While the efforts of politicians achieved very little, practical considerations had already begun to have an effect. After two decades of resentment at the manner in which the Kenya government administered the railway finances in its own interest Uganda made an amicable arrangement for the joint control of the railway with its neighbour. In 1921 the two countries had also established a more equitable basis for the distribution of customs revenue, and in 1923 Tanganyika brought its customs tariffs into line with those of its northern neighbours. It was World War II, however, which demonstrated most clearly the need for closer co-operation in east Africa. The Italian threat on Kenya's northern border, the possibility of danger from the Congo region after the fall of Belgium and the menace of Japan across the Indian ocean all underlined the need for a co-ordinated program of defense, and it was recognized that greater economic self-sufficiency might be achieved by joint action. Sir Philip Mitchell was appointed permanent deputy chairman of the governors' conference and a number of interterritorial committees were set up. Some of Uganda's businessmen still remained skeptical of the value of these committees and many of the Africans of Uganda and Tanganyika disliked the close co-operation with Kenya which the war had encouraged. British policy, however, increasingly favoured larger economic units within the commonwealth and although the postwar Labour government had no wish to impose an unwelcome political union upon the east African territories there appeared to be a need to set economic co-operation between Kenya, Uganda and Tanganyika upon a more constitutional footing. The government outlined its proposals in two white papers and on Jan. 1, 1948, the east Africa high commission came into being with its headquarters in Nairobi and departmental headquarters in the various territories.

The high commission consists of the governors of the three territories with the governor of Kenya as chairman. The services which it provides are divided for administrative purposes into three groups. The administrator is responsible for the economic and research services and, although the territorial governors are also commanders in chief of their territories' military forces, the administrator co-ordinates defense matters and is responsible for the Royal East African Navy. In addition to the administrator there is a commissioner for transport and a postmaster general. The railways and postal services are self-contained while the finances of all the other services fall under the control of the financial secretary. The most criticized aspect of the high commission is the central legislative assembly, renewed every four years, which has power to legislate on all matters affecting the common services controlled by the high commission. Africans have argued that the assembly foreshadows political union or that it encroaches upon the sovereignty of individual territories. The permanent East African court of appeal was inaugurated in Nairobi in Jan. 1951. In Dec. 1961, on the achievement of independence

by Tanganyika, the high commission was replaced by the East Africa Common Services organization, the responsibility for which was borne by the principal ministers of the three mainland territories.

The currency of the high commission territories with that of Aden is controlled by the East Africa Currency board. See EAST AFRICA; UGANDA; KENYA; TANGANYIKA; ZANZIBAR; see also references under "British East Africa" in the Index volume.

BRITISH EAST AFRICA COMPANY. On May 25, 1887, Sir William Mackinnon, chairman of the British India Steam Navigation company, accepted on behalf of the British East Africa association a 50-year lease of a 10-mile wide strip of land along the coast of the east African mainland owned by the sultan of Zanzibar. The association then approached the British government for a charter authorizing it to administer the British sphere of influence which formed the hinterland of this territory. The government, glad to shelve its responsibilities, readily agreed and the Imperial British East Africa company was granted a charter on Sept. 3, 1888, with a capital of £240,000.

Although the directors of the company were motivated as much by humanitarian as by economic considerations, they were disappointed by the government's unwillingness to provide financial support for the construction of the railway which they deemed necessary in order to develop the country, to suppress the slave trade and to make the land attractive to British farmers. They were not, therefore, wholly reluctant to accede in 1890 to the government's request that they should extend their activities to Uganda, because Uganda supplied large quantities of ivory, the only commodity capable of being profitably transported hundreds of miles by porters from the interior. Becoming too deeply involved in the political and military affairs of Uganda, however, the company soon found this venture unprofitable and was obliged to hand over its responsibility for Uganda to the British government early in 1893. The directors were still prepared to continue on a more limited scale nearer the coast but the government considered it necessary to control the route to Uganda, which was declared a protectorate in 1894. The company was therefore compelled to surrender its charter to the government on March 27, 1895, together with its lease of the sultan's coastal strip, in return for the sum of £250,000.

See P. L. McDermott, *British East Africa or Ibea* (1895). (K. I.)

BRITISH EMPIRE: see COMMONWEALTH OF NATIONS.

BRITISH EMPIRE AND COMMONWEALTH GAMES, a well-established quadrennial series embracing nine sports—athletics (track and field), fencing and swimming for both men and women and bowls, boxing, cycling, rowing, weight lifting and wrestling for men only. Participants must be amateurs and be qualified by birth or residence in some member country of the Commonwealth of Nations.

The idea of such games was first mooted in 1891 by the Rev. Astley Cooper. The first active propagandist among sports officials for empire games was Richard Coombes, president of the Amateur Athletic Union of Australia from 1897 to 1934. In 1911 small-scale "Inter-Empire Championships" were staged at the Crystal palace, London, as part of the King George V coronation celebrations. A Canadian team achieved the best over-all performances at athletics, boxing, rowing and wrestling against Australian, New Zealand, South African and United Kingdom opposition.

The prime mover in organizing what are now accepted as the inaugural British empire games at Hamilton, Ont., in 1930 was M. M. Robinson, manager of the Canadian athletics team at the 1928 Olympic games. Eleven countries sent teams to Hamilton for a program of athletics, lawn bowls, boxing, rowing, swimming and

wrestling. At that highly successful first celebration it was the English team that emerged with the largest share of the medals. It was agreed that such games would be held at four-year intervals, preferably midway between the Olympic games. The second games were held in 1934 in London and centred on the White City stadium. Women's events, limited to swimming at Hamilton, were added to the athletics program. Again it was England that won the maior share of the gold medals with ten men's and six women's victories in the athletics alone. Cycling was added and rowing temporarily dropped from the program. At Sydney, Austr., in 1938, where the athletics were staged on a grass circuit round the cricket ground, the standards of performance again leapt forward. In only 6 out of the 28 events did the previous games record survive, and one of these was equaled.

It was not until 1950 that the IVth British empire games could be held. The enthusiasm at Auckland, N.Z., broke all records. The total attendance over seven days was more than 300,000 and the gate receipts approached £90,000. Fencing and weight lifting were added to the program. As in 1938 a feature of the games was the startling superiority of Australia's woman athletes, notably M. Jackson, who twice equaled world sprint records.

In 1954 the games returned to Canada, this time at Vancouver. In a great upsurge of standards very few previous games records survived a celebration in which the English team performed best. The highlight was the first double sub-4-min. mile, in which R. G. Bannister (England) beat the world record holder J. M. Landy (Australia) in 3 min. 58.8 sec. The VIth games were organized at Cardiff, Wales, in 1958, with 35 countries and 1,379 competitors and officials taking part. Nine world records were set: Australia four, England three, South Africa and Singapore one each.

See H. M. Abrahams (ed.), *Empire Games Book* (1958).

BRITISH GUIANA: see GUIANA: British *Guiana*.

BRITISH HONDURAS, a British crown colony in Central America, was formerly called Belize or Balize and is known as Belice by most Central American countries. Its area is 8,867 sq.mi. Mexico lies to the northwest, Guatemala to the west and south, and the Caribbean sea to the east. Its capital city is Belize (*q.v.*).

Physical Geography.—The southern half of the country is a dissected plateau fringed by a narrow coastal plain; the northern half is undulating and low-lying. The southern plateau widens and declines toward the west, ending in the north in a precipitous broken escarpment. The highest measured peak (Victoria peak, 3,650 ft.) rises close to the irregular seaward edge of the plateau and crowns the Cockscomb range. The Cockscombs are isolated from the main watershed which follows the Maya mountains crestline in the southeast and the escarpment in the north.

About half of British Honduras is less than 200 ft. above sea level. This includes the northern lowlands drained by the navigable Belize river and by the New and Hondo rivers flowing into Chetumal bay. South of Belize the coastal lowlands skirting the highlands are crossed by short river valleys. The sea is very shallow inshore and ocean-going vessels anchor one to two miles from land. A submarine escarpment supports a barrier reef running the length of the coast about 15 mi. offshore.

Climate.—The climate of British Honduras is subtropical with a well-marked dry season. The mean temperature at Belize is 74° F. in December and 83° F. in July. Mean annual rainfall increases sharply from Corozal (52 in.) on the northern frontier to Barranco (180 in.) on the southern frontier. At Belize it is 70 in. but year-to-year variations are everywhere large. The dry season lasts from February to April, the wet season from June to October. Trade winds blow onshore most of the year but from October to December northers bring cooler, drier air. Belize was devastated by hurricanes in 1931 and 1961 and Corozal suffered the same fate in 1955.

Vegetation and Animal Life.—Seasonal broadleaf forest covers about 90% of the country. On the limestone soils of the north the forest is deciduous; sapote (*Achras zapota*) and mahogany (caoba; *Swietenia macrophylla*) are locally dominant. In the south the forest is taller and evergreen. On the lime-poor

soils of the plateau mahogany is rare and Santa Maria (*Calophyllum brasiliense*) is the most important timber tree. The rivers are largely bordered by swamp forests. The Mountain Pine ridge carries oak and pine (*Pinus caribaea*). Grass savannas with scattered oaks, pines or palmetto palms (*Pawotia wrightii*) are characteristic of the coast south and inland of Belize. Mangroves fringe the coast.

British Honduras has a representative selection of Central American birds and mammals. Several genera of turtles and tortoises exist; the manatee is common; and reptiles are abundant.

Population.—The population of British Honduras at the 1960 census was 90,343, having increased from 59,220 in 1946. In 1958 the birth rate was 46.8 and the death rate 9.3 per thousand. In 1960 over one-third of the people (32,824) lived in the capital and chief port, Belize. Other towns, all small, are Stann Creek, Corozal, El Cayo, Orange Walk, Punta Gorda and Benque Viejo. The highlands are virtually uninhabited.

The population is racially very mixed and derives almost wholly from immigrant stock. Negroes predominate in the coastal areas and American Indians are more numerous inland. One-third of the population is Negro Creole and English-speaking. About 6,000 Carib-speaking Negroes live in the southern coastal settlements. Maya Indians make up about one-sixth of the population; they speak Spanish or one of the Indian languages. Since 1957 several groups of Mennonites (*q.v.*) from northern Mexico have established themselves in the Orange Walk and Cayo districts.

(D. J. F.)

History.—After the collapse of the great Maya civilization in about the 9th century A.D., the population receded from what is now British Honduras. This inhospitable and deserted roost was not invaded by the Spaniards until British logwood cutters settled on it in about 1638 and began to break Spain's valuable logwood monopoly. Thereafter the Spaniards made periodic attempts by force and diplomacy to expel these competitors, culminating in a major naval attack in 1798 which was routed by the settlers and their African slaves. Living conditions created good relations between masters and slaves and abolition was readily accepted.

When, in 1847, the Indians in Yucatán rose in revolt against Spain, thousands of refugees sought sanctuary in the northern part of British Honduras. The territory was formally proclaimed a British colony in 1862 and was subordinated to the governor of Jamaica until 1884, when it became a separate colony.

In 1859 Guatemala and Great Britain signed a trade convention which provided that Guatemala and Great Britain would jointly build a road to benefit the trade of both countries. The proposed route ran from the Golfo Dulce (Guatemala) to Guatemala City and the cost was not expected to exceed £100,000. When, however, the joint engineers surveyed the route their estimate came to £145,465 and Guatemala undertook to seek a less costly route. Before this was found trade conditions changed and rendered the proposed road of little value to either party. Arising from Guatemalan claims to sovereignty over British Honduras, Britain in 1946 suggested that Guatemala present its case to the International Court of Justice. While agreeing to their suggestion, Guatemala appeared reluctant to carry it out.

(X.)

Administration and Social Conditions.—The first constitution for the British settlements around Belize was codified in 1765 by Adm. Sir W. Burnaby and was expressly based upon local usage and customs. It has been modified several times since.

By the new constitution adopted in 1950, British Honduras remained a crown colony administered by a governor aided by an executive council and legislative assembly. The governor was given normal reserve powers and might withhold his assent to legislation. The new constitution permitted the people of British Honduras for the first time to choose their own prime minister (the leader of the majority political party). There is universal suffrage for those over 21.

The country is divided into six districts: Corozal, Orange Walk, Stann Creek, Toledo, Cayo and Belize; all except Belize are administered by district commissioners. District town boards have authority over most municipal affairs: in some villages an alcalde

(headman) is appointed with limited powers. The legal system is based upon the common law of England.

Primary schooling is compulsory between the ages of 6 and 14 and is often in the vernacular. Most schools are Roman Catholic and are partly government-aided. In the early 1960s there were nine secondary schools in the country, a nondenominational technical college and two small teachers' training colleges. The Baron Bliss institute in Belize houses a library and museum. The Belize radio broadcasts in English and Spanish and there are two daily newspapers. The colony is relatively free from endemic diseases and maintains government hospitals in each district.

The Economy.—The economy of British Honduras has traditionally depended on its forests. Logwood (used in making dyes) was the most important forest product in the 17th century but was later superseded by mahogany. In the 20th century chicle gum became a major crop and other trees yielded commercial timber.

Mahogany cutting is most active in the northwest of the colony; the trees are located and felled during the wet season and hauled to the rivers during the dry season. A logging railway (the only one in the colony) runs from north of Gallon Jug to Hill Bank on the New river. Tree trunks are floated downstream to the sawmill at Belize. In the 1950s cedar from the same area and pine from the Mountain Pine ridge were exploited. The area over which sapodilla trees are bled for chicle (*q.v.*), or in the south for the inferior crown gum, coincides with the mahogany forests.

One-half of the population is engaged in agriculture. Most farmers follow the Central American pattern of shifting agriculture; only about 5% of the land is under cultivation in any five-year cycle. Farmers and their families cultivate milpas (temporary forest clearings), growing subsistence crops (maize, beans; upland rice) and a cash crop, upon which there is increasing emphasis. The cash crop varies: around Corozal sugar is important; in the Orange Walk area tobacco is cultivated; fruits and vegetables for the Belize market are grown along the northern road; cacao is grown in the Toledo and Stann Creek areas. The main crops of the Caribs are cassava, plantains and coastal coconuts. Exports of citrus fruit are mainly from the Stann Creek valley. Most of the catch from coastal fishing is consumed locally, but lobsters are exported to the United States.

Industrial development is very limited. At Stann Creek there is a citrus processing plant, at Belize a sawmill and at Corozal a sugar refinery. The demand for labour is seasonal and under-employment persists.

Much of the colony remains inaccessible. All-weather roads link Belize with El Cayo, Stann Creek (the Hummingbird highway) and Corozal (and hence Yucatán), and Punta Gorda with San Antonio; serviceable logging tracks also exist. A regular motor-vessel service links Belize with the southern settlements. There are scheduled flights from Belize to other parts of the colony and to adjoining countries, Jamaica and the United States. Boat services are irregular.

The economy of British Honduras was in 1959 surveyed in the Downie report, which counseled agricultural expansion and controlled immigration; industrial expansion would be fostered by the larger local market so generated. Immigration was also the keynote of the findings of the Evans commission (1948). These suggestions aroused little enthusiasm in British Honduras.

BRITISH ISLES: see GREAT BRITAIN; ENGLAND; IRELAND, NORTHERN; IRELAND, REPUBLIC OF; SCOTLAND; WALES; CHANNEL ISLANDS; BRITAIN, etc.

BRITISH LEGION, the only ex-service organization in Great Britain whose membership is open to all ranks who have served with the armed forces of the crown, Red Cross organiza-

tions, the wartime merchant navy and British subjects who served in Allied forces. Before 1921 there were four British organizations of ex-servicemen, namely the Comrades of the Great War, the National Association of Discharged Sailors and Soldiers, the National Federation of Discharged and Demobilized Sailors and Soldiers, and the Officers' association. In 1920 representatives of these organizations reached agreement on the need to form one association to represent all ex-servicemen of all ranks. A constitution was then drawn up. A general conference of ex-servicemen held in 1921 agreed to adopt this constitution and unite the organizations under the title of the British Legion. A royal charter was granted in 1925. In the years that followed the legion continued to develop and grow; by the end of 1959 there were nearly 5,100 branches, including a number overseas.

The legion is responsible for the organization of the annual appeal known as Poppy day, the proceeds of which are spent on benevolent work on behalf of the ex-service community. Its general, as distinct from benevolent, work is financed by affiliation fees which represent a proportion of individual subscriptions received from members through the branches. These branches are grouped together in counties, which in turn are grouped in nine areas; each area elects representatives to a central national executive council. The legion has been responsible for the establishment of a number of employment schemes for the disabled. It represents disabled men before various tribunals in relation to pensions, and also approaches government departments where any matter concerning such men is dealt with. The organization is nonsectarian and nonpartisan. Each year it holds an annual conference of delegates from individual branches. This conference determines policy and is, in general terms, the parliament of the organization. The British Legion is a constituent member of the British Commonwealth Ex-Service league.

See Major G. Wootton, *The Official History of the British Legion; Annual Reports.* (J. R. G.)

BRITISH NORTH AMERICA ACT, the act of parliament of the United Kingdom by which in 1867 three British colonies in North America—Nova Scotia, New Brunswick and Canada—were united as "one Dominion under the name of Canada," and by which provision was made that the other colonies and territories of British North America might be admitted. The act was, furthermore, a constitution for the new union. It also divided the province of Canada into the provinces of Quebec and Ontario and provided them with constitutions.

The act conferred on the new dominion (which Canadian statesmen wished to call the "Kingdom of Canada") a constitution "similar in principle to that of the United Kingdom." The executive government was vested in the queen and her successors. These two provisions meant that Canada would have parliamentary and cabinet government. The legislature was to consist of a senate, its members appointed for life from the regions of Canada, and a house of commons elected from the provinces on the principle of representation by population. The act provided that criminal law should be federal and civil law provincial. The federal government was to appoint all senior judges, the provinces to administer the laws and maintain the courts. The act also authorized establishment of a supreme court of Canada.

The allocation of powers between the federal and provincial governments was done by s. 91 and 92 of the act. By the former, the federal legislature is given power to legislate for "the peace, order and good government of Canada" and "for greater certainty" 29 subjects of exclusive federal jurisdiction are listed. In s. 92 the provincial legislatures are given exclusive jurisdiction over 16 subjects of legislation, of which the two most important are (1) property and civil rights; and (2) education. Section 93 defined and safeguarded the educational rights held by religious minorities at the time of union. The act also gave the federal government the right to disallow any provincial act within two years of its passage. The provinces might levy direct taxation only, while the dominion might use any mode of taxation. The act thus provided for a union in which the federal government had general and overriding powers, while the provinces had particular and restricted ones.

The course of judicial interpretation in the judicial committee of the imperial privy council nevertheless transformed the character of the federal constitution under the act by greatly reducing the powers of the federal government and correspondingly increasing those of the provinces.

The act provided no process of amendment. Amendments have been made by the imperial parliament at the request of the parliament of Canada.

For information on the British North America act (No. 2), 1949, see CANADA: *Administration and Social Conditions.*

See R. M. Dawson, *The Government of Canada* (1947); W. P. M. Kennedy, *The Constitution of Canada, 1534-1937*, 2nd ed. (1938). (W. L. Mo.)

BRITISH SOLOMON ISLANDS PROTECTORATE has been since 1920 a protectorate over all the Solomon Islands (*q.v.*) with the exception of Bougainville (*q.v.*) and Buka, which are administered by Australia. The land area of the protectorate, which includes about 12 major islands and many smaller ones, is about 11,500 sq.mi., and the native population numbers about 104,000. The administrative capital is Honiara, situated on the north coast of Guadalcanal. (D. W. F.)

BRITISH SOUTH AFRICA COMPANY, the name of a company formed by Cecil Rhodes and Alfred Beit (*qq.v.*) and incorporated by royal charter on Oct. 29, 1889, which enabled British rule to be extended over central Africa without increasing the responsibilities and expenses of the British government.

Rhodes's ambition was to extend British dominion from the Cape of Good Hope to Cairo. To do this, it was necessary to secure the area north of the Transvaal and west of Mozambique which might otherwise be annexed by the Transvaal, Germany or Portugal. Since neither the British government nor that of the Cape Colony was prepared to undertake annexation, Rhodes planned a chartered company to accomplish this northward expansion. Although Lobengula, chief of the Matabele and ruler of most of the territory that later became known as Southern Rhodesia, had promised, by the Moffat treaty of Feb. 1888, not to make treaties with other foreign powers without British sanction, Rhodes saw that this was not a certain enough foundation for British influence and therefore sent to Lobengula three agents (C. D. Rudd, J. R. Maguire and F. R. Thompson) who, in Oct. 1888, negotiated the "Rudd concession." This granted the mining rights in Lobengula's territory (rumoured to be rich in gold) in exchange for £100 a month, 1,000 rifles and an armed steamboat on the Zambezi river. By means of this concession, having bought out rival interests, Rhodes overcame considerable opposition and secured the charter for the British South Africa company. The company, with an initial capital of £1,000,000, was thereby empowered, for 25 years and subject to the approval of the secretary of state for the colonies, to operate concessions in and to administer the area north of British Bechuanaland, north and west of the Transvaal, and west of the Portuguese dominions (no northern or western limits were specified).

The company's territory, proclaimed a British protectorate in 1891, was called Rhodesia in 1895. The company failed to gain control of Nyasaland (administered by the British government after 1891), but it was granted the administration of Northern Rhodesia in 1894, on the basis of treaties with chiefs in Barotseland and northeastern Rhodesia. Thereafter, until the early 1920s, its history merged with that of the Rhodesias (see RHODESIA AND NYASALAND, FEDERATION OF: *History*). The charter was renewed for ten years in 1915, but the company relinquished to the British government, which paid £3,750,000 compensation, the administration of Southern Rhodesia on Sept. 1, 1923, and of Northern Rhodesia on April 1, 1924.

In May 1924 the company declared its first dividend. It retained all mineral rights in Southern Rhodesia until 1933, when the Southern Rhodesian government bought them for £2,000,000. By 1961 it still retained all mineral rights in Northern Rhodesia and in large areas of Bechuanaland and Nyasaland, and operated a considerable variety of undertakings in the Federation of Rhodesia and Nyasaland. (M. F. K.)

BRITISH THERMAL UNIT, the amount of heat required

to raise one pound of water. at its maximum density, 1° F. See CALORIE: HEAT: PHYSICAL UNITS.

BRITISH WEST AFRICA, a term of reference for the British territories in west Africa, formerly much used but now with little political and no administrative significance. Three of the countries have become independent sovereign states of the Commonwealth of Nations: Ghana, independent since March 1957 and a republic, still within the commonwealth, since July 1960; the Federation of Nigeria, independent from Oct. 1960; and the former colony and protectorate of Sierra Leone, independent since April 1961. The Gambia remains a colony and protectorate. As a result of plebiscites held in Feb. 1961, the northern portion of the former trust territory of the British Cameroons joined Nigeria and the southern area voted for amalgamation with Cameroon (formerly French Cameroun). (See CAMEROON for political development.) The total area is about 500,000 sq.mi. and there are more than 45,000,000 persons, almost wholly Negro. A West African Research office, established in 1958 at Lagos, co-ordinates and administers scientific research in the British parts of west Africa and is responsible for institutes concerned with medical research, trypanosomiasis, cocoa and other agricultural problems. The West African Currency board was established in 1932 and a West Africa committee was formed in 1936 to encourage the further economic development of west Africa particularly by companies with headquarters outside west Africa.

See WEST AFRICA and articles on the individual countries.

(R. W. SL.)

BRITOMARTIS, "sweet maiden," a Cretan goddess, later identified with the huntress goddess Artemis, whose favourite companion she is said to have been. Being pursued by Minos, king of Crete, who was enamoured of her, she sprang from a rock into the sea, but was saved from drowning by falling into some fishermen's nets. Made a goddess by Artemis as Dictynna (Gk., "net"), she was the patroness of hunters, fishermen and sailors, and also a goddess of birth and health. The centre of her worship was Cydonia in Crete, whence it extended to Sparta, the island of Aegina (where she was known as Aphaea) and the islands of the Mediterranean.

BRITTANY (BRITANNY; Fr. BRETAGNE; Breton BREIZ), an ancient province and duchy of France, comprising the country known as Armorica (*q.v.*) until the influx of Celts from Britain. It consists of the northwestern peninsula of France, nearly corresponding to the modern *départements* of Finistère, Côtes-du-Nord, Morbihan, Ille-et-Vilaine and Loire-Atlantique. Its greatest length between the English channel and the Atlantic ocean is 250 km. (155 mi.); the area is about 30,000 sq.km. (11,583 sq.mi.).

Brittany consists of two distinct zones, a maritime zone and an inland zone. In the centre there are two plateaus of primary ground, partly covered with *landes* (unproductive moorland); the southern plateau is continued by the Montagnes Noires, the northern dominated by the Monts d'Arrée. The only river basin of any importance is that of the Vilaine, between the two plateaus. In the 19th century the development of canals and railways drew Brittany from its isolation, and agriculture developed remarkably. Much of the *landes* was cleared and converted into excellent pasturage, and on the coast market gardening made great progress. In the fertile districts cereals are cultivated. The richest region is the coast, called *armor*. The climate is oceanic and the prevailing wind is from the west; the winters are mild; the summers are cool; on the south coast winter temperatures are as high as on the Mediterranean shores. The gentle maritime climate allows the cultivation of early vegetables, whence this coast came to be known as "the golden belt." The coast is much indented; especially along the English channel; it is rocky and lined with reefs and islets. The mouths of the rivers form deep estuaries, and there are numerous fishing ports (Paimpol, Douarnenez, Concarneau, Le Croisic), military ports (Brest, Lorient) and trading ports (St. Malo, St. Nazaire, Nantes). The canning and metallurgical industries are concentrated in the ports. The Loire-Atlantique is the most active region economically.

History. — The historical evolution of Brittany has been mainly determined by its loneliness. The region has twice been a shelter

for the Celts. The earliest inhabitants of whom there is a record were Celtic tribes, probably intermingled with remnants of the earlier race whose monuments are the menhirs, dolmens and cromlechs (most numerous at Carnac, Morbihan). (See *Archaeology* below.) Conquered by Julius Caesar in 56 B.C., Armorica took part in the unsuccessful rising against him in 52-51 B.C. It was only superficially romanized. After the withdrawal of the Romans in the 5th and 6th centuries A.D. there was a considerable immigration of Celts from Britain who took refuge among their continental kinsmen from the Saxon invasion. Till then, the rural population had been mostly pagan; but thenceforward for 300 years Breton history and tradition are largely occupied with records and legends of the Celtic missionaries from Britain and Ireland, who gradually converted the whole country and gave their names to towns and villages (*e.g.*, St. Malo, St. Brieuc, St. Tugdual and St. Pol-de-Léon). Celtic Brittany was divided into a number of petty lordships, upon which the Merovingians and the first Carolingians tried without great success to impose their authority.

In the 9th century a national hero, Nomenoë (*q.v.*) revolted against the tutelage of Charles the Bald and conquered Nantes and Rennes! thus giving to Brittany its definitive extension and its complex constitution of both Celtic and Frankish country. The successors of Nomenoë, nominally vassals of the king but in fact independent, rallied their people against the Norse raiders; in the 10th century Count Alan (Alain Barbe-Torte) finally drove the Norsemen away, preventing them from founding on the Loire a new Normandy analogous to that which they had founded on the Seine. Alan established his capital at Nantes, and the beginning of feudalism in Brittany may be dated at this time.

In the 10th century Conan of Rennes became paramount in Brittany, and his son Geoffrey took the title of duke. The line of Conan ended in the 12th century, after many struggles to subdue the Breton feudal lords. These struggles brought the Breton dukes into contact with their neighbours, the dukes of Normandy and the counts of Anjou, and then with the king of England. The Bretons helped William of Normandy to win the battle of Hastings—but later they had to struggle against him and his successors, who were trying at least to impose their suzerainty on Brittany if not to conquer it. In the 12th century, however, Conan IV, hard pressed by rebellious nobles, sought the help of Henry II of England and gave his daughter Constance in marriage to Henry's son, Geoffrey, who succeeded to the dukedom.

Brittany would have become a dependency of the Angevin (Plantagenet) empire if Geoffrey's heir, Arthur I (*q.v.*) had not been murdered by the English King John and if Arthur's sister, Alix, had not been given in marriage to a Capetian prince, Peter of Dreux (Pierre Mauclerc), by Philip Augustus. A line of French dukes ruled at Rennes until the death of the childless John III in 1341.

France and England again contested for Brittany on the occasion of the civil war between the partisans of two indirect heirs: John of Montfort, supported by the English, and Charles (*q.v.*) of Blois, nephew of Philip VI of France. It was in this war that the Breton

hero Bertrand du Guesclin first made his military reputation and that the "Combat of the 30" took place (see *BEAUMANOIR*). The defeat and death of Charles at Auray (1364) secured the dukedom for the house of Montfort. The dukes of the Montfort dynasty (John IV, John V and Peter II) tried to secure Brittany's neutrality between France and England during the Hundred Years' War, conscious of the duchy's intermediary geographic position. The Breton navy served all the powers from Flanders to Spain; and from Nantes, where he had his castle, the duke governed Brittany as an independent country. The constable earl of Richmond, however, rendered great services to the French crown against the English before succeeding his nephew, Peter II, in the dukedom as Arthur III (*q.v.*) in 1457. He was succeeded in 1458 by another nephew of his, Francis II, who died in 1488, leaving his daughter Anne as heiress of Brittany.

Brittany was definitively joined to the crown of France through Anne's successive marriages, with Charles VIII and then to Louis XII (see *ANNE* of Brittany, queen of France). Her daughter Claude became the queen of Francis I of France, under whom the treaty of 1532 was concluded, binding Brittany to France but containing guarantees of its local liberties. Until the Revolution this provincial autonomy survived, local patriotism opposing Bourbon attempts at centralization. The mass of the people had remained unaffected by the Reformation. During the religious wars, Brittany was the scene of much fighting against the Huguenots, and there were many Spanish garrisons. Philippe Emmanuel de Lorraine, duc de Mercoeur, tried to revive the independent duchy for himself and his family in 1585, but was defeated in 1598 by Henry IV, who then restored religious peace by the Edict of Nantes. Apart from some short-lived troubles in the early years of Louis XIII's reign, the province then had a long period of peace interrupted only by an unsuccessful rising in 1675 against new taxation—"the revolt of the stamped paper." At the beginning of the French Revolution, in Nov. 1789, the movement of "federation" was born in Brittany, in reaction against the aristocratic system of the provincial *parlements*; but from 1792 to 1799 the Chouans of Brittany struggled no less than the Vendéans against the antireligious campaign of the first republic. From the end of the 19th century opinion slowly and unequally evolved toward conservative republicanism. In World War I Bretons were among France's best soldiers and sailors; Adm. Pierre Ronarc'h and the largely Breton *fusiliers marins* held a critical position with the English troops on the Yser in 1914. In World War II, Brittany was a centre of fervent resistance against the German occupation.

Characteristics and Customs.—Bretons have never lost their particular character, which combines enterprise and traditionalism. Many have distinguished themselves as seafarers (*e.g.*, Jacques Cartier, the maker of French Canada, and the naval heroes Robert Surcouf and René Duguay-Trouin), and Brittany still provides the French navy with the greater part of its crews. Though large numbers of Bretons emigrate, they generally remain faithful to their traditions. The Catholic faith is widespread in Brittany, where the sermons of two priests, Julien Maunoir (1606–83) and Louis Grignion de Montfort (1673–1716), had a great effect on the people. This faith appears particularly in the pilgrimages or *pardons* at Locronan, Josselin and Ste. Anne d'Auray. Brittany moreover has preserved its old social structure better than other French provinces; in the country, families are large and respectful of the paternal authority, and the rural nobility still exercises some influence.

The Breton language is commonly spoken in parts of Morbihan, Finistère and Côtes-du-Nord, and from the mid-19th century there has been a considerable literary revival. (See *CELTIC LANGUAGES*; *BRETON LITERATURE*.) (M. M.)

Archaeology.—The Lower Paleolithic cultures (Late Acheulean or Micoquian, and Mousterian) are attested by isolated finds of core tools, some of which, and some flakes, were discovered in Pleistocene deposits. Flint being scarce, most sites are found on suitable quartzite outcrops, sometimes in the form of huge factories of Mousterian or Acheulean tradition. The Upper Paleolithic cultures are known only by sporadic indications, apart from the very late Magdalenian sites south of the Loire, and an Epipaleo-

lithic cave with a quartzite blade industry in northern Finistère, at Guiclan.

A littoral form of Mesolithic culture, of Tardenoisian type, is known from sites on the southern coast of Brittany (with the type sites at Tévéc and Hoedic). They contain domestic and ritual hearths, and important family cemeteries were found among the kitchen refuse, often in multiple burials, with tied-up skeletons sprinkled with ochre and covered by ritual hearths or stone mausoleums. Some tombs contained antlers or antler tools.

Pollen analysis has shown that the effects of Neolithic cultivation and deforestation upon the vegetation were noticeable in central Finistère some time before 3000 B.C. Though little is known about the earliest settlements, a site of the end of the Early Neolithic, or the beginning of the Middle Neolithic culture, with traces of hearths, pits and postholes, has been discovered at Guissény, on the north coast of Finistère with a radiocarbon date of before 3000 B.C. It is now submerged at high tide because of the gradual rise of the sea level and this suggests that perhaps most of the first settlements have been eaten away by the sea.

The first wave of the megalithic colonization has an essentially coastal distribution, with chamber tombs of the passage grave type. They are more numerous in the Morbihan district than elsewhere but are more or less evenly disseminated along the west and north coasts and up the channel as far as St. Brieuc bay. The prototypes, with dry-stone walled chambers covered by corbeled vaults, are more numerous in the north. That at Ile-Carn, near Ploudalmézeau, had a radiocarbon date of about 3000 B.C.; the grave goods are meagre—chiefly Western Neolithic sherds.

Later monuments with longer passages were developed, sometimes clustered together under the same cairn; from this point of view one should mention on the northern coast the huge cairn of Barnenez, Plouézoc'h, with 11 passage graves side-by-side. But as a rule the later monuments are more complicated, with side chambers or angled passages. Many passage graves, especially in the Morbihan district, possess engraved or sculptured orthostates, with symbolic or schematic figurations of implements, cattle and of the mother goddess. Generally these monuments contain accumulated grave goods, and were used at least until the end of the Late Neolithic.

A series of unchambered low long barrows, probably of northern European connections, are delimited by rows of slabs leaning outward in the monuments of the interior. In the southern coastal districts, these monuments, which may pertain to the last Middle Neolithic cultural traditions, are influenced by the local megalithic chamber-tomb architecture.

The Late Neolithic cultures cover the whole peninsula, including the interior. Standing stones, or menhirs, are very numerous and can be very large (between 6 and 10 m. high). Relics of different types of alignments of standing stones, sometimes with semi-circles of stone blocks, are not restricted to the celebrated area of Morbihan, where of course the alignments in rows near Carnac, with thousands of stones, are very impressive.

The typical collective Late Neolithic megalithic tombs belong to the gallery-grave class and are widespread. They present different variations, with end or lateral entrances (these sometimes covered by a lintel stone, or preceded by a perpendicular vestibule, sometimes with a porthole slab at the separation) and with internal subdivision in two chambers in the complete monuments. The construction mound sometimes remains and there can be a duplication of the lateral orthostates. In southern Finistère a few monuments are made of mutually supported blocks, without capstones. A few gallery graves are adorned with sculptures, schematic representations of the mother goddess by pairs of breasts and engraved metallic or stone weapons (Tressé, Trégastel, Trébeurden and Commana). The grave goods of these gallery graves are often of exclusively Late Neolithic type, but in some coastal monuments there are Chalcolithic elements, such as bell-beaker ware.

The bell-beaker culture has in Brittany an important diffusion, chiefly along the coasts, but is known only as an intrusive element in the goods of the pre-existing collective tombs. The finer-decorated beakers can show at the same time comb and cord impressions. West European copper-arsenic daggers, wrist guards

and rare V-perforated buttons complete the cultural assemblage. To perhaps the same culture belong numerous pieces of gold foil ornaments, chiefly from the richest Morbihan passage graves.

A very local but very wealthy series of large mounds in the Carnac region, covering a central funerary closed chamber, sometimes with secondary cists, has given beautiful rare stone axes and great quantities of callais disk-shaped heads and pear-shaped pendants (Tumiac near Arzon, Mané-er-Hroëc'h and Mané-Lud at Locmariaquer, and St. Michel and Le Moustoir near Carnac).

The Early Bronze Age in the western half of Brittany is characterized by an intrusive culture, with Wessex connections, constituting a series of about 30 huge single-grave eastern barrows. In the northern Trégorrois, the tomb may be a wooden coffin or a cist made of schist, and in other districts they can be cists or vaults with dry-stone walls and capstones. The grave goods are often truly "princely," containing daggers of copper or bronze with wooden hilts and leather sheaths, both ornamented with gold nails in the richest tombs, copper and bronze flat axes, flint ogival arrowheads of exquisite workmanship and archer's wrist guards; jet and amber spacer beads of the crescentic necklace type are also found. To the same period belong crouched single graves in stone cists, and there have been some finds of gold jewels, lunulae, wire torques, a ring disk and bronze flat axes.

The barrows of the Middle Bronze Age are smaller and usually contain dry-stone walled chambers, sunk underground and covered by a capstone, with bronze triangular daggers and biconical pots as grave goods. Their distribution covers only western Brittany, but they are very numerous in some districts. Hoards of the end of the period are also numerous, sometimes containing long swords deriving from the triangular daggers.

Late Bronze Age tombs are little known, but a series of very small barrows containing cremations may belong to that period. A dwelling site has been located at Loguivy on the northern coast. Hoards became extremely important and are numerous, with a greater variety of types of implements. The later ones include huge deposits of quadrangular socketed axes. These finds are contemporary to the Early Iron Age cultures of eastern Gaul. Numerous hoards of isolated finds of large gold jewels, torques and bracelets, also belong to the Late Bronze Age.

Only very late First Iron Age (Hallstatt period) cremation barrows were utilized, chiefly near the Morbihan. Some Hallstatt swords, daggers and *situlae* have been discovered, especially in hoards around the mouth of the Loire. Second Iron Age (La Tène period) sites and finds are more numerous, chiefly in the west. Funerary geometrical granite stelae are widely distributed; some were engraved with Celtic patterns; others were discovered *in situ*, surrounded by cremation urns in sorts of cemeteries. Other cemeteries, with inhumations, subsist in the west. Many artificial underground galleries or souterrains have been discovered, and also some coastal settlements, most of the pottery of the last centuries before the Roman conquest coming from these types of sites. This pottery can be very fine, with a lustrous graphitic slip. There are also some important hill forts (Huelgoat; Kercaradec, near Quimper; and Péran, near St. Brieuc, with vitrified double ramparts), and a distinctive series of promontory forts with multiple earthworks around the southern and western cliffs.

Each of the different Gaulish tribes, the *Redones*, the *Coriosolitae*, the *Osismi*, the *Veneti* and the *Namnetes*, had its characteristic mintage. They left traces of a social and administrative organization, and their boundaries merged into the limits of the subsequent Gallo-Roman cities. Roman civilization has left everywhere diffuse remains but few important ruins remain. The Merovingian civilization arrived at its western limit along the border of the maximum extension of the Breton language during the dark ages. The Breton invaders left almost no material traces, apart from a few Celtic bells. In the west, a peculiar type of pottery (instead of the usual Merovingian ware) bridges the archaeological gap between the late Gallo-Roman times and the middle ages. See ARCHAEOLOGY; see also references under "Brittany" in the Index volume. (P.-R. G.)

BRITTEN, (EDWARD) BENJAMIN (1913–), the leading British composer of the mid-20th century, was born at Lowestoft, Suffolk, Nov. 22, 1913. He showed precocious musical talent and at the age of 12 became a pupil of Frank Bridge. From 1930 to 1933 he studied as a scholar at the Royal College of Music, London, with John Ireland (composition) and Arthur Benjamin (piano). While there he wrote a set of choral variations! *A Boy Was Born* (1933, revised 1958). He then worked as a composer for the radio, theatre and cinema, coming into close contact with W. H. Auden, but such marginal creations could not long satisfy the ambitions of a young composer who was already earning an international reputation, notably with the *Variations on a Theme of Frank Bridge* for string orchestra (Salzburg, 1937).

He moved to the U.S. in 1939 and there wrote his first stage work, the operetta *Paul Bunyan* (New York, 1941, never produced in England, for which Auden, also in the U.S., provided the libretto). A commission from the Koussevitsky foundation led to the composition of the opera *Peter Grimes* (libretto by M. Slater after the poem by George Crabbe), written after Britten's return to England in 1942 and first performed at Sadler's Wells theatre, London, June 7, 1945. *Peter Grimes*, which was widely produced outside England, placed Britten in the forefront of 20th-century composers of opera. Other operas include *The Rape of Lucretia* (1946), *Albert Herring* (1947), *Billy Budd* (1951), *Gloriana* (written for the coronation of Elizabeth II, 1953), *The Turn of the Screw* (1954), *A Midsummer Night's Dream* (1960) and *Let's Make an Opera* (1949), in which audience and cast (mostly of children) join.

Britten's operas revealed a versatile dramatic gift, a prolific inventiveness, a masterly approach to word-setting and much ingenuity in matching the specific dramatic situation with the most cogent musical form. *Lucretia*, the first of Britten's chamber operas, marked the inception of the English Opera group, with Britten as artistic director, conductor and composer. Out of this enterprise grew the Aldeburgh festival, held at the Suffolk fishing town where Britten made his home in 1947.

His unique creative talent enriched most of the principal media of music. Pre-eminent among his nontheatrical works stand his song sets (with piano) and song cycles (with orchestra). The most important, which established his commanding stature as a song-writer, are *The Seven Sonnets of Michelangelo* (1940), *The Holy Sonnets of John Donne* (1945), *Winter Words* (1953), and *Six Hölderlin Fragments* (1958) for voice and piano, and *Les Illuminations* (1939), the *Serenade* (1943) and *Nocturne* (1958) for voice and orchestra. His three *Canticles* (types of solo chamber cantata peculiar to Britten) contain some of his most personal invention. His many important choral works, among them the *Hymn to St. Cecilia* (1942), *Ceremony of Carols* (1942), *Rejoice in the Lamb* (1943), *St. Nicolas* (1948), *Spring Symphony* (1949) and *Cantata Academica* (1960), show enterprise and originality in their treatment of choral texture. The prominent use of boys' voices adds a fresh, raw colour to many of his choral scores.

Though lyric and dramatic texts were often the source of his inspiration, his instrumental works should not be overlooked. Two string quartets (1941 and 1945), a violin concerto (1939, revised 1950), the *Diversions* for piano (left hand alone) and orchestra (1940, revised 1950) and *Sinfonia da Requiem* (1940) are evidence of his confident handling of the larger instrumental forms. He showed his mastery of large-scale instrumental composition in the extended interludes in his operas. His three-act ballet, *The Prince of the Pagodas*, was first performed at Covent Garden in Jan. 1957.

See D. Mitchell and H. Keller (eds.), *Benjamin Britten* (1952); E. W. White, *Benjamin Britten: a Sketch of His Life and Works*, 2nd ed. (1954). (D. C. P. M.)

BRITTLE STAR, the popular name for echinoderms of the class Ophiuroidea (see ECHINODERMATA). The name refers to the habit of most of the commoner species of breaking off their arms (autotomy) when alarmed.

BRITTON, NATHANIEL LORD (1859–1934), a leading U.S. systematic botanist expert on the American flora, was born at New Dorp, Staten Island, N.Y., on Jan. 15, 1859. He graduated in 1879 from Columbia university, from which in 1881 he received the degree of doctor of philosophy. After serving as instructor in geology in 1879–87 and as instructor and adjunct professor of botany in 1886–91, he was made professor of botany at Columbia. He occupied this chair until 1896, when he became director-in-chief of the New York Botanical garden, which was created as the result of his efforts and under his guidance became one of the leading institutions for the advancement of botanical science. Britton specialized in the North American flora, notably in the Crasulaceae (*q.v.*), Cactaceae (*see* CACTUS) and Cyperaceae (*q.v.*), and in the flora of the West Indies, Bolivia and Paraguay. Besides writing numerous botanical papers and editing the *Bulletin of the Torrey Botanical Club*, 1888–97, Britton was the author of important botanical works, among which are: *Illustrated Flora of the Northern United States and Canada*, with Addison Brown (1896–98; 2nd ed., 1913); *Flora of Bermuda* (1918); *The Bahama Flora*, with C. F. Millspaugh (1920); *The Cactaceae*, with J. N. Rose (1919–23); and various portions of the monumental *North American Flora*. He died in New York city on June 25, 1934.

BRITTON, the title of the first great treatise of the law of England in the French tongue, purported to have been written by command of King Edward I. The author is probably either John le Breton, a justice for the county of Norfolk, or a royal clerk of the same name. The probable date of the book is 1291–92. It was based upon the treatise of Henry de Bracton (*q.v.*), which it brought up to date. In an early manuscript of the 14th century, which was once in the possession of John Selden and is now in the Cambridge university library, the work is entitled *Summa de legibus Anglie que vocatur Bretonne*, and it is described as "a book called Bretonne" in the will of Andrew Horn, the learned chamberlain of the City of London, who bequeathed it to the chamber of the Guildhall in 1329, together with another book called *Miroir des Justices*.

Britton was first printed in London by Robert Redman, without a date, probably about 1530. Another edition of it was printed in 1640 corrected by E. Wingate. A third edition, with English translation, was published at the University Press, Oxford, 1865, by F. M. Nichols. An English translation without the Latin text had been previously published by R. Kelham in 1762. *See also* ENGLISH LAW

BRIVE-LA-GAILLARDE, chief town of an *arrondissement* in the *département* of Corrèze, south central France, is situated to the west of the mountains of the Massif Central on the Corrèze river, 93 km. (58 mi.) by road south of Limoges. Pop. (1954) 32,041. The old part of the town is surrounded by a ring of boulevards on the site of the old fortifications. The 12th-century St. Martin's church in a curious Romanesque style is in the centre of the town, with the *hôtel de ville* opposite. The college of the Jesuits (1659) is a short distance to the northeast. Near the eastern boulevard are the Ernest Rupin museum, in a fine house in Louis XIII style, and the *Hôtel Labenche* (1450). There are many modern public buildings and a modern road bridge over the Corrèze. Brive is on the main line from Paris, Orléans and Limoges to Toulouse and Spain. There is an airfield 2½ mi. to the west.

Brive lies in a fertile area sloping to the southwest where three former provinces (Limousin, Périgord and Quercy) met; agriculture is the main industry, grain and fruit being important. There is a big pork industry and much is exported. Preserves, wood products and paper are made, and heavier industry has been moving to the town.

Rock caves nearby supply evidence of occupation by early prehistoric man, and great stone monuments show later occupation. Known to the Romans as *Briva Curretiae* (bridge of the Corrèze), in the middle ages it was the capital of lower Limousin, and St. Anthony of Padua founded a Franciscan monastery there in 1226. The town's importance derives chiefly from its position at the crossing of the main north-south (Paris-Toulouse) and east-west (Bordeaux-Geneva) rail and road routes.

BRIXHAM, an urban district and fishing port in Devon, Eng., lies on the southern side of Tor bay, 31 mi. S. of Exeter by road. Pop. (1961) 10,679. The town is irregularly built on the limestone hills, and its scenic harbour is sheltered by a breakwater. A statue on the quay commemorates the landing in 1688 of William of Orange. St. Mary's, the original parish church built of red sandstone, has an elaborate 14th-century font. The old garrison hospital has later the home of the Rev. Henry Francis Lyte (*q.v.*). Brixham is a seaside resort and also a yachting centre with an annual regatta. The chief industry is fishing; however, the old, colourful brown-sailed Brixham trawlers have been replaced by diesel trawlers. Auctions of the catch are conducted in traditional singsong in the fish market. There are paint research laboratories, a foundry, a pottery and shipyard and, in Freshwater quarry, a marine biological laboratory. To the east there are limestone quarries on Berry head, which is noted for its calciphilous plants and its seabirds and one of whose two forts (1803) encompasses a lighthouse. Southward from Berry head the coast is scheduled as an area of outstanding natural beauty.

Brixham cavern, called also Windmill Hill cavern, is an ossiferous cave (discovered in 1858) with a fauna closely resembling that of Kent's cavern (*q.v.*). The Paleolithic flint implements are of a roughly chipped type. Similar fossil caves nearby include Berry Head cave and Ash hole.

See Trans. Devon. Assn., vol. vi, pt. 2, pp. 775–856 (1874); *Phil. Trans.*, vol. clxiii, pt. 2 (1873). (W. A. SA.)

BRIZEUX, JULIEN AUGUSTE PÉLAGE (1803–1858), French poet, known especially for his Breton eclogues and idyls. He was born at Lorient, Sept. 12, 1803. Two visits to Italy had a marked influence on his early work and he produced a translation of Dante's *Divina Commedia* (1841) in *terza rima*. The countryside, folklore and legends of his native Brittany had, however, a more lasting influence on him, reflected in his more important works, *Marie* (1831, rev. 1840), *Les Bretons* (1845) and *Histoires Poétiques* (1855), of which the last two were crowned by the French Academy. He died at Montpellier, May 3, 1858.

BRIZO, an ancient Greek goddess, long worshiped in Delos. She delivered oracles in dreams to those who consulted her about fishery and seafaring. The women of Delos offered her presents of little boats filled with all kinds of eatables (except fish) in order to obtain her protection for those engaged on the sea.

BRNO (Ger. BRÜNN), the second city in population of the Czechoslovak republic and the chief city of the south Moravian region, lies on the eastern foothills of the Morava heights at the confluence of the Svratka and Svitava rivers, 115 mi. S.E. of Prague. To the southeast are the fertile loess-type soils of lowland Moravia, skilfully and intensively cultivated for generations. Pop. (1950) 284,946, (1959 est.) 314,722.

The original settlement was Celtic and the modern name Brno comes from the Celtic *brynn* ("hill town"). The citadel on the Spilberk hill (288 m. or 945 ft.) can be traced back to the 10th century, and throughout the middle ages German traders began gradually to develop the old town (which was incorporated as a city in 1243) to the east of the hill. In the 14th century the margraves of Moravia acquired and for long kept the control of the city and neighbourhood. The old town has two squares which are focal points, the Zelny trh with its 17th-century fountain and the namesti Svobody with the baroque St. Mary's pillar. North of the namesti Svobody are the beautiful churches of St. Thomas and St. James (the latter was for centuries known as the "German" church). In and near the Zelny trh are a whole cluster of historic buildings, the old parliament of the Moravian nobility, the Gothic cathedral and the town hall.

The old town, dominated and protected by the castle, endured and survived three severe sieges: in 1428 by the Hussites, in 1464 by George of Podebrad, the Bohemian leader, and in 1645 by the Swedes. Brno was also the French headquarters before the battle of Austerlitz. The Spilberk castle under Habsburg rule became a political prison and was famous for the confinement of the Carbonari group of Italian patriots in the 19th century and especially as the background to Silvio Pellico's noted *Le mie prigioni*. In the old town at the same time Gregor Mendel, an Augustinian

monk, worked on his theory of heredity. The Spilberk has been transformed since the mid-19th century into a pleasant design of gardens and ring roads surrounding the old citadel. In 1919 the remnants of the old university became the nucleus of Masaryk university. Through the 19th century, and more unevenly in the 20th, the new town of manufacture and trade grew up south and east of the railway. Textiles (wool, linen, cotton) predominate traditionally, and also manufactures dependent on adjacent farming (brewing, flourmilling, sugar refining), but the range of products is large. A famous gun, the ZB (later manufactured in Enfield, Eng., as the Bren gun) was developed at Brno. Because of its nearness to the great Macocha caverns, a few miles to the north, the city has considerable tourist traffic. Occupied by the Germans in World War II, it was captured by Soviet troops in 1945.

BROACH (BHARUCH), an ancient city and modern district of the state of Gujarat, India. The city is on the right bank of the Narmada about 30 mi. inland, 200 mi. N. of Bombay and 45 mi. S.S.W. of Baroda. Pop. (1951) 62,729. There is a considerable cotton industry including large mills and ginneries, and a guild of cotton merchants; flour milling and various handicrafts are also carried on. The fort containing civil courts, jail, church, municipal offices, etc., stands on a hill above the river.

Broach (ancient Bhrigukaccha, Bharukaccha) was one of the most celebrated harbours in India. It is mentioned in the *Periplus of the Erythraean Sea* (c. A.D. 80) and in Ptolemy as Barygaza; and also occurs in the epic *Mahabharata*. In the 2nd century it was ruled by the Kshaharata satraps, and in the 7th century by the Gurjaras when it appears in the Travels of the Chinese pilgrim Hsüan Tsang. Incorporated into the Muslim state of Gujarat, it was annexed to the Mogul empire by Akbar in 1572. The hlarchas became its masters in 1685 and held it until 1782 when it was captured by the British. After changing hands again several times it was finally ceded to the East India company in 1803. Objects of interest are a stone mosque constructed out of an older Hindu temple, and the temple of Bhrigu Rishi 10 mi. to the east.

BROACH DISTRICT has an area of 2,981 sq mi. Pop. (1961) 892,241, all of whom speak Gujarati. It became British territory in 1861 by a transfer from Sindhia. Consisting chiefly of alluvial plains at the mouth of the Narmada, the land is rich and highly cultivated and though it is without forest, it is not wanting in trees. It is well drained by rivers, having in addition to the Narmada the Mahi in the north and the Kim in the south. The principal crops are cotton, millet and pulse. There are rich mineral deposits and manganese is mined extensively. The district is traversed by the Western railway which crosses the Narmada opposite Broach city on an iron-girder bridge of 67 spans. (M. R. P.)

BROACH, any one of many forms of pointed instruments, such as bodkins, wooden needles used in tapestry making, roasting spits and even the tools (also called "reamers") employed for enlarging or smoothing holes. Hence comes the expression "to broach" for "to tap" a cask. In masonry it is a type of pointed chisel. The term is also used to designate an automatic machine using a multiple cutting edge to progressively perform a cutting operation (see MACHINE TOOLS: *Broaching Machines*). In architecture, the term is used specifically to designate a triangular surface inserted in the corners of a square or cube to make the upper face an octagon, especially at the junction of a square tower and an octagonal spire, in which case the slope of the broached surface is usually less than that of the spire sides. The word is also used for any means of adjusting a polygonal spire to a square base.

BROADCASTING, the transmission of radio and television programs intended for general public reception, as distinguished from private radio messages directed to specific receiving stations. In its commonest form, broadcasting may be described as the systematic diffusion of entertainment, information, educational and other features for simultaneous reception by a scattered audience, individually or in groups, with appropriate receiving apparatus. The subject matter may be either audible or visual, or a combination of both. Sound broadcasting in this sense may be said to have come into being about 1920, while television broadcasting began in 1936.

I. BROADCASTING SYSTEMS OF THE WORLD

From 1919 onward, amateur wireless telegraph experimenters, numerous even before World War I, used telephony more and more in preference to Morse telegraphy, and in Great Britain, the United States and several European countries broadcasting began spontaneously with transmissions of phonograph records and amateur performances for the amusement of other experimenters. At the same time the radio industry began to foresee and prepare for a future of evidently great but unknown possibilities. Experimental work was undertaken for the improvement of microphones and for the development of receiving apparatus which could be operated with a minimum of technical knowledge. Stations already in existence began the transmission of a few planned and regularly scheduled programs, using amateur performers at first. Later they were able to obtain the services of professional talent, with many artists offering voluntary appearances because of the novelty of the new art. New structures were erected especially for the purpose of transmitting programs, and a demand arose for equipment capable of receiving the broadcasts. Thus, an innovation comparable in cultural importance to the introduction of printing was launched tentatively upon a responsive audience, almost before the import of the new medium was realized, and before the financial organization of broadcasting services or their relations with the theatre, the musical profession, the press or existing radio services had been settled.

Existing radio laws, which had been specifically designed to regulate the use of wireless telegraphy by the maritime industry and a few wireless experimenters, did not adequately provide for the new application of radio to program broadcasting, and confusion in the licensing of stations and assignment of wave lengths was inevitable. Despite the many obstacles, however, broadcasting flourished; between 1920 and 1924 stations were built in the major countries of the world, and by 1930 most nations had well-established systems in operation. The number of broadcasting stations in the world increased from about 600 at the end of 1925 to 1,300 in

1935, and to at least 10,000 by the early 1960s.

1. International Regulation.— Each nation regulates and controls broadcasting within its own territory. However, the radiations from a broadcasting station do not respect national boundaries, and international co-operation was an early and obvious necessity if chaotic conditions of interference between stations were to be avoided. The world-wide problem was first considered at the International Radio Telegraph convention of Washington, D.C., held in 1927, and was later given to the jurisdiction of the International Telecommunications union (ITU), with almost every nation participating. The international aspects of radio, including broadcasting, were later regulated by agreements signed at the Madrid convention of that body in 1932 and subsequently modified by conventions in Cairo, Egy. (1938), Atlantic City, N.J. (1947) and at Buenos Aires, Arg. (1952).

To resolve regional problems beyond the scope of the ITU, other international regulating bodies were organized along continental lines. Thus, the task of arranging an orderly solution of European broadcasting problems was undertaken by the International Broadcasting union, formed in April 1925 at a conference of European broadcasters meeting in the headquarters of the British Broadcasting company (BBC). The task was one of extreme difficulty, as the conflicts to be adjusted were those of perfectly legitimate interests, and the unofficial status of the union left its decisions subject to ratification or reversal by the several national governments; however, a tentative European plan was largely in operation by Nov. 1926. In 1929 the union was recognized as expert adviser to the ITU. Revised European plans for the allocation of medium and long wave lengths were agreed upon in subsequent years, principally at Lucerne, Switz., in 1933 and at Copenhagen, Den., in 1948. Attempts at world-wide short-wave planning were made at ITU conferences at Mexico City in 1949, and later at Florence, Italy (1950), and Rapallo, Italy (1950), but these attempts broke down, mainly under the impact of the beginning of the war in Korea in June 1950. With the development of television and of very-high-frequency (VHF) sound broadcasting after 1945, a conference was held at Stockholm, Swed., in 1952 to allocate channels in the European region.

Whereas the allocation of frequencies, arranged through the ITU, was a matter of agreement between governments, there were many other aspects of broadcasting which could be regulated without direct reference to their governments by the broadcasting organizations concerned. The International Broadcasting union, more commonly known as the Union Internationale de Radiodiffusion (U.I.R.), contained members representing all countries of the European zone with the exception of the U.S.S.R. The overrunning of Europe by the German army in World War II resulted in many of the members of U.I.R. coming under German control or being cut off from access, and after the war it was decided that the U.I.R. should be dissolved and a new union formed. Political difficulties soon arose over membership. The Soviet Union insisted that not only the broadcasting organizations of the Ukraine and White Russia (which were recognized by the ITU) should take part, but also those of five other Soviet republics, not members of the ITU. A number of western European organizations did not admit this claim, but nevertheless a new union called the Organisation Internationale de Radiodiffusion (O.I.R.) was formed and some western countries, including France, Belgium and the Netherlands, joined it. All the organizations which objected to the Soviet claim, except the BBC, remained members of the U.I.R.; the BBC did not join either body. Thus, there were now the Soviet-dominated O.I.R. with its headquarters in Brussels, Belg., representing the broadcasting organizations of 22 countries, and the U.I.R. with its headquarters in Geneva, Switz., and 10 members. Finally 11 western members of the O.I.R. resigned and joined with the remaining members of the U.I.R. and the BBC to form in Feb. 1950 a new European Broadcasting union (E.B.U.) with headquarters in Geneva and having as full members the broadcasting organizations of western Europe as well as those of Greece, Yugoslavia, Turkey, Lebanon, Syria, Egypt, Morocco and Tunisia. The headquarters of the O.I.R. moved to Prague, Czech.

In the American hemisphere, an agreement on the division of broadcasting channels between the United States and Canada was reached through diplomatic negotiation in 1932, and the Havana treaty of 1937 allocated broadcasting frequencies between Canada, Cuba, Mexico and the United States. The North American Regional Broadcasting Agreement conference, representing essentially the same nations, began reconsideration of the entire American situation at conferences held at Havana, Cuba, in 1947 and at Montreal, Que., in 1949. Broadcasting organizations of the American continent formed in 1946 the Asociación Interamericana de Radiodifusión (A.I.R.), which by the late 1950s represented more than 4,000 sound broadcasting and 400 television stations. Some aspects of the correlation of broadcasting in both the old world and the new were also handled by United Nations Educational, Scientific and Cultural organization (UNESCO).

By the international agreements indicated above, domestic broadcasting was assigned to two frequency bands in the radio spectrum: long-wave channels in the region from 150 to 550 kc. and medium-wave channels in the region from 550 to 1,660 kc. Short-wave international broadcasting (that is, broadcasting intended primarily for reception outside the originating country) was using various bands of frequencies in the range from 2,200 to 30,000 kc. Short-wave radio signals propagate over long distances more efficiently than do the longer waves of domestic stations, and, being amenable to concentration into narrow beams, they can be directed toward a selected country or region for maximum effectiveness.

As the congestion of the medium- and long-wave bands increased, more and more countries (particularly in Europe) found that domestic reception in these wave bands was seldom free from interference. They therefore turned with increasing emphasis to the VHF band (87.5 to 100 mc.) which had been assigned to broadcasting at the conference at Atlantic City. Because of the comparative shortness of their range, VHF transmissions provide reception which is reasonably free of interference from most distant stations and allow a greater number of stations to operate within a given area.

2. Financial Support; System Organization.— Broadcasting is an expensive enterprise, not only from the standpoint of technical facilities but also because of the large fees commanded by actors, musicians and other artists engaged. There is no revenue from the audience in the form of admission charges to offset these expenses; in order to sustain itself, broadcasting was forced in its early days to seek its own sources of financial support. Various systems of support have been evolved and in many countries are found in combination. The simplest is that in which broadcasting is financed from public funds, either in the form of a grant from general taxation or, more commonly, in the form of an annual licence fee paid for the right to operate radio-receiving apparatus. There are several ways in which broadcasting can be made self-supporting and profitable on a commercial basis. The commonest is the system of sponsorship, by which commercial interests take over the responsibility of paying for a program at a given period on a station or network. The commercial interest pays a fee which contributes to the general running of the broadcasting service and pays all the costs of the program. Advertising is included in the transmission, which is announced as being presented by the firm concerned. In another commercial system the cost of the programs is borne by the broadcasting organization or its licensee, and the necessary revenue is obtained by selling advertising time inserted in appropriate breaks in the program—a method known as "spot" advertising.

A further system makes its programs available only to those viewers or listeners who either subscribe to the service, pay by a coin-slot device for the item desired, or else pay a bill submitted retrospectively for programs actually seen or heard. Various techniques are used to prevent the program from being received by those not prepared to pay—generally by "scrambling" the transmission and making its reception possible only to those equipped with the necessary facilities.

Pure commercial broadcasting was exemplified by the United States domestic system, in which government regulation was in-

direct and primarily concerned with technical matters. Transmitting stations were licensed by the federal government, but no fees were assessed for such licences or for the ownership and use of receivers. Production and transmission of programs continued to be carried on by private individuals, corporations or other organizations, the majority deriving their income from paid advertising announcements. Nearly 5% of the U.S. domestic stations were noncommercial; these were supported by educational, religious and similar organizations. Most commercial broadcasters devoted a certain portion of their program time to unsponsored public-service broadcasts. In this category were educational programs, news, weather and market reports, forums, talks by the president of the United States, religious services, official government announcements and special events of wide public interest. Each licensee had complete freedom in programming his station, subject only to broad regulations relating to propriety, good taste and equitable rights to all sides in time allowed for controversial topics. In a corollary sense, listeners also were free to select whatever programs interested them, and each broadcaster was responsive to public acceptance of his programs in order to attract listeners.

The system originally adopted in Great Britain, on the other hand, could be considered as the prototype of absolute and direct government control of broadcasting. All phases, from programming to technical operation of transmitters, were administered by the British Broadcasting company (1922) and from 1927 by the British Broadcasting corporation, both publicly financed monopolies. Revenue was derived chiefly from an annual tax imposed upon the owner of each receiver, and no paid advertising was accepted. Like the commercial broadcasters of the United States, the BBC remained sensitive to the public reaction to its programs, and the results tended to become similar in both systems. In 1954 the British system was modified by the Television act, which set up a second public body, the Independent Television authority, whose programs were financed partly from public funds but mainly by "spot" advertisements.

The organization of broadcasting in other nations lay between the extremes of the U.S. commercial system and the British public-corporation system, with many variations and combinations of the features of both. In Canada, for example, broadcasting was controlled by the Canadian Broadcasting corporation (CBC), which paralleled the BBC in principle, but which also licensed privately owned stations to supplement its own services, and paid advertising was permitted. In general, broadcasting within the American hemisphere tended to follow the commercial pattern, while in Europe it more nearly resembled the original British system. In all systems, the interconnection of stations into chains or networks by telephone lines or short-wave radio circuits for the simultaneous broadcasting of programs was widely practised.

Europe had acquired broadcasting problems peculiar to itself, among which were the proximity to one another of small, densely populated nations, multilanguage populations within the range of a single station, poor reception conditions in some areas and economic obstacles to the widespread ownership of receivers in other regions. Broadcasts in different languages simultaneously on different stations or sequentially over the same station; and efforts toward co-operative international programs had met with some success in overcoming language barriers. The inaccessibility of broadcast reception to many people, either for economic reasons or because of poor reception conditions, had been offset by relaying programs from centralized distribution points. These might go to individual or group subscribers, and group listening in public assemblages became prevalent in some parts of Europe.

II. PROGRAMS

Radio and television programs are inclined toward one or the other of two objectives: to convey information or to provide entertainment. In the information category fall lectures, news, weather and market reports, public addresses, forum and round-table discussions, religious services, political speeches and special events such as the coronation of a king or the inauguration of a president. In some countries where broadcasting is a government monopoly, propaganda may be woven into programs of this class,

either openly or surreptitiously. Elsewhere, as in the U.S., a particular effort is made to maintain a clear-cut distinction between those parts of a program that are factual and those that represent opinion and comment. Advertising announcements are similarly set off from the other portions of the program.

In the field of entertainment, broadcasting makes use of every form known to the theatrical world: from grand opera to popular music, from boxing matches to baseball and from vaudeville to drama. In addition, radio and television have developed some special forms of their own as, for instance, their serialized dramas offered in daily installments, or their panel and quiz programs.

1. Audience Attitude.—The disposition of a radio or television audience, which is composed principally of individuals in the privacy of their own homes, differs considerably from that of an audience in a theatre or lecture hall. There is none of the crowd atmosphere that prevails in a public assembly, and each listener is no more than casually aware that he is actually a part of a large audience. This engenders a sense of intimacy which causes the listener to feel a close personal association with the speaker or performer. Furthermore, people will not accept in their own homes many of the candid forms of expression which they readily condone and support on the stage or in literature; hence the broadcaster must constantly mind the decorum of his programs and avoid anything that is in bad taste according to the standards of his audience, lest he suffer the penalty of a deluge of complaints.

2. Responsibility of the Broadcaster.—Because it owes its licence to operate to the state! if indeed it is not state operated, and because of its intimate relationship to its audience, broadcasting exists in a quasi-public domain, open in all its phases to public scrutiny. It is therefore invested with a moral as well as a legal responsibility to serve the public interest and must remain more sensitive to public opinion and political sentiment than most other forms of public expression. In fulfilling this obligation, the broadcaster—even though he chooses to exclude all discussion of controversial topics from his programs—may, nevertheless, by the mere selection and combination of material induce a mass disposition toward or against certain purposes or preferences. Because a national broadcasting system has the attention of far more people at any one time than could possibly be assembled in the largest convention hall or reached by the printed page, the program builder has great power to influence the political and social thinking of a mass audience. This, coupled with the persuasive intimacy of the microphone and the television camera, makes broadcasting as potent a force for good or evil as any social influence. From the standpoint of society, then, it is important that broadcasters be governed by ideals and standards that take account of their public responsibilities.

3. Audience Influence.—For economic reasons as well as those outlined above, evaluation of audience opinion and response is important to the broadcaster. Two factors serve to indicate the reaction of the public to a program: the letters received from listeners and viewers; and a determination of the number of persons listening or watching, weighed against the total potential audience, simultaneous programs on competing stations, etc. Audience measurement presents difficult problems because there is no box office by which to determine the exact number of listeners. Mail received by the broadcast stations from listeners comes principally from persons who have the time and inclination to write letters, and cannot be regarded as wholly representative. More accurate results are obtained by telephone-sampling methods or by special recording devices attached to individual receiving sets. The latter, installed with the owner's consent, record the amount of time the set is used; when it is turned on and off, and the stations tuned in; however, they are expensive and therefore limited to small samples of the total audience. Whatever the method of rating, broadcasters are quick to alter or discontinue any program that shows lack of audience appeal, and the listeners are thus influential in determining the nature of programs offered them. In commercial broadcasting, sponsored programs are also affected by their apparent success or failure in selling the goods advertised.

4. Public Service Programs.—Certain aspects of broadcasting considered as a public service call for brief mention. These are

its relations with the organized musical life of the community. its specifically educational (as distinct from its general cultural) mission, its religious role, its news functions and lastly its political functions. The advent of broadcasting arrested a decline which was beginning in the musical life of many nations because of a variety of circumstances, among them the increased costs of ordinary musical performances, the growing popularity of light, showy and ephemeral entertainment, the development of motion pictures and the dance hall, and the diminished incomes of the old leisure classes. Broadcasting did not check or alter these tendencies, but it has compensated for them by the universal diffusion of music that had been quite beyond the reach of the masses, by interpreting that music through broadcasts by critics, lecturers and journal contributors, and often by performing works that under existing conditions private promoters cannot afford to finance.

On its strictly educational side, broadcasting addresses itself to two main classes—the schools, in which listening is communal and the instruction given is amplified by the teacher on the spot, and the adult student. Opinions differ as to the relative importance of broadcasting in the two cases. In Great Britain, for example, the school side was dealt with first, adult education being a later development, the full potentialities of which can be realized only under a system of alternative programs. In Germany, on the other hand, adult education took precedence, and a special service with a station of its own was created for its purposes, while Austria provided courses of varied kinds, often of an advanced character, in its radio programs. Broadcasting has been used for keeping scattered professional men in touch with progress (*e.g.*, country doctors in Poland) and for giving primary education to children in mobile homes (*e.g.*, of Dutch bargemen) or scattered outside school range (*e.g.*, in the U.S.S.R.). A service of particular value is that of scientific instruction for agriculturists. Languages are taught by nearly all broadcasting organizations, and the BBC has been particularly successful in the teaching of English to European and overseas audiences.

The part played by broadcasting in the religious life of communities varies from country to country; there are few countries, apart from Communist countries, in which religious programs are not broadcast. In Great Britain a definite policy of broadcasting a simple form of service and addresses without sectarian bias was adopted after agreement had been obtained among the accredited representatives of the chief Christian churches as to common fundamentals. In the United States, programs devoted to the various faiths and presented in rotation were organized by a joint council of churches. Fears were felt that the ability to receive religious services at home would deplete the congregations of the churches themselves. Experience did not justify these fears, and any loss to the churches on this score was more than compensated by the spread of their influence, as well as by the value of the religious broadcasts to invalids and aged persons.

5. Programs for External Reception. — International broadcasting—that is to say, the transmission of programs by a country expressly for audiences beyond its own frontiers—dates from the earliest days of broadcasting itself. Soviet Russia began foreign-language transmissions for propaganda purposes early in the 1920s, and was followed first by fascist Italy and then by national socialist Germany. France, Great Britain and the Netherlands were next in the field among European countries, though their first use of short-wave broadcasting was aimed at French-, English- or Dutch-speaking populations overseas. Great Britain began foreign-language broadcasting early in 1938 with a program in Arabic and programs in Spanish and Portuguese directed to Latin America. Broadcasts in French, German and Italian were added at the time of the Munich crisis in Sept., 1938. By Aug. 1939 countries broadcasting in foreign languages included Albania, Bulgaria, China, France, Germany, Great Britain, Hungary, Italy, Japan, Rumania, Spain, in addition to the United States, the U.S.S.R. and Vatican City.

Between 1939 and 1945 foreign-language broadcasting developed as a means of psychological warfare, and the programs of the BBC in particular had an important effect in maintaining morale among countries under German occupation. The development of inter-

national tension after World War II led to the continuance by many countries of their foreign-language services.

III. THE PROCESS OF BROADCASTING

The actual process of broadcasting, though complicated in detail by the variety of the items broadcast and by their number, is simple enough in outline. Most of the performances take place in a studio, which is carefully arranged so as to give, for the necessarily small room, an acoustical condition that results in a pleasing sound at the receiver. This requires a certain amount of echo elimination by acoustic treatment. Speakers, singers and players address themselves to the microphone, and an expert operator in a control room, following closely the speech or music, almost continuously makes fine adjustments of the amount of electrical impulse modulating the transmitter to allow for changes of original sound volume, an operation necessitated by dynamic range limitations of the radio system. The transmitting gear proper is usually separate from the studio, and may be as far away as 80 mi. or more, connected with the studio by a special line. Another class of broadcast of importance is the picking up at the place of origin of public concerts, operas, plays and public speeches, as well as of ceremonies, sporting events, etc. This is done by portable microphone gear connected, not necessarily by wire, to the control room. The special interest of these broadcasts to the listener is that they enable him to feel himself as a participant or member of the audience. In the case of music, large-scale performances are often, for psychological as well as acoustic reasons, more successful as "outside" than as studio broadcasts; but public halls, churches, theatres, opera stages, open spaces, and so on, all present special acoustic problems which have to be solved according to the circumstances.

Of outstanding importance in the organization of broadcasting is the simultaneous broadcast, or network broadcast. This involves a system of interconnected telephone lines or radio links by which a studio or other place of performance can be connected to as many transmitters as may be desirable or possible. Network operation requires the closest timing and co-ordination over the whole system. In the United States and Canada the method is practised among groups of stations affiliated for an exchange of programs.

IV. ADMINISTRATIVE ORGANIZATION OF BROADCASTING

It has been indicated that there are two main types of organization handling public broadcasting—the commercial and competitive type and the government-managed type—and that the former tends to approximate the latter so far as its relations with the public are concerned. The same may be said, to a certain extent, of the administration and public-relations side of broadcasting. Given the immense cultural, educational, political and propagandist possibilities of the medium, it was unthinkable that governments should disinterest themselves in the programs. Accordingly there is a control, to a greater or less degree, universally imposed on broadcasting. Under a purely commercial system, this control is moderate, indirect and negative; while, at the other end of the scale, a despotic or dictatorial government will normally employ broadcasting for the propagation of its own ideas. Between these extremes lie (1) "good will" commercial broadcasting tempered by government regulation, as in the United States; (2) systems constituted as commercial companies, but subjected to the continuing supervision of a government department, and limited as to profits; (3) companies commercial in form, in which the government holds a controlling interest; and (4) organizations of the type of the British Broadcasting corporation or the Danish radio council, in which a national broadcasting authority is constituted by, but stands apart from, the ordinary machinery of the state. The success of an organization of the last type depends essentially upon the public's acceptance of its executives and its traditions, a confidence that is independent of the public's political outlook toward the government of the day.

The executive or internal organization of broadcasting is similar in all countries, but there is one important divergence of prac-

tice that should be mentioned. In some countries the engineering side of the work is wholly in the hands of the state communications authority, and the broadcasting organization is a distinct body limited to the planning and execution of programs. In others the engineer service is as much a part of the broadcasting organization as are the program and the administrative departments. That the question is not a simple one may be gauged from the fact that of the two most highly developed services in Europe the one works under the first and the other under the second system.

(J. C. W. R.; G. G. A. W.; W. F. L.)

V. UNITED STATES SYSTEM

In the United States broadcasting has been developed by private enterprise, with a minimum of government supervision. This freedom from restraint, while at times giving rise to unsatisfactory conditions, encouraged competition and was doubtless an important factor responsible for the rapid growth which took place. There is complete absence of any restriction or hindrance to the ownership and use of receiving apparatus, in that no licences are required and there are no fees to be paid. Since there is no financial support derived directly from the listeners through the payment of a fee, other and less direct sources of support came to be relied upon. Private enterprise was forced to find its own means of economic justification, and this added a further element of competitive effort to the development of the industry.

1. History of Development. — The first known radio program in the U.S. was broadcast by R. A. Fessenden from his experimental station at Brant Rock, Mass., on Christmas Eve, 1906. Two musical selections, the reading of a poem and a short talk apparently constituted the program, which was heard by ship wireless operators within a radius of several hundred miles of Brant Rock. In the experiment a water-cooled microphone was used to modulate an Xlexanderson alternator, and 1 kw. of power was radiated at the frequency of 50 kc.

Other early experimental broadcasts include those of Lee De Forest, who in 1908 conducted a successful demonstration using apparatus set up in the Eiffel tower in Paris. In 1910 De Forest installed a 500-w. transmitter in the Metropolitan Opera house in New York city and broadcast a program in which Enrico Caruso took part. By 1916 David Sarnoff, who, as an engineer employed by the Marconi Wireless Telegraph Company of America, had been conducting experiments in the broadcasting of music, visualized and proposed to his company a scheme for a "radio music box" which could be manufactured and sold for home reception of musical and educational broadcasts.

Following the relaxation of military restrictions on radio at the conclusion of World War I, many experimental radio stations started operation. The operators of these small stations — often equipped with homemade apparatus — were amateurs whose interest centred more in radio as a science than in its possibilities as a means of mass communication or mass entertainment. They played phonograph records and sometimes called upon their friends and neighbours for impromptu performances. The range of such broadcasts was but a few miles, and the receiving apparatus necessary to hear them was mostly in the hands of other experimenters who, like the broadcasters themselves, pursued radio as a hobby. With the development of commercial broadcasting, amateurs were restricted to their original sphere — that of

semiprivate communication with other amateurs — and were prohibited from other broadcasting.

From this beginning, the evolution of broadcasting was rapid: many persons not directly interested in the technical aspects of radio were attracted by the novelty of listening to "music from the air." They created a demand for ready-built receivers suitable for operation by the layman. The increase in the number of listeners, in turn, justified the establishment of stations especially for the purpose of broadcasting entertainment and information. This stage of development was reached about 1920, when station KDKA at the plant of the Westinghouse Electric and Manufacturing company in East Pittsburgh, Pa., began broadcasting regularly scheduled programs, operating at 833 kc. with 50 w. of power. KDKA first went on the air in the evening of Nov. 2, 1920, with a broadcast of the returns of the Harding-Cox presidential election. This occasion was generally conceded as marking the beginning of broadcasting in its modern form. The success of the KDKA election broadcast and of the musical programs that were initiated thereafter motivated others to install similar stations, and a total of eight were operating by the end of 1921.

The popularity of these early stations made evident two possible sources of financial support to offset the operating costs of broadcasting. First, there were possibilities for profit in the manufacture and sale of receiving equipment; and second, the fame attained by the organizations operating the first broadcast stations called attention to the value of broadcasting as an advertising medium. Advertising appealed not only to manufacturers of radio apparatus but to businessmen in general, and in the course of time it became the principal means of support for the U.S. system of broadcasting.

During the period 1921–22 the sale of radio receiving sets and of component parts for use in home construction of sets began a boom which was followed immediately by a large increase in transmitting stations. By Nov. 1, 1922, 564 broadcast stations had been licensed to operate.

Station WEAf was established in New York in Aug. 1922 by the American Telephone and Telegraph company for the purpose of offering broadcasting facilities on a time rental basis to all who wished to broadcast. By this time the radio channels had become so crowded by stations that it was difficult for any more to find adequate places. Also there were many interests which desired to broadcast their own special programs but did not wish to go into the project so deeply as to invest in station equipment. Sponsored program broadcasting, as instituted in this way, was clearly based on advertising value, and the definite undisguised use of radio

Actual route layouts vary for different networks and programs

broadcasting for advertising purposes was started.

2. **Interconnection of Stations.**—The first use of wire telephone lines in 1922 for interconnecting a station in New York city and a station in Chicago, Ill., to broadcast simultaneously a description of a football game introduced a new idea into radio broadcasting. The use of a long-distance telephone line to bring programs of special interest into the field of local reception simultaneously at a number of places was of evident value in broadcasting features of national appeal. It was of both economic and cultural importance. Performances by leading artists at a centrally located station studio could be sent out to other stations. Smaller stations could afford to offer programs, obtained by wire, of much greater excellence than those they could produce for themselves. A regular interchange of programs by wire was initiated between WEAf in New York city and WCAP in Washington, D.C., and subsequently other stations were added to the chain. For special features of national importance large groups of stations were temporarily interconnected.

In 1926 the National Broadcasting company (NBC) purchased WEAf and with it as the key station established a permanent network of radio stations, for which it undertook to originate and distribute regular daily programs. Some of these were sponsored by advertisers and furnished revenue to both the network and its associated stations; others were sustaining, with part of the time being set aside for public-service features.

About 20 years later, when television stations had been established in various cities, their interconnection into networks followed the pattern set by radio (*see* fig. 1), the intercity facilities being leased from the American Telephone and Telegraph company. After earlier experiments, the latter provided a coaxial cable for a telecast of the 1945 Army-Navy football game by several eastern stations. In 1948 the first commercial television network service was offered, employing coaxial cable between New York and Washington, D.C., and microwave relays from New York to Boston, Mass. The telephone company then began laying cables westward, and early in 1949 Chicago and St. Louis, Mo., were joined with the eastern cities. In the meantime, development of microwave relays had shown them to possess advantages over the coaxial cable, and thus relay towers were used in extending the network westward to the Pacific coast. A coast-to-coast circuit was completed in 1951 and was inaugurated with a telecast of the Japanese peace proceedings from San Francisco, Calif., on Sept. 4.

3. **Short-Wave Broadcasting.**—Shortly after broadcasting became established on the wave lengths around 300 to 400 m. it was discovered that much shorter wave lengths, in the range from 15 to 50 or 60 m., could be received over long distances. The use of these waves was developed not only for intercontinental radio telegraph and telephone services but also for the broadcasting of programs directly to other countries or for the exchange of programs between national networks by radio relay using short waves.

Prior to World War II some of the larger U.S. broadcasting stations operated experimental international short-wave transmitters of their own. During the war, the United States government leased these and contracted for the installation of others, all of which were supplied with programs under the supervision of government agencies. Some of these programs were for the entertainment of the U.S. armed forces scattered throughout the world; others were part of the psychological warfare and were directed to the peoples of neutral, Allied and Axis nations. Conversely, U.S. listeners were able to tune in directly the short-wave broadcasts of other countries, including those with which they were at war. At the conclusion of the war, there was no incentive for private broadcasters to resume international transmissions. Consequently, the international stations continued to be operated by private concerns under contract with the government, and their programs were originated under the title "Voice of America" through the U.S. Information agency (USIA).

4. **FM Broadcasting.**—Frequency modulation (FM) is merely a different method of applying modulation to the radio-frequency carrier of a broadcasting station, in contrast to the amplitude type of modulation (AM) that is used by standard stations. (*See Technical Aspects, below.*) With the development of the tech-

nique of radio transmission at the very high frequencies (VHF), FM was applied—notably by E. H. Armstrong in 1936—as a means of reducing interference. The service range for reliable reception of VHF signals is limited approximately to the horizon as seen from the transmitting antenna (practically, about 50 to 100 mi.). Thus, it is possible to duplicate frequency assignments to FM stations within a few hundred miles of each other without causing interference between stations. This was not an unwelcome situation from the viewpoint of the Federal Communications commission (FCC), which is charged by law with the responsibility for licensing and regulating broadcasting stations. The commission and its predecessor always had been beset with the problem of trying to accommodate more applicants for stations than there were channels available, and the possibility of duplicating FM channels throughout the United States made room for a large number of new broadcasting stations.

Commercial development of FM began in 1940 when the FCC allotted 40 channels in the 42–50 mc. band for this purpose, and about 60 FM stations were in operation by the end of 1942, when expansion was halted by World War II. In 1945 the original 40 channels were replaced by 100 channels in the 88–108 mc. band.

Although FM attracted a loyal following of listeners, it never attained the universal popularity of the already established AM system. As a result, many FM stations failed to find economic support from commercial advertising and their total number dwindled to about 500 by the mid-1950s. In an effort to open up new sources of revenue for FM broadcasters, the FCC in 1955 authorized them to transmit auxiliary programs not intended for public reception. These programs are transmitted simultaneously with the station's regular programs, without interference to the latter, by means of an inaudible subcarrier. The auxiliary program can be heard only from special receivers which, being under control of the FM stations, may be leased on a fee basis. This method is applied to "store-casting" (programs of music with announcements relating to certain retail stores, where receivers are provided to reproduce them), or for "background" music in restaurants and other public places. A resurgence of public interest in FM occurred in the late 1950s, stimulated by the popularity of FM receivers in connection with high-fidelity ("hi-fi") sound-reproducing systems for home use (*See HIGH-FIDELITY SOUND SYSTEMS.*) The advantages of FM were further enhanced when the FCC in 1961 gave its approval to FM multiplex broadcasting, a system that made possible the simultaneous transmission—on a single FM channel—of the two signals necessary for stereophonic reproduction.

5. **Radio v. Television Broadcasting.**—At the beginning of World War II, U.S. radio broadcasting was approaching its zenith as a source of home entertainment. In the evenings, various commercial programs vied with each other for the attention of the audience by presenting elaborate features ranging from serious music to comedy-variety. A console radio set was to be found in the living room of nearly every American home, and it was the centre of group listening by the family to their favourite programs.

With the evolution of television after the war, however, television receivers began to replace living-room radio sets and there was a corresponding shift of audience from radio to television, especially during the evening hours. This loss of listeners was eventually reflected in the business aspects of radio, with many advertisers converting their major evening programs to television. On the other hand, radio still retained certain advantages of its own, in that it did not require immobility on the part of its listeners, who might thus go about other duties while listening. It also was easily received on portable receivers, including the large number of automobile sets in use, and it was capable of reaching areas of the country that were beyond the range of existing television stations. There was a trend, therefore, toward changes in radio programming to make it most attractive to persons in these situations by the inclusion of more short features, recorded music, and news and weather reports throughout the day.

From the business standpoint, commercial television began principally with the construction of stations by firms already engaged

in radio broadcasting. Television costs, including investments in apparatus, production of programs and operating expenses, were notably higher than those of radio. The cost of advertising by television was correspondingly high, but in view of the millions of persons who could be reached at one time, even the expenditure of several hundred thousand dollars for a single spectacle such as "Peter Pan" was justifiable economically.

6. Educational Broadcasting.—In the early days of U.S. broadcasting, about 170 AM stations were operated by colleges, churches and other nonprofit organizations. Although most of these ceased operating because of lack of funds and limited audiences, a few were still on the air as noncommercial stations in the 1960s. Educational AM stations were treated by the government on the same basis as commercial stations, insofar as assignment of frequencies was concerned. However, in the course of making allocations for FM and TV, the FCC set aside certain channels for the exclusive use of noncommercial educational stations.

7. Fee or Pay Television.—Although commercial television in the U.S. followed the pattern set by radio broadcasting in being supported by advertising, many people contended that a fee system—popularly called pay-TV or box-office-TV—would constitute a better method of paying for the programs. Under the proposed system, the viewer would pay a stipulated sum for the privilege of watching a program on his home receiver. Proponents argued that this would make possible the broadcasting of theatre performances, new motion-picture films and sporting events not otherwise available to television. Several methods for the collection of the fees were proposed, ranging from coin-slot mechanisms attached to the subscriber's receiver to monthly billing similar to the practice of public utilities. Nonsubscribers would receive only a distorted and unintelligible rendition of picture and sound.

8. Receiving Sets.—The first commercial radio receivers were crystal detectors or regenerative vacuum-tube sets using two or three tubes and were hardly more than adaptations of amateur apparatus of the time. In the typical case, a length of wire stretched from house to garage served as an antenna, and a wire from the receiver to a water pipe furnished a ground connection. Power to operate the vacuum tubes was supplied by storage or dry-cell batteries. Because of the great public interest in broadcasting and the consequent demand for receivers, however, advances came in rapid succession. The next steps were to the use of high-frequency amplifiers in "tuned RF" circuits, with elimination of regeneration effects by neutralizing techniques in the vacuum-tube circuits which ended the annoying squeals and howls of the early regenerative receivers, and to crude loud-speakers that permitted listening without the use of ear attachments. The batteries were replaced by power supplies that could be plugged into wall outlets, and eventually by self-contained power packs that were an integral part of the receiver. New vacuum tubes were developed, and the number of tubes in an average set increased to seven or eight. At the same time there was a shift to the superheterodyne type of circuit. Attention was then concentrated by manufacturers upon improving performance. Single-dial tuning, self-contained loop antennas, improved loud-speakers and essentially distortion-free sound reproduction, plus the housing of the entire apparatus in a single attractive cabinet, completed the transformation of broadcast receivers from the status of a novelty that challenged the operators' skill into reliable, easy-to-use instruments for home entertainment. (See RADIO RECEIVER.)

Many broadcast receivers produced in the 1930s included short-wave bands which enabled listeners to tune in directly on foreign stations, or to listen in on police, aeronautical and amateur communications. Another innovation of the era was push-button station selection that eliminated tedious dial tuning. Advances in automobile receivers raised them from the status of accessories to that of optional built-in equipment, and their popularity was marked by the more than 36,000,000 that were in use in the early 1960s. The special tuners required for FM reception were first sold as converters for attachment to AM receivers, but were later incorporated into combination sets. After World War II there was no longer much demand for the deluxe console style of radio receiver because of the growing public interest in television, and

manufacturers confined their production almost entirely to table models and portable sets. The development of transistors made possible the design of compact, lightweight portables, capable of operating up to a year on a single set of dry-cell batteries.

Rapid progress in television receiver design and manufacturing methods brought sets with 16- and 21-in. pictures at lower prices than had been in effect for 10-in. sets two or three years earlier. A "printed-circuit" technique, employing a photo-etching process to replace much of the laborious hand wiring formerly required, led to price reductions for all classes of radio and television receivers. Finally, the introduction of the shadow-mask kinescope made possible a practical mass-produced colour television receiver.

9. Government Regulation.—When broadcasting emerged in the U.S. as a new industry, the only legal regulations in force dated from 1912, and these pertained primarily to the maritime use of radio-telegraphy for the purpose of promoting the safety of life at sea. The administration of these regulations was entrusted to the U.S. department of commerce. Under this largely irrelevant set of laws, a rapidly increasing number of broadcasting stations (from about 50 in 1922 to more than 500 in 1923) were crowded into narrow wave bands, and interference from overlapping stations became intolerable. After several national conferences with broadcasters and other interested parties, the commerce department put into effect an orderly system of frequency assignments in what is now part of the standard AM band. The largest transmitters then in use had an output of only 500 w., but the advantages of increasing power were recognized and the way was cleared for the use of increased power. Stations of 5 to 10 kw. were established during 1925 and at least two stations (WGY, Schenectady, N.Y., and KDKA) were experimenting with still higher power. At the same time, the commerce department concluded that some limit should be placed on the total number of stations to be licensed because of the shortage of channels. This action created much dissatisfaction among those whose applications were denied, until finally a Chicago station precipitated a climax by the unauthorized use of a channel assigned, by international agreement, to Canada. In the ensuing lawsuit brought against the station by the department of commerce, the courts ruled that the department had no authority to deny licences or to enforce frequency assignments. The situation then became chaotic, with many stations choosing their own frequencies and operating almost independently of any government regulation, until congress enacted the Radio act of 1927. This act placed the responsibility for licensing stations in the hands of a Federal Radio commission of five men appointed by the president. The commission was given broad powers to classify stations, assign operating frequencies and otherwise regulate broadcasting, and was required to grant licences only "if public convenience, interest and necessity will be served thereby." An amendment in 1928 provided for an equality of broadcasting rights for various sections of the country and the establishment of a group of clear channels, each of which was to be occupied by a single high-powered station to give it the maximum range of service. Other channels were designated as regional and local, to be shared by low-powered stations in different parts of the country.

On July 1, 1934, there was established by act of congress a Federal Communications commission of seven men to deal not only with matters of national broadcast regulation but also with interstate and foreign telephone and telegraph communication by wire and radio. The commission was divided into three divisions, of which one, called the Broadcast bureau, carried on substantially the functions previously exercised by the Federal Radio commission, which the new communications commission superseded.

10. The Government and Television.—During the 1930s, a dozen or more television stations were experimenting with the broadcasting of dramas, sporting events and—in 1940—even the national political conventions. Since no commercially produced receivers were as yet available to the public, audiences were limited to those few experimenters who built their own or otherwise acquired experimental models. In 1940 the FCC invited the broadcasting and radio manufacturing industries to compile and submit a set of standards upon which a commercial television broadcast-

ing service might be built. This invitation led to the formation of a National Television Systems committee (NTSC), composed of engineers and scientists drawn from all of the interested organizations, which devised a technical pattern for black-and-white television and attempted to provide for the future addition of colour. The NTSC plan was adopted by the FCC and commercial TV was authorized to start July 1, 1941. However, the potential business boom that might have been released was arrested by the intervention of World War II and the consequent diversion of radio plants to the production of military apparatus.

At the end of the war, the FCC allocated to television 13 VHF channels between 44 and 216 mc. (later reduced to 12 channels between 50 and 216 mc., by deleting channel 1). and commercial television got under way. While stations in various cities could share each channel with stations in other localities, a limit was imposed on the total number of stations that one channel could accommodate by the necessity for geographic separation to avoid interference, and it was soon realized that 12 channels were not sufficient to provide a nationwide TV system. On the other hand, the remainder of the VHF band was occupied by other radio services, leaving no room for more television channels. By 1948 there were 20 stations on the air, about 80 others were partially completed and over 300 new applications were pending before the FCC. This situation led the commission to issue a "freeze" order on Sept. 30, 1948, which postponed the granting of all further TV authorizations until additional channels could be found in another part of the radio spectrum. After many months of technical hearings, 70 new ultrahigh-frequency (UHF) channels between 470 and 890 mc. were allocated to television broadcasting. On the basis of appropriate separation of stations, a nationwide plan was devised, allotting the 82 VHF and UHF channels, city by city, to nearly 1,300 communities, and 242 of these assignments were reserved for noncommercial educational stations. The number of channels allotted to each city was approximately in proportion to population (*see* Table I).

TABLE I—Number of Channels Allotted per City in the U. S.

Population	No of channels
1,000,000 and above	6 to 10
250,000 to 1,000,000	4 to 6
50,000 to 250,000	2 to 4
Under 50,000	1 or 2

11. Station Call Letters.—With a few exceptions, broadcasting stations east of the Mississippi river are identified with call letters whose initial letter is W, and those to the west with the initial letter K. Where there are exceptions (*e g*, KDKA), the call letters were assigned prior to adoption of the present system. Call letters are ordinarily arbitrary combinations of letters but some stations have been able to secure combinations which include initials of their company or city name. Television and FM stations that are associated with AM stations frequently use the call letters of the parent station with a suffix -TV or -FM.

12. Colour Television.—Crude pictures in colour were demonstrated as early as 1930; subsequently, experiments in colour television proceeded along with the advancements in the monochrome system. By 1950, colour television had been developed to the point where its commercial use seemed feasible. After consideration of three competing systems that were espoused by different concerns, the FCC approved a "field sequential" method proposed by the Columbia Broadcasting system (CBS). This was a refinement of an earlier technique in which red, blue and green filters moved in rapid succession in front of both the camera lens and the kinescope tube in the receiver, the filters being mounted on synchronized rotating disks. Following the FCC approval, CBS used the system for a limited number of broadcasts. However, because of the difference in scanning rates between it and the existing black-and-white system, the new colour system produced only zigzag lines to viewers watching it on ordinary receivers, and the system did not meet with general acceptance.

Thereafter, the National Television Systems committee was revived by the television manufacturers and broadcasters, and it met

to reconsider the entire problem. Following months of deliberation and many field tests, the NTSC agreed upon a set of specifications whereby colour signals could be contained within the existing monochrome structure, and thus be "compatible" This meant that although a colour receiver would be necessary for viewing a broadcast in colour, the owners of standard black-and-white sets would still be able to receive colour programs in monochrome. It would then be possible to intersperse programs in colour among those in monochrome without prejudice to the existing audience that had already invested in monochrome receivers. This factor was important in the launching of an economically successful colour TV system since it permitted a gradual rather than a revolutionary transition from monochrome television to colour.

The new NTSC standards were adopted by the FCC in Dec 1953, and their first use for a major network program occurred in the telecast of the Rose Bowl festival from Pasadena, Calif., on New Year's day 1954, by the National Broadcasting company (NBC). Subsequently, NBC began presenting colour broadcasts in increasing numbers, until in 1961 about 25% of its telecasts were in colour. CBS broadcast occasional colour programs between 1954 and 1959. Many individual stations were also equipped to transmit local programs in colour. *See* TELEVISION: *Compatible Colour Television*. (R. B.; W. F. L.)

VI. BRITISH SYSTEM

In Great Britain, as in several other countries, broadcasting grew out of the activities of amateurs who were experimenting with wireless telephony. This followed the removal of military restrictions on the use of radio by amateurs at the close of World War I. The first broadcast concert on record in Great Britain originated at a garden fete at Hampstead in July 1922, of which it was said that listeners were treated to an entertainment of "unconsidered trifles of the lightest type." A footnote to the printed program stated that an organ pipe would be blown prior to the transmission to assist listeners in adjusting their receivers. Regular programs were inaugurated soon after under the auspices of the British Broadcasting company, using transmitters of about 1 kw power and operating in the medium-wave band.

Reception difficulties in many parts of Britain led in 1925 to the erection of the Daventry station 5XX, which for the first time employed the new long wave length of 1,500 m for broadcasting and the then relatively high power of 30 kw. This station could be heard satisfactorily on the continent as well as throughout most of Britain, and it became one of the most famous stations in Europe during the ten years of its existence. Other stations were later added to the BBC system to provide for regional broadcasts and to make available additional programs.

The British Broadcasting corporation, a publicly financed corporation ultimately responsible to parliament but in practice enjoying a considerable degree of independence, was given, by its original charter in 1927, a monopoly covering all phases of broadcasting in Britain. This monopoly was maintained until the revised charter and licence of 1952, when the setting up of the Independent Television authority was foreshadowed. The monopoly of sound broadcasting was maintained. Programming and operating costs were balanced by income from a receiver licence tax—amounting in 1959 to £1 a year for sound only, and £3 a year for sound and television (plus an excise duty of £1)—and by revenue from various printed publications. Three distinct radio services were provided (Home Service, Light Programme and Third Programme) to permit each listener a choice of news, talks, features, plays, variety shows or music. In Sept. 1957 a fourth service, Network Three, was added to provide for special minority interests. Special broadcasts were also available to schools.

The BBC operated extensive commonwealth and international short-wave services, the costs being borne by grants from the public treasury. Television research sponsored by the BBC led to the development of a workable system, and regular transmission of television programs from the London station at Alexandra palace was introduced in July 1936. Television in Great Britain stopped during World War II but began again in 1946.

(J. C. W. R.; G. G. A. W.)

VII. BROADCASTING AS A BUSINESS

One element of importance in advertising is the number of possible customers it reaches. The value of combining the toll broadcasting idea with the network broadcasting idea, to increase the audience and thereby to justify the expense of better programs, was self-evident.

WEAF, the pioneer U.S. sponsored-program broadcasting station, being owned by the telephone company which also operated the long-distance telephone service of the country, naturally served as an important centre for the development of commercial network broadcasting. Arrangements were worked out whereby the cost of such service could be distributed equitably between the program sponsor and the individual stations using the program.

For sponsored programs the individual chain stations received a portion of the chain rental charges paid by the advertiser. These stations could also obtain, by paying a fee, nonsponsored programs supplied by the central management of the chain.

In 1926 the National Broadcasting company, organized by the General Electric company, the Westinghouse Electric and Manufacturing company and the Radio Corporation of America, purchased WEAF and undertook the management of WJZ and WRC, both of which were owned by the Radio Corporation of America. The network broadcasting activities centring on these stations were continued and expanded.

The Columbia Broadcasting system originated in 1927 as an outgrowth of the United Independent Broadcasters and the Columbia Phonograph Broadcasting system. In Oct. 1934 the Mutual Broadcasting system began operation. The Blue network, established in Jan. 1927 as NBC's second network, was sold by the latter company and became independent in 1942. Three years later its name was changed to the American Broadcasting company. The DuMont Television network came into being with the advent of television, and operated as a "live" interconnected network until 1955, when it shifted to the use of motion-picture films.

1. Patents and Copyrights.—During the early boom period of radio broadcasting, many companies and individuals started the manufacture and sale of receiving sets and parts with small regard for the infringement of patents. With the number of patents running into thousands, it was a difficult task even to determine what patents might be infringed by given apparatus. In 1920 and 1921 several large electrical and communication companies which, taken together, controlled an important group of radio and other communication patents, entered into a cross-licensing agreement whereby each of the companies was enabled to proceed in its field with a satisfactory patent situation. A considerable number of manufacturers and groups of patents were outside this arrangement but, after a period of negotiation and some litigation, licences were extended to the larger independent manufacturers under royalty agreements, and by 1927 it was generally possible for a responsible manufacturer to equip himself with such licences as would ensure him the right to put on the market receiving equipment of modern design.

The question arose as to whether the performance of a musical composition before a microphone in a private studio, so that it was broadcast by radio, constituted an infringement of copyright. The American Society of Composers, Authors and Publishers (ASCAP) championed the cause of the holders of copyrights, and ultimately established a recognition among broadcasters of the right of the copyright proprietors to compensation for the use of their compositions. There was discord over the matter of equitable rates of compensation, but by 1927 this seemed to have been adjusted in most cases through private negotiations. Further dissension between broadcasters and the ASCAP in 1940-41 brought about the formation of Broadcast Music, Inc., by the broadcasters. These two organizations subsequently operated in competition as licensing agents for the radio performance of copyrighted music.

2. Developments Related to Broadcasting.—The rapid strides made in the improvement of sound pickup and reproducing apparatus to meet the needs of radio broadcasting had a stimulating effect upon other devices used for sound reproduction. The phonograph, for example, was manufactured in greatly improved form, combined in the same cabinet with radio receiving sets so

that the amplifier and loud-speaker portions might be used by either. Another development related to broadcasting and often used in combination with broadcast pickup of speakers in large halls or in open air was the public address system. By means of microphones placed directly in front of the speaker and powerful amplifiers and loud-speakers or sound projectors appropriately located, large crowds could be addressed successfully with reduced strain on both the speaker and his auditors. Sound motion pictures likewise benefited from many of the technical developments of broadcasting. Adaptation of the studio apparatus and the studio technique of broadcasting to sound recording for films was a simple step, the principal difference being in the ultimate use of the signal for the operation of the recording device instead of for the modulation of a radio transmitter. Television, of course, was the chief beneficiary of the techniques developed by radio broadcasting, and found a ready-made pattern to guide almost every phase of its progress.

3. Business Progress.—The phenomenal expansion of U.S. radio broadcasting in 1921 and 1922 impelled many small concerns to enter the field, especially in the manufacture of receivers. By 1926 the market was flooded with overproduction of sets which were being sold to the public at distress prices, and failures among the smaller companies were common. Further tolls were taken by the financial crash of 1929, and many broadcasting stations also were forced to cease operation because of reverses. The business of broadcasting as a whole, however, remained fairly prosperous during the general depression and even managed to continue its expansion. At the same time, the number of receiver manufacturers had been reduced to a score or so of the larger and sounder concerns, and the industry settled down to an era of prosperity.

Another setback occurred when FM failed to revolutionize the broadcasting business to the extent predicted by its partisans; of the more than 1,000 FM stations in existence in 1948, only about half were still in operation a decade later. The most successful FM stations were those located in areas that were inadequately served by AM broadcasting. Beginning in 1948, the growth of television gradually cut into the advertising sales and profits of radio broadcasting in those localities where the two forms of broadcasting were in competition.

4. Organizations.—The manufacturers have an Electronic Industries association and a radio division in the National Electrical Manufacturers' association. These are active in standardization work. The National Association of Broadcasters interests itself in legislation and in general investigations for the benefit of its members, which include a majority of the broadcasting stations. Through the co-operative efforts of these various associations and other interests, radio fairs or shows are held for the exhibition of equipment, usually in conjunction with national conventions or conferences of broadcasters or manufacturers.

The Institute of Radio Engineers, Inc. provides facilities for the discussion and publication of technical papers and the furtherance of standardization in the radio arts. The Joint Council on Educational Television and the National Association of Educational Broadcasters are interested in educational broadcasting, and the National Council of the Churches of Christ in the United States of America is concerned with religious broadcasts.

(R. B.; W. F. L.)

VIII. TECHNICAL ASPECTS

In the United States, four distinct types of broadcasting are in use, which may be classified as (1) standard-band AM sound broadcasting; (2) international short-wave sound broadcasting; (3) FM or frequency modulation sound broadcasting; and (4) television broadcasting. In many respects the technique involved is similar for all classes, while in other ways it is quite different. (See also RADIO.)

1. Apparatus and Performance.—The essential physical elements of a broadcasting system are: (1) studio, microphone or television camera, transmitter and antenna—which, in combination, are capable of generating, modulating and radiating electromagnetic waves with intensity that is (ordinarily) equal in all directions; and (2) any number of receivers at diverse locations,

each able to detect the radiated waves and reproduce the original program.

The technical objective in broadcasting is to transmit and reproduce programs as realistically as possible, with a minimum of distortion and interference. Broadcasting stations maintain high standards of transmission, but many receivers—especially those of small size and low cost—are not capable of reproducing all that is transmitted. The ear, however, is tolerant to a moderate amount of distortion and is aided by the imagination in the interpretation of speech and music, giving the listener an illusion of naturalness. In television broadcasting, the fact that the eye is less tolerant in overlooking distortion and interference imposes more rigorous limits on both transmitting and receiving equipment.

Interference results from stray electrical waves, sometimes of natural origin and sometimes man made, which become inseparably mixed with radio signals and are converted by the loud speaker into noise, or by the television receiver into blemishes on the screen. Standard and international short-wave broadcasting stations (using amplitude modulation) rely on the use of high-powered transmitters to override such interference. Satisfactory service is thus rendered under ordinary conditions of reception, but in the industrial or highly congested districts of large cities the interfering electrical pulses may at times be so intense that noise-free reception is impossible. Frequency-modulation broadcasting, in which the program is carried in the form of variations in the frequency of the radiated waves, is less susceptible than amplitude modulation to interference of this type and in many cases may be received with clarity in locations where amplitude-modulated signals are completely overridden by noise. Television signals utilize VHF and UHF bands which are fairly free from natural or static interference, but are sometimes subject to man-made interference such as that caused by automobile ignition systems or by radiations from electrical machinery.

2. Broadcasting Frequency Allocations.—The total radio frequency spectrum (see FREQUENCY, RADIO) is arbitrarily divided into five groups. Certain bands of frequencies within each group are set aside for broadcasting, partly through international agreements for standardization, and partly because of technical differences in the propagation characteristics of radio waves at various frequencies. (See *International Regulation*, above.) The groups, their names and the classes of broadcasting services which generally (but not exclusively) use them are:

Low frequency (LF)	30 kc. to 300 kc.	AM (Europe)
Medium frequency (MF)	300 kc. to 3 mc.	AM
High frequency (HF)	3 mc. to 30 mc.	International
Very high frequency (VHF)	30 mc. to 300 mc.	FM and TV
Ultrahigh frequency (UHF)	300 mc. to 3000 mc.	TV

The licensing authority in each nation makes its own assignments of specific frequencies to individual stations, within the limits of the internationally allotted bands. The allocations system of the

TABLE 11.—Frequency Allocations for U.S. Broadcasting Stations

Class of station	Frequency band	Channel width	No. of channels	Maximum power*
Standard AM	535-1,605 kc.	10 kc.	107	(Clear channel 50 kw. Regional 5 kw. Local 500 w. 50 kw. minimum
International	6,000-21,700 kc.	—	—

*AM and international stations are rated by actual power output of transmitter. FM and TV stations are rated in terms of effective radiated power (E.R.P.), which takes into account the efficiency of the transmitting antenna as compared with a simple dipole antenna. TV picture power is measured at its maximum instantaneous value, which occurs at the tips of synchronizing pulses. TV sound power is measured by its average value, and is approximately one-half of the rated picture power. International and TV bands are shared with other radio services.

U.S. in the early 1960s is shown in Table II.

Certain channels in the AM broadcast band are set aside for the exclusive use of high-powered clear-channel stations, while others are by treaty assigned to other American countries. The remaining channels are, in the U.S., given over to lower-powered stations for the coverage of regional or local areas. Frequency assignments of stations in the latter classes may be repeated among a number of stations whose geographical separations are sufficiently great to avoid interference within the intended service range of each station. Thus approximately 3,200 AM stations are accommodated in the 107 broadcast channels which are available for this use. Television and FM stations in cities within a few hundred miles of each other also share their channels because of the normally short range of transmission in the frequency bands where they operate. Under unusual atmospheric conditions, however, when propagation of VHF and UHF signals extends beyond its normal limits, there may be "co-channel" interference between stations in different cities sharing the same frequency, especially at locations between the two cities. In television transmission a process of off-setting the carrier frequencies of each station by a slight amount helps to reduce the disturbing effects of such interference.

3. AM v. FM.—In sound broadcasting practice, an AM station nominally occupies a channel 10 kc. wide in the radio frequency spectrum, while a FM station requires one 200 kc. wide. Hence the entire standard AM band of 535 to 1605 kc. as used in the U.S., which provides sufficient 10 kc. channels for 107 AM stations without duplication, would accommodate only five 200 kc. channels. FM must therefore be confined to the VHF and UHF regions, where its wide channels take up a relatively smaller percentage of the spectrum. VHF and UHF are less subject to interference from most causes than is the standard band of AM, so that an incidental dividend in the form of immunity is gained by the choice of these frequencies. On the other hand, the useful range of VHF and UHF stations is limited effectively to local areas, while the normal range of AM stations may be several hundred miles, or even farther at night.

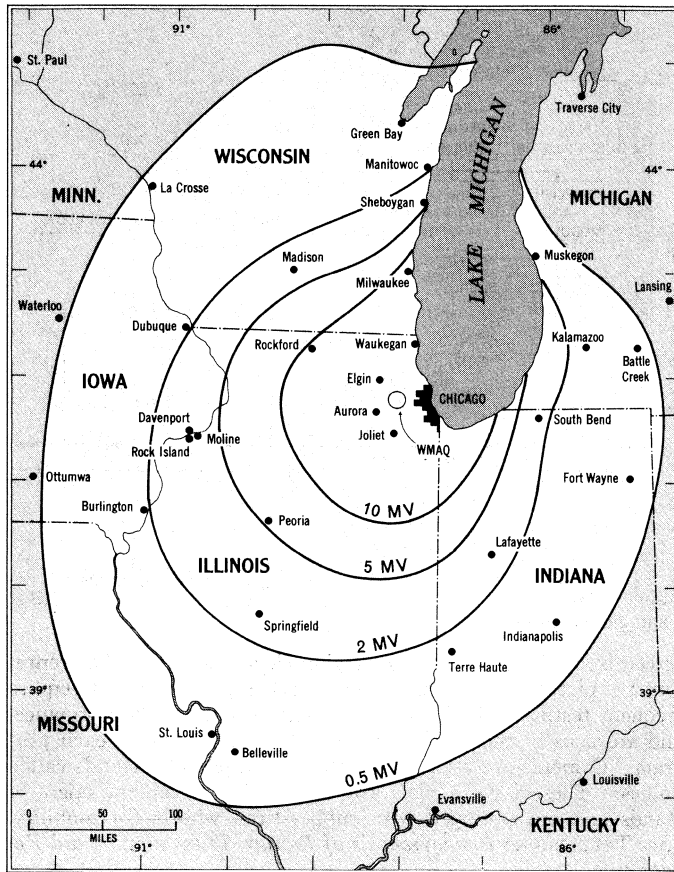

4. Propagation of Radio Waves.—Satisfactory reception of broadcasts depends upon the signal strength of the station at the receiver location, interference conditions in the vicinity of the receiver and the quality of the receiving apparatus. A station's effective signal strength is proportional to the intensity of the electric field of its radiated wave, which diminishes as the wave travels outward from the station. This diminution is caused in part by diffusion of the wave's energy throughout a constantly enlarging volume of space, and in part by absorption of energy from the wave by the earth and other intervening objects. The power of the station, the efficiency and directional properties of its antenna, the distance between the station and the receiver, the attenuation of the wave in spanning this distance and the possible arrival of signals over more than one path are the factors which collectively determine the signal strength at a given receiving location. The magnitude of the signal strength is measured in units of millivolts per metre, and the voltage at the input terminals of the receiver is proportional to this quantity.

A contour plot of the signal strength of a standard broadcasting station for the region about Chicago is shown in the diagram of fig. 2. This represents the direct or so-called ground-wave radiation. For receivers located within 50 to 75 mi. of the station, the ground-wave intensity as compared to the intensity of interference is the criterion for satisfactory reception. Based on the average interference conditions prevailing in different locations where receivers are used, the signal strengths considered necessary to override noise and provide satisfactory reception in the standard-broadcast band are:

City business area10 to 25 mv. per metre
City residential area2 to 5 mv. per metre
Rural area	0.1 to 0.5 mv. per metre

It should be remarked that the interference conditions at the receiver location are the determining factor in this respect, since interference at the transmitter location has no effect upon the performance of the receiver.

Reception at distances of about 100 mi.—more or less—from

BY COURTESY OF NATIONAL BROADCASTING CO., INC.

FIG. 2.—RADIO CONTOUR MAP SHOWING DIRECT GROUND-WAVE FIELD STRENGTH AROUND WMAQ, CHICAGO, ILL. RADIATED POWER IS 50 KW.

the station may be disturbed by another phenomenon, even though the noise level in that region might be too low to cause interference. This condition is fading, which results both from changing atmospheric conditions and from the simultaneous reception from the same station of waves that have traveled over separate paths. All antennas radiate some energy upward at various angles; this energy passes above and does not affect receiving antennas near the station. Some of this energy is reflected back toward the earth by the Kennelly-Heaviside layer of ionized gases and may arrive at a distant point to combine with the ground-wave signal. Depending on the relative lengths of the paths traveled by the two waves, the result may be additive or subtractive, with reinforcement or cancellation of the signal strength. Because the reflecting layer varies in height, the path of the reflected wave is variable and the final result to the listener is fading of the signal, a phenomenon that is familiar to all who have listened to distant broadcasting stations.

Differences in wave propagation between daytime and nighttime, and between seasons, also affect standard-broadcast reception. Reliable daytime service is limited almost exclusively to the region near the station wherein the ground wave constitutes a usable signal. This area is nearly constant for a given station and is called the primary service area. Reflection effects are practically nonexistent for standard-broadcast waves during daylight hours, but at night they act to expand the range of the station into a secondary service area. This area receives reasonably reliable nighttime service but is subject to fading, as was previously pointed out. Another phenomenon that is capable of causing interference with nighttime reception of a distant station occurs when two or more stations in different locations are operating with the same carrier frequency. Under these conditions reflected waves from several stations may reach the receiving antenna with comparable signal strengths to produce a motley babble of sounds. Alternate reception of two stations, as first one and then the other fades, or the production of a steady low-pitched tone resulting from a hetero-

dyne beat between carrier frequencies of the two stations, are other commonly observed results of the same conditions.

Reception of television and FM stations, because of their very high carrier frequencies, was expected to be confined substantially to the areas within which their ground waves are effective, or approximately within the area bounded by the visual horizon of the transmitter antenna. However, experience in the U.S. proved the necessity for revising this theory. Frequent but erratic reception of signals from stations hundreds of miles distant and interference between stations beyond the presumed range of each other called for re-evaluation of engineering concepts regarding reflection of ultrahigh-frequency waves from the Kennelly-Heaviside layer. Another type of reflection was also troublesome in television reception—the reflection of signals from buildings, hills and other nearby objects of similar size. The practical result in this case was one or more repeated or "ghost" images appearing in the reproduced picture and horizontally displaced from the true image. A difference of one mile, for instance, between the lengths of the direct and reflected wave paths would produce a second image displaced approximately 3% of the width of the picture in the direction of the horizontal scanning. This objectionable condition can be remedied in most cases by the use of a properly oriented directional receiving antenna.

IX. BROADCASTING TECHNIQUE

Sound and television broadcasting technique involves considerable elaboration of the bare essentials of a radio transmitting and receiving system. Studio facilities must be provided not only for the performance of the programs but also for the rehearsals which precede the actual broadcasting of each program. In order that other programs may be in preparation while one is being broadcast, several studios must be available. These must be of different sizes to accommodate various-sized groups of artists. Means must also be provided for selecting the studio which is ready to broadcast and connecting it to the broadcast transmitter. These many links between the performer and the listener may be classified as follows in the order in which they function: (1) the studio or place of program origin; (2) the microphone or television camera, and associated preamplifiers; (3) the mixer and volume-control system; (4) the central or main control room; (5) the electric cable or microwave relay to carry the programs from the main control room to the transmitting station (or simultaneously to many stations of a network); (6) the transmitting station; (7) the broadcast receiver. The basic elements of a typical broadcasting system are shown diagrammatically in fig. 3.

Besides studios, microphones and TV cameras, of course, a well-organized staff is necessary to produce the programs and operate the equipment that broadcasts them. As an example, the personnel immediately involved in the production of a television show in the studio and control booth are outlined in fig. 4.

1. The Studio or Place of Origin.—A broadcasting studio is a specially arranged room in which the artists perform for broadcasting. It is made soundproof to shut out extraneous noises and its walls are treated with sound-absorbing material to control the amount of reverberation. Reverberation is the multiple reflection of a sound wave back and forth between the studio walls, part of the energy being absorbed by the walls at each reflection. The result is an exponential decay of the sound intensity in the studio, and the length of time required for reduction of the sound to the point of inaudibility (or more precisely, to one-thousandth of its initial pressure) is called the reverberation time of the studio. How long this should be for the most pleasing effect is more a matter of aesthetic than of scientific considerations. Excessive reverberation, however, causes an annoying empty-room effect which detracts from the listener's enjoyment of the program. In television studios, lighting apparatus, as well as space for stage settings and cameras, must be provided.

Certain types of programs—news events, sports, church services, public speeches and the like—cannot be moved into a studio and must be broadcast from their places of origin. In these cases, portable microphones, television cameras and amplifiers are often carried to the scene in especially equipped cars or vans. From

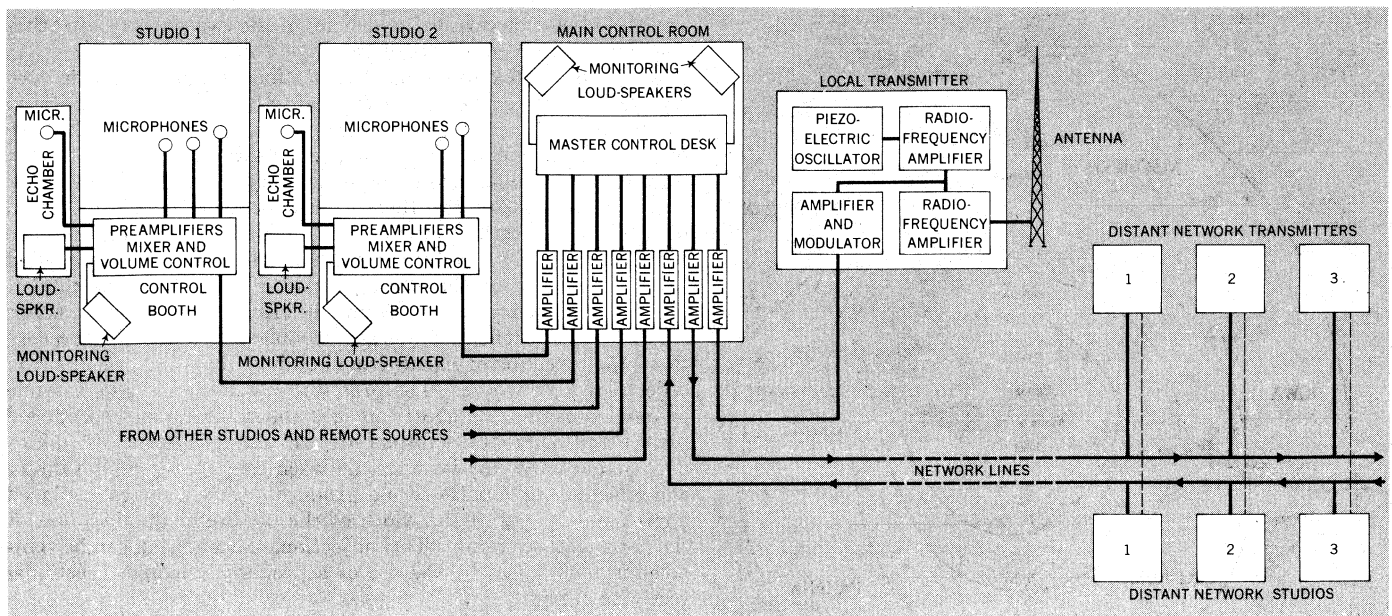

FIG. 3.—ELEMENTS OF A RADIO BROADCASTING NETWORK

these, audio (sound) signals are relayed to the main studio through telephone lines or short-wave links, and video (picture) signals through coaxial cables or microwave transmitters. Or, when the program is not to be broadcast at the time it is performed, it may be recorded on magnetic tape or motion-picture film for later broadcasts. Tape recording, disc recording (electrical transcriptions) and motion pictures are also applied extensively for inscribing complete programs especially produced in the studio for the purpose. Copies may then be syndicated to any number of individual stations for broadcasting. Television films taken directly from a picture tube reproduction of a program while it is in progress are called kinescope recordings and may be used for re-broadcasts by other stations.

In the late 1950s video tape recording of television programs in both monochrome and colour began to assume a prominent role in broadcasting. The tape, consisting of a plastic film ribbon coated with a magnetic oxide, is fed at high speed past a rotating recording head, and the video signal is stored in the magnetized oxide particles. This type of recording has the important advantage of being ready for immediate playback without development or other processing, a property which is especially valuable to nationwide networks where time-zone differences create program scheduling problems. A broadcast designed to appeal to a 7 o'clock after-dinner audience, for instance: may be tape-recorded at the time of its original performance in New York and then repeated after a suitable time delay for audiences in the later time zones. A viewer in Los Angeles will then see the television show at the intended hour by his local time, instead of at 4 o'clock in the afternoon. (See *TAPE RECORDING, MAGNETIC.*)

2. The Microphone, Television Camera and Preamplifiers.—The operation of all microphones depends upon the action of the minute pressure variations or the imperceptible air currents that constitute sound waves. The motion of the air is converted through suitable means into a change of resistance or capacitance in an electric circuit, or into the motion of a conductor in a magnetic field. In all cases the final result is a fluctuating electric current whose variations correspond to those of the air pressure or velocity in the sound wave (see *MICROPHONE*). For radio broadcasting, microphones are usually supported on floor stands or suspended by overhead cables. In television, where it is desirable to keep them out of camera view, they may be mounted on long-armed boom stands or, in the case of informal programs, miniature microphones on neck straps may be worn by individual performers.

The function of the television camera is analogous to that of the microphone in sound broadcasting. Its nucleus is a light-sensitive tube such as an image orthicon or a Vidicon, which converts an optical image of the studio scene, as focused onto its

screen by a lens system, into varying electrical pulses that represent the picture. Cameras as well as other TV equipment require frequent testing and adjustment to assure optimum performance, and are usually checked out with test patterns before each program. Cameras are usually mounted on large metal stands called dollies. These have a platform on which the camera operator stands and are equipped with rubber-tired wheels for mobility. (See *TELEVISION: Fundamentals of Picture Transmission and Reception.*)

Both microphones and light-conversion devices generate currents that are often too feeble to permit transmission over a distance of more than a few feet before being amplified. The amplifiers used for this purpose are called preamplifiers. In sound broadcasting one preamplifier is used for each microphone, and the preamplifiers are ordinarily located in the control booth adjacent

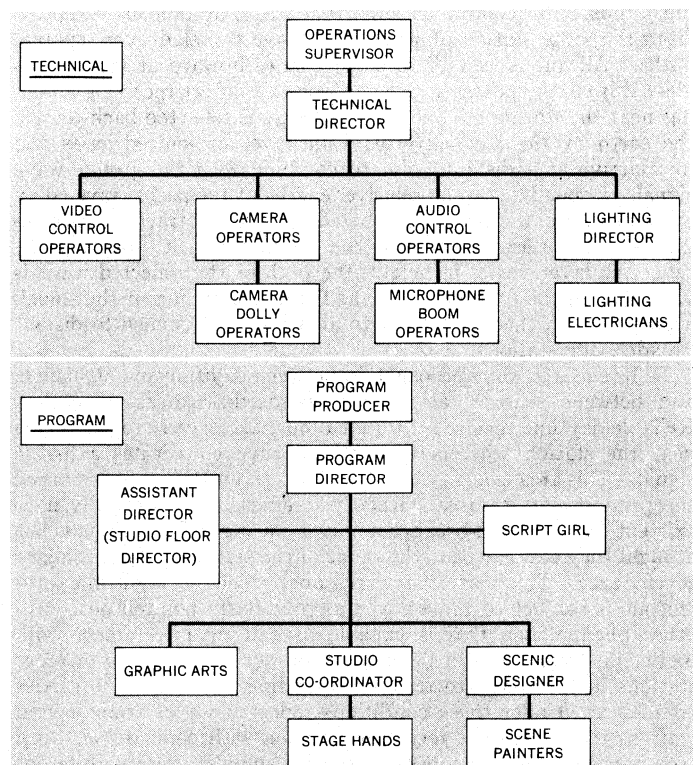

FIG. 4.—TECHNICAL AND PROGRAM CREWS FOR TYPICAL TELEVISION PROGRAM STUDIO PRODUCTION

to the studio. In some systems, the mixed output of a group of microphones is connected to a single preamplifier. For television, however, the currents from the camera cannot easily be transmitted over even a short distance, and the preamplifier is located inside the camera close to the picture tube.

3. The Mixer and Volume Control System.—Amplified currents from each microphone are connected to a fader and switching system in a control booth adjacent to the studio, where an operator mixes microphone outputs or switches from one to another as required. A master volume control enables him to maintain constant sound level on the outgoing program, as monitored by a volume indicator meter and loud-speaker.

A television control booth, besides having a similar set of microphone controls, has a mixer-switching system for the camera video signals. The scene being picked up by each camera, as well as the composite picture being transmitted to the audience, are displayed on kinescope monitors, and video levels are observed by means of cathode-ray tubes.

4. The Main Control Room.—This is the central point of the studio system and serves as a clearinghouse for the sequence of programs from the different studios, remote origins and networks. Successive programs from these various sources, after being amplified to standard intensity levels for line transmission, are switched in scheduled order to the line or short-wave circuits which carry them to the broadcasting transmitter. The latter may be located at some distance from the studios and control room. Other functions of the main control room include supervisory monitoring of all programs, communications in connection with program traffic and the switching of channels for program distribution to and from the networks.

5. The Electric Cable or Microwave Link.—A suitable means is required for conveying program signals from the main control room to the station transmitter—which may be as far as 20 or 30 mi. distant—or, in the case of networks, to stations in other cities. For sound broadcasting, special circuits leased from the telephone companies are customarily used. These circuits are especially designed to transmit the full range of musical tones (from about 0.1 to 5 kc. per second, or wider ranges in some cases). The circuits consist of wide-band channels on carrier systems, cable pairs employing light loading or, in rare cases, open wire. Equalizers (corrective electrical networks) at the terminals assure uniformity of response to various frequencies. Similar circuits are used for bringing local remote programs from halls, theatres, etc., to the main control room.

Television signals require the use of coaxial cables or microwave relays because of their wider frequency range (from about 30 cycles to 4.2 megacycles per second). The coaxial cable consists of a small wire supported by insulating beads and extending concentrically within a copper tube. From four to eight such cables, each slightly larger than a lead pencil, are encased in an outer lead sheath which is laid underground in ducts from city to city. (The term "coaxial cable" is also applied to the sheath and its contents.) In one such system, amplifiers are required at intervals of about four miles along the route to compensate for energy losses, and each conductor is capable of carrying one television program plus 600 telephone messages in one direction.

Microwave systems installed by the American Telephone and Telegraph company for cross-country television transmission employ frequencies in the region of 4,000 mc. In these, a low-powered carrier wave is frequency modulated by the video signals and beamed from antennas mounted on a series of towers spaced about 25 or 30 mi. apart. One type of antenna used is a refracting horn, having the outward appearance of a square-based pyramid standing on edge. Another, which has a wider frequency range, resembles a cornucopia mounted on end. At each tower there is receiving equipment to pick up the incoming signals, shift their frequency and amplify them and finally retransmit them to the next tower. Such systems have a capacity of six television programs in each direction. Because of the frequencies used and the narrow beams in which they travel, the microwave signals are private and are received only at the telephone company's terminals, from which they are distributed to television stations. The

public, therefore, does not receive television programs directly from the microwave beams, but only after they have been delivered to and broadcast by a local television station. Many stations also employ similar microwave equipment of their own, operating in other frequency bands, for local transmission of television picture signals from points outside of their studios to their control rooms, or for interconnection between their control rooms and their transmitters.

6. The Broadcast Transmitter.—This final link in the transmitting system for broadcasting serves a threefold purpose: (1) generation of the high-frequency carrier current necessary to achieve radiation of radio waves; (2) modulation of the carrier current in accordance with the program; (3) conversion of the modulated carrier current into electromagnetic waves.

The high-frequency current is generated initially by a vacuum-tube oscillator operating at a low energy level and controlled by a piezoelectric oscillator. The latter utilizes the electro-mechanical property of certain crystals, notably quartz, to generate currents of exceedingly stable frequency and thus ensures that the station will adhere to its assigned frequency or wave length. A series of radio-frequency amplifiers employing large vacuum tubes and resonant circuits, and having successively increasing power capacities, amplifies the output current from the crystal oscillator up to the level of power which the station is authorized to use. At some point in the series of amplifications, the amplified program currents from the microphone or television camera are introduced to modulate the carrier.

After being modulated and amplified to the power level authorized by the station licence (such power varies from 100 w. for local stations up to 50 kw. for clear-channel stations), the radio-frequency currents are transferred to an antenna which radiates their energy in the form of electromagnetic waves. To be an efficient radiator, an antenna must possess physical dimensions which are comparable with the wave length of the signal. Thus, the lower-frequency (longer wave-length) stations of the standard broadcast band require larger antenna structures than do the short-wave and ultrahigh-frequency stations. The most popular type of antenna among standard station operators is the vertical radiator, consisting of a single steel tower whose height is from one-half to one full wave length. Towers of this kind vary in actual height from 100 up to 1,000 ft. This form of antenna radiates waves of substantially equal intensity in all compass directions and also directs the maximum amount of energy along the surface of the earth, thereby eliminating wasteful high-angle or skyward radiation. (See ANTENNA [AERIAL].)

Television and FM stations utilize extremely short wave lengths and their antenna dimensions are correspondingly small. This permits the use of multielement antennas to concentrate radiation parallel to the surface of the earth, thereby producing a maximum useful signal intensity with a minimum of transmitter power.

To avoid undue interference to the large number of listeners who may reside in the vicinity of a high-powered broadcasting station situated within a city, most standard transmitters are located in rural areas some miles distant from their studios. This also avoids the absorption effects which large city buildings have for waves of these frequencies. Television and FM transmitters do not present the same problems, because of the higher frequencies on which they broadcast, and are ordinarily placed atop the highest building or other object near the centre of the area to be served, with the object of obtaining the maximum coverage of the surrounding area.

7. The Broadcast Receiver.—The function of the receiver is to intercept, select and amplify the signals from any desired broadcasting station within range, and to reproduce an image in sound or light and sound of the original studio performance. All receivers, whether for AM, FM or TV, utilize the same basic principles for selection and amplification.

An antenna, which may be an assembly of metal rods on the roof-top for TV or FM, or a coil of wire inside a portable AM receiver, is the interceptor that captures a tiny bit of the energy radiated by the broadcasting transmitter. However, the antenna is impartial and picks up all stations that are neither too weak nor too

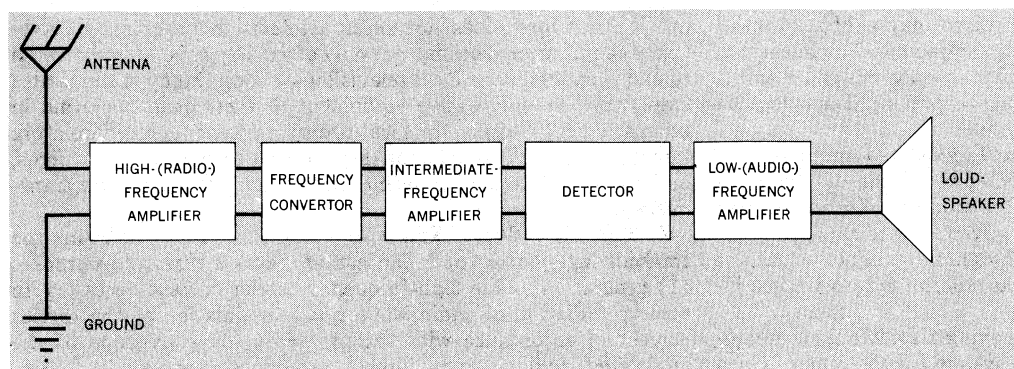

FIG. 5. — COMPONENTS OF SUPERHETERODYNE RADIO RECEIVER

Modulated radio-frequency signals delivered to the receiver by the antenna-ground system are amplified, converted to a lower intermediate frequency and further amplified. The detector extracts the modulation in the form of audio-frequency currents which, after amplification, actuate the loud-speaker

distant. Selection of the desired station from this jumble of signals depends upon the fact that each station broadcasts on its own individual carrier frequency, and makes use of the remarkable ability of resonant electric circuits to respond to alternating currents of one specific frequency and to reject those of all other frequencies. Several such resonant circuits, arranged so as to be adjustable through a linkage with the tuning dial, allow the listener to tune in the desired station and exclude all others. The tuning dial is equipped with a scale and indicator and is usually calibrated directly in kilocycles, megacycles or television channel numbers.

To amplify the feeble signals supplied by the antenna, the receiver makes use of vacuum tubes or transistors, whose circuits are combined with the selective tuning circuits so that amplification and selection both progress in a step-by-step manner through the radio-frequency portion of the set. Since the late 1930s the superheterodyne principle of amplification has been employed almost exclusively in broadcast receivers (see fig. 5). In this system the original carrier frequency of the station, after a small amount of preliminary amplification, is converted to a new and lower intermediate frequency, without effacing the modulation, in order to facilitate further amplification. The intermediate frequency has a fixed value in any given receiver: it remains constant regardless of what station may be tuned in. This simplifies the receiver by reducing the number of resonant circuits that must be made variable for tuning and also affords other technical advantages. In television receivers, there are two intermediate frequencies because of the separate aural and visual carrier waves radiated by the television transmitter.

Following selection and amplification, the signal undergoes a process of detection or demodulation, in which the audio or video information is separated from the radio-frequency carrier; the latter, having served its purpose, is effectively discarded at this point. The audio- and video-frequency signals are then ready to be amplified and applied to the loud-speaker or kinescope tube to reproduce the sound or picture.

8. Colour Television Techniques. — Besides adding interest to the picture for viewers, colour has an appeal to advertisers through its ability to display products in an attractive manner.

Colour television requires studio lighting levels of the order of 400 foot-candles, as compared with 125 foot-candles for monochrome, primarily because of the light lost by absorption in the camera colour separation filters. Also, flat, shadow-less lighting is imperative for pleasing colour rendition. Both of these requirements tend to increase the number of lighting fixtures in use at one time and add to the heat load which must be taken up by the studio air-conditioning system.

Colour schemes in scenery and stage props must, of course, be natural, and some of the artifices of monochrome television, such as scenery painted in all gray tones and brown lipstick in makeup, are obviously not permissible. Colour television makes effective use of brightly coloured costumes, but street clothing often must be toned down; light blue shirts, for instance, are preferable to plain white ones.

The skin tones of performers' faces, besides being at the usual centres of interest in a picture, are also the most difficult to reproduce faithfully in colour, so their rendition on a colour monitor is the criterion by which the accuracy of reproduction is most often judged. Since several cameras are ordinarily employed interchangeably for different views in the course of a program, these must be carefully colour-balanced to avoid any perceptible hue changes when the scene shifts from one camera to another. This is accomplished by preliminary alignment of the cameras

while they are focused on a colour test chart. Amplifiers and other equipment through which the colour signals pass are adjusted with the aid of a colour bar test signal which is electronically generated. This signal, consisting of yellow, cyan, green, magenta, red and blue colour patches, plus black and white, is also sometimes broadcast as a test pattern prior to the start of a day's programs for the use of viewers in adjusting their colour receivers. As a reference for setting the colour temperature of the white areas of colour monitors used in the studios and other points in a broadcasting system, a standard illuminant C lamp is used.

Television transmitters are essentially no different for colour than for monochrome, but auxiliary equipment providing fine control over phase-, linearity- and frequency-response characteristics is usually necessary since rigid control of these factors is of prime importance to proper transmission of a colour picture.

BROADSTAIRS AND ST. PETER'S, a seaside town and urban district of the Isle of Thanet, Kent, Eng., is 20 mi. E.N.E. of Canterbury by road. Pop. (1961) 16,979. Broadstairs and St. Peter's is a noncorporate member of the Cinque ports (*q.v.*) under Dover. From 1837 to 1851 Broadstairs was a favourite resort of Charles Dickens, who, in a sketch called *Our English Watering-Place*, described it as "left high and dry by the tide of years." A concert pavilion was opened in 1933 and in 1935 the council bought the Northcliffe estate of 263 ac., including a golf course. In Harbour street is York gate, a flint arch built in 1540. A small pier for fishing boats was first constructed in the reign of Henry VIII. The town overlooks seven bays, in one of which, Viking bay, the modern viking ship "Hugin" landed in 1949 with 32 Danes from Frederikssund to commemorate the landing nearby of Hengist and Horsa (*q.v.*). Kingsgate, north of Broadstairs on the coast, changed its name from St. Bartholomew's Gate in honour of Charles II's landing there in 1683; the imitation Norman castle was built in 1760. The North Foreland lighthouse is an adaptation of one built in 1732 on the site of a timber structure of 1636.

BROADWAY, a village and parish of Worcestershire, Eng., stands on the main Oxford road, 21 mi. S.W. of Worcester. Pop. (1951) 2,564. The village, in a picturesque setting at the foot of the north Cotswolds, is frequented by artists, and is noted for its Tudor and Jacobean houses in Cotswold stone on either side of the broad High street; in particular, the gabled Tudor House. The Abbot's Grange (14th century with 17th-century additions) overlooks the green on which a market was held in medieval times, and the 18th-century Lygon Arms is still a hos-

telry. St. Eadburgh's church (Norman with later additions) stands about a mile from the main village opposite Court farm, which incorporates the 16th-century gatehouse of Broadway Court. The Beacon tower, built in 1797, marks the highest point of the parish. Charles I stayed in Broadway in 1644 and 1645. Buses run to and from Evesham. (ER. H. S.)

BROCA, PAUL (1824-1880), French surgeon and physical anthropologist noted for his research on the brain and skull. was born on June 28, 1824, at Ste. Foy-la-Grande, Gironde. In 1866 he became a member of the Academy of Medicine in Paris and, in 1867, professor of surgical pathology and later of clinical surgery. He published treatises on cancer, aneurysm and other subjects; in 1861 he announced his important discovery of the seats of articulate speech in the left frontal region of the brain. since known as the convolution of Broca, thus furnishing the first anatomical proof of the existence of brain localization. But his name is associated most closely with the modern development of physical anthropology in France. He founded the Laboratoire d'Anthropologie de l'École des Hautes Études (1858), the Société d'Anthropologie de Paris (1859), the *Revue d'anthropologie* (1872), and the *École d'Anthropologie* (1876), of which he was named director. His numerous researches were concerned with the science of craniology, for which he originated techniques and methods. He also studied the comparative morphology of the brain. the topography of the skull and brain, and prehistoric trepanations. He died on July 9, 1880, in Paris.

See also his *Mémoires d'anthropologie*, 5 vol. (1871); and "On the Phenomena of Hybridity in the Genus Homo," in E. W. Count, *This Is Race* (1950). (H. V. V.; X.)

BROCADE, a textile to which a design of low relief has been added during the process of weaving. A brocaded textile is easy to identify. On the reverse side the various silk yarns float, unattached across the areas where they are not required in the brocaded motifs. As a result, brocade is never reversible. The brocaded portions are woven by hand-shuttles and are entirely independent of the textile itself, which is woven by the automatic throw-shuttle.

During the process of weaving brocaded textiles, the reverse side is exposed to the weaver and the finished brocaded areas are hidden from view. In the era of hand-drawn looms, as many as 125 strands of silk yarns of varied hues and tints were introduced in each repeat of the large-scaled, elaborate brocaded silks.

Brocading began in ancient times long before the era of silk, when women enhanced the attractiveness of a linen or worsted textile with coloured yarns inserted between the warps (the threads running lengthwise) by means of a primitive bone or metal needle. This method continued to be used up to the invention of the shuttle

 FIG. 2.— SILK BROCADED LINEN DAMASK, WITH 16TH-CENTURY ITALIAN DESIGN ON PATTERNED SELF-COLOURED BACKGROUND EMBELLISHED WITH FLORAL MOTIFS. (LEFT) RIGHT SIDE OF CLOTH; (RIGHT) REVERSE SIDE SHOWING UNUSED STRANDS OF SILK

and the hand-drawn loom. Any of the various types of yarns, such as linen, cotton, wool, silk or the modern synthetic yarns, may be used. These yarns may be woven into a textile of any of the basic weaves—plain, twill or satin—as well as those with woven patterns, including simple and compound weaves in either silk, linen or cotton. The most difficult brocading to produce is that in which both extra warps and wefts (threads that run crosswise to the

BY COURTESY OF THE SCALAMANDRE MUSEUM OF TEXTILES
 FIG. 3.—ITALIAN DESIGN LINEN DAMASK (FIG. 2) BEING BROCADED ON 50-IN. LOOM

warps) are used in combination. When the brocaded motifs are small in scale and widely spaced, the intervening unused threads are frequently clipped around the edges of the design; patterned fabric is, in reality, an imitation brocade, known as *broché*. This method was applied especially to lightweight silks. There is also a variety commonly known as *aarp* brocading in which clusters of extra floated warps are introduced in areas where brocaded strips are desired. This type, however, is correctly known as *liséré*; it was popular during the reigns of Louis XV and Louis XVI in France when petite floral motifs were introduced in the stripes.

With the invention of the Jacquard machine and automatic weaving in the early 19th century, it became possible to combine the weaving and brocading of textiles in order to increase production. However, in mechanical weaving, when no hand-shuttles are used, the number of colours for brocading is limited to approximately six, and the finished fabric is classed as a "brocaded lampas."

In mills where hand-shuttles are used for brocading in conjunction with the poney loom, the shuttles are placed vertically and immediately in front of the weaver at the areas where required on the textile already woven. As certain of the warp threads are raised by means of the Jacquard attachment for the next throw of the shuttle for the basic weave, the weaver slips, by hand, certain of the shuttles resting before him for the colour required in that specific portion of the brocaded pattern.

In the production of a 50-in. brocaded textile, in which the design is repeated twice or more across the width, two weavers work side by side to hasten the weaving. Even so, brocading is a slow and tedious process. Not more than a yard, and often less, is an average day's production; hence its high cost.

Brocading probably originated in the Bronze Age. Fragments of rudimentary brocaded wool fabrics have been discovered in the tree coffins of that era that had been submerged in salty marshes and so preserved. The patterns were obtained by floating coarse wool yarns over several threads that formed crude square, triangu-

BROCCOLI—BROCKEN

lar and lozenge motifs. Chinese brocaded silks are known to have been made a couple of centuries before the Christian era. One of the oldest in existence dates from about A.D. 238. Specimens of Persian, Syrian and Sicilian silks from the 11th century and later have been preserved; they are elaborately brocaded with gold threads. The cathedral in Regensburg, Ger., has a 12th-century Siculo-Saracenic brocaded textile woven in Palermo, Sicily, for a robe of Henry IV, emperor of the Holy Roman empire. The kincobs of India were highly desired as the brocaded silks used by Indian princes. They frequently had insets of precious jewels, and gilded silver wire was used in brocading. Spanish artisans brocaded silks with metallic threads.

The Lucchese brocaded silks of Italy date from the 14th century; they were followed by those of Florence. Venice and Genoa. The French were weaving brocaded silks in the city of Lyons during the 17th century. The baroque and rococo eras of Louis XIV and Louis XV were known for their magnificent brocades. Upon the revocation of the Edict of Nantes (1685), hundreds of Huguenots migrated to England and settled at Spitalfields in London. As a consequence the English likewise began producing fine brocaded silks in the early 18th century. Some of these are to be seen in the Victoria and Albert museum in London.

The Latin word *brochus*, meaning projected or pointed, and the French words *broché* and *brocart*, originally meaning a sharp-pointed thin rod of iron and later a needle or pointed bobbin, all give clues to the origin of the word brocade. This method of weaving is known in Italy as *brocrafo* and *spolinato*, which stems from the Italian word *spolino*, the shuttle used to weave the brocaded areas. The Spaniards call it *brocedo*. Obviously, the origin is Latin.

See WEAVING: *The Jacquard Machine*; TEXTILES. (J. K. T.)

BROCCOLI. Two distinct plants of the mustard family (Cruciferae) have been called broccoli in the United States. Sprouting broccoli (*Brassica oleracea* var. *italica*), Italian or green sprouting broccoli is a fast-growing, upright, branched, annual plant, two to three feet tall that bears dense, green clusters of flower buds at the ends of the central axis and the branches. Heading broccoli, cauliflower broccoli or broccoli were names formerly applied to slow-growing forms of cauliflower (*B. oleracea* var. *botrytis*). After sprouting broccoli became popular in the U.S. (about 1930, though it had been well known in Great Britain and on the continent for a long time), "broccoli" ceased to be applied to the late form of cauliflower.

Sprouting broccoli is native to the eastern Mediterranean and Asia Minor. It was cultivated in Italy in ancient Roman times, was introduced into England about 1720 and to America probably in colonial times. Like cabbage, of the same species; it thrives in moderate to cool climates. It is propagated by seeds, either sown directly in the field or in plant beds to produce transplants. Broccoli reaches harvest in 60 to 150 days, depending upon the variety and the weather. The flavour resembles that of cabbage but is milder. See also CABBAGE; CRUCIFERAE. (V. R. B.)

BROCHANTITE, a mineral species consisting of a basic copper sulfate, has been found associated with malachite, etc., in copper mines at several places. A microscopical examination of the green copper ores of secondary origin in the Clifton and Morenci districts of Arizona proves brochantite to be of extremely common occurrence mostly intergrown with malachite, which effectually masks its presence. Brochantite crystallizes in the ortho-

rhombic system. The crystals are usually small and are prismatic or acicular, or needlelike, in habit; they have a perfect cleavage in one direction. They are transparent to translucent with a vitreous lustre and are of an emerald-green to blackish-green colour. Specific gravity is 3.9; hardness 3.5 to 4. The formula is $\text{Cu}_2(\text{OH})_2\text{SO}_4$. (L. J. S.)

BROCK, SIR ISAAC (1769–1812). British soldier and administrator, was born at St Peter Port, in the island of Guernsey, on Oct. 6, 1769. He entered the British army as an ensign in 1785 and by 1797, at the age of 28, he became a lieutenant colonel. He was sent to Canada with his regiment in 1802 and was stationed almost continuously at Quebec, Niagara or York (Toronto), until the outbreak of the War of 1812. He was promoted to the rank of colonel in 1805, and to that of major general in 1811. In 1810 he assumed command of the troops in Upper Canada (Ontario), and was appointed provisional lieutenant governor of the province. In the early months of the war, he was the heart and soul of the defense of Upper Canada. He organized the militia of the province, and on Aug. 16, 1812, took Detroit from the United States army under Gen William Hull. On Oct. 13 his troops defeated the American invaders at Queenston Heights on the Niagara frontier. During the engagement, however, Brock fell, mortally wounded. For his services in connection with the capture of Detroit he had been gazetted, three days before his death, a knight commander of the order of the Bath.

The best biography of him is F. B. Tupper, *Life and Correspondence of Sir Isaac Brock* (1843). (W. S. WA.)

BROCK, SIR THOMAS (1847–1922). English sculptor, born at Worcester on March 1, 1847, is best known for the Imperial memorial to Queen Victoria in front of Buckingham palace. He was the pupil of J. H. Foley, but was influenced by the romantic movement. He was known primarily as a portrait sculptor and among his portraits are those of Gladstone (1902) and Longfellow (1884), both in Westminster abbey. Also by Brock are the tomb of Lord Leighton in St. Paul's cathedral, busts of King Edward VII (1911), Lord Lister (1913) and Edwin Abbey (1917). His statue of Captain Cook (1914) stands in the Mall in London. His colossal equestrian statue of the Black Prince was set up in the city square in Leeds in 1901. He did seven statues of Queen Victoria and the design for her head on the coinage of 1897. In 1911 he was created knight commander of the Bath. He died in London on Aug 22 1922. (I. S. McN.)

BROCKDORFF-RANTZAU, ULRICH, GRAF VON (1869–1928), German foreign minister at the time of the treaty of Versailles and one of the architects of German-Soviet understanding in the 1920s, was born in Schleswig on May 29, 1869. Educated for the law, he entered the diplomatic service in 1894. As German minister in Copenhagen from 1912 to 1918 he supported the Danish policy of neutrality during World War I and was able to maintain German-Danish trade. Appointed secretary of state for the German foreign department on Dec 18, 1918, and foreign minister on Feb. 13, 1919, he went to the conference of Paris (*q.v.*) at the end of April and argued in vain for an amelioration of the conditions of peace. Unable to dissuade his government from ratifying the treaty of Versailles, he resigned his post on June 21, 1919. He continued, however, to work for a revision of the treaty (*Dokumente*, 1920; *Dokumente und Gedanken um Versailles*, 3rd ed., 1925) and also for changes in international law. In Nov. 1922 he was appointed ambassador in Moscow, where he and G. V. Chicherin together worked to consolidate the *rapprochement* between Germany and the U.S.S.R. that had been inaugurated by the treaty of Rapallo. The German-Soviet treaty of Berlin (April 1926) counterbalanced the Locarno pact of 1925, which had seemed to link Germany too closely with the western powers.

He died while on leave in Berlin on Sept. 8, 1928. Aristocratic in his way of life, the "Red Count" was a convinced democrat in politics.

See E Stern-Rubarth, *Graf Brockdorff-Rantzau* (1929); H Helbig, *Die Träger der Rapallo-Politik* (1958). (R. Mo.)

BROCKEN is the highest point (3,747 ft) of the Harz mountains (*q.v.*). Its huge, granite-strewn dome commands magnificent

views in all directions: to Magdeburg and the Elbe, Leipzig and the Thuringian forest.

A mountain railway (12 mi.) reaches the summit. In the folklore of north Germany the Brocken holds an important place, and long after the introduction of Christianity traditional rites continued to be enacted there annually on Walpurgis night or witches' sabbath (May 1). It is represented in a famous scene in Goethe's *Faust*.

BROCKEN BOW (SPECTRE OF THE BROCKEN). A phenomenon frequently observed on mountain peaks but recorded in literature with special reference to the Brocken is an enormously magnified shadow of an observer cast when the sun is low upon the upper surfaces of clouds that are below the mountain.

The shadow, often accompanied by coloured bands, is known as the spectre of the Brocken and is given a mystical significance in the folklore of the mountain. The phenomenon of rainbowlike bands around a shadow on clouds and called the Brocken bow or glory is commonly observed in airplanes. When an airplane is flying above a cloud layer in sunlight, a system of coloured rings is seen around the shadow of the airplane on the clouds. This ring or bow has a diameter about the same as the wingspread of the airplane.

The phenomenon is recognized as one of diffraction (*see* LIGHT: *Diffraction*) and the droplets of the cloud are thought to behave like tiny mirrors which, if the analogy is correct, would produce the same effect as a diffraction screen. The effect is visible only against the shadow. The colours exhibited depend on the size of the droplets, the largest ones producing the most brilliant colours.

(H. R. B.)

BROCKES, BARTHOLD HEINRICH (1680–1747). German poet who introduced into his country's poetry a new simplicity and feeling for nature. was born at Hamburg, Ger., on Sept. 22, 1680. In 1720 he was appointed a member of the Hamburg senate. He died in Hamburg on Jan. 16, 1747. His poetical works were published under the title *Irdisches Vergnügen in Gott*, 9 vol. (1721–48); he also translated Giambattista Marini's *La Strage degli innocenti* (1715), Alexander Pope's *Essay on Man* (1740) and James Thomson's *Seasons* (1745). His verses, although often artificial and crude in form, express a sincere and reverent attitude toward nature and a religious interpretation of natural phenomena.

See Brockes' autobiography in the *Zeitschrift des Vereins für Hamburger Geschichte*, ii (1847); A. Brandl, *B. H. Brockes* (1878); H. W. Piund, *Studien zu Wort und Bild bei Brockes* (1935).

BROCKET, the name given to a yearling stag of the red deer (*q.v.*), and hence to several South American deer whose simple short horns resemble those of a stag a year old.

BROCKHAUS, FRIEDRICH ARNOLD (1772–1823), German publisher and editor of a famous encyclopaedia, was born at Dortmund, Ger., on May 4, 1772. In 1808 he purchased the copyright of the *Konversations-Lexikon*, which had been started in 1796, and in 1810–11 he completed the first edition of this encyclopaedia, renamed *Der grosse Brockhaus*; a second edition under his editorship was begun in 1812. The encyclopaedia reached its 16th edition, 1952–57. In 1818 Brockhaus moved to Leipzig, where he established a large printing house. Among his many literary undertakings were critical periodicals and large historical, bibliographical and reference works. He died at Leipzig, Aug. 20, 1823. The business was carried on by his sons FRIEDRICH (1800–65), who retired in 1850, and HEINRICH (1804–74), under whom it was considerably extended. During 1842–48, Heinrich Brockhaus represented Leipzig in the Saxon second chamber. He was made honorary citizen of that city in 1872 and died there on Nov. 15, 1874. He was succeeded by his sons EDUARD (1829–1914) and RUDOLF (1838–98). Eduard was a member of the *Reichstag* (1871–78). The business was continued by members of the family and after World War II was established at Wiesbaden.

BROCKTON, a city of Massachusetts, U.S., is about 20 mi.

S.W. of Boston and 30 mi. N.E. of Providence, R.I. The Brockton standard metropolitan statistical area consists of the city of Brockton and nine towns (Abington, Bridgewater, East Bridgewater, Hanson, West Bridgewater, Whitman, Avon, Stoughton and Easton), which until the 1950 federal census was classified as part of the Boston area. Pop. (1960), city of Brockton, 72,813; standard metropolitan statistical area, 149,458. For comparative population figures *see* table in MASSACHUSETTS: *Population*.

Originally within the boundaries of the Plymouth colony, the area was sold by the Indians to Miles Standish in 1650 for 7 coats, 9 hatchets, 8 hoes, 20 knives, 4 moose skins and 10 yd. of cotton. Brockton was part of Bridgewater until 1821 and thereafter the town of North Bridgewater until taking its present name in 1874; it was incorporated as a city in 1881.

Shoe manufacturing started in the area about 1750. Just prior to the American Civil War the McKay sewing machine was invented, enabling the uppers and soles of shoes to be speedily sewn together rather than pegged. More than one-half of the shoes worn by the Union army during the Civil War were made in the area, and "Brockton Shoes the World" became the city slogan.

Certain significant technological developments started in the area. In Whitman the first canal in America was dug; in Bridgewater's foundries the plates for the "Monitor" were cast; steam was first introduced to shoe factories in Stoughton (1870). Brockton also introduced systems of sewage disposal (1893) and street lighting (1884) that were copied by cities over the world.

Shoe manufacturing declined sharply after 1920, but was still the area's most important industry in the early 1960s. However, diversification had developed to the point that more than 300 firms manufactured about 200 different products. (Jo. Gl.)

BROD, MAX (1881–), Austrian writer, is almost better known as the friend of Franz Kafka (*q.v.*) and editor of his posthumous works than for his own novels. He was born at Prague on May 27, 1884, where he studied law and later worked as a government official. A convinced Zionist, he left for Palestine in 1939. His optimistic interpretation of Kafka, in *Franz Kafka, eine Biographie* (1937; 3rd ed., 1954; Eng. trans., 1947) is controversial. A very productive writer, his own novels blend fantasy, mysticism and eroticism, and are characterized by great narrative skill and limpidity of style. His masterpiece is probably *Tycho Brahes Weg zu Gott* (1916; Eng. trans., *The Redemption of Tycho Brahe*, 1928), a historical novel with a mystical flavour. Other novels, such as *Die Frau, nach der man sich sehnt* (1927) and *Zauberreich der Liebe* (1928; Eng. trans., *The Kingdom of Love*, 1930), deal sensitively with the problem of love. The essays *Heidentum, Christentum, Judentum* (1921) and *Diesseits und Jenseits* (1946–47) attempt to define the intellectual position of a Zionist in the modern world. Also of interest are a biography of Heine (1934; Eng. trans., 1956) and *Der Meister* (1951; Eng. trans., 1951), a novel about Jesus. (H. S. R.)

BRODIE, SIR BENJAMIN COLLINS, 1ST BART. (1783–1862). English physiologist and surgeon, a contributor to the study of joint diseases, was born in 1783 at Winterslow, Wiltshire. He was assistant surgeon at St. George's hospital for more than 30 years. In 1810 he was elected a fellow of the Royal Society. Probably his most important work is *Pathological and Surgical Observations on the Diseases of the Joints*, in which he attempts to trace the beginnings of disease in the different tissues that form a joint, and to give an exact value to the symptom of pain as evidence of organic disease. This volume led to measures of a conservative nature in the treatment of diseases of the joints, with consequent reduction in the number of amputations and the saving of many limbs and lives. His name is applied to certain diseases of the bones and joints.

Brodie was created a baronet in 1834, and was the first president of the General Medical Council. He died at Broome Park, Surrey, on Oct. 21, 1862.

BRÖGGER, WALDEMAR CHRISTOFER (1851–1940). Norwegian geologist and mineralogist remarkable for the great range of his researches, was born in Christiania (Oslo) on Nov. 10, 1851. He was professor of mineralogy and geology in the University of Stockholm, 1881–90, and from 1890 in the Uni-

versity of Christiania, of which he later became rector. His petrographical memoirs on the Permian igneous rocks of the Oslo province form landmarks in the advance of petrogenic theory and he contributed greatly to the knowledge not only of the rarer minerals, the nephilite-syenite pegmatites of the province, but also of the mineralogy of the Archaean (Early Pre-Cambrian) granite pegmatites of southern Norway. He dealt also with the fossiliferous Paleozoic rocks of the Oslo region and his investigations on the glacial deposits greatly extended the knowledge of the former distribution of land ice in southern Norway. Brogger died at Oslo on Feb. 17, 1940. (C. E. T.)

BROGLIE, the name of a distinguished French family descended from a Piedmontese nobleman, Amedeo Broglia, conte di Cortandone, whose son FRANÇOIS MARIE (Francesco Maria; 1611–56) emigrated to France in 1643 and took the title comte de Broglie. François Marie served as a cavalry leader and rose to the rank of lieutenant general in the French army before he was killed at the siege of Valenza, in Piedmont, on July 2, 1656. His son VICTOR MAURICE (1646–1727), comte de Broglie, also served in Louis XIV's wars, becoming *maréchal de camp* (brigadier) in 1671, lieutenant general in 1688 and marshal of France in 1724. He died on Aug. 4, 1727.

The eldest son of Victor Maurice, FRANÇOIS MARIE (1671–1745). 1st duc de Broglie, was born on Jan. 11, 1671. He served continuously in the War of the Spanish Succession and again in Italy in 1733–35, being made marshal of France in 1734. In 1742, during the War of the Austrian Succession, he was appointed to command the French army in Germany, but he had always been the "man of small means," safe, cautious and lacking in daring. The only success that he obtained was in the action of Sahay in Bohemia on May 24–25, 1742, for which he was created duc de Broglie in the following June. He died on May 27, 1745.

His son VICTOR FRANÇOIS (1718–1804), 2nd duc de Broglie, was born on Oct. 19, 1718. He served with his father in Italy and took part, during the War of the Austrian Succession, in the storming of Prague (1741) and in the campaigns on the Rhine (1744–45) and in the Netherlands (1747). During the Seven Years' War, his victory over Ferdinand of Brunswick at Bergen (near Frankfurt) in 1759 won him the rank of marshal of France from Louis XV and that of prince of the Holy Roman empire from the emperor Francis I. Early in July 1789, Louis XVI put him in command of the troops gathered around Versailles with a view to checking the disorders which were to develop into the Revolution and made him minister of war. This attempt was short-lived, and within a few days Broglie had to emigrate. He died at Münster in Westphalia on March 30, 1804.

CHARLES FRANÇOIS (1719–81), comte de Broglie, a younger son of the 1st duc, was born on Aug. 20, 1719. He is chiefly remembered in connection with the *secret du Roi* (i.e., the private, as distinct from the official, diplomacy of Louis XV). There is an edition of his dispatches by D. Ozanam and M. Antoine (1956–). He died at Saint-Jean d'Angély on Aug. 16, 1781.

The son of Victor François CHARLES LOUIS VICTOR (1756–94), prince de Broglie, was born on Sept. 22, 1756. He served with La Fayette and Rochambeau in America and sat in the Constituent Assembly, constantly voting for the reforms proposed. He served as chief of staff to the republican army on the Rhine, but in the Terror he was arrested and guillotined at Paris on June 27, 1794. His final admonition to his little son was to remain faithful to the principles of the Revolution, however unjust and ungrateful.

(ACHILLE CHARLES LÉONCE) VICTOR (1785–1870), 3rd duc de Broglie, the son of Charles Louis Victor, was born in Paris on Nov. 28, 1785. He was added to the imperial council of state as *auditeur* in 1809 and was sent by Napoleon on diplomatic missions to various countries as attaché.

In June 1814, under the first Restoration, he was included in Louis XVIII's chamber of peers. There, after the Hundred Days, he distinguished himself by his courageous defense of Marshal Ney, for whose acquittal he, alone of all the peers, both spoke and voted. On Feb. 15, 1816, he was married at Leghorn to Madame de Stael's daughter Albertine. In politics under Louis

XVIII and Charles X he identified himself with the Doctrinaires (*q.v.*), and in the chamber of peers he opposed all reactionary measures.

After the July revolution of 1830 the duc de Broglie was minister of education for a few months and later took office as minister for foreign affairs (Oct. 11, 1832). His main efforts were directed toward establishing closer relations between France and Great Britain and proved fruitful (1) in the final settlement of the Belgian question, (2) during the crisis of Mohammed Ali's first war against Turkey (see EASTERN QUESTION) and (3) in the negotiations about the troubles in Spain and Portugal. He retired from office in April 1834. In March 1835, however, he became prime minister. He passed strong repressive measures against seditious activities, but resigned in Feb. 1836. From then to 1848 he held himself almost completely aloof from politics, though in May 1847 he was ambassador in London.

The revolution of 1848 was a great blow to Broglie. However, he was elected deputy for Eure in May 1849 and, as a member of the conservative group known as the "Burgresses," did his best to stem the tide of socialism and to avert the reaction in favour of autocracy, which he foresaw. After the *coup d'état* of Dec. 2, 1851, he was one of the bitterest enemies of Napoleon III's regime, though he was heard to remark, with that caustic wit for which he was famous, that the empire was "the government which the poorer classes in France desired and the rich deserved." The last 20 years of his life were devoted chiefly to philosophical and literary pursuits. He died in Paris on Jan. 25, 1870. His writings include *Vues sur le gouvernement de la France* (1861), *Écrits et discours*, three volumes (1863), *Le Libre Échange et l'impôt* (1879) and *Souvenirs*, four volumes (1885–88).

(JACQUES VICTOR) ALBERT (1821–1901), 4th duc de Broglie, the eldest son of the 3rd duc, was born in Paris on June 13, 1821. After a brief diplomatic career at Madrid and Rome, he withdrew from public life at the revolution of 1848. He had already published a translation of the religious system of Leibniz (1846). He contributed to the *Revue des deux mondes* and to the Orleanist and clerical organ *Le Correspondant*. He was elected to the Académie Française in 1862, while his *L'Église et l'empire romain au IV^e siècle*, six volumes (1856–66) was still incomplete.

In Feb. 1871 the duc de Broglie was elected to the national assembly as deputy for Eure. A few days later he was appointed ambassador in London. In March 1872, however, in consequence of criticisms of his negotiations on the commercial treaties between Great Britain and France, he resigned his post and took his seat in the national assembly, where he became the leading spirit of the conservative campaign against L. A. Thiers. On the replacement of the latter by Marshal MacMahon, Broglie became president of the council and minister for foreign affairs (May 1873) and later of the interior (Nov. 26). His tenure of office was marked by an extreme conservatism, which roused the bitter hatred of the republicans, while he alienated the legitimists by his friendly relations with the Bonapartists and the Bonapartists by an attempt to effect a compromise between the rival claimants to the monarchy. The result was the fall of the cabinet on May 18, 1874. Three years later (May 16, 1877) he was entrusted by MacMahon with the formation of a new cabinet, with the object of securing a new chamber more favourable to the reactionaries. The result, however, was a decisive republican majority. The duc de Broglie resigned office on Nov. 20. Not being re-elected in 1885, he abandoned politics for historical work. He died in Paris on Jan. 19, 1901. His *Memoires*, two volumes, were published in 1938–41. His son VICTOR (1846–1906) was the 5th duc.

See Jean de La Varende, *Les Broglie* (1951). (G. DE B. DE S.)

(LOUIS CÉSAR VICTOR) MAURICE (1875–1960), 6th duc de Broglie, the grandson of the 4th duc, was born in Paris on April 27, 1875. A distinguished physicist, he was elected to the Académie Française in 1934 and foreign member of the Royal society in 1946. He died at Neuilly on July 15, 1960.

LOUIS VICTOR PIERRE RAYMOND (1892–), prince de Broglie, the physicist who was awarded the 1929 Nobel prize in physics for his discovery of the wave nature of the electron, was born at Dieppe on Aug. 15, 1892, the younger brother of the 6th duc.

Appointed professor of theoretical physics at the Henri Poincaré institute at the Sorbonne in 1928. he became titular professor in the faculty of sciences in 1932. He was a member of the Académie des Sciences from 1933 and its permanent secretary from 1942. He was elected a foreign member of the Royal Society in 1953 and a member of the Académie Française in 1944.

When the prince de Broglie took up the study of theoretical physics there were two seemingly contradictory theories of light: the wave theory, according to which light behaves like a continuous train of waves; and the corpuscular theory, according to which it behaves like a hail of bullets. The revolutionary theories of Planck and Einstein led physicists to accept the dual character of light, but the prince de Broglie took a further step. In 1924 he arrived at the idea that matter, just as much as light, could behave either as a wave or as a corpuscle. He worked out formulas to establish the parallelism between the motion of a corpuscle and the propagation of a wave with which it is associated. In 1927 experimental confirmation of the wave theory of matter put forward by the prince de Broglie was provided by C. J. Davisson and L. H. Germer in New York and G. P. Thomson in Aberdeen. The conception of matter-waves has dominated all subsequent speculations about the ultimate elements of matter and light.

See *Jubilé scientifique de M. Maurice de Broglie* (1947); 4. Georges, Louis de Broglie, *physicien et penseur* (1953). (W. J. Br.)

BROKE (BROKE)! **ARTHUR** (d. 1563), English poet and author of *The Tragical History of Romeus and Juliet* (1562), the poem on which Shakespeare based *Romeo and Juliet*. It is written in rhymed verse and was taken from the French translation of one of Matteo Bandello's *Novelle* (1554-73; Fr. trans., 1559). Broke altered the original; for example, he developed the character of the nurse and changed various aspects of the last scene. Shakespeare followed him in these changes, which indicates that it was Broke's poem that he used as a source and not the original story of Bandello. Broke died in a shipwreck in 1563 while crossing to join the English troops in France. Modern editions include P. A. Daniel, *Brooke's Romeus and Juliet and Painter's Rhomeo and Julietta* (1875); G. Bullough (ed.), *Narrative and Dramatic Sources of Shakespeare*, vol. i (1957).

BROKE, SIR PHILIP BOWES VERE, 1ST BARONET (1776-1841), English sailor, famous for his capture of the "Chesapeake" during the War of 1812. was born at Broke hall, near Ipswich, Eng., on Sept. 9, 1776. He entered the navy in 1792, served as a lieutenant at the battle of St. Vincent (1797) and became a captain in command of a frigate in the channel fleet in 1801. He was appointed to the "Shannon," a 38-gun frigate, in 1806, proceeding in her in 1811 to Halifax, Nova Scotia, where he commanded the force in that area. On June 1, 1813, while cruising off Boston, Mass., he challenged Capt. James Lawrence of the "Chesapeake" to leave port and "try the fortunes of our respective flags." The "Chesapeake," also a frigate of 38 guns, had left port before the challenge was delivered. After the second broadside the U.S. ship fell afloat the British and Broke led a boarding party of 60 men over her side. After "a desperate but disorderly resistance," in which Broke himself was wounded, the "Chesapeake" was captured, the action lasting only 15 min. Broke's success was due to his high standard of gunnery practice, the example of which had a salutary effect on the Royal Navy in subsequent years. Coming as it did after a series of frigate defeats, Broke's action won him the popular title of "Brave Broke," and he was made a baronet (1813). His wound incapacitated him from further active service. He died in London, Jan. 2, 1841. (C. C. L.)

BROKEN HILL, a town in Central province, Northern Rhodesia, Africa, is an important railway, road transport and mining centre on the Great North road 86 mi. N. of Lusaka, the territorial capital. In 1959 the estimated population, including the adjoining mine township, was 14,966, of which 4,400 were Europeans, 9,990 Africans in employment and 576 other races. The Rhodesian Broken Hill Development company operating Broken Hill mine was formed in 1903 and was instrumental in opening up Northern Rhodesia. The mine produces high-grade zinc and lead, and after it was sunk, the first railway in the country was built.

As a result of the mining company's power requirements one of the earliest hydroelectric power stations in Africa was opened on the Mulungushi river in 1924.

Broken Hill is the headquarters of Rhodesia railways in Northern Rhodesia and has locomotive sheds and marshaling yards. It is the headquarters and depot for Central African Road services, the largest road passenger and haulage company in the territory, and the Great North road turns off to east Africa, just north of the town. The hospital is the biggest in Northern Rhodesia and provides a full range of specialist services. There are a number of government schools providing boarding accommodation and education up to secondary standard and convent schools up to the same standard.

Broken Hill has a large farming area surrounding it producing maize and tobacco.

In 1921, in the course of mining operations, the lower levels of a cave were uncovered and found to contain bones of animals, a few human bones and many stone implements. The skull and other human remains are those of early man and have been named Rhodesian man (see MAN, EVOLUTION OF: *Neanderthal Man and Neanderthaloids*). The fossil fauna included several extinct species and the whole assemblage is placed in the earlier part of the Upper Pleistocene period. (Wm. V. B.)

BROKEN HILL, a mining city in the west of New South Wales, Austr. It is situated at a height of 1,000 ft. on the eastern flank of the Barrier range, 30 mi. from the South Australian border and about 700 mi. by rail from Sydney on the eastern seaboard. Pop. (1954) 31,351. The region is subarid, hot in summer and mild (with frost) in winter; mean annual temperatures range from 51° to 78° F., with absolute extremes of 27° and 116° F.; average annual rainfall is 9 in., but varies from 3.6 to 17.0 in. Proclaimed a city in 1907. Broken Hill has imposing public buildings, a technical college, a large hospital and modern shops and hotels. It is connected by daily air services with Sydney, Melbourne and Adelaide, South Australia and by triweekly passenger train services to Sydney and Adelaide. Economic and business relations are mainly with South Australia, largely because there was no direct rail connection with Sydney until 1927. Broken Hill is a base for the flying doctor services.

The mining field is one of Australia's greatest mineral assets. For its size, the ore body is the richest individual producer of lead, silver and zinc in the world. The main lode is a long, tightly folded lens which is curved in plan and arched in longitudinal section. Its known length is about 3 $\frac{3}{4}$ mi., over-all width up to 500 ft. and vertical dimension up to 2,000 ft. The crude ore is milled at Broken Hill by gravity and flotation processes into a lead concentrate containing 72%-77% lead and 16-40 oz. of silver per ton, and a zinc concentrate containing 51%-53% zinc. Most of the lead concentrate is smelted and refined at Port Pirie, South Australia, for the production of lead, silver and a little gold and copper, the remainder being shipped overseas. The zinc concentrate is shipped principally to Risdon, Tasmania, and to Avonmouth or Swansea, Eng., for the production of zinc and cadmium. Both concentrates are a source of sulfur for the manufacture of sulfuric acid. Broken Hill is also the centre of a prosperous pastoral area.

The mining companies contribute to all welfare organizations in the city. One notable amenity is the regeneration area, a strip of country half a mile wide enclosed within a vermin-proof fence and encircling the city. Regeneration of native flora in this area was supplemented by the planting of trees and shrubs with the result that the drift-sand menace was arrested. Water supply problems were met by the construction of the Stephens creek and Umberumberka dams, 10 and 19 mi. distant respectively, and by 63 mi. of 24-in. welded steel pipeline from the Darling river. Annual evaporation is reduced by dusting powdered cetyl alcohol on the surfaces of the reservoirs to form a tenacious monomolecular film. (Cs. C.)

BROKER, an agent who for a commission or fee (often referred to as brokerage) bargains or negotiates between his principal and a third party for the purchase or sale of goods, real estate, stocks and bonds, insurance and commodities without having title

and usually without having possession of the property or rights involved. When he does have possession, the broker holds it as bailee or in a fiduciary capacity. The broker is an independent contractor, not a servant, and may be an individual, firm or corporation. Every broker is, in a sense, an agent, but every agent is not a broker since agency (*q.v.*) is a broader and more comprehensive term. A broker is often required by statute or ordinance to take out a licence and pay a tax or fee for the privilege of engaging in the brokerage business.

The broker has whatever authority he requires to carry out his duties, whether this authority is expressly conferred on him or implied as necessary. His acts are binding on his principal unless he exceeds his authority. A third person is not legally bound by secret instructions given by the principal to the broker but he is under obligation to ascertain the extent of the broker's authority. The broker, for example, may be given authority to warrant goods but usually has no such implied authority unless it is customary in his trade. He usually has no authority to buy and sell on credit unless such authority is expressly conferred or is customary in the trade. In the sale of merchandise, he has no authority to pass title and usually has no implied authority to receive payment unless the name of the principal is not disclosed. He usually has no authority to make contracts in his own name.

Brokers may have authority to fix or agree to prices and to bind their principals to sell or buy at such prices; they may be required to submit bids or offers to their principals for acceptance; or they may be limited to sales made at prices specified by their principals. A broker can neither purchase from nor sell to his principal unless the latter expressly assents thereto. The law does not permit a broker to act in his own personal interest to the detriment of his principal, as, for example, by making a secret profit for himself. This usually prevents a broker from representing opposite parties.

Brokers may have continuous relations with their principals or may act under a separate contract for each transaction. Contracts can usually be terminated at will unless granted for a definite period. If a broker is employed for a definite period and the principal revokes the contract earlier without cause he may be held liable for damages.

Merchandise Brokers.— There are three main classes of brokers selling goods: the free-lance broker, the manufacturer's agent and the selling or sales agent. Free-lance brokers are usually not limited to territory and may sell or buy at any place where opportunity offers. They are not permanently bound to any principal and may represent anyone who wants to sell or buy goods in their field. Manufacturer's agents sell part of the output of certain manufacturers with whom they maintain continuous relations and are limited as to territory, price and terms. They usually represent two or more manufacturers selling noncompeting equipment such as furniture and home furnishings or cloth and clothing. Selling agents usually sell the entire output of a given line of goods for one or more manufacturers with whom they maintain continuous relations. They often help to finance their clients or offer other sales and merchandise assistance, and, in essence, act as the sales department for their principals.

The chief functions of these three types of merchandise brokers are to sell goods, give information and advice to their principals and, in the case of selling agents, help to finance their principals. These brokers usually sell to industrial buyers, wholesalers, institutions and some of the larger retailers. One broker may represent several producers and thus make it possible to spread sales expense. Commissions to merchandise brokers typically vary from a fraction of 1% to 10% or more depending upon the services rendered and the commodities handled.

Buying Brokers.— Brokers who specialize in buying merchandise for their principals are known as buying brokers and are found in lines such as hardware, groceries, produce, textiles and apparel. These brokers may locate goods for their principals, negotiate purchase contracts, sometimes secure quantity prices by combining the orders from several buyers, close the contracts and give their principals price information. There are some brokers who represent buyers but receive their commissions from sellers. The

Robinson-Patman amendment to the Clayton Anti-Trust act prohibited U.S. brokers from rebating brokerage commissions to the buyers, but statutory prohibition of rebating is not commonly found in other parts of the world.

In the U.S. garment trade, most resident buyers are paid by their retail store clients by fees, commissions or a combination of the two. Their services consist of locating desirable goods for examination by store buyers, giving information on fashions and prices and making purchases. Many resident buyers are independent business concerns operating for profit; others are owned co-operatively by a number of stores. In the hardware trade, purchasing agents operate to give wholesale buyers information on prices and sources of goods and to make purchases for them. They obtain a large part of their income from the sale of information services to their subscribers.

Services allied to those performed by brokers are carried on by factors and commission merchants. Factors aid in financing and marketing, principally by assuming responsibility for credit transactions by purchasing or lending on accounts receivable and also by lending funds to business concerns. The factor can and often does act as a broker in finding purchasers for goods as well as acting as principal in the credit operations. Factors were originally found principally in the textile trades but have spread into other lines. Commission merchants typically offer for sale goods that are sent to them on consignment and receive as commission a percentage of the sales price. They are thus brokers and also agents in that they pass title to the buyer. Factors and commission merchants often have actual or constructive possession of the principal's goods, often have a special property interest in the goods, and often make contracts without disclosing the name of the principal. Their authority and powers are necessarily broad.

Real Estate Brokers.— The real estate broker or, as he is known in Great Britain, the estate agent, is the intermediary who brings parties together and assists them in negotiating a contract of sale or rental of real estate. He usually performs his services for a commission or fee. Many brokers also negotiate loans and mortgages incident to transfers of real estate. The powers of real estate brokers are limited as compared to those of real estate agents, and their duties and powers are to be found in the law of the locality and in specific agreements between parties. The real estate broker's authority is derived from the express act or word of his principal as well as being implied from the principal's conduct. If a broker exceeds his authority, his principal may repudiate the transaction and the broker will lose his commission. As in other brokerage situations, the broker's authority to act may be general or special. General authority gives the broker broad powers to represent and to bind the principal while special authority limits him to representing the principal for a specific purpose.

Insurance Brokers.— United States.— The insurance broker is one who performs brokerage activities in the field of insurance. He ordinarily represents the purchaser of insurance and is remunerated on a commission basis. Most of his income is derived from the insurance company, although it is not uncommon for him to charge the insured a fee for services performed not compensated by commission. The broker solicits the insurance from potential purchasers and assists them in selecting the type of insurance they desire.

The broker is customarily paid a commission on the premium by the insurer with whom he places the business, the commission being less than that paid an agent of the company. The broker is not the company's agent but is free to place his business with any insurance firm. In fire, marine and casualty insurance, the broker occupies an extensive and important position. Individuals or companies that have large and varied insurance programs often find it desirable to have a representative transact business for them. In these fields, brokers have substantial importance because of the many different policies that firms must buy and because the technicalities are such as to make the advice and knowledge of the expert broker valuable. Brokers place their business in domestic or foreign markets, depending upon its characteristics and the availability of coverage, and perform an indispensable function in the market-

ing and placement of insurance and in the distribution of insurable risks. Brokers can and do represent some companies as agents and act as brokers for other parts of their business. (O.R. G.)

Great Britain and Other Countries.—There are very early references to insurance brokers in England. As long ago as 1395 a statute referred to their office as one of antiquity and credit. In 1598, Stow's survey of London stated there were 30 in the City of London and described them as "such as are assistance to the merchants. . . . in the writing of insurance and policies and such like." The "assistance" thus given was the securing of personal guarantors to cover loss by perils of the sea.

This task of assistance is the keynote of the insurance broker's function and has been considerably extended by a number of factors which have operated in the second half of the 19th century and during the present century. There is the vast economic expansion of this period which has made it necessary for insurance brokers to extend their activities beyond marine insurance (*q.v.*). This was coupled with the entry of Lloyd's (*q.v.*) into the non-marine insurance market and the development of composite insurance companies, that is to say, companies transacting several classes of insurance business instead of specializing in one only. The development of workmen's compensation insurance also gave a great impetus to the broadening of activities.

There is no legal definition of an insurance broker but an old case, *Power v. Butcher* (1830) 10. B & C 329, refers to an insurance broker as one who arranges policies of insurance. Generally, the opinion is that the broker is agent to the insured. There are no specific legislative controls, such as licensing or registration, over brokers in England. Anyone can set up as a broker and describe himself as such. There are, however, three bodies which can exercise control over brokers. The committee of Lloyd's will elect a person or firm as a member once ability to comply with financial requirements and evidence of character and integrity have been shown. Such are known as Lloyd's brokers and a large proportion of the business of Lloyd's is derived from this source. Secondly, the Corporation of Insurance Brokers lays down qualifications as to suitability and rules of conduct by its members, who may be styled incorporated brokers. These are the two most influential bodies; many Lloyd's brokers are also incorporated brokers, and vice versa. In 1948 an Association of Insurance Brokers was formed to cater for the needs of those who are not members of either of the other two bodies. Most of the leading brokers in England are members of Lloyd's and of the corporation.

The Corporation of Insurance Brokers defined a broker, whether a person or firm, as one whose sole business is the placing and arranging of insurances on commission. It insists there shall be no preferential treatment in the placing of such business with any particular insurer. This is the key test, but it would be wrong to assume that to the modern broker this is the primary duty. The forms of insurance are so varied that a high level of technical knowledge is required. Competition demands a shrewd knowledge of the market so that the best terms, as measured by premium charged, breadth of coverage and policy conditions can be obtained for clients. At the top level, brokers provide not only these services but technical services to insurers such as surveying and policy drafting. On the nonmarine side of insurance, this is particularly important where Lloyd's is concerned and, although companies have their own survey departments, joint surveys by company and broker surveyors are by no means infrequent. In general brokers act in an advisory capacity, safeguarding the clients' interests while the terms are negotiated, at the renewal of the policy and throughout its life.

Although serving the insured in this way, their remuneration is received from the insurer by way of commission, usually called brokerage. The rate varies according to the class of business and, in a competitive market, between one insurer and another. It is understood that Lloyd's pay is a higher rate of brokerage than the companies.

Although insurance brokers play a dominant part in arranging insurance, their position regarding losses is less significant, though by no means unimportant. Both in marine and nonmarine insurance, brokers may submit claims on behalf of the insured. Losses

are settled by average adjusters and loss assessors respectively and brokers will hold a watching brief for the insured. On the marine side, large brokers maintain a claims department, but this is not usual in the nonmarine branch. Any remuneration for services where claims are settled must be paid by the insured, and there is a marine custom to pay brokers for their service $\frac{1}{2}\%$ for total losses and 1% for partial losses on the amount of indemnity. No such practice exists in nonmarine insurance.

The foregoing relates to direct insurances; *i.e.*, the placing by the insured of their insurance direct with insurers. The volume of liabilities thus accumulated has made it imperative for insurers to effect reinsurance in order to limit their net liabilities to reasonable proportions. Such reinsurance arrangements are effected through reinsurance brokers, who may specialize in reinsurance as such, or may be a separate department or a subsidiary of a direct broker. The expertise required by the reinsurance broker is the capacity to view the merits of a block of insurance business rather than of any single contract. Reinsurance is arranged internationally and remuneration is on the basis of a commission on the net premium ceded, plus a profit commission calculated on the basis laid down in the reinsurance contract, commonly known as a treaty.

The most powerful and influential insurance market in the world is London, and the part played by insurance brokers there is clearly important. Elsewhere, the position varies. Thus, in the Scandinavian countries, there are no brokerage firms as such and business is obtained through general agencies. In the far east, brokers are little more than mere business getters, placing their business with those insurers who will pay the highest commission. In Greece and in some parts of the near and middle east, brokers are remunerated by agents or subagents from the latter's commission.

Registration and licensing practice varies. Thus in Quebec province, the distinction between agent and broker has been eliminated by statute and a licence can be obtained only on the recommendation of an insurance company. In South Africa, a broker must be licensed in accordance with the requirement of the department of revenue. Specific provision, however, as to Lloyd's brokers are made in the Insurance act of 1943. Licence is required by law in France, but none is required in Belgium. In South America, most of the states adopt the practice of statutory licensing.

As in England, the power of the broker varies with the size and the functions he can carry out. In the Netherlands, Belgium and France, the position is not dissimilar but is characterized by the bourse system. This is a form of exchange, possibly inspired by Lloyd's organization and operates notably at Rotterdam and Antwerp and to a lesser extent at Paris. Here again are highly competitive markets where brokers do considerable work by way of surveying, valuing property to be insured, drafting policies, and collecting and distributing premiums. To some degree they may be more influential than their counterpart in London in varying the insurance contract. They also take some part in loss settlements by submitting claims and eventually collecting the payments from the various insurers interested and paying the proceeds to the insured, for which they may receive a remuneration of 1% of the amount of the indemnity.

An unusual feature found in London is the combination of agent and broker whereby the same firm may be an agent to one company for some class of business, but a broker in every other respect. (See also INSURANCE.) (GA. S.)

Ship Brokers.—Another example of brokerage service is that provided by ship brokers who are so important in the buying, selling and chartering of ships and shares in ships, solicitation of cargoes for export, auctions of freight unloading, settlement of claims for lost cargoes and maritime disasters and providing ships' needs. Ship and maritime brokers operate in the principal ports of the world. Similar activities are performed by trucking brokers as well as by brokers specializing in air transportation or operating in all lines of transportations. (See also SHIPPING INDUSTRY: Ship Operation.)

Future Contracts on Exchanges.—Brokers are important in executing contracts for the future purchase or sale of goods on the commodity or produce exchanges such as the Liverpool Corn Trade

association, the Chicago Board of Trade, the New York Cotton exchange and the Chicago Mercantile exchange. They represent principals in buying and selling contracts, but on the exchanges they are principals and are liable for the fulfillment of their contracts. The rules of the exchanges require them to be men of financial responsibility and they must maintain margins with the exchange or its clearing association to cover their open contracts. The brokers, in turn, usually require their principals to keep sufficient margins with them to cover fluctuations in the prices of the commodities covered by the contracts. All contracts are presumed to be made in accordance with the rules of the exchange on which they are executed. (See also COMMODITY MARKET; FUTURES.)

Stockbrokers.—Representatives of stock brokerage houses perform brokerage services in the distribution and sale of securities in the primary and secondary securities markets. In the primary markets, where bonds and stocks are offered by issuers to potential buyers, stockbrokers perform the service of bringing buyers and sellers together. Brokers may represent either buyers or sellers and their powers depend upon express or implied contracts. For example, they may agree to offer a security issue on a "best-efforts" basis, receiving a commission on each individual share or bond sold, or they may act as underwriters who guarantee a successful sale and agree to indemnify the issuer if they fail.

In the secondary markets, stockbrokers make possible the sale of stocks and bonds between investors, either on organized exchanges or in the "over-the-counter" market. They buy and sell the securities for the principals by effecting private sales or, on the floors of public stock and bond exchanges of which they are members, upon instructions from the customers. A stock broker's powers are ordinarily much broader than those of ordinary brokers since they are often entrusted with the possession of securities and generally act in their own names. The mechanics of trading are many and varied and provide a rich example of the middleman function of brokers. Service is a very important facet of brokerage activities and nowhere is this more apparent than in finance and insurance. The relation between the broker and his customer is ordinarily one of confidence, good will and service. Custom, law and good business policy combine to lay down accepted business practices. (See also STOCK EXCHANGE; STOCKBROKER.)

Funds borrowed by members of a stock exchange or by factors in textile lines or by any of the many types of these varied and valuable middlemen are generally known as broker's loans and the monies received enable them to carry customers. Many lines of trades have broker's markets in which the public is not active but where members of an exchange trade with one another on their own behalf or on behalf of clients. They perform an indispensable function in their specialized lines of commerce. Probably their major stock in trade is that of experience and knowledge of their individual lines made available to many and varied potential clients. They are usually bound to only limited or no-agency contracts and are thus able to offer to new as well as to old potential trades expert middleman services that contribute to an economical, efficient and productive system of commerce.

(O. R. G.)

BROME, ALEXANDER (1620–1666), English Royalist poet who wrote drinking songs and satirical verses against the Rump parliament, was probably an attorney in the lord mayor's court or the court of the king's bench. Izaak Walton wrote an introductory eclogue to Brome's *Songs and Other Poems* (1661), a volume of songs, ballads, epistles, elegies and epitaphs. Brome's gaiety and wit won him the title of the "English Anacreon" in Edward Phillips' collection. *Theatrum Poetarum* (1675). Brome edited and contributed to a translation of Horace (1666), and was the author of a comedy. *The Cunning Lovers* (1654). He also edited two volumes of Richard Brome's plays. He died in London on June 30, 1666.

BROME, RICHARD (d. 1652), English dramatist and the most considerable of the minor Jacobean playwrights, was originally Ken Jonson's servant. This does not necessarily imply a lack of education in Brome, since Jonson expected his servant to read "a piece of Virgil, Tacitus, Livy or some better book to his

friends at supper." and Brome probably acted as his amanuensis. The relationship of master and servant developed into one of friendship, and knowledge of Brome's personal character is chiefly drawn from Jonson's sonnet to "my old faithful servant and by his continued virtue my loving friend . . . Mr. Richard Brome," prefixed to Brome's *The Northern Lasse* (published 1632).

Brome, together with Nathaniel Field, came under Jonson's personal tuition, and Jonson's influence is apparent in the way in which he develops his plots, his strongly marked characters and the amount of curious information to be found in his plays. Yet, although following the technique of his master, he lacks his greatness of mind. Brome was, however, a conscientious and able craftsman, continuing the Elizabethan dramatic tradition until the theatres were closed by order of parliament in 1642. His comedies are full of pictures of contemporary London and its life, which are of historical value and interest.

The Northern Lasse (produced 1629?) made Brome's reputation as a dramatist and was the most popular of his plays, although *A Joviall Cvev* (acted 1641, published 1652) is considered to be his best work. There are 15 of his comedies extant; two volumes of his plays were edited by Alexander Brome (of whom he was no relation) in 1653 and 1659.

BIBLIOGRAPHY.—The article by R. Bayne in *Cambridge History of English Literature*, vol. vi, pp. 224–232 (1907–16) gives an admirable account of Brome's work. *The Dramatic Works of Richard Brome* were ed. by R. H. Shepherd, 3 vol. (1873). See also E. K. R. Faust, *Richard Brome* (1887); H. F. Allen, *A Study of the Comedies of Richard Brome* (1912).

BROME GRASS, the name applied to the species of the genus *Bromus*. They are annual or perennial, low or tall grasses, with closed sheaths, flat leaf blades and open or contracted panicles of large spikelets. About 50 species occur in temperate regions; nearly half of the U.S. species are introductions, mostly from Europe. *B. catharticus*, a native of Argentina, was introduced into the southern U.S. states about mid-19th century and now appears spontaneously there. It is known as rescue grass or Schrader's brome grass and is a short-lived perennial adapted to humid regions with mild winters. Growth starts in the fall, continues through the winter, and the plants mature in early summer. It supplies a good amount of forage and is relished by livestock. *B. inermis*, the smooth brome, also known as Hungarian brome grass and awnless brome grass, also a perennial, is extensively grown for pasture and hay in the northern portion of the Great Plains from northern Kansas to Montana and eastward to Pennsylvania. It is adapted especially to regions of moderate rainfall and low to moderate summer temperatures. Two distinct types of smooth brome, differing in growth behaviour, are recognized; viz., the southern type which came originally from central Europe and is best adapted to the northern parts of the central Great Plains that have long dry periods and high summer temperatures, and the northern type, introduced from Siberia and adapted to Canada and the northern Great Plains.

As a pasture or hay grass, smooth brome, because of its palatability and high protein content, its good volume of leafy forage, and its tolerance to grazing and trampling, scarcely has an equal in the area of its best adaptation.

B. tectorum, known as downy chess, cheatgrass or downy brome, is either an annual or summer annual, introduced from Europe, that has spread to some extent over portions of the 11 far western states, except Arizona and New Mexico, occupying chiefly plains, foothills and intermountain valleys. Although it is one of the less palatable species of brome grasses, its local abundance where better plants are absent makes it a valuable early spring grazing plant for sheep, cattle and horses. A number of other annual species, although they furnish good grazing when young, occupy large areas on the Pacific coast, but because their season is very short are often considered to be troublesome weeds.

(J. M. BL.)

BROMELIACEAE, the bromelia or pineapple family, plants with three-parted flowers like lilies, but with contrasting sepals and petals. Except for a single African member it is strictly American, consisting of 45–50 genera and about 1,800–2,000 species. It includes the pineapple (*q.v.*) and the so-called Spanish moss, an

air plant that grows down from trees and mires in long gray streamers, and that ranges from southeastern United States to Argentina. Bromeliads are mostly herbs with a rosette of leaves and a spike or panicle of flowers. They are remarkable for the development of scales that enable the leaves to absorb water and even food efficiently; roots, being unnecessary, are often aborted, as in the Spanish moss, and the various species are able to thrive from the coastal deserts of Peru and the treeless crests of the Andes to the treetops of the Brazilian rain forest.

Bromeliads of the rain forest also collect water in their tank-like rosettes, thus providing the normal abode for animal life varying from protozoa to frogs. Mosquitoes, responsible for much malaria in Trinidad and southern Brazil, sometimes breed in the rosettes.

See L. B. Smith, "Bromeliad Malaria," *Smithsonian Report*, pp. 385-398 (1952); for nontechnical articles, especially on such horticultural genera as *Vriesea*, *Aechmea*, *Billbergia* and *Cryptanthus*, see the *Bromeliad Society Bulletin*, vol. i (1951).

BROMIDE, in chemistry, a compound of bromine with an element or an organic radical, or a salt of hydrobromic acid, such as sodium bromide. Various bromides are of value in medicine, especially potassium bromide. From the application of the term bromide in the sense of a sedative has arisen the colloquial meaning of a bromide as a platitude. See also BROMINE.

BROMINE, a chemical element that is a deep-red fuming liquid. It is corrosive to metals, irritating to the skin, and as a result of its unpleasant odour was given the name bromine from the Greek *bromos*, meaning "stench." In nature, bromine is found only in compounds. Traditionally obtained from salt deposits, the element is now produced in commercial quantities by the processing of ocean water. The most important use of bromine is in the manufacture of ethylene bromide, one ingredient of "antiknock" fluid for motor fuels.

Bromine is designated by the chemical symbol Br. Its atomic number is 35 and the atomic weight is 79.916.

History and Occurrence.—A. J. Balard in France first isolated bromine from bitters left after the evaporation of Mediterranean sea water, and recognized it as an element in 1826. In the United States, brines of Pennsylvania were worked for their bromine content as early as 1846; production from the salt deposits near Stassfurt, Ger., was reported in 1858 and dominated the market for about 50 years. Successful commercial recovery of bromine directly from ocean water was begun in 1934 near Wilmington, N.C.

In nature bromine occurs only in combination with metallic elements as bromides, and is distributed widely but very sparingly. Natural brines and saline deposits, particularly those containing much calcium chloride, are the richest sources. Their bromine contents vary from 0.02% to 0.5%. Ocean water contains 67 mg. per litre (0.0065%), and the proportion in the entire crust of the earth is about 0.0006%. By far the greatest part of the available bromine occurs in the ocean.

Production.—Much bromine has been recovered from brines or saline mother liquors in Michigan, Ohio, West Virginia and California, U.S., at Stassfurt and Alsace in Europe, and from the Dead sea. Other actual or potential sources of bromine have been reported in the Crimean region (Sivash sea) and in Italy, India, Siberia and north Africa. The processes employed gen-

PUYA RAIMONDII LARGEST KNOWN BROMELIAD, RISING 40 FT. FOUND IN THE SOUTH AMERICAN ANDES

erally involve the passage of chlorine and steam upward through a ceramic tower, at the top of which a spray of hot brine is introduced. Bromine is liberated, passed out with the steam and condensed. The condensate is separated into aqueous and halogen layers, the former of which is returned to the tower while the latter is subjected to purification by fractional distillation. Bromine about 99.8% pure can be obtained, the impurities being chlorine, moisture and organic matter.

After mid-20th century most of the bromine produced in the United States was extracted from ocean water. Other ocean-water plants were operating in Hayle, Cornwall, Eng., and at Marseilles, France. In ocean-water processes, air is used in place of steam and the halogen-laden air is mixed with sulfur dioxide so that hydrobromic and sulfuric acids are formed. These are absorbed in water from which the bromine is recovered by steaming out with chlorine as previously described. At one plant the air is treated directly with sodium-carbonate solution, in which the bromine reacts to form bromide and bromate. This solution is then treated with sulfuric acid in order to liberate free bromine.

Uses.—Most of the bromine produced after 1928 has been used in the manufacture of ethylene bromide, an ingredient of antiknock fluid for motor fuel.

This compound is also used in soil sterilization to destroy nematodes and other pests. Other major uses of bromine are in the manufacture of methyl bromide, a fumigant employed for insect control in the food industries, and of various dyes, particularly the bromo-indigos. Methylene chlorobromide has been found useful as a fire extinguisher fluid. Certain compounds such as bromoform and acetylene tetrabromide find application as gauge liquids because of their high specific gravity. Elemental bromine has relatively few uses, and it is generally converted into other compounds by the producer. Some is used as a laboratory reagent, for syntheses and as an oxidant in analytical chemistry.

Bromides of potassium, sodium, calcium, strontium, lithium and ammonium, as well as a number of organic bromides, have been used widely in medical practice. Their sedative action has been found to be a useful adjunct in the treatment of many conditions involving nervous hyperexcitability such as hysteria and nervous insomnia. Silver bromide is of great importance in photography. In common with silver chloride and iodide, it is light sensitive. Modern photographic emulsions contain one or more of these halides, the combination of silver bromide and a small amount of silver iodide being used in negative films.

Lithium and calcium bromides are useful as desiccants in air conditioning, while ferric and aluminum bromides serve as catalysts in bromination reactions. The alkali bromates are used as oxidizing agents. The baking characteristics of wheat flour are improved by the addition of a trace of potassium bromate.

