, Poland, Yugoslavia and Italy). Novelty baskets are imported from the orient (especially Japan), Latin America and Europe. Many gift baskets are woven in Mexico, from a coarse reed called tule or from palm in natural colour or dyed in several bright hues. Mexican basketry styles vary from town to town. In addition to containers, Mexican basketry export items include mats, sombreros, fans and handwoven miniature horses and riders of tule. Among the commonest and most useful basketry articles imported into the United States are rattan furniture from Hong Kong, women's summer handbags from Japan and laundry baskets made in Madeira.

In London the Worshipful Company of Basketmakers, one of the city's oldest craft guilds, remains active. Other important basketmaking centres in England are Birmingham, Lancashire, Yorkshire and Somerset. The English basketmaker is required to serve an apprenticeship of three years. A large proportion of them are physically handicapped persons.



BY COURTESY OF THE "JOURNAL OF THE ROYAL SOCIETY OF ARTS"

FIG. 2.—CONSTRUCTIONAL PARTS OF A SIMPLE WICKERWORK BASKET
The modern process of manufacture differs little from that employed by primitive weavers several thousand years ago

The willows commonly used in English basketmaking grow best in medium-weight clay soil. The withies are cut in winter, sorted into lengths and graded, boiled for several hours in large tanks, then peeled. Among the common products of modern English basketry are trade hampers, laundry and shopping baskets, pram and cycle baskets, wicker chairs and tables, garden furniture, picnic and fishing baskets, dog and cat baskets and wicker dog kennels. The basketry panniers of British air-borne divisions in World War II were so strongly made that they were dropped without parachutes.

How Baskets **Are** Made.—Reference to the accompanying illustration will help the reader to understand some of the methods employed in modern basketmaking and some of the terms commonly used by basketmakers in describing their work. The foundation of the round or oval basket is the slath formed by interweaving one series of parallel rods with another series crossing the first one at right angles. The stakes which comprise the rigid framework of the sides are driven in at each side of the bottom sticks. The bye-stakes are merely inserted in the upset. The commonest weaves (or strokes) employed in the construction of an ordinary basket are: the rand, a single strand manipulated in a simple over-and-under weave; the slew, two or three parallel strands employed instead of one; the fitch, two strands worked alternately one under the other; the pair, two strands worked alternately one over the other (used especially in filling up bottoms and covers of round or oval baskets); and the wale or three-ply or more coil weave, three or more strands worked alternately, forming a binding course. Plaiting and other weaves are used in bordering and finishing.

In addition to willow, several other materials are commonly grown and sold commercially for use in basketmaking. Among the commonest are: pulp reed in several thicknesses, the thickest of

which (no. 10) generally is used for stakes; Hong Kong grass, a strong grass twine sold in hanks of twisted strands weighing three to four pounds per hank; cane, used especially for chair seats; and rush, employed for the same purpose. Raffia is much used by young people's handicraft projects for making imitations of American Indian coiled basketry.

"Machine-Made" Basketry. — In the United States the term "basket" is applied to a variety of containers used in the transportation and storage of fresh fruits and vegetables. The standard sizes of these "baskets" were prescribed by the Standard Container acts of 1916 and 1928, administered by the Production and Marketing administration of the U.S. department of agriculture. Five types of baskets are specified in these acts: (1) berry and till baskets, (2) hampers, (3) round stave baskets, (4) climax baskets and (5) splint or market baskets. Of these only the market baskets are true baskets in the sense that they are made by interweaving of elements. The other "basket" types are constructed by overlaying. bending, binding and stapling wooden staves or pieces of wood veneer. They are made wholly or partially by machinery.

Many patents have been issued for labour-saving basketmaking machinery. As early as 1847 a patent for a machine for preparing basket splints was issued to A. and G. Van Riper of Bergen county, New Jersey. The first fully automatic "basketmaking" machine was patented by Emmett Horton of Dundee, N.Y., Nov. 27, 1894. This machine assembled Concord grape "baskets" of wood and metal; it did not weave them. So-called machine-made baskets adopted the name but not the technology of the basketry craft. No satisfactory automatic basket-weaving machinery has been perfected. True basketry, therefore, remains a handicraft.

BASKETBALL. The only major sport of strictly U.S. origin, basketball was invented in Dec. 1891 by James Naismith (1861–1939), a Canadian, a graduate of McGill university and Presbyterian Theological college: who went in 1890 to the International Young Men's Christian Association training school (now Springfield college) at Springfield, Mass., as a student in physical education. A year later he became an instructor. An outstanding athlete at McGill, an incident in a rugby contest convinced Naismith, as he later wrote, that "there might be more effective ways of doing good besides preaching." He decided to "drop the ministry and go into this other work." (*Basketball, Its Origin and Development*, p. 23, Association Press, New York, 1941.)

The students at Springfield, studying to become Y.M.C.A. secretaries, were bored with the Swedish, German and French forms of calisthenics of that period. To fill the void that existed between football and baseball, Luther Gulick, head of the physical education department, asked Naismith to devise an indoor game. After several unsuccessful attempts to modify popular outdoor games for indoor use, he prepared a set of 13 rules embodying 5 principles that still govern the game:

1. There must be a ball—large, light and handled with the hands.
2. There shall be no running with the ball.
3. No man on either team shall be restricted from getting the ball at any time it is in play.
4. Both teams are to occupy the same area, yet there is to be no personal contact.
5. The goal shall be horizontal and elevated.

A pair of peach baskets, nailed to the balcony 10 ft. above the floor, became the goals. The class of 18 was divided into two 9-man teams.

The game instantly became popular and the students, no longer recalcitrant, were eager to introduce the game in nearby localities. Upon hearing of basketball's immediate acceptance, many wrote to Springfield for copies of the rules. During the summer of 1892, several of the students took up new positions in various Y.M.C.A.s and in foreign countries, thus popularizing the game. At Cornell in 1892, class basketball was played with 50 on a side. Geneva college (Beaver Falls, Pa.) and the University of Iowa are believed to be among the first colleges to play the game, but it was its acceptance by Yale in 1894 that induced other institutions to follow suit. The game was played in Canada in 1892, and was introduced in France in 1893 by Mel Rideout who also demonstrated it in London in June 1894 on the 50th anniversary of the founding of the Y.M.C.A. (*see* also *International Basketball*, below).

RULES AND EQUIPMENT

Originally, players had a choice of three kinds of uniforms: knee-length trousers, borrowed from football; jersey tights, as commonly worn by wrestlers; and short padded pants, forerunners of today's uniforms. The original soccer ball was soon replaced by a larger, laced ball, which, in 1937 gave way to the laceless ball, and in 1941, to the molded ball. In 1893, the Narragansett Machine Co. of Providence, R.I., made the first hoops. Originally a ladder was used to remove the ball from the net following each successful throw. Later a pole was used to retrieve the ball, then a chain fastened to the bottom of the net with a cord that extended within reach of an official. Subsequently, a hole was cut in the net, thus permitting the ball to fall through. In 1895, a 4 × 6-ft. screen was introduced for a backboard to prevent spectators from interfering with any toss. Glass backboards were legalized by the professionals in 1909. Fan-shaped backboards were made legal in 1940–41 and the transparent backboards, although commonly used in public auditoriums since the mid-1930s, were finally authorized in 1946–47.

In the early days, the courts were of irregular shapes with occasional obstructions such as pillars, stairways or offices that interfered with play. In 1903, it was ordered that all boundary lines must be straight. In the early years, the number of players upon a team varied according to the size of the playing area but in 1895 the number was set at five. Gulick rewrote the rules through questionnaires mailed to numerous groups and individuals until he helped form the first official rules committee in 1896. The composition of this committee, as with the girls' rules committee, has varied through the years with the withdrawal and return of certain bodies. In 1913 there were as many as five sets of basketball rules: the collegiate, Amateur Athletic union-Y.M.C.A., state militia groups and two varieties of professional rules.

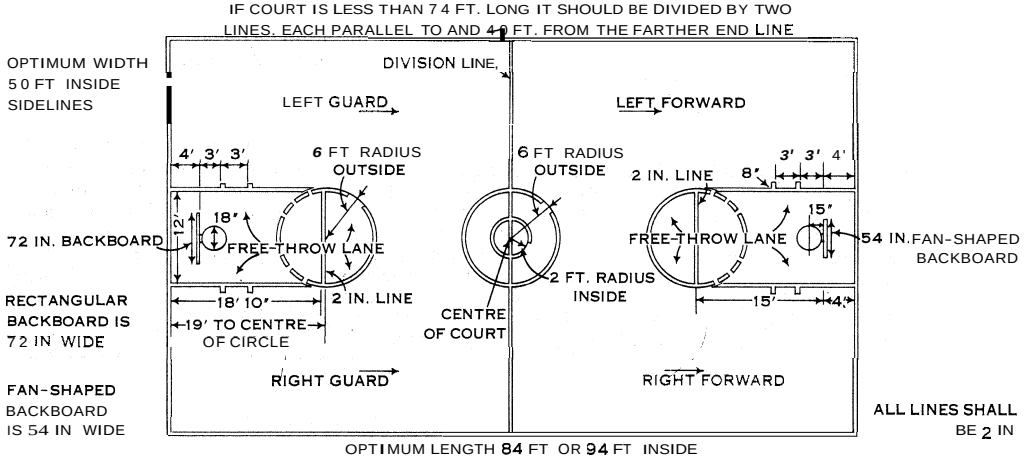

DIAGRAM OF BASKETBALL COURT

(Left) Large backboard for college games; (right) smaller backboard for high school, Y.M.C.A. and A.A.U. optional

Growth of Game. — Major

collegiate rules changes over the years were as follows:

1894–95—Free-throw line moved from 20 to 15 ft of basket
1895–96—Field goal changed from 7 to 2 points, foul shots from 3 to 1 point.
1897–98—Player could not touch ball with both hands more than once.
1900–01—Dribbler could not shoot for a basket. This restriction was withdrawn in 1908–09.
1905–06—Colleges formed own rules committee until 1915, when the National Collegiate Athletic association, the Amateur Athletic union and the Y.M.C.A. formed joint rules committee.
1909–10—Player disqualified upon committing his fourth personal foul. Glass backboards legalized.
1913–14—On out-of-bounds ball, opponent of last player to touch ball would put it into play. Bottom of net left open.
1918–19—Player may re-enter once. Before this, once player left game, he could not re-enter.
1920–21—Backboards moved in 2 ft. from walls of court, This prevented players from "climbing" up wall for a shot and also cut down the number of out-of-hound plays on ends of the court.
1921–22—Running with the ball became a violation, no longer a foul.
1923–24—Each player, when fouled, must attempt his own free throw. Heretofore, each team had its most accurate marksman attempt all free throws.
1929–30—The double referee system was introduced.
1930–31—Maximum circumference of ball was reduced from 32 to 31 in., its maximum weight from 23 to 22 oz.
1932–33—It became mandatory lor a team, under penalty of forfeiting possession of the ball, to advance the ball beyond mid-court within 10 sec. No player may stand within the foul lane with the ball for more than 3 sec.
1934–35—Circumference of ball was set at 29½ to 30¼ in.
1935–36—Player may re-enter a game twice.
1936–37—To limit effectiveness of extremely tall players from securing easy baskets, no member of a team having the ball was allowed to stand—with or without the ball—more than 3 sec. within the foul lane. The number of time-outs allowed a team was increased from 3 to 4.
1937–38—The laceless ball mas made legal. The centre jump, after a field or foul shot, was eliminated; the ball was put into play from out-of-bounds on the end line where the last score was made. Any defensive player was prohibited from interfering with the ball if his arm or hand touched the other team's basket.
1938–39—Circumference of the ball was reduced to 30 in. Teams were granted 5 time-outs.
1939–40—Backboards were moved in 4 ft. from the end line to eliminate frequent stepping out-of-bounds.
1940–41—Fan-shaped backboards were legalized.
1944–45—The number of allowable personal fouls per player was increased irom 4 to 5. Goal tending became illegal, a defensive player no longer could touch a ball upon its downward flight while the ball was above the level of the hoop. Teams were permitted to substitute players without restriction.
1946–47—Transparent backboards were authorized.
1948–49—Players were permitted to consult their coaches during a time-out.
1949–50—The molded ball was made the official ball.
1956–57—The free-throw lane was widened from 6 to 12 ft.

Synopsis of Rules.— The National Basketball committee of the U.S. and Canada meets annually to formulate rules for the N.C.A.A., National Federation of State High School associations. the Y.M.C.A., the Canadian Intercollegiate Athletic union and Canadian Amateur Basketball association. Rules for women, professional and international basketball groups vary slightly.

The college and high school basketball rules follow:

Equipment.—The ideal playing court (see diagram) for colleges and adult groups is a rectangular surface, free from obstructions, measuring 94 × 50 ft.; for teams of high school age, 84 × 50 ft. In the latter case, if the court should be less than 74 ft. long, it is divided by two lines, each parallel to and 40 ft. from the farther end line, thus providing a greater front court.

The backboard is of flat, rigid material, midway between the sidelines, 4 ft. in from the end lines. There are tn-o styles of backboards: rectangular 6 ft. horizontally and 4 ft. vertically (it may be transparent) or fan-shaped, 54 in. wide with a 29 in. radius from centre base to the top. The top of the rectangular backboard is 13 ft. above the floor and the fan-shaped board is 12⅔ it.

The basket, rigidly attached to the backboard, is a metal ring ⅝ in. thick, painted bright orange. with an 18-in. inside diameter, 10 ft. above and parallel to thr floor, with the nearest inside point of the ring 6 in. from the surface of the backboard.

The cord of the net is to be from 120 to 144-thread seine twine, and so constructed as to check the ball momentarily as it passes through.

The ball is spherical, of the molded type, 29½ to 30 in. in circumference, weighing 20 to 22 oz., inflated so that, when dropped to a solid wood floor from a height of 6 ft., it should rebound to a height of from 49 to 54 in.

Officials.—The officials shall consist of a referee, umpire, two timers and two scorers. The referee shall check and approve all equipment, the timers' and scorers' signals and the score at the end of each period.

The National Association of Approved Basketball Officials, founded in 1920, trains officials and governs the ethics of referees who officiate almost every college and high school contest played in the U.S.

Players and Substitutes.—Each team shall consist of five players, one who will act as captain and who shall speak to the official on matters of interpretation of rules and essential information in a courteous manner. A substitute may enter a game upon reporting to the scorers and being recognized by the referee. There is no limit upon the number of substitutions a team may make. All players must wear numbers on front and back of shirts. Home teams wear white or light uniforms, road or visiting teams wear dark uniforms. Numbers 1 and 2 must not be used, and it is recommended that no number have a digit greater than 5.

Scoring and Timing.—The visiting team has the option of choosing either basket for the first half and the teams change baskets for the second half. If a player tosses the ball into his opponents' basket, it shall count for his opponents.

A successful toss from the floor (field goal) counts 2 points. A successful free throw from the foul line counts 1 point. The team with the greater number of points at the end of the playing time shall be declared the winner.

For teams of college and adult age, a game consists of two zo-min. halves, with a 15-min. half-time intermission. Teams of high school age play four 8-min. quarters, with a 1-min. intermission between quarters and 10 min. between halves; for teams younger than high school age, 6-min. quarters are recommended.

In the event of a tie upon the expiration of regulation playing time, teams of college age play as many 5-min. extra periods as are necessary to decide the contest. High school teams play an extra period of 3 min. If, at the conclusion of that overtime, the score is still tied, the game shall continue, after a 1-min. intermission, with as many extra 3-min. periods as needed until one team has acquired a 2-point lead. The game thus ends at that point, called "sudden death."

If any period terminates after the ball has left a player's hand, the toss, if successful, shall count. The decision of the referee at all times is final.

A team may have five 1-min. time-outs during regulation time and an extra time-out for each overtime period played. Any additional time-out requested incurs a technical foul.

Time-out occurs and the game clock stops when an official signals a foul, jump ball, unusual delays in getting a dead ball alive, or for an injury or a conference with the scorer or timer. A player also may request a time-out while his team has the ball or when play is suspended.

Fouls.—Basketball is a noncontact game. A player may pass or bounce (dribble) the ball to secure a position whereby he or a teammate may make a successful toss from the floor. A foul is committed whenever one player makes such contact with an opponent so as to put him at a distinct disadvantage. It provides the offended player with an unhindered throw for a goal from behind the foul line, which is 1j ft. irom the basket. If the offended player was fouled while in the act of shooting, he has two free throws if he missed his shot—one free throw if his toss was successful. Unsportsmanlike conduct by a player or coach incurs a technical foul and possible banishment.

Violations.—A violation occurs when a player (with the ball) takes an excessive number of steps; causes the ball to go out-of-bounds; steps over the foul line while tossing for a iree throw; steps over the end line while tossing the ball in to a teammate or fails to pass the ball in within j sec.; runs with, kicks or strikes the ball with his fist; dribbles a second time after having once concluded his dribble; remains more than 3 sec. in his free-throw lane while he or his team has the ball; causes the ball to go into his hackcourt; or retains the ball in the backcourt more than 10 sec. Penalty is loss of the ball—opponents throw in ball from the side.

Definitions.— Basketball terms and definitions are as follows:

Dribble.—This is ball movement by a player who taps the ball in the air or to or on the floor and then touches (bounces) it one or more times. A dribble ends when a player touches the ball with both hands simultaneously or loses contact with it.

Held Ball.—&'hen two opponents have one or two hands so firmly upon the ball that neither can gain possession without undue roughness it is called a held ball. It occurs in the front court when a player is so closely guarded that he cannot pass or try for a goal or is obviously withholding the ball from play.

Jump Ball.—A method of putting the ball into play. The referee tosses it up in one of the three circles between two opponents who try to tap it to a teammate.

Pass.—Throwing, batting or rolling the ball to another player. is a pass. The main types are (1) the chest pass—the ball is released from a position in front of the chest; (2) the bounce pass—the ball is bounced on the floor to get it past a defensive opponent; (3) the roll pass on the floor; (4) the hook pass (side or overhead); and (5) the baseball pass

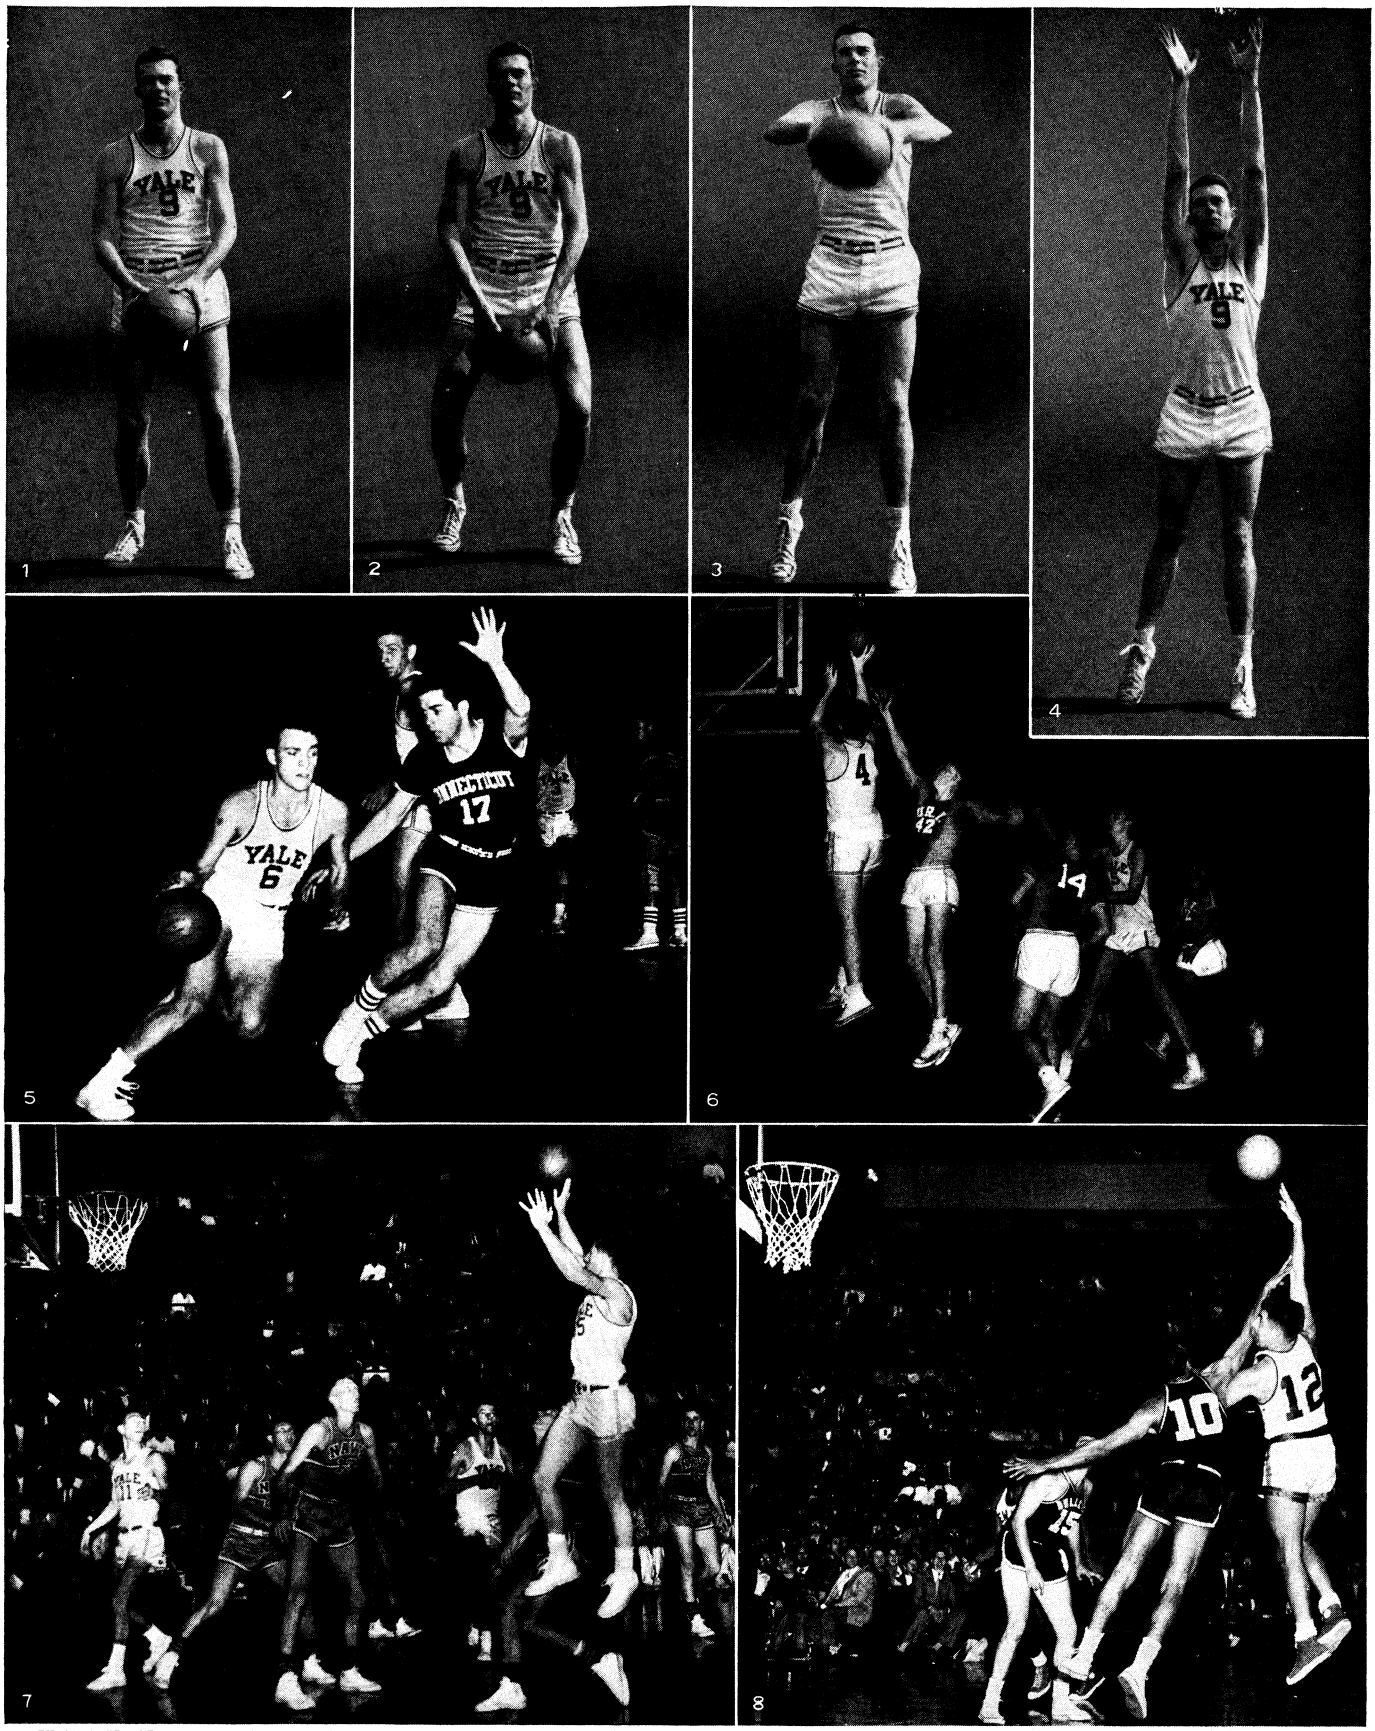
AN EARLY BASKETBALL TEAM AND COURT STRATEGY

1. The Yale university team of 1896–97, the first to play a game of college basketball with five men on a side (*v.* University of Pennsylvania, March 20, 1897).
2. The centre jump, start of the game
3. The rebound. Control under the basket is a major factor in team play
4. Shifting zone defense, with the ball outside at a guard position
5. Shifting zone defense, with the ball inside at a forward position
6. Man-to-man defense demonstrated on an outdoor court

BASKETBALL



BY COURTESY OF (1–4) THE SEAMLESS RUBBER CO., (5–8) HOWARD HOBSON; PHOTOGRAPHS, (5) HERBERT C. EDGAR, JR., (8) WILLIAM N. JACOBELLIS

SOME BASIC BASKETBALL SHOTS AND TECHNIQUES

1-4. Correct body positions for the free throw
5. The dribble. Offensive player keeps body and ball turned away from defensive player
6. Short, or lay-up, shot under the basket
7. The jump shot from outside
8. The hook shot

—a pass is made a longer distance with one hand in a manner similar to a baseball throw.

Shots From the Field.—The main field shots are: the lay-up (the shooter jumps and lays the hall against the backboard so it will rebound into the basket) and the over-the-rim shot (the player jumps and shoots or lays the ball over the rim). From a distance of 12 to 24 ft. from the basket many players use a one-hand shot from a stride, jump or standing position, and a hook shot, which is overhead. From longer range, so-called set shots may be the two-hand shot starting from a chest position or the one-hand shot.

Free-Throw Shot.—This shot may be the one-hand, two-hand chest or underhand toss style.

Pi-tot.—A movement which takes place when a player with the ball steps once or more than once in any direction with the same foot while the other foot (pivot foot) is kept at its point of contact with the floor.

Rebound.—This occurs after any try for a basket from the floor or foul line is unsuccessful but the ball does not go out-of-bounds and remains in play, both teams attempting to gain possession of the ball.

Running With the Ball (*Traveling*).—A term which denotes progressing in any direction in excess of the prescribed limits while holding the hall.

Screen.—This is legal action of a player who, without causing contact, delays or prevents an opponent from reaching his desired position.

Blocking.—Any personal contact which impedes the progress of an opponent who does not have the ball is called blocking.

Live Ball.—The ball when it is in play; dead ball is one not in play.

PLAYING THE GAME

Each period starts with an official putting the ball in play by tossing it up at centre court between the opposing centres. usually the tallest member of each team or the one who can jump the highest. After each successful basket or foul shot the ball is again put in play by the team that is scored on tossing in the ball from behind the end line where the score was made. As basketball progressed. various teams and coaches devised skillful plays or maneuvers to facilitate their offensive movements. Some systems put the emphasis upon speed and high scores, others upon ball possession and intricate ball handling, definite play patterns and low scores.

Defense also developed over the years. There are two kinds of major defense patterns with numerous variations of each. One is called man-for-man defense, whereby each player guards a specific opponent wherever he moves except when it might be better for him to guard another player in a more threatening scoring position. in which instance a teammate guards his opponent. This is called "switching." The other is the zone or 5-man defense. In this system a player guards a specified area irrespective of which opponent plays in that area. The pressing defense exists when a team guards an opponent so thoroughly that it forces the opposition to hurry its movements, especially to commit errors.

According to a study completed by Howard Hobson and reported in his *Scientific Basketball,* the average U.S. college team, in an average game, tries 68 shots a game, converting 24; attempts 32 free throws. making 21; and scores 69 points. There are approximately 102 rebounds in an average game, 11 jump balls, 21 personal fouls, 17 occasions when the ball is lost on misplays and 14 interceptions.

The game, while largely a winter sport, is played in the U.S. on a 12-month basis in summer playgrounds, churches, schools, municipal and industrial halls, schoolyards, backyards. Y.M.C.A.s, etc.—often on an informal basis between two or more players. Youngsters are known to start playing as soon as they can lift an undersized basketball.

"Biddy" basketball was introduced in 1950 for youngsters less than 12 years old with the ball smaller than the official ball and baskets lowered to 8 ft. above the ground. An international tournament is held annually in the city of the defending champion. Junior high schools and grammar schools also hold intracity tournaments.

BIG TIME BASKETBALL

Intersectional college contests were a rarity up to Dec. 29. 1934 when Ned Irish, former New York city newspaperman, introduced big time basketball at Madison Square Garden with Notre Dame meeting New York university and St. John's playing Westminster (Pa.) college before an audience of 16.138. Other arenas in principal cities followed suit as air travel permitted teams, especially during the Christmas recess, to cover tremendous distances, even from coast to coast. Some teams participated in as many as nine games upon such excursions. Such innovations brought about a more uniform interpretation of officiating and helped introduce new styles of shooting, offense and defense and focused even greater attention on the game and its better-known players. In the second half of the 20th century as many as 40 pre-season tournaments have been staged in all sections of the nation, largely in December, thus allowing colleges to face opponents or appear in areas they otherwise would not reach.

During the mid-1920s and again after World War II, many colleges and universities constructed large field houses that helped popularize the game even more. *See* also STADIUM.

Tournaments.— The first A A U. tournament, staged in 1897, was won by the 23rd street Y M C.A. of New York city Curiously, while the Y M C A. was prominently identified with the growth of the game, it did not hold its first national tournament until 1923 Naismith played a prominent role in the inception of the first national collegiate tournament, in 1938, through the National Association of Intercollegiate Athletics which consists largely of 450 of the smaller colleges. In that same season, the New York city basketball writers organized the National Invitation tournament, annually played at Madison Square Garden under the auspices of the Metropolitan Colleges association. In 1939 the N C.A A. started its tournament, now called the university division, and, to accommodate its smaller college members, the so-called college division in 1957.

Players and Coaches.—Some of the leading college players over the years have been John Schommer, University of Chicago, 1909; Forrest DiBernardi, Westminster (Mo) college. 1921; Howard Cann, New York university, 1920; Vic Hanson, Syracuse university, 1927; John Wooden, Purdue university. 1932; Jack McCracken, Northwest Missouri State college, 1933; Edward McNichol, University of Pennsylvania, 1917; Hank Luisetti, Stanford university, 1938; Mike Novak, Loyola university (Chicago), 1939; George Mikan, DePaul university, 1946, who was tabbed in the Associated Press poll of 1950 as the game's "greatest basketball player of the first half-century"; Bill Russell, University of San Francisco, 1956, greatest defensive centre of all time; and Wilt Chamberlain (7 ft. $1\frac{1}{16}$ in. tall), University of Kansas, 1959.

Basketball statistics first came into prominence in the early 1930s and records of most college teams and players are maintained by national bodies on a weekly and seasonal basis. Throughout each season, coaches, radio, television, newspaper and magazine writers participate in numerous all-America, sectional, tournament, state and conference polls to provide greater recognition to the more outstanding teams and players. Upon a more local scale, high school players are named to all-conference, district and all-state teams.

Among the game's more prominent and successful coaches have been Forrest C. Allen, who, upon his retirement in 1956, had coached 49 teams to 770 wins and 233 losses; Adolph Rupp, of Kentucky, with the best all-time coaching percentage; W. E. Meanwell, H. C Carlson who introduced the "figure eight" in the late 1920s; Henry Iba, the greatest exponent of the ball-control game; and Frank W. Keaney, who introduced the "race horse," high-scoring game in the early 1940s.

Spectators.— Basketball is played before more spectators in the U S. than any other sport The nation's 19,000 high schools perform before 100,000,000 fans in any season. The state of Indiana reports 10,000,000 fans in one season and the various elimination and final rounds of the state tournament draw more than 1,000,000. The Minnesota State High School championship final at the University of Minnesota's Williams arena draws over 19,000 annually. U.S. colleges attract between 15,000,000 and 20,000,000 fans in any season.

INTERNATIONAL BASKETBALL

Y.M.C.A. instructors from the United States introduced basketball to other countries soon after the turn of the 20th century.

U.S. soldiers took the game to the Philippines in 1900, and U.S. service teams further developed the game in Europe after World War I. The biggest influence, however, came from U.S. service teams during and after World War II. Thousands of these teams played basketball in many countries and increased interest and participation outside the U.S. Girls and boys both play, and outdoor courts predominate.

Basketball was demonstrated at the 1904 Olympic games, played at the inter-Allied games in Paris in 1919, and 21 nations sent teams to the Olympic games at Berlin in 1936. The game was a part of the Olympic games (*q.v.*) schedules thereafter.

The development of air travel aided international basketball, and many games and tournaments are held each year. The Harlem Globetrotters, for example, have played all over the world to huge crowds.

U.S. college and other amateur teams have toured Europe, South America, the far east and other areas. On one tour the Yale university team played 30 games in eight countries of South America in less than two months. There were also visits of teams from other countries to the U.S. after 1943, when the University of Havana defeated Long Island university in Madison Square Garden.

Basketball is second only to soccer as an international sport. International tournaments in addition to the Olympic games include the Pan-American games, the national A.A.U. championships and numerous annual sectional tournaments such as the European, Mediterranean and South American. The International Federation of Basketball, with representatives from many countries, formulates rules and policies for the international games.

WOMEN'S BASKETBALL

Girls'basketball was first played by teachers of the Buckingham grade school of Springfield. Mass., soon after the game was founded. The women were accustomed to paying periodic visits to the college gym and, on taking an interest in the new game, asked that they be permitted to play it too. One of these teachers was a Maude Sherman, who later became Mrs. Naismith. Smith college, in 1892, became the first women's college to play basketball although it always has been upon an intramural basis.

Clara Baer, who introduced the game at Newcomb college in New Orleans, La., had a hand in fashioning the women's style of play with her set of women's rules, published in 1895. On receiving a diagram of the court from Naismith, Miss Baer mistook dotted lines, indicating the areas wherein the players might best execute team play, to be restraining lines with the result the forwards, centres and guards confined their activity to specified areas. This seemed appropriate since many felt that the men's game was too strenuous for women. Women's rules over the years frequently have been modified; there are six players on a team, instead of five as in men's basketball. and the court is divided so that the three forwards play in the forecourt and do all the scoring, while the three guards are confined to the back court.

Few women's colleges participate upon an intercollegiate basis. Most high schools girls' teams play preliminary to the boys' varsity games. However, girls' basketball is so popular in Iowa that the annual state elimination draws more than 250,000 spectators.

Among the more outstanding girls' teams of all-time, the Baskin (La.) high school team won 218 in a row, 1947–53, and the Wayland (Tex.) Flyers concluded their 1956–57 season with 104 wins in succession. The Edmonton Grads of Canada, former students at the McDougall Commercial school of that city, played from 1915 to 1940, winning 502 of 524 games—78 successively.

PROFESSIONAL BASKETBALL

In its early years, basketball became so popular at the various Y.M.C.A.s that the organization banned the sport because the contests monopolized the use of the gymnasiums which formerly were available to five or six times as many members. In 1897, the North branch of the Philadelphia Y.M.C.A. outlawed the game and the disgruntled members dropped their membership and formed independent teams that played in social halls, armouries, vacant warehouses and public auditoriums before paid gatherings. The first team to exact a profit from such contests was the Trenton (N.J.) team whose captain, Fred Cooper, former Princeton soccer coach and subsequent recreation director for Trenton, was paid off first and thus became basketball's first professional.

The professional game prospered in Philadelphia, New York city and Worcester, Mass. The first great professional team was the BuffaloGermans, members of the Buffalo Y.M.C.A. who organized in 1895 as 14-year olds and, with newcomers, played together for 44 years, winning 792 out of 878 games. They traveled throughout the nation and at one point won 111 games in a row.

Some of the more prominent stars of the early years were Harry Hough. Lew and Ed Wachter. Jack Inglis, Winnie Kinkaid, Willie Kummer, Joe Fogarty and Andy Sears.

Possibly the most famous of professional teams was the Original Celtics, largely consisting of players from the sidewalks of New York city, organized in 1915 and disbanded in 1928. They were managed by James and Thomas Furey, and then by Tex Rickard and, through the occasional addition of superior players, were regarded as the game's best by 1919. In their heyday their stars were "Horse" Haggerty; Chris Leonard; Johnny Beckman, the highest paid; Dutch Dehnert, who invented the pivot play; Nat Holman; Pete Barry; Dave Banks; Ernie Reich; Benny Borgman; Joe Lapchick and Elmer Ripley. The Celtics played every night and almost exclusively on the road. During the 1922–23 season, they won 204 of 215 games, rarely lost a series to an opponent and, in one Sunday afternoon-evening doubleheader against the Cleveland Rosenblooms, appeared before 22,000 spectators.

The first professional league was the National Basket Ball league, formed in 1898 largely to protect the players against unscrupulous promoters and to save the sport from extinction because of rough play. The game differed from the college rules in that a netting separated the players from the spectators and players bounced off the ropes like prize fighters in a ring. There was no outside ball. Because of the inequality of the teams or inability of some clubs to meet expenses, leagues did not survive for more than three or four seasons and such circuits as the Inter-State, Western Pennsylvania. Philadelphia, Central, Eastern, Hudson River, New York State and American leagues successively came into existence. As a rule, the same players performed in all the circuits, some playing for several cities or clubs in the same season.

The depression of the 1930s hurt professional basketball and the new National league was organized in 1938 in and around the upper midwest but the play-for-pay ranks took on major league status in 1946 with the organization of the Basketball Association of America under the guidance of Walter A. Brown, president of the Boston Garden. This organization and the National league combined in 1949, after a costly players' war, to form a 17-team National Basketball association which attracted the top college stars. Weaker clubs were dropped until by 1954–55 only eight remained In 1961 a ninth team was added and a rival organization, the eight-team American Basketball league began competition.

The professional game was saved through three radical changes during the 1954–55 season: (1) the 24-sec. rule which forced a team to make a try for a basket within 24 sec. after acquiring possession of the ball; (2) a bonus free throw anytime the opposing team committed more than six personal fouls in a quarter or more than three personal fouls in any overtime; and **(3)** two foul shots for any backcourt foul.

The Harlem Globetrotters, organized in 1927–28, hold a unique position and are considered to be one of the greatest basketball attractions in the world. Three units annually appear on all seven continents.

BASLE: *see* BASEL.

BASNAGE, JACQUES (1653–1723), minister of the French

Reformed Church, remarkable for his historical and patristic learning, was born at Rouen on Aug. 8. 1653, of a distinguished Norman Huguenot family. He studied classics at Saumur and theology at Geneva under Francis Turretin and at Sedan under Pierre Jurieu. He nas ordained to the ministry at Rouen in 1676, but because of the revocation of the Edict of Nantes in 1685 his congregation was proscribed. Basnage, however, was permitted to withdraw to Holland. where he received a refugee's pension until he was appointed to the Walloon Church at Rotterdam in 1691. There he opposed Jurieu for sympathizing with the revolt of the Camisards (*q.v.*), since Basnage, like Calvin, repudiated the right of the subject to revolt against royal authority. In 1709 he was appointed to the French church at The Hague. By his part in assisting the grand pensionary A. Heinsius in preparing for the peace of Utrecht, his skill became known to the French diplomatists who sought his guidance at The Hague from 1715 in negotiating the treaty of the triple alliance of 1717. Basnage obeyed the French government's request for his aid. when renened Protestant revolt was threatened, by writing *Instructions pastorales aux réformés de France sur l'obeissance due au souverain* (1720). He hoped, in vain, to be able to use his influence with the French government to obtain relief for Protestants. He wrote *Annales des provinces unies* (1719) after being appointed Dutch historiographer, but his chief historical works, among 25 other writings, nere *Histoire des Juifs* (1706; Eng. trans. 1708) and *Histoire de l'église* (1099)—incorporating his earlier *Histoire de la religion des églises réformées* (1690)—in which patiently and with great erudition he rebutted Bossuet's *Histoire des zariations des e'glises protestantes* (1688), which attacked Protestantism.

See A. Mailhet, *Jacques Basnage* (1880) ; E. and *E.* Haag, *La France Protestante,* vol. i *(1877).* (B. H)

BASOCHE (BAZOCHE), an ancient French guild of clerks, from among whom legal representatives (*procureurs*) were recruited. This guild was even older than the guild of the *procureurs,* with which it was often at variance. It dated. no doubt, from the time when the profession of *procureur* (procurator, advocate or legal representative) was still free in the sense that persons permitted to render that service were not yet public and ministerial officers. For this purpose there was established near each important juridical centre a group of clerks, that is, of men skilled in law nho at first would probably fill indifferently the roles of representative or advocate. Such was the origin of the *Basoche* of the *parlement* of Paris, which naturally formed itself into a guild, like other professions and trades in the middle ages. But this organization eventually disintegrated, dividing up into more specialized bodies: that of the advocates, whose history then begins; and that of legal representatives, whose profession was regularized in 1344. In early days, and until the first half of the 16th century, the *Basoche* was organized in companies in a military manner and held periodical reviews or parades *(ntontues),* sometimes taking up arms in the king's service in time of war. Later, satirical and literary entertainments, as well as public morality plays, were given by clerks of the Palais de Justice; these played an important part in the history of the national theatre, particularly in the development of French comedy.

See L. A. Fabre, *Etudes historiques sur les clercs de la basoche (1856).* (J. P. E ; **X.**)

BASQUE, a people who live in a region bordering the Bay of Biscay and encompassing the western foothills of the Pyrenees. The Basque territories in Spain comprising 6,824 sqmi. are the provinces of Navarre (Navarra) and the "Provincias Vascongadas," Guipuzcoa, Álava and Biscay (Vizcaya), and in France, Basse-Navarre, Labourd and Soule in the *de'partement* of Basses-Pyrénées. They are differentiated from other peoples of France and Spain by their traditional culture and language and by the sentiment of being Basques.

The population of the four Spanish provinces numbers 1,568,759, but this figure includes a considerable number of persons attracted from other parts of Spain to the industrial centres of the region, particularly Bilbao. Moreover, the inhabitants of the southern zone have lost something of their Basque character so that not more than 750,000 can be considered truly Basque. The French Basques number between 100,000 and 120,000. Few persons irom other parts of Spain or France have ever settled in the Basque countryside. On the other hand, many Basque surnames are found in other parts of Spain.

In physique the Basques are not notably different from the other peoples of western Europe, though the skeleton of the face is peculiarly narrow and orthognathism, or absence of forward protrusion of the jaws. is also very marked. They are, however, quite exceptional in the frequencies of their blood groups. They have a rather high frequency of blood-group 0 , an exceptionally low frequency of blood-group B and a frequency of Rh negative higher than any previously recorded. The frequency of the CDe chromosome is high and that of cDE the lowest recorded in Europe. These facts, combined with the unique character of the Basque language (*q.v.*), has led to the supposition that the Basques descend from a different, and more ancient, European people.

The land that they inhabit has a mild and damp climate and is largely hilly and wooded. It contains mines of iron ore which from early times favoured the development of industry, particularly shipbuilding. They farm small holdings of bottom land, carefully tended slopes of grass, which is cut by hand and fed to stabled cons, and apple orchards and mountain sheep pastures nhich are still communal in many instances. The farmhouses are grouped loosely into villages or are scattered over the lower slopes. The household is a physical and social entity of great permanence, in regard to the buildings, the farm and the family, and this permanence was formerly defended by a traditional law of inheritance that ensured the descent of the property, intact, to a single heir or heiress and condemned surplus children to celibacy or emigration. The attachment to the household is illustrated in many of their customs and it is common for men to be known by the name of their house rather than by their patronym.

The Basques are known for their honesty, energy and fidelity, for their agility in dancing and their fine voices, for their strong Catholicism and for their belief in witches—a reputation established and perhaps exaggerated by the famous campaign of the magistrate Pierre de Lancre against the sorceresses of Labourd in the early 17th century. Their ethnic solidarity and their position astride the Franco-Spanish frontier make smuggling one of their traditional occupations.

Not all the inhabitants of the Basque territories are typical. In the larger industrial towns, not only rural customs but the Basque language tend to be lost. It had already disappeared from the valley of the Ebro and southern Navarre by the end of the 18th century. Today it is barely spoken anywhere to the south or east of Pamplona. in most of Alava or in parts of Biscay. The areas where it is still spoken have best preserved their customs and are limited, roughly, to the zones of coastal humidity. Today, virtually all Basques speak French or Spanish.

An enterprising, seafaring people with a traditionally high birth rate, they have, from the beginning, played a leading part in the colonization of the new world. Communities of Basques are found in all the countries of Central and South America and in the western states of the United States, particularly Nevada and California, where their skill in pastoral farming and in the restaurant business has brought prosperity to many. An estimate of their numbers in the new world is not possible but there are probably 500,000 persons who are conscious of their Basque descent.

The early history of the Basques remains a subject for speculation, but Roman authors record the presence of the tribe of Vascones in lands corresponding somewhat to the province of Navarre. They appear to have resisted the Visigoths, the Franks, the Normans and, on occasions, the Moors who occupied the valley of the Ebro. It was the Basques, not the Moors as the *Chanson de Roland* relates, who cut the rear guard of Charlemagne's army to pieces at Roncesvalles in AD. 778.

At the end of the political turmoil of the middle ages the provinces of Álava, Biscay and Guipuzcoa are found united with Castile. The kingdom of Navarre was annexed by Ferdinand II of Aragon in 1513. However the Basques retained, in France as well as in Spain, a degree of local autonomy and privileges in matters of trade, taxation and military service. These were incorporated

in bodies of traditional la known as the *fueros* (*q.v.*) or *fors,* which determined the rights of the popular assemblies and the rules of inheritance. To these laws, the framework of their political and social organization, the Basques showed themselves much attached. Those of the French Basques were abolished by the Revolution. Recently, a more favourable attitude toward regional culture has been taken, and since the *Loi Daixonne* (1951) the Basque language. formerly outlawed in any official context, is admitted to state schools. In Spain the attempts of the state to encroach upon local privileges during the 19th century moved the Basques to support the cause of Don Carlos, with disastrous results. In the following period the ambition of political independence in the form of a Basque national state was formulated by Sabino de Arana Goiri, who founded the Partido Nacionalista Vasco in 1894 with the motto: "God and traditional law." Retention of their *fueros* was, for the Basques, a more important feature of Carlism than either the dynastic issue or the political preeminence of the Church, but once the Carlist wars were over, the unity of *fuero,* faith and dynasty disintegrated.

The advent of the republic in 1930 divided the political aspirations of the Basques: Guipuzcoa, Biscay and to a certain extent Álava were prepared to work for a status of relative autonomy within the republic, and for this reason they remained loyal to it in spite of its anti-Catholic policy; Navarre, on the other hand, was eager to see the republic overthrown and furnished one of the strong points of the rebellion in 1936 and. in its Carlist "Requetés," some of its best troops. The city of Bilbao, nhich had been a stronghold of liberalism against the Carlists. became at the same time the centre of republican government and also of Basque nationalism. The fighting lasted until Sept. 1937 and is chiefly remembered outside Spain for the bombing and burning, supposedly by German aircraft, of Guernica, the traditional assembly place of the province of Biscay and a symbol of the Basque nation in nationalist eyes. After the war, many Basques went into exile in the new world and a Basque national government continues to reside in Paris.

BASQUE LANGUAGE. The Basques (*q.v.*) call their language Euskara, Eskuara or Úskara, according to the dialect. It is spoken today in the north of Spain (in the province of Guipúzcoa, part of the provinces of Biscay [Viscaya] and Navarre [Navarra]•and a few districts in the province of Álava) by between 500,000 and 600,000 persons; and in the southwestern corner of France (western part of the *département* of Basses-Pyrénées) by about 90,000. Basque has never been the official language of a country. It has given way before the Romance languages. It comprises a large number of varieties of speech, which are grouped into eight dialects. Viscayan differs considerably from all the others, which are: Guipuzcoan, northern and southern upper Navarrese, spoken only in Spain; Labourdin, western and eastern lower Navarrese and Souletin, spoken mainly in France but each having a subdialect spoken in Spain. Nevertheless, the essential features of the structure of the language are everywhere the same.

Origins of the Basque Language. — Basque is the only living language in western Europe which does not belong to the Indo-European family. In the past the most varied hypotheses were advanced about its origin and relationship, but it can now be affirmed that it is-a continuation of the language of the Aquitani (who in the time of Julius Caesar inhabited the region lying between the Garonne. the Pyrenees and the Atlantic ocean) and that of the Vascones (who occupied the greater part of the Spanish Navarre and some districts of other provinces), and that it does not come from the old Iberian. The Aquitani and the Vascones spoke languages close to each other or dialects of the same language. The Vascones still lived south of the Pyrenees in the time of Ausonius (4th century A.D.) and invaded Aquitania in the 6th century. There are good grounds for thinking that Basque is related to the Caucasian languages (*q.v.*), which, although varied, form a family. The most likely hypothesis is that the ancestral language of Basque was introduced by immigrants coming from Asia Minor at the beginning of the Bronze Age (c. 2000 B.C.).

Basque words have been known since the 8th century, but the oldest dated and printed texts are 16th century. Basque is written with characters belonging to the French and Spanish alphabets.

Phonology. — Basque has five vowels, *i, e, a, o* and *u,* analogous to those of Spanish, and a few diphthongs; there is in Souletin a sixth vowel, *ü,* similar to the French u. Basque has palatalized consonants; a soft *r* and a hard *r (hari* "thread," *harri* "stone"); a consonant notated as *s,* intermediate between the initial consonant of the English *sun* (notated in Basque as *z*) and the initial consonant of *slzake* (notated in Basque as *ch* or x); and the three corresponding affricates *(tz, fs, tch* or tx). The fricative and affricated consonants are voiceless. There are voiced and unvoiced occlusives. Only the dialects in France have aspirated occlusives *(ph, th, kh),* as well as the consonant *h;* the aspirated occlusives are only phonetic variants of *p, t* and *k.* No Basque word begins with an *r.* The Latin *rege(m)* ("king") has become *errege* in Basque.

Vocabulary. — Basque words are formed principally by means of suffixes and by a process of composition, rarely by means of prefixes. The notation of numerals is vigesimal: *(h)ogoi* "20," *berrogoi* "40" (the prefix *berr-* means "twice," "again"). Basque has borrowed many words from Latin, Spanish, French and Gascon. But its morphology, which makes great use of agglutination, and its syntax are peculiar to Bisque.

Declension. — All the nouns and adjectives follow the same declension, which makes no distinction between grammatical genders and comprises three varieties of form: the indefinite. without distinction of numbers; the definite singular and the definite plural may be distinguished. The nominative indefinite is identical to the stem: *harri* "stone(s)"; the nominative singular *harrin* contains the postponed definite article *-a,* which is based on the third person demonstrative; the nominative plural is *harriak.* Certain case suffixes can be added to one another. Thus. a Basque noun in the genitive may be declined like an ordinary noun: *gizon* "man," *gizona* "the man," *gizonaren* "of the man." *gizonari* "to the man," *gizonarena* "that of the man," *gizonarenari* "to that of the man." There exists a so-called active case contrasted with the nominative. the subject or "passive" case: *gizona* (nominative) *dago* "the man stays"; *gizonak* (active) *badaki* "the man knows it"; *gizonak* (active) *dakusa haurra* (nominative) "the man sees the child"; *haurrak* (active) *dakusa gizona* (nominative) "the child sees the man."

In the personal pronouns and the conjugation, in the second person singular. Basque distinguishes between familiar and polite forms. The latter are old plural forms. New plural forms have been created by adding a plural suffix to the old ones. The personal pronouns are *ni* "I," *gu* "we," *hi* second singular familiar, *zu* second singular polite, *zuek* "you" (pluralj. There is no personal pronoun for the third person, but there are three demonstratives with the value of personal pronouns: *hau* (Latin *hic*), *hori (iste)* and *hura (ille).*

Conjugation. — The Basque conjugation is much more complex than the declension. Most verbs are conjugated by means of auxiliaries. These are four in number: "to be," "to become," "to have" and "to do." The personal forms are very numerous and may contain several indications of persons (a prefix and one or two suffixes): *nago* "I stay," *nagozu aldean* "I stay near you" (*aldean* means "near"); *nauzu* "you have me." *eman dautzut* "I have given it to you.!' The roots of these verbs are *go-* "stay" and *u-* "have.'! The signs of the persons are: *n-* "I" (subject or "passive"); *-zu* "to you" (polite), "you" (polite, active): d- "he," "him." "she." "her." "it," (subject or "passive"); *-tzu* "to you" (polite). When the second person familiar of the singular is expressed by a suffix. Basque differentiates the masculine (suffix *-k*) from the feminine

(suffix *-n*). To express "you have it." Basque has four forms: *duk* (familiar masculine. when speaking to a man, a boy. or an animal), *dun* (familiar feminine, when a woman or a girl is addressed). *duzu* (polite: when one person of either sex is addressed), *duzue* (plural, when speaking to several persons or animals). Finally. when the speaker is on familiar terms with someone and uses the pronoun. hi in addressing him, in independent or main clauses special forms of address must be used, which contain the supplementary suffix *-k* or *-n* and show the sex of the person who is being spoken to. Thus, instead of saying *nago* "I stay," *du* "he (she, it) has it," the speaker must say *niagok* or *niagon, dik* or *din*.

Syntax.—The most important feature of the syntax of Basque is the fact that subordination is expressed by suffixes or prefixes joined to the personal verbal forms: *dugu* "we have him (her, it):" *dugun* "whom (which) we have"; *ikusi dugu herria, ederra cia,* "we have seen the country, it is beautiful"; *ikusi dugun herria ederra da* "the country which we have seen is beautiful"; *ikusi badugu* "if we have seen it" (*ba-* means "if"); *baitugu* (for *bait-dugu*) "because (that) we have it." The relative verbal forms can be declined: *duguna* "he whom (she whom. that which) we have"; *ikusi dugunaren* "of that which we have seen." Sometimes pronouns and interrogative adverbs are used as relatives, in imitation of the Romance languages; but the verb in the relative clause then has the prefix *bait-*, which shows dependence: *non* "where?"; *non ikusi dugu?* "where have we seen him?"; *herria non ikusi baitugu* "the country where we have seen him." Two verses of the priest-poet Bernard Dechepare, published in 1545, run as follows: *Suyak bano gaizkiago erra diro gizona; Itchasoak ez iraungi eratcheki dadina* "(Love) more cruelly than fire can burn the man; the sea cannot extinguish what takes fire"; *suyak* "the fire'! (active); *bano* "than"; *gaizki* "cruelly"; suffix *-ago* "more"; *erra diro* "it can burn him"; *gizona* "the man" (nominative); *itchasoak* "the sea" (active); *ez* "not"; *iraungi* "extinguish"; *eratcheki dadina* "he who (she who, what) takes fire."

BASRA (AL BASRAH), the port of Iraq, capital of a *liwa* (province) and largest town of the south, is situated on the western bank of the Shatt al Arab, formed by the union of the Tigris and Euphrates. at the exit from Lake Hammar, 70 mi. by water above Fao (Al Faw) on the open Persian gulf. Pop. (1957) 164,-623. The adjacent terrain is low-lying and deeply intersected by creeks and watercourses. The city is an agglomeration of three small towns and several villages clustered around Ashar creek (Nahr al 'Ashshar), which enters the Shatt al Arab from the southwest. At the head of the creek, two miles from its confluence. lies Basra proper; at the confluence lies Al 'Ashar; and Al Ma'qil is four miles farther up the Shatt. The villages are Jubaylah, Manawi and Ribat al Saghir. Around these settlements are extensive palm groves intersected by drainage channels and minor inlets, to a depth of about three miles from the Shatt; and with the rise of the tide, river water is ponded back twice daily to give largely natural irrigation of the date palms.

Basra city proper is a closely settled Arab town of narrow streets; Al 'Ashar extends about one mile along the river and contains most of the larger modern public and commercial buildings; Al Ma'qil has a "western" residential quarter. Most of the inhabitants gain a living either from commerce and port activities or from date packing. At harvest time large numbers of tribesmen arrive as casual labourers.

The original city, Bassorah of the *Thousand and One Nights,* was founded by Caliph Omar I in A.D. 636 at Az Zubayr, about 8 mi. from the modern town. It was famous in the time of Harun al-Rashid but declined in importance with the decay of the Abbasid caliphs. The canals were neglected and. as the silt accumulated, communication with the Persian gulf was much reduced. The town was taken by the Turks in 1668 and later underwent many changes of fortune. Between 1720 and 1752 the East India company established itself, and Basra developed considerably during the 19th century as a transshipment point for river traffic to Baghdad. During World War I, Basra once more came into its own as the port whereby communication was maintained between Mesopotamia and India. Many improvements were effected, and both town and port grew in importance. In 1914 construction of a modern harbour began at Al Ma'qil (previously Basra had no wharves) where there is a deep channel offshore. In 1930 the port installations were transferred to Iraqi ownership and between 1918 and 1939 the Rooka channel was dredged through the outer bar of the Shatt al Arab to allow vessels of 30 ft. draft to reach Basra. Air and rail communications were also established. In World War II port installations were developed at Tannumah on the eastern bank of the river, which is there 300 to 400 yd. wide. Basra is now the focus of southern Iraq and sole port for the entire country.

The *liwa* (pop. 1957, 502.884; area 4,747 sq.mi.) extends from the frontier with Kuwait as far as Iranian territory. Besides its riverine section, which is by far the most important, there are expanses of desert. It is a highly productive region growing dates, rice, corn and millet. (W. B. FR.)

BAS-RHIN, a *département* on the eastern frontier of France, comprises the northern part of the plain of Alsace and the flanking highlands that lie to the west. It extends along the left bank of the Rhine between the upper plain of Alsace (Haut Rhin) and the Rhenish Palatinate in Germany. The area became part of France at the end of the 17th century, but as a part of Alsace-Lorraine (*q.v.*) was lost to Germany from 1871 to 1919. Pop. (1954) 707.931; area 1,848 sq.mi.

The southwest corner of the *département* includes the northern part of the Vosges and reaches 3,600 ft. in the Hochfeld massif. As the crystalline rocks of the High Vosges give way northward to sandstones, the uplands lose height, but they rise steeply from the floor of the Khine rift valley, with its infilling of soft sediments that include young alluvium along the flood plains of the Rhine and its tributary the Ill, and flights of gravel terraces. The plain has a sheltered climate, with warm, sunny summers. Where covered with loess, the terraces are exceptionally fertile and are highly cultivated for corn, sugar beet, fodder crops and hops, but elsewhere are barren tracts left under forest: the largest being the Forest of Haguenau. The low-lying belts of damp alluvium are rich meadowlands. At the foot of the highlands is a rich zone of small towns and villages surrounded by vineyards and orchards. In the north of the plain is the Pechelbronn oil field.

Strasbourg. its old town sited originally on the Ill river just above its confluence with the Rhine, owes its importance to its expansion into a great river port on the Rhine and to its position at the crossing of the river by a major west-east route. This approaches from Lorraine by the Col de Saverne and is followed by canal and railway as well as by road. Strasbourg (*q.v.*), the capital of the *département,* with cathedral and university, is the largest town. Wissembourg, Haguenau, Saverne, Molsheim, Erstein and Sélestat are also centres of *arrondissements.* The court of appeal is at Colmar (Haut Rhin). (AR. E. S.)

BASS, a name given several fishes of two different groups: the sea bass (Serranidae) and the sunfish families (Centrarchidae). Most of these fishes are carnivorous, attain a length of more than a foot and are important game fishes.

Sea Bass.—Most of the Serranidae inhabit the shallow waters of tropical oceans and many of these are known as groupers, hamlets, etc.; only an occasional species is known as a bass. One such group, *Paralabrax* (including kelp bass, sand bass, etc.), inhabits the Pacific ocean off Mexico and southern California, and are among the fishes commonly taken from there by sport fisher-

men. Most of the catch is by hook and line, with live bait; they are also speared by skin divers. Paralabrax are solitary or occur in small groups. They are not migratory and most individuals spend all of their life in the same area. Growth is rapid and many of these bass attain a length of a foot or more in their first year.

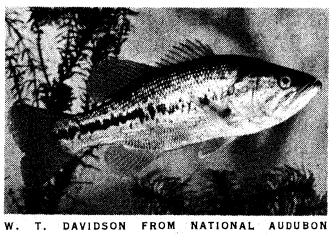
The giant sea bass (Stereolepis *gigas*) occupies a similar area. It may exceed a length of seven feet and a weight of 600 pounds. The genus Centropristes (including bank, rock and black sea basses) inhabit the Atlantic ocean off the United States. They attain a size of about two feet and are important game fishes. The floating eggs hatch in about five days. Centropristes are solitary or occur in small groups.

Another group of the sea bass family lives or spawns in fresh water. These fish can be distinguished from other fish called bass by the division of the dorsal fin into two separate units. Four species, the European bass (Morone labrax), the oriental spotted bass (Lateolabrax *japonicus*) and the striped bass (Roccus saxatilis) and its smaller relative the white perch (Roccus *americanus*) live in both salt and fresh water. The European bass is found along the Mediterranean and Atlantic coasts of Europe; the oriental spotted bass occurs along the Pacific coasts of Asia; the striped bass is native to the Atlantic coast of North America from New Brunswick to Florida and has been successfully introduced into several locations on the Pacific coast of North America between Oregon and the Colorado river; and the white perch is found along the Atlantic coast of North America between Nova Scotia and South Carolina, but seldom occurs in full sea water. The two North American forms can be distinguished by distinct striping.

The last four species mentioned have similar habits. The adults swim in large schools along the coasts, in estuaries or in landlocked lakes. During the spring they run up the rivers and spawn in running nater. The spawning sites may be in brackish water or far upstream in fresh water. The northern populations tend toward the brackish-water spawning sites. Large females may produce more than 1,000,000 eggs that are slightly heavier than water. The eggs hatch in about two or three days. The larger fishes may exceed 100 lb. and 6 ft. These important game and food fishes are caught by nets or hook and line. Sport fishermen obtain them using a variety of lures or live bait fishing from boats or the shore. The use of surface baits is most successful.

Two other species, the white bass (Roccus *chrysops*) and yellow bass (*Morone interrupta*) are similar, but are restricted to the fresh waters of eastern North America. The yellow bass can be distinguished by the predominantly yellow colour and interrupted dark stripes. Similar to landlocked stocks of the other species, they live in lakes and move into the inlets to spawn.

Fresh-water Bass.—The fresh-water bass, or black bass, which are merely large and elongated sunfish, include six species of Micropterus. The native range is lakes and streams in eastern North America from southern Canada to northern Mexico. The largemouth bass (M. *salmoides*) occupies the entire range of the group and has been introduced widely elsewhere. It is most common in quiet waters, often with much vegetation and attains a weight of more than 20 lb. in Florida, but elsewhere rarely exceeds 10 lb. The smallmouth bass (M *dolomieui*) occupies the northern two-thirds of the eastern United States. It is most common in clear running streams and is usually slightly smaller than the largemouth. The spotted bass (M. punctulatus) inhabits the southern two-thirds- of eastern United States. It inhabits sluggish streams that often are moderately silty. Few spotted bass exceed 5 lb. Other Micropterus species are restricted to parts of the southeastern Cnited States.



W. T. DAVIDSON FROM NATIONAL AUDUBON SOCIETY

LARGEMOUTH BASS (MICROPTERUS SALMOIDES)

The largemouth actually has the largest mouth, but because the relative mouth size changes with age, these fish are most easily recognized by the deep notch in the dorsal fin. Spotted and smallmouth bass can be distinguished by the longitudinal stripe of the spotted bass. In spring adult males of the black bass dig nests in gravel or around roots of aquatic plants; the females lay 1.000 to 25,000 eggs in one or more nests. The young, which hatch in 3 to 6 days, are protected by the father for several days after hatching. Although immature black bass may congregate in schools, adults are usually solitary. They are captured by use of a variety of lures and live baits. A spoon lure often obtains large bass. Fly casting may result in the best sport. See also FISHES. (C. Hu.)

BASS, from Middle English base meaning low or deep, but influenced in spelling as a musical term by the Italian basso, French basse and German Bass, and used to describe the lowest male voice (see SINGING; VOICE). the lower part of a composition (see HARMONY). In compounds, the word denotes the member of an instrumental family with a low register (*e.g.,* bass clarinet), the lowest of all being called contra bass. The double bass is the lowest member of the violin family (*q.v.*).

BASSANO, JACOPO DA (JACOPO or GIACOMO DA PONTE) (1510–1592), Venetian painter, was one of the leading genre and landscape painters of the late Renaissance Venetian school. He was born at Bassano in 1510 and died there on Feb. 13, 1592. He was first a pupil of his father, Francesco da Ponte, then of Bonifazio Veneziano, a follower of the school of Titian, in Venice. His subjects were generally peasants and villages, cattle and landscapes, with some portraits and historical subjects. One of his earliest subjects was "Samson Slaying the Philistines"; the remains of this fresco can still be seen on the outside of the Casa Michieli, Venice; he painted portraits of Sebastiano Venerio Doge of Venice, Tasso, Ariosto, etc. His genuine works are somewhat rare and valuable, many of those which are called originals being copies either by his sons or by others. Bassano's style varied considerably during his lifetime; at first his style was modeled on his father's, and he was then strongly influenced by Titian before he developed his own characteristic manner. Although he painted few great pictures, his altarpiece of the Nativity at Bassano is estimated highly by the best judges, and in Lanzi's opinion is the finest work of its class.

One of his best pictures is the "Good Samaritan" in the National Gallery, London, where there are also "A Portrait of a Gentleman" and "Christ Driving the Money Changers out of the Temple." There are also pictures by him at Dublin, Florence, Milan, Naples, in the Louvre and at Venice. His four sons were all painters and assisted their father: Francesco (1543–91); Giambattista (1553–1613); Leandro (1558–1623); and Girolamo (1540–1622). Pictures by Leandro are at Dresden, Dublin, Madrid, Munich and Venice.

BASSANO DEL GRAPPA, a town in Vicenza province, Veneto, northern Italy. lies on the Brenta river at the foot of Monte Grappa, 27 mi. N. of Padua by road. Pop. (1957 est.) 28,753. Between 1036 and 1259 it became important under the Ezzelini family who built the castle, within whose walls is the old cathedral and near which is the great pottery. The town was the birthplace of the Da Ponte family of painters surnamed Bassano. It flourished as a dependency of Venice (1404–1796), trading in silk and wool, ceramics, jewelry and printing. Napoleon defeated the Austrians there on Sept. 8, 1796, and it was severely damaged during the fighting on Monte Grappa in 1917–18 and again in World War II. In the central Piazza della Libertà are the Remondini houses which held the famous printing and publishing works from 1650 to 1850. The 13th-century Torre di Ezzelino is now the civic tower. In the cloister of the old convent is the civic museum which contains, notably, paintings by Jacopo da Bassano (*q.v.*), drawings by Antonio Canova, Vittore Carpaccio (*qq.v.*) and others, ceramics, more than 1.000 legni (wood blocks) and a large collection of printed matter from the Remondini printing works.

Bassano is an agricultural and commercial centre. Its industries include metallurgy, ceramics, tanning, jewelry, printing, and the manufacture of automobiles and plastics. The famous *grappa* (a kind of brandy) has been made since the end of the 18th century in the distillery near the covered bridge.

BASS CLARINET: *see* CLARINET.

BASSEIN, the chief town of a district of the same name in the Irrawaddy division of the Union of Burma. It lies on the eastern bank of the Bassein river, the most westerly distributary of the Irrawaddy. Pop. (1953) 77,905. In spite of dangerous bends the Bassein river is navigable by ships of 10,000 tons up to Bassein, which is a port as well as an administrative centre. Vessels of the Inland Water Transport board ply between Rangoon and Bassein by inland waters. A railway runs northeast from Bassein to Henzada, where it is linked by ferry across the main Irrawaddy to a short line to Letpadan and so to Rangoon. Bassein is an important centre of the rice trade and has several rice mills and an expanding light industry including sawmills and machine shops. It has considerable mercantile potentialities.

Bassein district has a pop. (1941) of 664,727 and an area of 4,145 sq.mi. Its eastern half is a vast rice-growing alluvial plain in the Irrawaddy delta, interrupted only by undrained fresh-water swamps and cutoffs. The western half is formed by the forested southern portion of the Arakan Yomas and extends to the western or Arakan coast. (L. D. S.)

BASSELIN, OLIVIER (*c.* 1400–*c.* 1450), French poet, reputedly the author of French drinking songs which were popular in his native valley, the vau-de-Vire in Normandy. The songs were known as *vaux-de-vire,* from which originated the nord "vaudeville." Little is known of Basselin, except that he was a fuller by trade, and that, from an anonymous poem lamenting his death, it would seem likely that he was killed at the battle of Formigny (1450). The songs were first published by a Norman lawyer, Jean le Houx, in a collection of drinking songs of which the first edition is lost, at the beginning of the 17th century. The language shows that le Houx at least revised them considerably. Their authenticity is discussed in V. Patard's *La Verité dans la question Olivier Basselin et Jean le Houx à propos du Vau-de-Vire* (1890). *Les Vaux de Vire de J. le Houx,* ed. by A. Gasté, was translated by J. P. Muirhead (1875).

BASSERMANN, ALBERT (1867–1952), German stage and screen actor, was born on Sept. 7, 1867, at Mannheim. He began his career in his native city in 1887. There followed short engagements in Cologne, Liineburg, Hanover and Bern where the actor established himself in such character parts as Ring Philip II in Schiller's *Don Carlos,* Shylock, Iago, and Mephistopheles in Goethe's *Faust.* From 1890 to 1895 Bassermann acted on the stage of the Meiningen Court theatre. By the end of the century he gained a foothold in Berlin. From 1909 to 1915 he was a member of Max Reinhardt's company at the Deutsches Theater, Berlin, celebrating his greatest triumphs again as King Philip and Mephistopheles, but also as Lessing's Nathan, Schiller's Wallenstein and Shakespeare's Benedick, Othello and King Lear. Bassermann rejected routine characterizations and, with infinite care, studied the details and subtleties of his roles, putting on every one of them his inimitable artistic stamp, sometimes in defiance of tradition. After World War I he worked at the Berlin Staatstheater am Gendarmenmarkt in some of Leopold Jessner's expressionist productions of the classics. In 1933 Bassermann left Germany in protest against the Nazi regime, and the audiences of Zurich and Vienna benefited by this move. In 1938 he went to the Cnited States where he worked in Hollywood playing sharply-profiled episodic parts in a score of films. In 1946 he returned to Europe touring the German-language area with his own company. Berlin saw him again as Pastor Manders in Henrik Ibsen's *Ghosts* and as Attinghausen in Schiller's *Wilhelm Tell.* Bassermann died in Zurich on May 15, 1952. (A. M. N.)

BASSES-ALPES (literally "Low Alps"), a *départements* of southeastern France, formed in 1790 out of the northern part of Provence. It is bounded to the north by Hautes-Alpes, east by Italy and Alpes Maritimes, south by Var and west by Vaucluse and Drôme. Pop. (1954) 84.335. Area 2,698 sq.mi. The *de'partement* is high and mountainous, and is one of the poorest and most thinly populated parts of France. Only in the Durance valley, as it opens out in the southwest toward the lowlands of Provence, is the altitude below 1,000 ft. and the mountains near the Italian frontier rise above 10,000 ft. There differential erosion of heavily folded and overthrust rocks of diverse lithology is responsible for a complex variety of mountain scenery. but most of the *département* farther west consists of the rugged but monotonous limestone *préalpes.* Their wall-like western edge overlooks an embnyment of Miocene sediments that extends up the Durance basin as far as Digne. Between mountain-girt basins. where the valleys of the Durance and its tributaries open out, are almost impassable gorges, and the area is divided into separate compartments. Only with the 20th-century development of motor roads has their isolation been broken down. The Route Napoléon, traversing the *de'partement* from north to south through Digne in the west, and the road from Briançon to Nice through Barcelonnette over high passes in the heart of the Alps are much frequented by summer tourists.

Basses-Alpes lacks the rich forests and verdance of the northern French Alps, and above its cultivated basins and valleys the mountains are largely covered with scrub and much bare rock is exposed. Cereals and vegetables, with fruit trees and vines, are cultivated, and there is extensive use of irrigated meadows for the production of fat lambs. Transhumance between the lowlands of Provence and the high Alps is in decline, however. Clustered villages and small towns, often perched on defensive sites, are characteristic of the settlement pattern. Above its spectacular gorges in the extreme south of the *département* the Verdon river has been impounded by the Castillon dam in a scheme to provide irrigation and hydroelectric power.

Digne (pop. [1954] 8,098) is the capital of the *département,* which forms the bishopric of Digne in the ecclesiastical province of Aix-en-Provence. The *de'partement* is divided into four *arrondissements,* centred upon Digne, Barcelonnette, Castellane, and Forcalquier. It comes under the *académie* and court of appeal of Aix. (AR. E. S.)

BASSES-PYRÉNÉES, the extreme southwestern *de'partement* of France, is at the western (lower) end of the Pyrenees. Consisting of the former province of Béarn and part of Gascony (*qq.v.*), it is bounded on the north by Landes and Gers, on the east by Hautes-Pyrénées, on the south by Spain and on the west by the Bay of Biscay. Pop. (1954) 420,019. Area 2.978 sq.mi. The crestline of the Pyrenees, forming the French frontier with Spain, falls westward from the Pic d'Anie, and the highest summits barely reach 6,000 ft. There are easy passes at about 3,000 ft., so that the Pyrenees are far less of a barrier than in the central and eastern parts of the range. In addition to the historic road route by the pass of Roncevaux, two railways cross the frontier, one by the coast from Bayonne to San Sebastian across the Bidassoa river, the other from Pau to Saragossa by the Somport tunnel.

The crystalline core of the Pyrenean system is not exposed in this western part of the range and the mountains are composed of a variety of sedimentary rocks, with a great fan of debris spread out to the north, drained by tributaries of the Adour river. The ancient Basque language still survives north of the Pyrenees in the districts on the approaches to Roncevaux and the Bidassoa. The Basques (*see* BASQUE) have distinctive customs, dances and rural traditions and the Basque countryside is also rendered distinctive by its farmhouses, with windows and frontage under the gable which has one side of the roof very long to cover barn and stable, the latter small because the very mild climate reduces the need for stabling.

In spite of the heavy precipitation, the western Pyrenees have no permanent snow. Their mild, wet climate is responsible for the exceptional verdance of the Basque country, and there is rich farming in the valleys, with corn (maize) and potatoes especially important crops. The vine is unimportant and vineyards are disease-ridden, but cider apples are extensively grown. Generally the farming is mixed, with emphasis upon cattle and poultry; unlike the areas farther east, little transhumance is practised. Market towns such as Pau are situated at the contact of mountain and plain. Others, such as Oloron and St. Jean-Pied-de-Port, serve the higher valleys. St. Jean-Pied-de-Port, on the Nive river, was the ancient capital of Navarre controlling the approach to the pass of Roncevaux. There are several spas in the *de'partement,* notably at Eaux-Bonnes, Eaux-Chaudes. Cambo-les-Bains, St. Christau and Salies-de-Béarn. With the development of motor transport, the

tourist industry has become an increasingly important resource. Pau is an important centre inland, and the old fishing port of Biarritz has become one of the major seaside resorts of France. St. Jean-de-Luz, famous as a winter resort, retains some importance for fishing, chiefly for tunny. Salt is exploited near Bayonne, and iron pyrites on the frontier at Itxassou. In 1951 one of the world's major deposits of natural gas mas discovered near Pau at Lacq. Large-scale exploitation has taken place since 1955, and gas is piped to Toulouse, Bordeaux, and farther to Nantes, Paris and Lyons. Much is used locally to drive a major electric-power station, aluminum plants, and other industrial works making fertilizers and plastics. The necessary purification of the gas yields great quantities of sulfur. As a result of this sudden industrial development, a new town, Mourenx la Neuve, has been established 3 mi. S. of Lacq.

Pau (*q.v.*), capital of the *département,* Bayonne (*q.v.*), the chief port, and Oloron give their names to the three *arrondissements* that constitute the ddpartement, which forms the bishopric of Bayonne. The court of appeal is at Pau, and the acaddmie at Bordeaux. (AR. E. S.)

BASSET HORN, a clarinet (*q.v.*) pitched a fourth lower than the ordinary B flat clarinet, probably invented by A. and M. Mayrhofer of Passau, Bavaria, *c.* 1770. The name derives from its basset ("small bass") pitch and the arcuate, bugle-horn shape of the original design, which was soon supplanted by an angular form. It was employed notably by Mozart, in about 20 works from 1781 onward. By 1850 it had practically vanished until its revival by Victor Mahillon, which was followed by its reintroduction into the opera orchestra by Richard Strauss from Elektra (1909) onward. It is made to order by most makers. in straight form with upturned bell, and is regularly used in the works that demand it. It differs from the alto clarinet in having a narrower bore, in being pitched in F instead of (usually) E flat, and in having a downaard extension of compass to sound the low F of the bass voice. For bibliography, see the article CLARINET. (A. C. BA.)

BASSETT, JOHN SPENCER (1867–1928), U.S. historian, was born at Tarboro, N.C., Sept. 10, 1867. He graduated from Trinity college (now Duke university) in 1888, and received the Ph.D. degree at Johns Hopkins university, Baltimore, Md., in 1894. From 1893 to 1906 he taught history at Trinity college and thereafter at Smith college, Northampton, Mass. He died at Washington, D.C., on Jan. 27, 1928.

Bassett was active in establishing the South Atlantic Quarterly as a critical organ for the postwar South (1902), and became its first editor. He wrote numerous works in American history and biography, including *The* Federalist System (1906), Life of Andrew Jackson, 2 vol., (1911), The Plain Story of American History (1915), The Middle Group of American Historians (1917) and Expansion *and* Reform (1926).

BASSETT, RICHARD (1745–1815), U.S. political leader, was born in Maryland, April 2, 1745. Entering politics in Delaware, he served in the legislature and represented that state in the constitutional convention of 1787. He signed the U.S. constitution and supported its ratification by Delaware. He served his state as U.S. senator (1789–93), as chief justice of the court of common pleas (1793–99) and was then elected governor. In 1801 Pres. John Adams, shortly before his retirement from the presidency, appointed him a judge of the U.S. circuit court. Bassett was thereafter known as one of the so-called "midnight judges." He died Sept. 15, 1815. (E. E. R.)

BASSI, AGOSTINO (1773–1856), an Italian lawyer who became a pioneer in bacteriology and one of the precursors of Louis Pasteur and Robert Koch in establishing the germ theory of disease. He was born near Lodi on Sept. 25, 1773. Although he was trained as a lawyer and was employed for a time as a civil servant he was unable to practice his profession because of poor eyesight and ill health. During his university years he had acquired a taste for science and so he retired to his farm, where he wrote on such subjects as the raising of potatoes (1817), vinification (1823) and cheese (1820). He also wrote on such diseases as pellagra (1846) and cholera (1849).

About 1815 he became interested in a disease of silkworms called by the French muscardine and by the Italians *mal de* segno which was producing serious economic losses in Lombardy. After 20 years of study Bassi was able to show that the disease was contagious and was caused by a microscopic, parasitic fungus that was transmitted from one silkworm to another by contact or through infected food. The organism is known as Botrytis bassiana in honour of its discoverer. In 1835 Bassi published his results in a classic monograph, *Del Mal* del Segno, Calcinaccio o Moscardino (The Disease of *the* Sign, Calcinaccio or Muscardine).

Although Bassi received many honours during his lifetime, his work was generally ignored by the medical profession; and it was not until 20 years after his death in Lodi on Feb. 8, 1856, that the germ theory of disease was firmly established through the labours of Pasteur, Koch and others.

BASSOMPIERRE, FRANÇOIS DE (1579–1646), marshal of France, noted for the *Mémoires* written during his 11 years in captivity, was born on April 12, 1579, at Château d'Haroué in Lorraine, the son of Christophe de Bassompierre (a staunch supporter of the Holy League). His early travels took him through Bavaria to Trent, through Italy to Verona, Rome. Naples and Florence and back to Lorraine by way of the St. Gotthard pass. He was presented at court in 1598 and found favour with Henry IV, whom he accompanied in the campaign against Savoy (1602). He went to Vienna, served as a volunteer against the Turks (1603) and was presented at the imperial court (1604). Returning to France, he rose in royal favour, being appointed colonel-general of the Swiss guards (1614), grand master of the artillery (1617) and chevalier des Ordres du *Roi* (1619). He supported Louis XIII against the queen mother and took part in the defeat of her forces at Ponts-de-Cé (1620). He was sent to Madrid as ambassador extraordinary (Dec. 1620–May 1621) to settle the Valtellina (*q.v.*) dispute and mas appointed marshal of France (1622) after the campaigns against the Huguenots under Benjamin de Rohan-Soubise. Again as ambassador extraordinary, he went to the Swiss cantons (Nov. 1625–Feb. 1626) and, to settle the question of the Catholic servants of Queen Henrietta Maria, to England (Sept. 1626). He was named one of the four presidents of the assembly of notables (Dec. 1626–Feb. 1627) and took part in the siege of La Rochelle (1628) and in the mission to Switzerland (1629–30). At this point, because of his relations with the queen mother's confidante, Louise Marguerite de Lorraine, princesse de Conti, to whom he was secretly married, Bassompierre came under suspicion of complicity in the conspiracy that the cardinal de Richelieu foiled on the "day of dupes" (Nov. 11, 1630). He was arrested on Feb. 25, 1631. After Richelieu's death (Dec. 1642) he was liberated from the Bastille (on Jan. 21, 1643), but he died, on Oct. 12, 1646, at Provins, without having regained his offices. Bassompierre's *Mémoires* (1665; ed. by the Société de l'Histoire de France, 4 vol., 1870–77) inspired the duc de Saint-Simon to write his own. He also wrote accounts of his embassies, 4 vol. (1668). (F. C. S.)

BASSOON (German Fagott; Italian fagotto), the normal tenor and bass instrument of the orchestral woodwind. Its narrow conical bore leads from the curved metal "crook," on to which the double reed is placed, downward through the wing joint (on which are the left-hand fingerholes) to the butt joint (on which are the right-hand holes). The bore then doubles back, ascending through the butt to the long joint and bell, where the holes are controlled by keywork for the left thumb. The bassoon is held on a sling aslant across the body, and thus, with the doubled-back bore, the tubing, which is 8 ft. long, too long to be controlled if in a straight line, is comfortably manageable. Its classical compass is three octaves upward from the B flat below the bass stave, the most-used melodic range coinciding with that of the tenor voice. Higher notes, up to treble E. have come into use since the mid-19th century, adding to the difficulty of what is in any case an exceptionally difficult instrument to play because the traditional placing of the fingerholes is scientifically irrational, yet essential to the production of a tone quality that has been one of the pri-

mary colours of the composer's orchestral palette from Handel's time. The reed is made by bending double a shaped strip of matured cane *(see* WIND INSTRUMENTS) and is placed between the lips retracted over the teeth.

The bassoon is a 17th-century development of the earlier *fagotto* or *Dulzian,* the English form of which was known as the "curtal." It was first mentioned *c.* 1540, in Italy, with the descending and ascending bores contained in a single piece of wood. Many examples survive in museums at Brussels, Berlin, Vienna, etc. The present construction in four separate joints is thought to have been developed in France after 1650, closely following the reconstruction of the shawm which produced the oboe (*q.v.*), to which the bassoon served as bass. During the 18th century the individuality of the bassoon became recognized not only in the orchestra (in which two have normally been since employed) but also as a solo instrument for concertos; yet well into Mozart's time no mechanism was required beyond four keys, most of the semitones outside the natural scale of C having been well obtained by cross-fingerings. Leisurely addition of keys from *c.* 1780 led to J. X. Savary's Paris models of *c.* 1840 which with further improvements in bore and mechanism have become the 20-keyed French bassoon made by the famous firm of Buffet-Crampon. This, built in rosewood, is used in France, Italy and Spain. and some British players still play it. or other similar models.

BASSOON, WOODWIND INSTRUMENT BELONGING TO THE OBOE FAMILY

While it has preserved and developed the sympathetic vocal sonority of the classical instrument. the French bassoon remains a difficult instrument to control, owing to inherent unevenness in the quality and steadiness of many notes. A good player can overcome these defects, but alterations to minimize them were initiated in Germany in 1825 by Carl Almenraeder. A reformed model was developed by the firm of J. A. Heckel and perfected in the German bassoon now standard everywhere except in the Latin countries named above. It is of European maple, with its own positions and sizes of the holes to give a more even and positive response throughout the compass. It is quicker to learn, easier to choose reeds for. and in many respects more telling in a large orchestra. Research on old bassoons suggests that its tone quality, different from the French and by some considered to have sacrificed eloquence for expediency, may not represent as gross a deviation from classical tone as was hitherto believed.

The first useful contrabassoon or double bassoon, sounding an octave lower than the bassoon and much employed in large scores, was developed in Vienna and used occasionally by the classical composers. The modern contrabassoon follows Heckel's design of c 1870, with the tubing doubled back four times and often a metal bell, pointing downward.

BASSO-RILIEVO, the term applied to sculpture in which the design projects but slightly from the plane of the background. *See* RELIEF.

BASS ROCK, a small island in the Firth of Forth, about 3 mi. N.E. of North Berwick, East Lothian, Scot., circular in shape, a mile in circumference and 350 ft. high.

On three sides the cliffs are precipitous, but they shelve toward the southwest landing. Bass Rock, like North Berwick Law and Traprain Law. is the weathered plug of a volcano of the early Carboniferous period from which poured the lavas covering 50 sq.mi. of the mainland. It is composed of phonolitic trachyte, which differs from that of Traprain Law in being nonporphyritic. Sea birds, especially Solan geese, haunt the rock in vast numbers. A lighthouse with a six-flash lantern of 39,000 candlepower was opened in 1902. For a considerable distance east and west there runs through the rock a tunnel, about 15 ft. high, accessible at low water. St. Baldred, whose name has been given to several of the cliffs on the shore of the mainland, occupied a hermitage on the Bass, where he died in 756. In the 14th century the island became the property of the Lauders, called afterward the Lauders of the Bass, from whom it was purchased in 1671 by the government and a castle erected in which many Covenanters were imprisoned. At the Revolution four young Jacobites captured the rock, and, having been reinforced by others, held it for King James from June 1691 to April 1694, surrendering only when threatened by starvation. Thus it was the last place in Great Britain to submit to William III.

BASSVILLE (BASSEVILLE), **NICOLAS JEAN HUGOU DE** (1753–1793), French journalist and diplomat, whose death in Rome at the hands of a mob was exploited by the French Revolutionary governments as a grievance against the papacy, was born at Abbeville on Feb. 7. 1753. He was at first employed as a tutor and wrote two educational works. At the outbreak of the Revolution he became one of the editors of the *Mercure national.* In 1790 he published his *Mémoires historiques, critiques et politiques sur la Rdvolution de France.* Through the Girondin minister P. Lebrun-Tondu he entered the diplomatic service. went in 1792 as secretary of legation to Naples and was shortly afterward sent on a mission to Rome. His conduct in Rome, in particular his provocative display of the French tricolor, enraged the Roman populace. On Jan. 13, 1793. Bassville, who had been driving with his family to the Corso, was pursued by a hostile crowd and received an injury from which he died next day. The responsibility for the murder was laid by the Convention on the pope, and in 1797, by an article of the treaty of Tolentino, the Directory exacted damages of 300.000 livres for Bassville's family. The poet Vincenzo Monti, in his epic *Bassvilliana* (originally *In Morte di Ugo di Bassville,* 1793), described Bassville's soul looking down on the revolutionary scene as a penance before entering paradise.

See F. Masson, *Les Diplomates de la Rtvolution* (1880).

BASSWOOD: *see* LINDEN.

BASTAM (BUSTAM, also BISTAM and BOSTUM), a small town in Khurasan. Iran, lies at the southern foot of the Elburz mountains in a well-watered plain, about 4 mi. N. of Shahrud which now belongs to the province *(ostan)* of Mazanderan and Gorgan. Famous since Sassanian times and once thriving, it lost its position to the more modern Shahrud. Bastam has a group of remarkable buildings, some of great beauty, that cluster around the tomb of the famous Sufi poet and mystic Abu Yazid al-Bastami (d. 874). They include the mausoleum of the saint, a 12th-century minaret, a mosque wall of 1120, other tombs, a superb portal with faïences (1313) and a 15th-century college. A few hundred yards to the southwest are interesting ruins, including a Friday mosque and a charming little cloister with fine stucco. The greater part of these constructions is due to two Mongol monarchs, Ghazan Khan and Uljaitu. (H. Bo.)

BASTAR, the southernmost district of Madhya Pradesh, India. Pop. (1961 census) 1,167,810. Area 15,124 sq.mi. The district headquarters town is Jagdalpur (13,793), on the main road running from southern Orissa onward into Maharashtra state. Bastar (Old Bastar), from which the district and one of the two petty principalities (Bastar and Kanker) absorbed into it in 1948 took their name, is a village 12 mi. N.W. of Jagdalpur.

The southern part of the district is divided by the Bailadila ("Bullock's Hump") range, running north-south. In this range rich deposits of iron ore (600,000,000 tons est.) are worked. West of it the country falls away into the Godavari valley and is the habitat of much big game. Much of the east of the district is a plateau at 1,500–2,000 ft. on which lies Jagdalpur; it has a fairly temperate climate. The Indravati river enters the eastern plateau from Koraput district (Orissa) and passes north of Jagdalpur; where it leaves the plateau at Chitrakot, about 60 mi. W. of Jagdalpur, there is a waterfall 94 ft. high in fine scenery. The Mahanadi (*q.v.*) crosses the district's northeastern corner. Less

than 10% of the district is cultivated, the villages being separated by broad forest tracts. But it has considerable undeveloped timber and mineral resources. The forests contain sal and teak. The chief crops are rice and small millets. There has been much shifting cultivation to the great damage of forest areas, but there are still about 5,000 sq.mi. of good forest. Most of the people are aborigines—Gonds (66%) and Halbis. (D. G. NA.)

BASTARD, a person born out of lawful wedlock. Commonly called illegitimate, he suffers a disadvantageous position at law. Among the Romans, bastards were classified as *nothi,* children born in concubinage. and *spurii,* those not so born. Both classes had a right of succession to their mother, and the *nothi* were entitled to support from their father but had no rights of inheritance from him Both, however, had in other respects most of the rights of citizenship. The Germanic law was based upon an entirely different principle. It recognized as legitimate only those whose parents were of the same social rank. All others were regarded as bastards and took the status of the parent of inferior rank. The aim of all the Germanic codes was to preserve purity of race, not to improve morals, for incestuous unions were not censured. The influence of the Germanic law lasted throughout the early feudal period, and bastards were debarred rights of inheritance.

In the 13th century the influence of Roman law tended to modify this severity. An exception was probably made for those whose fathers were of royal blood, in which case it seems that no stigma was attached to the accident of their birth, nor did they suffer from the usual disabilities as to inheritance which attended those of illegitimate birth. Among the Franks, Theodoric I, a natural son of Clovis, shared the kingdom with the legitimate sons; Zwentibold, natural son of Arnulf, was created king of Lorraine by his father in 895; and William the Conqueror actually assumed the appellation of bastard.

England.—Under the common law of England a bastard was regarded as *filius nullius,* "son of no one," or *filius populi,* "son of the people," and the rights and duties appertaining to the parent-child relationship had no application to him. Yet, from early days in England the bastard was treated as a free man, whatever his parents' status, and he could acquire property and gain a surname by reputation. The practical import of illegitimacy related mainly to restrictions on inheritance of property.

Until the 16th century in England the maintenance of an illegitimate child was assumed by the parish in which he was born. The first effort to shift the burden was an act of 1576 which imposed obligations of support on the mother and putative father and called for imprisonment in default of payment. Re-enacted in the Poor law of 1601, the provision had extensive influence in the United States as well as in England. The sole purpose of the original legislation was to relieve the parish, but by 1844 the mother had an independent civil remedy against the putative father.

In mid-20th century England the support of an illegitimate child is primarily the mother's duty; she is usually the child's legal custodian. By statute she and the child have the right of intestate inheritance from each other, and the relationship resembles that of mother and legitimate child. The legal ties between child and putative father are few. He has a conditional right to custody and limited responsibility for the child's support. Contributions for its maintenance may be compelled on the basis of an enforceable agreement between the parents or a judgment in affiliation proceedings. To succeed in an affiliation proceeding the mother must meet certain crucial conditions: she must be unmarried, widowed or living separate from her husband; she must usually apply for an order within 12 months of the date of the child's birth; and she must introduce evidence corroborating her testimony on paternity. Support is limited to 30s. weekly, payable until the child is 16, or until 21 if needed for education and training. The putative father may also be required to contribute to maintenance of a child for whom the National Assistance board or a local authority is providing financial assistance.

United States.—With the exception of Connecticut the American colonies followed the common law on illegitimacy. Over the years the out-of-wedlock child's position, though improved, has remained inferior to the legitimate's. As in England, the mother is legal custodian. Mother and child may inherit from each other, and in a growing number of states the child may inherit from the mother's collateral, as well as lineal, ancestors and descendants. In the absence of acknowledgment of paternity or intermarriage of the parents, statutes do not usually permit intestate inheritance from the father. The states differ in answering the question whether the putative father has a custody claim superior to that of other relatives or interested parties in cases where the mother is unable to care for the child. In the state of Arizona. however, the lam declares any child to be the legitimate child of its parents, whether married or not, with full rights of support and inheritance.

Legislation concerning support of illegitimate children still bears the imprint of the Elizabethan Poor law. Although state laws may afford several remedies for the support of these children, affiliation or "bastardy" proceedings are most commonly employed. These retain the traditional characteristics of proceedings quasi-criminal in nature; suit must be instituted within a limited time following the child's birth, and the terms of support are often less favourable than those applicable to legitimate children with respect to duration of the obligation and amount of support. A few states are notable for their protective approach to illegitimacy. In Minnesota, for example, the law provides that upon adjudication of paternity the father is subject to all the obligations for the care, education and maintenance of the child and to all the penalties for failure to discharge these obligations which would be imposed upon him were the child his legitimate offspring. The Minnesota statute further provides extensive administrative aids in enforcement of this law through state and county public-welfare machinery.

The widespread use of short-form birth certificates has eliminated one sore distinction between legitimate and illegitimate children. The tendency of modern legislation has been to enlarge the illegitimate child's rights and to impose upon the states a definite obligation to assist in their enforcement.

Continental Europe.—In certain European countries legislation on illegitimacy is integrated in the body of child-welfare laws. Norway led the way; the Castberg law of 1915 placed the illegitimate child on virtually the same basis as the legitimate. Swedish law requires appointment of a child-welfare officer in every case of illegitimate birth, and an illegitimate child whose parents have been formally betrothed may inherit from its father and bear his name. In Germany illegitimate births must be reported to the child-welfare board; it has legal responsibility for protecting the child and may supervise its care by the mother or arrange for its placement. In the Soviet Union the burden of support, which was placed upon the putative father by laws enacted prior to 1944, has been shifted to the state with respect to all out-of-wedlock children born since that time.

Experience on the continents of North America and Europe demonstrates that the most advantageous time to provide help for mother and child lies within the days immediately following birth. Thus discovery of cases of illegitimate birth is an indispensable prerequisite to the state's proper discharge of its responsibility.

(M. K. R.)

BASTARNAE, a large tribe which in Hellenistic and Roman times was settled in Europe east of the Carpathian mountains (Alpes Bastarnicae) from the upper valley of the Dniester to the Danube delta. The name Peucini, sometimes applied to the tribe, belonged properly to a section of it living on the Peuke Island formed by the southernmost Danube mouths. According to Pliny the Bastarnae constituted one-fifth of the German race, and their Germanic origin was accepted by Tacitus and is confirmed by

archaeology and by headdresses represented on Trajan's column. The Bastarnae were used by the Macedonian kings Philip V and Perseus against their Thracian enemies and later by Mithradates of Pontus against the Romans. Subdued decisively by the Roman general M. Licinius Crassus in 29 B.C., they gave little trouble for the next two centuries. In the 3rd century A.D. they joined other tribes in raiding Roman territory and were transplanted south of the Danube by the Roman emperor Probus (A.D. 279–280).

BASTI, a town and district in the Gorakhpur revenue division of Cttar Pradesh, India. The town, headquarters of the district, is on the Kuana river 38 mi. W. of Gorakhpur. Pop. (1951 census) 33,203. The town has three sections: (1) Old Basti, an elongated settlement extending east-west between the provincial road and the railway; (2) Pukka Bazar, a later suburb of official and professional residences, a mile to the southwest along the provincial road, and (3) the "civil station," an administrative quarter, on a higher site over the Kuana, half a mile west of Pukka Bazar. Basti is the seat of a college of Gorakhpur university. It is on the Delhi-Muzaffarpur national highway and the Northeastern railway between Lucknow and Gorakhpur. Agricultural produce from the district is exported through the town, and textiles, salt and building stone are imported for local use. Local manufactures are hand-loom cloths and wooden, earthen and glass articles.

Basti remained little more than a village until it was made the headquarters of the Basti district in 1865. Its growth as an administrative and commercial centre is shown by the population increase from about 5,000 in 1872 to more than 45,000 (1959 est.).

BASTI DISTRICT is part of the Saryupar plain, extending northward from the Gogra river. Pop. (1961) 2,621,937. Area 2,821 sq.mi. It is drained southeastward mainly by the Gogra tributaries Rapti, Kuana and Ami. From south to north it comprises three physiographical zones: the *tarhar* or plainland, often flooded during the rains; the *uparhar* or upland; and the *tarai* (*q.v.*). Drainage is defective causing swamps and jheels or marshy meres; of these Lake Chanda in the southwest and Lake Badhanchh in the east are quite extensive. There is some tube-well irrigation; the main crops are rice, barley, wheat, sugar cane, oilseeds and pulses. There are several sugar-processing factories. Considerable transit trade is carried on with Nepal. (R. L. SI.)

BASTIA, the biggest town in Corsica, the former capital of the island and still the military headquarters, lies on the east coast, 22 mi. S. of the tip of the Cap Corse peninsula, the northernmost point of the island. It is close to the mainland of Italy (117 km. or 72.6 mi. from Leghorn) and is an outlet for the fertile north valleys of Corsica. Pop. (1954) 42.729. Of the two very different parts of the town the older *(Terra Vecchia),* in the centre, is dominated by a Genoese keep, or *bastiglia,* which was built in 1383 and gives the town its name; an old fishing village and the old harbour are located there. The harbour is enclosed by the upper town *(Terra Nuova)* on the south and the modern town on the west and north, where the chief hotels and the railway station are situated. Farther to the south the densely populated old town is a network of alleys connected by dark, vaulted passages overlooked by the church of S. Giovanni Battista, with its classical façade, which is floridly decorated, as are the law court, the theatre and the *hôtel de ville.* Cap Corse is celebrated for its sweet wines; there are flourishing lime fruit trees and olives and some antimony mines near by. In Bastia itself cigarettes, cigars, *pâtés* and preserves are made. Exports include wine, timber, fish, chestnuts, tannin, early vegetables and fruits, crustaceans and asbestos.

Bastia was one of the first Corsican towns to welcome the union with France but, because of the strong Roman Catholic feeling of the inhabitants, it opposed the anticlericalism of the Revolution. The town was taken by the English in 1745 and again in 1794, was occupied by the Germans in 1942 and was heavily bombed in 1943. The damage has been repaired. From the Place St. Nicolas there is a fine view of the islands of Elba, Monte Cristo and Capraia. Vescovato, *c.* 20 km. (12 mi.) S., is the birthplace of the French naval hero Louis de Casabianca who with his 10-year-old son was immortalized by Felicia Dorothea Hemans in her poem about the Battle of the Nile beginning, "The boy stood on the burning deck."

BASTIAN, ADOLF (1826–1905), German ethnologist and traveler, was born June 26, 1826, in Bremen. After receiving a medical degree in 1850, he undertook the first of many journeys around the world as a ship's surgeon. After five years spent in the far east he began publication of his work on the peoples of eastern Asia. He made other trips to Africa, South America and India and published a long series of papers on Buddhism and on the psychological aspects of native superstitions. Bastian's observations were keen but unsystematized, and his influence was limited to his own day. He favoured independent invention rather than diffusion as an explanation of similar customs. When not on one of his journeys abroad, he lived in Berlin, where he was professor of ethnology at the university and curator of the museum, to which he contributed a notable collection. He also edited the *Zeitschrift fur Ethnologie* from 1869, in conjunction with the pathologist, R. Virchow, and Robert von Hartmann. He died Feb. 2, 1905, in Port of Spain, Trinidad. Bastian's more important works were: *Der Mensch in der Geschichte* ("Man in History," 1860); *Die Volker des ostlichen Asien,* 6 vol. (1866–71); *Ethnologische Forschungen* (1871–73); *Die Kulturlander des alten Amerika* (1878–79); *Der Buddhismus in seiner Psychologie* (1881).

For an appraisal of his work, *see* R. H. Lowie, *The History of Ethnological Theory* (1937).

BASTIAT, (CLAUDE) FREDERIC (1801–1850), French economist, was born June 29, 1801, at Mugron, near Bayonne. He became a lucid expositor of the policy implications of classical economics and was at his best in exposing the fallacies of protectionism. For example, in a well-known satirical parable he formulated a petition of the candlemakers for protection against the sun, suggesting how much the candlemakers and related industries could profit if only the sun were eliminated as a competitor in furnishing light (see *Sophismes e'conomiques,* Eng. trans., 1922). Bastiat carried on vigorous propaganda for free trade and was the dominant personality in a short-lived French free-trade association.

During the revolutionary years 1848–49 Bastiat wrote effectively against the rising wave of socialism, which he attempted to identify with protectionism. The appeal of Bastiat's popularized economic science was enhanced by an extreme optimism concerning the future material welfare of society. He served in the constituent assembly of 1849 and in the subsequent legislative assembly of the same year.

Toward the end of his life Bastiat attempted a treatise on political economy, *Les Harmonies e'conomiques* (1850). He was, however, unequal to the rigorous task of making an original contribution to fundamental economic theory. His important role was that of a brilliant economic journalist. He died on Christmas Eve, 1850, in Italy, where he had gone because of poor health.

See *Oeuvres complètes* (various editions) for an interesting *Memoir* of Bastiat. The English translation of *Les Harmonies kconomiques* contains a sketch of his life and writings. (D. DD.)

BASTIDE (Provencal BASTIDA), an old military word for the fortified towns founded in southwestern France, chiefly between the second half of the 12th century and the beginning of the Hundred Years' War. The founders were the monarchy, the feudal nobility and some abbeys. Bastides were built on a geometrical plan—rectangular, square, circular or lozenge-shaped—with streets running at right angles or parallel to one another and, in the middle, a large square with arcades. Their function was not only military but also political and economic. and they were therefore endowed with important charters of privileges in order to attract inhabitants. A good example is the existing bastide of Libourne, founded by the English seneschal Roger de Leyburn (1270). Other types of bastides are represented by Sauveterre-de-Guyenne, Monségur, Montauban and Mont-de-Marsan.

BASTIEN-LEPAGE, JULES (1848–1884), French rustic genre painter and portraitist, was born of peasant stock in Damvillers, Meuse, Nov. 1, 1848. He was educated at Verdun, and in 1867 began studying under Alexandre Cabanel at the Ecole des Beaux-Arts, Paris. He first exhibited at the Salon of 1870 and after military service returned to Lorraine. He won a medal at the 1874 Salon for "Spring Song," which stylistically owes a little to Edouard Manet. "The Hayfield" (Luxembourg museum, Paris), popularly acclaimed at the 1878 Salon. follows in the tradition of J. F. Millet, and there is always an element of sentiment in his work alien to the Impressionists. "Joan of Arc listening to the Voices" (Metropolitan museum, New York) in which Joan is represented as a Lorraine peasant, typifies his subject pictures. Although not a pioneer of the *plein air* ("outdoor") school, he was much imitated in both France and England. His portraits include those of his biographer C. A. A. Theuriet, Henry Irving (National Portrait gallery, London) and Sarah Bernhardt (1879). He died in Paris, Dec. 10, 1884.

See C. A. A. Theuriet, *Bastien-Lepage* (1885; Eng. trans., 1892); Marie Bashkirtseff, *Journal Intime* (1890). (D. L. Fr.)

BASTILLE, a former fortress on the east side of Paris which became first a French state prison and then a place of detention for important persons charged with miscellaneous offenses. The storming of it by an armed mob of Parisians on July 14, 1789, owes its significance in the ideology of the French Revolution to the fact that the Bastille had become a symbol of despotism in the minds of those whom government policy had kept in ignorance of its real function.

With its eight towers 100 ft. high linked by walls of equal height and surrounded by a moat more than 80 ft. wide, the Bastille dominated Paris. The first stone was laid on April 22, 1370. on the orders of Charles V of France, who had it built as a *bastide* or fortification (the name Bastille is a corruption of *bastide*) to protect his wall around Paris against English attack. The Bastille, in fact, was originally a fortified gate, but Charles VI turned it into an independent stronghold by walling up the openings at the same time as the Porte Saint-Antoine was being built as a new gate a little way to the north. Finally its defensive system was completed on the eastern flank by the erection of a bastion in 1557, when Paris was threatened by the Spaniards after the battle of Saint-Quentin. Thenceforward entry into it was from the south side, between the two towers overlooking the Seine river. In the 17th century a transverse block was built, dividing the inner court into two unequal parts.

Cardinal Richelieu was the first to use the Bastille as a state prison; *i.e.,* as a prison for persons not guilty of common crimes or offenses but who had in some way endangered the security of the state, of the sovereign or of some group of citizens (sometimes even of a particular family). Whereas previously only persons of exalted rank in the kingdom had been appointed governors of the Bastille, Richelieu entrusted it to Charles Leclerc du Tremblay, a brother of the celebrated Father Joseph. The oldest known list of prisoners, 53 names of persons of every condition, belongs to the Richelieu period. From then onward the average yearly total of prisoners was about 40, interned on the king's orders, that is, by a *lettre de cachet* (*q.v.*): high-ranking foreigners, secret agents, journalists and political trouble-makers in general, but also gentlemen of vicious morals and young men held in restraint at the request of their own families.

Under Louis XIV a new class of prisoner came to be admitted; viz., sinister persons who were implicated in scandalous cases of witchcraft. poisoning or coining but whose trial was in the hands of regularly appointed judges. From being a state prison the Bastille thus became a place of judicial detention, in which the *lieutenant de police* (an officer first appointed in 1667, with his headquarters at the Châtelet) could hold prisoners. Under the regency of the duc d'Orléans, moreover, the practice began of detaining in the Bastille persons who were being tried by the *parlement.* Imprisonment by *lettre de cachet* remained, however, in force, and prohibited books, as in the case of the *Encyclopédie,* could also be placed in the Bastille. The treatment of the prisoners varied according to their status, but conditions were constantly improving. The cost of upkeep of the old building, however, was very high, and demolition was proposed in 1784.

There were only seven prisoners in the Bastille when the mob advanced on it on the morning of July 14, 1789—with the intention not of storming the Bastille but simply of asking the governor, the marquis de Launay (Bernard René Jourdan), to distribute the arms and munitions stored in it. Then enraged by his attitude and led by a determined band, the people forced their way in. Two days later, on July 16, the assembly of electors of Paris decided that the Bastille was to be razed to the ground. The task was entrusted to a master mason. "Patriot" P. F. Palloy, who had the idea of carving miniature Bastilles out of the stones and sending them to the municipalities. Demolition was expensive and was still incomplete in 1792. In 1840 a column was erected to the memory of the victims of the July revolution of 1830.

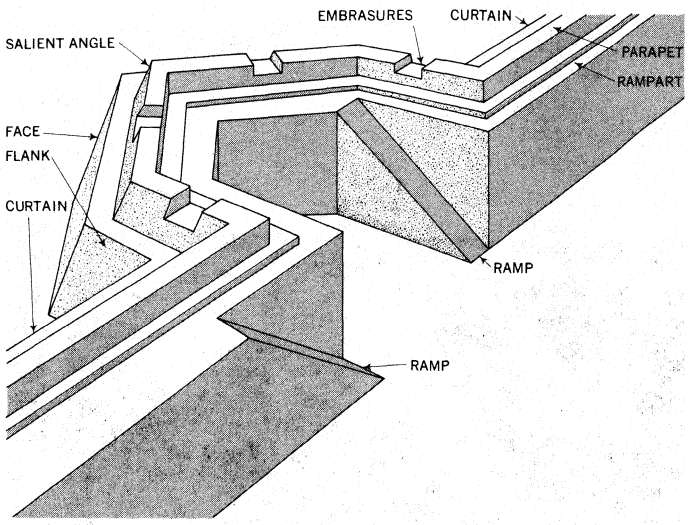
BASTION, an element of fortification that remained dominant



PLAN OF A TYPICAL BASTION

for about 300 years before becoming obsolete in the 19th century. A projecting work consisting of two flanks and two faces terminating in a salient angle, it was designed to permit defensive fire in front of neighbouring bastions and along the curtain connecting them.

Revolutionary changes took place in fortification (*q.v.*) during the 15th century after the fall of Constantinople in 1453 demonstrated that cannon could breach the stoutest masonry. Medieval walls and towers were gradually replaced by low, screened works as men dug into the earth for protection instead of building upward. Earth from the ditch was thrown up to form the rampart and parapet that provided cover for the musketeers and for the gunners of the artillery. And the bastion added to defensive firepower by eliminating the "dead space" just below the parapet.

The citadel at Antwerp, built in 1568 at the impressive cost of 1,400.000 florins, was for long Europe's most famous example of a fortification with a bastioned "trace," or general plan. By a historical coincidence, Antwerp took the lead three centuries later in the development of the "ring fortress" that replaced the bastion and similar works with detached underground strongholds protected by a crown of concrete. By 1889 the Belgian city was ringed by 24 such works, some of them at a distance of 12 mi., and the bastion had become a relic. (LN. Ms.)

BASUTO: see SUTO.

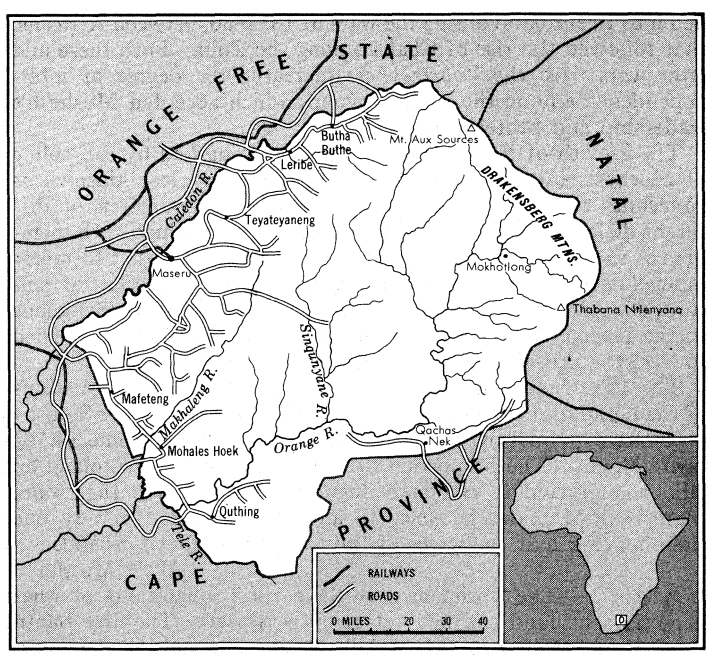
BASUTOLAND, a British colony, one of the three high commission territories in southern Africa, the other two being the protectorates of Swaziland and Bechuanaland. It is an enclave within the Republic of South Africa, but administered by Great Britain. Basutoland's independence is largely due to Moshesh who united scattered tribes to form the Basuto nation during the 19th century. Its area is 11,720 sq.mi. and it extends from latitude 28° 35′ to 30° 40′ S. and from longitude 27° to 29° 30′ E. Much of Basutoland is impoverished and heavily populated and its economy is entirely dependent on the export of agricultural products and labour, mainly to South Africa.

Physical Geography.—Basutoland consists mainly of the highest part of the great plateau of southern Africa. Nearly three-quarters of the country is between 6,000 and 11,000 ft. in height; this region is a highly dissected plateau of basaltic lavas overlying Stormberg rocks of the Karroo system, mainly shales and sandstones. which outcrop below about 6,500 ft. to the west and in the Orange River valley. These sedimentary rocks form the so-called lowlands and foothill regions of Basutoland.

The country can be divided into well-marked regions. The western lowlands form a long fringe, about a quarter the area of Basutoland, between the Caledon river and the Cave Sandstone foothills, and are situated at an altitude of about 5,000–6,000 ft. They consist of undulating basins and plains composed of softer sedimentaries with numerous, steepsided plateaus and conical hills of more resistant Cave Sandstone. The plateaus formed useful natural fortresses, the best known being Thaba Bosiu, which was Moshesh's headquarters (see ***History*** below). There are many caves and shelters at the base of the sandstone cliffs, used originally by the Bushmen (whose paintings can still be seen). while villages are now strung out along the slopes of the hills. Cultivation is carried on extensively in the basins and plains, the plateaus being reserved for grazing. The majority of the Basuto people live here, and the density of population is high, with more than 200 people per square mile in places. Most of the administrative centres are situated in the lowlands. Soil erosion is serious, particularly in the south, and this region has the highest proportion of migrant labour in Basutoland. A vigorous soil conservation campaign has been carried on for many years with considerable success.

The Cave Sandstone terrace is a long narrow zone between the highlands and the lowlands, with an average altitude of more than 6,000 ft. This region is one of the most productive in Basutoland and is better watered than the lowlands, with a more fertile soil and higher crop yields. The long barrier of the Maluti mountains. spurs of the main Drakensberg, over 10,000 ft. in places, marks the western edge of the highland region, a mature plateau deeply cut by river valleys and forming South Africa's main watershed. There rise the Orange river and its main tributaries, which drain west to the Atlantic and have cut the highlands into great blocks; and from there flow the Natal coastal rivers, such as the Tugela. Much of the eastern edge of the plateau is above 10,000 ft. high and descends in a spectacular escarpment thousands of feet to the terraces of Natal. The fingers of high plateaus above 8,000 ft. in height form the cattle post country; they are not permanently inhabited, except for herdboys, and are used as grazing for livestock. The deep valleys, such as the Senqunyane, have fertile soil, produce good crops and are well populated. The highlands are the most important economic region in Basutoland; large amounts of wool and mohair are produced; wheat and peas are the main crops. The long narrow subregion of the Upper Orange valley lies at a lower altitude, has less rainfall and more infertile soil and is more densely populated than the highlands. Maize (corn) and sorghum are the main crops as in the lowlands.

Climate.—Despite its subtropical latitude of about 30° S. the climate is equable with moderate annual temperatures due to the high altitude. Rainfall varies considerably in amount and seasonal periodicity. Three-quarters of Basutoland has more than 25 in. average annual rainfall, the highest totals occurring in the



ROADS, RAILWAYS AND PRINCIPAL PLACES OF BASUTOLAND. INSET SHOWS LOCATION OF THE PROTECTORATE IN AFRICA

ig ls and t lowest in the t lowlands d Orange River valley. T ere is a marked t maximum, with three-quarters f the total annual ai fal from ct to April. Rainfall is lly convectional d associated with t u l Showers t t be of short duration id heavy, sc cetimes ? an h falls in an hour. Hail often falls n d may lo much damage to crops. Snow may fall in consider ol amounts at any time f th year in the t while the lowlands occasionally have snow in winter. Mean annual t atures are fairly low g z from an average of about 45° F. for June and ".y t about 69°–70° F. for Ja ary in the lowlands, while it is estimated that in the highest part of the t tl range oi t t is from about 10–60° F. Frosts occur widely in winter and ic-casionally during summer as well. The highlands usually have a growing s is of less t a six months.

Vegetation n d Animal Life.—The vegetation of t consists mainly of t oe a rasslands. Most f the country is treeless, :p.t for the administrative d mission :i where willows, p l s ar is have e a ., and some of the warm sheltered valleys which l i ;en us trees a shrubs. The highlands contain some of the finest natural grazing in southern Africa, particularly those areas with Themeda *triandra* or red grass. A bitter karroo bush, Chrysocoma, invaded large areas of highland which had been seriously overgrazed, but with ,controlled grazing this problem has been largely overcome.

A wide variety of wild life was once found in Basutoland, but it has been nearly all exterminated, except for a few small antelopes and hares. During the 19th century the Basuto traded otter and leopard skins. ostrich feathers and cranes wings with the Zulus for cattle, hoes, assegai blades, necklaces and copper rings.

(N. C. P.)

The People.—The people of Basutoland consist of a cluster of tribes which accept the authority of the paramount chief, the ruling member of the house of Moshesh (Moshoeshoe). Most of these tribes, collectively Basuto or Suto (*q.v.*), are bf southern Sotho (*q.v.*) linguistic stock. Moshesh was originally the chief only of the Koena group (Molibeli, Monaheng, Hlakwana, Kxwakxwa and Fokeng tribes), which thus formed the nucleus of the nation. The nation absorbed members of other southern Sotho—but non-Koena—tribes, including the Phuting, Kxolokwe, Sia, Tlokwa, Taung and Rolong. There were also many Nguni-speaking tribes, some of which (Phetla and Phuthi) were original settlers in the area and others (Natal Nguni such as Tebele, Bhaca and Zulu and Cape Nguni such as Tembu) were offshoots of and fugitives from Nguni tribes outside Basutoland. They fled into Basutoland during the wars of 1818–30, between Africans, that followed the rise of Chaka among the Zulu. Both these and later wars with the Voortrekkers increased the degree of interdependence among the various groups which accepted Moshesh's leadership and protection.

The growth of the Basuto state has been marked by the policy of Moshesh and his successors to appoint their close kinsmen as governors of territorial area6 to rule over groups often of different dialect and custom. Under them, chiefs include both members of the Basuto royal house and also of royal houses of formerly independent tribes. There has been a continual process of cultural adaptation by non-Koena groups to the culture and language of the Koena, although the Nguni groups in particular have tried to resist cultural amalgamation.

The 1936 census report, the last to show the ethnic affiliations of the population, showed that Sotho-speakers (commonly Sesuto) accounted for just over 85% of the total population, some 14.5% being Nguni. The proportion of men absent from Basutoland on labour migration is extremely high. It is estimated that more than 45% of males between 15 and 50 are absent at any one time, leaving half the wives of the country without husbands.

(J. F. M. M.)

History.—The Bushmen were the earliest inhabitants of what is now Basutoland but died out many years ago. The first Bantu were Nguni (Zulu-speaking) tribes who crossed the Drakensberg in the 18th century and settled along the banks of the Caledon river. Later they were joined by Sesuto-speaking tribes.

CONSTANCE STUART FROM BLACK STAR

BASUTOLAND GOAT-HERDER AND HIS FLOCK

They all lived at peace, disturbed only by intermittent cattle raids, until early in the 19th century, when that part of Africa was set in turmoil by the Zulu despot Chaka. Many tribes fled over the Drakensberg, pursued by his regiments, ravaging and plundering, until eventually the social fabric of the people was almost destroyed. Eventually a young chief, Moshesh, born about 1790, gathered the remnants of the tribes about him and, using impregnable mountain fortresses such as Thaba Bosiu as his bases, beat back the invaders.

No sooner was the Zulu menace from the east contained than the Basuto people had to face the Europeans who were trekking up from the south. With the unerring skill of a diplomat, Moshesh played off the rulers of the Boer states and the colonial government of the Cape Colony against each other. Moshesh welcomed missionaries and traders to Basutoland but with both he showed himself well able to hold his own. As tension increased between Basuto and Boers, who were passing through or settling in his country in increasing numbers, Moshesh's conviction grew that the only hope of "existence and peace" lay in British protection. He laboured incessantly to make this hope a reality. Protection was first granted in 1843. Then in 1848 British sovereignty was proclaimed over the Orange river country, and in 1849 the boundaries of hloshesh's territory were reduced. But in 1854 the British renounced sovereignty over the Boers north of the Orange. and Moshesh was left to battle on through repeated disappointments and almost continuous strife with his Bantu, Boer and British neighbours, until at last, in 1868, Basutoland was proclaimed British territory. The Boers, who had overrun practically the whole country up to the foothills, protested in vain against this interference and had to be content with a 30-mi. strip of "conquered territory" along the Caledon. Moshesh died two years later, happy that his people had at last become British subjects. The Basuto owe their existence as a nation to the genius of Moshesh who must be regarded as one of the dominating figures of South African history in the 19th century.

In 1871, without adequate consultation, Basutoland was annexed to the Cape Colony and a small administrative staff established. Then tactless attempts at direct rule, ignoring Basuto customs and loyalties, coupled with precipitate doubling of the hut tax. led to minor revolts and increasing restlessness. This finally flared into open revolt (the Gun War, 1880) when the government attempted to disarm the people. Peace was re-established in 1883, and the Cape Colony, weary of attempting to administer Basutoland, asked the British government to be relieved of the responsibility, while the Basuto chiefs for their part preferred British protection to the possibility of renewed encroachment from the Free State. In 1884 Basutoland became a crown colony. The new "governor's agent" was instructed

that "nothing more should be attempted at first than the protection of life and property and the maintenance of order on the border," and that the Basuto "were to be encouraged to establish internal self-government sufficient to suppress crimes and settle intertribal disputes." These instructions were faithfully obeyed. The chiefs were left to rule their people according to native law and custom, and the authority of Moshesh's senior son and of his son Lerotholi after him was supported. By 1898, after a few bloody affrays, Lerotholi enjoyed "undisputed supremacy." British control was peacefully accepted, and thenceforth (except for one incident during the South African War of 1899–1902) the Basuto remained loyal. Credit for this was due to the early resident commissioners, Sir Marshall Clarke (1884), Sir Godfrey Lagden (1893) and Sir Herbert Sloley (1902), and of Lerotholi, nho was paramount chief from 1891 to 1905 during the difficult transitional period.

After 1884 the Basuto settled down rapidly and, with advice and help from missions and government, advanced in education and agriculture. But fears for their future were never entirely allayed. During the South African War, they were uneasily neutral. In 1906 the extension of the South African railway system to Maseru, indicative of the growing importance of the country's agriculture, trade and labour supplies, was strenuously opposed by the younger chiefs as a potential threat to their independence, although only one mile of the new line lay inside the border. These fears were revived again in 1909 by the unification of the four South African colonies and discussion about the transfer of the administration of the high commission territories, Basutoland, Bechuanaland Protectorate and Swaziland to the government of the new Cnion of South Africa. A deputation petitioned the king asking that the country should remain "outside (the Union) as far as possible, independent as it is now" and was reassured. Thereafter the matter remained quiescent until 1933, when informal discussions were opened between the Union and British governments. In 1935 an *aide-mémoire* recalled the pledges made by the British government both to the British parliament during the passage of the South Africa act (1909) and to the inhabitants of the territories, and recorded that the two governments nou- agreed that in the ensuing years their native policies "should be directed to bringing about a situation in which if transfer were to become a matter of practical politics it could be effected with the full acquiescence of the populations concerned." The Basuto determination to avoid incorporation was, however, strengthened at mid-20th century by the tide of African independence movements. Notwithstanding, South African prime ministers suggested that Basutoland was in more need of the Union than the Union was of Basutoland. In 1952 D. F. Malan spoke of the economic consequences of the Union treating Basutoland as a foreign state, while H. F. Verwoerd, in reviewing the proposed Basutoland constitutional changes (which probably put an end to the possibility of transfer; see Administration and Social Conditions, below) stated that the Cnion would not continue indefinitely to absorb the surplus inhabitants of the high commission territories. Assurances on future constitutional progress were given by British Prime Minister Harold Macmillan during his visit in Jan. 1960.

The uncertainty of the political future of Basutoland goes a long way to accounting for the laissez-faire policy nhich characterized the British administration in Basutoland in the 50 years that followed crown colony rule. Declining prices following the world-wide depression in the 1930s, accompanied as it was in Basutoland by a severe drought, forced the British government to pay greater attention to the territory's problems. A comprehensive financial and economic report of considerable consequence was drawn up by Sir Alan Pim. He referred to the government and native organization which worked practically independently of each other with no attempt being made "to combine them into a real system of government, or to make such modifications in the native system as would render it capable of dealing with the changing conditions of modern times and with the effects of the introduction of a money economy and of contact with European institutions." As a result of the Pim report some administrative reforms were initiated in 1938, and moneys were made available from the Colonial Development fund for soil conservation and agriculture.

The death of the paramount chief in 1940 gave rise to a series of disputes and aggravated conditions in a society that a report drafted for the Commonwealth Relations office (Cmd. 8209, H.M.S.O., 1951, the "Jones report") described as both "anachronistic and insecure." This feeling of insecurity found its most obvious expression in the intensification of Basuto belief in magical, supernatural aids usually referred to as "medicines." At least 133 cases of "medicine" murder. whose primary aim was to obtain human flesh for its supposed magical value, were recorded betneen 1940 and 1958. Yet the secondary causes, the Jones report suggested, were almost entirely political and stemmed from the rivalry and multiplication of chiefs and tribal authorities. (S. Tr.)

Population.—The 1956 census gives the African population of Basutoland as 638,857, an increase of 14.37, since 1946, of whom the great majority were Basuto. There were also 154,782 absentees in South Africa. Most Basuto are Christians because of sustained missionary activity. Europeans numbered 1,926 in 1956 comprising government officials, missionaries and traders, while there were 891 Asiatics and Eurafricans. The density of population decreases considerably from the lowlands to the highlands, the average density being 54.8 per square mile, while distribution is very uneven. The largest centre of population is Maseru (*q.v.;* pop. 5,739), the capital. (N C. P.)

Administration and Social Conditions.—The territory is administered by a resident commissioner in Maseru, the capital, under the direction of the British high commissioner in whom the sole power to legislate reposed prior to 1960. An advisory body known as the Basutoland council was established in 1910 with the resident commissioner as president, the paramount chief as chief councilor, and 99 Basuto members. In Sept. 1955, following a resolution asking for legislative powers in all internal matters, the council set up two committees to formulate detailed proposals. Since then agreement has been reached with the British government with regard to constitutional changes for Basutoland. This constitution, which came into operation at the end of 1959, retains certain legislative and reserve powers for the high commissioner. A legislative council, called the Basutoland National council, was created. It has the power to legislate for all in Basutoland and the right to discuss those matters which remain in the high commissioner's legislative sphere. The council consists of 80 members of whom half are elected by the district councils. There is an executive council comprising four unofficial members and four official members, of whom one is the resident commissioner who presides and has both a deliberative and casting vote. There is a single voters' roll for Basuto and non-Basuto British subjects and British protected persons. The position of the paramount chief is specifically recognized in the new constitution and he will have the right to nominate 14 persons to the council.

The first modern political association was the Lekhotla la Bafo ("League of Commoners") which sought to end British influence in Basutoland. Later the Basutoland African congress became the major political organization urging self-government. With the impending elections this transformed itself into the Basutoland Congress party, while a new organization, the Basuto National party, also emerged. Both proclaim the right of the Basuto nation to rule themselves without constitutional limitations. There are two weekly and three monthly Sotho newspapers. Since 1951 there have been four registered trades unions.

For administrative and fiscal purposes the country is divided into nine districts under district commissioners—Maseru, Qachas Nek, Mokhotlong, Leribe, Butha Buthe, Teyateyaneng. Mafeteng, Mohales Hoek and Quthing. Under the 1959 constitution local government is in the hands of the district councils uith the principal or ward chief as the titular presiding officer.

Justice.—Under the Native Courts proclamation Basuto courts are divided into two groups. those of class B (of which there are 47) function as courts of first instance; those of class A

(12) have first instance as well as appellate jurisdiction. In addition there are four higher Basuto courts of appeal which also have first instance as well as appellate jurisdiction; appeal from these is to the judicial commissioner's court. The Basuto courts deal with cases arising under Basuto law and custom. except (1) offences punishable by death or by life imprisonment; and (2) civil disputes where the amounts involved are more than £250 for B courts and more than £500 for A courts. They may also deal with laws over which the high commissioner may give them jurisdiction. The Basutoland judiciary is headed by a chief justice. Under him there are the judicial commissioner, registrar of the high court, magistrates, and the various presiding officers of the subordinate courts — that is, administrative officers in their judicial capacity. In addition, a puisne judge was appointed. The Basutoland police establishment consisted of about 12 European officers and more' than 400 African subordinate officers and men. There were 10 jails.

Finance.—In 1946 a Basuto national treasury was established. Its main revenues are court fines and the proceeds of the sale of unclaimed stray stock. From these moneys chiefs' salaries and the expenses of local government are paid.

The government budget in the early 1960s allowed for an expenditure of just under £2,000,000 annually. The chief heads of expenditure mere education, police and prisons, medical, native administration plus district administration. Colonial development and welfare grants accounted for about 10% of the total expenditure.

The main sources of ordinary revenue are customs and excise, local tax. income tax, and wool and mohair export duty. Basutoland currency is the same as in South Africa.

Medical Services. — Basutoland is not a tropical country and tropical diseases do not present serious problems. The principal diseases in the territory are venereal disease, chronic rheumatism, malnutrition. infections of the respiratory tract and dyspepsia. The heaviest toll of lives in children is due to tuberculosis: malnutrition, diphtheria, whooping cough and gastroenteritis. The incidence of nutritional and deficiency diseases is comparatively high and is allied to a staple diet of maize. There are a number of government and subsidized mission hospitals, child welfare centres, venereal disease clinics and health centres, including the mountain dispensaries. Mass diphtheria, whooping cough (with the assistance of UNICEF) and smallpox immunizations have taken place. WHO has co-operated in nutritional and tuberculosis surveys.

Education.—Basutoland has a higher proportion of the African population attending school than any country in Africa. This is possible because a substantial part of public funds is allocated to education, and because the missions bear the entire or partial cost of more than 90% of the schools. In the early 1960s there were more than 1,000 schools and institutions in the territory; only about 1% were not under mission control, and approximately 18% were unaided. The first schools were started by the Paris Evangelical Missionary society shortly after its arrival in Basutoland in 1833. The Roman Catholic mission founded its first school in 1864 and the Anglican Church mission followed in 1870. From 1871 onward the administration of Basutoland began to give financial support to the mission schools, and a government high school was established in Maseru in 1939. There were in the early 1960s about 20 secondary schools, several teachers' training centres, the Lerotholi technical school and other technical training centres, but these have not been eagerly attended by the Basuto. In 1945 the paramount chief alienated land for the Pius XII college where there are faculties of arts, science, commerce and education. The college caters mainly to the education of African Catholics. A number of Sotho are studying in South Africa and in the United Kingdom on government bursaries.

The **Economy.**—Basutoland has no industries and its internal economy rests on a peasant agriculture. Land is theoretically common property, administered in trust for the people by the paramount chief through the hierarchy of chiefs, subchiefs and headmen. Arable land is allocated as far as possible to each household (average four persons) but thousands of households

BY COURTESY OF SOUTH AFRICAN TOURIST CORP.

LARGE HAND-WOVEN BASKETS IN BASUTOLAND WHICH ARE USED FOR STORING GRAIN

remain without land holdings. The system of land tenure "does not permit of real development or of much improvement, either in crop production or in agricultural methods" (Colonial reports. *Basutoland,* 1957). Soil erosion and primitive farming have decreased the area of arable land to 12.4% (930,000 ac.) of the total land area. The population mas estimated to reach 1,000.000 by 1963. Soil conservation is of vital importance. and as a result of a campaign launched in 1936, following the Pim report, most of the territory's arable land is now protected. Much has been done to encourage improved farming methods. A pilot project to demonstrate mixed farming on a co-operative basis has been undertaken in the 62-sq.mi. Tebetebeng valley. A slow but steady improvement in farming practice and living conditions is claimed for the scheme.

The principal crops are maize, sorghum, beans and winter wheat in the lowlands, and maize, spring wheat. peas and barley, with some sorghum in the valley, in the highlands. The villages are encouraged to grow vegetables. In 1936 there were more than 800 vegetable gardens under the supervision of field demonstrators By the early 1960s there were about 30,000 such gardens. Livestock numbered more than 360,000 cattle, 80,000 horses, 3.500 mules. 49,000 donkeys, 1,200,000 sheep and 500.000 goats. Very little livestock are kept in the lowlands except where tablelands have been reserved for grazing, and are mostly kept at mountain cattle posts practically the year round. Bovine and equine improvement is taking place.

Most of the retail trade in the territory is conducted by Europeans, there being, however, a few Indian traders in the northern districts. Europeans and Indians will not be granted further licences to establish new trading stations, as an increasing number of Sotho have engaged in trading activities since World War II. Approximately 2,700 Sotho hold trading licences of one sort or another, principally for bakeries, cafés, livestock trading, milling, general trading (subject to certain restrictions) and road transport. Another feature of postwar commercial activity has been the development, particularly in the field of wool and mohair marketing, of co-operative societies, which buy, grade and market produce. Basutoland has to import all the consumer and capital items it needs (principally foodstuffs, clothing, blankets and tin ware) as well as a certain amount of agricultural commodities (*e.g.,* plows) and livestock, the main exports being wool and mohair followed by wheat, sorghum and cattle. The value of imports usually exceeds the value of exports, often by a considerable figure, but the adverse balance is offset by the export of labour to the mines, industries and farms of South Africa resulting in a flow of income to Basutoland in the form of remittances to relatives, deferred wages paid locally, savings brought back from South Africa and payments to recruiting agents in the territory. The number of Sotho working in South Africa is not fully known. In 1958, 93,695 passes for South

Africa were issued to workers for the mines, agriculture and other work; this, however, was an emigration figure and is not an exact measure of migrant workers in that country. The Basutoland Co-operative Banking union was formed in Dec. 1957; it is a multipurpose organization which embraces banking, advances to co-operative societies, production and marketing. The possibility of mineral deposits in Basutoland is remote; there is, however, a diamond prospect on the Kau river.

Communications.—The territory is linked with the railway system of South Africa by a short line from Maseru to Marseilles on the Bloemfontein-Natal main line. The main road system totaling approximately 560 mi. is principally confined to the western lowlands. From Maseru a main road extends to the north to Butha Buthe and to the south to Quthing, with several short branch main roads eastward to the foothills of the mountains and a few westward to join South Africa's road system. Progress has been made in the building of a main road from Maseru into the mountainous area to the east. Qachas Nek on the southeastern border is connected by a main road with South Africa. Main roads are maintained by the public works department but the standard is generally low, the roads in many cases following the line of the original sunken wagon tracks formed by early missionaries and traders. Motor services of the South African railways operate between the government stations of Butha Buthe, Mohales Hoek and Quthing and the railroads in the Orange Free State. There are approximately 1,600 mi. of bridle paths in the territory, which are now constructed and maintained by the administration. The territory's main air strips, which can be used only by light planes but are being improved, are at Maseru, Mokhotlong, Sehonghong, Semonkong, and Qachas Nek, although there are others, used principally by traders, for transporting merchandise to their stores. Air transport includes regular mail services. A telegraph system covers much the same area as the main roads and a government radio links Maseru to Mokhotlong and Qachas Nek. (S. TR.)

BAT, the common name for flying mammals belonging to the order Chiroptera (from the Greek meaning "hand wings"). The general body form is similar to that of other small mammals such as mice or shrews. For instance, the skin is covered by fine fur; the mouth is equipped with teeth; a four-chambered heart pumps blood separately to the lungs and to the rest of the body; and mother bats have mammary glands to nurse their young. Most bats feed on insects, and the teeth, the skeleton, and the proportions of the brain show bats to be more closely related to mammals of the order Insectivora (shrews, moles and their relatives) than to those of the order Rodentia (gnawing mammals, mice, rats, squirrels, etc.). In fact, bats differ from shrews principally in having modifications for flight. These modifications include not only the wings and associated membranes that are usually attached to the hind legs and tail, but also the relatively large breast muscles that operate the wings, special modifications of the hind feet for clinging, and sensory adaptations for flying in the dark.

Even mare than other small mammals, bats restrict their activities to twilight and nighttime. They are perhaps the only vertebrate animals that commonly live in the deeper and totally dark parts of caves, where they hang upside down. The hind feet are modified for clinging; usually the toes bend inward or ventrally. and the claws are so sharply curved that once a bat is hanging from a twig or the rough surface of a rock no further muscular contraction is required and it hangs securely in deep sleep, hibernation, or even after death.

FIG. 1.—ROUSETTE FRUIT BATS (ROUSETTUS LEACHI) HANGING FROM CEILING OF A CAVE

Bats, in their mythological and artistic role, are famous as symbols of darkness and eerie mystery, and they are known by many people as haunters of churchyards and tombs or as squalid invaders of attics. In European and many other cultures bats are coupled with the nether regions; demons are pictured with the wings of bats, while feathered wings adorn the angels. Bats are victims of many more mundane superstitions, such as the belief that they tangle themselves in women's hair. While this may have happened on rare occasions, probably with a weak or semitorpid bat (see below under Body *Temperature* and Hibernation), a bat in normal possession of its faculties can easily avoid collision with a person. In Chinese and other far eastern cultures the bat is a symbol of good fortune, happiness and longevity. Stylized representations of bats are found in designs in oriental jade, china, metalwork and paintings. Two bats sketched on a Chinese greeting card that accompanied a gift symbolized the good wishes of the giver.

ORIGIN AND RELATIONSHLPS OF BATS

Bats, birds and insects are the only animals that can sustain themselves in the air for extended periods; of these only the bats are entirely a flying group. There are no bats that cannot fly, and many species are quite clumsy on the ground. Bats evolved the power of flight quite independently of the birds—and long after the appearance of the first flying insects. While the oldest fossil birds date from sometime during the Jurassic period (extending roughly from 130,000,000 to 160,000,000 years ago). the earliest bat fossils are from the early part of the Eocene, about 60.000,-000 years ago. The shorter geological history of bats, being less than half as long as that of birds, accounts in some measure for the fact that bats are closer, anatomically speaking, to their non-flying ancestors than are birds. Birds evolved feathers, a unique and radical departure from the scaly skins of the reptilelike ancestors of both birds and mammals; feathers serve as insulation and provide aerodynamically efficient contours for uings and body.

Bats, on the other hand, have a body covering like that of other mammals; their wings. likened to exaggerated webbed feet, are composed of a thin layer of skin stretched between spars formed from extremely thin and elongated finger bones. The "thumb," however, is not involved in the wing, and usually bears a small clan useful for clinging.

Internally. too, zoologists have found the structure of birds to be more highly specialized for flight. For example. most of a bird's bones are penetrated by air spaces connected to the larger air sacs and lungs; bat bones, however, are of the same basic structure as those of other mammals.

It is possible that bats, from their evolutionary beginnings, have been auditory animals which listened in the darkness even when they were tree-climbing forms that jumped and glided before their descendants took to the air. Birds on the other hand may well have evolved from ancestors that used their eyes far more than their ears.

FIG. 2 — AMERICAN LEAF-NOSED BAT (PHYLLOSTOMUS)

According to this interpretation the Megachiroptera (see *Classification* below) have deviated from the ancestral pattern. While this hypothesis has not been accepted by all students of mammalian evolution, it is supported by the fact that the oldest known fossil bats are typical Microchiroptera with relatively large auditory portions of the brain.

NATURAL HISTORY

For millions of years bats have been accustomed to roost by day in caves, crevices among rocks, hollow trees, cracks behind loose bark and similar natural hiding places. They do not construct nests nor do they dig or gnaw out holes as shelters. The only exception is one species (Uroderma bilobatum) belonging to the family Phyllostomidae — the leaf-nosed bats of the American tropics which feed largely on fruit. These bats cut the central vein of large palm leaves so that the leaf bends down to form a tentlike shelter under which the bats roost singly or in small groups.

When men began to build houses and other types of buildings, and to dig artificial tunnels as mines and tombs, bats began to use these retreats as substitutes for natural hiding places. This habit becomes particularly conspicuous in the many species that tend to be colonial. The females of many species congregate in early summer in roosting places that they find suitable as nursery colonies. There the young are born and cared for until they are well grown, and few if any adult males are present. Toward the end of summer these colonies are gradually deserted. (See Annoyance below for a discussion of bats in buildings.)

Body Temperature and Hibernation. — Bats differ from most other mammals in the ease and rapidity with which their body temperature and metabolism fluctuate. This is especially pronounced in colder climates, although even tropical bats show similar tendencies. When fully awake and active, bats have body temperatures between 100° and 105° F., and this is the case whether they are flying in cold winter air or in the stifling heat of an attic on a sunny day in summer. Under these conditions of wakefulness and activity bats regulate their body temperature just as other mammals do. The large surface area of the wing membranes greatly facilitates heat loss; when the blood vessels in the wings are dilated, a relatively large amount of blood flows out from the body and back again. In the cold these blood vessels are constricted, allowing the wing membranes themselves to cool almost to the air temperature but conserving the heat of the body as a whole.

When bats are at rest, however, the body temperature often falls rapidly to that of the air around them, and when they sleep this seems always to occur. Thus in summer a resting bat may have a body temperature of 80° or even 90°, but the same bat resting in the same spot on a cold day may allow its body to cool as low as 35° or 40° if the air temperature falls that low. The responsiveness and activity of the animal is roughly proportional to the body temperature, and bats cannot fly with normal strength or agility unless their tissues are warmer than about 80° F. On colder days they must warm themselves to this level before they can fly at all. Their heart rate, respiration, food utilization and bodily energy consumption (usually measured by the rate of intake of oxygen) all fall rapidly with lowered body temperature. This is why bats are often found in various degrees of lethargy and often fail to respond vigorously or to fly off for some minutes after they are first disturbed.

The bats of northern climates are mainly insectivorous, and during the lean winter months many species of them hibernate. Usually they lay on fat in the late summer and early fall, and they may reach double their minimum body weight of the previous spring. In the fall they seek out hiding places where they can pass the winter relatively undisturbed at a lowered body temperature and a greatly reduced metabolic rate. This in turn enables them to survive all winter on their stores of body fat. Such hibernation is apparently an adaptation for tiding themselves over the colder months when their insect food is not available in adequate quantity. An alternative solution adopted by some species is to migrate south to warmer climates, as many birds do (see below). Even these migratory bats undergo on cold days varying degrees of torpor that merge indistinguishably into hibernation.

One danger facing a hibernating mammal is that its winter retreat may fall below the freezing point of the water in its tissues, and this is usually fatal if prolonged more than a few hours or days. Bats sometimes increase their metabolic heat production at body temperatures within a degree or two of freezing and thus generate a small but sufficient amount of extra heat to tide them over brief cold spells. In other cases they respond by waking up completely and moving to other. more sheltered roosting places. In many cases bats move several times during the winter, seeking out retreats that are close to but not actually at freezing temperatures in order to conserve their stores of body fat.

Longevity. — Bats are unusually long-lived for animals of their size. This longevity is associated with the large proportion of their life spent in hibernation or varying degrees of lethargy and with lowered body temperature. It is a general rule that the smaller a bird or mammal the shorter the average life span of the species. Mice and shrews seldom live more than one year, and three or four years is an unusually long life span even for a pampered laboratory rat or mouse. But many small ($\frac{1}{4}$ oz.) insectivorous bats, which had been marked with numbered bands to study their migrations and homing (see below), have been recaptured as long as 10–15 years after banding. Occasionally such bats have been recovered after 21 years. Larger fruit bats (Megachiroptera) have lived up to 19 years in captivity.

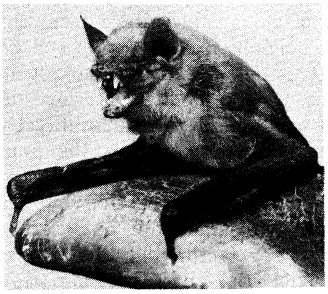
Breeding Habits. — Bats reproduce like other mammals in all basic respects. The male introduces sperm into the female reproductive tract by copulation and the developing embryo implants itself in the wall of the uterus. As the embryo grows the maternal tissue forms a placenta to nourish the embryo by bringing an abundant supply of the mother's and the embryo's blood into close proximity across a very thin and permeable membrane.

Most bats have only one young at a time, and reproduce only once a year, but there are a few exceptions. Females of the American red bat (Lasiurus borealis) have been found carrying three or even four newborn young whose combined weight exceeded that of their mother. At birth the young are poorly developed except for the claws. The milk teeth are also specialized for holding on tightly to the mother's fur or nipple (fig. 3).

JOHN H. GERARD FROM NATIONAL AUDUBON SOCIETY

FIG. 3.—AMERICAN RED BAT (LASIURUS BOREALIS) NURSING TWO YOUNG

Baby bats are usually carried only for the first few nights, and after that are left in the daytime roost. Some observations indicate that mother bats occasionally nurse young other than their own and that nursing may to some extent be communal. The young develop rapidly; little brown bats (*Myotis*) fly before they are a month old. Nothing is known about how they learn to catch flying insects.



LYNWOOD M. CHACE FROM NATIONAL AUDUBON SOCIETY

FIG. 4.—LITTLE BROWN BAT (MYOTIS LUCIFUGUS) RESTING ON BRACKET FUNGUS

The bats that hibernate in the winter have a specialized feature of reproduction that is unique among mammals, although there are similar cases among reptiles and insects. The sperm often survive for some months in the female reproductive tract before their union with an ovum. or egg cell, occurs and fertilization is actually accomplished. This is especially likely to occur over the winter, when the females are spending most of their time in hibernation, for during this period the ova have not yet matured and been released from the ovary into the uterus; this latter process (ovulation) ordinarily occurs shortly after the final awakening from hibernation. While mating may occur during the fall, winter or spring, the sperm stored from fall and winter matings assure that all or almost all the females in reproductive conditions will become pregnant.

Migration. — Some bats that live in colder climates migrate to warmer regions in search of insect food during the winter. and even those that hibernate in caves may be obliged to fly many miles from their summer range to find suitable places for hibernation. The occurrence of migrations was suspected long ago because of seasonal fluctuations in bat populations and the finding of bats during the fall on ships as far as 500 mi. from land and around lighthouses or radio towers during nights when large numbers of migrating birds collide with these obstructions.

Many of the thousands of bats marked with numbered metal bands have been retaken after migratory flights of as long as 800 mi. Little brown bats (Myotis) have been retaken in caves up to 168 mi. from their summer roosts; a bat banded at Dresden, Ger.. during the winter was caught again the following summer in Lithuania, 475 mi. to the north; and a free-tailed bat banded at Carlsbad caverns, New Mexico, was taken near Jalisco, Mex., 810 mi. to the south. Nothing is yet known about the methods of navigation employed by bats during these long migratory flights.

Homing Ability. — Coupled with the ability to perform long migrations are impressive powers of homing. If banded and carried to some distance before being set free. many bats succeed in finding their way home. In some such experiments a few little brown bats have returned so rapidly that they must have flown directly home from as far as 60 mi. during a single night. In other experiments bats have homed from as far as 180 mi., but these extreme cases may not be typical The vision of these small insectivorous bats is known to be quite poor, and in certain experiments blindfolded bats homed from several miles in a single night; hence vision is not required for long-distance navigation.

Orientation. — Bats are almost completely nocturnal. and while many are active in the twilight of evening or early morning, only one or two species occasionally hunt by day. Even the fruit-eating Megachiroptera, which have prominent eyes, are nevertheless nocturnal animals. Furthermore most of the Microchiroptera are able to fly successfully into the totally dark reaches of underground caverns, and many species do so habitually — either using caves as daytime roosts or as places of hibernation. Flight in total darkness requires some means of avoiding collisions with all sorts of obstacles such as stalactites of caves or branches of trees. Many of the insectivorous Microchiroptera catch insects in the dark, usually flying insects that must be individually located and pursued.

The blind-flying abilities of bats were first studied by Lazzaro Spallanzani (1729-1799), one of the outstanding natural scientists of the 18th century. Thinking at first that bats could see in what to us would be darkness, he mas forced by the results of his experiments (1793) to conclude that they did not need their eyes at all. He even surgically removed the eyeballs from several bats in order to be certain that some residual vision did not explain their continuing skill at avoiding small threads and their rapid and accurate selection of suitable landing places. A Swiss physician and zoologist, Charles Jurine, repeated Spallanzani's experiments and found that if the ear canals were tightly plugged, a bat became disoriented and helpless.

Spallanzani extended these experiments in many ways, eliminating all sense organs other than the ear, and convinced himself that hearing took the place of vision in guiding flying bats through darkness. These experiments, however, were largely forgotten until the 20th century, when biologists, using electronic instruments, discovered that bats orient themselves by emitting high-frequency orientation sounds and receiving the echoes as they bounce off objects. While these sounds have a very weak low-frequency component that can sometimes be heard under quiet conditions as a faint ticking, the great bulk of the acoustic energy lies in a frequency range above that to which human ears are sensitive. Interference either with the emission of these high-frequency sounds (by covering the mouth or, in some bats, the nostrils) or with hearing produce equally drastic disorientation. Bats have been using the equivalent of "sonar" for millions of years. This natural sonar is useful not only for simple flight patterns but also for the maneuverings needed in flying through tortuous caves and for catching flying insects.

The orientation sounds consist of short clicks, or sound pulses, lasting from 0.0002 to 0.1 second in various species under varying conditions Since sound travels through air at a speed of about 1.2 ft. in 1,000th of a second (or 1.2 ft. per millisecond), bats' sonar pulses extend over distances of a few inches to about 100 ft. Most kinds of bats use pulses that last only a few milliseconds and that are effective to a distance of only a few feet. The horseshoe bats (family Rhinolophidae). however, employ pulses lasting as long as $\frac{1}{10}$ of a second. The short pulses of all other bats produce echoes that return from objects located a few feet distant only after the outgoing sound has ended; this timing probably facilitates the discrimination of an echo from the outgoing signal.

In many of the bats most specialized for feeding on flying insects (especially the families Vespertilionidae and Molossidae) the pulses, emitted in a rather broad beam. do not have a single frequency but rather a frequency that drops by about one octave from beginning to end of each very short pulse of sound. For example, the common little brown bat of the United States (Myotis *lucifugus*) usually emits pulses which begin at about 100.000 cycles per second (c.p.s.) and drop to 40,000 c.p.s. by the end of a pulse of sound that lasts only about 2 milliseconds. This very rapid frequency sweep is roughly comparable, to frequency modulated radar or sonar, but the rate of frequency change is very much greater (in proportion to the actual frequencies involved), and the bat's sound system appears to combine the advantages of FM and pulsed sonar.

The horseshoe bats. on the other hand, employ a narrow beam of nearly constant frequency in their long pulses; they sweep this beam back and forth to scan their surroundings. It is important to note that the wave lengths of the orientation sounds used by various bats range from 0.1 to 1.0 in., and that these dimensions are roughly the sizes of the insects and other small objects that bats must detect.

The hearing of bats extends to frequencies approximately as high as those of their own emitted sounds. and the large external ears undoubtedly improve sensitivity to or discrimination of echoes of other sounds. The brain of a microchiropteran has large areas that are concerned with hearing, while the visual portions are reduced. The cerebral cortex is relatively small and simple in structure, with few if any folds in its surface. But the auditory nerve. the auditory areas of the medulla oblongata and the midbrain, and the auditory areas of the diencephalon are all relatively large. For example, the upper (dorsal) surface of the midbrain of most animals has four small lobes, two on each side, known as anterior and posterior colliculi. The anterior pair are composed of nerve fibres and cells concerned with vision, the posterior two with hearing. In most mammals they are roughly equal in size, but in bats (and in whales, which also use sonar) they are very much larger. In many species of bats the colliculi protrude dorsally so that they form a third pair of obvious lobes

when the brain is viewed from above, rising between the cerebral cortex and the cerebellum. These unusually large auditory lobes have also been found in the brain casts of fossil bats from the Eocene period (about 60,000.000 years ago), showing that then as now bats depended heavily on hearing. Probably even these remote ancestors of present-day bats possessed efficient sonar systems.

The individual pulses of orientation sound are emitted at different rates depending on the type of flight and the problems of navigation. Straight flight many feet above the ground and far removed from obstacles is usually accompanied by the emission of only a few pulses per second. But when a bat approaches a small or difficult obstacle such as a wire it speeds up the repetition rate of these sounds. until the rate may rise to more than 100 pulses per second. When flying insects are pursued on the wing, a similar but more extreme change in tempo often occurs. A bat that cruises while emitting 5 pulses per second may speed up its pulse repetition rate to 200 per second when closing in on a flying insect.

Vision can be eliminated from consideration because of an experiment performed by Spallanzani. He released several blinded bats and recaptured a few of them some days later early in the morning as they returned to their roost in the bell toner at Pavia. On killing the bats and examining their stomachs he found that they had caught just as many insects as the normal bats taken at the same time.

In experiments imitation insects are also pursued with the same increase of pulses, a fact that strongly suggests that bats detect insects chiefly by hearing echoes from the insects' bodies. In the early 1960s it was found that the little brown bat can catch small insects even when it is being bombarded with a loud noise covering most of the range of human hearing and far exceeding the faint sounds made by the beating of the wings of the insects; a much weaker noise, in the range of the bat's orientation sounds, causes the bat to stop trying to catch insects.

Echolocation is perhaps the chief method of hunting insects; however. sounds generated by the flying insects themselves often attract a bat's attention, and some insects are located and pursued by bats "homing" on the sounds arising from the insect's wingbeats or those made as the insect crawls on the ground or vegetation. The fact that so many moths have evolved elaborate auditory organs to warn them of approaching bats indicates that bats hunt mainly by echolocation rather than by silently heading toward sounds originating from their prey (see Control *of Insects* below).

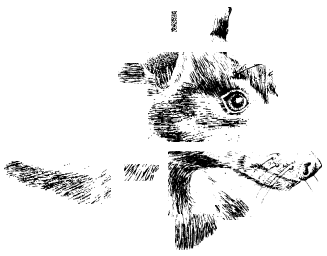
Bats commonly fly together in large groups, especially when leaving caves for the evening, and apparently the presence of many other bats' orientation sounds and echoes does not prevent the sonar of a given animal from operating efficiently. When hunting insects in wooded areas, and in the rain, bats must discriminate the faint echoes bouncing off insects from those bouncing off the ground, treetrunks, branches, twigs and raindrops. Most bats drink at times by skimming just above the surface of a pond or stream and delicately dipping the very tip of the lower jaw into the water. Some of these bats catch aquatic insects emerging from the water, and other species catch fish.

A bat's brain is well adapted for rapid handling of complex patterns of sound and echo, discriminating and interpreting auditory signals with a skill and speed that impresses even those familiar with the latest advances in radar and computing machines.

IMPORTANCE TO MAN

In some parts of the world bats are used as human food, the large flying foxes that weigh two or three pounds being especially sought after in parts of Africa and Australia. The accumulated guano under bat roosts is used in the American southwest and elsewhere as fertilizer, and the bat guano of Carlsbad caverns is said to have been used during the Civil War as a source of nitrates for gunpowder.

Control of **Insects.**—The most important service to mankind performed by bats is undoubtedly the destruction of billions of insects every night throughout the world. It is difficult to assess the aid to agriculture from this wholesale process of insect destruction. Many of the species eaten are small gnats or flies which do not affect man directly, and in many regions the numbers of such insects are so astronomical that predation by bats and birds may not be a serious limiting factor, but there is evidence that bats are important predators which over the years do exert a real pressure on the population of many species of moths.



RUSSELL F PETERSON IN "NATURAL HISTORY OCT 1958

FIG. 5 — FLYING FOX (PTEROPUS)

The caterpillars of moths are among the most destructive insect pests that cause widespread damage to agricultural crops. As explained above under Orientation, all of the insect-catching bats guide their flight in the dark by emitting high-frequency sounds, and these sounds are particularly numerous when insects are being hunted. Most moths, including many species whose caterpillars are agricultural pests, have highly specialized organs of hearing especially sensitive to the ultrasonic sounds of bats. These "ears" are not located on the head but on the thorax, or middle portion of the body, and they serve to warn the moth of an approaching bat so that the moth tries to escape—and often succeeds—by dodging or dropping to the ground.

These auditory organs are so specialized and occupy a large enough part of the moth's body that they must serve some useful function and have what biologists call survival value. That is, the moths and their ancestors over long periods of time must have tended to survive and reproduce their kind more successfully because of these acoustic warning devices. These organs of hearing are especially sensitive to bat sounds and to few other naturally occurring noises; there appears to be no other function for them. It therefore follows that bats must indeed have been important predators on moths over long periods of time in order for the evolution of these highly refined sense organs to have taken place. This means that bats are important limiting factors in the ecological pressures limiting the numbers of destructive moths.

Guano Production.—Since bats catch and digest a good fraction of their weight in insects every night their droppings (guano) can accumulate rapidly, and in a few years a colony of a few hundred bats can produce a pile of guano several inches deep In heavily populated roosts and especially in caves such as Carlsbad caverns. New Mexico, nhich shelters millions of bats in the summer the guano accumulates to the point where it is of commercial value as fertilizer. Many carloads have been taken from Carlsbad and other caves in the southwestern United States

Charles Campbell set up bat roosts in and near San Antonio, Tex., in the early 1930s to attract the free-tailed bats; one such roost was actually used by a large colony that produced salable quantities of guano. Almost every other attempt at artificial colonization, however, has been a failure.

Pest Species.—The larger fruit bats, especially the flying foxes, of the suborder Megachiroptera, are serious pests in fruit orchards, particularly in Australia. Their importation alive into the United States has therefore been prohibited by law.

Of far greater importance, however, is the ability of various bats to transmit certain diseases of man and livestock. In many areas of tropical America the presence of vampire bats seems to limit the success of stock raising. It is doubtful whether the mere loss of blood from bat bites is of any consequence; but of significance is the fact that blood parasites such as trypanoiomes (protozoans) and viruses are often transmitted from the hat to its victim, or from one animal to another via the hat acting as a vector of the disease. An even more serious problem is posed by the transmission of rabies.

Transmission of Rabies.—Epidemics of rabies in cattle have occurred sporadically for years in South and Central America and at such times vampire bats occasionally fly out in broad daylight and attempt to bite larger animals. They may also bite other

kinds of bats such as the common fruit-eating bats of the genus *Artibeus* (family Phyllostomidae), and these in turn, when in the terminal "furious" stage of the disease, may make unprovoked attacks on larger animals and men. In Trinidad there have been especially serious outbreaks of human and animal rabies in which vampire and to a lesser extent other bats have been implicated as the vectors.

Until about 1953 it was thought that rabies was transmitted by bats only in tropical areas, but in that year and subsequently rabies has been found in many species of insectivorous bats in the United States. Most of the few human cases of rabies contracted from bats in the U.S. have occurred in the southwestern states and in Florida, but rabid bats have been found as far north as Pennsylvania, Michigan and Montana. In a few cases the rabid bat has flown out in daylight and attempted to bite without provocation Although there have been a few human deaths from bat rabies. the great majority of bats in the United States are so small that their bites fail to break a person's skin under ordinary circumstances; in fact. only with difficulty has it been possible in laboratory experiments to cause infected bats to transmit the disease by biting other animals caged with them. Hence the hazard of widespread transmission of rabies from bats to dogs, foxes, skunks or human beings does not appear to be a major one. It is obviously prudent, however, to avoid being bitten by any bat that is unusually aggressive. It is important to recall, in this connection, that bats often become lethargic in daytime, even when completely normal and healthy, and will revive in a short time when disturbed. There is some evidence of transmission of rabies by aerosols in caves inhabited by bats.

On the other hand there is some evidence that bats. including some of the insectivorous species found in the United States, may survive an infection with rabies virus and appear to be in normal health; these bats may serve as carriers, which. at some later date, are able (at least under laboratory conditions) to infect other animals with the disease. It is of the utmost importance in any case where a person is bitten by a bat or other animal suspected of being rabid to secure the animal and to have it tested promptly by a public health laboratory. (See also RABIES).

Annoyance.—When bats select a house as a nursery colony, they often cause annoyance to the human occupants—particularly in view of the widespread superstitions and fears that bats arouse. The most common roosting places seem to be crevices in the outside trim of buildings or under loose shingles.

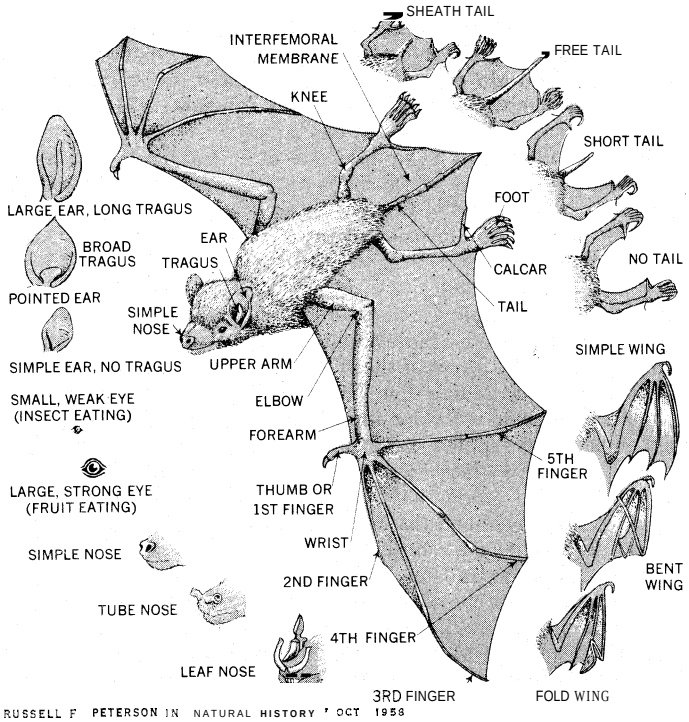


FIG 6 -ANATOMY OF A BAT AND COMMON STRUCTURAL VARIATIONS

It is important to realize the small size of most of the common bats of the United States or western Europe; hardly any weigh as much as one ounce, and weights of $\frac{1}{8}$ to $\frac{1}{3}$ oz. are much more usual, even for fully grown bats. The smaller bats are more abundant, and they can easily enter elongated cracks as narrow as $\frac{3}{8}$ or even $\frac{1}{4}$ in.

Many types of frame houses have boxed-in spaces along the ends of the roof or under the eaves, and when the boards become slightly warped, cracks of this size can easily open up. Hundreds of bats occasionally use such a space for a nursery colony, and their presence may go unnoticed for many years.

While various poisons can be used to kill the bats, time-honoured remedies such as burning sulfur candles or sprinkling moth flakes in the attic have little if any permanent effect, and many poisons merely drive away the bats rather than kill them, so that they can return within a few months. The best method, where it is practicable, is to close all cracks and openings by which bats enter the building, preferably during the winter or at other times when they are absent. This may require a very thorough chinking and sealing of all exposed cracks; and even then. once bats are established in a building, they may re-enter through other cracks after their original pathways are blocked.

CLASSIFICATION

CHARACTERISTICS

The several hundred species of bats are clearly divided into two major groups (suborders), usually designated as the large fruit-eating bats (Megachiroptera) and the small, insect-eating bnts (Microchiroptera). Distinct suborders they certainly are, but some of the hlicrochiroptera are larger than the smaller species of the Megachiroptera, and one family of the hlicrochiroptera feed mostly on fruit rather than insects A more fundamental distinction lies in the relative size of the eyes and ears and the corresponding roles of vision and hearing.

Megachiroptera.—The Megachiroptera, consisting of one family, Pteropidae. are visual animals; all of them have large and prominent eyes. and they orient themselves as man does. largely by eyesight. The flying foxes (q v.; genus *Pteropus*) are the largest of bats, with a wingspread up to 5 or 6 ft.; the likeness to a dog or fox is suggested in large part by the familiar proportions of eyes and ears.

Microchiroptera.—The Microchiroptera are far more diversified; about 15 families of these bats are recognizable, although only 3 are common in temperate latitudes. Several families, containing only small insectivorous species, differ from one another in the degree of specialization of the skeleton for flight (especially the shoulder joint), and in the size and shape of the ears and nose leaf. The latter is a fleshy structure surrounding the mouth or nostrils; in many bats it serves as an acoustic horn to form the sounds emitted by the bat into a narrower or broader beam.

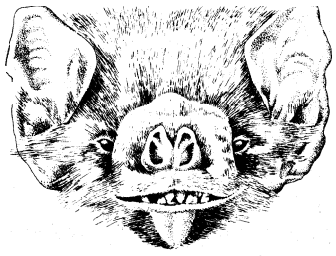
The Microchiroptera have smaller eyes and larger ears than do the Megachiroptera. and to varying degrees they all rely far more on hearing and far less on vision than do the Megachiroptera, the birds or any of the larger mammals. Fig 2 shows the face of a typical member of the Microchiroptera. While these bats are by no means blind they have very poor pattern vision, and their eyes cannot resolve fine details. Several families of special interest are included in the suborder *(see* below).

SPECIALIZATION AMONG VARIOUS GROUPS

Pteropidae (True Fruit Bats).—The Pteropidae (comprising the Megachiroptera) all feed on various kinds of fruit, and the only major specialization is found in those species that gather the nectar of flowers (for example, *Macroglossus* of the East Indies and the Philippines).

Macroglossus species are small bats that have elongated snouts and tongues, and they hover in front of flowers gathering nectar and pollen much as hummingbirds do. Another genus of the family, *Rousettus,* is exceptional in being able to fly in totally dark parts of caves, and it guides itself by emitting sharp, audible clicks and receiving their echoes reflected from obstacles.

Phyllostomidae (American Leaf-Nosed Bats).—(This family and those below are Microchiroptera) These bats (fig. 2) are confined to the new world tropics; they usually have a simple spear-shaped nose leaf. and feed for the most part on fruit, although some species also eat insects and the larger Phyllostomidae prey upon smaller birds and bats Several species of this family are highly specialized as nectar feeders; they have long snouts and tongues, and on their visits to certain flowers that bloom at night these bats incidentally facilitate cross-pollination.



BY COURTESY OF ANTHONY NATURAL HISTORY

FIG 7.—VAMPIRE (DESMODUS)

Desmodontidae (Vampire Bats).—Vampire bats (fig 7) feed solely on the blood of mammals and possibly also large birds. They too are found only in the tropical regions of South and Central America. Their teeth, stomach, and indeed the whole digestive apparatus is specialized for feeding on blood. The wounds inflicted on their victims are often so slight as not to awaken a sleeping man or horse. The bat's tongue is rolled into a tubular shape, and blood is drawn into the mouth by a peculiar action apparently intermediate between lapping and sucking. Vampire bats have been maintained in the laboratory for as long as 13 years on a diet of blood obtained from slaughter houses and fed to the bats in small dishes. Unlike most other bats, which lie almost flat on a horizontal surface and crawl along. the vampires stand on their hind legs, prop themselves with their folded wings and jump and scuttle rapidly.

Noctilionidae (Bulldog Bats).—This is a small family also confined to the American tropics and characterized by rather large, pendulous lips. One species Noctilio *leporinus* often feeds on small fish which it catches by flying low over the surface of fresh or salt water and gaffing them with long, highly curved claws on its specialized hind feet. The fish are then lifted to the mouth as the bat flies on.

Thyropteridae and **Myzopodidae.**—These are t o other tropical families, the former of tropical America and the latter of Madagascar. They both have sucking disks on the wrists and on the hind feet to assist in holding on to smooth surfaces.

Rhinolophidae (Horseshoe Bats).—This family is widely distributed in temperate climates of the old world. The common name refers to a most elaborate type of nose leaf, usually two concentric rosettes that surround the nostrils and resemble a horseshoe when viewed from in front (fig. 8). These bats emit inaudible, high-frequency sounds through their nostrils, and the nose leaves serve as a horn to concentrate the sound into a narrow beam. Horseshoe bats tend to rotate their bodies through a complete circle as they hang from one or both hind legs, pivoting around extremely flexible hip joints. When an insect flies past they quickly dart out to catch it. Like other insectivorous bats, they also engage in direct pursuit of insects on the wing.

Vespertilionidae and **Molossidae.**—These are the most common bats of temperate latitudes throughout the world. They have simple muzzles. The Vespertilionidae includes most of the common bats of North America and Europe, and the Molossidae (free-tailed bats) are represented in the United States by the bats that inhabit Carlsbad caverns, New Mexico, and many other caves in the southwest. The common name for the Molossidae refers to the tail, which extends for part of its length beyond the interfemoral membrane that is attached to the two hind legs. By contrast the tail of the vespertilionids and many other bats is largely attached to this membrane.

G. RONALD AUSTING FROM NATIONAL AUDUBON SOCIETY

FIG. 9.—RAFINESQUE BAT (PLECOTUS RAFINESQUII), OF THE FAMILY VESPERTILIONDAE, IN FLIGHT

These two families are exclusively insectivorous except for three species of the Vespertilionidae that feed on fish, much as does *Noctilio leporinus* described above. They do most of their hunting on the wing, pursuing and seizing flying insects. But some species also eat nonflying insects which they take from the ground or from vegetation. Enormous quantities of insects are devoured nightly by each bat; under some conditions a little brown bat (*Myotis lucifugus*) weighing about $\frac{1}{4}$ oz. may catch more than 1,000 mosquito- or gnat-sized insects in a single summer night. Their methods of locating and intercepting flying insects were described above in Orientation.

(D. R. G.)

BATAAN, a province and peninsula on the island of Luzon, Republic of the Philippines, is across the bay west of Manila. Pop. (1960) 145,922; area 517 sq.mi. It is approximately 30 mi. long and averages about 15 mi. in width. Traversing the peninsula from north to south are steep mountains of volcanic origin culminating in two major peaks, Mt. Natib (4,224 ft.) to the north and Mariveles mountain (4,444 ft.) in the south. There are few roads except the three principal highways, one of which runs north and south, parallel to the east coast on Manila bay, and continues around the tip of the peninsula and along the west coast; the second cuts across the mountains. connects the north-south road with Bagac and Moron on the west coast; and the third connects the coastal highway with Subic bay and Zambales. The principal town is Balanga, the provincial capital.

To the northwest is Subic bay, site of a U.S. naval base and a Philippine naval base. Two miles off the southern point of the peninsula is the island of Corregidor (*q.v.*).

After the Japanese invasion of the Philippines in Dec. 1941 and the subsequent fall of Manila on Jan. 2, 1942, the defending force of Filipinos and Americans withdrew to Bataan peninsula. The Japanese, advancing in the north from Lingayen, Vigan and Aparri, and in the south from Mauban and Antimonan, had apparently intended to split the forces of the U.S. commanding general, Douglas MacArthur. But MacArthur, before abandoning Manila, consolidated his lines and withdrew into Bataan. There his troops, without replenished supplies, held out until April 9, 1942. The remnants of the army, then commanded by Gen. Jonathan Wainwright (who succeeded MacArthur when the latter was ordered to Australia to take command there), escaped to Corregidor, which was forced to surrender a month later.

Almost three years later, U.S. forces under MacArthur fought their way back to the Philippines, and on Jan. 9, 1945, effected a landing on the southern and southeastern shores of Lingayen gulf, to the north of Manila. Bataan peninsula was sealed off from the north to prevent the Japanese from withdrawing to that area for a last stand. With resistance softened by repeated aerial bombardment, landings were made at Mariveles harbuur on the south-

ern tip of Bataan and on Corregidor, securing for the U.S. navy the use of Manila bay. (See also WORLD WAR II: *The War in the Pacific.)*

Agriculture is the principal industry in the province and rice the principal product; the narrow coastal plain along the Manila bay side of the peninsula is the principal producing district. Lesser crops are corn, sugar cane and fruit, primarily mangoes. The Bataan National shipyards are at Mariveles. (AN. C.)

BATAILLE, GABRIEL (1574 or 1575–1630), French lutenist and composer, master of the queen's music at the court of Louis XIII. On his marriage in 1600, he stated his occupation as clerk to a nobleman. but he later devoted himself to music and in 1617 acquired the court position that he held until his death. He shared with Pierre Guédron, Jacques Mauduit and Antoine Boesset the responsibility for the composition of the *ballets de cour*. His music appeared in contemporary collections, and the first of six volumes of *Airs de différents autheurs mis en tablature de luth par Gabriel Bataille,* in which Bataille provided lute accompaniments for songs by other composers, was published by Ballard in 1608. Bataille died in Paris, Dec. 17, 1630.

(C. A. L.)

BATAILLE, (FÉLIX) HENRY (1872–1922), French dramatist, who enjoyed a great success at the beginning of the 20th century, was born at Nîmes on April 4, 1872. Passionate love and its baleful effects provided the themes of most of his plays, including *Maman Colibri* (1904); *La Marche nuptiale* (1905); *Poliche* (1906); *La Femme nue* (1908), considered by many his best play; and *La Vierge folle* (1910). After 1911 Bataille's art evolved toward the play of ideas and finally he wrote a trilogy of social dramas, ending with *La Chair humaine* (1922), his last work.

Both his early training as a painter and his poetic talent are clearly revealed in his dramatic work. His lush style cruelly dated his plays, but his theory (largely unapplied in his own work) of what he called an "indirect language." capable of betraying (or concealing) a character's subconscious desires, made him a forerunner of Jean Jacques Bernard (*q.v.*) and the so-called "school of silence." Bataille died at Rueil on March 2, 1922.

See J. B. Besançon, *Essai sur le théâtre d'Henry Bataille* (1928).

(D. Ks.)

BATAK (not to be confused with the Batak [*q.v.*] or Battak of Sumatra), a small ethnic group occupying a heavily forested area on the east side of Palawan Island, Phil. Short statured and brown to dark-skinned they appear to be a composite of Negrito and Malayan type elements. Possessing a distinctive dialect, they are scattered in small hamlets with several families to a hut. The blowgun and bow are used in hunting, and minor dry gardening is practised; kin elders are leaders; garments are of bark cloth. Trade goods and mission work, with schooling and other government activities, are changing their traditional ways.

BIBLIOGRAPHY.—E. Y. Miller, "The Bataks of Palawan," *Ethnol. Surv. Publ. Phil. Is.,* vol. ii, part iii (1905); M. H. Venturello, "Manners and Customs of . . . Tribes of the Island of Palawan, Philippines," *Smithson. Misc. Coll.,* 48:514–558 (1907); Philippine censuses.

(F. M. Kc.)

BATAK (not to be confused with the Batak [*q.v.*] of Palawan in the Philippines), a powerful Proto-Malayan people who until 1825 lived in relative isolation in the highlands surrounding Lake Toba in Sumatra. Known as powerful magicians and cannibals who considered all strangers as enemies, they were shunned by their neighbours. Early in the 19th century missionaries appeared. Some met with disaster but the Rhenish Lutheran mission, which stressed schools, was singularly successful.

The Batak had felt Indian influences by the 2nd or 3rd century AD. and had borrowed ideas of government, writing, elements of religion, arts and crafts. They failed, however, to develop a unified state and today are found in six cultural divisions. Within these are exogamous patrilineal clans known as *marga.* A price is paid for a bride who then is a member of her husband's group. Among the Toba Batak a village consists of several clan houses but in the Karo division all dwell in one or more long houses.

Human beings, plants, animals and inanimate objects are considered to possess souls or spirits which can be coerced or enticed. There lies the power of the magicians. Armed with secret formulas written on bark books and with staffs and images animated by the indwelling spirits of sacrificial victims, they are able to deal with the major life crises. They are aided by mediums who, in trance, communicate with the dead. Cannibalism was practised but victims were confined to prisoners and lawbreakers.

Today most of the Toba Batak are literate, as is the case of many in the other groups. Many are Christians who occupy places of importance in trade and in the Indonesian government. Moslem missionaries have been active in regions to the north and south of the Toba. The estimated population of Batak lands is in excess of 1,500.000, of which about one-third is Christian, one-third Moslem and the balance still pagan.

After World War II there was a mass movement of Toba squatters into the rich plantation lands of the east coast, formerly owned by foreign investors. Their adjustment to humid lowland jungle environment raised many complex problems. See SUMATRA.

Cunningham, *The Postwar Migration of the Toba-Bataks to East Sumatra* (1958); B. ter Haar, *Adat Law in Indonesia* (1948); W. Keers, *The Proto-Malay of the Netherlands East Indies* (1948); R. Kennedy, *The Ageless Indies* (1942), *Bibliography of Indonesian Peoples and Cultures* (1955); E. M. Loeb, *Sumatra* (1935). (F.-C. CE.)

BATALA, a municipal town of Gurdaspur district, Punjab state, India, lies nearly 20 mi. S. of Gurdaspur on the Amritsar-Pathankot railway. Pop. (1951) 55,850. During the reign of Buhlul Lodi a Bhatti Rajput by the name of Rai Ram Deo founded the town in about 1465. A noteworthy agricultural machinery industry has developed in response to local demand, and Batala is a centre for the manufacture of lathe machines, precision tools and rolling mills. Baring Christian college is connected with Punjab university. (S. S. BH.)

BATALHA (*i.e.,* "battle"), a town of Portugal, 8 mi. S. of Leiria, is chiefly interesting for its great Dominican abbey of Santa Maria da Vitoria ("St. Mary of the Victory"), also known as Batalha. Pop. (1960) 14,029 (municipal). In the battle fought on the plain between Canoeira and Aljubarrota, 9 mi. S.W , John I of Portugal (*q.v.*) defeated John I of Castile in 1385 and secured the independence of his kingdom. The abbey, probably founded 1388. is built of golden-brown limestone and richly sculptured. It is roughly a parallelogram, about 500 ft. from north to south, and 445 ft. from east to west. The Founder's chapel contains the tomb of John I (d. 1433) and Philippa of Lancaster (d. 1415), his queen (*see* LANCASTER, JOHN OF GAUNT), with the tomb of Prince Henry the Navigator (d. 1460; *q.v.*). Several later monarchs are buried in the royal mausoleum. Plans and masons were procured from England by Queen Philippa, and the work was entrusted to Affonso Domingues, a native architect, and Huet or Houguet, probably an Irishman. Only the royal cloister, church and Founder's chapel were included in the original design; and all three show signs of British influence. The Capellas Imperfeitas ("Unfinished Chapels") are one of the most marvelous examples of Manueline architecture. The earthquake of 1755 damaged the monastery and the French sacked it in 1810. It was secularized in 1834, declared a national monument in 1840 and gradually restored.

BATANES, northernmost, smallest (76 sq.mi.), and most remote province of the Republic of the Philippines. is coextensive with the Batan Islands (formerly Bashi Islands) that lie between Luzon and Formosa. The islands are rocky, windswept and subject to frequent destructive typhoons. Estimated area under cultivation is only about five square miles. Fishing is more important than agriculture. Despite its small population (1960) 10,335, the province is a food deficit area. Basco is the capital and only significant community. (AN. C.)

BATANG (PA-AN), an important frontier town of Szechwan province, China, and at one time the capital of the Chinese province of Sikang. It was one of the chief depots for caravan travel between Ch'eng-tu and Lhasa, and its inhabitants are mainly Tibetans. For years the Tibetans tried to wrest its control from the Chinese, and Batang was the scene of many local conflicts. In 1950, after the military occupation of Tibet by Communist

China, Batang was incorporated in the Tibetan Autonomous district under the Szechwan provincial government. It is connected with Kan-tzu (Kantse) with a highway, and thus is linked with the principal communication line between Tibet and China. The elevation of Batang is around 8,000 ft. and the climate is mild. Rice is grown in the valley. Before 1950 there were both Roman Catholic and Protestant missions in Batang. The missionaries established modern schools and hospitals and also planted apples, pears, peaches, walnuts and grapes on the hillsides.

(T.-L. S.)

BATANGAS, a province in southern Luzon, Philippines, that includes nearby Maricaban and Verde islands. It lies across Verde Island passage from the island of Mindoro and surrounds famous Lake Taal. Less than 10 ft. above sea level, the lake is a volcanic crater about 14 mi. across at its maximum width. Volcano Island (Taal Island) rises within the lake and contains another small crater (Yellow Lake) upon it. Volcano Island, the modern Taal volcano, was last active in 1912.

The province has been noted for the fertility of its soil, sometimes compared to the fertile volcanic soils of Java. It is an agricultural province with rice, coconuts, sugar, coffee, corn and fruit among the principal products. It has also been known for its livestock industry, especially horses, and fishing is important, both in the lake and along the coast. The principal manufacturing industries are the sugar central at Nasugbu and a petroleum refinery at Bauan on Batangas bay. The population of the province (1960) 682,855.

The capital, also named Batangas, is a municipality with an administrative centre (poblacion) and 50 barrios. It is connected with Manila, about 70 mi. N., by good roads and by coastwise shipping and is the northern terminus of regular ferry service to Calapan, Mindoro. The town site is on a small plain on the west hank of the Calumpang river about a mile from the coast. Pop. (1960) 82,819. Other important settlements are Lipa, a chartered city with an estimated population of 69,342 in 1960 and the site of a military air base and a citrus experiment station; Taal, an old Spanish settlement with a historic cathedral and many buildings of Spanish architecture; Lamery and Balayan, both commercial centres on Balayan bay.

In World War II the shores of Batangas bay and Balayan bay were the scene of an Allied landing (Jan. 31 to Feb. 3, 1945) to aid in the attack on Manila from the south. (AN. C.)

BATAVIA, Indonesia: see JAKARTA.

BATAVIA, a city in western New York, **U.S.,** midway between Buffalo and Rochester, and the seat of Genesee county. (For comparative population figures see table in NEW YORK: Population.) Batavia's history dates, from 1801 when a settlement was made at a junction of Indian trails. The same year the place was platted by Joseph Ellicott, agent and surveyor-general of the Holland Land company, which consisted of residents of the city of Amsterdam in what was then the Dutch republic of Batavia (meaning "better land"). Between 1792 and 1797 the company of Dutch capitalists acquired an immense tract of approximately 3,600,000 ac. in western New York known as the Holland Purchase. In 1801 Ellicott opened an office in the new settlement from which purchasers of most of the lands of the state lying west of the Genesee river obtained their titles.

Batavia was identified with the Antimasonic party (*q.v.*) because William Morgan lived there before his mysterious disappearance in 1826. Batavia was incorporated as a village in 1823 and as a city in 1915. A council-manager form of government became effective in 1958.

Batavia is the trade centre of a farming region producing milk, eggs, vegetable products, small grain and alfalfa. Important manufactures include electronic products, television and radio sets, die castings, paper products, women's shoes, heat exchangers, sprayers and fire extinguishers. A U.S. veterans' hospital and a New York state school for the blind (opened 1868) are there. The Tonawanda Indian reservation of the Seneca Indians is 13 mi. N.W. of Batavia. Horse races at Batavia Downs attract huge crowds from the surrounding area. (C. C. MA)

BATE (BATES), **JOHN,** an English merchant who was condemned in the court of exchequer in Nov. 1606 for refusing to pay an extra duty of 5s. 6d. per hundredweight imposed by the crown on imported currants, in addition to the 2s. 6d. allowed by the statute of tonnage and poundage. The new duty was an extension to all importers of a similar levy previously made by the Levant company on importers who were not members of the company. The crown had extended this to all importers to recoup the £4,000 per annum which it lost when the company, because of the outcry against monopolies, surrendered its charter and the trade was thrown open. Bate's claim, that the new imposition was illegal without the sanction of parliament, had little basis in law. The interest of his case lies in the arguments advanced by the judges. Sir Thomas Fleming, chief baron of the exchequer, for example, asserted that, as such impositions were imposed by the king's "absolute" power rather than by his "ordinary" power, the king could fix what rates he pleased, a doctrine capable of making the crown financially independent of parliament. (R. B. WM.)

BATEMAN, HEZEKIAH LINTHICUM (1812–1875), U.S. actor and theatrical manager, was born in Baltimore, Md., on Dec. 6, 1812. He made his debut in 1832 and acted in various repertory companies until his two eldest daughters: KATE JOSEPHINE (1843–1917) and ELLEN DOUGLAS (1844–1936), were aged six and four respectively, when he, his wife and the two prodigies toured widely as stars. Ellen played Richard III, Shylock and Macbeth to Kate's Richmond, Portia and Lady Macbeth. In 1855 he managed a St. Louis (Mo.) theatre. As Kate's manager he later moved to New York city, where she was a hit in Leah the Forsaken (1863), Augustin Daly's version of Salomon Mosenthal's Deborah. The French company Bateman presented in New York (1867–69) began a craze for Jacques Offenbach *opéra bouffe* in the United States. In 1871 he leased the Lyceum theatre, London, engaged Henry Irving (*q.v.*), and presented him in The Bells, which made Irving a star. Bateman died March 22, 1873.

His wife, SIDNEY FRANCES (1823–1881), daughter of the English comedian Joseph Cowell and half-sister of the comic singer Sam Cowell, wrote plays, of which the most popular was Self (1857). After her husband's death, she managed the Lyceum and later Sadler's Wells theatre until her death on Jan. 13, 1881.

Ellen Bateman married early and gave up the stage, but Kate continued a long career of acting. She retired briefly in 1866 when she married George Crowe but returned in 1868, later playing Lady Macbeth and other roles with Irving. After 1892 she conducted a school of acting. Her daughter, Sidney Crowe, became an actress. Her younger sisters, Virginia and Isabel (Mrs. Edward Compton) also appeared on the London stage. (B. HT.)

BATES, EDWARD (1793–1869), U.S. lawyer, was born at "Belmont," the family home in Goochland county, Va., Sept. 4, 1793. He began to practise law in the territory of Missouri, and after its admission as a state in 1820 was elected (1826) representative in congress, where he served only one term. Bates was known as a conservative and as a southerner who had freed his own slaves. From 1830 to 1834 he served in the state legislature and after some years as a leader of the Whig party, he became identified with the newly organized Republican party. In the national convention of that party in Chicago in 1860 he received 48 votes for the presidential nomination. Appointed attorney general by Pres. Abraham Lincoln, Bates frequently dissented from the president's military policies. His service in the cabinet was not outstanding, and he differed frequently with his colleagues, Stanton, Seward and Chase. He served until 1864, when he returned to the private practice of law in St. Louis. He died there on March 25, 1869. (E. E. R.)

BATES, HENRY WALTER (1825–1892), English naturalist; explorer and author of The Naturalist on the River Amazons, was born at Leicester. In 1844 he met Alfred Russel Wallace (*q.v.*) and in April 1848 sailed with him for Brazil. Their object was to solve the problem of the origin of species and they hoped to meet their expenses by the sale of duplicate specimens. Bates, after spending seven and a half years exploring in detail the whole valley of the Amazon, sailed for England in 1859. He had collected 14,712 species of insects of which 8.000 were new to science. His paper, "Contributions to an Insect Fauna of the Amazon

Valley," read before the Linnean society in 1861, in which he stated and solved the problem of mimicry (*q.v.*), brought him enthusiastic letters from Charles Darwin and Sir Joseph Hooker. He moved to London in 1863 to try and find more remunerative scientific work. The same year his great and only book. *The Naturalist on the River Amazons,* with an introduction by Darwin, was published by John Murray, who also helped him to get the job of assistant secretary to the Royal Geographical society in 1864, a post which freed him from financial cares and which he kept until his death. "Bates." wrote Darwin to Sir Charles Lyell, "is second only to Humboldt in describing a tropical forest." Bates revised and edited many books and wrote several papers. In 1881 he was made a fellow of the Royal society. He sold his collection of butterflies after his appointment to the Royal Geographical society and concentrated on beetles, and after his death this collection was bought by René Oberthur of Rennes.

BATES, KATHARINE LEE (1859–1929), U.S. author and educator. who wrote the national hymn, "America the Beautiful," was horn in Falmouth. Mass., on Aug. 12, 1859. Following her graduation at Wellesley college, Wellesley, Mass., in 1880 (M.A., 1881), she engaged in teaching. In 1885 she became instructor and in 1891 professor of English literature in Wellesley college, serving in this post until 1925 when she was made professor emeritus. She was the author of numerous works in prose and verse. including stories and plays for children.

With Cornelia F. Bates, she translated Gustavo Bécquer's *Romantic Legends of Spain* (1909). Among her writings are, *The College Beautiful and Other Poems* (1887); *Rose and Thorn* (1888); *Hermit Island* (1891); *English Religious Drama* (1893); *American Literature* (1898); *Spanish Highways and Byways* (1900); *From Gretna Green to Land's End* (1907); *The Story of Chaucer's Canterbury Tales Re-told for Children* (1909); *In Sunny Spain* (1913); *Fairy Gold,* for children (1916); *Sigurd* (1919); and *The Pilgrim Ship* (1926); *America the Beautiful and Other Poems* appeared in 1911. She died in Wellesley, on March 28, 1929.

BATES, SIR PERCY ELLY, 4TH BART. (1879–1946), English shipowner, who was responsible in 1931 for outlining the policy which led to the construction of the two largest passenger ships in the world, the "Queen Mary" and "Queen Elizabeth," was born in Derby on May 12, 1879. Educated at Winchester, he entered a Liverpool shipping office in 1899, moved to the family shipping business on the death of his father in 1900, and succeeded to the baronetcy when his brother died in 1903. He was appointed deputy chairman of the Cunard line in 1922 and chairman in 1930. Bates maintained that two large and fast ships could operate the North Atlantic express passenger services better than three smaller ones. He negotiated the amalgamation of certain White Star liners with Cunard line in the combined Cunard White Star line in the 1930s. He filled many of the most important posts in the British shipping industry and served the government in both World Wars I and II. He died at Neston, Cheshire, on Oct. 16, 1946. (P. DF.)

BATES, WILLIAM (1625–1699), English nonconformist minister, one of those ejected under the Act of Uniformity (1662), was born in London in Nov. 1625. After taking his B.A. at Cambridge (1644), he became vicar of Tottenham and in 1654 of St. Dunstan's-in-the-West, London. At the Restoration (1660), he was made a royal chaplain, and was a commissioner at the Savoy conference (1661). He refused the deanery of Lichfield (1661) and in 1662 was ejected. Bates supported two attempts (1668. 1674) to reach agreement with the bishops, and in the cause of charity he occasionally received Anglican communion. He was licensed as a Presbyterian teacher (1672) and in his last years founded a Presbyterian congregation at Hackney, where he died on July 14, 1699.

BATESON, MARY (1865–1906), English historian of medieval social institutions, was born at Robin Hood's bay, Yorkshire, on Sept. 12, 1865, the daughter of W. H. Bateson, master of St. John's college, Cambridge. Educated in Germany, at the Perse school for girls and at Newnham college, Cambridge, she became an associate of Newnham college and a member of the council. She lectured there, with intervals, all her life, and furthered the interests of the college in numerous ways. She died at Cambridge on Nov. 30, 1906, leaving her library and property to Newnham.

Mary Bateson's reputation was established and has been maintained by her studies in monastic and municipal history. Her first major publication was *The Register of Crabhouse Nunnery* (1892), undertaken for the Norfolk and Norwich Archaeological society; perhaps her most important work was *Borough Customs* (1904-06), which she edited with introductions for the Selden society. She was responsible for the discovery *(English Historical Review,* xv, xvi) of the Norman origin of many Welsh and west midland towns. She also carried out extensive research in the municipal history of Leicester and Cambridge. Her more popular works include *Medieval England* (1903), and the chapter on "The French in America (1608–1744)" in the *Cambridge Modern History.* She was to have been one of the three editors of the *Cambridge Medieval History* but died shortly after accepting the appointment.

BATESON (BATSON, BETSON), **THOMAS** (c. 1570–1630), English composer, notable for his madrigals. Bateson is first heard of as organist of Chester cathedral, where he was appointed in 1599. From this it may be assumed that he was born in the early 1570s. In 1608 he moved to Dublin cathedral as organist and master of the choristers. He retained this post until his death, in Dublin, in 1630.

Although Bateson's career was that of a church musician, only one piece of church music by him survives, and that is the distinctly conventional seven-part anthem "Holy Lord God Almighty," probably written as a degree exercise 'for his Mus.B. in 1612. His reputation as a composer rests upon two sets of madrigals (1604 and 1618), one dating from his period at Chester, the other from that at Dublin, and each dedicated to a local dignitary. These two collections, each containing pieces for 3, 4, 5 and 6 voices, reveal him as a madrigalist of considerable range and invention: if not quite of the first rank. They have been republished by E. H. Fellowes as vol. xxi and xxii of *The English Madrigal School* (1922). A brief study of Bateson's work is contained in the same author's *The English Madrigal Composers* (192 1).

(J. J. N.)

BATESON, WILLIAM (1861–1926), British biologist and founder of the science of genetics, was born at Whitby, Aug. 8, 1861, son of William Henry Bateson, master of St. John's college, Cambridge.

Bateson not only gave genetics its name and occupied the first university chair devoted to the new field at Cambridge university; he also recognized in 1900 the recently rediscovered work of Gregor Johann Mendel (*q.v.*), which he quickly confirmed, as the key to an understanding of heredity and variation and thereby of evolution.

Bateson introduced and defended Mendel's principles that heredity occurs by the transmission of particulate elements, genes (*q.v.*), against the view that it was continuous and nonparticulate.

Bateson was prepared for his research in genetics by a boyhood interest in natural history, which continued as a student at Cambridge and led him as zoologist and embryologist to study problems of variation in Asia and the United States. These studies culminated in his classical work *Materials for the Study of Variation* (1894), which stressed the discontinuous nature of variation.

His application of Mendel's method of experimental crossing of varieties of domesticated plants and animals (1900-10) extended the scope of the principle of segregation of genes, and he was one of the first to show its application to hereditary diseases in man (1902-06).

Bateson's work at this time revealed new principles of factor interaction (dependence of a variant character upon two or more different genes), and of coupling and repulsion, the tendency of certain genes to retain in the offspring the associations in which they occurred in the parents. This was later generalized and explained by T. H. Morgan (*q.v.*) in his principle of linkage, linked genes tending to remain together since located on the same chromo-

some (see GENETICS; CYTOLOGY). Although Bateson at first refused to accept this interpretation, and his later work suffered from this refusal, he eventually (1926) acknowledged its truth.

He was director of John Innes Horticultural institution from 1910 until his death and in 1914 was president of the British association. His books include *Mendel's Principles of Heredity* (1902) and *Problems of Genetics* (1913).