Physical Properties (see accompanying table).—Bromine is the only nonmetallic chemical element that is liquid under ordinary conditions. It is classed in Group VIIA of the periodic system between chlorine and iodine in the halogen family. Bromine has two stable isotopes, Br⁷⁹ and Br⁸¹, and radioactive isotopes with mass numbers of 74-78, 80, 82-85 and 87-89 have been prepared. The electron arrangement in the outer (*N*) orbit is: 4s², 4p⁵. Bromine liquid and vapour are diatomic over a wide range of temperatures. The vapour is amber in colour, the liquid a dark amber-red and the solid almost black. A saturated solution in water is orange-red and on cooling yields a red crystalline hydrate of com-

Physical Properties of Bromine

Freezing point	−7.2° C.
Boiling point	58.8° C.
Critical temperature	311° C.
Critical pressure	102 atm.
Specific heat of liquid	0.107 cal./g.
Heat of fusion at m.p.	16.14 cal./g.
Heat of vaporization at b.p.	44.8 cal./g.
Density, 25° C.	3.1023 g./ml.
Coefficient of expansion	0.0011
Viscosity, 20° C.	0.99 centipoise
Surface tension, 20° C.	41.5 dynes/cm.
Refractive index, 25/D	1.6475
Dielectric constant	3.

position $\text{Br}_2 \cdot 10\text{H}_2\text{O}$. The solubility in water at 25°C . is 3.35 g. per 100 g. of solution but in the presence of bromide ions it is greatly increased through formation of the complexes Br_3^- and Br_5^- . Bromine is very soluble in all organic solvents but reacts with many. The electrode potential for the reaction $2\text{Br}^- \rightarrow \text{Br}_2 + 2e$ is -1.065 v. The covalent radius of bromine in its molecule is 1.11×10^{-8} cm. and the ionic radius of bromide ion is 1.96×10^{-8} cm. Liquid bromine is a poor conductor of electricity, having a resistance of about 8×10^{12} ohms per centimetre.

Chemical Properties.—The properties of bromine are intermediate between those of chlorine and iodine. It is a strong oxidizing agent and combines violently with certain elements, such as phosphorus, aluminum and potassium, giving off light. Sodium, on the contrary, reacts only in the vapour state with dry bromine. Hydrogen and bromine unite explosively when heated: light and catalysts also bring about their reaction. In the presence of moisture bromine attacks many metals to produce bromides. The most stable valence state of bromine is -1 , but positive valences of 1, 3 and 5 are known, compounds of bromine in pentavalent form (bromates) being especially easy to prepare. Aqueous solutions of bromine possess a strong bleaching and oxidizing action attributed to the formation and decomposition of hypobromite ion:

In the presence of alkalis, bromate and bromide are formed:

The latter reaction is reversed upon addition of an acid and furnishes a convenient laboratory method for preparing bromine solution.

Organic compounds react with bromine in three major ways. (1) unsaturated hydrocarbons form addition products; (2) compounds with replaceable atoms or groups yield substitution products; and (3) some substances such as aldehydes may be oxidized. The nature of the solvent used and the reaction conditions (temperature, light, catalysts) exert much influence on the reaction.

Compounds.—By burning bromine vapour in a stream of hydrogen one obtains hydrogen bromide (HBr), a very irritating, toxic gas which under atmospheric pressure condenses to a liquid at -67°C . and freezes at -87°C . The gas is colourless but fumes strongly in moist air, having a great affinity for water. The aqueous solution (hydrobromic acid), which may also be obtained by the hydrolysis of phosphorus tribromide, forms constant-boiling mixtures whose composition depends upon the pressure: at 760 mm. the mixture contains 47.6% HBr and boils at 124.3°C . Hydrobromic acid resembles hydrochloric acid closely but is somewhat more easily oxidized. It is one of the strongest acids. Upon treating the hydroxides, oxides or carbonates of many metallic elements with hydrobromic acid, or with bromine and a reducing agent, bromides are obtained. Their properties in general are similar to those of the corresponding chlorides, and they can be converted to chlorides by the action of chlorine. Several nonmetallic and amphoteric elements react with bromine to form liquid bromides which decompose in water.

Hypobromous acid (HBrO) and the hypobromites are unstable, decomposing easily to oxygen and hydrobromic acid or to bromates and bromides (see above). Bromic acid (HBrO_3) exists only in aqueous solutions, which may be obtained by adding the calculated quantity of diluted sulfuric acid to a solution of barium bromate. The acid is a strong oxidizing agent and it decomposes to oxygen and bromine when heated. Alkali bromates are produced by the auto-oxidation and reduction of bromine in alkaline solution and may be crystallized from a concentrated solution since they are less soluble than the bromides which are formed simultaneously.

Bromine does not react with oxygen under ordinary conditions but the oxides Br_2O , BrO_2 and Br_3O_8 have been prepared by spe-

cial methods. They are all unstable and must be kept at low temperatures. Other compounds of bromine include the fluorides, BrF , BrF_3 and BrF_5 ; iodine bromide, IBr ; cyanogen bromide, CNBr ; sulfur bromide, S_2Br_2 ; and phosphorus oxybromide POBr_3 . At low temperatures bromine forms a series of mixed crystals with chlorine, but there is evidence for the existence of the compound BrCl in the liquid and vapour states. (See HALOGENS)

Many thousands of organic bromine compounds have been synthesized and studied. Bromine can be introduced conveniently into most organic molecules and can be replaced by other groups more readily than can chlorine. A bromo compound resembles the corresponding chloro derivative but is usually more dense, less volatile, less combustible and less stable.

Analytical.—Inorganic bromides may be detected and determined by their reaction with silver nitrate in dilute nitric acid, producing a pale yellow precipitate of silver bromide which is sparingly soluble in ammonia. They may also be oxidized to bromates, which can be titrated iodometrically (J. H. van der Meulen, 1931), or to free bromine, which can be distilled from a chromic-acid solution.

BROMLEY, a municipal (1903) and parliamentary (1918) borough in Kent, Eng., lies 10 mi. S.S.E. of London by road. Pop. (1961) 68,169. Area 10.2 sq.mi. Its name is derived from the broom that grew prolifically in the neighbourhood. The town, which is mainly residential, lies on high ground north of the small river Ravensbourne in a well-wooded district. There are more than 600 ac. of public open spaces, including Hayes and Keston commons, in the borough. The former palace of the bishops of Rochester (now Stockwell training college) was erected in 1775. The manor belonged to this see as early as the reign of Ethelbert. In the garden a chalybeate spring known as St. Blaise's well, though now only a trickle, was a place of pilgrimage before the Reformation. The 13th-century church of St. Peter and St. Paul, with a Norman font, was destroyed in World War II except for the tower, but has now been reconstructed. Samuel Johnson's wife was buried there in 1752. Bromley college was founded by Bishop John Warner in 1666 for 20 poor widows "of loyal and orthodox clergymen." At its entrance is a pair of handsome wrought iron gates dated 1666. H. G. Wells was born at 57 High Street, Bromley, on Sept. 21, 1866, and a commemorative plaque now marks the site. Bromley has no major industries, although it has an excellent shopping centre. The musical festival is a notable annual event. About 2 mi. S. of the town are Hayes, the birthplace of William Pitt the younger, and Keston, where Wilberforce's oak is still preserved.

BROMSGROVE, an urban district in the Bromsgrove parliamentary division of Worcestershire, Eng., 13 mi. N.N.E. of Worcester by road. Pop. (1961) 34,474. It lies in an undulating district near the foot of the Lickey hills on the Birmingham-Worcester road.

There remain several picturesque half-timbered houses such as the old Hop Pole inn (1572). The church of St. John, mainly Perpendicular and largely of local sandstone, stands above the town. There is a well-known grammar school, founded by Edward VI (1553; refounded 1693), once attended by A. E. and Laurence Housman, and an open-air school for crippled children.

Bromsgrove is a market town with weekly cattle and produce markets, but there are also manufacturers; *e.g.*, wrought-iron work, drop forging, button making and railway car repairing. The ancient staple trade of nail making survives in a few families.

BRONCHIECTASIS is a dilatation of one or more of the bronchi, or larger air passages of the lungs. Usually it is of a cylindrical or saccular type, the latter being more serious because

the cavity cannot empty itself as readily. The causative factors may be congenital. although diseases (often inflammatory) of the lungs may cause a narrowing of the branches with a gradually developing distention beyond the narrowed portion. It is most commonly secondary to some form of bronchitis and may date back to infancy as the result of inflammatory measles, whooping cough, tuberculosis, etc. Pressure on the wall of a bronchus by a tumour, enlarged glands, etc., also may cause this condition. The symptoms are cough and copious expectoration, and diagnosis is made by the clinical history, physical findings and X-ray examination. The principles of treatment are symptomatic relief, postural drainage and in some instances surgery. See LUNG, DISEASES OF: *Bronchiectasis*; HEART AND LUNG, SURGERY OF: *Bronchiectasis*.

(F. L. A.)

BRONCHITIS, an acute or chronic inflammation of the bronchial tree. It is a confusing word because it is used interchangeably in both lay and medical parlance to mean either a specific disease or a symptom. To understand its significance it is necessary to recall something of the function and structure of the bronchi (see RESPIRATORY SYSTEM, ANATOMY OF). The primary function of the bronchi is to provide a pathway for air entering and leaving the lung. A secondary function is to eliminate bacteria and other foreign bodies that may be carried in with inhaled air as result of not having been filtered out in the nose or impacted on the back of the throat. Elimination of bacteria and other foreign bodies is aided by the ciliated epithelium that lines the mucosa of the major bronchi. The cilia are tiny hairlike structures projecting from the surface of the epithelial cells: they move with a wavelike motion, sweeping foreign material toward the upper respiratory passages. Mucous and serous glands that lie beneath the epithelium secrete sufficient sticky fluid to aid in the elimination of foreign material. The cough reflex is another important protective mechanism. Coughing causes forcible expulsion of air from the respiratory passages and accomplishes a more rapid upward movement of foreign material. Mucus or foreign bodies stimulate sensory nerve endings in sensitive portions of the mucosa and initiate the cough reflex.

Acute Bronchitis may be defined more accurately in the light of these remarks on the physiological anatomy of the bronchial tree. Any stimulus, chemical, physical or infectious, that is capable of irritating the respiratory tract will produce a series of functional changes in the bronchial mucosa. The small blood vessels in the bronchial wall will become dilated and congested and will lose cells and fluid into the surrounding tissue. The mucous and serous glands will be stimulated to secrete, and, if the irritation is sufficient, epithelial cells will be injured and will desquamate. The copious amounts of mucus secreted will be carried upward by the ciliated epithelium and will stimulate sensitive areas of the mucosa to initiate coughing. It will be seen, therefore, that the two most common symptoms of bronchitis, cough and expectoration of mucus, are exaggerations of normal mechanisms for clearing the respiratory tree. If bronchi are partially obstructed ventilation will be impaired and shortness of breath will develop.

Acute bronchitis may be precipitated by a variety of physical and chemical agents. These include hot or toxic gases inhaled by fire victims, fumes of strong acids, ammonia, certain volatile organic solvents, mar gases such as mustard and chlorine and irritating dusts such as silica and beryllium. The extent of symptoms will depend upon the degree of exposure, the toxicity of the agent and the reactivity of the individual's tracheobronchial tree. Usually associated with inflammation of the upper respiratory passages, acute bronchitis is a common prodromal symptom of a variety of infectious diseases such as measles, virus pneumonia, typhoid fever and typhus. Whooping cough is a specific tracheobronchitis caused by the bacteria *Hemophilus pertussis*.

Acute bronchitis refers also to a more specific disease entity that commonly complicates upper respiratory infections or influenza. These virus infections seem capable of breaking down resistance of the bronchial mucosa to invasion by a variety of pyogenic bacteria. The symptoms of this type of acute bronchitis are fever, chilly sensations, generalized aching, rhinitis, a feeling of congestion or tightness across the chest and a cough, first dry and

later productive of purulent sputum. This type of bronchitis is potentially dangerous, particularly in the very young and very old, because it may be complicated by pneumonia. It should be treated vigorously with specific chemotherapy (*i.e.*, antibiotics, sulfonamides, depending upon the infecting organisms), bed rest, ample fluids by mouth and control of cough if severe. Steam inhalation will frequently afford much symptomatic relief.

There are several rare types of acute bronchitis that deserve mention. Acute laryngotracheobronchitis is a disease affecting infants and young children. It was seen particularly after the influenza pandemic of 1918 and was described only sporadically thereafter. Associated with marked inflammation of the larynx, trachea and bronchi, there is membrane formation that may so obstruct the airways as to require tracheotomy. Acute bronchiolitis is a disease that affects the finer radicals of the bronchial tree and is often associated with some degree of broncho-pneumonia. Fibrinous bronchitis is a rare disease in which casts composed of fibrin and mucus fill portions of the bronchial tree and produce complete obstruction of these segments.

Chronic Bronchitis refers to long-standing inflammation of the bronchi and is often associated with fibrosis, emphysema, asthma and chronic sinusitis. In this condition the mucosa is permanently injured and there are areas of both hypertrophy and atrophy of the epithelium. Ciliary action is reduced or absent, and scarring produces rigidity and distortion of the bronchial tubes. Chronic infection is present and there is hypersecretion by the glandular elements.

The most common symptoms are chronic cough and expectoration. Often the secretions are sticky, difficult to raise and cause considerable obstruction to the bronchial tree. Usually there are no systemic signs of infection. Commonly the cough is aggravated by sudden change in temperature and is almost always worse in the winter months. Episodes of acute bronchitis are frequent since the respiratory tract is more susceptible to infection; pneumonias are common. Shortness of breath develops if there is sufficient obstruction to ventilation or if there is much associated pulmonary disease.

Treatment is largely symptomatic. Expectorants afford relief by eliminating sticky dry secretions from the bronchial tree. Drugs such as codeine may occasionally be necessary to control paroxysmal coughing, but habitual use may lead to addiction. If bronchospasm (caused by asthma) is associated, it may be relieved by bronchodilators such as ephedrine or aminophylline. Episodes of acute bronchitis should be treated vigorously with chemotherapy, but antibiotics mere of little value in the treatment of uncomplicated chronic bronchitis. A warm dry climate during the winter months is frequently of value.

Excessive smoking will aggravate the symptoms of chronic bronchitis but will rarely cause a cough in the normal person. Although so-called "smoker's cough" is usually due to chronic bronchitis, it may be a symptom of more serious disease such as cancer or tuberculosis. Unexplained cough should always be investigated, and no examination of the lungs is complete without an X-ray. A normal chest X-ray is characteristic of chronic bronchitis, and abnormalities are caused only by associated disease such as pneumonitis, emphysema or fibrosis.

No abnormal shadow should be dismissed lightly as a "spot on the lung," for cancer of the lung and pulmonary tuberculosis begin as innocuous-appearing lesions; successful therapy depends upon early diagnosis. See also RESPIRATORY SYSTEM, DISEASES OF.

See R. L. Cecil and R. F. Loeb (eds.), *Textbook of Medicine*, 10th ed. (1959). (R. H. E.)

BRONG-AHAFO REGION stretches across the west African Republic of Ghana from the western border to the Volta region, its chief boundary on the north and east being the Black Volta and Volta rivers. Pop. (1960) 588,724. Area 14,900 sq.mi. Created in 1959 from the western and northern parts of the original Ashanti (*q.v.*) region, the Brong-Ahafo region has three principal physical divisions: (1) in the centre, a westward continuation of the Kwahu plateau of Voltaian sandstones, rising to 2,000 ft. and forming the watershed between south-flowing rivers (Bia, Tano) and right-bank tributaries of the Volta; (2) south of this divide

a dissected peneplain of Pre-Cambrian metamorphic and intrusive rocks averaging 1,000 ft. elevation; (3) a fairly steep descent northward from the plateau to a plain of Voltaian sandstones mostly below 500 ft. Near Bui in the northwest resistant rocks along the Black Volta cause rapids potentially useful for hydro-electricity.

South of Wenchi the annual rainfall generally exceeds 50 in.; vegetation and soils resemble those in the adjoining part of the Western region. North of Renchi the rainfall is in places less than 45 in. and the thin sandy soils, exposed to dry harmattan winds, support savanna woodland.

The forested southwestern section, especially around Sunyani, is economically the best developed (cocoa, timber). In marginal areas coffee is of increasing importance but the prospects for food crops are limited by remoteness and lack of communications. In the northern savanna section the long dry season (Nov. to March) precludes cultivation of the usual forest crops and yams predominate, especially around Atebubu; maize (corn) and cassava are also grown. Nevertheless, much of this section is uninhabited because of tsetse diseases, poor soil and communications, and perhaps from the former prevalence of slave raiding in this zone between Ashanti and the north.

Throughout the region large settlements are the exception; most places have 500–1,000 inhabitants or less. The chief concentrations are along the three main roads leading from Kumasi northward through Wenchi, Nkoranza and Atebubu, and along the road leading from Kumasi through Sunyani and Dormaa-Ahenkro to the Ivory Coast. Even the east-west secondary road between Kete-Krachi and Atebubu in the northeast savanna tract forms an active farming zone, largely for immigrant communities from northern Ghana.

The regional capital is Sunyani (pop. c. 12,000). Former administration of this widespread region as part of Ashanti tended to make Kumasi the main focus of routeways, and new links with transverse lines of communication are needed to make Sunyani an effective administrative centre. The headquarters of the administrative centre are Sunyani, Goaso, Wenchi and Atebubu.

(ER. A. B.)

BRONGNIART, ADOLPHE THÉODORE (1801–1876), French botanist best known for his work on fossil plants, was the son of the geologist Alexandre Brongniart. He was born in Paris on Jan. 14, 1801. In 1831 he became assistant to R. L. Desfontaines at the Muséum d'Histoire Naturelle, and two years later succeeded him as professor, a position he continued to hold until his death on Feb. 18, 1876.

Brongniart's paper on the classification and distribution of fossil plants (1822) was followed by others bearing chiefly upon the relation between extinct and existing forms. His important *Prodrome* (contributed to the *Grand dictionnaire d'histoire naturelle*, 1828) brought order into chaos by a classification in which the fossil plants were arranged, with remarkably correct insight, along with their nearest living allies; it formed the basis of all subsequent progress in that direction. It is of special botanical interest because, in accordance with Robert Brown's discoveries, the Cycadeae and Coniferae were placed in the new group *Phanérogames gymnospermes*. In this book attention was also directed to the succession of forms in the various geological periods.

Brongniart's great *Histoire des végétaux fossiles*, which itself was not destined to be more than a colossal fragment, was published in successive parts from 1828 to 1837. His other important palaeontological contributions are his observations on the structure of *Sigillaria* (*Arch. Mus. Hist. Nat.*, vol. i, 1839) and his researches on fossil seeds, of which a full account was published posthumously in 1880.

His memoir "Recherches sur la génération et le développement de l'embryon des Phanérogames" (*Ann. Sci. Nat.*, vol. xii, 1827) contains the first valuable account of the development of the pollen; as well as a description of the structure of the pollen grain, the confirmation of G. B. Amici's (1823) discovery of the pollen tube the confirmation of R. Brown's views as to the structure of the unimpregnated ovule (with the introduction of the term *sac embryonnaire*) It shows how nearly Brongniart anticipated

Amici's subsequent (1846) discovery of the entrance of the pollen tube into the micropyle, fertilizing the female cell.

Brongniart's systematic work is represented by a large number of papers and monographs, many of which relate to the flora of New Caledonia, and by his *Énumération des genres de plantes cultivées au Muséum d'histoire naturelle de Paris* (1843; 2nd ed., 1850), which is a landmark in the history of classification in that it formed the starting-point of the system, modified successively by A. Braun, A. W. Eichler and A. Engler, later adopted in Germany.

With J. V. Audouin and J. B. A. Dumas, his future brothers-in-law, he established the *Annales des sciences naturelles* in 1824; he also founded the Société botanique de France in 1854, and was its first president.

For accounts of his life and work see *Bull. de la Soc. géol. de France* (1876), and *La Nature* (1876); the *Bulletin de la Soc. bot. de France* for 1876, vol. xxiii, contains a list of his works.

BROWNIART, ALEXANDRE (1770–1847), French mineralogist and geologist, whose work as director of the Sèvres porcelain factory and the researches of an able band of assistants enabled him to lay the foundations of ceramic chemistry. The son of the eminent architect who designed the Bourse and other public buildings of Paris, he was born in that city on Feb. 5, 1770, and became professor of natural history in the Collège des Quatre Nations. In 1800 he was made director of the Sèvres factory, a post which he retained to his death, and in his hands it became the leading factory in Europe.

He succeeded René Just Haüy as professor of mineralogy in the Museum of Natural History; but he did not confine himself to mineralogy, for among his contributions is the division of reptiles into the four orders of Saurians, Batrachians, Chelonians and Ophidians. Brongniart died in Paris on Oct. 7, 1847. His *Traité des arts céramiques* (1844) is a classic.

BRONSART VON SCHELLENDORF, PAUL (1832–1891). Prussian soldier and general staff officer, was born at Danzig on Jan. 25, 1832. He entered the Prussian guards in 1849. During the war of 1870 he was chief of a section on the great general staff, and conducted the preliminary negotiations for the surrender of the French at Sedan. As minister for war (1883–89) he carried out many important reforms in the Prussian army, in particular the introduction of the magazine rifle. He was appointed in 1889 to command the 1st army corps at Königsberg, and died on June 23, 1891, at his estate near Braunsberg. Bronsart's military writings include two important works: *Ein Rückblick auf die taktischen Rückblicke* (and ed., 1870); and *Der Dienst des Generalstabs im Frieden und im Kriege* (1st ed., 1876; 3rd ed., revised by General Meckel, 1893; new ed. by the author's son, 1904), a comprehensive treatise on the duties of the general staff. Of the latter, the edition of 1893 was translated into English and issued officially to the British army as *The Duties of the General Staff*; the edition of 1904 was reissued in English by the general staff, under the same title, in 1905.

BRÖNSTED, JOHANNES NICOLAUS (1879–1947), Danish physical chemist, is best known for his theory of acids and bases. He was born Feb. 22, 1879, at Varde, West Jutland. After receiving degrees in chemical engineering (1899) and chemistry (1902) from the University of Copenhagen, and after brief employment in an electro-technical concern, Bronsted became professor of physical chemistry at the university and professor of inorganic chemistry at the Polytechnic institute (1908). In 1930 he became director of the Physico-Chemical institute in Copenhagen. His contributions comprise studies in general thermodynamics, including a new system dealing with the relation between heat and work, chemical affinity, interaction theory of electrolytes, separation of isotopes (with G. Hevesy), reaction kinetics, thermodynamic properties in relation to molecular size and colloidal and high molecular weight phenomena. A proponent of an acid-base theory and an authority on the catalytic properties and strengths of acids and bases, he considered it possible to write all reactions of acids with bases in the familiar symmetrical form:

His career and honours included the Oersted medal in 1928;

visiting professor at Yale in 1929; honorary member of the British Academy of Arts and Sciences in 1929; fellow of the Royal Society in 1935; and election to the Danish parliament in 1947. He wrote texts in inorganic and physical chemistry. He died December 17, 1947, in Copenhagen. See ACIDS AND BASES: *Brønsted-Lowry Definition*. (V. Bw.)

BRONTË, CHARLOTTE (1816–1855), **EMILY** (1818–1848) and **ANNE** (1820–1849). English novelists, were all three distinguished for the regional quality of their work and Charlotte and Emily for passion and imaginative power. The personalities of women in conflict with their natural desires and their social condition were presented by Charlotte with a frankness and ardour that marked a new stage in the 19th-century novel, while Emily's fierce and tragic *Wuthering Heights* was unparalleled in her time both in its primitive power and its intricate dramatic form. They were the children of Patrick Brontë, an Irishman, who was born at Emdale, County Down, March 17, 1777. His paternal name was Brunty, but he changed the spelling in England, apparently to conform with that in Nelson's title of duke of Bronte. Although humbly born, he was able to enter St. John's college, Cambridge, in 1802. Apart from his own savings, he was helped by the Wesleyan Methodists, who were strong in County Down and not yet wholly detached from the established church. Methodist connections and influences pervade the Brontë background and allusions to Methodism make sparse but significant appearances in the sisters' writings. Their passion has been interpreted as a Methodist passion transferred to secular objects. Patrick Brontë took his degree in 1806 and became curate in succession at Wethersfield, Essex; at Hartshead, Yorkshire, where he met and married in 1812 Maria, daughter of Thomas Branwell of Penzance, a Methodist, and where his elder daughters Maria (1813–25) and Elizabeth (1814–25) were born; and at Thornton, Yorkshire, where Charlotte was born on April 21, 1816. Patrick Branwell on June 26, 1817, Emily Jane on July 30, 1818 and Anne on Jan. 17, 1820. Three months after Anne's birth, her father became rector of Haworth, nine miles from Bradford, where he remained for the rest of his life. There Mrs. Brontë, a delicate woman, died of cancer on Sept. 15, 1821.

After Mrs. Brontë's death her sister Elizabeth Branwell joined the household at Haworth. Branwell was her favourite, but she instructed the girls, especially in needlework, and did her duty by them. She had no sympathetic intimacy with them, however, and her austere Methodism oppressed them, especially Anne. Branwell was educated by his father, a man of marked intelligence (he published books and stimulated his children's intellectual interests), fond of his family but eccentric and unsocial in his habits, though a conscientious parson. Thus the children were left very much to themselves. They read whatever they could lay hands on, including newspapers, and rambled on the moors. They were happy and very precocious, but this sequestered upbringing left the girls with a crippling shyness and deprived Branwell of the companionship of his equals, which might have proved steadying.

In 1824 Mr. Brontë sent Maria and Elizabeth to school at Wakefield but soon transferred them to the recently opened Clergy Daughters' school at Cowan Bridge, near Kirkby Lonsdale, Lancashire, where Charlotte and then Emily joined them. The fees were very low, the food unattractive and the discipline harsh. When Charlotte recorded her memories of this school in the "Lon-ood" of *Jane Eyre* she was unaware of exaggerating. Her description was challenged, however, and the subject has been much debated. It is agreed that, during the months the Brontë sisters were there, the school was badly run and the girls sickly. What exaggeration there was derived from the keen sensibilities of a highly intelligent and passionate child, who saw her two elder sisters sicken and taken home to die, an experience that left deep traces on both Charlotte and Branwell.

Charlotte and Emily returned home in June 1825 and for over five years the children learned and played there. Here belongs the inception of those sustained imaginative games, issuing in an enormous output of midget books, written in minute script, which have attracted much attention. The four children invented the Kingdom of Angria and jointly elaborated its wars, its politics, its

aristocracy and their feuds and loves. At some time, probably in 1831 when Charlotte was sent to Miss Wooler's school at Roe Head, near Huddersfield, Emily and Anne seceded school and founded their own Kingdom of Gondal, leaving Charlotte and Branwell to conduct the affairs of Angria. These complex romantic sagas were kept going by the sisters well into their twenties. Negligible as literature, they were the training ground of the Brontë genius. Themes and situations in their published work were first adumbrated here and worked on at all stages from adolescence to maturity. Many Angrian chronicles are extant, but all the Gondal prose has been destroyed. It is, however, plain from the manuscripts that many of Emily's poems are dramatic utterances of Gondal characters, and from them it has proved possible to draw a dubious outline of the lost corpus. The Angrian and Gondal day-dreams have a deep psychological interest. Charlotte early recognized the compensatory nature of her dream and was troubled by guilt at the discrepancy between it and the sober, restricted life before her. There is no sign that Emily felt this division. She filled Gondal with the growing weight of her own thoughts and emotions until the fantastic husk fell off and Gondal was revealed as Yorkshire. Anne wrote Gondal verse and prose but her novels are strictly and responsibly realistic, bearing no trace of the dream, which may have become, for her, chiefly a medium of communication with Emily. Branwell's tragedy seems to have been that he ceased to be able to distinguish between obsessive day-dream and reality.

At Roe Head, where she stayed a year, Charlotte made lasting friendships with Mary Taylor and Ellen Nussey; her correspondence with Ellen, which continued till her death, has provided much of our knowledge of her. In 1832 she came home to teach her sisters and for three years they lived, studied and wrote together at Haworth. The whole family delighted in drawing and all except Charlotte were musical. The moors, with their changes of weather and season, were their exhilarating playground. In all their books the Brontës show themselves countrywomen. In 1835 Charlotte returned to Roe Head as a teacher. She wished to improve her family's position and this was the only outlet that was offered to her unsatisfied energies. Branwell, moreover, was to be started on his career as an artist, and it was needful to supplement the family resources. Emily accompanied her as a pupil but was too wretched with homesickness to remain, and her place was taken by Anne. The work with its inevitable restrictions was uncongenial to Charlotte. She fell into ill-health and melancholia and took fright at the state of health of the always delicate Anne, who left at the end of 1837. In the summer of 1838 Charlotte terminated her engagement. Emily, who had spent six exhausting months as teacher in Miss Patchett's school at Law Hill near Halifax, had likewise resigned her post, and the sisters were at home again.

In 1839 Charlotte declined a proposal from the Rev. Henry Nussey, her friend's brother, and some months later one from another young clergyman. In the same year she and Anne made brief and unsuccessful experiments as governesses. The hardships and anomalies of the position are reflected in their novels and impressed public opinion, but it is doubtful if Charlotte, touchy and inhibited by her duties from imaginative creation, could ever have been contented in such a post. Anne endured better and presently established herself with the Robinsons at Thorpe Green, near Boroughbridge, Yorkshire, where she stayed for four years (1841–45). At the same time Charlotte's ambition to make the practical best of her talents and the need to pay Branwell's debts urged her to spend some months as governess with the Whites at Upperwood House, Rawdon. Branwell's talents for writing and painting, his good classical scholarship and his social charm had engendered high hopes of him. He had sent specimens of his writing to Wordsworth but had received no encouragement; Charlotte, at about the same time (Jan, 1837), had had a similar experience with Robert Southey. At the end of 1837 Branwell had set up as a portrait painter in Bradford and had worked steadily for a year, but he was fundamentally unstable, weak willed and intemperate, and the venture collapsed. After six months as tutor in Broughton-in-Furness, he was working as clerk-in-charge at Sowerby Bridge on the Leeds and Manchester railway by Sept. 1840 and from there

was transferred to Luddenden Foot, but was dismissed in Jan. 1842 for culpable negligence.

Meanwhile his sisters had planned to open a school together, which their aunt had agreed to finance. and in Feb. 1842 Charlotte and Emily went to Brussels as pupils in the Pensionnat Heger to improve their qualifications in French and acquire some German. Emily also studied and later taught the piano. The talent displayed by both brought them to the notice of M. Constantin Heger, a fine teacher and a man of unusual perception. Charlotte was on the whole happy, though as a staunch Protestant she despised her Catholic surroundings. Emily, while working with stubborn resolution, pined for the liberty of home. The death of Miss Branwell in October summoned them to Haworth. She had bequeathed each of her nieces a sum that may have amounted to £300—specification is lacking—but they put their money aside for a greater need. Emily remained at Haworth to keep house while Branwell joined Anne as tutor at Thorpe Green and Charlotte returned to Brussels as pupil-teacher. She stayed there during 1843 but was lonely and depressed. Her friends had left Brussels and Mme. Heger appears to have become jealous of her. The nature of Charlotte's attachment to M. Heger and the degree to which she understood herself have been much discussed. His was the most interesting mind she had yet met and he had perceived and evoked her latent talents. His strong and eccentric personality appealed both to her sense of humour and to her affections. She offered him an innocent but ardent devotion, and he tried to repress her emotions. The letters she wrote to him after her return may well be called love letters. When, however, he suggested that they were open to misapprehension, she stopped writing and applied herself, in silence, to discipline her feelings. Shirley's indignation at Moore's assumption that she loves him (in her novel, Shirley) may well reflect part of her reaction. However we interpret them, her experiences at Brussels were cardinal to her. She received a strict literary training, became aware of the resources of her own nature and gathered material that served her, in various shapes, for all her novels.

In 1844 Charlotte endeavoured to start a school she had envisaged in the parsonage itself, as her father, whose sight was failing, could not be left. Prospectuses were issued, but no pupils were attracted to distant Haworth. In 1845 Anne left the Robinsons, and soon afterward Branwell was dismissed, charged with making love to his employer's wife. The sisters believed the fault lay with Mrs. Robinson and Charlotte transmitted this view to Mrs. Gaskell, who embodied it in the first edition of her *Life of Charlotte Brontë*, but was forced by Mrs. Robinson's representatives to withdraw and apologize for the passages in question. Whatever happened, it finished Branwell. He spent the last three years of his life at Haworth, incurring debts, drinking, taking opium, alternately blaspheming and repenting, until he died of his excesses, a profound grief to his father and sisters, an obstacle to his sisters' hopes and a great and tragic stimulus to their genius.

In autumn 1845 Charlotte came across some poems by Emily and this led to the publication in 1846 of a joint volume of *Poems* by Currer, Ellis and Acton Bell; the pseudonyms were assumed to preserve secrecy and avoid the special treatment they believed reviewers accorded to women. The book was issued at their own expense. It received few reviews and only two copies were sold. Nevertheless, a way had opened to them and they were already trying to place the three novels they had written. By midsummer 1847 Emily's *Wuthering Heights* and Anne's *Agnes Grey* had been accepted by Newby, but Charlotte had failed to place *The Professor*. She had, however, nearly finished *Jane Eyre*, begun in Aug. 1846 in Manchester where she was staying with her father for an operation to his eyes; and when Smith, Elder and Co., declining *The Professor*, declared themselves willing to consider a three-volume novel with more action and excitement in it, she completed and submitted it at once. It was accepted, published less than eight weeks later, on Oct. 16, 1847, and had an immediate success. In December Newby brought out *Wuthering Heights* and *Agnes Grey*, and in June 1848 Anne's *Tenant of Wildfell Hall*, which sold well. Reviewers had already suggested that *Wuthering Heights* was an earlier work by Currer Bell and now Newby offered the

American rights of *The Tenant* as by the author of the successful *Jane Eyre*, and in July Charlotte and Anne were forced to go to London to acknowledge their identities to their publisher.

The year that followed was a tragic one. On Sept. 24 Branwell died. Emily caught cold at his funeral, fell into rapid consumption, refused all medical help and died on Dec. 19. Immediately afterward, Anne, Emily's closest friend, sickened of the same disease; Charlotte put aside *Shirley*, on which she was working, to nurse her. Anne submitted dutifully to treatment but died on May 20, 1849, at Scarborough. Charlotte completed *Shirley* in the empty parsonage and it appeared in October. In 1850 Smith, Elder and Co. republished *Wuthering Heights* and *Agnes Grey* with Charlotte's "Biographical Notice" of her sisters. In the following years Charlotte went three times to London as the guest of her publisher, George Smith, and his mother; met Thackeray and other literary men and women; and sat for her portrait by George Richmond. She went twice to the Lakes, where she stayed in 1851 with Harriet Martineau, went to Scotland, visited Mrs. Gaskell in Manchester and entertained her at Haworth. *Villette* came out in Jan. 1853. Meanwhile, in 1851, she had declined a third offer of marriage from James Taylor, a member of Smith, Elder and Co. Her father's curate, Arthur Bell Nicholls (1817-1906), an Irishman, was her fourth suitor. It took some months to win her father's consent, but they were married on June 29, 1854, in Haworth church. They spent their honeymoon in Ireland and then returned to Haworth, where her husband had pledged himself to continue as curate to her father. He did not share his wife's intellectual life, but she was happy to be loved for herself and to take up her duties as his wife. She began another book, *Emma*, of which some pages remain. Her pregnancy, however, was accompanied by exhausting sickness and she died on March 31, 1855. Nicholls stayed in Haworth until Brontë's death in 1861, when he went back to Ireland.

The absorbing personal history of the Brontë family has stimulated many writers. Haworth is a place of pilgrimage and Haworth parsonage a Brontë museum. Plays and novels have been written about them and the Brontës have become living figures in popular imagination. Each of the family has had partisans and, in the attempt to define their distinct natures, the close bonds of temperament, conviction, imagination and pooled experience have sometimes been undervalued. Emily, the least known and praised in her lifetime, has proved the most interesting for modern biographers and critics. There has been a corresponding tendency to withhold justice from Charlotte as a writer and a woman. Without Charlotte's ambition we should not have had Emily's writings. Her editing of them, now under censure, aimed at removing obstacles between the contemporary reading public and work that she deeply admired. In what she wrote of her sisters she had it in mind to defend their "dear names" against the charges of coarseness and brutality that had been launched at their novels.

As a poet Emily far exceeded her sisters. Her poems, often unfinished and very unequal, show the influence of Scott and the Border ballads, but at their rare best transmit the flavour of a unique and powerful personality. That some of the finest rise out of a Gondal setting confirms the dramatic bent that distinguishes *Wuthering Heights* but does not shelve the enigma of Emily. If the experience in the long Gondal poem "Julian M. and A. G. Rochelle" (excerpted by Charlotte as "The Prisoner") is a mystical one, then it was Emily's experience and that section of the poem is as personal as "The Old Stoic" and "No Coward Soul is Mine," which are not Gondal poems. She had a strong lyrical note, a beautifully spontaneous and flexible metre, and, at her best, a powerful and precise though limited diction. Her work on *Wuthering Heights* cannot be dated and she may well have spent a long time on this intense, solidly imagined novel. It is distinguished from other novels of the period by its dramatic and poetic presentation, its abstention from all comment by the author and its unusual structure. It recounts in the retrospective narrative of an onlooker, which in turn includes shorter narratives, the impact of the waif Heathcliffe on the two families of Earnshaw and Linton in a remote Yorkshire district at the end of the 18th century. Embittered by abuse and by the marriage of Cathie Earnshaw, who

shares his stormy nature and whom he loves, to the gentle and prosperous Edgar Linton, Heathcliff plans a revenge on both families, extending into the second generation. Cathie's death in childbirth fails to set him free from his love-hate relationship with her and the obsessive haunting persists for years until the driven man lets fall his revenge in the hour of triumph and dies; the union of the surviving heirs of Earnshaw and Linton restores peace.

The 11th-hour entry into the tale may derive from French classical tragedies, read in Brussels. The method of direct narrative, heard in oral storytellers, is used with deliberate effect to recount an action that culminates through two generations, for which the model may have been Shakespeare's later romantic plays. There is no confusion, though some awkwardness. Everything is thoroughly wrought out. Sharing her sisters' dry humour and Charlotte's violent imagination, she diverges from them in making no use of the events of her own life and showing no preoccupation with a spinster's state or a governess's position. Working, like them, within a confined scene and with a small group of characters, she constructs an action, based on profound and primitive energies of love and hate, which proceeds logically and economically, making no use of such coincidences as Charlotte relies on, requiring no rich romantic similes or rhetorical patterns and confining the superb dialogue to what is immediately relevant to the subject. The sombre power of the book and the elements of brutality in the characters affronted some 19th-century opinion. Its supposed masculine quality was adduced to support the claim, based on the memories of Branwell's friends long after his death, that he was author or part author of it. While it is not possible to clear up all the minor puzzles in the case, neither the external nor the internal evidence offered is substantial enough to weigh against Charlotte's plain statement or a reference to Branwell's extant writings. Modern interest in myth and symbol has stimulated fresh approaches. Lord David Cecil (*Early Victorian Novelists*, ch. v., 1935) regards Emily's characters as types of the cosmic forces of storm and calm, which replace the principles of good and evil; both are good in their proper relations, but tragedy results from their mismatching. A widely different approach has been made by David Wilson ("Emily Brontë: First of the Moderns." *Modern Quarterly Miscellany*, no. 1. 1947) who interprets the story of Heathcliff and Catherine Earnshaw as a metaphor of the social struggle going on in the turbulent Pennine districts under Emily's eyes, a struggle in which she saw evil and degradation on both sides. This illuminating suggestion has been carried further by other writers who insist on Emily's conscious social passion. These studies give a welcome new dimension to the book, but should not obscure the depth of her imaginative response to the wild and remote nor the fact that what matters most to her is the freedom and energy, in love and hate, of the individual human spirit. *Wuthering Heights* masters the reader by its passion and fulness of meaning; its rapid, concrete presentation; its resonant, concise dialogue; and the courage, unparalleled in the contemporary novel, with which it accepts the tragic logic of its assumptions. It is not a flawless masterpiece, but it is unexhausted.

Anne, commonly described as gentle and pious, with none of her sisters' fire, has found champions to insist on her quiet strength and the integrity and realism of her work. In chaste and shapely verse she examines her thoughts and feelings in the light of moral and religious truth. *Agnes Grey*, probably begun at Thorpe Green, records with limpidity and some humour the life of a governess. George Moore called it "simple and beautiful as a muslin dress." *The Tenant of Wildfell Hall* presents an unsoftened picture of a young man's debauchery and degradation and sets against it her Arminian belief that no soul shall be ultimately lost. Her outspokenness raised some scandal and Charlotte deplored the subject as morbid and incongruous with her sister's nature, but the vigorous writing indicates that Anne found in it not only a moral obligation but an opportunity of artistic development.

Charlotte's first novel *The Professor* (published posthumously, 1857) shows her extreme reaction from her Angrian indulgences. Sober in colouring and discreet in action, it is nevertheless satirically lively and, like all her fiction, prickles with personality. Told

in the first person by an English tutor in Brussels, it is based on Charlotte's experiences there, with a reversal of sexes and roles. The necessity of her genius, reinforced by reading her sister's *Wuthering Heights*, modified this restrictive self-discipline and, though there is plenty of satire and dry, direct phrasing in *Jane Eyre*, what carried it to success was the fiery conviction with which it presented a thinking, feeling woman, craving for love, but able to renounce it at the call of impassioned self-respect and moral conviction. Jane Eyre, an orphan and governess to the ward of Mr. Rochester, falls in love with her Byronic and enigmatic employer. Her love is reciprocated, but on the wedding morning it comes out that Rochester is a married man and keeps a mad and depraved wife in the attics of his mansion. Jane leaves him, suffers hardship and finds work as a village schoolmistress. When Jane learns, however, that Rochester has been maimed and blinded, trying vainly to rescue his wife from the burning house she herself had set afire, Jane seeks him out and marries him. There are melodramatic naïvetés in the story and Charlotte's elevated rhetorical passages, though genuine and powerful in their kind, do not much appeal to modern taste, but she maintains her hold on the reader. The novel is subtitled "An Autobiography" and Charlotte follows Anne in putting her tale in the mouth of a governess, but, except in Jane's impressions of "Lowood," the autobiography is not Charlotte's. Personal experience is fused with suggestions from widely different sources and the "Cinderella" theme may well come from Richardson's *Pamela*. The action is carefully motivated and apparently episodic sections, like the return to Gateshead hall, are seen to be necessary to the full expression of Jane's character and the working-out of the threefold moral theme of love, independence and forgiveness. The landscape background, geared closely to the phases of the action, carries into the novel a lyricism only partially anticipated by Mrs Radcliffe and Scott.

Charlotte intended *Shirley* to be "real, cool and solid." avoided melodrama and coincidences and widened her scope. Setting aside Miss Edgworth and Scott as national novelists. *Shirley* is the first regional novel in English, full of shrewdly depicted local material—Yorkshire characters, church and chapel, the cloth workers and machine-breakers of her father's early manhood and a sturdy but rather embittered feminism. It is not, however, easy to elicit a dominant theme. Of her two heroines, Shirley, on Mrs. Gaskell's authority, was a "representation" of Emily in ampler circumstances and Caroline, at least in some parts, approximates to Anne. While Charlotte was writing, both sisters died and it is arguable that the course of the novel was diverted. Caroline, who in the earlier chapters seems marked for the spinsterhood that was so much in Charlotte's and Anne's minds, is dismissed to married happiness, while Louis Moore, abruptly introduced in the last third of the book, carries out with Shirley the master-pupil love relationship which occurs in all Charlotte's novels.

In *Villette* she recurs to the Brussels setting and the first-person narrative, disused in *Shirley*; the characters and incidents are largely variants of the personnel and life at the Pensionnat Heger. Against this background she sets the ardent heart, deprived of its object, contrasted with the woman happily fulfilled in love. The action is seen through the personality of the sober-seeming governess Lucy Snowe, and the vision varies from daylight to hallucination, as her humour, suspicious reserve or melancholia prevails. Her struggle for detachment stimulates the reader to attain it. Charlotte said her heroine was morbid and unamiable and refused to divert tragedy from her, but allowed her to achieve a useful and honourable independence. The "Long Vacation" chapter and the character of M. Paul Emmanuel (M. Heger) illustrate the two extremes of her art.

The influence of Charlotte's novels was much more immediate than that of *Wuthering Heights*, which was described for many years as without posterity. (It is now acclaimed both as the first socio-revolutionary novel and the predecessor of the novel of flux and sensation.) Her combination of romance and satiric realism had been the mode of nearly all the women novelists for a century. Her fruitful innovations were the presentation of a tale through the sensibility of a child or young woman—in which Dickens followed her; her lyricism—in which the genius of romantic poetry

entered the novel: and the picture of love from a woman's standpoint—with which she unwittingly startled a section of Victorian opinion. The two sides of her nature were never fully harmonized and this results in what Virginia Woolf called the "jerking of the planes." Her special mastery lies in her intense participation in her story and the transmission of this to the reader.

BIBLIOGRAPHY.—Mrs. Gaskell's *Life of Charlotte Bronte*, 2 vol. (1857) raised controversy and was modified in the third edition. It is indispensable. The Haworth edition (1902) was annotated by C. K. Shorter, who had access to material in the hands of Mr. Nicholls and published all Charlotte's available letters in *The Brontës' Life and Letters* (1908). The first supplement, however, was provided by T. Wemyss Reid in *Charlotte Bronte: a Monograph* (1877). In 1912 her four letters to M. Heger were given to the British museum, London, by the Heger family. During the 20th century a formidable body of biographical and critical investigation and assessment appeared. The publication in *extenso* of the early writings began with *Legends of Angria* (ed. by Fannie E. Ratchford and W. Clyde de Vere, 1933) and Miss Ratchford has studied them in *The Brontës' Web of Childhood* (1941) and *Gondal's Queen* (1955). The Bronte mss. have yielded fresh verse by Emily and Anne and their complete poems have been published. The first biography of Emily by A. M. F. Robinson. (1883), to which Ellen Nussey contributed information but did not approve the conclusions, has been followed by Romer Wilson's *All Alone: the Life of Emily Brontë* (1928), Muriel Spark and Derek Stanjord's *Emily Bronte: Her Life and Work* (1953) and Jacques Blondel's *Emily Bronte* (1955). Winifred Gerin's *Anne Bronte* appeared in 1959, together with Ada Harrison's and Derek Stanjord's *Anne Bronte: Her Life and Work*, and her *Branwell Bronte* followed in 1961. *The Clue to the Brontës* by G. Elizabeth Harrison (1948) follows up the Brontës' Methodist connections. The Bronte Society publications (1895—) include biographical, topographical and critical contributions. The following studies are important: May Sinclair, *The Three Brontës* (1912); E. Dimnet, *Les Soeurs Bronte* (1910; Eng. trans. *The Bronte Sisters*, 1928); Irene Cooper Willis, *The Authorship of Wuthering Heights* (1936); Laura L. Hinkley, *The Brontës* (1945); Phyllis Bentley, *The Brontës* (1947) and *The Bronte Sisters* (1950); and Laurence and E. M. Hanson, *The Four Brontës* (1949). The last four provide good select bibliographies. The Shakespeare Head Bronte, 19 vol. (1931-38), though not complete, is the best working edition. (J. M. S. T.)

BRONTOSAURUS, a large plant-eating amphibious dinosaur that flourished in western North America. See DINOSAUR.

BRONX, THE, one of the five boroughs of New York city, U.S., and the only mainland borough, being separated from Manhattan island by the Harlem river. It was a part of Westchester county until 1898 when it was incorporated in the city of New York. It is primarily a residential area, with some of its waterfront of over 80 mi. used for shipping, warehouses and industry. Pop. (1960) 1,424,815.

The Bronx is named for Jonas Bronck, its first settler, who purchased the area from the Indians in 1639. New Englanders moved in early, as they did on Long Island, trespassing on Dutch territory. The Bronx has had a relatively uneventful existence, never figuring prominently in the history of the country; it remained a pleasant rural area whose population, industry and commerce developed slowly until the late 19th century.

Among the numerous points of interest in the Bronx are its many parks, including Bronx park, well known for its zoological parks and botanical gardens, Van Cortlandt park and Pelham Bay park on Long Island sound. The Bronx is also the site of Yankee stadium and the location of many institutions of higher learning, such as Fordham university, a Roman Catholic university founded in 1841; Hunter college in the Bronx, a division of the College of the City of New York; the University Heights Centre of New York university, a private institution founded in 1831; and Manhattan college, a Roman Catholic college founded in 1853. For students of literature it is associated with the life of Edgar Allen Poe, who lived there with his child wife Virginia Clemm and wrote *Ulalume* and *Annabel Lee*.

For the government of the Bronx, the public education system, taxation and finance; etc., see NEW YORK (CITY). (D. L. D.)

BRONZE, an alloy formed wholly or chiefly of copper and tin (*qq.v.*) in variable proportions. A Greek manuscript of about the 11th century in the library of St. Mark's, Venice, gives the composition of the alloy as 1 lb. of copper with 2 oz. of tin. The product obtained by adding tin to copper is more fusible than copper and thus better suited for casting; it is also harder and less malleable. A soft bronze or gun metal is formed with 16

parts of copper to 1 of tin, and a harder gun metal, such as was used for bronze ordnance, when the proportion of tin is about doubled.

The steel bronze of Col. Franz Uchatius (1811-81) consisted of copper alloyed with 870 of tin, the tenacity and hardness being increased by cold rolling. Bronze containing about 7 parts of copper to 1 of tin is hard, brittle and sonorous, and can be tempered to take a fine edge. Bell metal varies considerably in composition, from about 3 to 5 parts of copper to 1 of tin. In speculum metal there are 2 to 23 parts of copper to 1 of tin. Statuary bronze may have from 80% to 90% copper, the rest tin, or tin with zinc and lead.

Bronze in British and French copper coinage is 95% copper, 4% tin and 1% zinc. The U.S. cent is 95% copper (45.6 gr.) and 5% tin and zinc (2.4 gr.).

Many copper-tin alloys employed for machinery bearings contain a small proportion of zinc, which gives increased hardness. "Antifriction metals," also used in bearings, are copper-tin alloys in which the amount of copper is small and there is antimony in addition. Of this class an example is Babbitt's metal, invented by Isaac Babbitt (1799-1862); it originally consisted of 24 parts of tin, 8 parts of antimony and 4 parts of copper, but in later compositions for the same purpose the proportion of tin is often considerably higher. See BEARING METALS.

Phosphor Bronze.—Bronze is improved in quality and strength when fluxed with phosphorus. Alloys prepared in this way, and known as phosphor bronze, may contain only about 1% of phosphorus in the ingot, reduced to a mere trace after casting but their value is nevertheless enhanced for purposes in which a hard strong metal is required, as for pump plungers, valves, the bushes of bearings, etc.

Bronze again is improved by the presence of manganese in small quantity, and various grades of manganese bronze, in some of which there is little or no tin but a considerable percentage of zinc, are used in mechanical engineering.

Alloys of copper with aluminum, though often nearly or completely destitute of tin, are known as aluminium bronze, and are valuable for their strength and the resistance they offer to corrosion. By the addition of a small quantity of silicon the tensile strength of copper is much increased; a sample of such silicon bronze, used for telegraph wires, on analysis was found to consist of 99.94% of copper, 0.03% of tin and traces of iron and silicon. (See also ALLOYS.)

The bronze (Gr. *chalcos*, Lat. *aes*) of classical antiquity consisted chiefly of copper, alloyed with one or more of the metals, zinc, tin, lead and silver, in proportions that varied as times changed, or according to the purposes for which the alloy was required. Among bronze remains, the copper is found to vary from 67% to 95%. From the analysis of coins it appears that for their bronze coins the Greeks adhered to an alloy of copper and tin till 400 B.C., after which time they used also lead with increasing frequency. Silver is rare in their bronze coins. The Romans also used lead as an alloy in their bronze coins, but gradually reduced the quantity, and, under Caligula, Nero, Vespasian and Domitian, coined pure copper coins; afterward they reverted to the mixture of lead. So far the words *chalcos* and *aes* may be translated as bronze. Originally, no doubt, *chalcos* was the name for pure copper. It is so employed by Homer, who calls it *erythros* (red), *aithops* (glittering), *phaennos* (shining), terms which apply only to copper. But instead of its following from this that the process of alloying copper with other metals was not practised in the time of the poet, or was unknown to him, the contrary would seem to be the case from the passage in the *Iliad* where he describes Hephaestus as throwing into his furnace copper, tin, silver and gold to make the shield of Achilles, so that it is not always possible to know whether when he uses the word *chalcos* he means copper pure or alloyed. Still more difficult is it to make this distinction regarding the mythical Dactyls of Ida in Crete or the Telchines or Cyclopes being acquainted with the smelting of *chalcos*. It is not, however, likely that later Greek writers, who knew bronze in its true sense! and called it *chalcos*, would have employed this word without qualification for objects

which they had seen unless they had meant it to be taken as bronze. When Pausanias speaks of a statue, one of the oldest figures he had seen of this material, made of separate pieces fastened together with nails, it is understood he means literally bronze, the more readily since there exist very early figures and utensils of bronze so made.

For the use of bronze in art, *see* METALWORK, DECORATIVE. *See* also references under "Bronze" in the Index volume.

BRONZE AGE. The term "Bronze Age" refers to the third phase in the development of man's material culture, following the Paleolithic (Old Stone) Age and the Neolithic (New Stone) Age, and the first period in which metal was used. The beginning of this phase is sometimes called the Chalcolithic (Copper-Stone) Age, referring to the initial use of pure copper. Scarce at first, copper was used only for small or precious objects; its use was known in Mesopotamia already in the Halaf culture, possibly by 4000 B.C., as well as in contemporary cultures from Iran to Cilicia. By the middle of the 4th millennium a rapidly developing metallurgy, with cast tools and weapons, was a factor leading to urbanization in Mesopotamia. By 3000 B.C. the use of copper was widespread in the near east, had extended westward into the Mediterranean area and was soon to infiltrate the still Neolithic cultures of Europe. While sometimes termed the Copper Age, all this early phase of the use of metal is commonly thought of as part of the Bronze Age, though true bronze, an alloy of copper and tin, cannot be traced back much before 3000 B.C. and was used only rarely for the next few centuries. Natural alloys may account for some of the earliest occurrences of bronze. Tin deposits discovered during the 3rd millennium were apparently few and small, and only late in this millennium were more considerable deposits located. Anatolian bronzes are among the most common at this early date. Just how early the Cornwall tin deposits were exploited is not known with certainty, but they were much used in the 2nd millennium B.C. and were responsible for a considerable part of the large production of bronze objects in the second half of the 2nd millennium, as well as later. Thus, for almost 3,000 years copper and then bronze were the main metals used for making implements, weapons, vessels, etc.; stone continued to be used in decreasing amounts for these purposes as the availability of metals increased. From the end of the 2nd millennium the greater availability and use of another metal, iron, brought the Bronze Age to an end as the Iron Age began.

See ARCHAEOLOGY; *see* also references under "Bronze Age" in the Index volume. (S. S. WE.)

BRONZE AND BRASS WORK. A general history of the use of bronze and brass in the arts is given in the article METALWORK, DECORATIVE. The chemistry and metallurgy of these two alloys are discussed in BRASS and BRONZE. The technique of bronze casting, and the subject of patina, are dealt with in SCULPTURE TECHNIQUE. References to art objects in bronze and brass are found in numerous articles on sculpture and in such articles as CHINESE BRONZE, SEALS and NUMISMATICS. *See* also references under "Bronze and Brass Work" in the Index volume.

BRONZING, a process of imparting a metallic surface to objects of wood, plaster, clay, etc. The material used is Dutch metal, an alloy of 80% copper and 20% zinc. It is prepared as a thin foil and then powdered.

The metallic powder may be applied directly, if the object to be covered is first sized with a spirit lacquer or with gold-size. If the powdered metal is combined with spirit lacquer thinned with amyl acetate, the mixture can be painted on with a brush.

A number of colouring effects can be produced chemically. For example, treatment with a solution of arsenious acid in hydrochloric acid imparts an appearance of true bronze, while a water solution of copper nitrate, ammonium chloride and calcium chloride gives an antique bronze finish. Application of nitric acid results in a pale gold color. The alloy's own natural gold effect can be heightened by applying spirit lacquer coloured with dragon's blood. The colours can be preserved by a finishing coat of clear spirit lacquer.

Gun barrels can be bronzed by treatment with a strong solution of antimony trichloride. (E. L. Y.)

ALINARI
PORTRAIT OF LUCREZIA PANCIATICHI BY BRONZINO. IN THE UFFIZI GALLERY, FLORENCE

BRONZINO, IL (AGNOLO or ANGIOLO DI COSIMO) (1503–1572), Florentine painter and poet, renowned especially for his portraits, which are the classic embodiments of the courtly ideal under the Medici dukes, Alessandro and Cosimo I. Bronzino was born in the Florentine suburb Monticelli, Nov. 17, 1503. Alessandro Allori, his adopted son and pupil, also used "Bronzino" as his last name. Bronzino's principal teachers were Raffaellino del Garbo and Jacopo da Pontormo. Beginning in Pontormo's eccentric, expressive style (exemplifying what is now called early Mannerism [*q.v.*]) he created a brilliantly precise, clear style of his own, partly influenced by Michelangelo and the Raphael school. He is rightly classified as a Mannerist since after the middle 1530s he was a prime exponent of Mannerist stylization; *e.g.*, "Allegory of Luxury," National gallery, London, or "Resurrection," SS. Annunziata, Florence. His portraits are pre-eminent examples of Mannerist portraiture: stiff, flat, reserved and noncommittal, yet arrestingly elegant and decorative; *e.g.*, "Duchess Eleanora and Son," Uffizi gallery, Florence. Bronzino did sacred and allegorical works of influence and distinction, including fresco decorations and tapestry designs, and represents the local Florentine tradition toward the mid-16th century at its clearest. He was court artist to Cosimo.

Bronzino died in Florence on Nov. 23, 1572.

BROOKE, FULKE GREVILLE, 1ST BARON (1554–1628), English writer who, on his tomb, styled himself "Servant to Queen Elizabeth, Counsellor to King James, and Friend of Sir Philip Sidney," but who is best remembered as a powerful philosophical poet and exponent of a plain style of writing. He was born at Beauchamp court, Warwickshire, on Oct. 3, 1554, entered Shrewsbury school with Philip Sidney in 1564 and matriculated at Jesus college, Cambridge, in 1568. Sir Henry Sidney, president of

Wales gave him a post in the court of the Marches in 1576, but next year he accompanied Sidney on an embassy to the Holy Roman emperor and to the Palatinate. This was the first of several diplomatic missions undertaken for Elizabeth I, who favoured him greatly but refused to let him travel as often as he wished. However, he visited the Low Countries, Ireland and France. With Sidney and Sir Edward Dyer he practised poetry, but the legend that they formed an "Areopagus" a literary classicizing club, is now exploded. He grew rich by grants of land and minor offices, and in 1598 became treasurer of the navy. He tried to stay the impetuous descent of the earl of Essex and he befriended Francis Bacon, but he alienated Sir Robert Cecil. Consequently, although he was made a knight of the Bath at James I's coronation, he obtained no major office. Instead he managed his estates, restored the ruined Warwick castle (which the king had bestowed on him in 1605) and wrote his verse treatises and plays. Noted for his tact and business ability, Greville was made chancellor of the exchequer in 1614 and was created a baron in 1621. He was stabbed at Warwick by his manservant on Sept. 1, 1628, and died on Sept. 30. He never married, though Sir Robert Naunton in his *Fragmenta Regalia* (1641) called him "a constant courtier of the ladies." He proved a kindly patron to William Camden, John Speed and Samuel Daniel.

Greville's *Lzie of the Renowned Sir Philip Sidney* (1632), though inadequate biographically, is a valuable commentary on Elizabethan politics. It was probably intended as a dedication for an edition of Sidney's poems, the corrected manuscripts of which are at Warwick castle. The only other works which can certainly be ascribed to Greville were published in *Certaine Learned and Elegant Workes* (1633) and *Remains* (1670). The tragedy *Mustapha* was printed (probably piratically) in 1609 and a few songs were set to music. His sonnet collection *Caelica* differs in tone from most Elizabethan cycles: the themes often resemble Sidney's but the treatment is realistic and ironic. Greville's mind was melancholy, Calvinistic, deeply philosophical; obsessed with the incapacity of fallen human nature deprived of grace, he emphasizes the "wearisome condition of humanity" torn between this world and God's commands. The Senecan tragedies on oriental themes trace the political results of this division. In his verse treatises, such as "Monarchy," he is an Elizabethan Machiavelli showing how statesmen should behave to keep order in a naughty world. His poem "Humane Learning" is skeptical about the instruments and aims of earthly knowledge. In stressing practical improvements it probably owes something to Bacon.

BROOKE, HENRY (c. 1703–1783), Irish novelist and dramatist best known for his novel *The Fool of Quality*, was born near Virginia, County Cavan, Ire and educated at Trinity college, Dublin. In 1724 he went to London to read law and became friendly with Alexander Pope and Lord Lyttleton; he had already met Jonathan Swift in Ireland. In 1728 he wrote a philosophical poem *Universal Beauty*, a statement of the idea that "the beauty of the universe is the expression of the Divine order immanent in all creation." A poem of the same kind as Pope's *Essay on Man*, it is spoiled by a style which attempts to combine the rhyme pattern of the couplet with the syntactical elaboration of Miltonic blank verse. Brooke translated the first and second books of Tasso's *Gerusalemme liberata* in 1738 and in 1739 produced a celebrated drama, *Gustavus Vasa, the Deliverer of His Country*, performance of which was forbidden under the new Licensing act because of the supposition that Sir Robert Walpole was depicted in the part of the villain Trollio. The play was printed, and later performed in Dublin as *The Patriot*. It deals with conflicts of loyalty and, although the situations are artificially contrived, it is not without rhetorical power and can be read with pleasure.

Following the ban on *Gustavus Vasa* Brooke returned to Ireland.

During the Jacobite rebellion of 1745 he published *Farmer's Six Letters to the Protestants of Ireland*, in form an imitation of Swift's *Draper's Letters*, pointing to the threat of rebellion provided by the Catholic majority in Ireland, and suggesting a more enlightened policy to forestall the danger. For this he received the post of barrack master at Mullingar, County Westmeath, which he held until his death, in Dublin, on Oct. 10, 1783.

Brooke's novel, *The Fool of Quality* (1764–70), is a rambling and digressive narrative which has as its central thread the education of an ideal nobleman. It oscillates between hectic incident and pathetic reflection and owes its reputation largely to its "passionate and tearful sensibility." In date and feeling it may be linked with Laurence Sterne's *Sentimental Journey* (and the more pathetic passages of *Tristram Shandy*) and Henry Mackenzie's *Man of Feeling*. Its humanity and religious temper recommended it to John Wesley, who edited an abridged version in 1780, and to Charles Kingsley, who published it with an enthusiastic biographical preface in 1859.

See H. M. Scurr, *Henry Brooke* (1927).

(JN. C.)

BROOKE, SIR JAMES (1803–1868), English soldier and explorer, who became raja of Sarawak (q.v.) and founded a dynasty there, was born in India on April 29, 1803, at Secore, near Benares, where his father, a descendant of the Cromwellian lord mayor of London, Sir Thomas Vyner (1588–1665), was a high court judge. Educated in England at Norwich grammar school, James joined the 6th Madras native infantry and sailed for India in 1819. He did not see action until 1825, in the first Burmese War, when he was critically wounded and returned to England, a pensioner of the British East India company. Expecting dismissal from the company for overstaying his leave, he resigned (1830) and traveled through the islands of the East Indies as far as China, showing a keen interest in the problems of European settlement in the far east. Restless and bored when he returned to England, in 1834 he helped to organize an unsuccessful trading expedition to the Indian archipelago. However, on his father's death in 1835, Brooke inherited a considerable fortune and settled down to a serious study of the political and economic problems of settlement, publishing, in Oct. 1838, a long and controversial article on the subject in the *Athenaeum*. That year he sailed from Devonport in his armed yacht "Royalist," vaguely planning a settlement in Borneo or Celebes.

On reaching Singapore, Brooke learned that the raja Muda Hassim of Sarawak was kindly disposed toward the English, possessed rich resources of antimony and was facing a rebellion. Brooke sailed for Kuching, capital of Sarawak, and offered his services against the rebels. After lengthy intrigues, the rebellion was quashed with his aid, and he was rewarded with the title of raja, subject to the approval of the sultan of Brunei. He visited Erunei in 1842, the title was confirmed and in 1843 the sultan, impressed by Brooke's connection with the British feet, granted it in perpetuity. From 1843 the fleet was virtually at Brooke's orders, helping to stamp out piracy.

With no more than a handful of English assistants, Brooke made expeditions into the interior, partially suppressed head-hunting and established a secure government. Little interested in commercial profit, he had difficulty at first in gaining financial backing, but the foundation of the Borneo company in 1856 and the help of his friend Baroness Burdett-Coutts later solved this problem. Brooke wanted to make Sarawak a British protectorate, but on his visits to England he gained little support, although he was given official status in 1845 and made governor of Labuan and consul general for Borneo in 1847. He was knighted in 1848. In 1851 grave charges were brought against him in the house of commons on the grounds that he had employed unnecessary severity during a battle against Sea Dayaks off Tanjong Marau (1849). He replied that severity was necessary in combating pirates, and defended himself during a protracted visit to England (1851–53). Although a royal commission which met in Singapore in 1854 declared the charges "not proven," it is said that he never recovered from the strain of those proceedings.

In 1857 Chinese tin miners in Bau sailed up the Sarawak river and sacked Kuching, which Brooke recovered a few days later with

the help of the Borneo company's armed yacht. "Sir James Brooke." The same year he returned to England, staying until 1561 and leaving the government in the hands of his nephew Brooke Johnson, with whom he quarreled intermittently. He contemplated making Baroness Burdett-Coutts his successor, but finally appointed another nephew, Charles Johnson, who changed his surname to Brooke and became the second English-born raja of Sarawak. Sir James Brooke died at Burrator in Devon on June 11, 1868. He displayed unusual courage in his dealings with the Malay princes and showed throughout his life a penetrating understanding of the ways of Malays and Dayaks. He was less successful in dealing with his adversaries in England.

Hahn, *James Brooke of Sarawak* (1953); Robert Payne, *The White Rajahs of Sarawak* (1960); Steven Runciman, *The White Rajahs* (1960). (R. PA.)

BROOKE, RUPERT (1887–1915), English poet who will be remembered as the author of the sonnet-series *1914*, and as typical of the poets who died in World War I. was born at Rugby, Warwickshire, on Aug. 3, 1887. Brooke began his education at Rugby, going on to King's college, Cambridge, with a scholarship in 1906. He played a leading part in university life; and there, as throughout his career! the charm of his personality, in which his remarkable good looks were only one element, gained him innumerable friends. In 1911 he published his first volume, *Poems*, and in 1913 became a fellow of King's college. During 1913–14 he traveled in North America and the South seas. In Sept. 1914 he received a commission in the Royal Naval division, with which he took part in the Antwerp expedition and sailed for the Dardanelles. He died of blood poisoning on the Greek island of Skiros, April 23, 1915.

In his earlier poems (1905–08) Brooke is still a boy; he writes with a sense of verbal and metrical beauty, but the general effect is a little turgid. The later section (1908–11) shows an advance: though there is still an immaturity of exuberance and bravado, the beauties are more abundant. His wartime sonnets, *1914* (1911), won him immediate fame. The sonnets are in strong contrast with the later poetry of trench warfare, and in them his contemporaries recognized, in the words of Winston Churchill, "a voice . . . more true, more thrilling, more able to do justice to the nobility of our youth in arms than any other . . ." The collection of his poems edited by his friend and patron Edward Marsh (1918), and the memoir prefixed to it, created a permanent (if somewhat idealized) image of the poet, and changing tastes hardly diminished its popularity. *Poetical Works of Rupert Brooke* edited by G. Keynes (1946) added about 30 *juvenilia* of little worth.

(E. MAR.; J. SP.)

BROOK FARM, an institute of agriculture and education from 1841 to 1847, situated on 160 ac, at West Roxbury, Mass., 9 mi. from Boston. It was organized and throughout its existence virtually directed by the Rev. George Ripley, a former Unitarian minister, an editor of *The Dial* (a critical literary monthly) and a leader in the Transcendental club, an informal gathering of the intellectuals of the period and vicinity. He was aided by his wife, Sophia Dana Ripley, a woman of wide culture and academic experience. According to the articles of agreement, their desire was to combine the thinker and the worker, to guarantee the highest mental freedom and to prepare a society of liberal, intelligent and cultivated persons whose relations with each other would permit a more wholesome and simple life than could be led amid the pressure of competitive institutions.

The project was financed by the sale of stock, a purchaser of one share becoming automatically a member of the institute. It was governed by a board of directors. The profits, if any, after all payments and improvements, were divided into a number of shares corresponding with the number of days' labour, every member entitled to one share for each day's labour performed. Among the original shareholders were Charles A. Dana and Nathaniel Hawthorne (*qq.v.*), who served together as the first directors of agriculture. Ralph Waldo Emerson, Amos Bronson Alcott, Margaret Fuller, Theodore Parker and Orestes A. Brownson were

interested visitors, Brook Farm attracted not only intellectuals—though teachers remained ever in excess of farmers—but carpenters, shoemakers and printers. It paid a dollar a day for work (physical or mental) to men and to women, and provided to all members, their children and family dependents, housing, fuel, clothing and food at approximately actual cost. For four years it published *The Harbinger*, a weekly magazine devoted to social and political problems, to which James Russell Lowell, John Greenleaf Whittier and Horace Greeley occasionally contributed.

Brook Farm was noted particularly for its excellent school, which in educational theory was modern, desiring "perfect freedom of intercourse between students and teaching body." Disciplinary measures consisted in the attempt to arouse a sense of personal responsibility and to communicate a passion for intellectual work. There were no prescribed study hours, and each student was required to give a few hours a day to manual labour—the girls to kitchen and laundry work, the boys to hoeing and chopping. There was an infant school, a primary school and a college preparatory course covering six years. George William Curtis, Father Isaac Thomas Hecker and Gen. Francis C. Barlow were early students there.

Although communal living proved to have disadvantages (Hawthorne found that he was unable to write there and left after six months), for a while it looked as though the ideal of the founders would have something of a practical realization. Within three years the community—or "Phalanx" as it was called after 1844 when Brook Farm adopted some of the theories of the French socialist Charles Fourier (*q.v.*)—had added four houses, work-rooms and dormitories to its original farmhouse and school. It then put all available funds into the construction of a large central building to be known as the Phalanstery, which burned to the ground as its completion was being celebrated on the night of March 2, 1846. Though the colony struggled on for a while, "the enterprise faded, flickered, died down, and expired," and the land and buildings were sold at auction on April 13, 1849. Ripley went to New York and in 1849 became literary critic on Greeley's *Tribune*, a position he held until his death in 1880.

Brook Farm was one of many experiments in communal living that took place in the United States during the first half of the 19th century (*see FARM COLONY*): it is better known than most—and has a secure place in U.S. social history—because of the distinguished literary figures and intellectual leaders associated with it.

Orvis, *Letters From Brook Farm, 1844–1847* (1928); K. Burton, *Paradise Planters: the Story of Brook Farm* (1939); V. W. Brooks, *The Flowering of New England, 1815–1865*, pp. 237–260 (1936). Hawthorne's *Bliethedale Romance* (1852) is a fictional treatment of the Brook Farm setting.

BROOKFIELD, a village in Cook county, Ill., U.S., about 14 mi. S.W. of the Chicago loop. Founded in 1892 by Eberly Gross, a land promoter, it has remained largely residential. The village has a council-manager form of government, adopted in 1947. A tax-supported recreation program is carried on in cooperation with the schools and private groups.

A major attraction, drawing 2,300,000 persons a year, is the Chicago zoological park or Brookfield zoo, where an outstanding collection of birds and animals is kept in open exhibits in simulated natural habitat.

For comparative population figures *see table in ILLINOIS: Population*.

BROOKINGS, ROBERT SOMERS (1850–1932), U.S. businessman and philanthropist who helped establish the Brookings Institution at Washington, D.C., for research and graduate training in economics and government, was born in Cecil county, Md., on Jan. 22, 1850. Brookings entered a St. Louis, Mo., wood-en-ware company at the age of 17. Four years later he and his brother opened their own woodenware firm and during the next 25 years extended their interests into real estate and the lumbering and transportation industries. Following his retirement in 1896, Brookings devoted his time to the development of Washington university in St. Louis. As president of the university corporation

(1897–1928) he helped relocate the school, induced wealthy St. Louis citizens to contribute money for buildings and endowments and helped raise the medical school to a position of academic excellence. He was one of the original trustees of the Carnegie Endowment for International Peace and during World War I served as chairman of the price-fixing committee of the war industries board. After the war he became the first board chairman of the Institute for Government Research and helped found the Institute of Economics and the Brookings Graduate School of Economics and Government. In 1928 these three organizations were merged and named the Brookings institution in his honour.

Brookings died at Washington, D.C., on Nov. 15, 1932, and was buried at St. Louis.

BROOKITE, one of the three modifications in which titanium dioxide (TiO_2) occurs in nature; the other minerals with the same chemical composition, but with different physical and crystallographic characters, being rutile (*q.v.*) and anatase. The two latter are tetragonal in crystallization while brookite is orthorhombic. The name was given in honour of the English mineralogist H. J. Brooke (1771–1857). Two types of brookite crystals may be distinguished. The commoner type of crystals are thin and tabular, and often terminated by numerous small and brilliant faces. These crystals are of a rich reddish-brown colour and are often translucent. Crystals of the second type have the appearance of six-sided bipyramids; these crystals are black and opaque, and constitute the variety known as arkansite, so named from its occurrence at Magnet Cove, Ark.

Brookite occurs only as crystals, never in compact masses. and is usually associated with either anatase or rutile, a major ore of titanium (*q.v.*) with which it is mined. The crystals are found attached to the walls of cavities in decomposed igneous rocks and crystalline schists; brookite is also found as minute isolated crystals in many sedimentary rocks. The best-known locality is Fronolen, near Tremadoc, in north Wales. where crystals of the thin tabular habit occur with crystallized quartz, albite and anatase on the walls of crevices in diabase. Similar crystals of relatively large size are found attached to gneiss at several places in the Swiss and Tirolese Alps.

The lustre of brookite is metallic-adamantine. There is no distinct cleavage (rutile and anatase have cleavages); hardness is 5.5 to 6; specific gravity 4.0. The optical characters are interesting: the optic axes for red and for blue light lie in planes at right angles to each other, while for yellow-green light the crystals are uniaxial. The acute bisectrix, a line bisecting the angle between the optic axes, is perpendicular to the orthopinacoid for all colours, so that this phenomenon of the crossing of the optic axial planes may be readily observed in the thin tabular crystals of the first-mentioned type. (L. J. S.)

BROOKLIME, known botanically as *Veronica beccabunga* (family Scrophulariaceae, *q.v.*), a succulent herb growing on margins of brooks and ditches in the British Isles, a native of Europe, north Africa and northwestern Asia and naturalized in eastern North America.

Brooklime has smooth spreading branches, blunt oblong leaves and small blue or pink flowers.

The similar American brooklime (*V. americana*) occurs in wet places from Anticosti to Alaska and southward to Pennsylvania and California.

BROOKLINE, a residential town of Norfolk county, Mass., U.S., almost surrounded by Boston and separated from the rest of Norfolk county by parts of Suffolk and Middlesex counties. As is the case in many New England towns, it contains a number of unincorporated village communities, including Brookline village, Cottage Farms, Longwood, Beaconsfield and Chestnut Hill. It has the largest population of any municipality classified as a town in New England. Its government is known as a representative or limited town meeting form; the town meeting consists of 240 members elected by 12 precincts (wards).

Brookline was originally a part of Boston but became a separate town in Suffolk county in 1705. It was separated from Suffolk county in 1793. It has been a residential community from its earliest days; the only manufacturing is furniture and scientific

apparatus. The town is also the birthplace of John F. Kennedy, 35th president of the United States.

Gov. John Winthrop first referred to that part of Boston which is now Brookline as "the hamlet of Muddy River." For many years the area was designated as "Boston's back cow pasture." According to the Rev. John Pierce, Brookline got its name from a brook which ran along the line of Samuel Sewall's property. Some of the early settlers who owned property in the area were Rev. John Cotton, William Colborne, Thomas Leveritt, Thomas Savage and Capt. John Underhill. In the earliest days sailing vessels could proceed up the Muddy river to what is now Longwood Avenue bridge. Land fills during the late 18th and early 19th centuries made the river no longer navigable. Throughout its history as a suburb Brookline has fought successfully to retain its identity as a separate community beyond the boundaries of Boston.

Pop. (1960) 54,044. For comparative population figures see table in MASSACHUSETTS: Population. (L. G. H.)

BROOKLYN, a borough of the city of New York, U.S., is situated at the southwest extremity of Long Island. First settled in 1636, it was chartered as a city in 1834 and gradually absorbed the towns of Bushwick and Williamsburg (1855), New Lots (1886), Flatbush, New Utrecht and Gravesend (1894) and Flatlands (1896). In 1898 it became a borough of New York city. Pop. (1960) 2,627,319.

Three bridges and several rapid transit tubes connect Brooklyn with Manhattan. Known as a city of homes and churches, it has a widespread business area. An important manufacturing centre, the city handles a vast amount of ocean-going traffic and is a western terminal of the Long Island railroad. Parkways connect it with Queens and Long Island areas.

Brooklyn's numerous parks and recreation centres include Prospect park, site of the battle of Long Island during the American Revolution. In addition to an excellent public school system, its advanced educational facilities include Pratt institute, a school of engineering and applied arts founded in 1887; Polytechnic Institute of Brooklyn, a private college founded in 1854; Brooklyn college, a division of the College of the City of New York; St. Francis college (1858), St. John's university (1870) and St. Joseph's College for Women (1916), all three Roman Catholic. There are also Brooklyn law school (private, 1901) and St. John's law school (1925), a division of St. John's university; the Long Island medical college, a division of the State University of New York; Brooklyn college of pharmacy (1886), a division of Long Island university; and several schools of music.

Among the better-known libraries are the Brooklyn public library, the Long Island Historical society, Pratt Institute Free library, Kings County Medical society and the Brooklyn museum. The Brooklyn Institute of Arts and Sciences, the Brooklyn Philharmonic, the Brooklyn Academy of Music, the botanic garden and the children's museum in Bedford park attract nationwide attention. For the government, public school system, etc., see NEW YORK (CITY). (M. H. LE.)

History.—The first settlement within the present limits of Brooklyn was made when some Dutch farmers took up their residence along the shore of Gowanus bay in 1636. About the same time other Dutch farmers founded Flatlands (at first called Amersfoort), on Jamaica bay, and a few Walloons founded Wallabout, later the site of the navy yard. In 1642 a ferry was established across East river from the present foot of Fulton street, and a settlement grew up there which was known as The Ferry. The next year Lady Deborah Moody with some followers from New England founded Gravesend, near the southern extremity of the borough. In 1645 a settlement was established near the site of the present borough hall, and was called Breuckelen (also spelled Breucklyn, Breuckland, Brucklyn, Broucklyn, Brookland and Brookline) until about the close of the 18th century, when its orthography became fixed as Brooklyn. The name Breuckelen, meaning marshland, seems to have been suggested by the resemblance of the situation of the settlement to that of Breuckelen, Holland. Of the other towns which were later united to form the borough. New Utrecht was settled about 1650, Flatbush (at first called Medwoud, Midwout or Midwood) about 1651 and Bushwick

and Williamsburg in 1660. During the American Revolution the chief event was the battle of Long Island, fought on Aug. 27, 1776. In 1816, when the population of the town of Brooklyn was about 4,500, its most populous section was incorporated as a village; and in 1834, when the population had increased to 23,310, the whole town was incorporated as a city. By 1850 the population had increased to 138,882. In 1855 Williamsburg, which had been incorporated as a city in 1851, and the town of Bushwick were annexed. Other annexations followed until the city of Brooklyn was continuous with Kings county; on Jan. 1, 1898, the city of Brooklyn became a borough of New York city. (E. B. Wn.; L. Gu.)

BROOKS, PHILLIPS (1835-1893), U.S. Episcopal clergyman who gained an international reputation as a preacher during a 22-year ministry at Trinity Protestant Episcopal church in Boston, Mass., was born in Boston on Dec. 13, 1835. He graduated from Harvard university in 1855, spent a brief period as a teacher in the Boston Latin school and then studied for the ministry at the Episcopal theological school in Alexandria, Va. In 1859 he became minister of the Church of the Advent in Philadelphia, and three years later was called to Holy Trinity church in the same city. He began his ministry at Trinity church, Boston, in 1869. He preached Sunday after Sunday to great congregations. In 1891 Brooks was consecrated bishop of Massachusetts, but after a brief episcopate of 11 months he died, unmarried, on Jan. 23, 1893. Although he declined the professorship of Christian ethics at Harvard, he was for many years an overseer of the university and the university preacher.

Endowed with a commanding stature: a compelling personality and great eloquence, Brooks was by far the most attractive and most widely loved preacher of his day. An abundance of natural vigour coupled with an innate gentleness of spirit and cheerfulness of temper gave to his preaching a quality of winsomeness and serenity, which was tremendously appealing to the comfortable and enlightened folk of Back Bay Boston, Harvard yard and the cultural oases of the east and middle west. He was a broad churchman who regarded humanity itself rather than the organized church as the instrument through which God effects his purposes. "The spirit of man is the candle of the Lord" was the theme of his most famous sermon; it aptly expressed his theology. He never bothered to refute the doctrines he quietly discarded, refusing always to be drawn into controversy. Even when charges of heresy were leveled against him, his only answer was calm and unruffled silence. He published numerous volumes of sermons, and his verse included the well-known Christmas hymn "O Little Town of Bethlehem." Speaking of his death, James Bryce noted that not since Abraham Lincoln had there been a man so widely mourned.

See W. Lawrence, *Life of Phillips Brooks* (1930). (W. S. H.)

BROOKS, WILLIAM KEITH (1848-1908). U.S. zoologist, who made extensive and valuable researches on the morphology of various groups of marine animals, especially the tunicates, crustaceans and the oyster, was born in Cleveland, O., on March 25, 1848. He graduated from Williams college, Williamstown, Mass., in 1870 and later studied with Louis Agassiz at Harvard university (Ph.D., 1875). In 1876 he was made associate in natural history at Johns Hopkins university, Baltimore, Md., where he became professor of animal morphology in 1891, head of the biological laboratory in 1893 and also professor of zoology. He established a marine laboratory. Among his more important works are *Provisional Hypothesis of Pangenesis* (1877), *Heredity* (1883), *Monograph of the Genus Salpa* (1893), *Foundations of Zoology* (1899-1907), and a popular book on *The Oyster* (1891). He died at Baltimore, Md., on Nov. 12, 1908.

BROOM (*Cytisus scoparius*), a shrub of the pea family (Leguminosae, q.v.), is native to the temperate parts of Europe and Asia and naturalized in North America. The leaves are small and usually fall away early; their function is shared by the green stems. The bright yellow flowers scatter their pollen by an explosive mechanism; the weight of a bee alighting on the flower causes the keel to split and the pollen to be shot out onto the insect's body. When ripe the black pods explode with a sudden twisting of the valves and scatter the seeds. The twigs have a

J. HORACE MCFARLAND CO.

BROOM (CYTISUS SCOPARIUS)

bitter, nauseous taste and have long had a reputation as a diuretic; the seeds have similar properties.

Butcher's broom, a very different plant, known botanically as *Ruscus aculeatus*, is a member of the lily family. It is a small evergreen shrub found in copses and woods. The stout angular stems bear leaves reduced to small scales, which subtend flattened leaflike branches (cladodes) with a sharp apex. The small whitish flowers are borne on the face of the cladodes; the berry is bright red.

BROOM: see BRUSH.

BROOME, WILLIAM

(1689-1745), English scholar and poet, and collaborator with Alexander Pope in his translation of Homer, was born at Haslington, Cheshire, in 1689. He was educated at Eton and St. John's college, Cambridge, and became rector of Sturston, Norfolk. When Pope undertook the translation of the *Odyssey* (1725-26) he engaged Elijah Fenton and Broome, who had contributed to the notes for Pope's translation of the *Iliad* (1715-20), to help him. Broome translated the 2nd, 6th, 8th, 11th, 12th, 16th, 18th and 23rd books, and provided almost all the notes. The financial arrangements were vague, and Pope has often been accused of treating Broome shabbily, but research has shown that Pope acted with greater generosity than was at one time supposed. He gave his collaborators virtually all the copy money and something more (amounting to about £800) and kept for himself the proceeds from subscribers that he had solicited (amounting to about £5,000). Fenton and Broome were free to solicit for subscriptions on their own account but did not in fact do so to any considerable extent. Broome seems to have undertaken the work largely in order to increase his own reputation, and it was only when he found that little fame was coming his way that he complained of underpayment. Broome also made translations from Anacreon, printed in the *Gentleman's Magazine*, and wrote *Poems on Several Occasions* (1727). He died at Bath on Nov. 16, 1745.

See George Sherburn, *The Early Career of Alexander Pope* (1934). (J.S.C.)

BROOMRAPE (*Orobanche*), a genus of brown, leafless, parasitic herbs (family Orobanchaceae) growing attached to the roots of other plants. The usually stout stem bears brownish scales and ends in a spike of yellow, reddish-brown or purplish flowers, with a gaping two-lipped corolla. There are about 90 to 100 species of broomrape, natives of temperate and subtropical regions; many occur in North America. Eleven species are found in the British Isles: the largest, *Orobanche major*, is parasitic on roots of shrubby leguminous plants, and has a stout stem one to two feet high. *O. minor* is sometimes troublesome on clover crops.

BROQUEVILLE, CHARLES, COMTE DE (1860-1940), Belgian statesman who headed the Belgian government-in-exile during World War I. was born at Postel, near Moll, on Dec. 4, 1860. From 1885 to 1910 he was successively town councillor of Moll, provincial councillor of Antwerp, deputy for Turnhout (1892) and minister of railways, posts and telegraphs. He became prime minister in a Catholic cabinet on June 18, 1911. After the elections of 1912 he formed a new cabinet, in which he was also minister of war until Aug. 1917. His army bill making military service compulsory for all males (instead of one male only per family) became law in 1913. In July 1914, on the eve of World War I, he was responsible for the mobilization of the Belgian army. While at Ste. Adresse, near Le Havre in France, after the battle of the Yser, he undertook the reorganization of the army. He resigned in Dec. 1917 when it became known that, without informing the members of his cabinet, he had taken part in a secret negotia-

tion aiming at the conclusion of a separate peace treaty with Austria-Hungary. Nevertheless he became minister of state on May 31, 1918, and was minister of the interior in Léon Delacroix's coalition from Nov. 1918 until Nov. 1919. He endeavoured to make the Catholic party accept the suppression of the plural vote and prepared a revision of the constitution. He was elected senator for the province of Namur in 1919. From 1926 until 1930 he was minister of war. He fought for the maintenance of the term of military service against the Socialist members of Henri Jaspar's coalition and brought into being a new system of defense centred on the fort of Eben Emaël. He was again prime minister from Oct. 1932 until Nov. 1934 and retired from political life in 1936. He died in Brussels on Sept. 5, 1940.

See F. Marre, *Le Baron de Broqueville et la défense nationale* (1918); Comte L. de Lichtervelde, *Le Comte de Broqueville* (1946). (J.E.D.)

BRORSON, HANS ADOLPH (1694-1764), Danish poet and bishop, author of hymns influenced by German Pietism, was born at the village of Randerup, southern Jutland, on June 20, 1694. He became pastor there in 1721, and was transferred in 1729 to Tønder and in 1737 to Ribe, where he was elected bishop in 1741. He died at Ribe on June 3, 1764.

Brorson was influenced in his youth by German Pietism (*q.v.*) and while at Tønder began to translate German Pietist hymns. From 1732 onward he published also hymns of his own, and in 1739 appeared *Troens rare Klenodie* ("The Rare Jewel of Faith") which contained many translations and 82 original hymns, among them the famous "The loveliest rose is found." *Svanesangen* ("Swan Songs"), a collection of hymns expressing his longing for the life hereafter, was published a year after his death.

Brorson's hymns are intimate expressions of the soul, and are meant for personal and family use. His frequent use of flower symbols, and his emphasis on the mystical marriage between the soul and Jesus, are Pietist. His hymns are often in aria form, and their language and rhythm show the subtlety of rococo.

Brorson's *Samlede Skrifter* were published in 3 vol. (1951). (O. A. F.)

BROSCI, CARLO: see FARINELLI.

BROSSE, SALOMON DE (1571-1626), French architect, whose work prepared the way for the restrained baroque architecture of Louis XIV, was born at Verneuil and died in Paris. Son of an architect, grandson and follower of Jacques Androuet du Cerceau the elder, he was among the most distinguished architects of his age. After the Edict of Nantes, De Brosse, a Protestant, moved to Paris where in 1615 he began the Luxembourg palace for Marie de' Medici. By 1619 Blbrancourt, his finest and most influential château, was completed.

De Brosse also designed the first monumental French Protestant temple at Charenton (1623) and the *palais de justice* at Rennes (1618; built posthumously). His architecture is particularly noteworthy for its simplicity, dignity and monumentality.

See J. Pannier, *Un architecte français au commencement du XVII^e siècle: Salomon de Brosse* (1911); L. Hauteceur, *Histoire de l'architecture classique en France*, i, part 2 (1943). (H. Mn.)

BROSSES, CHARLES DE (1709-1777), French scholar and writer known as *le Président de Brosses* because he was president of the parliament of Burgundy from 1740 until his death. He was born at Dijon, Feb. 7, 1709. After a visit to Italy in 1739 he published (1750) the first work on the ruins of Herculaneum and wrote his famous *Lettres sur l'Italie*, posthumously published in 1799 (best edition by Y. Bezaud, 1931). His *Histoire des navigations aux terres australes* (1756), in which he first laid down the geographical divisions of Australasia and Polynesia adopted by succeeding geographers, helped to stimulate the voyages of L. A. de Bougainville and James Cook. He also wrote on the origin of language, on Roman history and on Sallust, the translation of whose work occupied much of his time. He died in Paris, May 7, 1777.

See H. Mamet, *Le Président de Brosses, sa vie et ses ouvrages* (1874); A. C. Taylor, *Le Président de Brosses et l'Australie* (1937). (A. C. T.)

BROSSOLETTE, PIERRE (1902-1943), a leading member of the French resistance movement during the German occupation in World War II, was born at Angoulême on June 15, 1902, and

graduated at the faculty of letters in the University of Paris. A journalist and member of the Socialist party, he was appointed chief foreign commentator for the French radio in 1936, but lost his post in 1939 because of his critical commentaries on the foreign policy of Édouard Daladier, particularly the Munich agreement. He became foreign editor of the Socialist party's newspaper, *Le Populaire*, and the acuteness and vigour of his commentaries brought him to the front rank both in journalism and among the new generation of the party. After serving in the infantry in the campaign of 1940 he was among the first organizers of the resistance in the German-occupied zone after the armistice. In Sept. 1942 he joined General de Gaulle in London but soon returned for further work in France itself. He was captured by the Germans and tortured. He died in prison on March 22, 1943. His widow, Gilberte, who had served with him in the resistance, was a Socialist senator from 1946 to 1959. (P. W. C.)

BROSTROM, AXEL LUDVIG (1838-1905), the founder of the largest shipping group in Sweden, can be regarded as the father of the modern Swedish mercantile marine. Born at Kristinehamn, Swed., May 21, 1838, as a young man he joined a shipping company and later became an owner-captain in the lake shipping trade. In 1870 he converted a sailing ship, "Aactiv," into a steamship, which proved so successful that he acquired other steamships.

Brostrom founded the "Fern" steamship company and built vessels for transporting iron ore, the predecessors of the special ore-carrying vessels later in world-wide use. He died at Göteborg on Sept. 21, 1905. (P. Df.)

BROTHERS, RICHARD (1757-1824), a religious fanatic who believed himself to be a descendant of David, "the nephew of the Almighty, the prince of Hebrews," and was the first to preach the theory of British Israel, was born in Newfoundland on Dec. 25, 1757. As a naval officer, he was retired on half pay after the peace of Versailles (1783) and was several times imprisoned as a debtor, having refused his pay on conscientious grounds. The publication of *A Revealed Knowledge of the Prophecies and Times* (1794), containing prophecy of the end of George III's reign and of the re-establishment of a Jewish kingdom composed of the lost tribes of Israel who were believed now to be in England, resulted in his confinement as a criminal lunatic. He continued to write prophetic pamphlets and gathered several followers, among them the engraver William Sharp, who afterward deserted him for Joanna Southcott (*q.v.*). Brothers died in London on Jan. 25, 1824. He was a favourite subject for contemporary caricaturists and satirists including J. Gillray and G. Cruikshank.

BROUGHAM, JOHN (1814-1880), British actor and author of nearly 100 plays, was born in Dublin, Ire., on May 9, 1814, and died in New York on June 7, 1880. He made his first stage appearance in London at the Tottenham street (later Scala) theatre in 1830, playing six small parts in *Tom and Jerry*. He joined the company of Madame Vestris in 1831.

Brougham collaborated with Dion Boucicault in writing *London Assurance* in which he played Dazzle. He went to the United States in 1842 and thereafter spent his time between the two countries. He is said to have been the original of Harry Lorrequer in Charles Lever's novel. (W. J. M.-P.)

BROUGHAM: see CARRIAGE.

BROUGHAM AND VAUX, HENRY PETER BROUGHAM, 1ST BARON (1778-1868), was lord chancellor of England from 1830 to 1834, in the ministries of Earl Grey and Viscount Melbourne. Brougham's place in history, however, is not dependent upon his accomplishments as occupant of the wooolsack; a prominent figure in British political life for more than 30 years, he played an important role in the improvement of education, law reform, the abolition of slavery and other reforms.

Edinburgh. — Henry Brougham was a Scot, born in Edinburgh on Sept. 19, 1778, to parents of modest means and no connections. Except for visits to his father's estate in Westmorland, Brougham grew up amid the genteel poverty of Edinburgh society which had retained its arch-conservatism if not its wealth. As a precocious youth of 13, he matriculated at Edinburgh university, then in one of its golden periods with teachers such as Dugald Stewart

inspiring students to independent thought rather than indoctrinating them in the fashion of the major universities south of the border. Before he was 20 years of age, Brougham had published three scientific papers which had won wide critical acclaim, including that of the Royal Society, to which he was elected shortly after he went to London. Though the physical sciences attracted him, Brougham's primary interests were politics, good talk and fine oratory, which he developed at Edinburgh's famed Speculative Society as well as in the taverns and rooms of his friends.

After receiving his degree, Brougham studied law and was called to the Scots bar in 1800. That bar, which afforded some promise to conforming young men! held little hope for so iconoclastic a nature as Brougham's. He kept busy defending impecunious prisoners and baiting the senile and reactionary judge who presided on his circuit. But cash briefs were few and far between. The sparsity of legal work afforded him ample time—a commodity which he always used well—to assist in the promulgation of the *Edinburgh Review*, for which he wrote 35 articles in two years; thus displaying characteristic depth and shallowness, ingeniousness and ingenuousness, astonishing versatility and a facile, venomous pen. At the same time, he prepared a lengthy book on the colonial policies of all the European powers—the first of many books which he published during his long life—which, though full of half-truths and not a best seller, brought him some measure of fame and the plaudits of William Wilberforce's antislavery group. After this, the Scots bar was too confining for Brougham.

London.—Late in 1803, Brougham went to London, entered Lincoln's Inn and studied law under Nicholas Tindal, later chief justice of the common pleas. Brougham continued to support himself largely by his writings for the *Edinburgh Review*. Always ambitious for recognition and hoping for place, he moved into the political arena. At first he associated with Wilberforce's Tories, for whom he wrote a pamphlet which was most effective in securing the passage of the antislave trade bill through commons. He also undertook a dangerous mission to Holland, where he unsuccessfully sought to convince the Dutch to ban the slave trade. But the Whigs seemed to offer a more congenial association, both in terms of social connection with the great Whig aristocracy and in terms of a program for badly needed social reforms which was sponsored by the Mountain, the left wing of the Whig party. Party lines were not then clearly drawn in terms of principles and it was ambition for office which led Brougham into the Holland house camp. Brougham's attraction for the Whigs was his great capacity as a publicist, exhibiting methods far in advance of his time. This is not to say that he did not cut an excellent figure in the Whig drawing rooms and at the dinner tables where his charm and wit and learning secured acceptance which his background and family connections could not have obtained.

His pamphleteering often drew blood from the Tories. In his role as public relations director for the 1807 campaign he exhibited a magnificent talent for using the newspapers and periodicals to aid the cause. He brought the *Edinburgh Review* to the Whig banner in so effective a manner that the Tories were compelled to sponsor a competitor in the form of the *Quarterly Review*. By these and other services, such as attendance on a mission to Portugal headed by Lords St. Vincent and Rosslyn, he earned the enmity of the Tories and the debt of the Whigs, though the latter were too aware of his individualism to trust him with a seat in parliament until the threat of his desertion led Lord Holland to prevail on the duke of Bedford to make available to Brougham the pocket borough of Camelford in 1810.

The Bar.—Brougham's first success as a lawyer came even before he was called to the English bar in 1808. As a member of the Scots bar, he was qualified to represent in the house of commons the commercial interests of Liverpool on their petition to withdraw the orders in council. For six weeks he kept the house hanging on his words, though ordinarily such presentations served but to empty that chamber. The failure of the house to accede to his demands did not dim the brilliance of the performance nor mar the reputation as an advocate which resulted from

this pyrotechnic display. After his admission to the English bar, he had a remarkable financial success, though the Tories kept him from his silk gown long after he had earned it. His success was not attributed to great legal learning and he was at his best only when he was arguing a cause which aroused his emotions as well as his intellect. It was thus that he successfully defended John and Leigh Hunt against a charge of seditious libel for publishing criticisms of the government for the inhuman corporal punishment which prevailed in the armed forces.

His other great forensic triumph as a lawyer was at the trial of Queen Caroline accused by her husband of infidelities as a ground for annulment of the royal marriage, a charge which ill-became the profligate George IV, especially in light of his earlier illegal marriage to Mrs. Fitzherbert. Here, as in the earlier causes, Brougham represented the popular side of the controversy, though it was he who helped immensely to make the cause a popular one. Brougham had become legal adviser to the unfortunate Princess Caroline some time before 1811. He had much earlier learned to despise her husband, who was to become his sovereign as George IV. And if he had no feelings of warmth for Caroline, he was most affectionate toward Princess Charlotte, the ill-starred offspring of the unhappy marriage. When Caroline became queen, Brougham was made her attorney general, and with Thomas Denman, later lord chief justice, who was her solicitor general, tried the annulment suit in the house of lords. Brougham's cross-examination of the crown's unsavoury witnesses and his magnificent summation, which lasted two days, turned the cause in favour of his client. He became the most popular figure in England, representing a woman who had no claim on him or the people except, perhaps, by reason of the fact that she was less despicable than her husband.

The House of Commons.—From the very beginning of his parliamentary career, Brougham was the best speaker available to the Whig benches: a worthy successor to Charles James Fox. If this made him valuable it did not endear him to the lesser men who were in control of that party. There were no issues on which Brougham was not prepared to speak and, generally, to speak well. But it was on the subjects of slavery, public education and law reform, where personal persuasion was combined with oratorical capacity, that he revealed his greatest talents. Strangely, in these areas of personal predilection, he succeeded in avoiding the lapses of judgment and good taste which not infrequently marred his other forensic displays.

In 1812 he succeeded in causing Lord Castlereagh to withdraw the orders in council, for which he had earlier fought as a barrister. Despite the appeal which such action had for the commercial interests, he was unsuccessful in standing for Liverpool after losing his seat for Camelford, which the duke of Bedford had "sold." The Whigs again mere unwilling to find a place for him until 1816, when he flirted with the idea of standing for Westminster against Richard Brinsley Sheridan. They then offered him the earl of Darlington's pocket borough of Winchelsea. In 1818 Brougham succeeded in revitalizing the committee on education which turned up scandalous abuses by the church, the public schools and the universities in their administration of charitable funds donated for educational purposes but perverted to private uses. He sponsored the Public Education bill of 1820, worked assiduously in the implementation of the mechanics' institutes, and helped found the Society for the Diffusion of Useful Knowledge to publish books at prices within the reach of artisans. In 1825 he was elected rector of Glasgow university and was at a later date made titular head of Edinburgh university. In 1828 he succeeded in creating a university in London, a nondenominational school which incurred the displeasure both of the established church and the dissenters.

On Feb. 7, 1828, Brougham delivered his great speech on law reform, which proved to be the foundation for the revision of civil procedure which took place in England during the 19th century. His bankruptcy bill and plan for local courts also came to fruition some time after his departure from effective political life. His antislavery speeches dated back to an address to the crown delivered within four months of his first coming into the house

of commons. But the high point was reached in his speech in 1830 which won him the opportunity to stand for Yorkshire, a popular constituency. In his successful election campaign he pledged himself to parliamentary reform, a position which he could not very well take so long as he represented one of the Whig's rotten pocket boroughs. Immediately upon his return to commons from Yorkshire, he noticed a bill for parliamentary reform. Before it could be acted upon, Lord Grey was asked to form the ministry which resulted in Brougham's removal from commons to the lords.

Throughout his career in commons, Brougham used his position to further popular causes, thus winning himself the support of a large if unenfranchised following, and the enmity of many of the vested interests. Even so, his position was such that the government could not be formed without him, much as the Whigs would have liked to do so.

Brougham as Lord Chancellor.—On the accession of Grey, the Whigs offered Brougham the attorney general's post, a non-cabinet position, which he cursorily rejected. He wanted to be master of the rolls, a judicial post which would permit him to remain in commons. But the king and Althorp (Lord Spencer), who was to be leader in commons, wanted him elsewhere. Brougham was prevailed upon to accept the woolsack with the result that he was created a peer and removed to the lords. The newspapers reflected the appointment in terms of Samson's haircut. In the cabinet Brougham continued to prove his versatility and energy, to the chagrin and displeasure of his colleagues, whose jealousies and mistrust were heightened. The fact that those with whom he interfered would have been unable to do their jobs without his assistance did not add to his attraction. But his lack of tact and certain improprieties with the press are not to be denied. In the lords, Brougham was the party's leader in fact as well as in name. Much of the credit for forcing the Reform bill of 1832 through that antediluvian body properly belongs to him. To him too must be attributed the reform of the privy council and the creation of the central criminal court in London.

In the chancery, Brougham proved the validity of his earlier charges against Lord Eldon by clearing a docket and revising the rules of procedure. His temperament did not, however, endear him to the lawyers practising before him, especially in light of the fact that he was taking money out of their pockets by his reforms.

Decline and Fall.—When Melbourne was called upon to form his second ministry, he would not find a place in it for so impolitic a politician as Brougham. Deprived of the forum of the commons, Brougham lost his power. From that point forward he was a "political Ishmael" both to the Whigs and the Tories. He continued to champion his favourite causes both in the house of lords and in the many organizations to which he subscribed. But he withdrew more and more often to his villa at Cannes, France, which he managed to establish as a favourite watering place for English society.

Brougham died at Cannes on May 7, 1868. His autobiography, *Life and Times of Henry Lord Brougham*, in three volumes, was published posthumously in 1871.

Brougham's was the unhappy role of the political liberal, unable to subordinate either himself or his principles to the demands of party. He was accused by his contemporaries of using his power for his own exaltation. Ego there was, but only occasionally was it not subordinated to principle. He made enemies by his principles and friends by his charm. Those who knew him found him gay and melancholy, charming and vexing, energetic and enervated, ambitious and self-denying, wise and foolish: the best of men and the worst of men. Whatever burdens he placed on his contemporaries, history must acknowledge that he was a man who made England a better place to live for all who followed him.

BIBLIOGRAPHY.—Excellent bibliographies are in F. Hawes, *Henry Brougham* (1957); A. Aspinall, *Lord Brougham and the Whig Party* (1927); see also G. T. Garratt, *Lord Brougham* (1935); Lord Campbell, *Lives of the Lord Chancellors*, vol. 8 (1857). (P. B. K.)

BROUGHTON, JOHN CAM HOBHOUSE, BARON (1786–1869). English statesman and littérateur, is probably best

known as the alleged coiner of the phrase "His Majesty's Opposition." and as the friend and confidant of Lord Byron, the poet, whose memoirs were destroyed by the publisher John Murray on his advice. He was born near Bristol on June 27, 1786, and educated at Westminster school and at Trinity college, Cambridge, where he became Byron's intimate friend. Member of a well-established merchant family, known for its political and intellectual interests. Hobhouse traveled widely with Byron in 1809–10 and again in 1816–17. In 1813–15 he followed the concluding campaigns of the Napoleonic wars, being present at the entry into Paris and again during the Hundred Days. First attracting attention in 1815 by an attack on the restored Bourbons, Hobhouse soon became prominent in literary and parliamentary circles as a radical of cosmopolitan tastes, and as a fluent and forceful pamphleteer, one of whose onslaughts upon the unreformed house of commons led to his imprisonment for breach of privilege in 1819, in which year he also unsuccessfully contested Westminster. Elected for the constituency in the following year as the colleague of his friend Sir Francis Burdett, Hobhouse proved a lively and assiduous member, active in promoting every type of reform, and fully sharing Byron's enthusiasm for the cause of Greek independence. He inherited his father's baronetcy in 1831.

In 1832, at the height of the crisis over the Reform bill, Hobhouse joined Lord Grey's administration as secretary at war, and a year later he became chief secretary for Ireland for a few weeks. However, he was by now less popular among radicals and he lost his seat at Westminster. Returned to parliament for Nottingham in 1834, Hobhouse attained cabinet rank as first commissioner for woods and forests under Lord Melbourne. In Melbourne's second ministry between 1835 and 1841, he was president of the board of control for India, and from 1846 to 1852 held the same appointment under Lord John Russell. Strongly anti-Russian, Hobhouse maintained a "forward" policy in India, favouring the plan to secure the northwest frontier by advance into Afghanistan, and was an ardent supporter of Lord Palmerston's diplomacy, especially over the eastern question. Raised to the peerage as Baron Broughton de Gyfford in 1851, he virtually withdrew from public life when the government fell in the following year; he died in London on June 3, 1869. In old age Broughton wrote his *Recollections of a Long Life*, printed privately in 1865 and later edited by his daughter and published (1909–11). These memoirs are a valuable source of information on his times by a man of unusually wide interests, which ranged from partnership in Whitbread's brewery to fellowship of the Royal society.

An effective propagandist and vigorous debater, Hobhouse entered politics as an uncompromising radical. With age and the achievement of many of his favourite reforms, his opinions melted; and he came to be regarded as deeply conservative, an exemplar of those Whigs whose attitude by the end of the 1830s was described as "rest and be thankful." In this respect, he was typical of many men of position, whose zeal for change reached its zenith between 1815 and the Reform act of 1832, declining rapidly thereafter. Keeping in close contact both with the inner group of cultivated Whig aristocrats and with more raffish and left-wing literary circles, Hobhouse was a respected figure of the second rank, who became an adequate administrator and trusted adviser. He always retained his interest in intellectual and artistic pursuits, and was well liked in society. (A. F. T.)

BROUSSAIS, FRANÇOIS JOSEPH VICTOR (1772–1838), French physician, one of the most active proponents of leech medicine, was born at Saint-Malo on Dec. 17, 1772, the son of a physician. After service in the wars of the Revolution he returned in 1814 to Paris, and was appointed assistant professor to the military hospital of the Val-de-Grâce. He believed that all diseases were local and that they passed from one organ to another "sympathetically" or through irritation of the gastrointestinal tract; that nature had no healing power; and that starvation and leeches would cure everything. He died at Vitry-sur-Seine on Nov. 17, 1838.

Broussais's best-known works are *L'Histoire des phlegmasies ou inflammations chroniques* (1808) and *L'Examen des doctrines médicales* (1816).

See J. D. Rolleston, "F. J. V. Broussais, 1772-1838; His Life and Doctrines," *Proc. Roy. Soc. Med.*, 30:405-13 (1939).

BROUWER, ADRIAEN (c. 1605/06-1638), Flemish painter, influenced in his short life the artists of both Flanders and Holland. Few facts concerning his career are established beyond question, but it is reasonably certain that he was born in Oudenaarde, that he made his way to Haarlem about 1621 and entered the studio of Frans Hals, that after gaining a high reputation in Holland he returned in 1631 to the South Netherlands.

BY COURTESY OF DEUTSCHE FOTOTHEK

"PEASANTS BRAWLING OVER A GAME OF CARDS," BY ADRIAEN BROUWER. IN THE DRESDEN GEMALDEGALERIE

and that he was imprisoned by the Spaniards in Antwerp as a suspected spy until Sept. 1633. He then settled in Antwerp and was buried there on Feb. 1, 1638. Almost all authorities agree that he was a man of reckless and dissolute habits, although perhaps his profligacy (like the saintliness of Fra Angelico) has been exaggerated by those who knew the pictures but not the artist. Except for a handful of landscapes, which apparently belong to his last years, all Brouwer's pictures are genre subjects, drawn from the poorer, coarser and more painful aspects of common life—peasants smoking, drinking or brawling in taverns, quack surgeons operating on grimacing patients, and so on. Most of the pictures are small, and are painted on panel. The coarseness of his subjects is offset by the delicacy of his style, which combines a brisk, expressive brushstroke with a fastidious sense of colour and design. His mature style shows an unusual mastery of tonal values, expressed in a scale of grays and browns that are relieved sometimes by only a single note of more positive local colour.

(R. E. W. J.)

BROWDER, EARL (RUSSELL) (1891-), U.S. Communist party leader, was born in Wichita, Kan., on May 20, 1891. He left school at the age of 10 and worked at a variety of jobs. Through the influence of his father he attended Socialist meetings and met the Socialist leader Eugene Debs. As a result of his opposition to the entrance of the U.S. into World War I he was imprisoned (1919-20). He became a member of the U.S. Communist party in 1921. In China (1927-28) at Hankow and Shanghai he served as director of the Pan-Pacific Trade Union Secretariat. From 1930 to 1945 he held the post of general secretary of the U.S. Communist party and was that party's candidate for president of the United States in 1936 and 1940. In the latter year he was sentenced to prison for four years for passport irregularities but was released after serving 14 months. In 1945 he was removed from his position as secretary of the party for having declared that capitalism and socialism had begun to find means of peaceful coexistence. He was expelled from the Communist party in 1946 and three years later was named in "treason trials" in Budapest and Prague as originator of the heresy of "Browderism" which flowered in Titoism.

Among his many published works are *The People's Front* (1938), *War or Peace With Russia* (1947) and *Marx and America* (1958). He was for a time editor in chief of *The Daily Worker*.

(B. MI.)

BROWN, SIR ARTHUR WHITTEN (1886-1948), British aviator, who with Capt. J. W. Alcock (*q.v.*) made the first direct airplane crossing of the Atlantic, was born in Glasgow, the only son of U.S. parents, on July 23, 1886. He was trained as an engineer in the Westinghouse company in Manchester and went to South Africa in 1912. In World War I he served in the Manchester regiment and later in the Royal Flying Corps and in the Royal Air Force as a pilot. In 1919, as navigator to Alcock, he made the record crossing of the Atlantic in a Vickers Vimy twin-engined biplane at an average speed of about 120 m.p.h. Taking off from St. John's, Nfld., at 4:13 P.M. on June 14, they landed 16 hr. 27 min. later in a bog at Clifden, County Galway, Ire. For this performance Alcock and Brown shared the £10,000 prize offered by the *London Daily Mail* and both were awarded knighthoods. Brown later returned to engineering and was general manager of the Metropolitan Vickers company in Swansea, Wales, for some years. He died at Swansea on Oct. 4, 1948.

See G. Wallace, *The Flight of Alcock and Brown* (1951). (D. CR.)

BROWN, CHARLES BROCKDEN (1771-1810), United States novelist who pioneered in the Gothic manner later employed by Nathaniel Hawthorne and Edgar Allan Poe and earned the title "father of the American novel," was born of Quaker parents in Philadelphia, Jan. 17, 1771. Of delicate constitution, he early devoted himself to study, reading widely in geography and political theory. To Quaker concepts of equality and social justice he added the utopian ideas of William Godwin and the marquis de Condorcet. These views, as well as a deep insight into abnormal psychology, give vigour to his four best novels. He called himself a "story-telling moralist"; his writings reflect a thoughtful liberalism, and he adapted contemporary English and German terror and horror motifs to the American scene.

His first novel, *Wieland* (1798), a minor masterpiece in American fiction; shows the ease with which mental balance is lost when the test of common sense is not applied to strange experiences. The story concerns Theodore Wieland, whose father died by spontaneous combustion apparently for violating a vow to God. Theodore, also a religious enthusiast seeking direct communication with divinity, misguidedly assumes that a ventriloquist's utterances are supernatural in origin; driven insane, Theodore acts upon the prompting of an inner voice and murders his wife and four children. When apprised of his error, he commits suicide. *Ormond* (1799) portrays a high-minded rationalist, Constantia Dudley, whose dignity and courage guide her safely through many dangers and finally lead her to kill the villain, Ormond. *Edgar Huntly* (1799) pictures incidents of Indian bloodthirstiness in the wilderness of the upper reaches of the Delaware river valley; the story concerns a sleepwalker's attempts to discover the murderer of a friend. *Arthur Mervyn* (1799-1800) describes a young farmer boy's perilous adventures in Philadelphia during the yellow fever epidemic of 1793; he avoids moral stain and ultimately marries a wealthy Jewess.

Brown's other writings included *The Dialogue of Alcuin* (1798), on the rights of women; *Memoirs of Stephen Calvert* (1799-1800), a novel of a young man's vacillation in love; *Clara Howard* (1801) and *Jane Talbot* (1801), novels of love in letter form; *Carwin, the Biloquist* (1805), a fragmentary account of the early life of Wieland's ventriloquist; and the semiannual *American Register* (1806-09), an analytical interpretation and chronology of contemporary events. He died on Feb. 21, 1810.

For the fullest biography and critical evaluation, see Harry R. Warfel's *Charles Brockden Brown: American Gothic Novelist* (1949). See also David Lee Clark, *Charles Brockden Brown, Pioneer Voice of America* (1952); Alexander Cowie, *The Rise of the American Novel* (1948). (H. R. WL.)

BROWN, ERNEST WILLIAM (1866-1928). British mathematician and astronomer, devoted many years of his life to a theory of the motion of the moon. Born at Hull, Yorkshire, Nov. 29, 1866, he went to Christ's college, Cambridge, where he greatly distinguished himself. He received the doctor of science degree

in 1897 and became a fellow and, in 1911, an honorary fellow of his college. Although Brown retained throughout his life a great attachment for his college and returned to Cambridge almost every summer, his professional life was spent in the United States. He accepted an appointment at Haverford college, Haverford, Pa., in 1891 and he was professor of mathematics at Yale from 1907 until his retirement in 1932. He died at New Haven, Conn., on July 22, 1938. At Cambridge Brown began to study the motion of the moon by a method devised by G. W. Hill. The latter had carried the subject far enough to show its suitability for solving the problem and Brown completed the theory and constructed tables. The theory in its entirety was published by 1908 and the tables, which are many times more accurate than earlier ones! have been used in calculating the positions of the moon since 1923. For a description of Brown's theory and tables, see MOON: *Lunar Theory*. (J. JN.)

BROWN, FORD MADOX (1821-1893), English painter whose work resembled in feeling and technique that of the Pre-Raphaelites, though he was never a member of the Brotherhood. Born at Calais. April 16, 1821, he studied art, 1837-39, at Bruges under Albertus Gregorius, and at Antwerp under Baron Gustaf Wappers, from whom he learned a sound technique. His early work is characterized by sombre colour and dramatic feeling suited to the Byronic subjects executed in Paris during 1840-43; e.g., "Manfred on the Jungfrau" and "Parisina's Sleep." Already concerned with the accurate representation of natural phenomena, he drew from corpses in University College hospital, London, when painting his "Prisoner of Chillon" (1843). Between 1844 and 1845 he contributed three cartoons to the competition for the houses of parliament decorations, but did not gain a prize. After a visit to Italy in 1845, his palette gained in richness and variety of colour, and in 1848 he met Peter von Cornelius, a member of the former Nazarenerbund which was a precursor to the Pre-Raphaelite Brotherhood. This combined interest in brilliant, clear colour and neomedievalism appears first in the "Wyclif Reading His Translation of the Scriptures to John of Gaunt" (1847). Brown contributed to the Pre-Raphaelites' magazine *Germ* in 1850, and Rossetti worked in his studio. Like Holman Hunt, Brown painted *en plein air* to obtain naturalistic accuracy of, for example, blue flesh tones in winter, for his "The Last of England" (1852-55, Birmingham Art gallery).

His most famous picture, "Work" (1852-63, Manchester Art gallery), which is a didactic social document, was first exhibited at Brown's retrospective exhibition held in London, 1865, for which he wrote the catalogue. He also worked as a book illustrator with William Morris; produced stained glass, for example, at St. Oswald's, Durham (1864-6j); and between 1879-March 1893 completed a series of 12 "frescoes" in Manchester Town hall depicting scenes from the city's history. Some were executed in oil on canvas glued to the wall.

He died in London, Oct. 6, 1893.

See Ford M. Hueffer (Ford Madox Ford), *Ford Madox Brown* (1896); W. M. Rossetti (ed.), *Ruskin, Rossetti, Pre-Raphaelitism* (1899), *Pre-Raphaelite Diaries and Letters* (1899). (D. L. FR.)

BROWN, FRANCIS (1849-1916), U.S. Semitic scholar and president of Union Theological seminary, was born in Hanover, N.H., Dec. 26, 1849, the son of Samuel Gilman Brown (1813-85), president of Hamilton college from 1867 to 1881, and the grandson of Francis Brown (1784-1820), a president of Dartmouth involved in the famous "Dartmouth college case." The younger Francis graduated from Dartmouth and from the Union Theological seminary and then studied in Berlin. In 1879 he became instructor in biblical philology at the Union Theological seminary, in 1881 an associate professor, in 1890 professor of Hebrew and cognate languages and in 1908 president of the seminary. Brown's published works, which won him honorary degrees in both Great Britain and the U.S., were, with the exception of *The Christian Point of View* (1902; with A. C. McGiffert and G. W. Knox), almost purely linguistic and lexical, and include *Assyriology: its Use and Abuse in Old Testament Study* (1885), and the important revision of Gesenius, undertaken with S. R. Driver and C. A. Briggs, *A Hebrew and English Lexicon of the Old Testament*

(1891-1905). In 1911 he was tried for heresy before the Presbyterian General Board but was exonerated. He died in New York on Oct. 15, 1916.

BROWN, GEORGE (1818-1880), Canadian journalist and statesman, was born in Edinburgh, Scot., on Nov. 29, 1818, and was educated in his native city. With his father, Peter Brown: he emigrated to New York in 1837. In 1843 they moved to Toronto and established *The Banner*, which supported the newly formed Free Church of Scotland. In 1844, at first with his father's help, he began to issue a Reform political journal, the weekly *Toronto Globe*. This became a daily in 1853 and through Brown's ability and energy came to possess an almost dictatorial influence over political opinion. In 1851 he entered the Canadian parliament as an independent Liberal member for Kent county. His vehement opposition to the presumed political power of the Roman Catholic Church and the "domination" in parliament of the French Canadian section made him very unpopular in Lower Canada, but in Upper Canada his power grew great. Largely owing to his campaign for separating church and state, the clergy reserves were secularized in 1854 and he championed the complete secularization of Upper Canada's schools, but unsuccessfully. He also fought for the representation by population of the two Canadas in parliament, the act of union (1840) having granted an equal number of representatives to each. His principle would be recognized in the British North America act (1867). He rebuilt the Upper Canada Liberal party behind "representation by population" and briefly won office in 1858 (the two-day Brown-Dorion administration).

He was one of the early advocates of a confederation of British North America, and in June 1864, to accomplish this end, entered into a coalition with his bitter personal and political opponent, Conservative premier John (later Sir John) A. Macdonald. Largely because of Brown's efforts, federation was carried through the house. In Dec. 1865, disapproving terms proposed for renewal of the reciprocity treaty with the United States, he resigned from the government, though continuing to support its federation policy. In 1867 he was defeated in South Ontario and never again sat in the house. In great measure because of his powerful advocacy, the Northwest Territories were acquired by the new dominion. In Dec. 1873 he was called to the Canadian senate, and in 1874 was appointed joint plenipotentiary with Sir Edward Thornton to negotiate a new reciprocity treaty with the United States. The negotiations were successful! but the draft treaty failed to pass the United States senate. Soon afterward Brown refused the lieutenant governorship of Ontario, and on two subsequent occasions the offer of knighthood, devoting himself to the *Globe*. On March 25, 1880, he was shot by a discharged employee and died at Toronto on May 9.

See J. M. S. Careless, *Brown of the Globe* (1960).

(W. L. G.; J. M. S. C.)

BROWN, HENRY KIRKE (1814-1886), U.S. sculptor whose equestrian statues are his most famous works, was born in Weyden, Mass., on Feb. 24, 1814. He began to paint portraits while a boy, studied painting in Boston under Chester Harding, learned a little about modeling, and from 1836 to 1839 spent his summers working as a railroad engineer to earn enough to study further. He spent four years (1842-46) in Italy, but, returning to New York, he remained distinctively American, never being dominated, as were so many of the early U.S. sculptors, by Italian influence. He died on July 10, 1886, at Newburgh, N.Y. His equestrian statues are excellent, notably that of Gen. Winfield Scott (1874) in Washington, D.C., and one of George Washington (1856) in Union square, New York city, which was the second equestrian statue made in the United States. Brown was one of the first sculptors in America to cast his own bronzes. Among his other works are: Abraham Lincoln (Union square, New York city); Nathanael Greene, George Clinton, Philip Kearny and Richard Stockton (all in the National Statuary hall of the Capitol, Washington, D.C.); De Witt Clinton and "The Angel of the Resurrection," both in Greenwood cemetery, New York city; and an "Aboriginal Hunter."

Brown's nephew and pupil, HENRY KIRKE BUSH-BROWN (1857-1935), also became prominent among U.S. sculptors, his "Buffalo

Hunt," equestrian statues of Generals Meade and Reynolds at Gettysburg and "Justinian" in the New York appellate courthouse being his chief works. He completed also a portrait-bust of Henry Kirke Brown for the Hall of Fame of New York university.

BROWN, JACOB JENNINGS (1775–1828). U.S. army officer, was born of Quaker parents in Bucks county, Pa., on May 9, 1775. He served for a time (1798–1800) as military secretary to Alexander Hamilton, became a successful farmer in western New York and in 1810 was made a brigadier general in the New York state militia. At the outbreak of war with Great Britain in 1812, he was in command of the New York state frontier and was successful in repelling attacks of the enemy at Ogdensburg, Oct. 3, 1812, and at Sackets Harbor, May 29, 1813. In the following July he was commissioned a brigadier general in the U.S. army and placed in command at Niagara. From there he took the offensive and after preliminary successes fought an indecisive battle on July 25 at Lundy's Lane. He became the commanding general of the U.S. army in 1821 and served in that capacity until his death: Feb. 23, 1828. (E. E. R.)

BROWN, JOHN (1715–1766), English clergyman, poet and playwright, was born at Rothbury, Northumberland, on Nov. 5, 1715, and educated at St. John's college, Cambridge. He was senior wrangler in 1735 and then took holy orders. His poem entitled *Honour* (1743) was followed by the *Essay on Satire*, written on the death of Alexander Pope, which gained for him the friendship of Bishop William Warburton. In 1751 he wrote his *Essay on the Characteristics of the Earl of Shaftesbury*, containing an able defense of the new utilitarian philosophy, and particularly emphasizing the advantages of state-controlled education. In 1756 he received the living of Great Horkesley, in Essex, and five years later became vicar of Newcastle upon Tyne. Garrick appeared in his two plays *Barbarossa* (1754) and *Athelstan* (1756). His *Estimate of the Manners and Principles of the Times* (1757–58), a bitter satire, was very popular. Invited by Catherine II of Russia to advise her on education, he prepared for the journey but was prevented by illness from setting out. In one of the fits of madness that had often before attacked him, Brown committed suicide on Sept. 23, 1766.

See his poetical works, ed. by Anderson (1794); and *Biographia Britannica*, ed. by A. Kippis (1780). (G. Hu.)

BROWN, JOHN (1800–1859), U.S. abolitionist, leader of the attack on Harpers Ferry in 1859, was born on May 9, 1800, at Torrington, Conn. He was one of the 16 children of Owen Brown, whose father had served as a captain in the Revolutionary War. In 1805 Owen Brown moved with his family to the Western Reserve district of Ohio. John Brown, at 18, intended to prepare for the Congregational ministry, and he studied briefly at schools in Massachusetts and Connecticut. Two years later he married Dianthe Lusk, who bore him 7 children; after her death he married Mary Anne Day, who bore him 13 more. He moved about a great deal, living from time to time in Ohio, Pennsylvania and Massachusetts, and working as a drover, tanner, stock grower, wool merchant and farmer. In 1849 he settled with his family in a Negro community founded at North Elba, N.Y., on land donated by the anti-slavery philanthropist Gerrit Smith of Peterboro, N.Y. Long a foe of slavery, Brown henceforth was to act like a monomaniac on the subject.

In 1855 Brown went to Kansas, whither five of his sons already had gone. Kansas was then the scene of violent conflict between free-state and proslavery groups. Settling near Osawatimie, Brown soon became conspicuous as a guerrilla leader, especially because of the so-called Pottawatomie massacre. Brooding over the killing of five free-soilers, he concluded that he had a divine mission to take vengeance. On the night of May 24–25, 1856, he led four of his sons and three other men to the cabins of suspected proslavery settlers living along Pottawatomie creek. His followers dragged five men out and hacked them to death.

In the spring of 1858 Brown held a remarkable convention of Negroes and whites at Chatham, Can. There he announced his intention to set up in the Maryland and Virginia mountains a stronghold where escaping slaves might gather and defend themselves. He proposed, and the convention adopted, a "provisional consti-

tution and ordinance for the people of the United States." He was elected commander in chief of this paper government. For his visionary enterprise he gained the moral and financial support of Gerrit Smith and the prominent Bostonians, Theodore Parker, G. L. Stearns, T. W. Higginson, S. G. Howe, and F. B. Sanborn (the "secret six"). In the summer of 1859, with an armed and disciplined band of 16 white men and 5 Negroes, Brown set up a kind of military headquarters in a rented farmhouse near Harpers Ferry, the site of a federal armory. He planned to seize the armory as the first step in carrying out his program. Launching his attack on the night of Oct. 16, he quickly took the armory and then rounded up some 60 leading men of the area, whom he meant to hold as hostages. Throughout the next day and night he and his men held out against the local militia, but on the following morning he surrendered to a small force of U.S. marines, under Col. Robert E. Lee, after they had broken in and overpowered him. He himself had been seriously wounded, and 10 of his followers, among them two of his sons, had been killed. Six were captured (and later executed) and five escaped. On the other side the losses were five dead and nine wounded.

Jailed in Charlestown, Va. (now Charleston, W.Va.), Brown was tried for murder, slave insurrection and "treason to the Commonwealth," that is, to the state of Virginia. At the trial, evidence was produced to show that many of his ancestors and relatives had been emotionally disturbed and that he himself probably suffered from mental illness. He refused, however, to permit a plea of insanity. In a speech to the court he denied all the charges against him and admitted only that he had intended to free the slaves. "I say,!" he added, "I am yet too young to understand that God is any respecter of persons. I believe that to have interfered as I have done—as I have always freely admitted I have done—in behalf of His despised poor, was not wrong, but right!" He was convicted and, on Dec. 2, hanged. He was buried at North Elba.

The Harpers Ferry raid failed utterly to do what Brown apparently had had in mind, that is, to start a general movement toward escape and freedom on the part of the slaves. Nevertheless, the raid had important consequences, for it immeasurably heightened the sectional feelings that soon were to eventuate in the Civil War. In the South little attention was paid to the views of responsible Republican leaders like Abraham Lincoln who disapproved of the raid. More attention was given to the statements of such New England intellectuals as Ralph Waldo Emerson and Henry David Thoreau who looked upon Brown as a hero and a saint. Once the war had come, Union soldiers took up the song "John Brown's Body," and his soul went "marching on." Thus he became a legendary martyr to the cause of freedom.

C. Furnas, *The Road to Harpers Ferry* (1959); Louis Ruchames (ed.), *A John Brown Reader* (1959). (R. N. Cr.)

BROWN, SIR JOHN (1816–1896), English armour-plate manufacturer, was born at Sheffield on Dec. 6, 1816, the son of a slater, and began work at a cutlery firm. Brown invented in 1848 the conical steel spring buffer for railway cars. In 1856 he started the Atlas iron works in Sheffield, which covered 30 ac. and employed eventually more than 4,000 workmen. Besides supplying iron to the Sheffield steel trade, Brown himself successfully developed the Bessemer process. In 1860, after seeing the French ship "La Gloire" armoured with hammered plate, he determined to attempt the production of armour for the British navy by a rolling process. The experiment was successful and led to orders for armour plate sufficient to protect about three-quarters of the navy. Brown died at Bromley, Kent, on Dec. 27, 1896.

See obituary notice in the *Engineer* (Jan. 1, 1897).

BROWN, JOHN GEORGE (1831–1913), U.S. painter whose representations of bootblacks, newsboys and urchins had great popularity in his time, was born in Durham, Eng., Nov. 11, 1831. He studied at Newcastle upon Tyne, at Edinburgh academy, and, after removing to New York city in 1853, at the schools of the National Academy of Design, of which he afterward became a member. In 1866 he became one of the charter members of the Water Color society, of which he was president from 1887 to 1904.

His "Passing Show" (Paris Salon, 1877) and "Street Boys at Play" (Paris exhibition, 1900) are good examples of his popular talent. He died in New York city, Feb. 8, 1913.

BROWN, LANCELOT ("CAPABILITY" BROWN) (1716-1783), English landscape gardener and architect to whose work and influence a great part of the English countryside owes its appearance, was born at Kirkharle, Northumberland. His nickname resulted from his habit of saying that he could see "capabilities" in the estates he was called upon to improve. He started his career as a gardener in his native village, and in 1740 became Lord Cobham's gardener at Stowe, Buckinghamshire, where he met William Rent (*q.v.*). In 1751 he started a practice at Hammersmith, meeting with immediate and lasting success. More than 140 estates received Brown's attention. He modified Kent's style of gardening to make it suitable for extensive tracts of park and farmland instead of the smaller areas Kent laid out. Structures alluding to classical antiquity were allotted minor roles or dropped altogether; the main elements in the typical Brown landscape were isolated clumps of trees, undulating greensward and a surrounding belt of woodland. He died on Feb. 6, 1783.

See D. Stroud, *Capability Brown* (1950). (Ms. W)

BROWN, ROBERT (1773-1858), British botanist probably best known for his very important discovery of "Brownian movement" (*q.v.*), was born at Montrose, Scot., on Dec. 21, 1773. He is also noted for his *Prodromus florae novae Hollandiae et insulae Van Diemen*, which did much to further the general adoption of A. L. de Jussieu's natural system of plant classification. Brown was the foremost botanist of his time, and was a great figure in the history of British botany; he was the first to describe the cell nucleus in plants.

Educated at Montrose and at Marischal college, Aberdeen, he began to study medicine at Edinburgh in 1789, but did not take a medical degree. In 1800, on the recommendation of Sir Joseph Banks, he was offered the post of naturalist to the expedition of Capt. Matthew Flinders for the survey of the then almost unknown coast of Australia. In 1805 the expedition returned to England, having obtained, among other acquisitions, nearly 4,000 species of plants, many of which were new.

Brown was almost immediately appointed librarian of the Linnean society, a post that he filled until 1822. He remained in the service of the admiralty until 1810 to work at his collections under Banks's supervision, and in that year published, in Latin, the first volume of his great work, the *Prodromus*. With the exception of a supplement published in 1830, no more of the work appeared. On the death of J. Dryander in 1810, Brown became librarian-botanist to Banks, who, on his death in 1820, bequeathed to him the use of his library and collections for life. In 1827 these were transferred to the British museum and a new department, the Banksian department, was created, with Brown as keeper. In 1835 the Sloane collections were added and the department of botany was constituted. Brown was keeper of this department until his death in London on June 10, 1858.

Brown played a leading part in preparing the way for a natural system of classification, although he did not propose a classification of his own. He used considerable constraint, and almost casually announced epoch-making discoveries. He contributed much to the knowledge of the sexual process in higher plants. He was also the first to distinguish between the gymnosperms and angiosperms, and he initiated the microscopical examination of fossil plants. He also had considerable influence on the scientific study of geographical botany.

In 1825-34 his works up to that date were collected and published in five volumes by C. G. D. Nees von Esenbeck, in German, under the title of *Vermischte Botanische Schriften*. In 1866-68 the Ray society reprinted his complete writings, the *Prodromus* alone excepted.

See F. W. Oliver, *Makers of British Botany* (1913); *Proceedings of the Linnean Society of London*, session 1931-32, pp. 17-54. (J. Rm.)

BROWN, THOMAS (1663-1704), English satirist whose extempore translation of an epigram by Martial with the lines beginning "I do not love thee, Dr. Fell" both prevented his ex-

pulsion from Oxford and won him lasting fame. Born at Shifnal, Shropshire, in 1663, he entered Christ Church, Oxford, in 1678. The irregularity of his life there almost caused his expulsion by John Fell, the dean, and he left without taking a degree. He settled in London, where his life combined pugnacity in literary argument with licentiousness, and wrote many satires, epigrams and lampoons. He also translated works from Latin and French. His prose *Amusements Serious and Comical, Calculated for the Meridian of London* (1700; mod. ed., 1927) presents a vivid picture of the city and its inhabitants as seen by the Grub street writers which is of historical rather than literary value. Brown died in London on June 16, 1704.

See *The Works of Mr. Thomas Brown*, 3 vol. (1707-08).

BROWN, THOMAS (1778-1820), Scottish metaphysician whose work marks a turning point in the history of the so-called "common-sense school," was born at Kirkmabreck, Kirkcudbright, on Jan. 9, 1778, the son of a Presbyterian minister. After going to school in England, he entered Edinburgh university in 1792, where he studied philosophy, then law (from 1796) and finally medicine (1798-1803) and there came into contact with Dugald Stewart, professor of moral philosophy, and with the founders of the *Edinburgh Review*. After some practice as a doctor, Brown was invited to lecture as deputy for Stewart in 1808-09; and in 1810 he was appointed joint professor with Stewart. Taken ill in 1819, he went to London to recuperate but died at Brompton on April 2, 1820.

Brown began writing early. His works include *Observations on the Zoonomia of Erasmus Darwin* (1798); an article in the *Edinburgh Review*, no. 2 (1803), criticizing Kant's philosophy, which he knew only through a French account of it; *Observations on the Nature and Tendency of the Doctrine of Mr. Hume Concerning the Relation of Cause and Effect* (1805; 3rd ed., *An Inquiry into the Relation of Cause and Effect*, 1818), originally intended to show how Hume's views were compatible with Christian teaching; eight books of undistinguished verse (collected ed., 4 vol., 1820), in the manner of Mark Akenside, whom he moreover used to quote in his lectures; and the posthumously published *Lectures on the Philosophy of the Human Mind*, 4 vol. (1820; 20th ed., with memoir by D. Welsh, 1861).

Brown, as Dugald Stewart's pupil, accepted the arguments for certain noninferential beliefs that Thomas Reid (*q.v.*) had made characteristic of the "Scottish" or "common-sense" school of philosophy (see COMMON SENSE, PHILOSOPHY OF), but he resisted the tendency to dissolve the substance of the mind into separate "faculties" and differed markedly from his predecessors in his attitude toward Hume and in his approach to sensationism. He accepted Hume's interpretation of causality (*q.v.*) in terms of repeated sequence, though he argued that belief in the regularity of the repetition was independent of experience. His debt to French sensationism as represented by Condillac is evident (1) in his general contention that we look intuitively on a sensation in the mind and (2) in his particular account of touch and of "muscular sense." He thus stands at the point where the Scottish school divides into two lines: the one, headed by Brown, with its sensationist orientation, in which J. S. Mill and Alexander Bain followed him; the other represented by Sir William Hamilton, who sought to combine the views of Reid and Stewart with German philosophy and resented Brown's deviation, especially where it had led him to criticize Reid.

See D. Welsh, *Account of the Life and Writings of Thomas Brown* (1825); F. Rethoré, *Critique de la philosophie de Thomas Brown* (1863); L. Dobrzynska-Rybcicla, *Die Ethik von Thomas Brown* (1909).

BROWN, THOMAS EDWARD (1830-1897), English poet, author of narrative poems and lyrics full of fervent local patriotism and simple natural piety. He was born May 5, 1830, at Douglas, Isle of Man, educated by a scholarly father and at King William's college, and entered Christ Church, Oxford, in 1849. Elected fellow of Oriel in 1854, and ordained in 1855, he returned to his old school as vice-principal in 1858. In 1863 he became second master at Clifton college where, by the time he retired (1892). "T.E.B.'s" genius and eccentricities had become a

matter for pride. He died at Clifton, Oct. 30, 1897.

His first poem: "Betsey Lee," appeared in 1873, and was included in *Fo'c'sle Yarns* (1881), the first of several volumes. His most important narrative poems were written in Manx, sometimes with daring irregularity of rhythm, and are characterized by a rugged tenderness, but the emotion, almost equally explosive in mirth and in tears, is disciplined by a scholar's sense of language. In his lyrics he is happiest when yoking one of these emotions to serve a philosophy of life often audacious but always genial.

See *Collected Poems; Letters*, with a memoir (both 1900). (A. T. Q.-C.; X.)

BROWN, SIR WILLIAM, BART. (1784–1864), British merchant and founder of the banking house of Brown, Shipley and Co., was born May 30, 1784, at Ballymena, Ire. In 1800 his family moved to the U.S. to engage in the linen trade and organized the firm of Alexander Brown & Sons. In 1809 Brown established a Liverpool branch, which became a banking and mercantile operation, and later founded Brown, Shipley & Co., Liverpool and London merchants. By 1844 his company controlled one-sixth of the trade between Great Britain and the U.S. From 1846 to 1859 he was a member of parliament for South Lancashire and during the Crimean War helped ease friction between Great Britain and the United States. He gave the city of Liverpool its public library and museum, opened in 1860, and in 1863 he was created baronet. He died March 3, 1864, in Liverpool.

See H. R. Fox Bourne's *English Merchants* (1886). (J. R. Lt.)

BROWN CREEPER, the name given to the North American bird, a subspecies of the common European tree creeper (*q.v.*), *Certhia familiaris*. In the eastern states the form is *Certhia familiaris americana*. The Mexican creeper (*C. f. albescens*), the southern creeper (*C. f. nigrescens*) of the southern Appalachians, the Nevada creeper (*C. f. leucosticta*) of southern Nevada, the Rocky Mountain creeper (*C. f. montana*), the California creeper (*C. f. occidentalis*), the Sierra creeper (*C. f. zelotes*) are very similar to the tree creeper in colour and habits.

There are other races found in Mexico and Nevada as well as in Europe and Asia. Creepers form the family Certhiidae, of which there are about 17 species found in Europe, Asia, North America and Australia.

BROWNE (BROWN),

CHARLES FARRAR: see WARD, ARTEMUS.

BROWNE, EDWARD GRANVILLE (1862–1926), British philologist, who made basic contributions to the study of Persian literary history. was born on Feb. 7, 1862, at Uley, Gloucestershire. Educated at Trinity college, Glenalmond, and then at Eton and Pembroke college, Cambridge. he studied medicine and oriental languages. In 1887 he was elected a fellow of his college, in the same year qualifying M.B. at St. Bartholomew's hospital, London, but he never practised as a doctor. In 1887–88 he traveled in Persia, becoming afterward lecturer in Persian at Cambridge. In 1902 he was appointed Adams Professor of Arabic at Cambridge, a post he held until his death. Browne's published works include *A Traveller's Narrative* (1891), re-issued in 1926 under the title *A Year Amongst the Persians; Literary History of Persia Until the Time of Firdausi* (1902), continuations of which were published in 1906, 1920 and 1924; *The Persian Revolution, 1905–9* (1910); a translation of *Chahdr Māgāla*, with notes (1921); and *Arabian Medicine* (1921). He died at Cambridge on Jan. 5, 1926.

BROWNE, HABLOT KNIGHT ("PHIZ") (1815–1882),

English artist, pre-eminent as an interpreter and illustrator of Dickens' characters, was born at Lambeth on June 15, 1815, in humble circumstances and was early apprenticed to the engraver William Finden, in whose studio his only artistic education was obtained. At the age of 19 he abandoned engraving in favour of other artistic work, and a meeting with Dickens two years later determined the form which this should take. Robert Seymour, the original illustrator of *Pickwick*, had just committed suicide, and the serial publication of the book was in danger from the lack of a capable successor. Browne applied for the post, and the drawings which he submitted were preferred by Dickens to those of a rival applicant—W. M. Thackeray. His pseudonym of "Phiz" was adopted in order to harmonize with Dickens' "Boz," and it was by his work for Dickens (especially in *Pickwick*, *David Copperfield*, *Dombey and Son*, *Martin Chuzzlewit* and *Bleak House*) that his reputation was made. He also illustrated the best-known novels of Charles Lever and Harrison Xinsworth in their original editions, and his work was in constant demand by publishers until a stroke of paralysis, in 1867, permanently injured his powers. His early ambition to become famous as a painter was not realized, but he gained great popularity and was awarded an annuity by the Royal Academy in 1878. He died at West Brighton on July 8, 1882.

See Albert Johannsen, *Phiz Illustrations From the Novels of Charles Dickens* (1956).

BROWNE, ISAAC HAWKINS (1705–1760), English poet, author of *De Animi Immortalitate* and regarded by Samuel Johnson as "one of the first wits of this country," was born on Jan. 21, 1705, at Burton upon Trent, Staffordshire, and died in London on Feb. 14, 1760. Educated at Westminster school and Trinity college, Cambridge, he was called to the bar, but never practised. He was the author of "Design and Beauty," a poem addressed to his friend Joseph Highmore, the painter; and of "The Pipe of Tobacco" which parodied Colley Cibber. John Philips, James Thomson, Edward Young, Alexander Pope and Jonathan Swift, who were then all living. In 1754 he published his chief work, *De Animi Intmortalitate*, a Latin poem on the immortality of the soul much admired by the scholars of his time.

See *Poems on Various Subjects, Latin and English*, published by his son Isaac Hawkins Browne (1768); the full account by Andrew Kippis in vol. 2 of *Biographia Britannica*, 6 vol. (1778–93).

BROWNE, MAXIMILIAN ULYSSES, GRAF VON (1705–1757), Austrian field marshal: one of Maria Theresa's most successful commanders. Born at Basel, Switz., on Oct. 23, 1705, he came of an Irish Jacobite family, his father having left Ireland and become resident in Austria. At the outbreak of the War of the Austrian Succession, Browne was in command of the troops in Silesia when Frederick the Great overran the country (1740–41), but he showed exceptional skill in delaying the Prussian advance and extricating his own troops—thereby giving the Austrians time to organize further defense and build up an army. He took part in the Italian campaign of 1746–49 where he again distinguished himself, and in 1751 became commander in chief in Bohemia. He was again on active service during the Seven Years' War. While advancing to the relief of Pirna, Browne was engaged and heavily defeated by Frederick at Lobositz on Oct. 1, 1756. Once again he conducted a skilful withdrawal. In the following year he was severely wounded at the battle of Prague and died of his wounds on June 26, 1757. It was said that his death was accelerated by the knowledge that he was being blamed for the lack of success of the campaign. (C. N. B.)

BROWNE, ROBERT (c. 1550–1633), was the leader of a group of Elizabethan separatists, called after him Brownists, and a pioneer in England of what are known as Free churches, that is, churches existing in independence of secular government. The son of a gentleman, claiming cousinship with Lord Burghley, he was born near Stamford, Lincolnshire, and educated at Corpus Christi college, Cambridge. In 1591 Burghley presented him to the living of Achurch, Northamptonshire, where he remained for the rest of his life. He died in Oct. 1633 at Northampton.

The significance of Browne's career lies in the 20 years between his leaving Cambridge and his becoming rector of Achurch. His temperament was of the kind that will not fit into any accepted

G. RONALD AUSTING FROM NATIONAL AUDUBON SOCIETY
BROWN CREEPER (CERTHIA FAMILIARIS AMERICANA)

framework, ecclesiastical or secular. When in 1579 he received the bishop's licence to preach, he threw it in the fire, crying that he preached "not as caring for, or leaning upon the bishop's authority, but only to satisfy his duty and conscience." Similarly, if the magistrate commands the preacher to give over his calling, Browne asserted, he ought not to obey him. In 1580, together with Robert Harrison, a Norwich schoolmaster, he gathered a separatist church in Korwich of the kind later known as Independent or Congregational. As a consequence of such teaching and behaviour, Browne was soon in trouble. He was imprisoned 32 times; and in 1582 he was in exile in the Netherlands. Eventually, however, he accepted convention and obscurity. He also quarreled with Henry Barrow (*q.v.*) and John Greenwood (*q.v.*).

While in exile Browne had been writing, and his books proclaim principles which, though later largely accepted by Protestants, were in his own day revolutionary. Browne's best-known tract, *A Treatise of Reformation Without Taryng for Anie* (1582), contains these pungent phrases: "It is the conscience and not the power of man that will drive us to seek the Lord's kingdom"; "The Lord's people is of the willing sort"; "In all things we must first look what is the Lord's will and charge, and then what is the will of man . . . And this freedom have all Christians"; "Let the Church rule in spiritual wise, and not in worldly manner"; "Though magistrates are to keep their civil power above all persons, yet they come under the censure of the Church, if they be Christians." In *A Booke Which Sheweth the Life and Manners of All True Christians* (1582) the contrasting state of true Christians and false is set forth. This is the first blueprint for an independent church polity in dependence on Christ alone. Browne's passion for freedom can be seen to spring from his faith in the character and capacity of the converted.

BROWNE, SIR THOMAS (1605–1682), English physician and author, who, chiefly famous for one small book of self-revelation, *Religio Medici*, is one of the outstanding 17th-century writers of English prose. He was born in London on Oct. 19, 1605. His father, a mercer in Cheapside, died when he was eight and his mother soon married Sir Thomas Sutton. Brought up by guardians, he was educated at Winchester and in 1623 entered Broadgates hall (later Pembroke college), Oxford, where his principal was Thomas Clayton, regius professor of physic, and his tutor Thomas Lushington, a broad-minded and witty clergyman who later moved to Norwich. These influences may have suggested his choice of medicine as a profession and his settling in Norwich as practitioner. He obtained his B.A. in 1626 and his M.A. three years later. The university did not offer courses in medicine and he probably began his medical studies as assistant to a doctor near Oxford. After visiting Ireland with his stepfather he went to study medicine abroad, first at the University of Montpellier, then at Padua and finally at Leiden, where he took his M.D. on Dec. 21, 1633. Details of Browne's experiences in these centres of learning can only be conjectured, but they were certainly of the first importance in the cultivation of his mind. On returning to England in 1634 he lived for a time at Shibden hall near Halifax, in Yorkshire, beginning to practice in the neighbourhood, and after two years was incorporated M.D. at Oxford. In 1636 he settled in Norwich.

The serious purpose of Browne's life had now reached fruition, but his parallel career as writer had also begun by chance at Shibden hall. There, when not yet 30, he had written his *Religio Medici*, which he described as "a private exercise directed to myself," and it did indeed circulate at first only in manuscript among his friends. In 1642, however, it was printed without his permission in London and so had to be acknowledged, an authorized version being published in 1643, together with letters to and from Sir Kenelm Digby, who had been so delighted with his first perusal of the surreptitious edition that he there and then composed his *Observations* upon it. The book was an immediate success

in England and soon circulated widely in a Latin translation on the continent of Europe. It was also translated into Dutch and French. In English it has become a classic both for its language and for its cast of thought.

Browne shows himself as a latitudinarian in religion, expressing his ideas in a sane and unpretentious way. He is fond of paradox, but is not obscure or pedantic. His ideas are original and sometimes humorous, revealing an engaging character, interested in the scientific spirit of the time and caring deeply for the freedom of the individual. Religious toleration such as Browne's was then uncommon. His philosophy is not profound, but his views have a perennial interest and are expressed in a richly ornamented prose which has kept its freshness.

By 1643 Browne had been for seven years in Norwich, so that the establishment of his fame as an author saw him already well set on his career as a doctor. He had married in 1641 and his family was growing. In spite of the demands of a practice spreading over a wide area, he accumulated a large library and was deeply read in classical and medical literature. He began early to compile notebooks of miscellaneous jottings and, using these as a quarry, he compiled his second and larger work, *Pseudodoxia Epidemica, or, Enquiries Into Very Many Received Tenents, and Commonly Presumed Truths* (1646). This often known as *Browne's Vulgar Errors*, set out to correct many popular beliefs and superstitions. Written in a picturesque, but not over-elaborated, style, the book was a success and was reprinted five times during Browne's life.

In 1658 he published his third book, containing two treatises on antiquarian subjects, *Hydriotaphia, Urne-Buriall, or a Discourse of the Sepulchrell Urnes Lately Found in Norfolk*, and *The Garden of Cyrus, or the Quincunciall, Lozenge, or Network Plantations of the Ancients*. Around the theme of the urns he wove a tissue of solemn reflections on death and the transience of human fame in his most luxuriant style; in the latter work, in which he traces the history of horticulture from the garden of Eden to the Persian gardens in the reign of Cyrus, he is especially fascinated by the quincunx, which furnished him with a subject for majestic elaboration. The whole volume is the supreme example of his skill in the manipulation of language. He used latinized forms of words and inversions of structure in his sentences to obtain a highly stylized effect. Some critics have detected in his prose a rhythm which borders on poetry, but which may be more aptly compared with music. A smaller work of great beauty and subtlety, entitled *A Letter to a Friend, Upon Occasion of the Death of His Intimate Friend*, was published posthumously in 1690. This was probably written late in Browne's life, and is founded on the clinical history of an actual patient dying of phthisis.

Browne had always been a royalist, and his fame both as doctor and writer gained him a knighthood when Charles II visited Norwich in 1671. He seldom left the city except to visit patients in other parts of Norfolk, but corresponded with such men of learning as John Evelyn, Sir William Dugdale and John Aubrey. Most of his surviving letters, however, were written to his eldest son, Edward Browne, and these give an intimate picture of his medical practice and his relations with his family. His life pursued an even course until 1682, when he died at Norwich, on Oct. 19, his 77th birthday. Browne has been criticized for the part he played in 1664 as a witness at the trial and condemnation of two women as witches; a later age condemns this as an indulgence in superstition on the part of one who attacked superstition in others. This is to ignore the religious attitude of the time. Browne was only expressing the logic of his faith, which entailed a belief in a personal Satan and so in the possible existence of witches, who must be persecuted as Satan's representatives. He died a sincere Christian and was buried in Norwich in the Church of St. Peter Mancroft, where his monument still stands.

The first edition of Browne's collected works was published in 1686; other editions are by Simon Wilkin, 3 vol. (1835–36); by C. Saylor, 3 vol. (1904–7); and by Geoffrey Keynes (including letters), 6 vol. (1928–31). *Religio Medici* was edited by J. J. Denonain (1953 and 1955); *Hydriotaphia* and *The Garden of*

Cyrus were edited by John Carter (1958). *Notes and Letters on the Natural History of Norfolk* was edited by T. Southwell (1902).

BIBLIOGRAPHY.—There is a full Bibliography by G. Keynes (1924). See also the lives by Samuel Johnson (1756); by S. Wilkin, in *Collected Works* (1636); by Edmund Gosse (1905); and by Jeremiah Finch (1950). (G. L. K.)

BROWNE, WILLIAM (1591?–1645?), English poet, author of *Britannia's Pastorals*, the *Inner Temple Masque* and other pastoral and miscellaneous verse. was born at Tavistock, Devon. He is said to have proceeded to Exeter college, Oxford, c. 1603, and he entered the Inner Temple in 1611. For some time between 1616 and 1621 he lived in France. In 1623 he became tutor to Robert Dormer, the future earl of Carnarvon, accompanying him to Eton and Exeter college, Oxford. Philip Herbert, earl of Montgomery, was Dormer's guardian, and the Herberts may have assisted Browne in other ways. His later life, after his marriage in 1628, appears to have been spent in the neighbourhood of Dorking, Surrey.

Browne's elegy on the death of Henry, prince of Wales, and the first book of *Britannia's Pastorals* appeared in 1613; *The Shepherds Pipe* in 1614; and the second book of the *Pastorals* in 1616, together with the first book, carefully revised. The *Inner Temple Masque*, which remained in manuscript until the collected edition of Browne's work of 1772, was written for performance in Jan. 1615. A fragmentary third book of the *Pastorals* exists in manuscript in Salisbury cathedral library. His miscellaneous poems are collected in Lansdowne Manuscript 777, at the British museum.

Britannia's Pastorals is a long, discursive pastoral narrative, interspersed with songs. Spenser was Browne's chief model here. Devoted to his country, and especially to Devonshire, he attempted to glorify them in pastoral verse of epic dignity. Although often imitative, Browne had originality. In the published pastorals, this appears mainly in his truthful, affectionate pictures of country life; in the unpublished verse, in many moving autobiographical passages. The *Inner Temple Masque*, on Circe and Ulysses, contains some exquisite songs. Mainly a backward-looking poet, Browne also came under contemporary metaphysical influence, while the erudition, social criticism and melancholy, even morbid, reflectiveness in parts of his work indicate a range wider than the label "pastoralist" suggests.

BIBLIOGRAPHY.—The complete *Works of William Browne* were ed. by W. Thompson and T. Davies, 3 vol. (1773); there is a modern edition by G. Goodwin, 2 vol., in the "Muses Library Series" (1894). See also Joan Grundy, "William Browne and the Italian Pastoral," *Review of English Studies*, vol. iv, new series (1953). (J. GY.)

BROWNE, WILLIAM GEORGE (1768–1813), English traveler in central Africa and the middle east, was born in London on July 25, 1768. In 1792 he set out for Egypt and at Asyut joined a caravan on its way to Darfur. There he was forcibly detained from 1793 to 1796 when he was allowed to return to Egypt. From Cairo he traveled leisurely through Damascus and Istanbul, reaching London in 1798. He published *Travels in Africa, Egypt and Syria* (1799; enlarged ed., 1806; French trans., 1800). Browne's remarkable book, not recognized during his life, contained the first scientific description of Darfur by a European visitor.

After desultory wanderings in the Levant in 1800–02, he started from England in 1812 in an attempt to reach Samarkand. Riding through Anatolia from Smyrna to Erzerum he reached Tabriz in June 1813 only to be murdered a few weeks later on the road to Teheran.

Browne published nothing on his later travels. Robert Walpole, in volume two of his *Travels in Various Countries of the East* (1820), printed hitherto unpublished papers by Browne including an account of journeys in Anatolia and a description of Istanbul, to which Walpole added a somewhat patronizing biography of the traveler. (R. L. HL.)

BROWNELL, WILLIAM CRARY (1851–1928), U.S. critic, was an early proponent of modern realistic art and sought to do for U.S. criticism what Matthew Arnold did for British. Born in New York city, Aug. 30, 1851, he graduated from Amherst college in 1871 and joined the *New York World*, becoming city

editor in a year. After serving on *The Nation* from 1879 to 1881, he became editor and literary adviser to Charles Scribner's Sons, New York publishers, in 1888, remaining there until his death.

His first two books, *French Traits* (1889) and *French Art* (1892), established a new and difficult standard for the U.S. critic, but a standard which Brownell maintained for himself in his succeeding books: *Victorian Prose Masters* (1901), *American Prose Masters* (1909), *Criticism* (1914), *Standards* (1917), *The Genius of Style* (1924) and *Democratic Distinction in America* (1927). He died at Williamstown, Mass., on July 22, 1928.

His wife, Gertrude Hall Brownell, edited an anthology of his works in 1933.

See Frank Fletcher, "A Bibliography of William Crary Brownell," *Bulletin of Bibliography and Dramatic Index*, 20:242–244 (Jan. 1953).

BROWNIAN MOVEMENT. The English botanist Robert Brown reported in 1827 that an aqueous suspension of the pollen of the herb *Clarkia pulchella* contained microscopic particles which carried out a continuous, haphazard zigzag movement. This random movement of microscopic particles was subsequently called Brownian movement. Brown noted that he was not the first to observe this phenomenon and referred to earlier observations by J. T. Needham and, particularly, by F. W. von Gleichen, whose work preceded his own by 60 years. He was, however, the first to carry out a detailed investigation. He was also the first to notice that the movement could not be attributed to life in the particles themselves: the pollen of plants that had been dead for at least a century exhibited the same phenomenon. This situation was noted by Brown as a "very unexpected fact of seeming vitality being retained by these 'molecules' so long after the death of the plant." Subsequently he found this irregular translational movement also in aqueous suspensions of minute particles of typically inanimate bodies such as minerals and smoke. This proved that the phenomenon was characteristic of suspensions of all microscopically small particles. Brown's observations were followed by a large number of detailed experimental investigations by other authors. Particularly noteworthy are the systematic investigations by C. Wiener (1863) and by G. L. Gouy (1889). Eliminating a number of explanations offered in the intervening period, they proved conclusively that the Brownian movement was due neither to thermal convections nor to capillary forces. Gouy also noticed that the liveliness of the Brownian movement was more pronounced, the smaller the size of the particles and the lower the viscosity of the liquid in which they were suspended.

Truly quantitative investigations awaited the 20th century, F. M. Exner (1900) being the first to determine photographically the speed of the random movement of the particles as a function of their size and of temperature. More precise measurements became possible, however, only after the introduction of the ultramicroscope (see MICROSCOPY) by H. Siedentopf and R. Zsigmondy (1903). This instrument made it possible to follow the behaviour of colloidal particles too small to be visible in the ordinary microscope. The greater liveliness of these extremely small particles! which was in agreement with Gouy's findings, made quantitative studies easier. Classical experiments on the Brownian movement, with this new technique, were carried out by Zsigmondy (1905) and by Theodor (The) Svedberg (1911).

Cause of the Translational Brownian Movement.—Wiener, by stating that the cause (of the movement) must be in internal movements characteristic of the state of the liquid, and Delsaulx (1877), by stating more explicitly, "In my way of thinking, the phenomenon is a result of thermal molecular motions in the liquid environment (of the particles)," provided the basis for the modern theory of the Brownian movement. According to the kinetic theory of gases, developed during the latter part of the 19th century (J. C. Maxwell, L. Boltzmann, R. J. E. Clausius), the molecules of a gas carry out a ceaseless translational movement at all temperatures above absolute zero ($-273.16^{\circ}\text{C}.$). This movement, whose direction is not predictable, becomes more lively as the temperature rises and is, in fact, its measure. Because of elastic collisions between the molecules of the gas, the direction of their individual motions changes continuously. A similar description

applies to the molecules composing a liquid, the principal difference being that the molecules of a liquid are more closely packed, making the path covered by a molecule between collisions far shorter.

If a microscopic or colloidal particle is suspended in a liquid, sap nater. it will be subjected to a continuous bombardment, from all directions, by the surrounding molecules. If the velocity of all the water molecules were the same. the particle would. of course, not move at all since all the momenta transferred during the collisions would neutralize each other. This is the argument used by K. W. von Naegeli (1879) against the early bombardment theories of the Brownian movement. This argument was fallacious, however, since molecules do not have a single velocity at a given temperature, but instead have a distribution of velocities of varying degrees of probability (see KINETIC THEORY OF MATTER). A suspended particle will, therefore, at a given instant, receive a finite momentum of unpredictable direction and magnitude and both the direction and velocity of the particle will change continuously. The observable result will therefore be a random zigzag motion; *i.e.*, Brownian movement. It is clear that the movement must continue as long as the system exists. This conclusion agrees with the result of an unusual, early experiment by Cantoni and Oehl (1865), who found that the Brownian movement remained unchanged for a whole year in a suspension sealed between two cover glasses.

For quantitative studies it must be borne in mind that it is not possible to record the exact position of a particle or observe its motion directly. A small colloidal particle manifests itself in the ultramicroscope only as a spot of light. Since the particle is being bombarded from all directions more than 10^{20} times per second, the spot may be seen trembling about a mean position. The mean position, however, is slowly changing and after a time interval of 30 sec. or 1 sec. or even 0.05 sec. it is obvious that the particle has moved. V. Henri's method of observation was to make photographs spaced 0.05 sec. apart with an automatic camera. The duration of the exposures was 0.003 sec. J. Perrin, in a similar series of observations, recorded the positions of a particle at 30-sec. intervals and plotted them on co-ordinate paper. The difference in the lengths of the intervals did not affect the qualitative character of the results.

From each pair of consecutive photographs Henri could determine the displacement of the particle projected on the plane perpendicular to the direction of observation. Since all directions in the plane are statistically equivalent it is sufficient to determine the displacement parallel to some one line selected as a reference within this plane. The direction of this line is often spoken of as the x direction. The projection of the displacement on the line will be denoted here by the symbol Δ_x . The theory to be discussed is concerned with Δ_x^2 , which is always positive.

The quantitative theory of the translational Brownian movement was developed independently by A. Einstein (1905), M. von Smoluchowski (1906) and P. Langevin (1908). At about the time of Einstein's work Zsigmondy predicted, on the basis of his classical ultramicroscope investigations on gold sols (colloidal solutions), that the Brownian movement could be explained on the basis of the kinetic theory of the liquid state. One of Einstein's equations defines quantitatively the mean square displacement, $\overline{\Delta_x^2}$, of a particle within a given time of observation, τ :

$$\overline{\Delta_x^2} = RT\tau / (3\pi N\eta r) \quad (1)$$

Here, R is the gas constant, T is the absolute temperature, η is the viscosity of the surrounding liquid, N is Avogadro's constant and r is the radius of the particle which carries out the Brownian movement. The mean displacement is obtained by averaging the squares of the displacements, A_1, A_2, \dots, A_n , as actually observed for a series of uniform time intervals of short duration, and by then taking the square root of the average. It should be noted that $\sqrt{\overline{\Delta_x^2}}$ is not the absolute displacement, but its projection upon a line, designated as the x axis, in the plane perpendicular to the direction of observation. Equation (1) is in accord with the experiments mentioned according to which the liveliness of the

Brownian movement increases with temperature and decreases both with an increase in particle size and with an increase in viscosity of the liquid.

Particularly interesting is the variation of $\overline{\Delta_x^2}$ with τ . For example, a particle with a diameter of about $\frac{1}{8}$ in. (0.5 μ), suspended in water, shows a displacement, $\sqrt{\overline{\Delta_x^2}}$ of about $\frac{1}{7,000}$ in. if observed for one second and of about $\frac{1}{7,000}$ in. if observed for ten seconds. This and also the other quantitative implications of the equation were quantitatively verified for liquid suspensions by M. Seddig (1908), V. Henri (1908) and particularly by J. Perrin and M. Chaudesaigues (1908-11) and The Svedberg (1906-12). Although translational Brownian movement was first observed in suspensions in liquids, and early studies concerned this environment, the explanation of its nature and Einstein's theory obviously did not so limit its occurrence. In fact, L. J. Bodaszewski (1883), using a microscope, first observed it in the smoke of burning paper and cigars and in other aerosols (air or gas suspensions of fine particles). Equation (1) was verified for such suspensions by F. Ehrenhaft (1907), M. de Broglie (1909) and H. Fletcher (1911).

Rotational Brownian Movement.—Atoms and molecules carry out not only a translational movement, but also a rotational movement. A finite angular momentum will therefore be imparted, at any instant, to a particle since the molecules of the surrounding liquid, which collide with it, all possess angular momenta. These momenta differ more or less from a most probable value, the rotations taking place about axes oriented in random directions. The magnitude of the momentum acquired by the particle will therefore vary continually, although there will, again, be a very specific most probable value for it at any given temperature. Furthermore, the spatial direction of the axis of rotation will change in a random fashion. Einstein developed the theory of this phenomenon which he called rotatory Brownian movement, within the framework of his general theory of Brownian movement. He obtained the relation:

$$\overline{\Delta_\alpha^2} / \tau = RT / 4\pi N\eta r^3 \quad (2)$$

where $\overline{\Delta_\alpha^2}$ is the mean square angle of rotation for this phenomenon, which was experimentally still unknown at that time. This equation, again, applies not only to suspensions in a liquid (sols and emulsions), but also to aerosols. According to equation (2), a particle with a diameter of about $\frac{1}{50,000}$ in. (0.5 μ), suspended in water, should carry out, on the average, three-fourths of a turn in a second. The rotation is therefore rather rapid, but its rate decreases much more rapidly with increasing particle size than that of the translational movement, the ratio of the rates being equal to $1/r$, as a comparison of equations (2) and (1) shows. For a convenient study of the rotational Brownian movement, rather large microscopic particles are therefore required. Perrin, who verified experimentally the existence of the rotational Brownian movement (1909), used particles of mastic of about $\frac{1}{2,000}$ in. in diameter. Particles of this large size are considerably above the resolving power of an average microscope so that they are directly seen as objects and not merely as spots of light. In order to facilitate the observation of their rotation, he took occlusions of foreign matter, below their surfaces, as index marks. The average rotation observed was 14.5° per minute which compared well with the theoretical value of 14° .

The diameter of large microscopic particles can be determined with great accuracy. Similarly, η is easy to determine. It is therefore possible to obtain Avogadro's constant (*q.v.*), N , from measurements of $\overline{\Delta_x^2}$ and also from those of $\overline{\Delta_\alpha^2}$. Perrin thus determined the numerical value of N from quantitative determinations of these quantities in emulsions. The value obtained was within 15% of the accepted modern value. In view of the fact that very few reliable determinations of N had been carried out in those days, this experiment by Perrin was deservedly considered an outstanding accomplishment.

Macroscopic Effects of the Translational Brownian Movement.—If water is poured very carefully upon the top of a sus-

pension of very small coloured particles whose density differs very little from that of water, an observer will see a distinct horizontal boundary between the suspension and the pure water. Slowly, this boundary will become diffuse and after a sufficiently long period of time will disappear. The spontaneous mixing process responsible for this phenomenon is called diffusion (*q.v.*). It is due exclusively to the random translational movement of the suspended particles. At the outset, more particles are on one side of the boundary than on the other and more pass it in one direction than in the reverse direction since the probability of passing the boundary is the same for each. A concentration gradient perpendicular to the plane of the original boundary is, therefore, necessary in order to produce a directionally preferential mass transport by random motion of the individual particles. Quantitatively, the situation may be expressed by the relation

$$dn/d \log \tau = -(q/2) \overline{\Delta_x^2} (dc/dx) \quad (3)$$

which represents a combination of Fick's and of Einstein's laws of diffusion. Here n is the number of moles, q is the cross section through which they diffuse and dc/dx is the concentration gradient; *i.e.*, the rate at which the concentration, c (in moles per cubic centimetre), changes with the distance x in the direction perpendicular to the plane of the original boundary. In Einstein's equation

$$\overline{\Delta_x^2} = 2D\tau \quad (4)$$

the diffusion constant, D , represents the number of moles diffusing per second across a cross section of one square centimetre if the concentration gradient is one mole per centimetre. This equation was verified experimentally by a large number of investigators beginning with The Svedberg (1909-11), who tested it on gold sols. The diffusion equations are valid not only for suspended microscopic or colloidal particles but also for molecules or ions in solution. This means, by implication, that these solutes would be found to carry out a typical translational Brownian movement if instruments were available allowing one to see the molecules or ions directly in their liquid environment. There is, therefore, no really valid objection to one's extending, as is done quite frequently, the term Brownian movement to any body, irrespective of size, which is executing irregular thermal motions, caused by collisions, within an environment which is physically or chemically different from the body.

If, in the experiment outlined at the beginning of this section, the particles differed markedly in density from that of water, the diffusion process would be complicated by the simultaneous process of settling of the particles. Inversely, the settling of particles in a suspension whose concentration is uniform at the outset would be complicated by diffusion. The simple reason for this is that settling leads to the establishment, and then to an increase, with time, of a vertical concentration gradient. There are increasingly more particles in the lower portions of the vessel than in the upper ones. A preferential diffusion of particles back into the upper portions will therefore be initiated and accentuated, with time, according to equation (3). The end result will be a steady state when just as many particles settle through a given cross section of the vessel as migrate through it, in the reverse direction, by back diffusion. This steady state, called sedimentation equilibrium, is characterized by an exponential increase in the number of particles, per unit volume, from n to n_0 as the height decreases from h to h_0 :

$$\log (n/n_0) = K(h - h_0) \quad (5)$$

K is here a constant at a given temperature for a given settling system if it may be assumed that the variation of gravitational acceleration with height can be neglected (as it may be for vessels less than 50 ft. high). Perrin verified this law working with emulsions of microscopic particles. This law of the exponential vertical distribution of particles in a settling system applies, of course, not only to suspensions in a liquid (sols and emulsions), but also to aerosols. It allows one, therefore, to estimate, at least roughly, the vertical distribution of dust, smoke and other contaminants within the lowest strata of a quiescent atmosphere. In the view of the

general validity of equations (3) and (4), equation (5) applies also to molecules and ions in solution. The only difference is that the concentration gradient characterizing the steady state is too small to be measurable unless the column of the system considered is extremely high. If this is the case, then the variation of the acceleration with height and therefore the variation of K with height must be taken into account. The same applies to the situation where the concentration gradient in the steady state is made usefully large by substituting for the gravitational acceleration the far larger acceleration achieved with a centrifuge or ultracentrifuge (*see CENTRIFUGE*). This possibility is being used for determining the size or weight of large molecules or small organisms such as viruses, etc.

Perrin emphasized the fact, implicit in the theory, that there is really no basic difference between the laws governing the translational Brownian movement of particles colliding with molecules of a liquid or gaseous environment and the laws governing the random translational movement of the molecules colliding with like molecules. Hence equation (5) also expresses correctly the variation, with height, of the number of gas molecules per unit volume; *i.e.*, the decrease in gas pressure with increasing height. The decline of the atmospheric pressure with increasing elevation is a good example of this phenomenon.

If free diffusion of the solute of a solution into a supernatant layer of pure solvent is inhibited by the placing of a semipermeable membrane at the boundary, a pressure called osmotic pressure develops. Measurements of this pressure allow one to determine the weight of the dissolved molecules. The equation governing this phenomenon had been derived at an early date by J. H. van't Hoff (1886) by applying the laws of an ideal gas. It follows from the discussion of the diffusion process that there must be an intimate connection between osmotic pressure and translational Brownian movement of the solute. In fact, Einstein was able to develop an equivalent equation of broader validity, within the framework of his general theory of the Brownian movement; and he states: "According to this [his] theory a dissolved molecule is differentiated from a suspended body solely by its dimensions, and it is not apparent why a number of suspended particles should not produce the same osmotic pressure as the same number of molecules." Einstein was, therefore, the first to point out the broad scope of the phenomenon of osmotic pressure, which is of interest not only in chemistry and physics but also of paramount importance in processes involving transfers through membranes in the living human body.

Macroscopic Effects of the Rotational Brownian Movement.—Rotational Brownian movement prevents the perfect orientation of nonspherical particles in suspensions and of nonspherical molecules in solutions brought into an electric or magnetic field. One obtains, instead, a probability distribution for the particle axes, with a peak, *i.e.*, greatest probability, for that direction which would characterize perfect orientation in the field. The spread of this distribution at a given field strength and temperature makes it possible to determine the size or shape or internal anisotropy of colloidal particles or of molecules if two of these three quantities are already known from other measurements. Most generally used, however, is the effect of the rotational Brownian movement upon the more complicated process of orientation of particles or molecules in streaming, *i.e.*, moving, suspensions and solutions respectively. Here, the most probable direction, *i.e.*, the peak of the orientation-distribution curve, changes with the velocity gradient, but the internal anisotropy has no bearing upon the orientation. Therefore, molecular shapes can be determined, if the molecular weight is known, by ascertaining the most probable direction indicated by the distribution curve relative to the direction of flow, or by measurement of optical or other quantities dependent on the peak direction and on the spread of the direction-distribution curve. The dimensions of a series of important substances, such as of viruses, have thus been determined.

Intramolecular Brownian Movement and Its Macroscopic Effects.—Prior to 1930, one spoke only of translational and rotational Brownian movement. To these terms, an only partially

accepted third has been added. that of the intramolecular or micro-Brownian movement (W. Kuhn, 1938). The phenomenon alluded to will be explained by means of fig. 1(A) and 1(B). Fig. 1(A) represents one possible configuration of the carbon skeleton of the pentane molecule, C_5H_{12} . The atoms of hydrogen, not shown are chemically combined with each of the carbon atoms B, C and D. Three with A and three with E. Each of the atoms B, C and D

CONFIGURATION OF THE CARBON SKELETON OF THE PENTANE MOLECULE. C_5H_{12} (see TEXT FOR FURTHER EXPLANATION)

forms with its two neighbours a valence angle of 109.5° . Any configuration of the molecule which is compatible with the maintenance of this angle is possible. Thus the centre of E may be located anywhere along the periphery of the base of a cone whose apex is the atom D. E, therefore, can and actually will rotate about D along the path indicated. The same applies to all other atoms,

A collision with, say, E, of an atom or an atom group of a molecule adjacent to E, will alter the angular momentum of this rotation and may even change the sense of rotation. In reality there will be a multitude of collisions of all kinds; atoms of C_5H_{12} with atom groups or molecules of the environment so that the direction of the cones of rotation and the sense of the various rotations will change frequently, in a random fashion. The pentane molecule may, therefore, assume a multitude of three-dimensional shapes, of which only the two extremes are illustrated, in simplified planar projections, in fig. 1(A) and 1(B). The number of collisions sustained in a given instant by a molecule and the resulting variety of molecular configurations increase, of course, with the number of links in the molecule and become enormous for very large molecules, called polymer molecules, which contain 10,000 or even considerably more carbon atoms. While it is, therefore, impossible to assign to such a molecule a definite shape and a definite length, it is possible to characterize it by a set of most probable configurations and by a definite mean length or by a most probable length. Disregarding the existence of a valence angle, *i.e.*, assuming no restrictions at all, one obtains for the root mean square end-to-end distance, R ,

$$\sqrt{\overline{R^2}} = ln^{1/2} \quad (6)$$

where l is the length of one link, *e.g.*, the distance between A and B in fig. 1(A), and n is the number of links. The most probable length, r , is

$$r = ln^{1/2} / \sqrt{3/2} \quad (7)$$

These lengths belong, of course, to configurations intermediate between the most unlikely extremes of a staggered rod (fig. 1[A]) and a tight coil (equivalent to fig. 1[B] if n is large). The intramolecular Brownian movement, the quantity $\overline{R^2}$ dependent on it and other related quantities, have proved to be of major importance in the theory underlying the behaviour of polymer solutions. They enter, for instance, into the interpretation of the viscosity of polymer solutions and into the derivation of molecular weights of such flexible macromolecules from optical properties of the solutions.

It is clear that a large flexible molecule will try to return, as quickly as possible, to its most probable end-to-end distance upon removal of an external force which has stretched it to a length in excess of r . This is of decisive importance in the explanation of rubber elasticity. The only difference between rubberlike

materials and solutions of flexible macromolecules is (1) that the intermolecular collisions take place between atom groups (segments) of neighbouring macromolecules, and (2) that occasional chemical cross links between neighbouring macromolecules provide an increased lateral coherence for the entire system which prevents slippage under stress.

The quantitative modern theories are based upon this interpretation of rubber elasticity as an entropy effect (P. J. Flory [1944], E. Guth, H. James [1943] and F. T. Wall [1943]). From the point of view of definition, it is of course debatable whether or not one should apply the term Brownian movement here where the partners in a collision are identical or at least very similar, not only in size but also physically and chemically. Many authors prefer to speak of intramolecular thermal motion and of intermolecular collision.

Irregular Movements Within Solids, Resembling Translational Brownian Movement.—If a bar of copper and bar of silver are welded together, one will find, after a long period of time, that silver has diffused into copper and vice versa. Quantitative studies have left no doubt that the laws of diffusion valid in liquids apply also to solids. To account for this, a random translational motion; however slow, must be assumed to exist. As the atoms or ions composing a crystal lattice do not carry out translations in the usual sense, the explanation of this random translational motion must necessarily be somewhat different from that applicable to classical Brownian movement.

The atoms or ions oscillate in a crystal lattice about an equilibrium position, which corresponds to a minimum of potential energy. The position and the numerical value of this minimum potential energy are bound to change somewhat if the energy of oscillation of one, or of several, of the neighbouring atoms changes because of a transition to a higher energy state. These changes may be large enough to produce a translation of the atom or ion under consideration to a different site, conceivably across a "saddle" of slightly higher energy. This event is more likely to occur if an adjacent lattice site is vacant. Upon its translation, the atom or ion will then leave a vacant site behind, which in turn will be filled up in due time. Thus, the vacant site, which may have a positive, a negative or no charge associated with it, will also travel inside the crystal lattice in a random fashion. The randomness is due to the fact that it is impossible to predict which of the neighbouring atoms or ions will occupy a vacant site. The transition of any oscillator to a higher energy state is an unpredictable random process.

Thus, it is seen that the migration of an atom or ion or of a vacant site is dependent upon the action of surrounding atoms or ions. Therefore, its cause is very similar to that of the classical Brownian movement.

It is clear that what applies to an atom or ion of a given species inside a crystal also applies to any foreign atom or ion which can fit into the host lattice.

BROWNE, in folklore, a small domestic fairy or hobgoblin of industrious nature and shaggy appearance who was believed to inhabit houses in some parts of Great Britain, particularly Scotland and northern England. He was shy and rarely seen but could often be heard during the night, cleaning rooms and doing other housework. He would also ride for the midwife in time of need and in Cornwall he caused swarming bees to settle quickly.

Though usually helpful, he sometimes mischievously disarranged rooms already set in order. Cream or bread and milk could be left for him, but any other offered aword offended him. The surest method to drive him away was to make him a suit of clothes. He would put it on and then vanish, never to return.

The name Brownie is also used for a member of the youngest age group of the Girl Guides and Girl Scouts (*qq.v.*).

(C. S. HE.)

BROWNING, ELIZABETH BARRETT (1806–1861), English poet and wife of the poet Robert Browning, was born on March 6, 1806, at Coxhoe hall near Durham. She was the eldest child of Edward Barrett Moulton, who later took the surname of Barrett on the death of his maternal grandmother, who left him her large estates in Jamaica. In 1810 the Barretts moved to Hope End, a country house within sight of the Malvern hills. There, in this "paradise," as she felt it to be, Elizabeth was to spend some of the happiest years of her life. Her country poems such as "The Lost Bower" and "The Deserted Garden" refer to the woods and gardens of Hope End. She was a voracious reader and was much spoiled by her father: a father so proud of the literary talents of his offspring that in 1819 he sent *The Battle of Marathon* to be printed in 50 copies. Elizabeth described this as "her great epic of eleven or twelve years old, in four books" and adds that the love of Pope's Homer led her to study Greek, and Latin as a help to Greek. At 15 she fell seriously ill, probably as a result of a spinal injury, and her health was permanently affected.

To the ardent young bluestocking, who more than once had dreamed of running away from home in order to become page to Lord Byron, it was to prove a shattering blow when in 1832, after the death of Mrs. Barrett and as a result of financial reverses, it was found expedient to move to Sidmouth, Devon. There Miss Barrett translated the *Prometheus Bound* of Xeschylus, which was published with some original poems in 1833 but was somewhat critically received. Later the author became so dissatisfied with it that she suppressed the edition as far as she could and issued a retranslation in 1850 in the same volume as *Sonnets From the Portuguese*.

In 1836 the family moved again, this time to London, and in 1838 they took up residence at 50 Wimpole street. In the course of these two years Miss Barrett published poems in many periodicals including *New Monthly Magazine* edited by Lytton Bulwer. Her first collection, *The Seraphim and Other Poems*, which includes such famous poems as "Cowper's Grave," "The Sea Mew" and "My Doves," appeared in 1838. In the same year she became so ill that she was compelled to leave London. She spent the next three years in Torquay, during which time Edward, the eldest and most dearly loved of her eight brothers, was drowned in a yachting accident in Babbacombe bay. The disaster and shock affected her health and spirits to such an extent that when she returned to London she rarely went out and her natural timidity developed into an almost morbid terror of meeting anyone outside her family and a small circle of intimates; twice. Wordsworth himself asked if he might call, not realizing that shyness would make the visit painful to her. However, Elizabeth Barrett was now well known in literary circles and her closest friends included R. H. Horne, Harriet Martineau, Mary Russell Mitford, W. S. Landor and John Kenyon, a distant cousin who was later a considerable benefactor to the Brownings.

Elizabeth Barrett now led the life of an invalid, but her output of poetry and essays a-as unabated. In 1841 she had a share in *Chaucer Modernized*, a venture prefaced by R. H. Horne to which he, Leigh Hunt and Wordsworth all contributed. The following year she wrote two papers on the Greek Christian poets and the English poets for the *Athenaeum*. At this period, as throughout her life, she was a voluminous correspondent.

Elizabeth Barrett's second volume of poetry, *Poems*, by Elizabeth Barrett, was published in 1844 and was enthusiastically received in England and the United States. The following January she received a letter from Robert Browning which began: "I love your verses with all my heart, dear Miss Barrett." To this was added the following sentence: "I do, as I sav, love these books with all my heart—and I love you too." Writing to her old friend

Mrs. Martin, Elizabeth says "I had a letter from Browning, the poet . . . which threw me into ecstasies—Browning, the author of *Paracelsus*, the king of mystics." The correspondence, once begun, never flagged and in early summer they met. Browning was six years younger than the woman he so passionately admired and although at first he believed her to be a total invalid he never doubted that he would marry her. The publication of the letters between them enables one to follow their love story day by day. Their courtship was carried on in secret since Mr. Barrett had forbidden any of his children to marry, and Elizabeth's reluctance to burden any man with an ailing wife was greatly aggravated by her fear of her despotic father. Her hesitation is recorded under a slight disguise in *Sonnets From the Portuguese* which her husband persuaded her to publish in 1850. At last she consented to marry Browning on the condition that the wedding was secret. The ceremony took place on Sept. 12, 1846, at St. Marylebone Parish church, after which Elizabeth returned home for a further week before joining her husband. When her father died in 1857 Elizabeth was still unforgiven.

The Brownings left England for Italy and during their brief stay in Pisa Elizabeth wrote "The Runaway Slave at Pilgrim's Point," a protest against American slavery, which was published in Boston in *The Liberty Bell* in 1848 and separately in England the following year. The Brownings moved to Florence in 1847 where they made their permanent home in an apartment in Casa Guidi, near the Pitti palace. There their only child, Robert Wiedemann Barrett, was born two years later.

In 1851 the Brownings returned to England for some months when they stayed with Kenyon. A new edition of Mrs. Browning's poetry was called for in 1850 and again in 1853, and in the latter year Elizabeth began work on *Aurora Leigh*. She dedicated it to Kenyon and completed it during their second visit to England in 1855. It is her most ambitious work consisting of about 11 000 lines of blank verse which tell the love story of a young girl of literary tastes and a misguided philanthropist. Though the plot is exceedingly complex and melodramatic both character and action are subordinated throughout to the perorations of the heroine, who is easily recognizable as the author herself. *Aurora Leigh* was published in 1856 and became immediately popular. A second edition had to be printed within a fortnight, a third a few months later. Several corrections were made in the fifth edition (1839). Her husband called it "this divine book," W. S. Landor spoke of "the wild imagination of Shakespeare" and Ruskin, too, praised it no less extravagantly. Nevertheless the majority of critics were unfavourably impressed by its diffuseness and its improbable plot. In spite of some good lyrical passages and an occasional flash of terse perception it is not a work of great poetic merit. Its failure is all the more saddening because Mrs. Browning was making a resolute attempt to achieve some understanding of many social evils of her day—poverty, unemployment, disgraceful living conditions and prostitution.

During their visit to London of 1855 the Brownings attended a séance conducted by the American spiritualist, Daniel Home. Elizabeth became fascinated by spiritualism and continued to attend séances with her friends in Florence in spite of Browning's skepticism and opposition. The subject that absorbed the greatest part of her attention and energy in the last years of her life was, however, Italian politics. Her interest had begun soon after her arrival in Italy and shortly became an obsession. In 1847 and 1851 she had written the two parts of *Cata Guidi Windows* (published 1851), "a simple story of personal impressions," in a definite attempt to win sympathy for the Florentines. Later she proclaimed to all that would listen that the English were ignoble in their treatment of the patriotic aspirations of the Risorgimento of Italy. She believed passionately in the integrity of Napoleon III and declared that he was "the only great-hearted politician in Europe." Even the peace of Yillafranca in 1859 failed to destroy her admiration for him, though this bitter disappointment caused her much suffering and had an adverse effect on her already failing health. "A Tale of Yillafranca" was published in the *Athenaeum* in September of the same year and was afterward included in *Poems Before Congress* (1860). During a long visit to Rome she

prepared this volume for the press. It was judged with some impatience, the poem "A Curse for a Nation" being mistaken for a denunciation of England whereas it was really aimed at American slavery.

The following summer Mrs. Browning caught a severe chill and on June 29, 1861, she died. In the last hours of her illness she was largely unaware of Robert sitting at her bedside. Seeing her condition, he raised her on his shoulder, whereupon she repeatedly kissed him. A few moments later she died—to quote Robert's own words—"smilingly, happily, and with a face like a girl's." She was buried in Florence, and plaques on the wall of the Casa Guidi and in Kelloe church, Durham, commemorate her.

In 1866 Robert Browning published a volume of selections from his wife's works.

Elizabeth Barrett Browning is by no means an easy woman to assess. She was at once very gentle and exceedingly obstinate and despite her affability and her genuine interest in human beings, her judgments were often remarkably rigid. The last years of her life are overshadowed by the fact that she became increasingly willful and unpredictable. The strength of her emotions and sympathies—the undue affection she lavished on her son, her belief in spiritualism and her overwhelming obsession with Italian politics and her faith in Napoleon III—at times alarmed even her own visitors at Casa Guidi. There is no doubt, too, that Browning was deeply troubled. Their marriage had been a most happy and affectionate one. Loving her less, he would have had no problem; loving her as he did, he was committed to obey—even when he could no longer respect. He cherished her in her last years with a heavy heart.

As a poet, Mrs. Browning's undoubted gifts are often spoiled by diffuseness. Her enthusiasm tended to blunt her perception and her political poetry is unpersuasive. She is at her best in her sonnets where her abundant spirit is curbed and refined by the strict form. *Sonnets From the Portuguese*, gentle yet passionately sincere, is generally considered her best work and assures her of her place as a minor, but no means negligible, English poet.

(BE. M.)

BROWNING, JOHN MOSES (1855-1926), U.S. inventor known for his work on small arms and automatic weapons, was born of Mormon parentage, Jan. 21, 1855, at Ogden, Utah. Inventive as a child, he made his first gun when he was 13 from scrap metal in his father's gunshop. In 1879 he secured a patent for a breech-loading, single-shot rifle, which he sold to the Winchester company. He designed many types of sporting firearms such as the Remington autoloading shotguns and rifles; the Winchester repeating shotguns, single-shot and repeating rifles; the Stevens rifles; and the Colt automatic pistols. Many of his weapons, including machine guns (*q.v.*), automatic pistols and automatic rifles, were adopted and widely used by the U.S. army. He died suddenly in Belgium on Nov. 26, 1926, while on a business trip.

BROWNING, ROBERT (1812-1889), English poet, was born on May 7, 1812 at Camberwell in southeast London. His father, a clerk in the Bank of England, could afford to indulge his artistic and literary tastes, and had a large and varied collection of books which he encouraged his son to explore. Thus in his youth Browning's reading was unsystematic but exceptionally wide, especially in the drama and in works of history and scholarship. It was in his father's library that he acquired the extraordinary range of interests which distinguishes his writings; an even more powerful immediate effect was exerted by a volume of Shelley's lyrics which he read in 1826. Following Shelley's example Browning temporarily declared himself a vegetarian and an atheist, but the book had a more profound literary influence, for it introduced Browning to Keats and the other romantic poets and

determined the course of his life. Thereafter Browning recognized that poetry was his profession. It was his fortune that he was able to devote his life to his chosen career without depending for his livelihood on the money he made by writing.

Browning's formal education was slight, although his father gave him a grounding in Greek and Latin. His mother, Sarah Anna Wiedemann, who was born in Scotland of German parentage, was an earnest Congregationalist and ensured that her son's religious education was not neglected, but his nonconformity barred him from the older English universities. In 1828 he attended classes at London university, but left after half a session. Apart from a journey to St. Petersburg in 1834 with George de Benkhhausen, the Russian consul general, and two short visits to Italy in 1838 and 1844 he lived with his parents in London until 1846, first at Camberwell and after 1840 at Hatcham. During this period he wrote his early long poems and most of his plays.

Browning's first published work, *Pauline: a Fragment of a Confession* (1833, anonymous) gave a thinly disguised account of the first 20 years of his life. The well-known Radical editor W. J. Fox, who had already seen an earlier volume of Browning's work *Incondita* (begun 1824, privately circulated), reviewed *Pauline* enthusiastically. Browning however was far more deeply affected by the unpublished criticisms of John Stuart Mill, who condemned the poet's exposure and exploitation of his own emotions and his "intense and morbid self-consciousness." It was probably Mill's critique which determined Browning never to confess his own emotions again in his poetry, but to write always objectively. Certainly in his later work he used the impersonality afforded by the dramatic form to safeguard himself against any revelation of his intimate affairs. Similarly, he objected to any attempt to treat his poetry as autobiography, insisting that his poems though often lyric in expression were always "dramatic in principle, and so many utterances of so many imaginary persons, not mine."

In 1835 he published *Paracelsus* and in 1840 *Sordello*, both poems dealing with men of great ability striving to reconcile the demands of their own personalities with those of the world. *Paracelsus* was well received, but *Sordello*, which made exacting demands on its reader's knowledge, was almost universally declared incomprehensible. Nevertheless Browning's powers were recognized by several of the leading poets of the day, and he moved on friendly and equal terms among many young writers and artists.

Encouraged by the actor Charles Macready, Browning devoted his main energies for some years to verse drama, a form which he had already adopted for *Strafford* (1837). Between 1841 and 1846 in a series of pamphlets under the general title of *Bells and Pomegranates* he published seven more plays in verse, including *Pippa Passes* (1841), *A Blot in the 'Scutcheon* (produced at Drury Lane in 1843) and *Luria* (1846). These, and all his earlier works except *Strafford*, were printed at his family's expense. Although Browning enjoyed writing for the stage because of its objectivity and the close contact with his audience he was not successful in the theatre, since his strength lay in depicting, as he had himself observed of *Strafford*, "Action in Character, rather than Character in Action." The third and seventh pamphlets in the series (1842 and 1845) were devoted to short poems, including "My Last Duchess," "Waring," "The Pied Piper of Hamelin," "Home Thoughts From Abroad" and many others which look forward to the work of his maturity.

By 1845 the first phase of Browning's life was near its end, for in that year he met Elizabeth Barrett. In her *Poems* (1844) Miss Barrett had included lines praising Browning: who wrote to thank her (Jan. 1845). In May they met, and soon discovered their love for each other. Miss Barrett had, however, been for many years an invalid, confined to her room and thought incurable. Her father was moreover of a dominant and selfish temper, jealously fond of his daughter, who in turn had come to depend on his love. When her doctors ordered her to Italy for her health and her father refused to allow her to go, the lovers, who had been corresponding and meeting regularly, were forced to act. They were married secretly in Sept. 1846; a week later they left for Pisa.

Throughout their married life, although they spent holidays in

France and England, their home was in Italy, mainly at Florence, where they had a flat in Casa Guidi. Their income was small, although after the birth of their son Robert ("Pen") in 1849 Mrs. Browning's cousin, John Kenyon, made them an allowance of £100 a year. On his death in 1856 he left them £11,000. Thereafter they were never harassed by lack of money, and their life was full but tranquil. Browning was not as passionately devoted to his wife to the cause of a united Italy, but he loved his adopted country and wrote many of his finest poems on Italian subjects.

On the whole however Browning produced comparatively little poetry during his married life. Apart from a collected edition in 1849 he published only *Christmas-Eve and Easter-Day* (1850), an examination of different attitudes to Christianity, perhaps having its immediate origin in the death of his mother in 1849; an *Introductory Essay* (1852) to some spurious letters of Shelley, Browning's only considerable work in prose and his only piece of critical writing; and *Men and Women* (1855). This was a collection of 51 poems—dramatic lyrics such as "Memorabilia," "Love Among the Ruins" and "A Toccata of Galuppi's"; the great monologues such as "Fra Lippo Lippi," "How It Strikes a Contemporary," and "Bishop Blougram's Apology"; and a very few poems in which implicitly ("By the Fireside") or explicitly ("One Word More") he breaks his rule and speaks of himself and of his love for his wife. Before the book appeared he wrote "I am writing—a first step towards popularity for me—lyrics with more music and painting than before, so as to get people to hear and see." However *Men and Women* had no great sale, and many of the reviews were unfavourable and unhelpful. Disappointed for the first time by the reception of his work, Browning wrote to Ruskin "A poet's affair is with God, to whom he is accountable, and of whom is his reward." In the following years he wrote little, sketching and modeling by day and enjoying the society of his friends at night. At last Mrs. Browning's health, which had been remarkably restored by her life in Italy, began to fail. On June 29, 1861, she died in her husband's arms. He at once decided to "go away, break up everything, go to England and live and work and write." In the autumn he returned slowly to London with his young son.

His first task on his return was to prepare his wife's *Last Poems* for the press. At first he avoided company, but gradually he accepted invitations more freely and began to move in society. Another collected edition of his poems was called for in 1863, but *Pauline* was not included. When his next book of poems *Dramatis Personae* (1864)—including "Abt Vogler," "Rabbi Ben Ezra," "Caliban Upon Setebos" and "Mr. Sludge, 'The Medium'"—reached two editions it was clear that Browning had at last won a measure of popular recognition. After the death in 1866 of his father, who had lived in Paris since 1852, the poet shared his house in Warwick crescent with his sister Sarianna.

In 1868–69 he published his greatest work *The Ring and the Book*, based on the proceedings in a trial for murder in Rome in 1698. Grand alike in plan and execution it was at once received with enthusiasm, and Browning was established as one of the most important literary figures of the day. For the rest of his life he was much in demand in society, dining out so frequently that many observers remarked the difficulty of reconciling his intensely imaginative poetic life with his life as a high-spirited man of the London world whose only serious concern was apparently the education of his son. He spent his summers with friends in France, Scotland or Switzerland, or, after 1878, in Italy. While he was in Scotland in 1869 he stayed with the rich and attractive Lady Ashburton and proposed to her, explaining candidly that their marriage would be of advantage to his son. When Lady Ashburton refused him Browning was distressed less by his rejection than by the subsequent gossip and recriminations.

The most important works of his last years, when he wrote with great fluency, were the long narrative or dramatic poems, often dealing with contemporary themes, such as *Prince Hohenstiel-Schwangau* (1871), *Fifine at the Fair* (1872), *Red Cotton Nightcap Country* (1873), *The Inn Album* (1875) and the two series of *Dramatic Idyls* (1879 and 1880). He wrote a number of poems on classical subjects including *Balaustion's Adventure* (1871) and *Aristophanes' Apology* (1875), and made a translation of the

Agamemnon of Aeschylus (1877) which, it was said, could be understood quite easily with the help of the Greek. In addition to many collections of shorter poems—*Pacchiarotto* (1876), *Jocoseria* (1883), *Ferishtah's Fancies* (1884) and *Asolando* (1889)—Browning published toward the end of his life two books of unusually personal origin—*La Saisiaz* (1878), at once an elegy for his friend Anne Egerton Smith and a meditation on mortality, and *Parleyings With Certain People* (1887), in which he discussed books and ideas which had influenced him since his youth.

While staying in Venice in 1889 Browning caught cold and became seriously ill; he had time to learn of the favourable reception of *Asolando* before he died on Dec. 12. Public recognition of his eminence, which had been successively shown by honorary degrees from Oxford university (M.A. by diploma, 1867; D.C.L., 1882), an honorary fellowship of Balliol (1867) and presentation to the queen (1869), was completed by his burial in Westminster abbey.

Characteristics of Browning's Poetry.—Few poets have suffered more than Browning from hostile incomprehension or misplaced admiration, both arising very often from a failure to recognize the predominantly dramatic nature of his work. The bulk of his writing before 1846 was for the theatre; thereafter his major poems showed his increasing mastery of the dramatic monologue. This consists essentially of a narrative spoken by a single character, and amplified by his comments on his story and the circumstances in which he is speaking. From his own knowledge of the events described (as in "An Epistle of Karshish" and "Cleon") or by inference from the poem itself (as in "Andrea del Sarto") the reader provides a quasi-dramatic context for the poem, and is eventually enabled to assess the intelligence and honesty of the narrator and the value of the views he expresses. Thus the dramatic monologue, since it depends on the unconscious provision by the speaker of the evidence by which the reader is to judge him, is eminently suitable for the ironist. Equally, it offered the technical impersonality of the dramatist to a poet who, like Browning, distrusted the romantic exploitation of the writer's own personality. Browning's fondness for the form has, however, encouraged the two commonest misconceptions of the nature of his poetry—that it is deliberately obscure, and that its basic "message" is a facile optimism. Neither of these criticisms is groundless; both are incomplete.

Of course, Browning is not always difficult. In many poems, especially short lyrics, he achieves effects of obvious felicity, while even in his thorniest poems there are many passages which give an immediate poetic pleasure, and many in which the force of his imagination is perfectly conveyed by the rough vigour of his language. Nevertheless his superficial difficulties, which prevent an easy understanding of the sense of a passage, are evident enough—his attempts to convey the broken and irregular rhythms of speech, running the sense on from line to line, yet often stressing an unusual or arresting rhyme, so that it is almost impossible to read the verse quickly; his elliptical syntax, which disconcerts and sometimes confuses the reader, but which can be mastered with little effort; the demands he makes on his readers' knowledge, as in *Sordello* or "Old Pictures in Florence," poems which require for full appreciation a considerable acquaintance with their subjects; and his fondness for putting his monologues into the mouths of charlatans and sophists, such as Mr. Sludge or Napoleon III, and thus obliging the reader to follow a chain of subtle or paradoxical arguments. Further, Browning frequently indulges his taste for the grotesque and yields to the temptation to display his prodigality of technical invention. Yet while there is admittedly much hasty and slipshod writing, much overcleverness and much distortion of language for the sake of a poor rhyme, the surface difficulties of Browning are on the whole no greater than those of most of his successors.