See Beatrice Bateson, *William Bateson, Naturalist* (1928), containing a memoir on his life and 14 of his essays on genetics; W. E. Castle, "The Beginnings of Mendelism in America," in L. C. Dunn (ed.), *Genetics in the 20th Century* (1951). (L. C. D.)

BATH, THOMAS THYNNE, 1ST MARQUESS OF (1734–1796), English politician, who, as a member of the connection led by the duke of Bedford, held important office during two critical periods of the reign of George III, was born on Sept. 13, 1734, the elder son of Thomas Thynne, 2nd Viscount Weymouth, to whose title he succeeded in 1751. He was secretary of state, first for the northern and then for the southern department from Jan. 1768 until Dec. 1770. As the minister responsible for public order during the riots in protest against the imprisonment of John Wilkes (*q.v.*), he became intensely unpopular. He was violently denounced, both by Wilkes and by "Junius" (*q.v.*), for encouraging the magistrates to use troops, which led to the St. George's Fields massacre. His resignation was probably due to personal inability to deal with the crisis in relations with Spain over the Falkland Islands. In Nov. 1775 he became secretary of state for the southern department again and held that office during the critical period of the American Revolution. In 1779, dissatisfied with Lord North's Irish policy and with the continuance of the American war, he followed Earl Gower, the lord president, into retirement. He was created marquess of Bath in 1789. He showed ability as a speaker but was prevented from becoming a statesman of distinction by his dissolute habits (especially in drinking and gambling) and by his indolence. He died in London on Nov. 19, 1796. (I. R. C.)

BATH, WILLIAM PULTENEY, 1ST EARL OF (1684–1764), English politician, who was prominent in opposition to Sir Robert Walpole, was born in London on March 22, 1684, a member of an old Leicestershire family. He was educated at Westminster school and at Christ Church, Oxford, and was member of parliament for Hedon, Yorkshire, from 1705 to 1734, and for Middlesex from 1734 to 1742. He was a prominent Whig during the reign of Queen Anne and was secretary at war (1714–17) in the first ministry of George I. When Walpole came to power in 1721 Pulteney failed to achieve high office. He was consoled for a time by the lucrative post of cofferer of the household but his failure to obtain the secretaryship of state in 1724 drove him into bitter and open opposition. Thenceforth he was a leader of the anti-Walpole Whigs and joined with Lord Bolingbroke in trying to form a united party of opposition. By his contributions from 1726 to the *Craftsman*, the paper which he and Bolingbroke had founded, and by his brilliant speeches in the house of commons, he helped to give coherence and direction to the Whig and Tory factions opposed to Walpole. The bitterness of his satire and the splendour of his rhetoric lowered the esteem in which Walpole and his ministry were held by the public and he was largely responsible for Walpole's failure over the Excise bill in 1733. His alliance with Bolingbroke and the Tories was never an easy one to maintain and it came to an end in 1735. Between 1735 and 1742 he was somewhat overshadowed by Lord Carteret, the earl of Chesterfield and William Pitt. When Walpole fell from power in 1742 Pulteney himself did not form a new government but accepted a cabinet post under Lord Wilmington and the earldom of Bath. He had already incurred considerable distrust, and his reluctance to shoulder responsibility ended his career in anticlimax. When Wilmington died (July 1743), Henry Pelham succeeded him and, apart from two days of office in Feb. 1746, Bath's political life was ended. He died on July 7, 1764. A man of many talents and scholarly tastes, his lack of clear purpose robbed him of the chance to become a notable statesman.

See J. H. Plumb, *Sir Robert Walpole*, 2 vol., with full bibliography (1956–60). (J. H. PL.)

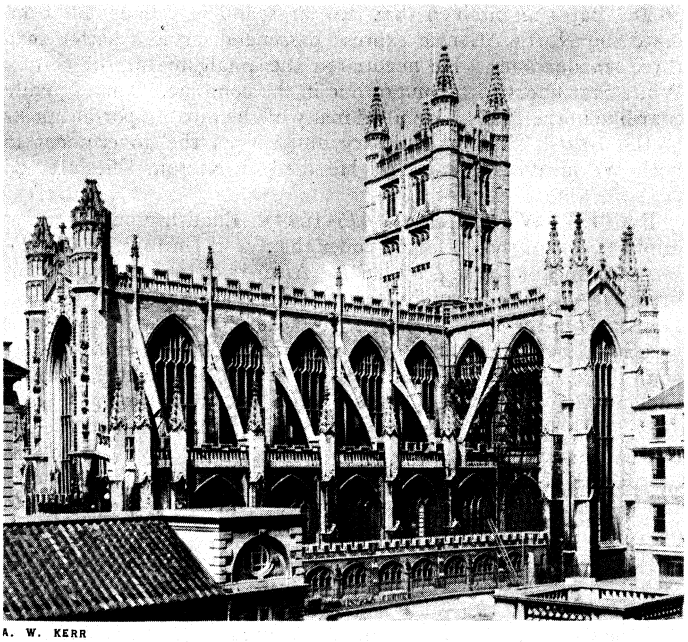
BATH, a city, parliamentary and county borough of Somerset, Eng., close to the borders of Gloucestershire and Wiltshire, is located 12 mi. E.S.E. of Bristol. Pop. (1961) 80,856. The city lies in a wide amphitheatre on a sharp bend in the river Avon, with steep hills rising several hundred feet on all sides. The racecourse on Lansdown (800 ft.) is the highest in England.

Bath is one of the most beautiful and architecturally distinguished of British cities, the only one with natural hot springs. The oldest parts of the city are on the north bank close to the river, but building has extended up the slopes on both sides. All buildings are constructed of, or faced with, Bath stone. The abbey church of St. Peter and St. Paul (16th century), a very fine and ornate example of late Perpendicular style, has been called "the Lantern of the West" from the many windows. particularly the great west window flanked by carved angels ascending and descending. Of the Georgian buildings, the North and South parades (1728) were conceived by John Wood as a sort of forum. The Pump room (1796), the third of a series of pump rooms on this site, affords a rendezvous for visitors as well as a fountain for "taking the waters."

Northwest of the original town wall, Gay street links Queen square (1735) with the Circus, laid out by the elder Wood and completed by his son, who added to this development the magnificent Royal crescent (1775) and also the assembly rooms (1771); Lansdown and Camden crescents were built as isolated features on the northern slopes. Milsom street (1761) soon became an unparallelled shopping centre; it contains the Octagon, originally a chapel designed by Thomas Lightoler in 1767. Prior Park (1742), now a school, was built in a vale with views northward over the city as a residence for Ralph Allen and also to demonstrate the qualities of Bath stone.

The group of municipal buildings includes the Guildhall (1776) with its magnificent Adam style banqueting room, and the Victoria Art gallery and Central library. Opposite these, Pulteney bridge with shops on either side of the carriage way leads to Great Pulteney street and the Holburne of Menstrie Art museum (china, plate, glass). Behind the museum lie Sydney gardens, formerly an 18th-century pleasure resort. King Edward VI Grammar school was founded in 1553.

Bath has retained its importance as a spa and tourist centre. The mineral springs, which are municipally owned and to which Bath owes its name, yield over 500,000 gal. of water daily at temperatures ranging from 114° to 120° F. The waters are drunk medicinally and used for hydrotherapy treatments. The Royal baths and treatment centre were entirely rebuilt behind the 18th-



A. W. KERR

ABBEY CHURCH OF SS. PETER AND PAUL, IN BATH. BUILT IN THE 16TH CENTURY

century colonnaded facade of Bath street. Other industries include general and electrical engineering, printing, bookbinding, joinery, and the manufacture of shoes and underclothes. After the dispersal from London of central government offices during World War II, Bath was selected as the secondary headquarters of the admiralty. The city lies on the Western region railway to south Wales, and to the south and west coasts. It is a centre of main roads.

History.—Pre-Roman sites on the neighbouring hills are evidence of very early settlement. The founding of Bath itself is attributed in legend to Bladud, son of Lud Hudibras and father of King Lear, who in 863 B.C. was cured of disease by immersion in the steaming swamps. Roman colonists had developed a considerable spa establishment well before the end of the 1st century A.D. The Roman baths were discovered in 1755, but full-scale excavations were begun only in the late 19th century and are still continuing. The Roman bathing establishment, with its Great bath, lined with lead mined in the Mendip hills, the Circular bath, and extensive heated rooms and plunge baths, was modified and extended throughout the 400 years of its popularity. The Roman name Aquae Sulis alludes to Sul, a local deity, identified by the Romans with Minerva.

Following the fall of Rome, Bath declined until its capture by the Saxons in 577 A.D., recorded in the *Anglo-Saxon* Chronicle The desolate site of the sacked city is probably the subject of the Anglo-Saxon fragment "The Ruin." The Saxons renamed the city Akemanceaster, and later, Aet Bathum. They built the first abbey there, in which Edgar, first king of all England was crowned, in A.D 973. Between 1088 and 1122 the Normans rebuilt the church, transferring there the diocese they had founded at Wells. The bishop's throne returned to Wells in 1206, but the bishop is still styled "of Bath and Wells." The Norman buildings were replaced by the present church in the 16th century.

The first civil charter was granted in 1189, and for about 500 years the city continued as a market town and cloth-weaving centre. Chaucer's Wife of Bath is said to excel even the weavers of Flanders, and Bath "beaver" was known throughout England. The royal visit of Queen Anne in 1702 inaugurated a golden age in which Bath re-emerged as a spa, and seasonal centre of fashion and elegance. This period is dominated by Beau Nash, master of ceremonies, the architect John Wood (*q.v.*) and his son, and their patron Ralph Allen who provided the stone with which the city was rebuilt, and encouraged the architects who swept away the Elizabethan town and designed the Palladian squares, crescents, and terraces. Bath olivers (a biscuit named after Dr. William Oliver, a Bath physician who founded what is now the Royal National Hospital for Rheumatic Diseases), Bath buns, Bath bricks, Bath chaps and Bath chairs, all take their name from the town. Many literary associations are found in the works of Smollett, Fielding, Jane Austen, Fanny Burney, Macaulay, Thackeray and Dickens. The Pump ,Room orchestra, founded by Nash in 1705. continued until well into the 20th century. To John Palmer, impresario, was granted the first patent in the provinces for a Theatre Royal.

Bath suffered air raids in 1942, in which the rebuilt assembly rooms were gutted, and some houses damaged. Most of these have been reconstructed, and there has been considerable cleaning and restoration of the weather-worn facades of famous buildings.

BATH, the process of immersing the body in some medium other than atmospheric air for the purpose of cleanliness or as a cure; and the building or room in which such immersion takes place.

Separate structures for baths existed at a very early date; they were probably similar to the types still to be found among primitive peoples. Although bathrooms occurred in early Egyptian palaces, remains are too fragmentary to permit complete analysis of Egyptian types. It is the palaces of the Aegean civilization that provide the earliest well-preserved examples of bathrooms. They are remarkable for both their careful structure and advanced

system of water supply and drainage. Examples are in the palaces of Knossos and Phaistos (*c.* 1700–1400 B.C.) and on the mainland as in the palace of Tiryns (*c.* 1200 B.C.). Bathing occupied an important place in the life of the Greeks. Vase paintings show that there mere showers, But even though in the later period there were public baths, they never received important and monumental architectural treatment. Eastern peoples seem to have had luxurious baths, which Alexander the Great is reported to have admired.

Roman Baths.—The Romans, with their customary organizing genius and love of luxury, developed not only the technique of bathing but also the planning of bath buildings to a degree before unknown. The bather undressed and left his clothes in the apodyterium. He was then anointed with oil in the elaeothesium or unctorium and, thus anointed, went to the room or court where he could indulge in violent exercise. After this he proceeded to the caldarium, or hot room, and the sudatorium or laconicum, a steam room. It was probably at this point that the body was scraped of its accumulation of oil and perspiration with curved metal strigiles. The bather then went to the warm room, or tepidarium, and then into the cold bath, or frigidarium, in which there was frequently a swimming pool. After the body was once more anointed, the process was completed. There is some question as to the exact order in which the hot and cold baths were taken and of the exact relationship of caldarium and laconicum, which were apparently often combined in one room.

To carry on this complicated process the Romans developed baths varying in size from those in the larger houses, in which each unit was merely a tiny room, to the enormous thermae of imperial Rome. The essential features that run through all types are: (1) an adequate system of furnishing hot, tepid and cold water; (2) the heating of the hot portions of the bath and sometimes also the tepidarium by the circulation of the smoke and heated air from a fire under the floor and through the hollow walls (see HYPOCAUST); and (3) adequate basins for warm and cold water in the hot bath.

A good example of the private bath exists in the so-called Villa of Diomede in Pompeii. Also in Pompeii are the two oldest Roman public baths extant, the Stabian baths and those of the Forum,

both of which have two complete sets of bathrooms, one for men and one for women. These are of a type characteristic of all the smaller baths, ruins of which have been found in many provincial towns such as Trier in Germany and Timgad and Homs (Leptis Magna) in Africa. The general scheme consists of a range of barrel-vaulted apartments flanking an open court. The rooms are of approximately the same size and are usually three in number: the apodyterium, usually surrounded by niches to serve as lockers; the tepidarium; and the caldarium, which has an apse at one end containing the labrum and at the other end the hot bath or alveus. The cold bath in both the larger Pompeian establishments takes the form of a small circular room with a large round pool in the centre. The baths of Homs have as their main feature a large swimming pool, lavishly cased in marble and bordered by a monumental colonnade.

The arrangement of rooms in these smaller baths varied widely and was often quite asymmetrical; a codified architectural type developed first in the great imperial thermae of Rome. The bath there served as a great social centre in addition to its primary purpose, and the architectural problem involved in its design was thereby complicated. Gardens, a stadium and exedrae, where lectures were given and poems read, all became necessary parts. The fully developed examples are those of Titus (A.D. 81), Domitian (A.D. 95), Trajan (C. A.D. 100), Caracalla (A.D. 217) and Diocletian (C. A.D. 305). Extensive remains of the baths of Titus, Caracalla and Diocletian exist.

The general scheme comprised a great open garden surrounded by subsidiary club rooms, and a block of bath chambers either in the centre of the garden, as in the baths of Caracalla, or at its rear, as in the baths of Titus. The main block contained, in addition to the frigidarium, caldarium and tepidarium, courts and smaller bathrooms. Of the three great bathrooms in this block, the tepidarium was made much the most important and was used, apparently, as the great assembly hall or lounge. In addition to the frigidarium there were often enormous unroofed swimming pools, or piscinae, as in the baths of Caracalla. The caldarium on the other side of the tepidarium is treated in the baths of Diocletian and Caracalla as a domed circular hall. Service was furnished by means of underground passageways; slaves could move swiftly and simply without being seen. In order to light and roof the enormous rooms the Romans were forced to develop an ingenious system of buttressing, cross vaulting and clerestory windows. Their scheme of groined vaults carried on interior columns and buttressed by cross buttresses, which form the walls of recesses opening from the room, has since been an inspiration to designers of great halls (*e.g.*, St. George's hall, Liverpool, Eng.; Pennsylvania station, New York city). The remains of the baths of Diocletian, whose great hall, slightly altered by Michelangelo, forms the church of Sta. Maria degli Angeli, give an extraordinarily vivid impression of what the thermae must have been. The important pieces of sculpture found in Roman baths, such as the Laocoon group from the baths of Caracalla, indicate the richness of their furnishings. Floors were universally of marble or mosaic. Walls were apparently sheathed with marble to a considerable height and decorated above with stucco reliefs, colour and mosaic. Gilt bronze was used freely for doors, capitals and window screens. Although not usually on the same colossal scale as in Rome, this is essentially the type of imperial bathing establishment repeated throughout the Roman empire. Examples exist in Trier, Ger , where facilities for heating adapt the structure to the raw northern climate; in Arles, France; in Lambessa (Lambèse), Djemila and Cherchel in north Africa; and at Ephesus in Asia Minor.

As a rule the sexes bathed separately, usually at different times, as is still common in the near east, or in different establishments. Arrangements for division of the sexes under the same roof and utilizing a common fire also were common, and this may account for the symmetrical disposition of many baths. Mixed bathing is first mentioned by Pliny the Elder (*Natural History* xxxiii. 153). The practice seems to have been largely restricted to courtesans (Martial 3.51; 3.72; 3.93; 7.35) and bluestockings (Juvenal 6.447). It was condemned by respectable citizens (Quintilian *Institutio orutoria* V. 9.14) and prohibited by the emperors

Hadrian and Marcus Aurelius. There are many contemporary references to Roman baths and bathing scattered through the works of Pliny the Younger, Seneca. Juvenal, Suetonius and, in the later empire, Ausonius and Statius. (See also ROMAN ARCHITECTURE; ROME: *Forum Boarium and Campus Martius.*)

Medieval Baths.—The excessive luxury of the public baths of Rome were bound to produce a reaction, and the church Fathers generally agreed that bathing should be confined to the purposes of cleanliness and health. Moreover the destruction of the great aqueducts (*q.v.*) of Rome led to the closing of the baths. Baths and the public buildings for them must have remained as a luxury in Europe, for by the 12th century there are indications that public baths were common. By the 14th and 15th centuries they were notorious. Late Gothic tapestries and woodcuts indicate the existence of many outdoor garden pools for bathing and bathhouses with large pools or basins of warmed water. In both cases the bathing was quite promiscuous; the abuse of this custom is indicated by the colloquial use of the Italian word *bagno* ("bath") for a brothel. From the Renaissance until the 19th century there was little additional development of bathing, and the mechanical arrangements were of the crudest, as in the famous bath of Marie Antoinette at Versailles.

Islamic Baths.—Bath architecture, however, progressed in the countries under Islamic rule. There, either through the development of a primitive eastern bath tradition or through the adoption of the Roman system or, as is perhaps more likely, through a merging of the two, the complicated technique of bathing continued and with it the growth of adequate architectural forms. The Alhambra (*q.v.*) at Granada has a beautiful set of bathrooms, all rectangular, which show the Moorish form at the beginning of the 14th century. Farther east Roman or Byzantine forms were the bases of the baths. Constantinople baths, which are typical, and whose form seems to have varied little, consist universally of a series of square rooms, carrying domes on pendentives. Each series of rooms is composed of a warm, hot and steam room, corresponding roughly to the tepidarium, caldarium and laconicum. The place of the frigidarium is generally taken by a basin of cold water at one end of the warm room. In addition to these vaulted chambers there are dressing rooms and frequently a luxurious rest room.

Russian Baths.—In Russia a great love of hot and steam baths

has resulted in a multitude of bathhouses. These are usually simple and consist only of a steam room and a cold bath; frequently even the cold bath is lacking and the bather plunges directly from the steam room into a river or outdoor pool or even snow. (H. HN.)

Finnish Sauna.—The sauna, or Finnish vapour bath, is a traditional national institution. It is presumed to derive from the Scythian baths described by Livy, who tells that these inhabitants of southern Russia threw water and hempseed on heated stones to create an intoxicating steam. The modern Finns omit the hempseed, but their country bathhouses have impressed visitors from the 18th century onward because men and women took steam baths together, beat themselves with birch twigs to stimulate circulation and cleanse the skin and completed the process by plunging into a stream or rolling in snow. (X.)

Far Eastern Baths.—Although bathing has always been popular in both China and Japan, it reached its highest development in the latter. There baths, which traditionally consisted of wooden tubs, usually of considerable size. may be outdoors in the court or garden. Many families followed a custom of serving one filling of exceedingly hot water for the entire family. In the more luxurious houses and hotels, modern conveniences were introduced and tubs were often built indoors. Massage is often associated with bathing in Japan.

The Japanese have also built numerous bath establishments of great size near medicinal springs; a famous example is that near Matsuyama on the island of Shikoku. In these establishments the bath proper consists of a large shallow pool with steps on which the bather sits. Surrounding the pool are cubicles for dressing. The main bathroom is frequently of two stories with tearooms, restaurants, etc., above. In all Japanese baths, public and private, there is no attempt to achieve privacy. Public baths, for instance, frequently have large unprotected openings through which people in the streets can watch the bathers.

Modern Baths.—Contemporaneous with the Industrial Revolution a new feeling for personal cleanliness led quickly to the erection of public bathhouses to compensate for the universal lack of home plumbing. Three main types were constructed. The mid-19th century baths consisted of a range of small individual bathrooms and a control office. With the development of athletics, shower baths and swimming pools were added. The second type, approximating the Roman, is a large and complex structure containing a swimming bath with adjacent ranges of showers through which the bathers are compelled to pass before entering the pool, steam, massage and rest rooms, and occasionally restaurants. The third type was developed in connection with medicinal springs and contains all necessary bath and treatment rooms, plus restaurants, card rooms, concert and dance halls and extensive gardens. Modern western architecture has developed no distinctive forms for either Turkish or Russian baths, both of which have been very popular since the beginning of the 19th century.

The European municipal swimming baths are, in many cases, works of great architectural interest. There are usually first- and second-class establishments under the same roof. The swimming pools are frequently large and are often vaulted, and their resemblance to Roman prototypes is strong. Noteworthy among these are the Guentz bath at Dresden, the municipal bath at Hanover and the enormous and monumental Karl Mueller public baths at Munich. The Imre baths at Budapest are especially lavish in their appointments and show, in their use of domed rooms, strong Turkish influence.

Medicinal baths exist in all countries; among the best known are those of Baden-Baden, Ger., and Karlovy Vary (Carlsbad), Czech.; Vichy and Aix-les-Bains in France; Bath and Harrogate in England; Spa in Belgium; White Sulphur Springs. W.Va., and Hot Springs, Ark., in the United States.

The design of swimming pools has become a science. By means of disinfectants the same water can safely be used again and again. making a swimming pool possible even when the water supply is limited. The tank is usually of reinforced concrete lined with glazed or ceramic tile and furnished at water level with a gutter that automatically removes floating scum.

The medium of the baths hitherto described has been water, vapour or hot dry air. Other substances used are sand, peat, radioactive mud, aromatic herbs in great variety, especially pine oil, scented and soluble salts, and ammonia. (H. HN.)

BATHOLITH, in geology, a huge body of igneous-appearing rock formed at great depth. The term was derived from the Greek *bathys,* "deep," and *lithos,* "stone." Batholiths are typically developed in the earth's great mountain belts and are composed predominantly of granitic rocks (*see* GRANITE). Beyond these qualifications, there is much diversity among geologists as to the meaning of the term. Since direct observations are limited to the upper parts of these masses, it is not surprising that a great diversity of opinion also exists as to how these large bodies were created. Various attempts to restrict the definition of batholith and to assign it a genetic meaning have led to much confusion. To satisfy the need for a more general and nongenetic term, these bodies may be referred to as large plutons (plutonic masses j.

The large plutons or batholiths appear to fall into two somewhat gradational classes: those formed contemporaneously with the mountain-making epoch (synchronous plutons) and those formed subsequent to it. In general, synchronous plutons are composed of rather heterogeneous and gradational rock types; they are associated with folded and strongly metamorphosed rocks; and they have gentle to steep gradational contacts (*see* METAMORPHISM). Pluton boundaries roughly conform with structures (foliation and bedding) in adjacent rocks. A marked layering (foliation), displayed more or less throughout, parallels the borders of the pluton. Abundant slablike masses of the adjacent rock, oriented parallel to the foliation, may be enclosed within the pluton.

Subsequent plutons (those formed after the mountain-making) are composed of highly uniform but rather distinct rock types. They are not necessarily observed to be associated with regional metamorphism and folding. Pluton boundaries are steep and sharp, and they crosscut structural features of the enclosing rocks. A weak foliation, if at all developed, is generally confined and parallel to the border zones. Angular blocks of the adjacent rock, in diverse orientations, occur within the pluton.

No single theory adequately explains the origin of large plutons, and it is generally agreed that batholithic bodies may have arisen in a variety of ways. One theory assumes the existence of large masses of molten rock (magma) that rise from great depths and become cooled and crystallized before reaching the earth's surface. Several methods of ascension have been considered. The hot liquid may have melted its way upward, assimilating the solid rock above. It may have advanced upward by engulfing large blocks of the overlying rock, which sank or became digested in the magma. It may have been forcefully intruded from the depths; and, following zones of weakness (folds and faults), may have spread out horizontally and made room by crowding aside and lifting the adjacent rock.

Another theory supposes that large plutons developed, mainly in the solid state, in mountain-making regions (orogenic zones), where portions of the earth's crust were actively undergoing folding, crushing and metamorphism. Recrystallization transformed the original minerals of the sedimentary rocks into quartz and feldspars to form granitic material. According to the chemical replacement theory, it is supposed that during metamorphism great quantities of rock-making material migrated differentially in a more or less dissociated state. Alkalies and silicon were added to the original sedimentary rocks, while calcium, iron and magnesium were carried away. By such chemical substitution or replacement, old minerals were transformed to minerals comprising granitic

rocks (granitization process). So gradual and perfect was this change that only faint (or even no) traces of sedimentary bedding or other structures may have been retained in the pluton. *See* also GEOLOGY; GEOCHEMISTRY; GEODESY; PETROLOGY.

See M. P. Billings, *Structural Geology (1954).* (C. A. CN.)

BÁTHORY, ISTVÁN: *see* STEPHEN (ISTVÁN) BÁTHORY (king of Poland).

BÁTHORY, SIGISMUND (ZSIGMOND) (1572–1613), prince of Transylvania, was the son of the prince Christopher Báthory and Elizabeth Bocskay, and the nephew of the great Stephen Báthory, king of Poland. He was elected prince of Transylvania in his father's lifetime, but on Christopher's death (1581) the government was at first entrusted to a regency because of his youth. In 1588 Báthory took over the government and, on the advice of his foreign counselor Alfonso Carrillo, joined the league of Christian princes against the Turks, thus reversing the traditional policy of Transylvania. This change aroused strong opposition in Transylvania and led to lengthy strife, which was subdued only in 1595 by the execution of Báthory's opponents. The same year he conquered Walachia for his vassal Michael the Brave, after defeating Sinan Pasha at Giurgiu. The turning point of his career was his separation from his wife, the archduchess Christina of Austria, in 1599, followed by his abdication in the same year, so that he might take holy orders. He offered his throne to the Holy Roman emperor Rudolf II, the Habsburg king of Hungary, in exchange for the Silesian duchy of Oppeln (Opole). In 1600, however, on invitation by the Transylvanians, he returned at the head of an army of Poles and Cossacks in an attempt to recover his throne, but was defeated at Suceava by his former vassal Michael the Brave, who had himself become prince of Transylvania. The following year the diet at Kolozsvir (Cluj) recalled Báthory to the throne, but Michael drove him out of Transylvania again before he could occupy it. He died in obscurity at Prague in 1613. (T. K.)

BATHOS, the Greek word for "depth," the bottom or lowest part of anything, was made current in English to describe a descent "from the sublime to the ridiculous" by Pope's satire *Peri Bathous (Miscellanies,* 1727–28), "the art of sinking in poetry." The title was a travesty of Longinus' On *the Sublime. See* FIGURES OF SPEECH: *The Literature* of *Figures* of *Speech.* (G. W. A.)

BATHSHEBA (in the Douai version of the Bible, BETHSABEE), wife of Uriah the Hittite and later of David, and mother of King Solomon. Information about her is found in II Sam. xi and xii and in I Kings i and ii. Bathsheba was a very beautiful woman, probably nobly born, a daughter of Eliam, who may have been a son of Ahithophel the Gilonite (II Sam. xxiii, 34), the famed vizier who sided with Abraham when the latter sought to seize his father's throne. Her seduction by David resulted in a pregnancy that precipitated the plotting of Uriah's death by the king, apparently without any collusion on her part. The child of the illicit union died in infancy; but subsequently, as the legal wife of David, she bore Solomon. When David was dying Bathsheba entered into a successful conspiracy with the prophet Nathan to block Adonijah's succession to the throne and win it for her own son. She appears as a strong-willed and fearless personality. Later as queen mother she occupied a characteristically influential position. (J. C. RY.)

BATHURST, EARLS, came of a family said to have settled in Sussex before the Norman Conquest. ALLEN BATHURST, (1684–1775), 1st earl, was born at Westminster on Nov. 16, 1684, son of Sir Benjamin Bathurst. Educated at Trinity college, Oxford, he was member of parliament for Cirencester from 1705 to 1712, when he was one of 12 Tories raised to the peerage, becoming Baron Bathurst of Battlesden. He defended Francis Atterbury, bishop of Rochester, in 1722 and was a consistent opponent of Sir Robert Walpole in the house of lords. He became a privy councilor after Walpole's fall (1742). He was given a pension of £2,000 a year soon after the accession of George III, and was created Earl Bathurst in Aug. 1772. Pope, Swift, Congreve, Matthew Prior and Sterne were among his friends. He died near Cirencester on Sept. 16, 1775.

HENRY (1714–1794), 2nd earl, was born on May 20, 1714, the eldest surviving son of the 1st earl, whose title he inherited in 1775. Educated at Balliol college, Oxford, he was then called to the bar and became a king's counsel (1745). As member of parliament for Cirencester from 1735 to 1754, he was at first in opposition as a supporter of Frederick, prince of Wales, but after his death (1751) Bathurst joined the Pelham connection. He was appointed judge of the court of common pleas in 1754. His appointment as lord chancellor in 1771, when he was made Baron Apsley, was unexpected and he proved incompetent. Loyalty to Lord North led him to resign, somewhat unwillingly, in 1778 to make room for Lord Thurlow in North's cabinet. Thereafter he was lord president of the council (1779–82). He died near Cirencester on Aug. 6, 1794.

HENRY (1762–1834), 3rd earl, was born on May 22, 1762, the elder son of the 2nd earl. He was member of parliament for Cirencester from 1783 until he succeeded to the earldom in Aug. 1794. Mainly as a result of his friendship with William Pitt, he was a lord of the admiralty (1783–89), a lord of the treasury (1789–91) and commissioner of the board of control for India (1793–1802). Returning to office with Pitt in May 1804, he became master of the mint and was president of the board of trade and master of the mint during the ministries of the duke of Portland and Spencer Perceval, only vacating these posts in June 1812 to become secretary for war and the colonies under the earl of Liverpool. For two months during 1809 he was in charge of the foreign office. He was secretary for war and the colonies until Liverpool resigned in April 1827 and deserves some credit for improving the conduct of the Peninsular War. As secretary for the colonies Bathurst was closely concerned with the abolition of the slave trade. He was lord president of the council in the government of the duke of Wellington from 1828 to 1830, and favoured Roman Catholic emancipation, but he strongly opposed the Reform bill of 1832. He died on July 27, 1834. Bathurst was made a knight of the Garter in 1817.

The present holder of the title is HENRY ALLEN JOHN (1927–), 8th earl.

BATHURST, a city of New South Wales, Austr., 129 mi. W.N.W. of Sydney by road and 149 mi. by rail. It lies on the south bank of the Macquarie river at an elevation of 2,206 ft. on a fertile, undulating plain west of the Blue Mountains plateau. Pop. (1954) 16,089. The city has an Anglican and a Roman Catholic cathedral, two hospitals and a racing track for cars and motorcycles. A 100-ft. carillon tower, the only one of its kind in Australia, forms a war memorial. Bathurst is a tourist centre and is famed for its trout fishing. There are cement-pipe, brick and railway works, a flour mill and canning and clothing factories. The district is a sheep-grazing area and produces vegetables, apples, pears and peaches.

Bathurst was officially founded in 1815, being named after the 3rd Earl Bathurst, then secretary for war and the colonies, but its progress was slow until 1851, when gold was found in the area. It became a municipality in 1862 and a city in 1885.

BATHURST, capital of the British colony and protectorate of Gambia, stands on the Island of St. Mary, a sandbank near the mouth of the Gambia river, west Africa. It is connected with the adjacent division of Kombo St. Mary, on the mainland to the west of Bathurst, by a bridge. Pop. (1951) 19,602. Commercial life is centred on the river front. The main streets have concrete drains on either side and concrete-bloc1 buildings now take the place of the former rectangular huts. A housing development has been built on Crab Island, a piece of land that has been reclaimed. A power station at Half-Die supplies electricity to Bathurst, Kombo St. Mary's area and Yundum airport. The new Victoria hospital completed in 1957 was built from the Colonial Development and Welfare funds. Education is provided by primary and infant schools, two secondary schools run by the Roman Catholic mission, a government-run secondary modern school (1958) and a Gambia high school (1959). There is a teachers' training college at Yundum.

Bathurst is the main port but, as the river is navigable, ocean-going steamers load peanuts at the ports of Kuntaur, Kaur and Balingho. There are irregular services of cargo and passenger

vessels to and from the United Kingdom. There are regular air services from Yundum airport, 18 mi. S.W. by road, to Europe and to the other west African territories. The marine department runs regular river steamer services as far as Basse in the upper river division. There are about 40 mi. of bituminous surface roads in the vicinity of Bathurst.

St. Mary's Island was occupied by a few fishermen at the end of the 18th century but was entirely unoccupied when Bathurst was founded by the British in 1816 as a military post to suppress slave-trading and as a trade outlet for merchants who were ousted from Senegal when it was restored to France. (C. I. J.)

BATHYCLES, a Greek sculptor of Magnesia in Ionia, was commissioned by the Spartans during the 6th century B.C. to make a marble "throne" for the statue of Apollo at Amyclae. Pausanias gives a detailed description of this monument, which was perhaps rather an altar built round a more ancient statue than it was a true throne. It was adorned with mythological reliefs and supporting figures in the round. Interesting architectural fragments have been recovered but virtually none of the sculpture. (C. M. RN.)

BATIK: see TEXTILES.

BATJAN, a mountainous island of the Moluccas, Indon., lies in the Molucca sea, close to the southwest coast of the island of Halmahera, and is in the Ternate division. It is 50 mi. long and 27 mi. wide. The greatest heights are in the south; Mt. Labuha. or Sibela, for example, reaches 6,922 ft. The centre is lower and the northern part is volcanic. There are no active volcanoes on the island, but sulfurous springs exist and in the south there are ancient and nonvolcanic rocks. West of Batjan are Great Tawali or Kasiruta, 19 mi. long and 15 mi. wide, Mandioli, 17 mi. by 9 mi., and several smaller islands. Gold, copper and coal exist in small quantities, but a company formed to exploit them later abandoned operations.

Batjan's animal life includes the crested Celebes black ape (*Cynopithecus* nigrescens), which exists elsewhere in the archipelago only in Celebes, Sulu and Buru; Batjan is the most easterly point on the globe inhabited by any of the apes. Other mammals are an eastern opossum (Phalanger orientalis). a pigmy flying phalanger (Petaurus ariel), the great Indian civet (*Viverra* zibetha) and several bats. Among the many birds is a bird of paradise, discovered by A R. Wallace and named after him Semioptera wallacei, Wallace's standard wing. Other birds are a red lory (Domicella garrula) ; little lorikeet (Charmosyna placentis) ; green parrot. with red bill and head (Geoffroyus *geoffroyi* cyanicollis); golden-capped sunbird (Hermotimia *auriceps*); racquet-tailed kingfisher (Tanysiptera *galatea*); a rare goatsucker (Aegotheles crinifrons); and a large and handsome fruit pigeon with metallic green and rust plumage. Among butterflies, Batjan has the fine blue *Papilio ulysses* and the beautiful "bird-winged butterfly."

Wallace described Batjan as "an island that would perhaps repay the researches of a botanist better than any other in the whole archipelago." It has fine trees, a great variety of surface and soil and a number of small streams, a few of which are navigable for small boats for some distance. Its products include sago palm, coconut palm, clove, nutmeg and excellent Moluccas dammar (a resin used for making varnish).

The estimated population of Batjan in 1956 was 21.482. partly people from Ternate and Tidore engaged in collecting forest products. and Javanese and others, working on the plantations of the Batjan Exploitation company. The Batjanese are supposed to have come originally from Halmahera, with whose people they have strong affinities. They cultivate the land on a small scale, fish and make baskets. Other inhabitants include the Serani. or Christian descendants of the Portuguese. Macassarese. Malays, Halmahera men and a few Chinese and Arab traders. Labuha, at the foot of high mountains. is the capital and a port trading in dammar. spices, copra, timber and mother-of-pearl.

The little fort. Barneveld, was built by the Portuguese. and captured from them by the Dutch in 1609. Batjan, hitherto independent. was placed under the suzerainty of the sultan of Ternate, but when the Dutch superseded him in 1683 they made it subject to themselves. Japan occupied Batjan in 1942. The island is now part of Maluku Utara (North Moluccas).

(E.E.L.; J.O.M.B.)

BATLEY, a municipal borough in the Batley and Morley parliamentary division of the West Riding of Yorkshire, Eng., 8 mi. S.S.W. of Leeds. Pop. (1961) 39,390. Area 7 sq.mi. It lies at the junction of the east Pennines and the Yorkshire plain Mentioned in the Domesday Book as Bateleia, by the mid-18th century it was an important wool and market town. Its situation on the southwest Yorkshire coal field led to its development as an industrial town and a centre of the heavy woolen trade as well as of the manufacture of shoddy (*q.v.*) and mungo. Other industries include the making of textile equipment and plastics and engineering. The history of cloth manufacture is shown at the Bagshaw museum (opened 1911). Oakwell hall, Birstall, a typical Yorkshire manor house dating from the 15th century and described as "Fieldhead" in Charlotte Brontë's Shirley, now belongs to the corporation. In a nearby farmhouse Joseph Priestley was born; he was educated at the Batley Grammar school (founded 1612), where Sir Owen Richardson was also a pupil.

BATLLE Y ORDÓÑEZ, JOSÉ (1856–1929), Uruguayan statesman, journalist and anticlerical, was born in Montevideo on May 21 1856, the son of Gen. Lorenzo Batlle, president of Uruguay from 1868 to 1872. His ancestry was Catalonian, and a grandfather, Josef Batlle, had emigrated to Uruguay at the beginning of the 19th century. José Batlle began but did not complete a law course. In the late 1870s he began a vigorous journalistic career, and on June 16, 1886. founded El Dia, which became Uruguay's leading newspaper. Batlle fought strongly against a succession of late-19th-century dictators. even those who belonged to his own Colorado party and on various occasions he was the object of personal attacks, persecution and temporary imprisonment.

By 1887 Batlle was ready to launch a long campaign to revivify and purify the Colorado party. That party's chief strength lay in Montevideo, the capital, and the power of its opposition, the Blanco or Nationalist party. was in the rural areas; the two parties had an unofficial working agreement to divide offices between them. At about the same time Batlle held the first of many public offices, that of political chief (governor) of the department of Minas. A few years later he was elected national deputy and in 1898 a senator. In 1895 Batlle began his long prolabour fight, the chief ultimate objective of which was the establishment of an eight-hour day to replace that of 15 to 19 hours then prevailing. This goal mas finally attained in Nov. 1915.

Batlle was first chosen president, by the congress. March 1, 1903. Almost immediately a Blanco revolt broke out that was not suppressed until a year and a half later after much bloodshed. In his first term, 1903–07, much of Batlle's energy was expended in improving the country's disastrous financial situation. He also supported bills legalizing divorce, abolishing income taxes for the lowest paid public officials, reorganizing the university curriculum, broadening popular education, etc.

Soon after the end of his first term. Batlle left with his family for Europe and remained there during most of the following four years. He was re-elected president in 1911 to serve until 1915. During his second term he sponsored bills providing for a state monopoly over insurance, encouraging immigration, nationalizing the Bank of the Republic. providing a minimum wage and workers' accident insurance, establishing vacations with pay, more extensive medical care and many other reforms.

His chief campaign during this period, however, was for creation of a plural bipartisan executive in order to prevent personal dictatorships which he felt were a blight on Latin American democracy. He probably received the inspiration for this idea during his residence in Switzerland. The threat that Batlle might be elected president for a third term, 1919–23, moved his opponents, who controlled a constitutional assembly in 1916–17, to compromise the issue and agree to a bifurcated executive with both a presidency and an independent national council of administration. Batlle served twice. in 1920 and 1926. as president of that council. He died in Montevideo, Oct. 20. 1929.

Throughout his life Batlle was a militant agnostic and foe of religious interference in government. He was one of Uruguay's

most controversial figures, arousing both fervent enthusiasm and violent opposition. In many respects, he was ahead of his times. He laboured indefatigably to better the lot of the lower income groups and to extend the powers and services of the state. His residence in Europe widened his views and converted him into one of the early advocates of a world political organization. See URUGUAY: History. (R. H. FI.)

BATON, from the French *bâton* ("a stick"), a word used in a musical connection to mean the stick used by the conductor of an orchestra to beat time. The practice dates from the 15th century when choirs were directed by a leader holding either a roll of paper or a short stick. In the 17th and 18th centuries conductors would sometimes beat time by tapping their batons on their desks, creating, according to Rousseau, an insufferable noise. A long baton with which the conductor marked the time by striking the floor was also used in the 17th century, notably by Lully. Ludwig Spohr, in 1820, and Mendelssohn, in 1829, were among the first conductors to use a baton to direct a symphony orchestra. Thereafter the baton, a lightweight wooden stick varying in length from 15 in. to 30 in., sometimes with a cork handle, became the instrument of the virtuoso conductor, who used it not only to beat time but to convey, by a great variety of personal gestures, the expression of the music. See also CONDUCTING.

BATONI (BATTONI), **POMPEO GIROLAMO** (1708–1787), Italian painter, who was ranked with Anton Raphael Mengs (*q.v.*) as a painter of historical subjects, was born at Lucca on Jan. 25, 1708. Probably his portraits are now better known, as he invented the type of "grand tourist" portrait, very popular among the English, which shows the sitter at his ease among the ruins of antiquity. He also painted three popes and many princes. Reynolds referred to him disparagingly in his 14th discourse, but as a competitor for English sitters he may not have been entirely disinterested. Most of Batoni's portraits are still in Country houses, but there are exaniples at Cardiff and Dublin, at the National Portrait galleries of Edinburgh and London, and at Oxford. He died in Rome on Feb. 4, 1787. (P. J. My.)

BATON ROUGE, the capital of Louisiana, U.S., and seat of East Baton Rouge parish, on the east bank of the Mississippi river, at the head of deep-water navigation, 80 mi. N.W. of New Orleans. It has a municipal airport and a well-equipped river port which accommodates ocean-going vessels.

Baton Rouge is located on the first bluff above the Gulf of Mexico and is free from overflow at all flood stages of the river. Surrounding the city is a fertile agricultural section adapted to stock raising and dairy farming. Across the river to the southwest are the great sugar plantations, known as the sugar bowl of the United States. Other staple crops raised in the area are rice, cotton, vegetables and fruits.

It is believed that the French named the town for a red cypress tree which marked a boundary between Indian tribes. The French established a fort on the site in 1719, and established a military force to subdue the Indians. The area was ceded to England in 1763 at the end of the French and Indian War. While England was at war with its American colonies; the Spanish overpowered the British garrison there in the first battle of Baton Rouge, Sept. 21, 1779, and controlled the area for the next 20 years. In 1800 Spain ceded Louisiana to France, and Napoleon sold the territory to the United States in 1803 (see LOUISIANA PURCHASE). Baton Rouge, however, was claimed by Spain along with the entire territory of West Florida. The inhabitants of Baton Rouge and the U.S.-born citizens of the surrounding parishes rebelled against Spanish rule in the second battle of Baton Rouge (Sept. 23, 1810), and established the West Florida republic (comprising that portion of West Florida east of the Pearl river, the present boundary between the states of Louisiana and Mississippi). The republic was annexed to the United States three months later. Baton Rouge was incorporated in 1817, and became the state capital in 1849. During the Civil War the capital was transferred to other towns; in 1882 it returned to Baton Rouge. Overshadowed by New Orleans down the river, Baton Rouge had a population of only 5,428 by 1860. Throughout the Civil War it was held by Cnion forces, except for a short period after the third battle of Baton Rouge. A Confederate force, under Gen. John C. Breckinridge. attacked the city on Aug. 5, 186.2, and a bloody engagement followed. Although both sides claimed the victory, the Union forces withdrew two weeks later because of a temporary threat to New Orleans. Union forces reoccupied the city in Dec. 1862.

The city grew slowly through the remainder of the 19th century; its population was only 11,269 by 1.900. Its growth as an industrial centre began with the building of the Standard Oil company's giant refinery in 1909. Subsequently, numerous chemical plants were established there, attracted by the proximity of the oil fields of the southwest, the economy of ocean and river transportation, and the abundance of natural gas and other natural resources. During World War II Baton Rouge became an important synthetic rubber centre. Refineries and dock facilities were expanded and many large industrial firms built local plants. The city's population increased by more than 300% in the decade 1940–50, from 34.719 to 125,629 (about one-third Negro).

In 1947 most of the suburbs were absorbed in the extension of the city's boundaries, accounting in part for the growth in population. And in the same year the city and parish governments were consolidated to meet the new demands of a rapidly growing urban area. The city continued to grow, and by 1960 the population numbered 152,419. The population of the standard metropolitan statistical area (East Baton Rouge parish) was 230,058 in 1960.

The Louisiana State university and Agricultural and Mechanical college occupies a 3,000-ac. tract along the river, bought in 1920, and occupied in 1925. The university dates to grants of land made by the United States to the state in 1806, 1811 and 1827 "for use of a seminary of learning." The seminary was opened in 1860, near Alexandria: In 1870 it became the Louisiana State university; and in 1877 the Louisiana State Agricultural and Mechanical college, which had been opened in New Orleans in 1874, was consolidated with it. Southern University and Agricultural and Mechanical college, a Negro institution, was founded in Baton Rouge in 1880. (*G.* M. **CA.**)

BATSWANA: see TSWANA.

BATTALION, a tactical military organization composed basically of a headquarters and two or more companies, batteries, or similar organizations. The term has been used in nearly every western army for centuries and has had a variety of meanings. In the 16th and 17th centuries it denoted a unit of infantry forming part of a line of battle, and was loosely applied to any large body of men. During the Napoleonic Wars the French developed an army organization in which the regiment was a unit of administration for its battalions serving as fighting units in the field. In this connection, the terms regiment and battalion often were used interchangeably, but in most modern armies the regiment is the higher unit.

In the armies of the British Commonwealth, infantry battalions, usually commanded by lieutenant colonels, are tactical units formed within regiments, which are not tactical but serve as administrative parent organizations. The equivalent tactical artillery and armoured units, however, are called regiments. In most military forces, the cavalry and aviation equivalent of the battalion is the squadron.

In the U.S. army of the early years of the 20th century a battalion usually numbered from 500 to 1,000 men, and normally was commanded by a lieutenant colonel. After World War I, the "square" infantry battalion of four companies was superseded by the "triangular" battalion of World War II and the Korean war, usually composed of three rifle companies, a heavy weapons company and a headquarters company. During World War II and in Korea, the infantry battalion often was used as the nucleus of a combat team in special operations, such as air-borne or amphibious assaults, requiring decentralization of tactical control by higher echelons.. Battalion combat teams included such reinforcements for independent action as attached artillery, tanks, engineers and other special elements. In 1957 the U.S. army eliminated its infantry battalions and regiments, replacing them with "battle groups" (see REGIMENT). Battalion organization was retained,

however, in most noninfantry commands. A further reorganization, begun in 1961, called for the restoration of infantry battalions as administratively and tactically self-sufficient units of between 800 and 900 officers and men, normally divided into a headquarters company and three rifle companies. Armoured battalions were to be reorganized along similar lines. From two to five battalions were to form the combat maneuver elements attached to a tactical brigade (*q.v.*).

In the Soviet army the battalion was smaller than its U.S. counterpart. A typical rifle battalion of a rifle division consisted of 550 officers and men organized into three 100-man rifle companies plus machine gun, artillery, mortar and service units.

(H. C. T.)

BATTAMBANG, a town and province of Cambodia, southeast Asia. The province consists largely of a low-lying plain west of the lake Tonle Sap and physically continuous with the eastern Bangkok plain in Thailand. It is largely shielded by the Cardamom mountains from the rain-bearing southerly winds, and its annual rainfall averages only 50 in., with winter drought. Its agriculture, therefore, is mainly dependent on the regular floods caused by the rise and fall of the water level in Tonle Sap, which is related more to the Mekong river regime than to the local rains. These floods, from August to October, make possible rice cultivation without engineered irrigation. The lake also yields an abundant supply of fresh-water fish, the foundation of a trade in dried, salted and fermented fish.

The population of the province is 452,000 (1958 est.) and of the town 31,190. The area of the province is 7,162 sq.mi. The town is sited roughly at the maximum limit of the lake floods and 25 mi. from the permanent water level. It is a market centre with a substantial Chinese trading community. It has rail and road links southeastward to Phnom Penh and a rail link to Thailand, and is a stop on the air route from Saigon to Bangkok. Part of the medieval Cambodian empire, in 1794 Battambang passed under Siamese suzerainty until 1907 when the French enforced the claim of the Cambodian kingdom. It reverted to Thailand in 1941 but was again ceded to Cambodia in 1946. (E. H. G. D.)

BATTANI, AL- (ABU- 'ABDULLAH MUHAMMAD IBN JABIR AL-BATTANI, called in Latin ALBATEGNIUS or ALBATENIUS) (*c.* 858–929), Arab astronomer described as "the greatest of Islam" (G. Sarton), was born about 858 in or near Harran and died near Samarra in 929. His remarkably accurate astronomical observations began in 877; he compiled a catalogue of the fixed stars for the years 880–881; he discovered the movement of the sun's apogee and assigned to annual precession the improved value of 54.5″ and to the inclination of the ecliptic that of 23° 35'; and he showed that annular eclipses of the sun were possible. His principal work, *De motu stellarum,* translated by Plato Tiburtinus (*c.* 1116) and annotated by Regiomontanus, was published at Nürnberg in 1537; the Arabic text from a manuscript in the Escorial library near Madrid, Spain, with a Latin translation by Nallino, was published in three volumes in Milan in 1899–1907.

See G. Sarton, *Introduction to the History* of *Science,* **vol. i** *(1927).*

(D. McK.)

BATTEN, in industry a term used in joinery for a board not more than 4 to 7 in. broad or 3 in. thick employed for various purposes, such as for strengthening or holding together laths and other woodwork. It is also applied to the strips of wood used in roofing for the fixing of slates or tiles; such battens are usually in sections about 2 by 1 in.

On board ship the name batten is applied to a strip of wood nailed to a mast to prevent rubbing or to fix down a tarpaulin over a hatchway in rough weather.

BATTENBERG, the name of a family of German counts, which died out about 1314, whose seat was the castle of Kellerburg, near Battenberg, in Hesse. The title was revived in 1851, when Alexander (1823–88), a younger son of Louis II, grand duke of Hesse, contracted a morganatic marriage with the Polish lady, Countess Julia Theresa von Hauke (1825–95), who was then created countess of Battenberg. In 1858 the countess and her children were raised to the rank of princes and princesses of Battenberg, with the title of *Durchlaucht,* or serene highness.

In 1917 the eldest son of this union, Louis Alexander (1854–1921), who had become an admiral in the British navy, was created marquess of Milford Haven *(see* MILFORD HAVEN, LOUIS ALEXANDER, 1ST MARQUESS OF), and, at the request of King George V, the members of the family who lived in England renounced, in 1917, the German title of prince of Battenberg and adopted the surname of Mountbatten. The second son, Alexander Joseph (1857–93), was elected Prince Alexander I of Bulgaria in 1879. *(See* ALEXANDER OF BATTENBERG.) Henry Maurice, the third son, married on July 23, 1885, Beatrice, youngest daughter of Victoria, queen of England, became a naturalized Englishman and was appointed captain general and governor of the Isle of Wight and governor of Carisbrooke. He died at sea on Jan. 20, 1896, of a fever contracted on active service with the British troops during the Ashanti War. The fourth son, Francis Joseph (1861–1924), married in 1897 Anna, daughter of Nicholas I, prince of Montenegro, and was the author of *Die volkswirtschaftliche Entwicklung Bulgariens von 1879 bis zur Gegenwart* (1891).

The only daughter of the princess of Battenberg, Marie Caroline (1852–1923), married in 1871 Gustavus Ernest, prince of Erbach-Schonberg. Princess Alice of Battenberg (b. 1885), daughter of Prince Louis Alexander, and Victoria Eugénie (Princess Ena of Battenberg; b. 1887), only daughter of Prince Henry Maurice, were both married before 1917, the former to Prince Andrew of Greece and the latter to Alphonso XIII, king of Spain. Prince Henry's youngest son, Maurice of Battenberg, was killed in action near Ypres on Oct. 27, 1914. For the descendants, with three exceptions, of princes Louis Alexander and Henry Maurice *see* MOUNTBATTEN.

BATTERING RAM: *see* ENGINES OF WAR.

BATTERSEA, a southwestern metropolitan and parliamentary borough of London, Eng., bounded northeast by Lambeth, southeast, south and west by Wandsworth and north by the river Thames, there crossed by the Chelsea, Albert and Battersea bridges. Pop. (1961) 105,758. Area 3.4 sq.mi. The Saxon form of the name was Badriceseg. In Domesday Book it was called Patricesy. The manor at the time of Domesday belonged to the abbey of St. Peter, Westminster. Under Henry VIII it passed to the crown and subsequently to the St. John family and to the earls Spencer. York road recalls the existence of a palace of the archbishops of York, occasionally occupied by them between the reigns of Edward IV and Mary. The parish church of St. Mary (1776) preserves stained glass and monuments from an earlier church.

In the 17th and 18th centuries Battersea was celebrated for its enameled ware, specimens of which are highly valued. Its market gardens were noted for the best and earliest celery in London.

On the riverbank are several large factories and the well-designed Battersea electric power station. Wandsworth common (175 ac.) and Clapham common (205 ac.) are partly within the borough. Battersea park (200 ac.), bordering the Thames between Albert and Chelsea bridges, was laid out in 1858 on the site of Battersea fields, a former resort which had become derelict. The park contains a lake, a subtropical garden and many handsome trees; in 1951 part of it was adapted as pleasure gardens in connection with the Festival of Britain. The Dog's and Cat's home (founded 1860) is on Battersea Park road.

Battersea has returned two members to parliament since 1918, one for Battersea North and one for Battersea South.

BATTERY. The term battery, as commonly used in electricity and electrochemistry, refers to a device for converting chemical energy directly to electrical energy. The mechanism of the process involves the arrangement of chemicals in such a manner that electrons are released in one part, or electrode, of the battery and caused to flow through an external circuit to the other part, or electrode. Such batteries are called voltaic cells.

The part of the battery at which the electrons are released to the external circuit is called the anode, or the negative electrode or pole; the part that receives the electrons from the external circuit is called the cathode or the positive electrode or pole. (The terms anode and cathode are used here in the accepted scientific sense in referring to components of a battery that produces elec-

tric current; in a device that consumes current—*e.g.*, an electroplating cell, an electron tube, etc. —the term anode is commonly applied to the positive electrode while the negative electrode is called the cathode.) Familiar examples of batteries are the so-called dry cells used in flashlights, lead-acid batteries used in automobiles and mercury batteries used in hearing aids.

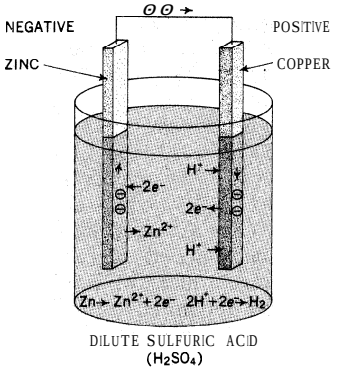

FIG. 1.— SIMPLE ZINC-COPPER CELL

Batteries that do not depend upon a chemical reaction have been developed to convert solar energy and nuclear energy directly to electrical energy. These are commonly called solar batteries, thermal batteries and nuclear batteries. The term battery, strictly used, means an assembly of two or more cells; but the term is now generally used to refer to one or more cells.

A Simple Cell.—One of the simplest batteries can be made from a zinc rod and a copper or carbon rod inserted in a solution of dilute acid (fig. 1). At the negative electrode the zinc atoms give up electrons to form zinc ions. This is indicated with the chemical equation $Zn \rightarrow Zn^{2+} + 2e-$. The released electrons move through the external circuit to the copper (or carbon) electrode, from which they are picked up by the hydrogen ions of the acid solution to form hydrogen atoms, and, in turn, hydrogen molecules. This is indicated with the equation

$$2H^+ + 2e^- \rightarrow 2H \rightarrow H_2 \text{ (gas)}$$

The current is carried through the solution in the internal circuit between the two electrodes by the ions of the solution.

This battery mill operate satisfactorily for a short time. but soon the hydrogen gas produced at the positive pole will cover the electrode and prevent further reaction. Such an electrode, coated with reaction products, is said to be polarized. In the early days of battery development a chemical called a depolarizer was added, presumably to react with and remove the hydrogen. It was recognized later, however, that any chemical with a strong enough affinity for electrons to remove them from the hydrogen would be the chemical to receive the electrons at the electrode in preference to the hydrogen. Hence, the chemical was not acting as a depolarizer but rather as the electron acceptor, called the cathodic material, at the positive electrode. An example of such a material is manganese dioxide in a dry cell.

Theory of Cell Operation.— A voltaic cell can be described as a device composed of two chemicals with different electron attracting powers immersed in an electrolyte and connected to each other through an external circuit. These two chemicals are called an electrochemical couple. In the zinc-acid cell described above, the electrochemical couple is the zinc-hydrogen ion couple. The reaction occurring between the electrochemical couple in thevoltaic cell is an oxidation-reduction reaction and can be written as one over-all reaction; *e.g.*, in the cell above the over-all reaction is

$$Zn + 2H^+ \rightarrow Zn^{2+} + H_2$$

It is also customary to write the electron reaction occurring at each electrode. For example, in the above cell at the negative electrode $Zn \rightarrow Zn^{2+} + 2e^-$ (oxidation occurs at the anode); at the positive electrode $2H^+ + 2e^- \rightarrow H_2$ (reduction occurs at the cathode). These are called half reactions, or electrode reactions.

The electron releasing or attracting power of ions (or atoms) in solution is indicated by a table of electrode potentials of half reactions called the electromotive force series or standard electrode potentials (Table I). Since it is necessary to have two half reactions to give the over-all cell reaction it is not possible to measure the voltage of a half reaction alone. However, for purposes of comparison, the voltage of the hydrogen half reaction

$$H_2 \rightleftharpoons 2H^+ + 2e^-$$

has been arbitrarily set at zero and the voltage of a cell in which this reaction is one of the half reactions is taken as the voltage of the other half reaction; these are the values given in Table I. Furthermore, such a table is compiled by measuring the voltage of each metal in a molar solution of a salt of the metal (*i.e.*, in solutions whose activity is unity).

From such a table it is possible to select the chemicals usable for the two half reactions and to predict the probable voltage of such a cell. The voltage will vary from these values according to the temperature and the concentration of the electrolyte.

Voltage, Current and Capacity of a Cell.—Ohm's law gives the relationship between the voltage (E), the current (I) of the cell and the resistance (R) of the circuit.

$$E = IR$$

E is given in volts, **I** in amperes and R in ohms. An analogy frequently helpful in visualizing the meaning of this equation is a comparison of the flow of electrons with the flow of water molecules down through a vertical pipe. E, the electrical potential or electromotive force, corresponds to the height of the pipe; R corresponds to the resistance to flow; and **I**, the current, is the rate of flow.

TABLE I.—*Electromotive* Force *Series* at *25°*

Element	Ion	Half reaction	Electrode potential (v.)*
Metals			
Lithium	Li^+	$Li = Li^+ + e^-$	−3.05
Potassium	K^+	$K = K^+ + e^-$	−2.93
Barium	Ba^{2+}	$Ba = Ba^{2+} + 2e^-$	−2.90
Calcium	Ca^{2+}	$Ca = Ca^{2+} + 2e^-$	−2.87
Sodium	Na^+	$Na = Na^+ + e^-$	−2.71
Magnesium	Mg^{2+}	$Mg = Mg^{2+} + 2e^-$	−2.37
Aluminum	Al^{3+}	$Al = Al^{3+} + 3e^-$	−1.66
Zinc	Zn^{2+}	$Zn = Zn^{2+} + 2e^-$	−0.76
Iron	Fe^{2+}	$Fe = Fe^{2+} + 2e^-$	−0.44
Cadmium	Cd^{2+}	$Cd = Cd^{2+} + 2e^-$	−0.40
Nickel	Ni^{2+}	$Ni = Ni^{2+} + 2e^-$	−0.25
Tin	Sn^{2+}	$Sn = Sn^{2+} + 2e^-$	−0.14
Lead	Pb^{2+}	$Pb = Pb^{2+} + 2e^-$	−0.13
[Hydrogen	H^+	$H_2 = 2H^+ + 2e^-$	0.00]
Copper	Cu^{2+}	$Cu = Cu^{2+} + 2e^-$	+0.34
Mercury	Hg_2^{2+}	$2Hg = Hg_2^{2+} + 2e^-$	+0.79
Silver	Ag^+	$Ag = Ag^+ + e^-$	+0.80
Platinum	Pt^{2+}	$Pt = Pt^{2+} + 2e^-$	+1.20
Gold	Au^{3+}	$Au = Au^{3+} + 3e^-$	+1.50
Nonmetals			
Sulfur	S^{2-}	$S^{2-} = S + 2e^-$	0.48
Iodine	I^-	$2I^- = I_2 + 2e^-$	
Bromine	Br^-	$2Br^- = Br_2 + 2e^-$	
Chlorine	Cl^-	$2Cl^- = Cl_2 + 2e^-$	
Fluorine	F^-	$2F^- = F_2 + 2e^-$	*C2.65*

*Oxidation potentials are same but of opposite sign.

Two other terms related to cells are the faraday and the coulomb. **A** flow of electrons is called an electric current. If 6.02×10^{23} electrons flow from one electrode to another, a faraday of electricity has passed. If 1/96,500 of a faraday is produced by the battery, a coulomb of electricity has passed. If the rate of flow of electrons is a coulomb per second, the strength of the current is one ampere.

The capacity of a cell is frequently given in terms of ampere-hours. Capacity is determined by the quantity of electrons that can be released at the anode and accepted at the cathode; this quantity in turn is determined by the amount of available reactive anodic and cathodic material on the electrodes. A 100 amp.hr. battery is one that will produce a current of 5 amp., for example, for 20 hours.

Types of Cells.—Voltaic cells can be classified as follows: (1) Primary batteries; (2) Secondary or storage batteries, or accumulators; and (3) Cells for scientific measurements.

Miscellaneous cells other than voltaic cells may be classified as: (1) Nuclear; (2) Solar; and (3) Thermal.

HISTORY

The two most commonly used types of batteries are the lead-acid battery employed in automobiles and the dry cell used in most flashlights. The lead-acid battery, which dates back to Gaston Planté's discovery of the lead-acid system in 1859, may be charged and discharged many times. The electric generator for

charging lead-acid batteries was not developed until 20 years later. The stimulus for the development of the generator was the invention of the electric light bulb by Thomas A. Edison in 1879. Prior to the invention of the generator, lead-acid batteries were recharged by batteries of the dry cell type, patented in 1868 by Georges Leclanché. Hence, the Leclanché cell, which is nonchargeable, became known as the primary battery and the chargeable type battery was designated the secondary battery, or storage battery, or accumulator.

The other batteries used industrially are the Edison battery, invented by Edison in 1908, and the nickel-cadmium, battery, invented jointly by W. Jungner and K. L. Berg in 1893–1909.

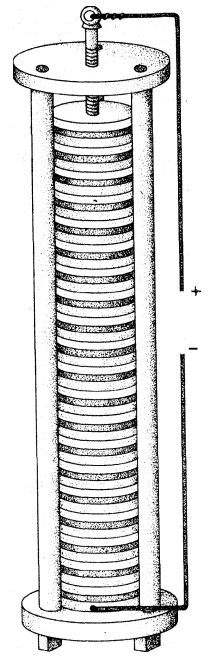

FIG. 2.—A VOLTA PILE

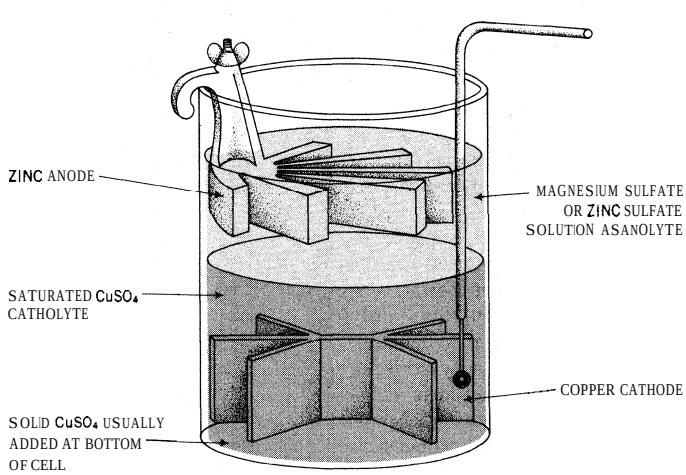
Primary Cell.—The early history of primary cells and batteries goes back much before this time. The Parthians (250 B.C. to 224 B.C.) may have used batteries for gold-plating jewelry. Records describe the observations of Alessandro Volta (1792) on the difference in potential of metals in contact with an electrolyte; he developed the concept of the electrochemical series. In 1800 he described (Philosophical Transactions *of the* Royal Society, 90, 403–431) the first operating battery (called a Volta pile). It consisted of a disc of silver (cathode), a slightly smaller disc of paper or cloth or similar material soaked in a salt solution (electrolyte), a disc of zinc (anode), then a second silver disc in dry contact with the zinc, followed by an electrolyte layer and a second zinc, and so on until a battery of substantial voltage was produced. In another form of the same battery, the individual cells were assembled in separate vessels called a "crown of cups." In such a cell, when the circuit is closed, zinc dissolves in the electrolyte as zinc ions, liberating electrons,

$$Zn \rightarrow Zn^{2+} + 2e^-$$

the latter giving the anode a negative charge. The electrons travel through the external connection from the anode to the cathode, where molecular hydrogen is liberated: $2H^+ + 2e^- \rightarrow H_2$, or, in terms of hydronium ions, $2H_3O^+ + 2e^- \rightarrow 2H_2O + H_2$. The cathode (silver or copper) is not electrochemically changed; it is an inert electrode.

Most of the early electrochemical discoveries were made with Volta's battery; among these were Sir Humphry Davy's electrolysis of molten salts that led to the isolation of the alkali metals, the carbon arc (1809) and the laws of electrolysis (Michael Faraday, 1833).



FROM W. A KOEHLER, "PRINCIPLES AND APPLICATIONS OF ELECTROCHEMISTRY" (JOHN WILEY & SONS, INC.)

FIG. 3.—DANIELL CELL, GRAVITY TYPE

The Volta pile type of battery polarizes readily on continued use. In 1836, a cell was developed by John F. Daniell that effectively prevents polarization. This cell (fig. 3) consists of a zinc anode immersed in a solution of zinc sulfate, magnesium sulfate or dilute sulfuric acid, and a copper cathode in a saturated copper sulfate solution. The two liquids may be separated by a porous diaphragm or, as is more common in commercial practice, by gravity alone, the copper sulfate solution being the heavier and remaining at the bottom of the battery container.

The anode reaction, as in the Volta pile, involves the solution of zinc during discharge

$$Zn \rightarrow Zn^{2+} + 2e^-$$

and the formation of zinc sulfate; at the cathode, metallic copper is deposited from the copper sulfate solution:

$$Cu^{2+} + 2e^- \rightarrow Cu$$

The over-all chemical reaction may be expressed as

$$Zn + Cu^{2+} \rightarrow Zn^{2+} + Cu$$

To offset the resulting loss in dissolved copper, and so to ensure maximum capacity, an excess of copper sulfate crystals is usually placed in the bottom of the container when the cell is assembled.

The Daniell cell has an open-circuit voltage of about 1.08 v. and, since it shows no marked polarization at moderate current drains, it gives a steady operating voltage. However, internal resistance in the standard construction is relatively great, and large current drains cannot readily be obtained; zinc corrosion is high, even when the cell is idle. Consequently, the cell, formerly much used for telegraph and similar applications, was largely superseded by other types; *e.g.,* the Lalande and air-depolarized batteries.

As early as 1801 it was observed that amalgamating the electrodes (*i.e.,* coating them with mercury) helped reduce wasteful corrosion of electrodes when batteries were not in use and thus improved their shelf life.

Oxidizing agents, or "depolarizers," were first used in 1839; their purpose is to prevent polarization at the cathode due to accumulation of hydrogen. Sir William R. Grove (1839) developed a two-fluid cell consisting of amalgamated zinc immersed in dilute (8%) sulfuric acid, the latter separated by a porous pot from a strong nitric acid solution containing a platinum cathode. The substitution, generally credited to Robert Wilhelm Bunsen, of cheap retort carbon for platinum contributed in large measure to the general acceptance of this cell. The over-all reaction

$$Zn + 2HNO_3 + H_2SO_4 \rightarrow ZnSO_4 + 2NO_2 + 2H_2O$$

involved reduction of nitric acid and placing zinc into solution, the cathode remaining unaffected, as in the Volta pile. The cell had a high initial voltage of 1.8–1.95, depending on the acid strength, and it was capable of delivering heavy currents at sustained voltages.

Dichromate Cell.—Further advance was effected by substituting chromic acid for nitric acid in the Grove-Bunsen cell. The diaphragm was commonly omitted and only a single solution was employed; the solution consisted of potassium dichromate, or the less expensive sodium salt, dissolved in sulfuric acid. On discharge, zinc dissolved anodically while dichromate was reduced, the cell reaction proceeding in accordance with the equation:

$$3Zn + 7H_2SO_4 + Na_2Cr_2O_7 \rightarrow 3ZnSO_4 + Na_2SO_4 + Cr_2(SO_4)_3 + 7H_2O.$$

The cell had a voltage of 2; it showed exceptionally low operating cost; and although it lacked the steady-drain characteristics of the Grove-Bunsen element, it was well adapted to the delivery of comparatively high currents for limited periods of time.

The introduction at the cathode of solid cathodic materials, such as manganese dioxide (MnO_2) and lead dioxide (PbO_2), by August Arthur de la Rive in 1856 marked an important forward step in primary battery development. Such solid materials may be substantially insoluble in electrolyte, so that there is little of the tendency characteristic of liquid cathodic material to migrate toward the zinc anode and accelerate corrosion of the latter when

the cell is not in use. Consequently, the need for two-fluid and diaphragm cells was eliminated. construction was simplified and the modern cell of good keeping quality was made possible.

Storage Batteries. — The idea of using a chemical reaction to store electrical energy dates back to the early experiments with electricity. If two platinum plates were used to pass an electric current through sulfuric acid solution for a short time and the current was interrupted, it was found that the platinum plates could then supply a small electrical current. The current was thought to result from a chemical reaction occurring on the surface of the platinum and mas described by the term "polarization." The current so available was too small to be of practical use, and the phenomenon was merely an electrochemical curiosity.

It was observed that the electrical current resulting from polarization was much greater when lead plates were used for the electrolysis. This observation was put to a practical use in 1859 by Planté, who rolled up two long strips of sheet lead separated by pieces of flannel and immersed the assembly in dilute sulfuric acid. This cell, after a short charge. could produce a moderate amount of current. The current available was increased to a useful value by giving the cell alternate charge and discharge. A modification of this type of battery is still in use today. The method of separation was improved to obtain materials of greater resistance to acid. and the principle (namely, the use of metallic lead with a large area) was developed to provide batteries that are useful principally for stationary service.

In 1881 Camille Faure devised a battery that required less lead and is the basis for the modern automobile battery. Instead of a thick sheet of lead, a latticework, or grid. of lead is used; and, instead of producing the active material by corroding the lead support. a paste of lead oxide is applied to the grid and is converted by an electric current to a material of high activity and relatively low weight.

Both the Planté and the Faure batteries had one serious disadvantage. When the battery was charged and discharged frequently, small particles of the active material of the positive plate fell to the bottom of the cell. This loss of active material reduced the capacity of the battery, and sediment built up until the cell was no longer usable.

The search for methods of preventing this trouble resulted in two types of construction, the Ironclad and the Kathanode. Both these batteries feature a barrier that holds the positive active material in place and has thereby increased life of the batteries to a point where they are practical and economical sources of motive power.

An entirely different line of attack was used about 1900 by Edison, who made a survey of all possible chemical systems that might be used in a storage battery and concluded that the combination of an alkaline electrolyte, an iron negative plate and a nickel oxide positive plate had considerable merit. He developed a practical battery using this system.

The nickel-cadmium battery was developed about the same time. Jungner, working in Sweden, found that cadmium could he used in the negative plate. The construction of this battery was similar to Edison's, and it, too, was found to be useful for certain applications.

PRIMARY CELLS

A number of types of primary cells are now in use. These may be classified as (1) dry; (2) wet; **(3)** solid electrolyte; (4) reserve; (5) fuel;,and (6) standard cells (to be discussed under *Cells* JOY *Measurement*).

Dry Cells. — These cells are not dry but contain an aqueous electrolyte that is unspillable or immobilized. Many of these cells are sealed to avoid seepage of the electrolyte or reaction products. In the early 1960s two types of dry cells were produced in large quantities. the Leclanchit cells and the mercury cells. Another type produced in smaller quantities was the alkaline zinc-manganese dioxide cell. Much research has been done on developing more suitable systems. Among the proposed systems studied are the Leclanchit type of cell in which magnesium anodes are used in place of zinc, and air-depolarized cells in which atmospheric oxygen is used as the electron acceptor material at the cathode.

TABLE II.—*Chemical Composition and Performance Characteristics of Various Dry Cells*

Type	Cell components: Anode	Cell components: Electrolyte	Cell components: Cathode	Energy-producing reaction	Open circuit voltage (v.)	Average voltage* (v.)
Commercial cells						
Leclanché	Zn	$NH_4Cl - ZnCl_2$	MnO_2	$Zn + 2MnO_2 \rightarrow ZnO.Mn_2O_3$†	1.5–1.65	1.25
zinc-mercuric oxide	Zn	KOH	HgO	$Zn + HgO \rightarrow Hg + ZnO$	1.34	1.30
Alkaline zinc-manganese dioxide	Zn	NaOH	MnO_2	$Zn + 2MnO_2 \rightarrow Mn_2O_3 + ZnO$	1.52	1.15
New cell developments						
Magnesium-manganese dioxide	Mg	$MgBr_2$	MnO_2	$Mg + H_2O + 2MnO_2 \rightarrow Mn_2O_3 + Mg(OH)_2$	1.8–2.0	1.4–1.5
Magnesium-bismuth oxide	Mg	$MgBr_2$	Bi_2O_3	$3Mg + 3H_2O + Bi_2O_3 \rightarrow 2Bi + 3Mg(OH)_2$	1.6	1.03
Air	Zn	NaOH	O_2(Air)	$Zn + \frac{1}{2}O_2 \rightarrow ZnO$	1.4–1.5	1.2–1.3
Indium	In	KOH	HgO	$2In + 3HgO \rightarrow 3Hg + In_2O_3$	1.15	1.05
Aluminum	Al	$AlCl_3 - (NH_4)_2Cr_2O_7$	MnO_2	$2Al + 3H_2O + 6MnO_2 \rightarrow 3Mn_2O_3 + 2Al(OH)_3$	1.7	1.3

Source: Morehouse, Glicksman and Lozier, *Proceedings of the* IRE, pp. 1462–83 (Aug. 1958).

The characteristics of several cell systems are given in Table II.

Leclanché Cells. — This type of cell was described in 1868, but the description came after several thousand of the cells had been in use in railroad signal systems and telegraph lines for several years. Approximately 90% of the dry cells produced annually in the United States are of this type.

The original type made by Leclanché contained a spillable electrolyte of ammonium chloride solution with zinc as the anode and manganese dioxide as the cathode. This same electrochemical couple was used later with an immobilized electrolyte. More than 2,000,000,000 of these cells were made each year in the early 1960s. Probably the best-known Leclanché dry cell is the cylindrical type commonly used in flashlights; a cross section of such a cell is shown in fig. 4. In this cell the amalgamate zinc can serve as both the container and the anode. The cathode is formed from a mixture of manganese dioxide and graphite to make a conductive medium. This mixture is packed around a graphite rod that serves as a chemically inert electrode and through which electrons can flow to the manganese dioxide which captures the electrons from the external circuit; as a result of the capture, manganese is reduced from a 4+ to a 3+ oxidation state.

The manganese dioxide may be naturally occurring ore or synthetic material. One of the best of the natural ores occurs in Ghana. Synthetic manganese dioxide for battery use may be made by either electrolytic or chemical oxidation of manganese. Usually a mixture of about 1 part of carbon black to 8 parts of manganese dioxide is used for the positive electrode material.

The electrolyte containsmainly ammonium chloride and zinc chloride. To this is usually added a small amount of mercuric chloride ($HgCl_2$), which amalgamates with the zinc and reduces local cell action; potassium dichromate ($K_2Cr_2O_7$) is often added to inhibit the corrosion of the zinc

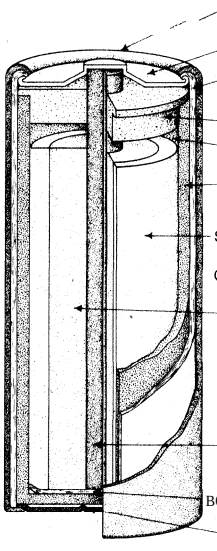

FIG. 4.— DRYCELL CONSTRUCTION

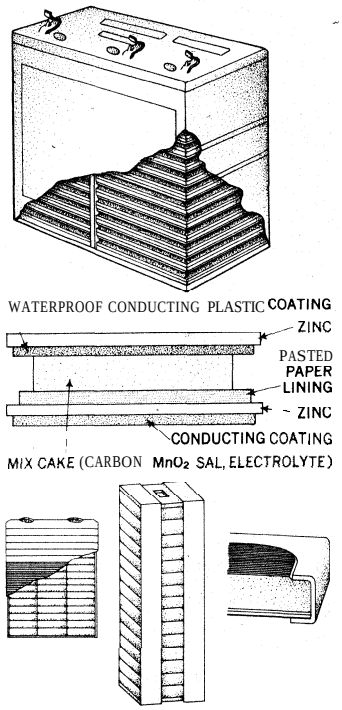

FIG. 5.—(ABOVE) CONSTRUCTION OF FLAT-TYPE B BATTERY; (BELOW) IMPROVED FLAT-TYPE B BATTERY CONSTRUCTION. "MINI-MAX"

and to give longer shelf life.

An "inside-out" cell is also constructed in which the zinc anode is at the centre of the cell. This type is claimed to give better utilization of the zinc.

A second type of construction is the flat cell type or the layer built type, which has been designed primarily for high voltage cells (fig. 5[a] and 5[b]).

The *Zinc-Mercuric* Oxide Cells.—This type of cell was suggested in 1884 hut was not developed for practical commercial use until the early 1940s. This cell (fig. 6) contains an amalgamated zinc anode, a mixture of mercuric oxide with about 5% graphite as the cathode and an approximately 45% solution of potassium hydroxide as the electrolyte. The cell gives about 1.34 v.

An advantage of this cell is a more constant voltage during the life of the cell as compared with the Leclanché cell; a disadvantage is the cost of the mercuric oxide as compared with the cost of manganese dioxide, which is in the ratio of about 100 to 1.

Mercury batteries are used in both civilian and military applications, including hearing aids, portable radios, communication equipment and scientific apparatus.

The *Zinc-Manganese* Dioxide-Sodium Hydroxide Cell.—The cell is similar in construction to the mercury cell (fig. 6). Its capacity is not as high as the mercury cell, but the cost is less. It gives an open circuit voltage of 1.52 v.

Miscellaneous Dry Cells.—Air dry cells, sometimes called air-depolarized cells, use molecular oxygen of the air absorbed on porous carbon as the cathode material to accept electrons. The anode is zinc and the electrolyte is sodium hydroxide. The disadvantage of these cells is that they dry out after long periods of operation. However, the wet type of air cell is quite satisfactory.

Magnesium dry cells have been investigated as replacements for the present Leclanché cells and appear very promising. Cells using magnesium anodes and manganese dioxide cathodes give 2 v. and'in many cases have better capacity characteristics than Leclanché cells. Other research in the early 1960s also indicated it might be possible to replace manganese dioxide in magnesium cells with organic cathodic materials.

Other dry cells using .aluminum-manganese dioxide and indium-mercuric oxide showed some promise in the early 1960s.

Wet Cells.—Primary cells containing free and mobile electrolyte are used when service requirements include a large capacity, moderately high currents and long life. Examples of uses with such requirements are telephone and telegraph circuits, and signal systems for marine, mine, highway and railway use. Examples of these cells are the Lalande cell of zinc-copper oxide-sodium hydroxide devised by Felix Lalande about 1880 and the zinc-air-sodium hydroxide cell.

FIG. 6.—ZINC-MERCURIC OXIDE CELL OR MERCURY BATTERY

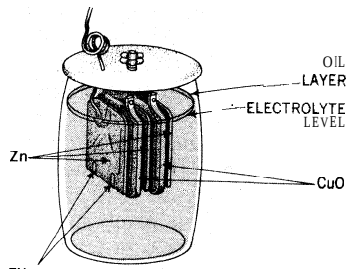

FIG. 7.—LALANDE (COPPER-OXIDE) CELL. AGGLOMERATED PLATE TYPE

Lalande cells (fig. 7) are designed in general to meet the following specifications:

Capacity	500–1,000 amp.hr.
Voltage and current	0.5–0.7 v. up to 15 amp.

The air cells can he used to replace Lalande cells; they differ from the Lalande cells in that a porous carbon electrode to absorb air-oxygen replaces the carbon electrode inserted in a mass of copper oxide. They are designed to give continuous current as high as 2 amp. and 1.1 to 1.2 v. The type used for railroad signal systems is shown in fig. 8.

FIG. 8.—AIR CELL BATTERY. RAILWAY TYPE

Solid Electrolyte Cells.—Cells used where a low current drain (in order of microamperes) is required may be constructed with a solid electrolyte. An example of such a cell is the silver-silver iodide-iodine cell. The silver iodide is an ionic conductor. This cell has an open circuit voltage of 0.69 and a peak current of 20

Solid electrolyte cells give long shelf lives of 10 to 20 years. Hence they are suitable for long-term operations that require very low drain or for stand-by services. An example of a commercial solid electrolyte cell is a silver-silver bromide-copper bromide cell that is about $\frac{1}{2} \times 1$ in. over-all, weight 0.15 oz., produces 95 v., contains an available charge of 1 coulomb and produces a flash current of 8 μamp.

Solid electrolyte cells are also constructed by encasing the electrolyte in a solid wax. One such cell contains a zinc anode, a manganese dioxide cathode and an electrolyte of zinc chloride dissolved in a solid wax of polyethylene glycol.

Reserve Type Cells.—Primary cells sometimes referred to as "one-shot" or "delayed action" batteries are those that are assembled in an inactive state (usually without the electrolyte), then activated just before use. Two examples are the water-activated magnesium-silver chloride cell and the magnesium-cuprous chloride cell. The dry-charged lead-acid battery employs the same principle in the storage battery class of batteries. Reserve type primary cells are packaged in hermetically sealed containers and stored dry in the inactive state. Hence, they have a long shelf life. They find numerous uses, among them air-sea rescue equipment, radiosonde equipment and emergency lighting.

Another type of reserve cell is the zinc-bivalent silver oxide (AgO) cell, which is stored dry and activated with potassium hydroxide. This is primarily for military operations and is used when high watt-hour capacities per unit weight are required. The main problem with this type of cell is to devise a method for activating it quickly with the electrolyte and to minimize the time lag between activation and the moment of maximum operating voltage.

There are several other systems for reserve type cells such as a zinc (or cadmium or lead) anode with lead dioxide cathode and sulfuric acid electrolyte, the gas activated type that may be represented by the zinc-chlorine gas type using ammonium chloride solutions as the electrolyte, or the heat-activated (thermal) cell. which contains an electrolyte that is a nonconductive solid at room temperature but becomes a conductive liquid as it is melted.

Fuel Cells.—Much interest was given in the early 1960s to the problem of finding a method for converting the energy in fuel directly to electrical energy. The challenge to the scientist is that the theoretical thermodynamic efficiency of using fuel to produce electricity directly in a fuel cell is two or three times greater than that of using the fuel to heat a boiler to run a turbine and a generator (Table III). In 1839 Grove demonstrated the first fuel cell. In later years many types of electrochemical couples were explored for fuel cell use.

TABLE III.—*Efficiency of Energy Conversion by Several Processes*

Energy source	Conversion processes	Efficiency (%)
Chemical	electrochemical	90.0
Chemical, nuclear, or solar	heat → mechanical (*e.g.*, steam-turbine)	40.0
Chemical nuclear, or solar	hrat → tbermionic	8.0
Chemical: nuclear, or solar	heat → thermoelectric	7.0
Solar	P-N junction	12.0
Nuclear	β-current	1.0
Nuclear	contact potential	0.01

Source: Morehouse, Glicksman, and Lozier, Proceedings *of the* IRE, pp. 1462–83 (Aug. 1958).

The simplest fuel cell might be described as one that is similar to the air-depolarized Leclanché cell but with the zinc anode replaced by a graphite anode (which is the fuel). In such a cell the carbon would be the electron-releasing electrode and the oxygen (from the air) the electron-accepting electrode material. The over-all reaction would be

$$C + O_2 \rightarrow CO_2$$

The electrolyte can be an acidic or a basic solution. However, this cell is not usable at room temperature because the reaction is very slow and only a very low current can be obtained. These cells have been investigated at high temperatures (600°–800° C.) using molten electrolytes, but the thermodynamic efficiency is considerably reduced and problems of cell construction become very difficult to solve. This cell gives about 0.8 v. with a current density of 55 ma. per square centimeter.

The three fuels that probably have received the most attention are hydrogen gas, carbon monoxide gas and the hydrocarbons. One of the major problems of such a cell is the slow rate of reaction at the electrodes. This can be improved considerably by impregnating the electrodes with a catalyst. The rate can also be increased by operating the cell at elevated temperatures. Many modifications of these cells have been devised. Fig. 9 shows a unique type using ion-exchange material that serves as a solid electrolyte for the hydrogen-oxygen type of cell.

Many uses may be found for fuel cells. One of the important potential large-scale uses is that of replacement for army field generators.

FIG. 9.— HYDROGEN-OXYGEN FUEL CELL WITH ION-EXCHANGE SOLID ELECTROLYTE

STORAGE CELLS

Electrochemical cells that can be discharged and then recharged to their original state are called secondary or storage cells, or accumulators. The charging process is the reverse of the discharge process, hence the electrode reactions in these cells must be reversible.

The main types of secondary batteries produced commercially are listed in Tables IV and V with some pertinent data.

The Lead-Acid Battery.—The most used of all types of storage batteries in the early 1960s was the lead-acid type. More than 30,000,000 lead-acid batteries were made each year for automobile and truck use alone, and perhaps 500,000 tons of lead were used for these batteries, representing the greatest single use of lead.

Lead-acid batteries are made in many shapes and sizes, depending on the intended use; they are usually classified as automotive (fig. 10), motive and stationary. The automotive type is made in the greatest number.

Chemical Reactions.—The active constituents of a lead-acid cell are sulfuric acid, a set of plates containing lead and another set of plates containing lead dioxide. On discharge the lead atoms of the lead plates give up electrons and form lead ions, which in turn form lead sulfate:

$$Pb \rightarrow Pb^{2+} + 2e^-$$
$$Pb^{2+} + SO_4^{2-} \rightarrow PbSO_4$$

Since a faraday of electricity is 96,500 coulombs or the flow of 6.02×10^{23} electrons, and since an ampere is a coulomb per second and two electrons are released for every lead atom that reacts, then 103.61 g. of lead and 49 g. of sulfuric acid are required to produce 96,500 ampere-seconds of electric current. The reactions at the lead dioxide plate are:

$$PbO_2 + 4H^+ + 2e^- \rightarrow Pb^{2+} + 2H_2O$$
$$Pb^{2+} + SO_4^{2-} \rightarrow PbSO_4$$

Hence the production of 96,500 ampere-seconds of current also re-

TABLE V.—*Typical* Applications and Performance Characteristics of Various Secondary Batteries

Type	Application	Life characteristics		Charge retention
		Cycle service life	Float charging life	
Lead-acid				
Automotive	high currents for a few seconds or minutes; *e.g.*, engine cranking	250–400 c.	up to 4 years in automotive service with good care	20% to 30% drop per month
Motive	discharge rate of 3 to 10 hours with nearly complete discharge: electric trucks, air conditioning and lighting of railroad cars	3–6 years	...	...
Stationary	designed for long service life, in particular on float type charging: emergency power, railway signals, telephone exchanges			
Lead-antimony grid		6–8 years	14 years	30% drop per month
Lead-calcium grid		not determined	25 years (est.)	6% drop per month
Planté positive		10–14 years	25 years	...
Low discharge	specially designed stationary for low discharge rates and low self-discharge rates: recording, warning and control devices; industrial and laboratory instruments	10–20 c. with 6 months to a year between cycles	20 years	15% drop per year
Electrolyte retaining	designed to have nonspillable electrolyte for portable high-rate power in place of dry cells: radio, photographic flash units, guided missiles	200–300 c.	...	30% drop per month
Kickel-iron (Edison)	heavy duty industrial and railway applications	1,800 c.	1–12 years heavy industrial; 14–25 years standby	25% to 35% drop per month
Nickel-cadmium				
Pocket plate	general purpose cell with wide applicability where mechanical and electrical abuse and long life are important factors	as good as sintered plate if not better	25 years	20% to 40% drop per year
Sintered plate	high rate and low temperature	several thousand cycles*	20–25 years (est.)	less than 50% drop per year
Zinc-silver oxide				
High rate	discharge rates of 1 minute to 30 minutes	10–20 c. over 3–6 months	...	...
Medium rate	discharge rates of 30 minutes to 5 hours	40–50 c. over 6–9 months	...	20% to 30% drop per year
Low rate (1 hr. and over)	discharge rates over 1 hour	150 c. over a year; 300 c. with special construction	...	...
Cadmium-silver oxide	low-rate and long-life applications	600–700 c., 3,000 c. on a 40% discharge	estimated to be good	estimated to be as good as zinc-silver oxide

*One manufacturer claims 5,000 c.

quires 119.5 g. of lead dioxide and a second 49 g. of sulfuric acid.

The discharge stops before all the materials are consumed, usually when the acid can no longer reach the active materials. When this occurs the cell voltage drops to a very low value.

Since the discharge consumes sulfuric acid, the state of charge of the battery can be measured by measuring the strength of the acid. This is done with a hydrometer. The acid of a fully charged battery will usually have a specific gravity of approximately 1.250; *i.e.*, the acid is 1.280 times as heavy as an equal volume of pure water. Partly discharged automobile batteries will show the following specific gravities for the corresponding percentages of charge: 1.250, 75%; 1.180, 50%; 1.130, 25%; and 1.080, 0%.

Charging a Battery.—Charging a lead-acid battery reverses the chemical changes, displaces the sulfate from the plates and causes a rise in the specific gravity of the acid.

In general, a battery may be charged at a high rate without harm as long as the gas evolution is not excessive and the temperature does not rise above 120° F. for a prolonged period. When a battery is being overcharged only a portion of the energy is used to charge the battery; the remainder is used to decompose water. About half of the electric energy put into the battery during this overcharge period is converted to heat, and the battery temperature rises rapidly. The main gases (hydrogen and oxygen) evolved are explosive, and other gases sometimes released are poisonous. Battery rooms must therefore be adequately ventilated.

FIG. 10.—CONSTRUCTION OF AUTOMOBILE BATTERY

Manufacture.—The manufacture of a storage battery begins with the casting of the grid on the plates. The purpose of this grid is to support the active material and conduct current to the cell terminals. The grid in most batteries is cast from a high-purity lead alloyed with approximately 5% to 12% antimony, 0.5% tin and a few hundredths per cent of copper and arsenic. Antimony makes the grid hard; lead will resist continued attack by sulfuric acid under storage battery conditions.

The grid is converted to a plate by filling it with active material in the form of a stiff paste that is made by mixing lead oxide with water and sulfuric acid in the proper amounts.

When making negative plates, the oxide is blended with about 1% of "expander" to provide better capacity. The expander is a mixture of barium sulfate, carbon black and an organic material usually derived from lignin. For positive plates no expander is used, but in other respects the paste and manufacturing operations are the same as with the negative plates.

After the plates have been pasted, dried and assembled, they are immersed in weak sulfuric acid and charged. This converts the paste to sponge lead in the negative plate and to lead dioxide in the positive plate.

The positive and negative plates are kept from direct electrical contact by an insulator called a separator, which is porous enough to retain sulfuric acid and allow electric current to flow between the plates when carried by the sulfuric acid. Separators are made of wood, microporous threaded rubber, plastic or glass fibres.

Battery manufacturers in the 1940s began a practice of constructing a battery, charging it, removing the electrolyte, then sealing the battery hermetically to prevent deterioration until it is ready to be put into use. Such a battery is called a dry-charged battery. This practice extends battery life, which actually begins when the acid is added.

The storage battery is quite sensitive to small amounts of some impurities. The lead used in making oxide is of a high purity and contains at least 99.95% lead, the chief impurity being bismuth with traces only of silver, copper and nickel.

The acid used for batteries is also of high purity, containing a few hundredths of a per cent, at most: of iron. The water used for filling the battery is normally specified as distilled water. Chlorides, iron or manganese are all seriously harmful to battery life at concentrations that in some cases appear extremely minute. Manganese can be tolerated in amounts up to 0.00005% of the weight of positive active material, and this amount is occasionally

introduced from water. Chlorides are harmful if present at concentrations of 0.01% or higher; the problem of chlorides is more important in shipboard than in automotive operation of batteries.

Copper from electrical wire occasionally finds its way into the cell, where it deposits on the negative plate and promotes hydrogen evolution. The amount tolerated is less than 0.01%.

Pure sulfuric acid diluted with pure water is the only electrolyte generally accepted for use in lead type storage batteries. For years, however, promoters have sold battery additives that they allege have a secret composition, will remove sulfation. increase capacity. increase cranking ability, reduce operating temperature, prolong battery life and sometimes even rejuvenate worn-out batteries.

The battery additives most frequently consist of a mixture of magnesium sulfate and sodium sulfate. From results of tests on these materials it is usually concluded that they are of little value.

Motive Power Batteries.—A second major class of storage battery is used for motive power to operate electric trucks, mine locomotives, switch engines and the air conditioning and lighting systems of railway cars. These batteries are required to supply power for 3 to 10 hours instead of the few seconds needed to crank an automobile engine. They are designed to withstand frequent deep discharges instead of remaining almost fully charged. The initial cost, which is about three times that of a comparable automobile battery, is not nearly so important as a low cost per year of operation. Finally, the weight and volume, while limited, are not nearly so critical as in the automobile battery. These considerations dictate a construction quite different from that of the automobile battery.

The most important difference is that the positive plates are armoured or protected to prevent the loss of active material that would otherwise occur in batteries that are alternately charged and discharged.

The second difference is that the plates are made thicker, with thicker grid members, to withstand grid corrosion. Finally, because of the large size of the cells, they are usually assembled in thin-walled rubber jars that are then collected in sturdy steel trays. These trays may contain units ranging in capacity and size from a 12-v., 225-amp.hr. battery to special, custom-built units weighing many tons and with capacities as great as 1,000 amp.hr.

Stationary Batteries.—A third major class of storage battery is described by the term "stationary batteries." These are batteries that are used to supply stand-by emergency power for places where the cessation of electric service would be disastrous. as for example, in hospital operating rooms. naval vessels, telephone exchanges. railway signal systems, municipal fire alarm systems and burglar alarms for bank vaults.

Different requirements for stationary service lead to construction features that are different from both automobile and motive power batteries. The chief difference results from the facts that in the stationary battery weight and volume are less important while long life is more important. The plates are usually heavier, the acid volume is increased considerably and the acid specific gravity is reduced. The insulation between the plates may be either single, double or triple.

One class of stationary batteries has plates practically identical with those of motive power batteries. A second kind, the Planté type, uses antimony-free lead sheets whose surfaces are grooved to increase battery output. The Tudor battery is a modification of the Planté type; instead of grooved flat sheets of lead it uses pure lead castings with surfaces as large as practical.

The Manchester battery is another type of stationary battery. A framework of antimonial lead is cast with large, round holes. These holes are filled with rosettes made from corrugated lead tape wound in a spiral and pressed into the holes.

In about 1935 it was suggested that an alloy of lead and calcium might be a suitable material for storage battery grids. The advantages of such an alloy in battery grids are (1) low hydrogen evolution rate; (2) very low water requirement; and (3) very low floating charge current. (The floating charge is the charge that must be applied continuously to keep the battery fully charged.)

FIG. 11.—EDISON CELL

Experimental batteries of this construction have been in use long enough to indicate that they are a practical and important type of battery with a life considerably longer than that of any previous pasted plate type. This battery was developed by the Bell Telephone laboratories and was installed in telephone exchanges throughout the United States. It was believed suitable for stationary use only.

Stationary batteries are expected to have a long life because of the almost ideal conditions under which they are operated.

The Edison Battery.—Edison, after 10 years of research starting in 1898. developed an alkaline cell that uses iron as the anodic material, nickelic oxide (Ni_2O_3) as the cathodic material and potassium hydroxide as the electrolyte. The construction is shown in fig. 11. On discharge the iron atoms lose electrons, forming iron ions (Fe^{2+}), which in turn react with hydroxyl ions to form $Fe(OH)_2$ or FeO. At the cathode the nickel in the 3+ oxidation state picks up electrons to form nickel in the 2+ state—$Ni(OH)_2$ or NiO.

The voltage of these batteries varies with degree of charge but in general varies from 1 to 1.35 v. The degree of charge is determined by measuring the voltage.

These batteries are used widely in industrial and railroad applications that involve heavy-duty use. A disadvantage of these batteries is their drop in voltage at high current drain, which makes them undesirable for automotive applications. However, these batteries may be overcharged or they may remain uncharged for long periods of time; furthermore, they can be operated at higher temperatures and they have a longer life than do lead-acid batteries. However, they are more expensive, have a poorer temperature coefficient and do not retain a charge as well as lead-acid batteries.

The Nickel-Cadmium Battery.—At the same time Edison was working on his cell, Jungner and Berg were developing the nickel-cadmium cell (1893–1909). This cell is similar to the Edison cell except that cadmium replaces iron as the anodic material. The resulting advantages are: (1) a reduction in the rate of self-discharge; (2) better performance at low temperatures; and (3) ability to be trickle charged. The voltage is only slightly lower than the Edison battery. In general two types of the nickel-cadmium cell are in use, the pocket type and the sintered-plate type. For some purposes nickel-cadmium batteries may be hermetically sealed.

Other Types of Secondary Cells.—Other types of secondary batteries are the zinc-silver (II) oxide-alkali battery and the cadmium-silver (II) oxide battery, which furnish higher currents or much greater watt-hour capacity than other types of secondary cells. Their use is determined by requirements.

CELLS FOR MEASUREMENT

An important use of cells is that of making certain special or unique types of measurements in the control or research laboratory. The hydrogen electrode, the calomel (mercurous chloride) electrode, the glass electrode and the standard cell are examples of cells and electrodes used for such purposes. In fig. 12 is shown

a type of hydrogen electrode. The hydrogen gas is adsorbed on the platinum. The system then acts as though the electrode were made of hydrogen and the platinum the inert electrode. The half reaction is

$$H_2 \rightarrow 2H^+ + 2e^-$$

In fig 13 is shown a calomel electrode, made of mercurous chloride-mercury, and a solution of potassium chloride. The half reaction is

$$2e^- + Hg_2Cl_2 \rightarrow 2Hg + 2Cl^-$$

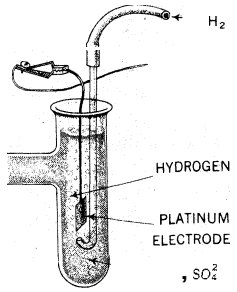

FIG. 12.— HYDROGEN ELECTRODE FOR STANDARD LABORATORY MEASUREMENTS

Both the hydrogen electrode and calomel electrode are used as reference electrodes to couple with other electrodes in making exact measurements.

For very accurate measurements a standard cell is used to calibrate the voltage measuring devices. The Weston standard cell has been used for this purpose. Calibrated cells are kept at the national bureau of standards and are used for standardization purposes.

The glass electrode (fig. 14) is another useful electrode used mainly by control laboratories in measuring pH (acidity or alkalinity) values of solutions. The principle of the operation is as follows. if two solutions of different acidity are separated by a thin glass membrane, a difference in potential exists. This potential can be measured with the aid of a second electrode (usually a calomel electrode is used). These electrodes are frequently built into a compact pH measuring unit with a simple electronic circuit to serve as a voltage measuring apparatus. The scale on the meter is calibrated in pH units rather than volts, and thus the pH of the solution can be determined directly. In the research laboratary the voltage of electrochemical couples has been used for many years as a direct measure of the driving force of chemical reactions and hence is a fundamental thermodynamic measurement. From such data the thermodynamic free energy (available work) of a process can be calculated through the relationship

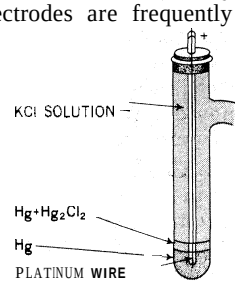

FIG. 13.— CALOMEL ELECTRODE

$$\Delta U = -nF(\text{emf})$$

where ΔU is the change in the free energy, n is the number of chemical equivalents in the reaction, F is 96,500 coulombs and emf (electromotive force) is the voltage of the cell (the electrochemical couple).

From such a calculation it is possible to determine another important thermodynamic quantity — the equilibrium constant for the reaction — through the relationship

$$\Delta U = -RT(\ln K)$$

where R is a constant, T is the absolute temperature and $\ln K$ is the natural logarithm of the equilibrium constant.

Also if the voltage of a cell is determined at two or more temperatures the heat of the reaction (AH) can be calculated from a well-known equation in thermodynamics known as the Gibbs-Helmholtz equation. (See THERMOCHEMISTRY: The Gibbs-Helmholtz Equation.)

Once the values of ΔU and ΔH have been determined, then the entropy change ΔS of the process can be computed through the relationship

$$AU = \Delta H - T\Delta S$$

Hence we find that a very powerful tool in fundamental science is the electrochemical couple (or cell), which can be devised for any oxidation-reduction process to provide thermodynamic data on chemical processes.

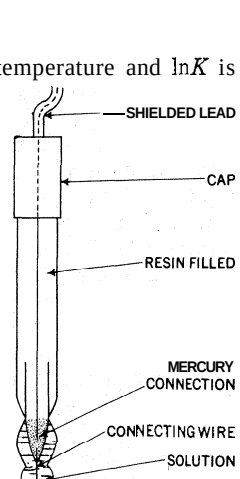

FIG. 14.— GLASS ELECTRODE

THE SOLAR BATTERY

The problem of how to trap and make use of solar energy has been approached through several different methods. One of the most successful is the Bell solar battery. The principle of operation of this cell depends upon the use of a combination of two materials, or electrodes, one of which has a deficiency of electrons (electron holes) in the structures of the atoms (called a P electrode) while the other has an excess of electrons over those needed for a simple 4-electron-pair-bonded structure (called an N electrode). The combination of these two electrodes is called a P-N junction. The energy of sunlight is sufficient to dislodge these extra electrons and cause them to go through the external circuit to the electron-deficient electrode. Such a cell is about 12% efficient in converting sunlight into electrical energy; it gives about 0.4 v. on open circuit voltage and about 40 ma. per square centimetre on electrode area. Cells of this type have a very long life and are among the most promising solar converters devised up to the early 1960s. One of their important uses is to power electronic circuits in artificial satellites.

NUCLEAR BATTERIES

Conversion of nuclear energy directly into electrical energy can be done with a nuclear battery. No highly efficient nuclear battery had been produced by the early 1960s, but a number of designs had been proposed. One of the cells used for industrial purposes was the @-current type. In this cell the @-particles (electrons) emitted by a radioactive source (Strontium-90 is an ideal source) are caught on the collector and discharged to the external circuit. The voltage of such a cell is high (up to 10,000) but the current is very low, being in the order of 50 $\mu\mu$amp.

Another design, the thermojunction type, utilizes the heat produced by the nuclear changes in the radioactive substance. This heat is absorbed on a sensitive thermocouple. Another type, the contact potential-difference cell, contains two electrodes; from one of the electrodes electrons can be driven off readily by the radiations of a radioactive substance; the other electrode is relatively insensitive to these radiations but can collect the electrons from the other electrode.

(A. B. GA.)

BATTERY, MILITARY. This term denotes either a group of guns, rockets, guided missiles, or other weapons in position under a single tactical commander, or a tactical and administrative unit of the artillery branch. In the U.S. army an artillery battery corresponds in size to a company of the infantry. The corresponding organization in the British artillery is called a troop. Battery, in the British service, denotes a larger unit of battalion size; it is made up of several troops, and two or more batteries comprise an artillery regiment. In naval usage, the term battery applies to two or more guns of the same calibre controlled as a unit. Guns of the largest calibre are known as the main battery; smaller weapons are referred to as the secondary battery if employed against surface targets or as the antiaircraft battery if used against aircraft. Battery also refers to the ready-to-fire position of an artillery piece or naval gun. See also ARTILLERY; GUNNERY, NAVAL.

(H. C. T.)

BATTICALOA, a town and administrative district on the east coast of Ceylon. The town is situated on an island 69 mi. S. of Trincomalee. The population of the town was 17,439 and of the district 270,722, in 1953. Area of district 2,792 sq.mi. Batticaloa was formerly of importance as a port, but this is now used only by local sailing boats. In addition to its function as the administrative capital of the district, it is the railhead of a branch of the Ceylon government railway. Through it pass the coconuts and paddy that are the traditional produce of the district, but it also handles traffic to and from the area of more

than 100,000 ac. in the hinterland which is the care of the Gal Oya Development board. The face of the district as well as the functions of the town have been revolutionized by the board's activities, a part of the nationwide effort to make the economy more self-sufficient. The old Dutch fort of Batticaloa dates from 1682. (B. H. F.)

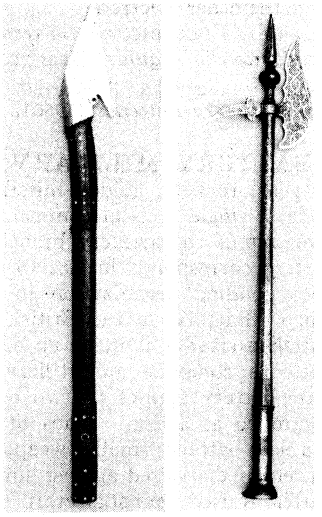
BATTISHILL, JONATHAN (1738–1801), English composer of church music and popular songs. Born in London in May 1738, he was a chorister at St. Paul's cathedral (1747), and later a harpsichordist at Covent Garden. In 1763 he married a singer at Covent Garden and wrote songs and choruses for plays. In 1764 he wrote songs for *Almena,* an opera produced at Drury Lane as the work of Battishill and Michael Arne. In the same year he became organist at St. Clement's and St. Martin's and wrote psalms and hymns, catches, glees and madrigals. After his wife's elopement in 1777, he declined and died, at Islington, Dec. 10, 1801.

See J. B. Trend, "Jonathan Battishill," in *Music and Letters,* vol. xiii (July 1932). (Cs. CH.)

BATTLE, a market town and parish in Sussex, Eng., 6 mi. N.W. of Hastings by road. Pop. (1961) 4,300. It was named after the battle in 1066, which ensured William, duke of Normandy, the crown of England. Before the battle, which took place on a ridge southeast of the town, William vowed to build an abbey on the spot if victorious, and in 1094 its church was consecrated, the altar standing where Harold fell. The great gateway, built in 1338, survives, but the church was pulled down and the abbey (now a girls' school) was converted into a mansion after the Reformation. The Battle Abbey roll, popularly supposed to have been a list of William's companions, was probably a list of family surnames. It seems to have been compiled in the 14th century; the original document may have been burned at Cowdray in 1793. The parish church, with its Elizabethan deanery of red brick, dates largely from the 12th century.

The battle site was called "Senlac," a French version used by Orderic Vitalis of a local name, but even in Domesday Book the battle is named after Hastings (*q.v.*).

BATTLE-AX, a cleaving weapon for hand-fighting. Its use as a weapon of war dates from the Bronze Age. According to Homer, Agamemnon was attacked by Peisander with such a weapon. In the 11th century the Danish battle-ax was a regular part of the equipment of fighting men in England and under the Statute of Winchester of 1285 certain classes were required to maintain these weapons. In the 14th century the classic example of its effective employment occurred when Robert the Bruce felled Sir Henry Bohun with a single blow the day before the battle of Bannockburn (June 23, 1314). It was sometimes the custom to secure the ax to the wrist by a chain to ensure its retention.



A B

BY COURTESY OF THE METROPOLITAN MUSEUM OF ART

TWO KINDS OF BATTLE-AXES (A) 15TH-CENTURY GERMAN POLEARM, (B) 16TH-CENTURY SAXON POLEARM

The oldest bodyguard of the English sovereigns, the Honourable Corps of Gentlemen-at-Arms, introduced battle-axes into its equipment in 1526 and for centuries all their duties were ordered to be carried out "with their axes" or "with their pole-axes." At the funeral of a sovereign the ax was carried in the left hand, reversed and draped.

The Swiss halbert of the middle ages was in effect a battle-ax with a steel head combining the cutting edge of an ax, the point of a spear and a hook for pulling a mounted opponent from his saddle. A long pole served as a handle. See HALBERT. (LN. Ms.)

BATTLE CREEK, a city of Calhoun county, Mich., U.S., 114 mi. W. of Detroit, at the confluence of Battle creek, from which it gets its name, with the Kalamazoo river. (For comparative population figures, see table in MICHIGAN: Population.)

A combat between two Indians and two land surveyors resulted in the name Battle Creek, that name being taken over, first informally and then officially, with the chartering of the village in 1850. The Western Health Reform institute, founded by the Seventh Day Adventists in 1866, became the Battle Creek sanitarium (renamed Battle Creek Health centre, 1959), under the direction of John Harvey Kellogg from 1876 to 1943. His pioneering in dietetics and experiments with grains motivated the manufacture of ready-to-eat cereals, which became the city's chief industry. Battle Creek's reputation as "the health city" was furthered in 1930 when the W. K. Kellogg foundation was established to improve the well-being of children. The foundation and city stimulated Programs primarily for youth, including the Ann J. Kellogg School for Special Education (1931), which integrates one-third of its students who are physically handicapped with two-thirds of its students from a regular school district; the Kellogg Community college (1956); and extensive parks and recreation facilities. Battle Creek exceeds all other places in the number of boys placed on All-American interscholastic swimming teams, and its baseball diamonds are used each year for the American Amateur Baseball congress finals. Besides cereals, manufactures include farm machinery, railroad and loading equipment, pumps, valves, cartons and packaging devices. Cultural groups include a civic theatre, art centre, chorus and symphony. Slum clearance and flood control are the city's most recent improvements.

Operational headquarters of the Office of Civil and Defense Mobilization, located in Battle Creek from 1954, was ordered moved to Washington, D.C., in 1961, but the staff college and training centre for civil defense personnel remained. (B. B. Lo.)

BATTLEDORE AND SHUTTLECOCK, a game played by two persons with small rackets, called battledores, made of parchment, plastic or rows of gut or nylon stretched across wooden frames, and shuttlecocks, made of a base of some light material, like cork, with trimmed feathers fixed round the top.

The object of the players is to bat the shuttlecock from one player to the other as many times as possible without allowing it to fall to the ground.

Ancient Greek drawings represent a game almost identical with battledore and shuttlecock, and it has been popular in China, Japan, India and Siam for at least 2,000 years. In Europe it has been played by children for centuries. A further development is badminton (*q.v.*).

BATTLEMENT, the parapet of a wall consisting of alternating low portions known as crenels or crenelles (hence crenelated walls with battlements) and high portions called merlons. Battlements were devised in order that warriors might be protected by the merlons and yet be able to discharge arrows or other missiles through the crenels. The battlement is an early development in military architecture; it is found in Chaldea, Egypt and prehistoric Greece as well as commonly in Roman fortifications. It was in the middle ages that the battlement received its highest development, crenels being narrowed and frequently given splayed sides, the merlons often having in the centre a thin slit sometimes cross shaped to give the widest possible arc for the discharge of missiles. The developed medieval battlement was frequently bracketed out from the face of the wall and holes in its floor were furnished to allow objects to be dropped directly downward upon attacking forces. In actual siege use the battlement was usually covered with a protecting shed of timber and hides. In the Saracen countries and in Italy, through eastern influence, the battlement frequently takes decorative shapes, and toward the end of the Gothic period, as the military necessity decreased, the battlement became merely decorative. A similar persistence of the battlement as a purely decorative form occurs in much late Gothic throughout Europe, especially in the Perpendicular work in England, when it is richly ornamented with tracery and frequently pierced as well. (T. F. H.)

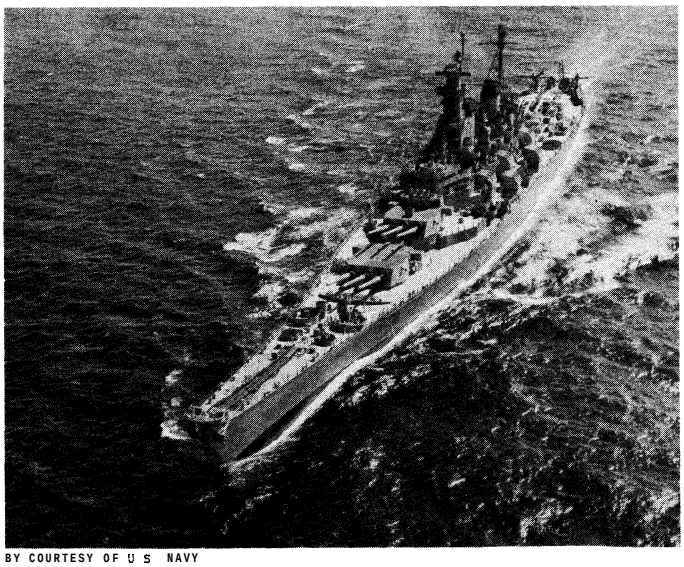
BATTLESHIP, the name for the type of warship which was

the capital ship of the navies of the world from about 1860 until 1943. Battleships were designed to combine large size, the most powerful guns, the best armour and underwater protection, fairly high speed and great cruising radius with general seaworthiness. Before the advent of aircraft carriers they were the largest fighting ships afloat, some displacing as much as 72,000 tons. In their ultimate development, battleships were able to hit targets with great precision at a range of about 22 nautical miles, and to absorb an astonishing amount of damage from enemy shells, bombs, torpedoes or mines while remaining afloat and continuing to fight. The type was superseded as the capital ship by the aircraft carrier because the carrier's planes could discharge their bombs against an enemy at a distance of about 300 nautical miles, as was done with considerable effect in the Pacific during World War II. *(See* AIRCRAFT CARRIER.)

After World War II no nation built or planned to build any new battleships, but the type had played such an important role in world history for nearly a century that interest in it continued. Many persons believed that the splendour and ingenuity combined in the design of battleships entitled them to be regarded among the most magnificent of man's creations. The battleships of the world's navies exhibited from year to year the highest development of shipbuilding skill. The naval architects who designed them spurred the industrial world to make constant improvements in steel and other metals and themselves made important advances in marine engineering and applied electronics.

For the better part of a century, Great Britain was pre-eminent in this field. It completed its first battleship, the "Warrior," in 1861. From that date until construction of the "Lord Nelson." begun in 1905. the Royal Navy built about 110 vessels that might be called battleships, although the name did not come into use until after 1870. Beginning with the "Dreadnought," completed in 1906, the first all-big-gun ship, which gave her name to the type, the Royal Navy built 43 more battleships. This same period saw the construction of 13 battle cruisers, which had big guns and high speed but lacked the heavy armour of battleships. This total excludes the "Courageous," "Glorious" and "Furious," which have incorrectly been described as battle cruisers by many newspapers. *(See* CRUISER.) Great Britain has named its battleships for sovereigns, for great sailors and soldiers and for fighting ships of earlier periods.

H.M.S. "Vanguard," completed in 1946 and the last battleship remaining in the Royal Navy, was sold for scrap in 1960. She displaced 51,420 tons and was the 12th vessel of the Royal Navy to bear the name. Four battleships, "Anson," "Duke of York," "Howe" and "King George V," were scrapped in 1958. Others had been scrapped after the end of World War II.



BY COURTESY OF U S NAVY

U.S.S. "MISSOURI"; *57,500* TONS: SPEED, *35* KNOTS; NINE 16-IN. GUNS
The formal surrender of Japan was signed on board the "Missouri" in Tokyo bay on Sept. 2, 1945. The ship was decommissioned Feb. 26, 1955

The U.S. navy built a total of 59 battleships between 1890 and 1945. By an act of March 3, 1819, congress directed that all U.S. ships of the line be named for states. Later acts specified that first-rate ships, ships of the first class and battleships would all be named for states. An exception to the rule came up in 1895 when congress provided for two battleships and directed that one be named "Kearsarge" after the Union vessel that sank the famous Confederate sea raider "Alabama" during the American Civil War.

In 1945, when World War II ended, the "Kentucky" was 73% completed. with her machinery installed, and the "Illinois" was 22% completed. Plans were made to convert the "Kentucky" into a guided missile battleship, but this idea was abandoned and she was scrapped in 1958. The "Illinois" had been scrapped earlier. In 1961 the United States had 8 battleships but all of them were out of commission and in a state of preservation popularly known as "mothballing."

France scrapped some battleships after World War II but in the 1950s had two in commission, though in reserve, the "Jean Bart" and the "Richelieu." Chile had one battleship in reserve, the "Almirante Latorre," and Soviet Russia had one such ship, the "Sevastopol" of World War I vintage.

THE CAPITAL SHIP IN THE 19TH CENTURY

The essential backbone of the world's fleets throughout the great colonial wars was the sailing ship of the line of battle, usually called the ship of the line. This vessel was the predecessor of the battleship. The ship of the line had been developed by the time of the Spanish Armada, and the type changed relatively little between 1588 and 1840. Nelson's flagship at Trafalgar, in 1805, the "Victory," was representative of this type. She was a three-decker, with guns on all three decks; she was 186 ft. in length and of 2,162 tons burden. This historic vessel was preserved in the naval dockyard at Portsmouth, Eng., where it was kept open to the public.

Up to about 1840 there were clear-cut distinctions between types of warships. A sloop of war carried all her guns (usually less than 20) on the weather deck. A frigate had guns on two decks, the number of guns varying between 24 and 50. A ship of the line had 64 or more guns on three decks. The guns themselves varied from 4-pounders to 32-pounders. A few large ships of the line had some 42-pounders instead of 32s on the lower deck, 24-pounders on the middle deck and 18-pounders on the main deck, for a total of from 64 to 100 guns. The frigates and sloops of war carried smaller guns, some only 4-pounders or 6-pounders. It had become common practice to rate ships by the number of guns they carried. These were smooth-bore, muzzle-loading guns, throwing solid balls.

Rifled guns of various kinds were tried for shipboard use, but the early types had many defects. W. G. Armstrong built a rifled field gun for the British army in 1858, and it was adapted for naval use. Improvements in metal went along with the development of better guns. The introduction of 68-pounder guns, and then larger ones, along with steam propulsion, led to the building of steam sloops of war that mounted only 24 guns or less but were more formidable than older ships of the line.

Shipbuilding was an art for many centuries, but it did not become a science until after the battleship had become established as a type. To understand this gradual development it must be remembered that the evolution of the battleship began before there existed any well-understood body of scientific knowledge to guide ship designers and builders. The previous lack of science in shipbuilding was often illustrated by serious losses of ships at sea.

Steam and Iron Produce the Battleship. — The first steamer in any navy was the U.S.S. "Fulton," completed in 1815. A steamer of the French navy crossed the Atlantic to French Guiana in 1824–25, and one of the Royal Navy arrived in Barbados in 1832. The U.S. navy acquired two steam-powered side-wheelers of 3,300 tons each in 1842, "Mississippi" and "Missouri"; and the "Princeton" in 1844, the first man-of-war to use the screw propeller. In various navies auxiliary steam power was installed

in existing sailing ships. The Royal Navy laid down its last sailing ship, "Sanspareil," in 1851, but converted her to a steam-screw ship before launching. In 1852 the "Agamemnon" was laid down as a steam two-decker.

The British squadron that bombarded Sevastopol during the Crimean War, in 1854, included only two steam ships of the line. The sailing ships were pushed or hauled into position by steam tugs, and the Russian forts replied with shell guns. Largely because of their experience in that war, the French planned to build 40 screw ships of the line, 20 frigates, 30 corvettes, 60 dispatch vessels and transports. By early 1857, however, the French experiments with rifled guns led them to conclude that armour was necessary for their warships and they stopped building wooden ships of the line. The able naval architect, Stanislas Dupuy de Lôme (*q.v.*), was then placed in charge of ship design for the French navy. He had devised the method which both England and France had used in converting sailing ships of the line to steamers, and he began the first armoured warship in 1858. His "Gloire" displaced 5,617 tons and carried 36 guns. Her hull was plated from stem to stern with iron 4.3 in. to 4.7 in. thick, backed by 26 in. of wood. Her dimensions were $252\frac{1}{2} \times 55 \times 25$ ft. and she was the first seagoing armour-clad.

A parliamentary committee reported in London in 1859 that both England and France had 29 ships of the line built or completing, while France had 34 large frigates without including the 4 new ironclads, and England had 26 frigates. These were all steamers, and the committee concluded that sailing ships had no further value in war. In that same year the "wooden walls" of England reached their final stage of development with the launching of four three-deckers, each displacing 6,930 tons. But by this date the tide was turning; the era of wooden warships was about ended.

In 1859 the British admiralty ordered two ironclads, the above-mentioned "Warrior" on April 29, 1859, and, after further discussion, a sister ship, the "Black Prince." Completed in Oct. 1861 and Sept. 1862, they each displaced 9,210 tons and their dimensions were $380 \times 58 \times 26$ ft. They could attain a speed of 14 knots, had a coal capacity of 850 tons and a complement of 707 officers and men. Their main armament consisted of twenty-eight 7-in. (6:-ton) guns. Their hulls were of iron; iron armour $4\frac{1}{2}$ in. thick covered a section 213 ft. long amidships, with a backing of 18 in. of teak; the armour extended 6 ft. below the water line and 21 ft. above it. These two ships, with the French "Gloire" and "Couronne," were the first battleships, although the name was not then applied to them.

In the United States, the ironclad "Monitor" was ordered Sept. 16, 1861. She was built by a group formed by her designer, John Ericsson, and gave her name to this new class of ships. To expedite construction, one New York firm built the hull, another the engines and a third the turret. Her displacement was 987 tons; complement 58; guns two 11-in. in a revolving turret; speed 6 knots; dimensions $172 \times 41\frac{1}{2} \times 11$ ft. After trials on March 3, 1862, she departed New York on March 6.

Meanwhile the South also built an ironclad, the C.S.S. "Virginia," better known by her former name, "Merrimack." When the Union navy abandoned the Norfolk navy yard, April 20, 1861, it had scuttled the frigate "Merrimack" and burned her to the water's edge. The Confederates raised her and hauled her into dry dock on May 30. They converted her into an ironclad ram by mounting a cast-iron ram on the stem and building an armoured casemate amidships, about 180 ft. long with slanting sides. Ten guns, including four rifles, were mounted in the armoured casemate. Her displacement after the reconstruction was 3,200 tons; complement 320; speed 5 knots; dimensions: $275 \times 38\frac{1}{2} \times 23$ ft.

The battle between the "Monitor" and "Merrimack" on March 9, 1862, was indecisive, but it attracted world-wide attention as the first duel between ironclads. The spectacular success of the "Merrimack" on the previous day, when she rammed and sank the "Cumberland" and then destroyed another sailing vessel, the "Congress," by gunfire, served to convince the general public that the day of the wooden man-of-war was ended. (See "MONITOR" AND "MERRIMACK," BATTLE OF.)

According to many writers, the U.S. Civil War demonstrated the value of the ram as a weapon. Until about 1900 nearly all the large ships had rams. The United States launched the armoured ram "Katahdin" in 1893. The Austrian Adm. Wilhelm von Tegetthoff won the battle of Vis (Lissa) in 1866 by ramming the Italian flagship, but after that no major warship was sunk in action by ramming. In fleet maneuvers, the "Iron Duke" sank the "Vanguard" in Sept. 1875, and the "Camperdown" sank the "Victoria," June 22, 1893. Both these sinkings were accidental and did not prolong the career of the ram as a practical naval weapon.

Turret **Ships.**—Capt. Cowper Coles, R.N., used a ratt as a gun platform in the Sea of Azov in 1855, and proposed a more elaborate armoured raft for attacking the Russian defenses. He applied for a patent for a revolving turret on March 30, 1859. An experimental turret was built and tested in 1861. Coles had suggested cutting down a ship of the line, armouring her and fitting her with turrets. On April 4, 1862, the conversion of the 121-gun "Royal Sovereign" was ordered. On April 29, 1862, the "Prince Albert" was laid down; she became the Royal Navy's first iron turret ship.

In 1866–67 "Monarch" and "Captain" were laid down as iron turret ships. "Monarch" of 8,300 tons may be regarded as the first truly seagoing turret ship. She mounted four 12-in. guns in two turrets. "Monarch" was commissioned May 1869, and after the death of George Peabody in London on Nov. 4 of that year, carried his body to Massachusetts. The "Captain" capsized during a full gale at sea on Sept. 7, 1870, and sank with the loss of Captain Coles and 473 officers and men. The U.S.S. "Monitor" had been lost at sea on Dec. 31, 1862. H.M.S. "Devastation," completed in 1873, displaced 9,330 tons, had four guns in two turrets and had no sails. From 1865 onward the U.S. navy was neglected until 1883 when five monitors and three small cruisers were authorized.

The Italians introduced the monster gun in 1872 and the British went to the larger guns in 1874, also installing submerged torpedo tubes and electric lights in the "Inflexible." The royal corps of naval constructors dates from 1883. Torpedo nets to protect big ships were installed in 1884. The "Colossus," completed in 1886, used steel for general construction instead of iron; she had breech-loading rifles, which had been readopted and were standard thereafter.

First U.S. Battleships.—Congress authorized three vessels in 1890 that were classed as battleships, "Indiana," "Massachusetts" and "Oregon," officially numbered BB-1, BB-2 and BB-3. Completed in 1895–96, each displaced 11,700 tons. They had belt armour 18 in. thick and a speed of 15 knots. They carried four 13-in. 35 calibre guns in two turrets; eight 8-in. 35 calibre in four turrets; and some smaller guns, besides six torpedo tubes. They

H.M.S. "VANGUARD": 51,420 TONS; SPEED 30 KNOTS: EIGHT 15-IN. GUNS
Completed in 1946, the "Vanguard," Britain's largest battleship, was too late to see action in World War II

were good ships but their turrets were not balanced, a defect that caused them to list when the guns pointed abeam. Before they were completed, two other vessels, the "Texas" and "Maine," were officially reclassified as "second-class battleships," although first authorized as "armored vessels." Plans for both were purchased in England. The "Texas" displaced 6.300 tons and mounted two 12-in. and six 6-in. guns; the "Maine" displaced 6,700 tons and mounted four 10-in. and six 6-in. guns.

The Chinese-Japanese War of 1894–95, the Spanish-American War of 1898 and the Russo-Japanese War of 1904–05 all resulted in further building of battleships, with improvements of various kinds. Some authorities would have chosen the armoured cruiser as the principal ship, but the consensus supported the battleship. The outbreak of the Spanish-American War was due in large measure to the wave of indignation that swept the United States after the mysterious sinking of the battleship "Maine" in the harbour of Havana, Cuba.

Developments in U.S. Ships.—The 8-in. turrets of the "Indiana" class suffered from blast effects when the 13-in. guns were fired. The "Kearsarge" and "Kentucky," designed in 1897, had 8-in. turrets placed on top of the larger turrets. Later, the "New Jersey" class had an 8-in. turret on a 12-in. turret. Experience in the fleet went against the two-story turret and the arrangement was abandoned in the "Connecticut" class. "South Carolina" and "Michigan," BB's 26 and 27, authorized March 3, 1905, displaced 17,000 tons and had eight 12-in. 45 calibre guns in four centreline turrets. They were the first all-big-gun ships to be designed but they were not commissioned until 1910.

Dreadnoughts.—Completed in 1906, H.M.S. "Dreadnought" gave her name to a more powerful class of battleships and caused all navies to build this larger type. She had four propellers driven by Parsons turbines; displaced 21.845 tons fully loaded; made 21 knots; and mounted ten 12-in. 45 calibre guns in five turrets, three on the centreline. Adm. Lord Fisher was responsible for this type and also for the battle cruiser, first laid down early in 1906, in three of "Invincible" type. Their features were high speed (27 knots), eight 12-in. guns and light armour, in a displacement of 20,135 tons. After the "Dreadnought," Britain built 13 more BB's before the outbreak of war in 1914, and completed 5 of "Royal Sovereign" and 5 of "Queen Elizabeth" class in 1915–16. The "Queen Elizabeth" displaced 33.000 tons, carried eight 15-in. 42 calibre guns in four centreline turrets, used oil fuel and steamed at 25 knots.

The battle of Jutland (May 31, 1916) and other experience in the war years, 1914–18, demonstrated the primacy of the battleship. The German ships at Jutland showed that their greater subdivision and their damage-control system had made them almost unsinkable, but this had been achieved by sacrificing offensive power and making the ships uncomfortable to live in.

The naval conference held 1921–22 at Washington, D.C., limited the size and armament of individual ships and total tonnage. (See WASHINGTON, TREATIES OF.) It specifically provided that the strength in capital ships of the three leading naval powers, the U.S., Great Britain and Japan, would be in the ratio of 5:5:3. As a result, the United States scrapped seven of the nine battleships it had under construction, although they were nearing completion. The treaty not only restricted the building of battleships but led to the use of lighter and more expensive materials to keep within weight limits. Tremendous increases in building costs occurred, especially after 1937 when unrestricted building was resumed. In the language of business, the battleship had been "priced out of the market." Nevertheless, a British cabinet inquiry in 1936 reaffirmed belief in the battleship, and five ships of the "King George V" class were completed 1940–42. Armed with ten 14-in. guns, they displaced 44,460 tons and had a speed of 28 knots. Four ships mounting 16-in. guns were ordered in 1939, but work was suspended in 1940.

Germany built two battleships of the "Scharnhorst" type with nine 11-in. guns in three turrets. They displaced 38.100 tons and had a speed of 31.5 knots. Two German battleships of the "Bismarck" class displaced 52,600 tons; they had eight 15-in. guns and a speed of 30 knots. Two so-called "pocket battleships" built by Germany, the "Liitzow" and "Admiral Scheer," were actually armoured cruisers rather than battleships. Japan completed two battleships after the Washington conference while England was building the "Nelson" class. The Japanese vessels "Nagato" and "Mutu" were of 36,000 tons, with eight 16-in. 45 calibre guns, and a speed of 23 knots. "Nelson" and "Rodney" were completed in 1927 and displaced 38,000 tons. Their speed was 23 knots, and they mounted nine 16-in. guns in three turrets, all on the centreline forward. Later, Japan built two giant battleships, the "Yamato" and "Musashi," completing them in 1941–42. These ships displaced 72.000 tons, mounted nine 18.1-in. guns and had a speed of 27 knots. They were the largest battleships ever built.

Comparatioe Strength in Battleships and Battle Cruisers of Major Powers, 1914 and 1939
(Ships Under *Consiruction Are in Parentheses)*

Country	1914	1939
Argentina	2	
Austria-Hungary	16(4)	
Brazil	4	
Chile	3	
Denmark	3(1)	
France	28(5)	7(3)
Germany	52(5)	2(4)
Great Britain	71(4)	15(6)
Italy	22(6)	4(4)
Japan	24(6)	10(2)
Netherlands	9	
Norway	2(2)	
Spain	2(1)	
Sweden	4(1)	
Turkey	3(1)	1
United States	35(4)	15(6)
U.S.S.R.	4(8)	3(1)

Note: By 1959 the U.S. had 15 battleships, France 2, Great Britain and the U.S.S.R. each 1.

The later U.S. battleships included three of the 1916 program completed after 1918, "West Virginia," "Colorado" and "Maryland." Seven other ships of this program were scrapped. No additional battleships were begun until 1937–38, when work started on "North Carolina" and "Washington." They displaced 46,800 tons, carried nine 16-in. 45 calibre guns and had a speed of 27 knots. Four more ships were begun in 1939–40 ("Alabama," "Indiana," "Massachusetts" and "South Dakota"), slightly smaller, with the same main battery guns and speed. Four more ships were completed in time to participate in the war in the Pacific, "Iowa," "New Jersey," "Missouri" and "Wisconsin." Each displaced 57,450 tons and had a speed of 33 knots.

BATTUS, in Greek mythology, a garrulous old man of Lycia (or the Peloponnesus; see Ovid, Metamorphoses). He saw Hermes in the act of driving off Apollo's cattle, which he had stolen, but promised to say nothing when bribed with a present. Hermes returned in disguise to test Battus' word; the old man, bribed anew, revealed the secret and was turned to stone. (T. V. B.)

BATU ISLANDS (BATOE ISLANDS), 3 greater and 48 lesser islands of Indonesia, lying athwart the equator west of Sumatra. Administratively the islands are part of the Nias district of Tapanuli (North Sumatra). They are separated by the strait of Siberut from the Mentawai group to the south. The three chief islands. from north to south, are Pini (or Mintao). Masa, and Bala; the administrative centre is Tela. The estimated population of the entire island group in 1956 was 13,102 and the area 464 sq.mi. The islands are generally low and covered with forest, notably coconut palm. There is trade in copra and forest products. The natives are of Malayan or proto-Malayan stock, akin

to those of the island of Nias, to the northwest. Only about 20 of the smaller islands are inhabited. Japan occupied the islands during World War II. (J. 0. M. B.)

BATU KHAN (d. 1255), Mongol prince, founder of the Golden Horde (*q.v.*), was a grandson of Genghis Khan. Elected commander in chief in 1235 for the Mongol invasion of Europe, he had by 1240 conquered almost all Russia. In the campaign in central Europe, one Mongol army defeated Henry II, duke of Silesia, at Liegnitz on April 9, 1241; another, led by Batu himself, defeated the Hungarians at Mohi on April 11. The securing of the territory conquered and the further conquest of Europe were probably prevented by the death of the great khan Ogadai (Dec. 1241). In order to exercise more influence in the Mongol capital Batu withdrew to the lower Volga. There he established the state of the Golden Horde to which all Russian princes were in some degree subject. (K. SA.)

BATUMI (BATUM), capital of the Adzhar Autonomous Soviet Socialist Republic of Georgian S.S.R., lies on a gulf of the Black sea, about 10 mi. N. of the Turkish frontier and 160 mi. W. of Tbilisi. Pop. 82,000 (1959), with Adzhars, Georgians, Russians and Armenians predominating.

The subtropical climate and mild winter (Jan. average 43° F.) make Batumi a popular resort. Rectangular in plan, its streets and gardens are lined with palms and other exotics. North of the town are the Batumi Botanical gardens, with a rich collection of subtropical and tropical plants. With the best harbour of the trans-Caucasian coast, Batumi is an important port, trading chiefly with other Soviet Black sea ports. The major exports are refined oil and petroleum products. citrus fruits, tea and manganese; and imports are metals, machinery, grain and paper. There is a large oil refinery, using crude oil brought by pipeline from Baku. Other industries include a shipyard, engineering works, zinc-plating works, veneer and furniture works and a range of light industries (woolens, shoes, leather, tobacco, brewing-). Power for the town is supplied by the Adzharis-Tskalskaya hydroelectric station. The S. Rustaveli Pedagogical institute is located there.

It has been Russian since 1878, when it was ceded by the Turks. Batumi is the terminus of a railway from Samtredia on the Tbilisi-Tuapse line. (R. A. F.)

BATWA, one of the best known of the many pygmoid groups scattered across equatorial Africa. Like all other African pygmoids the Batwa, averaging somewhat over 5 ft. in height, are a people of mixed ancestry, probably descendants of the original inhabitants of the tropical rain forest. They live in the high mountains and plains around Lake Kivu, in the Republic of the Congo and Ruanda-Urundi, in symbiosis with the pastoral Watussi, the agricultural Bahutu, and other tribes. Many specialize in pottery, which they market; others hunt; some act as court musicians and attendants.

Westward, in the marshes south of the Congo river, is the large (approximately 100,000) group of Batswa, who, like the Batwa, have adopted much of the culture and language of neighbouring tribes. They live largely by fishing and trapping.

North of the Congo, in the forests west of the Ubangi river, are the Babinga This is also an acculturated group of pygmoids, but perhaps because of similarity of habitat they have retained more of the traits of the pure pygmies of the Ituri forest (see BAMBUTI) and are still mainly nomadic hunters and gatherers.

Further to the west, in Cameroun and Gabon. there are other scattered groups that are even closer, physically, to the true pygmy. See also PYGMY.

BATZ, JEAN, BARON DE (1754–1822), French royalist conspirator of the Revolutionary period, was born at Tartas in Gascony on Jan. 26, 1754, of a noble family. During Louis XVI's reign he occupied himself in financial transactions, including the foundation of an insurance company, made a fortune and rose to be grand seneschal of the duchy of Albret. Sent to the estates-general of 1789 as deputy for the nobility of Nérac, he concerned himself with the financial business of the Constituent Assembly. Emigrating in 1792, he returned to France to work against the Revolution. He made an unsuccessful plan to save Louis XVI on his way to the guillotine in Jan. 1793. did much to organize the riots against the Convention in March and tried to rescue Marie Antoinette from prison in June. Meanwhile he and a cosmopolitan clique of financiers were doing their best, by dubious operations, to discredit the republic and to raise funds for the royalists. A number of deputies in the Convention were implicated with them in a fraudulent scheme to make money on the shares of the French India company. In June 1794 the Convention offered a reward for Batz alive or dead, and a number of his associates were guillotined. Arrested for participating in the rising of 13 Vendémiaire (Oct. 1795), Batz contrived to get himself liberated. After this little is known of him, but in Dec. 1801 his name was removed from the list of proscribed *émigrés*.

On the Restoration of the Bourbons in 1814, Batz was made a knight of the Order of St. Louis. Retiring to his estate at Chadieu in 1820. he died there on Jan. 10, 1822.

BAUDELAIRE, CHARLES PIERRE' (1821–1867), French poet and critic, one of the greatest poets of the 19th century, the author of Les Fleurs du mal. He was born in Paris on April 9, 1821. His father, Joseph François (b. 1758), died in 1827, and in 1828 his mother married Jacques Aupick, a soldier who had risen in the ranks and had become a general, an ambassador and finally a senator. Baudelaire was educated at the Collège Royal at Lyons and later (1836) at the Collège Louis-le-Grand in Paris, where he distinguished himself in the writing of Latin verse, for which he won a prize at the public *concours général*. After passing his *baccalauréat* (1839) he began to study law, but rumours of the irregularities of his life reached his parents—it was then that he contracted the venereal disease from which he was eventually to die—and, in May 1841, to wean him from his dissolute associates, they sent him on a trip to India which was intended to last two years. However, when the boat put into Mauritius for repairs, Baudelaire decided that nothing would induce him to go any farther and insisted on being shipped back to France. Nevertheless, this trip made of Baudelaire a true and original poet, and it was on the journey that he wrote the first of his *Fleurs du* mal. He never forgot his only experience of the east but kept for it a nostalgic and mystical longing which is a characteristic feature of his poetry.

Shortly after his return to Paris (Feb. 1842) he reached his majority and obtained control over the capital which he inherited under his father's will. He proceeded to squander it living the luxurious life of a dandy at the Hôtel Lauzun, in the Île Saint Louis, and laid the foundations of the pile of debts which were to cripple him for the rest of his life and to be settled only after his death. It was at this time that he formed the association with the mulatto woman, Jeanne Duval, whom he loved passionately for a time and for whom he remained responsible. She inspired the first cycle of love poems, the cycle of the "Black Venus," which are among the finest erotic poems in the French language. It was in this period of leisure and freedom from anxiety that he composed a large number—perhaps the largest number—of the poems which were eventually to form part of Les Fleurs *du* mal; *i.e.*, the Lesbian poems, the poems of revolt and decay and the great erotic poems. In this period he became acquainted with many artists such as Delacroix and Courbet and established the knowledge of painting which was to make of him one of the most interesting art critics of the 19th century.

In a couple of years, however, he had squandered half his inheritance and his parents obtained a decree to place the remainder of his capital under trust. As a result he had to give up his life of extravagance and knew straitened means, later real poverty. It was then that he became interested in revolutionary activities and took part, with other men of letters, in the revolution of 1848, but the establishment of the Second Empire ended his active interest in politics. During this period he developed a sympathy for suffering and toiling humanity. He became a professional writer and his first publications were articles of art criticism,

his "Salons" (1845 and 1846—the latter a landmark in aesthetic criticism), but he also printed some of his poems in avant-garde reviews. He tried many forms of journalism and published his only novel, the autobiographical *La Fanfarlo,* in 1847. It was probably composed several years earlier, during his period of luxurious living, and gives a faithful picture of his personality at that time.

What Baudelaire did between the second revolution of 1848 and the *coup d'état* of Dec. 1851 is not clear but, with the advent of the Second Empire, the great and mature period of his creative life opened. He became widely known as the translator of Edgar Allan Poe and as a literary and art critic, for it was at this time that he formulated his aesthetic doctrine which eventually enabled him to publish a considerable number of his poems. He had known English as a child—his mother had been born in London in 1793, the daughter of an *dmigrd—and* in his youth he had been interested in satanic literature, in such works as M. G. Lewis' *The Monk.* Between 1852 and 1865 he was occupied with translating the prose writings of Poe—he attempted only one poem, "The Raven"—and in studying him critically. His first article on the poet appeared in the *Revue de Paris* in 1852; the *Histoires extraordinaires* was published in 1856, the *Nouvelles hisfoires extraordinaires* in 1857—each with a long introduction—the *Aventures d'Arthur Gordon Pym* in 1858, *Eureka* in 1864 and *Histoires grotesques et skrieuses* in 1865. When Baudelaire came across the works of Poe he had the sensation of finding himself in him and of discovering poems and tales which he himself had conceived many years before. Poe gave him confidence in his own aesthetic doctrine and in his ideals of poetry. At this time he formed the association with the women who inspired two further cycles of love poems—the cycle of the "White Venus," inspired by Mme Sabatier, and the cycle of the "Green-Eyed Venus," inspired by the actress Marie Daubrun; in many of these poems he reached the highest peaks of his art.

So well known had Baudelaire become as a critic and translator of Poe that the *Revue des deux mondes* ventured to print a selection of his poems and 18 were published in June 1855. It was this that made him notorious.

Baudelaire's one collection of poems, *Les Fleurs du mal,* was published in 1857 by his friend Poulet-Malassis, who had inherited a printing press at Alençon. Shortly afterward the poet, his publisher and the printers were prosecuted at a famous trial for obscenity and as a result they were fined and six of the poems were banned. The consummate art of the collection was understood and appreciated by a few readers—Victor Hugo wrote to him from exile praising the work—but, for the general public, for several generations, the book remained a byword for depravity, morbidity and obscenity. Baudelaire published a further edition of *Les Fleurs du mal* in 1861 greatly enlarged and enhanced. but omitting the banned poems, which were published in 1866, in Belgium, in a collection entitled *Les Épaves.* A third and further enlarged edition was being prepared when the poet became paralyzed in 1866. It was published posthumously by his friend Charles Asselineau. though not. probably, as it was planned, but it contains the six "Nouvelles fleurs du mal" which had appeared in *Le Parnasse contemporain* in 1866, as well as poems which had nothing to do with the collection.

The failure of *Les Fleurs du mal,* from which he had hoped so much, was a bitter blow to Baudelaire, and the remaining years of his life were darkened by growing failure, pessimism and despair. Although some of his finest works were composed then, few of them were published in book form, though some appeared in periodicals—his "Salon" of 1859 in *La Revue française,* his "Richard Wagner et Tannhauser à Paris" in 1861 in *La Revue européenne,* "Le Peintre de la vie moderne" (Constantin Guys), in 1863 in *Le Figaro,* and prose poems, intended to form part of a collection to be entitled *Spleen de Paris* (1869). in various papers. This was a work of which Baudelaire was particularly fond and he had been engaged on it for many years—he was working on it in Belgium at the time of his final collapse. He had obtained the idea from *Gaspard de la nuit* by "Aloysius" Jacques Bertrand (*q.v.*), but the subject matter is similar to that of the poems in verse composed in this period, and they were written in a pessimistic mood which reflects the aging and saddened Baudelaire. They express, even more poignantly than *Les Fleurs du mal,* his feeling for the large modern town, for Paris, and his compassion for outcasts and failures. Two books—Les *Paradis artificiels* and the second version of *Les Fleurs du mal*—were published in 1860 and 1861 by Poulet-Malassis, who immediately went bankrupt. Baudelaire was involved in his failure, and his financial difficulties were thereby made desperate. In an effort to retrieve his fortunes he presented himself for election to the Académie Française in 1861 but withdrew on the advice of his friends. To escape from his creditors, and to try to dispose of the copyright of the various volumes he had ready for publication, he went on a lecture tour to Belgium in 1864. This proved a failure and he was also unsuccessful in negotiating a contract for his books. He was particularly anxious to publish his aesthetic criticism, for he valued it as highly as his poetry and considered that all his writings were an organic whole. To appreciate his poetry it is necessary to understand his doctrine of art. His poetry is the crystallization of his vision in a poem; while his criticism is a meditation on the nature of a work of art and the principles which underlie it. He believed that every great artist was bound eventually to become a critic. His criticism is an explanation of his poetry and his poetry is an extension of his aesthetic doctrine.

In Feb. 1866, he became seriously ill at Namur, Belgium, and was taken back to Paris where he died on Aug. 31, 1867. He died obscure and almost forgotten and only two speeches were made at the graveside before a handful of people, but they were by close friends, Charles Asselineau and Théodore de Banville.

Baudelaire died unrecognized with all his works out of print and many of his writings unpublished, but the situation has greatly altered since his death. In modern times critics of every country place him among the greatest European poets of the 19th century. His admirers claim that he revolutionized the manner of thinking, writing and feeling in western Europe, and that his aesthetic doctrine marks a date of paramount importance not only in the history of poetry, but also in art in general. It was in him that the Symbolist movement in every country found its source. In May 1949, by the decision of the court of appeal, the ban on Baudelaire's poems was finally removed and the verdict and sentence of Aug. 20, 1857 were rendered null and void, as if they had never occurred. The poet was completely vindicated.

BIBLIOGRAPHY.—The first edition of Baudelaire's *Oeuvres complètes,* 7 vol. (1868–70), was edited by C. Asselineau, with a preface by Théophile Gautier. It does not contain the *Journaux intimes,* other posthumous works, or the correspondence. Fragments of the *Journaux intimes* were published in *Le Livre* in Sept. 1884, and the first complete edition in 1909. *Lettres 1841–66* were published in 1905, and *Lettres inddites à sa mère* (1918) and *Deuxièmes lettres inddites à sa mère* (1926). Some *Juvenilia* were published by Jules Mouquet in 1932. A complete edition of his entire works, including *Juvenilia, Oeuvres posthumes* and *Correspondance générale,* was edited by Jacques Crépet (1922–53). The best one-volume edition is that by Yves Le Dantec for the "Pléiade" series (1950); a further volume contains translations from Poe. Asselineau was the first to attempt a vindication of Baudelaire's character in *Charles Baudelaire, sa vie et son oeuvre* (1869); and in 1872 a group of friends published a collection entitled *Souvenirs, correspondances, bibliographie,* edited by Charles Cousin. The first complete biography was included in *Oeuvres posthumes et correspondances inddites,* which was published in 1887 and revised and enlarged in 1907 by Eugène and Jacques Crépet. A short selection of the many works on Baudelaire and his writings follows: L J. Austin, *L'Univers poétique de Baudelaire* (1956); *W*. T. Bandy, *Baudelaire Judged* by *His Contemporaries* (1845–67) (1933); W. T. Bandy and J. Mouquet, *Baudelaire en* 1848 (1946); G. Blin, *Baudelaire* (1939) and *Le Sadisme de Baudelaire* (1948); A. Cassagne, *Versification et métrique de Charles Baudelaire* (1906); *J.* Champfleury, *Souvenirs et portraits de jeunesse* (1872); *G.* T. Clapton, *Baudelaire et De Quincey* (1931) and *Baudelaire, the Tragic Sophist* (1934); *A.* Fairlie, *Baudelaire: les fleurs du mal* (1960); *A.* Ferran, *L'Esthétique de de Baudelaire* (1933); B Fondane, *Baudelaire et l'expérience du gouffre* (1947); M Gilman, *Baudelaire the Critic* (1943); P. J. Jouve, *Tombeau de Baudelaire* (1942); P. Mansell Jones, *Baudelaire* (1952); J. Massin, *Baudelaire "entre Dieu et Satan"* (1945); *H.* Peyre, *Connaissance de Baudclaire* (1951); J. Pommier, *La Mystique de Baudelaire* (1932) and *Dans les chemins de Baudelaire* (1945); *F.* Porch&,*Baudelaire, histoire d'une âme* (1944); J. Prévost, *Baudelaire* (1953); P. Quennell, *Baudelaire and the Symbolists,* rev. ed. (1954); S. A. Rhodes, *The Cult of Beauty in Charles Baudelaire* (1929); M. Ruff, *L'Esprit du nzal et l'esthdtique baudelairienne* (1955);

J. P. Sartre, *Baudelaire* (1947); *E.* Starkie, *Baudelaire*, rev. ed. (1957); M. Turnell, *Baudelaire* (1953); *G.* Turquet-Milnes, *The Influence of Baudelaire in France and England* (1913); *P.* Valéry, *Situation de Baudelaire* (1926); *R.* Vivier, *L'Originalité de Baudelaire*, *2nd* ed. (1952). (E. ST.)

BAUDIER, MICHEL (*c.* 1589–1645), French historian whose works, though full of digressions, inaccuracies and unhistorical judgments, can be enjoyed for their collection of much curious information. especially on the reign of Louis XIII, was a native of Languedoc. As soldier and traveler he acquired a wide knowledge of languages and his histories include an account of the court of the king of China (1626); a religious history of Turkey (1626), translated from the Arabic; and an account of the kings of Persia. On French history his most important work was a *Histoire du maréchal de Toiras* (1644); he also wrote a strongly biased *Histoire du cardinal d'Amboise* (1634) and a curious romance entitled *Histoire de l'incomparable administration de Romieu, grand ministre d'état de Raymond Bkrenger, comte de Provence* (1635), as well as some works on near-contemporary English history. His *Vie du cardinal Ximénès* (1635) was reprinted in 1851 with a notice on its author.

BAUDISSIN, WOLF HEINRICH, GRAF VON (1789–1878), German man of letters, who, with J. L. Tieck's daughter, Dorothea, was responsible for the translation of Shakespeare's plays begun by A. W. Schlegel and continued, nominally, by Tieck. He was born at Copenhagen on Jan. 30, 1789, entered the diplomatic service and traveled in Italy, France and Greece. In 1827 he settled in Dresden, where he lived until his death on April 4, 1878. His translations of Elizabethan drama—in *Ben Jonson und seine Schule*, 2 vol. (1836)— of Molière, of Italian plays and of the Middle High German epics *Iwein* and *Wigalois*, as well as of Shakespeare, contributed to the enrichment of German literature and the development of romanticism.

BAUDOUIN I (1930–), fifth king of the Belgians, elder son of King Leopold III and Queen Astrid, was born at the Stuyvenberg castle, near Brussels, on Sept. 7, 1930. Just before he was five he lost his mother in a motor accident. On the German invasion of Belgium in 1940, he was sent with his elder sister Princess Josephine Charlotte and his younger brother Prince Albert to Cahors in southwestern France, and in June he reached Lisbon in Portugal, but at the end of July he rejoined his father at Laeken palace, near Brussels, where the royal family remained in seclusion. He accompanied his father during his internment in Germany (June 1944–May 1945) and his subsequent voluntary exile in Switzerland. Baudouin was for the most part privately educated but during his father's stay at Pregny near Geneva (1945–50) he attended a state college at Geneva. On Aug. 11, 1950, before a joint session of the senate and the chamber of representatives, Baudouin was informed that parliament had granted him power to exercise the royal prerogatives, to which he answered in French and Flemish, "I accede to the will of parliament." He took the oath to observe the constitution and the law. As prince royal he acted as head of state until Leopold's abdication on July 16, 1951. He took the oath as king before both houses of parliament on July 17. On June 30, 1960, he proclaimed the independence of the Belgian Congo in person at Léopoldville. On Dec. 15, 1960, he married a lady of the Spanish nobility, Doña Fabiola de Mora y Aragon.

BAUDOUIN DE COURTENAY, JAN NIECISŁAW (1845–1929), Polish linguist, whose works anticipated modern structuralist trends, was born at Radzymin, on March 13, 1845, of a Polonized French family. He was educated in Warsaw, Prague, Jena (where August Schleicher helped him publish his first major scholarly work, *Einige Fälle der Wirkung der Analogie in der polnischen Deklination* in 1868) and Leipzig (where, in 1870, he published another major work, in Russian, on the Old Polish language). In 1871, Baudouin de Courtenay began his long teaching career. For a short time he taught in St. Petersburg, but soon moved to Kazan, where he developed his own linguistic school. In 1883, he transferred his activities to Dorpat university. A short stay at the University of Cracow, near the turn of the century, was brought to an end by political misunderstandings and, in 1900, he returned to Russia, where he taught (this time at St. Petersburg university) until the end of World War I. In 1918, he returned to Poland, to assume the post of honorary professor at Warsaw university, where he remained until his death, on Nov. 3, 1929.

Although Baudouin de Courtenay was a specialist in comparative linguistics, he had little of the 19th-century interest in the history of languages. He turned his attention, rather, to general problems—questions of language mixture, child speech, dialect registration and the effect of linguistic structure on world outlook. Most important, he considered the sounds of language structural entities—rather than mere physical phenomena—in his *Versuch einer Theorie phonetischer Alternationen: Ein Kapitel aus der Psychophonetik* (1895). His theory, cleared of its psychological overtones by such linguists as N. S. Trubetskoi, has become a part of modern linguistics.

See the biographical article by K. Nitsch in *Polski Słownik Biograficzny*, vol. 1, pp. 359–362. (L. L. T.)

BAUDRY, PAUL JACQUES AIME (1828–1886), French painter, known especially for his mural decorations, was born at La Roche-sur-Yon, Vendée, on Nov. 7, 1828. He won the Prix de Rome in 1850 with his picture of "Zenobia Found on the Banks of the Araxes." Baudry derived strong inspiration from Italian art with the mannerism of Correggio, as was evident in the two works he exhibited in the Salon of 1857, which were purchased for the Luxembourg palace in Paris. His murals show imagination and a gift for colour, as seen in the frescoes in the Paris Cour de Cassation, at the chateau of Chantilly and some private residences —the Hôtel Fould and Hôtel Paiva—but, above all, in the decorations of the Paris Opéra. He died in Paris on Jan. 17, 1886.

BAUER, BRUNO (1809–1882), German theologian and historian, who held that Christianity derived from the consciousness of its early adherents, not from a historical Jesus, and that it was primarily Hellenic rather than Jewish in conception. Born Sept. 6, 1809, at Eisenberg, Saxe-Altenburg, Bauer studied at Berlin where he adopted Hegelian views. In 1834 he became *Privatdocent* at Berlin, but distrust of his views led to his transfer to Bonn in 1839. There his licence to teach was revoked in 1842, after the publication of his *Kritik der evangelischen Geschichte der Synoptiker* (1841), and he retired to Rixdorf near Berlin. In 1843 his most radical book, *Das entdeckte Christentum* (first published 1927) was suppressed by the Ziirich censor. His most important historical work was *Geschichte der Politik, Kultur und Aufklärung des 18. Jahrhunderts*, four volumes (1843–45). He died at Rixdorf, April 13, 1882.

BIBLIOGRAPHY.—M. Kegel, B. *Bauer und seine Theorien über die Entstehung des Christenturns* (1908); *G.* Runze, *B. Bauer redivivus* (extracts; 1934); *A.* Schweitzer, *Geschichte der Leben-Jesu-Forschung*, 6th ed. (1951).

BAUER, OTTO (1881–1938), the leading theoretician of the Austrian Social Democrat party, was born in Vienna on Sept. 5, 1881. He was one of the founders of the Socialist educational movement "Die Zukunft," and with F. Adler of the theoretical Socialist periodical *Der Kampf* and a collaborator on Karl Kautsky's journal *Die Neue Zeit*. Bauer became secretary to the parliamentary fraction of the Social Democrat party in 1904 and at once revealed his gifts as a theoretician. His first work, *Die Nationalitatenfrage und die oesterreichische Sozialdemokratie* (1906; new ed. 1924), was a radical treatment of the problem of nationality in the Dual Monarchy. In this book Bauer proposed a solution based on separate national states, thus anticipating, in many particulars, the European system which was established after World War I.

As a prisoner of war in Russia Bauer studied Bolshevism at first hand, and on his return to Austria in 1917 he became leader of the left wing of his party, which worked for a republic and self-determination for all nationalities. In the provisional administration of German Austria (Oct. 1918) he was appointed undersecretary of state for foreign affairs by Victor Adler and became minister a few days later, on the latter's death (Nov. 1918). Bauer was then a strong advocate of *Anschluss* with Germany, a policy widely supported in Austria at the time, and indeed on March 2, 1919, he signed a secret *Anschluss* protocol with Ulrich von Brock-

dorff-Rantzau, the German foreign minister. He resigned, however, in July 1919, as the constituent assembly's attitude toward *Anschluss* was too cautious for him. After 1918 it was, however, Bauer who really guided the international and internal policy of his party which he preserved as a non-Bolshevik but advanced Socialist organization.

Bauer was a member of the Austrian national council from 1929 to 1934. After the uprising of Vienna Socialists and workers in 1934 he went into exile, but continued to direct the program of the Austrian Socialist party from Czechoslovakia and France. He died in Paris, July 4, 1938.

Bauer wrote an important account of his own and his party's activities, *Die osterreichische Revolution* (1923; Eng. trans., 1925). His other chief works are *Bolshevismus oder Sozialdemokratie* (1920); *Der neue Kurs in Sovietrussland* (1921); "Das Weltbild des Kapitalismus" in *Der lebendige Marxismus* (1925).

BAUERNFELD, EDUARD VON (1802–1890), Austrian dramatist, a master of drawing-room comedy who for 50 years dominated the Vienna *Burgtheater*, was born in Vienna on Jan. 13, 1802. He studied philosophy and law at the University of Vienna and became the friend of Schubert and of Grillparzer; the latter had considerable influence on his style. Bauernfeld's comedies were witty pictures of Viennese society but the clever and stimulating talk also reflected the acute social and political questions of the day and the writer was for a while in the forefront of the liberal movement in Vienna. Of his plays may be mentioned especially *Die Bekenntnisse* (1834), *Bürgerlich und romantisch* (1835), *Crossjahrig* (1846), *Krisen* (1852) and *Aus der Gesellschaft* (1867). Bauernfeld died at Oberdohling on Aug. 9, 1890. His collected works were published in 12 volumes in 1871–73; a selection was edited by E. Horner in 1905.

BAUHAUS is the common shortened name of Das Staatliche Bauhaus Weimar, a school of design founded in 1919 by Walter Gropius (*q.v.*) in Weimar, Ger. It was largely responsible for revolutionizing the teaching of painting, sculpture, the industrial arts and architecture throughout the western world. Gropius was selected by the duke of Sachen-Weimar-Eisenach at the recommendation of the retiring director of the Weimar School of Arts and Crafts, the Belgian Henry van de Velde (*q.v.*). The Bauhaus owes the greater part of its success and influence to the sincerity, integrity and perseverance of its founder. The school attracted students from Germany and Austria who became enthusiastic followers of the Bauhaus' principles. The townspeople of Weimar, however, did not appreciate the institution and, in April 1925, after constant attack by the press and public, the Bauhaus moved to Dessau where new administrative, educational and residential quarters were constructed. These buildings, designed by Gropius, marked the maturation of the modern movement in architecture; they housed the Bauhaus until it was closed in 1933 by the German National Socialist government as a reputed centre of communist intellectualism. In 1928 Gropius resigned to enter private practice and was succeeded by the architect Mies van der Rohe who remained until the school was closed. .After 1933 some of the dispersed faculty went to the United States. In 1937 Lazslo Moholy-Nagy founded the New Bauhaus in Chicago (later known as the Institute of Design), which with Gropius' appointment to the school of design at Harvard, Josef Xlbers' at Black Mountain college and Mies van der Rohe's at the Illinois Institute of Technology in Chicago spread the ideas of the Bauhaus throughout the U.S.

The Bauhaus sought to end the 19th-century schism between the artist and the technically expert craftsman by training students equally in both fields. In the first years each workshop was taught by both a craftsman and an artist. Later. as the school developed its own teachers. each workshop was led by one artist-craftsman. Students were bound to complete a full legal three-year apprenticeship. .After a six-month preparatory course students went into the various training workshops (crafts snd formal) for practical instruction. As instructors in the workshops. Gropius assembled a faculty noted and admired for its brilliance, energy and productivity. Among them were the German.., Gerhnrd Marks (sculptor), Oskar Schlemmer (scenic designer). Josef Albers (painter) and Adolf Meyer (architect); the Swiss Johannes Itten (painter), Paul Klee (painter) and Hannes Meyer (architect); the Austrian Herbert Bayer (typographer); the Russian Wassily Kandinsky (painter); and the American Lyonel Feininger (painter). The Bauhaus published its own books, pamphlets and quarterly periodical, of which the most important have been translated into English.

BAUHIN, the name of a French family noted for its botanists, all of whom were physicians.

GASPARD BAUHIN (1550–1624), an anatomist and outstanding herbalist, noted for his precise descriptions, was the son of Jean Bauhin, a physician who fled earlier to Switzerland as a Protestant exile. Gaspard was born at Basel on Jan. 17, 15.50, and studied medicine at Padua, Montpellier and in Germany. In 1582 he was appointed to the Greek professorship at Basel, and in 1588 to the chair of anatomy and botany. He was afterward made city physician, professor of medicine, rector of the university and dean of his faculty. His most important botanical work was *Pinax theatri botanici* (1623). When he died at Basel on Dec. 5, 1624, he had completed only three parts of a planned 12-part folio entitled *Theatrum botanicum,* only one of which was published (1658).

JEAN BAUHIN (1541–1613), elder brother of Gaspard, after studying at Tiibingen under the German botanist Leonhard Fuchs, and traveling with the Swiss naturalist Konrad von Gesner, began to practise medicine at Basel, where he was elected professor of rhetoric in 1566. His great work, *Historia plantarum universalis,* unfinished at his death, was published at Yverdon, Switz., in 1650–51. He also wrote *Prodromus* (1619) and *De thermis aquisque medicatis* (1600).

JEAN GASPARD BAUHIN (1606–1685), the son of Gaspard, was also trained in medicine and was professor of botany at Basel for 30 years.

BAULE (BAOULE), a Twi (Twifo) people who live in the Republic of Ivory Coast between the Kumbu (Comóe) and Bandama rivers and are related to the Akan peoples of Ghana. The ancestors of the Baule had founded the states, or chiefdoms, of Amenfi and Twifo Heman but as a result of dissensions over the chieftaincy, or Stool disputes, between 1570 and 1580 some Twifo migrated from Amenfi and Heman to the area around the source of the Kumbu river. These are the ancestors of the present Baule. Others founded a Kumbu state along the Volta river, which is now the Akwamu state of Ghana. In the 18th century the Baule were joined by migrants from the Ashanti (*q.v.*), whose Warebo family tried to establish their rule over the Baule and build a chiefdom on the Ashanti model but had little success. The Baule preferred to live in independent villages formed of extended family groups. These were divided into quarters, or wards, with family compounds on either side of the main village street, a pattern also found among other Akan peoples such as the Bono.

The Baule, like the Ashanti, have a kinship organization based on matrilineal descent, succession and inheritance. They also have similar religious beliefs and practices in which ancestor worship has a prominent place. *See* also AFRICA: *Ethnography (Anthropology): West Africa.* (K. A. Bu.)

BAULE, LA (LA BAULE-SUR-MER), a fashionable seaside resort on the west coast of France near the mouth of the Loire, facing south, is in the middle of a bay with a five-mile sweep of sand. In the *département* of Loire-Atlantique, it is 48 mi. W. of Nantes by road. Pop. (1954) 13,166. The bay extends from Pornichet to Pouliguen. Behind the line of hotels bordering the front are luxurious villas scattered among the pine trees. There is a park, an open-air school, a casino, golf and tennis clubs, and a harbour for yachtsmen. Nearby are salt marshes. During the

season there is air service from St. Nazaire airport (14 mi. E.) to Paris and London. (CH. M.)

BAUMBACH, RUDOLF (1840–1905), German poet whose student songs and narrative verse were widely known, was born at Kranichfeld on the Ilm, in Thuringia, on Sept. 28, 1840, and died at Meiningen, where he was ducal librarian, on Sept. 21. 1905.

Baumbach was a poet of the vagabond school, and wrote, in imitation of Viktor Scheffel, many excellent drinking songs, among which "Die Lindenwirtin" endeared him to the German student world. But his real strength lay in narrative verse. especially concerning the scenery and life of his native Thuringia. Special mention may be made of *Frau Holde* (1881), *Spielmannslieder* (1882) and *Von der Landstrasse* (1882).

BIBLIOGRAPHY.—A. Selka, R. *Baumbach* (1924); *E.* Diez, R. *Baumbach* (1933); *F.* Tenner, R. *Baumbach als Heimatdichter* (1938). (A. Gs.)

BAUMGARTEN, ALEXANDER GOTTLIEB (1714–1762), German philosopher who established aesthetics as a distinct philosophical discipline (*see* AESTHETICS, HISTORY OF), was born in Berlin on July 17, 1714. Studying under Christian Wolff at Halle, he was subjected early to the influence of Leibniz. He was appointed extraordinary professor at Halle in 1737 and ordinary professor of philosophy at Frankfurt-on-Oder in 1740. He died in Frankfurt on May 26, 1762.

Of his writings, the *Meditationes philosophicae de nonnullis ad poema pertinentibus* (1735; new ed. with Eng. trans. by Karl Aschenbrenner and W. B. Holther, 1954) and the *Aesthetica,* 2 vol. (1750–58), are the most important, being pioneer works in the development of modern aesthetic theory. His *Metaphysica* (1739) was used by Kant in his lectures. Other works are *Ethica philosophica* (1740) and *Acroasis logica* (1761). Posthumous publications are *Jus naturae* (1763), *Philosophia generalis* (1770) and *Praelectiones theologicae* (1773).

His brother, SIEGMUND JACOB BAUMGARTEN (1706–57), was professor of theology at Halle, where Johann Salomo Semler (*q.v.*) was his pupil. His application of Wolffian methods to theology did much to modify the influence of Pietism. His chief work was *Evangelische Glaubenslehre,* 3 vol. (1759).

BAUR, ERWIN (1875–1933), German botanist best known for his studies in experimental genetics, was born at Ichenheim, Baden, on April 16, 1875. He studied medicine in the universities of Strasbourg and Kiel and obtained his M.D. degree in 1900. After practising as physician in mental diseases he entered the University of Freiburg im Breisgau to study botany and was awarded a Ph.D. in 1903.

Baur started his botanical activity in the same year as an assistant in the Institute of Botany of Berlin university and in 1911 became professor of botany in the Agricultural school of Berlin, where he founded the Institut fur Vererbungsforschung. After World War I he was instrumental in organizing an institute for the same purpose in Dahlem-Berlin and in 1929 became director of the Institut fur Zuchtungsforschung in Müncheberg. He died in Müncheberg on Dec. 2, 1933.

Baur started his work in botany as a bacteriologist but later specialized in experimental genetics. He collected wild species of *Antirrhinum* (snapdragon) in Spain and other Mediterranean regions, and investigated their behaviour under controlled crossing and under varying laboratory conditions, such as X-rays, ultraviolet light, etc. He studied also viral chlorosis of certain members of the mallow family (Malvaceae) and carried out investigations on cereals, lupins, tobacco and other important economic plants.

He founded in 1908 and edited, among other periodicals, an important journal, *Zeitschrift fur Induktive Abstammungs- und Vererbungslehre.*

Baur's publications include *Einführung in die experimentelle Vererbungslehre* (1911; 2nd ed., 1914; 3rd ed., 1930); *Physiologie und Biologie der Fortpflanzung in Kultur der Gegenwart* (1917) and numerous articles in various periodicals.

BAUR, FERDINAND CHRISTIAN (1792–1860), Protestant theologian and church historian. The 19th century is the era when study and research in Christian theology, Roman Catholic and Protestant, came to be dominated by the modem historical method. Of the movement to apply the critical historical method to theology, Baur may be regarded as the foundation, just as Adolf von Harnack (*q.v.*) is probably its fruition.

Baur was born in Schmiden, near Cannstatt, on June 21, 1792. After receiving an early training in the theological seminary at Blaubeuren, he went in 1809 to the University of Tiibingen. In 1817 Baur returned to the theological seminary at Blaubeuren as professor. In 1826 he was appointed professor of theology at Tiibingen, where he remained until his death on Dec. 2, 1860.

Baur was the founder of the Protestant "Tubingen school" (the Roman Catholic "Tubingen school" of theologians found its outstanding representative in Johann Adam Möhler [*q.v.*]). As a student and during his early career as a professor, Baur showed the influence of the philosophical and theological thought of Friedrich Schleiermacher. Thus his work of 1824–25 on the natural religion of antiquity. entitled *Symbolik und Mythologie,* interpreted the religious significance of the ancient myths on the basis of Schleiermacher's definition of religious feeling as set down in the latter's *Addresses on Religion* and in his *The Christian Faith.* Baur's early work gives evidence also of impulses from the thought of Schelling.

During his early years as a professor at Tubingen, however, Baur exchanged these influences for that of Hegel, and his fame as a theologian and church historian is due largely to his application of Hegel's philosophy to the stuff of Christian theological history. In 1835 he published a radical examination of the Pastoral Epistles, in which he employed Hegelian analysis to explain the development of early Christianity. That development was viewed as the outcome of a conflict between primitive Jewish Christianity and Gentile Christianity. According to the Hegelian categories Jewish Christianity was the thesis, to which Gentile Christianity then provided the antithesis. What emerged from the conflict was neither Jewish nor Gentile Christianity, thus neither the thesis nor the antithesis, but a synthesis, the Catholic Christianity whose workings Baur discerned in the Pastoral Epistles. He therefore assigned the Pastoral Epistles to the 2nd century and denied their Pauline authorship.

In his work *Paulus* of 1845 (English trans. 1873–75) he carried these principles into a general interpretation of the life and thought of the apostle. He contended that only the Epistles to the Galatians, Corinthians and Romans are genuinely Pauline, and that the Paul of Acts is a different person from the Paul of these genuine Epistles, the author being a Paulinist who is at pains to represent Peter as far as possible as a Paulinist and Paul as far as possible as a Petrinist. Those writings alone he considered genuine in which the conflict between Jewish Christians and Gentile Christians is clearly marked. Two years after his monograph on Paul, in 1847, Baur published a book on the four Gospels. *Kritische Untersuchungen iiber die Kanonischen Evangelien.* In this he maintained that the authors of the Gospels were conscious of the conflict between the Jewish and the Gentile parties. and that the Gospels reveal a mediating or conciliatory *Tendenz* on the part of the writers or redactors; hence the "tendency theory" is associated with the names of Baur and the Tübingen school. In keeping with this theory, Baur interpreted the Gospels as adaptations or redactions of an older Gospel, such as the Gospel of the Hebrews, of Peter, of the Egyptians or of the Ebionites. The Petrine Matthew, he maintained, bears the closest relationship to the original Gospel; the Pauline Luke is later and arose independently; Mark represents a still later development; the account of John is an idealized portrait and not historically reliable.

Despite his apparent captivity to Hegelian categories, Baur was a historical scholar of genuine independence and creativity In his later years, indeed, as his research carried him into the history of the church since the New Testament, he manifested an ever greater independence of Hegelian philosophy. On two of the cardinal doctrines of Christianity he wrote historical-theological monographs that are still of considerable value: on the doctrine of reconciliation and atonement *(Die christliche Lehre von der Versöhnung,* 1838); and on the doctrines of the Trinity and the Incarnation *(Die christliche Lehre von der Dreieinigkeit und*

Menschwerdung, 1841–43). His lectures on the history of dogma, published posthumously by his son *(Ausfiihrliche Vorlesungen iiber die christliche Dogmengeschichte,* 1865–68), helped to establish the history of dogma as a distinct theological discipline.

These works, together with his church history (*Kirchengeschichte,* 1853–63) changed theological and church-historical scholarship for generations. In the century between the beginning of Baur's work and the end of Harnack's work, Christian source materials were subjected to a critical scrutiny unparalleled in all the history of Christian historical study. The very rejection of Baur's theses by Harnack—and of Harnack's theses by later scholarship––bears witness to the importance of Baur's thought. For Christianity is a historical religion, and the sources of Christian history are therefore a legitimate subject for historical investigation and for the speculations to which such investigation leads. Thus both his disciples and his critics have carried out the basic purpose of Baur and the Tiibingen school, the interpretation of the Christian faith according to the methods and canons of critical historical scholarship.

Jahrhundert,* pp. 450 ff. (1947). (J. J. PN.)

BAUTZEN, a city of Germany which after partition of the nation following World War II became a regional capital of the German Democratic Republic in the district of Dresden, lies about 71 km. (44 mi.) E.N.E. of Dresden and 40 km. (25 mi.) W. of Gorlitz, on a granite elevation on the right bank of the upper Spree. Pop. (1959 est.) 41,294. This town in the Oberlausitz (Upper Lusatia) grew out of the Slavic settlement of Budissin. The peace of Bautzen was concluded in 1018 between the German king Henry II and the Polish king, Boleslaw I. Bautzen became German in 1031, and the capital of the Lusatian City federation in 1346. The quaint medieval skyline is dominated by the late Gothic St. Petri-Kirche which contains an undenominational church, the nave being divided in the middle; in one half, Protestant services have been held since 1524 and in the other, Roman Catholic services. Bautzen has long been the seat of the Roman Catholic bishop of Meissen. On the upper side of the town is the 15th-century Ortenburg castle. The town is a centre of the Sorbs (*q.v.*), a West Slavic people numbering about 60,000 to 70,000, also known as the Wends.

The town, which was damaged during the last days of World War II, has a varied industry including wagon and vehicle building, iron foundries, radio equipment and machinery plants. There is also a training school for heavy machinery manufacture. Bautzen is a railway junction, including the Dresden-Gorlitz line.

The Battle of **Bautzen,** 1813.—The town gives its name to the hard-fought battle of May 20 and 21, 1813, between French troops under Napoleon I, Soult and Ney and the allied forces of Prussians led by Blücher, Kleist and Yorck, and Russians commanded by Tsar Alexander I and Barclay de Tolly. Soon after dawn on May 21 it became clear that a decisive victory for the French could be won only by the intervention of Ney, who had originally been stationed nearly 40 mi. from the left of the main body. He reached Preititz at 10 A.M., an hour earlier than ordered, and halted. The respite enabled the allies to organize a fierce counterattack, and when he resumed his advance at 1 P.M. they began a general retreat eastward, the tsar directing the rearguard with the utmost skill and bravery. It was too late for the French to cut them off, and the Russo-Prussian army retired unharmed, leaving no trophies. Napoleon's tactical success was unquestionable but strategically, owing to the want of cavalry and Ney's lack of intelligent initiative, it was a *coup manquk* or barren victory. See NAPOLEONIC CAMPAIGNS.

BAUX, LES, a village of France, in the *dkpartement* of Bouches-du-Rhône, 11 mi. N.E. of Arles. Pop. (1954) 68. In the middle ages Les Baux was a flourishing town and the seat of the seigneurs des Baux, who owned the Terres Baussenques, extensive *domaines* in Provence and Dauphiné; in 1174 the principality of Orange passed by marriage to Bertrand des Baux. But in their struggles with Raymund Berengar II of Provence in the 12th century. and with the house of Anjou in the 13th century, the influence of the family declined and they were forced to abandon many of their possessions in Provence.

The village has the ruins of a chbteau with a 13th-century dungeon. In Saint Vincent's church (16th and 17th centuries) a *fête du pastrage* (adoration of the shepherds) is held on Christmas eve. At Fontvieille, 5½ mi. away. is the mill. now a museum, which inspired Alphonse Daudet's *Lettres de mon moulin.*

BAUXITE, the principal ore of aluminum, is a mixture of hydrous aluminum oxides. In 1821 P. Berthier discovered that a nonplastic. claylike material from Les Baux, near Arles, France, was practically devoid of silica, either free or combined. Analysis showed 52% alumina, 27.6% ferric oxide and 20.4% combined water. It was named "beauxite" by A. Dufrénoy in 1847; in 1861 the spelling was corrected by H. St. Clair Deville to correspond with that of the type locality. The name "bauxite" was thereafter applied to similar materials the world over and includes rocks in which silica also is an important constituent.

All bauxites are formed by thorough weathering, from many different rock types, but no one process is universally explanatory. Clay minerals may or may not be an intermediate stage, and some bauxites appear to be more truly reworked chemical precipitates than simple alteration products *in situ.* The mineralogy and associations of bauxite and the similar aluminum and iron-bearing material known as laterite (*q.v.*) have been closely examined. Some workers have tried to keep the two terms separate, with laterite indicating iron-rich deposits, but others consider that there is no sharp dividing line. Soil studies in the tropics have pointed to rainfall, seasonal fluctuations, ground-water composition and drainage rate as determining whether products of weathering are ferruginous or aluminous. Such phenomena as dialysis. electrolytic migration and electrokinetics have been claimed to play a part in formation of Indian laterites.

Varieties.—Bauxites vary with the type to which they belong, with the primary or sedimentary nature of the deposit and with their geologic history. The terms "laterite type" and "terra rossa type" were introduced to distinguish bauxites of different appearance or origin. However, some bauxites do not appear to fit in either class. Some deposits are soft, friable and structureless; some are hard, dense and pisolitic, or pealike; still others are porous but strong, or are stratified or largely pseudomorphic after parent rock. Bauxite may grade into laterite or clay. laterally or vertically. The laterite type is commonly pisolitic and mottled. Pisolites vary from buckshot size to a foot or more in diameter. Both pisolites and groundmass may exhibit great colour variations, depending on both composition and texture. Common colours are pink, cream, red, brown, yellow and gray. Exposed surface of lateritic ore is rough, often scoriaceous like lava, and in vertical faces a vermicular, or wormlike, structure with variegated colours may be seen. Such material tends to harden or reconsolidate on exposure. Although terra rossa types are granular and earthy, they also may possess pisolitic structures.

Composition and Character.—Constituent minerals are rarely recognizable in hand specimen, and even in thin section complete identification may be difficult. Combined petrography, X-ray diffraction and differential thermal analysis have shown that gibbsite (trihydrate), boehmite and diaspore (monohydrate) (*qq.v.*), alone or in mixtures, are the constituent alumina minerals. No dihydrate of alumina has been identified, but mixtures of tri- and monohydrate may approximate such a composition. Clay minerals such as kaolinite, and hematite, magnetite, goethite, siderite and quartz are common impurities. Most deposits contain rutile or anatase, with other residual minerals such as zircon. Certain minor elements such as niobium may reach unusual levels; manganese, chromium, vanadium, zirconium and phosphorus are commonly present, and cobalt, nickel, tin, gold and diamond have been found. Specific gravity of bauxite varies with type and composition from 2.45 to 3.25. Hardness also varies with type, geological age and history; monohydrates are generally harder than trihydrate types. Combined water is driven off in two main stages; trihydrate converts at about 250° C. to monohydrate with loss of two moles of water, and most of the remainder is driven off at around 550° C.

Practical dehydration is attained at about 950° C. Bauxites fuse at 1,800° C. or higher.

Occurrence and Production. — Bauxite and laterite are found in most countries, with a tendency toward tropical distribution. In the following examples parent rock types are given in parentheses. It will be seen that some of the major ore deposits are derived from rocks of medium or low alumina content. Extensive mining of monohydrate ores has been done, for example, in France, Italy, Yugoslavia and Greece (all limestone), and of trihydrate ores in Arkansas (nepheline syenite), the Guianas (granitic and dioritic rocks), and after 1950 in Jamaica (limestone). Essentially trihydrate ores occur in Ghana (shale, phyllite and schist) and Guinea (nepheline and gabbroic rocks) and in India (basalt) and Brazil (nepheline rocks). Low-grade ores in Georgia and Alabama occur on sedimentary clays. Malaya, Australia, Nyasaland, Northern Ireland, Germany and other areas contain less extensive or lower-grade deposits. Russian (Crals) and Asian deposits are largely monohydrate. Examples of compositional ranges are given in the accompanying table.

Compositional Ranges of Bauxite

Constituent	North and South America	Jamaica	West Africa	Mediterranean	Southeast Asia
Water	28%–31%	23%–29%	23%–30%		27%–30%
Silica	1%– 8%	0.5%– 4%	1%– 5%	2%–14%	3%– 8%
Titania	2%– 3%	2%– 3%	1%– 4%	2%– 3%	0.5%–10%
Ferric oxide	1%–10%	15%–22%	5%–20%	16%–22%	3%–10%
Alumina	54%–61%	48%–52%	48%–60%	55%–61%	53%–58%

Much of the silica in bauxites may be combined with alumina in clay mineral and, in ore destined for aluminum production, this silica should be less than about 10%; North American practice sets 6%–8% as top limit for Bayer treatment, a widely used process of selective leaching by a causticized soda solution, but in Europe the maximum is somewhat lower. In the second half of the 20th century ore yielding about 50% caustic-soluble alumina was considered commercial. Iron oxide is objectionable only as a diluent in the Bayer process. As a general rule, four tons of bauxite are required to yield one ton of metal.

World reserves are numbered at least in the hundreds of millions of tons. Jamaica alone has been quoted at more than 300,000,000 tons. Annual world production, exclusive of the U.S.S.R., exceeds 12,000,000 tons, of which roughly 85%–90% is for metal production. The balance is divided among chemicals, abrasives and refractories, and the petroleum industry. Soviet production is estimated at more than 1,000,000 tons annually.

United States. — From the first operation by Edward Nichols in 1883 on the claylike bauxite of northwestern Georgia to the second half of the 20th century, production developed to an important industry serving many fields, with annual production running at an average of about 1,800,000 tons.

American bauxites are predominantly trihydrate in nature as indicated above. As mined, free moisture may be 10%–20%, but this is generally driven off in kilns before marketing. The chief minerals are gibbsite, kaolinite, hematite, goethite, siderite (in some Arkansas ore), anatase or rutile and quartz.

The United States supplies of metal-grade ore suffered during World War II by extended exploitation, which gradually brought about a change in definition of commercial ore, particularly with respect to the permissible amount of combined silica. The Bayer process is less efficient with high silica ores, and a combined treatment may be employed in which, following the Bayer caustic digest, the residue is sintered with lime and soda ash. This renders additional alumina soluble, raises over-all recovery and enables material with as much as 13% silica to be utilized. The smelting step in the production of aluminum, developed simultaneously by Charles M. Hall in Oberlin, O., and Paul Héroult in France in 1886, reduces the purified alumina obtained by the Bayer process in a predominantly cryolite electrolyte.

Although Arkansas remains the centre of U.S. production, by the second half of the 20th century bauxite-consuming industries were nearly two-thirds dependent on imports from Surinam (Dutch Guiana) and Jamaica. Exploration of lower-grade bauxites and bauxitic clays in the southeastern and northwestern states was intensified following World War II, with the industry looking to lower-grade domestic reserves. Nevertheless, the Arkansas region is estimated to contain 95% of the U.S. supply of commercial ore. During and following World War II researchers in the U.S. and Canada also investigated alternative sources of alumina. Kaolinite, anorthosite, nepheline syenite and alunite can be treated by sinter processes but are not competitive with available bauxite.

Compositional restrictions on bauxite for uses other than the production of the metal affect silica, iron and water contents in particular. For abrasive purposes calcined ore with about 86% alumina, 6% silica, 3%–4% ferric oxide and 3% titania is fused in special electric furnaces. The bulk of silica and iron is removed as slag. Considerable purified alumina is also fused to yield a white abrasive of certain specific properties. For refractories, a composition of 82%–85% alumina, 9%–11% silica and 2% or less ferric oxide is required. Chemical-grade ore is again different. Bauxite is also used for aluminous cement, for aluminum sulfate for papermaking and water treatment and for aluminum chloride for petroleum treatment. Purified alumina also is used as a catalyst carrier, an inert filler in plastics and rubber, and in ceramics. The consumption of bauxite in the U.S. in the early 1960s was about 3,500,000 tons annually, with about 85% going into the aluminum industry. See ALUMINUM; see also Index references under "Bauxite" in the Index volume.

BAVARIA (German BAYERN), the largest of the *Länder* of the Federal Republic of Germany, though second to North Rhine-Westphalia in population. Bavaria, since the loss of the Palatinate in 1945, has an area of 70,549 sq.km. (27,239 sq.mi.). It is bordered by Austria on the south, Czechoslovakia on the east, Thuringia and Lower Saxony on the north, Hesse on the northwest and Baden-Württemberg on the west.

Physical Geography.—Bavaria, in the southeast of Germany, is framed by the Alps to the south, the Böhmerwald (Bohemian forest) to the east, and the Rhön and Spessart highlands to the north. It merges into the Main and Neckar lands of Württemberg to the west. The Danube river roughly divides the country into a northern and a southern half between which there are marked general contrasts.

The northern half falls into five main physical divisions from west to east. The northwest corner of the state embraces the Spessart, a thickly wooded plateau of horizontal red sandstone rocks. Then follows the upper Main basin, an undulating limestone platform with a cover of loam soils. The Fränkische Hohe is a north-south sandstone plateau (1,500 ft. high), scarped to the west and sloping gradually to the east. The valley of the Rednitz has sandy soils that are covered with pine forests around Nürnberg. The Fränkische Alb is a wooded limestone plateau, with a deeply dissected westward-facing scarp. The Ries, centred on Nordlingen, is a circular, fertile lowland below the level of the plateau. To the east, in Oberpfalz, highlands of crystalline rocks are forested with spruce and fir; across them stretches the north-south valley of the Naab in a damp and wooded lowland.

The southern half is the Bavarian plateau. This lies between the Danube and the Alps and narrows to the west and east. Its altitude rises from about 1,500 ft. along the Danube to 3,000 ft. at the foot of the Alps. It is crossed by the valleys of many rivers from the Alps draining northward to the Danube. Its main physical features are due to the effects of valley glaciers that formerly issued from the Alps. Rolling hill country lies east of the Lech, on which there are considerable areas of fertile loam soils. The glacial gravels west of the Lech are wooded and separated into strips by wide south-north valley floors. A fluvioglacial plain is centred on Munich. Arcuate belts of wooded morainic hills

TABLE I.—*Average Temperature Ranges in Bavaria*

Location	Height above sea level	Average temperature (° F.)	
		January	July
Würzburg	587 ft.	32	65
Nürnberg	1,050 ft.	31	65
Munich	1,736 ft.	28	63
Zugspitze	9,721 ft.	12	35

in the foot of the Alps and between them are several large lakes. The Danube valley has fertile tracts of drained bogland.

Apart from the Main valley, which is one of the warmest parts of Germany, Bavaria has in general a cold climate (see Table I). The total precipitation at Munich is 34 in. as compared with 23 in. at Bayreuth Wiirzburg has an average of about 28.5 days with snowfall, as compared with 53 at Munich, and 181 at the Zugspitze (9,721 ft.), Germany's highest peak. (R. E. DI.)

HISTORY

The earliest known inhabitants of the country afterward called Bavaria were highly civilized Celts, who were subdued by the Romans just before the opening of the Christian era, their land being included in the province of Raetia. The cities of Augsburg, Regensburg and Passau were originally Roman colonies. During the 5th century the district was ravaged by the troops of Odoacer and, after being almost depopulated, was occupied by tribes who, pushing along the valley of the Danube, settled there between A.D. 488 and 520. Their origin is disputed, but they were composed of a mixture of Germanic tribes and were known as *Baivarii* or *Baiuwarii,* names derived most probably from *Baya* and given to them because they came from *Baya-Hemum* (between Brno and Lake Balaton). Their country was bounded by the Enns, the Danube, the Lech and the Alps.

Frankish Influence.—The Bavarians soon came under the dominion of the Franks and were ruled from about 555 to 788 by dukes of the Agilolfing family, possibly of Frankish descent. For a century and a half these dukes resisted the inroads of the Slavs, and by the time of Duke Theodo I (d. 717) were independent of the feeble Frankish kings. When Charles Martel became the virtual ruler of the Frankish realm. he brought the Bavarians into strict dependence, and Pepin the Short was equally successful in maintaining his authority.

The first heralds of Christianity in Bavaria were wandering Irish and Scottish friars. They came from Burgundy (from the monastery at Luxeuil) probably as early as the beginning of the 7th century. In the second half of the 7th century the wandering bishops St. Marinus and Annianus worked in the Upper Bavarian alpine foreland, around Bad Aibling. The mission of the three "Bavarian apostles," St. Rupert (*q.v.*) in Salzburg, St. Emmeram in Regensburg and St. Korbinian in Freising, at the beginning of the 8th century, was of more lasting effect. Their work was furthered by Duke Theodo, and Rupert in particular founded several religious houses. St. Boniface (*q.v.*) organized the Bavarian church (739) into the bishoprics of Salzburg, Freising, Regensburg and Passau and thus established the first national church right of the Rhine.

Union With Carolingian **Empire.**—Tassilo III, who became duke of the Bavarians in 749, did homage to the Frankish king Pepin the Short on coming of age in 757, but, during the early years of the reign of Charlemagne he acted as an independent ruler. He founded several religious houses (Wessobrunn, Innichen in the Pusterthal and Rremsmiinster, among others); and in this the bishops and nobility would not lag behind the duke and the ducal house. A wider movement of settlement swept Bavarian territory and pushed the frontiers back in the southeast, east and north. Tassilo's position as possessor of the Alpine passes, as an ally of the Avars and as son-in-law of the Lombard king Desiderius was so serious a menace to the Frankish kingdom that Charlemagne determined to crush him. The details of this contest are obscure. The outcome, however, was that Tassilo had to surrender his duchy in 788. The country was ruled by Gerold, a brother-in-law of Charlemagne, until his death in a battle with the Avars in 799, when its administration was assimilated with that of the rest of the Carolingian empire.

When the empire was partitioned in 817, Bavaria was assigned to Louis the Pious and then to his son Louis the German, king of the Eastern Franks, and to the latter in part by the treaty of Verdun Louis, who called himself king of Bavaria, made Regensburg his capital and was active in improving the condition of Bavaria. When he divided his possessions in 865, it passed to his eldest son Carloman, and after his death in 880 formed part of the territories of the emperor Charles III the Fat. Its defense was left by this incompetent emperor to Arnulf, an illegitimate son of Carloman, and it was mainly because of the support of the Bavarians that Arnulf was able to take the field against Charles in 887 and to secure his own election as German king. On his death in 899 Bavaria, which was the centre of the East Frankish kingdom, passed to his son, Louis the Child, during whose reign it was constantly ravaged and all but depopulated by the Hungarians.

For the defense of Bavaria the mark, or duchy, of Carinthia had been erected on the southeastern frontier, which during the reign of Louis the Child was ruled by Liutpold. count of Scheyern, who fell in the disastrous defeat of the Bavarians by the Hungarians at Pressburg (Bratislava) on July 4, 907. His son Arnulf I rallied the remnants of the race and drove back the Hungarians. As early as 909 Arnulf styled himself "by the grace of God duke of Bavaria and the adjacent territories."

The Bavarian Duchy.—Refusing to acknowledge the supremacy of the German king Conrad I, Arnulf was unsuccessfully attacked by Conrad. After Conrad's death (Dec. 918) King Henry I made war on Arnulf, who also set himself up as king. The *Salzburg Annals* say that Arnulf was chosen to be ruler *"in regno Teutonicorum,"* but this probably means only in his independent kingdom of Bavaria, with which he was content after recognizing Henry as German king (921). He appointed bishops, struck coins, issued laws and pursued his own foreign policy inclined toward Italy. A similar conflict took place between Arnulf's son Eberhard and Otto I the Great; but Eberhard was less successful than his father, for in 938 he was driven from Bavaria by his uncle Berthold, who received the duchy, with reduced privileges. from Otto. When Berthold died in 947, Otto conferred the duchy upon his own brother Henry (Henry I of Bavaria), who had married Judith, a daughter of Arnulf; Henry's short reign was spent mainly in disputes with his people. The ravages of the Hungarians ceased after their defeat by the emperor Otto on the Lechfeld in 955. In 955 also Henry I was succeeded by his young son Henry II the Quarrelsome (d. 995). The' royal succession was still by no means rigidly fixed and the ambitious and forceful Henry, a cousin of the king Otto II, made an attempt to gain the German crown (975). The attempt miscarried; and in 976 Henry was formally deposed, Bavaria being given to Otto, duke of Swabia. At the same time Carinthia was made into a separate duchy. In 985, Duke Henry II recovered Bavaria from the Luitpolding Henry III, who had succeeded Otto of Swabia in 983. Henry II proved himself a capable ruler by establishing internal order, issuing important laws and reforming the monasteries. His son reached the goal toward which his father had striven in vain, being elected German king as Henry II in 1002. He gave Bavaria to his brother-in-law, Henry of Luxembourg, after whose death in 1026 it passed successively to Henry, afterward the emperor Henry III, and then to another member of the family of Luxembourg, as Duke Henry VII. In 1061 the empress Agnes, mother of and regent for the German king Henry IV, entrusted the duchy to Otto of Nordheim, who was deposed by the king in 1070, when the duchy was granted to Otto's son-in-law Count Welf, son of Azzo II, of Este. In consequence of his support of Pope Gregory VII, in his quarrel with Henry, Welf lost but subsequently regained Bavaria and was followed successively by his sons, Welf II in 1101, and Henry IX in 1120. Henry was succeeded in 1126 by his son Henry X the Proud, who obtained the duchy of Saxony in 1137. King Conrad III, however, refused to allow two duchies to remain in the same hands, declared Henry deposed and bestowed Bavaria upon Leopold IV, margrave of Austria.

When Leopold died in 1141, the king retained the duchy

himself. It continued to be the scene of considerable disorder, and in 1142 he entrusted it to Henry II Jasomirgott, margrave of Austria. The struggle for its possession continued until 1156, when the emperor Frederick I Barbarossa persuaded Henry to give up Bavaria to the Welf Henry the Lion (*q.v.*), duke of Saxony.