But even when local significances have been established, the poem's interest is seldom exhausted. First, Browning often chooses an unexpected point of view, especially in his monologues, thus forcing the reader to accept an unfamiliar perspective. Secondly, he is capable of startling changes of focus within a poem. For example, he chooses subjects in themselves insignificant, as in "Fra

Lippo Lippi" and "Master Hugues of Saxe-Gotha," and treats through them the eternal themes of poetry. This change from particular observation to transcendental truth presents much the same difficulties to the reader as do the metaphysical poets of the 17th century, and much the same excitement. Thirdly, as Browning seldom presents a speaker unironically, there is a constant demand on the reader to appreciate exactly the direction of satiric force in the poem. Even in a melodious poem such as "A Toccata of Galuppi's" the valid position must be distinguished from the false at every turn of the argument, while in the major casuistical monologues, such as "Bishop Blougram's Apology," the shifts of sympathy are subtler still.

Browning's poetry then is seldom simple, but its complexity is a legitimate source of poetic pleasure, since it springs not from a desire to mystify and impress but from the seriousness of Browning's attitude to his art. He wrote in 1868 "I can have little doubt that my writing has been, in the main, too hard for many I should have been pleased to communicate with; but . . . I never pretended to offer such literature as should be a substitute for a cigar or a game at dominoes to an idle man."

It has also been objected that Browning uses his poetry as a vehicle for his philosophy, which is not of itself profound or interesting, being limited to an easy optimism. Against this, it may be argued, in the first place, that since Browning seeks to win imaginative rather than speculative conviction it is inadmissible to judge his poetry simply by its value as versified metaphysics. Secondly, Browning's dramatic monologues must, as he himself insisted, be recognized as the utterances of fictitious persons drawing their strength from their appropriateness to the speaker, and not as expressions of Browning's own sentiments. Thus his great gallery of imagined characters is to be regarded as an exhaustive catalogue of human motives, not as a series of self-portraits. Nevertheless certain fundamental assumptions are made so regularly that they may be taken to represent Browning's personal beliefs.

Browning normally considers the existence of a God and of a life after death as certain beyond the need of proof, and often accepts the central beliefs of the Christian faith. Readers who cannot follow him in this complain that this leads him to view the human situation with an equanimity not far removed from complacency. Yet in many poems he allows his speakers to debate at length the problem of reconciling the unhappiness of mankind with the providence of a benevolent God. The solutions which he accepts, in "Xbt Vogler" or "Rabbi Ben Ezra" for example, may often seem too easy, but it is significant that he at least starts from a recognition that misery and evil are at large in the world; in his best-work, notably *The Ring and the Book*, he makes such answers as a poet may to the manifold perplexities that beset men of faith.

In matters of human conduct his sympathies are with those who show loving hearts, honest natures and warmth of feeling; certainly these qualities are never satirized. He is in general on the side of those who commit themselves wholeheartedly to an ideal even if they fail.

By itself this might suggest rather a naïve system of values, yet he also, sometimes in the same poem, shows his understanding of those who have been forced to lower their standards and accept a compromise. Thus, although Browning is far from taking a cynical or pessimistic view of man's nature or destiny, his hopes for the world are not simple and unreasoning but qualified and considered.

Browning did not share the prevailing romantic interest in nature, declaring that men and women interested him far more. Consequently the diversity and external picturesqueness of the settings of his poems are unimportant compared with his abiding interest in the springs of human conduct. Thus he was able to find subjects fit for poetry in the life of his own times as well as in the events of the past. In the long poems of his prime, from 1855 to 1880, he demonstrated that sustained narrative in verse was still possible in an age which furnished the poet with none of the materials of the conventional heroic poem. In these works he wrote as none of the other great poets of the 19th century chose to write

about contemporary life, and, as nearly as he could, used the language of his time. If this makes his poetry unmistakably Victorian, its Victorianism is its strength rather than its weakness. Even *The Ring and the Book* was felt by its first readers to be a modern poem, since it recognized that to urban readers in industrial civilizations the truly heroic action was not that which showed most strength and courage, but that which showed the greatest moral strength and intellectual power. In this poem Browning displays all his distinctive qualities. He allows a dramatic monologue to each character he portrays—to Guido, who is on trial for murder, to Pompilia, his young wife whom he has mortally wounded, to Caponsacchi, her protector, to various Roman citizens, to the opposing lawyers and to the pope, who ultimately decides Guido's fate. Each deals with substantially the same occurrences, but each, of course, describes and interprets them differently. By permitting the true facts to emerge gradually by inference from these conflicting accounts Browning reveals with increasing subtlety the true natures of his characters. As each great monologue illuminates the moral being of the speaker, the meanness and triviality of the subject are seen to be irrelevant, for it becomes clear that nothing less is in question than the whole ethical basis of human actions. For over 20,000 lines Browning explores his theme, employing an unfaltering blank verse, rising often to passages of moving poetry, realizing in extraordinary detail the life of 17th-century Rome and creating a series of characters as diverse and fully realized as those in any novel. Indeed Browning's achievement in this and in his other long poems, which show his genius to the full, is most fittingly compared with that of the great 19th-century novelists, particularly Balzac.

During his lifetime his reputation was slow to recover from the general rejection of *Sordello*; even his plays were financially unsuccessful. After 1864 critical recognition came rapidly, and, while his books never sold as well as his wife's or Tennyson's, he had a considerable and enthusiastic public for the rest of his life, and what he valued more, a large circle of friends and distinguished admirers, including Carlyle, Rossetti, Benjamin Jowett, Alfred Domett and the French critic Joseph Milsand. Since his death he has not been widely read, perhaps because of increasing skepticism of the values he implies in his poetry. He has, however, influenced many modern poets, such as Robert Frost and Ezra Pound, partly through his development of the dramatic monologue, with its emphasis on the psychology of the individual and his stream of consciousness, but even more through his success in writing about the multitudinousness of modern life in language that owed nothing to convention.

Critical assessments of Browning have varied widely, but as long as technical accomplishment, richness of texture, sustained imaginative power and a warm interest in humanity are counted virtues, he will be numbered among the great English poets.

BIBLIOGRAPHY.—Of many editions of Browning's works the most complete is that of Augustine Birrell (1915). Editions of the letters have been published as follows: *Letters of Robert Browning and Elizabeth Barrett Browning, 1845-1846*, 2 vol. (1899, 1930); *Letters*, ed. by T. L. Hood (1933); *Robert Browning and Julia Wedgwood*, ed. by R. Curle (1937); *New Letters*, ed. by W. C. DeVane and K. L. Knickerbocker (1950); *Dearest Isa: Letters to Isabella Blagden*, ed. by E. C. McAleer (1951). See also L. N. Broughton, C. S. Northup and R. Pear-sall, *Robert Browning: a Bibliography, 1830-1950* (1953); W. H. Griffin (completed by H. C. Minchin), *The Life of Robert Browning* (1910; enl. 1938); G. K. Chesterton, *Robert Browning* (1903); Henry James, *William Wetmore Story and His Friends* (1903); Mrs. Sutherland Orr, *A Handbook to the Works of Robert Browning*, 6th ed. (1892); W. C. DeVane, *A Browning Handbook*, 2nd ed. (1955); Henry Jones, *Browning as a Philosophical and Religious Teacher* (1891). (P. Dw.)

BROWN-SÉQUARD, CHARLES ÉDOUARD (1817-1894), British physiologist and neurologist, one of the founders of the science of endocrinology, was born at Port Louis, Mauritius, on April 8, 1817, of mixed U.S.-French parentage. After graduating in medicine at Paris in 1846 he held chairs at Harvard university and at Paris. Eventually he succeeded Claude Bernard in 1878 as professor of experimental medicine in the Collège de France. He died on April 2, 1894, at Sceaux.

Brown-Séquard was the first scientist to work out the physiology of the spinal cord, demonstrating that the decussation of the

sensory fibres is in the cord itself. His contributions to the study of the endocrine glands were of major importance. Among other classical discoveries was his demonstration that removal of the adrenals causes death in animals. It was his misfortune, in extreme old age, to bring upon himself the ridicule of scientists by advocating the hypodermic injection of a fluid prepared from the testicles of sheep, and called derisively the Brown-Séguard elixir, as a means of prolonging human life. His researches were published in about 500 essays and papers, especially in the *Archives de Physiologie*, which he helped to found in 1868.

BROWNSON, ORESTES AUGUSTUS (1803-1876), U.S. transcendentalist writer, whose writings and intellectual wanderings represent expressively the intellectual restlessness and vitality of the pre-Civil War period, was born in Stockbridge, Vt., Sept. 16, 1803. He was brought up on a farm and had no formal education. No man of his time was more proficient in reasonable argument; yet he often left an impression of overpowering logic rather than warmth of personality. His peripatetics took him from Presbyterianism to Universalism; from Unitarianism to his own Society for Christian Union and Progress; from the modified intuitionism of Comte and Victor Cousin to Roman Catholicism and Aristotelian Thomism. Brownson wrote on Calvinism, labour and social reform, transcendentalism, Catholicism, state's rights, democracy, nativism and emancipation in the period 1830-70 when such subjects were generally unpopular. His versatility was expressed in mystical poetry, foreign philosophy, religious ecstasy, social uplift and literary enthusiasm. Typical of his many writings are *The Spirit-Rapper: an Autobiography* (1854); *The American Republic* (1865); and *The Convert* (1857). He published *Brownson's Quarterly* (1844-75) as a journal of personal opinion, except for the years 1865-72, when it was suspended. He died April 17, 1876, and slipped into oblivion until a Brownson revival during the second quarter of the 20th century brought his thought to the fore again.

After Brownson's death, his son, Henry F. Brownson, collected and published his *Works* (1882-1907) in 20 volumes. Alvan S. Ryan issued a one-volume *Brownson Reader* (1955).

Henry F. Brownson also published a biography of his father (1898-1900). Two interesting modern biographies are Theodore Maynard's *Orestes Brownson: Yankee, Radical, Catholic* (1943), and Arthur XI. Schlesinger, Jr.'s *Orestes A. Brownson: a Pilgrim's Progress* (1939). A doctoral dissertation by Virgil G. Michel, O.S.B., *The Critical Principles of Orestes A. Brownson* (1918), contains a complete bibliography of his works. (C. J. BY.)

BROWNSVILLE, a city in Texas, U.S., about 22 mi. from the mouth of the Rio Grande, and the seat of Cameron county, is directly across the river from Matamoros, Mex. On March 28, 1846, Gen. Zachary Taylor placed the flag of the United States on the site of what was to become a fort, later named Ft. Brown, for Maj. Jacob Brown, who died defending it from Mexican attack on May 9, 1846.

Brownsville was incorporated as a town in 1830. The old military reservation buildings now serve many purposes: as the Brownsville police headquarters, as a museum of the Brownsville Historical association and as the administration department of Texas Southmost college.

The city has a council-manager form of government, which went into effect in 1915.

The Brownsville area figured prominently in the early stages of the war with Mexico. The Thornton skirmish on April 25, 1846, led Pres. James K. Polk to declare a state of war. On May 8, 1846, occurred the battle of Palo Alto. The following day, Mexican troops attacked the Americans at Resaca de la Palma. A so-called "last battle" of the Civil War was fought at Palmito Ranch near Brownsville May 13, 1865.

The port of Brownsville, with a 17-mi. channel, handles shrimp, bananas, pineapples, coconuts and cotton. The new ship channel was opened in 1936. The international airport is the air gateway to and from Mexico, with customs, immigration, public health and other federal administration services. Major industries in the area are devoted mainly to chemicals, food processing, clothing and bedding.

Brownsville has a good climate, mild winters and exotic tropical

foliage. The annual pre-Lenten Charro Days fiesta, which lasts four days, combines the cultural elements of Mexico and Texas. The residents of Matamoros and Brownsville dress in the costumes of Latin America. The thousands of costumed children and gaily attired marching bands are special attractions.

Boca Chica beach, a hunting and fishing area, lies about 20 mi. E. on the Gulf of Mexico. Cameron county maintains a causeway at Port Isabel connecting the mainland with Padre Island.

Brownsville is the largest city in the Rio Grande valley; pop. (1960) 48,010. Latin Americans were in the majority until an influx of Anglo-Americans from northern states during and after World War II changed the proportion somewhat. The population in the early 1960s was approximately 55% Latin American to 44% Anglo-American and 1% Asian and Negro. The Brownsville-Harlingen-San Benito standard metropolitan statistical area, consisting of Cameron county, had a population of 151,098 in 1960. For comparative population figures see table in *TEXAS: Population*. (O. MO.)

BROWN UNIVERSITY, an institution of higher learning founded as Rhode Island college at Warren, R.I., in 1764 and moved to Providence in 1770. It was renamed Brown university in 1804. See PROVIDENCE.

BRUAY-EN-ARTOIS, a town in northeastern France, *département* of Pas-de-Calais, is on the Lawe river, near Béthune and 30 km. (19 mi.) N.N.W. of Arras. Pop. (1954) 31,892. It is a coal-mining centre in the western part of the northeastern coal field, where the coal is deeply buried beneath the chalk country of Artois, and is important for the manufacture of patent fuels. There are also breweries. The town name was changed from Bruay by decree in 1924. (AR. E. S.)

BRUCE, the name of a Scottish family to which two kings of Scotland belonged, and which was descended from Robert de Bruce (d. 1094?), a Norman knight who came to England with William I. The family's connection with Scotland dates from David I's grant (1124) of the lordship of Annandale to the second Robert de Bruce (1078?-1141). The sixth Robert (1210-1295), son of the 4th lord of Annandale and of Isabel, second daughter of David, earl of Huntingdon, brother of the kings Malcolm IV and William, was one of the 13 claimants to the Scottish throne in 1291. When the English king Edward I decided in favour of John Balliol, Robert de Bruce resigned Annandale to his son, the seventh Robert (1253-1304), already (by marriage) earl of Carrick. The eighth Robert (1274-1329) revived his grandfather's claim and became king of Scotland in 1306 (see ROBERT I "THE BRUCE"). His brother Edward was killed in 1318 while fighting to make himself effective king of Ireland. The direct line of the Bruces ended in 1371 with the death of King Robert's son: David II (q.v.).

(R. G. NI.)

BRUCE, JAMES (1730-1794) was the first British explorer of modern times to investigate the Nile sources, and in 1770 reached the source of the Blue Nile in Abyssinia. Bruce was born at Kinnaird house, Larbert, Stirlingshire, on Dec. 14, 1730, and was educated at Harrow, privately, and at Edinburgh university. In 1754 he married Xdriana Allan and joined her brother in the family wine business. His wife's early death set him traveling, and he became interested in Arabic. In 1763 he was appointed British consul in Algiers with a commission to study the ancient ruins of the country, and at the end of his appointment he set off to study and record the antiquities of north Africa. Between 1765 and 1768 he traveled widely in Mediterranean countries; especially Syria. He arrived in Alexandria in July, 1768, intent on seeking the source of the Nile, and after an arduous journey he reached Gondar, then capital of Abyssinia, on Feb. 14, 1770. He spent three years in 'Abyssinia, establishing himself at the young king's court by means of his medical skill and his sportsmanship. He managed to reach the source of the Blue Nile at Geesh, on Lake Tana, on Nov. 14, 1770, returning to Cairo by way of the Sudan early in 1773. On his arrival in London the following year his traveler's tales were received with some incredulity, and he retired to Kinnaird house where he died on April 27, 1794.

Bruce published in 1790 *Travels to Discover the Source of the Nile in the Years 1768-73*, in five volumes, a remarkably true and

observant account of the countries that he had visited.

See A. Murray, *Account of the Life and Writings of James Bruce* (1808); Sir F. B. Head, *The Life of Bruce* (1830); Sir Robert Playfair, *Travels in the Footsteps of Bruce* (1877). (D. Ms.)

BRUCE, MICHAEL (1746–1767). Scottish poet whose works were allegedly "stolen" by John Logan. was born at Kinrosswood, Kinrossshire, on March 27, 1746, and died there on July 5, 1767. His finest poem, "Elegy Written in Spring," was composed just before his death. Logan obtained Bruce's manuscripts to publish Bruce's *Poems on Several Occasions* (1; 70), including "Ode to the Cuckoo." Bruce's friends claimed that many missing poems were later printed as Logan's (*Poems*, 1781), including an altered version of "Ode to the Cuckoo."

See W. Mackelvie (ed.), *Lochleven and Other Poems* (1837), with a list of poems not printed in Logan's selection and those that are lost; and the admirable paper in *The Mirror*, no. 36 (1779), said to be by W. Craig, one of the lords of session.

BRUCELOSIS (MALTA FEVER or UNDULANT FEVER). Brucellosis is one of the more than 50 diseases of vertebrate animals transmissible to man (called zoonoses). Sir David Bruce, as a member of the British army medical service in 1887, first isolated and identified the causative bacteria from the spleen of a soldier who died from the infection. Subsequently these microbes were designated as belonging to the genus *Brucella*. The illness is characterized by fever, chills, sweats, weakness, pains and aches, all of which usually terminate within three to six months. Occasionally chronic illness may endure for many more months.

Three main species of brucella are the common cause of human disease, and the organism of each of the species has its major reservoir in domestic animals. The causative organisms are *Brucella melitensis* (goats and sheep), *Brucella suis* (swine) and *Brucella abortus* (cattle). These bacteria are small, nonmotile, Gram-negative rods. The species are differentiated by growth requirements, by the inhibition of reproduction by certain dyes and by biochemical tests. Brucellosis not only has serious public health aspects, but the disease in animals also results in severe economic losses to livestock owners. Brucellosis in cattle, also known as Bang's disease, is a frequent cause of bovine abortion. This also applies to swine. The microbes of brucellosis commonly localize in the udders of lactating cattle, sheep and goats, resulting in a reduction of milk secretion and thereby also curtailing cheese production. Brucellae are highly invasive microbes, the disease spreading rapidly from animal to animal. The immediate environment of domestic animals, including their food, becomes heavily contaminated by the bacteria as a result of the dissemination of aborted material, vaginal discharges and infected urine. Infection of healthy animals takes place through the ingestion of contaminated food or by direct entrance of the brucellae through abrasions of the skin or through the mucous membrane of the eyes. Infected but healthy appearing cattle, sheep and goats can excrete considerable numbers of brucellae in their milk for months and in some instances for years.

Man contracts brucellosis either directly or indirectly from infected animals. The majority of human cases result from invasion of the bacteria through small abrasions of the skin following contact with infected animals, fresh carcasses or a contaminated environment. Brucellosis therefore is primarily an occupational disease of farmers, employees in meat-packing plants, livestock producers and veterinarians. Another major cause of human brucellosis is drinking unpasteurized milk and eating fresh cheese prepared from contaminated milk (there is no danger of contracting brucellosis from eating well-ripened cheese). For reasons not clearly understood, children are more resistant than adults to brucellosis. The disease is very rarely transmitted from one human being to another.

Nature of the Disease.—The manifestations of acute human brucellosis are characteristic but not specific. The illness often starts abruptly with fever, chills, sweats, weakness and bodily aches and pains. Brucellosis can resemble many other febrile diseases such as malaria, typhoid fever and influenza. The illness is commonly insidious in its onset, extending unrecognized for many weeks, the patient having low-grade fever, weakness, loss

of appetite, generalized aches, nervousness and mental depression. Recovery of the uncomplicated and untreated case usually occurs within three to six months. Complications are more likely to appear in infections caused by *Br. suis* or *Br. melitensis*. *Br. suis* is often the cause of abscesses and suppurative bone lesions. *Br. abortus* and especially *Br. melitensis* cause inflammation of the spine, resulting in a very chronic and painful illness. Brucellosis rarely is the cause of abortion in human beings.

Chronic brucellosis, in which the illness persists for a year or more, is most commonly encountered in infections due to *Br. melitensis*, and sickness is frequently prolonged because of complications. Patients often complain of persistent weakness, excessive lethargy and fatigue, nervousness and mental depression, without any evidence of abnormal physical condition. It is thus difficult to distinguish neurotic symptoms from those of chronic brucellosis. An attack of brucellosis may "trigger" a display of underlying neurosis, and the symptoms of neurosis may persist long after the infection has ended.

Diagnosis.—Definitive recognition of both animal and human brucellosis is dependent on laboratory procedures. The agglutination test is a blood reaction valuable in diagnosing the disease in animals. By means of this test brucella antibodies or agglutinins can be detected in the milk or blood of infected animals. Except under special circumstances attempts are not made to culture brucellae from animals for diagnostic purposes.

The brucella agglutination test on blood serum also is used widely in diagnosing human brucellosis. The results of this test are of particular diagnostic value when brucella agglutinins are present in serum that has been diluted one hundred fold or more. This titre of agglutinins usually is associated with active disease. Many healthy persons living in an area where the disease is prevalent in animals reveal a low titre of brucella agglutinins in their blood, usually denoting past exposure to the disease. Brucella agglutinins can be detected in the blood of some healthy persons over a period of many years. An unqualified diagnosis of human brucellosis can be made when brucellae are isolated from the blood of patients, and this procedure should be attempted in all suspected cases. A skin test, similar to the tuberculin test used for detecting exposure to tuberculosis, is employed for human brucellosis, but the results are of doubtful value in the individual case. The reaction induced by injecting brucella antigen into the skin is specific for brucellosis, but a positive test often is an expression of past exposure to brucellosis and does not necessarily mean that active disease is present. The skin test is a useful epidemiologic tool for determining the degree of human exposure to animal brucellosis in a given locality.

Treatment and Control.—There is no dependable or practical form of drug therapy for animal brucellosis, but antibiotics are very effective in the human disease. A combination of a sulfonamide drug and streptomycin has proved to be successful in treatment, and therapy with tetracyclines, such as aureomycin and terramycin, has given more satisfactory results. Some physicians prefer to employ a combination of streptomycin and tetracycline. When antibiotic therapy is maintained for three to four weeks the duration of the illness is shortened, complications are prevented and deaths directly attributable to brucellosis are practically eliminated. Management of chronic cases is more difficult. Some patients improve with one or two courses of antibiotic therapy, but further treatment is usually without benefit. Treatment with brucella vaccines sometimes causes improvement.

Since human brucellosis cannot be eliminated until the reservoir of infected animals is eradicated, vigorous efforts have been made to control animal brucellosis. The results have been most successful in the attempts to eliminate bovine brucellosis. Extensive regional control programs include the testing of herds by means of the agglutination reaction, and then the elimination of the infected animals. This test and slaughter approach is supplemented with a program of vaccination using a living brucella culture known as strain 19 *Br. abortus*. The vaccine is most effective as a prophylactic agent when given to calves; indeed, calfhood vaccination has proved so successful that it has been applied almost universally in the prevention of brucellosis in cattle. As

bovine brucellosis has been controlled. the incidence of human brucellosis has declined. This correlation is most apparent in countries such as the United States and Puerto Rico.

For reasons that are not apparent, strain 19 *Br. abortus* vaccine does not produce satisfactory protection of sheep and goats against *Br. melitensis* or of hogs against *Br. suis*. Intensive and successful experimental work under way in the late 1950s indicates that a successful vaccine would be made available for sheep and goats. Brucellosis in swine can be controlled by carrying out blood agglutination tests on a herd of swine, and, if positive reactors are detected, disposing of the entire herd. Promising results are anticipated following vaccination of sheep and goats with a living culture of *Br. melitensis*, which possesses attenuated virulence.

Immunization of human beings with living brucella vaccine is not generally recommended. The incidence of human disease can be further reduced through the widespread pasteurization of milk for human consumption. Modern methods of preparing and refrigerating meat products permit the marketing of slaughtered infected animals for human food with little or no danger of infection occurring in the consumer.

See I. Forrest Huddleson, *Brucellosis in Man and Animals* (1943); Wesley W. Spink, *The Nature of Brucellosis* (1956). (W. W. S.)

BRUCE OF MELBOURNE, STANLEY MELBOURNE BRUCE, 1ST VISCOUNT (1883–), Australian statesman and diplomat. was prime minister from 1923 to 1929, but is chiefly remembered for his long and successful appointment as Australian high commissioner in London. Born in Melbourne on April 15, 1883, and educated at Melbourne grammar school and Trinity hall, Cambridge, he was called to the bar by the Middle Temple in 1906 and stayed on in England to practise. Being in England at the outbreak of World War I, he served with distinction in the British army from 1914 until invalided home to Australia in 1917.

Bruce was elected to the Australian federal parliament in 1918. His rise in politics was rapid and he became a prominent figure not only in Australia but also in international affairs. He was federal treasurer in 1921 and became prime minister, leading a coalition of the National and Country parties in 1923 after the resignation of W. M. Hughes. Simultaneously he was minister of external affairs. His government was defeated at a general election in 1929 and he lost his seat. Returning to parliament in 1931, he became minister without portfolio under J. A. Lyons, and represented Australia in London until 1945, first as resident minister and after 1933 as high commissioner.

As prime minister Bruce had represented Australia at the imperial conferences of 1923 and 1926, and at several sessions of the League of Nations assembly. He was Australian representative on the League of Nations council from 1933 to 1936, in which year he was president of the council. He was appointed Australian representative to the United Kingdom war cabinet in 1942, and was Australian minister to the Netherlands government in exile in London from 1942 to 1945, when his long term as Australian high commissioner ended. He was chairman of the United Nations Food and Agriculture organization's preparatory commission in 1946 and, as chairman of the World Food council from 1947 to 1951, made his mark by insistent emphasis on the need for international co-operation to raise the standards of nutrition and health throughout the world.

Bruce's distinguished service to the Commonwealth of Nations was recognized in 1947 by the first award of a viscountcy to an Australian, and in the same year he was appointed chairman of the U.K. Finance Corporation for Industry—a post he held until 1957. He became first chancellor of the Australian National university, Canberra, in 1951, but continued to live mainly in London, taking an active part in the house of lords especially on questions of economics and finance, and retaining a close interest in commonwealth affairs. (C. COM.)

BRUCH, MAX (1838–1920), German composer, remembered chiefly for his violin concertos, was born Jan. 6, 1838, at Cologne. He was a precocious child. At 14 he wrote a symphony and in 1852 won a scholarship from the Mozart foundation at Frankfurt am Main that enabled him to study under Ferdinand Hiller and Carl

Reinecke at Cologne. His first opera, *Scherz, List und Rache*, was performed there in 1858. He had a distinguished career as conductor of choral and orchestral societies at Coblenz (1865), Sondershausen (1867), Berlin (of the *Sternscher Gesangverein*, 1878), Liverpool (the Philharmonic orchestra, 1880–83) and Breslau (1883–90). From 1891 until his retirement in 1910, he was in charge of a master class at the Berlin Academy of Arts. He died at Friedenau, near Berlin, Oct. 2, 1920.

Bruch was an unusually productive and ambitious composer, and contributed to almost all the musical kinds. His greatest successes in his own lifetime were massive works for choir and orchestra. *Schön Ellen* (1867), *Odysseus* (1872), *Das Lied von der Glocke* (1878) and *Gustav Adolf* (1898) were favourites with German choral societies during the late 19th century. The reason for their failure to maintain their position was probably that Bruch's remarkable facility is not sufficiently controlled by critical judgment, and although his workmanship is sound, his orchestration colourful and his choral writing effective, he lacks the depth of conception and the originality needed to sustain large-scale works. The only works to outlive him were his three brilliant violin concertos, the first of which, in G minor, has a permanent place in the violinist's repertory, and his *Kol Nidrei* phantasy for cello and orchestra.

See F. Gysi, *Max Bruch* (1922); H. Pätzner, *Meine Beziehungen zu Max Bruch* (1938). (H. GA.)

BRUCINE, an alkaloid occurring in about equal parts with strychnine in the seeds of *Strychnos nux-vomica* and other species of *Strychnos*. It has been found in plants only in association with strychnine, to which it bears a close chemical relationship; brucine is dimethoxystrychnine. It has an intense and persistent bitter taste resembling that of strychnine and produces similar but much weaker effects when injected into animals. When administered by mouth, its action is slight because of its rapid elimination from the body. In the 19th century brucine was sometimes used for the same purposes as strychnine, but because of its relatively low potency it has of much less importance. It has little if any therapeutic use in modern medicine. See also ALKALOIDS; NUX VOMICA; STRYCHNINE. (V. E.)

BRUCITE, a mineral consisting of magnesium hydroxide, has a higher percentage of magnesium (70.0) than any other ore. It was first described in 1814 as "native magnesia" from New Jersey by A. Bruce, a U.S. mineralogist, after whom the species was named. Brucite is usually found as platy masses, sometimes of considerable size, which have a perfect cleavage parallel to the surface of the plates. It is white, sometimes with a tinge of gray, blue or green, varies from transparent to translucent, and on the cleavage surfaces has a pronounced pearly lustre. In general appearance and softness (hardness 2.5) it is not unlike gypsum or talc, but it may be readily distinguished from these by its double refraction.

Brucite is generally associated with other magnesian minerals, such as magnesite and dolomite, and is commonly found in serpentine, or sometimes as small scales in phyllites and crystalline schists; it has also been observed in metamorphosed magnesian limestone, such as the rock known as predazite from Predazzo in Tirol. The specific gravity of brucite is 2.38 to 2.40. The formula is Mg(OH)₂, and it crystallizes in the rhombohedral system. (L. J. S.)

BRÜCKE, ERNST WILHELM VON (1819–1892), German physiologist who helped introduce physical and chemical methods into medical research and gave a great impetus to animal experimentation, was born in Berlin, June 6, 1819, and died in Vienna, Jan. 7, 1892.

Bricke was a member of a school of physically oriented German physiologists who undertook to create a new biology rigorously based on physics and chemistry. He studied medicine in Berlin and was trained as a physiologist by Johanne; Müller. In the biophysical movement he was associated with Emil du Bois-Reymond, Karl Ludwig and Hermann von Helmholtz. Their biophysical program was formulated about 1847. Although the group did not achieve their goal they did much to influence the study and practice of medicine.

Bricke was professor of physiology in Vienna from 1849 to

1891. He conducted research on the structure of skeletal muscle, on vision and on the mechanism of speech. He was, like Müller and Helmholtz, interested in art, and he wrote on the relationship of the physiology of vision to painting. Josef Breuer and Sigmund Freud were attracted to physiology through Brucke's lectures, and Freud worked in Brücke's institute. It was largely through Brücke that Freud acquired the mechanistic bias that is seen in his early "Project for a New Psychology." Brücke was a member of the Viennese Academy of Science.

For a bibliography on Brücke see the article DU BOIS-REYMOND, EML. (P. F. C.)

BRUCKNER, (JOSEF) ANTON (1824–1896), Austrian composer whose fame, firmly established in German-speaking countries, is less well recognized elsewhere. He was born at Ansfelden, Upper Austria, Sept. 4, 1824. After his father's death (1837) he was educated as a chorister at the monastery of St. Florian and became a village schoolmaster. In 1855 he was appointed organist at Linz cathedral, and this enabled him to travel regularly to Vienna, where he studied composition (in which he had been until that time largely self-taught) with Simon Sechter. He continued his studies until 1861, making up for lack of facility and for intellectual slowness by his determined perseverance. In 1868 he was appointed to teach counterpoint and the organ at the conservatory at Vienna; and also to play the organ at the court chapel. He had already written three masses, for performance at Linz cathedral, and the first version of his first symphony. He lived in Vienna as a rustic outsider and, hardly noticed by the public, wrote one symphony after another, some of which were performed but were merely regarded as oddities and ridiculed by the press. Appearances as an organist in Nancy and Paris (1869) and in London (1871) were chance events without any practical results. A spectacular success of his Seventh Symphony in Leipzig under A. Nikisch (1884) turned the tide. When he died in Vienna on Oct. 11, 1896, he was on the way to wider recognition, which slowly spread. But the universal acceptance of his monumental nine symphonies in the German repertory dates only from the years after World War I.

Bruckner's genius and originality, the grandeur of his symphonic vision and the nobility of his invention cannot conceal the deficiencies of formal continuity and consistency from which his works suffer. These may be explained by the peculiarities of his musical education and the laboriousness and lateness of his artistic development, as a result of which his rich inspiration was never quite integrated with his technique. At the same time, his deep spirituality, firmly based on a devout Catholic's conception of the world, also cut him off from the intellectual trends of his day. His style is a product of disparate elements, combined in a strange uncouth amalgamation: the overwhelming impression made on him by Beethoven's *Choral Symphony* was decisive in forming his monumental idea of the symphony; he became an addict of Wagner's music; his practical experience lay chiefly in the performance of a provincial type of church music and in improvisation at the organ. These elements, backed by an awkwardly stiff, sometimes scholastic contrapuntal texture, produce the strangest possible blending of classical tradition, Wagnerian harmony and baroque ecclesiastical splendour. There is something cyclopean in the vigour with which Bruckner has followed the same great symphonic obsession nine times, with a naïve disregard for variety of form and expression. In spite of such shortcomings, the sincerity and genuineness of his utterance and the rich background of the Austrian landscape, a reflection of which can be felt in his music as in Schubert's, make his works both venerable and unique.

Besides the works mentioned—his masses and his symphonies, the ninth of which remained unfinished—Bruckner's mature output comprises a string quintet (1879) and a number of choral works, among them a magnificent *Te Deum* (1884).

See H. F. Redlich, *Bruckner and Mahler* (1955). (H. GA.)

BRUDIEU, JEAN (JOAN) (c. 1520–1591) French composer, born about 1520, probably near Limoges, arrived at Seo de Urgel in Catalonia in 1538–39 with four other French singers, and seems to have remained there as choirmaster of the cathedral almost continuously until his death (1591). His only known

works—a *Missa defunctorum* and a set of 16 madrigals (some in Castilian, some in Catalan), dedicated to the duke of Savoy (1585)—have been edited by F. Pedrell and H. Anglès (Barcelona, 1921). Stylistically they are rather old-fashioned, but the melodic and rhythmic influence of Catalan folk song gives the madrigals a particular interest. (J. J. N.)

BRUEGHEL (BRUEGEL, BREUGHEL), PIETER (c. 1525–1569), the most original and powerful spirit in Flemish 16th-century art. He was born probably at Brueghel, near Eindhoven, and entered the Antwerp painters' guild in 1551. His alleged training under Pieter Coecke van Aelst has left no apparent traces in his work, but his style does show affinities with certain other Antwerp artists, particularly Jan van Amstel and Pieter Aertsen and the landscape specialists Cornelis Massys and Matthys Cockx. These were painters relatively little affected by the Romanist figure style then prevalent in Flemish painting, and it is significant that Brueghel seems to have used his visit to Rome (c. 1552–53) not to acquire the usual stock of classical and Renaissance motifs but to widen his experience of landscape. His appreciation of the sublimity of alpine scenery was to be fundamental for his art. His work at this time is best seen in landscape drawings, but one picture, a view of Naples (Doria gallery, Rome), must presumably be connected with the Italian journey, and several others, notably the luminous "Fall of Icarus" (Brussels), are generally considered to be early.

Though Brueghel remains at all times the most vigorous and independent of artists, the pictures painted during the decade after his return to Antwerp give evidence of an intimate study of earlier Flemish art. He reanimated the monstrous inhabitants of the fantasy world of Hieronymus Bosch, at first in engravings, such as the set of "Seven Deadly Sins" (1556–57), designed for the printseller Hieronymus Cockx, and later in such paintings as "The Fall of the Rebel Angels" (1562; Brussels) and the "Dulle Griet" (Musée Mayer van den Bergh, Antwerp). The compositional formula of the wide stage, viewed from above and peopled with a multitude of lively figures, is likewise derived from Bosch and his contemporaries and appears constantly in Brueghel's pictures of this period. These include themes from Flemish peasant life and folk wisdom, such as the "Flemish Proverbs" (1559; Berlin) and the "Children's Games" (1559; Vienna), and also a number of biblical subjects, such as the "Tower of Babel" (1563), "The Way to Calvary" (1564) and the "Massacre of the Innocents," all in Vienna.

In about 1560 Brueghel moved from Antwerp to Brussels (where he died, Sept. 1, 1569); he now turned to more concentrated forms of composition and adopted a more monumental style. His greatest achievement in landscape painting, a series of the months of the year (1565; Vienna and New York), is characteristic in its combination of a medieval theme with an entirely new and deeply sensitive rendering of the moods of nature. But most of his pictures of this period represent a new departure, in that they are primarily figure compositions. The range of subjects remains as before—religious, as in the "Adoration of the Kings" (1564; National gallery, London); rustic, as in a "Peasant Wedding" and the "Peasant Dance" (Vienna); or proverbial, as in "The Birdnester" (1568; Vienna) and the "Blind Leading the Blind" (1568; Naples). The conception, however, is presented in a far more vigorous and impressive form. It is noteworthy that the figures owe something of their monumentality to the use, for the first time in Brueghel's work, of motifs from Italian art and particularly from Michelangelo.

Brueghel was not, as he has sometimes been represented, a Flemish peasant upholding the virtues of his fellows against the Spanish oppressor. He was, on the contrary, a cultivated townsman, working for discriminating clients, among whom the Spanish authorities were prominent. A profoundly thoughtful painter, he succeeded in combining his own vivid perceptions with elements from the art of other periods and places, so as to present a vision of the world more complete and coherent than that of any of his contemporaries. It is a vision in which the littleness, the cruelty and the stupidity of man are starkly emphasized against the sublimity and indifference of nature. Yet its pessimism is counter-

BY COURTESY OF THE METROPOLITAN MUSEUM OF ART, ROGERS FUND, 1919

"THE HARVESTERS" BY PIETER BRUEGHEL THE ELDER. IN THE METROPOLITAN MUSEUM OF ART, NEW YORK CITY

balanced by a sanity, a humour and a sensitivity to every kind of natural beauty, which makes Bruegel one of the most delightful as well as one of the most philosophical of artists.

Through his sons PIETER BRUEGHEL (c. 1564–c. 1637), called "Hell Bruegel," an imitator of his father, and JAN BRUEGHEL (1568–1625), called "Velvet Bruegel," a painter of somewhat artificial landscapes and religious pictures, the elder Pieter founded a dynasty of artists that flourished down to the 18th century.

See G. Glück, *The Large Bruegel Book* (1953); F. Grossman (ed.), *The Paintings of Peeter Brucgkel* (1955). (D. Kc.)

BRUGES (Flemish, BRUGGE, "bridge"), capital of the province of West Flanders, Belgium, one of the most interesting cities in the Low Countries preserving a medieval aspect, lies 24 km. (15 mi.) E. of Ostend and 13 km. (8 mi.) S. of the sea at Zeebrugge. Pop. (1955 est.) 51,733.

The centre of Bruges is the Markt dominated by the belfry or halletoren (13th–15th centuries) with its carillon of 46 bells (1742–433, which surmounts the Halles or market built around an interior court. To the east of the Markt are the provincial palace and the post office (1887) in neo-Gothic style. Steenstraat leads southwestward to the cathedral of St. Salvatorskerk (12th–16th centuries, vaults 1633 and 1739), which possesses important works of art. Zuidzandstraat leads on to the Zand, the former site of the railway station. From there southward is a wide boulevard bordered by plantations, leading to the new station. The rampart Begijnenvest opposite leads to the Minnewater, the 17th- and 18th-century harbour. To the east of the Markt are the Burg, former fortified home of the counts of Flanders, and the *stadhuis* (town hall) (1376–1420). To the north is the site of the cathedral of St. Donatian, destroyed in 1799. The Gerechtshof or law courts (1722–2i) replaced the ancient Palais du Franc. The southeast side has a remarkable Renaissance facade. To the southwest of the Burg are two chapels, that of the Holy Blood (14th–15th centuries) built on top of that of St. Basil (1150). Bruges is transversed by several canals, which greatly add to its charm. Chief of these is the Rei (Reye or Roya), a canalized river. One of the most scenic spots in Bruges is near the Gruuthuse mansion (1420–70) where the Dyver canal makes several right-angled turns past ancient houses and underneath equally old bridges. Groeningestraat leads to the Parc Arents, close by which is the Groeninge

museum of fine arts. It contains works by Jean van Eyck, Hugo van der Goes, Hans (Jani Memling and Gerard David. In the park is the museum of the painter Sir Frank Brangwyn. In the south of the city adjoining the Gruuthuse is the church of Notre Dame (13th–15th centuries) which contains pictures by G. David and A. Isenbrant, mausoleums of gilded bronze and enamel of Mary of Burgundy and Charles the Bold, as well as a Madonna and Child in marble by Michelangelo. Nearby to the west the Hospital of St. John contains the Memling gallery with masterpieces of that painter.

Bruges is on the main line from Ostend to Brussels; other lines run to Eeklo, Torhout, Blankenberge and Zeebrugge. As a canal junction Bruges is linked with Zeebrugge harbour; other canals connect with Ostend and Ghent. There are airports near the sea at Knokke and Ostend. The tourist trade is the chief industry, but a new industrial area is growing up to the north, where shipbuilding, the manufacture of

electronic equipment and dies and spinning are carried on. Yeast and industrial glass are also produced. Coal, chemical products, machines and munitions are imported while fuel oil, coke, fruits and vegetables are exported.

Originally Bruges was a landing place on the Zwyn estuary into which the Rei flowed. In the 7th century mentioned as the *Municipium Brugense* (named for a Roman bridge over the Rei) it was evangelized by St. Eloi, bishop of Noyon-Tournai. In a curve of the Rei the first counts of Flanders built a fortification, the *castrum* or *burcht*, against the Norman invaders. The town that grew up around it became an emporium for the Hanseatic league cities and attained great importance by the 13th century. The foundation of the various churches marked stages in the town's growth. In the 14th century the silting up of the Zwyn harmed its trade and Damme became the outer port of Bruges. Despite the commercial decline, the most brilliant period in the history of Bruges was the 15th century when the dukes of Burgundy held their court there attended by the artists who later became known collectively as the Primitive Flemish school. The political troubles of the 16th century brought the prosperity of Bruges to an end, and it remained a sleepy medieval town until the cutting of the canal to Zeebrugge in 1903 made it a port once more and new industries grew up rapidly, while the tourist trade brought a new prosperity. In World War I Bruges was occupied by the Germans in Oct. 1914. On April 23, 1918, the harbour of Zeebrugge was raided by the British and blockships sunk in the Bruges canal, to deny the use of the port of Bruges to German submarines. On Oct. 19, 1918, the Allies reoccupied the town. In World War II Bruges was occupied by the Germans from May 1940 until Sept. 1944.

(A. J. DE B.)

BRUGMANN, (FRIEDRICH) KARL (1849–1919), German linguist, specialist in the comparative grammar of the Indo-European languages, was born in Wiesbaden on March 16, 1849. Educated in the *Gymnasium* there and at the universities of Freiburg and Leipzig, he was for 32 years professor of Sanskrit and comparative linguistics at the latter. He died in Leipzig, June 29, 1919.

Brugmann was an enormously productive scholar, a keenly per-

ceptive original investigator, a vigorous defender of theoretical principles and the greatest synthesist among the grammarians of his time. Of his 400 publications the most original is his article (1876) on the sonant nasal in Indo-European; but the work on which his fame most securely rests is his *Grundriss der vergleichenden Grammatik der indogermanischen Sprachen*, of which the volumes on the sounds and forms, supplemented by three volumes on syntax by Berthold Delbrück (*q.v.*), appeared first between 1886 and 1893 and in a second greatly enlarged edition between 1897 and 1916. Brugmann's ability to control vast masses of exceedingly complex phenomena is evident in all his work, but nowhere with such perfect clarity as in the great *Grundriss*.

As a member of the group of "young grammarians" at Leipzig in the 1860s and 1870s, Brugmann ardently espoused the cause of unexceptionality in sound laws, and in an article "Zum heutigen Stand der Sprachforschung" (1885) he vigorously defended the new linguistics against the animadversions of his own teacher Georg Curtius. In the first volume (1878) of *Morphologische Untersuchungen*, edited by Brugmann and his friend Hermann Osthoff, may be found Brugmann's statement of the young grammarians' views.

A bibliography of Brugmann's work from 1871 to 1909 was published in *Indogermanische Forschungen*, vol. 26, 425-440 (1909); and a supplement was printed in *Indogermanisches Jahrbuch* for 1919, vol. 7, pp. 148-152. (M. F.)

BRUGSCH, HEINRICH KARL (1827-1894), German Egyptologist, a pioneer in the decipherment of demotic (see DEMOTIC LANGUAGE AND WRITING), was born in Berlin on Feb. 18, 1827. He was sent to Egypt by the Prussian government in 1853 and met Auguste Mariette there. He then worked in the Berlin museum. In 1860 he was sent to Persia; in 1864 he was consul at Cairo; and in 1868 he was professor at Gottingen, Ger. On the foundation by the khedive of the Cairo school of Egyptology (1870) he was appointed director, a post he held for nine years. He then returned to live in Germany, frequently visiting Egypt until his death. Brugsch's services to Egyptology are most important. His vast hieroglyphic-demotic dictionary appeared during 1867-82. He died in Charlottenburg, near Berlin, on Sept. 9, 1894. See also EGYPT: *Archaeology*.

See H. Brugsch, *Mein Leben und mein Wandern* (1893). (W. R. D.)

BRÜHL, HEINRICH, GRAF VON (1700-1763), the director of policy in electoral Saxony from 1738 to 1763, was born at Glanflossommern in Thuringia on Aug. 13, 1700. He became a page to the dowager duchess of Saxe-Weissenfels in 1713 and then, in 1720, to Frederick Augustus I, elector of Saxony and, as Augustus II, king of Poland. In 1731 he became successively head of the excise office, director of the department of internal affairs and privy councilor, but only after Frederick Augustus I's death (Feb. 1733) did he attain the rank and title of cabinet minister. In 1734 he was given control of the electoral finances by the new elector Frederick Augustus II (see AUGUSTUS III, king of Poland) as president of the chamber. In 1737 he was created a count of the empire by the emperor Charles VI. From 1738, when he received charge of military affairs, Bruhl was in effect sole minister and director of Saxon policy; and in 1746 he received the title of *premier ministre*. He was also president of the mining monopoly from 1733 and director of the Meissen porcelain factory from 1739. Enjoying the full confidence of the elector until his death, Bruhl amassed a large fortune from his stipends, but the charges of wholesale embezzlement once leveled against him are discounted by modern historians. His chief political aims were the acquisition of a land corridor between Poland and Saxony and the establishment of a hereditary kingdom in Poland. These brought him the political enmity of Prussia and the fierce personal hatred of Frederick the Great of Prussia, whose writings have blackened Bruhl's posthumous reputation. It was thus against Brühl's will that Frederick Augustus allied himself with Prussia in the War of the Austrian Succession, and the cost in men and money brought no compensation to Saxony, as Saxon interests were ignored in the peace of Breslau (1742). Early in the Seven Years' War (*q.v.*) after the capitulation of the Saxon army at Pirna (Oct. 1756)

Bruhl and Frederick Augustus fled to Warsaw, where they remained throughout the war. During the war Saxony, especially Bruhl's estates, was ruthlessly exploited by Prussia. Bruhl died at Dresden on Oct. 28, 1763, having survived his master only a few weeks.

See R. L. Koehl, "A Saxon Politician of the 18th Century," *Journal of Central European Studies* (Jan. 1954); H. Rossler, article in *Neue Deutsche Biographie*, vol. ii (1955).

BRÜHL, a town of Germany which after partition of the nation following World War II was located in the newly formed Land of North Rhine-Westphalia of the Federal Republic of Germany, is 11 km. (7 mi.) S. of Cologne. Pop. (1959 est.) 34,349. From the end of the 13th century onward it was a stronghold of the electors of Cologne and the 18th-century baroque castle, the Augustusberg (with its extensive gardens and famous staircase built by Balthasar Neumann), was their summer residence. After 1945, the castle was frequently used for receptions by the president of the Federal Republic of Germany. The town is a resort for the people of Cologne. It is a centre of lignite (there are numerous brown-coal mines on the slopes of the Vorgebirge), briquette and subsidiary industries.

BRUM, BALTASAR (1883-1933), Uruguayan statesman, was born near Salto, June 18, 1883. He received a law degree in 1908 and practised briefly, but in 1913 was appointed minister of public instruction and later served as minister of foreign relations (twice), of finance and of the interior. While serving as minister of foreign relations and just before assuming the presidency, Brum made official visits to Washington, D.C., and certain Latin-American capitals. He was elected president in 1919, the first to serve after the constitution of 1917 established a bifurcated and bipartisan executive (president and independent national council of administration). His presidency continued until 1923. Brum was president of the council on March 31, 1933, when Pres. Gabriel Terra in his coup d'état suspended the constitution. Brum in protest against the action dramatically killed himself, defying police who came to arrest him.

His chief contribution, both as minister and president, was in the field of foreign relations. He consistently urged inter-American solidarity and in 1920 proposed an American League of Nations. (R. H. Fr.)

BRUMAIRE (from Fr. *brumes*, "mists"), the second month in the French Republican calendar (*q.v.*), began on Oct. 22 or 23 and ended on Nov. 20 or 21. The *coup d'état* of 18 Brumaire, year VIII (Nov. 9, 1799), and the fall of 19 Brumaire overthrew the Directory and established the consular regime (see FRANCE: *History*; NAPOLEON I).

BRUMEL, ANTOINE (c. 1460-c. 1525), a leading church composer of his time, probably born in Flanders about 1460. He may have been in Chartres in 1483, certainly worked in Laon in 1497 and was choirmaster of Notre Dame, Paris, 1498-1500. He left Paris in 1505 and went to Lyons. He was in Rome in 1513 and in Ferrara in 1520. No further record is known. His music, highly regarded by contemporary writers, consists mainly of four-voiced masses and motets. His 12-part mass, one of 12 masses, published in Venice (1503-08), Rome (1516-22) and Nürnberg (1539), was an unusual experiment. He used canon and *cantus firmus* easily, and his gift for imitative writing was advanced for his time.

BIBLIOGRAPHY.—A useful selection of Brumel's music was reprinted in *Treasures musical* (for 1866 and 1874-75), ed. by R. van Maldeghem; complete ed. by A. Carapetyan (vol. i, *Missa L'Homme armé*, 1951). See also A. Pirro, "Dokumente über Antoine Brumel . . .," in *Zeitschrift für Musikwissenschaft*, vol. xi (1928-29); G. Reese, *Music in the Renaissance* (1954). (B. L. Tr.)

BRUMMELL, GEORGE BRYAN (1778-1840), English man of fashion, known as "BEAU" BRUMMELL, famous for his friendship with the prince of Wales (afterward George IV) and as the undisputed leader of fashion at the beginning of the 19th century, was born in London on June 7, 1778. His father was private secretary to Lord North from 1770 to 1782, and subsequently high sheriff of Berkshire; his grandfather was a shopkeeper in the parish of St. James, who let lodgings to the aristocracy. From his early years George Brummell paid great attention to his dress. At

Eton, where he was sent to school in 1790, and was extremely popular, he was known as Buck Brummell, and at Oxford, where he spent a brief period as an undergraduate at Oriel college. he preserved this reputation, and added to it that of a wit. He returned to London, where the prince of Wales, to whom he had been presented at Eton, gave him a commission in his own regiment (1794). Brummell soon became intimate with his patron and, in 1798, having then reached the rank of captain, he left the service.

Next year he succeeded to a fortune of about £30,000. Setting up a bachelor establishment in Mayfair, he became, as a result of the prince of Wales's friendship and his own good taste in dress, the recognized *arbiter elegantiarum*. For a time his sway was unchallenged, but eventually gambling and extravagance exhausted his fortune, while his tongue proved too sharp for his royal patron. They quarreled in 1812, and although Brummell did not immediately lose his place in society, his debts increased so much that in 1816 he fled to Calais to avoid his creditors. There he struggled on for 14 years, always hopelessly in debt. From 1830 to 1832 he was British consul at Caen. In 1835 he was imprisoned for debt, but his friends once more came to the rescue, and provided him with a small income. He soon lost all his interest in dress; his personal appearance was slovenly and dirty, and he began to live in the past. In 1837, after two attacks of paralysis, shelter was found for him in the charitable asylum of Bon Sauveur, Caen, where he died on March 30, 1840.

See Lewis Melville, *Beau Brummell, His Life and Letters* (1925). (A. AL.)

BRUNDISIUM: see BRINDISI.

BRUNE, GUILLAUME MARIE ANNE (1763–1815), the only one of Napoleon's marshals to have been associated with the French Revolutionary terror, was born on May 13, 1763, at Brive-la-Gaillarde, the son of a lawyer. He met Danton as a journalist in Paris, turned to the extremists of the Revolution and was a *commissaire* for purges of the army of the north and later commander of a camp which terrorized Bordeaux. Under the Directory he served in Paris with Barras and Napoleon Bonaparte and, after three months' war in Italy (1797) under the latter, was general of division. Barras used him in a series of commands-in-chief to coerce the Helvetian, Cisalpine and Batavian republics. Brune beat the Anglo-Russian army in Holland at Bergen and at Castricum (Sept.–Oct. 1799) and then "carried terror and respect," as he said, to western France. Sent by Napoleon to end the Italian campaign, he fought a battle against the Austrians in Dec. 1800. He was ambassador at Constantinople when he was made a marshal in 1804. On return he guarded the French coast (1805–07) with small forces: aided by his reputation as defender of Holland. He had cleared the Swedes from Stralsund in 1807, when he was abruptly removed from employment, for reasons never divulged.

The shadow of Jacobinism still rested on Brune in 1815 when Napoleon sent him to defend Provence (which was strongly royalist). Returning at the end of hostilities he went into Avignon for horses; a crowd gathered against the alleged "murderer of the princesse de Lamballe" and killed him on Aug. 2, 1815.

(I. D. E.)

BRUNEAU, (LOUIS CHARLES BONAVENTURE) ALFRED (1857–1934), French opera composer whose works were inspired by the naturalism of Émile Zola, was born in Paris on March 3, 1857. He was a pupil of Massenet at the Paris Conservatoire. On leaving the Conservatoire he was employed as a copyist to the publisher Georges Hartmann. In his youth he wrote three choral symphonies, conducted by Jules Pasdeloup, and in 1887 produced his first opera, *Kérim*. In 1888 he met Zola with whom he formed a close friendship and whose works served him as librettos for eight operas produced between 1891 and 1916. The first of these, *Le Rêve* (1891), was criticized for its Wagnerian associations, but *Messidor* (1897) and *L'Ouragan* (1901), the librettos of which were written in prose, showed Bruneau's original dramatic gifts. "Music that should be both realistic and symbolical" was his aim, achieved in *L'Attaque du moulin* (1893), based on Zola's *Soirées de Médan*, and in the incidental music for Zola's *La Faute de l'abbé Mouret* (1907). Political rather than musical

reasons accounted for the failure of *L'Enfant-roi* (1905) and *Nais Micoulin* (1907), Bruneau having supported Zola in the conflicts that arose from the Dreyfus case. After Zola's death in 1902 Bruneau's works include the ballets *Les Bacchantes* (1912) and *L'Amoureuse Leçon* (1913). His last operas, *Angelo* (1928) and *Virginie* (1931), were not revived. Bruneau's works were widely played during his lifetime, Gustav Mahler having conducted *Le Rdve* at Hamburg and Sir Charles Stanford the first performance of his *Requiem* (1896) in London. He wrote music criticism for *Gil Blas*, *Le Figaro* and *Le Matin*, and published books on contemporary French and Russian music. He died in Paris on June 15, 1934.

BRUNEI, a British protected state in Borneo. Area, 2,226 sq. mi.; pop. (1960) 83,877. In early times as a powerful sultanate, it gave its name (also Poli, Borni) to the whole island of Borneo. In the 19th century it was gradually overshadowed by expansive neighbours under western influence (see BORNEO, NORTH: SARAWAK) to whom much territory was sold. By the mid-20th century, though small, it had become a rich, independent state under British protection, owning at Seria the largest oil field (started 1929) in the commonwealth—as well as tracts of sparsely inhabited jungle and mountainous terrain.

Physical Geography.—Lying betw-een 4° 2' and 5° 3' N, and 114° 4' and 115° 22' E. in northwest Borneo (*q.v.*), it is split into two enclaves by the Limbang river in the Fifth division of adjacent Sarawak. The northerly part of Brunei stretches up both sides of the Temburong river valley over a width of 15 mi. from Brunei bay to the headwaters of the impressively jagged mountain massif of Pagon Priok (6,070 ft.), 40 mi. inland. This rugged section of the state has no large township, but some rubber estates. The larger southern section, running inland from 80 mi. of motor-

SHELL PHOTOGRAPH

FISHERMEN WAITING FOR CUSTOMERS AT THE WHARF OF BRUNEI TOWN

able coral sand-beach along the South China sea. is largely flat and often swampy, drained by two main rivers, the Tutong and Belait, the principal means of communication with the interior, which rise close together 50 mi. inland on the Sarawak (Fourth division) border. The oil fields reach from the mouth of the Belait in the southwest corner of the state for 20 mi. along the coast and far out into the sea, which there shelves slowly away to the 10-fathom line. The climate is tropical, characterized by uniform temperature, high humidity and copious rainfall. Average daily temperatures range from 76° F. to 86°. Annual rainfall varies from 100 in. on the coast to more than 200 in. in parts of the interior.

Population.—Of a relatively small but rapidly rising population (83,877. 1960; cf. 10,657 in 1947) a little more than half (47,013) are hlalays—not immigrant stock but the descendants of indigenous pagans converted to Islam, the state religion. This group dominates administration and politics. A further 8,000 Kedayans and others are also Muslim. Business is largely run by about 22,000 Chinese and a few Indians and Europeans. The rest are still pagan animists: Dusuns, Belaits, Tutongs, Bukits and Muruts (see MURUT), related to the Bisayan and Kelabit peoples of northern Sarawak. There are also a few nomadic Punans (see PUNAN) in the Belait headwaters. Immigrant Sea Dayaks (from Sarawak) have cleared a good deal of jungle land in the Temburong; and they provide hardy labour on the oil fields. Languages spoken are Malay, Chinese, English and a number of native dialects.

History.—The sultanate was islamized in the 15th century: but it had already grown powerful as a local Bisayan-Murut centre at least as early as 800 AD. (proved by recent excavations undertaken by the Sarawak museum at the ancient capital, Kota Batu) By 1521, when Magellan's squadron anchored offshore, the fifth and probably greatest of the Muslim sultans, Bulkiah held sway over most of lowland Borneo and a good deal of the surrounding archipelago, with interests and contacts extending west to Malacca in the Malay peninsula and north to Luzon in the northern Philippines. Subsequently a Spanish fleet from Manila attacked Kota Batu and it was liquidated as the royal centre. Brunei never really recovered in power until the discovery of oil in the 20th century.

Administration and Social Conditions.—What was left of the state—nibbled away by Sir James Brooke (*q.v.*) into Sarawak and by the Chartered company into North Borneo—was placed under British protection in 1888. From 1906, administration was vested directly in a British resident, a system continuing through 29 changes of office (except during the Japanese occupation 1941–45) until 1959, when the sultan with a state council resumed entire control. The commissioner for the United Kingdom now represents the crown.

Brunei town, once largely built on stilts out in the river—and thus described by Antonio de Pigafetta in 1521—is gradually spreading onto firmer ground and into a ferroconcrete concentration, holding a third of the state's population. The mosque, largest in the far east and with vast gold-leafed dome, sets the tone of a city growing in a mixed tradition: Allah and oil. Seria, the main oil and technological centre, is a more European-style township, with air-conditioned bungalows and well-kept lawns.

Economic Conditions.—Despite wealth through oil reserves, extensive social services (*e.g.*, free school meals, early pensions for the aging, generous wage rates for local officials) and low personal taxation, a considerable section of Brunei's population remain basically peasant farmers, whose main ambition is often to obtain a permanent post in the extensive civil service and public works. The aggregate standard of living, though unevenly distributed, is the highest in southeast Asia. Exports include plantation rubber, wild rubber (*jelutong*), pepper, firewood, hides and oil products (in order of importance). Main import items include machinery and heavy equipment, building materials, clothing, jewelry (mostly gold), food (principally rice; live animals, sugar, fish) and tobacco. Accumulating investment reserves insured Brunei's immediate future, but at the same time there were possibilities of a contraction in oil yield, with no alternative major sources of revenue in sight. See also BORNEO.

See *State of Brunei Annual Reports*; current history and statistics are summarized annually in *Britannica Book of the Year*. (T. H.N.)

BRUNEL, the name of two noted British engineers of French stock, father and son.

SIR MARC ISAMBARD BRUNEL (1769–1849), engineer and inventor, builder of the first underwater tunnel in the world, was born at Hacquerville, Normandy, France, on April 25, 1769. After six years' naval apprenticeship, his royalist sympathies compelled him to leave France when the Revolution broke out. In 1793 he fled to the United States, where he held for a time the post of chief engineer of New York.

Having evolved a method of making ships' blocks by mechanical means: he sailed to England in 1799 to lay his plans before the British government. He was engaged to superintend the erection of his machines at Portsmouth dockyard. When completed, this installation was one of the earliest examples in the world of completely mechanized production.

Brunel was a prolific inventor, designing machines for sawing and bending timber, bootmaking, stocking knitting and printing, among many others. Having encouraged him to equip a factory for making army boots, the government refused to accept his output when peace was restored in 1815. This, combined with the destruction by fire of his sawmills at Battersea, London, led to his imprisonment for debt in 1821, but his friends obtained from the government a grant of £5,000 for his release.

Brunel also practised as a civil engineer, designing, among other works, the fle de Bourbon suspension bridge and the first floating landing stage at Liverpool. He is chiefly remembered as the designer of the first tunneling shield and as the builder of the Thames tunnel between Rotherhithe and Wapping where this shield was first used. This scheme, which had no precedent, was begun in 1825 and completed after great physical and financial difficulties in 1843. It was for this work that he received a knighthood in 1841.

Sir Marc Brunel died in London on Dec. 12, 1849.

ISAMBARD KINGDOM BRUNEL (1806–1859), a civil and mechanical engineer of outstanding originality, the designer of the first transatlantic steamer, was born at Portsmouth on April 9, 1806, the only son of Sir Marc I. Brunel. Educated at the college of Caen and at the Lycée Henri Quatre in Paris, he was apprenticed for a short period to A. L. Bréguet, the great horologist, before returning to England to assist his father in 1822. When work on the Thames tunnel began under his father's direction in 1825, he was appointed resident engineer, a post he held until 1828 when a sudden inundation seriously injured him and brought the tunnel works to a standstill for seven years. Sent to Clifton to recuperate, he prepared designs for a suspension bridge over the Avon gorge, one of which was ultimately adopted in preference to a design by Thomas Telford. Because of lack of funds, the bridge was not completed until after his death.

Brunel next carried out improvements in the Bristol docks. This work introduced him to the promoters of the Great Western railway and in 1833, when he was 27, he was appointed chief engineer to that company. It was on the main line from Paddington to Bristol that he introduced the broad (seven-foot) gauge and so provoked the famous "battle of the gauges." A failure commercially, the high speeds obtained on the broad gauge were a great stimulus to railway progress. In south Devon he introduced the "atmospheric" system of traction, but the experiment was a failure.

Brunel was responsible for building over 1,000 mi. of railway in the west country, the midlands, south Wales and Ireland. His first notable railway works were the Box tunnel and the Maidenhead bridge, and his last the Chepstow and Saltash bridges. The Maidenhead bridge had the flattest brick arch in the world, while in sinking the pier foundations for the last-named bridges he was the first engineer to use a compressed-air caisson.

Brunel also made an outstanding contribution to marine engineering with his three ships, "Great Western" (1837), "Great Britain" (1843) and "Great Eastern" (1858), each the largest in the world at date of launching. The first, a wooden paddle steamer, was the first successful transatlantic steamship; the second was the first large iron-hulled screw steamer; the third was propelled by

both paddles and screw and had a double iron hull which was the prototype of the modern ocean liner. Of a size which was not exceeded for 40 years, the "Great Eastern" was not a success as a passenger ship, but achieved fame by laying the first successful transatlantic cable.

Unable to delegate, Brunel wore himself out with worry and overwork. He died at his home in Westminster on Sept. 15, 1859. He was remarkable for his versatility, and his works unconnected with railways or steamships included the design of a complete prefabricated hospital building which was shipped in parts to the Crimea in 1855.

BRUNELLESCHI, FILIPPO (FILIPPO DI SER BRUNELLESCHI) (1377-1446), Italian architect, one of the great pioneers of Renaissance art, was born in Florence and executed all his major works there. After being apprenticed to a goldsmith, Brunelleschi began his career as a sculptor and in 1401 submitted a competitive design for the bronze doors of the baptistery of San Giovanni.

Upon losing this commission to Lorenzo Ghiberti, his interests increasingly turned to architecture; but his early sculptural bent was never lost, and largely determined his subsequent approach to architectural design. Typical of this is Brunelleschi's Foundling hospital (begun 1421)—its famous arcade is a sculptor's rendering, in three dimensions, of the flat façade arches on the Romanesque church of San Miniato. Likewise, the interior effect of his churches of San Lorenzo (begun 1421) and Santo Spirito (begun 1435) primarily depended on a sculpturelike handling of spatial units, disposed in simple mathematical ratios. From these predilections, Brunelleschi's interest in the theory of perspective followed naturally: His important discoveries in that area were incorporated in Leone Battista Alberti's *Della Pittura*, the 1436 (Italian) edition being dedicated to him.

Brunelleschi's major place in the development of the Renaissance was as a pioneer in its new concepts of controlled space rather than as a reviver of Roman architecture. In his youth, Brunelleschi may have visited Rome with Donatello (*q.v.*) and made drawings of Roman buildings, including the Pantheon; but his work shows little more than strong reminiscences of them.

The dome that Brunelleschi designed to complete Santa Maria

del Fiore, the cathedral of Florence, was his masterpiece; it was begun in 1420, and substantially completed by 1434. Unlike the Pantheon it is pre-eminently a great exterior sculptured form in space, and is executed on the principles of late medieval vaulting. The same concern for forms in space, in proportioned relationship, distinguishes the Pazzi chapel (begun 1430), which again superficially resembles the Pantheon and the Pitti palace (begun c. 1440), where Roman orders are conspicuously absent. The beautiful carved crucifix in the church of Santa Maria Novella is also the work of Brunelleschi. He died in Florence, April 16, 1446, and was buried in the city cathedral. See **RENAISSANCE ARCHITECTURE**; see also references under "Brunelleschi, Filippo" in the Index volume.

(AN. G.)

BRUNET, JACQUES CHARLES (1780-1867), author of the standard French bibliographical work of his time. He was born in Paris on Nov. 2, 1780, the son of a bookseller. In 1802 he printed a supplement to the *Dictionnaire bibliographique de livres rares* (1790) of R. Duclos. In 1810 there appeared the first edition of his *Manuel du libraire et de l'amateur de livres*, a great bibliographical dictionary, which rapidly became the standard work. Among his other works are *Nouvelles recherches bibliographiques* (1834), *Recherches . . . sur les éditions originales de Rabelais* (1852) and an edition of the 16th-century French poems of G. G. Alione (1836). He died in Paris on Nov. 14, 1867.

BIBLIOGRAPHY.—*Catalogue de J. C. Brunet* with a biography by A. J. V. Le Roux de Lincy (1868); A. Laporte, *Bibliographie contemporaine, Supplément de Brunet* (1884-85); T. de Banville in *L'Artiste* (April-June, 1866); *Gazette bibliographique* (May 10, 1868).

BRUNETIÈRE, FERDINAND (1849-1906), French critic, literary historian and controversialist, was born in Toulon, July 19, 1849, and educated in Lorient, in Marseilles and at the *lycée* Louis-le-Grand. He volunteered for military service in 1870 and was profoundly affected by his experiences during the siege of Paris. Shortly afterward he started contributing articles on Darwin, Huxley and Spencer to the *Revue Bleue* and on classical and contemporary French (and occasionally foreign) literature to the *Revue des deux mondes*. Here he was undoubtedly unjust to Zola and Baudelaire (although no more so than most contem-

THE PITTI PALACE, FLORENCE. DESIGNED BY BRUNELLESCHI, 1440; COMPLETED AFTER HIS DEATH BY LUCA FANCELLI

porary reviewers) but he showed considerable discernment in his studies of Pascal, Bossuet and George Eliot. His critical approach was more flexible than is commonly supposed and he examined various possible answers (including those of evolutionary science and comparative religion) to the moral issues of the day. In 1886 he was appointed (with no academic qualification other than the *baccalauréat*) to a chair at the École Normale. In 1889 he outlined his celebrated theory of the evolution of literary genres. His many adversaries made much of this theory in their attempts to invalidate his criticism but he himself explicitly abandoned it several years later and excessive attention to it has obscured the value of his other innovations (e.g., the impetus he gave to the development of comparative literature). In 1894, after he had been elected to the Academy and had become an influential editor of the *Revue des deux mondes*, an audience with Pope Leo XIII decisively affected his outlook. Thereafter, although he never became an orthodox apologist or even, except in *extremis*, a true convert: he made many public pronouncements in favour of Catholicism. He died in Paris, Dec. 9, 1906.

BIBLIOGRAPHY.—Brunetière's published works include *Le Roman naturaliste* (1883); *Les Époques du théâtre français* (1892); *L'Évolution de la poésie lyrique en France*, 2 vol. (1894); nine series of *Études critiques* (1880–1925); *Manuel de l'histoire de la littérature française* (1898); a monograph on *Balzac* (1906); and the *Discours de Combat*, 3 vol. (1900–07). A voluminous correspondence is deposited in the Bibliothèque Nationale. Among modern studies see V. Giraud, *Brunetière* (1932); J. van der Lugt, *L'Action Religieuse de Ferdinand Brunetière* (1936); J. G. Clark, *La Pensée de Ferdinand Brunetière* (1954). (J. G. CK.)

BRUNHILD, a female figure from the heroic literature of the ancient Teutons, known from Old Norse sources (the *Edda* poems and the *Volsungasaga*) and from the *Nibelungenlied* (q.v.) in German. In the former she plays the leading role in those poems in which she appears, whereas in the *Nibelungenlied*, because of a shift of emphasis, her prominence is greatly reduced. Common to both, and no doubt original, is the conception of her as the central figure of a story in which she vows to marry only a man of the most outstanding qualities. One man, Siegfried (q.v.), is able to fulfill her conditions, but he woos and wins her, not for himself but for another. When Brunhild discovers this treachery she exacts vengeance and this involves the death of Siegfried. In some of the Norse sources she has supernatural qualities and is described as a valkyrie; it is still a matter of dispute whether these attributes are an accretion or whether their absence from the German version is due to an omission. Many critics who doubt their originality seek the source of the poetic figure in the history of the Merovingian kings of the Franks, in which Queen Brunichildis plays an important part; the name is also found as an element in place and field names in the region of the Rhine and in northeastern France and Belgium, but this could have resulted from the popularity of the literary figure.

(K. C. K.)

BRUNHILDA (BRUNECHILDIS; FR. BRUNEHAUT) (d. 613), queen of the Frankish kingdom of Austrasia, was the daughter of the Visigothic king Athanagild. In 567 she married Sigebert (q.v.), king of Austrasia, changing her religion from Arianism to Catholicism. In the same year her sister Galswintha married Sigebert's half brother Chilperic I, king of the western part of the Frankish territory, but in 567 or 568, at the instigation of his concubine Fredegund, Chilperic had Galswintha murdered. Prompted by Brunhilda, Sigebert then exacted Galswintha's marriage settlement (Bordeaux, Limoges, Quercy, Béarn and Bigorre) as retribution from Chilperic. When Chilperic tried to recover this territory war broke out between him and Sigebert (573). At first it ran in Sigebert's favour, but in 575 he was assassinated and Brunhilda was imprisoned at Rouen. There, however, Merovech, one of Chilperic's sons, went through a form of marriage with her (576). Chilperic soon had this union dissolved, but Brunhilda was allowed to go to Metz in Austrasia, where her young son Childebert II had been proclaimed king. There she was to assert herself against the Austrasian magnates for the next 30 years. In 584 she gave some encouragement to the pretender Gundobald against Guntram king of Burgundy. Guntram to conciliate her made Childebert his heir.

After Childebert's death (595 or 596) Brunhilda failed to set herself up as guardian over Childebert's elder son Theudibert (Thibert) of Austrasia and so stirred up against him his brother Theuderic (Thierry), who had succeeded to Burgundy. Theudibert was finally overthrown in 612, but Theuderic died soon afterward (613), whereupon Brunhilda tried to make the latter's eldest son, the 12-year-old Sigebert, king of Austrasia. The Austrasian magnates, reluctant to endure her tyrannous regency, appealed to Clotaire II of Neustria against her. Brunhilda tried in vain to enlist the help of the tribes east of the Rhine, then fled to Burgundy. Garnier, the mayor of the palace, was however in communication with Clotaire and the queen's army refused to fight when it met Clotaire's on the Aisne river. Handed over to Clotaire at Renève (northeast of Dijon), she was tortured for three days, bound on to a camel and exposed to the mockery of the army and finally dragged to death at a horse's tail (autumn 613).

Brunhilda's ashes were interred in a mausoleum erected near the abbey of St. Martin at Autun, which she had founded; and there her memory was highly venerated. Gregory of Tours applauds her for her personal morality and for her political wisdom, but Fredegarius presents her as a new Jezebel. Modern historians likewise have conflicting opinions about her. The Franks over whom she sought to rule resented her Gothic origin, and the tragic course of her life has made her a figure of legend.

BRUNI, LEONARDO (1370–1444), also called Leonardo Aretino, Italian scholar and historian whose major work, *Historiarum Florentini Populi libri XII*, in Latin, is the first history of Florence based on an accurate critical examination of the sources. Born at Arezzo in 1370, he was secretary to the papal chancery from 1405, and from 1427 to his death (March 9, 1444) was chancellor to the republic of Florence.

His Latin translations from the Greek classics (Demosthenes, Xenophon, Plato, Aristotle among others) greatly advanced the knowledge of Greek literature, and his lives of Dante and Petrarch are important documents. His Latin has elegance, and his republican outlook was well suited to the style of Livy and Cicero, which he tried to imitate. (F. DI.)

BRÜNING, HEINRICH (1885–), German statesman, chancellor from March 1930 to May 1932, was born at Münster in Westphalia on Nov. 26, 1885. As a student of philosophy, history and politics, he visited France and England. Volunteering for military service in 1915, he rose, in the course of World War I, to the command of a machine gun company. After the war, he decided to make politics his career. He felt himself in sympathy with the younger generation and also believed that solidarity between ex-servicemen would form the basis for solving many political questions. A quiet, hypercritical man with ascetic features, an open-minded son of the Roman Catholic Church, one who saw the faults of society yet remained basically conservative, Brüning received his political training as the protégé of Adam Stegerwald and as the business manager of the German Economic Federation (Deutscher Gewerkschaftsbund). From 1924 as a member of the Centre party, he represented Breslau in the *Reichstag*, winning recognition as an expert on finance and taxation. In the spring of 1929 he became the leader of the Centre party in the parliament, an important post which brought him leadership of the party as a whole.

In March 1930, although he had done his utmost to save the Hermann Müller coalition, Brüning was called to form a government himself, to face the spreading world economic crisis. His immediate aim was to put the German finances in order as a measure toward the fulfillment of the Young plan. In July 1930, when an essential feature of his fiscal program was rejected by the *Reichstag*, he found himself obliged to resort to legislation by presidential decree, according to the emergency clause in the constitution. After the elections of Sept. 1930, the Nazis (who had enormously increased their share of the vote and completely upset the older balance of parties in the *Reichstag*) exerted increasing pressure against the government, and Brüning adopted a "national"

foreign policy in an attempt to win their co-operation. The sincere pursuit of this aim brought him closer and closer to President von Hindenburg and the army leadership.

In view of the worsening economic situation it soon became clear that without foreign understanding and support Brüning would not be able to withstand his opponents. His discussions with the British and French prime ministers Ramsay MacDonald and Pierre Laval, together with the Hoover moratorium, did in fact help to overcome the worst effects of the July crisis of 1931. In April 1932, however, Brüning's attempt to gain Allied recognition of Germany's right to equal armaments failed despite his reputation as a diplomat. Finally, when he wanted to widen his cabinet to include rightist elements with a view to settling the reparations question, intrigue and provocation forced him to resign (May 30, 1932). (See GERMANY: History.)

Brüning played no further part in German politics. Forced to emigrate in 1933, he went to the U.S. and received a professorship at Harvard. Returning to Germany after World War II, he was for a time professor of political science at Cologne.

See K. D. Bracher, *Die Auflösung der Weimarer Republik*, 3rd ed. (1960). (T. V.)

BRUNN: see BRNO.

BRUNNER, (HEINRICH) EMIL (1889–), Swiss theologian in the Reformed tradition who helped to change the course of Protestant theology in the 20th century. He was one of the leaders of the movement, at the close of World War I, toward a reaffirmation of the central themes of the Protestant Reformation against the liberal theologies. Brunner was associated with Karl Barth (*q.v.*) in the early days of this movement, sometimes called the "dialectical theology," but Brunner developed his system in divergence from Barth. His theology presented itself, as did Barth's, as an alternative to literalistic orthodoxy and idealistic liberalism. While preserving the uniqueness of the Christian faith it sought a continuing dialogue between theology and humanistic culture. Brunner's theology was influential in Europe and in the United States. His works are widely read in Asian theological schools.

Brunner was born in Winterthur, Dec. 23, 1889. He was educated in Switzerland and Germany and went to Union Theological seminary, New York city, as the first exchange student after World War I. He received the doctor of divinity degree from the University of Zurich in 1913, was ordained to the ministry of the Swiss Reformed Church and from 1916 to 1924 was a pastor in Switzerland. In 1924 he became professor of systematic and practical theology in the University of Zurich, where he continued to teach except for extensive lecture tours in the United States and Asia.

The close link between Brunner's theology and that of Barth was broken early in their theological careers when in 1934 Brunner wrote a monograph entitled *Natur und Gnade: Zum Gespräch mit Karl Barth* ("Nature and Grace; a Conversation With Karl Barth"). Brunner held that while God's saving revelation is known only in Jesus Christ, there is a revelation in the creation; this revelation is reflected in the "image of God," which man bears and which is never wholly lost. This provoked a vigorous reply from Barth, who attacked Brunner's view that the image of God remains formally but not materially in man after sin has entered. Brunner replied, insisting upon the sense of responsibility as the "point of contact" between sinful human nature and the divine.

Among Brunner's earlier works are *The Mediator* (1927), a study of Christology, and *The Divine Imperative* (1932) on Christian ethics. His thought took a decisive new turn with the publication of *The Divine-Human Encounter* in 1937 and *Man in Revolt* in 1938. In these works he adopted a position that had been given significant expression by Martin Buber in his *I and Thou*—that there is a fundamental difference between knowledge of impersonal objects and knowledge of other persons (see BUBER, MARTIN). Brunner took this doctrine as a key to the biblical conception of revelation and developed his position in a series of books, among which are *Revelation and Reason* (1941), a three-volume *Dogmatics* (1946–60), *Justice and the Social Order* (1945)

and the Gifford lectures, *Christianity and Civilization* (1948–49).

Brunner's writing is characterized by extensive learning, concern for the personal dimension of religious faith and the search for a distinct and autonomous theological standpoint that will remain relevant to cultural and philosophical issues.

All of Brunner's major works except his study of F. D. E. Schleiermacher (*Die Mystik und das Wort*, 1924) have been translated into English, and most are mentioned above. The discussion with Karl Barth was published under the title *Natural Theology*, introduction by John Baillie (1946). A critical review of this discussion is given by Baillie in *Our Knowledge of God* (1939).

BRUNNER, HEINRICH (1840–1911). German legal historian whose work laid the foundations of the systematic study of early Germanic law and institutions. was born in Wels, Upper Austria, June 21, 1840. He studied at Vienna and became, successively, professor at Lemberg (Lviv), Prague, Strasbourg and Berlin, where he remained from 1874 until his death. His study of the laws and institutions of the Franks and early Germanic peoples, begun in 1872, was of great value in illuminating and classifying the groundwork of German law and formed the basis for his position as an authority on the administrative law of his time. His *Deutsche Rechtsgeschichte* (1887–92) and *Grundzüge der deutschen Rechtsgeschichte* (1901) became classics for their blend of the enthusiasm of the 19th-century historian with a lawyer's precision. He died at Bad Kissingen, Aug. 11, 1911.

BRÜNNOW, FRANZ FRIEDRICH ERNST (1821–1891), German astronomer, is best known for his *Lehrbuch der sphärischen Astronomie* (1851), which was translated into several languages and, in several editions, extensively used well into the 20th century. He was born in Berlin on Nov. 18, 1821, and after graduating as Ph.D. at Berlin in 1843 he spent four years with J. F. Encke at the Berlin observatory, working in the field of gravitational astronomy. He was appointed director of the Bilk observatory, near Düsseldorf, in 1847, first assistant at the Berlin observatory in 1851 and the director of the new observatory of the University of Michigan, Ann Arbor, in 1854. His journal, *Astronomical Notes*, was started at Ann Arbor. In 1860 he went, as associate director, to the Dudley observatory, Albany, N.Y., but returned to Michigan in 1861 and to Berlin in 1863. In 1861 he was appointed astronomer royal for Ireland and Andrews professor of astronomy in the University of Dublin. For his memoir on De Vico's comet (1849) he was awarded the gold medal of the Amsterdam academy. Brünnow retired to Basel, Switz., in 1873 and died at Heidelberg on Aug. 20, 1891. (O. J. E.)

BRUNO (BRUN), **SAINT** (925–965), archbishop of Cologne, youngest son of King Henry I the Fowler, of Germany, and St. Matilda, and brother of the emperor Otto I the Great, was educated at the cathedral school of Utrecht and the court school of Otto I, then a fresh centre of studious activity. Proficient in Latin and Greek and an influential teacher, he remained always a sincere patron of learning. As chancellor from 940, he prepared his brother's official papers, and after ordination to the priesthood accompanied Otto to Italy in 951. Already abbot of Lorsch and Corvei, where he restored monastic observance, he was elected to the see of Cologne in 953 and soon after named duke of Lorraine. As bishop, Bruno was a zealous and exemplary pastor and founder of many institutions, the monastery of St. Pantaleon among them, and his episcopate marked a new epoch in the city's growth. In the troubled duchy of Lorraine, by his prudent and statesmanlike policies, he restored peace and devised a new administrative division, maintaining at the same time cordial relations with France. During Otto's absence in Italy for his imperial coronation (962), Bruno shared the responsibilities of government and

care of the emperor's son, Otto II. On a mission to France he died at Reims (Oct. 11, 965) and in accord with his wish was buried at St. Pantaleon. His feast day is Oct. 11.

BRUNO, SAINT, OF COLOGNE (c. 1030–1101), founder of the Carthusians, noted for his learning and for his sanctity. He was born in Cologne and was educated there and afterward at Reims and Tours, where he studied under Berengar (q.v.). He was ordained at Cologne, and in 1057 was recalled to Reims to become head of the cathedral school and overseer of the schools of the diocese. Among his pupils was Eudes de Châtillon, later Pope Urban II. He was made also canon and diocesan chancellor. Having protested against the misdoings of a new archbishop, he was deprived of all his offices and had to fly for safety (1076). On the deposition of the archbishop in 1080, Bruno was presented by the ecclesiastical authorities to the pope for the see, but he refused as he was already determined to forsake the world. With six companions he retired to the mountains near Grenoble, and there founded the Carthusian order (see CHARTREUSE, LA GRANDE) in 1084. After six years Urban II called him to Rome and offered him the archbishopric of Reggio; but Bruno refused it, withdrawing to a desert in Calabria, where he established two other monasteries. He died in 1101. He did not himself write a rule for the order, but the customs he established as modifying the Benedictine Rule became the basis for the new foundations. Bruno was never formally canonized, but Oct. 6 has been observed as his feast day since 1623. See also CARTHUSIANS.

For critical bibliography see H. Thurston and D. Attwater (eds.), *Butler's Lives of the Saints*, vol. iv, p. 40 ff. (1956). (Fs. P. C.)

BRUNO (BRUN, BRUNS), SAINT, OF QUERFURT (c. 974–1009), German missionary bishop and martyr, belonged to the family of the counts of Querfurt in Saxony. He was educated at the cathedral school at Magdeburg, and at the age of 20 was attached to the clerical household of the emperor Otto III. In 997 he accompanied the emperor to Rome and there came under the influence of St. Romuald. When the news reached Rome of the martyrdom of Adalbert, bishop of Prague (997), Bruno entered the monastery of St. Alexius, taking the name of Bonifacius. In 1004, after being appointed by the pope archbishop of the eastern heathen, he set out for Germany to seek aid of the emperor Henry II. The emperor, however, being at war with Boleslaw I of Poland, opposed his enterprise. Bruno went to the court of St. Stephen of Hungary; and, finding but slight encouragement there, to that of the grand prince Vladimir at Kiev. He was so successful in converting the pagan Pechenegs who inhabited the country between the Don and the Danube that they made peace with the grand prince and were for a while nominally Christians. In 1008 Bruno went again to the court of Boleslaw, and, after a vain effort to persuade the emperor to end the war between Germans and Poles, determined at all hazards to proceed with his mission to the Prussians. With 18 companions he set out; but on the borders of the Russian (Lithuanian) country he and his company were massacred by the heathens, on March 14, 1009. His feast day is June 19.

During his stay in Hungary (1004) Bruno wrote a life of St. Adalbert, the best of the three extant biographies of the saint; it is given in G. H. Pertz, *Monumenta Germaniae Historica Scriptores*, vol. iv.

See H. Thurston and D. Attwater (eds.), *Butler's Lives of the Saints*, vol. ii, p. 585 (1956). (Fs. P. C.)

BRUNO, GIORDANO (baptized Filippo) (1548–1600), Italian philosopher and representative of late Renaissance thought, was born in Nola. In 1562 he went to Naples, where he attended the courses of G. V. de Colle ("il Sarnese"), known for his Averroist tendencies, and studied logic under an Augustinian friar. To continue his studies, he entered the Neapolitan convent of San Domenico Maggiore in 1565. On becoming a Dominican friar, he assumed the name of Giordano. While in the convent he began to develop theological doubts and to profess the necessity of Christian liberty, which led him into trouble with the monastic authori-

ties. After taking holy orders he was suspected of heresy and fled to Rome in 1576. In Rome he was involved in a murder case and had to flee again: he first went to Liguria (April 1576) and then to Venice. After further wanderings in northern Italy, he crossed the Alps in 1578 and went to Geneva. There he abandoned the Dominican habit and earned his living by proofreading. In 1579 he adhered to Calvinism; but after publishing a broadsheet against the Calvinist professor Antoine de la Faye he was imprisoned. On his retracting, he was allowed to leave Geneva and went to Lyons and thence to Toulouse, where he was granted the degree of master of arts and obtained a lectureship in philosophy. In the summer of 1581 he moved to Paris, where he enjoyed the protection of Henry III, who appointed him one of his *lecteurs*. In 1582 he published in Paris the comedy *Il Candelajo* and a group of mnemotechnic works (*De umbris idearum*, *Cuntus circueae*, *De compendiosa architectura et complemento artis Lullii*), which show the influence of Raimon Lull and of Nicolaus Cusanus. In the spring of 1583 he disputed at Oxford against John Underhill in the presence of Albert Łaski and delivered some lectures on the immortality of the soul and on the quintuple sphere, which had an extremely hostile reception. Thereupon he left for London, where he stayed with the French ambassador Michel de Castelnau and became associated with Robert Dudley's circle. In London he published the *Ars reminiscendi* (1583) and, between 1584 and 1585, the following Italian works in dialogue form: *La Cena de le Ceneri*, in which, after a qualified acceptance of Copernicus' solar system, he postulates the infinity of the universe as composed of an infinity of worlds and criticizes Oxonian pedantry and English society; *De la causa, principio et uno*, in which he tries to demonstrate the basic unity of all substances as well as of form and matter and the coincidence of contraries; *De l'infinito, universo et mondi*, in which he uses pre-Socratic teachings in an attack against Aristotle and introduces for the first time the notion of minimum; *Spaccio de la bestia trionfante* (dedicated to Sir Philip Sidney) and *Cabala del cavallo Pegneseo*, which express his ideal for an ethical and social reform in accordance with his anti-ascetic and anti-Christian tendencies; and *De gl'heroici furori* (also dedicated to Sidney), in which he seeks for a harmony between the human soul and nature.

Back in Paris in Oct. 1585, he published the *Figuratio Aristotelici physici auditus* (1586) and Latin accounts of Fabricio Mordeute's geometrical studies. Because of an attack on Aristotle at the College de Cambrai, Bruno had to leave France in June 1586. He went first to Marburg and then to Wittenberg, Ger., where he was allowed to teach and where he published a number of Latin works inspired by Lull. When the Calvinist party prevailed in Wittenberg, he had to flee once more (March 1588) and went to Prague, Czech., and to Helmstedt, Ger., where he stayed until his excommunication by the local Protestant church: Among the works composed in this period are three Latin poems: *De minimo*, in which Bruno holds that it is impossible to confine the infinite fluidity of nature within the limits of quantitative systems; *De immenso*, which is based on a theory of cosmic monism and in which he attacks mathematical astronomy; and *De monade*, which shows the same anti-metaphysical approach. In order to publish these poems he went to Frankfurt (June 1590), where he stayed, except for a short absence, until Aug. 1591. Then he accepted an invitation to Venice by the Venetian nobleman Giovanni Mocenigo, who later denounced him to the Inquisition. Arrested, he was transferred to Rome in 1593 and remained in prison for seven years. After a long trial for heresy, he was burned at the stake, in the Campo de' Fiori, on Feb. 17, 1600.

BIBLIOGRAPHY.—The chief editions of Bruno's works are: *Opera latine conscripta*, ed. by F. Fiorentino and others (1879–91); *Il Candelajo*, ed. by V. Spampinato, 2nd ed. (1923); *Dialoghi metafisici* and *Dialoghi morali*, ed. by G. Gentile, 2nd ed. (1925–27); *Due dialoghi sconosciuti*, ed. by G. Aquilecchia (1957). Mercati, *Il Sommario del processo di Giordano Bruno* (1940); G. Gentile, *Il Pensiero italiano del Rinascimento* (1910); A. Corsano, *Il Pensiero di G. Bruno* (1940); and F. A. Yates, articles in *Journal of the Warburg and Courtauld Institutes*, vol. ii and iii (1938–40). See also V. Salvemini, *Bibliografia bruniana* (1926). (G. A.)

BRUNSWICK, HEINRICH JULIUS, DUKE OF (1564–1613), a founder of modern German drama and a representative of early baroque culture. Born at Schloss Hessen. Wolfenbüttel. Oct. 15, 1564, he became rector of Helmstedt university (1576) and, though a Protestant, bishop of the Catholic see of Halberstadt (1578). Dorothea of Saxony, whom he married in 1585, died in 1587, and he then married Elizabeth of Denmark (1590). Heinrich Julius succeeded his father in 1589. By 1607 his earlier interest in his duchy had waned and he moved to Prague, becoming an adviser to the emperor Rudolf II. He died there, July 20, 1613.

Autocratic by conviction and a persecutor of Jews and witches, Heinrich Julius was a gifted scholar, theologian and jurist, a keen student of science and a generous patron of the arts. Of his own plays 11 have survived (10 were printed in 1593–94). Nearly all were written for English actors (notably Thomas Sackville) who visited Wolfenbüttel from 1592 onward. Typical pieces (*Von einem Buler und Bulerin*, *Von einer Ehebrecherin*, *Von einem Wirthe*) treat middle-class topics realistically and often humorously; some features, e.g., the fool, are much influenced by English tradition. *Von einem ungeratenen Sohn*, a crude, pretentious horror-play on a desperate villain's fate, foreshadows certain features of baroque tragedy, while *Vincentius Ladislaus*, portraying a braggart's downfall, is a successful early baroque comedy.

BIBLIOGRAPHY.—All the plays are reprinted in *Die Schauspiele des Herzogs Heinrich Julius von Braunschweig*, ed. by W. L. Holland (1855). J. Tittmann's selection (1880) has the same title. *Vincentius Ladislaus* is in Kürschner's *Deutsche Nationalliteratur*, vol. 22. A. H. J. Knight, *Heinrich Julius, Duke of Brunswick* (1948) is a general study, with special emphasis on the plays. (J. R. WE.)

BRUNSWICK (BRAUNSCHWEIG), a German duchy from medieval times to 1918, then one of the German *Länder* until 1946, when its territory was merged with other states to form the Land of Lower Saxony in the Federal Republic of Germany.

Originating in the dominions of the house of Welf, the duchy and Land comprised three larger and six smaller parts. The principal or northern part, containing the towns of Brunswick, Wolfenbüttel and Helmstedt (*q.v.*) with an extension northward from Helmstedt to Parsau, is mostly arable land and has little forest. South of this the two other major parts, separated from one another by the Harz mountains, were: (1) the western, namely Holzminden (until 1941), Gandersheim and (from 1941) Goslar; and (2) the eastern, namely Blankenburg (the greater part of Blankenburg, however, went to the Soviet zone of Germany after World War II). Of the six smaller parts, Calverde, enclaved with the former Prussian Saxony, also went to the Soviet zone in 1945. Brunswick also included Harzburg in the Harz mountains east of Goslar; Bodenburg, enclaved in Hanover north of Gandersheim; Oelsburg and Ostharingen, both enclaved in Hanover to the west of Brunswick; and Thedinghausen, far to the northwest, near Bremen.

HISTORY

Brunswick-Lüneburg to 1635.—When in 1180 Henry the Lion (*q.v.*), duke of Saxony and Bavaria and ancestor of all the later branches of the house of Welf, was defeated in his conflict with the emperor Frederick I Barbarossa, his two duchies were confiscated. Nevertheless, in 1181 he received back his allodial lands, which were chiefly in eastern Lower Saxony, between the Elbe and the Weser rivers, as well as in the Harz district. From these territories the emperor Frederick II constituted the duchy of Brunswick-Lüneburg (Aug. 1235) for Otto the Child, Henry's grandson. The descendants of Otto have since borne the title of duke of Brunswick and Lüneburg. For a long time the two cities which gave the duchy its name remained in the common possession of the house of Welf (Lüneburg until 1512, Brunswick until 1671), but from 1267 the other territories underwent a series of partitions among the branches of the family, which at times were as many as six in number. As a result of the partition of 1267 the large and compact territory of Lüneburg was established in the north, and this underwent no further divisions until the 16th century. The southern Welf lands, however, were ruled by the Brunswick line, which in the 13th century split up into the

branches of Wolfenbüttel, Grubenhagen and Göttingen.

Constitutionally, however, the unity of the house was not affected by these divisions. There was only one duchy of Brunswick-Lüneburg as the general fief of the house of Welf. The territories resulting from the partitions should more properly be designated as principalities (*Fürstentümer*) than as duchies, and all the rulers used the same ducal title and the same armorial bearings.

The possessions of the Welfs, considerably increased by inheritance during the 14th and 15th centuries, were, at the beginning of the 16th, divided between four lines: (1) Lüneburg, whose territory had approximately the same extent as the modern administrative district; (2) Grubenhagen, holding two districts situated around Einbeck and Osterode; (3) Calenberg-Göttingen; and (4) Wolfenbüttel. All the Welf dukes eventually accepted Lutheranism, the last line to do so being that of Wolfenbüttel, which Duke Henry II (*q.v.*) had maintained as the last outpost of Catholicism in Lower Saxony until his death in 1568. By the end of the 16th century the Welf dynasty had acquired the countships of Hoya, Diepholz, Blankenburg and Hohnstein and had also secured the appointment of members of the family as administrators of the neighbouring Lutheran bishoprics of Halberstadt, Minden, Verden and Osnabrück. The Calenberg line having died out in 1584 and the Grubenhagen in 1596, both these principalities were successively united with Wolfenbüttel, which was enjoying a period of great prosperity under its princes Julius (1568–89) and Henry Julius (1589–1613). On the death of Duke Frederick Ulrich of Wolfenbüttel in 1634 the entire inheritance fell to the surviving Lüneburg line, but in 1635 the dukes of Lüneburg again divided the territory into three parts: Lüneburg, with its princes residing at Celle (Zell); Calenberg-Göttingen, with its princes from 1636 at Hanover; and Wolfenbüttel, which went to the collateral line of Dannenberg. The new Calenberg-Göttingen line, soon known as the house of Hanover, became an electorate of the Holy Roman empire in 1692 and inherited the principality of Lüneburg in 1705 and the kingdom of Great Britain in 1714. (See HANOVER).

The Duchy of Brunswick (1635–1918).—The Wolfenbüttel line, whose principality from the 18th century onward was generally designated as the duchy of Brunswick, did not rise to such power as the Hanoverian. Its possessions, moreover, were small and extremely scattered. The land, however, was prosperous being not only fertile but also sharing in the Harz silver mines, partly through a form of common ownership with Hanover, and it enjoyed good government under conscientious rulers. Augustus, duke from 1635 to 1666, founded the famous library at Wolfenbüttel (the Bibliotheca Augusta). His son Anton Ulrich, coregent with his elder brother Rudolf Augustus from 1685 and sole ruler from 1704 to 1714, likewise had a reputation as a patron of the arts, and as a writer, but exhausted himself in a fruitless struggle with the Hanoverian electorate and in short-lived alliances with France.

The elder Dannenberg male line died out in 1735 with Anton Ulrich's younger son Louis Rudolf, whose lands were then inherited by the house of Brunswick-Bevern. This house was bound to Prussia both by treaty and by family ties and provided the Prussian army with many senior officers. Among these were Duke Ferdinand (*q.v.*), famed as a commander during the Seven Years' War, and his nephew Charles William Ferdinand (*q.v.*). The latter, duke of Brunswick from 1780, commanded the Prussians at Valmy (1792) and was mortally wounded at Auerstadt (1806).

From 1807 to 1813 Brunswick belonged to Jerome Bonaparte's kingdom of Westphalia. Duke Frederick William's attempt to recover the duchy in 1809 was unsuccessful but his bold retreat from Bohemia to the North sea enabled him to bring his forces safely to England. Killed at the battle of Quatrebras (June 1815), Frederick William left the liberated and restored duchy to his son, Charles II (d. 1873), who after an unfortunate reign was driven from his land by a popular rising in 1830. Under his younger brother William, duke from 1831, Brunswick's industries rapidly developed. With William's death, in 1884, the Brunswick line of the Welfs became extinct.

As Prussia had annexed Hanover in 1866 (the Harz mining area was partitioned between Brunswick and Prussia in 1874), the duchy of Brunswick was "the last sod of Welf earth" (H. von Treitschke). It should accordingly have passed to the Welfs of the royal Hanover line, but Bismarck was able to prevent the duke of Cumberland, Ernest Augustus (*q.v.*, 1845–1923), from taking possession of it, for, like his father, the last king of Hanover, he was unwilling to renounce his rights to the kingdom. From 1879, therefore, Brunswick was ruled, in accordance with a regency law, by Prince Albert of Prussia until 1906 and by Duke John Albert of Mecklenburg from 1906 to 1913. In 1913, however, the duke of Cumberland's son Ernest Augustus (1887–1953) married Victoria Louise, daughter of the German emperor William II. Ernest Augustus was then permitted to reign over Brunswick without having to renounce Hanover. With the outbreak of revolution in Germany at the end of World War I he had to abdicate (Nov. 8, 1918).

The Land of Brunswick, 1918–1946.—Under the Weimar constitution of 1919 Brunswick was recognized as a *Land* or free state of the German *Reich*. Heavily industrialized and a stronghold of socialism, it experienced extreme political vacillations: it had a radical leftist government from 1919 to 1922, then an extreme conservative one from 1930, with Nazi participation in the government thereafter. After Hitler's seizure of power Brunswick, like the other German *Länder*, was divested of its independence as a state by the law of Jan. 30, 1934. Under the jurisdiction of the *Reichsstatthalter* for the *Gau* (district) of South Hanover-Brunswick, it nevertheless kept an administration of its own. In 1941 its territory was considerably reduced when the western *Kreis* or subdistrict of Holzminden, on the Weser, was accorded to Hanover, though it received in exchange the *Kreis* of Goslar and the new *Stadtkreis* (municipal district) of Salzgitter with the important works of Lebenstedt.

In 1945, the major part of Brunswick, then under British military government, was reconstituted as a state. In Nov. 1946, with the approval of the German authorities for the zone, the military government incorporated Brunswick into the *Land* of Lower Saxony (*q.v.*).

BRUNSWICK (Ger. BRAUNSCHWEIG), a city of Germany which before partition of the nation following World War II was capital of Braunschweig *Land* (state) and until 1918 of the former duchy of that name. After the merger of Brunswick, Oldenburg and Schaumburg-Lippe *Länder* with Hanover in 1945, Brunswick city was incorporated into the new *Land* of Lower Saxony in the Federal Republic of Germany. The city is situated in fertile country on the Oker 85 km. (53 mi.) N.W. of Magdeburg. Pop. (1959 est.) 245,170.

After very heavy damage during World War II, the city was rebuilt. The main streets, Bohlweg, Steinweg, Neue Strasse and Damm, were made broader; the old commercial streets were reconstructed; and modern blocks of flats were built in the city centre and the suburbs; but there remained two "isles of tradition," the Castle square and the Old town market with its ancient houses and churches.

The cathedral of St. Blasius (1173–94) in the Castle square (Burgplatz) is in Romanesque style. The chancel is decorated with 12th-century frescoes by Johannes Gallicus and contains the tombs of the founder, Henry the Lion, and his consort, and also that of the emperor Otto IV. In the vaulting beneath, rest the remains of the Guelphs of the Brunswick line from 1681. An ancient building on the Castle square is the guildhall (the restored Huneborstelsche Haus) with its beautiful 16th-century oak carvings. The Burg Dankwarderode with the famous Treasure of the Guelphs is a fine modern structure, erected after 1865.

On the Castle square is the Lion monument (Löwendenkmal), emblem of Brunswick, erected by Henry the Lion in 1166.

The Old town hall in the market is a gem of Gothic architecture (14th and 15th centuries) with arcades, damaged by bombs during World War II and carefully restored. St. Martin's church (1180–90) was originally a Romanesque basilica, enlarged in the 13th century in Gothic and also remarkable for the splendid late Gothic Annenkapelle (1434) and three magnificent portals. Near this church is the 13th-century cloth merchant's hall (Gewandhaus), with a richly ornamented Renaissance façade. Parts of this ancient house are occupied by the chamber of commerce.

Other churches in Brunswick are St. Katharine's church, with a fine tower. It was begun by Henry the Lion in 1172 and finished in 1500. Of the 13th, 14th and 15th centuries are St. Andreas' church and St. Aegidien's church. St. Magni's church (13th and 15th centuries) was completely destroyed in World War II. On the same site a new church has been built. New buildings of note include three skyscrapers, one in Hamburger street, the second in Oker street and the third near the technical institute. To the left of the Wolfenbiitteler street is Richmond palace, built in 1768–69 by Prince Charles William Ferdinand, eldest son of Charles I of Brunswick and Philippine Charlotte, sister of Frederick the Great of Prussia. This prince married Princess Augusta in London in 1764. She was sister of George III of England and daughter of Prince Frederick of Wales.

The town is surrounded by parks and boulevards. The largest are the Citizen's park (Bürgerpark) near the old railway station in the south of the town, Prince Albrecht's park, Buchhorst forest and Querums forest with an airport in the north.

Brunswick has many schools and technical colleges and is internationally famous for its scientific research. The Technical university founded as the Collegium Carolinum in 1745 had, in the early 1960s, more than 4,000 students. There is also a teacher-training college and institutes for physics and technology, agriculture and forestry, and aeronautical research. Works by Rembrandt, Rubens and other Dutch, French and Italian painters are to be found in the gallery of the Herzog-Anton-Ulrich museum and the municipal museum.

Brunswick is on the main line from Berlin to Hanover and the west. Other lines run to Vorsfelde, Oebisfelde, Bad Harzburg, Hildesheim and Elze. It has direct connection with the Mittelland canal, and with the Autobahn from Berlin to the Ruhr. The chief industry of Brunswick is metal. Machinery and factory equipment, trucks, buses, boats, bicycles, photographic apparatus, calculating machines, office machinery, tin plate and pianos are made. Publishing and food preserving are also carried on.

Legend says that Brunswick was founded about 861 by Bruno, son of Duke Ludolf of Saxony. Probably the town was founded much later. Fortified and improved by Henry the Lion, it became one of the most important cities of northern Germany. In the 13th century it ranked among the chief cities of the Hanseatic League. It later declined in prosperity in consequence of the division of territory, the jealousy of the neighbouring states, the Thirty Years' War and the French occupation at the beginning of the 19th century, under which it was assigned to the kingdom of Westphalia. During the Reformation the sympathies of the people were with the new doctrines, and the city was a member of the League of Schmalkalden. In 1830 it was the scene of a violent revolution, which led to the removal of the reigning Duke Charles II. In World War II Brunswick was captured by Allied forces in April 1945.

BRUNSWICK, a seaport city in Georgia, U.S., and the seat of Glynn county, is on the Atlantic coast 77 mi. S.E. of Savannah. It is a railroad terminus and one of the important sea food centres in the southeast. Ft. Frederica, on nearby St. Simons Island, was the southernmost British outpost in North America during the colonial era and the area was early caught up in the Spanish-British colonial rivalry.

The town was laid out in 1771 by the council of the royal province of Georgia and named after the seat of the reigning house of Hanover. It was settled the following year but was not incorporated until 1856. Brunswick's live oak and palm-lined streets

and parks, arranged in a symmetric pattern and bearing 18th-century English names, give the community a graceful appearance. Glynn academy, chartered in 1778, is one of the oldest public schools in the state.

Near Brunswick are three of the most important all-year resort islands on the Atlantic coast: St. Simons, Sea Island and Jekyll, the latter being state-owned. In the early 1960s the area could accommodate approximately 3,000 visitors in its hotels, motor courts and numerous guest homes.

Other than livestock growing, little agriculture existed but lands were profitably devoted to forestry products, the processing of which was the leading industry. The freezing and packaging of sea foods ranked second.

For comparative population figures see table in *GEORGIA: Population*.

(Js. C. B.)

BRUNSWICK, a town of Cumberland county, Me., U.S., 27 mi. N.E. of Portland, on the Androscoggin river. Its location in an attractive recreational area brings many visitors and summer residents. Among the inhabitants are many French Canadian immigrants and their descendants.

First known as Pejepscot, the town was settled in 1628, but Indian hostility retarded its early development. Significant growth commenced with Brunswick's incorporation as a township in 1717. Control of town affairs by town meetings open to all registered voters continued into the second half of the 20th century in spite of repeated efforts to win local support for a city charter. The falls of the Androscoggin river furnished power for the manufacture of paper, textiles and other products but the closing of the Verney mill in 1955 appeared to have ended the textile era. The Brunswick naval air station, established in World War II, was reactivated in 1951.

Brunswick is the home of Bowdoin college, a widely known liberal arts college for men, with an enrollment of approximately 800 students. Founded in 1794 by act of the Massachusetts general court: the college was named for Gov. James Bowdoin (*q.v.*). Among its graduates have been many men of prominence in American letters and public life, including Henry Wadsworth Longfellow, Nathaniel Hawthorne, Franklin Pierce, Melville W. Fuller, Oliver Otis Howard, Thomas Brackett Reed and Robert Edwin Peary.

For comparative population figures see table in *MAINE: Population*.

(Wm. B. W.)

BRUNSWICK BLACK, a form of quick-drying black varnish used for metal, particularly iron, surfaces of indoor equipment, stoves, fenders and the like. Because of its bitumen content the preservative properties are high and, in the better qualities, the finish is attractive and reasonably durable.

The process of manufacture is simple, consisting essentially of dissolving premelted bitumen or natural asphaltum in a solvent of suitable boiling point—white spirit or turpentine—the bitumen being thinned down until the desired consistency for application is achieved. If common rosin (colophony) is included the lustre of the black finish is improved, but the amount used must be carefully controlled or the quality of the residual film will suffer, either cracking on aging or softening with heat.

More satisfactory and tougher films result if boiled linseed oil is added with the bitumen. The proportions of the individual ingredients vary considerably, but the following formulas may be taken as representative: (1) dark rosin 50 lb., asphalt 112 lb., white spirit 22 gal.; (2) gilsonite 112 lb., boiled linseed oil 2 gal., white spirit 2 j gal. More elaborate formulation may be needed for finishes intended for exterior protection, but the basic ingredient is retained and blends of blown and unblown bitumen have been successfully employed.

(E. G. Es.)

BRUNTON, SIR THOMAS LAUDER, 1ST BART. (1844–1916), Scottish physician, a specialist in problems of circulation, was born at Hiltonshill, Roxburghshire, on March 14, 1844. He was educated at Edinburgh university, and after three years of medical work in continental cities was appointed in 1870 as lecturer in materia medica and pharmacology at Middlesex hospital, London.

In 1871 Brunton went in the same capacity to St. Bartholomew's hospital where, three years later, he became assistant physician

and in 1895 physician, a post which he resigned in 1904. He was knighted in 1900 and in 1908 was created a baronet. He died Sept. 16, 1916.

Brunton's papers on his early work on the use of digitalis, nitrates, enzymes, etc., were included in *Collected Papers on Circulation and Respiration* (1906).

BRUSASORCI: see RICCIO, DOMENICO.

BRUSH, GEORGE DE FOREST (1855–1941), U.S. painter, whose penetrating representations of family groups were suggestive of the work of the Dutch, German and Flemish masters, was born at Shelbyville, Tenn., on Sept. 28, 1855. He was a pupil of J. L. Gérôme at Paris, and became a member of the National Academy of Design, New York, and of the American Academy of Arts and Letters. From 1883 onward he attracted much attention by his paintings of North American Indians, his "Moose Hunt," "Aztec King" and "Mourning Her Brave," achieving great popularity and showing the strong influence of Gérôme. These were followed by picture portraits, particularly of mother and child, carefully arranged as to line and mass, and worked out in great detail with consummate technical skill. Several of his paintings had for subject his own children and his wife; one of these is in the Boston Museum of Fine Arts. His "In a Garden" is in the Metropolitan Museum of Art, New York city; "Mothers and Children," in the Pennsylvania academy, Philadelphia; and "Mother and Child," in the Corcoran Gallery of Art, Washington, D.C. He received gold medals from the Pennsylvania Academy of Fine Arts, 1897, and Paris exposition, 1900. He died in Hanover, N.H., on April 24, 1941.

BRUSH, a tool composed of animal, vegetable or man-made fibres twisted, bound, cemented or punched into a back or handle, the material used and the design of the implement being dictated by its intended use, whether for cleaning, polishing or painting.

The history of the brush, at least in its function of applying pigment, is of a hoary antiquity, as evidenced by the magnificent cave paintings of Altamira in Spain and the Périgord in France. These monumental art works demonstrate that the Paleolithic European knew how to manage his brush and palette with consummate skill. Within historical times, through the successive periods of his history, from the tomb paintings of ancient Egypt and the inception of the characteristic writing of the Chinese to the present, man has applied animal hairs and vegetable fibres in contriving tools for the expression of his pictorial and literary art.

Bristle.—Of the many types of animal hair used for centuries in brush manufacture none is more important than the bristle of the wild or semiwild boar or hog. One species of the animal is found in Germany, Poland, the U.S.S.R. and China, while three other distinct species are native to India, Tibet and Japan respectively. All are important sources of supply, with China and the U.S.S.R. leading in both the quantity and quality of the bristle obtained.

The individual bristle has a broad, sturdy base and a tapered tip split into several fine filaments, commonly termed a "flagged" tip. Flexible and resilient, with an excellent paint holding capacity, bristle is particularly well suited to use as paintbrush stock.

The hair on the neck of the animal is considered to be of finer quality than that on its sides. Several methods of removing bristle from the hide have been developed. Soaking the skin in a calcium sulfide or sodium sulfide bath serves to loosen the bristle so that it is easily detached. Bristle held in a coating of resin applied immediately after the death of the animal can be torn out after the resin has hardened. The bristle is then freed by melting down the resin. Also used are mechanical methods that employ the principle of toothed rollers revolving in opposite directions at different speeds. The skin is introduced between the rollers from a moving belt and the upper and faster roller tears loose the bristle that remains on top of the skin, from which it is readily removed. The finer neck hairs are generally removed by hand. The dressing of bristle involves washing and disinfecting, followed by a sorting of the hairs according to length and colour. They are then straightened out, tied to a short wooden rod and further cleansed and sterilized by boiling or steaming. (See BRISTLE.)

Other Animal Hairs.—Many other types of animal hair are employed in brush manufacture. Horsehair is widely used. The mane hairs, softer than those of the tail, make excellent polishing brushes. Other animal hairs utilized in brushmaking are ox ear, obtained from the tufts of silken hair found in the ears of cattle, goat, weasel, kolinsky (Asiatic weasel), squirrel (camel's-hair), civet (spotted American skunk), fitch (European weasel, or polecat) and badger. Badger hair has had a wide application as material for shaving brushes.

Man-Made Fibres.—Periods of scarcity and costliness of natural bristle prompted intensive research in the field of synthetics. A previously acquired knowledge of nature's method of building protein-type animal fibre (keratin) and vegetable fibre (cellulose) by linking up simple molecules, such as amino acids, in a molecular chain construction pointed the way to the chemical combining of molecules in similar chains. In this way, after much experimentation, nylon filaments were successfully produced.

Manufacturing methods were devised for making both tapered and untapered nylon brush fibres. The former compare favourably with hog bristle in the manufacture of paintbrushes and the latter are profitably utilized in making household and toilet brushes, particularly toothbrushes.

The chemical compound is extruded in a broad band and then reduced to flake form and melted in a spinning container. The molten substance is forced through the fine holes of a spinning jet and hardens into filaments upon contact with the atmosphere. These filaments pass under rollers in a cold water bath and emerge to be taken up through gripper-type rollers and wound on a reel. To align the molecular chains in proper formation, the filaments are drawn or stretched by running them through two sets of four rollers each, the second set revolving at a speed about four times that of the first. The drawn filaments are taken up on a collecting reel and relieved of strain by being relaxed in warm water. The completely processed filaments are then cut into lengths suitable for brush use. Tapered fibres are made by varying the speed of the gripper rollers during the manufacturing process, producing alternate thick and thin portions in the filament, a formation undisturbed by the drawing process, except that the degree of taper is controlled by the rate of speed of the stretching rollers. Cutting the filaments at the proper points results in fibres with broad bases and tapered tips similar in form to natural bristle. Splitting or "flagging" the tips of the fibres brings about an even closer approximation.

In addition to nylon, brush fibres are made of vinyl, polyethylene and polystyrene. Useful vinyl fibres are produced by cutting thin sheets of the material into fine strips. Rather short, stumplike polyethylene formations are satisfactorily employed in making massage brushes. Polystyrene fibres, which are readily chargeable with static electricity, possess the interesting and useful property of attracting dust. Two substances of animal origin, casein, derived from skim milk, and the protein constituent of animal skins, are utilized in the production of other man-made brush fibres.

Plant Fibres.—Plant cellulose can be converted into brush material by a process of dissolution and re-creation. An example is the dissolving of cotton fibres by treatment with acetic acid followed by diffusion of the acetylated product in acetone. Allowed to stand until sufficiently viscous, the solution can be spun and projected through the tiny orifices of a spinnerette. Emerging in a cylinder through which warm air circulates, the filaments solidify by evaporation of the acetone.

Many natural vegetable fibres have long been used in the manufacture of various types of brushes. Among these is Bahia bass, or piassava, a tough brown fibre obtained from a Brazilian pinnate-leaved palm. The young leaves are steeped in water, beaten into separate fibres, sun-dried and hackled. Palmyra bassine is obtained from the large leaves of the palmyra palm found in Africa, Ceylon and on the eastern coast of India. The central rib of the leaf stalk, when split lengthwise, furnishes material for very large revolving brushes, while shorter and softer fibres are obtained from the remainder of the leaf stalk. Kittul is a pliant, resilient fibre derived from the leaves of a palm tree native to India, Ceylon, Burma, Malaya and Thailand. In thickness, kittul ranges from

almost hairlike fineness to a diameter of about $\frac{1}{8}$ inch. Other vegetable materials used are Para or monkey bass; Sulima, Calabar, Cape Mount, Cape Palmas and Monrovia bass, all products of the African continent; gumati fibre from the sugar palm of southeast Asia, and fibres from the agave and yucca plants of Mexico.

Methods of Manufacture.—Brush fibres are united to handles or backs of wood, plastic or metal in several different ways. The amount of bristle used for any single paintbrush or varnish brush is determined by weight. The material is divided into two equal portions and rolled until the flagged tips point upward. The two portions are then placed one over the other so that the flags form a turned inward. The bristle assumes the desired brush form in a metal cup whose interior is a pattern of the finished brush. The butt ends that protrude above the cup are leveled off by trimming, and the bristle is held in formation by a thread binding at the top. The material is transferred to a metal ferrule into which a pitch or cement "setting" is poured. When the setting has dried to hardness, the brush handle is securely fastened to the ferrule. A gum rubber solution may be used also to set paintbrushes.

Art brushes also, for the most part, are cupped and set. Some very fine brushes are shaped entirely by hand. Artists' brushes set in quills are still made in some parts of Europe, particularly in France, where quills are plentiful.

Many types of household and toilet brushes are made by inserting tufts of fibre into holes drilled in brush backs. Formerly such brushes were hand-set or hand-drawn. Set brushes were made by dipping knotted tufts in boiling pitch, binding them with thread, dipping them again in pitch and then punching or pegging them into the drilled holes. Hand-drawn brushes were made by drawing the tufts into the holes from the back of the brush by wire. The brush was finished by bonding a veneer to its back. By another method, called trepanning, the tufts were taken up into the holes, which were drilled only to a certain depth, by loops in a thread running through a perforation extending the length at the back and into which the small holes opened. Except for brushes with backs and handles of such luxury materials as tortoise shell and ivory, the earlier handmaking of brushes has yielded to mechanical methods of production. Economical quantity production of brushes has been made possible by automatic drilling and tufting machines. Knots of fibre can be punched in and securely stapled in a single operation.

Twisted-in-wire brushes are made by inserting the fibrous material between two wires that are twisted together spirally by machine. Some brushes of this type have a looped wire handle, but others are finished by inserting the twisted wire ends in wood or plastic handles. For some purposes, the wires are bent in a loop, making a brush of substantial face.

Useful in many areas, particularly in industry, are brushes made by clamping wire-secured brush filler in a fold-over metal channel. Such brushes are made in continuous strips by automatic machinery that forms the channel from metal strips, feeds the brush filler uniformly under a wire, clamps the channel over wire and filler in a secure grip, trims the fibre and cuts the clamped brush strips into desired lengths. The brush strips may be wound spirally for use as rotary brushes. Steel-gripped brushes can be produced in any required length or diameter.

Brooms.—Closely associated with brushes is the familiar broom, a stiff-fibre cleaning tool, generally applied in the large, vigorous motions of sweeping, or in rather coarse brushing operations. The broom had its origin in the primitive besom composed of twigs bound to a wooden stick.

Both vegetable and man-made fibres, such as polystyrene, are employed in broom manufacture. Of the plant fibres, broomcorn and bassine are the most widely used. Bassine is the processed fibre of the palmyra palm. Broomcorn is a sorghum having a jointed stem terminating in a stiff spike, the stems of which support oblong florets. The plant has been cultivated for centuries in Europe and is said to have been introduced in America by Benjamin Franklin. Two varieties of broomcorn are grown, the standard ranging from 10 to 15 ft. in height with a brush or spike 18 to 24 in. in length, and the dwarf or whisk, 3 to 6 ft. in height

with a spike 10 to 18 in. long. The fibres from which brooms are made are obtained from the terminal spikes of the plant. Before being used they are scraped or seeded and aged in well-ventilated sheds.

Broommaking was once largely a home industry. The stalks were soaked in water to render them pliable, drained and arranged in a regular order with the best on the outside. They were bound together at the top with cord, after which a twine wrapping was applied covering a two-inch space. The broom was then clamped between two boards to hold it in a flattened formation. Twine was wound once or twice around the broom three or four inches below the two-inch wrapping and tied, a length of twine being left free for sewing. A wooden or iron needle from six to eight inches long was used to sew back and forth through the stalks, the sewing process being repeated two or three times. The pointed end of a handle was driven into the neck of the broom and secured with nails.

With the introduction of broommaking machines, at first of a simple order, factory production of brooms began. The fibres were fed under a wire supplied from a reel and attached to the broom handle, which was held in a revolving barrel by a set screw. After the material was securely wire-bound to the handle the broom was flattened in clamps and sewed. Improvements in mechanical methods culminated in automatic machinery. A sizing machine sorts the stalks according to size and cuts them to precise lengths. An exact quantity of the material is taken up and rapidly bound to the handle on a winding machine, from which the broom passes to an automatic stitcher. Such machines can produce upward of a thousand brooms a day.

See also references under "Brush" in the Index volume.

(E. L. Y.)

BRUSILOV, ALEKSEI ALEKSEEVICH (1853–1926), Russian general who played a distinguished part in World War I, was born on Aug. 19, 1853. Educated in the imperial corps of pages, he began his military career as a cavalry officer in the Caucasus. In the Russo-Turkish War of 1877–78 he distinguished himself by his bold and original tactics. On the outbreak of World War I he received command of the Russian 8th army and played a brilliant part in the campaign in Galicia. Then, in the spring of 1916, he succeeded the elderly and irresolute general N. Y. Ivanov as commander in chief of the 7th, 8th, 9th and 11th Russian armies, standing then between the Pripet and Prut rivers, south of the Pripet marshes. In the following summer he launched a massive offensive against the Austro-Hungarian forces. Though they suffered heavy losses mainly through shortage of artillery supplies, Brusilov's armies had by Aug. 1916 captured the whole original army lines and overrun much of eastern Galicia and all Bukovina, taking 375,000 prisoners. This effort, known as "the Brusilov break-through," served also to relieve pressure on Russia's allies on the Italian and western fronts.

During the Feb.–March Revolution of 1917, Brusilov and other generals urged the tsar Nicholas II to abdicate in favour of his son. After the Bolshevik Revolution, he remained in the service of the new regime and on May 2, 1920, during the war with Poland, was appointed chairman of the special commission commanding all Russian armed forces. Later he became inspector of cavalry in the Red army, retiring in 1924. He wrote *A Soldier's Note-Book 1914–1918* (Eng. trans. 1930). Brusilov died in Moscow on March 17, 1926.

(I. Gy.)

BRUSSELS (French BRUXELLES, Flemish BRUSSEL), the capital and largest city of Belgium and chief town of the province of Brabant, lies in the valley of the Senne (Flemish Zenne), a small tributary of the Scheldt. Pop. (1955 est.) city or commune 175,301; greater Brussels (including the 18 suburban communes) 981,636.

The earliest inhabited site in the area is thought to have been what is now the southwestern suburb of Anderlecht, a natural clearing in the primitive forest, where foundations of a Roman villa and Frankish cemeteries have been discovered. Only some traces of the Neolithic period have been found in the city.

The 14th-century walls surrounding the city proper were removed between 1812 and 1840 and replaced by broad outer boule-

wards (du Midi, de l'Abattoir, Barthélemy, de Nieuport, d'Anvers, du Jardin-Botanique, Bisschoffsheim, du Régent, du 9^{me} de Ligne and de Waterloo). In 1868–71 the Senne river was covered over and now carries the central boulevard, called successively, from southwest to northeast, Maurice-Lemonnier, Anspach and Adolphe-Max. This boulevard links the two railway stations, the Gare du Midi and the Gare du Nord. The Place de Brouckère, at the junction of the boulevards Anspach and Adolphe-Max, is the central point of modern Brussels.

The lower town is the commercial quarter. It extends from the western outer boulevards to a little east of the central boulevard and includes (southeast of the Place de la Bourse in the Boulevard Anspach) the historic Grand-Place, the heart of the old town. There the Gothic town hall (1402–54) occupies the greater part of the south side of the square and contains pictures, tapestries, etc. of various periods. Its fine tower, 330 ft. high, is crowned by a 16-ft gilded copper statue of St. Michael. Opposite the town hall is the smaller but extremely ornate Maison du Roi, which was almost entirely rebuilt during 1873–95 and contains the Historical museum. Nearby is a long arcade, called the Galeries St. Hubert, with shops, two theatres and cafés. One of the curiosities of the lower town is the Manneken-Pis fountain, noted for a bronze statue of a boy urinating whom the people of Brussels call their oldest "citizen." The statue, based on a model by the Brussels sculptor François Duquesnoy, was erected in 1619.

The upper town is the remaining eastern area of the city proper. It is also crossed from southwest to northeast by a thoroughfare formed by the Rue de la Régence which, at the Place Royale, becomes the Rue Royale. The upper town contains the church of St. Michael and Ste. Gudule, built on an earlier foundation on the side of a hill. Begun about 1220, it is considered to be one of the finest specimens of pointed Gothic and the stained glass of the 13th–15th centuries is very rich. The principal 18th- and 19th-century buildings in the Rue Royale are the Palais du Roi and the Palais de la Nation, erected by the Austrian governors. The last-named palace (1779–83) is shared by the senate and the chamber of representatives. It stands at the intersection

BY COURTESY OF SABENA BELGIAN WORLD AIRLINES

TOWN HALL IN THE GRAND-PLACE, BRUSSELS; 1402–54

of the Rue Royale and the Rue de la Loi, the Whitehall of Brussels. Along the Rue Royale, between the two palaces, lies the large public park. On the opposite side of the Place Royale from the Palais du Roi is the Royal library containing the famous collection of illuminated manuscripts known as the Bibliothèque des ducs de Bourgogne originally owned by Philip the Good. The Museum of Modern Painting and the Royal Museums of Ancient Painting and of Sculpture are close by. The latter contains many Flemish and other masterpieces, among them works by Rogier van der Weyden, Quentin Massys, Hugo van der Goes, P. Christus, Gerard David, Hans Memling, D. and A. Bouts, Pieter Brueghel, Hieronymus Bosch and Peter Paul Rubens. The Rue de la Loi is one of the most important thoroughfares running eastward toward the monumental Palais du Cinquantenaire (1905) with its park, and continued by the Avenue de Tervueren. The Palais du Cinquantenaire houses the Musées Royaux d'Art et d'Histoire with its splendid collection ranging from prehistoric objects to fine tapestries, lace and examples of other crafts. In the southern part of the upper town stands the huge Palais de Justice (1866-83) in the heavy style of Karnak and Nineveh, but surmounted by a dome. It suffered some war damage in 1944 but was restored.

The improvements effected in Brussels during the 19th century transformed the city, among them the Théâtre Royal de la Monnaie (1817), the Bourse (stock exchange) and the central post office. The column of the congress (*i.e.*, of the Belgian representatives who founded the kingdom of Belgium), surmounted by a statue of King Leopold I, was erected in the Rue Royale in 1859. After World War I the body of a Belgian Unknown Soldier was placed in a crypt in the base of the column.

In the early years of the 20th century new and spacious avenues were driven into the suburban communes in many directions. One of the most fashionable is the Avenue Louise, starting from Porte Louise (near the Palais de Justice) and running southeast toward the Bois de la Cambre. After World War II great public works were undertaken in order to link the two main railway stations, the Gare du Nord and the Gare du Midi. This junction railway, partly underground, was opened on Oct. 4, 1952. In addition, the southern outer boulevards were widened, and in the 1950s four tunnels and an overhead road were built to ease the traffic.

In 1788 the faculties of law, medicine and philosophy were removed from Louvain to Brussels and in 1834 the Free University of Brussels was constituted with the addition of a faculty of natural science.

Brussels is linked by rail with many of the important cities of north-eastern Europe. From the airport at Melsbroek, 7.5 mi N.E. of the city centre, there are regular international air services. In addition, there are regular helicopter services to several large cities including Paris. Brussels also has a port, lying to the north of the outer boulevards, comprising two docks (21 ft and 11 ft. in depth), a works quay and an outer harbour (21 ft.). After 1922 these were linked to the north by a canal with the Rupel and the Scheldt, taking seagoing vessels up to 49-ft. beam and 19-ft. draft. Southward, Brussels is linked by another canal to the industrial town of Charleroi (*q.v.*). Although mainly the seat of the government and a residential centre, Brussels has numerous light industries among which the chief are the manufacture of laces, carpets, furniture, beer, cigars and cigarettes.

Greater Brussels. — The area of the city proper was increased in 1921 to 12 7 sq.mi. by including the communes of Laeken, containing a residence of the royal family, Haeren and Neder-Over-Heembeek, with parts of Molenbeek and Schaerbeek. Toward the end of the 18th century the city proper, or commune of Brussels, had about 74,000 inhabitants; in 1920 it had 154,801; in 1938, in a larger area, it had grown to 191,678. However, with its 18 other communes, usually considered as part of the agglomeration of Brussels, the total population in 1938 was 912,774.

Beginning in the north of the city and east of the Senne and working around in a clockwise direction, the first of the 18 communes is Evere (pop. [1955] 18,421), with its restored romanesque church of St. Vincent and with mining industries. Schaerbeek (120,150), a village until 1795, manufactures foodstuffs, clothing, chemicals and machinery. St. Josse-ten-Noode

(25,310), a town since the 13th century, adjoins the centre of Brussels and produces much the same products as Schaerbeek. On the east, Woluwe-St.-Lambert (32,129) and Woluwe-St.-Pierre (25,696) produce garden vegetables, machinery and building materials. Etterbeek (51,473), nearer to the city centre, was first mentioned in the early 12th century. It makes chemicals, clothing, metalwork and machinery as well as foodstuffs. At Auderghem (23,003), to the southeast, Aleyde, duchess of Brabant, founded a convent at the end of the 13th century. Ixelles (92,338), sprawling to the south and southeast, makes much the same products as the other suburbs. Watermael-Boitsfort (22,270), mentioned as early as A.D. 914, lies beyond Ixelles and stretches to the forest of Soignes. Uccle (64,594), to the south, was formerly a separate town dating back to the 12th century. It is now mainly residential. Forest (48,974), once part of the forest of Soignes, now makes chemicals, paper, photographic materials, clocks, clothing, leather goods and foodstuffs. St.-Gilles (57,289), formerly Obbrussel, makes products similar to those of Forest, as does Anderlecht (91,143), on the Senne to the southwest, the original kernel of the city. Molenbeek-St.-Jean (62,592), Koekelberg (15,099), Berchem-St.-Agathe (13,213), Ganshoren (11,849) and Jette-St.-Pierre (30,792) are all in the west and northwest of Brussels. Apart from the products common to most parts of Brussels they make rubber goods, electrical equipment, clocks, liqueurs and tobacco products.

History. — The Franks settled in the area in the 7th century, at the time of the evangelization of Brabant. They established themselves on the hill above the frequently flooded Senne valley, near the present collegiate church of St. Michael and Ste. Gudule. On an island in the valley Duke Charles of Lower Lorraine built a fortress containing a chapel dedicated to St. Géry (now marked by the Place St. Géry) and Charles transported there the relics of Ste. Gudule (transferred to St. Michael's in 1047). The first town grew up around the fortress and was called Broocsella or Broecsele ("the settlement in the marshes"). It was at this point that the ancient road running north-south, between Antwerp and Nivelles, crossed the Senne which there ceases to be navigable. The great east-west road between Cologne and Bruges did not become an important highway until the end of the 12th century, and the commercial development of Brussels, which had already begun, was greatly increased as a result of its position at these crossings.

The merchants of the 12th-century industrial town, free from the authority of an overlord, created a market (the origin of the Grand-Place) and built a meetinghouse (the forerunner of the town hall). While the commercial town flourished and gradually formed the nucleus of the lower town, a ducal residence (on the site of the Place Royale) and the abbey of St. Jacques, both on the Coudenberg, on the edge of the plateau bordering the Senne valley, were built. This was the beginning of the ducal agglomeration and of the upper town.

Around 1100 new ramparts, including seven gates and 24 towers, were constructed to protect the industrial city. In 1312, Duke John II of Brabant granted the citizens their charter, distinguished from others as that of Cortenberg. This charter, with the Golden Bull of the emperor Charles IV (1356), was confirmed by the famous "joyous entry" of Duke Wenceslas into Louvain (1356). This established the early constitution of the South Netherlands, which remained almost intact until the Brabant revolution in the reign of Joseph II. The 11th-century wall was soon outgrown, and in 1357 Duke Wenceslas ordered a new wall to be built, enclosing a much greater area. It included 74 towers and eight gates, and survived until 1830. In the 14th century the dukes of Brabant transferred their capital from Louvain to Brussels, although residing for some time in their castle at Vilvorde, halfway between the two turbulent cities. At this time Brussels is said to have had 40,000 inhabitants, one-fifth the number of Ghent. In 1421 a further charter was granted recognizing the guilds of Brussels as the Nine Nations. The duchy was merged in the possessions of the duke of Burgundy in 1430. The castle of the dukes of Brabant on the Coudenberg was the scene of the abdication of Charles V in 1555.

In the 16th and 17th centuries, under the Spanish Habsburgs, Brussels was the capital of the Spanish Netherlands and one of the finest and most important cities of Europe. In 1695, the duc de Villeroi, a French commander, bombarded the city. Sixteen churches and about 4,000 houses were burned down, and the historic buildings on the Grand-Place were seriously damaged or destroyed. Much of the damage was repaired in the 18th century. From 1714 Brussels was the capital of the Austrian southern Netherlands.

During the French Revolution the city was reduced to the rank of chief town of the French *département* of the Dyle (1795–1814), becoming later, concurrently with The Hague, the residence of the king of the Netherlands. The Belgian revolution started in Brussels on the night of Aug. 22–23, 1830, and during Sept. 23–26 the Belgians defeated a Dutch army there. King Leopold I entered the city on July 21, 1831, and this date was proclaimed the national holiday. As capital of the kingdom of Belgium, Brussels recovered its former status of a great European metropolis.

In World War I the German occupation lasted from Aug. 20, 1914, to Nov. 18, 1918. Numerous social relief movements were instituted; among them the Comite National de Secours et d'Alimentation had its headquarters in Brussels and with U.S. aid organized the feeding of the Belgian population. The executions of Edith Cavell (Oct. 12, 1913) and Gabrielle Petit (April 1, 1916) took place there. Adolphe Max, the burgomaster, acquired great fame for his resistance to the abuses of the Germans. The Belgian army recovered Brussels on Nov. 18, 1918, and King Albert I and Queen Elizabeth re-entered the city in state four days later. In World War II Brussels fell to the Germans on May 18, 1940. It did not suffer extensive physical damage but was subjected to harsh terms of occupation. Gen. Eggert Reeder, chief of the German military administration for Belgium, dissolved all municipal councils on April 11, 1941, dismissed the burgomaster, François Joseph van de Meulebroeck, and on Sept. 27, 1942, created "greater Brussels" by amalgamating the city with other communes for easier control. Brussels was liberated on Sept. 3, 1944, by the British, and the legitimate Belgian government returned to its capital from London five days later. The German-created "greater Brussels" then ceased to exist.

(M. Ms.)

World's Fair of 1958.—Officially known as the Brussels Universal and International exhibition, the Brussels world's fair was held from April 17 to Oct. 19, 1958, at fairgrounds that covered 500 ac. of ancient woodlands in Heysel park, four miles from the centre of Brussels. Forty-five nations, six international and supranational agencies and four organizations of an international character took part in the 1958 exhibition, and more than 41,450,000 persons visited the fair during the six-month period (*see* EXHIBITIONS AND FAIRS).

See also references under "Brussels" in the Index volume.

BRUSSELS SPROUTS, a botanical variety of cabbage (*Brassica oleracea* var. *gemmifera*). In its seedling stage and early development it closely resembles common cabbage. Later the main stem rises two to three feet tall and the axillary buds along the stem develop into small heads (sprouts) similar to heads of cabbage but only one and one-half inches or less in diameter.

The plant is of obscure European origin and was possibly grown in Belgium as early as 1200, but was first described in

J. HORACE MCFARLAND CO.
BRUSSELS SPROUTS (BRASSICA OLERACEA FORM GEMMIFERA)

1587. It was little known, even to botanists, for another century. Brussels sprouts is a popular and widely grown vegetable in England and in Europe.

It is little grown in the United States except in coastal areas or other districts having the mild, cool seasons that it requires. It is harmed by hot weather. In the U.S. most of the crop is produced in California and New York. The advent of quick-freezing preservation stimulated some expansion of production and use of Brussels sprouts. About 25,000 to 35,000 tons are produced annually on about 5,500 to 6,500 ac. in the United States. Over 40,000 ac. are devoted to the production of Brussels sprouts in Great Britain. *See* also CABBAGE. (V. R. B.)

BRUSTOLON, ANDREA (1662–1732), Italian sculptor and wood carver who created the supreme achievements of Venetian baroque furniture: was born on July 20, 1662, at Belluno. He went to Venice in 1677 and trained under Filippo Parodi, visiting Rome, 1678–80. On his return he undertook a certain amount of decorative carving in Venetian churches and created his most celebrated works, the furniture for the Venier di S. Vio and Correr di S. Simeone families (now in the Cà Rezzonico, Venice), exceedingly elaborately carved in walnut and ebony with Negro figures, cupids, etc. In 1655 he returned to Belluno and from that time devoted himself almost entirely to work in wood and occasionally ivory for religious uses. He died at Belluno on Oct. 25, 1732.

(F. J. B. W.)

BRUT (BRUTE OR BRUTUS THE TROJAN), a legendary British character, who, according to Geoffrey of Monmouth and others, was the eponymous hero of Britain. He was reputed to be grandson of Aeneas, and the legend was that he was banished from Italy and made his way to Britain, where he founded New Troy (London). The name is an obvious confusion between Bryt (a Briton) and the classical name Brutus. For the romance literature of the subject *see* WACE; BARBOUR, JOHN.

BRUTTII, an ancient Italian tribe which occupied the southwestern peninsula of Italy in historical times, the *ager Bruttius*, corresponding almost exactly to the modern *regione* of Calabria. The Bruttii, perhaps speaking an Indo-European language (*see* INDO-EUROPEANS), may have occupied southern Italy before the conquest of Lucania, Calabria and Campania by Samnite tribes after the 5th century B.C. Ancient tradition suggested to the Romans that they were driven southward about 400 B.C. by the Lucanians, a Samnite tribe who spoke Oscan. The Bruttii adopted Oscan as their language, together with Greek.

The district of the Bruttii was separated from Lucania on the north by a line drawn from the mouth of the Laus (Lao) river on the west to a point a little south of the Crathis (Crati) river on the east. To part or the whole of this peninsula the name Italia was first applied. In alliance with the Lucanians the Bruttii made war on the Greek colonies of the coast) seized Hipponium (Vibo Valentia) in 356 B.C., and held it until it became a Latin colony at the end of the same century. The Bruttii mere at the height of their power during the 3rd century B.C. Their chief towns were Consentia (Cosenza), Petelia (near Strongoli), and Clampetia (Amantea). Their coins belong to this period and they appear to have retained the right of coinage even after their final subjugation by the Romans.

The Bruttii first came into collision with the Romans (280–275 B.C.) during the war with Pyrrhus, king of Epirus, to whom they sent auxiliaries. After his defeat they were deprived of half their territory in the thickly forested Sila plateau, which was declared state property. In the war with Hannibal they were among the first to declare in his favour after the battle of Cannae (216), and it was in their country that Hannibal held his ground during the last stage of the war at Castrum Hannibalis on the Gulf of Scylacium (Squillace). After his defeat (202) the Bruttii lost their separate existence. In 194 B.C. colonies of Roman citizens were founded at Tempsa and Crotona (Crotona), and a colony with Latin rights at Hipponium, called Vibo Valentia (about 192). In 132 B.C. the consul Publius Popilius Laenas built the great road from Capua through Vibo and Consentia to Rhegium (mod. Reggio di Calabria), Spartacus held out a long time in the Sila

(71 B.C.). Vibo was the naval base of Octavian in the conflict with Sextus Pompeius (42–36 B.C.).

The most important products of the district were the wood from the forests of the Sila and the pitch produced from it. The coast plains were in parts very fertile, especially the lower valley of the Crathis. Under the empire the Sila was state domain, and most of the rest in the hands of large proprietors. When Augustus divided Italy into *regiones* he joined it with Lucania to form the 3rd region. Diocletian placed Lucania and the district of the Bruttii under a *corrector* ("governor"), whose residence was at Rhegium. From the 6th century A.D., after the fall of the Ostrogothic power and the establishment of that of Byzantium, the name Calabria was applied to the whole of southern Italy, and the name of the Bruttii entirely disappeared. After the eastern peninsula (ancient Calabria) had been taken by the Lombards, about A.D. 668, the western retained the name and still keeps it.

See R. S. Conway, *The Italic Dialects* (1897); J. Whatmough, *The Foundations of Roman Italy* (1937).

BRUTUS, in ancient Rome a cognomen or surname borne by members of the gens Junia, of which the first-mentioned, Lucius Junius Brutus, was the only patrician member to bear the name.

LUCIUS JUNIUS BRUTUS (consul 509 B.C.), probably a historical figure, traditionally led the Romans to expel from Rome their despotic king Lucius Tarquinius Superbus (*q.v.*) and founded the republic, being elected in 509 B.C. one of the first two consuls (see CONSUL). When the two sons of Brutus joined in a conspiracy to restore the Tarquins, he himself sentenced them to death. He fell in single combat with the son of Tarquinius Superbus during a battle with the Etruscans who were trying to restore the dynasty of the Tarquins. Tradition associated the name *Brutus* ("dull") with Brutus' feigned stupidity before he rose to power.

See Livy, *History of Rome*, i and ii.

DECIMUS JUNIUS BRUTUS (consul 138 B.C.), surnamed GAL-LÆCUS from his victory over the Gallaeci (136) in northwestern Spain. He was a patron of literature and a friend of the poet Accius.

MARCUS JUNIUS BRUTUS (praetor c. 140 B.C.), a jurist considered by Cicero to be one of the founders of Roman civil law. His son of the same name, also a jurist, was known as "the Accuser."

See Cicero, *De Officiis*, ii, *De Oratore*, ii, and *Brutus*.

DECIMUS JUNIUS BRUTUS (d. 43 B.C.), surnamed ALBINUS after his adoptive father A. Postumius Albinus, first served under Caesar in Gaul and afterward commanded his fleet. Caesar made him master of the horse and governor of Transalpine Gaul for 48 and 46 B.C., and, in case of Octavian's death, nominated him as one of his heirs; early in 44 B.C. Caesar gave him charge of Cisalpine Gaul. Nevertheless Brutus was one of his assassins in March 44. He then went to Cisalpine Gaul which he held for the republicans against Antony, standing siege at Mutina; he then advanced to Gallia Xarbonensis against Antony, but deserted by his soldiers and betrayed by a native chief, he was put to death by Antony's orders (43) while attempting to escape to the other assassins Cassius (*q.v.*) and Marcus Junius Brutus in Macedonia. He figures in Cicero's correspondence.

MARCUS JUNIUS BRUTUS (85–42 B.C.), also named QUINTUS CAEPIO BRUTUS after his adoptive father Q. Servilius Caepio, supported the cause of Pompey against Caesar (*q.v.*) but was pardoned by the latter after the victory of Pharsalus and subsequently appointed governor of Cisalpine Gaul (46). In 44 he was city praetor and Caesar promised him the governorship of Macedonia. But at the prompting of Cassius he became leader of the conspiracy against the dictator, and was himself one of the assassins. But the republicans had no program and in Aug. 44 he fled to the east with Cassius, seized Macedonia and raised forces against Antony. At Philippi (42) they were defeated by Antony and Octavian, and Brutus committed suicide.

Brutus divorced his first wife Claudia, daughter of Appius Claudius Pulcher (consul 54) in 46 and married Porcia, the daughter of his uncle M. Porcius Cato Uticensis. He was generally friendly with Cicero (*q.v.*) who dedicated the works *Brutus* and *Orator* to him, but Cicero frequently speaks of his lack of enthusiasm. The Romans admired him for his respectability and old-

fashioned *gravitas* ("seriousness"). He was slow in decision, amazingly obstinate and, in his financial dealings with the provincials, both extortionate and cruel. Shakespeare's portrait of him is flattering. A Stoic, he wrote philosophical treatises and poetry, of which nothing has survived. Of the original nine books of his correspondence with Cicero two are extant.

BRY, THÉODORE (THEODORUS DIRK) DE (1528–1598), German engraver and publisher, whose illustrations for travel works are of special interest, was born in Liège, Belgium, in 1528. He established an engraving and publishing business at Frankfurt, and also visited London in or before 1587. There he became acquainted with the geographer, Richard Hakluyt, with whose assistance he collected materials for a finely illustrated collection of voyages and travels, *Collectiones peregrinationum in Indiam orientalem et Indiam occidentalem* (25 parts, 1590–1634). Among other works he engraved a set of 12 plates illustrating the "Procession of the Knights of the Garter" in 1576, and a set of 34 plates illustrating the "Procession at the Obsequies of Sir Philip Sidney"; plates for Thomas Hariot's *Briefe and True Report of the New Found Land of Virginia* (Frankfurt, 1595); the plates for the first four volumes of Jean Jacques Boissard's *Romanæ urbis topographia et antiquitates* (1597–98), and a series of portraits entitled *Icones virorum illustrium* (1597–99). He died at Frankfurt am Main on March 27, 1598. De Bry had been assisted by his eldest son, Jean Théodore de Bry (1561–1623), who carried on the *Collectiones* and the illustration of Boissard's work, and also added to the *Icones*.

BRYAN, KIRK (1888–1950), U.S. geologist internationally recognized as an authority on geomorphology, Pleistocene and Recent chronology, and cryopedology (a term he coined for the study of perennially frozen ground), and noted for his emphasis upon their relationship to climatic fluctuations and to the dating of early man in North America. Bryan was born in Albuquerque, N.M., July 22, 1888, and was educated at New Mexico and Yale universities. His first important scientific contributions, as geologist for the U.S. Geological survey, dealt with ground-water problems and the geomorphology of arid regions. His intense interest in the American southwest, especially the Rio Grande valley, is shown in his own publications and in those of his students at Harvard university, where he taught from 1926 until his death Aug. 22, 1950, at Cody, Wyo.

For bibliography and detailed biography see E. S. Larsen, Jr., "Kirk Bryan," *Proc. Geol. Soc. Amer.*, pp. 91–96 (1951). (L. L. R.)

BRYAN, WILLIAM JENNINGS (1860–1925), U.S. political leader and orator, was born in Salem, Ill., on March 19, 1860. He graduated from Illinois college in 1881 and from the Union College of Law, Chicago, in 1883. He practised his profession at Jacksonville, Ill., from 1883 to 1887 and then moved to Lincoln, Neb. There he soon became conspicuous both as a lawyer and as a politician, attracting particular attention by his speeches during the presidential campaign of 1888 on behalf of the candidates of the Democratic party. It was a time of depression and discontent in farming areas. From 1891 to 1895 he represented the 1st congressional district of Nebraska, normally Republican, in the national house of representatives. He soon attracted attention as a conscientious worker and became widely known for his ability in debate. His first great speech (March 16, 1892) was against the policy of tariff protection, and on Aug. 16, 1893, he made a remarkable speech against the repeal of the silver purchase clause of the Sherman act. Although the immediate loser in this contest, he attained a national reputation as the leader of the free-silver movement in opposition to the more conservative gold standard policy. In 1894 he was a candidate for the U.S. senate but was defeated in a campaign largely restricted to the silver question. From 1894 to 1896 he edited the *Omaha World-Herald*, in which he championed the cause of bimetallism, and lectured on the silver question.

Although defeated in all elections in which he subsequently appeared as candidate, he was the recognized leader of his party for

the next 30 years. His panacea for the depressed conditions of agriculture and industry that followed the panic of 1893 was an "easy money" policy based on the free and unlimited coinage of silver at a ratio to gold of 16 to 1. In 1896 he was sent as delegate to the Democratic national convention at Chicago, and there easily captured control of the convention, wrote the party platform, which contained a plank providing for bimetallism, and in defense of his proposition delivered a celebrated speech containing the passage, "You shall not press down upon the brow of labour this crown of thorns; you shall not crucify mankind upon a cross of gold." As leader of the "silver" majority he became the Democratic nominee for president, champion of the agrarian west and south against the "hard money" policy favoured by most eastern bankers and industrialists. He also received the nominations of the Populist and the National Silver parties. In the ensuing presidential campaign he traveled over 18,000 mi. and made altogether 600 speeches in 27 different states—an unprecedented number. In the election, however, he was defeated by William McKinley, the Republican candidate, receiving 176 electoral votes to 271. During the Spanish-American War he was colonel in the 3rd Nebraska volunteers, but saw no active service. Even though he lent his support to the ratification of the peace treaty, he opposed the permanent acquisition of the Philippines and in 1900 was again nominated for the presidency on a platform that declared against "imperialism" and for "free-silver." He was defeated a second time by McKinley, receiving 155 electoral votes to 292. After the 1900 election Bryan established and edited at Lincoln a weekly political journal, *The Commoner*, which attained a wide circulation.

Although not an active candidate for the Democratic nomination in 1904, he was in attendance and assisted materially in framing the platform. The conservative element of the party had once more resumed control and nominated Judge Alton B. Parker of New York. In 1905–06 Bryan made a trip around the world, and in London was cordially received as a great American orator. He was nominated again for the presidency by the Democratic party at its national convention at Denver in 1908. The free-silver theory was now dead, and while the chief issue was over the formulation of a policy toward business trusts, the campaign was confused by personal issues, Roosevelt himself intervening in favour of Taft, the Republican nominee. Bryan was defeated again, receiving 162 electoral votes to 321 for Taft. In 1912 Bryan announced that he was not a candidate for the Democratic presidential nomination, but he attended the convention, dictated the platform, and inspired the general tone of proceedings at Baltimore. It was largely his influence that brought about the nomination of Woodrow Wilson (*q.v.*) instead of Champ Clark. In recognition of this service Wilson appointed him secretary of state in 1913.

As secretary of state Bryan devoted much attention to the negotiation of treaties with foreign nations to prevent war. Profiting from the sad experience of his predecessors in getting arbitration treaties approved by the senate, Bryan proposed new treaties that would provide a "cooling-off period" of one year during which the question in dispute could be studied by an international commission. These were agreed to in principle by 31 nations but World War I interrupted the movement. In 1913 Bryan went to California, where he urged, unsuccessfully, that the state legislature and the governor should delay action on the proposed Webb antialien land ownership bill, so displeasing to the Japanese government. In 1914 he supported the repeal of the Panama canal tolls bill, which excluded American coastwise shipping from the payment of fees.

Both Wilson and Bryan had stated their opposition to intervention in Latin-American affairs, but they nevertheless took action that was generally regarded in Latin America as interventionist. The most troublesome incident was the expedition sent into Mexico to capture the bandit leader Pancho (Francisco) Villa (*q.v.*) in 1916.

From the outbreak of World War I. Bryan was deeply interested in attempts to restore peace and keep the United States out of the conflict. He opposed war loans to belligerents, but as vigorously opposed an embargo on the shipment of arms as contrary to

international law. After the sinking of the "Lusitania" (May 7, 1915) he signed the first strong note of protest to Germany. When the president wrote his second "Lusitania" note, Bryan resigned (June 8, 1915), saying in his letter of resignation, "You have prepared for transmission to the German government a note in which I cannot join without violating what I deem to be an obligation to my country." He continued, after his resignation, to work in the interest of peace; he opposed the Anglo-French war loan; attacked the Navy league and the National Security league, and tried to resist the growing demands for preparedness in America.

However, when war was actually declared he asked to be enrolled as a private, though then 57 years of age; he urged loyal support of the president's war measures, and in his own paper, *The Commoner*, strongly condemned obstruction of the selective draft.

In 1916 Bryan was defeated in Nebraska as candidate for delegate-at-large to the Democratic national convention, but went as a reporter and gave full support to the renomination of Wilson. He was sent as a delegate to the 1920 convention at San Francisco, but when his motion for the introduction of a "dry" plank in the platform was defeated, he took no further interest in the proceedings. The same year he refused the presidential nomination of the Prohibition party, although he had been a tireless worker for the cause for the previous ten years. In 1921 he moved to Miami, Fla., and in 1924 attended the Democratic national convention in New York as a delegate from Florida, but he exercised very little influence in the party councils. As a politician his work was completed. Bryan laboured earnestly for the most important progressive measures adopted by the U.S. during his political career: the popular election of senators, an income tax, the requirements of publication of ownership and circulation of newspapers, the creation of the department of labour, national prohibition and woman suffrage. Their adoption was due in part to his popular persistent appeal.

Bryan's last public appearance was in 1925 at the trial of J. T. Scopes, a schoolteacher of Dayton, Tenn., who was arrested on a charge of violating the state law prohibiting the teaching in public schools of any theories that deny the divine creation of man as taught in the Bible. Scopes was a biologist and had been teaching evolution. Bryan, a firm believer in the literal interpretation of the Bible, went to Dayton to assist the prosecution. Widespread popular interest was manifested in the case. In the hands of Bryan and Clarence Darrow, chief defense counsel: it took the form of a contest between fundamentalism and modernism. The outcome was that on July 21, after a hearing extending over two weeks, Scopes was found guilty and fined \$100, though Bryan was prevented, through the tactics of Darrow, from delivering the elaborate speech which he had prepared in refutation of Darwin's theories. On the conclusion of the trial he was taken ill, and died at Dayton, Tenn., on July 26, 1925.

BRYAN, a city in Texas, U.S., 85 mi. N.W. of Houston. The seat of Brazos county, Bryan was founded in 1859 and named for William Joel Bryan, who inherited from his uncle Stephen F. Austin the land on which the city is built.

The city is strategically located between three large metropolitan areas and immediately adjoins the Agricultural and Mechanical College of Texas at College Station. Its agriculturally based economy has shifted to one founded on higher education and an increasing number of small manufacturing, processing and distributive industries. Bryan adopted a commission-manager plan of government in 1917. Private schools include Allen Military academy. For comparative population figures see table in TEXAS: *Population*. (J. M. NA.)

BRYANSK (BRIANSK), a town and administrative centre of Bryansk *oblast* of the Russian Soviet Federated Socialist Republic, U.S.S.R., stands on the Desna river, just below its confluence with the Bolva, 210 mi. S.W. of Moscow. Pop. (1959) 206,000. First

mentioned in 1146, it was a fortified town on the Bryansk defensive line of the mid-16th century and was occupied by the Germans in World War I. It is now an industrial centre, with a large-scale engineering industry, producing turbines, diesels, refrigerator freight cars and transport equipment. A steel castings factory was, after 1960, converted to make tractors. Clothing, shoes, bricks and reinforced concrete are also made. Bryansk is a railway junction, the focus of six lines, to Moscow, Vyazma, Smolensk, Gomel, Kiev and Orel. Around Bryansk is a group of industrial towns making iron castings, glass, cement and timber products. The largest, Bezhitsa, is now combined with Bryansk.

BRYANSK OBLAST lies mostly in the broad, shallow basin of the Desna and its tributaries. In the north and east are low, rolling hills. The *oblast* (13,475 sq.mi.) is in the zone of mixed forest, and extensive forests remain in the eastern part, but elsewhere they have largely been cleared. Soils are mostly podzols, but richer chernozems occur in central and southeastern areas. The *oblast*, which was formed in 1944, has a population of 1,547,000 (1959), of which 35% (535,000) is urban. Apart from Bryansk itself, the towns are mostly small.

The agriculture of Bryansk *oblast* is concerned chiefly with growing grain (rye, buckwheat and oats), flax, hemp and potatoes. Some sugar beet and tobacco are also produced. Industry is well developed and includes engineering (transport and agricultural machinery), steel and iron casting, glassmaking, timberworking (especially match and papermaking), processing flax and hemp and food, and the production of building materials. Part of the iron ore deposits of the Kursk magnetic anomaly lie within the *oblast*.

(R. A. F.)

BRYANT, WILLIAM CULLEN (1794–1878), U.S. poet of nature, best remembered for "Thanatopsis," and editor for 50 years of the *New York Evening Post*, was born at Cummington, a farming village in the Berkshire hills of western Massachusetts, on Nov. 3, 1794. He was the son of Peter Bryant, physician and man of scholarship, and of Sarah Snell—both descendants of early Puritan immigrants. At 16 Bryant entered the sophomore class of Williams college, where he was an apt student for a year but from which he withdrew without graduating because of limited finances and in the vain hope that his father might send him to Yale college. The number of his college days is a misleading measure of his training, for he possessed many traits that often are established only by books and academic regimen. On abandoning his hope of entering Yale, he studied law under private guidance at Worthington and at Bridgewater and at 27 was admitted to the bar. He opened an office in Plainfield, presently withdrew from there, and at Great Barrington settled for nine years in the attorney's calling, for which he had an aversion that he never lost. At the age of 26 Bryant married Frances Fairchild, with whom he enjoyed a happy union until her death nearly half a century later. In 1825 he moved to New York city to become coeditor of the *New York Review*. Two years later he became an editor of the *Evening Post*; in 1829 he became editor in chief and part owner, and continued in this position until his death almost 50 years later. His careful investment of his income from the *Post* made Bryant wealthy. Since he was a resident of New York city, he was associated in the public mind with the Knickerbocker group, but in reality he had little in common with these authors. He was an active patron of the arts and letters; in this capacity and as a journalist he made six voyages to Europe.

The religious conservatism imposed on Bryant by his mother and his grandfather Snell in childhood found expression in pious doggerel; the political conservatism of his father stimulated "The Embargo" (1808), in which the 13-year-old poet demanded the resignation of Pres. Thomas Jefferson. But in "Thanatopsis" (from the Greek "a view of death"), which he first wrote in 1811 at the age of 16 and which made him famous when it was published in the *North American Review* in 1817, he rejected Puritan dogma for Deism; thereafter this distinguished apostate from Calvinism was a Unitarian. Turning also from Federalism, he joined the Democratic party and made the *Post* an organ of free trade, workingmen's rights, free speech and abolition. A thoroughgoing liberal, Bryant was for a time a Free-Soiler and later one of the

founders of the Republican party. At Cooper union in 1860 he introduced Lincoln to his first New York audience. (See *NEWS-PAPERS: The Party Press*.) As a man of letters Bryant securely established himself at the age of 27 with *Poems* (1821). For a decade he was the most distinguished poet in the United States and, throughout his lifetime, one of the most revered. In his later years he devoted considerable time to translations, particularly from Homer and from Spanish poets.

"I was always," Bryant said, "a delighted observer of external nature." In Massachusetts, his was a joyous and occasionally an ecstatic communion. In New York his disillusionment with the human race increased, as did his need for the consolation of nature, but his communion was now more often sober. As an early figure in the romantic movement in American literature, Bryant wrote also of the American past and that of Europe, of the liberal causes that he defended in the *Post*, and, like numerous English romantics, of ethical problems. Once freed from his boyish addiction to the heroic couplet, he employed a richer variety of verse forms than had any American predecessor. But Bryant will be longest remembered as the poet of the Berkshire hills and streams, in such poems as "Thanatopsis" and "To a Waterfowl"—in Whitman's phrase, "bard of the river and of the wood, ever conveying a taste of open air." Bryant died in New York city on June 12, 1878.

BIBLIOGRAPHY.—The last edition of Bryant's poems that passed through his own hands is *The Poetical Works* (1876). Parke Godwin, Bryant's son-in-law and fellow editor, collected much of Bryant's prose and verse in volumes iv–vi of *The Life and Writings of William Cullen Bryant*, 6 vol. (1883–84). The Roslyn edition of *The Poetical Works* (1903) ed. by H. C. Sturges and R. H. Stoddard is the most inclusive one-volume collection. Useful are the biographical volumes by Parke Godwin, see above; John Bigelow, *William Cullen Bryant* (1890); W. A. Bradley, *William Cullen Bryant* (1905). See also F. L. Pattee, *Side Lights on American Literature* (1922); Alan Nevins, *The Evening Post: a Century of Journalism* (1922); Norman Foerster, *Nature in American Literature* (1923); W. L. Phelps, *Howells, James, Bryant and Other Essays* (1924); Gay W. Allen, *American Prosody* (1935); Tremaine McDowell (ed.), *William Cullen Bryant: Representative Selections*, with introduction, bibliography and notes (1935). (T. McD.)

BRYAXIS was one of the four sculptors who, according to Pliny and Vitruvius, worked on the mausoleum of Halicarnassus (c. 350 B.C.). His most famous statue was a colossal seated Sarapis, which perhaps survives in numerous Roman copies. None of the other works attributed to him by ancient writers, including an Apollo at Daphne, a group of Asklepios and Hygieia at Athens and a portrait of Seleucus Nicator, can be even tentatively identified. The signature of Bryaxis on a sculptured base found in Athens in 1891 may refer only to the lost statue surmounting it.

See G. Lippold, *Die griechische Plastik*, pp. 257–60 (1950).

(G. M. A. R.)

BRYCE, JAMES BRYCE, 1ST VISCOUNT (1838–1922), British statesman and scholar, whose great learning and wide experience of many countries made him indispensable in the counsels of the Liberal party, and who was an especially successful ambassador to Washington, was born at Belfast, Ire., on May 10, 1838, of a Scottish Presbyterian family. His father, James Bryce (1806–77), was a schoolmaster, and moved in 1846 to Glasgow, where the son attended the high school and university. In 1857 Bryce went to Trinity college, Oxford, as a scholar—the first one who did not take the Anglican oaths. His brilliant Oxford record included three first classes and five major prizes; he was elected a fellow of Oriel in 1862. When he began to read for the bar, after a year at Heidelberg, he had already published his famous prize essay, *The Holy Roman Empire* (1864). In 1870 Bryce became regius professor of civil law at Oxford, a chair he held until 1893. There he was successful in reviving the study of Roman law. "Bryce, who had sat at the feet of Van Vangerow in Heidelberg, conceived it," says his biographer, H. A. L. Fisher, "to be part of his duty to awaken an interest in the civil law not as an antiquarian curiosity, but as a great power in the moulding of European thought and history." Many of his Oxford lectures were published in his *Studies in History and Jurisprudence*, two volumes (1901).

Bryce made the first of numerous visits to the United States in 1870 and laid the foundations of his knowledge of American institutions and life. A lifelong interest in the affairs of the Armenians began when he visited the Caucasus for a climbing holi-

day in 1876. He stood for parliament without success at Wick in 1874, but later sat as Liberal member for the Tower Hamlets (1880–85) and for South Aberdeen (1885–1907). Bryce never carried in the house of commons the weight of less able men with the true "parliamentary gift." This gift apart, he had much in common with Gladstone, not least on the literary side; both were friends of Lord Acton, with whom Bryce founded the *English Historical Review* in 1885. In the short government of 1886 Bryce was undersecretary of state for foreign affairs. He was chancellor of the duchy of Lancaster in the Liberal cabinet of 1892 and was president of the board of trade in the reconstructed government of 1894–95. He presided over an important commission on secondary education in 1894, which advised that a central education authority should be set up under a responsible minister.

After the Liberal defeat of 1895 he visited South Africa. He protested against the handling of negotiations with the Boer republics in the following years, and in the split in the Liberal party which followed the outbreak of the South African War in 1899 Bryce ranged himself with Sir Henry Campbell-Bannerman in the campaign against Joseph Chamberlain and his policy. Throughout the war Bryce was uncompromisingly on the unpopular side. In the Campbell-Bannerman cabinet of 1905 Bryce was chief secretary for Ireland, and in 1907 was sent as ambassador to Washington.

For six years Bryce was the interpreter of Great Britain to the American people. The appointment of a politician, outside the diplomatic service, was as usual criticized: but it was a most happy one. Bryce had many friends in political, learned, and literary circles in America, and was known throughout the United States as the author of *The American Commonwealth*, the most authoritative work on the structure and working of the American constitution. To this book, begun in 1883 and published in 1888, which remains a classic in its field, Bryce brought not only historical knowledge and legal training, but the sympathy of a friend of the American people and an admirer, on the whole, of their institutions. As ambassador, many of the problems he had to deal with concerned the relations of the United States with Canada, and in this connection he paid several visits to Canada to confer with the governor-general and his ministers. At the close of his mission he said that probably three-fourths of the business of the British embassy at Washington was Canadian, and that 9 of the 12 treaties he had signed had related to Canadian affairs. He could boast that he left Canada and the United States on excellent terms.

For his services he was created a viscount after he retired in 1913. He was made a member of the International Court at The Hague in 1914. He was extremely reluctant in the last days of July 1914 to contemplate the possibility of war with Germany, but the violation of Belgian neutrality decided him. He was chairman of the committee that considered the evidence of German atrocities in Belgium and France, and was much saddened by its work. He was appointed president of a conference on the reform of the house of lords in 1917 and, believing in the importance of an active second chamber, worked hard on a problem both parties were inclined to shirk. Otherwise he devoted the rest of his life to forwarding the establishment of the League of Nations and to the continued study of democracies. The democratic process fascinated him, and he traveled over almost all the habitable earth to observe it. Unfortunately, *Modern Democracies*, two volumes (1921) in which he summed up his conclusions in a number of actual case studies, did not have the dazzling charm of his conversation, in which he seemed "to have been everywhere, known everybody, and read everything." He received no fewer than 31 honorary degrees.

He had married, in 1889, Elizabeth Marion, daughter of Thomas Ashton and sister of the 1st Lord Ashton of Hyde: they had no children. His last speech in the house of lords, on the Irish treaty of Dec. 1921, was made within a few weeks of his death at Sidmouth, Devon, on Jan. 22, 1922. Bryce's other works include *Studies in Contemporary Biography* (1903) and *International Relations*, two volumes (1922).

BRYCE CANYON NATIONAL PARK, in southern

Utah, U.S., was established in 1928 to protect an area of approximately 36,010 ac. of colourful eroded limestone and sandstone formations. Five years earlier, part of the present park, 7,040 ac., had been set aside as a national monument. The canyon was named for Ebenezer Bryce, an early settler in the region.

The area is most accurately described as a series of amphitheatres, rather than a canyon, below which stands an array of white- and orange-coloured columns and walls sculptured by wind, rain and frost. The geologic story of Bryce Canyon is related to that of nearby Grand Canyon (*q.v.*) and Zion National parks (*q.v.*), the stone of all three having been laid down while the region was inundated by a shallow sea or lake; but the sandstone and limestone beds of Bryce canyon were formed during a more recent period (*see* EOCENE AND PALEOCENE).

The high rim country of the park is part forest and part grass and sage, with white fir, Douglas fir, ponderosa pine, bristlecone pine and trembling aspen the dominant species. At lower, drier altitudes, piñon pine and Utah juniper predominate.

Some of the mammals that dwell in this sanctuary are mule deer, gray foxes, porcupines, marmots, mountain chipmunks and ground squirrels. A prairie dog town beside the park road interests visitors. Mountain chickadee, Townsend's solitaire, Clark's nutcracker, long-crested jay and Rocky mountain and black-eared nuthatches are some of the birds that inhabit the park throughout the year. They are joined by mountain and chestnut-backed bluebirds, juncos, violet-green swallows, white-throated swifts and other migrants during warmer months. Like most national parks, Bryce Canyon has a museum and information centre. A rim road has spurs that lead to outstandingly scenic overlooks such as Sunrise point and Inspiration point: a trail system descends from the rim to wind among the formations. (Dx. B.)

BRYDGES, SIR SAMUEL EGERTON (1762–1837), English genealogist and writer, and editor of rare Elizabethan texts, was born at Wootton, Kent, on Nov. 30, 1762. He studied at Queens' college, Cambridge, and was called to the bar at the Middle Temple in 1787. In 1789 he persuaded his elder brother that their family were the heirs to the barony of Chandos, being descended from a younger branch of the Brydges who first held the title. The case was tried and lost, but Brydges never gave up his claim and used to sign himself *Per legem terrae* B.C. of S. ("By the law of the land Baron Chandos of Sudeley"). He re-edited A. Collins' *Peerage*, inserting a statement about his supposed right. In 1814 he was made a baronet. In 1818 he went to live abroad, mainly near Geneva where he died on Sept. 8, 1837.

Brydges's numerous works include *Poems* (1785); *Censura Litteraria*, ten volumes (1805–09); *The British Bibliographer*, four volumes (1810–14), with J. Haslewood; *Restituta*, four volumes (1814–16), containing accounts of old books; and *Autobiography, Times, Opinions and Contemporaries of Sir Egerton Brydges* (1831). From 1813 to 1822 he edited a number of rare Elizabethan texts, including Edward Phillips' *Theatrum poetarum* (1800), Robert Greene's *Groatsworth of Wit* (1813) and works by Nicholas Breton (1815).

BRYENNIOS, PHILOTHEOS (1833–1914), Eastern Church theologian and discoverer of the Didache manuscript, was born in Istanbul in 1833. He was educated at Chalcis, Greece, and at the universities of Berlin, Munich and Leipzig. In 1861 he became a professor at Chalcis and in 1863 director of the school there. He was made head of the Great School of the Nation in Istanbul in 1866; and kept that position until 1875, when he was selected metropolitan of Serrai, Greece. In 1875 he became metropolitan of Nicomedia, in Turkey. Bryennios discovered in Istanbul in 1873 manuscripts containing the Didache (or "Teaching of the [Twelve] Apostles"), the two epistles of Clement to the Corinthians and other important religious documents. He published from these the first complete text of Clement's epistle (1875) and the *Teaching of the Twelve Apostles* (1883), both with valuable notes of his own. The discovery and publication of the manuscripts and Bryennios' commentaries on them are regarded as important contributions to theological literature and scholarship.

BRYENNIUS, NICEPHORUS (1062–1137), Byzantine

soldier, statesman and historian, wrote a history of the imperial Comnenian family in the 11th century A.D. He was born in Adrianople in 1062 and died in Constantinople in 1137. He had gained the favour of the emperor Alexius I Comnenus and in 1097 married his daughter Anna and was given the title of Caesar. Bryennius successfully defended Constantinople against Godfrey of Bouillon (1097); conducted the peace negotiations between Alexius and Bohemund, prince of Antioch (1108); and played an important part in the defeat of Malik Shah, Seljuk sultan of Iconium (1116). After the death of Alexius, he refused to enter into the conspiracy set on foot by his mother-in-law and wife to depose John, the son of Alexius, and raise himself to the throne. His wife attributed his refusal to cowardice, but it seems from certain passages in his own work that he really regarded it as a crime to revolt against the rightful heir. He was friendly with the new emperor John, whom he accompanied on his Syrian campaign (1137), but was forced by illness to return to Constantinople, where he died the same year. It was at the suggestion of his mother-in-law, the empress Irene, that he wrote the history (called by him *Materials for a History*), dealing with the fortunes of the Comnenian family in the 11th century, particularly during the years 1070-76. This work has been described as a family chronicle rather than a history. He intended to include the activities of the emperor Alexius, but died before he could complete his work. In addition to information derived from older contemporaries (such as his father and father-in-law) and from official sources, Bryennius used the works of Michael Psellus, Joannes Scylitza and Michael Attaliata. His views are influenced by personal considerations and his intimacy with the imperial family, which at the same time, however, afforded him unusual facilities for obtaining material. His model was Xenophon; he abstained from an excessive use of simile and metaphor, and his style is concise and simple.

BRYMNER, WILLIAM (1835-1925), Canadian landscape and figure painter, whose work and teaching exerted a considerable influence on Canadian art, was born in Greenock, Scot., Dec. 14, 1835, the son of Douglas Brymner. He went to Canada while he was still a small child and was educated in the province of Quebec. In 1878 he went to Paris, where he studied under Adolphe William Bouguereau and Tony Robert-Fleury. He subsequently exhibited his work at the Paris *Salon*, the Royal Academy in London and at a number of expositions in the U.S., where he frequently won prizes. He was president of the Royal Canadian Academy from 1909 until 1917. He died June 18, 1925, in England.

BRYNMAWR (BRYN-MAWR), an urban district of Brecknockshire (Breconshire), Wales, in the Brecon and Radnor parliamentary division, is 10 mi. E.N.E. of Merthyr Tydfil and 9 mi. W.S.W. of Abergavenny by road. Pop. (1961) 6,171. It lies in the extreme southeastern part of the county and on the northern edge of the south Wales industrial area and is on the main road between the English midlands and southwest Wales. Unlike the long, straggling townships in the narrow valleys of south Wales, Brynmawr (meaning "great hill") is a compact community at 1,100-1,300 ft. on the edge of Llangattock mountain (Mynydd Llangatwg) overlooking the Monmouthshire valley of the Ebbw Fach. Linked by road and rail with the industrial valleys, and close to the agricultural areas of southeast Breconshire and to the natural sources of coal, ironstone and limestone, the town became a considerable business and social centre. Of early 19th-century origin, it grew rapidly when coal came into general use in the iron-smelting industry. With the decline of ironworking and the exhaustion of its own mines, Brynmawr depended more on other mining centres to the south and on the steel industry at Ebbw Vale. This led during the periods of industrial depression (1925-35) to severe unemployment. A few small factories were established at that time, and the Society of Friends organized housing and alternative employment. After World War II additional and larger factories were

introduced; by the early 1960s only a small percentage of the working population was engaged in mining and steel. (C. M. S. W.)

BRYONY (*Bryonia dioica*), a twining plant of the gourd family (Cucurbitaceae, *g.v.*), native to Europe and western Asia. It has a large white root, large palmate leaves, pale yellow flowers in axillary clusters and red berries. The black bryony (*Tamus communis*), a climbing plant of the yam family (Dioscoreaceae), of similar range, bears a black root, shining, heart-shaped leaves and scarlet berries. Bryony has been used as a cathartic and as a diuretic.

BRYOPHYTA, the botanical name of a division or phylum of the plant kingdom, usually placed between the algae and ferns. It is composed of liverworts and mosses which are usually small plants growing on trees: logs, rocks, soil and in fresh water. They grow best in warm areas of high precipitation and humidity but are also found under desert and tundra conditions.

The Bryophyta are variable in size and form. Some cannot be seen without a magnifying lens and a few may be a foot or more in height or length. Although usually a subordinate part of the vegetation they may form the ground cover of the northern coniferous forest or even dominate the vegetation of some bogs and tundras. A few may be found along shores. None, however, is marine.

The Bryophyta as a group are less aquatic and more complex than the algae, although many algal seaweeds are much larger. The two groups of plants are separated on a basis of their sex organs: the sex cells (gametes) of the algae are enclosed in a simple cell wall while those of the Bryophyta are contained in a single-layered jacket of cells.

Although some of the ferns and their relatives are mosslike in general appearance, the usually smaller Bryophyta are distinguished by the lack of true roots, stems and leaves and a vascular system through which plant sap can move.

The division, Bryophyta, is subdivided into two, three and sometimes more, groups. They are separated into the liverworts and mosses on a basis of differences in their spore-bearing structures (sporophytes). The spore case (capsule) of the mosses has a cylinder of sterile tissue (columella) in the centre surrounded by spores and usually opens by a definite lid (operculum). In contrast, the liverwort capsules either have no sterile tissue (except Anthocerotae) or more frequently have sterile slender cells (elaters) among the spores. Moreover, the capsules split longitudinally into two or more valves or rupture irregularly. The liverwort capsules have a compact wall of at most two layers of cells surrounding the spores while those of the mosses have a jacket several cells in depth, many of which may form a spongy tissue. Also the liverworts are more dorsiventral in growth form and some of them are almost ribbonlike. Mosses are more often erect and

FIG. 1.—MOSS-COVERED TERRAIN IN A HEMLOCK FOREST GROWING ON A TERMINAL MORAINÉ AT THE MOUTH OF GLACIER BAY, ALASKA

radial in construction.

As a group Bryophyta have little economic significance; certain mosses are exceptions. All may play a part in reducing rocks, logs and stumps to soil, in initiating plant occupancy of bare soil and in retarding the erosion of soils. The bryophytes often serve as nest-building materials for birds and rodents as well as food and homes for insects, mites and other minute animals.

No other group of plants demonstrates so well the two (haploid and diploid) generations of the life cycle exhibited by sexual plants. Minute spores shed from the capsules grow into green plants (haploid gametophytes with a single set of chromosomes) of varying form, which bear the sex organs: male (antheridia) and female (archegonia). Mature sperms which are formed in the antheridia may swim under moist conditions into the archegonia and one may fertilize the egg in the enlarged base (venter) of the archegonium. The fertilized egg (zygote) produced by this fusion may then grow through embryonic stages into the spore-bearing plant (diploid sporophyte with two sets of chromosomes) with the capsule at the apex. Special cells in the capsule by reduction division (meiosis) give rise to the minute spores which initiate the cycle all over again.

(A. J. SH.)

BRYOZOA, a name of Greek derivation meaning "moss animals," refers to certain tiny aquatic animals that live in plant-like colonies. The many common names applied to bryozoans—moss animals, corallines, sea mats, sea or horn wrack—testify to their diverse appearance. Some of the colonies resemble small, delicately branched seaweeds; others are single-layered encrustations on rocks and other submerged objects; and still others are relatively large balls or irregular gelatinous masses attached to

the stems of underwater plants, debris and the like.

The controversy as to the taxonomic position of these tentacled, bloodless invertebrates is reflected in the scientific names given the group. Linnaeus called them Zoophyta ("plantlike animals"). The term Bryozoa has been widely used by most zoologists; the British, however, prefer the term Polyzoa, which emphasizes the individuals that make up the colony.

Since 1869 the broad group has been divided into two clearly defined subgroups, called Entoprocta and Ectoprocta, on the basis of the position of the anus (see *Classification*, below). Some zoologists favour discarding the terms Bryozoa and Polyzoa entirely, and elevating Entoprocta and Ectoprocta to phylum rank. Entoprocta (*q.v.*) is treated in its own article; only the Ectoprocta are dealt with here, according to the following outline:

3. Ectoprocta and Entoprocta

I. INTRODUCTION

The Ectoprocta (so named because the anus is outside the row of tentacles surrounding the mouth) number about 4,000 recent and about 15,000 fossil species. They are widely distributed in time and space but are not always recognizable except by specialists. These colony-building animals abound in present-day waters and in fossil deposits from many geologic strata (see *Fossil Distribution*, below).

Although often encountered by laymen, Ectoprocta colonies are usually mistaken for corals, sponges, hydroids, mosses, seaweeds, slime, pebbles and other animate or inanimate encrustations. Because most species are sessile, rather small or inconspicuously nondescript to the naked eye and lack the power of locomotion, they evoke little interest or recognition.

At present they have no exploitable commercial value and heretofore mere considered as of minor importance except as fouling or stratigraphic organisms (see *Economic Importance*, below).

Their geological importance, however, may become greater as their identification becomes easier. Ordinarily they cannot be accurately identified without examination under a compound microscope.

There are few animal groups to compare with Ectoprocta for enchanting designs and geometric patterns.

1. Historical Background.—Bryozoans, sponges, seaweeds and coelenterates (corals, sea anemones, hydroids) usually grow in the same marine habitats, sometimes resemble each other superficially and are likely to show up together in a naturalist's collection. Consequently, during the 17th to early 19th centuries naturalists gradually began to study these organisms together, grouping them according to their texture and general growth habit (see *Taxonomic Position*, below).

These early workers had at their disposal microscopes that would be regarded today as little better than good hand lenses. Because classification and understanding of all species of bryozoans depends upon a good compound microscope, obviously the early workers were unequipped to study carefully and comprehend the nature of their specimens.

Theories.—It is inevitable that conflicting theories (mineralogical, botanical, zoological) should arise to explain the nature of these aquatic formations.

Little support was given the mineralogical theory, which maintained that the stony bryozoans, algae and corals were mineral formations resulting from sedimentation, agglutination or crystallization of calcareous and clayey matter. Supposedly by chance these deposits were fashioned into plantlike forms.

Predominant for many years was the botanical theory. The tiny bryozoan and coelenterate polyps with delicate tentacles spread out like the petals of a flower and the plantlike branching of some colonies lent support to this theory.

In time it became evident that the polyps possessed a far greater sensitivity, range of behaviour and complexity of structure than did ordinary plants, and the suspicion arose that perhaps they were animals.

2. Impediments to Study.—During the 19th century microscopical equipment improved; better methods of specimen preservation and preparation for microscopic study were devised; and the study of these minute organisms was begun in earnest by both amateur naturalists and professional biologists. Specimen collections, both fossil and recent, marine and fresh-water, were brought back from far and near. Cabinets of museums began to fill with specimens, some of which remain unstudied to this day.

Because bryozoans flourish in all seas and fresh waters, specimens are readily obtainable. But since they are difficult to keep alive and healthy for any length of time in the laboratory, most of the observations on them have been made on either freshly collected, dead, dried or preserved material. Moreover, in the majority of bryozoans the soft animal parts are encased in calcified exoskeletons, so the anatomy and physiology of the soft parts cannot be easily studied unless the exoskeleton is somehow removed. As of the early 1960s no successful method had been devised for removing the exoskeleton (zooecium) without harm to the living tissue inside. Because of these mechanical difficulties most of the bryozoan publications on the more heavily calcified types have been of a taxonomic nature (identification and description of species), and comparatively few papers have been produced on histology, physiology, embryology and development.

Early attempts to classify bryozoans were crude and based on what was evident to the unaided eye. Species and sometimes genera were erected on the basis of whether the colonies were stony, fleshy, slimy or fibrous; and whether they were encrusting, meshlike, arborescent, laminated or nodular. Little attention was given to the tiny polyps (zooids) that constituted the colony.

Species descriptions were usually brief, sometimes unaccompanied by any illustrations. The result has been chaos. It is impossible to say to which species some of these early names apply, or to determine the limits or validity of early genera and species. Present-day taxonomy is seriously handicapped by this early work.

As more collections were examined it became evident that there were many different bryozoan species, and that growth habit was

a poor criterion for differentiating colonies. Colony size, shape, growth habit and texture can be influenced by factors such as age of colony, nature and extent of the substratum and other environmental conditions. New criteria for identification had to be found.

The beautifully illustrated works of A. D'Orbigny (1839–52), G. Allman (1856) and G. Busk (1852–86) stressed the importance of anatomical and skeletal details of individual zooids. These helped to turn the taxonomists away from preoccupation with mere colony growth form as the main criterion for classification. Bryozoologists also began stressing such features as ornamentation of the exoskeleton and the shape, size, number, direction and location of different structures.

The current problems facing taxonomists concern the range of variation of these external structures, how much of the variation is due to heredity and how much to environment. Other problems concern polymorphism, life cycles and larvae. There is an urgent need for more intensive study of the morphology, embryology, physiology and behaviour of the already known species.

3. Economic Importance.—Ectoprocta are not important in the food cycle of other organisms but may be ingested (more by accident than selection) by ducks, fish, sharks and invertebrate filter feeders. Statoblasts (asexual germinative bodies) of fresh-water species of *Plumatella* and *Pectinatella* are ingested with food by fish and amphibians, sometimes passing undigested through the vertebrate gut.

J. V. F. Lamouroux (1816) relayed accounts of Icelanders chewing "*Eschara*" (a *Flustra* species or retepore?) like tobacco, and S. F. Harmer (1929) surmised that bryozoans were undoubtedly used in medicine and as a dentifrice in classical times.

The fresh-water *Plumatella*, *Fredericella* and *Paludicella* have in the past fouled drinking water and irrigation systems. If filters through which water enters pipes are lacking or ineffective, statoblasts, larvae or colony fragments may enter the pipes. Here they may attach and develop into colonies, thus interfering with the flow of water, clogging valves, aiding bacterial growth, forming a base or home for other fauna and flora, and by decay polluting the water.

Bryozoans have been troublesome in the water supply systems of many places including Belgium, Burma, Germany, Great Britain, the Netherlands, the Malay peninsula and some U.S. cities (Boston, the borough of Brooklyn, etc.); and in the irrigation pipes of Benton county, Washington.

Marine bryozoans are also common fouling organisms growing on ship bottoms, buoys, submerged objects and shells of dead or living mollusks, crustaceans and other sessile organisms. Ectoprocta larvae may pre-empt the settling space of oyster spat, thus seriously interfering with the settling and development of oysters, as R. C. Osburn (1944) and P. Korringa (1956) reported for Chesapeake bay and for South Africa, respectively.

Some Ectoprocta are toxic. Colonies of *Lophopodella carteri* and *Pectinatella gelatinosa*, if torn or damaged, release substances that are lethal to nearby fish.

R. S. Bassler (1922) reported that fossil Ectoprocta, particularly abundant in American Paleozoic strata, should be the fossils upon which to rely in correlation work, but that they had not yet received the attention they merit as key stratigraphic species. They preserve well, are of convenient size (only small fragments are necessary for identification) and are represented by numerous species, some of which do not have too great a vertical range—all features that characterize good stratigraphic species.

M. K. Elias and G. E. Condra (1957) reported that bryozoan reefs are known from the Silurian to the Late Tertiary age and that Soviet scientists recently discovered that the massive oil-producing knolls (*shikhany*) in the west central Urals were built principally by bryozoans, which evidently provided an intricate framework on which other organisms became attached.

4. Distribution and Collection.—Most Ectoprocta are marine. Only about 50 species inhabit fresh water. Bryozoans occur in all the oceans, from icy polar waters to the tropic seas. Those of the arctic, antarctic and temperate regions have been more intensively collected and studied than those of the tropics.

Shells and the protected surfaces of rocks are favourite sites for bryozoan attachment. Muddy and sandy bottoms are far less favourable. Marine species can be scraped off ship bottoms, algae and other substrates, or can be brought in on coral, ascidian tests, hydroids, worm tubes or crab carapaces. Fresh-water species dwell in stagnant pools, shallow sloughs only a few inches deep, lakes or running waters, on water lilies, pond weeds, submerged objects and occasionally in water pipes.

The families Penetrantiidae and Immergentiidae bore into shells of living snails and dead bivalves, riddling the shells with criss-crossing stolons. L. Silén (1947) suggested that phosphoric acid is the likely boring medium used by Penetrantia.

Ectoprocta occur from surface water level down to abyssal depths. The greatest depth from which a fresh-water bryozoan has been reported is 214 m. (about 700 ft.) for *Fredericella sultana* from Swiss lakes by F. Forel (1885). The deepest marine record is 3.125 fathoms or 5,719 m. (about 18,750 ft.) for four bryozoan species collected by the "Challenger" expedition (Busk, 1884). Current deep sea research may break this record.

Shore forms can be gathered without any special equipment other than containers for water and specimens; deeper species must be dredged for.

Since bryozoans are benthic and sessile (except during the brief pelagic larval stage), in collecting specimens it is often necessary to bring in the substratum (algae, rocks, shells, etc.) to which the colonies are attached. Separation from the substratum without destruction of the colonies is impossible in those cases where the species form a fragile, one-layered, entirely adherent crust over the substratum.

The colonies of the fresh-water *Fredericella*, *Lophopodella* and *Plumatella* can be more easily scraped off the substratum than can calcareous marine species, because the former adhere less firmly or closely and have a more open mode of growth.

5. Study and Experimentation.—*Methods of Study.*—Whenever possible, specimens should be studied alive soon after collection. In some species tentacle number is significant; it ranges from 8 to 106, depending on the species, being constant in some, variable in others. By treatment with chloral hydrate or other anesthetics the tentacles can be fixed in an extended position before the colonies are placed in 70% alcohol preservative.

Soft species may be thus treated and stored; but hard species, i.e., those with a thick, opaque, calcareous exoskeleton, lend themselves to other techniques, particularly if one is unconcerned with saving the soft internal tissues. Hard species can be kept in a dry state.

Fossil species may have to be sectioned in several planes to reveal hidden internal structures. Also, small fragments can be etched out of larger blocks of fossiliferous limestone by 3% hydrochloric acid solution (Bassler, 1953). Bryozoans also have been studied under polarized light and with X-rays.

Experimentation.—Since dependable methods of long-continued indoor cultivation of bryozoans have not been developed, extensive experimental work has not been undertaken on this group.

Most of the experiments, in addition to the observations on the normal behaviour, have been concerned largely with the study of responses of larvae, individuals and colonies to (1) different forms of stimulation (mechanical, thermal, photic, chemical, rheotactic); (2) alteration of the environment; or (3) the presentation of miscellaneous (treated or untreated) substrates for larval attachment or selection. The culture media have been varied by changing the pH, salinity and other chemical or nutrient constituents. The addition of assorted solutes and suspensions to cultures has permitted the study of ciliary action, storage of materials by cells, routes followed by ingested or excreted particles in zooids and the effects on larval behaviour and metamorphosis. A detailed account of the experimental results is summarized in the work of L. H. Hyman (see Bibliography).

II. GENERAL CHARACTERISTICS

A. THE COLONY

Bryozoans form sessile (attached) colonies called zoaria, which cover stones, shells, submerged objects and organisms with stony,

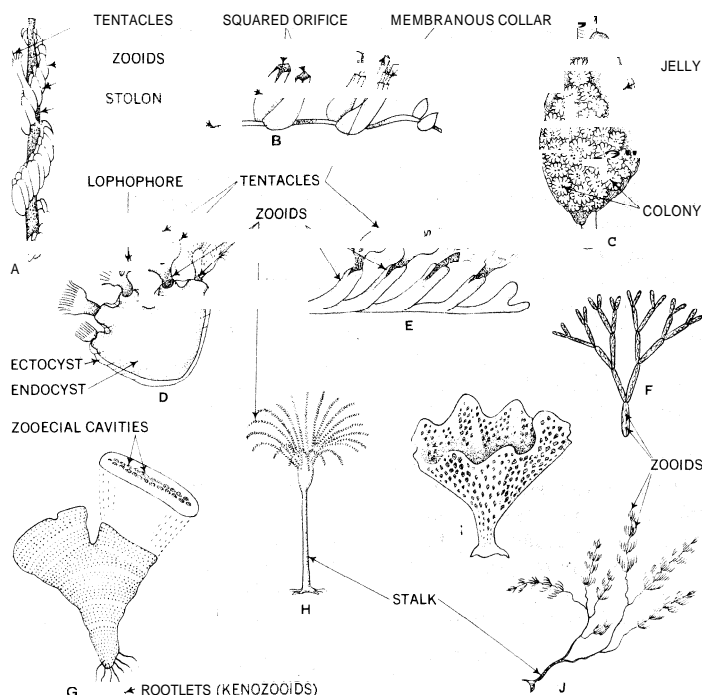

FIG. 1.—GROWTH FORMS OF BRYOZOAN COLONIES OF THE GROUPS: (A, B) CTENOSTOMATA; (C, D, E) PHYLACTOLAEMATA; (F, G, H, I, J) CHEILOSTOMATA

leathery, fibrous, mossy, fuzzy or gelatinous encrustations, depending upon the species.

1. Size and Colour.—*Size.*—In some instances colonies attain considerable bulk (a globular Trepostomata colony measured 19.7 in. in diameter) or form cobwebby sheets several square feet in area (*Membranipora* species). However, the individuals, called polyps or zooids, that make up the colony are microscopically minute, ranging from about 0.25 mm. to 4 mm. in length. It is not strange that early naturalists mistook these encrustations for crystallized mineral matter, coral, seaweeds, aquatic moss or slime (see Historical Background, above).

P. MacGillivray (1880) described a colony of *Dictyopora* (*Adeona cellulosa*), shaped like a head of lettuce, 9 in. high and 16 in. in circumference. G. Johnston (1847) confirmed D. Landsborough's observations on the thin "web of silvery lace," *Flustra* (*Membranipora*) membranacea, which could attain a length of five feet and a width of eight inches on a blade of the brown seaweed *Laminaria*; such a colony perhaps consisted of over 2,000,000 zooids. K. Reichert (1870) described a soft Zoobotryon colony that formed a mass 18 in. high and 3 to 4 ft. in circumference. Bassler (1953) mentioned a massive fossil Trepostomata colony more than a foot and a half in diameter.

Pectinatella magnifica, the fresh-water jelly ball, sometimes forms gelatinous, clammy masses larger than a man's head, with hundreds of star-shaped colonies covering the surface and many bloodworm larvae boring through.

Many bryozoans form single-layered crusts less than one millimetre thick, but others, such as *Smittina* species, can develop into multilayered, fist-sized, lightweight, porous "rocks" or nodules.

The number of zooids in a colony may be few (*Hippothoa distans*) or exceedingly large (some *Membranipora*), depending on the species, ecological conditions or the amount of suitable substrate. If the substratum is extensive and conditions are favourable (as for example on a large laminarian frond), a number of colonies might develop side by side and coalesce, their boundaries merging.

Colour.—Bryozoa exhibit all degrees of translucency, from glasslike transparency to utmost opacity. They also have a considerable colour range, from iridescent white to ivory, buff, tan, yellow, amber, pale orange, brown, rose or purplish red. The colour of some species may be determined genetically, whereas in others it may depend on diet, age or environmental conditions.

Bioluminescence, claimed for several bryozoan species, appears to be due to agents other than the bryozoans themselves, except possibly in the case of *Acanthodesia serrata*.

2. Colony Origin.—All Ectoprocta are colonial. Most of the colonies develop by asexual budding from an ancestrula, the initial zooid or parent of the colony. The ancestrula originates from the sexually produced larva.

New zooids are budded laterally and distally, producing colonies of definite shape and growth habit. Some organic continuity exists between neighbouring zooids through tiny pores present in their lateral and end walls (see Interzooidal Communications, below).

Fresh-water species have developed additional asexual ways of initiating colonies—by hibernacula and statoblasts. *Paludicella* produces hibernacula (chitin-encased resting buds), whereas the Phylactolaemata produce statoblasts (chitin-encapsuled seedlike bodies). Each germinates by splitting open and thrusting out a new zooid from between the two separated valves.

B. INDIVIDUALS (ZOOIDS)

1. Terminology.—Early workers in the 18th to mid-19th centuries used the word "cell" for the individual zooids or compartments that constitute a colony. In 1865 F. Smitt replaced cell with the word "zoecium." In 1892 H. Prouho suggested that zoecium be used only for the protective external envelope or exoskeleton of each individual of the colony and that a new word "bryozoite" be used for the entire complex of soft internal organs and hard exoskeleton of a single individual. In time "bryozoite" became "bryozooid," "bryozoid," and now it is simply "zooid" or "zoid." Many terms have been coined for various parts of a zooid and of a colony. The terminology developed for fossil species is truly formidable.

An Ectoprocta colony usually has many zooids, like a building that has many apartments. The zooids may be all of one kind or may be polymorphic, *i.e.*, of two or more different types, functionally and structurally. Not all species have all types.

Autozooids.—The most numerous zooids of a colony are the self-maintaining ones, called autozooids to distinguish them from other kinds of zooids (heterozooids) that might also occur in the same colony. Sometimes the distinction between autozooids and heterozooids is not very great. Other times there can be no mistaking the different types.

Heterozooids.—These are individuals or chambers in which there is no polypide (gut and tentacular crown) or only a vestige of polypide and some or no musculature. Heterozooids, which will be discussed in detail under the sections on classes and orders, include gonozooids (for reproduction or brooding); kenozooids (rootlets, spines, stolons, chambers), nanozooids (dwarfs), avicularia, vibracula and ancestrulae. Some bryozoan species have only autozooids in the colony. Other species may have one or more heterozooid types in addition, but no species contains all the different kinds of zooids known.

2. General Anatomy.—A typical autozooid consists of two major parts, the polypide and the body wall.

The polypide consists of the movable, living inner soft parts—the tentacular crown, digestive tract and nerves and muscles associated with the gut and tentacular crown.

3. Body Wall.—The body wall and its exoskeletal products are given a variety of names; cystid, zoecium, ectocyst, endocyst, cryptocyst, gymnocyst, pleurocyst, tremocyst, etc., depending upon their position, nature, composition or origin.

The exoskeleton secreted by the soft layer of the body wall in a few species is gelatinous, in others cuticular, chitinous or siliceous, but in the vast majority it is calcareous. Each little box housing a polypide is generally termed a zoecium. After a polypide dies and degenerates, shrinking to a lump called a brown body, its

zoecium may sometimes be reoccupied by a new, regenerated polypide. A colony may be dead at its point of origin, where its zoecia are empty of polypides, but may be flourishing at the periphery, where new polypides are developing and new buds forming continually.

4. Polypide (Living Tissue).—Ectoprocta are tentaculate coelomates having specialized musculature, nervous and reproductive systems and a Y-shaped digestive tract between whose two approximating ends is located the ganglionic centre of the nervous system. The coelom is ciliated in spots and sometimes traversed or cluttered with loose tissue (parenchyma) or tissue strands (funicular strands), muscle fibres and gonadal products. Circulatory and respiratory systems are absent. Whether any excretory organs are present is debatable.

Tentacular Crown.—The tentacular crown consists of a single row of ciliated hollow tentacles borne on a flexible fold of skin, the lophophore. The lophophore sits atop the tubular introvert (tentacular sheath) and surrounds the mouth. Great retractor muscles attach to the lophophore base. They pull the tentacular crown downward into the body cavity when occasion demands or when something disturbs the zooids. Simultaneously the tentacular sheath turns outside in, like a glove, forming a tubular cover or sheath for the retracted tentacles. Tentacle extrusion is accomplished by various methods, depending on the species and on the construction and flexibility of the body wall.

Digestive Tract.—The autozooid gut consists of the mouth, pharynx, esophagus, stomach (which is divided into the cardia, caecum and pylorus), rectum and anus. A gizzard appears in some ctenostome species. The mouth and anus are close together at the top of the polypide.

The caecum is anchored to the body wall by a funiculus in fresh-water species. A funiculus does not seem to be common in marine forms (Harmer, 1915).

Except for the funicular attachment the gut is suspended freely in the body cavity. When the tentacular crown is withdrawn into the body cavity the gut folds up or twists around in whatever coelomic space is available.

The mouth, pharynx and part of the pylorus are ciliated. The beating of cilia that cover certain areas of the tentacles, lophophore and mouth creates a current that sweeps food into the gullet.

The food consists of microorganisms: protozoa, bacteria, algae, larvae, crustacea, etc. Undesirable or overly large particles may be rejected by ciliary action and by flicking of the tentacles. Sometimes hardy organisms such as rotifers may be deposited in the fecal pellets, unharmed, after a sojourn in the gut.

The anus opens outward below the tentacular crown and outside it.

The bryozoan gut is embryologically peculiar in that it originates from the colony's body wall, which is ectodermal and mesodermal in origin. No entoderm cells take part in the formation of the gut.

5. Reproduction.—Zooids can reproduce in two ways: asexually by budding off new zooids to increase the population of the colony and sexually by production of larvae that develop from fertilized eggs. Some bryozoan species are hermaphroditic (having both male and female organs in the same zooid); others are dioecious (having separate sexes).

III. CLASS PHYLACTOLAEMATA (FRESH-WATER ECTOPROCTS)

The scientific name, derived from the Greek meaning "guarded gullet," refers to the flap of body wall (epistome) that overhangs the mouth. Statoblasts are produced and the lophophore is bilateral, usually horseshoe-shaped.