Rule of the **Wittelsbachs.**—In 1180 Henry the Lion was placed under the imperial ban, and the duchy was given by Frederick I to Otto, a member of the old Bavarian family of Wittelsbach (*q.v.*) and a descendant of the counts of Scheyern. After the destruction of the Carolingian empire the borders of Bavaria had been continually changing and for a long period after 955 this process was one of expansion. To the west the Lech still divided Bavaria from Swabia, but on three other sides the duchy had been extended and embraced a large area north of the Danube. During the later years of the rule of the Welfs, however, the extent of Bavaria had been reduced. The energies of Henry the Lion had been devoted to his northern rather than his southern duchy, and, when the dispute over the Bavarian succession was settled in 1156, the district between the Enns and the Inn had been transferred to Austria. The increasing importance of Styria, elevated into a duchy in 1180, and Tirol had diminished the strength of Bavaria, which now had few opportunities for expansion.

When Otto of Wittelsbach was invested with Bavaria in Sept. 1180, the duchy was bounded by the Bohmerwald, the Inn, the Alps and the Lech; and the power of the duke was practically confined to his extensive private domains around Wittelsbach, Kelheim and Straubing. Otto was succeeded in 1183 by his son Louis I, who took a leading part in German affairs during the earlier years of the reign of the emperor Frederick II, and was assassinated at Kelheim in Sept. 1231. Louis was the real founder of the Bavarian principality, and he recklessly used every means to extend his power. He increased his dominion, especially toward the east and north, by astute policy, by inheritance, by purchase, by feudal acquisitions and by force; founded cities (Landshut, Straubing, Landau.and Iser); and also won the Palatinate of the Rhine (1214). His son Otto II increased the area of his lands mainly by purchases; and he had strengthened his hold upon the duchy before he died in Nov. 1253. The efforts of the dukes to consolidate their power over the duchy had been fairly successful; but they were soon vitiated by partitions among different members of the family, which for 250 years made the political history of Bavaria little more than a chronicle of territorial divisions, family feuds and petty squabblings. The duchy was, however, enriched by a many-sided intellectual and artistic life in the individual newly risen courts and by a very able administration.

Division of the Duchy.—The first division was made in 1255 between Louis II the Stern (1253–94) and Henry I (XIII, 1253–90), the sons of Duke Otto II, Louis obtaining the western part of the duchy, afterward called Upper Bavaria, and Henry the eastern, or Lower Bavaria. In the course of a long reign Louis became the most powerful prince in southern Germany. He was the uncle and guardian of Conradin of Hohenstaufen, and, when this prince was put to death in Italy in 1268, Louis and his brother Henry inherited the domains of the Hohenstaufen in Swabia and elsewhere. Louis helped Rudolf of Habsburg to secure the German throne in 1273, married the new king's daughter Mechtild and aided him in his campaigns. For some years after the death of Louis in 1294 his sons Rudolf I (d. 1319) and Louis, afterward the emperor Louis IV, ruled their duchy in common; but in 1310 a division of Upper Bavaria was made, by which Rudolf received the land east of the Isar, with the town of Munich, and Louis the district between the Isar and the Lech with his capital at Ingolstadt. This arrangement, however, soon led to war between the brothers, and in 1317, three years after he had been chosen German king, Louis compelled Rudolf to abdicate, and for 12 years ruled alone over the whole of Upper Bavaria. Munich rose to importance and became the focus of the great intellectual church-state controversies of the time. But in 1329 Louis concluded the treaty of Pavia with Rudolf's sons, Rudolf and Rupert, to whom he transferred the Palatinate of the Rhine and also a portion of Upper Bavaria north of the Danube which was afterward called the Upper Palatinate. At the same time it was decided that the electoral vote should be exercised by the two lines alternately, and that if either branch of the family became extinct the surviving branch should inherit its possessions.

When in 1290 Henry I of Lower Bavaria died, the duchy was ruled by his three sons, Otto III, Louis III and Stephen I. Otto, who was king of Hungary from 1305 to 1308, died in 13'12, leaving a son, Henry III; Louis died childless in 1296; and Stephen left two sons at his death in 1310, namely, Henry II and Otto IV. Henry III died in 1333 and his cousin Otto IV in 1334, and as neither left any sons the whole of Lower Bavaria passed to Henry II. Dying in 1339, Henry left an only son, John I, who died childless in the following year, when the emperor Louis IV secured Lower Bavaria and united the whole duchy under his sway. The union of Bavaria under Louis lasted seven years, with much benefit to the country. When he died in 1347, he left six sons to share his possessions, who agreed upon a division of Bavaria in 1349. Its history, however, was complicated by its connection with Brandenburg, Holland and Tirol, all of which had also been left by the emperor to his sons. All six brothers exercised some authority in Bavaria; but only three left issue, and of these the eldest, Louis, margrave of Brandenburg, died in 1361, his only son Meinhard dying two years later without issue. The two remaining brothers, Stephen II and Albert I, ruled over Bavaria-Landshut and Bavaria-Straubing respectively, and when Stephen died in 1375 his portion of Bavaria was ruled jointly by his three sons. In 1392, when all the lines except those of Stephen and Albert had died out, an important partition took place, by which the greater part of the duchy was divided among Stephen's three sons, Stephen III, Frederick and John II, who founded respectively the lines of Ingolstadt, Landshut and Munich. Albert's duchy of Bavaria-Straubing passed on his death in 1404 to his son William II, and in 1417 to his younger son John, who resigned the bishopric of Liège on becoming duke. When John died in 1425, this family became extinct, and after a contest between various claimants Bavaria-Straubing was divided between the three remaining branches of the family.

The main result of the threefold division of 1392 was the temporary eclipse of Bavaria. Neighbouring states encroached upon its borders and the nobles ignored the authority of the dukes, who for 50 years were mainly occupied with internal strife. This condition of affairs, however, was not wholly harmful. The government of the country and the control of the finances passed mainly into the hands of an assembly called the Lnndfag or *Landschaft,* which had existed since the beginning of the 14th century. The towns, assuming a certain independence, became strong and wealthy as trade increased, and the citizens of Munich were often formidable antagonists to the dukes. Thus a period of disorder saw the growth of representative institutions and of a strong civic spirit. The rule of Stephen III, duke of Bavaria-Ingolstadt, was marked by struggles with various towns and with his brother, John of Bavaria-Munich. Dying in 1413, he was followed by his son Louis, called the Bearded, a restless and quarrelsome prince, who had played an important part in the affairs of France, where his sister Isabella was the queen of King Charles VI. About 1417 he became involved in a violent quarrel with his cousin, Henry of Bavaria-Landshut, fell under both the papal and the imperial ban and in 1439 was attacked by his son Louis the Lame. This prince, who had married a daughter of Frederick I of Hohenzollern, margrave of Brandenburg, was incensed at the favour shown by his father to an illegitimate son. Aided by Albert Achilles, afterward margrave of Brandenburg, he took the elder Louis prisoner and compelled him to abdicate in 1443. When Louis the Lame died in 1445, his father came into the power of his enemy, Henry of Bavaria-Landshut, and died in prison in 1447. The duchy of Bavaria-Ingolstadt passed to Henry, who had succeeded his father Frederick as duke of Bavaria-Landshut in 1393, and whose long reign was almost entirely occupied with family feuds. He died in July 1450, and was followed by his son, Louis IX the Rich, and about this time Bavaria began to recover some of its former importance. Louis IX expelled the Jews from his duchy, took some steps for the security of traders and improved both the administration of justice and the condition of the finances. In

1472 he founded the University of Ingolstadt, which very soon achieved a prominent position, and he made an attempt to reform the monasteries. On his death in 1479 he was succeeded by his son George the Rich, who died without sons in Dec 1503, hereupon a war broke out for the possession of his duchy.

Bavaria-Munich passed, on the death of John II in 1397. to his sons Ernest and William III, but they only obtained possession after a struggle with Stephen of Bavaria-Ingolstadt. Both brothers were then engaged in warfare with the other branches of the family and with the citizens of Munich. William. a loyal servant of the emperor Sigismund, died in 1435, leaving an only son, Adolf, who died five years later; and Ernest died in 1438. In 1440 the whole of Bavaria-Munich came to Ernest's son Albert, whose attempts to reform the monasteries earned for him the surname of Pious. He died in 1460. leaving five sons, the two elder of whom, John IV and Sigismund, reigned in common until the death of John in 1463. The third brother, Albert IV the Wise (d. 1508), who had been educated for the church, joined his brother in 1465 and, when Sigismund abdicated two years later, became sole ruler of Bavaria-Munich, in spite of the claims of his two younger brothers.

(L. LK.)

Reunion of the Duchy and Consolidation. — In 1487 Albert married Kunigunde, daughter of the Habsburg emperor Frederick III, partly in order to secure inheritance rights, but Bavarian designs for aggrandizement were checked in 1488 by the foundation of the Swabian league, and the duke, faced also with domestic difficulties, had to abandon hopes of expansion at the expense of the Habsburgs in the treaty of Augsburg (1492). When George the Rich of Landshut left his duchy on his death in 1503 to his son-in-law Rupert of the Palatinate, Albert claimed the inheritance as the nearest male heir. In the war which followed, Albert had the support of his brother-in-law the emperor Maximilian and defeated Rupert, but had to agree to a compromise which, while it secured him Landshut, gave the Upper Palatinate north of the Danube to Rupert's sons. Maximilian received some Tirolese possessions as a reward. In 1506 Albert established by decree the rule of primogeniture for the whole of Bavaria, an act of profound importance which made Bavaria, for the time being, the largest purely German state However, after Albert's death (1508), the elder of his two sons. William IV (1508–50) was eventually forced by the younger. Louis X. to yield a share in the government and a part of the duchy to him. Louis achieved this concession (1516) by allying himself with the estates, with whom William was constantly at odds. Later, however, with the help of his chancellor Leonhard von Eck, a jurist who aimed at strengthening the prerogative according to the principles of Roman law, William systematically broke the power of the estates, and the unity of Bavaria was restored on the death of Louis in 1545.

William regarded the Reformation primarily as a threat to authority and took measures against the spread of non-Catholic doctrines. In recognition of these measures the papacy granted him larger rights of control over the church. William, however, did not allow his Catholicism to interfere with political considerations. He was usually to be found in opposition to the Habsburgs and allied himself with the Protestant princes of the League of Schmalkalden, and in 1532 the first of many treaties securing French subsidies for Bavaria was concluded. In 1546, however, Bavarian policy changed abruptly to an alliance with the Habsburgs, following the introduction of the Reformation in the Palatinate. William's heir, Albert, was married to the elder daughter of the Habsburg Ferdinand I, and there were vague promises that the Wittelsbachs might one day inherit some Habsburg dominions on the extinction of their male line. William then maintained an attitude of partisan neutrality, which contributed to Charles V's victory at Mühlberg in 1547.

William's son Albert V (1550–79); a great patron of art. made some concessions to the Protestants in the early years of his reign as he could not afford to antagonize the estates, who demanded some relaxation of the pro-Catholic regulations. Even so, he established the Jesuits (whom his father had introduced into Bavaria) at the University of Ingolstadt in 1556. With the revival of Catholicism following the Council of Trent, Albert felt strong enough to strike when, in 1564, letters were discovered which revealed a nascent conspiracy among the Protestant nobles. Bavaria then became a strictly Catholic country. Albert's son William V (1579–97) extended the influence of his dynasty over the church. In 1583 a concordat gave papal sanction to a strengthening of ducal control over the clergy. In the same year William's younger brother Ernest became archbishop and elector of Cologne, being the first of the long series of Wittelsbach archbishop-electors which only terminated in the middle of the 18th century. William was an ineffective ruler under whom finance and administration fell into evil days and in 1597 he abdicated.

William V's son Maximilian I (1597–1651) used absolutist methods to restore order in finance and administration, enabling Bavaria to play a considerable part in European affairs. His dilemma was that, whereas his devout Catholicism and his desire to acquire for himself the electoral dignity held by the Protestant Palatinate branch of his family inclined him toward an alliance with his cousin the emperor Ferdinand II, his leading position among the German princes made him particularly sensitive to any strengthening of imperial power. His leadership of the Catholic league was decisive in the early Habsburg victories in the Thirty Years' War (*q.v.*), and he was well rewarded when he secured both the position of elector (in 1623) and the Upper Palatinate. In 1630, however, as leader of the opposition of both the Catholic and Protestant estates to the growing power of the emperor, he forced the reluctant Ferdinand II to dismiss Wallenstein and with him his independent imperial military power. During the later phases of the Thirty Years' War Bavaria suffered invasion and devastation by Swedish and French armies. In the peace of Westphalia (1648), however, Bavaria retained both the Upper Palatinate and the position of elector.

The reign of Maximilian's son Ferdinand Maria (1651–79) was necessarily devoted to reconstruction. His son Maximilian II Emanuel (1679–1726) had a restless character and was full of schemes which were of little benefit to his country. His marriage to the archduchess Maria Antonia, daughter of the emperor Leopold I and the Spanish infanta Margaret (daughter of Philip IV of Spain), gave him hopes that his son Joseph Ferdinand would succeed to the Spanish crowns, but Joseph Ferdinand died in 1699. In the War of the Spanish Succession, Maximilian sided with the French. After the defeat of Blenheim (1704), in which his army shared, he was dispossessed of his territory, but was restored by the peace of Baden (1714). His son from a later marriage. Charles Albert (1726–45), took advantage of the death of the Habsburg emperor Charles VI without male heirs in 1740 to have himself elected Holy Roman emperor and king of Bohemia, as Charles VII, but could not make good his position against Charles VI's heiress Maria Theresa and spent most of his imperial reign as a fugitive from Bavaria (see AUSTRIAN SUCCESSION, WAR OF THE). His early death in Jan. 1745 allowed a settlement with the Habsburgs, and in the peace of Füssen (April 1745) Bavaria escaped without territorial losses.

Charles Albert's son Maximilian III Joseph (1745–77) pursued a policy of reconstruction and economic development and concerned himself with his people's welfare. On his death, however, the line descended from the emperor Louis IV became extinct, and in 1777 Bavaria passed to the head of the senior branch of the Wittelsbachs, the elector Charles Theodore of the Palatinate. Thus Bavaria and the Palatinate (to which Jiilich and Berg had been added) were reunited for the first time since the partition of 1329.

The emperor Joseph II took this opportunity to put forward a claim to about one-third of Bavaria and sent troops across the frontier, with the secret consent of Charles Theodore nho. having no legitimate heirs, hoped, in return, for the elevation of his natural children to the status of princes of the empire. The protests of the next heir, Charles, duke of Zweibriicken, supported by Frederick the Great of Prussia, led to the War of the Bavarian Succession (*q.v.*). By the peace of Teschen (May 13, 1779) only the Inn district was ceded to Austria, and the succession was secured to Charles of Zweibrucken. Meanwhile Charles Theodore abandoned his predecessor's enlightened internal policy, and the

government was inspired by the narrowest clericalism.

The Revolutionary Wars.—In 1792 the French Revolutionary armies overran the Palatinate; in 1795 the French, under J. V. Moreau, invaded Bavaria itself, advanced to Munich—where they were received with joy by the long-suppressed liberals—and laid siege to Ingolstadt. Charles Theodore fled to Saxony, leaving a regency to arrange an armistice with Moreau (Sept. 7, 1796), in return for a heavy contribution. Immediately afterward Moreau was forced to withdraw, but before the death of Charles Theodore (Feb. 16, 1799) the Austrians had again occupied the country. The new elector Maximilian IV Joseph, a younger brother of Charles of Zmeibrucken, succeeded to a difficult inheritance. Though his own sympathies and those of his minister, M. J. von Montgelas, were French rather than Austrian, the state of the Bavarian finances and the disorganization of the troops placed him helpless in the hands of Austria. On Dec. 2, 1800, Bavaria shared in the Austrian defeat at Hohenlinden, and Moreau once more occupied Munich. By the treaty of Lunéville (Feb. 9, 1801) Bavaria lost the Palatinate and the duchies of Zweibriicken and Julich.

The influence of Montgelas now gave Bavarian policy a new direction. On Aug. 24 a separate treaty of peace and alliance with France was signed at Paris by which compensation was promised. partly at the expense of Austria, for the territory on the left hank of the Rhine ceded at the treaty of Lunéville. Accordingly, in the territorial rearrangements of 1803, Bavaria received the bishoprics of Wurzburg, Bamberg, Augsburg and Freising, part of that of Passau, the territories of 12 abbeys and 17 cities, the whole forming a compact territory.

Pursuing the policy of alliance with France, Bavarian troops fought in Napoleon's Ulm-Austerlitz campaign of 1805, and by the treaty of Pressburg (Dec. 26) the principality of Eichstatt. the margraviate of Burgau, the lordship of Vorarlberg, the Tirol and other territories were to be added to Bavaria. On the other hand Wiirzburg was to be ceded by Bavaria to the elector of Salzburg in exchange for Tirol. The treaty also acknowledged the assumption by the elector of the title of king, as Maximilian I, which formally took place on Jan. 1, 1806. Externally the freedom of Bavaria continued to be restricted by the power of Napoleon—from July 1806 onward technically in his capacity of protector of the Confederation of the Rhine, which the new kingdom joined. Internally, however, full sovereignty provided the basis for the creation of a modern state. Traditional privileges were swept away, often ruthlessly, by Montgelas' central bureaucracy. His reforms were anticlerical in spirit and many monasteries were secularized. French pressure, moreover, helped to bring about equality before the law, universal liability to taxation. abolition of serfdom, liberty of conscience and some individual constitutional safeguards proclaimed in the constitution of May 1, 1808.

Again engaged in war with Austria on the side of France in 1809, Bavaria by the treaty signed at Schonbrunn on Oct. 15 ceded southern Tirol to Italy, receiving as compensation parts of Salzburg, the Inn district, Hausruck and the principalities of Bayreuth and Regensburg. In 1813, however, a few days before the battle of Leipzig, Bavaria made a timely switch to the anti-French side with the treaty of Ried (Oct. 8). In the ensuing territorial settlement, which was only concluded in 1816, Bavaria lost much of what had been gained under the treaty of Schonbrunn but received Wiirzburg and Aschaffenburg and regained parts of the Rhenish Palatinate on the left bank of the Rhine.

Constitution of 1818.—Meanwhile on Feb. 1, 1817, Montgelas had been dismissed because of his reluctance to concede a liberal constitution. On May 26, 1818, the constitution was proclaimed. The parliament was to consist of two houses with the lower house elected on a very narrow franchise. Religious equality and the rights of Protestants were guaranteed—concessions which were denounced at Rome as a breach of the new concordat that had just been concluded (1817). The parliament was hardly opened (Feb. 5, 1819) before the doctrinaire radicalism of some of its members so alarmed the king that he considered taking repressive measures, but the parliament gradually moderated its tone and Maximilian ruled until his death as a model constitutional monarch. (See also MAXIMILIAN I.)

Louis I.—On Oct. 13, 1825, Maximilian was succeeded by his son Louis I, the earlier years of whose reign were marked by a liberal spirit and by financial reform; but the revolutions of 1830 in France and in Germany and the opposition of the parliament to his expenditures in France and in Germany on building and in works of art frightened him into reaction. In 1837 the Ultramontanes came into power with Karl von Abel (1788–1859) as prime minister. Clericalism now gained the upper hand; the Protestants were harried and oppressed; and a rigorous political censorship was imposed. The king's infatuation with an Irish adventuress, Lola Montez, helped to bring about the collapse of the regime. Ultramontanes and radicals, equally incensed at her influence, joined in riotous demonstrations in 1847. Neither the Protestant Georg Ludwig von Maurer, who had succeeded Abel as minister, nor his successor, Prince Ludwig von Oettingen-Wallerstein, the head of the cabinet nicknamed the "Lolaministerium," was able to restore order; and on March 20, 1848, unable to deal effectually with the further crisis caused by the Paris revolution, the king abdicated in favour of his eldest son, Maximilian II. (Louis I's second son Otto had become king of Greece as Otho I in 1832).

Anti-Prussian Policy.—In dealing with the movement for German unity, Maximilian II's aim was to avoid having Bavaria crushed by the superiority of a Protestant Prussia in a Germany which excluded Austria. He therefore refused to support a hereditary German emperorship in Prussian hands. Similarly by refusing to join the Alliance of the Three Kings (of Prussia, Saxony and Hanover) of May 1849, he enabled Saxony and Hanover to withdraw from it in accordance with an escape clause stipulating that Bavarian abstention would constitute grounds for resignation from the alliance. In Feb. 1850, Bavaria founded the Alliance of the Four Kings, with Wurttemberg, Hanover and Saxony. This was in accordance with the aim of the king and his minister L. von der Pfordten (1811–80) of establishing the medium states—of which Bavaria was the biggest—as a third force in Germany to counter the preponderance of Austria and Prussia. Bavaria propagated the idea of a German "directorate of three" (*Trias*). In the events which led to the humiliation of Prussia at Olmutz in 1850 and to the restoration of the old diet of the Confederation, Bavaria cast its lot with Austria. Von der Pfordten's reactionary internal policy, though less severe than that of statesmen elsewhere in Germany, led nonetheless from 1854 onward to a struggle with the parliament, which ended in the dismissal of his ministry on March 27, 1859. He was succeeded by Karl Freiherr von Schrenck-Notzing (1806–84), who introduced important reforms including the separation of the judicial and executive powers an the drawing up of a new criminal code.

Maximilian was succeeded on March 10, 1864, by his son, Louis II, a youth of 18. The government was at first carried on by Schrenck and Von der Pfordten in concert. Schrenck soon retired, when the Bavarian government, in order to maintain its position in the Prussian *Zollverein* (customs union), found it necessary to become a party to the Prussian commercial treaty with France, signed in 1862.

In the complicated Schleswig-Holstein question (*q.v.*) Bavaria consistently opposed Prussia and finally, in 1866, sided actively with Austria. (See SEVEN WEEKS' WAR.)

Union With the German Empire.—The rapid victory of the Prussians and Bismarck's moderation paved the way for a complete revolution in Bavaria's relation to Prussia and the German question. The South German confederation, contemplated by the treaty of Prague, never came into being; and, though Prussia, in order not prematurely to excite the alarm of France, opposed the suggestion that the southern states should join the North German confederation, an offensive and defensive alliance with Prussia was signed at Berlin on Aug. 22, 1866, in reaction against the French demand for "compensation" in the Palatinate. In the Franco-German War of 1870–71, the Bavarian army marched against France under the command of the Prussian crown prince.

In Dec. 1870, Louis sent a letter to the king of Prussia, asking him to become German emperor. The letter had been drafted by Bismarck, who gave the king of Bavaria the promised reward of secret donations from the *Welfenfonds,* the confiscated fortune of

Louis's former comrade in arms, George V of Hanover. Earlier, on Nov. 23, 1870, a treaty had been signed between Bavaria and the North German confederation, by which, though Bavaria became an integral part of the new German empire, it received a larger measure of sovereign independence than any of the other constituent states. Thus it retained a separate diplomatic service, military administration and postal, telegraph and railway systems. The treaty was ratified by the Bavarian chambers on Jan. 21, 1871, in spite of the opposition of the Catholic-Federalist "patriot" party. Bavaria became involved in the *Kulturkampf* ("Struggle of outlooks" between the Prussian government and Rome) that followed the promulgation in 1870 of the dogma of papal infallibility. Munich university, where Johann Josef Ignaz von Dollinger (*q.v.*) was professor, became the centre of the opposition to the new dogma, and the Old Catholics (*q.v.*) were protected by the king and the government. The federal law expelling the Jesuits was proclaimed in Bavaria on Sept. 6,1871. On March 31, 1871, moreover, the bonds with the rest of the empire had been drawn closer by the acceptance of a number of laws of the North German confederation, of which the most important was the new criminal code, which was finally put into force in Bavaria in 1879. The opposition of the "patriot" party, however, reinforced by the strong Catholic sentiment of the country, continued powerful, and the king's support for successive liberal ministeries alone prevented its finding disastrous expression in parliament.

Regency of Prince **Luitpold.**—Meanwhile, Louis II and his brother Otto I (d. 1916) both having been declared insane, the heir presumptive, their uncle Luitpold, was proclaimed regent on June 7, 1886; six days later Louis committed suicide. During Luitpold's long rule Bavaria shared in the common prosperity of Germany, but it was long before it forgot its particularism.

The Catholic-Clerical party came into power in Feb. 1912, when Georg von Hertling formed a cabinet. In December of the same year Luitpold died; and on Nov. 5, 1913, his son Louis III, who had succeeded him as regent, was made king even though his cousin Otto I was still alive. Nine months later Germany entered World War I.

Revolution of 1918.—A pacifist Independent Socialist, Kurt Eisner (*q.v.*), a German Jewish journalist from Berlin, took advantage of the war weariness of the population to depose the Wittelsbach dynasty in the night of Nov. 7–8, 1918—before the Berlin revolution—and to proclaim a Bavarian republic with himself at its head. King Louis III fled, thus ending the rule of one of the oldest European dynasties. After the republic had been proclaimed throughout Germany, Eisner became a prominent protagonist of Bavarian rights and of an admission of German war guilt. The disastrous failure of the Independent Socialists at the state parliament elections in Jan. 1919 fatally weakened Eisner's political influence. The following month, he was murdered by a young Bavarian nobleman. There were fresh revoluntionary outbreaks, particularly in Munich. The new government led by the orthodox Social Democrat Johannes Hoffmann and the state parliament went to Bamberg. Munich became the scene of operations of the "Red Terror" of the workers' and soldiers' councils (*Räterepublik*). The insecurity of law and order in turn led to the formation of citizens' defense corps (Einwohnerwehren) and of the free corps. These helped the units of the Reich army which recaptured Munich in May 1919. Their ruthlessness made people speak of the rule of the "White Terror."

Constitution of 1919.—The new Bavarian constitution was passed by the state parliament at Bamberg in Aug. 1919, shortly before its return to Munich. In accordance with the Weimar constitution, Bavaria became a parliamentary republic; a move to have a president as head of the Bavarian state failed. The centralism of the Weimar constitution led to much criticism in Bavaria. To assert Bavarian rights, the Bavarian wing of the Roman Catholic Reich Centre party seceded from it and formed the Bavarian People's party (Bayerische Volkspartei). While not subversively anti-Republican, this party hankered after the Wittelsbach dynasty and never completely gave up the idea of a Bavarian restoration. In 1920, Coburg acceded to Bavaria after a plebiscite.

Conflicts with the **Reich.**—The Hoffmann government resigned in March 1920 as a result of pressure put on it by the citizens' defense corps and the army after the right-wing Wolfgang Kapp Putsch in Berlin. As the strongest party in the state parliament, the Bavarian People's party proposed as prime minister a nonparliamentarian, Gustav von Kahr, the permanent official in charge of Upper Bavaria. Kahr had intrigued with the local Reich army commander, Gen. Arnold von Mohl, to undermine the Socialist government. The Social Democrats refused to join the Kahr government and remained in the Bavarian political wilderness until after World War II. The trend to the right was further emphasized by the entry of the German Nationalists into the government. This curious coalition between the particularist and predominantly Roman Catholic Bavarian People's party and the centralist and overwhelmingly Protestant German Nationalists from then on provided the parliamentary basis of Bavarian governments. Kahr provoked several conflicts with the Reich government. He refused to disband the citizens' defense corps (on which he was politically dependent) in accordance with the undertakings given to the Allies by the Reich government. He only complied in June 1921, following an Allied ultimatum. In his eyes, the danger came from the left and not from the right. Following the murder of the Centre leader Matthias Erzberger by right-wing extremists in Aug. 1921, he therefore refused to carry out a Reich "Decree for the Protection of the Republic" and to lift the Bavarian state of emergency, which had been applied principally against the left. But now the Bavarian People's party withdrew its support from Kahr and replaced him as prime minister by the more conciliatory Graf Hugo von Lerchenfeld, who arranged a compromise with the Reich. Following the assassination of the Reich foreign minister Walther Rathenau in June 1922, Bavaria, stronghold of extremist elements, again tried to evade the application of Reich security measures (see GERMANY: History: The German Republic). The dispute was, however, settled by a compromise between Lerchenfeld and the Reich president, Friedrich Ebert. The Bavarian government succeeded in retaining its people's courts (Volksgerichte), which operated outside normal court procedure and without the right of appeal. Lerchenfeld's fate illustrates the dilemma of Bavarian politics. The Democrats left his government because they considered him too particularist. He then had to take in the German Nationalists but was thrown over by them and the other right-wing groups as being too conciliatory in his attitude to the Reich authorities. The new premier, Eugen von Knilling, was much more right-wing than Lerchenfeld. The conflict between Bavaria and the Reich assumed critical proportions in 1923, when the French occupation of the Ruhr brought Germany into the greatest danger. When Gustav Stresemann, then Reich chancellor, gave up the passive resistance to the occupation, there was a great outcry in Bavaria which induced Knilling to appoint Kahr as Bavarian state commissioner (Generalstaatskommissar) with dictatorial powers, without previous consultation with the Reich authorities. The Reich government was compelled to counter with a declaration of a general state of emergency. It rightly mistrusted the Kahr-Knilling policy of trying to establish a collaboration with the extreme right-wing groups which had found refuge in Bavaria. Kahr now prompted the local Reich army commander, Gen. Otto von Lossow, to refuse to carry out an order of his superiors in Berlin to take measures against the National Socialists. The Bavarian government also attempted to detach the army corps in Bavaria from its allegiance to the Reich by assuming authority over it. Adolf Hitler and Gen. Erich Ludendorff (who had established himself in Bavaria) were not slow to take advantage of this situation. Hitler could only have contempt for the Bavarian authorities after a breach of the peace which he had committed in May had gone unpunished. On Nov. 8, 1923, Hitler and Ludendorff struck in Munich. They marched on a meeting at the *Bürgerbräukeller* (beer cellar) where they seized Kahr, Lossow and the Munich police chief. Hitler forced these men in a dramatic scene to support his proclamation of the national revolution and of the deposition of the existing authorities. However, as soon as Hitler's prisoners were free, they disowned him. Belatedly, energetic measures were taken to deal with Hitler and Ludendorff. Their

TABLE 11.—*Bavaria's Government Districts, Their Capitals and Populations*

Government district (*Regierungsbezirk*)	Capital	Population (1959 est.)	Area (sq.mi.)
Upper Bavaria (OBERBAYERN)	Munich	2,676,300	6,308
Lower Bavaria (NIEDERBAYERN)	Landshut	961,100	4,152
Upper Palatinate (OBERPFALZ)	Regensburg	872,900	3,725
Upper Franconia (OBERFRANKEN)	Bayreuth	1,072,600	2,897
Middle Franconia (MITTELFRANKEN)	Ansbach	1,343,100	2,912
Lower Franconia (UNTERFRANKEN)	Würzburg	1,067,000	3,277
Swabia (SCHWABEN)	Augsburg	1,331,800	3,938
Total		9,324,800	27,239

armed procession through Munich on the following day ended ignominiously. (Hitler mas to take his revenge against Kahr when he had him murdered after the purge of June 30, 1934.) The Hitler-Ludendorff trial should have come up in the supreme Reich court. But the Bavarian government succeeded in retaining the right of emergency jurisdiction just long enough to ensure that the case should come up in a Bavarian people's court. Hitler received the minimum sentence for high treason of five years, but with the stipulation that the further execution of the sentence should be suspended after a few months. Ludendorff was acquitted. (See also NATIONAL SOCIALISM.)

With the resignation of the state commissioner Kahr in Feb. 1924 and the change of premiership from Knilling to Heinrich Held, the leader of the Bavarian People's party. in June 1924, Bavaria entered more settled conditions. In 1925, the Bavarian People's party tipped the scales of the Reich presidential election in Hindenburg's favour by its refusal to support the Roman Catholic Centre candidate, Wilhelm Marx. Held retained power until the National Socialists overthrew the Bavarian constitution in March 1933.

In 1945, Bavaria became part of the U.S. occupation zone. The Bavarian Palatinate was detached from Bavaria and joined the new Rhineland-Palatinate state. The Bonn constitution of 1949 pleased Bavarian wishes far more with its federalist provisions than that of Weimar had done. The grand alliance of the Christian Social Union—the Bavarian counterpart of the Christian Democrats and the successor of the Bavarian People's party—with the Social Democrats was broken up in 1954. A coalition government excluding the Christian Social Union was then formed. This however resigned in 1957, after which the Christian Social Union resumed its leading position in the government. (F. EK.)

Population.—'The indigenous population of Bavaria is derived from three separate Germanic peoples: in Upper and Lower Bavaria and the Upper Palatinate from the *Baivarii;* in the Main area and the Frankish hills from the Franks; and west of the Lech and south of the Ries from the Suebi. These separate origins are shown by different patterns of settlement and dwellings. But this basic structure was greatly altered by the influx of refugees, mainly from Czechoslovakia, after 1939 and especially after World War II. The estimated population in 1959 numbered 9,324,800, an increase of 12.6% in relation to the 1939 figure.

Bavaria is divided into seven Government districts, as shown in Table II. It is further divided into 48 urban and 143 rural divisions. Towns with more than 100,000 population (1959) were: Munich, the capital (1,065,104), Nürnberg (448,900) and Augsburg (204,990).

Social Conditions and Government.—Bavaria is mainly a Roman Catholic country, old Bavaria (Upper and Lower Bavaria and the Upper Palatinate), Lower Franconia and Swabia overwhelmingly so. The Protestant population is concentrated in the northwest and east in what were once the princely states of Ansbach and Bayreuth, in Coburg and in the former Frankish imperial cities. In 1950 there were 6,600,895 Roman Catholics and 2,458,032 members of the German Evangelical Church and Old Catholics.

Most schools are parochial. There are universities in Munich, Würzburg and Erlangen, the last being Protestant, a technical school in Munich and a school for economics and the social sciences in Nürnberg.

With the exception of the Main basin. Bavaria is a land of average-size peasant holdings (25–75 ac.) and of small towns with light industries. Farmers, craftsmen and traders predominate among its citizens, without great variety of wealth or status. The old Bavaria was extended during the Napoleonic Wars by the addition of the bishoprics of Würzburg and Bamberg on the river Main. Under the Napoleonic regime. the old divisions were replaced by divisions comparable to the French *départements,* and government was centralized in Munich. The constitution of 1808 brought to the country the essential reforms of the Napoleonic code.

The Bavarian constitution as laid down on Dec. 2, 1946, provides for a minister president to be elected for four years by the lower house of the Bavarian parliament (the *Landtag*) and for an advisory second chamber (*Senat*) consisting of representatives of economic, social, cultural and religious bodies.

The Economy.—In spite of much industrial development during the 20th century, agriculture and forestry still form the backbone of the Bavarian economy. Nearly one-third of the country is covered by forest, mainly coniferous. More than half of the country is farmland; of the balance less than 5% is wasteland and about 7% is urbanized. Of the farmland itself more than half is arable, and more than half the arable land is devoted to grain—mainly wheat in the south and rye in the north. The meadows and pastures lie mainly on the Bavarian plateau in Upper Bavaria and Swabia. Butter is an important product of the Munich, Memmingen and Nurnberg areas and also of the Allgau district in southwestern Bavaria just north of the Allgau Alps; the greatest area for cheese is Swabia. Pigs are kept mainly in Lower and Middle Franconia and in Lower Bavaria. Vegetables are widely grown, but especially in the Main valley, around Munich and in Lower Bavaria around Staubing. The greatest hop-growing area in Germany is the Hallertau, between the Danube and the Isar. Vines are cultivated in the Main valley and neighbouring areas.

Bavaria is poor in the two important industrial minerals, coal and iron. Such coal as there is is mined chiefly on the slopes of the Alps in Upper Bavaria and in the Upper Palatinate north of Regensburg. Some iron is found in the Upper Palatinate and Upper Franconia. Of other minerals. notable are salt (around Berchtesgaden, Bad Reichenhall and Rosenheim), kaolin (in the Upper Palatinate, around Tirschenreuth and Amberg, and in Upper Franconia) and crystalline graphite, the deposits of which in the Bavarian forest northwest of Passau are the greatest in Europe. Lignite is mined in Amberg, Schwandorf and in the Sulzbach-Rosenberg district and on the northern slopes of the Bavarian Alps.

Industry was long undeveloped in Bavaria but during the 20th century this state of affairs changed Industrialization was greatly helped by the development of hydroelectric power and was accentuated after 1939 by the influx of refugee industrial workers. Industry is largely centred in the great towns and is varied in character. China and glass, scientific instruments, textiles and paper are all important manufactures, while in the great industrial centres of Munich, Augsburg and Nürnberg-Fürth the manufacture of automobile engines and agricultural machinery has been built up. Special mention must also be made of brewing, which is situated mainly in and around Munich. Tourists are also a source of revenue especially in the Alpine area.

The Main is navigable as far as Bamberg for 600-ton barges. The Danube is navigable upstream to Regensburg, and, for small barges, to Ulm.

BAVARIAN SUCCESSION, WAR OF THE (1778), between Austria and Prussia. After the loss of Silesia the Austrian emperor Joseph II and his chancellor Prince Kaunitz wished to acquire Bavaria in order to restore Austria's position in Germany. When the Bavarian electoral line of the Wittelsbachs failed on the death of Maximilian Joseph on Dec. 30, 1777, a treaty was signed (Jan. 1778) with his successor Charles Theodore the elector Palatine which ceded Lower Bavaria and the lordship of hfindelheim to Austria. However, as imperial troops were already in occupation of the territory, Frederick II of Prussia declared war on July 3, 1778, in support of the claims to Bavaria made by Charles, duke of Zweibriicken, the next Wittelsbach in the succession to Bavaria after Charles Theodore. Austria's ally France refused to give aid, and Frederick with Saxony as his ally entered Bohemia where he was opposed by an imperial army led by the emperor himself, Ernst Cideon Laudon and Franz Moritz Lacy. There was little fighting, since each force was concerned to cut its opponent's communications and deny it supplies. Hence contemporaries nicknamed the war the "potato war" (*Kartoffelkrieg*). Maria Theresa, whose consent to the occupation of Bavaria had been given very unwillingly, made peace proposals to Frederick II against Joseph II's wishes. With France and Russia acting as intermediary between Austria and Prussia, the representatives of the two powers met at Teschen on March 10, 1779. On May 13, 1779, they reached an agreement whereby Austria was to receive the Inn district, a fraction of the territory originally occupied. (FH. WR.)

BAX, SIR ARNOLD EDWARD TREVOR (1883–1953), English composer, whose work represents romantic musical tendencies between World Wars I and II, and contributed considerably to the revival of English music, was born in London on Nov. 8, 1883. In 1900 he entered the Royal Academy of Music where he studied the piano under Tobias Matthay and composition under Frederick Corder. Influenced by the Celtic revival and Irish poetry, in 1909 he wrote the symphonic poem *In the Faery Hills.* He spent the year 1910 in Russia. During the following years, under the pseudonym Dermot O'Byrne, he published short stories and poems in Ireland where he spent much time. In 1916 and 1917 he wrote three symphonic poems, *The Garden of Fand, Tintagel* and *November Woods,* which established his reputation. In 1920 Sergei Diaghilev produced his ballet, *The Truth About the Russian Dancers,* on a scenario by J. M. Barrie. Between 1921 and 1939 he wrote seven symphonies dedicated to the musicians he admired, among them John Ireland and Jean Sibelius. He also wrote numerous piano and chamber works, including a sonata for viola and harp (1928) and a nonet (1930). Living for long periods on the coasts of Ireland and Scotland, he wrote music that was romantically evocative and richly orchestrated, though sometimes turgid in texture. He was knighted in 1937, and in 1942 was appointed master of the king's music. He died at Cork, Ire., on Oct. 3, 1953.

BAXTER, ANDREW (1686 or 1687–1750), Scottish metaphysical rationalist who maintained the essential distinction between matter and spirit against tendencies that he suspected in the more advanced British epistemology of his century, was born at Aberdeen and educated at King's college there. Having gone to Utrecht in the Netherlands as tutor to two young gentlemen in 1741, he went on an excursion to Spa in 1745 and there met John Wilkes. for whose intellect he conceived a fervent admiration subsequently expressed in a number of letters. Returning to Scotland in 1747, he lived at Whittingehame, near Edinburgh, till his death on April 23, 1750.

Baxter published anonymously *An Enquiry Into the Nature of the Human Soul* (1733; 3rd ed., 1745; *Appendix,* 1750) and *Matho, sive cosmotheoria puerilis* (1738; Eng trans., enlarged, 2 vol., 1740). a compendium of scientific knowledge. *The Evidence of Reason in Proof of the Zmntortality of the Soul* (1779) was edited from his papers by John Duncan. In his *Enquiry,* Baxter begins by arguing (1) that matter is essentially inert (this seems to be aimed at John Toland's "Motion Essential to Matter," *Letters to Serena,* 1704) and (2), in opposition to any mechanistic explanation of change and movement, that all effects in matter are immediately produced by "an immaterial Being," "a constant and universal Providence." Then, in a long argument against John Locke, uho had suggested that man might be a simple material substance endoned by God with the power of thinking. Baxter insists on the immateriality of the human soul and on its continued consciousness after the body's death. Next follows "An Essay on the Phaenomenon of Dreaming," in further support of his antimechanistic theme. After this he attacks George Berkeley. whom he mistakenly supposed to have denied the existence of matter. The last section of the *Enquzry* is an argument against the eternity of matter.

BAXTER, GEORGE (1804–1867), English engraver and printer who invented a patented process of colour printing that made available reproductions of paintings on a mass scale. He was the second son of JOHN BAXTER (1781–1858), printer and publisher of Lewes, Sussex, who was responsible for the popular illustrated "Baxter" Bible. George was born on July 31, 1804, in Lewes, where he learned engraving, and moved to London in 1827. In 1835 he obtained his patent. Basically Baxter's process consisted of carefully etched plates (sometimes as many as 20), a system of register points and superlative printing on a hand press, using only the best colours and oils and paper. He mixed the colours himself and, since he left no record of their preparation, this part of the process remains unknown. He collaborated with the publisher, G. Mudie, supplying colour illustrations for new volumes, and also worked for the London Missionary society, producing prints depicting scenes in missionary history. He visited Buckingham palace at the command of Queen Victoria and the prince consort but, while patronized by high personages, he seems not to have had great business sense and never made a fortune. His patent. upon expiring in 1849. was renewed for another five years despite protests from competitors in the same line, but the fiercest competition came from cheap coloured lithographs. In 1860 he retired to Sydenham. where he died on Jan. 11, 1867.

See C *T* Courtney Lewis, *George Baxter* (1908) and *J* Cordingley, *Early Colour Printing and George Baxter* (1949). (J. C. MN)

BAXTER, RICHARD (1615–1691), one of the greatest English Puritan ministers, was famous for his preaching, learning, nriting and his pastoral counseling. His influence on English Protestantism was more profound than that of any other 17th-century Puritan minister. He was born at Rowton, Shropshire, in Nov. 1615. and after completing free school at Wroxeter studied divinity. Though greatly influenced by Puritans, he was ordained into the Church of England in 1638. Within tuo years, however, he had definitely allied himself with the Puritans in opposition to episcopacy. In 1641 he was elected minister of Kidderminster, where he remained, with several interruptions, until the Restoration in 1660. Baxter's ministry at Kidderminster is classic in Protestant history. He reformed the town and made it a model for Protestant pastor and English priest alike. His church was packed for each service, and it was enlarged to accommodate the crowds.

Baxter preached with passion and conviction, though he never was emotionally uncontrolled. His sermons were classic Puritan models. They had two primary objects. First, he aimed to convert the congregation away from self-centredness, indifference and pride—from sin—to a life of utter trust and faith in God; the conversion itself was always foremost in his sermons. Second, he sought to lead his congregation into a life of disciplined Christian obedience; the converted Christian reflected the life of faith in his day-to-day activities of business, family and personal relations, his conversation and deportment. Baxter's preaching was soundly doctrinal, with a very practical application. He was ill most of his life and claimed he preached as a "dying man to dying men." His concern for conversion is reflected in a large number of his published works, such as *A Call to the Unconverted* or *A Treatise* on *Conversion.*

One of the most important aspects of his ministry was long overlooked. Baxter epitomized the Puritan concern for the pastoral ministry. At Kidderminster he developed a systematic and comprehensive scheme of personal pastoral counseling and catechising. His program included every family and person in his parish. As he stated it, "Two days every week my assistant and I, myself, took fourteen families between us for private catechising and conference." In these personal conferences Baxter sought to deal with all personal questions that disturbed his parishioners. So successful was he that people came from miles around for his advice and counsel, and letters came to him from all over England. Even pastors sought his advice on counseling methods and techniques.

His efforts and methods were clearly outlined in *The Reformed Pastor* and in *The Right Method for a Settled Peace of Conscience.* His pastoral concern was further reflected in a vast amount of devotional writing prepared for the use of the perplexed and the steadfast in the parish. His *Saints' Everlasting Rest* (1650) is a classic in Protestant devotional literature, and the *Poor Man's Family Book* brought comfort and inspiration to countless people.

Baxter was not an introverted pastor and preacher. He was in the centre of every major controversy of his age and acted in and wrote on most of them. He served a short time as a chaplain in the Parliamentary army. He fought the Quakers and Baptists, and he published highly controversial doctrinal treatises such as his famous *Aphorisms of Justification* (1643). He helped to bring about the restoration of the king and fought for toleration of moderate dissent within the Church of England. Though he failed to win his point and was persecuted for over 20 years, he lived to be vindicated in the revolution of 1688. He died, a distinguished and honoured minister, on Dec. 8, 1691.

BAY, an architectural term for any division of a building, between vertical lines or planes, especially the entire space included between two adjacent supports; thus, the space from pier to pier in a church, including that part of the vaulting or ceiling between them, is known as a bay.

A term also applied to a roofed structure projecting from a wall and one story high, a bay window being such a structure. When a bay window is carried on brackets, or a corbel, it is called an oriel. Bay windows came into use during the late Gothic period. Although found throughout Europe, they are peculiarly characteristic of England. They usually occur at the end of the great hall of large Tudor and Jacobean manor houses and castles, reserved for the lord's dais, from which they open. Occasionally there is one on each side of the hall at each end of the dais. Befitting their position, they are often extremely rich, with fan vaults and window seats at the sill. They are also found in similar positions in the great halls of the English colleges. During the Jacobean period their use was much increased and they are found on the fronts of houses wherever an accent was desired.

BAYAMÓN, a town situated in a beautiful and fertile valley about 15 mi. S. of San Juan, the capital of Puerto Rico. In the ten years between 1950 and 1960 the town doubled its population, rising from 20.171 to 41,731. The community's population spurt was caused by the fact that many of the capital's middle-class families moved into the area. As a result, Bayamón is considered part of the greater metropolitan area of San Juan (*q.v.*).

The town was founded in 1772. Within its municipal district is located the first settlement of Puerto Rico, known as Villa de Caparra and founded in 1508 by Juan Ponce de León. The rural area around Bayamón is one of the most productive fruit-growing sections of Puerto Rico. Oranges, limes, lemons, bananas, grapefruit and pineapples are grown on well-managed farms, and canning is one of the principal industries. The area also contains an oil refinery, bottling plants, a grain storage mill and many other important industries. Bayamón, on the main highway between San Juan and Arecibo, is connected with the capital by means of rapid throughways. Roads also lead into the mountains and the interior towns of Comerio and Barranquitas. (T. G. Ms.),

BAYAR, CELAL (1883–), Turkish statesman and third president of the Turkish republic, was born at Umurbey, a village near Bursa, on May 15, 1883. His father became the local mufti and brought his son up in the Muslim tradition. For a time Celal attended a French school at Bursa, where he specialized in economics and finance. Joining the Bursa branch of the German Orient bank, he rose to be local manager. Becoming interested in politics, he joined those seeking to rid Turkey of the tyrannical sultan Abdul-Hamid II. After the Young Turk revolution in 1908 he became secretary of the Izmir branch of the Committee of Union and Progress. During World War I he was active in organizing the railway system of Anatolia. After the collapse of Turkey he promoted resistance to the Greek occupation of the Izmir region. Elected deputy, he took part in the last Ottoman parliament in Jan. 1920.

When the British arrested Turkish nationalists, Bayar escaped and joined the great national assembly in Ankara. Because of his experience in finance, he served as minister of national economy from Feb. 1921 to Jan. 1922. After the liberation, he was elected deputy for Izmir. In March 1924 he was made minister of reconstruction and resettlement of refugees, but in July he resigned to become head of the newly founded Turkish Commercial bank. He held this post until Sept. 1932, when he again was made minister of national economy, in which capacity he did much to develop Turkish industries and mines. He became prime minister on Oct. 25, 1937, but resigned on Jan. 25, 1939, because of his disagreement with the policy of the Republican People's party, as he wanted more economic freedom for the country.

In June 1945 he resigned from the party and also from his seat in parliament. In Jan. 1946. together with Refik Koraltan, Adnan Menderes and Mehmed Fuad Koprulu, he organized the opposition Democratic party, which won 62 seats in the general election of July 1946. Under Bayar's leadership the Democratic party secured an overwhelming victory at the election of May 1950, and he was elected president of the Turkish republic by the new parliament. He was re-elected president on May 14, 1954. Arrested during the *coup d'état* of May 27, 1960, he was subsequently brought to trial, with other leaders of the Democratic party, on charges of crimes against the state, and in Sept. 1961 was sentenced to death; the sentence subsequently was commuted to life imprisonment. (M. P. P.)

BAYARD, PIERRE TERRAIL, SEIGNEUR DE (*c.* 1473–1524), French soldier known as *le Chevalier sans peur et sans reproche* or as *le* bon *chevalier* because of his knightly fearlessness and magnanimity, was born at the Chhteau Bayard (near Pontcharra) in Dauphiné, of a noble family, nearly every head of which for two centuries past had fallen in battle. He accompanied Charles VIII into Italy in 1494 and was knighted after the battle of Fornovo (1495). Shortly afterward, entering Milan alone in pursuit of the enemy, he was taken prisoner, but was set free without a ransom by Ludovico Sforza. In 1502 he was wounded at the assault of Canossa. Bayard was the hero of a celebrated combat of 11 French knights against an equal number of Spaniards and is said on one occasion to have made good the defense of the bridge of the Garigliano singlehanded against about 200 Spaniards, an

exploit that brought him such renown that Pope Julius II sought to entice him into the papal service, but unsuccessfully. In 1508 he distinguished himself again at the siege of Genoa by Louis XII. At the siege of Padua he won further distinction by his valour and his consummate skill. Severely wounded at Brescia, he nevertheless hurried to join Gaston de Foix in the terrible battle of Ravenna (1512). In 1513, when Henry VIII of England routed the French at the battle of the Spurs (Guinegate), Bayard found his escape cut off. Unwilling to surrender, he rode up to an unarmed English officer and summoned him to yield; the knight complying, Bayard in turn gave himself up to his prisoner. Henry VIII released him without ransom, merely exacting his parole not to serve for six weeks. On the accession of Francis I in 1515, Bayard was made lieutenant general of Dauphine; and after the victory of Marignano he had the honour of conferring knighthood on his youthful sovereign. When war again broke out between Francis I and the emperor Charles V, Bayard, with 1,000 men, held Mézières, which had been declared untenable, against an army of 35,000 and after six weeks compelled the imperial generals to raise the siege. This stubborn resistance saved central France from invasion and gave Francis time to collect the army that drove out the invaders (1521). In 1523 Bayard was sent into Italy with Guillaume de Bonnivet, who, being defeated at Robecco and wounded during his retreat. implored Bayard to assume command. Guarding the rear at the passage of the Sesia, he was mortally wounded by an arquebus ball (April 30, 1524). He died in the midst of the enemy. His body was restored to his friends and interred at Grenoble.

Bayard was one of the most skilful commanders of the age. He obtained complete information about the enemy by reconnaissance and espionage. In the midst of mercenary armies he remained absolutely disinterested, and to his contemporaries and his successors he was the faultless knight, heroic, devout, generous, gay and kindly.

BIBLIOGRAPHY.—The best-known 16th-century biography is *La Très Joyeuse, Plaisante et Récréative Hystoire . . . des faiz, gestes, triumphes et prouesses du bon chevalier sans paour et sans reprouche, le gentil seigneur de Bayart,* by "Le Loyal Serviteur" (1527), modern ed. by O. H. Prior, *Histoire du seigneur de Bayart* (1927). *See* also S Shellabarger, *The Chevalier Bayard* (1928); *P.* Ballaguy, *Bayard* (1935); *M* Brion, *Bayard* (1942).

BAYARD, THOMAS FRANCIS (1828–1898), U.S. statesman, diplomat and lawyer, was born in Wilmington, Del., on Oct. 29, 1828, of a distinguished family. He was directly descended from the French hero, Chevalier Bayard, and from Ann Bayard, a sister of Peter Stuyvesant. His great-grandfather, Richard Bassett (1745–1815) was governor of Delaware; his grandfather, James Asheton Bayard (1767–1815), was a prominent Federalist congressman from Delaware and one of the U.S. commissioners who negotiated the treaty of Ghent with Great Britain that ended the War of 1812; his uncle, Richard Henry Bayard (1796–1868), was chief justice of Delaware; and his father, James Asheton Bayard (1799–1880), was a well-known constitutional lawyer. All of the foregoing represented Delaware in the U.S. senate.

Thomas Francis Bayard's formal education was limited to a few years in an academy in Flushing, N.Y. He did not attend college but in 1848 began the study of law in the office of his father and was admitted to the bar in 1851. He practiced chiefly in Wilmington and for one year, 1853–54, served as U.S. attorney for Delaware, an office his father had held some years earlier. During the crisis of 1860–61, which led to the Civil War, he opposed secession and was instrumental in keeping Delaware in the Union. As a peace Democrat, he opposed the war. From 1869 to 1885 he was a U.S. senator from Delaware and opposed the reconstruction policies of the Radical Republicans. His abilities made him a leader of the Democrats in the senate, and his views on financial and legal questions gave him a high reputation for statesmanship. He was a member of the electoral commission of 1877. In the Democratic national conventions of 1880 and 1884 he received votes for nomination as the party's presidential candidate. From 1885 to 1889, during the first administration of Pres. Grover Cleveland, he served as secretary of state. While in office, the most important problems he faced concerned relations with Great Britain: the Alaskan boundary, the North Atlantic fisheries, fur sealing in the Pacific, and Samoa. In 1893 he was appointed ambassador to Great Britain, the first U.S. representative in Great Britain to hold that diplomatic rank. As ambassador he was considered too pro-British and after several speeches which were considered critical of the United States, the house of representatives passed a vote of censure. Because of failing health, he left London in 1897 and died the following year on Sept. 28 in Dedham, Mass.

His son, THOMAS FRANCIS BAYARD (1868–1942) carried on the remarkable family tradition of public service, representing Delaware in the U.S. senate from 1923 to 1929.

See Lester B. Shippee, "Thomas Francis Bayard," in S. F. Bemis, ed., *The American Secretaries of State and Their Diplomacy* (1928), vol. viii, pp. 47–106. (AR. R.)

BAYAZID I (1354–1403), Ottoman Turkish sultan from 1389 to 1403, called Yildirim ("the Thunderbolt"), was the son of Murad I, on whose death on the battlefield of Kosovo he succeeded to the throne. In the earlier years of Bayazid's reign Ottoman suzerainty over Serbia was established, Bulgaria definitely conquered and Walachia reduced to vassal status. There were also successful campaigns against Hungary, Bosnia, Albania and Greece. Moreover, in 1394, Bayazid began a blockade of Constantinople that lasted for seven years. The Ottoman advance in the Balkans gave rise to a strong counteroffensive organized in Europe. This "crusade" suffered a crushing defeat at the battle of Nicopolis (Nikopol, on the Danube) in 1396. It was imperative, however, that the Ottomans—a small minority ruling, in Europe, over a vast non-Turkish and non-Muslim subject population—should extend their territories in Asia Minor if their state was to retain its Turkish and Muslim character. Bayazid, throughout his reign, was engaged in a series of campaigns which led to the annexation of the other Turkish amirates in Asia Minor. This policy caused discontent both among the Ottoman warriors, loath to make war on their fellow Muslims, and among the populations of the subjugated amirates. It also brought Bayazid into conflict with Timur (*q.v.*). The Ottoman army, its unity impaired by the discontent, was routed by Timur at Ankara in 1402, and Bayazid was taken prisoner. He died in captivity at Akshehir in March 1403.

See P. Wittek, *The Rise of the Ottoman Empire* (1938). (*V.J.* P.)

BAYAZID II (c. 1447–1512), Ottoman Turkish sultan from 1481 to 1512, was the elder son of the sultan Mohammed II. On Mohammed II's death (1481) Bayazid's brother Jem contested the succession, but Bayazid was victorious (1482). Jem took refuge with the Order of St. John of Jerusalem at Rhodes, was sent to France and remained, until his death in 1495, a captive in Europe. The earlier years of Bayazid's reign saw the consolidation of Ottoman control over Hercegovina (1483) and the capture (1484) of Kiliya and Akkerman (Belgorod-Dnestrovski) on the estuaries of the Danube and the Dniester. This success gave the Ottomans a firm hold on the land route to the Crimea, nhere the Tatar khan was the sultan's vassal. There followed (1485–91) a local war in Cilicia betueen the Ottomans and the mamelukes of Egypt and Syria, both sides claiming a dominant influence in the frontier lands along the Taurus mountains. Cilicia, in 1491, remained under mameluke control. The Ottomans, however, fearing that a Christian coalition, using Jem, might be formed against them, could only commit a moderate proportion of their resources to fighting in Cilicia, but even so. the mamelukes held their position on the frontier only by deploying their full military strength.

When Jem died in 1495 the Ottomans threw off their restraint, built a new and powerful fleet and made war against Venice (1499–1503). This brought them valuable gains in the Morea and on the Adriatic shore (Lepanto, Modon, Coron, Navarino and Durazzo).

Meanwhile, a serious danger arose in the east. The Safawid dynasty, established in Persia during the years of the Ottoman-Venetian war, mas Shi'ite Muslim, nhereas the Ottomans were Sunnite or orthodox. The Safanids had long conducted religious and political propaganda amongst the Turkmen tribes in Asia Minor, which indeed supplied their main military strength, and it became increasingly possible that Ottoman control over large areas might be undermined and eventually destroyed. Tension grew until, in

1511, a great Shi'ite revolt broke out in Tekke, in southwestern Asia Minor. At this time also conflict broke out between Bayazid's sons over the future succession. One of them, Selim, moved from Trabzon (Trebizond) to the Crimea, won the aid of the Tatar khan and crossed the Danube into the Balkans. Fearing that the strong forces which had crushed the Shi'ite rebellion in Asia Minor (June 1511) might be used to gain the succession for his chief rival, Ahmed, Selim then marched against his father, but was defeated at Çorlu (Aug. 1511) and took refuge in the Crimea. Ahmed, failing to secure the support of the janizaries, who favoured Selim, now seized much of Asia Minor by force. The attitude of the janizaries and the fear that Ahmed might turn to Persia for assistance led to the recall of Selim from the Crimea to Istanbul and to Bayazid's abdication in favour of Selim (April 1512). Bayazid died near Demotika in May 1512.

See S. *N.* Fisher, *The Foreign Relations of Turkey, 1481–1512* (1948). (V. J. P.)

BAYBARS (BIBARS) **I** (1223–1277), mameluke sultan of Egypt and Syria, whose official title was al-Malik al-Zahir Rukn-al-Dīn al-Salihi. He came as a boy from the Kipchak Turks beyond the Caspian sea and was taken as a slave to Egypt. Rising to military eminence, he led the mameluke vanguard at the battle of Ayn Jalut in Palestine against the Mongols in 1260. In that year, having defeated and killed his own sultan, Sayf al-Din Kutuz, he was acclaimed by the army commanders as their chief. A leader of great, even foolhardy, courage, he typified mameluke morality by his entire lack of scruple in the struggle for power. A refugee caliph from Baghdad solemnly invested him with the governance of the sultanate and so gave religious sanction to his rule. With shrewd statesmanship backed by force and trickery, Baybars broke the ring of potentially dangerous states surrounding him and made Egypt the most powerful Muslim state in the middle east. By alliances and commercial concessions he neutralized the maritime powers of the Mediterranean. His command of the Red sea enabled him to exercise paramount influence over Mecca and Medina. He deprived the Frankish crusaders of most of their kemaining possessions on the Syrian coast, seizing Jaffa and Antioch in 1268, crushed the Armenians in a bloodthirsty raid, punished the Assassins in their Syrian strongholds and, beyond the southern border of Egypt, sent his armies as far as Dongola, whose Christian king they dethroned. His exploits, real and fictional, gave rise to popular legends such as the *Romance of Baybars,* a cycle of stories of Arab chivalry. Baybars died in Damascus in 1277.

BAY CITY, a port of entry in Michigan, U.S., 100 mi. N.N.W. of Detroit, on both sides of the Saginaw river near its mouth on Saginaw bay (Lake Huron) ; the county seat of Bay county. The city has been governed by a council-manager form of government since 1921. Pop. (1960) city, 53.604; standard metropolitan statistical area (Bay county), 107,042. (For comparative population figures *see* table in MICHIGAN :.*Population.)*

Between 1836 and 1867 six villages were platted along the Saginaw river, on which the Chippewa Indians had plied their canoes. The present Bay City was formed by a series of consolidations of five of these villages, culminating in 1905 with the union of Bay City and West Bay City. The sixth, Essexville, adjoins Bay City on the northeast.

The Bay county region played a leading part in the saga of the Saginaw valley lumbering era, 1850–90. All the available sites along its rivers were occupied by sawmills, shingle and other woodworking mills, saltworks and shipyards. Saginaw river teemed with rafts of logs, tugboats, scows, schooners and steamboats. Immense quantities of rough pine lumber and other wood products, salt and frozen fish were shipped out by water and rail. With the depletion of local forests and the high tariffs and duties on Canadian lumber, the mills began to close one after another.

With the end of the lumber era, the city's chief industries were soft-coal mining, commercial fishing and beet-sugar production. Lean decades followed the lumber boom, but new industries developed, and by mid-20th century Bay City was one of the busiest ports on Lake Huron.

Among Bay City's leading industries are the manufacture of ships, heavy machinery, castings, welding machines, automobile parts, electrical equipment, precut houses, furniture, cement, beet sugar, clothing and petrochemical products. Bay county has several oil-producing wells, and its rich farm lands produce sugar beets, potatoes, a variety of other vegetables, and dairy and meat products.

There are several riverside parks and, along the bay shore, Bay City state park, amusement parks, bathing beaches and summer cottages; boating and fishing are enjoyed on the river and the bay.

Public education includes a junior college, established in 1922. (G. E. Bu.)

BAYER, FRIEDRICH (1825–1880), founder of the well-known German chemical firm, Farbenfabriken Bayer Aktiengesellschaft Leverkusen, was born at Barmen on June 6, 1825. He served as an apprentice with a firm dealing in chemical products and quickly became the deputy of the owner. He soon established his own business in chemicals and dyewoods and took up the manufacture of dye extracts and dyestuffs. In 1863, together with Friedrich Weskott, Bayer founded a new firm producing triphenyl methane and azo dyestuffs and later also alizarin dyestuffs. At the time of his death at Wurzburg on May 6, 1880, his business served textile firms throughout the world and the foundation for Farbenfabriken Bayer A. G. Leverkusen was already laid. After his death the management of the firm was taken over by his son, Friedrich Bayer, together with H. T. von Bottinger. (E. C. K.)

BAYERN: *see* BAVARIA.

BAYES, THOMAS, (1702–1761), English mathematician, author of the first expression in precise, quantitative form of a mode of inductive inference, was born in 1702. He was the eldest son of Ann Bayes and Joshua Bayes, a fellow of the Royal society and one of the first six Nonconformist ministers to be publicly ordained as such in England. Educated privately, he was ordained and began his ministry by helping his father, then minister of the Presbyterian meetinghouse in Leather lane, near Holborn, London. Between 1720 and 1731 Bayes went to minister at the Presbyterian chapel in Tunbridge Wells, where he remained till his death on April 17, 1761, having retired from the ministry in 1752. In 1731 he published a tract entitled *Divine Benevolence, or an attempt to prove that the Principle End of the Divine Providence and Government is the Happiness of His Creatures,* and in 1736 another, entitled *An Introduction to the Doctrine of Fluxions, and a Defence of the Mathematicians against the objections of the Author of the Analyst.* He was elected to fellowship of the Royal society in 1742.

Bayes's main works, the paper which contains the theorem which bears his name *(see* PROBABILITY: *Inverse Probability),* and a paper on asymptotic series, were published posthumously in the *Philosophical Transactions* by his friend the Rev. Richard Price (*q.v.*).

See J. G. Anderson, *Mathematical Gazette,* vol. 25 (1941), and *Biometrika,* vol. *47* (1958). (G. A. B.)

BAYEUX, a town of northwestern France in the *département* of Calvados, lies on the Aure 6 mi. S.W. of Arromanches (where the Allies set up an artificial harbour during the Normandy landings in World War II) on the coast and 17 mi. N.W. by road of Caen. Pop. (1954) 9,077. A bypass encloses the city, in part modern, nith white buildings, and in part medieval. In the old town, with its cobbled streets and timbered houses, is the splendid Gothic cathedral. The Romanesque west towers (12th century) survive from an earlier church, while the central tower is 15th century with a modern upper part; the 1lth-century crypt was restored in the 15th century. The former bishop's palace (11th–14th century) is now the hôtel de ville, law courts and art gallery. Near the cathedral is the Museum of Queen Matilda containing the celebrated Bayeux tapestry (*q.v.*), telling the story of the Norman conquest of England. During World War II Bayeux was occupied in June 1940 and recaptured on June 7, 1944, the first town of France to be liberated from German occupation. At the entrance to the

SCENES FROM THE BAYEUX TAPESTRY

The tapestry, which is 231 ft. long and 20 in. wide, is embroidered in coleured wools on a background of coarse linen. It is believed to have been made before the end of the 11th century. No comparable work survives

1. At the left, building of earthworks for William's camp at Hastings. Centre, a messenger brings to William at Hastings news of Harold. At the right a woman and child escape from a house to which soldiers are setting fire
2. The serving of a meal, and, in the centre, the bishop blessing the meal at table. At the right William is seen between his two half-brothers, Bishop Odo and Robert of Mortain
3. An English ship coming to Normandy. At the right Duke William orders the building of a fleet
4. Details of shipbuilding. Cutting and planing timber, building the hulls and launching by means of reeves and blocks

FURTHER SCENES FROM THE BAYEUX TAPESTRY

1. Harold is offered the crown, and in the centre is shown crowned; the archbishop Stigand (Stigant) is at his left. In the right-hand panel is shown the appearance of a comet (now known to have been Halley's comet) which appeared at that time and was regarded as an omen of evil

2. The battle of Hastings, the English defending the ridge against the French. The movement, line and balance of the masses of light and shade make these panels one of the best illustrations of the sense of rhythm and composition found in the Bayeux tapestry

town on the Cherbourg road is the memorial to the Allied landings of 1944 and to the liberation, and to the east of the city is the British memorial and war cemetery. Lacemaking and the manufacture of plastic goods are carried on, but the chief industries are the making of dairy products (cream and butter) and the export of meat, especially canned beef.

Bayeux was known as Augustodurum and later Civitas Baiocassium to the Romans and had a bishopric from the late 4th century. Captured in 880 by the Scandinavian Rollo, it was soon after settled by the Normans, one of whom, Duke Richard I, built the castle which survived from 960 until the 18th century. During quarrels between the sons of William the Conqueror it was pillaged by Henry I of England in 1106. It was besieged and captured on several occasions during the Hundred Years War and the religious wars of the 16th century. (S. BE.)

BAYEUX TAPESTRY is a band of linen, 231 ft. long and 20 in. wide, now light brown with age, on which were embroidered, in worsteds of eight colours. about 72 scenes representing the Norman conquest of England. The story begins with a prelude to Harold's visit to Bosham on his way to Normandy and ends with the flight of the English from Hastings; originally, it may have been taken further, as the end of the strip has perished. Along the top and the bottom run decorative borders with figures of animals, scenes from the fables of Aesop and of Phaedrus, from husbandry and from the chase and occasionally scenes related to the main pictorial narrative. It has been restored more than once, and in some details the restorations are of doubtful authority.

When first referred to (1476), the tapestry was used once a year to decorate the nave of Bayeux cathedral. There it was "discovered" by Bernard de Montfaucon who published the earliest complete reproduction of it in 1730. Having twice narrowly escaped destruction during the Revolution, it was exhibited in Paris at Napoleon's desire in 1803–04 and thereafter was in civil custody at Bayeux, except in 1871 and from Sept. 1939 to March 1945.

Montfaucon found at Bayeux a tradition, possibly not more than a century old, that assigned the tapestry to Matilda, wife of William the Conqueror, but there is nothing else to connect the work with her. It may have been commissioned by the Conqueror's half-brother Odo, bishop of Bayeux: Odo is prominent in the later scenes, and three of the very few named figures on the tapestry have names borne by obscure men known to have been associated with him. This conjecture would date the work not later than *c.* 1092. Various 12th-century dates have sometimes been proposed; but after *c.* 1924 it was generally agreed that nothing in the tapestry is incompatible with an 11th-century date and that its affinities are with works, especially English works, of the 11th century, rather than with those of the middle and end of the 12th. That it was made in England is not proved, though there is a circumstantial case for thinking that it was.

The tapestry is of great interest as a work of art. It is also important evidence for the history of the Conquest, especially for Harold's relation to William before 1066; its story of events seems straightforward and convincing, despite some obscurities. The decorative borders have value for the study of medieval fables. The tapestry's contribution to knowledge of everyday life c. 1100 is of mediocre importance, except for military equipment and tactics.

Greenaway (1953), which also provides a bibliography for critical discussion of the tapestry. *See* also E. A. Freeman, *Norman Conquest,* vol. iii, appendix A (1875); J. H. Round, "The Bayeux Tapestry" in *The Monthly Review,* vol. xvii (1904); H. Prentout, "La Tapisserie de Bayeux" in *Revue des cours et conférences,* 23e année (1922). (J. H. R.; ER. S.)

BAY ISLANDS (ISLAS DE LA BAHÍA), a group of small islands in the Caribbean sea, constituting the department of Islas de la Bahia, Honduras. Area, 101 sq.mi. Pop. (1961) 9,060. The population is English-speaking and Protestant. Discovered in 1502 by Columbus, the main islands were settled in the 17th century by the British and by "Carib Indians" from the mainland. They were annexed to Great Britain in 1852 but were ceded to Honduras in 1859. The islands include Roatán, 30 mi. long by 9 mi. wide; Guanaja, 9 mi. long by 5 mi. wide; and several smaller islands and a number of cays or islets. The islands are low, the highest point being about 900 ft. in the hills of Roatán. Agriculture is the chief activity, although there is some fishing and lumbering. The chief products are bananas, plantains, cassava, coconuts, sweet potatoes, poultry, swine and cattle. (C. F. J.)

BAYLE, PIERRE (1647–1706), French philosopher famous for his encyclopaedic dictionary, was born the son of a Calvinist minister at Carla-le-Comte (now Carla-Bayle), near Pamiers, on Nov. 18, 1647. Converted to Catholicism in 1669, he relapsed into Calvinism in 1670 and went for a time to Geneva, where he became acquainted with Cartesianism. Returning to France, he worked as a tutor till, in 1675, he was appointed professor of philosophy at the Protestant academy of Sedan. On the suppression of that academy in 1681, he went to Rotterdam, where he was appointed professor of philosophy and history. In 1682 he published; anonymously, his reflections on the comet of 1680. After deriding the universal superstition that held comets to presage catastrophe, he suggests that other equally long-standing opinions may be equally questionable, including much Christian tradition. His *Critique générale* (also 1682), defending the Calvinists against Louis Maimbourg's *Histoire du Calvinisme,* is said to have earned him the personal enmity of Pierre Jurieu, who had written less successfully against the same book. Subsequent publications were the *Recueil de quelques pièces curieuses concernant la philosophie de M. Descartes* (1684) and a pioneer plea for religious toleration, to be extended even to atheists, *Commentaire philosophique sur ces paroles de Jtsus-Christ: "Contrains-les d'entrer"* (1686). From 1684 to 1687 he was editor of the influential periodical *Nouvelles de la république des lettres.* Serious trouble arose when he was accused of having written a pamphlet *Avis important aux réfugiez sur leur prochain retour en France* (1690), advocating a conciliatory attitude to the French government (whereas Jurieu's party stood for full participation by French Protestants in the War of the Grand Alliance against France). Bayle defended himself in La *Cabale chime'rique* (1691) and other pamphlets, but was eventually deprived of his professorship (1693).

Thereafter Bayle devoted himself to the composition of his remarkable *Dictionnaire historique et critique,* the first edition of which appeared in 1697 (the *Projets et fragments d'un Dictionnaire critique* had appeared in 1692). In this encyclopaedia the articles themselves, on religious, philosophical and historical subjects, are little more than summary expositions; the importance of the work consists in the copious notes and commentaries on the articles. These erudite annotations are cleverly designed to undo whatever effect of orthodoxy the articles may have. From the mass of quotation, anecdote, obscenity and speculation that they offer, the sceptical intention emanates persistently. It was Bayle who devised this oblique method of subversive criticism, which the 18th-century *Encyclopkdistes* adopted. Ostensibly a supplement to Louis Moréri's dictionary, Bayle's was in fact a work of considerable originality, the significance of which was plain enough to his contemporaries.

Objections were promptly made; in particular to the article "David"; to the bias in favour of Manichaeism, Pyrrhonism, atheism and Epicureanism; and to the use of Scripture to introduce indecencies. Bayle undertook to modify his text in the second edition (1702); but in fact no change of any importance was made.

Bayle's last years were troubled by allegations that he was conspiring with France to detach the Dutch from their Anglo-Austrian alliance. He died on Dec. 28, 1706.

BAY LEAF, the leaf of the sweet bay tree, a species of laurel (*Laurus nobilis*) that grows in Mediterranean countries, especially Turkey, Greece, Yugoslavia and Portugal. Dried bay leaves, grayish-green in colour, are a popular seasoning for marinated meats, soups, stews, sauces and fish and are indispensable in pickling. Bay is one of the earliest known herbs, the leaves having been used to form the wreaths of laurel with which victorious athletes were crowned in ancient Greece. During the middle ages they were employed in various rituals to prevent evil and were prized for supposed medicinal values. (M. W. N.)

BAPLIS, LILIAN MARY (1874–1937), English theatrical manager and founder of the Old Vic, was born in London on May g, 1874. She received a musical education, appeared as a child prodigy in London and went with her parents, who were singers, to South Africa in 1890. She returned to England in 1898 to assist her aunt, Emma Cons, who had turned the Coburg theatre (renamed the Victoria theatre in 1833) into a temperance hall under the name of the Royal Victorian Coffee Music hall. Taking complete control in 1914, Lilian Baylis created the Old Vic, world famous as the home of Shakespearean productions, and in 1931 took over the derelict Sadler's Wells theatre and made it a centre of opera and ballet which likewise became famous. Nobody did finer service for the English theatre. Lilian Baylis was created a companion of honour in 1929. She died in London on Nov. 25, 1937. (W. J. M.-P.)

BAYLISS, SIR WILLIAM MADDOCK (1860–1924), English physiologist, one of the most distinguished of his generation, was born at Wolverhampton on May 2, 1860. In 1881 he entered University college, London, as a medical student, but preferring the pursuit of science to the practice of medicine, in 1885 he went to Oxford and continued to study physiology under his former teacher, John Burdon-Sanderson. In 1888 he returned to London and worked in the physiological laboratories of University college, where he carried on his researches for 35 years.

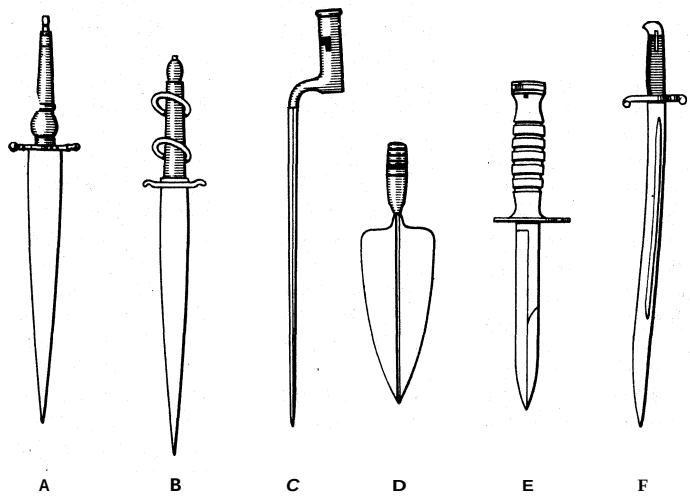
Bayliss' researches covered a wide range and resulted in valuable discoveries, the more important being those on the electromotive phenomena associated with the heart's action; the nervous mechanisms controlling the activities of the viscera and of the circulation to the various parts of the body; the application of recently acquired knowledge of surface phenomena to physiology; and the discovery, in conjunction with Ernest Starling, of secretin, the hormone which excites the pancreas to secrete its digestive juice when acid chyme passes from the stomach into the duodenum.

During World War I Bayliss experimentally investigated the nature of wound shock and devised methods for treatment which were widely and successfully used and saved many lives. His original contributions to science appeared in the scientific journals devoted to physiology and biochemistry between the years 1890 and 1924. His *Principles of General Physiology,* published in 1914, had a world-wide influence and was regarded as the best exposition of the foundations of modern physiology, made particularly palatable by interesting historical allusions. Bayliss' pre-eminence as a discoverer was suitably recognized by learned societies at home and abroad. In 1919 he received from the Royal society the Copley medal, the highest honour for philosophical researches, last given to a physiologist in 1739. He was knighted in 1922 and died at Hampstead on Aug. 27, 1924. (A. B. L.)

BAYLY, THOMAS HAYNES (1797–1839), English popular song writer and dramatist, was born at Bath on Oct. 13, 1797. He was educated at Winchester college and at St. Mary hall, Oxford. In 1824 he became famous with the song "I'd Be a Butterfly," which he followed with "We Met—'t was in a Crowd," "She Wore a Wreath of Roses," "Oh, No, We Never Mention Her" and other ditties. He himself set some of his songs to music; a well-known example is "Gaily the Troubadour." Bayly also wrote two novels, *The Aylmers* and *A Legend of Killarney,* and many plays, the most successful being *Perfection,* which was produced by Madame Vestris and praised by Lord Chesterfield. Bayly died on April 22, 1839. His *Songs, Ballads and other poems* were published in 1844 with a memoir by his widow.

See A. Lang, "*T.* H. Bayly," in *Essays* **in Little (1891).**

BAYONET, a short, edged weapon designed for attachment to the muzzle of a firearm. The origin of the bayonet is obscure, but tradition states that it was developed in the town of Bayonne, France, early in the 17th century and that it derived its name from its place of origin. There is considerable circumstantial evidence to support this tradition, for the earliest references to the use of the bayonet (1640–47) are all connected with Bayonne. Maréchal de Puységur, a native of that city, described these first bayonets as having a straight double-edged blade a foot long with a tapering wooden handle, also a foot long, that could be inserted into the muzzle of a musket. This new weapon, considerably shortened, gradually spread throughout Europe and supplanted the pike. Certain regiments of the British army used it in Tangier as early as 1663, and in its native France, the regiments of fusiliers and grenadiers raised in 1671 also were armed with it.



BAYONETS FROM THE EARLY 17TH CENTURY TO WORLD WAR II

(A) Plug bayonet, (B) ring bayonet, (C) socket bayonet, (D) Rice-Chillingworth trowel bayonet, (E) World War II M4 knife bayonet, (F) sword bayonet for 1855 rifle. (Not drawn to scale)

The plug bayonet, as this first type was called, had several serious defects as a weapon. Once it was inserted in the muzzle of the musket, no shot could be fired until it was removed. If pushed in too tightly, it was difficult to remove, and if not driven in tightly enough, it might fall out or be left in the body of an enemy. Further refinements were obviously necessary. Before 1689 a new bayonet was developed with loose rings on the haft to fit around the muzzle. This system also had disadvantages, and was superseded almost immediately by the socket bayonet that Vauban (*q.v.*) introduced into the French army in 1688. This new bayonet had a sleeve that slipped over the muzzle and was held in place by a stud on the barrel that locked in a right-angled slot in the socket. Usually the blade was triangular in cross section, useful only for thrusting. The socket bayonet rapidly became popular and was adopted by all European armies shortly after 1700. With a few alterations to make the attachment more secure, it remained the basic bayonet form for more than 150 years. In America the bayonet was adopted more slowly. Militiamen were allowed the choice of a bayonet, a sword or a tomahawk until the beginning of the American Revolution.

Since the triangular bayonet could be used only for thrusting or stabbing, attempts were soon made to develop a more versatile weapon. Flat blades with both single and double edges and of various lengths were tried before 1750 with the thought that they could be used separately as swords. Because they tended to make the gun muzzle-heavy, they were applied primarily to the shorter arms such as musketoons and rifles. On some of these bayonets, swordlike handles instead of sockets were used, and they were attached to a lug on the side of the barrel by means of a spring catch. By 1855 such bayonets were standard for the shorter rifles. Some sword bayonets were equipped with saw teeth and could be used as pioneer or engineer tools; others were equipped with heavy bolo blades for cutting brush; and still others were developed as trowels for entrenching purposes. Experiments were carried out with rod bayonets that could be retracted into the stock, and still others were hinged to the muzzle and folded back against a spring so they would fly out into position when released.

As long as firearms were predominantly single-shot weapons and battle tactics called for hand-to-hand fighting in mass formation, the bayonet was an arm of the utmost importance. With the adoption of multishot firearms for general military use (*see* SMALL ARMS, MILITARY), the bayonet became merely an auxiliary

weapon, useful primarily when all ammunition had been expended or when silence was desired. The American Civil War was the last major conflict in which hand-to-hand fighting with the bayonet sometimes decided actions.

In World War I there were a few raids and "over the top" advances in which the bayonet was important tactically. A few instances of bayonet fighting occurred in World War II and the Korean conflict, but mass bayonet attacks were no longer common. Yet the bayonet still had its uses and was retained even on the newer types of rifles. In keeping with its new status, however, it was shortened and modified so that it could also be used as an all-purpose knife. As such it was found to have great morale value during World War II and was one of the last pieces of equipment to be discarded by a soldier in an emergency. The U.S army bayonet (M1) used in World War II and the Korean war had a 10-in. blade in contrast to the M-1905 bayonet with its 16-in. blade. Both were equipped with hand grips and could be carried in scabbards when not affixed to a rifle.

(HD. L. P.)

BAYONNE, a port town in the extreme southwest of France, centre of an arrondissement in the *département* of Basses-Pyrénées, is situated at the confluence of the Nive river with the Adour, 5 mi. from its mouth. Pop. (1954) 26,897. The Roman name was Lapurdum, whence the name Labourd applied to the coastal district between the Adour and Bidassoa rivers. The mouth of the Adour is an artificial channel made in 1578 by diverting the river from its former outlet at Capbreton, which was being closed by the southward drift of sand from the Landes. Bayonne developed during the 19th century as an importing port for British coal and Spanish ore and an exporting port for the products of the Landes forests. Imports of coal and ore have fallen off, but the development of the production of oil at Parentis and of natural gas at Lacq in its hinterland have given new life to Bayonne. It is also a fishing port. chiefly for tunny.

Grand Bayonne, the old town encased within the ramparts of Sebastien Vauban's fortification, lies on the left bank of the Nive. Its principal buildings are the Château Vieux and the cathedral of Sainte Marie. The latter, built on the site of a Roman temple, dates from the 13th to 16th century; two high towers (210 ft.) are 19th-century additions. Across the Nive, Petit Bayonne is the quarter of museums, the Château Neuf and arsenal. The Musée Basque is a fine regional museum displaying the distinctive features of Basque culture. The Bordeaux road is carried across the Adour by the Pont St. Esprit, and downstream along the right bank of the Adour are the port and industrial establishments at Le Boucau and Forges. Biarritz on the coast is almost continuous with Bayonne, the whole forming an urban concentration of 70.000 inhabitants. (AR. E. S.)

BAYONNE, a city of Hudson county. N.J., U.S., on a peninsula adjacent to Jersey City about 7 mi. S.W. of New York city. In 1960 the population of this highly industrialized port city was 74,215. (For comparative population figures see table in NEW JERSEY: Population.)

Settled by the Dutch in 1646, it was originally known as Konstable's Hoeck (Constable's Hook). In 1869 the townships of Constable's Hook. Bergen Point, Centerville and Salterville were consolidated and incorporated as the city of Bayonne.

In 1875 the Prentice Oil company established the first oil refinery there. The subsequent establishment of other oil refineries made Bayonne one of the major oil refining centres of the United States. The city is the eastern terminus of many cross-country pipeline systems. Bayonne's other industries include the manufacture of chemicals, heavy structural shapes, textiles, food products, electrical equipment, heating apparatus and cork products.

During World Wars I and II Bayonne was a major shipping, shipbuilding and embarkation point. It is included within the Port of New York. There are 9 mi. of heavy-duty waterfront docks and wharves and a U.S. navy supply depot. The Elco works, the oldest builder of standardized cruisers in the United States, was established at Bayonne in 1892; it manufactures both naval and pleasure craft.

The Bayonne bridge. spanning the Kill van Kull and connecting the city with Staten Island, is one of the longest (1,652 ft.) steel arch span bridges in the world. (D. N. A.; M. P. M.)

BAYOU, a term applied to creeks, secondary water courses, and minor rivers in the flood plains of the lower Mississippi basin and Gulf Coast region of the U.S. that have little or no current. A bayou lake (in some cases called simply a bayou) is a lake formed in a river channel abandoned because of a shift in the stream's course. The term bayou is an American-French adaptation of a Choctaw Indian word. It is not applied to similar water features that are characteristic of river flood plains and low coastal plains elsewhere.

BAYREUTH, a town of Germany which after partition of the nation following World War II was located in the Land (state) of Bavaria. Federal Republic of Germany. The capital of the government district of Upper Franconia, site of the Wagnerian festivals, it is situated 70 km. (43.5 mi.) N N.E. of Nürnberg, on the upper basin of the Rote (Red) Main river in a wide valley between the Fichtelgebirge and the Franconian Jura. Pop. (1959 est.) 61.088.

The first reliable historical reference to it dates from 1194, and a document, bearing the seal of Duke Otto VII of Merano. confirms its existence in 1231 as a town. In the strategic position near the Main, at the intersection of the trade routes from Eger to Bamberg and from Niirnberg to Kulmbach and Lichtfels, the dukes of Merano in 1170 erected a fortified castle and a number of dwelling houses which ultimately became part of the town centre. After the death of Otto VIII, the last of the house of Merano, Bayreuth passed into the possession of the Hohenzollerns, and became one of the principal centres of that part of the country. Early in the 17th century the margrave Christian made Bayreuth his residence, and he and his successor built many of its fine baroque buildings. The other arts were also attracted to Bayreuth: in 1614 Heinrich Schütz came from Dresden to inaugurate the new organ in the main church, and in 1726 Georg Philipp Telemann was appointed master of music to the court. Although he never lived there he composed each year an opera for performance in the court theatre. In 1732 Wilhelmina, sister of Frederick the Great, came to Bayreuth as the wife of the young heir, and during their reign the town enjoyed a period of considerable artistic splendour. The opera house, built at her request, survives as a charming foil to that other opera house which was to bring world-wide fame to the town.

The name of Richard Wagner appeared in the programs of the court theatre for the first time in 1860, when his opera *Tannhäuser* was performed before an illustrious audience, which included King Maximilian II and his family. The young crown prince Ludwig, who ascended the Bavarian throne six years later, was to become Wagner's most devoted and generous champion. In 1872 Wagner settled there and the foundation stone of the Festival theatre was laid, the culmination of years of persistent planning. The theatre was erected during the next two years on a slight eminence just outside the town, and was uncompromisingly plain, being entirely designed to give the most perfect possible realization to the vast visual and aural demands of Wagner's music dramas. It opened in 1876 with the complete ***Ring*** cycle, but this first season, although an unquestionable artistic success, was so costly that six years passed before the theatre was able to open its doors again for the première of *Parsifal* in 1882. After Wagner's death in 1883 Bayreuth became, under the aegis of his widow, Cosima, a place of pilgrimage for lovers of Wagner from all over the world. Wagner's son, Siegfried, carried on the tradition from 1909 until his death in 1930. World War I once more closed the theatre. and when the festival performances were resumed in 1924 there were many obstacles to be overcome, both financial and also in the changed cultural atmosphere. Yet such men as Arturo Toscanini, Heinz Tietjen and Wilhelm Furtnangler brought fresh international glory to the festival. Under Adolf Hitler's protection the theatre was enabled to continue throughout World War II, until performances were suspended in 1945. In 1951 under the revolutionary artistic leadership of Wagner's grandsons, Wolfgang and Wieland, the

theatre gave its first postwar season, and Bayreuth once more took its place among the major European cultural centres.

(RU. L.)

BAY RUM, a fragrant liquid cosmetic widely used by hairdressers. It is composed of oil of bay, called also oil of myrcia, to which has been added alcohol, water, oil of orange peel and oil of pimenta. *See* BAY-RUM *TREE.*

BAY-RUM TREE, a small aromatic tree *(Pimenta racemosa)* of the myrtle family (Myrtaceae), native to the West Indies and closely related to the allspice (*q.v.*) and the clove. From the leathery leaves, sometimes five inches long, is distilled bay oil used in making a bay rum (*q.v.*). In Jamaica the tree is called bayberry.

BAYTOWN, a highly industrialized city of southeastern Texas, U.S., on Galveston bay, in the Houston metropolitan area. The unincorporated community of Baytown was annexed by Pelly in 1945 and the new city was founded in 1947 by combining the cities of Pelly and Goose Creek. being called Pelly till 1948, when the name was changed to Baytown. The area, rich in early Texas history, was settled in 1822; in 1864 a Confederate shipyard was built at Baytown. But oil, not history, has marked Baytown since 1916, when petroleum was discovered in the area, and for a time it was one of the most colourful of the state's boom towns. Oil is produced, refined and shipped to the world from docks on the Houston ship channel at Baytown, which has been the site of a major refinery since 1919. Other dominant industries are petrochemicals and synthetic rubber. For comparative population figures *see* table in TEXAS. *Population.* (G. M. F.)

BAZAINE, ACHILLE FRANÇOIS (1811–1888), marshal of France who was sentenced to death for his capitulation to the Germans at Metz in 1870, was born at Versailles on Feb. 13, 1811. Failing in the competitive examination to the École Polytechnique, he entered an infantry regiment as a private in 1831. As a second lieutenant in 1833, he served with distinction in Algeria and with a French mission during the Carlist War in Spain. With the rank of colonel in 1850, he led a brigade in the Crimean War and was promoted major-general and appointed governor of Sevastopol (1855). In the French and Sardinian war against Austria, he captured the tower of Solferino (1859). In Mexico, in 1863, he conquered Puebla at the head of his division in May and became commander of the French expeditionary corps in August. A widower, he married at 57 a girl of 17, Maria Josefa de la Peña y Barrajón. Promoted marshal on Sept. 5, 1864, he skilfully conducted the retreat of the French troops from Mexico City to Veracruz in 1867.

Bazaine was commander of the army corps in Lorraine at the outbreak of the Franco-German War and became commander-in-chief on Aug. 10, 1870. As it had been decided that the French forces were to be regrouped at Châlons, he began half-heartedly to move toward Verdun, but allowed himself to make a stand at Borny (Aug. 14), where he was wounded, and fought inconclusive battles at Rezonville and Gravelotte (Aug. 16). After failing to support F. C. Canrobert at Saint-Privat two days later, he resolved to avoid battles in the open and withdrew his forces into the entrenched camp at Metz, where he was invested by the Germans. Apparently unconcerned at the disastrous turn of the war, he remained militarily inactive, but began negotiations with Bismarck, probably hoping to play a political role with his intact forces as a trump card. On Oct. 28, 1870, however, he capitulated to the Germans at the head of an army of 140,000 men. Denounced immediately as a traitor by Léon Gambetta. but defended in the national assembly by N. A. T. Changarnier (May 29, 1871), Bazaine returned to France from captivity and asked for a commission of inquiry. This started on April 12, 1872, and ended in a severe censure of his conduct at Metz. Rejecting the commission's report, Bazaine demanded a trial by a military court. He was defended by two famous barristers. C. A. and G. Lachaud (father and son), and accused by Gen. R. A. Séré de Rivière. On Dec. 10, 1873. the court sentenced him to degradation and death, but recommended mercy. Marshal de MacMahon commuted the sentence to 20 years' seclusion.

Incarcerated on the fle Sainte-Marguerite, Bazaine escaped on Aug. 9, 1874, helped by his wife. He fled to Italy and later to Spain. where he died destitute, in Madrid. on Sept. 28, 1888. *See* FRANCO-GERMAN WAR.

BAZALGETTE, SIR JOSEPH WILLIAM (1819–1891), English civil engineer, notable for designing the main drainage scheme for London as it was actually carried out, was born at Enfield, Middlesex, on March 28, 1819. Various drainage authorities were superseded in 1848 by the metropolitan commission of sewers. Bazalgette served with this from 1849, becoming chief engineer in 1852, a post he continued to hold under the metropolitan board of works which replaced the commission in 1855. Inexperience, reluctance to commit themselves to vast expense and disagreement among numerous consultants held the board back from starting work until 1859; Bazalgette completed most of it by 1865. Other works he executed for the board included the Victoria (north side) and Albert (south side) embankments (1860–70), Chelsea embankment (1871–74), Northumberland avenue (1876), new bridges at Putney and Battersea and the Woolwich steam ferry. Bazalgette was knighted in 1874. He was president of the Institution of Civil Engineers in 1884. He died at Wimbledon park, London, on March 15,1891. (S. B. HN.)

BAZILLE, (JEAN) FRÉDÉRIC (1841–1870), French painter who. as friend, benefactor and colleague of the Impressionists. played an important role during the movement's formative years. He was born at Montpellier on Oct. 6, 1841, and studied medicine before his wealthy parents permitted him to switch to painting. At Charles Gabriel Gleyre's classes in Paris he met Monet and Renoir with whom he frequently traveled and worked, occasionally also sharing his studio with them when they could not afford their own. As a painter he combined a certain naïveté and stiffness with a delicate feeling for nature and an exquisite sense of colour. He seemed destined to occupy a prominent place among the Impressionists had he not been killed on Oct. 29, 1870, during the Franco-German War.

See J Rewald, *The History of Impressionism,* 2nd ed., which includes bibliography (1955); F. Daulte, *Frédéric Bazille et son temps* (1954). *(J N. R.)*

BAZIN, HENRI ÉMILE (1829–1917), was one of a group of notable engineers of the French *corps des ponts et chaussées* ("corps of bridges and roads") who made significant contributions to the science of hydraulics and fluid mechanics in the 19th century. Born at Nancy on Jan. 10, 1829, he became the fifth in a succession of brilliant engineers including Adhémar Jean Claude Barré de Saint-Venant (1797–1886), personally the most remarkable; Arsène Jules Émile Juvénal Dupuit (1804–66), famous for his work on open-channel flow; Jacques Antoine Charles Bresse (1822–83), who extended the work of Dupuit into an exact mathematical form; and finally Henri Philibert Gaspard Darcy (1803–58), best known for his scientific work on pipe flow.

Bazin, acting as Darcy's assistant, was trained to be a careful and assiduous experimenter. He carried on Darcy's original program of tests on open-channel resistance. His studies also extended to wave propagation, to flow over weirs and to the contraction of the liquid vein coming from an orifice. His most valuable publications describing his researches in these fields were published by the French Academy of Sciences in 1865 (to which he was elected in 1913) as well as in the *Annales des ponts et chaussées* during the period 1888–98. In 1875 Bazin became engineer in chief of the corps and was placed in charge of the Bourgogne Canal system. In 1886 he was appointed inspector general of the corps in Paris.

Bazin retired from active duty in 1900. By the time of his death he had 35 titles of scientific writing to his credit. He died on Feb. 7, 1917, at Dijon. (W. E. HD.)

BAZIN, RENÉ (FRANÇOIS NICOLAS MARIE) (1853–1932), French novelist of provincial life, strongly traditionalist in outlook and style, mas born at Angers (Maine-et-Loire), Dec. 26. 1853. and educated at Paris and Angers, where he became professor of law. He entered the Académie Française in 1903 and

was made an officer of the Legion d'honneur in 1918. He died in Paris, July 20. 1932. He wrote many novels and travel books and two excellent biographies, *Charles de Foucauld* (1921; Eng. trans. 1923) and *Pie X* (1928: Eng. trans.). Of his novels, the best are *Donatienne* (1903); *De Toute son âme* (1897); *Le Terre qui meurt* (1899); *Les Oberlé* (1901); *L'Isolée* (1905); *Le Blé qui lève* (1907) and *Magnificat* (1931), all of which are available in English translations.

Bazin's work is traditional in the best sense, marked by purity, clarity and elegance of style, delicacy in the painting of word pictures, and a love of nature, of work, especially on the land, and of the simple virtues. Also a poet. he transfigured all he touched. A Catholic writer, he was concerned with the spiritual development of his characters and with the action of grace on their souls. He was, before the word acquired its later associations, a deeply "engaged" writer and his work had great influence on the upholders of traditionalism in French literature.

BAZOOKA, the popular name given the 2.36-in. shoulder-type rocket launcher adopted by the U.S. army early in World War II. The weapon was simply a smooth-bore steel tube, originally about 5 ft. long, open at both ends and equipped with hand grip, shoulder rest, trigger mechanism and simple sights. It was named bazooka because of its resemblance to the crude horn of that name used by the radio comedian Bob Burns. The 14½-lb. bazooka was an important new U.S. weapon of World War II, and surprised the Germans when first used in the North African landings in Nov. 1942. It not only revived the ancient principle of the rocket and stimulated further work in that field, but in tactical situations it provided infantrymen with the striking power of light artillery.

The bazooka was developed chiefly for attacking tanks and fortified positions st short range in situations where artillery was not available. It fired a 19-in.-long rocket that weighed about 3½ lb. The bazooka rocket carried 8 oz. of pentolite, a powerful explosive, and nas designed according to the "shaped charge" principle that gave it power to penetrate as much as 5 in. of armour plate at 300 yd. As the launcher tube was open at both ends, the bazooka had the added advantage of being recoilless. Its chief defects were short range and lack of accuracy, both stemming from the rocket's low velocity, about 300 ft. per second. Another drawback of the bazooka was the backblast that accompanied its firing, making use of the weapon impossible in enclosed spaces. To escape the backhlast the operator held the bazooka on his shoulder with about half the tube protruding behind him. Normal procedure called for one man to load the launcher and another to fire it.

The bazooka was fired by an electrical trigger mechanism consisting, in the earliest models, of small flashlight batteries, later replaced by a simple impulse generator. Many different types of sights were tried out during World War II, a reflecting sight becoming standard equipment in 1944. To facilitate carrying the bazooka in the field, especially in jungles, later models were built in two sections that could quickly be fitted together for firing. A lightweight aluminum launcher was developed in 1945 to replace the earlier steel models.

The German counterparts of the U.S. bazooka were a light 88-mm. rocket launcher known as *Panzerschreck* ("tank terror") or *Ofenrohr* ("stovepipe") and a heavy 88-mm. launcher mounted on a two-wheel carriage.

During the final stages of World War II a more powerful launcher of 3.5-in. bore was under development for the U.S. army to combat heavily armoured German tanks. It saw active service during the Korean war (1950–53) and made the 2.36-in. launcher obsolete. Like its predecessor, it was a two-piece, smooth-bore launcher with reflecting sights. Made of aluminum, it was 5-ft. long and weighed about 15 lb. It fired smoke rockets or antitank rockets (length 23½-in., weight 8½ to 9 lb.) for a maximum range of about goo yd. *See* also ROCKETS. (*H*. C. T.)

BDELLIUM, a name applied to the bitter aromatic gum resins derived from species of *Commiphora*. Bdellium is similar to true myrrh (*q.v.*) and is sometimes found as an adulterant of it. *See* also RESINS.

BÉ, NOSY: *see* NOSSI-BÉ.

BEACH, AMY MARCY (née CHENEY) (1867–1944), U.S. pianist and composer, whose *Gaelic Symphony* (1896) was the first work in this form by an American woman, was born Sept. 5, 1867, in Henniker. N.H. She was a precocious and prolific composer of choral works, piano pieces and songs in an unpretentious romantic vein. She was soloist in her piano concerto with the Boston Symphony orchestra on April 6, 1900. She died in New York, Dec. 27, 1914.

See P. Goetschius, *Mrs.* H. H. *A. Beach, Analytical Sketch (1906).* (N. Sy.)

BEACH refers to those parts of the shore of a lake or sea upon which material is being deposited by waves and currents. In technical writing those shore segments formed mostly of mud are not designated beaches. The materials making up a beach are of mixed sizes, but usually one size of material — sand, gravel or cobbles — predominates. A beach made up largely of cobbles, large pebbles and boulders is called a shingle beach, and the term beach may derive from an ancient dialect word for shingle. In general the material making up beaches exposed to vigorous wave action tends to be more homogeneous than that found on protected beaches.

The limits of beaches have not been precisely defined. Some physical geographers define the seauard edge of the beach as the low-tide mark; others include an offshore area beyond the low-tide mark. The landward edge of the beach is likewise variously defined and delimited.. Some authorities define the inner edge as the ridge of material thrown up by the highest tides and storms, while specialists include the landward slope of this ridge and the depression, swamp or lagoon behind it.

Both the materials and forms of beaches depend upon the state of waves and currents along the particular stretch of beach and upon the kinds of materials available along the shore at the beach or nearby. For example, along several coasts of the world, limestone cliffs are attacked by the waves, the soluble materials are removed, and the insoluble residue of flint accumulates as shingle on the adjacent beaches.

Conversely, shore lines made up largely of loosely consolidated sandstones or certain kinds of granites will produce unmixed sandy beaches.

Beach form is influenced by the general nature of the shore line, the kinds of water movement along the shore and the type of materials of which the beach is composed. The cross section of the beach at right angles to the shore line is generally rather low and flat if the beach material is largely sand, whereas the slope may be quite steep if the beach material is coarse — pebbles and cobbles. In general, beaches tend to become steeper near their landward margin. Most beaches where waves normally break have a slope of less than 20°.

The commonest location of beaches is at the heads of bays or other re-entrants in the shore front. Material is carried by waves and currents from more-exposed locations into the quiet waters of the bay and there deposited as bay-head, or crescent, beaches having the shape that their name implies.

Beaches with special shapes or locations are often designated by special terms such as spit, hook, bay-mouth bars and others.

Most beaches exhibit a number of interesting and characteristic small features and shapes. For example, ripple marks formed on sandy beaches by currents are asymmetrical, and perpendicular to the current; naves, however, form symmetrical ripple marks at right angles to their own movement. Another small feature is the beach cusp, looking like a tiny bay, up to several inches deep and a few feet wide, whose mode or origin is almost certainly associated with wave action. (W. C. C.)

BEACH PEA (*Lathyrus japonicus*), a characteristic beach plant of northern regions that because of its ability to bind sandy soil has found some use in seaside gardens. It is a perennial herb of the family Leguminosae native to cool sandy shores throughout the northern hemisphere and extending northnard to the Arctic. sea.

The beach pea is a smooth, stout. trailing or climbing pealike

plant, one foot to three feet high, with tendril-bearing leaves divided into six to ten oblong, thick leaflets, and with clustered, showy, purple flowers about one inch long.

BEACH WORMWOOD (Artemisia stelleriana), a perennial plant of the family Compositae native to northeastern Asia and naturalized in North America on sandy sea beaches from Quebec to Delaware and also on the coasts of Sweden. The white woolly plant, with foliage similar to that of the dusty miller (*Senecio* cineraria), is cultivated as a border plant, and is especially suited to seaside rock gardens. See also ARTEMISIA.

BEACHY HEAD, BATTLE OF, a naval action, known to the French as the battle of Béveziers (*i.e.*, Pevensey), fought off the coast of Sussex, Eng., near Eastbourne, on July 10 (new style; June 30, old style), 1690, between an Anglo-Dutch and a French fleet during the War of the Grand Alliance (*q.v.*). The allied force, which consisted of 35 British sail under the earl of Torrington (Arthur Herbert) and of 22 Dutch commanded by C. Evertzen, was at anchor under the headland at Beachy Head, when a French fleet of more than 70 sail under the comte de Tourville appeared. The French fleet, which had been trying for some days to engage the. Anglo-Dutch, had instructions to co-operate with an expected Jacobite rising in England. In view of the French fleet's known superiority, Torrington had wanted to retire to the mouth of the Thames, but he was ordered to remain and fight. He therefore bore down on the French, but his line became separated. The rear under Sir Ralph Delaval engaged; the Dutch in the van fought a close action with the French and were isolated by them until the tide turned and the French were carried westward, the English and Dutch ships having dropped anchor. At the first opportunity Torrington withdrew to the Thames. Brought to trial before a court-martial on a charge of retreating, he defended his conduct on the grounds that he had maintained "a fleet in being" as a potential threat which rendered any proposed invasion impossible, and was acquitted. This doctrine subsequently often inspired the strategy of maritime powers which found themselves in an inferior situation. In 1692 Tourville's command of the English channel ended when his fleet was annihilated by Adm. Edward Russell at the battle of La Hogue (*q.v.*).

BIBLIOGRAPHY.—J. K. Laughton (ed.), Memoirs Relating to Lord Torrington (1889); P. H Colomb, Naval Warfare, 3rd ed. (1899); J. Tramond, Manuel *d'histoire* maritime (1927). (C. C. L)

BEACON, a signaling object or device, such as a radio transmitter that indicates geographical location or direction to ships or aircraft by transmitting special radio signals, or a conspicuous object, either natural or artificial. visible as a mark from a distance by day and, if lighted (*e.g.*, a lighthouse). at night. The term is also applied to a watchtower or signal station. Marker beacons used to assist mariners are erected on small islands, isolated rocks, reefs, shoals and at suitable positions on the coast line, and are also used to mark the limits of the fairway in harbours, estuaries and rivers. Rotating light beacons mark airports at night and during periods of low visibility. Various types of beacons also mark established airways. See AIRPORT; AIRWAYS; LIGHTHOUSES; NAVIGATION; RADAR: *Accessory* Devices: *Radar* Beacons.

BEACONSFIELD, BENJAMIN DISRAELI, EARL OF (1804–1881), British statesman and novelist, who was prime minister in 1868 and 1874–80, and the creator of the modern Conservative party, was born in London on Dec. 21, 1804. He was of Italian-Jewish descent, the eldest son and second child of Isaac D'Israeli (*q.v.*) and of Maria Basevi. His grandfather Benjamin D'Israeli emigrated to England from Cento, near Ferrara in Italy, in 1748 and after a moderately successful business career became a member of the London Stock exchange. He left £35,000 on his death in 1816. The elder Benjamin's second wife, Disraeli's grandmother, was descended from the great Portuguese Jewish family of Villareal—a connection of which her grandson was very proud. The numerous picturesque details with which he embroidered his own story of his descent are, however. for the most part fictitious or nonproven. The most important event in Disraeli's boyhood was Isaac D'Israeli's quarrel in 1813 with the Sephardic synagogue of Bevis Marks, which led him in 1817 to decide to have his children baptized as Christians. Since Jews (by religion) were excluded from parliament until 1858, it can be safely asserted that but for this curious accident Disraeli's subsequent political career could never have taken the form it did.

Early **Career.**—Disraeli went to school first at Blackheath, then to an establishment called Higham hall. in Epping forest, kept by a Unitarian minister. At the age of 17 he became articled to a firm of solicitors in the City, but he longed to make his mark on the world in a more sensational manner than was open to a mere lawyer's clerk. His first efforts were disastrous.

In the autumn of 1824 he began to engage in reckless speculation in South American mining shares. The bubble burst a year later and Disraeli was subsequently burdened with a debt which was to encumber him till he was well past middle age. Before this calamity he had persuaded his father's friend, the great publisher John Murray, to launch a daily newspaper, the Representative, which proved a complete failure. Disraeli was unable to pay his promised share of the capital and the resulting recriminations involved him in quarrels with Murray, J. G. Lockhart. J. W. Croker and other people of importance in the Tory literary-political world. As if this were not enough for a young man of barely 21, he then produced an anonymous novel, Vivian Grey, five volumes (1826–27), in which he lampooned Murray and related the whole story of the Representative under the thinnest of disguises. The author's identity was soon discovered and the critics did not spare him. Certainly the crudities and absurdities of the novel are obvious enough, but an impudent gusto carries the story along and there are many flashes which hint at the Disraeli of later literary fame.

The strain of all these events induced in Disraeli something that would now be called a nervous breakdown. He did little of interest during the next four years apart from writing another equally extravagant novel The Young Duke, three volumes (1831). In 1830 he set off on 16 months of travel in the Mediterranean and the middle east with his sister Sarah's fiancé. William Meredith. This "Grand Tour" ended in tragedy with Meredith's death from smallpox in Cairo. Disraeli's experience of the colour and glamour of the east left a lasting effect on his whole cast of mind. The oriental descriptions with which his novels abound are merely one aspect of this. It also affected his attitude toward foreign affairs and it is by no means fanciful to see in those experiences the origin of his policy toward India, Egypt and Turkey in the 1870s.

On his return to England he at once plunged into London social and literary life. His friend Sir Edward Bulwer (later Lord Lytton) introduced him into the salons of such people as Lady Blessington. Mrs. Norton and Lady Cork. His dandified dress, his conceit and affectation, his exotic good looks made him a striking though not always popular figure uherever he went. He soon found himself beset with invitations to fashionable parties and met most of the celebrities of the day. During the next few years he published a number of books; the only one of any literary value was Contarini Fleming, four volumes (1832), which also has considerable autobiographical interest.

Political Beginnings and **Marriage.**—Disraeli had by 1831 made up his mind to enter politics and since his family was now settled at Bradenham, near Wycombe in Buckinghamshire, it was natural that he should seek a seat in that locality. As an independent radical, he fought and lost High Wycombe no less than three times: twice in 1832, once in 1835. He realized after the third attempt that he must attach himself to one of the great political parties, and, since his radicalism had many features not inconsistent with a somewhat eccentric interpretation of Toryism, he gravitated toward the Tory-Conservative party. His increasing friendship with Lord Lyndhurst, a brilliant but rather disreputable former Tory lord chancellor, led in the same direction. In 1835 he fought Taunton as the official Conservative candidate. He was again defeated. but he secured much notoriety from a resounding quarrel with the Irish leader Daniel O'Connell, arising out of an election speech. Disraeli's extravagant behaviour, load of debts and open liaison with Henrietta, wife of Sir Francis Sykes (and the original of his novel Henrietta Temple), combined to give him a dubious reputation at this time. Finally at the election of 1837 he was returned to parliament as Conservative member for Maidstone in Kent. His maiden speech in the house of commons (Dec. 7, 1837)

was a failure. A combination of elaborate metaphors, affected mannerisms and foppish dress resulted in his being howled down, the Irish members, in revenge for O'Connell, leading the uproar. But he was not silenced The last words of his speech shouted high above the clamour were both defiant and prophetic: "I will sit down now but the time will come when you will hear me."

Disraeli was never a man to ignore the lessons of experience. He learned to adapt himself to the ways of the house and before long was a speaker who commanded attention. His social position was consolidated by his marriage in 1839 to Mrs. Wyndham Lewis (née Mary Anne Evans), widow of Disraeli's colleague as member for Maidstone. She was 12 years older than Disraeli and highly eccentric but she had a life interest in a house in Park lane and in a fortune which produced some £4.000 a year, and was deeply devoted to her second husband. It would be absurd to deny that Disraeli's motives in proposing were principally material. Indeed on one occasion he actually admitted as much in a letter to her. But there is no reason to doubt the truth of her own half jesting remark: "Dizzy married me for my money but if he had the chance again he nould marry me for love."

Breach With Peel.—Sir Robert Peel, anxious to cultivate talent in his party, seems to have encouraged Disraeli, inviting him to attend sessions of the 19th-century equivalent of the "shadow cabinet." When in 1841 the Conservatives won the election Disraeli had reason to expect office. No offer came and when he wrote a supplicating letter to Peel he received a cool and formal refusal. It is said that Peel would have included him, but that Lord Stanley, a key figure in the cabinet who had conceived a strong personal aversion for Disraeli, absolutely vetoed any offer. Disraeli was much mortified at the rebuff and began to assume an ever more critical attitude toward Peel and the type of Conservatism that he represented.

Disraeli's pen had not been idle during the past ten years He had written a number of novels; *The Wondrous Tale of Alroy* and *The Rzse of Iskander* (1833) were of little merit, but *Venetia* (1837), a fictional account of the lives of Byron and Shelley, remains very readable and *Henrietta Temple,* three volumes (1837) is one of the most attractive of all his romances, uith a memorable portrait of his friend Count d'Orsay. He also produced a long and bad epic poem *The Revolutionary Epick* (1834) and an equally unsuccessful blank verse *Tragedy of Count Alarcos* (1839). During these years too he wrote a series of pamphlets and open letters and a political treatise in which he adumbrated the theory of Toryism that was to be fully expounded in the first and greatest of his political novels, *Corzingsby.* These political works published in the 1830s include A *Vindication of the English Constitution* (1835) and *The Letters of Runnymede* (1836). The latter was a reprint (together with a tract on "The Spirit of Whiggism") of a series of pseudonymous letters, satirizing the characters of the principal ministers on Lord Melbourne's second administration, which had appeared in the *Times* during 1836.

Disraeli maintained that the Tories, although seeming to be the party of monarchical and ecclesiastical privilege, had in reality almays been on the popular side. The Whigs were a group of selfish oligarchs who by destroying crown and church were destroying the two great safeguards for popular liberties. The revolution of 1688 had, he argued, been in the interest of a narrow class and the Reform bill of 1832, though ostensibly aimed at widening popular suffrage, was in fact designed to consolidate the supremacy of the Whig party. In the 1840s Disraeli's Toryism took on a new colour with the emergence of a group of youthful Tories (of which George Smythe, later Lord Strangford, and Lord John Manners, later duke of Rutland, were the most important members) who were nicknamed "Young England," and who looked to Disraeli for their inspiration. *Coningsby; or, The New Generation,* three volumes (1844) is the novel which immortalizes their attitudes and aspirations, and the hero is a portrait of Smythe. "Young England" was hostile to the cool pragmatic humdrum middle-class Conservatism of Peel. It was romantic, aristocratic, nostalgic and escapist. It looked to a nonexistent golden past where the people and the nobility were united in a generous alliance supporting an enlightened throne and a conscientious church. The contemporary flirtation of some Chartists with Toryism seemed to give a certain plausibility to the creation of such an alliance. A year later (1845) Disraeli published *Sybil; or, The Two Nations,* three volumes, in which the causes and nature of Chartism were vividly analyzed and depicted.

By this time he was in more or less open revolt against Peel and had publicly clashed with him, declaring at the beginning of the parliamentary session in 1845 that "a Conservative government is an organized hypocrisy." In the autumn of that year a combination of the Irish famine and the arguments of Richard Cobden decided Peel to repeal the protective duties on foreign imported grain known as the corn laws. Here was an issue on which Disraeli could rally not merely the romantic scions of noble houses but the great mass of country squires who formed the backbone of the Conservative party. Lord Stanley, in the house of lords, was the only important member of the cabinet to resign, but a large majority of backbenchers declined to follow Peel. Acting ostensibly as lieutenant to Lord George Bentinck, who nominally led the rebels, Disraeli in a series of brilliant speeches consolidated the opposition to Peel. But his invective greatly embittered politics and created lasting resentment among the supporters of his former chief. Peel himself seldom responded in kind, but he did on one occasion taunt Disraeli with having solicited office from him: Disraeli categorically denied the charge but whether this was genuine forgetfulness or a deliberate lie will never be known. The protectionists could not stop the repeal of the corn laws because the bill had the backing of Lord John Russell and the Whigs, but they were able to put Peel in a minority on the question of Irish coercion and thus force him to resign (June 1846).

Conservative Leader in **the** House of Commons.—The corn laws crisis was a turning point in Disraeli's career. The loyalty of nearly all the Conservative ex-ministers to Peel and the death of Bentinck in 1848 gave him an indisputable claim to the leadership of the opposition in the house of commons—a claim which even Stanley who led the party as a whole could hardly contest. Disraeli devoted the next few years to endeavouring to extricate his party from what he now recognized to be "the hopeless cause of protection." The policy was sensible enough but it inspired mistrust among his followers, as too did Disraeli's pride in and insistence upon his Jewish ancestry. He had voted with the Liberals in 1847 for removing Jewish civil disabilities and in *Tancred; or, The New Crusade,* three volumes (1847), the third of the trilogy including *Coningsby* and *Sybil,* he set forth some highly unorthodox views about the relationship between Christianity and Judaism. The party could not. however, dispense with his talents whatever it thought of his character. Besides, with his election for Buckinghamshire in 1847 and his purchase of Hughenden manor in 1848 with the help of the Bentincks, his social and political position was fortified: he had become a county member and a country gentleman with a landed estate. His finances, however, despite his father's death (1848) and his wife's income, remained shaky in the extreme. He closed the protectionist phase of his career by writing a remarkably impartial *Life* of Lord George Bentinck (1852).

Russell's government fell in 1852 and the earl of Derby (as Lord Stanley had become since his father's death in 1851) formed a short-lived minority government. Nearly all its members were new to office. Disraeli was chancellor of the exchequer despite his protest that he knew nothing of finance. "You know as much as Mr. Canning did," replied Derby, "They give you the figures." His budget in fact brought the government down (Dec. 1852), but Disraeli can hardly be blamed for this. The free trade majority in the house was determined to defeat measures which relieved agriculture, even though the method chosen did not involve protection, and yet Disraeli could not escape bringing forward some such proposals if he mas to placate his own followers. For the next six years the Tories were in opposition. The balance of power in a house of commons where neither of the traditional parties seemed able to secure a clear majority rested with the Peelites, the Irish and the Radicals. and none of these groups, however hostile on occasion to the Whig-Liberal party, was likely to favour the Tories for long. The Peelites were perhaps the most likely converts, but

Gladstone, their most vigorous figure, was animated by implacable personal animosity for Disraeli. In 1853 the collapse of the earl of Aberdeen's coalition gave Derby a chance to take office and secure renown as the man to end the Crimean War. He timorously hesitated and much to Disraeli's indignation let the opportunity go to Lord Palmerston. It was difficult to be more conservative in home or more jingoistic in foreign affairs than he, and Disraeli's party found most of their potential thunder stolen. Temporary unpopularity, however, resulted in a defeat for Palmerston in 1858 and once again Derby formed a minority government with Disraeli as chancellor of the exchequer. Disraeli with his notions of popular Toryism had for some time felt that there was no reason to leave parliamentary reform as a Whig monopoly, and no need for Conservatives to conserve the 1832 settlement which had been made in the Whig interest. Accordingly he introduced a moderate reform bill in 1859. But its provisions seemed too obviously designed to help his party and the majority of the house combined to defeat them and turn out the government. Palmerston was in office for the next six years. It was a period of quiescence for Disraeli. In his private life the most notable event was his inheritance in 1863 of some £30,000 from an aged Jewish widow, Mrs. Brydges Willyams of Torquay, who had been his devoted friend and admirer.

The "Leap in the Dark."—Palmerston died immediately after the general election of 1865 had given him a comfortable majority. He was succeeded by Earl Russell (as Lord John Russell had become) who promptly brought forward a measure of parliamentary reform. Moderate though this was, it aroused the strong opposition of the Tories and, more seriously, a revolt within the Whig-Liberal party. Russell was defeated and Derby formed his third minority government with Disraeli again chancellor of the exchequer. Disraeli's opposition to the Liberal bill had been based on opportunism rather than principle. Although the initiative for a new Conservative reform bill came from the queen and Lord Derby, Disraeli plunged into the battle with an enthusiasm combined with a mastery of parliamentary tactics unsurpassed by any other statesman of the day. He believed strongly that the measure should be a sweeping one, subject to certain safeguards, for which he cared much less, and so persuaded most of his party, although Lord Cranborne (later 3rd marquess of Salisbury) resigned together with two other members of the cabinet. Above all Disraeli was determined that the bill should be carried by a Conservative government.

These considerations dictated the course of events in 1867. The bill in its original form abolished the £10 rating qualification and gave the vote in the boroughs to all householders who paid their own rates; *i.e.*, did not "compound" them along with their weekly rent to a landlord. In addition there were to be a number of "fancy franchises" as Disraeli's enemies called them, designed to give the vote to men of means and education. But with the Liberals in a majority in the house of commons, Disraeli was obliged to accept their amendments. In the end nearly all the so-called safeguards vanished, including the proviso against "compounders." The resulting measure doubled the existing electorate and was undoubtedly far more democratic than most Conservatives had envisaged. It was indeed "a leap in the dark," as Derby called it, but Disraeli could fairly claim that it had gone far toward "realizing the dream of my life and re-establishing Toryism on a national foundation."

The "Top of the Greasy Pole."—In Feb. 1868 Derby, worn out by repeated attacks of gout, retired from politics and Disraeli became prime minister. "Yes," he said in reply to a friend's congratulations, "I have climbed to the top of the greasy pole." It was in a sense a "caretaker" premiership, for everyone awaited the general election which was due to be held as soon as the new electoral register was completed. Meanwhile Gladstone, now undisputed leader of the opposition, seized the initiative by moving a series of resolutions in favour of disestablishing the (Anglican) Church of Ireland. Disraeli's hope of countering by a successful "no-popery" cry failed and the autumn election gave the Liberals an increased majority. Disraeli set a precedent by resigning without waiting for parliament to meet. Before he left office Queen Victoria conferred at his request a peerage upon his wife who became Viscountess Beaconsfield in her own right.

The whole face of politics had changed in the three years since Palmerston's death. From a chaotic collection of ill-defined shifting groups influenced as much by personalities as politics there emerged two great parties with intelligible coherent policies. Their respective leaders seemed singularly well chosen to polarize the confused forces which had hitherto animated British politics. For 12 years they fought a deadly duel. Each detested the other and history records scarcely a flicker, on either side, of those generous emotions toward the political enemy, which have so often softened the seeming acerbity of parliamentary life.

For the moment Disraeli deemed it wise to play a comparatively peaceful role, gradually creating for the Conservative party a new image, which would in the course of time, he hoped, persuade the new electorate. His seeming apathy, however, disturbed his supporters and there was talk of supplanting him by Derby's son and successor, the 15th earl. These misgivings were increased by the publication of *Lothair*, three volumes (1870), described by G. E. Buckle, Disraeli's biographer, as "a gaudy romance of the peerage so written as to make it impossible to say how much was ironical or satirical, and how much soberly intended." It is a most enjoyable novel full of wit and epigram, and contains a good-humoured satire on the Roman Catholic Church, but to many grave persons it must have seemed an undignified production for a former prime minister.

From 1872 onward, however, Disraeli took charge of his party with a firm hand. On three broad issues he sharply differentiated Conservative from Liberal policy. In a speech at Manchester (April 3, 1872) he defended the monarchy, the house of lords and the church against the radical threat which he claimed to discern in Gladstone's policy. At the Crystal palace three months later he asserted for the first time the Conservative belief in consolidating the empire, with special emphasis on India. And in the same speech he dwelt on the importance of social reform: the old "condition of the people" question which he had analyzed so vividly in *Sybil* a quarter of a century earlier. During these years of opposition yet a fourth distinctive Conservative policy began to emerge: upon Disraeli there descended in some degree the inheritance of Palmerston: the belief in a strong foreign policy, in a firm line with Russia and in the greatness of Britain; and he severely criticized Gladstonian tendencies toward "little Englandism" and reduction of armaments.

In Dec. 1872 Disraeli suffered a personal bereavement none the less poignant for having been long expected. His wife died of cancer after many months of illness. Her oddities never disturbed Disraeli, while her affection, her management of domestic affairs, and her deep devotion to him had rendered his life happy as it had never been before. There were more material losses too. He no longer had her house in London, and her fortune, which was entailed, passed to her cousins. Disraeli was now 68 and his health was not good. It is a testimony to his indomitable will that he determined to continue the political battle despite the personal distress and confusion inta which he was thrown. The society of women remained essential for him. From this period dates his romantic friendship with the sisters, Lady Bradford and Lady Chesterfield, to whom he poured out the secrets of politics and the affections of his heart in a profuse and fascinating series of letters which only ceased with his death.

At this juncture he had the consolation that public affairs at last began to move in his favour. Gladstone's ministry, declining in popularity, was defeated in the house of commons in 1873 on a proposal for an Irish university. Gladstone promptly resigned but Disraeli shrewdly, and much to Gladstone's anger, refused to take office on the ground that he could not dissolve parliament for some months owing to the amount of uncompleted business and that a minority government could only damage his party's prospects. Gladstone reluctantly returned to office, but less than a year later himself decided on a sudden dissolution. Disraeli had not neglected the vital problems of party organization and machinery so necessary in the new era of mass democracy. Indeed he had always kept a careful eye on party management, delegating the work

first to his own solicitor, Sir Philip Rose, and then after 1868 to Sir John Gorst. The result of Disraeli's ideas, Gorst's labours and Gladstone's unpopularity was reflected in a triumphant election which returned the Conservatives by a substantial majority over the Liberals. For the first time since Peel's victory in 1841 the Conservative party was in undisputed command of the house of commons.

Second Administration, 1874–80.—It was Disraeli's tragedy that power came to him too late. He had never possessed the vitality and the iron constitution of a Palmerston or a Gladstone. and he aged rapidly during his second premiership. Certainly he achieved much but he could have done far more, even a few years earlier. He formed a strong cabinet, his great catch being Lord Salisbury, who swallowed his personal doubts and returned as secretary for India. The 15th earl of Derby as foreign secretary, Sir Stafford Northcote as chancellor of the exchequer and R. A. Cross at the home office were the principal other appointments. Disraeli was further fortified by his friendship with the queen who was politically conservative and had already acquired a considerable dislike for Gladstone. This was perhaps surprising. The prince consort. whose opinions dominated the queen long after his death, was a friend of Gladstone and declared that Disraeli "had not one single element of a gentleman in his composition." But the queen was frightened at Gladstone's radicalism and susceptible to Disraeli's extraordinary charm with women. He treated her as a human being where Gladstone treated her as a political institution. In doing so Disraeli indulged in a degree of flattery to which the word oriental has been legitimately applied. As he himself observed, where royalty is concerned butter should be laid on with a trowel. and he certainly acted up to his precept.

His anxiety to please the queen landed him in difficulties at once. Largely at her instance he gave his support to the archbishop of Canterbury's measure (known as the Public Worship Regulation act) to suppress the more extreme ritualistic practices of the high church party in the Church of England. This was a subject in which it was unwise to meddle; although the bill was passed, it was never effective and Disraeli was to pay dearly for it in the bitter opposition of the high churchmen to his eastern policy three years later. But in the session of 1875, embarking on a program of social reform which touched the real interests of the masses more effectively than most of Gladstone's measures. he was at last able to show that Tory democracy was not a mere phrase. The Artisans' Dwellings act was the first measure to make effective slum clearance possible. A Public Health act codified the complicated law on that subject and translated into reality Disraeli's own half-joking witticism in the Manchester speech of 1872: "Sanitas sanitatum, omnia sanitas" (an alliterative misquotation of *vanitas vanitatum, ornnia vanitas,* "vanity of vanities, all is vanity," taken from the Book of Ecclesiastesj. Equally important were an enlightened series of factory acts preventing the exploitation of labour and two trades union acts which clarified the doubtful legal position of those bodies. These reforms have been described as "the charter of the social and industrial freedom of the working classes." The detailed work was done by Cross, the home secretary, but the measures would never have been enacted without Disraeli's initiative, support and supervision.

Important though Disraeli's domestic program was, it took second place in the public eye to his imperial and foreign policy. He felt that British prestige in both these fields had declined during Gladstone's administration and he entered office in a mood to reverse that trend. His first great success was the affair of the Suez canal shares. The canal, opened in 1869, had at once transformed the strategic considerations which affected the route to India. The extravagant and spendthrift ruler of Egypt, the khedive Ismail, owned slightly less than half the Suez Canal company's shares, and was anxious to sell them. This fact was communicated by a patriotic journalist to the foreign office which regarded a purchase as absurd. Disraeli, however, boldly overruled Derby and at the end of Nov. 1875 bought them for the government. the money being put up by his friends the Rothschilds until parliament could confirm the bargain. The transaction did not in itself affect the control of the route to India, but it gave England an indirect stake in Egypt which in the end led to military occupation. Financially it was an excellent bargain and in terms of imperial prestige it seemed a notable triumph.

Disraeli's next effort, early in 1876, was to bring in a bill conferring on Queen Victoria the title empress of India. This was intended to symbolize the special status of that great dominion and to vindicate the personal relationship of the sovereign with her Indian subjects. The measure passed but there was a good deal of opposition, and despite subsequent claims it is hard to see that much was gained by it. Disraeli himself would gladly have postponed it, but the queen insisted. For some time his health had been poor and it became clear to him in the summer of 1876 that the strain of leading the house of commons was too much. Accordingly in August he accepted a peerage, taking the title earl of Beaconsfield.

From 1876 to 1878 his life was dominated by a major issue of foreign policy. The conflict between Russia and Turkey which had lain dormant since the Crimean War was abruptly reopened by the revolt of the Christian subjects of the Ottoman empire against intolerable misrule *(see* EASTERN QUESTION). Russia declared war on Turkey in April 1877 and its troops reached the gates of Constantinople early the next year. British sentiment then veered steeply against Russia. Hitherto, thanks to an unparalleled moral crusade by Gladstone, whose pamphlet, *The Bulgarian Horrors and the Question of the East,* sold 40.000 copies in four days, public opinion had been strongly hostile to the Turks. But the Russian victories aroused the old Crimean sentiments and renewed fear for the safety of the route to India. Beaconsfield was determined not to allow Russia to dictate a victor's peace and, knowing that the Russian forces were exhausted, he rightly reckoned that the threat of British intervention would be enough. Gladstone's pro-Russian propaganda was highly embarrassing at this juncture and both Beaconsfield and the queen came to regard him with an almost pathological hatred. The cabinet was divided and after much vacillation Lord Derby resigned on the question of sending the fleet to Constantinople. But the prime minister stood firm, Salisbury succeeded Derby at the foreign office and Russia was obliged to submit the highly pan-Slavist treaty of San Stefano, which it had forced upon Turkey. to a European congress. Beaconsfield attended the congress of Berlin *(q.v.)* in the summer of 1878, and made a great personal impression, obtaining nearly all the concessions that he wanted. Many of the arrangements had been fixed beforehand, but at one moment the Russians seemed inclined to make difficulties and Beaconsfield gave orders for his special train to be ready to take him from Berlin. The threat worked and he was able to return in triumph to London declaring that he had brought back "peace with honour."

This was the climax of his career. The queen offered him a dukedom which he refused and the Garter which he accepted. His prestige was at its height. Thereafter his fortunes maned. The forward policy of Lord Lytton, the viceroy of India, brought disaster in Afghanistan. and in South Africa an unwary British force was slaughtered by the Zulus at Isandhlwana. Agricultural distress combined with an industrial slump to bring the government into disfavour. At the general election of 1880 the Conservatives received a heavy defeat. Beaconsfield courageously agreed to retain the party leadership, and despite this burden found time to finish *Endymion,* three volumes (1880)—a mellow political novel (for which his publishers paid him £10.000) in which he surveyed his own early career through the rose-coloured spectacles of romantic nostalgia. His health mas, however, failing rapidly and he died at his London home on April 19, 1881. A few days after his burial in the family vault at Hughenden, Queen Victoria came in person to lay a wreath upon the coffin of her favourite minister.

Character and Influence.—On any assessment of his character Disraeli must be regarded as one of the most extraordinary figures ever to have reached the summit of British politics. That a man of Jewish origin, loaded with debts, and widely regarded as a combination of flashy litterateur and opportunist adventurer should have become leader of the Tory party may well be evidence of the unexpected fluidity of the Victorian social structure, but it is also evidence of a determination, a courage, and a parliamentary genius

seldom surpassed in British history. On the Conservative party his influence was profound. He provided it with a romantic ideology none the less potent for being based on a very dubious version of history; and at a more material level he reorganized the party machinery on lines from which it had not far departed three-quarters of a century later. If the "myth" of popular Toryism by which he interpreted past history can be easily destroyed, this does not alter the fact that he made it a reality in his own day. More than almost any other contemporary statesman he discerned intuitively what the newly enfranchised masses wanted both at home and abroad. His policy of social reform, his vision of the empire as a great confederation of self-governing states tied to the mother country by an imperial tariff, and his determination, perhaps all the greater because of his basically alien origin, to stand up for what he deemed to be Great Britain's vital interests, might well have ensured a long lease of power for the Conservative party, had his health been stronger and his energy greater. The sincerity of his beliefs and the extent to which he was influenced by opportunism and love of power rather than high principle must always remain a matter of argument. He was an enigma to his contemporaries. He remains one even today.

BEACONSFIELD, probably from Old English *beacnes-feld,* "field marked by beacon," an urban district in the South Bucks parliamentary division of Buckinghamshire, Eng., 24 mi. W.N.W. of London by road. Pop. (1961) 10,019. It lies just off the Chilterns and in the days of coach travel was an important posting station on the London-Wycombe road and some of its coaching inns still survive. The four wide streets of the old town are bordered with early 17th-century houses; the new town is mainly residential, although there is furniture and machinery manufacture and a filtration plant. In the parish church Edmund Burke is buried and the poet Edmund Waller (lord of the manor in 1624), lies in the churchyard. G. K. Chesterton's grave is in the churchyard of St. Teresa of the Child Jesus. In the town there is the famous miniature village of Bekonscot built in a large rock garden with its own railway system and minster. Beaconsfield was adopted by Disraeli for his earl's title.

BEADLE, GEORGE WELLS (1903–), U.S. geneticist, co-winner of the 1958 Nobel prize for physiology and medicine and, from 1961, president of The University of Chicago, was born in Wahoo, Neb., on Oct. 22, 1903. He was educated at the University of Nebraska, Lincoln (B.S., 1926; M.S., 1927), and Cornell university, Ithaca, N.Y. (Ph.D., 1931). His Ph.D. thesis dealt with the genetics of maize.

In 1931 Beadle went to the California Institute of Technology, Pasadena, where, in the laboratory of T. H. Morgan (*q.v.*), he began work on *Drosophila melanogaster,* the small fly that the Morgan school had made into one of the classic organisms of genetic research. In 1935 he went to Paris where, with Boris Ephrussi, he initiated a study of gene action in *Drosophila* by means of organ transplantation techniques. Beadle and Ephrussi investigated certain inherited defects in the formation of the brown pigment of the eyes of *Drosophila* by this method and showed that the chemical steps in the synthesis of the pigment are under the control of specific genes. Beadle taught genetics at Harvard university for one year (1936–37) and then was made professor of biology at Stanford university, Stanford, Calif. (1937). In 1946 he became professor and chairman of the division of biology at the California Institute of Technology. He was elected chancellor and, after a faculty reorganization, president of The University of Chicago in 1961.

At Stanford, Beadle was joined in the *Drosophila* investigation by Edward Lawrie Tatum (*q.v.*). Technical difficulties inherent in the use of *Drosophila* for biochemical studies became apparent, however, and Beadle and Tatum cast about for another organism in which a biochemical approach to genetics could be effectively pursued. The red bread mold, *Neurospora crassa,* filled their requirements, and they began experiments on this organism. In 1941 they made the important discovery that the synthesis of vitamins and amino acids in *Neurospora* is under the control of the genes. This finding opened a rich field, the exploration of which brought to light much new knowledge about genes and biochemical processes. The basic fact that emerged from these studies was that the function of the genes in the cell is that of determining the synthesis of enzymes and other proteins. This principle found wide application in biology, including human genetics, and its revelation won for Beadle and Tatum (with Joshua Lederberg) the Nobel prize. (N. H. H.)

BEADLE (BEDEL or BEDELL), originally a subordinate officer of a court charged with the duty of securing the appearance of defendants at law suits. Now, seldom used, the word denotes a court crier, a minor parish officer or other person charged with purely ceremonial functions. *See* JUDICIARY AND COURT OFFICERS. (P. B. K.)

BEADS. From the earliest times beads have been worn by man either for ornament or for their magical properties. Among primitive peoples they were as much magical as decorative; hence great conservatism was observed in their shapes and materials. Through the value attached to beads as light articles of trade and as substitutes for coinage they bear useful witness to ancient trade and cultural contacts. (The word "bead" is derived from the Saxon *biddan* [German *bitten* "to pray"] because of its association with the rosary.) In prehistoric times beads were worn not only around the neck but around the hips, over the ears, threaded through the nose and even attached to the eyelashes. In Arab countries today, single blue talismanic beads are attached to domestic animals, children, brides and even automobiles to avert ill luck.

HISTORY

Stone Age.—The earliest beads probably were plant seeds, but by Acheulian times collars of sea shells and small fossils were bored for stringing, and from the Aurignacian and Magdalenian periods (*c.* 30,000 B.C.–10,000 B.C.) whole necklaces of pierced shells have survived, some of them carried long distances from the sea. Collars of pierced canine teeth of arctic foxes and of chamois and human teeth pierced for stringing also have been found.

A type of bilobed bead derived from the Paleolithic steatopygous Venus figurine was carved out of mammoth ivory and much worn in Siberian Paleolithic settlements. It was perhaps ancestral to a bone or stone bead of double-ax shape that was popular in the Neolithic period, especially in northern Europe, Britain and southern France. Spherical steatite beads became popular in Neolithic Switzerland (Cortaillod culture), and spread into western Europe. Beads of stone, bone and amber, pierced through their narrower ends, became common in the late Neolithic in Scandinavia and are found in Megalithic graves of western Europe, especially in Ireland.

Early Egypt.—The earliest Egyptian beads, dating from *c.* 4000 B.C., are made generally of stone, usually steatite, covered with a near-glass glaze; glass itself is not found until much later. In the predynastic period appeared beads of blue fai'ence, which continued essentially the same until Roman times. These beads have a core of quartz fragments cemented together by heat with a small admixture of lime; this core is covered with a thick glaze coloured blue with copper salts or purple and black with manganese. These faïence beads gradually were perfected until the 12th dynasty, the greatest period of Egyptian beadmaking. Glazed quartz beads, which appear in the predynastic period, continue until this dynasty. Other favourite materials were green feldspar, lapis lazuli (possibly from Persia), carnelian, turquoise and hematite;

amethyst also appears. These materials were made up into predominantly spherical, barrel-shaped and discoidal beads, but locust, falcon, crouching baboon, hippopotamus-head and conus shell shapes are well represented. It was during the 12th dynasty that collars of multiple strings of beads with plaque ends in the shape of lotuses or hawk heads began to be worn. Some of the beads were strung into these collars both laterally and vertically. so that spacer beads with multiple borings were needed to keep the strings in position. This development had a considerable influence on beadmaking outside Egypt. From the 19th to the 22nd dynasty, small oblate and cylindrical beads were made by the millions to cover mummies, and in some cases were worked into complete covers and funerary shirts of bead network. During this period and down to about 600 B.C., amuletic beads and pendants in various materials become popular. Beads in the form of a small double-handled pot, a hawk's claw and a human leg can be traced from the late 12th dynasty onward, but beads in the shape of poppy heads (often of carnelian) do not become common until the 18th.

Ancient Mesopotamia. — In the late 4th millennium B.C., a number of shapes were common to the Sumerian culture and the cultures of the Indus valley. Materials were lapis, carnelian, pearls, etc., which were shaped into ribbed spheres or "melons," or into barrel shapes of octagonal section. Biconical beads were made of carnelian and shorter, barrel-shaped beads were of carnelian and chalcedony, often decorated with a hatched white eye or with a check-hoard pattern. Chalcedony, carnelian and agate were favourite materials among the Sumerians and the later Babylonians, and the most elaborate set of beads to have survived from their territory is an early 2nd-millennium necklace from Uruk (Warka; biblical Erech) of banded agate with gold bindings and settings. These materials were introduced for beadmaking throughout the near east in the Persian period. Faïence also was used for headmaking by the end of the 4th millennium B.C. at Ur and Kish.

Metal Beads. — In the Sumerian and Indus civilizations variously shaped gold beads were in use by the early 3rd millennium B C. There were tubular. spherical and melon-shaped beads, but most distinctive was a tubular bead with two semicircular wings attached to each side as though in imitation of a plant seed. By 2000 B.C. a spherical bead like a nasturtium seed, with light flutings along the line of the piercing, was in use; it remained popular with the Babylonians and lasted into Assyrian times.

Elaborate gold beads shaped like cowrie shells produced during the Egyptian 12th dynasty were worn around the hips; others, from Dashur and Lahun, were shaped like flat double lion heads. These were sometimes mounted on necklaces with double-rhombic beads of a peculiar shape that is imitated by the earliest gold beads from Mochlos in Crete. Twelfth-dynasty beads from Byblos, on the coast of Lebanon, are shaped like the head of the goddess Hathor. Both there and in Egypt beads shaped like drops of liquid are found.

Similar to the double-rhomb beads are the gold heads from the famous treasure of the "second city" of Troy (c. 2000 B.C.) and contemporary gold beads from Poliochni on the island of Lemnos (Greece). At these two sites, however, and at Alaca Huyuk in Anatolia, there occur tubular gold beads with double coils of gold wire soldered on each side of the tube; this appears to be a central Anatolian design.

Meanwhile the Minoan and Mycenaean peoples of Crete and the Aegean developed gold beads of great originality and beauty in the shapes of polyps, lilies and lotuses, after motifs painted on Mycenaean and Minoan vases; copies of these exist in gray and green glass pressed into shaped molds. In addition there are a number of spherical Mycenaean gold beads with granulated patterns on them, and tubular beads built up entirely of granules. All these are more elaborate than anything found in 18th-dynasty Egypt, where there are few new shapes except for beads resembling flies, which also were known in Canaanite territory.

Faïence and Amber Beads. — Although faïence beads had been known in Egypt and Sumer and other parts of the ancient near east from the 4th millennium B.C., the faïence industry underwent a large technical expansion in the second half of the 2nd millennium, and a considerable number of beads were transported to Crete and Mycenae, thence finding their way to central and western Europe. Two major routes by which these trade beads could have traveled are now known: via the Danube and the Rhine rivers, or by sea to the south of France, down the Garonne river to the Atlantic coast. Large numbers of them are found in the rich Aunjetitz graves of central Moravia and of the contemporary Bronze Age culture in Wessex, Eng. There, as elsewhere in Europe, the heads are of a long, tubular, segmented type known from the 18th-dynasty Tell el-Amarna remains. Their mean date is 1400 B.C. and they provide a valuable chronological link between Early Bronze Age Europe and the Late Bronze Age Mediterranean cultures. Elaborately bored amber spacers found in Wessex, ancestral to spacers used in elaborate Bronze Age necklaces of Yorkshire jet, are of a type known at several Mycenaean sites.

Glass Beads. — Although glass was used in Egypt for beads in the 5th dynasty, true glass beads first became common in the near east in the second half of the 2nd millennium B.C. They were particularly popular during the 18th dynasty. They first appear in Europe in the Late Neolithic and Early Bronze Ages; a few spherical beads of plain opaque blue glass have been found in' southern Spain, France, the Scilly Isles and Brittany. A green glass bead was found in a Megalithic chambered tomb at Loughcrew in Ireland. The origin of these beads is unknown.

Eye Beads. — Beads of opaque glass with impressed circlets of glass of a different colour came to Britain and western Europe in the Late Bronze Age. Their precise origin is unknown, but they probably were manufactured in the Mediterranean. There are four chief varieties: (1) spot eye beads, in which simple spots of coloured glass are stuck into a matrix of a different colour; (2) beads with small circlets. usually white, pressed into the surface of a spherical glass bead of (usually) blue glass; (3) stratified eye beads, in which a spot was pressed into the matrix bead, a second spot pressed into the first, and so on; (4) inserted cane eye beads. in which pieces of a glass cane or rod with the required pattern in it were broken off and pressed into the matrix. Types (1) to (3) are known from 1300 B.C. onward, and type (2) in particular is found in the Late Bronze Age graves of Europe, often accompanied by beads of a blue glass matrix with an encircling sinuous line of white glass pressed into it. Type (2) becomes commonest, however, in the 9th century B.C., particularly in the late Villanovan and early Etruscan graves of Italy. These varieties probably were introduced by oriental traders and later copied locally. A spherical blue glass bead with multiple impressed white circlets was manufactured in quantities on the Syrian coast and exported to Asia Minor, south Russia. Italy and southern Spain, with occasional examples reaching Brittany and Britain. Only this type is at present known to be an import and not a local manufacture. Large quantities of eye beads were manufactured in Phoenicia and Carthage, whence they were exported to Sardinia, Ibiza (Balearic Islands) and southern Spain. It is probably from this source that blue glass beads were introduced for trading to the natives of the west African coast.

Phoenician workshops at Carthage and in the Egyptian delta made fancy beads in the form of comic human faces and animal heads. These were made by fastening small spirals of molten glass onto a white or yellow glass matrix or by impressing coloured blobs to form the required design. Some of the Phoenician and deltaic beads are barrel-shaped with medial "eyes" of blue spots surrounded by white rings and terminal rows of blobs (matrix usually yellow glass and blobs blue). Beads of this type were current in Hallstatt Europe; oriental traders probably introduced them to the north of the Adriatic, where many local copies were made. Eye beads of essentially these techniques were made during Roman and Saxon times: often the Anglo-Saxon beads have a dull red matrix and yellow impressions or vice versa; these colours are never found in glass beads before the Roman period. There is a class of blue and red glass biconical beads with lines of white inlaid glass (found in southern France, Spain and occasionally in Britain) that appears to be Visigothic in origin.

The most elaborate cane beads of type (4) were manufactured in Syria, probably in the caravan cities of the interior, and have

sections of millefiori canes. *i.e.,* canes made of multiple coloured strands, embedded in a glass matrix usually red and of biconical shape. In the most attractive of these the cane patterns are made up into small human faces. They were manufactured until about the 8th century A.D., and are essentially the same in technique as the 7th–9th-century beads from viking graves, which are much larger and covered with elaborate checker patterns. These last are not generally found in graves of the same period in other parts of Europe, but specimens are known from a Crimean grave and from Syria.

American Beads.—Among the Indians of North and South America, a great quantity of stone and shell beads commonly were worn, the latter being either complete shells or shaped out of shells, but on the whole, except in the classical Inca civilizations of Peru, beads of fine stone are rather more rare. Some, of a curious shape that suggests a double ax, are mostly Peruvian, but there are elaborate Aztec and Inca beads of jadeite and other coloured stones in the shape of frogs, human skulls, etc., and a number of sites in Peru, Guiana and the Honduras have yielded elaborate tubular gold filigree beads.

Trade Beads.—Since the middle ages, beads have been used on an extensive scale for trade and barter. Explorers have at all times found them invaluable as gifts to primitive peoples, and during the 17th and 18th centuries this trade in beads was enormous. Their importance was well known to the Spanish conquistadors, and Renaissance glass beads manufactured in Venice are said to have been worn until recent times by primitive peoples of Brazil and the Amazon. (WM. C.)

BEADWORK

Beadwork is mostly either woven or sewn. In woven work the weft is threaded with beads before weaving in, and a loom should be used. It occurs in America in the form of braid, belts and aprons. The so-called "bias weave" of North America is technically plaiting, although it looks like weaving. Most beadwork, though sewn, closely resembles woven work; usually not more than one to five beads can be threaded at a time. Various types are: couched bead strings (lazy stitch); netlike mesh; designs sewn onto a fibre, fabric or skin base; or beadfabric made by stitching in rows of individually sewn beads.

Europe.—Beadwork as an extension of embroidery has been practised in Europe for many centuries. All kinds of articles may be decorated with embroidery and, when a particularly rich effect is desired, beads, bugles, seed pearls, sequins, pieces of mica, metal thread (often gold or silver gilt) and even small pieces of straw may be included in the decorative scheme. During the middle ages, when embroidery was regarded as an important art form, beads sometimes were used in the finest embroidered work. A notable example of this is provided by the magnificent Butler-Bowden cope (of English workmanship) in the Victoria and Albert museum, London, dating from about 1330. This had numerous details embellished with seed pearls and green beads, some of which still can be seen in the best-preserved part of the cope. Late medieval German embroideries often have details similarly worked with beads and seed pearls.

The term beadwork may be applied more correctly to certain small pictures showing heads of apostles and executed entirely with coloured beads stitched to a vellum backing, which also are preserved in the Victoria and Albert museum. These are believed to have come from Halberstadt cathedral, in Germany, and to date from the 13th century. Such work, although made with needle and thread, may owe its inspiration to the contemporary small-scale mosaics, the finest of which came from Byzantium.

During the Renaissance pearls and beads often were sewn in patterns on the clothing of those who could afford such luxuries. In England. a great deal of excellent embroidery was worked during the Elizabethan period. Purses and other small objects often were liberally and charmingly adorned with gilt thread, beads and seed pearls. By the third quarter of the 17th century, beadwork had become so popular in England that many articles—chiefly fancy boxes, small pictures. and a particular form of basket—were decorated all over with beads. In every other respect, these objects resemble the contemporary embroidery executed with coloured silks and gilt thread. Beadwork was not in great favour during the 18th century in England. Elsewhere in Europe beads sometimes were used to produce fantastic effects, as in the case of a vase and stand in the Victoria and Albert museum, standing about $4\frac{1}{2}$ ft. high, the entire surface of which is embedded with coloured beads. Such freaks are related to the grottoes and follies of the period and have nothing to do with needlework. In southern Italy and Sicily a bold form of decoration with gilt thread and coral beads was produced, apparently in considerable quantity, during the 17th century and presumably later.

Beadwork again came into favour all over Europe during the 19th century. Every imaginable object in the house that could be decorated with embroidery frequently was, and beads often played a prominent part. As with all embroidery, the final effect much depended on the skill and taste of the embroiderer. Purses knitted with bead-threaded cotton were particularly popular shortly after 1800, and throughout the 19th century small articles such as gloves, mittens, belts, garters, stockings, parasol covers, etc., frequently were decorated with beads. At the same period a great many women's dresses were richly ornamented with beads of all kinds disposed in artful compositions. Beads were again a notable feature of dress decoration during the 1920s. (P. K. T.)

New World.—The simplest and earliest American Indian beadwork may have been a string made from bone, shell or seeds. The introduction of glass trade beads by Europeans between the 15th and 19th centuries stimulated more complex designs. The commonest beads were glass seed beads, about $\frac{1}{10}$ in. in diameter, sold by the string or by weight.

Among the North American Plains Indians beadwork designs originally were geometrical, similar to the old porcupine-quill or moose-hair embroidery, and were placed on skin clothing, bags, etc. In the 19th century, under French-Canadian influence, pastel-coloured or transparent beads were used as well as the original black, white and primary-coloured beads, and floral designs became popular. In South America aprons represent the best-known form of beadwork since the 19th century; the designs are geometrical. The Eskimos of Greenland and North America use beadwork to ornament thigh-boots and tunics; the women achieve a magnificent cape effect with mesh beadwork.

Africa.—In Africa beadwork is used to ornament ceremonial headdresses, leggings and bags and, among the Yoruba of Nigeria, in the making of human or animal figures on'a cloth core. It is also used to cover calabash vessels (Nigeria, Cameroons, eastern and southern Africa); in the making of aprons (Angola and southern Africa), and in the covering of tribal masks (Cameroons and Congo). A notable example of west African beadwork is the regalia (headdress, tunic and flywhisk) of the oba (ruler) of Benin, which was made of red coral, carnelian or jasper. The Zulu of southern Africa formerly used beadwork motifs to convey love messages, while the beadwork collars, aprons, etc., of the Ndebele constitute a tourist attraction.

Asia.—Trade beads are used over most of southeast Asia, mainly as dress and weapon ornaments. Borneo beadwork, exceptionally, uses curvilinear zoomorphic ornament, mostly in black, yellow and red. Oceanic beadwork is simpler and, except in Melanesia, tends to rely on natural materials. (M. A. C.)

BIBLIOGRAPHY.—Information on metal bead types can be found in general works on ancient jewelry—*e.g.,* E. Coche de la Ferté, *Les Bijoux Antiques* (1958); *Catalogue of Jewellery in the British Museum* (1921). The basic classification of beads is that of H. C. Beck, "Classification and Nomenclature of Beads and Pendants," *Archaeologia,* vol. lxxvii. For general information on prehistoric beads, *see* J. Déchelette, *Manuel d'archkologie prkhistorique, celtique et gallo-romaine* (1924); for detailed iniormation on prehistoric faience beads *see* J. F. *S.* Stone and L. C. Thomas, "Use and Distribution of Faïence in the Ancient East and Prehistoric Europe," *Proc. Prehist. Soc.,* vol. xxii. Early glass beads in the near east are best discussed by H. C. Beck, "Glass Beiore 1400 B.C.," *Ancient Egypt and the East* (1934); and eye beads by G. Eisen, *American Journal of Archaeology,* xx, part 1, part 3 (1916). Petrie, *Amulets* (1914); *A.* Lucas, *Ancient Egyptian Materials and Industries* (1948). *See* also W. C. Orchard, "Beads and Beadwork of the American Indians," *Contr. Mus. Amer. Indian,* vol. xi (1929).

BEALE, DOROTHEA (1831–1906), English pioneer of secondary education for girls and principal of the Ladies' college, Cheltenham, was born in London on March 21, 1831. In 1848 she studied under F. D. Maurice at the newly opened Queen's College for Ladies, London, and in 1857 became head teacher of the school pilloried in Charlotte Bronte's Jane Eyre as "Lowood"—the Clergy Daughters' school at Casterton, Westmorland. She succeeded Miss Adelaide Procter as principal of the Ladies' college in 1858, at a critical time in its history. Under her management it developed rapidly.

As a witness before the Schools Inquiry commission in 1865, Miss Beale pleaded the cause of secondary education for girls, and, realizing the necessity for trained teachers for this purpose, she opened in 188j the residential training college of St. Hilda, Cheltenham, followed in 1893 by St. Hilda's hall, Oxford, for women students. She was president of the Headmistresses' association from 1895 to 1897, and in 1898 established St. Hilda's East in London as a centre for social study and for the training of workers. Miss Beale died at Cheltenharn on Nov. 9. 1906.

See Elizabeth Raikes, *Dorothea Beale of Cheltenham* (1908); *Amy* Key Clarke, *A History of the Cheltenham Ladies' College* (1953).
(S. J. C.)

BEAM, originally, a solid piece of timber, as a beam of a house, of a plow, a loom or a balance. In structural engineering a beam is a horizontal member spanning an opening and carrying a load. This load may be a brick or stone wall above the opening, in which case the beam is often called a lintel or a lintel beam. The load may be a floor or roof load in a 'building and then the beam is usually called a floor joist or a roof joist. In a bridge floor the lightly loaded beams are the stringers and the heavier ones are called floor beams. Large beams that carry the end reactions of other beams (perpendicular thereto) are usually called girders. Beams may be of stone, wood, steel or other metals, reinforced concrete, plastics and even brickwork with steel rods in the bond between bricks. For weight reduction, beams of metal are formed as an I or other shape having a thin vertical web and thicker horizontal flanges where the metal is most useful. See ARCHITECTURE: Techniques. (L. E. G.; X.)

BEAN, the seed or pod of certain leguminous plants, chiefly of the tribe Phaseoleae. Originally bean referred to the seed or pod of Vicia *faba*, an old world species called Windsor bean, broad bean and horse bean. All beans named in this article were grown for food in prehistoric times. They are seed-propagated as annuals.

The dry mature seeds of the principal beans used for food, except soybeans, are rather similar in composition although they differ widely in eating quality. Broad beans, common American beans (Phaseolus vulgaris), lima beans (P. *lunatus*), mung beans (*P. aureus*) and cowpeas (*Vigna* sinensis) contain from 21% to 25% protein, 58% to 64% carbohydrate and about 1½% fat. Soybeans (*Glycine* soja) are distinctive for their high protein, 35%, low carbohydrate, 35%, and high fat content, 18%. Both mature and immature seeds of most of these types of beans are eaten, as are the immature pods of a few. The bonavist, or hyacinth bean (Dolichos *lablab*) and the scarlet runner, or white runner bean (P. coccineus) are eaten in the immature stage but not commonly when mature.

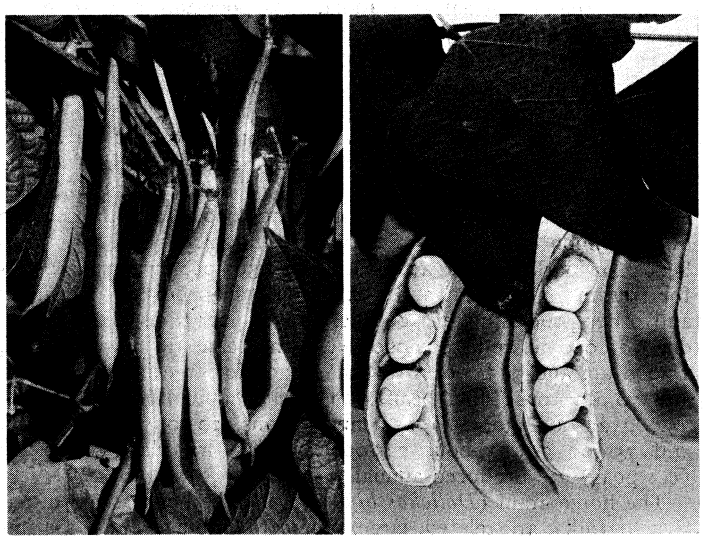
The soybean (*q.v.*) is the world's most important bean. Of Chinese origin, it has been a major source of food and oil in China and Japan for thousands of years but was virtually unknown in Europe and America until 1900. In the orient many different food products long ago were developed from soybeans, including beverages, sauces and preparations superficially resembling milk and cheese. Most of the soybeans produced in the United States are made into oil and meal. The oil is used principally for food, although important quantities are used in paint, chemical and other industries. The meal is used mainly for animal feed but its use for human consumption and for industrial purposes is large and growing. More than 100 different products and uses are commercially important, ranging from adhesives and plastics to fire fighting foam and waterproofing preparations. The United States and China (with Manchuria) produce most of the world's supply.

The common bean of Central American and South American origin is the world's second most important bean. Unknown to the old world before Columbus, it is now grown the world over. It is called French bean, haricot bean and kidney bean in various countries; in the United States, however, kidney bean refers to a specific type that is definitely kidney-shaped and red, dark red or white. Some varieties are grown only for the dry seeds, some only for the edible immature pods, and others for the seeds, either immature or mature. Brazil, China and the United States produce more than half of the world's supply of this bean in the mature state.

The grouth habit of most varieties of common bean is either an erect bush one to two and one-half feet tall or a climbing plant four to seven feet long, but a few important kinds are of intermediate form. Dwarf and semiclimbers are grown most extensively. When the climbing type is grown for its immature pods, artificial supports are necessary to facilitate harvesting. Varieties differ greatly in size, shape, colour and fibrousness or tenderness of the immature pods. In general, varieties grown for dry mature seeds produce pods that are too fibrous to be eaten at any state of development. Most edible-podded kinds produce relatively low yields of mature seeds or seeds that are of low eating quality. Seed colours range from white through green, yellow, tan, pink, red, brown and purple to black in solid colours and countless contrasting patterns. Seed shapes range from nearly spherical to flattened, elongated and kidney-shaped. Pods are of various shades of green, yellow, red and purple, and splashed with red or purple; pod shapes range from flat to round, smooth to irregular and straight to sharply curved; and length ranges from three to eight inches or more.

Common beans are frost-tender and most varieties are harmed by extremely hot weather. Varieties grown for the dry seeds are limited by weather and soil conditions to definite regions or districts within which they are grown profitably. Most edible-podded varieties can be grown over wide ranges of territory if they are planted at suitable times. The edible-podded varieties are popular in many countries, especially in Europe and the temperate zones of the Americas. In the United States the edible-podded bean is variously called snap bean. stringless bean and green bean. Most of the acreage and production involve varieties of the bush habit but the highest yields are obtained with Blue Lake beans. of climbing habit, in the Pacific northwest states.

The Windsor or broad bean is the world's third most important bean and is the principal bean of Europe although little known in the United States. The large-seeded form originated in the Mediterranean region and the small-seeded, possibly older. form originated in the middle-eastern region to the nest of the Himalayas.



(LEFT) L. W. BROWNELL. (RIGHT) J. HORACE MCFARLAND CO.

(LEFT) COMMON BEANS (PHASEOLUS VULGARIS) AND (RIGHT) BUSH LIMA BEANS (P LUNATUS)

China was the leading producer in the 1950s The broad bean will not tolerate hot weather; it is grown in summer only in the cool parts of the temperate zones and during the winter in the warmer parts. Unlike other beans described, it tolerates slight freezing. The plant is erect, from two to five feet tall and bears few branches; the stem and branches are crowded with short-petioled leaves; the pods are nearly erect in clusters in the axils of the leaves; the seeds are large and irregularly flattened.

The lima bean, of Central American origin, is of commercial importance in few countries outside the Americas. From the origin the small-seeded forms evolved to the north and east, and the large-seeded form to the south. The Caribbean (eastern) type has a tendency to develop harmful quantities of hydrocyanic acid in the seeds under adverse conditions, but the small-seeded North American and large-seeded South American types do not show that tendency. Grown only for food, dry mature lima beans are produced in California. They constitute approximately one-tenth of the total dry bean production in the United States. About two-thirds of these are the standard lima, grown only for dry beans, and one-third the baby lima, also grown for its immature seeds.

Both bush and climbing forms of lima bean plant occur. There is a wide range of pod size and shape and in seed size, shape, thickness and colour. Pods are wide, flat and slightly curved. The seeds of most commercial varieties are white or pale green but a few have red or purple patterns. Countless seed shape and colour combinations occur. The lima bean is readily distinguished by the characteristic fine ridges in the seed coat that radiate from the "eye." The lima bean is a perennial in the tropics but is normally grown as an annual; it requires a longer season and warmer weather than most varieties of common American bean.

The cowpea, despite its name, is more akin to the beans named in this article than to the pea (*Pisum*). It is native to India, a very long-podded form (two to three feet) called asparagus bean is native to China. The dry seeds of the edible variety black-eye bean are marketed in the United States as a class of bean, causing confusion among those accustomed to calling them cowpeas As grown in the southern United States, cowpeas are called peas, field peas or southern peas. They grow well only in warm climates.

The scarlet runner bean is native to tropical America. Naturally a perennial, it is grown to a small extent in temperate climates as an annual. It is a vigorous climbing plant with very showy racemes of scarlet flowers, large coarse pods and large, coloured seeds; it is one of the few plants that twines from right to left. A white-flowered, white-seeded form, the White Dutch runner was formerly grown to a small extent in the United States; the dry mature seeds were sold under the name of Oregon lima or butternut bean. Both scarlet and white forms are grown in Great Britain and Europe for the attractive flowers and the fleshy immature pods.

The mung bean is native to India. The pods and seeds are much the smallest of any of the beans named here. The pods are slender, 3 to 4 in. long, and contain 10 to 14 spherical to oblong seeds about $\frac{1}{8}$ in. in diameter. Extensively grown in the orient for food as bean sprouts and otherwise, the mung bean is little known in Europe and the Americas except for the preparation of sprouts.

The average annual harvested acreage and production of the several commercially importarit kinds of beans in the U.S are approximately as follows. soybeans, 21,000,000 ac. and 465,000 000 bu.; common beans, dry, 1,425,000 ac. and 14,300,000 cwt.; snap beans for market, fresh, 40,000 ac and 1,500,000 cwt.: snap beans for freezing. 33,000 ac. and 85,000 tons; snap beans for canning and other processing, 115,000 ac. and 250.000 tons; lima beans, dry, 122,000 ac. and 1,800,000 cwt.; lima beans for market, fresh, 15,000 ac. and 375,000 cwt.; lima beans for freezing, 65,000 ac. and 70,000 tons; lima beans for canning and other processing, 35,000 ac. and 30.000 tons; mung beans, 20,000 to 30.000 ac and 75,000 cut.; about 725,000 cwt. of dry black-eye beans (cowpeas) are produced annually.

The horse gram (Dolichos *biflorus*) and the bonavist bean, native to India. are related, large, tropical climbing plants, the immature seeds of which are commonly used for food in Asia. The dry seeds are large, dark to black, nearly round to slightly flattened and elongated, with distinctive and prominent hilum and raphe of contrasting white. See also special headings such as CALABAR BEAN; CAROB; SOYBEAN.

See W. W. Robbins, Botany of Crop *Plants*, 3rd ed. (1931); U. P. Hedrick, *Vegetables* of *New* York, vol. i, part ii (1928). (V. R. B.)

BEAR, any of the large mammals of the family Ursidae, order Carnivora. They are most closely related to the dog, raccoon and weasel families: the four families are grouped in the superfamily Canoidea. Bears have massive bodies and very short tails. Their ears are short and rounded and their five-toed feet have powerful, nonretractile claws by means of which nearly all the bears can climb at least fairly well. The fur is coarse and shaggy. In colour bears range from almost pure white to black; only a few kinds (for example, the Asiatic black bear) have conspicuous markings. In size they range from about 4 ft. long (the Malay bear) to more than 9 ft. (the giant grizzly of southwestern Alaska —especially Kodiak Island).

Natural History.—Bears walk with the forefeet turned slightly inward; they can run as fast as 30 miles per hour. They walk or run with their feet placed flat upon the ground. The run is a light, undulating gallop. All bears swim well, especially the polar bear. Most bears are omnivorous; the teeth indicate the varied diet, the molars being more of the crushing type than the shearing type typical of carnivores. Because of their addiction to sweets, bears are one of the few kinds of wild animals that suffer from tooth cavities. Bears have keen senses of smell and hearing but a less well developed sense of sight, the polar bear being an exception to the latter.

Bears are not true hibernators, but those that live in cold climates, except the polar bear, become fat with the onset of cold weather and spend most of the winter asleep, rousing at irregular intervals. When they emerge from the den in early spring, their intestinal tract is partially collapsed and they eat sparingly for a few days. The one to four young are usually born during the winter dormant period after a gestation period of six to eight months: they are blind and naked and usually weigh less than 1 lb A cave, hole under a trea or a windfall of timber is used as the winter den. The polar bear, however, gives birth to its young in a cave in snow. Bears are solitary, the male and female separating after mating. The young are reared by the mother until they are more than half grown—in about two years. The mother is very protective of her cubs even against male animals and is likely to be dangerous to humans if the cubs seem to be threatened. Otherwise bears generally avoid humans. The grizzly and its close relatives seem more prone to attack without apparent provocation than other kinds, but even among grizzlies this is not common In attacking large prey or fighting each other, bears strike with the forefeet, often from an erect position. A medium-sized bear is easily able to break the neck of an ox with a single blow. The jaws are used only secondarily.

Distribution and Classification.—Bears occur widely over the northern hemisphere and parts of South America but are being reduced in numbers because they often prey on domestic livestock and are much sought as trophies.

Of the 14 genera of the Ursidae. 6 are of living bears: *Ursus*, Tremarctos, Selenarctos, Thalarctos, Helarctos and *Melursus*. Eight other genera are known only as fossils from all the major land masses except Africa. The best known of the extinct species in *Ursus spelaeus*, the giant cave bear which occurred in central Europe and Asia contemporaneously with early man during the Ice Age. It was larger than any living species. Bears of the genus Ursavus are first known as fossils from the Middle Miocene deposits of Europe (about *20,000,000* years ago).

American Black and Brown Bears.—The commonest bear of temperate North America is the black bear, *Ursus* americanus and its relatives. In eastern North America it is almost invariably black. In the west it may be black, brown or cinnamon, cubs of different colours occurring in the same litter. More than 85 "species" of this bear have been described but all are probably no more than subspecies (varieties; geographic races) of the one species *Ursus* americunus.

The American black bear (brown bear, cinnamon bear, according

to the colour phase) has been known in historic times to occur from northern Alaska almost to central Mexico. It is now gone from most of this region, being found mainly in wilderness areas. It is a forest dweller and in the wild, like its Eurasian counterpart, U. arctos, is shy and retiring; but in national parks and similar areas, where it is protected and in constant contact with humans, it loses its timidity and often becomes a nuisance. It appears to be tame but in fact remains a powerful and potentially dangerous wild animal. Its food consists of a wide variety of small and large animals (including occasional domestic livestock), berries and fish. It evinces a marked predilection for cured meats and sweets, to the dismay of campers. It hunts larger prey by stalking and then making a quick charge. In seeking smaller animals it digs out their burrows, overturns rocks and tears apart rotten logs. Except in the mating season, in early summer, the adults live apart. The affectionate courtship, during which the mates often fondly caress each other, lasts a month and a female breeds every second year.

Grizzly Bears.—The huge, long-clawed grizzly bear (Ursus horribilis and its relatives) is quite different. Primarily a denizen of open country, it is notoriously fierce and untractable, and cannot tolerate the presence of humans. More than 90 "species" have been described but their validity is doubtful. All bears show great individual variation and this is especially so among the grizzlies. Owing to the lack of specimens the classification of the grizzly bears probably can never be solved satisfactorily. Some of the better known bears of the grizzly group are the giant "brownies" of southwestern Alaska, the southern grizzly, the plains grizzly and the Canadian grizzly. The largest living land carnivore is a variety of grizzly from Kodiak Island; this bear may attain a length of more than 9 ft. and a weight in excess of 1,500 lb.

In the month-long mating season, the males fight for a female's favour, the defeated animal usually being driven away rather than killed. Because of its size, ferocity and the remoteness of its habitat the grizzly is considered by sportsmen to be one of the most desirable of big game trophies. For the same reasons it is the subject of many of the North American Indians' legends, and in some primitive religions is accorded the role of a deity, usually an avenging or malevolent one. To kill a grizzly was a mark of manhood to early American Indians, who wore bear-claw necklaces with pride.

Eurasian Brown Bear.—The brown bear of Eurasia (*Ursus* arctos) is found over the temperate region of the northern hemisphere from Spain to islands off the Alaskan coast, and in Japan and the Kurile Islands. It is variable in size. The European variety measures 4–5 ft. long and weighs about 300 lb. The race from eastern Siberia is almost as large as the largest of the grizzly group from Alaska. In colour the old world brown bear varies from almost yellowish through brown to black. Although individually variable. certain colour phases are more common in certain regions.

Ursus arctos is commonly found in zoos. It can be trained and becomes quite tractable. Formerly it was frequently trained to move rhythmically to music—the so-called "dancing bear" common in carnivals and festivals in European cities. Varieties of this species are the "blue bears" of Tibet and Kansu province, China; the Manchurian, or Mongolian. black bear; the huge Siberian brown bear; and the Japanese brown bear.

Himalayan Bear.—The Asiatic black bear (*Selenarctos thibetanus*)—also called Himalayan, Tibetan, or moon, bear—is found from northern China and Manchuria south into Burma and the Himalayas, also in Japan and Formosa. This species is the size of the American black bear, which it resembles in colour except for a conspicuous inverted V-shaped whitish blaze on the chest. It weighs about 250 lb. The hair of the neck and shoulders is especially coarse and long, forming a mane. Gestation requires six months; usually two cubs are born.

H. ARMSTRONG ROBERTS

POLAR BEAR (THALARCTOS MARITIMUS)

Malay Bear.—The Malay bear (Helarctos *malayensis*)—also called sun bear, or bruang—is small, measuring about 33 ft. long and weighing about 100 lb. It is found in the Malay peninsula and in Sumatra and Borneo.

W. SUSCHITZKY

MALAY BEAR OR SUN BEAR (HELARCTOS)

It is black with a gray-tan muzzle. The hair is prominently whorled on each side of the chest and on the shoulders. The head is short and flat; the ears very small; and the teeth often reduced in number.

Sloth Bear.—The sloth, or honey, bear (*Melursus ursinus*) is about 5 ft. long and weighs about 230 lb. The fur is long, coarse and black except for a pale-coloured blaze, or splash, on the chest. Although most bears have somewhat protrusible lips, this characteristic is especially pronounced in the sloth bear. These animals are found in India, Assam and Ceylon, inhabiting rocky places in jungles. Seemingly they prefer a more vegetarian diet than other bears, but relish insects, especially termites.

Spectacled Bear.—The spectacled bear (Tremarctos ornatus) lives in the Andes from southern Venezuela to northern Chile. It is about 4 ft. long. The body is black or almost so. Usually a narrow white stripe passes on each side of the muzzle from behind the eye forward nearly to the bridge of the nose, then downward across the cheek to the throat and backward to the chest. It is this feature that gives the animal its common name. Tremarctos has never been common in historic times and is now rare. Curiously, in some parts of its geographic range it seems to prefer the most arid, cactus-covered areas; elsewhere it inhabits the dense forest. It lives mainly on vegetation including fruit, nuts and tender palm buds.

Polar Bear.—The polar bear (Thalarctos *maritimus*)—also called white, or ice, bear—is a denizen of the circumpolar Arctic. Almost as large as the giant brown bears, it is slenderer in build and has, for a bear, a rather long, flexible neck. It lives on the ice floes of the open ocean—many individuals probably never come to land. The soles of the feet are heavily insulated with fur. The polar bear is solitary and a wanderer, traveling great distances in search of food. Its diet consists mainly of seals but it also feeds on fish, birds, young walruses and an occasional stranded whale. Polar bears swim very well and are often found many miles from land or ice packs. Sometimes they follow migrating seals southward as far as the Gulf of St. Lawrence in America and the mouth of the Amur river in Asia. Mating takes place in alternate summers. Two two-pound cubs are born in mid-winter. The mother and cubs emerge from the den in March and the cubs stay with the mother for about 17 months. Polar bears are usually shy, but are dangerous when attacked. They are much sought as trophies. Although the flesh is tasty, the liver, because of its extremely high concentration of vitamin A, may prove toxic. The hide is an important source of clothing to Eskimos.

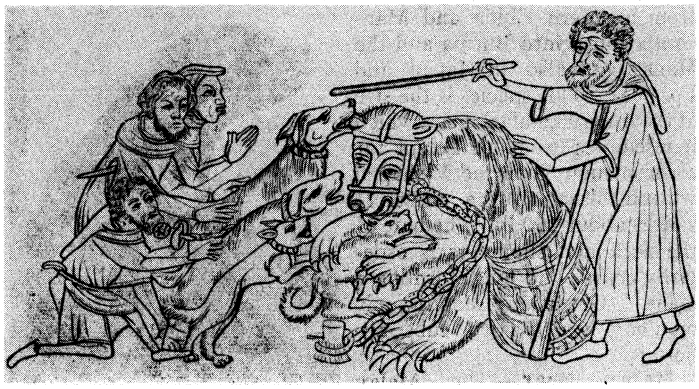
BEARBAITING and a similar sport, bullbaiting, were popular for hundreds of years in England but were permanently outlawed by act of parliament in 1835 because of their cruelty. The exhibitions took place usually on Sunday at theatrelike arenas popularly called bear gardens. There crowds of all classes gathered



HISTORICAL PICTURES SERVICE

BEARBAITING IN THE **14TH** CENTURY. FROM THE LOUTERELL PSALTER

to delight in the bloody spectacle of a bear or bull chained by the leg or neck to a stake and harassed by dogs.

Many large groups of bears were kept expressly for the purpose. For a baiting attended by Queen Elizabeth I in 1575, 13 bears were provided. Of it Robert Laneham (*c.* 1575) wrote that it was "very pleasant to see," especially "the nimbleness and wait of the dog to take his advantage"; and the bear, tearing himself free: shaking his ears "with the blood and the slaver hanging about his physiognomy."

When a bull was baited, often its nose was blown full of pepper to further arouse it. Specially trained dogs might be loosed singly, each attempting to seize the tethered animal's nose. Often a hole in the ground was provided. into which the bull might thrust this vulnerable part. A successful dog was said to have pinned the bull.

Many variations. usually refinements of brutality, stemmed from traditional baiting procedures: the whipping of a blinded bear; the baiting of a pony with an ape tied to its back. A Spanish nobleman entertained by the latter said "to see the animal kicking amongst the dogs, with the screaming of the ape, beholding the curs hanging from the ears and neck of the pony, is very laughable." Dogfighting and cockfighting were companion diversions.

A sport called bull-running also developed in some towns as an annual affair. Butchers provided the bull. and the townspeople, armed with clubs, chased it until all were exhausted, when the bull was killed.

Baiting and its variations declined, although very slowly, from the late 17th century onward. The conscience of cultivated people seems finally to have been touched. The Puritans agitated for an end to animal baiting., Allied activities had scattered revivals in the U.S. frontier; for example, fighting dogs were matched against badgers; a chained bull in an arena was matched against a grizzly bear. The battle ended, in each case, when one killed the other. (These and similar diversions are described in H. McCracken, *The Beast That Walks Like Man* [1955].) Prohibitive legislation followed the progress of civilization; as U.S. frontiers disappeared, so did such brutal pastimes. (B. W. DA.)

BEARBERRY (*Arctostaphylos uva-ursi*), a prostrate evergreen shrub of the heath family (Ericaceae) native to dry, sandy or rocky soil and widely distributed in high northern regions. In North America it is found on rocks and bare hills from Labrador and Alaska south to Virginia, Colorado and California; in the British Isles it grows on stony alpine heaths. The trailing, much branched stems, often somewhat matted on the ground, bear leathery, entire leaves, small heathlike white flowers and smooth, red, insipid, berrylike fruits (drupes) about a third of an inch in diameter. It is one of the finest evergreen ground covers found in the native flora, brilliantly green in summer and bronzy in winter. It is difficult to grow unless started from rooted cuttings in peaty, acid sand. It can be dug from the wild only by taking frozen clumps in midwinter. The alpine bearberry (*A. alpina*), a smaller depressed-prostrate shrub with veiny, toothed leaves: withering in winter but persistent, and black, juicy, edible fruit, grows from arctic America south in high altitudes to British Columbia, Colorado and northern New England and on high mountain heaths in the British Isles. *See* also MANZANITA.

(N. TR.)

BEARD, CHARLES AUSTIN (1874–1948), U.S. historian. political scientist and educator, was born near Knightstown. Ind., on Nov. 27, 1874. His father was a landowner and prosperous businessman. After graduation from DePauw university, Greencastle. Ind., in 1898 Beard spent four years abroad. chiefly in England. He received the Ph.D. degree in 1904 from Columbia university, and served with great distinction as a member of the faculty there from 1907 to 1917. resigning in protest against what he considered an infringement of academic freedom. For several years, beginning in 1917. he was director of the Training School for Public Service in New York. His teaching was characterized by understanding, tolerance and realism.

Beard was one of the intellectual leaders of the progressive era, 1900–17. and of American liberalism; he was also a leader in movements for improvement in municipal government and administration and in national planning. He wrote voluminously in several fields and served at different times as president of the American Historical association and the American Political Science association.

His early interest was in European history as is indicated by such works as *The Office of Justice of the Peace in England* (1004), and (with J. H. Robinson) *The Development of Modern Europe* (1907). 'Ihe latter work emphasized the "new" history, stressing economic and social forces, and the development of ideas. *The Economic Basis of Politics* (1922, 1945), indicated the close relationship between economic forces and political action. He wrote several successful textbooks in the fields of history and political science. His works in the American field stimulated thought and aroused prolonged controversy. Several of the basic factors in the formative period of U.S. government are brilliantly analyzed in *The Supreme Court and the Constitution* (1912), *An Economic Interpretation of the Constitution of the United States* (1913) and *The Economic Origins* of *Jeffersonian Democracy* (1915). He was not an economic determinist, but insisted upon the importance of economic groups and motives in political and governmental action. In later life he gave more attention to noneconomic forces and to the power of the military establishment in determining public policy. He and his wife, Mary R. Beard, produced in four volumes a monumental synthesis of the U.S. entitled *The Rise of American Civilization,* two volumes (1927), *America in Midpassage* (1939) and *The American Spirit* (1942). The position of the American citizen in relation to his government is discussed in *The Republic* (1943).

In the 1930s and 1940s Beard's interests turned to the history and problems of U.S. foreign policy. He collaborated with G. H. E. Smith to write *The Idea of National Interest* (1934) and *The Open Door at Home* (1934). Beard supported the entrance of the U.S. into World War I but was disillusioned by its aftermath. He profoundly distrusted the foreign policies of F. D. Roosevelt whom he regarded as untrustworthy and irresponsible. In two books, *American Foreign Policy in the Making, 1932–1940* (1946) and *President Roosevelt and the Coming of the War 1941* (1948), he charged Roosevelt with mendaciously undermining U.S constitutional government. He was criticized as an isolationist but was generally recognized as one of the great figures of American scholarship.

Beard died on Sept. 1, 1948. (T. S. BY.)

BEARD, DANIEL CARTER (1850–1941), a pioneer leader of the Boy Scouts of America. was born in Cincinnati. O., June 21, 1850. Because of his interest in outdoor life he wrote *American Boys' Handy Book* in 1882 and later organized the Sons of Daniel Boone. After Robert Baden-Powell founded the Boy Scout movement in England and the U.S. branch was incorporated in 1910 as the Boy Scouts of America, the Sons of Daniel Boone joined with the Boys Scouts of America and Dan Beard became a national officer. A talented painter and illustrator. he was the author of about 20 books for boys on various aspects of scouting and served as an associate editor of *Boys' Life* magazine. He died at Suffern, N.Y., on June 11. 1941. (L. R. Lu.)

BEARD, in modern usage, refers to the hair grown upon a man's

chin and cheek; "mustache" or "moustache," singular or plural, refers to the hair on the upper lip. The term whiskers has been used to refer to a mustache or beard or both, or to what hair remains on a shaven face; "whisker" refers to a single facial hair. In fhe past the words have had less exact meaning. Beard has stood for all these things, and whisker signified what is now called mustache. "Mustache" sometimes referred to a hanging curl on the side of the head.

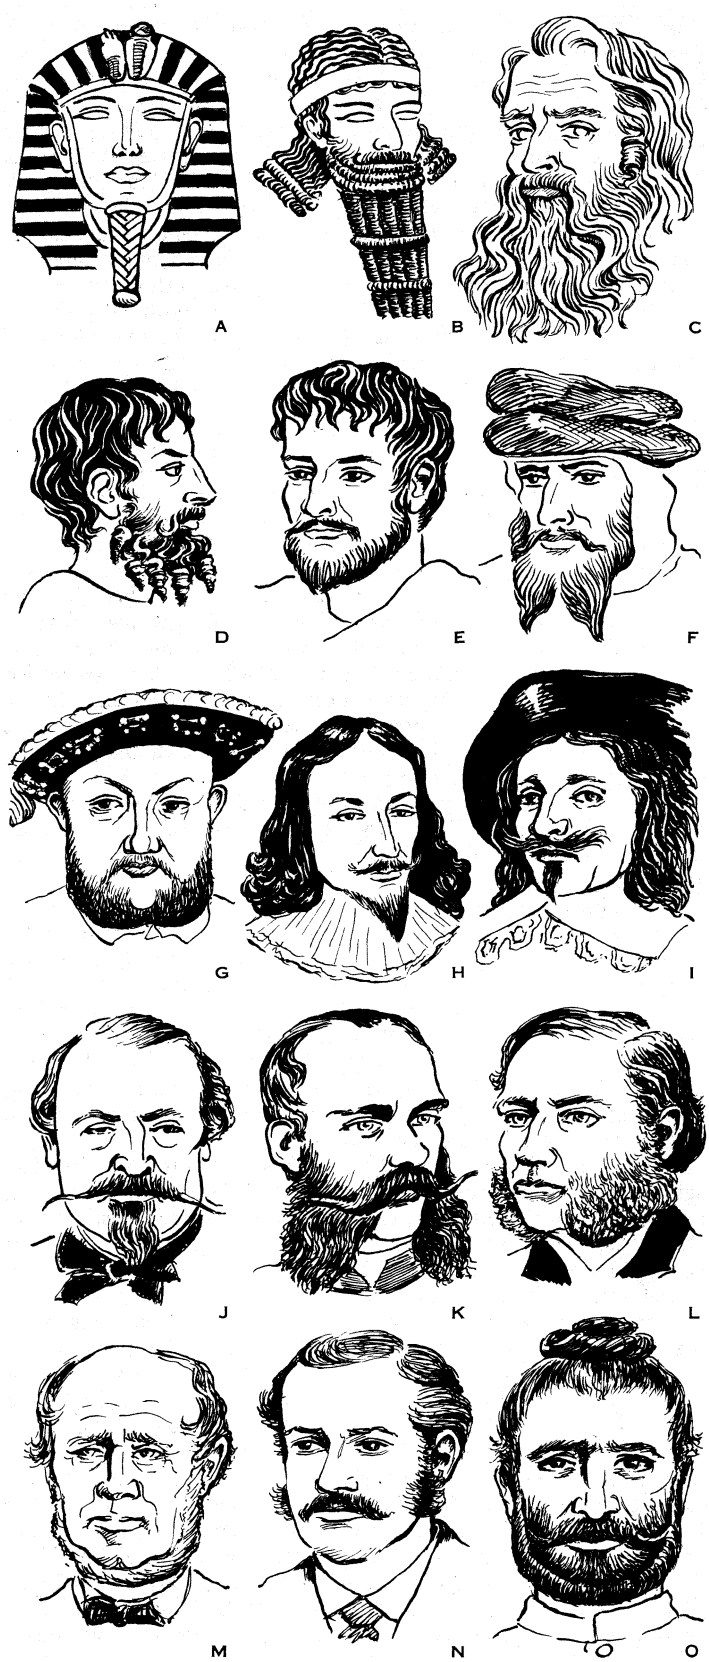
The bearded races of mankind have commonly held the beard in high honour. It is the sign of full manhood; the lad or the eunuch is beardless, and the bearded woman is reckoned a witch. The future King John gave deadly offense to the chieftains when visiting Ireland in 1185, by plucking at their flowing beards. The oath o the beard is as old as history, as when a man swears "by his chin." Adam, the primal man, and the deity and prophets of many faiths have been traditionally pictured with beards, as were kings and nobles and dignitaries. Beards have assumed all shapes and lengths, some being cultivated to lengths exceeding a man's height. Islamic peoples still hold the beard in high esteem.

The earliest records indicate that the Egyptians grew hair on their chins. They frizzed. dyed or hennaed, and sometimes plaited this beard with interwoven gold thread. Later. a metal, false beard or *postiche*, which was a sign of sovereignty, was worn by queens as well as kings. This was held in place by a ribbon tied over the head and attached to a gold chin strap, a fashion existing from about 3000 B.C. to 1580 B.C.

The Mesopotamian civilizations (Chaldean, Babylonian, Assyrian, Median and ancient Persian) devoted great care to oiling and dressing their beards, using tongs or curling irons to create elaborate ringlets and frizzles, in a tiered effect. Assyrians resorted to a black dye for eyebrows, hair and beard, while the Persians used henna which produced an orange-red colour, a style which existed from 1900 B.C. Gold dust. gold thread and scented yellow starch were sometimes used in the hair and beard for festive occasions. In ancient India and Turkey, the beard was allowed to grow long, a symbol of dignity and wisdom. To cut the beard was infamy among the Turks; slaves were shaved as a mark of servility.

Patriarchs of the tribes of Israel grew luxuriant beards embellished by a hanging earlock (peyot); the peyot is still worn by some very pious orthodox Jews. Beards predominated among the Greeks until 323 B.C., at which time Alexander the Great ordered his soldiers clean shaven, fearing their beards might serve as handles to the enemy. Grecian beards were frequently curled with tongs to create hanging curls. The Etruscans of northern Italy (c. 1000 B.C.) favoured the Asian fashion of the long beard, which was eventually handed on to the Romans. The Romans frowned on the curled beard of the Greeks, feeling that it was effeminate, and preferred a trim, well-groomed shape. The use of the razor was encouraged in Rome by Lucius Tarquinius Priscus (616–578 B.C.), in an effort toward hygienic reform. However, shaving did not become general until about 454 B.C., when a group of Greek Sicilian barbers came to the mainland from Sicily. Barber shops were situated on the main streets, but were patronized only by those who could not afford slaves. Scipio Africanus, according to Pliny, was the first Roman to shave daily. Philosophers, however, still retained their beards. A beard at this time also signified mourning. The ancient Celts, as described by Polybius, wore extremely long mustaches but otherwise were clean shaven, as were the Britons observed by Julius Caesar. The Byzantine civilization favoured beards and mustaches, and the hair moderately short, a combination of oriental and Roman origin, which later influenced medieval and Renaissance Europe. From the 7th to 16th centuries, the beards of Byzantium were curled, split on the centre of the chin, square cut or pointed and some were extremely long. By the end of the 12th century, the Greek, Roman and oriental influences disappeared. and the cities of Florence and Venice began to set the mode for the courts of Europe.

Until the advent of Christianity in the 7th century, all Anglo-Saxons wore beards; members of the clergy were then compelled by law to shave. English princes wore mustaches until William I (1066–87) compelled them to cut them off in accordance with the Norman fashion. The Crusades were perhaps accountable for the



BEARDS FROM 3000 B.C. TO THE 19TH CENTURY

(A) Egyptian *postiche* or false beard, 3000 to 1580 B.C.; (B) Mesopotamian, c. 1917 B.C.; (C) Jewish patriarchal; (D) Grecian curled, 323 B.C.; (E) Roman, c. 234 B.C.; (F) Saracenic or Moorish, 7th to 16th century; (G) English, Henry VIII (1535); (H) Vandyke. 17th century; (I) French and Dutch "la mouche," 17th century; (J) Napoleonic "imperial," 19th century; (K) Austrian "Franz Josef," 19th century; (L) "mutton chop" side whiskers, 19th century; (M) "slugger," "neck warmer" or "chin curtain," 19th century; (N) mustache and sideburns, late 19th century; (O) Indian Sikh rolled beard

return of beards, and for more than four centuries great diversity was allowed: beards, mustaches and shaven faces all were found. Of the English kings, Henry II (1154–89) was close shaven; Henry III (1216–72) was long bearded; Edward II (1307–27) curled his beard in three ringlets; Edward III (1327–77) had a long forked beard which flowed in patriarchal style; Richard II (1377–99) wore a little tuft on each side of his chin; Henry IV (1399–1413) wore two curled locks on his chin. The mid-13th and 14th centuries were a period of many shapes and varieties of beards. Henry V (1413–22) was clean shaven and thereafter beards were rare, except in older men, until the 16th century.

The Renaissance fashion in Europe included both clean-shaven faces and beards varying in shape and length. In the middle of the 16th century the Spanish style of cropped pointed beard and trimmed mustache took over. Many men starched their beards in the 1560s. In England Henry VIII (1509–47) brought the beard back into favour in 1535, after which beards of all shapes and lengths were worn. The Flemish painter Sir Anthony Vandyke (1599–1641) painted so many aristocrats with a pointed type of beard that it became known as the Vandyke beard. They were dressed with pomade or wax, applied with a tiny brush and comb. Other gadgets were used to keep the mustache and beard in shape while sleeping. In 1637, Louis XIII triumphed over the Spanish influence when he amused himself by shaving his courtiers, leaving only a tiny lip beard "a la royale" or "la mouche," a custom adopted by the French and Dutch cavaliers. This vogue led to the creation of the Corporation of Barber-Hairdressers. In the 1640s and 1650s Frenchmen were typically clean-shaven. The mustache when it was worn became so diminutive that its later disappearance was hardly noticed.

Peter the Great of Russia in 1705 proclaimed: "The beard is a useless embarrassment"; he ordered them cut off and levied a tax on those who refused to comply. The empress Catherine later repealed the law.

With the adoption of the powdered wig in 18th-century Europe, the facial growth once again disappeared, and it was not until the 1800s that it returned. In the early part of the 18th century Americans showed a general preference for English fashion but from 1760 until 1780, French fashion was also followed, the tendency of both being toward the clean-shaven face. The French military from 1800 to 1806 wore mustaches, as did the Prussian guard. Hussars affected a distinct, ferocious mustache with long drooping ends. Small side whiskers became the order for the British army in 1808 and lasted until 1860.

During the Victorian period, from about 1840 to 1870, London set the fashion for the world. Side whiskers attained a longer, more luxuriant growth and were sometimes referred to as "mutton chops" or "Piccadilly weepers." In the United States they were called "dundrearys" after Lord Dundreary, a character in the play *Our American Cousin.* The name "burnsides" or "sideburns" came from the name of the U.S. Civil War general, Ambrose Burnside. The "imperial," a pointed tuft of whiskers on the chin, was named in honour of Napoleon III. Long side whiskers merging into a mustache became kno n as the "Franz Josef" in honour of the emperor of Austria. In the 1880s the trend was toward the clean-shaven, although beards and mustaches were retained by older and professional men. In the British army the "walrus" mustache became popular; it was forbidden to shave the upper lip. In the U.S., a mustache that curled upward at the ends, called a "handle bar," found great favour. Professional men favoured the Vandyke. Eventually, whiskers became a distinguishing mark of butlers and footmen, who wore them into the 20th century. Small mustaches were generally popular until the 1920s, although many continued to wear them after that.

Beards became popular among the British troops serving in South Africa early in the 20th century and again among the men on desert patrols during World War II. British naval personnel were allowed to wear mustaches or beards; only mustaches were permitted in the marines. United States army regulations, corrected to 1917, stated that hair must be kept short and the beard must be neatly trimmed. In the second half of the 20th century there was a renewed interest in chin whiskers, though they were worn only by a small minority of men.

In the far east many ancient traditions continued to be practised. Indian Sikhs let their hair and beards grow long. The beard is twisted and rolled tightly to the chin; the ends are tied over the head. The Japanese, having broken with their ancient custom of shaving, often wear short beards or mustaches.

See Ruth Turner Wilcox, *Mode in Hats and Headdress* (1945).

(W. J. **T.**)

BEARDSLEY, AUBREY VINCENT (1872–1898), English artist in black and white, whose ornate style typified *fin de siècle* English arts and letters, was born at Brighton on Aug. 24, 1872. In 1883 his family settled in London, and in the following year he appeared in public as an "infant musical phenomenon." In 1888 he obtained a position in an architect's office. In 1891, under the advice of Sir Edward Burne-Jones and Puvis de Chavannes, he took up art as a profession and attended classes at the Westminster School of Art. From 1893 until his death, at Menton, France, on March 16, 1898, his work met with a storm of criticism. Beardsley had an unswerving tendency toward the fantastic; he deliberately ignored proportion and perspective, and the freedom from convention which he displayed caused his work to be judged with harshness. In certain phases of technique he excelled. and his earlier methods of dealing with the single line in conjunction with masses of black are in their way unsurpassed, except in the art of Japan. He was always an ornamentalist rather than an illustrator; his work must be judged from that point of view. His frontispiece to *Volpone* is held by some to be, from this purely technical standpoint, one of the best pen drawings of the age. His posters for the Avenue theatre and for T. Fisher Unwin were among the first of the modern cult of poster art, then regarded by few as true art.

"THE PEACOCK SKIRT" FOR SALOMÉ BY AUBREY BEARDSLEY, 1894

The following are the chief works which are illustrated with drawings by Beardsley: the *Ron Mot Libmry; The Pall Mall Budget; The Studio* (1893); Sir Thomas Malory's *Morte d'Arthur* (1893–94); Oscar Wilde's *Salomé* (1894); *The Yellow Book* (1894–95); *The Savoy Magazine* (1896); *The Rape of the Lock* (1896); and *Volpone* (1898).