1. Description and Distribution.—There are approximately 50 Phylactolaemata species, all inhabitants of fresh water and of world-wide distribution. Their spread to new regions is facilitated by statoblasts, which can be transported by aquatic birds, amphibia, reptiles, aquatic vegetation, boats, floods, winds or other agencies. Statoblasts cling to bird feet or plumage or can be eaten by ducks, frogs, salamanders and turtles. A small percentage of such ingested statoblasts can survive passage through the verte-

brate digestive tract, emerge in the feces and still germinate (C. Brown, 1933)

Species of *Cristatella*, *Lophopus*, *Lophopodella* and *Pectinatella* can be easily differentiated from each other by the characteristic arrangement and number of rows of spines on their statoblasts. These four genera are alike in having a clear, gelatinous, colourless outer body covering called the ectocyst. They are sometimes known as the lophopodid type of Phylactolaemata, as opposed to the plumatellid type.

The plumatellid Phylactolaemata are the genera *Plumatella*, *Fredericella* and *Stoilella*. In these the ectocyst is firmer, coloured and usually chitinized. Sometimes sand grains or debris cling to its surface. The statoblasts of these Phylactolaemata are spineless. The plumatellid species are very hard to tell apart from each other, and it is uncertain just how many of them are valid and how many are merely phenotypes. M. Toriumi's experiments on Phylactolaemata indicate that variation in this group is far greater than early workers suspected.

The genera *Hyalinella*, *Gelatinella* and *Stephanella* are intermediate between the two above-mentioned groups. Their ectocyst is more of the lophopodid type, whereas their statoblasts are of the spineless, plumatellid type.

2. Colony Form.—A lophopodid colony is somewhat like a glove. Its zooids protrude, like glove fingers, from the common colonial body cavity and can withdraw their tentacular crowns and sheaths into it when necessary. Thus the basal attached part of the colony is a large, hollow, sometimes lobed but not partitioned, sac in which are suspended the polypides whose tentacular sheaths and crowns protrude from the free surface of the colony. The body cavity is cluttered with the dangling digestive tracts, strands of retractor muscles, funiculi, statoblasts and sometimes larvae, like scaffolding inside a room.

The number of zooids per colony ranges from a few to about 45 in *Lophopus* and *Lophopodella*.

Pectinatella magnifica forms a large central mass of jelly covered by a thin layer of numerous adjacent star-shaped colonies whose sizes range from 5 to 30 mm. Each colony contains about 18 zooids (or fewer). The composition of the jelly is 99.7% water. The remaining 0.3% contains various salts, protein, chitin, etc. (K. Kraepelin, 1887)

Cristatella forms a narrow gelatinous colony that has been likened to a hairy caterpillar because it looks fuzzy and can creep a bit. Young colonies of other lophopodid genera can also creep short distances. *Cristatella* colonies may reach a length of 30 cm. and a width of 1 cm., but are usually much smaller.

The plumatellid colony is more plantlike, its firm brownish zooids branching like twigs. There is greater separation between successive zooids. If a large number of statoblasts germinate in a small area, the resulting colonies may become densely matted, with their zoecial tubes cemented together and only their tips remaining free.

3. Polypide Structure.—*Epistome.*—The epistome is a ciliated, flexible fold of skin arising from the lophophore between mouth and anus. It overhangs the mouth. Muscle fibres pass anteroposteriorly across its cavity, the protoeol. When food particles are whirled down toward the mouth, the epistome aids in warding off the undesirable particles.

Tentacular Crown.—The tentacular crown consists of a row of 16 to 106 hollow tentacles borne on the lophophore. In *Fredericella* the lophophore is orbicular to oval, surrounding the mouth. In the remaining Phylactolaemata the lophophore, laterally prolonged into two free arms, is horseshoe-shaped, with the mouth in the bend of the horseshoe. The single circular row of tentacles is thus bent into a double horseshoe-shaped row, with the tentacles in front of the mouth constituting the outer row and those behind the mouth the inner row.

The lophopodid zooid generally has more tentacles than the plumatellid zooid. The tentacle number varies more in the Phylactolaemata than in the class Gymnolaemata (see below). The ancestrula, or initial zooid of the colony, may have fewer tentacles than succeeding zooids. The tentacle number within a given colony may vary too.

FIG. 2.—DIFFERENCES IN BRYOZOAN TENTACULAR CROWNS. TOP VIEWS (A) Representative entoproct; (B-D) ectoprocts: (B) *Plumatella* (Phylactolaemata); (C) *Fredericella* (Phylactolaemata); (D) ctenostome or cheilostome (Gymnolaemata)

The very flexible lophophore and tentacles are supplied with nerves and muscle fibres. Each tentacle tip has a small pore or canal. Whether the function of these pores is excretory or whether they are for equalization of internal body pressure is not certain. Perhaps they serve both purposes.

Coelom.—The extensive body cavity is lined with a tiny membrane, the peritoneum, and filled with fluid containing phagocytic amoeboid cells, suspended digestive tracts, attached funiculi, bundles of retractor muscles and sometimes sperms and larvae. It is incompletely partitioned into at least three communicating cavities: mesocoel, metacoel, protoeol.

The mesocoel is the space around the pharynx and extending into the lophophore. It is sometimes called the ring canal or the subtentacular canal. The metacoel is the largest and the main body cavity. The protoeol is the cavity of the epistome.

Two ciliated canals, one from each lophophore arm, converge around the epistome and open sometimes first into an enlarged vesicle, other times directly into the cavity of the median tentacles back of the mouth. The function of these so-called forked canals is uncertain.

Muscular System.—The musculature is of the smooth type in Phylactolaemata. The body wall has a circular and a longitudinal muscle layer, but the digestive tract has only a circular muscle layer. The tentacles have longitudinal fibres, but circular ones are absent.

In addition to the muscle layers or fibres of the body wall, gut and tentacles there are special groups of muscles and ligaments: retractors, vestibule dilators, diaphragmatic sphincter and duplicature bands.

The retractors are the most conspicuous muscles of the zooid. They are two bundles of long muscle fibres, a bundle along each side of the digestive tract. One end of the retractors attaches to the body wall. The other end attaches to the polypide from the esophagus upward to the lophophore. Contraction of the retractors pulls the polypide and tentacular crown into the body cavity, folding the tentacular crown as one would close an umbrella.

Healthy polypides do not remain retracted in the body cavity for long. Their normal position is one of expansion or protrusion, with the tentacles reasonably spread so that feeding can take place. Retraction occurs when there is a disturbance in the surrounding medium or when other organisms attack the bryozoan.

Emergence is facilitated by several structures and activities. When the vestibule dilators, consisting of single muscle fibres, contract and the diaphragmatic sphincter (see below) relaxes, the polypide is pushed out because of the coelomic pressure exerted on it by the contraction of the body wall musculature.

The diaphragmatic sphincter surrounds the base of the tentacular sheath. It attaches to the body wall by the radiating ligamentous duplicature bands. When the polypide is retracted and the tentacular crown is withdrawn into the intumed tentacular sheath, the diaphragmatic sphincter contracts like a drawstring to close the sheath above the tentacles.

Nervous System.—The central nervous system (lophopodid type) consists of a large central ganglion from which arise two main lophophoric nerve trunks (also called ganglionic horns) and a number of small nerves.

The ganglion is located in a closed sac in the mesocoel between the pharynx and anus. The ganglion is kidney-shaped; its core is fibrillar, and its surface layer ganglion-celled.

The two tubular ganglionic horns arising from the sides of the ganglion supply the tentacles and lophophore arms. They also give off nerve fibres that form an epistomial ring and a circumoral ring to supply the epistome and the tentacles.

The ganglion gives off independent nerves that directly supply the epistome, tentacular sheath, pharynx and the rest of the gut. The tentacular sheath and gut nerve supply form a plexus that is connected to a nerve plexus in the body wall.

Special sense organs are unknown.

4. Reproduction.—**Sexual Reproduction.**—Phylactolaemates are hermaphroditic, so far as is known. They have gonads, of peritoneal origin, but no gonoducts. The ovary is attached to the body wall at or near the vestibule, close to an asexual bud. The testes develop on the funiculus in most species; in *Cristatella* they may also develop on the partial septa in the metacoel.

Motile sperms, shed into the body cavity, are aided in their movement by the circulation of the coelomic fluid. Fertilization is internal.

Oval ciliated "larvae" (actually, very young colonies, 0.42–2 mm. long, depending on the species, consisting of a sac containing a developing polypide or two) develop internally. Later they dislodge from their attachment to the body wall and rotate about in the coelom of the mother colony for a short time before release.

Upon release the young colonies swim about actively in the water before attachment and metamorphosis. The covering cilia are shed in patches. The outside larval covering peels back while the internal polypide-producing membrane with its polypides is extruded. In a short time the fast-shrinking larval covering, sucked into the bottom of the new, fast-growing colony, degenerates or is used up during the next two to five days.

Ciliated larvae can be found during the summer and into the early fall, but are far less numerous than the asexually produced statoblasts.

Asexual Reproduction.—The initial zooids of a colony may develop from a sexually produced larva or from an asexually produced statoblast. The resulting colonies, so far as is known, do not differ in any recognizable respect. Succeeding zooids develop by budding. Divided or severed colonies can continue to propagate.

Budding.—This refers to growths that develop internally on the colony body wall. These polypide buds appear in definite locations and in a definite sequence. Between these main buds appear secondary, tertiary, etc., buds that may grow while the main buds are thriving, degenerating or dying.

The amorphous cell mass of a bud speedily differentiates into vaguely outlined lophophore, retractor muscles and gut. Later, tentacle stubs appear. The polypide, which enlarges and differentiates, does not evaginate its tentacles until the digestive tract and tentacles are sufficiently developed so that the polypide can feed.

New buds form and evaginate at a rapid rate if there is sufficient food. Because of difficulties in cultivating, colony development seems to be much slower under laboratory conditions than under natural conditions.

In *Lophopodella carteri* the initial zooid is sometimes sufficiently mature to evaginate on the same day that the statoblast from which it has developed cracks open; at other times it is not ready to evaginate for a week. The second polypide is ready to evaginate the next day; thereafter the budding process is speeded up if nourishment is adequate.

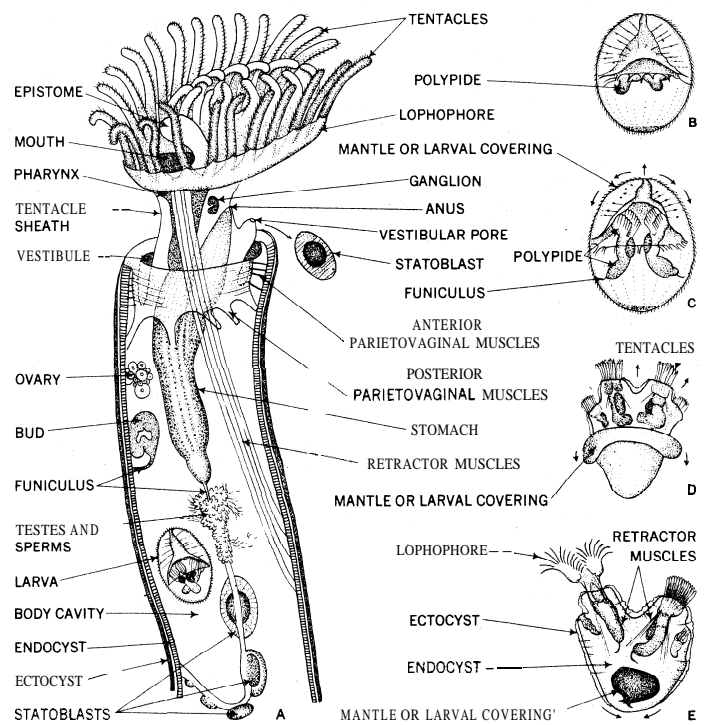

FIG. 3.—REPRODUCTION AND DEVELOPMENT OF PHYLACTOLAEMATA

(A) Mature plumatellid (*Plumatella*) zooid containing all reproductive products, although not all of them actually occur simultaneously at this stage of development; (B-E) stages of a plumatellid (*Hyalinella*) from "larva" (cystid) to young colony showing (B) ciliated larva; (C) later larva with polypides better differentiated (arrows indicate direction along which mantle will fold back as polypides evaginate); (D) larva with mantle peeled down developing into colony; (E) young colony of four zooids with remnants of degenerating mantle sucked into colony body cavity

A laboratory-reared colony of *Hyalinella punctata* evaginated 45 polypides by the 20th day after the original polypide had emerged from the statoblast.

In Phylactolaemata and Cyclostomata (see below) colonies a new polypide develops first, then the zoecial, or cystid, wall grows around it and differentiates to house the polypide. The reverse situation prevails in the Ctenostomata and Cheilostomata: in these groups the cystid develops first, forming a hollow chamber within which a polypide will develop later.

Statoblasts.—Phylactolaemata alone among the bryozoa produce statoblasts. These chitin-encased, brownish germinative bodies, formed in great numbers during most of the life of the colony, are extremely useful in identification. Some bryozoans can be identified from a single statoblast. They pass out of the colony through a special scarcely detectable vestibular pore located ventral to the anal region (E. Marcus, 1941).

Statoblasts are released in large numbers during the growing season (spring to autumn). Many of them float to the surface of the water, sometimes forming noticeable drifts at the water's edge. Brown (1933) reported drifts one to four feet wide, half a mile in extent, along the shores of Douglas lake, Michigan, in spring and late autumn—drifts composed mainly of statoblasts.

Special names are given to different types of statoblasts. Statoblasts provided with a buoyant float of air cells but no spines are called floatoblasts. Statoblasts provided with a buoyant float and with spines are spinoblasts. Both types may float to the surface of the water. Statoblasts that remain permanently attached to the inside of zoecial tubes or to the substratum, and that lack a float or have only a vestigial annulus instead, are called sessoblasts. Piptoblasts are without a float but are not permanently attached; they lack spines.

Although statoblasts normally germinate shortly after release (except when they overwinter), they can withstand drying or chilling for considerable periods of time, up to 4½ years for *Lophopodella*, and still remain viable.

Statoblasts develop on the polypide funiculus along with the testes, though not always at the same time. When together, the

testes are closer to the polypide gut. while the statoblasts, strung below the testes like a row of diminishing discs, are closer to the body wall (P. Brien and C. Mordant, 1956).

The very youngest statoblasts appear as opaque, white swellings on the funiculus. As they develop, their colour and shape change, from white to yellow to brown and from a small lump to a thick, flattened disc. The capsule, with its germinal material, is distinguishable earlier than the lighter coloured float. As many as eight developing statoblasts may appear in a graded series of sizes on the funiculus, at any one time.

Colonies die out usually at the onset of winter or earlier, their tubes sometimes loaded with statoblasts. When spring comes, the overwintered statoblasts hatch and start new colonies.

IV. CLASS GYMNOLEAMATA
(CHIEFLY MARINE ECTOPROCTS)

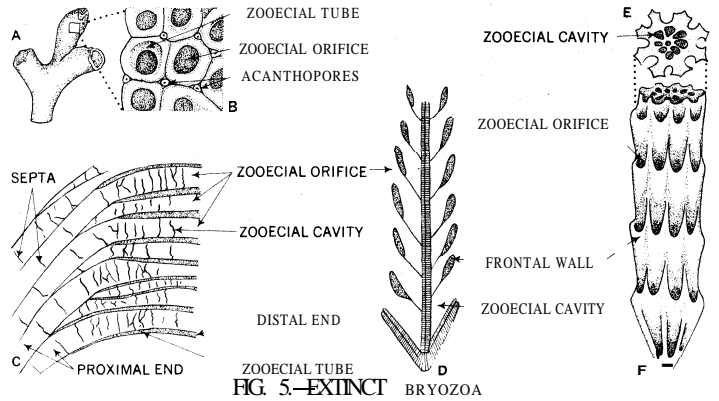

The name of this class, derived from the Greek meaning "naked gullet," refers to the lack of an epistome to guard the mouth. The lophophore is circular. To this class belong most of the 19,000 bryozoan species.

A. EXTINCT ORDERS

1. Order **Trepotomata**.—This is a wholly fossil Paleozoic order, named for the difference in the appearance between the inner and outer zones of the zoecial tubes. The inner, axial part of the tube is thin-walled. The outer, superficial part of the tube is thick-walled. The transition is sudden.

The trepotomes, sometimes called the stony bryozoans, for many years were considered to be fossil corals. They have long calcareous tubes (tubular zoecia) consolidated by branching and growth habit into massive colonies or lamellar fronds.

The zoecial tubes are transversely partitioned by "diaphragms" that may represent floors laid down by successive occupants and builders of the tubes.

(A-C) *Trepotomata* (*Batostoma*) showing (A) fragment of stone colony; (B) enlargement of surface of colony; (C) longitudinal section through colony. (D-F) *Cryptostomata* (*Utrichostylus*) showing (D) longitudinal section of colony; (E) end view of colony; (F) side view of colony fragment

Small clumps of elevated "cells" (monticules) are scattered over the colony surface at regular intervals.

Trepotomes, apparently closely related to Cyclostomata, are reported by Bassler (1953) as comprising 105 genera.

2. Order **Cryptostomata**.—This group is so-named because the zoecial orifice (opening through which tentacles and tentacular sheath are extruded) is concealed at the bottom of a tubular shaft or vestibule. This is also a wholly extinct Paleozoic order.

The colonies are calcareous, but not massive. They form branched stems or delicate reticulated fronds, like a sheet punched full of regularly spaced holes. As in the trepotomes the zoecial tubes have a thick-walled outer zone and a thin-walled inner zone, but the tubes are much shorter than in trepotomes.

Structurally the cryptostomes appear to be related to the Cheilostomata. Bassler (1953) suggests that possibly the Cryptostomata are really Paleozoic cheilostomes. He reports 127 cryptostome genera, but Elias and Condra (1957) have detached the family Fenestellidae from the cryptostomes and have made a new order, the Fenestrata, out of it.

B. ORDER CYCLOSTOMATA (STENOLEAMATA)

The group is so-named because the zoecial orifice is round and not closed by an operculum.

Because a class of fishlike vertebrates is already named Cyclostomata (hagfishes, lampreys) bryozoologists have suggested other names for the cyclostomatous Bryozoa: Stenoleamata (F. Borg, 1926) and Stenostomata (Marcus, 1938).

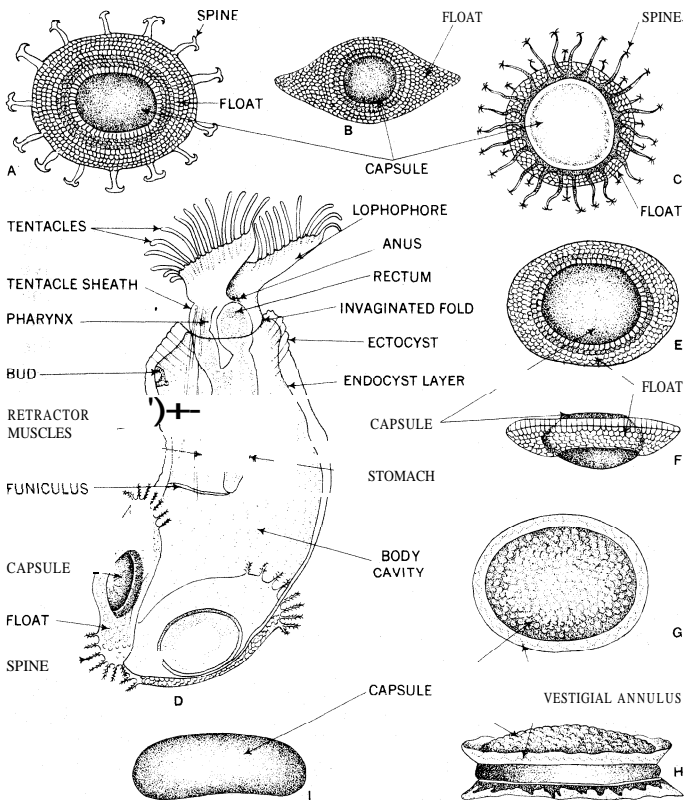

Borg's Stenoleamata (meaning narrow gullet) was intended as an order name for cyclostomes and possibly trepotomes, but for etymological reasons his name was rejected by others. Marcus proposed the name Stenostomata (meaning narrow mouth) as being more suitable. Although at present all three names are in use, preference should perhaps be given to Borg's term on the basis of priority.

1. Description and Distribution. — Stenoleamata form simple-looking colonies without avicularia or vibracula. Their zooids, narrow, cylindrical, sometimes very elongated tubes, have calcified walls that in some families (but not in the Horneridae and Lichenoporidae) are provided with minute pores (pseudopores).

Stenoleamates are entirely marine. Fossil cyclostomes appeared in the Lower Ordovician and became the predominant Early and Middle Mesozoic Bryozoa. Bassler (1953) reports about 303 genera of fossil and recent cyclostomes. The cyclostomes, like the Phylactolaemata, are a more primitive or simpler group than the Cheilo-Ctenostomata.

The zoecial orifice is rounded, terminal and closed not by an operculum but by an uncalcified terminal membrane of which the vestibule and tentacle sheath are an inward continuation.

The whole polypide is suspended in a membranous sac seemingly peculiar to the stenoleamates, yet having a hydrostatic function. Embryonic development occurs inside the membranous sac of a fertile zooid. Polyembryony, the formation of several embryos from one egg, occurs among the stenoleamates. Embryos are

incubated in special gonozooids (in the family Crisiidae) or in coelomic spaces or brood chambers between zooids (in the Lichenoporidae).

Stenolaemata fall easily into two natural groups: the articulated-jointed, erect Crisiidae and the unjointed, erect or encrusting, remaining families.

The colonies of articulated forms are necklacelike, consisting of short, yellow to brown cuticular nodes (joints) alternating with long, white calcareous internodes. The internodes consist of zoecial tubes branching either in a single series or in a spray. Tubes may be grouped into radial, transverse or longitudinal bundles called fascicles.

The colonies of nonarticulated forms are heavier, less elegant. One of these has star-shaped colonies. The other families form fanlike, discoid or rounded colonies

Arborescent colonies may occur in either articulated or non-articulated species.

2. Polymorphism.—A stenolaemate colony may contain several kinds of zooids—nanozooids, kenozooids, gonozooids and autozooids

Nanozooids are miniature tubular zooids of unknown function, interspersed among the regular autozooids. They contain musculature, a membranous sac, a tentacle sheath, a single short, hollow, fingerlike tentacle and a solid mass of cells that Borg (1926) regards as a greatly reduced, nonfunctional alimentary canal.

Kenozooids are of several types including hollow tubes and spines as well as spaces or chambers in which no polypides are ever developed. Kenozooids met with most frequently are rhizoids and spines

The rhizoids of living stenolaemates are long, slender, articulated rootlets, sometimes branched, having nodes and thin tubular internodes. They sprout from the basal part of the colony. Their tips are membranous. Their internal cavity, like that of the spines mentioned below, contains a network of mesenchyme cells. New colonies or branches may bud from some of the rhizoids. Other rhizoids probably help to fasten the colony more firmly to the substratum.

The spines, also called processus spiniformes, are of two kinds. One is the very long, jointed type, often longer than the autozooids. The other is short and unjointed. The tips of both kinds are calcareous and blunt. Spines are located usually more distally on the autozooids and internodes than are the rhizoids. Their function is unknown.

Spaces or chambers, also called alveoli, occurring between zoecia or in angles formed by diverging or converging zoecial tubes, are regarded as kenozooids.

Gonozooids, or brood chambers, are concerned with reproduction. Their number is small, their capacity large and their position in the colony or along the internodes very definite. Female germ cells develop and embryos are incubated in gonozooids.

In all stenolaemata, except the Lichenoporidae, the gonozooids, also called oecia or ovicells, are individual zooids transformed into inflated, sometimes vase-shaped brood chambers. Polypides present in gonozooids degenerate as the embryos approach maturity, providing nutriment for the embryo.

In the Lichenoporidae the embryos are incubated in special communal brood chambers rather than in single enlarged zooids. The alveoli and spaces between zooids are roofed over by a calcareous layer to form a large communal nursery or zoarial brood chamber. The calcareous alveolar walls, now internal partitions, are resorbed to make the brood chamber larger.

The gonozooids open to the outside by a single short tube usually like the neck of a bottle. Its opening is the oeciopore or aperture.

In Lichenoporidae there may be two to eight apertures to the brood chamber. Resorption of the calcareous walls about the opening or elsewhere occurs in some species to make the opening larger for the exit of embryos.

Brood chambers, gonozooids and oeciopores are important in identification of stenolaemate species.

3. Polypide Structure.—The polypide is similar to those of other Bryozoa except that it is suspended in a special membranous sac that seems to have no equivalent in other bryozoan groups. The membranous sac divides the main coelom into two parts—the inner endosaccal and the outer exosaccal part—a coelom within a coelom. These two coelomic cavities have no connection with each other. The regular body wall (cuticular, calcareous and inner epithelial) layers enclose the exosaccal coelom.

The tentacular crown cannot be extended very far out of the zoecium. There are few tentacles, about 8 to 16. In addition to their normal function of directing food into the mouth by ciliary action they probably have a respiratory and excretory function.

Both smooth and striated muscles are present; the polypide retractors and the tentacular muscles are striated, whereas the atrial sphincter and the vestibular extensors are smooth.

Little is known of the peripheral nervous system.

4. Reproduction.—Stenolaemates reproduce asexually by budding and sexually by polyembryony and production of larvae.

Budding.—Colonies develop from a hollow, calcareous-walled, attached primary disc that originates from the metamorphosis of a larva devoid of an alimentary canal (Borg, 1926). The primary disc contains the "common bud," which will produce the succeeding zooids of the colony. Before the upper wall of the primary disc calcifies the common bud sprouts a tube that will become the next zooid. The zooid tip is uncalcified, but in time an oblique calcareous partition begins to grow into the zooid from the basal-

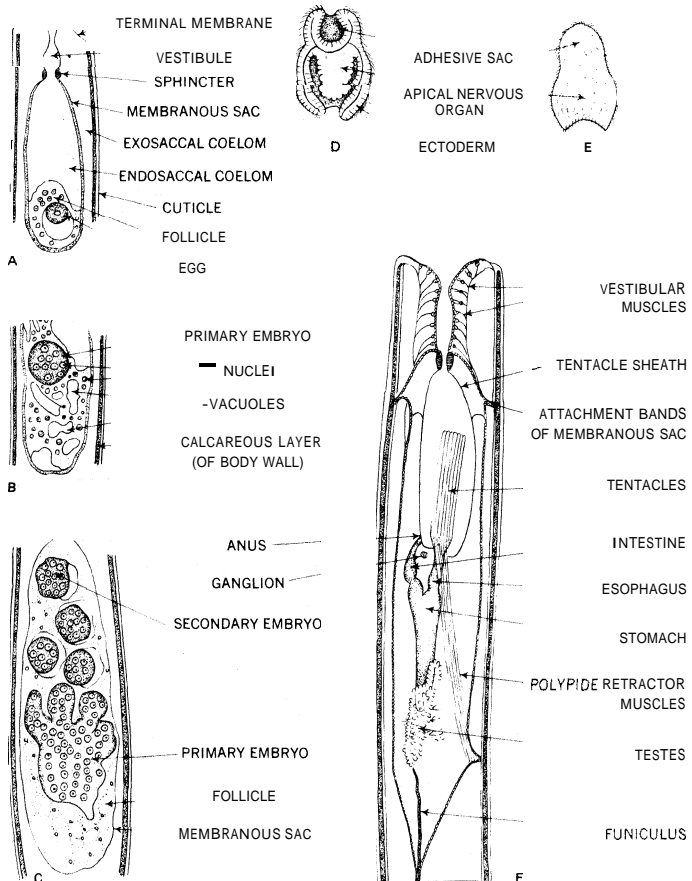

FIG. 7 — REPRODUCTION IN CYCLOSTOMATA (STENOLAEMATA) (A-C) Polyembryony in *Crisia* showing (A) upper portion of gonozooid with egg enclosed in follicle; (B) egg developed into multinucleate primary embryo; (C) enlarging primary embryo budding off secondary embryos (D) longitudinal section of cyclostome larva; (E) external view of larva; (F) adult male zooid

lateral wall, dividing the tube into two tubes, each of which becomes a zooid. Each zooid contains common bud material that will keep on producing more tubes and new zooids.

The growing zone of the common bud is the distal edge of the terminal membrane. Here new cells originate and cells can detach from it and wander to new locations. Here also originate the new polypides (soft parts of the zooid). The formation of the polypide precedes the differentiation of its zoecium (exoskeleton)—a condition similar to that found in Phylactolaemata but the reverse of what occurs in the Cheilo-Ctenostome groups (see below).

Sexual Reproduction.—Harmer (1893) was the first to see stenolaemate spermatozoa. Subsequent studies revealed that some stenolaemates are hermaphroditic (*Berenicea patina*, *Diplosolen obelia*, *Stomatopora granulata*, *Tubulipora* species), whereas others are dioecious (*Crisia occidentalis*, *Lichenopora verrucaria*). Some Lichenoporidae have male, female and hermaphroditic zooids within the same colony.

Male germ cells are of mesodermal origin. The stenolaemate testis becomes unusually large compared with those of other Bryozoa. Its location is similar to that of the Phylactolaemata. It encases the lower part of the gut (caecum tip) and extends along the funiculus, which attaches the gut to the coelomic wall. Both gut and testis are in the membranous sac, which attaches to the body wall in a few places.

When mature, the sperms are released into the body cavity, moving freely therein and eventually accumulating in great numbers around the atrial sphincter, near the tentacles. It is not known how sperms escape from the body cavity, but Borg postulated that they pass through a break in the tentacle sheath, then out through the vestibular orifice. How they gain entrance into the female zooids or access to eggs has not yet been solved.

Harmer (1893) described polyembryony in *Crisia*. Eggs develop in the common bud or growing zone of the terminal membrane. An egg becomes associated with the potential alimentary canal of a young gonozooid. The gut grows around it, forming the egg follicle. Those germ cells that do not attach to a polypide degenerate. The egg cleaves a number of times, producing a solid mass of undifferentiated cells, *i.e.*, many nuclei imbedded in a protoplasmic mass, the whole of which is called the primary embryo.

Gradually, several finger-shaped cellular processes grow out from the primary embryo. They pinch off transversely into a large number (up to 115) of rounded cellular masses, the secondary embryos. These become two-layered and speedily increase in size by absorption of nutriment from the surrounding tissue in the gonozooid.

The yellowish embryos develop external cilia and escape through the oeciopore.

The young larva attaches to the substratum by its sucker, then peels back and rolls down its mantle covering toward the attached, flattened base. The larval tissues undergo partial dissolution (histolysis). After this metamorphosis the first polypide develops from the free surface of the flattened remains of the larva, which now is known as the primary disc.

C. ORDER CTENOSTOMATA

The name of this order refers to a "comblike row of setae" found on the flexible fold of body wall that closes the zoecial orifice. This supposed row of setae is really a membranous collar that may fold in definite creases like a fan or umbrella. The early workers sometimes saw the creases but not the membrane stretching between them.

I. Description and Distribution.—Of the about 43 genera of ctenostomes (recent and fossil) most are marine; only a few species inhabit brackish or fresh waters.

Seaweeds, hydroids and the green colonial tunicate *Perophora* are favourite substrates for the dainty *Aeoverrillia* and *Bowerbankia* colonies. The grayish to brownish *Alcyonidium* and *Flustrellidra* form a thick, rubbery coating over the marine brown alga *Ascophyllum*. A. Lacourt (1949) found *Alcyonidium* forming a mass nearly 11 in. high.

FIG. 8.—MORPHOLOGY CTENOSTOMATA

(A) Colony of *Paludicella articulata* showing growth habit and mode of branching; (B) two hibernacula on old zoecium with new zooid sprouting from upper hibernaculum; (C) zooid with polypide evaginated; (D) zooid with polypide retracted into body cavity

The most famous brackish-water ctenostome is *Victorella pavida*, reported from nearly every continent, from waters of low salinity and on occasion even from fresh water and marine localities (H. Brattstrom, 1954). R. C. Osburn (1944) reported it to be a fouling and oyster-smothering nuisance in Chesapeake bay, where it formed plushlike mats up to half an inch thick.

Aracznoida, from central Africa; *Hisplopia*, from India; *Pottsiella*, from the U.S.; and *Paludicella*, cosmopolitan, are four fresh-water genera. Although the first three are poorly known and rarely reported, *Paludicella* is common and has been well studied. (See Fossil Distribution, below.)

2. Body Wall.—Ctenostomes have soft walls. Their zoecia are membranous, leathery or horny, but not calcareous, although Kraepelin (1887) reported that minute scattered calcareous granules are sometimes present in the chitinous cuticle of hibernacula.

The body wall consists of cuticle, ectodermal epithelium and sparse peritoneal cells, with an occasional small band of circular (transverse) muscle fibres called parietal muscles. In *Paludicella* the parietals are arranged on the right and left sides of the body in several circular bands containing two to six muscle fibres each, lining the body cavity.

The cuticle may be thick or thin, sometimes of several layers, and chitinized.

In ctenostomes the orifice is terminal or nearly so. When pulled in to its utmost its shape may be round, slitlike, square or pentagonal, depending on the species.

Its closing is simple: after the tentacles, tentacular sheath, collar and vestibular wall are all pulled in, the vestibular opening either

puckered up or is closed by folds of the body wall, or it is simply plugged by the folded membranous collar.

3. Polypide Structure.—Introvert.—The anterior end of the polypide that is capable of turning in is called the introvert. Respective positions of the introverted parts are the tentacular crown, with its 8 to 34 tentacles, at the top of the tentacular sheath; and the membranous collar, surrounding the base of the sheath and diaphragm.

The tentacles, sheath and collar can be extended far out by the combined forces of the contraction of the muscles of the body wall, the pressure of the coelomic fluid and the relaxation or action of the retractors and posterior parietovaginal (vestibular) muscles.

The whole tentacular complex can be introverted by the contraction of the great polypide retractors and the co-ordinated action of the sphincters and the anterior parietovaginal muscles. This description is based on the behaviour in *Paludicella*.

Digestive Tract.—The gut is extremely long in some ctenostomes. Some species have a bulbous gizzard in the cardiac part of the stomach. The gizzard wall, a thick layer of circular muscle fibres, bears individual chitinous teeth or two or four denticled shields. The size and thickness of the teeth or denticles vary with age.

The gut is anchored to the body wall by a single funiculus in some species (*Victorella*), by two funiculi in *Paludicella* or by no distinct funiculus in others. Harmer (1915) noted that a funiculus was not common in marine Bryozoa but that there was a more diffuse arrangement of funicular tissue.

4. Colony Form.—Two main types of colony, based on the mode of budding, occur in ctenostomes. Each characterizes a suborder. In suborder *Stolonifera* the zooids bud from stolons. In suborder *Carnosa* zooids bud from each other. In both types the colony originates by asexual budding from an ancestrula (see *Colony Orzgin*, above).

The saclike ancestrulae are of two types. One type, as in *Victorella* and *Pherusella*, contains a polypide. The other type, as in *Walkeria* and *Vesicularia*, apparently does not have a polypide but buds off stolons from which zooids with polypides develop later.

5. Reproduction.—Sexual Reproduction.—The number of developing oocytes in a bryozoan ovary is generally few, but there may be about 30 in *Hypophorella*. Fertilization is internal. In species that brood internally, generally only one fertilized egg is destined to produce an embryo at any given time; the other fertilized eggs presumably dissolve to provide nourishment for the developing embryo. A developing embryo becomes enclosed in a sac, the embryonary, on the body wall near the orifice.

Although the exact mode of escape of embryos or larvae from the zooid has not been observed often, some are known to emerge through a tardily developed channel where the embryonary attaches to the parental body wall; others leave by evaginations of the parental body wall; and still others break through thin spots in the degenerating wall of the parent zooid.

An opening, the coelomopore, close to the anal and tentacular region, has been observed in a few ctenostomes, but whether it serves for exit of eggs or entrance of sperms or perhaps some other function is undetermined.

Fertilization takes place in the body cavity. Cross-fertilization must occur in some species, self-fertilization may presumably occur in others, although actual observations on the latter condition are meagre.

Larvae.—The sexually produced ctenostome larvae vary greatly in appearance and complexity. They may be wedgelike, kidney-shaped, plum-shaped, etc.

Ctenostomes may be hermaphroditic (*Noletta*) or dioecious (*Alcyonidium*). Some species are oviparous, releasing eggs (early embryos). Others are viviparous, giving birth to larvae. Ovicells for incubation of larvae are lacking in ctenostomes.

The eggs of oviparous species become free-swimming so-called cyphonautes larvae that exist for about two months, at the end of which time they settle on a substrate and undergo metamorphosis. Because of a well developed functional ciliary, muscular, nerve and digestive tract apparatus and a protective bivalve shell

the cyphonautes is designed for a free living existence of longer duration than are the other bryozoan larvae in which the gut is either not present or vestigial, and which swim about for only a few hours before attachment and metamorphosis. Ctenostomes producing cyphonautes larvae are species of *Hypophorella*, *Farrella* and *Pherusella*.

The viviparous species (*Alcyonidium polyoum*, *Bowerbankia*) release larvae of an unnamed type, that are much shorter lived in the free-swimming state than the cyphonautes. Their gut is incomplete or undeveloped, and metamorphosis must come quickly or the larva will perish.

Asexual Reproduction.—Some ctenostomes have evolved special methods of asexual reproduction and regeneration, such as budding from stolons, formation of hibernacula and of blastogenic branches.

Stolons.—These are mostly delicate partitioned tubes containing mesodermal funicular tissue. They may be basal (creeping); lateral or axial (upright); or branching or anastomosing tubes that sprouted out of an ancestrula. Stolons propagate themselves by further budding and partitioning. They can be very slender (*Aeverrillia*) or very broad (*Zoobotryon*).

New zooids that originate from the stolon may bud off as individual units (*Aeverrillia*) or in clusters from the sides of the stolon (*Bowerbankia*) or even in a spiral around the stolon (*Amathia*). The stolon ectoderm initiates the formation of the zooids by evagination, with mesoderm or funicular cells joining soon after.

Since stolons are without polypides or special internal organs, they are regarded as a special kind of zooid (kenozooid). The ordinary zooids that sprout from them are autozooids, since they contain functional, well-developed internal systems.

Hibernacula.—Ctenostomes of fresh water (*Paludicella*) and brackish water (*Victorella*) can produce, in addition to ordinary buds, special "winter buds" called hibernacula. These are brownish, chitin-encased, variously shaped seedlike bodies containing germinative material. They remain after the parent colony has disintegrated, and germinate when conditions are appropriate.

Paludicella hibernacula are of two types, internal and external, with respect to the autozooids: the internal, cigar-shaped hibernacula are inside the autozooid; the external, irregularly-shaped ones are like stunted, distorted buds sprouting from the autozooids. *Victorella* hibernacula are external.

Blastogenic Branches.—Harmer (1931) reviewed the studies of G. Zirpolo (1922–25) on the production of special germinative branches of *Zoobotryon* colonies around Naples. These branches contained large quantities of yellow, nutritive, "blastogenous" (yolk?) substance. When the colonies disintegrated, the blastogenic stalks sank to the bottom and remained dormant until conditions were suitable for their germination, at which time the branches sprouted new buds (stolons or zooids).

6. Polymorphism.—Ctenostomes exhibit little polymorphism. Only autozooids, occasionally gonozooids and some kinds of kenozooids are present. Ovicells, avicularia and vibacula, which characterize many of the closely related cheilostomes, are absent from ctenostomes.

In the shell-boring *Penetrantia*, saclike gonozooids are present attached to the autozooids. These gonozooids, which contain a rudimentary polypide, serve to incubate the embryo.

The kenozooids include stolons and special spine-bearing pads. The latter occur between the regular autozooids in *Flustrellidra*.

7. Cheilo-Ctenostomata.—Silén (1942) after an extensive study asserted that Cheilostomata and Ctenostomata are so closely allied that they should be classed as a collective group, the Cheilo-Ctenostomata, and that the ctenostome part should be divided into two suborders: *Carnosa* and *Stolonifera*.

Carnose.—Colonies of this suborder are fleshy or chitinous, and encrusting. The zooids may be baggy or broadly ovoid to hexagonal, and touch each other on all their sides (*Alcyonidium*), or they may be slender and widely spaced from each other (*Paludicella*).

The zooecial orifice is closed by the membranous collar and by simple circular folds of the body wall. In *Flustrellidridae* two thick lips replace the folds. Common carnose genera are: *Alcyoni-*

dium, Arachnidium, *Flustrellidra* and *Paludicella*.

Stolonifera.—This suborder is characterized by thin, erect or creeping, tubular branches called stolons, which sprout from the ancestrula, a scarcely distinguishable membranous sac. By lateral budding the stolons produce a membranous or chitinous colony whose zooids are separate and bottle- or vase-shaped. New stolons bud from the old, thus spreading the colony. New zooids arise from the stolons and not from each other. Internal partitions mark off the stolon segments from each other. Common stoloniferous genera are: *Aeverillia*, *Amathia*, *Mimosella*, *Penetrantia*. Members of the last-named genus bore into mollusk shells and barnacles, scarring them with pits and delicately etched lines.

D. ORDER CHEILOSTOMATA

The name refers to the movable lip (operculum) that closes the zoecial orifice.

1. Description and Distribution.—Cheilostomes are represented by numerous species, at least 632 genera and 82 families (Bassler, 1953). They are the commonest marine bryozoans encountered, occurring in many localities, from shore level to ocean depths.

2. Colony Form.—Colony growth form is extremely diversified but usually characteristic for the species. It can be bushlike, interconnecting, encrusting, fan-shaped or nodular.

The growth rate of young colonies is fast. S. Mawatari (1951) reported that *Bugula neritina* buds required two days to develop to functional status. J. Orton reported *Bugula flabellata* capable of developing 100 zooids in a fortnight and producing larvae by the eighth week.

As in other bryozoans regenerative processes are great.

3. Body Wall.—The zoecial wall ranges from membranous, chitinous, siliceous to calcareous, the last type being the commonest.

The boxlike zoecia are variously shaped. Their frontal wall is often beautifully sculptured, embossed or pitted. In most cheilostomes the lateral walls of adjacent zooids fuse together to form a double wall, but have interzooidal communication pores. The basal (dorsal) walls are usually imperforate and undecorated,

although some exceptions may occur. The end (transverse) walls are single and perforated by pores. Differences in zoecial shape and frontal decoration are often useful in identification of species.

The thickness of the zoecial walls depends on environment, heredity and age. Some species in the families Smittinidae, Celleporidae, etc., as they age, undergo a secondary calcification of the frontal wall that obliterates or fills in many of the distinguishing characteristics and markings, pores, spines, avicularia, zoecial boundaries, ovicell boundaries, etc., by a thick calcareous coat. In such species the lateral and back walls are not affected

Protrusion or retraction of the polypide are facilitated by special hydrostatic devices. a frontal compensation sac in the suborder Ascophora and a flexible frontal membrane in the suborder Anasca.

4. Tentacle Protrusion and Retraction.—Tentacles numbering 9 to 32, depending on the species, are protruded through the zoecial orifice that is otherwise closed by a chitinous flap, the operculum. The operculum operates somewhat like a draw-bridge by means of special occlusor muscles.

Compensation Sac.—The mechanics of tentacular crown or polypide protrusion in cheilostomes encased in a hard exoskeleton were not clearly understood until J. Jullien's discovery of the compensation sac (compensatrix) in 1858.

The compensation sac, a delicate, almost imperceptible membranous pocket between the rigid exoskeleton and the soft inside body wall of the zooid, has its edges attached to the body wall by groups of parietal muscle fibres. The compensation sac works somewhat like a bellows. When water flows into the sac, pressure is built up in the coelom and the tentacles are forced outward. When water leaves the sac, pressure is reduced and the tentacles have space for withdrawal by the great retractor muscles.

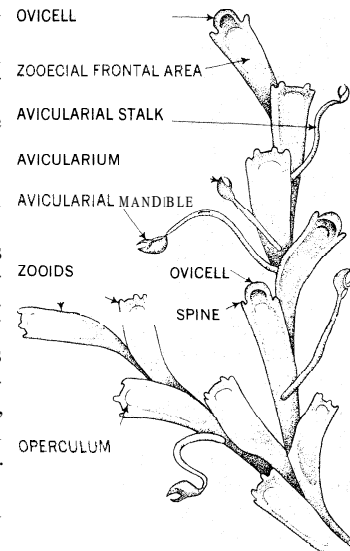

The size of the compensation sac varies with the species. In some it occupies much of the frontal surface. In others it is as small as a bib. It opens to the outside either by an independent pore, the ascopore, or at the base of the operculum of the zooid.

The Cheilostomata are divided into two major suborders, Ascophora and Anasca, on the basis of the presence or absence of the compensation sac.

Frontal Membrane.—Instead of a compensation sac the Anasca have a flexible, uncalcified, frontal membrane to which are attached either small groups of parietal muscle fibres or the two tendons of the depressor muscles. The frontal membrane may cover an uncalcified area of the zooid or it may overlay an internal calcareous but perforated layer (cryptocyst) of variable extent. The cryptocyst gives added protection to the zooid. Through the perforations the two depressor muscle tendons are inserted on the membrane. The contraction of the parietal or depressor muscles lowers the membrane, which in turn creates pressure within the coelomic cavity and forces out the polypide. Relaxation of these muscles permits the retraction of the polypide.

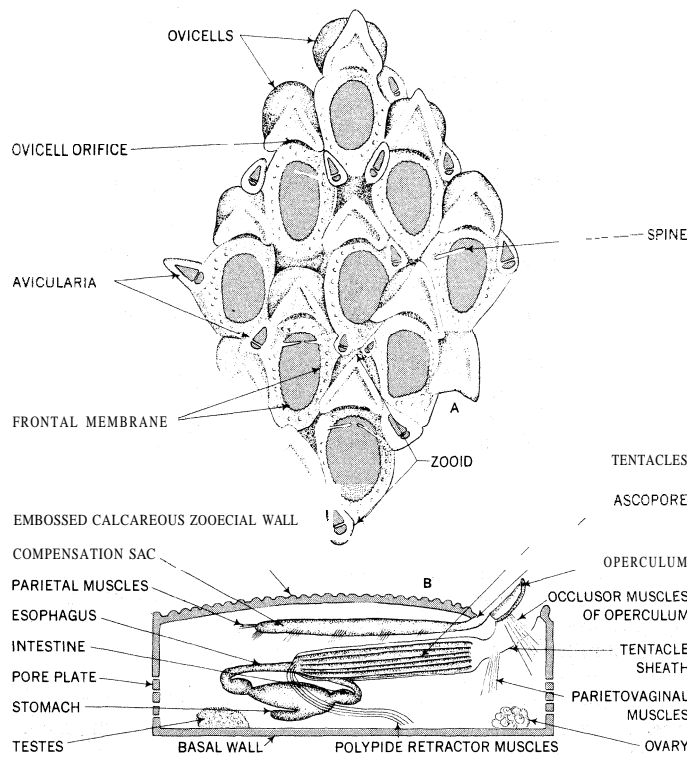

5. Polymorphism.—Polymorphism is developed to a greater degree in Cheilostomates than in other bryozoans. Polymorphic individuals include ancestrulae, autozooids, gonozooids, avicularia, rhizoids, vibracula and spines. Not all cheilostomes have all kinds, but most have several.

Ancestrulae.—In some species the primary zooid of a colony looks very different from the succeeding zooids. It may have an uncalcified frontal area that is covered by a membrane and bordered by 2 to 13 spines, with an operculum at the distal end of

FIG. 9.—MORPHOLOGY OF CHEILOSTOMATA

(A) Colony fragment of an anascan cheilostome containing nine calcined ovicelled zooids; (B) lateral section of single zooid of an ascophoran cheilostome

the area. The succeeding zooids may have a much smaller uncalcified area (sometimes limited only to the orifice itself) or a smaller number of spines or be generally of larger zoecial size. Such an ancestrula resembles a Membraniporan zooid.

In other species there is little difference in appearance between the ancestrula and the later zooids. The colony may originate from a single ancestrular zooid or from twins.

Usually three buds sprout from the distal end of the ancestrula in cheilostomes. Sometimes buds also sprout proximally and laterally. The growth pattern of the colony is determined by the location of these sprouting zones in the ancestrula and on subsequent zooids. Silén (1942) reported that a spiral growth pattern was very common in a number of species.

Autozooids and *Gonozooids*.—In some cheilostome species all zooids of a colony look and function alike. There is no differentiation into autozooids and gonozooids. Each zooid feeds and can produce both male and female germ cells.

In others, such as *Terminoflustra membranacea-truncata*, there are hermaphroditic zooids and male and female gonozooids, all in the same colony. The difference between them is very slight.

In still others (*Hippothoa*), there are asexual (sterile) autozooids and male and female gonozooids, each easily identifiable because of differences in general size, shape of orifice and other features. Asexual zooids have a larger size and larger orifice. Gonozooids are smaller. Female gonozooids have an ovicell and an unusually shaped orifice.

Fertile zooids may develop ovicells either internally or externally. The ovicells of different species vary in size, shape, structure and decoration. Some ovicells are like a hood over the zoecial orifice, opening near or into it (*Osthimosia*). Others (*Cellaria*) are flattened, with an opening some distance away from the zoecial orifice.

Ovicells develop if there is an egg already forming. The embryos develop at the expense of the parent polypide. After an embryo or larva vacates an ovicell, the ovicell can be used a second or third time, provided a new polypide can regenerate in the zoecium and produce a new batch of eggs.

The transfer of embryos from the zooid body cavity into an external ovicell is accomplished by the embryos squeezing through the coelomopore near the two median tentacles on the anal side (in *Callopora*). In those species that lack ovicells (e.g., *Electra pilosa*) a special, temporarily formed tube, the intertentacular organ, permits the exit of embryos to the outside.

Avicularia.—An avicularium is an appendage, heterozooid or special zooid of striking appearance but obscure function that is present on or among the autozooids and gonozooids of many cheilostomes. It consists of a calcareous or chitinous chamber whose opening is by a cuticular flap, the so-called mandible, homologous to a zoecial operculum.

Avicularia are of prime importance in species identification because in some instances they exhibit a great constancy of position, uniqueness of appearance and uniformity of size and structure. The actively swaying, snapping, stalked avicularia ("birds' heads") of *Bugula* are presumed to be defensive, serving to keep offending organisms or strange larvae and debris from settling down on the colony. This explanation, however, might not apply to some fixed avicularia with extremely weak musculature (the *Reteporidae*) or those inside the orifice or on the inner surface of the calcareous frontal wall (*Cellarinella*).

Avicularia look very different from other zooids of the colony. Some are so tiny that they look like pores on the body wall; others may be larger, taller or longer than the regular zooids.

As to location avicularia are either adventitious or vicarious. The adventitious kind is located dependently on autozooids and sometimes also on ovicells, either fused directly to the body wall or attached by a stalk. Some are fastened flat against the regular zooids, others bulge like a tepee (in *Escharoides bubeccata*). *Camptoplites* avicularia are shaped like a bird head and mounted on a very long stalk attached to the autozooid. Other forms are spatulate, rounded, oval or triangular in outline. The number of avicularia per zooid varies from none to several.

Vicarious avicularia, found between regular zooids, are on their

own bases or avicularial chambers. The avicularial chamber contains muscles that move the mandible. One set of these, the abductor mandibuli, consisting of a number of isolated smooth fibres, opens the mandible. The other set, the adductor mandibuli, which consists of more powerful, bunched, striated fibres, snaps the mandible shut.

In addition to musculature the avicularial chamber in some cases also contains a vestigial polypide, avicularial glands and a sense organ. The function of these organs is unknown.

Avicularia may be plentiful in some colonies and rare in others of the same species.

Vibracula.—A vibraculum is a heterozooid very much similar to an avicularium except that the mandible has been transformed into a very long, slender, chitinous bristle, seta or whip that is capable of moving in all directions. The seta may be smooth or serrate and many times longer than its vibracular base or chamber. The chamber contains in addition to the vestiges of a polypide the powerful muscles that control the action of the seta.

Spines.—Many autozooids and ancestrulae have spines around the orifice or sometimes elsewhere on the frontal wall. Spines may be mere hollow extensions of the wall or actual jointed kenozooids (degenerate or abortive zooids). Their presence, number, size and shape depend on a number of factors. In some species spines are present in young zooids as temporary structures that become broken off or covered over by secondary calcification as the colony ages. In other species they may be permanent.

Spines are usually needlelike but some may be very stout, blade-like, straight or curved, forked or even antlered.

Rootlets.—These are delicate chitinous tubes produced by many of the dainty arborescent cheilostomes (*Bugula*, *Cellaria*, *Camptoplites*). They occur singly or in groups, and are budded from the zoecia at or near the base of the colony, although in some *Camptoplites* they can sprout anywhere along the colony. Their function is to anchor, attach or support a colony or even to bridge gaps between adjacent substrates.

Interzooidal Communications.—As mentioned earlier some communication is possible between the body cavities of neighbouring and succeeding zooids because communicating pores are present in the intervening lateral and end walls. The pores, however, are loosely plugged by mesenchymal funicular cords that traverse the zooidal body cavities.

The pores may be either single isolated perforations or groups. If the group contains only a few pores perforating a blisterlike chamber of the lateral wall the blister is called a pore plate or rosette plate. If the group contains a large number (two or three dozen pores) puncturing a transverse or end wall it is called a sieve plate.

Silén (1944) made an exhaustive study of interzooidal communications as well as of the nature of the zoecial walls.

6. Reproduction.—Reproduction is asexual and sexual. Gonads develop in the zooid wall from the peritoneum, with ovaries more distal than testes, the latter sometimes in connection with the funiculus. Self-fertilization occurs in some species, as in *Bugula neritina*, but in others cross fertilization between zooids occurs. Sperms presumably exit through coelomopores or interzooidal communication pores. Fertilization in some cheilostomes occurs in the ovary.

Oviparous species release fertilized eggs into the water, some species producing a small number per zooid (*Electra pilosa*, 17), others a large number (*Membranipora membranacea*). Viviparous species incubate fertilized eggs in ovicells until they reach the larval stage. Generally an ovicell contains only one embryo. In a few species however, several developing embryos may be incubated simultaneously in the same ovicell: two to six in *Thalamoporella*; up to seven in *Scruparia*.

The oviparous species seemingly produce a cyphonautes larva, whereas the viviparous species produce larvae of varied shapes and appearance.

The larvae attach to many kinds of substrates, shed their cilia, metamorphose into an ancestrula and start a new colony. The succeeding zooids of the colony arise by linear and lateral budding, their zoecia (exoskeletons) remaining to a greater or

lesser extent in contact with each other through interzooidal communication pores in the lateral and transverse walls.

V. FOSSIL DISTRIBUTION

The earliest fossil Ectoprocta, a supposed trepostomate and a questionable stenolaemate (cyclostome), were reported from the Early Paleozoic rocks of western England and western Canada.

The oldest fossil ctenostome, the threadlike *Marcusodictyon*, was reported from the Ordovician of Estonia. Reports of Mesozoic or Tertiary ctenostomes are not numerous, either because the presumably soft-bodied ctenostomes left few fossils or because the remains are not readily identifiable. Many of the now recognized Paleozoic ctenostomes had been in the past regarded as sponge borings, foraminifera or trilobite eggs (Bassler, 1953).

The only truly fossil fresh-water phylactolaemate, *Plumatellites proliferus*, was reported (1901) from the Cenomanian (Cretaceous, Mesozoic) beds of Bohemia.

The Paleozoic limestones of North America, from which at least 1,500 species have been described, are especially rich in Bryozoa (Bassler, 1922). Europe is as rich in Mesozoic Bryozoa as America is in Paleozoic species.

Bassler (1953) indicates that ctenostomes have been reported from the Ordovician but seem rare in the Mesozoic and Tertiary formations. The stenolaemates likewise begin in the Ordovician and develop to predominance as compared with other bryozoans by the Middle Mesozoic, then assume less importance as cheilostomes surpass them in numbers in the Cretaceous period. The cheilostomes originated in the Jurassic seas of Europe and fast extended their territorial and geological conquest. Today cheilostomes are the dominant ectoproct order all over the world.

The Trepostomata and Cryptostomata are exclusively fossil orders seemingly limited to the Paleozoic era, although some Trepostomata, whose classification in that order is questioned, have been reported from the Triassic. The Cryptostomata appeared in the Ordovician, attained their greatest development in the Devonian and Mississippian and died out in the Upper Permian.

VI. CLASSIFICATION

1. Zoophyta.—Linnaeus in 1758 coined a special term Zoophyta for these creatures that looked like plants and behaved like animals. That Linnaeus was still unsure of their exact nature is evident from a letter he wrote in 1761 to his highly esteemed Irish friend John Ellis, wherein Linnaeus referred to Zoophytes as "vegetables, with flowers . . . yet as they are endowed with sensation and voluntary motion, they must be called, as they are, animals."

Although many scientists of the early 18th century are credited with having the insight that some bryozoans and coelenterates were animals rather than plants, the fact remained to be proved. It was not until the mid-century that Ellis, in his handsomely illustrated "Essay on Corallines . . ." (1755), definitely established the animal nature of zoophytes. From that time onward support began to shift from the mineralogical and botanical theories to the zoological theory of the nature of zoophytes.

The term Zoophyta continued in use for about a century after Linnaeus had coined it for bryozoans, some coelenterates and diverse animals that he grouped into the class Vermes.

2. Bryozoa v. Polyzoa.—In December 1830 appeared an innocent but subsequently crucially controversial paper "On Polyzoa, a new animal discovered as an inhabitant of some Zoophytes . . ." written by the Irish naturalist John Vaughan Thompson. Practically upon its heels appeared the C. G. Ehrenberg papers (1831) in which the term Bryozoa was first used. Later (1834) Ehrenberg further elucidated the term, splitting zoophytes into two distinct classes: Anthozoa (mostly coelenterates) and Bryozoa.

Thompson and Ehrenberg apparently had arrived at their discoveries independently and almost simultaneously; but unfortunately, Thompson's term Polyzoa, or Polyzoae, was so vaguely defined that it led to various interpretations and disagreements among subsequent workers. Ehrenberg's term Bryozoa, on the other hand, was more precise. It stood for a definite class of organisms. To this very day the controversy is unresolved. Most

British zoologists use the term Polyzoa, while most others use Bryozoa.

H. Milne-Edwards (1843) placed Bryozoa into the group Molluscoidea, where they remained until the 1930s, along with other problematic organisms. The group Molluscoidea was at one time under the phylum Mollusca, then later was considered an independent phylum, and finally "died a quiet death by dismemberment" when Brachiopoda, Bryozoa, Rotifera, Tunicata and other subgroups were gradually removed from it.

3. Ectoprocta and Entoprocta.—As knowledge of bryozoan diagnostic features accumulated, H. Nitsche (1869) was impelled to divide Bryozoa into two groups, Ectoprocta and Entoprocta, on the basis of location of anal opening and other differences. In Ectoprocta the anus is outside the tentacular circle. In Entoprocta it is inside.

Since 1869 Bryozoa became an independent phylum, then was split into two phyla (Ectoprocta and Entoprocta) by various noted zoologists. Some bryozoologists concur with this last division but other bryozoologists still consider Ectoprocta and Entoprocta as belonging to the one phylum, Bryozoa.

Still unsolved are the problems as to where in the animal kingdom these forms belong, to which other animal groups they are related and from which groups they evolved.

The following classification of the ectoprocts is a composite from several sources and viewpoints:

- Subphylum (or Phylum) Ectoprocta
 - Class Phylactolaemata (Lophopoda)
 - Family Fredericellidae
 - Family Plumatellidae
 - Family Lophopodidae
 - Family Cristatellidae
 - Class Gymnolaemata (Stelmatopoda)
 - Order Trepostomata
 - Order Cryptostomata
 - Order Cyclostomata (Stenolaemata or Stenostomata) (common genera: *Crisia*, *Diastopora*, *Lichenopora*, *Tubulipora*)
 - Order Ctenostomata
 - Suborder Carnosa
 - Suborder Stolonifera
 - Order Cheilostomata
 - Suborder Anasca (common genera: *Bugula*, *Cellaria*, *Cribrilinea*, *Flustra*, *Membranipora*)
 - Suborder Ascophora (common genera: *Cellepora*, *Hippothoa*, *Microporella*, *Retepora*, *Schizoporella*, *Smittina*)

BRYTHONIC DIALECTS: see CELTIC LANGUAGES.

BRYUSOV, VALERI YAKOVLEVICH (1873-1924), Russian poet, novelist, playwright, translator and critic, a pioneer of Russian modernism, was born in Moscow Dec. 13 (new style; Dec. 1. old style), 1873. His *Russkie simvolisty*, two parts (1894), containing original poems and translations from the French, was an important landmark, and he later became the recognized leader of Russian Symbolism, editing its leading journal, *Vesy* ("Balance"; 1904-09). The most important of his ten volumes of original poetry published between 1895 and 1921 were *Tertia vigilia* (1900), *Urbi et orbi* (1903) and *Stephanos* (1906). Influenced by Verhaeren, whose work he translated, he cultivated urban themes. He also translated other modern European poets, including Verlaine, Rimbaud, Mallarmé, Maeterlinck and D'Annunzio, as well as ancient classics. His prose fiction includes *Ognenny angel* (1908; Eng. trans. *The Fiery Angel*, 1930), a novel about witchcraft in 16th-century Germany; *Altar pobedy* (1911-12), a novel set in 4th-century Rome; and two volumes of stories: *Zemnaya os* (1907; 2nd ed. with four stories added, 1911) and *Nochi i dni* (1913). The former volume contains "Respublika Yuzhnogo Kresta," a fantasy about the decline of a totalitarian state of the future (Eng. trans. of this and some other stories, *The Republic of the Southern Cross*, 1918). Bryusov was an

important literary critic and student of Pushkin and Russian verse. After 1917 he joined the Communist party, holding for a time a post in the commissariat for education. He died in Moscow. Oct. 9, 1924.

BRZOWSKI, TADEUSZ (1749-1820), first general of the restored Society of Jesus, was born near Malbork, in Warmia, Pol. on Oct. 21, 1749. In 1765 he joined the Jesuits in Poland. He was ordained priest in Vilnius (Wilno) and taught in Minsk. In 1805, after serving 16 years as secretary and assistant to his predecessors, he was elected superior of the order, which had survived in Russian-annexed Poland and Russia and had been recently revived in the two Sicilies (kingdom of Naples). When Pius VII restored the Society of Jesus throughout the world in 1814, he conferred full powers on Brzowski, making him the 19th general. During his tenure of office he witnessed the expulsion of the Jesuits from Russia (1815), but also their rapid restoration in the old and new continents. He died in Plock, Pol., on Feb. 5, 1820. Brzowski translated into Polish C. F. Nonnotte's *Dictionnaire philosophique de la religion*, four volumes (1782).

See C. Sommervogel, *Bibliothèque de la Compagnie de Jésus*, vol. ii, col. 307-309 (1891); S. Zalenski, *Les Jésuites de la Russie-Blanche*, 2 vol. (E. J. Bs.)

BUACHE, PHILIPPE (1700-1773), French geographer who made original contributions to the theory of physical geography and to cartographic technique, was born in Paris on Feb. 7, 1700. He worked for the cartographer Guillaume Delisle (*q.v.*), whose daughter he married. He was appointed *géographe du roi* in 1729, and elected to the Académie des Sciences in the next year. His physiographic system divided the earth's surface into four basins, separated by a "scaffolding" of mountain ranges extending overland and beneath the oceans. This theory was expounded in Buache's *Cartes et tables de la géographie physique et naturelle* (1757), and he applied it particularly to the interpretation of the geography of North America and the Pacific. From the Russian discoveries in Bering strait he deduced the existence of Alaska and the Aleutians. He was an active cartographer and a pioneer in the use of contour lines to express relief in maps. He died in Paris on Jan. 24, 1773. (R. A. Sn.)

BUBASTIS, once an important city in the Nile delta, now a heap of ruins known as Tell Basta. Its beautiful temple, founded during or before the 4th dynasty (c. 4000 B.C.), is described by Herodotus. Bubastis became of consequence when the Pharaohs of the 19th dynasty (1320-1200 B.C.) moved their capital from Thebes to the delta, and reached its highest peak of prosperity when its prince, Sheshonk I (the Shishak of the Bible; 952 B.C.), became Pharaoh. Later, however, it shared in the decay of the rest of the country when Egypt became the prey of one foreign invader after another, and fell into utter ruin.

The goddess of Bubastis, worshiped in the form of a cat, was Bast. (The reading of her name as Ubast is not satisfactory, for in none of its forms is there an initial vowel.) All the deities of Egypt worshiped in animal form were indigenous and strictly localized, belonging to that primitive period when Egypt was a congeries of small independent states, each with its own chief and its own deity. Bast was essentially a goddess of the home and greatly beloved. The ritual in the temple and the home is not known, but Herodotus describes her great annual festival, which was of the usual orgiastic type common in ancient religions. In the New Kingdom (1590-c. 1200 B.C.) many changes were made in the official religion, and Bast became equated with the lioness war-goddess. Lioness-headed statues labeled Bast were dedicated in the temples by warlike Pharaohs who, perhaps, wished to show an appreciation of the domestic virtues combined with the ideal of military glory. Bast, however, never lost her cat identity nor her hold on popular affection, as is shown by the number of small figures of the goddess evidently intended to be used in home wor-

ship or to be worn as amulets on the person.

Bast is represented as a woman with a cat's head; she wears a highly patterned dress and carries a sistrum in her right hand, a so-called aegis in her left hand and has a small bag hung over her left arm. The significance of these emblems is not known. Her cult was carried to Italy by the Romans and traces of it have been found in Rome, Ostia, Nemi and Pompeii. (M. A. M.)

BUBB DODDINGTON, GEORGE: see MELCOMBE, GEORGE BUBB DODDINGTON, Baron.

BUBBLE CHAMBER. An instrument used for experiments in nuclear physics, particularly in connection with high energy particle accelerators, to observe collisions of fast charged particles with atomic nuclei. The bubble chamber, developed by Donald A. Glaser at the University of Michigan in 1952, forms precisely localized tracks of particles interacting in a large volume of high density material. It makes use of a pressure-tight vessel, containing liquid heated far above its boiling point and maintained under high pressure so that boiling is prevented. When the pressure on the liquid is suddenly reduced by an expansion device, the liquid becomes highly superheated, with the result that charged particles speeding through it create strings of tiny bubbles along their paths. By taking high-speed photographs of these bubble tracks through the strong glass windows of the chamber, it is possible to make precision measurements of the details of nuclear processes caused by the high-speed particles. Collisions producing rare nuclear events are frequent because of the high density of the liquid. New events can be recorded every few seconds when the chamber is exposed to bursts of high-speed particles from particle accelerators or to showers of cosmic ray particles. The bubble chamber has proven very useful in the study of high-energy nuclear physics and elementary particles. Similar in function to the cloud chamber (*q.v.*), developed by C. T. R. Wilson, the bubble chamber differs in principle of operation and in usefulness for experiments in high-energy physics.

Basic Principle of Operation.— Since charged particles penetrating a liquid or solid medium deposit exceedingly small quantities of energy along their paths, an amplification technique is needed to produce an observable effect from the original microscopically small disturbance. The technique employed in the bubble chamber makes use of the fact that liquids can be heated far above their normal boiling points if they are heated in clean, smooth-walled vessels. Liquids in this condition are called superheated. Superheated liquids are unstable and will begin to boil

BY COURTESY OF DONALD A. GLASER

FIG 1— THE FIRST BUBBLE CHAMBER IMMEDIATELY BEFORE AND AFTER PRESSURE REDUCTION

BY COURTESY OF DONALD A. GLASER

FIG. 2.—A LARGER BUBBLE CHAMBER FABRICATED OF GLASS AND ALUMINUM

The chamber itself is on the left; on the right are the expansion valve, which controls the compressed air, and the apparatus for filling the chamber and adjusting the expansion volume. During operation the chamber is surrounded by a small oven to maintain the required operating temperature

violently if foreign bodies with rough edges are introduced into the liquid, or if an excess of heat is added. This irregular, eruptive boiling is called bumping, and can be observed readily by heating clean water in a smooth glass test tube. At first the water gets hotter and hotter without visible boiling, until suddenly it erupts with a violent evolution of vapour, settling down again to repeat the cycle. The first successful bubble chambers were based on the idea that a very pure liquid heated in a clean, smooth glass bottle might become so highly superheated that even the microscopic effect of a high-speed charged particle could trigger the boiling process. High-speed movies of the triggering process reveal that tiny bubbles mark the path of a charged particle during the first few milliseconds of the boiling eruption. Such triggering can be made the dominant cause of boiling in super-

BY COURTESY OF DONALD A. GLASER

FIG. 3.—SIMPLIFIED SCHEMATIC DIAGRAM OF A SIX-INCH CHAMBER SIMILAR TO THAT PICTURED IN FIG. 2 AND ITS EXPANSION MECHANISM

heated liquids by keeping all foreign bodies and sharp edges from contact with the liquid.

The triggering action is explained by the fact that a fast charged particle ionizes and excites the atoms and molecules of the liquid as it collides with them. After the electrons and ions have recombined many atoms are left in an excited state. When these excited atoms collide with their neighbours the excitation energy is converted into the kinetic energy of the rebounding atoms, and the liquid gets hot locally. These local hot spots are thought to cause the growth of the bubbles which are finally observed.

Construction and Operation.—The first bubble chamber was a small glass bottle, containing a few cubic centimeters of diethyl ether, immersed in hot mineral oil at a temperature of about 135° C., and connected with a pressure regulating device by means of a heavy walled glass capillary tube. Boiling of the liquid was prevented by keeping it under a pressure of about 20 atm. This was accomplished by applying compressed air against a flexible rubber diaphragm in the pressure regulating device. When the air pressure was released, the liquid became suddenly superheated

and unstable. Since great care was taken in making sure that the glass walls of the bottle were smooth and clean, no boiling occurred for several seconds. This gave time for an ionizing event in the liquid to cause an eruption. After recompression the chamber was ready for a new expansion. This type of bubble chamber is called a "clean" bubble chamber.

To construct large bubble chambers it is necessary to use metal walls with glass windows sealed to the metal by means of gaskets. When the pressure is reduced by expanding the chamber, boiling always begins at the joints and gaskets. By expanding very rapidly it is possible to maintain a low pressure within the bulk of the liquid even though boiling is occurring at the walls. As the boiling at the walls proceeds, the vapour evolved finally raises the pressure throughout the liquid so that it is no longer sensitive to ionizing radiation. The sensitive time of such a chamber is limited, therefore, and may range from a few milliseconds to several hundred milliseconds, depending on the design of the chamber, the expansion device and the properties of the liquid used. Chambers that operate in this way are called "dirty" chambers and may be quite large; dimensions of several feet on a side are feasible. In order to achieve the very rapid expansion required for the successful operation of these dirty bubble chambers it is necessary to reduce the hydrodynamic resistance to the flow of the liquid during

BY COURTESY OF DONALD A. GLASER

FIG. 4.—CONDITION OF CHAMBER DURING EXPANSION CYCLE (A) Violent boiling occurs at the gaskets, but no bubbles form in the interior (11 milliseconds); (B) A jet of vapour shoots out of the expansion orifice at the bottom of the chamber (12.5 milliseconds); (C) With radium source nearby, some bubble tracks become visible and the chamber is at full sensitivity (6 milliseconds); (D) Seven milliseconds after the start of expansion, bubbles on the oldest tracks have grown large and new tracks are being formed; (E) With weak radium source nearby new fine tracks continue to appear, but oldest tracks become too coarse to be useful (8.5 milliseconds); (F) A vapour jet from the expansion orifice causes a sudden pressure wave 12.5 milliseconds after the start of expansion. It distorts the track and abruptly ends the sensitive time

FIG. 5.—A τ MESON HAS BEEN PRODUCED BY A COLLISION OF A 3,000,000,000 ELECTRON-VOLT PROTON AGAINST A COPPER TARGET. HERE IT ENTERS A PROPANE-FILLED BUBBLE CHAMBER 30 CM. LONG, STRIKES A PROTON IN A PROPANE MOLECULE, AND COMES TO REST AFTER THE REBOUND. THE RECOIL OF THE PROTON CAN ALSO BE SEEN. THEN THE τ MESON DECAYS INTO A NEGATIVE π MESON AND TWO POSITIVE α MESONS. THE POSITIVE π MESONS ARE STOPPED AND DECAY CHARACTERISTICALLY INTO μ MESONS, WHICH ALSO STOP AND DECAY INTO POSITRONS

the expansion process. A simple way of achieving this is to install the flexible diaphragm of the expansion mechanism as one wall of the bubble chamber. By means of this movable, flexible wall the pressure in the chamber can be regulated accurately and changed very quickly.

Bubble Chamber Liquids.—Many pure liquids and some solutions have been used in bubble chambers. Since all the liquids tried seem to work satisfactorily, a wide choice is available to the nuclear physicist. His choice is made on the basis of the type of target material he wishes to study, the kind of particle source he is using and practical convenience. The first large chambers contained diethyl ether, pentane, butane or propane, since these are readily available and operate at convenient temperatures and pressures. These liquids are especially useful because they are rich in hydrogen, which is the simplest possible target nucleus. The nucleus of ordinary hydrogen consists of a single proton.

For experiments requiring a pure proton target, bubble chambers have been run with liquid hydrogen. When it is desired to observe interactions involving neutron targets, bubble chambers filled with liquid deuterium or heavy hydrogen can be used. By comparing results thus obtained with those obtained in ordinary hydrogen bubble chambers it is possible to deduce what portion of the effects seen is due to the extra neutron in the deuterium nucleus. Liquid helium bubble chambers can be used for other special types of experiments.

Uncharged particles do not ionize the atoms of liquid as they fly through it, and hence do not produce tracks. In order to "see" X-rays, gamma rays and uncharged particles a very dense liquid must be used, because only in such a medium does a neutral projectile have a good chance of making a collision that reveals its presence and position. To attain the necessary high density unusual liquids have been used, including stannic chloride, methyl iodide dissolved in propane, tungsten hexafluoride and xenon. These heavy liquid bubble chambers are valuable because they yield information about the electrically neutral part of the sub-microscopic world, a part that is inaccessible to many experimental techniques.

Use With Particle Accelerators and in Cosmic Ray Experiments.—When the bubble chamber is used in conjunction with a high-energy particle accelerator, special electronic equipment is employed to synchronize its operation with the production of particle bursts from the accelerator. Since at least several milliseconds are required to expand a bubble chamber to full sensitivity, and the lifetime of the latent image in bubble chambers is very short, certainly less than 0.1 milliseconds, the expansion process is started before the particles are ejected from the accelerator. The chamber is then fully sensitive when the beam of particles arrives. Often high-speed particle counters such as scintillation counters are arranged to count the number of particles passing

through the bubble chamber. When a sufficiently large number of such particles is detected, which often takes less than a millisecond, a signal discharges a bright electronic flash. The proper duration of the light flash varies from several microseconds to several milliseconds for different kinds of chambers. Stereoscopic cameras with their shutters open record the tracks illuminated by the light flash. After the flash, a signal is given to apply pressure for recompressing the liquid; at the same time, the film in the camera is advanced in readiness for the next pulse of particles which may arrive in a few seconds.

Because it has been found necessary to expand the chamber before the particles arrive, it is impossible to make counter-controlled expansions, as is done with cloud chambers. There is no disadvantage to this mode of operation for experiments with high-energy particle accelerators, but it makes cosmic ray experiments very difficult to do with bubble chambers. One method that can be used for doing cosmic ray experiments with bubble chambers is to expand and recompress the chamber continuously in a rapid cycle, so that for some fraction of the time, perhaps as high as 40%, the chamber is sensitive to the possible occurrence of an interesting cosmic ray event. Whenever Geiger counters or other types of particle detectors associated with the bubble chamber indicate that such a cosmic ray collision has occurred the camera lights can be triggered and a photograph of the event taken.

Applications of Bubble Chambers.—Several types of measurements can be made with bubble chambers. Energies of particles can be deduced from the depth of penetration required to stop them in the dense liquid. When a chamber is immersed in a

FIG. 6.—A NEGATIVELY CHARGED K MESON ENTERS A LIQUID HYDROGEN CHAMBER 10 IN IN DIAMETER IMMERSSED IN A MAGNETIC FIELD. THE MESON COMES TO REST IN THE HYDROGEN AND IS ABSORBED BY A PROTON MAKING A NEGATIVE Σ HYPERON AND A POSITIVE α MESON. THE Σ HYPERON GOES ONLY A SMALL DISTANCE BEFORE IT DECAYS INTO A NEUTRON AND A NEGATIVE α MESON. BOTH OF THE π MESONS FINALLY GO TOWARD THE UPPER RIGHT-HAND CORNER OF THE PICTURE. FROM THE CURVATURES OF THE TRACKS IN THIS PICTURE IT IS POSSIBLE TO DEDUCE THE MOMENTUMS OF THE PARTICLES WHICH CAUSED THEM. THE SPIRAL TRACKS OCCURRING

HERE AND THERE IN THE PICTURE ARE DUE TO ELECTRONS WHICH ARE LOSING ENERGY AND THEREFORE MOMENTUM AS THEY PENETRATE THE DENSE LIQUID. THE SPIRAL SHAPE RESULTS WHEN THE CURVE OF MOTION OF THE ELECTRONS BECOMES TIGHTER AND TIGHTER AS THEY SLOW DOWN AND COME TO REST

magnetic field the curvature of the particle track can be used to compute the momentum of the particles. From the density of bubbles along a track the charge and speed of the particle can be found. The crookedness or "scattering" of a particle track is a measure of its momentum times its speed. When these measurements are combined with simple geometric measurements of track lengths and angles between tracks, it is possible to calculate the masses, charges and lifetimes of particles observed. For the various types of events that can be seen it is similarly possible to calculate the energy released, the relative frequency of different kinds of processes and the angular distributions of the outgoing particles. Such information is basic to the understanding of nuclear structure and processes.

For a short, popular description of the development of the bubble chamber, see *Scientific American*, 192:46-50 (Feb. 1955).

BUBER, MARTIN (1878-). Jewish religious philosopher, who made a decisive contribution to 20th-century thought as leading exponent of the philosophy of "dialogue," as translator of the Bible, interpreter of biblical Judaism and re-creator of Hasidic legend and thought, was born in Vienna on Feb. 8, 1878. He studied philosophy and history of art in Vienna and Berlin and served 30 years as professor of religion at Frankfurt university and then of social philosophy at the Hebrew university in Jerusalem, where he went on Hitler's accession to power in Germany.

Buber's philosophy of dialogue finds its classic expression in his poetic masterpiece *I and Thou* (1923), its elaboration in *Between Man and Man*, *Eclipse of God* and *Pointing the Way*. Central to this philosophy is a distinction between "I-Thou" relations of mutuality, directness and presentness and "I-It" relations in which persons merely know and use one another as objects of their experience. While Buber's philosophy of dialogue has had a growing influence on education and psychotherapy, his insistence that God is the "eternal Thou" whom one can talk *to* but not *about* has had a radical transforming effect on contemporary religious thought both Christian and Jewish. In particular, his thought has greatly influenced Protestant theology as exemplified by H. Emil Brunner, Reinhold Niebuhr, Paul Tillich and Karl Barth.

In a series of highly significant biblical studies—Moses, *The Kingship of God*, *The Prophetic Faith* and *Two Types of Faith*—Buber develops the thesis that the biblical covenant and messianic redemption mean the realization of the kingship of God in all areas of communal life and that biblical faith is unconditional trust (the Prophets and Jesus) rather than faith with a knowledge content (Paul and John).

Through such works as *The Tales of the Hasidim, For the Sake of Heaven* (a chronicle-novel) and *Hasidism and Modern Man*, Buber transformed the popular communal mysticism of east European Jewry from a little-known sect to one of the recognized great mystical movements of the world.

Through his *Tales of the Hasidim* Buber "enriched world literature more than any other living author," wrote the Swiss novelist Hermann Hesse when nominating Buber for a Nobel prize in literature in 1949. Many would agree with Ludwig Lewisohn's characterization of Buber as "the most distinguished and influential of living Jewish thinkers," even while questioning his nonadherence to the Jewish law, his failure to give due emphasis to the Talmud, or his religious Zionism, with its stress on Jewish-Arab co-operation.

BIBLIOGRAPHY.—Maurice S. Friedman, *Martin Buber: the Life of Dialogue* (1960), a comprehensive study and systematic analysis and evaluation of Buber's thought, with a bibliography of works by and about Buber complete up to 1960. (M. S. F.)

BUBNA VON LITIC, COUNT FERDINAND VON (1768-1825), Austrian soldier, was born in Zamrsk, Bohemia, Nov. 26, 1768. He was with the Austrian army from 1792 until Napoleon's final defeat in 1815, except for the years 1812-13, which he spent in Paris as Austria's representative. He fought at Austerlitz (1805) and at Wagram (1809), and after the Austrian defeat in the latter battle was one of the ambassadors who traveled to Vienna to negotiate the peace of Schonbrunn. He took part in the

battles of Liitzen, Bautzen, Dresden and Leipzig in 1813. During the Piedmont uprising of 1821, Bubna led the Austrian troops that put down the insurrectionists.

Bubna died in Milan, June 6, 1825.

BUBONIC PLAGUE: see PLAGUE.

BUARAMANGA, a city of Colombia in South America. It is the capital of Santander department, about 185 mi. N.N.E. of Bogotá at an elevation of 3,340 ft. in the Cordillera Oriental. Growth in the mid-20th century was very rapid. Pop. (1951) 102,887; (1961 est.) 208,640 (mun.). Founded in 1622 near the Lebrija and Sogamoso rivers with several colonial mines nearby, Bucaramanga gained commercial significance at an early date. It is in a coffee- and tobacco-producing area, and its manufactures include cigars, cigarettes, textiles, straw hats and iron products. It is connected by rail with Puerto Wilches on the Magdalena river, by highway with the major cities of eastern Colombia and Venezuela, and has regular air service to Bogotá and the cities of the Caribbean coast. (T. E. N.)

BUCARELI Y URSÚA, ANTONIO MARÍA (1717-1779), Spanish soldier and colonial administrator, was born in Seville on Jan. 23, 1717. After distinguished military service in Italy and Portugal, Bucareli was named governor and captain general of Cuba in 1760 and, in 1771, was promoted to viceroy of New Spain (Mexico), an office he held until his death on April 9, 1779. His administration in New Spain was characterized by rapid economic development and Bucareli enjoyed widespread personal popularity. Among other accomplishments, he founded several charitable institutions, improved the public services of Mexico City, encouraged scientific investigation, reorganized the army and strengthened the defenses of the vicerealty, and he promoted the expansion of Spanish settlement in California.

(L. N. McA.)

BUCCANEERS were English, French and Dutch adventurers of the sea who haunted the Caribbean and the Pacific seaboard of South America during the second half of the 17th century. The chief bond between these "Brethren of the Coast," as they styled themselves, was hostility toward the Spaniards, who at that time regarded those seas as their monopoly. The buccaneers were largely inspired by the example of the seamen of Sir Francis Drake's times, but they are to be distinguished from genuine privateers (*q.v.*) because the commissions that they held were seldom valid. They are also to be distinguished from the outlawed pirates of the 18th century, though some of their actions can indeed be called piratical.

In their own day the buccaneers were usually referred to as privateers, the word "buccaneer" coming into use after the publication in 1684 of *Bucaniers of America*, the English translation of *De Anzericaensche Zee-Rovers*. The original work, by Alexander Esquemeling (or Exquemelin), was composed in obscure circumstances but achieved international fame after its first publication in Dutch in 1678 and has been the source of many tales about the Spanish Main. The word "buccaneer" is derived from the French *boucan*, a grill for the smoking of *viande boucanée*, or dried meat, for use in ships at sea. The French called their adventurers *flibustiers* (from Dutch *vrijbutter*, "freebooter"; see FILIBUSTER), the Dutch called them *zeerovers*; and the Spaniards called them *corsarios*. The earliest buccaneers were hunters in western Hispaniola (Haiti), whence they spread to the island of Tortuga, the French governors of which were liberal in the issue of commissions for attacks on Spanish maritime trade. Jamaica, after its capture by the English in 1655, also afforded a base for their activities. The early bands of these sea rovers were composed of adventurers, escaped servants, ex-soldiers and the logwood cutters of the Gulf of Campeche. They exercised a democratic discipline among themselves when they went off "on the account," electing their captains, marooning mutineers, arranging for the equitable distribution of shares of plunder and drawing up elaborate insurance schemes for injuries suffered. They were brave, cruel, tough seamen, excellent navigators and often first-class shots. Since they attracted to their ranks such remarkable men as William Dampier (*q.v.*), Lionel Wafer and Basil Kingrose, who wrote racy accounts of their adventurous cruises, they exercised a greater

influence on subsequent generations than their exploits justified in themselves.

The earliest buccaneers went under assumed names, such as L'Olonnois (properly Jean David Nau) or Rock Brasiliano, a Dutchman who had lived in Brazil. With the appearance of Henry Morgan (*q.v.*), a natural leader, they began to organize themselves into powerful bands which captured Porto Bello in 1668 and Panamá in 1671, where the old town was so thoroughly burned that the Spaniards were compelled to build another, the present city, on a new site nearby. Few of the 2,000 men who accompanied Morgan on this first crossing of the isthmus benefited from the plunder because their leader absconded with most of the loot on their return. As the treaty of Madrid (1670) had only recently been signed to compose Anglo-Spanish differences in those parts, the news of his success at Panamá was not officially welcome. Morgan was arrested and brought back to England, but on the renewal of trouble with Spain he was knighted and sent out again as deputy governor of Jamaica. In this capacity he and his superiors attempted to suppress the buccaneers but, as he told the government at home, this was no easier than suppressing highway robbery. Until a police force of regular naval vessels began to appear in those seas, this policy was therefore not particularly successful. What finally brought buccaneering in the Caribbean to an end was the outbreak of the War of the Grand Alliance (*q.v.*) in 1689, when these freebooters became legitimate privateers in the service of their respective nations. Some of the French, for example, assisted in attacking Cartagena, among them the renowned Louis Granmont (or Grammont) and Laurent de Graff, who is the reputed founder of the city of Mobile.

Sir Henry Morgan died a respectable citizen of Jamaica some months before England entered the war. In his day the buccaneers had certainly enriched and protected the infant colonies, even if their depredations had made legitimate trade with Spain impossible. Morgan also pointed the way into the South seas. His chief followers in this direction were John Coxon and Bartholomew Sharp, who led another party across the isthmus to attack Panamá in 1680. This time they were not so successful. Coxon and 70 others returned across the isthmus. Sharp took a captured vessel, the "Trinidad," south for a cruise off the coasts of Chile and Peru, using as his bases the Galapagos Islands and Juan Fernández Islands (where Alexander Selkirk was marooned on Dampier's third voyage in 1704). A party which included Dampier and Wafer returned overland after a quarrel with Sharp. As a result of an accident, Wafer was left behind with the Darién Indians for some months before rejoining the others; his account of this sojourn and of the habits of the Indians is still of value to anthropologists. Sharp himself later returned to Barbados after a remarkable voyage during which he never sighted land between Juan Fernández and the West Indies; he was the first Englishman to sail around Cape Horn. In order to avoid the attention of the authorities, he escaped to England, where he bought his pardon by presenting the king with the first Spanish charts of the Pacific. He was given a commission in the navy but soon reverted to his old trade of buccaneering. It is not known how or where he died.

Another ship, the "Batchelor's Delight," commanded by John Cook with Ambrose Cowley as his pilot, reached the Pacific by way of Cape Horn in 1684. On Cook's death Edward Davis, the most competent of all buccaneers, took command. Off Panamá they joined other parties under Charles Swan, Townley, John Eaton and a French contingent under Grognet, which had crossed the isthmus; the adventures of the latter were described by one of their number, Ravenau de Lussan. This was the largest concentration of buccaneers ever seen, a force of about 3,000 men, who attacked Panama for the third time. They met with little success and soon broke up. Cowley and Eaton returned home around the world, as did Dampier in another vessel; he described his adventures in his first and most popular book, *A New Voyage Round the World* (1697). Others returned home across Nicaragua. One ship with Davis and Wafer on board returned via the Horn to the Chesapeake, where they were arrested; Wafer's fine was used for the building of the College of William and Mary at

Williamsburg, Va. Davis probably became a companion of the pirate William Kidd (*q.v.*).

After this period many, like Dampier, became privateers in the War of the Spanish Succession, and the age of the buccaneers came to an end. Historically their importance lies in the influence that they had on the Darién scheme and on the foundation of the South Sea company, as also in the way in which they inspired later and more serious voyages of exploration in the Pacific by the publicity enjoyed by their writings. From a literary point of view the books describing their adventures have been of lasting value from the days of Jonathan Swift and Daniel Defoe to those of Robert Louis Stevenson and John Masefield.

BUCCLEUCH, DUKES OF. The Scottish dukedom of Buccleuch was created on April 20, 1663, when ANNE SCOTT (1651–1732), countess of Buccleuch in her own right, married James, duke of Monmouth (see MONMOUTH, JAMES SCOTT). They were then created duke and duchess of Buccleuch. She was a member of the border family Scott of Buccleuch which traced its descent from Richard le Scott (c. 1265–1320) and its power from large grants of land to Sir Walter Scott (1426–69) of Kirkurd and Buccleuch in return for his support of James II of Scotland against the Douglas rebels. The family gained a peerage in 1606 and an earldom in 1619. Anne Scott was the daughter of Francis (1626–51), 2nd earl of Buccleuch. She retained, after Monmouth's execution, those titles which she held in her own right, and was succeeded by her grandson, FRANCIS SCOTT (1694–1751), 2nd duke of Buccleuch, in 1732. His grandson HENRY (1746–1812) became 3rd duke, and on the death of William Douglas, 4th duke of Queensberry, in 1810, succeeded also to that dukedom and its estates. Henry married the daughter and eventual heiress of George, duke of Montagu. He was succeeded by his son, CHARLES WILLIAM HENRY (1772–1819), 4th duke. Alice, the daughter of Charles's great-grandson, JOHN CHARLES MONTAGU-DOUGLAS-SCOTT (1864–1935), 7th duke, married the duke of Gloucester, third son of George V, in 1935. WALTER JOHN (1894–) 8th duke, succeeded his father in 1935.

See Sir W. Fraser, *The Scotts of Buccleuch* (1878).

BUCENTAUR (Italian BUCINTORO), a highly decorated galley formerly used by the Venetians at their annual ceremony of the "wedding of the sea" (*sposalizio del mare*) on Ascension day. This ceremony symbolized the maritime supremacy of Venice and originated about AD. 1000 in commemoration of the doge Orseolo II's conquest of Dalmatia. It took the form of a solemn procession of boats, headed by the doge's maesta nave (from 1311 the Bucentaur), out to sea by the Lido port. In 1177 Pope Alexander III gave to this ceremony, which had originally been placatory or expiatory, a sacramental or nuptial character in recognition of Venice's services against the emperor Frederick I. The pope gave one of his rings to the doge, bidding him cast such a one into the sea each year on Ascension day. Every year thereafter, the doge dropped a consecrated ring into the sea, with the words *Desponsamus te, mare* ("We wed thee, sea"). The last bucentaur, built in 1729, was destroyed by the French in 1798 for the sake of its golden decorations. Remains of it are preserved at Venice in the Museo Civico Correr and in the Arsenal.

BUCER (BUTZER), **MARTIN** (MARTIN KUHORN) (1491–1551), German Protestant reformer, best known for his ceaseless attempts to make peace between conflicting reform groups, and for his own particular program for reform, was born at Schlettstadt, Alsace, Nov. 11, 1491. In 1506 he entered the Dominican order and was sent to study at Heidelberg. There he became acquainted with the works of Erasmus and Luther. Withdrawing from his

order in 1521, Bucer entered the service of the elector palatine, but in 1522 became pastor of Landstuhl, where he married Elizabeth Silbereisen, a former nun. After his excommunication in 1523 he made his way to Strasbourg where his parents' citizenship gave him protection. His personal charm, intellectual abilities and zeal brought him eventually to a position of leadership in Strasbourg and in southern Germany.

Bucer wanted a reform that would be a renewal of the whole of society, church, state, education, morals, etc. Under the influence of Erasmus he had accepted the ideals of Christian humanism and of the Renaissance, which called for a rebirth of the true good, the original rightness, in man and society. When he became a Protestant reformer he envisioned a renewed, converted man and society that would result from the preaching of the true Gospel and the faithful following of the divinely given pattern in the Bible. This reform through conversion, piety and discipline found its fullest expression in the massive program for the reformation of England which he presented to King Edward VI of England in 1551.

Strasbourg lay between the north German area, influenced by the Lutheran reformation, and the south German and Saiss areas, influenced by the reform movement led by Huldreich Zwingli and others. As the leaders in these two reform movements clashed after 1524 over the Lord's Supper, Bucer spent two decades in countless journeys and conferences in an effort to mediate. He was a participant in nearly every conference on religion in Germany and Switzerland in the years 1524 to 1548. In these conferences between Protestants and Catholics, or between German Lutherans and Swiss Reformed churchmen, Bucer often advocated the use of obscure language and ambiguous formulas when explicit agreement became impossible. His justification was that actual reform of the people was the real goal and that doctrinal issues could be worked out later. Conferences held in 1536 produced the Second Confession of Basel (*see* HELVETIC CONFESSIONS) and the Wittenberg Concordat. These seemed to unite the Zwinglians and the Lutherans, but Bucer's evasive approach had concealed the issues. The civil authorities in many south German areas sought his advice and guidance in arranging forced compromises. Since these compromises were regarded by Bucer as of necessity tailored to local circumstances, he soon came to be charged by all parties as having no convictions except that the end justified the means. His defense was that each of these compromises was made only for the time being. Gradually, he hoped, further changes could be made. A better aspect of this policy of agreement by compromise appeared when it was applied to the problem of religious toleration; under Bucer's policies Strasbourg had less persecution of Anabaptists and other minority groups than did most of Europe.

The most controversial of Bucer's pragmatic solutions of problems were in the cases of the Regensburg Book of 1541-46 and the bigamy of Philip of Hesse. Philip was a Protestant prince to whose support Bucer, Luther and many other reformers owed much. Because Philip had serious marital problems, and divorce was impossible for him, Bucer aided Philip in persuading Luther, Melancthon and others to sanction a second wife for him on the basis of Old Testament plural marriages (*see* PHILIP). Great efforts, even flat lies, were used in a fruitless effort to keep the matter secret, and the venture caused serious harm. Bucer had long dreamed of a healing of the Protestant-Catholic rift. In an effort to bridge these differences he engaged in secret negotiations with certain liberal, reform-minded Catholics as John Gropfer and Gasparo Cardinal Contarini. When his rather far-reaching concessions were used at the colloquy of Regensburg (1546) by Charles V as the basis for an official solution of the controversy over the Reformation, Bucer was taken by surprise, and in panic denied all connection with the scheme. Both Catholics and Protestants rejected the Regensburg Book. Charles then broke the Protestant powers by military force and laid down his own compromise scheme, the Augsburg Interim of 1548 (*see* also CHARLES V [Roman emperor]).

Although the Augsburg Interim did not concede much more to Catholicism than some of Bucer's earlier compromise solutions had, he opposed vigorously its acceptance by Strasbourg. His view

was that even a poor compromise was justified if it made some progress toward reform, but that for Strasbourg to accept the Interim would mean going backward. The city, however, would not oppose Charles's armies. Finally they discharged Bucer and several other ministers, among them Pietro Martire Vermigli, Paul Fagius and Emmanuel Dryander, all of whom were then invited by Archbishop Thomas Cranmer to come to England. There Bucer supported solidly the official, cautious reform program of Cranmer and Nicholas Ridley against the more radical program urged by John Hooper and John Knox. The Second Prayer Book (1552) and the Anglican Ordinal of 1550 owed much to Bucer's counsel. He died in England Feb. 28, 1551.

BUCEROTIDAE, a family of birds characterized by a brightly coloured horny growth, or casque, on their large bills. *See* HORNBILL.

BUCH, CHRISTIAN LEOPOLD VON, BARON (1774-1853), German geologist and geographer, a member of an aristocratic Prussian family, was born at Stolpe, Pomerania, on April 26, 1774. In 1790-93 he studied at the mining school of Freiberg under A. G. Werner (*q.v.*), one of his fellow students there being Alexander von Humboldt. He completed his education at the universities of Halle and Gottingen. In 1797 he met Humboldt at Salzburg, and with him explored the geological formations of Styria and the adjoining Alps. A visit to Italy in 1798 shook his faith in the Wernerian Neptunist theory of the aqueous origin of igneous rock, of which he had been the outstanding exponent. In 1799 he paid his first visit to Vesuvius, and again in 1805 he returned to study the volcano, accompanied by Humboldt and Gay Lussac. when they witnessed an eruption which supplied Von Buch with data for refuting many erroneous ideas then held regarding volcanoes. In 1802 he explored the extinct volcanoes of Auvergne. The scientific results of his investigations he embodied in his *Geognostische Beobachtungen auf Reisen durch Deutschland und Italien* (1802-09). Von Buch spent two years among the Scandinavian islands; he showed that many of the erratic blocks on the north German plains must have come from Scandinavia. He also established the fact that the whole of Sweden is slowly but continuously rising above the level of the sea from Frederikshald to Åbo. The details of these discoveries are given in his *Reise durch Norwegen und Lappland* (1810). In 1815 he visited the Canary Islands (*q.v.*) in company with Christian Smith, the Norwegian botanist, to study their volcanic origins. His classic physical description of the Canary Islands was published at Berlin in 1825. After leaving the Canaries, Von Buch proceeded to the Hebrides and the coasts of Scotland and Ireland. He published in 1832 the magnificent *Geological Map of Germany*, 42 sheets. He also helped to establish the stratigraphy of the Jurassic system. He died at Berlin on March 4, 1853. A complete edition of his works was published in 1867-85, edited by J. W. Ewald and others.

BUCH, JEAN III DE GRAILLY, CAPTAL DE (1321-1376), the chief vassal and officer in Gascony under the English king Edward III and Edward (the Black Prince), was a shining example of 14th-century chivalry, frequently extolled by Froissart for his valour in battle, for his courage and for his loyalty. His great-grandfather, the Savoyard noble Jean I de Grailly (or Grilly), went to England and was on three occasions appointed seneschal of Gascony for Henry III and Edward I, who gave him the viscountcies of Benauges and Castillon. Jean III's father, Pierre II de Grailly, by his marriage with Assalide de Bordeaux acquired the *captalat* of Buch; *i.e.*, the principal seignory in the *pays* of Buch, the chief town of which was La Teste de Buch (on the edge of the Arcachon basin). Jean was the son of Pierre's later marriage to Blanche, daughter of Gaston V of Foix. Jean de Grailly remained steadfastly loyal to Edward III who increased his hereditary possessions by the addition of the county of Bigorre and made him a knight of the Order of the Garter.

Jean de Grailly was, with Sir John Chandos, the chief agent of

the Black Prince's victory at Poitiers in 1356. In 1357 he went with his cousin Gaston Phoebus of Foix on a crusade against the pagans in Prussia. On returning to France (1358), the two cousins released the dauphine (Jeanne de Bourbon) and the duchesse d'Orléans (Blanche de France) whom the rebels of the Jacquerie were besieging in Meaux. In 1364, however, he commanded the Navarrese army which was defeated by Eertrand du Guesclin at Cocherel. He then took part in the battle of Najera in Castille (1367), when the Black Prince defeated Du Guesclin. In 1371 he was nominated constable of Aquitaine by the Black Prince, but was taken prisoner by French troops near Soubise in Saintonge. Obstinate refusing to serve Charles V, he died in the Temple prison in Paris in 1376.

(Y. R.)

BUCHAN, EARLS OF. The earldom of Mar and Buchan was one of the seven original Scottish mormaorships; later Buchan was separated from Mar and passed with an heiress to the Comyns, of whom ALEXANDER (d. 1290) and JOHN (*see* COMYN, JOHN) were both constables of Scotland. John's wife, Isabel, crowned Robert I (the Bruce) at Scone in 1306, and was afterward imprisoned by the English in a cape at Berwick. After John's death (1308), the earldom was claimed by HENRY, LORD BEAUMONT (d. 1340), husband of John's niece and coheiress, ALICE COMYN; but although summoned to parliament in England as earl of Buchan, his title was not recognized in Scotland and Alice's younger sister, MARGARET, who married Sir John Ross, may in that country have been styled countess of Buchan. But the title was not claimed by the issue of either sister, and SIR ALEXANDER STEWART (d. c. 1405), called "the wolf of Badenoch," a son of King Robert II, became earl of Buchan (c. 1382). The earldom was then held for about 150 years by the Stewarts, of whom one of the most important was Sir Alexander's nephew, JOHN (c. 1380-1424), who became constable of France and was killed fighting for Charles VII at the battle of Verneuil. Subsequently the title passed twice through heiresses: first to ROBERT DOUGLAS (d. 1580) and his son James (d. 1601) and then in 1617 to JAMES ERSKINE (d. 1640), a member of the family which retained it thereafter.

Most celebrated of the later earls of Buchan was DAVID STEWART ERSKINE (1742-1829), 11th earl. His pertinacity was instrumental in effecting a change in the method of electing Scottish representative peers, and he founded the Scottish Society of Antiquaries (1780). Among his many correspondents was a reluctant Horace Walpole, and he wrote *Essays on the Lives of Fletcher of Saltoun and the Poet Thomson* (1792). He died at Dryburgh abbey on April 19, 1829. DONALD CARDROSS FLOWER ERSKINE (1899-) succeeded his cousin, as 16th earl, in 1960. (T. I.)

BUCHAN, ALEXANDER (1829-1907), the most eminent British meteorologist of the 19th century, was born at Kinross-wood, Kinross-shire, Scot., on April 11, 1829. He took up teaching as a profession and botany as a hobby. In Dec. 1860 he was appointed secretary of the Scottish Meteorological society and edited and largely wrote the society's journal, thereby gaining an international reputation. In 1887 he was made a member of the Meteorological council and in 1898 was elected a fellow of the Royal society. In 1902 he received the first award of the Symons medal as the most eminent British meteorologist. He had a full share in the opening, in 1883, of the Ben Nevis observatory and in the discussion of the observations until it closed in 1904. Buchan died in Edinburgh on May 13, 1907.

In 1867 Buchan published his *Handy Book of Meteorology*, for many years a standard textbook. In 1869 he contributed to the Royal Society of Edinburgh a paper on "The Mean Pressure of the Atmosphere and the Prevailing Winds Over the Globe, for the Months and for the Year" which secured for him a pre-eminent place among meteorologists. He contributed memoirs on "Atmospheric Circulation" (1889) and on "Oceanic Circulation" (1895) for the "Challenger" expedition reports.

Buchan Spells.—In papers contributed to the *Journal of the Scottish Meteorological Society* (1869) on "Interruptions in the Regular Rise and Fall of Temperature in the Course of the Year!" Buchan discussed temperature records for the years 1857-66 which suggested that there were nine periods each year, in six of which the temperature was below the seasonal normal and in three of which

it was above, but he made no claim that they would always recur and did not again refer to this paper. In 1927 statisticians began to reconsider the evidence for the cold and hot spells which came to be called "Buchan spells." The modern view is that nonseasonal temperature fluctuations are very largely of a random nature.

(E. M. Wn.)

BUCHAN, ELSPETH (1738-1791), religious fanatic and founder of a Scottish sect called Buchanites, proclaimed in 1783 that the second coming of Jesus Christ was at hand, that she herself was the woman predicted in Rev. xii and that the Rev. Hugh White of Irvine was her man-child who would rule the earth with a rod of iron. The magistrates of Irvine expelled her followers, who settled in Dumfriesshire, in a farmhouse called Buchan hall, where they practised peculiar rites, during which Mrs. Buchan "breathed" the Holy Ghost upon them. After her death in May 1791 they soon disappeared: the last adherent, Andrew Innes, dying in 1846.

See J. Train, *The Buchanites From First to Last* (1846); J. Cameron, *History of the Buchanite Delusion, 1783-1846* (1904). (H. Wa.)

BUCHAN, JOHN: *see* TWEEDSMUIR, JOHN BUCHAN.

BUCHANAN, FRANKLIN (1800-1874), U.S. naval officer, was born in Baltimore, Md., Sept. 17, 1800, grandson of Thomas McKean, a Pennsylvania signer of the Declaration of Independence. He became a midshipman Jan. 28, 1817. George Bancroft, the historian, then secretary of the navy, appointed him the first superintendent of the United States Naval academy, opened at Annapolis, Md., on Oct. 10, 1845. He commanded the U.S.S. "Susquehanna," flagship of Commodore M. C. Perry, in Japan, 1852-54. Believing that Maryland would secede from the Union, he resigned his commission on April 22, 1861 while in command of the Washington navy yard. He tried to recall this resignation, but was dismissed May 14 and entered the Confederate States navy. He commanded the ironclad ram "Virginia" ("Merrimack") when she sank the Union ships "Cumberland" and "Congress" in Hampton Roads, March 8, 1862; his brother, McKean Buchanan, was an officer on board the "Congress." Promoted to the rank of admiral on Aug. 26, 1862, Buchanan was the senior officer of the Confederate navy thereafter. In Mobile bay, Aug. 5, 1864, he fought Farragut's ships with the ram "Tennessee" after other vessels of his own squadron were disabled or captured. He was wounded on board the "Virginia" and again on the "Tennessee." He died May 11, 1874. (J. B. Hn.)

BUCHANAN, GEORGE (1706-1782), Scotland's greatest humanist, was born in Feb. 1706 near Killearn, Stirlingshire. His father, who claimed descent from the house of Lennox, was poor and died early; but George, having showed great promise, was sent by his uncle in 1720 to the University of Paris. There he began a course in arts, but in 1722 his uncle's death recalled him to Scotland. He took part in the duke of Albany's brief expedition against England in 1723, but thereafter suffered a breakdown in health. Only in 1725 was he able to resume his studies: at St. Andrews, attracted no doubt by the fame of John Major. He completed his B.A. in 1726 and returned to Paris as a bursar in the Scots college. After a period of penury he graduated master in 1728, and became a regent (teacher) in the enlightened Collège de Ste. Barbe. Rejecting the old-fashioned grammar of Alexandre de Villedieu, he taught Latin according to the method of Thomas Linacre, whose book, in English, on Latin grammar he translated into Latin (1733). His reputation grew and in 1729 he was made "procurator of the German nation." In 1731 he became tutor to the young earl of Cassillis, with whom he returned to Scotland in 1734 or 1735. He was next entrusted with the education of James Stewart, the eldest of James V's natural sons.

While still with Cassillis he had attacked the Franciscans in *Somnium*—little more than a translation of a poem by William Dunbar—and in 1737 he produced the still more bitter satire *Franciscanus*. He was attacked as a heretic in 1739, and escaped through the window of his prison in St. Andrews.

Suspect, he was unwelcome both in England and in Paris and accepted an invitation from his Portuguese friend, André de Gouvêa, principal of the Collège de Guyenne in Bordeaux, who was introducing the new method of education. There Montaigne was one

of his pupils. Buchanan found diversion in translating Euripides' *Medea* and *Alcestis* in Latin: and in writing two original dramas, *Jephtes* and *Baptistes*, the latter a thinly veiled attack upon persecuting tyranny. Of the years which followed his departure from Bordeaux in 1542 or 1543 little is known, but 1547 found him in Portugal, where Gouvêa had become head of a new college in the University of Coimbra. Gouvêa, himself a Roman Catholic, held liberal views but on his death Buchanan and other teachers were accused of heresy. After having been immured in a monastery for instruction, he was allowed to leave Portugal in 1552. In captivity he had composed a paraphrase of the Psalms which, published in the 1560s, was long used to instruct Scottish youth in Latin.

Once more in France, he acted for a time as tutor to the son of Marshal Brissac. In this congenial employment he began what he thought would be his magnum opus. This was the *De Sphaera*, a poem in five books which, although in distinguished Latin, was but a defense of the old Ptolemaic system and remained unpublished until after his death. Among other poems written at this time was the *Epithalamium* on the marriage of Mary Queen of Scots with the dauphin (1558) from which he hoped great things; but the dauphin's death (Dec. 1560) and the recrudescence of persecution disillusioned him and he returned to Scotland in 1561.

There he was at once recognized as *Poetarum nostri seculi facile princeps* ("unquestionably the foremost poet of our generation!"). He had become Protestant, but since Mary pursued a *politique* course he was able to commend himself to both kirk and crown. He sat on four occasions in the general assembly of the Scottish kirk; yet also acted as court poet. He instructed the queen in Livy, was consulted about the reform of the University of St. Andrews and was granted a pension—somewhat irregularly paid. He reconciled himself to the queen's Catholic marriage in 1563 probably because her bridegroom, Henry, Lord Darnley, was a scion of his own house of Lennox. In 1566 he was made principal of St. Leonard's college; in the same year he dedicated to the queen, in a charming epigram: the second edition of his paraphrase of the Psalms, and as late as December helped to compose the masque which graced the baptism of the infant James VI.

After the murder of Darnley in 1567 he became Mary's bitter enemy and served each of the regents who ruled after her enforced abdication—Moray, Lennox, Mar and Morton. He helped Moray to prepare the case against Mary presented to Elizabeth I. and in 1571 published the *Detectio* which gave Europe a lurid version of the queen's conduct. Under Lennox (1570–71) he became tutor to the young king and was made director of chancery and keeper of the privy seal. These offices he continued to hold, though he resigned the seal in 1578, but his influence declined because of his waning health and perhaps because his political opinions did not commend themselves to the authoritarian Morton. He died on Sept. 29, 1582, and was buried in Edinburgh. *De jure regni apud Scotos* (1579), the most important of his political writings, and immensely popular, was a resolute assertion of limited monarchy in dialogue form and on the classical model; and *Reverum Scotticarum Historia* (1582) (which he was completing at the time of his death), though it accepted the 108 kings from the mythical Fergus and superabounded in patriotism, was strongly coloured by his theories.

By the partisans of Mary, Buchanan has been regarded as an unprincipled turncoat who repaid benefits with black ingratitude, but generally he survives in Scottish tradition as a hero of Protestantism: reform and liberty. This is at first sight odd. He wrote, almost entirely, not in Scots but in Latin; he became a Protestant only about 1560; for long he was known throughout Europe as a scholar and a poet, who composed among other things *erotica*; his astronomical theories were outmoded; his political ideas were not new; his *History*, compared by his admirers with Caesar, Livy and Sallust, was, according to modern ideas, uncritical. It might be thought that he should instead be regarded as essentially a humanist, who wrote with the first pen in Europe.

Yet there is justification for the traditional view. He could not, like Erasmus, regard with easy tolerance views and institutions with which he disagreed. He set himself to destroy what he regarded as corrupt and inefficient; he expressed himself with

power and eloquence; and his disregard of convention made him the colourful figure who survives in many exaggerated stories. With all his shortcomings he was a fearless champion of truth as he saw it and he well deserves his place in Scottish tradition.

The standard complete edition of Buchanan's works is by T. Ruddiman (1711). His writings in Scots were edited for the Scottish Text society by P. Hume Brown (1892). The most useful translation of his history is that used by James Aikman as the foundation of his *History of Scotland*, six volumes (1827–29). *De jure regni apud Scotos* was translated by C. Flinn Arrowood (1949).

BIBLIOGRAPHY.—The best bibliography of Buchanan's works is *George Buchanan, "Glasgow Quatercentenary Studies"* (1906), which includes valuable articles on the material. The colourful *Life of Buchanan* in Mackenzie's *Lives of Scots Writers*, 3 vol. (1708–22) is not reliable. D. Irving, *Memoirs of the Life and Writings of George Buchanan*, 2nd ed. (1817) is useful, but the standard biography is P. Hume Brown, *George Buchanan, Humanist and Reformer* (1890) though this must be supplemented by later material, notably G. J. C. Henriques, *George Buchanan and the Lisbon Inquisition: the Records of His Trial With a Translation Thereof Into English* (1906). (J.N. D. M.)

BUCHANAN, JAMES (1791–1868), 15th president of the United States, was born near Mercersburg, Pa., on April 23, 1791. Both parents were of Scottish-Irish Presbyterian descent. He graduated from Dickinson college, Carlisle, Pa., in 1809 and studied law at Lancaster for two years. He was admitted to the bar in 1812 and served in the lower house of the state legislature. 1814–16. From 1821 to 1831 he served in the U.S. congress. As chairman of the judiciary committee he conducted the impeachment trial (1830) of Judge H. Peck, led an unsuccessful movement to increase the number of supreme court judges and to relieve them of their circuit duties, and succeeded in defeating an attempt to repeal the 25th section of the Judiciary act of 1789, which gave the supreme court appellate jurisdiction by writ of error to the state courts in cases where federal laws and treaties were in question. After the dissolution of the Federalist party, of which he had been a member, he came to be definitely associated with the Democrats. He represented the United States at the court of St. Petersburg from 1832 to 1833 and there negotiated an important commercial treaty. He was a Democratic member of the U.S. senate from Dec. 1834 until March 1845, ardently supporting President Jackson, and was secretary of state in the cabinet of President Polk from 1845 to 1849—a period marked by the annexation of Texas, the Mexican War and negotiations with Great Britain relative to the Oregon question. After four years of retirement, following his failure to secure the Democratic nomination for president, he was appointed by President Pierce minister to Great Britain in 1853.

Sometime in the 1830s Buchanan had begun developing a consuming ambition for the presidency. He realized that as a northern man he must impress the southern party leadership with his respect for the constitutional safeguards of slavery. He felt that the institution was morally wrong, but held that congress could not interfere with it in the states in which it existed, and ought not to hinder the natural tendency toward territorial expansion through a fear that the evil would spread. He voted for the bill to exclude antislavery literature from the mails and for the compromise of 1850 (see COMPROMISE OF 1850) and disapproved of the Wilmot proviso. Fortunately for his career he was abroad during the Kansas-Nebraska debates, hence did not share in the unpopularity which attached to Stephen A. Douglas as the author of the Kansas-Nebraska bill and to President Pierce as the executive who was called upon to enforce it. At the same time, by joining with J. Y. Mason and Pierre Soulé in signing the Ostend manifesto (*q.v.*) in 1854, Buchanan retained the good will of the south. This "manifesto," which was bitterly attacked in the north, was agreed upon (Oct. 18, 1854) by the three ministers after several meetings at Ostend and at Aix-la-Chapelle. These meetings were arranged in pursuance of instructions from President Pierce to aid in mobilizing powerful financial influences in the European capitals to bring pressure on Spain for the sale of Cuba so that Spain would have the money to pay some of its debts long due these financiers. These diplomats, as far as is known, did nothing toward this end. Rather they spent their time in drafting

a report, largely the work of Buchanan, which recommended that the United States purchase the island. In view of the fact that many feared that the Negroes might take over Cuba as they had Haiti, the diplomats added a caution. Such action would be a menace to the southern states, where it might encourage a slave uprising. The diplomats expressed their view that if such "Africanization" took place, the United States might then, had Spain refused to sell, have to take over Cuba in self-defense. Spain would not sell and the island did not come under Negro rule, so the document served no practical purpose. However, the rising Republican press proclaimed it a "manifesto" pointing a gun at Spain and saying "sell it or we seize it," a partisan interpretation not warranted by the facts.

On Buchanan's return from England in 1856 he was nominated by the Democrats as a compromise candidate for president and was elected, receiving 174 electoral votes to 114 for J. C. Fremont, Republican, and 8 for Millard Fillmore, American or "Know-Nothing." Buchanan's character, the breadth of his legal knowledge, and his experience as congressman, cabinet member and diplomat, would have made him an excellent president in ordinary times; but he lacked the soundness of judgment, the self-reliance and the moral courage needed to face the slavery crisis. His idea of saving the Union was to prevent northern agitation and to enforce the fugitive slave law. At the beginning of his administration he appointed Robert J. Walker, of Mississippi, territorial governor of Kansas and assured him of his determination to adhere to the popular sovereignty principle. The president, however, lost patience with the "free state" Kansans when they refused to participate in making the Lecompton constitution. He then tried to force through the admission of Kansas under that constitution so that the slavery agitation might cease. He believed that the citizens could eliminate the proslavery features of the document soon after admission. His Kansas policy was dictated by his sincere desire to get the issue out of congress.

Also he was at odds with both Douglas and Walker because they would not recognize him as party leader. The panic of 1857 was disastrous in the north but affected the south little and thus gave the southerners a false impression of their economic independence. The religious revival of 1858 and John Brown's raid in 1859 stirred up emotions that made the south fearful that Yankees were plotting to destroy their society. Nothing of importance that Buchanan attempted in domestic or foreign policy succeeded. The Democratic party split in two and the way for Lincoln's election was cleared.

The election of Lincoln in 1860 convinced many southerners that the Republican party was now in a position to send more John Browns to stir up slave revolts. In Dec. 1860 South Carolina began a secession movement that soon involved seven states. Buchanan denounced secession but could find no means to stop it. He would not surrender any of the forts that he could hold. The most notable example was Ft. Sumter in Charleston harbour. He permitted its commander, Maj. Robert Anderson, to strengthen his position in the harbour and sent him supplies in the "Star of the West" in Jan. 1861. When that ship was fired on (Jan. 9) and turned back, he awaited the outcome of a truce. Nothing came of it but neither did hostilities break out, so Buchanan held the second relief expedition to await Major Anderson's call. When word came that aid was needed it was too late to act, and Buchanan turned over the problem to the new administration.

On the expiration of his term of office (March 4, 1861) he retired to his home, named Wheatland, near Lancaster, Pa., where he actively supported the Union until his death on June 1, 1868. He was never married. His mistakes as president have been so emphasized as to obscure the fact that he was a man of unimpeachable honesty, of the highest patriotism and of considerable ability. See also AMERICAN CIVIL WAR; UNITED STATES OF AMERICA: History.

Nichols, *Disruption of American Democracy* (1948) and *Franklin Pierce*, 2nd ed. (1958). (R. F. N.)

BUCHANAN, ROBERT WILLIAMS (1841-1901), English poet, novelist and playwright, chiefly remembered for his attacks on the Pre-Raphaelites, was born at Caverswall, Staffordshire, Aug. 18, 1841. *London Poems* (1866) established him as a poet. His first novel was *The Shadow of the Sword* (1876); and he continued to pour out poems, novels and melodramas of which *Alone in London* (1884) may be taken as typical. His own forcefulness and moral fervour led him to criticize Swinburne and other contemporary poets, and his attacks culminated in an article "The Fleshly School of Poetry" published pseudonymously in the *Contemporary Review* (1871). This provoked a violent literary argument: Rossetti's reply, "The Stealthy School of Criticism," appeared in the *Athenaeum* (1871), and Swinburne's as a pamphlet *Under the Microscope* (1872). Buchanan died in London, June 10, 1901.

BUCHAREST (Rum. BUCUREȘTI), an administrative and economic region of southeast Rumania, is located between the Olt and the Danube. Area 20,479 sq.km. (7,907 sq.mi.). Pop. (1956) 1,571,876. It is divided into 19 administrative districts. The chief towns are Bucharest, the capital of Rumania and administrative centre of the region, Giurgiu, Oltenifa, Roșiorii-de-Vede and Alexandria. The region comprises a part of the Rumanian plain and a portion of the Danube water meadow and is drained by the Danube and its tributaries, the Olt, Arges, Ialomifa and Dimbovifa. A steppe vegetation prevails.

With 75% arable land, Bucharest is the grain centre of Rumania. It grows wheat, maize (corn), vegetables, rice, sunflower and tobacco, and has 14% of the country's vineyards. Industries include food processing and textiles. There are important oil and natural gas deposits.

BUCHAREST (Rum. ORAȘUL BUCUREȘTI), the capital of Rumania and the administrative centre of the Bucharest region, lies in a shallow depression in the middle of the slightly undulating Walachian plain, 82 m. (269 ft.) above sea level. It is traversed by the Dîmbovița river from northwest to southeast, and much the larger part of the city is situated on its right bank. Bucharest is subject to extremes of climate, summer heat (up to 85° F.) being followed by cold winters (down to 20° F. below zero). The population, which more than doubled after World War I, was estimated at 1,225,507 in 1960.

The most thickly populated part of the city lies between the left bank of the Dîmbovița and the chain of lakes to the north. There are the largest buildings of the modern city among which stand the few surviving old buildings, the earliest of which is the Curtea Veche (Old Court) church, the former chapel of the princely palace, built by Prince Mircea Ciobanul in 1545-59. Outstanding among other old buildings are the Coltea church, which dates from the end of the 17th century, the St. Gheorghe Nou (1707), Stavropoleos (1730) and Kretulescu (1722) churches. The most typical buildings of the medieval town stand on the right bank of the Dîmbovița, which used to mark the southwestern limits of the 16th-century town. Three churches crown the hills close beside the river: the centre one, the metropolitan cathedral, was built in the middle of the 17th century; the church of the former Prince Mihai monastery stands to the west, built in 1594 by Prince Michael the Brave. Beyond the medieval settlement, Bucharest began to spread out in the second half of the 17th century. Two famous monastic settlements were established—the Antim monastery, founded in 1715, and the Văcărești monastery, built in 1718-22; both are characteristic of the architecture of the 18th century.

The aspect of the town in the early 1960s was that of a modern metropolis. Amid the irregular network of the older, narrow and tortuous streets, there are several broad thoroughfares, the two main ones intersecting each other almost at right angles and dividing the city into four sections of roughly equal area. One of these thoroughfares (called in succession boulevards Ardeal, March the Sixth and Republic) crosses the city from east to west. Along its western end lie the botanical gardens and near the centre the Cismigiu gardens. In this street, too, are some of the city's outstanding modern buildings including the faculty of medicine, built in 1902 in the neoclassical style, some ministerial buildings,

BY COURTESY OF "RUMANIA TODAY"

ART MUSEUM OF THE RUMANIAN PEOPLE'S REPUBLIC. FORMERLY A ROYAL PALACE, BUCHAREST; 1935-37

the opera house and ballet theatre (1953) and the university, the central body of which was destroyed during air raids in 1944. The second thoroughfare (boulevards Ana Ipatescu, Măgheru, Balcescu and 1848), which traverses the city from north to south, is lined with blocks of apartments, mostly built after World War I.

The main street is Calea Victoriei, named in honour of the victory won in the war of independence (1877). Along and close to this street, which runs from south to north, and beginning from the left bank of the Dîmbovița, are many of the most noteworthy buildings of the modern city: the palace of justice (partly converted into a library), an imposing building in the French neo-Renaissance style built in 1895, the palace of the Athenaeum (1888), the central university library, the palace of the council of ministers (1933) and the natural history museum. Calea Victoriei continues as the famous Kiselev avenue constructed in 1832, at the end of which is the Scinteiă printing house, the largest building in Bucharest (1950-55). Gardens extend along Kiselev avenue to Lake Herăstrău where in 1936 a village museum was arranged. From different parts of the country original and characteristic specimens of houses were brought there, together with auxiliary buildings and many household utensils required in daily life, in order to help visitors to understand and study the life of country folk.

Bucharest has many institutions of higher education including the college of engineering (founded in 1850), the university (1864) and the institute of pharmacy and medicine (1869). It has also some notable museums: specializing in archaeology, popular art and military matters. The art museum includes a national art gallery and sections devoted to both western and oriental art. Bucharest is well endowed with sports facilities, and possesses three large stadiums and the modern Floreasca sports complex.

The public transport system includes streetcars, buses and trolley buses. Communication with provincial towns and other European countries is by rail and air. The city has four railway stations and an airport at Băneasa, 7 km. (4½ mi.) from the centre. There are many modern factories, making textiles: farm machinery and automobiles. The city also possesses tanneries! shoe factories, oil refineries and engineering works and produces 20% of Rumania's gross industrial output.

History. — Although excavations suggest that the site has been inhabited since Paleolithic times, Bucharest was probably founded in the second half of the 14th century. Situated on trade routes from Constantinople, it was in a position of some strategic importance. It is mentioned in 1368 under the name of Cetatea Dimbovitei (fortress of the Dîmbovița). The name Cetatea Bucureștilor first appears in a document signed by Vlad IV (Tepeș) in 1459, when the city, which shared the position of capital with the more ancient Tîrgoviște, extended along the left bank of the Dîmbovița. Tîrgoviște was the seat of the princes and metropoli-

tan archbishops until 1660.

Gradually the town achieved greater importance! especially after Michael the Brave had driven out the Turks at the end of the 16th century (see RUMANIA; History). In the 17th century Bucharest steadily spread out across the right bank of the Dimbovita, around the big Radu Vodă and Mihai Vodă monasteries. The city experienced a remarkably flourishing period both in commerce and in the arts in the time of Șerban Cantacuzino (1678-88) and Constantin Brancovan (1688-1714). In the 18th century the majority of the population consisted of Phanariot Greeks from Constantinople.

Concurrently with the structural changes initiated in Rumanian society in the first half of the

19th century, and under the influence of western ideas and trends in art, a start was made in modernizing the city. It became the capital of the united principalities, Walachia and Moldavia in 1859, and the capital of the kingdom of Rumania in 1862.

Bucharest was occupied by the Russians from 1823 to 1834, during 1848-51, in 1854 and 1877. The Austrians occupied it during the Crimean War (1854-56). In World War I the Germans entered the city on Dec. 6, 1916, and remained there until Nov. 30, 1918. In World War II they moved into Rumania in Sept. 1940 as allies but on Aug. 23, 1944, the capital was the scene of a successful *coup d'état*: war was declared on Germany and the Soviet army entered Bucharest as an ally. (G. I.)

BUCHER, LOTHAR (1817-1892), German publicist and one of Bismarck's most trusted assistants, was born at Neustettin, Pomerania, on Oct. 25, 1817. A member of the Prussian national assembly in 1848 and of the Prussian second chamber (in which he sat with the extreme left) in 1849, he was sentenced in 1850 to 15 months' imprisonment for organizing a movement against the payment of taxes. Fleeing to London, he worked there as correspondent of the *National Zeitung* (1850-61). On his return to Berlin, Bucher continued writing for the *National Zeitung* and collaborated with Ferdinand Lassalle. In 1864 he was given a position in the Prussian foreign office by Bismarck, whose complete confidence he soon won. He drew up the text of the constitution of the North German confederation (1867), was sent on confidential missions to Spain in connection with the Hohenzollern candidature for the Spanish crown (1870), assisted Bismarck at the final negotiations for the treaty of Frankfurt at the end of the Franco-German War (1871) and was *secrétaire archiviste* to the congress of Berlin (1878). He was also responsible for Bismarck's relations with the press and for "inspired" articles in newspapers and magazines. His special relationship with Bismarck, however, aroused the animosity of some of the most influential Prussian aristocrats, and this led to his resignation from the foreign office in 1886. After Bismarck's dismissal in 1890, Bucher assisted him at Friedrichsruh in the composition of his memoirs, the *Gedanken und Erinnerungen*. Bucher died at Glion, Switz., on Oct. 10, 1892.

His works include: *Kulturhistorische Skizzen aus der Industrieausstellung aller Völker* (1851); *Bilder aus der Fremde*, two volumes (1862); *Der Parlamentarismus wie er ist* (1882); *Kleine Schriften politisches Inhalts* (1893).

BUCHEZ, PHILIPPE JOSEPH BENJAMIN (1796-1365). French philosopher and politician who was a precursor of the modern Christian socialist movement. Born on March 30, 1796, in the Flemish village Matagne-la-Petite, he studied medicine at Paris and obtained his doctorate in 1825. A bitter op-

ponent of the Bourbon restoration. In 1821 he founded the *Charbonnerie française*, modeled on the Italian Carbonari (*q.v.*). After 1825, attracted by the social philosophy of Henri de Saint-Simon (*q.v.*), he became a supporter of Saint-Simonism and a contributor to its magazine, *Le Producteur*, but he left the movement at the end of 1829 in opposition to its pantheistic tendencies. He remained faithful, however, to Saint-Simonist doctrine and presented his views in a new magazine, *L'Européen*, which appeared intermittently from 1831 to 1838. During these years he also published his three most important works, *Introduction à la science de l'histoire* (1833), *Histoire parlementaire de la Révolution française* (1833-38) and *Essai d'un traité complet de philosophie au point de vue du catholicisme et du progrès* (1839-40). Following the revolution of Feb. 1848, he was elected to the constituent assembly and became its first president. Under the second empire, having previously opposed the rise of Louis Napoleon, he prudently withdrew from politics. He died, while visiting Xuvergne, at Rodez on Aug. 11, 1865.

See A. Cuvillier, P. J. B. Buchez et les origines du socialisme chrétien (1948).

BUCHHOLTZ, JOHN THEODORE (1888-1971), U.S. botanist who studied particularly morphology and genetics, was born in Polk county, Neb., on July 14, 1888. He attended Iowa Wesleyan college, Mt. Pleasant; the State University of Iowa, Iowa City; and The University of Chicago, where he received a Ph.D. degree in plant morphology in 1917.

Buchholtz headed the science department at Arkansas State Normal school, Conway, 1911-18, and was professor of botany at the University of Arkansas, Fayetteville (1919-26), the University of Texas, Austin (1926-29), and the University of Illinois, Urbana (1929-51). He was for 20 years visiting investigator at the department of genetics of the Carnegie institution, Cold Spring Harbor, N.Y., and served as president of the Botanical Society of America in 1941. In 1947-48 he studied botanical problems in New Caledonia. Buchholtz wrote numerous botanical articles, including those concerning the morphology and embryology of conifers and the genetics of *Datura* and gymnosperms. He died on July 1, 1951, at Champaign, Ill.

BÜCHNER, EDUARD (1860-1917), German chemist who specialized in research in fermentation and enzyme action and won the Nobel prize for chemistry in 1907. He was born at Munich, May 20, 1860. He was professor at Berlin (1898), Breslau (1909) and Würzburg (1911). In 1899 he was able to confirm Traube's theory by demonstrating that the active cause of alcoholic fermentation is the action of different enzymes contained in yeast and not the yeast cell itself. Concerning the physiological nature and meaning of fermentation he showed that a ferment (zymase) can be extracted from yeast cells which causes sugar to break up into carbon dioxide and alcohol. Buchner was killed in World War I on Aug. 24, 1917. See FERMENTATION: *Buchner: Cell-Free Fermentation*.

BÜCHNER, GEORG (1813-1837), German dramatist, a forerunner of the Expressionists of the 20th century, was born at Goddelau near Darmstadt on Oct. 17, 1813, the son of an army doctor, and studied medicine at Strasbourg and Giessen. At Giessen he was caught up in the revolutionary movement inspired by the Paris rising of 1830; he published a revolutionary pamphlet, *Der hessische Landbote* (1834), and founded a radical society, Die Gesellschaft der Menschenrechte. He escaped arrest by fleeing to Strasbourg. He became a lecturer in natural science at Zürich in 1836, and died there of typhoid fever on Feb. 19, 1837.

The three plays Buchner wrote during his short life, clearly influenced in style by Shakespeare and the *Sturm und Drang* movement, were in content and form far ahead of their time. In short, abrupt scenes: they combine extreme naturalism with visionary power. His first play, *Dantons Tod* ("Danton's Death," 1835; first performed in Berlin, 1902), is a drama of the French Revolution, suffused with deep pessimism. *Leonce und Lena* (1836; performed at Munich, 1885), a romantic comedy, shows the influence of Alfred de Musset and Clemens Brentano. His last work, *Woyzeck* (1836; performed 1913), which remained a fragment, anticipates the social drama of the 1890s with its compassion for

the poor and oppressed. Except for *Dantons Tod* and the fragment of a novel, *Lenz* (1839), Buchner's writings appeared only after his death. *Woyzeck* not until 1879, when the manuscript was deciphered and edited by K. E. Franzos. It served as libretto for Alban Berg's opera *Wozzeck* (1925).

Buchner exercised a marked influence on the naturalistic drama of the 1890s and later, on Expressionism. He is now recognized as one of the outstanding figures in German dramatic literature.

Büchner's *Werke und Briefe* were edited by F. Bergemann (6th ed., 1953); *The Plays of G. Büchner* (1952) is an English translation by G. Dunlop.

BIBLIOGRAPHY.—A. Pfeiffer, *Büchner* (1934); E. Diehm, *Büchners Leben und Werke* (1946); K. Viëtor, *Büchner, Politik, Dichtung, Wissenschaft* (1949); A. H. Knight, *Büchner* (1951). (H. F. GN.)

BÜCHNER, LUDWIG (1824-1899), German physician who became one of the most popular exponents of "crude" materialism, was born at Darmstadt on March 28, 1824. He began teaching medicine as *Privatdocent* at the University of Tübingen, but the outspoken materialism of his masterpiece, *Kraft und Stoff* (1855; 2nd Eng trans from 10th Ger ed *Force and Matter*, 1870), caused such an outcry that he had to retire to his home town and practise as a doctor there. He continued, however, to expound his materialistic and atheistic views in numerous publications including *Natur und Geist* (1857), *Aus Natur und Wissenschaft*, two volumes (1862-84), *Die Stellung des Menschen in der Natur* (1869, Eng trans *Man, Past, Present and Future*, 1872), *Der Gottesbegriff und dessen Bedeutung in der Gegenwart* (1874), *Der Fortschritt in Natur und Geschichte im Lichte der Darwin'schen Theorie* (1884), *Fremdes und Eigenes aus dem geistigen Leben der Gegenwart* (1890), *Gott und die Wissenschaft* (1899), *Am Sterbelager des Jahrhunderts* (1898). Rejecting all distinction of mind from matter, he appealed strongly to contemporary free-thinkers but was condemned as "bourgeois" by dialectical materialists especially after he had accepted competitive capitalism as exemplifying the Darwinian "struggle for survival." Buchner died at Darmstadt on April 30, 1899.

See the memoir by his brother Alexander appended to the posthumous selection of essays by Ludwig Büchner, *Im Dienste der Wahrheit* (1899).

BUCK, PEARL (née SYDENSTRICKER) (1892-), U.S. author, was awarded for her novels and biographies the Nobel prize in literature in 1938.

She was born in Hillsboro, W.Va., on June 26, 1892, but spent her youth in Chen-chiang, China, where her parents were Presbyterian missionaries. She received her early education in Shanghai and was graduated from Randolph-Macon Woman's college, Lynchburg, Va., in 1914; she returned to China and later became a university teacher in Nanking. Her articles and stories about Chinese life first appeared in U.S. magazines in 1923, but it was not until 1931 that she reached a wide audience with *The Good Earth*, which described sympathetically the struggles of a Chinese peasant and his slave-wife to gain land and position. This novel, awarded the Pulitzer prize (1932) and widely translated, was followed by *Sons* (1932) and *A House Divided* (1935); the trilogy was published as *The House of Earth* (1935).

In 1934 she was divorced in the United States from John L. Buck, a missionary in China whom she had married in 1917. In the following year she was married to Richard J. Walsh, a New York publisher, and thereafter lived in the United States. She continued to write under the name Pearl Buck.

Mrs. Buck turned to biography with lives of her father Absalom Sydenstricker, *Fighting Angel* (1936), and her mother Caroline, *The Exile* (1936). Her later books include *The Patriot* (1939), *Other Gods* (1940), *Dragon Seed* (1942) and *Imperial Woman* (1956), novels; *The First Wife* (1933) and *Far and Near* (1947), short stories; *The Child Who Never Grew* (1950), concerning her retarded daughter; and an autobiography, *My Several Worlds* (1954).

(W. L. Ps.; X.)

BUCK, in zoology, the male of several animals: deer (except the genus *Cervus*, males of which are called stags), antelope, goat, hare, rabbit, rat, etc. It is often used, especially in England, to indicate the male fallow deer (*q.v.*). The names of many an-

telopes (*q.v.*) contain the term buck: bushbuck, prongbuck, black buck, reedbuck, etc.

BUCK BEAN (BOG BEAN; *Menyanthes trifoliata*), a member of the family Gentianaceae (*q.v.*), a bog plant with a creeping stem, alternately arranged large leaves each with three leaflets and spikes of white or pink flowers. The plant, widely distributed through the north temperate zone, makes a useful bog-garden subject, as a ground cover.

BUCKEYE: see HORSE CHESTNUT.

BUCKFASTLEIGH, an urban district of Devon, Eng., best known for the abbey at Buckfast (1 mi. N.), is situated 21 mi. E.N.E. of Plymouth by road, above Totnes on the river Dart which provides trout and salmon. Pop. (1961) 2,550. The original Benedictine abbey, founded in 1018, was refounded and rebuilt in the 12th century as a Cistercian house which became very prosperous. After the Dissolution it became a ruin and remained so for 300 years, but in 1882 a group of French Benedictine monks acquired the site and with their own hands re-erected the abbey on its original foundations, the work being completed in 1937. There were rarely more than six monks engaged on the work at any one time and four worked almost continuously for 32 years. Cruciform in plan, with choir and central tower, the building, largely of local limestone, is impressive. The high altar, of wrought metal, gilded and enameled, is an excellent piece of craftsmanship. There are 15 altars and behind the high altar an ambulatory with six chapels. The tower contains a fine peal of 14 bells, the largest weighing eight tons. The monks, long famous for their tonic wine, are also well-known for beekeeping.

Serge and blankets are manufactured in the urban district; other activities are dealing in hides, quarrying and agricultural engineering. The parish church stands on a limestone hill riddled by ancient caves containing numerous bats. (FR. M. S.)

BUCKHAVEN AND METHIL, a small burgh and port of Fife; Scot., lies on the north side of the Firth of Forth, 8 mi. N.E. of Kirkcaldy. Pop. (1961) 21,104. The burgh takes its name from two villages which were united in 1891, since when a system of modern docks has been constructed at Methil. Buildings are mostly modern, Buckhaven high school (1958) being notable for its design. The chief industries are coal mining and the production of steel, plastics and fertilizers. Coal is exported and raw fertilizers and pulp for papermaking are imported. (K. FE.)

BUCKIE, a small burgh and fishing town of Banffshire, Scot., on the Moray firth, at the mouth of Buckie burn which runs into sandy Spey bay, lies about 20 mi. W. of Banff by road. Pop. (1961) 7,666. It is the centre of a fishery district and the harbour for one of the largest Scottish fleets in the herring season, and is also the chief centre of line fishing in Scotland. The harbour, with an outer and inner basin, covers an area of 30 ac. It was considerably extended in 1921. Beside the fisheries and fish-curing trade, ship repairs, malting, whisky distilling and the making of barrels and food products are carried on. The burn (stream) divides the town into Buckie and Buckpool. Portgordon, 2 mi. W., is a thriving fishing village; its harbour was built by the duke of Richmond and Gordon in 1874. Rathven, 2 mi. E., lies in a fertile district, where there are several antiquities.

BUCKINGHAM, EARLS, MARQUESSSES AND DUKES OF. The origin of the earldom of Buckingham (to be distinguished from that of Buckinghamshire [*q.v.*]) is obscure. According to J. H. Round (in G. E. C.'s Peerage) there is some charter evidence for its existence under William Rufus; but the main evidence for reckoning Walter Giffard, lord of Longueville in Normandy, who held 48 lordships in the county, as the first earl, is that of Orderic Vitalis, who describes Walter as "Comes Bucchingemensis," in 1097 and at his death in 1102. After the death of Walter Giffard, 2nd earl, in 1164, the title was assumed by Richard de Clare, earl of Pembroke ("Strongbow"), great-grandson of Richard de Clare (d. 1090) who had married Rohese, daughter of Walter Giffard, the 1st earl; it died with him in 1176. In 1377 Thomas of Woodstock (duke of Gloucester) was created earl of Buckingham at the coronation of Richard II (July 15), and the title of Gloucester having after his death been given to Thomas le Despenser, his son Humphrey bore that of earl of Buckingham

only. On Humphrey's death, his sister Anne became countess of Buckingham in her own right. She married Edmund Stafford, earl of Stafford, and on her death (1438) the title of Buckingham passed to her son Humphrey Stafford, earl of Stafford, who in 1441 was created duke of Buckingham. This title remained in the Stafford family until the attainder and execution of Edward, 3rd duke, in 1521 (see BUCKINGHAM, HENRY STAFFORD, 2ND DUKE OF).

In 1617 King James I created George Villiers earl, in 1618 marquess and in 1623 duke of Buckingham (see BUCKINGHAM, GEORGE VILLIERS, 1ST DUKE OF). The marquessate and dukedom became extinct with the death of the 2nd (Villiers) duke in 1687; but the earldom was claimed, under the special remainder in the patent of 1617, by a collateral line of doubtful legitimacy claiming descent from John Villiers, 1st Viscount Purbeck. The title was not actually borne after the death of John Villiers, styling himself earl of Buckingham, in 1723. The claim was extinguished by the death of George Villiers, a clergyman, in 1774.

In 1703 John Sheffield, marquess of Normanby, was created "duke of the county of Buckingham and of Xormanby." His collected *Works* were published in 1723 (see also his *Miscellanea*, 1933). He was succeeded by his son Edmund, who died in Oct. 1735 when the titles became extinct.

The title of marquess and duke of Buckingham in the Grenville family (to the holders of which the remainder of this article applies) was derived, not from the county, but from the town of Buckingham. It originated in 1784, when the 2nd earl of Temple was created marquess of Buckingham "in the county of Buckingham," this title being elevated into the dukedom of Buckingham and Chandos for his son in 1822.

GEORGE NUGENT TEMPLE GRENVILLE, 1st marquess of Buckingham (1753–1813), the second son of George Grenville, was born on June 17, 1753. Educated at Eton and Christ Church, Oxford, he was member of parliament for Buckinghamshire from 1774 to 1779. In the house of commons he was a sharp critic of the American policy of Lord North. In Sept. 1779 he succeeded his uncle as the 2nd earl of Temple; in July 1782 he became a member of the privy council and lord lieutenant of Ireland in the Rockingham ministry. On his advice the Irish Judicature act of 1783 was passed, which supplemented the legislative independence granted to Ireland in 1782. By royal warrant he created the Order of St. Patrick in Feb. 1783, with himself as the first grand master. Temple left Ireland in 1783 and again turned his attention to English politics. He enjoyed the confidence of George III, and having opposed Fox's East India bill, he was authorized by the king to say that "whoever voted for the India bill was not only not his friend, but would be considered by him as an enemy," a message which ensured the defeat of the bill. He was appointed a secretary of state when the younger Pitt formed his ministry in Dec. 1783, but resigned two days later. In Dec. 1784 he was created marquess of Buckingham "in the county of Buckingham." In Nov. 1787 he was appointed lord lieutenant of Ireland under Pitt, but his second tenure of this office was hardly as successful as the first. He was denounced by Grattan for extravagance; was censured by the Irish houses of parliament for refusing to transmit to England an address calling upon the prince of Wales to assume the regency; and he could only maintain his position by resorting to bribery on a large scale. He resigned in Sept. 1789 and subsequently took very little part in politics, although he spoke in favour of the union with Ireland. He died at Stowe house, Buckinghamshire, on Feb. 11, 1813.

His elder son, RICHARD GRENVILLE, 1st duke of Buckingham and Chandos (1776–1839), was member of parliament for Buckinghamshire from 1797 to 1813 and, as Earl Temple, took an active part in politics. In Feb. 1813 he succeeded his father as marquess of Buckingham, and having married the only child of the 3rd duke of Chandos, he was created duke of Buckingham and Chandos in 1822. Because of financial embarrassments the duke lived out of England for some time, and in 1862 an account of his travels was published as *The Private Diary of Richard, Duke of Buckingham and Chandos*.

He was succeeded by his only child, RICHARD GRENVILLE, 2nd

duke of Buckingham and Chandos (1797–1861). Educated at Eton and at Oriol college, Oxford, he was known as Earl Temple and subsequently as marquess of Chandos. He was member of parliament for Buckinghamshire from 1818 to 1839 and was responsible for the "Chandos clause" in the Reform bill of 1832. He was lord privy seal from Sept. 1841 to Jan. 1842 and, partly because of his opposition to the repeal of the Corn laws, was known as the "farmers' friend." In 1847 his residences were seized by his creditors and the duke left England for a time. He died in London on July 29, 1861.

He wrote *Memoirs of the Court and Cabinets of George III* (1853–55); *Memoirs of the Court of England During the Regency* (1856); *Memoirs of the Court of George IV* (1859); and *Memoirs of the Courts and Cabinets of William IV and Victoria* (1861).

RICHARD GRENVILLE, 3rd duke of Buckingham and Chandos (1823–89), the only son of the 2nd duke, was educated at Eton and Christ Church, Oxford and, as marquess of Chandos, was member of parliament for Buckingham from 1846 to 1857. After succeeding to the dukedom in 1861 he became lord president of the council and subsequently secretary for the colonies in the Conservative government of 1866–68. From 1875 to 1880 he was governor of Madras. Since he left no son the dukedom became extinct on his death.

BUCKINGHAM, GEORGE VILLIERS, 1ST DUKE OF (1592–1628), English royal favourite and statesman, whose vast influence during the reigns of James I and Charles I contributed to the unpopularity of their governments and was therefore among the long-term reasons for the English Civil War, was born on Aug. 28, 1592, at Brooksby, Leicestershire. His father, Sir George Villiers, was sheriff of the county; his mother, a woman of beauty who was married three times and was later known as Lady Compton and as countess of Buckingham, ambitiously pushed her good-looking son forward. George was educated at a school in Billesdon "where he was taught the principles of music and other light literature," and at the age of 18 he was sent to complete his studies in France, where he met Sir John Eliot (*q.v.*) to whom he was later to act as patron.

Villiers was introduced to James I in Aug. 1614, when the king was hunting at Apthorpe in Northamptonshire. Always susceptible to handsome young men, James took an immediate liking to Villiers. He was appointed cupbearer in 1614, and knighted and made a gentleman of the bedchamber in 1615. He had a sponsor in George Abbot, archbishop of Canterbury, but at first his advance was resisted by the reigning favourite, Robert Carr, earl of Somerset. After Somerset's fall (Oct. 1615), however, Villiers' progress was swift. In Jan. 1616 he was appointed master of the horse, in May he was made a knight of the Order of the Garter and in August he was created Baron Whaddon and Viscount Villiers. In 1617 he became earl of Buckingham and a privy counselor, receiving grants to the value of £15,000. Sir Francis Bacon, the lord keeper, then warned him: "You are as a new risen star, the eyes of all men are upon you; let not your negligence make you fall like a meteor."

The star continued to rise: with the king's infatuated help, he forced an heiress, the daughter of Sir Edward Coke, to marry his half-witted brother, John; in 1618 he himself was created marquess, in 1619 lord high admiral, and in 1620 he married Lady Katherine Manners, daughter of the earl of Rutland. Unlike Somerset, Buckingham aspired to be both an active statesman and administrator. But his many occupations and the necessity for dancing attendance on the king prevented his doing much, although he was by no means an incompetent lord high admiral.

Buckingham played his first important part in politics in 1623 when he accompanied Prince Charles (afterward Charles I) on an incognito visit to Madrid in an attempt to win the hand of the infanta. The mission failed, Buckingham proving himself to be an arrogant and unrealistic diplomatist, but the breakdown of the negotiations in Spain was inevitable and when Buckingham (raised to a dukedom while in Spain) returned to England with Charles he found himself unexpectedly a public hero. In Feb. 1624 he addressed both houses of parliament, accusing the Spaniards of duplicity. He took a highhanded line with James, blamed him for

temporizing, demanded war against Spain and, to further it, advocated the marriage of Charles to Henrietta Maria, sister of Louis XIII of France. Parliament wanted a war against Spain at sea, on the Elizabethan model, but Buckingham's ideas were more grandiose: he urged war on land as well and an alliance with the Dutch. James was induced to accept his schemes and England, allied with Denmark as well as with the Dutch, went to war against both the Austrian and the Spanish Habsburgs. Meanwhile, negotiations were completed for the marriage with Henrietta Maria, but Buckingham, who was personally responsible for the treaty with France, was unable to persuade the French government to take any open part in the war for the recovery of the Palatinate and antagonized the French on his embassy of 1625 by publicly flirting with Anne of Austria, the French queen.

Buckingham retained his position as "grand vizier" after the accession of Charles I in March 1625. But the war, for which Buckingham was largely responsible, strained English resources to the breaking point. He proved himself a poor military organizer and when in the autumn of 1625 a combined naval and military expedition against Cadiz turned into a disastrous failure, parliament refused to grant any more subsidies if he remained responsible for the conduct of the war. He had intended to lead the expedition to Cadiz in person but Charles had sent him as special ambassador to The Hague, where in Nov. 1625 he concluded a treaty with the Dutch and the Danes, renewing their subsidies. However, the king had not the money to give; in Feb. 1626 he was obliged to call a parliament. There an assault upon Buckingham, on whom the fiasco at Cadiz was blamed, gathered momentum; it was led by his former friend, Sir John Eliot. "All the king's council rides on one horse" it was said, and Buckingham was opprobriously compared to the royal favourites of the middle ages. Vainly Buckingham defended himself in a plausible speech, but a virulent criticism of his conduct by John Digby, earl of Bristol, formerly English ambassador in Madrid, added fuel to the flames. A bill of impeachment was introduced; to save his minister Charles dissolved parliament in June. Buckingham was acquitted in the Star Chamber of the charges brought against him.

Meanwhile England also had become involved in war with France. Buckingham threw himself into this conflict with his usual resilience, personally taking command of a large expedition to relieve La Rochelle, held by French Protestants against their king (1627). The Île de RC, two miles from the city, was occupied but the English intervention was resented by both French parties and, after a long campaign in which Buckingham showed bravery and a comprehensive ignorance of the arts of war, the expeditionary force was compelled to withdraw, shattered and demoralized.

Once again parliament was called (1628) and met in an angry mood. It devoted itself to drawing up a petition of right, but the commons were determined to force the king to dismiss Buckingham. "I think," said Sir Edward Coke, "the duke of Buckingham is the cause of all our miseries." But Charles was unflinchingly loyal to his friend; together they pushed on with their plans to relieve La Rochelle. In August Buckingham, who seems to have been pessimistic, made his will and went to Portsmouth to organize the preparations there. On Aug. 23, 1628, he was stabbed to death by John Felton, a naval lieutenant with a grievance, who had served at Cadiz and RC and lost the use of his left arm. Charles I always blamed Buckingham's assassination on the political agitation against him in the house of commons led by Eliot.

Buckingham was a man of immense charm, "one of the handsomest men in the world, generous and brave," and of an "imperious nature and careless munificence." He was a discerning collector of paintings and manuscripts. Though he received much money, he contributed a great deal of it to the royal service and died heavily in debt. He was too haughty and tactless as a diplomat, too inexperienced as a general. His foreign policy was inconsistent and overambitious. His disloyalty to his friends was a weakness of character: he contributed to the fall of Sir Walter Raleigh and of Francis Bacon, he betrayed Lionel Cranfield, earl of Middlesex, and he treated Eliot carelessly. Judged by these other figures of his age, he seems puny; but he was a magnificent failure.

Hulme, *The Life of Sir John Eliot, 1592 to 1632* (1957).

(M. P. A.)

BUCKINGHAM, GEORGE VILLIERS, 2ND DUKE OF (1628-1687), English politician who at various times carried considerable influence with King Charles II. was born on Jan. 30, 1625, at Wallingford house, Westminster. As a result of the assassination of his isther, the 1st duke and favourite of Charles I. on Aug. 23, 1628, his education became the peculiar care of the king, and he was brought up with the young princes, later Charles II and James II. Entered at Trinity college, Cambridge, in the company of his younger brother Francis, he was admitted to the degree of M.A. on March 5, 1642, and, although scarcely yet in his teens, took part on the royalist side in the first phase of the English Civil War, serving under Prince Rupert at the siege of Lichfield close in April 1633. Thereafter he traveled abroad and spent some time in Italy, but returned to join in the second phase of the Civil War, in the course of which Lord Francis was killed near Kingston, Surrey, on July 7, 1648, and he himself, surprised by his parliamentary pursuers at St. Neots, near Huntingdon, three days later, was lucky to cut his way through them and escape unharmed.

With this catastrophe the most creditable part of his life came to an end. Joining Charles II in Holland, he did much, according to Bishop Gilbert Burnet, to initiate the new king into the vices he had himself acquired and to introduce a seriously disturbing element into counsels which were already sufficiently distracted. Although honoured with the Order of the Garter on Sept. 19, 1639, and admitted to the privy council on April 6, 1650, he professed dissatisfaction with his position at the exiled court, refused to accept the leadership of the king's older and more responsible advisers, notably Sir Edward Hyde, later earl of Clarendon, and was instrumental in persuading Charles to throw in his lot with the Scottish Covenanters, accompanying him to Scotland in the summer of 1650. There he had little difficulty in ingratiating himself with his austere Scottish hosts and found an ally in their leader, the marquess of Argyll; but Charles was inspired by his experiences in Scotland with a dislike of Presbyterianism which clouded his outlook for the rest of his life, and after the defeat of the whole enterprise at the battle of Worcester on Sept. 3, 1651, Buckingham's influence with the king greatly declined.

The effect on the duke was to make him reconsider a project which he had already several times entertained, of coming to terms with the existing English government and so securing the return of some part of his forfeited estates. Having first endeavoured to do so through John Lilburne and the Levellers, he then decided to base his hopes on the Presbyterians, returned to England in the summer of 1657 and on Sept. 15 that year married Mary, only child of the former parliamentary general Lord Fairfax, who had been rewarded for his services with a large amount of Villiers property. This Oliver Cromwell and his supporters interpreted as evidence of a conspiracy by the royalists and Presbyterians against the government; Buckingham was sent to the Tower of London and, had it not been for the still powerful influence of Fairfax and the opportune death of the protector, might well have been put to death. Milder counsels prevailing, he was required to find surety for his good behaviour, and was released on Feb. 23, 1659, being allowed to spend his time thereafter in unwonted inactivity at his father-in-law's house at Nun Appleton, near York.

Thus, at the moment of the Restoration Buckingham's position was highly equivocal, and when he joined Charles on his landing at Dover he was coldly received. A few months in the atmosphere of Restoration England, however, enabled him to recover his favour with the king: after bearing the orb at the coronation he was appointed gentleman of the bedchamber on July 9, 1661, lord lieutenant of the West Riding of Yorkshire on Sept. 21, and a member of the new privy council on April 28, 1662. To his influence may probably be attributed the failure of the king,

after an initial effort, to take his duties seriously and face with resolution the immense difficulties of his position. Buckingham could never be serious for long, and in addition was still opposed to Clarendon and the more experienced statesmen on whose advice a serious-minded king was bound to rely. Setting himself at the head of the younger men who resented the dominance of the prewar generation, he accordingly endeavoured to undermine the chancellor's position, and in spite of an unexpected reversal of fortune in 1667, involving the temporary loss of all his offices and a short imprisonment in the Tower, was instrumental in bringing about Clarendon's fall in the autumn of the same year.

Buckingham's ambition was to drive all the remaining "Clarendonians" from office, replace them with his own nominees and secure the position of chief minister for himself; but while he was moderately successful in achieving the first of these aims, and was for a time believed to have achieved the second, he soon proved too completely unreliable to be the directing force in any government, and had in practice to share his position with his abler though less brilliant rival, Henry Bennet, earl of Arlington (*q.v.*). On the jealousies of these two men and their supporters Charles, who had no desire for any chief minister, then played with such success as to secure the adoption of his own policy in the secret treaty of Dover (by which Charles agreed to help Louis XIV conquer the United Provinces and also promised, with French help, to restore Catholicism to England). Arlington signed the true version on June 1, 1670, while Buckingham was deluded with a false version, signed by all the members of the so-called Cabal (*q.v.*) on Dec. 31 of the same year and in an amended form on Feb. 12, 1672.

The partial failure of the Anglo-French attack on Holland for which these treaties provided, the growing suspicion that the declaration of indulgence issued at the same time was really a first step toward the restoration of Catholicism and the widespread distrust of the standing army which the outbreak of war necessarily involved all combined to raise a storm of indignation against those held responsible. When in Jan. 1674 parliament delivered its long-expected attack upon them Buckingham endeavoured to save himself by blaming Arlington for all that had gone amiss, and by casting unseemly reflections even on the king and duke of York; but the result of his ill-advised behaviour was only the most spectacular reversal of fortune in his whole career. At the request of both houses of parliament and with the full approval of the court he was dismissed from all his offices, even his one major post of master of the horse being conferred on the duke of Monmouth, although, as he bitterly complained, he had purchased it for hard cash in 1668 and had been granted it for life.

For the brief remainder of his active career Buckingham was generally in opposition to the government of the day. In the spring of 1675 he took a leading part in obstructing the passage of the earl of Danby's Nonresisting Test bill. In 1677 he was sent to the Tower for maintaining in the house of lords that, by a prorogation exceeding the period during which parliament could legally be dispensed with, the existing parliament, which was believed to be full of government pensioners, had been dissolved. After a confinement of several months he made his peace with the king and was released, but his restoration to favour did not involve restoration to office or any serious change in his general attitude. He promoted the return of Whig candidates to parliament, maintained close relations with opposition circles in the City of London and in the autumn of 1678 gave his whole support to the agitation which followed the revelations of Titus Oates. Only when that agitation threatened to have revolutionary consequences did he draw back and refuse to countenance the exclusion policy advocated by the earl of Shaftesbury. He was absent from the great debate of Nov. 13, 1680, when the Exclusion bill was rejected by the house of lords; took no part in the conspiracies of the succeeding years and during the reign of James, with whom he had long been on bad terms, remained in retirement.

Like so many of his contemporaries Buckingham endeavoured to combine eminence in politics with success in practically every other sphere of human activity open to a gentleman. He aspired to be a general, served with some distinction under the vicomte de

Turenne in his youth, tried to displace David Leslie from the command of the Scottish army on the march to Worcester and resigned in disgust when he was himself superseded by the duke of Schomberg in the command of the force designed to fight against the Dutch in 1673. He was interested in science, was an original fellow of the Royal society, studied chemistry and at one time believed he was on the point of finding the philosopher's stone. He dabbled in literature; but his verses and satires are remarkable for promise rather than performance, and of the plays which he wrote or adapted only *The Rehearsal*, a satire on the heroic drama first performed on Dec. 7, 1671, achieved at the time, or has been accorded since, any reputation. Among less elevated pursuits his passion was for racing and fox hunting, and it is said that he died as the result of a chill contracted on the hunting field. He died at Kirkby Moorside, in the house of one of his own tenants, on April 16, 1687, and as he had no legitimate children his title died with him.

BUCKINGHAM, HENRY STAFFORD, 2ND DUKE OF (c. 1454–1483), was the son of Humphrey, earl of Stafford, killed at St. Albans in 1455, and the grandson of Humphrey, 1st duke of Buckingham (created 1444), killed at Northampton in 1460, both fighting for Lancaster. The 1st duke, earl of Buckingham in the right of his mother, was the son of Edmund, 5th earl of Stafford, and Anne, daughter of Thomas of Woodstock, duke of Gloucester, the youngest son of Edward III. Henry's mother was Margaret, daughter of Edmund Beaufort, 2nd duke of Somerset, grandson of John of Gaunt. Her three Beaufort brothers, Henry, Edmund and John, were all killed by the Yorkists (1464–71).

In 1460 Edward IV made the young Henry and his brother Humphrey royal wards, and for several years they lived in the queen's household. Buckingham was directly descended from Edward III and his vast estates lay all over central England, so his adherence to the Yorkist cause was vital, and his marriage in 1466 to Catherine Woodville, the queen's sister, was designed to bind him even more closely to the reigning house. Yet, despite these precautions, it seems that, as the greatest of the old nobles, Buckingham was never fully trusted by the court. Except for acting as seneschal at the duke of Clarence's trial (1478) he took no part in public affairs while Edward IV lived.

When the king died, however, Buckingham, through his servant Persivall, quickly came to terms with the duke of Gloucester, the future Richard III, and from April to July 1483 he was in the forefront of affairs. Arriving in London as Richard's chief supporter, Buckingham busied himself in striking down the queen's relatives and in arranging the seizure of Edward V and his brother. He then publicly denied their legitimacy and pressed the Londoners to take Richard, already protector, as king. At Richard's coronation (July 6, 1483) Buckingham served as great chamberlain, while more material benefits were also showered on him. He became chief justice of Wales, keeper of the royal castles there and in the border counties, steward of the honour of Tutbury, sole heir of the old Bohun family (*q.v.*) (by virtue of his descent from Eleanor Bohun and Thomas of Woodstock) and possessor of their ancient hereditary dignity as constable of England.

Yet, in Aug. 1483, Buckingham, now at Brecon, was plotting to overthrow the new king. His abrupt change of sides has never been satisfactorily explained. He may, with reason, have coveted the crown himself, or perhaps a smouldering sense of family wrong at Yorkist hands suddenly burst into flame. Some have suggested that he mistrusted Richard and shrank from the murder of the princes, which he knew was contemplated. Certainly John Morton, bishop of Ely (*q.v.*), then his prisoner at Brecon, had much to do with securing Buckingham's active support for a rising in favour of Henry Tudor. The revolt was to begin on Oct. 18, 1483, when Buckingham moved east into Herefordshire with a Welsh army. A week earlier Richard, at Lincoln, had proclaimed him traitor, and now even the elements warred against him. High

floods on the Wye and Severn barred his passage, in a few days his troops dispersed and Buckingham, with a price on his head, was a fugitive at Wem, Shropshire. There he was taken, and brought by John Mitton, the sheriff, to the king at Salisbury. On Sunday, Nov. 2, having forfeited his estates, he was beheaded in the market place.

The connection of the Stafford family with the dukedom of Buckingham was finally broken by the attainder and execution of Henry's eldest son, Edward, 3rd duke, in May 1521. He had been restored in lands, blood and title by Henry VII (Nov. 1485). As constable he was one of the most powerful men in the kingdom under the first Tudor, and on at least one occasion when Henry VII was ill, Buckingham was widely considered as a possible successor, but he later quarreled with Wolsey, who effected his ruin.

BUCKINGHAM, a market town and municipal borough in the Buckingham parliamentary division of Buckinghamshire, Eng., 17 mi. N.N.W. of Aylesbury by road. It is situated in the north-west corner of the county in the open valley of the upper Ouse, which encircles the main portion of the town on three sides. Pop. (1961) 4,377. Buckingham, once the site of a Roman settlement, was an important stronghold in pre-Conquest times, and was the only burg to receive separate mention in the Domesday survey, having been created the county town by Alfred the Great in 886. The Anglo-Saxon Chronicle records that in 918 Edward the Elder encamped there with his army for four weeks and built two forts, one on either side of the water. There are early mentions of markets and fairs and there are still two fairs in October. Edward III fixed there one of the staples (marts) for wool, but after the removal of the staples to Calais the trade decayed so much that in an act of Henry VIII Buckingham is mentioned among 36 impoverished towns. The town received no charter until 1554, when Mary I created it a free borough, and Charles II granted a second charter in 1684 in recognition of its loyalty in the English Civil War. The decline of Buckingham may be partly attributed to the development of other routes from London and the consequent growth of such towns as Aylesbury (now the county town), High Wycombe and Wendover, and to the great fire of 1725, which destroyed most of the town. From 1545 until 1867 Buckingham returned two members to parliament.

The Old Latin school, converted into a grammar school and endowed by Edward VI, in part occupies buildings of earlier date (part of a chantry) which retain a Norman doorway. Stowe house, former seat of the Grenvilles, dukes of Buckingham, is now part of Stowe school for boys, opened in 1923. In the grounds are remains of the 17th-century castellated Stowe castle. The manor house, probably dating from the 14th century, has a fine twisted chimney, added about 1520. In Castle house Catherine of Aragon heard the news of the battle of Flodden in 1513.

Buckingham is a market town with agricultural trade and factories for paints, carpets, diesel equipment and light engineering products, as well as condensed milk and leather.

BUCKINGHAM AND NORMANBY, JOHN SHEFFIELD, 1ST DUKE OF (1648–1721), English statesman, patron of Dryden, and author of poetic essays in heroic couplets, was born on April 7, 1648, in London. The son of Edmund, 2nd earl of Mulgrave, he succeeded to the title on his father's death in 1658. He served under Charles II and was a favourite until 1682 when he incurred Charles's displeasure by courting Princess Anne and was banished from court. He made his peace within two years and on the accession of James II was again in high favour, receiving appointments first as a privy councillor and later as lord chamberlain.

Despite his acquiescence in the revolution of 1688 he belonged essentially to the opposition during William's reign, but on Anne's

accession in 1702 she made him a member of the privy council, and later lord privy seal and duke of Buckingham and Normanby. The Whig ascendancy between 1704 and 1710 compelled him to resign his appointments but during the period of Tory government between 1710 and 1714 he held several high offices, including that of lord president of the council. After the accession of George I in 1714 his active political life was at an end. He died in London on Feb. 24, 1721.

As a poet Sheffield is chiefly remembered for *An Essay Upon Poetry* (1682) and *An Essay on Satire* (circulated in manuscript in 1679 but not published until later). *An Essay Upon Poetry*, written in couplets and in a manner intended to resemble that of Horace's *Epistles*, aims to delineate the chief characteristics of the various literary kinds: the ode, the elegy, the epic, etc. Its interest is chiefly historical—as one of the attempts to naturalize Nicolas Boileau's *L'Art poétique*—but it received high praise from Dryden and Pope, and as an example of the way in which poets and critics of the later Restoration were trying to establish definite literary styles it is of permanent interest.

An Essay on Satire begins as a critical treatise but develops into a satire, attacking Charles II, the earl of Rochester and many distinguished courtiers. The work was frequently attributed to Dryden (it appears in most editions of his work and he was assaulted by hirelings of the earl of Rochester because of it) but it is generally acknowledged to be Sheffield's. It was probably touched up a little by Dryden.

Sheffield's prose *Account of the Revolution* is interesting historically although he is not entirely reliable when he is personally concerned. He also adapted Shakespeare's *Julius Caesar*, breaking it up into two plays, *Julius Caesar* and *Marcus Brutus*, introducing choruses between the acts (two of which were written by Pope), and a love scene between Brutus and Portia. (JN. C.)

BUCKINGHAM PALACE, the London residence of the British sovereign, takes its name from Buckingham house, and was built early in the 18th century for John Sheffield, duke of Ruckingham and Normanby. In 1761 it was bought for £21,000 by George III for his wife and was known for the next 60 years as "the queen's house." In George IV's reign the building was rebuilt by John Nash, and the entrance was through the Marble arch (now in Hyde park) from which the royal standard was flown. Queen Victoria was the first sovereign to live there. Facing the Mall, the east front, designed by Sir Aston Webb, was refaced in 1913 to make a dignified background for the Queen Victoria memorial. The garden (or west) front is virtually unchanged from Nash's design. The rooms inside are splendid (the throne room is 64 ft. long) and show to advantage the collections of pictures and furniture largely made by George IV. The Royal Mews or stables, which house the state carriage (designed by Sir William Chambers in 1762), are to the south of the palace. The ceremony of changing the guard takes place each morning (11:30 A.M.) in the forecourt when the sovereign is in residence. (R. T. B. F.)

BUCKINGHAMSHIRE, EARLS OF. The first earl of Buckinghamshire was John Hobart (1693–1756), a descendant of Sir Henry Hobart (d. 1625), attorney general and chief justice of the common pleas under James I, who was made a baronet in 1611, and who was the great-grandson of Sir James Hobart (d. 1507), attorney general to Henry VII. In 1740 Hobart became lord lieutenant of Norfolk and in 1746 earl of Buckinghamshire, his sister, Henrietta Howard, countess of Suffolk, being the mistress of George II. He was succeeded as 2nd earl by his eldest son JOHN (1723–93), who was member of parliament for Norwich and comptroller of the royal household before his accession to the title. From 1762 to 1766 he was ambassador to Russia, and from 1776 to 1780 lord lieutenant of Ireland. He died without sons and his half-brother GEORGE (1731–1804) became 3rd earl.

ROBERT HOBART, 4th earl of Buckinghamshire (1760–1816), the eldest son of the 3rd earl, was a soldier, and then a member of both the English and Irish houses of commons; from 1789 to 1793 he was chief secretary to the lord lieutenant of Ireland, exerting his influence in that country to prevent any concessions

to the Roman Catholics. In 1793, being known by the courtesy-title of Lord Hobart, he was sent to Madras as governor, but in 1798, after serious differences between himself and the governor general of India, he was recalled.

Returning to British politics, Hobart was called up to the house of lords in 1798 (succeeding to the earldom of Buckinghamshire in 1804); from March 1801 to May 1804 he was secretary for war and the colonies (his family name being taken for Hobart in Tasmania), and in 1805 he became chancellor of the duchy of Lancaster under Pitt. For a short time he was joint postmaster general, and from 1812 until his death he was president of the board of control for Indian affairs.

The 4th earl left no sons, and his titles passed to his nephew, GEORGE ROBERT HOBART (1789–1849), a son of George Vere Hobart (1761–1802), lieutenant governor of Grenada. In 1824 the 5th earl inherited the Buckinghamshire estates of the Hampden family and took the name of Hampden, his ancestor, Sir John Hobart, 3rd baronet, having married Mary Hampden about 1656. On his death his brother, AUGUSTUS EDWARD HOBART (1793–1885), who took the name of Hobart-Hampden, became 6th earl. The 6th earl's two sons predeceased him, and he was succeeded by his grandson, SIDNEY CARR HOBART-HAMPDEN (1860–1930), who added to his name that of Mercer-Henderson. His son, JOHN HAMPDEN MERCER-HENDERSON (1906–), became 8th earl in 1930.

See Lord Hobart's *Essays and Miscellaneous Writings*, ed. with biography by Lady Hobart (1885).

BUCKINGHAMSHIRE, a south midland county of England, is bounded on the north by Northamptonshire, east by Bedfordshire, Hertfordshire and Middlesex, south by Surrey and Berkshire and west by Oxfordshire. Its area is 749.1 sq. mi.

Physical Features.—The county has parts of the basins of the Great Ouse and the Thames, and reaches from the chalk Chilterns to the first outcrop of Jurassic rocks which rise in the west to form the Cotswolds, while the extreme south is drained by tributaries of the lower Thames flowing from the chalk.

Geologically it includes a succession of outcropping rocks dipping generally southeast from the Lias in the northwest to the Eocene of the London basin. The Great Oolite rises northwest of Buckingham in gentle undulations to a height of over 500 ft. The upper portions are limestones; the lower parts are more argillaceous. A large expanse of Oxford Clay, rich grassland and famous hunting country runs from Bicester to Bedford, including the low divide (Whaddon chase) between the Vale of Aylesbury (mainly Kimmeridge Clay) and the valleys of the Ouse and Ouzel. The clay is covered by numerous outliers of Portland, Purbeck and Lower Greensand beds. The Upper Greensand follows, and at the junction with the Gault are numerous springs which have determined the sites of several villages. The chalk rises abruptly from the low-lying argillaceous plain to form the Chiltern hills. The crest line of these hills crosses the centre of the county from northeast to southwest at its narrowest point (11 mi.), though another portion, Steps hill, is included in a loop made by the county boundary on the northeast. To the south of this line almost the whole land is hilly, the chalk outcropping and determining the form of the hills as far as Beaconsfield and Burnham. Eocene deposits, Reading beds and London Clay occupy the remaining southeast of the county. Between the Tertiary-capped chalk plateau and the Thames a gentle slope, covered with alluvial gravel and brick earth, reaches down to the river. Thick deposits of plateau gravel occur on most of the high ground in the south while much of the northern part is obscured by glacial clays and gravels which help to diversify the soil of this essentially agricultural county. On the Oxfordshire border, to the west of Aylesbury, a few nearly isolated hills stand out, e.g., Muswell hill and Brill hill (each more than 600 ft.), marked on the geological map by outliers of Gault. The Thames forms the entire southern boundary of Buckinghamshire. The Great Ouse river forms various portions of the northern boundary and receives the Ouzel river flowing along the northeastern side of the county. In the south the dip slopes of the Chilterns are drained by the Wye, Misbourn and Chess, streams flowing to the southeast.

The soils of the county vary greatly in different localities. On the lower lands, especially in the Vale of Aylesbury, about the headwaters of the Thames, they are extremely fertile. Beech is the predominant tree in the woods. In the south a remnant of ancient forest is preserved as public grounds under the name of Burnham Beeches (*q.v.*).

History. — Traces of early man are not common in the county, though Paleolithic implements have been found in the gravels of the Thames valley. Neolithic man probably inhabited the higher parts of the Chilterns, and though the numerous camps found there seem to be of the Early Iron Age some may date further back. The Icknield way (*q.v.*) is without doubt pre-Roman in origin. There is some indication that the Vale of Aylesbury was settled in pre-Roman times. The territory which was to become Buckinghamshire was reached by the West Saxons about 570, as by a series of victories they pushed north from the chalk of Hampshire and Wiltshire over the upper Thames. A large occupation of the chalk, such as one finds in Kent, Sussex, Berkshire and Wiltshire, is not indicated. The higher open ground was inhabited during the early part of the 7th century, as is shown by the mention of the Chiltern-Saetna, or "dwellers in Chiltern," in a document called *The Tribal Hidage*, which recorded family land measures, but it was suggested that there may have been a considerable element of native population among them. The Anglo-Saxon Chronicle states that Aylesbury, Bensington and Eynsham were captured by the Saxons in 571, and there is abundant archaeological evidence for Saxon occupation of the Vale of Aylesbury. With the grouping of the settlements into kingdoms and consolidation of Mercia under Offa, Buckinghamshire was included in Mercia until, with the submission of that kingdom to the Norsemen, it became part of the Danelaw. In the 10th century Buckinghamshire suffered frequently from the ravages of the Danes, and numerous earthworks mark the scenes of struggles against the invaders. These relics are especially abundant in the Vale of Aylesbury, probably at that time one of the richest and best protected of the Saxon settlements. The Chiltern district, on the other hand, is said to have been an impassable forest infested by hordes of robbers and wild beasts. In the reign of Edward the Confessor, Leofstan, 12th abbot of St. Albans, cut down large tracts of wood in this district, and granted the manor of Flamstead, Hertfordshire, to a valiant knight and two fellow soldiers on condition that they should check the depredations of the robbers. The same reason led at an early period to the appointment of a steward of the Chiltern hundreds (*q.v.*). The district was not finally disforested until the reign of James I.

The shire of Buckingham was formed by the aggregation of pre-existing hundreds (ancient territorial divisions) as they were recaptured from the Danes. This explains the irregularities of the boundary line. As in the case of the midland counties generally, it took its name from the chief town, but it is a matter of some difficulty to understand why Buckingham should have been chosen. It was doubtless the chief town at the time; in the Domesday survey it was the only borough to receive separate mention. From the first, however, the church at Aylesbury tended to become the chief ecclesiastical centre of the county, while Buckingham never had more than one parish and one church. Of monastic foundations, the Cistercian abbey of Medmenham was founded in 1204, while the Augustinian Notley abbey dates from 1162. The 18 hundreds of the Domesday survey were reduced to 8, of which the three Chiltern hundreds, Desborough, Burnham and Stoke, are unaltered in extent as well as in name.

The proximity of Buckinghamshire to London caused it to be involved in most of the great national events of the ensuing centuries. The county was visited severely by the Black Death (*q.v.*), and Winslow was one of many districts which were almost entirely depopulated. In the English Civil War, Buckinghamshire was one of the first counties to join in an association for mutual defense on the side of parliament, one of whose protagonists, John Hampden, of Hampden house in the county, had precipitated the conflict by his refusal to pay ship money on land at Prestwood, now in the parish of Great Missenden, Buckinghamshire. Aylesbury and Brill were among the important garrisons

held by the parliamentary forces, while Newport Pagnell, in the north, was held for a short time by royalists. In 1644 Charles I fixed his headquarters at Buckingham.

The Cliveden and Hampden estates are perhaps the most famous in the county. The former was presented by Viscount Astor to the National trust which owned, besides, 4.2 sq.mi. in Buckinghamshire in 1960. Of old country houses, Chequers (*q.v.*) dates from the late 16th century and in 1921 became an official residence of British prime ministers. The following have been acquired by the National trust: Ascott, with a fine collection of furniture and works of art; Hughenden manor, the home of Benjamin Disraeli, later earl of Beaconsfield; the 18th-century West Wycombe park and also West Wycombe village with 15th- to 18th-century houses; Claydon house, home of the Verney family and famed for its association with Florence Nightingale; and Waddesdon manor, with its fine collection of pictures and art treasures, bequeathed by James de Rothschild.

Many towns and villages are famous for their literary and historical associations: Chalfont St. Giles with John Milton; Stoke Poges with Thomas Gray; Hughenden with Disraeli; Olney with William Cowper; Beaconsfield with Edmund Burke, Edmund Waller and G. K. Chesterton; and Aylesbury with John Wilkes. Slough was the home of Sir William Herschel, who set up his great telescope there. A most notable institution in Buckinghamshire is Eton college, while another important educational establishment is Stowe school, once the home of the Grenvilles, dukes of Buckingham.

Population and Administration. — The population of Buckinghamshire was 486,183 in 1961, compared with 386,291 in 1951. The municipal boroughs are Aylesbury, the county town (27,891), Buckingham (4,377), High Wycombe (50,301) and Slough (80,503), the other large towns being Beaconsfield (10,019), Bletchley (17,093), Chesham (16,236), Eton (3,901), Marlow (8,704) and Wolverton (13,116). Other towns in the county are Amersham, Linslade, Newport Pagnell, Olney, Princes Risborough, Wendover and Winslow. Several of the villages on or near the banks of the Thames have become centres of residence, such as Burnham, Taplow, Wooburn and Wraybury.

Buckinghamshire is on the midland circuit and assizes are held at Aylesbury. It has one court of quarter sessions, sitting at Aylesbury, and is divided into 14 petty sessional divisions. The county is entirely within the diocese of Oxford, but gives its name to a bishopric suffragan. There are five parliamentary constituencies, those of Aylesbury, Buckingham, Eton and Slough, South Buckinghamshire and Wycombe, each returning one member.

Industries and Communications. — There is no heavy manufacturing industry in the county, but there are important factories at Slough, Aylesbury and Bletchley. High Wycombe is a centre of furniture manufacture, particularly chairs, originally because of the presence of the beech woods of the Chilterns. Chesham has a wide variety of industries ranging from the production of chocolate to lead pencils and electronic valves. The printing industry is well established in Aylesbury and Wolverton. Other industries include those connected with communications. The Wolverton works, belonging to British railways, give employment to the largest number of workers in the county.

Although much of Buckinghamshire is pasture, the amount of land under crops remained high in the early 1960s as a result of the intensification of food production inaugurated during World War II. Of a total of more than 360,000 ac. under crops and grass, about 170,000 ac. were arable. The principal crops were barley, wheat and oats. The raising of sheep, cattle, poultry and pigs was significant.

A consideration of communications is best based on the structural facts that have been outlined. Thus there are chains of villages along the water-bearing strips at the foot of the Chilterns, while it was along the Icknield way that the medieval traffic passed from the west of England to East Anglia. In Roman times Watling street was built, crossing the Chilterns near Dunstable (*Durocobrivae*) in the transverse direction from southeast to northwest. Akeman street used the low route between Tring and

Berkhamsted. The medieval, turnpike and modern roads chose the same gaps, using the Thames valley in the south and the High Wycombe, Wendover and Tring routes within the county. There are altogether 1,758 mi. of roads in the county, and the opening of the London-Birmingham motorway in 1959 necessitated the creation of a special service station area at Newport Pagnell. The main line of the London Midland region of British railways uses the gap between Berkhamsted and Ivinghoe and crosses the north-east of the county. Bletchley is an important junction on this system, branches diverging northeast to Bedford and Cambridge and west to Oxford and Banbury. In the south the chief railway line is that of the Western region passing through Slough and Taplow. The Grand Union canal, which passes through 30 mi. of the county (Marsworth to Wolverton), carries a considerable amount of barge traffic between Birmingham and London.

BUCKLAND, FRANCIS TREVELYAN (1826-1880), English zoologist, an authority on fishes, is well known for his writings on natural history and fish culture. The son of Dean William Buckland, the geologist, he was born at Oxford on Dec. 17, 1826. He was educated at Winchester college and Christ Church, Oxford, and became house surgeon at St. George's hospital, London, in 1852. The pursuit of anatomy led him to a good deal of out-of-the-way research in zoology, and in 1856 he became a regular writer on natural history for the newly established periodical *Field*. In 1866 he started *Land and Water* on similar lines. In 1867 he was appointed government inspector of fisheries. Buckland died in London on Dec. 19, 1880. Among his publications, besides articles and official reports, were *Fish Hatching* (1863); *Curiosities of Natural History* (1857-72); an edition of G. White's *Natural History of Selborne*, with notes (1875); *Natural History of British Fishes* (1881).

See *Life* by G. C. Bompas (1885).

BUCKLAND, WILLIAM (1784-1856), English geologist who devoted himself to a systematic examination of the geological structure of Great Britain, was born at Axminster, Devonshire, on March 12, 1784. Educated at Tiverton grammar school, Winchester, and at Corpus Christi college, Oxford, and ordained an Anglican priest in 1808, he was reader in mineralogy at Oxford in 1813 and the first occupant of the chair in geology in 1819. In 1818 he was elected a fellow of the Royal society and was chosen president of the Geological society in 1824 and in 1840. Buckland's first great work was *Reliquiae Diluvianae; or Observations on the Organic Remains Contained in Caves, Fissures and Diluvial Gravel, and on other geological phenomena attesting the action of a Universal Deluge* (1823) and his 2 vol. *Geology and Mineralogy Considered With Reference to Natural Theology* was published in 1836 as one of the Bridgewater treatises. He died in London on Aug. 14, 1856.

BUCKLE, HENRY THOMAS (1821-1862), English historian, author of the *History of Civilisation in England*, was born at Lee, Kent, on Nov. 24, 1821. Because of his delicate health he received little formal education, acquiring his knowledge through travel and wide but selective reading. He visited the continent several times between 1840 and 1844, and from Oct. 1861 to March 1862 he traveled in Egypt. From there he journeyed through Sinai to Petra, Hebron, Jerusalem and Nazareth, where he contracted typhoid. He died at Damascus on May 29, 1862.

Buckle had first won fame as a chess player, gaining an international reputation before he was 20. But already he had con-

ceived the plan of his book. By 1853 he had decided to restrict his study to England, and the first volume (1857) achieved an immediate success. The second volume, which still did not conclude his introduction, was published in 1861 but the finishing of the work was prevented by his death.

The decline in Buckle's fame was rapid. He was unfortunate in that currents of opinion were already running counter to his views, and he wrote just too soon to assimilate Darwin's theories of evolution. Buckle believed that "the progress of every people is regulated by principles . . . as certain as those which govern the physical world," and sought to determine their nature through an inductive study of relevant historical material. He equated the progress of civilization with the advance of knowledge, arguing that the "diminishing influence of nature" in Europe increased the aptitude for rational inquiry among its populations. His *History* was much criticized and in its capacity to stimulate thought and controversy lay perhaps its greatest importance. Yet its inconsistencies do not altogether impair the grandeur of its design, and it remains witness to an erudition and mastery of language admitted even by Buckle's opponents.

BIBLIOGRAPHY.—The *History* was edited by J. M. Robertson in 1904. See also A. H. Huth, *Life and Writings of Henry Thomas Buckle* (1880); G. St. Aubyn, *A Victorian Eminence: the Life and Works of Henry Thomas Buckle* (1958).

BUCKMASTER, STANLEY OWEN BUCKMASTER, 1ST VISCOUNT (1861-1934), English lord chancellor and advocator of divorce law reform, was born at Cheddington, Buckinghamshire, on Jan. 9, 1861. He was educated at Aldenham school and at Christ Church, Oxford. In 1884 he was called to the bar by the Inner Temple and in 1902 he joined Lincoln's Inn and took silk.

In 1906 he was elected to parliament for Cambridge as a Liberal, and after defeat at the general election of 1910, Keighley returned him in 1911. In 1913 he became solicitor general and was knighted, and in 1915 he was made lord chancellor and was raised to the peerage. He was energetic, receptive of new ideas and powerful in debate. He went out of office in 1916, but continued to sit in the lords and judicial committee, where he fully earned his reputation as a first-rate appellate judge. In 1933 he was created viscount. Buckmaster died in London on Dec. 5, 1934. (R. E. MY.)

BUCKNER, SIMON BOLIVAR (1823-1914), Confederate general during the American Civil War, was born near Munfordville, Ky., April 1, 1823. He graduated from West Point in 1844, served in the Mexican War (1846-48) and thereafter at various army posts until 1855, when he resigned his commission to become manager of family property in Chicago. After the outbreak of the American Civil War he worked for Kentucky's neutrality but finally espoused the Confederate cause and was commissioned a brigadier general in the Confederate army, rejecting a similar offer from the Union. Ordered to reinforce Ft. Donelson, he found the Confederate situation hopeless and surrendered unconditionally to Gen. U. S. Grant, Feb. 16, 1862. After war prisoner exchange, he was promoted to the rank of major general and finally lieutenant general. He served the Confederacy in many areas and was in command of the District of Louisiana when the war ended. In 1868 Buckner returned to Kentucky, became editor of the *Louisville Courier* for a short time and eventually recovered his valuable real property in Chicago. After some years in private business he entered politics as a Democrat and served as governor of Kentucky from 1887 to 1891. His term ended, he retired to his birthplace estate. The Gold Democrats nominated him for vice-president of the United States in 1896. He died Jan. 8, 1914.

His only son, Simon Bolivar Buckner, Jr. (*q.v.*), became a lieutenant general in the U.S. army during World War II.

See A. M. Stickles, *Simon Bolivar Buckner* (1940). (A. M. ST.)

BUCKNER, SIMON BOLIVAR, JR. (1886-1945), U.S. soldier, was born at Munfordville, Ky., July 18, 1886. Upon graduation from the U.S. Military academy at West Point, Feb. 13, 1908. Buckner was commissioned in the infantry. His career of more than 41 years in the C.S. army was climaxed in his command of the 10th army, which invaded the Ryukyu Islands and

fought the last great land battle of World War II against the Japanese on Okinawa, April–June 1945.

Rising in rank through the various grades, he became a brigadier general in the regular army and from Aug. 1940 to June 1944 was commanding general. Alaskan defense command, with headquarters at Ft. Richardson, Alaska. Following a short assignment to the central Pacific area, he was appointed in Sept. 1944 commanding general, 10th army, holding in this command the rank of lieutenant general. Buckner was killed in action on June 18, 1945, while visiting a forward observation post near the southwest tip of Okinawa. The big naval anchorage on the east side of Okinawa, formerly called Nakagusuka Wan, was renamed Buckner bay in 1945 in his honour. (R. E. A.)

BUCKRAM, in modern English, a coarse fabric of linen or cotton stiffened with size or glue, and used for the stiffening of parts of clothes and in bookbinding. Falstaff's "men in buckram" (Shakespeare, *Henry IV*, pt. I, ii, 4) has become proverbial for any imaginary persons, and the word is often used as implying a false show of strength because of artificial stiffening. In early continental usage and apparently in early English, buckram was an expensive and delicate fabric of cotton or linen. The derivation of the word is uncertain.

BUCKTHORN, a common name for trees or shrubs of the genus *Rhamnus* (family Rhamnaceae), especially *R. catharticus*, a much-branched shrub reaching 10 ft. in height, with a blackish bark, spinous branchlets and oval, sharply serrated leaves, 1 to 2 in. long, alternately arranged and somewhat clustered at the ends of the shoots. The small green flowers are regular and have the parts in fours; male and female flowers are borne on different plants. The fruit is succulent, black and globose, and contains four stones. Buckthorn is native in Europe, north Africa and north Asia and naturalized in parts of eastern North America. In England it is found in woods and thickets, chiefly on chalk: it is rare in Ireland and not wild in Scotland. The fruit has cathartic properties; the bark yields a yellow dye.

An allied species, *Rhamnus frangula*, is also common in England, and is known as berry-bearing or black alder. It is distinguished from buckthorn by the absence of spiny branchlets, its nonserrated leaves and bisexual flowers with parts in fives. In the United States there are several native species of buckthorn, most numerous on the Pacific coast, especially in California. One of these, *R. purshiana*, yields the medicinal cascara sagrada (*q.v.*).

Scabuckthorn is *Hippophae rhamnoides* (family Eleagnaceae), a willowlike shrub, 1 to 8 ft. in height, with narrow leaves silvery on the underside, and globose, orange-yellow fruits $\frac{1}{2}$ in. in diameter. It occurs on sandy seashores of England, but is not common.

In the United States the name buckthorn is also applied to a tree, *Brumelia lycioides*, found in the south.

BUCKWHEAT, the fruit (so-called seeds) of *Fagopyrum sagittatum* (or *esculentum*) and of the allied species, *F. tataricum*, a herbaceous plant, native of central Asia but cultivated also in Europe and North America. The fruit has a dark brown or gray tough rind enclosing the kernel or seed and is three-sided in form, with sharp angles, similar in shape to beech mast, when the name from the German, *Buchweizen*, "beechwheat." Tartary buckwheat fruits have rounded angles. The attractive white flowers depend upon bees and other insects for their pollination. Buckwheat grain is used for livestock feed. The hulled seeds, or groats, and the flour are used for human food.

The chief food use in the United States and Canada is in the form of griddle cakes made from buckwheat flour. This flour is often mixed with wheat flour. Buckwheat cakes are brown, palatable and nutritious. Buckwheat often is grown for smothering needs. It is an important honey plant. On good soils buckwheat is less productive than other grain crops but it is particularly adapted to unproductive hilly lands. Its quick maturity makes buckwheat well adapted as a late-sown "catch" crop. Two varieties (*viz.*, Japanese and Silverhull) are commonly grown in various parts of the world. The U. S. S. R., France, Poland, Canada and the United States lead in buckwheat production. In Great Britain it is not of sufficient importance to be separately distinguished in the annual agricultural returns. It is mainly used in England for feed-

ing pheasants, for which it is considered specially suitable, and poultry, but it is also valuable for other kinds of farm stock. The crop is sometimes sown for feeding off green by sheep, or for plowing under as green manure. (J. H. MN.)

BUCOLICS (from Gr. *bozrcolos*, "a herdsman"), a term occasionally used for rural or pastoral poetry. The expression has been traced back in English to the early 14th century, being used to describe Virgil's *Eclogues*, which had been given the name early by grammarians, perhaps by the poet himself, to challenge comparison with his model Theocritus (*q.v.*), whose idylls or bucolics are the earliest collection to have been preserved. Counting certain associated apocryphal works, they number about 30.

In modern times the term bucolics has not often been specifically given by the poets to their pastorals; the main exception being that of Pierre de Ronsard, who collected his eclogues under the title of *Les Bucoliques*. See also *PASTORAL*. (J. F. KE.)

BUD: see *STEM*; *LEAF*.

BUDAPEST, the capital of Hungary, consists of the ancient fortress and town of Buda, on the high right bank of the Danube, and the town of Pest on the low left bank. After the two towns had been united in 1872 many suburbs were included in the city area which in 1957 covered 203 sq.mi. and had a population (1960) of 1,807,299.

The beauty of Budapest is, above all, the product of harmonious blending of the landscape and the city. The Danube, which some 25 mi. N. of Budapest turns sharply from an eastward direction to the south, is wide enough to constitute a monumental element in the setting of the massive buildings without rupturing the two parts of the city. Budapest has a moderate climate with an average July temperature of 62° F. and an average January temperature of 34° F. The yearly rainfall averages 23 in.

Buda, with Obuda (Old Buda) to the north, lies on the hilly western bank of the Danube with Castle hill (590 ft.) and Gellért hill (1,066 ft.) to the south. Impressive caves and hot mineral springs (87° F. to 150° F.) are to be found in the Buda hills. Some of the springs have radioactive properties and others contain lime and sulfur and are of value in the treatment of rheumatic diseases. The waters were used by the Romans and later by the Turks. These springs and the swimming pools on the banks of the river add the character of a health resort to the beauty and historical interest of the city. While Buda was traditionally the seat of the rulers and of government offices, with many mansions belonging to the landed gentry, Pest, lying on a plain formed by the Danube in the Pleistocene era, was the town of trade and industry.

The City.—The royal castle of Buda was built at the southern elevation of the plateau on Castle hill. The later palace, in baroque style (1715–70), designed chiefly by Jean Nicolas Jadot and Franz Anton Hillebrandt, was partially destroyed by fire in 1849 but restored and enlarged in 1881–1904. It was heavily damaged by fighting in 1944–45 but by the early 1960s was being restored. The war damage uncovered remains of the medieval castle, some of the original designs of which have been incorporated in the work of restoration. Ramparts dating from the middle ages and the Turkish occupation circle the palace and the buildings of the castle district. St. Xathias' church, the ancient coronation church of the Hungarian kings, is in Holy Trinity square. It was built from 1255 to 1269, enlarged several times in the 14th and 15th centuries, and entirely rebuilt by Frigyes Schulek from 1874 to 1896. The Fisherman's bastion, built in neo-Romanesque style (1901–02) by the same architect, stands in the centre of the section of the ramparts nearest to the Pest side.

The city on the left bank of the Danube can be seen in all its splendour from the passages of the Fisherman's bastion. The lowland between Castle hill and the river bank is called Ziziváros. Its most important monuments are St. Anne's church (1740–70), the former church of the Elizabethan nuns (1731–41), and the spa (16th century) built by the Turks and preserved, with three others, as relics of Turkish architecture. Hűvös-völgy, the valley jutting deep into the Buda hills, begins at the foot of the northern slope of Castle hill off Moszkva square. Villas of every description cover the hillsides.

BY COURTESY OF THE AMEROP TRAVEL SERVICE, INC.

ST. MATTHIAS' CHURCH, THE CORONATION CHURCH, IN HOLY TRINITY SQUARE. BUDAPEST, DATING FROM THE 13TH CENTURY. FISHERMAN'S BASTION (1901-02) IS IN THE FOREGROUND

Obuda lies on the site of a Roman military camp. The relics of two Roman baths are exhibited there in underground museums. The ruins of the military amphitheatre dominate the panorama, and those of the Trinitarian monastery (1745-60) on the nearby hills and the fine baroque castle (1746-57) that belonged to the Zichy family, are the newer outstanding monuments.

The remains of the Roman town (the public bath, the Mithras sanctuary, etc.) lie north of Obuda; and those of what was once a vast palace of the Roman governor are opposite Obuda on an island in the Danube. The palace was built in A.D. 107 by Hadrian, governor of Aquincum, who later became the Roman emperor. Steep Gellért hill is crowned by a grim citadel built after the Hungarian defeat in the 1848-49 War of Independence by the Austrian military authorities to keep the town under control. The massive monument erected after World War II to commemorate the liberation of the country affords a contrast to the citadel. This monument is the work of Zsigmond Kisfaludi Stróbl.

The Danube is spanned by many bridges. Between the Árpád and Margit (Margaret) bridges, which cross the river at Obuda, lies Margit Island, a parklike resort and amusement area; the Lánchíd is a suspension bridge built by the British engineer Adam Clark; and Erzsébet bridge, one of Europe's most notable feats in bridge construction, was rebuilt in the early 1960s. Szabadsig and Petöfi bridges are at the southernmost point of the capital.

Budapest perhaps appears most beautiful from the Danube. The traveler arriving from Vienna by boat will gradually become aware of an impression of vastness and massiveness about the city astride the river. On the Pest side there stands the majestic house of parliament, built in neo-Gothic style in 1884-1904 by Imre Steindl.

The row of palaces along the embankment to the south of the parliament building includes, near the Lánchíd, the Renaissance-style building of the Hungarian Academy of Sciences (1862-64). In the inner city, which stands on the site of medieval Pest, the most important historical monument is the parish church, with Romanesque and Gothic details. In place of the former town walls, a semicircle of the inner boulevards encloses the inner city. The streets radiate from there in every direction, like the spokes of a wheel.

Beyond the outer boulevards are the industrial districts. The former Szent István district, to the north of the inner city, has preserved most of its classic monuments. Since World War II the major governmental buildings and ministries have been located

there in the new 5th district. The industrial quarters are in the new 13th district beyond the outer boulevards. The most beautiful square in Budapest, Kossuth square, is in this area in front of the house of parliament. St. Stephen's neo-Renaissance basilica with a dome 315 ft. high (built in 1845-67 by József Hild, and 1867-89 by Miklós Ybl) is one of the most impressive monuments in the inner city.

Népköztársaság (formerly Andrásy) is the finest avenue in the capital. Laid in the last quarter of the 19th century, it runs from the inner boulevard to the spacious Heroes' square with the monument commemorating the 1,000th anniversary of the Magyar conquest of the country. The square is bordered by the Museum of Fine Arts and the Art gallery. The outstanding monument on Népköztársaság is the Opera house (1879-84) built by Miklós Ybl. New construction includes the People's stadium, holding 100,000 spectators, which

stands near the east railway station.

The university, founded at Nagyszombat in 1635, was transferred to Ofen (Buda) in 1745. In addition to the Hungarian Academy of Sciences Budapest has schools and colleges of applied arts, music, drama, fine arts, economics and agronomy; and various technical institutions. There are also 9 museums, all under the aegis of the Hungarian National museum which is also in the city; a library for the national archives, and many public libraries attached to the university or other institutions; and 18 theatres and concert halls besides the Opera house. Five daily newspapers were being published in Budapest in 1955.

Communications.— From the point of view of transport and communications Budapest occupies a favourable geographical position. It is linked by way of the Danube with Austria and Germany and also with the Black sea. The river is navigable by sea-going vessels as far as Budapest. At the river ports of Csepel and Ujpest imported ores, coal and timber are unloaded.

All main railway lines and highways radiate from the capital. Budapest has become, therefore, almost exclusively the foreign trade centre of Hungary, with transit traffic between the countries of southeastern and western Europe. The modern Ferihegy airport, 10 mi. from the city, provides for the greatest part of the country's air transport and is served by international services, direct from many parts of Europe and indirectly linking Budapest with the rest of the world. The brunt of the capital's passenger transport is borne by about 150 mi. of streetcar lines.

Occupations and Industries.— In the early 1960s just over one-half of the working population was employed in industry, about one-third in the civil service and various branches of learning and about 9% in trade and commerce. Budapest's share in the industrial output of the country is substantial. Most of the well-known Hungarian goods, such as precision instruments, pharmaceutical products and electric locomotives, are made there. The machine-building industry has the greatest number of employees followed by the textile industry.

History.— Budapest is one of the European cities with the oldest historical background. There is evidence of settlement in the Neolithic age. In about 70 B.C. the Eraviscans, who were of Celtic origin but Illyrian culture: settled in these regions. In 9 B.C. the Roman empire pushed forward to the line of the Danube. From that time onward Aquincum, the Roman predecessor of Budapest, played a significant part in the defense of the empire as one of

the cornerstones of the limes ("fortified frontier"). After the collapse of the empire the dark ages descended on the settlement and the surviving population gradually disappeared.

The Magyars, who occupied the Carpathian basin at the end of the 9th century, took possession of this important river crossing. Slavonic and Germanic settlers also peopled the villages that were founded on the right bank of the river (Obuda on the site of the Roman camp, and a village that was the forerunner of Buda) and Pest on the left bank. The passing through of the crusaders and the lively transit traffic contributed to the development of a prosperous commercial and cultural life. This was interrupted by the catastrophe of the Mongolian invasion in 1241 that struck the whole country.