See A. Symons, *Aubrey Beardsley* (1898; new ed., 1949); *A.* E. Gallatin, *Aubrey Beardsley;* a *Catalogue of Drawings and Bibliography* (1945); R. **A.** Walker (ed.), ***Best*** *of Beardsley* (1948).

BEARER SECURITIES, one of the forms in which stocks and shares can be held by the proprietor. The bond to bearer is a document stating upon its face that the bearer of it is entitled to a specified amount of stock in the loan, debenture, share or other security which that bond represents; bearer securities are not registered and full title is transferred merely by delivery of the document. The instrument may be for a British government stock, such as a consol or war loan; for foreign government loans; for shares in a rubber, oil, mining or other such company. The interest or dividend payments are met by the provision of coupons which are small pieces of paper, numbered and, as a rule, dated, which must be presented to named bankers when the payments become due. and which, after a few days for examination, will be exchanged for checks in payment of interest or dividend due on the bearer's holdings.

Bearer securities are regarded as being more liable to loss than are registered or inscribed stocks and shares, for the latter must be dealt with by a deed of transfer, involving signatures and witnesses, whereas bearer securities can be passed from hand to hand like a bank note. Generally speaking, British investors prefer registered or inscribed stocks and shares, but French, Belgian and other European investors often prefer bearer securities.

In the United States a combination of bearer-and-registered security is common. While the bonds of U.S. railroads are generally bearer securities, for example, the share capital is represented often by certificates made out in the name of an individual or a firm who, when selling, will sign the certificates on the back and pass them on to buyers who frequently treat the certificates as bearer securities, leaving the stock or share in the names of the original holders as stated on the face of the certificate. The certificates pass from hand to hand in the same way as a bearer security, although any holder can have the stock registered, if he desires it, in his own or another name. Dividends, as they fall due, are claimed and collected by the holder at the time the payments fall due: if the registered proprietor does not want to be troubled with such claims, he merely gives notice of his desire, and the actual proprietor will then put the shares into his own or some other name. Various companies issue registered bonds, but these securities are not to bearer. The risk of loss entailed by the holding of a bearer security is the reason why many proprietors deposit such bonds with their bankers, who will detach coupons when they fall due, present them for payment to the proper agents and credit the interest or dividend to the proprietors' bank accounts.

BEAR GRASS (*Xerophyllum tenax*), a North American plant of the lily family (Liliaceae), called also elk grass, squaw grass, fire lily and turkey beard, native to mountainous districts from northern California to British Columbia and eastward to Montana. It is a smooth light-green perennial with a stout, unbranched stem, from two to six feet high, which rises from a woody, tuberlike rootstock with cordlike roots. At the base the stem bears a dense tuft of very narrow, grasslike, rough-edged leaves, from one-half to one-fourth inch wide apd from two to three feet long; the leaves of the upper part of the stem are similar but much smaller. At flowering, which occurs only once in from five to seven years, the top of the stem develops a large showy cluster, 6 in. to 18 in. long, of very numerous small creamy white flowers, each on a slender stock 1 in. to 2 in. long. In many parts of its range the plant is very common on dry hillsides. When in bloom it is a striking feature of the vegetation of mountain slopes. Because of its attractive appearance it is a favourite with tourists who visit alpine resorts within its range, being especially abundant in Mt. Rainier and Glacier National parks. Hupas and other northwestern Indians used the fibres of the leaves in making garments and baskets and roasted the bulbous rootstocks for food. The turkey beard (X. *asphodeloides*) of the southern United States, found in dry pine barrens from New Jersey to Florida, is similar but nith less showy flowers.

In the southern and southwestern United States the name bear grass is given to various kinds of yucca, especially to Yucca *filamentosa* and Y. glauca; also to the camas (Camassia scilloides) and the aloelike *Dasylirion* texanum, all of which have grasslike leaves.

BEARING METALS. In a theoretically perfect bearing the load should be carried on a film of oil between the axle and bearing, and the nature of the bearing metal should therefore be immaterial.

In actual practice, however, such perfection is not attained and it becomes necessary to select a metal which will minimize as far as possible the inevitable mechanical errors of adjustment and alignment. The properties which a good bearing metal should possess are, first, a low coefficient of friction and, secondly, sufficient plasticity to allow the axle to bed down combined with sufficient compressive strength to carry the total load.

The selection of a bearing metal depends on the various requirements of the application (see BEARINGS).

PROPERTIES REQUIRED IN BEARING METALS

Antiseizure Properties.— This quality, the resistance of the surfaces to weld together when they are in rubbing contact, is always desirable in bearing metals and can be most important. If the surfaces were always separated by a fluid film, there never would be metal-to-metal contact. But starting, stopping, deflections of shaft and housing, heavy loads and poor lubrication require varying antiseizure properties. Formerly it was believed that a bearing metal required two constituents, namely hard particles in a soft matrix. Experience has disproved this theory through the effective use of pure soft metals (tin, lead and cadmium) and compositions of soft particles in a hard matrix (copper-lead and certain bronzes).

In general, the order of decreasing antiseizure quality is: white metals (tin, lead and cadmium alloys), copper-lead, aluminum alloys, silver, leaded bronzes and bronzes.

Compressive Strength.— This is important when unidirectional loads are supported. To prevent extrusion, the metal must have sufficient strength to support the load. For white metals the strength is increased by reducing operating temperatures whereas harder materials are relatively unaffected. The effective strength of white metals and copper-lead compositions can be increased by reducing their thickness and by bonding them to a strong backing shell of steel.

The strength of white metals can be increased by alloying metals which develop hard particles; the wear resistance is also improved. The order of increasing compressive strength is: white metals, copper-lead, thin babbitt overlays, aluminum alloys, silver, leaded bronzes and bronzes.

Fatigue Strength.— This is necessary for bearings subjected to dynamic loads as obtained in crankshaft bearings. If the allowable load is exceeded, cracks develop and loosen small areas of metal. These areas, or "tiles," increase in number until insufficient surface remains to carry the load, and a burned-out bearing occurs. The effective fatigue strength of white metals, copper-lead and aluminum alloys can be highly improved by bonding thin layers to a steel back.

For example, the fatigue life of babbitt can be increased six fold by a reduction in babbitt thickness from 0.016 in. to 0 003 in. White metals are extremely sensitive to temperature; a 40° F. rise can halve the fatigue life. The order of increasing fatigue strength is the same as for compressive strength.

Corrosion Resistance.— Resistance of the bearing metal against attack by the lubricating oil can be necessary. In such problems it is necessary to consider (1) the lubricant; and (2) the metal. If the oil becomes acid by oxidation (a time and temperature effect accelerated by metal catalysis) or if organic acids are deliberately added (such as lard oil to increase "oiliness"), the liquid may attack lead, cadmium and copper.

Modern oils for environments where undesirable oxidation may occur are inhibited by chemical additives against acid formation. Active sulfur compounds can be another source of corrosion. These are present either naturally or as chemical additives and may attack copper or silver. These corrosive actions can range from mild to extremely severe, in which the bearing metal is rapidly dissolved, depending on the temperature and combination of oil and metal. Tin base babbitt and aluminum are the most resistant alloys.

Embedability.—This property is the tolerance of a bearing metal to dirt particles. If the material has a high degree of embedability, the dirt is easily pushed below the surface preventing damage. But if the dirt is difficult to embed, it will cause scoring and wear, especially of the shaft. In general, white metals have the highest tolerance to dirt particles. As the metal becomes harder. there is less tolerance so that finally the hard bronzes require clebn lubricants. However, under slow speed, extremely dirty environments and limited lubrication, a hard bronze and a hard shaft can develop the least wear.

CHARACTERISTICS OF TYPICAL BEARING METALS

White Metals.— This classification covers tin base alloys, lead base alloys and cadmium base alloys. The alloys of tin and lead are referred to as babbitt's metal after Isaac Babbitt who patented the bonding of such alloys to a strong backing material. They are also referred to as antifriction metals. Many compositions exist but typical ones are shown in Table I.

The additives to each of the base metals harden and strengthen the alloy, thereby improving the compressive and fatigue strengths. The lead alloys are cheaper than the tin alloys and can give as

TABLE I.— Typical While Metal Alloys

Cadmium base alloy	...	...	...	...	...	98.4*	1.5

*Minimum

good service, especially when the layer is thin (under .010 in). Cadmium alloys are relatively expensive; they are used only where their slightly improved fatigue resistance is necessary. Tin alloys do not corrode.

Lead alloys must have over 3% tin (or equivalent in other effective metals) in order to resist attack by organic acids. Cadmium alloys are made noncorrodible by the addition of small amounts of indium. Although all of these alloys have low strength, they can be made to sustain loads up to 5,000 lb. per square inch if they are used as a layer between .001 to .003 in.

Copper-Lead.— These bearing materials are essentially a matrix of copper filled with lead. The lead content is 25% to 35% with as much as 5% silver added to increase strength in special cases. The metal is cast on a steel back.

Copper-lead bearings have approximately 50% greater strength than white metals but there is a considerable loss in antiscore quality and embedability.

Aluminum Alloys.— These metals are used where increased load-carrying capacity and complete resistance to corrosion are desired. Since their antiseizure and embedability qualities are only moderately good, thin bahbitt overlays may be necessary. Typical compositions are (1) 6½% tin, 1% copper, 1% nickel, balance aluminum; and (2) 4% silicon, 1.2% cadmium, balance aluminum.

The first composition is used as a casting of thick, single metal while the latter is rolled into thin sheets for bonding to steel. The high thermal expansion of the cast aluminum may cause malfunctioning if it is placed in a ferrous housing and too high an operating temperature is reached.

Silver.— This is one bearing metal which is used in its pure form. by electroplating or by soldering a pure sheet onto a steel hacking to give maximum support. Silver bearings sustaining 8,000 lb. per square inch were developed for heavy loads in high output engines. The antiseizure and embedability qualities of the silver are poor and an overlay of noncorrosive lead is added by electroplating, to aid in "running-in" and dirt tolerance. The cost of silver bearings is very high.

Bronzes.— There is a tremendous variety of these alloys but they can be classified according to lead content. When the lead content is high with a small percentage of tin and zinc, the bearing metals have good load-carrying capacity and fair antiseizure properties. Such materials are used for medium-speed bushings that are loaded too high to permit the use of babbitts.

As the lead content is reduced, the bronze is strengthened by the addition of tin and zinc. However, the antiseizure quality is decreased; consequently a tin bronze can be used only at low surface speeds such as in a linkage bushing. When the alloy consists of copper and tin, it is termed a tin bronze and is used in applications requiring high loads (up to 10,000 lb. per square inch) with low surface speeds.

Tin bronzes are used as a backing material. They provide the necessary strength and can serve as a bearing metal if the babbitt is worn through. Aluminum bronze is hard and has high load-carrying capacity with poor antiseizure properties.

Bronzes are relatively cheap and easy to install. Corrosive resistance is improved by the additions of larger quantities of tin and zinc. A popular variation is the porous, sintered bronze bushing which is impregnated with lubricant to carry oil over extended periods. (A. F. UD.)

BEARINGS. In some operations friction is essential; in many other cases, however, it is most desirable to keep it at a minimum. The device interposed between two surfaces, moving relative to each other, to reduce friction is called a bearing.

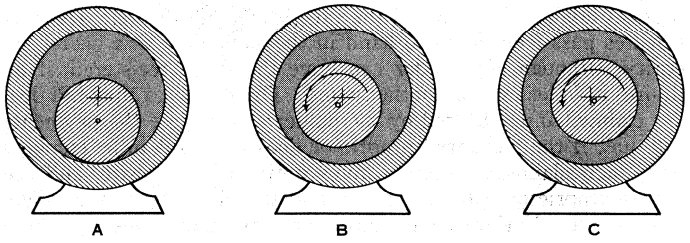

FIG. 1.—SCHEMATIC DRAWING SHOWING SUCCESSIVE POSITIONS ASSUMED BY JOURNAL: (A) AT REST; (B) STARTING; (C) RUNNING AT FULL SPEED

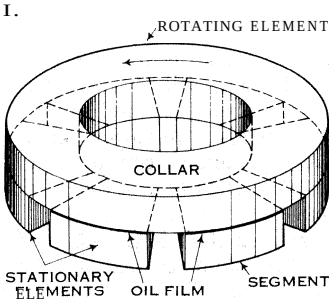
Bearings take many forms. They vary from a thin band (bushing) of low-friction material to a complex assembly of rollers, races and retainers.

There are three general classes of bearings: hydrodynamic or slider bearings. hydrostatic or externally pressurized bearings, and rolling bearings The useiulness of a bearing was probably first noticed uhen prehistoric man accidentally discovered the reduced effort required to move a cart after some animal fat was placed between the axle and the wheel On the other hand, the rolling type of bearing aas invented sometime later, although prehistoric man again first utilized the principle when he placed a length of branch under a heavy tree trunk to reduce the effort needed to move the trunk. Fruitful, scientific analyses of each of the three types of bearings were not initiated, however, until late in the 19th century.

HYDRODYNAMIC BEARINGS

When an oil film is interposed between a shaft and the outer member surrounding the shaft an important phenomenon occurs as the shait begins to turn. This phenomenon, the wedge effect, results in self-generated pressure sufficiently high to support the load on the shaft, as shown in fig. 1.

A bearing supporting a load in this way is identified as hydrodynamic, because pressure is generated by the flow of a fluid through a wedge-shaped passage. The friction, a direct function of the viscosity of the lubricant, is small because metal-to-metal contact does not exist.

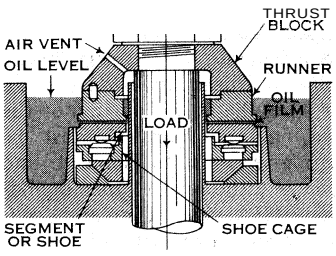


FROM SAMUEL J BERARD, EVERETT O WATERS AND CHARLES E. PHELPS, "PRINCIPLES OF MACHINE DESIGN," THE RONALD PRESS COMPANY (1955)

FIG. 2.—TILTED-PAD THRUST BEARING

History.—The science of hydrodynamic bearings dates back to the period of the great railway expansion. The Institution of Mechanical Engineers in England hired Beauchamp Tower to study friction in railway journal bearings. Results were quite erratic until Tower decided to run the journal in an oil bath. To do this he drilled a hole through the outer housing, the hearing. so the oil could reach the journal. When the test started, oil began to flow back out through the hole. To prevent this, Tower drove a wooden plug into the hole, but when the shaft rotated, the plug was forced out.

A gauge was then substituted for the plug to measure the pressure. Tower reported these observations before a meeting of the institution in 1883. Osborne Reynolds, present at the meeting, later studied the phenomenon analytically and reported his deductions before the same group in 1886. Reynolds proved the principle of hydrodynamic action and pointed out its dependence upon lubricant viscosity. He is thus recognized as the founder



FROM SAMUEL J BERARD EVERETT O WATERS AND CHARLES E PHELPS, PRINCIPLES OF MACHINE DESIGN," THE RONALD PRESS COMPANY (1955)

FIG. 3.—KINGSBURY THRUST BEARING

of the hydrodynamic lubrication theory. Nevertheless it is interesting to note that N. Petroff, a Russian, working independently at about the same time, also recognized the phenomenon of hydrodynamic action. Many other investigators have made and continue to make important contributions to the analysis and design of hydrodynamic bearings.

These bearings may be typed as slider bearings, in which the surfaces translate relative to each other, and journal bearings, in which a shaft—the journal—rotates inside the sleeved bearing.

Slider Bearings.— Slider bearings generally consist of two plane members. The runner or moving member translates while the shoe or pad is stationary but slightly out of parallel with the moving member. In practice the shoe is usually mechanically pivoted so it can assume the proper wedge angle when the runner begins to move. Oil or other lubricant fills the very thin space between the two members.

By far the greatest use of the slider principle has been made in the tilted-pad thrust bearing. schematically sketched in fig. 2 with an application illustrated in fig. 3.

Albert Kingsbury of the United States and A. G. M. Michell of Australia independently invented the tilted-pad bearing. A collar, the runner. to uhich the shaft is attached rides on segmental pads resting on slightly rounded supports to permit rocking The entire unit may be submerged in a lubricant or. if operating in a horizontal position, the runner may be made to dip into an oil bath, pulling the oil up between the pad and runner. The pad, of course, tilts to form the necessary wedge. Three to eight pads may be used. Pressures as high as 1.000 lb per square inch are generated, supporting loads at coefficients of friction as low as 0.001.

In a test conducted by the Kingsbury Machine works on a twin-screw steamship, a loss in friction of only 6.2 h.p was measured on a tilted-pad supported shaft as compared to a loss of 109 h.p. on a collar-supported shaft.

Journal Bearings.— The journal bearing consists of a shaft, transversely loaded, rotating within a cylindrical shell. The portion of the shaft within the shell, having a finer finish, is the journal.

The shell, made of a low-friction material and surrounded by or pressed into a stronger housing, is the bearing (fig. 4). The shell itself is often called a bushing, sleeve or brass. The small clearance, only a few thousandths of an inch, left between the journal and bearing is all that is needed to permit the journal to assume an eccentric position. This eccentricity forms the oil-filled wedge (fig. 1) which provides the pressure needed to support the shaft and load hydrodynamically.

FIG. 5.—FILMATIC BEARING. WITH PIVOTED-PADS AROUND THE JOURNAL

In some applications, as in a ship in rough water, heavy loads and unusual distortions in the supporting structure require a bearing of relatively low rigidity. The pivoted-pad design is incorporated in the journal bearings in such cases. This permits self-alignment of the shaft as well as a reduction in shaft stress which would otherwise result. Pivoted-pad journal bearings are also used with high-speed spindles where radial displacement within the bearing must be at a minimum. The bearing in fig. 5 is one example of such design.

Because minor disturbances can cause discontinuities in the film pressure generated around the journal, partial journal bearings have been developed. The bearing shell circles the journal only partly, 60°, go° and 120° angular spans being most often used. The railway axle bearing (fig. 6) is an example of a partial bearing.

Lubricants.— Lubricants may be liquid, semisolid (plastic) or solid. If air is considered, and it should be because it has proved useful as a lubricant, the gaseous state must also be included.

Petroleum-base oils are most representative of liquid lubricants. For operation at unusual speeds or temperatures synthetic oils have been used. Greases made of mineral oils and saponified fats are the semisolids most useful in some highly loaded bearings.

Examples of solid lubricants are graphite, talc and soapstone. At temperatures several hundred degrees above ordinary bearing conditions, at very high unit pressures, or in meeting other demanding requirements, inert, layer-lattice or laminar solids are used. Molybdenum disulfide, synthetic waxes and solid fatty acids are typical examples.

Viscosity at operating temperature is the most important single property of a hydrodynamic lubricant. It governs the lubricant's fluid friction and thus the power loss suffered in the bearing. Obviously there are other requirements to be satisfied, and to meet these, many additives are compounded into the oil base. For instance, inhibitors are added to improve the viscosity index, polar hydrocarbons to increase oiliness and organic compounds of sulfur, phosphorus or nitrogen to minimize oxidation.

Thermal Equilibrium.— Though the coefficient of friction is very small in a well-designed bearing, some frictional heat still is generated. Unless this heat is dissipated, the lubricant will begin to decompose. Therefore a satisfactory temperature must

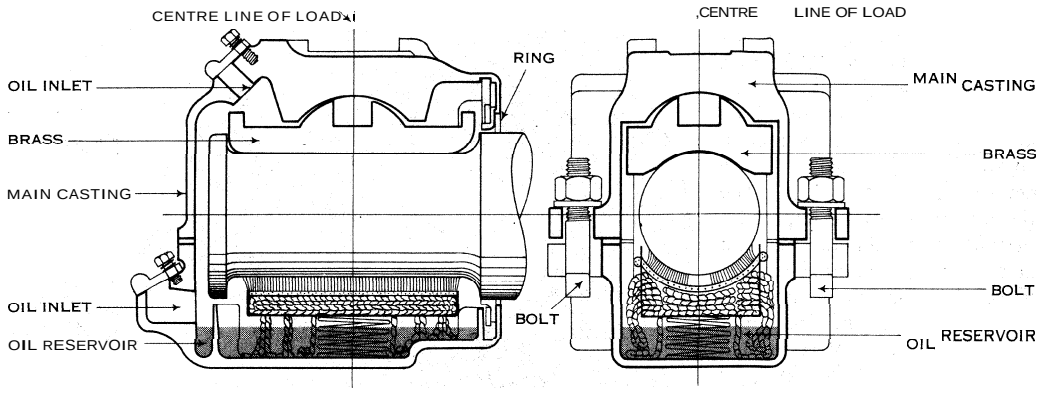

FIG. 6.— SIDE AND END VIEWS OF JOURNAL BEARING FOR RAILWAY FREIGHT CAR AXLES

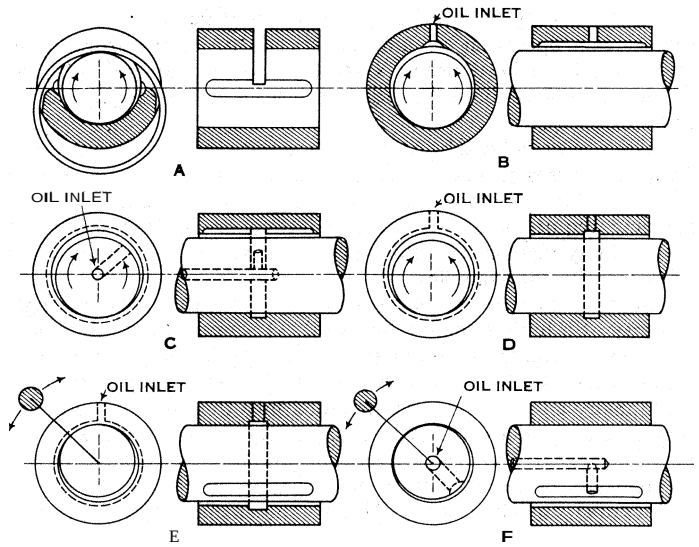
be maintained in the bearing by proper heat balance.

Where large exposed surfaces are available, natural radiation and convection will dissipate the heat; otherwise, water, air or even the lubricant itself may be used to carry the heat away.

Grooving.— The hydrodynamic bearing needs a copious supply of lubricant to function properly. Though the clearance is quite small the bearing must be full continuously. The lubricant is usually fed to the bearing opening at a point of low pressure, and grooves machined on the inside surface of the bushing in axial and circumferential directions help distribute the lubricant. These grooves must be properly designed and carefully machined. An excessive number of grooves, or an improper plan, can reduce capacity, increase friction losses and eventually cause bearing failure. A selection of grooving schemes is shown in fig. 7.

Lubricating Devices.— Various methods are used to carry lubricant to the bearing; a few of these are illustrated in fig. 8. In order of increasing efficiency, the various lubrication methods may be arranged as follows: (1) hand feed, in which oil is poured directly onto the bearing through a hole in the frame or onto a felt plug or cotton waste inserted in the oil hole; (2) wick feed, whereby oil is transferred by capillary action from a reservoir to the bearing; (3) grease lubrication, in which grease is forced into the bearing by means of a compression cup fixed to the frame; (4) drop feed, in which lubricant drips slowly from a visible level oil cup; (5) ring oiling, by means of which lubricant is raised from a sump beneath the journal by a ring fitting loosely around the shaft; (6) splash lubrication, in which lubricant is distributed by shaft rotation in a fully enclosed bearing; (7) flooding, in which journal and bearing are partly submerged in an oil bath; and (8) forced lubrication, with the oil pumped under pressure to the bearing. Probably the most important requirement for any lubricating device is that it be reliable.



FROM SAMUEL J. BERARD, EVERETT O. WATERS AND CHARLES E. PHELPS, "PRINCIPLES OF MACHINE DESIGN," THE RONALD PRESS COMPANY (1955)

FIG. 7.— TYPICAL GROOVINGS USED IN JOURNAL BEARINGS

Bearing Materials.— It may appear that strength is the only requirement for bearing materials, but this is far from true. To be sure, the major portion of the bearing, the housing, must be strong enough to support and transmit the load to the foundation. However, of greater concern are the properties of the thin inner lining, the sleeve or bushing.

The material of which this lining is made must be low in dry friction because during starting and stopping, as well as during occasional periods of overload, metal-to-metal contact occurs. It must be score-resistant because abrasive foreign particles may damage it. It must be corrosion-resistant because acids form when lubricants "wear." It should have high heat conductivity to help maintain proper running temperatures.

A single material possessing all these characteristics at desirable levels is yet to be developed. Instead, bearing materials always represent a compromise: in one application, corrosion resistance may be the prime requirement, while in another it may be fatigue strength. (See BEARING METALS.)

FIG. 8(A).—LUBRICANT DISPENSING DEVICES
(A) Oil-ring bearing

HYDROSTATIC BEARINGS

The need for combating fluid friction under heavy loads and at low speeds was effectively illustrated by an amusing creation exhibited at the Paris Industrial exposition in 1878. A bulky mass mounted on four lionlike feet rested solidly on a flat plate. When oil was pumped to the contacting surfaces through each foot with just sufficient pressure to begin raising the mass, the heavy block could be moved with surprising ease.

This illustrated the principle of the hydrostatic or externally pressurized bearing. When loads are too high or speeds too low, pressure within the bearing will not be self-generated, but externally supplied pressure can provide the film needed between the moving surfaces. This is the function of the hydrostatic bearing.

Heavy rotating machines, like large turbines, are often provided with hydrostatic bearings. The shaft is floated by externally supplied pressure, metal-to-metal contact is broken and a film of oil substituted. The machine can now be started without any damage to the shaft or bearing. When sufficient speed is attained, lubricant pressure will be generated hydrodynamically and the external pressure supply can be cut off. The reverse procedure is used when stopping.

Probably the most spectacular hydrostatic bearing is that supporting the Hale telescope at the Palomar observatory. Equipment weighing almost 1,000,000 lb. is turned through one smooth revolution per day using a torque of only 50 foot-pounds.

The only power needed is a $\frac{1}{12}$ h.p. motor, because the coefficient of friction measures less than 0.000004 for the system.

Hydrostatic bearings may be in the form of oil pads, step bearings or lifts. The Hale telescope uses oil-pad bearings. Large vertical turbogenerators are supported on step bearings, as are centrifuges running at speeds as high as 90,000 r.p.m. Oil lifts are used, as already stated, during the starting and stopping of large turbines.

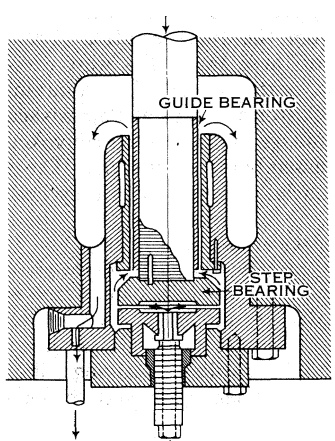
FIG. 8(B-E).—LUBRICANT DISPENSING DEVICES
(B) drop-feed oiler; (C) bottle oiler; (D) wick-feed oiler; (E) waste-packed **bearing**

Oil Pads.—The oil pad is nothing more than a shallow recess in the bearing which is kept filled with oil under high pressure. The oil leaks out slowly, so a slight replacement flow must be maintained. The total area of all pads in a bearing must be sufficient to develop forces which equal the load being supported. Oil enters at the centre of each pad, flows outward in all directions, is collected, filtered and recirculated. Though pressures needed may be several thousand pounds per square inch, the volume of oil flowing through the bearing is only a few cubic inches per second. If the dimensions, number and arrangement of pads are carefully selected, friction losses remain extremely small.

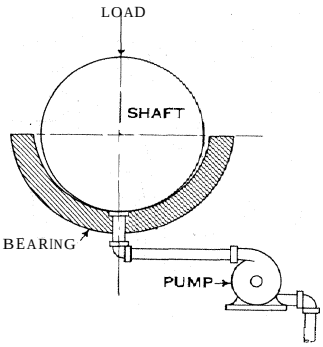


FROM DUDLEY D FULLER "THEORY AND PRACTICE OF LUBRICATION FOR ENGINEERS , REPRODUCED BY PERMISSION OF JOHN WILEY & SONS, INC.

FIG. 9.— STEP TYPE HYDROSTATIC BEARING FOR VERTICAL TURBOGENERATOR

Step Bearings.—This type of bearing is often used to support thrust loads. Oil under pressure is pumped into a shallow circular recess at the end of the shaft (see fig. 9). The supply varies logarithmically between the edge of the recess and the outside of the shaft in all radial directions. A sufficient flow must be maintained to support the existing thrust load.

Lifts.—Hydrostatic lifts are used to displace shafts radially a ay from the bearing. Thus separated, the shaft can he safely rotated, as explained previously. Were this not done, in the case of a heavily loaded shaft, the resulting friction would overheat the bearing material and permit it to tear or pit. Once sufficient speed is attained hydrodynamic pressure takes over; thus the lift supplements the ordinary journal bearing A schematic diagram of a lift ls presented in fig. 10.



ROM DUDLEY D FULLER, "THEORY AND PRACTICE OF LUBRICATION FOR ENGINEERS , REPRODUCED BY PERMISSION OF JOHN WILEY & SONS. INC

FIG. 10.—A HYDROSTATIC LIFT BEARING SHOWN SCHEMATICALLY

ROLLING BEARINGS

The modern rolling bearing is an assembly consisting of four parts. the inner ring or race; the outer ring or race; the rolling element—a ball or a roller; and the separator or cage or retainer (see fig 11).

The rollers may be cylindrical, tapered, barrel-shaped (convex) or hourglass-shaped (concave). The hollow spiral roller bearing (Hyatt) and the small-diameter needle bearing are special types.

There are several functionally different ball bearings and even roller bearings manufactured. The unsymmetrical, angular-groove bearing is designed to carry an axial as well as a radial load. Some ball bearings contain spherical races which permit slight lateral rotation between inner and outer rings, thus allowing for a small misalignment of the shaft.

In addition, some may contain a single row of rolling elements, others two rows. The Conrad type contains fewer balls than the notch-filled type because the side notch permits more balls to be passed into the raceways. Because bearings are sometimes used in inaccessible places or in dusty atmospheres, the lubricant must be applied prior to installation. These bearings are therefore provided with metal or felt shields between the inner and outer rings.

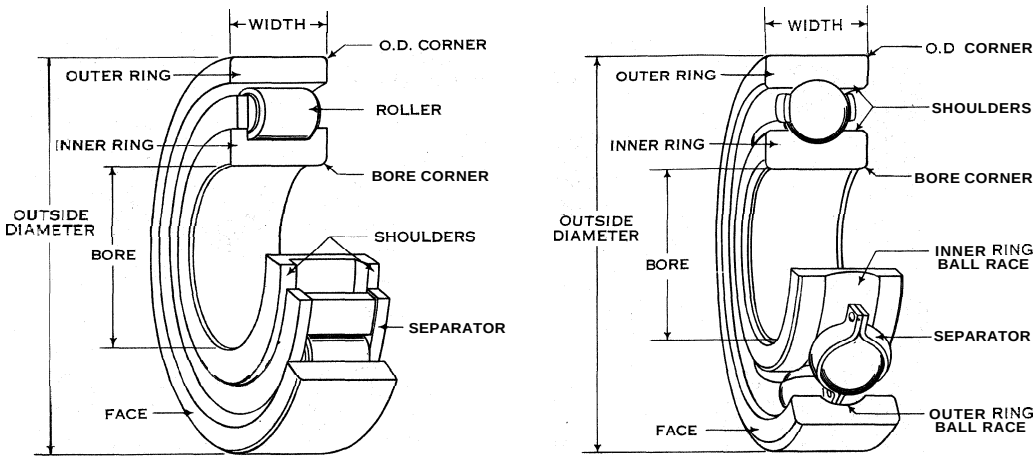
Rolling bearings are also designed to carry axial loads only. Such bearings contain a row of balls or rollers, held properly spaced by a retainer, between two rings having flat or grooved raceways. Although made primarily for one-way thrust, the addition of a third ring, mounted on the shaft between the two identical outer rings, permits thrust in either direction

Load Capacity.—In 1881 Heinrich Hertz investigated the deformations that occur when elastic bodies are contact under pressure. Although his theoretical deductions were based on assumptions not fully applicable to the operation of rolling bearings, subsequent bearing investigations proceeded from his findings. The first systematic study applying directly to ball bearings was performed by Stribeck around 1900. He found the bearing capacity to depend on the square of the ball diameter as well as on the number of balls in the bearing He proved also that balls running in curvilinear grooves can support higher loads than those running in cylindrical grooves.

Bearing Materials.—Materials for rolling bearing components must meet rigid specifications. A bearing assembly is subjected to intense unit stresses as it transfers the load from the frame to the shaft. and these stresses may vary widely in magnitude, thus subjecting each component to fatigue or even impact conditions.

In addition, much heat may be generated. Consequently, optimum performance depends not only upon good design and close fabrication tolerances but upon the wise choice of high-quality materials as well. Materials having tensile strengths of over 200,000 lb. per square inch and hardnesses of over 600 on the Brinell scale are needed. The limited availability of extremely high-strength materials is probably the one single factor which retarded the development of rolling bearings. High-carbon steels alloyed with chromium, nickel, molybdenum and other constituents are used. Quality must be carefully controlled; bearing components must be carefully fabricated and properly heat-treated for strength and hardness.

Lubrication.—Rolling bearings depend on rolling action rather than lubrication to achieve low friction losses. Thus the coefficient of friction is determined by the finish and, particularly, the hardness of the bearing material rather than by the viscosity of the lubricant, as in other types of bearings. Nevertheless, some



BY COURTESY OF ANTI-FRICTION BEARING MANUFACTURERS ASSOC., INC.

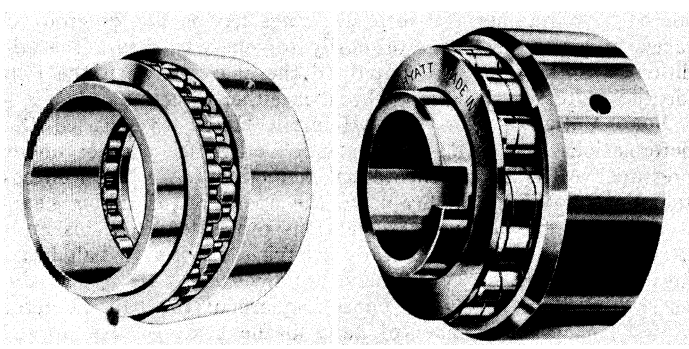
FIG. 11.— PARTS OF BALL ROLLER AND CYLINDRICAL BEARINGS

lubrication is needed, although in relatively small amounts. The primary function of the lubricant is to protect the highly polished bearing surfaces from corrosion and abrasion, and it must also assist in dissipating whatever frictional heat may be generated.

If some sliding should occur between cage and rolling elements, the lubricant present should reduce the friction. Pure mineral oils or grease added in controlled amounts are best. At low speeds the greases serve well, while at high speeds oils are preferred.

OILLESS BEARINGS

Another kind of bearing that cannot properly be included in any



BY CO RTESY OF (LEFT) ORANCE ROLLER BEARING CO , (RIGHT) HYATT BEARINGS DIVISION, GENERAL MOTORS CORP

FIG 12.— STAGGERED ROLLER BEARING AND SPIRAL ROLLER BEARING

of the three major categories is the sintered or oilless bearing, designed for use in places inaccessible for lubrication. Powdered metals are mixed in desired proportions and then bonded under high pressure into the required shape. This compacted mass is heated to a temperature just below the melting point of the mixture. The particles unite during this sintering process into a partly fused yet porous mass.

The bearing is then fully impregnated with a lubricant. Nongumming, low-oxidizing oils having a high viscosity index are generally used, as well as grease, graphite, molybdenum disulfide and even wax. If completely sealed, these bearings serve satisfactorily for long periods of time. See also Index references under "Bearings" in the Index volume.

BÉARN, an ancient frontier province of southwestern France, included within the modern *département* of Basses-Pyrénées. It was bounded on the west by Soule and Lower Navarre, on the north by Chalosse, Tursan and Astarac, on the east by Bigorre and on the south by the Pyrenees. Its name can be traced to the town of Beneharnum (Lescar). Conquered by the Vascones (see BASQUE; GASCONY) in the 6th century, it became in 819 a viscounty feudally dependent on the dukes of Aquitaine, but in the 11th century the viscounts ceased to acknowledge any suzerain. They then reigned over the dioceses of Lescar and Oloron, but their capital was Morlaas, where they had a mint. In the 13th century Gaston VII, of the Catalan house of Moncade, made Orthez his seat of government. His long reign (1229–90) was a perpetual struggle with the kings of France and England, each anxious to assert his suzerainty over Béarn.

As Gaston left only daughters, the viscounty passed at his death to the counts of Foix (*q.v.*), from whom it was transmitted through the house of Grailly to the kings of Navarre. When Henry III of Navarre (known before his mother's death as prince de Béarn) became Henry IV of France, Béarn passed to the French crown.

From the 11th century onward the Béarnais were governed by their own special customs or fors. Moreover, from the 12th century they had a kind of representative government, with *cours plénières* composed of deputies from the three estates. From 1220 onward the judiciary powers of these assemblies were exercised by a *cour* majour of 12 barons jurats charged with maintaining the integrity of the fors. When Gaston Phoebus of Foix wished to establish an annual hearth tax (fouage) in Béarn, he convoked the deputies of the three estates in assemblies called ktats. These acquired extensive political and financial powers, which they held till 1789.

See P. Courteault, *Histoire de Gascogne et de Béarn (1938).*

BEAS (BIAS, ancient Greek HYPHASIS, Sanskrit VIPASA), a river of India, is one of the five giving the Punjab its name (punch, "five"; ab, "waters"). It rises 13,326 ft. above sea level in the snowy Rohtang pass north of Kulu (Kangra district). It flows southward for about 70 mi. along the Kulu valley, receiving tributary torrents from the crests to the east, then turns west through the Kangra valley for 100 mi. It debouches on to the Punjab plains some 20 mi. E. of Gurdaspur, turns southwest and joins the Sutlej (*q.v.*) 25 mi. N.E. of Ferozepur after a course of 290 mi. and a descent of 12,500 ft. The Beas is the only Punjab river not cut by the Indo-Pakistan border frontier; but it was involved in the Punjab waters dispute between the two countries in 1947–60 because of its contribution to the flow of the Sutlej. At Jogindernagar in Mandi district (Himachal Pradesh) the upper Beas operates a hydroelectric station supplying Lahore, Amritsar and Jullundur. (L. D. S.)

BEATIFICATION, in the Roman Catholic Church, is the second stage in the process of canonization. The beatified person is called "blessed," and a limited cult is authorized. A similar

process exists in the Russian church for authorizing local cults. *See* CANONIZATION.

BEATITUDES, a name, derived from the Latin *beatitudo*, referring specifically to the nine blessings (Matt. v, 3–12), which in the Vulgate all begin "*beati sunt* . . . ," at the beginning of the Sermon on the Mount (*q.v.*). Four of them have parallels (Luke vi. 20–23) in the Sermon on the Plain, where their simpler form and their direct address in the second person stamp these four as the original nucleus of the expanded nine. Of the five others, Matt v, 5 could be a later interpolation because it often precedes verse 4 in ancient texts; it appears to be derived from Ps. xxxvii, 11, as Matt. v, 8 seems to be from Ps. xxiv, 4. Nevertheless both of these as well as the remaining three may at some time have been formulated by Jesus himself. The compiler of the Sermon on the Mount or his source seems to have brought the nine together by association of form and to have softened Jesus' paradoxical blessings upon actually needy, suffering people by transposing them into a more spiritual key. Luke's beatitudes are immediately followed by four exactly parallel maledictions, each beginning, "Woe to you . . . ." They are probably not old tradition but a literary reflex of the four beatitudes. (KE. G.)

BEATON (BETHUNE), **DAVID (c.** 1494–1546), Scottish cardinal and statesman, who was a promoter of the French alliance and an implacable opponent of the Reformation in Scotland, was the third son of a Fife laird, John Beaton of Balfour. He entered St. Andrews university in 1509, moved to Glasgow university in 1511 and thereafter studied in Paris and Rouen, before returning to Scotland in 1521.

Beaton's career as a churchman began when he was presented to the chancellorship of Glasgow cathedral before 1519, by his uncle, James Beaton *(see* below), who resigned the abbacy of Arbroath in his favour in 1524. From 1522 Beaton was extensively engaged in diplomatic missions, the most important of which were the negotiations leading to the marriages of James V of Scotland to Madeleine, daughter of Francis I of France, in 1537, and to Mary of Lorraine, in 1538. At Francis' request he was provided to the French bishopric of Mirepoix in Dec. 1537. A year later he became the first Scotsman to be raised to the cardinalate. He was appointed coadjutor to the archbishopric of St. Andrews in 1537, and succeeded his uncle as archbishop in 1539. Pope Paul III refused to make him papal legate in Scotland until Jan. 30, 1544.

Beaton's career as a statesman commenced with his appointment as keeper of the privy seal (Jan. 3, 1529). which marked the beginning of his ascendancy as the most trusted counselor of James V, whom he dissuaded from following the religious policy of the English king Henry VIII. When James was dying, Beaton probably tried to get himself nominated one of the governors of the kingdom for James's infant daughter Mary Stuart, but there is no proof of the story that he forged the king's will. The earl of Arran, who was proclaimed protector and governor on Jan. 3, 1543, imprisoned Beaton later that month, ostensibly for treason. He was released in April, however, and led the opposition to Arran's pro-English policies. Arran changed sides and submitted to Beaton in Sept. 1543, being absolved by the cardinal at Stirling, where both took part in Mary's coronation. In Dec. 1543 Beaton resumed the office of chancellor which he had been given in January. Having thus re-established his ascendancy he reversed Arran's former policies. In place of half-hearted encouragement of Protestantism came suppression of heresy which earned him the reputation of a cruel persecutor. In foreign affairs he showed determination in opposing and thwarting Henry VIII's plans for the subjugation of Scotland by the marriage of Mary to the future Edward VI of England, declaring void the treaty which had arranged the marriage. His policy led to war with England in 1544, and Henry saw in him an enemy whose removal would be welcome, and gave his approval to plots to assassinate Beaton.

The trial and execution (March 1, 1546) of the reformer George Wishart (*q.v.*) encouraged Beaton's enemies to take action. He showed no fear, taking part in the wedding of his illegitimate daughter, Margaret, with the earl of Crawford's heir and attending meetings of the privy council. But on May 29, 1546, a band of conspirators, including Norman Leslie. master of Rothes, and William Kirkcaldy of Grange, surprised him in St. Andrews castle and murdered him. His body lay unburied for several months while the murderers held the castle against the government.

Beaton was a man of worldly ambitions and was neither scholar nor patron of learning albeit a benefactor of St. Mary's college, which his uncle had founded at St. Andrews. Although John Knox and others have exaggerated his cruelty and immorality. both were harmful to the Roman Catholic Church in Scotland, which he tried to preserve by repression rather than by reform. As a statesman his actions were governed by ecclesiastical considerations, as a churchman by self-interest. After his death the French alliance, on which he had based his policies, threatened to lead to the complete subjection of Scotland to France.

JAMES BEATON (d. 1539), the cardinal's uncle, was abbot of Dunfermline, Kilwinning and Arbroath. and successively, archbishop of Glasgow (1509–22) and of St. Andrews (1522–39). He was treasurer of Scotland (1505–09) and chancellor (1513–26). As one of the regents during James V's minority, he supported the French alliance.

JAMES BEATON (*c.* 1524–1603), the cardinal's nephew, was an adviser of Mary of Lorraine and a determined opponent of the reformers. He became the last Roman Catholic archbishop of Glasgow in 1552, but in 1560 he went to France, where he spent the rest of his life, serving as ambassador there for Mary Stuart and for James VI.

BEATTIE, JAMES (1735–1803). Scottish poet and writer on philosophy whose once popular poem *The Minstrel* heralded the Romantic revival: was born at Laurencekirk. Kincardine. Oct. 25 (old style: new style, Nov. 5, as given on Beattie's tombstone), 1735. A farmer's son, he graduated from Marischal college, Aberdeen, and after some years of teaching in a rural school became professor of moral philosophy there.

His *Original Poems and Translations* (1760) already showed a Romantic attitude toward Nature. It was, however, with his *Essay on the Nature and Immutability of Truth, in Opposition to Sophistry and Scepticism* (1770) that he achieved fame. A vigorous defense of orthodoxy against the rationalism of David Hume, it is based on social rather than metaphysical arguments and enjoyed wide popularity. The next year he published the first part of *The Minstrel*, a poem in the Spenserian stanza tracing the development of a poet's mind under the influence of Nature. The second part was published in 1774. Although the setting is artificial and the moralizing tedious, it reflects the author's gentleness and sensitivity to natural beauty. To his generation it was a revelation, and it influenced Burns, Scott. Eyron and Tennyson. This double success opened all doors. Hailed as the defender of Christianity and the poet of a new era. Beattie was welcomed into Samuel Johnson's circle: sat to Reynolds, and was given a life pension by George III. He spent the summer of 1773 in London, and his diary of the visit gives a vivid picture of the literary life of the day.

Success brought little happiness. His wife became insane: and his sons died young. Beattie, who published the elder boy's writings with a memoir in 1794 *(Essays and Fragments in Prose and Verse, by James Hay Beattie),* was overwhelmed by the death of the younger and never recovered his health. He died at Aberdeen, Aug. 18, 1803.

His *Poetical Works* were edited with a memoir by A. Dyce (1866). His *London Diary, 1773* (1916) and *Day-Book, 1773–1798* (1948) were edited by R. S. Walker.

See M. Forbes, *Beattie and his Friends* (1904).

BEATTY, SIR (ALFRED) CHESTER (1875–), naturalized British mining engineer and director of many companies, distinguished for the part he played in developing the central African copper deposits, was born in New York on Feb. 7, 1875, the son of J. Cuming Beatty, a banker. He was educated at Westminster school. Dobbs Ferry, N.Y., at the Columbia School

of Mines and at Princeton university. gaining the M.E. degree in 1898. He was professionally engaged in the development of the porphyry copper ores of the Gnited States, first as consulting engineer to the Utah Copper company and later as a director of the Nevada Consolidated, the Ray Consolidated and the Chino Copper companies. In 1913 he relinquished his U.S. mining interests and settled in Great Britain, becoming a naturalized British subject in 1933. In 1914 he largely financed the original Selection Trust, Ltd., and formed, in 1921, a small syndicate known as Copper Ventures Ltd., a prospecting company that, by acquiring the Nkana and Rhodesian Congo Border concessions, initiated the development of the so-called "copper belt" of Northern Rhodesia and led to the eventual formation of two large copper groups, Rhokana corporation and Rhodesian Selection Trust.

For his services to the copper mining industry, Beatty was knighted in 1954. He was also honoured with foreign decorations and with medals and awards from learned and technical institutions. (C. W. D.)

BEATTY, DAVID BEATTY, 1ST EARL, OF THE NORTH SEA AND OF BROOKSBY (1871–1936), British admiral of the fleet, who commanded Britain's battle cruisers in the battle of Jutland, was born on Jan. 17, 1871, second son of Capt. David Longfield Beatty of County Meath, Ire. He entered the training ship "Britannia" as a naval cadet in 1884. From 1896 to 1898 he served with the naval brigade in Egypt and the Sudan, for which he obtained the distinguished service order and early promotion to commander. He served with distinction in China during the Boxer rebellion in 1900, and was promoted to captain at the early age of 29. In 1911, as a rear admiral. he became naval secretary to the first lord of the admiralty, then Winston Churchill, and in 1913 was appointed to command the battle cruiser squadron.

Soon after the outbreak of World War I in Aug. 1914 Beatty's naval force made a raid into the Heligoland bight and sank three cruisers and one destroyer without loss. A few months later he intercepted the German squadron under Admiral von Hipper in its third attempt on the English coastal towns. In a running fight, the rear German battle cruiser "Blücher" was sunk by British gunfire. Further damage to the enemy would probably have been inflicted but for the fact that the flagship "Lion" was disabled and that Beatty's second in command misunderstood his signal to rene the engagement, which was broken off. This action was known as the battle of the Dogger bank.

In the battle of Jutland (*q.v.*) on May 31, 1916, the battle cruiser fleet under Beatty was heavily engaged in a running fight with the German battle cruisers in the van under Hipper. Although Beatty's battle cruisers had the advantage of numbers, they were handicapped by conditions of light, and the ships themselves proved unable to sustain the gunfire of the German battle cruisers, with the result that the "Indefatigable" and "Queen Mary" were sunk. The fifth battle squadron, which was also part of Beatty's command, having failed to follow Beatty's change of course on account of defective signaling, was unable to render the powerful support it could have given during the early part of the engagement. Nevertheless, Beatty succeeded in his main object of drawing the combined high sea fleet to the northward, whence Admiral Jellicoe, with the whole British grand fleet, was hastening to meet and engage it. In Dec. 1916, on Jellicoe's being appointed first sea lord, Beatty became commander in chief of the grand fleet.

From 1919 to 1927 he served as first sea lord, having to deal with the creation of a much smaller, modernized peacetime navy. In 1921 he was a British delegate at the Washington conference on the limitation of armaments. He received the knight commander of the Bath in 1914, and in 1919 the order of merit, when he was created Earl Beatty. In May 1901 he married Ethel (d. Jan. 13, 1932), daughter of Marshall Field of Chicago, and had two sons. He died in London, March 11, 1936.

See W. S. Chalmers, *The* Life and *Letters* of *David, Earl Beatty* (1951).

BEAU BASSIN-ROSE HILL, a town of the British island colony of Mauritius, lies on the western slope of the central tableland 63 mi. S. of Port Louis (*q.v.*), the capital. Beau Bassin and Rose Hill were originally separate communities of approximately equal size. Beau Bassin lies at 700 ft. and Rose Hill 900 ft. above sea level. Pop. (1952) 28,690.

The town, which has no industries, is almost exclusively a residential area for people who commute daily to and from Port Louis and other parts of the island. It has preserved much of its original rural character with separate villas or bungalows, each with a garden and trees, and large blocks of apartments are few. The colony's education department and central statistical office are there; and there are a town hall combined with a theatre and reception hall, a public library, public gardens and sports grounds and an attractive little public park known as Balfour gardens. There are four churches, law courts and the Queen Elizabeth college for girls. founded in 1954.

The town is a junction point for both railways and roads, the main road from Port Louis to the south of the island and that to the east meeting at Rose Hill. Bus routes radiate to all parts of the island. About 2 mi. N.E. of Rose Hill is the governor's residence, Le Reduit. (M. V. M. H.)

BEAUCAIRE, a town of southeastern France in the *département* of Gard, lies on the Rhône opposite Tarascon and 15 mi. E. of Nîmes by road. Pop. (1954) 7.862. Beaucaire is linked to Tarascon by a suspension bridge (rebuilt in 1959) and a railway bridge Beaucaire's outstanding feature is the pine-clad rock rising abruptly from the river. On top of the rock is the castle, the chief remains of which are a triangular keep and small Romanesque chapel (1374–1474). From the garden around the castle there is an extensive view over the Rhône delta, the Camargue. The most important buildings of the old town, at the foot of the castle are the churches of Saint-Paul (15th century), and the fine hôtel de ville (1683). There are a Roman museum and two art galleries. Bull racing takes place on summer Sundays in the arena The Beaucaire canal connects with Aigues-Mortes and the Canal du Midi or Languedoc canal, and the town is an important river port, trading in wine and stone from quarries in the vicinity

Known in Roman times as Ugernum, its modern name comes from the medieval term Bellum Quadrum, used for the castle rock. In 1125 Beaucaire became the possession of the counts of Toulouse who built the castle and of whom one established the importance of its fairs by the grant of privileges; the July fair is now mainly devoted to leather goods. Beaucaire suffered severely in the religious wars when the town and its castle were destroyed by Richelieu in 1632. During World War II Beaucaire was in German occupation from Nov. 1942 to Aug 1944.

BEAUCE, a region of northern France, stretching southwest of Paris toward the forest of Orleans. Beauce is a monotonously flat, dry, treeless platform of limestone covered with loam soil which, as the local name of the district indicates, is extremely fertile It has long been one of the great grain-growing areas of France and wheat and sugar beet dominate the farming Large villages stand out in the level landscape by reason of their church spires and their water towers; the market towns include Chartres (*q.v.*), Chateaudun, Étampes and Pithiviers. Farther southwest, a tract of similar country between the Loir and Loire rivers is known as Petite Beauce (AR E. S.)

BEAUCHAMP, the name of several important English families The baronial house of Beauchamp of Bedford mas descended from HUGH DE BEAUCHAMP, who came to England at the Norman conquest, and whose second son. PAYN, received from William II the barony of Bedford. Payn's son, SIMON. steward to King Stephen, left a daughter. whose husband. Hugh de Beaumont, was created earl of Bedford (1138). But Simon's nephews, MILES and PAYN, refused to hand over Bedford castle, and the barony of Bedford remained in the line of Payn's descendants until the death without issue of JOHN DE BEAUCHAMP who fell fighting in the baronial cause at the battle of Evesham (1265). A younger branch of this family lived at Eaton Socon, Bedfordshire, holding a barony there until the 14th century.

The Beauchamps of Elmley. Worcestershire, from whom' were descended the Beauchamp earls of Warwick and the Barons Beauchamp of Abergavenny, of Powick, of Bletsoe, of St. Amand and of Kidderminster, were founded by the marriage, late in the

11th century, of WALTER DE BEAUCHAMP with Emeline, daughter of Urise d'Abetot, by which he acquired the shrievalty of Worcestershire and extensive estates. But the most momentous Beauchamp marriage was undoubtedly that of Walter's descendant, WILLIAM DE BEAUCHAMP, with Isabel, sister and eventually heiress of William Mauduit. 8th earl of Warwick. Their eldest son, WILLIAM DE BEAUCHAMP (d. 1298). succeeded him as 9th earl. His descendants (see WARWICK, EARLS OF) were much involved in the wars and constitutional struggles of the late 13th and of the 14th centuries. GUY DE BEAUCHAMP (d. 1315), 10th earl of Warwick, fought against the Scots at the battle of Falkirk (1298) and was one of the lords ordainer who opposed Edward II: his grandson, THOMAS DE BEAUCHAMP (d. 1401), 12th earl, a lord appellant (1388) against the ministers of Richard II, was imprisoned by the king (1397) in the Tower of London (the Beauchamp tower was named after him) and was only released and restored to his titles on the accession (1399) of Henry IV. His grandson, HENRY BEAUCHAMP (1425–45), was made premier earl and created duke of Warwick (1444) by Henry VI. On the death of Anne, his only child, in 1449, his vast inheritance passed to his sister Anne, wife of Richard Neville, earl of Salisbury, who thereupon became earl of Warwick.

WILLIAM DE BEAUCHAMP (d. 1411), a brother of the 12th earl of Warwick, succeeded by entail to the estates of the Lords Bergavenny and was summoned in that barony (1392); his son, RICHARD (d. 1422), was created earl of Worcester (Feb. 1421) but died without male issue.

A younger son of William de Beauchamp and Isabel Mauduit was WALTER DE BEAUCHAMP (d. 1303), founder of the house of Beauchamp of Powick which acquired a barony by writ (1401) and by patent (1447). On the death of RICHARD BEAUCHAMP (1503), without male heirs, the title became extinct. From the Beauchamps of Powick were descended the Beauchamps of Bletsoe: ROGER BEAUCHAMP, Walter's grandson, was the founder of the line, which continued into the 15th century. The Beauchamps Lords St. Amand were descended from Walter's great-grandson, WALTER DE BEAUCHAMP (fl. 1415), whose son, WILLIAM DE BEAUCHAMP (d. 1467), acquired by marriage the St. Amand lands and titles (1449). A famous member of this branch of the family was RICHARD (c. 1430–81), bishop of Salisbury, first chancellor of the order of the Garter. This line became extinct in 1508.

Another younger son of William de Beauchamp and Isabel Mauduit was JOHN BEAUCHAMP of Holt (fl. 1297). His grandson, JOHN BEAUCHAMP (d. 1388), steward of the household of Richard II, was created (Oct. 1387) lord de Beauchamp, baron of Kidderminster (the first barony created by patent). He was, however, impeached by the king's enemies a year later, and executed. Although the title was restored (1398) to his son, JOHN (d. 1420), he was forfeited by Henry IV and the barony became extinct.

The Lords Beauchamp of "Hache" (1299–1361), so named from their seat of Hatch Beauchamp in Somerset, were an entirely distinct family, probably descended from Robert surnamed "the constable" or "Fitz-Ivo," who held part of the honour of Mortain, including the Somersetshire lands, from William I's half brother Robert of Mortain. In the 12th century they held directly of the crown. ROBERT DE BEAUCHAMP (d. 1252), appointed a judge by Henry III in 1234, was a member of this family.

The title "Beauchamp of Hache" was revived for the Seymours (relations of Henry VIII's 3rd wife, Jane Seymour) in 1536 and 1559. The title of "Beauchamp of Powyke" was revived as a barony for William Lygon (descended through females from the Beauchamps of Powick), who was created Earl Beauchamp in 1815, and was ancestor of William Lygon (1903–), 8th Earl Beauchamp.

BEAUCHAMP, ALPHONSE DE (1767–1832), French historian, whose many writings are more interesting as compilations than as original works, was born at Monaco in 1767. In 1784 he became an officer in a Sardinian regiment, but after the outbreak of war between Sardinia and the French Republic, he refused to fight in what he considered an unjust cause and was imprisoned. On his release he worked in a government office and, after the fall of Robespierre, was made superintendent of the press. In his *Histoire* de la guerre de la Vende'e et des Chouans (1806) he used material to which his position gave him access, and was deprived of his post. He died in Paris on June 1 or 3, 1832.

Among his works dealing with contemporary events, the following are valuable but not completely reliable: Vie *politique,* militaire *et privée* du *général* Moreau (1814); Catastrophe de *Murat* (1815); *Histoire* de la guerre *d'Espagne* et de Portugal (1819); and Mkmoires secrets et *inédits* pour servir *à* l'histoire *contemporaine* (1825). The *Mémoires* of Fouchk which he edited (1824), were also probably revised and completed by him. (P. LY.)

BEAUFORT, the family name of the descendants of John of Gaunt, duke of Lancaster, by his liaison with Catherine Swynford, derived from a lordship lost by Gaunt in 1369, the modern Montmorency-Beaufort near Bar-sur-Aube, France. The four offspring of the union were legitimized, after their parents' subsequent marriage (1396), by the pope in Sept. 1396 and by Richard II in Feb. 1397; they were expressly excluded from succession to the crown by their half brother Henry IV in 1407 but this did not deprive the line of the place assigned to it by its royal blood. (For a genealogical table of the Beauforts, see LANCASTER, HOUSE OF.)

In the first generation JOHN (c. 1371–1410), the eldest son. through whom the line descended, was a courtier and crusader. He was created earl of Somerset, knight of the Garter and later marquess of Somerset and marquess of Dorset for his services as a lord appellant against Richard II's uncle and enemy Thomas of Woodstock, duke of Gloucester, in 1397. Although reduced to the rank of earl, he remained in favour after Henry IV seized the crown (1399), receiving grants and offices until his death on March 16, 1410. The second son, HENRY (see BEAUFORT, HENRY) (c. 1374–1447), became cardinal bishop of Winchester. The third and youngest son, THOMAS (d. 1426), also prospered under both Richard II and Henry IV. Though he served as chancellor of England from 1410 to 1411, he was primarily a professional military commander and as the French wars of Henry V progressed, offices, lordships and titles fell upon him. He became earl of Dorset (1412), duke of Exeter (1416) and count of Harcourt in Normandy (1418). On the accession of the infant Henry VI (1422), he continued in the wars and was a rather obscure member of the protectorate council. He died childless and his property remained to his eldest brother's heirs. The sister of John, Henry and Thomas, JOAN (d. 1440), made a suitable second marriage to Sir Ralph Neville (afterward earl of Westmorland).

The next generation saw the family's apogee, its place in politics being assured by Cardinal Henry. Although the Beauforts had but a moderate fortune, much of which was due to royal favour, Henry's ability, his legendary wealth derived from Winchester and his dealings in government finance gave the Beaufort faction a pre-eminence which their control over Henry VI from the mid-1430s assured. There was, however, a shortage of heirs: of John's children, the eldest, HENRY (1401–18), earl of Somerset, died unmarried after a brief career in the wars; the next, JOHN (1404–44), left, besides a legitimate and an illegitimate daughter, only a bastard son. His career was nipped in the bud by the fortunes of war; captive in France from 1421 to 1438, he was created a knight of the Garter about 1440, lieutenant of Guyenne, earl of Kendal, duke of Somerset in 1443, and after an ill-fated expedition to France, died in mysterious circumstances on May 27, 1444. John's third son, EDMUND (see SOMERSET, EDMUND BEAUFORT, duke of) (1406–55), was the most notable of the generation. A knight of the Garter before 1436, earl and marquess of Dorset by 1443, lieutenant and governor-general of France, Normandy and Guyenne, he became duke of Somerset in 1448. The sisters of the second generation married well: JOAN (d. 1445) to James I, king of Scotland, and MARGARET (fl. 1421) to Thomas Courtenay, earl of Devon.

After the death of the powerful William de la Pole, duke of Suffolk, in 1450, Edmund, with his possible claim to the throne (though deprived of the cardinal's fortune by the cardinal's tender conscience), became the natural leader of the Lancastrian party in a struggle for power with Richard, duke of York (*q.v.*), which even-

tually led to open conflict in the Wars of the Roses. Edmund was killed at the first battle of St. Albans on May 22, 1455, and although he had three sons and five daughters, the end of the Beauforts came rapidly. His eldest son, HENRY (1436–64), duke of Somerset, marquess of Dorset and titular count of Mortain, a victorious Lancastrian commander at the battles of Wakefield (1460) and of St. Albans (1461), fled to Scotland after the disaster of Towton (1461) and was then attainted and condemned to forfeiture. Failing to get French help, he deserted to the Yorkists in 1463 and was restored to his position; but a further tergiversation brought his attainder, forfeiture and execution on May 15, 1464, the day of his defeat and capture as Lancastrian commander at Hexham. Unmarried. he was survived only by a bastard son. Edmund's second son, EDMUND (*c.* 1439–71), "duke of Somerset" to Lancastrians alone, was attainted in exile in 1465 and, after a brief career as a Lancastrian commander, was captured and beheaded at Tewkesbury on May 6, 1471. He was the last male Beaufort, his younger brother, JOHN, "marquess of Dorset," like his brothers unmarried, having died before him in the battle (May 4, 1471). It was left to his cousin, the legitimate daughter of John, 1st duke of Somerset (see above), MARGARET BEAUFORT (*q.v.*) the mother of the future king Henry VII, to continue, in some measure, the fame of a remarkable line.

BEAUFORT, FRANÇOIS DE VENDÔME, DUC DE (1616–1669), French prince whose popular leadership during the Fronde won him the name of roi des Halles ("king of the markets") and who as admiral of France worked for the expansion of French power in the Mediterranean, was born in Paris on Jan. 16, 1616, the second son of César, duc de Vendôme, and his pious but simple-minded wife, Françoise de Lorraine-Mercoeur. He served as a volunteer in Louis XIII's Piedmontese campaign of 1630 (during his father's imprisonment) and won a high reputation in the campaigns against the Spaniards from 1635 to 1640. At the same time, however, he linked himself with the opposition to Cardinal Richelieu and became known as a devoted partisan of the queen, Anne of Austria. In 1642 he fled to England to avoid interrogation about the conspiracy of Cinq-Mars, but on Richelieu's death he promptly returned to France. He then enjoyed Anne's especial confidence, and on Louis XIII's death (May 1643), when she became regent, he hoped to control public affairs. When Jules Mazarin became prime minister, Beaufort, the duchesse de Chevreuse (*q.v.*) and others plotted to supplant him, giving themselves such consequential airs that they were called "les Importantd" Convinced that his life was in danger, Mazarin had Beaufort arrested (Sept. 2, 1613).

On May 31, 1648, Beaufort escaped from Vincennes. In Jan. 1649 he presented himself to the rebellious *parlement* of Paris and became one of the generals of the Fronde (*q.v.*). His record, his good looks, his sincerity and his sorties against the royal forces blockading Paris won him the adoration of the populace. From the peace of Rueil (March 1649) to the arrest of the prince de Condé (Jan. 1650) he made common cause with J. F. P. de Gondi, later cardinal de Retz (*q.v.*). Gondi, however, regarded Beaufort and his mistress the duchesse de Montbazon (Marie d'Avaugour) as unfit for serious intrigues and obtained from the court Beaufort's designation as admiral by consenting in his name without his knowledge to the arrest of Condé. After Condé's release and Mazarin's flight from France (Feb. 1651), Beaufort organized the patrols round the Palais-Royal to prevent Anne's taking Louis XIV to join Mazarin. Thereafter Beaufort and Gondi became progressively estranged. When Mazarin returned (Jan. 1652), Beaufort led the troops of Gaston, duc d'Orléans, on Condé's side. On July 30, 1652, he shot his sister Elisabeth's husband, the duc de Nemours (Charles Amédée de Savoie) in a duel. On the collapse of the Fronde he was banished from Paris.

Restored to royal favour in 1658, he concerned himself with his duties as admiral. In 1664 he led the expedition to Djidjelli, the first French attempt on Algeria. Sent as admiral and as "general of the church" to Crete to help the Venetians in Candia against the Turks, he was lost in battle on June 25, 1669. Later generations, believing him to have survived, tried to identify him with the Iron Mask (*q.v.*).

See E. de Lanouvelle, *Gabrielle d'Estrées et les Bourbon-Vendôme* (1936); Isabelle de Broglie, *Le Duc de Beaufort* (1958).

(J. G. R.-S.)

BEAUFORT, HENRY (c. 1374–1447), English cardinal and bishop of Winchester, who was a dominant figure in English politics during the first half of the 15th century, was the second son of John of Gaunt. duke of Lancaster, by Catherine Swynford. Legitimized with his brothers and sister soon after his parents' marriage in 1396 (see BEAUFORT), having studied at the universities of Cambridge and Oxford, and already possessed of livings and royal favour, he became chancellor of Oxford in 1397 and bishop of Lincoln in 1398. The Beauforts moved easily from the reign of their cousin Richard II to that of their half brother Henry IV; and Henry Beaufort began almost at once to play a formidable part in English politics. A member of the royal council and chancellor of England in 1403, he became bishop of Winchester, one of the richest sees in England, in the following year. He resigned the chancellorship in 1405 and led a powerful but moderate opposition group (of which his brothers formed a nucleus and with which the prince of Wales, afterward Henry V, became associated) within the council to the influence and administration of Thomas Arundel (*q.v.*). When the prince's influence was greater (1410–11), Henry was supreme in council and his brother Thomas acted as chancellor; but when the prince went into eclipse Bishop Beaufort went with him. After the accession of Henry V (1413) he again became chancellor. But by 1417 his ambitions flew higher: resigning the chancellorship he departed for the Council of Constance where, having added his weight to the papal side, he was created cardinal and legate a *latere* by the newly elected and grateful Pope Martin V.

The pope was also prudent: the new cardinal legate would be a useful tool in England. Henry V saw the danger clearly and for three years harried his uncle covertly but mercilessly until he resigned his cardinalate and for a time abandoned his Roman ambitions. Overtly his career had continued undisturbed Under Henry VI his talents had fuller scope. His wealth was legendary; the emoluments of Winchester were multiplied by his judicious financing of an insolvent government, especially after 1422. (One carefully unredeemed loan brought into his possession crown jewels much undervalued; this fraudulent conversion was to add to the deathbed anguish of a surprisingly tender conscience.) Beaufort's generous financing of the state was therefore not wholly disinterested patriotism and his largest loans were made either for financial and political gain or from political necessity. Against the man on whom the government's solvency depended there was little his opponents could do: this was the secret of his resilience in politics and of part of his wealth.

But his desire for power not only in England but as a prince of the church provided armament for his enemies. When Beaufort became cardinal of St. Eusebius and legate in 1426, Humphrey, duke of Gloucester, who had already forced him again to resign the chancellorship which he had held since 1424, made the alleged incompatibility of Roman and English office the excuse for further attack. His legation was questioned in 1428 and his right to hold the see of Winchester as cardinal in 1429; Gloucester tried, on the same grounds, to effect his exclusion from the council early in 1430. But Beaufort survived these and some later onslaughts, and with the support of the young Henry VI he finally displaced Gloucester from leadership in the mid-1430s.

Although never committed to the cause of peace. he conducted fruitless and sometimes nerve-wracking negotiations at Arras in 1435 and at Calais in 1439; these brought a new attack from Gloucester in 1440 but Beaufort retained power until his retirement from politics in 1443. He had led an ineffective crusade against the Hussites in 1427, and two years later attempted to lead another: but the diversion of his troops to the French war brought

him into papal disfavour until 1432 and subsequent pressure at home forced him to abandon his Roman ambitions. But despite this failure, despite his arrogance and self-seeking, his rapacity and his neglect of his diocese, his political and financial acumen enabled Beaufort to dominate English politics for more than 40 years and, though self-interest and loyalty conflicted most cruelly, his career and his record were not unworthy of his talents and of his birth. He died at Winchester on April 11, 1447.

(P. S. LE.)

BEAUFORT, MARGARET (1443–1509). known as "the Lady Margaret," was the mother of Henry VII of England and foundress of St. John's and Christ's colleges, Cambridge. Born May 31, 1443, she was the daughter and heiress of John Beaufort, 1st duke of Somerset. and was the great-granddaughter of John of Gaunt, duke of Lancaster. Her father died in 1444 and she became the ward of Henry VI's chief minister, William de la Pole, duke of Suffolk; he married her to his son and heir John in 1450. but the marriage was dissolved before March 24, 1453. She married Edmund Tudor, earl of Richmond, half brother to Henry VI, in 1455, but next year became a child-widow, with an infant son, Henry Tudor. She was married again to Sir Henry Stafford, a Lancastrian, by 1464; but he died childless in Oct. 1471. She took as her last husband, before Oct. 1473, Thomas, Lord Stanley, afterward earl of Derby, with whose help her son Henry gained the crown in 1485, her own claims being passed over. She died on June 29, 1509.

Margaret translated various books of devotion and was a valuable patron of the printers William Caxton and Wynkyn de Worde. Under the influence of her confessor John Fisher, later bishop of Rochester, she founded the Lady Margaret professorships of divinity at Oxford and Cambridge in 1502. Also at Fisher's bidding she completed in 1505 the endowment of Christ's college, and in her will left the bulk of her remaining estates to endow St. John's college, for which the charter of foundation was given in 1511.

BEAUFORT: see PORT ROYAL, S.C.

BEAUFORT SCALE, a series of numbers from 0 to 17 to designate the force of the wind. The numbers 0 to 12 were arranged by Adm. Sir Francis Beaufort (1774–1857) in 1806, to indicate the strength of the wind from a calm, force 0, to a hurricane, force 12, "that which no canvas could withstand." The British admiralty accepted the scale for the open sea in 1838 and it was adopted in 1874 by the International Meteorological committee for international use in weather telegraphy.

The Beaufort scale as originally drawn up made no reference to the speed of the wind and various attempts, particularly during the 20th century, have been made to correlate the two. In June 1939 the International Meteorological committee, meeting at Berlin. adopted a table of values referring to an anemometer at a height of six metres (20 ft.). This was not immediately adopted by the official weather services of the United States and Great Britain, where an earlier scale, referring to an elevation of 11 metres (36 ft.), is used. The Beaufort force numbers 13 to 17 were added by the U.S. weather bureau in 1955. The table above shows the wind speed in miles per hour corresponding to each Beaufort number on the two scales, but omits the description of the criteria used in estimating the speed of the wind. The Beaufort wind scale may be used to estimate the wind where there are no wind instruments (*see* ANEMOMETRY).

Beaufort	International scale, 1939		British and U.S. scale	
	Descriptive term	Rind speed	Descriptive term*	Wind speed
0	Calm	0–1	Light	less than 1
1	Light air.	2–3		
2	Light breeze	4–7		
3	Gentle breeze.	8–11	Gentle.	
4	Moderate breeze	12–16	Moderate	13–18
5	Fresh breeze	17–21	Fresh	19–24
6	Strong breeze.	22–27	Strong	25–31
7	Moderate gale	28–33		32–38
8	Fresh gale		Gale	39–46
9	Strong gale			47–54
10	Whole gale	49–56	Whole gale	55–63
11	Storm	57–65		64–72
12	Hurricane	more than 65		73–82
13				83–92
14			Hurricane	93–103
15				104–114
16				115–125
17				126–136

*Terms used by U.S. weather bureau. Other English-speaking countries use slightly different designations.

(W. E. K. M.; E. M. Bs.)

BEAUFORT SEA is that angle of the Arctic ocean lying north of the 750-mi. Alaska-Canada coast line from Cape Parry west to Point Barrow, and bounded on the east by Banks and Prince Patrick islands.

Coastal navigation is possible only during two or three months of late summer. In the 19th century whaling was carried on extensively. Trading posts have existed at six points, including Barrow and Herschel Island.

There is a clockwise current in Beaufort sea, to which the MacKenzie river and currents through Bering strait contribute. This giant eddy traps ridged and rafted old ice floes, making penetration extremely difficult. Explorations afoot were made by E. de Koven Leffingmell and Vilhjalmur Stefansson, and their colleagues, beginning in 1907. Sir Hubert Wilkins flew over portions as early as 1926. In 1947 the U.S. air force initiated regular weather flights over Beaufort sea and discovered several "ice islands."

The continental shelf underlying Beaufort sea is relatively narrow, seldom exceeding 100 mi. in width. Much of the sea is between 1,500 and 3.000 ft. deep; immediately to the north the bottom drops to about 12,000 ft. To the west is Beaufort basin, where depths of approximately 15,000 ft. have been recorded.
(J. E. CL.)

BEAUGENCY, a town of France in the *département* of Loiret, lies 26 km. (16 mi.) S.W. of OrlCans on the OrlCans railway. Pop. (1954) 3,250. It is at the foot of vine-clad hills on the right bank of the Loire, crossed there by a bridge of 26 arches dating in part from the 13th century. The château is mainly 13th-century with a massive 11th-century donjon. Portions of the Benedictine abbey remain, including the abbey-church of Notre-Dame, Romanesque but frequently restored. The hôtel-de-ville has a decorated Renaissance façade and the church of St. Étienne is pure Romanesque. The lords of Beaugency were powerful from the 11th to the 13th centuries, when the fief was sold to the crown, afterward passing to the house of OrlCans. Joan of Arc defeated the English there in 1429. In 1567 the town was sacked and burned by the Protestants. In Dec. 1870 the German army defeated the French army of the Loire near the river northwest of Beaugency. The town suffered damage in 1940. (AR. E. S.)

BEAUHARNAIS, the name of a French noble family well-known in Orléanais from the 15th century and distinguished in European history from the Napoleonic period. The widow of Jean Jacques de Beauharnais, seigneur de Miramion (d. 1645), was Madame de Miramion (Marie Bonneau; d. 1696) whom Bussy-Rabutin tried to abduct and who in 1661 founded the charitable order for women known as the Miramiones. Claude de Beauharnais (c. 1680–1738) was the father of two sons, François (1714–1800) and Claude (1717–84), comte des Roches-Baritaud. François also had two sons, François (1756–1823), marquis de La Ferté-Beauharnais, a deputy in the estates-general of 1789 who emigrated to serve in the royalist army against the Revolution but later adhered to Napoleon; and Alexandre (1760–94), vicomte de Beauharnais, who by his marriage to Josephine Tascher de La Pagerie, the future empress Josephine (*q.v.*), became the father of Eugène de Beauharnais (*q.v.*) and Hortense (*q.v.*), queen of Holland and mother of Napoleon III. Claude, who distinguished himself as a naval officer, married Marie Anne Françoise Mouchard (1738–1813), who as Fanny de Beauharnais kept a literary salon and was the mother of Claude (1756–1819), comte de Beauharnais. This Claude's daughter Stéphanie de Beauharnais (1789–1860)

was adopted by Napoleon I and married in 1806 to Charles Louis, the future grand duke of Baden and is remembered for her conviction that Kaspar Hauser (*q.v.*) was her son. Eugbne's two sons, Auguste (1810–35), husband of Maria II of Portugal, and Maximilien (1817–52), husband of the Russian grand duchess Maria Nikolaevna, succeeded in turn to his dukedom of Leuchtenherg. Maximilien's son Nicolas (1843–90) received the Russian title of Prince Romanovski, which remains with his descendants.

BEAUHARNAIS, EUGÈNE DE (1781–1824), French soldier, prince of the empire and viceroy of Italy for his stepfather Napoleon I, was born in Paris, on Sept. 3, 1781. His father, the general Vicomte Alexandre de Beauharnais (1760–94), served in the American Revolutionary War; was deputy for Blois in the estates-general of 1789, commanded the army of the Rhine in May–August 1793, lost Mainz to the Prussians and was guillotined on June 23, 1794. The marriage of the general's widow, Josephine Tascher de la Pagerie (*see* JOSEPHINE), to Napoleon Bonaparte in March 1796 was at first resented by Eugène and his sister Hortense; but their stepfather proved to be no less kind than watchful over their interests. In the Italian campaign (1796–97) and in Egypt (1798–99) Eugene served as aide-de-camp to Bonaparte. The services rendered by Eugbne in the *coup d'ktat* of 18 Brumaire (Nov. 9, 1799) and at the battle of Marengo (1800) established his fortunes. In 1804 he received the title of prince and also was appointed archchancellor of state and colonel-general of the *chasseurs à cheval.*

In 1805, when Napoleon proclaimed himself king of Italy, Eugène became viceroy there with large administrative powers; and in 1806 Napoleon adopted him. Eugene revealed himself a faithful agent, energetic and intelligent. With the help of Giuseppe Prina he reorganized public finances and the civil service, built new roads and introduced the French legal system. At the palaces of Milan and Monza his fine bearing and his benevolent manner won the esteem of the Italian aristocracy.

A soldier by temperament, Eugene took good care of the Italian army. In 1805 Napoleon, mistrusting his capacity as a strategist, had not made Eugbne commander of the Italian forces in the war against Austria, but in 1809 he allowed him this honour, appointing Marshal Alexandre Macdonald to supervise him. Defeated at Sacile, Eugene won an important victory at Raab (Gyor) and acquitted himself creditably at Wagram. In 1812 he and his Italian corps distinguished themselves in Russia, at Borodino and at Maloyaroslavets; and in 1813 he fought well in Germany.

In 1814 he held out as long as possible in Italy against the onslaught of the Austrians and Neapolitans, resisting all their attempts to induce him to desert Napoleon. Finally, however, he had to conclude the armistice of Schiarino-Rizzino (April 16). He then retired to Munich, to the court of the king of Bavaria, whose daughter Amelia Augusta he had married in 1806. He resided there with the title duke of Leuchtenberg. He died in Munich on Feb. 21, 1824, leaving two sons and four daughters. There is an edition of his *Me'moires et correspondance* (1858–60) by Baron P. E. A. Du Casse.

BEAUJEU, an ancient seigniory of France (in the modern *département* of Rhône), which gave its name to the old province of Beaujolais. The seigneurs de Beaujeu gradually enlarged their possessions, from the 10th to the 13th centuries, into a considerable feudal lordship. In 1210 Guichard de Beaujeu was sent by King Philip II Augustus on an embassy to Pope Innocent III; he mas present at the French attack on Dover, where he died in 1216. His son Humbert took part in the wars against the Albigenses and became constable of France. Isabeau, daughter of Humbert, married Renaud, comte de Forez; and their second son, Louis, assumed the name and arms of Beaujeu. His son Guichard, called the Great, had a warlike life, fighting for the king of France, for the count of Savoy and on his own account. Guichard's son Édouard I de Beaujeu, marshal of France, fought at Crécy and perished in the battle of Ardres in 1351. His son died without issue in 1374 and was succeeded by his cousin Édouard II, who gave his estates of Beaujolais and Dombes to Louis II, duc de Bourbon, in 1400. Louis's great-grandson Pierre II had the title seigneur de Beaujeu in 1474, when he married Anne (*q.v.*) of France, daughter of Louis XI, that princess being thereafter called "dame de Beaujeu." Louise of Savoy, mother of Francis I, got Beaujolais assigned to herself despite the claims of Anne's son-in-law Charles, the constable duc de Bourbon.

In 1531 the province was united to the French crown, but in 1560 Francis II gave it back to the house of Bourbon-Montpensier, from which it passed to that of Orléans. The title comte de Beaujolais was borne by Louis Charles d'Orléans, youngest son of Philippe Egalité.

BEAULY (a corruption of *Beaulieu),* a village in Invernessshire, Scot., lies where the Beauly river widens into Beauly firth. 13 mi. W. of Inverness by road. Pop. (1961) 1,112. Of interest are the noble remains of the priory founded about 1230 by John Bisset of the Aird for monks of the Valliscaulian order, and dedicated to the Blessed Virgin Mary and St. John the Baptist. On the right bank of the river stood Lovat castle, long since demolished. Anciently a Bisset possession, it was acquired by Hugh Fraser, forebear of the present Lord Lovat, in the 14th century. The modern castle of Beaufort, 3 mi. S., is the chief seat of the lords of Lovat. There a 13th-century stronghold was successively replaced by several others; of these one, Castle Dounie, was burned by order of the duke of Cumberland in April 1746, after the battle of Culloden. (C. I. F.)

BEAUMANOIR, PHILIPPE DE RÉMI, SIRE DE (*c.* 1250–1296), French administrator, jurist and author of two verse romances; his father, who held the *"beau manoir"* ("fair manor") in the village of Remy, near Compibgne (Oise), became *bailli* of the Gâtinais. Philippe, the second son, traveled in Britain and in 1280 succeeded his brother Girard in the title. He became *bailli* of Clermont (1279–82) and seneschal of Poitou (1284–88) and Saintonge (1287–88); after a mission to Rome (1289), he was successively *bailli* of the Vermandois (1289–91), Touraine (1292) and Senlis (1292–96). He died, Jan. 7, 1296, and was buried at Compiègne.

His romances La *Manekine* and *Jehan et Blonde* are preserved in a single 14th-century manuscript. The dozen lyrics attributed to him by Jeanroy are probably the collective work of a poetic circle in the Beauvaisis. His major work, the *Coutumes de Beauvaisis,* drafted *c.* 1280–83 and continually enlarged and emended, survives in 13 manuscripts, occupying 1,000 pages in the Salmon edition: it is a remarkable early instance of the codification of French customary law which was finally carried through under the later Valois kings.

BEAUMANOIR, an old Breton seigniory (in the modern French *dkpartement* of Côtes-du-Nord), which gave its name to an illustrious family. Jean de Beaumanoir, captain of Josselin and marshal of Brittany for Charles of Blois, is remembered for his share in the battle of the Thirty, celebrated by an unknown trouvbre and retold with variations by Jean Froissart. This was an episode in the struggle for the succession to the duchy of Brittany (*q.v.*) between Charles of Blois, supported by the king of France, and John of Montfort, supported by the king of England. John Bramborough, the English captain of Ploermel, continued his ravages in the district of Josselin in spite of a truce. Beaumanoir sent him a challenge, and on March 27, 1351, a fight took place near Ploermel, with 30 picked champions, knights and squires, on either side. Beaumanoir's side comprised 30 Bretons, Bramborough's 20 Englishmen, 6 German mercenaries and 4 Brabançons. The battle, fought with lances, swords, daggers and maces, is reminiscent of the last fight of the Burgundians in the *Nibelungenlied,* especially in the advice of Geoffroy du Bois to his wounded

leader, who was asking for water: "Drink your blood, Beaumanoir; that will quench your thirst!" The victory was decided by Guillaume de Montauban, who mounted his horse and overthrew seven of the English champions, the rest being forced to surrender. All the combatants were either dead or seriously wounded, Bramborough being among the slain. The prisoners were well treated and released for a small ransom.

(1927–28); Comte de Laigue, *Le Combat des Trente* (1913); E. Déprez, "La Querelle de Bretagne," *Mémoires de la société d'histoire et d'archdologie de Bretagne*, vol. vii (1926).

BEAUMARCHAIS, PIERRE AUGUSTIN CARON DE (1732–1799), one of the two most important French dramatists of the 18th' century (the other being Pierre Marivaux), whose comedies, *Le Barbier de Se'ville* and *Le Mariage de Figaro*, continue to hold and amuse audiences. He was also remarkable for his personality and his adventures.

At Court.— Beaumarchais was born in Paris, Jan. 24, 1732, the son of a watchmaker named Caron. He learned his father's trade and when he was 19 invented an escapement mechanism still used in modern watches. Another watchmaker attempted to steal his invention but Beaumarchais outwitted him: the dispute, settled in his favour, made him famous and led to his introduction at court (1754). He purchased an appointment in the royal household, married a wealthy young widow, Mme Franquet (1756; she died in 1757), and adopted the pseudonym "de Beaumarchais" (from the name of an estate of his wife's). In 1759 he became teacher of the harp to the daughters of Louis XV. He obtained a patent of nobility in 1760 and was able to use his influence with the king to do the financier Joseph Paris-Duverney a service. Duverney showed his gratitude by enabling Beaumarchais to amass a fortune. While acting as Duverney's agent in Madrid (1764–65), he spent some time trying to persuade one of his sister's Spanish suitors to marry her. The Spanish setting of both "Figaro" plays o es much to this visit. On his return to Paris he made his literary debut.

He had a passion for the theatre, but he attempted a genre which did not suit him—the *drame bourgeois*, a type of serious domestic drama popular at the time. *Eugénie* (Jan. 29, 1767) was only moderately successful. A second *drame bourgeois*, *Les Deux Amis* (Jan. 13, 1770), was a complete failure. He then decided to make a comedy out of a farce he had had privately performed in 1766. This was the beginning of *Le Barbier de Se'ville*.

The **Goëzman** Affair.— The play was ready for production when something unexpected happened and led to its postponement for five years. Beaumarchais had not settled all his obligations to Duverney before the latter's death (1770). He was falsely accused of fraud by Duverney's heir, the comte de la Blache; the courts found in Beaumarchais' favour but his opponent lodged an appeal. Meanwhile Beaumarchais was put under house arrest as a result of a fight with the duc de Chaulnes (who was later found guilty of provoking the quarrel). Beaumarchais was imprisoned for breaking house arrest: he was allowed out (under surveillance) to seek audience with his judges, but had to bribe the wife of Louis Goezman, who was *rapporteur* or secretary to the bench, before he was granted a brief and unsatisfactory interview. Goezman received a bigger bribe from Beaumarchais' opponent and on his recommendation the judges declared Beaumarchais' financial agreement with Paris-Duverney void, ordering him to pay the heir a vast sum as well as costs. This ruinous judgment (April 6, 1773) was never implemented. Mme Goezman had returned most of the bribe given her by Beaumarchais, except for 15 louis which she said had been given to her secretary, but Beaumarchais discovered the secretary had received nothing and opened a public attack on the Goezmans. An official investigation was ordered. Beaumarchais put his case to the public in a series of brilliant polemical *Mémoires* (1773–74), which won him general sympathy. Although he was sentenced to be officially disgraced (*"condamné* au *blâme"*), so were his opponents: Goezman was expelled from the judicature, from which he had earlier been suspended because of another scandal unearthed by Beaumarchais in the course of the pamphlet war. When the verdict was announced (Feb. 26, 1774), the public greeted Beaumarchais as a conquering hero, for he had won a moral victory.

The Secret Agent.— However, the *blâme* deprived him of most of his privileges, including his right to continue sitting as a judge for the Louvre tribunal, a post he had purchased in 1763 and held ever since, and to recover his good name he entered the secret service (March 1774). Sent to London. he stopped the distribution of a scandalous pamphlet about Louis XV's mistress, Mme Du Barry, and returned to Paris. After the accession of Louis XVI (May 1774) he went back to London and then crossed Germany and went as far as Vienna, claiming that he was pursuing the author of a scurrilous libel on the sterility of the marriage of Louis XVI and Marie Antoinette. The empress Maria Theresa was suspicious of his story and had him imprisoned but when he returned to Paris he was well paid and was at last able to have *Le Barbier de Se'ville* performed (Feb. 23, 1775). It was immensely successful. Though the subject matter was trite, it was a fast-moving play, full of lively dialogue and amusing scenes, and in Figaro he created an original comic character as witty and ingenious as he was himself. It was first made into an opera by Giovanni Paisiello (*q.v.*) in 1782; though very popular, this was superseded by Rossini's version (1816).

For ten years Beaumarchais was involved in many different sorts of activity. He was sent to London (April–Dec. 1775) to recover from another secret agent, the chevalier d'Éon de Beaumont (*see* EON, THE CHEVALIER D') some compromising secret documents, including French plans to invade England. While there he established contact with John Wilkes and the opposition to George III. An ardent supporter of the American revolutionaries, he wrote secretly to Louis XVI and his foreign minister, Vergennes, urging them to intervene in the colonists' favour (Sept. 1775–May 1776). The French government then instructed him to send help to the rebels: he acquired capital, armed and equipped a fleet and dispatched volunteers, stores and provisions (June 1776–81). He was one of the Frenchmen who contributed most to the cause of American independence—he lost a considerable amount of money in the process.

Le Mariage de **Figaro.**—In 1777 he founded the Société des Auteurs Dramatiques to secure reasonable royalties for playwrights—most of the concessions demanded were secured in three decrees of 1780—and in 1779 he undertook the editing of the complete works of Voltaire (70 vol., 1785–89). At this time he was occupied with *Le Mariage de Figaro*, but it was four years before he saw it performed. Louis XVI disapproved of it but finally consented to its being produced in Paris. The triumphant first night (April 27, 1784) is a memorable date in the history of the French theatre. In *Le Mariage* (published in 1785), the sequel to *Le Barbier*, Figaro was much bolder and mocked both the nobility and absolutism in general; the pre-revolutionary atmosphere gave his attacks extra point. In this play, which was altogether more complex and richer than the previous one, Beaumarchais' comedy reached its peak.

The Coming of the Revolution.— The aftermath of this triumph was less happy. The king, displeased by an attack Beaumarchais had made on the writer of an article hostile to *Le Mariage*, incarcerated him in a prison usually reserved for juvenile delinquents, Saint Lazare, but because of the uproar he was released after a few hours (March 1785). Beaumarchais refused to leave until six days later. In the same year he was attacked by Mirabeau (*q.v.*) for his dealings in a firm he had founded, the Compagnie des Eaux de Paris, and he was libeled in 1786 by a hack employed by Guillaume Kornmann, a minor government official who had been prevented only by Beaumarchais' intervention in 1781 from divorcing and disgracing his young wife in order to obtain her money. In the tedious pamphlet-war that followed, Beaumarchais incurred the enmity of some who were important in the early stages of the revolution. In 1786 he married his third wife, Nlle de Willermaulaz, with whom he had been living (his second wife, whom he married in 1768, had died in 1770); however, he continued to have affairs with other women. From Eugénie, his daughter by his third wife, the present representatives of his family are descended. His opera *Tarare* (1787) was an abortive

work, as was La *Mère coupable* (1792), in which characters from Le Mariage de Figaro reappear. He was finishing the construction of a sumptuous mansion on the outskirts of a working-class suburb when the revolution broke out. He endeavoured to mediate, but because of his wealth he was not trusted by the revolutionaries. He was imprisoned and might have perished in the massacres of Sept. 1792 if one of his mistresses had not obtained his release. Nevertheless, he wished to serve the republic and, having secured the post of commissionaire extraordinaire, was charged with the task of gaining possession of 60,000 muskets stored in Holland. He was tricked by his enemies, failed (Sept. 1792–Oct. 1794) and once more narrowly escaped the guillotine. In his own defense he wrote Les Six *Époques* de ma vie (1793), an interesting and sometimes brilliant pamphlet. After exile in Hamburg he returned to Paris (July 5, 1796), where his wife, his daughter and his sister were living in poverty in his splendid mansion, which had been ravaged by revolutionary militiamen. He was struggling to restore his fortunes and had again begun literary and political work when he died on May 17, 1799.

Beaumarchais has always had his detractors. He was sometimes unscrupulous, but he loved his family and worked for the common good and for progress. A writer only by chance, he remains a classic of the French theatre. Mozart's opera Le *Nozze* di Figaro (1786) and Rossini's *Il* Barbiere di *Siviglia* (1816), by isolating the poetic element contained in his two masterpieces, consolidated and increased their renown.

BEAUMARIS (BIWMARES), a market town and municipal borough in the Isle of Anglesey, Wales, is situated at the north-eastern end of the Menai straits 4 mi. from the Menai road bridge to the mainland. Pop. (1961) 1,960. Beaumaris castle, a moated double ring of towered walls built by Edward I in 1295–1323 as a defense against the Welsh, was linked to the sea by canal. The church of St. Mary has an early 14th-century nave. The town, on drained marshland (beau marais), was made a borough in 1294 and reached its greatest prosperity in Tudor times. The grammar school dates from 1603 and the assize court from 1614. As county town for Anglesey it continued as a centre for social life, maritime and local trade, until the Industrial Revolution. Beaumaris then became a summer and winter resort and later a yachting centre. Off the easternmost point of Anglesey and 4½ mi. from Beaumaris is Puffin Island (Priestholm) where numerous sea birds breed. There are bus and ferry services between Beaumaris and Bangor. Boats are built locally and slate is quarried in the neighbourhood.

BEAUMONT (BELMONT, DE BELLOMONTE), the name of an Anglo-Norman family descended from ROGER DE BEAUMONT (*c*. 1015–*c*. 1096) of Beaumont-le-Roger in Normandy and his wife Adeline, daughter of Waleran, count of Meulan. Their son, ROBERT DE BEAUMONT (c. 1046–1118), count of Meulan and 1st earl of Leicester (?1107), distinguished himself at the battle of Hastings (1066) and was rewarded by William I with lands in Warwickshire, to which he added by inheritance the county of Meulan and the Norman estates of his father. One of the chief advisers of William II, Robert attained even greater prominence in the reign of Henry I, whom he aided in his French wars, commanding a division at the battle of Tinchebrai (1106). His consistent sagacity led Henry of Huntingdon to style him "wisest of all men from here to Jerusalem" (*Historiae* Anglorum, vii, 30). He died at Préaux in Normandy on June 5, 1118.

After his death most of count Robert's French fiefs went to one of his twin sons, WALERAN DE BEAUMONT (1104–66), count of Meulan, while the English fiefs fell to the other twin, ROBERT DE BEAUMONT (1104–68), 2nd earl of Leicester. The landless third son, HUGH (called "the Poor"), received the earldom of Bedford from King Stephen in 1138. Both twin brothers at first supported Stephen and prompted him to imprison the bishops of Salisbury and Lincoln in 1139, thus precipitating the civil war between Stephen and Matilda. Subsequently Robert devoted himself to founding religious houses (notably St. Mary des Prés, better known as Leicester abbey). Waleran profited little from transferring his allegiance to Matilda (1149), but by adhering to Henry Plantagenet (afterward Henry II) when he landed in England in 1153 Robert was taken into the new king's favour. He was appointed in 1155 chief justiciar, a post which he held until his death. While remaining loyal to Henry II in his dispute with Thomas Becket, Robert strove unsuccessfully to reconcile the two. He died on April 5, 1168, and was succeeded by his son, ROBERT DE BEAUMONT (c. 1135–90), 3rd earl of Leicester, who joined the rebellion against Henry II in 1173 and for a time lost his English fiefs. He died in Greece in 1190, while on crusade. (For the subsequent history of the earldom, see LEICESTER, EARLS OF.)

Possibly descended from the earlier Beaumonts, LOUIS DE BEAUMONT (d. 1333) was grandson of John of Brienne, king of Jerusalem, and related to Edward II and to his queen, Isabella. Through their intercession he was elected in 1316 to the bishopric of Durham. Before his consecration (1318) Louis was seized by Northumbrian freebooters and, with his brother Henry, was held to ransom. As bishop he did little to defend his troubled diocese against Scottish inroads, instead engaging in quarrelsome litigation, especially with William Melton, archbishop of York. He died in Sept. 1333.

Louis' younger brother, HENRY DE BEAUMONT (c. 1283–1340), created Baron Beaumont by writ (1309), was denounced in the Ordinances of 1311 as one of Edward II's favourites. He played a prominent part in the Scottish campaigns of Edward II and Edward III, being present at the battles of Bannockburn (1314), Dupplin (1332) and Halidon Hill (1333) and proving himself a skillful soldier and diplomat. Through his marriage with Alice Comyn, Henry claimed the Scottish earldom of Buchan, and it was under his leadership that Edward Balliol and the "disinherited lords" invaded Scotland in 1332. Accompanying Edward III on his expedition to Flanders, Henry died there on about March 10, 1340. The barony descended in the direct male line to JOHN (1409–60), 6th baron, who was created 1st viscount (1440). At the death of his son WILLIAM (1438–1507), 2nd viscount and 7th baron, the viscountcy expired, and the barony fell into abeyance until 1840 when it was revived in favour of one of the coheirs, MILES THOMAS STAPLETON (1805–54), 8th baron. Miles's granddaughter, MONA JOSEPHINE TEMPEST FITZALAN-HOWARD (1894–), became the 11th holder of the barony. (R. G. NI.)

BEAUMONT, (JEAN BAPTISTE ARMAND LOUIS LÉONCE) ÉLIE DE (1798–1874), French geologist who prepared, with O. P. A. P. Dufrénoy, the great geological map of France, was born at Canon, Calvados, on Sept. 25, 1798. In 1835 he was appointed professor of geology at the École des Mines. He held the office of engineer-in-chief of mines in France from 1833 until 1847, when he was appointed inspector general; and in 1861 he became vice-president of the Conseil-Général des Mines. He was a member of the Academy of Berlin, of the Academy of Sciences of France and of the Royal Society of London, a senator of France from 1852, and, from 1853, perpetual secretary of the Academy of Sciences. He died at Canon on Sept. 21, 1874.

BEAUMONT, SIR JOHN (1583?–1627), English poet who contributed to the development of the heroic couplet and of a clear and natural poetic style. Elder brother of Francis, the dramatist (see BEAUMONT AND FLETCHER), he was a son of Francis Beaumont, justice of the common pleas. After entering Broadgates hall (later Pembroke college), Oxford, in 1597 and the Inner Temple a year later, he inherited Grace-Dieu priory, Charnwood, Leicestershire, in 1605. As a Catholic recusant he forfeited two-thirds of his income and was required to live on his estate, where he entertained Michael Drayton and Ben Jonson. He married

Elizabeth Fortescue and had seven sons and four daughters. Through the duke of Buckingham, whose mother was a Beaumont, he won the favour of James I and Charles I, who made him a baronet in Jan. 1627. He was buried on April 19, 1627, in Westminster abbey, near Chaucer, Spenser and his brother Francis.

Beaumont probably wrote *The Metamorphosis of Tnbacco* (1602). a poem on the divine herb which shows his delight in myths from Ovid. It was dedicated to Drayton, who called John and Francis Beaumont "My deare companions whom I freely chose/My bosome friends." His most ambitious poem, "The Crowne of Thornes," in 12 books, was never printed, but it survives in British museum Additional manuscript 33,392, partly in his own handwriting. He mentions this devotional poem in an elegy on Henry, earl of Southampton. In 1625 he wrote a dramatic entertainment for James I, *The Theater of Apollo* (Royal manuscript 18. A. lxx, ed. by W. W. Greg, 1926). *Bosworth-Field, with a Taste of the Variety of Other Poems, Left by Sir John Beaumont* was published in 1629 by his son Sir John, with tributes by Jonson and Drayton. The title poem describes in vigorous verse the battle which took place in Leicestershire in 1485. In every known copy of the book leaf N3 has been cut out, but the censored poem, on the deaths of Catholics in an accident at Blackfriars, is in British museum Stowe manuscript 960. *Bosworth-Field* includes sacred poems such as "In Spiritual1 Comfort" and "Against Abused Love," poems to James I, Charles I and Buckingham, translations from Horace on quiet country life and elegies on the poet's friends, his brother Francis and his seven-year-old son Gervase, "whose winning love/To me was like a friendship." Further editions appeared in 1710, 1717 and 1790.

Beaumont stood for order and precision in poetry: "Pure phrase, fit Epithets, a sober care/Of Metaphors, descriptions cleare, yet rare." He wrote that James I "leades the lawlesse Poets of our times./To smoother cadence, to exacter Rimes." Wordsworth praised the "spirit, elegance, and harmony" of Beaumont's verse.

BEAUMONT, WILLIAM (1785–1853), U.S army surgeon and physiologist who advanced knowledge of digestion by observing the stomach directly through an external opening into a patient's stomach, was born Nov. 21, 1785, at Lebanon, Conn. He studied medicine with a practitioner and joined the army as surgeon's mate during the War of 1812. In 1819 he was appointed post surgeon at Ft. Mackinac in northern Michigan. There, on June 6, 1822, a Canadian trapper, Alexis St. Martin, was severely wounded in the side by a shotgun discharged at close range. The stomach was lacerated and a permanent fistula (opening) developed. Beaumont saw the opportunity to study digestive processes directly by means of St. Martin's "open stomach." He established the chemical nature of digestion, observed the comparative rates of dissolution of foods, and noted the effect of emotions on gastric secretion His results were published in 1833 in a classic work, *Experiments and Observations on the Gastric Juice and the Physiology of Digestion*, which was immediately acclaimed in scientific circles Beaumont died April 25, 1853, at St. Louis, Mo., where he had practiced privately after resigning from the army in 1840.

BEAUMONT, a city of Texas, U.S., at the head of navigation on the Neches river, 28 mi. from the Gulf of Mexico. 16 mi. by highway N.W. of Port Arthur, and 70 mi. N.E. of Galveston; the seat of Jefferson county. Pop. (1960) city of Beaumont, 119,-175; Beaumont-Port Arthur standard metropolitan statistical area (Jefferson county) 306,016. (For comparative population figures *see* table in TEXAS: *Population.)* Beaumont is a key port of the east Texas petrochemical industry and the second ranking port in Texas. The city was chartered in 1881 and has had a council-manager form of government since 1919.

Before 1800 French and Spanish fur trappers frequented the area. In 1825 Noah Tevis of Tennessee established a town there called Tevis Bluff, and in 1835 he sold 50 ac. of land for a townsite to Henry Millard who allegedly named the place for his brother-in-law, Jefferson Beaumont. The area prospered in the 19th century as a result of the exploitation of the timber growing nearby. The port flourished as a shipping outlet for cotton, sugar cane and cattle, and as an entry point for the illegal African slave trade.

The years after the American Civil War were uneventful until the railroad boom of the 1890s, which eventually brought five lines through the city. When the Spindletop oil well was discovered nearby in 1901, a typical oil boom city sprang up overnight, and the population increased fivefold in 25 years (from less than 10,000 in 1900 to about 50,000 by 1925). Beaumont became the centre of Texas' petrochemical industry which comprises a number of the world's largest oil refineries. The city's industrial activities include ship and barge building, ship repair, the manufacture of drilling and pipeline equipment and the milling of rice products.

Beaumont has its own art museum, a public library and a symphony orchestra. Lamar State College of Technology, a four-year institution with an annual enrollment of more than 6,000 students, was established there in 1923. (E. W. F.)

BEAUMONT AND FLETCHER (fl. *c.* 1607–1625), two English dramatists whose names are associated with a large body of plays most of which were collected in *Fifty Comedies and Tragedies. Written by Francis Beaumont and John Fletcher* (1679). Some they wrote in partnership, some in collaboration with other playwrights and some one or the other wrote unaided: one or two they may have had no share in at all. The plays were popular throughout the 17th century and were a strong influence on Restoration drama. Beaumont and Fletcher were involved either individually or as collaborators in the composition of almost the whole collection, but their individual talents and careers were in some ways markedly different.

FRANCIS BEAUMONT (*c.* 1584–1616) was the son of Francis Beaumont, justice of common pleas, of Grace-Dieu priory, Charnwood forest, Leicestershire. He entered Broadgates Hall (later Pembroke college), Oxford, in 1597 (but took no degree) and the Inner Temple in 1600. There he probably wrote the Ovidian poem *Salmacis and Hermaphroditus* (1602). His career as playwright began *c.* 1606. During collaboration with John Fletcher (*c.* 1607–14; *see* below) he was the dominant partner, mainly responsible for the three best-known plays. "They lived together on the Bankside, not far from the playhouse, both bachelors; lay together; had one wench in the house between them . . . the same clothes and cloak etc." (John Aubrey, *Brief Lives*, c. 1680). The partnership apparently ended in 1613 or 1614 when Beaumont married a Kentish heiress. He died in London, March 6, 1616, and was buried in Westminster abbey.

Little is known of the life of JOHN FLETCHER (1579–1625), apart from the records of his plays. He was baptized at Rye, Sussex, on Dec. 20, 1579, the son of Richard Fletcher, who had been president of Bene't (later Corpus Christi) college, Cambridge, and later became bishop of Bristol, of Worcester and (in 1595) of London. The boy may have entered Bene't college in 1591, but probably did not take a degree. He may be the Fletcher whose marriage in 1612 is recorded at St. Saviour's, Southwark, where he is said (by Sir Aston Cokayne in 1658) to have been buried on Aug. 29, 1625, "in the same Grave" as Philip Massinger (*q.v.*), who died 15 years later. It is not known when he started writing plays. His name is first linked with Beaumont's in Ben Jonson's *Volpone* (1607 Quarto), to which both men contributed encomiums. Fletcher began to work with Beaumont probably *c.* 1607 or 1608, at first for the Children of the Queen's Revels and its successor, and then (from c. 1609–10 until Beaumont's retirement) mainly for the King's Men at the Globe and Blackfriars theatres. From *c.* 1613 he was often assisted, or his plays were revised, by Massinger, who succeeded him in 1625 as chief playwright of the King's Men; other collaborators included Nathaniel Field and William Rowley (*qq.v.*). Throughout his career he also wrote plays unaided.

The Authorship of the Plays. — The canon of the Beaumont

and Fletcher plays is approximately represented by the 52 plays in the folio *Fifty Comedies and Tragedies* . . . (1679), which had been preceded by a smaller folio in 1647. But any consideration of the canon must omit one play from the 1679 folio (James Shirley's *Coronation,* of which the authorship is fairly conclusively proved by external evidence) and add three not to be found in it *(Henry VIII, Sir John van Olden Barnavelt, A Very Woman).* Of these 54 plays not more than 14 are by Beaumont or Beaumont and Fletcher in collaboration. The other 40 represent Fletcher either unaided or in collaboration with dramatists other than Beaumont, principally Massinger. About a dozen others, including Shakespeare, Jonson, George Chapman, Thomas Middleton and John Webster, have with varying degrees of plausibility been detected, but the chief need is to determine the respective shares of Beaumont, Fletcher and Massinger. Attempts have had to be based on internal stylistic evidence, chiefly through the identification of metrical or linguistic habits sufficiently restricted to one or other of the dramatists in question to be valid as clues. For example, a succession of investigators since 1901 have shown that Fletcher used certain pronominal forms much more freely than the other writers concerned: these include *ye* for *you, 'em* for *them,* and *'s* for *his.* Since 1874, when F. G. Fleay began his work on the canon *(see* below), metrical tests have shown Fletcher's comparative fondness for feminine endings and his avoidance of rhyme, alexandrines and enjambment. Such tests can be fairly objective, but many readers have also felt able to distinguish differences in tone, choice of material and attitude to life, describing Beaumont, for example, as having greater powers of characterization and deeper feeling than Fletcher, more sentimentality and less indecency and a less mannered style. Full agreement has not been achieved. For a listing of the 54 plays and a summary of modern opinion regarding their authorship and dates, *see* the appendix of this article.

The Major Plays.— For the modern reader the most interesting are the plays written before Beaumont's retirement. Fletcher's *The Faithful Shepherdess* and Beaumont's *The Knight of the Burning Pestle* are very different. *The Knight* has generous humour in its picture of the citizen characters, excellent literary burlesque and a "play within the play" ironically foreshadowing features of the tragicomic romance. *The Faithful Shepherdess* is an attempt to anglicize the pastoral romances of Torquato Tasso and Giovanni Battista Guarini (*qq.v.*); its elaborate patterns achieve that harmony of grave and gay required by tragicomic theory; Fletcher's poetry is here at its freshest, sharing "Dorique delicacy" with Milton's *Comus,* which derives in part from it.

The masterpieces of the collaboration, *Philaster, The Maid's Tragedy, A King and No King,* show, most clearly in the last, the emergence of most of the features that distinguish the Fletcherian mode from Shakespeare, Chapman or Webster: the remote, often pseudohistorical, fairy tale setting; the clear, smooth speech rising to great emotional arias of declamatory rhetoric; the basically sensational or bizarre plot which faces the characters with wild "either–or" choices between extremes and which can be manipulated toward a sad or a happy ending as the playwrights choose; the sacrifice of consistency and plausibility in characterization so that patterns can be made out of constantly shifting emotional states and piquant situations can be prolonged. Specially noteworthy are the long, surprising and wonder-rousing scenes, such as those in the woodland in *Philaster* (act III, scene 3) where Bellario, Arethusa and Philaster are at cross purposes: the harmonies are the helpless pathos of Arethusa, the bitter, bewildered disillusion of Philaster and the pretty self-sacrifice of Bellario, the girl disguised as a pageboy. Scenes similarly orchestrated, though on darker themes, are those in which *(A King and No King,* act III, scene 1) Arbaces discovers that he has a passion for his (supposed) sister Panthea, or in which Amintor *(Maid's Tragedy,* act II, scene 1) realizes that his bride is the king's kept woman, or in which (act III, scene 2) he and his noble friend Melantius face each other with a series of moral impasses (the dramatists cheating about human nature in order to resolve situations developed to extremes for the sake of theatrical excitement).

Thierry and Theodoret has affinities with the three masterpieces but is more lurid; it is notable for its pseudohistory, for the character of Brunhalt the lustful queen (a favourite Fletcherian type) and for containing what Charles Lamb thought the finest scene in Fletcher (act IV, scene I), in which Thierry's young wife Ordella, veiled, presents herself to him as a willing sacrificial victim whose death, Thierry has been told, will make it possible for him to have an heir—she unveils and he cannot strike her, profoundly moved by her wish to sacrifice her life for love of him. But the teeth are set on edge by Brunhalt's "comic" paramour Protaldye, an evil braggart. Another interesting play of the collaboration is the lively *Coxcomb,* which combines "comicall satyre" (Fletcher's) with the appalling adventures of the chaste and pathetic Viola (Beaumont's), a character closely resembling the keeper's daughter in the Fletcherian part of *The Two Noble Kinsmen;* it can be contrasted with *Cupid's Revenge* (story from Sir Philip Sidney's *Arcadla),* which is significant in the growth of the tragicomic mode especially for the discontinuity in the main character Leucippus and for the uncertain and unexpected tragic ending.

Of Fletcher's unaided plays, six, as E. M. Waith has shown, illustrate most completely the middle kind which he had perfected: *The Mad Lover, The Loyal Subject, The Humorous Lieutenant, Women Pleased, The Island Princess, A Wife for a Month* (all between *c.* 1616 and *c.* 1624). Each of these is a series of extraordinary situations and extreme attitudes, displayed through intense declamations. Moral codes and the human personality are subjected to dislocating pressures so that a new, exciting design can be fashioned from them; the skilful rhetoric and the timeless, remote settings should help us to accept this operation. The best of the six are perhaps *The Loyal Subject,* extraordinarily consistent in obeying its own nature, and *A Wife for a Month,* a florid and loquacious play, in which a bizarre sexual situation is handled with cunning piquancy and the personages illustrate clearly Fletcher's tendency to make his men and women personifications of vices and virtues rather than individuals. Readers who cannot acquire the taste may be better pleased by *Valentinian,* which ably mingles French and Jacobean courtly codes and "servile royalism" with Roman history and contains Fletcher's most elaborate study (comparable with Amintor and Melantius in *The Maid's Tragedy)* of the important heroic theme of noble friendship; or by *Bonduca* (= Boadicea), a well-articulated costume-panorama of the Roman-British wars, very far from the learned realism of Jonson's Roman plays, but not so remote from *Cymbeline.* The best of Fletcher's comedies, for urbanity and consistency of tone, is probably *The Wild-Goose Chase,* a play of episodes rather than of intricate intrigue, but alive with ironic laughter and easy wit,

Lastly, there are the Fletcherian plays in which others besides Beaumont had a hand. *Wit at Several Weapons* is a comedy that might have been written wholly by Middleton and *The Captain* (to which Beaumont may, however, have contributed) is a lively, complex play of sexual intrigue, with tragic dilemmas too. Of the numerous plays in this group a personal preference may be expressed for *The False One* and *The Beggar's Bush.* The former is an original, incisive and moderately subtle treatment of the story of Caesar and Cleopatra which may well have aided Dryden to compose *All for Love* and for which the greater credit goes to Massinger. The latter is worth reading for its "version of pastoral" which genially persuades us that it is better to be a country beggar than a tyrannical king. But neither of these is representative of those features of the canon which modern criticism has most emphasized.

Theatrical and Literary Repute and Influence.— John Dryden states that *Philaster* was Beaumont and Fletcher's first success. From 1616 to the closing of the playhouse in 1642 their plays were probably much more frequently performed at court by the King's Men than those of any other dramatist. The 1647 folio, with encomiums contributed by many famous Cavalier poets, was a major literary event and the favour expressed ("Shakespeare to thee was dull") now seems astonishing. Known facts and figures all support Dryden's statement *(Essay of Dramatick Poesie,* 1668): "their plays are now the most . . . frequent entertainment of the stage; two of theirs being acted through

the year for one of Shakespeare's or Jonson's." Between 1663 and 1682, 38 of the plays were produced, many frequently, but their popularity waned markedly after 1682 and more frequent use was made of "improved" versions: of these about 20 were prepared, by authors who included Sir William Davenant, Sir John Vanbrugh, George Farquhar, Thomas Betterton and Colley Cibber. By 1700 the plays were being dislodged, Shakespeare (usually altered) drawing level. During the 18th century two or three were staged intermittently (especially *The Chances* and *Rule a Wife).* There was a similar decline in critical esteem. They certainly influenced Restoration drama deeply, both serious and comic. Seventeenth-century criticism customarily ranked them with Shakespeare and Jonson as superior to all other English playwrights. Dryden put them third and in his *Defence of the Epilogue, or An Essay on the Dramatique Poetry of the Last Age* (1672) and the preface to his version of *Troilus and Cressida* (1679) defended them against the neoclassical strictures of Thomas Rymer, made in *Tragedies of the Last Age* (1678), but was himself by no means blind to their faults. In the next century, comparatively ignored by the critics, they achieved three collected editions (in 1711, 1750, 1778). In 1798 Monck Mason wrote of them in his *Comments* on the plays as "totally neglected," but in his edition of Massinger (1805) William Gifford followed tradition in ranking Fletcher with Shakespeare and Jonson.

The Romantic critics' radical revaluations did not derive, as earlier ones had, from neoclassical principles. They constitute in general a just and formidable indictment, which has never been satisfactorily met. Lamb commented in *Specimens of English Dramatic Poets . . . About the Time of Shakspeare* (1808) on Fletcher's fandness for "unnatural and violent situations . . . He seems to have thought that nothing great could be produced in an ordinary way . . . Shakespeare has none of this contortion in his mind, none of that craving after romantic incidents, and flights of strained and improbable virtue, which I think always betrays an imperfect moral sensibility." Coleridge added that the plays are "mere aggregations without unity; in the Shakespearian drama there is a vitality which grows and evolves itself from within." He said (in *Literary Remains,* vol. i, lecture viii, 1836) that "In Beaumont and Fletcher you have descriptions of characters by the poet rather than the characters themselves" and he mas echoing Richard Flecknoe's opinion *(A Short Discourse of the English Stage,* 1664) when he affirmed that their women are "when of the light kind, not decent; when heroic, complete viragos." He ranked them below Massinger and Jonson, but heartily praised their overflowing comic wit. William Hazlitt *(Lectures Chiefly on the Dramatic Literature of the Age of Elizabeth,* 1820) admired their descriptive and lyrical facility, their mastery "of melting modulation or sounding pomp" and wide range of material, but thought that they sacrificed too much to contriving "ludicrous distresses," willful and violent surprises and "a catastrophe in every scene." Leigh Hunt objected to the mixture of indecency and ('servile royalism" with "poetry of the highest order" and produced a bowdlerized edition (1855). Meanwhile four more collected editions appeared, culminating in Alexander Dyce's in 11 vol (1843–46). Among Victorian critics, the most notable were Henry Hallam (*Introduction to the Literature of Europe in the Fifteenth and Sixteenth Centuries,* vol. iii, 1839), George Darley (in his edition, 1840), W. B. Donne *(Essays on the Dranta,* 1858), Swinburne (in the ninth edition of the *Encyclopedia Britannica,* 1875). G. C. Macaulay in *Francis Beaumont* (1883) and A. W. Ward *(A History of English Dramatic Literature,* rev. ed., 3 vol., 1899). They did not much modify the Romantics' case; but there emerge more understanding of tragicomedy as a "mixed kind" and more discrimination between Fletcher's wit and Beaumont's greater dignity and integrity; Swinburne, like most 19th-century critics. judged the plays as dramatic poems rather than stage plays, but confidently distinguished between the pair ("Beaumont was the twin of heavenlier birth") and heaped flowery praise on both: "there hangs about their memory . . . a music of the morning. a breath and savour of bright early manhood."

Later criticism did not respond to this note, although Ward said that they still ranked second only to Shakespeare, and in an article published in 1910 and reprinted in *Contemporaries of Shakespeare* (1919), pp. 143–65, Swinburne moderated his earlier enthusiasm. Work on the canon was begun by F. G. Fleay ("Fletcher, Beaumont and Massinger," *Transactions of the New Shakespere Society,* vol i, 1874). R. Boyle ("Beaumont, Fletcher and Massinger." *Englische Studien,* vol. v and vii–ix, 1882–87) and E. H. C. Oliphant *(The Plays of Beaumont and Fletcher,* 1927). Later commentators have continued their work and are also concerned with the sources, stagecraft, social and intellectual 'milieu and the thesis, first propounded by A. H. Thorndike, that the earlier tragicomedies influenced Shakespeare's last plays, especially *Cymbeline.* All this has made it possible for 20th-century critics to see the dramatists as the chief devisers of English tragicomedy, the play of the "fairy-tale" and the "middle mood" (Ristine and Ellis-Fermor), as "entertainers to the Jacobean gentry" or "Jacobean absolutists" (Wallis and Danby) and as transmitters of the "baroque" taste of their period, whereby their flights, straining and contortions correspond to similar features in Rubens or Bernini (Mincoff). (For the titles of these critical works see *Bibliography.)* This has corrected the Coleridgean stress on poetry and characterization at the expense of stagecraft and the Jacobean milieu, but has not checked the mounting disesteem. Rupert Brooke *(John Webster and the Elizabethan Drama,* 1916) went farther than most in describing Fletcherian tragicomedy as "a sea of saccharine," but many would agree that their plays mark the decline of Stuart drama. They now normally rank below such Stuart contemporaries as Chapman, Middleton, Webster, Cyril Tourneur and even perhaps Ford and Massinger himself. Their sexual licence is now less shocking than their constant devaluing of sex. Dispraise of their psychological improbabilities, sacrifice of characterization to piquant stage thrills and frequently mawkish and superficial verse has strengthened and extended the Romantics' censures. T. S. Eliot wrote in *Selected Essays* ("Jonson," Faber and Faber Ltd., London, 1951) that the "blossoms of Beaumont and Fletcher's imagination draw no sustenance from the soil, but are cut and slightly withered flowers stuck into sand." No one has refuted the view of L. C. Knights *(Drama and Society in the Age of Jonson,* Chatto and Windus Ltd., London, 1937): "In these plays tragedy becomes pathos, and pathos an indulgence . . . Each of the tragedies and tragi-comedies . . . is a series of cunningly contrived situations to exploit, not to explore and express, emotions; and that is decadence."

APPENDIX.—The following lists of the 54 plays attempt only to represent summarily the results of some 20th-century research. They are based mainly on E. K. Chambers, *The Elizabethan Stage,* vol. iii (1923), G. E. Bentley, *The Jacobean and Caroline Stage,* vol. iii (1956), and Cyrus Hoy, "The Shares of Fletcher . . ." in *Studies in Bibliography,* vol. viii, ix and xi–xiv (1956–61). These authorities do not always agree; dates assigned are often highly conjectural. The descriptions of each play are based on those of E. M. Waith, *The Pattern of Tragicomedy in Beaumont and Fletcher* (1952).

I. By Beaumont unaided (1):
1. *The Knight of the Burning Pestle* (1607), parody of the type of popular play based on chivalric romances.

II. By Fletcher unaided (15):
2. *The Faithful shepherdess* (1608–09), pastoral tragicomedy; 3. *The Wonzan's Prize* (?1611), comedy of trickery; 4. *Bonduca* (1609–11 or 1613–14), historical tragedy; 5. *Valentinian* (1610–14), pseudohistorical tragedy; 6. *Monsieur Thomas* (1610–16), tragicomedy; 7. *The Mad Lover* (1616), tragicomedy; 8. *The Chances* (?1617), romantic comedy; 9. *The Loyal Subject* (1618), tragicomedy; 10. *Women Pleased* (?1619), tragicomedy; 11. *The Island Princess* (?1619–21), tragicomedy; 12. *The Humorous Lieutenant* (?1619), tragicomedy; 13. *The Wild-Goose Chase* (1621), comedy of trickery; 14. *The Pilgrim* (1621), romantic comedy; 15. *Rule a Wife and Have a Wife* (1624), comedy of trickery; 16. *A Wife for a Month* (1624), tragicomedy.

III. By Beaumont and Fletcher in collaboration (10 in all):
(a) In which Beaumont is dominant but including in varying small proportions some Fletcher (4)—17. *The Woman Hater* (1606), comedy of trickery; 18. *Philaster* (1608–10), tragicomedy; 19. *The Maid's Tragedy* (1608–11), tragedy; 20. *A King and No King* (1611), tragicomedy. *(b)* In which the shares of Beaumont and Fletcher are approximately equal (3)—21. *The Coxcomb* (1608–10). comedy of trickery; 22. *Cupid's Revenge* (1611), tragedy; 23. *Love's Pilgrimage* (?1616), romantic comedy.
(c) In which Fletcher's share is the larger (3)—24. *The Captain* (1609–12), mixed comedy; 25. *The Scornful Lady* (1613–17), comedy of trickery; 26. *The Noble Gentleman (c.* 1625; perhaps

a revision by Fletcher of an early play by Beaumont, 1605–06), comedy of trickery.

IV. By Beaumont, Fletcher and Massinger (3):
27. *Thierry and Theodoret* (date of composition unknown; printed 1621), historical tragedy; 28. *The Beggar's Bush* (?1622), romantic comedy; 29. *Love's Cure* (?revived 1625), romantic comedy.

V. By Fletcher and Massinger (12; the shares vary a good deal from play to play, the plays being either direct collaborations between the two writers or revisions by Massinger of plays originally by Fletcher alone).
30. *The Little French Lawyer* (1619–23), comedy of trickery; 31. *Sir John van Olden Barnavelt* (1619), historical tragedy; 32. *The Custom of the Country* (1619), tragicomedy; 33. *The False One* (1620), historical tragedy; 34 *The Double Marriage* (1621), pseudohistorical tragedy; 35. *The Spanish Curate* (1622), romantic comedy; 36. *The Sea Voyage* (1622), romantic comedy; 37. *The Prophetess* (1622), historical tragedy; 38. *The Lover's Progress* (1623–34), pseudohistorical tragedy; 39. *The Elder Brother* (1625), comedy of trickery; 40 *A Very Woman* (1625–34), tragicomedy.

VI. By Fletcher with various other collaborators, including plays written by Fletcher and Massinger together with a third and sometimes a fourth collaborator (13):
(a) With Shakespeare (there is no general agreement here, but these assignments probably represent majority opinion)--41. *Henry VIII* (1613), history play; 42. *The Two Noble Kinsmen* (1613), tragicomedy. (b) With Shirley—43. *The Nightwalker* (1633; Shirley's revision of a play by Fletcher, *c.* 1611), tragicomedy. (c) With Field—44. *Four Plays in One* (?1609–12). (d) With Massinger and Field--45. *The Honest Man's Fortune* (1613), tragicomedy; 46. *The Knight of Malta* (1616–18), tragicomedy; 47 *The Queen of Corinth* (1616–17), tragicomedy. (e) With an unknown reviser—48. *Wit Without Money* (1614), comedy of trickery. (f) With Middleton—49 *The Nice Valour* (?1616), mixed comedy (g) With Rowley—50 *The Maid in the Mill* (1623), romantic comedy. (h) With John Ford, Massinger and Webster—51. *The Fair Maid of the Inn* (1626), tragicomedy (i) With Massinger, Jonson and Chapman—52. *Rollo, Duke of Normandy or, The Bloody Brother* (?1617–30), historical tragedy.

VII Plays to which neither Beaumont nor Fletcher contributed (2): (a) By Middleton and Rowley—53 *Wit at Several Weapons* (1609), comedy of trickery. (b) By Ford—54 *The Laws of Candy* (?1619), tragicomedy.

BIBLIOGRAPHY.—The standard modern editions are those edited by A. Dyce, 11 vol. (1843–46), by A. H. Bullen, 4 vol. (1904–12; incomplete) and by A. Glover and A. R. Waller, 10 vol. (1905–12). There are many separate editions of particular plays in the Malone society reprints and other series, including J. D. Jump's fully annotated ed. of *Rollo, Duke of Normandy* (1949). All the books on the history of drama and the standard works on Stuart drama have sections on Beaumont and Fletcher; *see*, for example, F. H. Ristine, *English Tragicomedy* (1910); *U*. M. Ellis-Fermor, *The Jacobean Drama* (1936). A few others are: G. C. Macaulay, *Francis Beaumont* (1883); *A. H.* Thorndike, *The Influence of Beaumont and Fletcher on Shakespeare* (1901); *C*. M. Gayley, *Beaumont the Dramatist* (1914); *A.* C. Sprague, *Beaumont and Fletcher on the Restoration Stage* (1926); J. H. Wilson, *The Influence of Beaumont and Fletcher on Restoration Drama* (1928); *D*. M. McKeithan, *The Debt to Shakespeare in the Beaumont-and-Fletcher Plays* (1938); B. Maxwell, *Studies in Beaumont, Fletcher, and Massinger* (1939); R. C. Bald, *Bibliographical Studies in the Beaumont and Fletcher Folio of 1647* (1938); *L*. B. Wallis, *Fletcher, Beaumont and Company* (1947); M. Mincoff (Minkov), *Baroque Literature in England* (1947); *E*. M. Waith, *The Pattern of Tragicomedy in Beaumont and Fletcher* (1952); *J*. F. Danby, *Poets on Fortune's Hill* (1952); W. W. Appleton, *Beaumont and Fletcher* (1956).
(P. UR.)

BEAUNE, the capital of an *arrondissement* in the *département* of Côte-d'Or, France, lies on the Bouzaise river, in the Burgundian wine country, 37 km. (23 mi.) S.S.W. of Dijon. Pop. (1954) 12,316. The town is circular in shape and parts of its old walls, with 13th-century towers and 16th-century bastions, are still in existence while other parts have been replaced by promenades which separate the old town from the suburbs. Two of the great round towers of the ancient château, dismantled by Henry IV, still stand. The most interesting building is the hospital of St. Esprit, the Hôtel-Dieu (*q.v.*), built in 1443 by Nicolas Rolin. the last chancellor of Burgundy. It is in the Flemish style with high-pitched roofs, covered with coloured tiles, and dormer windows, and in the main courtyard, the Cour d'Honneur, there is an outdoor pulpit and a well with 15th-century ironwork. The hospital is still in use and the patients are looked after by a nursing order; one of the wards is used as a museum to house Rogier Van der Weyden's great altarpiece, "The Last Judgment," painted for Rolin. The chief remaining early church is that of Notre-Dame, begun at the end of the 11th century; it contains a beautiful series of 15th-century tapestries representing the life of the Virgin. In the town are a belfry of 1403, many Gothic and Renaissance houses and numerous vast wine cellars. In the Hôtel des Ducs is a wine museum.

Beaune, which lies on the main railway line from Paris to Marseilles. is the centre of the wine trade of Burgundy and the "Vente des Vins des Hospices" (sale of vintage wines) takes place there each November *(see* WINE: *Regional Classification of Wine: Burgundy)*. Livestock, cereals, vegetables, oil and vinegar are marketed.

There was a prehistoric settlement there, near a copious spring; and under the Roman empire it had a prosperity due to stock-breeding. agriculture and viticulture. It was fortified at the time of the Germanic invasions (3rd and 4th centuries A.D.), became the seat of a count in the time of Charlemagne, and later an inalienable part of the patrimony of the Capetian dukes. In 1227 it became the first seat of the Burgundian parliament, or *jours généraux*, and a ducal residence. On the death of Charles the Bold it sided with his daughter, Mary of Burgundy; but in spite of the efforts of her husband, the emperor Maximilian, it was taken by the forces of Louis X I in 1478. During the Wars of Religion the tom-n expelled the partisans of the League, which had occupied it, and welcomed Henry IV, who confirmed its conimunal privileges. The revocation of the Edict of Nantes in 1685, which resulted in the large-scale emigration of Hugenot artisans, dealt a severe blow to its formerly prosperous cloth and leather industries, and it was its vineyards alone which in the 18th century regained for it some measure of prosperity. It was a centre of monastic life and its communities included Benedictines, Franciscans, Dominicans, Carthusians and Oratorians. (L. PE.; L.-N. L.)

BEAUREGARD, PIERRE GUSTAVE TOUTANT DE (1818–1893), Confederate general, was born near New Orleans, La., on May 28, 1818. After graduation from the U.S. Military academy at West Point, N.Y., in 1838, he was appointed lieutenant of engineers. During the Mexican War (1846–48), he accompanied the expedition against Mexico City commanded by Gen. Winfield Scott. In this campaign, he distinguished himself at Veracruz, Cerro Gordo, Contreras and in the assault upon the western gates of the capital city. Following a seven-year tour of engineering duty (1853–60), Beauregard was appointed superintendent of West Point, a position he held for only a few days. After the secession of his native state in Feb. 1861, Beauregard, resigned from the U.S. army and accepted a commission as brigadier general in the Confederate army. He eventually became one of the eight full generals of the Confederacy and participated in almost every important theatre of the war. Beauregard commanded the forces that bombarded Ft. Sumter, S.C., helped defeat McDowell at first Manassas (Bull Run), assumed tactical command at Shiloh after the death of Albert Sidney Johnston, conducted the defense of Charleston and, toward the end of the war, defended the southern approaches to Richmond. He formally surrendered in April 1865. Though he proved to be a capable combat commander, Beauregard revealed serious deficiencies as a general officer. His penchant for questioning the orders of his superiors smacked of insubordination. Though he frequently displayed sound strategic sense, his specific plans were almost always unworkable because of their detail, complexity and lack of realism. In the immediate postwar era, he considered leaving the United States and accepting a foreign command, but decided to remain in Louisiana. He earned a comfortable fortune as a railroad director, adjutant general of the state and manager of the Louisiana lottery. His last years were marked by bitter verbal quarrels with Joseph E. Johnston, Jefferson Davis and William Preston Johnston over their published accounts of the war and Beauregard's role in it. He died in New Orleans on Feb. 20, 1893. Beauregard was the author of *Principles and Maxims of the Art of War* (1863) and *Report on the Defense of Charleston* (1864). *See* also AMERICAN CIVIL WAR.

(1933); T. Harry Williams, *P. T. G. Beauregard: Napoleon in Gray* (1955), (ed.), *With Beauregard in Mexico: the Mexican War Reminiscences of P. G. T. Beauregard* (1956). (O. A. S.)

BEAUTY BUSH (*Kolkwitzia amabilis*), a hardy deciduous shrub from China that belongs to the honeysuckle family. The twiggy plant, which grows to a height of five to eight feet, is particularly attractive in bloom with its numerous flattish clusters of pink flowers with yellow throats and white bristly hairs that clothe the flower stalks and sepals. It is easily propagated by green wood cuttings.. See also CAPRIFOLIACEAE. (J. M. BL.)

BEAUTY CULTURE: *see* COSMETICS AND COSMETOLOGY.

BEAUVAIS, capital of the Oise *département* of northern France, lies at the foot of rolling hills where the Thérain river is joined by the Avelon, 74 km. (46 mi.) N.N.W. of Paris by road. Pop. (1954) 24,645. Heavily damaged by bombardments in 1940, the town was rebuilt on the original plan. It is dominated by the Gothic cathedral of St. Pierre, which consists only of a transept and choir with apse and seven apse-chapels. It is the loftiest choir ever built, about 157 ft. high under the vault. The north and south portals with their wooden doors, the stained glass windows (13th to 16th centuries), tapestry, an astronomical clock and a cloister are other features of interest. The cathedral was founded in 949 but work was interrupted by several collapses, the transept being built 1500–48. The older little Romanesque church of the Basse Oeuvre occupies the site intended for the nave. Nearby is the Palais de Justice (towers 14th century, the rest rebuilt in the 16th century), formerly the bishop's palace. St. Étienne's church has a Romanesque nave and Gothic choir with interesting stained glass windows. The ancient ramparts are now occupied by boulevards. Manufactures include carpets, blankets, felt, brushes, chemical products and tractors. The tapestry factory was destroyed in World War II. There is market gardening. Formerly there was trade in grain and wine. From Tille airport (2 mi. N.E.) air services leave for London.

Capital of the Bellovaci tribe, Beauvais was conquered by Caesar in 52 B.C. and called first Caesaromagus, and later Civitas de Bellovacis. In the 9th century it became a countship, which passed in 1013 to the bishops, who became peers of France. The English besieged it in 1346 and 1433. During the siege by the Burgundians in 1472 an enemy standard was seized by a girl, Jeanne Hachette (*q.v.*). Marshal Foch directed operations from the town hall in 1918. The crash on Oct. 5, 1930, of the British airship R-101 at Allonne (4 mi. S.E.) resulted in the cancellation of all airship activity by the British government. During World War II Beauvais was occupied by the Germans from June 8, 1940, to Aug. 1944. *See* also Index references under "Beauvais" in the Index volume. (RO. L.)

BEAUVOIR, ROGER DE (real name EUGÈNE AUGUSTE ROGER DE BULLY) (1806–1866), French writer, more important for his personality than for his writings. Born in Paris, Nov. 8, 1806, he was intended for the diplomatic service but became a writer and one of the dandies who protested by their manner of living against the bourgeois ideal of the early days of Louis Philippe's reign. In his youth he was good-looking and elegant, a man about town and a member of the exclusive Jockey club, a well-known wit whose epigrams went the round of the salons. His house had the honour of being described in La Mode; one of its chief features was a Gothic room hung with black velvet. At one time he rented an apartment in the Hôtel Lauzun, the 17th-century palace in the Île Saint Louis, where Baudelaire also lived, and the notorious Club des Haschichins met in his rooms. He was the idol of the young men of his day and was said to resemble a nobleman from a Veronese picture. He had always been passionately fond of the theatre and in 1847 married a beautiful actress from the Comédie Française, Éléonore Léocadie Doze, but they separated after a long and notorious lawsuit, following which his mother-in-law had him imprisoned and fined for a satirical poem, *Mon procès* (1849). The last 20 years of his life were spent in unhappy obscurity. He had spent his money too lavishly, lost his looks, grew stout and bald and, during his last six years, crippled by gout, scarcely stirred from his chair. He died in Paris, Aug. 27, 1866. He wrote in the historical horror style fashionable in the early 1830s, when his works had a great vogue. His *Écolier de Cluny ou le sophisme* (1832) is his best and most characteristic work and is said to have given Dumas the idea for La Tour de *Nesle. Le* Chevalier de *Saint-Georges,* 4 vol. (1840), considered by some his greatest work, enjoyed immense success as a novel and as a play.

See J. Boulanger, *Les Dandys* (1907). (E. ST.)

BEAUX, CECILIA (1863–1942), U.S. painter, whose academic portraits of women and children were especially popular, was born in Philadelphia, Pa., where she became a pupil of William Sartain. However, her real art training was obtained in Paris, with such painters as J. N. Robert-Fleury, Adolphe Bouguereau and P. A. J. Dagnan-Bouveret. In 1890 she exhibited at the Paris exposition. Returning to Philadelphia, she obtained in 1893 the gold medal of the Philadelphia Art club, the Dodge prize at the New York National academy and the Saltus gold medal of the National Academy of Design in 1913. She won the gold medal of the National Institute of Arts and Letters in 1942. Among her portraits are those of Mrs. Theodore Roosevelt and her daughter. Her "Dorothea and Francesca" and "Ernesta and Her Little Brother" are good examples of her skill in painting children. Her autobiography *Background with* Figures was published in 1930. She died Sept. 17, 1942, in Gloucester, Mass.

BEAUX-ARTS, ÉCOLE DES. The École Nationale des Beaux-Arts of Paris was founded in 1671 by Jean Baptiste Colbert, minister of Louis XIV; to this was soon joined an academy of painting and sculpture formed earlier by Cardinal Mazarin. The purpose is to give instruction in drawing, painting, sculpture, architecture and engraving to a fixed number of students selected by competitive examination. The training consists of lectures on diverse subjects and practice in studios under the direction of eminent artists.

Architectural Training. — Beaux-Arts design consists of making a pleasing composition of well-proportioned elements in a well-proportioned whole that will satisfy all practical requirements. Successful graduates are particularly competent, in the aesthetic aspect of building. The purpose of the training is to impart a method of studying any problem in architectural design which may be presented. During the years they remain in the École the students take part in a succession of competitions, culminating in that for the Prix de Rome, considered the highest possible honour.

The method of study depends on the following principles: (1) division into ateliers or groups of students, with competitions between and within the ateliers; (*) a tradition of older pupils helping the younger, who in return do various technical tasks for them; (3) the teaching of design and the judgment of the competitions by practising architects; (4) beginning of the study of design as soon as the student enrolls; (5) the system of the *esquisse.* The *esquisse* is a preliminary sketch showing the main ideas of a student's solution of a problem, or *parti,* done on a small scale in a short and fixed time, without the aid of criticism or documents. He must conform to the main features of this sketch in his *rendu,* or final submission. The purpose is to build mental discipline, the ability to channel thinking in a chosen direction. (*See* ARCHITECTURAL EDUCATION: *France.*)

Influence on the U.S.—Architectural education in the United States was from 1900 to 1935 almost entirely under the tutelage of men trained in the system of the Paris school, including Desirée Despradelle at Massachusetts Institute of Technology (1900), M. Prévôt at Cornell (1901) and Paul Cret at the University of Pennsylvania (1903). Among the first Americans to attend the École were Richard M. Hunt, H. H. Richardson and Charles F. McKim (*qq.v.*). The effect of its influence was an increase in the understanding of classic architectural theory and the evolution of architectural forms. About 1935 this system began to be displaced by an essentially German curriculum stemming from functionalism and machine-inspired theory. *See* ARCHITECTURAL EDUCATION: *The United States;* BAUHAUS.

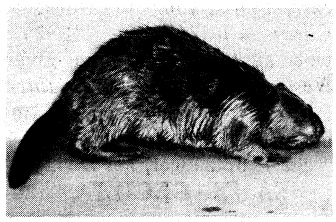
BEAVER, any of the large aquatic rodents of the family Castoridae. The beaver is characterized by a thickset body, which may reach three feet and weigh more than 60 lb., and a broad, flattened, scaly tail, about one foot long, which is used as a rudder in the water. The ears are small and rounded, and the legs short. Although the five-toed forefeet are small, the hind feet are large and webbed with the second hind toe cleft. The coat. a dense, fine underfur overlaid with many coarse guard hairs, varies in colour from a glossy tan to dark brown, the lower parts being paler. The long, yellowish incisor teeth are ever-growing and chisellike..



JOHN H. GERARD

AMERICAN BEAVER (CASTOR CANADENSIS) **AFTER A SWIM**

The new world beaver, *Castor canadensis,* once ranged over all of North America northward from northern Mexico, excluding the arctic coastal plain. Once numerous, it is much reduced in numbers and gone from many former haunts. It differs from the Eurasian species mainly in the form of the nasal bones of the skull.

The old world beaver, *Castor fiber,* formerly occurred in England and all of central and northern Europe and central Asia. Except for Scandinavia, it is now found in Europe only in the Elbe and Rhône drainages. It is extinct in England.

Beavers can dive and swim with ease, having the nose and ears provided with watertight valves. They prefer streams and small rivers but also live around the margins of forest-edged lakes. In streams they build strong dams of sticks, stones and mud that may last for many years, impounding pools sometimes many acres in extent. They are industrious animals, often repairing a damaged dam overnight. Eventually silt fills the pond and produces a meadow; in the western United States these meadows are important additions to livestock grazing lands.

Beavers build dome-shaped island lodges of sticks plastered with mud. The interior may be 6 ft. high. When the mud freezes in winter, the lodge becomes impregnable to predators, but one or more tunnel entrances open below the ice level. In rivers and lakes beavers often burrow into banks.

Food usually consists of tender bark, cambium and buds, mainly of aspens, willows and alders, but a wide variety of plant food is eaten. Saplings, even large trees, are felled by gnawing, cut into portable lengths and dragged or floated through beaver-made canals to the pond. Branches?twigs and small logs are cached for winter food by being anchored in the bottom mud in deep water.

Beavers live in colonies, one or more family groups to a lodge. A family usually consists of a mated pair and two sets of offspring. Breeding takes place in midwinter. Two to eight, usually four, young are born four months later. Of placid disposition, beavers often work co-operatively. When alarmed they immediately seek safety in the water.

Beaver fur is highly prized and some of the early 19th-century explorations of western North America were made by trappers seeking beavers. The hides, trimmed and stretched to a circular shape, were a standard medium of exchange. Both sexes possess musk glands in the lower abdomen that produce a musk-smelling liquid, castoreum, once valued for its alleged medicinal properties, but now used in perfumes *(see* CASTOREUM).

Fossil beavers, some exceeding seven feet in length, are known from the Oligocene epoch; one large beaver, *Trogonotherium,* of the later Pleistocene epoch of Europe was contemporaneous with early man (about 1,000,000 years ago).

BEAVERBROOK, WILLIAM MAXWELL AITKEN, 1ST BARON (1879–), Canadian-born financier and British newspaper proprietor, who at times exercised considerable political influence, won two fortunes and held the rank of British cabinet minister (1918, 1940–42) in World Wars I and II. The son of the Rev. William Aitken, a Presbyterian minister who had emigrated to Canada from Scotland, he was born at Maple, Ont.. on May 25, 1879, and was brought up at Newcastle, N.B. At the age of 12 he sold newspapers to earn pocket money, and at 17 he entered a law office in New Brunswick where he began a lifelong friendship. described in his book *Friends* (1959), with Richard Bedford Bennett (afterward Conservative prime minister of Canada and Viscount Bennett). Aitken's meeting with Bennett began his career as a financier; acting on Bennett's advice, he began to sell bonds and soon abandoned the law. He worked at Halifax, Nova Scotia, at Calgary, Alta., and at Montreal, Que., where in 1907 he set up as a stockbroker. He had arranged the amalgamation of the entire cement industry of Canada and had become a millionaire by 1910, when he moved to England. He remained there, but he retained close ties with Canada, often revisiting that country and from the mid-20th century spent two to three months there each year. He represented (1916) the Canadian government with the Canadian forces in Europe during World War I. He made large gifts to the University of New Brunswick at Fredericton and sewed it first as its chancellor (1947–53), becoming later honorary life chancellor (1954).

As soon as he reached England, Aitken took up politics. He was elected to parliament as Conservative member for Ashton-under-Lyne, Lancashire, in Dec. 1910, and became private secretary to Andrew Bonar Law who in 1911 succeeded A. J. Balfour as leader of the Conservative party. Aitken was influential rather than successful in politics. He helped Bonar Law to secure the party leadership; he worked with him to install Lloyd George as prime minister in place of H. H. Asquith in Dec. 1916; he assisted in the breakup of the Lloyd George coalition in 1922; and he tried. unsuccessfully, to overthrow Stanley Baldwin as Conservative leader in 1930–31. He tried by all possible means, and particularly through the publicity of his newspapers, to force Conservative governments to adopt in full his doctrine of imperial free trade and to disentangle Great Britain from trade arrangements with foreign countries which, in his view, damaged British Commonwealth interests. In this he never was wholly successful.

Beaverbrook never secured a large following in parliament. He was disappointed of office when the Lloyd George government was formed in 1916, and instead went to the house of lords (1917) as Baron Beaverbrook. Later he was to regret this move which he described as "relegation." He had previously received a knighthood (1911) and a baronetcy (Jan. 1916). The rapidity with which honours were showered upon him offended some Conservative traditionalists and reinforced the charge, frequently leveled at him by opponents, that he was a political adventurer. Nevertheless, during his terms of office in World Wars I and II, his energy and drive produced valuable results. Beaverbrook served as chancellor of the duchy of Lancaster and minister of information (1918), was a member of Winston Churchill's war cabinet (1940–42j, minister of aircraft production (1940–41), minister of supply (1941–42) and lord privy seal (1943–45). He was British lend-lease administrator in the U.S. in 1942. Beaverbrook wrote vividly of his political experiences in *Politicians and the Press* (1925), *Politicians and the War* (1928, 2nd ed. 1960) and in *Men and Power: 1917–18* (1956). His advice was also sought by Edward VIII, afterward duke of Windsor, during the constitutional crisis which led to the king's abdication in 1936.

Beaverbrook's third career, that of newspaper proprietor, began in Dec. 1916 when he secured financial control of the *Daily Express;* his active control of that paper dates from the end of 1918. He founded the *Sunday Express* which first appeared on Dec. 29, 1918, and he acquired the *Evening Standard* in 1923. All three papers have been stamped with his idiosyncrasy. His championship of individual enterprise was made plain in his book. *Success* (1921). Holding no regard for position or dignity in themselves, and for those people and institutions he disliked, he proved a formidable opponent. His purposes were furthered by the professional and technical skill of his staff, which secured mass circulation for the *Daily Express* and the *Sunday Express,,* and earned Beaverbrook another fortune.

See T. Driberg, *Beaverbrook* (1956). (J. F. B.)

BEAVER FALLS, a city of Beaver county, Pa., U.S., on a plateau 50 ft. above the Beaver river, 4 mi. from its confluence with the Ohio, and about 30 mi. N.W. of Pittsburgh. (For com-

parative population figures, *see* table in PENNSYLVANIA: *Population.)*

Producing cold-drawn steel products, corrugated boxes, drilling and excavating equipment, seamless tubing, castings, cork products, motor coaches, ceramics and enamelware, the city is the primary industrial and trading centre of the county.

Almost all of the original townsite, laid out in 1806, was sold to the Harmonists (a religious sect founded in Germany in the late 18th century) in 1849, but adjoining land was purchased and the settlement retained its identity. Beaver Falls was incorporated as a city in 1868. Geneva college, established in 1849 at Northwood, O., by the Reformed Presbyterian Church, was moved in 1880 to College Hill, which later became part of Beaver Falls. The college enrolls more than 1,000 students annually.

(J. A. KE.)

BEAVER MUSK: *see* CASTOREUM.

BEBEL, AUGUST (1840–1913), cofounder of the German Social Democratic party and its most influential and popular leader for more than 40 years, was born in Deutz near Cologne on Feb. 22, 1840, the son of a Prussian noncommissioned officer. After the early death of his father he grew up in extreme poverty at Wetzlar, where he learned turnery. In 1858, after the completion of his apprenticeship, as was then customary, he began to travel as a journeyman. This took him through southern Germany and Austria and finally: in the spring of 1860, through Thuringia to Leipzig, where he settled and where his political career began.

From an early age Bebel, who was physically weak, showed a strong interest in learning and education. In southern Germany and Austria he had come into contact with Catholic journeymen's circles and, although a Protestant, had joined one since it offered certain educational facilities to working men. In Leipzig in 1861 he joined the workers' education club, which, like many other such associations at that time, was formed through the initiative of members of the liberal-minded *bourgeoisie.* In 1865 Bebel became chairman of the Leipzig association. Political and economic circumstances, however, gave the workers' education movement an increasingly political orientation, and this process. which had nothing to do with the acceptance of any established ideology, was significantly reflected in the development of Bebel's onn political views. Like the other young workers in the new associations, Bebel had not yet heard anything of the Communist manifesto, Engels or Marx. "For the young generation of workers." he wrote, "the gap between the events of the end of the '40s and the beginning of the '60s, seemed like a century." Only a small minority, whom Bebel strongly opposed, attempted to form a workers' political movement free from the control of the Liberal Progress party. The spokesman of this group was F. Lassalle. and his Allgemeine Deutsche Arbeiterverein (founded in Leipzig in 1863) was in fact an independent organization of the sort that the minority wanted. By its demand for universal suffrage it showed itself to be altogether at variance with the Liberal Progressives.

If in 1863 Bebel believed that the working classes were not ready for the vote, he was already changing his mind when he began his friendship with Wilhelm Liebknecht, who came to Leipzig from Berlin in 1865. Liebknecht, older than Bebel and a man with university training, became in many respects Bebel's mentor. But the more open-minded Bebel always maintained his independence. The Austro-Prussian conflict (1866), which divided German opinion between the advocates of a "Little Germany" and those of a "Great Germany," drove the Saxon workers' associations into an alliance with the radical anti-Prussian democrats, as Bebel and Liebknecht, the workers' leaders, were implacable opponents of Bismarck. The Sachsische Volkspartei (Saxon People's party) was thus brought into being. and in 1867 Bebel entered the constituent *Reichstag* of the North German confederation as a member for this party. This and similar parties in southern Germany were for the workers' associations only a half-way house to the Sozialdemokratische Arbeiter-Partei Deutschlands (Social Democratic Workers' Party of Germany; S.D.A.P.) which constituted itself in 1869 at a congress at Eisenach. The S.D.A.P. affiliated itself to the International Working Men's association (the First International) in London. The "Great German" Eisenach party and the "Little German" Lassalleans differed principally in their attitudes to the Bismarckian solution of the German problem, but under the pressure of common persecution united in 1875.

Already in 1867, as member of the North German *Reichstag,* Bebel had protested against the Bismarckian "greater Prussia." believing that it meant "turning Germany into one great barracks." In his parliamentary speeches he untiringly continued this protest both before and after the founding of the German empire. He and Liebknecht were the only voices to speak against the war loan voted in the *Reichstag* on July 21, 1870, and their action provoked a vehement outcry. As a result of their unyielding stand they were brought to trial on a charge of high treason at Leipzig in March 1872. The sentence of two years' imprisonment may be regarded as an extreme case of ' class justice," since the only real accusation against the two men was their political creed. The period of enforced idleness in prison at Hubertusburg strengthened Bebel's delicate health due to tuberculosis and he finally recovered. Also, he was able at last to give himself a systematic education. He concerned himself not only with Marx, Engels and Lassalle but also with Plato and Aristotle, with Thomas More and Machiavelli, with Eugen Duhring, J. S. Mill and Henry Carey, with Charles Darwin. Ernst Haeckel and Ludwig Biichner. Having taken English and French lessons from Liebknecht, he characteristically tried to put his knowledge to practical use by translating Yves Guyot and Sigismond Lacroix's work on the social doctrines of Christianity—and moreover wrote a critical refutation of it (*Christenturn und Sozialismus,* 1875).

Beginning with an earlier sentence in 1869, Bebel suffered a total of nearly five years' imprisonment within less than 20 years, though he never once faced any graver charge than that of "spreading doctrines dangerous to the state," *"lèse-majesté,"* "libel of Bismarck" or "libel of the *Bundesrat."* These sentences constituted a serious threat to his livelihood—the more so because his activities in the party and in the *Reichstag* anyhow cost him great sacrifices. As the party itself could only afford the most essential expenditure and as a member of the *Reichstag* received no allowances, Bebel continued to rely on his income as a craftsman He had established himself in Leipzig as a master turner and had soon after married the daughter of a railway worker in 1864. Not until the end of the 1880s was he able to live by his writing.

As a writer Bebel had most success with *Die Frau* und *der Sozialismus* (1879), which went through many editions and was translated into many languages. This book was the most powerful piece of Social Democratic propaganda for decades. Above all, by its combination of science and prophecy, it became the plan of German social democracy in the conditions produced by Bismarck's emergency laws (1878–90). The book contained a detailed account of the utopian Socialist society of the future and gave the members of the oppressed party the strength to hold to their convictions. Bebel himself never doubted that this period of repression under the emergency laws was anything more than an episode, declaring to his opponents in the *Reichstag:* "Your lances will be shattered in this struggle like glass on granite." It was chiefly because of him that the crisis in the party. apparent in the early years after 1878, did not develop into a catastrophe His unshakable confidence gave his colleagues the courage to stand firmly together, but he opposed all tendencies within the party toward retaliation by force, since terrorism or attempts at subversion might have endangered the very existence of the party

These tactics were proved right when the emergency laws were allowed to lapse and when in the elections of Feb. 1890 the Social Democrats received nearly 20% of the vote. Bebel's position at the head of the party was now uncontested, and in the *Reichstag* he was the most prominent opponent of the government. Within the party itself he opposed all the "opportunist" tendencies which, since the ending of the anti-Socialist laws, had come out into the open. According to these, features of the existing social and political structure might be developed gradually until social democracy was attained. At the Erfurt congress of 1891 he reproached the leader of the Bavarian Social Democrats, Georg von Vollmar, with belying the "inspiration" of social democracy without which "a party such as ours cannot exist." "If we set our fine aims far

in the iuture and forever emphasize that they will only be realized by later generations, then the masses will quite justifiably desert us alrogether." The struggle against open reformism and the theoretical revisionism advocated by Eduard Bernstein at the end of the 1890s reached its climax at the Dresden congress of 1903. Just as he condemned all deviations from the party's official radical creed, so too was Bebel unwilling to yield to left-wing pressure to indulge in extraparliamentary experiments and thus perhaps to bring repression on the party again. It seemed to him that the correct policy was still to adhere to legal parliamentary methods. In fact. in election after election, the party gained new adherents, and Bebel lived to see the day when, in 1912, it became, with 110 seats. the strongest group in the Reichstag. He died at Passug, Switz., on Aug. 13, 1913.

Bebel, as no other, embodied the tradition of the German Social Democratic party. Already in 1882 Engels had described him as "a unique manifestation of the German, indeed of the European working class." Certainly the man under whom the German Social Democratic party developed from very small beginnings to become the strongest, most disciplined and best organized in the Socialist International was a unique personality. A member of the *Reichstag* from 1867 almost continuously until his death, he achieved his most celebrated triumphs as a parliamentarian. Even his opponents could not withhold their respect in the face of his passionate honesty. A shrewd contemporary, Hellmut von Gerlach, suggested that in politics Bebel lived from hand to mouth: "His political aims were for the most distant future or for the immediate present"; he did not concern himself with what might lie between. This is true. Bebel believed that the great cataclysm was coming and that the existing order would collapse of its own accord. He had, however, no really systematized political theory, but held to a simple belief in the inevitability of progress, so that his "revolutionary Marxism" is seen on closer inspection to be based on a "development" that moved toward its goal with the irresistible force of a law of nature. To sum up, for him and for the leading body of Social Democratic thought which he represented. political activity essentially consisted in promoting as effectively as possible the politico-social interests of the working classes. His contradictory combination of futuristic revolutionary sentiment and a social policy rooted in the present reflects the equivocal position of his party under the conditions of the new German empire. Exactly because he embodied in himself all the contradictions of the party, he was idolized by the workers as a man of their own kind. This explains to a great extent both the strength of Bebel's position within the party and the political passivity of German social democracy, already noticeable before his death and fully revealed when, on the fall of the empire, the party had to face its first great political test.

In 1910 Rebel's memoirs up to the year 1892 were published under the title *Aus meinem* Leben (new ed. 1953; Eng. trans. of 1st ed., *My Life,* 1912).

BEBINGTON, a municipal borough (1937) in the Bebington parliamentary division of Cheshire: Eng., 4 mi. S.S.E. of Birkenhead by road. Pop. (1961) 57.202. On the Wirral peninsula, its frontage on the west bank of the Mersey river forms part of the port of Liverpool. At Storeton are extensive freestone quarries. The Port Sunlight model village in Bebington was founded in 1888 for workers in the soap factory and contains the famous Lady Lever Art gallery. Other industries include margarine, processing of organic chemicals and substances and engineering.

BECCAFICO, a common name (derived from the Italian for "figpecker") for the garden warbler *Sylvia borin* of the old world warbler family Sylviidae, but sometimes applied to other *Sylvia* species. The beccafico. about five and one-half inches long, is buff below and gray-brown above. The bird breeds in Europe and winters in Africa. Though chiefly an insect eater, it fattens in autumn upon berries and fruits, including figs. and is one of the small songbirds prized for eating in the Mediterranean countries of Europe. (A. L. RD.)

BECCAFUMI, DOMENICO (DOMENICO DI PACE, called MECHERINO) (*c.* 1486–1551), Italian painter and sculptor, the leading Sienese Mannerist painter, was the son of a peasant, Giacomo di Pace. He took the name Beccafumi from his father's and his own patron. He was born near Siena and died there in May 1551. A visit to Rome about 1510 brought him into contact with the work of Raphael and Michelangelo and he was profoundly influenced by Sodoma after his return to Siena in 1512. His work showed an original sense of colour and curious, elongated forms. In the later 1520s he became official painter to the Sienese republic and he worked there all his life except for short visits to Pisa and Genoa.

Much of his best work is in the Siena gallery. In addition to painting he designed 35 mosaics for the pavement in the Siena cathedral (1517–46) and two bronze angels for the cathedral (1548). Several of his designs were executed by pupils as chiaroscuro woodcuts. (E. K. WE.)

BECCARIA, CESARE BONESANA, MARCHESE DI (1738–1794), criminologist and economist whose Dei delitti e delle pene was the most influential volume on the reform of criminal justice ever produced, was born of a noble Italian family in Milan on March 1j, 1738. Although he revealed no outstanding talents while attending the Jesuit college at Parma and the University of Padua, he experienced an intellectual awakening after completion of his formal education when he first read the works of Montesquieu. Beccaria quickly became involved in the main currents of 18th-century thought. He contributed regularly to *Il Caffè,* a periodical modeled on the Spectator and dedicated to the causes of enlightenment and reform. He occupied the chair of economics in the Palatine college of Milan from 1768 to 1771 and served in various public offices in Milan from 1771 until his death from apoplexy on Nov. 28, 1794.

His Dei delitti e delle *pene'* (1764; Eng. trans., J. A. Farrer, Crimes and *Punishments,* 1880) is all the more remarkable when it is recalled that the book was published when the author was only 26 years of age and had no extensive background of study or experience in jurisprudential matters. Beccaria's argument is founded on the utilitarian concept of "the greatest good for the greatest number." In a rational and systematic fashion he attacked the savage criminal procedures and penalties of his day. He denounced the use of torture and secret proceedings in the judicial process. He was the first modern writer to subject the death penalty to fundamental criticism. He argued for the proportioning of penalties to offenses and urged that certainty of penalties is more efficacious than severity. He asserted that prevention of crime is of greater importance than its punishment.

The significance of Beccaria's work was immediately recognized: it has been translated into 22 languages. In France, Voltaire published a commentary on the work. In England tribute was paid to it by such reformers as Bentham and Samuel Romilly. The book stimulated many practical programs of reform, among the most important being those instituted by Leopold of Tuscany in 1789. Although many of the proposals advanced by Beccaria have since been widely adopted throughout the world, the book still retains much interest and significance.

Beccaria's most important work in economics is his *Elementi* di *economia* pubblica, published in 1804 after his death. He analyzed the division of labour in economic life, and his discussion of population anticipated some of the ideas of Malthus. He was one of the first to apply mathematics to economic analysis.

BECCLES, a municipal borough and market town of east Suffolk, Eng., 9 mi. W.S.W. of Lowestoft by road or rail. lies on a ridge on the right bank of the river Waveney. which forms the Norfolk boundary. Pop. (1961) 7,330. Beccles ("the meadow by the water") was originally a fishing village. By the 14th century it had become a wool and agricultural town with a fine Perpendicular

church (the detached tower was built in the 15th century). Beccles was incorporated in 1584 and reincorporated in 1835. The grammar school, founded in 1631, was extended in 1953. Printing and bookbinding, engineering, malting and flour milling are the chief industries. Beccles is a yachting centre with an annual regatta. It has a fine open-air swimming pool and there is good fishing.

BÊCHE-DE-MER, a name applied to certain sea cucumbers, sausage-shaped marine animals of the class Echinodermata *(see* ECHINODERMATA: *Holothuroidea)* and especially to the oriental food product prepared from the body wall of these animals. The French term *bêche-de-mer* is derived from the Portuguese *bicho da mar,* meaning "sea worm"; the Malay name, *tĕripang* ("trepang"). is also used.

The animals are collected mostly in the Indo-Pacific reef area. About 24 species, ranging in length from six inches to more than two feet, are used. After the sand-filled intestine has been removed, the animals are parboiled, dried and smoked, then sorted and packed for shipment, mostly to China but also throughout eastern Asia, and from Madagascar to Japan. The prepared product is soaked, cut into pieces and made into a soup, not unlike turtle soup in taste.

In some Asian countries the production and protection of these protein-rich animals is supervised by governmental fisheries. Bêche-de-mer, as a canned soup product, has been marketed in western countries as a gourmet item. (EL. D.)

BECHER, JOHANN JOACHIM (1635–1682), German chemist, physician, scholar and adventurer, is remembered for his theories on combustion which preceded and influenced the theory of phlogiston as enunciated by G. E. Stahl *(see* CHEMISTRY: *The Phlogiston Theory).* He was born at Spires in 1635. After a hard childhood and youth, in which study was difficult because of the necessity of supporting his mother and brothers, Becher began an extraordinary career in which the publication of learned works alternated with enterprises involving colonization and trade. His first book, an edition of Salzthal's *Tractatus de lapide trismegisto,* appeared in 1654, when he was 19, and was followed by a score of works.

Becher's ideas and experiments on the nature of minerals and other substances are set forth in his *Subterranean Physics* (1669). It was his view that substances are composed of three elements, which he called the vitrifiable, the mercurial and the combustible earths. When a substance was burned he supposed that combustible earth was liberated. This concept is the basis on which G. E Stahl founded his doctrine of "phlogiston."

Becher was active in a variety of projects, some practical and some impractical. At Munich he suggested to the elector of Bavaria the establishment of colonies in South America and a monopoly of the cloth trade, until he was forced to flee by the anger of the merchants; in 1666 he was in Vienna under the protection of Count Zinzendorf, and after an interval in Bavaria was again in Vienna where he proposed a Rhine-Danube canal and the opening up of trade with the Low Countries, and later was employed in experiments for transmuting the Danube sand into gold. He fell into disgrace with Zinzendorf, fled to Holland and then to England, where he died in 1682.

BECHTEL, FRIEDRICH (1855–1924), German philologist, who received his greatest distinction in the field of Homeric criticism and in Greek dialectology, was born Feb. 2, 1855, in Durlach near Karlsruhe. After receiving his earlier education in Durlach and at the *Gymnasium* in Karlsruhe he attended the University of Heidelberg, but later transferred to Gottingen. where he studied Sanskrit under T. Benfey and the Baltic languages under A. Bezzenberger. It was under August Fick, however, that he was trained in classical philology. Bechtel received the doctorate at Gottingen in June 1876. After several years in Berlin he was appointed professor *extraordinarius* at Gottingen in 1884 and *ordinarius* at Halle in 1895. Of his numerous publications the most important are: *Die griechischen Personennamen nach ihrer Bildung erklärt* (with Fick, 2nd ed., 1894); *Lexilogus zu Homer* (1914); *Sammlung der griechischen Dialektinschriften* (4 vol. ed. in collaboration with H. Collitz, 1884–1915); *Die griechischen Dialekte* (3 vol., 1921–24). He died in Halle on March 9, 1924.

(J. W. P.)

BECHUANALAND, a territory in southern Africa named after its principal inhabitants, a group of Bantu tribes of Sotho origin, the Bechuana (properly Batswana or, radically, Tswana). It comprises the Bechuanaland protectorate (222,000 sq.mi.) in the north and British Bechuanaland (52,393 sq.mi.) in the south. The latter was annexed to the Cape colony in 1895 and is part of the Cape Province of the Republic of South Africa.

Physical Features. — The protectorate is bounded on the west by South-West Africa, on the north by the Caprivi strip, on the northeast by Southern Rhodesia, on the east and southeast by the Transvaal and on the south by the Cape Province. The southern boundary is the Molopo river and the Ramathlabama *spruit* (a small stream). The protectorate has a mean altitude of about 3,300 ft. The eastern side, along the Transvaal border, is hilly, but the hills soon slope away westward into the Kalahari desert (*q.v.*). The latter is not a desert in the usual sense, having large areas wooded-like parkland, a good crop of grass after the rains, quantities of a kind of melon called *tsama* and water at various depths under the sand, as well as in "pans" after the rains.

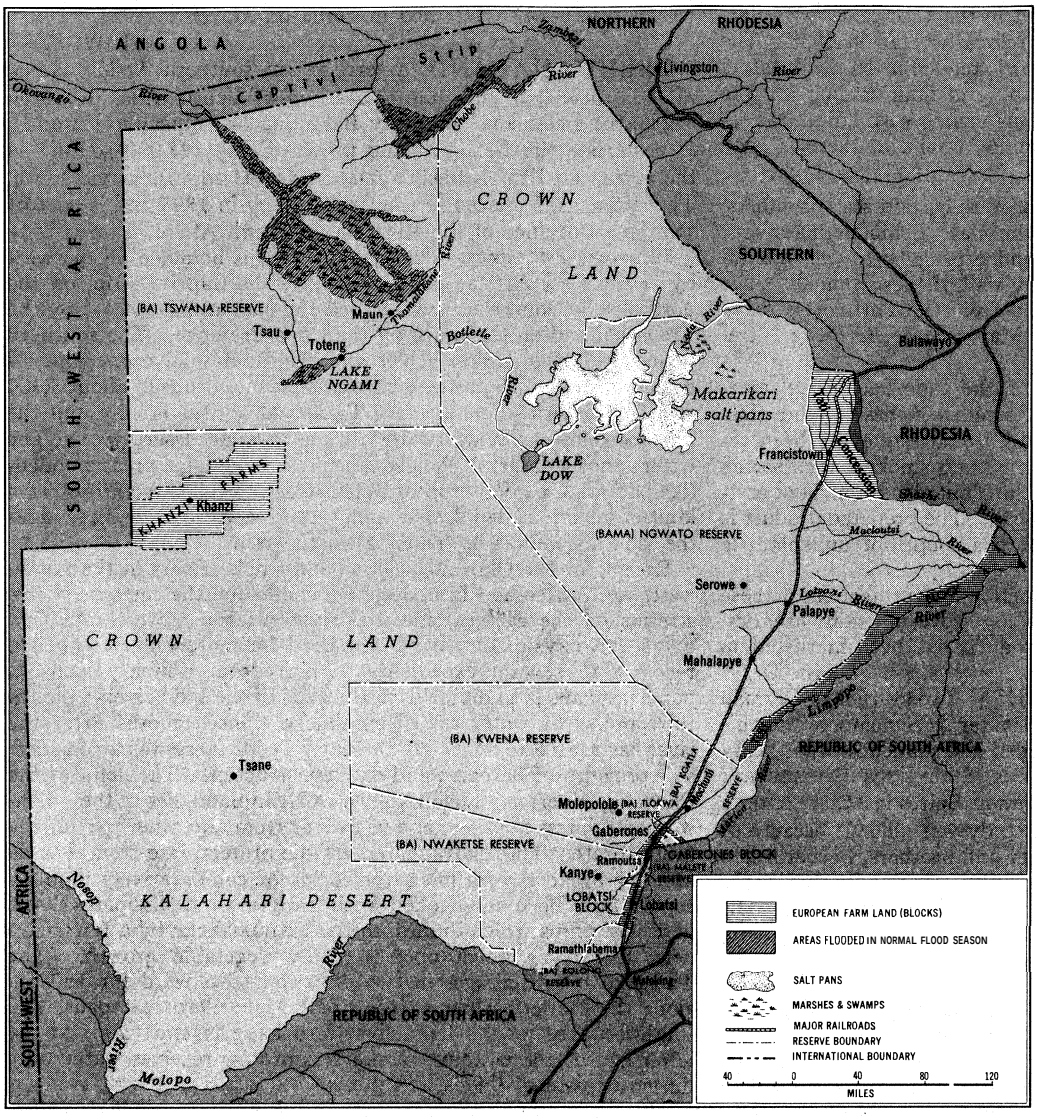
Except for the Okovango (*q.v.*) and Chobe rivers in the northwest, the Marico and Limpopo (Crocodile) on the east and a few streams on the eastern side, the rivers of the protectorate flow only a few days of the year. The need for more water compelled recourse to several expedients. Apart from ordinary wells, a popular means is to dig holes in the beds of the sand rivers; plentiful supplies of water are often thus obtained months after the river has ceased to flow. By the early 1960s there was a considerable program of borehole and dam construction. The delta of the Okovango river, in a region known as Ngamiland, lies in the northwest and differs in aspect and character from any other part of the protectorate. The Okovango enters the protectorate from Angola in a fine broad stream but after 60 mi. of comparatively uninterrupted flow becomes choked with papyrus and dissipates itself in vast swamps which drain into the Thamalakane by a few channels themselves much obstructed by vegetable growth. The Thamalakane discharges in two directions; eastward for 160 mi. along the Botletle river to the great Makarikari salt pans, and southwestward by the Lake river into Lake Ngami (*q.v.*) at the lower end of the swamps. Lake Ngami now receives water only during occasional floods.

The climate of the protectorate is subtropical, varying to temperate. In vinter the days are often pleasantly warm and the nights cold, with occasional frosts. The summer is hot. In August, seasonal winds from the west carry sand and dust across the whole country. The average annual rainfall is 18 in., but this varies from 25 in. in the north to 9 in. or less in the western Kalahari. Most of the rain falls between December and the end of April in heavy, short showers.

True forest, except in a large area on the banks of the Chobe, is rare Much of the territory is covered nith savanna woodland, species of *Acacia* predominating. In the northeast, however. mopane (*Colophospermum mopane*), mogonono *(Terminalza sericea)* and mokusi (*Baikiaea plurijuga*) are usually dominant. as morukuru (*Spirostachys africanus*) often is in the middle Kalahari. The Chobe forest consists chiefly of mokwa or bloodwood (*Pterocarpus angolensis),* mokusi and monato or Rhodesian ash *(Burkea africana).* There is much good grazing in the protectorate. Typical grasses are *Aristida, Eragrostis, Panicum, Urochloa, Digitarza, Schmidtia, Cenchrus* and *Setaria.*

The fauna of Bechuanaland consists of various South African animals. Game reserves and bird sanctuaries contain many species of antelope as well as the hippopotamus, giraffe, buffalo, pelican, ostrich, bustard, etc. Crocodiles are found in some of the rivers. The principal fish are the catfish, tiger fish and *Tilapia,* the last two especially in the Okovango and the Chobe rivers. Puff adders, cobras and other poisonous snakes are numerous, as are scorpions, tarantulas and many kinds of spiders, termites, mosquitoes and other insects. (AY. SY.)

The People.—Bechuanaland is occupied by many peoples of diverse origins and cultures, numbering in all over 300,000. The



BECHUANALAND PROTECTORATE SHOWING THE PATTERN OF SETTLEMENT AND AREAS SUBJECT TO INUNDATION DURING FLOOD SEASON

original inhabitants were Bushmen. The northwestern Bushmen groups, the Naron, Auen, Kung and Heikum, live in Bechuanaland and adjoining parts of South-West Africa, and number about 8,000. They are known as Sarwa (Masarwa) by the Bantu-speaking tribes, who regard them as serfs and inferiors. They perform menial duties and hunting for Bantu, and do not intermarry with them.

The most numerous group is that called Tswana (Batswana or Bechuana) which consists of a cluster of tribes, similar in culture and language, of the western Sotho linguistic grouping of the southern Bantu. The Tswana of Bechuanaland include the tribes known as Rolong, Hurutshe, Kwena (including the Ngwato, Tawana and Ngwaketse), the Rgatla, Tlokwa and Malete. There are other Tswana outside Bechuanaland in South Africa. The first Bantu-speaking tribes to enter Bechuanaland were probably the Kgalagadi, who intermingled with the Bushmen and are usually classed with them. They were followed by the ancestors of the Rolong and the Tlhaping of the Cape Province, and later by the remaining Tswana groups. Tswana tribes were in these regions by A.D. 1600 but were probably not in the modern Bechuanaland before 1700.

During the 19th century there was continual pressure from other Bantu tribes to the east, mainly Nguni-speakers, and many Tswana groups fled into the drier parts of the area, near the Kalahari, forming numerous small splinter groups as they seceded from the originally large clusters. Others followed into Bechuanaland as a consequence of Boer pressure in the Transvaal. Under British administration the main tribes are now independent chiefdoms, each under the rule of a hereditary chief. Most Tswana are at least nominal Christians, missions having worked in Bechuanaland since the early 19th century. Many Tswana find employment outside Bechuanaland, especially in the Transvaal mines.

There are also numbers of European administrators, missionaries and traders living in the protectorate.

For accounts of the culture and social organization of the non-European groups *see* BUSHMAN and TSWANA. (J. F. M. M.)

History.—The Sotho group of peoples, to which the Tswana or Bechuana belong, came into southern Africa at the time of the Bantu migrations *(see* AFRICA: *Ethnography [Anthropology])*. In some cases the Tswana have only recently been occupying their present homes. The chiefs of the principal Tswana tribes claim descent from a legendary man named Masilo, supposed to have lived in the 17th century or earlier. Others trace a genealogy to an ancestor even more remote.

A European expedition headed by J. Trüter and W. Somerville visited the Tlhaping of southern Bechuanaland in 1801. These early visitors were followed by the traveler Martin Heinrich (Henry) Lichtenstein and the naturalist W. J. Burchell. The Rev. John Campbell having in 1813 been invited by the chief of the Tlhaping to "send instructors," the London Missionary society established a mission on the Kuruman (properly Kudumane) river. Under Robert Moffat, who took charge in 1821, Kuruman became one of the foremost Protestant missions of southern Africa. About this time the rise of the Zulu power had set up a chain of destructive movement across the continent. Thousands of refugees, fleeing from Chaka's Zulu armies, roamed the countryside pillaging and plundering and in their furn starting fresh waves of migration. In 1823 the Tlhaping, threatened by one such horde, were saved only by Moffat's enlisting the help of Griqua mounted riflemen. In the same year Sebetwane started from the Vaal river and, after fighting his way through Bechuanaland, founded the powerful but short-lived empire of the Makololo in the Zambezi valley.

About 1826 Mzilikazi (Umsilikazi, Mosilikatze), son of Machobane, one of Chaka's captains, after breaking away from his master, settled with his people, the Ndebele, in what is now the western Transvaal. From there he raided extensively into Bechuanaland. These depredations continued even when the Ndebele, after their defeat by the Boers in 1837, had moved to the north. The great trek of the Boers from the Cape Colony (1835 *et seq.)* brought the *voortrekkers* across the Vaal river to the frontiers of Bechuanaland. The Boers disliked the proximity of powerful, independent chiefs; thought that the penetration of Bechuanaland by the missionaries of the London Missionary society and by British traders and hunters would curb Boer expansion northward; and claimed a western boundary that included the "missionaries' road," the highroad from the Cape to the interior, which ran through

Bechuanaland. They came sharply into conflict with David Livingstone (*q.v.*), who had landed in Africa in 1841 and had settled among the Kwena, a senior Tswana tribe, whose chief, Sechele (Setshele), became a Christian. Livingstone sided with the natives in their resistance to the various demands of the Boers, who further suspected him of supplying Sechele with firearms. In 1852 a raid was made on Sechele's town of Dimawe. During the raid Livingstone's mission at Kolobeng, near Dimawe, was ransacked, though by whom was never conclusively proved. The widely publicized raid on Dimawe was only one incident in a struggle that lasted for many years.

In 1867 gold was discovered near the Tati river, in country claimed both by the Ngwato and by the Ndebele. Pres. Marthinius Pretorius of the Transvaal in 1868 proclaimed the annexation of a huge area including the gold fields, but the British government refused to recognize this. At the same time Macheng (Matsheng), chief of the Ngwato, sought without success to persuade the British to occupy the gold fields. In the south the arbitration award of R. W. Keate, lieutenant governor of Natal, in 1871, purporting to define a boundary between the Rolong and the Transvaal, did nothing to abate Boer encroachment. Disorders among the tribes in 1878, quickly suppressed, led to the occupation of southern Bechuanaland by a small police force. On the withdrawal of this force in 1881 the country relapsed into anarchy.

The Pretoria convention of 1881 defined the boundaries of the Transvaal on all sides for the first time but still did not curb Boer encroachment. Quarrelsome chiefs relied on European supporters (not all of them Boers), to whom they promised land and cattle. These so-called "volunteers" then set up the two little republics of Stellaland and Goshen, threatening the "missionaries' road." In 1883 Pres. S. J. P. Kruger of the Transvaal led a deputation to London to seek a revision of the Pretoria convention. The London convention of 1884 conceded to the Boers, among other things, small alterations in the western frontier; but Kruger failed to get the "missionaries' road," though he tried hard to do so. About this time. moreover, German colonization in South-West Africa was causing concern to the British; humanitarians, inspired by John Mackenzie, a successor of Moffat at Kuruman and a vehement campaigner for native rights, were opposing the extension of Boer authority and advocating that the country should be taken under British protection; and Cecil Rhodes (*q.v.*) threw all his weight into a campaign for the annexation of Bechuanaland to the Cape Colony. The British government then decided to establish a protectorate over the territory that later became British Bechuanaland and sent John Mackenzie as the first deputy commissioner. Mackenzie, without men or money, was unable to make much headway against the prevailing anarchy. He was soon superseded by Cecil Rhodes, who did no better. Freebooters from Goshen attacked Mafeking, Kruger annexed the country of the Rolong, the republican flag was hoisted at Mafeking, and the freebooters proceeded to carve up the adjacent native lands. The British government, prompted by these aggressions, sent a strong force under Sir Charles Warren to set matters in order (which he did without firing a shot) and then extended the protectorate northward to the 22nd parallel of south latitude and westward to the 20th degree of east longitude (March 1885). The territory south of the Molopo river was constituted as the crown colony of British Bechuanaland (Sept. 1885; annexed to the Cape Colony, 1895). In 1892 another proclamation considerably enlarged the protectorate by adding thereto the territory between the Shashi and Motloutsi rivers; the Tati district; those territories north of latitude 22° claimed by Khama (Kgama), chief of the Ngwato since 1875; and some vast ill-defined areas lying north and west of Khama's country.

In the early 1890s the protectorate, as Rhodes had intended, became the springboard for the British South Africa company's colonization of Southern Rhodesia. But in 1895 a plan to hand the administration of the protectorate over to the company was frustrated by the action of the three chiefs Khama, Sebele and Bathoen, who, supported by the missionaries, traveled to London and wrung from Joseph Chamberlain an assurance that their people would remain under the protection of the crown. In return they had to surrender strips on the east of their countries for the construction of a railway. The Jameson raid at the end of 1895 completed the ruin of any plans for the company's administration of the protectorate.

In World War I the Tswana supplied a company of the South African native labour contingent. In World War II no fewer than 10,000 Tswana served in the African Pioneer corps in the middle east and in Italy. In June 1946, 1,000 men were recruited to serve for two years in the middle east in the newly formed High Commission Territories corps.

South Africa often expressed the wish that the administration of Bechuanaland (with Basutoland and Swaziland) should be handed to it. The British government's position was made public on June 20, 1935: no transfer was to take place until the inhabitants had been consulted and until parliament had expressed its opinion.

In 1948 Seretse, son of Khama's son Sekgoma II and heir to the Ngwato chiefship, married an Englishwoman, Ruth Williams. For reasons set forth in a White Paper the British government refused to recognize him as chief and excluded him from Bechuanaland. This provoked resentment in the tribe, which culminated in disturbances and bloodshed. Most Ngwato asserted their continued adherence to Seretse and refused to accept or to nominate anyone else as chief. Toward the end of 1956 Seretse was permitted to return to the country, not as chief of the Ngwato, but free to take part in the political life of the tribe.

Population and Settlement. — The African population was 292,755 at the 1946 census; there were 3,173 Europeans, 676 coloureds (of mixed ancestry) and 248 Asians according to the 1956 census. The strips ceded by the chiefs in 1895, now known as the Lobatsi, Gaberones and Tuli blocks, were in 1904 vested in the high commissioner as crown land and, with the exception of certain portions reserved for government purposes, were in 1905 granted to the British South Africa company, which disposed of the land to European settlers. A fourth area of European settlement is the Tati district, around Francistown in the northeast, where the land and mineral rights are owned by the Tati company. The European areas cover about 7,500 sq.mi. Most of the African population lives in the tribal reserves, which occupy about 102,000 sq.mi. and contain towns which are fairly large by African standards. Serowe (*q.v.*), capital of the Ngwato, had a population of at least 30,000 in 1960, and Kanye, capital of the Gwaketse, approaches it in size. There are also sizeable secondary towns in the larger territories. All the land in the protectorate which is not owned by Europeans and is not tribal territory is crown land, comprising an area of about 166,000 sq.mi. A few European farmers of Afrikaner stock farm a block of crown land round Khanzi on the border of South-West Africa.

Administration and Social Conditions. — The protectorate is under the general direction of the high commissioner for Basutoland, the Bechuanaland protectorate and Swaziland, who in turn is responsible to the British government. The protectorate government consists of a resident commissioner and a legislative council with an elected unofficial majority, comprising equal numbers of Europeans and Africans. For administrative purposes the territory is divided into 12 districts, each in charge of a district commissioner.

There are in addition professional and technical officers organized in departments (medical, veterinary, public works, agriculture, education, etc.). The headquarters of the administration were at Mafeking in the Cape Province of the Republic of South Africa, but it was decided to move them to Gaberones inside the protectorate. African affairs are administered through the traditional tribal authorities, who are advised by administrative officers.

Taxation. — The rate of African tax was increased from £1 8s. to £2 with effect from Jan. 1, 1958. At the same time it was agreed that tribal treasuries (established in 1938) should receive a rebate of 50% of the tax collected instead of the existing 35%. In addition, after 1949 a tax was levied on Africans which varied according to the property or earnings of the taxpayer. Non-Africans pay a poll tax for every male of 21 years and over, and also income tax.

Living Conditions.—There is little opportunity for wage earning within the protectorate and most of the people live the life of peasant farmers. Housing is generally of the traditional African type though European type housing may sometimes be seen.

There are 9 government hospitals and health centres and more than 30 dispensaries. In addition several hospitals and dispensaries are maintained by missions. Clinics are conducted at outlying villages by both government and mission doctors.

Most social problems are solved according to long established tribal custom of communal responsibility, but destitution is relieved when necessary by public funds.

Justice.—The system of law is South African law, amplified by the Cape statutes promulgated up to June 10, 1891, and by Bechuanaland orders in council, proclamations and high commissioner and government notices subsequently enacted. The courts of justice are the high court (with a judge as president), three classes of subordinate courts (within the jurisdiction of administrative officers) and African courts under the chiefs and their councilors, an appeal lying to the district commissioners.

Education.—There are about 170 primary schools for Africans, 5 secondary schools, a homecraft centre and a teacher training college. Awards or grants are given to enable students to follow post-secondary courses in the protectorate and in South Africa. There are 9 primary schools for Europeans and 5 for Eurafricans.

The Economy.—The economy of the Tswana is based mainly on agriculture and cattle raising, with emphasis on the latter. Because of the lack of industries within the protectorate about 20,000 men a year, recruited by licensed agencies, engage in wage labour in South Africa.

With the scanty rainfall and poor methods, agriculture among the Africans (maize or corn, sorghum, millet, cowpeas, peanuts and tobacco) rarely rises much above the subsistence level. There is an agricultural experimental station at Mahalapye, and extension work is carried out in the reserves. There is also an irrigation scheme at Mogobane. The Tswana are essentially pastoralists. There are more than 1,300,000 cattle in the country, and many sheep and goats. Foot-and-mouth disease is a great danger to livestock and stringent precautions are taken against it.

Trade and Finance.—The principal commercial activity is the export of livestock and livestock products to South Africa, the Rhodesias and the Congo region. The main channel is the abattoir and cold storage at Lobatsi belonging to the Colonial Development corporation. About 62,000 cattle are slaughtered annually for export. There is also a substantial trade in by-products, such as hides, horns and bones.

The chief imports are textiles, general merchandise, vehicles and foodstuffs. The main sources of ordinary revenue, excluding contributions from C.K. Colonial Development and Welfare and grant-in-aid funds, are taxes and duties, postal and telegraph services, and revenues from government property. The protectorate uses the currency of South Africa. The Standard Bank of South Africa Ltd. and Barclays Bank (Dominion, Colonial and Overseas) each have branches at Francistown and Lobatsi and operate agencies from there.

Mining.—There is an old-established gold mining industry in the Tati district. Kyanite, asbestos and manganese are also exported, while occurrences of copper and nickel, and extensive coalfields are known. An important function of the geological survey, financed from Colonial Development and Welfare funds, is the development of the protectorate's underground water resources.

Communications.—With few exceptions the roads of the protectorate are of earth or sand. A good earth road runs through the protectorate beside the railway from south to north, and serviceable roads connect the main road with Kanye (28 mi.), Ramoutsa (3 mi.), Molepolole (36 mi.), Mochudi (3 mi.) and Serowe (42 mi.). The Francistown-Maun road (315 mi.) has been much improved, as also has the Lobatsi-Khanzi road (406 mi.) across the most forbidding part of the Kalahari.

The railway from Cape Town to the Rhodesias runs through the protectorate for 394 mi. on the eastern side. The line (single-track; gauge 3 ft. 6 in.) enters at Ramathlabama on the southern boundary and leaves at Ramaquabane in the Tati district. Formerly owned and operated by the Rhodesia Railways Ltd., the railway was transferred to a statutory body established under the laws of Southern Rhodesia and operating under the laws of Southern Rhodesia, Northern Rhodesia and the Bechuanaland protectorate.

The protectorate has no air service of its own, but there is a chartered air service between Francistown and Khanzi via Maun. There are several airports and landing strips.

A government-owned radio service, controlled by the police, is also available to the public for the transmission of telegrams when there is no other form of telegraphic communication available. At Maun the South African government controls a large radio station providing assistance to civil aviation. (AY. SY.)

BECK, JAKOB SIGISMUND (1761–1840), German philosopher, who was a strong critic of Kantian philosophy and wrote many books on the subject, was born at Marienburg in Prussia on Aug. 6, 1761. Educated at Konigsberg, he was appointed professor of philosophy at Halle in 1791 and at Rostock in 1799. He died at Rostock on Aug. 29, 1840.

Beck's major work was a compendium of Kantian philosophy, *Erläuternder Auszug* aus den *kritischen Schriften* des Herrn Prof. Kant, three volumes (1793–96), of which the third part was entitled *Einzig* moglicher Standpunkt, *aus* welchem die kritische Philosophie *beurteilt* werden muss. His contention was that Kant contradicted himself in holding that things in themselves furnish the material of our apprehensions while existing outside the category of causality; this contradiction he explained by saying that Kant's statements about their affective power were to be taken as concessions to popular prejudice. The proper interpretation of Kant's theory, he held, was subjectivist: as knowledge of objects outside the domain of consciousness is impossible, nothing positive is left if we remove the subjective element. God is a symbolic representation of human conscience. Beck also wrote *Grundriss* der *kritischen Philosophie* (1796), showing the influence of Salomon Maimon; and *Commentar über* Kants Metaphysik der *Sitten* (1798). Kant disavowed him, and his exegesis came to be neglected as greater attention was paid to Fichte.

BECK, JOZEF (1894–1944), Polish army officer and statesman, was born in Warsaw on Oct. 4, 1894, the son of a lawyer. As a member of the secret military organization headed by Jozef Pilsudski, he fought tsarist Russia as an artillery officer of the Polish legion. After the arrest of Pilsudski by the Germans (July 1917) and the disbanding of the Polish legion, Beck went underground as an officer of the Polish Military organization. On the restoration of Poland, Pilsudski, now head of state, made Beck his liaison officer. From 1922 to 1923 Beck served as military attaché in Paris. After Pilsudski's return to power in 1926, Beck, now a colonel, was the marshal's *chef* de cabinet. On Dec. 6, 1930. he was appointed undersecretary of state in the ministry of foreign affairs and on Nov. 2, 1932, became foreign minister. He followed a policy designed to serve his country's interests mainly by the alliances with France and Rumania and by nonaggression treaties with the U.S.S.R. and Germany. In April 1939 he concluded a Polish-British alliance. After the German-Soviet partition of Poland Beck was interned in Rumania, and was kept under Gestapo guard at Stanesti. He died there of pneumonia on June 6, 1944.

BECKE, FRIEDRICH (1855–1931), Austrian mineralogist and petrologist, whose main contributions were in two fields—in the development of optical methods of research and in the study of a difficult group of metamorphic rocks, the crystalline schists. He was born in Prague, on Dec. 31, 1855, and studied in Vienna: where under the influence of Gustav Tschermak, he took up mineralogy and allied sciences as his life work. He was called to the chair of mineralogy at the University of Vienna in 1898, was appointed rector of the university in 1921. and retired in 1927.

In 1903 he presented to the International Geological congress assembled in Vienna a classic paper on the mineral composition and texture of the crystalline schists, which was published in amplified form in 1913. It contained the first comprehensive theory of metamorphic rocks and proved to be singularly fruitful for further advances in this field. A subsequent contribution on retrogressive metamorphism marked another advance and led to a deeper understanding of many ancient mountain belts.

In 1907 Becke became editor of Tschermak's *Mineralogischen und Petrographischen Mitteilungen.* In 1929 he was awarded the Wollaston medal of the Geological society of London. He died June 18, 1931. (A. Kf.)

BECKENHAM, a municipal borough and (with the urban district of Penge) a parliamentary constituency. Kent, Eng.. about 10 mi. S.S.E. of central London. Mainly residential, it extends from the site of the former Crystal palace almost to the south end of Bromley and includes West Wickham. Pop. (1961) 77,265. From 1894 to 1935, when it was incorporated, the town was governed by an urban district council. The church of St. George was built in 1866 on the site of an ancient Perpendicular church. Among other buildings and institutions are the town hall (1932) and the Ada Lewis homes for retired governesses (1925). Langley court is the headquarters of the Wellcome physiological research laboratories. The parish church of West Wickham, originally built in the 15th century, was rebuilt in 1884. Wickham court, built in 1480, also retains some of its original structure. Bethlem hospital (the historic Bedlam; *q.v.*) was moved from Lambeth to Shirley on the border of Beckenham and Croydon in 1930.

BECKER, CARL LOTUS (1873–1945), U.S. historian, was born Sept. 7, 1873, on a farm near Waterloo, Ia. In 1896 he transferred to the University of Wisconsin from Cornell college, Mt. Vernon. Ia., and came under the influence of Frederick Jackson Turner (*q.v.*). Becker received fellowships at Columbia and Wisconsin and took his doctorate at Wisconsin in 1907. He taught at Penn State, Dartmouth, Kansas and Minnesota, and in 1917 settled at Cornell university, Ithaca, N.Y., where he remained for the rest of his life. Ithaca was the ideal environment for Becker. He had time to polish the essays that made him known as a thinker and stylist, and time also to devote to a brilliant group of graduate students. His *Declaration of Independence* (1922) and *Benjamin Franklin* (1946), and his *Heavenly City of the Eighteenth Century Philosophers* (1932) were definite contributions to American and French history, as were also other texts in colonial and modern European history. Becker's presidential address, "Every Man His Own Historian!" before the American Historical association in 1931 was a vigorous statement of relativity in the search for historical truth. Despite ill-health, he finished *The Founding of Cornell University,* a congenial subject, before his death at Ithaca on April 10, 1945.

See Charlotte Smith, *Carl* ***Becker:*** *on History and the Climate* of *Opinion (1956).* (G. S. Fo.)

BECKER, GEORGE FERDINAND (1847–1919), U.S. geologist in charge of the U.S. geological survey for 40 years, was born in New York city on Jan. 5, 1847. He was educated at Harvard university, the University of Heidelberg and the Royal School of Mines, Berlin. Becker taught at the University of California, where he met Clarence King who, in 1879, organized the geological survey to which Becker was one of the first called. His best-known report was the comprehensive *Geology of the Comstock Lode and Washoe District* (1882); his most important theoretical contribution was the *Finite Homogeneous Strain, Flow and Rupture of Rocks* (1893). Becker's chief interest was the study of the interior of the earth. . He foresaw that such studies could not be prosecuted successfully without a great body of physical data on the rocks and minerals which compose the earth and established a geophysical laboratory in the geological survey with Carl Barus and William Hallock as physicists.

Becker studied the gold and diamond mines of South Africa in 1896 and was detailed as geologist to the United States army in the Philippines during 1898 and 1899. He died in Washington, D.C., on April 20, 1919. (G. T. Fr.)

BECKER, WILHELM ADOLF (1796–1846), German classical archaeologist, was born in Dresden and was educated at Schulpforta and Leipzig. From 1842 he was professor of classical archaeology at Leipzig. His early studies in the comedies of Plautus had aroused his interest in Roman daily life, and led to his publication of *Gallus* (1838), the story, in 12 scenes, of a Roman youth from Suetonius' *Life of Augustus,* which he embellished to include all aspects of Roman life and customs. The book became a classic in its field, the English translation passing through ten editions between 1844 and 1891. A similar work on the Greek side. *Charikles,* followed in 1840 (8th Eng. ed. rev., 1895). He is also known for his great *Handbuclz der romischen Altertümer* ("Handbook of Roman Antiquities," 5 vol., 1843–68), completed after his death by J. Marquardt and T. Mommsen, and works on Roman topography. He died in Meissen on Sept. 30, 1846.

A list of his works is given by Urlichs in *Allgemeine deutsche Biographie.* (M. I. W.)

BECKER-MODERSOHN, PAULA: *see* Modersohn-Becker, Paula.

BECKET, FREDERICK MARK (1875–1942), U.S. inventor and pioneer metallurgist, was born in Montreal, Que., on Jan. 11, 1875. He was graduated from McGill university in 1895 and sought work in the United States in the field of electrical engineering. The next eight years, however, he spent alternating industrial jobs with courses at Columbia university to acquire further knowledge of electrochemistry and metallurgy. In 1903 he helped organize the Niagara Research laboratories, which were acquired in 1906 by the Union Carbide corporation with Becket as chief metallurgist. He became vice-president of the corporation's metallurgical companies and head of its metallurgical research, and served as consultant until his death in 1942. He proposed and developed the process of using silicon. instead of carbon, as a reducing agent in electric furnace metal production—a process that made low-carbon ferroalloys and certain steels practical. He pioneered in the production of electric furnace ferrovanadium, ferromanganese, ferromolybdenum, ferrotungsten and low-carbon ferrochromium—the essential ingredient of stainless steel (q *v.).* During World War I he made possible tonnage production of previously unavailable ferrozirconium and speeded silicon production for shell steel and aviation use. More than 100 patents, covering a wide range of electric furnace and chemical products, were issued in his name. He died in New York city on Dec. 1, 1942. (A. B. Ki.)