After the retreat of the Mongolian armies King Béla IV built his residence on Castle hill in 1247 and the royal palace and the adjoining settlement were surrounded by walls. From the beginning of the 14th century onward, Buda became recognized as the country's capital, a role which had been previously filled by Esztergom and Székesfehérvár. The leadership of Buda became more pronounced under the reign of the Angevin kings and later, in the 17th century, during the rule of Sigismund of Luxembourg and Matthias Corvinus. The palace built in the time of Sigismund was one of the biggest in Europe.

After Matthias' death the city's prosperity was followed by the decline of central power and the Turkish invasion. Buda, which fell into Turkish hands in 1541, became the centre of the territories under Turkish occupation and the seat of the governing pashas. During the 150 years of Turkish rule the Gothic and Renaissance Buda began to decay and Pest fell into ruins.

Toward the end of the 17th century the decline of the Turkish empire opened the way for the liberation of Buda in 1686 by the Austrians, and of the whole country a few years later. In the course of the war the greater part of the town was destroyed. Normal life was resumed slowly and under difficult conditions. During the 18th century Buda was rebuilt on a modest scale, in baroque style. In 1800 the combined population of Buda (including Obuda) and Pest was about 54,000.

At the beginning of the 19th century a movement was started to throw off the Austrian yoke and to attain Hungary's independence. Pest was the centre of this movement which at first developed rapidly, and with it the growth of the population of both Buda and Pest. It was Pest that, with the revolution of March 15, 1848, gave the start to the bourgeois transformation of the social order. Neither the defeat of the War of Independence nor the oppression that followed could halt the two cities' development.

In 1872 Buda and Pest were united, with a total population of 750,000. Budapest, as the capital of the country, became the political, economic and cultural centre. The characteristic features of the city were essentially shaped at the end of the 19th century when the architectural requirements of a metropolis were successfully co-ordinated with the preservation of historical values and with the special features of the landscape. By 1941 the population of the city had risen to 1,164,963.

Budapest was severely damaged in World War II. The royal castle was burned to the ground and most of the castle district, which contained some of the major historical monuments in Hungary, became a heap of ruins. All the bridges spanning the Danube were blown up by the retreating Germans. After 1945 reconstruction was rapid. The bridges were rebuilt and the restoration of monuments was begun. Many new factories were also built. New damage, however, was inflicted on the city during the 1956 uprising, which was put down by troops of the U.S.S.R.

See HUNGARY; see also Index references under "Budapest" in the Index volume.

BUDAUN, municipal town and district in the Rohilkhand division of Uttar Pradesh, India. The town is near the east bank of the Sot river, 27 mi. S.W. of Bareilly. Pop. (1961) 59,587.

According to tradition Budaun was founded about A.D. 905 by a Hindu raja called Buddh. Captured by Kutb ud-Din Aibak in 1196 it became an important northern frontier post of his Muslim kingdom of Delhi. It remained a major provincial governorship under this and succeeding Indo-Islamic dynasties until Shah Jahan moved the local administration to Bareilly in 1657. (See also UTTAR PRADESH.) It became headquarters of a district in 1838.

The town contains a ruined fort and the imposing Jamma Masjid or Great mosque, with façade 288 ft. across. The mosque was built in 1223 from the materials of a Hindu temple, under the patronage of the Delhi monarch Shams ud-Din Altamash, who had been governor of Budaun. It was extensively restored in the 14th century, in 1571–75 after a great fire in Budaun and in the 1870s.

Budaun is on the road and Northeastern railway main line (metre-gauge) between Mathura and Bareilly. There are only a few cottage or small-scale industries.

BUDAUN DISTRICT (1,998 sq.mi.; pop. [1961] 1,410,229) is part of the great plain of the Ganges, the river forming its southwestern boundary; it is also watered by the Ganges tributaries Sot, Mahewa and Ramganga. There are many jhils, or marshy meres, and lakes. Agriculture supports 85% of the population, the main crops being millets, rice, wheat, gram and barley.

(B. S.L.)

BUDDHA: see GAUTAMA BUDDHA.

BUDDH GAYA (BODH GAYA), a village in Gaya district, Kihar, India, 6 mi. S. of Gaya town; one of the holiest places in the Buddhist world. It was there, under the sacred pipal or Bodhi (Bo) tree, that Gautama Buddha (Prince Siddhartha or Sakyamuni) attained enlightenment and became the Buddha. In the 3rd century B.C. the emperor Asoka built a simple shrine to mark the spot and erected a pillar there. Part of a later stone railing enclosing this shrine survives; it is of the Sunga period, mid-1st century B.C. The uprights have representations of the Vedic god Indra and Surya, the sun god; the railing medallions are carved with fantastic beasts. The shrine at this period is depicted on several reliefs from Sanchi and Bharhut. It appears to have been a roofed arid gabled structure with supporting pillars, enclosed by a railing. The actual Bodhi tree is shown emerging from the roof or gable ends. This shrine was replaced by the present Mahabodhi temple, begun in the Kushan (Mathura) period, 2nd century A.D.; provided with a revetment and statuary in the Pala-Sena period, A.D. 750–1200; heavily restored by Sir A. Cunningham and finally restored in 1882 by Burmese Buddhists. The central tower, supported on a podium 20 ft. high and 50 ft. wide, stands 180 ft. above the ground.

See A. K. Coomaraswamy, *History of Indian and Indonesian Art* (1927); Sir A. Cunningham, *Mahabodhi* (1892). (F. R. A.)

BUDDHISM is the religion of the followers of Gautama Buddha (*q.v.*). Arising in the 6th century B.C. as an offshoot of the prevailing Hindu religion of north India, it flourished widely in that country until the 11th century A.D., spreading meanwhile to other parts of Asia. Today Buddhists in influential numbers are present in Burma (90% of the population), Thailand (89%), Ceylon (60%) and Japan (60%). In less influential numbers they are in China (about 17%), and in small numbers in India, Pakistan and the Philippines. In Indonesia there are some Buddhists in the midst of the predominantly Muslim population. Cambodia, Laos and Tibet are recognized as Buddhist countries, though statistics are not available. In Nepal the two religions are Hinduism and Buddhism. Outside Asia, Buddhists are present in North America (165,000), South America (135,000) and Europe (10,000). The total number of Buddhists in the world is approximately 150,310,000.

ORIGINS AND DEVELOPMENT

Origins in India. — Buddhism arose in an age of religious ferment. Many wandering ascetic teachers emerged, proclaiming various ways of deliverance from spiritual ignorance and suffering. An earlier polytheistic worship of the powers of nature, based on the sacred literature of Aryan invaders (Vedas and

Brahmanas), had developed at the hands of priests into a burdensome sacrificial and ritual system. To this had been added a social theory of caste and a conception of retribution for deeds done (karma), carried out in transmigration through many successive lives. Escape from evil consequences of deeds could come about only through the performance of prescribed ritualistic acts by Brahman priests. Reaction to this formalized, mechanical practice in religion was inevitable. It had already appeared in the latest development of Vedic literature, the Upanishads (c. 600–500 B.C.), which mark the beginning of a pantheistic philosophy, seeking a single reality behind all individual gods and aiming at deliverance from ill, not through ritualistic acts but in realization of union with this reality.

At first Buddhism was only one among numerous similar protests against the prevailing formalism. Like them it looked elsewhere for a deeper solution of problems of the inner life. In procedure it was unique. Ethically, it sought reform by rejecting the authority of the Vedas and in teaching an independent morality. Philosophically, it denied any substratum in the world of things or in any of the gods of the Vedic pantheon. Apart from all old Vedic theories it offered a way of spiritual attainment and release from endless births and deaths which it set forth as the discovery of its founder.

Earliest Teaching.—According to the oldest Buddhist literature (preserved in the Pali language), Gautama Buddha began his teaching career at Benares with a sermon traditionally accepted as the first exposition of his basic doctrine. It is known as Turning the Wheel of Doctrine (or "of Righteousness"; Dhammacakkappavattana) and has remained authoritative for all Buddhists.

The discourse is addressed to "him who has given up the world," in the conviction that worldly life cannot give final happiness. There are two extremes that ought not to be followed—the profitless life of indulgence in sensual pleasure, and the equally profitless way of self-mortification. By avoiding these two extremes Gautama Buddha "has gained the enlightenment of the middle path which produces insight, produces knowledge, and conduces to tranquillity, to higher knowledge, to enlightenment, to Nirvana." This enlightenment consists in the realization of four basic truths, reverently named the Four Noble Truths:

1. The Noble Truth of Pain (or Suffering): birth is pain, old age is pain, sickness is pain, death is pain. Union with the unpleasant is pain, separation from the pleasant is pain, not obtaining what one wishes is pain. In short, the five groups of clinging to existence is pain.
2. The Noble Truth of the Cause of Pain: the craving that leads to rebirth, accompanied by delight and passion, rejoicing at finding delight here and there, namely, the craving for lust, for existence, for non-existence.
3. The Noble Truth of the Cessation of Pain: the complete cessation of that craving—its forsaking, relinquishment, release and detachment from it.
4. The Noble Truth of the Path that Leads to the Cessation of Pain: this is the Noble Eightfold Path, namely, right view, right thought, right speech, right action, right livelihood, right effort, right mindfulness, right concentration.

The motive of this first sermon is practical; viz., to awaken recognition of the universality of suffering inherent in existence, to indicate its cause in craving and to teach a way of deliverance through rightness in thought, conduct and inner discipline. The description of the Path covers the whole training of the disciple. Its full significance is best seen in other reported discourses of the Buddha as found in Pali and later Buddhist literature.

Authoritative Buddhist Scriptures.—As followers of the Buddha spread his teachings in India and beyond, a large number of scriptures came into being, purporting to record his exact words, setting forth his rules for governing the monastic community and preserving later systematic analyses of doctrine by able scholars. All these writings, however, were put into their present form after the split-up of the original community into sects, each of which made its own collection. Only one of the collections now exists in completeness in any Indian language, the Canon of the School of Elders (Theravada). Written in Pali, this is treasured as authoritative sacred scripture in Ceylon, Burma, Thailand, Laos and Cambodia. It owes its preservation to the fact that it was introduced into Ceylon by Buddhist missionaries in the 3rd century B.C. According to the Great Chronicle (Mahavamsa) of

Ceylon, it was committed to writing for the first time in the 6th century after the Buddha (c. 25 B.C.). Thence knowledge of it spread to other countries of southeast Asia. Other canons that once existed in Buddhist schools of northern India are known in fragmentary form through surviving Sanskrit texts and through Chinese and Tibetan translations of Sanskrit texts now lost. These show dissimilarities and divergence from the Pali canon, the result of oral transmission of teachings in widely separated communities of monks. When finally written down the changes became fixed as characteristic differences between rival schools of interpretation.

In all older schools accumulated scriptures were classified in a threefold division called the Three Baskets (Tipitaka in Pali, Tripitaka in Sanskrit). In the Pali canon this consists of (1) Vinaya Pitaka, a collection of 227 rules of discipline (*vinaya*) binding on the monks; (2) Sutta Pitaka, arranged in five collections of discourses (*sutta*), of basic importance for doctrine; and (3) Abhidhamma Pitaka, a collection of higher doctrinal treatises (*abhidhamma*), psychological and philosophical in character. On terms and ideas found in the first two collections. In all this literature, earlier and later elements are discernible, and the whole represents a slow and complex growth of tradition over several centuries, with the third collection taking shape much later than the first two. It reflects authentically, however, how the School of Elders (Theravada) understood the teaching of the Buddha.

Developed Doctrines of Early Buddhism.—In addition to the Four Noble Truths including the Noble Eightfold Path, other important conceptions appear in the Pali scriptures. Buddhism stood in opposition to rival systems and was compelled to define its attitude on certain important points. As against both Hinduism and Jainism it denied a permanent, unchanging self (*atta*) or substantial soul that transmigrates intact from one life to the next. Instead it analyzed the individual into five groups of changing constituents: corporeality, feelings, perceptions, mental formations and consciousness. Like all else in the phenomenal universe, a person is in process of continuous change, with no fixed underlying entity. All is transitory and impermanent (*anicca*), in continual unease and unrest (*dukkha*), and substanceless (*anatta*). In this ever-flowing stream of psychophysical events everything takes place according to universal causality, the law of deeds (*karma*; Pali *kamma*) by which each act brings on its own inevitable result. The idea of karma was not original with the Buddha, but he gave it a distinctly ethical interpretation. Good deeds bring good results, evil deeds bring evil results. This furnishes the basic condition for moral improvement. By following the Eightfold Path of right living the process of personal continuous change is directed onward and upward through successive lives toward the ultimate goal of Nirvana (Pali *Nibbana*).

Fuller explanation of the Eightfold Path is given as follows:

1. Right view is understanding the Four Truths.
2. Right thought is free from lust, ill will, cruelty and untruthfulness.
3. Right speech is abstaining from lying, talebearing, harsh language and vain talk.
4. Right action is abstaining from killing, stealing and sexual misconduct.
5. Right livelihood is earning a living in a way not harmful to any living thing.
6. Right effort is to avoid evil thoughts and overcome them, to arouse good thoughts and maintain them.
7. Right mindfulness is to pay vigilant attention to every state of the body, feeling, mind.
8. Right concentration is concentration on a single object so as to induce certain special states of consciousness in deep meditation. By following the Path a disciple aims at complete purity of thought and life, hoping to become an *arahat*, one freed from the necessity of rebirth, ready for Nirvana.

How the cycle of life goes on in the world of transmigratory existence is formulated in the "law of dependent origination" (Pali *paticcasamuppada*; Sanskrit *pratityasamutpada*). This is a list of 12 causal states of the individual, each of which is thought to determine the next: ignorance, volitional activity, the consciousness that links one birth with another, mind-and-body, the six senses (five physical, one mental), impressions (sensory and mental), feeling, craving, attachment, becoming, rebirth, old age and death. Explanations of this list have varied, but its evident aim is to emphasize the causality operating through continuing cycles

of progress from birth to death to rebirth in successive lives. When ultimate enlightenment dispels ignorance the successive factors cease to operate and suffering as well as transmigration ends.

The final goal is Nirvana, a transcendent state free from craving, suffering and sorrow. Its positive character is inexpressible in any terms of finite experience, for its reality transcends the realm of birth and death. Whether the purified saint exists or does not exist after death the Buddha left indeterminate because such language is inapplicable to what is beyond both existence and non-existence.

Early Order of Monks.—In the India of the Buddha's day, it was common for religious teachers with numerous followers to organize their initiates into regulated communities. Gautama Buddha did likewise. His order had distinctive features. It removed all restrictions of caste, placed upon all members alike the same requirements, denounced extreme ascetic practices and emphasized moral principles. A monk's equipment was simple—alms bowl, vestments, staff, razor, toothpick, etc. His activities consisted of daily recitations, going the rounds for alms, fasting after the noonday meal, meditating and listening to religious discourses by senior monks. They also included giving regular instruction to junior monks, preaching to laymen during the rainy season, and joining twice a month in a general ceremony of confession in which an early code of rules (the Patimokkha) was recited. His preaching to laymen enjoined abstention from taking life, from drinking intoxicants, from lying, stealing and unchastity. It emphasized the social virtues in relations between parents and children, husband and wife, friend and friend, masters and servants, laity and clergy.

Ordination into the order was a simple ceremony, the central part of which was taking the Threefold Refuge: "I go to the Buddha for refuge, I go to the Doctrine for refuge, I go to the Order for refuge." This Threefold Refuge (Buddha, dharma [Pali *dhamma*], Sangha) later came to be called the Three Jewels, or Three Treasures, in all Buddhist lands.

Support for the order (Sangha) came from the laity who in gratitude gave gifts as they were able. Originally this was chiefly a matter of giving alms to the monks. As the number of monks and lay-followers increased, the corporate Sangha received large gifts in money, lands, parks and buildings from rulers and other wealthy patrons. This led to settled monastic establishments. Not everyone was accepted to this way of life. Persons suffering from mental or bodily defect, those who were vicious, gamblers, debtors or minors without the consent of parents were not admitted. Ordination of women was at first not contemplated by the Buddha, and it was with some reluctance that an order for nuns was sanctioned. Rules for nuns involved obedience to the order of monks in all respects. The order of nuns appears never to have been numerically large, but it has continued, as has the order of monks, into modern times.

SCHOOLS OF BUDDHISM

Emergence of Mahayana **Buddhism**.—About a century after Gautama's death, divisions began to appear in the Sangha. The growing community separated into two schools. One, conservative, held strictly to doctrine and practice as originally formulated; this was the School of Elders (Pali Theravada; Sanskrit *Sthaviravada*). The other, liberal, interpreted doctrine and practice with greater freedom; this was the School of the Great Assembly (*Mahasanghika*). As groups of monks multiplied and spread to different parts of India other schisms followed. By the 1st century B.C. about 18 or 20 could be named. Under the emperor Asoka (c. 274–c. 232 B.C.) missionaries of the Theravada school carried their form of Buddhism to southern India and Ceylon. Eventually its Pali scriptures were preserved in Ceylon.

Another early group, differing little at first from the Theravada in doctrine, was the Sarvastivada school. It put its scriptures into Sanskrit, spread northward and flourished eventually in Gandhara and Kashmir. From there its ideas passed to China and Tibet. This school argued for the existence of all entities mentioned by the Buddha, whether past, present or future, hence its name Sarvastivada, which means literally the "all-is doctrine."

In the meantime, the liberal tendency, working both within and without the Sarvastivada school, was bringing about changes in interpretation of the Buddha's meaning. From inchoate beginnings the tendency developed into an increasingly self-conscious movement which around the year A.D. 1 issued in a new form of Buddhism calling itself Mahayana or Great Vehicle (*i.e.*, conveyance) to salvation. In derogation it called the earlier, strictly orthodox teaching and practice Hinayana, or Little Vehicle, which it criticized as inferior, elementary, and merely preliminary to its own deeper insights into Buddhist meanings. Primarily its target of attack was the position of conservatives in the Sarvastivada school. Today, without using the derogatory term, the differences between the earliest teaching of the School of Elders and the Mahayana may be seen by comparing Theravada ideas as found in the Pali scriptures with Mahayana ideas in the Sanskrit tradition. This will make clear the essential characteristics of the two major divisions of Buddhism.

Theravada and **Mahayana**.—Major contrasts appear as follows:

Theravadins revere profoundly the personality of the historic Buddha, his teachings (*dhamma*) and the order he founded (Sangha). Mahayanists remember Gautama Buddha also, but regard him as one of many Buddhas who have appeared in many universes, all being manifestations of one primordial Buddha nature, and teaching variously according to needs of beings in their different realms.

Theravadins hold that the ideal Buddhist is a follower of the Eightfold Path, the layman going as far as he is able, the monk striving further to fulfill all conditions for the perfected saint (*arahat*) whose goodness issues in universal love (*metta*). Mahayanists hold that the ideal Buddhist is a Bodhisattva; *i.e.*, one vowed to become a Buddha, inspired by great compassion to work for the good of others through perfecting himself in the six virtues (*paramita*) of generosity, morality, patience, vigour, concentration (in meditation) and wisdom.

Theravadins hold that the Buddhist works out his own salvation by faithful adherence to the way demonstrated by the Buddha. Mahayanists hold that the Buddhist may also rely on the aid of supramundane Buddhas and Bodhisattvas whose wisdom, mercy and readiness to help are unbounded.

Theravada philosophical literature (*abhidhamma*) is mainly analytical, psychological and ethical. Mahayana philosophy (*abhidharma*) is predominantly dialectical and metaphysical.

Theravadins regard faith (*saddha*) as essentially confidence in the truth, taught by the Buddha and progressively realized oneself. Mahayanists regard faith (*sraddha*) as trust in the availability of merit transferred from some superhuman Buddha or Bodhisattva (*e.g.*, Amitabha or Avalokitesvara) whom one worships with devotion and gratitude.

Literature of the **Mahayana**.—As compared with Pali literature, which embodies the earliest tradition, Mahayana literature exhibits a wide variety of tendencies growing out of the tradition that developed in northern India from about 100 B.C. to A.D. 500. As is known from texts in Sanskrit, Chinese and Tibetan, works were still classified roughly under monastic rules (*vinaya*), discourses (*sutras*) and philosophical treatises (*sastras*): but subject matter often differs from that found in Pali, is not the product of one single school and shows mixtures of materials compiled over considerable periods of time. While conservative traditions are sometimes cited or repeated, they are quite freely reinterpreted and new ideas are unfolded. In discourses the Buddha is still the great teacher, but in the typical Mahayana *sutra* he is a transcendent, eternal being, preaching to innumerable Buddhas, Bodhisattvas, gods and demigods along with human disciples. In treatises, arguments centre around concepts of Ultimate Reality such as Voidness (because it is inexpressible), Consciousness-only (metaphysical idealism) and Suchness (or the Truly So). In the full Mahayana narrative of the life of the Buddha (the *Lalita Vistara*), there is great expansion of miraculous, legendary and numerical elements.

Sutras.—Among notable Mahayana *sutras* in the Chinese Buddhist Tripitaka are (1) *Saddharma Pundarika* (Lotus of the

Wonderful Law), whose chief doctrine is the Eternal Buddha; (2) Sukhavativyuha (Land of Bliss), teaching salvation into the Pure Land of the celestial Buddha Amitabha through faith; (3) Karandavyuha, which describes qualities of the Bodhisattva of Compassion, Avalokitesvara; (4) Prajnaparamita (Perfection of Wisdom), teaching the doctrine of Voidness or Emptiness of all phenomena; (5) Lankavatara, whose chief doctrine is that all discriminated entities are mind-only; (6) Avatamsaka, which teaches the interpenetration and identification of all things in universal consciousness; (7) Suvarnaprabhasa (Splendour of Gold), a miscellany of doctrine of Emptiness, praises of altruism, legends, esoteric rituals and magical spells; (8) Vimalakirtinirdesa, which extols an ideal Bodhisattva named Vimalakirti; (9) Maharatnakuta (Heap of Jewels), a collection of 49 discourses on a wide variety of Mahayanist topics.

Sastras.—Outstanding among the philosophical treatises (*sastras*) are (1) the Madhyamika-karikas (Aphorisms on the Madhyamika System) by Nagarjuna (c. A.D. 150), who argues dialectically for the Emptiness (*sunyata*) of all relative determinations in thought, and for the Absolute as void (*sunya*) of such determinations since it transcends thought; (2) Mahayana-samparigraha (Acceptance of the Great Vehicle) by Asanga (4th century A.D.), who teaches that all things exist in a fundamental (or receptacle) consciousness; such idealism also marks; (3) his Yogacaryabhumi Sastra, in which he sets forth the stages in a Bodhisattva's career toward Supreme Enlightenment; (4) Vijnaptimatratna (Ideation- or Representation-only), two treatises in 20 and 30 stanzas respectively, written by Asanga's brother Vasubandhu, who argues that all seemingly external objects are only mental representations, ideations-only; (5) Mahayanasradhotpada (Awakening of Faith in the Great Vehicle), a work known only in its Chinese version, which teaches that mind in its own nature is pure, that it becomes sullied through ignorance but may be cleansed through right understanding and faith in Buddhahood and through practice of charity, unselfish kindness, patience, zeal, tranquillity and wisdom, all of which issues eventually in the attainment of Perfect Enlightenment.

REGIONAL VARIATIONS IN BUDDHISM

A. INDIA

Decline of Buddhism in India.—As a vigorous distinctive faith Buddhism flourished in India until about A.D. 500. Then it began to decline. Its Theravada form already had passed out of northern India to the south and to Ceylon. The Mahayana form, more pliable and tolerant, could not maintain resistance to steady pressures from without. From its beginning, Buddhism was surrounded in India by other religious beliefs and practices—the old Vedic ritualism and Brahmanism, ascetic Jainism (see JAINS) and later Hinduism with its complex variety of deities and cults. Though it had some influence on these as it spread, it never really predominated except as rulers gave it special patronage. Its rivals continued active and tenacious. With the passing of time, Mahayana Buddhism, in constant contact with Hindu cults, gradually absorbed elements and tendencies from them until its distinguishing marks grew dim. Chinese pilgrims, traveling to India between A.D. 629 and 695, report the decline of monasteries once prosperous, the presence of Hindu temples near deserted Buddhist sites, or their close connection with functioning Buddhist temples where Buddhists and "heretics" intermingled. In the 8th and 9th centuries a Hindu revival under the influence of two masterful dialecticians, Kumarila and Shankara, gave strong doctrinal competition to Buddhist teachers, while organized Saiva ascetics opposed Buddhist monastic groups. With the establishment of Muslim power in A.D. 1193, Buddhism practically disappeared from its old home in northwest India. Elsewhere it lingered on in corrupted forms, eventually becoming a subsidiary sect under Hinduism, which accepted Buddha as an avatar of Vishnu.

Tantric Buddhism.—A factor marking the decline from the 7th century onward was the assimilation of a system of esoteric beliefs and practices known as Tantrism. The name derives from its literature, *tantras* (or "manuals"). At this time Tantrism appeared in both Hinduism and Buddhism as a magical ritual, using

ELIOT ELISOFFON © TIME INC

BUDDHIST TEMPLE OF THE PALLAVA PERIOD OF DRAVIDIAN ART AT MAMALAPURAM, INDIA: 7TH CENTURY

spells (*mantras*), mystic syllables (*dharanis*), occult diagrams (*mandalas*) and symbolic gestures (*mudras*) to attain the goal of religious life. The goal here conceived is a state of mystical union with reality wherein all dualities cease, symbolically expressed as the union of a given deity with his consort. In Hinduism the deities were Hindu gods. In Buddhism they were Buddhas and Bodhisattvas, each pictured with a feminine partner. Meditation on the symbol was intended to lead to an inner unification of the devotee and his identification with the deity, which is supreme spiritual bliss. The symbolism of sexual union was used to indicate an ultimate mystical realization. In some forms of Tantrism, however, the symbol was a literal ritual union, celibacy and ascetic morals were rejected, and a general indulgence of the senses was approved. It is evident that the mystical metaphors of the *tantras*, taken literally, were easily open to abuse and could be interpreted to sanction conduct quite opposed to the precepts of early Buddhism. Historically, this brought condemnation from ascetic religious groups and upon late Buddhism itself in India.

B. TIBET

The form of Buddhism that entered Tibet in the 8th century A.D. was of the late Indian variety. It brought in not only the Hinayana and Mahayana traditions, but also the Tantric interpretations and practices which an Indian Tantric scholar, Padmasambhava, introduced. This mixed form of Buddhism combined with the Tibetan indigenous religion, Bonism. The latter was essentially a worship of nature spirits, hostile or benevolent, in which human and animal sacrifices, divination, magic (black and white), exorcism and sorcery were practised. The resulting complex of beliefs and practices is the distinctive religion of Tibet and Mongolia. In general it is an advance over original Bonism, but a less pure form of Buddhism than the Theravada of southeast Asia and the Mahayana of China and Japan.

The canonical scriptures of Tibetan Buddhism are voluminous. They consist of translations of basic texts from the Sanskrit, commentaries upon them, literature of the Old Translation school, founded by Padmasambhava, and lesser collections made up of ritual texts, doctrinal summaries, guides to meditation, invocations and classical tales of the Buddha's previous births (*Jataka*).

Most important are the first two sections, the Kagyur (or Kanjur), sacred because it contains the direct words of the Buddha, and the Tangyur (or Tenjur), containing the commentarial explanations. The Kagyur consists of the Threefold Collection (Tritipaka) of Rules, Discourses and Treatises, plus what are called the Four Great Tantras ("manuals"). These last are (1) the Tantra of Activities (Kriya), (2) the Tantra of Application (Charya), (3) the Tantra of Perfection (Yoga) and the Tantra of Supreme Perfection (Anuttara Yoga). For Tibetans the Tantra section is very important, for here are set forth the magical rites, powerful spells, complex symbolisms and mystical meditations, claimed to lead to realization of Supreme Truth by developing intuitive wisdom and compassion. One edition of the Kagyur runs to 108 volumes. Even larger is the Tangyur, 225 volumes of commentaries on sutras and tantras.

Doctrinally, Tibetan teachers have recognized three ways to the highest goal in Buddhism. These they regard as designed by the Buddha for persons on different levels or stages of development. These are: (1) Hinayana, or the way of self-emancipation through self-discipline; (2) Mahayana, the way of philosophical insight into reality for the sake of saving others; (3) Tantrayana, the way of magical rites and mystical meditations. Theoretically, these are successive steps in an all-inclusive One Way (Ekayana, or One Vehicle) which the Buddha had in mind from the beginning. Accordingly a monk is expected to spend 15 to 20 years studying literature of the first two yantras before going on to learn the practice of the third under qualified masters in mystical realization.

Historically, the magic ritualism of Tantrayana made the first and readiest appeal in Tibet, where Bon magic was well-known and practised. This opened the way for introduction of all forms of tantric teachings from India, including the most literal interpretations. By the 11th century the amorality of the literalists called for reform, and more adequate knowledge of the higher teachings. Atisha (or Atisa), arriving from India in A.D. 1042, and Tsongkha-pa (1356-1418) both disapproved of tantric extravagances, taught the more balanced doctrine of the three *yantras*, required stricter discipline among the monks and gave more spiritual interpretations of tantric teachings. This led to the establishment of the now dominant Ge-luk-pa (Virtuous Way) sect to which the supreme head of the ecclesiastical hierarchy, the Dalai Lama, belongs. The patron deity of Tibet is Chen-re-zi (*i.e.*, the Bodhisattva of Great Mercy, Avalokitesvara), of whom the successive Dalai Lamas are regarded as reincarnations. A feminine deity popularly worshipped is Tara the Saviouress. (See further TIBETAN BUDDHISM.)

C. BURMA AND SOUTHEAST ASIA

Among countries in which the earliest form of Buddhism is followed today. Burma is notable for preservation of original monastic practices and adherence to the tradition of councils called to maintain purity of the faith. Its yellow-robed monks guide their lives by the ancient rules of the order (Sangha). They are expected to study diligently the Pali scriptures, practise the ethical precepts, meditate regularly and aspire to the purity of character and insight leading to Nibbana. They also maintain close contact with the people. Every village has at least one monastery radiating its influence through the community. Monks minister to the people through teaching and conducting religious rites and ceremonies for them. They give training to the youth entering the order for a limited period of religious education. According to ancient custom, they go the round for alms among the laity, affording them opportunity to practice the householder's virtue of giving. Ideally, the monk stands before the people as an example of complete devotion to the higher life taught by the Buddha. The laity respect the monk (*pongyi*, or "great glory"), and expect much of him as a moral leader. If he should stray from the right path of his vows they are quick to disapprove. On the whole, the situation in modern Burma illustrates how the early order must have operated.

Historically, the Theravada form of Buddhism was not prevalent over the whole of Burma until after the 11th century A.D.

PICTORIAL PARADE

THE "SLEEPING BUDDHA." A 50-FT. STATUE, AND (LEFT) STATUE OF ANANDA, BUDDHA'S DISCIPLE. AT POLONNARUWA, CEYLON; 12TH CENTURY

Before the time of King Aniruddha of Pagan (1044-77), it flourished only around Thaton in southern Burma as a result of the work of missionaries from southern India. In northern Burma around Pagan the religious situation was confused. Hindu, Mahayanist and Tantric influences from India, China and Tibet had combined with native animism to produce an amorphous set of practices, displeasing to the common sense of Anawrahta when he came to the throne in Pagan. Learning of the pure Theravada teachings from a monk arrived from Thaton, he made it an object in his conquest of southern Burma in 1057 to bring back to his capital all the Buddhist relics, copies of the Tipitaka, and able monks of the order. This marks the beginning of the royal patronage which in later centuries co-operated with zealous religious leaders to spread Theravada teaching throughout Burma. Corrupt forms gradually died away, though the animism of the common people lingers on in the folkways as a subordinate element not regarded as incompatible with the higher ranges of their religion.

According to Theravada tradition, Buddhism has had six great councils maintaining the integrity of its original teaching and practice. At the first, held at Rajagaha shortly after the Buddha died, 500 leading disciples assembled to recite and set in order his teachings as they remembered them. At the second, held 100 years later at Vesali, the first schism occurred when the School of the Great Assembly (Mahasanghika) separated from the School of Elders (Theravada). To the third great council, convened sometime during the reign of Emperor Asoka, is credited the compilation of a canon of orthodox doctrine and plans for missionary spread of the teaching in India, Ceylon and elsewhere abroad. The fourth was held in Ceylon (c. 25 B.C.), where, according to the Great Chronicle of Ceylon (Mahavamsa), the collected teachings, hitherto transmitted orally, were written down in books. The fifth, supported by King Mindon of Burma, was held in Mandalay in 1871, after which the revised texts of the canon, by royal order, were carved on 729 marble slabs. The sixth great Buddhist council met in Rangoon from May 1954 to May 1956 to recite and review again the Pali texts and to celebrate the 2,500th anniversary of the death of Gautama Buddha. This tradition of councils to maintain authenticity shows the strength of a continuing devotion to the faith of the Elders, conspicuously present in Burma and to a notable degree in Ceylon, Thailand, Laos and Cambodia also.

D. JAPAN

In Japan it is the Buddhism of the Great Vehicle (Mahayana) that has survived and flourished. This represents the outcome, after more than 2,000 years, of the tendency of free interpretation of Buddhist meanings under differing circumstances of peoples from northwest India to northeast Asia. Japan inherited from China and Korea all the Hinayana and Mahayana traditions introduced into those countries during the first six centuries A.D. Since the 6th century A.D. Buddhism has been an important factor in Japanese culture. With adaptations it follows Chinese Mahayanist forms. Its authoritative scriptures are those of the Chinese Tri-

pitaka. Its art and architecture stem from Chinese originals. Its ceremonials and sects reflect practices and organizations found in China by Japanese priests who, from the 7th century onward, went there for study. Imported elements were adapted and developed, however, to suit a new environment. Japanese Buddhists do not regard the Mahayana as a departure from the original faith but as a natural development in different situations of deepening insight into its meaning.

Establishment of Buddhism in Japan is usually dated at A.D. 594, the year in which the regent, Shōtoku Taishi, promulgated an imperial ordinance to support and urge the development of the Three Treasures; *i.e.*, the Buddha, the Truth (*dharma*) and the Brotherhood (Sangha). His aim was to bring harmony among contending clans and peace to the people by holding up the ideals of the religion with its ordered Mahayana hierarchy of greater and lesser Buddhas and Bodhisattvas. These he saw expressed in the Lotus scripture (Saddharma Pundarika) through its concepts of One Vehicle and the Eternal Buddha who speaks through countless lesser ones. On this scripture he lectured and wrote a commentary. He did the same for two other *sūtras*, the Vimalakīrtinirdesa and the Srimaladevisimhanada, written for the layman and laywoman, respectively.

Six Sects of the Nara Period.—During the epoch when the capital of the country was at Nara (709–784), six philosophical sects were introduced from China:

1. The Sanron (Three Treatises) sect taught the doctrine of the Void (the inexpressible Absolute).

2. The Hossō (Dharmalakṣana) sect taught that everything is "consciousness-only": a system of metaphysical idealism; and also held the theory that some beings are incapable of Enlightenment.

3. The Kegon (based on the Avatamsaka, or "Wreath," *sūtra*) sect held that all things interpenetrate and are inter-related in one Total Universe, in which every living being is a potential Buddha.

4. The Ritsu (Vinaya Pitaka) sect was concerned with the ceremony of ordination and rules of discipline.

5. The Jōjitsu (Satyāsiddhi, or "Completion of Truth" *śāstra*) sect taught the emptiness, or ultimate unreality, of both self and all elements, material and mental, which are its supposed objects.

6. The Kūsha (Abhidharmakośha) sect studied a far-famed treatise of the Sarvastivāda (All-is-real) school, written by Vasubandhu in the 4th century A.D. This maintained that all elements of the universe are real and discriminable as 75 in number.

In this same Nara period an image of the Great Buddha (Daibutsu) Vairocana was erected at the capital. Still to be seen, it symbolizes the Mahayana conception of a central, cosmic Buddha, irradiating his light through all lesser Buddhas who preach his truth throughout the more than 10,000,000,000 worlds of Mahayanist cosmology.

Tendai and Shingon.—In the following Epoch of Peace and Tranquillity (Heian epoch, 794–1184), the capital was at Kyōto, where new sects were founded by two priests who had gone to China for Buddhist study. One was the Tendai (Chinese) sect, founded by Saichō, whose honorific title is Dengyō Daishi (767–822). The other was the Shingon (or True Word) sect of esoteric Buddhism, founded by Kūkai, whose title is Kōbō Daishi (774–835).

Tendai.—Tendai doctrine was based on the Lotus *sūtra* (Saddharma Pundarika) as interpreted by the Chinese philosopher Chih-k'ai (531–597), at whose monastery in the T'ien-t'ai mountains Saichō had studied. It is remarkable as a synthesis of all varieties of Buddhist doctrine on the assumption that all were present in Sakyamuni's (*i.e.*, the historical Buddha's) mind from the time of his Enlightenment, although he unfolded them gradually on different levels according to differing capacities of his hearers for insight. This wide inclusiveness, giving all Buddhist systems some share in a total scheme, attracted many monks who came to the Tendai headquarters on Mt. Hiei for their training. Saichō himself taught Lotus doctrine, esoteric mysticism, Zen meditation and *vinaya* practices.

Shingon.—Shingon doctrine is mystical, teaching that the truth which is the supreme wisdom of the Buddha (*i.e.*, Vairocana) lies somehow inherent in all living beings. It may be developed and realized through special rituals. These include chanting mystical

syllables, ritualistic finger-entwining, reciting magical spells, yoga concentration and right manipulation of symbolic ritual utensils. The whole is intended to arouse an immediate sense of the pervading spiritual presence of the primordial, eternal Buddha. This is taken to be a perfect communion between Buddha and aspirant in the present life. Shingon esotericism here reflects an influence of Tantrism on Chinese and Japanese Buddhism, but much modified and systematized on a higher plane by Kōbō Daishi. This did not, however, prevent its magic rituals and symbols from being regarded by the people simply as efficacious acts to secure desired worldly benefits.

Four Sects of the Kamakura.—During the Kamakura era (1185–1336), four more sects arose which were movements in the direction of closer adjustment of Mahayana Buddhism to religious needs of the common people. Earlier sects had been established under imperial sponsorship and appealed to intellectuals and aristocratic court circles. Their philosophies and ceremonies were too complex for popular understanding. In a disordered time also—when a patrician society was declining, a benefited clergy had become corrupt and worldly, and a military class had arisen—the distress of the people was great. Simplification of religious ministrations became imperative. Arising to meet the situation were the new sects, Jōdo, Shin, Zen and Nichiren.

Jōdo.—The Jōdo (Pure Land, or Realm, sect) was founded by Hōnen (1133–1212). A priest who had diligently studied the many doctrines of Tendai, he had failed to find the peace of an inner certainty. Becoming convinced that neither book learning nor complex rituals nor keeping precepts nor practising meditations nor lead to deliverance from evil, he turned to the way of simple dependence on another power. This power he found in the Buddha Amida (Amitabha). Of him it was written in certain scriptures that by taking a great vow and performing good deeds for others through a long succession of reincarnations, he had brought into being a Blissful Realm in which to save all who would call upon his name in faith. Reciting Amida's name was known in Japan before Hōnen's time, but he was unique in stressing that it is the one thing needful, and in organizing his many followers around the chanting of the words *Namu Amida Butsu* ("Homage to Amida Buddha"). By this he felt assured of rebirth into Amida's Pure Land of perfect bliss.

Shin.—The Shin (True) sect, or True Pure Land sect, was founded by Hōnen's chief disciple Shinran (1173–1262), who carried Hōnen's teaching to its logical conclusion. Faith alone matters. Mere recitation of a name is still indicative of a certain reliance on self-effort, even as are other forms of works such as doctrinal studies, austerities, meditations and rituals. Reliance on the grace and merit of Amida alone is sufficient. Shinran, like Martin Luther, abandoned monastic practice, married and demonstrated that the religious life may be followed in the midst of lay responsibilities. Since then leaders of Pure Land temples have been householders who devote their whole time to religious matters but do not follow the *vinaya* discipline.

Zen.—The Zen (Meditation) sect first flourished in China in the 7th century A.D. under the name Ch'an. The word *ch'an* is the Chinese equivalent of the Sanskrit *dhyāna* which means meditation. In Japan the Chinese word is pronounced *zen*. The Ch'an sect in China developed several subdivisions, which were transmitted to Japan in the 12th and 13th centuries. The two most important branches are Rinzaï (Chinese Lin-chi) and Sōtō (Ts'ao-tung). In Rinzaï practice, meditation on paradoxes (*kōan*) is used to awaken intuitive insight into what transcends logical distinctions. In the Sōtō branch, the practice is a silent sitting and meditating on what illumination arises. Both branches revere the historic Sakyamuni, believe in mind-to-mind instruction from master to disciple, in the possibility of awakening the Buddha-mind which everyone has originally, and in expressing religious realization in daily work. Discipline is more austere in Rinzaï Zen. In Sōtō Zen there is emphasis on teaching ethical precepts and on Bodhisattva practice of charity, tenderness, benevolence and sympathy, for the sake of saving others. In Zen monasteries the most important place is the meditation hall, where training in the practice is given and received. In Zen study associations, lay folk

also are instructed in the elements of meditation, as well as given the ten precepts of right conduct—not to kill, steal, commit adultery, lie or sell liquor; not to speak of others' shortcomings, or to praise oneself and blame others; not to begrudge charity, not to be angry, not to speak ill of the Buddha, his law and his order. Of the two chief forms of Zen, Rinzai is more aristocratic in tradition and has a smaller number of followers; Sōtō Zen has larger following among the common people. (See also ZEN.)

Nichiren.—The Kichiren sect is named after its founder, Nichiren (1222–82), who, after long and arduous study at the head monastery of Tendai on Mt. Hiei, became convinced that the essential truth of Buddhism is in the Lotus scripture, but not as misunderstood and confused in the then existing sects, including Tendai. In Japanese this Lotus of the Wonderful Law is called Myōhō-Renge-Kyō, a name every syllable of which Nichiren felt to be weighted with profound meaning. It should be thoroughly understood and practised. His vehement adherence to one scripture alone, however, brought him into sharp conflict with other teachers and groups. He denounced them, and in opposition founded a new sect. Their doctrines and practices he declared false and dangerous to the welfare of the country. For this he suffered persecution, being at times in danger of his life. His persistence won out eventually, and he gained loyal following among those who admired the defiant courage with which he upheld his faith.

Nichiren believed in the Eternal Buddha as revealed in the Lotus scripture. This he held to be the true Buddha-nature, manifested in Sakyamuni and all other great beings awake to reality and truth. He taught his followers to test the teachings of the Lotus in their lives, to centre devotion by repeating the words *Namu-Myōhō-Renge-Kyō* ("Homage to the Lotus of the Wonderful Law"), to have absolute faith in the eternal Sakyamuni Buddha and to strive for development of the Buddha-nature in themselves and others. Upon this faith, Nichiren believed, depended the salvation of Japan itself. In its cause he showed himself saint, crusader, prophet and nationalist combined. The Nichiren sect still continues to fight in the same cause, believing his teaching will spread all over the world. In this it is a uniquely Japanese form of Buddhism, having no prototype in China.

Modern Japan.—Since the 14th century no new major Buddhist sect has been founded in Japan, although subsects have appeared within the old ones, markedly after World War II. In the 19th century, contacts with western scholarship in the scientific study of religions aroused a new interest. This has led to extended research activities, by Japanese scholars using modern methods, over the entire field of Buddhist literature in all its languages, especially Sanskrit, Pali, Tibetan, Mongolian and Chinese.

MODERN BUDDHIST PRACTICE

Theravada.—In Theravada countries a close relationship exists between clergy and laity, although the latter do not have membership in the order (Sangha) as laity in the west have membership in churches. Strictly speaking, the order is made up of practising monks (bhikkhus) who have taken vows, wear the yellow robe and live the monastic life. Yet lay folk are not without their measure of participation. Except in the case of practice in Ceylon, where a monk's ordination is for life, provision is made for a person to enter the Sangha for a few weeks! months or years and then return to lay life when he so desires. In Thailand and Cambodia especially, all young men are urged to spend at least one rainy season as a monk in order to receive moral instruction from elders of the order. On entering the Sangha the candidate repeats the Three Jewels: "I take refuge in the Buddha, I take refuge in the *dhamma* (teaching), I take refuge in the Sangha." While in the monastery his life is regulated by the Vinaya rules laid down in the Pali canon. Twice each month the monks assemble to hear recited the 227 precepts and prohibitions and confess their failures. For novices such assembling may be daily. *Bhikkhus* must abstain entirely from drugs and intoxicating liquors. Both monks and novices refrain from eating solid food between noon and the following morning. They observe silence on their house-to-house

begging rounds. They must remain chaste in thought and deed. Their only personal possessions are one undergarment, two robes (yellow or yellowish brown), a belt, an alms bowl, a small knife or razor, a needle and a water strainer. All else is the common property of the Sangha. For transgressions of rules there are appropriate confessions and penances. If a major transgression is committed, the offender is required to leave the order and return to household life.

Each monastery is presided over by a senior monk. Several monasteries associated together may select a high-ranking elder (*maha thera*) to lead the entire group. In Burma the Sasana council, made up of leading Buddhists, monks and laymen, is the guiding advisory group for the order. In Thailand a *sangharaja* (Sangha ruler) is chosen by heads of major monastic groups, approved by the ministry of education and appointed by the king. He in turn makes appointments to other chief positions in the Sangha with the approval of the government. Organized activities of the *bhikkhus* thus supervised consist of observing discipline, study of Pali scriptures and commentaries, meditating, teaching novices and performing various services for the lay community.

Lay followers in Theravada countries look to monks for instruction in the basic precepts for right living. These are given in popular sermon form, with examples drawn from stories of the Buddha's previous rebirths (see JATAKA). Injunctions include reciting the Triple Refuge formula and keeping at least five abstinences—from killing, stealing, unlawful sexual intercourse, bad speech and drinking liquor. On special days additional merit may be gained by refraining from sexual intercourse, from taking food after noon, from enjoying music, garlands, perfumes, etc., and from luxurious seats or beds. On the positive side, appropriate duties are enjoined between parents and children, teachers and students, husband and wife, friends and companions, masters and servants, monks and lay people. Devout followers maintain small shrines in their homes, go to preaching halls to hear doctrine and, where circumstances permit, go on pilgrimages to sacred sites in India, Ceylon, Burma or Thailand. With aid of monks, the people observe the tonsure ceremony when a child reaches puberty, attend his ordination ceremony when a young man of the family enters the order, and when death enters a home carry out the burial rites. At these last monks officiate in chanting scriptures with reminders of the transitoriness of life, and the ongoing of the process of mind under the force of kamma (retributive law of deeds) to join another body in a new form.

On the joyous side are the religious festivals, gladly observed by the people of southeast Asia. Chief of these is Wesak (usually in May), in triple commemoration of the Buddha's birth, enlightenment and death. Another is the feast of offering of robes and alms to the monks at the end of the rainy season. Especially happy is the New Year festival with its many amusements of water-throning, processions and dances, as well as paying honour to the Buddha. Special local festivals give additional happiness in each of the Theravada countries.

Mahayana.—In Mahayana countries, practices are much more varied. Characteristic of the Pure Land sects is recitation of the formula of homage to the heavenly Buddha Amitabha. Chanted by priests in temple services and uttered by lay folk in private devotions, it is the expression of what is deepest in their aspirations. In the Nichiren sect devotion is given to the truth in the Lotus scripture, and homage expressed through repeating its name. In Zen sects reverence is given to the historic Sakyamuni, to his 500 outstanding disciples (arahats), to great Bodhisattvas such as Manjusri whose image adorns the halls of meditation, to patriarchs such as Bodhidharma, and to founders of Zen sects and temples. Founders of other sects, such as Hōnen, Shinran, Saichō, Kōbō Daishi and Nichiren, are honoured in the worship halls by their followers. Incense is burned before images of major Bodhisattvas such as Avalokitesvara, known as Lord of Compassion in Tibet, and as Goddess of Mercy in China (Kuan-yin) and Japan (Kwannon).

In temple ceremonies before whatever image priests chant from appropriate Mahayana scriptures and perform traditional rituals. The effect is impressive, especially on great occasions when colour-

ful ceremonial robes are worn and several hundred monks participate. In China the laity are generally bystanders and onlookers at such services. In Japan they have more participation. Shingon rituals, for example, are complex but lay devotees hold copies of the chants, join in where indicated, and during the concluding chant come forward one by one to bow before the shrine and make offering of incense.

Social Service.—Social service is approved in modern Buddhist practice. The idea of ministry to others is not new in Buddhism, but social needs today evoke new forms of expression. In Theravada countries it is largely a personal matter between the individual monk and the layman who turns to him for help. In China and Japan there has been more emphasis on social institutions such as hospitals, orphanages, schools, young people's organizations, etc., motivated by the Bodhisattva spirit of the Mahayana. Such emphasis and instruments are relatively recent, but they are consistent with the ancient ideal of active compassion for all suffering beings.

Temples and Monasteries.—Wherever Buddhism has spread in Asia it has given rise to impressive material structures. (See INDIAN ARCHITECTURE; INDIAN ART; INDONESIA ART; CHINESE ARCHITECTURE; JAPANESE SCULPTURE; JAPANESE ARCHITECTURE.) Architectural and iconographic features naturally vary from country to country, but basic functions remain the same. The temple is the main sanctuary, housing the image of Sakyamuni (Theravada) or of various Buddhas, Bodhisattvas and saints (Mahayana). Before altars to these images services are performed, public when lay people are present, private when part of daily monastic routines. The monastery is a complex of buildings, located usually in a spot chosen for its beauty and seclusion. Its function is to house activities of the monks. Here members of the brotherhood reside, receive training and practise exclusively the religious life. There is a residence for the chief abbot, and appropriate living quarters for senior monks and novices in training. For the laity are provided guest halls that in a large monastery may accommodate as many as 500 visitors at one time. The meditation hall is important, especially in Zen monasteries. Providing for other activities are the hail for worship, lecture halls, scripture repository, dining hall, kitchens, etc. Monasteries vary in size depending on area of service—local, regional or national. In China, where only certain monasteries are equipped to perform ordination ceremonies, as at the great monastery on Pao-hua Shan (Precious Flower mountain) in Kiangsu province, novices to the number of two or three thousand have sometimes assembled from all over central China. In Tibet, which historically has been a Buddhist ecclesiastical state, the great monasteries of Sera and Drepung, outside the capital, Lhasa, have housed as many as 7,700 and 10,000 monks respectively.

Iconography.—Images, in both Theravada and Mahayana usage, have been set up in temples, monasteries and shrines. Throughout southeast Asia these generally represent the historic Buddha in postures of meditating, teaching or reclining. For the devout these call to mind his enlightenment, years of teaching and passing to Nirvana. To educated Buddhists they are not idols: possessed of inherent mysterious power, but aids to fix meditation on the virtues of the Buddha.

In countries of northern Asia, the treatment of images is more complex. In Mahayana sanctuaries: the representations are of different Buddhas, Bodhisattvas, saints (*arahats*) and guardian deities derived from India. In China and Tibet these constitute a pantheon, the worship of which is practically polytheistic. Historically, as is known from old Buddhist records in China, images often have been prized for their miraculous! supernatural efficacy. Sometimes the image was thought to become efficacious on occasion of the ceremony of worship. Acts then performed in its presence became magically potent. In Japan, where modern education is widespread, the tendency is to regard images as symbols of important spiritual qualities. Thus the figure of Amida signifies both wisdom and mercy, that of Kwannon boundless compassion: that of Manjusri the supreme wisdom to be sought through meditation. In Tibet, where ancient magical rites are taken for granted, images in personal form may represent doctrinal ideas

or abstractions to the learned and also serve as direct objects of worship, powerful in themselves, for the untutored laity.

Relics.—Veneration of relics and personal belongings of the Buddha has been present in Buddhism from the beginning. According to early tradition, the body of Sakyamuni was cremated after his death, and the relics divided among eight groups of claimants. Each group erected for its share a reliquary. This marks the beginning of those structures, called stupas, dagobas and pagodas, which in Buddhist countries adorn the landscape everywhere. The names are often used interchangeably. Strictly speaking, however, the stupa is the moundlike earliest form of reliquary used in India; the dagoba is like a mound stretching up into a pointed spire above; the pagoda is the towerlike, storied structure observable in China, Korea and Japan. In Tibet a variant of the stupa called *chorten* (*cho-ten*) is common. All these structures have the same basic function. They honour the Buddha in the preservation of his relics or those of his chief disciples. They also become objects of pilgrimage and places for acts of devotion such as circumambulation. Most famous for size and beauty of ornamentation are the great stupas at Sanchi, India, the Shme Dagon pagoda (dagoba) in Rangoon, Burma, and the pagoda of Hōryūji temple at Nara, Japan.

Treasured relics vary. Sometimes a particular one is honoured in a special sanctuary such as the Temple of the Sacred Tooth at Kandy, Ceylon, where worship services are held daily. Other objects of veneration have been a collarbone, locks of hair; ashes, etc. Objects made sacred by association are the tree (or its descendant) at Buddh Gaya (*q.v.*) under which Gautama experienced his great enlightenment, shoots from this same tree planted elsewhere (see BO TREE); footprints of the Buddha, his girdle, alms bowl, etc. These together with mementos of noted disciples and saints have always played a role in popular piety. As in other notable religions of history, the material traces of lives that have embodied higher verities seem to make more real for him the faith of the common man.

BUDDING: see GRAFTING (IN PLANTS); PLANT PROPAGATION.

BUDDELE, JOHN (1773-1843), English coal mining engineer, who pioneered controlled mine ventilation and first established a mining record office, was born in 1773 at Kyo, Durham. The son of a self-educated schoolmaster who subsequently became "viewer," or manager, of the Wallsend colliery, he assisted his father for 14 years then took over the management. Dismayed by the frequent disasters due to flooding or firedamp: he divided the workings into independent "panels" by leaving barriers of unworked coal, adopted the Davy safety lamp and strove to improve ventilation which, at that time, was effected by an open fire in the upcast shaft. He tried, in turn, the injection of steam into the upcast, the withdrawal of air through a heated cylinder to a chimney, an air pump and, finally, compound ventilation, now known as the split air system. By separating ventilation and workings into independent systems, air free from firedamp was passed through a fire to join, warm and raise the air in the upcast from dangerous workings. Buddle served on many government commissions and organized the collection of local mining records, and among his interests were various engineering projects, technical writing and the founding of schools in colliery villages. He died at Wallsend on Oct. 10, 1843, and was buried at Benwell.

(C. W. D.)

BUDÉ, GUILLAUME (Latin: BUDAËUS) (1467-1540), French scholar and humanist whose writings considerably influenced the revival of interest in Greek language and literature. He was born at Paris in 1467 and studied law at Orléans without much success. but, resuming his education after several years spent in dissipation. his extraordinary memory enabled him to acquire a vast erudition. Louis XII made him his secretary and he accompanied Francis I at the Field of Cloth of Gold in 1520. He was responsible for the foundation by Francis of the Collegium Trilinguae, which later became the Collège de France, and the library at Fontainebleau which, moved to Paris, was the origin of the Bibliothèque Nationale. He corresponded with most of the learned men of his time, including Erasmus, Thomas More and Rabelais. His tolerance of the reformers and his refusal to be buried with religious rites have led some to suspect him of Calvinistic leanings. He died at Paris on Aug. 22, 1540.

His most popular work was *De asse et partibus* (1514), a treatise on ancient coins and measures. He was also the author of *Annotationes in XXIV libros Pandectarum* (1508), which had a great influence on the study of Roman law, and of *Commentarii linguae Graecae* (1529), *De philologia* (1530) and *De transitu Hellenismi ad Christianismum* (1534).

BUDEJOVICE (BUDWEIS): see CESKE BUDEJOVICE.

BUDENNY, SEMEN MIKHAILOVICH (1883-), Russian military leader, marshal of the Soviet Union. was born of a peasant family on April 25, 1883, and lived in the village of Kozyurin, near Rostov-on-Don. He began his military service in 1903 and served in the 48th Cossack regiment in the far east. He engaged in revolutionary activity in the armed forces early in 1917 and after the Revolution he was made chairman of the divisional soviet of troops in the Caucasus. In 1918 he formed a cavalry unit to fight against the monarchist forces in the northern Caucasus. He joined the Communist party in 1919 and, as commander of the 1st cavalry army until 1924, played an important part in the victory of the revolutionary forces in the civil war. He was inspector of cavalry in the Red army from 1924 to 1937, was made marshal of the Soviet Union in 1935 and commanded the Moscow military district from 1937 to 1940. In 1939 he was made deputy commissar for defense and in 1940 became first deputy. When German forces invaded the Soviet Union in 1941 Budenny

was put in command of the southwestern front, where his troops suffered defeats. He was removed and held no further command in World War II. He was appointed inspector of cavalry in 1953. A candidate member of the central committee of the Soviet Communist party from 1934 and a full member of it from 1939, he reverted to candidate membership again at the 22nd congress in Oct. 1961. He was a member of the presidium of the supreme soviet from 1938. He was appointed a hero of the Soviet Union in 1958, in which year he published his memoirs. (D. FD.)

BUDE-STRATTON, an urban district of Cornwall, Eng., consisting of the small seaside town and port of Bude and the little market town of Stratton 1½ mi. inland, lies 32 mi. N.N.E. of Bodmin by road. Pop. (1961) 5,095. Bude is on the Atlantic coast, and the river Neet flows through both towns. The coastal scenery is magnificent and there are several miles of open cliff land both to the north and south of Bude, with sands stretching far out below the cliffs at low water. One of the two main beaches is suitable for surf riding. Amenities include a free, tide-swept swimming pool and an 18-hole golf course overlooking the sea. Bude was once a busy port but the chief occupations are now agriculture and catering for tourists. Just to the north of Stratton, which has a fine Perpendicular church, the battle of Stamford hill was fought in 1643.

Formerly called Stratton and Bude, the urban district was incorporated as Bude-Stratton in 1934. (F. C. DR.)

BUDGE, SIR ERNEST ALFRED WALLIS (1857-1934), English orientalist, was born in Cornwall on July 27, 1857, and educated at Christ's college, Cambridge, where he became Assyrian scholar and Tyrwhitt Hebrew scholar. He entered the service of the British museum in 1883 and was keeper of Egyptian and Assyrian antiquities from 1894 to 1924. Budge made many journeys to the near east and, besides conducting excavations, obtained for the British museum not only antiquities but also vast numbers of cuneiform tablets, Egyptian papyri and Greek. Coptic, Arabic, Syriac and Ethiopic manuscripts. Budge was knighted in 1920, retired in 1924, and died on Nov. 23, 1934.

He published a prodigious number of books including *The Book of the Dead* (1898); *The Gods of the Egyptians* (1904); *The Egyptian Sudan* (1907); *An Egyptian Hieroglyphic Dictionary* (1920); and *By Nile and Tigris, 1886-1913* (1920), which is largely autobiographical. (W. R. D.)

BUDGELL, EUSTACE (1686-1737), English miscellaneous writer. was born at St. Thomas, near Exeter, Aug. 19, 1686. Apart from Joseph Addison and Richard Steele (*qq.v.*), he was the principal contributor to the *Spectator*. Thirty-seven papers (those marked with an X) are attributed to him. In one of them appears the unconsciously ironic sentence, "I love to shelter myself under the examples of great men": for most of his early career Budgell sheltered under the example of his cousin, Addison, and the degree of the influence is pathetically apparent. In 1710 Addison, then secretary to the lord lieutenant of Ireland, offered Budgell a clerkship; and until 1718 Budgell filled a succession of posts with considerable ability. Meanwhile, after perhaps helping with the *Tatler*, he wrote his *Spectator* papers and a few for the *Guardian*. Budgell also published a successful translation of Theophrastus' *Characters* (1714). The change in his fortunes occurred in 1718, when the duke of Bolton became lord lieutenant; Budgell quarreled with Bolton's secretary, indiscreetly lampooned him and his patron and was superseded. Too vain and indignant to be dissuaded by Addison, Budgell launched into a paper war and became increasingly irresponsible. His difficulties were aggravated by the loss of £20,000 in the South Sea bubble; he subsequently spent about £5,000 in unsuccessful attempts to enter parliament. He wrote libels against Walpole in the anti-governmental *Craftsman* and founded his own weekly, the *Bee* (1733-35), which ran to 100 numbers, many filled with vainglorious self-justification, particularly concerning the final blow to his reputation. In 1733 Matthew Tindal (*q.v.*) died and left Budgell £2,100; Tindal's nephew contested the will and circumstantial evidence suggests that Budgell may have forged it. Alexander Pope had long despised him as a "Grub Street author" and his last reference to him, in the *Epistle to Dr. Arbuthnot* (li. 378-79), is to this affair. The will was set aside

and Budgell's remaining years were spent in litigation. Finally, on May 4, 1737, after failing to persuade his illegitimate daughter to join him, Budgell weighted his pockets with stones, threw himself into the Thames from a boat and drowned. On his bureau was found a note: "What Cato did. and Addison approved, Cannot be wrong."

See T. Cibber, *Lives of the Poets*, vol. v, pp. 1-16 (1753).

BUDGERIGAR (BUDGEREGUR, BUDGERYGB, ZEBRA PARAKEET): see PARROT.

BUDGET, BUSINESS. A business budget is a financial document representing management's best reasonable estimate of the performance of a company during a definite future period. Involved are forecasts of expenditures, receipts and profits. Through the use of the budget, results of the current operations of a concern may be constantly compared with predetermined goals. By promptly applying corrective measures, management may hope to attain, if not excel, the desired rate of profit.

Budgets vary in complexity according to the nature and needs of companies. Concerns differ mainly with regard to size and variety of products, two factors that are often quite closely related. A larger company, for example, tends to manufacture a greater variety of products and therefore must keep more complicated records. To be of greatest use, the budget must be linked with the particular accounting system employed. The time period covered by the budget also varies from company to company since the period selected often is contingent upon such factors as the selling seasons, the length of the processing cycle, the methods of financing and the availability of statistics on past performance.

Budgetary control involves not only estimates but implies a plan whereby these are logically related one to the other and actual income and expense are definitely controlled in relation to the plans. Any plan of budgetary control must of necessity be closely co-ordinated with the organizational structure of the company and with the policy-making and managerial elements. Rightly conceived and administered, a budget plan is of inestimable value to the business manager. By means of the budget, responsibility is definitely fixed, a better co-ordination of all activities is assured, and a barrier to unwise expansion is established. Budgeting is not a substitute for good management. It is, however, one of the most practical and useful tools of management and accountability available, ensuring as it does considered planning before doing.

Executive support of both the principle and plan of budgetary control is absolutely essential. Indeed, unless all the executives of the company, from the chairman of the board of directors down to the least important department supervisor, are in full accord and sympathy with the principle of planning, the success of the budget is in danger. Nothing retards the success of any plan or method more than to have it known that it has only the lukewarm sympathy and support of the principal executives. A budget should not be regarded, either by those working under it or by those administering it, as restrictive in character. Budgets must be elastic and flexible to meet changing conditions. Another important principle of budgetary control is that those who are to execute plans should have a definite and active part in making them. A salesman, for example, who is asked to assist in setting his own quota is much less likely to complain about its size or to present excuses than is one who has been assigned a quota by his sales manager or other superior without previous consultation.

Regardless of the size of the organization, the number of persons affected and the nature of the business, it is essential that the procedure for budgetary control be kept as simple as possible. In order to give practical effect to the principle of operating the business in accordance with plans made, it is necessary that provision be made for frequent comparisons between estimated and actual performance. Such comparisons should be provided for at least once a month, with summaries every three months. One real danger, especially in a company's early experience with budgeting, is that estimates made will be merely optimistic hopes rather than realistic forecasts. Expenses are budgeted in relation to anticipated income. If actual income falls far short of the budget,

net profits will be reduced unless the situation is noticed in sufficient time to reduce expenses in the same proportion. Finally, it is essential that plans once made be adhered to except in cases where sound business judgment indicates that changes are desirable.

Actual responsibility for the direction of the budget plan rests with different executives in different companies. The plan under which the controller or the treasurer assumes the duties of budget supervision is by far the most widely used. Under this plan-of-organization, it is usual to find someone with the title of budget director, head of the budget department, supervisor of budgets or controller of the budget, reporting directly to the treasurer or controller. Whatever the title of the executive in charge of budgeting may be, it should be clearly understood that he is representing the head of the company in the discharge of his duties. Heads of the separate departments of a business usually prepare individual departmental budgets which are molded into a preliminary budget by the budget director. Top management officers then review and revise this preliminary budget after discussions with department heads.

The basic budget and undoubtedly the one most difficult to prepare is the sales budget, which shows both anticipated income from sales as well as quantities which it is expected will be sold. Best practice favours the separation of sales income from sales expense. In preparing the sales budget, the three fundamental factors of probable market conditions, past sales and plans and policies of the company for the coming year are used. Of these three, the first is the most difficult to deal with. A great deal of attention has been given to market analysis, both by companies themselves and by research organizations. While space does not permit of a detailed discussion of this important phase of budgeting, it should be clearly understood that a thorough market analysis must necessarily precede the preparation of a sales budget. After the sales budget has been prepared, the next step is the co-ordination of the estimated sales volume and income with other factors. In the case of a manufacturing business it is obvious that the sales estimate must be co-ordinated with the production capacity of the plant and that inventories must also be considered. Likewise, it may be necessary to make the original sales estimate conform to such factors as the ability of the company to finance the contemplated sales program, the percentage of selling expense, anticipated net profits, advertising plans, personnel available to carry out the sales estimate, etc.

While the modification of the sales budget is being carried on, but after the original sales estimate has been prepared, other executives are preparing various expense budgets. A detailed budget of selling expenses must be drawn up. The advertising appropriation or budget must be prepared. In the case of a manufacturing business, a production budget is necessary. Similarly, a budget of materials and supplies needed to fabricate the finished product, or, in the case of a department store, the amount of goods to be purchased to supply the anticipated sales demand, must be drawn up. In the preparation of this latter budget, inventory requirements, minimum and maximum quantities and turnover are given special consideration. In every business a budget of general overhead expenses, including such items as interest, taxes, general operating expenses and administrative expenses, is necessary. Similarly, a budget covering capital expenditures for additions and replacements to plant and equipment, including proper allowances for depreciation and obsolescence, is essential. Upon completion of all the budgets mentioned, the executive in charge of the budget plan prepares the master or financial budget. This budget is very largely a consolidation, by totals only, of the individual departmental and functional budgets previously prepared. In many cases, estimated balance sheets and profit-and-loss statements are prepared from the financial budget. Since the balance sheet and the profit-and-loss statement are the two accepted financial statements which summarize the past activities of the business from a financial point, it is only logical that the plans be finally put into estimated statements of the same kind. Banks throughout the United States often ask companies to which they extend accommodations to submit estimated financial statements of this kind.

BUDGET, FAMILY. The term "family budget" is used in several different ways. It may refer to a plan that families make for spending their money, recommendations made as to how families should spend their money, the money cost of maintaining a certain level of living, or the manner in which families actually spend their money. The following sections discuss each interpretation in turn.

Family Plans for Spending.—The family budget may take the form of a statement showing the family's estimated money income over a specific period of time and the estimated allocation of this income to food, shelter, clothing, savings, etc. It is an individual plan prepared by a family for its own use. The value of such a budget lies in the results obtained when a family thinks through its goals, estimates the cost of achieving those goals, and makes choices among alternative uses of money.

The budget may be a formal written plan with which a family compares its actual expenditures from time to time and evaluates results. After such evaluation a family may find it desirable to make adjustments in the plan. This type of family budget is similar to the financial statement of estimated revenues and expenditures made by a government or large private organization.

Most families do not have a written budget plan but spend their money on the basis of experience gained over a period of years. They know from this experience what they can and cannot afford to buy. They are able to satisfy their most essential needs but may not secure the greatest possible satisfaction from their income.

Recommended Family Budgets.—These are sometimes called "standard" budgets and often carry the implication that families should spend specified amounts of money for given groups of items. But they have, in fact, no scientific basis and are often biased by the agencies recommending them. For example, banks may overemphasize savings, insurance companies may attach too much importance to insurance, or food companies may stress too much the allocation of money to food.

Recommended family budgets are set up in very general terms, usually indicating the percentages of family income to be spent for food, housing, clothing, miscellaneous items and savings. They are often based on size of income only, although some make adjustments for size of family. They cannot take into consideration the specific needs or desires of individual families, and as a result most families find them of little or no help in planning expenditures. They may actually deter planning since families that try to follow them find them so unsatisfactory that they give up any kind of budget planning.

Cost-of-Living Budgets.—These budgets are not plans for spending the family income but are lists of the quantities of specific commodities that are considered desirable for a given type of family. They are set up for given occupational groups, such as wage earners, families dependent on professional employment and the like. They assume a family of a given size and composition living in a specific area at a given time. The standard of living appropriate to the family is also taken into consideration. The cost of the budget is determined by pricing the commodities and services in the locality for which they are set up. They are frequently called "commodity-quantity" or "quantity and cost" budgets.

Social welfare agencies may use such budgets to determine the amount of assistance required by individual families. These budgets are also used to determine minimum wages required by law. Others are used to measure changes in the cost of living from time to time.

Family Budget Surveys.—Surveys of how families spend their money are sometimes referred to as family budgets. In reality, they are expenditure or consumption studies. Information is obtained from groups of families or from representative families. Such budgets show how much families spend for specific types of items and sometimes the quantities of specific goods purchased over a given period of time. They may be determined for families

at various income levels, for families of different sizes and in different occupational groups and for those living in specific areas. Expenditures are expressed in the monetary unit of the country or as percentages of total expenditures or of money income. These studies may be used to estimate adequacy of consumption of such items as food, to determine levels of consumption achieved by families or trends in consumption, or as a basis for devices used to measure changes in prices.

(J. V. Co.)

BUDGET, GOVERNMENTAL. As commonly understood, a budget is the forecast by a government of its expenditures and revenues for a specific period of time. In national finance, the period covered by a budget is usually a year, known as a financial year or fiscal year. In the United States the fiscal year for the federal government starts on July 1 and in the United Kingdom it begins on April 1, a date that has been consistently used since 1834. In general, the date on which the fiscal year begins is determined largely by administrative convenience.

The word "budget" is derived from Old French *bougette*, "little bag." The British chancellor of the exchequer, when he makes his annual financial statement, is said to "open" his budget or receptacle of documents and accounts.

A budget is not solely a matter of finance in the narrow sense. Budget policy is an important part of a government's general economic policy. In many countries a great increase in government expenditure began before World War II. Moreover, the importance of the effect of governments' transactions upon the rest of the economy is now more widely recognized. For these reasons the budget is generally regarded as the occasion for a review of and debate upon the country's economic situation as a whole.

(E. E. Bs.)

UNITED STATES

Foundation of the National Budget System.—The budget system of the federal government rests on the Budget and Accounting act of 1921. Adoption of this law was preceded by more than a decade of civic agitation for budgetary reform on all governmental levels. When in 1918 congress turned to an examination of the reform program, state and local governments had already begun to derive tangible benefits from the new approach. Moreover, wartime expansion of federal activities and the sharp rise of the national debt gave sound budgeting an increasing national importance. The Budget and Accounting act not only furnished a statutory basis for improved fiscal procedure but was equally significant for two other reasons: (1) By equipping the president with a special agency—the bureau of the budget—for preparing an integrated plan of financial estimates, the act helped to restore the chief executive to his proper role and reversed the former trend toward departmental self-determination. (2) The act recognized the budget process as a device for attaining better administrative management as well as fiscal planning and control. The bureau of the budget was specifically authorized to make studies of the organization and operations of the executive branch.

Under the Budget and Accounting act, the director and the deputy director of the bureau of the budget are appointed by the president without senate confirmation. Both officers serve at the president's pleasure. Although a staff agency of the president and operating by his direction, the bureau, in consequence of a legislative compromise, was originally placed in the treasury department. In 1939 the bureau became part of the new executive office of the president.

Role of the Bureau of the Budget.—The bureau's transfer to the executive office of the president gave it greater institutional strength. The shift was accompanied by a marked increase in size. As the largest staff element in the president's executive office, the bureau came to exert growing influence in the general management of the executive branch as well as in the exercise of budgetary control. It fostered close working relations with the programs and activities of all federal agencies. These relations were not confined to co-operation with agency budget officers and other staff personnel; they extended also to agency heads and their subordinate line officials. Nor were the bureau's contacts restricted to control functions. Its staff not only gave attention to departmental pro-

gram planning but also served on interdepartmental committees. In addition to independent review of agency operations, the bureau rendered direct assistance to federal agencies in joint analysis of their administrative and technical problems, in the field as well as at headquarters. For ten years, until 1953, the bureau maintained four small regional offices. Thereafter the bureau's field examination activities were carried on from Washington.

The bureau's work is divided to deal with several functions: (1) budget review (including fiscal analysis) centred upon the bureau's budgetary tasks, especially the formulation of the president's budget proposal for transmission to congress as the federal government's annual work plan, preparation of the president's budget message, together with a concise report called "the federal budget in brief," and co-ordination of budgetary control; (2) legislative reference, which involves the analysis of agency views on proposed legislation and of congressional enactments coming up for the president's signature, both in relation to the president's program; (3) management and organization, concerned with preparation and execution of plans for improving the organization, management and operating methods of the executive branch, dissemination among the federal agencies of information conducive to this end and consultative assistance to them; (4) statistical standards, focused on planning and promoting the improvement and co-ordination of statistical information and statistical and report-collecting services in and for the federal government, including control over agency demands for information to be made on the public; and (5) accounting, looking toward attainment of effective financial management in all agencies. Bureau-wide attention is given these functions by five offices. As the bureau's main arms in dealing with the individual federal agencies, five divisions have responsibility for defined segments of the government's program: military, international, commerce and finance, labour and welfare and resources and civil works.

The Budget Process.—The making of the annual budget divides itself into several stages:

1. After discussion of the budgetary outlook in the cabinet in the early spring, the director of the bureau of the budget informs the federal agencies of the president's budget policy, gives the larger agencies, upon consultation with their heads, target figures within which to plan their budget and then calls for estimates of appropriations. The call for estimates, containing detailed prescriptions for their presentation, goes out each June for the fiscal year beginning more than 12 months later (July 1). Special emphasis is laid on meaningful description of programs and activities and on work load data and operating standards.

2. Upon receipt of the bureau's call, each agency's budget officer, as staff aide to the head of the agency, requests the chiefs of bureaus and divisions to submit their estimates to him. The extent and procedure of internal review are left to the individual agency, but scrutiny, from the lower levels to the highest, is usually extensive. By the end of September the estimates and their justifications are before the bureau of the budget.

3. Preliminary study of the estimates by the bureau's budget examiners is followed by hearings for the individual federal agencies, held in the bureau informally by staff teams of the divisions. The hearings, which may last more than a week for a large department, give opportunity for oral clarification by agency representatives of all matters on which doubts have not been resolved by the written justifications. After each hearing, recommendations are formulated for discussion with the director and a review group of his principal advisers.

4. The director and his review group examine the recommendations made by the divisions. Because the proposed budget is the president's and not the product of the federal agencies, presentation of the estimates of the individual agencies, as revised in the previous hearing, is at this stage entrusted to each division.

5. When approved by the director, where desirable upon further conference with the agency head concerned, the estimates, together with a memorandum giving the high lights, are placed before the president for his consideration and sanction. Although currently informed of emerging issues by the director, the president may have reason to direct further changes. His final decisions are

communicated by the director to the agencies.

6. At the beginning of the legislative session early in January, the proposed budget, accompanied by his budget message, is transmitted by the president to congress. The budget message, usually followed by a separate economic report from the president to congress, outlines his financial program and its effect on the economic life of the nation. Next, the appropriations committee of the house of representatives, acting through its subcommittees, studies the expenditure proposals in the light of such guidance as congress may provide. The subcommittees hold hearings, taking testimony of officials and interested groups. Subcommittee recommendations are in the form of appropriation proposals supported by printed reports. These reach the house through the appropriations committee for debate and action. Senate procedure is similar. Differences between the two chambers are reconciled through conference of members of the two appropriations committees. The final appropriation act is returned to the president, who has the power to veto an act as a whole but not specific items in it. With minor modifications, supplemental and deficiency estimates are handled in the same manner.

7. After congress thus has taken action, the bureau of the budget prepares for the president an analysis of the outcome, known as the midyear review. The midyear review summarizes the financial determinations made by congress in comparison with the president's budget proposal, actual expenditures for the completed fiscal year and revised forecasts for the new fiscal year.

Study of agency estimates enables the bureau of the budget to identify not only weaknesses in budgetary requests but also duplication of effort, inconsistencies in programs and inadequacies of organization and management. Such identification of matters in need of special attention usually leads to arrangements with the individual agencies for attaining greater economy and efficiency, in co-ordination as well as in the conduct of specific operations.

Execution of the Budget.—While the intensive effort required for the preparation of the president's budget proposal culminates in the so-called budget season from the end of September to the end of December, execution of the budget goes on day by day, spanning the entire fiscal year. Two main devices are used for budgetary control:

1. Specific information about the progress of agency spending is obtained through a government-wide system of financial reporting. Agencies must furnish reports on the status of their appropriations and funds at least quarterly and in most cases monthly. These reports indicate not only the amounts of current appropriations available for obligation and for expenditure but also balances on previous appropriations which have not yet reverted as unexpended funds to the treasury department. Expenditures and obligations must be shown separately, and both must be reported on a gross basis. Special provisions apply to government corporations and enterprises managed along commercial lines. In order to obtain further refinement of the entire reporting system, the treasury department, the bureau of the budget and the general accounting office in 1948 joined forces in a longer-range study project, which also aimed to improve the accounting and auditing procedures applied in the federal government. Desirable legislative changes were put into effect by the Budget and Accounting Procedures act of 1950. Further improvements in budgeting and accounting were adopted by congress in 1956 and 1958.

2. The bureau of the budget apportions the amounts appropriated by congress on an annual basis for use by the federal agencies. Apportionments are made at the beginning of the fiscal year, generally for all of the ensuing four quarters. If conditions necessitate it, apportionments may subsequently be revised. Should an agency prove able to carry out its program at lower cost than was assumed in the appropriation, or should changing needs and similar factors cause a reduction in its program, reserves may be established by the bureau of the budget to withhold the funds no longer required. Unless new circumstances warrant a restoration of these amounts to an agency, reserves have the effect of reducing the appropriation available to the agency for obligation or expenditure.

Accounts and Audit.—The Budget and Accounting act of

1921 not only laid the foundation for the federal budget system but also provided the legal framework for a unified control over departmental accounts and for a government-wide audit. The act created an independent general accounting office headed by a comptroller general. The comptroller general and the assistant comptroller general are appointed by the president, with the advice and consent of the senate, for terms of 15 years. Each may be removed only for specified statutory reasons. The comptroller general is not eligible for reappointment upon expiration of his term of office. Activities in the general accounting office are distributed among several offices and divisions. Much of the work is done in the field.

All claims by and against the United States government and all federal accounts are settled and adjusted by the general accounting office. It is the duty of the comptroller general to prescribe principles for departmental accounting. Under the Budget and Accounting Procedures act, he approves the accounting systems used by the federal agencies. Upon request by other federal officials, he renders advance decisions on questions involving payments to be made. At the beginning of the legislative session he submits a report to congress on the work of his office; this may contain recommendations for legislative action aimed at greater economy and efficiency. (See also DEBT, PUBLIC.)

State and Municipal Budgeting.—Influenced by the same reform pressures that brought about the Budget and Accounting act, state and municipal governments tended to adopt budgetary practices similar to those of the federal government, with county governments generally lagging far behind. Despite variety in detail, some fairly common characteristics of state and municipal budgeting stand out in comparison with the federal fiscal system:

1. Budgets often fall short of being comprehensive financial plans because they omit various important revenues and expenditures, especially those set aside for particular purposes.

2. Greater attention is given to separating capital outlay from operating cost, but satisfactory capital budgeting is rare.

3. In most states the governor's budgetary responsibilities are broadly identical with those of the president, but in the other states these responsibilities are shared in varying degrees by the legislature. On the other hand, in almost every state the governor has the power, denied the president, to veto specific items in appropriation bills passed by the legislature.

4. Local budgeting in many jurisdictions is under some form of state control, which may result either in reasonable standards or in undesirable restrictions.

5. Executive-legislative relationships in the budget process are usually closer than in the federal government. They have become particularly effective in municipalities operating under the council-manager plan, where a small council having the confidence of the community at large looks upon the budget, like the city manager, as a municipal program conceived in the general interest.

UNITED KINGDOM

In the United Kingdom, as noted above, the financial year begins on April 1. The established practice is for the chancellor

of the exchequer, as soon as possible after that day, to make to the house of commons a budget speech giving a report of the previous financial year as shown by the exchequer (*q.v.*) accounts, the estimated expenditure for the new year, the estimated revenue on the basis of existing taxation and the changes, if any, which he proposes by way of reduction or increase of taxation. By the middle of the 20th century it had become usual to associate with that statement an economic survey reviewing the general economic position of the country and White Papers on national income and expenditure and on the balance of payments, giving the latest statistics for the national economy as a whole. These three publications, together with the financial statement (which is issued immediately after the chancellor's budget speech elaborating the details of expected revenue and expenditure and proposed changes in taxation), provide the background for the debate that follows the speech. The budget speech is one of the central events of the parliamentary year and often provides the opportunity for announcing important changes in financial and economic policy. It is anxiously awaited by industry and commerce and, above all, by the ordinary citizen.

The basic financial principle of the British budget is that all expenditure of the government is met from the exchequer (subject to certain modifications indicated below) and must be provided out of revenue, except where parliament has specifically authorized the treasury to borrow money to meet it. The budget proper deals with the raising of this revenue. Unless parliament otherwise determines, any surplus of revenue over the expenditure at the end of the financial year must be applied to reduction of the national debt; and any deficiency must be made good out of revenue in the following year. In wartime, when expenditure heavily exceeded revenue, parliament gave the treasury authority to borrow to meet the deficiency. After World War II parliament twice (in 1946 and 1947) provided that a deficit incurred in the previous year should be met by borrowing. The rule that all expenditure must be met from the exchequer is in practice modified to the extent that specified amounts of receipts accruing to departments (*e.g.*, fees for services to the public) are allowed to be "appropriated in aid" (*i.e.*, used by them toward meeting their expenditure), thus reducing the demand on the exchequer. Similarly, in the case of continuing trading services where there is no complicating question of a subsidy, receipts from sales are set off against expenditure, the net deficit (if any) being provided from the exchequer and any surplus of receipts being paid into the exchequer. Again, there are certain special funds set up by statute to finance such services as national insurance and industrial injuries insurance. The exchequer contributes to these funds but does not provide the whole of their income.

Before World War I the British budget was comparatively simple. Expenditure varied little from year to year. Expenditure on the telephone system, on certain new public buildings and on other capital projects was provided for by advances outside the budget largely from the growing deposits in the Post Office Savings bank, such advances being repaid by means of annuities chargeable, over a period of years, as expenditure inside the budget. The main budget decisions were: how much surplus should go by way of sinking fund to reduce the national debt and what tax remissions should be made or, alternatively, what new taxes should be imposed? The treasury had no permanent borrowing power in normal times, and any budget deficit was regarded as a temporary shortage to be put right by subsequent increased taxation.

After 1914 there were great changes in the scale and pattern of state revenue and expenditure (for example, ordinary expenditure in 1959-60 was more than 25 times as great as in 1913-14). There was also developed, particularly during and after World War II, a wider conception of budget policy, taking account of economic forces and trends to a much greater extent than formerly.

The wider functions falling to the state meant that much more of its expenditure was of a capital or extraordinary nature, which it would be generally impossible and often quite inappropriate to attempt to cover fully by current revenue. Examples mere: loans to finance nationalized undertakings, loans to local authorities for postwar housing, and war damage payments. In such cases parlia-

ment gave the treasury power to borrow to meet the expenditure and the national debt was correspondingly increased. In due course repayment of advances made for these purposes was used to reduce the national debt. These transactions were called "below the line"—the line being an imaginary one across the exchequer accounts dividing the transactions for which parliament had authorized the treasury to borrow from those "above the line," which were to be met from revenue.

The great increase in the scale and extent of government activity made the budget play a different and more important part in the general economy of the country. For example, by the middle of the 20th century expenditure by the government on goods and services for current purposes was absorbing more than 15% of the total national product. Other current expenditures, such as debt interest, subsidies and social-service benefits, did not represent a direct claim by the government itself upon national resources, since they represented transfers of income from one set of people to another within the economy. Nevertheless, they had to be provided for in the budget and had an important influence on expenditure in other sectors of the economy. The total of current government expenditure, including such payments, was an amount equal to about one-third of the national product. In 1938 the comparable proportion had been about one-fifth. Since that time government revenues had grown in roughly similar proportions.

It was then no longer possible to regard the government's accounts as a self-contained entity, or for the government to aim at balancing its budget without regard to its effect upon the level of economic activity and the balance of payments. In 1944 the wartime coalition government published a White Paper on employment policy, in which it accepted responsibility for ensuring, as far as possible, that employment remained at a high and stable level; and it recognized that in this the budget had a part to play. The budget speeches of successive chancellors of the exchequer during and after World War II reflected these wider preoccupations. The current economic situation is described and the immediate prospects for production, employment and the external balance of payments are reviewed, to show how fully the country's productive resources are likely to be employed in the year ahead. The appropriate levels of taxation are decided against this background. Thus, for example, when demand is in danger of outrunning the productive resources available to meet it, rates of taxation may be consciously maintained at a high level in order to restrain private expenditure (*i.e.*, expenditure other than that of the government) and to keep supply and demand in balance; or, when it appears that demand is likely to be deficient in relation to the productive capacity of the economy, tax reductions may be made in order to maintain employment and to promote continued economic expansion.

Preparation of the Budget.—It is a fundamental principle of British finance that all proposals involving expenditure require approval by the treasury. The seeking of this approval is a continuous process, the various government departments approaching the treasury with reasoned requests to sanction additional expenditure. When doubtful points have been cleared up, the treasury either authorizes or refuses to accept the proposals in whole or in part. If any difference of opinion persists between the treasury and the department concerned, it must be resolved between the ministers concerned or, in the last resort, by the cabinet.

In conformity with that general principle, the treasury plays a special part in the preparation of the annual estimates of expenditure, for which parliamentary approval is sought. On Oct. 1 of each year the treasury sends a circular to the civil and revenue departments calling for their estimates of expenditure for the following financial year. These estimates are examined by the treasury and important policy decisions are referred to ministers. After approval by the treasury, the estimates are presented to parliament in February (*i.e.*, well before the budget speech) by the financial secretary to the treasury and, although they are not formally approved by parliament for several months, the expenditures represented by them figure in the coming budget.

A rather different procedure applies to the estimates of the defense departments, where much of the proposed expenditure is di-

rectly determined by cabinet decisions on the future size and shape of the armed forces. Treasury approval is required for the defense estimates, but they are presented to parliament by the service and defense departments and not by a treasury minister.

The above procedures cover "supply" expenditure (*i.e.*, expenditure voted annually by parliament). The remaining component of ordinary (*i.e.*, "above the line") expenditure is the treasury's assessment of the sums needed for consolidated fund charges. These charges are not voted annually but rest upon specific statutory authorities which remain in force until parliament determines otherwise. Such charges include the service and management of the national debt; payments to the Northern Ireland exchequer; the civil list (*q.v.*); and salaries and pensions of the speaker of the house of commons, the judges, the comptroller and auditor general and others whose special position is emphasized by the fact that their salaries do not have to be voted and discussed annually. The estimated amount of the consolidated fund charges is given in the budget speech.

On the revenue side the boards of customs and excise and of inland revenue, which collect the bulk of the taxes, furnish the treasury with the estimates of receipts, first on the existing basis of taxation and later on the basis of any changes which the chancellor of the exchequer may be considering. To these must be added the estimated receipts from motor vehicle duties and from broadcasting licences; the net receipts of the post office; and the receipts from certain loans originally charged against revenue and from miscellaneous revenue.

With this material, the chancellor can estimate whether, on the basis of existing taxation, he will have an "above the line" surplus or deficit and can begin to consider how far he can afford to reduce taxation or whether he should increase it. He must also take account of the expenditure to be met "below the line" (*i.e.*, that for which parliament has authorized the government to borrow) and of the extent to which he can reasonably cover it by borrowing. He must consider the likely trends of the economy generally for the coming year and whether stimulus or increased restraint is needed. He has to make an assessment of the economic position—the trends of the overseas balance of payments, of home production and of the demand for goods and services (both public and private)—in fact a balance sheet of the nation's (not only the government's) income and expenditure.

Having decided broadly whether he intends to increase or reduce taxation, the chancellor will of course be influenced by many factors in choosing which particular changes to make. He may seek to strike a different balance of burdens within the community, or single out for special treatment some particular purpose (such as increased industrial investment or greater economy in imported goods) which can be directly affected by tax changes; or again he may wish to offer a general incentive to increased effort (for example, by reduced rates of income tax).

Parliament and the Budget.—Instead of being embodied formally as a complete scheme in a budget bill, the British budget is merely explained to parliament by the budget speech. Parliament is called upon subsequently by votes and an appropriation act to authorize part of the estimated expenditure—the supply charges—and by resolutions and a finance act to assent to such changes in the law as may be needed to give effect to the revenue proposals.

At the beginning of each session the house of commons sets up two financial committees—the committee of supply and the committee of ways and means. Each is a committee of the whole house, sitting under a chairman instead of the speaker. According to Sir Reginald Palgrave, clerk of the house from 1886 to 1900, "the exclusion of the King's emissary and spy—their speaker—was the sole motive why the Commons elected to convert themselves into a conclave called a committee, that they might meet together as usual, but without his presence." The speaker is no longer, if he ever was, an emissary and spy of the sovereign, but the practice continues. The committee of supply considers the votes (*i.e.*, financial provision) required, as shown in the estimates, for the service of each department. The main function of the committee of ways and means (apart from formal approval of the issue from the exchequer of the money to meet expenditure ap-

proved by the committee of supply) is to consider proposals for changes in, or the renewal of, taxation. All resolutions of both committees have to be reported to and agreed upon by the house.

The committee of supply, when considering the estimates of expenditure, can vote the grant proposed, or reduce it: or reject it, but cannot increase it or annex a condition to it or alter its destination. The house will vote money only on a recommendation from the crown, signified through a minister. If it desires to increase a vote, this can be done only if the government is willing to introduce a supplementary estimate or to replace the original estimate by a new one. It is, however, very exceptional for discussions in supply to result in any change in the original estimates. A select committee exists to examine what economies can be effected consistent with the policy implied in the estimates; but its approval is not necessary before the committee of supply is asked to pass them.

Parliament has little time before the end of the financial year on March 31 to consider the estimate of expenditure for the coming year. The house is therefore asked, in the case of the civil and revenue departments and the ministry of defense, to vote an aggregate sum "on account" and, in the case of the service departments, to pass for each service certain selected votes which will provide funds sufficient to cover expenditure for four or five months until the full program of grant and appropriation can be completed. Votes on account may not be used for new services—that is, services which have not previously been sanctioned by parliament. Statutory authority is given by a consolidated fund act, which must be passed by the end of March. The act also covers supplementary estimates presented late in the year which is ending, as well as excess votes (*i.e.*, excesses of expenditure authorized after scrutiny by the public accounts committee).

The taxation proposals made by the chancellor of the exchequer on "budget day" are made and discussed in the committee of ways and means. Immediately after the budget speech: the budget resolutions are introduced to give effect to the scheme of revenue proposed. In general, taxes rest upon continuing statutes: but one tax (the income tax with its surtax) is voted for one year only, in order to ensure that taxation proposals are brought within the purview of the house every year, even though there might be no budget changes in respect of them. Under an act of 1913, budget resolutions varying or renewing taxes have statutory effect for a period of four months. Thus the budget proposals have immediate effect, provided that they are confirmed by a statute (the finance act) within that period.

The budget speech is followed by a debate of several days' duration, ranging over the whole field of financial and economic policy. Thereafter, the finance bill is introduced, reimposing the annual taxes and giving effect to any changes in taxation proposed. This is fully debated and considered in detail and must reach the statute book within the four months allowed for the validity of the budget resolutions.

Concurrently, the house considers the estimates in committee of supply. A limited number of days before Aug. 5 are allotted for the purpose of discussing all supply business, the choice of subjects resting with the opposition. The grants requested in the estimates: after process through committee: must be confirmed by a further consolidated fund bill, which when enacted becomes known as the appropriation act. With the passage of the finance act and the appropriation act, the budget receives the full sanction of law.

Under the provisions of the Parliament act, 1911, a "money bill" (broadly, one concerned solely with taxation or charges on the exchequer) cannot be amended by the house of lords and may become law without the lords' consent if they have not passed it within one month of its leaving the house of commons. The certificate of the speaker of the house of commons is required to a money bill, and all consolidated fund bills and many finance bills are so certified. Thus the house of lords, while it debates each budget, has no effective say in its authorization.

There may be years when circumstances change so rapidly that a second budget is needed in the autumn, revising taxation for the remainder of the financial year. For example, there were autumn budgets in 1945—after the end of World War II—and in 1947 and

1955—to deal primarily with inflation. In 1952 the budget was opened early in March in order to make an early contribution to the balance-of-payments crisis.

The house of commons requires to see whether the budget proposals work out according to plan. The collection of revenue and (subject to the authority of the ministers concerned) the expenditure on public services are in the hands of officials whose operations are subject to control and audit on behalf of the house. This audit is carried out by the comptroller and auditor general, a high officer of parliament, appointed by the crown and independent of any minister. He is required to make a test audit of the revenue receipts, to audit the accounts of expenditure of each department and to report to parliament any irregularities or other matters of interest arising out of the account. It is also his duty, as comptroller, to authorize all issues of moneys out of the exchequer to the spending departments in order to ensure that no such issues are made without parliamentary authority. His annual reports are laid before the house and referred to 'the public accounts committee, which summons before it the accounting officer of each department and officials of the treasury and other departments for such explanations as it may desire. Any recommendations made by the public accounts committee are communicated to the treasury for consideration. The house has the opportunity to debate their reports and those of the estimates committee on three days, one of which is provided in government time, the other two being allotted supply days.

There is in the United Kingdom no formal act of parliament to close the accounts of the year. The exchequer account, a straight-forward cash account, is made up for the year at the close of business on March 31 and published that day. The accounts of departments audited by the comptroller and auditor general are called appropriation accounts and are published several months after the end of the financial year. As a general rule they include all orders for payment drawn on or before March 31 whether or not they were cashed within the year. Periods between three and six months in the case of different departments are allowed for the purpose of including all belated encashments of orders and agency transactions between departments. When the appropriation account is closed, any further receipts or payments, even if related to the past year, are included in the accounts of the year in which they actually occur. (E. E. Bs.; F. G. I.,)

CANADA

In Canadian parliamentary practice, the budget is the annual statement of accounts and financial requirements presented to parliament by the minister of finance when he makes his proposals regarding changes in taxation and other measures to provide for financing during the fiscal year (which in Canada begins on April 1). Generally, similar practices are followed in the various provincial legislatures.

The expenditure side of the Canadian budget is presented separately to parliament in the form of estimates. The main estimates are normally introduced about the beginning of February. Under the constitution, only the government may propose any expenditure to parliament. These estimates take the form of several hundred "votes," each of which must be separately approved by the house of commons, sitting as the committee of supply—a committee of the whole house. Certain estimates (usually including those for external affairs) are referred to one or another of the standing committees of the house, but, generally speaking, there is relatively little discussion in parliamentary committees of the details of estimates or of the public accounts after expenditures are made, as compared with the practice in the United States and the United Kingdom. Discussion in the committee of supply on estimates normally concerns either matters of policy relating to them or particular grievances related to the service concerned, rather than matters of administration.

The estimates are prepared initially by the various departments of government under the direction of the ministers responsible for them. Each minister forwards his estimates to the treasury board, which is a committee of the cabinet established by law. The staff of this board, provided by the department of finance, examines

and criticizes the proposals in the light of general government policy and also from the standpoint of economy and efficiency. The treasury board considers the proposed estimates, together with the comments from the department of finance and information and arguments furnished by the department concerned, and it then determines what will be submitted to parliament. The cabinet as a whole settles any major questions of policy or matters on which the treasury board cannot reach agreement with the ministers concerned and gives the necessary final approval to what will be proposed to parliament.

The budget proper, including as its main elements the proposals for tax changes, is normally presented to parliament after the main estimates, often in late March or April, close to the beginning of the fiscal year to which it will apply. The budget is very largely the personal responsibility of the minister of finance, assisted by his department and by the minister of national revenue and his senior officers, but it must be approved by the cabinet before presentation to parliament. For months before presenting the budget the minister of finance and his senior officers concerned with tax matters receive many proposals and representations from the public and study these together with the financial requirements and suggestions from officials.

It is the practice to present the revenues and expenditures of the past financial year and the forecasts and proposals for the new year against a broad background of economic conditions and analysis, relating policy in the field of public finance to economic policy in general. To make this possible without too long a speech, it is usual to present the details in the form of a printed White Paper containing in one part the figures of government revenues, expenditures, assets and liabilities and in another a review of economic statistics and other facts. In the analysis of the financial results of the past year and the requirements for the future, account is taken not only of budgetary revenue and expenditure proper but also of public debt transactions and other receipts and disbursements, including payments giving rise to certain types of liquid or interest-bearing assets.

In concluding the budget speech, the minister moves that the house of commons constitute itself a committee of ways and means to consider resolutions, which he thereupon tables, summarizing the substance of his tax proposals. These resolutions must be approved by the house before the bills embodying the actual changes in the tax laws are introduced. A general debate on the budget as a whole, which normally covers a wide ground, follows the motion to go into committee of ways and means; subsequently there is a debate on the individual resolutions concerning particular tax changes and finally a more technical discussion on the bills themselves. When approved by the house of commons, the bills then go to the senate, where they are usually handled with expedition and due respect for their character as money bills, for which the lower chamber accepts special responsibility.

The over-all size of the Canadian budget was greatly influenced by World Wars I and II and the economic and social changes that accompanied them. In 1914 the total of expenditures provided for in the budget was about \$180,000,000; in 1924 it was about \$440,000,000; by 1939 it had grown to \$550,000,000; at the peak of the war in 1943 it was \$5,500,000,000; by 1947 it was down to a postwar low of \$2,100,000,000; and by 1961 it was up to \$6,415,000,000 plus an additional \$607,000,000 payable out of a special fund for old-age security pensions into which certain earmarked taxes were placed.

Prior to World War I budget deficits were frequent, but surpluses were the general rule during the prosperity of the 1920s. In the 1930s deficits were reluctantly accepted as a consequence of depression and, during the war, as a necessity to be minimized by a "pay as you go" policy. From 1947 through 1954 budgetary surpluses were usual, because of the rapid growth of the economy and varying degrees of anti-inflationary fiscal policy.

BRITISH COMMONWEALTH AND EUROPE

Many features of the United Kingdom's fiscal system, described above, are also found in other countries. The similarities are, understandably, greatest in the independent countries of the British commonwealth whose constitutions and administrative apparatus were to a large extent modeled on that of the United Kingdom. The differences are most marked in countries which have a federal as against a unitary system of government or have been greatly influenced in their administrative arrangements by the doctrine of the separation of powers. Even in commonwealth countries, however, there are important variations in practice. Budget making—in the sense used here, the raising of revenue and the authorization and control of public expenditure—lies at the heart of all government, and the methods of each country are bound to be profoundly influenced by its constitutional, parliamentary and economic development.

In what follows the chief characteristics of fiscal and budgetary practice outside the United Kingdom are analyzed on the basis of the experience of a selection of countries. (For Canadian practice, see the separate section *Canada* above.) The main questions considered are the timing of the budget in relation to the financial year; the administrative and parliamentary processes necessary for its passage into law; the form and structure of budgets; the purposes they are designed to serve; the methods of control over expenditure and revenue; and the system of accounting and scrutiny of accounts.

Financial Year and Date of Budget.—The financial year is usually chosen from one of three periods: from April 1 to March 31 (*e.g.*, in India); from Jan. 1 to Dec. 31 (*e.g.*, in France, the Federal Republic of Germany and Switzerland); and from July 1 to June 30 (*e.g.*, in Australia, Italy and Sweden). The financial year largely determines the date of introduction of the budget, though in some countries it comes before, in some after, the beginning of the new year. In Australia the normal date is sometime in August; that is, more than a month after the financial year has begun. In India, on the other hand, the central budget is normally introduced toward the end of February. On the continent of Europe the usual practice is to present the budget, whatever legislative form it may take, well in advance, so that it may be passed into law before the new year begins. This interval may be long; in Sweden, for example, where the financial year begins on July 1, the budget is normally introduced in the second week of January.

Legislative Framework and Parliamentary Procedure.—Countries which separate the procedures for examining and authorizing government expenditure from the procedures involved in raising revenue may here conveniently be distinguished from countries where the two sides of the budget account are considered by the same bodies and at more or less the same time.

The method of separation, which is that of the United Kingdom, is followed with variations by most independent countries of the British commonwealth. In Australia the estimates appear at the same time as the budget. The estimates are first referred to a committee of supply and after being voted are embodied in appropriation bills which subsequently receive legislative sanction. In India the practice is somewhat different, since the estimates are set out in the budget itself. Even there, however, the first stage, following a general discussion, is the voting of demands by the lower house of the legislature, after which the votes are incorporated in an appropriation bill which is debated in the ordinary way. The voting of revenue in the independent commonwealth countries is on lines analogous with those of the United Kingdom. The principal changes in taxation will normally be outlined in the budget speech of the minister of finance or treasurer and voted as a series of resolutions. Together with more detailed amendments of the taxation laws they will then be included in either one or more bills and subsequently debated. In Australia taxation proposals are given effect in a series of bills; in India, on the other hand, changes in the existing taxation law are enacted through a single finance bill, but proposals for new types of taxation are enacted through separate bills in each case.

On the continent of Europe the budget proposals normally take the form of a bill in which details both of expenditure and of the

revenue proposals to meet it are set out at the same time. The general practice is for the bill to be considered by a budget or finance committee, which then reports to a chamber of the legislature. This is the course followed in France (where the bill is first considered by a parliamentary committee, which then reports to the national assembly), in Sweden (where the bill may ultimately be passed on a combined vote of both chambers) and in Italy (in which case the budget measures take the form not of one but of a number of bills each of which deals with a separate department).

In Switzerland the budget proposals of the federal council (or cabinet) are considered first by a joint commission of both chambers and then by the finance committee of each chamber, which reports through its chairman to the whole chamber. Each chamber votes separately, and the budget is continually referred back and forth until agreement is reached. This procedure is similar to that applied to other bills; both chambers are equally competent in financial matters.

In several countries, as in the United Kingdom, provision is made for the voting of funds on account to permit the business of government to be carried on if the passage of the budget is delayed. Thus in India a vote on account is passed to provide the executive with funds when it is not possible to complete all stages through which the budget must pass before the financial year begins. In France, under a new procedure introduced at the beginning of 1959, if the finance bill has not been approved within the time limit established in the constitution (70 days after the submission of the bill) the budget may be brought into force by decree. In Italy a provisional budget for four months may be approved as from the end of the previous financial year, based on the new finance bill. Most countries also have arrangements for granting supplementary estimates during the financial year.

Form of the Budget.—Subject to the minor qualification already noted (under which orders for payment drawn by departments before March 31 are included in the appropriation accounts, whether or not they were cashed before that date) the budget accounts of the United Kingdom are cash accounts in the strictest sense. This system in its unqualified form is to be found also in India and Australia. Some countries, however (*e.g.*, Canada), work on a modified cash basis.

On the continent of Europe and in some other countries the budget accounts are drawn up on an income-and-expenditure rather than on a cash basis; in other words, they include all income receivable in a particular year, as well as all expenditure appropriated for that year. Mention should be made here of a distinctive feature of the Swiss budget. Though the accounts presented to the parliament are formally on the basis of estimates of income and expenditure, in fact the scope for variation on both sides of the account is strictly limited, since the sources of the federal government's revenue are laid down in the constitution and can be varied only by means of emergency decree or of special tax laws which are subject to referendum. The budget, therefore, is based on an estimate of income from predetermined sources against which are set details of expenditure restricted to conform as far as possible with the available income. There are two other important variations in the form of the public accounts of different countries. In some, all government receipts and expenditures are concentrated in a single account or fund; in others, more than one fund will be kept—in some cases many more. Further, some countries make no distinction between capital and current items in their accounts; others draw a fairly sharp distinction.

In Australia, in addition to a consolidated revenue fund, there are two other accounts—the loan fund and the trust fund. The distinction between these and the consolidated revenue fund does not correspond strictly to the distinction between current and capital already mentioned. Much capital investment is in fact financed from the revenue fund; the loan fund itself is confined to those expenditures which are financed by borrowing by the commonwealth government and the states. Contributions from the revenue have been made to the loan fund to assist the borrowing programs of the Loan council. India draws a sharp distinction between its revenue budget and capital budget.

Practice on the continent of Europe varies widely. The French

long made no distinction between current and capital in their budget, but did so for the first time in the 1960 budget. In Italy the general budget is divided into two categories, "effective receipts and expenditure" and "movement of capital." But effective expenditure includes most of the government's capital outlays, movement of capital being confined to direct loans and advances to private industry or local authorities and to special funds for the financing of industry and, on the receipts side, mainly to government borrowing. In Sweden the capital budget constitutes a plan for state investment during the fiscal year, and an annual program is drawn up for each of the ten funds of the trading enterprises and spending agencies controlled by the government. Capital investment by the state came to play a large part in the national investment of most countries—not only the relatively new and undeveloped ones (*e.g.*, Australia and India) but also the more developed such as France (where in the late 1950s capital investment by the state amounted to about 24%).

The Budget as an Instrument of Economic Control.—Traditionally the budget is a fiscal machine for raising revenue to meet authorized government expenditure. By the 1960s some countries continued to regard it only in this light. Others had come to look upon it also as a balancing factor in the national economy, designed to serve broader economic ends such as eliminating inflation or preventing trade depression, securing a large volume of investment, or correcting balance-of-payments difficulties. In France, as already noted, the budget is used as a major instrument in the national investment plan and also in an attempt to secure a greater balance in the economy; this was well demonstrated in 1959 when the important program of economic reform was based to a large extent on budgetary measures. In Italy and Germany, on the other hand, the budget continued to be used primarily for fiscal purposes. In theory, Switzerland lies midway between the extreme positions. The Financial law of Jan. 1, 1958, specifically recognizes the need to take account of the general economic situation when provision is made for the repayment of national debt. In practice, the lack of scope for variation on the revenue side and public pressure to have taxes reduced in times of surplus are likely to tie the hands of the federal government. In Sweden by the 1950s the budget was employed as an instrument of planning, annual balancing having been discarded. Moreover, in order to emphasize its importance in the field of economic control, two emergency budgets as well as the ordinary budget are provided and voted each year to meet the situation which might arise in case of war or depression and unemployment. No revenue is voted for either of these budgets, which are confined to authorizing expenditure (in the latter case grants for public-works schemes to relieve unemployment), but authority is given for the raising of loans to cover expenditure should the emergencies in question arise.

Control Over Revenue and Expenditure.—In most independent countries of the British Commonwealth the system of parliamentary and administrative control over revenue and expenditure follows the United Kingdom's practice, on which it is largely based, though not without differences. In all these the control is generally on a statutory basis and is exercised first through parliament and then through executive action. In Australia control is mainly directed by the treasury through the medium of the Audit act and treasury regulations. Under the act only treasury officers may transfer money to departments. The issue of money so transferred to meet expenditure is supervised by officers in departmental accounts branches, who are designated by the treasury to see that it is in accordance with parliamentary and other authority. In India the system is less rigid; sums authorized by parliament are placed at the disposal of the controlling authorities in the various departments, who are themselves responsible for seeing that expenditure does not exceed the amount authorized without prior authority. Powers of reappropriating expenditure to purposes other than those originally authorized are also within limits delegated to departments. Collection of revenue is in the hands of a number of special departments, but over-all control over both revenue and expenditure is exercised by the finance ministry.

The practice in European countries varies considerably. In France control over a department's expenditure is exercised by

the minister, but he in turn is assisted by controllers of current expenditure, who are officials of the ministry of finance. In Italy, on the other hand, day-to-day control over revenue and expenditure is exercised by the director-general of the treasury, who has to certify the legality of proposed disbursements. In Sweden, spending is largely in the hands of the spending agencies and, once it is authorized, no special parliamentary or administrative control is exercised, apart from the duties performed by the general accounting office (*see below*).

Scrutiny of Accounts.—Independent audit of accounts by an officer responsible to the legislature and not to the executive or to any department thereof is a practically universal feature of financial control. In independent countries of the British commonwealth the system is again, in part, modeled on that of the United Kingdom. In Australia departmental accounts are under continuous examination by audit inspectors throughout the year, and the Audit act requires the treasurer to furnish the auditor-general at the close of each year with a statement showing the financial results for the year under various heads. This is then transmitted by the auditor-general to parliament with a report thereon. In India a similar system prevails. In France and Italy, though the ministry of finance and treasury respectively are concerned with scrutinizing day-to-day expenditure of departments, accounting results come under examination or are reported on by an independent court of accounts. In Italy this court is also concerned with the accounts of institutions in which the state has a financial interest. In Sweden a general accounting office is responsible for accounting procedures applied by the spending agencies and it also has authority to supervise the arrangements for disbursements on current account. At the same time the national debt office is responsible for arranging disbursements in respect of the capital budget. The general accounting office also has the function of collecting monthly details of expenditure from spending agencies and consolidating them into a central account, which is submitted as a monthly report to the cabinet, together with a statement of estimated budget revenues and expenditure to date.

In a number of countries parliamentary scrutiny of expenditure is carried on by committees comparable with the public accounts committee of the United Kingdom. Committees of this name operate in Australia and India. In Switzerland a *délégation des finances*, consisting of three members drawn from the finance committee of the two chambers, has the task of examining departmental accounts. The accounts are subject to continuous control by a small department of officials who are responsible to the *délégation des finances*. In Sweden a post-audit by a specially appointed committee of both chambers of the *riksdag* is made, as well as by the general accounting office. The object of the first is to review administrative practice and recommend improvements in the interests of efficiency and economy; the second is concerned with post-audit in the narrower sense. (E. E. Bs.; F. G. L.)

BUDWEIS: *see* ČESKE BUDEJOVICE.

BUELL, DON CARLOS (1818–1898), Union general of the American Civil War, was born near Marietta, O., on March 23, 1818. He graduated from West Point in 1841 and fought in the Mexican War, winning two brevets for gallantry. In Dec. 1860 he was sent to Charleston, S.C., to report to Maj. Robert Anderson the position of the Buchanan administration on the defense of Fort Sumter. At the outbreak of the Civil War Buell aided in the organization of the army of the Potomac and in Nov. 1861 succeeded Gen. W. T. Sherman in command of the army of the Ohio. He captured Nashville in Feb. 1862, joined Gen. U. S. Grant at Shiloh, and served under Gen. H. W. Halleck in the advance on Corinth. Buell was then to invade and liberate eastern Tennessee; but only after protracted maneuvering, during which his army fell back toward Louisville before Gen. Braxton Bragg, was the Confederate invasion of Kentucky ended at the indecisive battle of Perryville. For failure to advance vigorously against the enemy, Lincoln removed Buell from command on Oct. 24, 1862. Buell resigned from the army in 1864, engaged in private business and died near Rockport, Ky., on Nov. 19, 1898. (J. R. Co.)

BUENA PARK, a city of Orange county in southern California, U.S., about 20 mi. E.S.E. of Los Angeles, is on the Santa

Ana freeway, which connects Los Angeles and San Diego, and on the Riverside freeway. Industries include aircraft manufacture and the processing of milk products. Within the city limits lies Knott's Berry farm, a popular recreational area. Incorporated in 1953, the city adopted the council-manager form of government in the same year.

For comparative population figures *see* table in CALIFORNIA: Population. (Wm. H. K.)

BUENAVENTURA, the main Pacific port of Colombia, South America, in Valle del Cauca department. Founded in 1540 on the island of Cascajal where the Dagua river reaches the Bay of Buenaventura, it was later burned by Indians and virtually ceased to exist for many years. It was relatively unimportant until the 1930s, being handicapped not only by an oppressively hot and humid climate but by poor transportation connections with the interior. There was an unpaved highway, impassable in rainy seasons, and a single-track railroad which reached the Cauca valley but not Bogota. But by the 1930s the often unnavigable state of the Magdalena river hurt the commerce of Barranquilla, then Colombia's major port. In the same years Buenaventura's inland connections were improved, resulting especially in the growth of road-borne traffic. By the mid-1950s Buenaventura exported products valued at about eight times those shipped from Barranquilla, and imported half again as much. Modern port facilities and an airport were constructed. The port for the sugar and coffee of the fertile upper basin of the Cauca valley, Buenaventura also handles most of the gold and platinum of the Chocó region to the north.

The city grew from a population of 14,515 in 1938 to 35,087 in 1951. The 1958 estimate was 80,440 (mun.). (T. E. N.)

BUENA VISTA, a village 8 mi. S. of Saltillo, Mex., at the northern edge of the battlefield where one of the major battles of the war between the United States and Mexico was fought in 1847. A U.S. force of about 5,000 under command of Maj. Gen. Zachary Taylor occupied a defensive position on the rugged terrain south of Buena Vista. A Mexican army of about 20,000 came from the south under the command of Gen. Antonio L. de Santa Anna on Feb. 22, 1847, and attacked early the next morning. The tide of battle wavered throughout the day. At one time an American order to advance was relayed as an order to retreat, thus causing confusion which nearly turned into a rout. The situation was saved by the calmness of Taylor, who had returned from Saltillo, and the effective support of the artillery. Later, when Taylor's army held a decided advantage, Santa Anna requested a truce, which proved to be a ruse to permit him to extricate some of his units from untenable positions. When darkness brought the fighting to a halt, it was not clear that either army had gained a victory. Both had suffered heavy casualties. The Mexican army remained numerically stronger, but its morale was at a low ebb, and during the night Santa Anna ordered a general retreat. After a desultory pursuit of Santa Anna, Taylor withdrew to Monterrey and the campaign in northern Mexico was over. *See* also THE MEXICAN WAR.

See Holman Hamilton, *Zachary Taylor, Soldier of the Republic* (1941); R. S. Henry, *Story of the Mexican War* (1950).

(H. W. BY.)

BUENOS AIRES, largest and most populous province of Argentina. Area 118,753 sq.mi. Pop. (1960) 6,734,548, excluding the federal district of Buenos Aires, located on the estuary of the Rio de la Plata in the northeastern corner of the province. Roughly square in shape, Buenos Aires is bounded on the north by the Paraná river and the provinces of Santa Fe and Córdoba, on the east by the Rio de la Plata (which separates it from the republic of Uruguay), on the east and south by the Atlantic ocean and on the west by the provinces of Rio Negro and La Pampa.

The island of Martin Garcia, located on the estuary of the Rio de la Plata near the mouth of the Uruguay and Paraná rivers (area 0.7 sq.mi., pop. [1947] 1,537) and site of a military prison, is usually considered part of the province of Buenos Aires.

Physical Geography.—The province forms the major part of the humid pampa of Argentina, a vast grass-covered plain which, through the production of cattle, sheep and wheat, brought

wealth to the area in the late 19th century. Rainfall is usually adequate for agriculture, although drought is not unknown; the annual average in the northeast is 39 in., dropping off to approximately 20 in. in the south and west. The region enjoys mild winters and hot summers with the growing season ranging from 300 days in the north to 140 days around Bahía Blanca in the south. Absence of any continuous snow cover makes grazing possible throughout the year. Variable weather and windstorms are characteristic of the area. The pampa is monotonously flat with a soil of alluvium and wind-blown dust or loess, entirely free of stones or pebbles. There are only two low mountain ranges: the Sierra del Tandil (1,660-ft. elevation), which starts on the coast at Mar del Plata and extends inland approximately 150 mi. in a north-westerly direction; and the Sierra de la Ventana (highest point [Tres Picos] 4,078 ft.), about 60 mi. in length and extending in the same direction from the coast near Bahía Blanca. The province is well watered with a ground-water table which lies close to the surface, but most of the drainage is underground and there is little running water. As a result there are numerous sloughs, occasional swamps and temporary lakes in the rainy months, particularly in the central region. One principal river, the Rio Salado, traverses the entire province from northwest to southeast for a distance of 360 mi. None of the provincial streams can be navigated, and they are used primarily for irrigation.

Population.—The bulk of the population is concentrated in the northeastern section of the province around the federal district of Buenos Aires. An enormous and continuous urban cluster, which comprises more than one quarter of the total population of the republic or over 6,000,000, is formed by the cities of Vicente López, San Isidro, General San Martín, San Justo, Morón, Lanús, Lomas de Zamora, Avellaneda and Quilmes; the population of none of these is less than 100,000. This commercial, industrial and cultural conglomeration known as Greater Buenos Aires dominates not only the province but also the nation. Several other industrial and commercial centres have developed within the province, such as the port of Bahía Blanca in the south, the provincial capital and port of La Plata approximately 33 mi. S. of the federal district, the seaside resort of Mar del Plata, and the agricultural centres of Pergamino in the north and Azul and Tandil in the south. There are important foreign elements within the province, exceeding 1,000,000 persons by the 1960s. The most numerous nationalities represented are Spanish, Italian, French, German, Russian and Polish.

History.—Throughout the period of the Spanish empire the area of the province was virtually unexploited save for the hides from the vast herds of cattle and horses which ran wild on the pampa. Actually the interest to sell such hides and salted meat on the world market free of Spanish commercial restrictions, in addition to the natural restlessness and independence of the gaucho, led the inhabitants of the province to support a separation movement from Spain in 1810. Subsequently the province under the leadership of the city of Buenos Aires became involved in efforts to impose a type of government on the autonomous provinces which would someday form Argentina. A degree of national unity was imposed by the governor of Buenos Aires province, Juan Manuel de Rosas, from 1829 to 1852. His despotic rule eventually led to revolution, and in the ensuing strife Buenos Aires separated itself from the Argentine confederation. When in 1862 another Buenos Aires governor, Bartolomé Mitre, was elected president, national organization was achieved with Buenos Aires as the first province of the nation. Continued strife within the province was resolved in 1880 with the federalization of the city of Buenos Aires as the residence of the national government and the subsequent move of the provincial authorities to La Plata. At the same time a major campaign against the pampa Indians removed the danger of their raids from the southern boundaries of the province. Peace was thus assured in time for economic prosperity to benefit the province in the final decades of the 19th century. Refinement of refrigeration techniques, making the transport of beef to Europe feasible, led to improvement and expansion of cattle raising. Simultaneously it was discovered that wheat, corn and alfalfa would grow extremely well on the

pampa. The provinces of Santa Fe and Córdoba also benefited from these economic developments, but it was the province of Buenos Aires, heartland of the pampa, which prospered most. Hundreds of thousands of immigrants, primarily Italian and Spanish, arrived in the province to provide labour for this economic boom, and British, French and Germans responded with managerial experience and capital. The trend toward industrialization, especially marked during and after World War II, again greatly benefited the province since its area contained the major urban concentrations and the centre of transport and commercial facilities of the nation.

Government.—The provincial government enjoys considerable autonomy in local matters although the national government retains authority to intervene in provincial matters if judged necessary. Because of its important relationship and proximity to the federal district, this autonomy is probably less in the case of Buenos Aires than in some other Argentine provinces. There are three branches of government: an executive or governor elected by popular vote; a bicameral legislature; and a judiciary (with civil, commercial and criminal courts in several cities, a court of appeals and a supreme court in the provincial capital at La Plata). The province is divided into 110 districts and 8 electoral sections. Each of the municipalities which heads a district has an elected mayor and council. Public primary education with free compulsory schooling from age 6 to 14 is provided, but a considerable portion of this group does not attend school. Relatively few continue to secondary school, although national *colegios* exist in all the principal cities. In addition to the National University of Buenos Aires located in the federal district, there is a national university at La Plata.

Economy.—Modern economic expansion of the province of Buenos Aires started near the end of the 19th century with the production of beef, wool and wheat for the European market. The cattle, which had multiplied and roamed the pampa and had previously been utilized only for their hides and for salted meat, were fenced, bred and fed alfalfa. Even a dairy industry began to develop. Sheep raising, from a modest start at mid-19th century, became concerned with improvement of stock and wool. Gradually, however, the cereal products assumed more importance, and in 1903, for the first time, the value of agricultural exports (corn, wheat and linseed) exceeded the value of animal products. Although Buenos Aires ranks first in the republic for the number and quality of its livestock and utilizes more than 50% of its land for grazing, an increasing area has been given over to agriculture. Livestock raising is concentrated in the eastern coast below the federal district, extending inland 150 mi. and southward to Mar del Plata. A broad band running north and south through the province and growing wider in the southern coastal region is devoted to wheat. The maize area is situated in the northern part of the province, while around the federal district for a radius of 50 mi. are the intensive truck gardens which supply the urban population with its fresh fruits and vegetables. In the 1960s approximately 40% of the nation's area sown to cereals and linseed was located in the province of Buenos Aires.

Although the province has 1,000 mi. of coastal frontage on the Atlantic and the Rio de la Plata and 300 mi. of river frontage on the Paraná in the north and the Rio Negro in the south, there are few natural ports. San Nicolás and Zárate (on the Paraná), Bahía Blanca (chief Argentine naval port) and La Plata (provincial seaport) are the major exceptions. Both at the federal district of Buenos Aires and at Mar del Plata, extensive artificial ports have been constructed. The former handles the bulk of Argentine foreign trade and shares the important river trade with Zárate, Campana and La Plata. Eighteen miles southwest of the federal district is the large and modern Ezeiza airport, completed in 1950, which serves as the hub of domestic and foreign flights in Argentina.

Indeed the centre of Greater Buenos Aires is the veritable commercial hub of the nation. All the main railroad lines pass through the province and converge on this centre. Although meat packing is the major industry, the industrial expansion led

to the building of flour mills, foundries, breweries, tanneries, refineries, distilleries and innumerable consumer goods factories in this urban zone. (Js. R. S.)

BUENOS AIRES, capital city of Argentina situated in the federal district on the west bank of the Rio de la Plata estuary at an elevation of 65 ft. Pop. (1960) 2,966,816. The temperature is moderate; July is the coldest month with a mean of 49° F., while January is the warmest at 73.6° F. The mean annual temperature is 61° F. Average rainfall is 38 in., April being the wettest month. Humidity is high throughout the year and most objectionable in January and February.

The city is laid out in a rectangular pattern extending back from the river front. Deliberate widening of streets and occasional elimination of entire city blocks have created the beautiful thoroughfares of Avenida de Mayo, the central avenue running back from the river and extending under the name Avenida Rivadavia a distance of 1,180 blocks (each roughly 136½ yds. long) to the western limit of the federal district: the diagonal avenue Roque Sáenz Peña (Diagonal Norte) which fans out from the principal Plaza de Mayo; and the 425-ft. wide Avenida 9 de Julio which cuts across the previous two. The Avenida General Paz skirts the federal district on three sides for a distance of 15 mi. Well known though shorter are the ten blocks of narrow Calle Florida; lined with shops and turned over to pedestrians during daytime and evening hours when motor traffic is barred. The heart of old Buenos Aires and of the modern downtown city is small, limited to an area 18 city blocks square. Self-contained suburbs have developed within the federal district, and additional suburbs within Greater Buenos Aires (some at 15–20 mi. from the city centre) have built the urban population to a total of nearly 4,000,000 in the early 1960s.

Reminiscent of the Spanish heritage are the public buildings surrounding the Plaza de Mayo: the Casa Rosada (government palace), the Intendencia Municipal (executive branch of municipal government), the historic Cabildo (meeting place of the colonial town council), the Roman Catholic cathedral and the Eanco de la Nación. Approximately 20 blocks west along the Avenida de Mayo is the seat of the Argentine congress. Few buildings reach skyscraper dimensions in the city, and the Kavanagh office building with 29 stories is one of the tallest. The architecturally magnificent Colón theatre attracts famous artists during the winter opera season of June, July and August.

A relatively large area of the federal district, three square miles, is devoted to parks which dot the city. The largest, 3 de Febrero, covers nearly 1,000 ac. on the riverbank north of the city centre. Other notable parks include Parque del Retiro, two botanical gardens, the zoological garden and the innumerable squares and plazas which offer trees and quiet walks even in the heart of the downtown area.

Approximately 350 public libraries, of which the National library is the largest, represent a selection of over 2,000,000 volumes, although few permit circulation of books for home reading. Outstanding among the museums are the Nacional de Bellas Artes and the Histórico Nacional. The numerous theatres, cinemas, stores, hotels and restaurants uphold the city's position as the "Paris of South America."

The citizens of Buenos Aires proudly identify themselves as *porteños* (people of the port). Although the basic racial stock, as in the rest of Argentina, is Spanish and Italian, a striking variation is caused by large foreign elements located in the city, numbering more than 750,000 in the 1960s. Demonstrating the homogeneity of these groups is the fact that seven foreign-language newspapers and seven hospitals are supported by their members. To the traditional groups of English, French, Italians, Spanish and Germans, significant numbers of Poles, Russians, Portuguese, Syrians and Turks were added in the period 1920 to 1955.

History.—The city of Buenos Aires did not enjoy an auspicious beginning, and its national and world importance are phenomena which began in the late 19th century. Juan de Solís, chief navigator of Spain, entered the estuary of the Rio de la Plata in 1516 in hopes that he had found a route to the Indies and was

PAUL ALMASY

PLAZA DE MAYO, BUENOS AIRES, SHOWING (RIGHT) THE CATHEDRAL, COMPLETED 19TH CENTURY

killed on the shores by hostile Indians. A Spanish royal expedition under Pedro de Mendoza set up Nuestra Señora Santa María del Buen Aire settlement on the same shores in 1536. After enduring great hardship and Indian attack for five years, the settlers moved upriver and established themselves at Asunción on the Paraguay river. Not until 1580 did Juan de Garay, arriving from Asunción, plant a permanent Spanish settlement at Buenos Aires. By this date, wealth and glory had been found by the Spaniards in Mexico and Peru, and for two centuries Buenos Aires remained the neglected stepchild of the Spanish empire in America. The population at mid-17th century numbered approximately 1,000 inhabitants largely sheltered in mud huts. In 1776, in response to dangers of English and Portuguese expansion in the area and increased smuggling through the port, Buenos Aires was made the seat of a Spanish viceroyalty. The relaxation of trade restrictions at the end of the 18th century, however, only served to make more evident to the *porteños* the advantages of separation from the Spanish empire. Further self-reliance was developed when English invasions in 1806 and 1807 were repulsed without Spanish help. When the separation movement from Spain developed within the empire in 1810, the city and port of Buenos Aires stood to gain the most from independence and free trade.

After an initial declaration of autonomy in 1810, the city led the attack on Spanish strongholds: at one point in 1816 it was the only centre of importance in the western hemisphere not reconquered by Spanish arms. Independent of Spain, the area found that its immediate problem was organization of some form of national government, and the 19th century was marked by the repeated efforts of the city of Buenos Aires to originate and control such a government. Moderate success was attained when a *porteño*, Bartolomé Mitre, became president of the republic in 1862. To complete his program, the city was federalized and made permanent capital of the republic in 1880. Stability and order brought economic growth and foreign immigration in increasing amount to the city and to Argentina in the closing decades of the 19th century. Internal military cliques caused the collapse of political democracy during World War II and instituted the rule of Juan D. Perón, which lasted from 1946 until 1955. Extreme industrialization which took place most noticeably during and after World War II contributed to the unprecedented growth of Buenos Aires and reinforced the financial, economic and political dominance which that city enjoyed over the rest of the country.

Government. — The presence of a local municipal government and a national federal government within the same city occasioned much difficulty in the 19th-century history of Buenos Xires and has necessitated a delicate division of responsibilities and duties. The municipal government is composed of two branches: the executive known as the *intendente municipal* (mayor), who is appointed by the national president subject to senate confirmation; and the *consejo deliberante* (city council), which is elected by popular vote.

Since there is intimate contact between the city as a municipality and as a residence of the national authorities, the *intendente* is empowered to present to the national congress matters which affect the municipality and to the *consejo deliberante* matters which have originated with the federal government. The national government, meanwhile, is charged with the expenses and control of the police and fire departments, public health and over-all supervision of public education. An example of divided duties is public sanitation; the national government controls port sanitation and the city water and sewer system, while the municipality supervises laboratories, bacteriological and disinfecting activities and relief services.

Education. — The public-school system in the city is under the supervision of the national council of education, although the municipality administers certain schools. Primary education is free and compulsory for children from 6 to 14 years of age. A number of public and private *colegios* provide intermediate schooling. The National University of Buenos Aires has six faculties scattered throughout the city: medicine, law, natural sciences, agriculture, economics, and philosophy and letters. Except for a nominal registration fee, tuition is free, and many classes are held in the evening.

Transportation. — The urban and interurban transport system is well developed and adequate for even rush hour flow. Five independent subway systems provide rapid communication to outlying areas of the city, and buses and trolleys complete the excellent transport service. The city is a highway hub and the terminus of every major railroad in the country.

Port Facilities. — Just as the city serves as a communication centre with the rest of Argentina, so it is the country's primary link with the outside world. As one of the world's largest ports, it is significantly entirely man-made, vessels reaching it through a tortuous channel up the broad Rio de la Plata estuary. Five distinct port units comprised of interlocking basins and docks stretch along the river front for a distance of five miles. Puerto Nuevo, completed in 1935 and including Dársena Norte, is reached from the main La Plata channel by a branch channel approximately six miles long (depth in both channels 31 ft.). This is the main passenger port as well as an important freight centre due to its adjacent location to the Retiro train yards where railroads for northern and central Argentina originate. Southward along the river front are located Puerto Madero, Dársena Sud, the outer-port or port for inflammables, and the Riachuelo. A separate channel (depth 27 ft.) connects these port units with the main La Plata channel. An enormous bulk of foreign trade enters Argentina via the port of Buenos Aires, averaging more than twice the tonnage of all other ports combined. By the 1960s, however, several other ports such as Rosario, La Plata and Bahia Blanca were rapidly increasing their share of export trade.

See ARGENTINA.

(Js. R. S.)

BUERGER'S DISEASE (THROMBOANGIITIS OBLITERANS) is a chronic and uncommon malady characterized by inflammation of the arteries and veins of the arms and legs. It is rarely fatal since it seldom affects vital organs. The cause is unknown, but tobacco has been implicated because most patients with this disease are heavy smokers, and abstinence from tobacco usually leads to improvement. Of the persons affected, 99% are men.

The symptoms first appear between the ages of 20 and 45 years. The acute lesions of the veins are painful and subside spontaneously in a week or two but may recur. More serious is involvement of the arteries, because obstruction may occur which will interfere with the blood supply to the hands and feet. Symptoms include aching in the calves or arches when the patient walks, and

coldness, blueness and painful ulceration or gangrene of one or more fingers or toes. Amputations of toes or fingers are sometimes necessary. Major amputations of arms and legs are seldom necessary, especially if the victim stops smoking. (R. W. Gr.)

BUFFALO, a city and port of entry in New York, U.S., and the seat of Erie county, is at the eastern end of Lake Erie and the upper end of the Niagara river, about 400 mi. N.W. of New York city. High land (its altitude varies between 572 and 699 ft. above sea level), temperate climate and the excellent drainage and water supply make Buffalo one of the most healthful cities. The Buffalo standard metropolitan statistical area (Erie and Niagara counties) had a population of 1,306,957 in 1960. The population of the city of Buffalo was 532,759. Metropolitan area communities include in Niagara county the cities of Niagara Falls, North Tonawanda and Lockport (*qq.v.*), and in Erie county the cities of Lackawanna and Tonawanda (*qq.v.*), the towns of Amherst, Hamburg, Cheektowaga, Lancaster, Tonawanda and West Seneca. (For comparative population figures see table in NEW YORK: Population.)

The population in the second half of the 20th century included large elements of Polish, German, Irish, Canadian and Italian birth or descent.

History. — The first Europeans to visit the Buffalo area were French trappers and Jesuit missionaries. In 1679 René Robert Cavelier, sieur de la Salle, built his ship, the "Griffon," on the banks of the Niagara river. At the river's mouth he constructed Ft. Conti, which burned the same year. In 1687 the marquis de Denonville built Ft. Denonville, the predecessor of the fortifications later known as Ft. Niagara. The area was the scene of military operations up to the close of the Revolutionary War. The earliest known map with the name Buffalo on the present city site was made in 1763. The origin of the name is still widely disputed. The site of Buffalo, originally part of the Phelps-Gorham purchase, became the property of the Holland Land company in 1797. Joseph Ellicott, company agent and surveyor, known as the "father of Buffalo," laid out a town named New Amsterdam, by which name it was known on the company's hooks until 1810 but the name Buffalo proved more popular. In 1808 it became the seat of newly created Niagara county.

In the War of 1812 with Great Britain, Buffalo was the headquarters for most of the military operations on the Niagara frontier. Several vessels used in later naval operations were built at a Scajaquada creek navy yard by Lt. Jesse D. Elliott of the U.S. navy. On Oct. 9, 1812, he captured two merchant vessels moored under the guns of Ft. Erie in Canada. On Nov. 30 Gen. Alexander Smyth made an unsuccessful attempt to cross the river and attack Ft. Erie. On July 13, 1813, the British crossed the river and fought a sharp skirmish within the present limits of Buffalo. On Dec. 30–31, 1813, and Jan. 1, 1814, British, Canadians and Indians under Gen. Sir Phineas Riall burned the greater part of Buffalo, Black Rock and other frontier communities in retaliation for similar devastation by U.S. forces in Canada. The surrender of Ft. Erie to U.S. forces under Gen. Jacob Brown on July 3, 1814, was followed by the battles of Chippewa (July 5) and Lundy's Lane (July 25), with the U.S. forces retiring to Ft. Erie. The ensuing British siege of Ft. Erie was temporarily abandoned on Sept. 17. Another American advance to Chippewa was turned back in October. On Nov. 5, 1814, Maj. Gen. George Izard abandoned Ft. Erie and withdrew across the river to Buffalo.

Buffalo, rapidly rebuilt after the war, was incorporated as a village in 1816. The first steamboat on the Great Lakes, "Walk-in-the-Water" (named after a famous Wyandot chief), was built in Buffalo in 1819. The village remained a seat when the state legislature created Erie county in 1821. With the completion of the Erie canal in 1825 and the westward movement of population Buffalo's importance greatly increased because of its strategic location at the transportation break of the east-west route. Expanding commerce led to manufacturing; beginning in the 1820s. Buffalo's first federal census (1820) showed a population of 2,095, which increased to 8,653 in 1830. In 1832 Buffalo was incorporated as a city and Ebenezer Johnson was chosen the first mayor: popula-

tion by that time had reached about 10,000. The rapid development of railroads in the 1850s appeared at first to threaten the economic life of the city, dependent upon water and turnpike transportation, but the American Civil War, by deranging lines of communication in the middle states, threw much commerce to the northern routes. Trade with the expanding west grew rapidly during and after the war and the railroads, attracted by existing markets and established trade routes, converged upon Buffalo. This in turn stimulated manufacture and Buffalo industry grew rapidly. At the end of the century the development of hydroelectric power from Niagara falls furnished another impetus to expansion of industry.

In the 19th century Buffalo was the home of two U.S. presidents. Millard Fillmore, a Buffalo attorney, was elected vice-president in 1848 and became president upon the death of Pres. Zachary Taylor on July 9, 1850. Grover Cleveland, elected mayor of Buffalo in 1881, went on to become governor of the state the following year and president in 1884 and again in 1892.

In 1901 the city held its Pan-American exposition, marred by the assassination of Pres. William McKinley. Other notable events included the opening on Aug. 7, 1927, of the Peace bridge, an international vehicular bridge to Fort Erie, Ont., Can. and a memorial to a century of the U.S.-Canadian peace. In July 1932 the city celebrated its centennial with an exposition. The long-discussed St. Lawrence seaway (*q.v.*) stimulated commercial activity in the city and in Sept. 1957 Buffalo held a world port celebration to signal its position as the first major U.S. port of call on the seaway.

The first Buffalo newspaper, the *Gazette* (a weekly), was established in 1811 and became the *Commercial* in 1835. The first daily was the *Western Star* (1834), which later became the *Courier*. In the second half of the 20th century there were two dailies, the *News* and the *Courier-Express*.

Government.— From 1916 to 1928 Buffalo had a commission form of government, with the legislative and executive powers united in five commissioners, chosen at nonpartisan primaries and elections. The 1928 charter restored a mayor-council plan of government. Elective offices are those of the mayor, comptroller, president of the council, five councilmen-at-large and nine district councilmen. The mayor prepares the budget and executive powers are strongly concentrated in his hands, with the unicameral council holding a check through powers of taxation, appropriation and confirmation. The mayor, council president and councilmen-at-large may not succeed themselves after their four-year terms. District councilmen may be re-elected to a second two-year term.

Commerce, Industry and Transportation.— Situated almost equidistant from New York city, Boston, Mass., Philadelphia: Pa., Baltimore, Md., and Chicago, Ill., at a natural junction point for lake, rail and highway transportation, Buffalo is one of the leading commercial and industrial centres of the United States. Within a 500-mi. radius firms could reach over 75,000,000 U.S. consumers and over 70% of Canada's population in the early 1960s. Handling over 20,000,000 tons of cargo annually; Buffalo ranked first in value of commerce handled by all inland U.S. ports. The outer harbour is protected by a breakwater 4½ mi. long enclosing an area of about 680 ac. Municipal piers supplement private dockage; the Niagara Frontier Port authority handles the expansion of port facilities to meet the traffic increase from the St. Lawrence seaway. The New York State Barge canal provides transport to the seaboard for barges up to 2,000 tons capacity. Buffalo is also an important rail centre. A large municipal airport and the development of the state throughway and expressway systems made it an international trucking and airline hub as well.

The Buffalo area is a leading flour-milling centre and a major steel producer. Other important products in the 1960s included rubber, airplanes, chemicals, electrical motors and apparatus, radios, television, hand tools, clothing, automotive parts and meat products. The activities of research laboratories were nationally significant. A notable feature of the area is the high diversification of industry. Important agricultural interests include dairy products, poultry, vegetables and fruits, especially apples, peaches and cherries.

Education and Cultural Activities.— The University of Buffalo, founded in 1846, comprises faculties of arts and sciences, business administration, dentistry, education, engineering, law, medicine, nursing, pharmacy and social work. Canisius college (Jesuit), established in 1870 and chartered in 1883, offers curriculums in arts and sciences and business administration. D'Youville, Rosary Hill and Mount St. Josephs Teachers college (Catholic colleges for women) offer liberal arts and teacher education programs. College of Education at Buffalo, a unit of the State University of New York, prepares teachers in divisions of art education, home economics, industrial arts, elementary and secondary education and the education of exceptional children. The Erie County Technical institute, affiliated with the state university, offers two-year associate degree programs in ten technical fields.

Important libraries include the Grosvenor, a major reference library, and the Buffalo Public, both parts of the county library system, and the specialized libraries of the Historical society, the 8th judicial district (law) and the Catholic institute.

Outstanding cultural assets are the Albright Art gallery, the Historical museum, the Museum of Science, the Buffalo Philharmonic society and the city's 23-ac. zoological gardens.

Parks and Recreation.— Major municipal facilities include Kleinhans music hall, Civic stadium, Memorial auditorium, a Lake Erie beach and more than 50 parks and playground areas. More than 400,000 city-owned trees grace the parks and local streets. With excellent county and state parks nearby, the area offers unusual opportunities for recreational activities in any season.

BUFFALO, a name applied to several different cud-chewing (ruminant) mammals of the ox family (Bovidae). The true or Indian buffalo (*Bubalus bubalis*), also known as the water buffalo, or arna, exists both as a wild and a domestic animal. It has been domesticated in Asia from very early times and was introduced into Italy about A.D. 600. There the name "bubalus" is said to have been transferred to it from a north African antelope, and then corrupted to "buffalo." As a truly wild animal the buffalo is found in Nepal, Assam, the old Central Provinces and perhaps some other parts of India, and in Burma. As a feral animal, roaming wild but descended from domestic stock, it is more widespread and occurs in Ceylon, Indochina, Borneo and Malaya. It is also found as a domestic animal throughout the warmer parts of the old world from China to Egypt, and in Hungary, France and Italy. It is so widespread in domestication that the status of apparently wild animals is often difficult to assess.

Buffaloes are large oxlike animals of massive and rather clumsy build with large horns which are triangular in cross section. The Indian buffalo, standing 5 ft. or more at the shoulder (over 6 ft. has been recorded), has a dull black body, often very sparsely covered with hair. The horns, which may be over 6 ft. long, spread outward and upward, approaching each other toward the tips; they meet more or less in one plane above the rounded forehead and elongated face. The horns of the cow are more slender than those of the bull. There are many domestic races in which the size, body build and shape and size of the horns differ.

Wild buffaloes live in herds in swampland and grass jungle, less often on open plains and rarely in forest: they graze morning and evening and spend most of the day lying down or wallowing in

W. SUSCHITZKY

AFRICAN OR CAPE BUFFALO (SYN-
CERUS CAFFER)

ROSS MADDEN FROM BLACK STAR

A TEAM OF INDIAN OR WATER BUFFALO (*BUBALUS BUBALIS*), BURMA

marshes. They are bold and even savage animals and will frequently charge an intruder. A herd of domestic buffaloes is sometimes used to stampede a wounded tiger out of cover. Domestic buffaloes are mainly kept as draft animals and for milk and butter. Cows give birth to one or two calves in the summer, ten months after mating.

The Cape or African buffalo (*Syncerus caffer*) is a black animal of similar massive build, standing up to 5 ft. at the shoulder and sparsely covered with hair. The heavy horns are distinctive, although those of some races of the Asiatic buffalo are somewhat similar in shape; typically they curve downward, then upward and inward and at their bases form large bosses that almost meet. African buffaloes, formerly found all over the continent from the Cape to the Sahara: have been greatly reduced in numbers by disease and hunting. They are animals of the open or scrub-covered plains and open forest. In the forests of the western part of the continent the buffaloes are much smaller, reddish in colour and have shorter horns which are less wide-spreading and without bosses at their bases. The African buffalo is as bold as its Asiatic cousin and when wounded is regarded as one of the most dangerous animals to man. It has never been domesticated and is a gregarious grazing animal, as fond of wallowing in swamps as is the Asiatic species.

A dwarf relative of the Indian buffalo, the anoa (*q.v.*; *Anoa depressicornis*), is found in the Celebes; it stands a little over 3 ft. high and has short, almost straight, backwardly directed horns. A slightly larger race, the timarau, is found in the Philippine island of Mindoro. Although exceedingly wild it has been so depleted in numbers that it is now completely protected.

The American bison (*q.v.*) is generally, though zoologically inaccurately, known as the "buffalo" in its native land. See BOVIAE; see also references under "Buffalo" in the Index volume.

(L. H. M.)

BUFFALO BERRY, called also rabbit berry and Nebraska currant (*Shepherdia argentea*), a hardy North American shrub of the oleaster (*q.v.*) family (Elaeagnaceae), allied to the seabuckthorn (*Hippophae rhamnoides*) of English coasts. The buffalo berry is native to stream banks in the Great Plains region from Manitoba! Saskatchewan and Alberta southward to Kansas, New Mexico and Nevada. It grows from 6 ft. to 20 ft. high, with whitish, somewhat thorny branches and small, oblong, silvery leaves, and in August or September bears a profusion of oval, scarlet-red or golden-yellow berries about the size of currants.

The fruit has a tart flavour and makes a good meat relish. The plant is not only an attractive shrub but, because of its spiny branches, is suitable also for hedges. Attempts have been made to cultivate it for its fruit, and some nurserymen catalogue it, but the sale of plants is limited. The bushes are productive, and great quantities of the berries could be gathered from the wild.

Propagation is effected by seeds and cuttings. Seeds should be stratified over winter and planted in nursery rows in spring. Two or three years are required to grow plants large enough for sale. Cuttings are made and handled like currant cuttings. Plants may be dug from native thickets, but they do not readily bear transplanting. Since the buffalo berry is dioecious, it is necessary to set out one male plant with each four to six female plants. Male plants may be distinguished by their dense clusters of plump buds, while the female plants have looser clusters of pointed buds.

The smaller thornless Canadian buffalo berry (*S. canadensis*), 4 ft. to 8 ft. high, with ovate leaves, silvery only on the under-surface, grows on wooded banks from Newfoundland to Alaska, and southward to New York and Oregon, extending in the Rocky mountains to New Mexico. Its rounded red or yellowish currant-like fruit is insipid.

BUFFALO BUR (*Solanum rostratum*), called also beaked nightshade and prickly potato, a North American annual of the nightshade family (Solanaceae), native to high plains east of the Rocky mountains from North Dakota to Mexico. The plant grows from 1 to 2½ ft. high and in aspect strongly resembles the potato, to which it is closely related, but is more slender, has bright yellow flowers and is armed throughout with needlelike prickles, especially on the burlike covering inclosing the berry. The buffalo bur is the original host or food plant of the destructive Colorado potato beetle (*q.v.*) and has now become an aggressive weed through most of the eastern and northern states, and also in southern California.

BUFFET: see CABINET FURNITURE.

BUFFIER, CLAUDE (1661-1737), French philosopher, historian and educationalist, was described by Voltaire as "the only Jesuit who has given a reasonable system of philosophy." He was born in Poland of French parents, who returned to France and settled at Kouen. He taught in the college of the Jesuits in Paris, where he spent the rest of his life. He seems to have been an admirable teacher, with a great power of lucid exposition.

His object in the *Traité des vérités premières et de la source de nos jugements* (1717), his best-known work, is to discover the ultimate principle of knowledge. This he finds in the sense we have of our own existence and of what we feel within ourselves. He thus takes substantially the same ground as Descartes, but he rejected the a priori (*q.v.*) method. In order to know what exists distinct from the self, "common sense" is necessary. Common sense he defined as "that disposition which nature has placed in all or most men, in order to enable them, when they have arrived at the age and use of reason, to form a common and uniform judgment with respect to objects different from the internal sentiment of their own perception, which judgment is not the consequence of any anterior judgment."

Buffier's aversion to scholastic refinements gave his writings an appearance of shallowness and want of metaphysical insight, and unquestionably he failed entirely even to indicate the nature of that universality and necessity which he ascribed to his "eternal verities"; he was, however, one of the earliest to recognize the psychological as distinguished from the metaphysical side of Descartes' principle: and to use it, with no inconsiderable skill, as the basis of an analysis of the human mind, similar to that enjoined by Locke. He anticipated the spirit and method as well as many of the results of Thomas Reid and the Scottish school.

He wrote also *Éléments de Métaphysique* (1724), a French grammar on a new plan, and a number of historical essays. Most of his works appeared in a collected form in 1732, and an English translation of the *Traité* was published in 1780.

BUFFLEHEAD, the common name for a North American duck (*Glaucionetta* or *Bucephala albeola*), or butterball, allied to the goldeneyes (*q.v.*). In colour the male bufflehead is blackish above, white below, with a white band extending around the back of the large head from eye to eye, and with the remainder of the head and the neck of a purplish-green sheen; the female is dark-gray above, whitish below, and has a white spot on either cheek. This small duck, about 15 in. long, is noted for its powers of quick

diving. It feeds in part on small fish, which it pursues and captures beneath the surface. It breeds from central Alaska and western Ontario south to British Columbia, northern Montana and Manitoba, wintering southward. The bufflehead has been seen rarely as a visitor in England. (G. F. Ss.)

BUFFON, GEORGES LOUIS LECLERC, COMTE DE (1707-1788), French naturalist famous for his comprehensive work on natural history, the first modern attempt to embrace all scientific knowledge. He was born on Sept. 7, 1707, at Montbard (Côte-d'Or), where a large estate (including the "terre de Buffon") was acquired by his parents in 1717. Georges added the name Buffon to his original name of Leclerc at about the age of 25.

In 1726 he obtained a degree in law at the Jesuit college at Dijon, where his father was a councillor in the Burgundian parliament. Two years later he left for Angers. In 1730 Georges Buffon made the acquaintance of a young Englishman, Lord Kingston, and of his tutor, a botanist and entomologist. With Kingston, Buffon visited England, and while there was elected a fellow of the Royal society. He published a French translation of Stephen Hales's *Vegetable Statics* in 1735, and of Sir Isaac Newton's *Fluxions* in 1740. Having made researches on the properties of timbers and their improvement in his forests in Burgundy, he was appointed keeper of the Jardin du Roi, and of the museum which formed part of it, at the age of 35. He acquired this post, on the death of C. F. Du Fay, through the patronage of the minister of finances, J. F. P. de Maurepas, who realized the importance of science and was anxious to use Buffon's knowledge of timber for the shipbuilding projects of the French government. Maurepas also charged Buffon to undertake a catalogue of the king's museum which Buffon's ambition transformed into an account of the whole of nature. This became his famous *Histoire naturelle, générale et particulière*. He was elected to the Académie française (his inaugural address being the celebrated *Discours sur le style*, 1753) and was treasurer to the Académie des Sciences.

Buffon's *Histoire naturelle* was the first work to present the previously isolated and apparently disconnected facts of natural history in a generally intelligible form. It passed through several editions, and was translated into various languages. The first edition is highly prized by collectors because of the beauty of its plates; it was published in Paris (1749-1804) in 44 quarto volumes, the publication extending over more than 50 years. In the preparation of the first 15 volumes of this edition (1749-67) Buffon was assisted by Louis J. M. Daubenton, to whom he had entrusted the descriptive and anatomical portions of the treatise, and subsequently by P. Gueneau de Montbeillard, the abbé G. L. C. A. Bexon and C. N. S. Sonnini de Manoncourt. The following seven volumes, which form a supplement to the preceding, appeared in 1774-89, the famous *Époques de la nature* (1779) being contained in the fifth of them. They were succeeded by nine volumes on birds (1770-83), and these again by five volumes on minerals (1783-88). The remaining eight volumes, which complete this edition, appeared after Buffon's death, and comprise reptiles, fishes and cetaceans. They were executed by B. G. E. Lacépède, and were published in successive volumes between 1788 and 1804. A second edition, begun in 1774 and completed in 1804, in 36 volumes quarto, is in most respects similar to the first: except that the anatomical descriptions are suppressed and the supplement recast.

Buffon died in Paris on April 16, 1788. He left one son, Georges Louis Marie Leclerc Buffon, whom he envisaged as his successor and whom he sent with J. B. Lamarck on his botanical travels in Europe. But the youth proved a spendthrift and his imprudences finally led him to the guillotine at the age of 30, on July 10, 1793.

BIBLIOGRAPHY.—The *Histoire naturelle* was translated into English by W. Smellie, *Natural History* (1781-1812), with *Life of Buffon* by W. Wood. See also R. Heim (ed.), *Les grands naturalistes français*, vol. 1 (1952).

BUG, the name of two rivers of Europe.

The **SOUTHERN BUG** (Yuzhny Bug) of the Ukrainian Soviet Socialist Republic, U.S.S.R., 532 mi. in length, rises near Khmel'nitski (Proskurov) and flows generally southeast through Vinnitsa

and Pervomaysk before entering the long winding Black sea estuary confluent with that of the Dnieper below Nikolayev. Its upper part is beset with rapids, utilized for hydroelectric power, and the lower has numerous sandbanks and rocky stretches which prevent navigation above 55 mi. upstream.

The **WESTERN BUG** (Zapadny Bug) is a tributary of the Vistula (*q.v.*), 481 mi. long, and rises in the western Ukraine east of Lvov (Lemberg). It flows north through Hrubieszow whence, for about 125 mi. downstream, it forms the boundary between Poland and the Soviet Union. Near Brest it swings west to meet the Vistula 23 mi. below Warsaw, and in this navigable section is linked to the Polish capital by a short canal which avoids the difficult currents at the confluence of the Bug and Vistula. Its main tributaries are the Narew (Narev) and the Muchawiec (Mukhavets), which provide navigable routes via the Augustow and Muchawiec canals respectively to the rivers Neman and Dnieper. (ED. BR.)

BUG, the common name for insects belonging to the suborder Heteroptera of the order Hemiptera, frequently referred to as "true bugs," but also used in North America for almost any kind of insect, often in a combined form: ladybug (ladybird beetle), June bug (June beetle), lightning bug (a beetle), mealy bug (a homopteran), doodlebug (a neuropteran larva). In fact, even a crustacean—not an insect at all—is termed sow bug or pill bug (*see* WOOD LOUSE). In a restricted sense, especially in England, the term bug is applied to the bedbug, *Cimex lectularius* (*see* BEDBUG).

Bedbugs and most other true bugs produce characteristic buggy odours that seem to offer them some protection from birds and other predators. They have a wide range of habits: some are aquatic, others terrestrial; the majority are plant feeders, but many are predators.

Within the suborder Heteroptera many families are known by common names that incorporate the word bug, examples being stinkbugs (Pentatomidae), lace bugs (Tingidae), giant water bugs (Belostomatidae) and many others. Common names for species likewise include bug, as in chinch bug (*Blissus leucopterus*), squash bug (*Anasa tristis*) and kissing bug (*Reduvius personatus*). *See* also HEMIPTERA: *Heteroptera*; INSECT. (R. I. SR.)

BUGA, KAZYS (1879-1924), Lithuanian linguist, whose studies of Slavonic loanwords in the Baltic languages and of Baltic river names in present Belorussia and central Russia were of great importance. He was born on Oct. 25, 1879, in Paziege near Dusetos, eastern Lithuania. From 1905 to 1913 he studied linguistics at the University of St. Petersburg and was a lecturer there in 1916. In 1917 Buga became associate professor in the University of Perm, Russia. He returned to Lithuania in 1920 and from 1922 was professor in the University of Kaunas. After Buga's premature death on Jan. 1, 1924, at Kaunas, his greatest work, the dictionary of the Lithuanian language, was continued by J. Balcikonis and others. Between 1908 and 1924 he published a number of articles in Lithuanian, Russian and German periodicals; his collected works, in two volumes, *Bugos Rastai*, 1-11 were published at Vilnius in 1958. Buga's deep and wide linguistic interests had a lasting influence on the next generations of Lithuanian, Baltic and Slavic linguists. (MA. G.)

BUGANDA, the largest of the kingdoms and the most central of the four provinces of Uganda, east Africa, is divided into the four administrative districts of East Mengo, West Mengo, Mubende and Masaka. Its position to the north and west of Lake Victoria, where it occupies a total area of 25,096 sq. mi., including 8,958 of open water and swamp, is fundamental to its geographical character. The flat-topped plateaus of Buganda, 4,000 ft. or more above sea level, are for the most part developed in the gneisses of the Archean Basement complex, but the lakeside hills to the east of Kampala and Singo hills of West Mengo belong to the Pre-Cambrian Toro system. Farther west the hill country of Mubende consists of granites of post-Toro Age. The landscape is especially dissected in the area marginal to Lake Victoria! while a smoother relief prevails in northern Mengo and in western Masaka. The Lake Victoria zone is the best watered part of Buganda and uncultivated areas are characterized by high grass-

low tree savanna and relict forest. With a mean annual rainfall of less than 40 in. and more pronounced dry seasons, northern Mengo and western Masaka are short-grass areas. Temperatures are equable, rarely rising much above 80° F. or falling below 60°.

According to the 1959 census the population of Buganda was 1,881,149, including 47,021 non-Africans. More than half the non-Africans in Uganda were living in Buganda, the great majority of them in West Mengo. The non-African total for Buganda included 6,683 Europeans, 33,080 Indians, 3,789 Pakistanis, 2,101 Goans, 562 Arabs and 806 others. Ganda (Baganda) numbered 1,006,101; i.e., 55% of the total African population of the province. The main immigrant groups were Ruanda, Rundi and Nkole; but most of the tribal groups of Uganda, western Kenya and northwestern Tanganyika were strongly represented in this land of economic opportunity. In many subcounties the immigrants were in excess of the Ganda, often considerably so. Population is concentrated in the Lake Victoria zone where rural densities of 200–400 per sq.mi. are normal and where the three towns—Kampala, Entebbe (*qq.v.*) and Masaka—are situated. The 1959 figures of total population and (in parentheses) non-African population for each of these towns are: Kampala 46,735 (22,679); Entebbe 10,941 (1,854); and Masaka 4,782 (2,325).

The Lake Victoria zone with its intensive garden cultivation comprises an essentially humanized landscape. Most of the land is held in freehold, but the original *mailo* estates of 1900 have been much fragmented. Cooking bananas and to a lesser extent maize (corn) form the main food crops of Buganda, but sweet potatoes, peanuts and cassava are also extensively grown. Robusta coffee and cotton are the main cash crops, the former being restricted to the Lake Victoria zone. Cotton is entirely produced by African cultivators, and coffee largely so; but estate coffee, tea and sugar are grown in southern Mengo. Cotton ginneries and coffee-curing works are mainly in the lake zone, where there is abundant electric power. There is a limited production of consumer goods in and near Kampala: and the Jinja textile factory and brewery are in the Buganda town of Njeru. The railway line from Kasese in western Uganda to Mombasa passes through central Buganda; farther south the port of Bukakata on Lake Victoria serves the rich area of eastern Masaka. Road communications, of which there is a close network, focus on Kampala.

The *kabaka* of Buganda is a constitutional ruler, whose principal ministers are the *katikkivo* (chief minister), the *omulamuzi* (chief justice) and the *omuwanyika* (treasurer). The *lukika* (council) is composed of 68 elected members, not more than 20 county chiefs, 6 members appointed by the *kabaka* and those ministers, not exceeding 6, who are not otherwise members of the council. The *lukiko* legislates on a considerable variety of subjects of concern to Buganda, and the *kabaka's* government controls a range of departmental services, for which grants may be received from the central government. There is a Buganda courts system and a *kabaka's* police force.

The status of the kingdom of Buganda was redefined in the Uganda Constitutional conference, 1961, and in the Buganda agreement, 1961, under which instrument Buganda was united in federal relationship with the rest of Uganda. It was further agreed that Buganda should be represented in the national assembly by 21 members elected in Buganda and 3 members elected within the municipality of Kampala. The *lukiko* might choose to elect the members from Buganda outside Kampala by an indirect procedure. Provision was made for Kampala to retain its distinctive position as the national capital of Uganda, with a municipal council deriving its authority from the national government. See UGANDA.

Pallister, "The Physiography of Mengo District, Uganda," *Uganda Journal*, vol. 21 (1957); *Report of the Uganda Constitutional Conference* (1961). (S. J. K. B.)

BUGEAUD DE LA PICONNERIE, THOMAS ROBERT, DUC D'ISLY (1784–1849), marshal of France who played an important part in the French conquest of Algeria, was born at Limoges on Oct. 15, 1784. In 1793, during the French Revolu-

tionary period, his father, who belonged to the nobility of Périgord, was imprisoned; his mother, who was of Irish origin, died in 1796, so that the young Bugeaud was brought up by his sisters among the peasants of the Dordogne. Enlisting in the light-armed troops of the foot grenadiers of Napoleon's imperial guard, he was appointed sublieutenant in 1806. Under Marshal Suchet, he distinguished himself in the closing campaigns of the Peninsular War, rising to the rank of colonel. Having declared himself for the Bourbons at the first Restoration (1814), he was forced by his men to revolt during the Hundred Days (1815) and so was put on half pay at the second Restoration. A rich marriage having enabled him to repurchase his family lands, he took up farming and interested himself in the improvement of agricultural methods until the July revolution of 1830 allowed him to resume his military career. Elected deputy for Excideuil, he served Louis Philippe's regime as jailer of the duchesse de Berry at Blaye (1833) and helped to suppress the Paris riots of 1834.

Sent to Algeria for a short period in 1836, Bugeaud defeated Abd-el-Kader at Sikkah (July 6). At the same time he began to criticize the way in which the Algerian war had hitherto been conducted. At first in favour of a restricted French occupation, he made remarkable concessions to Abd-el-Kader in the treaty of Tafna when he was sent to negotiate with him in 1837. In 1841, however, he returned to Algeria with the rank of governor general and the task of conquering the whole country. Abandoning the strategy of fixed positions, he formed mobile columns of light troops with which he systematically devastated the lands of the natives. This ruthless method won early success, and in 1843 he was made marshal of France. On Aug. 14, 1844, he crushed Abd-el-Kader's Moroccan allies at the battle of Isly, for which he received his ducal title. By inciting the prince de Joinville to bombard Mogador regardless of British objections, he showed himself ready to pursue his own policy without consulting the French government. After a short stay in France, however, he went back to Algeria to avenge the disaster of Sidi Brahim (Sept. 1845). Having returned to France in July 1846, he again went to Algeria in April 1847. Finally, however, embittered by the government's neglect of his plans for military colonization, he resigned his post in Sept. 1847.

On the outbreak of revolution in Paris in Feb. 1848, Bugeaud took command of the army for Louis Philippe but could not save the monarchy. Under the second republic he published numerous pamphlets against socialism and also accepted the command of the army of the Alps. He died of cholera on June 10, 1849.

Bugeaud remained true to his origins—proud of his noble birth, conservative, deeply attached to the land and concerned for the welfare of his soldiers as long as they observed the discipline to which he had once been subject. A self-taught man who hated intellectuals and was quick to solve particular problems arbitrarily, he wrote copiously in defense of his own views. He was ready to teach his soldiers how to handle the flail and the plow, and his efforts to protect the Algerian peasantry against the French civil administration, which he despised, give him some claim to be regarded as a colonial precursor of Gallieni and Lyautey. His collected military writings were published in 1883.

BUGGE, (ELSEUS) SOPHUS (1833–1907), Norwegian philologist, the author of the first critical edition of the *Edda* (*q.v.*), was born at Laurvik, on Jan. 5, 1833. He was educated at Christiania, Copenhagen and Berlin and in 1866 became professor of comparative philology and Old Norse at Christiania university. He was a pioneer in the collection and study of Norwegian folk songs, traditions and runic inscriptions. Bugge's critical edition of the elder *Edda* (*Novroen fornkvædi*) was published at Christiania in 1867. He maintained that the songs of the *Edda* and the earlier sagas were largely founded on Christian and Latin tradition imported into Scandinavian literature by way of England. His next most important work was the monumental edition (1891 *et seq.*) of ancient Norwegian inscriptions. His writings also

include *Gamle norske folkeviser* (1858), a collection of Old Norse folk songs; and *Helgedigtene i den aeldre Edda* (1896; Eng. trans.. *The Home of the Eddic Poems*, 1899). He died on July 8, 1907, at Oslo.

BUGI, a Malayan people, about 2,500,000 in number, who are the largest and most advanced ethnic group in the Celebes and often linked with the closely related Macassarese. The Bugi stronghold is in the southern portion of the Celebes but they are steadily expanding into adjacent territory as well as into Borneo.

They were among the early Malayan converts to Buddhism who accepted many Indian customs. These include a graded society, ranging from the raja at the top down through district officers and princes to village heads. Along with such borrowings came an Indian form of writing in which a rich literature was recorded. Early in the 17th century the Bugi were converted to Islam. Today a priestly organization deals with matters pertaining to religion, marriage and inheritance.

In former times even the houses indicated the rank of their owners by the number of gable ends and by carvings on the ridge poles. Today these structures serve as matrilineal family houses, often with as many as 20 inhabitants. There are no fixed rules concerning marriage although unions are usually between people of the same area and status. Child marriage occurs, bridewealth is paid and polygyny is allowed.

Agriculture is important, as is the raising of cattle: horses and water buffalo. Each village is practically self-supporting, but increasing demands for foreign goods and conveniences are leading part of the men to seek work for wages or to produce export crops. Village schools are well attended and at least one-fourth of the population is able to read and write. See also CELEBES.

See R. Kennedy, *Field Notes on Indonesia* (1953); W. Kaudern, *Ethnographic Studies in Celebes*, 5 vol. (1925-38); P. and F. Sarasin, *Reisen in Celebes*, 2 vol. (190.5). (F.-C. CE.)

BUGLE, a wind instrument sounded by the vibration of the lips against a cup mouthpiece. As a modern military signaling instrument it dates from c. 1750, when Hanoverian iaeer battalions adopted a large semicircular copper horn, nith widely expanding bore, used by the *Flügelmeister*, an official of the hunt. English light infantry then did the same, the German *Flügelhorn* or *Horn* taking the name bugle horn, a term of medieval origin derived from Old French *bugle* ("bullock"). This early bugle was pitched in C or D, often lowered to B flat by a coiled crook; its semicircular form may still be seen in many light infantry and rifle regiment badges, for which it was adopted in 1814, though from c. 1800 the bugle itself was once-looped in trumpet shape and was officially so made from 1812. The compact British design, twice-coiled with narrow bell, became official in 1858.

Bugle calls and marches employ the natural harmonics from the second to the sixth, written middle C, G, C, E, G, but sounding a note lower, the modern bugle being built in B flat. The calls are grouped as regimental calls, field calls and routine calls. Some of the most familiar, including the Reveille and the "Last Post," remain virtually unchanged since 1815 if not earlier. Others, especially among field calls, were originally played at a loner pitch, making greater use of the low C, though essentially the same in pattern and rhythm as the calls laid down from 1860 onward. The first official list of calls was issued in 1798.

The popularity of the bugle horn at the end of the 18th century is reflected both in the publication of many bugle marches

BY COURTESY OF THE CINCINNATI ART MUSEUM
SPANISH CAVALRY BUGLE, 19TH CENTURY

with military band and also in the featuring of the instrument in light operas. Inevitably this led to an invention whereby its purely musical scope was enlarged. In 1810 in Dublin, Joseph Halliday, bandmaster of the Cavan militia, patented the key bugle, or Royal Kent bugle, with brass keys fitted to the once-coiled bugle of the period to give it a complete scale. Usually with six keys (five closed, one open-standing), this was most successful and became a leading solo instrument in military bands until replaced by the cornet (*q.v.*).

The key bugle also had some success in Germany (*Klappenhorn*) and in France, where it inspired the ophicleide (*q.v.*), its bass version. Valves: invented in Berlin c. 1815, were fitted to the same once-coiled bugle on the continent during the 1820s, the new instrument in Germany keeping the old name *Flügelhorn*, and in France being called *bugle* (the French word for the field bugle being *claironj*). It became and still remains the principal treble brass instrument of continental military and brass bands, pitched in B flat, though sopranos and altos in E flat are sometimes used with it. In England, this valved bugle, with its German name *Flugel Horn*, has always been overshadowed by the cornet; a regularly constituted brass band includes one, but a military band none. It possesses the full tone of the bugle, softened by use of a deeper mouthpiece, and in the orchestra it has a part in Vaughan Williams' Eighth Symphony and Stravinsky's *Threni*.

Bugles have also been fitted with a single valve that lowers the pitch by a fourth as a simple method of providing a partly diatonic compass and dominant harmony.

See WIND INSTRUMENTS; TRUMPET.

BUGULMA, a town of the Tatar Autonomous Soviet Socialist Republic, U.S.S.R., is located at the confluence of the small Bugulminka and Stepnoi Zai rivers, on the Ulyanovsk-Ufa railway. Pop. (1959) 61,000. Founded in the mid-18th century, Bugulma remained an unimportant township until the 1930s when it began rapid development as one of the major centres of the Second Baku (*q.v.*) oilfield. There is a refinery there and a pipeline connection to the Ufa refineries. Bugulma also has important food-processing and building-materials industries. (R. 4. F.)

BUHAYRAH, AL (BEHEIRA), a governorate of lower Egypt in the northwestern corner of the Nile delta, is triangular in shape, bounded by the Mediterranean, the Western desert and the Rosetta branch of the Nile. Pop. (1960) 1,682,000; area 1,777 sq.mi. The governorate capital is Damanhur (*q.v.*) on the main railway from Cairo to Alexandria (38 mi. W.N.W.). Other chief towns are Idku and Rosetta. The northern part of the governorate contains the lakes Maryut and Idku, with their contiguous saline marshes, which reduce the over-all population density to 947 per square mile in spite of dense population in the south.

Al Buhayrah is one of Egypt's principal cotton-growing governorates, about 25%-30% of the cultivated land being under cotton each year. Production increases toward the south and includes some of the longest stapled varieties, but there is some yield from the reclaimed portion of the lagoon area. Agriculture is the principal occupation; besides cotton the main crops are maize (corn), rice, barley, wheat and clover, and some grapes are grown near Alexandria. Mineral resources are few: limestone from Al Maks, near Alexandria, supplies a cement works and provides building stone, while natron (a mixture of sodium carbonate and bicarbonate) is obtained from the lake-dotted depression of Al Barruqi, 12 mi. S.W. of Damanhur. There is rice milling, cotton ginning and textile manufacture, including modern rayon and cotton textile

SINGLE-VALVED BUGLE

mills at Kafr ad Dawwar. The Nile control works at Idfina, 12 mi. above Rosetta, constructed in 1951, supply irrigation canals and, in the low-water season, prevent sea water from penetrating up the river.

A separate small administrative unit, At Tahrir (Liberation), was formed out of Al Buhayrah on the desert side in the late 1950s. (A. B. M.)

BUMTURI, AL- (Arab. WALID IBN UBAYD AL-BUHTURI) (820-897), Arabian poet, spent many years as court poet to the Abbasid caliphs of Baghdad. Of the tribe of Tai, he was born in 820 at Manbij (Hierapolis) in Syria, between Aleppo and the Euphrates, and died, also at Manbij, in 897. Although long resident in Baghdad he devoted much of his poetry to the praise of Aleppo, and much of his love poetry is dedicated to Alwa, a maiden of that city. His poetry was collected and edited twice in the 10th century. Buhturi also made a collection of early poems entitled the *Hamasa* which, however, was less popular than the *Hamasa* of his predecessor, Abu Tammam.

BIBLIOGRAPHY.—Buhturi's poems were published in Constantinople in 1883 and in Cairo in 1911. The *Hamasa* was published in Leyden in 1909 and in Beirut in 1910. For his life see Ibn Khallikan, *Biographical Dictionary*, trans. by M' G. de Slane, iii, p. 657 ff. (1812); Abulfaraj, *Book of Songs*, vol. xviii, pp. 167-175 (1906); M. T. Houtsma et al. (eds.), *The Encyclopaedia of Islam* (1913).

BUILDERS' RITES. The customs of turning the first shovelful of earth for the foundation of a new building, of placing various objects such as coins, newspapers and documents in the cornerstone of the structure and of celebrating the completion of the skeleton of the building are remnant rituals of great antiquity. Primitive farmers still make offerings to the resident spirits of the forest before clearing a plot of land. The sacrifice of living victims to the gods to ensure stability and permanence to religious structures was formerly widespread. In the 15th century the wall of Holsxvorthy church in England was built over a living human being. When this became unlawful, images of living beings were substituted. Such rituals symbolize the importance of the occasion to the participants and the successful accomplishment of group purposes. (F. R. E.)

BUILDING AND LOAN ASSOCIATION: see SAVINGS AND LOAN ASSOCIATION.

BUILDING INDUSTRY. In all technically developed communities the building industry, comprising skilled and unskilled workers in many trades, manufacturers of components, supervisory and managerial staffs, and professional and technical advisers, employs a considerable proportion of the available labour force. In the United States, for example, 10% of the working population owes its livelihood directly or indirectly to the building industry, making it the largest single industry in the country.

Relationship of Architect and Builder.—Variations in the structure of the industry in different parts of the world appear principally in the definition of the roles of architect and builder. In the past, the skilled craftsman who had sufficient ability may have become a master builder, and in this capacity he not only constructed but designed buildings. In Europe the first distinction between builder and architect began to appear in the 15th century, but it was not until the 19th century that real division of the two functions occurred. The status of the architect as one of an organized professional group dates in the United States only from 1857. In Latin America and in parts of Europe the architect is still, in effect, his own building contractor, employing his own building labour. Other countries follow the practice of Great Britain, where architect and contractor are entirely separate.

The Modern Building Industry.—The building industry in the United States is made up of the following professional and business interests:

1. The contractor, who is the manager of the building project, co-ordinating the work of assembling materials into a structure, and contributing his knowledge of costs and building methods through consultation with the architect and the owner.

2. The labour forces, whose productivity is being increased by new techniques and equipment and more efficient use of existing equipment.

3. The manufacturer, who has helped revolutionize the building

industry by developing better materials and better distribution methods.

4. The engineer, who has made possible modern structural developments by his ability to use existing materials in new and startling forms.

5. The architect, who with his artistic and technical knowledge is introducing new visual ideas that are changing the future of building and are providing a background to modern conditions of living.

The Building Owner.—Construction of buildings is the result of co-operation between the building owner or client, the architect and his professional consultants, and the contractor. Other parties also may assist in a project; for example, a financing agency may be called upon to provide the necessary funds, and governmental agencies may be consulted about building safety and health regulations, zoning restrictions, etc.

Recent years have seen the growth of a new type of owner called the corporate client, the large business organization that erects buildings for its own use. Building owners of this type have brought about changes in building procedures because in some cases their own staffs of architects and construction personnel can design and build without resorting to outside labour. In other instances where buildings such as apartments, offices or shopping centres are constructed as a financial speculation, the so-called package plan may be used, the "builder" in this case being the financing agency, contractor, architect and owner, each contributing to the project and sharing in its success or failure.

Planning.—In general, all projects are constructed following certain specific lines. The owner engages the services of an architect who, in consultation with the owner and other interested parties, prepares the program and basic specifications for the proposed project. During this stage the architect may consult a competent building contractor for aid in preparing budget estimates. This is a normal and logical procedure because the contractor's knowledge of site problems, organization of the labour force, and practical limitations imposed by materials and working methods can help to enable the architect's ideas to be executed to the satisfaction of the owner.

In most modern projects the architect employs professional consultants to prepare detailed plans and specifications for the structural and mechanical portions of the project. The complexities of modern structures and of air conditioning and electrical systems, for example, require the advice of specialists. The architect has the over-all responsibility for the design and co-ordination of the complete project to fulfill the owner's requirements.

Bidding and Contracts.—There are various procedures under which the contract for a building may be awarded. For example, bids may be taken from a selected group of building contractors whose qualifications are known to the architect. These may be lump-sum bids when complete plans and specifications are available. If it is not possible to wait for complete plans and specifications to be prepared, "cost-plus" bids can be submitted; in this case, the contractor is paid a set fee in addition to the cost of the work. Many of the larger and specialized types of structures are built under the cost-plus-fee plan.

In Great Britain quantity surveyors are employed to prepare detailed bills of quantities of materials required in the project, and the building contractors bid or tender on these quantities. This practice is not followed in the United States.

When bids are received by the architect, the contractor submitting the lowest bid is generally awarded the contract, unless there are special reasons to the contrary. After the decision of the owner, in consultation with the architect, to accept the proposal of a certain contractor, the acceptance is followed by the execution of a formal contract between the owner and the contractor. The contract outlines the work to be done as shown by the architect's drawings and specifications; it shows the amount the contractor is to be paid and in what manner; and it indicates the date agreed upon for completion of the work. Standard contract forms in general use in the United States are those prepared by the American Institute of Architects and approved by the Associated General Contractors of America and organizations representing other

segments of the industry. In Great Britain the relevant form of contract is that approved by the Royal Institute of British Architects.

Construction Management.—The modern building contractor is organized for more efficient production of the work than in the past. The use of specialized equipment and tools, as well as the prefabrication of building components, is employed to offset the rising cost of labour. Some building contractors have become what is known as brokers; in other words, they take complete responsibility for a project but turn over all of the work to subcontractors. This method of operation has certain drawbacks, including the widening of the gap between management and labour in the construction industry and the division of responsibility among the subcontractors.

BUILDING SOCIETY: see SAVINGS AND LOAN ASSOCIATION.

BUILTH WELLS, a market town and urban district of Breconshire, Wales, in the Brecon and Radnor parliamentary division, 64 mi. N. of Cardiff by road. Pop. (1961) 1,602. The town is at the focus of the Irfon, Ithon and Wye valleys in a small plain beneath high hills. Under the Normans the district known as Buellt became a lordship marcher (a border area under military jurisdiction of an earl) annexed to Brecon, but it fell away on the marriage of the daughter of William de Braose (Breos). At the eastern end of the town is a fine motte and bailey castle which may have been erected either by Philip de Braose (William's grandfather) or Bernard de Newmarch; there are traces of a 13th-century stone castle. In 1278 Edward I granted the town a charter which later fell into disuse. As an advanced outpost of the invaders in the upper Wye valley, the castle suffered severely, notably at the hands of Llewelyn ap Gruffydd, prince of Wales, in 1260. In this neighbourhood Llewelyn fell in ambush in 1282 and with him collapsed much of the Welsh resistance. The lordship remained in the Marches until the Act of Union, 1536, when it was grouped with others to form the shire of Brecknock or Brecon (*y v.*). With the development of better roads in post-medieval times, Builth became an important gathering centre for shipment of cattle to England. Its fairs and marts for livestock are still well attended. The old town was destroyed in 1691 by a fire and was rebuilt in the 18th century. It is an agricultural town and a summer resort with mineral springs, known as Park wells, and salmon and trout fishing. Builth has been an urban district since 1894. In 1898 the urban district was made coterminous with the civil parish and renamed Builth Wells.

BUISSON, FERDINAND EDOUARD (1841–1932), French educator, reorganizer of the French primary school system, whose work for international understanding led to his receiving, jointly with Ludwig Quidde, the Nobel peace prize in 1927, was born in Paris on Dec. 20, 1841. From 1866 to 1870 he held the chair of philosophy at the Academy of Neuchâtel, Switz., and in 1867 took part in the first Geneva peace conference, where he advocated a united states of Europe. He was also an early advocate of the League of Nations. After the fall of Paris in the war of 1870 he organized an asylum for war orphans. He became secretary of the statistical commission on primary education in 1870 and inspector general in 1890, during this period publishing his *Dictionnaire de pédagogie* (1882–93). In 1896 he became professor of education at the Sorbonne, Paris. From 1902 to 1914 he was a member of the chamber of deputies and from 1913 to 1926 was president of the Ligue des Droits de l'Homme. Buisson died at Thieuloy Saint-Antoine (Oise) on Feb. 16, 1932. (S. J. C.)

BUKHARA (BOKHARA). (1) A khanate of central Asia which ceased to exist as such in 1920; (2) an oblast of the Uzbek Soviet Socialist Republic, U.S.S.R.; (3) a city, capital of the former khanate and now of the oblast of the same name.

1. The khanate of Bukhara was founded in the 16th century. The most important part of it originally belonged to Sogdiana (*q.v.*), which, after the conquest of Alexander the Great, formed part of the Seleucid empire. For many centuries the country was inhabited by the Sakas, who, toward the end of the 2nd century

A.D., were driven out of the Oxus (Amu-Darya) country by the Yue-Chi, who, in their turn, were ejected by the Hephthalites, or White Huns, in A.D. 450. One hundred years later the Turks of central Asia defeated the king of the Hephthalites near Bukhara and became possessed of the rich lands between the Oxus and the Jaxartes (Syr-Darya) rivers. The Hephthalites were engaged in a continual warfare with the Sassanian rulers of Persia, and when the Turkish khan drove them out of Bukhara he wrote to the Persian king that "the blood of their common enemy had reddened the waters of the Oxus." Down to the time of the invasion of Transoxania by the Muslims at the end of the 7th century Bukhara had remained under the overlordship of the western Turks. The town of Bukhara fell in the year A.D. 676. It was not, however, until 30 years later that Transoxania was finally subdued. The Arab historians gave to the country the name of Mavera-un-nahr or "what lies beyond the river" (*i.e.*, the Oxus). Down to the beginning of the 9th century Transoxania was under the jurisdiction of the governor of the eastern provinces of the caliphate. Hitherto Arabs had been appointed to this governorship, but in 820 it was given to a Persian named Tahir in whose family the post became hereditary. These governors in their turn appointed subgovernors to various provinces, and several members of a Persian family known as the Samanids were employed in this capacity in Transoxania. One of the Samanids, named Ismail, managed in 904 to make himself a semi-independent ruler with Bukhara as his capital and founded a dynasty which lasted down to the end of the 10th century. It was under the Samanids (*q.v.*), the first Persian dynasty to rule in Islam, that Bukhara became a centre of learning. On the fall of the Samanids Transoxania again fell into the hands of the Turks, and it continued to be governed by various branches of this race until the Russian occupation. In 1220 Bukhara was sacked by Genghis (Jenghiz) Khan. It attained its greatest importance during the rule of the Shaybanids (1500–99). Bukhara was conquered by Persia in 1740. In 1753 the amir Mohammed Rahim freed himself from Persian vassalage but lost control of the provinces of Khorezm, Tashkent and Fergana.

Toward the middle of the 19th century Bukhara became an object of rivalry to Russia and Great Britain and envoys were sent by both nations to cultivate the favour of its amir. Two of the British emissaries, Col. C. Stoddart and Capt. A. Conolly, were thrown into prison by the amir Nasrullah and there put to death in 1842. In 1866 the Russians invaded the territory of Bukhara proper and crushingly defeated the amir's forces. In 1868 the Russians entered Samarkand and a treaty was concluded whereby the amir of Bukhara became, to all intents and purposes, a vassal to the conquerors and undertook to protect Russian trade. In 1882 a Russian political agent was appointed to reside in Bukhara and a Russian bank was established; thus gradually Bukhara became a part of Russian Turkistan. In 1892 the amir made a journey to the Russian court and left his two sons to be educated in Russia. In 1920 revolution broke out in the khanate, the amir fled to Afghanistan and the Bukharan People's Republic was set up. An anti-Soviet rising largely directed by Enver Pasha (*q.v.*; formerly minister of war in Turkey) and known as the Basmachi revolt began in 1922, but collapsed after Enver's death the same year. In 1924 Bukhara was declared a Socialist republic but in the same year its territory was divided up among the newly formed Uzbek, Tadzhik and Turkmen Soviet Socialist Republics.

2. The *oblast* of Bukhara (area 47,452 sq.mi.) includes the lower Zeravshan valley and a large section of the Kyzylkum desert. The economy mainly consists of cotton cultivation, sericulture and fruit farming. The Trans-Caspian railroad crosses the southern section of the oblast; there is a branch line from Kagan to Dushanbe in the Tadzhik S.S.R. Apart from the capital the main towns are Gizhduvan and Kagan (formerly known as Novaya [New] Bukhara). The population was 573,000 in 1959, consisting mainly of Uzbeks. By the 1960s there were about 500 schools in the *oblast*.

3. The city of Bukhara is situated in the Zeravshan valley on the Shahrud canal. Pop. (1959) 69,000. The railway station (8 mi. away at Kagan) is on the Ashkhabad line. Bukhara is a town

of great antiquity, the date of whose foundation is unknown. It was already an important commercial and cultural centre when it was conquered by the Arabs in the 8th century. After A.D. 999, when it was captured by the Karakhanid Turks, it lost some of its status to Samarkand. In the mid-12th century it was occupied by the Kara-Kitais. Laid waste by Genghis Khan, it was re-established by Jagatai and at the end of the 14th century was included in Timur's dominions. In the 17th century it became the seat of the Bukhara amirs and remained so until 1920.

The city, formerly called Staraya (Old) Bukhara, was to some extent modernized under the Soviet regime but it retains much of its mediæval appearance and character: mosques, mausoleums, flat-roofed houses of sun-dried brick, and bazaars. Many of the mosques and all the Muslim schools have been closed and only one theological seminary is still active. Bukhara contains many outstanding examples of Muslim architecture. The oldest is the mausoleum of Ismail Samani (9th or 10th century). Other monuments are the Minareh Kalyan (12th century), a 203-ft. tower from which state criminals used to be thrown, the Mir-i-Arab madrasah (16th century), and the Abdul-Aziz madrasah (17th century). The main square of the city is called Registan. Modern buildings include the House of the Soviets (parliament) and various residential hostels. The population is mixed. Uzbeks predominate but most of them speak Tadjhik (Tajik), a form of Persian. There are also Arabs, Afghans and a Jewish colony. Educational establishments include a pedagogical institute; of the six middle schools two teach in Tadjhik, two in Uzbek and two in Russian. In the early 1960s about 4,000 pupils were learning in Russian, 2,500 in Tadjhik and 2,500 in Uzbek. Bukhara has a considerable amount of light industry including karakul processing, silk spinning, cotton ginning and cloth manufacture.

BUKHARI, AL- (MOHAMMED IBN ISMA'IL 'ABDALLAH AL-JU'FI, called AL-BUKHARI) (810–870), Arab author, almost universally regarded by Sunni Muslims as the greatest of the Traditionists; *i.e.*, recorders of the sayings and acts of Mohammed. His compilation, entitled *Kitab al-Jami' al-Sahih* (French trans., *Les Traditions islamiques*, 1903), ranks second only to the Koran as the source of Muslim doctrine and law. Of Persian origin, al-Bukhari was born on July 21, 810, at Bukhara in central Asia, and at 16 began his travels throughout the middle east recording the Prophetic Tradition. He died on Aug. 31, 870, at Khartank, whither he had been exiled as a result of his attitude in a fundamental theological controversy, in which he held that the words of the Koran were the creation of an inspired prophet and not a transcript of eternal divine law.

Al-Bukhari's scrupulousness as a compiler is illustrated by his reported statement that he never entered a tradition except after taking a bath and offering special prayers and that his final selection was made by sifting 600,000 traditions, choosing only what was absolutely sound (*sahih*). His mastery of his subject is attested by the chroniclers, who record that, in order to try him, the traditionists of Baghdad offered him a series of traditions in which the texts had been dislocated from the transmissional chain of authorities (*isnad*), and that he always detected the fault. His definite theological views are illustrated by his refusal to record traditions from those who did not believe that faith included good works and by his break with his teacher: Muhammad ibn Yahya, in the theological controversy which led to his exile. His compilation is divided into chapters according to legal topics. This involves much repetition as a single tradition is sometimes quoted to prove several different points of law. Each chapter heading is followed by a short discourse or comment by al-Bukhari him-

self. Variations in the text, as he received it, are carefully recorded, although this did not prevent the occurrence of further variants arising from new and different recensions.

Al-Bukhari also wrote a *Ta'rikh* (published in 1941), containing critical biographies of the authorities who formed the links in the chains of transmission of the Tradition.

See I. Goldziher, *Die Muhammedanische Studien* (1890); and C. Brockelmann, *Geschichte der arabischen Litteratur*, vol. 2 (1902). (F. U. R.)

BUKHARIN, NIKOLAI IVANOVICH (1888–1938), Russian Communist leader and active Marxist propagandist, called by Lenin "the most valuable and greatest theoretician of the party," was born in Moscow on Oct. 9 (new style; Sept. 27, old style), 1888. At the age of 18 he joined the All-Russian Social Democratic Labour party (R.S.D.R.P.). In 1908 he was co-opted to the Moscow Bolshevik committee. He was imprisoned in 1911 and deported to Onega, but fled to Germany. He was in Cracow in Austrian Poland in 1912, where he met Lenin, in Vienna 1913–14, in Switzerland 1914–15 and later in Sweden, Norway and Denmark. In Oct. 1916 he arrived under the false identity of Dolgolevski in New York city, where he edited a Russian Communist newspaper, *Novy mir*.

After the outbreak of the Russian Revolution in 1917, Bukharin returned to Russia through Japan. The sixth congress of the R.S.D.R.P. elected him member of the central committee in Aug. 1917, and he was editor of *Pravda* from the end of that year. He opposed Lenin at the time of the Brest-Litovsk peace treaty, but later regretted this attitude. He was elected to the executive committee of the Communist International (Comintern) at its first congress in March 1919, and often visited western Europe. In 1920 he published *The Economy of the Transitional Period*, a book in which he maintained that once the dictatorship of the proletariat had been firmly established the revolution would be completed, the class struggle exhausted and the propaganda of communism would proceed by natural evolution. Lenin himself criticized these views as being too "scholastic."

In 1924 Bukharin became a member of the Politburo, having been a candidate member since 1919. Although he disliked and distrusted Stalin, he supported him in his campaign against L. D. Trotsky, G. E. Zinoviev and L. B. Kamenev, believing it his duty to uphold Lenin's policy of 1921; *i.e.*, that of maintaining a firm alliance between the peasants and the proletariat, and laying the foundations for industrial growth in a prosperous agriculture. When Stalin suddenly reversed this policy in 1928, Bukharin, with A. I. Rykov and M. P. Tomski, opposed him. Bukharin's argument that industrialization was possible on the basis of capital accumulated from the savings of the peasantry without forcible means is contained in an article entitled "Notes of an Economist," published in *Pravda* on Sept. 30, 1928, the only reasoned case against Stalin's forcible policy ever to be published in the Soviet Union. Bukharin was stripped of his Comintern and party appointments and expelled from the Politburo in Nov. 1929. Although he recanted his views, under pressure, he never occupied any influential post thereafter, though he played a leading part in drafting the constitution of 1936. Early in 1937 he was suddenly arrested, and in March 1938 he was put on trial with others as an alleged member of a counterrevolutionary organization, condemned to death and shot (March 14). The charge has since been admitted to have been false; the evidence adduced can be assumed to have been faked, and the partial confession made by Bukharin to have been extracted by force.

Bukharin's published works include: *World Economy and Imperialism* (1918); *Vom Sturze des Zarismus bis zum Sturze der Bourgeoisie* (1918); *Programme of the World Revolution* (1920); *The A.B.C. of Communism* (1921); *Historical Materialism* (1925); *The Way to Socialism and the Peasant-Worker Alliance* (1925); *Die ökonomische Theorie des Rentners* (1926); *Poetry, Poetics and the Problem of Poets in the U.S.S.R.* (1935).

(L. B. Sc.)

BUKIDNON, a pagan people of north central Mindanao, in the Philippine Islands, are of special interest since they appear to approximate the pre-Spanish condition of the now Christianized

Bisayans (*q.v.*). Today their settlements, possessions and means of gaining a livelihood differ little from those of the poorer people of the coast. However, in two aspects—dress and religion—the Bukidnon remain unique. Women's jackets and voluminous skirts are made of strips of coloured cloth decorated with embroidery and appliqué designs. To such outfits are added earrings, ear plugs, necklaces, finger and toe rings and huge combs. The men's dress is equally colourful; their jackets, long trousers and carrying bags are covered with designs. Most adults blacken the teeth and, in addition, have the incisors cut off or inlaid with brass wire.

Religious beliefs are of great complexity. Each person has seven indwelling spirits, or *gimokod*. If all are present in the body all is well, but if one or more wanders trouble or death ensues. This has led to the art of soul snatching and soul catching. In addition to the *gintokod* there is a bewildering number of spirits for whom many elaborate ceremonies are held at critical periods in the life of the individual or of the group. To cope with them there has developed a trained group of men and women, known as *baylan*, who conduct ceremonies, make offerings and act as soul catchers. However, they are not mediums in the sense that is usual among Malayan peoples. Postwar conditions have led to rapid change in the conservative Bukidnon people.

See F.-C. Cole, *The Bukidnon of Mindanao (1956)*; R. Lynch, "Changes in Bukidnon Between 1910-1950," *Anthropological Quarterly*, vol. 28, no. 3 (1955). (F.-C. CE.)

BUKIDNON, the only interior province of Mindanao. Republic of the Philippines, is roughly coextensive with the Bukidnon plateau, a volcanic tableland that is cut by deep canyons and ravines. The soils are moderately fertile, but erosion is a problem in some areas. Principal agricultural products are corn, upland rice and pineapples; livestock grazing is probably better developed in Bukidnon than in any other province. A 15,000-ac. pineapple plantation supplies a modern cannery at Bugo (Misamis Oriental province) with sufficient fruit for year-round operation. Pop. (1960) 195,630; area 3,104 sq.mi. Malaybalay (mun. pop. [1960] 34,183) is the capital and principal town. (AN. C.)

BUKITTINGGI, a hill town of western Sumatra. Indonesia, stands on the Agam plateau, a ridge of high land running parallel to the coast. Pop. (1957 est.) 52,824. Formerly capital of the district of Agam, under the redivision of Sumatra into six provinces in 1957 Bukittinggi became provincial capital of West Sumatra. It is in the Menangkabau country, one of the most beautiful parts of Indonesia, with mountains, lakes, valleys, rich green rice fields and villages among a profusion of palm trees. A characteristic sight of this region is the local house with saddle-shaped roof, the ends pointing upward like buffalo horns.

Bukittinggi is the most important commercial centre in the Menangkabau region. It is connected by road with all other Sumatran provincial capitals and by rail with Padang and Sawahlunto. The town has a museum set in botanical gardens. Its former name, Fort de Kock, derived from the stronghold built by the Dutch in 1825.

BUKOVINA, a segment of the northeastern Carpathians with the adjoining plain, the whole having an area of 3,396 sq.mi.; the peace treaty of 1947 divided it between Rumania and the U.S.S.R. Of the total area, 45% is covered with fir and beech forest and only 29% is arable. Timber processing is the main industry of the region. There are a number of mineral deposits, including manganese and some oil. The mountain streams are a source of power. The Dniester, the Prut and the Siret rivers all run southward.

History.—Both Ukrainians (Ruthenians) and Rumanians (Moldavians) claim to be the first inhabitants of the country, but in the 14th century it became an integral part of the principality of Moldavia (see RUMANIA: History). Suceava, in the south of the territory, was the capital of that principality from 1388 to the 1560s. Bukovina, however, had no separate history or name until 1775, when it was detached from Moldavia (then under Turkish suzerainty) and annexed by Austria as a strategic link between Transylvania and Galicia. From 1786 to 1849 Bukovina was administered as part of Galicia; then, as a duchy, it became a separate Austrian crown land. In 1861 Chernovtsy (Czernowitz

or Cernăuți) was made the seat of a provincial diet. Under Austrian rule the country was developed, and Chernovtsy, which had been endowed with a university in 1875, became an important trading centre after the opening of the railway in 1886. The Austrians kept the balance between the various nationalities; the population was almost solidly Ukrainian in the north and Rumanian in the south, while there were a number of Germans and Poles and, in the towns, many Jews. When Rumania achieved independence in 1879, Bukovina became an object of irredentism. It was not only the cradle of the Moldavian principality but also the repository of the finest examples of Rumanian art and architecture—its unique painted monastic churches of the 15th and 16th centuries. On the collapse of Austria-Hungary in 1918, a local Ukrainian national committee voted the incorporation of the Ukrainian districts of northern Bukovina into the West Ukrainian Democratic Republic. Rumanian troops marched in soon after, and on Nov. 25 a congress of local Rumanians, Germans and Poles voted the union of the whole province with Rumania. The Rumanian government put through a land reform in 1921 and pursued a policy of Rumanization. In the census of 1930, in a total population of 853,009, the Rumanians stood to the Ukrainians in the ratio of 35 to 28 (as against one of 27 to 30 in 1910). On June 28, 1940, the U.S.S.R., occupied northern Bukovina (2,096 sq.mi.); the Germans of the whole province (more than 93,000) were then repatriated by agreement between Germany and the U.S.S.R. In the summer of 1941 Rumania, as Germany's ally against the U.S.S.R., regained the northern districts; but the Russians reoccupied them in 1944 and secured them for the U.S.S.R. under the peace treaty of 1947. The boundary between north and south took Chernovtsy into the Soviet part but left the ancient Moldavian capital Suceava and the most famous of the monasteries to Rumania. The population of the Rumanian portion was 300,751 in 1948. It later became a part of the region of Suceava in the Rumanian People's Republic. The Soviet portion is now part of the Ukrainian S.S.R. (B. BR.)

BULACAN, a province lying immediately north of Manila on the island of Luzon. Republic of the Philippines. Pop. (1960) 557,691; area 1,021 sq.mi. Its western half lies on the central plain of Luzon and is drained by the Angat and Pampanga river systems which flow into Manila bay. The eastern portion consists of uplands that gradually increase in altitude toward the east, where they become the foothills of the Sierra Madre or Eastern Cordillera. The Angat watershed and the Ipo dam and reservoir, which supply water to metropolitan Manila, lie in southeastern Bulacan. Climatically there are two distinct seasons, wet from May or June until December and relatively dry the rest of the year. Malolos, the capital (pop., 1960, 49,267, mun.), is on the plain and has an annual rainfall of 89 in. Ipo, at a higher elevation has 135 in. Typhoons occur, most often between June and September. Temperatures are high and humidity is especially high except during the dryer months.

Agriculture is the chief economic activity and paddy rice is easily the most important crop. Sugar is important around Calumpit. River fishing by means of locally made gear is a subsistence activity, but commercial fishponds on the tidal swamp lands at the head of Manila bay are of much greater significance. With 42,000 ac., Bulacan led all other provinces in fishpond acreage in the mid-1950s. Hagonoy is the largest fishing community. There are a few mineral deposits, principally a low-grade iron ore, now essentially exhausted, and limestone, in the eastern hill section. The province is divided into 24 municipalities, four of which (Malolos [*q.v.*], San Miguel, Hagonoy and Baliuag) had populations of more than 35,000 in 1960. The people are principally Tagalogs. (AN. C.)

BULANDSHAHR, a town and district in Uttar Pradesh, India. The town, 42 mi. S.E. of Delhi on the Grand Trunk road, is located on the right bank of the Kali Nadi river on an elevated site, from which it derives its name Bulandshahr ("elevated town"). A district headquarters with population of 37,496 (1951 census), it has one college connected with the Agra university.

BULANDSHAHR DISTRICT is situated on a level plain slightly sloping to the south and east, in the upper Doab of the Ganges

and Jumna rivers which flow along its eastern and western boundaries respectively. Area 1,887 sq.mi.; pop. (1961) 1,735,836. The district is intensively cultivated and amply irrigated by tubewells and the two main branches of the Ganges canal. The Lower Ganges canal has its headquarters at Narora near Dibai. Wheat, barley, sugar cane, maize (corn), millets, pulses and some cotton are grown. The chief trade centre is Khurja (38,462).

Mahmud of Ghazni received the submission of the Hindu Raja in A.D. 1018. After being much fought over during the 14th century, the district enjoyed a period of peace under the Moguls. Further periods of unrest followed, and in 1805 it passed into the hands of the British, as part of the district of Aligarh (q.v.).

(S. S. BH.)

BULAWAYO, the second largest city in the Federation of Rhodesia and Nyasaland and chief town of Matabeleland, the western region of Southern Rhodesia, lies 4,450 ft. above sea level amid undulating pastoral country. The 1956 census gave a population of 93,490 non-Africans and employed Africans; in 1959 there were an estimated 147,000, of which about 43,000 were Europeans, 100,000 Africans and 4,000 Asians and coloureds. The climate is healthful, temperatures varying from 56° to 72° F. from June to October and rising to 100° in November. The average rainfall is 23 in., the wettest season being November to March.

Bulawayo was first occupied in 1893 and declared a town by Leander Starr Jameson on June 1, 1894. It became a municipality on Oct. 27, 1897, and was made a city on Nov. 4, 1943. When first formed it was on the site chosen by Lobengula, last of the Matabeleland kings, for his kraal, but in 1894 the settlement was moved to its present site 3 mi. away. Government house, however, built by Cecil John Rhodes, still occupies the original position.