BECKET, THOMAS (À) (1118–1170), by his contemporaries more commonly called Thomas of London, English royal chancellor, archbishop of Canterbury and martyr, was born in London on Dec. 21, 1118. His mother was a native of Caen; his father, Gilbert, belonged to a modest Norman family from the neighbourhood of Rouen, but before Thomas was born he migrated to London, where he prospered in trade, acquired property and was at one time sheriff. Thomas was well educated, first at Merton priory. later at London and Paris, but he never achieved academic distinction. At the age of 21 he was more interested in courtly pursuits (notably hunting) learned from one of his father's friends. After two or three years as clerk to a relative, Osbert Huit-Deniers, about that time justiciar of London, Thomas mas brought by clerical friends of his father to the notice of Theobald, archbishop of Canterbury, whose household he joined (*c.* 1142). Among the brilliant young men in Theobald's service he was not at first at ease, though he made some friends; of those by whom he was teased and made to feel inferior Roger of Pont l'Evêque, later archbishop of York and an opponent, is especially mentioned by 'Thomas' biographers. Thomas was with Theobald when the latter slipped out of the country, defying royal prohibition, to attend

the Council of Reims (1148) and he had a hand in some important negotiations, such as those to prevent the coronation of king Stephen's son, Eustace, in 1152. But his known acts as Theobald's clerk reveal little, if anything, of the man, though the year or more (probably before 1148) that he was allowed—or encouraged—to spend at Bologna and Auxerre on the study of civil and canon law may be thought to have been important for the future. He accumulated the benefices that his position entitled him to expect and became archdeacon of Canterbury, after ordination as deacon in 1154. About the end of that year, on Archbishop Theobald's recommendation, he became Henry II's chancellor.

Chancellor.— In this office Thomas was expected by Theobald and the clerics of his circle to be their friend at court. They were on occasion disappointed. He was reproached in particular for the unusually large financial demands made in 1159 by Henry II on the greater churches of the realm. Two years earlier, in a famous legal case, he energetically supported Battle abbey's claim, in virtue of a royal charier, to exemption from episcopal jurisdiction, though Archbishop Theobald was sympathetic to the bishop's cause (which also had papal support). This was one of his acts as chancellor which as archbishop he felt impelled to try to explain. Yet Thomas' former patron and colleagues continued to expect his co-operation, as in 1160–61, when Theobald was promoting the candidature of Bartholomew, archdeacon of Exeter, to the vacant see of Exeter; Bartholomew was, in the event, elected, though the king had earlier been thought to favour another candidate. Thomas' archidiaconal duties, understandably, do not seem to have received much of his attention after his appointment as chancellor; he resisted the abolition by Theobald of "second aids," an irregular archidiaconal perquisite. In secular matters the chancellor impressed contemporaries by his energy, pomp, administrative ability and diplomatic finesse. An intimate friendship grew between him and the king, about 15 years his junior, who found in him both comrade and counselor. Thomas had a prominent part in Anglo-French diplomacy and war in 1158–60. conducting preliminary negotiations for the betrothal in 1158 of the king's eldest surviving son, Henry, to Marguerite, daughter of Louis VII; organizing the Toulouse campaign of 1159, in the course of which he took the field and is said to have unhorsed a French knight in single combat; and negotiating the ensuing peace.

Archbishop.— Henry's influence secured Thomas' election in 1162 to the see of Canterbury, vacated by the death of Theobald, who may have intended Thomas to succeed him. Thomas was not eager to accept. He was convinced that what he conceived to be his duty as archbishop would inevitably conflict with the king's will. Acceptance would also entail a change in his mode of living that was hard to make Henry, for his part, confidently expected that Thomas' elevation to Canterbury would not affect their co-operation, except to make it more effective. He was soon undeceived He expected Thomas to retain the chancellorship; the archbishop insisted on resigning according to custom Their relations deteriorated rapidly during 1163. At the Council of Woodstock (July 1163) Thomas successfully opposed a proposal to divert to the exchequer a customary payment that was one of the perquisites of the office of sheriff. Nevertheless, the fact that the heir-apparent was left in Thomas' charge suggests that a *modus vivendi* was possible until the great dispute over the customs of the realm began at the Council of Westminster (Oct. 1163). The immediate issue was Henry's claim that clerks convicted of felony in ecclesiastical courts should be punished by the lay power. The archbishop may have contributed something touard making this an issue by tactless handling of a recent case. At Westminster he persuaded his episcopal colleagues to reject the king's claim and to qualify their assent to the ensuing demand that they should observe the customs of the realm. Later some of the bishops wavered (their support may never have been very firm) and Pope Alexander III, confronted by an antipope and conscious of a debt to Henry II for support, urged moderation. In this situation Thomas in Dec. 1163 declared his readiness, after all, to observe the customs of the realm without reservation What that would mean became plain when the Constitutions of Clarendon (*q v*) appeared in the following month. In the main clauses of these constitutions the king sought in terms of custom to define the boundaries between lay and ecclesiastical jurisdictions, to regulate the exercise of excommunication, to control appeals to Rome and to conserve royal rights in episcopal and monastic elections. Most of the constitutions certainly, the others probably, represented (or at least were consonant with) the practice of Henry I's time, as his grandson claimed. To ecclesiastical objectors, including Thomas, this was immaterial; their complaint was that some of the constitutions were in conflict with their reading of canon law. At Clarendon, however. Thomas reluctantly assented to the constitutions, and his colleagues followed him. Henry immediately requested and seemingly expected papal approval of the constitutions; this Alexander III refused. Thomas disregarded his assent given at Clarendon and could plead a papal mandate to do so. The king retaliated in Oct. 1164 by taking measures which evidently had no other object than the ruin of the archbishop. From this intolerable situation Thomas escaped to France in Nov. 1164.

Thomas spent his first two years of exile in the Cistercian abbey of Pontigny and the last four in the Benedictine abbey of Ste. Colombe at Sens, adapting his mode of life to those of his hosts and outdoing them in austerity. He occupied much of his ample leisure in improving his knowledge of the canon law and in corresponding busily with friends and enemies. Negotiations for a settlement continued energetically but were vitiated by the obstinacy of the antagonists. Thomas believed that a papal threat of excommunication and interdict would be immediately effective; Alexander III was reluctant to commit himself to such drastic action. Thomas received from the pope in 1166 wide powers to use ecclesiastical censures and excommunicated a number of prominent English subjects of Henry II, including Richard de Lucy, the justiciar. In 1169 he excommunicated the bishops of London and Salisbury, the former a bitter enemy, the latter hitherto a friend. On both occasions Alexander III intervened to annul the effect of the sentences Henry II gave further offense in 1170 by causing the archbishop of York to crown the heir-apparent: this was a deliberate infringement of the archbishop of Canterbury's undoubted right to perform the ceremony and it ignored a last-minute papal prohibition. The threat of an interdict immediately produced a reconciliation between king and primate. The matters in dispute were not mentioned, and the unreality of the reconciliation at once became apparent. Thomas suspended, with papal authority, the bishops who had participated in the young king's coronation. These sentences preceded Thomas to England; news of them recrossed the channel to Henry II and provoked him to the rash words that inspired four knights of his household to set out for Canterbury. On Christmas day, 1170, Thomas publicly excommunicated his enemies; four days later, the knights murdered him in his cathedral church.

The murder was a great shock to western Christendom. A cult of the martyr was born at once and quickly spread as far afield as the Holy Land and Iceland (where it had great popularity). Henry II contributed to its dissemination, and his daughters were prominent in introducing it to the lands in which they settled after their marriage. About ten biographies appeared within the decade, and others followed. Miracles wrought by the martyr were officially recorded at Canterbury: within a few years the monks of the cathedral priory were able to present Henry II with a circumstantial record of several hundreds of them. Thomas was canonized in 1173. His shrine at Canterbury long remained a fashionable and popular resort for pilgrims, including the imaginary narrators of Chaucer's *Canterbury Tales.*

Thomas' canonization was a tribute to his posthumous reputation, to the causes he championed and to the circumstances of his death. His personality remains in important respects elusive. His conduct as archbishop is the problem; there are no surprises in his earlier career. His biographers report a stark contrast between his demeanour as archbishop and his earlier behaviour. They may have overdrawn the contrast, influenced by their knowledge of the sequel, but in any case they can scarcely be said to explain it. His ardent defense of the rights of his see is not unexpected; in his defense of the church at large, however, his

attitude is distinguished from that of his few sympathetic colleagues by his refusal to compromise, once he had taken an unequivocal stand in 1164. The stand he took a year earlier on Henry II's propori! for the treatment of felonous clerks was in itself somewhat idiosyncratic in its intransigence. The broad problem that faced him was certainly difficult: to reconcile Henry II's conservative reassertion of the customs of the realm with a developing canon law that was rendering them archaic. A definitive solution was out of the question, but a temporizing agreement might have been possible without injury to conscience. Thomas showed no readiness to negotiate on specific issues; in exile he occupied himself more and more with the general principles governing the relationship of secular to ecclesiastical authority and in this theoretical formulation of the issue he was diverging from his episcopal colleagues. His free use of ecclesiastical censures in 1166, 1169 and 1170 was a stumbling block to agreement. But his intransigence was matched by Henry II's vindictiveness toward the end of 1164 and by his subsequent persistence in trying to vindicate his claims—and the very manner of their formulation at Clarendon had created special difficulties for ecclesiastics. It is difficult to imagine what settlement could have been reached while the archbishop lived. Thomas himself, in his last year of life, came to believe that only by his death could the deadlock be resolved. He did not court death, but he faced it calmly. His removal made possible a compromise which, in practice, secured to Henry II and his successors most of the substance of the Constitutions of Clarendon, yet eliminated those features which Thomas had found most objectionable.

BECKFORD, WILLIAM (1709–1770), lord mayor of London (1762–63 and 1769–70) and pioneer of the radical movement, was born in Jamaica, W.I., on Dec. 19, 1709, the son of Peter Beckford, speaker of the Jamaican house of assembly. William Beckford was the wealthiest absentee West Indies sugar planter of his generation. He combined business in London with the life of a country gentleman in Wiltshire. Elected to parliament for Shaftesbury in 1747, he became alderman of Billingsgate ward in 1752, and he represented the City in parliament from 1754 until his death. From 1756 he developed a close political connection with William Pitt the elder, and through him important popular city interests, hitherto usually in opposition, were for the first time brought into close alliance with the government. These interests resented the retirement of Pitt and the terms of the peace of Paris, and in 1763 Beckford gave strong support to John Wilkes. From 1761 he had begun criticizing the system of parliamentary representation, and during the crisis of 1769 over Wilkes and the Middlesex election he was a strong supporter of agitation for the abolition of "rotten" boroughs. While Wilkes won popularity for the Wilkite movement, it was Beckford who inspired its leaders and provided a program of reform—shorter parliaments, a place and pension bill and more equal representation of the people. He broke through all court etiquette when presenting a City remonstrance to the king, again on Wilkes' behalf, on May 23, 1770: George III having rejected the petition in a discourteous manner, Beckford appalled the courtiers by answering in a firm but respectful speech, the approximate text of which was engraved on his monument in Guildhall. Beckford died in London on June 21, 1770.

BECKFORD, WILLIAM (1760?–1844), the eccentric author of the oriental novel *Vathek,* was probably born on Oct. 1, 1760, at Fonthill Gifford, Wiltshire. His father, William Beckford, who derived a huge income from sugar in Jamaica, was twice lord mayor of London and a friend of the earl of Chatham, who stood godfather to his son. The boy was idolized. At the age of five he received piano lessons from Mozart, then eight years of age. He was taught architecture by Sir William Chambers and drawing by Alexander Cozens, whose romantic reputation as a son of Peter the Great fired his imagination. He was naturally talented, but the adulation he received induced an arrogant and unstable temper in him which dominated his life. In his 11th year his father died, leaving him a large fortune.

In 1777 he went to Geneva and thence made the grand tour. An account of his experiences, called *Dreams, Waking Thoughts, and Incidents,* was published in 1783, but it was so singular a work that he was persuaded to recall all but six copies. He married, in 1783, Lady Margaret Gordon; and although he was dogged by scandals in which he had previously been involved, the marriage was a happy one. But his wife died in 1786, after the birth of their second daughter. Beckford spent many years abroad and published accounts of his travels in *Italy; With Sketches of Spain and Portugal* (1834) and *Recollections of art Excursion to the Monasteries* of *Alcobaça and Batalha* (1835). From 1796 his energies were devoted to his Gothic "abbey" at Fonthill, his estate in Wiltshire. His architect was James Wyatt, but Beckford himself supervised the planning and building of what became the most extraordinary house in England. He furnished it with works of art and with books that included the entire library of Edward Gibbon, purchased en bloc at Lausanne. He lived at Fonthill as a recluse, with only a few intimates and domestics, from 1807 until 1822, when he sold it. Shortly afterward, the 260-ft. tower fell and laid the house in ruins. Beckford died at Bath on May 2, 1844.

Vathek, the book on which his fame chiefly rests, was written in 1752, in French. He commissioned Samuel Henley to make an English translation, intending to publish the two versions simultaneously. But while Beckford's attention was distracted by his wife's death, Henley published the translation anonymously in 1786, claiming in the preface that it had an Arabic original. Beckford's own text appeared the following year, but he had been robbed of his due acclaim. *Vathek,* the story of a caliph who sold himself to the powers of evil, belongs to the genre, then popular, of the oriental tale. Byron pronounced it superior to Dr. Johnson's *Rasselas,* but his comparison was hardly just, since he admired the detail, not the fable. Nevertheless the book is a masterpiece of fantastic invention, bizarre, colourful and sustained, culminating, with the final hopelessness of the Hall of Eblis, in prose passages of a gloomy and surrealist magnificence unique in its kind.

Among Beckford's other books are *Modern Novel Writing, or the Elegant Enthusiast* (1796) and *Azemia* (1797), burlesques of the novel of sensibility.

The Episodes of Vathek was translated by Sir F. T. Marzials, with French text (1912). Beckford's *Journal* of his travels in Portugal and Spain and *Life at Fonthill, 1807–22* were edited by Boyd Alexander (1954 and 1957).

BECKLEY, a city of West Virginia, U.S., 72 mi. S.E. of Charleston and the seat of Raleigh county. (For comparative population figures *see* table in WEST VIRGINIA: *Population.)* It is the commercial centre of the New River and Winding Gulf coal fields, often called the Smokeless coal fields. Gen. Alfred Beckley established the first settlement in 1838, but the city's real growth dates from the beginning of coal mining in the region. The first commercial shipment from the mines was made in 1890. Grand View park, a state park overlooking New River gorge, is 10 mi. from the city.

Beckley is the site of several hospitals, including the Raleigh General hospital, the Beckley Memorial hospital (a hospital of the United Mine Workers), the Pinecrest sanitarium (a state tubercular hospital) and a U.S. veterans hospital. At an altitude of 2,438 ft., Beckley is noted for its mild summer climate. Beckley college, an independent junior college, opened in 1933, enrolls several hundred students annually. (K. K. McC.)

BECKMANN, MAX (1884–1950), German Expressionist painter, whose greatest works dealt with the human situation, in the portrayal of which he was unsurpassed by his contemporaries. He was born in Leipzig, Feb. 12, 1884, and was active chiefly in Berlin, Frankfurt and Amsterdam to which he fled in 1937 from Nazi persecution. In 1947 he went to St. Louis, Mo., to teach at Washington university and in 1949 to New York where he taught at the Brooklyn Museum art school. While he had the greatest admiration for Rembrandt, Goya and Munch, the subjective impressionism of Lovis Corinth was the basis of his early style in which epic themes were monumentally conceived. The traumatic impact of World War I profoundly changed his style to one influenced by the expressive distortion of late medieval art and conditioned by his new concept of space design. His commentaries of the early 1920s on life's futility and the bestiality of man were phrased in symbolism of great plastic force, equally evident in his brilliant graphic work and his canvases. About 1930 French influence brought more ample forms and more splendid colour and encouraged primarily formal pictures, such as his inventive still lifes and weighty landscapes. Yet, his work culminated in the psychologically penetrating nine great triptychs of personal iconography created during the last 18 years of his life.

Beckmann is best represented in the Museum of Modem Art, New York, the City Art museum, St. Louis, the Minneapolis Institute of Arts and the Museum of Fine Arts, Boston.

Beckmann died in New York city on Dec. 27, 1950.

BECKWITH, JAMES CARROLL (1852–1917), U.S. painter, whose portraits in the French academic tradition were, representative of the American art of the day, was born at Hannibal, Mo., on Sept. 23, 1852. He studied at the National Academy of Design, New York city, and in Paris (1873–78) under Carolus Duran. Returning to the United States in 1878, he became a prominent figure in U.S. art.

Beckwith took an active part in the formation of the Fine Arts society and was president of the National Free Art league which worked to secure the repeal of the U.S. duty on works of art. Among his portraits are those of W. M. Chase (1882), X. Jordan (1883), Mark Twain, T. A. Janvier, Gen. John Schofield and William Walton. In 1904 he exhibited at St. Louis "The Nautilus" and a portrait of Mrs. Beckwith.

He died in New York city on Oct. 24, 1917.

BECKX, PIERRE JEAN (1795–1887), 22nd general of the Society of Jesus, was born in Zichem, Brabant, Belg., on Feb. 8, 1795. He entered the order in 1819 at Hildesheim, in the Prussian province of Hanover, and was elected general in 1853. His best-known work, Der Monat Maria, was published in English (The Month of Mary) in 1883. Beckx's long tenure of office was marked by rapid growth and increased missionary activity, as well as by opposition to the order in Germany, France, Spain and Italy. He died in Rome on March 4, 1887.

BECQUE, HENRY FRANÇOIS (1837–1899), French dramatist and critic, born at Neuilly on April 18, 1837, whose play ***Les*** Corbeaux (1882) marked a turning point in the history of French drama and made of Becque an unwilling chef *d'école.* With it Becque broke with the tradition of the conventional well-made play and offered a public accustomed to Émile Augier, Alexandre Dumas and Victorien Sardou a realistic picture of life: human "carrion crows" are seen despoiling a defenseless widow and her daughters. The performance of this play gave rise to feelings comparable with those provoked by Victor Hugo's Hernani. La Parisienne (1885), equally outstanding, gives proof of fine stagecraft and keen observation of human nature; it has a gay yet bitter epilogue, the one-act play Veuve (1897). La Navette (1878), a one-act play is in the same vein as La Parisienne; the unfinished Les Polichinelles, inspired by Becque's contact with the stock exchange, resembles Les Corbeaux in tone and technique.

These plays far outstrip Becque's earlier dramatic works, now forgotten: his opera *Sardanapale* (1867), with music by Victorin Joncikres; *L'Enfant prodigue* (1868), an indifferent light comedy performed through Sardou's influence; Michel Pauper (1870), a rhetorical piece with socialist leanings; and *L'Enlèvement* (1871), a verbose comedy. Though often called the first of the realists in the *théâtre libre* style, Becque can be considered as continuing the classical tradition from Les Corbeaux onward. In his critical writings—Querelles *littéraires* (1890), Souvenirs *d'un* auteur *dra*matique (1895) and Confe'rences (published posthumously, 1926)—he attempted to wean the theatre from Dumas, Eugkne Scribe and Henri Meilhac, and lead it to a conception akin to that of the 17th century. He died in Paris on May 12, 1899. His complete works, in seven volumes, were edited by J. Robaglia (1924–26).

See A. Arnaoutovitch, Henry Becque, 3 vol. (1927). (D. Ks.)'

BÉCQUER, GUSTAVO ADOLFO (1836–1870), Spanish writer, born in Seville, Feb. 17, 1836, whose fame rests principally on his *Rimas* (1860–61), 76 brief lyrics in assonance which describe his struggle for perfect expression, his joy in love and his anguish in betrayal. Their appeal was universal, but they grew hackneyed from overquotation, until in the 1930s poets recognized their own tendencies in Bécquer's refined sensibility and his pure approach to his art and claimed him as a major influence in their work. The *Cartas* literarias a *una mujer* and the *Cartas* desde mi celda (1864) are essays in meditative self-analysis, hitherto unfamiliar in Spanish letters. His power to evoke an atmosphere of haunting mystery in the Leyendas suggests the influence of Edgar Allan Poe and E. T. Hoffmann, while the bitterness and conciseness of the *Rimas* have led to a belief in the influence of Heine. But Bécquer's originality is to have conveyed in Spanish rhythms all the half tones of emotion and to have given poetic significance to the ephemeral. He died in Madrid on Dec. 22, 1870.

BECQUEREL, the name of a French family, several members of which have been distinguished in chemical and physical research.

ANTOINE CÉSAR BECQUEREL (1788–1878), best known for his work in electrochemistry, was born at Châtillon-sur-Loing on March 8, 1788. After passing through the École Polytechnique he became *ingénieur-officier* in 1808 and saw active service with the imperial troops in Spain from 1810 to 1812 and again in France in 1814. He then resigned from the army. His earliest scientific work was in mineralogy but he soon turned his attention to the study of electricity and especially of electrochemistry. In 1837 he received the Copley medal from the Royal society "for his various memoirs on electricity, and particularly for those on the production of metallic sulphurets and sulphur by the long-continued action of electricity of very low tension." which it was hoped would lead to increased knowledge of the "recomposition of crystallized bodies, and the processes which may have been employed by nature in the production of such bodies in the mineral kingdom." In biological chemistry he worked on the problems of animal heat and on the phenomena accompanying the growth of plants, and he also studied meteorological questions and observations. His works include: *Traité d'électricité* et du *magnétisme* (1834–40), *Traité* de physique *dans ses* rapports *avec la chimie* (1842), *Éléments* de *l'électro-chimie* (1843), *Traité complet* du magnitisme (1845), *Éléments* de *physique terrestre* et *de météo*rologie (1847), and Des *climats* et de *l'influence qu'exercent les* sols *boisés* et *déboisés* (1853). He died on Jan. 18, 1878. in Paris, where from 1837 he had been professor of physics at the Musée d'Histoire Naturelle.

His son. ALEXANDRE EDMOND BECQUEREL (1820–1891), is remembered for his experiments in light. He was born in Paris on March 24, 1820, and was in turn his father's pupil, assistant and successor at the Musée d'Histoire Naturelle; he was also appointed professor at the short-lived Agronomic institute at Versailles in 1849, and in 1853 received the chair of physics at the Conservatoire des Arts et Métiers. Edmond Becquerel paid special attention to the study of light: investigating the photochemical effects and spectroscopic characters of solar radiation

and the electric light, and the phenomena of phosphorescence, particularly as displayed by the sulfides and by compounds of uranium. In connection with these latter inquiries he devised his phosphoroscope, an apparatus which enabled the interval between exposure to the source of light and observation of the resulting effects to be varied at will and accurately measured. He published in 1867–68 a treatise in two volumes on La *Lumière, ses causes et ses effets.* He also investigated the diamagnetic and paramagnetic properties of substances and the phenomena of electrochemical decomposition and proposed a modified statement of Faraday's law which was intended to cover certain apparent exceptions. He died in Paris on May 11, 1891.

His son, ANTOINE HENRI BECQUEREL (1852–1908), Nobel prize winner, who succeeded to his father's chair at the Musée d'Histoire Naturelle in 1892, is the discoverer of radioactivity. He was born in Paris on Dec. 15. 1852, studied at the École Polytechnique (where he was appointed a professor in 1895) and in 1875 entered the department *des ponts et chaussées* of which in 1894 he became *ingénieur en chef.* He found in 1896 that uranium (*q.v.*) at ordinary temperatures emits an invisible radiation which in many respects resembles Rontgen rays and can affect a photographic plate after passing through thin plates of metal. For these researches he was in 1903 awarded a Nobel prize jointly with Pierre and Marie Curie. He also engaged in work on magnetism, the polarization of light, phosphorescence and the absorption of light in crystals. He died at Croisic in Brittany on Aug. 25, 1908.

BED, a general term for a resting or sleeping place for men or animals and, in particular, for the piece of domestic furniture used for that purpose; this article deals with the latter. The word also is used by analogy to mean a base or a supporting surface (*e.g.*, of a river or of a billiard table).

Ancient Times.—In ancient times beds were used not merely for sleeping but also, except in Egypt, for reclining when taking meals. They were either solid constructions built into the wall, or lighter objects made of wood or metal, or a combination of both, consisting of a couch supported on four legs with a low headboard at one end. The legs and the headboard might be made of plain wood or finely cast bronze, according to the means of the owner. Egyptian beds were particularly light and elegant. Representations of a bed on an Assyrian bas-relief, on an Etruscan funeral monument and on an Archaic Attic painted vase (all in the Louvre, Paris) show remarkably little variation in design. The Greek bed was the simplest: the wooden frame, inlaid with ivory or mother-of-pearl, was laced across with bands of hide upon which the coverings were placed. The Assyrian and Etruscan beds were more magnificent, with carved or inlaid frames and curved bed heads, upon which numerous cushions were placed. In each case, the many cushions at the bed head provided support for the upper part of the body of the diner. Roman beds were of similar design, the frames of wood or metal sometimes being covered with decorative mounts of bronze, ivory and tortoise shell. The emperor Heliogabalus had a bed made entirely of silver. Roman beds. like the earlier Etruscan, often were arranged for two persons with a board or railing at the back in addition to the raised portion at the head. In the walls of some of the houses at Pompeii there are bed niches, probably closed by curtains or sliding partitions; and classical dining rooms with built-in bed platforms are preserved.

Middle Ages.—In the later middle ages meals were no longer taken in a reclining position and beds were reserved for resting or sleeping. Even princes' beds, as shown on early medieval ivories and miniatures, are of remarkable simplicity. Until the 12th century the frame was constructed of turned wood. the main ornaments being the four balls that formed the lower terminals of the legs. A sloping plane under the mattress or pallet, augmented by head pillows, is often shown, so that a semiupright position had to be assumed and apparently was preferred. The poorer classes slept in large shallow chests on mattresses stuffed with straw. Presumably the peasant usage of built-in bunks, often two tiers high. is medieval in origin.

In 12th-century manuscripts appear much richer bedsteads, with inlaid ornament, carving and painting and with embroidered coverlets and mattresses. To keep out drafts the bed was protected with curtains which constituted small pavilions, enclosing at first not only the bed of the lord and his lady but also of those in their immediate entourage. These curtains were suspended from the ceiling, and until the 15th century beds had neither posts, cornices nor high wooden backs. (*See* also DRAPERY AND CURTAIN.) In some Norman manuscripts the occupant of the bed is shown wearing night clothes, but from about the 13th century until the 16th people generally slept naked. More money was spent on the construction and decoration of beds in the middle ages than on any other article of furniture, and in all large houses played an important part in births, marriages, deaths and even the reception of distinguished visitors. Minute descriptions of them are found in early inventories when those of other pieces of furniture are meagre; and in wills, from the 14th century onward, the best bed often heads the list of personal legacies. In the 14th century the wood frame of the bed declined in importance, being entirely covered by rich materials hung immediately over the bed or suspended from rods running around two or three sides of the bed at slightly overhead height.

The tester bed made its first appearance in the 14th century, but it was not until the 15th that it became general among the rich. The tester was slung from the ceiling or fastened to the walls, thus creating a room within a room, shut in by double curtains so as to exclude all drafts. Beds were commonly used as couches and seats in the daytime, and the curtains were drawn and looped up in the form of a bag. At this time, in Italian beds the mattress often was placed on a second level surrounded by an intermediate step platform on three sides. The spaces within were used for storage. Beds with elaborate cantilevered ceilings projecting from the headboards also are known.

In the 15th century, fixed beds were introduced in western Europe. Judging from contemporary pictorial records, the bed often was placed in a corner of the room. It consisted of a paneled back with carved columns at the front corners, supporting the tester, from which hung the curtains (which enclosed the bed posts) of precious fabrics imported from the far east or Italy. These beds, according to the normal medieval construction, were held together by pegs and could be taken apart for transport; noblemen habitually took their furnishings and hangings with them from one to another of their residences, and it was therefore necessary that beds be easily dismantled. The support for the mattress was still a trellis of leather straps nailed to the bed frame. A remarkable feature of 15th-century beds was their size, as much as 7 or 8 ft. by 6 or 7 ft., and it has been suggested that several people slept in them. One of the late 14th-century Apocalypse tapestries in the cathedral of Angers does, in fact, show a bed occupied by four men, and Albrecht Diirer. on his journey to the Low Countries in 1520, claimed to have seen a bed large enough for 50 persons in the Hôtel de Nassau in Brussels. In northern Europe and Russia, particularly in farmhouses, beds were often clustered near or placed on a large tiled stove in one corner of a main living room.

In the middle ages the king of France reclined on a bed known as the *lit de justice* when he was in the presence of *parlement.* The princes of the realm sat on stools, the greater officials stood and lesser ones knelt around him. Louis XI is believed to have introduced the ceremony, which lasted as long as the monarchy. The king and great nobles possessed a state bed or *lit de parade,* used only on formal occasions. The body of the king was laid out on the state bed after his death: the beds of the king and queen were saluted by the courtiers as if they were altars, and none approached them even when there was no railing to prevent it. In the *chambre de parade,* where the state bed was placed, took place the *grand lever,* while the *petit lever* was held in the bedroom where the monarch actually slept.

16th, 17th and 18th Centuries.—During the 16th century beds became more decorative, with much carved work on the bed head and the posts. The inventory description of the bed of Raoul de la Faye, dating from 1544, described the "pillars in the form of wild men." while that of Charles Cornu, dating from 1545, had pillars carved with figures of Hercules. Some of the most elaborate beds ever made date from the 16th century. During

this period the tester, instead of being merely a framework supporting a textile covering, was paneled and adorned with carved moldings like the bed head. In France, the taste for elaborately carved bedsteads hardly survived the beginning of the 17th century, when they disappeared again behind precious fabrics, but in England the carved oak or walnut bedstead with paneled and inlaid bed head and tester continued into the first half of the 17th century. The most famous of the English Elizabethan beds is the great bed of Ware (in the Victoria and Albert museum. London); about 11 ft. square, it was one of the sights of London, and there are many 17th-century literary references to it. Such large beds, however, were not exceptional in the 16th century; the beds of Henry VII and of Henry VIII, which were shown to visitors to Windsor castle in Elizabeth I's reign, were of about the same size, with hangings of gold and silver. During the first half of the 17th century two types of bed were made, one with heavy carved frame and the other with a light framework and elaborate hangings, but by the middle of the century the latter had become prevalent in England and Europe. When the curtains were drawn it looked boxlike and severe, the sole note of fantasy being given by the feathers attached to the ends of the four posts.

About the middle of the century the bed was placed in an alcove, separated from the rest of the bed chamber by a low railing. The second half of the 17th and the early 18th century was a period of magnificent beds. No fewer than 413 were described in the inventory of Louis XIV's palaces, some of great splendour. The great bed at Versailles had crimson velvet curtains on which "The Triumph of Venus" was embroidered with so much gold thread that the velvet scarcely showed, but under the influence of Madame de Maintenon the mythological subject was replaced by a biblical one. At Versailles women received their friends in their beds in any circumstances that were thought deserving of congratulation or condolence, and during the 17th century this curious custom became general among the upper classes, perhaps to avoid the tiresome details of etiquette. The fashions in bed design introduced in the second half of the 17th century originated in Paris. The earliest mention of a new canopy design is in the inventory of Cardinal Mazarin of 1660, consisting of a low couch with a tall headboard up to a canopy suspended from the ceiling. An earlier type, known as a lit d'ange, extended over only half the bed, but a later version, the lit *à* la duchesse, covered its whole length. Other forms were the lit *à impériale* and the lit *à dôme*, with canopy formed as a crown and a dome respectively. Another innovation was the day bed, a couch, with low head, supported on six legs with carved stretchers between. Soon after, the sofa or divan, modeled on a Turkish couch for reclining, became fashionable in Europe, and later still was introduced the ottoman, a simple divan without back or arms.

In the 17th century the appearance of the bed was determined by its hangings, but in the 18th the frame came into the open again, appropriately carved and gilded. The curtains became lighter and were made of taffeta or satin instead of the heavy brocades and velvets of the 17th century. The introduction of a less formal style was due to a change in social customs; the bed ceased to be the central point of the residence, visitors were received in the boudoir or the salon, and more distinction was drawn between private and public life.

Bed heads previously had been set against a wall of the bed chamber, but about the middle of the 18th century a new fashion in France turned the bed around so that the long side ran parallel to the wall. This construction, called *à* la *polonaise* in homage to Queen Maria Leszczynska, was surmounted by a more or less elaborate canopy like that of the beds of the first half of the century. The type was not generally introduced in England, where the four-poster construction with tester and curtains all around remained the usual bed until the mid-19th century. Nevertheless, many variations of the four-poster were devised in England, particularly in the Chinese taste with pagodalike japanned tester.

Modern Times.—During the second half of the 19th century, metal bedsteads became common; these were made at first of cast iron, subsequently of brass tubing. Though they had nothing to recommend them beyond their hygienic qualities,' they enjoyed some return to fashion in the late 1950s. One of the main features of the 20th century has been the tendency to abandon the traditional double or matrimonial bed in favour of two small single beds. A popular form is the divan, or day bed, which serves as a seat during the day and a bed by night. In reaction against functional starkness, bedsteads with large headboards, either elaborately carved and gilded or covered with quilted satin, were introduced in the 1920s and 1930s. Two types of folding bed—one folding into the wall, the other into the base of a settee—were introduced in an effort to solve the problem of lack of space; indeed such devices had been commonly used in the latter half of the 19th century, when they were built into wardrobes or other massive units of furniture.

Orient.—In the near east it was the custom to make beds simply by piling up rugs on the floor. In both Persian and Indian miniatures lovers are shown reclining on low divan beds, with carved legs at the corners and sometimes a low headboard as well. No sheets or bed coverings are used, but the head is supported on a pillow or bolster. No difference is apparent in the representations of beds in miniatures dating from periods as far apart as the 15th and 19th centuries.

In China, however, beds not unlike those of the Egyptians were used about 2,000 years ago, and replicas of them are found in pottery in the tombs of the Han period (202 B.C.–A.D. 221). Some magnificent specimens executed in carved wood and in lacquers have come to light. During the Ming period (1368–1644) and probably earlier, it became the custom in some sections to enclose the beds with gauze or netting; later the bed was made along the back wall of a small square room with a small antechamber cut off by sliding doors. These beds were covered with matting and were never so soft and voluptuous as those of the near east. The pillows were made of wood, porcelain or stone, carved to fit the neck and lower part of the head of the sleeper.

In Korea and northern China the gudeul or floor is made of flat stones, bricks or earth with flues under the top layer; somewhat below the level of the floor is a fireplace. When cooking is going on the heat circulates through the flues in the floor, and sleeping places are arranged on the warm spots.

According to the traditional arrangement, which persisted until well into the 20th century, the Japanese slept on the floor, the bedding being put in a closet in the morning and the room used for eating and general social gatherings. The whole floor was covered with tatami or resilient mats covered in woven fibre, the people sleeping between shikifuton ("underquilt") and *kake*-futon ("overquilt"). They were warmed during cold weather with a kotatsu or little wooden box holding a charcoal burner, but this often caused skin diseases and sometimes started fires. For these reasons it gradually fell into disuse; but whole families used to sleep on the same tatami, their feet toward the burner and their bodies radiating from that point like the spokes of a wheel. See also FURNITURE; INTERIOR DECORATION. (J. F. H.)

BEDAUX, CHARLES EUGENE (1887–1944), U.S. efficiency engineer who developed the Bedaux plan for measuring and compensating industrial labour. He was born on Oct. 26, 1887, in Charenton, a suburb of Paris, France, migrated to the United States at the age of about 20, and became a naturalized citizen in 1917. During and after World War I he organized management consulting firms in both North America and Europe. Bedaux's wage incentive plan used "Bedaux units" to measure human productivity, one unit indicating the work to be done by one man in one minute. A bonus was paid for work done in excess of 60 units per hour. The Bedaux plan was widely used to improve labour productivity and management efficiency but unions were critical of its complexity and of the speed-up that sometimes resulted from the use of improper standards. In 1937 Bedaux gave up management of his American enterprises, settled in France and collaborated with the Nazis and the Vichy French government during World War II. He was arrested in Algiers during the Allied invasion of north Africa and was returned to the United States where he was charged with treason. He took his own life, dying in Miami. Fla., on Feb. 18. 1944.

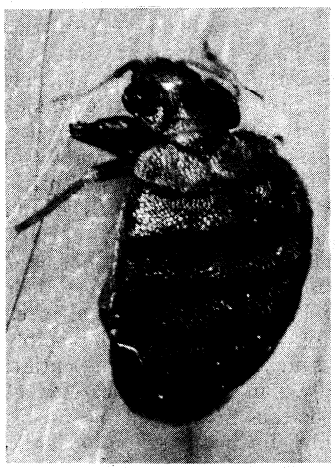
Yorker, pp. 28-47 (Sept. 22, 1945), pp. 32-45 (Oct. 6, 1945) and pp. 32-48 (Oct. 13, 1945); Gordon B. Carson (ed.), *Production Handbook,* sec. 15, pp. 50–57 (1958). (F. T. MA.)

BEDBUG (*Cimex lectularius*), a nocturnal insect belonging to the family Cimicidae in the order Hemiptera (*q.v.*). The adult is reddish brown in colour, broad and flat. 4 to 5 mm. long, and apparently wingless, with the body densely covered with short hairs and bristles. The greatly atrophied, scalelike first pair of wings are very inconspicuous and nonfunctioning. The peculiar disagreeable odour of bedbugs is due to the secretion of the scent, or stink, glands so characteristic of heteropterous insects.



FRITZ GORO

BEDBUG (CIMEX LECTULARIUS), A *PARASITE* OF MAN, FEEDING

The male has a more pointed abdomen terminated by a large curved penis lying in a deep groove of the left side of the eighth segment. The female has on the right side of the fourth (or fifth) abdominal segment a copulatory pouch that is indicated ventrally by a notch in the hind margin of the segment. This pouch is the organ of Ribaga, beyond which is a mass of cellular tissue called the organ of Berlese. In mating, the male injects the spermatozoa into the organ of Ribaga, from which they pass through the organ of Berlese and reach the genital tract by wandering through the general body cavity (hemocoele). Thismethod of mating is unique, since in other insects the spermatozoa are inserted into the female by way of the vagina.

The female lays an average of 200 or more eggs at the rate of 3 or 4 a day under favourable conditions, with temperatures about 70° F. and ample opportunities to feed. No eggs are laid at temperatures below 50" F., and starved females soon stop laying eggs. The eggs hatch in six days or longer, depending upon the temperature. There are five nymphal stages, and the nymph must feed before it will molt to the next stage. In favourable temperatures, the nymph requires from four to six weeks to reach maturity. There may be three or more generations a year.

Bedbugs are among the most cosmopolitan of human parasites. They are shy creatures that seek concealment during the day in tufts or folds of mattresses, in cracks and joints of bedsteads, even in the hollow frames of metal beds, beneath loosened wallpaper, behind baseboards, window casings, cracks in the wall or wherever they can find shelter. From these hiding places the bugs come forth at night to suck the blood of man. After feeding, they retreat to their hiding places to digest the meal, which may require several days. Adult specimens have lived a year without food. Bedbugs will feed on poultry and other animals as well as on man. Close relatives are *Cimex hemipterw* of tropical Africa and Asia, which have the same habits, and various species that feed on bats, swallows and martins.

Control involves vigilant cleanliness and thorough application of repressive measures. Infested quarters may be fumigated or heated to temperatures of 120° to 125° F. for several hours. Hiding places may be treated with a good fly spray; various DDT preparations give control. (H. B. HD.; X.)

BEDDGELERT, a village and civil parish of Caernarvonshire, north Wales. Pop. (1951) 762. The village lies in the heart of Snowdonia in a picturesque hollow where the Colwyn river joins the Glaslyn before the latter enters the pass of Aberglaslyn.

Bronze Age remains were found in the parish, within which lies Dinas Emrys, the site of an ancient Celtic fort famous in tradition. A Celtic monastic cell was founded there in the 6th century, said to be the oldest in Wales, excepting Bardsey. It was later superseded by a priory of Augustinian canons. The priory buildings have disappeared, but remains of the 13th-century monastic church are incorporated in the present parish church.

A legend relates that Llewelyn the Great's faithful hound, Gellert (*q.v.*), was buried at Beddgelert; hence the name "the grave of Gellert." The dog is said to have protected the prince's infant son by killing a wolf and that Llewelyn, on his return home, impetuously killed Gellert, believing that the dog had slain the child. Neither the legend nor this derivation of the place name have historical foundation. The village is a well-known tourist centre with salmon and trout fishing. (W. O. W.)

BEDDINGTON AND WALLINGTON, a municipal borough (1937) in the Mitcham parliamentary division of Surrey, Eng., 1½ mi. W. of Croydon. Pop. (1961) 32,588. Beddintone and Waletone are both mentioned in Domesday Book. Beddington hall, from 1349 the seat of the Carew family, became in 1864 a girls' orphanage and is now used by the Surrey County council. In St. Mary's church (14th century) are many memorials to the Carews. There are 204 ac. of parks and recreation grounds in the district, which is mainly residential, being 11 mi. S. of London. Croydon airport (closed from 1959) was partly in the borough.

BEDDOES, THOMAS LOVELL (1803–1849), English poet, author of the strange tragedy *Death's Jest Book,* who never fulfilled his early promise, was born in Clifton, Somerset, on June 30, 1803. Beddoes' father was a celebrated scientist of considerable literary gifts. His mother was a sister of Maria Edgeworth. Sent to Bath grammar school (1814) and to Charterhouse (1817), where his marked abilities, his overbearing character and his passion for the drama soon became evident, he nourished his imagination (like Shelley, whom he greatly admired) on Gothic romances, writing one while still at school. In 1820 he went to Pembroke college, Oxford, and in his first year there published a group of three verse tales entitled *The Improvisatore* (1821) which reflect the nature of his early reading. Later he destroyed most of the copies. He first appears as a considerable writer in *The Bride's Tragedy* (1822), which is based on the story of a murder committed by an undergraduate and made the subject of a popular ballad. Beddoes' obsession with death is already evident: throughout much of the play, as throughout much of his later work, death is the only subject of conversation, but the verse is of a respectable quality and George Darley hailed Beddoes as a coming dramatist. In 1824 he took his B.A. and in 1825 he went to Gottingen to study anatomy and medicine. In Gottingen he continued his extraordinary poem, *Death's Jest Book* (or *The Fool's Tragedy,* 1850), which was not published until after his death. It is the work of a man who had thought long and deeply about the nature of the drama. In the preface he follows the Schlegels and Willem Bilderdijk in arguing that most modern dramatic theorists are "prejudiced in favour of the literature of the South." He believed that the English drama differed essentially from the Greek. "It is not Shakespeare who is lawless, they are lawless who judge his British example by the precept of the Greek." He described *Death's Jest Book* as an example of "the florid Gothic" and had little hope that it would be appreciated by reviewers "who have learnt the Odes of Horace by heart at Eton." Although his friends were probably right to dissuade him from early publication, the fact that *Death's Jest Book* remained on his hands for a long period seems to have interfered with his further development. It contains passages of brilliant verse, but everywhere one notices his inability to create characters entirely different from himself. It is difficult to keep one's attention on the plot: what one listens for is the ground bass of his incomparable meditation on life and death, the poet's strivings toward "a wished-for change of being." Yet Beddoes was more successful with blank verse than in the lyric. He said himself that he could seldom capture "the right sort of idea in the right light for a song" and besides powerful lines and images one finds in his lyrics a concentration of unmusical consonants which often recall Browning. He turned away as if by instinct from the Mediterranean to the wilder imaginings of the north.

After trouble with the university authorities Beddoes left Göttingen and went to Würzburg, where he received his M.D., joined a revolutionary group, the Freie Reichstadt, and after further trouble moved to Zürich, where he seems to have enjoyed one of

the happier interludes in his troubled life. His interest in writing English verse was waning, though he returned to it sporadically. Sometimes he wrote in German and some of his German writings survive. In 1840 he had to flee from Switzerland, probably for political reasons, and he never settled long in one place again. In 1846–47 he paid his last visit to England and on Jan. 26, 1849. he committed suicide in Basel. Browning was interested in his work and intended to have made it the subject of his first lecture, had he been elected professor of poetry at Oxford.

BIBLIOGRAPHY.—His *Works* were edited by H. W. Donner (1935), who also edited a comprehensive selection, *Plays and Poems,* in the Muses' Library (1950). This edition printed the whole early version of *Death's Jest Book* for the first time. Donner also wrote the standard biography, *Thomas Lovell Beddoes: the Making oj a Poet* (1935) and edited *The Browning Box* (1935), a collection of letters by Beddoes' friends and admirers. (I. R. J. J.)

BEDE (BAEDA or BEDA) (672 or 673–735), English historian and theologian whose *Historia ecclesiastica gentis Anglorum (Ecclesiastical History. of the English Nation)* has justly earned him the title of the father of English history. Of Bede, commonly called the Venerable Bede, almost all that is known is contained in the short autobiographical notice which he has appended to his *Ecclesiastical History:* "Thus much concerning the ecclesiastical history of Britain, and especially of the race of the English, I, Baeda, a servant of Christ and priest of the monastery of the blessed apostles St. Peter and St. Paul, which is at Wearmouth and at Jarrow, have with the Lord's help composed, so 'far as I could gather it, either from ancient documents, or from the tradition of the elders. or from my own knowledge. I was born in the territory of the said monastery. and at the age of seven I was, by the care of my relations. given to the reverend Abbot Benedict (Biscop). and afterwards to Ceolfrid, to be educated. From that time I have spent the whole of my life within that monastery devoting all my pains to the study of the scriptures; and amid the observance of monastic discipline, and the daily charge of singing in the church, it has ever been my delight to learn or teach or write. In tny 19th year I was admitted to the diaconate, in my 30th to the priesthood, both by the hands of the most reverend Bishop John (of Hexham), and at the bidding of Abbot Ceolfrid. From the time of my admission to the priesthood to my (present) 59th year, I have endeavoured, for my own use and that of my brethren, to make brief notes upon the Holy Scripture. either out of the works of the venerable fathers, or in conformity with their meaning and interpretation." Then follows a list of his works, so far as. at that date, they had been composed. As the *Ecclesiastical History* was written in 731, the following dates for the principal events in Bede's uneventful life are obtained: birth, 672–673; entrance into the monastery. 679–680; ordained deacon, 691–692; priest, 702–703.

The monastery of Wearmouth was founded by Benedict Biscop in 674, and that of Jarrow in 681–682. Though five or six miles apart. they were intended to form a single monastery under a single abbot, and so Bede speaks of them in the passage given above. It is with Jarrow that Bede is chiefly associated, though no doubt from the close connection of the two localities he would often be at Wearmouth. The preface to the prose life of Cuthbert proves that he had stayed at Lindisfarne prior to 721, while the Epistle to Egbert shows that he had visited him at Uork in 733. It is in his works that we must chiefly seek to know him. They fall into three main classes: (1) scientific; (2) historical; (3) theological. The first class comprises works on grammar, one on natural phenomena, and two on chronology and the calendar. These last were inspired largely by the Paschal Question, which was the subject of such bitter controversy between the Roman and Celtic Churches in the 7th century. They form a natural transition to the second class. In this the chief place is held by the *Ecclesiastical History of the English Nation. By* this almost exclusively he is known to others than professed students. It is indeed one of the most valuable and one of the most beautiful of historical works. Bede had the artist's instinct for proportion, the artist's sense for the picturesque and the pathetic. His style, too, modeled largely on that of Gregory in the *Dialogues,* is limpid and unaffected. And though it would be wrong to call Bede a critical historian in the modern sense of the words, he showed a very unusual conscientiousness in collecting his information from the best available sources: and in distinguishing between what he believed to be fact, and what he regarded only as rumour or tradition.

Other historical works of Bede are the *History of the Abbots* (of Wearmouth and Jarrow), and the lives of Cuthbert in verse and prose. The *History of the Abbots* and the prose life of Cuthbert were based on earlier works which still survive. In the case of the latter it cannot honestly be said that Bede has improved on his original. In the *History of the Abbots* he was much nearer to the facts. and could make additions out of his own personal knowledge. The Epistle to Egbert, though not historical in form, may be mentioned here. because of the valuable information which it contains as to the state of the Northumbrian church, on which the disorders and revolutions of the Northumbrian kingdom had told with disastrous effect. It is probably the latest of Bede's extant works, written in Nov. 734, only six months before he died.

The third or theological class of writings consists mainly of commentaries, or of works which, if not commentaries in name, are so in fact. They are based largely on the works of the four great Latin fathers, SS. Augustine, Jerome, Ambrose and Gregory, though Bede's reading is very far from being limited to these. His method is largely allegorical. For the text of Scripture Bede used both the Latin versions, the Itala and the Vulgate, often comparing them. But he certainly knew Greek, and possibly some Hebrew. Indeed it may be said that his works, scientific, historical and theological, practically sum up all the learning of western Europe in his time. which he thus made available for his countrymen. And not for them only; for in the school of Uork, founded by his pupil Archbishop Egbert. was trained Alcuin (Ealhwine), the initiator, under Charles the Great, of the Frankish schools, which did so much for learning on the continent. And though Bede made no pretensions to originality, least of all in his theological works, freely taking what he needed, and (what is very rare in medieval writers) acknowledging what he took, "out of the works of the venerable Fathers," still everything he wrote is informed and impressed with his own special character and temper. His earnest yet sober piety, his humility, his gentleness, appear in almost every line. "In history and in science, as well as in theology, he is before all things the Christian thinker and student." (C. Plummer's Bede, i. 2). Yet it should not be forgotten that Bede could hardly have done what he did without the noble library of books collected by Benedict Biscop.

Several quaint and beautiful legends have been handed down as to the origin of the epithet of "venerable" generally attached to his name. Probably it is a mere survival of a title commonly given to priests in his day. It has given rise to a false idea that he lived to a great age, some medieval authorities making him 90 when he died. But he was not born before 672 *(see* above); and though the date of his death has been disputed, the traditional year, 735, is most probably correct. This would make him at most 63. Of his death a most touching and beautiful account has been preserved in a contemporary letter. His last hours were spent, like the rest of his life, in devotion and teaching, his latest work being to dictate, amid increasing bodily weakness, a translation into the vernacular of the Gospel of St. John, a work which has not survived. It was a fitting close to such a life as his.

Bede was canonized and named a doctor of the church in 1899. His feast day is May 27. (C. P.)

BIBLIOGRAPHY.—The collected works of Bede, ed. by J. A. Giles, 12 vol. (1843–44), has been largely superseded by editions of the separate works. The best edition of the *Historia ecclesiastica,* the *Historia abbatum* and the Epistle to Egbert, is that of C. Plummer, *Venerabilis Baedae opera historica* (1896). The Leningrad manuscript of the *Historia ecclesiastica,* which was unused by Plummer, has been edited in facsimile by O. Arngart (1952). The Alfredian translation was edited by T. Miller for the Early English Text society (1890–98) and by J. Schipper in *Bibliothek der angelsächsischen Prosa,* IV (1897–99). Modern translations include that of A. M. Sellar, rev. ed. (1912); L. C. Jane's revision of J. Stevenson in "Everyman's Library" (reprinted 1954); L. Sherley Price in *The Penguin Classics* (1955). There is a concordance by P. F. Jones (1929). Editions of Bede's other works are: B. Colgrave, *Two Lives of St. Cuthbert* (1940), with trans.; W. Jaager, *Bedas metrische Vita Sancti Cuthberti* (1935); *C. W.* Jones, *Opera de temporibus* (1943); *M.* L. W. Laistner (ed.), *Expositio actuum*

apostolorum et retractatio (1939); trans. of Epistle to Egbert, D. Whitelock, *English Historical Documents 500–1042,* no. 170 (1955).

Many aspects of Bede's work are discussed by various scholars in *Bede: His Life, Times, and Writings,* ed. by A. Hamilton Thompson (1935). *See* also B. Capelle, "Le rôle théologique de Bede le Venerable," *Studia Anselmiana* (1936); *M.* L W. Laistner and H. H. King, *A Handlist of Bede Manuscripts,* pp. 215–336 (1943); E. S. Duckett, *Anglo-Saxon Saints and Scholars,* (1947). On Bede's chronology, *see* R. L. Poole, *Studies in Chronology and History* (1934); W. Levison, *England and the Continent in the Eighth Century,* pp 265–279 (1946); C. W. Jones, *Saints' Lives and Chronicles in Early England* (1947).

(D. Wk.)

BEDFORD, EARLS AND DUKES OF. The present English title of duke of Bedford comes from a line of earls and dukes in the Russell family. John, Baron Russell, was created earl of Bedford in Jan. 1550, and his descendant, William, the 5th earl, became duke of Bedford in May 1694. The title of duke of Bedford had been previously held, however, notably by the third son of King Henry IV, and the earlier creations will first be considered here.

JOHN PLANTAGANET (1389–1435) was born on June 20, 1389, the third son of Henry IV of England, and was created duke of Bedford by his brother Henry V in 1414. He acted as lieutenant of the kingdom during Henry's expedition to France in 1415 and in Aug. 1416 commanded the ships which defeated the French fleet at the mouth of the Seine and was instrumental in relieving Harfleur. Again appointed lieutenant in July 1417, he marched against the Scots who abandoned the siege of Berwick at his approach; and on his return to London he brought Sir John Oldcastle, the Lollard leader, to trial and was present at his execution. He resigned as lieutenant in Dec. 1419 and joined the king in France. Returning to England he undertook the lieutenancy for the third time in June 1421 and in the following May conducted the queen to join Henry in Normandy. Replacing his brother, who was ill, as commander of the English troops, he went to the relief of Cosne, but on hearing of the king's danger he left the army and hurried to his side. Henry, who died in Aug. 1422, may have wanted Philip the Good, duke of Burgundy, to become regent in France, but when he declined the office it too was assumed by Bedford who, after the death of the French king Charles VI in Oct. 1422, presided at a session of the *parlement* of Paris and compelled all present to take an oath of fidelity to Henry VI, the new king of England. Meanwhile the English parliament had decided that Bedford should be "protector and defender" of the kingdom, and that in his absence the office should devolve upon his brother Humphrey, duke of Gloucester. Confining himself to the conduct of affairs in France, the protector took up Henry V's work of conquest, captured Meulan and other places, and sought to strengthen his position by an alliance with Philip of Burgundy. This task was rendered more difficult as Gloucester had just married Jacoba, countess of Holland and Hainaut, a union which gave the English duke a claim on lands which Philip hoped to secure for himself. Bedford, however, having allayed Philip's irritation, formed an alliance with him and with John VI, duke of Brittany, at Amiens in April 1423, and himself married (June 1424) Anne, a sister of the Burgundian duke. With powerful allies the war against Charles VII of Valois was prosecuted with vigour and success, and a real victory was won over the French and Scots at Verneuil on Aug. 17, 1424. But Bedford's efforts to foster Anglo-Burgundian friendship were jeopardized by the hostility between Philip and Gloucester, and his work was partially destroyed by Gloucester's invasion of Hainaut in Oct. 1424. Bedford's rule in France was deliberately mild. He lowered taxation, reformed the debased coinage, encouraged trade by granting privileges to merchants, and purified the administration. But since he had to finance his government and campaigns without English aid, his rule, however moderate, was bound to be burdensome to the French.

Bedford was forced to return to England in 1426 when the struggle for power between Gloucester and the chancellor, Henry Beaufort, bishop of Winchester, resulted in an open quarrel. After he had effected a public reconciliation and knighted the young king Henry VI, Bedford promised to act in accordance with the will of the council and, in harmony with the decision of this body, raised some troops and returned to France in March 1427. Having ordered Gloucester to desist from a further attack on Hainaut, he threatened Brittany and compelled Duke John to return to the English alliance; and the success of his troops continued until the siege of Orléans, to which he consented with reluctance. was undertaken in Oct. 1428. The siege lost England both allies and prestige for it involved attacking a lord who was a prisoner, and breaking a treaty. Having assured himself that Philip was prepared to desert him, Bedford sent orders to his army to raise the siege in April 1429. He then acted with great energy and judgment in attempting to stem the tide of disasters which followed this failure, strengthened his hold upon Paris and sent to England for reinforcements; but before any engagement took place he visited Rouen, where he sought to bind the Normans closer to England, and after his return to Paris resigned the French regency to Philip of Burgundy in accordance with the wish of the Parisians. Retaining the government of Normandy, Bedford established himself at Rouen and directed the movements of the English forces with some success. He did not interfere to save the life of Joan of Arc. He was joined by Henry VI in April 1430, when the regency was temporarily suspended, and he secured Henry's coronation in Paris in Dec. 1431. His wife Anne died in Nov. 1432 and he was married at Thérouanne to Jacqueline, daughter of Pierre I, comte de St. Pol, in April 1433.

But notwithstanding Bedford's vigour the English lost ground steadily. The death of Anne and Bedford's second marriage destroyed the friendly relations between England and Burgundy. Negotiations for peace had no result, and the duke had to return to England in June 1433 to compose the dissensions which increased his difficulties at a critical stage of the war. In England Bedford did his utmost to restore the finances of the government, appointing a new treasurer and ordering a detailed investigation into the crown's resources and commitments. Discouraged by the result, which showed the resources of the government to be inadequate for peace, let alone war, and by the failure of the commons to grant new supplies, he remained in England as chief councilor when his demands with regard to a continual council were conceded (Dec. 1433). He left England again in 1434, but early in 1435 was obliged to consent to the attendance of English representatives at a congress held to arrange terms of peace at Arras. Unable to consent to the French terms, the English envoys left Arras in September, and Philip of Burgundy made a separate treaty with France. Bedford only lived to see the ruin of the cause for which he struggled so loyally. He died at Rouen on Sept. 14, 1435, and was buried in the cathedral of that city. He left a natural son, Richard, but no legitimate issue. Bedford was a man of considerable administrative ability, brave and humane in war, wise and unselfish in peace. Universally respected, he had been a moderating influence in English politics at a time when the talents of most statesmen were marred by personal ambition, and his death was a great loss for England at a critical period.

GEORGE NEVILL (c. 1457–83), son of John, earl of Northumberland, was created duke of Bedford in 1470, but after his father's attainder and death at the battle of Barnet in 1471 he was degraded from the peerage (1477).

The next duke of Bedford was JASPER TUDOR (*c.* 1430–95), half-brother of Henry VI and uncle of Henry VII. He was made earl of Pembroke in 1453. Having survived the vicissitudes of the Wars of the Roses he was created duke of Bedford in 1485 after Henry VII's accession. The duke, who was lord lieutenant of Ireland from 1486 to 1494, died without legitimate issue on Dec. 21, 1495.

JOHN RUSSELL (c. 1486–1555), 1st earl of Bedford, was a son of James Russell (d. 1509). In 1513 he took part in the war with France. He was with Henry VIII at the Field of Cloth of Gold in 1520 and, returning to military service when the French war was renewed, lost his right eye at the siege of Morlaix in 1522. In 1523 he went secretly to France, where he negotiated a treaty between Henry and Charles, duc de Bourbon, who was anxious to betray the French king, Francis I. After a short visit to England,

Russell was sent with money to Bourbon, joining him at the siege of Marseilles. He visited Pope Clement VII in Rome in 1524 and, having eluded the French, who endeavoured to capture him, was present at the battle of Pavia in Feb. 1525, returning to England about the close of the year. In Jan. 1527 he was sent as ambassador to Clement, who employed him to treat on his behalf with Charles de Lannoy, the general of the emperor Charles V. The next few years of Russell's life were mainly spent in England. He entered the Reformation parliament for Buckingham in 1529 and, although an opponent of the party of Anne Boleyn, retained the favour of Henry VIII. He took an active part in suppressing the Pilgrimage of Grace in 1536, and was one of the commissioners appointed to try the Lincolnshire prisoners. He received many high honours and offices, and became Baron Russell in 1539. When Charles V and Francis I were threatening to invade England in 1539, he was sent into the west, and crossed to France when Henry attacked Francis in 1544. He was in command of an army in the west of England in 1545, and when Henry died in Jan. 1547 was one of the executors of his will. Under Edward VI Russell was lord high steward and keeper of the privy seal, and the defeat which he inflicted on the rebels at Clyst St. Mary, near Exeter, in Aug. 1549, was largely instrumental in suppressing the rising in Devonshire. He was created earl of Bedford in Jan. 1550, and was one of the commissioners appointed to make peace with France in this year. He opposed the proposal to seat Lady Jane Grey on the throne; supported Mary I, who reappointed him lord privy seal (Nov. 1553); and helped to prevent Sir Thomas Wyat's rising from spreading to Devonshire. He went to Spain to conclude the marriage treaty between Mary I and Philip II in 1554. He died in London, soon after his return, on March 14, 1555. By extensive acquisitions of land, Bedford was the founder of the wealth and greatness of the house of Russell. Among the many properties which fell into his hands was Covent Garden, and seven acres of land in London formerly the property of the protector Somerset.

FRANCIS RUSSELL (*c.* 1527–85), 2nd earl, was the only son of the 1st earl. He took his seat in the house of lords as Lord Russell in 1552. Russel1 was in sympathy with the Protestant reformers, whose opinions he shared, and was imprisoned during the earlier part of Mary's reign. He inherited the earldom in 1555, and left for the continent where he met foreign reformers and fought at the battle of St. Quentin (1557). When Elizabeth I ascended the throne (Nov. 1558) Bedford became an active figure in public life. He was made a privy councilor, had some influence in the religious settlement, and was sent on diplomatic errands to Charles IX of France and Mary Stuart. He was governor of Berwick and warden of the east marches of Scotland (Feb. 1564–Oct. 1567) in which capacity he conducted various negotiations between Elizabeth and Mary. When the northern insurrection broke out in 1569, Bedford was sent into Wales, and he sat in judgment upon the duke of Norfolk in 1572. He was president of the council of Wales in 1576, and in 1581 was deputed to arrange a marriage between Elizabeth and the duc d'Anjou. Bedford died in London on July 28, 1585. He was succeeded by his grandson EDWARD RUSSELL (1572–1627).

FRANCIS RUSSELL (1593–1641), 4th earl, was the only son of William, Lord Russell of Thornhaugh, to which barony he succeeded in Aug. 1613 He became earl of Bedford by the death of his cousin Edward, the 3rd earl, in May 1627. When the quarrel broke out between Charles I and parliament in 1628, Bedford supported the demands of the house of commons as embodied in the Petition of Right, and in 1629 was arrested for his share in an opposition pamphlet, but was quickly released. The Short parliament meeting in April 1640 found the earl as one of the king's leading opponents. He was in the confidence of John Pym and Oliver St. John. In July 1640 he was among the peers who wrote to the Scottish leaders refusing to invite a Scottish army into England but promising to stand by the Scots in all legal and honourable ways; and his signature was afterward forged by Thomas, Viscount Savile, in order to encourage the Scots to invade England. In the following September he was among those peers who urged Charles to call a parliament, to make peace with the Scots and to dismiss his obnoxious ministers; and was one of the English commissioners appointed to conclude the treaty of Ripon. When the Long parliament met in Nov. 1640, Bedford was generally regarded as the leader of the parliamentarians. In 1641 he became a privy councilor and was appointed treasurer. Bedford was essentially a moderate man. He did not wish to alter the government of the church, was on good terms with Archbishop Laud and, although convinced of Strafford's guilt, was anxious to save his life. The earl of Clarendon considered that he supported the opposition more from ambition than from principle, like many peers excluded from the royal service. Bedford died in the middle of the parliamentary struggle on May 9, 1641. Apart from politics, Bedford was important as head of an association for draining a great area of the fens called after him the "Bedford level." However, the scheme ran into financial difficulties and the king took it into his own hands in 1638, giving land to the earl in compensation.

WILLIAM RUSSELL (1616–1700), 5th earl and 1st duke of Bedford, played a minor part in politics. His son Lord William Russell (1639–83) was involved in the opposition to Charles II, led by Lord Shaftesbury, and was executed for treason in 1683. It was partly because of his son's fame as a patriot martyr that the 5th earl was granted a dukedom in 1694. He died on Sept. 7, 1700, and was succeeded by his grandson WRIOTHESLEY RUSSELL (1680–1711), 2nd duke, who was succeeded by his son WRIOTHESLEY RUSSELL (1708–32).

JOHN RUSSELL (1710–71), 4th duke, brother of the 3rd duke, uas born on Sept. 30, 1710. The new duke joined the opposition to Sir Robert Walpole and in Nov. 1744 became 1st lord of the admiralty in the administration of Henry Pelham. He was subsequently lord privy seal in Lord Bute's cabinet of 1761. He wanted peace at any cost, mas sent to France to negotiate in 1762, and signed the peace of Paris in 1763. He was lord president of the council in George Grenville's cabinet in the same year. Bedford was the leader of a political group which bore his name. The Bedford Whigs were a group built up on family connections and electoral influence. Lord Sandwich, Lord Gower, Lord Weymouth and Richard Rigby were notable Bedfordites. Because of his failing eyesight, Bedford himself did not hold office after 1765, when the Grenville administration fell, but his party continued to hold office in successive ministries, and it remained a cohesive political group for more than a decade after Bedford's death at Woburn on Jan. 15, 1771.

FRANCIS RUSSELL (1765–1802), 5th duke, eldest son of Francis Russell (d. 1767), marquess of Tavistock, the eldest son of the 4th duke, was born on July 23, 1765, and succeeded his grandfather as duke of Bedford (1771). Regarding Charles James Fox as his political leader, he joined the Whigs in the house of lords and became a member of the circle of the prince of Wales, afterward George IV. Bedford was greatly interested in agriculture. He established a model farm at Woburn and made experiments in sheep breeding which were recorded by Arthur Young in the *Annals* of *Agriculture* (1795). He was a member of the original board of agriculture, and was the first president of the Smithfield club. He died at Woburn on March 2, 1802.

Francis was succeeded by his brother JOHN RUSSELL (1766–1839), 6th duke, who continued his work for agriculture, and became a governor of the newly founded Agricultural society in 1838. He also rebuilt Covent Garden market. The 19th-century dukes of Bedford, who were noted for their eccentricity, mainly devoted themselves to the management of their estates. The 6th duke was succeeded by his eldest son FRANCIS RUSSELL (1788–1861), upon whose death his only son WILLIAM RUSSELL (1809–72) became 8th duke. William was succeeded by his cousin, the grandson of the 6th duke, FRANCIS CHARLES HASTINGS RUSSELL (1819–91), 9th duke, a horticulturalist and agriculturalist who made experiments in fertilizers and cattle breeding. He became president of the Royal Agricultural society in 1879. His sons, GEORGE WILLIAM FRANCIS SACKVILLE RUSSELL (1852–93) and HERBRAND ARTHUR RUSSELL (1858–1940) succeeded in turn to the title. Herbrand, who was a noted naturalist, built up the live collection of rare animals still kept in Woburn park and was president of the Zoological Society of London (1899–1936). His wife

MARY DU CAURROY (née Tribe) (1865–1937), attained notoriety in the 1920s as the "Flying Duchess" and took part in record-breaking return flights to India (1929) and South Africa (1930). Their son HASTINGS WILLIAM SACKVILLE RUSSELL (1888–1953), 12th duke, was a keen ornithologist and a supporter of the Social Credit movement. He was well known and the object of much public animosity, because of his pacifism in World War II.

JOHN ROBERT RUSSELL (1917–), 13th duke, was born on May 24, 1917, the elder son of the 12th duke. Faced, after succeeding to the title in 1953, with paying heavy death duties on his father's estate, the 13th duke developed to the full the commercial possibilities inherent in opening a "stately home" to the public. He showed himself to be a resourceful publicist and by the end of the 1950s both he and Woburn abbey were well known to the British public. In 1959 he published a volume of memoirs, *A* Silver-Plated Spoon.

See J. H. Wiffen, *Historical Memoirs of the House of Russell* (1833); G. S. Thornson, *Two Centuries of Family History* (1930).

BEDFORD, a municipal borough and the county town of Bedfordshire, Eng., lies 50 mi. N.N.W. of London by road. Pop. (1961) 63,317. The town lies in the fertile valley of the Great Ouse, on both sides of the river. Near the site was a small Roman station controlling the ford; the rich cemetery of Kempston indicates Saxon occupation. Bedford (Bedcanforda, Bedanforda, Bedeford) is first mentioned in 571 when Cuthwulf defeated the Britons there. It was captured from the Danes by Edward the Elder in 914. Because of its central position and fordable river site it became the capital of the nascent shire to which it gave its name (see BEDFORDSHIRE). In the Domesday Book, as the county town, it was entered apart from the rest of the shire and was assessed for ship service. The prescriptive borough received from Henry II its first charter which was confirmed by successive sovereigns down to Charles II. The castle, first mentioned in 1136, was destroyed in 1224. St. Paul's, the principal church and one of the four old ones, is mainly Decorated and Perpendicular; it contains the pulpit where John Wesley preached his assize sermon in 1758 and a brass to Sir William Harpur, a Bedfordian and lord mayor of London in 1561, to whom four schools owe their foundation. These schools, controlled by the Bedford Charity (Harpur trust), are Bedford High school and Dame Alice Harpur school for girls, Bedford Modern school and Bedford school for boys. The latter, administered by the canons of Newnham priory sinde the 12th century, seemed likely to disappear after the dissolution of the monasteries, but Bedford corporation obtained letters patent from Edward VI in 1552 to maintain the school, and Harpur endowed it with land in Bedford and London. The "Bunyan Meeting" (1850) stands on the site of the barn in which John Bunyan preached from 1656 onward and in the panels of a pair of bronze doors (1876) are scenes from his Pilgrim's Progress; the parlour is now the Bunyan museum. Bedford's public library contains the Mott-Harrison collection of his works as well as a collection of old books and pamphlets. In the town Bunyan, who was born at Elstow about 1½ mi. S., underwent a long but in part nominal imprisonment. Howard house. which belonged to John Howard, the prison reformer, is near the Howard Congregational church which he helped to found in 1772. The Cecil Higgins Museum of Art contains works of art, and the Prichard collection of natural history and antiquities is housed in the Embankment museum nearby. Close by is a mound on which'stood the Norman castle and where there was a bowling green for more than four centuries. There are four public parks. Bedford gave its name to several towns in the U.S., including one in Massachusetts and one in Indiana.

Bedford is traversed by two trunk roads and a main line railway from London to Scotland. The county town of a large agricultural area, it is a centre for commerce (especially law, banking, insurance) and for local government, including branches of government departments and nationalized industries. The largest factories make pumps, diesel engines, gas and steam turbines, agricultural implements, milling machinery, switchgear, malleable tube fittings, castings of all kinds, electric lamps. transistors and confectionery. Complementary to the Royal Aircraft Establishment at Thurleigh, outside the town, are the wind tunnels in the town operated by a consortium of leading aircraft firms. There is a College of Aeronautics at Cranfield (10 mi. S.W.) and an Institute of Agricultural Engineering near Silsoe (10 mi. S.). Bedford College of Physical Education for girls was founded in 1903. At Cardington (2½ mi. S.E.), once the home of John Howard, is the Royal Air Force centre where the airship R-101 (destroyed over France in 1930) was built. (G. F. SI.)

BEDFORD, a city of Indiana, **U.S.,** 70 mi. S.S.W. of Indianapolis; in the heart of the Indiana limestone district; the seat of Lawrence county. (For comparative population figures *see* table in INDIANA: Population.)

Bedford was settled in 1825 and incorporated as a city in 1889. Deposits of oölitic limestone were discovered in the 1830s, and limestone soon became the region's primary industry. Bedford limestone is a highly prized building material. Immense quarries and mills produce, fabricate and ship an average of 6,000,000 cu.ft. of stone annually.

Other industries include foundries, machine shops, clothing manufacturing and wood products. A local cattle and hog auction is one of the most active in the midwest. The city owns 477 ac. of well-developed public parks and has the state's first municipally owned forest. (J. M. Gu.)

BEDFORD, a borough and county seat of Bedford county, Pa., U.S., on the Raystown branch of the Juniata river, 38 mi. S.W. of Altoona. Its permanent population is less than 5.000. In the heart of the Alleghenies, it is the centre of a recreational area; Bedford Springs, a fashionable resort nearby, was the summer White House of Pres. James Buchanan. Bedford is the centre of a region producing limited amounts of metal, mine, lumber and textile products.

A settlement was made there about 1750 by an Indian trader, Robert Ray, and the place was originally known as Raystorvn. Ft. Bedford (named for the duke of Bedford), an important frontier post for many years, was built in 1751 and served as a supply base for the campaign against Ft. Duquesne in 1758. The town was laid out in 1766 and incorporated in 1795. Washington went there in 1794 to review the army sent to quell the Whisky insurrection. His headquarters, as well as other interesting 18th-century houses, are still standing. (C. C. G.)

BEDFORDSHIRE, a south midland county of England, is bounded northeast by Huntingdonshire, east by Cambridge. southeast by Hertfordshire, west by Buckinghamshire and northwest by Northamptonshire. Its area is 473.5 sq.mi.

Physical Features. — Bedfordshire lies principally in the middle part of the catchment basin in the Great Ouse, which enters from the west and traverses the vale of Bedford in a very winding course before leaving the county near St. Neots, Huntingdonshire, and draining northeastward toward the Wash. In the south are the headwaters of the Lea. which joins the Thames, and in the north a few tributaries of the Nen.

Three upland ridges cross Bedfordshire from southwest to northeast. dipping gradually to the southeast, and between them two lowland areas cover most of the county. The northern uplands are little more than a rising cap of boulder clay. marking the northern limit of the Ouse valley. Apart from the older rocks exposed in the upper Ouse valley, the whole of the northern half of the county rests on Oxford Clay. Between Turvey and Stevington the Great Oolite is exposed by the Ouse mainly as'limestone bands, formerly quarried for building stone and used in the riverside villages. Above, also occurring as a thin strip, are cornbrash limestones, and overlying them the Kellaways beds, revealed in boreholes and shallow diggings as a sandy clay containing irregular "doggers" (masses) of concreted sands. South of the clay vale the Lower Greensand forms an elevated ridge running irom Leighton Buzzard through Woburn and Ampthill and broken in the east by the valley of the Ivel. A narrow plain of gault lies between this ridge and the chalk of the Chiltern hills, which there rise abruptly to a range of hills and ridges reaching nearly 800 ft in the Dunstable downs. Below the Lower Chalk of the northern escarpment the Chalk Marl has washed down to form a sloping shelf passing by gradual transition into the upper gault. Dividing the Lower Chalk

and the Chalk Marl is a band of Totternhoe stone. a clunch much used in the early churches of the region. All over the county considerable patches of drift deposits obscure the solid formations below. Clay-with-flints occurs as a capping to the chalk hills. while boulder clay, the most extensive, forms a large spread in the north and centre. Gravels, alluvium and peat occur in most of the principal valleys.

The soil surface is greatly varied. Clays cover almost two-thirds of the county, the Oxford Clay region having a heavy, dark-brown soil with the highest clay content which is difficult to drain. The boulder clay soils are lighter and chalky. with an admixture of stones and fine gravel. In association with alluvial deposits, as in the Ivel valley, the boulder clay forms good market gardening soil, and where it occurs as a capping over greensand it gives a light loam. The gault gives rise to stiff, tenacious soil, badly drained, but lighter and suited to arable farming where it approaches the chalk. The greensand provides a light sandy soil. On the chalk the lime content is high and the soil light, but where it is covered with gravel or clay-with-flints the variety is greatly increased.

The county shares the relatively continental climate of East Anglia. Average temperatures show a wide range from 40° F. in January–February to 61°–62° F. in July. Humidity and average annual rainfall are low, the latter varying from about 20 in. in the Ouse valley to 28 in. in the Chilterns.

About 58% of Bedfordshire is devoted to mixed farming, the most intensive concentration being in the east and centre. About 22% is permanent grass and rough grazing, mainly in the gault clay vale, in the southern part of the vale of Bedford and on the chalk hills, where stretches of open downland still remain, with isolated patches of heath on the clay-with-flints. Water meadows lie in well-marked strips on the alluvium of the river valleys and an isolated survival of undrained alluvial bog occurs at Flitwick moor. Woodland, once the natural vegetation of Bedfordshire, now accounts for only about 4% of the total, with scattered woods, predominantly oak, on the northern boulder clay, and a series correlated with the greensand, mainly coniferous plantations (especially around Woburn), on the site of earlier natural woods.

Woburn park contains a large private collection of deer, including rhe famous Père David's herd, and other imported animals, but apart from possible escapes there are no wild ungulates Resident wild mammals and birds are typical of the south midlands. The broad movement of summer visitors and passage migrants from the south brings them across the county, and wild fowl pass over on their migration routes from the Wash, many geese, ducks and swans pausing to rest by flooded pits, artificial lakes and riversides, where in spring waders may also be seen. The larks of Dunstable downs were once supplied to the London market in considerable quantity. A small downland National Nature reserve at Knocking Hoe, Shillington, preserves an unusual assemblage of chalk-loving plants while other parts of the chalk downs at Dunstable and Sharpenhoe are under the care of the National Trust. At Whipsnade is the country zoo of the Zoological Society of London.

History.––Fossil remains of rhinoceros. mammoth, etc., have been found with Paleolithic implements in the preglacial valley gravels at Biddenham and Kempston, and at Cardington an Acheulean working floor was discovered buried in the deposits of a small ancient lake.

Where it is free from clay-with-flints, the chalk provided the prehistoric inhabitants with hunting grounds and pasture, while across its northern edge runs an ancient trade route, the Icknield way. The light soils of the greensand were also readily cleared and cultivated, but the gault and Oxford Clay regions were impenetrable. Maiden Bower, near Dunstable, probably represents a causewayed camp (now with Iron Age ramparts) of the earliest Neolithic inhabitants. There is evidence of secondary Neolithic habitation at Waulud's bank (Leagrave), Eaton Socon and Barton Hill farm (Streatley), and a crouched woman, buried nith a polished flint knife. was excavated from a bowl barrow among the Five Knolls group of tumuli on Dunstable downs. The Beaker folk. arriving about 1800 B.C., lived mainly on the alluvial deposits of the Ouse basin. Burial mounds at the Five Knolls and Galley Hill (north of Luton) represent barrow cemeteries of the early Bronze Age, and collared urns and bronze weapons from a number of sites evidence the arrival of farmer–herdsmen from northwest Europe about 800 B.C.

The Chiltern escarpment, on which earthworks remain, offered defensible sites to the Iron Age arrivals spreading from East Anglia by way of the Ouse and Icknield way. Remains indicate that their settlements were restricted to the chalk and greensand, to river valleys and to the gault where overlain with gravel. Fine bronzes have been found at Felmersham and Stanfordbury, Shefford. Roman settlement followed the same pattern, with some opening up of the north of the county. Watling street crosses the Romanized Icknield way at Dunstable where there was a posting station (Durocobrivae), and Bedford and Sandy were stations at fords across the Ouse and Ivel respectively. A Roman road ran north through Biggleswade and Sandy to Godmanchester, and others crossed from southwest to northeast.

Cemeteries at Kempston, Luton and Sandy provide evidence of Anglian and Saxon penetration via the Fenland river routes by early in the 6th century, and the *Anglo-Saxon Chronicle* records, in 571, the capture of Limbury (Lygeanburg) by West Saxons advancing along the Icknield way from the Thames valley. Alfred's treaty of about 886 placed the Danelaw boundary "along the Lea as far as its source; then straight to Bedford, then up the Ouse as far as Watling street." (C. E. FR.)

The Saxon king Edward the Elder recovered the Danish part of the area, of which Bedford had become a military centre, and soon afterward the whole area became known as Bedfordshire. From this time it had both stability and unity, though from the Norman conquest until 1574 it had the same sheriff as Buckinghamshire. Bedford received its first charter in 1166. The royal manors of Leighton Buzzard and Luton were sizeable and that of Dunstable sometimes exercised burghal privileges, but Bedford is really the only ancient borough.

Bedfordshire has been a county of prosperous farming on moderate-sized estates; of small market towns; of cottage industries; of river navigation; in the middle ages, of modest religious houses; after the Reformation, of Puritan tendencies; and from the mid-19th century, of industrial development.

The estates of the Norman lords, of whom Hugh de Beauchamp of Bedford was the chief in 1086, gradually disintegrated. Bedford castle was besieged and demolished in 1224. The only medieval baronial family continuing until the 20th century was that of Grey of Silsoe. The Tudor period saw a new gentry, such as the Burgoynes, Crawleys and Gerys. The yeomen and village craftsmen flourished (Thomas Tompion, the clockmaker, was the son of a Northill [or Ickwell] smith) and market gardening was known at Sandy by at least 1618.

The monastic houses included: the Benedictine nunnery of Elstow, founded by Judith, niece of William the Conquer07 (the church partly survives); the Cistercian abbeys of Woburn and Warden; the Gilbertine priory of Chicksands, of which there are remains, and the Augustinian priories of Newnham and Dunstable. This last, founded by Henry I and still partly standing, kept a chronicle, and its best-known prior, Richard de Morins (1202–42), was entrusted with special missions by king and pope.

The area was served by several small market towns. The making of pillow lace, of which the first local evidence is at Eaton Socon in 1596, took strong hold in Bedfordshire; lacemen of Bedford and a dozen other centres distributed thread and patterns to village lacemakers and marketed the finished work. By 1689 plaiting straw for hats was extensively carried on as a home industry in and around Dunstable, though in the 19th century the hat factories eventually concentrated at Luton.

Puritanism came slowly, yet took deep root, especially during the Civil War and Commonwealth when, though there were such royalists as the Wentworths, the county as a whole under Lord St. John and Sir Samuel Luke took the parliamentary side. In 1650 was founded in Bedford the congregation now known as "Bunyan Meeting" from its later minister, John Bunyan. After the Restoration Bunyan was imprisoned, during part of which time he wrote *Pilgrim's Progress.* John Howard of Cardington, the

BY COURTESY OF THE BRITISH TRAVEL ASSOCIATION
WOBURN ABBEY, BEDFORDSHIRE

prison reformer, was also a Nonconformist.

In the main the landed estates remained small, but in the 18th century land began to be concentrated in fewer hands and by the end of the 19th century half the county was owned by fewer than 50 persons. The largest estate belonged to the duke of Bedford; his family, the Russells, had increased their holding in the county to 33.000 ac. by 1873, their residence, Woburn abbey, having been extended and rebuilt by Henry Flitcroft and Henry Holland and their park enlarged to 2,500 ac.

Communication was by roads mainly radiating from Bedford, until in the 17th century the Ouse was made navigable up to Bedford for lighters from King's Lynn. This was followed in the 18th century by further navigation to Shefford along the Ivel. The years after 1840 saw the coming of railways; the collapse of river navigation; the incorporation (1864) of Dunstable (q v.); the great growth of Luton (*q.v.*, 1876); the development of industry in all three boroughs; the rise to importance of the brick, cement and sand industries; and the disappearance of almost all the large estates.

Among secular buildings of historic interest are: Luton Hoo (former seat of the marquis of Bute), designed by Robert Adam (1767), but later gutted by fire; Hinwick house (Queen Anne period); Elstow Moot hall, a 17th-century museum associated with Bunyan; and a 16th-century dovecot and stable at Willington, owned by the National trust.

Population and Administration.— The population of the town of Bedford was only about 4,000 as late as 1801, while Leighton Buzzard (*q.v.*) and Luton were half that size and other towns smaller still. The population of Bedfordshire was 380.704 in 1961, that of the three boroughs being Bedford, the county town (63,317), Luton (131,505) and Dunstable (25,618). There are three parliamentary divisions and one parliamentary borough (Luton). each returning one member to parliament. The county has one court of quarter sessions and seven petty sessional divisions; Bedford and Luton have separate commissions of the peace and Bedford a separate court of quarter sessions. Assizes are held at Bedford. The archdeaconry of Bedford is in the diocese of St. Albans.

Industries and Communications.— Bedfordshire is a prominent agricultural county where interests are almost equally divided between cereals (chiefly wheat), livestock (including milk) and root crops, except for practically the whole of the eastern side, where the light soils of Potton, Biggleswade, Sandy and Maulden are wholly suited to intensive market gardening. Some of the best vegetables (sprouts, potatoes, peas) in the country are grown there for London and provincial markets.

Bedford. Luton and Dunstable have all become industrial centres manufacturing both capital and consumer goods, this development being attributed to their proximity to London and their good rail and road communication with midland sources of raw materials. Luton's products include ball bearings, hats, electrical equipment, precision instruments and automobiles (the last being also made at Dunstable), and Bedford produces machinery, generating plant and precision and electronic instruments.

The various geological formations are considerably exploited. notably by a great range of brickworks in the Oxford Clay south of Bedford. Chalk is quarried for cement near Dunstable and Houghton Regis, while around Leighton Buzzard quantities of sand are taken for glassmaking and brick and molding purposes.

Near Bedford are the College of Aeronautics and a royal aircraft establishment. The National Institute of Agricultural Engineering is at Wrest Park, near Silsoe, and a large food research centre at Colworth house, near Sharnbrook. At Old Warden is the Shuttleworth (agricultural) college and there are colleges of further education at Bedford and Luton.

The London-Birmingham motorway (expressway) crosses the southern part of the county, entering near Luton, and there are three important trunk roads: Watling street passing through Dunstable, the Great North road by Biggleswade and the London-Leicester-Carlisle road through Bedford. The county is crossed by three main railway routes from London to Scotland; that from King's Cross passes through Biggleswade; the Euston route serves Leighton Buzzard; and the St. Pancras route runs through Luton and Bedford. There are also rail services from Bedford to Northampton, Bletchley and Cambridge. There is a civil airport at Luton. (A. J. Go.)

BÉDIER, (CHARLES MARIE) JOSEPH (1864–1938), French scholar, who made an invaluable contribution to the study of medieval French literature, was born in Paris on Jan. 28, 1864. He was appointed professor of medieval French language and literature at the Collège de France in 1903. He won recognition as early as 1893 with *Les Fabliaux,* a work on 13th-century French narrative poetry. The publication of his *Roman de Tristan et Iseult* in 1900 set a European seal on his reputation as a writer, while his profound scholarship found its fullest expression in his epoch-making critical edition of the *Roman de Tristan* by Thomas (1902–05). He was the first to show that the earliest Tristan poem was the product of an individual genius, not of popular tradition. In his next great work, *Les Légendes épiques* (4 vol., 1908–21), he developed with a wealth of detail his theory that the great epic poems of medieval France were equally remote from popular tradition and that they were closely connected with certain sanctuaries situated along the routes used by pilgrims in the 11th and 12th centuries. As a sequel to this study he published in 1922 a critical edition of the *Chanson de Roland* in which he applied the strictly conservative method of editing which became closely associated with his name. He was elected to the Académie Française in 1921. He died at Grand-Serre, Drôme, on Aug. 29, 1938. (E. VR.)

BEDLAM, the popular name of Bethlehem Royal hospital, the first lunatic asylum in England and, with the exception of one in Granada, Spain, the first in Europe. It was originally founded by Simon FitzMary, sheriff of London, in 1247, as a priory in Bishopsgate street for the sisters and brethren of the order of the Star of Bethlehem. Bedlam was mentioned as a hospital in 1330 and some lunatics were accommodated there by 1403. In 1547 it was handed over by Henry VIII with all its revenues to the City of London as a hospital for lunatics. It became famous and afterward infamous for the brutal ill-treatment meted out to the insane. In 1675 it was moved to Moorfields; and in 1815 to St. George's road in southeast London; and in 1930 to Shirley on the borders of Beckenham and Croydon. Now a part of the national health service, it is known as Bethlem Royal hospital and the Maudsley hospital. The word Bedlam was used generically for all insane

asylums and is used colloquially for an uproar.

BEDLINGTON, an urban district (officially called Bedlingtonshire) in the Wansbeck parliamentary division of Northumberland, Eng., 12 mi. N. of Newcastle upon Tyne by road. Pop. (1961) 29.373. It lies on high ground about $2\frac{1}{2}$ mi. above the mouth of the Blyth river. The port of Blyth is partly in Bedlingtonshire. The main industries are mining and exporting coal, brickmaking and agriculture; there are also factories making shirts, gloves, electrical components and light engineering equipment. The iron works flourished until the 1860s. Bedlington is known for a famous breed of terriers.

Bronze Age remains were found in the area. Bedlington and the hamlets belonging to it were bought by Cutheard, bishop of Durham, between 900 and 915 and (although in Northumberland) became part of the county palatine of Durham over which Bishop Walcher was granted royal rights by William the Coriqueror. Bedlington lost these privileges in 1536, though remaining in the hands of the bishops of Durham until taken over by the ecclesiastical commissioners in 1866. Bedlingtonshire was made part of Northumberland for civil purposes in 1832 and 1844.

BEDLOE, WILLIAM (1650–1680), English informer, who in Oct. 1678 came forward to claim the £500 reward for information concerning the murder of the magistrate Sir Edmund Berry Godfrey and who for a while played a role second only to that of Titus Oates in sustaining the panic of the alleged "popish plot." Bedloe was born at Chepstow on April 20, 1650. Emboldened by his success he denounced various Roman Catholics and, having become very popular, married an heiress and lived luxuriously. Afterward his fortunes waned and he died of a riding injury at Bristol on Aug. 20, 1680. He appears to have been well-educated; he was certainly clever, and after coming to London in 1670 he became acquainted with some Jesuits and was occasionally employed by them. Calling himself at different times Captain Williams, Lord Gerard, Lord Newport or Lord Cornwallis, he traveled from one part of Europe to another, underwent imprisonment and became an expert in all kinds of duplicity. But the details of his career, provided by partisans, must be treated with caution.

BEDMAR, ALFONSO DE LA CUEVA, MARQUÉS DE (1572?–1655), Spanish diplomatist, was allegedly responsible for the so-called "conspiracy of Venice" in 1618. Philip III of Spain nominated him ambassador to the Venetian republic in 1607—a time when the viceroys of Naples and Milan, the duque de Osuna and the marqués de Villafranca, were endeavouring to increase Spanish power in Italy. To this policy Venice was resolutely opposed. The ambassador, who was made marqués de Bedmar in 1614, had little hesitation about using his diplomatic privileges to promote the designs of Osuna and Villafranca. Consequently the Venetian government invented the alleged conspiracy to seize the republic in order to provide a pretext for Bedmar's expulsion.

Philip III then sent him to the Spanish Netherlands where, for a time, he exercised the functions of first minister. In 1622 he was made a cardinal, resigning the marquisate to his brother Juan. He spent much of his later life in Rome, assisting in Spanish diplomatic representation to the Vatican. In the 1620s he was made bishop of Málaga and of Oviedo, where he died.

He either wrote, or caused to be written, *Squittinio della libertà veneta* (1612), an anonymous work attacking the Venetian government.

BEDOUIN (Arabic *badawi* "desert dweller"), the nomadic tribesmen of the middle eastern deserts, who live in black goats' hair tents and subsist on the products of animal husbandry. The Bedouins constitute about one-tenth of the total population of the middle'east, but inhabit or utilize almost nine-tenths of its land area. The annual wandering cycle of the Bedouins, determined by the grazing needs of their herds or flocks, takes them into the desert during the rainy winter season, and closer to the cultivated land with its rivers, springs and wells, in the dry summer months. The Bedouins can be classified according to the animal species which form the basis of their livelihood. First in prestige and historical importance are the camel nomads, occupying huge wandering territories and organized into large tribes in the Syrian and Arabian deserts, as well as in the Sahara, where the most typical representatives are the Tuareg. Beneath them rank the sheep and/or goat nomads, whose much smaller wandering areas keep closer to the cultivated regions, in the fertile crescent countries of Jordan, Syria and Iraq. A special subvariety of the latter are the west-Iranian and Moroccan tribes practising transhumance; *i.e.,* a vertical kind of nomadism, up into the mountains and highlands in the summer, and down into the valleys and lowlands in the winter. The cattle nomads are found mainly in south Arabia and in the Sudan where they are called Baggara (*q.v.*).

Following World War I the Bedouin tribes had to submit to the control of the governments of the countries in which their wandering areas lay. This also meant that internal feuding and the raiding of outlying villages had to be given up, to be replaced by more peaceful commercial relations. The tribal character of Bedouin society continued, however, as did the patriarchal order in their extended, patrilineal, endogamous and polygynous families. Among the Arabic-speaking tribes, the head of the family, as well as of each successively larger social unit making up the tribal structure, is called *shuykh* ("sheikh"); the *shaykh* is assisted by an informal tribal council of male elders. Religious traditions, frequently older than the official religion of Islam, play an important role in Bedouin life, as do the values of hospitality. bravery, generosity. dignity and honour, vengefulness and forgiveness, independence and leisure.

In addition to the "noble" tribes who trace their ancestry to either Qaysi (north Arabian) or Yamani (south Arabian) origin, Bedouin society comprises scattered, "ancesterless," vassal tribal splinter groups who shelter under the protection of the large noble tribes and make a living by serving them as blacksmiths. tinkers, artisans, entertainers and other trades. This class structure has assumed a most elaborate form among the Tuareg (*q.v.*) who, alone among the middle eastern Bedouins, are matrilineal. Slavery still persists among both the Arabian and Saharan Bedouins.

Although the Bedouins traditionally despise agricultural work, artisanship and other manual labour, many of them have become sedentary throughout the millennia of middle eastern history because of political or economic pressures. After the 1920s, and even more so after World War II, this trend became greatly accelerated, as a result of the settlement policies of middle eastern states. *See* also ARAB; NOMADS.

BEDSORE (DECUBITUS **ULCER),** an ulceration or death of a section of skin. Bedsores can occur on any bony prominence of the body that bears weight; *e.g.,* by pressing on the mattress beneath a patient. Bedsores are likely to occur in patients suffering from chronic debilitating diseases.

The apparent chief cause of bedsores is interference with the blood supply to an area of skin as result of external pressure on blood vessels. To prevent such interference, the position of bedfast patients should be changed frequently. Other apparent causes are prolonged friction, as from restlessness and uncleanliness. Bedsores frequently occur in bedfast patients who have lesions of the nerves that supply the skin of the legs or back; incontinence of bladder or bowel results in soiling their skin and setting the stage for ulcerations.

Every effort should be made to prevent bedsores because of the potentially dangerous secondary infections that can develop. But even uith the best of care bedsores sometimes occur. Treatment includes improving the general condition of the patient, relieving the pressure or friction, establishing cleanliness and administering local treatment.

BEDSTRAW, a common name for small lacy-flowered herbs of the genus *Galium* of the madder family (Rubiaceae). The name

refers to the old practice of using the dried plants in the making of beds. About 300 species are known, found chiefly in temperate parts of the northern hemisphere, many of them being common weeds. The tiny white or yellow flowers often aggregate into large airy clusters. In the United States and Canada there are about 60 species of *Galium*, several of which are introduced weeds. Among the more conspicuous are the sweet-scented bedstraw (G. *triflorum*); the northern bedstraw (G. boreale), with profuse clusters of white flowers; the white or great hedge bedstraw (G. mollugo), called also wild madder and false baby's-breath; and the California bedstraw (G. californicum), a yellow-flowered species. Common British species are the yellow or Our-Lady's-bedstraw (G. verum) and the goose grass, or cleavers (*q.v.*; *G.* aparine); both are found in Europe and North America. Some species, including G. verum, G. *trifidum* and G. *boreale*, yield dyes.

BEDWELLTY, an urban district in the Bedwellty parliamentary division of Monmouthshire, Eng. Pop. (1961) 27,336. The district is about 6 mi. long and is largely a high ridge between the Sirhowy and Rhymney valleys, though the northeastern portion almost adjoins the Ebbw vale. The district includes many villages or townships such as Bedwellty, New Tredegar, Aberbargoed (where are the municipal offices), Pengam, Charlestown and Blackwood, the last, at the southern end of the district, about 13 mi. N.W. of Newport by road. St. Sannan's church in Bedwellty village dates back to the 12th century and its register to 1624.

The chief industries of the area are farming and coal mining and there are clothing factories and an iron foundry.

BEDWORTH, a manufacturing and residential town and urban district of Warwickshire, Eng., lies 3 mi. S. of Nuneaton and 5½ mi. N. of Coventry. Pop. (1961) 32,501. Coal is mined from two pits. There is a growing light engineering industry centred in a modern trading estate, and tapes, ribbons and trimmings are made; similar industries are carried on in the area of Coventry, extending southward from Bedworth. Corley hall, 4 mi. W., is a Jacobean farmhouse, reputed to be the original Hall farm in George Eliot's Adam Bede.

BEDZIN, a town in the Katowice wojewodztwo (province) of Poland, lies on the Czarna Przemsza river, a tributary of the Vistula, 290 km. (180 mi.) S.W. of Warsaw. Pop. (1960) 39,000. One of the oldest towns in the Upper Silesian industrial region, Bedzin arose on the trade route between Wroclaw (Breslau) and Cracow (*qq.v.*). A castle and settlement were in existence there in the 13th century. After the third partition of Poland, in 1795, the town was seized by Prussia. Between 1807 and 1918, when it was returned to Poland, it belonged successively to the duchy of Warsaw and the Polish kingdom (a Russian dependency). The first coal mine in the Upper Silesian basin was started there in 1785. The town is now a mining and industrial centre (metallurgy, machinery and electrotechnical products). (K. M. Wi.)

BEE, the common name for any of about 20,000 species of insects of the superfamily Apoidea of the order Hymenoptera (*q.v.*). In addition to the few common sorts that readily come to mind—honeybees, bumblebees and perhaps carpenter bees—thousands of more wasplike or superficially flylike bees are included in the Apoidea. The smallest are only 2 mm. (about $\frac{1}{13}$ in.) in length, the largest over 30 mm. (over 1 in.). Bees are universally abundant, wherever there are flowers (see below).

Bees are closely related to the sphecoid wasps (see WASP). The principal biological difference between bees and wasps is that most bees (except for parasitic kinds, see below) directly provide their young with a mixture of pollen and honey, storing such supplies in their nests, whereas wasps feed their young prepared animal food or provision their nests with insects or spiders. Associated with this difference in food preference are certain structural differences. Whereas wasps are covered with unbranched hairs, bees have at least a few branched or feathered hairs to which pollen often clings. Such hairs are part of the mechanism by which bees gather pollen.

Relationships to Flowers.—Bees are entirely dependent on flowers for food, which consists of pollen and nectar, the latter sometimes modified and stored as honey. There is no doubt that the bees and the flowers that they pollinate evolved simultaneously during the earth's history.

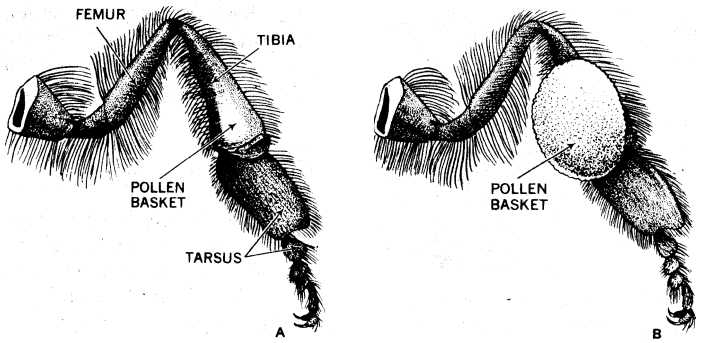

FIG. 1.—LEG OF WORKER HONEYBEE; (A) POLLEN BASKET EMPTY; (B) POLLEN BASKET FULL

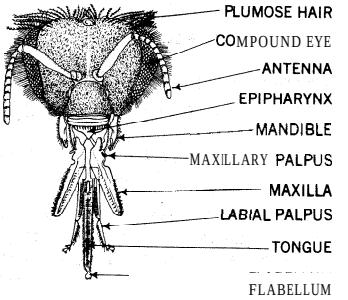
As bees go from flower to flower gathering pollen, they lose small quantities. These small amounts of inadvertently lost pollen are significant, for they often result in cross-pollination of plants. (Self-pollination, the closest possible inbreeding, is often genetically undesirable or, in some plants, produces no seeds.) The practical value of bees as pollinators is enormously greater than the value of their honey and wax production. Especially in areas of intensified agriculture, where natural habitats of bees have been destroyed, efforts are being made to encourage the increase of both wild bees and the honeybee.

General **Description.**—Male bees are usually short lived and never collect pollen, nor have they other responsibilities in connection with providing for the young. Female bees do all the work of nest-making and provisioning and usually have special anatomical structures that assist them in carrying pollen. In most females, hairs on the end segments (tarsi) of the forelegs are used to brush pollen from the anthers of the flowers. The tarsi of the fore- and middle legs gather the pollen from the hairs of the body of the bee. Collected pollen is then passed to the pollen-carrying organs, which vary among different kinds of bees.

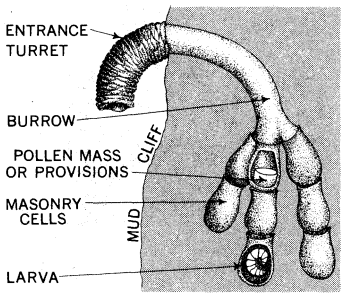
Some primitive bees (*e.g.*, in the families Colletidae and Halictidae) have masses of long hairs on the basal segments (coxae, trochanters and femora) of the hind legs and on the undersurface of the abdomen. These hairs constitute the scopa, the pollen-carrying structure. In many bees of the families mentioned above the scopa has been lost from the abdomen, being limited to the hind legs; in two subfamilies (Panurginae and Anthophorinae) the scopa is enlarged on the more distal parts (tibiae) of the hind legs and reduced or absent on both the abdomen and basal leg segments; finally, in the social bees (honeybee, bumblebee, etc.) the scopa is limited to the outer sides of the hind tibiae where it consists of long hairs surrounding a smooth area, the whole being called a pollen basket, or corbicula. In the family of leaf-cutting bees (Megachilidae), the scopa has been lost from the legs and is limited to the underside of the abdomen. In one subfamily of colletid bees (Hylaeinae) the scopa is absent, and pollen, mixed with nectar, is carried to the nest in the expanded portion of the fore-gut, the crop.



BY PERMISSION OF BAZAAR EXCHANGE & MART, FROM CHESHIRE, "BEES AND BEE-KEEPING"

FIG. 2.—HEAD AND MOUTH PARTS OF HONEYBEE

Most bees are polylectic; that is, they gather pollen from a wide variety of flowers; however, some bees collect pollen only from flowers of certain families, others from flowers of certain colours. Finally, there are the oligolectic bees, which gather pollen from only a few related kinds of flowers. Some oligolectic bees show no structural adaptations to their favoured flowers, but others have obvious adaptations of this sort. For example, several unrelated bees have scopae consisting of sparse bristles; this



BY COURTESY OF U.S DEPT. OF AGRICULTURE

FIG. 3 — NEST OF BURROWING BEE (ANTHOPHORA OCCIDENTALIS); EXTERIOR VIEW WITH TWO CELLS CUT OPEN

enables them to carry the pollen of Onagraceae (evening primrose and relatives), which is webbed together as though by cobwebs. Some tiny tubular flowers have anthers inside the tube, from which ordinary bees cannot easily extract the pollen. Unrelated oligolectic bees have evolved means of getting such pollen; for example, *Proteriades* and some species of *Andrena* pull pollen out of *Cryptantha* flowers by means of hooked hairs on the proboscis; some *Calliopsis* species hook pollen within *Verbena* flowers with groups of curved hairs on the front tarsi.

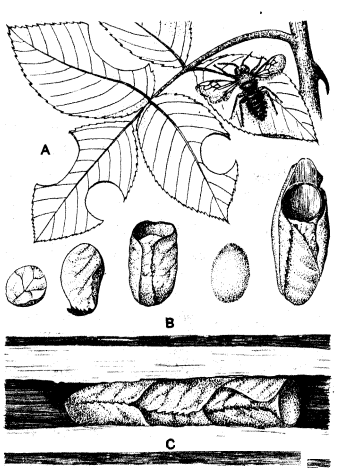
The mouth parts of bees, like the pollen-collecting and -carrying devices, seem to be adapted to different flowers. In colletid bees the lobelike glossa is short and broad, like that of most wasps; other bees (families Halictidae, Andrenidae, Melittidae) have short but pointed glossae. The remaining families of bees have long mouth parts which serve for sucking nectar from deep tubular flowers; some species of *Euglossa* from the American tropics have mouth parts so long that they reach beyond the tip of the abdomen even when folded. The jaws are not involved in these adaptations; they are used mainly for making the nest.

Solitary Bees.—The majority of the Apoidea are solitary bees; that is, each female makes her own nest (usually a burrow in the ground) and provisions it. Among such bees there are no castes (worker, queen, drone). The mother bee constructs cells, each of which is an enclosed space supplied with pollen and honey, and lays a single egg in each. Some cells of burrowing bees are lined with wax, others with cellophanelike material, whereas a few are unlined. Sometimes the cells branch from the main burrow; occasionally they are sections of the burrow separated by partitions. When a cell is completed and an egg laid. the mother closes the cell and goes on to build and provision another. All families of bees contain species that live in this way.

On flat ground nests are indicated by the little hillocks (tumuli) of dirt excavated and left around the entrance. Some species make chimneys or turrets at the nest entrance; *Anthophora* species, far example. construct their nests in clay banks, fashioning turrets that project outward and downward (fig. 3). Nests of these bees often are made in aggregations, so that the term solitary is hardly appropriate, although each female makes her own nest.

Some of the solitary bees nest in wood or in the pith of twigs or canes; carpenter bees *(Xylocopa* species), which sometimes damage timbers by their burrowing, are good examples.

The family Megachilidae, which includes the leaf-cutting bees, contains species which find and use pre-existing burrows or hollows or make exposed nests. The cells are made of materials such as pieces of leaves or petals, pebbles, mud, resin and down plucked from plants. The leaf-cutting bees, *Megachile* species, are among the commonest members of this family. They make nests consisting of rows of cells laid end to end in burrows in wood, in the ground, in corn or weed stalks, etc. (fig. 4). Neatly cut oval pieces of leaves, often from roses, are used to make a thimble-shaped cell. After a cell is provisioned with pollen and honey, an egg is laid in it, then the cell is capped with remarkably perfect round pieces of leaves. Some European megachilid bees (of the genus *Osmia*) are noteworthy for making their nests only in abandoned shells of land snails.



FROM GRANDI INTRODUZIONE ALLO STUDIO DELLA ENTOMOLOGIA VOL II

FIG 4 — LEAF-CUTTING BEE (MEGACHILE CENTUNCULARIS) (A) ADULT ON LEAVES OF OWN CUTTING; (B) DIFFERENTLY SHAPED PIECES OF LEAVES (LEFT) FASHIONED INTO A CELL (RIGHT) AROUND A POLLEN MASS: (C) SERIES OF LARVAL CELLS CONSTRUCTED IN STEM

Most solitary bees are short lived as adults. Some species may be in flight only a few weeks of the year, having spent the rest of the year in their cells as eggs, larvae, pupae and young adults. Other species have several generations yearly, so that adults may be found during two or three different periods, or more or less continually. In temperate climates solitary bees usually pass the winter in their cells, either as mature larvae (prepupae) or as young adults.

Social Bees.—Occasionally, nests of normally solitary bees are inhabited by two females, each of which makes her own group of cells. In a few species as many as 40 females normally live together in one burrow, but each makes and provisions her own cells. In some halictid bees (sweat bees) weakly differentiated queens and workers exist. The queens establish their nests in the spring, making and provisioning the cells and laying eggs; during the summer the eggs hatch as workers. In the fall young queens and males are produced; the males and workers die, but the queens hibernate and start the cycle again the next spring. This is very much the same life cycle as that of the bumblebees, except that the halictid colonies are very small, consisting of a queen and two or three workers, rarely up to hundreds of individuals. As in the solitary bees, the halictids put all necessary food for one larva in a cell and do not add to it after the egg is laid and the cell closed.

The better-known social types, *e.g.,* bumblebees and especially honeybees, feed the young progressively; the queens lay their eggs in empty or nearly empty cells and food is not provided until the eggs hatch. There is, however, an interesting little group of bees (species of *Allodape, Exoneura,* etc.) found in Africa, southern Asia and Australia. in which progressive feeding occurs among scarcely social forms These bees live in hollow twigs; the nest is a mere burrow. The eggs are laid on the walls of the burrow and when they hatch the larvae are fed progressively.

The bees that exist in large, well-organized colonies represent a minority of the Apoidea, the subfamily Apinae (family Apidae). Included in the social bees are the well-known honeybees (*Apis* species), bumblebees (*Bombus* species) and the less known meliponines, or stingless bees (*Melipona* and *Trigona* species). For details on the life cycle of social bees *see* SOCIAL INSECTS. An account of the honeybee is given in BEEKEEPING.

Parasitic Bees.—In several families of bees there have evolved species that are called parasitic because they lay their eggs in cells of various working bees. The young larva, which usually has a large head and large jaws, destroys the egg or young larva of the host, then eats the provisions. These bees lack the scopa and other structures associated with collecting and carrying pollen. They also lack various structures of the jaws and legs that are used for making nests. Robbers and parasites of the social bees are also known.

See ENTOMOLOGY; INSECT; *see* also Index references under "Bee" in the Index volume.

BEEBE, (CHARLES) WILLIAM (1877–), U.S. biologist, explorer and author, combined high distinction in detailed biological research and exploration with an unmatched literary skill in the field of natural history. He was born in Brooklyn, N.Y., on July 29. 1877, and educated at Columbia university (B.S.. 1898). He was curator of ornithology at the Bronx Zoological park from 1899 and director of the department of tropical research of the New York Zoological society from 1919. He led

numerous scientific expeditions to Mexico, Venezuela, the orient, British Guiana, Sargasso sea, Bermuda, Galápagos Islands and the West Indies. He descended in a bathysphere to a depth of 3.028 ft. in 1934, a record at that time. Noted as a lecturer, he received numerous prizes and honours for scientific research and writing. Among many important technical and popular books and articles are *Monograph of the Pheasants* (1918), *Jungle Days* (1925), *Beneath Tropic Seas* (1928), *Book of Naturalists* (1944), *High Jungle* (1949) and *Unseen Life of New York* (1953). His versatile interests ranged from mountain pheasants through the mammals of lowland tropical forests to the fishes of the deep sea, and he was equally enthusiastic about living animals in their native habitats whether insect, tadpole, snake, anteater or hummingbird. (A. E. E.)

BEECH, the name for well-known trees of the genus *Fagus,* members of the family Fagaceae to which belong also the oaks, chinquapins, chestnuts and tanbarks. The name beech is from the Anglo-Saxon meaning "a book." The connection of the beech with books is supposed to have originated in the fact that the ancient runic tablets were made from thin slabs of beechwood. Ten species, several with well-known horticultural varieties, have been described; all are indigenous to the northern hemisphere. They are all large (80–100 ft. or more), round-headed and spreading, with smooth light coloured bark. The two principal species are the American (*Fagus grandifolia*) and the European beech (*F. sylvatica*).

The American beech ranges from New Brunswick to Minnesota and south to Florida and Texas. It attains its best development on dry sandy loams, but is found on a variety of sites throughout its range and is one of the principal trees of the northeastern climax forest. Root suckering is prevalent, and a considerable portion of the natural reproduction has its origin under the parent trees in this manner. Several varieties of the American beech are also recognized: these include *pubescens, caroliniana* and *jerruginea.* The wood of this tree is used for veneer, flooring, novelties, turnery and furniture and is destructively distilled for charcoal, wood alcohol and acetate of lime.

The European beech is a common and important forest tree spreading from southern Norway and Sweden to the Mediterranean. It is a native of England and a commonly planted tree in Scotland and Ireland. It occurs in the Swiss Alps up to elevations of 5.000 ft.; it abounds in the U.S.S.R. and is widely distributed in Asia Minor and the provinces of Iran. Beechmast, the fruit of this tree, was at one time known in England as buck; the county Buckingham was so named because of its famous beech forests. Beechmast has been used as a food in times of distress and famines, and produces an abundant supply of food for game animals and swine, which are turned into beech forests to forage on the fallen fruits. In France the fruits are used for feeding pheasants and fattening domestic poultry. The well-ripened nuts yield from 17% to 20% of a nondrying oil suitable for illumination, and are used in certain parts of France in cooking and as a substitute for butter.

European beech features broadly oval, lustrous, dentate leaves, which often persist on the branchlets through the winter, although dead. Conspicuously elongated. shiny, chestnut-brown winter buds, unisexual flowers which are monoecious, and smooth olive-gray bark which remains unbroken even on the oldest and largest trunks are other identifying features. Several well-known varieties are important decorative plants. These include the graceful weeping beech (var. *pendula*); the bronze or copper beech (var. *atropunicea*), a form with purple or copper-coloured leaves; and the cutleaf beech (var. *laciniata),* featuring sharp, deeply lobed leaves. The Japanese species, *F. japonica* and *F. Sieboldii,* also are occasionally used as ornamentals in the western hemisphere.

HORACE MCFARLAND CO.

AMERICAN BEECH (FAGUS GRANDIFOLIA) LEAVES AND FRUIT

The antarctic beeches, 17 species widely distributed in Australia, New Zealand and South America, belong to the genus *Nothojagus. See* also NUT; TIMBER. (E. S. HR.)

BEECHAM, SIR THOMAS (1879–1961), the leading English conductor of his time and the main figure in the revival of opera in England. He was also a master of language who endeared himself to the public by his witty speeches and tirades against the insufficiencies of British musical standards.

Born at St. Helens, Lancashire, April 29, 1879, he was educated at Rossall school and Wadham college, Oxford. He studied music with S. Walsing (piano). J. Varley Roberts and Charles Wood (composition), and M. Moszkowski (orchestration). In 1902 he gained experience as conductor of K. Truman's traveling opera company and in 1905 he gave his first London concert at the Bechstein (later Wigmore) hall with players from the Queen's hall orchestra. In 1910 he began to promote the production of opera in England, and during the following years conducted the first performances in England of works by Delius, Richard Strauss, Stravinsky and others. He was knighted in 1916 and later that year succeeded to the baronetcy of his father, Sir Joseph Beecham. Selfless in the pursuit of his ideal, he made great financial sacrifices to establish opera in England, founding the British National Opera company after World War I, and the Imperial League of Opera in 1927. In 1928 he visited the United States and in the following year organized in London a festival of the works of Delius. In 1932 he founded the London Philharmonic orchestra and in 1933 was appointed artistic director at Covent Garden. During World War II he toured Australia, Canada and the U.S. and in 1947 founded the Royal Philharmonic orchestra.

Beecham greatly improved the standards of British orchestras and ensured an international status for British opera production. His repertory ranged from Handel to the mid-20th century and his interpretations were admired for their verve and elegance of style. His personal preference went, however, to the 18th century and he was especially associated with the works of Mozart. He wrote his autobiography, *A Mingled Chime* (1943) and the standard biography of Delius (1958). He died in London on March 8, 1961.

BEECHDROPS, a North American annual plant. *Epifagus virginiana,* belonging to the broomrape family (Orobanchaceae): It is parasitic on the roots of the American beech, *Fagus grandifolia,* and ranges from Nova Scotia and Wisconsin south to Florida and Louisiana. The slender, branching stems, up to one and one-half feet high, and purplish-, yellowish- or pale brown, bear scalelike leaves and numerous axillary flowers. The usually sterile upper flowers, about one-third inch long, are whitish with two brown-purple bands; the lower, which may develop even underground, are smaller, unopening, and fertile. Each capsule contains about 850 minute seeds. The underground portions of the plant are a tuberous stem from which arise the flowering shoots, and the roots that maintain contact with the host. Beechdrops seeds germinate only when they are in contact with beech roots. Beechdrops is sometimes called cancerroot because of its supposed efficacy in the treatment of cancerous sores. (J. W. TT.)

BEECHER, HENRY WARD (1813–1887), U.S. clergyman, holds a leading place in the history of American oratory, and was one of the most conspicuous and controversial public figures of his day. Born on June 24, 1813, in Litchfield, Conn., he was the eighth child of the Rev. Lyman Beecher (*q.v.*) and his first wife, Roxana Foote. The boy who was to become (in John Hay's estimate) "the greatest preacher the world has seen since St. Paul preached on Mars Hill" grew up a boisterous but apparently backward child. Sent to various schools, he showed little promise until taken in hand by instructors at the Mount Pleasant Collegiate institute in Amherst and then at Amherst college, where he enrolled in 1830. Though never distinguished as a scholar, he managed to curb a congenital distaste for hard study, at the same time gaining sufficient poise to become a superior speaker and popular leader. After three postgraduate years in Cincinnati, O., at Lane

Theological seminary, of which his father had been made president in 1832, Beecher in 1837 was settled over his first parish, a Presbyterian congregation of 20 souls at Lawrenceburg, Ind. His marriage to Eunice White Bullard took place the same year.

During this pastorate and a later one at Indianapolis, Ind. (1839–47), Beecher gradually discovered and cultivated the techniques that were the vital elements of his power as a preacher. He came to believe that a sermon succeeds through adherence to the single objective of effecting a moral change in the hearer. His extraordinary dramatic sense and his ability in the use of figurative language were well adapted to such an objective, as was his highly emotional conception of God as one who "loves a man in his sins for the sake of helping him out of them." Beecher's success mounted in both preaching and lecturing, and in 1844 he gained a wide reputation through publication of *Seven Lectures to Young Men*, a set of vivid exhortations on the vices and dangers in a frontier community.

In 1847 Beecher accepted a call to the newly established Plymouth Church (Congregational) in Brooklyn, N.Y. By the early 1850s his oratory was drawing weekly crowds of 2,500, and the church claimed the largest membership of any congregation in the United States. The minister and his admirers sometimes exaggerated his influence in public affairs, but Beecher clearly did become a spokesman and symbol of the Protestantism of his time; both his pronouncements and his personal life were regularly matters of national or even international interest. Dramatic antislavery gestures atoned in the public mind for the preacher's earlier reticence on this subject, and his lectures of 1863 in England worked the Beecher magic upon audiences initially hostile both to him and to the northern point of view. After the American Civil War he was outspoken and frequently courageous in support of a moderate Reconstruction policy, in favour of Cleveland's 1884 candidacy, and in advocacy of woman suffrage, evolutionary theory and scientific biblical criticism. His outlets for these appeals, in addition to Plymouth Church, were the *Independent*, a Congregational journal which he edited in the early 1860s, and later the undenominational *Christian Union*.

The public had more than its share of exposure to Beecher's personal life in the 1870s, after his former friend and protégé Theodore Tilton brought suit against him for alleged adultery with Tilton's wife. Two ecclesiastical tribunals exonerated Beecher, but the jury in the civil suit failed to reach agreement, as have later students of the evidence. That the minister was at least indiscreet to a degree that did little credit to his intelligence has been generally accepted, and was in fact acknowledged by Beecher himself.

Despite the shadow cast by this scandal, Beecher remained active and influential for another decade. He died of apoplexy on March 8, 1887. Mrs. Beecher and four of their ten children survived him.

Besides his sermons, the works that best indicate the nature of his contributions to American Protestantism and to the art of preaching are *Evolution and Religion* (1885), *Life of Jesus the Christ* (1871–91) and *Yale Lectures on Preaching* (1872–74). Other notable works are *Star Papers* (1855), ***New*** *Star Papers* (1859), *American Rebellion: Report of Speeches Delivered in England . . .* (1864) and *Norwood: a Tale of Village Life in New England* (1867).

BIBLIOGRAPHY.—The most balanced, if incomplete, assessment of Beecher appears in Constance M. Rourke, *Trumpets of Jubilee* (1927). Lyman Abbott's biography (1903) is the best large treatment. *See* also biographies by W. C. Beecher *et al.* (1888), Paxton Hibben, with bibliography (1927); Lyman Beecher Stowe, *Saints, Sinners, and Beechers* (1934); and the account of the Tilton affair in Robert Shaplen, *Free Love and Heavenly Sinners* (1954). L. *G.* Crocker, *Henry Ward Beecher's Art of Preaching* (1934), *Henry Ward Beecher's Speaking Art* (1937) treat of Beecher as orator. (WI. R. H.)

BEECHER, LYMAN (1775–1863), U.S. clergyman, was an outstanding exponent of the revivalistic tradition in American Protestantism and founder of one of the most remarkable families of the 19th century. He was born in New Haven, Conn., on Oct. 12, 1775, and was graduated from Yale college in 1797. During pastorates at Litchfield and Boston he became widely known as the sturdy and eloquent champion of the established religious order, fostering a "continuous revival" and battling rationalism, Roman Catholicism and the liquor traffic as well as disestablishment of the churches.

In 1832 Beecher turned his attention to the evangelization of the west, becoming president of the newly founded Lane Theological seminary in Cincinnati, O. This venture did not live up to expectations. Beecher's Calvinism, hard doctrine for Bostonians, proved too mild for western Presbyterians, who had the revivalist tried for heresy; and a bitter dispute over the slavery issue dealt the seminary a blow from which it never fully recovered. Retiring in 1850, Beecher died on Jan. 10, 1863.

Lyman Beecher was, by one contemporary estimate, "the father of more brains than any other man in America." Among the 13 children of his three marriages, Henry and Harriet achieved lasting fame *(see* BEECHER, HENRY WARD; STOWE, HARRIET ELIZABETH BEECHER), and five others were well known in their day: CATHARINE (1800–78) was a leader in the women's education movement; EDWARD (1803–95) attained prominence as minister, college president and antislavery writer; CHARLES (1815–1900) became superintendent of public instruction in Florida; ISABELLA (1822–1907) was an able campaigner for women's legal rights; and THOMAS (1824–1900) was a pioneer in adapting church life to modern urban conditions.

BEEF is the flesh of mature cattle, as distinguished from veal (the flesh of calves), and comprises the red muscle or lean meat, fat and connective tissues; in carcasses the term also includes the bones.

Beef as a Food.—Beef is a staple food in most meat-eating countries and in some the demand for it is closely associated with prosperity. It is easily digestible and is an excellent source of high-quality protein as well as of considerable food energy, minerals and vitamins. One hundred grams of medium-fat beefsteak, edible portion, cooked, contains 59% water and provides 233 calories, 27 g. protein, 13 g. fat, 224 mg. phosphorus, 3.4 mg. iron and 5.5 mg. niacin, as well as small amounts of other minerals and vitamins.

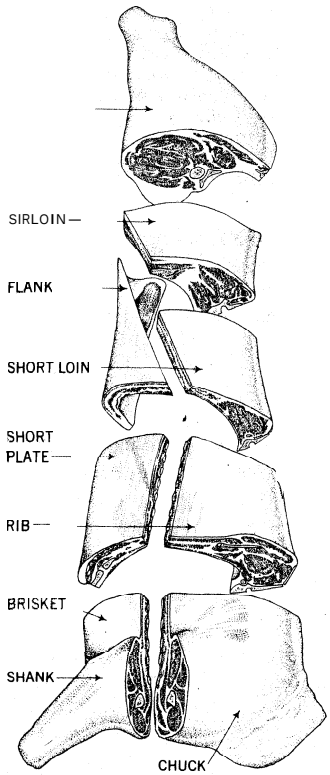
National and regional preferences for special types and weights of beef persist. In New England the preference is for mature "heavy steer beef" from animals two and one-half to three years old, refrigerator-cured for 10 to 20 days, while in general the trend in the United States and Great Britain has been toward younger, leaner and more tender beef, at the expense of flavour. Yearling or baby beef, slaughtered at 10 to 16 months and at live weights of 700 to 1,200 lb., after intensive grain feeding, provides tender, high-quality roasts and steaks of a size suited to the needs of the modern small urban family. Beef from dairy cows is used mainly for meat products in the United States but is prepared for the table in some countries.

Methods of preparation and cooking vary widely with national tastes and the quality of the meat. The finer cuts from the ribs, loin and round (the upper part of the hind leg) are usually used for roasts and steaks. Cuts containing coarser muscle and more connective tissue may need longer, slower cooking as in stews and pot roasts, or may be chopped or ground for hamburger, sausage and other meat products. Beef is canned in many forms, such as roast beef, corned beef, beef stew, beef hash and chili con carne. It can also be cured as salt (corned) beef or dried (jerked) beef. Boneless ground beef, when cooked, dehydrated and compressed, forms an important food in emergency army rations. *(See* MEAT COOKERY.)

As might be expected, beef consumption is highest in the major exporting countries. In Argentina the annual per capita consumption is well over 200 lb. In Australia and New Zealand it is 110 to 130 lb. and in the United States and Canada 80 to 90 lb. United Kingdom consumption, about 50 lb., is higher than in most western European countries.

Factors Affecting **Beef** Quality.—Tenderness, juiciness and

flavour in beef are largely determined by the amount and distribution of fat, the composition of the muscle bundles making up the red meat and the presence and consistency of connective tissue (tendons and ligaments). Apart from the differences in cuts from different parts of the animal, these factors may be affected by its age, breed, sex. feeding, health and treatment before and after slaughter. As a beast matures, it lays down fat externally and later between the muscle bundles, giving an effect of marbling; this improves the flavour and texture of the meat. With age, the colour of the red meat deepens, the flavour strengthens and the muscle fibres may become coarser and the connective tissue tougher. The highest-quality beef comes from specialized beef breeds that mature quickly. Beef from stock that have been used for breeding is generally coarser and tougher than that from young females (heifers) and castrated males (steer, ox or bullock beef). Toughness may be found also in meat from animals that have been undernourished, diseased or exhausted before slaughter. Whether in the public municipal abattoir common in Europe or the private meat-packing plants, more usually found in the western and southern hemispheres, stunning, mechanical or electrical, usually precedes bleeding, except in ritualistic slaughter. Inadequate bleeding can affect adversely the keeping quality of the meat Great attention is paid to hygienic aspects of the slaughter processes. and ante-mortem and (especially) post-mortem inspection may be obligatory.



BY COURTESY OF NATIONAL LIVESTOCK AND MEAT BOARD

FIG. 1.—U.S. METHOD OF CUTTING BEEF

Beef is generally improved in tenderness and flavour by aging or ripening; *i.e.*, hanging for 10–14 days at approximately 36° F. Changes that enhance the meat are brought about by the formation of lactic acid in the muscles and the action of enzymes which hydrolize the connective tissue. Modern developments in controlled ripening involve forcing fat into the lean meat, using ultraviolet lamps and treating with enzymes. When beef is frozen for storage or shipment, large ice crystals can form, damaging the muscle fibres and breaking up the texture. This may produce "drip," with loss of flavour and keeping quality when the meat is thawed. Chilled beef, which is carried at temperatures of 28° to 30° F., does not suffer in this manner.

Classes and Grades.—From the butcher's point of view the beef animal should have a high proportion of carcass to live weight. The percentage varies from 40% to 65%, with an average of 54%. Beef carcasses are classified, largely on the basis of sex, into steers, heifers, cows, bulls, stags and rigs. Steers are castrated males; heifers are females that have not calved. Heifers mature earlier than steers and tend to fatten more readily. The two are, ho ever, classified together under most grading systems. Cows are females that have calved. They may be marketed after a number of years in the breeding or dairy herd, or quite young because of inefficient production. Their carcasses may therefore range from little worse than heifer beef to something suitable only for hamburger. Bulls are adult males, and stags are males that have been castrated after reaching maturity. Their flesh is coarser and darker than that of steers, increasingly so with age; like cows, they produce a wide range of carcass types Rigs are males that have been imperfectly castrated or in which one or both of the testicles have failed to descend.

The classes are subdivided into grades that are determined by conformation, finish or fatness and quality, including marbling, texture and firmness. The ideal beef carcass should be compact and well-fleshed and should yield a low percentage of bone and a high percentage of the more valuable cuts (rib, loin, rump and round). The external fat or covering should be firm, smooth and evenly distributed. Marbling and fine texture are usually taken as indications of tenderness. **A** bright cherry-red lean meat and creamy white fat are desired by the trade. Meat that shows youth and has soft, porous bones with pronounced cartilages is generally preferred.

In the United States federal grading and stamping of beef was started by the department of agriculture on May 1, 1927. The official grades of steers and heifers in descending scale of fatness and natural tenderness are prime, choice, good, standard, commercial, utility, cutter and canner, the four higher grades being applied to younger animals. Cows are graded commercial or lower; vealers and calves: prime. choice, good, standard, utility and cull; and bulls and stags: choice, good, commercial, utility, cutter and canner. Similar grading standards are employed in other countries, especially in the export trade.

Cutting practice varies from country to country, as do the names given to the cuts from different parts of the carcass. In the second half of the 20th century, self-service at retail brought increased emphasis on smaller cuts and prepackaging.

Beef By-Products.—The most valuable by-product is the hide, which represents about 7% of the live weight. This is used for leather The body hair is used for felt, the ear hair for brushes and the tail hair for upholstery. Edible beef suet is used in some countries for oleo oil and oleostearin, both of which are used for oleomargarine, salad oils and lard compounds. Inedible fats are used for soap, glycerin, lubricants and leather dressing.

Bones, hoofs and horns may be used for novelties or. ground into bone meal, for casehardening steel, for animal feed or for fertilizer. Edible bones and connective tissue are cooked to make gelatin. Glue is made from inedible bones. Most of the blood is dried and used for animal feed or fertilizer, but some is used in textile sizing, waterproof glue and pharmaceutics and some in the manufacture of sausages for human consumption.

Casings and bladders are used for sausage, lard and cheese containers and goldbeater's skins Many offal parts are valuable food, such as liver, heart, tongue, brain, sweetbread (thymus gland), kidney, tail and tripe (stomachs of adult cattle). Miscellaneous parts not suitable for human food are cooked, dried and ground for poultry and animal feed.

Important pharmaceutical products are made from many glands and organs. Best-known of these are insulin and adrenaline. made from the pancreas and adrenal glands respectively. Extracts are also made from the pituitary, pineal, thyroid, parathyroid and sex

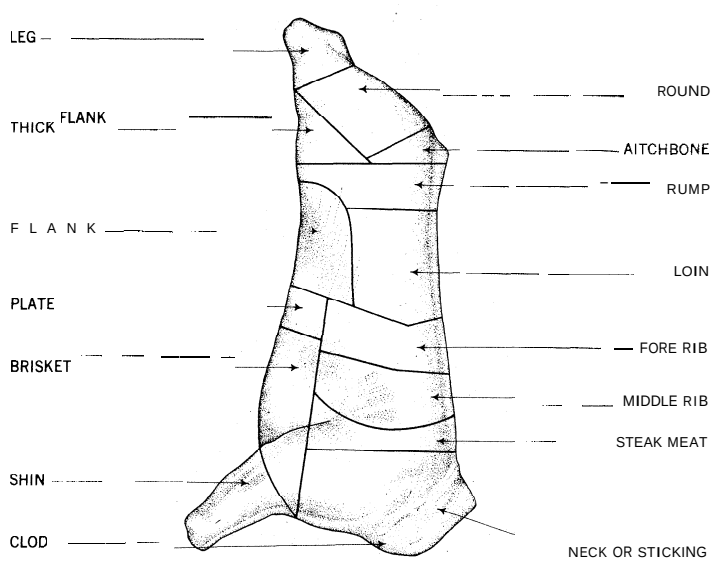


FIG 2.— ENGLISHMETHOD OF CUTTING BEEF

glands and from the liver and spleen. Bone marrow and rennet are other by-products.

Beef Production.— Because of their extensive digestive tract (complex "stomach") cattle are able to subsist entirely upon grass and roughage such as hay, fodder crops, silage and crop residues. Many of the world's cattle, estimated at nearly 1,000,000,000 in the second half of the 20th century, are produced extensively in regions where topography, deficient rainfall or distance to market makes more intensive agriculture impracticable. To the extent that cattle are produced upon pasture, beef is a seasonal product, being most plentiful at the close of the normal grazing season. This can be avoided if cultivated pastures are used, as in Argentina, where beef cattle reared on remote, poor natural grasslands are fattened for the European market all the year round on alfalfa pastures near the ports. In other areas, too, range cattle not sufficiently fat for slaughter as high-grade beef are sold for further feeding to farmers in surplus feed-producing areas, such as the corn belt of the United States. In Australia cattle reared in the Northern Territory uplands may walk hundreds of miles to be fattened in the eastern coastal areas of Queensland. Similarly nearly 500,000 cattle go from Ireland to Great Britain every year for further fattening. Only in Britain, Canada and the United States are grain feeds, with hay, silage and by-product feeds such as sugar beet pulp, distiller's grain and molasses: used extensively in cattle fattening. This makes possible the production of good beef in the winter months. Mixed supplement formula feeds and added doses of hormones, such as stilbestrol, are used to increase the rate and efficiency of fattening gain.

In the past, the best-quality beef has been produced in temperate climates. The principal regions of commercial production have been North America, the southeastern part of South America, the north and east of the Australian continent and Europe. In the 20th century, however: there were developed several breeds of cattle that thrive in hot, humid climates *(see* CATTLE: *Breeds).* Experiments have also been made in synthetic tenderization of beef carcasses. Such developments have enabled, for example, the southeastern United States to become an increasingly important producing area.

In addition to the production from specialized beef breeds, there has always been some by-production from dairy herds, the quality being improved by using a beef bull on cows of suitable breeds to produce steers and heifers that mature quickly and produce good beef carcasses. This contributed to the rapid growth of production in the United Kingdom, for instance. World production of beef and veal was estimated to exceed 50,000,000,000 lb. annually in the early 1960s. The United States was by far the largest producer, with a total of about 16,000,000,000 lb.; Argentina and the U.S.S.R. each produced nearly 6,000,000,000 lb.; Brazil and France, nearly 3,000,000,000 lb.; the United Kingdom, western Germany and Australia nearly 2,000,000,000 lb. and Canada nearly 1,500,000,000 lb. All had increased their production substantially during the century. In several countries, notably the United States, the increases followed a cyclical pattern based on the interaction of prices and supply.

Trade.— Beef enters into world trade on an appreciable scale. During the 19th century it was exported mainly "on the hoof," but the introduction of refrigeration in the 1880s led to a rapid expansion of frozen beef shipments, mainly from Argentina and Australia to the United Kingdom. Early in the 20th century it was found that shipping beef at temperatures slightly above freezing preserved the natural quality and flavour of the meat. This chilled beef became a dominant proportion of South American exports during the first half of the century. The United Kingdom is the largest market for beef imports. Other western European countries, mainly western Germany and Italy, take smaller but appreciable quantities, and the United States is a substantial importer when domestic production is cyclically low. *See* also MEAT.

BEEFEATERS: *see* YEOMEN OF *THE* GUARD.

BEE FLY, any member of the family Bombyliidae of the order Diptera *(q.v.)*, many of which resemble bees in appearance; most of them have long proboscises and obtain nectar from flowers. Their coloration, which is sometimes metallic, results from the presence of dense hair; in many species the body bears patches of scales and these are sometimes present on the wings; they are delicate and easily abraded. The larvae are thought to be either predaceous or parasitic. The largest number of species occur in the tropics. Many of the bee flies are quite small, and their immature stages are unknown. The largest and most showy species are tropical, but species with a length of ½ in. occur in temperate regions. Too little is known about the biology of bee flies to permit a conclusion about their value to man; those known to be beneficial are very common.

The large bee fly, *Bornbytius major,* of holarctic distribution, is parasitic on solitary bees; it is one of the earliest to appear in spring. Larvae of several species of *Villa* are of importance in destroying eggs of grasshoppers, while others are parasites of caterpillars. *Anthrax anale* is a parasite of tiger beetle larvae; the habits of the European *A. trifasciata,* parasitic on the wall bee, are described by Jean Henri Fabre. In Africa several species of *Villa* and *Thyridanthrax* are parasitic on the puparia of tsetse flies. *Villa (Hemipenthes) morio* is directly injurious, being parasitic on the beneficial ichneumonid, *Banchus fernoralis.*

(C. H. CN.)

BEEKEEPING. Beekeeping is one of the oldest forms of animal husbandry; its beginnings are lost in antiquity. It is the art of caring for and manipulating colonies of honeybees *(Apis* species) so that they will produce and store a quantity of honey above their own requirements. In recent years bees have been frequently utilized to pollinate crop plants in order to increase the production of seed, fruit or fibre.

Some areas are especially well suited for beekeeping and honey production; others, because of the lack of sufficient nectar-producing flowers or because of severe climatic conditions, are entirely unsuited. It is not economically feasible to overcome unfavourable climatic conditions or to grow nectar plants exclusively for honey production.

HISTORY

In spite of the long history of beekeeping little progress in increasing the productivity of bees was made until after 1850. Colonies of bees were kept in bark, reed, straw or even earthenware hives, and any honey present was taken whenever desired, colonies often being killed in the process. Lack of any method of controlled breeding hindered the development of characteristics useful to the beekeeper.

Man first domesticated honeybees by establishing colonies in cylinders of bark, straw, mud or other materials. Hives essentially of this type are still in use in some areas of the old world. In Europe the dome-shaped, woven straw "skep" became the standard hive. In early America a section of hollow log, known as a bee gum, was widely used; however, it began to be replaced even in colonial times by the box-type hive. The common practice was to remove all the honeycombs through the bottom of the skep or box hive and from the end (back) of the bee gum hive; but in Europe, at least from the 17th century on, additional chambers of straw or wood that communicated with the main chamber through holes in the top or sides of the latter chamber were often added during the honey season to be filled with honey. This led to the method of multiple-story beekeeping perfected later *(see* below).

Although improvements in hive structure were steadily intro-

duced from early times, none gained enough acceptance to change the nature of beekeeping.

Modern beekeeping stems from about the mid-19th century. About *1840* Moses Quinby of New York placed boxes capable of holding about five pounds of honey over holes in the top of box hives. By replacing these boxes as they became filled with honey he developed a method of multiple-story beekeeping in which the actual nest of the colony remained undisturbed. About the same time he invented the bellows smoker, which is used to quiet bees during handling. In 1851 the Rev. L. L. Langstroth discovered the "bee space" and invented the truly movable frame hive. The bee space, a space of approximately $\frac{5}{16}$ in. between surfaces, is an area that bees will not fill with comb or propolis (a cementing substance) as they do smaller or larger areas. Quinby and Langstroth entirely independently published books in *1853* setting forth their discoveries and beekeeping methods. The invention of comb foundation (a thin sheet of wax molded into the form of the midrib of a comb used to guide the bees in building their combs in the frames), the honey extractor and the queen excluder, within the following *30* years, completed a revolution in beekeeping methods.

KINDS OF HONEYBEES

There are four species of honeybee: one of these is the well-known and almost universally domesticated common, or western, honeybee, *Apis mellifera,* found wild in Europe, Asia Minor and Africa; the other three are the giant, or rock, honeybee (A. *dorsata),* little honeybee *(A. florea)* and eastern honeybee (A. *indica),* all native to India and southeastern Asia and found abundant throughout jungle and cultivated areas.

Common Honeybee. — Many so-called races of *A. mellifera* are known and several of them have been carried to many countries. The European, or black, bee is found throughout northern Europe from Great Britain to the U.S.S.R. The British form appears to differ somewhat from that of the continent. The most widely distributed and used race is the Italian — a yellow bee, originally from the mountainous areas of northern Italy. Two races of grayish bees, the Carniolan, from the areas east of the Adriatic sea, and the Caucasian, from the Caucasus mountains, have been widely distributed but are not as extensively used as the Italian. Each of these four races has certain merits for beekeeping. The northern European bees are reported to be more hardy than the southern races in severe climates, but they have a shorter tongue, tend to swarm excessively and are more susceptible to certain diseases and parasites. Caucasians are reported to be the most gentle, but they carry excessive amounts of propolis into the hive so that the frames and parts of the hive are sealed together.

Other races of the eastern Mediterranean — Egyptian, Cyprian and Syrian — have been exported to other countries for trial, but appear to have less desirable characteristics than the commoner races. They are nervous, frequently vicious, and do not seem to be very productive. They are now seldom, if ever, used outside their native habitats.

Other Species. — The rock and the little honeybees build a single comb in the open, suspended from a limb of a tree, cornice of a house or similar surface. Neither of these species is readily adaptable to beekeeping as a colony builds only a single comb, and colonies leave the comb in mass and migrate to a new locality if bothered or if nectar supply becomes scarce. Attempts, however, have been repeatedly made to keep A. *dorsata* in hives, and a hive of a suitable shape for the large single comb is in use on a limited scale in parts of India. The eastern honeybee is used rather extensively in India and other areas of southeast Asia in the same type of beekeeping which is employed for *A. mellifera.*

FIG. 2. — THREE CASTES OF BEES: (A) WORKER: (B) QUEEN; (C) DRONE; (TOP) PHOTOGRAPH OF LIVING BEES; (BOTTOM) DRAWINGS OF THE THREE CASTES

THE COLONY

A colony of honeybees consists of several to many thousands of individuals (up to about *50,000)* living in a nest. Most of the colonies of domesticated honeybees are nested in man-made hives; occasionally, when a hive is crowded, the bees will swarm and nest in a hollow tree, under house eaves and in other sheltered places. In any case the nest is almost always within a cavity that the bees fill, at least partially, with vertical combs of wax. This wax is secreted by the worker bees. The combs consist of two layers of hexagonal cells, each extending outward from the midrib for slightly more than one-half inch with a slight upward slope. The combs are approximately an inch thick and are spaced approximately $1\frac{3}{8}$ to $1\frac{1}{2}$ in. from centre to centre, leaving a bee space slightly less than $\frac{1}{2}$ in. wide between combs.

Castes

The bees of a colony include three castes--one queen, several hundred drones and the remainder workers. The queen and workers are females, the drones males. The colonial or social life of the honeybee has a family basis since the queen is normally the mother of all other members. The basis of this family-society is a division of labour in which the function of reproduction is performed by the queen and drones and all other duties are performed by the workers.

Colonies of honeybees are perennial and the development of new colonies is accomplished by swarming, when a queen and some of the workers move to a new location.

Queen. — The queen honeybee is considerably larger than a worker bee and longer than a drone, although not so thick or broad.

Queens are produced in a colony under only three conditions: (1) queenlessness (when the queen is killed or is removed from the colony); (2) a failing queen (when a queen because of age or other reason is unable to produce the number of eggs required); and (3) the swarm impulse.

Both unfertilized and fertilized eggs are produced by every normal queen. In the peculiar type of reproduction found in the bee, the males (drones) develop from unfertilized eggs. Fertilized eggs develop into females. Whether the female larvae develop into workers or queen is determined by the type and quantity of food given to them. At first all larvae receive mass feedings of a special food known as royal jelly secreted by a pair of modified salivary glands of the worker.

During the third day after an egg hatches, in the case of worker and drone larvae, the nurse bees change the manner of feeding by giving the food directly to the larvae at intervals. This apparently results in a reduction in the amount supplied. It is generally thought that the composition is also changed by the addition of pollen and honey (or nectar) and that the proportion of these materials is gradually increased until they make up the entire food supply. In the case of larvae destined to be queens the mass feeding of royal jelly continues throughout larval life. Caste-determining substances are also thought to be present in the larvae of the queen and workers. The queen larva is reared in a specially constructed cell. It is much longer than the worker cell and is vertical rather than horizontal since the space between combs is insufficient for its length.

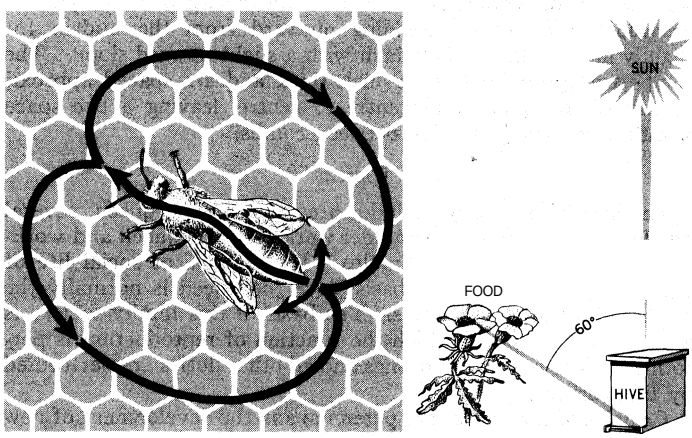
The developmental period for the queen is 16 days, including 3 days as an egg, 53 as a larva and 73 as a pupa. The young queen leaves the hive on orientation flights during the early days of her adult life and on mating flights during the second week. Within a few days after mating with one or several drones, the queen begins to lay. Although a queen is capable of laying 3,500 eggs a day, this number is hardly ever reached. Probably a third of this number is the usual rate even in the most active brood-rearing seasons, which are late spring and early summer.

Workers. — The entire life span of a worker bee during the most active seasons (late spring and summer) is made up of three periods of approximately three weeks each. These are the developmental period and the periods of inside and outside duties. Bees developing in late summer have less arduous duties and live several months over the inactive winter season. The developmental period of 21 days consists of 3 days for the egg, 6 for the larva, and 12 for the pupa.

Although bees may perform any duty at almost any age, they are physiologically more suited to certain tasks at certain ages. Therefore in a balanced colony the workers engage in a succession of duties in a rather regular sequence, though with considerable overlap.

The time schedule, from which individual bees deviate greatly, is as follows. During the first three days after emergence as adults, bees groom themselves, loiter on the combs of brood and receive food from other bees, but do not take it from cells themselves. The 3rd to the 6th day is devoted to caring for older brood, and from the 6th to the 13th to caring for larvae less than three days old. During the period from the 12th to the 18th days the wax glands are producing at their maximum potential, and whenever wax is required it is furnished by bees of this age. The final two or three days of the period of indoor activities are spent in guard duty at the entrance to the hive. Depending upon the season and the requirements of the colony several other functions are performed by member bees during the second and third weeks of adult life. These include ventilating the hive; packing pollen into the cells; cleaning out and polishing cells; removing debris from the hive; and receiving (from field bees), manipulating and depositing nectar. During the second week bees usually begin orientation flights — short flights in front of the hive and into the surrounding area; thus they learn the appearance of their home and can return directly from the field when outside duties are undertaken. In a balanced colony with a population of bees of various ages, outside duties, which consist of gathering water, nectar and pollen, are begun about the 21st day and continued as long as the bee lives. No definite sequence in gathering food and water has ever been noted, but the field force is divided among the different activities according to the needs of the colony. Once started, an outside duty is usually continued as long as conditions remain unchanged, even to gathering of nectar or pollen from the same plant species and in the same exact locality.

Drones. — The only function of the drone is to serve as a potential mate for the queen. Drones develop in a manner similar to that of the workers, but 24 days (3 for the egg, 6½ for the larva and 14½ for the pupa) are required. Their adult life may continue for several months, or until no nectar is available in the field. When the honey flow stops, the drones are prohibited by the workers from eating. When they then become weakened, they are carried from the hive by the workers and left to die.



BASED ON VON FRISCH, 'SEES, THEIR VISION, CHEMICAL SENSES AND LANGUAGE' (1950) BY PERMISSION OF CORNELL UNIVERSITY PRESS

FIG. 3—WORKER BEE DANCING ON VERTICAL SURFACE OF HIVE: BY THE ANGLE OF ITS BODY AND THE RAPIDITY OF ITS MOVEMENT, THE BEE CAN INDICATE WITHIN 15° THE LOCATION OF NECTAR

Life Cycle and Work

Yearly Cycle. — The honeybee is greatly influenced by temperature. When the temperature approaches 100° F. (about 38° C.) bees do not go into the field but remain in the hive, or cluster around the entrance on the outside. Bees lose the power to fly at 50° F. and to move at all at 45° or slightly below.

Despite their sensitivity to cold temperatures honeybees are the only insects that do not hibernate but remain active during the winter. When the temperature within the hive falls to 57° F. a cluster is formed. This consists of a more or less spherical shell of three outer layers of bees, with other bees inside. All of the bees, however, do not join the cluster until the temperature falls below 50°. As the temperature continues to fall the cluster becomes more and more compact. It can never become a solid mass of bees as it is intersected by the combs, which must contain some stores of honey and pollen to sustain the bees through the winter.

Contraction of the cluster conserves heat (supplied by the metabolic processes of the bees) by reducing the radiating surface in proportion to the mass. This allows the colony to maintain a temperature of at least 57° F. except on the surface of the cluster.

As the cluster contracts, higher temperatures are produced in the centre; whenever this temperature reaches 91° or 92° F., the queen begins egg laying. Once brood rearing is started, higher temperatures must be maintained. Brood rearing is usually begun in mid-winter and continues with gradual increase until spring. When the weather becomes warm enough for bees to gather pollen and nectar from early blooming plants, brood rearing increases much more rapidly.

In late spring the population of the colony reaches a high level and the hive becomes crowded. This acts as a stimulus to the swarming instinct. A portion of the bees and the old queen leave the hive, migrate to a new location and establish a new colony. A newly emerged queen then takes over the old colony.

With an abundance of nectar-producing flowers in the summer the colony is able to manufacture more honey than it requires. The instinct of the bee is to store this excess for food in the future.

Brood rearing is somewhat reduced during this honey flow but continues at a low rate and finally stops in the autumn.

In climates without a cold or dormant season the spring and summer activities described above continue at all times.

Manufacture of Honey. — Nectar, the raw material of honey, is produced by the flowers of many plants. It is essentially a watery solution of three sugars — fructose, glucose and sucrose — with traces of proteins, salts, acids and essential oils. Although other sugars and other compounds are sometimes found, 99% of the solids in nectars are the three sugars mentioned. The sugar content of nectars varies from 3%–4% to 80%, depending on the species of flower, on soil and air conditions — especially moisture — and probably on other factors. The honey produced by a colony at any given time is usually derived from the nectar of only one or of a few plant species.

Bees prefer nectars of high sugar content and usually do not gather those of less than 15% sugar. To change nectar to honey the bees convert a complex sugar, sucrose, to simple sugars, fructose and glucose, using enzymes produced by special salivary glands. Water is removed from nectar by evaporation until the sugar content reaches about 80%.

Whenever the weather is suitable, a few scout bees of a colony are always in the field. These bees find sources of nectar and pollen and direct other bees to these sources. A scout returning with a supply of newly found nectar attracts the attention of other bees by performing a "dance." This consists of a series of loops and straight runs performed on the comb accompanied by "tail wagging." The direction and distance of the source of nectar are indicated by the intensity and rapidity of the maneuvers of the scout. Samples of the nectar that has been gathered are distributed by the scout to possible recruits. The recruited workers then proceed to the indicated position and search for the same type of nectar. Such recruits, after finding an abundant supply of nectar, return to the hive and try to attract other bees. This process continues until the available field force of the colony is at work gathering the same type of nectar.

When a nectar gatherer returns to the hive with a load of nectar it is given to one or more of the hive bees. These bees manipulate the nectar with their mouth parts, then deposit it in cells. The manipulation of nectar by the bees and the moving of air over its surface after it has been placed in a cell evaporate the excess water.

Pollination. — Many plants require insect pollination for the production of seed and fruit. These include most of the clovers and related small legumes, vegetable crops and fruits. Of course, these plants have always required insect pollination, and this occurred naturally until the practices of modern agriculture produced extensive areas of pure stands of crops that produce pollen and nectar for only a relatively short portion of the year. Since insect pollinators, especially the honeybees, require a steady supply of food throughout their active period, they were forced to disperse to more promising wild fields and many of them have been greatly reduced in number. The extensive use of herbicidal chemicals since World War II, in an effort to eliminate weeds in fence rows, roadsides and cultivated fields, and the application of insecticides to control insect pests (at the same time killing pollinators) has intensified these problems. Although the honeybee is not the most efficient pollinator for some plants it is the only insect that can be controlled so that desired numbers can be obtained where and when needed. The number of bees required for efficient pollination varies with the crop. For apple and other fruit trees one colony per acre is the usual recommendation; for others with abundant bloom, such as clover and alfalfa (lucerne), two to four colonies may be necessary; while such crops as melons may be properly pollinated with one colony to several acres.

The presence of colonies of bees does not assure the pollination of a particular crop, and the placing of bees for pollination frequently presents special problems to the beekeeper. Another plant blooming within the flight area may attract the bees from the crop for which pollination is desired.

Some areas, because of the lack of food plants at certain seasons — no available major honey plant — or other factors, require that bees be introduced when bloom begins and removed as soon as pollination is accomplished. Although few crops require the application of an insecticide at the exact time pollination is in progress, application of a poison even at other times and on other plants may adversely affect the bee by contamination of other blooms, as of cover crops in an orchard. If the crop is not a major honey plant but requires pollination at the time the honey crop is usually produced the beekeeper must receive sufficient return for the services of the bees to pay the expense of moving and the equivalent of the value of the honey crop.

In spite of these limitations and problems farmers and beekeepers, with the aid of research entomologists, have developed rather successful methods for the use of honeybees in the pollination of most major crops.

BEEKEEPING PRACTICES

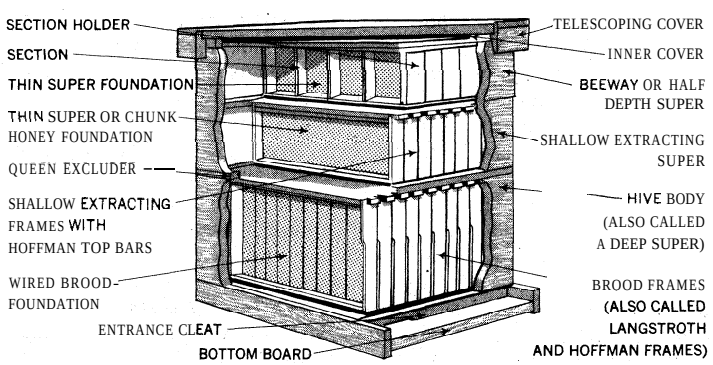
Although the theory of beekeeping management is rather simple, in practice keen observation and attention to detail are necessary. One of the most important principles is to have a vigorously producing queen at all times. Although queen bees may live several years, modern beekeeping practices require such a rate of egg laying that queens should be replaced after one or two years. Ideally, whenever the brood pattern appropriate to the season is not maintained the colony should be requeened.

Old queens, and perhaps also defective ones, tend to increase the frequency of swarming of even uncrowded colonies. Since natural supersedure or even rearing the new queen within the colony causes too much interruption in the brood-rearing cycle to be economical, separate colonies and equipment are used for rearing queens. Queens may also be bought from specialist rearers who operate largely in Italy and the southern United States, where the climate is favourable for rearing queens early in the season.

Materials

Hives. — The so-called Langstroth hive or those of similar construction are now generally used in all areas where beekeeping is of importance, except in German-speaking countries. The size of the hive is determined by the size and number of frames. The standard hive contains ten frames, $9\frac{1}{8}$ by $17\frac{5}{8}$ in. spaced $1\frac{3}{8}$ in. from centre to centre. The hive body is a box without top or bottom, with the ends grooved at the upper edge to support the top bars of the frames. This rests on a bottom board, so constructed that an opening is left at the front for the hive entrance. Two hive bodies are usually used in order to furnish room for the development of strong colonies and to contain enough stores for wintering. Surplus honey is stored in supers placed above the hive bodies. Full depth supers are identical with hive bodies except in position and function. Shallow extracting supers are similar except the frames are only $5\frac{3}{8}$ in. deep. Comb honey supers used for the production of comb honey are usually 43 in. deep. They are filled with sections $4\frac{1}{4}$ in. square, resting in section holders with separators or fences between each. The top of the hive usually has two covers — a flush fitting inner cover and an outer, or telescopic, cover.

Beekeeping Tools and Equipment. — A veil, smoker and hive



BY COURTESY OF WALTER T. KELLEY CO.

FIG. 4.— CUTAWAY VIEW OF A LANGSTROTH HIVE; THIS TYPE AND COMPARABLE MODELS ARE MOST COMMONLY USED IN U.S. BEEKEEPING

tool are essential for working with bees. The veil is usually a protective cylinder of cloth or wire netting with appropriate fittings at the top and bottom to fit around the crown of a hat and the neck or shoulders of the wearer. The smoker, used to tranquilize the bees, is a metal cylinder, a portion of which serves as a firebox, with one end drawn out into a spout; smoke can be directed as desired by use of a bellows attachment opposite the spout. The hive tool—a thin piece of steel eight to ten inches long, with one end bent at a right angle—is sharpened at both ends; it is used to pry apart the different parts of the hive and to scrape wax, propolis and debris from frames, bottom boards and the interior surfaces of the hive.

Gloves of leather or wax-impregnated cloth are frequently used, although the experienced beekeeper works without them except under unfavourable conditions. A bee brush is sometimes used to brush the bees from combs.

Many other devices are frequently used in the apiary. A queen excluder is an insert of wire (or wire and wood) or a zinc sheet, with passageways .163 in. wide permitting worker bees but not the queen to pass through. It is sometimes placed between the brood nest and super, or elsewhere in the hive to prevent the queen from moving into a certain area. A bee escape is a small metal device made to fit into an oval opening usually present in the inner cover; it allows the bees to move in one direction but not to return. It is frequently placed below supers of honey before they are to be removed to free them of bees.

Extractors are essential pieces of equipment for separating honey from the comb. An extractor is a metal cylinder in which some type of basket or carrier for frames of honey may be whirled, by hand or motor. The wax plugs, or caps, are removed from the combs by means of a hot uncapping knife, or in large establishments by a power-vibrated blade. The combs are then placed in the extractor and the honey removed by centrifugal force. Extractors are of two genera1 types: the small basket or reversible rack-type in which 2, 4 or perhaps 8 small frames are placed at right angles to the radius of the extractor; and the radial type that may hold as many as 30 or 50 frames placed in the position of radii. The latter must be power-operated.

A wax press is necessary to separate wax from the cocoons in old brood combs; new combs can simply be melted and filtered to obtain the wax.

PROCEDURE

The beekeeper's year is said to begin in the autumn. At this season proper wintering conditions must be provided. These include a large colony of young bees, a vigorous queen, sufficient stores of honey and pollen in the combs and adequate protection. Dependent upon the size of the colony, the strain of bee and the climate, especially the length and severity of the winter, the amount of honey required will be 20 to 80 lb. In areas with extremely cold winters additional insulation should be provided around the hive, elsewhere protection from the full force of the wind is sufficient. In mild, damp climates ventilation should be as free as possible. Hive entrances should be protected in some way to keep out predators.

In the spring, hive bodies and frames should be manipulated so that those containing brood are below, since the bees are inclined to extend the area of brood upward but not downward. Swarming is prevented by not allowing the brood nest to become crowded. A certain amount of unfilled combs should always be present to allow expansion of the brood, to provide room for the bees to rest when they are in the hive and to receive nectar whenever a surplus becomes available. The proper management of a colony requires that the beekeeper open the hive to determine the conditions present and make the proper manipulation of frames and hive bodies. As far as possible this should be done under proper weather conditions, on warm sunny days without wind. The bees are quieted by puffing smoke into the entrance before the hive is opened, and into parts of the hive containing bees at intervals during the examination. Movements of the beekeeper should be deliberate as quick motions tend to excite the bees.

As a honey flow develops, supers of combs should be added, a new one before the one previously added has been completely filled. Dependent upon the character of the available nectar, the climate and the organization of the beekeeper's work, honey is removed as each unit (super or comb) is filled with ripened honey, at the end of the flow from each major source or at the end of the producing season. Average annual yields of honey (above what the bees need for wintering) range from 10 to 20 lb. in southern England and 30 to 40 lb. in the southern United States to several hundred pounds in Australia where eucalyptus trees supply abundant nectar.

BY COURTESY OF KANSAS STATE UNIVERSITY OF AGRICULTURE AND APPLIED SCIENCE

FIG. 5.—(TOP) SMOKING HIVE ENTRANCE; (CENTRE) SMOKING UNDER INNER COVER; (BOTTOM) REMOVING UPPER BROOD CHAMBER. AN EXTRA COVER IS USED TO PREVENT ROBBING

Proper management requires that some honey be left for the use of the colony at all times. In temperate climates it is a generally accepted practice that a food chamber, a super containing honey, be left or returned to the colony at the approach of winter. This is the second or upper story of the brood nest which usually becomes restricted to one story by the end of the honey flow. In Europe beekeepers remove nearly all the reserve honey, replacing it with a sugar sirup.

Control of Honeybee Diseases and Enemies.—Bees are subject to several diseases and parasites. The most serious of these are two bacterial diseases of the larva—American and European foul brood—and the acarine and nosema diseases of the adults.

An infestation of American foul brood is usually fatal to a colony unless prompt treatment is given. Formerly American foul brood was extremely serious, as control or prevention was almost impossible in the bee yard. Now, however, disease-resistant strains of bees are available and medication, by the use of sulfadrugs, etc., is effective in preventing the development of the disease, or in some cases in curing colonies in which it has appeared.

European foul brood is less damaging to the colonies, visible symptoms usually being restricted to a short period of the year, followed by spontaneous disappearance, though the infestation persists. Proper management, usually requeening, may enable the bees to recover from an attack; but complete eradication is difficult.

Acarine disease is caused by a mite infestation of the adult honeybees' breathing system (the trachea). It has been equated, on doubtful evidence, with "Isle of Wight disease," reputed to have arisen in that island in 1904 and to have killed very large numbers of colonies in Great Britain. It later spread throughout much of northern Europe and appeared in India, Africa and South America, but is not found in Scandinavian countries and has not spread to North America, Australia or New Zealand. Chemical controls have been somewhat effective, and it appears that races other than the European, or black, bee are somewhat resistant to the mite.

Nosema disease is caused by a protozoan parasite infecting the adults' digestive tract. Proper beekeeping practices, especially proper wintering and the provision of fresh water, appear to lessen the effects of the disease and eventually eliminate it from an apiary.

Other diseases, such as parafoul brood, sacbrood, purple brood and fungus infections, affect larvae; and septicemia and fungus infections, adults. All of these are of minor importance and proper beekeeping practices usually prevent their development or eliminate them when they appear.

The wax moth will completely destroy unprotected combs, whether empty or filled with honey. Such an infestation cannot develop in a strong, healthy colony because the bees literally carry the moths out of the hive. Stored combs may be protected by the use of fumigants.

Minor enemies of bees include mice, rats, skunks, raccoons, bears and woodpeckers. Mice enter the hives during the winter, when the bees are clustered, and destroy the combs. Skunks and raccoons sometimes disturb the hives at night and eat the bees as they crawl from the entrance. Woodpeckers make large holes in hives, and bears smash hives to obtain honey. Certain birds and toads as well as dragonflies, robber flies and a few other insects destroy numbers of honeybees.

Sources of Information on Beekeeping. — Because of the long and intimate association of man and the honey bee, the literature on bees and beekeeping is voluminous. Much of it, however, is philosophical or even anthropomorphic rather than factual and practical.

In most countries there are governmental agencies engaged in research, educational and regulatory activities in beekeeping. In the United States these activities are usually within the scope of entomology, but in other countries they are more likely to be associated with agricultural production divisions such as horticulture, agronomy or animal husbandry. In Canada and the United States governmental agencies conduct research, issue bulletins or other publications and otherwise disseminate information. Almost all agricultural colleges have a course in beekeeping in the curriculum and furnish basic information to beginning beekeepers and report new discoveries or improved practices to experienced ones by means of meetings, field demonstrations, bulletins, press releases and radio and television presentations. Many associations of beekeepers and auxiliary groups such as apiary inspectors, research workers and industrial concerns (bee supply manufacturers, honey packers, etc.) hold regular conventions and many of them issue periodical letters or news sheets.

Laboratories for research on bees and beekeeping exist in most countries, and are usually run or supported by governmental agencies or by universities. These laboratories are not necessarily permanently located, but extensive research has been carried on over long periods at Beltsville, Md.; Madison, Wis.; Baton Rouge, La.; Davis, Calif.; Phoenix, Ariz.; and Logan. Utah.

The literature on bees, beekeeping and related subjects has been listed and reviewed by Apicultural Abstracts, published in England by the Bee Research association. The titles of articles and books in all languages are listed in four languages and reviewed in English.

BEELZEBUL (BEELZEBUB or BAALZEBUB), in the Gospels, is the prince of devils (*e.g.,* Matt. xii, *24).* In the Old Testament, in the form Baalzebub, it is the name given to the god of the Philistine city of Ekron (II Kings i, 1–18). Neither name is found elsewhere in the Old Testament, and there is only one reference to it in other Jewish literature.

The meaning of the word is obscure. Baal (*q.v.*) is a common title for Semitic gods, and *zebub* derives from a root meaning "flies"; hence, "lord of flies." The form Beelzebub is due to the influence of the Vulgate, while the form used in the Greek text is Beelzebul. *Zebul* is probably a distortion of *zebub,* introducing the stigma of "dung."

See G. Kittel (ed.), *Theologishes Wörterbuch zum Neuen Testament,* vol. i, pp. 605 ff (1933); F. L. Cross (ed.), *The Oxford Dictionary of the Christian Church,* p. 149 (1957).

BEER, the beverage obtained by the alcoholic fermentation of a malted cereal, usually barley malt with or without other starchy material, and to which hops have been added. For information on the history and process of brewing, *see* the article BREWING.

Lagers and Ales. — Although the term beer is frequently employed to designate fermented malt beverages in general, a distinction exists between the so-called lager beers of the type most popular with the U.S. consumer and the ales brewed mostly in Great Britain, both with respect to their method of production and their final taste characteristics.

In the brewing of lager beer, bottom fermentation is employed, so termed because the type of yeast selected settles to the bottom of the fermenting tank after completion of fermentation. After fermentation has terminated, the "green" beer is aged in huge storage tanks from one to two months or longer at temperatures near the freezing point of water (32°–34° F.). During storage, the beer becomes "mature"; *i.e.,* it clears up, acquires mellowness and becomes charged with carbon dioxide gas, all important factors in the final taste appeal of the finished product. It is from the storage phase of the brewing process that the beer derives its name, the German word for storage being Lager.

In ale brewing, on the other hand, the yeast selected is of the top-fermenting type; *i.e.,* it rises to the top of the fermenting ale, forming a relatively thick foam. Also, somewhat higher fermentation and storage temperatures are employed.

United States.--Of U.S. lager beers, nearly all of which were originally introduced by German brewers about the middle of the 19th century and which since then have largely displaced the top-fermented beers then in vogue, the Pilsener and Dortmund types enjoy by far the greatest popularity. These beers are characterized by a pale colour, a medium hop flavour, a relatively strong carbonation and an alcohol content of 3%–3.8% by weight. These two types, which differ only slightly, comprise the major volume of U.S. beer production.

The Vienna type, with its amber colour and very mild hop taste, and the various Munich type beers with their dark-brown colour, full-bodied and somewhat sweet malt flavour, slight hop taste and alcohol contents ranging from 3%–5% by weight have never attained more than local importance in regions having concentrated foreign populations.

Bock beer, thought to have originated in the German city of Einbeck, whose name was confused with *ein* Bock ("a goat"), is brewed in winter for consumption in the spring. It is a heavier beer, similar in colour to the Munich type, with a slightly sweet malt flavour and a more pronounced hop taste than regular pale beer.

California steam beer, available in the San Francisco region, is characterized by a very high carbon dioxide gas content that renders the beverage highly effervescent. All but the last of these beers first gained prominence in the German cities and localities after which they are named.

Ale, stout and porter now form a relatively small percentage of the total U.S. beer production.

Great Britain. — In England today ale is synonymous in meaning with beer. Until about the end of the 17th century, however, ale meant a brew made with malt, yeast and water alone, whereas beer was a malt brew in which hops also had been used. Since that time, the distinction has no longer applied, except insofar as the term ale is not applied to black beers (stout and porter) or to lager beer. The Old English ale, a very potent liquor, had no rival un-

til the 15th century when beer was introduced by continental brewers. The popularity of the new liquor grew gradually, although in rural districts generally the old-style ale prevailed until early in the 18th century. By the end of the 16th century brewers in London and other centres had combined the techniques of ale and beer brewing and were producing very strong, well-bittered beers, for which a substantial demand arose at home and in Europe.

Pale ale, a light-coloured beer with an incisive hop flavour, was evolved at Burton upon Trent in the 18th century and widely exported. It is still one of the most popular brews in the United Kingdom. Its alcohol content ranges from 3% to 5% by weight Strong ales, which are usually darker in colour, have up to 6.5% alcohol by weight.

Stout, first brewed about the end of the 17th century, has a dark, often black, colour, a rich malty taste and, in some brands, a strong hop flavour. The strongest brands have an alcohol content of over 5% by weight.

Another of the main types of British beer is draught mild or bottled brown ale, generally nut-brown in colour, lightly hopped, often sweetish and, on the average, the least alcoholic.

Altogether about 3,000 "beers" of local or wider use and reputation are produced in the United Kingdom and many do not fall in any of the main categories—strong ale, pale ale, mild or brown ale, stout and lager. Porter, popular in the 18th and 19th centuries, was a dark, full-bodied beer with a mild hop flavour, resembling weak stout.

Miscellaneous.—Weiss bier, a special type of ale peculiar to the Berlin region of Germany, and at one time brewed on a small scale in the U.S., is made of wheat and barley malt and has a very pale colour, a somewhat tart taste and a rich foam.

There are several other special types of beer or beerlike cereal beverages that enjoy only local favour or are consumed for dietetic reasons. Among the former may be mentioned the Faro and Lambic beers found in Belgium that are fermented with wild yeasts and are rather acidic in character. To the second category belong the various malt tonics of high nutritive value and low alcohol content and often enriched with minerals and vitamins, and the so-called near beers that are similar to the Pilsener type beers but have an alcohol content of less than .4% by weight. Beerlike drinks brewed from other starchy materials are widely known and used, among them the sake of Japan and suk of Korea, both made from rice.

Beer of 4% alcohol content is slightly more than nine-tenths water. A total of 100 g. includes 4.4 g. of carbohydrates (about 170 cal. per 12 ounce bottle), .6 g. of protein, 4 mg. of calcium, 26 mg. of phosphorus, .03 mg. of riboflavin, .2 mg. of niacin, a trace of thiamine and .2 g. of ash. Flavour, taste and aroma are usually considered best by Americans at a temperature of 42° to 45° F. For consumption figures *see* BREWING: *Consumption.*

BEERBOHM, SIR MAX (1872–1956), British caricaturist and writer whose economical and often caustic drawings stand alone as a sophisticated commentary on the social and literary life of his time. Henry Maximilian Beerbohm was born in London, Aug. 24, 1872, and educated at Charterhouse and Merton college, Oxford. Before he had left Oxford, Beerbohm had made a reputation as an essayist of wit and polish, *The Yellow Book* offering him a congenial hospitality. This reputation was maintained, when he succeeded G. B. Shaw as dramatic critic to the *Saturday Review,* by the judiciously small amount of work which he published and its uniformly high accomplishment in essays, fiction and parody alike. This includes *The Works of Max Beerbohm* (1896); *The Happy Hypocrite* (1897); *More* (1899); *Zuleika Dobson* (1911); *Seven Men* (1920); *And Even Now* (1921); *Around Theatres,* 2 vol. (1924); and *Mainly on the Air* (1946). He showed the same skill and charm as a broadcaster after 1935.

As a caricaturist, Beerbohm's fame followed a parallel line, and his skill as a draftsman increased with the years. Among his published drawings are *Caricatures of Twenty-five Gentlemen* (1896); *The Poet's Corner* (1904); *Fifty Caricatures* (1913); *A Survey* (1921); *Rossetti and His Circle* (1922); and *Observations* (1925). His residence in Italy. at Rapallo, gave him many advantages for the detached observation of personalities and tendencies, although once or twice it may have endangered his perspective; and he was free from a fear of acid comment which had dimmed the art of caricature in England since the early Victorian age.

Beerbohm was knighted in 1939. He died in Rapallo, Italy, on May 20, 1956.

BEERNAERT, AUGUSTE MARIE FRANÇOIS (1829–1912), Belgian statesman and Nobel prize winner, was born in Ostend on July 26, 1829, of Flemish stock. A lawyer by profession, he was elected to the Belgian chamber of deputies in 1873 and later served as minister of public works. He was prime minister and minister of finance from 1884 to 1894. In 1895 he was elected president of the chamber of deputies.

He held the post of president of the International Law association from 1903 to 1905. He was Belgium's first representative at the Hague peace conferences in 1899 and 1907. In 1909, when he was 80 years old, Beernaert and Baron d'Estournelles de Constant were awarded the Nobel peace prize. Beernaert died in Lucerne, Switz., on Oct. 6, 1912.

BEERSHEBA, the chief town of the Negev, the arid southern part of Israel, lies on the border between cultivation and the wilderness. Pop. (1961) 43,158; municipal area 11 sq.mi. A Turkish-Arab town was laid out there by German army engineers about 1900, in rectangular form. After it became a part of Israel its main streets were renamed Herzl, Independence and Liberation. The principal buildings were a mosque (now municipal museum) and the government offices. Since 1949 there has been a large growth of residential quarters with shopping centre, cultural hall, youth hostels, a resident hostel for scientists (Hias house) and an institute for research in the arid areas. Building is the main industry. The industrial zone contains ceramic, glass and chemical factories, a motor vehicle repair workshop and a flour mill. A railway links the town with Lydda (Lod) and Dimona. Main roads fan out to Elath (Eilat) by the Gulf of Aqaba, the potash works by the Dead sea and the phosphate mines in the hills. An agricultural belt surrounds the town which is the chief market for about 100 settlements in the northern Negev, for the mining enterprises, and for the 15,000 nomad Bedouin in the region.

In the Bible Beersheba is mentioned as the home of the patriarchs Abraham and Isaac and is referred to in the book of Samuel as the southern limit of the Holy Land, in the phrase "from Dan to Beersheba." In Roman times, when it was known as Birosaba, it was the capital of a flourishing district, and in the Byzantine empire an episcopal see. The name may mean "seven wells", or "well of the oath" (of Abraham and Abimelech; Gen. xxi, 31). In World War I the capture of Beersheba on Oct. 31, 1917, by British troops opened the way for the penetration of the Turkish front in Palestine, and ultimately to the capture of Jerusalem. (No. B.)

BEESTON, CHRISTOPHER (alias HUTCHINSON) (1570?–1638), actor and theatrical manager, was one of the most influential figures in the English theatre in the early 17th century. Nothing is known of his early life. In 1598 he appeared in *Every Man in His Humour* with Shakespeare, Augustine Phillips and Richard Burbage and in 1602 he was with Worcester's Men. He remained with them after they became the Queen's Men in 1603 and succeeded Thomas Greene as their business manager in 1612. In 1616 he established them at his theatre, the Cockpit (later the Phoenix) in Drury Lane, where he remained for the rest of his life as manager to the succeeding companies. Beeston held two-thirds

of the shares, owned the costumes and retained control of the plays he had bought—practices that brought him the reputation of being shrewd rather than honest—but he had great influence with the training he gave young actors. In 1637 he collected together the King's and Queen's Boys. more popularly known as Beeston's Boys, a company that was established by royal warrant and afterward managed for a short time by his son William. Beeston was a life-long friend of Thomas Heywood and produced many of his plays and also contributed verses to the *Apology for Actors* (1612). He died in London and was buried at St. Giles in the Fields on Oct. 15, 1638.

BEESTON AND STAPLEFORD, an urban district in the Rushcliffe parliamentary division of Nottinghamshire, Eng., 4 mi. S.W. of Nottingham. Pop. (1961) 56,720. The Trent and Erewash rivers, the construction of the Beeston canal at the end of the 18th century and of the railway in 1838–40 and, most of all, the proximity of the coal field, have contributed to the industrial development of the district. It has also expanded as a residential area for workers in Nottingham and other towns nearby. A large group of drug factories are at Beeston which also has engineering works making boilers, etc., and factories for telecommunications equipment, fluorescent lighting, textiles, and other goods. Beeston and Stapleford parish churches are both of the 13th century, and there is a manor house dating from the 17th century The Bramcote manor house is Elizabethan and at Stapleford is the Hemlock stone, a 40-ft. pillar of Triassic sand. The railway marshaling yard at Toton is one of the largest in the country. Other industries in the district include the production of pencils, cardboard boxes, clothing and furniture. There are gravel and sand works and some mining and quarrying. The district is well known for rose growing.

BEESWAX, the most widely distributed and commercially important animal wax, is a product of digestion secreted by the worker bee for constructing the cell walls of the honeycomb; it is estimated that about ten pounds of honey are consumed for one pound of wax secreted.

Beeswax is a yellowish solid of agreeable, somewhat honeylike odour and of a faint balsamic taste. It is insoluble in water but soluble in carbon tetrachloride (warm ether dissolves beeswax, but it is not soluble in this solvent in the cold) and chloroform. The commercial value of beeswax for polishes results from its texture. In early times it was preferred to tallow for candles on account of its higher melting point (62°–65° C.) and freedom from odour. The modern use of beeswax for church candles is in accordance with religious ordinance. U.S., European and some Japanese waxes are derived from the common honeybee, *Apis mellifera,* whereas the bulk of the African and Indian waxes are from other varieties, especially *Apis dorsata.* Large quantities are exported from east Africa, South America and the West Indies, and considerable quantities are produced in the United States.

Beeswax, besides being used for church ceremonial candles, is also employed in the manufacture of furniture and floor waxes, ointments, encaustic paints, wax paper, lithographic inks, artificial fruits and flowers, modeling wax, etc.

Beeswax is separated from the honeycomb by the following method: after removal of the honey by draining or by means of a centrifuge, the combs are melted in hot water and the wax strained from gross impurities (dead bees, cocoons, etc.); the residue is pressed to obtain more wax. In large-scale operations the melted honycombs are expressed in a hydraulic press. The press residues are boiled up with water and pressed again. The cake still contains about 10% of wax, which is recovered by extraction with a volatile solvent; such extracted wax is darker and of lower quality that that obtained by expression.

Beeswax varies in colour from golden-yellow to almost black, depending on the care used in its preparation and also on the age and food of the bees. To preserve the quality and colour, beeswax must always be melted in water and never by direct heat. For some purposes the wax must be bleached; the most satisfactory method is to expose the wax in the form of thin films to the action of moist air and sunlight. The addition of a little oil of turpentine accelerates the process. Ozone may be used, but bleaching by chemical oxidizers, such as chlorine, etc., is less satisfactory, since the produce is unsuitable for many purposes (*e.g.,* candles). Bleached beeswax is used in cosmetics and ointments.

Beeswax consists chiefly of free cerotic acid and myricin (myricyl palmitate), with small quantities of other fatty acids and alcohols, and about 10% of hydrocarbons. East Indian (Ghedda) wax, like most waxes from the far east, exhibits marked chemical differences from that of European origin.

(P.R.E.L.; G.H.W.)

See C. S. Bisson, *Investigations on the Physical and Chemical Properties of Beeswax* (1940).

BEET, a biennial plant grown for the thick, fleshy taproot and adjoined hypocotyl that forms during the Erst season. In the second season a tall, branched, leafy stem arises to bear numerous clusters of minute green flowers which develop into brown corky fruits commonly called seeds or seed balls. Most of these fruits contain several seeds. The flowers are normally cross-pollinated by wind-borne pollen; cross-pollination may occur over distances of a mile or more.

Types.—Beet is the cultivated form of the plant *Beta vulgaris* (family Chenopodiaceae), a native of Mediterranean lands. Four distinct types of beet are cultivated: (1) sugar beet, as a source of sucrose or "cane" sugar; (2) garden beet (also called table beet and red beet), as a garden vegetable; (3) mangel-wurzel or mangold, as a succulent feed for livestock; and (4) leaf beet or Swiss chard. for its leaves which are used as a potherb.

Cultivation.—Cultivation of the leaf beet, in common with most crop plants. goes back to prehistoric times. The garden beet was developed about the beginning of the Christian era but its origin is obscure. The sugar beet is unique among important crop plants because it is a modern development with a well-documented history. It originated in Germany early in the 19th century.

Beets grow best on deep friable soils that are high in organic matter and they respond well to chemical fertilizers and manures. Beets are grown extensively under irrigation. They tolerate relatively high salt content of the soil but are sensitive to high acidity and to low content of boron. Boron deficiency retards growth and causes black lesions in the flesh of the root.

Beets are most extensively grown in temperate to cool regions or during the cooler seasons of regions having hot summers. In garden beet, high temperature reduces the intensity of colour and increases the prominence of light-coloured zones in the root.

As commonly grown in the United States, garden beet varieties are harvested 8 to 10 weeks after planting; in Europe they are grown a few weeks longer. Sugar beets and mangel-wurzels are harvested after 20 to 30 weeks, and leaf beets after 8 weeks. Average yields in the United States are: (1) garden beets for market, 175 to 200 bu. per acre; for canning, 9 tons per acre; (2) sugar beets and mangel-wurzels, 14 to 16 tons per acre. Yields two to three times as high as the averages are sometimes obtained.

Garden Beet.—Garden beet (called beetroot in Great Britain) ranges in shape from flattened oblate through globular and somewhat conical to long tapered. Skin and flesh colours are usually dark to dark purplish red, some nearly white. The flesh is marked by concentric zones of lighter red, purple or white. On cooking, the colour diffuses uniformly through the flesh. Garden beet is grown commercially and in kitchen gardens in Europe, the U.S. and Canada.

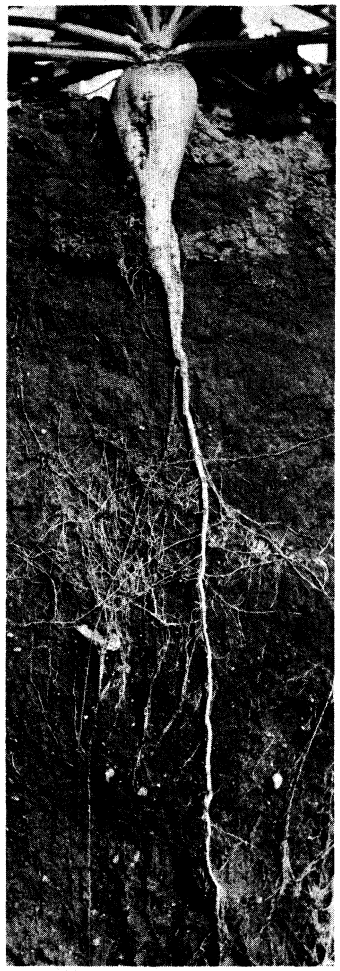
The seeds are sown about 1 in. apart in drills 1 j to 24 in. apart. In Great Britain and Europe the plants are thinned to stand about 8 in. apart in the row and are allowed to grow large. In the United States beets for fresh market are thinned to 3 to 4 in. apart and are harvested when 2 to 2½ in. in diameter. In growing "baby beets" for canning the stand is not thinned. This practice saves hand labour and through crowding of the plants produces heavy yields of the desired small size of roots. In the U.S. beets for canning are usually harvested by machines that lift the plants from the soil, remove the tops and deliver the roots into a truck

driven alongside the harvester. Beets for fresh market are pulled by hand, tied in bunches and hauled to a central point for washing and packaging.

The leaves that form atop the enlarged root are sometimes used as a potherb, but the leaf beet *(Beta vulgaris* var. *cicla)* is more often so used. In leaf beet the leaves are highly developed but no fleshy enlarged root is formed. *(See* CHARD.)

Sugar Beet.—The sugar beet is far more important commercially than other types. It has been bred to produce a high content of sugar in its roots and a high yield. The average sugar content is about 15% but that of beets in some fields may approach 20%. The sugar beet has white flesh and nearly white skin; it is typically of a half-long, sharply tapered shape. It is the dominant source of sugar in regions too cool for growing sugar cane.

About one-third of the world's sugar production is from beets and two-thirds from cane. The principal beet-sugar growing areas are the U.S.S.R. (European and Asiatic), the United States, France, Poland, the Federal Republic of Germany, the German Democratic Republic, Czechoslovakia and the United Kingdom. In the United States the principal beet-sugar producing states are California, Colorado, Idaho, Montana, Nebraska, Minnesota, Michigan, Washington, Utah and Wyoming.



BY COURTESY OF THE GREAT WESTERN SUGAR CO.

SUGAR BEET, A CULTIVATED FORM OF THE PLANT BETA VULGARIS; ROOTS OF THE SUGAR BEET MAY EXTEND SEVERAL FEET INTO THE GROUND

Powered implements had been long used in preparing the soils and planting and cultivating sugar beets, but until the 1950s no machines were generally available that could reduce the expensive hand labour of thinning the beets and of harvesting. *See* also SUGAR. (V. R. B.)

BEETHOVEN, LUDWIG **VAN** (1770–1827), German composer, was born in Bonn on Dec. 16 or 17, 1770, and baptized on Dec. 17.

LIFE

Origins **and** Family.—Beethoven's family came from the Flemish Brabant. His earliest-known ancestor was Jan van Beethoven, who lived in Campenhout at the end of the 15th century. Most of his forebears on his father's side were farmers and labourers and the "van" was only an indication of family descent, not a title of nobility. Records of Beethoven's grandfather, Louis van Beethoven (baptized 1712 at Mechelen [Malines]; died at Bonn 1773) state that he was the principal singer at St. Peter's at Louvain, bass singer at St. Lambert's at Liège and, from 1733, singer and later *Kapellmeister* of the electoral chapel at Bonn. Of his three children only one survived, Johann (born in 1740, died in Bonn in 1792); he was a tenor at the electoral court and married Maria Magdalena Keverich (born 1746 in Ehrenbreitstein, died 1787 in Bonn), who had previously been the wife of a valet of the elector of Trier, and who came from a respected family of the Rhine and Moselle district. She bore Johann van Beethoven seven children, of whom four died young. Ludwig was the second child; his two brothers, Karl and Johann, followed him later to Vienna, where they were to play a considerable part in his life.

Bonn and Vienna.—Beethoven's father, aware of the child's talents, wanted to turn him into an infant prodigy. His method of teaching was not practical, however, being at once too strict and too unsystematic. In later years drunkenness brought the father so low that, after the death of his mother, young Ludwig was appointed by the court to act as his brothers' guardian, a fact that certainly influenced his entire life. Beethoven had a few lessons from the court organist, Gilles van der Eeden, and the musicians Tobias Friedrich Pfeiffer and Franz Georg Rovantini, but he did not receive any regular musical instruction until after the arrival in Bonn of Christian Gottlob Neefe in 1779. As early as 1782 Ludwig was his deputy as court organist, and later he also played the harpsichord and viola in the court orchestra. In 1783 the *Neun Variationen über einem Marsch von E. C. Dressler* appeared as his first work in print, on the title page of which he appears as two years younger than his actual age. In fact, as late as 1810 Beethoven was under the impression that he was born in 1772.

His attendance at a private school left him with gaps in his education, which he was at pains to fill during the rest of his life. However, the spelling of his letters does not indicate a lack of culture; his correspondence reveals a wide knowledge of technical, philosophical and literary writings and an ability to think loftily and to express himself with style and ease. He had no use for show of any kind. His cultural development was encouraged by his knowledge of the family of the deceased court councilor Christoph von Breuning, who considered him as one of the household. A lifelong friendship bound him to the councilor's daughter Eleonore, her husband-to-be, Franz Wegeler, a physician, and her brother Stephan.

Beethoven's gifts were such that at the beginning of 1787 he set out, possibly at the suggestion of Neefe, to meet Mozart in Vienna. However, his mother's illness brought him back to Bonn after a fortnight, and her death in 1787 affected him deeply. In 1790 Haydn visited Bonn on his way to England. There is no proof that Beethoven met either Mozart or Haydn on these occasions. In 1791 he accompanied the court orchestra to Mergentheim, and in the same year, at Aschaffenburg, he took part in a competition with the abbé F. X. Sterkel, one of the greatest pianists in Germany. In 1792 his patron in Bonn, Count Ferdinand Waldstein, himself a gifted composer, sent Beethoven again to Vienna, this time to study with Haydn.

Beethoven arrived in Vienna on about Nov. 10, 1792, and, except for some brief journeys, he was never to leave the city again. He was now a fine pianist, proficient also on the violin and viola, and the numerous works he had written during his later years at Bonn, including piano and chamber works and particularly the two cantatas (1790) on the death of Joseph II and the accession of Leopold II, gave proof of his talents. As a member of the court orchestra he was familiar with the German, French and Italian music of the time. In spite of this, however, he sought to acquire further knowledge in Vienna from a number of experts. He first went to Haydn, but in spite of mutual respect master and pupil failed to satisfy each other. Greatly preoccupied with activities of his own, among them his second journey to London in 1794, Haydn was judged by the young Beethoven not to be strict enough. Somewhat behind Haydn's back, Beethoven went to other teachers: the theorist Johann Schenk, to J. G. Albrechtsberger for counterpoint, and the court composer, Antonio Salieri, for vocal composition.

During 1794 and 1795 Ludwig's brothers came to Vienna. In the meantime the court at Bonn had been dissolved and so there was no practical reason for his returning there. Because of his introductions and obvious gifts he soon made his entrance into the cultured middle class, and, through Count Waldstein, into the nobility. He was in demand everywhere as a performer and as a teacher. In 1795 his Piano Trios, op. 1, were published, surpassing all his earlier compositions.

Life in Vienna.—Beethoven maintained close links with Vienna throughout his life; he played his works in its *salons* and academies; he had pupils from all walks of life, including the archduke Rudolph. He spent the summer months, and sometimes part

of the autumn, out of town, where in long walks he could indulge his love of nature. In 1796 he undertook a journey to Niirnberg, Prague, Dresden and Berlin, where he played at the Prussian court and at the Singakademie, and composed Cello Sonatas, op. 5, for the king. Frederick William II. He paid several visits to Hungary, in particular to Budapest. The years 1811 and 1812 he spent at Bohemian spas with visits to Prague and Linz in 1812. Later his correspondence frequently contains plans for traveling to Italy, Paris and, particularly, London. But because of illness or lack of money or work in hand they were never realized.

An invitation in 1808 to leave Vienna for Kassel as music director led to important social and aesthetic developments. As a result of this offer three of Beethoven's most powerful patrons, Archduke Rudolph, Prince Josef Max Lobkowitz and Prince Ferdinand Kinsky, combined to guarantee him an annual salary of 4,000 florins, in order that he could devote his entire time to composition, on the condition that he should remain a resident in Vienna. Beethoven was thus placed in the unprecedented position (for a composer) of complete independence from any employment or commission. Mozart had achieved freedom from his princely patron, not indeed to the detriment of his musical genius but at the cost of greatly reduced circumstances; the aging Haydn won equality through the esteem in which he was held by Prince Esterházy. Beethoven, however, secured independence not only for himself but subsequently, by his example, for all musicians. The musician was no longer a servant of the court; he was the equal of the nobleman, a belief to which Beethoven firmly adhered and which was to have a far-reaching influence. In the meantime Beethoven's troubles were by no means over. Mainly because of the devaluation of the Austrian currency in 1811 the contract with the princes was continually being reduced, and payment often did not arrive for months. The archduke Rudolph attempted to meet his obligations, but Beethoven had to go to law to receive part of the sums due him from the princes.

Beethoven was similarly unfortunate with regard to payments due him from his publishers. His correspondence with them shows that he was often financially harassed; fees were sent grudgingly or arrived late. Moreover, Beethoven sometimes asked his brothers to help him in business affairs, causing further vexation and disagreement. After the death of his brother Karl in 1815, Beethoven was appointed guardian of his nephew, also named Karl, born in 1806. This led to long and bitter quarrels with Karl's mother, Johanna, whom Beethoven not unjustly considered unfit to be a mother, and also with the nephew himself, who was of a difficult nature. Beethoven undertook his obligation seriously but his treatment of the boy was severe, leading to the latter's attempted suicide. Beethoven's intentions, however, were of the best: though he could ill afford it he was determined to provide an inheritance for his nephew.

Ill-health is a recurring subject in Beethoven's correspondence. During his youth he survived an attack of typhoid fever, and later he frequently wrote of abdominal complaints and colic. As early as 1794 and 1796 there were signs of an ear infection, which in 1801 he mentioned to his friend Wegeler. The realization that he was threatened with deafness nearly drove him to suicide. His "Heiligenstadt Will," written for his brothers in 1802, is an impressive and moving document of inner self-conquest. The affliction progressed swiftly and after 1818 it was only possible to converse with him by writing. In the numerous "conversation books" left by Beethoven (many of them deliberately destroyed by the composer's biographer, Anton Schindler) the speech of Beethoven's interlocutor and sometimes that of Beethoven himself was written down. Beethoven's deafness thus indirectly provided a unique biographical source. But mistrust resulted from his deafness, making social intercourse increasingly difficult with friends and even more with constantly changing servants.

Beethoven and Women. — Beethoven remained unmarried, although he had a considerable number of woman admirers, corresponded with ladies of the aristocracy and is said to have seriously considered marriage in 1810 with Therese Malfatti, the daughter of a landowner. An important document is Beethoven's passionate love letter, *An die unsterbliche Geliebte* ("To the immortal beloved"), found on his desk after his death. The date of this letter is not known, nor is it known whether it was ever sent and if so whether the recipient returned it. Attempts were made to show that it was destined for Countess Giulietta Guicciardi, for Countess Therese von Brunswick or for the singers Magdalena Willmann and Amalie Sebald. Later research discounted these claims and postulated Countess Josephine Deym. younger sister of Therese von Brunswick. A number of love letters from Beethoven to her were published. Subsequently Countess Anna Marie Erdődy, to whom Beethoven also wrote. at whose house he stayed and to whom he dedicated chamber works. was suggested. From all Beethoven's correspondence with these women. however, and even from his caustic criticisms of the mother of his nephew there emerges a lofty conception of womanhood. He frequently regrets not having been blessed with a happy marriage, that it was not his lot to marry the woman of his choice. Indeed, his conception of the ideal woman is evident enough without recourse to his correspondence: it is expressed in the sublime and sensitive music of *Leonore* in his only completed opera.

Last Years. — The history of Beethoven's later years is almost entirely that of his music. By 1810, when his deafness had isolated him, he had completed the "Emperor" Concerto and was engaged on the Seventh Symphony, performed in Vienna in 1813. The following year the new version of *Fidelio* was given successfully in Vienna. Beethoven was greatly preoccupied later with legal matters concerning the custody of his nephew, and relatively few works were written between 1815 and 1820. The *Missa Solemnis* was completed in 1823 and the Ninth Symphony in the following year. The latter was performed in May 1824 in Vienna, though the Philharmonic society in London, to whom Beethoven had sent a score, had earlier paid for the sole right to perform it over a period of 18 months. In 1826, disturbed by his nephew Karl's attempt at suicide, Beethoven took the boy to Gneixendorf, the home of his brother Johann. On his way home Beethoven caught a cold that developed eventually into cirrhosis of the liver. from which he died in Vienna on March 26, 1827.

Character. — Beethoven's character is partly revealed in the vast number of his letters to friends, publishers, artists and various official institutions, and in the annotations of his sketchbooks. First references are to the supplementing of his early education. He was born and bred in the Rhineland, where the many political changes developed a democratic outlook and a desire for independence. Having dedicated his Third Symphony to Napoleon the liberator, he tore up the dedicatory page on hearing that Napoleon had proclaimed himself emperor. His belief in democracy and independence never left him, despite his friendly relations with the nobility and acquaintance with court circles. His responsibility for his brothers and his activities in the court orchestra in Bonn early accustomed him to rely on himself, and his concern for his nephew proves that he retained this sense of responsibility in later life. His love of nature may well have been inspired by the beauty of the countryside around Bonn and the nearby hills of the Siebengebirge. The same trait is seen in his frequent visits to villages near Vienna, in the choice of his many abodes in Vienna, where he usually tried to procure an open view, and above all, of course, in the "Pastoral" Symphony.