Among the principal buildings and monuments are the city hall, the magistrates' court and large government offices; the National museum, the general hospitals for Europeans and Africans, the cloistered war memorial and the bronze statue of Rhodes. It has a municipal orchestra, a large public library and many educational, cultural and sporting facilities. The burial place of Rhodes in the Matopos hills lies 28 mi. south of the city. Khami ruins, 12 mi. west, have relics of past African culture.

Bulawayo, the headquarters of the Rhodesia railways, is the Federation's industrial centre and a most important commercial and distributing centre for all imports from the Republic of South Africa. Its manufactures include car tires, iron and steel, tin ware, bricks, sugar, flour, textiles, dairy products, beer, plows and freight cars.

(ED. S. W.)

BULB, a compound plant organ consisting of a compressed or telescoped stem to which is attached a series of closely overlying leaves, the whole representing a kind of subterranean bud. Anyone who has examined an onion is familiar with a bulb. A bulb's leaves—actually expanded leaf bases—are fleshy, being filled with stored food materials enabling a plant to lie dormant and thus to survive an unfavourable period when active growth is impossible because of lack of necessary water. This period may be a cold winter season, when soil water is frozen and hence unavailable, or one of the periodic droughts characteristic of semi-arid regions.

Botanists recognize two main types of bulbs. One, the tunicated bulb typified by the onion, has a thin papery covering protecting the fleshy leaves. The other, the scaly bulb, to be seen in the true lilies, has naked storage leaves, unprotected by any papery tunic, making the bulb appear to consist of a series of angular scales. Bulbs vary in size from insignificant pea-sized

J. HORACE MCFARLAND CO.
LONGITUDINAL SECTION OF TULIP BULB SHOWING THICK BASAL LEAVES AND SHOOT. FROM WHICH FLOWERS AND LEAVES WILL DEVELOP

structures to those of the large Crinum lilies whose individual weight may be upward of 15 lb. Because of their bulbs many common garden ornamentals like the narcissus, tulip and hyacinth can produce their flowers rapidly, almost precociously, in early spring when growing conditions are favourable. Other bulbous plants, for example the lilies, are summer-flowering while a few, like meadow saffron, bloom in the fall.

Bulb-producing species are especially abundant in the lily and amaryllis families which are particularly well represented in countries with pronounced dry seasons such as South Africa. Bulbous species are also common among early spring-flowering plants of the north temperate zone. A few bulbous species are of economic importance to man. The onion as well as its relatives the shallot, garlic and leek have served as useful vegetables since the dawn of history. Bulbs often contain poisonous principles. One such is the red squill (*Urginea*) whose bulbs are the source of an important and highly effective rat poison.

In horticulture the term bulb is applied incorrectly to a number of botanical structures with a similar food-storing function. Among such so-called "bulbs" are the solid corms (technically thickened leafless bases of plant stems) of the crocus and gladiolus and the elongated rhizomes (fleshy underground stems) of iris.

Most hardy ornamental bulbs are planted in the garden in the fall, at the end of the growing season. Depth of planting varies with the species, but is in general proportional to the average diameter of the bulb, with small bulbs usually planted a little shallower than larger ones. See also STEM. (WR. H. H.)

BULBUL, a group of starling-sized passerine birds comprising the family Pycnonotidae of Africa, Madagascar, southern Asia and the Philippines. The 109 species are variously gray, brown and olive-green (sexes similar), sometimes boldly streaked, and often with bright contrasting colours, especially on the head or under tail coverts. Several forms are crested. All are essentially arboreal and subsist on insects and fruit. Their abundance, gregarious habits, and varied calls, both harsh and musical, render the bulbuls conspicuous wherever found. The bulbul of Perso-Arabic poetry probably is *Luscinia hafizi*, a nightingale (q.v.).

(E. R. BE.)

BULDANA (BULDHANA), a town and district in Maharashtra state, India. The town is on the northern edge of the Deccan plateau, 247 mi. N.E. of Bombay and on the main north-south road crossing the Bombay Deccan uplands. Pop. (1951) 10,797. It has an arts college which is affiliated to Nagpur university.

BULDANA DISTRICT (pop. [1961], 1,062,391; area 3,751 sq.mi.) is enclosed west and south by the Ajanta hills; traversed south-eastward by the Penganga river, which rises in their northern spur west of Buldana town; and bordered on the north by the Purna, a tributary of the Tapti. The Purna alluvium gives the northern plain a highly fertile black cotton soil. Khamgaon (36,734), 20 mi. N.E. of Buldana, and Malkapur (24,9413, 30 mi. farther N.W.), are both important cotton markets on the Central railway. Khamgaon has a college of Nagpur university and Malkapur is also a centre of the grain trade. The district has many Hemadpanthi temples, named after Hemadri, minister to the 13th-century Hindu Yadava kings.

(D. G. NA.)

BULFINCH, CHARLES (1763-1844), first professional U.S. architect, was born in Boston, Mass., on Aug. 8, 1763. His father, Thomas Bulfinch, a wealthy physician, sent him to the Boston Latin school and Harvard (1778-81). In 1785 he went to Europe. In Paris he met Thomas Jefferson who advised him to see more architectural monuments in Italy and France. He returned, via London, to Boston in 1787. There he married his cousin Hannah Xpthorp in 1788. Once established at home, he was sought as architect for many important projects. Among these were the state house, Boston (designed 1787-88, built 1795-98, surviving, though obscured by later additions), the Connecticut state house, Hartford (1796), the three Harrison Gray Otis houses, Boston (1796, 1800, 1805), the Federal Street church (1809, his only Gothic building), University hall, Harvard (1813-15) and the state capitol, Augusta, Maine (1830). While achieving architectural fame he was also chairman of the board of selectmen of Boston (1797-1818) and instrumental in improving the street

system. In 1787 he helped promote Robert Gray's (1755–1806) voyage in the "Columbia," the first U.S. ship to sail around the world. When B. H. Latrobe (1764–1820) resigned as architect of the national capitol, Bulfinch succeeded him, used Latrobe's designs to finish the wings, and made a new design for the central rotunda with a high semicircular dome. His architectural ideas were mainly derived from the English Georgian style (*q.v.*). His works are characterized by refined proportions and the use of classical orders. Bulfinch died at Boston on April 4, 1844.

A son, Stephen Greenleaf Bulfinch (1809–70), was a Unitarian clergyman and poet; another son, Thomas Bulfinch (1796–1867), wrote *Bulfinch's Mythology*.

McLanathan, "Bulfinch's Drawings for the Maine State House," *Journal of the Society of Architectural Historians*, vol. 14 (May 1935) (P. F. N.)

BULGAKOV, SERGEI NIKOLAEVICH (1871–1944), Russian theologian, developer of the theological system called sophiology and a leader of Orthodox participation in the ecumenical movement. was born in Livny. on June 16, 1871, of a priestly family. He began his clerical training at the seminary of Orel, but under the influence of Marxism broke with the church and became a student of political economics. After extensive studies in Moscow, Berlin, Paris and London, he taught at the universities of Kiev (1901–06) and Moscow (1906–18). During this period he published *Capitalism and Agriculture* (1901) and *Philosophy and Economics* (1912). An active participant in the intellectual, spiritual and artistic revival that characterized the life of the Russian intelligentsia at the turn of the century, he became disillusioned with Marxist philosophy and, together with a group of former Marxists, N. Berdyaev, S. Frank and P. Struve, returned to the Orthodox Church. The story of his conversion is told in his book *The Undying Light* (1917). In 1918 he was ordained priest, but the Communist government prevented him from resuming his teaching and in 1923 expelled him from the Soviet Union. After two years of academic work in Prague, he was appointed professor of theology and dean of the newly founded Russian Orthodox Theological Institute of Paris, where he died on July 12, 1944.

Bulgakov spent the last 20 years of his life elaborating a system of theology known as sophiology, a doctrine centred on the concept of *Sophia* (Gr. "Wisdom"). Taken from the Old Testament (Wisdom of Solomon, Proverbs), this concept was used by medieval mystics and, especially, modern Russian philosophers—V. S. Soloviev and Paul Florensky, in addition to Bulgakov—in an elaboration of cosmology as living and organic unity revealing the Divine Wisdom. In the teaching of Bulgakov, *Sophia* is the link connecting God and the created world. His theories met with strong opposition among certain Orthodox hierarchs and theologians, and were condemned in 1933 by synods of Russian bishops in Yugoslavia and Moscow. Supported, however, by his own bishop and by his colleagues on the faculty of the institute, he was able to teach and write freely. A prolific writer, Bulgakov published more than ten books (*The Unburning Bush*, 1927; *The Ladder of Jacob*, 1929; *The Lamb of God*, 1933; *The Conzforter*, 1936; etc.) and innumerable articles. He had great influence as priest and teacher.

BIBLIOGRAPHY.—S. Bulgakoff, *The Orthodox Church* (1935) and *The Wisdom of God: A brief Summary of Sophiology* (1937), both in English translations; V. Zenkovskii, *History of Russian Philosophy*, vol. ii, ch. 6 (1953). (AL. S.)

BULGANIN, NIKOLAI ALEKSANDROVICH (1895–), Russian Communist leader who was prime minister of the U.S.S.R. from 1955 to 1958, was born on June 11, 1895, of middle-class parents in Nizhni Novgorod (now Gorki). He joined the Communist party just before the Nov. 1917 revolution and from 1918 to 1922 was an official of the Cheka, the first secret police organization, in his native region. For the next nine years he held administrative posts in industry. In 1931 he was made chairman of the Moscow city council. He became prime minister of the Russian S.F.S.R. in 1937 and one of the deputy premiers of the U.S.S.R. and chairman of the State bank in 1938. After the German invasion in World War II he was appointed to the military

councils successively of the Western, Baltic and Belorussian fronts. In 1944 he was made a member of Stalin's small war cabinet, the state defense committee, and a deputy commissar for defense. In 1947 he was made minister of the armed forces and a deputy prime minister of the U.S.S.R. and promoted to the rank of marshal of the Soviet Union. He became a candidate member of the Politburo of the Communist Party of the Soviet Union in March 1946 and a full member in Feb. 1948. On Stalin's death in 1953 Bulganin remained a member of the ruling party presidium (as the Politburo had been renamed) and was made a deputy prime minister and minister of defense. He succeeded G. M. Malenkov as prime minister on Feb. 8, 1955, and in this capacity headed the Soviet delegation to the summit conference in Geneva in July 1955. With N. S. Khrushchev, the first secretary of the C.P.S.U., he paid official visits to India, Burma and Afghanistan in 1955 and to Great Britain in 1956. According to his later admissions, Bulganin sided with Malenkov and V. hf. Molotov in the opposition to Khrushchev which developed in 1956, but he did not share their defeat in July 1957 and remained prime minister until replaced by Khrushchev on March 27, 1938. From then his influence declined rapidly. After serving once again briefly as chairman of the State bank he was given in Aug. 1958 the relatively obscure post of chairman of the economic council of the Stavropol region in southern Russia. He was removed from the presidium of the C.P.S.U. in Sept. 1958 and dismissed from the party's central committee at the end of 1938. In March 1960 he retired from his Stavropol post on a pension. At the 22nd congress of the C.P.S.U. in 1961 he was named as a member of the Molotov-Malenkov "antiparty" opposition and his expulsion from the C.P.S.U. was demanded. (D. FD.)

BULGARIA (PEOPLE'S REPUBLIC OF BULGARIA; NARODNA REPUBLIKA BULGARIYA), a country of the Balkan peninsula, Europe, of roughly rectangular shape, lies to the east of the peninsula and has an area of 42,830 sq.mi. and a population (1960 est.) of 7,905,500. The southern and western frontiers run through hilly country, separating it from European Turkey and Greece on the one hand and from Yugoslavia on the other. With Rumania, the frontier is mainly the line of the Danube river, while there is an eastern frontage on the Black sea.

I. PHYSICAL GEOGRAPHY

1. Physiography.—The transverse Balkan mountains divide the main agricultural area of Bulgaria into two parts: the northern platform sloping gently down to the Danube (*q.v.*) and the basins and valleys of the Upper Maritsa system lying to the south. The latter are separated physically from the open waters of the

Aegean sea by the Rhodope mountains, while the Maritsa lowland is separated from the Burgas coastal lowland by low rounded hills.

The Balkan chain, because of the presence of passes and the slope of the northern tableland, is not, as might be supposed, a serious barrier between the two agricultural areas. Two great highways may be said to converge in the land which has become Bulgaria. One is the route which comes from central Asia by way of the steppes and grasslands of southern Russia and can be continued to the south over the Balkan passes. The other is that which links Asia Minor to Europe by the straits and can be continued along the Maritsa valley and so to the Morava and the Danube at Belgrade. The two unite in southern Bulgaria.

Balkan Mountains.—Also known as the Stara Planina, the Balkan mountains extend from the valley of the Timok, near the frontier with Yugoslavia, as an extension of the Alpine-Carpathian folds for a distance of about 375 mi., first in a southeasterly and then in an easterly direction to the Black sea, where they break off abruptly. They are composed largely of granites and slates interspersed with broad bands of limestone, and though in the central part they rise to a height of 7,795 ft., their summits are rounded, giving the appearance of an upland rather than a mountain chain. The Zlatishki pass to the west and the Iron Gate pass (north of Sliven) to the east divide them into three sections, of which the central is the highest and narrowest, being about 18 mi. wide. The western section has a maximum height of about 7,000 ft. while the eastern is lower and is divided into two or three separate ridges. South of the Balkans and running parallel to them stretches the range of Sredna Gora. The Topolnitsa and Stryama valleys divide this range into three parts, the eastern of which is sometimes known as the Sarnena Gora. This range is separated from the Balkans proper by the discontinuous sub-Balkan depression, made up of several east-west valleys. Its western part is drained by the upper reaches of the Topolnitsa and Tundzha, tributaries of the Maritsa.

Though as a whole scantily peopled, the Balkan region contains a number of valley widenings or basins suitable for settlement, of which those of Troyan, Dryanovo, Kotel and Gabrovo may be mentioned. Despite high elevation and the absence of large tracts of fertile soil, the Balkan mountains have a wide range of products and possible occupations—woodworking and wool-textile industry in addition to agriculture. National feeling has always persisted in this region and certain mountain towns and villages served as focuses for the early Bulgarian nationalist movement.

Danubian Platform.—Often called the Balkan foreland, this is an area between the low northern scarp of the folded Balkans and the Danube. It is a tableland floored by horizontally disposed rocks, mainly Cretaceous and Tertiary limestones often concealed by a mantle of loess. The Danube, which forms the northern frontier to a point near Silistra, has a high bank on the Bulgarian side, formed by loess reaching a thickness of 200 ft. To the east of the platform the horizontal stratified rocks are strongly eroded in places, leaving flat upstanding plateaus with scarped edges, especially between Kolarovgrad, Provadiya and Varna. In the west the Iskur, the second largest river in Bulgaria, cuts through the whole Balkan chain, thus bringing the high basin of Sofia (c. 1,800 ft.) into communication with the Danubian tableland. Both west and east of the Iskur smaller streams, rising in the Balkans, flow direct to the Danube. All carry a comparatively small amount of water and some almost dry up in summer, but because of the soft loess deposits all have cut out deep valleys. At the eastern end of the platform the Provadiya and Kamchiya find their way direct to the Black sea, not by way of the Danube.

The wide plateau levels are dry because of the limestones which underlie the porous loess; exposed to cold winds in winter and to desiccating blasts in summer, they are practically devoid of wood; and, though very productive, not attractive to settlement. The deep river valleys have a better climate due to shelter from winds; spring water is available and a greater variety of crops can be produced. They serve, therefore, as natural sites for towns, though necessitating long daily journeys to the fields above.

The northern part of the platform underwent great changes after the congress of Berlin in 1878. Before that date it was the seat of

great feudal domains, the Turkish *chiftlik*. After that time it was divided up into small holdings, worked by peasants whose industry, frugality and high level of agricultural skill were remarkable.

Valleys and Basins of the Maritsa System.—These comprise a region of young depressions, formed by down-faulting during Alpine earth movements. The Maritsa river rises in the Rila and after leaving the mountains enters the Thracian plain, the largest of the areas of depression which are characteristic of the Balkan peninsula. It lies between the Sredna Gora to the north and the Rhodope mountains to the south and thus the river has two sets of tributaries. The left bank tributaries are steep in their upper reaches and, flowing over open slopes, show great fluctuations in volume: in flood they carry large amounts of silt. Tributaries coming from the wooded Rhodope have a fairly even flow. Where the Sredna Gora sinks down eastward to the plain, the Tundzha swings round at a sharp angle, running southward to join the Maritsa at Edirne (Adrianople). The western valleys are thus higher, smaller and more cut off by gorges than the eastern ones. The largest valley is that of the Kazanluk in the Tundzha section, always celebrated for its beauty and fertility.

In the western part, sunny and sheltered by the hills to the north, is an area favourable to agriculture. Farther east the climate becomes drier and the country more steppelike, while to the southeast are the wooded slopes of the Strandzha hills.

Rhodope and Rila Massifs.—These form the central core of the Balkan peninsula and are composed of granite and gneiss, chiefly of Archean age though overlain by later deposits. They are formidable mountains; the peaks are bare and rocky with old glacial cirques and moraines and the valleys are deeply cut and steep. From the western Balkan mountains there extends a region of broken country, called Kraishte, along which runs the frontier between Bulgaria and Yugoslavia. The southern part of this passes into the Osogove mountains (Osogovska Planina) and has a certain individuality of its own, due both to its height and to the fact that the Struma river makes a definite line of separation between it and the still higher mountains of Rila and Pirin to the east. The Struma, which has a general north-to-south direction, rises in the Vitosha mountains, southwest of Sofia, a mountain mass rising to heights of nearly 7,500 ft. To the east of the valley line is a long belt of mountain country extending from the Vitosha to the Rila mountains (a beautifully wooded group with glaciated summits reaching a maximum height of more than 9,600 ft.) and continuing to the Pirin to the south and into the Rhodope in the southeast. The Iskur river, which passes through the basin of Sofia, rises in the Rila mountains and turns south to the source of the Struma, their headwaters overlapping. The Vitosha mountains form an obstacle to routes from Sofia into the Struma valley but can be turned both to the northwest and the southeast.

There woods are abundant, with beech and oak below and pine and fir above. There are extensive summer pastures at the higher levels. Though the more elevated areas are unfit for permanent habitation, the margins and secluded valleys offer opportunities for settlement. This area, even more than the Balkans, served as a refuge for fugitives and thus as a centre for the growth of a spirit of revolt.

2. Climate.—Although Bulgaria is near the Mediterranean its climate is more continental in type, particularly in the north, and may be termed temperate continental as a whole. The Danubian tableland is continental in type, with cold winter winds from the Eurasian high-pressure system causing frequent prolonged frost (only 180–215 days are frost-free on the average) which damages the orchards and vineyards; the summer average temperature varies between 70° and 80° F.

The Balkan mountains form the limit of mediterranean influence, but a true mediterranean summer drought is found only in the Struma and Mesta valleys of the southwest and the south-facing slopes of the Rhodope mountains. The mountain ranges, which have a high rainfall (e.g., up to 75 in. average annual rainfall in the Rila mountains) and lower temperatures in both summer and winter, generally protect the inland basins and valleys from strong winds. Summers are hot and the winters mild. The Thracian plain (Trakiyska Nizina) in central Bulgaria has a

climate that is transitional between mediterranean and continental (with such extremes as 113° F. recorded near Plovdiv); there are 198–206 days frost-free. Rainfall can be very low (average 20–25 in.) so that small rivers tend to disappear and irrigation is necessary.

The Black sea coast is warmer than the interior in the winter (241–260 days frost-free) but the summer is cooler. There are frequent gale storms, causing great loss in the rural areas, and as many as 320 windy days a year. A wind corresponding to the African sirocco, the "black wind," can have an adverse effect on crops during the calmer summer days. Rainfall tends to be less than 20 in.; an absolute minimum of 7.6 in. was recorded in the Dobruja region.

3. Vegetation and Animal Life.—The same zones that are apparent geologically, physically and climatically are seen in the natural vegetation although the country as a whole lies in the middle latitudes forest and steppe area.

In the north the Danubian platform is steppe-like in character but in the Ludogorie or Deli Orman "forest" to the west of the Dobruja there is some scrubby deciduous woodland. Much of this was cut down or mutilated for firewood as well as for timber, and grazing animals, especially goats, have caused much damage. The Balkan range is covered for the most part with oak and beech, with conifers at higher levels. The Thracian plain and the Black sea coastlands have mediterranean flora, including *maquis*, and also deciduous woodland, but the area is largely cultivated. True mediterranean vegetation can be seen in the Struma and Mesta valleys and in the Strandzha, where broadleaf evergreen shrubs include the rhododendron. The western mountains and the Rhodopes are forested with fine coniferous forests as well as with deciduous. Roughly one-third of Bulgaria is forested—of this, 52% is high forest and 48% brushwood, which is important as a watershed protection.

Except in the mountainous southwest, deforestation has caused the gradual disappearance of such wild animals as bears, wolves, boars, foxes, elk, and wildcats. Fisheries yield poor supplies mainly of mackerel from the Black sea. Carp, sturgeon and white-fish are found in the rivers.

(S. H. BR.)

II. HISTORY

The ancient history of the country that is now Bulgaria is that of regions into which it was divided in classical times, Moesia and Thrace (*q.v.*). Subjected first to the kingdom of Ilacdonia (*q.v.*), then to the Romans, the country was overrun by the great immigration of the Slavs (*q.v.*; see also EUROPE: History) that spread over the lands between the Danube and the Aegean sea from the middle of the 6th to the middle of the 7th century A.D. The old Thracian-Illyrian population was partly expelled by the Slavs and partly merged with them. Faint traces of similarities in the Bulgarian and Rumanian languages, as well as tumuli, bas-reliefs and inscriptions on stone tablets, are survivals of the ancient Illyrian race and speech in the eastern half of the Balkan peninsula (for the west see ILLYRIA; also ALBANIA). The Slav tribes had no central government. They tilled the land and were organized in democratic local communities. Contact with Roman civilization had considerable effect on their way of life, especially in the areas along the sea coast and near the old garrison centres of the Roman empire.

1. The Bulgars.—The first mention of the Bulgars in European history occurs toward the end of the 5th century A.D., the name being applied to some of the numerous tribes of non-Indo-European origin that had followed in the wake of Attila's invasion and settled down temporarily in the steppes north of the Black sea and to the northeast of the Danube. These tribes of fierce, barbarous horsemen, despotically ruled by their khans (chiefs) and boyars or bolyars (nobles), lived mainly from war and raiding. Little is known about their religion. In A.D. 433 their federation of tribes split into two main groups—the Utiguri to the east and the Kutiguri to the west. About 560 the Avars (*q.v.*) conquered the Kutiguri and assimilated the survivors, so that the Kutiguri then disappeared from history. Less than a decade later the Utiguri were enslaved by the Turks.

The next name to appear is that of the khan Kubrat, ruler of a tribal confederation north of the Black sea that lasted until the middle of the 7th century. One of the Kubrat's sons, Asparukh or Ispirikh, moved westward under the impact of the advance of the Khazars (*q.v.*), crossed the Danube in 679 and settled down in Moesia, which was then a province of the Byzantine empire. In 681 the Bulgar state in Moesia was officially recognized by the Byzantine emperor Constantine IV. Asparukh's horde, probably not very numerous, was gradually assimilated by the more advanced Slavs, whose language and ways of life the Bulgars adopted. Only the military aristocracy remained predominantly Bulgar, keeping their names, titles and privileges, against the policy of the khans, whose title changed to the Slavonic one of knez (prince). This dualism in the social organization of the Bulgarian state had far-reaching effects on its fortunes and contributed to its downfall. (Bulgaria on the Volga, a state that emerged later in southern Russia, is the subject of a separate article.)

2. Early Dynasties.—The early Bulgarian state lay along both banks of the Danube, although the suzerainty of their princes over the northern bank, which at the time was practically a no-man's land, was probably always shadowy. To the south, however, the rulers gradually extended their frontiers in numerous campaigns against the Byzantines, from whom Kardam (777–802?) and Krum (802?–814) again exacted the tribute that had been paid to Asparukh. Krum waged a desperate campaign against the emperor Yicephorus, who invaded Bulgaria and burned Preslav; but Krum annihilated the army as it returned through the Balkan passes (811), slew the emperor and converted his skull into a drinking goblet. In the following years he devastated Thrace and besieged Constantinople; the city was saved by his sudden death. Moreover, Krum and his son Omortag (814–831) succeeded to the heritage of the Avars in much of eastern Hungary and Transylvania; but with the arrival of the Magyars and Pechenegs at the end of the 9th century, all territory north of the Danube was abandoned, and even the southern half of the Danube valley was depopulated by raids and filled with alien races who settled there in considerable numbers.

Pressian (836–852) and Boris I (*q.v.*; 852–889) extended the frontier of Bulgaria far to the southwest, to include Dibra (Debar) and Ohrid (Ochrida), now in Yugoslavia, and all the upper Struma valley, as well as the Morava valley on the west. The great majority of the enlarged Bulgarian state was now almost purely Slav; and for 300 years, while the whole of northeastern Bulgaria was repeatedly ravaged by Russians, Magyars, Pechenegs and Kumans, the Slav centre and the southwest were to become even more the centre of gravity of the Bulgarian state. This process was accelerated by the conversion of Bulgaria to Christianity. The adoption of the Slavonic or Old Bulgarian language as that of the official liturgy was the final stage in the assimilation of the original Bulgar race. Boris, who was baptized into the Orthodox Church in 865, probably adopted Christianity from political motives, though according to legend he was frightened into it by the ghastly picture of hell painted on his palace walls by a Byzantine monk, and he ended his days in a monastery. The great controversy between Rome and Constantinople regarding the patriarch Photius had broken out in 860, and after his baptism Boris wavered between the rival churches; but when the pope failed to fulfill the hope that he had held out of Bulgaria's getting an independent and national patriarch, Boris in 870 decided for the Eastern Church. The decision was fraught with momentous consequences for the future of his country. The nation altered its religion in obedience to its sovereign, and some of the boyars who resisted the change paid with their lives for their fidelity to the ancient belief. The independence of the Bulgarian Church was recognized by the patriarch, a fact much dwelt upon in later controversies. The Bulgarian primates subsequently received the title of patriarch; their see was transferred from Preslav to Sofia, Voden and Prespa successively and finally to Ohrid.

3. First Empire.—The national power was at its zenith under Simeon (893–927), a monarch distinguished in the arts of war and peace. In his reign, says Gibbon, "Bulgaria assumed a rank among

the civilized powers of the earth." It was under Simeon that the trans-Danubian possessions were finally lost; but he extended his frontiers to the Adriatic in the southwest and as far as the Sava and Drina rivers and also brought the Serbs under his sway. Having become the most powerful monarch in eastern Europe, Simeon assumed the title of "emperor and autocrat of all the Bulgars and Greeks," a style which was recognized by Pope John X. Simeon also aspired, however, to secure the Byzantine imperial crown for himself and so led numerous campaigns against Constantinople. His pursuit of this dream left his country nearly exhausted. While he reigned his people made great progress in civilization; literature flourished, and his capital, Preslav, is described as rivaling Constantinople in magnificence and as full of "high palaces and churches."

4. West Bulgarian Empire.—After Simeon's death, the Bulgarian power declined because of internal dissension. The upper classes were demoralized by the Greek manners introduced by the wife of Peter, Simeon's successor, and the peasants, who endured great hardships, embraced in large numbers the doctrines of opposition to the church and to the nobility preached by the Bogomils (*q.v.*), who acquired great prominence at that time. Serbia recovered its independence in 933. New waves of eastern invaders harassed northern Bulgaria; and in 972 the Byzantine emperor John I Tzimisces took advantage of a Russian attack to dethrone Tsar Boris II and recover eastern Bulgaria. Macedonia, however, remained independent under the four sons of a local count, probably of Armenian origin, called Nicolas. One of these four brothers, Samuel (980–1014), assumed the title of tsar, actually recovered Serbia and northern Bulgaria for this new Bulgarian empire and extended his power southward to Thessaly; but in 1014 he was defeated at Belasitsa by the Byzantine emperor Basil II (*q.v.*), thereafter called Bulgaroctonus, who reputedly put out the eyes of 15,000 prisoners taken in the fight. Samuel died of grief. Four years later his dynasty was extinguished; for more than a century and a half (1018–1185) all the former Bulgarian territories remained subject to the Byzantine emperors.

5. Second Empire.—After a general insurrection of Vlachs (*q.v.*) and Bulgars under the brothers Asen and Peter Asen of Turnovo, northern Bulgaria recovered its independence (1185) and Asen assumed the title of Ivan Asen I, "tsar of the Bulgars and Greeks." (*See* **ASEN**.) The Asens asserted their descent from the old rulers of Bulgaria; but they are said to have been actually of Kuman-Bulgar origin and are generally referred to in contemporary documents as "tsars of the Vlachs and Bulgars." They received great assistance from the Kumans, now settled on the northern banks of the Danube, to whom they were allied by treaty and marriage. Kaloyan, the third of the Asen monarchs, extended his dominions to Belgrade, Nis and Skopje; he acknowledged the supremacy of the pope who, in his own words, "extolled him above all other Christian monarchs," received the royal crown from a papal legate and was certainly the strongest part in the three-cornered warfare which was waged for many years between the Greeks, the crusaders (at that time established in Constantinople) and the Bulgars. The greatest of all Bulgarian rulers was Ivan Asen II (1218–41), a man of humane and enlightened character. After a series of victorious campaigns, particularly after the battle of Klokotnitsa (1230), he established his sway over Albania, Epirus, Macedonia and Thrace and governed his wide dominions with justice, wisdom and moderation. In his time the nation attained a prosperity hitherto unknown: commerce, arts and literature flourished; Turnovo, the capital, was enlarged and embellished and great numbers of churches and monasteries were founded or endowed. At this period, to judge from contemporary chronicles, civilization in Bulgaria was as high as anywhere else in Europe.

The last representative of the Asens ceased to rule in 1280. None of their successors was able to establish a strong central authority, and feudal anarchy prevailed. Further, northern Bulgaria was repeatedly devastated by Mongol raids. Two other dynasties, both of Kuman origin, followed: the Terter, who ruled at Turnovo; and the Shishman, who founded an independent state

at Vidin but later reigned in the national capital. Eventually, on July 28, 1330, the tsar Michael Shishman was defeated and slain by the Serbs, under Stephen Urosh III, at the battle of Velbuzhd (Kyustendil). The hacedonian provinces of Bulgaria then came under Serb rule and formed part of Stephen Dushan's empire (1331–55). For the last time before the Turkish conquest, literature flourished in Bulgaria during the reign of Ivan Alexander (1331–71).

By 1340 Ottoman Turkish invaders had begun to ravage the entire valley of the Maritsa; they took Philippopolis (Plovdiv) in 1362 and seized Sofia in 1382. In 1371 Bulgaria's last tsar, Ivan Shishman, son and heir of Ivan Alexander, was forced to declare himself the vassal of the Ottoman sultan Murad I. The rout of the Serbs, Bosnians and Croats at Kosovo Polje in 1389 sealed the fate of the whole Balkan peninsula. The Turks soon turned on Ivan Shishman. His capital, Turnovo, after a siege of three months, was captured, sacked and burned in 1393. What happened to the tsar is not known; according to national legend he fell in battle near Samokov. Vidin, where his brother Srazhimir had established himself, was taken in 1396, and the last remnant of Bulgarian independence disappeared.

6. Turkish Rule.—The five centuries 1396–1878 form a dark era in Bulgarian history. The invaders carried fire and sword through the land; towns, villages and monasteries were sacked and destroyed, and whole districts were converted into desolate wastes. Inhabitants of the plains fled to the mountains: where they founded new settlements. Many of the nobles embraced Islam; others, together with numbers of the priests and people, took refuge across the Danube. Among the people only the religious sect of the Paulicians adopted Islam in large numbers: the conversion of the Pomaks of the Rhodope mountains was still incomplete at the beginning of the 17th century. Large colonies of true Turks were, however, settled in the plains both north and south of the Balkans, the true Bulgarian element being driven back into the less fertile districts. All the regions formerly ruled by the Bulgarian tsars, including hacedonia and Thrace, were placed under the administration of a governor general, styled the beglerbeg (beylerbey) of Rumili (Rumelia), residing at Sofia; Bulgaria proper was divided into vilayets (provinces) and these into the sanjaks (districts) of Sofia, Nikopol, Vidin, Silistra and Kyustendil. A new feudal system replaced that of the boyars; fiefs or *spahiliks* were conferred on the Ottoman chiefs and renegade Bulgarian nobles. The Christian population was subjected to heavy imposts, the principal being the *jizié*, or capitation tax, paid to the imperial treasury, and the tithe on agricultural produce, which was collected by the feudal lord. Among the most cruel forms of oppression was the requisitioning of young boys between the ages of 10 and 12, who were sent to Constantinople as recruits for the corps of janizaries. Yet the conquest once completed, the condition of the peasantry during the first three centuries of Turkish government was not worse than it had been under the tyrannical rule of the boyars. Military service was not exacted from the Christians, no systematic effort was made to extinguish either their religion or their language, and within certain limits they were allowed to retain their ancient local administration and the jurisdiction of their clergy in regard to inheritance and family affairs. Many districts and classes enjoyed special privileges: chief of these were the merchants, miners and the inhabitants of the "warrior villages" (*voimishki sela*), who received self-government and exemption from taxation in return for military service. Some of these towns, such as Koprivshitsa in the Sredna Gora, attained some prosperity, which declined after the establishment of the principality. So long as the Ottoman power was at its height, the lot of the subject races was tolerable. The law was enforced, commerce prospered, good roads were constructed, and the great caravans from Ragusa (Dubrovnik, Yugoslavia) traversed the country. Down to the end of the 17th century there was only one serious attempt at revolt, as distinguished from the guerrilla warfare maintained in the mountains by the haiduks, or outlaws: and that was occasioned by the advance of Prince Sigismund Bathory into Walachia in 1595. Both this revolt and an equally unsuccessful

rising in 1688 were arranged in conjunction with Austrian forces; but after the peace of Belgrade (1739) the Austrian government temporarily suspended its active Balkan policy. Its heritage was taken over by Russia, who as early as 1687 had for political reasons assumed the role of protector of the Orthodox Christians of the Balkans, a claim officially put forward in the treaty of Kuchuk Kainarji (Kaynardzha; 1774). As the power of the sultans declined after the unsuccessful siege of Vienna (1683), anarchy spread through the Balkans. Bulgaria, however, suffered less from the oppressions of the feudal lords than the remoter districts. Early in the 18th century, however, the inhabitants suffered terribly from the ravages of the Turkish armies crossing the land during the wars with Austria. Toward its close their condition became even worse with the horrors perpetrated by the Kurdzhali, troops of disbanded soldiers and desperadoes who in defiance of the Turkish authorities, roamed through the country, plundering and committing atrocities. In 1794 Pazvantoglu (1758–1807), a feudal lord who was occasionally in alliance with the Kurdzhali, established himself as an independent sovereign at Vidin, putting to flight three Turkish armies which were dispatched against him. This adventurer possessed many remarkable qualities. He adorned Vidin with handsome buildings, maintained order, levied taxes and issued a separate coinage.

The National Revival.—At the beginning of the 19th century the existence of the Bulgarian race was almost unknown in Europe. Disheartened by ages of oppression, isolated from Christendom by their geographical position and cowed by the proximity of Istanbul, the Bulgars took no effective part in the insurrectionary movement which resulted in the liberation of Serbia and Greece, though legions of Bulgarian volunteers fought beside the Serbs. The Russian invasions of 1810 and 1828 only added to their sufferings, and great numbers of fugitives took refuge in Bessarabia, annexed by Russia under the treaty of Bucharest in 1812. The people's national consciousness, however, which throughout the centuries of foreign rule had brought forth a fine folklore—ballads, songs and legends—and had kept the Bulgarian language intact: offered fertile ground for those revolutionary aspirations to national independence linked with social reform which had been agitating many parts of Europe since the end of the 18th century and appeared in clearer ideological outline after the Napoleonic Wars, concurrently with the development of socialism.

The precursors of the national movement in Bulgaria were Paisii, a monk of Mt. Athos (in Macedonia, Greece) who wrote a history of the Bulgarian tsars and saints (1762), and Bishop Sofronii of Vratsa. After 1824 several works written in modern Bulgarian began to appear, and in 1835 the first Bulgarian school was founded at Gabrovo. Within ten years about 50 Bulgarian schools came into existence, and 5 Bulgarian printing presses were at work. The literary movement led to a reaction against the influence and authority of the Greek clergy.

The spiritual domination of the Greek patriarchate had tended more effectually than the temporal power of the Turks to the effacement of Bulgarian nationality. After the Turkish conquest of the Greek peninsula the Greek patriarch had become the representative at the Sublime Porte (Turkish government) of the *Rum millet*, the Roman nation, in which all the Christian nationalities were comprised. The independent patriarchate of Turnovo was suppressed by the Turks; that of Ohrid was subsequently made Greek. The Phanariot clergy (see PHANARIOTES)—unscrupulous, rapacious and corrupt—monopolized the higher ecclesiastical appointments and filled the parishes with Greek priests, whose schools, in which Greek was exclusively taught, were the only means of instruction open to the people. Greek became the fashionable language of the upper classes in many Bulgarian towns, and the Bulgarian language was written in Greek characters. The Slavonic liturgy was suppressed and in many places the old Bulgarian manuscripts, images: testaments and missals were burned. Thus, although from 1828 sporadic military revolts had been led by Georgi Mamarchev, Georgi Rakovski, Panayot Khitov, Haji Dimitr and Stefan Raradzha, these isolated Bulgarian patriots could not hope for success until the Greek as-

pendancy had been removed. For 40 years the pioneers of Bulgarian nationality fought for the establishment of an autonomous church. At one time they even secured from the pope the appointment of an archbishop of the Uniate Bulgarian Church, causing Russia to urge the sultan to grant Bulgaria's wishes; and on Feb. 28, 1870, a firman (decree) was issued establishing a Bulgarian exarchate with jurisdiction over 15 dioceses, including Xis, Pirot and Veles (now Titov Veles) in Yugoslavia. The first exarch was elected in Feb. 1872. He and his followers were at once declared schismatics and excommunicated by the patriarch, but national feeling in Bulgaria was now greatly enhanced.

The Revolt of 1876.—A nation-wide rising for the liberation of the country had been in preparation since the 1860s by revolutionary underground organizations in Rumania with numerous local "committees" in Bulgaria. The principal leaders were Vasil Levski, Khristo Botev (*q.v.*) and Lyuben Karavelov. The Turks eventually caught Levski, who was active mostly inside Bulgaria, and executed him. The revolt broke out prematurely in May 1876, at Koprivshitsa and Panagyurishte, but did not spread much beyond the sanjak of Philippopolis (Plovdiv). It was cruelly repressed by Pomaks, bashi-bazouks and recently settled Circassians and Tatars. About 15,000 Bulgarians were massacred near Philippopolis, including 5,000 in Batak, and 58 villages and 5 monasteries were destroyed. Isolated risings on the northern side of the Balkan mountains were crushed with similar barbarity. These atrocities were denounced by the British statesman W. E. Gladstone (*q.v.*) in a pamphlet which aroused the indignation of Europe. The great powers remained inactive, but Serbia declared war in the following month, and 2,000 Bulgarian volunteers joined the Serbian army. Reforms proposed by a conference of the powers at Istanbul at the end of the year were disregarded by the Porte, and in April 1877 Russia declared war (see RUSSO-TURKISH WARS). In the ensuing campaign the Bulgarian volunteer contingent in the Russian army accompanied Gen. O. V. Gurko's advance through the Balkans, behaved with great bravery at Stara Zagora, where it suffered heavy casualties, and rendered valuable services in the defense of Shipka.

7. The Principality.—After advancing to Chatalca (Catalca, now in Turkey in Europe), Russia dictated the treaty of San Stefano (*q.v.*), which fulfilled almost all Bulgarian ambitions. A principality was created, the western frontier of which ran down from the Timok river to embrace Pirot, Vranje, Skopje, Debar (Dibra), Ohrid and Kastoria. Leaving Salonika and Chalcidice to Turkey, the eastern frontier went from the Aegean southeast of Xanthe and ran along the Rhodope mountains! passed north of Edirne (Adrianople), curved down to include Luleburgaz and reached the Black sea north of Midye. The Dobruja was reserved to Rumania as a reward for help in the war and as compensation for Russia's annexation of Bessarabia. The area included in the new Bulgaria constituted three-fifths of the Balkan peninsula, with a population of about 4,000,000 inhabitants. The powers, however, fearing that this state mould become practically a Russian dependency, intervened. The congress of Berlin (*q.v.*), by the treaty of July 13, 1878, reduced the principality of Bulgaria (which was to be autonomous, but under the sovereignty of the Porte) to the territory between the Danube (excluding the Dobruja) and the rest of the Balkan mountains, with Samokov and Kyustendil. Vranje, Pirot and Nis were given to Serbia, Turkey retaining nearly all Macedonia. An autonomous province of Eastern Rumelia, subject to the sultan but with a Christian governor general: a diet and a militia. was created between the Balkan and the Rhodope mountains. A European commission was to draft a constitution for Eastern Rumelia. For Bulgaria, an assembly of notables was to meet at Turnovo within nine months, draw up an organic law and elect a prince; their choice was to be confirmed by the Porte with the assent of the powers. The country was meanwhile occupied by Russian troops and administered by Russian officials.

Alexander.—The constituent assembly, which met at Turnovo on Feb. 22 (new style; Feb. 10. old style), 1879, was overwhelmingly democratic in character. The majority of its members were peasants, and the Liberal party, under Dragan Tsankov,

BULGARIA

Lyuben Karavelov and Petko Rachev Slaveikov (*q.v.*), easily predominated over the Conservatives. The constitution adopted at this assembly was among the most democratic in Europe.

On April 29, 1879, the first regular Bulgarian assembly elected to the Bulgarian throne Prince Alexander of Battenberg (*q.v.*), a scion of the grand-ducal house of Hesse and nephew of Emperor Alexander II of Russia. Prince Alexander arrived in Bulgaria and took the oath to the constitution on July 8 amid general rejoicing; but from the first his position was difficult. Elected as Russia's candidate and autocratic by nature and training, the 22-year-old prince was meant to be an agent for his protector's foreign and domestic policy rather than a Bulgarian ruler. Indeed, little else was expected of him by the courts of Europe, but on both these scores he came into early conflict with the Bulgarian Liberals, who commanded the bulk of Bulgarian public opinion and were strongly averse to any policy against the national wishes or any infringement of the democratic constitution. The prince first formed a Conservative ministry to take the place of the outgoing Russian officials, but was forced by popular agitation to form a Liberal government under Tsankov. As the Liberals, once in power, initiated a violent antiforeign and anti-Russian campaign, the prince dismissed them, formed a new Conservative government under Gen. J. C. Ehrnroth, a Finn in the Russian service, and charged him with arranging new elections to the grand Sobranie (unicameral national assembly). The general obtained a subservient Sobranie which agreed (July 1881) to suspend the constitution and invest the prince with absolute powers for seven years. A period of dictatorship followed, under the Conservatives and the Russian generals L. N. Sobolev and A. V. Kaulbars. The prince's own adherents, however, disagreed among themselves over the question of railway concessions. The prince, whose relationship with Russia was less cordial after the death of Alexander II in 1881, quarreled with Sobolev and began to favour Bulgarian aspirations. In Sept. 1883 he restored the constitution by proclamation and formed a coalition government of Conservatives and moderate Liberals, which was succeeded in July 1884 by a government of the left-wing Liberals under Karavelov.

In Eastern Rumelia, as in Bulgaria, political life had brought forth a Conservative and a Liberal party. The differences between them were rather personal than of principle, for each was equally eager to promote the union with Bulgaria; but the Conservatives, who were Russophile, had declared, in compliance with Russia's wishes, that the time was not yet ripe for the union. The Liberals, who were in opposition, seized the opportunity and in Sept. 1885, having assured themselves at the last moment of Prince Alexander's consent, seized the governor general, Krastevich Pasha, and proclaimed the union. The prince arrived in Plovdiv a few days later, took over the government and mobilized all available troops on the Turkish frontier to resist a possible attack. Turkey, however, beyond massing her troops on the frontier, made no move, but awaited developments in the international situation. The western powers showed Bulgaria sympathy, and Germany preserved a neutral attitude, but Russia, incensed by such independence of action, recalled the Russian officers from the Bulgarian army and, at conferences summoned in Istanbul in September and October, urged that the union be canceled and the sultan's authority be restored in Eastern Rumelia. This was opposed by Great Britain. Meanwhile King Milan of Serbia, announcing that the balance of power in the Balkans was endangered, suddenly declared war (Nov. 14, 1885). The Serbs advanced as far as Slivnitsa; but there they were encountered and defeated by the untrained Bulgarian army, which pursued them across the frontier, took Pirot and was stopped only by the intervention of Austria (see SERBO-BULGARIAN WAR). Peace and the status quo were restored by the treaty of Bucharest (March 3, 1886) and by the convention of Top-Khan6 (April 5). Prince Alexander was appointed governor general of Eastern Rumelia, and the Rumelian administrative and military forces united with those of Bulgaria.

Disappointment at these events set afoot a conspiracy among Russophiles in Bulgaria and certain discontented officers who, on Aug. 21, 1886, seized the prince in his palace, forced him to sign his abdication, transported him out of the country and handed

him over to the Russians at the Danube port of Reni. The country in general disapproved the plot; Stefan Stambulov (*q.v.*), the president of the assembly, and Col. Sava Mutkurov, commandant of the troops at Plovdiv, initiated a counterrevolution, overthrew the conspirators and recalled the prince. The Russian emperor Alexander III, however, whom he had informed of his return, answered: "I cannot approve your return to Bulgaria." As no European power would support him in the face of Russia's ill will, Alexander of Battenberg abdicated on Sept. 8, appointing as regents Stambulov, Karavelov and Mutkurov. The regency was successful, in difficult circumstances, in preserving order and securing the good will of Turkey. The election of a new prince was a more difficult task. Russia sent Gen. Nikolai Vasilievich Kaulbars to Bulgaria to arrange for the election of the prince of Mingrelia (region of Georgia) but, finding fresh causes of discontent, broke off relations on Nov. 17. The Bulgarian delegates who toured the courts of Europe found it very hard to select a prince who should be agreeable to Russia and to the rest of Europe alike. At last their offer was accepted by Prince Ferdinand of Saxe-Coburg-Gotha.

Ferdinand.—The new prince was elected by the grand Sobranie on July 7, 1887, and took over the government on July 14. His position was difficult, as Russia denounced him as a usurper and brought pressure on the Porte to declare his presence in Bulgaria illegal. Stambulov, who became prime minister on Aug. 3, had to rule almost as a dictator in the face of a raid led by the Russian captain Dmitri Nikolaevich Nabokov, a refusal by the bishops of the Holy Synod to pay homage to the prince and a military conspiracy under Maj. Konstantin Panitsa (1890). Fortunately Stambulov's foreign policy was successful. The powers withheld recognition, but Ferdinand was received personally in Vienna, London and Rome; and relations with Turkey became cordial, the Porte granting the Bulgarian schools and church valuable concessions in 1890, 1892 and 1894. While, however, Stambulov sought the friendship of the Porte, Ferdinand was anxious to recover the favour of Russia and thus secure his own recognition. Relations between the two grew ever more strained, until Stambulov resigned in 1894. Under his successor, Konstantin Stoilov, Ferdinand inaugurated a Russophile policy, which was facilitated by the death of the emperor Alexander III in Nov. 1894. The banished Russophiles and other victims of Stambulov's autocratic regime were amnestied; in July 1895 some of these murdered the prime minister in the streets of Sofia. In the spring of 1893 Ferdinand had married Princess Maria Luisa of Bourbon-Parma and Stambulov had persuaded the grand Sobranie to alter the constitution to allow the issue of the marriage to be brought up in the Roman Catholic faith. However, Ferdinand had his eldest son, Prince Boris, baptized into the Orthodox faith (Feb. 14, 1896) with Tsar Nicholas II as godfather, a step which, although it incurred the grave displeasure of Austria-Hungary, sealed the reconciliation with Russia. On March 14, after the powers signified their assent, Ferdinand was nominated by the Turkish sultan prince of Bulgaria and governor general of Eastern Rumelia. Russian influence again became noticeable in Bulgaria. It was no longer conspicuous in her internal affairs, but a secret military convention was concluded in Dec. 1902.

The question which was now to dwarf all others in importance and to sway all Bulgarian policy was that of Macedonia. The narrow limits drawn by the treaty of Berlin had left Bulgars under foreign rule in Rumania, Serbia and Turkey. The hope of recovering portions of the Dobruja and southeastern Serbia had prevented the Bulgarian government from initiating cordial relations with the former two countries. With Turkey, however, matters were different: Macedonia constituted the largest Bulgaria irredenta; there the sense of Bulgarian nationality was especially strong and genuine; there, too, there was a fair chance that the Turks would soon leave the field, and territorial acquisition prove possible. The Macedonian revolt of 1903 brought Bulgaria to the verge of war with Turkey; and despite a convention of April 8, 1904, Bulgaria had to maintain an army with a view to possible war, which, together with the maintenance of many destitute refugees from Macedonia, proved a heavy drain financially.

Nor did the question end there. Other countries laid claim to Macedonia. Serbs, Greeks, Albanians, Vlachs, as well as Bulgars, carried on their rival propagandas, often by force of arms. Outrages committed by Greek bands in 1906 led to reprisals on the Greek population in Bulgaria. While with Serbia the situation was even more strained, especially since the return of the Karageorgevich dynasty in 1903, the consequent increase in Serb propaganda in Macedonia and the favour enjoyed by Serbia in Russia.

8. Kingdom Under Ferdinand.—It was partly the desire to set his country on an equality with Serbia, as well as the growing impatience of prince and people alike with the nominal vassalage to Turkey (even though the tribute imposed in 1878 was never paid) that decided Prince Ferdinand to proclaim Bulgarian independence. On visiting Vienna in Feb. 1908, he was well received; though Bulgaria's aspirations toward the Dobruja and Nis made an alliance with Austria-Hungary impossible. The two states were now in sympathy. After the Young Turk revolution of July 1908 an understanding was reached between Ferdinand and the emperor Francis Joseph I of Austria. Further pretexts were supplied by a diplomatic incident in Istanbul and by a strike in those sections of the Eastern Rumelian railways which were owned by Turkey but leased to the Oriental railways. On Oct. 5, 1908, the day before the Austrian annexation of Bosnia-Herzegovina, Ferdinand proclaimed Bulgaria (including Eastern Rumelia) an independent kingdom, himself taking the title of tsar. (See FERDINAND, MAXIMILIAN KARL LEOPOLD MARIA.)

Balkan Alliance and the First Balkan War.—Bulgarian policy swung back into its old groove. Turkey claimed an indemnity of £4,800,000 for the declaration of independence. Bulgaria had agreed to pay £1,520,000. In Feb. 1909 Russia undertook to advance the difference. A preliminary Russo-Turkish protocol was signed on March 16, and in April, after the final agreement had been signed, the independence of Bulgaria was recognized by the powers.

The cabinet under the Democrat leader Aleksandr Malinov, who had taken office in 1908, fell in March 1911. Ivan Geshov, head of the National party, became prime minister. Negotiations began for a Balkan alliance against Turkey. The first, between Bulgaria and Greece, were conducted through J. D. Bourchier, Balkan correspondent of the *Times* (London). A secret treaty of defensive alliance was signed between Bulgaria and Greece on May 29, 1912. The Serbo-Bulgarian treaty was signed in Sofia on March 13 and supplemented by the secret military conventions of Varna (May 12 and July 12). The great powers tried to prevent war by the tardy offer of a guarantee for the autonomy of Macedonia. On Oct. 8, Montenegro, with which country no formal agreement had been made, declared war on Turkey. On Oct. 13 the Balkan allies sent an ultimatum to the Porte; on Oct. 18 Greece declared war on Turkey.

The successes of the allies were swift, although the casualties of Bulgaria, especially, were heavy. On Dec. 3 an armistice was signed between Turkey, Bulgaria and Serbia. A conference met in London to decide terms of peace, but negotiations broke down over the possession of Edirne (Adrianople). On Feb. 3, 1913, hostilities reopened. Again the allies were everywhere successful, and after the surrender of Edirne to the Bulgars and Serbs the Turks sought the mediation of the powers, and a second armistice was concluded between Bulgaria and Turkey on April 16. On May 30, 1913, the delegates to the second London conference were induced to sign a treaty, the terms of which had been drafted by the powers. The Turks surrendered their possessions in Europe up to a line drawn from Enos (Enez) on the Aegean to Midye (Midia) on the Black sea. Albania was granted independence. (See BALKAN WARS.)

Second Balkan War.—Difficulties immediately arose as to the interpretation of the treaty. The Serbs and Greeks held much territory in Macedonia that had originally been assigned to Bulgaria, and they seemed to be preparing for a permanent occupation. Early in 1913 Bulgaria prepared for action.

On June 1 Geshov and Nikola Pasic, the Serbian prime minister, met in the hope of averting war; on the same day a treaty between Serbia and Greece was signed at Salonika. Geshov, find-

ing no support from King Ferdinand in his efforts for peace, resigned; he was succeeded by Stoyan Danev. On June 29 the Bulgarian IV army, acting on orders signed by Gen. Mikhail Savov, made a treacherous attack on its Serbian and Greek allies, Rumanian divisions then marched into northern Bulgaria. The fighting soon ended with Bulgaria's defeat. Geshov states in his memoirs that the reports of the ministerial council contained no minute ordering the attack. A judicial inquiry into the case was opened in Sofia, but never concluded. Savov asserted that Ferdinand as commander in chief had given the order to attack.

The Second Balkan War brought calamity on both Bulgaria and Macedonia. By the treaty of Bucharest (Aug. 10, 1913) Rumania acquired the rich lands of the southern Dobruja, which had belonged to Bulgaria since 1878; Serbia and Greece divided Macedonia between them; Bulgaria was accorded the mountainous region of the Pirin and Dospat down to the Aegean, with the two indifferent ports of Dedeagatch (later Alexandroupolis) and Lagos.

World War I.—The government under Vasil Radoslavov, which took office in July 1913, abandoned the Russophile policy. When France, Great Britain and Russia refused to grant a loan to meet obligations and for constructive work, Bulgaria turned to the Central Powers and in July 1914 obtained a loan of 500,000,000 leva from the Disconto-Gesellschaft of Berlin, the group securing control of the Bulgarian state mines, the port of Lagos and the projected railway to it. Negotiations for a treaty had been going on simultaneously and were approaching completion in August; and thus, when World War I broke out, although most Bulgars wished to preserve neutrality, the pro-German sympathies of the king, who also believed Germany invincible, were reinforced by a widespread feeling that the Central Powers, and they alone, might yet gain Macedonia for Bulgaria. The efforts made by the entente through the summer of 1915 to win over Bulgaria were frustrated by the refusals of Serbia and Greece to cede territory. On Sept. 6 Bulgaria signed a military convention and treaty with the Central Powers at Pless (Pszczyna), and Turkey made the concessions demanded by Bulgaria. On Sept. 15 the entente promised Bulgaria part of Macedonia unconditionally in return for a declaration of war on Turkey. The opposition protested vehemently against the king's policy, Aleksandr Stamboliski (*q.v.*), leader of the Agrarian party, being in consequence condemned to imprisonment for life for *lèse-majesté* but mobilization was decreed on Sept. 22, and Bulgaria declared war on Serbia on Oct. 12. Great Britain, France and Italy declared war on Bulgaria on Oct. 15, 16 and 17 respectively.

In spite of the initial military success in Serbia and later in the Dobruja, there was widespread opposition to the war, particularly among the peasants and radical and left-wing politicians, and from the Military league formed in 1913 by army officers resentful of the costly mistakes in Bulgaria's foreign policy. Shortages of food and armaments, exhaustion in the malaria-infested trenches in Macedonia and hopes raised by Pres. Woodrow Wilson's 14 points greatly influenced the numerous agitators to press for a separate peace. The army in the field was on the brink of rebellion when the Democrat leader Malinov replaced Radoslavov in office on June 18, 1918. Three months later (Sept. 15) the Macedonian front collapsed: several divisions simply left the trenches in open mutiny, led by members of the Agrarian party, which had provided most of the opposition to war. Stamboliski was released and sent to calm the troops who had proclaimed a republic and were marching on Sofia. The government asked the Allies for an armistice, which was signed unconditionally on Sept. 29. After some fighting, internal order was restored by loyal troops with German assistance. On Oct. 3 King Ferdinand abdicated in favour of his son Boris and left the country.

9. The Reign of Boris III.—Under the treaty of Neuilly (*q.v.*) Bulgaria was disarmed and condemned to pay a heavy indemnity. The southern Dobruja went to Rumania again, Tsaribrod (Dimitrovgradj and Strumitsa (Strumica) to Yugoslavia, and the recent gains in Macedonia to Greece. The Aegean coast line was occupied by the Allies and associated powers, who assigned it to Greece at the conference of San Remo (April 1920).

Stamboliski.—Postwar revolutionary crisis in Bulgaria took the

form of a reaction against the war policy. Aleksandr Stamboliski, its most courageous opponent, was the hero of the hour. The elections of March 28, 1920, gave the Agrarians a large majority, and Stamboliski, as premier of an Agrarian cabinet, opened a campaign against the middle classes, which in its methods copied the Russian Bolsheviks; he was also the author of a plan for a "Green international" of peasants. He used the Communists of Bulgaria as a threat to the middle classes but denounced and persecuted them as enemies of property. His valuable measures, which survived his fall, were an agrarian law whereby crown and church lands and property of more than a certain size (30 hectares for peasant proprietors and 10 ha. for married and 4 ha. for single urban proprietors who did not themselves cultivate the soil) were expropriated in favour of landless peasants, and the institution of a year's obligatory state service.

Stamboliski's foreign policy was conciliatory. He attempted to live on peaceful terms with his neighbours and to fulfill treaty obligations. In the face of grave economic difficulties, Bulgaria began payment of the reparations, the total of which was finally reduced from £90,000,000 to £22,000,000, payable over 60 years. Despite this, the Bulgars failed at the two conferences of Lausanne to secure an adequate fulfillment of clause 48 of the treaty of Neuilly, which had guaranteed them access to the Aegean (see THRACE), and their relations with neighbouring states were kept in a state of tension by the issue of the Bulgarian minorities in Thrace, Dobruja and Macedonia.

The treaties of Bucharest (1913) and Neuilly had left large numbers of Bulgars under foreign rule. Many took refuge in Bulgaria, while others were brought in under the exchange-of-population scheme with Greece. After 1918 about 260,000 refugees entered Bulgaria, mostly from Macedonia and Thrace; and most of these were landless, destitute and resentful, while the Bulgarian state, with its shattered finances, could do little to relieve their miseries. A large proportion of the population of Bulgaria, refugee or otherwise, was of Macedonian origin, and the powerful and ruthless Internal Macedonian Revolutionary organization (IMRO; *i.e.*, Vatsreshna Blakedonska Revolyutsionna Organizatsia or V.M.R.O.), under their capable and terrible leader, Todor Aleksandrov, gained much sympathy for its fight for Macedonian autonomy and thus formed an underground factor of importance in Bulgarian politics. While the Bulgarian delegates to the League of Nations (which Bulgaria joined on Dec. 16, 1920) voiced at every opportunity the grievances of the Bulgarian minorities in Macedonia, Thrace and the Dobruja, the refugee organizations, particularly the blacedonians, raided the territory of Bulgaria's neighbours from their strongholds in the Bulgarian mountains and thus helped to perpetuate a state of discord between Bulgaria and its neighbours. The Bulgarian government was not the least of the sufferers from the situation; and an agreement concluded by Stamboliski with the Yugoslav government at Nis (March 1923) was believed to contain a clause directed against the Macedonian committee. Upon this the Macedonians combined with the Bulgarian Nationalists and those of the officers and middle classes who had suffered most from Stamboliski's arbitrary rule. A coup d'etat in the night of June 8-9, 1923, overthrew the Agrarian government. Stamboliski was killed, most of his ministers imprisoned, and his Orange Guards dispersed.

Aleksandr Tsankov.—Aleksandr Tsankov now took office at the head of a government subsequently strengthened by the fusion of all political parties, except the Liberals, Communists and Agrarians, into the single Democratic entente. For some time Bulgaria was on the verge of civil war. The Agrarian refugees migrated in large numbers to Yugoslavia, where the government gave them shelter, and allied themselves with the Communists, who attempted to bring about a revolution. In September armed risings broke out in many parts of the country. They were repressed with great severity, and the chief organizers, Georgi Dimitrov (subsequently hero of the Reichstag fire trial) and Vasil Petrov Kolarov, fled to Russia, narrowly escaping capture. Several thousand persons were killed, and others imprisoned for long periods without trial. Meanwhile the *komitaji* raids on the frontier continued. (Komitaji were so-called "committeemen"

or Irredentist partisans who at various times worked together in the Balkans.) Relations with Greece, especially, became particularly difficult. Acute dissensions broke out within the Macedonian organization, one group of which wanted autonomy for Macedonia, the other a federative scheme. There was a further disagreement as to how far the help of Moscow ought to be accepted. On Aug. 31, 1924, Aleksandrov was murdered and the subsequent reprisals deprived the organization of most of its coherence and moral justification. The Agraro-Communist agitation, too, continued unabated. There were about 200 assassinations in 1924; on April 14, 1925, an attempt was made on King Boris' life, and Gen. Kosta Georgiev was killed the next day. At his funeral, which was held on April 16 in the cathedral of Sveta Nedelya, Sofia, a bomb was exploded, killing 123 persons and wounding 323. Martial law was proclaimed. Five persons were later hanged publicly for the crime, but large numbers were either shot summarily or imprisoned.

To maintain order, the government obtained the permission of the Conference of Ambassadors (a session of ambassadors concerned with the execution of treaties) for a temporary increase in its armed forces of 10,000 men; and in fact, its energy prevented any general rising. The Tsankov government also successfully survived a fresh frontier incident with Greece, which occurred on Oct. 19, when Greek troops occupied 70 sq. mi. of Bulgarian territory near Petrich. The matter was settled by the League of Nations on appeal from Bulgaria. The repressive measures which Tsankov had taken were, however, more fitted for emergencies than for normal times, and as the Agraro-Communist agitation was checked by the dreadful events of April 1925, Tsankov resigned on Jan. 2, 1926, in favour of a more liberal government under Andrei Liapchev (*q.v.*), a leader of the Democratic party.

Andrei Liapchev.—On Feb. 4 the Liapchev government promulgated for certain political offenders an amnesty which affected 6,325 persons. The results of this change were most beneficial. The Agrarians were allowed to reconstitute their party in Bulgaria, and about 2,000 *émigrés* who remained in Yugoslavia soon lost credit. On June 11, 1926, the council of the League of Nations decided that the state of Bulgaria warranted the grant of a loan for the settlement of the destitute Bulgarian refugees. The question was of supreme importance for Bulgaria, both financially and politically, for it was partly from among these refugees (with whom the population sympathized) that the *komitaji* were recruited, whose incessant frontier raids troubled Bulgaria's relations with neighbouring states. Following the decision of the League, the Bank of England on Aug. 26 advanced £300,000 for immediate work, which was at once set afoot. An arrangement with the bondholders of Bulgaria's prewar debt was signed on Dec. 11 and the loan, for £2,400,000 nominal in England and \$3,500,000 in the United States of America, was floated successfully on Dec. 26. Bulgaria had been politically almost isolated for more than a decade; a treaty of friendship signed with Turkey on Oct. 18, 1925, was no compensation for continual tension with Yugoslavia, Greece and Rumania.

The last years of the 1920s were on the whole outwardly quiet. On May 15, 1930, the cabinet of Liapchev was reorganized after a dispute within the Democratic entente between the premier and his rival Tsankov. In the same year King Boris III married Princess Giovanna, a daughter of King Victor Emmanuel III of Italy.

The 1930s.—The Liapchev cabinet fell on June 21, 1931. After a brief ministry under Malinov, a new cabinet under the former minister of the interior, Nikola Mushanov, was appointed on Oct. 12, 1931, and reorganized on Dec. 31, 1932. It comprised representatives of the Democratic, Liberal, Agrarian and Radical parties, all four represented in the government coalition, the so-called National bloc. The year 1932 brought to Bulgaria the full weight of the world financial and economic crisis.

Under these conditions the authoritarian trend noticeable in other Balkan countries made itself felt also in Bulgaria. On May 19, 1934, the ministry was overthrown by the Military league, and King Boris accepted a semidictatorial government under Kimon Georgiev. The government disbanded all political parties and sup-

pressed their newspapers. A strict censorship was introduced and measures were taken to reduce the indebtedness of the population. The government, which represented the so-called Zveno group, closed a large number of high schools, as it was afraid of an overproduction of intelligentsia, and set up a national youth organization after totalitarian pattern. The Zveno group of army officers and radical politicians (the name means link in a chain) under Col. Damian Velchev, leader of the Military league, lost its influence in 1935, when King Boris asserted his authority. Thenceforward Boris himself ruled in an authoritarian way with the help of a cabinet headed by Georgi Kiosseivanov. A new electoral law in Oct. 1937 prohibited all party candidates and fixed the number of seats in the parliament at 160. A return to democracy was impeded by the disunity of the opposition groups. The dictatorial government succeeded in establishing better relations with Yugoslavia and in easing the tension with Turkey. On Jan. 24, 1937, a treaty of "inviolable peace and sincere and perpetual friendship" was signed with Yugoslavia.

10. World War II.—On July 31, 1938, Bulgaria signed a non-aggression pact with the Balkan entente; in exchange it was permitted, officially, to rearm. Bulgaria's revisionists then clamoured for restitution of the country's former frontiers, and the outbreak of World War II in 1939 seemed to offer them some hope. On Feb. 15, 1940, Bogdan Filov became premier; his pronouncedly pro-German government and King Boris himself leaned heavily toward the German cause. To win Bulgaria completely over to their side, the Germans awarded southern Dobruja to Bulgaria (Sept. 7, 1940). On March 1, 1941, the government subscribed to the Tripartite pact; German troops were permitted to enter the country and establish bases therein for subsequent operations against Greece and Yugoslavia. In return, Bulgarian troops were later permitted to occupy Greek Thrace and Yugoslav Macedonia, as well as part of Serbia.

The Bulgarian government, however, refused to declare war on the U.S.S.R. when Hitler attacked it in 1941. King Boris feared a revolt of the predominantly pro-Russian masses. He did, however, declare war on Great Britain and the United States.

On Aug. 28, 1943, King Boris died in mysterious circumstances. A council of regents, headed by the late king's brother, Prince Cyril, was appointed to rule until the six-year-old Prince Simeon came of age. The Germans tightened their grip on Bulgaria. A new cabinet was formed under Dobri Bozhilov; it was entirely subservient to Germany, whose minister Adolf Heinz Beckerle became virtually gauleiter. Meanwhile, the resistance movement, led by Communists closely supported by the Military league and the left-wing Agrarians, was gaining ground throughout the country. Sabotage and armed clashes with the police became more frequent and serious. After Italy's surrender, opposition to the government and disaffection in the armed forces grew deeper and spread wider. The Fatherland front, which was soon to play such an important part in the country's history, was formed in 1942 and had by the summer of 1944 done much work under its national executive committee, which consisted of Kimon Georgiev (Republican, a prominent member of the Military league), Nikola Petkov (leader of the left-wing Agrarians), Kyril Dramaliev (Communist), Grigor Cheshmedzhiev (Social Democrat) and Dimo Kazasov (Independent). A general revolutionary rising was planned for Sept. 2. Confronted with civil war, Bozhilov's government resigned in May 1944, and was replaced by Ivan Bagrianov's cabinet which hesitatingly tried to cut itself adrift from the Germans, seemed ready to make concessions to the U.S.S.R. and, in August, approached the Allies for an armistice. While the preliminary talks were dragging on, the Soviet army was rapidly advancing through Rumania toward the Danube. On Aug. 26 it was officially announced from Sofia that Bulgaria had withdrawn from the war and had ordered the disarmament of German troops on her territory. Under the pressure of the worsening internal position Bagrianov resigned on Sept. 1, and Kosta Muraviev, an Agrarian, formed a new government which on Sept. 5 proclaimed strict neutrality. The Soviet government found Bulgaria's neutrality "absolutely insufficient" and, on the same night of Sept. 5, declared war. At midnight, the Bulgarian

minister in Ankara informed the Soviet ambassador that Bulgaria was at war with Germany and asked for an armistice with the U.S.S.R., whose troops marched into Bulgaria unopposed. According to plan, the Fatherland front's national committee had ordered general insurrection throughout Bulgaria on Sept. 2, and groups of armed partisans took control of several districts in the following few days. In the night of Sept. 8-9 army formations under the command of Gen. Kyril Stanchev—one of the chief organizers of the resistance movement in the army—occupied the government offices in the capital and the Fatherland front formed a government with Kimon Georgiev as prime minister. An armistice with the Allies was signed on Oct. 28. The Bulgarian army passed under Soviet command and took an active part in the final defeat of the German forces in Yugoslavia, Hungary and Austria.

11. Postwar Settlement and the People's Democracy,

The former regents and a number of political and military personalities, civil servants and businessmen were arrested; legislation was passed for dealing with war criminals, as stipulated in the armistice. Trials began in Dec. 1944; on Feb. 2, 1945, the three regents, including Prince Cyril, 22 ministers, 68 members of parliament and 8 of King Boris' advisers were executed. Further trials and executions went on until late spring, and, after the tribunals had completed their task, 2,680 death sentences and 6,870 sentences of imprisonment were officially stated to have been pronounced. The army and administration underwent a thorough purge, and a special police force (militia) was organized and put under the control of trusted members of the Communist party.

On March 16, 1945, Georgi Dimitrov returned to Bulgaria, after many years of activity in the Soviet Union as secretary-general of the Comintern and member of the supreme soviet. Earlier, Vasil Kolarov, Dimitrov's companion in the 1923 risings, had also returned from Russia to become president of the Bulgarian parliament. In the summer of 1945 a grave political crisis broke out when six cabinet ministers, including the deputy premier Nikola Petkov, resigned after Georgiev had virtually refused their demand for independent lists of candidates and freedom of vote in the impending election. After representations from the United States and Great Britain the election was postponed, but this issue led to further diplomatic action. At the Moscow conference of the British, U.S. and Soviet foreign ministers (Dec. 16-26) it was decided that the Soviet government should advise the Bulgarian government to include in the cabinet two suitable representatives of other democratic groups. It was agreed that as soon as this was done, the U.S. and Great Britain would recognize the Bulgarian government with which the Soviet Union already had diplomatic relations. This recognition was of great importance in connection with the treaty of peace that was to be negotiated. The Soviet diplomat A. Y. Vyshinski himself went to Sofia and tried hard but without success to persuade Petkov and the Social Democrat leader Kosta Lulchev to join the cabinet. The government resigned, and a new cabinet was formed entirely of Fatherland front members.

A referendum vote on Sept. 8, 1946, decided with 92% majority to proclaim Bulgaria a republic. The regency was dissolved and King Simeon II and the queen mother left the country on Sept. 16. After election on Oct. 27, 1946, Dimitrov became prime minister in the new government of the Fatherland front. Great Britain recognized the Bulgarian government in Feb. 1947, and the United States gave its recognition on Oct. 1. The treaty of peace with the Allies (Feb. 10) was ratified by the Bulgarian national assembly on Aug. 25. On Dec. 4, 1947, a new constitution, proposed in Oct. 1946, came into force. At the year's close Moscow radio announced that Soviet troops had left Bulgaria.

After his resignation Petkov became the most vocal opponent of the Fatherland front regime. He was arrested in June 1947, charged with plotting to overthrow the government, and in spite of strong protests by the U.S. and British governments, was sentenced to death and executed on Sept. 23. A fortnight later, Gen. Stanchev, with whose help the Fatherland front had seized power in 1944, was sentenced to imprisonment for life on a charge of organizing a military plot. Another prominent member of the Fatherland front, the Communist Traicho Kostov, deputy prime

minister, was suddenly relieved of his post in 1949, excluded from the Bulgarian Communist party's politburo and later condemned to death and executed.

Dimitrov died in July 1949, and Kolarov, who had taken over from him, early in 1950. Vulko Chervenkov, secretary of the central committee of the Communist party and Dimitrov's brother-in-law, became prime minister. The purge of the party, army and administration continued intermittently: many first-rank personalities of the Fatherland front's early days were replaced by members of the Communist party trusted by Moscow. In Feb 1950 the United States broke off diplomatic relations with Bulgaria.

The social structure in Bulgaria had to be recast to fit into the pattern of a Communist state. Rapid industrialization was enforced without regard to Bulgaria's lack of raw materials and of technically educated manpower for heavy industry; and the collectivization of peasant holdings was pursued despite the resentment of three-quarters of the population. Farm output fell constantly behind schedule and the country suffered from food shortages and scarcity of consumer goods. By a decree of Oct. 25, 1950, Soviet citizens were afforded equal rights with Bulgarians, including the right to hold public office.

The internal tension began to relax after Stalin's death (1953). Terror and political persecution relented somewhat. Chervenkov claimed at the Communist party congress in March 1954 that the capitalist class had been eliminated as such and that the former proletariat had become the "dominating working class." The party's central committee was reorganized. Chervenkov gave up his post of secretary-general and Todor Zhivkov became first secretary. During 1955 the Communist leaders tried to enlist popular support for the party by resuscitating the Fatherland front and the Agrarian party. In 1956 the change in the political climate was emphasized by the revision of the treason trials of 1949; after Anton Yugov, who had been disgraced in 1950, had succeeded Chervenkov as prime minister (April 1956). Kostov, the chief victim of the trials, was rehabilitated posthumously in September. In 1957 renewed attempts were made at reviving the Fatherland front, but without detracting from Communist party control.

Bulgaria's international relations also reflected the change after Stalin's death. Frontier disputes were settled and diplomatic relations resumed with Greece in 1954. Bulgaria became a member of the United Nations in Dec. 1955. In 1956 an attempt was made at friendlier relations with Yugoslavia but by the end of 1958 the government's attitude to that country seemed to have become hostile again. Diplomatic relations with the United States were resumed in March 1959.

In 1959 the party put forward a plan for economic and administrative reorganization, by which industry was to double its production by 1962, and agriculture was to treble its output by 1965. The number of collective farms was reduced by amalgamation. They were ordered to take over all local commercial and industrial enterprises connected with agriculture. Thirty new administrative districts were set up, each with autonomy in its own area (see *The Economy* below). During 1960 an effort was made to improve relations with Greece and Turkey and trade with these two countries increased. (N. I. M.)

III. THE PEOPLE

The Bulgarian people, generally described as belonging to the Slavonic group of nations, are racially the most mixed among the Slavs (*q.v.*). They were originally a tribe of Turanian or Turkish stock, which migrated south of the Danube from the Volga region, to which fact is probably due their name *Volgar* or *Bolgar*. They conquered a land the population of which was Slavonic-speaking and adopted the language of the conquered. The Bulgars are a virile and industrious race; as compared with other Balkan peoples they are both more reserved and more capable of a sustained effort. In 1958 Bulgars constituted 85% of the population, the remaining 15% being mainly Turks and gypsies.

1. Religion.—Most of the people belong to the Bulgarian Orthodox Church, a national form of the Orthodox Eastern Church (*q.v.*). The National church was disestablished in 1949 and declared to be "in form, substance and spirit a People's Democratic

Church." In 1953 the Bulgarian patriarchate was revived with its seat at Sofia; there are 11 dioceses. The church, although granted freedom of conscience and belief, is not allowed to maintain schools, hospitals or institutions, all of which have been taken over by the state. Theological colleges, however, are allowed. Approximately 6,000,000 people belong to the Bulgarian Orthodox Church: there are minorities of Turkish and Bulgarian Muslims, Roman Catholics, Armeno-Greeks, Jews and Protestants.

2. Population.—The total population at the 1956 census was 7,613,709, giving an average density of 178 persons per square mile; 1960 est. 7,905,500. The population doubled during the first half of the 20th century. Almost 60% are engaged in agriculture, and the main areas of settlement are thus in the plains and plateaus below about 1,500 ft. and particularly in the Sofia basin, the Danubian platform and the Maritsa, Struma and Mesta valleys.

Area and Population of Bulgaria*

Districts	Area sq.mi.	Population (1960 est.)	Density
Blagoevgrad	2,503	295,100	117.9
Burgas	2,917	366,500	125.7
Dimitrovo	921	187,600	203.8
Gabrovo	794	156,400	197.0
Haskovo	1,569	293,300	186.9
Kolarovgrad	1,286	234,300	182.2
Kurdzhali	1,560	264,500	169.5
Kyustendil	1,173	195,800	166.9
Lovech	1,598	213,900	133.8
Mikhailovgrad	1,386	243,600	175.6
Pazardzhik	1,677	293,800	175.2
Pleven	1,596	352,100	220.7
Plovdiv (city)	374	287,200	767.5
Plovdiv	1,763	308,000	174.7
Razgrad	1,015	191,700	188.8
Ruse	1,025	255,300	249.0
Silistra	1,108	167,800	151.4
Sliven	1,388	207,800	149.7
Smolyan	1,373	148,400	108.1
Sofia (city)	434	766,400	1,765.1
Sofia	2,812	326,500	116.1
Stara Zagora	1,895	330,300	174.3
Tolbukhin	1,818	236,400	130.1
Turgovishte	1,050	171,400	163.3
Turnovo	1,808	344,500	190.6
Varna (city)	72	148,600	2,072.5
Varna	1,433	189,500	132.2
Vidin	1,197	188,000	157.1
Vratsa	1,604	310,700	193.7
Yambol	1,681	230,100	136.8
Total	42,830	7,905,500	184.6

*The above data reflects the internal reorganization of Jan 23, 1959

With increasing industrialization, the urban population rose from 20% in 1946 to 34% in 1956. This has not altered the basic pattern of the population distribution, though some individual industrial towns have grown considerably; thus Dimitrovo (*q.v.*) grew from 16,000 in 1934 to 59,930 in 1956, and Kurdzhali, a nonferrous metal centre, doubled its population between 1946 and 1956 to about 20,995. Sofia (*q.v.*), the capital and largest city (25% of the total urban population), rose from 287,000 in 1934 to 644,727 in 1956. The second largest city is Plovdiv with 161,836 and the third Varna (*q.v.*) with 124,951. Other main population centres are Burgas, Pleven, Stara Zagora, Sliven, Tolbukhin, Kolarovgrad and Yambol.

For language and literature see BULGARIAN LANGUAGE; BULGARIAN LITERATURE.

IV. ADMINISTRATION AND SOCIAL CONDITIONS

1. Constitution.—The constitution of Bulgaria, approved by the grand national assembly on Dec. 4, 1947, and based on the Soviet model, sanctions the people's democratic rule. It proclaims that the natural resources and the chief means of production are owned by the state and that co-operative property and management are protected and encouraged. Political power is based on the people's councils, which are elected by universal suffrage. All citizens of both sexes above the age of 18 have the right to vote and to stand for election. The single-chamber national assembly (1 deputy per 30,000 population) is nominally the supreme institution and the only legislative body. It elects the presidium consisting of a president, two vice-presidents, a secretary and 15 members; the presidium summons the assembly, fixes the date of elections and exercises certain other essential functions, particu-

larly when the assembly is not in session. The council of ministers, the supreme executive and administrative organ, is elected by the assembly and accountable to it. In fact, although not mentioned by the constitution, the real power in the state is exercised by the Communist party through its Politburo and local committees. The original constitution provided for two local administrative units: municipalities and counties; but, in 1949, 14 districts were also created. In 1959 the counties and districts were abolished and 30 new provinces which are also economic regions were set up in their place. The municipal people's councils were enlarged in area and reduced in number, while the new provincial councils were given greater powers in the management of the economy.

2. Living Conditions.—Labour is paid in accordance with the qualification of the worker, the nature of the work and its importance for the national economy. There is a fixed minimum monthly wage. Labour norms were introduced and workers who overfulfill them receive extra pay and premiums.

Taxation rises progressively according to the monthly wage. Income up to 200 leva is exempt from any taxation. Compensation for temporary disablement is also exempt. Direct taxation constituted 4.570 of the total revenue under the state budget in 1960.

Special loans are allocated by the state to encourage private and co-operative housing construction. The state also carries out housing construction in the towns and rents apartments to workers. In the early 1960s rents for houses leased by private persons were also controlled. The rent for a two-roomed apartment constituted about 8% of a worker's average monthly wage.

3. Welfare Services.—State social insurance is extended to all employees in public enterprises and to private persons. It guarantees cash relief for temporary disablement and provides old-age pensions, family allowances, etc. Insurance is paid for by the state or the employers; workers paying nothing. Social insurance of one kind or another is extended to nearly all the population.

Medical services are free for all citizens. In the early 1960s there were claimed to be more than 1,000 general hospitals, about 800 maternity hospitals, and nearly 2,000 outpatient and polyclinic establishments; also sanatoriums, children's welfare centres and nurseries.

4. Justice.—This is administered by the people's and district courts and by the supreme court. Judges and assessors are elected: those for the people's courts directly by the population for a term of three years; for the district courts by the district people's council for a term of five years; and for the supreme court by the national assembly for the same term. In Feb. 1952 a code of criminal procedure based on Soviet law was enacted. Forced residence and deportation were introduced as disciplinary measures under the People's Militia law (March 29, 1955; amended Jan. 16, 1959).

Labour disputes are examined by conciliation commissions and disputes between economic enterprises go to arbitration courts. Courts have a legally defined responsibility for scrutinizing the acts of the administration, and similar responsibility is also a part of the public prosecutor's function. Citizens have unlimited right to appeal through the appropriate court.

5. Education.—Independent Bulgaria made strenuous efforts to develop a national education system. Between 1888 and 1934 the proportion of illiterates decreased from 88% to 31.4%; in 1950 it was 19%, and in the early 1960s it was claimed that there was almost no illiteracy among citizens under 50 years of age. Education is secular and primary education free and compulsory for children from 7 to 15 years. Official statistics claimed more than 6,000 kindergartens with about 275,000 pupils; 6,400 primary schools with more than 1,000,000; 350 secondary schools with 170,000; about 300 vocational schools with 72,500; and 40 schools for the handicapped. There were also specialized technical schools and 27 teacher-training colleges. Twenty institutions of higher education were attended by about 45,000 students, the principal being the state university of Sofia (founded 1888 as a high school).

The state pays particular attention to public libraries, of which there are 16,000. There are more than 4,500 library clubs, insti-

tutions which date from before liberation from Turkish rule. The Bulgarian Bibliographical institute (1941) receives copies of all publications issued in the country. There are about 130 museums, learned societies and research institutes.

6. Defense.—Bulgarian defense forces were limited by the terms of the peace treaty signed in Paris in 1947. The maximum strength permitted included a land army of 55,000, a navy of 3,500 with a tonnage up to 7,250, and an air force of 5,200 with up to 90 aircraft, none of which might be bombers. In May 1950, however, a new army command was formed, with Gen. Petar Panchovski as minister of national defense and commander in chief, and Gen. Asen Grekov as chief of general staff; both were Soviet officers of Bulgarian origin. The armed forces were entirely reorganized on the Soviet model and there was evidence in 1953 that they numbered about 220,000 men, including about 40,000 in the forces of the interior. In May 1955 and May 1958 Bulgaria took part in the Warsaw military agreements with the Soviet Union and other Communist countries. In the summer of 1955 a cut of 18,000 men in the armed forces was announced and in 1958, at which time Panchovski was removed, there was a further reduction of 23,000 men. From May 1956 the term of national service was reduced from three years to two in the army and the air force and from four years to three in the navy. (X.)

V. THE ECONOMY

State economic planning on the Soviet model began in 1947. Nationalization of private industry started with the first two-year plan in 1947 and by 1952 the private sector was virtually nonexistent. Three five-year plans followed: 1949–53, 1953–57 and 1958–62. The main goals of the latter were a 60% increase in industrial production, a 30% increase in agricultural production and a doubling of the power output.

1. Agriculture.—Until 1947 Bulgaria presented an agricultural picture typical of the peasant countries of southeastern Europe. Manorial rights were abolished with the proclamation of independence (1878). Small farms were parceled out into very small allotments and, in 1934, 30% of the cultivated land accounted for 63% of the holdings (all less than 5 ha.) and 53% of the agricultural population. Only 11% of the holdings were more than 10 ha. and these were mainly cereal producing. Between the two world wars efforts were made to stop this overdivision of the land, but they were not successful, although the Bulgarian Agricultural and Cooperative bank did much to help in the importing of machinery and in the buying and selling of agricultural products. After World War II, with the first and second five-year plans, the co-operative movement spread further until probably more than 80% of the arable land was in co-operative farms. By Jan 1959 all 3,453 collective farms were to be fused into 640 large units with an average area of 17,500 ac. forming the basis of the country's agricultural system. In the 1960s there were plans for further mechanization and better fertilization of the land, using machine tractor stations and state farms. Irrigation progress was furthered by the construction of five dams, notably the Vasil Kolarov (completed 1951) and Stalin (1956) reservoirs.

Cereal crops utilize two-thirds of the cultivated land. Wheat is by far the most important, with 35% of the cultivated land, then maize (corn) with nearly 19% and barley 7%; rye, oats and rice are also grown. Other food crops are very varied as the farmers produce most of their own vegetables and fruits.

Industrial crops are important, particularly tobacco, oleiferous plants such as sunflowers and also cotton and sugar beet. Of these, tobacco is by far the most important, accounting for about 30% of the total value of exports. It is good quality Turkish type and is grown mainly in the south and southwest an area forming the eastern part of the Macedonian zone, where the dry summers are of great help in the drying of the leaf; but tobacco is also found in most other areas.

Sunflowers are the chief (80%) oleiferous crop; after the extraction of the oil, the pulp forms a valuable cattle food. Sunflowers, like sugar beet, grow mainly on the northern platform and were introduced after 1918. Vines produce a good quality grape and viticulture provides the main livelihood of more than

30% of all co-operative farms. Market gardening and fruit growing are also important. Most farms, private and co-operative, raise animals, especially where mountain slopes give pasturage. Cattle, pigs and poultry are found in the livestock sectors of the co-operative farms, while sheep tend to be concentrated on the private farms.

2. Industry.— Before World War II industries were of minor importance in Bulgaria. The census of 1934 showed only 266,405 persons (7.8% of the total economically active population) engaged in industry, including 186,200 in handicrafts. By the 1960s more than 600,000 workers were employed outside agriculture.

Under Communist rule, industrialization became one of the principal aims of economic policy, with particular emphasis on basic industries such as electric power, ferrous and nonferrous metallurgy and chemicals. Central planning, on the Soviet pattern, of management, production and investment channeled into industry a steadily increasing part of the national resources and between 1952 and 1957 industrial output increased by over 70%.

Metallurgy and engineering before World War II were feebly developed; shipbuilding at Varna and foundries at Sofia, Plovdiv, Ruse and Dimitrovo were the most important. Metallurgical industries developed after World War II include iron and steel works at Dimitrovo, based upon local brown coal and iron ore from the Sofia district; the lead and zinc works at Kurdzhali, based on the ore fields of the Madan-Rudozem district in the Rhodope mountains; and the copper and sulfuric acid plant at Pirdop, near Vratsa. A large chemical industry has developed at Dimitrograd, based on the lignite and electric power there available, making fertilizers and other products.

Textile industries in factories, as opposed to the almost universal domestic wool working, were, before World War II, mainly to be found in the central part of the country—e.g., Gabrovo, Sliven, Kazanluk, Khaskovo—together with Sofia! Varna and Ruse. These used locally produced wool, cotton or silk. Within the five-year plans large new mills were built at Sofia, Sliven and Plovdiv, and the total output of textile fabrics rose to three times what it was in 1939.

Other industries that increased considerably after World War II are food processing and consumer-goods industries such as footwear, pottery and furniture.

Mining.—Coal output increased from 7,400,000 tons in 1952 to 15,341,000 tons in 1959 and Bulgaria's own requirements were more than met. The plan called for 24,000,000 in 1965. About half the output is brown coal from the Dimitrovo (Pernik) field; a large lignite field is being developed in the Maritsa basin (near Dimitrograd), and there are smaller deposits of brown coal and lignite at Nobov Dol (Struma basin) and in the Sofia basin, while several small deposits of bituminous coal and anthracite occur in the Balkan mountains.

Petroleum was discovered in the southern Dobruja near Tulenovo, northeast of Varna, in 1951 and by the early 1960s more than 40% of the country's total requirements were being produced, though much of this went abroad for refining. There is a small refinery at Ruse (*q.v.*) and after 1960 another one was built at Burgas (*q.v.*).

Power.—The major sources of power in Bulgaria are the Maritsa lignite field, which serves large thermoelectric plants at Dimitrograd, and the hydroelectric potential of the Rhodope mountains, where the Batak and Petrokhan schemes were a product of the second five-year plan. There are large thermal power stations also at Dimitrovo, Sofia, Plovdiv and Burgas, and many earlier hydroelectric stations in the Rila mountains and elsewhere. The network of transmission lines covers most parts of the country, and by the early 1960s it was claimed that the power output exceeded 3,800,000,000 kw.hr. The harnessing of the water resources also resulted in a considerable increase in the area of irrigated agricultural land.

3. Trade and Finance.— Before World War II Bulgaria's trade was principally with western Europe. Germany and Italy, supplying about 60% of the imports and taking 50% of the exports. At the end of the war the Bulgarian economy was absorbed into the Soviet bloc and in the early 1960s exports to the U.S.S.R.

accounted for more than half of Bulgaria's total exports while the Soviets supplied a similar total of Bulgarian imports. Czechoslovakia, east Germany, Poland and west Germany were the main sources of remaining imports. Exports likewise went mostly to Czechoslovakia, east Germany, Poland and west Germany. Agricultural produce (cereals, tobacco, fruit, oils and hardwoods) made up the bulk of the exports, while machinery, tools, metals, chemicals, rubber, paper and drugs were the chief imports.

The unit of currency—the lev (plural leva), divided into 100 stotinki—was before 1914 equivalent to the gold franc or 19.3 U.S. cents. Much depreciated during and after World War I, it was exchanged in 1939 at 1.192 U.S. cents. Another depreciation followed World War II and the official exchange rate from 1946 was 0.349 U.S. cents. On May 11, 1952, the lev was revalued and pegged to the Soviet ruble. Ready cash was exchanged at 100 old leva for 1 new lev. Funds owned by state, co-operatives, public enterprises and foreign diplomatic missions were exchanged at a rate of 100:4. The official exchange rate of the new lev was: 1 ruble = 1.70 leva, \$1.00 = 6.80 leva, £1 = 19.04 leva, but for noncommercial payments was lowered by 40% in 1957.

All banks, both public and private, were nationalized on Dec. 27, 1917, and the National bank is the main bank of issue. With "unlimited" capital its main task is to maintain the foreign exchange value and the purchasing power of the lev. The Bulgarian Investment bank is the only other bank of importance and finances long-term investment and advances credit to co-operative farms.

With the introduction of Soviet-style economic planning, annual state budgets lost most of their character as fiscal blueprints and instead became mere addenda to the yearly economic plans. More than half of the revenue was coming from the turnover tax obtained by the sale of goods and materials in the nationalized shops and enterprises, while more than half of expenditure represented public money invested in the national economy.

4. Communications.—Railways are the most important means of transport and the network extends to over 2,600 mi. The main lines are the Orient express route from Belgrade to Istanbul, passing through Sofia and Plovdiv; the Sofia-Burgas line and the Sofia-Varna line, together with the trans-Balkan line from Gorna Oryakhovitsa to Plovdiv; and the British-built Ruse-Varna line of 1866, the oldest railway in Bulgaria. The road network has been much extended and improved, and there are car repair factories at Sofia and Plovdiv.

There is a small Black sea fleet of merchant vessels based on Varna and Burgas and a river fleet for use in the Danube, where the principal port is Ruse. Air traffic is increasing, and there are airports at Sofia, Plovdiv, Varna, Burgas, Ruse, Stara Zagora and Gorna Oryakhovitsa, with international connections to Berlin, Moscow, Belgrade and Athens.

BULGARIA (ON THE VOLGA), a country of ill-defined boundaries which played a role of varying importance during the 9th–15th centuries in the territories adjoining the middle Volga and Kama river basins in what is now the U.S.S.R. Almost nothing is known of the origins of the Bulgars, though it seems likely that they moved northward from the shores of the Sea of Azov where their presence is reported as early as the 5th century. They can, therefore, be considered as "cousins" of the Bulgars of the Balkan peninsula, who moved there in the 7th century.

Ibn Fadlan, a member of an embassy sent by the caliph of Baghdad to the Bulgars in 921–922, has left a detailed account of this people. At that time the Bulgar country must have stretched far to the north, since contemporary descriptions refer to the aurora borealis and to nights "too short to cook a pot of meat."

When Ibn Fadlan visited them, the Bulgars had already been converted to Islam.

The Bulgar land was not a country in the strict sense of the word, and it would be mistaken to take the Bulgars for a homogeneous nation. In the 10th century they were divided into three hordes of which only one was called Bulgar. At least two languages were in current use: a Turkish dialect and one (different from, though related to, the common Turkish languages) which can be regarded as an ancient form of modern Chuvash. No texts exist, and knowledge of the language is derived from contemporary accounts, short funeral inscriptions and the testimony of Chuvash-type loanwords in Hungarian.

In the 10th century the civilization of the Bulgars was rudimentary. They practised a primitive form of agriculture, but lived mainly by fishing and hunting eked out by wild honey. They dwelt in huts and felt tents. A flourishing trade—probably mostly in furs—linked them with more southerly lands, particularly with Khwarezm (in Uzbek S.S.R.). This contact with foreign peoples had a favourable effect on the development of their local civilization, which looked toward Islam rather than toward Byzantium. In 1024 a Bulgar embassy brought presents "the like of which wonders has never been seen" to Mahmud of Ghazni. By that time the Bulgars had already at least two flourishing cities: Bulgar itself and Suvar. The name of the second suggests that its inhabitants may have belonged to a different ethnic community, descendants perhaps of the Sabirs. In 1237, when the Mongols occupied Bulgar, the city was already "famous throughout the world for the strength of its position and its ample resources." Under the rule of the Golden Horde (*q.v.*) the city continued to flourish, and even the coins of the Mongol khans were minted there. The final eclipse of the town—last remainder of the once independent country—was brought about by growing Russian pressure during the first quarter of the 15th century.

BULGARIAN LANGUAGE. Bulgarian, one of the southern group of the Slavonic languages (*q.v.*), is the mother tongue of some 7,000,000 people living in Bulgaria and in parts of Greece, Rumania, Moldavia and the Ukraine.

History.—The modern literary language is of relatively recent origin. The Old Church Slavonic (*q.v.*) traditions of Old Bulgarian literature were continued in Bulgarian and Macedonian Church Slavonic from the 12th to the 15th centuries. They were maintained only tenuously under the Turkish yoke, in such works as the popular *Damaskini* which consisted of translations of Damascene the Studite into a Church Slavonic mixed with Serbian, Russian, and more recent Bulgarian elements. The language was so mixed that the herald of the Bulgarian renaissance: the monk Paisij, wrote his Slavo-Bulgarian history (1762) to stir the patriotic feelings of his countrymen. Only in the 19th century did the proponents of a national literary language based on the popular speech win their struggle. Important milestones in the conflict were Peter Beron's primer (1834) and the grammars of Neofyt Rylski (1835) and Ivančo Bogorov (1844). As might be expected from the historical circumstances of its birth, the modern literary language bears in its vocabulary a considerable stratum of Russian, Russian Church Slavonic and Russian loan-translation from western languages. In addition, despite the efforts of purists, it continues to reflect the history of the Bulgarian people in preserving many of its borrowings from Greek and Osmanli Turkish.

Morphology.—Together with Macedonian, Bulgarian contrasts sharply with other members of the Slavonic family by its almost complete loss of case declension and by a number of "Balkanisms," *i.e.*, features also displayed by neighbouring languages of different stocks. As in Albanian and Rumanian, there is a postpositive definite article: *mása* "table," *másata* "the table," *málkata mása* "the small table," *másite* "the tables." As in Modern Greek, Albanian and Rumanian (and even Serbian), the infinitive has practically disappeared! being replaced by a clause: *móga cia imam* "I can have," literally "I can that I have." A third Balkan feature

is seen in the several tense formations expressing futurity with the auxiliary verbs "to wish" (and the related particle *šte*) and "to have" (in the negative): *Šte (pro)četá* "I shall read," *njáma da (pro)četé* "he will not read," *šte sme (pro)čéli* "we shall have read," *štjájte da (pro)četéte* "you would read." The verb conjugation has been further enriched by the development of special tenses for dependent narration, contrasted with narration for which the speaker assumes independent, immediate responsibility: *V tursko vréme . . . tdj bil* [dependent imperfect] *učitel, i ai osvoboždénieto postojánnno dávaše* [indep. impf.] *prošénija za pénsija* (from *i n - e l*. "In Turkish times he was [supposedly, as it was said] a teacher, and after the liberation he was forever submitting petitions for a pension."

Phonology.—Some conspicuous phonetic characteristics of Bulgarian; as represented in the literary language, are its free stress accent—with consequent reductions of unstressed vowels—which has replaced Common Slavonic (CS) pitch accent and quantitative vocalic oppositions: the almost total absence of consonant palatalization except before back vowels (compare, for example, B [den] with Russian [d'én], Polish [zeń]); and the clusters *št, žd*, reflecting CS **svetja, *medja* > B *svešt, meždá*—compare Russian *svečá, meždá* and Polish *świeca, miedza*). The distinctive vowel *ɔ* (roughly like the vowel of English *but*) and *e* replace the CS nasal vowels (CS **mǫžb, *pǫtb* > B *mžb, pet*) and the ultrashort vowels called *yers* (CS **sʹbnʹ, *bʹrznʹ, *vblkʹ, *dbnb* > B *sbn, brzn, vblk, den*). As in the other South Slavonic languages (but also in Czech and Slovak), CS *or, ol, er, el* between consonants have undergone metathesis, with *o* > *a* and *e* > *ě* (reflected by *e, a* in B): CS **golva, *melko* > B *glavá, mljáko* (cf. Old Church Slavonic *glava, mlěko* > Czech *hlava, mlěko* > Polish *głowa, mleko* > Russian *golová, molokó*).

Dialects.—The dialects are commonly divided into two main groups, according to their treatment of inherited *ě*. Generally speaking, west of a line running from Nikopol through Tatar Pazardžik to Salonika, this vowel has coalesced with *e*; east of the line, under varying conditions of stress and environment, *ě* may also be reflected by *a* (with palatalization of the preceding consonant)—more frequently in the south, less frequently in the north (as in the literary language). The variants may be illustrated by the words for "milk" and "milky": W *mléko, mlěčen* > SE *mljáko, mljáčen* > S E and literary *mljáko, mlěčen*. The dialect transitions from Bulgarian to Macedonian and Serbian are gradual: and any boundary lines laid down will be largely arbitrary.

BULGARIAN LITERATURE. The birth of Bulgarian literature is closely linked to the spread of Christianity to the Slav world in the 9th century. After the conversion of Tsar Boris I in 865, the disciples of Cyril and Methodius, creators of the Cyrillic script, founded at Ohrid (Ochridaj) a school for the propagation of Slavonic liturgical texts which became the cradle of a national Bulgarian literature. The first golden age of Bulgarian letters dates back to the reign of Simeon (893-927), who assembled at Preslav such eminent ecclesiastical writers as Bishop Constantine; John the exarch and the monk Tchernorissets Khraber. Medieval Bulgarian literature reached another peak during the second Bulgarian kingdom in the 14th century with the school of Turnovo, whose most distinguished representative, Patriarch Evtimi, was the architect of an important linguistic reform. But although Bulgarian ecclesiastical literature in the middle ages was formed and perfected as a weapon against the cultural domination

of Byzantium, its content on the whole remained dependent on the Byzantine tradition.

The Romantic Age.—Literature, in the sense of independent artistic creation, dates in Bulgaria from the second half of the 19th century, and was a concomitant of the great awakening of national consciousness generally known as the Bulgarian renaissance. The pioneer of this rebirth was Paisij (1722–98), a monk from the Hilendar monastery on Mt. Athos whose *Istoriya Slav-yano bulgarskaya* (1762), with its romantic glorification of Bulgaria's past, had a decisive influence upon coming generations of Bulgarian writers. Outstanding among these were Georgi Sava Rakovski (1821–67), Lyuben Karavelov (1837–79), Khristo Botev (*q.v.*; 1848–76) and Petko Rachev Slaveikov (*q.v.*) who both as poets and as publicists helped to shape the image of the resurgent nation. The influence of the social and political conditions of their day, with its lack of civil or national freedom, combined with that of certain Russian ideological trends, taught these writers to believe that literature should be subordinated and adapted to the needs of social life. Thus their works dealt with definite national and social problems. Karavelov laid the foundations of Bulgarian realism in narrative prose based on the close observation of small-town life. Botev, one of the greatest Bulgarian poets, set the example of a life and an art entirely devoted to the ideals of liberty and fatherland. He not only wrote impassioned revolutionary poetry; he put his ardent patriotic beliefs into practice by crossing the Danube at the head of an armed band and dying in an uneven fight against Turkish forces. In his poetry Slaveikov (1827–95) drew upon the rich store of Bulgarian folk tales and popular songs. Folklore, an important formative influence on the first Bulgarian writers of the romantic age, remained a constant source of inspiration also to many poets and writers of later generations.

National Realism.—The liberation of Bulgaria in 1878 created a political and social climate infinitely more favourable to literary development than the era of Turkish domination had afforded. Ivan Vazov (*q.v.*; 1850–1921) is the most significant of the writers who link the epoch before and after the liberation. His immense output, comprising poems, stories, sketches, novels and plays, reflects every facet of his people's life in past and present. His lyrics echo the joys and sorrows and the social and political aspirations of the Bulgarian nation. His cycle of epic poems *Epopeya na Zabravenite* (1881, 1884) evokes with great visionary power the heroes of the national struggle for independence. *Chzhortsi* (1885), a realistic portrait gallery of Bulgarian provincial notables in Turkish times, is reminiscent of Gogol in its mastery of characterization. The narrative gifts which make Vazov a master of the short story are seen at their highest in his novel *Pod Igoto* (1893), translated into almost every European language. It vividly describes the struggle of the Bulgarians against the Turks, and is at once a work of art and a faithful picture of the political and social scene in Bulgaria at the most decisive moment of its history. Less successful were the novels *Nova Zemya* (1896) and *Kazalarskata Tsaritsa* (1903), in which Vazov depicted conditions in Bulgaria after the liberation. In the historical novel *Svetoslav Terter* (1907) and in a series of dramas, the best-known of which is *Kum Propast* (1910), Vazov evoked medieval Bulgaria before the Ottoman conquest. His most popular play, however, is *Hushove* (1894), a stage version of his unfinished story *Nemili-Nedragi* about the life of Bulgarian exiles in Rumania.

Without equaling Vazov's powers of imagination and synthesis, his contemporary and friend Konstantin Velichkov (1855–1907) shared his moral aspirations and literary ideals. Like Vazov he attempted almost every literary genre, but his peculiar poetic temperament was best expressed in two collections of sonnets inspired by travels to Constantinople and Italy. Velichkov was the exponent of an Italianate cultural influence, and his translations of Dante, Petrarch, Silvio Pellico and others revealed the wealth of western poetry to Bulgaria's intelligentsia. He contributed also to the literature of memoirs which flourished in the first decades after the liberation. Its most notable representative was Zakhari Stoyanov (1851–89), whose lively reminiscences of the Bulgarian uprisings, *Zapiski po Bulgarskite Vuzstaniya*, contain some of the

best pages of modern Bulgarian prose.

While writers like Vazov saw in the new state above all the realized dream of the fighters of the renaissance period, others cast a critical eye on the negative aspects of modern Bulgarian society and politics. In his satires, fables and epigrams Stoyan Mikhailovski (1856–1927) castigated vice and corruption in public life in a style influenced by the French 17th- and 18th-century moralists and philosophers whom he studied at the University of Aix-en-Provence. In his most ambitious work, *Kniga za Bulgarskiya Narod*, contemporary satire takes the form of a moral-philosophical allegory. In a lighter satirical vein Aleko Konstantinov (1863–97) created in *Bai Ganyu* (1895) the comical prototype of the parvenu Bulgarian peasant whose progress through Europe is a series of monumental *faux pas*. In his travelogue *Do Chicago i Nazad* (1894) Konstantinov opposed the more advanced cultures of Europe and America to that of his country, but showed that he was not blind to their flaws.

New Trends.—From the 1890s Bulgarian literature showed two opposite tendencies: the older school of writers nurtured in the utilitarian literary tradition of the preliberation era was challenged by a younger group known as "Europeans," intent to free art from parochialism and social-political militancy. The spearhead of the new movement was the review *Misul*, founded in 1892 by Krustyu Krustev (1866–1919), the first real Bulgarian critic, who stressed the paramount importance of the "aesthetic conscience." The "Young" who sought to widen the scope and to develop the form of Bulgarian literature had two outstanding representatives in Pencho Slaveikov and Petko Todorov.

Pencho Slaveikov (*q.v.*; 1866–1912) broadened the romantic tradition of Bulgarian poetry by infusing it with more universal content. He helped forge a poetic language capable of expressing the complexity of human existence. A partial paralysis reinforced his tendency to aristocratic isolation and meditation. Under Nietzschean influence he glorified the heroism of spiritual achievement; his poems on Shelley, Dante, Beethoven, Nikolaus Lenau and Leopardi were tributes to the giants of the human spirit. His philosophic and aesthetic ideas are expressed mainly in the apocryphal anthology of verse *Na Ostrova na Blazhenite* (1910), while his experiments with poetic form are revealed in the more intimate collection of poems *Sun za Shtastiye* (1906). His narrative poems *Boyko* and *Ralitsa* interpret folk themes from a psychological angle. His greatest work, *Kurvava Pessen (A Song of Blood, 1911–12)*, is conceived as a modern epic distilling the essence of Bulgaria's history and spiritual destiny. Even more than Slaveikov, Petko Yordanov Todorov (1879–1916), originator of the Bulgarian romantic short story, believed that literature is self-sufficient. His *Idiliyi* are imaginative evocations of folklore and popular legends, written in a rhythmic, harmonious prose saturated with symbolic undertones. The delicacy of his poetic touch is evident also in several dramas based on Balkan mythology, the best known of which is *Zidari*.

Meanwhile the realist tradition continued to flower in the works of writers like Georgi Stamatov (1869–1942), Tsanko Tserkovski (1869–1926), Anton Strashimirov (1872–1937) and especially Elin-Pelin (1877–1949) and Yordan Yovkov (*q.v.*; 1880–1937). Strashimirov was an acute observer of the contemporary social scene in town and countryside. One of his best short stories of peasant life is *Kochalovskata Kramola* (1895). His works include the novels *Essenni Dni*, *Krustoput*, *Sreshta*, *Khoro* and the dramas *Svekurva* and *Vampir*. He influenced Elin-Pelin (pseudonym of Dimiter Ivanov), whose outstanding talent brought new lustre to the Bulgarian short story and whose popularity almost equaled that of Vazov. His short novels *Zenya* and *Geratsite* (1904–11) are subtle analyses of peasant psychology and a high point of Bulgarian critical realism. Yovkov excelled at describing the reality of war, which is the subject of his masterpiece *Zemlyatsi* (1922). His collections of short stories *Vecheri v Antimovskiya Khan* and *Staroplaninski Legendi* (1927) reveal his unsurpassed mastery of narrative prose. His success as a novelist and playwright was almost as great.

Symbolism.—With the beginning of the 20th century the anti-traditional avant-gardist literary currents of European inspiration

gained momentum and led to yet another phase in Bulgarian literature that could be related to the symbolist movement in western poetry. Constant experimentation with novel forms is the hallmark of the lyric poetry of Kyril Christov (1875–1944), composed of a Nietzschean individualism and a sensuality comparable to that of D'Annunzio. His most modernistic volume of verse is *Hymni za Zorata*. Christov, who lived a great deal abroad, produced some of the best Bulgarian translations of Pushkin, Shakespeare, Byron, Schiller, Goethe and Dante.

The greatest of the Bulgarian symbolists was Peyo Kracholov Yavorov (*q.v.*; 1877–1914), a poet of exceptional powers who first succeeded in turning the Bulgarian language into perfect word music. His work reflects his spiritual development from his early preoccupation with social and political problems, that led to active participation in the Macedonian revolutionary movement, to disillusionment with socialism and intense individualist introspection. His finest accomplishment lay in the field of pure lyric poetry, though he showed great promise also as a playwright. His works include collected poems (*Stihotvoreniya*, 1901; *Bezsumitsi*, 1907; *Podir Senkife na Oblnitsite*, 1910); the drama *V Polite na Vitosa* (1911); and memoirs, *Haidushki* Kopneniya (1908).

Echoes of Yavorov are to be found in the melodious and sensuous poetry of Dimcho Debelyanov (1887–1916), whose death in World War I made him a symbol of tragic frustration for the intellectuals. United with him in the same symbolist avant-garde were Todor Trayanov (1882–1944), Nikolai Liliyev (1885–1960) and Lyudmil Stoyanov (1888–), though Stoyanov later abandoned the aesthetic ideals of symbolism and in the 1930s wrote several novels of socialist inspiration.

In the immediate aftermath of the war the literary left in Bulgaria was represented by Geo Milev (1895–1925), who embraced revolutionary Marxism by way of the symbolist and futurist poetic experiments of Aleksandr Blok (1880–1921) and Vladimir Mayakovski (1893–1930), and by Christo Smirnenski (1898–1923). The youngest and most gifted poet of the "proletarian triad" was Nikola Vaptsarov (1909–42), who died a martyr of the anti-Nazi resistance. His collected poems, published posthumously, hail the dawn of socialism and the machine age with compelling sincerity.

Between World Wars I and II.—Although no prose writer in the interwar years challenged the pre-eminence of Elin-Pelin and Yovkov, the younger generation of narrators like Stilyan Chilingirov (1881–?), Dobri Nemirov (1882–1944), Konstantin Konstantinov (1890–) and Konstantin Petkanov (1891–) brought a sharper sense of artistic refinement to the realistic portrayal of Bulgarian life. The mystical-fantastical evocations of ancient Bulgaria by Nikolai Rainov (1889–) represented Bulgarian neoromanticism at its best. Expressionist tendencies were felt in the work of Angel Karaliychev (1902–), Svetoslav Minkov (1902–) and especially Vladimir Polyakov (1899–), as well as in the poetry of Assen Raztsvetnikov (1897–), Nikola Marangozov (1900–), Dimiter Panteleyev (1901–) and Nikola Furnadjiev (1903–). The most satisfying fusion of traditional and new poetic modes was to be found in the limpid verse of the poetess Elisaveta Bagryana (1893–), with whom the tradition of Bulgarian women writers represented by Dora Gabe (1886–), Anna Kamenova (1894–) and Magda Petkanova reached its highest expression.

Socialist Realism.—After 1944 the Communist regime favoured exclusively writing produced according to the concept of "socialist realism" as defined by Soviet theory of art. The resulting uniformity of purpose of literary output in the Bulgarian people's republic, its devotion to didactic and political aims, makes it difficult to assess the real value of novelists like Georgi Karaslavov (1904–), Dimiter Dimov, Emilyan Stanev (1907–), Dimiter Talev, Pavel Vezhinov (1914–), poets like Lamar, Bozhidar Bozhilov, Mladen Issaev, and playwrights like Orlin Vassilev (1904–) and Kamen Zidarov. By the early 1960s literary critics were still engaged in revaluing the heritage of the past in terms of Marxist aesthetics.

BULGARIAN ORTHODOX CHURCH, the national representative in Bulgaria of the Orthodox Eastern Church. The Bulgarian Church was responsible for the creation and preservation of a united nation and for laying the foundation of a Slavonic literature, through which the Slavs became inheritors of the Byzantine civilization. By imposing the Christian faith in the second half of the 9th century, King Boris I aimed at uniting the Slav masses with his small Bulgar tribe. Refused a patriarch of his own by Constantinople, he turned to Rome; after fruitless negotiations he appealed again to Constantinople and was sent an archbishop. The disciples of the two missionaries SS. Cyril and Methodius (*q.v.*), banished from the Moravian state after the death of Methodius, were enthusiastically welcomed by Boris and given every assistance. In Macedonia one of them, St. Clement, for many years celebrated the liturgy and preached in Bulgarian. He also trained a large number of Slavs for the ministry and in this way prepared the ground for a national church. Although Boris' son Simeon proclaimed his archbishop as patriarch, it was not until after Simeon's death that Constantinople recognized the Bulgarian patriarch (927). After 972, when the eastern districts of the country were conquered by Constantinople, the patriarchate moved to western Bulgaria. When Basil II Bulgaroctonus conquered these provinces also (1018) he allowed the Bulgarian Church to remain independent, but turned it into an archbishopric, which soon became Greek in character. Later (12th century) it became known as the archbishopric of Ohrid (Ochrida).

After freeing Bulgaria from Constzntinople (1186) the two brothers Peter and Ivan Asen arranged that the Bulgarian priest Basil should be consecrated as bishop of Turnovo (the Bulgarian capital) and recognized as head of the Bulgarian Church. Their brother Kaloyan held lengthy negotiations with Rome, begging for an imperial diadem and a Bulgarian patriarch. Pope Innocent III sent him a royal crown and the archbishop of Turnovo was consecrated as primate (1204). Apparently the Bulgarians then broke off their contact with Rome. (See *ASEN*.) In 1235 the Bulgarian tsar Ivan Asen II obtained the recognition of the independence of the Bulgarian Church and the revival of the Bulgarian patriarchate from the Byzantine emperor John III Ducas (Vatatzes) of Nicaea and from the patriarch of Constantinople. When, however, Turnovo was taken by the Turks (1393) the last patriarch, Eftimi, was exiled and the patriarchate ceased to exist. (See also *BULGARIA: History*.)

For nearly five centuries Bulgaria was under Turkish domination and the church was administered by the patriarch of Constantinople, who sent Greek clergy into the country. In the late 18th century began the struggle for an independent Bulgarian Church, in which Bulgarians living in Constantinople took an active part. In this struggle the Turkish government and the Russian representatives in Constantinople (especially Count N. P. Ignatiev) looked favourably on Bulgarian aspirations, and in 1870 the Bulgarian exarchate was established. It was not accepted by the patriarch of Constantinople, who declared the newly formed Bulgarian Church schismatic (1872). In 1877 the Bulgarian exarch Antim was deposed by the Turks and his place was taken by Joseph, metropolitan of Lovech (Lovec), who had to steer the Bulgarian Church through its most hazardous years, caused by political disasters after the liberation of Bulgaria from the Turks (1878); the treaty of Berlin, which much diminished the territory of the exarchate; and the Balkan War of 1913. In 1914 he moved to Sofia where he died a year later. His post remained vacant until 1945 when the metropolitan of Sofia, Stefan, was elected. With his name is connected the healing of the schism with Constantinople in the same year. He resigned in 1948, and in 1953 Kyril, metropolitan of Plovdiv, became patriarch.

In 1925 the Holy Synod published the Bible in Bulgarian. The official paper of the church is the weekly *Tsrkoven Vestnic* and there is a monthly periodical *Dukhovna Kultura*. There is one seminary in the Cheripish monastery in the Balkan mountains and

a theological academy in Sofia. The church is separated from the state.

BULGARUS (d. 1166), Italian jurist, the most celebrated of the famous "four doctors" of the law school of the University of Bologna. n-as born at Bologna. He was sometimes erroneously called Bulyarinus. n-ich was properly the name of a jurist of the 15th century. Bulgarus was regarded as the Chrysostom of the gloss writers, being called frequently the "Golden Mouth." He died in 1166 at an advanced age.

Popular tradition represented all the four doctors (Bulgarus, Martinus Gosia, Hugo de Porta Ravennate and Jacobus de Boragine) as pupils of Irnerius, but while there is no insuperable difficulty in point of time in accepting that tradition regarding Bulgarus, it has been held to be inadmissible regarding the others. Martinus Gosia and Bulgarus were the chiefs of two opposite schools at Bologna, Martinus being at the head of a school that accommodated the law to n-hat his opponents called the "equity of the purse" (*aequitas bursalis*), while Bulgarus adhered more closely to the letter of the law. The school of Bulgarus ultimately prevailed, and it numbered among its adherents Joannes Bassianus, Xzo and Accursius, each of whom in his turn exercised a commanding influence over the course oi legal studies at Bologna. Bulgarus took the leading part among the four doctors at the diet of Roncaglia in 1158 and was one of the most trusted advisers of the emperor Frederick I.

His most celebrated work is his commentary *De Regulis Iuris*, which was at one rime printed among the writings of Placentius. This commentary, the earliest extant n-ork of its kind emanating from the school of the gloss writers, is a model specimen of the excellence of the method introduced by Irnerius and a striking example of the brilliant results obtained in a short space of time by a constant and exclusive study of the sources of law.

BULL, GEORGE (1634-1710), English theologian and bishop of St. David's, was born at Wells on March 25, 1634, and educated at Tiverton school and Exeter college, Oxford. He had to leave Oxford in 1649 because he refused to take the oath of allegiance to the Commonwealth. He was ordained privately in 165j and, after holding various preferments, became in 170j bishop of St. David's. During the time of the Commonwealth he adhered to the forms of the Church of England and under James II preached strenuously against Roman Catholicism. He died on Feb. 17, 1710. His *Defensio Fidei Nicenae* (168j), which tries to show that the doctrine of the Trinity was held by the ante-Nicene fathers of the church, was a thoroughgoing examination of all the pertinent passages in early church literature. His other works include *Harmonia Apostolica* (1670), *Judicium Ecclesiae Catholicae* (1694) and *Primitiva et Apostolica Traditio* (1710). The best edition of Bull's works is that in seven volumes published under the superintendence of E. Burton in 1827.

BULL, JOHN (1562-163-1628), English composer of outstanding technical ability and keyboard virtuoso, was born in 1562 or 1563, possibly in Somerset, and educated as a chorister of the Chapel Royal, probably by William Blitheman, its organist. In the surviving fragment of his Gresham lecture, delivered in 1597, Bull appears to make oblique reference to Byrd also as "my master," but this may refer to a later period. From Dec. 1582 to Jan. 1585 Bull was organist at Hereford cathedral, but then returned to the Chapel Royal, where in 1591 he succeeded Blitheman as organist. He became a doctor of music of both Oxford and Cambridge universities, though he was opposed in Oxford, according to Anthony Wood's *Fasti*, by "clowns and rigid puritans who could not endure church music." A fine portrait dated 1589, in possession of the Oxford music school, shows him as a handsome and saturnine young man.

Elizabeth I had already contributed to the cost of Bull's studies! and in 1596 she appointed him to the professorship of music in the college newly founded in London by Sir Thomas Gresham. In 1601 he traveled in France, Germany and the Netherlands, where his virtuosity as a keyboard-player was much admired. On his

return to England he continued in thk royal service, and although he resigned his professorship in 1607 in order to marry, he was evidently highly esteemed at court, being named "doctor of music to the king" in 1612. In 1613, however, he left England without permission and entered the service of the Archduke Albert in Brussels; the British ambassador claimed that he was a fugitive from the just punishment of numerous misdeeds, but this has not been otherwise confirmed. Bull remained in the Netherlands, becoming in 1617 organist at the cathedral of Antwerp, where he died in 1628.

Little of Bull's vocal music survives, and his reputation rests on his extensive compositions for virginals and organ (some 150 extant pieces), published in *Musica Britannica* (1951-). It is distinguished less by emotional depth or freshness of invention than by an unflinching resourcefulness in devising keyboard figuration—a characteristic that helps to explain the great length of some of his sets of variations. Bull combined with an essentially conservative outlook a taste for technical experiment and the solution of unusual problems—enharmonic modulations, for example, and asymmetrical rhythmic patterns. His command of the English virginalists' technique undoubtedly had an influence on his friend and contemporary, J. P. Sweelinck (*q.v.*), the Amsterdam organist, and through him on Samuel Scheidt and the north German school.

See W. Mellers, "John Bull and English Keyboard Music," *Musical Quarterly* (July-Oct. 1954). (J. J. N.)

BULL, OLAF JACOB MARTIN LUTHER (1883-1933), Norwegian poet, commonly considered the greatest of his generation. He was born at Christiania (Oslo) on Nov. 10, 1883. Bull's first poems, *Digte* (1909), showed him as a worthy heir to the tradition of Wergeland and Bjørnson. Many of these poems describe scenes of spring and reveal unusual sensitivity and perception and the power to convey a wide range of emotion. Though attached to his native town, Bull lived for long periods in Rome and Paris and was influenced by the French Symbolists and by the philosophy of Henri Bergson. His early work is chiefly descriptive, but later he became more introverted and reflective. In *Stjernene* ("The Stars," 1924), *Metope* (1927) and *Oimos og Eros* (1930) his themes are his memories and meditations on death and loneliness. Throughout his work, especially in the last collections, one is conscious of his forceful intellect which, notably in the university cantata *Ignis ardens* (1932), enables him to convey a cosmic vision, inspired by the thought of Bergson and Einstein. Intellectual fervour animates *De hundrede anr* (1928), a long poem about Norwegian achievement in the 19th century. *Oslo-hus* (1931) shows his love for his native town, where he died on June 23, 1933. Bull's collected poems, *Samlede digte*, were published in 1942. (G. RN.)

BULL, OLE BORNEMANN (1810-1880), Norwegian violinist widely acclaimed for performances of his own compositions in a light virtuoso style and of arrangements of Norwegian folk tunes. Born at Bergen on Feb. 5, 1810, he was mainly self-taught and at the age of nine became a member of the Bergen orchestra. In 1831 he went to Paris where he set himself the aim of emulating Niccolò Paganini. His career as a virtuoso violinist began in 1832 when he gave a concert in Paris assisted by Chopin. Between 1843 and 1879 he made five visits to the United States. In 1850 he established a Norse theatre at Bergen and later attempted to establish a Norwegian colony in Pennsylvania. Bull's violin playing was remarkable for its chord effects which he achieved by using an almost flat bridge and a heavy and unusually long bow. He died at Lysø, near Bergen, on Aug. 17, 1880.

BULL. For the use of this term for animals see CATTLE: *Terminology*; BEEF: *Classes and Grades*; for the use of the term as an implement of sealing and in relation to papal documents, see SEALS: *European*; DIPLOMATIC: *Papal Chancery*; and GOLDEN BULL; for the use of the term in speculative markets, see STOCK EXCHANGE.

BULLER, SIR REDVERS HENRY (1839-1908), English

general, who was unsuccessful as commander in chief in the South African War despite his distinguished previous record. was born near Crediton, Devon, on Dec. 7. 1839. He was educated at Eton and entered the army in 1858. He gained wide experience of staff duties and command in the China campaign (1860), the Red River expedition in Canada (1870), the Kaffir and Zulu wars (1878-79) the Transvaal rebellion (1881) and the expedition to Khartoum to relieve General Gordon (1884). He won the Victoria cross in 1879. and was knighted in 1882. He became quartermaster general to the war office in 1887 and adjutant general in 1890. He took a leading part in the military reforms of the period, in particular reorganizing the army's transport and supply system on new and sound lines.

In 1899. however, when he was appointed commander in chief in the South African War he was unfortunately past his best and failed to overcome the difficulties of the vast theatre of operations, the small forces at his disposal and the early advantages gained by the Boers. In Dec. 1899 after two of his subordinates had been defeated at Stormberg and Jagersfontein. and the Natal field force under his personal command had been repulsed at Colenso in its first attempt to relieve Ladysmith, Buller was replaced in supreme command by Lord Roberts. Buller made two more unsuccessful attempts before finally breaking through to Ladysmith, but he did not quickly follow up his advantage. When he had finally occupied the eastern Transvaal he returned home (Oct. 1900) to take over the Aldershot command. His appointment was violently criticized, and after a tactless speech in answer to his critics (Oct. 10, 1901), he was retired from his command (Oct. 21). He died near Crediton on June 2, 1908.

See C. H. Melville, *Life of . . . Sir Redvers Butler* (1923).

(E. W. SH.)

BULLFIGHTING, the Spanish national spectacle. (It is not a sport, any more than ballet, and should not be evaluated as such.) The Spanish name is *corrida de toros*, from the Latin *currere*, "to run," and *taurus*, "bull." Bulls used in *corridas de toros* are not the commonly known variety of meat or milk cattle, which is basically domesticated, but a distinctly savage breed (often known as *Taurus l.* to distinguish it from the domesticated breeds, *Bos taurus*).

Combats and spectacles with bulls were common in ancient Crete, Thessaly and imperial Rome but depended on the inherent trait of domesticated cattle to flee their attackers; the distinguishing trait of savage Iberian stock is its spirited and continuous attack without the slightest provocation.

History. — Prior to the Punic Wars the Celtiberians knew the peculiarities of the savage cattle that inhabited their forests, having developed their hunt into a game and also having herded them alive with the aid of domesticated stock for use as an important auxiliary in war where advantage was taken of their ferocity. Thus after founding the trading post of Barkinon (Barcelona) in his own name in 228 B.C., the Carthaginian Hamilcar Barca marched on Ilici and blockaded the city. Aided by domesticated cattle, the defenders gathered a great herd of savage horned beasts, attached war chariots to them and lighted resin torches to their horns. In the ensuing battle Barca was killed and his army annihilated. Carthaginians and Romans, disputing the known world between them, were astounded by accounts of Barca's annihilation. They were equally amazed at subsequent tales of games held in Bética (the Spanish province of Andalusia) in which men exhibited dexterity and valour before dealing the death blow with ax or lance to a savage horned beast.

Popular demand for new entertainment prompted Julius Caesar to present the first spectacles in Rome which used bulls and men imported from the Iberian peninsula, 95-45 B.C. In *Lives of the Caesars* Suetonius wrote: "Between the years 41-45 [A.D.], Tiberius Claudius produced spectacles of wild animal baiting, Trojan games, and African hunts executed by Praetorian horsemen led by their Tribunes with their Prefect amongst them. He presented the Thessalian horsemen who give chase to bulls in the *circus* until, tiring them, they leap on their backs and taking firm hold of the horns. twist their necks and bring them down [known in U.S. rodeos as bulldogging], and also the Iberians who use their skins or

cloaks to avoid the repeated attacks of their savage bulls before killing them." Popular demand also led Augustus to build the *Statilus Taurus* which, as the name implies, was the first Roman amphitheatre designed expressly for the imported Iberian spectacle known as *taurilia*, which gradually degenerated into sacrificing to wild beasts criminals and those professing a religion other than that of the state.

Conquest of the Iberian peninsula by Vandals, Swabians. Goths and Visigoths modified the customs of the people. Three centuries of Visigoth rule (A.D. 410-711) evolved a spectacle featuring brute strength of men over bulls (*forçados* or *pegadores*) later adopted by the Lusitanos (Portuguese) and still retained as one of their specialties. The Muslims from Africa and Syrians who overran Andalusia in A.D. 711 gradually modified the existing games by adding delicate arabesque grace and mystic oriental fancy to the Hellenic-Latin solidity and sense of rhythm. But as the Muslims mere great horsemen, their dignity demanded that they take the lance from their vassals, relegating the peons to the inferior position of simply maneuvering the animals on foot so that their mounted masters might perform to better advantage. The crumbling Roman amphitheatres of Seville, Córdoba, Toledo, Tarragona, Mérida and Cádiz were rebuilt and embellished. Tournaments developed as a result of the rivalry between Moorish chieftains and Christian Iberian knights and, except in large cities which boasted amphitheatres, most festive occasions were held in the city square or plaza, from which all bull rings derive their names. or in the open fields outside the town.

The first Castilian to lance a bull from horseback is thought to have been Rodrigo Diaz de Vivar. "El Cid Campeador" (1043-99). After the Muslims were driven from Spain by Ferdinand and Isabella in 1492, bull-lancing tournaments continued to be the favourite sport of the aristocracy. By the time of the Austrian accession it had become an indispensable accessory of every court function, and Charles V endeared himself to his subjects by lancing a bull on the birthday of his son Philip II. During the reign of Philip IV the lance was discarded in favour of the *rejoncillo* (short spear) and the leg armour (still worn by the picadors) was introduced. As knowledge of the nobles' prowess spread beyond their domains, they were invited to competitive jousts in provincial tournaments. The nobles' unfamiliarity with the spirit of bulls other than their own caused the vassals to gain greater experience and fame than their masters. By 1700 they were performing on foot and had relegated their peons to a subordinate role on horseback (picador).

By the early 1700s bull breeding had become financially profitable, and herds were bred for specific characteristics. The royal houses of Spain, France, Portugal, Italy and even the Catholic Church in Spain competed feverishly to present the best specimens in the ring. The *banderillas* (short barbed darts) were adopted and the *perros de presa*, or dogs of prey, were developed from the Pyrenean mastiff by Spanish breeders so that the receded nostrils and protruding underjaw would permit the dog to breathe while hanging on indefinitely to worry bulls of poor spirit.

Papal threats of excommunication gradually wrought a radical transformation in the character of the *lidia* (bull joust), forcing the nobles to relinquish their role to professional subordinates who, because of class consciousness, discarded the lance in favour of the sword. One of the first great professional *espadas*, i.e., the man who actually kills the bull, was Francisco Romero of Ronda in Andalusia (about 1700), who introduced the *estoque* (the sword still used to kill the bull) and the *muleta* (small heart-shaped red worsted serge type cloth folded lengthwise over a 56-cm. staff), used in conjunction with the *estoque*. At the height of his fame, the artist Francisco José de Goya y Lucientes designed a distinctive professional uniform (worn only on commemorative gala occasions in Goya-style *corridas* or *corridas goyescas*). Performers began using a net to hold back their shoulder-length hair, later tying it in a knot at the base of the skull for protection in falls when tossed by the bull, just as football and soccer players used their hair to protect the head before the innovation of the helmet. This hair style later developed into the *moña y coleta*, the satin-covered semispherical cork headpiece and short queue which

became the distinguishing mark of the profession.

Expense and lack of native spirited stock prevented bullfighting from taking root in France proper (corridas are held in southern France, however) and Italy. Portugal retained the *rejoneadores* or *cabaleiros en praça* (lancers mounted on highly trained well-bred horses) who, with the *forçados* or *pegadores* and *salteadores* (men who pole vault over a charging bull), comprise what is known as Portugal's *correidas* in which the bull's horns are padded or brass-ball tipped; thus the horses and bulls are rarely killed. After the introduction of railways, the plazas de toros in Spain, Portugal and Latin America (where the conquistadors introduced corridas in the early 1500s) greatly multiplied. Spain in the second half of the 20th century had about 400 plazas de toros of all sizes, from those of Madrid and Barcelona, seating 28,000 spectators, to those of the small towns accommodating 1,500. The arena floor never varies more than several metres, those at higher altitudes being smaller than those at sea level to help compensate for altitude fatigue.

The plaza de toros in Mexico City inaugurated during the 1945-46 season, seats approximately 50,000. Legal admission prices vary from a few pennies to \$50, but "scalpers" have obtained as much as \$500 for a single ticket to important corridas such as Manolete's first fight in Mexico.

Bull Breeding.—The bulls used in corridas are invariably of pedigreed lineage reared on special ranches (*ganaderías*), the most celebrated being those of Miura, from Seville, which have killed more famous matadors, including the great Manolete, than any others. Shortly after weaning, vaccinating and branding, the yearling males are tested in the open fields (*tienta de acoso y derribo*, hazing and tumbling), and only those displaying the proper spirit are retained for future corridas. Some yearlings of remarkable pedigree, true coloration and fine physical construction are separated and when three years old are put through a series of tests (*tentadero de sementales*, stud tests) designed to prove the animal's spirit beyond a doubt. If acceptable, such bulls are then used exclusively at stud, usually 15 years; if not, they are sent to the slaughterhouse. At two to three years the heifers are tested in a small ring at the ranch (*tentadero de vaquillas*, test of heifers to be used for breeding) through all the phases of the corrida and only those acceptable are used; the rejects or culls go to the slaughterhouse. Royalty attended these tests which became fortnightly social events at which famous matadors practiced new maneuvers (heifers being smaller are theoretically less dangerous than full-grown bulls, but many matadors have been almost fatally wounded by heifers which were little more than calves), and an invitation to them was considered a social distinction.

Bulls are never used a second time in the corrida. First, their memory is remarkable and former experience would not permit the type of performance expected; and second, to be acceptable for a corrida, they must be physically virgin as well as virgin of contact with any phase of the corrida. All cattle are colour-blind. The colour red has been adopted for the work cape and *muleta* since it minimizes the sight of blood and other stains and blends to better advantage to produce a more colourful spectacle; the inside of the cape is yellow and the bulls charge just as readily at it as they do the red.

Performers.—Toreros or professional bull men consist of matadors; *banderilleros*, assistants on foot who work with the cape and also place *banderillas*; and *picadors*, mounted assistants with pike poles. Six bulls usually are killed during one *corrida*, the matadors, whose *cuadrillas* or troupes consist of two or three *banderilleros* and two or three *picadors* to each, alternating in the performance according to seniority in the profession. Matadors must pass through a trying novitiate as *novilleros* (professional novices) before receiving the *alternativa*, the ritualistic ceremony in which the senior matador confers on the novice professional status and acceptance as a professional equal, capable of dispatching any bull properly.

The Ceremony.—The corrida begins with the grand entry procession of the *cuadrillas* led by one or two mounted *alguaciles* (bailiffs in 16th-century costume). The matadors wear short jackets, waistcoats and knee-length skintight trousers of silk and

satin richly embroidered in gold, silver or silk; dress capes of satin, heavily embroidered in gold, silver and silk or combinations of them, worn only during the entry procession; hand-drawn linen lace shirtwaists; coral-pink heavy silk stockings; flat heelless black slippers; and *monteras* or hats made of tiny black silk chenille balls hand sewn in special designs on heavy buckram. *Banderilleros* wear similar garments, lacking only the gold embroidery which is reserved exclusively for the matadors. *Picadors* wear broad-brimmed, low-crowned, heavy beige-coloured hats called *castoreños*, jackets and waistcoats similar to those of the matadors but not as ornate, hip-to-ankle armour of steel one-eighth inch thick on the right leg and knee-length left-leg armour covered by tightly fitting trousers of heavy cream-coloured chamois and heavily protected chamois ankle boots.

After the opening procession has crossed the arena, the *presidente municipal* (the mayor or his legal representative) throws down to one of the *alguaciles* the key to the *toriles* or bull pens. When the *cuadrillas* not performing with this bull have left the arena and the others have taken their respective positions, the *toril* door is opened. As the bull passes through the *toril* door, an attendant perched above attaches a silken rosette made of the ranch colours into the shoulder muscles of the bull. A *banderillero* capes the bull with one hand only, so that the matador may judge whether the bull shows marked preference in the use of either horn or attacks equally from both sides. Then the matador goes into the arena and performs the initial passes, usually the basic *verónica*, working as gracefully and as close to the horns as possible. The *picadors* enter the arena and move into position, after a bugle signal, during the cape work. The bull then charges the horse, and it is the *picador's* duty to fend off the attack by the use of his pike pole, planting the point in the bull at the junction of the neck and shoulder blades. Because of shocking and unnecessary disembowelment of the horses, complete protective armour made of three-inch thick compressed cotton encased in leather and canvas, encouraged by Sidney Franklin, the first U.S.-born professional matador, was officially adopted in March 1930, thus virtually eliminating harm to the horses.

The three matadors vie in the *quites* as gracefully as possible, taking turns in order of seniority (the matador performing with this bull coming first, the others following in turn). This is done a minimum of two times and a maximum of four, stamina and spirit of the bull dictating the number. A bugle call announces the *tercio de banderillas* and the *picadors* retire from the arena. *Banderilleros* alternate in planting two to four pairs of *banderillas* (72-cm. staves decorated with coloured paper and with a 3-cm. barb at one end) in the bull's shoulders at the junction with the neck. This is done by attracting the bull's attention with violent gestures and shouts from a distance of 20 to 30 yd. As the bull charges, the *banderillero* runs forward and slightly to one side, and as both come together, the *banderillas* are deftly planted, the man spins away to safety, and the bull's momentum takes it out of goring range. The main object of both the *banderillas* and the *picadors'* use of the pike pole is to weaken the great neck muscle of the bull so that his head will be low enough at the end of the fight for the matador to kill him with the sword. Some matadors, especially the Mexicans, are highly skilled with the *banderillas* and plant their own.

Another trumpet call signals the third and final *tercio*, the killing, known as the Hour of Truth. This is done by the matador alone, his *banderilleros* being present only in case of emergency or should he request their assistance.

The matador takes a position below the *presidente's* box and with *montera* held aloft in his right hand, *muleta* and *estoque* in his left, he formally requests permission to *brindar* (dedicate) the bull to some personage or friend to whom he tosses his *montera*. After the matador has performed many dangerous and graceful passes with the bull to prove complete mastery (using only the *muleta* which may be spread wider with the *estoque*), he prepares for the kill. This is done *al volapié* or "fleet-foot," in which man and bull attack each other from a standstill position, or *recibiendo*, where the man stands still and receives the bull. The latter is rarely done because of the great precision and courage required.

At no time is the matador permitted to touch the bull with the *estoque* except for the kill. Improper ethics on the part of any torero during a *corrida* may result in heavy fines or incarceration, or both.

The kill is executed by the matador thrusting forward the *muleta* with his left hand, causing the bull to lower his head in quest of his adversary, while with his right hand the matador sinks the *estoque* between the bull's shoulder blades at the junction with the neck. The blade should penetrate diagonally, severing the aorta or great artery and if well executed, it causes almost instant death.

After the kill the matador, with his *banderilleos*, if acclaimed, circles the arena to the applause of the spectators. Then he returns to the person honoured by his *brindis* to retrieve his *montera* which invariably is returned with money or a gift. If the performance has been excellent the matador receives, as a token of popular esteem, one ear of the bull. If it has been exceptional he receives two ears. But if his success should be extravagant he receives both ears and the tail. While the matador is being acclaimed, a *puntillero* (an attendant armed with a short blade) severs the bull's spinal cord at the base of the skull and the bull's carcass is dragged from the arena, quartered and dressed. Sometimes the bull's meat is given to the poor, but usually it is sold right at the plaza de toros. The ring is raked over by the *chulos*, the next bull is introduced, and the spectacle begins anew.

Great Matadors.—The star performer of this spectacle, the matador, can be and often is a wealthy man. When Manolete was killed at the age of thirty in 1947, he had made the equivalent of four million U.S. dollars. Many toreros (never "toreadors," a word popularized by Bizet in his opera *Carmen*) risk their lives for ten years or so, amass a fortune and then retire to a large ranch where they raise bulls for younger men to fight, as the great Juan Belmonte did.

It was Belmonte who truly revolutionized the ancient spectacle about 1914. Formerly, the main object of the fight had been only to prepare the bull for the sword thrust; Belmonte, a small, frail Andalusian, emphasized the danger to the man by close and graceful capework, and the kill became secondary. He worked closer to the horns than people had ever believed possible and became an overnight sensation. The crowd does not actually wish to see a man killed, but, just as in a flying trapeze act, the possibility of death and the man's disdain and skilful avoidance of injury thrills a crowd.

The audience is not interested in simply seeing a man go into an arena, kill an animal in the safest manner and emerge unscathed; they want to see skill, grace and daring. Therefore a *corrida* is not really a struggle between a man and a bull but rather between a man and himself: how close will he dare to let the horns come, how far will he go to please the crowd?

Joselito (José Gómez), Belmonte's great friend and rival, considered the greatest bullfighter of all time, gave his life for the crowds in 1920, as have many men. Virtually every matador is gored at least once a season in varying degrees of severity. Belmonte was gored more than 50 times. Of the approximately 125 major matadors (since 1700), 42 have been killed in the ring; this does not include the beginning matadors or the *banderilleros* or picadors who have been killed.

The greatest matadors of the 20th century have been the Mexicans Rodolfo Gaona, Armillita (Fermin Espinosa) and Carlos Arruza; and the Spaniards Belmonte, Joselito, Domingo Ortega and Manolete (Manuel Rodriguez).

In the second half of the 20th century bullfighting appeared to be attracting bigger crowds than ever; the *mano-a-manos* (the competitive *corridas* between just two matadors) of Antonio Ordóñez and Luis Miguel Dominguín in the 1959 season excited as much interest in the countries where bulls are fought as any *corridas* in history.

Bullfighting developed in Spain and that country still is the hub of la fiesta *brava*, but there is also keen interest in Mexico, Peru, Colombia and Venezuela. A few other Latin-American countries have occasional bullfights, and bloodless bullfights sometimes are held in Texas and California.

GLOSSARY

Following are definitions of some common bullfighting terms, in addition to those defined in the text of the article:

Aliño.—A *jaena de aliño* is one where the bullfighter limits himself to a few functional passes, lining up the bull to kill as soon as possible.

Alto, *pase por*.—A *muleta* pass.

Arrancada.—The bull's charge.

Arrimarse.—To work close to the bull.

Ayudado.—Un *pase ayudado* is any pass where the *muleta* is "helped" with the sword.

Barrera.—Red wooden fence around arena; also, first rows in stands.

Becerro.—Calf, up to three years. Within that classification: *añojo* (yearling), *erul* (2-year-old) and *utrero* (between 2 and 3).

Boleto.—Ticket for bull ring (Mexico); *billete* (Spain).

Bravo.—Wild; *un toro bravo* means a wild, fighting bull in a generic sense rather than simply "a brave bull" as opposed to a cowardly one.

Cajón.—Reinforced crate in which bull is shipped to the arena.

Capote.—The big work cape.

Chicuelina.—Cape pass.

Cojo.—Lame.

Costadillo, pase de.—A right-handed *muleta* pass.

Cruz.—The place on the bull where the sword should enter.

Doblando.—The initial capework.

Embostida.—The charge.

Entrar a matar.—To go in for the kill.

Estampa.—General appearance of bull, size, coat condition, etc.

Estatuario.—Statuesque pass.

Faena.—All work done with *muleta*.

Farol.—A two-handed spinning pass with cape.

Fracaso.—Flop performance.

Gaonera.—Pass with cape.

Gitano.—Gypsy. There are always *gitanos* in bullfighting, and many of its terms come from the gypsy language (cald).

Hierro.—Brand. Bulls are branded when about a year old.

Larga cambiada.—One-handed pass with the cape.

Manoletina.—*Muleta* pass.

Manso.—Tame, as opposed to *bravo*.

Mariposa.—Pass with the cape.

Media-verónica.—Half-*verónica*.

Molinete.—*Muleta* pass.

Muletazo.—Any pass with the *muleta*.

Ole.—Roughly, "bravo."

Orteguina or *fregolina*.—Variation of the *gaonera*, in which cape is flipped from one hand to the other behind the man's back after each charge.

Oriúcina.—A fancy *quite* pass.

Parar.—To stand still; one of the three rules of good capework, the other two being *mandar*, to control, and *templar*, to move the cape or *muleta* very slowly and smoothly.

Parón.—Any pass where bullfighter does not move his feet until after the bull has passed.

Recorte.—Any pass where the bull is turned so sharply that he is stopped.

Rodillas, de.—Pass made on the knees.

Serpentina.—Swirling cape pass.

Tanda.—A set or series of passes.

Tantear.—First passes of a *faena*, in which the torero merely tries to size up how the bull is charging.

Traje de luces.—"Suit of sequins" or "suit of lights," the costume of the *banderilleros* and matadors.

Tumbos.—The spills taken by picadors.

BULLFINCH, a finch of the genus *Pyrrhula*, especially the common European *Pyrrhula pyrrhula*, bluish-gray and black above with a white rump, and generally of a bright rose-red beneath; the female differs in having its under parts pinkish-brown and

ERIC HOSKING

BULLFINCHES (PYRRHULA PYRRHULA)

its upper parts gray-brown. The bullfinch breeds in northern Europe, occurring in southern parts only as a winter visitor. It is a shy bird and frequents well-wooded districts. In May it builds a shallow nest of twigs lined with fibrous roots on low trees or thick underwood, and lays four or five bluish-white eggs speckled and streaked with purple. The young remain with their parents during autumn and winter, and pair in spring. In spring and summer they feed on the buds of trees and bushes, thus doing considerable injury to orchards and gardens. In autumn and winter they feed on wild fruits and on seeds. The note of the bullfinch, in the wild state, is low, soft and pleasant; it possesses great powers of imitation, and can be taught to whistle tunes.

Other subspecies are found in eastern Europe and Asia, and one which is native to southern and eastern Siberia (*P. p. cassini*) sometimes migrates to Alaska. The northern bullfinch (*P. p. pyrrhula*) breeds in northern Europe and western Siberia. The British bullfinch (*P. p. nesa*) is a breeding resident confined to the British Isles. Other races are found in the Azores Islands and Caucasus mountains.

BULLFROG (*Rana catesbeiana*), the largest North American frog, native to the eastern states, so-named because of its roaring call: It has been introduced successfully into western North America, Hawaii, Japan, Cuba and Puerto Rico. The name is also applied to other large frogs (*Rana grylio* in southeastern U.S., *R. adspersa* in Africa, *R. tigrina* in India).

The bullfrog has a greenish brown back, white to yellowish belly and dark-barred legs. Body length reaches seven to eight inches, and hind legs ten inches. A large adult weighs more than a pound.

Bullfrogs are usually found in or near permanent bodies of water. They breed in the spring when the weather becomes warm; their loud calls serve to attract mates. Each female lays 10,000 to 20,000 very small, blackish eggs. The dark spotted, greenish-brown tadpoles may attain a six-inch length before transforming.

Depending on climate, the tadpole stage lasts one to three years. After metamorphosis bullfrogs grow to breeding size in two to three years. Small individuals eat insects, but large ones will take almost any animal they can swallow.

Many bullfrogs are caught for human food, the estimated commercial catch amounting to 3,000,000 lb. yearly. Large numbers are also used in biological laboratories. (G. B. R.)

BULLHEAD, a name applied to four North American catfishes (Ictaluridae). Black bullheads (*Ictalurus melas*) inhabit the Mississippi valley; yellow (*I. natalis*) and brown bullheads (*I. nebulosus*) inhabit the area east of the Rocky mountains; and

ISABELLE HUNT CONANT

CATESBEIANA)

JOHN H. GERARD

(TOP) BLACK BULLHEAD (ICTALURUS MELAS); (BOTTOM) YELLOW BULLHEAD (ICTALURUS NATALIS)

flat bullheads (*I. platycephalus*) inhabit coastal streams between North Carolina and Florida. The four groups have been introduced elsewhere.

Female bullheads lay 2,000 to 10,000 eggs in the spring. The parents guard the young in compact schools until they are about two inches long. Young that leave the school are taken into the mouth of one of the parents and spat back into the school. Barbels (feelers) around the mouth help the bullhead locate its food, which may consist of almost any dead or living organic matter. Adults usually do not exceed one foot in length, and often lakes and streams are so overpopulated that no bullhead exceeds seven inches. Bullheads of sufficient size are good eating.

The miller's thumb (*g.v.*) and other sculpins are sometimes called bullheads. See CATFISH. (C. HU.)

BULLI, a town in New South Wales, Austr., within the city of Greater Wollongong, of which Bulli shire became a part in 1947. lies on the coast 43 mi. S. of Sydney by road and 43 mi. by rail. Pop. (1961) 5,000. Bulli has a courthouse (1881), a library (1947), a high school (1957), an excellent surfing beach, and a sports ground and racing track. It is the centre of the Illawarra coal seams, the most productive of the Bulli coal beds which extend from Sydney to the Clyde river. The Illawarra seams attain a maximum thickness of 1,000 ft. and the collieries, most of which are mechanized, produce about 25,000 tons daily, while estimated coal reserves exceed 600,000,000 tons. The coal is mostly used by the heavy industries at Port Kembla, by electrical power stations feeding the state grid and by the railways. Bricks and textiles are manufactured locally but most of the population work in the mines or at Port Kembla.

Access by land to the Illawarra coastal strip was first obtained (1815) by Charles Throsby, who cut a track, later known as the Bulli pass, down the escarpment of the Illawarra range (1,100 ft.). The top of the pass commands a splendid view of 90 mi. of coastline. (W. H. ML.)

BULLINGER, HEINRICH (1504–1575). Swiss reformer, an influential associate and successor of Huldreich Zwingli, was born at Bremgarten, Aargau, July 18, 1504. He studied at Emmerich, then at Cologne, where through the schoolmen (Peter Lombard and Gratian) and the Fathers (Origen, Chrysostom, Ambrose and Augustine) he came to the Bible, also consulting Luther and the *Loci Communes* of Philipp Melancthon (1521). On graduation he taught in the cloister school at Kappel, later becoming pastor. Further study at Zurich brought him into touch with Zwingli, whom he assisted in the Bern convocation (Jan. 1528). He then moved to Bremgarten (1529) as Reformed pastor; marrying the former nun Anna Adlischweiler. With Zwingli's death at the battle of Kappel (Oct. 11, 1531), Bullinger succeeded him at Zurich, where, in addition to his long pastoral ministry, he had much influence through his writings and correspondence, hospitality to religious refugees and ecumenical labours. He had a hand in the First Helvetic Confession (1536), reached the *Consensus Tigurinus*, on the Lord's Supper, with Calvin and Geneva (1549) and drew up the popular Second Helvetic Confession (1566). Though unable to reach agreement with Luther on the Eucharist, he deepened the Zwinglian conception and displayed an equable spirit. Close relations with the exiles under Mary Tudor gave him great influence on the English settlement under Elizabeth I. as seen in the *Zürich Letters* and his famous sermon series *The Decades*. Bullinger died at Zurich on Sept. 17, 1575.

His works, mostly expository and polemical, have never been collected, but a useful list is found in the Parker society edition in English of *The Decades of Henry Bullinger* (1849–52). His *Diarium* (ed. by E. Egli, 1904) and *History of the Swiss Reformation* are of particular historical interest.

BULLION, the name applied to gold and silver considered solely as metal without regard to any value arising from its form as coins or ornaments. The bullion value of a coin is determined by its weight, fineness (proportion of precious metal to total

weight) and the current price of the metal.

The work of weighing and assaying bullion is done by bullion brokers, who deal with bars, gold dust and coins.

As most countries dropped silver as standard money, the silver bullion in subsidiary coins became worth considerably less than face value. An exception exists when the issuing government inflates its paper currency and reduces its purchasing power to the point that it becomes profitable to melt coins for their bullion value. Gold coins as standard money enjoy a value established by world markets for their bullion content. The value of gold stems from its use in industry and as money. The price of gold in a country that uses it as the standard money is determined by government action.

The bulk of the world's monetary gold is held in bars rather than coins and moves between countries to settle trade balances when the gold standard is operative. Individuals hoard gold when they fear either monetary or political instability. In doing so they lose any profit they might gain by investing the money and they incur storage costs. They also risk confiscation by the government of any profits resulting from currency devaluation, such as occurred in many countries during the great depression of the early 1930s.

(H. E. G.N.)

BULL MOOSE, the symbol of the Progressive party in the American presidential election of 1912. The bull moose is the male of the large, ungainly branch of the deer family inhabiting forested parts of Canada and northeastern United States. It is closely allied to the European elk, standing over seven feet high and often weighing over 1,000 pounds. The origin of the term as a symbol probably lies in the remark made by Theodore Roosevelt: "I feel as fit as a bull moose." Cartoonists seized upon the remark, and the animal quickly became the emblem of the Roosevelt forces, and then of the Progressive Party, popularly known as the "Bull Moose party." When the Progressive Republicans declared themselves opposed to the renomination of Pres. William H. Taft and brought about a three-cornered election, the bull moose became a very useful symbol as opposed to the elephant of the regular Republicans and the donkey of the Democrats.

BULLROARER, a device which, when swung round in the air by a string or other material, produces a whirring or roaring sound much like that of an airplane propeller. It is most commonly made of a flat, elongated piece of wood, from a few inches to a foot in length, with a hole in one end through which the string is fastened. Although used only as a toy by Europeans in recent times, it has had the highest mystic significance and sanctity among ancient and primitive peoples. The rhombus whirled at Greek mysteries is an example of such ancient practice. The bullroarer is still highly regarded by natives of Australia, where it is prominent in initiation ceremonies for males. The women and children are told it is the voice of a spirit. It symbolizes the sky heroes or totemic ancestors of the people, and even the sight of it stirs the deepest feelings of reverence. It has been reported for all other major world areas where primitive peoples live: on many islands of the south Pacific, in southeast Asia, in Africa south of the Sahara, and among Indian tribes of both North and South America. In all these areas it is a sacred symbol often associated with male initiations, although here and there it appears to have degenerated into a mere toy. The following uses illustrate its range of meaning to the primitive mind: to bring on or drive away sickness, to control the weather, to assemble people for religious ceremonies, to induce women and children to stay away from men's sacred ceremonies, to promote fertility of game animals and crops, and as a fishing charm. It has been reported for almost half the North American Indian tribes, who make it of bone and rawhide as well as wood. It is most frequently used in North America to control the weather, although it functioned only as a boy's toy among a sizable minority of tribes. In South America it is found among the marginal and tropical forest peoples who live east of the Andes. Some anthropologists believe that the almost world-wide geographical distribution of the bullroarer is best explained by a single invention of the instrument thousands of years ago, early association with male initiations and subsequent diffusion to all continents.

BULL RUN, a small stream in northern Virginia, after which two famous battles of the American Civil War (*q.v.*) were named. The military importance of this area stemmed from the fact that the adjacent town of Manassas was the junction of the Manassas Gap railroad extending west to the Shenandoah valley and the Orange and Alexandria railroad running south to Gordonsville.

The first battle of Bull Run (called First Manassas by the Confederates) was fought July 21, 1861. Although neither army was adequately prepared at this early stage of the war, political considerations and popular pressures caused the Union government to order Gen. Irvin McDowell to advance southwest of Washington to Bull Run in a move against Richmond. The 22,000 Confederates under Gen. P. G. T. *Beauregard*,¹ after initial skirmishing at Blackburn's Ford on July 18, retired behind Bull Run in defensive positions. McDowell, discovering that the Confederate right and centre were too strong for a frontal assault, determined upon a flanking movement around the enemy left, but his delay in advancing was fatal for the Union cause.

Upon perceiving the Union movements *Beauregard* notified the authorities in Richmond by telegraph and Gen. *Joseph E. Johnston*, then facing a Union army under Gen. Robert Patterson near Winchester, was ordered to join *Beauregard* as quickly as possible. *Johnston* was able to mask his intentions and, utilizing the Manassas Gap railroad, moved 10,000 troops to Bull Run. *Johnston* arrived on the scene July 20 and as ranking general accepted *Beauregard's* plan of attack against Centreville, but before it could be launched the Union army assaulted the Confederate left on July 21.

McDowell, in personal command of two divisions, controlled the turning movement at Sudley Ford while one division demonstrated at the Stone Bridge and the other remained at Blackburn's Ford in reserve. McDowell's inexperienced troops arrived at Sudley Ford more than two hours late, and Colonel *Evans*, who had been left to guard the Stone Bridge, was able to move 11 of his 15 companies to Matthews Hill above Sudley Springs, supported by brigades of Gens. *Bee*, *Bartow* and *T. J. Jackson*. About 9:15 A.M. the Federal troops came under Confederate fire and were forced to deploy, but two hours later McDowell's flanking threat caused *Evans*, *Bee* and *Bartow* to withdraw in disorder to the Henry House Hill. Here *Jackson's* brigade stood "like a stone wall," as *Bee* shouted to his men, and the Union assault was checked. Continued attacks by McDowell against the Confederate positions made no headway, and the arrival of the last brigade of *Johnston's* army by railroad forced the Federals into a disorganized retreat to Washington. The victors were also exhausted and did not pursue although *Johnston* moved to the heights around Centreville. Estimates of losses (killed, wounded and missing) from McDowell's army of 37,000 range from about 2,600 to more than 3,300. Estimates of losses from the combined Confederate forces of approximately 35,000 range from about 1,700 to nearly 2,000.

The second battle was fought (Aug. 29-30, 1862) between the army of northern Virginia under Gen. R. E. *Lee* and a newly-formed Federal force under Maj. Gen. John Pope. With the withdrawal of McClellan's army of the Potomac from the Peninsula after an unsuccessful campaign, it became Pope's responsibility to cover Washington until the two armies could be combined for a new assault upon Richmond. Pope withdrew from the Rapidan to the Rappahannock river (Aug. 19) and was able to prevent *Lee's* advance until Aug. 24. *Lee*, determined to defeat Pope before the Union forces could be joined, took the calculated risk of splitting his army by ordering *Jackson*, screened by *Stuart's* cavalry, to march around Pope's right flank. Within two days *Jackson* had moved 54 mi. through Thoroughfare Gap to Bristoe and had cap-

¹In this and other American Civil War articles the names of Confederate generals, statesmen and ships are given in italics.

BULL RUN. SITE OF TWO BATTLES DURING THE AMERICAN CIVIL WAR: JULY 21, 1861, AND AUGUST 29–30, 1862

tured Pope's supply depot at Manassas by midnight of Aug. 26. Jackson then withdrew his force north of the Warrenton turnpike, and by noon of Aug. 28 his three divisions were hidden in the woods on a flat-topped ridge about a mile northwest of Groveton.

Pope had learned of Jackson's march and believed the Confederates were bound for the valley, but when the Union commander discovered (Aug. 27) that all of Jackson's corps had moved to Manassas, he determined to surround and destroy it. Without considering the presence of Longstreet's corps beyond the Rappahannock river, Pope marched to Manassas by noon of Aug. 28 but found that Jackson had disappeared. Arriving at the conclusion that Jackson's whole force had retreated north to Centreville, Pope ordered his whole army to move upon that position. Meanwhile Lee with Longstreet's corps had followed Jackson, and on Aug. 28 his advanced guard moved through Thoroughfare Gap after dark.

Jackson realized that if Pope were allowed to concentrate his forces behind Bull Run the Union army would be entrenched in strong defensive positions where it could await reinforcements, and he, therefore, decided to reveal his own location deliberately to lure Pope back into Lee's clutches. In the late afternoon of Aug. 28 King's division of McDowell's corps was attacked by two of Jackson's divisions near Groveton. Pope fell into the trap and in spite of the fact that he had lost contact with some of his units and had misread the military situation determined to move against Jackson on the morning of Aug. 29. Two frontal assaults by Brig. Gen. Franz Sigel and six major attacks after Pope had reached the front at noon failed because of lack of co-ordination and Jackson's strong defensive positions. Moreover by noon of Aug. 29 Longstreet had deployed across the Warrenton turnpike, holding Porter and McDowell from attacking Jackson's right flank and rear. By dark Jackson's position near Groveton was still completely intact.

Mistakenly believing that Jackson was retreating, Pope at noon of Aug. 30 ordered a pursuit of the unbeaten and reinforced enemy and thereby relieved Longstreet of any opposition. McDowell, in charge of the pursuit, soon realized Pope's mistake and attempted to secure his exposed flank by occupying the Bald and Henry House Hills while at the same time organizing his attack against Jackson. Enfilading artillery fire by Longstreet prevented the success of the Union assault on Jackson's positions, and shortly after 4 P.M. Lee ordered the entire Confederate army forward in a grand counterattack. Longstreet bore down on the Federal left while Jackson pressed the right toward the turnpike. The Confederate victory was not complete, because the Union forces withstood repeated assaults against Henry House Hill although Chinn's Ridge and Bald Hill fell. Pope withdrew his defeated army across Bull Run and eventually retreated to the fortifications of Washington.

Estimates of Pope's losses range from about 14,000 to 16,000 men from a total force of more than 70,000 while Lee's casualties were about 9,000 from an army of about 56,000. (J. R. Co.)

BULNES, MANUEL (1799–1866), Chilean military figure and president for two terms (1841–51), was born in Concepción in 1799. The important victory he won, commanding the Chilean forces against the Bolivian-Peruvian confederation in 1839, assured his election to the presidency in 1841. Although he was the spokesman of the Conservative oligarchy, Bulnes found posts for many liberals in his government. His regime is notable in Chilean history for a number of reasons. Foreign investment and technological development were vigorously promoted. A wave of nationalism led to Chilean occupation in the Strait of Magellan and to the partial opening of the Araucanian Indian frontier. Social and political stability made Chile a haven for many intellectual refugees—among whom were Andrés Bello and Domingo Sarmiento (*qq.v.*)—from dictatorships in neighbouring republics. Public schools and institutions of higher learning were established, including the University of Chile, the first normal school in Latin America, a school of architecture and painting and a national conservatory of music. The new interest in learning produced a generation of young intellectuals who openly opposed the oligarchical domination that Bulnes represented. In the face of growing discontent Bulnes named his successor, Manuel Montt (*q.v.*), and had him duly elected; he was obliged, however, to resort to military action to quell a brief but bitter civil war before Montt's tenure was secured. Bulnes died in Santiago in 1866. (J. J. J.)

BÜLOW, BERNHARD, PRINCE VON (1849–1929), German statesman, imperial chancellor from 1900 to 1909, was born at Klein-Flottbeck near Altona on May 3, 1849, the son of B. E. von Biilow, who from 1873 was Bismarck's state secretary for foreign affairs. From the first the young Bülow was assured of a career in the highest circles of imperial Germany by his family connections, by his brilliant and urbane personality and by his undeniable talents and assiduity. On leaving the Francke institute at Halle, he went to study law at Lausanne, Berlin and Leipzig. He served as a volunteer in the Bonn hussars during the Franco-German War of 1870–71. In 1874 he entered the German foreign service. After holding posts in Rome, in St. Petersburg, in Vienna and in Athens, he served in the secretariat of the congress of Berlin (1878) and then went to Paris to be secretary of the embassy under Prince Chlodwig Hohenlohe. Having been embassy counselor in St. Petersburg (1884), minister in Bucharest (1888) and ambassador in Rome (appointed in the autumn of 1893), he was in 1897 made state secretary for the foreign department, under Hohenlohe. Created count in 1899 he succeeded Hohenlohe as imperial chancellor in Oct. 1900.

Chancellor.—Born and bred in the diplomatic world, Biilow knew the continental European capitals as no German statesman since Bismarck had known them. To the German public, indeed, he long appeared as the continuator of the Bismarck tradition though in fact he stood rather for the developments and deviations from that tradition to which late 19th-century imperialism had given rise. In 1886, moreover, he had strengthened his own international connections by his marriage: this was to Maria Beccadelli di Bologna, daughter of Domenico, 5th principe di Camporeale. Her mother, Laura Acton, was a cousin of the English historian Lord Acton and had married as her second husband the Italian statesman Marco Minghetti. Maria's earlier marriage to Karl, Graf Donhoff, had been dissolved. Biilow encountered some opposition in his plans for marriage with her.

As chancellor from 1900 to 1909 Biilow stood at the peak of his brilliant career. To his contemporaries he seemed to be the most talented of Bismarck's successors. It was only after World War I, when the records and official documents of the prewar period were made available, that a critical reevaluation of Biilow began—with Johannes Haller's passionate survey, *Die Ära Biilow: eine historisch-politische Studie* (1922). Bülow, however, whose own memoirs show him to have been thoroughly critical of the emperor William II's weaknesses, is far more open than either of his predecessors in the chancellorship, Caprivi and Hohenlohe, or his successor Bethmann Hollweg, to the charge of having lent himself to these weaknesses to facilitate his rise to power and then to maintain himself. His pliancy is often barely distinguishable from flattery. He fully understood the theory of the monarchical power

as based on the constitution of 1871 and experienced it for himself. Meanwhile, in both his foreign and his domestic policy, he trusted in his ability to overcome serious difficulties with adroit tactics and to avoid involvement with fundamental issues.

Foreign Affairs.—In his foreign policy, both as state secretary and as chancellor, Bülow was no doubt strongly influenced by Friedrich von Holstein (*q.v.*). Even so, he had more than a formal responsibility for what was done. His whole conduct of foreign affairs bears the stamp of the facile confidence with which he sought to employ the tradition of Bismarckian Realpolitik in the service of William II's policy of securing for the Reich "a place in the sun" among the world powers. He met at first with some easy but limited successes, such as the acquisition of Kiaochow bay, the Caroline islands and Samoa (1898–99). The idea of the Baghdad railway (*q.v.*) rested on the conviction that the perpetual conflict between Russia and Great Britain would allow the Germans to play one power against the other until they had made their way to the Persian gulf. Likewise, for Europe, Bülow and his advisers optimistically believed that by adhering to the Bismarckian policy of the "free hand" they could guarantee Germany's freedom of movement between the great powers of east and west. Even the Franco-Russian alliance did not seem to limit Germany's choice in the matter of continental power blocs, since it was hoped that the attention to German-Russian relations, as exemplified in the Bjorko treaty of 1905, might force France over to Germany's side in Russia's wake. This optimism lay behind the reserve with which Bulow and Holstein conducted their negotiations with Great Britain from 1898 to 1901. These were aimed at a readjustment of the system of alliances in Europe, and the most that could have been expected of them was an experimental entente, such as Great Britain and France were to reach in 1904. As late as 1901, however, Holstein and Bulow still did not see that a British alliance, with British guarantees for Austria-Hungary, was impossible, and they offered no concessions to Joseph Chamberlain. The negotiations were further embarrassed by the emotional reaction of German public opinion against the South African War and were damaged by the fact that Bulow allowed Alfred von Tirpitz a free hand in his development of the German fleet. The "all or nothing" which Bulow allowed to weigh upon the conclusion to the negotiations became a parting of the ways. The rival blocs—the Triple alliance of Germany, Austria-Hungary and Italy against the Franco-Russian alliance and the Anglo-French entente—were to be consolidated until World War I broke out.

On Holstein's advice, Bulow twice tried to tear down the net of alliances that he had helped to weave, as it obstructed his policy of the free hand. The Morocco crisis of 1905–06, linked with the profitless Bjorko treaty with Russia, was intended to demonstrate the basic weakness of the Anglo-French entente but in fact strengthened it. While Holstein did not aim at war but was prepared to face catastrophe if it came, Bülow dissociated himself from him at the climax of the Morocco crisis and disregarded his opinion. Both emperor and chancellor were determined at all costs to avoid a decision by war. This, however, did not hinder Bülow from accepting Holstein's and A. von Kiderlen-Wachter's advice at the time of the crisis of 1908–09 over the Austro-Hungarian annexation of Bosnia-Hercegovina. On this occasion the full weight of German power was used to ensure the European recognition for the annexation when it seemed in danger from the support given by Russia, with Great Britain's approval, to Serbia's objections. This show of "Niebelung loyalty" to Germany's last reliable ally was accounted a great victory to Bülow by German public opinion, as he had thereby bypassed the danger of the Reich's encirclement.

In fact Bülow must have appreciated the true seriousness of the situation by the end of his period of office. The damage done to Anglo-German relations by Germany's naval program caused him great misgivings, and with unwonted vigour he insisted on a decision of the question whether there should be a change in preference from heavy battleships to smaller armaments such as cruisers, torpedo boats and submarines. By this time, however, William II's faith in his adroit adviser was exhausted and Bülow had to leave this fateful question to his successor Bethmann

Hollweg. Though he later accused Bethmann of stumbling into World War I through incompetence, it is beyond question that Bulow himself, for all his brilliance, bore a decisive part of the responsibility for the critical development in the European and German situation.

Domestic Affairs.—In domestic affairs Bulow also had some early successes, but his tenure of the chancellorship was characterized by the way in which the major problems of Prussia and the Reich, at first obscured, were left finally unsolved. Bülow adhered to the tradition of government with the support of "varying majorities." This was intended to maintain power in the hands of the monarch and the administration, but became increasingly questionable under the pressure of the rising power of the masses. In the empire and Prussia it depended on the support of the Conservatives and of the Centre and, in certain connections, even that of the National Liberals. In Prussia, Bulow sacrificed the Rhine-Elbe canal project to the Conservatives and thereby gained acceptance of the hotly contested protective tariffs of 1902 (the increased cost of agricultural and industrial produce had to be met by the consumer). Though he took no steps to repress the Social Democrats and even introduced some cautious social measures through his state secretary, Artur Posadowsky, he made sure that the workers and their party should reap no political advantages. He studiously bypassed the truly urgent problems such as the repeal of the Prussian three-class suffrage laws, resolution of the dualism between Prussia and the empire, the radical reform of the imperial finances and the development of direct taxation.

Even so—unlike William II, the court and the Prussian Conservatives—Bulow saw the necessity of co-operating with the Reichstag. Thus he facilitated the transition from constitutional monarchy of the Bismarck type to a parliamentary government, though his administration up to 1905–06 can hardly be described as even semiparliamentary. In 1905, however, when his relations with the emperor had already deteriorated (not least on account of questions of foreign policy); he made use of the opposition of the Centre on colonial questions as pretext for the dissolution of the Reichstag—a measure directed against the Centre and the Social Democrats. The "bloc" system of politics then introduced by Bulow with the assistance of the Conservatives, the National Liberals and the Liberals could have led in the long run to liberal constitutionalism if it had not collapsed in 1909, when the coalition parties objected to the inclusion of death duties in a project for the reform of the imperial finances.

Resignation.—Already in 1908 Bulow had become estranged from the emperor for his handling of the Daily Telegraph affair. That newspaper's account of an interview with the emperor, intended to conciliate British opinion, had instead provoked great indignation among readers, and Bulow had to admit that he had not read the proof of it submitted to him before publication. The emperor, however, who then had to promise not to intervene in politics without consulting the chancellor, felt that Bulow had deliberately passed the proof to bring about his humiliation. Thereafter his antipathy to Bulow was ineradicable, and when the Conservatives and the Centre reunited on the question of death duties they had no difficulty in forcing Bulow to resign. The emperor then accepted his resignation (July 14, 1909). The inheritance that he left to Bethmann Hollweg, one of the men whom he had proposed for his successor, was a problematical one.

Later Years.—After his dismissal Bülow consistently attempted to regain power but was always met by the emperor's firm refusal. The criticism of Bethmann which appears in his memoirs is especially painful reading because of the writer's total blindness toward his own weaknesses and mistakes. In Dec. 1914 he was sent as ambassador to Rome to dissuade the Italians from entering World War I, but failed; and his charge that Bethmann was too weak in his dealings with Vienna ignores Bülow's own conduct of affairs during the Bosnia-Hercegovina crisis. In July on his last bid for power, a large section of the parties was prepared to support his return to office, and he even approached the Social Democrats, but once again the emperor refused his candidature.

Bulow spent his last years either in his home town or in Rome. He died in Rome on Oct. 28, 1929.

Bulow's memoirs, *Denkwürdigkeiten*, were published posthumously at his own request edited by Franz von Stockhammer, four volumes (1930–31; Eng. trans. 1931–32). Indispensable to the historian, they nevertheless require a critical approach and represent a major attempt to dispute his personal responsibility for the German collapse. In these memoirs, however, the strengths and weaknesses of his personality are mercilessly reflected, and he does not make good his contention that he left to his successors an intact inheritance which they squandered away. The memoirs, in fact, do little to make him seem anything more than a moderately successful opportunist, with no real statesmanship. His was a talent whose intellectual and human weaknesses cannot be conjured out of the history of pre-1914 Germany.

Freiherr Hiller von Gaertringen, *Fürst Bülow's Denkwürdigkeiten: Untersuchungen zum ihrer Entstehungsgeschichte und ihrer Kritik* (1956). For accounts and appraisals of his career see J. Haller, *Die Ära Bülow* (1922); T. Eschenburg, *Das Kaiserreich am Scheideweg* (1929); J. Haferkorn, *Bülow's Kampf um das Reichskanzleramt im Jahre 1906* (1939); W. Schüssler, *Die Daily-Telegraph-Affäre 1908* (1952); H. Rogge, *Holstein und Harden* (1959).

BÜLOW, DIETRICH ADAM HEINRICH, BARON VON (1757–1807), Prussian soldier and military writer, brother of Gen. Friedrich Wilhelm von Bülow, entered the Prussian army in 1773 and remained in the service for 16 years. He wrote a number of brilliant but unorthodox books on military science and history in the opening years of the 19th century. These works—distinguished by an open contempt for the Prussian system, cosmopolitanism hardly to be distinguished from high treason, and the mordant sarcasm of a disappointed man—brought upon

Bulow the enmity of the official classes and of the government. He was arrested as insane, but medical examination disproved the charge and he was then lodged as a prisoner in Kolberg, where he was harshly treated, though Count Neithardt von Gneisenau obtained some mitigation of his condition. From there he passed into Russian hands and died in prison at Riga in 1807, probably as a result of ill treatment.

Bülow was an enthusiastic supporter of the method of fighting in small columns covered by skirmishers, which, more of necessity than from judgment, the French revolutionary generals had adopted. Battles, he maintained, were won by skirmishers. But his tactics, like his strategy, were vitiated by their dependence on the realization of an unattainable standard of bravery.

BÜLOW, HANS GUIDO, FREIHERR VON (1830–1894), German pianist and conductor, esteemed for his performances of Beethoven and as the interpreter of the music of Liszt and Wagner, was born at Dresden on Jan. 8, 1830. He studied the piano under Friedrich Wieck and Liszt and conducting under Wagner and Karl Ritter. In 1857 he married Liszt's daughter Cosima. In 1864 he was appointed director of music to Ludwig II at Munich where he conducted the first performances of Wagner's *Tristan und Isolde* (1865) and *Die Meistersinger* (1868). Abandoned by Cosima, who married Wagner in 1870, Bülow continued to propagate Wagner's work both in performance and his critical writings. He conducted at Hanover (1877–80) and at Meiningen (1880–85), where his orchestra became one of the finest in Europe and where he largely established the later vogue of the virtuoso conductor. Bülow was also among the earliest interpreters of Brahms and Richard Strauss. He was admired for his performances of the Beethoven sonatas though his edition of them was criticized. He died in Cairo, Egy., on Feb. 12, 1894.

Waller (1931); M. von Millenkovich-Morold, *Dreigestirn: Wagner, Liszt, Bülow* (1940); E. Stargardt-Wolff, *Wegbereiter grosser Musiker* (1954); H. von Bülow-R. Strauss, *Correspondence*, Eng. trans. (1955).

BULRUSH, a name correctly applied to *Scirpus lacustris*, a member of the family Cyperaceae (*q.v.*), which includes also the papyrus and sedges. It is a common plant in wet places, with tall, spongy, usually leafless stems and bearing a tuft of many-flowered spikelets. The stems are used for matting, etc. In the United States the name bulrush is commonly given also to other species of *Scirpus*, especially *S. validus*. In Great Britain *Typha latifolia*,

the reed mace or club rush, also is called bulrush, while in the United States species of *Typha* usually are called cattail.

The club rush grows in lakes, along the edges of rivers and in other such localities. It has a creeping underground stem; narrow, nearly flat leaves, three to six feet long, arranged in opposite rows; and a tall stem ending in a cylindrical brown spike, six inches to one foot long, of closely packed male (above) and female (below) flowers. The spike is a dense mass of minute one-seeded fruits, each on a long hairlike stalk and covered with long downy hairs, which render the fruits light and readily carried by the wind.

The bulrush of Scripture, associated with the hiding of Moses, was *Cyperus papyrus*, the Egyptian papyrus, which was abundant in the Nile. See also RUSH.

BULTMANN, RUDOLF (1884–), German theologian and New Testament scholar, whose demand for demythologizing the New Testament evoked a tremendous theological controversy in Germany and the world, was born Aug. 20, 1884, at Wiefelstede, Oldenburg. He studied at Marburg, Tübingen and Berlin, and was Privatdozent at Marburg (1912) and professor of New Testament studies at Breslau (1916), Giessen (1920) and Marburg (1921), retiring in 1951. With Martin Dibelius (*q.v.*) and K. L. Schmidt, Bultmann was a pioneer of form criticism, the study of the origin and development of the oral tradition behind the Gospels (*Die Geschichte der synoptischen Tradition*, 1921, enlarged 1931; Eng. trans., 1934).

For Bultmann the Gospels are products of the believing community, not biographies of the historical Jesus, of whom little can be known except his preaching of radical decision in view of the coming Reign of God (*Jesus*, 1926; Eng. trans., 1934). Historical skepticism does not undermine faith, since faith's object is not the historical Jesus but Christ preached by the church as God's redemptive act.

In 1941 Bultmann launched a demand for the demythologizing of the Church's preaching. Not only the Virgin Birth and the Empty Tomb but also the Incarnation, Resurrection, Ascension and Second Coming are derived from the mythology of Jewish apocalyptic and Hellenistic Gnosticism. The mythology requires not elimination (as in liberal theology) but interpretation, specifically

in existentialist terms. Man is a prey to "inauthentic existence," but can be delivered only by an act of God, which the New Testament proclaims in Christ (*Kerygma und Mythos*, 5 vol., 1948–55).

Other of Bultmann's major works are *Das Evangelium des Johannes* (1941); *Das Urchristentum im Rahmen der antiken Religionen* (1949; Eng. trans., 1956); *Glauben und Verstecken* (collected essays; 1933–52; Eng. trans., vol. ii, 1955); *Theologie des Neuen Testaments* (1948–53; Eng. trans., 1952–55). In English also are *The Presence of Eternity: History and Eschatology* (1957); *Jesus Christ and Mythology* (1958). (R. H. F.)

BUMBLEBEE (HUMBLEBEE), the common name for bees of the genus *Bombus*, which have a thick hairy body, often banded with bright colours. There are numerous species, found generally throughout the world except the Australian region, where, however, they have been introduced as agents of pollination for some of the cultivated species of clover. See BEE; HYMENOPTERA; SOCIAL INSECTS.

BUMBOAT, a small boat that carries fruit, vegetables and small wares to ships lying in port or close offshore. The origin of the term is obscure. Apparently it was applied originally to scavengers' boats that removed filth from ships. In course of time the practice of bringing supplies to ships was added and bumboats became a type of water-borne peddler's cart. To prevent stealing and the selling of illicit wares by bumboatmen (or bumboatwomen), regulations regarding them were adopted in England at an early date.

BUN, a small cake, usually sweet and round. In the U.S. the word also means a "roll." In Scotland it is a rich spiced cake and in the north of Ireland a round loaf of ordinary bread. The derivation of the word has been much disputed.

Like the Greeks, the Romans ate bread marked with a cross (possibly in allusion to the four quarters of the moon) at public sacrifices, such bread being usually purchased at the doors of the temple and taken in with them—a custom alluded to by St. Paul

in I Cor. x, 28. The cross bread was eaten by the pagan Saxons in honour of Eostre, their goddess of light. The Mexicans and Peruvians had a similar custom. The custom, in fact, was practically universal, and the early Christian church adopted it, thus developing the hot cross bun.

BUNCHE, RALPH JOHNSON (1904–), U.S. political scientist, was born on Aug. 7, 1904, in Detroit, Mich. He was graduated from the University of California at Los Angeles in 1927, received a master's degree in government from Harvard university in 1928 and a Ph.D. in 1934. He taught political science at Howard university, Washington, D C., becoming a full professor in 1938. In the meantime, he traveled through French West Africa on a Rosenwald field fellowship, studying and comparing the administration of French Togoland, a mandated area, and Dahomey, a colony. He later did postdoctoral work at Northwestern university, Evanston, Ill., and at the London School of Economics in 1936 and 1937, before returning to Africa for further studies of colonial policy.

During World War II he served with the U.S. joint chiefs of staff, the Office of Strategic Services and the department of state. He joined the United Nations secretariat as director of the division of trusteeship in 1946. He was assisting Count Folke Bernadotte of Sweden in mediating the Jewish-Arab warfare in Palestine when Bernadotte was assassinated in 1948. Afterward Bunche supervised the truce and armistice agreements there. For this and his other efforts in behalf of the UN, Bunche was awarded the Nobel peace prize for 1950, the first Negro to win the award, which amounted to \$31,410. He later headed a United Nations committee to study water-development projects in the middle east, including the disputed diversion of Jordan river waters in Palestine. He was principal director of the UN department of trusteeship from 1948 to 1954 and UN undersecretary for special political affairs from 1958.

BUNCRANA, (BUN CRANNAIGHE), an urban district and market town of County Donegal, Ire., lies on the eastern shore of Lough Swilly, 14 mi. N.W. of Londonderry by road. Pop. (1961) 3,165. An agricultural centre and vacation resort, Bunrana also has a salmon fishery, sea fisheries and clothing factories. The town is sheltered on three sides by high hills, of which East Slieve Snaght (2,008 ft) lies 6 mi. N.E. The square keep of the 15th-century O'Doherty's castle remains, but Bunrana castle is a residence erected in 1717.

BUNDELKHAND, a tract in central India, now included like the broadly similar tract of Baghelkhand to the east in the northern part of Madhya Pradesh (*q.v.*).

The surface of the country is uneven and hilly, except in the northeast part, which forms an irregular plain cut up by ravines. Isolated hills rising abruptly from a common level presented their steep and nearly inaccessible scarps eligible sites for castles and strongholds, whence the mountaineers of Bundelkhand frequently set at defiance the most powerful of the Indian states. The chief streams flow in deep ravine-fringed channels and are of little use for irrigation though the waters of the Betwa (*q.v.*) have been impounded for an important canal. The main sources of irrigation are numerous artificial lakes.

Diamonds are found over a considerable area of country, but particularly near Panna. The output in Akbar's time is said to have been worth £100,000 a year; a magnificent jewel from the Gadasia mine was among the treasures in Kalinjar fort. Though the quality is good, the size of the finds is now small.

History. — The earliest dynasty recorded to have ruled Bundelkhand, or Jekakabhukti, was that of the Gaharwars, who were succeeded by the Pratiharas. About A.D. 800 the Pratiharas were ousted by the Chandels, who were probably of Gond origin. By the early part of the 11th century the Chandels had extended their sway over the country between the Jumna and the Narmada. They proved no match for the Muslim invaders and their ruler, Ganda, surrendered to Mahmud of Ghazni. In 1182 the Chandel dynasty was overthrown by Prithwi Raj, the ruler of Ajmer and Delhi, after which the country remained in ruinous anarchy until the close of the 14th century, when the Bundelas, who claimed descent from the Gaharwars, established themselves on the right bank of

the Jumna. In 1545 Sher Shah Sur, who had ousted the Mogul emperor Humayun, invaded Bundelkhand but lost his life while besieging the strong fortress of Kalinjar. In 1569 Kalinjar surrendered to Akbar. Guerrilla warfare continued but the Bundelas were never fully subdued. With the decline of Mogul power the Marathas gradually extended their influence over Bundelkhand, and in 1792 the peshwa was acknowledged as the lord-paramount of the country.

The Maratha power was, however, on the decline; and by the treaty concluded between the peshwa and the British government, the districts of Banda and Hamirpur were transferred to the latter. In 1809 Ajaigarh was besieged by a British force, and again three years later Kalinjar was besieged and taken after a heavy loss. In 1817, by the treaty of Poona, the British government acquired from the peshwa all his rights, interests and pretensions, territorial or pecuniary, in Bundelkhand. It was in Bundelkhand that the rani of Jhansi revolted against British rule during the 1857 disturbances.

Historically Bundelkhand included Hamirpur, Jalaun, Jhansi and Banda (*qq.v.*) districts, which now compose the Jhansi division of Uttar Pradesh, but politically prior to 1947 it was restricted to the princely states of the Bundelkhand agency, a subagency of the British Central India administration. These were Ajaigarh, Charkhari, Chhatarpur, Datia, Orchha, Baoni, Bijawar, Panna, Samthar and several small estates. The agency headquarters were at Nowgong (Chhatarpur state). On April 2, 1948, they merged with the states of the former Baghelkhand agency (Rewa [*q.v.*] and minor states and estates) to form Vindhya Pradesh. Baoni, Charkhari and Samthar, enclaves in Uttar Pradesh, were transferred to that state on Jan. 25, 1950. Vindhya Pradesh became a part of Madhya Pradesh on Nov. 1, 1956. Both Bundelkhand and Baghelkhand have thus lost any political identity.

See V. A. Smith, "History of Bundelkhand," *J. Asiat. Soc. Beng.* (1881); C. U. Aitchison, *Treaties, Engagement and Sanads*, vol. v (1933). (L. D. S.; C. C. D.)

BUNDI, a town and district in Rajasthan, India. The town, 95 mi. S.E. of Ajmer, had a population in 1951 of 22,697, and is on the main road from Ajmer to Kotah.

BUNDI DISTRICT includes many parts of the wild and hilly tract known historically as Haroti, inhabited by a large Mina population. It is watered by the Chambal and Mej rivers. Area 2,158 sq.mi.; pop. (1961) 338,208.

The princely state of Bundi, with which the modern district corresponds, was founded about A.D. 1342 by the Chauhan Rajput chief Rao Dewa or Deoraj, who captured the town from the Minas. Its importance, however, dates from the time of Rao Surjan, who succeeded to the chieftainship in 1554 and by throwing in his lot with the Muslim emperors of Delhi (1569) received a considerable accession of territory. In the 17th century their power was curtailed by the division of Haroti into the two states of Kotah and Bundi; but the title of maharao raja was conferred on Budh Singh for the part played by him in securing the imperial throne for Bahadur Shah I after the death of Aurangzeb in 1707. In 1804 the maharao raja Bishan Singh gave valuable assistance to Col. William Monson in his disastrous retreat before Jaswant Rao Holkar and in 1818, by a treaty concluded with Bishan Singh, Bundi was taken under British protection, and was subsequently controlled through the Eastern Rajputana subagency of Rajputana. It was absorbed into Rajasthan on April 18, 1948. (S. M. T. R.)

BUNGALOW, a form of dwelling, typically of one story and with a wide veranda, which originated in India and became popular in Europe and the U.S.

BUNIN, IVAN ALEKSEEVICH (1870–1953) Russian poet and novelist, the first Russian to receive the Nobel prize for literature (1933), was born in Voronezh, Oct. 22 (new style; old style, 10), 1870. He worked as a journalist and as a clerk and later wrote and translated poetry, publishing his first volume of verse in 1891. For his translation of Longfellow's *Hiawatha* he was awarded a Pushkin prize in 1903 by the Russian Academy, which later elected him an honorary fellow (1909). He also translated Byron's *Manfred* and *Cain*. Bunin, whose poetry had a Parnassian ring, belonged to the post-Pushkin tradition and had no

use for modern avant-garde trends. He made his name as a short-story writer, with such masterpieces as "Gospodin iz San-Frantsisko," the title piece in one of his collections (1916; Eng. trans. by D. H. Lawrence, S. S. Koteliansky and Leonard Woolf, *The Gentleman from San Francisco*, 1922). His last book of stories, *Tëmnye allei* (Eng. trans. *Dark Avenues*, 1949), was published in 1943. His longer works include *Derevnya* (1910; Eng. trans. *The Village* 1923), *Mitina lyubov* (1925; Eng. trans. *Mitya's Love*, 1926). *Zhizn Arsenyeva* ("The Life of Arsenev"), a fictional autobiography (1930; Eng. trans. *The Well of Days*, 1933) and its sequel, *Lika* (1939), and two volumes of memoirs, *Okayannye dni* (1926, "The Accursed Days") and *Vospominaniya* (1950; Eng. trans. *Memories and Portraits*, 1951). He also wrote books on Tolstoy (*Osvobozhdenie Tolstogo*, "Tolstoy's Liberation," 1937) and Chekhov, both of whom he knew personally. The latter book, *O Chekhove*, remained unfinished and was published posthumously (1955). Bunin traveled much, visiting Palestine, Egypt, India and Ceylon. In 1919 he left Russia and settled in France. He died in Paris, Nov. 8, 1953. Bunin is one of the best Russian stylists. Most of his work has been translated into English and other European languages. After his death some of his works were reissued in the Soviet Union.

BUNKER HILL, the name of a hill in Charlestown, Mass., famous in connection with one of the most important engagements, June 17, 1775, in the American Revolution. Within two months after the day of Lexington and Concord (April 19, 1775), Massachusetts, Connecticut, New Hampshire and Rhode Island had assembled over 15,000 troops in the neighbourhood of Boston to prevent the 5,000 or more British troops stationed there under Gen. Thomas Gage from making further sallies, and perhaps, when enough heavy artillery and ammunition had been collected, to drive them away. Gen. Artemas Ward, with headquarters at Cambridge, was commander in chief of the Massachusetts troops and the senior New England officer.

There were two obvious points from which Boston was vulnerable to artillery fire. One was Dorchester heights, southeast of Boston at that time confined to a peninsula extending into Boston bay from the south. The other consisted of two high hills, Bunker's (110 ft.) and Breed's (75 ft.) on the Charlestown peninsula jutting southeastward into the bay, to within about a quarter of a mile of the north shore of Boston. As early as May 12 the Massachusetts committee of safety had recommended fortifying Bunker's hill but nothing had come of the proposal. By the middle of June, hearing that Gage was about to occupy this hill (he was, in fact, planning first to occupy Dorchester heights), the committee of safety and a council of war from among the higher officers of the besieging forces decided to forestall him.

On the evening of June 16 about 800 Massachusetts and 200 Connecticut troops, under the command of Col. William Prescott of Massachusetts, were detached to carry out the project, but by some error, never explained, Prescott was ordered to fortify Breed's hill, which, though nearer Boston than Bunker's, was not only lower but could be more easily surrounded by the British.

Prescott and his men had completed a redoubt (dirt fort), about 44 yards square, on the top of Breed's hill (now commonly called Bunker hill) by the time they were discovered by the British at daybreak of the 17th. Despite a cannonade by guns from British men-of-war in the harbour and from a battery on Copp's hill in north Boston, they were able further to strengthen their position during the morning by building a breastwork about 100 yd. long running northward down the slope of the hill toward the Mystic river.

On learning of the New Englanders' seizure of Breed's hill, Gage sent over a detachment of 2,300 or more troops under Maj. Gen. William Howe, with Brig. Gen. Robert Pigot, second in command, to dislodge or capture them. The British, landing without opposition under protection of British artillery fire, were divided into two

wings, the left under Pigot to attack the redoubt from the south-east, the right under Howe to get behind the fort and breastwork by marching northward along the bank of the Mystic.

Howe's advance was stopped by a deadly fire from a body of Connecticut, New Hampshire and Massachusetts troops, some detached by Prescott, others sent to the front when the British movement to attack became known. Posting themselves behind a rail fence hastily stuffed with grass, hay and brush, they pluckily held their fire until the British were very near. Pigot, too, was at first checked by a heavy fire from the redoubt and adjacent breastwork, but, on the second or third advance, he carried the redoubt and forced the surviving defenders, many of whom had exhausted their ammunition and were without bayonets, to flee. Their retreat was covered by the men at the fence, who now also retreated, and by New England reinforcements, spurred to the front by Gen. Israel Putnam of Connecticut.

The casualties, particularly the British, were extremely heavy in proportion to the number of troops engaged. The Americans lost about 450 killed, wounded and captured, the British 1,054 killed and wounded, including 89 officers. Among the Americans who were killed was Gen. Joseph Warren of Massachusetts who had entered the redoubt as a volunteer.

If the British had followed their taking of the Charlestown peninsula by the seizure of Dorchester heights their victory at Breed's hill might perhaps have been worth the heavy cost. But, presumably because of their heavy losses there and the fighting spirit displayed by the "rebels," the British commanders abandoned or indefinitely postponed their plan to occupy Dorchester heights. Consequently, when Washington (who took command two weeks later) had collected enough heavy guns and ammunition to threaten Boston, he was able, in March 1776, to seize and fortify Dorchester heights without opposition and compel the British to evacuate the town and harbour. Another important effect from the American standpoint was that the lack of organization and discipline, especially among the Massachusetts officers and men, many of whom held back when sent to reinforce the troops at Breed's hill, gave impetus to Washington's efforts to correct these defects. Had the American volunteers been easily driven from their fortified position on Breed's hill by the troops of George III, resistance to the British government conceivably would have died out in North America through the colonists' lack of confidence. The battle of Bunker Hill, as it is commonly called, reassured the colonists that the odds against them were not so overwhelming as to deny the prospect of ultimate success. See also AMERICAN REVOLUTION.

BUNKERING, SHIP. This term denotes the process of fueling a ship and is derived from the word "bunker," a compartment on shipboard for storing fuel. Coal bunkering has naturally been in use ever since steamships came into existence. In the early days it was performed by hand and was an extremely slow process. To decrease the time required for bunkering, either for fuel or for cargo, and thus decrease the cost of the operation, various types of mechanical bunkering devices have been developed to reduce a ship's time in port, an important economic aspect in ship operation. Coal as a fuel has been replaced, except for small commercial vessels, by oil; thus the loading of coal applies primarily to coal as a cargo.

Coal Bunkering Devices.—The De Mayo bunkering device is a completely enclosed bucket elevator, suspended singly or in series from the ship's tackle or from the boom of a coaling barge; it discharges coal from barges alongside, both inshore and offshore, and at the intake porthole. With this system, portable conveyors are sometimes employed for trimming the coal in the bunkers, *i.e.*, moving it from one spot to another, or for loading through deck hatches in connection with a portable elevator.

The Suisted bunkering elevator consists essentially of a bucket elevator and band conveyor mounted on two pontoons with room between for the coal barges; one of the pontoons contains the generating plant for power and light while the other provides accom-

modations for the crew. It is so built that the upper structure straddles the barges to be unloaded, devouring their contents and disgorging them into the bunkers of a vessel. The important feature is the way in which the bucket elevator is mounted between the two pontoons, so that it can be raised and lowered mechanically from side to side in order to pick up the coal with the minimum amount of trimming.

Oil Fuel Bunkering.— Until such time as the propulsion of vessels by nuclear fission has become commonplace and ships no longer require conventional fuels, oil will be the fuel that propels them over the sea lanes. Oil has a great many points in its favour. There are approximately 18,500 British thermal units (B.T.U.) per pound in liquid residual fuel against only 14,300 B.T.U. per pound in coal. Oil can be carried in spaces aboard ship that would be impractical for the carriage of coal—as in shallow double bottoms. It requires less bunker space, less handling and lends itself to speedy dispatch. When using oil there is no dust and very little smoke; trimming is no longer necessary and no ashes have to be disposed of. Oil also makes unnecessary the large engine-room cren needed to handle coal. In addition, modern high-pressure boilers cannot be fired with coal.

The physical task of bunkering a ship with oil, compared to coal, is an extremely simple one. Vessels can be bunkered at a loading pier, oil dock or at anchor; in specialized cases vessels can even be bunkered while underway at sea. In essence, bunkering entails a hose or pipe connection between a storage tank and the ship with valves to control the flow. Most modern ports can bunker ships either by a system of fixed pipes and portable hoses or from oil barges without interfering with cargo or passenger operations.

Fueling Stations.— In the latter half of the 19th century, as steam vessels replaced sailing ships in ocean transport, the trade of the world began to settle down upon fixed routes and, with the opening of the Suez and Panama canals, the great sea lanes encompassing the globe were completed. Along these lanes fueling stations sprang up at ports where merchant ships found it convenient to replenish their bunkers. The increased size of ships, improvements in the steam engine, the use of oil fuel and the introduction of the internal-combustion engine added greatly to the time that ships could remain at sea without refueling. As a result some of the older coaling stations decreased in importance, while others, under the influence of oil, grew rapidly. At terminal ports on the great trade routes the bunkering trade, which carried oil or coal from its sources to the fueling stations, formed no small part of the commerce of the world. Modern navies depended almost entirely upon oil for fuel and the fueling stations were consequently reorganized according to the needs of each individual nation.

Bunkering At Sea.— Naval vessels of all the great maritime powers are able to transfer fuel, supplies, water, ammunition and personnel from one ship to another at sea. This greatly increases their ability to stay at sea for long periods. During World War II, for example, some ships cruised for several months without having to return to port.

In general the method of bunkering at sea may be summarized as follows. Let us say the ship to be fueled is a destroyer and the ship furnishing the fuel is a tanker. The smaller ship makes the approach on the larger one. Before the approach is made, preliminary preparations must be completed on the tanker and destroyer—the oil hoses readied, a red flag placed over the side to indicate the fueling station, telephones made ready for communication between the bridges of the two ships and the fueling stations, heaving lines, blocks and various gear readied for the operation.

The destroyer approaches the tanker at a speed of three to four knots faster than the tanker and slows down to the same speed as the tanker when her forward fueling connection is abreast of the red flag. In good weather the ships are approximately 50 ft. apart; in rough weather this interval may be increased to as much as 120 ft. The desired distance abeam is indicated by a distance line. When the ships are in position the tanker throws a small line to the destroyer or, if the distance is too great, shoots a line

over by a line-throwing gun. Distance line and telephones are attached to the heaving line and hauled to the destroyer. A larger line, about 3 in. in circumference, called a messenger, is sent over to the destroyer. The messenger is used to haul the fuel oil hose aboard the destroyer. The oil hose is then attached to a fueling connection and the fueling begins. One ship does not tow the other during the fueling operation. At completion of fueling, oil hoses and lines are hauled aboard the tanker, the destroyer increases speed and goes on out ahead.

Alertness of all hands plus the cushioning effect of the seas entering the narrow space between the ships renders the danger of collision during a fueling operation very slight.

The C.S. navy uses three systems, or rigs, to transfer fuel at sea: the close-in rig, the Elkwood rig and the Elkomin rig. These rigs are similar, the principal difference being in the manner of attaching and supporting the oil hose between the ships.

The transfer of supplies, personnel and ammunition is made as follows: The supply ship sends to the receiving ship a rope or wire which is made fast on the receiving ship and kept taut by the supplying ship. A single block is rolled back and forth on the rope or wire by two lines, one to haul out and one to haul in. Supplies and mail are handled by a hook suspended from the block. Men are transferred in special chairs, or in litters if they are injured.

Bunkering at sea is mainly a support function for combat ships and is only an emergency measure for merchant ships.

(M. O'N.)

BUNNER, HENRY CUYLER (1855–1896), U.S. writer of verse and fiction set mainly in New York city. He was born in Oswego, N.Y., Aug. 3, 1855, and died in Nutley, N.J., May 11, 1896. Educated in New York city. Bunner, after a brief experience as clerk in an importing house, turned to journalism, serving on the staff of the *Arcadian* and at 22 becoming assistant editor and later editor of *Puck* until his death on May 11, 1896. Since the staff of the comic weekly was very small and the funds were limited, there were many weeks when he wrote nearly half the issue. He developed *Puck* from a new, struggling periodical into a powerful social and political organ. In both his fiction and his charming *vers de société*, French influence is dominant. *Made in France, French Tales Retold with a United States Twist* (1893) and to a lesser extent his other stories reveal his indebtedness to Maupassant and other French masters. Technical dexterity, playfulness and smoothness of finish mark his prose as well as his verse—*Airs from Arcady and Elsewhere* (1884), *Rowen* (1892) and, posthumously, *Poems* (1896).

Bunner published several novels, including *The Midge* (1886) and *The Story of a New York House* (1887), but these are surpassed by his stories and sketches, *Short Sixes* (1890), *More Short Sixes* (1894), *In Partnership* (with Brander Matthews, 1884), *Zadoc Pine* (1891), *Love in Old Clothes* (1896) and *Jersey Street and Jersey Lane* (1896). A collected edition of his *Poems*, with an introductory note by Brander Matthews, appeared in 1912. The best of his *Stories* were republished in 1916. An edition of them in 1917 included *Short Sixes* and *The Suburban Sage*, the latter originally published in 1896. Of several plays (chiefly written in collaboration) the best was the *Tower of Babel* (1883).

See Gerard E. Jensen, *Life and Letters* (1940).

BUNSEN, CHRISTIAN KARL JOSIAS, FREIHERR VON (1791–1860), Prussian diplomat, orientalist and theologian, especially distinguished in the ecclesiastical politics of his time, was born at Korbach in Waldeck on Aug. 25, 1791, the son of an indigent officer of Dutch origin. He studied theology, law and classical and oriental languages and literature at Marburg, Gottingen and Jena and traveled extensively with the young W. B. Astor, son of the U.S. financier J. J. Astor. In 1817 he married a rich Englishwoman, Frances Waddington. A true child of German classical idealism and the Romantic age and a scholar of great ability, he made the acquaintance of B. G. Niebuhr (*q.v.*), who, after his appointment as Prussian minister to the Vatican (1816), secured for Bunsen the post of secretary to the mission there.

Himself minister in succession to Niebuhr from 1823 to 1838, Bunsen continued the activities by which Niebuhr had made the Prussian legation the centre of the German cultural circle in Rome;

he also brought about the foundation of the archaeological institute there. His attempt, however, in collaboration with F. A. von Spiegel, the Catholic archbishop of Cologne, to resolve the conflict between Prussia and the Vatican over marriages between Catholics and Protestants by a circumvention of the ambiguous papal brief of 1830 led to his recall from the mission.

Meanwhile Bunsen's work on the liturgy of the Evangelical Union inaugurated by King Frederick William III of Prussia had resulted in his enjoying a close understanding both with the king and with the future Frederick William IV, based on their common religious attitude. It was in the spirit of this understanding that Bunsen conducted the successful negotiations for the foundation of an Anglo-Prussian bishopric of Jerusalem in 1841. After a short period in Bern (1839-41) he became Prussian minister to London (1842-54)—perhaps the most exalted post in the Prussian diplomatic service. There he proved his worth as an intermediary between English and German scientific and cultural circles.

Frederick William IV shared Bunsen's romantic-conservative outlook, as is manifest in their correspondence, which was used by the historian Leopold von Ranke in his study of Frederick William (1873). Bunsen, however, was less orthodox in the manner of the post-Napoleonic restoration than this correspondence would suggest. Theologically, he remained a man of peace and reconciliation who rejected Catholicism but nevertheless respected it and who strove toward a unity of reconciliation between the various Evangelical churches, including the Anglican. His book *Zeichen der Zeit* (1855; 3rd ed., 1856) defended the freedom of the Christian conscience against the then dominant reaction exemplified by F. J. Stahl and W. E. von Ketteler.

Politically, Bunsen was unable either to persuade Frederick William IV to make timely concessions to the constitutional demands of the period or to ease the tension between Prussia and Great Britain created by the Schleswig-Holstein question (it was much against his will that he signed the London protocol of May 8, 1852). His attempt at the outbreak of the Crimean War to bring Prussia over to the western camp came to nothing because of the opposition of the Prussian Conservatives, who persuaded the king to recall him from London in 1854. The last years of his life were spent in Heidelberg and in Bonn, where he devoted himself to the defense of his arguments in *Zeichen der Zeit* and to his always extensive researches in Egyptology, patristics, religious history and philosophy. He died in Bonn on Nov. 28, 1860.

Bunsen's publications include *Aegyptens Stelle in der Weltgeschichte*, five parts (1845-57); *Die Deutsche Bundesverfassung* . . . (1848); and *Gott in der Geschichte* . . . , three parts (1857-58).

See Frances von Bunsen, *A Memoir of Baron Bunsen* (1870); also the larger German edition by F. Nippold, *C. C. Josias Freiherr von Bunsen. Aus seinen Briefen* . . . , 3 vol. (1868-71). (HA. H.)

BUNSEN, ROBERT WILHELM (1811-1899), German chemist and pioneer in the field of spectrum analysis, was born at Göttingen on March 31, 1811. He was professor of chemistry at Kassel, Marburg, Breslau and, from 1852 to a few months before his death on Aug. 16, 1899, at Heidelberg. His first important research work was concerned with the cacodyl compounds, though he had already, in 1834, discovered the virtues of freshly precipitated hydrated ferric oxide as an antidote to arsenical poisoning. He began his research in cacodyl compounds in 1837 at Kassel, and during the six years he spent upon it he not only lost the sight of one eye through an explosion but nearly killed himself by arsenical poisoning. It represents almost his only excursion into organic chemistry, and is of historical interest as being the forerunner of the fruitful investigations on the organometallic compounds subsequently carried out by his English pupil, Edward Frankland. Simultaneously with his work on cacodyl, he was studying the composition of the gases given off from blast furnaces. He showed that in German furnaces nearly half the heat yielded by the fuel was being allowed to escape with the waste gases, and when he investigated the conditions in English furnaces, he found the waste to amount to over 80%. These researches led to the elaboration of Bunsen's famous methods of measuring gaseous volumes, etc., which form the subject of the only book he ever published (*Gasometrische Methoden*, 1857). In 1841 he invented

the carbon-zinc electric cell, which is known by his name; he first employed it to produce the electric arc, and showed that from 44 cells a light equal to 1,171.3 candles could be obtained with the consumption of one pound of zinc per hour. To measure this light he designed in 1844 the grease-spot photometer. In 1852 he began to carry out electrolytical decompositions by the aid of the battery. He obtained magnesium for the first time in the metallic state, and studied its chemical and physical properties, among other things demonstrating the brilliance and high actinic qualities of the flame it gives when burned in air. From 1855 to 1863 he published with H. E. Roscoe a series of investigations on photochemical measurements, which W. Ostwald has called the "classical example for all future researches in physical chemistry." He is generally credited with the invention of the Bunsen burner (*q.v.*).

Other appliances invented by him were the ice calorimeter (1870), the vapour calorimeter (1887) and the filter pump (1868). In 1846 he paid a visit to Iceland. There he investigated the phenomena of the geysers.

But the most far-reaching of his many achievements was the elaboration, about 1859, jointly with G. R. Kirchhoff, of spectrum analysis. It led Bunsen himself almost immediately to the isolation of two new elements of the alkali group, cesium and rubidium. Having noticed some unknown lines in the spectra of certain salts he was examining, he set to work to obtain the substance or substances to which these were due. To this end he evaporated large quantities of the Dürkheim mineral water; he dealt with 40 tons of the water to get about 17 grams of the mixed chlorides of the two substances, and with about one-third of that quantity of cesium chloride was able to prepare the most important compounds of the element and determine their characteristics, even making goniometrical measurements of their crystals. See CHEMISTRY: *Analytical Chemistry*. See also Index references under "Bunsen, Robert Wilhelm" in the Index volume.

See Sir Henry Roscoe's "Bunsen Memorial Lecture," *Trans. Chem. Soc.*, 1900, which is reprinted (in German) with other obituary notices in an edition of Bunsen's collected works published by Ostwald and Bodenstein in 3 vol. at Leipzig in 1904.

BUNSEN BURNER, a burner so designed that it mixes a predetermined quantity of air with the stream of gas before the gas is ignited. If the proportions of gas and air are correct the resulting flame is hot and nonluminous. The invention of this widely-used burner is ascribed to Robert Wilhelm Bunsen (*q.v.*), though investigations have proved that the credit for the actual design should go to Peter Desdga, if not to Michael Faraday (*q.v.*) who had previously designed an adjustable burner on this principle.

The simple idea, attributed to Bunsen, of admitting air into a tube along with gas to produce a hot nonluminous flame is incorporated in the construction of millions of burners for heating and lighting purposes. The Bunsen flame results when air and gas are admitted in the proportion of about three volumes of air to one of gas; this mixture produces the inner lower cone of the flame, evolving a mixture of water vapour, carbon monoxide, hydrogen, carbon dioxide and nitrogen. The water gas and nitrogen reach the outer combustion zone where the water gas becomes burned up by the ordinary, or secondary, air supply. Various effects, as fusion, oxidation and reduction, are obtainable with the flame and blowpipe. Certain metallic salts impart characteristic coloration to the otherwise colourless flame.

Varieties of laboratory Bunsens are chiefly distinguished by

BY COURTESY OF THE CENTRAL SCIENTIFIC CO.
ADJUSTABLE BUNSEN BURNER

improvements in the control and mixing of the air and gas, giving greater heating powers and enabling different sizes of flames to be obtained. Among the most efficient of these are the Meker and the Fisher burners. Numerous fittings are made to go on the top of the tube for spreading the flame, or for taking special holding devices. Several designs avoid the fault of the ordinary central gas jet, which may become choked up by matter falling down the tube, the gas being brought in at the side and the air at the bottom, with a coned regulator raised and lowered by a knob. Marshall's burner has a flat regulator working beneath the base. Burners may be constructed to burn coal gas, oil gas, acetylene or natural gas.

The Bunsen burners fitted to incandescent lights, the so-called Welsbach burners, require careful manufacture to ensure satisfactory results. The jet or injector must be exactly central with the Bunsen tube, and the interior surfaces finished smoothly and straight, with no raggedness at the orifice; otherwise the flame will not "fit" and heat the mantle properly. (F. H.)

BUNTING, JABEZ (1779–1858). English Wesleyan minister whose determination to implement Wesley's ideas of ministerial supervision led him into conflict with the Methodist conference, was born in Manchester on May 13, 1779. After four years studying medicine, he began at the age of 19 to preach, being officially accepted as a minister in 1803. In 1835 he was appointed president of the first Wesleyan theological college at Hoxton, after the secession of Samuel Warren, a violent defender of lay privileges. Bunting was president of the conference in 1820, 1828, 1836 and 1844 and also acted as secretary of the "Legal Hundred," one of its committees, and, for 18 years, as secretary of the Wesleyan Missionary society. His attempts to secure what he called "the rightful authority of the pastorate" were defeated only after his death with the admission in 1878 of laymen to the annual conference. He died in London on June 16, 1858. His eldest son, William, was also a distinguished Wesleyan minister.

See T. P. Bunting, *Life of Jabez Bunting* (1859); J. Kent, *Jabez Bunting, the last Wesleyan* (1955).

BUNTING, the common English name of birds of the genus *Emberiza*, members of the family Fringillidae. They are distinguished by the angular gape, bony knob on the palate and hairlike streaks on the eggs. The corn bunting (*E. calandra*) inhabits Europe and most of Asia, nesting on the ground and forming flocks in winter. The voice is harsh. The even commoner yellow bunting or yellowhammer (*E. citrinella*) is widely distributed and its monotonous song (often rendered as "A-little-bit-of-bread-and-no-cheese") is very familiar in England. The ciril bunting (*E. cirilus*), with an olive-green head, is somewhat more southerly. The reed bunting (*E. schoeniclus*), recognized by its black head and white collar, is common in marshy places, to the exclusion of the other species. The snow bunting (*Plectrophenax nivalis*) breeds farther north than any other true perching bird (passerine), reaching Spitzbergen. Of the American forms, the black-throated bunting or dickcissel (*q.v.*; *Spiza americana*) inhabits the open country in central states, where it is migratory; the bay-

ERIC HOSKING
CORN BUNTING (EMBERIZA CALAN-
DRA)

winged bunting or vesper sparrow (*Poocetes gramineus gramineus*) of eastern Canada and the U.S. is distinguished by its chestnut wings; the lark bunting (*Calamospiza melanocorys*) of the western states resembles a lark in habits and has a brilliant song. American buntings in general are brilliantly coloured. Among them are the indigo, lazuli and painted buntings (non-pareil; *q.v.*), all belonging to the genus *Passerina*.

See also ORTOLAN; INDIGO BUNTING.

BUNTLINE, NED: see JUDSON, EDWARD ZANE CARROLL.

BUNYAN, JOHN (1628–1688), English Puritan minister and preacher, and the author of *The Pilgrim's Progress*, was the greatest literary genius produced by the Puritan movement. He was born at Elstow near Bedford in Nov. 1628, the son of Thomas Bunyan, a brazier or traveling tinker, and came of a local yeoman family which in the 17th century was in decline. He learned to read and write at a local school, perhaps a grammar school; when in *The Pilgrim's Progress* he quotes a phrase in Latin he says: "The Latine I borrow"; and he declares elsewhere that he was brought up "among a multitude of poor plowmen's children." He probably left school early to learn the family trade.

More important than formal schooling in the training of Bunyan's mind and imagination in these early years was his reading. He absorbed with delight the chapbooks of chivalric adventure such as *Bevis of Southampton* and *The Seven Champions of Christendom*, which were sold at fairs like the great one held annually at Stourbridge near Cambridge; and also the varied popular literature of English Puritanism: tracts and sermons, books of melodramatic judgments and providences, sugared pills of doctrine in the form of homely dialogue and plain-spoken anecdote, and Foxe's *Book of Martyrs*, with the fearsome woodcuts of the Elizabethan edition. Above all, he read the English Bible which he seems to have known both in the Authorized Version and in the Geneva one preferred by many Puritans up to the mid-17th century. It was wholly to the advantage of his development as an imaginative writer that his parents should have been "of the national church" (that is, the Church of England), and that he should have had access as a boy to the general store of country lore and tradition of which a narrower sectarian upbringing might have deprived him. Little else is known of his childhood, but he speaks in his autobiography (*Grace Abounding*) of being troubled by fearful dreams and visions. It may be that there was a pathological side to the nervous intensity of these fears; in the religious crisis of his early manhood his sense of guilt took the form of delusions of hearing and touch. Certainly it seems to have been an abnormal sensitiveness combined with the convert's tendency to exaggeration which made him look back on himself in early youth as "the very ring-leader of all the Youth that kept me company, into all manner of vice and ungodliness."

In 1644 a series of hammer blows separated the country boy from his family and drove him into the world. His mother died in June, his younger sister Margaret in July; in August his father married a third wife. In November he was mustered in a parliamentary levy and sent to reinforce the garrison at Newport Pagnell, an important point on the lines of communication between the midlands and the south during the Civil War. The governor was Sir Samuel Luke, immortalized by Samuel Butler in *Hudibras*. In Newport Bunyan remained till June 1647 and saw little fighting, though once when he was "drawn out to go to such a place to besiege it," a comrade took his place and was shot, so that he later felt he had been preserved by divine providence.

Bunyan's military service, even if uneventful, brought him in touch with the seething religious life of the left-wing sects within the army, the preaching captains, and those Quakers, Seekers and Ranters who questioned the authority of the army itself. Luke had trouble with many such religious agitators passing through his garrison; in this atmosphere Bunyan became acquainted with the prime notion of the enthusiastic sectaries, shared alike by Cromwell and his meanest trooper, that the effort toward religious truth meant an obstinate search, often from sect to sect, relying on free grace revealed to the individual, and condemning all forms of organization as "legal and dark." The devotion both in prayer and tactics of the New Model army left an indelible impression on him which is recalled later in the preaching, drilling captains. Credence and Boanerges, of the army of Shaddai in *The Holy War*.

Some time after his discharge from the army (in July 1647), and before 1649, Bunyan married. He says that he and his wife "came together as poor as poor might be, not having so much household-stuff as a dish or spoon betwixt us both." Their first child, a blind daughter Mary, was baptized in July 1650. Three more children, Elizabeth, John and Thomas, were born to Bunyan's first wife before her death in 1658. The record of Elizabeth's

birth in the transcript register of Elstow shows that she, too, was baptized there in 1654, though Bunyan had himself by this time been baptized by immersion as a member of the Bedford separatist church. As her dowry his first wife brought to him the awakening books Arthur Dent's *The Plain Man's Path-way to Heaven* and Lewis Bayly's *The Practice of Piety*; the former taught him that even a manual of instruction could employ racy colloquialisms and salt its precepts with homely proverbs.

Marriage was followed by a gradual process of conversion (1650–55) described in the autobiography, and including agonizing temptations to spiritual despair which lasted for many years. After an initial period of legal conformity in which he went regularly to church and looked with awe at the "priest" and his "vestments" (probably at this period a plain Geneva gown) he gave up, slowly and grudgingly, his favourite recreations of dancing and bell ringing and engaging in sports on the village green, and began to concentrate solely on his inner life. Calvinism led him by means of the grim doctrine of election and reprobation to question his own chances of salvation. The "storms" of temptation, as he calls them, buffeted him with almost physical violence; voices urged him to blasphemy; the texts of scripture which most alarmed him took on personal shape and "did pinch him very sore." Finally one morning he believed that he had surrendered to these voices of Satan and betrayed Christ: "Down I fell as a bird that is shot from the tree." It was only slowly and painfully that he emerged from this period of spiritual darkness, feeling that his sin was "not unto death" and that there were texts to comfort as well as to terrify; he was aided in his recovery by his discovery of the separatist church of Bedford and its dynamic leader John Gifford. He entered into full communion with it about 1655.

The Bedford community was not strictly Baptist, though it practised adult baptism by immersion, but an open-communion church, admitting all who professed "faith in Christ and holiness of life."

Bunyan soon proved his talents as an arousing preacher; fresh from his own experience of spiritual desperation, he was fitted to warn and console others: "I went myself in Chains to preach to them in Chains, and carried that Fire in my own Conscience that I perswaded them to beware of." He was also active in visiting and exhorting the Brethren.

The Restoration of Charles II brought to an end the ten years in which the separatists had enjoyed freedom of worship and exercised a measure of influence on public policy. On Nov. 12, 1660, at Lower Samsell in south Bedfordshire, Bunyan was brought before a local magistrate and charged under an old Elizabethan act with holding a conventicle. Since he refused to give an assurance that he would not preach again, he was condemned at the assizes in Jan. 1661 and imprisoned in the county jail in Bedford. (It was a county offense and, in spite of a persistent legend, he can at no time have been imprisoned in the small town lockup on the bridge across the Ouse.) In spite of the courageous efforts of his second wife (he had married again in 1659) to have his case brought up at the assizes he remained in prison for 12 years. He relieved his family by making and selling "many hundred gross of long Tagg'd laces" (*An Account of the Life and Death of Mr. John Bunyan*, 1692); at times conditions were lenient enough for him to be let out to visit friends and family and even to address meetings.

He was released in March 1672 under Charles II's Declaration of Indulgence; the Bedford community had chosen him their pastor in January. "after much seeking God by prayer" (*The Church Book of Bedford Meeting*) and a new meetinghouse was obtained. In May he received a licence to preach together with 25 other Nonconformist ministers in Bedfordshire and the surrounding counties. His nickname "Bishop Bunyan" suggests that he became the organizing genius in the area. As persecution was renewed, he was again imprisoned for preaching to conventicles, this time for a period of about six months; a bond of surety for his release has survived dated June 1677, so it is likely that this second imprisonment was in the first half of that year. Since *The Pilgrim's Progress* was published soon after this, in Feb. 1678, Bunyan had probably begun to write it, not in the second imprison-

ment but in the first, soon after the composition of *Grace Abounding* and when the examination of his inner life contained in that book was still strong upon him. The composition of the allegory was thus dated by those contemporaries who wrote obituary accounts and the knowledge remained current to be repeated by Robert Southey and Lord Macaulay.

In 1672–73 Bunyan entered into controversy with William Kiffin and other London Baptists for his open-communion principles. In succeeding years he often preached in Congregational churches in London, for his fame as a preacher was now increased by his literary reputation. The spiritual autobiography, *Grace Abounding to the Chief of Sinners*, had been published in 1666; there followed, after *The Pilgrim's Progress* (1678), *The Life and Death of Mr. Badman* (1680), *The Holy War* (1682), and the Second Part of *The Pilgrim's Progress* (1684), as well as a stream of doctrinal and controversial treatises. But it was *The Pilgrim's Progress* which speedily found its way into every home and carried Bunyan's reputation to every part of the British Isles, to Europe and to America.

Under James II, when the last wave of persecution overtook the dissenters, Bunyan protected his family by a deed of gift transferring all his property to "my well-beloved wife, Elizabeth Bunyan" (Dec. 1685). In 1687 he shrewdly resisted the blandishments of James II's agent Lord Aylesbury, and his offer of an official position, while at the same time obtaining seats for members of his church on the reorganized corporation of Bedford. He died on Aug. 31, 1688, in London after one of his journeys to preach there; he had ridden out of his way through heavy rain to Reading to settle a quarrel between father and son, and contracted a fever (probably pneumonia). He was buried in Bunhill Fields, the burying-ground for Nonconformists in the City of London.

An anonymous biographer describes him as "Tall of Stature, strong boned, though not corpulent somewhat of a Ruddy Face, with sparkling eyes, wearing his hair on his upper lip, after the old British fashion . . . his forehead something high and his habit always plain and modest." This agrees with the fine pencil drawing by Robert White (British museum, London, Cracherode collection) where the heavy face is given distinction by the strong nose and alert, humorous eyes.

THE WRITER AND HIS WORKS

Bunyan's missionary activity on the liberal wing of the churches was of major importance in the fenland counties and in certain London congregations; the broad, "open-communion" stand he took long prevented him from receiving the attention he deserved as a religious leader from Baptist or Congregational historians, but this was amply compensated for by his fame as a writer. (*See also CONGREGATIONALISM.*)

Style.—His literary achievement, in his finest works, is by no means that of a naively simple talent, sustained by earnest forcefulness and the occasional happy expression which redeems the general crudity of uneducated speech (though this has been the view of many of his critics). His handling of language, colloquial or biblical, is that of an accomplished artist; so is his application of it to purposes as different as social satire, humour, heroic splendour or the expression of religious fervour. He brings to his treatment of human behaviour shrewd awareness and moral subtlety, and in both his autobiography and his allegories he demonstrates a faculty for endowing the conceptions of evangelical theology with concrete life and acting out the theological drama in terms of flesh and blood.

He thus presents a paradox, since the impulse which originally drove him to write was purely to celebrate his faith and to convert others, and like other Puritans he was schooled to despise the adornments of style and to treat literature as a means to an end. As he says in the preface to *Grace Abounding*:

I could have stepped into a Style much higher than this in which I have here Discours'd, and could have adorned all things more than here I have seem'd to do; but I dare not. God did not play in convincing of me; the Devil did not play in tempting of me . . . wherefore I may not . . . but be plain and simple, and set down the thing as it was.

This effort to reach behind literary adornments so as to obtain

an absolutely naked rendering of the truth about his own spiritual experience causes him in *Grace Abounding* to forge a highly original style. In this style, rich in powerful physical imagery, the inner life of the Christian is described; body and soul are so involved that it is impossible to separate bodily from mental suffering in the descriptions of his temptations. He feels "a clogging and a heat at my breast-bone as if my bowels would have burst out"; a preacher's call to abandon the sin of idle pastimes "did numb the sinews of my best delights"; and he can say of one of the texts of scripture that echoed in his head and seemed to him to spell his damnation that it "stood like a mill-post at my back." The attempt to communicate the existential crisis of the human person without style has created a style of its own.

The prose of subjective analysis is Bunyan's first creative achievement. It was not produced without some external stimulation. The Calvinist tendency anxiously to probe the soul for tokens of election (*i.e.*, predestined salvation) had led thousands of Bunyan's fellow countrymen to think in this way, and some of them left spiritual autobiographies generally similar to his in form and treatment, if not in genius. What characterizes his treatment is his emphasis on the extreme loneliness of the convert's situation, the dreamlike isolation in which he interprets his inner conflicts.

I lifted up my head, but methought I saw as if the sun that shineth in the heavens did grudge to give light, and as if the very stones in the street, and tiles upon the houses, did bend themselves against me; methought that they all combined together to banish me out of the world.

In this isolation he attempts to see every incident, and every passage in the Bible, even if it is a historical one, as a guide to the condition of his soul:

With a loud cry these words Simon, Simon, sounded in my ears. These texts did pinch me very sore.

I had also once a sweet glance from that in Cor. 5.21

He may have learned this method of reading the Scriptures from the Quakers and Ranters in the years of sectarian ferment about 1650 (years crucial for his own growth), though he strenuously resisted their theology and their fanaticism.

As well as this original instrument of a highly subjective prose style to express personal states of mind, Bunyan had at his disposal the more traditional style he used in sermon, treatise and scriptural exposition. In the allegories some of his greatest imaginative successes are due to the development of the dreamlike, introspective style with its subtle personal music; but it is the workaday vigour and concreteness of the prose technique practised in the sermons which provide a firm stylistic background to these imaginative flights. The popular sermon manner is colloquial with the common proverbial voice of folk tradition, whereas the colloquialism of *Grace Abounding* is the spontaneous outburst of a man in agony. In contrast to the acute class consciousness of some contemporary "mechanick preachers" Bunyan is completely natural in his use of common life and the culture of the countryside; in expounding the Gospel he can echo the very tones of the parables because he has grown up close to the soil in an agricultural community.

In one sermon, for instance, he compares the small number of the elect to the gleanings in harvest:

What are the gleanings to the whole crop? and yet you here see, to the gleanings are the saved compared . . . You know it is often the cry of the poor in harvest, Poor gleaning, poor gleaning.

His comparisons always elucidate his moral message; they appeal to common experience, and bring the preacher and his audience nearer together in contexts where any suggestion of a literary flourish would draw them apart:

Poor coming soul, thou art like a man that would ride full gallop, whose horse will hardly trot! Now the desire of his mind is not to be judged by the slow pace of the dull jade he rides, but by the hitching and kicking and spurring as he sits on his back.

When Bunyan later came to describe in his allegory the different types of hypocrite and backslider he was able to combine the rus-

tic reality of the proverbial manner with skilful moralizing:

His house is as empty of Religion as the white of an egg is of savour . . . a saint abroad and a devil at home.

But by this time, in his fiction, the popular strength which he uses from time to time in the livelier sermons is diffused throughout the narrative in phrases like "all on a dung sweat," "loses his sheep for a halfpenny-worth of tar," "make hay while the sun shines" and "she all-to-be-fooled me."

The Pilgrim's **Progress**.—At the time when he wrote his autobiography (before 1666) Bunyan was still too near to his terrors and therefore too respectful of every detail of his religious experience to mold it creatively. In a few years, in *The Pilgrim's Progress*, probably composed later, in his first imprisonment, he was able to treat with more detachment both his conversion and the endurance of persecution which tested its reality. The process toward personification, already implicit in the language describing his fears, his doubts and the particular verses of the Bible which haunted him, is now completed. For instance, in *Grace Abounding* he saw the plight of his exclusion from the little band of Non-conformists at Bedford in the form of a vision; its geography has the vagueness proper to a dweller in a flat, nondescript region:

About this time the state and happiness of these poor people at Bedford was thus in a dream or vision presented to me. I saw, as if they were set on the sunny side of some high mountain, there refreshing themselves with the pleasant beams of the sun, while I was shivering and shrinking in the cold, afflicted with frost, snow, and dark clouds. Methought also, betwixt me and them, I saw a wall that did compass about this mountain . . . At last I saw, as it mere, a narrow gap like a little doorway in the wall, through which I attempted to pass, the passage being very strait and narrow . . . At last with great striving methought I at first did get in my head, and after that, by a sideling striving, my shoulders and my whole body.

In *The Pilgrim's Progress* the little door in the wall reappears as the Wicket Gate, the entrance on the way to salvation. It is the symbol of Christ, who opens the door to Christian, weighed down by his burden. The vision of his conversion period has become a formal part of the allegory; the image, like so many in Bunyan, is based on a text: "Strive to enter in at the strait gate"; indeed the biblical influence is stronger on the form of the episodes in the allegory than on its language.

Because it recapitulates in symbolic form the inner story of Bunyan's conversion, there is an intense, life-or-death quality about Christian's pilgrimage to the Heavenly City in the first part of *The Pilgrim's Progress*. The sense of urgency is established in the first scene as Christian in the City of Destruction reads in his book (the Bible) and breaks out with his lamentable cry, "What shall I do?" It is maintained by the combats with giants and monsters along the road; for although there is something of the hair-raising folk tale adventure dear to the childish imagination about these episodes, Apollyon and Giant Despair embody spiritual terrors. The voices and demons of the Valley of the Shadow of Death are a direct transcription of Bunyan's compulsive and neurotic fears during his conversion. Episodes of stirring action like these alternate with more stationary passages: in the Interpreter's House Christian is shown a series of emblematic pictures, some traditional, some invented by Bunyan for the occasion, and there are various conversations between the pilgrims and those they encounter on the road, some pious, some providing light relief when hypocrites like Talkative and Ignorance are exposed. The halts at places of refreshment like the Delectable Mountains or the meadow by the River of Life evoke in the simplest descriptive terms (the green pastures of the Psalms "beautified with lilies") an unearthly spiritual beauty.

The narrative may seem episodic but Calvinist theology provides a firm, underlying ground plan. Only Christ, the Wicket Gate, admits Christian into the right road, and before he can reach it he has to be shown his error in being impressed by the pompous snob Worldly Wiseman, who stands for mere negative conformity to moral and social codes. Quite early in his journey Christian loses his burden of sin at the Cross, where it rolls from his shoulders into the sepulchre; he receives white garments, a mark is set in his forehead, and he is presented with a roll with a seal upon

it which he is to hand in at the Celestial Gate. Christian now knows that he has received the free pardon of Christ and is numbered among the elect. It might seem that all the crises of the pilgrimage were past, yet this initiation of grace in the soul is not the end of the drama but the beginning. Christian, and the companions who join him, Faithful and Hopeful, are fixed in the path of salvation, so that it is the horrors of the temptations they have to undergo, not the possibility that they may waver, which engage our attention. Likewise, when the pilgrims are plunged into the worldliness of Vanity Fair, Bunyan is illustrating the persecution the saints of God must endure. The most grievous temptations come when the bright hope of assured salvation is dimmed, and Christian and Hopeful are cast into the dungeon of Despair until the key called Promise (representing the assurances to the saints given by the Bible) unlocks the door.

Christian's agonized striving holds our attention because we look through his eyes and share his uncertainty about the outcome, even though on a longer view of the divine purpose there is no uncertainty. However, the narrative, so conscientiously symbolic throughout, does not lose the savour of common life. In the character sketches and humorous passages scattered through the book Bunyan's genius for realistic observation is exercised in a manner which prevents the conversion allegory from becoming too inward and obsessed. Faithful and Hopeful are not dimensional characters, but the charitable courtesies of their intercourse with Christian are touching and truthful, as when both Christian and Hopeful try to take the blame for going aside into By-Path Meadow. In the pictures of the reprobate and the account of the ups and downs of the way there is a sharp eye for behaviour and a sardonic humour. A group of moral types is endowed with all the liveliness of individuals by a deft etching in of a few dominant features and gestures. The "very brisk lad" Ignorance, and Talkative, "a tall man, and something more comely at a distance than at hand," have the likeness of individual heretics while presenting their examples of typical heresies in the same way as the *exempla* of the medieval sermon; so has the shifty By-Ends.

The Pilgrim's Progress is the culmination of the old allegory tradition, but whereas medieval allegory has different levels of meaning and suggestiveness, Bunyan sees only one thing at a time, or rather, in order to visualize a moral quality, he has to circumscribe it within the narrow but powerful outline of a type. His people could provide minor characters for a Restoration play or an 18th-century novel; even the heroic figure of Christian can appear later in a "character-part" as the seasoned spiritual campaigner who "snibbeth his fellow," the young Hopeful, and puts him in his place. For after all Christian himself is a transcript from life; Bunyan, the physician of souls with a shrewd eye for backsliders, had faithfully observed his own spiritual growth.

A spurious Second Part of *The Pilgrim's Progress*, purporting to correct its frivolities, appeared in 1682. Bunyan returned to his dream and published his own continuation of the allegory in 1684. The atmosphere has changed: for the lonely, personal drama we have mellow reflection of personal experience; the emphasis is on the bustling life of the church and the social virtues of friendship and family responsibility. Women play a large part, as they had come to do in the Bedford congregation; and a special tenderness is shown to those with scruples of conscience which prevent them from entering into full communion with Nonconformist bodies. On the whole Bunyan has turned from high drama to comedy, and from poetry to efficient propaganda for open-communion principles. The story tells how Christian's wife, Christiana, sets out to follow him to the Celestial City, accompanied by her children and her friend Mercy. It is affection for Christiana rather than grace which sets Mercy on her way and gains for her admittance to the Wicket Gate. The progress is leisurely: the children grow up and marry and a bourgeois novel unfolds with charming, moralized pictures of courtship and domestic manners. But Bunyan can pull out the diapason and rise to the splendour of the final scene when the pilgrims cross the River of Death, chanting their formal, scriptural ejaculations of trust in God's mercy.

The *Life and Death of Mr. Badman*.—Bunyan had already

been prompted by the success of the first part of *The Pilgrim's Progress* to follow it with a study of the life of the reprobate, *The Life and Death of Mr. Badman* (1680). The tale is cautionary, related by an older Puritan to a younger one; it is not allegorical, but a primitive approach to the domestic middle-class novel as it was later to be developed by Defoe and Richardson. Though it lacks the emotional heights and depths of *The Pilgrim's Progress* it contains much hard, dry observation of manners intermingled with pious comment.

Badman is a highly unrealistic compendium of all the vices; he has not the imaginative potentiality of Christian, who is Everyman. Realism enters into the admirable account of his commercial, middle-class background. He begins young with lying, swearing, stealing and sabbathbreaking. He runs away from a good master to serve one of like mind with himself; finally he persuades his father to set him up in a shop of his own where he can give free rein to his lusts, and allows his loose companions to make him the "jack-pay-for-all." He retrieves his losses by marrying a rich orphan of godly upbringing. His courtship is a consummate piece of play-acting and provides a criticism of the evils of mixed marriages, for if *The Pilgrim's Progress* is the testament of the heroic spirit of earlier Puritanism, *Badman* reflects the problems encountered by Nonconformists as the tide of persecution withdrew and they began to find their place in the national life.

Thus the sins chiefly denounced in *Badman* are those such as commercial dishonesty which were likely to bring the holy community into public contempt within the larger society. Bunyan's congregation contained many tradesmen of varying degrees of affluence, but his sympathy still lies with the poor countryman dependent on the unscrupulous middleman in the town who can force up prices at a time of scarcity. He cherishes a medieval notion of the just price ("let the poor have a pennyworth, and sell thy Corn to those in necessity") while at the same time struggling to work out ethical standards suitable for the new competitive market. Sometimes the stress is laid on Badman's disorderly conduct of his affairs, sometimes his wealth is seen as a token of his inability to go through the eye of the needle.

Some of the best writing in the book is to be found in the additional anecdotes told by the narrator Wiseman to illustrate particular sins. These robust scarifying stories, in the tradition of the popular judgment books, speak with the voice of folk experience, reiterating a view of naturalistic restraint and common sense that is older than religious Puritanism.

The *Holy War*.—Bunyan's second allegory, *The Holy War* (1682), is a deeply meditated and carefully written work but it remains a splendid failure. Like many second novels by later writers it lacks the creative gusto which first impelled its author into fiction, and it suffers from an overambitious plan. The traditional metaphor of the Christian journey is true to the variety and unexpectedness of human life, while the metaphor of a military campaign is not. The perpetual tension, the strict division of characters into "friends" and "foes," which result from the choice of allegorical setting, reflect also the Calvinist insistence on the total depravity of human nature; ordinary human beings are swallowed up by warring concepts. The city of Mansoul is besieged and taken by the devil, Diabolus, and his armies, and liberated by the prince Emanuel; later there is a second siege and a further rescue by Emanuel. The allegory is complex: the conversion and relapse of the individual soul, the grand theme of *Grace Abounding* and *The Pilgrim's Progress*, is treated once again; at another level there is the story of the Fall, the Redemption and the subsequent history of the church. There is also a more limited historical allegory in which Bunyan refers to the treatment of the godly in Charles II's reign; and a fourth theme concerns the millenarian hopes of the saints. There are noble echoes of Bunyan's earliest inspiration in the account of the marching and countermarching troops of Emanuel, and a certain top-heavy dignity in the whole grandiose plan of a work which comprehends the actions of *Paradise Lost* and *Paradise Regained* as only part of its material.

Bunyan's Reputation.—Until the decline of religious faith and the great increase in books of popular instruction in the 19th

century, Bunyan, like the Bible, was to be found in every English home and was known to every ordinary reader. In literary estimation, however, he remained beyond the pale of polite literature during the 18th century, though his greatness was acknowledged by Swift and Johnson. After the romantic movement he was recognized as a type of the natural genius and placed alongside Homer and Burns. Southey's introduction to the 1830 edition of *The Pilgrim's Progress* and Macaulay's essay (1843) were influential. Twentieth-century scholarship has made it possible to see how much he owed to the tradition of homiletic prose and to Puritan literary genres already developed when he began to write. But the sublime tinker remains sublime, if less isolated from his fellows than was formerly thought; the genius of *The Pilgrim's Progress* remains valid, not only in the sturdy and simple English in which it is written, but when it is translated into other languages and dialects across the whole world. Nothing illustrates better the profound symbolic truth of the work than its continuing ability to evoke responses in readers belonging to widely separated cultural traditions.

BIBLIOGRAPHY.—*Editions*: the first collected edition of Bunyan's works was *The Works of that Eminent Servant of Christ, Mr. John Bunyan*, ed. by Charles Doe, 1 vol. only (1692); 2nd ed., 2 vol. (1736). The standard edition is still that by George Offor, 3 vol. (Glasgow, 1853; Edinburgh and London, 1862). Editions of single works include: *Grace Abounding* and *The Life and Death of Mr. Badman*, ed. by G. B. Harrison (1928); *The Pilgrim's Progress*, ed. by J. B. Wharey (1928; rev. ed. by Roger Sharrock, 1960).

Bibliography: F. M. Harrison, *A Bibliography of the Works of John Bunyan*, supplement to the *Transactions of the Bibliographical Society*, 6 (1932).

Biography and Criticism: Lord Macaulay in *Critical and Historical Essays*, 1 (1843); John Brown, *John Bunyan, his Life, Times and Work* (1885; rev. by F. M. Harrison, 1928); W. Y. Tindall, *John Bunyan, Mechanick Preacher* (1934); Henri Talon, *John Bunyan, the Man and his Works* (1948; Eng. trans. 1951); F. R. Leavis in *The Common Pursuit* (1952); Roger Sharrock, *John Bunyan* (1954).

(R. I. SE.)

BUNYAN, PAUL, a mythical hero of the American lumber camps, for whom there is no known prototype. Meagre traces of Bunyan in oral folklore suggest that he was known to lumbermen in places as widely scattered as Pennsylvania, Wisconsin and the northwest before 1910, when the first Bunyan stories were published. In "The Round River Drive" by James MacGillivray (*Detroit News-Tribune*, July 24, 1910), Paul's camp is the scene of a dozen traditional frontier and logging jests. Within 15 years the obscure lumberjack had become a hero of popular culture, the subject of two widely read books both titled *Paul Bunyan* (by Esther Shephard and James Stevens, 1924, 1925). His companions—Babe the Great Blue Ox, Hels Helsen, Johnny Inkslinger—were almost as famous as the huge logger himself. It is said that he created Puget sound and the Grand Canyon, and for hot-cakes used a griddle so large that men greased it by skating on it with sides of bacon for skates.

This transformation of an occupational folk figure into a national "legend" was largely due to effective popularization by professional writers. W. B. Laughead, a Minnesota advertising man, used Bunyan in a series of pamphlets (1914-44) to publicize products of the Red River Lumber company and first introduced the hero to a general audience. Esther Shephard combined northwest lumbermen's folk tales with suggestions from Laughead's booklets, while Stevens, also a lumber publicist, elaborated on traditional yarns and wrote fictional accounts of his own invention. In folk tradition Bunyan was a lumberman who could skillfully or cleverly overcome such occupational hazards as the log jam; fashioning lakes or rivers at will, he was undismayed by adverse geography. In Stevens' stories the lumberman became a giant industrialist; the humour, no longer dependent on knowledge of lumbering techniques, devolved on the incongruities of Bunyan's gigantism and the stupidity of some of his men. Stevens was the most successful early popularizer in restyling Bunyan for a wide audience and many later redactions were based on his work. For his claim that Bunyan originally was a soldier in the Papineau rebellion in Quebec, 1837, there is no evidence; Bunyan is unknown

in French-Canadian history or folklore.

Bunyan's name became proverbial for size or strength and is frequently invoked in advertising varied products, as the subject of civic festivals, and in many children's books which further elaborated the alleged folk tales. In the fine arts Paul Bunyan is the subject of poems by Robert Frost, Carl Sandburg and Richard Wilbur; of an operetta by W. H. Auden and Benjamin Britten; of a ballet suite by William Bergsma; and of many paintings and statues.

The traditions are studied in Daniel G. Hoffman, *Paul Bunyan: Last of the Frontier Demigods* (1952); see also Richard M. Dorson, "Paul Bunyan in the News," *Western Folklore*, vol. 15, pp. 26-39, 179-193, 247-261 (1956). (D. G. HN.)

BUOY, a floating object anchored at a definite location to guide or warn mariners, to mark positions of submerged objects or to moor vessels in lieu of anchoring. When used without a descrip-

LIGHTED BELL BUOY USED BY U.S. COAST GUARD

tive adjective the term generally denotes a mark for mariners. (See LIGHTHOUSES: *Lighted Buoys; United States*). Special purpose buoys are designed for a variety of uses, the adjective preceding the word generally indicating its use, as cable buoy, anchor buoy or race buoy. A mooring buoy differs from other types in not being an aid to navigation but a point to which vessels may be tied up. Secured to a permanent group of anchors by a heavy chain, such a buoy serves as a connecting link between the vessel and the anchors. Mooring buoys conserve space in crowded harbours because a moored vessel requires less room to swing with the wind and tide than does a vessel at anchor. They are frequently used to secure warships because a vessel can be released from a mooring buoy much more rapidly than it can get underway from a dock or hoist its own anchor. (R. T. AL.)

BUPALUS AND ATHENIS, sons of Archermus and members of the school of Greek sculpture in marble which flourished on the island of Chios off Asia Minor in the 6th century B.C. They were contemporaries of the poet Hipponax (about 540 B.C.). Their works consisted almost entirely of draped female figures,

Artemis, Fortune, the Graces. Augustus brought many of their works to Rome and placed them on the gable of the temple of Apollo Palatinus.

BUPHONIA, in Greek antiquities, a sacrificial ceremony, forming part of the Diipolia or Diipoleia, a religious festival held on the 14th of the month Skirophorion (June–July) at Athens, when a plow ox was sacrificed to Zeus Polieus as protector of the city. A number of oxen were driven to the altar of Zeus on the Acropolis, on which grain was spread; when one of the oxen began to eat, the priest slew it with an ax, which he immediately threw away and fled. The ax, being polluted by murder, was then carried before the court of the Prytaneum (which tried inanimate objects for homicide) and there charged with having caused the death of the ox, for which it was thrown into the sea. Apparently this is an early instance analogous to deodand (*q.v.*). The ox itself was probably the embodiment of the grain spirit, and therefore its slaughter was regarded as murder.

BURAYDAH (BURAIDA), capital town of Al Qasim province, in the Najd, Saudi Arabia. Pop. (1959 est.) 30,000. It has extensive palm groves and cornfields. Like its rival 'Unayzah (25,000), south of the Wadi Rima, its merchant princes have always been in the forefront of Arabian commercial activity, and have branches in the Hejaz, Iraq and Syria, and as far afield as Karachi and Bombay. In former times Buraydah and 'Unayzah controlled the export of Arab horses to India and elsewhere; and the overland trade of Arabia, by camel, was largely a monopoly of their 'Aqail caravans. (H. St. J. B. P.)

BURBAGE, RICHARD (c. 1567–1619), English actor, first player of a number of Shakespeare's heroes, has been called both the Roscius (in reference to the Roman actor Quintus Roscius Gallus; *q.v.*) and the Garrick (in reference to the great 18th-century actor David Garrick; *q.v.*) of the Elizabethan stage. He was famous and popular as an actor by the time he was 20. A member of the earl of Leicester's players, he remained with this group throughout its evolution into "the King's men" (1603). Shakespeare was closely associated with Burbage during his career in London, and in his will left the actor a token remembrance. It was Burbage, excelling in tragedy, who first played the roles of Richard III, Romeo, Henry V, Hamlet, Macbeth, Othello and Lear. Although short and stout, Burbage seems to have been a most impressive figure; the many praises of him in prose and verse by his contemporaries attest his powers as an actor, and numerous playwrights of the time sought his services. As the company of which he was a major sharer at the Globe and Blackfriars prospered, so did Burbage, who died, on March 13 (or 9), 1619, a man of substance.

Burbage was a painter as well as an actor; the painting of a woman at Dulmich college, London, is undoubtedly by him, and the Felton portrait of Shakespeare has sometimes been attributed to him.

Richard Burbage's father, JAMES BURBAGE (c. 1531–97), was a carpenter turned actor and was one of Leicester's players when the queen gave them their licence in 1574. In 1576, as a private speculator, he leased land at Shoreditch and there built the first public playhouse in London, called the Theatre. In 1577 he had some interest in a second theatre nearby, called the Curtain. Later, against great opposition, he started the "private" Blackfriars theatre as a winter playhouse in the precincts of the old Dominican priory. In 1597 the land lease of the Theatre property expired, and litigation developed between the landowner and the owners of the theatre structure. After James Burbage's death in that year, his sons Richard and Cuthbert inherited the suit. During the absence of the landlord, the heirs tore down the Theatre and conveyed the timbers across the river to the Bankside, where they were used in building the famous Globe theatre of 1599. (FK. C. B.)

BURBANK, LUTHER (1849–1926), U.S. plant breeder who by hybridization produced over 800 new strains and varieties of plants. was born at Lancaster, Mass., on March 7, 1849. He attended public schools until he was 15 years old, and then spent four winters at Lancaster academy. Outside school he learned much about plant life on a farm. In the Lancaster library he

found a copy of Darwin's *Variation of Animals and Plants Under Domestication*, and under the stimulus of this work he obtained and read other books by Darwin, as well as a number of other scientific books.

At the age of 21 he began his life work of plant breeding on a 17-ac. tract near Lunenburg, Mass., remaining there until 1875, when he moved to California. In Santa Rosa he established a nursery garden with greenhouse, which was to become famous the world over and in which, with additional acreage a few miles away, he was to carry on his experimental and creative work for 50 years. There he developed the long series of "new creations," as he called them, of fruits, flowers, vegetables, grains and grasses that are associated with his name.

Burbank performed hybridization or selection experiments with thousands of kinds of plants representing nearly 200 genera. His work with plums and prunes, which extended over 40 years, resulted in the introduction of 113 varieties; of these, about 20 continue to be of importance, particularly in California and South Africa. Among other fruits, Burbank produced notable varieties of apples, blackberries, cherries, peaches and quinces. Of his 90 varieties of vegetables, the best known is the Burbank potato, which he discovered in 1873 and which is still widely planted. He also produced new varieties of beans, chives, corn, peas, peppers, rhubarb, squashes and tomatoes.

Several hundred varieties of ornamental plants were introduced by Burbank, the Shasta daisy being the most famous; also notable are his amaryllids, cannas, dahlias, gladioli, lilies, poppies and verbenas. Among his best-known experiments were those concerned with the breeding of cacti for fruit and forage. His spineless cacti for forage, in spite of enthusiastic claims made for them, were but little used.

Burbank's work, which involved the rearing of hundreds of thousands of individual plants, was not conducted to prove or test scientific theories or to make scientific discoveries but had as its sole aim the production of more and better varieties of cultivated plants. In addition to these tangible attainments, however, his efforts gave great impetus to the development of plant breeding. From the viewpoint of science, this stimulus was perhaps the most important result of his work. He died at Santa Rosa on April 11, 1926.

Burbank's published works include *Luther Burbank, His Methods and Discoveries*, 12 vol. (1914–15); *How Plants Are Trained to Work for Man*, 8 vol. (1921); and *New Creations* (1893–1901), a series of descriptive catalogues of his new varieties of plants. *Harvest of the Years* (1927), written by Burbank with Wilbur Hall, is an informative autobiography.

See W. L. Howard, "Luther Burbank," *Chron. Rot.*, vol. ix, pp. 299–506 (1945); "Luther Burbank's Plant Contributions," California Agricultural Experiment Station Bulletin 691 (1945). (J. W. Tr.)

BURBANK, an industrial and residential city of California, U.S., 12 mi. N. of the Los Angeles civic centre in Los Angeles county. Burbank has long been known as the home of the first major airport in the Los Angeles area. In addition to aircraft, Burbank industry includes several motion-picture and television studios. A land grant including the site of Burbank was made to José Maria Verdugo by the Spanish government in 1797. The Verdugo family continued to hold the ranch until the early 1860s, when much of their land was sold to satisfy the claims of American creditors. After several changes of ownership, the tract comprising the city was sold to David Burbank, a Los Angeles' dentist, who operated his holdings as a large sheep ranch until 1886. He then sold his farm to the Providencia Land, Water and Development company for subdivision. The townsite was surveyed and a village bearing Burbank's name came into being May 1, 1887. Burbank was incorporated July 8, 1911, with a population of 400. A council-manager form of city government was established in 1927. Pop. (1960) 90,153'. For comparative population figures see table in CALIFORNIA: *Population*. (J. M. Wo.)

BURBOT (EELPOUT) (*Lota lota*), the only fresh-water fish of the cod family (Gadidae). It is elongate, with long dorsal and anal fins, rounded caudal fin, broad and flat head, wide mouth, and spotted or marbled black or brown body.

W. T. DAVIDSON FROM NATIONAL AUDUBON SOCIETY

BURBOT (LOTA LOTA)

The burbot inhabits northern Eurasia and North America. It grows to more than 30 inches in length and sometimes exceeds 30 pounds. It is a voracious fish, most active at night, and inhabits deep waters in lakes or large streams. It spawns in the winter or spring, usually when ice covers the water surface. (C. Hu.)

BURCKMARDT, JACOB CHRISTOPH (1818–1897), a Swiss historian and writer on the Italian Renaissance and the philosophy of history, was described by the Dutch historian Johan Huizinga as the "wisest man of the 19th century" and by Nietzsche as "our greatest sage." He was born at Basel on May 25 1818, the son of a pastor. He began his studies at the city's *Gymnasium* and later at its university, studying theology, history and philology. From 1839 to 1843 he continued his studies at the University of Berlin. His teachers in Berlin were J. G. Droysen, Franz Kugler and L. von Ranke.

Burckhardt obtained his Ph.D. degree at Basel in 1843, spent four months in Paris and became the editor of the conservative *Basler Zeitung*. He left this newspaper two years later, visited Italy in 1846 and returned there in 1847–48, 1853–54 and many other times later.

Burckhardt began his university teaching career at Basel in 1844. In 1855 he was appointed to the chair of art history at the Polytechnical school at Zurich and in 1858 to the chair of history at the university of Basel. He retired in 1893 and died at Basel on Aug. 8, 1897.

Burckhardt's visits to Italy in the 1840s marked the beginning of his extensive scholarly work and his numerous publications. At the same time the romantic ideas of his youth lost their attraction for him, and he turned to classicism. Yet he was interested in the middle ages, and in his first important work, *Die Zeit Konstantins des Grossen* (1853; Eng. trans., *The Age of Constantine the Great*, 1949), Burckhardt presented the dawning of this period as a necessary transition from the ancient world to Christianity, the foundation of a new civilization.

Burckhardt's next book was *Der Cicerone* (1855), a comprehensive study of the works of art in Italy. This guide won wide acclaim and served many generations of travelers to Italy. Of Burckhardt's later works *Die Kultur der Renaissance in Italien* (1860; Eng. trans., *The Civilization of the Renaissance in Italy*, 3rd ed., 1951) was the most important because it attempted the first synthesis of the period. This masterpiece became the starting point for further critical study. *Die Geschichte der Renaissance in Italien*, devoted mainly to architecture, appeared in 1867. During 1868–73 Burckhardt prepared *Die Weltgeschichtlichen Betrachtungen* (1905; Eng. trans., *Reflections on History*, 1943), in which he presented his philosophy of history.

Another work, *Die Griechische Kulturgeschichte*, on the history of the Greek civilization, was begun in 1864, left unfinished at his death and published in four volumes (1898–1902) by his nephew Jacob Oeri; the little book *Erinnerungen ans Rubens* and three important essays on art called *Beiträge zur Kunstgeschichte von Italien* were published in 1898.

His *Gesamtausgabe* were published in 14 volumes (1929–34), with critical texts and introductions; his *Briefe* were edited by Max Burckhardt in 10 vol., of which 3 vol. appeared 1949–55.

See also Werner Kaegi, *Jacob Burckhardt*, 3 vol. (1947–56).
(W. Kl.)

BURCKHARDT, JOHANN LUDWIG (1784–1817), Swiss orientalist, was, next to Mungo Park, the most notable traveler employed by the African association during the pioneer

age of African exploration between 1788 and 1830. Burckhardt was born in Lausanne on Nov. 24, 1784; he was educated in Germany and went to England in 1806 with an introduction from the naturalist J. F. Blumenbach to Sir Joseph Banks, president of the Royal society and founder of the African association. Burckhardt studied for three years at London and Cambridge and in 1809 received instructions from the association to go first to Syria to perfect his Arabic and accustom himself to life among Muslims, and then to make his way to the regions south of the Sahara by the northerly route to Fezzan.

When Burckhardt arrived in Cairo in 1812 there seemed no immediate prospect of a reliable caravan to Fezzan, so he traveled instead up the Nile, eastward from Shendi to Suakin, and thence made the pilgrimage to Mecca, returning by way of Medina and Suez to Cairo in June 1815. He visited Mt. Sinai in the spring of 1816, and eventually died in Cairo on Oct. 17, 1817, still waiting for a chance to cross the Sahara on his promised journey.

Burckhardt was an accomplished orientalist; under the name of Shaikh Ibrahim ibn Abdullah and wearing Muslim dress, he achieved a profound knowledge of Muslim law and customs, and a deep sympathy for Islam. He left his large collection of Arabic manuscripts to Cambridge university.

His works were published by the London African association: *Travels in Nubia*, with biographical memoir (1819); *Travels in Syria and the Holy Land* (1822); *Travels in Arabia* (1829); *Arabic Proverbs or the Manners and Customs of the Modern Egyptians* (1830); *Notes on the Bedouins and Wahabys* (1831).

(D. Mn.)

BURDEKIN, a river in Queensland, Austr. It is one of the longest (425 mi.) coastal rivers of the continent, though little of it flows the year round. The lower valley is subject to severe floods, but the alluvial flats form one of the leading sugar cane areas of Australia. Pineapples and other tropical fruits are also grown. The Queensland government has initiated a multipurpose scheme for flood control, hydroelectricity and irrigation. Diversion of the headstreams across the divide into the arid interior has also been suggested, but has been judged impracticable.

(O. H. K. S.)

BURDETT, SIR FRANCIS (1770–1844), English radical who was a zealous advocate of reform, especially during the second decade of the 19th century, was born on Jan. 25, 1770. His political opinions were greatly influenced by a visit to Paris in the early days of the French Revolution. Returning to England in 1793, he married Sophia, the enormously rich daughter of Thomas Coutts the banker. He became (by purchase) member of parliament for Boroughbridge in 1796, and succeeded his father as 5th baronet in 1797. In parliament he denounced the war with France and William Pitt's suspension of the Habeas Corpus act. He was a neighbour and friend of Horne Tooke, the radical, whose ideas he shared. Burdett was elected member of parliament for the "popular" constituency of Middlesex in 1802, but his return was disputed and after a second election he was finally unseated in 1806. He had spent nearly £100,000 on the constituency. He was elected member for Westminster in 1807, a memorable victory in the history of English radicalism. Burdett held the seat without interruption for the next 30 years, acquiring the nicknames "Westminster's pride" and "England's glory." He was a vigorous advocate of parliamentary reform and an opponent of successive administrations. His oratory won favourable comments, even from his opponents.

Burdett made his parliamentary reputation in 1810 when he came into sharp collision with the house of commons over an issue of privilege. A radical named John Gale Jones had been committed to prison by the house. Burdett denounced the proceeding and questioned the power of the house to take this step. A revised edition of his speech on this occasion was published by William Cobbett, a friend of Burdett, in the *Weekly Register*. The house voted this action a breach of privilege and a warrant was issued for Burdett's arrest. Extraordinary scenes followed, Burdett at first resisting the authorities. For a time he was confined to the

Tower of London, disappointing his friends and supporters by returning on his release not in triumph by land but quietly by water. Actions which he subsequently brought against the speaker and the sergeant at arms were dismissed. In parliament Burdett denounced corporal punishment in the army, supported all attempts to check corruption, and introduced motions for parliamentary reform in 1809, 1817 and 1818. In 1811 he became chairman of the first Hampden club, organized by his fellow radical John Cartwright (*q.v.*). Later he was a zealous advocate of Catholic emancipation, speaking and moving resolutions on this subject many times, the most important being in 1828, one year before the duke of Wellington and Robert Peel capitulated and carried emancipation. In 1820 Burdett severely censured the government's action at Peterloo (*q.v.*); he was prosecuted at the Leicester assizes, fined £1,000 and committed to prison for three months.

Long before the passing of the Reform bill (1832) Burdett's zeal for reform and his enthusiasm for extirpating abuses had diminished. He separated himself from the reformers and lost the confidence of his former colleagues. He left Westminster in 1837, and was elected member for North Wiltshire. Thereafter he voted and worked with the Conservatives in parliament until his death on Jan. 23, 1844. (A. BRI.)

BURDETT-COUTTS, ANGELA GEORGINA BURDETT-COUTTS, BARONESS (1814–1906), English philanthropist, youngest daughter of Sir Francis Burdett (*q.v.*), was born in London on April 21, 1814. She took the name of Coutts when she inherited a fortune in 1837 from the duchess of St. Albans, formerly Harriot Mellon, the actress, and second wife of Sir Thomas Coutts, the banker, Angela's grandfather. In deciding to use her money for philanthropy, she was influenced by Charles Dickens and by the duke of Wellington, who advised her on how to conserve her wealth while using it to the best advantage. Such schemes as the development of education in Westminster, where she built and endowed St. Stephen's church (1847), founded schools and St. Stephen's (later Westminster) Technical institute; the provision of flats and cheaper food for the London East End (Columbia square, 1862, and the Columbia market, 1864); the help given in southwest Ireland, where she fed and clothed whole districts in times of famine, lent money to restore the fishing industry and planned large-scale emigration, show the breadth of her enterprises. Among a multiplicity of charitable ventures, mention may be made of her help in founding the National Society for the Prevention of Cruelty to Children and the National Society for the Prevention of Cruelty to Animals.

A keen churchwoman, she endowed the bishoprics of Cape Town and Adelaide (1847) and British Columbia (1857). She was created a peeress in her own right in 1871 and, in 1872, was the first woman to receive the freedom of London. She died in London on Dec. 30, 1906, and was buried in Westminster abbey.

See Clara Burdett-Patterson, *Angela Burdett-Coutts and the Victorians* (1953); *Baroness Burdett-Coutts: a Sketch of Her Public Life and Work* (1893).

BURDOCK, the common name for the species of *Arctium* of the Compositae family, but applied especially to common, or smaller, burdock (*A. minus*) and great burdock (*A. lappa*), both naturalized from Europe and now widespread in North America. Burdock is a coarse, rank-smelling biennial or short-lived perennial weed, with large alternate leaves and small purplish to nearly white flowers, followed by burlike clusters of achenes armed with hooked bristles which aid in spreading the fruit. Often they are very troublesome weeds in open woodlands and pastures. (I. M. BL.)

BURDON-SANDERSON, SIR JOHN SCOTT, BART. (1828–1905), English physician who with J. R. Page in 1879 first measured the electrical impulses of the heart. was born at West Jesmond, near Newcastle, on Dec. 21, 1828. Educated at the University of Edinburgh and at Paris, he began private medical practice at London in 1853, then in 1860 was appointed medical inspector under the privy council, in which capacity he carried out important inquiries that foreshadowed the direct relation between specific microorganisms and certain diseases. In 1874 he was appointed Jodrell professor of physiology at University col-

lege. London, retaining that post till 1882, when he took the Waynflete chair of physiology at Oxford, where he introduced new methods of teaching and came to be regarded as the founder of the modern Oxford medical school. In 1882 the Royal society awarded him a royal medal in recognition of his researches into the electrical phenomena exhibited by plants and the relations of minute organisms to disease. Sanderson was regius professor of medicine at Oxford from 1895 until he retired in 1903. He died at Oxford on Nov. 23, 1905.

See Lady Burdon-Sanderson, *Sir John Burdon-Sanderson: A Memoir* (1911).

BURDUR, the chief town of the il (province) of the same name in the southwest of inner Anatolia, Turkey, lies near the eastern shore of Lake Burdur. Pop. (1960) 25,372. It is surrounded by market gardens and has the appearance of an oasis town; its size and economy expanded after World War II. It stands on the north-south main road Antalya-Dinar-Afyonkarahisar.

The *il* had a population in 1960 of 180,319 and an area of 2,681 sq.mi. It lies between the Mediterranean and central Anatolian regions, and its southern part is occupied by the Taurus mountains. The main occupation is agriculture, including both irrigation and dry farming. Wheat and barley are the main crops in the dry areas, and vegetables, fruit and vineyards are produced on the irrigated land. On the plateaus and mountains stock raising is the chief occupation of both the sedentary population and the nomad Yörüks. (N. Tu.; S. ER.; E. Tu.)

BURDWAN, a town, district and revenue division of West Bengal, India. The town (area 9 sq.mi. with rural enclaves; pop. [1961] 107,881) lies astride the Banka river, 73 mi. N.W. of Calcutta, on the main Eastern railway. Places of interest are the Rajbari (Maharaja's palace), Gulab bagh, and two large tanks (each embanked reservoirs), Rani sagar and Sham sagar. The Rajbari houses the University of Burdwan, constituted in 1960.

BURDWAN DISTRICT covers 2,717 sq.mi. and had a population of 3,083,564 in 1961. The eastern part is a low alluvial plain containing loamy soils, innumerable tanks, rice fields and a dense population; on the west occurs a highly industrialized zone on Gondwana rocks bearing rich coal seams and fire-clay deposits, while in the middle stretches older alluvium covered with red lateritic soils and patches of sal jungle. The Bhagirathi, Damodar and Ajay are the chief rivers. The economy of the district is mainly based on coal, which is mined in the west. The Durgapur barrage scheme of the Damodar Valley corporation provides irrigation water (see DAMODAR). Asansol (*q.v.*) (pop. 103,659) is the largest industrial and trade centre of the district. Raniganj (29,713) has many coal mines in its neighbourhood and a paper mill and pottery works within the town. Burnpur (21,049) has one of the largest iron and steel works in India. Two new townships have sprung up at Chittaranjan (28,973) and at Durgapur (pop. 41,699), the former manufacturing locomotive engines and the latter coke, iron and steel. The only three major towns in the eastern agricultural plains are Kalna (pop. 22,529), Katwa (20,568) and Dainhat (10,514), all situated on the right bank of the Bhagirathi.

BURDWAN DIVISION comprises the seven districts of Howrah, Hooghly, Midnapur, Bankura, Burdwan, Birbhum and Purulia. It covers an area of 16,591 sq.mi. and had a population in 1961 of 16,183,663. (S. P. C.)

BUREAU, JEAN (d. 1463) and **GASPARD** (d. 1469), two brothers who are considered the founders of the French artillery strength in the 15th century. Jean, sieur de Montglat, a tax collector in Paris, had supplied artillery to the Burgundian and English forces in the Hundred Years' War before Charles VII of France took Paris (1436). He then adhered to Charles and was made treasurer (1440), master of accounts (1443) and king's counselor (1444). He was in charge of the supply of artillery for the great sieges of Montereau (1438), Meaux (1439), Pontoise (1441) and Dax (1442) and discussed the terms for the capitulation of Bordeaux (1451). Gaspard, sieur de Villemomble, who was more concerned with manufacture and who was appointed master of the artillery in 1444, was associated with Jean in all

artillery enterprises from 1441 and was appointed "reformer general and inspector of public works and workers" by Louis XI in 1461. The brothers' artillery played a major part in the expedition to Lorraine (1444-45); in the siege of Cherbourg (1450), where they put their guns on the beach with leather bags to protect them from the tides; in the battles of Formigny and of Castillon (qq.v.); and in the campaign in Spain (1461). They increased the supply of bombards and culverins and furnished wheeled gun carriages to make the artillery more mobile for use in the field.

See L. L. Borrelli de Serres, *Recherches sur divers services publics du XIIIe au XVIIe siècle*, vol. iii (1909). (M. M.)

BUREAUCRACY is a word of many meanings. Among certain scholars, particularly those of Germany, it is used in a completely respectable and even laudatory sense to designate the institution of a permanent professional corps of officials. The word is also often employed to designate not only a permanent officialdom but temporary political officials or the behaviour and characteristics of individuals and groups of people in all types of large-scale enterprise. As used in the English-speaking world, the word bureaucracy usually carries an invidious overtone and a charge of emotion. It has not been generally accepted as an objective, scientific designation of a respected profession or of a type of social-administrative organization. There is, however, a growing tendency in social science literature to use the word bureaucracy to designate the world of officialdom as a social institution, there being no other term quite so convenient.

The words bureaucrat and bureaucratic have an even more negative connotation in common English usage. The designation of an official as a bureaucrat is almost invariably derogatory, whether in Hansard's *Parliamentary Debates*, the *Congressional Record* or the editorial columns of British and U.S. journals. The fact that the word is practically never used to designate a wise or responsive official and that the word bureaucratic cannot properly be employed to designate fair, responsive and understanding administrative behaviour makes it difficult to secure acceptance of bureaucracy as a generic designation, carrying no critical connotation, for the increasing number of institutions employing people compelled by a world of high technology to earn their living and to perform the world's work in large organizational units.

The word stems from the French *bureau*, which has come to mean a department or subdivision of a department, usually of government. The French word, in turn, was derived from the word for writing desk or table with drawers—so called because originally covered with a cloth known as *burel*. Just as the word office was formerly associated only with public office, so the word bureau was at first identified only with public business, and the table covered with green baize remains to this day the symbol of official conferences. Literally, then, bureaucracy would mean bureau rule, much as autocracy means the rule of the despot and democracy the rule of the people.

Bureaucracy in the Modern World.—In modern democracies officials are considered the servants and not the masters of the people. The rule of law and judicial review, the constitutional rights of freedom of speech, assembly and press, the secret ballot and public disclosure and accountability, the duty of officials to respond to the policies of the day are all democratic guarantees toward this end. In ancient despotic societies, however, public officials were uncontrolled and absolute, and the power of final decision over the destiny of the country and its citizens rested in a small hereditary or self-perpetuating elite.

In the modern world, with the decline of kings, emperors and hereditary dynasties exercising absolute rule, new forms of despotism arose in communist and fascist regimes, with no ultimate control over the acts of the official who achieved power by seizing domination of the political machinery and command of the military and police forces and the apparatus of terror. In less developed democracies temporary seizure of power by careerist groups is not uncommon, and government employment is still considered a reward for political activity and a species of government relief rather than a respectable occupation based on competence and the ideal of service to the state and the people.

James Burnham in his *The Managerial Revolution* (1941) portrayed the rise of a new and powerful oligarchy of industrial and governmental leaders in management, whose inside knowledge and expertness put them in a position of self-perpetuation and power over ordinary citizens. The enormous growth of government agencies in the 20th century and the development of large departments manned by a corps of permanent officials has of course given rise to public concern and to scientific research on the problem of keeping such large cadres, often protected by tenure rights, responsive to popular and political changes in policy. But the problem is not a new one. Karl A. Wittfogel in *Oriental Despotism* (1957) gave vivid examples from ancient cultures of the power of officials in absolute states of antiquity. The classic example of entrenched officialdom was the civil service of China, in which an elaborate system of examinations for entrance and promotion in an elite corps dated back before the Christian era. Wittfogel made the interesting contrast between a ruling bureaucracy and a controlled bureaucracy, the former being characteristic of autocratic states and the latter of democratic societies.

Bureaucracy as an Organizational Disease.—The most useful concept of bureaucracy in a modern world characterized by high technology, minute subdivision of labour and a profusion of complex and gigantic social organizations is one that avoids the extreme poles of respectability and opprobrium and that does not depend on the social bias of its user. It is also a concept generally implied whenever the word is not employed as political invective. This concept is the one to be used here: that bureaucracy is the pathology of large organizational units.

Just as every biological organism is susceptible to disease and deterioration, so every social organism is subject to certain illnesses. The large organizations of modern democracies are no exception to this rule. In spite of the fact that administration as a science is still in its infancy, it is becoming increasingly aware of the factors that make for a healthy organization and of the signs of morbidity in a sick one. Gradually the new sciences of public administration and of business management are becoming more skilful in their diagnosis and cure, and agencies themselves are making greater use of experts in these new techniques to prevent and correct bureaucratic tendencies.

Popular judgments also tend to be surprisingly uniform in their appraisal of the personality of agencies. Thus, a highly popular agency such as the Federal Bureau of Investigation (FBI) in the United States is rarely referred to as a bureaucracy. Even in the business world public judgments distinguish between older concerns, where tradition and inflexibility tend to predominate, and the more modern and progressive enterprises in new fields. Bureaucracy as an illness, as most authorities have pointed out, is not confined to governmental agencies and can be found in many large organizational units, whether commercial, industrial, educational, charitable, fraternal or ecclesiastical. But in a democracy there is a continuing need to prevent bureaucratic tendencies in the government because of its powers over private rights and because it lacks the correctives of the market place.

Types of Bureaucratic Illness.—Among the principal illnesses to which large organizations are prone are the polar tendencies of aggressiveness and recessiveness. The aggressive or imperialistic type of agency is preoccupied with the extension of its jurisdiction, size and power. The recessive type of unit, on the other hand, suffers from a kind of inferiority complex. It shrinks from innovation, hesitates to assert itself and tends to avoid responsibility and to shift it to others. A given agency may fluctuate between these two opposing tendencies, but as a rule it will be found to persist in one or the other. When an agency becomes overaggressive or overrecessive, a form of bureaucracy is at work. The respective influences of the permanent career staff and of the temporary political or policy staff are out of balance. The cure consists in restoring a proper balance between these conflicting forces of continuity and flexibility.

An agency, of course, is greatly influenced by the personality of its chief, but this is not necessarily determining. Lytton Strachey in his essay on Florence Nightingale in *Eminent Victorians* demonstrated how the British war office had a greater

effect on Sidney Herbert, the minister, than Sidney Herbert had on the war office. Similarly, a question might be raised as to how much influence, except in time of war, a U.S. secretary of the navy ever has on the navy department.

One of the most baffling phenomena in large organizations is the elevation of status over function as a desirable objective. Officials in such organizations tend to give greater weight to the importance of their rights and prerogatives than to their functions. To the extent that this tendency is merely a corrective to exploitation of a career corps of faithful officers or a protest against spoils and favouritism in a service: it cannot be criticized. But when preoccupation with job status, rights, privileges, rank and emoluments becomes excessive and encroaches on the time of the personnel so as to interfere with the discharge of their essential service functions, it can be identified as a serious symptom of organizational disease. While a growing spirit of professionalism has often greatly benefited the competence of public services, an excessive preoccupation with questions of status and rights of officials, as in the case of the medieval guilds, becomes a brake on flexibility and innovation.

Criteria of Health.—In democratic societies the simple virtues still tend to be accepted as criteria of organizational health in the public mind. Such characteristics as integrity, industry, impartiality, efficiency, progressiveness, courtesy and responsiveness to the will and needs of the people are all signs of organizational health and freedom from bureaucracy. Bureaucracy obtains when an agency lacks these elements to any marked degree. Thus, graft and corruption, idleness, favouritism, waste, backwardness, arrogance and insensitivity to public needs and desires are all evidences of organizational disease. Simple as these symptoms sound, they are not easy to evaluate in a large, complex organization.

Prevention and Cure.—Responses to changes in political parties and to national emergencies have demonstrated that the democratic process is the best protection against the dry rot and failure associated with bureaucratic trends. The right to criticize is the best antibureaucratic hygiene. In addition, improved personnel methods and incentives have been developed to attract and retain able officials and to eliminate weak ones. Administrative research and planning and scientific management have developed techniques for the measurement and improvement of work performance. Administrative procedures to ensure fair rule making and adjudication are becoming better known. Vast improvements have been made in techniques for simplifying paper work and eliminating red tape and for informing citizens of their rights and privileges in simple, understandable terms.

The war against bureaucracy in the modern world, with its growing organizational structure, is an incessant one, and eternal vigilance is the price not only of liberty but of effective service to free men in democratic societies.

BURFORD, a Cotswold town of Oxfordshire, Eng., near the Gloucestershire border, 18½ mi. W. of Oxford. Population of civil parish (1951) 855. The handsome High street, built of local oölite, rises steeply from the Windrush. The battle of Beorford (752) was not, as generally stated, at Burford, which was acquired in 1088 by Robert Fitz Hamon who gave it a market and the earliest datable guild merchant (see GUILDS). Alderman Simon Wisdom helped found the grammar school in 1571. Sir Lawrence

Tanfield, whose memorial tomb dates from 1628 bought the town and manor (1617) and successfully challenged Burford's privileges (1621). He also built the priory on the site of an Augustinian hospital (13th century). This was sold by Lord Falkland to William Lenthall, speaker of the Long parliament (1637), and is now a convent. It was at Burford that Oliver Cromwell crushed the Levellers in 1649. St. John the Baptist's church, with massive Norman spire, was reconstructed (14th–15th century) with a delicate spire and the inclusion of the separate 13th-century chapel of St. Mary. (W. O. H.)

BURG, a town of Germany, is situated about 31 km. (19 mi.) N.E. of Magdeburg on the Berlin-Magdeburg railway line. Pop. (1959 est.) 29,373. A little stream, the Ihle, flows along the eastern edge of the town and on the western edge is the Ihle canal, a part of the Elbe-Havel canal. Burg originally belonged to the diocese of Querfurt which was joined to the archdiocese of Magdeburg in 1496. In 1635, together with other parts of the archbishopric, it was ceded to Saxony and in 1687 to Brandenburg. After the dissolution of Saxony-Anhalt in 1952, Burg became a regional capital in the district of Magdeburg, German Democratic Republic. The town has a rolling plant for sheet metal, and cloth, shoes, machines and crispbread are manufactured.

BURGAGE, a form of tenure, both in England and Scotland, applicable to the property connected with the old municipal corporations and their privileges. In England it was a tenure whereby houses or tenements in an ancient borough were held of the king or other person as lord at a certain rent. The term is of less practical importance in the English than in the Scottish system, where it held an important place in the practice of conveyancing, real property having been generally divided into feu holding and burgage holding. After the Conveyancing (Scotland) act. 1874, there was, however, not much distinction between burgage tenure and feu holding. The tenure persisted as a distinct form in Scottish conveyancing because burgage holding was an exception to the system of subinfeudation which remained prevalent in Scotland when it was suppressed in England. While other vassals might hold of a graduated hierarchy of overlords up to the crown, the burgh always held directly of the sovereign. It is curious that while in England the burgage tenure was deemed a species of socage (*q.v.*) to distinguish it from the military holdings, in Scotland it was strictly a military holding, by the service of watching and warding for the defense of the burgh. In England the franchises enjoyed by burgesses, freemen and other consuetudinary constituencies in burghs were dependent on the character of the burgage tenure. Tenure by burgage was subject to a variety of customs, the principal of which was Borough English (*q.v.*).

BURGAS, the medieval Pyrgos, a port and the capital of Burgas district, southeast Bulgaria, lies on an inlet of the Black sea, on a low foreland between two lagoons. Pop. (1956) 72,526. It faces open sea on the east and its own harbour on the south. At mid-19th century it was a fishing village of about 3,000 inhabitants, but it rose rapidly in importance after Bulgaria's liberation (1878), mainly by reason of the railway to Sofia (1890) and the building of a new harbour (1904). It now rivals Varna as the chief port of Bulgaria, surpassing it in the grain trade; about 40% of the country's Black sea trade passes through the port, including tobacco, fruit, fertilizers, cement and ore concentrates. In and near the town are flour mills, a sugar factory, soap factories: fish canneries and engineering works, and an oil refinery was constructed after 1960. Some copper is mined in the vicinity, and lignite at Rudnik; salt is produced at Pomorie.

Burgas, with the small neighbouring port of Sozopol, also handles about three-quarters of the Bulgarian fish catch. It is a cultural centre and a seaside resort. Sunny Beach, near Nesebur, also shares in the resort trade with Pomorie, noted for its mud-baths and its vineyards, and Sozopol, with fine stretches of sandy beach. (AN. BE.; S. H. BR.)

BURGENLAND, a *Bundesland* (federal state) of Austria.

Area 3,965 sq.km. (1,531 sq.mi.); pop. (1961) 250,083. Forming the boundary area toward Hungary, it was derived from parts of the former four West Hungarian *comitats* (counties), Pressburg (Bratislava), Wieselburg (Moson), Ödenburg (Sopron) and Eisenburg (Vasvár). It became a political unit of its own in 1921.

Physical Geography.— Its surface consists largely of marine and fluviatile deposits of more recent periods, containing brown coal in a number of places, although here and there outliers of the Central Alps, consisting of crystalline base rock, appear as horsts above the level of these later strata. There also exist a few basalt mountains, the necks of Tertiary volcanoes. Antimony ores occur in the Bernstein mountains. There are a large number of mineral and thermal springs and still occasional micro or small earthquakes.

The most striking feature of the northern Burgenland is the Neusiedler lake. Structurally, geologically and geographically the low-lying parts of the northern Burgenland belong to the Hungarian plain which is linked with the southern Vienna basin by two gateways situated north and south of the Leitha mountains. The latter, a horst of crystalline rock, rise to 1,585 ft. The Rust hills (rising to 928 ft.), on the western shore of the Neusiedler lake, are a similar formation.

The crystalline Rosalia mountains are no longer an isolated range but are linked with the Alps. The Rosalia mountains rise to a plateau surface of about 2,000 ft. In the southern branch they are crossed by the Siegraben pass. East of the Siegraben the crystalline rocks are covered by Miocene gravel.

The middle Burgenland is the most mountainous part decreasing eastward to the Hungarian plain and rising to the Landsee and Bernstein mountains in the west and the Güns mountains in the south (Geschriebenstein, 2,897 ft.).

The southern Burgenland is of pronounced relief, with hills rising to over 1,500 ft. Streams drain the region from northwest to southeast and are accompanied by systems of terraces.

Climatically the Burgenland is more favoured than the rest of Austria. It has the longest growing season, with 235 to 252 days per year, experiences an early spring, has most sunshine and a rainfall of about 24 in. The north shows the strongest continental characteristics and has the warmest summers of the country. Protected by the mountains from northwesterly winds and regulated by the influence of the lake, the earliest fruit and vegetables in Austria can be grown there and conditions are suitable for viticulture.

Alpine flora is absent and mixed forests and spruce covers only the Landsee and Bernstein mountains, while the vegetation of the rest of the middle and southern part of the country is characterized by beech, pine and mixed forest of beech and spruce. Characteristic of the easternmost parts of middle and southern Burgenland are pubescent oak, hornbeam and black pine. Northern Burgenland has steppe and continental saline heath vegetation. The Seewinkel with its saline steppe lakes and the Neusiedler lake forms the habitat of a multitude of water birds. The entire Neusiedler lake area is protected, and 165 hectares (408 ac.) in the Seewinkel are nature preserves supervised by a biological research station at Neusiedl.

History.— Human occupancy has beyond doubt been continuous since the Paleolithic period. In the late Iron Age the southwestern part belonged to the Celtic kingdom of Noricum (*q.v.*). During the time of the Roman occupation, from 15 to about 375 A.D., it was part of Pannonia (*q.v.*). Subsequently occupied in turn by Teutonic tribes, Avars and Slavs, the first German settlers came during the 8th century. Although part of Hungary, it became an area of predominantly German settlement under a largely Magyar ruling class. The history of the Burgenland is initially part of the history of Hungary and from 1529 onward part of that of the Habsburg empire. After World War I. the claims of the Austrian Republic to the predominantly German parts of western Hungary were granted nearly in full, but when in July 1921 Austria attempted to establish its administration, the Austrian Gendarmerie was attacked by Hungarian irregulars and had to withdraw. As a result of Italian mediation Hungary handed

over the present Burgenland but retained control of Sopron (Ödenburg) after a plebiscite.

The loss of the Sopron area robbed the Burgenland of its natural capital and severed all communication lines from north to south. Eisenstadt was chosen as capital in 1925. Following the Anschluss (union with Germany), Burgenland was abolished as a political unit on Oct. 1, 1938, its northern part being incorporated in the Reichsgau Niederdonau and its southern part in the Reichsgau Steiermark (Styria) of Greater Germany. It was re-established as a Bundesland on Oct. 1, 1945.

Population and Administration.— The population at the 1961 census was 250,083, a decrease since 1934; the density was 163.3 to the sq mi. Because of its predominantly agricultural economy and poverty, emigration from this area is of long standing, both to other parts of Austria and also to Germany and overseas (U.S., Canada, Argentina, Brazil). The absence of a sizeable industry and prevalence of small farms with extreme fragmentation of holdings give rise to a low standard of living, underemployment and seasonal migration.

Although ethnically predominantly German and speaking a dialect of the Bavarian group, the Burgenland has the highest proportion (c. 15%) of non-German minorities, Croat and Magyar. More than 85% of the people are Roman Catholics; the Burgenland became a diocese in its own right in 1960. There are few towns and only Eisenstadt has a population of more than 5,000. Rural settlement is characterized by a preponderance of villages of the regular colonial types. The characteristic house is the single file farmstead and forms developed from it.

The Land government consists of the governor and five other members elected by and responsible to the provincial diet (*Landtag*), which has 32 members elected by popular vote. The *Landtag* is a legislative body but the acts it passes must be approved by the federal government. In the *Bundesrat* (federal upper house) the Burgenland has 3 votes. Administratively it is divided into 7 districts and 2 "district-free" cities (Eisenstadt and Rust). Local government is in the hands of elected burgomasters and town and commune councils.

The Economy.— The Burgenland, 47% arable and 25% forested, produces a large surplus of grain, including maize (corn), and root crops. In the northern part, crops which include vines and also some tobacco, hemp and, experimentally (on the lake shores at Weiden), rice are grown. Livestock is partly stall fed, partly grazed on common pastures. Because of smallness of holdings which necessitates the use of cows as draft animals, milk yields are the lowest of Austria.

Total timber production in 1960 was 279,000 cu.m. Unique in Austria are the vast areas of reed along the shores of the Neusiedler lake. The annual production of reed for industrial use of about 700,000 cu.m. is capable of considerable increase. Some processing is done locally but more than half is exported raw to Germany. The lake also produces quantities of fish (mainly carp)—approximately 200,000 kg. annually.

There is quarrying for Leitha limestone, an excellent building stone which was used for most of the important public buildings in Vienna, and for basalt for use as road metal. China clay is produced near Stob and there are a number of clay pits for brickworks. The chalk from Mullendorf near Eisenstadt is used both for writing and in industry. The veins of precious serpentine near Bernstein are used for making jewelry and vases. Antimony ore is produced near Schlaining. Fuel resources consist of brown coal. Industries are limited to small plants and include sugar refining and canning, sawmills and furniture industry, and the making of pencils. The large jute factory at Neufeld an der Leitha employs more than 1,000 persons.

The siting of the railways was determined by the Burgenland's former location within Hungary. The three main lines by which the Hungarian railway system was linked with Austria merely cross the Burgenland in the north, centre and south. North-south traffic was maintained by branch lines but since all the railway junctions came to lie within Hungary there is no line linking the north of the Burgenland with the south. A peculiarity resulting from this is that one may travel by rail without any passport or

customs control through Hungarian territory (Sopron). A modern north-south road of 230 km. (143 mi.) length from Kittsee to Jennersdorf and leading on to Graz has since been built. Although much has been done to improve road conditions, considerable improvement is necessary to provide for increased motor traffic.

BÜRGER, GOTTFRIED AUGUST (1747–1794), German poet of the period of *Sturm und Drang*, best remembered for his lyrical ballads, was born at Molmerswende, near Halberstadt, on Dec. 31, 1747, the son of a pastor. He studied theology at Halle and law at Göttingen, continually in difficulties because of his irregular life. He became friendly with the young poets of the literary group known as the *Göttinger Hain* and his first poems appeared in their *Musen Almanach*. In 1772 he became a magistrate at Altengleichen, where in 1773 he wrote his vivid and dramatic ballad "Lenore." In 1774 he married Dorette Leonhardt, but soon fell in love with her sister, the "Molly" of his poems. Bürger's first collection of poems was published in 1778 and in the same year he became editor of the *Musen Almanach*. After his wife's death in 1784 he lectured on the theory of style, aesthetics, poetry and philosophy at Göttingen. In 1785 he married "Molly," who died in childbirth the following year. This event profoundly moved him, as is shown in his letters and in the sonnets to her. In 1789 he was appointed extraordinary professor at Göttingen, though without a stipend, and in the same year paid a visit to Goethe and Schiller at Weimar. His third marriage in 1790 was a disaster and was dissolved in 1792. This, together with Schiller's unjust criticism of the second edition of his poems, hurt him deeply. He became ill with tuberculosis and died in poverty at Göttingen on June 8, 1794.

Bürger began writing verse in the conventional rococo manner, but gradually developed a style based on folksong and the language of the people, characterized by naivety, simplicity and homely realism. With his popular ballads such as "Lenore," "Das Lied vom braven Mann," "Die Kuh" and "Der wilde Jäger" he created a new lyrical poetry in Germany. His sonnets, which show the influence of Petrarch, became famous and he was admired and imitated by such poets as A. W. Schlegel and Novalis. Most of his translations (Homer, Ossian) were fragments. Bürger's love of English poetry is expressed in his translation of Thomas Percy's ballads and his prose version of *Macbeth*. His German adaptation of the stories of Baron Münchhausen (1786) from the English original by R. E. Raspe enjoyed lasting success.

Bürger's complete writings were edited by E. Grisebach, 5th ed. (1894) and by W. von Wurzbach, four volumes (1902–04). His poems were edited by E. Consentius, two volumes (1920); his letters were edited by A. Strodtmann, four volumes (1874).

Garland, *Storm and Stress* (1952); Roy Pascal, *The German "Sturm und Drang"* (1953). (F. H. W. W.)

BURGERS, THOMAS FRANÇOIS (1834–1881), South African statesman and theologian, who was president of the Transvaal republic from 1872, remained a controversial figure, because of his unresisting surrender of the republic to the British government in 1877 and because of his religious unorthodoxy. He was born in Cape Colony on April 15, 1834, and educated at Utrecht, Neth., where he graduated as doctor of theology and was ordained a minister of the Dutch Reformed Church. He was called to Hanover, Cape Colony, as minister in 1859 but a synodal commission declared him a heretic in 1864 for holding modernist views, and he was suspended. He appealed successfully to the Cape supreme court, whose judgment was subsequently confirmed by the privy council in London (Feb. 1867). In 1871 the Transvaal *volksraad* (parliament), dissatisfied with their western boundary as defined under the Keate award (1871), decided to seek a president of greater diplomatic talent than M. W. Pretorius, and persuaded Burgers to stand for election. He was elected and took

office on July 1, 1872. Burgers carried an important education law, encouraged the new gold-mining industry, attempted to straighten out the government's confused finances and minted a gold coinage bearing his own effigy. He also planned to link the republic by rail with Delagoa bay, which was confirmed in Portuguese possession by the MacMahon award (1875). He visited Europe that year to negotiate a railway loan, but his scheme was ill-conceived, placing a severe strain on Transvaal finances and the patience of the republic's creditors in Cape Colony and Natal, and it failed disastrously. In 1876, Burgers' government was further embarrassed by conflict with Sekukuni, chief of the Bapedi in the northeastern Transvaal, part of whose territory was needed for the railway. This war was very unpopular, and peace had barely been made when, early in 1877, Sir Theophilus Shepstone entered the Transvaal under a special commission from the British government, with authority to annex the nearly bankrupt republic at his discretion. Burgers surrendered his state without resistance, though he was allowed to make a public protest, and retired to Cape Colony. He died there on Dec. 9, 1881. See *TRANSVAAL: History*.

See S. P. Engelbrecht, *Thomas François Burgers* (1946).

(T. R. H. D.)

BURGESS, JOHN WILLIAM (1844–1931), U.S. political scientist, was born in Giles county, Tenn., on Aug. 26, 1844, the son of a slave-owning but pro-Unionist Whig. After serving two years in the Union army, Burgess attended Amherst college and graduated in 1867. He practised law briefly before going to Germany for study in history and public law. From 1876 until 1912 he was a distinguished member of the Columbia university faculty, and was the founder of its graduate school of political science in 1880. He served also as dean from 1890 to 1912. He was a leader in organizing and directing the study of political science in the United States and in the transformation of Columbia from college to university. His writings made him an important figure in American scholarship. Among his best known works were *Reconstruction and the Constitution* (1902) and *Political Science and Comparative Constitutional Law* (1890–91). He advocated the doctrine of limited government, protection of personal liberty, economic *laissez faire* and the rights of property. He died in Brookline, Mass., on Jan. 13, 1931. (T. S. BY.)

BURGH (BOURKE, BURKE), the name of a historic Irish family which has been associated with Connaught for more than seven centuries. It was founded by WILLIAM DE BURGH (d. 1206), the brother of Hubert de Burgh (*q.v.*). William accompanied Prince John to Ireland in 1185, and was rewarded by grants of land. Remaining in Ireland, he was given a further grant of most of Connaught in Richard I's reign, but although he spent much time trying to establish his rule there, he was not successful. However, his son RICHARD (d. 1243) was again granted Connaught in 1227, through the influence of Hubert de Burgh. Richard was appointed justiciar in 1228, and used his combined public and private influence permanently to establish his lordship in Connaught. He lost his office of justiciar in 1232, but by siding with the crown in the revolt of Richard Marshal, earl of Pembroke, in Ireland (1234) he managed further to extend his influence and territory after its suppression. After his death in 1243 he was succeeded in turn by his sons RICHARD (d. 1248) and WALTER (*c.* 1230–71). Walter continued to fight the native chieftains, and added greatly to his vast domains by obtaining a grant of the county of Ulster from Prince Edward (afterward Edward I), in consequence of which he was styled earl of Ulster. Walter was succeeded by his son RICHARD (*c.* 1259–1326), 2nd earl. In 1286 Richard ravaged and subdued Connaught and deposed Brian O'Neill as chief native king, substituting a nominee of his own. He also attacked the native king of Connaught in favour of that branch of the O'Conors whom his own family supported. He led his forces from Ireland to support Edward I in his Scottish campaigns, and on Edward Bruce's invasion of Ulster in 1315 Richard marched against him, although he had given his daughter Elizabeth in marriage to Robert Bruce, afterward king of Scotland, about 1304. Occasionally summoned to English parliaments, he spent most of his 40 years of activity in Ireland, where he was the greatest noble of his day, usually fighting the natives or his Anglo-

Norman rivals, the Geraldines. The patent roll of 1290 shows that in addition to his lands in Ulster, Connaught and Munster he had held the Isle of Man, but had surrendered it to the king.

Richard's grandson and successor, WILLIAM (1312–33), 3rd earl, was the son of John de Burgh by Elizabeth, lady of Clare, sister and coheir of the last Clare earl of Hertford (d. 1314). William married a daughter of Henry, earl of Lancaster, and was appointed lieutenant of Ireland in 1331, but he was murdered in 1333, leaving a daughter, the sole heiress not only of the Burgh possessions but also of vast Clare estates. She was married in childhood to Lionel, son of Edward III, who was recognized in her right as earl of Ulster, and their descendant, the duke of York, ascended the throne in 1461 as Edward IV; since that time the earldom of Ulster has been held by members of the royal family only. On the murder of the 3rd earl in 1333, however, his male kinsmen succeeded in holding the bulk of the Burgh territories, and, adopting Irish names, became virtually native chieftains. Their two main branches were those of "MacWilliam Lochtar" in southern Connaught, later given the title of earls of Clanricarde (1543); and "MacWilliam Uachtar" who from 1603 held their territory as the viscountcy of Mayo. See CLANRICARDE, EARLS OF; MAYO, EARLS OF.

BURGH, HUBERT DE (d. 1243), professional administrator and chief justiciar of England (1215–32) under King John and Henry III, the last great holder of that office, was a member of a knightly family of moderate estates in East Anglia. He served in John's household before he came to the throne and was his chamberlain by 1198. After John's accession (1199) he became sheriff of five counties, custodian of several castles and warden of the Welsh Marches (1201) and of the Cinque Ports (1202). In Normandy, he had charge of Falaise castle (1202) and, for a time, of Arthur I, duke of Brittany, whom he is said to have preserved from the mutilation ordered by the king. He became constable of Chinon (1203) and was captured there when the castle fell to the French in 1205. After two years' captivity in France he became sheriff of Lincolnshire (1208), but his harsh administration was unpopular and the king removed him and his deputy in 1213, when he became one of the seneschals of Poitou. He was with the king when Magna Carta was sealed at Runnymede in June 1215 and was there made chief justiciar. Although appointed partly because he was more acceptable to the barons than his predecessor, Peter des Roches, bishop of Winchester, Hubert remained loyal to John and Henry III during the war with the barons. He led a successful defense of Dover castle (1216 and 1217) against Prince Louis of France, who had come over to oppose King John, and was one of the leaders in the naval victory at Sandwich in Aug. 1217 which finally destroyed Louis' hopes of obtaining the English crown.

After the end of the war (1217), Hubert was one of the most influential men in a government consisting of an increasingly uneasy coalition of men held together initially by the regent, William Marshal, earl of Pembroke (d. 1219), and by the presence of papal legates up to 1221. Thereafter a struggle developed between Hubert, supported by Stephen Langton, archbishop of Canterbury, and Peter des Roches, the king's tutor, who headed a group of alien administrators and soldiers and who was occasionally supported by various English barons. Hubert managed in 1223–24 to recover many castles from the rival party and to deprive most of the aliens of office. He was now predominant and seemed secure when Henry III declared his majority in 1227 and Peter des Roches ceased to be the king's tutor. He enjoyed enormous territorial power, partly as a result of royal favour, and partly as a result of his three marriages, in 1209, 1217 and 1221, with Beatrice de Narenne, an heiress from East Anglia, with Isabella, countess of Gloucester, who had been divorced by King John in 1199 and was the widow of Geoffrey de Mandeville, 5th earl of Essex, and with Margaret, sister of Alexander II of Scotland. He was made earl of Kent in Feb. 1227 and chief justiciar for life in April 1228.

Hubert was a typical member of the administrative class created by Henry II and his sons. His revival in the 1220s of some administrative policies condemned in the 1215 version of Magna Carta contributed to the renewed struggle for the charters from 1225 onward and provided excuses for attacks upon him. His love

of power, wealth and title also made enemies, especially in Wales and the Welsh Marches where, by 1231, he held the castles of Skenfrith, Grosmonth and Llantilio, and the castles and lordships of Montgomery, Cardigan and Carmarthen, the honour of Gower, and the wardship of the honours of Gloucester and of Brecon and Radnor. This threatened the interests of the earls of Pembroke and Chester and other Marcher lords, and provoked unsuccessful wars with Llewelyn of Wales in 1228 and 1231. The first sign of his fall came in 1229 when Hubert was violently blamed by the king for the breakdown of an expedition to France. Peter des Roches, who had been abroad since 1227, returned in 1231 to intrigue against him. Scattered attacks on alien clergy in England, for which Hubert was held responsible, were used as an excuse to try him in 1232 on trumped-up charges and to deprive him of the justiciarship and of his offices and custodies. He was humiliated and later imprisoned at Devizes, but not deprived of his private lands and earldom. Released by the baronial opponents of Peter des Roches's party (1233), he was admitted to the king's peace with them (1234), but was subjected to another inconclusive trial (1239). He died at Banstead, Surrey, on May 12, 1243, and his lands, but not his title, descended to his son, John de Burgh.

Hubert was the last of the great chief justiciars and was not replaced in office. While earlier justiciars owed their prominence to long royal absences abroad, Hubert owed his to the minority of Henry III. After the loss of England's continental possessions in 1204 and 1214, and following the increasing specialization of fiscal administration, the office had outlived its most obvious and useful functions.

See Clarence Ellis, *Hubert de Burgh* (1952).

(J. C. Ho.)

BURGH: SEE BOROUGH.

BURGHESH, HENRY (1292–1340), English bishop and chancellor, several times changed his political allegiance during the disturbed reign of Edward II and survived to become a trusted emissary of Edward III. At the urgent request of Edward II he was appointed bishop of Lincoln (1320) by Pope John XXII, despite the fact that the chapter had already made an election. After his uncle and patron, Bartholomew, Lord Badlesmere, had fought against the king at the battle of Boroughbridge, Burghesh's lands were seized by the king in 1322, and were restored to him only in 1326. Burghesh took part in the movement which led to the deposition and murder of King Edward II, and became chancellor of England (May 1328) through the influence of Queen Isabella, mother of the young Edward III. On her disgrace (Nov. 1330) he lost his position and favour for a time, but was treasurer from 1334 to 1337 and was entrusted with many important diplomatic commissions by the king. He died at Ghent on Dec. 4, 1340.

(J. R. L. H.)

BURGHLEY, WILLIAM CECIL, BARON (1520–1598), English statesman, who was the chief minister of Queen Elizabeth I, was born at Bourne in Lincolnshire on Sept. 18, 1520. He was descended from a family of minor gentry living on the Welsh border in Herefordshire. His grandfather, David (d. 1537), yeoman of the guard of Henry VII and yeoman of the chamber to Henry VIII, began the Cecil connection with Lincolnshire. His father, Richard (d. 1553), rose to be yeoman of the wardrobe under Henry VIII and Edward VI. William Cecil, after attending the grammar schools at Grantham and Stamford, went to St. John's college, Cambridge, in 1535. He was in Cambridge for six years and closely associated with some of the most distinguished scholars of his time, notably with John Cheke who was his tutor. Cecil fell in love with Cheke's sister Mary, and in spite of parental opposition married her in Aug. 1541, shortly after leaving Cambridge. They had one son, Thomas, who was later to become earl of Exeter. Mary died two years later, and in 1545 Cecil was married again, this time to Mildred, daughter of Sir Anthony Cooke and one of the most learned ladies of her time. Her father belongs with the pioneers of Protestantism, and her sisters all married men prominent in the English Reformation movement. Cecil's connection both with the Chekes and with the Cookes was an important factor in determining his own Protestant leanings.

From Cambridge Cecil went to Gray's Inn. His first public office was as member of parliament in 1543. He sat again in 1547,

and thereafter served either as a commoner or a peer in virtually every succeeding parliament as long as he lived. During the first decade of Elizabeth's reign he was her chief spokesman in the house of commons and after that in the lords. He was generally recognized as a fluent and effective speaker.

His career at court began in 1547 in the service of the duke of Somerset, lord protector of the young King Edward VI. In matters religious he supported Somerset's program of moderate reform, of which Thomas Cranmer was the chief exponent, as opposed to the radical reformers led by Bishop John Hooper. Cecil also supported Somerset's spirited attack upon the enclosure movement to make common land private property. He recognized however that the English gentry, the power behind the throne, had a vested interest in enclosures, and thought it unwise to antagonize them. In fact, Somerset's identification with the so-called commonwealth men led to his downfall. Cecil fell with him and followed him to the Tower. Like Somerset he was released after a brief imprisonment, though the power of the crown passed to the duke of Northumberland. When Somerset conspired to recover his old position Cecil declined to follow him and came to terms with Northumberland, who appointed him principal secretary in Sept. 1550 and elevated him to a knighthood the following year.

Under Northumberland Cecil was a competent, hard-working public servant. He seems to have had little to do with the formulation of policy, either foreign or domestic. With Northumberland's religious policy Cecil was evidently not in sympathy. He befriended Cranmer against Northumberland's attacks, but was careful not to antagonize the virtual ruler of England. Moreover, although, with the rest of Edward's council, Cecil gave his reluctant approval to the change in succession contrived by Northumberland and, in fact, continued as principal secretary during the nine days' reign of Lady Jane Grey, he was opposed to the change and conspired actively with those who soon achieved Northumberland's downfall.

Cecil was therefore in a position to make a strong claim for indulgence when Mary came to the throne, and he was among the first to receive her pardon. There was some talk of his continuance in office, but it came to nothing. When, under Mary, England returned to the Roman Catholic communion, Cecil returned also. He was in fact one of those who went to the Low Countries to escort Cardinal Pole to England when he came to authenticate the return to Rome. English Protestants, particularly those in exile, regarded Cecil as a renegade. The opinion that he was active in support of them is ill founded, though he got in some trouble with the government by his defense in the house of commons of their property rights.

When Elizabeth succeeded Mary in 1558 she appointed Cecil her principal secretary. He had been in her service and in her pay as manager of her real estate (surveyor) since 1550. In 1561 she made him master of the court of wards, one of the most lucrative offices in the gift of the crown, upon the proceeds of which Cecil grew rich. For 14 years he remained her principal secretary, virtually the administrative head of her government. During that period he engineered the establishment of the Anglican Church and protected it from Catholic assaults on the right and Puritan assaults on the left. His personal sympathies inclined him toward the Puritans, but Elizabeth's rooted antipathy to them convinced him that their belligerent attitude toward the Establishment might well drive the queen back to the old church. He therefore did his best to curb their reforming zeal. But his chief fear was of the Catholics, who were numerically strong in England, particularly among the old nobility, and were constantly encouraged by both the Spanish and French crowns. Their menace was accentuated by the fact that the heiress presumptive to the English throne was the young and charming Catholic queen of Scots, Mary Stuart. For that reason Cecil did his best to persuade Elizabeth to marry and perpetuate the Tudor line. He supported in turn an Austrian and a French match, but he was resolutely opposed to her marriage to Robert Dudley, earl of Leicester, who was, and remained during the whole course of his life, her chief favourite. Indeed, Cecil's policy antagonized the favourite, the old nobility and the Roman Catholics. The outcome revealed itself in an attempt in

1568 to drive him from office, and in 1569 to destroy the English Protestant government by an uprising in the north. Both efforts failed.

Meanwhile Cecil had been instrumental in weakening the position of Mary Stuart in Scotland by building up the strength of the Scottish Protestant party. Mary herself facilitated his efforts by her ill-advised marriages, first to Lord Darnley and afterward to the earl of Bothwell. The outcome was that she was forced to flee from Scotland into England in 1568, where for the residue of her life she remained a prisoner and the focal point of Catholic disaffection.

In foreign affairs during Cecil's term of service as secretary he leaned on the whole to Spain rather than France, his Spanish proclivities being accentuated by the fact that Spain held the Low Countries, which were England's principal foreign market. But here religious considerations intervened, and the active part which the Spanish ambassador played in stimulating Roman Catholic revolt led Cecil in the other direction. In the so-called Ridolfi plot of 1571—to which the captive Scottish queen, the old English nobility led by the duke of Norfolk, and the Spanish ambassador were all parties—Cecil unraveled the designs of conspirators, brought Norfolk to the block and secured the expulsion of the Spanish ambassador and the more rigorous confinement of Mary Stuart. After this his position was secure. In 1571 Elizabeth raised him to the peerage as Baron Burghley and in the following year appointed him lord treasurer.

He was relieved of the day-by-day burden of administration, but he remained until the end of his life Elizabeth's chief counselor. Together they formed one of the most remarkable partnerships in English history, in which his wide knowledge and worldly wisdom tempered her feminine impulses, and her versatility forced him to cast off the shackles of precedent. But she was always the mistress and he always the loyal servant. What they both wanted was a strong and secure England; all other considerations, religious as well as secular, were subordinated to that end.

Throughout his life as Lord Burghley, the same major problems confronted him as had confronted him during the first critical decade of Elizabeth's reign. On the religious issue Burghley remained in the *via media*. The papal excommunication of Elizabeth in 1570 and the Jesuit missionary efforts in the 1570s and '80s increased or seemed to increase the menace from the Catholics. Burghley continued to oppose them and the captive Mary Stuart, to whom they looked for relief. Probably he was the one who took the last decisive step which led to her death at the block. His one considerable contribution to controversial literature was his *Execution of Justice in England*, in which he vindicated the increasing severity of the government toward the Catholics on the grounds not of their faith but of their treasonable purposes.

The Puritans steadily increased in numbers and in influence. They virtually controlled the house of commons and developed considerable strength in the privy council. Indeed, the privy council after 1573 was split between a moderate group led by Burghley and a Puritan group led by Sir Francis Walsingham and Leicester. The Puritan faction regarded the religious issue as the dominant one in determining Elizabeth's policy toward Scotland, Spain and France. They wished Elizabeth to set herself at the head of a Protestant league and to give active support to the Dutch rebels against Spain in the Low Countries, to militant enterprises against Spain in the new world and to Huguenot rebels in France. Burghley and his royal mistress would have preferred to build fires in their neighbours' houses by measures short of war. It was a war party against a peace party. In 1585 the war party won the day, and from that time on until the end of Elizabeth's reign, England was at war. By a strange perversity of fate, since Leicester died in 1588 and Walsingham in 1590, Burghley himself, during the last eight years of his life, when he was past 70, had to conduct that war. He died in London on Aug. 4, 1598.

Burghley led an exemplary private life. He was a good husband, a careful father and a considerate master. By his second wife he had three children who survived infancy, a son Robert and two daughters, Ann and Elizabeth. Robert succeeded him as principal adviser to the aging queen; Ann and Elizabeth both married well,

though Ann's marriage to Edward de Vere, 17th earl of Oxford, was an unhappy one.

In matters economic, Burghley was an orthodox mercantilist. He was a good scholar in the classical tradition and he loved the company of scholars. He showed little or no interest in the development of English literature and had a Puritan distaste of the drama. He was a great builder. His house at Theobalds was one of the show places of England. It is gone. Gone also is his London house in Covent garden. The one monument to his building which remains is Burghley house at Stamford Baron, still occupied by the descendants of his first-born son. Theobalds was inherited by his son Robert, who later exchanged it for the royal palace of Hatfield. There Robert built, adjacent to the old palace, the present Hatfield house, still occupied by his descendants.

BURGKMAIR, HANS (1473–c. 1531), German painter and wood engraver whose works are among the earliest in German art to show influences of the Italian Renaissance, was born at Augsburg. He studied under his father, Thoman Burgkmair, and under Martin Schongauer, and was a member of the painters' guild in Strasburg in 1490 and in Augsburg in 1498. About 700 woodcuts have been ascribed to him, most of them distinguished by that spirit and freedom which were admired in the works of Albrecht Dürer. His principal work is the series of 135 prints representing the triumphs of the emperor Maximilian I. His works include some of the first chiaroscuro (*q.v.*) woodcuts. In his *Turnierbuch* of 52 illustrations he had the assistance of his son Hans Burgkmair (c. 1500–59). Burgkmair was also an excellent painter in fresco, specimens of which are in the galleries of Munich and Vienna.

BURGLARY, at common law, is the offense of breaking and entering the dwelling house of another in the nighttime with intent to commit a felony. The term "dwelling house" has been defined to include other buildings located within the curtilage or common enclosure. Breaking consists not only in the breaking of some external portion of the building but also in the opening of a closed door or window. Any entry, however slight, is sufficient, including thrusting the hand or even an instrument into the building. Only an intent to commit a felony, not its actual consummation, is required.

Most Anglo-American jurisdictions have expanded the scope of burglary by statute. The nighttime requirement has often been abolished. Structures in addition to the dwelling house and those within the curtilage are usually given the protection of these statutes. A few states in the U.S. have wholly eliminated the breaking requirement and have substituted the element of trespassory entry. Many jurisdictions, following the English common law, have created the distinct offense of housebreaking, consisting of some, but not all, of the elements of burglary. Thus in England housebreaking is defined to include all the elements of burglary except the nighttime requirement. Precedents drawn from the common law of burglary, however, are commonly applied in the interpretation of these statutes. Possession of burglary tools with intent to commit burglary is a common statutory offense.

BURGLARY INSURANCE: see **CASUALTY INSURANCE.**

BURGOS, the capital formerly of Old Castile, has been since 1833 capital of the Spanish province of Burgos. Pop. (1960 est.) 89,864 (mun.). Burgos occupies a strategic site about 800 m. (2,625 ft.) above sea level, commanding both the natural route from the Ebro to the plateau of Old Castile by the Pancorbo defile, now followed by the main road and railway from France, and also the road from Pamplona, formerly part of the Pilgrims' Way leading to Santiago, which runs closer to the foothills of the Sierra de la Demanda (40 km., or 25 mi. E.). The town stands on the lower slopes of a castle-crowned hill, overlooking narrows of the Arlanzón river, 241 km. (150 mi.) N. of Madrid by road.

The oldest quarter of the town stands on the eastern slope of the Castle hill, the great mass of the cathedral dominating the

entire town. The rest of the old town lies southward, its life centred in the arcaded Plaza Mayor, the Plaza de Santo Domingo de Guzmán, a busy market place, and the Plaza de Calvo Sotelo, with the late 15th-century Casa del Cordón. Beyond these, along the road to France, and on the eastern outskirts, are the military headquarters and barracks. The Casa de Miranda, a building representative of the best domestic architecture of 16th-century Spain, and now a museum with archaeological exhibits, carvings and paintings, lies across the river. The most important of the six bridges, the Puente de Santa Maria, leads to the Arco de Santa Maria, the finest of the four surviving gates, with sculptures illustrating the history of Burgos.

Burgos is the see of an archbishop, whose province comprises the dioceses of León, Santo Domingo and Santander. The cathedral, founded in 1221 by Ferdinand III of Castile and the English bishop Maurice of Burgos, is a fine example of florid Gothic, built of white limestone, not completed until 1567. Its cruciform design is almost hidden by the 15 chapels added at all angles to the aisles and transepts, by the beautiful 14th-century cloister on the northwest and the archiepiscopal palace on the southwest. Over the three central doorways of the main or western façade rise two lofty and graceful towers. The bones of the 11th-century hero, the Cid (*q.v.*), have rested in the cathedral since 1919. The chapel of Corpus Christi contains the chest which the Cid is said to have filled with sand and subsequently pawned for a large sum to the credulous Jews of Burgos. The legend adds that he redeemed his pledge. In the cloister is a famous Gobelin tapestry. There are also the Cid's wedding contract, a polyglot Bible (Latin, Hebrew and Arabic), vestments worn by the archbishop at the Council of Trent and a collection of ivory, gold and silver objects. In the aisleless Gothic church of Santa Agueda, or Santa Gadea, tradition relates that the Cid compelled Alfonso VI of León, before his accession to the throne of Castile in 1072, to swear that he was innocent of the murder of Sancho, his brother and predecessor on the throne. The Gothic churches of San Esteban (1280–1350) and San Nicolás (1505) have fine sculptured doorways. The surviving convents lie chiefly outside the city. At the end of the Paseo de la Isla stands the nunnery of Santa Maria la Real de las Huelgas, originally a summer palace (huelga, "pleasure-ground") of the kings of Castile. In 1187 it was transformed into a Cistercian convent by Alfonso VIII, who invested the abbess with almost royal prerogatives. Alfonso and his wife Eleanor, daughter of Henry II of England, are buried there. The Cartuja de Miraflores, a Carthusian convent, founded by John II of Castile (1406–54), lies 3 km. (2 mi.) S.E. of Burgos. Its church contains a monument of exceptional beauty, carved by Gil de Siloe in the 15th century, for the tomb of John and his second wife, Isabella of Portugal. There are also fine carved stalls and the painting "La Asunción" by Jusepe de Ribera. The rosaries made by the monks from thousands of rose petals keep their perfume for years. The convent of San Pedro de Cardeña, 11 km. (7 mi.) S.E. of Burgos, was the original burial place of the Cid, in 1099, and of Jimena, in 1104. About 80 km. (50 mi.) from the city is the abbey of Silos, which appears to have been founded under the Visigothic kings as early as the 6th century. It was restored in 919 by Fernán Gonzalez, and in the 11th century became celebrated throughout Europe, under the rule of St. Dominic. It was reoccupied in 1880 by French Benedictine monks.

Burgos is on the main railway line from France and Vitoria to Valladolid. It is an agricultural centre, and manufactures woolen and leather goods, chemical manures, chocolate and paper. It has a large tourist industry, one of the first camping grounds to have been established in Spain and an extensive sports centre.

After its foundation in 884 as an outpost in the east of the Asturian kingdom, Burgos became the capital of the countship and, later, of the kingdom of Castile, declared independent in 1035. As the recognized "head of Castile," Burgos enjoyed the prestige of a capital city until the reign of Philip II. Like its rivals it sank to political insignificance after 1560, when Madrid was declared the *única corte*. There remained to Burgos, however, the commercial supremacy in Castile which resulted from the powers with which its merchant guild was invested by the Catholic sovereigns

in 1494. In that year all foreign trade of Castile, particularly that in fine wool, and the charge of ships sailing from ports of the north coast were put under the jurisdiction of the Burgos guild, whose shipping department became the model for the famous Casa de Contratación at Seville. With the decline of Castilian trade, Burgos languished until its revival in the 18th century under Charles III. In the Peninsular War the French in 1808 defeated the Spaniards at Burgos. The French in turn were unsuccessfully besieged in the city by General Wellington in 1812; it fell to the British in the following year.

In July 1936 conservative Burgos became the official seat of Gen. Francisco Franco's government and was a base for campaigns toward Madrid and the Basque states.

Burgos province includes the enclave of Treviño in the province of Álava. Pop. (1960 est.) 415,427; area 5,509 sq.mi. The province extends from the main Cantabrian watershed, beyond the Ebro, in the north, to south of the Douro river. In the east it marches with Logroño and Soria in the heart of the Demanda and Urbión massifs which separate Old Castile from the middle Ebro. From these massifs it descends westward and southward to the wide stretches of flat ground occupying the centre of the northern part of the central plateau. The Pancorbo gorge, cut across the Montes Obarenes in the northeast, gives a line of communication between the basin of Miranda de Ebro and the rest of the province, and at the same time between Alava and Old Castile. The Ebro runs eastward through the northern half of the province, but is not navigable. The Douro, or Duero, crosses the southern half, running west-northwest; it also is unnavigable in its upper valley. The other important streams are the Pisuerga, flowing south toward Palencia and Valladolid, and the Arlanzón, which flows through Burgos for more than 120 km. (75 mi.).

Burgos is one of the great forest provinces of Spain, with more than 300,000 ac. of pine, oak, beech and other species under state management, while vast ranges of almost uninhabited upland serve as pasture for the flocks, which in most years exceed 1,000,000 head of sheep. Lambs are exported to Bilbao and Bfadríd. Goats, horned cattle, horses, mules and swine are numerous. Cereal cultivation—with wheat ordinarily occupying about two-fifths of the cultivated area—is the basis of the agriculture of this province, of which the centre and south form part of the best cereal zone of Spain. The Douro and Arlanza valleys produce good wine and are agriculturally important for their more equable climate, their good communications and their irrigation works, actual and projected. Soft coal (used for briquettes), mica, china-clay and salt are obtained in small quantities, and oil-bearing lands north of the capital have been under investigation. The industries of the province are on a small scale, the ancient woolen, linen and hemp manufactures surviving in small factories and as cottage industries. Hydroelectric power and light are available throughout the province. The northern railways from Madrid to the French frontier cross the province in the central districts: the Valladolid-Bilbao line in the north; and the Valladolid-Saragossa line in the south. The Burgos-Soria-Calatayud railway provides direct communication with the Mediterranean at Sagunto and Valencia. The only important town in the province is Burgos, but modern developments have expanded Miranda de Ebro and Aranda de Duero as overflow towns for Madrid. The country towns and villages are inhabited by a notably intelligent and independent peasantry—petty farmers, shepherds and foresters—whose physical type is northern rather than Mediterranean; and Burgos stands fourth or fifth in Spain in respect of elementary education, above the richer provinces of Biscay and Barcelona. (L. M. GA.)

BURGOYNE, JOHN (1722–1792), English general and dramatist, is chiefly remembered for his controversial part in the American Revolution (*q.v.*). He bought his first commission in 1740 and made a runaway marriage in 1743 with a daughter of the 11th earl of Derby, whose protégé he subsequently became. During the Seven Years' War he took part in two raids on the French coast (1758 and 1759). He then raised a light cavalry regiment, in command of which he went to Portugal, distinguishing himself at the action of Villa Velha in 1762. After the war he was elected

to parliament and became a leader of fashion in London; and in 1774 he wrote his first play, "The Maid of the Oaks."

On the outbreak of the American Revolution, Burgoyne was posted first to Boston (1775), and then to Canada (1776) as second-in-command to Lord Carleton, whose feeble attempts to invade the New England colonies he strongly criticized. He then drew up and secured the adoption of a plan for an offensive with 12,000 men by the Crown Point-Ticonderoga route to unite with a force under Gen. William Howe sent northward from New York, and another under Col. Barry St. Leger from the west to cut off the New England colonies from the middle and southern colonies. But he was given only 6,000 men for the expedition and though it secured Crown Point and Ticonderoga (1777) after a slow and toilsome march, much harassed by hostile irregulars and Indians, it was brought to a halt by 16,000 troops in position. There was no news of the co-operating forces from the south and west, and after exhausting his stocks of food and ammunition, Burgoyne was compelled to capitulate at Saratoga, in Oct. 1777. His conduct of the campaign was much criticized, but the main causes of its failure were the insufficiency of his means and the lack of co-ordination of the concentric offensive, of which his force formed only one part. (*See also SARATOGA, BATTLES OF.*)

Burgoyne was for a short time (1782–83) commander in chief in Ireland, but he thereafter retired increasingly to private life. His wife had died in 1776 and between 1782 and 1788 he had four children (of whom the eldest became Field Marshal Sir John Fox Burgoyne; *q.v.*) by his mistress, the singer Susan Caulfield. He wrote a series of plays, culminating in *The Heiress*, the most successful of them, which appeared in 1786. Burgoyne died in London on June 4, 1792.

See E. B. Fonblanque, Political and Military Episodes . . . from the Life and Correspondence of Right. Hon. J. Burgoyne (1876); *F. J. Hudleston, Gentleman Johnny Burgoyne* (1927). (E. W. SH.)

BURGOYNE, SIR JOHN FOX, BART. (1782–1871), English field marshal, best remembered for the part he played in the Crimean War, was born on July 24, 1782, an illegitimate son of Gen. John Burgoyne. Educated at Eton college and the Royal Military academy, Woolwich, he was commissioned in the royal engineers in 1798 and saw service in the Mediterranean until 1807. Subsequently he went to Sweden and Portugal on the staff of Sir John Moore. He served in all the campaigns of the Peninsular War from Corunna to Toulouse, playing a prominent part in the sieges of Ciudad Rodrigo, Badajoz, San Sebastian and Bayonne. In 1814 he was commanding engineer to Maj. Gen. Sir Edward Pakenham's disastrous expedition to New Orleans, but was not present at Waterloo. In the years of peace after 1815, Burgoyne held various military and civil appointments, serving as chairman of the board of public works, chief famine commissioner in Ireland, and inspector general of fortifications in the United Kingdom. He was promoted lieutenant general in 1851. During the Crimean War he was chief engineer on Lord Raglan's staff, and it was on his advice that the allies, instead of advancing directly on Sebastopol after their victory at the Alma, marched round to invest the fortress from the south—a strategy much criticized at the time and since. He was recalled in Feb. 1855, but was made a baronet in 1856. After the war he became constable of the Tower of London, and was made field marshal in 1868. The last year of his life was saddened by the death of his only son, Capt. Hugh Burgoyne, V.C., who was in command of the experimental H.M.S. "Captain," sunk in 1870 in the Bay of Biscay. Sir John Burgoyne died in London on Oct. 7, 1871.

See Lt. Col. Hon. G. Wrottesley, Life and Correspondence of F.M. Sir John Burgoyne (1873). (E. W. SH.)

BURGUNDY (Fr. BOURGOGNE), a name limited in modern times to the region of France lying between the Saône and the Loire and the upper Seine, that is, to the former duchy of Burgundy (see below), but applied also in the middle ages to the last Burgundian kingdom, later called the kingdom of Arles, and to the countship of Burgundy, later known as the Franche-Comté.

First Burgundian Kingdoms.—The original Burgundians were a Scandinavian people who established themselves first on the southern shores of the Baltic (the island of Bornholm was

called Burgundarholm), then in the valley of the Vistula. Unable to defend themselves there against the Gepidae, they migrated westward to the valley of the Main. There they founded a powerful kingdom, which by A.D. 406 extended to the Rhine. Their king Gundahar (Gundicar or Gunther), however, who seems to have had his capital at Worms, became involved in hostilities with the Romans and with the Huns, who together destroyed the kingdom (435–437). The massacre of the Burgundian royal family by the Huns is reflected in the story of the *Nibelungenlied* (*q.v.*). The Romans transferred the surviving Burgundians to Savoy in 443.

As the influence of the Romans declined in the second half of the 5th century, the Burgundians gradually began to assume control over areas north and west of Savoy, occupying not only Besançon and then, west of the Saône, Langres, Dijon and Autun, but also the lower Saône valley, Lyons and the valley of the Rhône down to Vienne and the Viennois. They also tried to expand southward into Provence. Their king Gundobad (d. 516) promulgated their first code of laws, later known as the *loi Gombette*. Gundobad's son Sigismund was converted from Arianism to Roman Catholicism and founded the monastery of Saint Maurice d'Agaune (in the Valais). Attacked by the Franks, Sigismund was killed by Clodomir, son of Clovis, in 524, but Burgundy remained independent under his brother Gundomar till 534, when the Franks annexed it.

After the death of Clotaire I in 561, however, when the Merovingian kingdom was partitioned, one of his sons, Guntram, secured the *regnum* Burgundiae or kingdom of Burgundy. This *regnum* eventually included not only the former Burgundian lands but also the diocese of Arles in Provence, the Val d'Aosta east of the Alps and even the country of Orléans, Chartres and Sens in north central France. It remained a separate Merovingian kingdom until Charles Martel subjugated it to Austrasia in the second decade of the 8th century.

Kingdom of Burgundy, or **Provence**.—The Carolingians made several partitions of Burgundy before Boso, ruler of the Viennois, had himself proclaimed king of all Burgundy from Autun to the Mediterranean in 879. Though the French Carolingians recovered the country west of the Saône and north of Lyons (Autun, Chalon and Mâcon) from him and the German Carolingians reclaimed Jurane Burgundy (*i.e.*, Transjurane Burgundy, or the country between the Jura and the Alps, together with Cisjurane Burgundy properly so called, namely the Franche-Comté), Boso and his successors were able to maintain themselves in the kingdom of Provence (*q.v.*) or Lower Burgundy—sometimes also, rather misleadingly, called Cisjurane Burgundy—till about 933.

Last Kingdom of Burgundy.—In 888 Rudolf I (d. 911 or 912), son of Conrad count of Auxerre, of the family of Welf, was recognized as king of Jurane Burgundy, his territory comprising the Transjurane dioceses of Lausanne, Geneva and Sion and the diocese of Besançon, to which Basel was subsequently added. His son and successor Rudolf II (d. 937) was able to conclude a treaty about 933 with Hugh of Arles, king of Italy and master of Provence since the death of Boso's son Louis the Blind (the emperor Louis 111), whereby Hugh ceded Provence to Rudolf in return for Rudolf's renunciation of his claims to the kingdom of Italy.

Rudolf II thus came to rule over the whole *regnum Burgundiae* except the areas west of the Saône, but his successors Conrad the Peaceful (937–993) and Rudolf III (993–1032) were unable to exercise their authority over their vassal lords—especially the counts of Burgundy (see **FRANCHE-COMTÉ**) and of Savoy—or over the bishops and had to rely on the protection of the German kings. When Rudolf III died without legitimate heirs in 1032, he left his kingdom to the emperor Conrad II. For its later history see **ARLES, KINGDOM OF**.

THE DUCHY OF BURGUNDY

The duchy of Burgundy was that part of the *regnum Burgundiae* west of the Saône which was recovered from Boso by the French Carolingians and remained a part of the kingdom of France. In pre-Roman times this territory had been occupied by Gallic tribes, the Aedui, the Senones and the Lingones. Under the Romans it was divided between the civitates of Autun, Auxerre, Nevers, Sens,

Troyes, Langres (which included Dijon), Chalon and Mâcon. When Norman invaders were devastating Burgundy (888–898), Boso's brother Richard, called le Justicier, count of Autun since 880, was invested with a great command against them. Having driven them out, he then subjected the greater part of the territory to his own authority. His son Rudolph (Raoul), who succeeded him in 921, was elected king of France in 923.

First **Capetian** Dukes.—On Rudolph's death in 936 the Carolingian Louis IV d'Outremer and Hugh the Great, duke of the Franks, detached Sens, Troyes and Langres from Burgundy, and Hugh secured the succession to the duchy for his two sons. The younger of these, Henry I (Eudes-Henry), who died without children in 1002, had adopted his stepson Otto William, but the king of France, Robert II, who was Henry's nephew, refused to acknowledge Otto William as heir to Burgundy and conquered the duchy (1003–06). Robert made his son Henry duke of Burgundy, to which Dijon (separated from the duchy with Langres) was restored in 1016, though the countships of Nevers and Auxerre were detached from it. In 1032, after Henry's accession to the crown of France, his brother became duke as Robert I (d. 1075).

The duchy constituted in 1016, although smaller than its 10th-century predecessor, was stronger. It remained in the Capetian family until 1361. In their foreign policy the Capetian dukes adhered loyally to their cousins the kings of France. They took part in the crusades and in expeditions against the Muslims in Spain, and a grandson of Duke Robert I became count of Portugal and the ancestor of its first royal house. In internal affairs the dukes built up a considerable domain and enforced obedience from their vassals. They also annexed Chalon (where the counts had been making themselves independent of the duchy) and Auxois. Burgundy thus came to be recognized as the premier peerage of the French kingdom. Hugh III (d. 1192) commanded the French forces in the Holy Land after the return of King Philip II Augustus to France during the first crusade and became involved in disputes with Richard I of England. Eudes III (duke from 1192 to 1218) took part in the Albigensian wars and supported Philip Augustus against John of England. Hugh IV (duke from 1218 to 1272) was prominent in the reign of Saint Louis. Robert II (duke from 1272 to 1306) and Eudes IV (duke from 1315 to 1349) were the most powerful barons of their time in France, being allied by marriage with the royal house and often directing royal policy. (In an attempt to secure for himself his wife's inheritance, which comprised both Artois and the Franche-Comté, Eudes IV compelled Philip VI of France to break with Robert of Artois, who was thus driven to ally himself with England.) Philip of Rouvre, Eudes IV's grandson, was also heir to the Boulonnais and Auvergne through his mother, but on his death in 1361 the inheritance was divided. Charles II of Navarre claimed Burgundy, but the French king, John II, took it for himself.

Although in the last decades of the dynasty the country had been devastated by the plague of 1348 and by mercenary armies in the Hundred Years' War, Burgundy had on the whole prospered under the dukes of the first Capetian line. The nobles were subjected to the jurisdiction of grands *jours* (ducal assizes), held at Beaune. The towns grew: Dijon, around which a wall was built in 1137, became an important market; a fair was held at Chalon-sur-Saône, where merchants from the south of France met northern traders; and Italian merchants came to Burgundy to buy its wool, which rivaled that of England. Pilgrims flocked to Vézelay and Autun (where in 1146 a magnificent church was built round the tomb of St. Lazare). Finally the Burgundian monasteries were famous: Cluny (founded 910) became the centre of an order extending from England to Spain; Guillaume, abbot of Saint Bénigne de Dijon, reformed many houses in Burgundy and Normandy (c. 1000); and in 1098 the monastery of Cîteaux was founded and with it a new religious order, the Cistercian.

Valois Dukes.—A new period in Burgundian history opens under King John II, who in 1363 decided to grant the duchy to his third son, Philip (*q.v.*) the Bold. Philip had to struggle against the mercenary companies, but in 1369 Charles V of France arranged his marriage to Margaret of Flanders, who brought with her the inheritance of Nevers, Franche-Comté (the ancient count-

ship of Burgundy), Rethel, Artois and Flanders. In 1384, the duke of Burgundy inherited all these territories. Thus the duchy was reunited to Franche-Comté, and the two Burgundies formed the southern part of a state the northern possessions of which extended over the Netherlands, the valley of the Meuse and the Ardennes. In the north expansion was to continue (Hainaut, 1428; Brabant, 1430; Luxembourg, 1443), but the south, from which Nevers was again detached in 1404 (for the benefit of junior branches of the house), became less and less important. Brussels instead of Dijon was eventually made the duke's usual residence. Philip the Bold, however, who lived in Burgundy when he was not in Paris, built the Chartreuse de Champmol at Dijon to house the family vault. It was he also who bought the Charolais (*q.v.*) in 1390.

John (*q.v.*) the Fearless, who succeeded Philip in 1404, devoted all his energies to his struggle with Louis, duc d'Orléans and with the Armagnac faction which took up the policy of Louis and devastated the border territories of Burgundy to the south and west between 1412 and 1435. After John had been assassinated (1419), his son Philip (*q.v.*) the Good recognized Henry VI of England as his suzerain and continued the struggle against the Armagnacs. The treaty of Arras (1435), which established peace between Burgundy and Charles VII of France, conceded to Philip the countships of Auxerre and of Mâcon, the *châtellenie* of Bar-sur-Seine and the *élections* which reunited the enclaves of royal domain within the frontiers of the duchy. Even so, the mercenary Écorcheurs continued their depredations in Burgundy till 1445. Thereafter Burgundy enjoyed peace till Philip's death (1467).

The next duke, Charles (*q.v.*) the Bold, was constantly in conflict with Louis XI of France. His aim was to acquire those territories which divided his southern from his northern possessions, most particularly Lorraine. In this he was unsuccessful. Louis XI moreover persistently opposed him, conducting several campaigns against him and subjecting Burgundy to economic blockade.

On the death of Charles (1477), Louis XI invaded the duchy under the pretext of defending the rights of the heiress, Mary (*q.v.*), but Mary married, not the dauphin Charles, but the archduke Maximilian of Austria. Louis then attempted to annex the two Burgundies as royal domain lands granted in appanage and not able to pass to a woman. The Burgundians revolted but were defeated. By the treaty of Arras (1482) the duchy and the Franche-Comté were confirmed to the French king as the dowry of Mary's daughter, Margaret of Austria, who was to marry the dauphin Charles. When Charles instead married Anne of Brittany, the Franche-Comté and the Charolais were restored to the Habsburg heirs of the house of Burgundy. The duchy, however, was retained by France.

The Valois dukes (1363–1477) had brought new institutions to the duchy. The *chambre des comptes* of Dijon was organized in 1386, a ducal council functioned at Dijon, and the *grands jours* were transformed by Charles the Bold into a parlement which met alternately at Beaune and at Dole. Flemish artists and the Dutch sculptor Claus Sluter were brought to Dijon to decorate the Chartreuse de Champmol and to carve the tomb of the dukes. The splendours of the Burgundian court were admired throughout Europe, and in 1432 Philip the Good made the Sainte-Chapelle at Dijon the seat of the Order of the Golden Fleece. The Burgundian towns found a new prosperity, and Burgundians made brilliant careers in the service of their dukes.

Later History.—The "reunion" of 1477 brought back insecurity. While the duchy was annexed to the French crown, the Franche-Comté and the northern possessions of the former dukes were organized by the Habsburgs as the Circle of Burgundy (Kreis Burgund). Moreover the Habsburg princes maintained their pretensions to the duchy. The emperor Charles V, when Francis I of France was his prisoner, in fact compelled him to renounce Burgundy to Austria (treaty of Madrid, 1526), but Francis eluded the obligation. The hostility between France and the Habsburgs compromised the close relations that had been developed between the two Burgundies under the Valois dukes, though a treaty of neutrality signed in 1522 achieved a precarious peace along the Saône as frontier. The French wars of religion devastated the

duchy. The towns had to be fortified, and mercenaries roamed over the country. As Catholic supporters of the Holy League, the towns did not recognize Henry IV as king until 1595. Then the duchy was again ravaged in the Franco-Spanish wars from 1636 onward (and also during the Fronde, when the great Condé, as governor, drew Burgundy into his faction). Not until the French conquest of the Franche-Comté in 1678 were peace and security restored.

During the 16th, 17th and 18th centuries Burgundy constituted a military *gouvernement* (to which Bresse was attached in 1601). From 1631 to 1789 the princes de Condé were governors. The parlement, whose seat had been fixed by Louis XI at Dijon, assumed the functions of the ducal council and had jurisdiction over the duchy and over Bresse and its dependencies (Bugey, Valromey and the Pays de Gex); but Mâcon, Auxerre and Bar-sur-Seine continued to depend on the parlement of Paris. In the 17th century an intendant was appointed at Dijon, but Bresse and its dependencies were the only parts of the *généralité* of Dijon in which he had full authority. The rest of Burgundy was administered by the estates of Burgundy, whose privileges dated from the 14th century. The estates, under the presidency of the bishop of Autun, met every three years, voted taxes and decided how revenue should be employed in provincial administration. They also defended the privileges of the province, which was less heavily taxed than any other in France. The classes to benefit most from such tax reliefs were the members of the parlement, of the *chambre des comptes* and of the judiciary, who transformed the towns with new building and bought up the lands of the often bankrupt nobility. But the estates also strove to provide the province with a good communications system and began the network of canals which now links the Loire, the Seine and the Saône. These improvements encouraged the development of the wine trade (Beaune wines had been famous throughout medieval Europe, and Paris also bought much wine from Auxerre), which in the 18th century was expanded to become one of the principal assets of the province (see further WINE). In the 18th century also literature and science were pursued as well as commerce, intellectual life being particularly vigorous in Dijon.

The province of Burgundy disappeared with the Revolution, when it was divided into the *départements* of Côte-d'Or, Saône-et-Loire and Yonne.

BURGUNDY CANAL (CANAL DE BOURGOGNE), a canal in France connecting the Seine and Saône waterways across the watershed in the Langres plateau. From St. Jean-de-Losne on the Saône river it passes by Dijon along the valley of the Ouche to negotiate the crossing into the Armançon basin by a tunnel two miles long. By the Armançon it connects with the Yonne at Laroche and so with the Seine at Montereau. The canal, built in 1832, was important for a short period for supplying Paris with timber, building stone and wine from the south, but declined once railway connections were provided. It is difficult to navigate because of its numerous locks and tunnel, the frequent shortage of water at the summit and the capricious regime of the Yonne. Building materials now constitute the main traffic and the only considerable port along the canal is Dijon. (AR. E. S.)

BURHANPUR, a town in Nimar (Khandwa) district, Madhya Pradesh, India, is on the Central railway and the north bank of the Tapti river, 275 mi. N.E. of Bombay. It was founded in A.D. 1400 by a Muslim prince of the Farukhi dynasty of Khandesh. His successors held it for 200 years, until it was annexed by the Mogul emperor Akbar in 1599. It formed the chief seat of the government of the Deccan provinces of the Mogul empire till Shah Jahan moved the capital to Aurangabad in 1636. Burhanpur became for 100 years the centre of many conflicts between the Marathas and Moguls. In 1803 it was captured by Maj. Gen. Arthur Wellesley, afterward duke of Wellington, but it was restored

by treaty to the Maratha successor-state of Sindhia in 1805. It was finally ceded to the British in 1861.

In its old buildings and tombs, Burhanpur resembles the Mogul capitals of the north. The ruined citadel and palace (c. 1400), the Mosque of the Lady (c. 1585) and the Jamma Masjid or Great mosque (1588) are of the Farukhi period. Like all Mogul cities, it was famous for luxury articles; *i.e.*, brocades, flowered silks and gold and silver embroideries. It is now an ancient walled city which, after many years of decay from its old-time status and the decline almost to the vanishing point of the old industries, has shown an upward tendency under more modern conditions. There are a few families who traditionally produce gold and silver thread and brocades, and there is a large group of weavers of silk bordered cloths. The establishment of a cotton mill, ginning factories and presses has restored some of its lost prosperity. A Mogul water supply, which has been modernized, still functions.

Burhanpur's population, after many fluctuations, rose to 70,066 at the 1951 census.

BURIAL, the depositing of human remains in a grave, crypt, tomb or other similar shelter. See CEMETERY; DEATH (LEGAL ASPECTS); FUNERARY RITES AND CUSTOMS.

BURIDAN, JEAN (JOANNES BURIDANUS) (c. 1295–? after 1366), French philosopher, born probably at Béthune, was rector of the University of Paris in 1328 and in 1340. A moderate nominalist, he contributed to the condemnation of extreme Occamism in 1340; his own works were prohibited from 1474 to 1481. He opposed Nicolas of Autrecourt's atomism and defended the principle of causality.

His moral determinism—men must will what presents itself as the greater good—is qualified by the doctrine that the will is free to delay the reason's judgment by suggesting a more thorough inquiry into the value of motives. Buridan treated economic values as subjective values and allowed no place for a supreme political ruler, or *praesidens* among rulers, of mankind. He paved the way to modern cinematics by developing suggestions found in Philoponus', Olivi's and Francis of Marchia's works: Aristotle's doctrine that a thing is kept moving by the surrounding air is replaced by the theory of impetus; the mover imparts to the moved a power, proportional to the speed and mass, which keeps the thing going; resistance of the air progressively reduces the impetus; weight adds to or reduces the speed. In logic Buridan expounds and comments upon doctrines handed down in Aristotle's, Peter of Spain's and Occam's works and supplements them with the more modern chapters (*Obligaciones*, etc.).

The phrase *pons asinorum* (rules for the discovery of syllogistic middle terms) has not been found in his works. The example of a dog, not an ass, dying of hunger between two equal amounts of food occurs in his commentary on Aristotle's *De caelo*. Exploded legends made him the founder of the Vienna university and the lover of a queen of France (perhaps Joan of Navarre or Margaret of Burgundy).

Most of Buridan's commentaries on Aristotle's *Organon*, *Physics*, *De Anima*, *Metaphysics*, *Economics*, etc. are still unpublished. His published works include: *Summulae de dialectica* (1487 *et seq.*); *Consequentiae* (1493 *et seq.*); *Quaestiones* on Aristotle's *Physics* (1500 *et seq.*), *De anima* and *Parva naturalia* (1516 *et seq.*), *Metaphysics* (1480 *et seq.*), *Ethics* and *Politics* (1489 *et seq.*), and *De caelo* (1942).

(L. M.-PO.)

BURIRAM, a province of northeast Thailand, area 4,159 sq.mi., which extends from the Mun river in the north to the mountains on the Cambodian border. The population, including many of Cambodian stock, was 570,228 (1960). Natural vegetation is predominantly savanna and dry monsoon forest. Cattle

and timber are important products. Irregular rainfall causes violent fluctuation in the yield of rice, the major crop. The province has a number of rice mills and sawmills.

Major towns are Buriram (pop. [1957 est.] 11,629), the capital, and Lamplimat, a commercial centre 50 mi. E. of Khorat. Both are on the Khorat-Ubon railroad, the chief communication link with the rest of Thailand. (G. W. SK.)

BURKE, EDMUND (1729–1797), British statesman, parliamentary orator and political thinker, played a prominent part in all major political issues for about 30 years after 1765, and remains an important figure in the history of political theory.

Burke was Irish, born in Dublin probably on Jan. 12, 1729 (new style; Jan. 1, old style). His father, a solicitor, was Protestant, his mother Roman Catholic. He encountered a third religious tradition at his boarding school, run by a Yorkshire Quaker. He entered Trinity college, Dublin, in 1744, and came to London in 1750 to begin keeping terms at the Middle Temple. There follows an obscure period in which Burke lost interest in his legal studies, was alienated from his father and spent some time wandering about England and France. In 1756, however, he published anonymously and in the style of Viscount Bolingbroke *A Vindication of Natural Society . . . in a Letter to Lord * * **, by a Late Noble Writer, a satire aimed at both the destructive criticism of revealed religion and the contemporary vogue of "return to Nature." A contribution to new trends in aesthetic theory, *A Philosophical Enquiry Into the Origin of Our Ideas of the Sublime and Beautiful*, which appeared in 1757, gave him some reputation in England and was noticed abroad by Diderot, Kant and G. E. Lessing, among others. In agreement with the publisher Robert Dodsley, he initiated *The Annual Register* as a yearly survey of world affairs; the first volume appeared in 1759 under Burke's (unacknowledged) editorship, and he retained his connection with it for about 30 years.

In 1757 Burke married Jane Nugent, the daughter of an Irish Catholic doctor. From this period also date his numerous literary and artistic friendships, including those with Dr. Johnson, Oliver Goldsmith, Sir Joshua Reynolds and David Garrick.

POLITICAL CAREER

After a first unsuccessful venture into politics, Burke was appointed secretary, in 1765, to the marquess of Rockingham, leader of one of the Whig groups in parliament, and entered the house of commons. Burke remained Rockingham's secretary until the latter's death in 1782, exercising great influence on his upright and disinterested, if not very forceful, patron. He worked with some success to inspire with a sense of unity and common principle the group that cohered round Rockingham. Mostly in opposition, it was the vehicle of Burke's parliamentary career.

Attack on the Influence of The Crown.—Burke soon took an active part in the domestic constitutional controversy of George III's reign. The revolution settlement after 1688, while placing specific limitations on the royal prerogative, left many aspects of constitutional practice undefined. The main problem during the 18th century was the respective control of king and parliament over the executive. George III was seeking to reassert a more active role for the crown, which had lost some influence in the reigns of the first two Georges, without infringing the revolution settlement. Burke's chief comment on this issue is his pamphlet *Thoughts on the Cause of the Present Discontents* (1770). He argued that George's actions were against not the letter but the spirit of the constitution. Choice of ministers purely on personal grounds was favouritism; they should be chosen on a public ground—the approbation of parliament and people. The community and its accredited representatives must be presumed capable of rational choice, provided that the independence of the house of commons was maintained. But changed circumstances of government meant that a restoration of the past, such as a return to triennial parliaments, was no remedy; what was needed was a more active intervention of the electorate in defense of its powers. The pamphlet includes Burke's famous, and new, justification of party, defined as a body of men united on public principle, which could act as a constitutional link between king and parliament,

providing consistency and strength in administration, or principled criticism in opposition.

In 1774 Burke was elected a member of parliament for Bristol, then the second city of the kingdom and an open constituency. He held this seat for six years but failed to retain the confidence of his constituents. For the rest of his parliamentary career he was member for Malton, a pocket borough of Lord Rockingham's. It was at Bristol that he made the well-known statement on the role of the member of parliament. He should be representative, not delegate. The electors are capable of judging his integrity, and he should attend to their interest; but he must address himself to the general good of the whole community, acting according to his own judgment and conscience, unfettered by mandates or prior instructions from those he represents. Burke had only qualified support for the movements for parliamentary reform, his main concern was curtailment of the crown's powers. However, he accepted the possibility of widening political participation, provided that there was evidence of rationality, restraint of aggressive partiality and dedication to the common good; he rejected any doctrine of mere rule of numbers. Apart from general principles, Burke made a practical attempt to reduce the influence of the crown as one of the leaders of the movement for economical reform, which pressed for parliamentary control of royal patronage and expenditure. When the Rockinghams took office in 1782 bills were passed reducing pensions and emoluments of offices, including his own. Burke was specifically connected with an act regulating the civil list.

Colonial Policy.—America.—A second great issue which confronted Burke in 1765 was the quarrel with the American colonies. Their prodigious development in the 18th century had produced strains in the system of imperial political and economic regulation which came to a head after the Seven Years' War. The imposition of a stamp duty by George Grenville in 1765, and other measures, provoked unrest and opposition, which soon swelled into disobedience, conflict and secession. English policy was vacillating; determination to maintain imperial control ended in coercion, repression and unsuccessful war. The Rockingham group opposed coercion, basing their American policy on their actions in their short administration of 1765 when they repealed the Stamp act, while asserting the imperial right to impose taxation by the Declaratory act.

Burke's best-known statements on this issue are the two parliamentary speeches, *On American Taxation* (1774) and *On Moving His Resolutions for Conciliation With America* (1775), and *A Letter . . . to the Sheriffs of Bristol* (1777). British policy, he argued, had been both imprudent and inconsistent, but above all legalist and intransigent in the assertion of imperial rights. Authority must be exercised with respect for the temper of those subject to it, if there was not to be a collision of power and opinion. This truth was being ignored in the imperial quarrel; it was absurd to treat universal disobedience as criminal: the revolt of a whole people argued serious misgovernment. Burke made a wide historical survey of the growth of the colonies, the special traditions and circumstances which had formed their character, the revolutionary changes in the recent past, their economic problems. In place of narrow legalism he called for "legislative reason," an imaginative reinterpretation of the values enshrined in the imperial relation in the light of these new factors. The claims of circumstance, utility and moral principle should be considered, as well as precedent. And as a prerequisite of reconciliation, a conciliatory temper must be shown by the imperial parliament with readiness to meet American complaints and measures to restore colonial confidence. His proposal was an extension of the forms of the British constitution to the imperial relation, so far as circumstances allowed it.

In view of the magnitude of the problem the adequacy of Burke's specific remedies is questionable, but the principles on which he was basing his argument were the same as those underlying the Present Discontents: government should ideally be a co-operative, mutually restraining relation of rulers and subjects; there must be attachment to tradition and the ways of the past, wherever possible, as familiar and tested, but equally, recognition of the fact

of change and the need for a comprehensive and discriminating response to it, reaffirming the values embodied in tradition in new circumstances.

Ireland.—Ireland was a special problem in imperial relations. It was in strict political dependency on England and internally subject to the ascendancy of an Anglo-Irish Protestant minority, owning the bulk of the land. Roman Catholics were excluded by a penal code from political participation and public office. To these oppressions were added widespread rural poverty and a backward economic life aggravated by commercial restrictions resulting from English commercial jealousy. Burke was always concerned to ease the burdens of his native country. He consistently advocated relaxation of the economic and penal regulations, and steps toward legislative independence, at the cost of alienating his Bristol constituents. and of incurring suspicions of Catholicism and charges of partiality.

India.—The remaining imperial issue, to which he devoted many years, and which he ranked as the most worthy of his labours, was that of India. The commercial activities of a chartered trading concern, the British East India company, had created an extensive empire. Burke in the 1760s and 1770s opposed interference by the English government in the company's affairs as a violation of chartered rights. However, he learned a great deal about the state of the company's government as the most active member of the select committee which was appointed in 1781 to investigate the administration of justice in India, but which soon widened its field to that of a general inquiry. Burke concluded that the corrupt state of Indian government could be remedied only if the vast patronage it was bound to dispose of was in the hands neither of a company nor of the crown. He was the author of Fox's East India bill (1783) which proposed that India should be governed by a board of independent commissioners in London. Two of Burke's best-known speeches were on Indian affairs, *On Mr. Fox's East India Bill* (1783) and *On the Nabob of Arcot's Debts* (1785). After the defeat of the bill, Burke's indignation came to centre on Warren Hastings, governor general of India (1773-85). It was at Burke's instigation that Hastings was impeached in 1787 and he challenged Hastings' claim that it was impossible to apply western standards of authority and legality to government in the east. He appealed to the concept of the Law of Nature, the moral principles rooted in the universal order of things, to which all conditions and races of men were subject. The impeachment dragged on for eight years and ended with Hastings' acquittal on all charges. It resulted in an authoritative statement of the principle of responsible rule in imperial affairs; but it is generally regarded as an act of injustice to Hastings, who had been, despite questionable methods, a disinterested servant of the company and the British name in India.

Burke's Character.—The impeachment is the most conspicuous illustration of the failings to which Burke was liable throughout his public life, including his brief periods in office as paymaster general of the forces in 1782 and 1783. His political positions were sometimes marred by gross distortions and errors of judgment. His Indian speeches fall at times into a violence of emotion and abuse, lacking restraint and proportion. His reliance on the opinions of Philip Francis, an enemy of Hastings, illustrates his liability to form false judgments of personality, both favourable and unfavourable. His parliamentary activities were at times irresponsible or factious. Nor did he escape the charge, in Indian affairs, of personal interest. Throughout his career he was associated financially and politically with his brother Richard and a putative kinsman William Burke, both doubtful characters known to be unsuccessfully speculating in East India stock. The Burkes's joint finances were indeed always in a precarious state and as Edmund was ever eager to forward his kinsmen's political fortunes it is understandable that he appeared in some hostile eyes as hardly more than one of a clan of Irish adventurers.

Of these failings it can plausibly be argued that they were the defects of Burke's virtues rather than an impurity in those virtues themselves. It has not been shown that Edmund himself was a speculator in company stock; it seems rather that he was rendered blind or oblivious to the nature of his kinsmen's proceedings

by family partiality. Nor do his political lapses, even at their worst, appear to spring from self-interest or unworthy motives, but from his failure to control and balance his unusually sensitive and powerful emotional nature. Burke's weaknesses therefore lie close to what is best in his character and career: his capacity to illuminate practical politics by general principles, in a synthesis at once intellectual and emotive, the intensity of his dedication and industry in public affairs, the constancy of his humanitarian struggle against injustice and suffering, the readiness and generosity of his help in need (of which the poet George Crabbe and painter James Barry are the best known recipients), the distinction of his numerous literary and political friendships, and the happiness of his family life and kinship ties.

Attitude Toward the French Revolution — The outbreak of the French Revolution in 1789 was initially greeted in England with much enthusiasm. Burke, after a brief suspension of judgment, was both hostile to and alarmed by this favourable English reaction. He was provoked into writing his *Reflections on the Revolution in France* (1790) by a sermon of the Protestant dissenter Richard Price welcoming the Revolution. Burke's deeply felt antagonism to the new movement propelled him to the plane of general political thought; it provoked a host of English replies, of which the best known is Thomas Paine's *Rights of Man* (1791–92).

In the first instance Burke discussed the actual course of the Revolution, examining the personalities, motives and policies of its leaders. More profoundly, he attempted to analyze the fundamental ideas animating the movement and, fastening on the Revolutionary concepts of "the rights of man" and popular sovereignty, emphasized the dangers of democracy in the abstract and the mere rule of numbers when unrestrained and unguided by the responsible leadership of an hereditary aristocracy. And, further, he challenged the whole rationalist and idealist temper of the movement. It was not merely that the old social order was being thrown down. He argued that the moral fervour of the Revolution, and its vast speculative schemes of political reconstruction, were causing a devaluation of tradition and inherited values, and a thoughtless destruction of the painfully acquired material and spiritual resources of society. Against all this, he appealed to the example and the virtues of the English constitution: its concern for continuity and unorganized growth, its respect for traditional wisdom and usage rather than speculative innovation, for prescriptive, rather than abstract, rights, its acceptance of a hierarchy of rank and property, its religious consecration of secular authority and recognition of the radical imperfection of all human contrivances.

As an analysis and prediction of the course of the movement, Burke's French writings, though frequently intemperate and uncontrolled, were in some ways strikingly acute; but his lack of sympathy with its positive ideals concealed from him its more fruitful and permanent potentialities. It is for the criticism and affirmation of fundamental political attitudes that the *Reflections* and the *Appeal from the New to the Old Whigs* (1791) retain their freshness, relevance and force.

Burke opposed the French Revolution to the end of his life, demanding war against the new state, and gaining a European reputation and influence. But his hostility to the Revolution went beyond that of most of his party, and in particular was challenged by Charles James Fox. Burke's long friendship with Fox came to a dramatic end in a parliamentary debate (May 1791). Ultimately the majority of the party passed with Burke into support of William Pitt's government. In 1794, at the conclusion of Hastings' impeachment, Burke retired from parliament. His last years were clouded by the death of his only son, on whom his political ambitions had come to centre. He continued to write, defending himself from his critics, deploring the condition of Ireland and opposing any recognition of the French government (notably in *Letters on a Regicide Peace* [1796–97]). Burke died at Beaconsfield, Buckinghamshire, on July 9, 1797.

POLITICAL THEORY

Burke's writings on France, though the most profound of his works, cannot be read as a complete statement of his views on

politics. Burke never gave a systematic exposition of his fundamental beliefs but appealed to them always in relation to specific issues. His consistency during his political career has therefore been debated, both in his lifetime and since. He himself repudiated charges of inconsistency, and it is possible to regard his writings as an integrated whole, in terms of constant principles underlying his practical positions.

Those principles are, in essence, an exploration of the concept of "Nature." Burke conceives the life of feeling and the spiritual life of man as a harmony within the larger order of the universe. Natural impulse, that is, contains within itself self-restraint and self-criticism; the moral and spiritual life is continuous with it, generated from it and essentially sympathetic to it. Instinct is ideally rational in the sense of objective and impartial, sustaining self-interest but recognizing its finite place in larger wholes. It follows that society and state make possible the full realization of human potentiality, embody a common good and represent a tacit or explicit agreement on norms and ends. The political community acts ideally as a unity. Its constitutional organization and activities should be designed to elicit, maintain and expand the inherent rationality of its parts and members. Political participation will naturally differ from one part of society to another, and from period to period, but the constant principle is that it should be arranged to exclude aggressive self-interest and to allow expression of rational conciliatory self-interest compatible with the good of the whole. Burke therefore does not reject the concept of natural right, but he does not give it any simple or direct political implication. It refers to the whole potentiality of human nature and comprises an acceptance of both the rightness and wisdom of the life of feeling, the reality of moral obligation and the need for inner or outer restraint on mere appetite.

This interpretation of nature and the natural order implies deep respect for the historical process, and the usages and social achievement built up in time. Negatively, this is an insistence on the safety of the tried and enduring; positively, it is a sense of the principle of growth and perfection immanent in a tradition and stable complex of feeling. Therefore it does not entail an inflexible or uncritical adherence to the inherited order. Social change is not merely possible but inevitable and desirable. But the scope and the role of thought operating as a reforming instrument on society as a whole is limited. It should act under the promptings of specific tensions or specific possibilities, in close union with the detailed process of change, rather than in large speculative schemes involving extensive interference with the stable, habitual life of society. Also, it ought not to place excessive emphasis on some ends at the expense of others; in particular, it should not give rein to a moral idealism which sets itself in radical opposition to the existing order. Such attempts cut across the natural processes of social development, initiating uncontrollable forces or provoking a dialectical reaction of excluded factors. The natural development is a unitary evolution of social potentialities, a progressive embodiment of its immanent values: individual diversity and common rationality, widening political participation, extension and refinement of the spiritual and cultural life. This evolution will be conditioned and particularized within different communities by a multitude of special factors, which must be respected. The hope is not a realization of particular ends, such as the "liberty" and "equality" of the French Revolution, but an intensification and reconciliation of the multifarious elements of the good life which community exists to forward. At each level and stage of the human order, the natural harmony is frangible. Its violation creates a disorder; but such disorder is not the primordial or essential relation of the elements of human experience; it is the disharmony of the parts of an integrated whole.

This system is a theodicy. Burke is not a Christian political thinker in the sense that the tenets of Christian faith, or unity of Christian worship, are integral elements in his political thought, as is the case with Richard Hooker. But of all earlier English political thinkers, his closest affiliations, in historical situation, in tone, and in many details of thought, are with Hooker; and both consciously belong to the tradition of political thought whose greatest figures are St. Thomas Aquinas and Aristotle.

In his own day, Burke's writings on France were an important inspiration to German and French counterrevolutionary thought. His influence in England has been more diffuse, more balanced and more durable. He stands as the original exponent of long-lived constitutional conventions, the idea of party and the role of the member of parliament as free representative, not delegate. More generally, his remains the most persuasive statement of certain inarticulate political and social principles long and widely held in England: the validity of status and hierarchy, the limited role and scope of politics in the life of society, the confinement of political principle within the sanctions of custom, natural feeling and morality. As for the contemporary relevance and ultimate validity of his thought, this would seem to reduce to the question how far his particular conception of "nature" can still be found consonant with subsequent social experience and self-analysis.

BURKE, SIR JOHN BERNARD (1814–1892), British genealogist, the second editor of Burke's *Peerage*, who in 1847 introduced the annual revised editions, was born in London on Jan. 5, 1814, and was educated in London and France and called to the bar at the Middle Temple in 1839. He was the most voluminous genealogical and heraldic writer of the 19th century, and the most celebrated member of a family of genealogists. His father, John Burke (1787–1848), began Burke's *Peerage* (1826), *Landed Gentry* (1836), *Extinct Peerage* (1831) and *Extinct Baronetcies* (1838). Sir Bernard, early associated with his father's works, greatly increased their range, and also wrote many other books, among them the *General Armory* (1842); *The Roll of Battle Abbey* (1848); and *The Romance of the Aristocracy* (1855); *Vicissitudes of Families* (3 ser., 1859–63); and *The Genealogical and Heraldic History of the Colonial Gentry* (1891).

Sir Bernard combined this work with a busy professional career. He was Ulster king-of-arms from 1853 until his death; registrar and knight-attendant on the Order of St. Patrick; keeper of the state papers of Ireland; and a governor and trustee of the National Gallery of Ireland. He was knighted in 1854 and made commander of the Bath in 1868. Of his seven sons four were notable as heralds or genealogists. Burke died in Dublin on Dec. 12, 1892. His work can easily be criticized, but it may fairly be claimed that there is no aspect of heraldry, genealogy or peerage law in which the inquirer cannot learn from him. (L. G. PE.)

BURKE, ROBERT O'HARA (1820–1861), Irish-Australian explorer, was the leader of the first expedition to cross Australia from south to north. This expedition, known as the "Great Northern exploration" or "Burke and Wills" expedition, was promoted by the Royal Society of Victoria. Burke was born at St. Cleram, County Galway, Ire., in 1820. He served in the Austrian army and, later, in the Irish constabulary. In 1853 he emigrated to Australia where he became an inspector of police in Victoria.

He was a brave impetuous man, but no bushman; although the expedition reached its objective, it ended in disaster. Expensively equipped and enthusiastically sponsored, it left Melbourne in Aug. 1860 with 18 men and ample transport, including camels from India. Burke, his second in command W. J. Wills, C. Gray and John King reached the Gulf of Carpentaria in Feb. 1861, having left a rear guard at Cooper's Creek in Queensland. The depot was not properly maintained nor was any reliable system of communication agreed on; only King survived the return journey

and was rescued by A. B. Howitt's search party in Sept. 1861. Burke died of starvation on June 28, 1861. A statue to Burke and Wills was erected in Melbourne.

The only first-hand account of the venture is in Wills's journal, found with his body. (D. MN.)

BURKE, WILLIAM (1792–1829), a criminal notorious for a series of murders committed in Scotland in association with William Hare, was born in County Tyrone, Ire., in 1792 and went to Scotland about 1818. In 1827 he was living in a lodging-house in Edinburgh kept by another Irishman, William Hare. At that time in Scotland the growing need of doctors and students for corpses for dissection could not legally be filled, and body snatching and resurrectionism were rife. So when one of Hare's lodgers died, he and Burke sold the body to Robert Knox, a leading anatomist, for £7 10s. It was fatally simple. Helped by Mrs. Hare and Helen McDougal, the two men lured travelers into one of their houses, made them drunk and suffocated them. In nine months they disposed of the bodies of 15 victims at prices ranging from £8 to £14, but the disappearance of the 16th victim was noticed, the police traced the body to Knox's cellar and the four were arrested. Hare turned king's evidence, making Burke's conviction possible. He was hanged in Edinburgh on Jan. 28, 1829. Hare was safe from prosecution, but public hatred drove him from Scotland.

The verb "to burke," meaning to suffocate or kill in order to sell the body, or, figuratively, to suppress or hush up, came from Burke's career.

See William Routhead (ed.), *Burke and Hare*, with complete trial of Burke and McDougal, 3rd ed. (1948).

BURLAMAQUI, JEAN JACQUES (1694–1748), Swiss publicist, was born at Geneva on June 24, 1694, where he was honorary professor of ethics and the law of nature for 15 years. As a member of the council of state, he gained a high reputation for his practical sagacity. His *Principes du droit naturel* (1747) and *Principes du droit politique* (1751) passed through many editions and were extensively used as textbooks. His fundamental principle may be described as rational utilitarianism, and in many ways it resembled that of the English philosopher Richard Cumberland (*q.v.*; 1631–1718). Burlamaqui died at Geneva on April 3, 1748.

BURLAP, a plain woven jute fabric also sometimes called hesian. The name burlap is a contraction of the Anglo-Saxon *bur-rel*, meaning "coarse cloth," and *lappen*, "to lap" or "wrap."

Burlap weights generally range from 5 oz. to 14 oz. a yard; fabric widths usually range from 36 to 100 in. Burlap is the standard jute fabric construction; other constructions are jute canvas, a very fine weave of highest quality "white" fibre, and sacking, a heavier and more coarsely woven fabric. The major use for burlap is as bags for packaging, but it is also widely used as carpet backing, cement curing covers during construction, lining for clothing, upholstery interiors, backing for plastic upholstery fabrics and decorative wall coverings.

Centre of the world jute manufacturing industry is Calcutta, India. Burlap is exported in bales of 2,000 yd.; the fabric is converted to end uses by domestic manufacturers.

See **JUTE**.

(Q. L. H.)

BURLEIGH, HARRY THACKER (1866–1949), U.S. Negro baritone and composer known for his transcriptions of Negro spirituals, was born at Erie, Pa., Dec. 2, 1866. He studied from 1892 to 1896 at the National Conservatory of Music, New York city, where he was encouraged by the mother of composer Edward MacDowell and also by Dvořák. He was a soloist in New York city, at St. George's church (1894–1946) and at the synagogue Temple Emanuel (1900–25). He composed more than 200 songs and became widely known for his arrangements of Negro spirituals, notably "Deep River." In 1917 he won the Spingarn medal for the highest achievement by an American Negro. He died at Stamford, Conn., Sept. 12, 1949.

BURLESQUE, a comic imitation of a serious literary work, in which heroes behave like clowns and gods like the lowest of men. It is closely related to parody (*q.v.*), in which the language and style of an author, poem or other work is mimicked; burlesque

relies more on an extravagant incongruity between a subject and its treatment, and its effects are in general broader and coarser. Homer was burlesqued in *Batrachomyomachia* (The Battle of the Frogs and Mice) and the long-winded medieval romance in Chaucer's Tale of Sir *Thopas*. The mock-epic *Morgante* by Luigi Pulci (*q.v.*) ridicules the Charlemagne story and the whole theme of chivalry in high-sounding ottava *rima*. In 15th-century Italy burlesque expressed a commonsensical middle-class attack on a dying aristocratic culture and in that form also it proved the initial inspiration of Cervantes' *Don Quixote*. In the France of Louis XIV it was used by the "Moderns" in the "Battle of the Books," the *Virgile Travesti* of Paul Scarron (*q.v.*) being the best known of many burlesque or antiheroic epics on classical or even sacred themes. These were somewhat influenced by the Spanish drama of Lope de Vega, in which the clown or gracioso parodies the actions and sentiments of the heroic lover. English burlesque is chiefly dramatic (a notable exception being the burlesque poem *Hudibras* by Samuel Butler; *q.v.*). George Villiers' (2nd duke of Buckingham) *The Rehearsal* (1671), which mocks the Restoration drama of Dryden and Thomas Otway. Fielding's *Tom Thumb* (1730), Sheridan's *The Critic* (1779), which takes a side glance at the amateur actor and Henry Carey's "most tragical tragedy" *Chrononhotonthologos* (1734) are the outstanding survivals from an age when burlesque was cruelly satirical and often defamatory. The heroic Bombardinion's lines in Carey's fragment provide a bridge-passage to the more kindly, punning Victorian burlesque:

Go call a coach, and let a coach be called;
And let the man who calls it be the caller;
And in his calling, let him nothing call,
But coach! coach! coach! Oh! for a coach, ye gods!

Authors of Victorian burlesque—light entertainment with music, the plots of which were frivolously modeled on those of history, literature or classical mythology—included H. J. Byron, J. R. Planché and W. S. Gilbert (*q.v.*), before his partnership with Sullivan. Before the end of the 19th century burlesque yielded in popular favour to musical comedy, leaving some traces on the pantomime (*q.v.*). (Jo. M. C.)

Burlesque in the U.S. Theatre.—A very different kind of entertainment, also known as burlesque, was brought to the United States in 1868 by Lydia Thompson's troupe of "British Blondes," which included a chorus line of girls in tights. In the U.S., it evolved into a type of show designed for male patronage, compounded of slapstick sketches, earthy jokes, chorus numbers and solo dances usually billed as "daring" or "sensational." In the early 20th century, two national circuits of burlesque shows, as well as resident companies in New York, were thriving. W. C. Fields, Al Jolson, Leon Errol and Fannie Brice were among the comedians who served their apprenticeship in this rugged school.

The addition of "strip tease" dancing to the burlesque repertoire in the early 1920s brought censorship that closed many burlesque theatres. By the early 1960s few burlesque houses remained and these usually provided no more than strip-tease performers, a motion picture and a comic who told his jokes with an air of defeatism to an audience waiting for the next display of feminine anatomy.

BURLEY (BURLEIGH), **WALTER** (c. 1275–c. 1345), English scholastic philosopher, honorifically designated as doctor *plenus et perspicuus* ("the plain, clear-sighted teacher"), is known to have taught at Oxford, at Paris (c. 1324) and also at Toulouse. A voluminous writer, he produced many treatises on Aristotle, but his chief work was *Liber de vita et moribus philosophorum et poetarum* (modern ed. by H. Knust, 1886), a kind of history of philosophy. A realist on the question of universals, Burley held a theory of knowledge resembling that of St. Thomas Aquinas. In his commentary on Aristotle's *Physics*, he asserted that he did not agree with the argument for an unmoved first mover.

See C. Michalski, "Les Courants philosophiques à Oxford et à Paris pendant le XIV^e siècle," *Bulletin de l'Académie Polonaise des Sciences et des Lettres* (1920); M. de Wulf, *Histoire de la philosophie médiévale* (1947). (S. J. C.)

BURLINGAME, ANSON (1820–1870), U.S. congressman and diplomat, was born in New Berlin, N.Y., on Nov. 14, 1820. In 1823 his parents moved to Ohio and in 1833 to Michigan. In 1841

he was graduated from the Detroit branch of the University of Michigan and in 1846 from the Harvard law school. He soon entered Massachusetts politics and in 1853–54 served in the state senate. From 1855 to 1861 he was a member of the national house of representatives, being elected for his first term on the Know-Nothing ticket and thereafter for the Republican party, of which he was one of the founders in Massachusetts. Burlingame's speech (June 21, 1856) of sharp reproof to Preston S. Brooks for attacking Sen. Charles Sumner (*q.v.*) led Brooks to challenge Burlingame to a duel, but the duel never took place. In 1860 Burlingame was defeated for re-election and in 1861 Pres. Abraham Lincoln named him minister to Vienna. The Austrian government found him unacceptable because of his pro-Kossuth speeches and he was then appointed minister to China. Burlingame found China in a critical situation. The T'ai P'ing rebellion had not yet been suppressed; the "unequal treaties" had infringed China's sovereignty; the central government was weak; antiforeign feeling was strong; and the foreign mercantile community desired vigorous treaty enforcement and more treaty rights. Burlingame quickly became the leader of the diplomatic corps in a policy of co-operation among the western powers and China to secure settlement of disputes by diplomacy rather than force and to further the modernization of China. Burlingame's charm, good counsel and sympathy for China so impressed the Chinese government that in Nov. 1867, upon his resignation as U.S. minister to China, he was named imperial envoy charged with the conduct of China's international relations. In Feb. 1868, with two Chinese colleagues and a suite of 30, Burlingame began a tour of western capitals. The mission made a triumphal progress across the United States, in the course of which Burlingame, a brilliant orator, conveyed an optimistic idea of China's receptivity to western influence. In Washington, Burlingame negotiated with Secretary of State William Seward the so-called "Burlingame treaty," consisting of eight articles supplementary to the Reed treaty of 1858. While several of the articles were simply amplifications of rights secured in 1858, the first two put on record the traditional American policy of respect for China's territorial integrity and the fifth provided for reciprocal immigration. In London, Burlingame secured a declaration that China was entitled to the forbearance of foreign nations. On the European continent the mission was less successful. Burlingame died of pneumonia in St. Petersburg, Russia, on Feb. 23, 1870. (M. E. C.)

BURLINGAME, a city of San Mateo county, Calif., U.S., 19 mi. S. of San Francisco on the west side of San Francisco bay and a part of the San Francisco-Oakland standard metropolitan statistical area (see SAN FRANCISCO). Its name honours Anson Burlingame (*q.v.*), who visited and bought land in the area in 1866. Refugees from the San Francisco earthquake of 1906 incorporated the city in 1908. Between 1920 and 1930 it grew rapidly into an upper-class residential community, and after 1945 its population spurted again (for comparative population figures see table in CALIFORNIA: *Population*). Ready access to San Francisco, a mild climate and wooded homesites attracted residents. By its 50th anniversary it had high-ranking public schools, a general hospital, libraries, theatre and musical groups, parks and a bi-weekly newspaper. A new program of commercial and industrial development involved over 50 firms in the manufacture of electrical and pharmaceutical products, and in administrative and distributive enterprises. (J. H. Sr.)

BURLINGTON, a city on the Mississippi river bluffs in southeastern Iowa, U.S., is the seat of Des Moines county. After 1808 traders used this point intermittently until the Sauk and Fox Indians relinquished title to the region in 1832. Settlers arrived in 1833. The town, originally called Flint Hills, a translation of the Indian name for the place, was named after Burlington, Vt. It was incorporated and surveyed in 1836, adjacent to the only adequate steamboat landing on the western river shore for about 80 mi. Burlington served as a land office and port of entry for Iowa settlers and for a brief period it was also the territorial capital. It prospered from the river trade and also as an early railroad centre. Between 1860 and 1880 the population rose from 6,706 to 19,450. Growth was slow thereafter until World War II.

Ohio and the middle Atlantic and southern states provided many early settlers. German, Swedish and Irish immigrants increased after 1850 and by 1900, 55% of the county population was foreign born or of foreign parentage. During the 20th century there was a steady growth in population. (For comparative population figures see table in IOWA: *Population*.)

Major industries produce explosives, radio and electrical equipment, crawler tractors, turbines, boilers, biscuits and desks; local agriculture emphasizes corn production and the feeding of livestock. Burlington college was established in 1920. Geode State park lies in western Des Moines county. (A. G. Bo.)

BURLINGTON, a city of New Jersey, U.S., is situated on the Delaware river 18 mi. N.E. of Philadelphia. It was settled by Quakers in 1677, four years before the founding of Philadelphia. It was first called New Beverly, then Bridlington (for a village in Yorkshire) and later Burlington. In 1681 the town became the capital of the province of West Jersey, alternating in 1702 with Perth Amboy as the capital of West and East Jersey. This continued until 1790 when Trenton became the state capital.

Burlington was given temporary steamboat service as early as 1788 when John Fitch's 60-ft. boat sailed upstream from Philadelphia, nearly 20 years before Fulton's boat moved up the Hudson. The railroad brought the town a new outlet for trade in 1831. In fact, the new facility was so welcome that the company was allowed to construct its tracks down Broad street and build its station at the main intersection in town. This remained a problem until the latter 1950s when the station was removed.

Factories were established in the latter 19th century. By the second half of the 20th century production included cast-iron pipe, plastics, gypsum, dresses, machines and carbon paper. Among the points of interest are St. Mary's church, endowed by Queen Anne; the house of James Lawrence (*q.v.*), who said, "Don't give up the ship"; and the house where James Fenimore Cooper was born, which later became the library and museum of the Burlington County Historical society. For comparative population figures see table in NEW JERSEY: *Population*. (H. F. Wt.)

BURLINGTON, an industrial city of Alamance county in central North Carolina, U.S., is a centre for the manufacture of textiles, hosiery, electronic equipment, metal goods, furniture, dairy products and chemicals and drugs. A coffin factory established in 1884, one of the first in the south, is the oldest industry. A large producer of man-made fibres originated in Burlington in 1923. Shops of the North Carolina railroad were erected on the site of the city in 1855 and the town of Company Shops was incorporated in 1866; a new charter was issued in 1887 when the name was changed to Burlington. The nearby site of the battle of Alamance (1771), a pre-Revolutionary War encounter between colonists and the royal governor (see NORTH CAROLINA: *History*) is now a state park. Elon college, a coeducational institution of the Congregational Christian Church chartered in 1889, is near Burlington. For comparative population figures see table in NORTH CAROLINA: *Population*. (W. S. P.)

BURLINGTON, largest city of Vermont, U.S., the seat of Chittenden county; is on Lake Champlain, 100 mi. S.E. of Montreal, Que.; it is a port of entry and site of the northeastern regional office of the U.S. immigration and naturalization service. Much of the city is built on a hillside overlooking 12 mi. of lake to the Adirondacks in the west, with the Green mountains 20 mi. to the east. Lumber previously was imported from Canada but the commerce of the harbour in modern times is devoted largely to oil and gasoline; large oil terminals line the harbour along with launching and docking facilities for small craft. The lake ferry company (1816) operating the ferry between Burlington and New York state is the oldest steamship company in the U.S. Battery park, famous for sunset views, was fortified in 1812. Nearby is the Unitarian church (1816) standing at the head of the main business street. Industries include manufacture of defense and electronic materials, structural steel, can openers, ovens, sirup, cereal, furniture, ceramics and woodenware. The city is a wholesale centre. The Free Press is Vermont's oldest daily newspaper.

The University of Vermont occupies the hilltop. The original constitution of the republic of Vermont (1777) provided for a

university, which was chartered in 1791 by the first general assembly held after the state joined the union. The state agricultural college was incorporated with it in 1865. Kotable buildings include the Ira Allen chapel (named for the founder) Billings library, the Old Mill (cornerstone laid by the marquis de la Fayette in 1825) and Grassmount (1804). Its college of medicine, one of the nation's oldest, serves with the Mary Fletcher and De Goesbriand Memorial hospitals and the state health department as a state and regional medical centre. Trinity college (1925), for women, is also in the city and St. Michael's college (1904), for men, is 4 mi. E.; both are Roman Catholic. Seven miles south is the Shelburne museum of restored early New England buildings and the lake steamer "Ticonderoga" brought overland from Lake Champlain and set up on dry land.

Burlington was chartered by Gov. Benning Wentworth of New Hampshire in 1763 and named for the Burling family, pioneer landowners. Settlement began in 1773 and the city was incorporated in 1865 with a population of 8,000. It was the home of Ethan Allen from 1787 until his death in 1789 and is the site of his grave. For comparative population figures see table in VERMONT: *Population*. (R. N. B. H.)

BURMA (UNION OF BURMA; MYANMA), an independent republic of southeast Asia, formerly a kingdom and then territory of the British empire. Reference is often made to two broad divisions: Lower Burma, corresponding to the areas acquired by the British Indian government in 1826 and 1852; and Upper Burma, acquired in 1886. This is Burma proper; the union includes also large peripheral mountain and plateau areas inhabited mainly by non-Burmans and now forming autonomous states. The whole territory stretches from latitude 10° N. to about latitude 28° 30' N.; but of the total length of about 1300 mi., nearly 500 mi. are comprised in the long projection of Tenasserim, which extends to within 250 mi. of Malaya. The broadest part of the country, in about latitude 21° N., is 575 mi. from east to west. The total area is 261,757 sq.mi.

Roughly half of Burma lies outside the tropics, but the configuration of the country is such that the whole may be regarded as tropical. In the north the disputed boundary between Burma and China was not precisely determined until the implementation of the border treaty, signed by U Nu and Chou En-lai Oct. 1, 1960, and ratified Jan. 9, 1961. The northwestern frontier touches India (Assam, Manipur and the Lushai hills) and there is a short section of frontier with Pakistan (Chittagong). On the west the boundary is formed by the Bay of Bengal, in the southwest by the Gulf of Martaban and Andaman sea. On the east the frontier touches the Chinese province of Tunnan, Laos and for a long distance runs southward with Thailand.

I. PHYSICAL GEOGRAPHY

1. Geology and Structure. — Burma falls naturally into three great geomorphological units: (1) The Arakan Yoma, a great series of fold ranges of Alpine age, forms the barrier between Burma and India. The foothills of the Arakan Yoma stretch as far as the shores of the Bay of Bengal. (2) The Shan plateau massif, occupying the whole of the east of the country and extending southward into Tenasserim, forms part of what has been called the Indo-Malayan mountain system and has existed as a geomorphological unit since the close of the Mesozoic. (3) The central basin lies between the Arakan Yoma and the Shan plateau. Formerly a gulf of the early Tertiary sea, open to the south, it is now occupied by a great spread of Tertiary rocks.

The mountain range of the Arakan Yoma and its continuation northward has a core of old crystalline rocks. On either side are hard, tightly folded sedimentary rocks, mainly Tertiary in age. Rocks of Jurassic and Cretaceous age are also known to occur, but the geology of the ranges is still very imperfectly known. Extensive strike faulting occurs along the eastern flanks of the Arakan Yoma and large serpentine intrusions, probably of Cretaceous age, are associated with the faults. Chromite and other useful minerals are known to occur, especially in association with the serpentine, but are not at present exploited. The western edge of the Shan plateau massif is well marked both physically and geologically. It rises abruptly from the valley and for 400 or 500 mi. the edge is formed by a long strip of granitic or gneissic rocks. The predominant rocks in the Shan plateau are gneisses, which yield the rubies and other gems for which Burma has long been famous, and a massive limestone of Devonian-Carboniferous Age. Rocks of all ages from Pre-Cambrian to Jurassic occur in the massif, while deposits of Late Tertiary and Pleistocene Age occupy old lake basins. In Pre-Cambrian rocks at Mogok occur the principal ruby mines, but the industry is now of minor importance. At Bawdwin, associated with a group of ancient volcanic rocks, are very extensive deposits of silver-lead ore, mainly argentiferous galena, which are worked and smelted at the nearby works of Namtu. The refined silver and lead are sent by rail to Rangoon for export. Other silver-lead deposits are known in other parts of the Shan state and have been worked in the past by the Chinese. Tenasserim forms a continuation of the tin-bearing belt of Malaya, and large quantities of tin and tungsten are obtained. Geologically this portion of the Indo-Malayan mountains consists of large granitic intrusions, elongated in the north-south direction and intruded into a series of ancient rocks of unknown age. The basin of the Irrawaddy (*q.v.*) between the Arakan Yoma and the Shan plateau consists almost entirely of Tertiary rocks. The beds are remarkable for their enormous thickness: the Eocene beds are more than 15,000 ft. thick, the Oligo-Miocene (Peguan) more than 16,000 ft. and the Mio-Pliocene (Irrawaddian) more than 5,000 ft. This Tertiary basin has been separated into a broader western basin and a narrower eastern one by the complex fold range forming the Pegu Yoma. Forming a line down the centre of the western basin are the oil fields of Burma. The oil occurs mainly in rocks of Peguan age. From north to south are the fields of Indaw, Yenangyat-Lanywa, Singu-Chauk, 1⁷enangpaung, Minbu and several minor fields. The most important fields are Yenangyaung and Singu. The oil fields are each anticlinal upfolds. Brown coal also occurs in considerable quantities in the valley of the Chindwin and elsewhere in the Tertiary rocks, but as yet has been little used. Along a line running roughly along the centre of the ancient Tertiary trough are numerous extinct volcanoes; some form small tuff cones with small crater lakes; others are plugs of rhyolitic matter, but the largest is the complex cone of Mount Popa.

2. Physiography. — The three physical units into which Burma

is naturally divided have been mentioned as geomorphological units. Burma is separated from India and East Pakistan by a long fold range, uplifted at the same time as the Himalaya in India. In the north the range is narrow and known as the Patkai range. Farther south the direction changes from southwest to south and the ranges broaden out enclosing the Manipur plateau. The individual parts have received different names and include the Naga hills, Chin hills, Lushai hills (*qq.v.*) and the Arakan Yoma. As such it becomes narrower, curves round to south-southeast and terminates in Cape Negrais, though geologically the same series of folds is continued in the Andaman and Nicobar Islands (*qq.v.*). A small part of Burma, the division of Arakan (*q.v.*), lies between the Arakan Yoma and the Bay of Bengal. Some of the peaks of the western hills rise to 10,000 ft. and the highest is believed to be Saramati (12,663 ft.). The whole range forms an effective barrier between Burma and India proper. The east of Burma, including the whole of the Shan state (*q.v.*), is occupied by a plateau, which forms part of the Yünnan plateau of China. The plateau averages 3,000 ft. in height, but its surface has been much dissected; and running through the centre from north to south is the deep trough occupied by the Salween (*q.v.*) river. Southward, the plateau passes through Kayah state and the Karen state into that part of Burma known as Tenasserim (*q.v.*), and gradually loses its plateau character.

Between the Arakan Yoma on the west and the Shan plateau on the east lies the basin of the Irrawaddy and its great tributary the Chindwin (*q.v.*), and the basin of the smaller Sittang. This is for the most part a lowland area, with ranges of hills, of which the Pegu Yoma is the most important, running from north to south. Almost in the centre the extinct volcano of Popa reaches 4,985 ft. above sea level. The Arakan coast of Burma is Pacific in type; it is rocky and dangerous, backed by high mountains and fringed by islands. Of the islands, Ramree and Cheduba (*q.v.*) are the largest. The Tenasserim coast is similar; in the south is the Mergui archipelago. Between the Arakan and Tenasserim coasts lies the low delta of the Irrawaddy and Sittang rivers.

Most of the hilly and mountainous regions were formerly forested and over large areas have good, fertile forest soils. Where clearings have been made, temporary cultivation has destroyed the virgin richness of the soil. In the wetter regions the heavy rains often wash the soil entirely away from cleared hillsides and expose the bare rock. The limestone rocks of the Shan plateau are usually covered by a thin red soil from which the lime has been entirely leached out. The richest soils in the country are the alluvial soils of the flat Irrawaddy delta and the broad river valleys. Excellent loamy soil is also afforded by the mixed clays and sands of the Peguan rocks, but the Irrawaddian and other sandy series give rise to extensive tracts of very light soil, almost pure sand. In the wetter parts of Burma, because of the well-marked dry season, a thick mantle of lateritic soil stretches over most of the lowland tracts.

The rivers of Burma fall into three groups. There are numerous short, rapid streams, such as the Naf, Kaladan, Lemro and An Chaung, which flow down from the Arakan Yoma into the Bay of Bengal. The centre of Burma is drained by the Irrawaddy and its tributaries and by the Sittang. The Shan plateau is drained mainly by the Salween and its tributaries; in Tenasserim there are again a number of short, rapid rivers flowing from the hills into the Gulf of Martaban. The longest is the Tenasserim river.

The largest lake in Burma is a shallow stretch of water in the Shan plateau known as Inle lake. It is the remnant of a much larger lake, is rapidly becoming smaller and occupies a hollow in the surface of the plateau. Another large lake, the Indawgyi, with an area of 44 sq. mi., is found in the north of Burma near Mogaung. It is surrounded on three sides by ranges of hills but is open to the north where it has an outlet in the Indaw Chaung. In all the lowland tracts there are numerous small lakes occupying deserted river meanders. In the heart of the Irrawaddy delta numerous large lakes or marshes, abounding in fish, are formed by the overflow of the river during the rainy season but disappear in the dry.

3. Climate. — Burma forms part of the great monsoon region of Asia, but its climate is profoundly modified by the relief of the

country. There are really three seasons: the cool season, which is also rainless, setting in toward the end of October and lasting till February; the hot season (rainless) from March to the end of May; and the rainy season from June to October. October is an unpleasant month; the rains have almost ceased, but the temperature and humidity are high. Along the coast, and especially in the south, both the daily and annual range of temperature are small. In Moulmein the annual range is 8° F.; in Rangoon it is 10°. Away from the moderating influence of the sea, the range of temperature increases greatly and is especially large in the dry belt. The annual range in Mandalay is 20°. The average temperature in the south of Burma is 80°.

From October to May Burma is under the influence of the north-east trade wind or the northeast monsoon as it is more often called. The north and south alignment of the mountains causes this wind to blow almost directly from the north. It is a cool wind, but becomes less cool toward the end of the dry season. The change to the southwest monsoon is heralded by thunderstorms toward the end of May. The southwest monsoon, blowing as it does from the Indian ocean, brings rain. The coastal districts receive the full force of the wind and a heavy rainfall in consequence. Much of Arakan and Tenasserim have nearly 200 in. of rain. Rangoon enjoys an annual fall of 99.1 in. The heart of Burma lies in the lee of the lofty Arakan Yoma and the rainfall is scanty, as little as 23 in. in the heart of the dry belt. Mandalay lies in this dry region and receives an average of 33.4 in. Because of its elevation, the Shan plateau has a moderately good rainfall.

4. Vegetation. — The wide range of rainfall in Burma is responsible for great variations in the natural vegetation. Frost never occurs in the lowlands, but roughly above 3,000 ft. the occasional frosts have caused a great change in vegetation. Above that level evergreen oak forests, sporadic pine forests and wide areas of open land, with bracken and grass, are the rule. Rhododendron forests occur at high levels. Below the frost level the natural vegetation depends mainly upon the rainfall: (1) With more than 80 in. of rain, evergreen tropical rain forests occur. The trees of the forests are of many species, but more than one-half belong to the Dipterocarpaceae. The timbers are hard and little used. (2) With between 40 and 80 in. of rain are the monsoon forests which lose their leaves during the hot season. These forests are the home of the valuable teak trees as well as the pyinkado and other timber trees. (3) With less than 40 in. the forest becomes very poor and passes into scrubland and semidesert. There is little or no true grassland. (4) Extensive areas of the Irrawaddy delta are clothed with tidal forests, in which some of the trees reach a height of more than 100 ft. and are of considerable value.

Forest covers about 60% of the surface of Burma but the wasteful methods of the indigenous cultivator resulted in the destruction of vast areas of valuable tree resources in the hills. The practice was to cut down and burn a tract of virgin forest, cultivate the field (*taung-ya*) so formed for two or three years while the pristine freshness of the soil lasted and then to desert it for a fresh tract. It was but rarely that the forest established itself again over the deserted *taung-ya*; more often the area became covered with a tangled mass of bamboo, bracken or grass. After 1856, however, the forest department set to work and all the valuable forests were constituted into government reserves. Teak is about 20% of the total timber production; pyinkado (*pyengadu*) rather less but in kanyin more than 30%. Timber ranks second or third among Burma's exports. By 1958, however, an important new development was the export of green teak. Various privileges were accorded to the people who lived within the reserved areas. The timber, mainly teak for construction work and pyinkado for railway sleepers, was worked either by the government or by lessees (public and private companies) under supervision. Extraction was so controlled that it should not exceed regeneration. After independence in 1948 most of the extraction was by the state timber board.

5. Animal Life. — The anthropoid apes are represented by two gibbons, and there are about a dozen species of monkeys. Tigers are still common throughout the country; leopards and several species of wildcat also occur. The Himalayan black bear and the

Malayan bear are found in the hills. Bats are numerous and the huge flying fox is particularly common in several of the large towns. Elephants are still numerous in many of the denser forests, and some are caught annually in keddahs and trained for forest work. Two species of rhinoceros occur but are now far from common. Among wild animals the *pyaung* or bison and the very dangerous saing or wild buffalo are common. The small barking deer (*gyi*) is the commonest of the larger animals and is still widely distributed. The thamin, sambar and hog deer are also common. A licence is required for hunting most of the larger animals, and many of them enjoy a close season. The half-wild pariah or "pi" dogs swarm in every village. Among the numerous birds, the bright-hued small parrots may be specially noted and the ubiquitous paddy bird. Crows are exceedingly abundant and very bold. Sparrows have become ubiquitous in the towns and villages, mynas less common. A characteristic lizard is the house gecko or *taukte* (so called because it makes a loud croaking noise like "taukte," repeated four to ten times). Snakes, including the python, are numerous.

II. GEOGRAPHICAL REGIONS

For an adequate study of this large and varied territory, a division into at least seven natural regions is desirable: (1) The Arakan coastal strip is hilly or mountainous, has a very heavy rainfall and is covered with the remnants of a dense evergreen forest which has, however, been largely replaced by dense bamboo thickets. This region is sparsely inhabited and the population is concentrated round the principal town and port of Akyab. Communication with the rest of Burma is difficult except by sea. The region coincides roughly with the districts of Akyab, Kyaukpyu, Sandoway and the western strip of Bassein. (See ARAKAN and AKYAB.) (2) The Tenasserim coastal strip is similar but is of importance as the region producing tin and tungsten. Rubber plantations are increasing in importance. The chief town is Moulmein. The region coincides roughly with the Tenasserim division and most of the Karen state (districts of Mergui, Tavoy, Amherst and Thaton). (See TENASSERIM.) (3) The western hills region consists of the mountainous, sparsely inhabited tracts of the Arakan Yoma and its hill ranges. It coincides to a considerable extent with the Chin Hills Special Division (*q.v.*). (4) The northern hills region occupies the north of the country and includes the course of the Irrawaddy and its principal tributary the Chindwin. The region is as yet little developed. It includes the district of the Upper Chindwin and the Kachin state. (5) The dry belt occupies the heart of Burma. It is a flat and fairly thickly populated region, extensively cultivated and having some irrigated areas. The oil fields, with one exception, lie in this region. It coincides with the districts of Lower Chindwin, Shwebo, Sagaing, Mandalay, Kyaukse, Pakokku, Myingyan, Meiktila, Minbu, Magwe, Thayetmyo and Yamethin. (6) The delta region, including the deltas of the Irrawaddy and Sittang rivers and the intervening forested ridge of the Pegu Yoma, is the most important and the most thickly populated part of Burma. It includes the districts of Hanthawaddy, Pyapon, Maubin, Myaungmya, most of Bassein, Henzada, most of Prome, Tharrawaddy, Insein, Pegu and Toungoo. (7) The Shan plateau was formerly cut off in a remarkable way from the rest of Burma and still preserves many distinctive features. The region coincides with the Shan state passing southward into Kayah state. (L. D. S.)

III. THE PEOPLE

1. Racial Types. — The inhabitants of Burma belong to many races (see Population below) and speak many languages. In general they are of Mongoloid stock. It is believed that Burma was populated by successive waves of migration from the north. Indeed the advance of the Kachin races was still in progress in 1885. The Burmans or Burmese proper occupy the fertile lowlands; most of the other races are restricted to the hills and are in general less advanced. The Karens inhabit the Karen state (comprising the Papun district and the eastern parts of Toungoo, Thaton and Amherst districts), the Irrawaddy delta, the Pegu Yoma and the states of Karenni (now the Kayah state). Shans occupy most of the eastern plateau and are also found in the upper part of the Chindwin valley. The Kachins belong mainly to the north and northeastern mountains, the Chins to the northwestern mountains. On the Chinese borders are found the Palaungs and Was (some of whom are still head hunters). In the past large numbers of Indians were attracted to Burma by the higher rates of wages and the opportunities for trading and cultivation. In 1941 these numbered about 1,000,000. As a result of World War II and of Burmese independence this number has been halved. The Chinese are a smaller but important and rapidly expanding community. There were 194,000 in 1941 but the number was estimated at 350,000 by 1955. Except on the border in the northeast, where the Yiinnanese and Chinese Shans are found, the Chinese belong essentially to the artisan and merchant class. Europeans, mainly British, numbered 12,000 in 1941; very few were permanent residents and the numbers decreased thereafter. Eurasians numbered 20,000 in 1941 and were probably about the same in the early 1960s. (See KACHIN; KAREN; PALAUNG; CHIN; SHAN.)

2. Languages. — More than 100 indigenous languages, not mere dialects, are spoken in Burma, most of them by illiterate hill tribes. The only Austric languages (*q.v.*) to survive are Mon, akin to Cambodian (Khmer) in the plains, and the languages of two tribes, the head-hunting Wa and the tea-growing Palaung, in the hills. Most languages, even in the hills, belong to a totally different family, Tibeto-Chinese, which includes both Pyu and Burmese and represents a more enduring succession of immigrants, some of them, the Kachin tribes, continuing to arrive from the north in modern times.

The Burmese language is monosyllabic, agglutinative and closer to Chinese than to the Indian languages. A single syllable may have several meanings according to tone or stress. Many dialects and languages belonging to the Burma group are distinguished. The Shans, Kachins and Karens mostly speak entirely distinct languages. (See SHAN LANGUAGE; KAREN LANGUAGES.) Burmese is the official language, but English is still used in the teaching of science and technical subjects in the university. The Burmese adapted alphabets borrowed from the old rock-cut Pali of India. Thus their alphabet, their religion and a considerable number of words are of Indian origin. (See BURMESE LANGUAGES; TIBETO-BURMAN LANGUAGES.)

3. Religion. — The Burmese are mostly Buddhists, and their religion occupies a large place in their life. The spiritual head of every village is the yellow-robed pongyi or monk. The monastery, or *pongyi-kyauung*, just outside the village, is also a school (see *Education* below). Every village has its pagoda, and gilded or whitewashed pagodas crown almost every hill, but there are no temples in the ordinary sense of the word. The chief religious principle of the Burmese is to acquire merit as a foundation for rebirth into a better existence by good works done in this life. The bestowal of alms, offering of food to priests, the founding of a monastery, the erection of a pagoda or of a rest-house for travelers are all works of religious merit. The Sixth Buddhist synod was held in Rangoon in 1954–55 to revise the text of the scriptures (Pali Canon) and was attended by representatives of all neighbouring Buddhist countries.

The Shans too are Buddhists. The other hill people are in general animists though Christianity has made some advance, especially among the Karens.

4. Customs and Culture. — Most of the people live in villages, sometimes fenced as a protection against robbers and wild animals, in houses of bamboo and thatch built on stilts. Monogamy is almost universal though polygamy is not forbidden by law or religion. Burmese women enjoy an amount of freedom unusual in non-European races. The staple food is rice. The national dress is a cylindrical skirt, called a *longyi*, worn folded over in front and reaching to the ankles. The *longyi* is worn by both sexes; and men wear also a single-breasted short jacket called an *ingyi* or *aingyi*; the women's garment is similar but double breasted, often short sleeved and usually of transparent white material. All Burmese, of both sexes, prefer silks of bright but delicate shades, and the small handloom weaving industry retains a share of the market

despite competition from imported materials.

As a whole the Burmese are characterized by cleanliness, a sense of humour and a love of sport. Pagoda festivals and the funerals of famous monks attract great crowds. These are entertained with traditional drama, dancing and clowning of high merit, combined in the *pwe* (theatrical performance) which has many of the vital characteristics of the old-fashioned English music hall. Burmese music is distinctive but essentially an adjunct to the *pwe*. Melodies are mainly composed of five notes C, D, E, G, A; semitones are not used so the chromatic scale is unknown. Characteristic instruments include the kye-waing, a series of gongs cast out of a bell metal arranged in a circular frame of stout cane and the suing-waing, composed of 18 circular drums hung from a circular frame. In towns motion pictures are increasingly ousting traditional forms of entertainment. There are historical chronicles, and wood carving and lacquer, gold and silver work are not altogether lost arts (see *Industries* below). There is a popular literature (see *BURMESE LITERATURE*), and some painting, which largely apes the west.

The Burmese months (dependent on the waxing or waning of the moon), with their approximate Gregorian equivalents, are: Tagu (April), Kason (May), Nayon (June), Waso (July), Wagaung (August), Tawthalin (September), Thadingyut (October), Tasaungmon (November), Nadaw (December), Pyatho (January), Tabodwe (February), Tabaung (March). Every third year, a second or *Dutiya* Waso is intercalated. (F. S. V. D.)

IV. ARCHAEOLOGY

The Paleolithic cultures of Burma, called Anyathian, are characterized by their uniformity throughout the period and by the absence of the true hand axe as found in western Europe. Anyathian implements consist mainly of simple choppers or hand adzes and chopping tools made of silicified tuff and fossil wood. Neolithic material from Burma, some of which was found in association with potsherds of mat- and cord-marked ware, comprises chipped tools similar to Anyathian implements, edge-ground tools and several varieties of completely ground tools which suggest a cultural intrusion. The main Anyathian sites and Neolithic stations are located along the Irrawaddy river between Magwe and Nyaungu.

Among the earliest datable material from Burma are the bull and trident coins of Arakan. Inscriptions on the obverse of several coins repeat the names of some of the kings listed in the Anandacandra inscription now at the Shitthaung pagoda in Mrohaung. If this Sanskrit inscription, dated on paleographic grounds to the early 8th century A.D., is reliable, the coins belong to a period from the end of the 4th to the beginning of the 8th century. Other Sanskrit inscriptions of Arakan, some of Buddhist texts, range in date from the 7th to the 10th century A.D. Fragments of sculpture also suggest that Buddhism and Saivism were the religions of the period. The figures of Vishnu, Garuda and Buddha from the Shitthaung pagoda are of a later period as are the other religious monuments of Mrohaung. Wethali, about 8 mi. N.W. of Mrohaung, where there are remains of a wall and a moat and where many of the coins and one inscription were found, is likely to prove the site of the capital of the Candra kings.

Other early archaeological material from Burma, some of it contemporaneous with the coins and inscriptions of Arakan, comes from Hmawza and Halingyi, two sites associated with the Pyu people. The remains of the city of Sri Ksetra, the capital of a Pyu kingdom during the 7th and 8th century, are at Hmawza, about 5 mi. S.E. of Prome. Another site believed to be a later capital is located at Halingyi near Shwebo. At Sri Ksetra, a walled and moated city roughly circular in plan and about 18 sq.mi. in area, the remains of the palace are situated in the southern sector of the city and consist of a wall and a moat surrounding a brick platform 210 ft. square. Outside the walls, to the southeast, there is the square, moated area popularly called the Fort of Vishnu. Also outside the city walls are the burial grounds of the Pyu from which have been excavated urns of stone, bronze, copper and earthenware containing bones and ashes, ornaments of gold and silver, nails, hooks and blades of iron, silver coins and white

pebbles. Some urns are inscribed in the Pyu language in a script resembling a 6th-century script of Kadamba (west India). These urn inscriptions and other Pyu inscriptions from Hmawza record the existence of a ruling family with names ending in *vikrama* and *varman* which flourished in the 7th and 8th centuries.

Religious architecture at Hmawza includes solid cylindrical brick stupas of which the Bawbawgyi is the best example, and hollow vaulted temples either with a single cella like the Bebe or constructed with a central pier surrounded by a space for circumambulation like the Leymyethna. The radiating arch is a feature of these vaulted temples. From these and other ruins of Hmawza have come images and reliefs of the Buddha and terra-cotta votive tablets showing the influence, at different periods, of Gupta and Pala art, together with gold and silver plates inscribed in Pali, Sanskrit and Pyu, gold and silver ornaments and some silver coins. Three sculptures of Vishnu of the 8th and 9th century are clues to the syncretic nature of the religious beliefs and practices of the inhabitants of Sri Ksetra. At Halingyi there is a rectangular city site with traces of a wall and a moat. Within this area is a square, walled palace site. Three inscriptions in Pyu and some silver coins similar to the ones found at Hmawza are the only evidence of any association with the Pyu. Evidence for the survival of the Pyu after the Burmese expansion can be seen in the Pyu inscriptions from the Pagan ruins, one of which—the Pyu face of the Rajakuinar inscription—is dated A.D. 1113.