Hélène von Breuning, who was something of a second mother to him, states that in boyhood Beethoven would be overcome by fits of rage. He was in no mood, during these seizures, to listen to reason; she had to wait until they subsided. This inner tension was not reduced with the years nor was his violent temper; they were inclined to be exacerbated by his deafness. He would fly into a rage if he felt slighted, or if he felt aspersions had been cast on his honour or responsibility, though in matters of social standing there was never any question of snobbery. He mas aware of these outbursts, of course; indeed, he was sometimes ashamed of them and would try to make amends.

In 1812 Beethoven was in the company of Goethe at Teplice. Carlsbad and Bilina. Beethoven's much-quoted remark showing that, unlike Goethe, he had little respect for the imperial court ("They must make room for us, not we for them") has been exaggerated, but two remarks of Goethe epitomize Beethoven's

character. "Never have I met such a concentrated, forceful and fervent artist. I can well understand that he must have a strange relationship to the world," Goethe wrote to his wife. And to C. F. Zelter: "I am astonished by his talent but he is unfortunately an altogether untamed personality . . . One must forgive him and pity him for his loss of hearing which, however, is perhaps less harmful to him from a musical than from a social viewpoint." It was of course precisely this "untamed" element in his character, which by endless effort and labour he was able to bring under control in his work, that raised his gifts to the level of genius. True enough, there are aspects of Beethoven's character and his behaviour that are baffling and that will remain so whatever explanation may be sought in the outer or inner circumstances of his life—the unsettled political conditions, his unceasing struggle for independence, his deafness, which often put him at the mercy of unreliable people, and his celibacy. He was, on the other hand, fundamentally honest and above all honest in his knowledge of himself. Worshiping nature and believing in the hereafter, he took Kant's motto: "Within us morality, above us the starry heavens."

MUSIC

Life and Work.—Beethoven's life was wholly absorbed by music. He was never without his sketchbook to store up themes and ideas that passed through his mind. Musical ideas, developed in the form of a canon, also occur in some of the notes with amusing rhymes and puns that he sent to his friends. Asking his doctor to call on him, he sends him a canon on the words *Doktor sperrt das Tor dem Tod* ("the doctor bars the gate against death"); to the tutor Brauchle and the cellist Joseph Linke, both in the service of Countess Erdődy, he writes in the form of a canon, the text of which is their two surnames. Several improvised canons on the text *Ars longa, vita brevis* ("art is long, life short") appear in friends' albums. To Anna Milder, the soprano who triumphed as Leonore, he sent a musical pun on her husband's name. To Friedrich Kuhlau he sent a canon on the words *Kühl, nicht lau* ("cool, not lukewarm")—the theme, originally by Kuhlau, was on the letters of the name Bach (which in German means "a brook"). Beethoven was clearly fond of improvising canons in this way, prompted by some personal situation. Many of his major works were similarly inspired by some event or state of mind connected with his personal life. In this Beethoven differs from his predecessors, who, though not necessarily less subjective, adhered more strictly to orthodox forms. Though it is not an indication of their greatness, it is right to say that each of Beethoven's major works still defines a world of its own more sharply than do the cantatas of Bach, the operas of Handel or the symphonies of Haydn or Mozart. The fact that earlier sketches may have been incorporated in a particular work does not detract from its individual character since it was Beethoven's habit to select from his store of sketches those that anticipated the work in hand. It is therefore not surprising that he was less successful than other composers with "occasional" works, *e.g.*, the incidental music for August Kotzebue's Die *Ruinen von Athen,* the overture *König Stephan,* also for a play of Kotzebue, and the cantata *Der glorreiche Augenblick,* hurriedly written for the congress of Vienna in 1814. Works written to commission without a time limit were of course another matter. Four years were spent on the three "Rasumovsky" String Quartets, op. 59 (written for Count Andreas Rasumovsky), the same time on the three quartets, op. 127, op. 130 and op. 132, written for Prince Nicolas Galitzin, while the great *Missa Solemnis* intended for the enthronement of his pupil the archduke Rudolph as archbishop of Olomouc in 1820 was not completed until three years later.

Though each of Beethoven's creations has a character of its own, significant features reappear throughout his work. The theme of the song "Gegenliebe" (1794–95) serves as the theme of the variations in the Fantasia for Piano, Chorus and Orchestra, op. 80 (1808), and it has a distinct resemblance, both with regard to the text to which it is set and in its musical shape, to the theme of the "Ode to Joy" in the Ninth Symphony. Thematic resemblances of this kind can serve musicologists on another plane. Comparing motives in the various works dedicated to Countess Erdody, Dana Steichen has attempted to establish her as "the eternal beloved."

Dedications.—Beethoven's dedications, like his canons, have a personal significance. Early in his career they were expressions of gratitude to his patrons or of admiration and friendship, such as the dedication of the Piano Sonata, op. 2, to Joseph Haydn and the third Piano Concerto to Prince Louis Ferdinand of Prussia in recognition of his fine piano playing and his admiration of the composer. His pupil Baroness Dorothea von Ertmann showed a particular understanding of Beethoven's style and was accordingly the dedicatee of the delicate yet powerful Sonata, op. 101. The *Sonata quasi una fantasia,* op. 27, no. 2 (later to become famous under the title of the "Moonlight" Sonata), was understandably dedicated to Countess Giulietta Guicciardi, whom Beethoven much admired at the time. The mighty Sonata, op. 53, was written for his former patron, Count Ferdinand Waldstein, and the delicate Sonata, op. 78, for his friend Therese von Brunswick. The fervent but extremely varied Piano Trios, op. 70, were dedicated to Countess Erdődy.

Opus Numbers.—Since Beethoven never had difficulty in having his works published soon after their composition, a high opus number usually indicates a late composition. There are, however, some important exceptions: the Wind Octet, op. 103. published posthumously, was composed in 1792 for the court banquets of the elector at Bonn and appeared in 1796 in a version for string quintet as op. 4; a *Rondo* a *Capriccio* for piano, op. 129, was published posthumously, though the autograph copy that the publisher edited had been written between 1795 and 1798 and entitled by Beethoven *Alla ingherese, quasi un capriccio,* not, as it is better known, *Die Wut über dem verlorenen Groschen* ("Rage over a lost penny"); a number of songs, later given opus numbers, particularly the eight songs forming op. 52, in fact belong to the Bonn period.

Beethoven usually gave no opus numbers to his variations until he wrote the Piano Variations, op. 34 and op. 35, which he mentions in a letter to the publishers, Breitkopf and Härtel, as "among the real number of my greater musical compositions." The numbers allocated by Beethoven himself reach as high as op. 137, which is a short fugue for string quintet, composed in 1817 and published in 1827.

Stylistic Origins.—In spite of the many studies that have been written of Beethoven's relation to his predecessors, and his independence of them, he was not a revolutionary. Rather, he enormously developed music as he found it. His methods of thematic development have been compared with those of Haydn, and his use of the first movement sonata form, which he inherited from Haydn and Mozart, has been shown. The String Quartets, op. 18, are compared to works of Carl Philipp Emanuel Bach, A. E. Forster, the Mannheim composers, Haydn and Mozart. Such comparisons, however, apply to external characteristics only; namely, thematic development and peculiarities of form.

His well-known admiration for the French school of opera composers of his time, Grétry, Méhul, Gossec and Cherubini (*q.v.*), leads to a consideration of the heroic element in his work. The "heroic" style was deliberately cultivated by these composers and certain aspects of their work clearly suggest Beethoven. The French violinist and opera composer Rodolphe Kreutzer, to whom the Violin Sonata, op. 47, is dedicated, should also be mentioned here. From the French Beethoven borrowed the idea of fanfare motives that reverberate throughout his work from the first movement of the First Symphony in C (1799) to the Third "Eroica" Symphony in E flat (1803); the overture *Leonore,* no. 3; *Wellingtons Sieg,* op. 91; the "Emperor" Concerto, no. 5 in E flat, op. 73 (1809); the recitative from the Ninth Symphony in D minor (1817–24), and the Agnus from the *Missa Solemnis* (1818–23). From an ethical viewpoint Beethoven was naturally drawn to subjects of epic or heroic grandeur and attempted to illustrate them in music by numerous means. He cultivated the march form in his early piano variations, the Piano Sonatas, op. 26 and op. 101, and military marches occur in his work up to the Ninth Symphony. Significantly the third "Rasumovsky" Quartet is also known as the *Heldenquartett* ("Heroes' Quartet"). He himself entitled the quartet, op. 95, *Qzcartetto serioso,* and the evocation of the figure of fate at the beginning of the Fifth Symphony (1805–07) belongs to the same order of ideas. Mention must also be made here of

the frequent use of the key of C minor, which he seems to have favoured from 1790 to 1807, using it in *Kantnte auf* dem *Tod Josephs II;* Piano Trio, op. 1, no. 3; String Quartet, op. 18, no. 4; the Third Piano Concerto; the Fifth Symphony; and the overture *Coriolan.* In his later works he seems deliberately to have avoided this key. The choice of C minor for the Piano Sonata, op. 111, was dictated by the use of an earlier sketch.

The derivative elements of Beethoven's style do not detract from the originality of his work. Indeed, features of style, form or technical procedure immediately acquire his personal stamp. His profile is outlined in the early Piano Trios, op. 1 (1793–95), and even more clearly in the Piano Sonatas, op. 2 (1795), all works displaying even at this early stage strongly contrasted but interdependent themes, a masterly sense of design and a highly condensed conception of form. While in his symphonies and chamber works Beethoven adhered to the four-movement plan of Haydn and Mozart, he used the piano sonata for a great variety of experiments in musical form, possibly because he was himself a pianist and therefore able to give immediate expression to his ideas at the keyboard. Breaking away from the conventional plan, the opening movement of the Sonata, op. 26, is a suitelike series of variations followed by a scherzo, a funeral march and finally an allegro of almost virtuoso brilliance. The first movement of the "Moonlight" Sonata, recalling the mood of a romantic novel, suggests a nocturne. In the same unconventional category is the great op. 57 (the "Appassionata") and the two movements forming op. 78, with its strange introductory bars. The first movement of the "Hammerclavier" Sonata, op. 106 has basically the same form as the first movement of the earliest sonata (op. 2, no. 1) but is greatly enriched by contrapuntal devices. A master of fugue and canon, Beethoven attempts, in the finale of the Sonata, op. 10, no. 2, a fusion of fugue and sonata form. The same combination is impressively used in the Sonata, op. 109, and again, in a completely novel manner, in the finale of op. 106. Through Neefe Beethoven early had become acquainted with Bach and knew much of the *Well-tempered Clavier* by heart. "He should not be called Bach (in German, 'brook')," he declared, "but *Meer* ('sea')." Long-cherished projects were for a quintet and an overture based on the notes bearing the four letters of Bach's name (in German B is B flat and H is B natural). Beethoven's polyphonic style, first illustrated in the Cello Sonata, op. 102, was wonderfully developed in the Piano Sonatas, op. 100, 109, 110 and 111, and again in the late string quartets, works that break completely new ground.

Following the theory of Wilhelm von Lenz. set out in his book *Beethoven et ses trois styles* (1852–55), much Beethoven criticism was devoted to his "three styles," as if his work fell into three distinct stylistic categories. This conception is no longer valid, in the sense that each of these styles coincides with a specific period in Beethoven's life. It is true that Beethoven's growth was a continuous process, but his early works are as perfect of their kind as those he wrote at the end of his life. The division of his work into stylistic periods is not erroneous so long as each style is not pinned down to a specific period and provided it is recognized that one style may find itself juxtaposed with another within a given work. On this basis an examination of the quartets is illuminating. The six quartets forming op. 18 (1798–1800), though traditional in structure, are perfect works of art covering a vast range of experience. Particularly memorable are the grave mood of the adagio affetuoso (no. 1), "La Malinconia" (no. 6), the gay and graceful andante scherzoso (no. 4) and the cross rhythms of the scherzo (no. 2). The fourth quartet of op. 18 also conveys a mood of solemnity and sadness; in the first movement of the first quartet a motive is developed on all four instruments.

The middle group consists of the three "Rasumovsky" Quartets, op. 59 (1806), introducing Russian melodies as a tribute to the Russian ambassador in Vienna to whom they are dedicated, the "Harp" Quartet, op. 74 (1809), so-called because of a harplike accompaniment figure in the first movement, and the *Quartetto serioso,* op. 95 (1810). Here a richer sonorous texture almost suggests an orchestral conception. These middle-period quartets are laid out on a bigger scale and make greater technical and emotional demands.

The third group, op. 127, op. 130 to 135 and op. 137 (1824–26), explores further problems. These quartets are remarkable for their wonderful transparent texture, the independence and also the interplay of the four string parts, and the profusion of thematic ideas. Additional movements are introduced. Not surprisingly the full significance of these late quartets was not immediately apparent and it was not until they were performed by the Joachim quartet toward the end of the 19th century that they gradually became established in the repertory.

It is less easy to establish a dividing line between one style and another among the piano sonatas, which follow each other with fewer gaps, or in the symphonies, which are less numerous. Beethoven disconcerted his public with the opening chord of the first movement of the First Symphony, a seventh, instead of a major triad, on the tonic, and he continued to disconcert them in the "Eroica" with its novel forms, and throughout the cycle of his symphonies culminating in the Ninth with its choral finale. He had been drawn to the idea of setting Schiller's ode "An die Freude" in his youth; in the Ninth Symphony his dream was triumphantly realized.

The 19th century was inclined to overemphasize the "heroic" aspects of Beethoven's work. He was held to be a Titan, a revolutionary, and it was only natural that this image of him should have been most successfully projected in certain of his symphonies. A strange tradition was established for a time favouring the odd-numbered symphonies, which were held to be forceful and heroic, as opposed to those with even numbers, considered lacking in these qualities. This distinction can of course no longer be accepted: the magnificent form in which the Second Symphony is cast, the serenity of the Fourth, the evocation of nature in the Sixth (the "Pastoral"), and the dancelike nature of the Eighth belong to the greatest manifestations of Beethoven's spirit.

The Viennese Classical **School.**—Haydn, Mozart and Beethoven are frequently grouped together as the Viennese classics. Though none of these three composers was born in Vienna there is some justification for thus grouping them since it was in Vienna that they each spent their most productive years, as indeed did other composers who merit the description "classical." But there the main resemblance between Beethoven and Haydn and Mozart ends. Admittedly they shared similar views on thematic development and the sonata form, but each brought an entirely individual character to his technique. Haydn is said to have thought of the slow movements of his symphonies as possessing a "moral character," a conception very far from that of Beethoven, whose musical message was dictated by an emotional state. Yet if a link is to be found between Haydn and Beethoven it is in their slow movements that it is most likely to be seen. Elsewhere Haydn's subtle humour, his use of folk song and the delightful surprises he springs on the listener were foreign to Beethoven's mind. So was the equally subtle spirit of Mozart, most convincingly revealed in the portrayals of his opera characters. To Mozart's many-sided musical personality, and particularly to his use of chromaticism, Beethoven throughout his life remained a stranger.

The Variation Form.—Variations, one of the fundamental musical forms, have been used by each of the Viennese masters in an entirely individual manner. In most of his piano variations Beethoven follows his predecessors, particularly Mozart, in the practice of maintaining the main outlines of the theme that become progressively transformed by figurations. In his later works in the variation form the figurations acquire an impressive character of their own. Beethoven was himself fully aware that his two sets of Variations, in F major, op. 34, and in E flat, op. 35, had broken new ground. The theme of the latter is also used, incidentally, in the "Eroica" Symphony as well as in a *contredanse* and in the *Prometheus* ballet music. The form of the Thirty-Two Variations in C minor almost suggests the recurring features of a *chaconne,* though there is no reason to suppose that Beethoven had this form in mind. The heights are reached in the Thirty-Three Variations on a Waltz by Diabelli, op. 120, one of the most amazing works in the variation form of all time.

Remarkable, too, are the variation movements in the instrumental works, among them those in the String Quartets, op. 18, no. 4, and op. 74, the Piano Sonata, op. 57, and the Piano Trio, op. 97. Other variation movements are the slow movement of the Fifth Symphony and the finales of the "Eroica" Symphony and the Choral Fantasia, op. 80. All these seem to have prepared the way for the transcendental Arietta in the Piano Sonata, op. 111, the wonderful slow movement in the String Quartets: op. 127 and op. 131, and the visionary use of the variation in the last movement of the Ninth Symphony.

Program Music. — Misconceptions are likely to arise about works of Beethoven bearing more or less picturesque titles such as the Sixth "Pastoral" Symphony in F (1807–08), *Wellingtons Sieg* and the Piano Sonata *Les adieux, l'absence et le retour*, op. 81a. Beethoven was in no sense of the term a composer of program music. Even in the Sonata, op. 81a, dedicated to the archduke Rudolph, who had fled from Vienna before the advancing French army. the only realistic effect is the passage in the first movement suggesting horn calls. Nor, apart from the bird songs at the end of the slow movement! can the "Pastoral" Symphony be considered a descriptive work in a realistic sense. The storm section of the finale: even though it depicts thunder and wind, belongs to the category of pure music. Possibly Beethoven foresaw the purely picturesque interpretation this work was likely to receive since he specified that it had been conceived *mehr Ausdruck der Empfindung als Malerei* ("more as an expression of feeling than of painting"). It is true that the first section of *Wellingtons Sieg* (originally conceived for the mechanical "Panharmonicon" of J. N. Mälzel, inventor of the metronome) is program music though the manner in which the theme "Rule Britannia" is made to dominate that of "Malbrook s'en va-t-en guerre" is its formal basis. Nor are there realistic associations in the remainder of the work. It is easy to see how a few isolated examples of this kind led musicians in the 19th century to bestow all sorts of fanciful interpretations on Beethoven's works. Titles were invented or borrowed from dramas, novels and poems. Fortunately the 20th-century view of Beethoven rejected all such sentimental associations, and Igor Stravinsky voiced a widespread feeling when he declared that it could make no difference musically if the "Eroica" Symphony had been inspired by a republican or an imperial Napoleon.

The form of Beethoven's overtures was dictated by the nature of the themes that they introduced. The forms of both the *Egmont* and *Coriolan* overtures are remarkable in this respect and so is the overture *Leonore* no. 2, the themes of which, borrowed from the opera *Fidelio,* are developed in such a way as to foreshadow the plot. In a work such as this may be seen the beginnings of the symphonic poem. Apparently, however, Beethoven was dissatisfied with it. In a later version, the great *Leonore* no. 3 overture, he returns to a more orthodox form. This is now often played as an introduction to the second act. A fourth overture, called *Fidelio,* was first given in 1814 and is still played as an introduction to the opera.

Vocal Works. — Beethoven wrote several important vocal works. His *Lieder* such as those on texts by C. F. Gellert, op. 48 (1803), several of which have become widely known in choral versions, were cast in the customary strophic form. In the last of the Gellert *Lieder,* "Busslied," and in the fourth of his settings of Goethe's "Nur wer die Selinsucht kennt" Beethoven approached the form of the romantic *Lied. An die ferne Geliebte* ("To the Distant Beloved"), op. 98 (1816), the text of which may well have touched on personal feelings at the time: is the first true song cycle. In general: it is true to say that the contours of Beethoven's long melodic lines are not easily adapted to a poetic text and it is therefore not surprising to find Beethoven admitting that he was "not fond of writing *Lieder.*" A by-product in his vocal music is the numerous versions of Scottish, Irish, Welsh and other folk songs with trio accompaniment commissioned from him by the Edinburgh publisher, George Thomson.

The tremendous finale of the Ninth Symphony and the *Missa Solemnis,* op. 123, had been dimly foreshadowed in the two early cantatas and, more clearly, in the Choral Fantasia, op. 80 (1808), the oratorio *Christus am Ölberge* ("Mount of Olives"), op. 85 (1802), and the Mass in C. op. 86 (1807). The *Missa Solemnis* is an altogether exceptional liturgical work. The setting of the Agnus Dei in the form of a prayer for peace within the soul and without, the ringing trumpet calls that resound in this work and the imperious drum rolls combine to project Beethoven's innermost feelings. In the sphere of incidental music his outstanding achievement is the music for Goethe's *Egmont.* Though he made many attempts he wrote only one opera, *Leonore,* later called *Fidelio.* It was a source of great anxiety to him. Its first performance. at the Theater an der Wien in Vienna on Nov. 20. 1805. was a failure partly because of the fact that Vienna was overrun by the French and also because of the excessive length of the opera and the unfortunate casting of the principal male roles. A revised version mas better received in 1806. and after further revision it was triumphantly established in the repertory in 1814. The quartet "Mir ist so nunderbar" in Act I, the recitative in the prison scene and Leonore's aria "Abscheulicher" are all superlative examples of musical and dramatic characterization. Characteristically the self-sacrificing Leonore. the tyrannical Pizarro and the long-suffering Florestan are more tellingly portrayed than the less complex figures of Marcellina and Jaquino. As if to demonstrate a consistent outlook. at the climax of the finale, "O, Gott. welch ein Augenblick!" Beethoven introduces the theme of a soprano aria in his early cantata on the death of Joseph II.

General Characteristics. — There are many distinctive features of Beethoven's musical language. Cross-rhythms with syncopations and sudden *sforzando* are immediately noticeable and also the crescendos that lead not to a fortissimo but unexpectedly and in the form of an illusion to a piano or pianissimo. The rhythmic regularity alone of the so-called "Jena" Symphony, long attributed to Beethoven. should have made its authorship doubtful; it is now authoritively attributed to Frederich Witt (1770–1837). Beethoven declared that he was born to the style of "obbligato accompaniment," meaning that each instrumental part in his work, not only in polyphonic but also in homophonic textures, has an individuality of its own. His writing for wind instruments in his early works was censured by contemporary critics for this reason. Certain wind instruments are used sparingly; *e.g.,* the trumpets and trombones that appear only in the last movement and the piccolo used only in the storm of the "Pastoral" Symphony. Likewise trombones, double bassoon, piccolo, triangle, cymbals and bass drum are reserved for the finale of the Ninth Symphony. In the first movement of the Violin Concerto in D (1806) and the scherzo of the Ninth Symphony the timpani have a melodic function. Beethoven also follows the practice of Haydn and Mozart of splitting a theme into its component motives. which are then developed independently and ultimately allowed to coalesce into new themes. The first movement of the Piano Sonata, op. 2, no. 1, and the Quartet. op. 18. no. 1, contain examples of this procedure. The first movement of the Fifth Symphony is built out of a single short motive. Earlier composers practised this development of a motive at certain points in a movement; Beethoven's developments of this kind spread over a whole movement, submerging the themes themselves. Particularly characteristic, too, is the manner in which the contour of a theme is passed from one instrument to another. The nature of the theme at the opening of the first movement of the Quartet, op. 135 (1826), baffled listeners as late as the 20th century. All these elements are unified in the complex works of Beethoven's last period where every note is significant.

With this greatly enriched technique Beethoven was able to plan works of much wider scope. Themes are sharply contrasted, and bold harmonies mark the nodal points in the structure. His innovations were not immediately accepted. The abrupt harmonic sequence shortly before the repeat in the first movement of the "Eroica" Symphony was long felt to he problematic. In the end, however, these new procedures were seen to be indispensable to Beethoven's highly individual conception of musical form. Finally, Beethoven extended the short coda of his predecessors into a lengthy autonomous section crowned by a brilliant conclusion, and he transformed the minuet, until then a traditional dance movement. into his characteristic scherzo in quick tempo, of which the finest example is that of the Ninth Symphony.

The Sketchbooks. — Beethoven's method of work greatly differs from that of most other composers. More than 5,000 pages of his all-important sketches have been preserved. From these it can be seen that he was in the habit of noting down ideas as they occurred to him, referring to them later and adapting them as the occasion demanded. Each section of a composition was written out, but certain passages appear in several versions with remarks such as "good" or "better." Beethoven's sketches thus seem to have had several purposes. They were in the first place reminders. Since he usually worked at several compositions at the same time, an appropriately chosen sketch would help him to maintain a sense of unity. Furthermore Beethoven's musical imagination was constantly alive and may well have obstructed an intellectual development of his material. His sketches would thus have acted as a necessary brake on his overflowing inspiration and obliged him to maintain his ideas within a given framework.

Another question arises from a study of the final manuscripts. Beethoven was concerned with composition as an act of creation right until the last notes of a work were set down on paper. Many composers go through a difficult period of gestation but once the work is exteriorized its visual notation presents no further problem. Beethoven's mind did not work in this way. He did not first translate music into terms of visual notation; somehow or other the sound of the music and its visual representation were one. A study of his manuscripts shows how the character of his music appears from the very way it is written out. Prominent sections are noted down boldly and emphatically while subsidiary sections are merely scribbled off. Slow sections are spread out over a considerable space while fast-moving accompaniment figures are illegibly jumbled together. Beethoven's manuscripts thus provide invaluable indications. The first movement of the Piano Sonata, op. 27. no. 2, the "Moonlight," is laid out, apart from one or two corrections, in a broad confident manner, while the following Allegretto has an almost affected appearance. In the finale, where an exceptional amount of space is given to a pause, the writing with its strange slants becomes almost wild. None of this is evident, of course, from the printed page. The manuscripts alone, or facsimiles of them, hold the true secrets of his work.

Though many of his works were not appreciated in his day and lesser works by his contemporaries were sometimes better received, Beethoven was freely recognized as the foremost composer of his time. So much is evident from his invitation to Kassel resulting in his contract with the princes Lobkowitz and Kinsky. He was made an honorary citizen of Vienna and an honorary member of the Gesellschaft der Musikfreunde. The festival cantata he was commissioned to write for the congress of Vienna placed him, in the eyes of the assembly, on an international level. Societies in Amsterdam, Neth.. Styria, Aus., Laibach, Yugos., and Stockholm, Swed., presented him with honorary titles; the king of France sent him a golden medal; the Philharmonic society in London commissioned a symphony from him and presented him on his deathbed with the gift of the first complete edition of the works of Handel. All his major works were published as soon as they were written, and he was the first composer to have the score and the parts of his symphonies published simultaneously. Before that time symphonies had been conducted from the first violin part. Beethoven's symphonies required a conductor solely in charge of the orchestra and with the full score before him.

Beethoven's fame after his death continued to grow and his influence branched out in many directions. On Schubert it was not entirely beneficial, and Mendelssohn and Schumann were nurtured on Bach rather than on Beethoven. But the link was firmly established with Brahms, particularly in his symphonic works. It was long before Beethoven's late quartets began to exert an influence, possibly not before the later quartets of Béla Bartók.

Throughout the first half of the 20th century, and particularly after World War II when the size of the musical public rapidly increased, Beethoven's achievement continued to make its full impact. Beethoven cycles became an established, often an indispensable, feature of concert seasons, and it was with Beethoven's nine symphonies rather than with classical or later romantic works that the virtuoso conductor triumphed. Between 1799, the year of Beethoven's first symphony, and 1828, when Schubert wrote his great C major symphony, roughly 1,000 symphonies were written; of these, except for some of the Schubert symphonies, only those of Beethoven remained in the repertory. No other music offered quite their challenge. Arthur Nikisch, Felix von Weingartner, Arturo Toscanini, Wilhelm Furtwangler and Otto Klemperer have been among the legendary Beethoven conductors The chamber works, notably the 17 string quartets, were similarly consecrated by performances in the form of cycles. Indeed. it was largely the vogue of the Beethoven cycles that promoted the organization of a type of festival, common in Germany at the beginning of the 20th century and later in other countries, devoted to the entire works of a chosen composer.

Summary List **of** *Works. — Instrumental Works in Sonata* Form. — Nine symphonies, the last with chorus; triple concerto, op. 56, for piano, violin, cello and orchestra: 6 piano concertos (including an early work, *c.* 1784, of which only the piano part is preserved); violin concerto, op. 61; mind octet, op. 103; septet for strings and wind, op. 20; 2 sextets for strings and wind; 3 string quintets; quintet for piano and wind; 4 piano quartets; 17 string quartets including the *Crosse Fuge,* op. 133; 10 piano trios, some for wind instruments; 7 trios for strings and wind; 10 violin sonatas; 5 cello sonatas; horn sonata; sonata for piano duet; 32 piano sonatas.

Variations and Smaller Works. — Wellingtons Sieg, op. 91, for orchestra; 6 concert overtures; 2 scores of ballet music; orchestral dances and marches; 2 sets of variations for piano trio; 3 sets of variations for cello and piano; 2 sets of variations and marches for piano duet; 23 sets of variations for piano; bagatelles, rondos, fantasia, dances and other small pieces for piano; duos for strings and wind; pieces for mandolin, guitar, organ and musical clock.

Vocal Works.—Two masses, in *C* major: op. 86, and the ***Missa*** *Solemnis,* op. 123; the oratorio, *Christus am Ölberge,* op. 85; the opera called *Leonore* in its first and second versions and *Fidelio* in its third version. Four scores of incidental music and other pieces for stage works; 3 cantatas in several movements and 4 in one movement; arias for one: two and three voices with orchestra. Italian and German songs for several voices; canons: about 150 non-German folk songs for piano, violin and cello; about 80 *Lieder* for voice and piano including "Adelaide," the Gellert *Lieder,* "An die Hoffnung" and the cycle *An die ferne Geliebte.*

See also Index references under "Beethoven, Ludwig van" in the Index volume.

BIBLIOGRAPHY.—*Editions:* Beethoven's complete works were published in Leipzig in an annotated edition of 24 vol. (1862–65) with a supplement (1888). Works not included in this edition were published under the editorship of W. Hess. *See* W. Hess, *Verzeichnis der nicht in der Gesamtausgabe veröffenlichten Werke* (1957). *A* new annotated edition of the works together with Beethoven's letters and sketches was begun by the Beethovenhaus in Bonn in 1952. In 1951 two volumes appeared, containing sketches of the *Missa Solemnis* and the *Choral Fantasia.*

General works: G. Kinsky, *Das Werk Beethovens Thematisch-bibliographisches Verzeichnis seiner sämtlichen vollendeten Kompositionen,* ed. by *H.* Halm (1955); G. Schmidt-Gorg (1954–). *See* also *T.* von Frimmel, *Beethoven Handbuch,* 2 vol. (1926). (P. **Mr.**)

BEETLE, the common name for any insect of the order Coleoptera. Beetles can usually be recognized by the presence

of four wings, of which the front pair are modified into horny covers (elytra, sing. elytron) that hide the rear pair and most of the abdomen and usually meet down the back in a straight line.

Beetles are exceedingly numerous and take many forms. They include some of the largest insects and some of the smallest: *Dynastes hercules,* the rhinoceros beetle, may reach a length of 7 in. (usually about 2 in, in the U.S.) and a South American long-horned beetle, *Titanus giganteus,* may measure close to 6 in.; some African and South American scarab beetles are nearly as big as a man's fist, and others are so small as to be nearly invisible to the naked eye, as small as $\frac{1}{100}$ of an inch long.

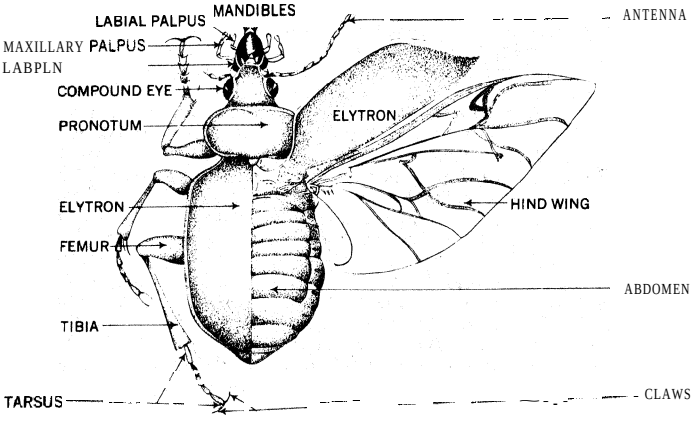
Occurrence. — In the animal kingdom beetles form by far the largest major group or order. At least 250,000 kinds are known, of which more than 25,000 inhabit North America. They thus constitute more than a quarter of all the kinds of animals.

Beetles may be found almost anywhere. Most of them feed either upon other animals (are predaceous) or upon plants (phytophagous), but some eat decaying matter of various kinds as well as a variety of other organic substances. They may be found in soil. in decaying plant or animal matter, in tissues of plants or on the exterior and in fungi. Many beetles are found crawling or flying in search of prey, swimming in or on the surface of ponds and lakes and creeping even in rock crevices in the intertidal zone along seashores. They live from the equator to the arctic regions —in deserts, jungles, forests, prairies and rocky peaks. Some beetles inhabit hot springs up to 120° F. and saline and alkali waters. Certain kinds live as "guests" in the nests of social insects. as parasites in the bodies of other insects and on the skin of some mammals. Several are pests inhabiting many materials that man has stored up for his future use. The only major niche that beetles have not invaded is the sea, where insects are almost entirely replaced by their crustacean relatives.

General Structure. — Many structural modifications are found among the beetles, with a corresponding variety of habits and habitats. So varied are both the structure and behaviour that it is very difficult to make any general statement on these topics. For example, a few beetles have no elytra and some have no wings at all.

As in all adult insects the segmented body consists of three primary body regions: head, thorax and abdomen. In beetles, however, two of the three thoracic segments are attached to the abdomen, the third (prothorax) being isolated as the region between the head and trunk, covered by a dorsal plate, the pronotum. The body covering (exoskeleton) varies from very horny and rigid to soft and flexible, but it usually consists of hard plates separated by flexible membranes.

The antennae are usually 11-segmented, but vary widely in form. The jaws (mandibles) may be relatively large, as long as the rest of the body, or almost completely absent; usually they are triangular in shape, suitable for biting or chewing. The paired maxillary and labial palpi (sing. palpus) are usually small and are used for feeling or handling food, but in some beetles one or the other pair may be greatly enlarged. The compound eyes are usually prominent, sometimes reduced or absent, and occasionally divided. Simple eyes (ocelli) are rarely present. An incised neck is sometimes evident, but in many beetles the head is recessed into the prothorax or under the pronotum.



FROM E. O. ESSIG "INSECTS OF WESTERN NORTH AMERICA" BY PERMISSION OF THE MACMILLAN CO., PUBLISHERS

FIG. 1.—STRUCTURE OF A GROUND BEETLE. FAMILY CARABIDAE

The prothorax is generally very distinct, the mesothorax and metathorax being hidden under the elytra along with most of the abdomen. The pronotum may be four-sided, very wide or very long, and sculptured with lateral spines or grooves and pits. The front legs emerge from cavities in the underside which may be confluent or separated by other parts. The cavities may be open behind or closed by other sclerites (plates). The mesothoracic spiracle (respiratory opening) is often visible just behind the base of the front legs. The mesothorax bears the elytra or wing covers and the second pair of legs. The metathorax bears the flying wings and the third pair of legs.

The legs are modified in various ways, for running, swimming, jumping, digging or clasping. In some beetles wings are not capable of producing flight, but in many others they are powerful and sustain strong flight. Small beetles are common flying in swarms particularly at dusk.

The abdomen is composed of ten segments, but often some of these are not externally visible. From five to eight segments can usually be seen, with short apical appendages evident in some beetles. Each abdominal segment has a pair of spiracles, the openings into the air-tube (tracheal) system.

Geographical Distribution. — As mentioned earlier Coleoptera are the most widely distributed of all large orders of insects; no other order has invaded the land, air and fresh water to so great an extent. Many of the dominant families, such as the Carabidae (ground beetles), Curculionidae (snout beetles, or weevils) and Scarabaeidae (scarabs, chafers), are almost as widely distributed as the order itself. On the other hand, the Dytiscidae (predaceous diving beetles) are more abundant on the northern continents, while the Cicindelidae (tiger beetles), Buprestidae (metallic wood borers), Cerambycidae (long-horned beetles, or longicorns) and Lucanidae (stag beetles) are essentially tropical families, becoming scarcer in more temperate zones. Some of the smaller families, however, are very restricted in their range; the Proterhinidae (closely allied to the weevils), for example, being almost confined to the Hawaiian Islands, and the aquatic family Amphizoidae occurring only in parts of North America and Tibet. Certain species of beetles of diverse families seem to be more tolerant of climatic differences than others, and about 270 kinds are common to Europe, North America and northern Asia. Many have become widely spread by man, and more than 100 species, especially those affecting grain and other stored products, are now cosmopolitan.

The study of island life yields some interesting features regarding the distribution of beetles. Thus in the Madeira Islands T. V. Wollaston as early as 1870 found 695 species of Coleoptera; of these, nearly 300 kinds are peculiar to those islands, although allied to European species. In the Hawaiian Islands W. E. Sharp mentions 428 species, among which 352 species had not so far (1910) been found elsewhere. Thus the peculiar species may have formerly existed elsewhere, migrated to the islands mentioned and since that time become extinct in their original homes; or they may have been evolved within the islands — the latter supposition being the more probable.

Geological Distribution. — The oldest known fossils of beetles come from the Upper Permian rock strata (about 200,000,000 years old) of Australia and the U.S.S.R. and consist of elytra only; the remains are not sufficient to establish the relationships of these beetles but some of them show affinities with the existing coleopterous family Hydrophilidae (water scavenger beetles). A great number of fossil remains of true beetles have been found in later strata, the Triassic of Queensland, Austr., and of Switzerland. Some of these fossils are leaf beetles and weevils. The English Jurassic beds have yielded remains of bark beetles. In the Miocene rocks of Florissant, Colo., and in the Prussian amber (Oligocene) many fossils referable to living genera have been found, including about 400 species of weevils.

Natural History. — Beetles and their larvae live and feed in almost all the diverse ways found among insects. The carnivorous

habit of seeking and devouring living prey occurs in the ground beetles, tiger beetles, lady beetles or ladybirds and in predaceous diving beetles. In these instances the beetles and their larvae have similar habits.

In certain rove beetles of the genus Aleochara, in the ground beetle Lebia *scapularis* and in the curious Metaecus paradoxus (family Rhipiphoridae) the larvae are true parasites and the adult beetles free-living—a habit that is rare among Coleoptera. *Metaecus* occurs in England and its newly hatched larva is a minute black, active creature that, by some unknown means, finds its way into wasps' nests. There it becomes an internal parasite of wasp larvae and subsequently bores its way out of its host, finally devouring the remains. A vast number of beetles and their larvae feed directly upon plants; this is the case with the whole family of the Chrysomelidae (leaf beetles) and with the weevils. Others, such as the long-horned beetles, bark beetles and metallic wood borers, feed in the larval stages upon the wood or bark of trees. Wireworms, injurious larvae of the Elateridae, and chafer larvae feed on the roots of various crops. Weevils have very diverse habits and no parts of plants, from the roots to the seeds, are exempt from the attacks of one or more species.

There is a great and diverse assembly of beetles, and more especially their larvae, that feed entirely upon decaying organic matter of various sorts. Thus the Silphidae include many carrion feeders and are well exemplified by the burying beetles; hosts of rove beetles frequent refuse of all kinds, and many Scarabaeidae live in dung. Many beetles and their larvae live in grain and other stored products, and some attack hides, furs, museum specimens, tobacco and drugs.

Apart from the more usual habits it is interesting to note certain exceptional modes of life found among beetles. There are genera and even whole families that live in the nests of ants or of termites. There are others that inhabit the extensive limestone caves of Europe and North America, whereas certain blind ground beetles are only found beneath huge boulders deeply embedded in the earth. There are also species that inhabit the seashore and are submerged by the tides. A few rove beetles live as external parasites around the anus of South American mammals.

Means of protection against enemies are varied among Coleoptera. Some are cryptically coloured and closely resemble their surroundings: in the African longicorn Petrognathe *gigas* the nhole upper surface resembles dead velvety moss, and its irregular antennae are very much like dried tendrils or twigs. Many weevils fall and feign death at the least alarm and, folding their limbs closely around the body, look like seeds or particles of soil, thus escaping observation. Certain beetles, especially those living in ants' nests, resemble ants, and the common wasp beetle of Europe, Clytus *arietis*, both in its movements and coloration, closely resembles a wasp (for further instances of this kind see MIMICRY). Other beetles obtain some measure of protection possibly from their repellent appearance, or from their evil-smelling or distasteful secretions, either in the form of exudations of blood from definite parts of the body, or as the product of special fetid glands. The so-called bombardier beetles of the Carabidae have the property of secreting an evil-smelling defensive fluid from the anal end of the body. In some cases this fluid volatilizes into a gas which looks like a minute jet of smoke when it comes into contact with the air, and its caustic properties act as a repellent to other insects or foes. Finally a number of beetles secure protection in virtue of their general agility: many ground beetles and tiger beetles run rapidly and the latter also take to wing with great readiness, whereas the flea beetles have remarkable powers of leaping.

Many beetles produce sound, usually brought about by the friction of one part of the body (the "scraper") against another part (the "file"). These stridulating organs were studied by Darwin and later, in 1900, by C. J. Gahan. They are generally present in both sexes and probably serve for mutual sexual calling. In some beetles there is a filelike area on the head which is rasped by the anterior margin of the prothorax. Among the longicorns the sound is produced either by rubbing the hind margin of the prothorax over a striated area on the mesothorax, or by rubbing the femurs of the hind legs against the margins of the elytra.

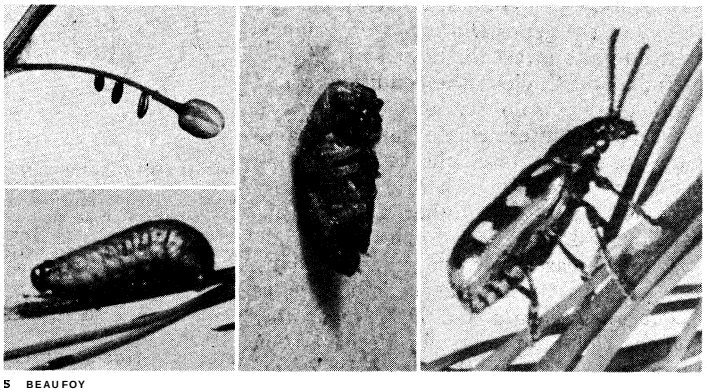
Stridulation, however, is not confined to adult beetles. but occurs in certain larvae also. Thus in some larvae of the superfamily Scarabaeoidea there is a series of ridges or tubercles on the coxae of the middle pair of legs, and the hind legs are modified in various ways as rasping organs. In the cockchafer larva and larvae of other chafers a ridged area on the mandible is rasped by a series of teeth on the maxillae. Stridulation in larvae is independent of sex and it has been suggested that it is to warn neighbouring larvae, inhabiting burrows in wood, etc., to avoid getting in each other's way.

Apart from recognition by sound, some other beetles emit a bright light for the same purpose. The source of the light is in special luminous organs that consist of an outer, light-producing layer and an inner, reflector layer. The outer layer is supplied with oxygen by means of air tubes (tracheae) and the reflector layer contains many urate crystals that appear to act as a background, scattering the light and preventing its dispersion internally. The light is produced as the result of the oxidation of the compound luciferin in the presence of the enzyme-like substance luciferase; this reaction takes place in the outer layer of the luminous organ. It has been suggested that this luminescence does not reside in the actual cells of the tissue concerned but is caused by the presence within the tissue of special luminous bacteria (for chemical details of this form of luminescence see BIOLUMINESCENCE).

Luminous beetles belong to the families Lampyridae (fireflies), Phengodidae, Drilidae and Elateridae (click beetles and wireworms); a familiar example of the first-meotioned family is the common European glowworm (*Lampyris* noctiluca) whose wingless female emits a bright light near the hind end of the body; the winged male exhibits a much feebler light. The Elateridae include beetles of the genera *Pyrophorus* and *Photophorus*, both sexes of which are winged and luminous. (See also FIREFLY.)

Economic Importance.— Many beetles are injurious, either as larvae or adults. Among those which attack farm crops. the wireworm (*q.v.*) is important. Wireworms are most prevalent in newly plowed grassland and attack the supervening crops, particularly cereals and roots. Flea beetles of the family Chrysomelidae cause great damage to plants of the turnip tribe. both the beetles and their larvae feeding upon the leaves and other plant parts. The asparagus beetle (*Crioceris asparagi*), belonging to the same family, is a familiar pest of that vegetable in Europe and North America (fig. 2). Related to it is the Colorado potato beetle (*q.v.; Leptinotarsa* decemlineata), which is destructive to potato foliage in the eastern half of North America; later it became established in the Bordeaux district of France. The Japanese beetle (*q.v.*) (*Popillia japonica*), one of the chafers, was accidentally introduced into New Jersey from Japan about 1916 and extended its range throughout eastern North America, where the beetle is injurious to the foliage of fruit and other trees and its underground larvae damage lawns and golf greens. The common white grubs, larvae of the May or June beetles such as Phyllophaga, attack the roots of grasses, potatoes, strawberries, cotton, etc.; the adults may feed on the foliage of trees.

Many weevils are highly injurious; for example, the boll weevil



S BEAUFOY

FIG. 2.— ASPARAGUS BEETLE. FAMILY CHRYSOMELIDAE: (TOP LEFT) EGGS; (BOTTOM LEFT) LARVA; (CENTRE) PUPA; (RIGHT) ADULT

(Anthonomus *grandis*) is the most serious enemy of the American cotton crop. It entered Texas about 1892 from tropical America, subsequently infesting almost the whole cotton belt. (See BOLL WEEVIL; COTTON,)

Larvae of many longicorns are destructive to living and dead timber, and species of *Anobium* and Xestobium, the deathwatch (*q.v.*) beetles, bore into furniture and the rafters of public buildings. The powder-post beetles (Lyctidae and Bostrychidae) have similar habits; one species, the lead-cable borer (Scobicia declivis), which is common in California and Oregon, eats holes through the lead sheathing of aerial telephone cables and sometimes causes short circuits or considerable damage because of the admission of moisture through the holes.

Many beetles, notably the granary weevil (*Sitophilus granarius*) and the meal worms and their allies, of the family Tenebrionidae, also attack stored grain, meal and other dried products. (See FLOUR BEETLE.) Many beetles are household pests, members of the family Dermestidae being the most important in this regard. Of these, the black carpet beetle (Attagenus piceus) is the most destructive in North America; it chiefly attacks textiles of rough finish, including carpets and upholstery; another species (*Thylodrias contractus*) is a common pest in museum collections, where it attacks dried insect specimens.

The above remarks serve to show the many injurious species of Coleoptera; nevertheless, there are others that have been employed by man to his benefit, particularly lady beetles, or ladybirds (Coccinellidae), and ground beetles (Carabidae). The Australian ladybird (Rodolia cardinalis) has been imported into most citrus-growing countries of the world for the purpose of controlling the fluted scale. Another Australian ladybird (Cryptolaemus *montrousieri*) has a similar habit of preying upon mealy bugs (Coccidae), and its introduction into the Hawaiian Islands and California has achieved a remarkable degree of success. The European ground beetle (Calosoma *sycophanta*) has been introduced into North America, where it preys upon the caterpillars of the gypsy moth and brown-tail moth. Several species of the family Histeridae (Plaesius *javanus*, Pachylister chinensis and Oxysternus *maximus*) have been used to control the banana-root borer (Cosmopolites sordidus), the common housefly and the palm weevil (Rhynchophorus *palmarum*), respectively, in various parts of the world.

A few beetles are of medical importance. Rove beetles of the genus Paederus and blister beetles (Meloidae) produce a substance that causes blistering when the insects come in contact with or are crushed on the human skin; in some parts of the world there may be seasonal epidemics of blistering dermatitis concurrent with the season of abundance of these beetles. The drug cantharidin is a blister-producing agent that is obtained from one of the blister beetles, the Spanish fly (Lytta vesicatoria). A few scarabaeid beetles, chiefly of the genus Onthophagus, gain entrance to and infest the bowels of children in India and Ceylon; the condition, called beetle disease, is not serious. Other beetles serve as the intermediate host of certain parasitic worms (*e.g.*, the tapeworm *Hymenolepis* diminuta) that are ordinarily parasites of rats or other animals, but which occasionally infect man.

Plant diseases may be transmitted by beetles; for example, the cucumber beetles (Diabrotica *vittata* and *D. 12-punctata*) and the Colorado potato beetle have been reported to transmit the viruses of cucurbit mosaic and spindle tuber of potatoes, respectively. See also INSECT for a general account with some information on beetles.

Control. — Control of pestiferous beetles embraces most of the same physical, chemical and biological methods used against many other insects (*see* ENTOMOLOGY: Principles of Insect Control).

CLASSIFICATION

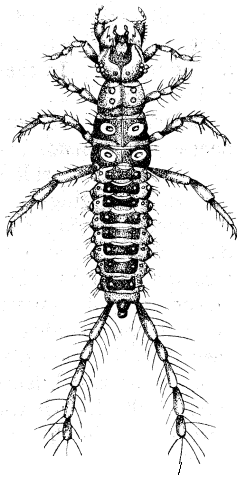
About 135 families of beetles are known. Of these more than 120 occur in the western hemisphere and at least 110 in the U.S. and Canada. The American forms of the order Coleoptera may be classified into 3 suborders and 22 superfamilies. Some of the major families are mentioned below in the framework of this classification.

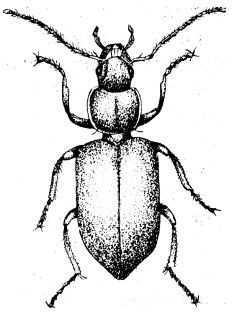
SUBORDER ARCHOSTEMATA

Only one small and rare family, Cupesidae, belongs in this suborder, members of which are believed to be representative of a primitive type of beetle. They occur under bark or in decaying logs and are rarely seen.

SUBORDER ADEPHAGA

A single group of families forms this suborder, with the Carabidae, or ground beetles, most conspicuous. They are principally distinguished by the structure of the underside of the prothorax and of the first visible abdominal segment; most of the families are easy to recognize from their general form and habits.





(ABOVE) FROM CARPENTER, "INSECT TRANSFORMATION" (U.S. DEPARTMENT OF AGRICULTURE); (BELOW) FROM SHARP, "FAUNA HAWAIIENSIS," CAMBRIDGE UNIVERSITY PRESS

FIG. 4.— GROUND BEETLE, FAMILY CARABIDAE; (ABOVE) LARVA; (BELOW) ADULT

The Cicindelidae (fig. 3) are called tiger beetles because of their voracious hunting habits. The larvae live in burrows in the ground, from which they venture to capture their prey with large sickle-shaped mandibles. The adults also have prominent mandibles and are commonly seen flying along sunny paths or sandy banks. They fly very strongly, but usually alight within a few feet. At least 125 kinds are known from North America.

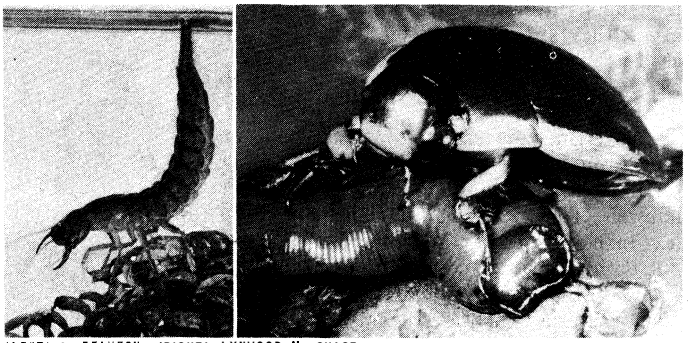
The Carabidae, or ground beetles (fig. 4), form one of the largest families of beetles. They are very common under stones, bark, moss, etc., particularly in damp places. Some of them are among the largest American beetles; they are usually black or inconspicuously coloured. They usually feed on other insects and small worms, and generally are harmless to man and his property. About 25,000 kinds are known, of which more than 2,000 occur in North America. (See GROUND BEETLE.)

The Dytiscidae (fig. 5) is the family of predaceous diving beetles. Their hind legs, with fringes of hairs, are used as oars for swimming. The larvae are aquatic and have large sickle-shaped jaws, with which they prey on other forms of aquatic life such as other insects, tadpoles, small fish and even each other. There are more than 2,000 species, of which nearly 400 live in North America.

Other families in this suborder are the Gyrinidae, or whirligig beetles, which pirouette on the surface of the water; the Haliplidae, or crawling water beetles; the Rhysodidae, or wrinkled bark beetles; the Amphizoidae, which are found only in western North America and Tibet.

SUBORDER POLYPHAGA

About 90% of the beetles belong to this suborder. These beetles cannot be distinguished from members of Adephaga by readily visible features but differ in the structure of the prosternum and the first abdominal sternite. The suborder is represented in North America by numerous families grouped into the following 20 superfamilies.



(LEFT) S BEAUFOY (RIGHT) LYNWOOD M CHACE

FIG 5 — PREDACEOUS DIVING BEETLE, FAMILY DYTISCIDAE (LEFT) LARVA HANGING HEAD DOWNWARD, AWAITING PREY; (RIGHT) ADULT FEEDING ON A LEECH

Staphylinoidea.—The Staphylinidae (fig. 6) are often called rove beetles, though the family includes many forms for which this name is inappropriate. This is one of the largest families of beetles and is probably the most difficult of all to describe in general terms. Simple characters that will distinguish it in taxonomic keys have not been found. Among its more than 20,000 species there are carnivores, a few scavengers, pollen feeders, true parasites, physogastric forms that live in termite nests, ant guests that look so much like ants that only an expert can tell them apart and many more. They are found wherever decaying matter occurs. usually preying on other insects present Most of them have greatly shortened wing covers that leave much of the abdomen exposed. The wings are folded in a complex but characteristic pattern under the elytra when not in use Many rove beetles are strong fliers. and when they occur in swarms they are often mistaken for gnats

JOHN H GERARD

FIG. 6 — ADULTROVE BEETLE, FAMILY STAPHYLINIDAE

The Silphidae include the large carrion beetles and the burying beetles. The latter, usually large, black and red or black and orange beetles, undermine the soil beneath a small dead animal until the carcass is completely buried. Eggs are then laid on the carcass, which the larvae upon hatching use for food.

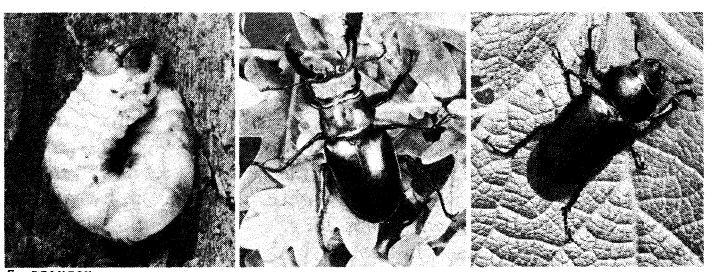
Here also, among a dozen small families, are the Ptiliidae, which inciude the smallest beetles — about $\frac{1}{4}$ mm. long (about $\frac{1}{64}$ in.).

Hydrophiloidea. — A single family, the Hydrophilidae, belongs here. These are the water scavenger beetles which may be very large and similar in habits to the Dytiscidae, except that the adults are scavengers. One group in this family lives on land, principally in manure and other decaying vegetable matter. They are small and seldom seen.

Histeroidea.—The family Histeridae includes small beetles that are usually glossy black, hard and compact. They mostly live in dung and decaying matter, where they go to find other insects as prey. The head is deeply sunken into the prothorax, resulting in a very stocky and compact shape About 3,000 species are known, of which 400 occur in North America.

Scarabaeoidea.—The families Passalidae, or bessbugs, and the Lucanidae. or stag beetles (fig. 7), are principally found in rotting wood. They are conspicuous beetles, approaching two inches in length. The stag beetles may have very long jaws, sometimes branched like the antlers oi a stag — hence the common name. The. flying adults are often attracted to lights on summer evenings.

The Scarabaeidae includes the scarabs, May or Tune beetles. chafers (fig. 8), dung beetles, etc. They are mostly compact and hard. but vary in size from one-eighth inch to the heaviest-known insect — an African beetle nearly five inches long (fig. 9). The group is distinguished by the unusual antennae. in which the last three segments are expanded into flat plates that fit together to form a club. Here belong the sacred scarab of ancient Egypt and



S BEAUFOY

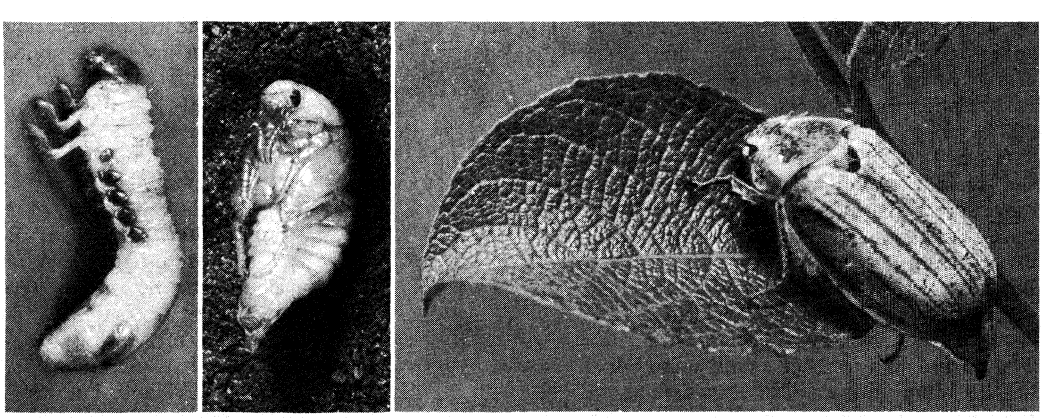
FIG 7 —STAG BEETLE. FAMILY LUCANIDAE (LEFT) LARVA. (CENTRE) ADULT MALE WITH LARGE MANDIBLES; (RIGHT) ADULT FEMALE

the brilliant gold and silver shining leaf chafers (subfamily Rutelinae). This is one of the most popular families' with collectors, because of the large size, great variety of colouring and extreme beauty of some forms. The Scarabaeidae includes some beetles that are serious pests, such as the Japanese beetle. More than 15.000 species are known, of which about 1,500 occur in North America. (See SCARAB; CHAFER.)

Dascilloidea.—The family Dascillidae are small soft-bodied plant beetles that occur chiefly on plants in moist regions. All four families in this superfamily are uncommon and not usually rated as pests.

Byrrhoidea.—About four small families are placed in this superfamily. They are inconspicuous and not often noticed, being small. convex, black beetles that are usually found under debris or bark.

Dryopoidea.—This small group includes most of the water beetles that are not put in the suborder Adephaga; it includes the families Dryopidae, Elmidae. Limnichidae, Psephenidae, etc. They do not swim but crawl on the bottom and under stones The larvae of Psephenidae are called water pennies because they are flat and almost circular. adhering to the undersides of stones



S. BEAUFOY

FIG. 8.— COCKCHAFER. FAMILY SCARABAEIDAE: (LEFT) LARVA: (CENTRE) PUPA: (RIGHT) ADULT

Elateroidea.—The Elateridae is an important family of slender but hard beetles that has many conspicuously coloured and large members in tropical regions. In North America they are usually small or moderate in size, known as click beetles, or snapping beetles (fig. 10). When turned on their backs, they suddenly snap their pronotum and head against the ground, thus bouncing into the air and often falling right side up. The larvae are known as wireworms; they are serious pests, living on roots of beans, potatoes, cotton and corn and other cereals. Almost 600 kinds occur in North America. (See WIREWORM.)

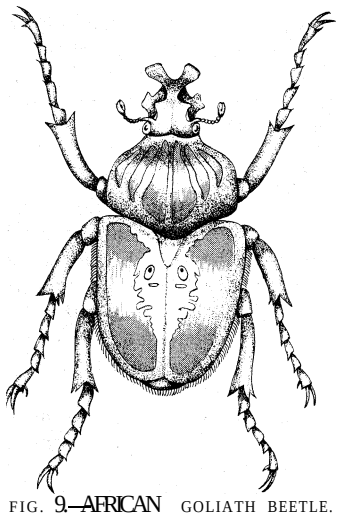


FIG. 9.—AFRICAN GOLIATH BEETLE. FAMILY SCARABAEIDAE. ONE OF THE LARGEST INSECTS

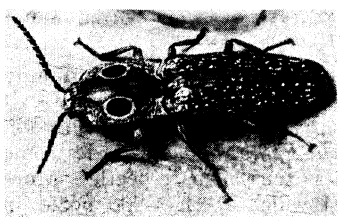
The Buprestidae is a family that includes many of the most beautiful of all beetles. They are called the metallic wood-boring beetles (fig. 11), but it is the larvae that bore. The larvae are often called flat-headed borers to distinguish them from the roundheaded larvae of the long-horned beetles (Cerambycidae). The colour of the adult is usually iridescent or metallic. In the tropics there are kinds about one-eighth inch long and beautiful giant species up to three inches long. They are popular with collectors, are often used in jewelry and for ornament and sometimes are serious pests of trees and shrubs. About 8,000 species are known, of which about 400 occur in North America.



JOHN H. GERARD

FIG. 10.—EYED CLICK BEETLE, FAMILY ELATERIDAE

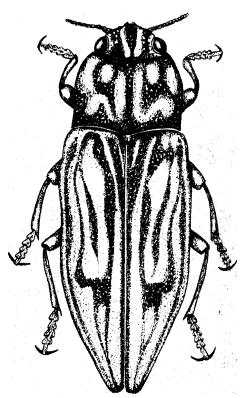
Other families in this group are the Cebrionidae, Cerophytidae, Melasidae, Plastoceridae, Trixagidae and Rhipiceridae, all of which are seldom seen.

Cantharoidea.—The Lampyridae is the family of the fireflies, or lightning bugs (fig. 12). These common beetles are known nearly everywhere for their display of flashing yellow lights on summer evenings. The light is emitted by a special organ at the ventral tip of the abdomen. The beetle can control the flashing, which is normally rhythmic according to a characteristic pattern depending on the species. In some species only the males are winged; the females, called glowworms, look like larvae and give their flashes from the ground. Some other beetles produce light, but not from the tip of the abdomen. About 2,000 species are known, of which fewer than 100 are found in North America. (See **FIREFLY.**)

The Cantharidae, or soldier beetles, have leathery elytra as do the Lampyridae, but do not produce light. They feed mostly on other insects, including pests such as aphids and mealy bugs, and should be classed as primarily beneficial. More than 1,300 species are known, of which nearly 200 occur in North America.

Other families of the Cantharoidea are the Lycidae, or net-winged beetles, looking more like insects of the order Neuroptera than like beetles.; the Phengodidae, which may be luminescent in all stages; and the Drilidae, whose larvae feed on snails.

Cleroidea.—The family Cleridae consists of the checkered beetles (fig. 13). They are usually rather small, soft-bodied beetles found in the soil or elsewhere about the nests or burrows of other insects, upon whose eggs and larvae they feed. As some feed upon injurious bark-beetle grubs, they are to be considered as beneficial. About 2,500 species are known; 200 are in North America.



BY COURTESY OF J. N. KNULL, THE OHIO STATE UNIVERSITY STUDIES

FIG. 11.—METALLIC WOOD-BORING BEETLE, FAMILY BUPRESTIDAE

The Dermestidae is a family of pests troublesome in stored materials and in museums and houses. They are small, often less than one-quarter inch long, but both larvae and adults feed extensively on dead animal and plant material. Although only about 550 species are known—150 in North America—they do more than their share of damage.

The Malachiidae, Melyridae and Dasytidae are all called soft-winged flower beetles. They are small, usually brightly coloured, and may show unusual developments of the antennae; some species have saclike orange-coloured structures along the sides of the abdomen. One of the members of the family Ostomatidae attains nearly an inch in length, is bright blue-green, and is common under dead bark; others of the family are pests in granaries.

FIG. 13.—CHECKERED BEETLE. FAMILY CLERIDAE

Bostrychoidea.—The Ptinidae. or spider beetles (fig. 14), are very small, dut can do great damage in stored food, in museums and in old wooden buildings. The Anobiidae, called deathwatch or drugstore beetles, are also small. They live in many vegetable materials including stored food, drugs and tobacco. Some Anobiidae larvae that burrow in dry wood of furniture, house beams, etc., make a faint ticking sound superstitiously thought to presage a person's death. (See DEATHWATCH.)

The Bostrychidae and Lyctidae are the powder-post beetles, so called because they bore into dry wood and leave powdery droppings. They may completely destroy large timbers and leave it perforated as if it had been riddled by fine shot. One western U.S. species is unique in its habit of boring into lead cables, causing moisture to short-circuit the wires; it is therefore known as the lead-cable borer or short-circuit beetle.

Lymexylonoidea.—This group includes the small families Lymexylonidae, or timber borers; the Micromalthidae, which have an unusual life cycle that includes reproduction by the larval stages; and the rare Telegeusidae, which resemble small rove beetles.

Nitiddoidea.— The Nitidulidae, or sap beetles, are usually small and oval and sometimes have the elytra abbreviated so as to expose the tip of the abdomen. They are common around decaying fruits, sap and fungi, and some are found on dead and dried animals, in flowers or under loose bark. Some of them are very similar in appearance to some rove beetles. About 2,500 species are known, of which 150 occur in North America.

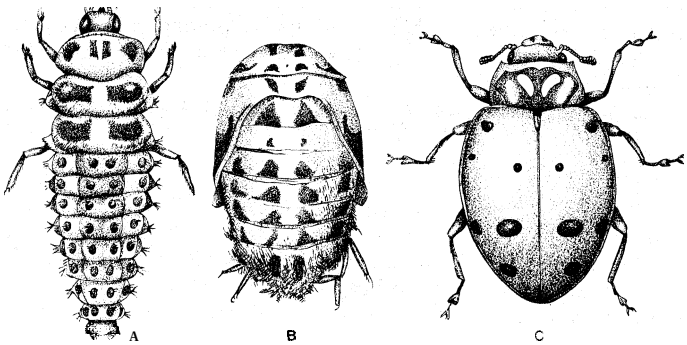
FIG. 14.—SPIDER BEETLE, FAMILY PTINIDAE

Cucujoidea.—The Cucujidae, or flat bark beetles, usually feed on mites and small insects, but a few feed on stored grain. They are extremely flat and often are reddish, brownish or yellowish in colour. The bark-dwelling species may be one-half inch long, but the stored grain feeders are usually less than one-quarter inch long. There are known only about 1,000 species, with 100 in North America.



BY COURTESY OF U S DEPARTMENT OF AGRICULTURE

FIG. 15.— LADYBIRD BEETLE. FAMILY COCCINELLIDAE: (A) LARVA: (B) PUPA: (C) ADULT

The Anthicidae are called antlike flower beetles. They are usually less than one-quarter inch long and are clearly divided into three body regions as are ants. In *Notoxus* the pronotum is prolonged forward in a sort of horn, with the head hanging down at an unusual angle.

Other families in this group are the Languriidae, or lizard beetles; Cryptophagidae, or silken fungus beetles; Phalacridae, or shining flower beetles; Orthoperidae, or fringe-winged fungus beetles; Lathridiidae, or minute brown scavenger beetles; Biphyllidae; and Byturidae.

Coccinelloidea.—The Coccinellidae comprise the lady beetles, often called ladybird beetles or ladybugs. They are usually almost hemispherical beetles, often yellow or orange and marked with black Lady beetles are very common and by some are thought to be good-luck omens. The larvae are elongated and soft-bodied, often seen crawling on walks and buildings as well as on plants. They live mostly on other soft-bodied insects, such as aphids, and thus are beneficial. A few are plant feeders that become serious pests, such as the Mexican bean beetle. About 3.000 species are knoun, of which about 400 occur in North America (See LADYBIRD.)

The Erotylidae, or pleasing fungus beetles, are small and rarely seen in North America, but in the tropics they attain a large size (about one inch), and are brightly coloured and very conspicuous, with the elytra tremendously arched over the back, enclosing a large air space. More than 2,500 species are known, with fewer than 100 in North America.

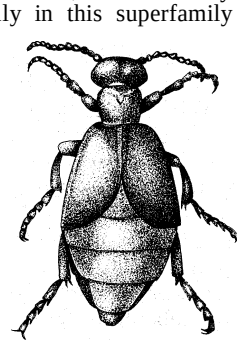
The Endomychidae, or handsome fungus beetles, are similar in many respects to the Coccinellidae and comprise about 1,140 species.

Colydioidea.—This group includes such little-known families as the Mycetophagidae, or hairy fungus beetles; Colydiidae, or cylindrical predaceous bark beetles; Discolomidae; Murmidiidae; and Bothrideridae. All of these species are inconspicuous forms unlikely to be encountered by anyone but an entomologist.

Mordelloidea.—The Mordellidae are called tumbling flower beetles because of their reactions when disturbed. They are mostly small forms with a silky appearance and a body tapering to a point beyond the elytra; their shape is distinctive, and the family is easily recognized, It is the only family in this superfamily and consists of about 800 species.

Melooidea.— Here occur some of the most unusual of any beetles. Some kinds have a complicated life history called hypermetamorphosis, in which the last larval stage differs in form from the earlier stages. Some members are parasitic inside other insects, and some have females that are wingless and look like larvae.

The family Meloidae includes the blister beetles and the oil beetles (fig. 16). Blister beetles, often about one-half inch long, are soft-bodied with leathery wings. When these beetles are crushed on human skin, a chemical called cantharidin, contained in their body fluid, produces large blisters.



AFTER A D IMMS INSECT NATURAL HISTORY, WILLIAM COLLINS SONS , CO , LTD

FIG. 16.—OIL BEETLE, FAMILY MELOIDAE

Oil beetles are usually larger and very full-bodied, with the short elytra somewhat overlapping at their origin. The name oil beetle comes from the oily exudation emitted from the joints of the legs when the beetles are disturbed. More than 2,000 species are known, including 200 from North America.

The Rhipiphoridae is a small family, also remarkable in having larvae that are parasites in insects, such as wasps and cockroaches. The elytra are reduced, and hypermetamorphosis occurs. These beetles are very similar in many ways to the order of insects known as Strepsiptera, or twisted-winged insects. This resemblance and other evidence indicates that the strepsipterans should be regarded as a family, Stylopidae, in the Melooidea.

Tenebrionoidea.—The Tenebrionidae are called darkling ground beetles. This is a large and varied family with 10.000 known species, 1,400 in North America. They are mostlv black or brown, seldom colourful, and range from one-quarter inch or less to nearly two inches. Some have the elytra completely fused down the middle. They are mostly scavengers of plant material and thus may be pests in stored grains and vegetables. But the noxious species are few, and the rest are substantially harmless.

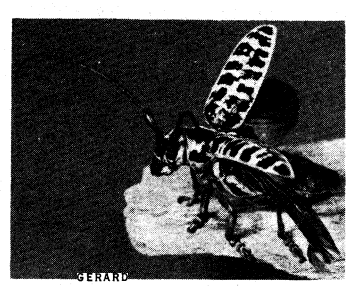
ALEXANDER B KLOTS

FIG. 17.—DARKLING GROUND BEETLE. FAMILY TENEBRIONIDAE. ASSUMING A POSTURE OF DEFENSE

The many other smaller families in the Tenebrionoidea include the Oedemeridae, Cephaloidae, Pedilidae, Scalidiidae, Pyrochroidae, Pythidae, Othniidae, Serropalpidae, Scraptiidae, Lagriidae, Nilionidae, Monommidae, Cisidae and Alleculidae.

Phytophagoidea.—This is by far the largest superfamily, containing also the three most important groups of pest beetles. Practically all the species, both as larvae and adults, feed on plants or plant material, many of them on crop plants.

The family Cerambycidae comprises the long-horned wood borers (fig. 18), whose larva are called roundheaded borers. Some of the most striking and beautiful beetles, as well as the longest over-all, are included in this family. They usually have long antennae (or feelers), rather long legs and a hard, slender body; many of them are good fliers. Most are flower feeders as adults and some do not feed at all; the larvae, however, bore in wood, damaging the timber and girdling the branches, and feed on roots, cones, etc. At least 20,000 species are known, of which 1,200 occur in North America.



JOHN H GERARD

FIG. 18.— COTTONWOODBORER. FAMILY CERAMBYCIDAE. WITH ELYTRA RAISED PREPARATORY TO FLIGHT

The Chrysomelidae are the leaf beetles. They are usually less than one-half inch long, are variously shaped and frequently brightly coloured or spotted. The adults are good fliers that feed principally on flowers and leaves; the larvae may feed on foliage, making tunnels in the leaves (miners), may feed on roots, or may bore in stems. Nearly all are classed as pests, many serious ones. Among the 24,000 species, with 1,000 in North America, are the tortoise beetles, flea beetles and many kinds of leaf beetles.

The Bruchidae or Mylabridae are the bean and pea weevils. They are small and inconspicuous, but do much damage to growing peas or stored peas and beans. The larvae bore in seeds and leave conspicuous holes. After emerging from peas or beans stored indoors, the beetles are often seen at windows in an attempt to escape.

The family Curculionidae is by far the largest family of all animals. It includes about 50,000 species, with nearly 2,000 in

North America. These are the true weevils, or snout beetles, in which the head is prolonged into a snout that may be as slender as a needle and longer than the entire body. The true weevils range in length from less than one-eighth inch to over two inches. Both adults and larvae feed in or on plants; they attack roots, leaves, fruits and seeds. Common species feed on roses and other flowers, on sweet potatoes, cotton bolls, plums and other fruit and on stored grain and many other common plants and plant products. (See WEEVIL.)

FIG. 19.—CLOVER LEAF WEEVIL, FAMILY CURCULIONIDAE

The Scolytidae are the bark beetles, which include shot-hole borers, engraver beetles and timber beetles. These are small cylindrical beetles, usually brown or black, that mine beneath the bark of trees. Trees are frequently killed by the beetles' burrowing in the cambium layer of the bark. The smaller European bark beetle (fig. 20) (Scolytus *multistriatus*) has been one of the chief carriers of Dutch elm disease (see ELM: Dutch Elm Disease).

FIG. 20.—SMALLER EUROPEAN ELM BARK BEETLE, FAMILY SCOLYTIDAE, CHIEF VECTOR OF DUTCH ELM DISEASE

Other families in this group are the Anthribidae, or fungus weevils; Brentidae, which are sometimes so elongate that a two-inch beetle may be less than one-eighth inch in diameter; and Platypodidae, or flat-footed ambrosia beetles which bore into wood and cultivate fungus in their tunnels for food for their larvae.

BEETS, NICOLAAS (1814–1903), Dutch pastor and writer, whose *Camera* Obscura is a classic of Dutch literature, was born at Haarlem, Sept. 13, 1814. As a student at Leiden, he was influenced by reading Byron and was one of the first to write romantic poetry, avoiding the hackneyed poetic vocabulary and imagery of the classical school. His poetry—*José* (1834), *Kuser* (1835) and *Guy de* Vlaming (1837)—played a part in the controversy between the classicists and the romantics. While still at Leiden, he also wrote the sketches, tales and essays collected as Camera *Obscura* (edited under the pseudonym Hildebrand. 1839; 3rd definitive ed. 1851). These continued the Dutch tradition of painting domestic scenes in a realistic manner, but combined with it the whimsical humour he had learned from reading Sterne, Lamb and Dickens.

Beets was ordained in 1839 and held pastorates at Heemstede (1840–53) and Utrecht (1854–74). He was professor at the State University of Utrecht, Neth., from 1874 to 1884. During his successful career in the church, he continued to produce a great quantity of prose and verse, of little value. He died at Utrecht, March 13, 1903.

BEET SUGAR: see SUGAR and BEET.

BEFANA (Ital., corrupted from *Epifania,* "Epiphany"), the Italian female counterpart of Santa Claus. On Epiphany, or Twelfth Night, she fills children's stockings with presents. Tradition relates that she was too busy to see the Three Wise Men of the east pass on their journey to pay adoration to the Saviour, saying that she could see them on their return. They went back another way, and Befana was punished by having to look for them forever. The sacred or secular song traditionally sung on her visit is the Befanata.

BEGAS, REINHOLD (1831–1911), German sculptor who dominated Prussian sculpture from 1870 onward, was the younger son of Karl Begas, the painter; he was born at Berlin on July 15, 1831, and died there on Aug. 3, 1911. He received his early education (1846–51) in the ateliers of C. D. Rauch and L. Wichmann. During a period of study in Italy, from 1856 to 1858, he was strongly influenced by the study of Michelangelo and by his admiration for the art of the baroque period. After the execution of the group "Borussia," for the façade of the exchange in Berlin, he was, for a few months in 1861, professor at the art school at Weimar. The statue of Schiller for the Gendarmen Markt in Berlin was his work. Among his chief works during this period were the colossal statue of Borussia for the Hall of Glory; the Neptune fountain in bronze on the Schlossplatz; the statue of Alexander von Humboldt, all in Berlin; the sarcophagus of the Emperor Frederick III in the mausoleum of the Friedenskirche at Potsdam; the national monument to the Emperor William; the statue of Bismarck before the Reichstag building and several of the statues in the Siegesallee. Begas was a versatile artist.

Although his preference was for mythological and decorative subjects, of which his "Mercury and Psyche" (1874) is a good example, he was the most famous German sculptor of his time in portraiture, and executed busts of many of his great contemporaries.

BEGGAR-MY-NEIGHBOUR, a card game, the outcome of which is wholly determined by the luck of the deal. An ordinary pack is divided equally between two players, and each holds his packet face down. Cards are turned up alternately from the top of the packets and placed in a single pile on the table, until an ace, king, queen or knave appears. The opponent must cover such a card with four plain cards for an ace, three for a king, two for a queen, one for a knave. If in so doing he turns an ace, king, queen or knave himself, he stops, and the obligation is reversed.

Whenever the full quota of plain cards is played to such a card, the player of the card takes all the cards from the table and places them underneath his packet, then makes a new lead. The one who gets all the cards into his hand is the winner. (A. H. MD.)

JOHN H. GERARD

CARMEN BEGONIA. HORTICULTURAL VARIETY OF BEGONIA GRACILIS

BEGONIA, a genus (family Begoniaceae) of succulent herbs, vines or undershrubs with about 800 species growing in tropical moist climates. Innumerable garden hybrids and varieties are grown chiefly in the greenhouse for their coloured foliage; many are tuberous. The flowers are white, rose, scarlet or yellow and are unisexual. the male containing numerous stamens. the female having a large inferior ovary and

two to four branched or twisted stigmas.

The rex begonia and B. *cucullata* (*semperflorens*) are the commonest in cultivation and are usually raised from stem cuttings. Others are propagated by leaf cuttings, tuber cuttings or seed. Hybridizing by the usual methods is easy because of the large size of the flowers and the interfertility of many species.

For information on cultivated begonias *see* Helen K. Krauss, *Begonias for American Homes and Gardens* (1947). The *Begonian,* published monthly by the American Begonia Society, is useful to all growers. (L. B. SM.)

BEGUINES, pious women who, although not under vow, lived a kind of communal life in *béguinages* where each had her own apartment. The origin of the word is disputed, but the movement started in southern Belgium in the 12th century. In addition to religious factors, the surplus of marriageable girls and widows in the upper classes, caused by the crusades, led to the establishment of this mode of life, which, although found principally in the Low Countries, spread to France, Germany and elsewhere in Europe. A revival took place in 17th-century Belgium, and some Beguines remain in Belgium and the Netherlands.

The male counterparts of the Beguines were called Beghards. They were often considered to be heretics or to have heretical leanings.

See E. W. McDonnell, *The Beguines and Beghards in Medieval Culture* (1954). (E. A. R.)

BEHAGHEL, OTTO (1854–1936), German linguist, whose major works were his studies of the German language, was born on May 3, 1854, at Karlsruhe. He was educated at the Gymnasium there and at Heidelberg and Gottingen universities; later he was professor successively at Heidelberg, Basel and Giessen universities. Behaghel was editor of the journal *Germania* and co-editor of the *Literaturblatt für germanische und romanische Philologie.* His *Die deutsche Sprache* (1886; 9th ed. 1953) and *Geschichte der deutschen Sprache* (1901; 5th ed., 1928) are standard treatises; his *Deutsche Syntax* (4 vol., 1923, 1924, 1928, 1932) is a massive compilation and classification of examples of German linguistic usage from the 8th century to the present. He died on Oct. 9, 1936. at Munich.

Bibliographies of Behaghel's work appear in two volumes published in his honour: *Beiträge zur germanischen Sprachwissenschaft,* edited by Wilhelm Horn (1924) and *Germanische Philologie,* edited by Goetze, Horn and Maurer (1934). (MY. F.)

BEHAIM (BEHEM), **MARTIN** (1436?–1507), German navigator and geographer, best known as the constructor of the Nürnberg globe, was born at Niirnberg, according to one tradition, about 1436, but as late as 1459 according to F. W. Ghillany. He first visited Portugal in connection with the Flemish trade and gained some reputation as a scientist on his claim to have been a pupil of the astronomer Regiomontanus. He became a member of the council which advised John II on navigation. His alleged introduction of the cross-staff into Portugal is a matter of controversy, and his improvements of the astrolabe were possibly no more than the replacement of cumbersome wooden models by handy brass instruments. His claim to have accompanied Diogo Cam (*q.v.*) on his second expedition to west Africa is now considered groundless; it is thought that he sailed only to the nearer coasts of Guinea, possibly with José Visinho or João Affonso d'Aveiro (1484–86).

In 1486 Behaim married a daughter of Jobst van Huerter, the captain donatory of Fayal in the Azores, and thereafter resided there. In 1490 Behaim visited Niirnberg and, with the help of the painter B. Glockenthon, constructed a terrestrial globe, the earliest extant. Behaim's representation of the world was surprisingly out of date, the more particularly in view of his Portuguese connections. His delineation leans heavily upon the Ptolemaic tradition. He does not show accurately the Portuguese discoveries, and his outline of west Africa is amazingly incorrect. Many fabulous islands are depicted in the Atlantic ocean. Finished in 1492, Behaim's globe has been cited as representing the geographical ideas of Columbus — it shows the east Asian coast only 80° distant from the Azores — but no contact between the two men has been estabtished although they were in Portugal at the same time. It is generally agreed that Behaim took no part in the Portuguese unveiling of the new world. He died at Lisbon on Aug. 8, 1507.

BEHAM, HANS SEBALD (1500–1550), German engraver and painter, was the most prolific of the so-called Little Masters of engraving, a group which also included his younger brother, Barthel Beham (1502–1540), and Georg Pencz (*c.* 1500–1550). All three artists, noted for their brilliant work on extremely small copper plates, grew up in Niirnberg under the influence of Albrecht Diirer's late classical style. It is likely, but not certain, that they worked in Diirer's studio. In 1525 the trio was banned from that city for independent religious views, but not for long. Later, Beham moved to Frankfurt am Main. His 252 engravings include biblical and mythological subjects, allegories, genre scenes and ornaments. Of particular charm are the genre scenes; such as the set entitled "Peasant Festival" (1537). Some of his woodcuts were of very large sizes, intended as wall decorations.

BIBLIOGRAPHY.—Gustav Pauli, *H. S. Beham* (1901); Arthur M. Hind, *A History of Engraving and Etching,* p. 83 (1923); Emil Waldmann, *Die Nürnberger Kleinnzeister* (1911). (H. JM.)

BEHAVIOUR may be defined as the externally apparent activity of a whole organism. Its essential characteristic is movement, which is found in most animals and some plants, and it is the result of external and internal changes called stimuli.

Behaviour may be classified in many ways, each independent of the rest. It may be organized into complex patterns either by the biological process of hereditary or by the psychological process of learning or both. The extreme cases are called innate (or instinctive) behaviour and learned (or conditioned) behaviour, respectively; but most behaviour is affected by both types of organization.

Behaviour is closely related to function. There are four primitive kinds of behaviour having obvious adaptive results: ingestive behaviour, including eating and drinking; shelter seeking; sexual behaviour; and investigatory or exploratory behaviour. In addition to these, certain types of behaviour are found chiefly in the more complex animals, including man: agonistic behaviour, including fighting and escape behaviour; allelomimetic behaviour or mutual imitation, including the co-ordinated movements of flocks and herds; care giving or epimeletic behaviour; and care soliciting or et-epimeletic behaviour. Eliminative behaviour. concerned with disposal of bodily wastes, has importance in some animals.

Behaviour may be described as social or nonsocial depending on whether its function is related to other members of the same species. Social behaviour in turn may be described according to the individual performing the activity, as in maternal behaviour, infantile behaviour, etc. Behaviour is playful if it has no apparent function other than activity itself, and this is characteristic of the young of social mammals. Behaviour is called normal or abnormal according to the degree of adaptation produced. Most authorities agree that there is continuous variation between normal and abnormal behaviour.

Behaviour may be classified according to the kind of stimulus which elicits it, in which case the behaviour may be called a tropism (*q.v.*) or taxis. For example, a moth which flies toward the light exhibits a positive phototropism or phototaxis. It is also described in terms of the motor organs used. as in manipulative behaviour, prehension, mastication, etc. Behaviour varies according to the parts of the central nervous system which control it, the simplest sort being reflex behaviour, characterized by simple and relatively invariable reactions. Certain forms of more complex behaviour may be called voluntary or conscious. as opposed to involuntary or unconscious behaviour. Both voluntary and involuntary behaviour are affected by learning.

In general, behaviour is always partly determined by heredity, in the sense that each species has its characteristic types of behaviour. It tends to be adaptive and, correlated with thii. tends to be variable. Finally, it is always affected by internal as well as external causes.

The principal practical problem of behaviour is control. The methods used have wide applications in human behaviour, in the management of domestic and game animals and in the control of pests. In most human societies sexual and fighting behaviour are highly regulated by law and custom. Failure of these methods produces the serious problems of divorce, prostitution, juvenile delinquency and crime; too severe control may also produce various forms of maladaptive behaviour and mental illness. Groups as well as individuals may create behaviour problems: group persecution and war, for example.

Basic research on these problems seeks to find the causes of behaviour: heredity, physiological causes such as hormones, the psychological factors of stimulation and learning, social environment and social organization and, finally, the general physical and biological environment. The applications of this research are chiefly directed toward the alteration of individual behaviour by training, drugs and surgery. Selective breeding is useful only in domestic animals.

The solution of behaviour problems through alteration of the social, biological and physical environment is equally fundamental, and such methods are beginning to be developed.

In short, control measures must permit flexibility and freedom of action, lest they create more problems than they solve, and positive methods are more effective than negative ones. Behaviour is a complex phenomenon with many causes, and its problems therefore have many alternative solutions. *See* ANIMAL BEHAVIOUR; CHILD PSYCHOLOGY AND DEVELOPMENT; PSYCHOLOGY; PSYCHOLOGY, COMPARATIVE; see also Index references under "Behaviour" in the Index volume.

BEHAVIOUR DISORDERS. The variety of terms used for this category of neurotic disorder — psychopathic personality, impulse-ridden personality, moral insanity, fate neurosis and neurotic character — indicates that until comparatively recently it was not a clearly defined or understood group. Some psychiatrists considered it as a kind of wastebasket collection of patients who did not fit into well-defined disease entities. The advancement of psychodynamic understanding, however, made a clearer definition of these patients possible.

Diagnosis. — Patients with behaviour disorders are distinguished from other neurotic sufferers by the fact that they express their unadjusted and unacceptable emotional tensions not by circumscribed neurotic symptoms but by their behaviour in relation to other people (interpersonal relationships). Unlike patients who suffer from neurotic symptoms, they act out their neurotic impulses. They are not satisfied with gratifying these impulses symbolically in fantasy; they are actors on the stage of life, and their disturbed behaviour affects those with whom they come in contact. Patients suffering from a compulsion neurosis, for example, express their hostile unacceptable impulses either by isolated fantasies or by compulsions to touch certain objects or to avoid touching them. Patients who are called neurotic characters express unacceptable hostile impulses by destructive acts that have practical consequences. The neurotic person fights out the conflicts caused by unacceptable impulses in his fantasy and by apparently meaningless peculiarities of routine performances (washing his hands excessively, etc.) that have no significance for anyone other than the neurotic sufferer himself. Patients with behaviour disorders have dramatic life histories; their mode of expression is action. Like all neurotic personalities, these patients, more than healthy persons, are influenced by unconscious tendencies that their conscious personalities cannot accept.

All this may be stated simply: the real neurotic is a rather inhibited person, while the neurotic character is the opposite; he is a man of action. The first distinction, accordingly, is between symptom neuroses and behaviour disorders.

The latter group includes a great variety of personalities, among which three large subgroups may be distinguished: the neurotic offenders, the eccentrics and the persons who again and again become involved in similar conflicting interpersonal situations and therefore may be described as suffering from a fate neurosis. Examples of the last subgroup are people who repeatedly embark on unsuccessful marriages ending with the same type of incompatibilities; who make and break friendships in the same repetitive manner; who repeat failures in their professional careers in a remarkably stereotyped fashion. Sigmund Freud first described, in a most impressive way, those patients who because of their deep-seated guilt feelings can never allow themselves to succeed in anything, who cannot tolerate success and who either destroy their achievements by unconsciously intended errors or react to success with severe depression.

On first inspection this group appears to consist of an extremely heterogeneous array of people. In spite of this great variety, however, certain common psychodynamic features are typical for them. Their neurotic acting out is characterized by three major features: irrationality, stereotyped repetition of behaviour patterns and self-destructiveness. The irrationality of behaviour is the result of the prominence of unconscious motivations. The stereotyped repetition of behaviour patterns, or symptomatic behaviour, also is explained from the same cause, since unconscious motivations cannot be corrected by conscious adaptations. These stereotyped irrational behaviour patterns are equivalent to neurotic symptoms; neither neurotic symptoms nor such unconsciously determined behaviour can be changed at the sufferer's choosing.

The third characteristic, self-destructiveness, is the result of unconscious guilt feelings, which were for a long time overlooked. Psychopathic personalities in earlier days were characterized by lack of conscience, of moral feelings; hence the old expression "moral insanity." Freud was the first to understand the significance of guilt feelings in neurotic delinquents; he spoke of crimes committed from a sense of guilt. These persons have deep-seated guilt feelings, usually derived from the Oedipus complex and emanating mostly from unconscious fantasies of early childhood, and they try to rid themselves of the pangs of conscience by displacing the source of their unconscious guilt feelings to some tangible conventional offense. By stealing or swindling they perpetrate a forbidden act that is much less objectionable than those forbidden impulses harboured in the unconscious. Punishment for such persons represents atonement for a smaller crime than the one about which they unconsciously imagine.

Because these psychodynamic processes, which have been described as "bribing one's conscience," were not understood, these offenders appeared incorrigible. They remain incorrigible, however, only as long as society conforms to their neurotic pattern by relieving their unconscious guilt feelings through punishment. Punishment atones for their crime, and by provoking punishment they relieve their guilt and can freely commit new offenses. This game of crime and punishment is endless. Only psychiatric therapy can break the pattern. Such people are emotionally sick and like other neurotics must be treated by psychotherapy. Because the nature of their neuroticism endangers society, they should be incarcerated until they are cured. Paroling them after they serve a part of their punishment, or letting them return to society after they have fully served their punishment but remain essentially unrelieved from their neurotic conflicts, necessarily leads to recidivism.

Only for practical reasons should these neurotic offenders be classified separately from those suffering from behaviour disorders that do not result in antisocial behaviour. A more harmless group, the eccentrics, also act on unconscious, mostly unacceptable, motivations that they express by pursuing seemingly senseless or exaggerated predilections. In this group belong some passionate collectors who will bankrupt themselves to obtain rare pieces for their collection; gamblers; and daredevils — climbers of exceptionally dangerous mountain peaks, adventurous explorers and hunters, racing car addicts and so on. Some of these persons may obtain fame by their bravado and stunning performances, in which, however, they always risk their physical or financial security.

Neurotic characters, because of their dramatic life histories, are favoured subjects of poets and novelists. Dostoevski's Dimitri Karamazov and Raskolnikov are classical examples of "fate neurosis" and of the neurotic offenders, while Balzac's Uncle Pons is

the masterful portrayal of an eccentric.

The influence of guilty conscience is clearly present in all three types. Deep scrutiny of the motivation of the neurotic offender always reveals the hidden desire to be caught and punished. His unconscious wish for atonement makes the neurotic offender overlook details that lead to his apprehension. It is not unusual for them to give themselves up and confess their deeds to obtain relief from the pangs of conscience.

Self-destructiveness in eccentrics manifests itself in their constant endangering of their lives or financial security. They play with danger and can satisfy their grandiose, fundamentally asocial, self-seeking tendencies only if they pay the price by constantly exposing themselves to potential destruction. This is most clearly seen in the gambler who cannot leave the gambling table as long as money is left in his pocket. Only recognition of this unconscious tendency as resulting from guilty conscience can explain the self-destructive and irrational nature of such behaviour. In fate neuroses the self-destructiveness is responsible for the stereotyped vicissitudes of life.

It is important to realize that as in all classifications the pure types are rare. Most persons with behaviour disorders also show some neurotic symptoms, although the behaviour disorder is more pronounced. And similarly, some persons who suffer from neurotic symptoms may also show irrational, unconsciously determined. behaviour in their important interpersonal relationships. In spite of this qualification, the three groups of behaviour disorders are easily distinguished by their emphasis on action, in contrast to the symbolic gratification in fantasy of neurotics suffering from well-defined psychopathological symptoms.

Treatment. — The treatment of behaviour disorders is, from a practical point of view, a most important chapter of psychiatry. The principal approach is psychotherapy, which may be combined with vocational rehabilitation, occupational treatment and re-education.

The neurotic offenders, in particular, confront society with a perplexing problem. From the point of view of psychiatry they belong to the large group of mentally disturbed persons, as do neurotics and psychotics. The neurotic offenders, however, because they endanger the security of society, belong also to the field of jurisprudence. They constitute a joint responsibility of these two disciplines. After the 1930s there was a growing trend toward recognizing the need for psychiatric evaluation and treatment of these cases. Penal codes all over the world were still based on pre-Freudian psychology, which did not know of the existence of unconscious motivations. In the United States, until comparatively recently, the McNaghten rules, formulated as a result of the murder trial of Daniel McNaghten in England in 1843 *(see* INSANITY: *McNaghten Rules),* were followed in all states except New Hampshire. These rules permit the plea of insanity only if a person cannot distinguish between right and wrong. For the large group of neurotic offenders this rule is meaningless. Their intellectual judgment might be completely unimpaired, but their conscious mind has no access to unconscious motivations and has no rule over them in spite of being fully capable of distinguishing between right and wrong. The neurotic offender is a victim of his irrational unconscious impulses, and he cannot apply his value judgment to guide his behaviour.

In 1954 the McNaghten rules were superseded in the District of Columbia when Judge David Bazelon in the U.S. court of appeals of the District of Columbia in the case of *Durham* v. *U.S.* applied the ruling of New Hampshire, which mas first applied in that state as early as 1807. Judge Bazelon stated that he considered the McNaghten rules obsolete in view of the modern advancements of dynamic psychology. The Durham ruling states that if a defendant's act is a product of a mental disease he is not guilty. Accordingly, his treatment belongs to the field of medicine.

It must be borne in mind, however. that even though the neurotic offender may be not guilty from the point of view of law he still constitutes a great menace to society. Consequently, during his psychiatric treatment society must be protected from his delinquent activities. In practice this implies a more severe treatment than the present legal procedure. It implies that the segregation (incarceration) of such a person should be indeterminate and should depend upon psychiatric recovery. It must be borne in mind also that there are a considerable number of incurable cases who aiter serving their penalty and returning to society constitute the same menace as they did before incarceration. The subjective sense of justice of the people might be satisfied by the fact that the criminal served his punishment, but the most important goal, the protection of society, is achieved only by an indeterminate sentence. The incurable neurotic or psychiatric delinquent whose disease endangers society must remain segregated forever., Incurable, of course, means only a prediction of probability, the correctness of which must be checked again and again by repeated examination of the imprisoned, mentally disturbed delinquent. It is obvious that the neurotic delinquent can be treated effectively by psychotherapy only if during treatment both he and society are protected by compulsory segregation from the consequences of his "acting out." However, patients suffering from behaviour disorders that are not antisocial often require hospitalization during the first phase of their psychotherapy because they are unable to control their symptomatic behaviour, which frequently endangers their own existence. After they have developed a strong rapport with their therapist this emotional bond in most cases suffices to curb their acting out in life while they are in treatment. After successful termination of the treatment this emotional bond to the therapist is no longer needed, and they acquire the capacity to find socially accepted outlets for their now sufficiently domesticated drives.

Etiology. — Most psychiatrists believe that in principle all behaviour disorders originate as psychoneuroses characterized by well-defined neurotic symptoms; early experiences in the family situation are of outstanding significance. This raises, however, a fundamental question: what are the specific factors that cause one person to develop a behaviour disorder and another person neurotic symptoms?

The social condition of the family has been considered an important factor, particularly in the causation of delinquent behaviour. In underprivileged groups there is a greater tendency for the family's social condition to cause unadjusted asocial impulses on the realistic level of action. Economic needs both reinforce antisocial trends and serve as their subjective justification. Also, a person living in a delinquent environment will readily identify himself with the attitudes prevailing in this group. All this, of course, will lead to a behaviour disorder only if the person who is exposed to these environmental influences is an acting out type. Otherwise he may just as well develop neurotic symptoms under the impact of the same experiences and environmental influences.

Is there a characterological "acting out" type of personality? This question has not been answered satisfactorily. A. M. Johnson's and S. A. Szurek's observations would indicate that some parents unwittingly impart to their children their own repressed unconscious delinquent tendencies and encourage their "acting out." Sheldon and Eleanor Glueck, on the other hand, by the statistical approach found several indications for a basic constitutional factor that expresses itself not only psychologically but also in certain features of physical build (mesomorphic or athletic types).

In the 19th century, particularly under the influence of Cesare Lombroso, inherited constitution was primarily emphasized. The advent of psychoanalysis and dynamic psychiatry called attention to environmental factors, and heredity went into oblivion. The controversy of environment versus heredity is based on the fallacy of expecting an "either/or" type of answer. Constitutional factors transmitted by the genes represent a universal factor that partially, at least, determines the effect of later environmental influences. Behaviour disturbances, like neuroses and psychoses, are the results of both hereditary and environmental factors.

BEHAVIOURISM is a conception of psychology. first systematically stated by John B. Watson (*q.v.*) in 1913, which holds its subject matter to be the objectively observable actions of organisms. The organism is seen as "responding" to conditions (stimuli) set by the outer environment and inner biological processes. Traditionally, psychology had been conceived as the science of consciousness, experience or mind, and while bodily activities had not been excluded, their paramount interest was considered to lie in their relations to mental phenomena. The characteristic method of psychology was thus introspection. Behaviourism, in the words of Watson, "attempted to make a fresh, clean start in psychology, breaking both with current theories and with traditional concepts and terminology" (John B. Watson, Psychology From the Standpoint of a Behaviorist, 3rd ed., p. 4, Lippincott, 1929). Introspection was to be discarded; only such observations were to be considered admissible as could be made by independent observers upon the same object or event—exactly as in physics or chemistry. In this way psychology was to become "a purely objective, experimental branch of natural science." However abstract these proposals may seem, they have had a revolutionary influence on modern psychology and social science and on man's conception of himself.

Watson's objectivist leanings were presaged by many developments in the history of thought and were in fact symptomatic of strong trends that had been emerging in biology and psychology since the late 19th century. But his desire to "bury subjective subject matter" was registered so persuasively as to enlist widespread co-operation. Between the early 1920s and mid-century, behaviourism in the methodic sense dominated U.S. psychology and had wide international repercussions. Though the chief alternatives to behaviourism (*e.g.*, Gestalt psychology and psychoanalysis; *q.v.*) promulgated methods which use experiential data, even these positions accommodated to the objectivist emphasis by a steadily increasing stress on the need for objective validation of experientially based hypotheses.

Behaviourism, however, is not merely a methodic platform or a general redefinition of the task of psychology. It is also the name for a varied class of programs, hypotheses and theories put forward by different persons in attempted fulfillment of such a task. Both as a method and as a conglomeration of hypotheses and theories, behaviourism led to much experimentation and a vast mass of results.

The period 1912–30 (roughly) may be called that of classical behaviourism. Watson was then the dominant figure, but many others were soon at work giving their own systematic twists to the development of the program. Classical behaviourism was polemical and programmatic. It was polemical in that a noisy residual battle was fought against introspective psychologists, It was programmatic in that most systematic work involved positing rather loosely stated hypotheses designed to show how phenomena formerly believed to require introspective study (*e.g.*, thinking, imagery, emotions, feeling) might be handled in terms of stimulus and response.

From 1930 through the late '40s the phase of neobehaviourism may be distinguished. The mantle of Watson passed to Clark L. Hull, who tried to translate the general methodic program of classical behaviourism into a detailed, experimentally based theory of adaptive behaviour. The aim was to achieve a statement of fundamental quantitative laws from which might be rigorously deduced the main phenomena of behaviour. The transition from classical to neobehaviourism was influenced by the importation from the philosophy of science of a set of prescriptions (*e.g.*, the analyses of logical positivism) concerning the nature of sound scientific theory. Hull's effort may be seen as guided by this so-called hypothetico-deductive view of theory. Hull did not dominate the interval to the extent that Watson did the classical period. Men like Edward Chace Tolman, E. R. Guthrie, Egon Brunswik, B. F. Skinner, Kenneth W. Spence and Neal E. Miller had important influence. Many neobehaviourists diverged markedly in specific problems and concepts, their work being related only by adherence to objectivist method. In general, the era was characterized by the effort to formulate more concrete analyses and "laws" of behaviour than did classical behaviourism. If the results still remain programmatic, this is not for want of trying.

A third phase beginning about 1950 may be distinguished. During this phase may be seen a tendency toward liberalization of behaviourist doctrine, methodic and conceptual, a concern on the part of many behaviourists with problem areas (*e.g.*, perception) formerly bypassed because of the odour of mentalism, and growing hospitality to use of introspective methods by persons who previously had not considered them legitimate.

HISTORICAL BACKGROUND

The establishment of psychology as an independent experimental science is usually placed in 1879, when the first psychological laboratory of appreciable significance was founded at Leipzig by Wilhelm Wundt. Wundt's systematization of the new psychology defined the horizons of orthodoxy in German psychology for many years. His position gathered international force through the influence of the many foreign students who came to work in his laboratory. One of these was Edward Bradford Titchener, who brought the new psychology (called by him structural psychology) to Cornell in 1892, and whose work soon became a reference point for orthodoxy in the United States. During Watson's formative years (early 1900s) structural psychology was already under questioning, but it still formed the background against which other theoretical positions were defined.

The Wundt-Titchener conception held the task of psychology to be a kind of introspectively based "chemistry" of consciousness. The aim of introspection was narrowly conceived as the analytic reduction of experience, no matter how complex, to a combination of ultimate elements. These were (1) sensations, such as redness, hardness or warmth; (2) the relatively faint copies thereof called images; and (3) feelings, such as pleasantness and unpleasantness. Though such a method had played a role in the gaining of much 19th-century knowledge of sensory mechanisms, results attained by it were often not reproducible by different investigators. When reproducible, they were not always illuminating. Knowledge did not seem to accumulate in the progressive manner desirable in science; instead, much effort was given to debate over questions which seemed never to approach resolution.

This state of affairs produced restlessness in many students. From the late 1890s, more and more workers in such fields as animal psychology, measurement of individual differences, study of rote learning and motor skill, and applied psychology were led by the demands of their problems to bypass the strictures of introspective psychology. Others, like the functionalists, with some of whom (*e.g.*, James Rowland Angell and John Dewey) Watson studied at The University of Chicago, had begun to question Titchener's position and had suggested a point of view recommending the study of mental functioning as it mediates man's adaptations to the environment. But Watson considered functionalism to be an inadequate compromise. In his first (and by far his most reserved) publication on behaviourism (1913) he submits that psychology "has failed signally . . . during the fifty-odd years of its existence as an experimental discipline to make its place in the world as an undisputed natural science." Further: "The time seems to have come when psychology must discard all reference to consciousness; when it need no longer delude itself into thinking that it is making mental states the object of observation." (John B. Watson, "Psychology as the Behaviorist Views It," Psychological Review, vol. 20, p. 163, 1913.) A new era had begun.

Many developments in the history of thought may be seen as precursors of behaviourism, and some may be said to have led up to it in a fairly definite way. Among the former may be mentioned

materialist and mechanist philosophy, especially in the modern period (*e.g.,* Thomas Hobbes in the 17th century; the English empiricists and associationists of the 18th and 19th centuries; and such materialist philosophers of the French enlightenment as J. O. de Lamettrie and P. J. G. Cabanis); the dominance of the mechanical world view in the physical science of the 18th and 19th centuries and its penetration into biology; the positivism of the French sociologist-philosopher August Comte, who explicitly repudiated introspection as a basis for psychology as early as 1838. More important are the influences which played upon Watson in a relatively direct way; some of these are cited below.

Animal Psychology.— Darwin's theory of evolution stressed psychological as well as structural continuities between animals and men, and he made important contributions to animal psychology in such works as *Expression of the Emotions in Man and Animals* (1872). The Darwinian impetus to animal psychology is reflected in the observational and experimental work of such English investigators as George J. Romanes, C. Lloyd Morgan and Leonard T. Hobhouse. In 1898 experimental animal psychology began in the United States with Edward Lee Thorndike's studies of the learning of cats and chicks in problem boxes (*e.g.,* devices in which the animal may escape confinement and receive reward by some such responses as pulling a loop of string, moving a latch, etc.). The animal research rapidly proliferated in the work of such U.S. investigators as W. S. Small, Robert M. Yerkes and H. A. Carr. By the time Watson was ready to codify his behaviourist program, there existed a large experimental literature to which he himself had significantly contributed. Not only were the animal methods objective; it also had become apparent that inferences from the objective findings to the associated animal consciousness, as demanded by introspective doctrine, typically added nothing to the observed data. Behaviourism is first and foremost an extension of the methods of animal psychology to the study of man.

Objectivistic Biology.— Several lines of work within physiology and zoology which had stressed objectivist and mechanist concepts should be cited. Though continuous with the trends which had produced U.S. animal psychology, the main line of descent of the latter was via Darwin and the evolutionist students of animal behaviour.

In 1890 Jacques Loeb began to develop his theory of tropisms or forced movements, which seeks an explanation of animal behaviour in purely physico-chemical terms. Loeb, a German who had moved to the United States, was one of Watson's professors at The University of Chicago. Herbert Spencer Jennings, another biologist who investigated the behaviour of lower organisms from an objective point of view, also influenced Watson.

It is customary to cite also a group of German zoologists, notably Theodor Beer, A. Bethe and Jakob von Uexkiill, who in 1899 proposed an elaborate objectivist terminology for the analysis of animal behaviour.

Russian reflexology (I. M. Sechenov, I. P. Pavlov and V. M. Bekhterev) impressively antedates behaviourism by calling for an objective psychology (human as well as animal), in the case of Sechenov as early as 18 jo. More importantly, there was a direct fusion of this tradition with behaviourism when, beginning in 1915, Watson undertook to integrate the conditioned reflex methods and principles of Pavlov and Bekhterev into his program.

U.S. Philosophy.— Important philosophical developments beginning in the late 19th century predisposed toward behaviourism. Pragmatism as developed by William James, Charles Saunders Peirce and John Dewey stressed that the meaning and truth value of propositions can be assessed only by determining their consequences for action. This suggests an objective criterion for the validation of knowledge—essentially what behaviourism proposes for the specific case of psychological knowledge. James and Dewey were initially psychologists but turned increasingly to philosophy. Both wrote papers in the early 1900s which called ruling concepts of "consciousness" in question. Also in the early 1900s, certain members of the realist and neorealist school (*e.g.,* F. J. *E.* Woodbridge, W. T. Bush and R. B. Perry) analyzed the concept of consciousness with objectivist overtones. Such papers of E. A. Singer as "Mind as an Observable Object" (1911) anticipated the main Watsonian emphases with special vividness.

CLASSICAL BEHAVIOURISM

Classical behaviourism (1912–30) is best understood as a set of orienting attitudes toward the business of psychology rather than as a worked-out set of explanatory principles or theory. Though common to many, these were translated into systematic thinking differently by different workers. Since Watson was the pacemaker, early behaviourism is best presented by citing common orienting attitudes but explaining each as developed by Watson.

Objectivism.— The insistence on objective techniques for securing data, and the corollary rejection of introspection, has been seen as definitive of behaviourism. Most of the time, Watson defended the central thesis on methodological grounds, but sometimes a metaphysical judgment is suggested to the effect that "mind" or "consciousness" does not exist.

S-R Orientation.— All lawful psychological statements are to be expressed in terms of stimulus and response. In Watson's words: "the goal of psychological study is the *ascertaining* of *such data and laws that, given the stimulus, psychology can predict what the response will be; or . . . **given** the response, it can specify the . . . stimulus."* (John B. Watson, *Psychology From the Standpoint* of *a Behaviorist,* 1st ed., p. 10, Lippincott, 1919.)

The terms stimulus *(S)* and response *(R)* have a definite meaning in physiology. An *S* is a measurable physical energy (*e.g.,* a given wave length of light) which can excite specialized receptors (*e.g.,* the cells of the retina) of a sense organ (*e.g.,* the eye). *R* is defined in terms of the contraction of muscle spindles or the secretion of glands. The causal connection between *S* and R is mediated by passage of nerve impulses through the intricate structures of the nervous system.

According to Watson (1919) we "use the term *stimulus* in psychology as it is used in physiology. Only in psychology we have to extend somewhat the usage of the term." When "the factors leading to reactions are more complex, as, for example, in the social world, we speak of *situations."* Analogously, "we employ in psychology the physiological term 'response,? but again we must slightly extend its use." We may deal with "simple responses," like the "movements which result from a tap on the patellar tendon [knee jerk] . . . but more often with . . . complex responses." "In the latter case we sometimes use the popular term 'act' or adjustment, meaning . . . that the whole group of responses is integrated in such a way (instinct or habit) that the individual does something which we have a name for, that is, 'takes food,' 'builds a house,' 'swims,' 'writes a letter,' 'talks.' "

Watson makes it quite evident that the main interest of psychology is in the relations between what he here calls situations and adjustments, not simple stimuli and responses. Often, however, he slurs over this distinction, citing, for example, as stimuli "words and sentences of a language" or "the printed score of a symphony," and as responses "building a skyscraper, drawing plans, having babies and uriting books . . . ." The assumption is that such complex stimuli and responses are always analyzable into combinations of simple ones, and the hope is that the laws worked out for simple stimuli and responses will hold for the complex. The problems thereby raised have plagued all other behaviourist writers.

Peripheralism.— Watson's program necessitated that he consider how phenomena traditionally classed as mental might be treated in objective *S-R* terms. Most of his positive systematic ideas are thus attempts to show that processes formerly conceived as determined primarily by the brain could be better understood if allocated mainly to receptors, effectors and their most direct nerve connections. Such a tendency to stress, in psychological explanations, events at or near the boundaries of the organism is called peripheralism.

Sensation and perception are brought to the "outside" merely by denying that such processes mediate between stimulation and response. The strategy is to extend to the human case the methods

for studying sensory acuity in animals. In such work the experimenter, for instance, puts an animal in a situation in which, by punishing one response (say running down an alley toward light of one wave length) and rewarding another (running down an alternate alley toward light of a different wave length), he finds whether the differential response can be learned. If so, it adds nothing, Watson would maintain, to say that the animal "sees" two different colours: all that can be observed is that the animal responds differently to a specified stimulus difference. Watson argues that precisely the same methods may be used in studying human sensory capacity and that it does not matter whether the subject registers differential response by some gross movement or by spoken words. (Such an analysis of the subject's report was ofren criticized by nonbehaviourists after 1913, when it was first suggested.)

Imagery and thinking were for Watson "the inner stronghold of a psychology based upon introspection." (John B. Watson, *Behavior: An Introduction to Comparative Psychology,* p. 16, Henry Holt and Company, Inc., 1914.) He was thus led to the bold maneuver of transferring thought processes to the periphery. Thinking and imagery are equated with "faint reinstatements" of the original muscular responses involved in speech and other motor behaviour. Such "minimal" responses (*e.g.,* slight movements of the larynx and tongue, gestural movements, etc.) are called collectively implicit behaviour, in contrast to gross motor responses (*e.g.,* walking, reaching, overt speech), which are called explicit. Implicit responses come, by a complex process of learning, to take the place of overt speech and thus of the objects and nonverbal action systems for which words themselves are substitutes. Contrary to some representations, Watson does not reduce thinking to "laryngeal activity" or "subvocal talking" per se. abbreviated components of nonverbal acts of any type may come to "represent" those acts (or others) in thinking.

Thinking, like other forms of behaviour, is always an S-R process. Very important in this and other hypotheses of Watson is the use made of movement-produced stimulation. Muscles are supplied with specialized receptors (kinesthetic) which are activated by local contraction. Thus, the kinesthetic "return" from muscular movement provides a stimulus which can call forth (by innate linkage or previous learning) another movement, and so on indefinitely. Sequences of thinking and indeed all serial behaviours may thus be conceived as bound together by kinesthetic stimuli.

Other well-known peripheral hypotheses concern feeling and emotion. Watson sought to account for the feelings of pleasantness and unpleasantness by reducing them to implicit responses within "the reproductive organs and . . . related erogenous zones" (*e.g.,* slight tumescence versus shrinkage of the genitals). Emotion was defined as a diffuse "*'pattern-reaction' involving profound changes of the bodily mechanism as a whole, but particularly of the visceral and glandular systems.*" (John B. Watson, *Psychology From the Standpoint of a Behaviorist,* 1st ed.) Different emotions were presumed to be correlated with distinct patterns of bodily activity.

Emphasis on Learning. — Traditional psychology had approached learning as subsidiary to sensory and perceptual problems. But an S-R psychology, by sidestepping perception, is prone to place central emphasis on learning. Moreover by 1913 learning had proved to be a field eminently open to objective study— whether the task was reception of Morse code by man or escape from problem boxes by animals. Behaviourism became primarily a learning psychology and remained so throughout its history.

After casting about for suitably objective laws, Watson fixed on the conditioned-reflex principles of Pavlov and Bekhterev. The basic principle is that if a stimulus is repeatedly presented along with another stimulus (unconditioned S) that already reliably evokes a given response (unconditioned R), that response will come to be evoked by the new stimulus. The new or conditioned stimulus has become a substitute for the unconditioned stimulus and is now said to evoke a conditioned response. Pavlov had studied the detailed laws of such stimulus substitution with respect to salivary secretion in dogs (in the typical case, the unconditioned stimulus is food in the mouth, the conditioned stimulus, a tone or light which by repeated pairings with food comes independently to elicit salivation). Bekhterev had studied motor conditioning (*e.g.,* foot withdrawal, the unconditioned *S* being electric shock).

In 1916 Watson reported joint work with K. S. Lashley on human salivary and motor conditioning and recommended the use of the methods, then little known outside Russia. Thereafter, he assigned progressively greater importance not only to the utility of the methods (*e.g.,* for the study of animal sensory acuity) but also to the value of conditioning principles for the explanation of behaviour. By 1924, after his well-known experiments on the conditioning of fear in children (Watson and Rayner, 1921), he was prepared to phrase all problems of learning in terms of conditioning. From then on, the dominant effort in U.S. learning theory was to explain all facts of learning by principles based wholly or largely on facts and methods of conditioning.

Environmentalism. — Popularly, Watson is best known for his denial of instinct and his insistence that "there is no such thing as an inheritance of *capacity, talent, temperament, mental constitution* and *characteristics.*" (John B. Watson, *Behaviorism,* rev. ed., p. 94, W. W. Norton & Company, Inc., 1930.) Actually, such claims appear only in certain nontechnical writings sueh as the book *Behaviorism,* written after he had resigned his professorship at Johns Hopkins and entered the advertising business. Watson left the academic life under circumstances which could well have embittered him, and academic restraint thereafter seemed to lose much of its attractiveness. His earlier technical writings show careful consideration of the nature of animal and human instinct (defined as a "hereditary pattern reaction") and of unlearned behaviour equipment in general.

From the beginning, though, Watson tended to stress environmental modifiability of behaviour as against determination by constitutional structure. This was entirely in accord with the spirit of the times: for instance, a marked "scientific progressivism" which placed practical control of phenomena above all else. And the very factors which made learning the central category of behaviourism would guarantee the influence of environment to be emphasized. Although there is no necessary connection between other orienting attitudes and environmentalism, a liberal definition of the extent to which behaviour may be shaped by environment has been the rule among behaviourist writers.

Other Theorists. — The above five orienting attitudes are evident in the writings of other prominent classical behaviourists, among them Edwin B. Holt, Albert P. Weiss and Grace A. de Laguna. Other theorists, such as K. S. Lashley, E. R. Guthrie (and his collaborator Stevenson Smith), E. C. Tolman, Walter S. Hunter, J. R. Kantor and Floyd H. Allport, overlapped the classical and neobehaviourist periods in their writings. Among these, Hunter, Kantor and Allport made major contributions in the classical phase, while Guthrie and Tolman are known mainly as neobehaviourists. Lashley and Tolman are highly atypical as either classical behaviourists or neobehaviourists. Lashley, a brilliant student of Watson, concluded, after years of psychophysiological research on the relations between brain functions and learning in animals, that the concept of stimulus-response and the conditioned reflex had little scientific value. Indeed, his research forced him to views compatible with Gestalt theory (the chief rival to behaviourist formulations), with the exception that he steadfastly remained an objectivist. Tolman, too, relates to behaviourism only via insistence on objective method, and holds a theory which, though different from Lashley's, is also congenial with Gestalt emphases.

Classical behaviourism led to much experimentation and ingenious refinement of objective method. Though Watson's chief interest, during the peak period of his theorizing, was in human genetic studies (*e.g.,* development of emotional reactions in infants), most of the classical research was done on animal learning. Conditioning studies using the Russian and modified techniques burgeoned. One research sequence, prompted specifically by Watson's theory of thinking, involved attempts to measure by mechanical and electrical means the anticipated implicit speech and general

muscular movements. This stream of work trickled out in the mid-1930s, the results being ambiguous.

During the classical period, behaviourism was under sharp criticism initially by structural psychologists and functionalists, and soon also by purposive psychologists such as William McDougall, Gestalt theorists such as Max Wertheimer, Kurt Koffka and Wolfgang Kohler, and by others. Yet when Watson in 1924 said, "Most of the younger psychologists realize that some such formulation as behaviorism is the only road leading to science," he was correctly reporting the trend. (John B. Watson, Psychology From the Standpoint *of* a *Behaviorist*, 2nd ed., p. vii, Lippincott, 1924.) Though behaviourism did not go unchallenged in later years, the vast majority of psychologists (especially in the United States) counted themselves behaviourists. Moreover, behaviourism was the only movement in modern psychology other than psychoanalysis to attain appreciable popular influence. The simplistic nature of the doctrines lent them to the type of dramatic exposition at which Watson was truly great. The unbounded optimism concerning the prospects for healthy shaping of human behaviour and society was irresistible.

NEOBEHAVIOURISM

The history of neobehaviourism after 1930 is almost coextensive with the history of basic psychology in that interval. Only a few trends can be cited.

The dominating aim was to develop the orienting attitudes of behaviourism into concrete and rigorous theory. Throughout its short history, scientific psychology had modeled its procedures on established sciences such as physics. In the 19th century this meant the extension of experimental method to subjective phenomena; for early behaviourism it meant the use of experimental method exactly as in physics (objectively). By the late 1920s there was much objective experimentation but few bodies of clearly stated predictive principles comparable to the crowning achievements of physics: its theories. Instead, experimentation sometimes seemed aimless, theoretical hypotheses only loosely related to data, and debate idle.

In this climate psychologists became aware of the bold codifications of the nature of theoretical science being made by philosophers of science (*e.g.*, logical positivists such as M. Schlick and Rudolf Carnap) and certain methodologically oriented scientists (*e.g.*, the physicist P. W. Bridgman). This "new" view held forth an ideal of rigorous theory and seemed to define a route toward its achievement. In barest outline, it asserts theory to be a hypothetico-deductive system. Laws or hypotheses believed fundamental are asserted as postulates, and the consequences of these (theorems) are deduced by strict logical and mathematical rules. The theorems are then to be tested by experiment. Positive results increase the probability of the hypotheses; negative results call them into question. Scientific theories differ from logical and mathematical systems only in that their basic terms are given empirical reference (made to describe the world) by operational definitions (Bridgman) which state the observational conditions under which the terms may be applied. A science aims toward explicit and, if possible, quantitative hypothetico-deductive organizations of events in its domain.

In broad aspect, neobehaviourism is a marriage between behaviourism and the "new" model of science. The general orienting attitudes are to be implemented by translation into theory in accord with the dictates of the model.

In 1929 Clark L. Hull began to advocate such a program and to work toward a comprehensive theory of behaviour. He was soon joined in this effort by students and associates at Tale, notably Kenneth W. Spence, Neal E. Miller, Carl I. Hovland and John Dollard. Though only Hull, his co-workers and a few others wrote theory in literal hypothetico-deductive terms, the objectives and imagery of the "new" view of science were shared by other neobehaviourists, as indeed by most psychologists. All, for instance, insisted on the operational definition of concepts, via reduction to concrete experimental operations under which presence or absence of the specified defining property could be noted. Almost all considered quantification of laws, and formal hypothetico-deductive statement, desirable, even if not immediately feasible. Even non-behaviourists — among them the influential "field" theorist, Kurt Lewin — worked within the hypothetico-deductive framework.

This brief discussion will stress contributions of Hull, Tolman, Guthrie and B. F. Skinner. But most experimental psychologists in this interval were neobehaviourists, at least in the sense of commitment to objectivism. Spence and Miller should be cited as leading contributors to the Hullian tradition and, after Hull's death in 1952, the main developers of his branch of neobehaviourism (reinforcement theory). Egon Brunswik's important objective approach to the analysis of perceptual achievement should be noted. The work (beginning in the late '40s) of the statistical learning theorists, such as William K. Estes, who brought neobehaviourism to new heights of mathematical elaboration, should be acknowledged. Outstanding philosophers of science and psychological methodologists who were active in defining the new view of science and analyzing theory are Herbert Feigl and Gustav Bergmann in philosophy and Spence and Paul E. Meehl in psychology.

Salient features of neobehaviourism follow.

1. The metaphysical overtones of classical behaviourism were eliminated. The position is well conveyed by Hull (1937):

> What, then, shall we say about consciousness? Is its existence denied? By no means. But to recognize the existence of a phenomenon is not the same thing as insisting upon its basic, *i.e.*, logical, priority. Instead of furnishing a means for the solution of problems, consciousness appears to be itself a problem needing solution. (Clark L. Hull, "Mind, Mechanism, and Adapted Behavior," ***Psychological Review,*** vol. 44, p. 30, 1937.)

2. Watson had emphasized the extension of animal methods to human behaviour study, as evidenced in his work on child development. The neobehaviourist tendency was to extend *laws* of animal behaviour (mainly learning) to the human level. Such theorists as Hull, Guthrie, Skinner and Tolman derived their fundamental principles from detailed study of animals (mainly rats) in "standard" learning situations, and generalized — with some, but often slight, allowance for biological differences — to human behaviour, or even behaviour in general.

3. .Watson's simple *S-R* framework became subspecified. For instance, Watson had given little theoretical attention to such internal behaviour determinants as motives or drives (such factors as hunger, pain avoidance, sex, curiosity, needs for approval, achievement, etc., which energize behaviour and determine its goal direction). Neobehaviourists introduced motivation into the causal equation for behaviour in a variety of ways. Indeed, such theorists as Hull and Tolman introduced a long chain of concepts, each representing some inferred process within the organism, as intervening between stimulus and response (intervening variables). Thus Hull had a variable to represent the strength of the relevant habit, the intensity of all present drives, the amount of inhibition working against the response, etc. Tolman had an even more elaborate array representing motivation, "means-end readinesses," "expectancies," anticipated "values," etc., of the organism. These variables, however, were presumed objectively calculable from relevant information about past behaviour of the organism and the present stimulus situation.

4. Watson's emphasis on Pavlovian conditioning principles as the basis of learning gave way to a variety of emphases in which classical conditioning was (a) subsumed under more general principles, (b) supplemented or (c) reinterpreted. This went hand in hand with diversification of basic research methods, each neobehaviourist preferring a somewhat different method or group of them. Hull, for instance, sought his main principles in trial-error learning situations (*e.g.*, simple mazes, boxes in which rats must press a lever to obtain food pellets, etc.) which make goal attainment or reward contingent on learning specified responses. He regarded such instrumental learning as fundamental; thus his major law of learning stipulated that *S-R* associations are formed only when the pairing of *S* and *R* is followed by reduction of need (principle of reinforcement). This principle represented an objective version of Thorndike's influential "Law of Effect" (1898 and after), which held *S-R* connections to be strengthened by satisfaction and weakened by discomfort or annoyance (an approach

to learning long regarded as an alternative to a conditioning approach). Hull maintained that the facts and generalizations of Pavlovian conditioning could be subsumed under the reinforcement principle, particularly when it is realized that the so-called unconditioned stimulus (*e.g.,* food in mouth) is always correlated with need reduction (*i.e.,* reinforcement). Because the conditioning situation could thus be conceived in reinforcement terms and because it involved an experimental arrangement of extreme simplicity, Hull regarded conditioning findings as valuable for suggesting basic explanatory principles. Many of his theoretical assumptions, including such principles as generalization (spread of the conditioned reaction from the stimulus of training to a similar stimulus), inhibition (factors, such as discontinuance of reward, which may weaken an extant conditioned response) and others, were based wholly or partly on results from the conditioning laboratory.

Skinner supplemented Pavlovian conditioning principles in that he recognized two primary types, each having special laws. Respondent (type S) conditioning is similar to the Pavlovian case, depending only upon temporal propinquity of stimuli. He was more interested in operant (type R) conditioning, in which instrumental behaviour is strengthened by presentation of a so-called reinforcing stimulus. The conceptualization differed from Hull's in that operant behaviour was said to be emitted rather than elicited by identifiable stimuli, and in other ways (*e.g.,* reinforcement is not equated with need reduction). Skinner devised the standard apparatus in which rats depress a lever to obtain small pellets of food. This and similar Skinner boxes (*e.g.,* for pigeons) later devised were used by many other neobehaviourists (*e.g.,* Estes, William N. Schoenfeld, Fred Reller). In them the conditions of operant behaviour have been analyzed in remarkable detail.

Guthrie stayed close to the facts of Pavlovian conditioning but reinterpreted its main principles. His major rule was that a recurring stimulus pattern acting at the same time as a response will tend to produce that response. Pavlov and others had assumed that *S* is conditioned to R gradually in repeated trials. Guthrie assumed that the associations producing the observed correlation of *S* and R gain full strength in a single trial, and showed ingeniously how apparent gradual acquisition could result from uncontrolled stimulus variability in conditioning experiments. With his principle of association and accessory assumptions concerning the role of kinesthetic stimulation and other matters, he constructed explanations of many learning phenomena.

Tolman, a theorist very different from the above-mentioned three, was a neobehaviourist only by commitment to objectivism. He reinterpreted classical conditioning principles, but more freely than Guthrie, in that they were translated into a system which conceived learning as resulting in something more like the commonsense notion of knowledge than direct S-R connections. For Tolman, the conditioned stimulus is a sign leading to the expectation that the unconditioned stimulus (significate) will follow without further activity by the organism. The sign produces preparatory behaviour (*e.g.,* salivation) appropriate to the significate. This type of learning is considered secondary to instrumental learning: here what is learned are "expectancies" that a given class of behaviours (R) will get the organism from the sign (S) to the significate (S). Such learning results in an *"SRS"* expectancy. Tolman based the details of his theorizing on instrumental learning situations, mainly simple mazes.

5. Watson's hypotheses were rather loosely stated suggestions. Neobehaviourists — whether hypothetico-deductive or informal — developed more specific theoretical analyses. Even if large generalizations were made too readily, there was a closer relation between hypothesis and experimentation.

In the course of this specification of general behaviourist ideas, peripheralist hypotheses were refined and multiplied. Hull in particular made provocative analyses of the role of kinesthetic stimulation in complex sequential behaviour; the role of drives and of implicit mechanisms such as the anticipatory goal response (*e.g.,* salivation, incipient chewing) in generating stimuli which could account for purpose, goal-directedness, certain aspects of thinking and other matters. Guthrie, too, explored the consequences of similar mechanisms (some as early as 1921).

6. Classical behaviourism never made up its mind as to whether it was concerned primarily with gross actions of the total organism in relation to complex "situations," or with stimuli and responses defined at physiological levels of specificity. Actually, it was concerned mainly with the former, but Watson did not always clearly say so. It was thus construable as a "muscle-twitch" psychology which reduced the field to physiology. Neobehaviourism tried to be more consistently psychological in outlook. Psychology was said (by Tolman and others) to be concerned with "molar" (*i.e.,* gross, flexible, goal-oriented) behaviour rather than with underlying physiological details. Many neobehaviourists considered physiology irrelevant. Others insisted that the levels of discourse of psychology and physiology be cleanly separated, and that psychology must go forward independently before a serviceable neurophysiology could develop. Yet no great clarity was achieved about such matters, in that neobehaviourists often drew upon real or fancied physiological materials. Nor was the ambiguity of classical behaviourism concerning the definition of S and R (especially the relation between physical S and situational *S* and between physiological R and behavioural R) eliminated.

LIBERALIZATION OF BEHAVIOURISM

Such general emphases of neobehaviourism as those mentioned above remained relatively stable until the mid-1940s, but they came increasingly under question after that time. Partly this resulted from failure of neobehaviourist systems to realize the theoretical and practical objectives announced in the 1930s. This was a failure made the more poignant by the need for humanly relevant psychological knowledge of a world that had emerged from war into an atomic era, and by the hopes for usable theoretical principles on the part of the vastly increased number of applied psychologists thereby called into existence.

This interval saw profound changes in psychology, in the course of which neobehaviourist positions were modified and liberalized. The pressures toward liberalization were partly internal to behaviourism, arising from the interaction between theory and research (especially where theoretical ideas were extended to complex human problems). But many extrinsic developments invited or enforced modifications of neobehaviourism. Among them were:

1. A growth in influence of established nonbehaviourist formulations (*e.g.,* Gestalt and related viewpoints; psychoanalysis and other personality theories stressing experiential analysis.

2. Resurgence of interest in such bypassed areas as instinctive behaviour, perception, complex motivational processes and thinking.

3. Revived concern with the physiological basis of behaviour — both reflecting and augmenting significant new knowledge about the nervous system.

4. Growing from the newly fashionable research areas, a wider excursion of theoretical ideas (*e.g.,* in perception the work of James Gibson and Ivo Kohler; in physiological psychology. D. O. Hebb; in study of instinctive behaviour, the awakening of animal psychologists to the ideas of Konrad Lorenz and the European ethologists).

5. Development of new approaches to behaviour analysis (*e.g.,* sensory processes, communication, simple learning) via formal and mathematical models — among them cybernetics, servo theory and information theory — drawing on modern systems engineering and probability mathematics.

6. Most general (and perhaps most significant), a growing recognition that wide-scope hypothetico-deductive theory is for the distant future, if indeed it is at all appropriate to such a science as psychology.

In responding to such trends, liberalized neobehaviourism all but lost its identifying characteristics. This was evident, for instance, in the 1959 volumes of Psychology: *A Study of* a Science, in which many influential theorists, including neobehaviourists, presented detailed retrospective analyses of their positions. Major orienting attitudes of classical behaviourism or neobehaviourist modifications thereof could be seen to be watered down to a point where distinctiveness was threatened. For instance, Guthrie, whose career overlapped classical behaviourism and neobehaviourism, once

and for all abandoned the persistent behaviourist hope that stimuli may be uniformly reducible to physical description, and response reducible to movement in space (*i.e.*, reducibility to Watson's "simple" stimuli and responses). Rather, "we find ourselves inevitably describing [stimuli] in perceptual terms"; moreover "it is . . . necessary that they have meaning for the responding organism." With regard to response, "we cannot reduce the classes of psychological facts which . . . we must deal with to component movements in space." (E, R. Guthrie, in *Psychology: A Study of a Science,* ed. by S. Koch. vol. ii, p. 165, McGraw-Hill, 1959.) In assuming that stimuli and responses depend for their identification on the perceptual sensitivities of human observers, Guthrie gave up one of the chief objectivist criteria of behaviourism—reducibility of observations to "pointer readings," as in physics and chemistry.

In the same volume; the important neobehaviourist N. E. Miller gave painstaking and insightful attention to central (*i.e.*, brain dependent) processes. and remained a peripheralist only to the extent of phrasing them in terms of the "central response." a type of "response" certainly not (in Miller's application) identifiable with muscle contraction or gland secretion. Indeed, he pointed out that this concept allows "the theory to exploit images, . . . perceptual responses, . . . and the possibility that central responses can contribute to the focusing of attention." (Neal E. Miller, in *Psychology:* A *Study of a Science,* ed. by S. Koch, vol. ii. p. 242, McGraw-Hill. 1959.) Tolman. in his contribution to the study. re-evaluated his objectivistic theory of purposive behaviour, indicating repeatedly that his major theoretical concepts (intervening variables) came from his "own phenomenology," and expressing serious doubts as to whether such concepts could even be applied objectively (*i.e.*, according to fixed rules which link them to behavioural pointer readings).

The above scattered points are representative of many others made by these men and converged upon by other contributors to *Psychology: A Study* of *a Science.* They were confirmed in the general literature and in a growing disposition among younger behaviourists to concentrate research on such formerly eschewed areas as perception. language behaviour. thinking and so-called mediational processes in general.

Though psychology remains conceptually heterogeneous, it has moved toward unity on such fundamental methodic questions as n-hat constitutes legitimate data. The strange kind of scientific purism that would disallow direct use of experiential data has been proved self-defeating by the history of behaviourism. The attack of behaviourism on the artificial introspection of structural psychology was just, and per se wholesome; the extension to nonelementaristic varieties of introspection which attempt to fix the organized structures, transitions and meanings of experience is not. Such experiential analysis must initially define the main problems of psychology, concerning action as well as experience. Further, it can suggest explanatory hypotheses and in important instances provide evidence in terms of which hypotheses are tested. Introspection oriented toward these ends was inevitably part of the psychological enterprise even during the hegemony of behaviourism, but it was rendered furtive by prevailing doctrine. In consequence, the psychology of creative problem solution, of art, ethics, religion and other characteristically human matters mas neglected, such subjects being disdainfully relegated to the humanities.

Meanwhile, it became unfashionable to consider the many weighty questions that must be asked concerning the integration of behavioural and experiential data, optimal techniques for experiential observation and for definition of experiential variables, etc. Psychology was beginning to make progress on such issues, and the simplification of man's image of himself that behaviourism had bequeathed to the 20th century was beginning to be rectified. Happily, behaviourism itself was participating in the task.

BEHBEHAN, the chief town of a large district (Shahrestan-e Behbehan) in Khuzistan, southwest Iran, is situated at the southern edge of a cultivated plain in the foothills of the Zagros mountains, about 5 mi. S. of the Marun river. Pop. (1956) 29,947. The district extends to Mt. Dinah (or Dinar) and is largely mountainous, with tribal populations. The town has recovered from earlier decay, partly because of the development of the neighbouring oil fields of Aqa Jari and Gach Saran. It lies on the ancient route from Elam, roughly conterminous with modern Khuzistan, through Fahlian into the heart of the old Persis, now Fars, with its former centres Persepolis and Estakhr. The road is motorable from Ahvaz to Behbehan, and there is a more difficult branch road to Kazerun. Nearby are ruins including those of the ancient city of Arajan and of two bridges, one of which consisted of a single arch 80 paces in span and of almost equal height. (H. Bo.)

BEHEADING, a mode of executing capital punishment. It was in use among the Greeks and Romans, and the former, as Xenophon says at the end of the second book of the *Anabasis,* regarded it as a most honourable form of death. So did the Romans, by whom it was known as *decollatio* or *capitis amputatio.*

The head was laid on a block placed in a pit dug for the purpose—in the case of a military offender, outside the entrenchments; in civil cases, outside the city walls, near the *porta decumana* (one of the main gates of the military camp). Before execution the criminal was tied to a stake and whipped with rods. In earlier years an ax was used; later a sword, which was considered a more honourable instrument of death, was used in the case of

Roman citizens. It was with a sword that Cicero's head was struck off by a common soldier.

Beheading is said to have been introduced into England from Normandy by William the Conqueror. The first person to suffer was Waltheof, earl of Northumberland, in 1076. An ancient manuscript relating to the earls of Chester states that the serjeants or bailiffs of the earls had power to behead any malefactor or thief, and gives an account of the presenting of several heads of felons at the castle of Chester by the earl's serjeant. It appears that the custom also attached to the barony of Malpas. The liberty of Hardwick, in Yorkshire, was granted the privilege of beheading thieves. (See GUILLOTINE.)

But beheading was usually reserved for offenders of high rank. In the reign of Edward II, Thomas of Lancaster was sentenced to be hanged, drawn and beheaded, but because of his high birth was pardoned all but the beheading. From the 15th century onward the victims of the ax include some of the highest personages in the kingdom. Simon, Lord Lovat, was the last person beheaded in England (April 9, 1747). The execution of Anne Boleyn was carried out not with the ax, but with a sword, and by a French headsman specially brought over from Calais. In the case of the 4th Earl Ferrers (1760) his petition to be beheaded was refused and he was hanged.

Executions by beheading usually took place on Tower hill, London, where the scaffold stood permanently during the 15th and 16th centuries. In the case of certain prisoners of state, *e.g.*, Anne Boleyn and Lady Jane Grey, the sentence was carried out within the Tower, on the green by St. Peter's chapel.

Beheading was only a part of the common-law method of punishing male traitors, which was ferocious in the extreme. According to Walcot's case (1696), I. Eng. Rep. 89, the sentence (translated from the Latin) was "that he be hanged by the neck and dropped to the ground alive and that his private parts be cut off and that his bowels within his belly be taken and put upon a fire and burned while he lives and that his head be cut off and that his body be divided into four parts to be placed where it may please his majesty the king to assign them." There is a tradition that Thomas Harrison, the regicide, after being disembowelled, rose and boxed the ears of the executioner. In 1814 the king was empowered by royal warrant to substitute hanging as the ordinary mode of executing criminals; but as late as 1820 in the case of the Cato Street conspiracy (33 Howell, State Trials, 1,566), after the traitors had been hanged as directed by the act of 1814, their heads were cut off by a masked man. Drawing and quartering were not abolished until 1870.

A low block: such as would be used for beheading, is believed to have been employed sometimes, and certain authors incline to the view that such a block was the one used at Charles I's execution. The more general custom, however, seems to have been to have a high block over which the victim knelt. Such is the form of that preserved in the armoury of the Tower of London (*q.v.*), which is undoubtedly the block upon which Lord Lovat suffered. The ax which stands beside it was used to behead him and the other Jacobite lords. On the ground floor of the King's house, at the Tower, is preserved the processional ax which figured in the journeys of state prisoners to and from their trials, the edge turned from them as they went, but almost invariably turned toward them as they returned to the Tower. The ax's head is 1 ft. 8 in. high by 10 in. wide, and is fastened into a wooden handle 5 ft. 4 in. long. The handle is ornamented by four rows of burnished brass nails.

In Scotland they did not behead with the ax or with the sword, as under the Roman law and formerly in the Netherlands and France, but with the maiden, an early form of guillotine.

Beheading is now very rare in European countries, most of which have abolished or limited capital punishment (*q.v.*), but it was practised very extensively by the Chinese war lords! especially by Sun Chuan-fang in Shanghai. Beheading was the method of execution prescribed by the German penal code until the death penalty was virtually abolished after World War II. During the National Socialist regime the penalty was imposed in an extended range of cases. (P. E. L.)

BEHEIRA: see **BUHAYRAH,** AL.

BEHETRIA, the Spanish name for a form of land tenure in medieval Castile that gave the tenant the right to choose and change his lord at will, and without loss of goods. The term was used to refer both to the institution and to lands over which it operated. The inhabitants of a behetria de mar a mar could choose anyone as lord, but more often the choice had to be made among members of a particular seignioral family (behetria de *entre parientes*). A register, the Becerro de *las* Behetrias, compiled in the mid-14th century, shows that at least 600 places in Castile chose their lord under this system. It existed also, but much more rarely, in Portugal, León and Galicia. The practice may have originated in the need to encourage settlers by special privileges in the 9th and 10th centuries, though some attribute it to the scarcity and mobility of landlords during the early years of the Reconquest. (P. E. R.)

BEHN, APHRA (1640?–1689), known as "the Incomparable Astrea," English dramatist, novelist and poet, the first English woman to earn her living as a writer. Her parentage and the date and place of her birth have never been established. It was long supposed that her father was a barber named James Johnson, of Canterbury, but it was subsequently presumed that an entry in the parish register at the church of SS. Gregory and Martin, Wye, Kent, for July 10, 1640, referred to her baptism: "Peter ye son and Ayfara ye daughter of John and Amy Amis." This legend, which originated in a manuscript note by Anne, countess of Winchelsea (1661–1720), was perpetuated by Sir Edmund Gosse and repeated by later biographers. A partial examination into the unscholarly confusion arising out of the parish register at Wye may be found in V. Sackville-West's monograph on Aphra Behn and also in the preface to Montague Summers' edition of her works (see Bibliography). Later information shows that both these children, Ayfara and Peter, died and were entered in the burial register at Wye a few days later. Aphra Behn's origin must therefore remain a mystery

Possibly the Amis couple produced another daughter whom they also named Ayfara or Aphra. All that is known for certain is that some unidentified child named Aphra traveled with a couple named Amis to Surinam (Dutch Guiana), then an English possession, from which she returned in 1658 when it was handed over to the Dutch. In Surinam Aphra learned the history and acquired a personal knowledge of the African prince Oroonoko and his beloved Imoinda, whose adventures she related in her novel *Oroonoko* (1688; reprinted 1930). She married a London merchant of Dutch extraction named Behn. Her wit and abilities brought her into high estimation at court and after her husband's death in 1666 Charles II employed her on secret service in the Netherlands during the Dutch War. She received no reward, however, and a period of the utmost poverty followed—she was imprisoned for debt for a short time—and this led to her writing as a means of supporting herself. In 1670 her first play, The Forc'd Marriage, mas produced. She was most successful as a writer of witty and vivacious comedies, of which The Rover (two parts, 1677 and 1681) is an excellent example; but her versatility, like her output, was immense. She was well read and often adapted the works of the older dramatists, The City-Heiress (1682), based upon Thomas Middleton's *A* Mad World, My Masters (1608). being a case in point; but although she frequently borrowed, some of her most notable triumphs were absolutely original. Although the dramas comprise the bulk of her work, her prose works of fiction are of equal and perhaps greater interest from the point of view of literary history. Oroonoko exerted unquestionable influence on the development of the novel and Macaulay admitted that, in spite of the coarseness which disfigures her work, the best of Defoe was not beyond her reach. Besides plays and tales, she published translations and poems. Her poems, most unequal in merit, have perhaps been underestimated; the best known, with its grand first line, "Love in fantastic triumph sate," has taken its place as an anthology piece, but others also deserve consideration.

Mrs. Behn attained great popularity and had become the centre of much scandal before her death in London, April 16, 1689,

when, strange to relate, she was buried in Westminster abbey.

BEHRENS, PETER (1868–1940), German industrial designer and architect whose work epitomized German architecture at the beginning of the 20th century, was born on April 14, 1868, in Hamburg. After attending the Fine Arts school at Hamburg, he went to Munich in 1897 during the time of the renaissance of arts and crafts in Germany. In 1900 the grand duke of Hessen called him to his newly founded artists' colony at Darmstadt, where he built his own house (1901) with all its furnishings. In 1903 he became director of the arts and crafts school in Dusseldorf.

In 1907 the most important event of his career occurred. Emil Rathenau, general director of the A.E.G. (Allgemeine Elektrizitäts-Gesellschaft—one of the largest electrical manufacturing concerns in the world), appointed him as artistic adviser for all A.E.G. products. Rathenau was a farsighted industrialist who recognized industry's need of the refining hand of an artist. It was in Berlin that Behrens found himself. Up to that time he was a mediocre painter producing woodcuts, book covers, ceramics, interiors, fabrics, carpets, etc. Now he concentrated intensely on creative work in the industrial sphere from the hexagonal trade-mark of the A.E.G. to the shapes of carbon-arc street lamps and a new conception of industrial building. Between 1909 and 1912 he built the A.E.G. factory complex. His turbine assembly works with its glass curtain wall was the most influential building in Germany at that time. Walter Gropius, Ludwig Mies van der Rohe and even Le Corbusier then worked in his office.

Behrens' later activities also included factory and administrative buildings: the Mannesman Werke in Dusseldorf (1913), Farbwerke at Hochst (1924) and the classical German embassy at St. Petersburg (1913). From 1922 to 1927 he was professor at the Academy of Fine Arts in Vienna. His later buildings demonstrated his idea that a building complex must have a heavy massiveness. He died in Berlin on Feb. 27, 1940. (S. GN.)

BEHRING, EMIL VON (1854–1917), German bacteriologist and winner of the Nobel prize for medicine in 1901 who is considered the founder of immunology as a science. He was born at Hansdorf in west Prussia on March 15, 1854, the day following the birth of Paul Ehrlich. After qualifying in medicine at Berlin he entered the army medical corps, becoming (1888) lecturer at the Army Medical college in Berlin.

Not until 1889, when he was 35 years old, did he become assistant at Koch's Institute for Infectious Diseases at Berlin. In 1890, while working with the Japanese investigator Shibasaburo Kitasato (*q.v.*) in Koch's laboratory, he showed that it was possible to provide an animal with passive immunity against the disease known as tetanus, or lockjaw, by injecting into it the blood serum of another animal infected with tetanus. The immunity was efficient against 300 times the fatal dose of tetanus. The paper of Behring and Kitasato was the first to use the word antitoxic. Soon after, Behring showed that immunity could also be obtained against diphtheria by injecting serum from an animal that had previously been injected with living cultures of the diphtheria bacillus. He extended Pasteur's theory of attenuated viruses to the science of toxins and antitoxins. This epoch-making discovery was soon given practical application. It was found possible to induce a degree of immunity even after the onset of the disease. The first human case was a child in a clinic at Berlin in 1891.

Diphtheria antitoxin was placed on the market in 1892. In a few years its administration had become a routine part of the treatment of the disease. For this work, he shared with Pierre Roux the 25,000 fr. prize of the Paris Academy of Medicine and the 50,000 fr. prize of the Institute of France.

In 1894 he became professor at Halle and in 1895 at Marburg. Ill-health forced him to give up the teaching function attached to the directorship of the Institute of Hygiene at Marburg. He became financially interested in the manufacture of antitoxic serum by the Farbwerke Hochst, which built and equipped admirable laboratories for him in which he conducted researches involving, it is stated, 7,000,000 oz. of cultures of the bacillus of tuberculosis. He devised a vaccine for immunization of calves against tuberculosis. This was used largely in Russia, Sweden and the United States, but the results did not survive the test of time and experience in providing immunity against this disease. He died at Marburg from pneumonia on March 31, 1917.

He wrote, among other works, *Die Blutserumtherapie* (1892); *Ätiologie des Tetanus* (1904); *Einführung in die Lehre von der Bekämpfung der Infektionskrnnkheiten* (1912).

BEHRING, VITUS: *see* BERING, VITUS JONASSEN.

BEILBY, SIR GEORGE THOMAS (1850–1924), British industrial chemist, was born in Edinburgh, Scot., on Nov. 17, 1850. After graduating at Edinburgh university, he entered the oil shale industry and greatly increased the yield of paraffin and ammonia by introducing the continuous retort. He next turned to cyanide production by the action of ammonia on a mixture of carbon and potassium carbonate. The rapid destruction of metals by ammonia led him to study the flow of solids, and he inferred that when a solid is caused to flow, as in polishing, the crystalline surface is broken down to a harder and denser layer. This suggested an explanation of the hardening of metals under cold working, for such layers, formed on surfaces of slip within the crystals, would increase resistance to further flow. Although much criticized, this theory gave a valuable stimulus to research. Beilby served on various royal commissions dealing with the supply and use of fuels and, as first director of the Fuel Research board (1917), was concerned with the production of oil from coal. He was president of the Institute of Chemistry (1909–12) and of the Institute of Metals (1916–18), was a fellow of the Royal society (1906) and was knighted in 1916. He died at Hampstead, London, on Aug. 1, 1924. (C. W. D.)

BEIRA, an ancient principality and former province of north-central Portugal, extending from the banks of the Douro as far south as the upper course of the Tagus. This historic unit was divided in 1835 into the districts of Aveiro, Coimbra. Viseu, Guarda and Castelo Branco. In 1936 three new provinces were created out of its area: Beira Alta, Beira Baixa and Beira Litoral (*qq.v.*). (J. M Ho.)

BEIRA, a seaport of Mozambique (Portuguese East Africa), and administrative headquarters for the *intendencia* ("district") of Manica e Sofala, lies at the mouth of the Pungwe (Punguè) and Buzi rivers, 528 mi. N. of Lourenço Marques. It is linked by railway with Cape Town (2,037 mi.) via Umtali, Salisbury (374 mi.) and Bulawayo (675 mi.). Pop. (1950) 42,539, of whom 31,210 were Africans; 6,574 Europeans; 2,901 Asians; and 1,854 mixed. Beira is the chief port for the Rhodesias and Katanga (Republic of the Congo), via the Beira and Mashonaland and Rhodesian railway. The completion of a railway to the Zambezi in 1922 made it also the port for Nyasaland. The town is built on a sandspit extending into the river and is connected to the port by light railway lines. The climate is fairly healthy; the annual temperature averages 75.58° F. and rainfall 62 in. There is a considerable business community, largely British; of the three banks, two are British. It is increasingly popular as a holiday resort for Rhodesians and there are golf links just outside the town.

At the river mouth there is a lighthouse with a 16-mi. radius, and the channel leading to the port is well buoyed and lighted. Vessels of 24-ft. draft can enter the port at high tide. There is good anchorage in 5 fathoms (18–27 ft. at low-water spring tides) 135 yd. from the shore; the bottom is of soft mud but safe in fine weather. The maximum depth in the harbour is 32 ft., and minimum 12 ft.; the depth at the customs wharf varies up to 20 ft. On Portella bar, and in Rambler channel, there is 12-ft. depth at lowest spring tides and 18-ft. depth at low tide (neaps). There are three quays with berthing accommodation: the Pungwe quay (889 yd.) permits five large vessels to berth simultaneously and has more than 20 electric cranes; the Chiveve quay (488 yd.) with steam cranes is used by coasting ships; the other quay is used for the handling of ores and liquid fuels. The port has had

a free general warehouse system since 1944.

The importance of Beira port is due to its position as nearest to the principal producing centres of central Africa and equidistant from the ports of central and northern Europe, whether by Cape or Suez routes. Its traffic was adversely affected by the completion in 1902 of the Salisbury-Cape Town railway, and Port Elizabeth also competed successfully for Rhodesian trade. But railway rates and port and customs dues were reduced in 1905, and in 1907 a branch of the Rhodesian customs was opened at Beira, following the precedent of Lourenço Marques; these measures were successful in reattracting the transit trade of the interior. In addition to the important transit trade to Rhodesia, Katanga and Nyasaland, Beira also handles an increasing volume of traffic for Mozambique's hinterland, and is being increasingly used for transshipment of cargo for the smaller coast ports. The principal exports are ores (chromium, copper, amianthus, zinc), tobacco, sugar, maize, tea, cotton, hides and skins. The main imports are liquid fuels, fertilizers, wheat, railway material, automobiles and trucks, textiles, and wine and other beverages.

Beira *intendencia* was administered by the Mozambique company under an 1891 charter for a term of 50 years, renewable on its expiry in 1941. The Portuguese authorities refused to rene it, however, and took over the administration of the district in 1941. The company continued its existence, enjoying certain concessions and maintaining its establishments. Beira occupies the site of an old Arab settlement. The present port owes its existence mainly to a clause in the Anglo-Portuguese agreement of 1891 providing for the construction of a railway between Rhodesia and the navigable waters of the Pungwe. At first the railway began at Fontesvilla, about 50 mi. up the river, but was later brought down to Beira. The Portuguese government bought out the port on July 28, 1948, at a cost of about 600,-000.000 escudos (£7,500,000). It has since been administered and developed by the Directorate of Port, Railways and Transportation services. On April 7, 1949, the government also acquired the Beira railway at a similar cost and by the early 1960s the tonnage handled at the port had greatly increased.

See also PORTUGUESE EAST AFRICA. (A. A. G. P.)

BEIRA ALTA, a province of northern Portugal, coincides roughly with the administrative districts of Viseu and Guarda. Pop. (1950) 691,713; area 3,682 sq.mi. Framed by the mountains of Estrêla in the south, Caramulo (3,514 ft.), Arada (3,661 ft.) and Montemuro (4,534 ft.) in the west, it is drained by the upper basins of the Mondego and Vouga, and in the east by the Coa, a tributary of the Douro It consists of high, forested plateaus in the west and bare monotonous uplands in the east. Despite its average elevation of about 1,500 ft. it is densely populated in the more humid western plateaus, with impressive flights of cultivated terraces on the deep valley slopes, which produce chiefly maize, cabbage and vines. Viseu (pop. [1950] 13,099) is the largest of the numerous centres of the west; Guarda (*q.v.*) (7,814), the eastern capital, is the seat of an old bishopric and an important centre of communications. East of Guarda conditions are more arid and poorer generally.

(J. M. Ho.)

BEIRA BAIXA (lower, *i.e.,* eastern Baixa), a province of east-central Portugal, which coincides roughly with the administrative district of Castelo Branco. Pop. (1950) 355,806; area 2.897 sq.mi. Much of the province consists of a monotonous landscape of undulating plateaus and extensive waste called *charneca.* The plateaus rise gradually for about 45 mi. N. of the Tagus and stretch 35 mi. from the Zêzere valley to the Spanish frontier. To the northwest it is dominated by the mountain blocks of Estrêla (6,532 ft.) and Guardunha (4,026 ft.). Between them, in the upper Zêzere, Cova de Beira is a rich agricultural basin, watered by irrigation. Covilhã (pop. [1950] 20.514) is its market centre, famed for textiles and a winter sports resort. The southern plateaus are poorer, resembling the features of Alentejo (q v), to which they are transitional. The Idanha scheme to irrigate about 35,000 ac. from the Carmona dam on the Ponsul river was developed in the 1960s.

Castelo Branco (*q.v.*) (13,177), the southern capital, is an old fortress town guarding the routes to the international frontier.

(J. M. Ho.)

BEIRA LITORAL, a province of north-central Portugal. includes the administrative district of Aveiro and parts of those of Coimbra and Leiria. Pop. (1950) 969,166; area 2,933 sq.mi. It stretches for about 70 mi. along the coastal plain from the ria of Aveiro to south of the Mondego valley. Inland it follows the edge of the interior mountains and the middle basin of the Mondego as far as the Dão confluence. It has varied landscapes: the sandy wastes and pinewoods of the coastal Gandara; Ria (the "little Holland" of Beira) with its salt pans, rice fields and the lagoon of Aveiro; the interior Bairrada with vineyards covering its limestone hills; and the intermixture of forests and cultivated fields in the middle Mondego basin. Aveiro (pop. [1950] 13,397), an old fishing port, and Figueira da Foz (11,104) are the chief coastal settlements. Coimbra (q. v.) (42,640), the capital, is on a hill site overlooking the Mondego, where it breaks out from the mountains. Its famous university was originally founded in 1290. The lower town has woolen, leather and food industries. (J. M. Ho.)

BEIRUT (BAYRŪT; BEYROUTH), the capital and chief port of Lebanon, lies on St. George's bay on the northern side of a triangular promontory backed by the Lebanon range. It was there. according to legend, that St. George slew the dragon. Pop. (1953 est.) 296.000, including suburbs 434,000 (*i.e.,* about one-third of the total population of Lebanon). Muslims form about one-third of the population, Maronites, Greek Orthodox and Armenian Orthodox forming the other major groups.

Modern Beirut. — Few traces remain of the old city which, until about 1835, was a completely fortified town, about ¼ mi. square, surrounded by gardens. In the first half of the 19th century Ibrahim Pasha (1789–1848) began to demolish the walls, and later in the century the great aqueduct of Herod the Great was broken down and the sea castle and Turkish fortress disappeared.

Toward the end of the century the city began to expand rapidly and in 1895 new harbour works and the railway to Damascus were completed. In 1916 Jemal (Cemal) Pasha cut wide streets through the old quarters. After World War II Beirut grew again, spreading along the hillsides to the east and west. Although there are many modern buildings, the general architectural effect is chaotic. The Christian quarter spread to the east and the Muslim quarter to the south. Many gardened villas overlook the town from the encircling wooded hills.

Beirut has little industry (mainly beer, canning and confectionery); it functions principally as the financial, commercial and transit centre for the Levant region. It is also one of the most active religious and cultural centres in the middle east, and is the seat of archbishops and bishops of several Christian communions. In addition to the extensive American University of Beirut, founded in 1866 and standing on the promontory of Ras Beirut, there are the French (Jesuit) University of St. Joseph (1881), the Lebanon university (1951) and the Académie Libanaise (1937). Elementary and secondary education is provided by many foreign missions (American, French and English) and by Lebanese denominational and lay schools, both private and state-owned. There is an archaeological museum, a racecourse, golf links and stadiums, and a bathing beach at Khaldeh.

The harbour, consisting of two artificial basins, was greatly developed under the French mandate (1920–41) and later. Protected by the northern mole (approximately 4,000 ft.) it can accommodate 17 large ships, 7 of them berthing alongside the quay (approximately 7,000 ft.). The port has a free zone for handling transit goods, and refrigerating depots.

Beirut is linked by good roads with its hinterland north, east and south, and is connected by a coastal railway (1942) with Tripoli (Tripolis), Homs and Aleppo to the north and Haifa to the south. There has, however, been no traffic with Haifa since the creation of the state of Israel in 1948. Another railway links Beirut wtih Damascus. The international airport, 10 mi from the city, is an important link in the world's air routes. (E. S AH)

History. — Beirut appears first in history in a list of Thutmose

III (early 15th century B.C.). In the epoch recorded by the Tell el-Amarna (*q.v.*) tablets (c. 1400 B.C.) its ruler was Ammunira, who contributed to the correspondence and was apparently a loyal vassal of the pharaohs. It was a Phoenician city, though it is not named in the Old Testament; the context forbids its identification either with Berothai (II Sam. viii, 8) or with Berothah (Ezek. xlvii, 16). According to Strabo (xvi, 735) Beirut was taken and destroyed by Tryphon in his struggle with Demetrius II for the Seleucid throne (140 B.C.).

Marcus Agrippa, lieutenant of Augustus, captured the city in 15 B.C. and made it a military colony, Berytus, with the full title Colonia Julia Augusta Felix Berytus, with the added privilege of the *jus Latinum* (Latin rights). Herod the Great showed it favour by erecting many fine buildings. Herod Agrippa I (c. 10 B.C.–A.D. 44) and his son Herod Agrippa II added to its attractions a theatre and an amphitheatre. In 1927–28 there was discovered, close to the Great mosque, a colonnade of the 1st century A.D. along with an inscription recording the restoration of the building by Queen Berenice and her brother Herod Agrippa II, two funerary inscriptions and an ornate pagan sarcophagus. It was in Beirut that Titus celebrated the fall of Jerusalem and his father's birthday with gladiatorial contests. In Roman times the city was sought by many desirous of Greek learning, while its school of Roman law, founded in the 3rd century A.D., had by the time of Justinian gained a higher reputation than the schools of Rome or Constantinople.

A disastrous earthquake in 551, however, necessitated the removal of the school to Sidon. After the earthquakes Beirut was never restored to its former splendour and in A.D 600 the great public buildings lay strewn where they had fallen (as late as 1840 ancient columns were being used as ballast in harbour works). In 635 it passed under the blighting influence of the Arab occupation of Syria.

The period of Frank domination was one of great military activity. Baldwin I captured the city in 1110 and in 1151 it was pillaged by the Egyptian fleet. From 1177 until its capture by Saladin (1187) it was the scene of incessant fighting. Saladin dismantled its defenses (1190), dreading its reoccupation by the Franks. John of Brienne (c. 1148–1237) restored the castle and ramparts, and the new defenses in size and magnificance excelled any that had been before.

The surrender of the city to the Muslims in 1291 marked the end of the kingdom of Jerusalem. Thereafter it was dominated in turn by Mameluke sultans of Egypt, Druze amirs of the Lebanon, and the Turks (from 1517). The most famous of the Druze amirs was Fakhr ed-Din (1572–1635), who made himself independent of the Turks, chose Beirut as his residence, fortified it and by an alliance with Venice did much to foster and develop its trade. It was he who restored the city's famous pine groves. The Turks forced their way into the city in 1763, and in 1789 Beirut was finally freed from Druze interference. Ahmad al-Jazzar of Acre (1720–1804) re-established the defenses, built a new castle on the site of the old and completed the surrounding walls, but his building was not substantial. Beirut was occupied by the forces of Mohammed Ali of Egypt in 1830–31, but in 1840 the Egyptians were dislodged, Beirut in the process being bombarded by the allied fleets (British, Austrian and Turkish), and the city restored to Turkish possession.

In World War I, during which the port fell into disrepair, the city was occupied by British and Arab forces on Oct. 8, 1918. In April 1920 it became the capital of the new state of Lebanon under French mandate. During World War II it passed into the control of the Free French and the British and in Sept. 1941 was made the capital of the independent and sovereign state of Lebanon.

(WM. C. B.)

BEISAN (Hebrew BET SHAN), a town in northern Israel, lies on the route from the Mediterranean to the Jordan via the valley of Jezreel (Esdraelon). It is the centre of a prosperous district (pop. [1956 est.] 7,900) and occupies part of the ancient and biblical city known as Beth-Shan or Beit-Shean (in classical times Scythopolis or Nysa). The citadel, Tell al-Husa, or "The Mound of the Fortress," is largely artificial and is 213 ft. high and 899 ft. long. To the north of the tell is a large cemetery containing graves of all periods from the Bronze Age to the Byzantine. Excavations on this site were carried out by the University Museum of Philadelphia between 1922 and 1933 under the direction of Clarence S. Fisher, A. Rowe and G. M. FitzGerald. Their work revealed an occupation on the mound extending from the Chalcolithic to the Arab period. The most important levels are those of the Late Bronze Age, when at the time of Thutmose III and Amenhotep III of the 18th dynasty and Seti I and Ramses II of the 19th dynasty Beth-Shan was within the Egyptian sphere of influence. In Level IX two temples, one to Mekal, a local god, lord of Beth-Shan, and another to his consort, a form of Ashtoreth (Astarte), were uncovered. A few Egyptian steles and a panel representing Nergal were also obtained from this layer. The strong double walls of the citadel, 15 ft. thick, were probably built by Thutmose III after his success at the battle of Megiddo. The next level of importance, VII, was that of the reign of Amenhotep III, about 1400–1375 B.C., where a large fort was excavated, built of mud bricks on a stone foundation, with flanking towers about 35 ft. high. Close to this was the house of the Egyptian commandant, and a considerable section of the town plan of this period was cleared, with streets and house walls standing 6 ft. high. In Level V, that of Ramses II, the city was refortified with strong double walls and a gate with flanking walls. The two temples were also rebuilt. Among the finds were many cult objects connected with serpent worship. After the time of Ramses III the Egyptian military garrison of Aegean troops seems to have handed over the citadel to the incoming Philistines.

On Mt. Gilboa, in about 1020 B.C., the Philistines of Beth-Shan defeated the Israelites, and the bodies of Saul and his sons were exposed on the walls of Beth-Shan (I Chron. x. 10). About 1000 B.C. David and the Israelites took Beth-Shan from the Philistines, and it remained in Israelite hands until plundered by Sheshonk I of Egypt in 926 B.C. From the 8th century B.C. until the Scythian invasion in 625 B.C. Palestine was under Assyrian domination. Whether the name Scythopolis is derived from Scythian invaders is uncertain. From 301 to 198 B.C. Palestine including Beth-Shan was under the control of the Ptolemies, but there are few remains of this period except for a temple dedicated to Dionysius and Astarte. In 198 Beth-Shan passed under Seleucid control as a result of the conquests of Antiochus III. In 108 B.C. the city was betrayed to the Jewish leader, John Hyrcanus It remained in Jewish hands until 64 B.C. when it passed to the Romans. Rebuilt by the Roman proconsul in 57 B.C., Scythopolis became a self-governing town of the Roman empire and the centre of the Decapolis, rivaling Jerusalem in population and trade. During the turbulent times at the end of the Roman empire and the beginning of the Byzantine era the city prospered and became the seat of a bishopric.

In A.D. 636 Beisan fell to the Arabs; later it was captured by the crusaders, fortified by Tancred and sacked by Saladin. In 1519 it became part of the Ottoman empire and the centre of a subdistrict. Under the British mandate from 1922 to 1948 it formed part of the district of Nazareth, and is now the centre of important agricultural experiments.

(M. V. S.-W.)

BEIT, ALFRED (1853–1906), British South African financier, was a close friend and collaborator of Cecil Rhodes (*q.v.*) and played a prominent part in the development of the Kimberley diamond fields, the Witwatersrand gold fields and the Rhodesias. He mas born on Feb. 15, 1853, the son of an importer at Hamburg, Ger., went to Amsterdam to learn the diamond trade in 1871 and then to Kimberley, as an agent, in 1875. In 1880, he was made a partner in Jules Porges and company (called Wernher, Beit and company after 1889), which became a leading South African mining house. He met Rhodes in 1879 and they became lifelong friends. sharing the same ideals. Beit was indispensable to Rhodes, providing the financial talent necessary for Rhodes's ventures. Together they formed (1888) De Beers Consolidated Mines com-

pany, which administered the Rhodesias until 1923. Both were deeply implicated in the Jameson raid (Dec. 1895). When Rhodes died (1902), Beit became one of his trustees. He himself endowed a chair of colonial history at Oxford university (1905), donated £100.000 to the University of Hamburg, and bequeathed £200,000 (subsequently given to the University of Cape Town) for a Johannesburg university and £1,200,000 in trust to develop communications and education in Rhodesia. Beit, who became a British subject in 1898, died at his home in Hertfordshire on July 16, 1906. (M. F. K.)

BEJA, a group of nomadic tribes occupying, since 4000 B.C. or earlier, the mountain country between the Red sea and the Nile and Atbara rivers from the latitude of Aswan to the Eritrean plateau. The Beja have been identified with the Erembes of the Odyssey, the Buka and Medju of ancient Egypt and more certainly with the Blemmyes of Roman times. The pure "Hamite" stock, still found among the Beni 'Amer in the south of the area, is small, wiry, straight-nosed, curly-haired, dark-skinned, slim and muscular. Farther north it has been modified by Arab, Armenoid and Negroid elements.

The best-known tribes are (1) the half-Arab Ababda of Korosko and Abu Hamed; (2) the Bisharin farther east, famous camel breeders; (3) the Amarar behind Port Sudan, purest of the northern Beja; (4) the Hadendoa south of the Amarar, Osman Digna's "Fuzzies" who broke the British square at Tamai in 1884; (5) the Beni 'Amer of Tokar and Eritrea, dominated by a foreign aristocracy barely 1,000 strong.

Apart from the Beni 'Amer, most of whom speak Tigre, the Beja retain their Hamitic tongue, To Bedawi. Christian in the 6th century, they have been Muslim since the 13th. Except for the Amarar and certain Suakinese tribes they are indifferent to education, trade or progress, solitary in habit and resentful of interference. Some cotton is grown in the Gash and Baraka deltas. See also AFRICA: Ethnography (Anthropology): Northeast Africa.

See A. Paul, *A History of the Beja Tribes of the Sudan (1954).*

(K. D. D. H.)

BEJA (BÉDJA), a town of northern Tunisia, Africa, is situated about 62 mi. W. of Tunis. Pop. (1956) 22,668, including 2,052 Europeans, some of whom left after Tunisia gained independence. The old town lies on the flank of a steep hill and is dominated by the kasbah and still partly encircled by Byzantine walls. The Great mosque, the sooks and the modern quarters are in the lower part; the "European" town slopes down to the railway station. The town stands in a region always celebrated for its wheat, which it exports. It is also a local market for other products.

Béja is the site of the ancient Vacca or Vaga, a Punic town which became a Roman colony. It was always "the granary of Afrikiya" (Tunisia), as it was described by the Arab geographer, al-Bakri, in the 11th century, and a road junction. The Turks made it an administrative and military centre, for the control of the roads to Algeria and the surveillance of the unsubdued tribes of the mountains.

The governorate of Béja extends over a diverse region of 248,525 inhabitants: the humid plain of the north, surrounded by hills covered with cork oaks and peopled by the Nefza tribe; the fertile hills of the bled (rolling country), enriched by French colonization; the grain and stockraising country northeast of the High Tell, with the old town of Teboursouk (pop. 6,568); and the rich alluvial plains of the lower Siliana and the Medjerda, an important area of agricultural settlement, with the towns of Testour and Medjez al Bab. (J.-J. Ds.)

BEJA, an episcopal city, district of the same name and the capital town of the province of Baixo Alentejo (*q.v.*), Portugal. The city stands on an isolated hill, 95 mi. S.S.E. of Lisbon by rail and 115 mi. by road. Pop. (1950) 14,028. It is the ancient Pax Julia and is partly enclosed by walls of Roman origin with two Roman gateways. The citadel with four towers, among them a Gothic keep of white marble, was founded by King Diniz (1272). Grain and fruit are grown and cattle and pigs are bred on the Campo de Beja, plains lying round the city; some copper, iron and manganese are mined and cloth, pottery and olive oil are manufactured. Beja is the central market for all these products.

The administrative district of Beja coincides with the southern part of Alentejo (*q.v.*); pop. (1960) 283,152; area 3,957 sq.mi.

(J. R. Mo.)

BÉJART, the name of a family of French actors associated with Molikre.

JOSEPH BEJART (c. 1617–1659) was a strolling player and later a member of Molikre's first company (the Illustre Théâtre), accompanied him in his theatrical wanderings, and was with him when he returned permanently to Paris, dying soon after. He created the parts of Lélie in *L'Étourdi* and Eraste in Le *Dépit* amoureux

His brother LOUIS BEJART (*c.* 1630–1678) was also in Molikre's company during the last years of its fravels and created many parts in Molikre's plays—Valère in Le *Dépit amoureux*, Dubois in Le *Misanthrope,* Alcantor in Le Mariage *forcé* and Don Luis in Dom *Juan,* ou *le* festin de Pierre. He was lamed in a brawl, and retired with a pension—the first ever granted by the company to a comedian—in 1670.

The more famous members of the family were two sisters: MADELEINE BÉJART (1618–1672) was at the head of the traveling company to which her sister GENEVIEVE (c. 1622–1675), who played under her mother's name (Hervé), and her brothers belonged, before they joined Molikre in forming the Illustre Théâtre (1643). Madeleine Béjart remained with Molikre until her death on Feb. 17, 1672 She was an excellent actress, particularly in soubrette parts, a number of which Molikre wrote for her. Among her creations were Marotte in Les *Précieuses* ridicules, Lisette in *L'Ecole* des *maris* and Dorine in *Tartufe*.

Her sister, or possibly daughter, ARMANDE GRÉSINDE CLAIRE ELISABETH BÉJART (1642–1700), seems first to have joined the company at Lyons in 1653. (For a discussion of the relationship between Madeleine and Armande, see MOLIERE.) In 1662 Molikre married her, he being then 40 and she 19. Neither was happy; the wife was a flirt, the husband jealous. They separated after the birth of a daughter in 1665 and met only at the theatre until 1671. But Molikre could not resist her charm and they were reconciled. Her portrait is given in Act iii, sc. 9 of Le Bourgeois gentilhomme. Armande's first appearance on the stage was in 1663, as Élise in La Critique de *l'école des* femmes. She was out of the cast for a short time in 1664, when she bore Molikre a son, Louis XIV and Henrietta of England standing sponsors. But in the spring, beginning uith the fetes given at Versailles by the king to Anne of Austria and Maria Theresa, she started her long list of important roles She mas at her best as Celimkne—really her own highly finished portrait—in Le Misanthrope and hardly less admirable as Angélique in Le *Malade imaginaire* She was the Elmire at the first performance of *Tartufe,* and the Lucile of Le Bourgeois *gentil*homme

After Molikre's death Armande leased the Théâtre Guénégaud, and by royal ordinance the residue of her company was combined with the players from the Théâtre du Marais, the fortunes of which were at low ebb. The combination, known as the Troupe du Roi, at first was unfortunate, but in 1679 they secured Marie Champmeslé (q v.) and absorbed the company of the Hôtel de Bourgogne. The combined company became the Comédie Française. Armande in 1677 had married Isaac François Guérin d'Estriché (1636-1728), an actor. She retired in 1694 and died on Nov. 30, 1700. See also MOLIERE.

BEJEL, first described in 1928, is a form of endemic syphilis occurring among Bedouin tribes and certain Arab villagers of Syria, Iraq and adjoining countries. The number of its victims exceeds 1,000,000 and may be many more, for it is found mostly in areas where scientific diagnosis is lacking and where populations are not accurately numbered. Few members of the infected communities escape.

Although endemic (nonvenereal) syphilis differs clinically from sporadic (venereal) syphilis, both are diagnosed by the same tests, treated by the same drugs and caused by the same parasite (*Treponema pallidum*); both elicit the same fundamental pathological changes in the tissues.

Bejel, like endemic syphilis elsewhere, is rarely transmitted congenitally or through sexual contact; it spreads by contact from child to child in an unhygienic environment. The infection appears

first as an eruption of the mouth and skin and has no more venereal origin or connotation than measles. The profuse rash, extremely contagious and persisting for a year or more, eventually fades into latency; the blood test remains positive. Later, the early stage may relapse, or latency may be terminated by the late stage, characterized. by soft, gummy ulcers of the skin, the bones and the centre of the face, patchy loss of skin pigment and other conditions.

The resemblance of endemic syphilis (bejel) to venereal syphilis on the one hand and to (nonvenereal) yaws on the other suggests that it is related to both, providing a basis for the theory that these three should be considered as one disease, treponematosis. *See* also PINTA; VENEREAL DISEASES; YAWS.

See E. H. *Hudson, Treponematosis* (1946), *Non-Venereal Syphilis* (1958). (Es. H. H.)

BEK, ANTONY (*c.* 1240–1311), bishop of Durham and one of Edward I's chief counselors and agents, was the third son of Walter Bek of Eresby, Lincolnshire, tenant and high steward of the bishop of Durham. He became one of Henry III's clerks before 1264. took service under the Lord Edward (afterward Edward I). and accompanied him to the Holy Land (1270–74). He led diplomatic missions to Scotland, Gascony, France, Germany, Italy and Aragon, executed military commissions in Wales (1277, 1283), and handled numerous financial matters. Despite his notorious pluralism, Edward secured his election as bishop of Durham (July 9, 1283). After consecration (Jan. 9, 1284) he continued to serve as Edward's chief diplomatic emissary, and he fought in Scotland, leading a division of Edward's army at the battle of Falkirk (1298). He ruled his palatinate diocese with semi-regal powers, ostentatiously and arrogantly, but with energy, courage and generosity, successfully defending Durham from the metropolitan claims of the archbishop of York. He subdued the independence of the monastic prior and chapter of Durham (1300) and, although this led to collision with Edward, he escaped the consequences by political submission. He sought, with partial success, to extend his palatine authority over the whole of northern England. He died at Eltham on March 3, 1311.

See C. M. Fraeer, A History of Antony Bek, Bishop of Durham, 1283–1311 (1957). (R. F. T.)

BEKE, CHARLES TILSTONE (1800–1874), British traveler and biblical scholar, who played an important part in the final phase of the discovery of the Nile sources, was born at Stepney, London, on Oct. 10, 1800. He entered on a business career in 1820, later studied law and between 1837 and 1838 was British consul at Leipzig, Ger. His interest in ancient and biblical history led to the publication of *Origines Biblicae* in 1834, and to a doctorate in philosophy at Tiibingen university, Ger. During 1840–43 Beke was in Abyssinia investigating commercial possibilities and exploring the Nile sources, and was awarded the Royal Geographical society's gold medal in 1845. The same year he sponsored the inconclusive expedition under Bialloblotsky to explore the Nile sources from the east African coast. Beke maintained that the White Nile was the main stream, with its ultimate source at least as far south as the equator, thus conflicting with Antoine and Arnaud d'Abbadie's views which favoured the Blue Nile with its main source in Abyssinia. In 1861–62 Beke traveled in Syria and Palestine, and in 1865 went again to Abyssinia, to negotiate with King Theodore for the release of the British consul and other prisoners; he was much consulted by the British government during the subsequent war. In 1873 Beke went in search of the "true Mt. Sinai" which he located at the head of the Gulf of Aqaba. He died on July 31, 1874, and was buried at Bekesbourne, Kent.

Most important among Beke's many works are *Origines Biblicae, or Researches in Primeval History* (1834), *An Essay on the Nile and Its Tributaries* (1847), *The Sources of the Nile* (1860), *The British Captives in Abyssinia* (1865) and . . . *Sinai in Arabia* . . . (1878).

See Emily Beke, Summary of the Late Dr. Beke's Published Works . . . (1876). (D. MN.)

BÉKÉSCSABA, a town of southeast Hungary, lies a few miles from the White Körös tributary to the Tisza and is connected by canal with the Körös river. Pop. (1960) 49,488 (mun.). Békéscsaba is a railway and road intersection point and serves as market and distributing centre to a fertile countryside. A 13th-century Roman Catholic church is evidence of long settlement, but two marked characteristics of BCkCscsaba in the past have been the strength of the Slovak element (over half the population in the early 20th century) and a tradition of Lutheranism. The town has long had important hemp and flour mills. (H. G. S.)

BÉKÉSY, GEORG VON (1899–), Hungarian-born physicist who won the 1961 Nobel prize for medicine for research into the mechanism of stimulation of the human inner ear, was born in Budapest on June 3, 1899. He attended the universities of Budapest and of Berne and received a Ph.D. degree from the University of Budapest (1923). After heading the Royal Hungarian Institute for Research in Telegraphy from 1924 to 1946 he was called to the chair of physics at the University of Budapest. Following a short period at the Royal Institute of Technology in Stockholm, he moved to the United States in 1947 and became a senior research fellow at the psycho-acoustic laboratory of Harvard university.

As early as 1928 his observations led to a new hypothesis that inaugurated the era of traveling-waves theories that accounted for the phenomena of hearing on the basis of vibrations of the basilar membrane in the cochlea of the inner ear. He recognized that first of all the distribution of the vibrations produced by a sound along the length of the basilar membrane must be known. Working with cochlear models and a highly specialized instrumentarium of his own construction he was able to obtain different vibration patterns by varying the elastic properties of the basilar membrane. Traveling waves could be observed along the basilar membrane with a flat maximum that shifted its location along the membrane with a change of frequency, the place of the maximum being determined by the pitch. His work made it possible to differentiate between certain forms of deafness and to select the proper treatment more accurately.

His main contributions were collected, translated and edited by E. G. Wever under the title *Experiments in Hearing* (1960). (G. KE.)

BEKHTEREV, VLADIMIR MIKHAILOVICH (1857–1927), Russian neuropathologist, who along with Pavlov played an important role in establishing the conditioned reflex doctrine in psychology, was born Jan. 22, 1857, in Ssarali, in the province of Viatka. He studied medicine in the medicosurgical academy at St. Petersburg. In 1844 he went abroad to do research work under E. Du Bois-Reymond, W. Wundt and J. M. Charcot, and was appointed professor at the University of Kazan, where he started clinical research of mental diseases and promoted the first psychophysiological laboratory. In 1893 he became professor of the Military Medical academy in St. Petersburg and was elected director in 1905–06.

To foster psychophysiological research, he founded in 1907 in St. Petersburg a psychoneurological institute, which existed on private donations up to 1917, when an additional brain institute was formed and both were taken over by the government. He published more than 500 scientific papers on pathology and anatomy of the nervous system and founded a society of neuropathologists and the periodical *Nevrologitcheski Vestnik*. On the celebration of his 70th birthday he received the title of scientist emeritus. Bekhterev died on Dec. 24, 1927, at Moscow.

His work on *The Nerve Currents in Brain and Spinal Cord* appeared first in Russia in 1882; the second edition in 1896 has been translated into French and German (1894). *The Functions of the Nervous Centres* appeared in Russia in 1909; his *Psychology Objectively Demonstrated* was published in 1910 (Fr. trans. by N. Kotyleff, 1913); and his *General Diagnosis of the Nervous System Diseases* in 1911. He also wrote *General Basis of the Reflex Action of Man: a Treatise of Objective Biological Study of Personality.*

See CONDITIONING: *History.*

BEKKER, AUGUST IMMANUEL (1785–1871), German philologist and critic who edited an enormous array of classical authors, studied classics at Halle under F. A. Wolf. In 1810 he was appointed professor of philosophy at Berlin. For several years, between 1810 and 1821, he traveled in France, Italy, England and parts of Germany, examining classical manuscripts and

gathering materials for his editorial labours. He died at Berlin on June 7, 1871. Some detached fruits of his researches were given in the *Anecdota Graeca,* 1814–21. His industry extended to nearly the whole of Greek literature, except tragedy and lyric. His best-known editions are: *Plato* (1816–23), *Oratores Attica* (1823–24), *Aristotle* (1831–36), *Aristophanes* (1829) and 25 volumes of the *Corpus Scriptorum Historiae Bysantinae.* The only Latin authors edited by him were Livy (1829–30) and Tacitus (1831). Bekker confined himself to textual recension and criticism, in which he relied solely upon the manuscripts, and contributed little to the extension of general scholarship.

BEL, the Semitic equivalent of Sumerian ENLIL, "lord of the air"; with Anu and Ea (*qq.v.*) one of the primary triad of deities at the head of the Sumero-Akkadian pantheon and honoured especially at the city of Nippur. The name of Enlil occurs on very early pictographic tablets; his titles include "father of the gods," "king of heaven and earth," "king of all lands." In hymns and myths written in Sumerian and dating from the 2nd millennium B.C. (but deriving from earlier originals) he appears as the heavenly maker and planner and the giver of good things for men's use. He also "named" rulers and gave them victory. Another and more sinister aspect of Enlil appears in the title "king of the deluge" given to him by Gudea, priest-king of Lagasa (Lagash) in southern Babylonia about 2000 B.C.

During the 3rd dynasty of Ur (early 2nd millennium B.C.), on temple accounts from several Sumerian sites, he and his spouse Ninlil are named as objects of local cult far more frequently than any other deities. But at Ur, the capital city, such documents contain only one reference to offerings for Enlil, and none to any temple of his there. Perhaps this apparent neglect of Enlil at Ur may explain why, according to a Sumerian account, he "summoned the storm," annihilated the land and made the city of Ur a city of the dead.

The Semites, who displaced the Sumerians as rulers of Sumer and Akkad, with Babylon as their capital city, retained the name, status and cult of Enlil, calling him by their name for a god, Bel, "lord." Therefore Hammurabi begins his code with the statement that Anu and Enlil, the first and second members of the chief cosmic triad, had given sovereignty over the peoples to Marduk (*q.v.*), the "Bel" of Babylon, Hammurabi's city. He describes Enlil as "lord of heaven and earth," as the god who determines fates, the god who had given to him the "black-headed people" and had enlarged his kingdom. He invokes Enlil as the destroyer of the very name and memory of any person who does not respect Hammurabi's name and code. In subsequent myths it is Enlil who causes the deluge, and from him the Zu-bird steals the tablets of destiny. With his "great net" he catches lawbreakers. In course of time the attributes of Enlil were transferred to Marduk, who becomes the Bel of later days. Similarly, in Assyria, the chief god Ashur assumes the name Bel, and to him "the old Enlil" and other deities pay reverence.

Enlil's consort, Ninlil, lady of heaven and earth, mother of gods, lady of lands, towns and houses, is rarely separated from him. She is the Belit (*q.v.*) of Assyria and the beloved spouse of Ashur.

Enlil's *E-kur,* or "temple mount," was at Nippur. From this site, first excavated late in the 19th century, have come many literary compositions written in Sumerian. Shalmaneser I, in the 13th century B.C., built an *E-kur* at Ashur. Early in the 2nd millennium B.C., King Erishum I had built for Enlil a temple, later restored by Shamshi-Adad I, with the name "house of the wild ox of the lands." In both Babylonia and Assyria "wild ox" was an epithet of Enlil and, in its feminine form, of Ninlil.

The god of Palmyra, in Syria, though called Bel, is not the Babylonian Bel. The Greek neoplatonist Damascius (fl. 6th century A.D.) mentions "Illios," a form deriving from "Ellil"; *i.e.,* Enlil. When Greek writers refer to the Babylonian deity "Belos," they invariably mean Marduk of Babylon. *See* DANIEL, BOOK OF.

For bibliography *see* ADAD. (T. FH.)

BÉLA III (d. 1196), king of Hungary from 1173, was the second son of King Géza II. Educated at the Byzantine court, he married Anne of Chbtillon, duchess of Antioch, and in 1173 was placed by the emperor Manuel by force of arms on the Hungarian throne. BCla began by adopting Catholicism and seeking the assistance of Rome. He established close spiritual ties with the western world, particularly with France. During his reign Hungary became the leading power of south-central Europe, and he had an annual income equal to that of the kings of France or England. He made the throne hereditary by crowning his infant son Imre as his successor. The attempt to recover Dalmatia, which involved BCla in two bloody wars with Venice (1181–88 and 1190–91), was only partially successful. But he helped the Serbs of Raska throw off the Greek yoke and establish a native dynasty and attempted to make Galicia an appanage of his younger son, Andrew. It was in Béla's reign that the Western emperor Frederick I Barbarossa, in the spring of 1189, traversed Hungary with 100,000 crusaders. In his last years BCla assisted the Byzantine emperor Isaac II Angelus against the Bulgars. On his first wife's death BCla married Margaret, sister of Philip II Augustus of France. BCla was in every sense of the word a great statesman, and his court was accounted one of the most brilliant in Europe. Many leading Hungarian dignitaries were educated in Paris; and the Cistercian and Premonstratensian monks, whom he invited to Hungary, introduced more advanced agricultural practices into the country.

See HUNGARY: *History.*

BIBLIOGRAPHY.—Gyula Pauler, *A Magyar Nemzet Torttnete as Árpádházi Királyok Alatt* ("History of Hungary Under the Árpád Dynasty"), 2 vol. (1899); B. Hóman and G. Szekfü, *Magyar Tortknet* ("History of Hungary"), 5 vol., 3rd ed. (1935–36); D. G. Kosáry, *A History of Hungary* (1941), with bibliography. (GE. GR.)

BÉLA IV (1206–1270), king of Hungary, was the son of Andrew II, whom he succeeded in 1235. During his father's lifetime he colonized and christianized Transylvania. The salient event of Béla's reign was the terrible Mongol invasion that reduced three-quarters of Hungary to ruins. When BCla received information that the Mongols contemplated the immediate conquest of Europe, he appealed for assistance to Pope Gregory IX, to Frederick, duke of Austria, and to the emperor Frederick II. In February and March 1241 the Mongols under Batu Khan burst through the Carpathian passes; in April BCla himself, after a gallant stand, was routed on the banks of the Sajó river and fled to Dalmatia. For the next 12 months the kingdom of Hungary ceased to exist. Dynastic troubles forced the Mongols to withdraw from Hungary, however, and BCla immediately began the reconstruction of his realm, which he accomplished with a single-minded thoroughness during the last 28 years of his reign *(see* HUNGARY: *History).*

Perhaps the most difficult part of his task was the recovery of the western portions of the kingdom (which had suffered least from the Mongo! invasion) from Frederick of Austria, who had seized them as the price of assistance that he had promised but never given. BCla crossed the Leitha river on June 15, 1246, and routed Frederick, who was killed in the battle. In the south BCla was obliged, in 1243, to cede Zadar (Zara) to Venice; but he kept his hold on Split and his other Dalmatian possessions. His wise policy of religious tolerance in Bosnia enabled Hungary to rule that province peaceably for many years. The new Serbian kingdom founded by the Nemanyich dynasty gave him much trouble, on the other hand, and was the occasion of many bloody wars.

In 1261 the Mongols, led by Nogai, invaded Hungary for the second time but were defeated by BCla. For a time Béla was equally fortunate in the northwest, where the ambitious and enterprising Premyslid dynasty had erected a new Bohemian empire that absorbed the former territories of the Babenbergs of Austria and threatened Hungary. BCla was almost constantly at war with Otakar II for possession of Styria, which ultimately fell to the Bohemians.

BCla died on May 3, 1270. By his consort Maria, daughter of the Nicaean emperor Theodore Lascaris, he had two sons, Stephen and Béla, and seven daughters, of whom St. Margaret of Hungary was the most famous.

For bibliography *see* under BÉLA III. (GE. GR.)

BELALCAZAR (BENALCÁZAR, BELAICÁZAR), **SEBASTIÁN DE** (SEBASTIÁN MOYANO) (*c.* 1495–1551), Spanish conqueror who opened up what is today Ecuador and southern Colombia, was born in Benalcázar, Extremadura, Spain, about 1495. Traveling to the new world in 1519, he became an officer in the forces of Pedro

Arias de Ávila and in 1524 conquered Nicaragua. He joined Francisco Pizarro's expedition to Peru in 1531, equipping his ship at his own expense, and was given command of the important supporting base at Piura. Chafing at the inactivity of this post, in 1533, at the head of 150 Spanish soldiers and some Indian allies, he set out to conquer what is now Ecuador. He defeated the Inca chief Rumiñahui and founded the cities of Quito and Guayaquil. Three years later he led an expedition in search of "Eldorado," a mythical region supposed to abound in gold. The expedition resulted in the invasion of Popayán (the southwestern part of present-day Colombia) and the founding of the city of the same name in 1538. Belalcázar then became governor of Popayán and the provinces called Equinoxiales. The close of his life was embittered by disputes with other Spanish leaders. He died at Cartagena in 1551, when en route to Spain, following indictment for the death of Jorge Robledo. (J. L. Tr.)

BELASCO, DAVID (1853–1931), U.S. theatrical producer and playwright, was born in San Francisco, Calif., on July 25, 1853. As a child actor he appeared with Charles Kean in *Richard III*, and later played in stock companies that toured the mining camps. During this period, he served also as secretary to Dion Boucicault. From 1873 to 1879 he worked in several San Francisco theatres as actor, manager and play adapter, and in the latter year toured in *Hearts of Oak*, which he wrote in collaboration with James A. Herne.

Belasco moved to New York in 1880, becoming associated there with the Frohmans as manager of the Madison Square theatre and later of the Lyceum. In 1890 he leased a theatre from Oscar Hammerstein and became an independent producer. Feeling the pressure of the Theatre Syndicate headed by Marc Klaw and Abraham L. Erlanger, he built his own theatre in 1906, naming it after himself.

Belasco was the first U.S. producer whose name, regardless of star actor or play, attracted patrons to the theatre. He chose unknown actors—Mrs. Leslie Carter, David Warfield, Blanche Bates, Frances Starr and Lenore Ulric, among many others—and elevated them to stardom. He also preferred playwrights—Henry C. DeMille, Richard W. Tully, Charles Klein and John Luther Long—whose success depended upon his collaboration. He gained a reputation for minute attention to detail, for sensational realism, for lavish settings, for astonishing mechanical effects and for courageous experimentation in lighting. In a day of careless production methods, he maintained a large permanent staff that worked constantly under his set designer, Ernest Gros, and his lighting technician, Louis Hartment, to perfect surprising effects. As a result, he brought to the theatre, in addition to the sensationalism for which he was noted, what George Jean Nathan, one of his bitterest critics, acknowledged to be "a standard of tidiness in production" that discouraged the "frowzy hustle and slipshod manner of presentation" that had previously obtained on the U.S. stage. However, though no one denied Belasco credit for the remarkable skills for which he received many honours, better critics deplored his theatricalism and his lack of taste and artistic judgment, as well as his failure to encourage the better dramatists, both American and European, who were then coming to the fore.

Belasco claimed to have been connected with the production of 374 plays, most of them written or adapted by himself. Typical of his better-known productions are *The Heart of Maryland* (1895); *Madame Butterfly* (1900), turned into the opera of the same name by Puccini; *Du Barry* (1901); *The Music Master* (1904); and *Lulu Belle* (1926). He also wrote *The Theatre Through Its Stage Door* (1919). Belasco died in New York on May 14, 1931.

See Craig Timberlake, *Life & Work of David Belasco, the Bishop of Broadway* (1954). (M. Rs.)

BELAWAN, a port of northern Sumatra, Indon. It is on Belawan, an island of mud and mangroves at the estuary of the Deli and Belawan rivers. Pop. (1950 est.) 45,000. As the port for Medan, 16 mi. away, serving the east coast trade, it became the most important port in northern Sumatra. The harbour is handicapped by the bar of the deep Belawan river, and constant dredging is necessary to keep the channel open and to enable ships of 23-ft. draft to enter at all times, and vessels of 26-ft. draft at high tide. A feature of the modern harbour is the assortment of storage tanks for rubber latex, palm oil and petroleum. There are several thousand feet of wharves with warehouse accommodation. Imports consist of manufactured goods and foodstuffs. The hinterland grows tobacco, rubber, tea, oil palm and sisal fibres in Deli, Langkat and Serdang and these are shipped from Belawan. The older harbour, up river, provides a haven for local fishing craft and small vessels.

Belawan is connected by shipping services with Singapore and Penang as well as with Sumatran and Javanese ports. A motor road links it with Medan, and it is the terminus of the Deli railway, which crosses a bridge over the channel south of the island.

BELAYA, a river of the Bashkir Autonomous Soviet Socialist Republic, U.S.S.R., the largest tributary of the Kama, rises in the southern Urals at the foot of Mt. Iremel and flows for 882 mi. draining 54,826 sq.mi. After flowing southwestward through a narrow mountain valley, the river turns sharply to the north and the valley becomes broad and terraced. It joins the Kama, an important tributary of the Volga, above Derbeshkinskiy. Snow forms over half the water supply and in spring water levels are very high, reaching more than 30 ft. below Ufa. The average discharge is 33,549 cu.ft. per second. The river is navigable to the village of Tabynsk, although shallows in places impede navigation. Its major tributary is the Ufa river, and the town of Ufa (*q.v.*) stands at the confluence of the two rivers. (R. A. F.)

BELCHER, SIR EDWARD (1799–1877), British naval officer who made many valuable surveys for the admiralty, was born in 1799. He entered the navy in 1812 and in 1825 was surveyor in Frederick William Beechey's expedition to the Pacific and Bering strait. He subsequently commanded a surveying ship on the north and west coasts of Africa and in the British seas, and in 1836 took up the work which Beechey left unfinished on the Pacific coast of South America. In 1852 he was given command of the government arctic expedition in search of Sir John Franklin. This, which proved an unsuitable appointment, was his last commission; he was created knight commander of the Bath in 1867 and an admiral in 1872.

Belcher died in London on March 18, 1877.

Belcher published *Narrative of a Voyage Round the World Performed in H.M.S. "Sulphur," 1836–1842* (1843); *Narrative of the Voyage of H.M.S. "Samarang" During 1843–1846* (1848); and *The Last of the Arctic Voyages* (1855). (T. E. A.)

BELCREDI, RICHARD, Graf (1823–1902), Austrian statesman who worked for a federal constitution under the Habsburg dual monarchy, was born, the son of a Moravian landholder, at Ingrowitz (near Svitavy, Bohemia) on Feb. 12, 1823. After a period in the civil service (1842–48) he devoted himself to legal and historical studies. In 1855 he became district commissioner of Znaim (Znojmo, Moravia), governor (*Landeshauptmann*) of Silesia in 1860 and *Statthalter* ("imperial representative") at Prague in 1864. Favouring the Moravian conservative party and recognizing that neglect of the Slavs—particularly of the Czechs—would endanger the monarchy, Belcredi conceived that the solution of the nationalities problem should follow the model of Swiss federalism. The opportunity to make these ideas effective came when he succeeded A. von Schmerling as first minister on May 27, 1865. Convinced that a stable constitution could only be built on the foundation of traditional rights, he revoked (Sept. 20, 1865) the February patent of 1861, intended by Schmerling to constitute Austria-Hungary as a centralized, German-speaking state, and he prepared for a reconciliation with Czech demands by establishing Czech as a language of instruction in Bohemian schools. These two measures antagonized the influential German military and diplomatic group which had the emperor's confidence and, before the Austro-Prussian War of 1866, Belcredi was left uninformed of the full seriousness of the diplomatic situation. The Austrian defeat at Königgrätz (Sadowa) destroyed his position, and it was useless for him to claim that his Czech policies had maintained the integrity of the dual monarchy. Belcredi opposed the compromise favouring Hungary advocated by the empress and by F. F. Beust (*q.v.*),

the new foreign minister; when the emperor reluctantly declared himself for the compromise as the only practicable solution (on Feb. 3, 1867) Belcredi resigned.

Belcredi's ministry was the last to advocate a federal constitution on a conservative basis under which the Slavs should maintain their historic rights. The emperor forbade him to return to his home in Moravia, and from 1881–95 he was president of the administrative court. He died at Gmunden (Upper Austria) on Dec. 2, 1902.

BELÉM, a city and port in northeast Brazil, capital of Para state. Pop. (1956 est.) 301,954. Belém is also called Pará and its full name is A Cidade de Nossa Senhora do Belém do Grãn Para ("The City of Our Lady of Bethlehem of the Great River"). It is located about 80 mi. up the Rio Par5 from the Atlantic between the Rio Guam5 and the Bay of Guajará at 32.8 ft. above sea level.

The climate is rainy—tropical with an annual average temperature of 78.7" F., and 86 in. annual rainfall. Maximum rainfall occurs during the period from January to June when the warm moisture-laden equatorial air masses from the North Atlantic move southwestward into the interior of South America.

A Portuguese expedition headed by Francisco Caldeira de Castelo-Branco established Belem as a fortified settlement in 1616. Since this expedition started on Christmas day the new outpost was named Belem (Port., "Bethlehem"). The extension of Portuguese power along the northern coast of Brazil was the result of French attempts to secure a foothold in that area after unavailing efforts farther south. An expedition sailed from France in 1612, financed and supported by private sources, with the sanction of the French court, Marie de' Medici then being queen-regent. The French established a fort and colony on the island of Maranhão, which they called St. Louis in honour of their king Louis XIII, a name retained in its Portuguese form, São Luiz. One of the three expeditionary vessels returned to France and about 300 colonists were brought over on the next voyage. Aid from the crown did not develop and the colony was forced to surrender to a Portuguese expedition in Nov. 1615. With the founding of Belém soon thereafter, the French were driven back to Guiana, subsequently their only possession on the South American mainland. Para territory was made a separate *capitania* in 1652, with the town of Belem as the capital, but it was reunited with Maranhão in 1654. Belem was restored as the capital in 1772 when the final separation occurred.

The 1820 liberal political movement in Portugal, supporting a constitutional monarchy, had reverberations in Belém which established a separate government and sent representatives to Lisbon. Belém did not accept the empire of Brazil established in 1822 under Dom Pedro I, or the declaration of independence from Portugal, and yielded only to force. Both Maranhão and Belém were invested by a naval expedition in 1823 under Adm. Archibald Cochrane (earl of Dundonald), then in the service of Brazil, and made a part of the empire. An uprising occurred but it was quickly suppressed. Internecine strife continued, the worst of the struggles being the Revolução da Cabanagem in 1835 when the Portuguese Indians and *Mestiços* attacked the Portuguese residents. Order was restored in 1836 after considerable loss of life.

The end of the 17th century saw the decline of the sugar industry in the region around Belém and São Luiz and this area was subsequently used for cattle grazing. During the 18th century both Belém and São Luiz prospered from the production of rice, cotton and coffee, until these commodities were produced more reasonably elsewhere in Brazil. In the 19th century Belém became the main exporting centre of the Amazon rubber industry, and in 1866 its position was further enhanced by the opening of the Amazon, Tocantins and Tapajos rivers to navigation by friendly nations. The rubber era terminated after the boom of 1910–12, but Belém continued to be the main commercial centre of northern Brazil and entrepôt for the Amazon valley.

The districts near BelCm supply the local markets with foodstuffs. Many of these commodities, as well as a wide range of items from the inland territory, are sold at the Mercado Municipal of Belém.

The most valuable products exported from the Amazon by way of Belém are nuts, chiefly Brazil nuts, jute and black pepper. Japanese immigration after the 1930s was an important factor in developing jute and black pepper, notably at Tomesu-Assu just south of Belém and near Santarém. The island of Marajó, the largest fluvial island in the world (180 mi. east-west, and 100 mi. north-south), located across the Rio Pará from Belém, is believed to offer great potentiality for the expansion of livestock grazing.

Belém is the main port for Amazon river craft and is served by international and coastwise vessels. A railway extends to Bragança (145 mi.), and the Belém airport is the principal air facility in northern Brazil. It is a city of great beauty, modern and comfortable, with tree-lined streets, several plazas and public gardens and many fine buildings, both public and private. It is the diocese of a bishop and the colonial cathedral, founded in 1719, is one of the largest in Brazil. Santo Alexandro, the oldest of Belém's churches, was built in 1616. The Palacio do Governo (government palace) and the Palacete Municipal (city hall) are important government buildings.

Belém is the leading educational and cultural centre of northern Brazil with academic training available in medicine, dentistry, pharmacy, law, engineering and the fine arts. The city also affords a normal school, an institute for research on tropical diseases and the Instituto Agronômico do Norte (Agricultural Institute of the North) specializing in tropical agriculture. The Museu Goeldi, the Teatro da Paz, a classical theatre, and the Biblioteca e Arquivo Phblico do Para (Para Public library and archives) are other notable facilities. The historic stately buildings are retreating in the face of multistory buildings of contemporary design.

(J. L. TR.)

BELEMNITE, a representative of a group of extinct cephalopod mollusks, common in Mesozoic deposits (laid down from 200,000,000 to 70,000,000 years ago), allied to squid and cuttlefish (*qq.v.*). The shell (up to 18 in. long, but usually smaller) comprised a straight cone divided internally into chambers and known as the phragmocone, the whole enclosed in a horny or calcareous plate. It was probably internal as in most modern Decapoda. *See* CEPHALOPODA; MOLLUSCA.

BELESME (BELLÊME), **ROBERT OF** (*c.* 1052–c. 1131), earl of Shrewsbury, was one of the most powerful, ambitious, cruel and irresponsible of the Norman barons. He was a son of Roger de Montgomery and of Mabel, daughter of William Talvas, from whom in 1079 he inherited the west Norman lordships of Belesme, Domfront and Alençon. He supported Duke Robert II (Curthose) of Normandy against William II (Rufus) of England in 1088 and 1090, but led Rufus knights against Curthose and Philip I of France in 1097, and as an able military architect built the original castle of Gisors on the border between Normandy and the French king's domain. By his succession in 1098 to his brother Hugh's English fiefs, including Shrewsbury with the earldom, and the honour of Arundel, he became the most powerful vassal of the English crown. His chief rival in Normandy was Rufus' younger brother Henry, who became king of England (1100). Robert rebelled against him (1101), was deprived of his English lands (1102) and fought against Henry at the battle of Tinchebrai (1106). The French king sent him as ambassador (1112) to Henry I, who kept him prisoner until his death at Wareham in Dorset about 1131. (G. W. S. B.)

BELFAST, the capital city of Northern Ireland, is a county borough and seaport of the first rank situated on the river Lagan at its entrance to Belfast lough. It is partly in County Antrim on the northern side of the river, and partly in County Down on the southern side. Pop. (1961) 416,094. Area 25.9 sq.mi. Belfast is a modern industrial city which has little architectural distinction though there are some fine buildings including the city hall (1906), Queen's University of Belfast (founded 1845), the Presbyterian Training college (1853), the Protestant cathedral of St. Anne (the nave consecrated in 1904 but the building not yet complete), the museum and art gallery (1929) and the Royal

BELFAST CASTLE ON CAVE HILL OVERLOOKING BELFAST: ABOUT 1870

Belfast Academical institution (1810). Just outside the borough's eastern boundary are the parliament building and Stormont castle. Several public parks and the Botanic gardens, together with playing fields, play centres and the grounds of Belfast castle, comprise 1,144 ac. of open space between the large areas of docks, shipyards, warehouses and factories. The city has a compact shopping centre and there are many hotels and restaurants. These and other amenities have made Belfast a popular holiday resort and a focal point for travel through Ulster.

From the city's airport at Nutt's Corner, in the hills 11½ mi. W.N.W., regular air services are maintained to Glasgow, Manchester. Birmingham, Liverpool and London. Steamer services run between the seaport and Heysham, Liverpool, Manchester, Glasgow. Androssan and many other ports in western Europe and America. Belfast is the centre for provincial railway and bus services.

The city's early history is obscure. In about 1177 John de Courcy, it is thought. built a castle commanding the ford near the mouth of the river *(Beal Feirste,* "the mouth of [approach to] the sandbank [or crossing]" whence its name). Repaired and rebuilt on numerous occasions, this castle appears to have survived until the beginning of the 17th century. Belfast's modern history may be said to have begun in 1611, when Sir Arthur Chichester built a new castle there. He did much to encourage the growth of the town, which received a charter of incorporation in 1613. It survived intact the insurrection of 1641 when, throughout Clster. the Irish massacred thousands of colonists and seized some of the most important towns and strongholds. In 1648 it was occupied by George Monck, the parliamentarian commander.

By 1685 Belfast had a population of about 2,000. largely engaged in the making of bricks (there is plenty of clay in the neighbourhood), ropes, nets and sailcloth, together with weaving and. on a small scale, shipbuilding. By the late 1730s the castle had again been destroyed, but Belfast was beginning to acquire economic importance. It tended to usurp Lisburn's function as the chief bridge town on the river Lagan and largely superseded Carrickfergus as a port. Linen was the main Ulster industry, stimulated by the settlement of French Huguenot refugees under the patronage of William III at the close of the 17th century, and the spinning and weaving of linen were conducted as a cottage industry nith Belfast as its chief port and market centre. Power-driven machinery mas first applied in Ulster. when the first water-driven cotton mill was established at Whitehouse, near Belfast, in 1784. By 1811 there were 15 steam-driven cotton mills in Belfast, but the industry finally died out when the American Civil War cut off supplies of raw cotton. However, by this time mechanization had been applied to both the spinning and weaving of linen and Belfast was becoming one of the greatest linen centres in the world. The modern linen industry comprises many factories producing a wide variety of household textiles. Other industries, including tobacco, became established. and timber yards. sawmills, engineering works. flour mills and rope works developed.

During the 17th century many small vessels were built in Belfast. including. it is claimed, the "Eagle's Wing." a ship of 150 tons constructed in 1636 to take Ulster Presbyterians to North America. However, shipbuilding did not become really established until the late 18th century, nhen William Ritchie founded first a shipyard (1791) and then a graving dock (1796). Following the Industrial Revolution the chief shipbuilding firm came to be Harland and Wolff. whose yard now covers about 300 ac. and contains 18 building berths for vessels up to 1,000 ft. in length. Concurrent with, and conducive to, this growth of shipbuilding were the continued development of the port and improvement of its facilities. particularly after the establishment of the Belfast Harbour commissions in 1847. By the early 1960s there were 7 mi. of quays equipped with more than 60 dockside cranes; the harbour estate contained 13 mi of roads and 15 mi. of railway lines. The chief imports were machinery. coal; grain, flour and .feeding stuffs; iron and steel; and petroleum. Ships, aircraft, agricultural produce, livestock and linen textiles were among the main exports.

Besides the linen, tobacco, shipbuilding, engineering and rope-making industries, all of which continue to flourish, the more recently introduced industries include food processing and the manufacture of clothing and aircraft. An aircraft factory was established in the city in 1937 and became one of the largest in Europe, employing more than 8,000 people. It was responsible for developing Great Britain's first all jet-powered vertical take-off and landing aircraft. The city was severely damaged by air raids in May 1941.

Belfast's population increased greatly during the 19th century reaching almost 350,000 in 1901. It became a city by royal charter in 1888; in 1892 its chief magistrate was granted the title of Lord Mayor; and it was given county borough status in 1898. After the passing of the Government of Ireland act, 1920, Belfast became the seat of the government of Northern Ireland. The city sends 4 members to the United Kingdom parliament and 16 to the parliament of Northern Ireland. Gas, electricity and public transport services are municipally owned.

See D. J. Owen, *History of Belfast (1921).* (J. Du.)

BELFORT, TERRITOIRE DE, an administrative division of eastern France, was formed from the southern portion of the *département* of Haut-Rhin (*q.v.*), formerly part of Alsace-Lorraine (*q.v.*), the rest of which was ceded to Germany in 1871 but recovered by France in 1919. It is bounded on the south by Switzerland, and by the *de'partements* of Doubs, Haute-Saône, Vosges and Haut-Rhin on the southwest, west, north and northeast and east, respectively. With an area of only 235 sq.mi. it is one of the smallest *de'partements* of France. In 1954 it had a population of 99,427, of whom 41,197 were in the town of Belfort. The territory is in the archbishopric, and comes under the court of appeal and the *académie* of Besançon. The northern part is occupied by the southern face of the Vosges, rising to 4.094 ft. in the Ballon d'Alsace, the southern part by the wooded hills around Delle that are the northernmost parts of the Jura. Between the Vosges and the Jura stretches the Trouée (depression) de Belfort, 15–20 mi. wide, connecting the valleys of the Rhine and Rhône, and traversed by the link canal as well as by important railways and roads. From early times the gap has been a great routeway from north to south, the historic Gate of Burgundy or Belfort gap, and the fortress town of Belfort owes its strategic importance to command of this route. Arable land: pasture and forest each occupy about one-third of the territory. There are important textile and engineering industries, especially at Belfort. Delle and Beaucourt are smaller centres with varied manufactures. (Ar. E. S.j

BELFORT, capital of the *département* of Territoire de Belfort. eastern France, stands on the Savoureuse river, 66 km. (41 mi.) W. of Basel by road. Pop. (1954) 41,197. It commands the

important strategic gap known as the Trouée de Belfort between the Vosges and the Jura. The river divides the town into the old and new quarters. The old, or fortified, quarter is on the east bank and contains the castle and public buildings, the church of St. Christophe (1727–50) in the classical style and the *hôtel de ville* (1721–24) in front of which is the majestic Lion of Belfort, 22 m. (72 ft.) long and 11 m. (36 ft.) high, of Vosges sandstone, created by F. A. Bartholdi (*q.v.*) to commemorate the siege of 1870–71. The museum has important archaeological collections. Belfort has electrical, metallurgical and textile industries, and carries on a trade in the wines of Alsace, brandy and cereals. It is on the main railway from Paris to Basel and Italy.

Gallo-Roman remains have been found in the district, but Belfort was not mentioned until the 13th century, when in possession of the counts of Montbéliard who granted the citizens a charter in 1307. It passed later to the archdukes of Austria. By the treaty of Westphalia (1648) the town was ceded to Louis XIV, who gave it to Cardinal Mazarin. Five times invested in the 17th century, it again suffered siege in 1814, 1815 and 1870. In World War I Belfort remained just behind the French lines, but in World War II it was occupied by the Germans from June 1940 to Nov. 1944.

Siege of Belfort, 1870–71.—For the events before the siege, see FRANCO-GERMAN WAR. Even before the investment Belfort was cut off from the rest of France by General von Werder's corps. The siege corps was commanded by Gen. H. L. U. von Tresckow and numbered at first 10,000 men with 24 field guns, seemingly adequate for the reduction of the 17th-century works built by Sebastien de Vauban. But the defender, Col. Pierre Denfert-Rochereau, a skilled military engineer with advanced ideas, increased his meagre force to 17,600 men and fortified the ridges commanding the town, the Perches on the east, and Bellevue and Des Barres on the west. The Germans attacked on Nov. 3, 1870, but met stiff resistance. Their main attack began one month later from the west between Essert and Bavillers, and ten days later Bosmont, to the southeast, was captured. Danjoutin, south of the Perches ridge, was stormed on the night of Jan. 7–8, 1871. Typhus and smallpox had broken out among the French, and the victory of von Werder at the Lisaine put an end to hope of relief. The siege corps was heavily reinforced and Perches ridge was captured on Feb. 8. The Germans could now shell the centre of the town, but the general armistice on Feb. 15 brought operations to an end. The garrison had lost 4,750 men and 336 citizens, while German losses were about 2,000 men.

BELFRY, originally a movable wooden tower employed in sieges for attacking and scaling city or castle walls; also a watch-tower, particularly one that had an alarm bell. In modern usage the word signifies any bell tower, attached or detached, and also the tower chamber where bells are placed. See also CAMPANILE.

BELGAE, the name given by Julius Caesar to the inhabitants of Gaul north of the Sequana and Matrona (Seine and Marne) rivers. Their claim to be of "German" stock means only that they had crossed the Rhine later than other Celts (see CELT); and Caesar exaggerates the difference between their culture and that of the rest of Gaul. The evidence suggests that they penetrated into these areas about 150 B.C.; the newcomers continued the vases *carénés* or "pedestal urns" of the so-called "Marne" civilization (see LA TÈNE), but introduced cremation. The most highly developed Belgic culture is found among the more southerly tribes, such as the Atrebates and Bellovaci (in northern France); the Nervii and other northern tribes (in modern Belgium and southern Netherlands) retained elements of Hallstatt culture (see HALLSTATT) at a time when most of Gaul was passing through the late La Tène period.

The Belgae of Gaul formed a coalition against Caesar after his first Gallic campaign, but were subdued in the following year (57 B.C.), the Atuatuci being enslaved. The Eburones in the north revolted in 53 and slaughtered 15 Roman cohorts; in revenge they were practically exterminated, and new tribes such as the Cugerni and Toxandri crossed the Rhine to replace them. (For the subsequent prosperity of the whole Belgic area under the empire, see GAUL.)

During the first half of the 1st century B.C. Belgae from the Marne district, with their pedestal urn culture, had crossed to Britain and had formed the kingdom that in 55 B.C. was ruled by Cassivellaunus (*q.v.*), in Kent, Hertfordshire and parts of Essex. The contact between this kingdom and the Gallic Belgae is given by Caesar as one of his reasons for crossing to the island in 55 and 54 B.C. After his Gallic victories (54–51 B.C.) further settlers (including his enemy Commius, king of the Atrebates) took refuge across the channel. Belgic domination spread to Hampshire, Berkshire and west Sussex, and Belgic culture is found in most of lowland England. The subsequent Belgic kingdoms can be identified by the coinage, which started about this time. The three most important were centred on Colchester, St. Albans and Silchester; and of these the first two were united later under Cassivellaunus' great-grandson Cunobelinus, who ruled from about A.D. 5 to just before the emperor Claudius' invasion of Britain in 43.

In decorative art (including coin types) the British Belgae showed themselves increasingly receptive of romanizing influences, and there was a steady stream of Roman imports. The chief Belgic contribution to southern England was the introduction of the heavy plow, which cleared many lands previously intractable.

(1937); S. J. de Laet, *The Low Countries* (1958). (G. E. F. C.)

BELGAUM, a town and district of Mysore state, India. The town stands nearly 2,500 ft. above sea level, 245 mi. S. of Poona by rail. Pop. (1961) 126,727. A 16th-century fortress contains two interesting Jain temples. The town is a centre of trade and of cotton weaving, and also has clay, soap, pottery and metal utensil works and a tannery. Its southern suburb Shahapur is known for gold and silver work, besides silk and cotton weaving. The ancient name of Belgaum was Venugrama, said to be derived from the bamboos characteristic of its neighbourhood. There is an airport at Sambre, 7 mi. away.

BELGAUM DISTRICT had a population (1961) of 1,979,244 and an area of 5,091 sq.mi. North and east the country is open and well cultivated, but the west is intersected by spurs of the forested Western Ghats (Sahyadri). Crops include millet, rice, cotton and sugar cane. There is a sugar factory and manufacture of cotton cloth. A line of the Southern railway crosses the district.

The ancient site Halsi, according to 5th century A.D. inscriptions on copper plates discovered there, was once a capital of the Kadamba dynasty. From mid-6th century to about 760 the country was held by the Chalukyas of Badami. After passing through many hands it became in 1818 part of Dharwar district under the East India company. In 1836 this was divided into two districts, Dharwar and Belgaum; it remained in Bombay until the linguistic reorganization of states in 1956. (V. V. B.; P. B. D.; M. S. H.)

BELGIAN CONGO, the former Belgian colony in central Africa that in 1960 became the Republic of the Congo; from 1885 to its annexation by Belgium in 1908—the period when it was virtually the personal property of King Leopold II—it was called the Congo Free State. This article deals with the history of the country to June 30, 1960, when it became an independent republic; for its later history, and for geography and details of population, see CONGO, REPUBLIC OF THE.

Early History.—The Republic of the Congo owes its existence as a political unit to the initiative of one man: Leopold II, king of the Belgians from 1865 to 1909. What existed before his time in the Congo river basin, and what had always existed, as far as is known, was a number of scattered independent tribal groups of varying size. Nothing seemed to indicate that these would ever be united. In the equatorial forest region these groups were generally very small, but in the northern and southern savanna regions they were sometimes larger and might even be called kingdoms. One of these kingdoms was called Congo, and gave its name to the river. At the time of its greatest extension, however, in the 16th century, it covered only a part of the present lower Congo (from Stanley Pool lake downstream) and the northern

part of the present Angola. In the 19th century, the kingdom had completely disintegrated and was only a historical memory. Leopold II was driven toward central Africa by his belief in his country's absolute need of a colony, but as he did not succeed at first in gaining the support either of his government or of the Belgian people as a whole for his ideas, he had to act in his private capacity and establish at his own cost a state of his own, which he conceived as a future Belgian colony.

Central Africa, when the king first turned his attention to it, was still largely unknown. The greater part of the Congo basin was still a blank on the map. The first task was exploration. For that purpose, in 1876, the king summoned a Geographical conference in Brussels which resulted in the foundation of an African International association. This was a scientific and philanthropic association, organized to promote the exploration and civilization of central Africa. As an international venture it was not a success, but it served as a very effective cover for the king's personal enterprises.

These took a decisive turn with the announcement of the results of the great journey across Africa in 1874–77 by Henry M. Stanley (*q.v.*), and his discovery of the course of the Congo. The king then decided to concentrate on the Congo, and to make Stanley his chief agent. Stanley entered the service of the king in 1878. He was officially engaged by the Comité d'Études du Haut Congo, and later (1882) by the International Association of the Congo (Association Internationale du Congo, or A.I.C.). These were only nominal affiliations as both organizations were mere tools in the hands of King Leopold.

In five years (1879–84) Stanley, helped by a few dozen young Europeans and by soldiers recruited mainly in Zanzibar, succeeded in establishing a connection between the Congo estuary and Stanley pool through the difficult cataract region. He then launched steamers on the upper river, and founded a few stations along the river up to Stanley falls. He met neither serious native resistance nor foreign opposition. On Stanley pool, however, which had been reached by the Frenchman Savorgnan de Brazza before his arrival, he had to leave the northern shore to the French, establishing his own station, Léopoldville, on the southern shore.

Stanley signed treaties with a number of African chiefs who transferred their sovereignty to the A.I.C., but to profit by these treaties and acquire a sovereign status, the A.I.C. needed the recognition of the great powers. In seeking such recognition King Leopold assured the powers that he would open the Congo basin to free trade and assure equal treatment to all nationalities.

This led first the United States (April 1884), then Germany (Nov. 1884) and afterward all the great European countries to recognize the A.I.C. as an independent power. The free-trade engagements regarding the Congo were at the same time emphasized in the Berlin act concluded at the end of the Berlin West African conference (Feb. 1885). This international conference had met, under the presidency of the German chancellor, Bismarck, not to deal with the partition of Africa, but specifically to define a free-trade zone in central Africa. On the day when the final act was signed, the A.I.C., having been recognized by all the major powers, was in a position to adhere to the act as an independent state.

Leopold's next step was to assume his place as the sovereign of the new state. The Belgian chambers in April 1885 authorized the king to act as the chief of the state, with the proviso that its union with Belgium should be "exclusively personal." Strictly speaking, Belgium bore no responsibility whatever in Africa, and this remained the case until its annexation of the Congo in 1908.

The Congo Free State.— From July 1, 1885, the new state took the name of Congo Free State (État Indépendant du Congo). Its sovereign and its central administration were in Brussels. The seat of the local government was at Boma, on the lower Congo. The frontiers which were defined by the king in 1885 enclosed a territory approximately coinciding with that of the Congo republic. These frontiers bore no relation to the real extent of territorial occupation, which was still limited to a few districts on the lower Congo and along the upper river. Nevertheless, they were accepted by all the powers, which could not disapprove of King Leopold's plan to open up central Africa to all traders at his own cost.

The occupation of the territory was a slow process, especially because of the financial difficulties of the state. It was mostly peaceful. The only serious clashes were with the Arabs, who, like the notorious Tipoo-Tib, had entered the eastern parts of the country as slave and ivory traders and had established political control over these regions. Most of the Arab chiefs were defeated in campaigns between 1892 and 1894. Many Belgian officers distinguished themselves in these campaigns. The Katanga region, with its great mineral wealth, had been secured during 1891–92 by expeditions which had to race with those of Cecil Rhodes' agents. King Leopold also tried to extend the territory of the state beyond its original limits. These efforts met with little success except for the temporary occupation of the Lado enclave on the Nile. This was leased from England during 1894–1909.

For years the personal subsidies of the king formed the major part of the state's resources. When the financial burden became intolerable for the sovereign, he appealed to Belgium. In 1890, and once more in 1895, he was granted considerable loans. Belgium in exchange received the right to annex the Congo state, if it wished to do so, in 1901. Financial salvation, however, was achieved mainly by the economic device known as the rkgime domanial, by which all the vacant land was declared state property. The products of this land were also considered to be state property. This applied to most of the ivory and rubber of the country. Traders, from 1891 on, were forbidden in most parts of the state to buy these products, which were thenceforth collected by state agents. This killed all private trade in many areas. In a few years, however, the rubber revenue became enormous and the basis of the prosperous state finances.

It was soon alleged that in many cases the compulsory collection of rubber involved oppressive treatment of the population. These charges appeared conspicuously in the report of the British consul at Boma, Roger Casement, which was published in 1904 by the British government. They led in England to a strong anti-Congolese campaign, led by E. D. Morel, who founded the Congo Reform association. An independent commission of inquiry was sent to the Congo and its report, while expressing admiration for the many signs of progress, confirmed the existence of grave abuses there.

The Congo state made serious efforts to improve the situation, but it appeared that the only way to eradicate the evil completely was to transfer control to Belgium. Belgium had not exercised its right of annexation in 1901, being satisfied at that time with the Free State regime, but in 1906 the chamber of deputies passed two motions in favour of annexation. Negotiations were long and difficult, however, because the king wanted Belgium to guarantee the continuance of the Fondation de la Couronne, a corporation which owned vast rubber estates covering more than one-tenth of the area of the state, the revenue from which was used at the king's discretion for various purposes of public interest. A first treaty of transfer, maintaining the Fondation, was signed in Nov. 1907, but this encountered strong opposition both in parliament and from public opinion and it was amended in March 1908 by a second act which suppressed the Fondation.

Annexation by Belgium.— Long debates took place in the Belgian parliament on annexation, which was opposed by the Socialists and some Liberals, and on the law setting forth the principles upon which the new colony should be governed. This law, called the Charte coloniale, established a colonial office (*ministère* des colonies) and a strict parliamentary control over colonial government. Annexation was effected on Nov. 15, 1908.

Under the new Belgian administration, with Jules Renkin as first colonial secretary (1908–18), the rkgime domanial was abolished and free trade completely restored. This led to the end of the campaign of the Congo reformers in England. Official recognition of the annexation was nevertheless withheld by the British government until 1913.

During World War I, the Congo defense force took part in several campaigns against the Germans: in the Cameroons, Rhodesia and especially in East Africa. A considerable part of German

East Africa was conquered by Congolese troops, which entered Tabora in Sept. 1916. After the war Belgium received a mandate over only a portion of these territories, viz., over Ruanda-Urundi (*q.v.*). From the economic point of view, private enterprise, and more specifically great capitalistic enterprises, were mainly responsible for the development of the country after 1908. Some of the big concerns dated from the Congo Free State era. One, the Compagnie du chemin de fer, had achieved a brilliant success by building the first Congo railway, from Matadi to Léopoldville, which was put into service in 1898. But the great era, especially for the mining companies, began after 1908. The Union Minière du Haut Katanga (established in 1906) produced its first ton of copper in 1911; in 1928 its copper production had reached 7% of world production. Diamonds were discovered in 1907 in the Kasai by a prospector of the Forminibre; in 1929 the Congo ranked second among the countries of the world, just after the Union of South Africa, in the production of diamonds. Mineral products took the place of rubber as the mainstay of the Congo economy. In 1901 rubber represented 87% of the total value of exports; in 1928 this proportion had dwindled to about 1%. Mineral products by the same time had reached more than two-thirds of the total. Copper alone in 1928 represented about half of all mineral exports. The main agricultural exports at that time were palm nuts, palm oil and cotton.

As a country whose economy was based on the export of raw materials, the Congo was seriously affected by the depression of the 1930s, and the fall in price of all primary products. The crisis became so severe that the country's financial stability was endangered. Belgium had to grant large subsidies to help the colony's budget and to avert catastrophe. In 1934, Belgian grants represented 47% of the Congo's budgetary receipts.

When World War II came, the economic crisis had been overcome. The main contribution of the Congo to the war was economic, and the Congo never left the side of the allies. The war effort was directed by the Belgian government, which had established itself in London in 1940 after the invasion of Belgium, and by the governor general of the colony, Pierre Ryckmans. A Congolese expeditionary force fought successfully against the Italians in Ethiopia in 1941, but this was less important than the production of raw materials, which was increased during 1940–45 to meet the demands of the allies. Congolese tin was of the first importance after the loss of southeast Asia. Uranium ore was furnished by the Union Minière to the United States for the construction of the first atomic bomb.

After the war, the rate of economic development increased still more rapidly. This is best illustrated by the growth of the white population: in 1944, 34,000; in 1958, 113,000 of whom 88,000 (78%) were Belgians. The growth of the big cities was enormous. In 1944 the population of Léopoldville was about 100,000; in 1958 it was estimated at 389,547.

Characteristic of that period was the ten-year plan for economic and social development (plan dkcennal), which was published in 1949. This aimed at the development of public works, the improvement of the living standard of the African population and the creation of a domestic market. It cost more than 50,000,000,000 fr., all furnished by the Congo exchequer or by public loans.

The Missions.—The civilizing work of the Belgians was marked from the beginning by close co-operation between the state and the missions. Protection of missionaries of all denominations was one of the provisions of the Berlin act of 1885. For a long time, however, state subsidies were reserved for Catholic missions, as they alone appeared to be "national" (Belgian). In 1946 the subsidies were extended to the Protestant organizations, which were all non-Belgian at that time.

Practically all the great Catholic orders sent missionaries to the Congo. The first to arrive were the White Fathers of Cardinal Lavigerie who, coming from the east, were already at work along the shores of Lake Tanganyika in 1880. Then came the Fathers of Scheut (1888), the Jesuit Fathers (1893), and others. The first important Protestant station was that of Léopoldville, established in 1882 by the Baptist Missionary society. Protestant missionaries came mainly from Great Britain, the United States and Sweden. In the 20th century the numerical relation between the two groups of missionaries was about four or five to one.

The work of the missionaries was never restricted to evangelization. It also made an important contribution to the medical services and to education. Up to 1954, when the first nondenominational state schools for Africans were opened, the state relied completely on the missionaries for the education of the Africans. The two main educational efforts of the missionaries were directed at primary education and the training of an African clergy. Because of these efforts the level of literacy in the Congo became one of the best in Africa, while the number of African priests grew steadily. But the development of college and university education was much slower. The first Congolese to graduate from a university received his degree at Louvain (Belg.) in 1956. An important step forward was the foundation of two universities in the Congo, the Catholic university of Lovanium, near Léopoldville (1954), and the state university of Elisabethville (1956).

The medical work of the missions supplemented the efforts of the state, the great industrial societies and specialized bodies like the FOREAMI (Fonds Reine Elisabeth pour l'assistance médicale aux indigbnes). The hardest fights were against sleeping sickness and malaria. The general mortality rate, which was still 30–40 per thousand in the interwar period, had come down to about 20 per thousand in 1957.

The **Belgian** System.—The Belgian system of colonial government had two main characteristics which distinguished it from the British and French systems: a high degree of centralization, and paternalism. Brussels remained up to 1960 the nerve centre of colonial government. Colonial law was made there by the king acting through his responsible minister, with the help of a colonial council (Conseil colonial). There was no legislative council in the Congo. Control was in the hands of the Belgian parliament. No body elected in the Congo itself had any control over the administration. Up to 1957 no inhabitant of the country, whether European or African, had the right to vote. This was the result of a deliberate policy of postponing elections until they could be organized with the assurance of an African majority. Thus control by the minority of European settlers was deliberately excluded.

The first elections were the municipal elections of 1957 in the great towns, with universal male suffrage. It was long believed in Belgium that the process of emancipation of the Congo would be a slow and gradual one. It proved on the contrary to be the quickest in Africa. The first Congolese parties asking for greater political liberty appeared in 1956. By 1958 several of these parties had published programs demanding the independence of the Congo. Thq Belgian government came to the conclusion that to try to curb African nationalism would be a fruitless task; they were confirmed in that opinion by the troubles which broke out in Léopoldville on Jan. 4, 1959. On Jan. 13 an official declaration of policy was made, promising independence to the country. No time limit was given, but the nationalist parties asked for immediate independence. To withstand this demand would have meant a struggle which every section of public opinion in Belgium wished to avoid. A round-table conference with African leaders met in Brussels during Jan.–Feb. 1960. It passed resolutions approved later by the Belgian parliament, which fixed the date of independence as June 30, 1960.

BELGIAN LITERATURE. The literature of Belgium falls into two divisions, according to the language in which authors

write: Flemish and French (see BELGIUM: Population).

FLEMISH

When speaking of the linguistic and literary conditions of Flemish Belgium, it must be remembered that for centuries the Belgian territories (Flemish and Walloon) were united politically, economically and culturally with what is now the Netherlands (see HOLLAND); it was only toward the end of the 16th century that religious influences made the northern (Reformed) Netherlands secede from the Catholic south. Thus, until approximately 1600 the literature of Flanders and Holland showed itself as a strongly united entity.

It was in Flemish that the literature of the medieval Netherlands flowered most profusely; for example, in the work of Henric van Veldeke (Heinrich von Veldeke, *q.v.*), in *Van* den vos Reinaerde (Reynard the Fox, *q.v.*), in *Beatrijs*, in the mystical writings of Hadewych and of Jan van Ruysbroeck (*q.v.*) and in the religious and secular drama (such as the Abele plays, *Mariken van Nieumeghen* and Elckerlyc, from which Everyman was translated), as well as in Jacob van Maerlant (*q.v.*) and his didactic school. It was, moreover, in Flanders that letters showed a new vigour under the influence of the Renaissance and the Reformation. In the literature inspired by the latter, the tone was set by the glowing satirical verse of the Catholic Anna Bijns and the polemical *Biencorf* der H. Roomsche Kercke of the Calvinist Philips van Marnix van Sint Aldegonde (*q.v.*), who also wrote in French. The Renaissance started with L. de Heere, C. van Mander and J. van der Noot—all three of whom, significantly enough, had to flee their country for religious reasons.

Emigre's fled in great numbers to the north because of the religious and political troubles which paved the way for the secession of the Netherlands, with the result that the impulse toward a great revival of Renaissance and baroque literature in Flanders was interrupted and a period of decline set in. Whereas Holland was approaching its golden age, partly helped by the immigrants from the south (*e.g.*, Joost van den Vondel), the Counter-Reformation in the Catholic south showed no first-class literary work. But J. de Harduyn (1582–1636), a lyrical poet after the fashion of the *Pléiade*, R. Verstegen (c. 1550–1640), a polemicist and a writer of "characters," A. Poirters (1605–74), a popular moralist, the dramatists Willem Ogier (1618–89) and C. de Bie (1627–c. 1711) and, especially, M. de Swaen (1654–1707), the last important baroque poet and playwright who was deeply inspired by religion, may be compared to their advantage with the majority of didactic, moralizing and popular writers of the period. The decline was most noticeable in the first half of the 18th century, the popular character of Flemish letters becoming more marked as the elite came increasingly under French influences.

Before the end of the 18th century, however, W. Verhoeven and J. B. C. Verlooy had started a reaction against the French influence. Like the contemporary historical and scientific writers, they reverted to the work of the 16th-century humanists; but they neglected the medieval masterpieces. The literary revival, though still very halting, was helped by the "Rederijkers" ("rhetoricians") who, despite the submission of the upper class to French influence, continued more or less successfully to use their own language. Karel Broeckaert (1767–1826) wrote dialogues modeled on Addison's Spectator essays in a spirit of rational liberalism, creating a literary figure, "Gysken," the ironical representative of the old regime; he also wrote the first Flemish prose story, *Jellen* en Mietje (1811). The poet P. J. de Borchgrave (1758–1819) embodied the transition from classicism to romanticism, and J. B. Hofman (1758–1835), a prolific playwright, introduced the middle-class tragedy or *drame* bourgeois.

Romanticism made its influence clearly felt in the first quarter of the 19th century and helped to revive Flemish national consciousness. Thenceforth nationalist inspiration and the glorification of the past were preferred to individual sensibility. The older generation (J. F. Willems, J. B. David, P. Blommaert, F. Snellaert), particularly active in Ghent, still gave proof of a rational spirit in vigorous philological, historical and controversial writings. It was they who rediscovered the treasures of the medieval inheritance (Van den **VOS** Reinaerde, Ruysbroeck and Maerlant, as well as old songs and chronicles) and to their group belonged the first two important poets of the new epoch, K. L. Ledeganck (1805–47) and P. van Duyse (1804–59). The younger generation, active in Antwerp, was more spontaneously romantic and preferred creative to philological work. Its typical representative was the prolific Hendrik Conscience (*q.v.*), the creator of the Flemish novel, of whom it is said that "he taught his people to read." Conscience wrote ardent historical novels, for example. De *Leeuw* van *Vlaanderen* (1838), an epic of the battle of the Golden Spurs, which has inspired patriotic feeling for generations; he also wrote moral-social stories and masterly rustic tales (De Loteling, 1850). Theodoor van Rijswijck and J. A. de Laet freed poetry from classical concepts and forms. The ultraromantic stories of E. Zetternam and F. van Kerckhoven denounced social evils.

Reaction against romanticism set in about 1860 with D. Sleeckx, protagonist of a quiet realism. Writing in general was now characterized by acute observation, description of local scenery, humour and pessimism. Anton Bergmann produced a masterpiece of storytelling (Ernest *Staes*, 1874). Virginie Loveling (1836–1923) made the novel more profound and widened the field of problems treated in it (Een dure eed, 1890). J. M. Dautzenberg, J. van Beers and R. Loveling made poetry finer and more sober. Max Rooses, spiritually allied to H. A. Taine, proved himself the first Flemish literary critic worthy of that name. He wrote the standard work on Rubens (1903).

Parallel to this rather dull realism was a remarkable revival in West Flanders. The genius of Guido Gezelle (*q.v.*) found in God, in nature, in his country and in an easily moved and deep-rooted sensibility the fourfold inspiration for an almost perfect and entirely original lyricism. With its passion, its soul-life, its contemplation of God's glory. its noble thirst for eternity and the discovery of a metaphysical sense in its innate melancholy, this poetry was without equal in the Europe of the period. Hugo Verriest (1840–1922), a nationalist agitator as well as an excellent *causeur*, made prose natural and supple once more. Albrecht Rodenbach (1856–80), the "ideal young man" who died too young, wrote militant songs, thoughtful lyrics, monumental epic verses and a verse-tragedy (*Gudrun*, 1882).

The generation of *Van* Nu en Straks ("Today and Tomorro ," 1893–94. 1896–1901), a review which was to make Flemish literature of European importance in the 1890s. was more fruitfully influenced by Gezelle, Verriest and Rodenbach than by its immediate predecessors of the 1880s. Led by Pol de Mont (1857–1931), a versatile and often brilliant personality but above all a fresh and already complex modern poet, this generation had, however, widened the horizon and, by their emphasis (though inconclusive) on sensuousness, on individualism and on the doctrine of art for art's sake, prepared the ground for their successors.

The writers grouped around Van Nu en Straks helped to bring about a true revival of Flemish letters. Though they held various opinions (there were anarchists as well as conservative Catholics in their ranks), they all strove, under the banner of neo-romanticism, for an art which would comprehend all human activity and in which individual feelings would be given universal significance. In his masterly essays and in his symbolic novel De *Wandelende* Jood (1906) their leader, August Vermeylen (1872–1945), advocated rationalism infused with idealism. Prosper van Langendonck (1862–1920), on the other hand, interpreted the incurable pain of the *poète maudit*. E. de Bom wrote the first modern Flemish psychological novel (Wrakken, 1898) and Alfred Hegenscheidt a Wagnerian drama (Starkadd, 1898).

The poetry and prose of Karel van de Woestijne (1878–1929) forms the symbolic autobiography of a typical fin de *siècle* personality, the sophisticated and tired sensualist who strives to attain increasing spiritual detachment and who is constantly concerned, since he possesses a disturbingly vivid imagination as well as a sharp intellect, with two of life's chief problems—those of man's relationship with woman and God's relationship with man. These are the themes of his work (often overloaded with meanings), one of the great achievements of European symbolism and one of the most passionate confessions of human frailty in literature.

Stijn Streuvels (*q.v.*), a master of prose (*Langs de Wegen*, 1902; *De Vlaschaard*, 1907; *Werkmenschen*, 1926), made the West Flemish landscape his microcosm, a visionary world of his own in which man is at one with nature. The polished work of the versatile Herman Teirlinck (1879– ; novelist, dramatist and essayist) is characterized by imagination, sensuality and a sonorous vocabulary. In F. V. Toussaint van Boelaere's stylistically refined stories — crystallizations of intense experience — there are often tragic undertones.

Apart from the influence of *Van Nu en Straks* other tendencies of writing developed, of no less importance in many respects, which were to complete the flowering of the late 19th century. Naturalism reached its apex in the robust tales (*Het Leven van Rozeke van Dalen*, 1906) and pithy plays of Cyriel Buysse (1859–1932) and in the now flourishing regional novel, best exemplified by Maurits Sabbe's emotional evocations of Bruges and by Lode Baekelmans' vivid treatment of life in Antwerp. The pictorial verse of O. K. de Laey and the vigorous rhythms of René de Clercq have a permanent quality as living poetry. Jules Persyn, a leader of the renascent Catholic intelligentsia, showed how to apply neo-scholasticism to literature. But the man who, apart from Vermeylen, represented the strongest intellectual force of his time was the priest Cyriel Verschaeve (1874–1949), the scope of whose work, like Vermeylen's, proved that he was more than a writer of belles-lettres; his poems, plays (*Judas*, 1917; *Maria Magdalena*, 1928) and essays are passionate expressions of his intensely Augustinian outlook.

The "Boomgaard Groep" ("Orchard Group"), which included A. de Ridder and P. G. van Hecke, introduced a peculiar nuance, striving to be more cosmopolitan than *Van Nu en Straks* and taking up the cudgels for a dilettante culture. The elegiac poet Jan van Nijlen, an amiable stoic, had certain affinities with it.

During and immediately after World War I there was a sudden new flowering of the picturesque regional or rustic tale; a few original books such as the exuberant *Pallieter* (1916), by Felix Timmermans (*q.v.*) and Ernest Claes' roguish *De Witte* (1920) became known far beyond the frontiers of Flanders. In the poetry of A. van Cauwelaert and the prose of F. de Backer (*Longinus*, 1934) it can be seen that the generation that fought on the front stressed life rather than literature. But the new trend that had revealed itself under the German occupation in World War I found its clearest outlet in a revolutionary expressionism. The review *Ruimte* ("Space," 1920–21), its most important rallying point, published this generation's manifesto: ethics must have priority over aesthetics and the art of the community over individualism. Expressionism was most apparent in lyrical production and on the stage.

The outstanding personality of this movement was Paul van Ostaijen (*q.v.*), who expressed his faith in humanity with moving lyricism (*Het Sienjaal*, 1918), but later turned to nihilistic Dadaism and, not long before his early death, to "pure poetry." In the meantime W. Moens, K. van den Oever, M. Gijsen and A. Mussche, in excessively metaphorical language and in revolutionary free verse, expounded a religious kind of humanitarianism, whereas V. J. Brunclair and G. Burssens practised Van Ostaijen's "pure poetry."

Against this expressionism the poets of *'t Fonteintje* ("The Little Fountain," 1921–24), the harsh and wanton Richard Minne (1891–) and his friends M. Roelants, R. Herreman and K. Leroux, reacted. They confessed their love of life in conservative forms, while the uncompromising traditional poet and essayist U. van de Voorde took up the defense of "eternal lyricism."

In the favourable atmosphere of expressionism the stage suddenly found a new life. Between 1923 and 1929 the "Vlaamse Volkstoneel," under the direction of J. O. de Gruyter and later Johan de Meester, was among the foremost avant-garde theatres in Europe. This revival also inspired native Flemish drama, the standard of which was raised by the playwright H. Teirlinck (*De Man zonder lijf*, 1925), Anton van de Velde (*Tijl*, 1925), Paul de Mont, Gaston Martens and Willem Putman. In 1930 H. van Overbeke staged for St. Bavo's cathedral in Ghent the first important open-air play in Belgium, *Het Lam Godsspel*, inaugurating a genre that became very popular after World War II.

By about 1930, however, the tide of expressionism had completely run out. The novel then took its revenge. As opposed to the more pictorial, anecdotal and provincial stories of their predecessors, Maurice Roelants (1895–) in his psychological *Komen en gaan* (1927), Gerard Walschap (1898–) in his dynamic novels and Lode Zielens in his stories of social interest sought to describe the inner man's conflicts and his moral, religious and social problems. Walschap, seeking to exert a direct influence on his contemporaries, broke with his predecessors in content and form (*Houtekiet*, 1940). Among the psychologists and stylists were F. de Pillecijn, M. Gilliams and A. van Hoogenbemt. The *Nieuwe Zakelijkheid* ("New Realism") writers included M. Matthijs, N. E. Fonteyne and A. Demedts. Three acute observers of human weakness, the corrosive Willem Elsschot (1882–1960; *Kaas*, 1933; *Het Dwaallicht*, 1946), the sceptical Raymond Brulez (1895– ; *Sheherezade*, 1932; *Mijn Woningen*, 4 vol., 1950–54) and the intellectual Marnix Gijsen (1899– ; *Het boek van Joachim van Babylon*, 1947), all clear stylists but perverse moralists, came to be recognized as important modern Flemish novelists. Poetry after 1930 turned its back on explosive humanitarianism and expressionist experiments. The tone was set by "personalistic" poets of the *Vormen* group — the hermetic dreamer P. G. Buckinx, the "vitalist" R. Verbeeck — and by such independents as the religious poet Albe, the dynamic B. Decorte and the noble pagans K. Jonckheere and H. Hensen.

The best writers of the generation which came to the fore during and after World War II were novelists. Poetry took second place: A. van Wilderode, H. van Herreweghen, Reninca, C. d'Haen and — to a certain extent — J. de Haes were traditionalists, whereas the experimental poets used new techniques and by exploiting the potentialities of the word, the image and the subconscious created confused worlds of their own which contain elements of both the real and the unreal. The most important members of this experimental school, inspired mainly by the French post-surrealists and by Van Ostaijen and Dylan Thomas, were Hugo Claus (1929– ; *De Oostakkerse gedichten*, 1955), *R.* van de Kerckhove, A. Bontridder, B. Cami and A. de Roover.. In the field of drama, three developments should be noted: the staging of the literary plays of J. Daisne and H. Hensen, which were only moderately successful in spite of their real literary qualities; massive productions such as *Het Heilig-Bloedspel* (written by Jozef Boon, directed by A. van de Velde, music composed by A. Meulemans, with a cast of 2,000), which drew thousands of spectators, many from abroad; and the success of small avantgarde theatres and of new experimental plays by Claus (*Een bruid in de morgen*, 1955), P. Sterckx, T. Brulin and J. van Hoeck. The novel was notable for its wide range of subjects and styles: magic-realistic (Daisne), psychological (H. Lampo), social (P. van Aken), Catholic problematic (G. Duribreux, P. Lebeau and V. van Kerkhove), populist (L. P. Boon), existentialist (J. Walravens) and experimental (Claus). The last three belonged to the *Tijd en Mens* group (1949–55) which was superseded by the new avantgarde groups, *De Tafelronde* (1953–), *Taptoe* (1953–55) and *Gard-Sivik* (1955–). (R. F. Ls.)

FRENCH

Belgium, situated on the farthest continental frontier of the Roman empire, possesses a literature in French the history of which seems to some to form merely a chapter in the great history of French literature. It is distinguished, however, by certain characteristics which have indeed become more apparent since the gradual development of a national consciousness after the achievement of independence in 1830.

In the middle ages an abundant literature was produced in the Belgian provinces: *chansons de geste, romans d'aventure*, lyrical and didactic poetry, fabliaux, plays and histories. The principal authors of this period, which stretches from the 11th century to 1530, are Jean Froissart, Georges Chastellain, Philippe de Commynes and Jean Le Maire de Belges (*qq.v.*). The last, in love with fine language, is considered a forerunner of the French poets Clément Marot and Ronsard.

This brilliant period was followed by one of great literary sterility (1530–1800). Economic decline and the indifference of those in power to intellectual activity largely explain the poverty of literary output. Two names, however, deserve mention — those of the bold, biting and exuberant pamphleteer who attacked the pope and defended the ideas of the Reformation, Philips van Marnix van Sint Aldegonde, and of Prince Charles Joseph de Ligne (*q.v.*), a talented dilettante-poet, essayist, moralist, biographer and letter writer — cosmopolitan in outlook and with a great sense of style.

With the 19th century began a period of transition. The conditions favourable to a literary renaissance slowly took shape, thanks, in particular, to the efforts of the song writer Antoine Clesse (1816–88), the poets Théodore Weustenraad and André van Hasselt (*q.v.*), the novelist Charles de Coster (*q.v.*) and the philosopher Octave Pirmez. The most vigorous and original writer of this group was undoubtedly Charles de Coster, whose masterpiece, *La Légende et les aventures héroïques, joyeuses et glorieuses d'Ulenspiegel et de Lamme Goedzak au pays de Flandres et ailleurs* (1867), although it had little success during its author's lifetime, later attracted numerous readers, particularly in eastern Europe.

By about 1880, Belgium had at last become conscious of its own literary potentialities and had achieved, in every sphere, a remarkable degree of success. A young writer, Max Waller, was responsible for the bringing together of its scattered energies. In 1881 he founded a review, *La Jeune Belgique,* organized several noisy demonstrations and shook public apathy. Numerous important works were to appear soon after.

Several novelists attracted attention. Camille Lemonnier (*q.v.*) wrote naturalistic, idealistic and imaginative novels. He was a painter of nature, an admirer of instinctive behaviour, a disciple of Zola. His *Un Mâle* (1881), and *Happe-Chair* (1886) are written in a highly distinctive style and make use of an obscure vocabulary. Eugène Demolder (1862–1919) drew his inspiration from the Bible, from legend and from folklore. He had a gift for the picturesque and the colourful. Georges Eekhoud (1854–1927) was a painter of social life, full of affection for the poor and the victims of misfortune and social injustice. Georges Rodenbach (1855–98), as well as being a poet of the old Flemish cities and the theme of melancholy, celebrated *Bruges-la-Morte* in a novel translated into English by Thomas Duncan in 1903. While Georges Virrbs (1869–1946) praised the rough life of the Campine, Louis Delattre (1870–1938) and Maurice des Ombiaux (1868–1941) wrote stories that were sentimental and vivacious, ironical and truculent, about Wallonia. Henry Carton de Wiart (1869–1951) published historical novels. Other novelists studied the working people or the lower middle classes: Hubert Krains, Georges Garnir, Hubert Stiernet, Edmond Glesener. Henri Davignon, on the other hand, made a study of leisured society.

In poetry, the generation which was brought to light by *La Jeune Belgique* includes at least two world-famous names: Émile Verhaeren and Maurice Maeterlinck (*qq.v.*).

Émile Verhaeren wrote of the Scheldt and of his native Flanders, of the spreading towns, of physical effort and married love. This tense, stormy, torrential poet arouses lasting responses and creates powerful symbols. Among his collections of poems, these deserve special mention: *Les Campagnes hallucinées* (1893), *Les Forces tumultueuses* (1902), *Toute la Flandre* in five parts (1904–11) and *La Multifile Splendew* (1906). Before making his name as a dramatist and essayist, Maurice Maeterlinck brought out a slim volume of poems, *Serres chaudes* (1889), followed, in 1897, by *Douze Chansons.* These works, abounding in contrasts between a real and a fairy world, influenced many French symbolist poets.

Verhaeren and Maeterlinck were closely followed by other poets, of whom the chief are Charles Van Lerberghe, Grégoire Le Roy, Albert Mockel, Iwan Gilkin, Albert Giraud, Émile Van Arenbergh, Valère Gille, Fernand Séverin, Max Elskamp and Adolphe Hardy. Some were symbolist in feeling, others followed the Parnassian ideal and others set out alone for uncharted territory. Of these solitary explorers the one most worthy of note is Max Elskamp (1862–1931), a colourful poet, at once learned and ingenuous, archaic and modern, who composed his work of the simplest materials, drawn from folklore and the daily life of the people.

At the same period, the theatre was also producing very varied works. The most interesting belong to the poetic theatre and the theatre of ideas. The dramatic work of Maurice Maeterlinck, which belongs to the poetic theatre, is centred on the idea of fatality. Everything about it is designed to arouse and maintain an oppressive atmosphere, a climate of mystery and uneasiness: a barely defined plot, hidden meanings and symbols. Although almost impossible to perform, these plays have exercised a profound influence upon the evolution of the drama. The most memorable are: *La Princesse Maleine* (1889), *Pelléas et Mélisande* (1892), *Monna Vanna* (1902) and *L'Oiseau bleu* (1909).

The best representative of the theatre of ideas is Gustave Vanzype (1869–1955). His plays are full of lofty idealism and are very clear in outline, but they have earned more esteem than success. Some which deserve special mention are: *Les Étapes* (1907), *Les Liens* (1912) and *Les Sémailles* (1919).

During this period inaugurated by *La Jeune Belgique* the corpus of Belgian drama was further augmented by the contributions of Charles Van Lerberghe, Edmond Picard, Émile Verhaeren, Paul Spaak, Iwan Gilkin, Georges Rency, Henri Liebrecht and several others.

History, criticism, the art of rhetoric and the essay were also well represented. The man principally responsible for the revival of historical studies, Godefroid Kurth (1847–1916) was succeeded and eventually surpassed by his pupil, Henri Pirenne (1862–1935), whose monumental and soberly written *Histoire de Belgique* (1899–1932) was a powerful work of synthesis.

One of the most notable literary critics was Firmin van den Bosch (1865–1949) who wrote *Impressions de littkrature contemporaine* (1905), and the ablest art critics included Camille Lemonnier, Arnold Goffin (1863–1934), Jules Destrée (1863–1936) and a few others.

The essay was, at the same period, enriched by many important works, including those of Maurice Maeterlinck, and many talented writers produced subtle, precise and biting rhetoric. At the outbreak of World War I Belgium had good reason to be proud of her contribution to French letters. The years following the war were no less brilliant than those which preceded it, and the place which literature had now assumed in the country's life was confirmed in 1920 when the Académie Royale de Langue et de Littérature Françaises was founded in Brussels.

After the armistice, new novelists and short-story writers appeared. Their leaders were André Baillon (1875–1932), author of the *Histoire d'une Marie* (1921) and of *Neveu de Mlle Autorité* (1930); Jean Tousseul (1890–1944), whose books describe the work of the quarrymen of the Meuse; Charles Plisnier (1896–1952), who, after being awarded the celebrated Prix Goncourt in 1937 for his short stories *Faux Passeports* and his novel *Mariages,* turned to writing long and detailed psychological novels; Franz Hellens (1881–), a novelist concerned with unlikely facts; Marie Gevers (1883–), whose every work is a great lesson in style, and Pierre Nothomb (1887–) a novelist of great power and abounding imagination. After these novelists mention must be made of Georges Simenon (the creator of Inspector Maigret), Jean de Bosschbre, Oscar-Paul Gilbert, Constant Burniaux, Robert Vivier, France Adine, Georges Linze, Lucien Marchal and others.

Poetry was also widely written and the influence of several reviews, among them the *Journal des Poktes,* founded in 1930 by Pierre-Louis Flouquet, stimulated the writing of lyric poetry. Among the finest of the poets is Marcel Thiry (1897–), who writes of speed, departure and absence; Henri Michaux (1899–), a fanatical individualist who bends the language to his will, and Géo Norge (1898–) a personality as singular as it is endearing. To these names should be added those of Roger Bodart, Robert Vivier, Lucien Christophe, Géo Libbrecht, Robert Goffin, Edmond Vandercammen, Armand Bernier, Maurice Carême, Mélot du Dy and Noel Ruet.

The theatre was dominated by Fernand Crommelynck (1885–), whose verbal facility lends itself to outrageous outbursts; of Herman Closson (1901–), for whom introspection is a function of action; and of Michel de Ghelderode (1898–),

an expressionistic and experimental dramatist whose works possess astonishing vigour and plastic sense. A new form of dramatic writing, the play for radio, has found in Théo Fleischman a particularly gifted pioneer.

Literature of other kinds has been well served by a number of authors. Historical research has claimed Charles Terlinden, Louis de Lichtervelde, Jacques Pirenne and others including Luc Hommel, permanent secretary to the Académie Royale, who is chiefly interested in the Burgundian period and Margaret of York. Criticism and the essay are represented by Gustave Charlier, Fernand Desonay, Carlo Bronne, Paul Fierens, etc. The statesman Paul-Henri Spaak should be remembered as an outstanding orator.

Since the end of World War II numerous new talents have appeared: the novelists Alexis Curvers, Stanislas Dotremont, Daniel Gillbs, François Mallet-Joris, Francis Walder (Prix Goncourt, 1958), Albert Ayguesparse, Paul Dresse, Arthur Nisin, Maud Frbre; the poets Charles Bertin, Liliane Wouters, Gérard Prévot, Jean Tordeur, Arthur Haulot; the dramatists Jean Mogin, José-André Lacour and Georges Sion; the essayists Adrien Jans, Marcel Lobet, Maurice Fraigneux; the critic Albert Kies; the historians Georges-Henri Dumont and Jean-Didier Chastelain; and many others. In 1960 literary life in Belgium enjoyed an unparalleled vitality and several international juries had acknowledged the exceptional quality of its output. (J.-E.-M.-G. D.)

BELGIUM (French BELGIQUE; Flemish BELGIE), a country in the northwest of Europe, lies between lat. 49° 30' and 51° 30' N. and long. 2° 32' and 6° 24' E. One of the smallest countries of the European continent, covering an area of 30,507 sq.km. (11,779 sq.mi.), it is bounded by the Netherlands on the north and northeast, by Germany and Luxembourg on the east and southeast, by France on the south and west and to the northwest has a 42-mi. coastline on the North sea.

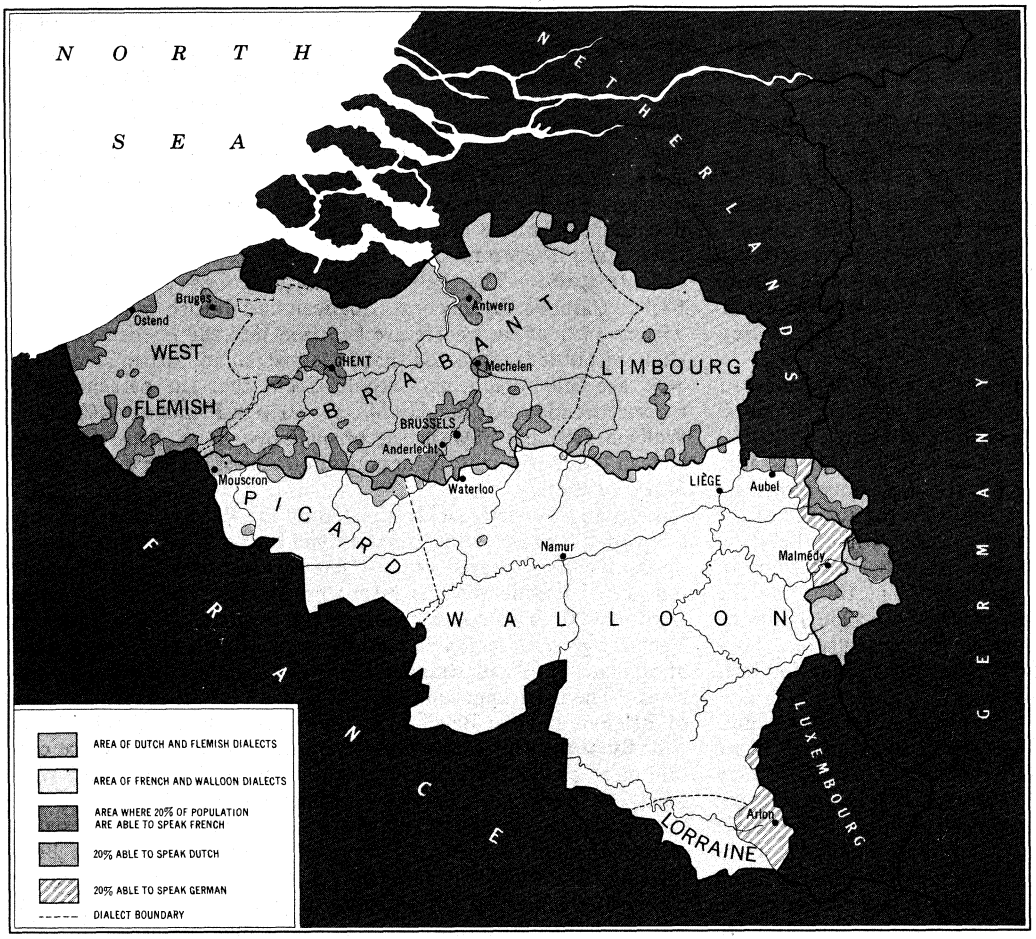
Part of the area formerly known as the Low Countries, Belgium derives its name from Gallia Belgica, the Roman designation of the southern part of that region, which was chiefly settled by Belgic tribes of Celtic origin. These tribes were later infused with Germanic elements, chiefly Salian Franks, whose migratory movement was largely broken by the forests of Flanders and Brabant or by the defensive frontier of the Roman empire. These Franks settled more especially in the northern part of the Low Countries and are now roughly represented in Belgium itself by the Flemish element, while the Walloons of the southern area are in general of a purer Celtic stock.

The Low Countries were incorporated in the empire of Charlemagne, but after his death (814) possession of the area became debatable. Belgium's medieval history is related largely to that of feudal duchies such as Brabant, Luxembourg, Flanders, Hainaut, Limburg and Libge. Its political division into Holland and Belgium was accomplished when the northern provinces of the Low Countries won, under Maurice of Nassau, their independence from Spain in 1609; this division has continued ever since except for an interim between 1815 and 183'1. The line of division was dictated rather by geographical, strategical and political reasons than by racial, religious or linguistic ones. In the nine provinces constituting modern Belgium there is thus a Flemish-speaking element (using a variety of dialects or Standard Dutch), which predominates in the northern provinces of East and West Flanders, Antwerp and Limbourg and in the northern half of Brabant (roughly the area settled by the Franks in the 4th century A.D.). In the rest of Belgium French-speaking Walloons largely people the original Gallia Belgica. This article contains the following sections and subsections.

I. PHYSICAL GEOGRAPHY

The country is generally low-lying and in Flanders dikes are necessary to prevent flooding. However, there are some wooded hilly districts, notably the Ardennes (*q.v.*) in the southeast. Main drainage is provided by the Scheldt and Meuse (*qq.v.*) rivers and their tributaries.

1. Geology.—Within Belgium's small area there is a coniidrr-



FROM F. DUSSART, "DE WERELD WAARIN WIJ WOHEN EN WERKEN," VOL. I, P. 48; BY COURTESY OF W. DE HAAN LTD., PUBLISHERS

LINGUISTIC AREAS OF BELGIUM

able variety of geology. Paleozoic rocks (Cambrian-Silurian) of slate and quartzite, which are part of the Hercynian chain running from western Ireland into Germany, outcrop in the higher Ardennes and the valleys of the Dender (Dendre), Senne and Dyle rivers. Most of the Ardennes region of this chain belongs, however, to the Devonian system which rests unconformably upon the Cambrian. Along its northern margin Ordovician and Silurian rocks appear, and Carboniferous beds constitute the narrow band of the Sambre-Meuse coal field. Zinc, lead and copper are worked in the Paleozoic rocks themselves. In the extreme south occur outcrops of Triassic and Jurassic sands, clays and limestone.

Northwest of the Ardennes the greater part of Belgium is covered by Tertiary and Cretaceous deposits. The latter are not extensive, for the chalk of the Artois ridge plunges northward beneath the Flanders plain to re-emerge first around Mons and then later in the Hesbaye and Herve regions around Liège. Tertiary deposits occupy most of the northern plain. The older Tertiary of Eocene and Oligocene is found in the western and central areas but narrows to the east, where it is flanked to the north by later Tertiary. Of the older Tertiary, the Eocene, chiefly of sand and marls, is found in the west, and the Oligocene stretches in a band from Antwerp on to Maastricht. The newer Tertiary comprises a discontinuous strip of Miocene and a fairly extensive area of Pliocene.

Quaternary deposits are of some importance in Belgium. Large areas of the country are covered with the *limon* (a fine, wind-carried dust), which is chiefly found on the Hesbaye plateau and in the Herve region and through Hainaut, Brabant and East Flanders. In the northeast of the country, large sheets of coarse sand and gravel, laid down in postglacial times by the Meuse, cover the Kempenland plateau. Another important series of recent deposits are the marine muds and flats of the polders in northwestern Flanders.

2. Climate. — The climate of Belgium is distinctly maritime. The winters are damp and mild with frequent fogs, the summers are cool. The Ardennes plateau, because of its more inland position and greater altitude, is the only area with a more rigorous climate akin to continental conditions. The annual mean temperature for the whole country is about 50° F., and rainfall averages 30–40 in. (F. J. M.)

3. Animal Life. — The mammals in the mountains to the east include wildcat, pine marten, roe and red deer. On the low ground where the land is cultivated, they are mainly small and medium sized. The latter include the usual species, badger, otter stoat, weasel, stone marten, polecat and fox. The small mammals include the usual shrews, mice, rats and voles, red squirrels as well as rabbits and hares. There are, however, several more typical of central Europe that extend into southeastern Belgium mainly, and these include the garden dormouse, common hamster, vole rat and pine vole. The water vole lives around the canals and dikes. The bird fauna is similar to that of western Europe including the British Isles. Notable exceptions are the black-tailed godwit, ruff, stone curlew and avocet as breeding birds in the western half of the country, and black grouse and capercaillie in the mountains to the east. A few central European species, including black woodpecker, great gray shrike and bluethroat, occur, and the woodchat shrike and Bonelli's warbler extend in from southwestern Europe. (MA. Bu.)

II. GEOGRAPHICAL REGIONS

Belgium can be divided into six distinct regions. Behind the North sea coast lies a lowland known by its historic name of Flanders. Farther inland the land rises gently to the east and southeast, forming the central low plateaus, bounded on the south by the well-defined valley of the Sambre-Meuse. Beyond this valley rises the plateau of the Ardennes, succeeded in the extreme south by a part of the hill-and-vale country of Lorraine. In the northeast is an area of heathland, the Kempenland (in French, Campine).

1. Flanders. — The lowland bordering the North sea coast from the French frontier to the Scheldt — the plain of Flanders — can be further divided into two parts: maritime Flanders, extending inland from the coast for 5 to 10 mi., and interior Flanders. Maritime Flanders is bordered by a straight coastline, 42 mi. in length, with broad, sandy beaches, lines of sand dunes and numerous seaside resorts. Inland of the dune belt an almost flat plain is seamed with drainage channels; more than half is under permanent pasture. Farms stand on low sandy ridges or hillocks above the damp lands. Interior Flanders, crossed by the Lys, Scheldt and Dender rivers. which flow northeast to the Scheldt estuary, rises inland to about 150 ft. In the west low hills of Pliocene sands extend southwest from near Passchendaele, culminating in Mont Kemmel or Kemmelberg (531 ft.). It has been for centuries one of the most closely settled parts of Europe. supporting flourishing agricultural. industrial and commercial activities. Farming is intensive. and textiles have been manufactured since the middle ages.

2. The Central Plateaus. — The land rises gently inland to about 700 ft. in the south, forming the central low plateaus of Hainaut, Brabant and Hesbaye, crossed by the Senne, Dyle, Geete

and Demer rivers, flowing via the Rupel to a common outlet in the lower Scheldt. The surface is covered with sand, clay and limon. Agriculture flourishes (wheat, sugar beet, dairy products), and market gardening and horticulture are carried on near the towns. The population density is high, many people living in prosperous villages and large towns, including the capital, Brussels. Textile, food-processing and metallurgical industries are widespread.

3. **Sambre-Meuse** Valley. — The narrow valleys of the Meuse and of its western tributary the Sambre extend along the southern edge of the central plateaus. In this area, 100 mi. in length but only from 3 to 10 mi. in width, is located approximately a quarter of the population and the greater part of the nation's heavy industry. The basis of industry is the coal field (see The Economy, below).

4. **Ardennes.**—These consist mainly of an undulating plateau, mostly above 1,000 ft., from which rise gently rounded summits; the highest are in the northeast: Signal de Botrange (2,277 ft.) and Baraque Michel (2,211 ft.). The rocks are mainly hard sandstones, slate and limestone, across which rivers flowing westward to the Meuse have cut deep winding valleys. On the surface of the plateau shallow depressions contain peat bogs, while the drier eminences are heath covered. Woodland, mostly plantations of spruce and Scots pine, occupies half the area. The thin, infertile soils, the poor drainage, the heavy precipitation (40–50 in.) and the bleak exposed plateau are not favourable for agriculture. Only a small part is farmland, mostly under permanent grass for beef cattle, with dairy farming in the valleys.,

5. Belgian Lorraine. — Lines of sandstone and limestone hills, with north-facing scarps, can be traced across the country, rising in places to more than 1,300 ft. Between them lie areas of clay and marl, upon whose less resistant outcrops the rivers, flowing westward to the Meuse, have developed their courses. The whole area was once under woodland and half is still wooded. Two-thirds of the farmland is under permanent pasture, supporting dairy cattle and pigs, while the arable mostly grows fodder crops. In the extreme south is a tiny portion of the Lorraine iron-ore field, which was responsible for the initial development of blast furnaces and steelworks.

6. Kempenland Plateau. — This lies mostly between 150 and 250 ft. above sea level, forming an indeterminate watershed between the Scheldt and the Meuse. Much is covered with heathlands developed on sheets of sand and gravel, though reclamation of parts has taken place. Some areas are now under permanent pasture and about a seventh is planted with coniferous trees. The Kempen forms one of Belgium's industrial districts, for concealed beneath the newer rocks is a coal basin. Numerous large factories were built, taking advantage of cheap land for spacious sites: zinc and other refineries, chemical works and glassworks. The southern part of the Kempen is crossed by the Albert canal. (F. J. M.)

III. THE PEOPLE

The common way of life, internal migration and the various ethnic strains have combined to mix and weaken the ancestral types (Paleolithic dolichocephali, Neolithic brachycephali, Celtic and German invaders). At most it could be said that the Nordic type is found more frequently in the northern provinces.

1. Languages. — By reason of its situation on the confines of the Roman and Germanic worlds, three linguistic groups are found in Belgium: Dutch and the Flemish dialects are spoken north of a line running more or less regularly from Mouscron (Moeskroen) to Aubel, approximately along the parallel on which Waterloo stands; French and the Walloon dialects south of this line; German and its dialects in the frontier communes of the east. In the Flemish towns, however, there are French-speaking minorities of varying importance. The Brussels agglomeration has been gradually transformed into a veritable enclave of French speech, and it tends to encroach outward more and more.

According to the 1947 census, 52.8% of the population spoke solely or mostly Dutch, 41.92% French and 0.92% German, the balance consisting principally of young children. A fairly large proportion (19.37%) were bilingual.

At the time of the constitution of the Belgian state in 1830, considerations of unity caused French to be the language of public life. But in 1898, when Dutch was also recognized as an official language, bilingualism became the rule. In 1932 this gave way, in principle, to a regional unilingualism, the use of two languages being maintained only in communes where a sufficiently important minority spoke a second national language. Since the number of these communes has to be reviewed at each census and tends to increase, the Flemish population has endeavoured to obtain the permanent definition of the linguistic frontier. (See also FRENCH LANGUAGE; FLEMISH LANGUAGE.)

2. Religion. — The Belgian state recognizes and assists the Roman Catholic, Evangelical, Anglican and Jewish faiths. About 95% to 97% of the people are baptized into the Roman Catholic Church; but it is estimated that in industrial and urban areas only 80% are fully practising Catholics, and that the percentage of regular attendance at Sunday Mass is 60% in Flanders, 40% in the Walloon area and 35% in the arrondissement of Brussels. The Roman Catholic territorial organization comprises six dioceses and 3,803 parishes.

Belgium was very quickly affected by the Reformation, but only a few islands of Protestantism survived the political events, though during the last hundred years it has seen a certain revival. The number of its adherents is estimated at about 75,000, of whom from 40,000 to 45,000 are effectively reached by the ministry. They are grouped in 284 communities, principally in the provinces of Hainaut (96) and Brabant (51), and belong to 15 denominations. The most important are the Union of Protestant Churches of Belgium and the Belgian Christian Missionary Church.

3. Customs and Culture. — If, on the one hand, there are certain more or less marked differences between Flemings and Walloons, the former being in general calmer and the latter more lively, there are also strong resemblances: a zest for work, common sense, love of the soil, a spirit of independence and friendliness. Both Flemings and Walloons have given during the centuries many proofs of their artistic disposition, in painting, music and literature. The Flemish primitives and their emulators of the Renaissance are justly famous. See BELGIAN LITERATURE; WALLOON LITERATURE; PAINTING; MUSIC. (L. G. Po.)

IV. HISTORY

It is sometimes suggested that Belgian nationality dates from 1830. It is true that after the Burgundian regime in the Netherlands (*q.v.*) and the abdication of the emperor Charles V the country was subject first to Spain, then to the Austrian Habsburgs, then to France and finally to the kingdom of the Netherlands, union with which ended with the 1830 revolution. But the Belgian provinces in fact preserved their ancient institutions and traditions (see BRABANT, DUCHY OF; FLANDERS, COUNTY OF) throughout modern history, and it was only for a short period, under the first French republic and Napoleon, that integration with an alien system could be enforced.

The Burgundian period, from Philip the Bold to Charles the Bold, was one of political prestige and economic and artistic splendour. The finest monuments of the country and its most famous paintings date from the 15th century, and the "Great Dukes of the West," as the Burgundian princes were called, were rightly considered as national sovereigns, their domains extending from the Zuider Zee to the Somme. The death of Charles the Bold (1477) and the marriage of his daughter Mary to the archduke Maximilian of Austria proved fatal to the independence of the Low Countries by bringing them more and more under the sway of the Habsburg dynasty. After the death of Maximilian's son the archduke Philip the Handsome (1506), the provinces were wisely governed by Margaret of Austria, Philip's sister, the aunt of the young prince Charles who was to become king of Spain as Charles I and Holy Roman emperor as Charles V (*q.v.*).

A. SPANISH RULE

Charles V, toward the end of his reign, issued a series of edicts which violated the liberties of the Netherlands. Then, in Brussels on Oct. 25, 1555, he abdicated the Netherlands to his son, who in Jan. 1556 became king of Spain as Philip II. Under Spanish rule

discontent increased in the Netherlands, and revolution broke out in *1567*, but the union between Catholics in the south and Protestants in the north could not be maintained after the first years of conflict. The formation of the League of Arras (Jan. *5, 1579)* by the Catholic provinces of Artois and Hainaut enabled Alessandro Farnese (*q.v.*) to resume the war against the Protestants of the Netherlands. William of Orange, who was supported by the Union of Utrecht (Jan. 29, 1579), at first tried to set up François, duc d'Anjou and brother of the king of France, in opposition to the king of Spain; but the assistance of the ambitious French prince proved to be useless. He arrived in Antwerp early in *1582* and attempted in the following year to gain possession of the city by force (Jan. *17*, 1583). This act of treachery put an end to his pretensions and promoted the success of Farnese. On Nov. *30, 1581*. the latter had captured Tournai. After a series of sieges he made himself master of Ypres, Dunkerque, Bruges, Ghent, Brussels and finally Antwerp, which capitulated on Aug. *17, 1585*. From this time onward the whole of the southern part of the Netherlands once more recognized Philip II as its sovereign.

The system set up by the treaty between Spain and the League of Arras (May *19, 1579)* in all the reconquered provinces was not one of Spanish domination, but simply of dynastic union with Spain. The country recognized Philip II as its legitimate sovereign but retained its autonomy. The king was represented by a governor general at Brussels. The council of state, the privy council and the council of finance which acted with him were, however, composed entirely of Belgian notables. All the provinces were confirmed in their constitutions and privileges. The only departments in which the king had sole control were the command of the army and foreign policy. Taxes could not be levied without the consent of the provinces. This was the principal safeguard of national autonomy; Philip II and his successors dared not withdraw it for fear of causing a fresh revolution.

Although the treaty of Arras represented the capitulation of the king of Spain in the political sphere, it gave him complete victory on the religious question. In all the provinces which Farnese reconquered the Protestants were obliged either to become reconciled to the Catholic Church or to emigrate, and the Spanish Netherlands, as the country was then called to distinguish it from the United Provinces, henceforth became exclusively Catholic.

The reconquest of Belgium by Farnese was intended to be merely the prelude to that of the *17* provinces of the Netherlands. The United Provinces were supported, however, by France and England, and under Maurice and Frederick Henry, the sons of William of Orange, they successfully repelled all the efforts of Philip II's generals. The destruction of the Spanish Armada in Aug. 1588 and the fact that Farnese was obliged to go to France to make war on Henry IV gave them opportunities of which they were not slow to take advantage.

1. Albert and **Isabella.**—The able Farnese died. worn out, on Dec. 3, *1592*, and was succeeded as governor by Philip's nephew, the Austrian archduke Ernest, after whose death (Feb. *1595)* Philip decided to try a new method: the government was entrusted to Ernest's brother, the archduke Albert (Feb. 1596), and he was instructed to conclude peace with France (peace of Vervins, May 2, 1598) in order to have his hands free for the reconquest of the United Provinces. Hoping that the provinces would be less recalcitrant to an independent sovereign than to the Spanish crown, the king on May 6, *1598*. handed over the whole of the Netherlands as a sovereign state to his daughter Isabella, who was to marry Albert (she did so in November, after Philip II's death). The new state's independence was, however, more apparent than real, and the stipulation that Catholicism was to be the only religion tolerated destroyed any prospect of winning over the United Provinces.

The war therefore continued. Albert was defeated at Nieuwpoort by Maurice of Nassau. Ambrogio di Spinola then took charge and obtained possession of Ostend in *1604*. In *1609* Albert had to conclude a *12* years' truce with the United Provinces.

The archdukes made use of the *12* years' truce to consolidate their position in the Spanish Netherlands and to reorganize Catholicism in the country on a firm basis with the aid of the Jesuits, nho from that time onward exercised a predominant influence over the religious and intellectual life of the country. They impressed themselves upon it so strongly that the results may be traced even down to the present day The reign of Albert and Isabella was the last period of brilliance which Belgian civilization enjoyed until the 19th century. It was at this time that the school of Rubens and Van Dyck flourished at Antwerp, Justus Lipsius (*q.v.*) enhanced the reputation of the University of Louvain and the Jesuits, who produced in Belgium the brilliant group of scholars known as the Bollandists (*q.v.*), began the monumental work of the *Acta Sanctorum*.

2. The Thirty Years' War.—As Albert and Isabella had no children. it was clear that after their death Belgium would revert to the king of Spain. Albert died in *1621*, and Isabella thenceforth acted merely as governor for Philip IV. On the expiry of the *12* years' truce, war was resumed—with unfortunate results for Spain. now to be involved in the long struggle that had opened in Germany in *1618*. Frederick Henry, Prince of Orange, captured 's-Hertogenbosch (Bois-le-Duc; Sept. *1629)* and Maastricht (Aug. *1632)*. The situation became more critical after the death of Isabella (Dec. 1, *1633)*. France concluded an alliance with the United Provinces and, in May *1635*, declared war on Spain. In Oct. *1637*, Frederick Henry entered Breda. Arras surrendered to the king of France in Aug. *1640*. In *1644* the Dutch obtained possession of Dalhem, Rolduc and Faulquemont, and in *1645* the capture of Hulst put them in complete possession of the left bank of the estuary of the Scheldt.

It was now clear that Spain could not continue to fight on two fronts In order to have his hands free for the war with France, Philip IV resigned himself to concluding peace finally with the United Provinces at Munster on Jan. *30. 1648* The independence of the United Provinces was at last recognized, and all the districts which they had conquered in Flanders Brabant and Limburg were ceded to them. Philip IV also granted their request for the perpetual closing of the Scheldt thus sacrificing Antwerp to Amsterdam and the prosperity of Belgium to that of Holland.

3. Louis **XIV.**—Even this surrender to the rebel republic did not enable the king of Spain to wage war successfully on France. He suffered a series of defeats, alternating with treaties, each one of which represented a further cession of territory to the French. After the defeats of Lens *(1648)* and the Dunes (1658), the peace of the Pyrenees in *1659* gave Louis XIV the greater part of Artois and a number of fortresses along the southern frontier of Belgium. Under the peace of Aix-la-Chapelle *(1668)* he also received Charleroi, Binche, Courtrai and other border towns. After further vicissitudes, some of the annexed districts were restored to Spain under the treaty of Rijswijk (1697), when Louis was for the first time compelled to give way before the general European coalition against him.

Three years later. on Nov. *1, 1700*, Charles II, the last remaining descendant of Philip II. died at Madrid without issue. In his will he left the whole of the Spanish monarchy, including the Catholic Netherlands, to Philip of Anjou, Louis XIV's grandson, who took the title of Philip V. From the beginning of his reign Louis had been endeavouring to make Belgium an outpost of France. England and the republic of the United Provinces were equally determined to prevent him from acquiring a position so likely to be dangerous to them. In Feb. *1701* Louis caused his grandson to hand over to him the government of the Netherlands. Thenceforward nar was inevitable. William III, in his dual capacity as stadholder of Holland and king of England, had a double reason to fear French expansion and was at once the initiator of the war and the one who carried it on most actively (see SPANISH SUCCESSION, WAR OF THE).

The duke of Marlborough's victory at Ramillies (May *23, 1706)* compelled the French to evacuate Belgium, and all their efforts to return were unsuccessful. The country was provisionally administered by a "conference" composed of English and Dutch until such time as Europe should have decided on its future. This was done by the treaty of Utrecht (April *11, 1713)*. when Belgium received as its sovereign the emperor Charles VI, head of the Aus-

trian branch of the house of Habsburg. (See also BARRIER TREATY for Anglo-Dutch measures affecting the Belgian provinces.)

B. AUSTRIAN RULE

The change of dynasty did not involve any change in the political system established in 1579 by the peace of Arras. Just as there had been no Spanish domination, there was now no Austrian domination. National autonomy was maintained; the traditional institutions were preserved; the provinces continued to vote their own taxes. The only connection between Belgium and Austria was that they had the same sovereign. The emperors were represented by a governor at Brussels, just as the kings of Spain had been. The emperor also appointed a "minister plenipotentiary" at Brussels. with whom his chancellery corresponded directly, to keep watch over the conduct of the governor.

In order to prevent any further attempt at annexation on the part of France, England and the United Provinces required the emperor to sign the third Barrier treaty (Nov. 15, 1715). This treaty gave the United Provinces the right to maintain garrisons at Namur, Tournai, Menin, Veurne, Warneton, Ypres and Termonde. Belgium was thus for a second time sacrificed to its northern neighbour, for whose safety it was made a bulwark. The frontier between Belgium and France, now that Louis XIV had made restitution of the last towns he had taken (Tournai, Ypres. Dixmude, etc.), was drawn almost exactly at it was to remain in the 20th century.

The country, which had been the cockpit of Europe since the middle of the 17th century, was now exhausted. The population was profoundly discontented. Disturbances broke out at Brussels under the administration of the marquis de Prié (H. J. L. Turinetti), who, as representative of the governor Prince Eugène of Savoy, earned the detestation of the people by ordering the execution of François Anneessens for daring to oppose the vote of fresh taxes by the Brussels municipality (1719).

Peace having been restored, an attempt was made to improve the economic situation of the country. There was no hope of reviving the prosperity of the port of Antwerp, since the closing of the Scheldt had been ratified by the treaty of Utrecht, but it was proposed to develop the maritime trade of Ostend and to connect it by means of canals with the Scheldt, the Meuse and the Rhine. On Dec. 19, 1722. the emperor Charles VI founded an India company in Ostend with a capital of 6,000,000 guldens. England and the United Provinces, however, opposed the scheme, and on May 31, 1727, in the preliminaries to the second treaty of Vienna, the Ostend company (*q.v.*) was sacrificed to "the welfare of Europe."

1. Maria Theresa.—On the death of Charles VI, on Oct. 20, 1740, the provinces recognized Maria Theresa without opposition. The War of the Austrian Succession, however, soon spread to Belgium, which in 1744 was invaded by the French under Maurice de Saxe. The Dutch garrisons of the barrier capitulated without attempting any resistance. The defeat of the English at Fontenoy on May 11, 1745, gave Louis XV the possession of Belgium, for which Louis XIV had striven in vain. He occupied it only as a pledge. however. and it was restored to Maria Theresa by the peace of Aix-la-Chapelle (Oct. 18, 1748).

Maria Theresa was the only foreign ruler of Belgium whose memory was to remain in the affections of the nation. The Franco-Austrian alliances of 1756 and 1757 secured a period of peace for Belgium which lasted 35 years. The time of rest thus provided after a century of almost incessant war was utilized to the best advantage. Private individuals and the authorities of the provinces worked together in restoring the prosperity of the country and developing communications! industry and agriculture. In Hainaut, coal mining and the glass industry were actively developed. The population increased with the national wealth.

Maria Theresa entrusted the administration in 1744 to her brother-in-law Charles of Lorraine, who became extremely popular in the country. She provided him with able ministers who adjusted customs tariffs in such a way as to protect national industries. Other reforms were introduced in order to rouse the country from the intellectual apathy into which it had fallen since the middle of the 17th century. An academy was founded at Brussels in 1772. When the Society of Jesus was suppressed in 1773. the government set up "royal colleges" in several of the towns. These were the first lay educational establishments to be created in Belgium.

Maria Theresa's innovations were inspired by the doctrine of enlightened despotism. She obtained acceptance for them because of the skill with which she managed to avoid offending the conservatism of her Belgian subjects. Her successor, Joseph II (1780–90), acted in an entirely different manner.

2. Joseph 11.—Joseph was sincerely anxious to promote the public welfare, but he firmly believed that progress must be imposed from above. Before he succeeded his mother he had made a hurried tour through the country and had come back full of contempt for the antiquated state of affairs that he found there. His first object was to obtain the abolition of the stipulations imposed on Belgium by the Miinster and the Barrier treaties, which he regarded as incompatible with his sovereign rights. Maria Theresa had already refused to pay the sums due for the upkeep of the Dutch garrisons. In 1781 Joseph informed the states-general of the United Provinces that he had decided to dismantle the Belgian fortresses and that they should therefore recall their troops. They accepted the situation so readily that he thought he would also be able to reopen the Scheldt. Much to his surprise, the Dutch fired on the vessels which he had ordered to sail up and down the river. The outbreak of war was prevented by French intervention; and the treaty of Fontainebleau (Nov. 8, 1785) confirmed the *status quo*.

Joseph might have won popularity by this foreign policy, but the internal reforms which he introduced aroused both religious and political opposition. His first measures were aimed at the church. The Edict of Tolerance (Nov. 1781), which recognized religious freedom in Belgium for the first time since the peace of Arras, deeply offended the clergy and the Catholic sentiments of the population. The suppression of the "unnecessary" convents (1783), of the religious confraternities and of pilgrimages and the closing of the episcopal seminaries and their replacement by two seminaries founded by the state at Louvain and Luxembourg (1786) aroused bitter feeling.

Still greater hostility was aroused by Joseph's attempt to modify the traditional institutions of the country. In 1787 the whole administration was remodeled. The country was divided into nine districts (cercles) with intendants at their head, attached to a council of government meeting at Brussels. Justice was to be administered by two councils of appeal and a supreme council of revision and by 64 courts of first instance. Thus, by nothing less than a coup *d'état,* the traditional autonomy of the Belgian provinces. which had been respected by all their rulers from Philip II onward, was destroyed and replaced by a centralized system working by the emperor's orders. A formidable movement of opposition broke out in all the provinces. Joseph's sister, Maria Christina, duchess of Saxe-Teschen, who was governor, dared not enforce the edicts. The emperor, however, persisted. He sent a new minister plenipotentiary, Ferdinand von Trauttmansdorff, to Brussels and entrusted the command of the troops to Gen. Richard Alton, count d'Alton, who had orders to enforce the reforms and repress disturbances.

3. The Revolution of 1789.—If the emperor was obstinate. the country was equally so. In Nov. 1788 the estates of Hainaut and Brabant refused to pay taxes.' The events of the following year in France and especially the news of the taking of the Bastille encouraged the Belgians in their resistance. The conservatives, whose leader was the lawyer Henri van der Noot, combined with the partisans of reform the chief of whom was another lawyer, Jean François Vonck. They fled to Holland, where they formed a corps of volunteers. On Oct. 24, 1789, under the leadership of Col. J. A. van der Meersch, they invaded the Kempenland and contrary to all expectation defeated the Austrian troops at Turnhout. This was the signal for a general rising. On Dec. 12 the government and the troops hurriedly evacuated Brussels. All Belgium, with the exception of Luxembourg, where the army was concentrated, was in a state of revolt.

The various parties were, however, very far from unanimity in their political views. Two opposing parties at once appeared in the congress. The Vonckists wished to adopt a constitution based on the principles laid down by the French national assembly; the Nootists simply desired to restore the position which had previously existed. The latter were supported by the clergy and by the majority of the people. Riots broke out; Vonck's partisans were terrorized and left the field clear for their opponents. Van der Noot was quite unable to control events. The Belgian republic, torn by internal disputes, soon fell into a state of anarchy and was unable to prepare for resistance.

4. Leopold II and Francis.—Joseph II died on Feb. 20. 1790, and was succeeded by his brother Leopold II. Leopold first attempted to win over the Belgians by conciliatory means, but his proposals were rejected. After his reconciliation with the king of Prussia at the convention of Dzierzoniow (July 27, 1790) he had recourse to arms. The Belgian army was driven back without difficulty, and on Dec. 3 the Austrian troops under J. B. Bender entered Brussels. A few days later the subjection of the country was complete.

Leopold, who did not wish to provoke further disturbances, made no attempt to reintroduce Joseph's reforms. Government was restored in the form in which it had existed under Maria Theresa. In spite of this, the restoration continued to be exceedingly unpopular, both under Leopold and under his son Francis II, who succeeded him as emperor on March 1, 1792. The course which the French Revolution was taking revived the hope of Belgian independence. Thus, when war broke out between France and Austria and Gen. C. F. Dumouriez won the battle of Jemappes (Nov. 6, 1792) and occupied Belgium, his victory was at first welcomed by the population. Dumouriez would have liked to make Belgium into a republic and to make use of it to further his plans for a restoration of the monarchy in France. The French convention, however, thwarted his plans. When the Austrians resumed the offensive and defeated Dumouriez at Neerwinden (March 18, 1793), thus once more taking possession of Belgium, the Belgians resigned themselves without difficulty.

The restored regime was of short duration. Jean Jourdan's victory at Fleurus (June 26. 1794) resulted in a fresh conquest of the Netherlands by France. The rule of the Austrian sovereigns was abolished in fact, and the position received legal sanction by the treaties of Campo Formio (1797) and Lunéville (1801), under which Francis II recognized the annexation of Belgium by the French republic.

C. Annexation by France

The battle of Fleurus enabled France to accomplish what Louis XIV had planned. After a period of occupation and military rule, the national convention on Oct. 1, 1795, voted the annexation of Belgium and the principality of Liège, which was thenceforth amalgamated with it.

France accomplished, but in a far more radical manner, what had been attempted by Joseph II. All branches of the administration were centralized and systematized. All privileges were abolished. The church, which had formerly been so powerful and so deeply respected, was persecuted. It is not surprising that the Belgians detested the new regime. Their hostility was the greater for the terrible economic crisis which accompanied the change of rule. The introduction of military conscription led in Oct. 1798 to a revolt of the peasants in the Flemish districts of the country, which was repressed without mercy.

Napoleon's coup d'ktat in Nov. 1799 was the starting point of a new era. Under the consulate and the empire, Belgium became accustomed to the system which still constitutes the basis of its administration. The country was divided into nine departments, each under a prefect. Courts of first instance and courts of appeal were created and had to administer the French code of laws. A metric system of weights and measures and currency was introduced. The clergy were reconciled with the government by the concordat. With the vast markets of the empire now open to Belgian industry a period of unprecedented activity succeeded. The manufacture of cotton and beet sugar made rapid progress.

The Napoleonic regime nevertheless remained unpopular. The complete lack of political liberty, the exigencies of conscription and the abuses of the Continental system led to a spirit of disaffection which, by the time of the fall of the empire, had become general. The occupation of Belgium by the allies in 1814 was hailed with relief.

D. Kingdom of the Netherlands

The powers were determined not to leave France in possession of Belgium. It could not be given back to the Austrian emperor, who in any case did not desire it. Under the influence of Great Britain it was decided to unite it in a single state with the old republic of the United Provinces and thus to constitute a new barrier better capable of resisting future French expansion than that of 1715. The kingdom of the Netherlands, the existence of which was confirmed by the treaty of Vienna (June 1815), was thus established for the convenience of Europe, regardless of the wishes of the Belgians and the Dutch who would have to live side by side in one country. Prince William of Orange ascended the throne on March 16, 1815, under the title of William I; he was crowned Sept. 27.

1. William I.—The new ruler was faced with the task of assimilating two peoples which for the last 200 years had had strikingly contrasted customs, economic interests, ideas and, above all, religions, the one being Catholic and the other Protestant. The fundamental law (grondmet) of the new kingdom gave the Belgians and Dutch an equal number of representatives in the states-general, although the population of Belgium was 3,500,000 and that of the Dutch provinces only 2,000,000. It also recognized religious liberty, and this was obnoxious to the Catholic Church. Finally, it gave extremely wide powers to the king, who was Dutch and Protestant. The king laid the constitution before the "notables" for adoption; they rejected it, but it was nevertheless promulgated. During the first few years, however, the situation did not appear unsatisfactory. Belgium began to assume the industrial character that has distinguished it ever since. Antwerp once more became a major port. The cotton-spinning industry at Ghent, the manufacture of linen at Verviers and the coal-mining industry in the Liège and Hainaut districts attained even greater prosperity than during the French occupation. The Dutch colonies provided new markets for export.

The king also endeavoured to promote education, with the support of the opponents of the old regime, who were apprehensive of the influence of the church. The three universities (Ghent, Louvain and Liege) were placed under state control; *athénées*, or state secondary schools, were created; the independent (*i.e.*, ecclesiastical) schools were subjected to inspection. In 1825 a "philosophical college" was set up at Louvain, and seminarists were required to attend it. These measures revived the hostility of the clergy. The substitution of Dutch for French as the official language irritated the middle classes, which had been affected by French influence.

William persisted in his plans. The opposition journals were prosecuted. but this only increased the strength of the movement. It became irresistible when, in 1828, the Liberals and the Catholics, who up till then had opposed one another, concluded the "union of parties." A general petition for the redress of grievances was organized and by Nov. 1829 had obtained more than 300,000 signatures. The revolution in Paris in July 1830 was not the direct cause of that which broke out in Brussels a few weeks later, but it fired the train.

2. The Revolution **of** 1830.—The disturbances broke out on Aug. 25, after a performance of Auber's opera La Muette de Portici (on the subject of Masaniello's revolution in Naples). The authorities were taken by surprise and lost their heads; the troops retired, without resistance, on the royal palace. On the following day a citizens' guard was organized under the command of Baron Emmanuel d'Hoogvorst and took over the duties of the lawful authorities. Disturbances at once broke out in the provinces and the red, yellow and black flag which had been the flag of the revolt of 1789–90 began to be shown. No one, however, yet contemplated the overthrow of the dynasty. All that was demanded at the

time was the administrative separation of Belgium and the Dutch provinces.

The king failed to realize the importance of the movement and still thought that it could be suppressed. He hurriedly sent his sons to Brussels at the head of a small body of troops. They found the town prepared for resistance, and as they did not dare to risk a fight the prince of Orange (later William II of the Netherlands) consented to parley with the rebels. He was unsuccessful, and on Sept. 3 he left Brussels, taking the garrison with him.

While the king was summoning the states-general at The Hague, volunteers were flocking into Brussels. Charles Rogier (*q.v.*) arrived at the head of a troop of Liégeois. French republicans came to foment the revolt. All regularly constituted authority was abolished. William, who hoped to obtain the support of the moderates, sent his second son, Prince Frederick, to occupy the town. His troops entered Brussels on Sept. 23, but were received by the population with a fusillade which checked their advance. After four days' fighting they retreated, and the volunteers and the citizens' guard, whose numbers were swollen by contingents from all parts of the country, victoriously pursued them to Antwerp.

On the evening of Sept. 25 there had been constituted an administrative committee which took the title of provisional government. It included Rogier, D'Hoogvorst, A. Jolly, Félix de Mérode, Alexandre Gendebien, Sylvain van de Weyer and Louis de Potter. This revolutionary government proclaimed national independence on Oct. 4. paying no attention either to the king or to the powers which had set up the kingdom of the Netherlands. On the same day it summoned a congress to draw up the constitution of the country. The congress met on Nov. 10.

In the meantime the Belgians had captured Antwerp, which Frederick had occupied on Oct. 2. The Dutch general David Hendrik Chassé maintained his position in the citadel and bombarded the town from there. On Nov. 24 the congress voted the perpetual exclusion of the house of Orange from the throne of Belgium.

William had already appealed to the powers to intervene, and in November, at the proposal of Great Britain, a conference of ambassadors was called in London. The main object was to avert a European war, which would have been the inevitable consequence if France had intervened in Belgium. Under French and British influence. Russia (which was paralyzed by the Polish rising), Prussia and Austria consented to give up the principle of legitimacy. On Dec. 20 the conference imposed an armistice on William and the Belgians. invited the provisional government to send a deputation and declared the dissolution of the unitary kingdom of the Netherlands. A month later, on Jan. 20. 1831. it decided that Belgium should be an independent and perpetually neutral state under the guarantee of the powers.

E. Independence

1. Leopold I.—The powers had first wished the Belgian congress to give the crown to the prince of Orange, but instead it elected Louis, duc de Nemours, a son of the new king of the French, Louis Philippe (Feb. 3, 1831). For the sake of preserving peace, Louis Philippe withdrew his consent. The congress then set up a regency. There ensued a period of anarchy, and France tried to cake advantage of it to bring about the partition of Belgium. Great Britain, honever, took a firm stand in favour of the decisions which had been adopted. The election of Prince Leopold of Saxe-Coburg as king (see Leopold I, king of the Belgians) put an end to the crisis. The conference drew up the treaty of Eighteen Articles (June 26, 1831) which regulated the separation between Belgium and the kingdom of the Netherlands. It was accepted by the congress, and on July 21 Leopold, who had made his consent conditional on the acceptance of the treaty, arrived in Brussels and took the oath of allegiance to the constitution. A few days later, William invaded Belgium (Aug. 2, 1831). His troops easily defeated the Belgians, who had not been able to organize an army. Leopold appealed to France. and with the consent of the conference Louis Philippe sent Marshal Étienne Gérard to restore the position. The Dutch retreated before him without an action.

The conference then replaced the treaty of Eighteen Articles by the treaty of Twenty-four Articles, which was much less favourable to Belgium (Oct. 15, 1831). Leopold accepted it reluctantly, but William protested against the forcible measures used against him and refused to sign. His resistance was not broken down even when France and Great Britain blockaded the Dutch ports and when the citadel of Antwerp was bombarded by the French. who captured it from Chassé on Dec. 23, 1832. On May 21, 1833, however, William agreed to conclude a provisional convention with Great Britain and France for the maintenance of the *status quo.* This was all in favour of the Belgians, who continued to occupy Limburg and Luxembourg, which they would have had to give up under the Twenty-four Articles.

William was finally obliged to accept the Twenty-four Articles on March 14, 1838. Belgium attempted to obtain their revision, but only received certain financial concessions. The definitive treaties were signed in April 1839. The Walloon part of Luxembourg was allotted to Belgium. and the rest became a grand duchy which was a member of the German confederation under the sovereignty of William. Limburg east of the Meuse and Maastricht remained in the possession of the Dutch. In return. Belgium was recognized as an "independent and perpetually neutral state" under the guarantee of the powers.

During the first years of Leopold I's reign, the general impression was that the new kingdom could not last. The revolution had resulted in a terrible economic crisis. and the discontented manufacturers formed a small but energetic Orangist party. It was thought that. because of its liberal character, the constitution would make it impossible for the king to govern. Thanks. however, to Leopold's wisdom and devotion and also to the energy of the nation, all the difficulties were overcome. In order to give the country new markets. an act was passed in 1834 for the construction of railways. These were some of the first railways to be built on the continent. Laws regulating the administration of the provinces and the municipalities were passed in 1836. The army was established on a sound basis. After 1839 the Orangist agitation declined and soon died away altogether.

Up to this point the Catholic and Liberal parties, whose joint action had made the success of the revolution possible, had worked together in parliament. They began to diverge soon after the existence of the state had been guaranteed by the treaties of 1839. The system of coalition cabinets was gradually replaced by that of ministries representing the party which had a majority in the chambers. After the disturbances of 1857 which led to the resignation of the Catholic Pierre de Decker and brought the Liberal Rogier into power, the new system mas regularly applied.

The king guided Belgian foreign policy of the country firmly in the spirit of neutrality required by the country's international undertakings. He gave proof of this in the crisis of 1848. Thanks to the liberal character of its institutions and to the electoral-reform measure unanimously adopted by the chambers. the country escaped the disturbances which then prevailed throughout Europe. From that time onward its political system was regarded as a model. The Belgian constitution was imitated more or less exactly by a series of European countries which adopted the parliamentary regime in the 19th century.

The fall of Louis Philippe (whose daughter. Louise, had been married to Leopold in 1832) and subsequently the *coup d'état* of 1852 by which Napoleon III became emperor of the French, placed Belgium in a difficult position. The freedom of the press which prevailed in Belgium made it possible for French refugees in that country to carry on republican propaganda against Napoleon, and this gave rise to unpleasant incidents. As early as 1853 the king induced parliament to grant funds by means of which Antwerp nas surrounded with a ring of forts to serve as a stronghold for the army in case of war.

Efficient measures were taken to assist the economic development of the country. After 1849 a policy of free trade was gradually substituted for protectionism. A national bank was founded in 1850; the local octrois (dues on foodstuffs brought into towns) nere abolished in 1860; in 1863 the dues imposed by the Netherlands on ships sailing up the Scheldt to Antwerp were redeemed. Thus, after two and a half centuries, the port was definitely freed

from Dutch control. (See also LEOPOLD I.)

2. Leopold II.—The grief displayed by the nation at the death of Leopold I (Dec. 10, 1865) and the loyalty with which the accession of Leopold II was welcomed proved that the new regime was firmly established. The international situation was critical. The French were anxious to seek compensation for the triumph of Prussia in the Seven Weeks' War against Austria. The tone of the Paris press toward Belgium was threatening. The attempts which Napoleon III made in 1867 to acquire the grand duchy of Luxembourg were a disquieting symptom, in spite of their failure. In the following year the French railway company of the Est negotiated for the purchase of the railways of the province of Luxembourg. The chambers on Feb. 23, 1869, adopted emergency legislation prohibiting the sale of the railways. and a rupture was averted only by the energy and skill with which negotiations were conducted by the minister Walther Frère-Orban, who was supported by the British cabinet.

The Franco-German War of 1870 provided fresh proof of the government's determination to preserve neutrality. The army was mobilized and sent to the frontier with orders to repulse any troops which attempted to cross it. The victory of Prussia completely altered the position of Belgium. The increased strength of Germany, on the one hand: and the possibility of a French revanche, on the other, greatly complicated its duties as a neutral state. In order to provide for future eventualities, the king persuaded parliament in 1887 to grant credits for the fortification of the positions of Liirge and Namur on the Meuse.

In the meantime the conflict of parties was growing more acute. The Education act adopted in 1879 under the Frère-Orban cabinet met with strong resistance from the Catholics. The government broke off diplomatic relations with the pope. The Liberal party, however, was weakened by the dissension in its ranks between the conservative or doctrinaire elements and the progressives: and it was defeated at the 1884 elections. From that time until 1914 there mas always a Catholic ministry in power.

At this time the working classes did not have the right to vote, and the long-standing discontent to which this gave rise facilitated the spread of socialist opinion among them. In March 1886 there was a riot at Liege which was followed by very serious outbreaks in all the industrial districts. They were repressed with much bloodshed. Auguste Beernaert's ministry ordered an inquiry into the position of the workers, and it was found that social reforms must be undertaken without delay. From 1889 onward a series of laws was adopted on workers' housing, the employment of women and children, factory inspection, workmen's compensation for accidents, etc.

The constitution restricted the suffrage to a minority of the nation, and its extension was demanded with increasing vigour by the progressives and socialists. In 1890 the chambers voted in favour of the principle of the revision of the constitution. Universal manhood suffrage was established three years later. but the system was tempered by plural voting. which gave more than one vote to electors fulfilling certain conditions regarding income, age, education and family. The reform of the electoral system was completed by the adoption of proportional representation in 1899.

The progress of democracy gave increasing scope to the Flemish movement. Although freedom to use either language is one of the principles of the Belgian constitution, French alone was used for legislative and administrative purposes in the years which followed the revolution. French was, as a matter of fact, the language of the enfranchised middle classes both in the Flemish and the Walloon provinces. Between 1840 and 1850, however, protests arose against a state of affairs which placed the Flemish language in a position of inferiority and was injurious to the rights of those who used it. In 1856 the government set up a commission to study the question of linguistic grievances. It was, however, some time before parliament began to adopt a series of laws intended to redress those grievances. The government set up a Flemish academy in 1886. In 1898 an act was adopted establishing the equality of the two national languages.

From the beginning of his reign, Leopold endeavoured to develop the colonial policy of Belgium. His personal interest in the exploration and commercial development of the equatorial regions of Africa led, in the creation of the Congo Free State? to results which had originally not been anticipated. The Comité d'Études du Haut Congo, formed in 1878 at the instance of the king and mainly financed by him, had developed into the International Association of the Congo, of which a Belgian officer, Col. M. Strauch, was president. As a result of H. M. Stanley's explorations in Africa and through the efforts of King Leopold in Europe, the International association was recognized during 1884–85 by the powers as an independent state. Declarations to this effect were exchanged between the Belgian government and the association in Feb. 1885. In April of the same year, the Belgian chambers authorized the king to be the chief of the state founded by the association, which had already taken the name of État Indépendant du Congo. The union between Belgium and the new state was declared to be purely personal, but its European headquarters were in Brussels, its officials, in the course of time, became almost exclusively Belgian, and financially and commercially the connection between the two countries became increasingly close. In 1889 King Leopold announced that he had by his will bequeathed the Congo state to Belgium, and in 1890 the Belgian government, in return for financial help, acquired the right of annexing the country under certain conditions. Reports of misgovernment created a strong agitation for reform in Great Britain. the United States and other countries responsible for having recognized the state, and public opinion in Belgium became seriously concerned. The bill for annexation was finally passed in Sept. 1908. and annexation was effected on Nov. 15. (For the full story of the Congo enterprise see BELGIAN CONGO.)

The system of military service based on selection by lot, with the possibility of providing a substitute, meant that in practice the well-to-do classes in Belgium were exempt. This constituted a social injustice and a danger to which the king for a long time drew attention without success. The revision of the constitution strengthened the position of the partisans of personal service. and that system was adopted in Dec. 1909. A few days later, on Dec. 17, Leopold II died at Laeken after a reign of 44 years. (See also LEOPOLD II.)

3. Accession of Albert I.—As Leopold II had no son, the crown passed to his nephew who touk the oath of allegiance to the constitution as Albert I on Dec. 23, 1909.

The early days of his reign were marked by a violent agitation by the Socialist party in favour of universal suffrage without qualification. There was a general strike in 1913, but no disturbances took place. In the same year the anxiety to which the international situation gave rise led Charles de Broqueville's ministry to pass a measure for the general reorganization of the army, the reform to be completed in five years. (See ALBERT I.)

4. World War I.—The international crisis which came to a head in July 1914 found Belgium unprepared for war, in spite of its recent military laws. The neutrality of Belgium and Luxembourg had been guaranteed by the five great powers (Great Britain, France. Prussia. Russia and Austria) in the treaties of 1839, which bound the guaranteeing powers to intervene if either party to a war violated that neutrality. On July 30, following the precedent in 1870, the British foreign secretary Sir Edward Grey addressed a message to the French and German governments, drawing their attention to this point and asking for an assurance that Belgian neutrality would be respected. The German government declared itself unable to answer, and on Aug. 2 German forces invaded Luxembourg. At the same time Belgium received an ultimatum demanding free passage of German troops across Belgian territory. If the request was refused, Germany would treat Belgium as an adversary. To this note Belgium, which had mobilized 15 classes of militia on July 31, replied by a formal refusal on Aug. 3. Parliament accepted war unanimously, and the Socialist party assured the government of its unreserved support. The leaders of the opposition joined the government as ministers without portfolio.

At 8 A.M. on Aug. 4 the German army invaded the country. Liirge fell on Aug. 7 and Namur on Aug. 23. In the province of Namur 1,949 civilians were killed and 3,000 houses destroyed.

After their entry into Louvain, the Germans set fire to the centre of the city; the cathedral of St. Peter, the famous library and 1,120 houses were destroyed. Seventy-nine of the inhabitants were shot. The town of Aarschot was almost destroyed. The Germans entered Brussels on Aug. 20. In the course of the occupation of Brabant, 594 inhabitants were shot and in the Antwerp and Hainaut provinces 665 persons. Antwerp was evacuated on Oct. 6, and with the withdrawal of the Belgian army to the Yser river under the command of King Albert, the whole country, with the exception of the southwestern districts of Flanders, was under German occupation. (See WORLD WAR I.)

Germany sent Colmar von der Goltz, Moritz Ferdinand von Bissing and Ludwig von Falkenhausen as successive governors general. The governor general, assisted by a central staff, exercised executive power. He legislated by promulgation of orders, except in east and west Flanders, Hainaut and south Luxembourg, where all power rested with the highest local military authorities. The powers of the Belgian provincial councils were finally suppressed on July 6, 1918. Many Belgian burgomasters were deported. The occupied territories paid a tribute, amounting finally to 60,000,000 fr. per month, for the maintenance of the German army in Belgium. The legislative measures instituted by the German military tribunals were numerous and repressive. On April 3, 1917, the governors were empowered to pronounce total or partial confiscation of property. The Belgian judicial powers were suppressed by a decree of April 7, 1918. A sentence pronounced on an absentee could be served by another person; general confiscation of all property forbidden by the Hague convention and the Belgian constitution, was introduced, as was deportation. The Belgian magistrates, bench of judges and court of appeal made frequent protests. Three presidents of the last-named were deported in 1918.

In order to disorganize the country, Germany sought to exploit the linguistic differences between Belgium's northern and southern provinces with the help of the so-called activists. The activists consisted of a small minority of persons who expected Germany to be victorious. The Flemish people energetically disavowed them; and to the last the nation maintained its anti-German attitude, encouraged by the exhortations of Désiré Mercier, the cardinal archbishop of Mechelen. On March 21, 1917, a decree was issued dividing Belgium into two distinct linguistic regions, with administrative centres at Brussels and Namur. All ministries were doubled. the Flemish remaining in Brussels, the Walloon moving to Namur. French became the only official language in the Walloon district, Flemish in the north. The activists attempted to organize a new independent Flemish state under German protection. On Feb. 11, 1918, an enormous demonstration was held in Brussels against separation. German troops dispersed the crowds, but, in face of the unanimous protests of the Belgian authorities, Germany did not dare recognize a legislative authority for the so-called *Raad van Vlaanderen*. With ceaseless energy, however, Germany continued the efforts to foster linguistic differences, notably by making Ghent university Flemish (1916).

The stoppage of overseas exports ruined Belgian industry. Unemployment increased enormously. Germany desired to recruit these workmen for its own use, but met with obstinate refusals. On Aug. 14 and 15, 1915, the first decrees appeared ordering severe penalties for persons who refused to work for Germany. At the same time, commissions were sent from Germany to take out of the Belgian workshops everything that could be used beyond the Rhine and to destroy systematically all machinery which could not be transported to Germany. By June 30. 1918, 167 factories had been completely destroyed, and 161 were on a list of the governor general for immediate destruction. Of the 57 blast furnaces, 26 had been razed to the ground. 20 put completely out of action. Only the mines necessary for Germany were spared.

On Feb. 18 and July 21, 1917, work was forbidden in all factories and workshops except by special permission. At this moment Germany ordered the stoppage of all public works undertaken by the provinces and communes for the relief of unemployment. These steps were preliminary to the plan of deporting the Belgian working population. In November the military authorities requisitioned able-bodied men between the ages of 17 and 60 throughout the whole country. Inhabitants on the lines of communication were mostly sent to the Yser or northern French fronts, to construct railways, prepare routes and dig trenches, often within the range of artillery. The other workmen were concentrated in great camps in Germany, whence they were dispatched to German factories or labour battalions; 57,718 were transported to Germany, 57,541 to the front; 2.531 died in consequence of ill treatment.

There was a serious food shortage. Immediately on occupation, the German government had repealed all measures taken by the Belgian government to ensure rationing. Public authority had now no further power to intervene, and private initiative stepped in. Committees sprang up everywhere. At Brussels the Comité Central de Secours et d'Alimentation was founded, under Ernest Solvay. The committee desired to import foodstuffs from England, but the British government refused. Finally, Gen. von der Goltz having promised to exempt all imported foodstuffs from requisitioning, the British government consented to allow their import under supervision of the embassies of Spain and the United States. The Commission for Relief in Belgium was set up to organize transport under supervision. The Comité Central, under its new name of Comité National de Secours et d'Alimentation, had, by Dec. 1918, distributed foodstuffs to provincial committees to the value of more than 3,500,000,000. (2,500,000,000 fr. for Belgium, 1,000,000,000 fr. for France). The profit made on the sale of foodstuffs was used to organize charitable works at an expenditure of 1,300,000 fr. After the United States entered the war, Herbert Hoover resigned his post as chairman of the Commission for Relief, and a Spanish-Dutch committee took over the work.

The German occupation forced the Belgian government to retire, first to Antwerp, then to Le Havre, France. At the same time, more than 1,000,000 Belgians left the country, 200,000 fleeing to France, 100,000 to England and 700,000 to the Netherlands. The government in Le Havre immediately set about reorganizing the army. which had never left the front. On March 1, 1915, it had called to the colours all Belgians from 18 to 25; numerous volunteers joined the forces, and the government was able to maintain an army in the field with an average effective strength of 150.000.

5. International Treaties. — Belgium was represented by Paul Hymans, Émile Vandervelde and J. van den Heuvel at the peace conference, but was not admitted to the deliberations of the Council of Ten. Hymans played an important part in drafting the covenant of the League of Nations and Vandervelde in framing the constitution of the International Labour office. By the treaty of Versailles, Belgian neutrality was abolished. Germany renounced its rights over Moresnet and the Walloon cantons of Eupen and Malmedy (*q.v.*) in Belgium's favour. Belgium was confirmed in the possession of these two cantons and joined the French in their occupation of the Ruhr. The grand duchy of Luxembourg, on July 25. 1921, entered into a customs, railway and consular union with Belgium. In Africa, Belgium received the mandate for Ruanda-Urundi. representing part of the territories conquered by the Belgian army, which was operating with the forces of the British empire during the war. The treaty of Versailles guaranteed Belgium priority for the sum of 2,000,000 gold marks on reparations account. In addition, the Allies declared themselves ready to transfer Belgium's war debt (5,600,000,000 fr.) to the German reparations account.

After the war the problem of Belgium's international status took on a new form. Belgium was anxious to become free of the restrictions on its right as a sovereign state to form defensive alliances, especially as the guarantee of neutrality had proved ineffectual. The treaties of Versailles, St. Germain and Trianon accordingly contained the provision that Germany, Austria and Hungary recognized that the treaties of 1839 no longer conformed to the requirements of the situation, consented to their abrogation and accepted in advance whatever arrangements might be made to replace these treaties by the principal Allied and associated powers, or by any of them, in concert with the governments of Belgium and the Netherlands.

The consequence of the new position was a military convention concluded in Aug. 1920 between Belgium and France, after full consultation between the respective general staffs. In Nov. 1920

the two governments informed the League of Nations that the military alliance had been concluded and that it was of purely defensive character. Belgium offered to conclude a similar agreement with Great Britain; indeed, Belgium wanted to see a Belgian-French-British entente established. This could not be achieved, but the Belgian foreign policy endeavoured to maintain the traditions of the entente and to reconcile the British and French points of view. In the Locarno pact initialed Oct. 16, 1925, Germany, Belgium, France. Great Britain and Italy took note of the abrogation of the treaties for the neutralization of Belgium. A treaty signed in Paris on May 22, 1926, by Great Britain, France and Belgium confirmed the abrogation of these treaties.

The question of the Scheldt was not solved by the treaty of Versailles. Belgium attempted to reach a modus vivendi on this subject with the Netherlands. On April 3, 1925, a new treaty was signed settling the relationship between the two countries. In 1927 a general treaty was drafted by the Belgian and Dutch governments, which was accepted by the Belgian parliament but rejected by the parliament of the Netherlands.

6. Internal Affairs.—After the conclusion of peace the government was chiefly occupied with the problem of feeding the country, which necessitated various measures prohibiting export and authorizing the requisitioning of home-grown foodstuffs. In consequence of the destruction of industry there were 800,000 unemployed in the country, and 2,400,000 persons, or one-third the population, were dependent on public assistance. The state was obliged to create relief works immediately. The number of persons organized in trade unions rose from 250,000 in 1914 to 875,000 in 1920. By the end of 1919 the 2,200 mi. of railway which had been destroyed were reconstructed. As a result of the recovery of the 24,000 Belgian machines brought back from Germany and of the huge orders for material placed in England and the United States (which were made possible by the credits granted to industry by the banks, these having enlarged their capital considerably for this purpose), industry recovered rapidly.

The reconstruction of the devastated regions, valued at more than 35,000,000,000 fr., called for very great sums; military pensions, indemnities for damage caused by war and unemployment doles swelled the budget disproportionately. The public debt had risen from 4,000,000,000 fr. before the war to 22,000,000,000 in 1919 and passed 30,000,000,000 in 1921. At the same time the fall of the exchange continually increased the cost of living, necessitating a great increase of salaries and readjustment of wages. The demand for social legislation increased greatly. On June 14, 1921, the working day was reduced to eight hours. To prevent or diminish conflicts, national councils, formed by delegates of the employers and the workmen in equal numbers, with an official as president, were set up. The action, although devoid of any legislative backing, was often successful. The financial measures of the government were also democratic in tendency, including income tax, supertax and an increase in death duties.

The fall of the exchange impoverished the middle classes and the *rentiers*. This was further accentuated by the housing law, permitting tenants to continue to occupy their dwellings and limiting the rent to a sum not exceeding 125% of the prewar rents. On the other hand, the quick recovery of industry contributed to enrich the industrial and commercial classes. The high price of living also improved the conditions of the peasants. Thus the middle classes were in a difficult situation between the rich capitalists on one side and the workmen and peasants on the other.

The considerable improvement in the condition of the working classes increased the power of the trade unions. The Socialist party formed the Banque Belge du Travail, while the wealth of the peasants gave the Bank der Boerenbonden great financial and political power. The political result was the weakening of the Liberal party, which was recruited from the middle classes, and a strengthening of the Socialist and Catholic parties.

The intellectual life of Belgium revived. The Association Internationale des Académies chose Brussels for its centre, and on Aug. 19, 1920, an Académie Royale de Langue et de Littérature Françaises was formed there. The status of legal personality benefited the universities. The profits realized by the Commission for Relief in Belgium went to constitute a university fund. Each university was further endowed with a capital of 20,000,000 fr.

The period of restoration mas blessed with a truce in the political struggle; universal male suffrage from the age of 21 was introduced at the demand of the Socialist party; female suffrage, which was claimed by the Catholic party, was granted for communal elections. The elections of Nov. 16, 1919, under the new franchise, had resulted in the Catholic party's losing the majority which it had held since 1884. At first the country was ruled by a "concentration" government, under Léon Delacroix and later (Nov. 9, 1920) under Henry Carton de Wiart; afterward it was ruled by a coalition between Catholics and Liberals under Georges Theunis (Dec. 16, 1921) and then. after the elections of April 1925. by a democratic Catholic-Socialist coalition under P. Poullet and Vandervelde. An act of 1921 made Flemish the administrative language of the Flemish-speaking districts

In May 1926 Henri Jaspar formed a coalition ministry consisting of representatives of the three great parties of Belgium. He made a vigorous effort touard financial stabilization. with the help of E. Francqui, who was principally responsible for the currency reform. He obtained from parliament special powers, under the king, to carry out the necessary measures. On June 7 parliament agreed to impose fresh taxation yielding 1,500,000,000 fr. On July 23 the state handed over the management of its railways to a national railway company. A royal decree was issued on July 31 converting the internal debt; the creditors of the state were given bonds, the rate of which was guaranteed. Under these measures, the franc rose to an exchange rate of 175 to the pound, and it was stabilized at this rate by law.

The Jaspar ministry. which had resigned in Nov. 1927 only to return in reconstituted form, was followed, after a period with Delacroix as premier (Nov. 1929), by Catholic-Liberal coalitions under Jules Renkin (June 1931) and Broqueville (Oct. 1932).

(H. PI.; J. PI.; C. VE.)

7. Leopold 111.—Deep national mourning followed the accidental death of King Albert I on Feb. 17, 1934, near Namur. He was succeeded by his son Leopold III. The successive cabinets of the first years of the new reign—formed by Theunis (Nov. 1934), by Paul van Zeeland (March 1935), by Paul Émile Janson (Nov. 1937), by Paul Henri Spaak (May 1938) and by Hubert Pierlot (Feb. 1939)—had to face financial problems, internal unrest and a new danger to national security. The pro-Fascist party—the Rexists—under Léon Degrelle, had made considerable headway by denouncing the alleged corruption of national parties and by making a pact with the Flemish Nationalists. This movement, however, was to be arrested by severance of the Flemish pact and by defeat in the municipal elections of Oct. 1938.

In March 1936 Germany occupied the Rhineland, and on Oct. 14 King Leopold, in order to obtain from parliament the measures necessary for strengthening the defense of the country, announced that Belgium would pursue a policy of independent neutrality. There was a general assent from all political parties at this decision. While asking to be released from its obligations under the Locarno treaty, Belgium reaffirmed its decision to withstand any act of aggression, with the support of Great Britain and France. These powers accepted the new situation. In fulfillment of these promises, a fortified line from Antwerp to Namur (the K-W or Dyle line) was constructed, and the Belgian army was placed in 1939 on a wartime footing of 2 cavalry and 20 infantry divisions. In addition, 8% of the country's manpower was mobilized, and more than 20% of the total budget was allotted for defense.

8. World War 11.—On May 10, 1940, eight months after the outbreak of World War II but within a few days of the German ambassador's assurance that Germany would respect Belgian neutrality, Belgium was invaded. Spaak, foreign minister in Pierlot's cabinet, immediately called on Great Britain and France to fulfill their pledge, and the Allied armies moved into Belgium.

After 18 days of bitter fighting, the Belgian and Allied forces were overwhelmed by the massive armour of the German army and by German air supremacy. After the enemy's breakthrough at Sedan, the Belgians held the coast and helped cover the evacuation of the British expeditionary force through Dunkerque. With tens of

thousands of refugees blocking the roads and no ports available, further fighting would have been useless, and Leopold, as commander in chief of his army, was compelled to surrender on May 28. In order to strengthen his troops, he had three days previously pledged himself to remain with them, and when his ministers urged him to escape, he refused to leave the country. This action was severely criticized at the time, but five months later, when Pierlot and Spaak eventually reached England and reformed the government there, the "misunderstanding" between king and government seemed to have been cleared up.

Four years of German occupation followed, with the king interned at the castle of Laeken. The spirit of the people, which had been weakened by the collapse of France (where many Belgians had sought refuge), was raised when, toward the end of 1940, the result of the battle of Britain began to be known. After Hitler's invasion of the U.S.S.R. in June 1941, the German administration became more exacting, and Belgian firms were forced to undertake work for the Nazis. The effort to recruit labour and to encourage anti-Soviet contingents to fight on the eastern front met with little response. It was estimated that only 2% of the population actively supported the German policy. The calculated release of Flemish prisoners of war while Walloons, in spite of Leopold's protests, were retained in captivity had only the effect of uniting the country. Confidence in Germany's defeat was furthered by the entry of the United States into the war and the resistance of a cross section of the population, of every religious and political colour, grew every month. Allied airmen were sheltered and an escape route was organized for young Belgians wishing to join the nucleus of a Belgian army that was being formed in England. The morale of the country was sustained by the circulation of Allied radio news bulletins and clandestine papers. This opposition brought harsh reprisals from the Germans, including the shooting of hostages, the imprisonment of 18,000 persons in concentration camps and the deportation of workers estimated at 140,000.

By the time the Allied troops reached Belgium, on Sept. 3, 1944, the resistance movement had been secretly trained and armed and was in radio communication with the army of liberation. The plans of the Germans to destroy the port of Antwerp were foiled, and the docks could be used to land ammunition and reinforcements during the eight months that ended with victory in May 1945.

9. **The** Regency. — With the liberation came a period of comparative prosperity. This was partly attributed to the fact that Belgium was left at the end of the war with a dollar surplus from U.S. lend-lease. Increased trade flowed through the port of Antwerp as the Allied armies advanced to the Rhine and military communications were re-established. But with the end of hostilities, successive governments were faced with the postwar problems of a rising cost of living and workers' demands for higher wages and pensions. Moreover, the life of the nation for the next five years was deeply disturbed by the question *royale,* which was to be inextricably woven into the pattern of all postwar politics.

In 1940 Pierlot and his government had sought refuge in London, with the governments of the other invaded western countries. Returning on Sept. 7, 1944, to find that Leopold and his family were in Germany, where they had been deported in June 1944, he summoned parliament and, on Sept. 20, saw a regent elected in the person of Leopold's brother Prince Charles, comte de Flandre, who undertook to assume Leopold's responsibilities until his liberation.

The first act of the finance minister, Camille Gutt, was to block all banking accounts. This drastic measure allowed him to levy a tax on fortunes made by war profiteers and collaborators. There followed a period of unrest when many people returned from concentration camps to denounce rivals, both political and personal. The Communists who, from the entry of the U.S.S.R. into the war in 1941, had taken an increasing share in the resistance, were with difficulty restrained when the government ordered the disarming of all civilians.

A new coalition government was formed on Feb. 11, 1945, under the trade-union leader Achille Van Acker. On May 8, 1945, the king was liberated by the U.S. army in Austria, where he remained. **A** month later Van Acker was charged with a mission to him. As early as Sept. 1944 an active campaign had been launched against Leopold by the Communists. They were soon joined by the majority of the Socialists and even by Liberals who wished to avoid disturbances at a time when the economic position was critical. Agreement could not be reached between the Socialist premier and the sovereign, and a bill prolonging the regency was introduced in July 1945, the Social Christians (Catholics) immediately resigning. In October the king issued a proclamation answering certain criticisms made against him, but he emphasized at the same time that the Belgian monarchy was founded on the will of the people and that he would accept their verdict.

Since Aug. 1945 a steady policy of reconstruction had been pursued. Loans from the United States and Canada had resulted in an improvement in economic conditions.

In the general election of Feb. 17, 1946, the Communists and Liberals lost seats to the advantage of the two main parties, Social Christian and Socialist. This showed a majority in favour of the king's return but not a clear majority over his opponents. Various efforts were made to solve the political crisis, and on Aug. 2 Camille Huysmans, the Socialist leader, came into office. His government was to last until March 19, 1947, when Spaak, who throughout the various coalitions had remained foreign minister, became prime minister, with a cabinet consisting of nine Social Christians, eight Socialists and two independents. Further attempts were made to solve the royal question, and there were interviews in Switzerland, where the king and his family were residing. During 1947 unemployment had become a major problem, rising to the peak of 220,000.

On July 3, 1947, the Benelux (*q.v.*) Union bill was ratified, in pursuance of an idea of economic union between Belgium, the Netherlands and Luxembourg, affecting 18,000,000 people, that had been outlined while the three governments concerned were in London. A collective agreement for mutual aid in military, economic and social matters, including Great Britain, France and the Benelux countries, known as the Brussels treaty, was signed on March 17, 1948. On April 4, 1949, Belgium was one of the 12 signatories of the North Atlantic treaty.

In May 1949 Prince Charles dissolved parliament. A general election was held on June 26, at which Belgian women exercised the franchise for the first time. In accordance with the census of 1947, the distribution of seats in the parliament was modified. There were 212 seats in the chamber of representatives instead of 202. A compromise left unaltered the number of Walloon seats, and allowed eight more seats to the Flemish region and two more to the bilingual greater Brussels area, so that the proportion was 104 Flemish, 76 Walloon and 32 Brussels representatives. The result of the election was that the Social Christian party gained seats, but not enough to avoid a coalition. Gaston Eyskens, as leader of that party, formed the new government with the Liberals. **A** bill for a referendum on the royal question was drafted and adopted by the senate. The king agreed to accept 55% of the votes cast as the minimum necessary for his return. The Socialists, led by Spaak, urged 66% or abdication.

In Feb. 1950, after a stormy passage through the lower house, the referendum bill was adopted by 117 votes to 92. On March 12 the referendum was made: 57.68% voted for the return of the king, who stated that it was now for parliament to make the final decision. Eyskens resigned on March 18, and after six weeks of uncertainty and strikes a general election was held (June 4, 1950). The Social Christian party, by gaining three seats, obtained an absolute majority over the left and was able to form a single-party government. Jean Duvieusart, the new premier, announced as one of the first points in his program the ending of the regency and the return of the king. After protracted debates lasting nearly a month, the bill was passed, and the prime minister flew to Switzerland to acquaint the king with parliament's decision. On July 22, accompanied by his sons Prince Baudouin and Prince Albert, Leopold flew to Brussels and went to the castle at Laeken. Loyalist demonstrations were opposed by counterdemonstrations, and unrest grew. The Socialists now ordered renewed resistance. and a march of protest to Brussels was timed for Aug. 1. In order to restore peace, Leopold announced, on Aug. 1, 1950, that he

had decided to transfer his royal powers to Baudouin as a step toward enabling the prince to accede to the throne when he came of age (Sept. 7, 1951).

10. **Baudouin.**—On Aug. 11. 1950, Baudouin, then known as the prince royal. took the constitutional oath. Duvieusart resigned and was succeeded on Aug. 15 by Joseph Pholien, a former minister of justice. Paul van Zeeland was appointed foreign minister and associated Belgium with the United Nations on the Korean question. On Jan. 10, 1951, the prince royal signed a decree empowering the minister for defense to send Belgian units to serve in the army of the North Atlantic Treaty organization (NATO). The prime minister declared that Belgium would contribute 10% of the western union defenses. On March 21 parliament passed the bill extending military service from one to two years. On July 16. Leopold abdicated definitively, and on the next day the prince royal ascended the throne as Baudouin I.

In Jan. 1952 Pholien resigned as prime minister and was succeeded by Jean van Houtte. After the election of April 1954 Van Acker formed a Socialist-Liberal government, with Spaak as minister of foreign affairs until he became secretary general of NATO and was replaced in the Belgian cabinet by another Socialist, Victor Larock.

The elections of June 1958 resulted in a short-lived one-party Social Christian government, which gave way to a Social Christian-Liberal coalition under Eyskens. The dispute with the Netherlands regarding the enclaves of Baarle Nassau and Baarle Hertog dating from the middle ages was finally resolved in Belgium's favour by the International Court of Justice in June 1959. The main difficulties of this government arose from the increasing political problems in the Belgian Congo (*q.v.*), which caused it to grant independence to the former colony on June 30, 1960. On Dec. 15, 1960, Baudouin married a lady of the Spanish nobility, Doña Fabiola de Mora y Aragón. On Dec. 20, 1960, the government submitted to parliament a bill, popularly kno n as the *loi unique*, outlining an austerity program including higher taxes, aimed at financial stabilization which was in part to offset the economic losses suffered in the Congo. This immediately resulted in a wave of crippling strikes and antigovernment demonstrations by Socialist-dominated trade unions largely in the Walloon areas.

(E. CA.; C. VE.)

V. POPULATION

Belgium is one of the most densely populated countries of Europe. There was in Dec. 1960 a total population of 9.178.154. This was equivalent to a density of 779 persons per square mile. The distribution among the nine provinces is shown in Table I.

The numbers inhabiting the Flemish area in 1959 were 4,653,478, the Walloon area 3,067.686 and the Brussels area (which may be regarded as too mixed to be classed as either Flemish or Walloon) 1,424,538 in 1960.

Brussels (*q.v.*) is the main financial centre, the seat of a great number of the industrial companies linked with three bank groups. Complaints about a too-large centralization of economic life in Brussels were often voiced by Walloons and Flemings. However, the concentration was partly due to the central position and easy access of the capital while various branches of industry were shifting to the region between the port of Antwerp and the Brabant province. Brussels and its suburbs had in 1960 an estimated 1,011,032 inhabitants. Other large cities are: Antwerp (Anvers) with 256,619 inhabitants, Liège 155,042; Ghent (Gand) 159,056 (*qq.v.*).

TABLE I.—*Population*

Province and capital	Area		Population	
	Sq.km.	Sq.mi.	1947 census	Dec. 1960 (est.)
Antwerp (Antwerp)	2.860	1,104	1,281,333	1,429,761
Brabant (Brussels)	3,284	1,268	1,798,468	1,973,729
East Flanders (Ghent)	2,978	1,150	1,217,280	1,272,161
West Flanders (Brugers)	3,235	1,249	996,449	1,065,627
Hainaut (Mons)	3,724	1,438	1,224,800	1,264,414
Liège (Liège)	3,940	1,521	963,851	1,010,534
Limbourg (Hasselt)	2,408	930	460,446	571,655
Luxembourg (Arlon)	4,118	1,706	213,478	218,784
Namur (Namur)	3,660	1,413	356,090	371,489
Total	30,507	11,779	8,512,195	9,178,154

The mining industry is concentrated in the following basins: Borinage (around Mons). Centre (around La Louvikre). Charleroi, Liège and Kempen (in Limbourg province). The textile industry is located at Courtrai (Kortrijk) and Roeselare (Roulers) in West Flanders. Ronse (Renaix). Ghent and Sint-Niklaas (St. Nicolas) in East Flanders and Verviers in the province of Liège, while the steel industry is mainly established in the provinces of Liège and Hainaut. Most of the other branches of industry are spread over the country, the province of Luxembourg being the poorest.

Development of electricity distribution after World War I encouraged the establishment of factories in places where building sites and labour were available, and small suburbs were rapidly outgrowing ancient cities. The coast is almost a continuous line of sand dunes and holiday resorts but industry was also expanding at Ostend and Zeebrugge. Metal-working factories exist at Ghent and Mechelen (Malines). Shoe manufactures made Izegem (in West Flanders) famous, but Diest (in Brabant) was becoming a shoe-making centre as well. Binche (in Hainaut) has a flourishing ready-made clothing industry.

Nurseries are concentrated in the Ghent and Bruges (Brugge) areas and market gardens in the region of Mechelen. The main glasshouses are around Brussels. The sugar industry is located at Moerbeke in East Flanders and Tienen (Tirlemont) in Brabant and the diamond industry at Antwerp. The main shipyards are at Hoboken and Temse (Tamise) on the Scheldt river. Fishing is organized from the ports of Ostend. Zeebrugge, Nieuwpoort (Nieuport) and Blankenberge. See also The Economy below.

VI. ADMINISTRATION AND SOCIAL CONDITIONS

1. Constitution and Government.— The Constitution was promulgated on Feb. 7, 1831, and revised in 1893 and 1920–21. The 1893 revision provided for the administration of colonies or protectorates under the condition that overseas territories should be defended by Belgian volunteers only. In 1920–21 the composition of the senate and the franchise were altered.

Belgium (officially Royaume de Belgique or Koninkrijk Belgie) is a constitutional, representative and hereditary monarchy. All powers derive from the nation. The king is the head of the state and his person is inviolable. He Shares the legislative power with the chamber of representatives and the senate. which are elected for four years. He sanctions and promulgates the laws and exercises the executive power in conjunction with his ministers who are responsible to parliament.

The king cannot act alone; his actions in the political sphere must be sanctioned by a minister. In the case of disagreement a minister can be dismissed by the king, or the minister (or the entire government) can resign. Ministers are appointed by the king generally from members of parliament. Since World War I the government has been headed by a prime minister who coordinates government policy. The number of ministers varies; they have equal rights. The government must rely on a majority in parliament. If it has not a majority, it ordinarily resigns and, if no other government is acceptable, parliament is dissolved and general elections must follow within 40 days.

The king is commander in chief of the armed forces, declares war, makes peace and concludes trade treaties. Treaties that may entail burdens for the state or for Belgians individually take effect only after they have been ratified by parliament, signed by the king and published in the *Moniteur Belge*. On the death of the king and until the heir to the throne has taken the oath before parliament, the royal prerogatives are exercised by the cabinet council under the responsibility of the ministers. If the king becomes unable to reign the cabinet council exercises his prerogative pending the election of a tutor or a regent by the assembled chambers.

The succession to the throne goes by primogeniture to the descendants of Leopold of Saxe-Coburg (King Leopold I). Females are debarred from succession. In the absence of a male heir the king may nominate his successor with the approval of parliament. The king comes of age on his 18th birthday. Sons of the king become by right members of the senate at 18, but cannot take part in votes until they are 25. A member of the royal family cannot

be a minister. The king can appoint ministers of state who have no special function but may be consulted in critical times.

Since 1949 the chamber has been composed of 212 members; the constitutional maximum is one deputy to every 40,000 inhabitants. Deputies are elected by universal direct suffrage. which extends to all male Belgians over 21 and (after 1949) also to women. All candidates must have the appropriate residence qualifications and be at least 25 years old. Voting is compulsory and secret. The distribution of seats among the lists of candidates is decided by the D'Hondt system of proportional representation (*q.v.*).

The organization of the senate is complex. The number of members elected directly equals half the number of members of the chamber of representatives who are elected by the same electorate. The candidates must be at least 40 years of age. A number of senators, one to every 200,000 inhabitants, are elected by the provincial councils by proportional representation. The directly elected and the provincial senators co-opt further members, their number being half that of the provincial senators. Since 1949 the senate has been composed of 106 directly elected members, 46 provincial members and 23 co-opted members, making a total of 175. In March 1960 a new electoral law was passed which in forthcoming elections would permit the Belgian people to elect 226 deputies instead of 212 and 183 senators instead of 175.

The chamber of representatives and the senate have equal powers. Bills may be introduced in both. Before being signed by the king they must have been passed in the chamber and the senate. Speeches can be delivered in French or Dutch (Flemish in its broader sense), this being facilitated by an interpreter system with earphones.

A court of accounts (*cour* des comptes), the members of which are appointed by the chamber of representatives, has authority to control all the operations of the treasury as well as the revenue and expenditure of the provinces. It sees that the budget is not exceeded, and that funds are not transferred from one authorized purpose to another.

The council of state (*conseil d'état*), created by the act of Dec. 23, 1946, consists of two sections: one of which deals with legislative matters and the other with administrative affairs. The legislative section is responsible for improving the drafting and editing of legal texts. The administrative section has the task of ensuring protection of the citizen's rights and interests in relation to the public powers.

2. Local Government. — The constitution recognizes the existence of nine provinces: Antwerp, Brabant, West Flanders, East Flanders, Hainaut, Liège, Limbourg, Namur and Luxembourg (*qq.v.*). These provinces and their communes are the principal units of local government. Local authorities administer affairs under the control of the central government through the minister of the interior but possess a considerable amount of autonomy. The executive head of each province is the governor, who is selected by the king on the advice of the minister of the interior. The governor transmits instructions from the minister of the interior to the communal councils and in general holds a watching brief for the central authority. He is also responsible for the execution of the provincial council's decisions on the public services coming within his competence.

The legislative power of the province resides in the provincial council, which is elected by parliamentary voters for a term of four years. The main duties of the provincial council are voting the budget and looking after such services as highways, drainage and education. The working administrative body within the province is the dkputation *permanente,* a core of the council elected by its own members. The body meets frequently under the presidency of the governor, whom it also advises; it cannot be suspended or dismissed by the central government.

The province is divided administratively into districts (*arrondissements*), of which there are 41. In every district there is a district commissioner who supervises communes of fewer than 5,000 inhabitants. The municipality (commune): of which there are 2,663, is the basic unit of local government, and there is a uniformity throughout the country in the details of its administration. The administrative power is vested in the burgomaster, the college of the burgomaster and aldermen, and the communal council. The burgomaster is nominated by the council and appointed by the king, and is usually a member of the council. He holds office for a period of six years, which may be renewed. The communal council also serves for six years and has the duties of voting the budget, of organizing police, public institutions and services (including primary education) and of administering public property. It is not responsible to any superior authority, but any decrees which overstep its powers can be annulled and its budget must be approved by the governors and by the king. The executive power of this council is delegated to the burgomaster and the college of salaried aldermen, of which the burgomaster is president.

3. Political Parties. — The Social Christian, Liberal and Socialist parties were often called the constitutional parties. The first two existed when Belgium became independent, although they were not organized. The Liberal party was founded in 1846 in Brussels. The Catholic party took shape at a congress at Mechelen in 1863. The Belgian Workers party was created in 1885. The present denominations Social Christian party and Belgian Socialist party were introduced after World War II.

The Social Christian party is an amalgam of landowners, industrialists, middle classes, peasants and workers linked by their devotion to the Roman Catholic Church. The farmers, through the Boerenbond with about 300.000 members, exercise a great influence and are responsible for the protectionist agricultural policy. Since World War II the influence of the Roman Catholic trade unions has been predominant in the party, which is stronger in the Flemish than in the Walloon area.

The Socialist party recruited its first adherents among the textile workers in the Ghent region and the miners and metalworkers in the Walloon industrial centres. After World War II the party gained some support among intellectuals and even among the farm workers. and aimed at overtaking the Social Christian party. The Socialists in the 1950s did not press for nationalization of industries and preferred forms of co-operation between private management and local or provincial authorities.

The Liberals exercise a policy of holding the balance between the Social Christian and the Socialist parties. After World War II they lost ground at general elections to the benefit of the Social Christian or Socialist parties, but their influence in government coalitions was often greater than their electoral strength. For instance, in the Socialist-Liberal cabinet after the April 1954 election they secured 7 portfolios out of 16.

The Communists obtained 12.7% of votes in the first postwar election (Feb. 1946), but later lost their influence over the workers. In June 1958 they obtained only 1.9% of the total votes cast.

The Christian Flemish People's union was an attempt to restore pre-1939 Flemish nationalism.

The trade unions are divided into Socialist (more than 630,000 members) and Social Christian (530,000 members) as well as some Liberal neutral unions. The Socialists are dominant in heavy industry and the Social Christians in the Flemish textile centres and in smaller industries. The total number of union members (1951) was more than 1,200,000.

4. Taxation. — Income tax is levied at a rate of up to 35% of earned income with separate taxes on unearned income, on real property and a personal complementary tax. In addition there are customs (except within the Benelux territories) and excise duties, transfer tax, stamp duties and estate taxes. Local governments also are authorized to levy taxes.

5. Welfare Services. — Social welfare in Belgium is operated under a law passed in Dec. 1944, amplified and extended by subsequent bills and decrees. The services are administered by the Central National Office of Social Security, which collects contributions from both employers and employees, and distributes sums to various national institutions dealing with family allowances, health, old age and holidays with pay. The state contributes only to old-age pension schemes. Contributions are compulsory for all wage earners in industry (except for miners, who have their own scheme), trade and agriculture, but not for self-employed persons. Participation by all employees in mutual insurance so-

cieties is compulsory; these conduct schemes of compensation for industrial injury. Public assistance is controlled by committees in each commune appointed by the communal council, under the ministry of health. Various public-health activities (dealing with maternity and child welfare, the prevention and treatment of tuberculosis and venereal diseases, etc.) are carried out by semi-official or unofficial organizations, subsidized by the state.

6. Justice. — The Belgian constitution provides that the judicial power can be exercised by courts and tribunals in the name of the king. The legal system itself is to a large degree patterned upon that of France. The administration of justice is centralized under the control of a minister of justice; there is a codified body of law.

The lowest court in each of the 229 judicial cantons (whose boundaries rarely coincide with those of the electoral cantons) is that of the justice of the peace, who deals with breaches of police regulations and can pass judgment in civil cases where the amount in litigation is small. Within each of 26 judicial districts there is a tribunal of first instance presided over by one or three judges sitting without a jury. It acts as a court of appeal to the justice of the peace. One or more chambers of the tribunal deal with misdemeanours involving a sentence of not more than five years' imprisonment. Each tribunal of first instance includes a children's court composed of a single judge.

There is a court of assize which is located in the provincial capitals to try crimes, as well as political and press offenses. Trial is by jury. The bench is composed of a judge of the court of appeal and two judges of the tribunal of first instance who sit with the jury. Courts of appeal are established in Brussels, Ghent and Liège. There are also various special tribunals.

At the top of the legal system there is the court of cassation in Brussels which provides for unity of jurisdiction. On appeal, the court does not deliver a fresh judgment but may suspend the sentence and send the case back to another court or tribunal. A minister can be accused by the chamber of representatives and brought before the court of cassation, which in this event is entitled to judge the ground of the case. A minister condemned can obtain mercy from the king only at the request of the chamber of representatives or of the senate. Judges are appointed for life and are irremovable except by court sentence. Justices of the peace and of tribunals are appointed by the king.

There are two types of police in Belgium, state and communal, each with the twofold function of preventing crime and investigating it. The burgomaster is the chief of the communal police. He can request the assistance of the state police.

7. Education. — Freedom of education is a constitutional liberty. After the separation of the Netherlands in 1831 many municipalities suppressed primary schools to alleviate expenses. Other schools were rudimentarily organized and many teachers were unqualified. A bill introduced in 1842 by a Catholic-Liberal coalition government compelled the municipalities to organize public primary schools or to adopt confessional (Roman Catholic) schools. Roman Catholic religious teaching was compulsory except for children belonging to another faith.

In 1879, under pressure of an anti-Catholic wing, a Liberal government ordered each municipality to organize at least one public school where religion was taught out of school hours. The state had the monopoly of teachers' training, and teachers appointed by local authorities needed state certificates. Violent opposition to these measures developed, and the political repercussions of what was called a "school war" were still felt at mid-20th century. Enrollment fell at many public schools and hastily organized confessional schools had, within two years, about 190,000 children or 66% of the total schoolgoing population.

In the 1884 election the Catholics gained the majority which they kept until World War I. They withdrew the state monopoly and allowed the local authorities either to have public schools or to replace them by the so-called "free" (independent) schools. After World War I, Jules Destrée, a Socialist minister. decided that teachers of both public and free primary schools would be paid by the state. Free secondary schools, however, were not subsidized.

A new "school war" started in 1954–55 when the Socialist-Liberal government undertook educational reform. Concessions were made to Catholic opinion but the 1955 bill. which proposed reduced subsidies to free schools, was declared unacceptable by the Social Christian party and the Roman Catholic Church. After the 1955 act (passed without the support of the Social Christian deputies) the framework of education was as follows:

1. Primary schools were to be built and maintained by the local authorities. Free primary schools, mostly Roman Catholic but including some Protestant and private schools, were to be organized by private bodies. Some municipalities subsidized free primary schools with heating, school meals and transportation.
2. Secondary and vocational schools were to be built and maintained by the state, the provinces and municipalities, or by independent (mostly Roman Catholic) organizations. Free and vocational schools were subsidized to a limited amount (3,000,000,000 fr. in *1955–56*).
3. The teachers must possess the appropriate certificates and would be paid by the state.
4. Free schools must observe the language regulations so that teaching could be in French or Dutch (Flemish) according to region.
5. Both in the state primary and secondary schools, parents could choose the type of religious instruction (Roman Catholic, Protestant or Jewish) for their children. In 80% of cases the Roman Catholic faith, taught by priests, was preferred.

Friction between Roman Catholics and Socialists over education continued until Nov. 1958 when a joint national committee drew up a final agreement (ratified May 1959) under which the school-leaving age was raised to 15 and tuition fees in all primary and secondary schools were abolished. The state ceased to subsidize the building of free primary schools but agreed to compensate them for losses incurred by the abolition of fees, also to increase the subsidy for teachers' salaries. The principle was restated that parents could choose between state and free schools.

By the early 1960s there were four universities and several institutions of higher education, such as mining schools, the University Institute for Oversea Territories, industrial and commercial schools and agricultural schools, which were organized by the state, the provinces or by Roman Catholic associations. The Louvain Roman Catholic university (founded in 1425) is bilingual, and the non-confessional Brussels university (1834) was becoming bilingual. The Liège university (1817) teaches in French, and Ghent (1817) taught in Dutch after 1930.

Nuclear research was divided among the four universities, the college of engineering at Mons and the Royal Military schools under the guidance of an Interuniversity Institute of Nuclear Sciences. An experimental reactor was established at Mol, in Antwerp province.

School attendance was made compulsory by the 1914 act for children between 6 and 14 (inclusive). Infant schools existed for children below the age of entry into the primary school. The secondary schools were divided into a lower degree category where education was by teachers trained in normal schools and a royal *athénées* category (free Roman Catholic colleges) divided into classical (Latin and Greek) and modern where lessons were given by university-trained teachers.

8. Defense. — According to the constitution the king commands the armed forces, declares war and makes peace. When the North Atlantic Treaty organization came into operation a way out was found from a complex situation. Baudouin, who then was prince royal, signed in Jan. 1951 a decree placing the Belgian fighting forces at the disposal of NATO.

In March 1951 compulsory military service was extended from one to two years; in Aug. 1952 it was reduced to 21 months, in May 1954 to 18 months and later to 12 months. The effectives in the early 1960s numbered more than 120.000. including about 50,000 conscripts. In addition, about 30.000 men were available for the territorial antiaircraft units.

The fighting forces included one infantry and one armoured division with more than 40,000 regular soldiers and the rest conscripts.

The air force, with about 21,000 personnel, comprised 400 aircraft and had three wings for interception, two fighter-bomber wings, and one transport squadron.

The navy, with 4,800 officers and men, was composed of one

frigate, a number of high-sea mine sweepers and coastal mine sweepers based on Ostend and Zeebrugge; one transport ship and several speedboats based in the neighbourhood of Cologne on the Rhine. A few mine sweepers for keeping open navigation on the Scheldt river were under commission.

VII. THE ECONOMY

Belgian is essentially a manufacturing country but a fair proportion of the population is engaged in agriculture. The economy suffered severely during the German occupations of both world wars, chiefly from the deportation of workers and the dismantling or deterioration of plants. But recovery in both cases was remarkably rapid.

1. Agriculture. — In the early 1960s more than 1,000,000 Belgians, about one-eighth of the total population, depended on agriculture for their livelihood and almost half worked on farms or market gardens. Three-fifths of the national territory was under cultivation, a rather high proportion considering that the region of the Ardennes consists of bleak uplands with thin soils. Agricultural income exceeded 22,000,000 fr. annually or approximately 6% of the national income. About 18% of the total value of agricultural production derived from crops, 65% from animal husbandry and 17% from market gardening. Four-fifths of the national requirements were in the 1960s covered by home agricultural production.

Wheat is the principal cereal crop, though oats, barley and rye are also grown. The latter is decreasing in importance. Potatoes and sugar beet occupy a considerable acreage and sugar extraction and refining have become important industries since World War II. Small quantities of tobacco and flax are also grown.

Beginning in the late 19th century, the area under pasture increased substantially at the expense of arable land. Permanent meadowland increased threefold by mid-20th century. The number of dairy cattle greatly increased, accompanied by an increase in pigs, kept particularly by small holders. Sheep declined steadily, with the growth of wool imports. A famous heavy (Belgian) breed of horses is still produced for draft and farm work, especially in Hainaut and Brabant.

Exports of agricultural products represented 18% of the total. Agriculture was not sufficiently profitable, and protection and subsidies were required. Import duties varied between 3% and 15%, but the main protection was derived from import prohibition and quotas. Subsidies were granted for the production of cheese, condensed milk and tobacco.

Effects of mechanization in agriculture and of the increased use of improved seeds and fertilizers were noticeable. Higher wages demanded by farm workers encouraged the conversion of fields to pastureland. The emphasis was on the production of fodder for the increasing stock of cattle and of poultry. Improvement in quality of meadows and of fodder resulted in a decrease of forage imports and in the development of the dairy industry, but cost prices remained high so that further rationalization and greater productivity were needed.

Between the mid-1950s and 1960s the number of horses used in agriculture decreased by more than 30,000 and the number of tractors increased by nearly 20,000. The most important obstacle to mechanization was the small farm — four-fifths of the 250,000 farms covered a surface of less than 49 ac., the average being between 14 and 17 ac. Only about 400 farms exceeded 247 ac.

2. Industry. — Belgium is one of the most industrialized countries of the world. The country's economic prosperity is mainly dependent on the large-scale import of raw materials for the production and subsequent export of manufactured articles. To assist industrial production Belgium has several advantages — a dense population which has acquired a great technical skill, a good system of communications (rail, road and water) and domestic supplies of coal.

During the middle ages the prosperity of the area was chiefly centred in the towns of Flanders, where the chief industry was textiles. The Meuse valley, especially around Liège, has been an industrial area since the 12th century, using local iron ore, charcoal from the Ardennes forests, and water power. In the 16th century coal mines were opened in the Meuse valley and an allied industry of iron smelting developed. There was also a variety of other occupations such as printing, diamond cutting and glassmaking. Under the Spanish Habsburgs the provinces forming Belgium experienced a period of wars and persecution, which caused the migration of many skilled workers.

In the 18th century, however, when rule passed to the Austrian crown. some recovery took place in the provinces' economic position; the clothing and lace trades revived, and mining technique was improved. Under the French occupation (1792–1814) industrial prosperity increased. After union with the Netherlands, the raw materials and the markets of the Dutch colonies were open to Belgium.

With the granting of independence from the Netherlands in 1831, a certain temporary distress resulted from the loss of overseas markets. By mid-19th century about 7% of the population was engaged in industry compared with about 25% in agriculture. The period of free trade contributed to the rapid advance of Belgium as an industrial region, and the country became the chief rival of Great Britain. Foreign capital was invested particularly in its iron and and steel trade. By the end of the century the number of industrial workers was nearly twice what it had been in 1840.

During World War I much of the country's plant was dismantled and removed to Germany, and many workers were deported. Various reparations, the rapid reconstruction of ports, factories and communications and the establishment of new industries and modern plants soon set the country on the path of economic recovery.

After its liberation in World War II, Belgian industry was handicapped by damaged or obsolete plants, a depletion of skilled labour and the loss of contact with overseas markets. After a period of initial hesitancy, some of the country's industries, particularly metallurgy and chemicals, assisted particularly by the wealth of basic resources in the former Belgian Congo, by the re-establishment of the economic union with Luxembourg (later widened to include the Netherlands as the Benelux union) and by the demands of western European rearmament, recovered their former prosperity despite temporary labour unrest.

Handicraft industries declined considerably in Belgium in the 20th century; about 200.000 workers were engaged at home in such occupations as clothmaking, tailoring, dressmaking, lacemaking and leatherwork in 1910; about 52,000 (33,000 women) in 1930, and still fewer in the early 1960s. More than 1,000,000 persons were engaged in manufacturing industries in the early 1960s, mainly in metallurgical, textile and food industries.

Coal Industry. — The coal industry dates from the 16th century, by which time mines were being worked in the Ardennes and Meuse valleys, and in the first half of the 19th century it became Belgium's most important industry.

By mid-20th century Belgium, in common with other western European countries, suffered from overproduction of coal. A rationalization policy under the European Coal and Steel Community (*q.v.*) closed uneconomic mines, and modernized others. Output was reduced to 22,600,000 tons in 1959, and was reduced still further in 1960.

Workable coal exists in two main fields. One, the Sambre-Meuse (*Bassin* du Sud), runs in a narrow band through the centre of the country from the French frontier on a general line through Mons, Charleroi, Namur and Liège. A second field (the *Bassin* du Nord or Noorderbekken) was developed after World War I; beginning in the vicinity of Aachen, Ger., and crossing Dutch Limburg, it extends west-northwest into the Kempen area. The southern field is structurally complex, seams are thin and broken, firedamp is prevalent and mechanization is difficult. The field is now "old," and many parts have been worked out (*e.g.*, around Namur), or abandoned as uneconomic. Output in 1959 totaled 13,970,000 metric tons, but with the ending of the subsidy system in 1963 declined rapidly. The Kempen field produced 8.800.000 tons in 1959 (more than one-third of the Belgian total) but has since cut back this production level.

For many years Belgium was unable to produce enough coking coal and long-flame coal for its industrial needs The development of the Kempen field supplied types previously lacking, and the

country became less dependent upon imports.

In the mid-19th century there were about 44,000 workers engaged in the coal industry, of whom 26% were women and children. There were 148,000 miners (123,000 Belgians and 25.000 foreigners) in 1938. By the early 1960s the number of miners was reduced to only 80,000, of whom about a quarter were foreigners.

Metallurgical Industry.—Production of iron, like that of coal. dates back many centuries; it was initially based on the local ore and abundant forests of the Sambre-Meuse belt. In 1827 coke-burning blast furnaces were erected near Liège and Charleroi. There was a decline of the domestic ores (which had reached about 850,000 tons yearly in the 1860s) toward the end of the 19th century. Supplies had thus to be drawn from the conveniently placed sources of Luxembourg and Lorraine. After World War I the Belgian iron and steel industry rapidly erected new plants and was soon established as one of the world's chief exporters of iron and steel. There was a temporary period of difficulty after 1945 following the German occupation of World War II. but production soon exceeded prewar output, and the industry benefited considerably from the demands created by the North Atlantic Treaty organization. By the early 1960s pig-iron production exceeded 5,000,000 tons annually. raw steel 6,000,000 tons and finished steel 4,000,000. More than half the steel mas produced by two large combines formed by a merger in 1955.

Belgium has only small deposits of nonferrous ores. Consequently there is a large import of these metals. Nonferrous industries expanded considerably during the 20th century. The chief of these was that of zinc, which was first based on local ores but came later to rely on imports. principally from the Congo. Refineries are situated mainly in the Liège area and in the Kempenland. Copper and lead were also refined on a large scale. A considerable percentage of the output was exported.

Engineering *and Chemical* Industries.—The Belgian heavy and light engineering industries are chiefly situated along the coal fields, but light engineering spread into the larger towns and communes. Both types are well organized and flourishing. The manufacture of rolling stock constituted at mid-20th century an important branch of heavy engineering; shipbuilding was of lesser but increasing significance, while aircraft and motor production remained relatively small. An electrical plant industry produced a large quantity of heavier equipment. while in addition a widespread light electrical and machine tool industry was to be found throughout the industrial area, mainly concentrated in Brussels, Liège, Antwerp and Charleroi.

By the early 20th century the chemical industry in Belgium began to develop. with an emphasis initially on primary products such as sulfuric acid and ammonium sulfate, the by-products of the coke furnaces. After 1918 the industry was expanded to produce more secondary chemicals, in particular fertilizers. The heavy production, including that from coal distillation and that of by-products of iron, zinc and other metals, as well as the large-scale manufacture of acids and salts (especially copper sulfate), was situated in the towns of the Sambre-Meuse area and in the Kempen area. The light production (*e.g.,* drugs, soaps, paints) infiltrated from these areas into the larger centres. Fertilizers constituted an important item of Belgian export.

Textiles.—Since the middle ages textiles have formed the chief occupation of Flanders. In addition to the earliest production of wool, linen and cotton, considerable manufacture of artificial silks and other fabrics was developed. The Flanders district began to concentrate during the 19th century on the making of cotton and linen; the cotton industry was centred chiefly in East Flanders. particularly around Ghent, and the linen in the Lys valley and the Courtrai area. Jute fabrics, silk, rayon and nylon were also produced there to a smaller degree. An important woolen industry sprang up in the Vesdre valley in eastern Belgium, its chief centre being Verviers.

Other *Industries.*—Miscellaneous industries include the production of leather and paper goods, furniture making and diamond cutting. Sugar is refined in many parts of the country and is derived almost entirely from domestic beet The old-established glass industry, founded at Charleroi and Val-St.-Lambert, spread into the Kempen area at Gompel. At mid-20th century pottery and bricks, using mostly domestic clay, were manufactured along the Sambre-Meuse valley, at the Scheldt-Rupel confluence, around Brussels and Ghent, and near Turnhout.

*Including the Saar. †Federal Republic of Germany only.

3. Foreign Trade.—Except for a period between 1834 and 1849, Belgian commercial policy from 1831 was one of free trade, though in the two final decades of the 19th century attempts were made to stimulate a declining agriculture by protective tariffs. In July 1921 a customs agreement between Belgium and Luxembourg was signed, which ensured mutually advantageous policy, particularly in agriculture and metallurgy.

During the 1920s and 1930s Belgium attempted, despite the prevailing trend of other nations during the period toward protection, to cling to the policy of free trade but was progressively forced in defense to impose moderate tariffs on the agrarian products and finished industrial goods of other countries. Continued efforts were made to promote export trade by the conclusion of bilateral trading treaties.

The country weathered the effects of the German occupation in World War II partly because the German regime was relatively mild. Moreover, the Belgian possessions in the Congo provided a rich source for a world hungry for mineral products. There followed an immediate postwar period of comparative hardship, but by the end of 1948 Belgium recovered to the prewar level. Belgium became a member of the Benelux Customs union (1948). Membership of the wider European Coal and Steel Community (1952), the European Atomic Energy Community (1958) and the European Economic Community (1958) aims at progressive economic integration with France. the Federal Republic of Germany (Western Germany), Italy, Luxembourg and the Netherlands.

Between 85% and 90% of the imports consist of raw materials and foodstuffs (chiefly iron ore, crude oil, raw wool, cotton and flax, fertilizers, wheat and maize). Exports cover a wide range of manufactured goods, coal, coke, refined oil and foodstuffs.

4. Finance.—The unit of Belgian currency is the franc, which from the foundation of the national bank in 1850 until 1918 was on the gold standard with a parity of 1 fr. = .29032238 g. of fine gold. The franc declined after 1918 and was stabilized in 1926 at 175 fr. to £1 sterling (.04184 g. fine gold per franc). It was devalued in March 1935 by 28% and again (following the pound) in Sept. 1949 (with 0.01777 g. of fine gold). The exchange rate in the early 1960s was 140 fr. to £1 sterling and 50 fr. to the U.S. dollar.

The budgetary position, in spite of two periods of German occupation during the 20th century, has in general been sound. Belgian budgets are presented in two main divisions: an ordinary budget for normal current expenditure financed by direct or indirect taxation; an extraordinary budget for capital investment and armament financed chiefly by loans. The chief items of the ordinary expenditure (135,995,000,000 fr. in 1960) were public-debt interest, pensions, defense and education.

Out of an extraordinary budget of 25,089,000,000 fr. in 1960, nearly 25% was earmarked for defense and about 40% for public works and communications.

By the early 1960s the national debt had increased tenfold from the 1938 figure of 44,201,700.000 fr. The national income was estimated at 257,600,000 fr. in 1948 and was more than 400,000,000,000 fr. in the early 1960s.

5. Transport and Communications.—The Belgian railway network (Société Nationale des Chemins de Fer Belges) is a state enterprise and is denser than that of any other country, but

the waterways, especially canals, are equally developed. Both means of communication handle national and transit traffic. The total length of the railways was 3,008 mi., of which 306 mi. were electrified. Light railways (chemins *de fer vicinaux*) afford a valuable contribution to the transport system. The total length of tracks was 1,040 mi., together with 4,400 mi. of supplementary autobus routes. In addition, street cars, trolley buses and autobuses were operated by seven town services.

The main roads maintained by the state and the provincial administration had a total length of 6,983 mi. This included the motorway, completed in 1957, between Ostend and Brussels. The total number of motor vehicles in the early 1960s was in excess of 1,000,000 (more than 60% passenger cars).

Navigable waterways with a total length of 983 mi. are important. The Albert canal which links Antwerp with Liege was a success because it brought about the revival of several branches of industry in the area around Liege and led to increased exports of finished and half-finished goods.

Several stretches of rivers and canals can be used only by 300-ton barges. Under a ten-year (1956–66) program most of them were to be made navigable for 1,350 ton barges. This would apply to the Meuse (Maas) river from the Netherlands to the French frontier and to the Scheldt river, for the benefit of the ports of Antwerp and Ghent. The program coincides with the extension of the port of Antwerp (*q.v.*) which handles most of Belgium's trade.

It was felt that the status of Belgian shipping was not in proportion to the country's economic position. For that reason it was decided in 1956 to construct 20 to 30 ships to provide an additional tonnage of 250,000 to 300,000. This would extend the Belgian merchant marine up to 800,000 net registered tons. Other Belgian ports which served seagoing vessels were Ghent, Ostend and Zeebrugge.

In 1919 a Belgian syndicate organized the first civil flights between Brussels, London and Paris. In 1923 the Sabena (Société Anonyme Belge d'Exploitation de la Navigation Aérienne) was founded. The government retained 50.7% of the shares in this international airline. There is a regular helicopter service to Eindhoven, Duisburg, Dortmund, Rotterdam, Lille, Maastricht, Cologne and Bonn.

After 1930, telecommunications included a *régie* (state monopoly) of telegraphs and telephones for the exclusive use of business organizations. *See* separate articles on the provinces and major towns; *see* also Index references under "Belgium" in the Index volume. (F. J. M.)

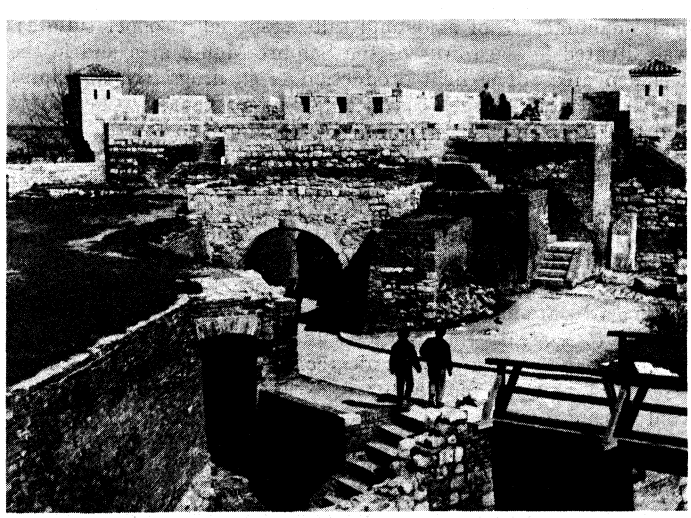
BELGOROD, an oblast (province) of the Russian Soviet Federated Socialist Republic, U.S.S.R., formed in 1954, and a town, the administrative centre of the oblast. The oblast covers 10,463 sq.mi., chiefly in the basins of the upper Vorskla, Northern Donets and Oskol. It is largely rural and of its 1,227,000 inhabitants (1959), only about 18% (224,000) are urban. Belgorod and Stary Oskol are the only sizable towns. The *oblast* lies in the forest-steppe, on rich chernozem (black earth). The forest has almost all been cleared since the 17th-century settlement of the area and now exists only as groves, predominantly oak, along the rivers. The open farm lands are mainly under grain: winter and spring wheat, barley, millet and maize (corn); with sugar beet important in the west of the oblast and sunflowers in the east. There are numerous orchards. Large iron-ore deposits occur around Belgorod and Stary Oskol; they are part of the Kursk magnetic anomaly (see KURSK). Mining is rapidly expanding.

BELGOROD town (pop. [1959] 71,000), situated on the upper Northern Donets at the foot of chalk bluffs to which it owes its name (meaning "white town"), on the Moscow-Kharkov railway, is chiefly concerned with processing agricultural products, as are the other towns. It was an old fortified town, part of the Belgorod defensive line, set up in 1636–38 to protect Russia's southern frontier. (R. A. F.)

BELGOROD-DNESTROVSKI, a town of Odessa oblast (province) of the Ukrainian Soviet Socialist Republic, U.S.S.R., formerly the Rumanian Cetatea Albă and earlier still the Turkish Akkerman. It stands on the southwestern shore of the broad, shallow Dniester estuary (Russ. Dnestrovski Liman) on the railway from Odessa to Izmail. It is a very ancient town: on its site stood Tyras, a colony from Miletus and, later, the Genoese factory of Mauro Castro under Moldavian princes. From 1484 to 1881 it remained Turkish, although captured several times by the Russians. The town was Rumanian from 1918 to 1940, and was occupied by the Germans in 1941–44. It was renamed Belgorod-Dnestrovski after its capture by the Soviet army in 1944. The old Genoese-Moldavian fortifications still survive. Wine producing and fish canningare its chief industries. (R. A. F.)

BELGRADE (Serbo-Croatian, BEOGRAD, "white fortress"), the capital of the Federal People's Republic of Yugoslavia as well as of the people's republic of Serbia, lies at the confluence of the Sava and Danube rivers. Its highest point is 146 m. (479 ft.) above sea level. Pop. (1961) 587,899. City area 629.1 sq.km. (242.9 sq.mi.). Situated on a ridge that extends 10 mi. S. of the old fortress (Avala hill, 511 m. [1,676 ft.]), Belgrade spreads fanwise southward and southeastward in the directions imposed by both location and history. Since World War II a new town, New Belgrade, has been developed on the plain to the north, between the left bank of the Sava and the right bank of the Danube.

Belgrade has several boulevards and avenues with names reflecting the country's recent history, such as Marshal Tito avenue, running south from Terazija, the central shopping area, and the Boulevard of the Revolution running southeast. Historic names have been retained in streets like Dusan, through the northern part of the city, Milos the Great, crossing the southern side to the west, and Karadjordj, on the western edge along the Sava. Old buildings preserved include the citadel (1725–36) with the Kalemegdan park, the Dositej museum (1780), Prince Milos cottage (1831) and the cathedral (1845). Among the more notable



BY COURTESY OF YUGOSLAV INFORMATION SERVICE

FORTRESS OF KALEMEGDAN. BELGRADE. YUGOS. (1725–36)

newer buildings are the National Assembly (1928), the tall Albanija house (1936), the Trade Union building (1957) and the Metropol hotel (1957). Public transport is by street car, bus and trolley bus, covering about 224 km. (140 mi.) of routes.

The capital has more than 260 schools, a university (founded 1863) and other institutions of higher education and research. There are also ten museums, four large archives (federal, republican, municipal and army), two public libraries, and a philharmonic orchestra. The Serbian Academy of Sciences is also located there.

Belgrade is an important communications centre. Railways and roads link it with Italy, Austria, Hungary, Rumania, Bulgaria and Greece, and roads with Albania. A 390-km. (244-mi.) road runs to Zagreb. More than 1,000,000 tons of freight is carried annually along the Sava and the Danube to its two ports. The airport at Zemun, to the northwest across the Sava, links the city with European capitals, and Yugoslav airlines provide many internal services.

The city is also a commercial and industrial centre. The extensive grounds of the Beograd fair (1957), with its monumental pavilions and unique architectural conception, are located in a park on the right bank of the Sava. In the early 1960s the city had about 150 industrial enterprises including various branches of production, predominantly consumer goods. In these enterprises and in commerce about 21% of the population found employment, while more than 20,000 persons were engaged in the handicrafts with their several thousand smaller workshops.

History.— Because of its exceptionally favourable position as a centre of land and river communications and its dominating situation overlooking the Pannonian plain to the northeast, the site where Belgrade stands has attracted various peoples since ancient times. The first fortress, on the hilly right bank of the confluence, was built by the Celts in the 3rd century B.C. and was known until the 7th century A.D. as Singidunum ("fortress on water" or "fortress of the Sings"). Within the walls of this citadel, subsequently enlarged, the town of Belgrade grew up. In the course of countless armed conflicts it was often destroyed, only to be rebuilt. and it changed masters many times. The Romans seized it from the Celts and in the 1st century A.D. it was the harbour for a considerable portion of the Roman Danubian fleet. From the 4th to the 6th century it was held by the Huns, Sarmatians, Goths and Gepids, but it was reconquered by the emperor Justinian. At the end of the 8th century the Franks captured it under Charlemagne, and the Bulgars held it from the 9th to the 11th century, when it was conquered by the emperor Basil II for Byzantium. It was later held successively by Greeks, Bulgars and Hungarians. In the 14th century it came under the rule of the Serbian kings and, under Stephen the Tall, it was proclaimed a capital for the first time. The despot, George Brankovic, surrendered the town to the Hungarians in 1427. From 1521 onward it was in the hands of the Turks, who called it Darol-i-Jehad ("home of wars of the faith"). Three times (1688–90, 1718–39 and 1789–92) it was occupied by the Austrians. who called it Griechische Weisseburg.

After the first Serbian uprising under Karageorge in 1804, Belgrade was the Serbian capital during 1807–13, but the Turks recaptured it and only in 1867 were they forced to surrender the citadel to the Serbs, whose rights were confirmed by the treaty of Berlin in 1878. From then on the town began to develop rapidly and between 1874 and 1910 its population grew from 27,605 to 89,816. During World War I the Austrians succeeded in occupying Belgrade on Dec. 2, 1914, but only for 12 days. The defense of the city against a further attack in Sept.–Oct. 1915, in which nearly the entire population took part, is legendary. It fell to the invaders on Oct. 9.

From Dec. 1, 1918, Belgrade was the capital of the kingdom of Yugoslavia. Much modern planning and building took place and the city began to lose what remained of its Turkish appearance. In 1921 it had a population of 111,740, and by 1931 it had 266,849. New residential suburbs grew on the south and southeast, while the adjacent town of Zemun. on the left bank of the Sava. was included in the city area. The old fortress of Kalemegdan is now a historical monument; its former glacis was replanned as a garden from which is seen the famous view of the plain across the Sava and the Danube.

On April 6, 1941, Belgrade was heavily bombed by the German air force, and a few days later it was occupied by the German army. It was liberated on Oct. 20, 1944, by units of the Yugoslav National Liberation army assisted by the Soviet army.

In Sept. 1961 Belgrade was the site for a meeting of more than 20 delegations from nonaligned nations of Asia. Africa and Latin America to discuss world disarmament, colonialism and the problems facing emerging nations of the world. (JO. MA.; K. SM.)

BELGRANO, MANUEL (1770–1820), the principal military leader early in the Argentine war for independence, was born on June 3, 1770, in Buenos Aires. Trained in law at Spanish universities. he was appointed secretary of the Buenos Aires official merchant's guild and became an advocate of liberal ideas. He received his first military experience at the time of the English invasion in 1806. After the viceroyalty of the Rio de la Plata broke with Spain (May 1810), Belgrano became a member of the junta and in 1811 was sent as commander of a small army to bring Paraguay under the authority of that body. His forces were repulsed. Later he was successful in defeating royalist forces at Tucumán and Salta in the Argentine northwest, only to be decisively defeated in that area in 1813. Belgrano was replaced as commander of the army in 1814 by José de San Martin (*q.v.*) and soon departed with Bernardino Rivadavia (*q.v.*) on an unsuccessful diplomatic mission to Europe. Like other leaders of South American independence Belgrano favoured the establishment of a monarchical type of government, and his European mission had as its purpose the furtherance of this goal. He died in Buenos Aires on June 20, 1820. See ARGENTINA: History.

(T. F. MCG.)

BELHAVEN AND STENTON, JOHN HAMILTON, 2ND BARON (1656–1708), one of the promoters of the revolution of 1689 in Scotland, was later prominent as a vigorous opponent of the union between England and Scotland. He was born on July 5, 1656, the eldest son of Robert Hamilton, Lord Presmennan (d. 1695), and succeeded to the title of Belhaven and Stenton through his wife in 1679. In 1681 he was briefly imprisoned for speaking slightingly of James: duke of York, in the Scottish parliament, and in 1689 he was among those who asked William of Orange to undertake the government of Scotland. Belhaven was at the battle of Killiecrankie (July 27, 1689) and was made a member of the Scottish privy council the same day. Passionately opposed to the Act of Union, he made, in the Scottish parliament on Nov. 2, 1706, a speech against this proposal which attracted much attention and was included by Daniel Defoe in his History of the Union, 2nd ed. (1786).

Shortly afterward Belhaven was imprisoned on suspicion of favouring a projected French invasion. He died in London on June 21, 1708.

BELIEF, a mental attitude of acceptance or assent toward a proposition. The different degrees of belief may be roughly indicated by the following scale: (1) surmising or suspecting; (2) opinion; and (3) conviction. Some philosophers have held that believing is an introspectable occurrence, either an intellectual act (an act of "judging") or, as Hume maintained, a special sort of feeling. Such an intellectual act does sometimes occur when we make up our mind to accept a proposition after a period of doubt, and it may recur subsequently when me again consider the proposition. Moreover, when we compare a proposition which we believe with another about which we have no belief, it does seem to be true that the two propositions "feel different," as Hume indicated. But a belief-attitude manifests itself in many other ways as well. It manifests itself by what we do in circumstances to which the proposition believed is relevant; by our decisions and the degree of confidence or of hesitation with which we take them; by the inferences which we draw; and by the surprise which we feel if the proposition turns out to be false. To mention only one example. a man shows his belief that a chair will support his weight by sitting down on it, without any belief-feeling or any act of judgment.

Belief "in" and Belief "that".— It is often said that believing "in" someone or something is quite different from belief "that," where what is believed is a proposition. The most important case

of belief "in" is belief in God. But we also speak of someone's belief in a person, in an institution, in a policy or in a method, and even of belief in oneself or one's own powers. The distinction is important, but should not be pressed too far. Believing "in" is an emotional and conative attitude and contains an element of valuation or approval. But a cognitive attitude, the acceptance of a proposition, is also an essential constituent of it. To believe in God, one must accept the proposition that God exists.

Reasonable and Unreasonable Belief.—A reasonable belief is one which is in accordance with the evidence. The evidence for a proposition is some known fact or facts which increase the probability of the proposition; the evidence against a proposition is some known fact or facts which decrease its probability. Moreover, if one believes reasonably, the degree of one's belief varies with the strength of the evidence. It would be unreasonable to be absolutely convinced that a book has been stolen, merely on the ground that it is not in its usual place on the shelf. It would be equally unreasonable if we merely surmised or suspected that it has rained in the night, when we find that the streets are wet at seven o'clock in the morning. A reasonable belief, of course. may be mistaken. It was reasonable for primitive people to believe that the sun was much smaller than the earth: the evidence which they had supported that proposition. Equally. an unreasonable belief may happen to be correct. I may believe that Jones is at home. on no evidence at all and merely because I wish to see him; my belief is unreasonable, but he may in fact be at home. It is also important to notice that the reasonableness or unreasonableness of a belief is determined by the evidence which the believer himself has. Facts, however relevant, which he does not happen to know are not evidence for him, though they may he for other people. Finally, one may have good evidence for a proposition although one cannot recall the evidence to mind. The estimates or judgments of experts are sometimes of this kind, being determined by a long series of relevant experiences which cannot be recalled in detail. The expert has reasons for his judgment but cannot *give* reasons for it, not even to himself.

Belief and Knowledge.—It is never a contradiction to say "What *A* believes is false," but it is, of course. a contradiction to say "What A knows is false." Even when the proposition believed is in fact true. the belief need not amount to knonledge. A belief which is correct but unreasonable (based on no evidence) cannot he counted as knowledge. Even a belief which is both reasonable and correct may still fall short of knowledge. I may believe that it will he a fine afternoon. because the barometer has risen. My belief is reasonable and may also turn out to be correct; hut it does not amount to kno ledge, because my evidence. though quite strong, is by no means conclusive. Thus if knowledge is to he defined in terms of belief, (1) the proposition believed must he in fact true, and (2) the believer must have conclusive evidence for it. In some cases, however, the only way to get conclusive evidence for a proposition is by direct observation of the state of affairs which makes the proposition true. This observation is knowledge, but knowledge of this kind falls outside the sphere of belief altogether.

BELINSKI, VISSARION GRIGOREVICH (1811–1848), eminent Russian literary critic, "father" of the Russian radical intelligentsia. Born in Sveaborg, Fin., July 12 (new style; June 30, old style), 1811, son of a drunken provincial doctor who resented the boy's brilliance, Belinski was expelled from Moscow university (1832) and earned his living as a journalist. His first substantial critical articles, "Literary Dreams" (published in the newspaper *Molva,* 1834), expounded F. W. J. Schelling's view of national character, applying it to Russian culture, though Belinski later embraced Hegel's philosophy of history. He obtained a permanent post (1839) with the journal *Otechestvennye zapiski.* By 1840 he was showing signs of revolt against orthodox Hegelianism.

Belinski's judgment of literary excellence was sound and sensitive and his articles on Pushkin, Lermontov and Gogol combined enthusiasm with perspicacity. Though his excitement about reshaping the world cannot be held responsible for the later tendency to evaluate art on purely political grounds, his bombastic patriotism led his cruder disciples to introduce into Russian literature the chronic ethical itch and journalistic shoddiness which nearly destroyed it as an art.

Some Soviet critics, tearing his rare political utterances from their context, consider his almost accidental contribution to the Russian "national" type of socialism his principal achievement. In fact he devoted his life to the promotion of literature, philosophy and art, and thought the success of social education depended upon the success of literature, since education derived from the effect literature had on the ideas and conduct of society. In 1846 Belinski joined the review *Sovremennik,* for which he wrote more soberly about literature's slow task of helping the still embryonic Russian nation to develop into an adult civilized society, In 1847 he wrote his famous letter to Gogol, denouncing the latter's *Vybrannye mesta iz perepiski s druzyami* as a betrayal of the Russian people because it preached submission to church and state.

Belinski died June 7 (N.S.; May 26, O.S.), 1848, in St. Petersburg.

BELISARIUS (*c.* 505–565), Byzantine general, one of several able military commanders who served the emperor Justinian I. He first won his military laurels at the age of 25, as commander of the east, by a victory over the Persians at Daras (530). Defeated in the following year, he was recalled to Constantinople, but with honour, and while there saved the throne for Justinian by putting down the Nika revolt in the city with a handful of mercenaries (532). In 533 Justinian sent an expedition under Belisarius against the Vandal kingdom of North Africa. In 534 Belisarius returned to Constantinople in triumph, at the peak of his career, having defeated the Vandals and taken prisoner their king. He was next sent to reconquer Italy from the Goths. In 535 he invaded Sicily, and in 536 went on to take Naples and Rome, which he held for a year against the whole strength of the Goths. Reinforcements were sent and he was able to rout the enemy and take Ravenna (540).

The Goths had wished to proclaim him emperor, and in spite of his refusal he was recalled and coldly treated by Justinian. The pretext for his recall was the renewed danger from the Persians under King Khosrau I, and from 541 to 544 he fought again on that front, but the revival of the Gothic forces caused him to be sent back to Italy. He spent five years of indecisive campaigning there with inadequate forces until his recall in 549. In 559 a vast horde of Bulgars penetrated to the walls of Constantinople and Belisarius came out of retirement to drive them off at the head of a makeshift army.

Belisarius was hampered throughout his career by the suspicion of Justinian, who never wholly trusted him, in spite of his proved loyalty. In 562 he was imprisoned and his fortune confiscated on a charge of conspiring against the emperor. but he was restored to favour (563) before his death. There is no truth in the later legend of his being blinded and reduced to beggary.

Belisarius was above all a cavalry commander, a great tactician rather than a strategist. He went into battle leading his own household cavalry, and by his personal courage and the simplicity and force of his character became the idol of his soldiers. These were of mixed race and difficult to control, but he maintained stern discipline, and applied his Christian and humane principles to the conduct of war. He was usually accompanied on campaign by his wife. Antonina, a friend of Theodora (*q.v.*), Justinian's wife. Belisarius was one of the last Roman citizens to receive the consulship (in 534, as a reward for his Vandalic victory).

BELIT, the Semitic name of NINLIL, wife of the Sumero-Akkadian god Enlil, or Bel (*q.v.*). She was "lady of heaven and earth" and was worshiped, especially at Nippur, throughout the recorded history of pre-Christian Mesopotamia. In the epilogue to his code of laws Hammurabi prays that she will use her influence in the place of judgment of Enlil against any who violate or use despitefully his code or stele. Like her husband, she is a deity of destiny.

On Assyrian documents she is sometimes identified with Ishtar of Nineveh and sometimes made the wife of either Ashur (*q.v.*) or Enlil. *See* also BABYLONIA AND ASSYRIA: *Religion: Sumerian Pantheon.*

BELIZE, the capital and principal seaport of British Honduras (*q.v.*), on the Caribbean coast of Central America, occupies both banks of the Haulover river, a delta mouth of the Belize river. Pop. (1960) 32,824. Various explanations have been given for the name Belize. It is probably derived from an ancient Maya Indian word for the Belize river, which was until the 10th century a heavily populated trade artery of the ancient Maya Indians. The first British settlement was established apparently in the 17th century. Belize is built on ground that is only a little above sea level and is surrounded by mangrove swamps. It was severely damaged by a hurricane and accompanying tidal wave on Oct. 31, 1961, and plans were made to rebuild it on an inland site not liable to flooding. The annual temperature range is from 55° to 95° F. with a mean average of 78° F. The climate is mitigated by sea breezes.

The houses are mostly built of wood, with verandas, and are raised on piles for coolness. They are roofed with corrugated iron or asbestos-cement sheets. Many of the modern buildings are of concrete. Palms and flowering trees and shrubs beautify the town. St. John's cathedral was built in 1812 and Government house in 1814. The town possesses an institute devoted to the arts and drama, technical and teachers' training colleges, and hotels. Belize is linked by motor roads with all the district towns except those in the Toledo (southernmost) district. There is a municipal airport for light airplanes at the northern end of the town, and an international airport, Stanley field, 10 mi. W. The chief exports are mahogany, cedar and other timbers (both millwood and in the round), coconuts, copra, maize and other agricultural products, furniture, boats and other wood manufactures. (A. H. AN.)

BELJAME, ALEXANDRE (1843–1906), French professor of English literature, author of the erudite and eminently readable *Le* public *et les hommes de lettres en Angleterre au XVIIIe siècle* (1881, 2nd ed., 1897; Eng. trans. 1948), was born at Villiers-le-Bel (Seine-et-Oise), Nov. 26, 1843. He was first on the list of *agrégés* in 1868, and later occupied with distinction a chair of English at the Sorbonne which had been specially created for him. In 1905–06 he was Clark lecturer on English literature at Trinity college, Cambridge. He died at Domont (Seine-et-Oise), Sept. 17, 1906. (J. G. CK.)

BELKNAP, WILLIAM WORTH (1829–1890), U.S. politician and Civil War general, was born at Newburgh, N.Y., on Sept. 22, 1829. He studied law and practised that profession in Iowa during the 1850s. He entered the Union army in 1861 as major of the 15th Iowa volunteers. In the Atlanta campaign under Sherman he gained distinction, rising to the rank of brigadier general in 1864 and major general in 1865. After the war he became collector of internal revenue for Iowa, leaving that post in 1869 to become secretary of war. In 1876 he was impeached by the house of representatives on charges of corruption. He resigned, was acquitted by the senate and the charges were never definitely proved. He died at Washington, D.C., on Oct. 13, 1890.

BELL, ALEXANDER GRAHAM (1847–1922), U.S. inventor and physicist, inventor of the telephone, was born in Edinburgh, Scot., on March 3, 1847. He was educated at Edinburgh university and the University of London, and, because of ill-health, moved with his father to Canada in 1870. In 1872 he opened a school in Boston for training teachers of the deaf and also gave instruction in the mechanics of speech. The following year he became professor of vocal physiology in Boston university. In 1876 he exhibited an apparatus embodying the results of his studies in the transmission of sound by electricity, and this invention, with improvements and modifications, constitutes the modern telephone (*q.v.*). He was also the inventor of the photophone, an instrument for transmitting sound by vibrations in a beam of light, and of phonographic apparatus. Later, he interested himself in the problem of mechanical flight. He gave numerous addresses and published many scientific monographs. Bell was the founder of the American Association to Promote the Teaching of Speech to the Deaf, and of the Volta bureau for the increase of knowledge relating to the deaf. He was for a time president of the National Geographic society and was appointed a regent of the Smithsonian institution by congress in 1898. He died on Aug. 2, 1922, at his summer home near Baddeck, Nova Scotia.

See C. D Mackenzie, *Alexander Graham Bell* (1928).

BELL, ALEXANDER MELVILLE (1819–1905), British-U.S. teacher of elocution and author, was born at Edinburgh, Scot., on March 1, 1819. He was the son of Alexander Bell, an early authority on phonetics and speech therapy, and the father of Alexander Graham Bell (*q.v.*). Melville Bell lectured on elocution at Edinburgh university from 1843 to 1865 and at University college, London, from 1865 to 1870. In 1870 he moved to Canada, teaching linguistics and philology at Queen's college, Kingston, Ont. He went to Washington, D C , in 1881, to be with his son, and lived there until his death on Aug. 7, 1905.

Striking in appearance, an excellent teacher and lecturer and a prolific writer, Bell exercised an important influence on the development of speech education. His most valuable and original scientific contribution was probably his system of "visible speech." He analyzed the positions assumed by the speech organs as they produce sounds and then invented symbols that depicted all the modes of action of throat, tongue and lips in speech formation and that could therefore represent any sound human speech organs are capable of uttering *(Visible Speech: the Science of Universal Alphabetics,* 1867). Bell's system provided a basis for subsequent international phonetic alphabets and for later graphic symbol systems for teaching the deaf. (R. L. McC.)

BELL, ANDREW (1753–1832), Scottish clergyman and pioneer of a system of education by mutual tuition, was born at St. Andrews on March 27, 1753. He graduated there and went as a tutor to Virginia, where he made a small fortune growing tobacco. After ordination in the Church of England, he went to Madras, India, where he introduced into an orphan school a "monitorial" plan which overcame the problem of the shortage of teachers by putting the better pupils to instruct the slower ones. On his return to London in 1797 he published *An Experiment in Education* which explained the advantages of his system, but his ideas had little popularity in England until they were adapted by Joseph Lancaster (*q.v.*), with whom Bell quarreled, in a school opened at Southwark in 1801 and by Robert Owen (*q.v.*) in New Lanark. Meanwhile (1801) Bell was rector of Swanage, Dorset. In 1811 he became superintendent of the National Society for Promoting the Education of the Poor in the Principles of the Established Church, a society newly formed to put his schemes into effect. He was master of Sherburn hospital, Durham (1809), canon of Hereford cathedral (1818) and prebend of Westminster (1819). He died at Cheltenham on Jan. 27, 1832, leaving a large fortune to endow educational schemes in Scotland.

See J. D. Meiklejohn, *An Old Educational Rejormer* (1881).

BELL, SIR CHARLES (1774–1842), Scottish anatomist, noted for his contributions to the study of the brain and nervous system, was born at Edinburgh in Nov. 1774. Educated at the high school and the University of Edinburgh, he devoted himself chiefly to the study of anatomy. under the direction of his brother John. In 1802 he published a series of engravings showing the anatomy of the brain and nervous system taken from dissections made for the lectures or demonstrations he gave on the nervous system. In 1803 he moved to London. Before leaving Edinburgh,

he had written his work on the *Anatomy of Expression,* in which he gave a rational explanation of the muscular movements which usually accompany the various emotions and passions.

In 1811 Bell published his *New Idea of the Anatomy of the Brain,* in which he announced the discovery of the different functions of the nerves corresponding with their relations to different parts of the brain; his latest researches were described in *The Nervous System of the Human Body* (1830), a collection of papers read by him before the Royal society. He confirmed François Magendie's discovery that in the nervous trunks there are special sensory filaments, the office of which is to transmit impressions from the periphery of the body to the sensorium, and was the first to discover that the anterior roots of the spinal nerves contain special motor filaments which convey motor impressions from the brain or other nerve centre to the muscles.

Bell also showed that some nerves consist entirely of sensory filaments and are therefore sensory nerves; others are composed of motor filaments and are therefore motor nerves; while a third variety contains both kinds of filaments and is therefore to be regarded as sensory-motor. These discoveries are regarded as the greatest in physiology since that by William Harvey of the circulation of the blood.

In the year 1812 he was appointed surgeon to the Middlesex hospital, a post he retained for 24 years. He was also professor of anatomy, physiology and surgery to the College of Surgeons of London, and for many years teacher of anatomy in the school which used to exist in Great Windmill street. In 181j he went to Brussels to treat the wounded of the battle of Waterloo. In 1836 he accepted the chair of surgery in the University of Edinburgh. He died at Hallow Park near Worcester on April 28, 1842.

Bell's chief works, other than those mentioned above, are: *System of Comparative Surgery* (1807); *Lectures Concerning the Diseases of the Urethra* (1810); *Quarterly Reports of Cases in Surgery* (1816–18); *Observations on Injuries of the Spine and of the Thigh Bone* (1824); and *Practical Essays* (1841).

(A. B. L.)

BELL, CHARLES FREDERIC MOBERLY (1847–1911), British journalist who played an outstanding part in the management of the *Times* (London) during a troubled period, was born in Alexandria, Egypt, on April 2, 1847. Educated privately in England, he returned to Alexandria in 1865 to work for a commercial firm, but soon established an informal connection with the *Times,* and in 1875 became official correspondent. In 1880 he helped to found the *Egyptian Gazette.* It was after a visit to Egypt by A. F. Walter, chief proprietor of the *Times,* that Bell was invited, in 1890, to assist in the paper's management. Its fortunes were at a low ebb after the Parnell-Pigott scandals *(see* PARNELL, CHARLES STEWART), but although Bell was somewhat out of touch with technical developments, his strong will, courage and industry enabled him to keep the paper alive. He reorganized the foreign department, writing personally to correspondents abroad, formed a publications department and founded *The Times Literary Supplement* (1902) and *The Times Educational Supplement* (1910). He was associated with H. E. Hooper in the sale of the reprint of the ninth edition of the *Encyclopædia Britannica* (1898) and of the tenth edition (1902–03). He was also an enthusiastic supporter of Hooper in the formation of the Times Book club in 1905. In 1908, despite much opposition, he brought about the sale of the paper to Lord Northcliffe. He became managing director of the newly formed publishing company, a post he retained until his death. in his office chair, on April 5, 1911.

BELL, GEORGE KENNEDY ALLEN (1883–1958), Anglican bishop of Chichester, outstanding leader of the ecumenical movement and advocate of the arts and drama in the service of religion, was born on Feb. 4, 1883, son of the vicar of Hayling Island, and educated at Westminster school and Christ Church, Oxford. After ordination in 1907 he was curate of Leeds parish church from 1907 to 1910 and student (*i.e.,* fellow) of Christ Church from 1911 until 1914, when he became chaplain to Archbishop Randall Davidson, obtaining widespread recognition for his unusual ability, discernment and industry. In 1924 he became dean of Canterbury, where he formed the Friends of Canterbury Cathedral. In 1929 he became bishop of Chichester. After the rise of Hitler, Bell secured asylum in England for Jews and non-Aryan Christians. During the decade 1929–39 he played a prominent part in movements for reunion of the churches, and established close relations with the German Confessional Church. During World War II, he became widely known as a critic of obliteration bombing. In 1942 he paid a visit to Sweden, where suggestions for peace with a non-Nazi government in Germany were given to him to relay to the British government. After the war he resumed contact with the German church and became a tireless itinerant on behalf of the ecumenical movement (*q.v.*) and the World Council of Churches (*q.v.*), of which he was first chairman and then president. He criticized the decision of the British government to manufacture nuclear weapons, and was a prominent speaker in the house of lords on a variety of problems, including Cyprus. Meantime he was active in urging a readjustment of the relations of church and state in England. His literary works included a definitive biography of *Randall Davidson* (2 vol., 1935), *The Modern Parson* (1928), *Christian Unity* (1948) and four volumes of *Documents on Christian Unity.* As bishop he was a true pastor and father in God, beloved by clergy and laity, and was recognized far beyond the borders of the Anglican communion as an apostle of unity. He died at Canterbury on Oct. 3, 1958. (N. S.)

BELL, GERTRUDE MARGARET LOWTHIAN (1868–1926). English traveler and administrator in Arabia, was born at Washington Hall, County Durham, on July 14. 1868, the daughter of Sir Hugh Bell, bart. Her brilliant career at Oxford, where she took a first in history in 1887, was followed by some time in Teheran, where her uncle Sir Frank Lascelles was British minister. Returning to the life of political and intellectual salons in England and Europe for a decade, it was not until 1899 that she embarked on the career of Arabian activities that made her famous. Visiting Palestine and Syria in that year, she was frequently back in the middle east during the following decade, extending her travels to Asia Minor. But her heart was set on an Arabian journey, which she began in 1913, being the second woman (after Lady Anne Blunt) to visit Ha'il, where she was not very favourably received, although she ever afterward favoured Ibn Rashid as against the Ibn Sa'ud dynasty. She never wrote a full account of this journey, though her literary output during the 20 years preceding World War I had been considerable, comprising *Safar Nameh* (1894); her translation, *Poems From the Divan of Hafiz* (1897); *The Desert and the Sown* (1907); *The Thousand and One Churches* (1909); and *Amurath to Amurath* (1911). She had always been a voluminous correspondent, and her letters, severely pruned to suit the taste of a touchy generation, were published in two volumes by her stepmother in 1927. But perhaps her greatest work was a masterly official report on the administration of Mesopotamia during the difficult period between the Armistice of 1918 and the Iraq rebellion of 1920. After a short period of war work in England and France she had plunged into the rough-and-tumble of middle east politics, mainly in Mesopotamia, where she served in turn under Sir Percy Cox, Sir Arnold Wilson and again Sir Percy Cox. That she exercised great influence on Cox is undeniable, and she played a principal part in the establishment in Baghdad of the Hashemite dynasty. The last three years of her life were devoted to the creation of an archaeological museum at Baghdad, which is her monument in the land she loved and served so well. She died in Baghdad on July 12, 1926.

(H. ST. J. B. P.)

BELL, HENRY (1767–1830), Scottish engineer who first placed a steamboat on the Clyde, was born at Torphichen, Linlithgowshire, in 1767. He was apprenticed to his uncle, a millwright, and then to a shipmodeler at Borrowstounness. He then went to London, where he found employment under John Rennie. Returning to Scotland in 1790, he first settled as a carpenter at Glasgow and afterward removed to Helensburgh on the Firth of

Clyde. In 1800 he submitted proposals to the British admiralty for the steam propulsion of vessels. His own steamboat, the "Comet" of 28 tons, launched at Port Glasgow in July 1812. was the first to attain commercial success in Europe.

Henry Bell died at Helensburgh on Nov. 14, 1830, A monument to his memory stands on the banks of the Clyde, at Dunglass, near Bowling.

See E. Morris, *Life of Henry Bell* (1844); *H.* P. Spratt. *The Birth of the Steamboat* (1958). (H. P. St.)

BELL, JOHN (1691–1780), Scottish traveler and doctor whose vivid accounts of his journeys did much to throw light on the contemporary way of life of the peoples of Russia and the east, was born at Antermony in 1691. After qualifying as a doctor he decided to travel and in 1714 set out for St. Petersburg where he joined an embassy departing for Persia. Returning to St. Petersburg in 1718, Bell spent the next four years in an embassy to China. passing through Siberia and Mongolia. Scarcely had he rested from this last journey when he was summoned to accompany Peter the Great in his expedition (1722) to Derbent and the Caspian Gates. In 1737 he was sent by the Russian government and the British minister on a mission to Constantinople, afterward settling there as a merchant. He retired to his estate of Antermony in 1747, living there until his death on July 1, 1780. His Travels, published in Glasgow in 1763, went through many editions and were reprinted in J. Pinkerton's Voyages and Travels (vol. vii, 1811).

BELL, JOHN (1796–1869), U.S. political leader, was born on a farm near Nashville, Tenn., Feb. 18. 1796, soon after the state's admission to the union. He graduated from Cumberland college (later University of Nashville) in 1814. Two years later, before he was 21 years old, he began to practise law in Franklin, Tenn. In 1817 he was elected to the state senate, but served only one term. In 1827 he won a seat in the U.S. house of representatives, defeating the distinguished Felix Grundy, and continued to serve until 1841. From June 1834 to March 1835 he served as speaker of the house. Although Andrew Jackson, also a Tennessean, actively opposed his election in 1827, Bell entered congress as a Jackson Democrat. Largely as a result of the bank controversy, he broke with Jackson in 1834 and supported Hugh Lawson White for president in 1836. After White's defeat Bell became a Whig, and in March 1841, as a re ard for party service, was made secretary of war in Pres. William Henry Harrison's cabinet. A few months later, after the death of President Harrison, he resigned this post as a result of the break between President Tyler and the Whigs led by Henry Clay. From 1841 to 1847 Bell practised law and supervised his coal and iron business. The state legislature elected Bell to the U.S. senate in 1847. Although a large slaveholder himself, he opposed efforts to expand that institution. As a senator he vigorously opposed President Polk's Mexican War policy, the Compromise of 1850, the Kansas-Nebraska bill and the attempt to admit Kansas as a slave state. After the disintegration of the Whig party Bell co-operated with (but never joined) the "Know-Nothings," yet always referred to himself as a member of the "Opposition." His conservatism and vigorous defense of the union brought him the nomination for president on the Constitutional Union ticket in 1860, but he carried only Virginia, Kentucky and Tennessee. He opposed secession and insisted that Lincoln's policy would be moderate. However, following Lincoln's call for troops, he openly advocated resistance and henceforth classed himself a rebel. He spent the war years in retirement in Georgia, returning to Tennessee in 1865. He died at his home near Dover, Sept. 11, 1869.

See J. *H.* Parks; *John Bell* of *Tennessee (1950).* (J. H. Pa.)

BELL, LAWRENCE DALE (1894–1956), U.S. aircraft designer, was one of the few aviation pioneers whose active career extended well into the era of supersonic jet aircraft. Born in Mentone, Ind., April 5, 1894, Bell saw his first airplane in 1910. Two years later he entered the aviation business as a mechanic for his brother, Grover Bell.

When his brother was killed in an airplane accident in 1913, "Larry" Bell decided to quit: but the attraction of flying was too great, and he went to work for another of the great pioneers. Glenn L. Martin. At the time of his death Bell was the still active head of one of the great manufacturing companies of America, Bell Aircraft Corp. Bell fighter airplanes, including the P-39 Airacobra, were widely used in World War II. Bell was entrusted with the design of the first jet aircraft in America, the XP-59A fighter, originally powered by two British Whittle engines, which made its first flight on Oct. 1, 1943. In 1947 Bell's experimental X-I rocket-propelled airplane was the first to break the so-called sonic barrier in level flight. Bell was awarded the Collier trophy, the Guggenheim medal and a presidential citation. He died in Buffalo, N.Y., Oct. 20, 1956. (S. P. J.)

BELL, a percussion instrument, usually of metal, made to vibrate by the action of a clapper within the bell or by a hammer striking the bell from outside.

Bell Founding.— The identifying characteristic of the bell is the campaniform. The earliest bells were probably beaten out of flat plates. until at the advent of the metal age small bells began to be cast. Later the art of casting was either lost or failed to spread as fast as civilization did, with the result that riveted plate bells came into being. Then, about the 8th century, casting was resumed and, from that time on, all bells with worthwhile musical tones have been cast of bronze.

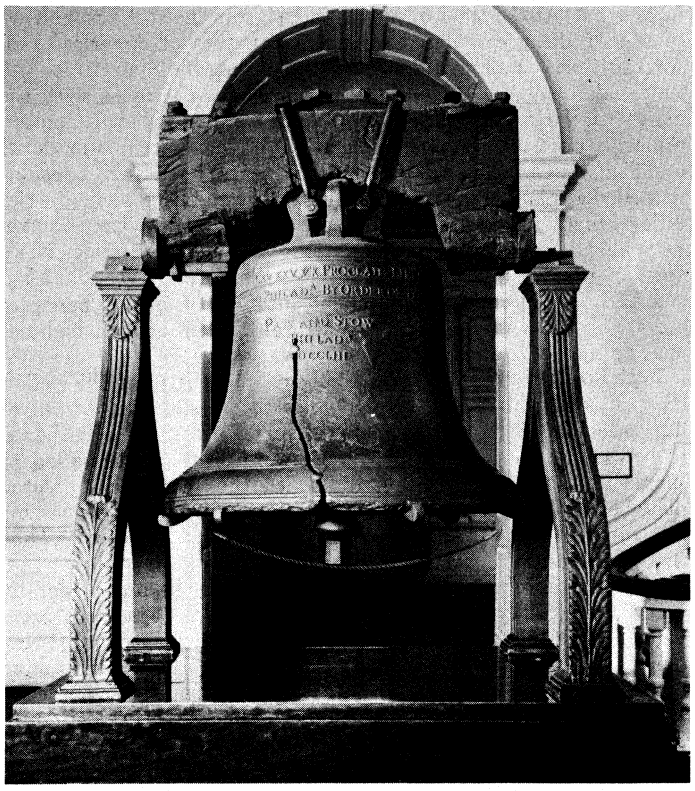
A bronze alloy of 77% copper and 23% tin is now generally used. Other alloys have been used in the past. The bells excavated at Nimrud by Sir Austen Henry Layard (see below) were ten parts copper to one of tin; other mixtures have been found in bells from widely different locations. While other metals such as iron, steel, gold, silver, zinc and lead have been used, in combinations and alone, none has been found that can compare in tone value with the clean bronze alloy of the early 1960s.

Resumption of bronze casting led to the primitive bell form, a type of the tintinnabulum whose height was greater than its diameter. Constant striking by the clapper caused the early bells to crack, since their walls were about the same thickness from the top ring to the edge of the lip. Later a ring of metal was added to the lip of the bell to strengthen it at the point of clapper impact. Curiously. this thickening of the lip improved the tone of the bell. It is now known that the strike tone, the main tone of the bell. is dependent upon the thickness of the lip. The primitive bell, invariably convex from top to lip, resembled a beehive in shape, and later became even more like one when rings were cast around the sides.

Early in the 13th century, the shape of the bell made a definite break with all primitive forms. The hallmark of the new form was a change in the waist from convex to concave, scarcely noticed at first as the waist became almost straight and potlike. Then, as the superior tone of the new shape was noted, the bell took on the gradually inward-sloping sides that are now used. Known as the archaic bell, this type evolved, through flattening of the crown, squaring of the shoulders, flaring of the sides down to the mouth or the sound bow and variations in its wall thickness, into the modern bell.

Originally, bells were often founded with considerable ceremony; many were beautifully inscribed. often with prayer or verse. Prayers were said while the metal was poured into the molds. The bells were then blessed by a church official, followed by thanksgiving and rejoicing.

The chief English centres of the art of bell founding in medieval times were London, York, Gloucester and Nottingham. Bells by John of York (14th century), Miles Graye (1605), Samuel Smith, father and son, of York (1680–1730), Abraham Rudhall and his descendants, of Gloucester (1684–1774), Robert Mot (16th century). Lester and Pack (1750), Christopher Hodson of London (who cast "Great Tom" of Oxford, 1681), Richard Phelps (1116) and H. Bagley (18th century) are still held in high repute. The Whitechapel Bell foundry was established by Robert Mot in the early part of the reign of Elizabeth I. It incorporated the business of the Gloucester foundry (Rudhall's), the Hertford foundry (John Briant), the Aldbourne foundry (the Wells), the Downham foundry, Norfolk (Dobson), and, as Mears and Stainbank, became one of the leading bell founders. Many of Mot's bells are still in existence, among them the fifth and seventh at



EWING GALLOWAY

THE LIBERTY BELL IN INDEPENDENCE HALL, PHILADELPHIA, PA.

Westminster abbey, cast in 1583 and 1598. Later the firm cast the original American Liberty bell, Big Ben and the famous Bow bells. The latter, which were originally cast in 1738 and 1762, were recast (with others) following their destruction during World War II. John Taylor and company, Loughborough. were the founders of "Great Paul," weighing 17 tons, for St. Paul's cathedral, London, and of "Great George," 15 tons, for the Anglican cathedral, Liverpool. The carillon in the Mountain Lake (Bok) Singing tower, Lake Wales, Fla., with its 71 bells covering a range of 4½ octaves chromatic, is a product of the Loughborough foundry. Gillett & Johnston, formerly of Croydon, built what in the early 1960s was the world's largest carillon, the 72-bell Laura Rockefeller Memorial carillon in New York city, and its companion instrument, second largest in the world, at The University of Chicago.

On the continent of Europe, famous medieval founders were Pieter van den Gheyn of Mechelen and Louvain (1554); Frans and Pieter Hemony, members of a Lorrainese family, who founded bells in Zutphen and Amsterdam (1641–77); Pieter, Matthias and Andreas Josef van den Gheyn, of Louvain and St. Trond (1717–91); Joris Dumery, of Bruges (1738–1834); four members of the Van Aerschodt family, of Louvain (1830–1926); and Ernest, Amadee and A. Jr. Bollee, of Orleans (1860–1929). Other founders include Petit & Fritsen, Aarle-Rixtel (1868) and Paccard of Annecy-le-Vieux (1895–1929).

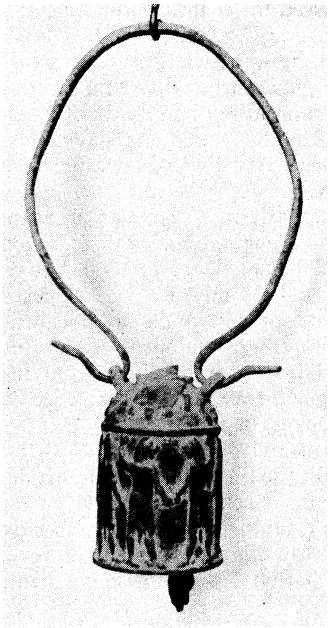
Early Bells.—The oldest bell in the world, found near Babylon, is reputed to be over 3,000 years old. China, Japan, Burma, India, Egypt and other ancient civilizations made use of bells in different forms so long ago that to trace their history is almost impossible.

Bells for horses are mentioned in Zech. xiv, 20. In Greek literature, bells are spoken of by Euripides (c. 484–407 B.C.) in his *Rhesus*. Aristophanes spoke of bells in his *Frogs*, and they are mentioned in the fables of Phaedrus The Romans Ovid, Tibullus, Martial, Statius, Manilius and Strabo all speak of bells. Plutarch's *Life of Brutus*, telling of the siege of Xanthus in Lycia, in 42 B.C., states that "their bells. on nets stretched across the river, rang when people tried to escape by suimming." Decorative ceremonial bells were reported as being hung on Lars Porsena's tomb in the 6th century B.C. and on the funeral car of Alexander the Great (356–323 B.C.). The Jewish-Roman historian Flavius Josephus wrote that "King Solomon, who reigned from 974 to 937 B.C., had large gold bells on the roof of his temple to keep the birds away." It is recorded that Gaius Octavianus (63 B.C.–A.D. 14), who later became the first Emperor Augustus, hung a bell before the temple of Jupiter. Hand bells were used in religious rites in Athens by the priests of Cybele, known to the Romans as "the great mother of the gods." Herodotus (*c.* 484–425 B.C.), the Greek historian, says that in Sparta when a king died women walked in the streets striking small bells. Thucydides, in his *History of the Peloponnesian War* (431–404 B.C.), states that during the siege of Potidaea in Macedonia the Spartan general Brasidas, hearing the bell on the sentry's uniform as he passed in the dark, raised his scaling ladders and passed inside the walls. The Bayeux tapestry depicts the ringing of hand bells at the funeral of Edward the Confessor.

Research by antiquaries proves the early use of bells. Eighty bronze hand bells, buried in a copper caldron, were found by Sir Austen Henry Layard (1817–94), excavator of Nineveh, in his further excavations at Nimrud, originally destroyed with Nineveh by the Medes *c.* 612 B.C. Small bells, similar to modern sleigh bells, have been found in ancient Peruvian tombs. All were copper and undoubtedly date to the pre-Incan era, though no earlier than A.D. 500, the beginning of the metal age in that area. No known record exists of clapper-type bells traceable to native origin having been found in the western hemisphere.

Development of the bell from its most primitive forms took two distinct directions—eastern and western. The "pot" and "bowl" were favoured in the orient, while the west later developed its bells on the "cup." The pot as used here means a hollow object with straight sides and a height exceeding its diameter; while bowl describes an absolutely convex object, with diameter far exceeding its height A cup is an object of nearly equal height and diameter, with convex sides. The bowl became the gong—a distinctly oriental instrument. The pot evolved into the Chinese and Japanese "barrel-formed" bells, with walls of equal thickness throughout and of impressive tone, though of no particular note

Western civilizations, using the cup as their general form, developed the technique of ringing bells by means of a clapper striking from the inside The bells found in Nimrud, others of cast bronze in Hyderabad, India, and still later ones in Rome—all with small finger loops on top—are those to which tintinnabulum, the onomatopoeic Latin word for anything tinkling, was first applied.



ERNEST MORRIS

ANCIENT BELL FOUND NEAR BABYLON, ABOUT 1000 B.C.

The first Christian writer to speak frequently of bells is Gregory of Tours, *c.* 585. He states that they were either struck or shaken, and even speaks of a cord used for this purpose. Credit has been given to Paulinus, bishop of Nola in Campania, Italy, for the creation of the bell resembling its modern form (*c.* 400), one writer stating that Paulinus caused a larger copper or bronze kettle to be mounted upside down at the top of the church, to "ring as a bell." On the other hand, Pope Stephen III, in 752, erected a belfry with three bells *(campanae)* at St. Peter's in Rome. It is possible that the name *campanae* led Walafrid Strabo to assert that bells were of Italian origin and from Campania.

Small bells were probably used in many places because there was no metal native to the section suitable for casting larger ones.

There mas ample copper but no tin to make bronze in Ireland. An example of substitutes is the cowbell type, brought to Ireland by St. Patrick and Palladius, the first missionaries from Rome, about AD. 450. Their bells were made from a flat plate with the corners cut out, then bent and riveted in a square or oblong shape These bells were used in Europe for nearly four centuries Many specimens of these small bells still exist, such as the bell of St. Gallen in Switzerland, believed to date from 612; the "Saufang" of Cologne dating from the 9th century, hammered round and riveted on two sides; and the "Bell of St. Patrick's Will" (in Irish, Clog Edachta Pátraic), preserved in the National Museum of Ireland.

Further references to the early history of bells are found in De *Tintinnabulis* by Hieronymous Magius. Gulielmus Durandus refers to *squilla* for the refectory, *nola* for the choir, *campana* for the steeple and *cymbalum* for the cloister Joannes Belethus writes of *tintinnabulum* for dormitory and refectory, *campana* for the tower and *campanella* for the cloister. Early Latin writers speak of *signum* in the tower—from which the Portuguese derive their words *sino* for "a bell." David is shown playing nine bells in a 14th-century psalter (Lambeth palace library Manuscript 233). The secular curfew bell was introduced in England by William the Conqueror. Bells play an important part in the rites of the Mass.

Bell Ringing and Change Ringing.—The evolution of the bell, from its archaic form to the forms in use in the 20th century, split in two directions in the west because of differences in bell-music tastes between the English and the people of the Low Countries.

In England, bell music has always been most appreciated when the bells are "clocked"; *i.e.*, rung in single note sequences as chimes and in mathematically precise "change ringing," or ringing "rounds." The people of the Low Countries found that bell music was most satisfying to them when full harmony was played from their towers. The "chiming" bell thus developed in England while on the continent of Europe the Flemish carillon-type bell was favoured. (See CARILLON.)

"Clocking" the bell consists of causing it to sound by letting it hang motionless and by pulling the clapper against the side of the bell with a rope. An alternate method was to place a striking hammer outside the bell, causing the strike to be made against the sound bow. This practice was disliked because it cracked and destroyed many of the early bells. "Chiming" the bell is achieved by swinging the bell just enough to permit the clapper to strike the sound bow, a method that provides little sound volume but permits one ringer to cause as many as three bells to ring gently. For "ringing," the bell is swung through slightly more than a complete circle, the clapper striking with its full weight against the sound bow at each change of direction or turn. The sound is thus louder and more far-reaching.

The art of scientific change ringing originated in England and is used there and in Scotland, Canada. South Africa, Australia and the United States. Change ringing is a method for producing changes in the note sequences in sets of bells numbering from 4 to 12, all tuned to notes of a major scale, with the tenor bell (largest in size and smallest in number) being the tonic or key-note while the smallest in size (largest in number) is the treble. With one ringer assigned to the rope on each bell, the rules governing change ringing are: (1) alter the sequence of the bells at each successive blow of the clappers; (2) each bell must move up or down ("hunt") in sequence only one place at a time (see Table I); (3) the first sequence is "rounds," *i.e.*, ringing down the sequence of the bell group from the treble to the tenor bell; and (4) the full composition of the changes, the "peal," is not completed until the sequence of rounds is reached again. Proper change ringing is not possible on less than 4 or more than 22 bells (see Table II). Changes are rung on 7, 9 and 11 bells, but. in each case, 8. 10 and 12 bells are used—the tenor bell remaining the last note of each sequence throughout the composition. The principal methods of change ringing. each of which has its special rules and advocates, are "Grandshire" (see Table I); "Plain Bob"; and "Stedman," named for its inventor Fabian Stedman of Cambridge, *c.* 1670.

TABLE I.—The First *20 Changes of* a *"Plain Course" of "Grandsire Triples"* (*Changes on 7* Bells)

Rounds	Rounds
1 2 3 4 5 6 7	7 5 6 1 4 2 3 (10th change)
2 1 3 5 4 7 6 (1st change)	5 7 1 6 2 1 3
2 3 1 4 5 6 7	5 1 7 2 6 3 1
3 2 4 1 6 5 7	1 5 2 7 3 6 4
3 1 2 6 1 7 5	1 2 5 3 7 4 6
4 3 6 2 7 1 5 (5th change)	2 1 5 7 3 6 1 (15th change)
4 6 3 7 2 5 1	2 5 1 3 7 4 6
6 4 7 3 5 2 1	5 2 3 1 1 7 6
6 7 4 5 3 1 2	5 3 2 4 1 6 7
7 6 5 1 1 3 2	3 5 4 2 6 1 7
	3 4 5 6 2 7 1 (20th change)

TABLE II.—*The* Number *of Changes* Possible *on Various Numbers of* Bells*

No. of bells	Name	No. of changes	Time needed			
			Years	Days	Hr.	Min.
4	Singles	24	..	...	..	1
5	Doubles	120	..	...	..	5
6	Minor	720	..	...	..	30
7	Triples	5,040	..	...	3	
8	Major	40,320	..	1	4	
9	Caters (quaters)	362,880	..	10	12	
10	Royal	3,628,800	..	105	..	..
11	Cinques	39,916,800	3	60	..	..
12	Maximus	479,001,600	37	355	..	..

*The number of possible changes on *any* series of bells may be determined, using the mathematical formula of permutations, by multiplying the number of the bells together. On three bells, only six changes or variations in the order 1 x 2 x 3 can be produced; on five bells, 1 x 2 x 3 x 4 x 5 = 120; and so on up to the astronomical total of 479,001,600 changes on 12 bells.

A relay of ringers rang 40,320 changes in 27 hours at Leeds in Kent. Eng., in 1761. Because a relay of ringers was used. this is not accepted as a true record, although it is not known to have been exceeded. In 1950 a single group of ringers at Winsford in Cheshire, Eng., rang 21,600 changes in 12 hr. 58 min., an accepted record.

Because ringing the bell, as the English preferred to do, demanded that it be rotated slightly more than a complete circle on each change of direction (a stay pawl, on a slider, stops the bell at the top of its inverted swing just as it passes the vertical centre line of motion), it nas found necessary to make the height of the bell somewhat less than its major diameter. Mounting the bell higher between its gudgeons, the pivot points around which it rotates, permitted a nearly perfect balance of the bell and reduced the muscular effort needed to sning it the many hundreds of times required for a complete set of changes. But this shortening of the height also caused a change in the tuning pattern of the ringing bell, as compared with those designed for carillon use. The result was that English bells, up to about 1895, generally produced tones composed of a different group of partials or overtones from those found in Flemish carillon bells. After that date, the Taylors of Loughborough, using data originally compiled by Canon Simpson and published in Pall *Mall* magazine, Oct. 1895, completely revolutionized the tuning of their bells, with the result that their product compared favourably in tone structure with the bells of Flanders.

The original English tone pattern was based on five main partial tones as follows: the strike, or fundamental, tone (the pitch note of the bell); a minor third and perfect fifth above the strike tone; the nominal, heard as an octave above the strike tone; and the hum tone (now a full tone), a major sixth or seventh below the strike tone on the octave of the minor third. Above the nominal, in larger bells, a major third and perfect fifth can be heard; in smaller bells they are too weak to be noted. Actually, English founders tuned only the fundamental or strike note, depending on careful design of their casting molds to cause the other partials to fall into position.

Tuning of a cast bell is achieved by placing the rough casting of the bell, as it comes out of the mold. on a lathe suitable for shaving off metal from the inside surface of the casting. Small bells are turned on a horizontal lathe, while large ones are usually machined on a vertical lathe Bell metal is removed by cutting tools, as the hell revolves in the lathe, at the points inside the bell surface where the various partial tones are produced. Ex-

treme care must be used in machining the bell, because the removal of even a fen- thousandths of an inch of metal at the wrong place can ruin the tone of a partial produced by a previously machined section. If too much metal is removed from one area, the bell will have a false tone, and the only remedy is to melt it down and recast it for tuning again. In the Cnited States, most church bells. both singly and in peals, were cast in England or cast in the U.S. by English methods.

Bells in Carillons. — The people of Flanders have worked for several centuries on their plan to have their tower bells used as true musical instruments; and this includes playing all of the intricate trills, arpeggios, runs and full harmony that are familiar to lovers of carillon music.

To achieve this result, the evolution of the carillon bell from its archaic form followed slightly different lines than did the English bell. As early as the 13th century continental founders considered it necessary for every good bell to produce three prominent notes. Frans Hemony declared in the 17th century that each true carillon bell must he designed and finished to include. in the arrangement of its partials (harmonics), three octaves, a minor third. a major third and two fifths. An analysis of the great bell of Erfurt. Germany, proves that Hemony's theory was carried out almost two centuries before his time, inasmuch as this nearly perfect bell was cast in 1497.

Flemish carillon bells, based on the research and experiments of nearly seven centuries. possess a group of partials as follows: the strike or fundamental tone (pitch note of the bell); a minor third and perfect fifth above the strike tone of the bell; the nominal, heard as an octave ahove the strike tone; and the hum tone. a full octave below the strike tone [compared with the original English tuning of the hum tone, a major sixth or seventh below the strike tone). The major third and perfect fifth above the nominal can be heard in Flemish bells of large size but are too weak to be noticed in smaller bells.

English hells are not suitable for playing in harmony, whereas the Flemish bells are perfect for this purpose. This is the major diiierence between the two types of bells, and there is little ground for preference of one over the other when the bells are to be used for clocking or ringing. It is only when a full carillon of 25 or more notes in the chromatic scale is heard that the difference in the tones of the two kinds of bells assumes major importance.

Large **Bells.**—Russia can claim the largest bells in the world. The "Tsar Kolokol" (king of bells), cast in 173.1, is the largest known. This bell, 19 ft. high, $22\frac{1}{2}$ ft. in diameter and weighing 193 tons, has never been rung. In 1737 fire destroyed its supports and its fall broke an 11-ton piece from its side. The hell at Trotzkoi weighs 171 tons. A second Moscow bell weighing 110 tons is the largest in actual use.

Other large bells are the great bell at Peking. 53 tons; Nanking, 22 tons; Olomouc, 17 tons: Vienna (1711), 17 tons; Notre Dame (1680), 17 tons; "Great Paul," St. Paul's cathedral, $16\frac{3}{4}$ tons; "Great Tom." Oxford, $7\frac{1}{2}$ tons; Independence hall bell in Philadelphia (cast by Meneely of Troy. N.Y., in 1876), $6\frac{1}{2}$ tons; "Big Ben" of Westminster, $13\frac{1}{2}$ tons (cracked); the original Wanamaker '%Founder'sbell" in Philadelphia, now owned by the Philadelphia National bank. $17\frac{1}{3}$ tons: and the Bourdon hell of the Rockefeller memorial carillon at Riverside church in New York. $18\frac{1}{4}$ tons. the largest tuned bell in the world and the largest. cast in England, supplied by Gillett & Johnston of Croydon, who also built The University of Chicago carillon with a tenor bell of $16\frac{1}{2}$ tons. The world's highest bells (700 ft.) are situated in the Metropolitan Life Insurance tower, New York city. They can be heard at the record distance of 28 miles.

Modern Bells and Electromechanical Bells. — Since the early 1930s a revolution in bells and bell uses has come about with the introduction of electronics. Because the aim of researchers was to duplicate the tonal perfection of fine-cast bells in a modern and economical way. their efforts have been to do this without infringing on the tradition of cast bells. Several electromechanical devices have been perfected for producing similar versions or perfect duplicates of the tones of fine-cast bells. In a purely electronic bell instrument the tones are generated by electronic oscillators. All of the so-called electronic units of the early 1960s used electronic amplifiers for magnifying sound generated by mechanical vibrating-tone generators.

In these instruments, a small tuned metal bar or rod is struck by a miniature hammer or clapper, just as the clapper strikes a cast bell. The impact of the hammer blow causes the rod or bar to vibrate, though the sound produced is but a very faint ping. If the tone generators are made of a bell-metal alloy similar to that used for cast bells, an electrostatic pickup unit is mounted solidly, close to the vibrating metal. If the bars are made of iron or steel. an electromagnetic unit is used.

With the electrostatic pickup unit, the physical movements of the vibrating-tone generator bar change the capacity of the pickup unit. thus causing fluctuations in the amount of electric current that passes through the unit. This causes the physical vibrations to he converted into electrical impulses: and these tiny impulses are then passed into electronic amplification devices.' There they are built up hundreds of thousands of times and passed to reproducers, which convert the electrical energy to audible sound.

With the electromagnetic pickup units, the physical vibrating movements of the iron or steel bars disturb the magnetic field of the pickup unit. This action causes fluctuation in the electrical energy created in the magnetic field, changing the physical vibrations into electrical impulses. As described above, the tiny impulses so developed are amplified and converted to audible sound.

The vibrating bars that generate the bell tones are usually straight round or flat bars. and the series of vibrations produced in them by the hammer blows contain the complete series of vibrations iound in the struck-cast bell, as well as added series over those in the bell. A pure bell tone can be produced from the small bar or rod by filtering out unwanted vibrations in the bar. The wanted vibrations are isolated by both mechanical and electronic filter methods.

Tuning the tone-generator bar or rod is far simpler than tuning a cast bell. Being small (one-eighth to one-fourth inch square or in diameter), the bars are tuned to accuracies impossible to achieve in tuning large cast bells. Manufacturers claim limits of plus or minus one-half cent in tuning the Flemish-type electric bell tone generators; and three cents plus or minus on tuning English-type electric bells. (A cent is equal to $\frac{1}{100}$ of a semitone, the octave being divided into 12 semitones or 1.200 cents.)

A few manuiacturers of modern electric bells have reached their goal of duplicating the tones of perfect cast bells. Both the English-type and Flemish-type tones are produced and are so nearly tonally perfect that even the keenest ear cannot detect whether cast bells or the electric bells are being played.

The cast bell originated as a single tone-generating unit and is still used alone in thousands of towers. It has never been possible for hell manufacturers to spread the use of their bells over broad markets, because the cost of the hell has always been high. Hence, until the advent of the electronic age and the invention of the electric bell, comparatively few large peals and carillons were in use.

The main deterrents to the broader use of cast bells having been the weight and cost of the bell itself, the cost of building towers to support them and raising them into the tower. and finding trained musicians to play them; it follows that modern electric bells fill a great need. One characteristic of the modern

electromechanical bells is the complete control it provides over the distribution of tones around the tower. Sound waves emitted from cast bells are omnidirectional and consequently cover the entire surrounding area with sound. By means of stentors the sound waves of electric bells can be projected in any and all directions, either horizontally or vertically, to selected areas.

The use of the single electric bell compares with that of the single cast bell. long used as a warning signal, a call to worship or a time indicator. Peals. rings, chimes and carillons are groups of individual bells, each tuned to be consonant when played with others in the same set. The building of a carillon of several octaves of fine-cast bells is an expensive project, but electric-bell units can be assembled at a fraction of the cost in as many as five full chromatic octaves. The cost of the entire electric instrument in the early 1960s was less than the cost of the tenor bell of a cast-bell carillon. Automatic playing devices for cast bells have always been expensive to purchase, cumbersome to operate and costly to maintain. Most of the moving parts of such devices must be in the open belfry since they must be close to the bells they are to play; this leads to weather damage. The modern electric bells are completely enclosed in metal cabinets for installation inside a building. The only units exposed to weather in the tower are the reproducers, which have no moving parts and are completely weatherproof.

Electronics and the modern electric bell have wrought great changes in the field of campanology. Through exact duplication of cast-bell tones, low initial cost, simplicity of installation and operation, wide range of automatic playing devices and the low maintenance costs as claimed by manufacturers, the modern instruments of the early 1960s far outnumbered the traditional cast-bell instruments. Evidence of this trend is the fact that there were about 80 cast-bell carillons on the North American continent, yet one electric-bell manufacturer alone listed over 5.000 full carillons, plus hundreds of single bells and peals, while other manufacturers reported varied numbers of instruments in daily use.

Electric bells are built in one-bell units, various multiple numbers of bells in peals and chimes and in full carillons of from 25 to 61 bells. Probably the highest achievement in the modern electric-bell field was the development of a 61-bell Flemish-type carillon that is equal in musical result to a cast-bell carillon of 61 bells weighing 275,372 lb. This instrument can be played from its one-manual electric keyboard, with foot-pedal expression control of the volume of the bells; it produces intricate carillon music passages that cannot be played on even the finest of cast-bell instruments. Just as the rope that swings the heavy cast bell is replaced by a pushbutton that rings the electric bell, so the electric keyboard replaces the clavier on the carillon.

BELL, BOOK AND CANDLE, an old ceremony of pronouncing the "major excommunication" or "anathema" (see EXCOMMUNICATION). Its origins are not clear, but it goes back certainly to the end of the 9th century, if not to the middle of the 8th. The bell represents the public character of the act, the book the authority of the words spoken by the presiding bishop. The candle is believed to symbolize the possibility that the ban may be lifted by the repentance and amendment of its victim. The ceremony is performed in some conspicuous place and, upon its termination, letters are written to bishops of other sees to report the fact. When the assemblage has been convoked a bishop appears with 12 priests; all of the 13 hold lighted candles. The bishop then recites the formula, ending thus: "We separate him . . . from the precious body and blood of the Lord and from the society of all Christians; we exclude him from our holy mother the Church . . . ; we declare him excommunicate and anathema; we judge him damned . . . until he shall . . . return to amendment and to penitence." Those present answer. "So be it!" Then the bishop and the 12 priests extinguish their candles by dashing them to the ground and (as a general rule) the ceremony is ended.

BELLA, STEFAN0 DELLA (1610–1664), known in France as ÉTIENNE DE LA BELLE, Italian engraver, whose most famous works are his engravings of military events, in the manner of Jacques Callot. He was born at Florence on May 18. 1610. He was apprenticed to a goldsmith, but turned his attention to engraving, and studied that art under Canta Gallina. By the liberality of Lorenzo de' Medici he was enabled to spend three years in study at Rome. In 1642 he went to Paris, where Cardinal Richelieu engaged him to make drawings at Arras of the siege and taking of that town by the royal army. About 1650 he returned to Florence. His productions numbered over 1,400 separate pieces. His masterpiece is the view of the Pont Neuf in Paris. He died in Florence on July 12, 1664.

BELLABELLA, the common name (popularized from the Indian corruption of Milbank) for a tribe of Kwakiutl Indians at Milbank, B.C., including the subtribes Kokaitk, Oetlitk and Oealitk. See KWAKIUTL.

BELLA COOLA. At the time of European contact the Bella Coola Indians of British Columbia occupied about 30 villages in the lower Bella Coola river valley and the adjacent sea coast, with outlying settlements at Kimsquit and Tallio. They probably numbered about 5,000, but were reduced by disease in the 19th century to less than 1,000, who lived in a single village. In the mid-20th century the population is increasing.

The language is the most northerly representative of the Salish stock. Like other tribes of the central British Columbia coast, the Bella Coola lived in permanent villages of large plank-built houses occupied by a number of families. Wood was used for houses, canoes and watertight boxes which served a variety of domestic purposes; shredded cedar bark provided clothing; baskets were made of cedar and spruce; alder and cedar were carved into masks and other ceremonial objects, including the spectacular totem poles of the 19th century. Fish was the basic food supply, supplemented by hunting and by collecting berries and roots. Salmon, taken in the summer, were eaten fresh or smoked; oil extracted from eulachon (candlefish) was used as a condiment. Life mas essentially on a village basis, with status dependent both on hereditary rank and on wealth, measured by ostentatious giving at potlatches. There was no formal tribal cohesion, but a strong feeling of unity based on common language, common origin and pride in respect to neighbouring tribes. Secret societies were important, with an unusually well-developed pantheon of deities and great dependence on numerous oral traditions.

See T. F. McIlwraith, *The Bella Coola Indians* (1949). (T. F. McI.)

BELLADONNA, a name for the deadly nightshade (Atropa belladonna). See ATROPINE; NIGHTSHADE; SOLANACEAE.

BELLAIRE, a city of southeastern Texas, U.S., entirely surrounded by the city of Houston. (For comparative population figures see table in TEXAS: Population.) A council-manager form of government has been in effect since 1949. The city, then 10 mi. S.W. of Houston, was founded in 1911 when W. W. Baldwin (1845–1936) bought a tract of ranch land and laid out two communities. He named one of them, the only one to survive separately, for Bellaire, O. A prairie just south of the city was the site, in 1921, of a mammoth ceremony in which 2,051 men were inducted into the Ku Klux Klan; it was one of the largest such meetings in the 20th century. Incorporated in 1918, Bellaire grew slowly until World War II caused the sudden growth of the whole Gulf region. Bellaire is primarily a residential city, and most of its inhabitants are employed in surrounding Houston. Managerial, professional and technical workers comprise nearly half of the city's population. (G. M. F.)

BELLAMY, EDWARD (1850–1898), U.S. writer and reformer, is best known for his utopian romance, Looking Backward. He was born on March 26, 1850, in Chicopee Falls. Mass. Of good New England family. he was the son of an impecunious Baptist minister. At 18, while studying for a year in Germany, he first realized how harsh was the lot of the urban poor. He became a journalist and free-lance writer. Bellamy's early essays

and stories reflected the religious unrest of the post-Civil War period. Several tales, some posthumously collected in *The Blindman's World and Other Stories* (1898), indirectly criticized conventional America. *Dr. Heidenhoff's Process* (1880) used symbols in a fashion reminiscent of Nathaniel Hawthorne.

Bellamy's *Looking Backward, 2000–1887* (1888) described a coming society that featured co-operation. brotherhood and an industry geared to human need. It appealed to a public still suffering the effects of the economic depression of 1883, disturbed by such industrial clashes as the Haymarket riot in Chicago (1886) and aware that other, even more spectacular, crises could arise. Bellamy's humanity, ingenious plot and confidence in man's inventiveness stirred elements from every class and section of the population. *Looking Backward* sold over 1,000,000 copies and precipitated numerous polemical attacks on and defenses of Bellamy's ideas.

Bellamy became an active propagandist for nationalization of public services and Nationalist clubs proliferated. His magazine, the *Nationalist* (1889–91), helped crystallize principles that his followers wrote into the Populist platform of 1892. but its successor. the *New Nation* (1891–94), saw his movement in decline. *Equality* (1897), a less successful sequel to *Looking Backward*, treated in detail problems of social organization and motivation too little developed in its predecessor. Bellamy's never robust health failed him, and he died of tuberculosis in Chicopee Falls on May 22, 1898. Two later volumes of his uncollected writings, *Edward Bellamy Speaks Again!* (1937) and *Talks on Nationalism* (1938), seemed timely to admirers who felt that aspects of Bellamy's work foreshadowed the New Deal.

See Arthur E. Morgan, *Edward Bellamy* (1944), which treats him as a social engineer rather than as a utopian; Sylvia E. Bowman: *The Year 2000* (1958), a critical biography. (L. Fr.)

BELLARMINE, SAINT ROBERT (Roberto Francesco Romolo Bellarmino) (1542–1621). Italian cardinal and theologian, outstanding in his day as a controversialist, mas born at Montepulciano, Tuscany, on Oct. 4, 1542. He entered the Society of Jesus in 1560 and, after studying in Rome. Mondovi (Piedmont) and Padua, was sent in 1569 to Louvain where he began the following year. after ordination, to lecture on theology. There he was forced by the strength of Protestantism and the Augustinian docttines of grace and free will prevailing in the Low Countries to define his theological principles carefully and precisely. He returned to Rome where he lectured on controversial subjects at the new Jesuit college founded at the instigation of Gregory XIII. He was made a cardinal by Clement VIII in 1599 and was appointed archbishop of Capua in 1602. He died in Rome on Sept. 17. 1621. He was canonized in 1930 and declared a doctor of the church in the following year. His feast is kept on May 13.

The subjects on which Bellarmine wrote have remained controversial, and his name has been passed over in the heat of subsequent disputes, but during his own day he was regarded as one of the most enlightened theologians and gave impartial attention to Protestant works. His most influential writings were the series of lectures published under the title *Disputationes de controversiis Christianae fidei adversus huius temporis haereticos*, in three volumes between 1586 and 1593. which contained a scholarly statement in lucid and uncompromising terms of Catholic doctrine under the four headings Christ, the church, the sacraments and grace, and stimulated comments from both Protestants and Catholics. Bellarmine took part in the preparation of the Clementine edition (1591–92) of the Vulgate in which the inaccuracies of the previous edition produced under Sixtus V were carefully corrected. In 1610 he published another important and controversial work, his *De potestate summi pontificis in rebus temporalibus* in reply to the posthumous work of William Barclay of Aberdeen, *De potestate papae* (1609), which denied all temporal power to the pope. Sixtus V, however, had not been satisfied with Bellarmine's restrictions on the extent of papal power, while, on the other hand, many French theologians, especially J. B. Bossuet, strongly criticized him for defending ultramontanism.

As a consultor of the Holy Office, Bellarmine took a prominent part in the first examination of Galileo's writings. He had followed with interest Galileo's scientific discoveries, and a mutual respectful admiration grew up between them. When Galileo visited Rome in Dec. 1615 he was warmly received by Bellarmine, and the high regard in which he was held is clearly testified in Bellarmine's letters and in Galileo's donation to the cardinal of his discourse on "floating bodies." Bellarmine himself did not proscribe the Copernican system but suggested instead that it be presented merely as a hypothesis until it could receive unqualified scientific demonstration.

Among Bellarmine's other works, his *De scriptoribus ecclesiasticis* (1613), his autobiography (first published in 1675) and his devotional treatises are of particular importance.

Both in his life and in his writings, Bellarmine is regarded by the Roman Catholic Church as one of its most powerful defenders. He was of a very genial and lovable disposition and took a passionate, personal interest in the relief of the poor. At his death he was himself a pauper, leaving not enough to pay even the modest expenses of his funeral. All his revenues had gone to the poor.

Bibliography.—A complete edition of Bellarmine's works was published in 12 vol. (1870–74). *See* also J. Fuligatti, *Vita del cardinale Bellarmino* (1624); E. A. *Ryan, The Historical Scholarship of Saint Bellarmine* (1936); J. Brodrick, *Robert Bellarmine, Saint and Scholar* (1961). (J. P. Bk.)

BELLARY, a town and district of Mysore state, India. The town is 305 mi. N.W. of Madras by rail and has a population (1961) of 85,755. It was strong and well fortified from early times. The fort, originally built in the 16th century, stands on a huge mass of bare granite rock, 2 mi. in circumference, which rises abruptly from the surrounding plains to a height of 450 ft. Haidar Ali (*see* Hyder Ali) built the present fortifications, according to tradition, with the assistance of a French engineer whom he afterward hanged for not building the fort on a higher rock adjacent to it.

The town has a considerable trade in cotton. in connection with which there are large steam presses, and some manufacture of cotton cloth. There are also a cotton mill, distilleries and a sugar factory.

Bellary District. Before 1953 Bellary district, then in Madras, had an area of 5,881 sq.mi. and a population (1951) of 1,243,525. In 1953 the larger part of the district (3,825 sq.mi.) was transferred to Mysore and the three eastern talukas (1,956 sq.mi.) to the newly formed state of Andhra (now Andhra Pradesh). In 1961 the population was 914,284. The district consists chiefly of an extensive plateau, 800–1,000 ft. above sea level. The highest tracts are on the west and south, where it rises to the elevated tableland of Mysore. Toward the centre the almost treeless plains present a monotonous aspect. broken only by a few rocky heights that rise abruptly from the black soil.

The district is watered by the Tungabhadra, formed by the junction of the two streams, Tunga and Bhadra, and the Haggari. Neither of the rivers is navigable: both are fordable during the dry season. Bellary has a smaller rainfall than any other district in south India. Agricultural productivity will be greatly increased with the completion of the distribution canals associated with the Tungabhadra dam, inaugurated in 1953, with administrative headquarters at Hospet (37 mi. W. of Bellary).

The principal crops are millet, other food grains, pulses, peanuts and cotton. There are manufactures of cotton and woolen goods, and cotton is largely exported; Large deposits of iron ore and smaller deposits of copper are found in the Copper mountain 8 mi. S. of the city. The district is traversed from east to west by the Southern railway.

The district abounds in prehistoric sites. A settlement and factory of Neolithic Age, where stone implements were manufactured, has been excavated at Sangankal near Bellary town. Hampi (about 35 mi. N.W.) is traditionally the kingdom of Kishkindha visited by Rama in the epic *Ramayana*. Bellary was within the dominions of the Mauryan emperor Asoka (3rd century B.C.). Subsequently it was included in the territory of the Satavahanas and ruled by the Pallava, Chalukya, Rashtrakuta and Hoysala dynasties in turn. The extensive ruins at Hampi

mark the site of the capital of the empire which flourished from A.D. 1336 to 1565. Its rulers were great patrons of learning and the arts, and of Sanskrit, Kanarese and Telegu literature

(V. V. B.)

BELLBIRD, the common name, derived from its penetrating bell-like call, for a conspicuous white forest bird, *Procnias alba,* of northern South America. The male carries a long. black, fleshy, erectile appendage ornamented with short white feathers on the forehead. The wattled bellbirds, *Procnias tricarunculata,* of Central America, are reddish with white head and throat; they carry three black wattles at the beak.

The bellbirds belong to the tropical American family Cotingidae, cotingas or chatterers (*q.v.*).

BELL COT (BELL COTE, BELL GABLE or BELL TURRET), a structure, not a tower, in which bells are hung. It occurs in the form of a gable rising from a main wall, a dormer in a sloping roof or a miniature tower, or turret, at the corner of a building. A favourite position is at the top of the main west gable of a church.

REPRESENTATIVE BELL COTS

(Left) Palazzetto della Fraternita dei Laici, Arezzo, Italy, begun In the 14th century. (Right) San Diego de Alcala, first of the Spanish missions in California (1769)

Occasionally, even when a tower is present, a small bell, known as the sanctus bell, will be hung in a bell cot near the eastern end of the church. The bell cot for this bell is often at the centre of the crossing of nave and transepts and elaborated into a flèche (*q.v.*).

In Renaissance churches, particularly in Spain and the Spanish colonies, the bell cot is frequently a large section of wall, often separated from any building, and pierced with arches in each of which a bell is hung.

BELLEAU, REMY (1528–1577), French poet and member of the Pléiade, a group of poets which aimed at the enrichment of French language and literature, was born at Nogent-le-Rotrou in 1528 He was of humble birth and his first patron was Christophe de Choiseul, who protected Pierre de Ronsard. Belleau's fellow student at the Collège de Coqueret He took part in the campaign against Naples in 1557 under René de Lorraine marquis d'Elbeuf, brother of the duc de Guise and, from about 1563 lived at Joinville, seat of the Guises, as tutor and later counsellor to Réné's son Charles. He enjoyed the favour of Charles IX and Henry III and was made secretary of the king's chamber. He died on March 6, 1577, while on a visit to Paris and was borne to his grave in the Grands-Augustins by Ronsard. Bai'f, Desportes and Amadis Jamyn.

Belleau was an enthusiast for the new learning and an excellent classical scholar His translation of Anacreon and his commentaries on the second book of Ronsard's *Amours* show his erudition His *Amours et nouveaux éschanges des pierres précieuses* (1576) are Renaissance by their learning but are also in the tradition of the medieval lapidaries *La Bergerie* (1565–72) is an idealized yet realistic account of two days spent at Joinville It follows Jacopo Sannazaro's *Arcndia* but its pastoral atmosphere is impaired by the occasional character of certain poems Belleau was called the painter of nature by Ronsard. He was observant of detail and shows a command of technical expression in describing buildings and works of art. The somewhat affected grace of his style was not appreciated by Malherbe and his followers and it was only in the 19th century that he was rehabilitated by Sainte-Beuve. He wrote a comedy in verse, *La Reconnue,* and a macaronic poem on the religious wars. *Dictamen metrificum* de *bello huguenotico ef reistrorum piglamine ad sodales*

BIBLIOGRAPHY —Belleau's works are published as follows *Oeuvres complètes,* 3 vol ed by 4 Gouverneur (1867); *Oeuvres poétiques,* 2 vol ed by C Marty-Laveaux (1878); *Les amours et nouveaux éschanges des pierres précieuses,* ed by A Van Bever (1909); *La Bergerie,* ed by D Delacourcelle (1954) *See* also A Eckhardt, *Remy Belleau, sa vie, sa "Bergerie"* (1917), D Delacourcelle, Le *sentiment de l'art dans la "Bergerie" de Remy Belleau* (1941) (D W D.)

BELLEAU WOOD, BATTLE OF, the second clash between U.S. and German troops in World War I. It took its name from that of a tract of forest land, less than a square mile in area in the French *département* of Aisne, 5 mi N.W. of Château-Thierry and 42 mi E N E of Paris When the German offensive of May 27, 1918. was launched on the Aisne (*see* CHEMIN DES DAMES, BATTLE OF THE), the 2nd division of the U S. expeditionary force under Maj. Gen. Omar Bundy was rushed to the assistance of the 6th French army and deployed across the Paris-Château-Thierry road west of the latter town. On its front lay Belleau wood and the villages of Torcy, Bouresches and Vaux, all occupied by the Germans. The Germans had been temporarily halted at Château-Thierry but were consolidating themselves at Vaux and in Belleau wood in preparation for a renewed advance west of Château-Thierry. The task of dislodging them was entrusted to the 2nd division.

The attack was made on June 6 by a marine brigade of the division commanded by Brig. Gen James Harbord. The woods were penetrated but could not be held. The ground was extremely difficult, almost impenetrable underbrush covering a rugged outcrop of rock. Three days later the attack was renewed The fighting was bitter, but after a struggle lasting over a fortnight the woods were finally taken by the division; Bouresches and Vaux were also captured. In this engagement the Germans lost 24 guns and 1,654 prisoners, but the U.S. losses were severe, amounting to 285 officers and 7,585 men killed, wounded and missing. The battle, while not of decisive effect in itself, was of marked psychological importance as demonstrating the valour of the American soldier in modern combat.

The battleground was in 1923 dedicated as a permanent memorial to the U.S. officers and men who lost their lives there, and the French government ordered the name to be changed from Bois de Belleau to Bois de la Brigade de Marine. (D. MACA.)

BELLECOUR (1725–1778), French actor, whose real name was JEAN CLAUDE GILLES COLSON, was born on Jan 16. 1725, the son of a portrait painter After playing in the provinces he made his debut at the Comédie Française on Dec 21. 1750, as Achilles in *Iphigénie* He was more successful, honever, in comedy parts. He urote a successful play, *Fausses apparences* (1761), and was very useful to the Comédie Française in editing and adapting the plays of others He died on Nov. 19, 1778.

Bellecour's wife, ROSE PÉTRONILLE (or PERRINE) LE ROY DE LA CORBINAYE, known on stage as BEAUMÉNARD, was born at Lamballe on Dec 20. 1730, the daughter of an artillery officer. Under the name of Beauménard she made her first Paris appearance in 1743 as Gogo in Charles Favert's *Le Coq du village* After a year at the Opéra Comique she played in several companies. including that of Marshal Saxe. In 1749 she made her debut at the Comédie Française as Dorine in *Tartuffe,* and her success was immediate She retired in 1756. but reappeared in 1761 as Madame Bellecour, and continued in soubrette parts in the plays of Molière and Jean Regnard She retired at the age of 60, but the Revolution put an end to her pension, and she died in poverty on Aug 5, 1799

BELLEEK, a village in County Fermanagh, N.Ire., is an angling centre and a frontier customs post. Pop. (1961) 162. Glacial diversion sends the river Erne northward through Belleek between Lower Lough Erne and the sea. In 1950 an agreement

was reached between the governments of Northern Ireland and the republic to improve drainage and provide hydroelectric power. Local Pre-Cambrian rocks include Moine schists and gneisses with veins of pegmatite, providing feldspathic material in the form of kaolin used for making chinaware. Belleek ware had its great period prior to 1884 and is valued by collectors for its delicate texture. *(See* CHINAWARE.) Attractive ware is still made, partly with imported materials. (Hu. S.)

BELLE-ÎLE-EN-MER, a small island off the south coast of Brittany, France, lies 8 mi. S.W. of the Quiberon peninsula. It has several fishing settlements, the largest being Le Palais. A citadel built there in 1572 was strengthened during the next three centuries when the island's position as an outpost of the mainland ports, Lorient and St. Nazaire, was highly important to France. Occupied by the British from 1761 to 1763, it was returned to France by the same treaty that yielded Great Britain the colony of Nova Scotia. (AR. E. S.)

BELLE-ÎSLE, CHARLES LOUIS AUGUSTE FOUQUET DE, DUC DE GISORS (1684–1761), marshal of France and statesman, chiefly important for his role in involving France in the War of the Austrian Succession, was born at Villefranche in Rouergue on Sept. 24, 1684, a grandson of the notorious Nicolas Fouquet. After joining the army at an early age, the comte de Belle-Isle, as he then was, fought in the War of the Spanish Succession and in the war of 1718–19 against Spain. He made a fortune by speculation in John Law's "system," but was disgraced and exiled to his estates by the duc de Bourbon. He recovered his position at court under the cardinal de Fleury and enhanced his reputation as a soldier by his command of operations in the Rhineland during the War of the Polish Succession. A man of vast ambition, he aspired to succeed Fleury as prime minister and sought to gain his ends by intrigue. Marshal of France in Feb. 1741, he was the leader of an anti-Austrian faction at the French court, which forced the aging and cautious Fleury into offensive operations against Maria Theresa in the interest of Charles Albert, elector of Bavaria *(see* AUSTRIAN SUCCESSION, WAR OF THE). France was thereby brought to repudiate Fleury's recognition of the Pragmatic Sanction and, through involvement in Europe, to forgo the chance of concentrating on naval and colonial rivalry with Great Britain. Belle-Isle's influence as French plenipotentiary at Frankfurt am Main was instrumental in securing the election of Charles Albert as emperor (Charles VII) on Jan. 24, 1742, for which service he was created duc de Gisors in March. Previously, however, he had committed France to an onerous treaty with Prussia (June 1741). As a military commander he was responsible for the skilful withdrawal of French forces from Prague in 1742 and for the successful defense of Provence against the Austrians and Sardinians in 1746–47. His duchy was made a peerage of France in 1748, and in 1749 he was elected to the Académie Française. Minister of war from 1758 to 1760, during the Seven Years' War, he carried out a number of minor administrative reforms, but was criticized for his failure to reinforce French troops at Quebec, which resulted in the loss of Canada. He died at Versailles on Jan. 26, 1761.

See Jacques Fleury, *Le Secret du maréchal de Belle-Isle* **(1934)** ; *M.* Sautai, *Les Préliminaires de la guerre de la succession d'Autriche (1907).* **(A. GN.)**

BELLE ISLE, STRAIT OF, connects the Gulf of St. Lawrence with the Atlantic ocean and separates the island of Newfoundland from Labrador. Its length is go mi. and its breadth is 10 to 17 mi. The strait is in the most direct route from the St. Lawrence and Great Lakes ports to Europe, but is open only from July until late November. During the rest of the year it is blocked by sea ice. (C. N. F.)

BELLENDEN (BALLENDEN, BALLENTYNE, BALLANTYNE or BANNATYNE), **JOHN** (fl. 1533–1587?), Scottish writer, whose translation of the *Scotorum Historiae* by Hector Boece (*q.v.*) had a profound influence upon Scottish national feeling, was educated at the universities of St. Andrews and Paris. He was in the service of James V as clerk of accounts from the king's earliest years and translated the *Historiae* which had just appeared in Paris (1526) at his request. It was published as *The History and Chronicles of Scotland* in 1536, prefaced by an original poem entitled *A Proheme to the Cosmographe* and later reprinted separately under the various titles of *Vertue and Vyce* and *An Allegory of Virtue and Delyte*. The *History*, written in a fluent and vivid style, is one of the earliest pieces of literary Scottish prose extant, and made accessible, among other stories of interest, the first account of Macbeth's meeting with the witches.

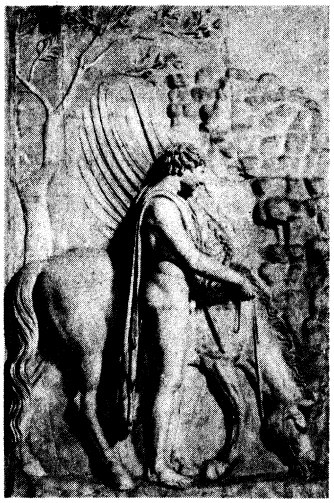
Also at the king's request Bellenden translated the first five books of Livy's Roman History, prefacing them with *The Proheme of the History*, another original poem. This was the first translation of a Latin classic in Britain, but it was not publicly printed until 1822.

In 1533 Bellenden had become archdeacon of Moray and a canon of Ross. Later, however, he appears to have lost the king's favour, and his strenuous opposition to the Reformation caused him to go into exile. Some authorities say that he died in Rome in 1550, but others that he was still alive in 1587.

The *Works* of John Bellenden were edited by W. and C. Tait (1821–22); *The First Five Books of the Roman History* were edited by W. A. Craigie for the Scottish Text society (1901).

See R. W. Chambers and W. W. Seton, "Bellenden's Translation of the History of Hector Boece," in *Scottish Historical Review*, vol. xvii, no. 65 (1919); D. Irving, *The History of Scottish Poetry (1861).*

BELLEROPHON (BELLEROPHONTES), a hero, probably of oriental origin, although provided with a Greek pedigree as early as Homer. In the *Iliad* he is son of Glaucus, the son of Sisyphus of Ephyre (traditionally identified with Corinth). Anteia, wife of Proetus, king of Argos, loves him, and, on her overtures being rejected, falsely accuses him to her husband (theme of Potiphar's wife, fairly common in Greek). Proetus sends Bellerophon to his father-in-law, the king of Lycia (Iobates, as later authors call him), with a written message that he is to be slain. The king sends him against the Chimera (*q.v.*); then against the Solymi, a warlike tribe; then against the Amazons; and finally, when he vanquishes them all, sets chosen warriors in ambush to kill him. Bellerophon kills them, and the king, recognizing him as more than human, marries him to his daughter. He lives in prosperity a while, then falls out of favour with the gods, loses two of his children and wanders, grief-stricken and shunning mankind, over the Aleian plain—*i.e.*, the Plain of Wandering.



ALINARI

RELIEF IN THE PALAZZO SPADA, ROME. SHOWING BELLEROPHON AND **PEGASUS**

Later authors, from Pindar on, add that, while still at Corinth, Bellerophon tamed the winged horse Pegasus (*q.v.*) with a bridle given him by Athena; that he visited Proetus because he had slain either the Corinthian hero Bellerus or his own brother, and so went into exile; that he used Pegasus to fight the Chimera, and afterward to punish Anteia (or, as they call her, Stheneboea) by inducing her to ride with him and then dropping her from a great height; that he earned the wrath of the gods by trying to fly up to heaven, being thrown from Pegasus in consequence, and lamed.

His adventures were frequently represented in ancient art, and formed the subject of the *Iobates* of Sophocles and of the *Bellerophontes* and *Stheneboea* of Euripides. Only fragments of these survive.

BELLEVILLE, a city of southeastern Ontario, Can., the seat of Hastings county, is situated on the Bay of Quinte, an inlet of Lake Ontario, at the mouth of the Moira river, 110 mi. E. of Toronto and 230 mi. W. of Montreal. The district was visited by Samuel de Champlain in 1615 and settled by United Empire Loyalists from the United States after 1776. Originally called

Meyers' Creek after Capt. John Meyers, who erected a gristmill on the site in 1790, the village's name was changed to Belleville in 1816. It was incorporated as a town in 1850 and became a city in 1877. Growth was rapid after World War II (pop. [1941] 15,710; [1956] 20,605; [1961] 30,163).

Natural assets include fertile soil, duck marshes and excellent fishing. Major products are cheese, whisky, cement, locks, oil burners, machinery. plastics, electronic products, heat-resistlint alloys and infant and dietary food products. In 1855 a line of the Grand Trunk railway (later a part of the Canadian National railways) reached Belleville. which became a division point; with nationwide dieselization of the system it became headquarters of a district in 1961.

To the north there are uranium mines at Bancroft and an iron mine at Marmora. Trenton air station. 9 mi. W., fighter command headquarters of the Royal Canadian Air Force until 1959, was then made transport command headquarters. Belleville is the site of the Ontario School for the Deaf. (R. L. PA.)

BELLEVILLE, a city of Illinois, U.S., 14 mi. S.E. of St. Louis, Mo., adjoining East St. Louis; the seat of St. Clair county. It is located on bluffs that form the eastern rim of a flood plain bordering the Mississippi.

The immediate area was settled before 1810, but Belleville was not founded until 1814 when the site was selected as the seat of county government. German immigrants comprised a large proportion of the early population. The city has grown steadily since its founding. (For comparative population figures see table in ILLINOIS: *Population.*)

Originally Belleville's economy depended on the services it rendered to the agricultural region which surrounded it. In 1352 the first bituminous coal mine was sunk nearby, and, economic diversification began. The manufacture of heating and cooking equipment was the city's leading industry after mid-20th century. Other important industries include the production of beer, paper cartons, cereal foods, bricks, stencil-cutting machines, wearing apparel, tools and dies.

Toward the centre of the city are blocks of one-story brick residences built in the first half-century of Belleville's existence.

Six miles east of Belleville is Scott air force base of the military air transport service (MATS). (R. E. M.)

BELLEVILLE, a town of Essex county, N.J., U.S., on the Passaic river, adjoining Newark. (For comparative population figures see table in NEW JERSEY: *Population.*) Belleville was a portion of that part of Newark which was incorporated as Bloomfield in 1812. Belleville became a separate municipality in 1839.

It was in Belleville that Nicholas Roosevelt in 1794 or 1795 completed one of the first steam engines constructed in America. In 1798, nine years before Robert Fulton built the "Clermont," one of his engines powered the 40-ft. ship "Polacca" which John Stevens, inventor and financier of Hoboken, constructed at the Roosevelt foundry. The craft was operated successfully on the Passaic river and sailed from Belleville to New York and returned to Belleville.

Belleville is a residential suburb of Newark and New York city, but also has considerable inanufacturing industries. including electrical goods, radio and television equipment, fire extinguishers, water pumps, aids to marine and aerial navigation and precision instruments. Some of Belleville's earlier Dutch inhabitants engaged in the manufacture of patent leather and papermaking machinery. (E. R. D.)

BELLFLOWER, the name given to various species of *Campanula* (*q.v.*) because of the shape of their handsome flowers.

BELLI, GIUSEPPE GIOACCHINO (1791–1863), Italian poet whose satirical sonnets present a vivid picture of life in papal Rome in the early 19th century. was born in Rome, Sept. 10, 1791. After an unhappy childhood he was employed in humble posts until. in 1816, marriage with a rich widow enabled him to devote much time to poetry. As a papal civil servant he held conservative political views and was deeply perturbed by the revolution of 1848 and the formation of the Roman republic of 1849. He was also throughout his life troubled by moral and religious scruples. He died in Rome, Dec. 21, 1863.

His sonnets in Roman dialect — more than 2,000 — contrast with the conlormity of his life. Composed mainly during 1830–39, they seem to have provided an outlet for his repressed feelings. Although he also wrote conventional poems in Italian, his originality lies in the sonnets, which express his revolt against literary tradition, the academic mentality and the social injustice of the papal system. The ritualism of the Roman Catholic Church and the accepted principles of commonplace morality were also the objects of his derision. But just as even in his most erotic vein Belli is never obscene, so his apparently most profane sonnets are never really impious; they register rather a passing mood of rebellion. Belli's greatest gift is for observing and describing the people of Rome. In hundreds of small perfect portraits he describes their speech and habits, vices and virtues, pleasures and sufferings, and also all the varied aspects of their life, including the theatres, the lotteries and the colourful processions.

An edition of Belli's sonnets (introduction by G. Vigolo) appeared in three volumes in 1952.

See E. Veo, *I poeti romaneschi* (1927), with bibliography. (F. DI.)

BELLIGERENCY, the condition of being in fact engaged in war. A nation is no less a belligerent by reason of having resorted to aggressive war in violation of international law. Nor is a declaration of war necessary to create a state of belligerency. The United States and Communist China were belligerents during the Korean conflict despite the fact that both parties avoided characterizing the hostilities as war. The 1949 Geneva Conventions for the Protection of War Victims apply not only to declared war but to any armed conflict between parties to the conventions and to the occupation of the territory of a party even if unresisted. Under the Geneva Prisoners of War convention of 1949, lawful belligerents comprise members of the armed forces as well as members of militias; volunteer corps and organized resistance movements who are commanded by a person responsible for his subordinates. have a distinctive sign, carry arms openly and conduct operations lawfully.

Nonbelligerency, or benevolent neutrality, describes the conduct of a nation in departing from a neutral's duties of impartiality by giving assistance to one of the contending factions in a war. Such departures are, under certain circumstances, authorized or even required by the United Xations charter.

If a state recognizes the belligerency of parties to a civil war, it thereby indicates that those parties have belligerent rights and duties similar to those existing in an international war and also binds itself to assume a position of neutrality toward those parties. Recognition of insurgency is only a recognition that revolt exists and does not accord belligerent standing to the insurgents. It may, however, involve limited contact with the insurgents and some acquiescence in the measures they take.

Under the Geneva conventions of 1949, to which many nations are parties. certain general safeguards of a humanitarian character, hut not all the protections of the law of war, are granted persons involved in a civil war. See also AGGRESSION ; INSURGENCY; WAR. (R. R. BR.)

BELLINGHAM, a city near the northwest corner of Washington, U.S., on the east shore of Bellingham bay; 18 mi. south of the U.S.-Canadian border; a port of entry and seat of Whatcom county. Bellingham is the nearest major town to the San Juan Islands, and lies just west of the wilderness area of the northern Cascade mountains. It was first visited by Francisco Eliza in 1791.

In 1792 the British explorer, Capt. George Vancouver, named Bellingham bay in honour of his associate Sir William Bellingham. The first settlers came in 1852 when Capt. Henry Roeder built a sawmill on the falls of Whatcom creek. At the end of the illusory Fraser river gold rush (1857–58) the community became a ghost town, but recovered in the 1880s with the opening of coal mines and the building of lumber mills.

Railroad construction to Bellingham Bay increased the population and in 1903 the towns of New Whatcom and Fairhaven merged to form the present city. Its main industries are pulp and paper processing, cement manufacturing, fish canning and pleasure craft and shipbuilding. The Western Washington College of Education,

which enrolls more than 2,800 students annually, was established in Bellingham in 1899.

For comparative population figures see table in WASHINGTON: *Population.* (K. A. M.)

BELLINGSHAUSEN, FABIAN GOTTLIEB VON (Russ. FADDEI FADDEEVICH BELLINSGAUZEN) (1779–1852), Russian antarctic explorer, was born on the island of Osel in the Baltic. Aug. 18, 1779. At the age of ten he entered the imperial Russian navy; he died an admiral and governor of Kronstadt. His greatest achievement was his voyage of exploration of 1819–21, when he commanded the "Vostok" and "Mirny" in a circumnavigation of Antarctica. He discovered certain of the South Sandwich Islands. Peter I Island and Alexander I Island (these two were the first sightings of land within the Antarctic circle). He almost certainly sighted. but did not recognize as land, two coastal areas between longitude 5° W. and 20° E.; the first was on Jan. 28, 1820. two days before E. Bransfield's discovery of Palmer peninsula, which, if Rellingshausen is left out of account, is the first-known sighting of the Antarctic continent. Bellingshausen died at Kronstadt on Jan. 13, 1852. His narrative was reprinted (1949) and translated into English (Hakluyt Society, 1945). (T. E. h.)

BELLINI, the name of a family of craftsmen in Venice, three members of which fill a great place in the history of the Venetian school of painting in the 15th and early 16th centuries.

JACOPO BELLINI (*c.* 1400–*c.* 1470) was the son of a tinsmith or pewterer, Niccolò Bellini, by his wife Franceschina. When the accomplished Umbrian master Gentile da Fabriano came to practise at Venice, where art was backward, several young men of the city took service under him as pupils. Among these was Jacopo Bellini. who probably followed his teacher to Florence. There the progress made in fidelity to natural fact and in sense of classic grace and style, by masters like Donatello and Ghiberti, Masaccio and Paolo Uccello, offered Jacopo better instruction than he could obtain even from his Cmbrian teacher. By 1429 Jacopo was settled at Venice and married to a wife from Pesaro named Anna, who bore her husband two sons. Gentile and Giovanni (though some evidences have been thought to point rather to Giovanni having been his son by another mother), and a daughter Nicolosia. In 1436 Jacopo was at Verona, painting a Crucifixion in fresco for the cathedral (destroyed by order of the archbishop in 1750). About 1440 he must have paid a visit to the court of Ferrara, where there prevailed a spirit of free culture and humanism most congenial to his tastes. His relations with the house of Este, which seem to have begun with a portrait of Lionello d'Este, son of the reigning *marchese* Niccolò III, appear to have been kept up; among Jacopo's extant drawings are several that probably belong lo the scheme of a monument later erected in memory of Niccolò. He was also employed by Sigismondo Malatesta at the court of Riniini. In 1453 he received a grant from the confraternity of the Scuola di San Giovanni Evangelista for the marriage of Nicolosia to Andrea Mantegna. In 1456 he painted a figure of Lorenzo Giustiniani, first patriarch of Venice, for his monument in S. Pietro di Castello, and in 1457 three figures of saints in the great hall of the patriarch. His activity can be traced in documents down to Aug. 1470, but in Nov. 1471 his wife Anna describes herself as his relict, so he must have died some time in the interval.

The materials which have reached posterity for a critical judgment on his work consist of a few pictures only, together with two important and invaluable books of drawings. These prove him to have been a worthy third (following the Imbrian Gentile da Fabriano and the Veronese Pisanello) in that trio of artists who, in the first half of the 15th century, carried toward maturity the art of painting in Venice and the neighbouring cities. Of his pictures, an important signed example is a life-size "Christ Crucified" in the archbishop's palace at Verona. The rest are almost all Madonnas: three signed—one in the Tadini gallery at Lovere, another in the Venice academy and another; dated 1448, in the Brera gallery at Milan; a fourth, much damaged, in the Venice academy; and a fifth, richest oi all in colour and ornamental detail. in the Uffizi at Florence. Plausibly, though less certainly, ascribed to him are a Madonna at Bergamo, a Crucifixion in the Civico Museo Correr and a "Christ in Limbo" at Padua.

But an abundance of drawings and studies are preserved in two precious albums in the British museum and the Louvre. Paris. The former, which is the earlier in date, belonged to the painter's elder son Gentile and was bequeathed by him to his brother Giovanni. It consists of 99 paper leaves. each covered on both sides with drawings made with a lead point, an instrument unusual at this date. Two or three of the drawings have been worked over in pen; of the remainder many have become dim from time and rubbing. The album at the Louvre, discovered in 1883 in the loft of a country house in Guienne, is equally rich and better preserved, the drawings being all highly finished in pen, probably over effaced preliminary sketches in chalk or lead. The range of subjects is much the same in both collections, and in both extremely varied, proving Jacopo to have been a craftsman of many-sided curiosity and invention. Jacopo's influence on the development of Venetian art was very great. not only directly through his two sons and his son-in-law Mantegna, but also through other workshops of the city.

GENTILE BELLINI (c. 1429–1507), the elder son of Jacopo, first appears independently as the painter of a Madonna, much in his father's manner. now in Berlin. His earliest signed work is the St. Lorenzo Giustiniani of 1465 in the Venice academy. In July 1466 he contracted with the officers of the Scuola di San Marco as an independent artist to decorate the doors of their organ. These paintings still exist in a blackened condition. They represent four saints, colossal in size, and designed with much of the harsh and searching austerity which characterized the Paduan school under F. Squarcione. In 1469 Gentile was knighted by the emperor Frederick III who was visiting Venice. He must have risen steadily in the esteem of his fellow citizens. since in 1474 he was commissioned by the senate to restore, renew and, when necessary, replace the work of an earlier generation of artists, a series of paintings that were perishing from damp on the walls of the hall of the great council in the ducal palace. In continuation of this work. Gentile undertook a series of independent paintings on subjects of Venetian history for the same hall! but had apparently only finished one, representing the delivery of the consecrated candle by the pope to the doge, when his labours were interrupted by a mission to the east.

The sultan Mohammed II had dispatched a friendly embassy to Venice. inviting the doge to visit him at Constantinople and at the same time requesting the dispatch of an excellent painter to work at his court. Gentile Bellini with two assistants was selected for the mission, his brother Giovanni being at the same time appointed to fill his place on the works for the hall of the great council. Gentile gave great satisfaction to the sultan, and returned after about a year with a knighthood, some fine clothes, a gold chain and a pension.

The surviving fruits of his labours at Constantinople consist of a portrait of the sultan himself. unfortunately in a hopelessly damaged condition, in the Layard bequest in the National gallery. London; an exquisitely wrought small portrait in water colour of a scribe, found in 1905 by a private collector in the bazaar at Constantinople and now in the Gardner museum at Boston; and two pen-and-ink drawings of Turkish types, now in the British museum. Early copies of two or three other similar drawings are in the Städel institute at Frankfurt am Main.

A place had been left open for Gentile to continue working beside his brother Giovanni in the ducal palace; and soon after 1480 he began to carry out his share in the great series of paintings (unfortunat'ely destroyed by fire in 1577) illustrating the part played by Venice in the struggles between the papacy and the emperor Barbarossa. These works were executed not on the wall itself but on canvas (the climate of Venice having so many times proved fatal to wall paintings), and probably in oil, a method which all the artists of Venice, following the example set by Antonello da Messina, had by this time learned or were learning to practise. They received the highest praise both from contemporary and from later Venetian critics, but no fragment of them survived the fire of 1577, though a drawing in the British museum purports to be the artist's original sketch for the subject of the pope bestowing a sword and hi.; blessing on the doge and his army. Their character can to some extent be judged by a certain number of kindred his-

torical and processional works by the artist which have been preserved. Of such the academy at Venice has three which were painted between 1490 and 1500 for the Scuola di San Giovanni Evangelista, and represent certain events connected with a famous relic belonging to the *scuola;* namely, a supposed fragment of the true cross. All have been much injured and repainted; nevertheless, one at least, showing the procession of the relic through St. Mark's square and the thanksgiving of a father who owed to it the miraculous cure of his son, still gives a good idea of the painter's powers and style.

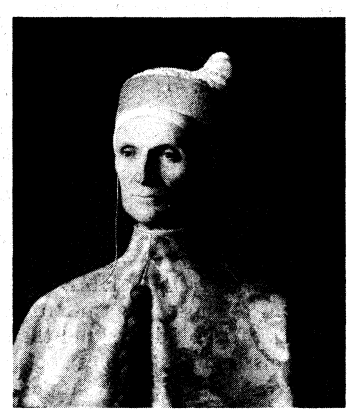
Gentile's great accuracy and firmness of individual portraiture; his strong gift (derived no doubt from his father's example) for grouping and marshaling a crowd of personages in spaces of fine architectural perspective; the severity and dryness of his Paduan manner much mitigated by the dawning splendour of true Venetian colour—these are the qualities that no injury has been able to deface. They reappear still more forcibly in the last work undertaken by the artist—the great picture, now at the Brera in Milan, of St. Mark preaching at Alexandria; this was commissioned by the Scuola di San Marco in March 1505, and left by the artist in his will, dated Feb. 18, 1507, to be finished by his brother Giovanni. Of Gentile's single portraits, for which he was almost as famous as for his processional groups, there survive one of a doge at the Civico Museo Correr in Venice, one of Catarina Cornaro at Budapest and one of a mathematician at the National gallery, London, besides one or two others in private hands. A much damaged Madonna is in the Mond bequest in the National gallery. The features of Gentile himself are known from a portrait medallion by Camelio; they can also be recognized in two extant drawings, one at Berlin supposed to be by the painter's own hand, and another, much larger and more finished, at Christ Church, Oxford, which is variously attributed to Bonsignori and A. Vivarini.

GIOVANNI BELLINI (c. 1430–1516) is generally assumed to have been the second son of Jacopo by his wife Anna; though the fact that she does not mention him in her will with her other son has thrown some slight doubt upon the matter. Until the age of nearly 30 both sons served as their father's assistants in works at Venice and Padua. In Giovanni's earliest independent works, he was more strongly influenced by the harsh and searching manner of the Paduan school, and especially of his own brother-in-law Mantegna, than by the more graceful and facile style of Jacopo. This influence seems to have lasted at full strength until after the departure of Mantegna for the court of Mantua in 1460. The earliest of Giovanni's independent works no doubt date from before this period. Three of these exist at the Correr museum in Venice: a Crucifixion, a Transfiguration and a "Dead Christ Supported by Angels." Two Madonnas of the same or even earlier date are in the United States, one at the Metropolitan museum, New York city, the other in the Johnson collection, Philadelphia; a third, that of G. Frizzoni, is now in the Civico Museo Correr at Venice: while two beautiful works in the National gallery of London seem to bring the period to a close. One of these is of a rare subject, the "Blood of the Redeemer"; the other is the fine picture of "Christ's Agony in the Garden," formerly in the Northbrook collection. The last-named piece was evidently executed in friendly rivalry with Mantegna, whose version of the subject hangs nearby; the main idea of the composition in both cases was taken from a drawing by Jacopo Bellini in the British museum sketchbook.

In all these pictures Giovanni combines with the Paduan severity of drawing and complex rigidity of drapery a depth of religious feeling and human pathos which is his own. They are all executed in the old tempera method, and in the last-named the tragedy of the scene is softened by a new and beautiful effect of romantic sunrise colour. Other works from Giovanni's early period include parts at least of the four triptychs from the church of the Carità, now in the Venice academy, and the polyptych of St. Vincent Ferrer in the church of SS. Giovanni e Paolo. The above-named norks are no doubt earlier than the date of Giovanni's first appointment to work along with his brother and other artists in the Scuola di San Marco, where among other subjects he was commissioned in 1470 to paint a "Deluge With Noah's Ark." None of the master's works of this kind, whether painted for the various schools or confraternities or for the ducal palace, have survived. The final triumph of Giovanni Bellini's earlier style is the Pietà in the Brera gallery at Milan.

In a somewhat changed and more personal manner, with less harshness of contour and a broader treatment of forms and draperies. but not less force of religious feeling. are the two pictures of the "Dead Christ Supported by Angels" (in those days one of the master's most frequent themes) at Rimini and at Berlin. Chronologically to be placed with these are two Madonnas, one at the church of the Madonna del Orto at Venice and one in the Lochis collection at Bergamo; devout intensity of feeling and rich solemnity of colour being, as in the case of all these early Madonnas, combined with a singularly direct rendering of the natural movements and attitudes of children.

To the middle of the decade following 1470 must be assigned the great altarpiece of the "Coronation of the Virgin" at Pesaro; and to the beginning of the next decade the "Transfiguration" at Naples and the "St. Francis in Ecstasy" in the Frick collection, New York city. After 1479–80 very much of Giovanni's time and energy must have been taken up by his duties as conservator of the paintings in the great hall of the ducal palace. Besides repairing and renewing the works of his predecessors he was commissioned to paint a number of new subjects, six or seven in all, in further illustration of the part played by Venice in the wars of Barbarossa and the pope. Not a trace of these survived the fire of 1577; neither have any other examples of his historical and processional compositions come down. Of his religious works, including both altarpieces with many figures and simple Madonnas, a considerable number have fortunately been preserved. They show him gradually throwing off the last restraints of the 15th-century manner, gradually acquiring a complete mastery of the new oil medium introduced in Venice by Antonello da Messina in 1475, and mastering with its help all, or nearly all, the secrets of the perfect fusion of colours and atmospheric gradation of tones. The old intensity of pathetic and devout feeling gradually fades away and gives place to a noble, if more worldly, serenity and charm. The enthroned Virgin and Child become tranquil and commanding in their sweetness; the personages of the attendant saints gain in power, presence and individuality; enchanting groups of singing and viol-playing angels symbolize and complete the harmony of the scene. The full splendour of Venetian colour invests alike the figures, their architectural framework, the landscape and the sky.



BY COURTESY OF NATIONAL GALLERY, LONDON

PORTRAIT OF THE DOGE LOREDAN BY GIOVANNI BELLINI. IN THE NATIONAL GALLERY, LONDON

The altarpiece of the Frari at Venice; the altarpiece of S. Giobbe, now at the academy; the "Virein Between St. Paul and St. George," also at the academy; and the altarpiece with the kneeling doge Barbarigo at Murano, are among the most conspicuous examples. Simple Madonnas of the same period (about 1485–go) are in the Venice academy, in the National gallery, at Turin and at Bergamo. An interval of some years seems to separate the last-named altarpieces from that of S. Corona at Vicenza. a "Baptism of Christ" in a landscape; while that of the church of S. Zaccaria at Venice, which is perhaps the most beautiful and imposing of all. is dated 1505. That of S. Giovanni Crisostomo at Venice, where the aged Saint Jerome, seated on a hill, is raised high against a resplendent sunset background, with St. Christopher and St. Augustine standing facing each other below him, in front, is dated 1513. The examples which remain of Giovanni's activity in the interval between the altarpieces of S Giobbe and of Murano and that of S. Zaccaria, consist of one allegorical picture in the Uffizi at Florence, and a set of five other allegories or moral emblems, on a smaller scale and very romantically treated, in the academy at Venice. To these should probably be added, as painted toward

the year 1501, the portrait of the doge Loredan in the National gallery, the finest portrait by the master which has been preserved, and in its own manner one of the most masterly in the whole range of painting. Another beautiful work, probably painted about the same time as the S. Zaccaria altarpiece, is the "Madonna of the Meadow" in the National gallery.

The last 10 or 12 years of the master's life saw him besieged with more commissions than he could well complete. Albrecht Dürer, visiting Venice for a second time in 1506, reports Giovanni Bellini as still the best painter in the city, and as full of all courtesy and generosity toward foreign brethren of the brush. In 1507 Gentile Bellini died, and Giovanni completed the picture of the "Preaching of St. Mark" which he had left unfinished. In 1514 Giovanni painted a "Feast of the Gods" for the duke Alfonso of Ferrara which was afterward altered by Titian and is now in the National Gallery of Art, Washington, D.C. He died in 1516.

Both in the artistic and in the worldly sense, the career of Giovanni Bellini was upon the whole the most serenely and unbrokenly prosperous, from youth to extreme old age, which fell to the lot of any artist of the early Renaissance. He lived to see his own school far outshine that of his rivals, the Vivarini of Murano; he embodied, with ever growing and maturing power, all the devotional gravity and much also of the worldly splendour of the Venice of his time; and he saw his influence propagated by a host of pupils, two of whom at least, Giorgione and Titian, surpassed their master. Giorgione he outlived by six years; Titian, as has been shown, challenged an equal place beside his teacher. Among the best known of his other pupils were, in his earlier time. Andrea Previtali, Cima da Conegliano, Marco Basaiti, Niccolò Rondinelli, Pier Maria Pennacchi. Martino da Udine, Girolamo Mocetto; in later time, Francesco Bissolo, Lorenzo Lotto and Sebastiano del Piombo.

BELLINI, LORENZO (1643–1704), Italian physician and anatomist whose description of the terminal straight uriniferous tubules of the kidneys and their orifices is commemorated by the eponyms Bellini's tubules and Bellini's ducts, was born at Florence on Sept. 3, 1643. He studied at the University of Pisa under F. Redi and G. A. Borelli and, when a mere youth of 19, published *Exercitatio anatomica de structura e usu renum* (1662), in which he showed for the first time that the kidney consists of an immense number of tiny canals. Appointed professor of philosophy, theoretical medicine and anatomy at Pisa in 1663, he stressed the value of urinalysis as an aid to diagnosis (1685), described the organs of taste (1665) and supported iatromathematical theories which were later forgotten. Retiring to Florence in 1693, he became physician to Duke Cosimo III and to Pope Clement XI. He died on Jan. 8, 1704, having achieved both fame and fortune.

(WR. R. B.)

BELLINI, VINCENZO (1801–1835), Italian opera composer whose chief gift was an ability to create vocal melody at once pure in style and sensuous in expression, usually of an elegiac character. His influence is reflected not only in later operatic composers, even early Wagner, but also in the instrumental music of Chopin and Liszt.

Born at Catania, Sicily, on Nov. 3, 1801. Bellini came of a family of musicians. In 1819 he went, with financial help from a Sicilian nobleman, to study at the Naples conservatory under Nicola Zingarelli. While a student, he attracted the notice of Domenico Barbaia, director of the San Carlo opera. Naples, and La Scala, hlilan, who commissioned an opera for Naples. When that proved successful, Bellini graduated to La Scala, where his first important opera, *Il Pirate,* was enthusiastically received in 1827. He was fortunate in having as librettist the best Italian theatre-poet of the day, Felice Romani. with whom he collaborated in his next six operas. Of these the most important are I *Capuletti ed i Montecchi,* based on Shakespeare's *Romeo and Juliet* (Venice: 1830), *La Sonnambula,* an *opera semi-serin* given at one of the smaller Milanese theatres in 1831, and *Norma,* his masterpiece, which was performed at La Scala on Dec. 26, 1831, with Giuditta Pasta in the title part. In 1833 Bellini spent some time in London, where *Beatrice di Tenda* (produced in Venice earlier in the year) was given without much success. In the same year he moved to Paris, where Rossini's influence secured him a commission to compose an opera for the Théâtre Italien. This was I *Puritani,* produced in 1835 with Giulia Grisi, G. B. Rubini. Antonio Tamburini and Luigi Lablache in the cast. Unfortunately an inept libretto has handicapped Bellini's most ambitious and beautiful work. Soon after its production he went to visit an English friend at Puteaux, outside Paris. Never robust in health. he fell ill, and died there, Sept. 23, 1835.

Bellini's fame was so closely bound up with the *bel canto* style of the great singers of his day that it was inevitably eclipsed by the music of the later 19th century with its greater resources of dramatic power and orchestral colour. Bellini was, indeed, no forceful reformer, but with gentle perseverance he did correct some of the grosser abuses of opera in his day. While he subordinates the orchestral accompaniment to the singers and places upon their voices the responsibility for dramatic expression, his harmony is more enterprising than Donizetti's and his handling of the orchestra in introductions and interludes is far from perfunctory. It is, however, for the individual charm and elegance of his luminous vocal melody that Bellini deserves to be remembered. In *Norma* he used his gift to breathe life into the frigid figures of classical opera and created a masterpiece that will always enchant and move an audience whenever singers able to sustain its radiant melody appear.

BELLINZONA, the political capital of the Swiss canton of Ticino (*q.v.*), lies 105 mi. from Lucerne by the St. Gotthard railway, and 14 mi. from Locarno. The city's population in 1960 was 13,435, mainly Roman Catholic and Italian-speaking. Until 1881 it was joint capital of the canton, with Lugano and Locarno. The old town is built on high ground rising from the level valley floor of the Ticino river a little below the junction of the Val Mesocco. It thus blocked the road from Germany to Italy, and a great wall was built from the town to the river bank. Bellinzona still possesses three picturesque castles (restored in modern times), dating in their present form from the 15th century. They belonged for several centuries to the three Swiss cantons that were masters of the town. The most westerly, Castello Grande (or San Michele), belonged to Uri; the central castle, that of Montebello, was the property of Schwyz; while that of Sasso Corbaro was in the hands of Unterwalden. The church of San Biagio (Blaise) has a remarkable 14th-century fresco, while the collegiate church of SS. Peter and Stephen dates from the 16th century.

Bellinzona is possibly of Roman origin; it is first mentioned in 590. It played a considerable part in the early history of Lombardy, being a key to the St. Gotthard, Lukmanier and San Bernardino passes. In the 8th century it belonged to the bishop of Como, while in the 13th and 14th centuries it was tossed to and fro between the cities of Milan and Como. In 1499 (like the rest of the Milanese) it was occupied by the French, but in 1500 it was taken by Uri. In 1503 the French king ceded it to Uri. Schwyz and Unterwalden. It became in 1798 the capital of the canton Bellinzona of the Helvetic republic, but in 1803 it was united to the newly formed canton of Ticino.

BELLMAN, CARL MICHAEL (1740–1795), Swedish poet, one of the outstanding poet-musicians of the 18th century, was born on Feb. 4, 1740, at Stockholm. The son of a wealthy

civil servant, he studied at Uppsala university and entered the government service, but his salary and a stipend from King Gustav III hardly allowed him to support himself and his family. In early youth, he published religious and satirical works and translations from German and French. By the 1760s, his popular drinking songs and biblical parodies were being sung throughout Scandinavia, circulated by word of mouth, handwritten copies and printed sheets. About 1765. Bellman began to write a cycle of songs, *Fredmans epistlar,* the title alluding to the Pauline epistles which were parodied in the early songs. "Fredman" was conceived as a respected clockmaker who took to drinking and died in poverty. Following the burlesque style of Jean Joseph Vadé and other French writers. Bellman began by adapting minuets, *contredanses* and arias from French musical comedies, in a highly original manner, but several songs in this collection were entirely of his own composition.

Fredmans epistlar was not published until 1790, when it appeared with an introduction by the famous critic J. H. Kellgren. During this time Bellman had strengthened the narrative and dramatic elements in his work, and had added many new figures to his gallery of middle-class Stockholmers. The 82 songs in the final collection reflect his poetic and personal development. Its feeling for nature and vivid characterizations make it unique in Swedish poetry. It was followed in 1791 by *Fredmans singer,* also a varied collection, but containing mainly drinking songs. *Baccki tempel* (1783), a poem in alexandrines, contained also some songs and engravings. Bellman died at Stockholm on Feb. 11, 1795. His other works, including plays and occasional poems, were published posthumously. Little known outside Scandinavia, Bellman has had great influence and continued popularity there.

There is a free adaptation in English of Bellman's works in H. W. Van Loon and G. Castagnetta. *The Last of the Troubadours* (1939); and a French prose version by N. Afzelius and P. Volboudt, *Les Épitres de Fredman* (1953). There are also translations into German, *Bellman-Brevier* by H. von Gumppenberg (1909); and *Fredmans Episteln* by F. Niedner (1909).

See N. Afzelius, *Myt och bild. Studier i Bellmans dikt* (1945) and *Bellmans melodier* (1947). (N. A. A.)

BELLO, ANDRÉS (1781–1865), South American poet and scholar, regarded as the intellectual father of South America. was born at Caracas, Venez., on Nov. 29, 1781. His early reading in the classics, particularly Virgil, influenced greatly his literary style and theories. At the University of Caracas he pursued widely divergent courses in philosophy, jurisprudence and medicine. Acquaintanceship with Baron von Humboldt (1799) led to the intense interest in geography so apparent in his later writings. He was friend and teacher of the great South American liberator, Simón Bolivar, with whom he was sent to London in 1810 on a political mission for the Venezuelan revolutionary junta. There Bello elected to stay for 19 years, acting as secretary to the legations of Chile and Colombia, spending his free time in study, teaching and journalism.

In 1829 he accepted a post in the Chilean ministry of foreign affairs, settled at Santiago and took a prominent part in the intellectual and political life of the city. He was named senator of his adopted country and founded the University of Chile (1842), of which he was rector until his death at Santiago on Oct. 15, 1865. Bello was mainly responsible for the Chilean civil code, promulgated in 1855, which was also adopted by Colombia and Ecuador and had much the same influence throughout South America as the Napoleonic code in Europe.

Bello's prose works deal with such varied subjects as law, philosophy, literary criticism and philology. Of the last, the most important is his *Gramdtica de la lengua castellana* ("Grammar of the Spanish Language," 1847), the leading authority in its field. As a defender of "purisms" in the Spanish tongue, Bello found himself in the midst of a literary polemic carried on through two rival periodicals, one of which was the medium for the romantic ideas of the great Argentinian educator D. F. Sarmiento. Branded as a conservative and under personal attack, Bello withdrew from the fight. Although his movement tbward spelling reform finally succumbed against the stone wall of the Spanish Academy, it later did achieve some significant results.

Bello's position in literature proper is secured by his *Silvas americanas,* two poems written during his residence in England, which convey with extraordinary force the majestic impression of the South American landscape. These were published in London (1826–27) and were originally projected as part of a long, never-finished epic poem, *América.* The second of the two. *Silva a la agricultura de la zona tdrrida* ("Ode to the Agriculture of the Torrid Zone")—undoubtedly inspired by Bello's contacts with Humboldt—is a poetic description of the products of tropical America, extolling the virtues of country life in a manner reminiscent of Virgil. It is one of the best-known poems in 19th-century Spanish-American letters.

Bello's complete works were issued in 15 volumes by the Chilean government (1881–93). He is the subject of an excellent biography by Miguel Luis Amunátegui (1882).

BELLOC, (JOSEPH PIERRE) HILAIRE (1870–1953), French-born poet, historian and essayist, was among the most versatile English writers of the first quarter of the 20th century. He was born at La Celle, St. Cloud, on July 27, 1870, the son of a French barrister and his wife, Bessie Rayner Parkes (1829–1925), who was prominent in the early women's suffrage movement. Belloc was educated at the Oratory school, Edgbaston, Birmingham, and then worked as journalist under W. T. Stead. After nine months' military service, as a French citizen, with the artillery at Toul, he entered Balliol college, Oxford, in 1894. He took a first in history, was president of the Union and in 1896 married Elodie Hogan (1870–1914) of Napa, Calif. He was naturalized in 1902 and sat as M.P. for Salford (1906–10), first as a Liberal and then as an Independent.

Verses and Sonnets (1895) and *The Bad Child's Book of Beasts* (1896) launched Belloc on his literary career. His *Danton* (1899) and *Robespierre* (1901) proved his lively historical sense and powerful prose style. This was characterized by strong rhythm and a great felicity in the description of landscape. It was also marred by occasional latinisms. *Lambkin's Remains* (1900) and *Mr. Burden* (1904) showed his mastery of satire and irony. In *The Path to Rome* (1902), perhaps his most enduring work, he interspersed his account of a pilgrimage on foot from Toul to Rome with comments on the nature and history of Europe. No one in his time did more than Belloc to restore the sense of Europe to English letters. Born and brought up a Roman Catholic, he showed in almost everything he wrote an ardent profession of his faith. This coloured with occasional inaccuracy and overemphasis most of his historical writing, which includes *Europe and the Faith* (1920), *History of England,* 4 vol. (1925–31), and a series of biographies ranging in period from *James 11* (1928) to *Wolsey* (1930). But he had, in a high degree, the power he so admired in Michelet—that of bringing history to life.

The Four Men (1912) described a walk through Sussex, the county where he made his home; and his love of sailing was vividly illustrated in *The Cruise of the Nona* (1925). Both books were a highly personal mixture of travel and mature reflection on history, philosophy and contemporary events. In political and economic matters Belloc was a follower of William Cobbett. He traced the economic maladies of modern England to the sequestration of monastic and common land by the nobility and mercantile classes, and his efforts were directed toward a more even distribution of wealth.

Belloc will probably, however, be best remembered for his essays and his poetry, especially his lighter verse, such as *The Modern Traveller* (1898) and the *Heroic Poem in Praise of Wine* (1932). His Taylorian lecture *On Translation* (1931) showed critical acumen, and *Belinda* (1928) was something more than a perfect pastiche. He also wrote a number of satirical novels, for which his close friend G. K. Chesterton did the illustrations.

Belloc engaged in much heated controversy, particularly with H. G. Wells, whose *Outline of History* he vigorously attacked, and with the Protestant scholar and historian G. C. Coulton; and this reflected his incapacity to devote himself for very long to

literature in any of its purer forms. But he remains one of the masters of modern English prose, a good poet, and a great literary personality. He died on July 16, 1953, at Guildford, Surrey.

BELLONA (originally DUELLONA), in Roman cult the goddess of war (*bellum, duellum*), identified with the Greek Enyo. Sometimes known as the sister or wife of Mars, she has been identified with his cult partner Nerio. Her temple at Rome. dedicated by Appius Claudius Caecus (296 B.C.) during a battle with the Samnites and Etruscans, stood in the Campus Martius, near the Flaminian Circus and outside the city's gates. There the senate met to discuss a general's claim to a triumph and to receive foreign ambassadors. In front of it was the *columna bellica,* where the ceremony of declaring war by the *fetialis* (see HERALD) took place.

The Asiatic Bellona, whose worship was introduced into Rome from Comana, in Cappadocia, apparently by Sulla during the first Mithridatic war, is to be distinguished from this native Italian goddess. A new temple was built for her and a college of priests instituted to conduct her fanatical rites, at which, wearing black dresses. they lacerated their arms and loins and sprinkled the blood on the spectators.

BELLOTTO, BERNARD0 (called CANALETTO) (1720–1780), Venetian view-painter whose carefully drawn scenes of town and country are dark in tone and cold in colour, was born in Venice on Jan. 30, 1720. He studied under his uncle, Canaletto (*q.v.*), and was himself known by that name. He painted scenes of Venice until 1742 when he left the city and, after traveling in Northern Italy for a time, left the country permanently in 1747. He spent the rest of his life at Dresden, in Vienna and in Warsaw, where he became court painter to Stanislaw II of Poland in 1770. His paintings of these northern cities are of a similar character to his uncle's Venetian views but darker and colder in tone and marked by heavy shadows.

Bellotto died on Oct. (?Nov.) 17, 1780, in Warsaw.

(F. J. B. W.)

BELLOWS, ALBERT FITCH (1829–1883), U.S. painter and etcher, particularly popular for his landscapes, was born at Milford, Mass., Nov. 29, 1829. He first studied architecture, then turned to painting, and worked in Paris and in the Royal Academy at Antwerp. He painted much in England; was a member of the National Academy of Design, and of the American Water Color society, New York city; and an honorary member of the Royal Belgian Society of Water-Colourists. His earlier work was genre, in oils; after 1865 he used water colours more and more exclusively and painted landscapes. Among his paintings are "Afternoon in Surrey" (1868); "Sunday in Devonshire" (1876), exhibited at the Philadelphia exposition; "New England Village School" (1878); and "The Parsonage" (1879). Bellows died in Auburndale, Mass., on Nov. 24, 1883.

BELLOWS, GEORGE WESLEY (1882–1925), U.S. painter, whose characteristic style of broad, fluid brush strokes full of energy and vitality manifested itself in sporting subjects, urban scenes and portraits, was born in Columbus, O., on Aug. 12, 1883, of sober New England and Long Island seafaring stock. Before completing his course at Ohio State university, where he excelled in baseball, his interest in art led him to move in 1904 to New York city, where he became a pupil of Robert Henri. In a remarkably short space of time Bellows developed great facility, as shown in the portrait of his father done during a visit with his family at Christmas time in 1906. His reputation was established the following year with "Forty-Two Kids," a sprawling group of city youngsters scattered over an old dock: diving and swimming. Immediately following this he caused a sensation with a series of prize fight pictures done after enthusiastic visits to Tom Sharkey's club where professional fights were staged. "Stag at Sharkey's" and "Both Members of This Club" showed violent action and a wholehearted robustness that was a new element in U.S. art. Thomas Eakins had depicted the prize ring realistically but in completely static renderings. During Bellows' early years' in New York he was associated with the group known as The Eight and was later active in the organization of the Armory show.

Bellows was interested in charming and gaily painted groups of women and children. in parks or skating, as well as in city and river scenes. His wife Emma and his daughters Anne and Jean, either singly or as a group, were frequent models, "Emma and Her Children" and "Lady Jean" being two of his most noted canvases. Another subject that he treated with both sympathy and character was old age. "Mrs. T. in Cream Silk," "Aunt Fannie" and "My Mother" show the dignity of age, which no one but Eakins had treated so admirably since John Singleton Copley.

In 1916 Bellows took up lithography and became almost as well-known in this medium as in painting. His numerous drawings show, also, his fine ability as a draftsman. He died in New York city on Jan. 8, 1925.

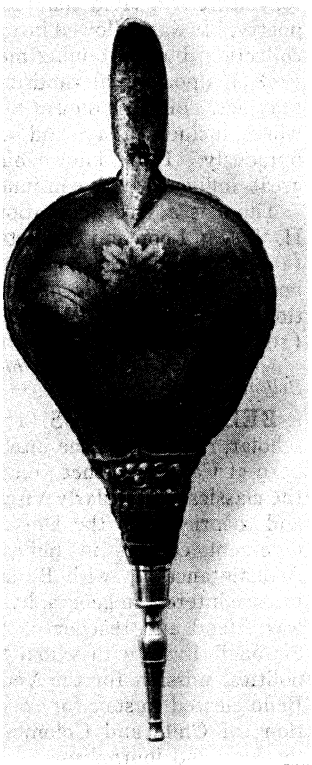
BELLOWS, an appliance that produces a current of air through compression of a collapsible bag or receptacle into which air has been admitted. Bellows were used as early as the period of the Greek occupation of Egypt.

The modern bellows consists-, in its simplest form, of two flat boards of rectangular, circular or pear shape. connected around their edges by a wide band of leather so as to include an air chamber whose volume can be increased or diminished by separating the boards or bringing them closer together. The leather is kept from collapsing, on the separation of the boards, by wire rings The lower board has a hole in the centre, covered inside by a leather flap or valve that can only open inward; there is also an open outlet, generally in the form of a pipe or nozzle, the aperture of which is much smaller than that of the valve When the upper board is raised air rushes into the cavity through the valve to fill up the partial vacuum produced; when the upper board is depressed the valve is closed by the air seeking an outlet. and this air is discharged through the open nozzle with a velocity depending on the pressure exerted.



BY COURTESY OF THE METROPOLITAN MUSEUM OF ART GIFT OF THE MEMBERS OF THE COMMITTEE OF THE BERTHA KING BENKARD MEMORIAL FUND 1946

AMERICAN LACQUERED BELLOWS. EARLY 19TH CENTURY

To avoid the drawback of an intermittent discharge of air, the double bellows are used. To understand their action it is only necessary to conceive an additional board with valve, like the lower board of the single bellows, attached in the same way by leather below this lower board. Thus there are three boards. forming two cavities, the two lower boards being fitted with air valves. The lowest board is held down by a weight and another weight rests on the top board. In working these double bellows the lowest board is raised, driving the air from the lower cavity into the upper. On lowering the bottom board again a fresh supply of air is drawn in through the bottom valve, to be discharged again when the board is raised. As the air passes from the lower to the upper cavity it is kept from returning by the valve in the middle board, and in this way a quantity of air is sent into the upper cavity each time the lowest board is raised. The weight on the top board provides the necessary pressure for the blast, and at the same time causes the current of air delivered to be fairly continuous.

BELL ROCK (INCHCAPE), a sandstone reef in the North sea, stands 12 mi. S.E. of Arbroath, Angus. Scot. It measures 2,000 it. in length. is under water at high tide, but at low tide is exposed for a few feet. the sea for a distance of 100 yd. around being then only three fathoms deep. Lying in the fairway of vessels making or leaving the Tay and Forth, besides ports farther north, it was a constant menace. In the great gale of 1799. 70 sailing ships were wrecked off the reef; the next year Kobert Stevenson (1772–1850), grandfather of R. L. Stevenson; modeled a tower and reported that its erection was feasible. but parliamentary powers were only obtained in 1806 and operations began in Aug. 1807. Though John Rennie had meanwhile been associated with Stevenson as consulting engineer, the design and details are wholly Stevenson's work. The tower is 100 ft. high; its diameter at the base is 42 ft., decreasing to 15 ft. at the top. It is solid for 30 ft. at which height the doorway is placed.

A bust of Stevenson by Samuel Joseph (d. 1850) was placed in the tower. According to tradition an abbot of Xberbrothock (Arbroath) had ordered a warning bell—whence the name of the rock—to be fastened to the reef so as to respond to movements of the waves. This was destroyed by Sir Ralph the Rover, whose ship was afterward wrecked at this very spot. Sir Ralph and his men being drowned. Robert Southey made the incident the subject of his ballad of "The Inchcape Rock."

BELLUNO, a city of northeastern Italy in the district of Veneto, capital of the province of Belluno, lies in the valley of the upper Piave at its confluence with the Ardo in the Dolomites 114 km. (71 mi.) N.N.E. of Padua by road. Pop. (1957 est.) 30.344. The 16th-century cathedral was partly rebuilt after an earthquake in 1873; in the Piazza del Duomo are the town hall, the Renaissance Palazzo dei Rettori, and the museum in a 17th-century building. The church of S. Pietro contains a high altarpiece by Sehastiano Ricci (1659–1734), a native of Belluno; outside the 15th-century church of S. Stefano is a Roman sarcophagus. Agriculture and the tourist trade provide the chief occupations. Of pre-Roman origin, the city was known to the Romans as Bellunum. It joined Venice voluntarily in 1405 and remained Venetian until taken by the French in 1797. It passed to Austria in 1813 and became part of the Italian kingdom in 1866. In World War II it was captured by the Allies in April 1945.

BELLWORT (*Uvularia*), the name given to a group of handsome woodland plants of the lily family, native to eastern North America. There are five or six species, all low perennials with slender, creeping root stocks which send up leafy stems from 6 to 20 in. high, bearing large pale yellow flowers, usually solitary and drooping at the ends of the branches, and blooming from April to June.

The most conspicuous is the large-flowered bellwort (U. *grandiflora*). This bears ovate leaves, somewhat hairy below when young, and narrowly bell-shaped, lemon-yellow, six-parted flowers about one and one-half inches long. It is found from Quebec westward to Minnesota and southward to Georgia and Kansas. The somewhat smaller perfoliate bellwort (**I;**. *perfoliata*), with more pointed leaves, which are smooth below, occurs from Quebec and Ontario south to Florida and Mississippi. In the two foregoing species the leaves appear as if impaled upon the stem (perfoliate). The other much smaller species, by some authorities regarded as belonging to the genus *Oakesia*, have sessile leaves. The sessile-leaved bellwort (U. *sessilifolia*) ranges from New Brunswick to Minnesota and south to Georgia and Arkansas. The mountain bellwort (*U. puberula*) is restricted to the mountains of Virginia, West Virginia and North Carolina, while the delicate U. *floridana* is found only in central Florida.

BELMONT, AUGUST (1816–1890), U.S. banker and diplomat, was born at Alzey, Rhenish Prussia, Dec. 8, 1816. At 14 he entered the banking house of the Rothschilds at Frankfurt am Main and later transferred to the Naples office. In 1837 he moved to New York, opened a small office on Wall street where he served as American agent for the Rothschilds and laid the foundations for the banking house of August Belmont & Co. He took an active interest in politics as a Democrat. From 1853 to 1855 he was chargé d'affaires for the United States at The Hague and from 1855 to 1858 he served as resident minister there. He was opposed to slavery and supported Stephen A. Douglas, but after the American Civil War began he became a loyal supporter of President Lincoln, exerting strong influence upon merchants and financiers in England and France in favour of the Union. He died in New York on Nov. 24, 1890.

His eldest son, PERRY BELMONT (1851–1947), was a member of congress (1881–88) and became U.S. minister to Spain in 1888–89. Another son, August Belmont (1853–1924), took a prominent part in financing and building the New York subway.

See A. **Belmont,** *A Few Letters and Sbeecher of the Late Civil War* **(1870)** ; **R. J.** H. Gottheil, **The** *Belmont-Belmonte Family* **(1917).** *(R. E.* **AT.)**

BELO HORIZONTE, a city of southeast Brazil, capital of Minas Gerais state. Pop. municipality (1950) 352,724; city, 338,-585. Lying at 2,811 ft. above sea level, it has an annual average temperature of 68" F. and about 60 in. of rainfall.

Belo Horizonte was inaugurated as Cidade de Minas in 1897, succeeding Ouro Prêto as capital of the state; its present name was adopted in 1901. Belo Horizonte, built on a plateau, was created on a plan approximating the pattern of Washington, D.C. Affonso Penna, chief executive of the state and subsequently president of the republic, had an important role in the development of the city. Belo Horizonte is located near the centre of the state with an area for expansion and is separated from the most heavily populated districts by the Serra do Espinhaço. The city is situated north and west of this uplift, while most of the state's inhabitants live to the south and east of the barrier.

Belo Horizonte is an attractive city, carefully planned and executed with many impressive buildings. It is the seat of the University of Minas Gerais. The city is a centre for important agricultural and mining industries, as well as diamond cutting. An increasing number of industrial establishments are found on its periphery, including chemical plants, furniture factories and food-processing plants. Cotton for textile mills is supplied from the São Francisco valley. Belo Horizonte can be reached from Rio de Janeiro, a distance of about 375 mi., by air, rail or automobile. (J. L. TR.)

BELOIT, a city of Rock county, Wis., U.S., at the confluence of Rock river and Turtle creek 70-mi. S.W. of Milwaukee. (For comparative population figures *see* table in WISCONSIN: *Population.)*

Beloit was settled in 1837 by the New England Emigrating company, on land obtained from Caleb Blodgett, who had previously purchased it from trader Joseph Thibault at the conclusion of the Blackhawk War. It was incorporated as a city in 1856. The village early pledged labour, land and money to bring a college to its site, and Beloit college was founded in 1846–47. After mid-20th century the college enrolled about 1,000 students annually.

The town developed as an industrial site, and centre of a rich farming and dairy area. Industrial plants in Beloit manufacture such products as air conditioning equipment, pumps, knives, paper and paper boxes, grinders, taps, dies, punch presses, rotary ovens, shoes. stokers, refrigerating units, light plants, radiators, hosiery and gloves, farm engines, electric brakes, machine-precision tools and paper-making machinery. (R. H. I.)

BELON, PIERRE (1517–1564), French naturalist and the first to indicate the homologies between the bones of the bird and human skeletons, was born near Le Mans in 1517. He received a medical degree at Paris, studied botany under Euricius Cordus at Wittenberg, and traveled as far as Syria and Egypt. In 1564 he was murdered in Paris. Belon's writings include *Les Observations de plusiers singularités et choses mémorables trouvées en Grèce, Asie, etc.* (1553), an account of his travels; *De aquatilibus* (1553), which describes and figures various animals that live in water; and *L'Histoire de la nature des oyseanrx* (1555), one of the finest 16-century ornithological works. It illustrates, classifies and describes, with many original observations, about 200 birds.

See **accounts of Belon in** *Dictionnaire biographique française* **(1951)** and in L. C. Miall, *The Earl;, Naturalists* **(1912).** (J. W. TT.)

BELORUSSIAN SOVIET SOCIALIST REPUBLIC (BELORUSSKAYA SOVETSKAYA SOTSIALISTICHESKAYA RESPUBLIKA; also BELORUSSIA, BYELORUSSIA or, as it is often known, WHITE RUSSIA) is one of the 15 constituent republics of the U.S.S.R. It covers an area of 80,154 sq.mi., and is bounded on the north and east by the Russian Soviet Federated Socialist Republic, on the south by the Ukrainian Soviet Socialist Republic, on the west by Poland and on the northwest by the Lithuanian and Latvian Soviet Socialist Republics.

Physical Geography. — The physical geography of Belorussia bears evidence of the Ice Age. The limit of the last advance of the ice-sheet lay across the territory of the modern republic and is marked by a line of terminal moraines, known as the Belorussian ridge (Belorusskaya Gryada). This ridge runs west-southwest to east-northeast from the Polish frontier north of Brest toward Smolensk and consists of low, rolling hills. Transverse river valleys cut the ridge into a series of uplands, the sequence being: Volkovysk upland, Shchara valley, Novogrudok upland, Neman valley, Minsk upland, Berezina valley, Orsha upland, Dnieper valley and a final group of uplands along the eastern boundary. The highest group is the Minsk upland, which .reaches 1,168 ft. in Gora Dzerzhinskaya and 1,135 ft. in Gora Lysaya.

North and south of the ridge lie extensive lowlands. To the south is the broad: shallow trough known as Polesye (Polesic) which is drained by the Pripet (Pripyat) and its tributaries. These flow eastward to join the Dnieper (*q.v.*) which crosses the eastern part of Polesye from north to south. The trough of Polesye collected the meltwater of the ice sheet and great quantities of material were deposited in the form of sands, lake clays, etc. These deposits. together with the flatness of the lowland, hamper drainage and have caused the formation of very extensive swamps (Pripet marshes) through which the rivers wind sluggishly. Spring floods are widespread, and along the Pripet often extend for ten miles on either side of the river.

North of the Belorussian ridge lie two more large lowlands: the Neman lowland, drained by the river of that name, in the northwest, and the Polotsk lowland, drained by the Western Dvina, in the north. These two lowlands are separated by two morainic ridges, the Oshmyany and Sventsyany (Švenčionys) ridges, with the Viliya (Neris) valley between them. The former ridge rises to 1.060 ft. This, with the Minsk and Novogrudok uplands, are the only areas of Belorussia to exceed 1.000 ft. The two northern basins contain many lakes of glacial origin, the largest of which is Lake Naroch. Thus Belorussia falls into three main drainage basins, the Dnieper-Pripet basin draining to the Black sea, and the Neman and Western Dvina basins, draining to the Baltic. (See also DNIEPER; DVINA, WESTERN.)

The continental climate is relatively moderate and humid with temperatures averaging 20° F. in January and 65° in July. Annual precipitation is 20–24 in. The whole area lies in the zone of mixed forest, with podsol soils dominant. Although great inroads have been made for centuries into the natural forest cover, about 29% of the area of Belorussia remains forested. The largest forests are in Polesye, where many parts are more than 50% forested. Pine is the commonest tree, occurring on the widespread sands of glacial origin. Birch is ubiquitous, while alder is very common in wetter areas. Spruce, widely found in the north, tends to die out southward and is rarely found south of the Pripet. Oak and hornbeam are the commonest hardwoods, although they make up only 5% of all forests. Maple, elm, ash and linden also occur. In the west, on the Polish frontier, is the Belovezh forest (*q.v.*), one of the largest surviving areas of primeval forest in Europe. noted for its wide range of flora and fauna. There a large reservation has been established. Along the rivers are extensive flood plain meadows, with damp clay soils. The largest swamp and bog areas occur in the south, in Polesye, and are mostly of the "lowland" type, with a vegetation of reeds, sedges and grasses, often with areas of swamp-forest of willow, alder and birch. Sphagnum bogs are less frequent (only about 14% of the total swamp area) and are found mainly in the north and central areas of Belorussia.

Of the fauna of Belorussia undoubtedly most interesting is the *zubr*, or European bison, the last survivors of which are found in the Belovezh forest reservation. Elk, beaver, wolf, fox, hare, wild pig, marten, deer and even a rare brown bear are all to be found.

History. — The Belorussian region has long been settled by man. Archaeology provides evidence of prehistoric cultures as early as the Magdalenian, while Neolithic remains are widespread. One theory holds that the original home of the Slav peoples was in the marshes of Polesye and. although it is more widely believed that the Slavs originated farther to the southwest, between there and the Carpathians, there is no doubt that the Belorussian area was one of the earliest to be settled by Slavs (*q.v.*). The early Slavic tribes, the Dregovichi, Radimichi, Krivichi and Drevlyane, had formed petty princedoms by the 8th–9th centuries A.D., such as those of Pinsk, Turov, Polotsk, Slutsk and Minsk. These all came, in time, under the general suzerainty of Kiev. The economy of the period was based on primitive, shifting agriculture on burned-over forest land, and on honey collecting. Along the rivers trade developed, particularly on the Dnieper, part of the "Water road" from Kiev to Novgorod. Along the rivers towns began to develop, most of the Belorussian towns being founded by the end of the 12th century. Polotsk and Turov are two of the earliest-mentioned tonns of Slavic foundation — 862 and 980. Brest is first recorded in 1017 and Minsk in 1067.

With the overthrow of Kiev by the Tatars in 1240, Kievan Rus broke up. Many of the Belorussian towns were laid waste. Almost all this area passed to the control of Lithuania. Although most of the aristocracy was Lithuanian and pagan, a number of Russian and Orthodox nobles remained as feudatories of the grand duke. Throughout the 13th and 14th centuries the power of Lithuania increased, encompassing Smolensk and Kiev and even reaching the shores of the Black sea. In 1386 the Lithuanian and Polish ruling houses were united under the Jagiellon dynasty and Catholicism became the official religion of Lithuania. Between Lithuania-Poland and the rising power of Muscovy there was an incessant and bitter struggle for this area. Although during the 15th and early 16th centuries the steppe areas and the region around Smolensk were lost to Moscow, Belorussia remained under Lithuanian control. During the 16th century a code of laws was drawn up, known as the Lithuanian statutes, defining civil and property rights. However, only the aristocracy and merchants derived any advantage. The position of the peasants became increasingly that of serfs.

In 1569 the Lublin union made Poland and Lithuania one state. although Lithuania retained its title of grand duchy and its code of laws. In Belorussia a mainly Polish-speaking, Roman Catholic aristocracy developed, although the peasants on the whole remained Orthodox. In 1596 the Union of Brest established the Uniate Church, but this made relatively little headway among the Orthodox. The rule of the Polish landowners was not popular and gave rise to a large-scale revolt in 1648–54, but Belorussia remained under Poland until the reign of Catherine the Great. Economic development was slight and the Belorussian population was almost entirely engaged in primitive agriculture. Trade lay in the hands of Poles and Jews. Conditions were particularly backward in the swamps of Polesye.

By the first partition of Poland, in 1772, Catherine the Great acquired eastern Belorussia, including the towns of Vitebsk, blogilev and Gomel. The second partition (1793) gave Russia Minsk and all the central part, and in 1795 the third partition united the remainder of present-day Belorussia to the Russian empire. The area was divided administratively among the governments (*i.e.*, provinces) of Minsk, Mogilev, Vilnius and Vitebsk. Under the tsarist rule the Uniate Church was persecuted and many of its members became Orthodox. In 1812 Napoleon crossed Belorussia in his advance on Moscow and again during his retreat. The forcing of the Berezina river (*q.v.*) was one of the heaviest battles of the campaign.

The 19th century saw the beginning of industrial growth in the towns of Belorussia, largely based on local supplies: timber working. glassmaking and boatbuilding along the rivers. Following the emancipation of the serfs in 1861 the tempo of industrialization increased, particularly with the coming of the railways, from

the 1880s on. Nevertheless the area remained economically backward to 1917, particularly in rural areas. This resulted in considerable emigration, nearly 1,500,000 persons leaving Belorussia during the 50 years before the Russian Revolution. Most of the emigration was to the United States or to Siberia: between 1896 and 1915 more than 600,000 persons migrated to Siberia. In 1898 the first congress of the Russian Social Democratic Revolutionary party was held in Minsk, founding the Marxist party in Russia. The house where the congress was held is preserved as a museum.

In World War I heavy fighting took place in Belorussia, with great destruction. The peace treaty between the Soviet revolutionary government and the Germans was signed in Brest in March 1918. On Jan. 1, 1919, the revolutionaries proclaimed the founding of the Belorussian Soviet Socialist Republic, but fighting continued between the Soviets and the Poles. In 1919 the Poles advanced east to the Berezina, only to be thrown back again. Peace was finally achieved in March 1921 by the treaty of Brest, which divided Belorussia between the U.S.S.R. and Poland. The frontier was the same as that following the first partition. In 1924 the regions of Polotsk, Vitebsk, Orsha and Mogilev were added to the original Belorussian S.S.R. and in 1926 Gomel was included.

In 1939, after the German attack on Poland, the U.S.S.R. entered Poland from the east, occupying all Belorussia up to the Bug river and including the Bialystok region. In June 1941 the German attack on the Soviet Union rapidly overran Belorussia. although the garrison of the Brest fortress made a prolonged and courageous stand. Heavy fighting once more devastated the area during the German retreat and a number of major engagements took place, notably at Vitebsk, Minsk and Borisov. Damage to property and to the economy in the war years was grievous, and many towns, including Minsk, were almost entirely destroyed. Seventy per cent of the housing in the republic and more than 10,000 industrial undertakings were destroyed. After the war, in 1915, a treaty between the U.S.S.R. and Poland left western Belorussia in Soviet hands, with the exception of the Bialystok (*q.v.*) region which was returned to Poland. The Polish population of these areas was transferred en masse to Poland. With the establishment of the United Nations, the Belorussian S.S.R. was given a seat in the general assembly of that body.

Population, Administration and Social Conditions. — The population of Belorussia by the census of 1959 was 8,060,000. Belorussians accounted for 6,444,000 or 80.0% of these. while the next largest ,nationality groups were Russians (729,000—9.1%), Poles (539,000—6.7%), Jews (150,000—1.9%) and Ukrainians (150,000 — 1.9%). In addition to the Belorussians living in the republic, there are about 1,297,000 Belorussians living elsewhere in the U.S.S.R., of which the largest groups are 845,000 in the R.S.F.S.R., 291,000 in the Ukraine, 108,000 in the Kazakh S.S.R. and 102,000 in the Baltic republics.

The number of *oblasts* of the republic has been steadily reduced since 1945 and the abolition of Molodechno *oblast* in 1960 reduced them to six. These administrative divisions are Minsk, Vitebsk, Gomel, Mogilev, Brest and Grodno (*qq.v.*). The Supreme Soviet, elected in 1959, consisted of 407 deputies (1 per 20,000 population).

A much higher proportion of the population is rural than in the U.S.S.R. as a whole: 69% as against the all-Union figure of 52%. The major towns are Minsk, the capital (509,000), Gomel (166,000), Vitebsk (148,000). Mogilev (121,000), Bobruisk (97,000), Brest (73,000), Grodno (72,000) (*qq.v.*), Orsha (64,000), Borisov (59,000) (*q.v.*), Pinsk (*q.v.*) and Molodechno. In all. Belorussia has 69 towns and 115 urban districts ("urban and workers' settlements"). There are more than 32,000 villages and rural settlements. These are in general of medium or small size, averaging 50 households ; more than half have fewer than 30 households. Only in the swamps of Polesye are villages larger, being concentrated on the patches of dry land. The trend to dispersed settlement of isolated farmsteads, which developed widely between 1861 and the Revolution. has been reversed and the peasants resettled in compact villages., Dispersed settlement remains common in the western areas, which were Polish up to 1939.

Industrial and other developments since World War II have done much to improve the very backward social conditions of Belorussia, although in many respects the republic still lags behind the other Union republics. In the early 1960s there were nearly 11,000 doctors and 1,000 hospitals and medical stations, providing about 52,000 beds. Despite progress, the Belorussian figures for doctors and beds remain below the national averages of 17.9 and 76.2 per 10,000 people. Education has also made great strides, and illiteracy, which was widespread in 1917, has been almost abolished. The republic has its own Academy of Sciences, founded in 1928, and a university, both located in Minsk. Many higher educational and technical institutions have been set up. Libraries and cinemas have been built in towns and rural areas. Both Belorussian and Russian are recognized as official languages.

The Economy. — Belorussia has a single council of national economy which was formed in 1958. Industry is primarily based on local raw materials, particularly from agriculture and the forests. Food-processing industries are found everywhere, in large and small towns alike. Flour milling, milk processing, butter- and margarine-making, meat packing, fruit and vegetable canning and jam and honey making are the major branches of this sector of the economy, which provides one-third of Belorussian industrial production. The forests are intensively exploited and the annual cut of timber significantly exceeds regeneration. Saw-timber and furniture are produced everywhere, while the two chief centres, Borisov and Bobruisk, together with the other main towns, produce a range of timber products: matches, paper and pulp, veneer, joinery and prefabricated houses. Equally widespread throughout the republic are the textile and footwear industries. The greatest concentration of the textile industry is in Vitebsk *oblast*, based on local flax, and centred on Orsha. Since the Russian Revolution engineering and metalworking have become very important in the larger towns and now occupy third place in industrial production, after food and textiles. Minsk supplies tractors and heavy commercial vehicles to all parts of the U.S.S.R. Gomel, Bobruisk and Lida make agricultural machinery; machine tools are manufactured in Minsk, Gomel, Vitebsk, Borisov and Baranovichi while Gomel, Rechitsa, Bobruisk and Pinsk build river craft. The small but growing chemical industry produces wood chemicals and fertilizers. The glass industry, once widespread in Belorussia, is now concentrated in a few centres of large-scale production, notably Kostyukovka and Borisov. Power for industry comes largely from thermal generating stations, many of which operate on peat from the wide bog areas and on timber waste.

The climate and poor podsol soils are not suited for cereals: and livestock husbandry, particularly of cattle and pigs, is usually dominant, especially in the lowlands with their abundant pasture. Milk, meat and other dairy products are important. The highest proportion of arable land is found on the morainic uplands, and rye, wheat, buckwheat and barley are grown. Flax is widely grown, especially in the northern half of the republic. In the south, hemp, to some extent, replaces flax. Potatoes are a very important crop for human and animal consumption and for industrial purposes. Near Minsk is an area of intensive market gardening. In Polesye drainage operations have been undertaken in many areas and the peaty soils reclaimed give high yields.

Belorussia is well served by a relatively dense railway network. It lies on trunk rail and road links between Moscow and Warsaw. The Dnieper and Pripet are navigable and the latter is joined by the Dnieper-Bug canal to the Vistula river system of Poland. The Western Dvina and Berezina can take small craft and rafts.

(R. A. F.)

BELOVEZH FOREST (BELOVEZHSKAYA PUSHCHA; Polish PUSZCZA BIALOWIESKA) is located in Brest and Grodno *oblasts* (provinces) of the Belorussian Soviet Socialist Republic. U.S.S.R., and in the Bialystok voivodship (province) of eastern Poland, in the drainage area of the headstreams of the Narev and Lesna, tributaries of the Western Bug. The forest is remarkable as one of the largest remaining areas of primeval mixed forest in Europe,

with a wide range of flora from western and eastern Europe. Trees include pine. spruce, oak, hornbeam, birch, elm and alder in various associations. Some trees are of very great size, one oak reaching 138 ft. in height. Along the rivers are swampy forest and meadow. The fauna (47 species of mammals and 181 of birds) include the elk, wild boar, lynx, deer and wolf and also the last survivors of the *zubr,* or European bison, the number of which is increasing after the grave depletions of World War II. Both Poland and the U.S.S.R. have established large nature reserves there. Bialowieza village in Poland, with the ruins of the tsar's hunting lodge, is a centre for tourists and scientists. (R. A F.)

BELOVO, a town of Kemerovo *oblast* (province) of the Russian Soviet Federated Socialist Republic, U.S.S R., lies on the small Bachat river, a tributary of the Inya. Pop. (1959) 107.000 It has become one of the more important coal mining centres of the Ruznetsk basin. A large zinc works, built in 1931, uses local ore from the Salair ridge and concentrated ore from Kazakhstan. A thermal electric plant has a capacity of 1,300,000 kw. Belovo lies on the axial railway of the Kuznetsk basin, from Xovokuznetsk to Novosibirsk, at the junction with a branch line to Guryevsk. (R. A. F.)

BELPER, an urban district and market town of Derbyshire, Eng.. lies on the east bank of the river Derwent, 7 mi. N. of Derby by road or rail. Pop. (1961) 15,563. Area 6.7 sq.mi Edmund Crouchback, son of Henry III, held the manor and founded the church. His hunting seat there is said to have been called Beaurepaire or Bellerepaire, from which the name Belper may derive. The most famous name in Belper's industrial history is that of Strutt; Jedediah Strutt (*q* v), the inventor of a ribbing machine. built the town's first cotton mills about 1780. The staple trade, once nails, is cotton and hosiery, but the manufacture of food products and engineering are also carried on. There are river gardens and a boating station on the Matlock road.

BELSWAZZAR (BEL-SHAR-USUR; Gr. BALTASAR or BALTHASAR) (d. 539 B C.), the coregent of Babylon who was killed at the capture of the city by the Persians. Until 1854 he was known only from the Old Testament narrative as told in the book of Daniel and from classical allusions to his reign, but from that year onward a number of references to Belshazzar were found in contemporary Babylonian inscriptions. In the accession year of Neriglissar (560–559 B C.) he already held an important administrative post as a royal official. He was the eldest son of Nabonidus, who later became king of Babylon (556–539 B C.), and of Nitocris, perhaps a daughter of Nebuchadrezzar II. This may account for the references in the book of Daniel to Belshazzar as "the son (*i.e.,* grandson) of Nebuchadrezzar" About 550 B C. Nabonidus moved with part of the army to Tema (Taimah) in northern Arabia where he remained an exile for ten years He handed over the major part of the army to the crown prince Belshazzar "and entrusted the kingship to him" (Nabonidus chronicle). During his coregency, documents continued to be dated by the regnal years of Nabonidus, though there may well have been a local practice of naming the years by Belshazzar's reign. Belshazzar continued to administer both the government and his own private estates as well as those of the king during the absence of Nabonidus, with whom he kept in touch by camel caravan. There was famine in the land and economic setback for a few years prior to the return of Nabonidus, c. 540 B C.

The story of Belshazzar's feast and death is known only from the book of Daniel (ch. v) and from Xenophon's *Cyropaedia* (vii. 5). His death occurred after the city of Babylon had fallen to the Persian general Gobryas without resistance on Oct. 12, 539 B.C., and probably before Cyrus entered the city 17 days later. The Nabonidus chronicle reports the capture of Nabonidus when he returned to the city soon afterward. *See* BABYLONIA AND ASSYRIA.

See R. *P.* Dougherty, *Nabonidus and Belshazzar* (1929).

BELT AND PULLEY: *see* PCLLEY AND BELT.

BELTANE (BELTENE, BELTINE or BEAL-TENE) (Scot.-Gael. *bealltain*), the Celtic name for May day, on which was held a festival originally common to all the Celtic peoples. The most important ceremony in later centuries was the lighting of the bonfires known as beltane fires, which is believed to represent the druidical worship of the sun-god. He who had the misfortune to get the charcoal-blackened bit of the cake cooked at the fire became *cailleach bealtine* (the beltane carline), a term of great reproach.

In the northeast of Scotland beltane fires were still kindled in the latter half of the 18th century. Cormac, archbishop of Cashel about the year 908, furnishes in his glossary the earliest notice of the custom. The Highlanders have a proverb, "He is between two beltane fires."

The derivation of the word beltane is obscure. Following Cormac, it was once usual to regard it as a combination of the name of the god Bel or Baal or Bil with the Celtic *teine,* "fire." Theories thereby connecting the Semitic Baal with Celtic mythology are now repudiated by philologists.

See John Ramsay, *Scotland and Scotsmen in the 18th Century (1888)*; A. Macbain, *Celtic Mythology and Religion* (1917).

BELTRAFFIO (BOLTRAFFIO), **GIOVANNI ANTONIO** (1467–1516), Italian painter of the Lombard school, influenced by Leonardo da Vinci. He belonged to a distinguished Milanese family and occupied important civic posts in his native town, painting as an accomplished amateur rather than as an artist by profession. His epitaph, which was removed from S. Paolo in Compito in Milan to the Archaeological museum, states that in his early youth he studied painting but in his later years was occupied with other work besides art. Leonardo came to Milan in 148j and Beltraffio became one of his ardent followers, conforming closely to his master's designs in his early work. He was a distinguished portraitist.

In 1500 he was commissioned to paint an altarpiece (now in the Louvre) for the church of the Misericordia, near Bologna. by Giacomo Casio, a merchant and poet, whose portrait Beltraffio painted several times (Chatsworth, Eng.; Brera gallery, city of Milan). The National gallery, London, possesses a "Madonna and Child" which, according to Morelli, is the master's best work, two pictures from the Salting Bequest and a portrait from the blond collection. Other works are in Milan (Brera gallery and Poldi-Pezzoli collection), Bergamo and in the Borromean palace on the Isola Bella. In Rome he painted a fresco in the church of S. Onofrio representing the "Madonna With the Founder" (1513). In the nuns' choir of San Maurizio, Milan, are 26 medallions of holy women painted in fresco by Beltraffio. His drawings can be studied in the Ambrosiana, Milan.

BELUGA (WHITE WHALE), a cetacean, *Delphinapterus leucas,* of the suborder Odontoceti (toothed whales), inhabiting arctic seas, where it is plentiful, and extending south to the Gulf of St. Lawrence and Cook inlet in Alaska. It reaches a length of 18 ft., is white with gray dapplings and has no back fin. Its voice, unlike that of many cetaceans, is audible to human ears and its liquid. musical trill gave it the name of "sea canary" among the old arctic whalers. The voice is probably used, as in many other whales, for echo-location. The food includes squids and fish; a single calf is born annually. *See* also WHALE. (L. H. M.)

BELVEDERE (BELVIDERE), an architectural structure built in the upper part of a building or in any elevated position to command a fine view. The belvedere assumes various forms, such as an angle turret, a cupola, a loggia or open gallery. The name is sometimes applied to the whole building, as the Belvedere gallery in the Vatican at Rome, or the Belvedere palace in Vienna.

BELY, ANDREI (real name BORIS NIKOLAEVICH BUGAEV) (1880–1934), a leading Russian Symbolist poet, novelist and critic, was born in Moscow, Oct. 26 (new style; 14, old style), 1880, the son of a professor of mathematics. Bely studied first natural sciences and then philosophy and philology at Moscow university. Influenced by Vladimir Soloviev, Kant, Schopenhauer and Nietzsche, he later became a follower of Rudolf Steiner. His best volumes of poetry are *Zoloto v lazuri* ("Gold in Azure," 1904), *Pepel* ("Ashes," 1909), *Urna* ("The Urn," 1909) and a charming autobiographical poem, *Pervoe svidanie* ("First Meeting," 1921). His prose fiction, even more important, includes the four experimental novels which he called *Simfonii* (1902–08), in which he applied

the principles of musical composition to prose narrative, and several others, of which *Serebryany golub* ("The Silver Dove," 1909), *Peterburg* (1913; Eng. trans. 1959) and *Kotik Letaev* (1922) are the most significant. Bely's bold experiments in narrative technique, especially in *Peterburg* and *Kotik Letaev* (which offered some parallels with James Joyce and reflected Steiner's teachings) strongly influenced younger postrevolutionary writers. While away from Russia (1912–16), he took part in the building of Steiner's anthroposophic temple at Dornach, near Basel. Of the books he wrote after his return from a short time as an *émigré* in Berlin (1922–23), his three volumes of memoirs (1929–37), though erratic and unreliable, are the most interesting. His most important critical works are *Simvolizm* (1910), his essay on Gogol in *Lug zelëny* ("The Green Meadow," 1910), his book on Lev Tolstoi and Dostoevski (1911), on Pushkin's *Medny vsadnik* (1929) and on Gogol's art (1934). He died in Moscow, Jan. 7, 1934.

BELZONI, GIOVANNI BATTISTA (1778–1823), Italian showman, engineer and explorer of Egyptian antiquities, was born at Padua on Nov. 15, 1778. He went to England in 1803 and, by means of his gigantic physique, earned a living in circcses in England, Spain and Portugal. In 1815 he went to Cairo to offer to Mohammed Ali pasha, the founder of modern Egypt, a hydraulic machine which he had invented. Through the British consul general, Henry Salt, Belzoni went to Thebes to remove the colossal head of Rameses II ("the Young Memnon") for the British museum. He then explored the temple of Edfu, visited Philae and Elephantine and cleared the great temple of Rameses II at Abu Simbel. He excavated at Karnak and, in 1817, discovered in the Valley of the Kings the tomb of the pharaoh Seti I, containing the aragonite sarcophagus sent to Sir John Soane's museum. Belzoni was the first to penetrate into the second pyramid of Giza (1818) and the first modern European to visit the oasis of Siwah. He also identified the ruined city of Berenice on the Red sea. He returned to England in 1819, and published in 1820 his *Narrative of the Operations and Recent Discoveries Within the Pyramids, Temples, Tombs and Excavations, in Egypt and Nubia* . . . (2 vol., atlas of plates, 3rd ed., 1822). In 1823 Belzoni set out for Timbuktu in west Africa, but died at the village of Gwato, near Benin, Nigeria, on Dec. 3, 1823. In 1825 his widow exhibited in Paris and London his drawings and models of the royal tombs of Thebes. (W. R. D.)

BEM, JOZEF (1794–1850), Polish army officer, who was one of the heroes of the Hungarian revolution of 1848–49, was born at Tarnow in Galicia on March 14, 1794, and was educated at the military school at Warsaw. Joining a Polish artillery regiment in the French service, he took part in the Russian campaign of 1812 and brilliantly distinguished himself in the defense of Danzig (Jan.–Nov. 1813). After 1815 he returned to the Polish service, but became involved in secret societies and lost his post. In the rising of 1830–31 his skill as an artillery officer won the battle of Iganie for the Poles (April 10, 1831), and he distinguished himself at the indecisive battle of Ostroleka (May 26). He took part in the desperate defense of Warsaw against I. F. Paskevich (Sept. 6–7, 1831). Then he emigrated and tried in vain (1833) to form a Polish legion in the service of Queen Maria of Portugal. In the Austrian revolution of 1848 he attempted to hold Vienna against the imperial troops (October) and! after the capitulation, hastened to Pressburg (Bratislava) to offer his services to the Hungarian leader Lajos Kossuth. He was entrusted with the defense of Transylvania at the end of 1848, and in 1849, as the general of the Szeklers, he performed miracles with his little army, notably at the bridge of Piski (Feb. 9), where, after fighting all day, he drove back a superior force of pursuers. After recovering Transylvania he was sent to drive the Austrian general A. von Puchner out of the Banat. Bem occupied the Banat but the Russian invasion recalled him to Transylvania. From July 12–22 he was fighting continually, but finally, on July 31 his army was annihilated by overwhelming numbers near Segesvár (Sighisoara), Bem only escaping by feigning dead. Bem was in command and was seriously wounded in the last pitched battle of the war, fought on Aug. 9 at Temesvár (Timisoara). On the collapse of the rebellion he fled to Turkey, adopted Islam and, under the name of Murad Pasha. served as governor of Aleppo, where, at the risk of his life. he saved the Christian population from being massacred. He died there on Dec. 10, 1850.

See Johann Czetz, *Memoiren über Bems Feldzug* (1850); *E.* Kovács, *Bem József* (1954). (*S.* Kt.)

BEMA, a word of Greek origin meaning a raised platform. Thus it was applied to the tribunal from which orators addressed assemblies of the citizens at Athens. That in the Pnyx. where the ecclesia (the Athenian assembly of freemen) often met, was a stone platform 10 to 11 ft. high. In the Athenian law court counsel addressed the court from such a platform, but it is not known whether each had a separate bema. Another bema was the platform on which stood the urns for the reception of the bronze disks by which at the end of the 4th century B.C. the judges recorded their decisions.

In ecclesiastical architecture the bema was originally the end of a Christian church where the higher clergy sat and the altar was placed. Later it took the form of a raised platform directly behind the altar in the apse of a basilica.

BEMBA (known also as BABEMBA or AWEMBA), a Bantu tribe about 150,000 in number, which inhabits the northeastern plateau of Northern Rhodesia, sparsely distributed in sandy deciduous woodland, 4,000 ft. above sea level, which stretches from longitude 29° W. to 32.5° E. and from latitude 9° N. to 12° S. The poor soil and lack of communications have made it difficult to introduce cash crops. The people practise shifting cultivation, pollarding the forest trees, firing the branches piled up on small circular patches beneath and sowing the staple crop, finger millet, in the ash bed so formed. By the early 1960s about 60% of the men were leaving the area to find work in the copper mines more than 400 mi. to the south.

The Bemba claim to be an offshoot of the Luba (*q.v.*) empire and are thought to have left the Congo in the late 18th or early 19th century. They were the largest and most warlike tribe of a group of agricultural and hunting peoples which practise matrilineal descent and matrilocal marriage and are commonly known as the Central Bantu. They dominated their neighbours and achieved a centralized government under a supreme chief, the *Chitimukulu.* This ruler, and the major territorial chiefs under him: were drawn from a single royal clan and succeeded to office by matrilineal rule. They were believed to have supernatural powers over the fertility of the land and the welfare of their people. Their powers rested on the sacredness of their persons and their prayers to ancestral spirits at relic shrines at their capitals, particularly at the annual tree-cutting, sowing and harvesting ceremonies. Their burial and accession ceremonies are among the most elaborate found among the Bantu.

The Bemba are divided into 40 matrilineal, exogamous, totemic clans with members dispersed over the country. The local group is the village, which is largely composed of the matrilineal relatives of the headman. It contains about 30 huts and moves every four or five years when the soil is exhausted. Crafts are little developed. Marriage is matrilocal in the first instance. Bemba bridegrooms used to do service for their fathers-in-law but this period of service is now being replaced by money payments. Also characteristic were elaborate nubility rites for girls known as *Chisungu,* but these are falling into disuse.

Chibemba, the language of the Bemba, has become the lingua franca of Northern Rhodesia. As it is closely related to the language of the Bisa, Lamba, Lala and Aushi, the term "Bemba-speaking peoples" is often applied to all the inhabitants of northeastern Rhodesia. *See* also BANTU LANGUAGES.

BEMBO, PIETRO (1470–1547), Italian cardinal and scholar, whose writings reflect the spirit of the early Italian Renaissance, was born at Venice on May 20, 1470. He was principally educated by his father, Bernardo Bembo, a man of great authority in the Venetian republic who introduced his son to the Florence of Lorenzo the Magnificent. Pietro accompanied Giulio de' Medici to Rome, where in 1513 he was appointed secretary to Leo X. On the pope's death he retired to Padua, and in 1529 he accepted the office of historiographer to his native city, being shortly afterward appointed librarian of St. Mark's. The offer of a cardinal's hat took him in 1539 again to Rome, where he devoted himself to theology and classical history, receiving as reward of his conversion the bishoprics of Gubbio and Bergamo. He died in Rome in 1547.

Bembo's works are entirely characteristic of the early Renaissance. His collected works (*Opere de Pietro Bembo,* 4 vol., 1729) include a history of Venice from 1487 to 1513, dialogues, poems and essays. Among the dialogues is *Gli Asolani* (1505), extolling platonic love though dedicated to the renowned Lucrezia Borgia whom Bembo had unsuccessfully courted. Other of his more original writings are the *Prose della volgar lingua* (1525), the earliest published examples of popular as opposed to Florentine Italian, and the *Rime* (1530), a collection of amorous poems.

BEMIDJI, a city of the scenic lake region of north-central Minnesota, U.S., about 150 mi. W. of Duluth; seat of Beltrami county.

A council-manager form of government has been in effect since 1953.

The city grew up around a trading post established on Lake Bemidji in 1888. In the 1890s large-scale lumbering operations were begun, and for 30 years Bemidji was a major logging and sawmilling centre. After mid-20th century the chief industries included creameries and woodworking plants. The largest city within a radius of 100 mi., Bemidji is an important trade centre. The region has long attracted tourists and sportsmen, and the numerous summer resorts in the vicinity entertain thousands of visitors annually.

Bemidji State college, which enrolls about 1,700 students annually, was founded there in 1913 and opened in 1919.

Bemidji is an Indian word first applied to the nearby lake; it was also the name of a Chippewa chief.

For comparative population figures *see* table in MINNESOTA: *Population.* (H. T. *H.)*

BEMONT, CHARLES (1848–1939), French scholar, who made a notable contribution to the study of English and European medieval history, was born in Paris on Nov. 16, 1848. He became in 1887 a lecturer at the École des Hautes Études in Paris and in 1896 was appointed assistant director. Many of his writings appeared in the *Revue historique,* founded in 1876, of which he was later editor. Among his most important works are: *Simon de Montfort, comte de Leicester* (1884); *Les Chartes des libertks anglaises* (1892); and *Histoire de l'Europe au moyen âge, de 395 à 1270* (1896, with G. Monod). During 1896–1906 he published the second and third volumes in the series *Rôles gascons.* He died in Paris on Sept. 20, 1939.

BENARES (BANARAS): *see,* VARANASI.

BENAVENTE Y MARTINEZ, JACINTO (1866–1954), one of the foremost Spanish dramatists of the 20th century, who received the Nobel prize for literature in 1922. He was born in Madrid on Aug. 12, 1866, the son of a noted children's doctor. He studied law at Madrid university, but abandoned it for the theatre. His early plays, *Gente conocida* (1896) and *La comida des las fieras* (1898), satirizing the corrupt Spanish society before the so-called disaster (the Spanish-American War of 1898), created a new movement in the Spanish theatre. which had been dominated by the blood-and-thunder melodramas of José Echegaray (1832–1916). In *Lo cursi* (1901) Benavente attacked the new bohemians in literature who used the word *cursi* ("vulgar") to describe everything admired by the *bourgeoisie.* After a series of cosmopolitan plays, such as *La noche del sábado* (1903), in 1907 Benavente produced his most celebrated work *Los intereses creados,* based on the Italian masked *commedia dell' arte.* It sums up his philosophy derived from *Don Quixote:* the clown-servant creates bonds of interest with society and by his loyalty enables his master, the idealist, to fulfill his dreams, thereby earning his own salvation. In 1908 followed *Señora Ama,* said to be his own favourite play, an idyllic comedy set among the people of Castile. Its popularity led to the production of his rural tragedy with the theme of incest, *La malquerida* (1913), which was his greatest success in Spain and in North and South America. In 1928 his play *Para el cielo y los altares,* prophesying the fall of the Spanish monarchy, was prohibited by the government of Primo de Rivera. During the Spanish civil war Benavente lived in Barcelona and Valencia and was for a time under arrest. In 1941 he re-established himself in public favour with *Lo increible* and his quasi-legendary fertility as a dramatist recalled the "golden age" of Lope de Vega. However, with the exception of the harsh tragedy *La Infanzona* (1948), recalling the drama of Eugene O'Neill, and El *Lebrel del cielo* (1952), inspired by Francis Thompson's "Hound of Heaven," Benavente's later works did not add much to his fame. He died in Madrid on July 14, 1954. A number of his plays have been translated into English.

See W. F. Starkie, *Jacinto Benavente* (1924); *I.* Sánchez Estevan, *Jacinto Benavente y su teatro* (1954). (W. *F.* SE.)

BENBOW, JOHN (1653–1702), English admiral, whose exploits against the French and death on active service made him a popular hero, was the son of William Benbow, a burgess owning the Tannery house, Shrewsbury. He served in the navy and merchant service from 1678. He was master of the fleet at the battle of La Hogue (1692) and commanded a squadron at the bombardment of St. Malo (1693) and in chase of privateers like Jean Bart in the Channel. In 1696, as master attendant at Deptford dockyard, he rented the house of John Evelyn, which he sublet to Peter the Great. of Russia, from whom he claimed substantial compensation for damage done to his property. In 1698 he sailed in command of a squadron to the West Indies, where he compelled the Spaniards to restore two vessels belonging to Scottish colonists at Darien. On Aug. 19, 1702, as commander in chief of the West Indies squadron of seven ships, Benbow chased four French ships commanded by J. B. Ducasse near Santa Marta. The insubordinate conduct of his captains left the flagship "Breda" unsupported. Although the admiral's right leg was shattered by a chain shot, he continued on the quarter-deck until the next morning, when his captains compelled him to return to Jamaica. Two of them mere court-martialed and shot, but Benbow died of his wounds on Nov. 4, 1702, and was buried at Kingston.

See Sir Geoffrey Callender and C. J. Britton "Admiral Benbow: Fact and Fiction," *Mariner's Mirror,* vol. xxx (1944). (C. C. L.)

BENCH: *see* CHAIR AND SOFA.

BENCHLEY, ROBERT CHARLES (1889–1945), U.S. writer of humorous essays and drama criticism, and an actor, was born in Worcester, Mass., on Sept. 15, 1889, and graduated in 1912 from Harvard. After a variety of minor jobs, he joined the staff of the old *Life* magazine in 1920 as drama critic. A monologue, "The Treasurer's Report," delivered as a skit in an amateur revue in 1922 and made later into one of the first all-talking motion pictures, brought him recognition as a humorist and a stage personality, and eventually led to his writing and acting in motion-picture short subjects, one of which, "How to Sleep," won an award from the Academy of Motion Picture Arts and Sciences in 1935. In all, he made 46 "shorts" and appeared in minor roles in about 50 feature pictures. Although motion pictures brought him his widest public acclaim, Benchley's writing was his best work.

Benchley was drama critic on the New *Yorker* (1929–1940) for which he also wrote "The Wayward Press" column under the pseudonym Guy Fawkes. His humorous essays were collected into 15 books, illustrated by Gluyas Williams' caricatures, among them My *Ten Years in a Quandary and How They Grew* (1936), and *Benchley Beside Himself* (1943). His writing was characterized by its warmth and the often nonsensical and *non sequitur* quality

of its humour, which capitalized on what he considered his own inadequacies; his satire, although sharp, was never cruel. He died Nov. 21, 1945, in New York city.

Benchley Roundup (1954) was a selection from his writings edited by his son, Nathaniel Benchley, who also wrote his biography (1955). (N. BY.)

BENCKENDORFF, ALEKSANDR KHRISTOFOROVICH, COUNT (1783–1844), Russian general and statesman, distinguished for his military service during the Napoleonic wars and for his later role as chief of police and suppressor of liberal thought, was born at Tallinn (Reval) in 1783, of Baltic German origin. He was a member of a band of officers who murdered the emperor Paul in 1801. Between 1506 and 1815 he took part in many campaigns. Named commandant of Moscow after Napoleon's retreat, he participated in the pursuit of the French forces, won distinction in numerous battles in German territory (including the Russian drive into Berlin) and spearheaded action against the French in the Netherlands and Belgium.

Benckendorff became aide-de-camp to the emperor Alexander I in 1819. In 1821, as lieutenant general, he was appointed commander of the cuirassier division of the guards. During the rising of 1825, he commanded the troops that acted against the Dekabrists (*q.v.*). Thereafter, he took a leading role in the prosecution of the Dekabrists. The relentless way in which he and fellow generals of German origin in Russia tracked down members of eminent Russian noble families who had been connected with the Dekabrist movement aroused popular belief that the German generals were trying to liquidate their Slav rivals in the government. His proposals for a more efficient, centralized organization of the police met with the emperor Nicholas I's approval, and in July 1826 he was appointed chief of *gendarmerie* and chief of the imperial chancellery's third section, which embraced the general direction of police corps and the work of the secret department of the ministry of police. Benckendorff died in St. Petersburg on Oct. 5 (new style; Sept. 23, old style), 1844. (G. A. LN.)

BENDA, the name of a family of Czech musicians who settled in northern Germany in the time of Frederick the Great. The most famous are Frantisek (Franz), who was regarded as the greatest violinist in 18th-century Germany, and Jiri Antonin (Georg), also a violinist but more famous as a composer. Sons of Jan Jiri Benda (1685–1757) and his wife, Dorota Brixi, both talented musicians, they were born at Staré Benátky, Bohemia, Frantisek on Nov. 25, 1709, and Jiri on June 30, 1722.

Frantisek became a violinist, attracted the attention of the crown prince, Frederick, whose orchestra he joined. and, on Frederick's accession (1740), settled in Berlin, where the rest of his family joined him in 1742. He remained in the royal orchestra, becoming *Konzertmeister* in 1771, until his death at Potsdam, March 7, 1786.

Jiri, after playing in the royal orchestra (1742–SO), was for nearly 30 years *Kapellmeister* to the duke of Gotha. He toured Italy in 1765–66 and composed Italian operas and intermezzi, but the works that won him renown throughout Europe were the melodramas *driadne auf Naxos, Medea* (both 1775) and *Pygmalion* (1779), and several Singspiele, of which the most famous was *Der Dorfjahrmarkt* (1775). Although not the inventor of the musical melodrama — a form in which spoken words are accompanied by illustrative music — Benda was a more solid musician than J. J. Rousseau, who is usually regarded as its creator, and his works enjoyed far greater fame than Rousseau's *Pygmalion.*

He retired from Gotha in 1778 and later settled at Kostritz, where he died, Nov. 6, 1795. Both he and Frantisek had sons called Friedrich. after the Prussian king, who were well-known violinists and composers. (Cs. CH.)

BENDA, JULIEN (1867–1956), French philosophical writer, a vigorous defender of reason and the intellect against romanticism and the cult of emotion, was born in Paris on Dec. 26, 1867, of lapsed Jewish parents who brought him up in an austerely rational way. Benda's first publications were articles on the Dreyfus case in the *Revue blanche* (1898; collected as *Dialogues à Byzance,* 1900). *L'Ordination* (1912) was his first novel. *Le Bergsonisme ou une Philosophie de la mobilité* (1912) inaugurated his lifelong assault on the philosophy of Henri Bergson. In 1927 appeared *La Trahison des clercs,* his most important work, a denunciation of those who put the intellect: which he believed ought to be devoted to universal spiritual values, to the service of racial or political ends. The evolution of his thought can be traced in the autobiographical works *La Jeunesse d'un clerc* (1936) and *Un Régulier dans le siècle* (1938). He regarded France as standing for the classical tradition, both ancient and modern, for intellectualism and for the disinterested love of truth and justice. Benda died in Paris on June 7, 1956.

BEN DAY PROCESS, a mechanical process for producing line or dot patterns or tints in photoengraved plates developed by Benjamin Day in the U.S. in 1879. Though fast becoming obsolete in the early 1960s because of relatively less costly and time-consuming methods, it was still being extensively used to produce plates for printing comic magazines and strips of Sunday newspapers.

For a job to be made in a multiple of colours, the engraver required a black and white drawing keyed for the overlapping of colours, by means of a tissue overlay placed over the drawing or on a photostat of it, as a guide in selecting tints and. values for desired effects. A negative is made photomechanically from the drawing, and a flat piece of sensitized zinc is exposed to this negative and then developed. The plate is then ready to accept the Ben Day tints. Those sections not requiring tints are covered with a chemical to which the Ben Day ink, applied later, will not adhere, and which resists etching in the acid bath. The Ben Day shading machine is a steel bar with two micrometers mounted on it between which is fastened the Ben Day screen, a gelatinous film on which appear patterns in relief. The patterns are many and varied as to size, detail and shape: single lines in various weights and sizes; round and square dots; herringbone, basket weave, stippled, etc. The screen is fastened to a four-sided frame, kept taut and placed over a pad so as not to injure the film. Then the pattern is rolled up with an acid-resisting ink and placed in contact with the image-bearing zinc. The inked Ben Day pattern is transferred to it by rollers and bone burnisher, the ink acting as a protective coating during etching. Changing the angles of the screen pattern by using the gauges to shift the screen horizontally and vertically gives many varied effects.

In most colour production one plate is used for each colour. Black is used to reproduce the key plate, usually an exact reproduction of the drawing. By changing the size of the dot formations, different strengths of colour can be obtained; *i.e.,* a heavier pattern printing blue over yellow will give a greener blue. In a black and white plate, a selected Ben Day tint can be "layed" in any area where a gray tone value is desired. (CT. A. M.)

BENDERY, a town of the Moldavian Soviet Socialist Republic, U.S.S.R., formerly the Rumanian Tighina. lies on the right bank of the Dniester, below its confluence with the Byk. The town is very ancient and as Tigin or Tungaty is mentioned in the early Russian chronicles. From 1538 to 1812 Bendery was held by the Turks, who built a fortress, still in existence. Standing at a crossing of the Dniester, the town was strategically important {"The Gate of Bessarabia"); a battle was fought there in the 1770 Russo-Turkish campaign. Between World Wars I and II Bendery belonged to Rumania. Its present importance is as a centre of communications on the navigable Dniester, where it is crossed by the Odessa-Kishinev main line, with a branch to southern Moldavia. Population (1956 est.) was 38,000. The centre of a fertile area of vineyards and market gardens, Bendery produces jam and other foodstuffs and repairs rolling stock and river craft. (R. A. F.)

BENDIGO, a city in Victoria, Austr., is situated on the inner flank of the Eastern highlands, 101 mi. N.N.W. of Melbourne by rail. Pop. (1954) 28,726 (36,918 including suburbs!. The climate is suitable for fruit, vegetable and wheat growing: mean temperature varies from 70° F. in January to 45° in July; average annual rainfall is 21.5 in., with a marked dry period from January to March. Bendigo, which was created a city in 1871 and officially called Sandhurst until 1891, is well laid out. It possesses 176 mi. of tree-lined streets, including the ironbarks which in spring and summer are alive with parakeets. There are fine public buildings,

an Anglican and a Roman Catholic cathedral, and 485½ ac. of parks and gardens.

More than 1,000,000 sheep and 50,000 cattle are sold annually in the market, making Bendigo the third largest livestock market in Australia. It is especially noted for its tomato crop and sends early fruit and vegetables to Melbourne. Iron foundries, potteries and the manufacture of food and textiles are among the main industries. There is also a large commonwealth ordnance factory and the city is important as a railway centre. Since 1870 large-scale conservation works (Coliban river and reservoirs at Malmsbury) have provided a plentiful water supply.

Bendigo's development started when alluvial gold was discovered on a sheep run in 1851, the richness of the finds rapidly attracting population. In 1853 about £A3,000,000 worth of gold was obtained and later the quartz reefs, which everywhere intersect the country as ridges and rises, were attacked. The ores are not of a high grade, but the great bulk available, together with improved mining and milling techniques and a cheap, assured supply of water, made working continuous. It was conducted at deep levels (953 shafts more than 2,000 ft., several more than 4,000 ft. and one at 4,593 ft.). About 22,000,000 oz. (worth £A90,000,000) were obtained, but because of high production costs gold mining had ceased, at least temporarily, by 1954.

See George Mackay, *The History of Bendigo* (1891).

BENDIS, a Thracian goddess in whom the Greeks recognized a figure similar to their own Artemis. In the Greek world, apart from areas adjacent to Thrace, the cult gained prominence only in Athens. At the outbreak of the Peloponnesian War, as a gesture of good will toward Thrace, the Athenians allowed the Thracians resident in the city to found a sanctuary, and shortly after, perhaps as a result of the great plague, took the unprecedented step of creating a state festival for the barbarian goddess. The first celebration, held on the 19th Thargelion (= May–June), 429 B.C., provides the dramatic setting for Plato's *Republic*. It included separate processions of Athenians and Thracians, a torch race on horseback and nocturnal rites. The chief sanctuary was in Piraeus, the harbour town, with later affiliates in Athens itself and on Salamis. *See* also ARTEMIS.

See M. P. Nilsson, *Geschichte der griechischen Religion*, 2nd ed., vol. i, pp. 833–834 (1955). (F. R. WN.)

BENDIX, VINCENT (1882–1945), **U.S.** inventor and industrialist important in the history of automobile manufacture and air transportation, was born on Aug. 12, 1882, in Moline, Ill. At the age of 16 he ran away to New York city, where he studied mechanics. By his 25th year he had organized the Bendix company, a pioneer producer of automobiles. During 1910–12 he developed the Bendix starter drive, which made the automobile self-starter practicable. In 1912 he formed the Bendix Brake company, which introduced mass production of four-wheel automobile brakes. The Bendix Aviation corporation, organized in 1929, manufactured a wide range of automotive, aviation, marine, radio and radar equipment. Keenly interested in aviation, Bendix founded the Bendix Transcontinental Air race in 1931. In 1942 he resigned as chairman of the board of the Bendix Aviation corporation and organized Bendix Helicopters, Inc. He died in New York city on March 27, 1945. (M. J. BI.)

BENEDEK, LUDWIG AUGUST, RITTER VON (1804–1881), commander of the Austrian army at Koniggratz (Sadowa), was born the son of a doctor, at Ödenburg (Sopron), Hung., on July 14, 1804. From the Maria Theresa military academy, he entered the Austrian army in 1822. Appointed to the general staff in 1833, he distinguished himself during the insurrection of 1846 in western Galicia and in the Hungarian campaign of 1849. But he made his reputation chiefly in Italy—in 1848 at Curtatone against the Piedmontese, in 1849 at Mortara and Novara and in 1859 at Solferino, where his successful fighting at San Martino enabled him to cover the Austrian retreat to the Mincio—and was Radetzky's chief of staff 1850–57. He was made quartermaster general to the army in 1860. Having been governor general and commander in chief in Hungary, he became commander in chief in Venetia in 1861, resigning the quartermaster generalship in 1864 and devoting himself exclusively to the command in Italy. When the Seven Weeks' War (*q.v.*) was imminent in 1866, the emperor Francis Joseph appointed Benedek to the command against the Prussians. He accepted reluctantly, as a stranger to the country and to the troops and with no confidence in the equipment at his disposal. His leading staff officers moreover obstructed him and Benedek was completely defeated by the Prussians at Koniggratz on July 3, but made good his retreat in magnificent order. He was suspended from his command and a court-martial was ordered, but the emperor stopped the inquiry. Benedek retired to Graz, having given his word that he would not attempt to rehabilitate himself. He died at Graz on April 27, 1881.

BENEDETTI, VINCENT, COMTE (1817–1900), French diplomat remembered chiefly for his role, as ambassador in Berlin, in the events leading to the outbreak of the Franco-German War in 1870, was born at Bastia in Corsica on April 29, 1817. He studied law and in 1840 entered the French consular service, serving in Cairo and at Palermo. In 1852 he was promoted first secretary of the embassy at Istanbul. From 1855 to 1861 he was director of political affairs in the French foreign office. As such he gave his support to the cause of Italian independence. When France recognized the new kingdom of Italy, he was appointed ambassador in Turin (1861), but he resigned in 1862 because of differences of policy with his government.

Benedetti's most important post was that of ambassador to Prussia from Nov. 1864 to Aug. 1870. This was a crucial period in Franco-German relations, in which Benedetti showed himself to be an efficient civil servant but hardly of sufficient stature to guide events, and he was certainly completely outclassed by Bismarck—on two occasions in particular. First, after Prussia's great gains in the Seven Weeks' War (1866), Benedetti negotiated with Bismarck with a view to obtaining compensation for France on its eastern frontier. Bismarck seemed to be willing to let France annex Belgium, and a draft treaty was in fact prepared to effect this. Bismarck kept a copy of it, in Benedetti's handwriting, which he published in 1870 as proof of France's expansionist ambitions; and this coup did much to alienate European sympathy from France. Second, in July 1870, it was Benedetti who was instructed to present the French government's request that the king of Prussia should confirm the prince of Hohenzollern's withdrawal of his candidature for the Spanish throne and that he should promise that the candidature would never be renewed. When Benedetti made this request in his famous interview at Ems, the king refused; Bismarck misrepresented their conversation to suggest that Benedetti had been insulted, and this was the immediate cause of the war. Benedetti's diplomatic career was ended; he retired to Corsica and took up practice at the bar there. He published a book, *Ma Mission en Prusse* (1871), to defend himself against the attacks made on him; he insisted that he simply carried out the instructions of his government, that the policy of compensation was not his own but that of the foreign minister, Edouard Drouyn de Lhuys, and that he gave his government ample information about events in Prussia. He also published *Essais diplomatiques* (1895; Eng. trans., *Studies* in *Diplomacy*, 1896). He died in Paris on March 28, 1900.

BENEDICT, SAINT, OF NURSIA (c. 480–*c.* 547), the patriarch of western monks. The only authority for the facts of St. Benedict's life is book ii of the *Dialogues* of St. Gregory the Great (Pope Gregory I). Gregory declares that he obtained his information from four of St. Benedict's disciples, whom he names, and there can be no serious reason for doubting that it is possible to reconstruct the outlines of Benedict's career. A precise chronology and a pedigree have been supplied for Benedict, according to which he was born in 480, of the great family of the Anicii; but Gregory says only that he was born of good family in Nursia, near Spoleto

in Umbria. His birth must have occurred within a few years of the date assigned; the only fixed chronological point is a visit of the Gothic king Totila to him in 542, when Benedict was already established at Monte Cassino (*q.v.*) and advanced in years. He was sent by his parents to the Roman schools, but shocked by the prevailing licentiousness, he fled. It was once usual to represent him as a mere boy at this time, but various considerations have been pointed out which make it more likely that he was a young man. He retired to Enfide (modern Affile), a remote spot in the Simbruinian hills, and somewhat later to the ruins of Nero's palace and the artificial lake at Subiaco (*q.v.*), 40 mi. from Rome. Among the rocks on the side of the valley opposite the palace he found a cave in which he took up his abode, unknown to all except one friend, Romanus, a monk of a neighbouring monastery, who clothed him in the monastic habit and secretly supplied him with food. In the cave Benedict spent three years of opening manhood in solitary prayer, contemplation and austerity.

After this period of formation, his fame began to spread abroad, and the monks of a neighbouring monastery induced him to become their abbot; but their lives were irregular and dissolute, and on his trying to put down abuses they attempted to poison him. He returned to his cave, but disciples flocked to him, and in time he formed 12 monasteries in the neighbourhood, placing 12 monks in each, and himself retaining a general control over all. Patricians and senators from Rome entrusted their young sons to his care, to be brought up as monks; in this manner came to him his two best-known disciples, Maurus and Placid. Driven from Subiaco by the jealousy and molestations of a neighbouring priest, but leaving behind him communities in his 12 monasteries, he journeyed south, accompanied by a small band of disciples, until he came to Cassino, a town halfway between Rome and Naples. Climbing the high mountain that overhangs the town, he established on the summit the monastery with which his name has ever since been associated. Historians see a certain significance in the fact that this event occurred *c.* 529, the year in which Justinian closed the schools of Athens, for certainly in the centuries which followed this monastery was one of the principal centres of religious and cultural life in western Europe. Benedict destroyed the remnants of paganism that lingered on about Cassino, and by his preaching gained the rustic population to Christianity. Few other facts of his career are known, though there is record of his founding a monastery at Terracina. His feast day is March 21.

Rule of St. Benedict.—In order to understand St. Benedict's character and spirit, and to discover the secret of the success of his institute, it is necessary, as St. Gregory says, to turn to his rule. Gregory's characterization of the rule as "conspicuous for its discretion" touches the most essential quality. The relation of St. Benedict's rule to earlier monastic rules, and of his institute to the prevailing monachism of his day, is explained in the article MONASTICISM. Here it is enough to say that nowadays it is commonly recognized by students that the manner of life instituted by St. Benedict was not intended to be, and as a matter of fact was not, one of any great austerity, when judged by the standard of his own day. His monks were allowed proper clothes, sufficient food, ample sleep. The only bodily austerities were the abstinence from flesh meat and the unbroken fast till midday or even 3:00 P.M., but neither would appear so onerous in Italy even now as they do to more northern peoples. Midnight office was not a part of St. Benedict's rule: the time for rising for the night office varied from 1:30 to 3:00 A.M., according to the season, and the monks thus had unbroken sleep for 7½ or even 8 hours, except in the hot weather, when in compensation they were allowed the traditional Italian summer siesta after the midday meal. The canonical office was chanted throughout, but the directly religious duties of the day can hardly have taken more than four or five hours—perhaps eight on Sundays. The remaining hours of the day were divided between work and reading, in the proportion (on the average of the whole year) of about six and four hours, respectively. The reading in St. Benedict's time was probably confined to the Bible and the Fathers. The work contemplated by St. Benedict was ordinarily field work, as was natural in view of the conditions of the time and best suited to the majority of the monks; but the principle laid down is that the monks should do whatever work is most useful. There were from the beginning young boys in the monastery, who were educated by the monks according to the ideas of the time. It has been noted that St. Benedict evangelized the pagan population around Monte Cassino, and a considerable time each day was assigned to the reading of the Fathers. Thus the germs of all the chief works carried on by his monks in later ages were to be found in his own monastery.

The rule consists of a prologue and 73 chapters. Though it has resisted all attempts to reduce it to an ordered scheme, and probably was not written on any set plan, still it is possible roughly to indicate its content. After the prologue and introductory chapter setting forth St. Benedict's intention, follow instructions to the abbot on the manner in which he should govern his monastery (2, 3); next comes the ascetical portion of the rule, on the chief monastic virtues (4–7); then the regulations for the celebration of the canonical office, which St. Benedict calls "the work of God" or "the divine work," his monks' first duty, "of which nothing is to take precedence" (8–20); faults and punishments (23–30); the cellarer and property of the monastery (31, 32); community of goods (33, 34); various officials and daily life (21, 22, 35–57); reception of monks (58–61); miscellaneous (62–73).

The most remarkable chapters, in which St. Benedict's wisdom stands out most conspicuously, are those on the abbot (2, 3, 27, 64). The abbot is to govern the monastery with full and unquestioned patriarchal authority; on important matters he must consult the whole community and hear what each one, even the youngest, thinks; on matters of less weight he should consult a few of the elder monks; but in either case the decision rests entirely with him, and all are to acquiesce. He must, however, bear in mind that he will have to render an account of all his decisions and to answer for the souls of all his monks before the judgment seat of God. Moreover, he has to govern in accordance with the rule and must endeavour, while enforcing discipline and implanting virtues, not to sadden or "overdrive" his monks or give them cause for "just murmuring." In these chapters pre-eminently appears that element of "discretion," as St. Gregory calls it, or humanism as it would now be termed, which without doubt has been a chief cause of the success of the rule. That success is attested to by the many editions and translations—more than 900 in all—printed since 1489, when the *editio princeps* of the *Rule* was published in Venice.

The following modern editions of the text are especially useful: O. Hunter-Blair, Latin and English (1886; 4th ed., 1934); E. C. Butler, *S. Benedicti regula monasteriorum* (1912; 2nd ed., 1927; 3rd ed., 1935); B. Linderbauer, *S. Benedicti regula monachorum* (1922), *S. Benedicti regula monasteriorum* (1928); Philibert Schmitz (1946); Gregory Arroyo (1942); Justin McCann, Latin and English (1952); Gregorio Penco (1958). Of the many commentaries the most valuable are those of Smaragdus and Hildemar (both 9th century); Calmet (1732, 2nd ed. 1734); Martène (J. P. Migne, *Patrologia Latina,* lxvi); P. Delatte (1913; Eng. trans., 1921); I. Schuster (1942; reprinted, 1945); Abbot I. Herwegen (1944); A. Lentini (1947); T. F. Lindsay, *The Holy Rule for Laymen* (1947); B. A. Sause, *The School of the Lord's Service,* 3 vol. (1948 *et seq.*); B. Steidle (1952); Van Zeller (1958).

(Eng. trans., 1951); Theodore Maynard, *St. Benedict and His Monks* (1954). Valuable, too, are the relevant sections of certain larger works: Thomas Hodgkin, *Italy and Her Invaders*, vol. iv, 2nd ed. (1896); F. Gregorovius, *History of the City of Rome in the Middle Ages* (Eng. trans.; 1894); F. H. Dudden, *Gregory the Great*, vol. i, ii (1905); H. M. Gwatkin *et al.* (ed.), *Cambridge Medieval History*, vol. i (1911). Mention also must be made of the controversy after 1938 on the priority of the *Rule* of St. Benedict over the so-called *Regula Magistri* ("Rule of the Master"), concerning this *see* edition of the *Rule* by G. Penco cited above. (E. C. B.; AM. S.)

BENEDICT (BENEDICTUS), the name of several popes and antipopes.

BEKEDICT I (d. 579), pope from 574 to 579, was elected to succeed John III, probably just after the latter's death (July 574), but was not consecrated until June 3, 575. He ruled the church during a period made calamitous by invasion and by famine and died during a siege of Rome by the Lombards.

ST. BENEDICT II (d. 685), pope from 683 to 685, was elected to succeed Leo II in 683. His consecration (June 26, 684) was delayed until the approval of the emperor Constantine IV Pogonatus could be obtained. Benedict died on May 8, 685, and his feast is celebrated on the anniversary.

BENEDICT III (d. 858), pope from 855 to 858, was chosen by the Roman clergy and people as successor to Leo IV in July 855. The election was not immediately confirmed by the western emperor Louis II, who set up Anastasius the Librarian as antipope; but by the beginning of October the imperial government's opposition to Benedict was dropped, and he was consecrated pope. He died April 17, 858.

BENEDICT IV (d. 903), pope from 900 to 903, was the successor of John IX. It was he who crowned the emperor Louis III in 901. He died in July 903.

BENEDICT V, called "the Grammarian" (Grammaticus) (d. 9651 966), pope or antipope from May to June 964, was elected by the Romans on the death of John XII. The emperor Otto I, however, having already deposed John and designated Leo VIII as his successor, thereupon forced his way into Rome and convened a synod, which deposed and degraded Benedict. Removed as a prisoner to Hamburg, Benedict died there. Either Benedict or Leo may be considered an antipope.

BENEDICT VI (d. 974), pope from 973 to 974, was elected to succeed John XIII and was consecrated on Jan. 19, 973, under the emperor Otto I's protection. Otto's death was followed by a resurgence of the Roman baronage, and Benedict was strangled in the summer of 974 by order of Crescentius, son of the notorious Theodora, who replaced him by the deacon Franco (Boniface VII).

BENEDICT VII (d. 983), pope from 974 to 983, formerly bishop of Sutri, was elected in Oct. 974 through the intervention of the emperor Otto II's representative Count Sicco, who expelled Boniface VII. Benedict governed Rome quietly for nearly nine years, and died there on July 10, 983.

BENEDICT VIII (Theophylact) (d. 1024), pope from 1012 to 1024, was a son of Count Gregory of Tusculum, and his elevation, in succession to the last nominee of the Crescentian faction, Sergius IV, inaugurated a series of Tusculan popes. He eliminated a rival pope, Gregory, and placed the government of Rome in the hands of his brother Romanus (later pope as John XIX). His rule was acceptable to the German king Henry II, whom he crowned emperor in 1014. Benedict was more of a feudal baron than a pope: he restored papal authority in the Campagna and in Roman Tuscany by force of arms, repelled a Saracen attack on northern Italy (1016–17) and encouraged the Norman freebooters in their attacks on the Byzantine power in the south. But the disciplinary decrees of the Council of Pavia (1022, unless it took place as early as 1018) suggest that he did not entirely neglect his pastoral office. He died on April 7, 1024.

BENEDICT IX (Theophylact), pope from 1032 to 1044, son of Alberic, count of Tusculum, was the nephew of the two previous popes, Benedict VIII and John XIX. He was thrust into the papacy by the Tusculan party. His violent and licentious conduct at length drove the Romans to insurrection, and in Jan. 1045 they elected the bishop of Sabina to succeed him as Silvester III. But Silvester was quickly driven out by Benedict's brothers and retired from the scene. At this point Benedict seems to have resolved on marriage and sold the papacy to the archpriest John Gratian. who, to deliver the Holy See from its scandalous occupant, offered Benedict a pension and became pope himself, as Gregory VI, in May. In 1046, however, the emperor Henry III came to Italy and. in December, held a council at Sutri where Gregory was deprived of the papacy, to be replaced by Suidger, bishop of Bamberg, who took the name of Clement II. In 1047, after Clement's death, Benedict reappeared in Rome and installed himself in the Lateran (Nov. 8); but at last, on July 17, 1048, the marquis of Tuscany drove him from Rome, where he was never seen again. He is supposed to have lived on until 1055 or 1056.

BENEDICT X (John Mincius) (d. c. 1080), antipope from 1058 to 1059, had previously been bishop of Velletri. His election (April 5, 1058) was secured by the Roman barons on the death of Stephen X (IX). This intrusion caused his successor, Nicholas II, to enact the electoral decree of 1059, which vested the right of designation in the cardinal bishops. Expelled from the papacy in Jan. 1059, Benedict died *c.* 1080, a prisoner in the monastery of Sant' Agnese.

BLESSED BENEDICT XI (Niccolò Boccasini) (1240–1304), pope from 1303 to 1304, was born at Treviso, Italy, the son of a notary. Entering the Dominican order in 1254, he became its general in 1296. Created cardinal priest of Sta. Sabina in 1298 and cardinal bishop of Ostia and Velletri in 1300, he loyally supported Boniface VIII against Philip IV of France. He was legate in Hungary in 1302. Unanimously elected to succeed Boniface on Oct. 22, 1303, he did much to conciliate his predecessor's enemies, France, the Colonnas and Frederick of Sicily. Nevertheless, while he demanded no retribution for the outrage done to Boniface at Anagni, he excepted Guillaume de Nogaret (*q.v.*) from the general pardon. Benedict died at Perugia on July 7, 1304. Clement XII confirmed the Dominicans in their cult of him (1736), and Benedict XIV included his name in his martyrology (1748); his feast is July 7.

BENEDICT XII (Jacques Fournier) (d. 1342), pope from 1334 to 1342, the third Avignon pope, was born at Saverdun in the Pays de Foix, France. Entering the Cistercian order and graduating doctor of theology at Paris, he became abbot of Fontfroide in 1311, bishop of Pamiers in 1317 and bishop of Mirepoix in 1326. He was created cardinal priest of Sta. Prisca in Dec. 1327. His distinction as an inquisitor and theologian recommended him to the cardinals in Avignon, who elected him to succeed John XXII on Dec. 20, 1334. His bull *Benedzctus* Deus (1336) put an end to the controversy concerning the Beatific Vision which had agitated the close of the previous pontificate. Benedict applied himself to a reform of the papal court and forced ecclesiastics holding a cure of souls to quit Avignon and to reside on their benefices. He also tried to recall the religious orders to their primitive observance by constitutions of 1335, 1336 and 1339: that for the Benedictines (*Summi magistri,* 1336) remained in force until the Council of Trent. Most of his reforming work, however, was undone by his successors. He died on April 25, 1342.

BENEDICT XIII (Pedro de Luna) (c. 1328–1423/24), antipope from 1394 to 1423, was born at Illueca, of one of the noblest families of Aragon. His birth, his legal knowledge (he had risen to be professor of canon law at Montpellier) and his good morals recommended him to Pope Gregory XI, who made him cardinal priest of Sta. Maria in Cosmedin in 1375. On Sept. 28, 1394, he was elected by the cardinals of Avignon to succeed Clement VII (Robert of Geneva). It had been hoped that he would help to end the great schism by abdicating voluntarily, but this he refused to do despite severe pressure: the French princes appealed to him in vain, 18 of his 23 cardinals deserted him and the papal palace in Avignon was besieged (1398). Then, in 1403, Benedict escaped from the palace, rallied his cardinals and, largely because of the support of Louis, duc d'Orléans, won back the obedience of France. On the instances of the French government, he began negotiations for an interview with Pope Gregory XII in 1407, with a view to their simultaneous abdication; and it was not entirely Benedict's fault that no interview took place. In 1408, however, the French declared themselves neutral in the dispute between Rome and Avignon, and in June 1409 the Council of Pisa pronounced both popes deposed. Benedict, still recognized by Aragon (with Sicily), Cas-

tile, Navarre, Armagnac and its dependencies and Scotland, meanwhile had convened a council of his own at Perpignan (Nov. 1408–Feb. 1409). Subsequently he had to take refuge in the impregnable castle of Peñíscola, on the coast of Valencia (1415). When the Council of Constance in its turn pronounced him deposed (July 26, 1417), he had lost all governmental recognition save that of Armagnac and Scotland. But Benedict, who had maintained his claims against three Roman popes (Boniface IX, Innocent VII and Gregory XII) and two Pisan ones (Alexander V and John XXIII), was not going to yield to Martin V.

Shortly before his death Benedict had created four new cardinals, three of whom elected a new antipope, Clement VIII (Gil Sánchez Muñoz). The other cardinal, in Nov. 1425, tried by himself to set up a Bernard Garnier, of Rodez, as rival antipope. This Garnier first took the name of BENEDICT XIV. (C. H. LE.)

BENEDICT XIII (Pierfrancesco Orsini) (1649–1730), pope from 1724 to 1730 and at first styled Benedict XIV, was born on Feb. 2, 1649. Entering the Dominican order in 1667, he taught philosophy at Brescia before being made a cardinal in 1672. He was successively archbishop of Manfredonia (1675), of Cesena (1680) and of Benevento (1686). As one of the *zelanti* whose endeavour it was to promote the purely ecclesiastical interests of the church, Orsini had taken part in five conclaves before that which resulted in his own promotion to the papal chair at the age of 75 on May 29, 1724. He had proved himself during his 40 years of diocesan experience to be pious, scholarly (his many theological works were published in three volumes at Ravenna in 1728) and exacting in matters of discipline. but his pontificate produced no spectacular results. His attack on the luxurious living of the cardinals and on the worldliness of the lesser ecclesiastics, made particularly at the Council of Rome (1725), had little effect. State affairs he left entirely to the venal and unpopular cardinal Niccolb Coscia, so that the drift toward disaster in the papal relations with the Bourbon monarchies of France and of Spain was left unchecked. Naturally an opponent of the Jesuits, Benedict continued to allow the Dominicans to preach the Augustinian doctrine of grace, even though he had insisted that the bull *Unigenitus* should be received without reservation in France. He died on Feb. 21, 1730.

BENEDICT XIV (Prospero Lambertini) (1675–1758), pope from 1740 to 1758, was born at Bologna, Italy, on March 31, 1675. At the age of 13 he entered the Collegium Clementinum in Rome. He served the curia in many and important capacities, yet devoted his leisure time to theological and canonistic study. Benedict XIII made him archbishop of Theodosia in partibus (1725), then archbishop of Ancona (1727) and cardinal (1728). In 1731 Clement XII translated him to his native city of Bologna, where, as archbishop, he was both efficient and popular. In a conclave that had lasted for months he was elected on Aug. 17, 1740, the successor of Clement XII. In many ways Benedict was the papal counterpart of the 18th-century enlightened despots: in the papal states he reduced the burden of taxation, tried to restrain usury, encouraged agriculture and supported a policy of free trade. He was conciliatory in his relations with the secular powers, making vast concessions to the kings of Spain, Portugal, Sardinia and Naples in matters of patronage, the right of nomination to vacant sees and secular jurisdiction over ecclesiastical changes. To oblige Frederick the Great, he abandoned his predecessors' custom of addressing the Prussian king merely as "margrave of Brandenburg." Similarly, Benedict had little sympathy with the extreme notions of the Jesuits: in the bulls *Ex quo singulari* (1742) and *Omnium sollicitudinum* (1744) he rebuked their missionary methods in accommodating their message to the heathen usages of the Chinese and of the natives of Malabar. In 1756 he condemned the practice of automatically refusing the last rites to French ecclesiastics who still opposed the bull *Unigenitus*. He reduced the number of holy days in several Catholic countries. To the end of his life he kept up his studies and his intercourse with other scholars. He founded several learned societies. Benedict was widely admired by contemporaries, both Catholic and Protestant; but his moderation perhaps too often bordered upon weakness, and he was thought by some to be too ready to compromise with the secular spirit of his age. He died May 3, 1758.

Benedict XIV's most valuable writings are *De servorum Dei beatificatione et beatorum canonizatione*, 4 vol. (1734–38); *Annotazioni sopra le feste di Nostro Signore e della beatissima Vergine*, with *Annotazioni sopra gli atti di alcuni santi de' quali si fa l'uffizio in Bologana*, 2 vol. (1740; Latin trans., 1745); *De sanctorum missae sacrificio* (1745); and *De synodo dioecesana* (1748), an English translation of extracts from which was published in 1926. There are three editions of his collected works, and his letters were edited by F. X. Kraus (1884).

BENEUICT XV (Giacomo Della Chiesa) (1854–1922), pope from 1914 to 1922, was born at Pegli, Italy, on Nov. 21. 1854 He graduated from the University of Genoa and studied for the priesthood in the Collegio Capranica in Rome before entering the papal diplomatic service. Then he spent four years in Spain before being employed in the department of the secretary of state in 1887. Pius X made him archbishop of Bologna on Dec. 16. 1907, and cardinal on May 25. 1914. He was elected pope as Pius X's successor on Sept. 3, 1914, a month after the outbreak of World War I, and the greater part of his papacy was taken up in dealing with the problems that the war raised. He endeavoured to follow a policy of strict neutrality, concentrating the efforts of the church initially toward the alleviation of unnecessary suffering Later he made positive efforts toward re-establishing peace, though hampered in these by the pro-Austrian sentiments of the majority of the cardinals. When the United States entered the war and took up the Allies' attitude that peace could not be restored to Europe until Germany had been defeated, Benedict's most elaborate proposal, contained in his note to the powers of Aug. 16, 1917 was doomed to frustration. His last years were concerned with the readjustment of the machinery of papal administration made necessary by the territorial changes which followed the war. Official relations were resumed with France, and a British representative was accredited to the Vatican for the first time since the 17th century. Benedict died on Jan. 22, 1922. (I. F. B)

BENEDICT, SIR JULIUS (1804–1885), German-born conductor and composer, best known for his opera *The Lily of Killarney* (Covent Garden, 1862), a melodious work that held the stage for over 50 years, was born at Stuttgart, Nov. 27, 1804. He was a pupil of J. C. L. Abeille, Hummel and Weber. Between 1323 and 1834 he conducted in Austria and Italy and wrote operas on Italian texts. He went to England in 1835 and his first English opera, *The Gypsy's Warning*, was produced at Drury Lane in 1838. He visited the U.S. in 1850 and on his return to England became conductor at Her Majesty's theatre, in 1852. In 1860 he wrote the recitatives for the production in Italian of Weber's *Oberon*.

In 1871 Benedict was knighted, having earlier been naturalized, and from 1876 to 1880 he conducted the Liverpool Philharmonic society. He died in London, June 5, 1885.

BENEDICT, RUTH (née FULTON) (1887–1948), U.S. anthropologist widely known for her concepts of culture and personality, was born on June 5, 1887, in New York city. After graduating from Vassar college, Poughkeepsie, N.Y., in 1909, she taught English in a secondary school in California until her marriage in 1914. From an early age until the 1930s she wrote and published poetry under the pseudonym of Anne Singleton. Turning to anthropology in the 1920s, she took her Ph.D. under Franz Boas at Columbia university, where she became assistant professor in 1930 and professor in 1948. Her field work was among tribes of the southwest, the Serrano of California and the Canadian Blackfoot. During her first 11 years of research and teaching she concentrated on American Indian religion and folklore: out of which came the two-volume study, *Zuni Mythology* (1935). In her famous book, *Patterns of Culture* (1934), which was translated into 14 languages, her principal interest became the study of cultures as "personality writ large," and she emphasized how small a part of the range of possible human behaviour is included among the accepted forms of any one society. The dependence of cultures on the temperamental possibilities of human beings

and the dependence of individuals on their cultural background provided complementary themes for a treatment combining scientific and literary talent. While her work was sometimes criticized as stating cultural contrasts too dramatically, it continued to provide a stimulating approach to anthropological theory. As a contribution to problems of human equality, she wrote Race: Science and Politics (1940), and, after applying anthropological methods to the study of Japanese culture, *The* Chrysanthemum *and the Sword* (1946). Ruth Benedict was a president of the American Anthropological association (1947), and, at her death on Sept. 17, 1948. in New York city. was director of a project for the anthropological study of contemporary European and Asian cultures.

BENEDICT BISCOP, SAINT (BISCOP BADUCING) (c. 628–689/690), English Benedictine abbot, of noble family, was for a time a thegn of Oswy, king of Northumbria. He then went abroad and after the second of five journeys to Rome lived as a monk at Lérins (666–667). It was under his conduct that Theodore of Tarsus went from Rome to Canterbury as archbishop in 668–669, and in 669 Benedict was appointed abbot of St. Peter and St. Paul (later St. Augustine's), Canterbury. Five years later he built the monastery of St. Peter at Wearmouth, in his native Northumbria, and in 652 a sister foundation (St. Paul) at Jarrow nearby, enriching them with relics and manuscripts from the continent. He died on Jan. 12, 689 or 690. His feast day is Jan. 12. Bede was one of his monks and pupils.

See A. Butler, *Lives of the Saints, ed. by H.* Thurston and D. Attwater, vol. i, **pp.** 72–74 (1956). (PL. GN.)

BÉNÉDICTINE, D.O.M., is an amber-coloured liqueur made at FCcamp on the coast of Normandy. It contains 43% alcohol by volume and 30 different. herbs as well as brandy. honey and sugar; formerly it also contained China tea. The exact recipe is the secret of the manufacturers.

The liqueur was first made in 1510 by Dom Bernardo Vincelli, "a very learned monk" of the abbey of Fécamp, a Benedictine monastery dating back to A.D. 658. Being a botanist and a chemist, he devoted himself to the preparation of medicinal beverages; his liqueur soon became known as Bénédictine, ad *majorem* Dei *gloriam* ("for the greater glory of God"). It acquired a wide reputation as a refreshing and recuperative cordial, and met with praise from Francis I when he visited the abbey in 1534.

In 1793, when religious orders were expelled from France, the monastery was burned to the ground and the liqueur ceased to be made. However, the recipe for it was given with other monastic documents to the civil administrator, whose descendant Alexandre le Grand found it 70 years later. He was a wine merchant, and after careful experiments began to produce the liqueur again. His business soon grew, and the present distillery and Bénédictine museum were built upon the grounds that formerly belonged to the abbey. Every bottle now bears the initials D.O.M., or Deo *Optimo Maximo* ("To God most good, most great"). (C. C. H. F.)

BENEDICTINES (BLACK MONKS; ORDO S. BENEDICTI; O.S.B.) take their name from St. Benedict of Nursia (c. 480–c. 547) whose rule they follow, but they are not alone in following that rule, and the name was not adopted till the late 14th century, on the analogy of such names as Franciscan and Dominican. In modern usage the title is applied to the main body of monks, wearing the black habit, who are the descendants of the traditional monasticism of the early medieval centuries in Italy and Gaul, as distinguished from other monks, such as the Cistercians. who follow the rule but are organized independently in a centralized order of their own. (For the rule, see BENEDICT, SAINT.)

Monastic Centuries. — St. Benedict wrote his rule c. 535–540 with his own abbey of Monte Cassino in mind; he founded no order and his rule spread slowly in Italy and Gaul by reason of its excellence as a practical code, and it was gradually substituted for, or adopted alongside. existing codes and customaries. The first great agent in its diffusion, after the sack of Monte Cassino (*c.* 580–590) and the move of the community to Rome, was Pope St. Gregory the Great, himself a monk, who knew, and possibly had followed, the rule, and who used monks as a bulwark of Roman orthodoxy in Italy, and as apostles of Christianity, as in the mission of St. Augustine to England. Between his death (604) and the days of Charlemagne (800) the rule spread gradually throughout western Europe save for the Celtic regions and some parts of Italy (including Rome), where a pre-Benedictine type of monachism survived in the monasteries serving city churches. In Gaul and the Rhineland Charlemagne, intent on monastic reform: could ask if there were any rule other than Benedict's, and he insisted on its exact observance throughout his empire. Henceforward Black Monks everywhere in northern and western Europe regarded St. Benedict as their patriarch.