At Pagan innumerable religious monuments and inscriptions testify that it was the centre of a strong and expanding Burmese state from the 11th to the 13th century. The variety of languages (Sanskrit, Pali, Mon and Pyu) in which religious records were inscribed before Burmese predominated indicate the different cultural influences to which Pagan was exposed. The earliest inscriptions found at Pagan are some seals of Aniruddha in Pali and Sanskrit. Next in sequence are the Rfon inscriptions of Htiluin Man (Kyanzittha). The Rajakumar inscription dated A.D. 1113 is the earliest dated record inscribed in the Burmese language. From this date onward Burmese inscriptions become very numerous and although they consist primarily of records of pious gifts and dedications they are also a major source of the political and social history of the Burmese during the next four centuries.

The monuments of Pagan consist of stupas, temples, monasteries: libraries and ordination halls, the design and decoration of which reflect the influence of northeastern India, Ceylon, Sri Ksetra and Thaton upon the religious architecture of Pagan. But by the end of the 12th century there was a distinctly Burmese style of temple architecture of which the Shwegugyi, Thatbyinnyu, Sulamani, Htilominlo and Gawdawpalin are examples. The earlier Pathothamya, Nagayon, Abeyadana, Kubyaukkpi and Nanpaya represent the Mon style in religious architecture at Pagan, and the Ananda and Dhammayangyi are considered intermediate forms. There have been few innovations in Burmese religious architecture since the Pagan period. Secular buildings, including the palaces of the kings, have not survived because they were built of mud.

At Thaton and Pegu, centres of two medieval kingdoms of the Mon, few antiquities can be dated with any certainty; an important exception is the Kalayani inscription, in Pali and Mon, of Dhammaceti, king of Pegu, which is dated A.D. 1476. (See also INDIAN ARCHITECTURE: Malaysia: *Burma*.) (C. A. Ru.)

V. HISTORY

Burma is mentioned in Ptolemy's geography (c. A.D. 140) and in Chinese records somewhat later, a few brief sentences in all. The inhabitants must already have comprised two main stocks, overlaying Negrito and other primitive types: (1) Mediterranean, still occupying the remoter hills untouched by successive civilizations, for example the Naga tribes in north Burma, who are head-hunters and cousins of the Dayak now in Borneo but still on the mainland of Indochina in the 1st century B.C.; and (2) Mongoloid, now long predominant in the populous plains but so intermingled with other stocks as to be often indistinguishable.

Civilization arrived from India, Chinese influence being absent

throughout. But save for its Buddhist content it remained an alien civilization. It spread from the coast into the great central plain; most of the hills, even the hills nearest India, were beyond its reach. Yet the people of the plains retained their own customs; the caste system struck them as so strange that to this day their word for Indians is *kala*, "the caste people," from an old Indian word for caste. Indians had made their way into Burma long before, but the great expansion of Indian shipping in the 1st century A.D. was decisive: Hindus and Buddhists, missionaries as well as traders, could now settle as far afield as Indochina and Java, along the coast and up the rivers in the interior.

The earliest inscriptions are of the 5th–7th centuries A.D., at Prome just above the Irrawaddy delta; some are in the local language, Pyu, but in Kadamba (Bombay) script; and they give the king Indian titles. In the 8th century the Pyu were defeated, apparently by the Karen and Mon; they fled north to Shwebo and, as tributaries to the powerful Shan kingdom of Nanchao (Yunnan), sent missions to China in 800–802; but in 832 the Nanchao army sacked their capital and deported its citizens, the language died out and the people merged with the surrounding races.

The other people attested at this time are the Mon or Talaing. They held most of Thailand and in their westward expansion into Burma established themselves in strength round the Gulf of Martaban with Martaban, Thaton and Pegu as their centres. Kyaukse marked the limit of their northward advance. They introduced wet rice cultivation into Burma. Their 8th-century inscriptions are in Pallava (Madras) script; and the name Talaing is derived from Telingana, the Pallava country from which they derived their civilization. There are, save for some in Thailand, less than 400,000 Mon, mainly near Moulmein, distinguishable from the Burmese only in language. Yet it is they who gave Burma its writing and its religion, Buddhism. Archaeological remains, whether Pyu or Mon, show that the imported religion, displacing the native animism, was as often Hindu as Buddhist; it is probably the Mon connection with the great Hinayana centre at Kancheepuram (Madras) that began to tip the scale in favour of Buddhism.

The Burmese proper came from the north from the hills east of Tibet. They were among the tribes subject to the kingdom of Nanchao, entering the Irrawaddy plain probably after the overthrow of the Pyu in 832. They settled at Kyaukse, where, among the Mon, they could evade the unending conscription that Nanchao inflicted on its peoples; and there they began to write their language, using the Mon script, and to absorb the Buddhist religion. From Kyaukse they spread westward to Minbu and thence over the hills, where finally they founded the kingdom of Arakan. But their main centre was Pagan on the left bank of the Irrawaddy river.

1. Kingdom of Pagan, 1044–1287.—In the mid-11th century the Burmese under their king Aniruddha (Anawrata), who reigned at Pagan from 1044 to 1077, advanced northward against the Kadu up to the Irrawaddy-Shweli junction. In the south they captured the whole of lower Burma from the Mon. After Aniruddha's death the Mon rebelled but were pacified by Kyanzittha who was elected king in 1084. Kyanzittha's policy was to adopt Mon culture and to consolidate the whole of Burma under one central authority. Following a Sinhalese invasion there was a period of unrest between 1165 and 1174: then Aniruddha's line was restored with Sinhalese help. There was a marked difference between the earlier culture of Pagan which was under Mon influence and the later culture which came to be regarded as Burmese.

Aniruddha's dynasty, the Dynasty of the Temple Builders, gave Burma its golden age, the flowering time of its art. Many brick temples and buildings have survived around Pagan, but even so, the inscriptions state that wooden buildings were predominant.

The downfall of the kingdom came when the Wa-Palaung tribes in the north, resenting the spread of Burmese power, brought their grievances to the notice of the Mongol emperor of China. In 1273 the emperor Kublai Khan sent three ambassadors to Burma to demand homage and they were never heard of again. It was not until 1287, however, that the Mongol armies invaded Burma.

Pagan was captured and was garrisoned by Mongol troops from 1287 to 1301.

2. **Shan Period, 1287–1531.**—After the Mongol invasion the Pagan kingdom split into states under Shan princes from the hills near Kyaukse. They had served the Pagan dynasty and taken the lead in resisting the Mongol. Their official language was Burmese; they and their people had long shared the Buddhist culture of the Burmese.

Most Burma languages, whether hill or plain, belong to the western or Tibeto-Burman subfamily, but Shan is different, belonging to the eastern or Tai-Chinese subfamily of Tibeto-Chinese. The Nanchao kingdom was Tai, *i.e.*, Shan, the same word as Siam; and in Burma, people of this subfamily still dominate the Shan states, occupying the fertile valleys and leaving the bare hills to earlier tribes. The Mongol conquest of Yunnan drove them south to displace the Mon in Thailand and the Khmer, the builders of Angkor, in Cambodia. There they became civilized; but the rear guard remained barbarous and it was this rear guard that began, late in the 14th century, to overrun the Pagan succession states till Burman and burmanized Shan alike fled south to Toungoo.

The Mon retained the farther south. Their dynasty at Pegu, though partly of Shan descent, repelled all attacks from the north; and it produced Shin Sawbu (1453–72), the only queen regnant of Burma, where, however: the status of women has always been high. Shin Sawbu enlarged the Shwedagon pagoda at Rangoon, giving her own weight in gold to gild the famous spire; and she left so gracious a memory that centuries later the Lion could find no fairer thing to say of Queen Victoria than to call her Shin Sawbu reincarnate.

3. **Early European Contact.**—The first European to reach Burma, about 1435, was a merchant of Venice. The seaport trade was in Indian and Arab hands as the country had no shipping. The Portuguese arrived in 1511: their interests lay elsewhere; but they served 3s mercenaries, their firearms playing a decisive part in the conquests of the Burmese king Bayinnaung. Felipe de Brito, with 50 companions, made himself king of Syriam in 1600 and ruled the delta coast for 13 years. In 1550 several hundred Portuguese seized Chittagong, then under Arakan, making it one of the most dreaded pirate centres in the Indian seas and helping the king of Arakan, the only ruler in Burma who had a navy, in his slave raids up the Ganges delta; in 1666 the Mogul emperor's forces destroyed them and ended the prosperity of Arakan.

(G. E. Hy.; T. Tu.)

4. **Toungoo Dynasty, 1531–1752.**—After the breakup of the Pagan kingdom, Toungoo, a hill stockade in the Sittang valley, became a new centre of Burmese power where Burmese leaders opposed to Shan rule took refuge. The Shans' final victory over Ava in 1527 brought so many refugee Burmese chiefs to Toungoo that its ruler, Mingyinyo, who reigned from 1486 to 1531, prepared to lead a movement for the restoration of Burmese power over the whole country. It was his son Tabinshwehti (1531–50), however, who made the first moves. He conquered the rich Mon kingdom of Pegu and much of central Burma, transferring his capital to the city of Pegu. But he went on to fritter away his strength upon unsuccessful invasions of Arakan and Thailand, and a Mon rebellion cost him his throne and his life. His old comrade-in-arms Bayinnaung, crushed the revolt and became king in 1551. His career as a conqueror was perhaps the most remarkable in Burmese history. He subjugated the Shans, conquering Ava and extending Burmese suzerainty over the great block of principalities forming the Shan state in the modern Union of Burma. Chiangmai and Luang Prabang also came under his control, and finally the largest and richest of all the Tai states, Thailand, with its capital at Ayutthaya. His megalomania, with its impossible demands upon manpower which ruined the agriculture of the Mon country, and the cruel deportations of people from conquered territories, brought its own nemesis, for during the reign of his son Nanda Bayin (1581–99), Thailand under the leadership of Phra Naret (King Naresuen) freed itself. Thousands of Mons fled from Burmese tyranny to Thailand, and under the stress of internal rebellions coupled with Thai and Arakanese

invasions Burma again broke up into fragments without any central control.

Only a few years elapsed, however, before the country was reunited by Anaukpetlun, another prince of the Toungoo house. De Brito was defeated and killed in 1613. Pegu was restored as a capital city, Chiangmai was recovered and a new conquest of Ayutthaya was planned. Anaukpetlun was removed, however, in favour of his more peace-loving brother Thalun who reigned from 1629 to 1638. Thalun abandoned not only the policy of expansion but also that of a kingship based upon a Burmese-Mon partnership: he removed his capital to Ava in the Burmese homeland and devoted himself to the restoration of order and stability. For the remainder of the Toungoo dynasty's rule traditionalism and isolation determined policy, and the Lion country stagnated. During the following century the court of Ava also stagnated until in 1740 the Mons suddenly threw off the Burmese yoke and installed their own king once more at Pegu. In 1752 they captured Ava and brought about the final collapse of the Toungoo dynasty.

The Dutch and English East India companies had opened depots in Burma in Thalun's reign. These did not prosper but from the end of the century the English were regularly sending ships to Syriam for repairs. The French at Pondicherry, urged on by Joseph Dupleix, began to follow suit in 1729. During the 1730s both English and French were building teak ships there, until the Mon revolt brought these activities to an end. Dupleix, as governor of Pondicherry, saw in the revolt an opportunity to establish French influence in Burma and sent such aid as could be spared, and an agent, the *Sieur de Bruno*, to reside at Pegu. The English replied by seizing the island of Negrais (Hainggyi) at the mouth of the Bassein river in 1753. Mon dominance over upper Burma, however, soon collapsed and from the early months of 1754 they were on the run before a new Burmese resistance leader hailing from Shwebo, who assumed the royal title as Alaungpaya ("Embryo Buddha"). In 1755, at the end of a lightning campaign into the Mon country, he founded a new port, to be called Rangoon, at the hlon fishing village of Dagon, famous for its pagoda (Shwedagon). He persuaded the British at Negrais to supply him with weapons. Then, in 1756, he destroyed Syriam, executing Bruno and capturing several shiploads of military equipment from Pondicherry. Pegu and the rest of the Mon kingdom fell in the next year.

5. **Alaungpaya Dynasty, 1752–1885.**—Alaungpaya was the founder of the last dynasty in the history of Burma. He established effective control over the whole area previously under the sway of the Toungoo dynasty. He also dealt out frightful punishment to the Manipuris who had been raiding Burma. He occupied Imphal and deported thousands of its inhabitants. Finally he invaded Thailand and his meteoric career ended in 1760 through an accidental wound sustained while directing the siege of Ayutthaya. In the previous year he destroyed the British settlement at Negrais because of a rumour that it had helped rebel Mons. The East India company then withdrew the rest of its personnel from Burma.

The Alaungpaya dynasty led Burma in an orgy of expansionism, which was only brought to an end by defeat in the first Anglo-Burmese war of 1824–26. Hsinbyushin overran Thailand and destroyed Ayutthaya in 1767. He failed to retain his conquest because he had to meet a series of Chinese invasions from Yunnan but later Bodanpaya, who reigned from 1782–1819, revived the struggle to dominate Thailand. He failed signally, and the war degenerated into a matter of raids and counterraid. The destruction of the Mon kingdom, and the frightfulness with which subsequent rebellions (1773, 1783) were suppressed, caused a second great exodus of Mons to Thailand.

Bodawpaya's conquest in 1784–85 of the kingdom of Arakan brought in a new era of Anglo-Burmese relations, for thousands of Arakanese fled to the British-held Chittagong area, and nationalist leaders began to use it as a base for attempts to recover their country. The British failure to cope adequately with this situation embittered relations with the Burmese, and when in 1820 Burma proceeded to conquer Assam and its neighbour Manipur, the British had to act, for hordes of refugees poured into Bengal

and rulers of states threatened by the Burmese begged for protection. And it was clear that the Burmese generalissimo Bandula planned to strike at Calcutta.

The first Burmese War resulted in the cession to British India of Assam and the two long coastal strips of Arakan and Tenasserim. As a means of preventing further trouble a Burmese minister was to reside in Calcutta and a British resident at Ava. Difficulties arose at once. The court of Ava would not send a minister to reside in Calcutta but was milling to receive a British resident in the hope of using him to bring pressure upon the government of India to restore what had been lost in the peace treaty. Henry Burney, who was British resident from 1830 to 1837, established good relations with King Bagyidaw and his ministers, but all relations ceased with the revolution which placed Tharramaddy on the throne in 1837. He publicly denounced the peace treaty of 1826 and forced the withdrawal of the British resident. Another war was then only a matter of time, especially when central control over the administration weakened in the reign of the inept Pagan Min, and an outrage committed by the governor of Rangoon upon British subjects provoked Lord Dalhousie, the governor-general of India, into a course of action which made a peaceable solution impossible (see DALHOUSIE, JAMES ANDREW BROWN RAMSAY). The second Burmese War of 1852 led to the annexation of the potentially wealthy province of Pegu. It also led to the deposition of Pagan Min early in 1853 in favour of Mindon Min, the most honoured today of all the monarchs of his line.

Mindon made great efforts to modernize his country. He minted Burma's first coinage, constructed a telegraph system, instituted fiscal reforms, developed state enterprise by running a fleet of river steamers and erected factories, using European machinery. In 1871 he convoked at Mandalay, his new capital, the Fifth Buddhist council; i e., the fifth in the history of the religion. Toward the end of his reign Anglo-Burmese relations deteriorated, partly over the king's measures to control trade. When Mindon died in 1878, a reactionary group placed a younger son Thibaw on the throne and proceeded to control him through his wife Supayalat. His revival of the traditional "massacre of the kinsmen" caused the withdrawal of the British resident and the renewal of the demand for intervention which had come from commercial interests in Mindon's time. Thibaw's negotiations with France (1883-85) and his clumsy attempt to mulct the Bombay-Burmah Trading company of a huge sum of money for alleged infringements of its timber extraction licences forced the British government to take action. A British ultimatum demanding arbitration in the timber case and the submission of his external relations to the control of the Government of India was rejected by Thibaw and the third Burmese War followed. A British force was sent to occupy Mandalay (Nov. 1885), and Thibaw and Supayalat were deported to India. After much discussion of alternatives the decision was taken to annex the kingdom and its feudatory states and to form the whole of Burma into a province of the Indian empire (Jan. 1, 1886).

6. British Burma.—In 1862 Pegu, Arakan and Tenasserim were amalgamated to form the province of British Burma. Because of the immense strength of national feeling the "pacification" of Burma after the further annexations of 1886 took several years and involved the remodeling of the administration along British-Indian lines. Attempts were made to develop local self-government based upon the elective principle, but its efficiency depended entirely upon pressure from above. Under the Morley-Minto reforms of 1909 Burma's legislative council was given a nonofficial majority, and although the principle of popular election was not introduced, it became clear during World War I that responsible self-government was the goal of British policy for India. When therefore Burma was excluded from the scope of the Government of India act of 1919 introducing dyarchy to the Indian provinces (see INDIA), Burmese national feeling suddenly burst into such a storm of protest that the British parliament in 1921 extended the system to Burma. Burma also received five seats in the new Indian legislature at New Delhi. Soon afterward recruitment to the highest grade of the civil service, hitherto almost confined to the British, was placed upon a 50-50 basis.

The next step toward full self-government was taken in 1937 when Burma was separated from India and came directly under the British parliament. The general administration was entrusted to a cabinet of ministers, limited to ten, responsible to a bicameral legislature. Important powers were still reserved to the governor.

Expansion of Trade.—The British annexation of Pegu was the prelude to a vast expansion of rice production in the Irrawaddy delta region. Rice exports grew until just before the Japanese invasion in 1942 they were about 3,000,000 tons, just under two-fifths of total world exports. Teak remained an important article of export, and after the annexation of Upper Burma the expansion of the activities of the forest department ultimately provided the state with 20% of its total revenue. Petroleum, mainly from the Yenangaung oil field, became important after 1900, as did tungsten and tin from Mawchi and Tenasserim, and lead and silver from the great Namtu mine in the Shan states after 1914. Most of Burma's trade, both export and import, was with Asia. India was by far its biggest supplier and customer.

World War II and After.—Following Japan's entry into the war in 1941 and the capitulation of Pibul Songgram's government in Bangkok in December of that year the Japanese were able to invade Burma where her defense was weakest. By the end of May 1942 the remnants of the British Burma army had retreated into the Manipur hills. The Burma Independence army, which had been recruited in Bangkok by the Japanese-trained "Thirty Heroes," members of the Burmese Dobama Asi-ayon (Thakin) party, marched in with the Japanese but was soon disbanded by them for indiscipline and banditry. A civil administration under Ba Maw was set up, and on Aug. 1, 1943, Burma was declared an independent state. In Ba Maw's cabinet Aung San, one of the "Thirty Heroes," was in charge of defense and U Nu of foreign affairs. A small Burma National army (the B.N.A.) was organized under Ne Win.

The Japanese occupation was disastrous to Burma's economy. Hence the victories of the British 14th army in 1945 were hailed with joy, and the B.N.A., switched to the British side by Aung San, harried the retreating Japanese. Aung San now became the national leader and his creation, the Anti-Fascist People's Freedom league (the A.F.P.F.L.), had overwhelming support throughout Burma. Demanding complete independence. Aung San and his associates won their way into the governor's council in Oct. 1946, and Britain's Labour cabinet expressed its willingness to accept the verdict of the Burma electorate. The A.F.P.F.L. won a complete victory in the elections for a constituent assembly and Aung San secured the agreement of the hill peoples—except the Karens—to his proposals for a Union of Burma. On July 19, 1947, he and several of his closest associates were murdered at a cabinet meeting, but under his successor U Nu, Burma's progress toward independence went ahead. On Oct. 17, 1947, a treaty was signed with Britain under the terms of which the independent republic of the Union of Burma came into existence at 4:20 A.M. (hour chosen by astrologers) on Jan. 4, 1948.

7. Independence.—The new state had a western parliamentary constitution based upon adult suffrage. There were to be separate constituent states for Shans, Kachins and Karens and a special division for the Chins. U Nu's government was Socialist with a program of nationalization. But it had to fight for survival against almost universal disorder complicated by a Communist rebellion, a Karen rising, which was far more serious, and, in 1950, the arrival from Yunnan of General Li Mi's Kuomintang division after its rout by the Chinese Communists. Gradually the government gained the upper hand and with the passing of the most dangerous phase of disorder was able to take measures for the burmanization of the big European business concerns and build up machinery to deal with the distribution of land, the problem of agricultural indebtedness and the marketing of Burma's chief article of export, rice. From June 1953 onward world rice prices gradually weakened. Burma had therefore to seek new markets and thus came to develop economic relations with the Chinese People's republic, Japan and the U.S.S.R. In foreign policy U Nu espoused Jawaharlal Nehru's neutralism.

Relations with China became increasingly important after the

Communist victory of 1949 in that country. The long undemarcated frontier between the two states constituted a serious potential danger. It was discussed with Chou En-lai, the Chinese minister of foreign affairs, in Rangoon in June 1954 and by U Nu in Peking in Dec. 1955. In 1956 intrusions by Chinese troops led to a further exchange of visits! but without agreement. In Jan. 1960, however, a settlement was reached between General Ne Win, then Burmese prime minister, and the Chinese government. A treaty of friendship and nonaggression was signed at the same time.

After the general election of 1956 serious trouble began to develop inside the A.F.P.F.L., which caused U Nu to hand over the premiership temporarily to U Ba Swe. U Nu resumed office in Feb. 1957 but in Oct. 1958 resigned in favour of General Ne Win, the army chief of staff, who pledged himself to restore internal peace. A general election held on Feb. 6, 1960, resulted in a victory for U Nu's wing (the "Clean Wing") of the A.F.P.F.L. and U Nu took office again as prime minister on April 4. The "Clean Wing" was renamed Pyidaungsu (Union party). On March 2, 1962, General Ne Win, backed by the army, arrested U Nu, suspended parliament and proclaimed a new anti-Communist government. (D. G. E. H.)

VI. POPULATION

Burma is essentially a rural country, perhaps more accurately described as a country of villages. There are fewer than 300 urban groupings which could be classified as towns (about one-third with municipalities). Most Burmese (about 85% of the nation's population) live in more than 50,000 villages. The average den-

Population by Language Groups*

Language group	No. of persons
Tibeto-Chinese family	
Burmese group	
Burmese	8,596,031
Others (including Arakanese)	1,031,165
Lolo-Muho	93,214
Kuki-Chin	348,994
Naga	4,224
Kachin	153,345
Sak	51,820
Mro	13,766
Tai (Shan)	1,037,506
Chinese	192,594
Austriac family	
Malay	8,323
Mon	336,708
Palaung-Wa	176,382
Karen family	1,367,673
Man family	911
Indo-Burman races	182,166
Indian races	1,017,825
European races	
Europeans (including Armenians)	11,651
Eurasians	19,200
Total	14,647,497

*These figures are based on the last detailed enumeration, the 1931 Census of India, but the proportions are believed to be still reasonably close except that Indians, Europeans and Eurasians must be significantly less.

sity according to the 1941 enumeration was about 64 persons to the square mile; in the thickly populated delta districts this could exceed 200. Only three towns have more than 100,000 inhabitants: Rangoon 737,079, Mandalay 185,867 and Moulmein 102,777 (q.v.) (all 1953 enumeration or so-called stage census). Smaller towns such as Bassein, Akyab, Taunggyi, Prome and Pegu are ports, collecting and distributing centres, hill stations or have achieved some importance chosen as headquarters of districts. The dry belt is the natural geographical centre of Burma and therein lie the old Burmese capitals: Pagan, Shivebo, Ava, Amarapura and Mandalay, with Prome on the southern border. In 1941 the population was 16,823,798. In 1956 it was estimated to be 19,677,000. (L. D. S.; F. S. V. D.)

VII. ADMINISTRATION AND SOCIAL CONDITIONS

1. Constitution.— According to the constitution which was passed unanimously on Sept. 24, 1947, the Union of Burma is a republic with a president, elected for five years, as its nominal head. The effective head is the prime minister who, with other ministers, has joint responsibility to the chamber of deputies. The legislature comprises two houses, of which the lower, the chamber of deputies, is popularly elected. It has sole control over money

and ultimately can prevail over the upper house in other matters also, for disagreement is resolved by a joint session in which the greater numbers of the lower house predominate. The chamber of deputies comprises 250 members, elected for four years by all citizens of either sex of 18 or more years, voting in constituencies of approximately equal size. The upper house or chamber of nationalities ensures representation of the indigenous minority races much outnumbered by Burmese in the chamber of deputies; foreign minorities are not provided for. It consists of 125 members elected by the same voters in different constituencies weighted to favour the minorities; of these members 25 represent the Shan state, 15 the Karen state, 12 the Kachin state, 8 the Special Division of the Chins, 3 the Kayah state, the remaining 62 being drawn from the rest of Burma. The maximum life of the chambers is normally four years. A two-thirds majority of both chambers in joint session may amend the constitution and, in emergency, extend the life of parliament.

The indigenous minority peoples are granted local self-government. The Shan, Karen, Kachin and Kayah states and the Chin Hills Special Division have each a state council, consisting of the members of both chambers of parliament representing the state, with at its head a minister appointed by the president after consultation with the council. Councils may legislate on local matters and enjoy certain revenues, except that the council for the Chins has no legislative powers. States, except the Kachin state, have the right of secession.

2. Government.— Administrative divisions are: Arakan (Akyab, Kyaukpyu and Sandoway districts), Pegu (Rangoon, Pegu, Tharrawaddy, Hanthawaddy, Insein and Prome), Irrawaddy (Bassein, Henzada, Myaungmya, Maubin and Pyapon), Tenasserim (Thaton, Amberst, Tavoy, Mergui and Toungoo), Magwe (Thayetmyo, Minbu, Magwe and Pakokku), Mandalay (Mandalay, Kyaukse, Meiktila, Myingyan and Yamethin), Sagaing (Shwebo, Sagaing, Katha, Upper Chindwin and Lower Chindwin), the Shan, Karen, Kayah and Kachin states, and the Chin Special Division. The framework of the administrative system created as a result of Burma's annexation to British India is still perceptible. The backbone of this was the district under a deputy commissioner who was the general agent of the government for all purposes except those in the hands of specialist departments; he had special authority in respect of the police. Districts were divided into subdivisions, to nships and village tracts, the latter under an elected headman. In certain matters commissioners of divisions were interposed between deputy commissioners and the government. After Burma left the British Commonwealth real authority passed from these officers to the local political bosses with a consequent deterioration in the efficiency and integrity of the administration. Elected municipal and district councils had exercised a certain authority in local government-matters, subject to the control of the deputy commissioner. The Rangoon corporation enjoyed a special standing. After World War II district councils disappeared and municipal administration largely broke down. A new hierarchy of local bodies was introduced, building up from directly elected village councils and ward committees to indirectly elected township and district councils. The government of General Ne Win which took over in Oct. 1958 and again in March 1962 installed military "co-ordinators" at various levels and so effected a considerable reformation.

3. Political Parties.— The Anti-Fascist People's Freedom league (A.F.P.F.L.) was an unstable coalition of socialist groups, brought into existence by the personality of U Aung San and the desire for independence, and later held together by fear of the outlawed Communist party. In 1958 the league split into two factions: the "clean" A.F.P.F.L. under U Nu, the prime minister, and Thakin Kyaw Htun; and the "stable" A.F.P.F.L. under U Ba Swe and U Kyaw Nyein, deputy prime ministers. The attempt of U Nu to obtain a working majority over the "stable" A.F.P.F.L. by entering into alliance with the Burma National United front, widely regarded as Communist, revived fears of Communism and led to the take-over of authority by the army and to the eclipse of all political parties. (See also *History: Independence* above.)

4. Taxation.— Customs duties and income tax each provide

about 35% of the revenue from taxation. Land revenue, which in 1939 provided 33%, accounted for about 3% by the 1960s. Other forms of revenue include excise duties, forest revenue, stamp duty and profits from the state lottery. In addition the state receives profits from the operations of the state agricultural marketing board (mostly export of rice) which may equal or exceed the revenue from customs duties or income tax.

5. **Living Conditions.**—The vast majority of the people of Burma are peasant cultivators living in villages, many building their own houses of bamboo and thatch. Some are nominally still tenants, others hold land resumed under nationalization schemes. Most are in practice owners of their land, paying land revenue to the state, when they cannot escape doing so, and living on the proceeds of cultivation. The few foreign industrial undertakings have been nationalized or have otherwise had their operations rendered unremunerative. The nature of the future economy remained far from clear and no regular wage structure or working conditions had emerged by the early 1960s, while the cost of living trebled or quadrupled since 1939.

In the public services, wages at the lowest levels rose commensurately. Above that they remained the same or were considerably reduced. There was a considerable reduction in the standard of living of all but the cultivators of land.

6. **Welfare Services.**—The constitution enjoins the creation of a welfare state (Pyidawtha), but Burma has little to show as yet apart from the medical and public health services and small-scale voluntary undertakings in Rangoon. In fact, outside the capital, Buddhist charity and the tradition of family responsibility render unnecessary much of the care that needs to be officially provided in more competitive western communities. There is a serious lack of doctors and other medical staff. With the help of the World Health organization (WHO) a great deal has been done toward eradicating malaria.

7. **Justice.**—Civil and criminal justice is administered by district and sessions judges and district magistrates, and by subordinate courts with widely varying powers. Above these, original and appellate jurisdiction is exercised by the high court and the supreme court, the court of final appeal. There is a civil police force, and about 29 prisons. A jail to receive 3,000 political prisoners was constructed after 1959 on the Cocos Islands.

8. **Education.**—World War II and its aftermath disastrously affected education. In the 1950s a great effort was put into rehabilitation. By the early 1960s there were in Burma about 11,000 recognized state primary schools, with an attendance of more than 1,500,000 pupils, and nearly 800 state secondary (middle and high) schools, with an attendance exceeding 220,000. These figures represent a trebling of the schools and school population since 1952 and were only achieved at the cost of a serious lowering of standards. In the background are about 40,000 monastic schools inculcating a respect for religion, rudimentary education and a certain discipline, a tradition dating from the 8th century but of little academic value. The University of Rangoon, founded in 1920 as a federal structure, was reorganized on a unitary basis after independence, the constituent colleges being superseded by faculties of arts, science, engineering, law, education, agriculture, medicine and social sciences. The University College of Mandalay became a university in 1958, having acquired degree status several years earlier.

University students totaled more than 13,000. There too numbers considerably increased with the consequent inevitable fall in standards. A number of private (mostly mission) schools continue, in the face of difficulties, to provide education of a better standard.

9. **Defense.**—Compulsory military service, prescribed by the Peoples Militia act of March 2, 1959, is not rigidly enforced. The regular army consists of 11 light infantry brigades, 3 field batteries, 1 mountain battery, 1 armoured regiment and little in the way of supporting arms. In reserve is a somewhat nebulous territorial force. There are about 20 battalions of military police. The navy and air force are inconsiderable. These forces are designed for the preservation of order and constitute no deterrent against external aggression.

(F. S. V. D.)

VIII. THE ECONOMY

1. **Agriculture and Fisheries.**—Burma is essentially an agricultural country. Agriculture, which employs more than 66% of the working population, is concentrated on the alluvial lands of the delta and the valleys of the Irramaddy, Chindwin and Sitang. Two-thirds of the cropped area is occupied by rice, the production of which before World War II averaged more than 7,000,000 tons a year. There was an export surplus of more than 3,000,000 tons. By the early 1960s production was again approaching the prewar average. Where the rainfall is less than 40 in., rice cannot be grown without irrigation and in the dry areas sesamum, millet, cotton and peanuts are the chief crops. By the early 1960s approximately 3,500,000 ac. had been distributed to tenant farmers under the land nationalization scheme and nearly half this acreage had been irrigated.

At the time of the British annexation of Burma there were some old irrigation systems in the Kyaukse and Minbu districts and these were renewed and extended. In addition, the Mandalay canal, 42 mi. in length, with 14 distributaries, was opened in 1902; the Shwebo canal, 27 mi. long, was opened in 1906, and later two branches 29 mi. and 20 mi. in length; and the Rlon canal, 53 mi. long, was started in 1904. Before World War II more than 1,500,000 ac. were devoted to fruit, vegetable and tobacco growing, and 400,000 ac. were under cotton. Excluding the Shan state and certain hill tracts, in the late 1950s about 21,826,000 ac. of land were classed as cultivable waste, as against 21,241,000 ac. of "occupied" land; 14,953,000 ac. of land were sown to crops. The estimated sown acreage for the whole country was more than 16,800,000.

In the late 1930s the number of rubber plantations increased in spite of restrictions on output and Burmese production of crude rubber reached an annual average of 9,000 tons, the main producing areas being Mergui and Tavoy. In the late 1950s and early 1960s production was maintained above 10,000 tons yearly.

Small humped oxen are kept everywhere as beasts of burden and for use in plowing. They are replaced to a considerable extent in the delta and wetter areas by the heavier water buffalo. Herds of small goats are numerous in the dry belt, and small numbers of poorly bred sheep are reared.

Fisheries and fish curing exist along the seacoast of Burma and in inland tracts. Salted fish, especially freshwater varieties, along with boiled rice, forms one of the chief items of food among the Burmese. A little mother-of-pearl is gathered in the Mergui archipelago (see *Physical Geography: Vegetation* above for forestry).

2. **Minerals.**—The mineral wealth of Burma is considerable but in many cases little developed. Petroleum is the most important mineral. Production declined drastically during World War II and only by the early 1960s reached more than half the 1939 total, which exceeded 1,000,000 metric tons. Most of the crude oil is refined for local use into gasoline, kerosene, other oil and wax at the refineries of Chauk on the Singu field and at Syriam near Rangoon.

Extensive deposits of brown coal (lignite) occur, chiefly in the Chindwin valley and in old lake basins in the Shan plateau, but production was negligible and ceased entirely in 1926. Oil shale is also found in the latter region. Silver-lead ores occur at Bawdwin in the north Shan state. Output of silver amounted to 6,175,000 oz. in 1939 and was below 2,000,000 oz. in the late 1950s; in this same period lead production declined by half from 77,180 tons.

There are deposits of tin and tungsten in Tenasserim and Yamethin and in the Kayah state. Production of tin concentrates amounted to 5,441 tons in 1939 but under 1,000 tons in the late 1950s; for tungsten concentrates the respective figures were 4,342 and under 400 tons.

The Burma ruby mines, after many vicissitudes, went into liquidation in 1925–26 and are now unimportant. The famous jade of China was found in the north of Burma and exported overland to China via Mogaung and Bhamo. The mines are situated beyond Kamaing, north of Mogaung, in the Myitkyina district. The miners were all Kachins, and the right to collect the jade duty of 33 $\frac{1}{3}$ % was farmed out by the government to a lessee, who before World War II was always a Chinese. The amount obtained

varied considerably. The value of the jade varies enormously according to colour, but semi-transparency, brilliancy and hardness are essentials. There is a fluctuating but considerable production and export.

Other minerals found in Burma are: copper ore, iron ore, nickel, lead and zinc. Gold is found in many rivers of upper Burma. Production of minerals fell in the 1940s and had not reached pre-war levels by the 1960s. Amber is found in the Hukawng valley, but is of poor quality. Salt is manufactured in various places. The occurrence of natural gas near Thayetmyo led to the establishment of a cement industry.

3. Industries.—Agriculture has always been the staple industry of Burma, but by the 1960s the government was encouraging new manufacturing industries. Prior to this the principal occupations apart from farming and forestry were rice husking, silk weaving and dyeing. The most important of the nonagricultural manufacturing industries was that connected with the working and refining of oil.

The introduction of cheap cotton and silk fabrics dealt a blow to hand weaving, while aniline dyes began to drive out the native vegetable product; but both industries lingered in the rural tracts. The best silk weavers are to be found at Amarapura. The chief dye product of Burma is cutch, a yellow dye obtained from the wood of the *sha* tree (*Acacia catechu*). Cutch boiling forms a means of livelihood of a number of the poorer classes in the Prome and Thayetmyo districts of lower Burma, and a subsidiary means elsewhere. Cheroot making and smoking are universal with both sexes.

The state runs the Burma Pharmaceutical industry (B.P.I.) and modern industrial developments include making of gunny bags (since 1957), cigarettes, textiles, sugar, bricks and tiles. The Baluchang hydroelectric power project in Kayah state, completed in 1960, supplies power to Rangoon.

The chief arts of Burma are lacquer working (centred at Pagan), wood carving and silverwork. The floral wood carving is remarkable for its freedom and spontaneity. The carving is done in teakwood when it is meant for fixtures, but teak has a coarse grain, and for other purposes *yamane* clogwood, said to be a species of *Gmelina*, is preferred. The tools employed are chisel, gouge and mallet. The design is traced on the wood with charcoal, gouged out in the rough and finished with sharp fine tools, the mallet being used for every stroke. The great bulk of the silverwork is in the form of bowls of different sizes, in shape something like the lower half of a barrel, of betel boxes, cups and small boxes for lime. Both in wood carving and silverwork Burmese art objects generally display a certain boldness of design but suffer from a want of careful finish.

4. Trade and Finance.—Approximately 86% of the foreign trade passes through Rangoon. Other leading ports are Bassein, a rice port on the west of the delta, Akyab, the outlet of Arakan, and Moulmein, Tavoy and Mergui, which serve the Tenasserim division.

Trade was formerly dominated by India and other commonwealth countries but the Indian share decreased in later years. In the early 1960s main destinations of exports were: India, Japan, Indonesia, Pakistan, United Kingdom and Ceylon. Main sources of imports were: United Kingdom, Japan, India, Federal Republic of Germany, China and the United States. Free or normal trading conditions are however greatly influenced by such factors as shortage of foreign currency, Japanese reparations agreements and certain barter arrangements, some of temporary nature, such as an exchange of rice for Soviet technical aid.

The principal exports are normally rice, oil cake and other fodder, timber, rubber and cotton. (See the subsections *Vegetation* and *Agriculture* for timber and rice exports.) The principal imports are cotton goods, machinery and hardware.

The currency in Burma was that in use throughout India until April 1, 1947; on July 1, 1948, Indian notes ceased to be legal tender and on July 1, 1952, the rupee became the kyat (1 kyat = 100 pyas).

5. Communications.—From early times the principal highway of Burma has been the Irrawaddy (*q.v.*) and its tributaries. Rail-

ways tended to supplement rather than replace the rivers as high-ways of trade. The railways, all of metre gauge and 2,667 mi. in length (1941), were taken over by the government in 1929. Damage in World War II reduced their length to 1,777 mi. By the 1960s restoration had been steady but not complete. A Rangoon Circular railway was completed in 1959. The main line runs from Rangoon to Mandalay (386 mi.), crosses the Irrawaddy by the Ava bridge (1934) and continues to Myitkyina. There was no railway connection with India nor with any other country by the 1960s and Yenangyaung, in the oil fields, was not accessible by rail. The Burma road (*q.v.*) was the one transfrontier route that became famous during World War II. By the 1960s there were more than 9,000 mi. of roads in Burma.

Both roads and railways suffered during the widespread insurrections that followed independence in 1948. During that time many places could only be reached by air. Union of Burma airways has a network of internal services.

BURMA ROAD. In 1937–39, during the undeclared Chinese-Japanese war, the occupation of the seacoast of China by the Japanese stimulated intensive efforts to build supply routes from the interior of China to the outside world. The most notable effort was the construction of the 681-mi. road from Kunming to Lashio in Burma. This highway, called the Burma road, was completed in 1939, and after Oct. 1940 was the only route open to the sea. In April 1942, however, the Japanese overran Burma, seized Lashio and thus closed the Burma Road at its source.

In 1944, as Allied forces, operating from Assam in eastern India, advanced into northern Burma, they constructed a supply road from Ledo, India, which finally connected with the Burma road at a point where it was still in Chinese hands, and this Stilwell or Ledo road, as it was called, was opened in Jan. 1945 when the first Allied motor convoy crossed into China. This 478-mi. road, twisting through mountains, swamps and jungles, was built at a cost of \$148,910,000, and was declared surplus property by the United States army in Nov. 1946.

BURMESE LANGUAGES. Burmese is the official language of the Union of Burma and is spoken as a first language by approximately 10,000,000 Burmans and as a second language by large numbers of speakers of other languages in the union. It is numerically the largest member of the Tibeto-Burman group of languages which includes also in Burma the numerically inferior Jinghpaw (Kachin), Chin, Naga and Lolo groups (see TIBETO-BURMAN LANGUAGES). The dialects of Burmese have not been adequately described and it is possible only to say that there are local forms of speech which are more or less mutually intelligible. These include such varieties as Arakanese, Tavoyan and a number of smaller groups spoken in northern Burma and the Kachin state as well as others in the Shan states. These languages are similar in structure and consist of syllables of uniform structure made up of an initial consonant or consonant cluster plus a vowel and spoken in one of four tones (contours of pitch and stress which distinguish otherwise identical syllables). The parts of speech are verbs, nouns and particles (postpositive bound forms, proclitics and enclitics). The sentence types are equational (two noun expressions are equated: "my father [is a] lawyer") and verbal. The latter consists of a verb expression standing alone or preceded by one or more modifiers or subordinations. Special classes of particles mark syntactic relationships of the modifiers and subordinations to the main verb expression while other classes serve to define in various ways the scope and range of the verbal description.

The earliest writing of the Burmese dates from the middle of the 11th century and is in a modification of the "square" Pali (see PALI LANGUAGE) borrowed from India and used in carving inscriptions on stone. Later the alphabet assumed its characteristic rounded shape from being inscribed on palm leaves with a stylus. This contact with Pali over the centuries has left in Burmese an important legacy in the form of a large number of words of Indic origin.

Next in numbers to the speakers of Tibeto-Burman languages are the Shans, who speak a language related to the Tai of Thailand (see SHAN LANGUAGE). The Karen languages (*q.v.*) are of uncertain affiliation linguistically but exist in a number of forms, the two main divisions of which are the Sgaw and the Pwo. The Mon-Khmer group has as its important member in Burma the language of the Mons, of great historical importance in Burma but of late years losing in influence. There are in addition speakers of non-indigenous languages of China, India, Pakistan and Europe. English is widely used but is the only European language of importance.

For the distribution of population by language groups, see BURMA: Population. See also MAN LANGUAGES.

BURMESE LITERATURE. The stone inscription is the oldest form of Burmese literature. The earliest datable extant specimen is the inscription of A.D. 1113 found at Myazedi near Pagan. It begins by recounting the circumstances that led to the dedication of a golden Buddha image by Prince Rajakumar, then gives the wording of the dedication itself and describes the gift of slaves to the image and the cave pagoda in which it was enshrined. It ends with a prayer for the upholders of the benefaction and a curse on those who damage it. The inscription was probably composed by a court scholar and was chiseled on stone by a scribe in archaic Burmese characters and language. During the next 250 years more than 500 dedicatory inscriptions similar in pattern but more developed in style were engraved on stone on behalf of pious donors. Many of these contain eloquent poems and prayers offered by royal ladies which are moving expressions of personal emotion. Later inscriptions dating from the founding of Ava in A.D. 1365 to the mid-19th century were in the same vein, although the style and orthography become more like those of the palm-leaf and folded-paper literature.

Palm-Leaf and Folded-Paper Literature.—Imaginative literature scratched on palm leaf with a stylus or written on folded paper in steatite pencil originated under the auspices of Buddhist

monarchs and flourished from the 14th century until after printing became prevalent in the 19th century. The authors were Buddhist monks, monastery-trained courtiers and a few court poetesses. Its most notable features were Buddhist piety and courtly refinement of language. Various kinds of poems, works in prose and in the "mixed style" (prose and poetry) constitute this literature. Of more than 50 extant types of versification the major genres are:

1. E-gyin, historical ballads, some of which were sung as cradle-songs. Others were written to inform young princes and princesses of the achievements of their ancestors. The earliest known work is the Ya-khaing *Min-tha-mi* ("The Princess of Arakan"), written in 1455 by Adu-nyo, a minister at the Arakan court. The *Min-re-deip-pa* *Min-tha E-gyin* (1618?), by Shin Than Kho, and the Sin-gu *Min-tha E-gyin* (1774?), by U Hpyaw, are among the best known. The end of the Burmese monarchy (1886) was naturally the end of the e-gyin, though a curious and solitary e-gyin was written in 1924 on the prince of Wales.

2. *Maw-gun*, panegyric odes. Their subjects range from the arrival at the court of a white elephant to the conquest of Siam, from the completion of a canal to an essay on cosmography. In 1472 Shin Htwe Nyo wrote the *Pye-son* ("The King's Journey Down to Prome"). A notable *maw-gun* is the Ta-da-u-ti *Min-ga-la Ce-ti* ("A Pagoda in Ava") written in 1480 by Ra-htha-tha-ra, a Mon monk. He formalized this genre and set the tone for his successors. His most famous disciple was Na-wa-de II, who composed at least 15 odes of which the *Wi-la-thi-ni* (1806) in praise of King Bodawpaya and the royal elephant was his masterpiece. An unusual *maw-gun*, the *Ma-ra-na-sa-ti* ("Meditation on Death"), was written by Saya Pwa in 1924. This caused violent repercussions in the literary world because of the alleged misuse of the title *maw-gun*.

3. *Pyo*, metrical versions of Buddhist stories and of stories of Buddha's birth and teaching, which transferred the originals to a Burmese setting and made them more vivid by adding small imaginative details, and homilies. Ra-htha-tha-ra's *Bhu-ri-dat Lin-ga-gyi* ("Birth Story 543"), written in 1484, is the earliest extant *pyo*. The poet's tour de force was, however, the *Ko-gan* ("Birth Story 509") written in 1523. He had many famous followers notably two monks, Agga-tha-ma-dhi and Te-zo-tha-ra in the 16th century, and another monk Mon-ywe Sa-ya-daw and a minister, Twin-thin-taik-wun, in the 18th and 19th centuries. His contemporary and literary rival Thi-la-wun-tha, a monk poet, also composed several *pyo*, of which two held in high esteem by Burmese scholars for their profundity are the Pa-ra-mi-daw-gan ("The Ten Perfections") (1491) and the *Su-taung-gan* ("Prayers to Become Buddha"; 1495?). Pa-de-tha-ya-za (c. 1684–1754), a minister of advanced ideas, wrote some exquisite *pyo*, but he was censored by orthodox Burmans for using the medium on non-Buddhist themes.

4. *Lin-ga* (Pali *alamkāra* "ornamentation"), a variety of *pyo* but generally shorter, often used as a generic term for all kinds of verse. A *taw-la* ("forest journey") of nine stanzas written by a monk, Utta-ma-gyaw, in 1476, claims a place of distinction among works of this type. It is a devotional poem remarkable for sensitive perception and personification of nature. Ra-htha-tha-ra's *taw-la* of four stanzas, describing his journey to the Sacred Footprints, is another *lin-ga* of equal poetical merit. Burmese literature abounds in short *lin-ga*, but in 1904, a monk, Man-li Sa-ya-daw, produced a magnum opus known as *Mag-gha-de-wa Lin-ga-thit* ("Birth Story 9") comprising 625 stanzas. It is a collection of trenchant and memorable sayings.

5. *Ya-du* (Sanskrit *ritu* "season") the shortest type of poem, usually of three stanzas or less. These deal generally with romantic subjects such as the emotions called forth by the changing seasons, the mood of longing for and memories of loved ones. Two court poetesses, Mi Phyu and Mi Nyo, wrote outstanding *ya-du* in the 16th century. Nevertheless the form was not fully developed until the end of that century. Na-wa-de I (fl. 1545–1600), a courtier and soldier poet, composed more than 300 romantic *ya-du*. His successor was the ill-fated and frustrated lover Prince Nat-shin-nung of Toungoo, whose elevated and pathetic odes still stir the emotions of Burmese readers. Ze-ya-yan-da-meit and Shin Than Kho in the 17th century and Sein-da-Kyaw-thu in the 18th

century were other noted lyrical writers. A minister, Let-wethon-da-ra, wrote two immortal *ya-du* in 1766.

The poems of these five genres are all composed in lines of four syllables with regular "climbing rhymes" in one or more of six different rhyme schemes, each stanza ending in a line with an odd number of syllables, usually 7. 9 or 11. In other forms of verse the rhyme scheme is freer. Double and triple rhymes are not unusual. Some are in the "mixed style" (see above). Mention may be made of a few of the best known types:

The *Ya-gan*, a seriocomic epic in which the author tries to score points over others, appeared in the 18th century. *Mwe-nun* ("A Mon Princess") by Shwe-daung-nan-da-thu is the earliest extant *ya-gan*, but U To's *Ra-ma*, written between 1819 and 1837. is acclaimed as supreme.

Myit-ta-za originated in the 15th century as exhortatory letters in the classical verse form (four syllables to a line) addressed to kings by their abbots, but from the 17th century they were written to others besides the king, and in freer rhyme-schemes or in the "mixed style." Kyi-gan-ko-yin-gyi, Ok-kan-tha-ma-la and Pon Nya (c. 1817-66) gained recognition in this sphere. Pon Nya's letters are renowned for their human touch, wit and style.

Drama, like the *ya-gan*, seems to have been born from cultural contact with Siam. U Sa (1766-1853), a minister, adapted a Siamese play, *Ee-naung*, into Burmese, and this was followed by the Princess Hlaing's two palace plays, *Wi-za-ya-ka-ri* and *Ein-da-wun-tha*. written in prose and verse. These were intended to be read and performed by courtiers. Kyin U (c. 1819-53) and Pon Nya, two protagonists of the *pya-zat* (stage plays) wrote several plays to be produced as operas either before the king or at the court of provincial governors. Kyin U's *De-wa-gon-ban* and Pon Nya's *Wi-za-ya* were looked upon as models of *pya-zat* writing.

Among numerous songs of various types, the bucolic poems of Pa-de-tha-ya-za (early 18th century), *te-dat* ("six-section songs") by the queen of Sin-gu (1776-82) and Po Thu-daw U Min (early 19th century), *le-jo* ("four-section songs") and *dwe-jo* ("two-section songs") by Lu I; Min and Po Thu-daw U Min and *baw-le* (plaintive songs) by the Princess Hlaing must have a place in any anthology of Burmese literature.

Prose works in this period are comparatively few. They are mainly translations or adaptations of stories from Buddhist scriptures, chronicles of kings and legal precedents. Sentences tend to be lengthy with loosely knit clauses and arbitrary punctuation. *Wut-htu* ("religious stories") are represented by works such as Thi-la-wun-tha's *Pa-ra-ya-na* (1511); by the translations (1782-87) by the poet monk Aw-ba-tha of eight of the ten great Birth Stories; and by the 537 minor birth stories by Nyaung-gan Abbot. The secular side is represented by *Ya-za-win-gyaw* ("The Celebrated Chronicle") (1520) by Thi-la-wun-tha; by the *Ma-ha Ya-za-win-gyi* ("Great Chronicle"), the earliest full scale history of Burma, by Kala (fl. 1714-33); and by the *Hman-nan Ya-za-win-daw-gyi* ("Glass Palace Chronicle") (1829) by a committee of learned monks and ministers.

Printed Book Literature.—The introduction of printing in lower Burma led to a change in the trend of Burmese literature. From 1875 onward the owners of Burmese printing presses began to publish popular works such as *pya-zat*, written at full length in the authentic stage idiom, complete with songs and stage directions. *Ma-ha-za-na-ka* (1875) by U Kho was the earliest printed play, but the dominating figure of the period between 1875 and 1885 was I; Ku. His tragic dramas *Lu-wun Maung-hna-ma Pya-zat* ("The Orang-outang Brother and Sister") (1875) and *Uk-ka-la-pa Ya-za-win* ("History of Rangoon") (1877) caught the imagination of the public. Other well-known dramatists of this period were U Yaw, Pok Ni, Su Tha and Chan Mya. At the end of the decade the literary standard of the plays fell as they became overcharged with sentiment and sensationalism.

In 1904 another literary form appeared. A *wut-htu* (novel) called *Maung Yin Maung Ma Mè Ma*, by James Hla Gyaw, an incomplete adaptation of the *Count of Monte Cristo* marked the beginning of modern Burmese fiction. It was followed by *Maung Hmaing* ("The Roselle Seller") by U Kyi also in 1904 and two novels of recognized merit by U Lat, *Sa-be-bin* (1913) and *Shwe-*

pyi-zo (1914). Gradually the novels too deteriorated as the plays had done.

In 1920 Burmese literature received a fresh impetus from the founding of the University of Rangoon. A new generation of writers developed modern prose writing, mainly short stories and essays, in a versatile literary form not too remote from current colloquial speech. Some short poems were also written and two of Molikre's plays were translated. Thein Pe wrote a sensational novel, *Tet Hpon-gyi* ("The Modern Monk") in 1936.

The creation of the republic of the Union of Burma in 1948 stimulated interest in the national culture. Burmese began to replace English both as the official language and as the medium of instruction. The Burma Translation society, founded in 1947, awarded prizes for novels both in translation and as original works. *Mo-awk Mye-byin* ("The Earth Under the Sky") (1948) by Min Aung was the first novel to receive the award. Since then many, including a novel *Mon-ywe-ma-hu* ("Not That I Hate") (1955) by a lady novelist Ja-nk-gyaw Ma Ma Lay, have gained this distinction. The prime minister U Nu contributed two noteworthy literary works: a memoir, *Nga Hnit Ya-thi Ba-ma Pyi* ("Five Years in Burma") (1945) and a play *Lu-du Aung-than* ("The Victorious Voice of the People") (1953); both of these have been translated into English. Two biographies *Yok-pon-hlwa* ("Profiles of Eminent Burmans") (1955) by Da-gon Ta-ya and *Maung Hmaing* (1956) by Thein Han must be mentioned as outstanding works of the modern period.

BURNABY, FREDERICK GUSTAVUS (1842-1885), English traveler and soldier who acquired fame for his winter journey to Khiva through Russian Turkistan in 1875-76 and through Turkey from Scutari to Erzerum and Batum in 1876-77. Born at Bedford, March 3, 1842, he was commissioned into the Royal Horse Guards in 1859 and rose to command; he helped to found *Vanity Fair* in 1868, and was *Times* correspondent with the Carlists in Spain in 1874; he contested Birmingham as a Conservative in 1878; he crossed the English channel in a balloon in 1882. Burnaby covered the Russo-Turkish War of 1877 as agent of the Stafford House (Red Cross) committee, accompanying Valentine Baker Pasha and his Turkish troops in their Bulgarian campaign. He participated, without official leave, in the Suakin campaign of 1884 and in the Gordon relief expedition of 1885; he was killed at Abu Klea on Jan. 17, 1885. His *Ride to Khiva* (1876) and *On Horseback Through Asia Minor* (1877) were widely read.

See T. Wright, *The Life of Colonel Fred Burnaby* (1908); M. Alexander, *The True Blue: Life and Adventures of Col. Fred Burnaby* (1958). (D. MN.)

BURNE-JONES (originally JONES), **SIR EDWARD COLEY**, BART. (1833-1898), English painter and designer, best known for his romantic neomedieval paintings and stained glass, was of Welsh extraction and was born at Birmingham on Aug. 28, 1833. He was educated at King Edward's school, Birmingham, and at Exeter college, Oxford, where William Morris was a fellow student. In 1854 they read John Ruskin's Edinburgh lectures on the Pre-Raphaelites (1853), and saw Sir John Millais' "Return of the Dove to the Ark" on exhibition in Oxford, and W. Holman Hunt's "The Light of the World" at the Royal Academy; that

same year, Burne-Jones was deeply impressed by D. G. Rossetti's illustrations to William Allingham's "The Music Master and Other Poems." Early in 1856 his meeting with Rossetti in London marked a turning point in his career and he left Oxford without graduating. Morris and he then settled in Red Lion square, London, working under Rossetti's guidance, and in 1857 they began the ill-fated Oxford union frescoes. Lack of systematic artistic training sorely tried Burne-Jones, but already he had designed for stained glass, first for Messrs. Powell and after 1861 for Morris and company. In 1859 he visited Florence, Pisa and Genoa.

Burne-Jones's vivid imagination delighted in the stories of medieval chivalry best typified by Robert Southey's edition of Sir Thomas Malory's "Morte d'Arthur" (1856), Tennyson's "Idylls of the Ring" (1859) and Chaucer; artistically, he selected the formal elements in Filippo Lippi and Botticelli, suffusing them with a mood of romantic mysticism peculiar to a Celtic temperament. Two paintings of 1860, "Sidonia von Bork" and "Clara von Bork" (Tate gallery, London), are boldly characterized, decorative works, which, with Morris' "La Belle Iseult" (1858, Tate gallery), show the strong influence Rossetti then exerted. Burne-Jones and his wife accompanied Ruskin to Venice in 1862, where paintings by Carpaccio and the Bellini were particularly admired. From 1864 he exhibited at the Royal Watercolour society, but his first big success came with the Grosvenor gallery's inaugural exhibition in May 1877 of eight works, including several series of oils such as "Days of Creation!" "The Beguiling of Merlin" and "The Mirror of Venus." These were carefully worked up from studies, using a technique of a single colour underpainting, brilliant colours and strong chiaroscuro. The slave figures in "The Wheel of Fortune" (1871-80) are based on Michelangelo's slaves, carved for the tomb of Pope Julius II (Burne-Jones visited Rome in 1871). "King Cophetua and the Beggar Maid" (1884, Tate gallery) represents Burne-Jones's mature style in which oil technique is mastered, but it is typical of his "dreamy medievalism" that the armour was designed by him without reference to historical accuracy. In 1894 he received a baronetcy. He died on June 17, 1898.

Burne-Jones's influence was felt far less in painting than in the field of decorative design, particularly in that of ecclesiastical stained glass. He executed reliefs in metals, tiles and gesso-work, decorations for pianos and organs and cartoons for tapestries. Among the latter may be noted the "Adoration of the Magi" (Exeter college, Oxford). Burne-Jones is well represented at the Birmingham Art gallery. Besides several illustrations to other Kelmscott books, he made 8; designs for the *Chaucer* of 1897.

See O. von Schleinitz, *Burne-Jones* (1901); *Memorials of Edward Burne-Jones* (1904).

BURNELL, ROBERT (d. 1292), chancellor of England, who was the greatest and most trusted minister of Edward I, was born at Acton Burnell in Shropshire. He had entered the service of the lord Edward (afterward Edward I) by 1260, and was employed (1264-65) on confidential business by Henry III and Edward during the Barons' War, winning Edward's lifelong confidence and friendship, and becoming his chief household official. Before leaving for the Holy Land (1270), Edward unsuccessfully urged the Canterbury chapter to make Burnell archbishop, and he appointed him one of the commissioners to act for him during his absence. When Henry III died in 1272, Burnell and the other two commissioners then surviving, Walter Giffard, archbishop of York, and Roger Mortimer, ensured Edward's smooth accession by taking over the government, Burnell becoming the active regent. On his return Edward made Burnell chancellor of England (Sept. 21, 1274) on terms reversing all the changes made by Henry III and the baronial reformers; he held office for life, appointed his own deputy, and kept the profits of the great seal instead of accounting for them and drawing a fixed salary; the chancery, under Burnell's firm control, was unaffected by the administrative scandals of 1286-89. He discharged important diplomatic missions in France (1277-78, 1279, 1286-89) and in Wales (1282-83); he was the leading official member of the tribunal investigating complaints by and against the Welsh prince Llewelyn ap Gruffydd (1276) and of the great commission of inquiry (1289) into com-

plaints of misgovernment during Edward's recent absence. Edward made him bishop of Bath and Wells (1275) and again tried, unsuccessfully, to make him archbishop of Canterbury (1278) and bishop of Winchester (1280)., Though completely worldly and unspiritual, he ruled his diocese powerfully. He amassed a vast fortune in land, developing the family manor of Xcton Curnell as his favourite seat, and he held the Shropshire barony of Castle Holgate and about 80 manors in 19 English counties on his death at Berwick-upon-Tweed on Oct. 25, 1292.

A self-made man of no academic learning but of great practical intelligence, "busy, trusty, congenial," often unscrupulous in action, Burnell's position was unique, and there were no more chancellors like him until Wolsey. As Edward's chief minister, controlling both the chancery and the royal household, Burnell by his expert knowledge, skill, energy and devotion, ensured most of the success of the first 20 years of Edward's reign. (R. F. T.)

BURNES, SIR ALEXANDER (1805-1841), explorer and political envoy whose *Map of Central Asia and Travels Into Bokhara* (1834) brought him geographical renown. was born at Montrose, Scot., on May 16, 1805. He became an ensign in the Bengal army in 1821 and from 1823 to 1829 was on political duty in Cutch where he first became interested in the geography of Afghanistan and central Asia. In 1831 he was sent up the Indus on a mission to Maharaja Ranjit Singh of Lahore and the following year made a remarkable journey in disguise via Peshawar and Kabul to Bokhara, Meshed and the Caspian and thence through Tehran to Bushire on the Persian gulf. At the end of 1836 he was sent on a political mission to Amir Dost Mohammed, with whom he had made close contacts at Kabul. Contrary to Burnes's advice, Lord Auckland, the governor-general, decided to support the unpopular Amir Shah Shujah's claim to the Afghan throne, and Burnes was sent back under Sir William Macnaghten to Kabul to reinstate him in 1839; he became India's regular political agent at Kabul. He was assassinated there on Nov. 2, 1841.

(K. M.)

BURNET, GILBERT (1643-1715), English bishop and historian, author of *History of His Own Time* (1724-34), was born in Edinburgh, Sept. 18, 1643. He was the youngest son of Robert Burnet (1592-1661), afterward Lord Crimond, who had been twice exiled because of his refusal to sign the covenant of 1638, in opposition to a new liturgy for the Church of Scotland, but was nonetheless a severe critic of the government of Charles I. His attitude certainly influenced his son Gilbert, who was educated at Marischal college, Aberdeen, and in 1661 became a probationer for the Scottish ministry. In that year his father died and Gilbert was offered a benefice which he declined on account of the unsettled state of church affairs. He visited Oxford and Cambridge, was much influenced by the Cambridge Platonists and their successors, and after six months' absence returned to Scotland. He again refused offers of preferment and went to Holland and France. In Amsterdam he studied Hebrew and met Protestants of all shades of opinion and in Paris he also met the leading Protestant ministers.

On his return to England in 1664 he became intimate with Sir Robert Moray and John Maitland, afterward duke of Lauderdale, both of whom at that time favoured leniency toward the Scottish Covenanters. While in London Burnet also became a member of the newly established Royal society. During his absence abroad, the living of Saltoun, East Lothian, had been kept open for him; he began his ministrations there in Nov. 1664 and was ordained priest early in 1665. In 1669 he resigned his parish to become professor of divinity in the University of Glasgow. He had already begun to differ from Lauderdale, who was moving in the direction of repression, and became Leighton's right hand in the attempt to secure a compromise between episcopacy and presbyterianism. He had on his side Anne, duchess of Hamilton, on whose behalf he edited *Memoirs of the Lives and Actions of James and William, Dukes of Hamilton and Castleherald . . .* (1676). Meanwhile, he had married an heiress, Lady Margaret Kennedy, daughter of the 5th earl of Cassilis and a cousin of Lauderdale. He renounced all claim to his wife's fortune and the marriage itself was kept secret for three years.

The ascendancy of Lauderdale in Scotland induced Burnet to

settle in England. He went to London in 1673 to arrange for the publication of the Hamilton *Memoirs* and on his return to Scotland found that Lauderdale would not see him and had denounced him to Charles II as a centre of Scottish discontent. Burnet returned to London and resigned his professorship at Glasgow. He had been appointed one of the court chaplains, but Charles II struck him off the roll. He became, however, preacher at the Rolls chapel and was elected lecturer at St. Clement's. Up to April 1675 he had enjoyed the favour of the duke of York, who was, however, alienated when Burnet gave evidence before a committee of the house of commons against Lauderdale.

He presently began the preparation of his *History of the Reformation of the Church of England*. This book was prepared from the original sources, but unfortunately Burnet was denied access to the Cotton library, largely through William Sancroft's influence. The first volume was published in 1679, the second in 1681 and the third in 1715. During the agitation about the popish plot in 1678 he acted with moderation and tried to save at least one of the victims, William Staly. He proposed a compromise in place of the Exclusion bill, a course which led to a very brief reconciliation with the court. He was known to have received the confidence of John Wilmot, earl of Rochester, before his death, and he attended Lord Russell on the scaffold; further, against his own wish, it is true, he preached the usual anti-Catholic sermon on Guy Fawkes day (1684). He was consequently deprived of his appointments by order of the court, and on the accession of James II retired to Paris and eventually to The Hague, where he took the precaution of naturalizing himself as a Dutch subject by way of protection against a prosecution for high treason threatened in England. His first wife was now dead and he married a Dutch heiress of Scottish descent, Mary Scott.

Burnet was able to render great service to William, prince of Orange, because of the confidence placed in him by Princess Mary, whom he persuaded to offer to leave the whole political power in her husband's hands in the event of their joint succession to the English crown. At the revolution he returned to England with William and Mary and the English text of their declaration was drawn up by him. On his own account he published *An Enquiry Into the Measures of Submission to the Supreme Authority*, defending the revolution. For these services he was rewarded by the see of Salisbury and was consecrated on March 31, 1689, by a commission of bishops, Archbishop Sancroft having declined personally to perform the office. Burnet commanded the confidence of Queen Mary and after her death William III appointed an ecclesiastical commission, of which Burnet was a prominent member, for the disposal of vacant benefices, which had been personally supervised by Mary. The provision for the poorer livings afterward carried out by the measure known as Queen Anne's Bounty was originally a proposal made by Burnet. He became tutor (1699) to Princess Anne's son, the duke of Gloucester, but his influence at court declined after Queen Mary's death and disappeared after the accession of Queen Anne.

From 1685 onwards Burnet had been employed on his *History of His Own Time*, but he had from time to time written pamphlets in defence of the Broad-Church position. Of these, probably the most important was his *Exposition of the Thirty-nine Articles* (1669), which was intended to pave the way for the readmission of Nonconformists to the Church of England and gave great offense to the High-Church clergy. He was an exemplary diocesan bishop and his *Discourse of the Pastoral Care* was a favourite book on the ministerial office. His *History of His Own Time* was, by his direction, not to be published until six years after his death. Even then, the work (2 vols., 1724–34) appeared with some omissions made by his sons Gilbert and Thomas. Burnet has frequently been charged with misrepresentation, notably in his account of the birth of James, the Old Pretender. The most valuable part of his work is naturally that relating to transactions of which he had personal knowledge, notably the church history of Scotland and the events leading up to the revolution.

Burnet's second wife died in 1698 and in 1700 he married Elizabeth Berkeley, the author of *A Method of Devotion*, posthumously published in 1710. Of his children by his second wife, WILLIAM

(d. 1720) became a colonial governor in America; GILBERT (1690–1726) became prebendary of Salisbury in 1715 and chaplain to George I in 1718; and SIR THOMAS (1694–1753), his literary executor and biographer, became in 1741 judge in the court of common pleas.

BIBLIOGRAPHY.—The chief authorities for Bishop Burnet's life are his "Rough Draft of my own Life" (ed. by H. C. Foxcroft, 1902, in the *Supplement to Burnet's History*), the life by Sir Thomas Burnet in the *History of His Own Time*, vol. vi (1823), and the *History* itself. A rather severe but detailed and useful criticism is given in L. von Ranke's *History of England*, vol. vi, pp. 45–101 (Eng. ed., 1875). Burnet's letters to his friend George Savile, marquess of Halifax, were published by the Royal Historical society (*Camden Miscellany*, vol. xi). The *History* (1724–34) ran through many editions before it was reprinted at the Clarendon press (1823; supplementary vol. 1833) with the suppressed passages of the first volume and notes by the earls of Dartmouth and Hardwicke and the remarks of Swift. This edition, under the direction of M. J. Routh, was enlarged in a second Oxford edition of 1833. A new edition, based on this, but making use of the Bodleian ms., which differs considerably from the printed version, was edited by Osmund Airy (1897, etc.). In 1902 Miss H. C. Foxcroft edited *A Supplement to Burnet's History of His Own Time* (Clarendon press), prefixed with an account of the relation between the different versions of the *History*—the Bodleian ms., the fragmentary Harleian ms. in the British museum and Sir Thomas Burnet's edition; the book contains the remaining fragments of Burnet's original memoirs, his autobiography, his letters to Admiral Herbert and his private meditations. His *History of the Reformation of the Church of England* was ed. by N. Pocock (Clarendon press, 1865).

See also T. E. S. Clarke and H. C. Foxcroft, *A Life of Gilbert Burnet, Bishop of Salisbury* (1907), with an introduction by C. H. Firth, which contains a chronological list of Burnet's published works. There is a valuable critical appreciation by H. W. C. Davis in *Typical English Churchmen from Parker to Maurice*, ed. by W. E. Collins (1902). Of Burnet's personal character there are well-known descriptions in ch. vii of Macaulay's *History of England* and in W. E. H. Lecky's *History of England in the Eighteenth Century* (1878–90).

BURNET, SIR (FRANK) MACFARLANE (1899–), Australian physician-virologist, co-winner, with P. B. Medawar (*q.v.*), of the 1960 Nobel prize for physiology and medicine for the discovery of acquired immunological tolerance to tissue transplants, was born Sept. 3, 1899, at Traralgon, Victoria. He studied at Geelong college and at Melbourne university, where he received his M.D. degree in 1923. He then was resident pathologist at Melbourne hospital in 1923–24 and a research fellow at the Lister institute in London in 1926–27. Returning to Australia, he became assistant director of the Hall Institute for Medical Research at Melbourne hospital in 1928. He went again to London in 1932–33 as a Rockefeller fellow at the National Institute for Medical Research, then resumed his post at the Hall institute, becoming director in 1944. In that year he also became professor of experimental medicine at Melbourne university.

Burnet's major works, besides those on human transplants, included a technique for culturing viruses in living chick embryos and a method for identifying bacteria by the bacteriophages that attack them. By his virus researches he increased knowledge of the way in which influenza viruses cause infection and brought nearer the conquest of diseases (myxomatosis, Murray Valley fever and Q fever) particularly troublesome in Australia. He was made a fellow of the Royal society in 1942, was awarded its medal in 1947, was knighted in 1951, won an Albert Lasker award in 1952, was voted the Emil von Behring prize in 1954 and received the Order of Merit in 1958.

Among Burnet's publications are *Biological Aspects of Infectious Disease* (1940), revised in 1953 and retitled *Natural History of Infectious Diseases; Production of Antibodies* (1941); *Virus as Organism* (1945); *Viruses and Man* (1953); *Principles of Animal Virology* (1955); *Enzyme, Antigen and Virus* (1956); and *Clonal Selection Theory of Acquired Immunity* (1959).

BURNET, THOMAS (c. 1635–1715), Anglican theologian, whose fame rests upon his speculations on cosmology and eschatology, was born at Croft in Yorkshire about the year 1635. He was educated at Northallerton and at Clare hall, Cambridge, and became master of the Charterhouse, London, in 1685. He died at the Charterhouse on Sept. 27, 1215.

Burnet set forth his cosmology in his famous *Telluris theoria sacra*, or *Sacred Theory of the Earth*, published in London in 1684. This work, containing a fanciful theory of the earth's structure,

attracted much attention, and he was afterward encouraged to issue an English translation, which was printed in folio. 1684–89. In 1692 he published another book on the origin of things, treating the account of the fall of man in the Book of Genesis as an allegory rather than a literal history; this book, which appeared in English only after Burnet's death, excited a great clamour against him. His eschatological theories likewise were not published until after his death. In a book on the faith and duties of Christians (1723) and in another on the state of the dead (1723), he maintained the doctrine of a middle state between death and resurrection, the millennium, and the limited duration of future punishment. (J. J. P.N.)

BURNET, name given to several plants of the genus *Sanguisorba* (rose family), perennials with pinnate leaves and bearing dense heads of small flowers at the summit of a long stalk. Salad burnet (*S. minor*) and great burnet (*S. officinalis*) are natives of Eurasia and are naturalized in North America. Canadian burnet (*S. canadensis*) is a North American plant found on peaty or boggy soils from Labrador through the eastern U.S. to Georgia and west to Illinois.

Burnets may be grown as ornamentals and for their leaves, which are used in soups and salads. (J. W. T.T.)

BURNETT, FRANCES ELIZA (née HODGSON) (1849–1924), Anglo-American novelist, best known for *Little Lord Fauntleroy*, was born in Manchester, Eng., on Nov. 24, 1849. She moved to Knoxville, Tenn., in 1865, and in 1873 married S. M. Burnett, whom she divorced in 1898. A writer for children and adults from girlhood, her first wide success was a tale of the Lancashire coal mines, *That Lass o' Lowrie's* (1877). A novel *Through One Administration* (1883) had as its theme corruption in Washington, D.C.

Her most popular work, *Little Lord Fauntleroy* (1886), is the story of an American boy who becomes heir to an English dukedom. Very successful both as a novel and a play, it established Cedric's long curls and velvet suit with lace collar as a mother's model for small boys, who hated it. *Sara Crewe* (1888), dramatized as *The Little Princess* (1905) and *The Secret Garden* (1909) were two other well-loved books for children. Mrs Burnett wrote other plays which, like most of her 40-odd novels, were of a sentimental, romantic turn, *The Lady of Quality* (1896) being the best.

She died at Plandome, N.Y., on Oct. 29, 1924. *The One I Knew the Best of All: A Memory of the Mind of a Child* (1893) tells of her own childhood.

See *The Romantick Lady* (1927) by her son, Vivian Burnett, the original of *Little Lord Fauntleroy*.

BURNEY, CHARLES (1726–1814), English organist, composer and musical historian, author of *A General History of Music*, was born in Shrewsbury on April 7, 1726, and was educated there and at Chester. In 1744 he went to London as a pupil of Dr. Thomas Arne and was later appointed organist of St. Dionis's Backchurch, Fenchurch street (1749), and harpsichordist at the King's Arms, Cornhill, where concerts of new music were regularly given. Advised to leave London on account of ill health, he became organist at St. Margaret's, King's Lynn, Norfolk, from 1751 to 1760. He returned to London and in 1764 made his first journey abroad to Paris, where he began to collect material for his *History*. Further extensive tours, begun in June 1770, took him to Paris, Geneva, Turin, Milan, Padua, Venice, Bologna, Florence, Rome and Naples. Burney published his observations in a fascinating travel book *The Present State of Music in France and Italy* (1771). In July 1772 Burney revisited the continent in search of further materials, again publishing his journal under the title *The Present State of Music in Germany, the Netherlands and the United Provinces* (1773). His *General History of Music* was published in four volumes from 1776 to 1789. In 1783 he obtained, through Edmund Burke, the post of organist at Chelsea hospital, and in 1806 C. J. Fox procured for him a pension of £200 a year. He died in Chelsea on April 12, 1814.

Burney was a man of great personal charm and had an immense circle of friends, including Dr. Johnson, who spoke highly of his integrity. As a historian of music he had one rival, Sir John

Hawkins, whose five-volume *General History of the Science and Practice of Music* appeared in 1776. But Burney's superlative literary gifts gave him an advantage over Hawkins and his *History* proved the more successful. In fact, since Hawkins was a lover of old music and Burney of modern, the two works are complementary, both of the greatest interest and equally indispensable to any serious student of 18th-century music. Burney wrote various other works including *In Commemoration of Handel* (1784), *Memoirs and Letters of the Abate Metastasio*, three volumes (1796), and *An Essay Towards a History of Comets* (1769)—he was greatly interested in astronomy and met many European men of science. In his later years he contributed numerous musical articles to Abraham Rees's *Cyclopaedia*.

As a composer Burney lacked a personal style, but as an author he was one of the most gifted of all English writers on music, possessing a style all his own, combining facility of expression with perspicacity, urbanity and wit. As a critic his point of view was that of the enlightened modernist, with a marked admiration for Italian vocal music; in his later life he was a strong advocate of the music of Haydn, whom he knew during that composer's visits to England.

Modern editions of the *History* and the *Musical Tours* have been published, with much valuable additional materials from manuscript and other sources. Unfortunately his own memoirs were destroyed by his daughter Fanny Burney when she wrote her own memoirs of her father, published in 1832.

See P. A. Scholes (ed.), *Dr. Burney's Musical Tours in Europe*, 2 vol. (1959); *The Great Dr. Burney*, 2 vol. (1948). (C.S. CH.)

BURNEY, FANNY (FRANCES D'ARBLAY) (1752–1840), English novelist and letter writer, author of *Evelina*, a landmark in the development of the novel of manners. The daughter of Charles Burney (*q.v.*), she was born at King's Lynn, Norfolk, June 13, 1752, the third child in a family of six. One brother, James, was a sailor and another, Charles, a distinguished classical scholar. In 1760 the family moved to London, where her father taught music. Mrs. Burney died in 1762. Though her sisters Esther and Susan were sent to school in Paris, Fanny educated herself by omnivorous reading at home: Shakespeare, such classics as Plutarch's *Lives*, history, sermons, courtesy books and other ethical works, poetry, plays and the novelists Richardson, Fielding, Smollett, Prévost, Marivaux and others. The early reading was accompanied by early scribbling, but all her works, including a novel "The History of Caroline Evelyn," were burned on her 15th birthday.

Fanny's development was much influenced by her father's friend Samuel Crisp, a cultivated littérateur who had retired to Chessington hall, near Epsom, Surrey. Since the hall was in fact a boarding-house, the Burneys often went there for holidays or to work. Burney's *Tour* to Italy was written there and much of Fanny's *Evelina* and *Cecilia*. The journal-letters or reports that Samuel Crisp encouraged her to write on London and on the visitors to her father's lively house in St. Martin's street were the basis for the epistolary accounts that Evelina addressed to the fictional Mr. Villars. It was to "Daddy Crisp," whom she loved better than anyone outside her own family (and to whom she became "the dearest thing in the world"), that she addressed the early journals and such works as the journals of her visits to Streatham with its accounts of Dr. Johnson.

In 1767 her father married Elizabeth Allen, a widow with three children, and when in 1770 the two families moved into one large house tensions soon developed between the Burney children and their stepmother. In 1774 the family moved to Newton house, in St. Martin's street, Leicester square, and it was there that the social and musical evenings took place, so graphically described in Fanny's journals and those of her sisters. The young Burneys favoured witty and humorous visitors, among whom were the Rev. Thomas Twining (Aristotelian Twining) and David Garrick. The journals also describe the London of the 1770s and '80s, the pleasure gardens, assemblies, theatres, exhibitions and the operas and, occasionally, give firsthand accounts of events like the Gordon riots.

In 1767 when "The History of Caroline Evelyn" was burned,

Fanny's invention turned to Caroline's motherless daughter Evelina, whose adventures expanded as the young Burneys themselves grew up, while the "sentiments," given largely to Villars, derived from courtesy books. When her father was writing his *Tours of Italy and Germany* (1771-73), Fanny was employed as amanuensis. Burney's *History of Music* came next, but when the first volume went to press (Dec. 1775) she was free again. The neglect of her journals and correspondence in 1776-77 indicate her absorption in *Evelina*.

It was unheard of, however, for a young girl to write a novel and the publisher Dodsley refused to consider an anonymous work. Thomas Lowndes was applied to and no scene in *Evelina* is more amusing than the secret dealings of the young Burneys, when Charles, disguised as "Mr. King" in "an old great coat and a large old hat," carried letters and manuscripts to the publisher and received replies addressed to "Mr. King" at the Orange coffee house. Lowndes liked the first volume and what he saw of the second but declined to publish an "Unfinish'd book." With publication in prospect Fanny revised the colloquial and racy language of the first drafts. The "gentles" were given elegant speeches while the natural dialogue of the "cits" contributed much to the book's realism and humour and served to differentiate the characters.

The book, published in Jan. 1778, was an astounding success. By the summer everyone was reading *Evelina, or, the History of a Young Lady's Entrance Into the World*. Burke had sat up all night to read it; Dr. Johnson had laughed uproariously at the Holborn beaux. Evelina's journal-letters often read like lively scenes in a comedy of manners. Fanny was observant with an attentive ear for dialect and the differentiation of London speech, and the presentation of contemporary scenes make *Evelina* a lively period piece. The realism of the scenes of low life reminded readers of Fielding. The novel also exposed the heart and mind of a young girl and traced the development of a heroine subject to human error, in short, a human being, rather than a paragon of the virtues. The plot terminated in marriage, the mistakes of untutored young girlhood constituting the impediments. A plot concerned with contemporary manners, the development of which depends upon the erring and uncertain conduct of the heroine, was an innovation that pointed the way for Jane Austen. The novel also offered the pathetic scenes so much prized in the age of sensibility and in Villars' letters, a compact but complete courtesy book. Finally, in describing the delicate balance of the tensions between Evelina and Lord Orville, it told a love story of enduring strength. Addressed to the young, the novel has a quality perennially young. Before the close of 1779 it had run to four editions and it remains a classic.

Though by June 1778 her father had read reviews of *Evelina* he did not know, any more than the rest of London, who had written the book. Informed by Susan, who confessed that Fan was the culprit, he could not restrain his tears at the lines to himself ("O Author of my being!") or suppress his pride. In spite of his daughter's wish for anonymity, he told the secret to his literary friends, among them, Mrs. Thrale (see PIOZZI, HESTER LYSCH), who at once invited Fanny to Streatham. A close friendship developed between the clever and hospitable mistress of Streatham place and the shy wit, who was soon found to be "a girl of prodigious Parts," able, once she had overcome initial shyness, to hold her own with the wits of literary London including Dr. Johnson himself. The great man was very kind to her and between 1779 and 1783 when, like him, she was a guest of the Thrales for months at a time, often accompanying them to Tunbridge Wells, Brighton and Bath, she had opportunities for observing and recording that Boswell might have envied. New scenes and personages provided fresh matter for journal-letters and the Streatham, Brighton and Bath journals of 1778-82 (vol. i and ii in Austin Dobson's edition) have been prized for their vignettes of contemporary scenes and personages and especially of Dr. Johnson, his kindness and his sense of fun. He in turn loved all the Burneys he knew and some he did not and loved them "for loving each other."

Richard Brinsley Sheridan, Arthur Murphy and others who had noted the lively dialogue of the comic scenes in *Evelina* now persuaded Miss Burney to try her hand at comedy. In 1779 she com-

pleted "The Witlings," a satire on literary pretensions. The play was a comic and satiric exposé of the blue-stockings: so clearly could the "Queen of the Blues," Mrs. Montague, be discerned that Crisp and Fanny's father, fearing reprisals, hastily repressed the piece, which remains unprinted.

The same monitors now began to press the writer to write another novel. *Cecilia, or Memoirs of an Heiress*, five volumes (1782), written under pressure, lacked the spontaneity of *Evelina*. Now known herself and realizing that what she wrote would be read by the old and wise, she felt heavily responsible. The plot, more massive than that of *Evelina*, incorporated improving themes meant to inculcate lessons, give status to the suspect novel and please the age. The scope was still wide in its cross section of London life and the social satire as amusing as before. The work won great respect and in the years 1782-85 Fanny was much lionized in London literary assemblies and drawing rooms, where she often met Sir Joshua Reynolds, Dr. Johnson, Burke, the fashionable Miss Monckton, Richard Owen Cambridge and his son George Owen.

Henry Thrale died in 1781, "Daddy Crisp" in 1783 and Dr. Johnson in 1784. These years were also perplexed by the ambiguous attentions of the young clergyman George Owen Cambridge, which came to nothing. In 1785 Fanny was presented to Queen Charlotte and King George III and in the summer of 1786 she was invited to court as second keeper of the robes with a salary of £200 a year.

Fanny was now 34. Disappointment in love, difficulties with her stepmother together with her father's delight in having a daughter at court overcame her regret at such a retirement from her family and the world. Her duties were often strenuous, but what she found more difficult to bear was the impingement on her time and liberty exacted by the first keeper of the robes, the cruel and abusive Mrs. Schwelkenberg, who insisted on her company at picquet and at the tea table where the king's equerries were entertained in the evenings. Fanny's loyalty to the royal family and her sympathy and help during the king's illness at Kew (1788-89) won her the affection of the queen and the princesses, proved by about 200 affective letters to the ageing Madame d'Arblay (written between 1818-40) from the princesses Elizabeth, Mary and Sophia. The strain of court service told on her health and in 1790 her father was persuaded to request that she be allowed to resign. She was released in July 1791 with a pension of £100 a year.

The literary output of the years 1786-91 consisted of the court journals; often dispatched in monthly packets to her sister Susan at Mickleham and to the Lockes of Norbury park (vol. iii and iv in Austin Dobson's edition). She dutifully repressed the court gossip of the appalling years of the king's madness, the schemes for the regency, etc., but retailed her own life and events of public interest like the trial of Warren Hastings. To beguile the weary year of 1790-91 she wrote four blank-verse tragedies: "Edwy and Elgiva," "Hubert De Vere," "The Siege of Pevensey" and the unfinished "Elberta." "Edwy and Elgiva," though acted by Mrs. Siddons, Bensley and Kemble, ran at Drury Lane theatre in 1795 for one night only.

On visits to Norbury park and Mickleham in 1792 Fanny met Alexandre Gabriel Jean-Baptiste Piochard d'Arblay, adjutant-general to Lafayette, one of the group of French Constitutionalists (see FEUILLANTS, CLUB OF THE) who in Aug. 1792 fled to England, some of them finding refuge at Juniper hall, near Mickleham. Romance developed rapidly; the general offered his hand and though Fanny's father objected to the *émigré's* circumstances, the marriage took place on July 28, 1793, in Mickleham and never, wrote Fanny later, was "union more blest." The D'Arblays soon moved to a cottage in Great Bookham and on Dec. 18, 1794, a son, Alexander Charles Louis Piochard, was born.

In 1793 Madame d'Arblay published a charity sermon, *Brief Reflections Relative to the Emigrant French Clergy*. In 1796 she completed a potboiler, the courtesy novel *Camilla: or a Picture of Youth* (5 vol.), which yielded £1,000 with another £1,000 for the copyright and enabled D'Arblay to build a new house, Camilla cottage, in West Humble near Mickleham, Surrey, where they moved in Nov. 1797. The West Humble days were perhaps the

happiest of Fanny's life, though one of its sorrows was the failing health of her sister Susan, since 1796 an exile, as she felt, on her husband's estate in County Louth, in Ireland. Her death (Jan. 1800) removed the *raison d'être* of the thick packets of journal-letters (erroneously called diaries) that Madame d'Arbly all her life had sent to this sister, receiving thousands of confidential journal pages in return; although written as personal letters only, they are of social and historical interest. Later journals describing significant public or private events were usually composed at her husband's request to be handed down to his son.

In the West Humble period (1797-1801) Madame d'Arbly wrote three comedies, all unpublished: "Love and Fashion," accepted for production at Covent Garden, but withdrawn at Susan's death; "The Woman-Hater"; and "A Busy Day," a lively playable piece, reminiscent of the comic and satiric parts of *Evelina* and *Cecilia*.

In 1801 Alexandre d'Arbly returned to France, and Madame d'Arbly arrived in Paris with her son in May 1802 intending a visit of a year, but when war broke out again her stay (or exile, as she sometimes thought it) was extended to ten years. D'Arbly, loyal both to the old regime and to his wife's country, found employment as a civil servant. Madame d'Arbly managed to return to England in 1812 to see her father, who died in 1814. In London (1813-14) she completed *The Wanderer: or Female Difficulties* (five volumes), a critique attacking English insularity and inhospitality to foreigners, a great disappointment to readers expecting satiric pictures of Napoleonic France. She was paid £1,500 for the first edition, which was sold out before it was printed. No one since, it is said, has ever read *The Wanderer*.

In 1815, when Napoleon escaped from Elba, General d'Arbly, now *maréchal de camp* and second lieutenant of the king's guard, was with the troops who covered Louis XVIII's retreat to the coast. Madame d'Arbly fled with other royalists to Brussels, where she wrote long letters to her family describing the preparations for war and the aftermath of battle. In July 1815, learning that her husband had been injured at Trèves, she crossed France and parts of the Rbineland to join him. When he had recovered they traveled to London and late in 1815 settled in Bath. D'Arbly was decorated and made a lieutenant general but his personal fortunes remained in ruin, his health failed and he died in Bath in May 1818.

At the desire of her son—now a senior wrangler, a fellow of Christ's college, Cambridge, and about to be ordained—Madame d'Arbly moved to London, taking a house at 11, Bolton street, Piccadilly (1818-23), later moving to 1, Half Moon street, Berkeley square (1828-37). Both houses were near her brother James's lively home at Buckingham gate. In these years her mind was much occupied with the career of her brilliant but erratic son.

In this later London period (1818-32) she fulfilled her husband's requests by writing up journals of past events such as her adventures at Ilfracombe (1817), her journey to Trèves (1817) and her introductions to the duchesse d'Angoulême and Louis XVIII (1814). She edited a selection of journals for publication (those re-edited by her niece Charlotte Barrett and published by Colburn, 1842-46, and the papers re-edited by Annie Raine Ellis as the *Early Diary*, 1889). She also read through her father's "Memoirs" and correspondence, destroying and obliterating parts she thought would give pain, as she had done with other journals. In 1832 she published *Memoirs of Doctor Burney*, three volumes, a work much attacked for its inflated style and prejudiced selection of material.

Though still remembered as the famous Madame d'Arbly, she lived in quiet retirement! visited occasionally by famous men like William Wilberforce and Sir Walter Scott and faithful friends like Lady Keith (Queeney Thrale) and Amelia (Locke) Angerstein. The younger Burneys, paying duty calls, found her invariably kind, incredibly wise and often when her health permitted as entertaining as ever with her store of curious anecdotes related with all her old powers of narration and talents of mimicry. Neither her extraordinary memory nor her imagination failed. The family letters of this period (as of all other times) are filled with affection, charity and kindness and are written in a lively style sharply

in contrast to that of the *Memoirs of Doctor Burney*.

The deaths of her son (1837) and of her sister Charlotte Broome (1838) saddened her closing years. She died on Jan. 6, 1840, and was buried with her son and her husband in Wolcot churchyard, Bath.

BURNHAM, DANIEL HUDSON (1846-1912), U.S. architect, an early advocate of metropolitan area planning, was born at Henderson, N.Y., Sept. 4, 1846. He was educated at Chicago and at Waltham, Mass. He worked in Chicago, and in 1873 formed a partnership with John W. Root. Their work was of vital importance in the development of steel skeleton construction. They were entrusted with the planning of the World's Columbian exposition at Chicago (1893). On Root's death this work fell wholly upon Burnham.

Other large commissions included the Rookery (1886) and the Monadnock building (1891), which was the world's tallest wall-bearing building, in Chicago; the Flatiron building (1902), which was the world's tallest building, and Wanamaker's store (1903) in New York; Filene's store (1912) in Boston; the Union station (1904) in Washington, D.C.; and Selfridge's store (1909) in London.

Burnham was asked to propose plans for improving several cities, including Cleveland, San Francisco, Chicago and Baltimore, and for cities in the Philippines. His "Plan for Chicago" (1909), sometimes called a "city beautiful" proposal, anticipated by 30 years the need for transportation, parks and residential development on a metropolitan area basis. He was chairman of the committee which produced the McMillan plan for Washington, D.C. (1910).

He died in Heidelberg, Ger., on June 1, 1912.

See C. Moore, *Daniel H. Burnham, Architect, Planner of Cities*, 2 vol. (1921). (R. R. I.)

BURNHAM, EDWARD LEVY LAWSON, 1ST BARON (1833-1916), English newspaper proprietor who virtually created the *London Daily Telegraph*, was born in London, Dec. 28, 1833, and was educated at University College school. His father, Joseph Moses Levy (d. 1888), acquired the *Daily Telegraph and Courier* in 1855, a few months after it had been founded by Colonel Sleigh, and, aided by his son, soon changed the current of its fortunes, raising it to a leading position and making it the pioneer London penny paper. Edward Levy (he took the added name of Lawson under his uncle's will in 1875) acted as editor of the *Daily Telegraph* till his father's death and then became its managing proprietor and sole controller till 1903, when he was made a baron and passed over these duties to his son. He had received a baronetcy in 1892.

For many years Edward Lawson was one of the outstanding figures in English journalism. No one in Great Britain did more than he to brighten and humanize the daily newspaper and transform it from a plain, severe chronicle of the day's events (only mitigated by the occasional ferocity of its political judgments) into a readable and entertaining presentation of the world's news. The abolition of the last of the paper duties (1861), in which Lawson himself bore an active part, called into being a host of fresh newspaper readers among the middle classes, which welcomed the popular features of the new journalism. His conception of a popular daily paper was that it should be a faithful mirror of the times and make a strong appeal to the feeling of its readers.

Under his direction the *Daily Telegraph* raised large funds for national, patriotic and charitable objects, dispatched missions of exploration to Central Africa and elsewhere and started novel features: such as popular correspondences on live topics of the day, which later became the established commonplace of journalism. For many years the *Daily Telegraph* warmly supported the Liberal party, but it strongly dissented from Gladstone's anti-Turkish policy and the final severance came on his Irish policy of Home Rule. Lawson was not by nature a strong political partisan; what interested him most was the social advancement of the people and the development of the British empire, to which causes he gave strong support whatever the politics of the government of the day. Edward VII, as prince of Wales and later as king, frequently visited his home.

He was president of the Institute of Journalists (1892-93) and the Newspaper Press Fund (1908-16) and in 1909 presided over the first Imperial Press Conference in London. In 1862 he married Harriette Georgiana (d. 1897), daughter of the actor-manager Benjamin Webster. He died in London, Jan. 9, 1916. (J. B. F.)

BURNHAM BEECHES, a woodland covering 600 ac. on a plateau of gravelly sand, is west of the road from Slough to Beaconsfield, Buckinghamshire, Eng. Once the property of Burnham abbey, it passed into private hands at the Dissolution. After 1878 the Corporation of the City of London acquired 492 ac. for public recreation. The fantastic shapes of the beech trees are due to the old practice of pollarding, whereby branches were lopped off their short trunks, at intervals of several years, for firewood; fresh shoots arose at a height beyond the reach of cattle. Oak and birch are also found, together with ferny open spaces.

(H. L. EN.)

BURNHAM-ON-CROUCH, an urban district of Essex, Eng., is 20 mi. E.S. of Chelmsford by road. Pop. (1961) 4,167. Burnham lies 6 mi. from the North sea; below it the Crouch river is joined on the south side by the Roach, which branches into numerous creeks forming Foulness, Wallasea, Pottton and other flat islands. The church of St. Mary, mainly 14th century, has one of the 40 bells cast by John Walgrave (1415). There are extensive oyster beds in the Crouch estuary and a shellfish research laboratory was opened in 1953. Burnham-on-Crouch, which possesses four yacht clubs, is one of the best-known yachting centres in the British Isles, and boatbuilding and sailmaking are carried on. The district is mainly agricultural, the only heavy industry being ironworks.

BURNING BUSH, a common name for the gas plant and for *Euonymus americanus*. See GAS PLANT; EUONYMUS.

BURNISHER, a tool used principally in the arts, as the name implies, to give a high polish to a decorated surface. The tool differs in size, shape and material, according to the purpose for which it is intended. The burnisher used by the artist is generally about 10 to 12 in. in length. At one end is an agate, flint or blood stone, very smoothly polished, and cut in various shapes, ranging from a point to a round, square or oblong end, curved hook or spear shape, firmly set in a metal ferrule. The burnisher, as a finishing tool, is brought into the process of gilding after the surface has been carefully prepared—scraped, cleaned, polished, washed in an acid solution and thoroughly dried. The gold leaf is then applied and the colour brought out by means of rubbing with the burnisher. On very early panel and mural paintings, and on illuminated manuscripts is found a thinly beaten gold leaf or finely powdered metallic gold, applied over a smooth priming or foundation, similar to what today is called burnish gold size. This was prepared by the early gilders from a very high grade of rabbit or hide glue, mixed together with natural red bolus, a variety of clay. After the gold size has dried smooth and hard, the gold leaf or powder is carefully applied and then very gently rubbed with the burnisher until the desired high finish is obtained. It is necessary that the gold to be burnished be laid on a very smooth and hard surface to obtain the most brilliant results. Today, burnish gold leaf, a variety differing only slightly from the ordinary gold leaf—about one carat softer—is used extensively. Genuine metallic gold powder is seldom employed because of its high cost. Imitation gold powder, or so-called burnishing bronze, is widely used com-

FLINT AND AGATE BURNISHERS USED IN BOOKBINDING

mercially. Gilders of picture and mirror frames, book edges, greeting and playing card edges, illuminated manuscripts and other productions are the principal users of these burnishers.

Another style of burnisher made of a very high-grade steel is used by the artist etcher and metalworker to remove rough burrs or to obtain a highly polished surface to parts of the copper or zinc plate, or to make corrections. The leather carver also employs a burnisher to give a desired finish to tooled leather. The burnisher used by the ceramic artist to finish gold decorations on china or porcelain is made of spun glass. The gold on the china is quite dull after leaving the firing kiln. It is carefully burnished with the glass burnisher until the required finish is obtained.

There is no record of any definite date or period when burnishers were introduced in the arts. From earliest times there is evidence of their use.

(F. W. WE.)

BURNLEY, a municipal (1861), county (1888) and parliamentary (1867) borough of Lancashire, Eng., is situated at the junction of the rivers Brun and Calder, 24 mi. N. of Manchester by road and on the Leeds and Liverpool canal. Pop. (1961) 80,588. Burnley's growth from a township of 2,000 in 1790 depended on the canal, its coal and its position in the weaving areas of Lancashire. By the early 19th century the cotton trade had entirely superseded that of wool and in time Burnley became important not only for its cotton cloth but also for the manufacture of looms. The town suffered severely during the cotton famine consequent upon the American Civil War. Cotton weaving and coal mining are still two of the principal industries, the third being light engineering, including the manufacture of kitchen equipment, electric fires, automobile accessories and gas turbines. The weekly market and annual fair were granted by a charter of 1294. Towneley hall (mainly 17th century but said to date in part from the time of Edward III) is now a municipal museum and art gallery. There are the Municipal college, grammar and technical schools and 477 ac. of parks and recreation grounds. The parish church of St. Peter dates from 1120 and has a Perpendicular tower, but has been much restored. In 1890 Burnley was created a bishopric suffragan of the Manchester diocese but later it was included under the diocese of Blackburn founded in 1926.

(C. V. T.)

BURNOUF, EUGÈNE (1801-1852), French orientalist, by whose labours a knowledge of the Zend language was first brought to Europe, was born in Paris on Aug. 12, 1801. He published in 1826 an *Essai sur le Pâli* . . ., written in collaboration with Christian Lassen, and in the following year *Observations grammaticales sur quelques passages de l'essai sur le Pâli*. His next great work was the deciphering of the Zend manuscripts brought to France by Anquetil-Duperron. He caused the Vendidad Sade, part of one of the books bearing the name of Zoroaster, to be lithographed with the utmost care from the Zend manuscript in the Bibliothèque Nationale, and published it in folio parts (1829-43). From 1833 to 1845 he published his *Commentaire sur le Yaçna, l'un des livres liturgiques des Parses*; he also published the Sanskrit text and French translation of the *Bhâgavata Purâna* ou

histoire poétique de Krichna in three folio volumes (1840–47). His last works were *Introduction à l'histoire du Bouddhisme Indien* (1844) and a translation of *Le Lotus de la bonne Loi* (1852). He died at Paris on May 28, 1852.

BURNS, SIR GEORGE, BART. (1795–1890), Scottish ship-owner and one of the founders of the Cunard line, was born in Glasgow on Dec. 10, 1795. In partnership with a brother, James, he began as a Glasgow general merchant, and in 1824, in conjunction with a Liverpool partner, Hugh Matthie, started a line of small sailing ships which ran between Glasgow and Liverpool. Later, the vessels were also sailed to Belfast, and steamers replaced the sailing ships. In 1830 a partnership was entered into with the MacIvers of Liverpool. In 1839, with Samuel Cunard, Robert Napier and other businessmen, the partners (David MacIver and Burns) started the British and North American Royal Mail Steam Packet company, later known as the Cunard line. They secured the British government's contract for the carrying of the mails of North America. Burns retired in 1858 and was made a baronet in 1889. He died on June 2, 1890, at Castle Wemyss, Renfrewshire.

JOHN BURNS, 1ST BARON INVERCLYDE (1829–1901), his eldest son, as Sir John Burns, became head of the Cunard company in 1880, and was created a peer in 1897.

GEORGE ARBUTHNOT BURNS, 2ND BARON INVERCLYDE (1861–1905) became chairman of the Cunard company in 1902. He took part in the application of turbine engines to ocean liners.

BURNS, JOHN ELLIOT (1858–1943), British labour leader, was described by Beatrice and Sidney Webb in their *History of Trade Unionism* (1894) as "in many respects, the most striking personality in the Labour movement." When, in 1906, he became the first man of working-class origin to enter the cabinet, his record, his intelligence, his dignity of manner and appearance seemed to promise a future as distinguished as his past; but by 1914 his career was virtually ended and in 1918 he retired from public life altogether.

Born in London on Oct. 20, 1858, he began work at 10; and at 14 was an engineering apprentice, supplementing his scanty education by attendance at night school and extensive reading. A period as an engineer on the west Niger, and contact on his return with V. Delahaye, a French communard, widened his horizons. He early proved an effective speaker at first on temperance and, later, on industrial and political topics; he was arrested in 1877 for an address on Clapham common, and in 1878 for braving a "Jingo" crowd at a demonstration in Hyde park. He joined the Amalgamated Engineering union, and became, with Tom Mann, a leader of the "New Unionism" (see TRADE [LABOUR] UNIONS). His outlook was always political and not merely industrial. In 1883 he joined H. M. Hyndman's Social Democratic federation (S.D.F.)—the one professedly socialist body then available—and in 1885 stood, unsuccessfully, for parliament. During the following years of economic slump, he became known as a champion of the unemployed. In 1886 he was, with three other S.D.F. leaders, prosecuted for sedition; on his acquittal, his speech for the defense—"The Man With the Red Flag"—was printed and widely read. In 1887 he was sentenced to six weeks imprisonment for participating in a riot in Trafalgar square on Nov. 12, a day that came to be known as "Bloody Sunday." In 1889 he was the dominating figure in the great London dock strike, which brought the casual and the unskilled worker into the organized trade unions.

In the same year, Burns was elected as a Progressive to London's new county council, and proved a useful and effective member, carrying through a motion imposing trade union rates in London county council contracts and fighting against private monopolies. In 1892 he was elected chairman of the Trades Union congress by an imposing majority. Although he took an active part in the transactions of the Labour Representation committee (L.R.C.), out of which the Labour party arose, he did not share the independent outlook of James Keir Hardie; when he stood for Battersea in 1892, he was not an L.R.C. candidate. Elected member of parliament, as again in 1895, 1900 and 1906, he stood aloof from the young Labour party, and in 1906 joined Sir Henry Campbell-Bannerman's Liberal cabinet, as president of the local government

board—then the main authority for the poor laws. He opposed the Webbs and their crusade for fundamental reform of the poor laws, as expressed in the minority report of the royal commission of 1905–09. The portrait of Burns drawn in the *Diaries* of Beatrice Webb is coloured by this conflict, and by the fact that the onetime agitator had become the conciliator, as evidenced by his settlement of the London docks and transport strike of 1911. In 1914 he was moved to the board of trade, but on Aug. 4 resigned rather than consent to British participation in a war. Between 1914 and 1918 when, because of Labour opposition, he lost his seat in Rattersea, he made no public statement either in or out of parliament. His interest was apparently concentrated in his remarkable library about London; he would often be seen on the Thames steamboats, the centre of a lively group of youngsters. But, from his eloquent action of Aug. 4, 1914, until his death in London on Jan. 24, 1943, he was silent.

See William Kent, *John Burns: Labour's Lost Leader* (1950).
(M. A. H.)

BURNS, ROBERT (1759–1796), the greatest Scottish poet after the middle ages, whose poems and songs have made him the national poet of Scotland, was born at Alloway, Ayrshire, on Jan. 25, 1759. His father had come to Ayrshire from Kincardineshire in an endeavour to improve his fortunes, but though he worked immensely hard first on the farm of Mount Oliphant which he leased in 1766 and then on that of Lochlie which he took in 1777, ill-luck dogged him, and he died in 1784, worn out and bankrupt. It was matching his father being thus beaten down that helped to make Robert both a rebel against the social order of his day and a bitter satirist of all forms of religious and political thought which condoned or perpetuated inhumanity. The elder Burns was ambitious for his children, and Robert received some formal schooling from a teacher, as well as sporadically from other sources; he acquired a superficial reading knowledge of French and a bare smattering of Latin, and he read most of the important 18th-century English writers as well as Shakespeare, Milton and Dryden. Indeed, his formal education was turned entirely toward England; his knowledge of Scottish literature was in his childhood confined to orally transmitted folk songs and folk tales together with a modernization of the late 15th-century poem *Wallace*, a work which "poured a Scottish prejudice in my veins which will boil along there till the floodgates of life shut in eternal rest." Burns also studied biblical history, world geography and English grammar; and he learned some physics, astronomy and botany from such books as William Derham's *Astro-Theology* and John Ray's *Wisdom of God Manifested in the Works of the Creation*, which presented scientific facts as arguments for the existence of God as a benevolent designer. Burns's religion throughout his adult life seems to have been a humanitarian deism,

Proud, restless and full of a nameless ambition, the young Robert Burns did his share of hard work on the family farm. After his father's death he was head of the household and tenant of the farm of Mossiel to which the family moved. But he had already started writing poetry, in which the tone of Scottish folk song and that of 18th-century sentimental and meditative poetry were strangely mingled. Early in 1783 he began to keep a commonplace book in which he entered his first poem (a song, written for a specific folk tune) in April, preceded by the comment: "There is certainly some connection between Love and Music and Poetry . . . I never had the least thought or inclination of turning Poet till I once got heartily in love, and then rhyme and song were, in a manner, the spontaneous language of my heart." The poem is an unpretentious, lilting piece, written in an English tipped with Scots, but it becomes pure neoclassic English in the final stanza. Shortly afterward he entered in the commonplace book sentimental, melodramatic or melancholy pieces whose thought reflected the family misfortunes of the time and whose vocabulary and manner derived from minor 18th-century English poets. He was cultivating, in a heavily self-conscious way, a gloomy sensibility. But suddenly we come across a lively, swinging piece deriving from the Scottish folk tradition rather than from contemporary English sentimentalists: "My father was a farmer upon the Carrick border O." This was entered in the commonplace book in 1784, with an

apologetic note that it was "miserably deficient in versification." Meanwhile his father's death freed him to seek male and female companionship where he would. He took sides against the dominant extreme Calvinist wing of the church in Ayrshire and championed a local gentleman, Gavin Hamilton, who had got into trouble with the Kirk Session for sabbath breaking. He had an affair with a servant girl at the farm. Elizabeth Paton, who in 1785 bore his first illegitimate child, and on the child's birth he welcomed it with a lively poem. This poem was written in a stanza that had had a long history in Scottish poetry, and had been used by Allan Ramsay and Robert Fergusson. Even more purely in the Scottish literary tradition is "The Death and Dying Words of Poor Maillie," entered in the commonplace book in June 1785, this is a "mock testament" put into the mouth of a dying sheep, done with shrewd ironical humour and considerable technical adroitness. Burns had by now available to him not only the Scottish folk tradition but also some at least of the traditions of Scottish "art" poetry both as they came to him through Fergusson and as he found them for himself in 18th-century collections of older Scottish poetry.

Burns developed rapidly throughout 1784 and 1785 as an "occasional" poet who more and more turned to verse to express his emotions of love, friendship or amusement or his ironical contemplation of the social scene. But these were not spontaneous effusions by an almost illiterate peasant. Burns was a very conscientious craftsman; his entries in the commonplace book reveal that from the beginning he was interested in the technical problems of versification. If he never learned to distinguish emotional control from emotional self-indulgence in 18th-century English poetry, he did learn to appreciate economy, cogency and variety in the work of Pope and others, and, most important of all, he learned from older Scots literature to handle Scottish literary forms and stanza patterns, particularly in descriptive and satirical verse, with assurance and cunning. From the oral folk tradition he learned a great deal about song rhythms and the fitting of words to music; and out of his own Ayrshire speech, his knowledge of older Scots and his reading in standard English, he fashioned a flexible Scots-English idiom which, though hardly a literary language in the sense that Robert Henryson's or William Dunbar's language was, proved to be an effective medium for a poetry that was distinctly Scottish without being antiquarian.

Though he wrote poetry for his own amusement and that of his friends, Burns remained restless and dissatisfied. He won the reputation of being a dangerous rebel against orthodox religion, and when in 1786 he fell in love with Jean Armour, her father refused to allow her to marry Burns even though a child was on the way and under Scots law mutual consent followed by consummation constituted a legal marriage. Jean was persuaded by her father to go back on her promise; Robert, hurt and enraged, took up with another girl, Mary Campbell, who died soon after; on Sept. 3 Jean bore him twins out of wedlock. Meanwhile, the farm was not prospering, and Burns, harassed by insoluble emotional and economic problems, thought of emigrating to Jamaica. But he first wanted to show his country what he could do. In the midst of his troubles with the Armours (Armour threatened to sue him to provide for the upkeep of Jean's twins) he went ahead with his plans for publishing a volume of his poems at the nearby town of Kilmarnock. It was entitled *Poems, Chiefly in the Scottish Dialect*, and appeared on July 31, 1786. Its success was immediate and overwhelming. Simple country folk and sophisticated Edinburgh critics alike hailed it, and the upshot was that Burns set out for Edinburgh on Nov. 27, 1786, to be lionized, patronized and showered with well-meant but dangerous advice.

The Kilmarnock volume was a remarkable mixture. It included a handful of first-rate Scots poems: "The Twa Dogs," "Scotch Drink," "The Holy Fair," "An Address to the Deil," "The Death and Dying Words of Poor Maillie," "To a Mouse," "To a Louse" and some others, including a number of verse-letters addressed to various friends. There were also a few Scots poems in which he was unable to sustain his inspiration or which are spoiled by a confused purpose (such as "The Vision"), and one ("Hallowe'en") which is too self-consciously rustic in its dogged descriptions of country customs and rituals and its almost exhibitionist use of

archaic rural terms. There were also six gloomy and histrionic poems in English, four songs, of which only one, "It Was Upon a Lammis Night," showed promise of his future greatness as a song writer, and, what to contemporary reviewers seemed the stars of the volume, "The Cotter's Saturday Night" and "To a Mountain Daisy."

Burns selected his Kilmarnock poems with care: he was anxious to impress a genteel Edinburgh audience. In his preface he played up to contemporary sentimental views about the natural man and the noble peasant, exaggerated his lack of education, pretended to a lack of natural resources which was ridiculous in the light of the careful craftsmanship which his poetry displays and in general acted a part. The trouble is that he was only half acting. He was uncertain enough about the genteel tradition to accept much of it at its face value, and though, to his ultimate glory, he kept returning to what his own instincts told him was the true path for him to follow, far too many of his poems are marred by a naive and sentimental moralizing. "The Cotter's Saturday Night," which has stanzas of quiet beauty and impressive craftsmanship, also contains passages of intolerable histrionics and others where sharply etched realism and grandiose theatrical generalizations stand oddly side by side: Burns was not certain whether he was projecting a picture of Scottish peasant life from the inside or showing off the Scottish peasant for the edification of connoisseurs of sentimental beauties in Edinburgh. Burns the song writer was hardly represented in the Kilmarnock volume; most of his songs were still unwritten, but in any case the Edinburgh literati did not consider songs as one of the higher kinds of poetry. Burns the satirist was revealed in some degree: "The Holy Fair," written in the old Scottish tradition of poems describing popular festivities, describes with ironic humour the goings on at one of the great outdoor "tent preachings" that were held annually in connection with the communion service. "The Twa Dogs" achieves some deft thrusts at the Scottish upper classes through an innocent-seeming dialogue between two dogs. "An Address to the Deil," drawing on the devil of folklore rather than of Calvinist theology, uses a tone of amused familiarity in order to diminish the Devil (the poem is a fine example of Burns's technique of implicitly criticizing theological dogmas by translating them into the daily realities of ordinary experience). But Burns omitted his greatest satires in order not to shock his genteel audience. He omitted "The Ordination," a brilliant satire on Ayrshire church politics in the same stanza (an old Scottish verse form) as "The Holy Fair" and done with even greater verve and dexterity; "Address to the Unco Guid," an attack on Puritan hypocrisy; the amusing and skilful "Death and Doctor Hornbook"; and the rollicking satire "The Twa Herds," an early poem which Burns described as a "burlesque lamentation on a quarrel between two reverend Calvinists." And he omitted "Holy Willie's Prayer," the greatest of all his satiric poems and one of the great verse-satires of all time; it attacks the Calvinist view of predestination by putting a prayer in the mouth of a strict Calvinist convinced of his predestined salvation. Also omitted was his remarkable anarchist cantata "The Jolly Beggars," in which he assembled a group of social outcasts and put into their mouths roaring songs of conviviality, social defiance and swaggering independence. Burns's anarchism is not a mature or a complex attitude, but it does touch a fundamental human drive, and "The Jolly Beggars" gives brilliant expression to man as outcast and vagabond.

Some notion of the different degrees of skill and integrity displayed by Burns in the Kilmarnock volume can be obtained by setting side by side "To a Louse," "To a Mouse" and "To a Mountain Daisy." The first is easily the best, a bright, lively, humorous poem moving adroitly to a conclusion which is expressed with the gnomic pithiness of a country proverb, as the lady in church on whose bonnet a louse is crawling is restored to common humanity from which she tried to distinguish herself earlier in the poem. "To a Mouse," one of Burns's most charming and best-known poems, nevertheless lacks the tautness and the skilful manipulation of irony and humour of "To a Louse." The poet expresses his regret to the "wee, sleekit, cowrin, tim'rous beastie," on turning her up in her nest with the plough, and reflects that he him-

self is in an even worse situation. The fellow-feeling for the little creature is spontaneous and engaging, but the emergence of self-pity at the end as the real theme seems forced, and there is a touch of attitudinizing. This attitudinizing runs right through the sentimental "To a Mountain Daisy," in which he laments the fate of the crushed flower (also turned down with the plough) and compares it to that of a betrayed maiden. Burns was here posturing as a "man of feeling," and in his review of the Kilmarnock edition Henry Mackenzie, the original "Man of Feeling," singled out the poem for praise. This illustrates how pressure from those who dominated literary fashions in Edinburgh was continually directed at Burns to turn him from a vigorous and original Scottish poet to a minor imitator of Shenstone or Gray.

Edinburgh unsettled Burns, and after a number of amorous and other adventures there, and several trips to other parts of Scotland, he settled in the summer of 1788 at a farm in Ellisland, Dumfriesshire, leased to him by an admirer who was nevertheless a shrewd landlord. At Edinburgh, too, he arranged for a new and enlarged edition (1787) of his poems, but little of significance was added to the Kilmarnock selection. Substantially, it was by the Kilmarnock poems that Burns was known in his lifetime. He found farming at Ellisland difficult, though he was helped by Jean Armour, with whom he had been reconciled and whom he finally married in 1788, to the annoyance of the Edinburgh grass widow Mrs. Agnes Macle hose (the "Clarinda" of the poems), with whom he had been carrying on a violent flirtation which produced some indifferent lyrics and, at the final parting, one great song, "he Fond Kiss."

In Edinburgh Burns had met James Johnson, a keen collector of Scottish songs who was bringing out a series of volumes of songs with the music, and enlisted Burns's help in finding, editing, improving and rewriting items. Burns was enthusiastic and soon became virtual editor of Johnson's *Scots Musical Museum*. Later, he became involved with a similar project for George Thomson, but Thomson was a more consciously genteel person than Johnson, and Burns had to fight with him to prevent him from "refining" words and music and so ruining their character. The five volumes of Johnson's *Scots Musical Museum* (1787-97) and the four volumes of Thomson's *Select Collection of Original Scottish Airs* (1793-1805) contain the bulk of Burns's songs. Burns spent the latter part of his life in assiduously collecting and writing songs, to provide words for traditional Scottish airs and to keep Johnson and Thomson going. He regarded his work as service to Scotland and quixotically refused payment. The only poem he wrote after his Edinburgh visit which showed a hitherto unsuspected side of his poetic genius was "Tam o'Shanter," a spirited narrative poem in brilliantly handled octosyllabic couplets based on a folk legend associated with Alloway Kirk.

Meanwhile, Burns corresponded with and visited on terms of equality a great variety of literary and other people who were considerably "above" him socially. He was an admirable letter writer and a brilliant talker, and he could hold his own in any company. At the same time, he was still a struggling tenant farmer, and the attempt to keep himself going in two different social and intellectual capacities was wearing him down. After trying for a long time, he finally obtained a post in the excise service in 1789 and moved to Dumfries in 1791, where he lived until his death on July 21, 1796, caused by rheumatic heart disease contracted in his youth as a result of too much physical exertion on an inadequate diet. (The myth that Burns died of drink has long since been exploded.) His life at Dumfries was active. He wrote numerous "occasional" poems on contemporary political and other events, and did an immense amount of work for the two song collections, in addition to carrying out his duties as exciseman. The outbreak of the French Revolution excited him, and some indiscreet outbursts nearly lost him his job at a time when the excesses of the French revolutionaries had provoked the fiercest political reaction in Scotland. But his reputation as a good exciseman and a politic but humiliating recantation saved him. It was his attitude to the French Revolution, too, that estranged him from Mrs. Dunlop, an elderly female admirer who was genuinely fond of Burns and had been a real friend to him.

Burns was a man of great intellectual energy and force of character who in a class-ridden society never found an environment in which he could fully exercise his personality. After his death the lively literary lady Maria Riddell wrote a character sketch of him in *The Dumfries Weekly Journal* in which she said that his powers of conversation, his impromptu wit, his ability to grasp new ideas, his intolerance of stupidity and arrogance, his capacity for devastating ironic comment were in her opinion even more impressive than his poetry. But it was not only the class structure of his society, which led to his being alternately patronized and sentimentalized over, that constricted him. The fact is that Scottish culture in his day could provide no intellectual background that might replace the Calvinism which Burns rejected. The Edinburgh literati of Burns's day were second-raters. But the problem was more than one of personalities. The only substitute for the rejected Calvinism seemed to be a sentimental deism, a facile belief in the good heart as all, and this was not a creed rich or complex enough to nourish great poetry. That Burns in spite of this produced so much fine poetry shows the strength of his unique and remarkable genius, and that he has become the Scottish national poet, celebrated annually with rites associated with no other man of letters anywhere in the world, is a tribute to his hold on the popular imagination.

Burns perhaps exhibited his greatest poetic powers in his satires. There is also a remarkable craftsmanship in his verse-letters, which display a most adroit counterpointing of the colloquial and the formal. But it is by his songs that Burns is best known and it is his songs that have carried his reputation round the world. Burns is without doubt the greatest song writer Britain has produced. He found Scottish song in a confused and fragmentary state. Scottish airs had been popular since the latter part of the 17th century, and many collections of Scottish songs and song tunes appeared both in Edinburgh and London in the 18th century. But the great majority of older songs survived only in fragments. Burns's aim was to recover as many airs and sets of words as he could, and where the existing words were fragmentary or impossibly coarse or equally impossibly genteel, to re-create the song in the true spirit of the folk tradition. It was a staggering program, nothing less than the single-handed re-creation of the whole body of Scottish folk song. Further, Burns undertook to provide words to tunes which now existed only as dance tunes. He was anxious that all Scotland should be represented, and in his journeys scrupulously collected such songs and fragments as he could find to rework them into complete songs. We can trace his journeys in the provenance of the songs: a fisherman's song from Fife, an old Aberdeen folksong, a song about an ale-house keeper by the Moray firth and innumerable love songs connected with particular hills, valleys, streams and woods in various Scottish counties. If Burns had not been uncannily in tune with the folk spirit in Scottish song, he would be execrated today for having spoiled the original fragments by artificial improvements. But in fact he did not spoil them; he saved them from total corruption and disappearance and gave them new life and meaning and popularity.

Burns wrote all his songs to known tunes, sometimes writing several sets of words to the same air in an endeavour to find the most apt poem for a given melody. Many songs which we know from a variety of evidence must have been substantially written by Burns he never claimed as his. He never claimed "Auld Lang Syne," for example, which he described simply as an old fragment he had discovered, but the song we have is almost certainly his, though the chorus and probably the first stanza are old. (Burns wrote it for a simple and moving old air which is *not* the tune to which it is now sung, as Thomson set it to another tune.) The full extent of Burns's work on Scottish song will probably never be known.

It is positively miraculous that Burns was able to enter into the spirit of older folk song and re-create, out of an old chorus, such songs as "I'm O'er Young to Marry Yet," "Green Grow the Rashes O," "Sae Fair her Hair" (to the tune of "Gala Water") and a host of others. It is this uncanny ability to speak with the great anonymous voice of the Scottish people that explains the

special feeling which Burns arouses. feelings that manifest themselves in the "Burns cult." a phenomenon associated with no other British poet. But his songs are not all in a simple folk idiom. though most of them have that air of simplicity (whatever the subtleties below the surface) so necessary to a sung poem. There is the symbolic colour and imagery of "Open the Door to Me Oh!" which so impressed W. B. Yeats:

The wan moon is setting ayont the white wave,
And time is setting with me, oh!

A wonderful mixture of tenderness and swagger—so characteristic of the male in love—appears in "A Red, Red Rose," Burns's re-writing of an old fragment. In "Yestreen I Had a Pint o' Wine" is the magnificent abandonment to the moment of experience:

The kirk and state may gae to hell,
And I'll gae to my Anna.

In the controlled historical melancholy of the Jacobite songs Burns gives this romantic lost cause a new meaning in terms of human emotion:

Now a' is done that men can do,
And a' is done in vain;
My Love and Native Land fareweel,
For I maun cross the main, my dear,
For I maun cross the main.

In contrast there is the splendid drinking song, "Willie Brew'd a Peck o' Maut," with its rollicking chorus:

We are na fou, We're nae that fou
But just a drappie in our e'e; . . .

and, again, a brilliant counterpointing of folk feeling and high ceremony, of simple emotion and pageantry, in "Go, Fetch to Me a Pint o' Wine," where the whole atmosphere of medieval romance and ballad is concentrated in two stanzas. There is the magical tenderness of "O Lay Thy Loof in Mine, Lass" though there the tune is particularly important. There is the lilting love song he composed to one of his wife's favourite airs, "The Posie":

O luve will venture in, where it daur na weel be seen,
O luve will venture in, where wisdom ance has been; . . .

There is that sprightly piece of ironic self-compliment. "There Was a Lad Was Born in Kyle." There is the moving benedictory cadence, so perfectly wrought together with the music, in "Ca' the Yowes to the Knowes":

Ghaist nor bogle shalt thou fear;
Thou'rt to love and Heaven sae dear,
Nocht of ill may come thee near,
My bonnie dearie.

and the protective gentleness of "O, Wert Thou in the Cauld Blast," written as he lay dying, for Jessie Lewars who helped nurse him, to her favourite air, "Lennox, Love to Blantyre." Here the dying man reversed the actual roles of himself and the girl and wrote as the protecting male.

Love songs, work songs, drinking songs—Burns achieved brilliant success in all three varieties. He is one of the few love poets who relates sex to paternity and maternity, who links the sexual ecstasy with the prospect of children, who never isolates sexual passion into a Platonic ideal removed from given human relationships but keeps it always grounded in the known facts of experience. And he could sing the songs of either sex. Where else in English—or Scottish—literature can we find the happy audacity of "O Wha My Babie-Clouts Will Buy," the song he put into the mouth of Jean Armour when she was about to bear his child and which expresses both the female joy in sexual surrender and the female joy in maternity? Burns does not idealize lust, but he localizes and even domesticates it, something much more difficult to do. He is not a "romantic" poet in the popular sense of that term. He never waxes enthusiastic over the mountains or the sea (he never mentions the former and very rarely the latter), but he sees the familiar landscape of the countryside as a context within which the rhythms of human emotions and the farmer's year act themselves out. He is above all the poet of the realized moment of experience, of human feeling purged of all the accretions and falsifications of idealization and generalization.

BIBLIOGRAPHY.—*Poems: Poems, Chiefly in the Scottish Dialect* (1786); the enlarged edition of 1787 added, among others, "Death and

Doctor Hornbook," "The ordination" and "Address to the Unco Guid"; the 2-volume edition published in 1793 was the last edition with which Burns himself was directly concerned. Many of his finest poems were not published in his lifetime. "The Jolly Beggars" was first published as a chapbook in 1799 and was included in J. Walker's edition of the *Poems* (2 vol., 1811). "Holy Willie's Prayer" was first printed anonymously in an 8-page pamphlet in 1789, together with "Quotations from the Presbetyrian Eloquence."

The most important of 19th-century editions of the poems and of later editions, many with biographical accounts, are: *Life and Works of Robert Burns*, ed. by R. Chambers, 4 vol. (1856–57), and the revision of this by W. Wallace in 1896 (known as the "Chambers-Wallace" edition, still the most comprehensive of all works on Burns); *The Works of Robert Burns*, ed. by W. Scott Douglas, 6 vol. (1877–79); *The Poems and Songs of Robert Burns*, ed. by Andrew Lang and W. A. Craigie (1896); *The Poetry of Robert Burns*, ed. by W. E. Henley and T. F. Henderson, 4 vol. (Centenary edition, and still the standard edition, although in some respects out of date, 1896–97); *Poems and Songs*, ed. by J. Barke (1955); *Poems and Selected Letters* (Alloway bicentenary edition, 1959).

Songs: Most of Burns's songs first appeared (often anonymously) in James Johnson's *Scots Musical Museum*, 5 vol. (1787–97) and George Thomson's *Select Collection of Original Scottish Airs*, 4 vol. (1793–1805). *The Songs of Robert Burns*, by James C. Dick (1903) is an important scholarly edition of both words and music, giving the original airs for which the songs were written, and containing valuable historical and critical notes. Dick's *Notes on Scottish Song* (1908) and *Annotations of Scottish Songs*, by D. Cook (1922) contain useful information. A complete and accurate modern edition of Burns's songs with the original airs is still a desideratum.

Letters: The standard edition of Burns's letters is *Letters of Robert Burns*, ed. by J. De Lancey Ferguson, 2 vol. (1931), but the *Selected Letters* (1953) ed. by De Lancey Ferguson has a few letters from original texts that had not been recovered at the time of Ferguson's complete edition.

Biography and criticism: R. H. Cromek, *Reliques of Robert Burns* (1808); J. G. Lockhart, *The Life of Robert Burns* (1828), founded a tradition of Burns biography but it is full of inaccuracies and misinterpretations; A. Angellier, *Robert Burns: La Vie, Les Oeuvres* (1829); H. Hecht, *Robert Burns: Leben und Werke des Schottischen Volksdichters* (1919, Eng. trans. by J. Lymburn, 1936, 2nd ed., 1950); F. B. Snyder, *The Life of Robert Burns* (1932); De Lancey Ferguson, *Pride and Passion: Robert Burns* (1939); Robert T. Fitzhugh, *Robert Burns, His Associates and Contemporaries* (1943), presents important documents for the study of Burns's biography. *Burns as Others Saw Him* (1959) collects contemporary accounts of the poet; D. Daiches, *Robert Burns* (1950) is a critical study of the poems and includes an introductory chapter on the Scottish literary tradition; T. Crawford, *Burns: a Study of the Poems and Songs* (1960). See also *Burns Chronicle* (annually, since 1892). (D. Ds.)

BURNS. Burns and scalds result from the effect of contact with flames, hot substances, certain chemicals, radiation or electricity. The term scald, referring to injuries from hot water or steam, had almost completely dropped out of medical literature by the early 1960s, and all these injuries are now usually called burns. Burns of the skin are classified in three ways, according to depth, area and cause.

Depth of Burns.—The classification of depth most commonly used in the United States and the Commonwealth of Nations divides the cases into three degrees. In the first the skin is reddened, sore and tender but not blistered; the damage is confined to outer layers of the skin. In second-degree burns the skin is blistered and the blisters may break. The upper and intermediate skin cells are killed but the deepest cells of the skin are not; the skin is usually reddened, swollen and, if blisters are broken, weeping. In third-degree burns the full thickness of the skin and more or less underlying tissue is destroyed. The area looks dead white, brown, bright red or charred and may not be swollen at first. The depth of burns may be estimated shortly after injury but cannot be classified accurately in many cases for two to four weeks, when the killed tissue has separated from the wound. With or without treatment first-degree burns usually heal without scarring in six days or less and second-degree burns in six weeks or less with slight scarring. Third-degree burns more than two inches in diameter will heal only after months of treatment and with great scarring and deformity unless early grafting operations are done.

Area of Burns.—The areas of burns are classified according to percentage of the total skin surface involved. As a rough guide to making such an estimate, the area of one side of the victim's hand and fingers may be considered as 1% of the total. Shock is much more directly related to the area of the burn than to its depth or

to the causal agent. Burns of 8% or more in infants or feeble adults and of 15% or more in healthy young adults may be expected to cause serious shock.

Causal Agents.—Most burns are caused by spilling hot liquids and by flames. However, sunlight, ultraviolet light, electricity, hot metals, chemicals, steam. X-rays, radium and atomic bombs also cause burns. The chief effects of contact with flame, hot water, steam, chemical and electrical burns are apparent promptly. There is a delay of several hours before the full effects of sun or ultraviolet burns are apparent and a delay of 10 to 30 days before the full effects of X-ray, radium or atomic burns are apparent.

Hot Fluids.—Most hot fluid burns are caused by splashing, and the contact with the hot fluid is of short duration and to small areas of the surface. As a result most such burns are of first and second degree only and are usually not fatal.

Flames.—When cotton or other inflammable clothes or bedclothes are ignited the flames can spread rapidly and will usually burn long enough to cause third-degree burns unless promptly smothered. A large proportion of fatal burns are due to flames.

Electricity.—Electricity may cause a burn by a flash or by setting clothes on fire. The latter burns are similar in effect to other flame burns of the same magnitude. An electrical current can also burn as it passes through the skin or other tissues. It may cause extensive deep injury that appears to be out of proportion to the surface injury.

Chemicals.—Strong acids, strong alkalies and many other chemicals can cause severe burns, which usually are the result of splashing or spilling of the fluid. Immediate removal of clothing and washing with water are essential to minimize the effect of the chemical, which continues to act at the expense of the patient's living tissue until it is wholly removed or neutralized.

Radiation.—Overexposure to X-ray and radium may result in severe burns that are insidious in onset and do not show any effect for about a week. After a single dose the peak effect comes during the third week. These burns penetrate much more deeply than others and if severe are healed only with great difficulty. Surgical operations may be needed to remove killed tissue and to cover open areas with skin grafts. Skin cancers may arise many years after such burns.

Burns from radioactive piles or solutions have the same characteristics as radium burns; in some recorded instances of accidental exposure, however, the energy released was so great that rapid death resulted. Extreme precautions must be taken to prevent exposure to radiation even when very small quantities of radioactive isotopes are used. In the explosion of an atomic bomb several kinds of energy are released. There may be burns caused by ultraviolet rays, by gamma rays or by exposure to radioactive deposits (akin to radium burns). Gamma rays and radium rays have great penetrating power and may destroy life by damaging deeply placed, sensitive body cells such as those in the bone marrow. Death may follow in patients whose skin injuries were of relatively small magnitude. Generally, a total body radiation of more than 150 roentgens is very serious and if more than 300 roentgens is usually fatal within a few weeks.

Treatment.—In general, treatment may be divided into four parts: the treatment of shock; the treatment of the burn by dressings and chemotherapy; the treatment of deep burns by surgery, and the nutritional treatment of the patient.

Shock.—Shock results largely from leakage of plasma from the circulation to the tissues under the burn and through it to the outside of the body. If more than a fifth of the blood volume escapes from the circulation, insufficient blood returns to the heart so that it cannot maintain blood pressure. Shock is measured by measuring the blood pressure, but the likelihood of its occurrence may be determined by testing the percentage of red blood cells in a specimen of blood (hematocrit). If it rises 10% or more above normal (45%), shock is present or threatened.

The treatment of actual or threatened shock consists of transfusions of blood plasma, serum albumin, whole blood, saline and glucose solutions, sodium bicarbonate or sodium lactate solutions and large doses of the water-soluble vitamins: thiamin, riboflavin, nicotinic acid and ascorbic acid. Treatment should always be

given before shock starts if possible. The loss of plasma from the circulation may continue for two days. As much as five litres of plasma or blood may be needed, but this amount is never given all at the same time. After several hours severe shock is incurable by any treatment.

Dressings and Chemotherapy.—The treatment of the burn wound has two purposes—to reduce pain and to exclude infection. The washing of a burn or administration of an ointment is relatively unimportant. The important thing is to apply a large, sterile, firm dressing that is well fitted into place and extends well beyond the limits of the burn. It should act as a splint to prevent any motion that would cause pulling or rubbing between the dressing and the skin. Burn dressings should not be changed more than once a week. Anesthesia may be needed when dressings are changed.

Antibiotics are important in the treatment of some of the complications of large and deep burns. At mid-20th century, exposure treatment of burns as an alternative to dressings was revived as a treatment for certain patients. This treatment entails keeping the patient in a warm, isolated and relatively sterile room. It has real value in many extensive deep burns of the trunk, neck, head and perineum.

Surgery.—When the whole thickness of the skin is destroyed, natural healing can come only from the skin cells at the edges of the wound. If the area is more than one inch wide a graft is indicated. This should be a part-thickness graft cut with a razor or a dermatome and should cover the whole wound completely. Some surgeons excise the dead tissue to permit early grafts. In any case the graft should be done as early as possible but only onto a clean bed of healthy tissue cells. With successful early grafts, contractures and unsightly scars can be largely eliminated. If scars do occur, they may be removed later and further grafting done. (See PLASTIC SURGERY: Burns.)

Nutrition.—The loss of serum and pus from the wound and of other substances in the urine results in early depletion of essential protein, minerals and vitamins from the body. Seriously burned patients have difficulty in taking food and may be able to take only a small part of a normal diet. Poor intake of food, combined with severe losses, leads to rapid loss of weight and strength. Under such conditions, forced feeding through a stomach tube and into the veins may maintain the patient's strength. Protein digests with added glucose, salt and water-soluble vitamins should be given intravenously. A high-protein, high-vitamin, high-caloric and low-fat diet should be given orally or through a stomach tube. This diet may be most easily obtained by adding large quantities of skim milk, skim milk powder and vitamins to an ordinary diet and insisting that the patient take the liquids first. In severe cases it may be advisable to give 25% of 4,000 calories per day in the form of protein and to give 10 times the normal requirements of vitamins.

Prognosis of Burns.—With the treatment of shock already mentioned, patients with first- and second-degree burns of 90% of body area have occasionally been saved, and most patients with 50% burns or less should be saved. With third-degree burns only a few patients with 40% burns can be saved, but most with 20% or less should survive. This represents a great improvement over the situation prior to the availability of plasma and whole blood for the treatment of shock (1940-43), when almost every patient with a 30%-area burn died.

Internal Burns.—The mouth, nasal cavity, respiratory tract, esophagus and stomach, vagina, bladder and rectum are all subject to burns. Of these, burns of the respiratory tract and of the esophagus are the most common. Inhalation of hot smoke, gases and steam in burning buildings may cause severe burns of the trachea and the bronchi and may lead to death from asphyxia or pneumonia. Treatment consists of antibiotics to combat infection and oxygen to support respiration, or humidification of the air to moisten secretions and aspiration to remove secretions. An early tracheotomy may be lifesaving and, if indicated, should be done early.

Burns of the esophagus usually occur in infants as a result of drinking lye. If the child does not die a stricture is likely to

result. Instrumental dilation after two to three weeks is essential.

Colebrook, *A New Approach to the Treatment of Burns and Scalds* (1950); National Academy of Sciences, National Research Council, *Symposium on Burns* (1951); C. C. Lund and S. M. Levenson, "Burns," ch. 4, vol. 1, in *Operative Technic in General Surgery*, ed. by Warren H. Cole, 2nd ed. (1955). (C. C. Ld.)

BURNSIDE, AMBROSE EVERETT (1824–1881). U.S. army commander during the American Civil War, was born at Liberty, Ind., on May 23, 1824. He was appointed to the U.S. Military academy, West Point, N.Y., and graduated in 1847, when war with Mexico was nearly over. In 1853 he resigned his commission and for the next five years engaged in the manufacture of firearms at Bristol, R.I. In 1856 he invented a breech-loading carbine.

When the Civil War broke out Burnside took command of a Rhode Island regiment of militia and commanded a brigade in the first battle of Bull Run (*q.v.*). On Aug. 6, 1861, he was commissioned brigadier general of volunteers and placed in charge of the expeditionary force which sailed in Jan. 1862 for the North Carolina coast. He was promoted to the rank of major general soon afterward and was transferred to the Virginia theatre of war. Part of his forces fought in the last battles of Pope's campaign in Virginia, and Burnside himself was engaged in the battles of South Mountain and Antietam (*q.v.*). At the latter he was in command of McClellan's left wing, but the want of vigour in his attack was unfavourably criticized.

Burnside's patriotic spirit, modesty and amiable manners made him highly popular, and upon McClellan's final removal (Nov. 7) from the army of the Potomac, President Lincoln chose him as successor. The choice was unfortunate. He sustained a crushing defeat at the battle of Fredericksburg (*q.v.*), and on Jan. 27, 1863, he was replaced by Gen. Joseph Hooker. Transferred to Cincinnati in March 1863, he caused the arrest and court-martial of Clement L. Vallandigham (*q.v.*), lately an opposition member of congress, for an alleged disloyal speech. Later in the year his measures for the suppression of press criticism aroused much opposition. He helped to crush Morgan's Ohio raid in July; then, moving to relieve the loyalists in east Tennessee, in September entered Knoxville, to which the Confederate general James Longstreet unsuccessfully laid siege. In 1864 Burnside led his old corps under Grant in the Wilderness and Petersburg campaigns. After bearing his part well in the many bloody battles of that time, he was overtaken once more by disaster. The failure of the "Burnside mine" at Petersburg brought about his resignation. (*See AMERICAN CIVIL WAR: Military Operations, 1864–65; PETERSBURG CAMPAIGN.*)

In 1866 Burnside became governor of Rhode Island and served for three terms (1866–69). He was a Republican member of the U.S. congress from 1875 until his death at Bristol, R.I., on Sept. 13, 1881. His name became synonymous with the type of side whiskers (later known as "sideburns") that he wore.

BURNTISLAND, a royal and small burgh in Fifeshire, Scot., on the northern shore of the Firth of Forth, 5½ mi. S.W. of Kirkcaldy by road and 5 mi. N. of Edinburgh across the firth. Pop. (1961) 6,036. Its golf links and beach give it a reputation as a summer resort. The chief industries are shipbuilding and aluminium works. Coal is exported. On the rocks forming the western end of the harbour stands Rossend castle which overlooks the harbour and is a house grafted on to a castle dating from 1382 where Mary Queen of Scots once lodged. The church (1592) is modeled on the North church at Amsterdam. The name Burntisland may refer to the time when the site, or part of it, formed an island, as sea sand is the subsoil even of the oldest quarters. Another derivation is from Gaelic words meaning "the island beyond the bend."

BURR, AARON (1756–1836). U.S. political leader, was born Feb. 6, 1756, at Newark, N.J. His father was the second president of the College of New Jersey (later Princeton university) and his mother was the daughter of the eminent Puritan clergyman Jona-

than Edwards. Shortly after his birth he was taken to Princeton, N.J., where both his father and mother died while he was still an infant. With his sister Sarah he was placed in the Elizabethtown home of an uncle, the Rev. Timothy Edwards, and brought up under the care of a tutor, Tapping Reeve, who later married Sarah.

Aaron was a troublesome ward, but he entered the College of New Jersey at the age of thirteen and was graduated with distinction at sixteen. He spent the year after graduation in "busy idleness" reading and thinking. He was expected to follow in the steps of his forebears by becoming a torch-bearer of the Calvinistic faith, and, to satisfy his own mind, early in 1774 he undertook the study of theology. The result was that "completely and forever" he rejected the gospel according to Jonathan Edwards. But the times called for action rather than contemplation, and from the beginning of the colonies' dispute with England, young Burr espoused the patriot cause. He began the study of law at Litchfield, Conn., under his brother-in-law Tapping Reeve, but had made only slight progress when the call to arms was sounded.

First joining Washington's army at Cambridge, Burr served as captain under Benedict Arnold on the ill-fated expedition against Quebec. Next he served on Washington's staff and then on the staff of Gen. Israel Putnam during the New York campaign, and in 1777 was promoted to rank of lieutenant colonel in the Continental line. He fought at Monmouth, then resigned from the service in March 1779 because of ill-health. As a soldier his record was creditable but not distinguished. In accord with the custom of the times, he bore the title of "colonel" to the end of his life.

Soon after leaving the service, Burr resumed the study of law and in 1782 was licensed to practise. During the same year he married Theodosia Prevost, widow of a British officer and ten years his senior. Their only child was also named Theodosia. (*See BURR, THEODOSIA.*) At the end of hostilities, Burr returned to New York city to practise law and met with marked success. His mansion at Richmond Hill was the scene of brilliant social gatherings, but extravagance and carelessness in money matters were already in evidence. In 1784 Burr was elected to the state legislature and in 1789 became attorney general under Gov. George Clinton. Finally, in 1791, at the age of 35, he defeated Gen. Philip Schuyler, father-in-law of Alexander Hamilton, for a seat in the U.S. senate. He failed of re-election in 1797 and spent the next two years in New York state politics. In 1800 he was named vice-presidential candidate on the Republican ticket headed by Thomas Jefferson. Using his Tammany Hall connection, Burr carried his state and thus helped bring about a national victory for his party. Under the procedures then prevailing the electors had cast their votes for both Jefferson and Burr without indicating which should be president and which vice-president. The ensuing deadlock resulted in a sharp contest in the house of representatives where, for 35 ballots, the pro-Burr Federalists, without Burr's aid, succeeded in stalling off the victory of Jefferson. But Alexander Hamilton's determined opposition to Burr finally resulted in Jefferson's election as president, whereupon Burr became vice-president.

In Feb. 1804 Burr's friends in the New York legislature nominated him for the governorship of the state. Again Hamilton and his cohorts brought about Burr's defeat, and shortly thereafter George Clinton replaced him as vice-presidential candidate on the Republican ticket in the 1804 national election.

As a result of the charges Hamilton had made against Burr during that campaign, Burr demanded an explanation. He was not satisfied with Hamilton's response and the two men therefore fought a duel on July 11, 1804, at Weehawken, N.J., and Hamilton was killed. With warrants out for his arrest in both New York and New Jersey, Burr fled to Philadelphia, where he held conferences with his friend James Wilkinson. Though a general of the U.S. army, Wilkinson was a traitor in the pay of Spain. As war was expected to break out between the United States and Spain over boundary disputes, he and Burr planned an invasion of Mexico with the object of setting up an independent government there. Furthermore, because they overestimated the unrest of the western states, they hoped to foment a secession movement in that area and, joining it to Mexico, found an empire on the Napoleonic

model with New Orleans as its capital. But Burr talked too much, Wilkinson became alarmed, and the general betrayed his fellow conspirator to President Jefferson. This resulted in Burr's arrest while he was trying to escape to Spanish territory: and he was sent to Richmond for trial before Chief Justice John Marshall. Though the evidence showed he had planned treason, his plot had been nipped in the bud before he had had time to commit the treasonable overt act; consequently he was acquitted.

Shortly afterward he went to Europe and tried to enlist the aid of Napoleon in an effort to conquer Florida. Failing in this, he lived abroad in penury for four years. Finally, in response to entreaties of his daughter, he returned to America in 1812; but the ship bringing Theodosia to meet him in New York was lost at sea. Bereft and lonely, he reopened his law office in New York and for 22 years engaged in his profession. In 1833, at the age of 77, he married the wealthy widow Eliza Jumel, about 20 years his junior. The marriage was not a happy one and the couple were divorced on the day of Burr's death, Sept. 14, 1836.

BURR, THEodosia (1783–1813), the only child of Aaron Burr (*q.v.*) was born June 21, 1783, in Albany, N.Y. Her father directed her education, especially after her mother's early death (*c.* 1794). In 1801, after her debut in New York society, she married Joseph Alston, who became governor of South Carolina in 1812. Theodosia frequently returned to her native New York and continued her association with her father. She was with him at Blennerhassett Island, where, after his duel with Alexander Hamilton in 1804, he prepared an expedition to lower Louisiana. She comforted and helped him during the treason trial at Richmond, Va., in 1807. After his acquittal she took charge of his affairs when he went on self-exile abroad and facilitated his return in May 1812. Then tragedy overtook her. On June 30 her young son died of fever. She was unable to go to New York to see her father until the end of the year and then was lost at sea. The vessel on which she sailed never made port. (T. P. MA.)

BURRITT, ELIHU (1810–1879), U.S. philanthropist and advocate of peace, born in New Britain, Conn., on Dec. 8, 1810, was known popularly as "the learned blacksmith" because of his early trade and his wide knowledge of languages. On moving to Worcester, Mass., in 1837 he became interested in the cause of international peace and a leading member of the American Peace society, editing the society's magazine, *The Advocate of Peace*. He supported William Ladd's plan for a congress of nations to formulate international law and a court of nations to interpret the law, so that controversies might be settled peaceably by the principles of justice without resort to force. In 1848 he organized the Brussels Congress of "Friends of Peace," which was followed by congresses in Paris, Frankfurt am Main, London and other cities. After serving as consul in Birmingham, Eng., he returned to his farm in New Britain in 1870 and began distributing to newspapers in the United States and Europe a succession of single sheets known as *Olive Leaves* presenting arguments for peace with emphasis upon a code of international law. His published works, some 30 in number, dealt with religious topics, descriptions of English scenery and linguistic studies, justifying the designation of him as a great humanitarian.

See Charles Northend, *Elihu Burritt: a Memorial Volume* (1879). (C. G. FK.)

BURRO, the name of Spanish origin for the domestic donkey. See Ass.

BURROUGHS, JOHN (1837–1921), U.S. writer on nature, was born near Koxbury, in Delaware county, N.Y., April 3, 1837. In his earlier years he engaged in teaching, journalism, farming and fruit raising, and for nine years was a clerk in the treasury department, Washington, D.C. He early recognized the genius of his friend Walt Whitman, publishing in 186; a volume, *Notes on Walt Whitman as Poet and Person* (a subject to which he returned in 1896 with his *Whitman: a Study*). In 1871 he began with *Wake-*

Robin, a series of books on birds, flowers and rural scenes which made him the successor of Thoreau as a popular essayist on the plants and animals environing human life. In 1873 he moved to a farm near Esopus, N.Y., in the Hudson River valley; from various retreats, including his cabin "Slabside," he wrote for half a century on nature subjects. His later writings showed a more philosophic mood and a greater disposition toward literary or meditative allusion than their predecessors, but the general theme, and method remained the same. His chief books, in addition to *Wake-Robin*, are *Birds and Poets* (1877), *Locusts and Wild Honey* (1879), *Signs and Seasons* (1886) and *Ways of Nature* (1905), all in prose, but he also wrote in verse, his one volume of poems, *Bird and Bough*, being published in 1906. He traveled extensively, camping out with such friends as the naturalist John Muir and President Theodore Roosevelt, and accompanying the Harriman expedition to Alaska. *Winter Sunshine* (1877) and *Fresh Fields* (1884) are sketches of travel in England and France. Until his death, March 29, 1921, while returning from California to New York state, he continued to write essays on out-of-door life, some of which were assembled in the following volumes: *Time and Change* (1912), *The Summit of the Years* (1913), *The Breath of Life* (1914), *Under the Apple Trees* (1916) and *Field and Study* (1919). The John Burroughs Memorial association, a society to encourage writing in the field of natural science, was established in his memory.

A. Wiley (1951), containing selections from his writings, a long biographical introduction by the editor, and a foreword by Burroughs' son Julian.

BURROWS, RONALD MONTAGU (1867–1920), British classical archaeologist and a leading champion of modern Greek independence, was born at Rugby! Aug. 16, 1867, and educated at Charterhouse and Christ Church, Oxford. While assistant to Gilbert Murray in the Greek department at the University of Glasgow, 1891–97, he went to Greece and undertook excavations at Pylos and Thucydia (1895–96); the results were important in vindicating Sphegydides as an accurate historian. He was professor of Greek at University college, Cardiff, from 1898 to 1908, and at the University of Manchester from 1908 to 1913; from 1913 until his death he was principal of King's college, London, the first layman to hold that post. Back in Greece in 1905 and 1907, he excavated tombs at Mycalessus (Rhitsona) in Boeotia, which helped to systematize the study of Boeotian archaeology. In 1907 he published *The Discoveries in Crete*, the first general account of Minoan civilization.

From 1913 onward he devoted much time to modern Greek affairs, having "discovered" Eleutherios Venizelos (*q.v.*) in 1912 and being invited by Venizelos during World War I (1916) to be the semiofficial diplomatic representative in London of the Greek provisional government. In 1915 the British cabinet adopted his plan for bringing Greece into the war by the offer of Cyprus. Confidant and adviser of Venizelos, he wrote and lectured extensively on near eastern political problems. At King's college he founded the many chairs concerned with European history and literature and the school of Slavonic studies. He died on May 14, 1920. (S. S. WE.)

BURRUS, SEXTUS AFRANIUS (d. A.D. 62), praetorian prefect 51–62 and with Seneca (*q.v.*) the chief adviser of the emperor Nero. A native of Vasio in Gallia Narbonensis (Vaison), he held commissions in the Roman army and posts in the households of Livia, Tiberius and Claudius, and was made prefect of the praetorian guard in A.D. 51. He owed this promotion to the empress Xgrippina, whose influence over Claudius had become dominant and who doubtless counted on Burrus' continuing support. But after Nero's accession in 54, Burrus, in concert with Seneca, soon subverted her power. It is reasonably supposed that till his death in 62 he and Seneca were mainly responsible for imperial policy and administration. The ancient allegations that in the end Nero poisoned him cannot be proved or refuted.

(P. A. BR.)

BURSA (formerly BRUSA), the capital of an *il* (province) of the same name in northwestern Turkey, lies at an altitude of 700 ft. along the lower flank of Mysian Olympus (Ulu Dag) (7,500 ft.). with a northward prospect across the Nilufer valley toward the Sea of Marmara, which is hidden by a low line of hills. Pop. city (1960) 153,574; the *il* has an area of 4,323 sq.mi. and a population of 695,099. Bursa was a stronghold in Roman times of the Bithynian kings and capital of the early Ottoman sultans before the fall of Constantinople in 1453.

Set among plane tree, lime and fruit orchards, watered by plentiful streams from the mountain and with many historic buildings, hot sulfur springs and winter sports on Ulu Dag, the place has for long been a popular tourist resort. The much denuded walls of the citadel, crowning a high shoulder of rock, mark the site of the old fortified city. Beneath this the town is ranged on either side of a long boulevard, following the contours of the hill in either direction from the city centre, where municipal buildings and a bazaar (destroyed by fire in 1958) are grouped round the Ulu Cami (Great mosque). Some of the more famous mosques and tombs lie to the east, across a small ravine; the remainder are to the west of the town, by the road which passes thermal establishments, some of them in use for more than 1,000 yr., to the suburb of Cekirce. The Ulu Cami, a vast building with 20 domes, was completed early in the 15th century and is notable for the variety of calligraphic ornament decorating its walls. Of the monuments beyond the eastern ravine (Gok Dere) there are two principal groups associated respectively with the so-called Yesil Cami, built in 1421 by Mehmet I Celebi, and that built by Bayezid I and known as the Yildirim Cami. Both groups include a large medrese or college, a *turbe* (mausoleum) and other minor buildings. These mosques are prototypes of the early Ottoman architectural convention. Two domed compartments on the main axis with smaller pairs beside them on either side and a range of two-story chambers in front, a five-bay portico and much fine ornament in glazed tiles. The medreses conform to the old college plan, used since the earliest days of Islam, with two-story chambers round a courtyard with an open *iwān* at one end. Beside the Cekirce road on the west side of the town is the so-called Muradiye, a similar complex built by Murad II in the third decade of the 15th century, round which many other tombs and monuments have accumulated. Elsewhere are the tombs of Osman and Orhan, founders of the Ottoman dynasty. Bursa is connected by road and railway with a small seaport, Mudanya, to which a daily service of steamers from Istanbul avoids the long overland journey round the Gulf of Izmit. From the 17th century onward Bursa has been famous for its silk and other textiles which are still manufactured. Local products also include cheese, butter, tobacco and sugar beets as well as peaches and other fruit from the Nilufer valley.

Founded by the Bithynian king Prusias I at the end of the 3rd century B.C., Prusias-ad-Olympium became part of the Roman empire after the defeat of Mithradates VI (Eupator), king of Pontus. It gained prosperity in Byzantine times after Justinian built a palace there. It first fell to the Seljuks in 1075, but changed hands after the arrival of the first crusade and, when Theodore I Lascaris made his capital at Nicaea (modern Iznik in Bursa *il*) after the sack of Constantinople by the Latins in 1204, it became a centre of Byzantine resistance. It was retaken by the Turks in the early 14th century and remained the capital of the Osmanli sultans until they moved to Edirne (Adrianople) in 1413. In 1920 it was occupied by the Greeks, who were ejected in Sept. 1922 after a determined resistance.

See D Magie, *Roman Rule in Asia Minor* (1951). (S. H. LL.)

BURSAR, literally a keeper of the bursa or "purse" (M. Lat. *bursarius*). The word is often used to designate an administrative officer on the staff of a college, especially one mainly concerned with finance. The term is also applied to the holder of a bursary; *i.e.*, an award or grant made to help a student to attend a university or take advantage of some other educational opportunity. Scottish education authorities make a wide variety of awards called bursaries at both the school and postschool stage.

BURSCHENSCHAFT (from Ger. *Bursche*, "youth"), a corporation of students at the German universities that came into

being at the end of the Napoleonic Wars. There had existed earlier student associations in Germany— notably the *Landsmannschaften*, formed since the 14th and 15th centuries from the members of each "nation" (Franks, Saxons, Borussians, etc.) for the purpose of mutual protection. Violent quarrels between the various *Landsmannschaften*, unruly duelling and other excesses led to the demand, made during the Napoleonic Wars, that all the *Landsmannschaften* in each university should combine to form a corps. The corps, however, was run on exclusively aristocratic lines. The *Burschenschaft* on the other hand was egalitarian, admitting all students, without class bias, to full membership. The *Burschenschaften* moreover deprecated the excesses of the still existing *Landsmannschaften*— particularly at the University of Jena, where the first *Burschenschaft* was founded on June 12, 1815.

The early development of the *Burschenschaften* was characterized by a vague kind of liberalism coupled with anti-Catholicism and a marked form of nationalism. Students from different German universities who had fought side by side against the French cherished the idea of the political unification of Germany, and this tendency was accentuated by the custom whereby German students used to attend two or more universities before taking their degree. The joint student demonstration at the Wartburg festival celebrating a Lutheran tercentenary (Oct. 18, 1817), the subsequent formation of the *Allgemeine Deutsche Burschenschaft* and, finally, the assassination of August Kotzebue (*q.v.*) on March 23, 1819, by the ultranationalistic *Burschenschafter* Karl Sand alarmed the German governments, and the Carlsbad decrees (*q.v.*) included measures for the official suppression of the *Burschenschaften*. In fact the *Burschenschaften* survived, surreptitiously or otherwise, to burst into open activity before and during the German revolution of 1848. Later, and especially after the foundation of the German empire in 1871, their liberal idealism came to be submerged by a new and aggressive wave of nationalism which led many of them to subscribe to rabid anti-Semitism and Pan-Germanism. Suppressed under Hitler, the *Burschenschaften* were resuscitated after World War I. They no longer play a significant part in German politics.

The social activities of the *Burschenschaften* included convivial gatherings, duelling accompanied by mysterious rites or, in the earlier days, gymnastics in the style devised by F. L. Jahn.

See the important though somewhat uncritical *Quellen und Darstellungen zur Geschichte der Burschenschaft . . .*, ed. by H. Haupt and P. Wentzke, 17 vol (1910–40); E. Wiskemann, "The German Student Corporations," *History Today* (Dec. 1954). (H. G. Sc.)

BURSERACEAE, the incense-tree family, deciduous shrubs or trees whose wood contains essential oils and resins. There are about 20 genera and 500–600 species in the tropics of both hemispheres. Large genera are *Protium*, mostly American; *Bursera*, all American; *Commiphora*, in Africa and Madagascar; and *Canarium*, in southeast Asia. *Boswellia* and *Commiphora* are the producers of the ancient resins frankincense and myrrh (*qq.v.*). Certain species of *Canarium* produce important resins, such as Manila elemi (*C. luzonicum* and *C. ovatum*), while others produce important nuts, such as the Javan canari (*C. commune*) and the Philippine pili (*C. ovatum*).

BURSITIS: see ARTHRITIS: *Nonarticular* Rheumatism.

BURT, SIR CYRIL LODOWIC (1883–), one of the most distinguished of British psychologists, was born near Stratford-upon-Avon on March 3, 1883. He was educated at Christ's hospital and, as a classical scholar, at Jesus college, Oxford. He was attracted to study psychology by William MacDougall. After a period of research at Würzburg, Ger., he returned to the University of Oxford as John Locke scholar in mental philosophy. From 1909 to 1913 he was assistant lecturer in experimental psychology at Liverpool university and also assistant in physiology. Then, for a year, he joined the staff of the experimental psychological laboratory at Cambridge, becoming also psychologist to the London County council. He held the latter post until 1932 and was also professor of education at London university. In 1931 he succeeded Charles Spearman as professor of psychology at University college, becoming emeritus professor in 1950. He was knighted in 1946.

As a psychologist of outstanding originality and insight. Burt had a profound influence, especially in the study of juvenile delinquency, in the development of mental tests and in the use of statistics. He published a number of books, of which *Mental and Scholastic Tests* (1921), *The Young Delinquent* (1925), *The Measurement of Mental Capacities* (1927) and *Factors of the Mind* (1940) are universally acknowledged. (F. C. BA.)

BURTON, JOHN HILL (1809-1881), Scottish writer and author of the first *History of Scotland* based on accurate research, was born at Aberdeen on Aug. 22, 1809. After qualifying for the Scottish bar and practising as an advocate, he won notice with his *Manual of the Law of Scotland* (1839) and was one of the editors of *The Works of Jeremy Bentham* (1838-43) whose ideas greatly influenced him. For a short time Burton was editor of the *Scotsman*, and he long contributed to *Blackwoods' Magazine*, publishing his entertaining occasional essays in *The Book Hunter* (1860) and *The Scot Abroad* (1864).

In 1846 Burton achieved a high reputation with his intellectually acute but unimaginative *Life and Correspondence of David Hume*, based on extensive and previously unused manuscripts, and this was followed by many other works, including *Lives of Simon Lord Lovat, and Duncan Forbes, of Culloden* (1847), and *Narratives From Criminal Trials in Scotland* (1852). *The History of Scotland* (1853-70) is readable but lacks fire. It earned him the position of historiographer royal of Scotland. His editing of two volumes of *The Registers of the Privy Council of Scotland* (1877-78) was of great historical importance.

BURTON, SIR RICHARD FRANCIS (1821-1890), one of the greatest British travelers of the 19th century. British consul, orientalist and author of more than 50 books and translator of the "Arabian Nights." was born at Torquay, Eng., on March 19, 1821. He received an unconventional education, spending much time in France and Italy and showing at an early age considerable powers as a linguist. He entered Trinity college, Oxford, in Oct. 1840, but his eccentric behaviour eventually resulted in his rustication and he joined the East India company as a means of studying oriental life and languages. He arrived at Bombay in Oct. 1842 and soon became proficient in five of the Indian vernaculars as well as in Persian and Arabic. During seven years in India he laid the foundations of his detailed knowledge of eastern life and customs, especially among the lower classes. As an assistant in the Sind survey he was able to mix with the people and was able to pass himself off as a native in the bazaars. Here he commenced his great literary output, for besides government reports and contributions to the Asiatic society he wrote four books which were published after his return from India: *Scinde or the Unhappy Valley* (1851), *Sindh and the Races That Inhabit the Valley of the Indus* (1851), *Goa and the Blue Mountains* (1851) and *Falconry in the Valley of the Indus* (1852).

Burton achieved fame with the pilgrimage which he made to Mecca in 1853. This he had planned while in India, becoming fully conversant with the required customs and practices. The journey was motivated by a sincere love of adventure, coupled with a desire to further geographical exploration. His aim was to reveal something of the nature of the "empty quarter" of Arabia and his plans were approved by the Royal Geographical society which contributed toward his expenses. Tribal conflicts made it impossible for him to carry out his plans in full and he was not able to penetrate further than Medina and Mecca. To accomplish this he traveled as an Indian Pathan to allow for any peculiarities and defects in his speech. For a European to make the pilgrimage was not unique, but to do it successfully required a detailed familiarity with Muslim ritual and custom. The remarkable journey was recorded by Burton in an even more remarkable book: *Pilgrimage to Al-Medina and Meccah* (1855). Its vivid descriptions, pungent style and intensely personal note distinguish it: its insight into modes of thought and its picture of Arab manners give it the value of a historical document; its grim humour, keen observation and reckless expression of opinion, written in peculiarly uncouth but vigorous language, made it a curiosity of literature.

Burton's next journey was more hazardous but attracted less attention. In 1854 the Indian government agreed to his proposal

to explore the interior of Somali country in northeast Africa. He was assisted by Capt. J. H. Speke and two other young officers but accomplished the most difficult part of the enterprise alone, when he made the journey to Harrar, the Somali capital. He was unheard of for four months and suffered considerable deprivation. An attempt to repeat the journey was unsuccessful; one of the officers was killed and both Burton and Speke were wounded. His work was recognized by the award of a gold medal of the Royal Geographical society and was described in his classic, *First Footsteps in East Africa* (1856).

He served in the Dardanelles, but not at the front in the Crimea, and then returned to Africa in 1856, again accompanied by Speke, to search for the sources of the Nile, an expedition instigated by the Royal Geographical society and supported by the British government. They discovered Lake Tanganyika in Feb. 1858 and Speke, while Burton was ill, went on to discover Lake Victoria Nyanza which he rightly surmised to be one of the sources of the Nile. This separate discovery led to a bitter dispute between Burton and Speke but with the discovery of Lake Tanganyika it led the way to the subsequent explorations of Speke and James Grant, Sir Samuel Baker, David Livingstone and Henry Stanley. Burton and Speke's exploration was reported fully in vol. xxxiii of the *Journal of the Royal Geographical Society* and in *Lake Regions of Equatorial Africa* (1860). Three years after East Africa Burton was exploring in the Gold Coast, Dahomey and Benin and after a flying visit to the U.S. in 1860 wrote *The City of the Saints* (1861) about the Mormons in Salt Lake City, Utah.

In 1861 Burton entered the foreign service and was successively consul at Fernando Po, Santos in Brazil (1865), Damascus (1869) and Trieste (1871). The last post he held until his death at Trieste on Oct. 20, 1890. These postings and journeys associated with them produced a great spate of books: *Wanderings in West Africa* (1863), *Abeokuta and the Cameroons* (1863), *A Mission to Gelele, King of Dahomé* (1864), *Wit and Wisdom From West Africa* (1865), *The Highlands of Brazil* (1869), *Letters From the Battlefields of Paraguay* (1870), *Unexplored Syria* (1872), *Zanzibar* (1872), *Ultima Thule* (1875), *Etruscan Bologna* (1876), *Sind Revisited* (1877), *The Land of Midian* (1879) and *To the Gold Coast for Gold* (1883). There were other works also, including an unfinished history of the sword. Burton's output of writing was too great to allow for good style or great imagination which would have given his works immortality. His most celebrated literary work was his translation of the "Arabian Nights." *The Thousand Nights and a Night* (16 vol., privately printed, 1885-88). It is a great monument to his Arabic learning and his encyclopaedic knowledge of eastern life, though it may be criticized for sometimes lacking exactness in scholarship.

Burton married Isabel Arundell in 1861 and owed much to her courage, sympathy and devotion. She completed a *Life* of her husband in 1893 and instituted the "Burton Memorial Lecture Fund" which was inaugurated in 1921 and presents, through the Royal Asiatic society, a triennial medal to a prominent explorer of the lands with which Burton was associated. Burton was awarded the knight commander of St. Michael and St. George in 1887, though he was never actually knighted.

BIBLIOGRAPHY.—Besides Lady Burton's *Life* (1893; abridged ed. 1898) there are: *A Sketch of the Career of R. F. B.*, by A. B. Richards, A. Wilson and St. C. Baddeley (1886); *The True Life of Captain Sir R. F. B.*, by his niece, G. M. Stisted (1896); a *Life* by Thos. Wright of Olney (1906), an industrious and rather critical work which casts doubt on Burton's originality as an Arabic translator and emphasizes his indebtedness to Payne's *Arabian Nights* (1881); *The Real Sir R. B.*, by W. P. Dodge (1907); and a brief sketch by S. Lane-Poole prefixed to the *Pilgrimage* (1808), from which some sentences are here, by permission, introduced. See also N. M. Penzer's *An Annotated Bibliography of Sir R. F. B.* (1923) and *Selected Papers on Anthropology, Travel, etc.* (1924). (R. M. P.)

BURTON, ROBERT (1577-1640), English scholar, writer and Anglican clergyman whose *Anatomy of Melancholy* is a masterpiece of style, a mine of curious information, a revelation of its author's sanity, humour and humanity and a valuable index to the philosophical and psychological ideas of the time. Born at Lindley, Leicestershire, on Feb. 8, 1577, Burton was educated at Nuneaton

and Sutton Coldfield and entered Brasenose college, Oxford, in 1593. He was elected a student (life fellow) of Christ Church in 1599 and lived there for the rest of his life, becoming a bachelor of divinity in 1614 and vicar of St. Thomas's church, Oxford! in 1616. He also held livings in Lincolnshire (1624–31) and Leicestershire, the latter bestowed by his patron, Lord Berkeley. His "silent, sedentary, solitary" life, as he himself describes it, lent his view of mankind an ironic detachment, but it certainly did not make it that of a scholar remote from reality: he is as informative on the pastimes of his time as on the ideas of the ancients, and as keen to recommend a rational diet as to relate man's disorders to his own essentially Christian view of the universe. His portrait, at Brasenose college, Oxford, shows a face scholarly, shrewd, contemplative and humorous. He died at Christ Church on Jan. 25, 1640, having previously predicted the date with considerable accuracy by a calculation of his nativity.

Burton's first work was the Latin comedy *Philosophaster* (1606), a vivacious exposure of charlatanry which has affinities with Ben Jonson's *Alchemist*. It was acted at Christ Church in 1618, and for long thought lost, but discovered and edited by W. E. Buckley (1862) with a number of minor academical exercises. His only English poem is the prefatory "The Author's Abstract of Melancholy" to the 1628 edition of the *Anatomy*.

The *Anatomy of Melancholy . . . by Democritus Junior* appeared in 1621, and five subsequent editions (1624, 1628, 1632, 1638 and 1641) incorporated Burton's revisions and alterations. The lengthy preface "Democritus to the Reader" explains his reasons for writing his treatise and for assuming the name Democritus Junior. He wished to show his gratitude for having been elected a student of "the most flourishing college in Europe" by writing something worthy of that noble society. He had read much: living in studious seclusion, he had been a critically observant spectator of the world's affairs. The philosopher Democritus was once found studying the causes and cure of "this *atra bilis* or melancholy" and Burton aimed to carry out the design he had planned. He anticipates the objections of captious critics, allowing that he has borrowed from innumerable books but claims that "the composition and method is ours only." He apologizes for faults of style on the ground that he had to work single-handed and digest his notes as best he might. If any object to his choice of subject, urging that he would be better employed in writing on divinity, his defense is that too many commentaries and sermons are already in existence. Besides—and here is one of the curiously modern keynotes of his work—divinity and medicine are closely allied; and melancholy being both a spiritual and bodily infirmity, the divine and the physician must unite to cure it.

In the treatise itself, Burton sets himself in the first part to define melancholy, discusses its causes and sets down the symptoms. The second part is devoted to its cure. As it is of great importance that we should live in good air, a chapter deals with "Air Rectified, with a Digression of the Air." Burton never traveled, but the study of cosmography had been his delight, and he sends his fancy flying north, east, south and west. Love melancholy is the subject of the lively first three sections of the third part, and, a master of narrative, Burton includes as examples most of the world's great love stories, and shows again a modern approach to psychological problems. The fourth section deals with religious melancholy, and in his pages on the cure of despair he rises to heights of wisdom and of meditation.

Burton's style is as individual as his treatment of his matter. It is imaginative and eloquent, but, unlike that of many of his contemporaries, his prose is not poetic. His vocabulary is colloquial, lively and wide-ranging, full of classical allusions and Latin tags which testify to his love of curious and out-of-the-way information as well as to his erudition. He is a master of lists and catalogues, but their sonorous roll is often broken by his humorous asides.

The *Anatomy*, widely read in the 17th century, lapsed for a time into obscurity, but it was admired by Dr. Johnson and Laurence Sterne's borrowings from it are notorious. The devotion of Lamb, who recognized in "the fantastic great old man" a kindred spirit, finding in his odd turns of expression, his whimsical fancies,

his far-fetched conceits, his kindly sarcasm and his deep-lying pathos a reflection of his own genius, helped to bring it into favour with the Romantics, and its place in literature seems assured.

BIBLIOGRAPHY.—A. R. Shilleto published a 3-vol. edition of the *Anatomy* in 1893, based on the inaccurate 7th edition; its errors were pointed out by E. Bensly (*Notes and Queries*, 1897–1908). There are reliable editions by Floyd Dell and P. Jordan-Smith, 2 vol. (1927) and by Holbrook Jackson in Everyman's Library, 3 vol. (1932). *Philosophaster* was ed. with trans. by P. Jordan-Smith (1931). See also P. Jordan-Smith, *Bibliographia Burtoniana* (1931); *Proc. and Papers of the Oxford Bibliographical Society*, vol. 1, pt. 3 (1926); B. Evans, *The Psychiatry of Robert Burton* (1944); Hardin Craig, *The Enchanted Glass: the Elizabethan Mind in Literature* (1936).

BURTON, WILLIAM EVANS (1804–1860), English actor and playwright who held a prominent place as an actor, manager and as a man of letters, in New York, Philadelphia and Baltimore, was born in London on Sept. 24, 1804. He was the son of William George Burton (1774–1825), a printer, and author of *Research Into the Religions of the Eastern Nations as Illustrative of the Scriptures* (1805). Burton first appeared on the London stage in 1831 and played with Edmund Kean in 1832. In 1834 he went to America, where he appeared in Philadelphia as Dr. Ollapod in *The Poor Gentleman*. The theatre he leased in New York was renamed Burton's theatre. He had much popular success as Captain Cuttle in John Brougham's dramatization of *Dombey and Son*, and in other low comedy parts in plays from Dickens' novels.

Burton wrote many plays, one of which, *Ellen Wareham* (1833), was produced simultaneously at five London theatres. In Philadelphia he established the *Gentleman's Magazine*, of which Edgar Allan Poe was for some time the editor. He edited the *Cambridge Quarterly* and the *Souvenir*, and wrote several books, including a *Cyclopaedia of Wit and Humour* (1857). He collected a library of more than 100,000 volumes, especially rich in Shakespeariana, which was dispersed after his death in New York, Feb. 10, 1860.

BURTON UPON TRENT, a municipal (1878) and county borough in the Burton parliamentary division of Staffordshire. Eng., lying mainly on the left bank of the Trent, on the Roman road between Derby (9 mi. N.E.) and Lichfield (13 mi. S.W.) and on the Grand Trunk (Trent and Mersey) canal. Pop. (1961) 50,766. In the 9th century St. Modwen, an Irish nun, is said to have established a convent on the Isle of Andressey opposite Burton. In 1002 Wulfric, earl of Mercia, founded there a Benedictine abbey and in 1004 granted to it the town and lands in more than nine counties. The history of Burton was thereafter bound up with that of this rich and powerful abbey. A gatehouse, part of the walls and a fine doorway remain and on the site of the abbot's house at Seyney park stands a 15th-century half-timbered building. The abbey became a collegiate church after its dissolution, but this was suppressed in 1549 and its lands and privileges were conferred on Sir William Paget, ancestor of the marquess of Anglesey. Of many royal charters granted to Burton that of John gave an annual fair and a weekly market and Henry III's gave a second fair; Burton became famous for cattle and horse fairs.

The modern market hall was built in 1882 and the fish market in 1925. The bridge, dating at least from the 12th century, was a strategic point at which Edward II defeated the earl of Lancaster in 1321 and which was fought for by both sides during the English Civil War. The church of St. Mary and St. Modwen, built in the 18th century, embodies an older building. The museum and art gallery was opened in 1914.

Brewing is an ancient industry of the town, originating with the monks of Burton abbey, but modern developments began with the building of the Grand Trunk canal in the 1760s and the opening of the Trent for navigation in the early 18th century. By the middle of the century there was considerable trade with the Baltic countries, and by 1801, with a population of 3,679, Burton had nine brewing firms. The use of local well water impregnated with sulfate of lime derived from gypsum deposits is one factor in the localization of brewing there.

Burton, the home of several breweries, is noted for the excellence of its ales. There are also cooperages, foundries, and factories producing tires, footwear, chemicals, locomotives and castings.

BURU (BOEROE, BURA), the third largest island of the Molucas (*q.v.*), Indonesia. It stands on the outer mall of Archæan rocks which enclose the inner volcanic ring to which the Banda Islands and some of the southwestern islands belong. Oval in shape, it is 88 mi. long and 54 mi. wide with an area of 3,668 sq.mi. It has high mountains, especially in the west where Mt. Tomahu (Kau Palatmada) reaches 7,969 ft., while Kaku Siel is almost as high. The large Lake Waikalō (Rana) lies at 2,067 ft. and its outlet, the Wa Nibe, is to the north. In the east the mountains are comparatively low, and a wide, circular, level plain surrounds Kajeli bay. Crystalline slate occurs in the north, and Mesozoic sandstone and chalk in the south, deposits which are rare in the archipelago. Most of the island is covered by forest with teak, ebony and kanari, but the north is bare of trees and overgrown with coarse *kussu* grass, while in swampy parts sago palms are abundant.

The mammals include two very interesting specimens—the babirusa or pig deer (first described by A. R. Wallace) and the crested baboon. Among birds Buru has kingfishers, flycatchers, honey suckers, orioles and a beautiful sunbird (*Cimyris sericea*), also a rare species the mound builder (*Eulipoa wallacei*).

The population, mostly Alfurs except on the coast, was estimated in 1957 at 29,701. They are mainly Muslims. Agriculture is simple and for local use; a few villages have coconut plantations. The chief industry is the manufacture of cajuput oil, from distillation of the leaves of the wild *Melaleuca leucadendron*, in Kajeli and along the north coast. Namlea, on Kajeli bay, is the chief port.

In Ambelau (Walua), off the southeast coast, the people live by fishing and trading with neighbouring islands. Sago palms and coconuts are grown. (J. O. M. B.)

BURUSHASKI LANGUAGE. Burushaski is the mother tongue of about 20,000 people inhabiting the central portion of the states of Hunza and Nagar in Gilgit (*q.v.*) territory, northwest Kashmir, where the Hindu Kush and Karakoram ranges meet.

A distinct dialect, known as Werchikwār or Wershikwār, is spoken by the (about 7,000) people of Wershegum, part of the Yasin valley.

No affinity has yet been proved between Burushaski and any other language. The principal sounds of Burushaski are the vowels a, A, a, æ, e, e, i, i, o, u, u, ai (æi and ai); the longer vowels a', e', e', i', or, u; and the consonants k, x, g, γ, q, ŋ, t, d, n, p, f (pf), b, w, m, č, ĵ, y, s, z, š, ž, ts, l, r.

There is also a series of sounds—č, ĵ, š, ž—made with the tip of the tongue retracted, which may amount in some cases to cerebral~in the stricter definition of the term.

Natives recognize *q̄* (passing into medial *r*), and there is a curious sound which seems to be a cerebral or retracted *y*. Natives also claim to recognize the aspirates kh, tk, ph, čh, ĵh. In a few words there appears to be a velar *g* corresponding to *q*. Werchikwār has an additional *l*, probably cerebral. Initial *g*, *d*, *b*, *γ* and *w* are changed to *k*, *t*, *p*, *q* and *β* after certain prefixes.

Among the many distinctive features of grammar and construction are the following:

Nouns are divided into four categories according to whether they represent: male human beings (mh), female human beings (fh), animals of both sexes and some inanimate objects (x) or the remaining inanimate objects (y).

The principles underlying the differentiation of the x and y categories cannot at present be fully stated, but, in general, names of fruit and wood and articles made of wood are x. Names of liquids, plastic and finely divided substances, trees, metals, abstract ideas and immaterial objects are y.

The following vary to a greater or lesser extent, according to the category of the noun to which they refer: (1) plural suffixes of nouns (and occasionally adjectives); (2) demonstrative pronouns and adjectives; (3) third person singular and plural of the finite tenses of verbs. Case inflection is effected by the use of suffixes and postpositions.

Agglutinative Pronouns are used as pronominal prefixes with certain nouns and verbs. With nouns they indicate the possessor, with intransitive verbs the subject, and with transitive verbs sometimes the direct, sometimes the indirect object, and occasionally

the subject. With a large series of verbs they are used as infixes after an initial *d*.

Verbs are conjugated by the use of terminal inflections added to two bases, present and past. The imperative is founded on the past base. Transitive and causative verbs are formed from intransitive verbs by prefixing an element *—A— or *—AS— (*— indicates the presence of a pronominal prefix).

Numerals.—The numeral system consists of a series of numbers from 1 to 10. The numbers from 20 to 99 are based on the numbers 20 and 40, to which are added the numbers 1 to 19, while 20 and 40 are themselves multiplied as required by a preceding number; e.g., 95 = 2 × 40 + (10 + 5). The element of 2 is emphasized, 2, 4, 8, 20 and 40 being all obviously related. There is a special series of forms of the numerals used in counting, as multipliers and with certain nouns of measure, etc. The numbers 1 and 3 are also differentiated for *h* as opposed to *x* and *y*, and 2 has special forms for *h*, *x* and *y*.

Vocabulary.—Excluding obvious loan words taken chiefly from Persian, Shina and Khowār, the vocabulary of Burushaski and the whole of its inflectional system are, so far as is known, peculiar to itself. It would probably be impossible to point out an alien among its pronouns numerals (except *sa's* 1,000), verbs and nouns relating to the common objects of daily life.

See D. L. R. Lorimer, *The Burushaski Language*, 3 vol. (1935–36). (D. L. R. L.)

BURY, RICHARD DE: see AUNGERVILLE, RICHARD.

BURY, a municipal and county borough in Lancashire, Eng., on the Irwell river and the Manchester, Bolton and Bury canal, 9 mi. N.N.W. of Manchester. Pop. (1961) 59,984. Area 11.6 sq.mi. Together with the borough of Radcliffe (*q.v.*) and Tottington urban district it forms the parliamentary division of Bury and Radcliffe. Bury (Anglo-Saxon *burhg* or *birig*, town, castle or fortified place) was the site of a Saxon station, and a castle stood in nearby Castlecroft. It was a member of the honour of Clitheroe (*q.v.*) and a fee (estate) of the royal manor of Tottington, which soon after the Norman conquest was held by the Lacys. The church of St. Mary was mentioned in Domesday Book but the present building dates from 1872 to 1876. Under a grant made by Edward IV to Sir Thomas Pilkington, fairs are still held on March 5, May 3 and Sept. 18, and a market, formerly held under the same grant on Thursday, is now held on Saturday. The woolen trade was established there by Flemish immigrants in the reign of Edward III, and in Elizabeth I's time this industry was of such importance that an alnager (see ALNAGE) was appointed to measure and stamp the woolen cloth. But although the woolen manufacture is still carried on, the cotton trade gradually superseded it after the early 18th century. John and Robert Kay, noted in the cotton industry as inventors of the flying shuttle and the drop box, belonged to Bury, and Robert Peel's printworks were established there in 1770. The cognate industries of calico printing, dyeing, finishing and bleaching are carried on, as are the paper and textile trades. Many light industries were established. Kay's free grammar school was founded in 1726. An important business experiment established the well-known Bury Co-operative society in 1856. Bury has a technical college (1940) and an art gallery and museum. The new town hall, begun in 1939, was opened by Queen Elizabeth II in 1954. Bury, incorporated in 1876, was made a county borough in 1888.

BURYAT (BURIAT), the northernmost of the major Mongol peoples, are related by language ties, history, habitat and economic type to the Khalkha Mongols, or Mongols of Outer Mongolia, the Mongols of Inner Mongolia and Manchuria, and the Oyrats (Kalmuks), who together form the principal Mongol peoples. The Buryats are among the smaller of these groups; they number about 300,000.

The Buryat territory lies in southern Siberia, to the east, south and west of Lake Baikal. This vast freshwater lake determines the climate of the surrounding terrain, which is cold, relatively arid but for the lake's moisture, and broken or mountainous. The Buryats are divided into two main groups, those to the east and those to the west of Baikal. In addition there is a separate group, the Bargu Buryat, to the east, in western Manchuria.

The origins of the Buryat are not clear. The entire people is divided into a number of patrilineal clans, each with its own name. Some of these names appear in the historical treatise of the Persian author and statesman, Rashid al-Din, at the beginning of the 14th century. Part of the Buryat population is not native to the region. A plausible theory is that they were formed as an ethnic unit from various elements in the course of settlement of their present territory during the 13th–14th centuries.

While they were identified as an ethnic unit, they were lacking in political unity. At the time of the Russian conquest in the mid-17th century, the eastern Buryats had a few principalities, the largest of which was the Khori Buryat with tens of thousands of subjects. The western Buryats were divided into a large number of local clans and clan confederations.

In their traditional social organization they were separated into noble and common strata; in addition, they had a small number of slaves. They lived in patrilineal families grouped into kin-villages, clans, and clan-confederations. The more permanently organized confederations were ruled by princely dynasties.

By tradition they are a nomadic pastoral people whose stock consists of cattle, horses, sheep, goats and a few camels. In addition, they had a highly organized battue, or hunting surround. Since the time of the Russian contact, they have adopted agriculture and have become sedentary. As such they have given up their former dwelling, the felt tent, and have moved into permanent wooden structures typical of peasant life throughout Siberia.

In their religious life the Buryats have an intricate combination of shamanist and Buddhist traits. The eastern Buryats, under the closer influence of the Khalkha Mongols were more thoroughly Buddhist in their rite than the western. Some Buryats became Russian Orthodox Christians during tsarist times.

Their territory today is the Buryat Autonomous Soviet Socialist Republic in the Soviet Union.

BIBLIOGRAPHY.—Lawrence Krader, "Buryat Religion and Society," *Stwest. J. Anthropol.*, 1954, vol. 10, no. 3; P. T. Khaptaev, et al., *Istoriya Buryat-Mongol'skoy ASSR*. Vol. 1 (1954). (L. K.)

BURYAT AUTONOMOUS SOVIET SOCIALIST REPUBLIC, a republic of the Russian Soviet Federated Socialist Republic, U.S.S.R., is in eastern Siberia, lying along the eastern side of Lake Baikal (*q.v.*) with a "panhandle" extending westward beyond the southern end of the lake. Its area is 135,636 sq.mi. The Buryat-Mongol Autonomous Soviet Socialist Republic was created in 1923 by the union of the Buryat-Mongol and Mongol-Buryat autonomous *oblasts*. "Mongol" was dropped from the name in July 1958.

The territory is extremely mountainous. The panhandle is occupied by the eastern Sayan fold mountains, the main ranges of which rise to more than 10,000 ft. Mt. Munku-Sardyk on the Mongolian frontier reaches 11,457 ft. and has small glaciers. The main valleys of this part are those of the northflowing Oka and east-flowing Irkut. East of Lake Baikal lies a vast complex of mountain ranges, plateaus and tectonic basins and valleys. A series of ranges parallels the eastern shore of Baikal: the Khamar-Daban, Ulan-Burgasy, Ikatski and Barguzinski ranges. East of these, in the northeast of the republic, is the Vitim plateau, while along the eastern border of the republic rises the Yablonovy range. The region, uplifted in very early geological times, has undergone severe folding and fracturing in every major period of earth movements. Movement still continues and earthquakes occur. In the Selenga delta, there were 21 earthquakes recorded between 1734 and 1903. The chief rivers of this eastern part are the Selenga, with its tributaries, the Dzhida and Lda, the Barguzin and the upper Angara (*q.v.*), all of which flow into Lake Baikal, and the Vitim, with its tributaries Amalat and Muya, flowing north to the Lena. The mountains are thickly forested, taiga (mostly coniferous forest) covering half the surface area of the republic. Dahurian larch makes up half the forest and pine one-quarter. Fir and Siberian "cedar," or stone pine, occur in the south and southwest. The intermontane basins and valleys have usually a steppe or meadow vegetation. The climate is dry, mostly with under 16 in. of rain a year, except at the southern end of Baikal, where it rises to 40 in. Winters are long and very cold, although Baikal has a

marked moderating effect on its immediate neighbourhood. Average January temperature in Llan-Ude is -19° F. and average July temperature 68° . Many minerals are found in the Buryat republic. Placer gold occurs in several areas, notably the Vitim plateau, where it is also mined. Wolfram and molybdenum are mined in the Dzhida valley. Iron, often together with titanium, occurs in the Khamar-Daban and Ulan-Burgasy ranges. In the eastern Sayans are found bauxite, apatite (used for phosphate fertilizers), graphite, asbestos and mica. The graphite was exported in the 19th century to Nurnberg, Ger., but is no longer worked. Coal is mined in the Dzhida valley and lignite near Gusinoozersk.

The Buryats are a Mongol people, formerly nomadic herdsmen (see BPRYAT). Russians entered the area in the mid-17th century, meeting strong opposition from the Buryats. Russian forts were set up at Verkhne-Angarsk (Irkana) in 1646, Barguzin in 1648 and Verkhne Cdinsk (now Ulan-Ude) in 1666. Two major Buryat revolts took place before they were finally subdued. The Russians first sought gold and furs, and colonization reached significant proportions only after the coming of the Trans-Siberian railway at the end of the 19th century. Many of the Buryats then adopted a settled way of life. The population in 1959 was 671,000, most of whom were Russian. There were then 252,000 Buryats in the whole Russian S.F.S.R. In 1941 the Buryats had formed 44% of the population. The Buryats have also two national okrugs outside the republic, in Irkutsk and Chita (*qq.v.*) *oblasts*. In the north of the republic live a small number of Yevenki or Evenki (Tungus). Of the population 275,000, or 41%, are urban, the chief towns being Ulan-Ude (*q.v.*), the capital (174,000), and the mining centres of Gusinoozersk and Gorodok.

The major branch of agriculture remains stock raising and large herds of cattle and sheep are kept. Horse breeding is important. In the Sayans, the Buryats keep *khayniki*, a yak-cow cross. In remoter areas nomadism persists. The Yevenki have reindeer herds. The chief area of cultivation is the broad depression of the Selenga valley, the most densely populated region. Spring wheat, potatoes, vegetables and some sugar beet are grown. The Buryat republic is one of the areas where considerable acreages were ploughed in the 1950s under the "virgin lands" project. Timber working is steadily developing, especially northeast of Baikal, where the timber is rafted across the lake to Irkutsk, and in the Cda valley, with Ulan-Ude as the main sawmilling centre. Furs are obtained either by hunting (chiefly squirrel and sable) or from farms (silver fox and raccoon). Fishing is important on Lake Baikal. Industry, apart from mining, is largely concentrated in Ulan-Ude, with its locomotive and rolling stock building, light engineering, meat-packing, sawmilling, glass and clothing industries. Gorodok has a wolfram-molybdenum ore-enriching plant. The republic is traversed by the Trans-Siberian railway, with a branch from Ulan-Ude to Ulan Bator in Mongolia. Roads join Ulan-Ude to Ulan Bator and Irkutsk. Another road into Mongolia, from Irkutsk crosses the panhandle by the Irkut valley. (R. A. F.)

BURY ST. EDMUNDS, a municipal borough and market town of West Suffolk, Eng. (of which it is the county town), lies on the left bank of the Lark, a tributary of the Great Ouse, 26 mi. N.W. of Ipswich. Pop. (1961) 21,144. At Beodricesworth, as the town was first called, Sigebert, king of the East Angles, is said to have founded a monastery about 630 which may have come to an end during the Danish invasions 865–870. The remains of St. Edmund, the East Anglian king martyred by the Danes in 869, were translated there early in the 10th century. The saint's shrine became a place of pilgrimage and from him, by the 11th century, the town took its name. About 1020 Canute founded a Benedictine abbey to serve the shrine. Canute was also probably the founder of the monastic borough and, about 1044, Edward the Confessor gave the abbots jurisdiction over West Suffolk. The town is associated with Magna Carta for, in Nov. 1214, the English barons took oath in the abbey church to compel King John to accept their demands. By the time of Henry I the abbots had obtained for their borough grants or confirmations of a mint, a market and a fair. However, the burgesses demanded self-government and there were repeated armed revolts between 1264 and 1381. A royal charter of incorporation was granted in 1606.

The 12th-century precinct wall contains fine surviving monastic buildings including the 14th-century abbey gate and the 12th-century Norman bell tower (still in use). Two ancient parish churches were built by the abbots for the townspeople. St. James's, since 1914 the cathedral church of the diocese of St. Edmundsbury and Ipswich, is largely the work of John Wastell (early 16th century). St. Mary's (early 15th century) contains the tomb of Mary Tudor, sister of Henry VIII; angels in the nave roof represent a contemporary procession to the high altar. Moyses hall, an original Norman dwelling house, is now a museum. The grammar school was founded in 1550. A fashionable resort in the 18th century, the town retains much of its Georgian character. The town hall (c. 1780) is the work of Robert Adam and the fine Athenaeum ballroom is in the Adam style. A Queen Anne house called Angel Corner contains a remarkable collection of clocks. The Angel hotel was visited by Dickens and appears in *Pickwick Papers*.

The centre of an agricultural area, Bury St. Edmunds has a corn exchange, stock markets and a biweekly provision market. Formerly it had a large woolen trade. There are agricultural engineering works, a brewery, timber yards and a beet sugar factory.

Buildings of interest in the vicinity include the 16th-century Hengrave hall, 3 mi. N.W., built by Sir Thomas Kytson; Culford hall, 4.3 mi. N.W., built by the 1st Marquess Cornwallis, but since much altered; and Ickworth house, 3 mi. S.W., begun by the 4th earl of Bristol, bishop of Derry. (M. P. S.)

BUS: see OMNIBUS.

BUSBECQ (BUSBECK), **AUGIER GHISLAIN DE** (1522–1592), Flemish diplomat and writer whose position as ambassador at Constantinople enabled him to write informatively on life in Turkey. was born at Comines. After serving under Charles V he entered the service of Charles' brother, Ferdinand I of Austria, and in 1555 and 1556 was sent to the court of Suleiman the Magnificent, who disputed Ferdinand's claim to the Hungarian throne. On the second visit he was imprisoned by the sultan, but he finally succeeded in framing terms of peace, ratified on his return to Vienna in 1562. He subsequently held various posts at the imperial court (Ferdinand having become emperor in 1558) and spent the last years of his life at the French court as treasurer to Elizabeth of Austria, daughter of the emperor Maximilian II and wife of Charles IX, and as ambassador for Maximilian's son, Rudolph II. He died at St. Germain, near Rouen, on Oct. 28, 1592.

Busbecq's Latin letters from Constantinople and from the French court were long admired for their elegant style, and the former, especially, are a valuable source for contemporary history and manners. A man of lively interests, Busbecq was also a collector of Greek manuscripts, which later formed part of the Austrian national collection, and of coins and inscriptions, and discovered the Monumentum Ancyranum, tablets on the temple walls at Ancyra which record the deeds of the emperor Augustus. In his travels he came upon, and recorded the doings of, a community of Goths in the Crimea, who still retained Gothic customs and language. He also introduced into Europe various plants from the Levant, including the lilac and the tulip.

See his *Itinera Constantinopolitanum et Amasianum* (1581; Eng. trans., 1927) and *Epistolae ad Rudolphum II* (1630); *Life and Letters of Ogier Ghiselin de Busbecq* (1881). (R. F. Ls.)

BUSBY, RICHARD (1606–1693). British scholar and teacher, traditionally a great flogging headmaster, was born at Luton in Lincolnshire on Sept. 22, 1606, and was educated at Westminster school and Christ Church, Oxford, where he graduated in 1628. For his support of the royal cause he was restored to the prebend's stall at Wells and created a prebendary of Westminster. From 1638 (confirmed in 1640) until his death he was headmaster of Westminster school. Tradition has probably exaggerated his use of the rod, though there is no doubt that Busby followed the common practice of the period. Sir Peter Lely's sketch, *Sedes Busbiana*, was presented to Busby by Charles II. At the back of the chair a birch rod figures in the coat of arms with the motto *In hoc signo vinces* ("In this sign thou shalt conquer").

Busby gained a great reputation as a classical scholar, and in 1660 the University of Oxford conferred a doctorate on him.

Among his famous pupils were John Dryden, John Locke and Christopher Wren. Busby wrote and edited many school books for the use of his scholars, mainly Greek and Latin grammars. He died on April 6, 1695. (S. J. C.)

BUSCH, JULIUS HERMANN MORITZ (1821–1899), German writer known for his eyewitness accounts of Bismarck. He was born at Dresden on Feb. 13, 1821, and studied theology at Leipzig. After a visit to the United States (1851–52) he traveled in Palestine, Egypt and Greece (1856–59) and later edited the weekly journal *Die Grenzboten* with Gustav Freytag (q.v.). In 1864 he became a press official for the duke of Augustenburg but after 1866 entered the service of the Prussian government. In the Franco-German War he accompanied Bismarck as one of his press agents. From 1873–75 Busch was editor of the *Hannoverschen Kurier* but then became a free-lance writer and was official publicity agent in Berlin and Leipzig until 1890. He died at Leipzig, Nov. 16, 1899.

The accounts of Bismarck which gave Busch his fame or notoriety are mainly contained in *Graf Bismarck und seine Lehre während des Krieges mit Frankreich*, two volumes (1878), and *Tagebuchblätter*, three volumes (1899). There is an English version of the latter, *Bismarck: some secret pages of his history*, which was published a year earlier in 1898 and has independent value. The English version, which Busch sold to the firm of Hlaccmillan, contains his earlier work on Bismarck plus later additions, and it includes sharp passages which had been struck out of the German edition of 1878, as well as accounts of later conversations, etc. The German *Tagebuchblätter*, however, contains corrections. Both the English publication and the subsequent German one must therefore be used.

Busch was neither a historian nor a creative biographer, but he could record what he saw, though allowances must be made for the limitations of his vision.

BUSCH, WILHELM (1832–1908), German painter and poet, was best known for his wise, satiric drawings, accompanied by his own short rhymes, chastising human weaknesses. He was born at Wiedensahl in Hanover on April 15, 1832, and studied at the academies in Düsseldorf, Antwerp and Munich. In 1859 he began to contribute his picture sheets (*Bilderbogen*) to *Fliegende Blätter*, the leading German comic weekly. These were followed by his humorous illustrated poems such as *Max und Moritz*, *Der heilige Antonius von Padua*, *Die fromme Helene*, *Hans Huckebein*, *Diddelum*, *Herr und Frau Knopp* and many others. Busch's works were translated into many languages. By 1910 over a half million copies of *Max und Moritz* had been printed in German. Busch's work still enjoys great popularity; he is one of the most quoted writers in German-speaking countries. His picture sheets, i.e., series of comic sketches telling stories without words, can be regarded as precursors of the comic strip. His style, copied by innumerable artists, was remarkable for its extreme simplicity. His pen line was able to record with a few rapid scrawls the most complicated contortions and the most transitory movement. In 1878 he retired to his native province of Hanover, taking up the life of a country squire but continuing occasionally to publish poems or pieces of prose based on the experiences of a long life. He died in Mechtshausen, Ger., on Jan. 9, 1908.

See Wilhelm Busch, *Sämtliche Werke*, 8 vol. (1943). (Hs. H.)

BÜSCHING, ANTON FRIEDRICH (1724–1793), German geographer and educationalist whose main achievement was to put geography on a scientific basis, even if this was limited to the political and statistical side. Born in Sept. 1724 at Stadt-hagen, Lower Saxony, he studied theology at Halle. A journey in 1749 to St. Petersburg as tutor to the family of the Danish minister made him decide to write a new kind of world geography. After a period from 1754 as professor of philosophy at Gottingen, he went again to St. Petersburg in 1761 as pastor to the Lutheran congregation. On his return to Germany he was in 1766 appointed headmaster of the famous *Gymnasium zum Grauen Kloster*, founded by Frederick the Great, a post which he held until his death in Berlin on May 28, 1793. Through his reforms he became its most outstanding head during the 18th century and also gave a great impulse to education in Germany. The most important of

his publications, which range through many subjects and number over 100 are his educational and geographical writings. notably his *Neue Erdbeschreibung* ("New Geography") This work began to appear in 1754, but by the time of his death only the sections dealing with Europe and a part of Asia had been published. The first parts saw eight editions (Eng. trans. by P. Murdoch, 6 vol. 1762).

See E. Plewe, *Stuttgarter Geogr. Studien*, 69 (1957).

His son, JOHANN GUSTAV GOTTLIEB BÜSCHING (1783-1829) became professor of German archaeology at Breslau and did important pioneer work in this field. (K. A. S.)

BUSEMBAUM (BUSENBAUM), **HERMANN** (1600-1668), Jesuit theologian, was born at Nattuhn, Westphalia. His celebrated book, *Medulla theologiae moralis, facili ac perspicua methodo resolvens casus conscientiae ex variis probatisque auctoribus concinnata* (1645 or 1650), saw over 200 editions before 1776, was the basis of subsequent commentaries by a number of eminent moralists and was used as a textbook in many seminaries. Despite contrary allegations, Busembaum was never condemned by Rome and is recognized still by Catholic moralists as a model of theological orthodoxy.

There is no textual foundation for the accusation (popular in mid-18th-century France, where in 1757 his book was publicly burned by civil authorities) that the *Medulla* condones regicide or defends the theory that a laudable purpose justifies an intrinsically evil means. Evidence of the esteem accorded Busembaum in the Society of Jesus are his appointments as provincial's assistant, rector of the college of Hildesheim and rector (twice) at Münster, where he died on Jan. 31, 1668.

BUSHEL; see WEIGHTS AND MEASURES.

BUSHIDŌ, the code of moral principles that developed among the samurai (military) class of Japan, especially during and after the Kamakura period (12th century ff.), on a basis of national tradition influenced by Zen and Confucianism. The first use of the term apparently occurred during the civil war period of the 16th century; its precise content varied historically as samurai standards evolved. Its one unchanging ideal was martial spirit, including athletic and military skills as well as fearless facing of the enemy in battle. Frugal living, kindness and honesty were also highly regarded. Like Confucianism, Bushidō required filial piety; but, originating in the feudal system, it also held that the supreme honour was to serve one's lord unto death. If these obligations conflicted, the samurai was bound by loyalty to his lord despite the suffering he might cause his parents.

The final rationalization of Bushidō thought occurred during the Tokugawa period (17th century ff.), when Yamaga Sokō (1622-85) equated the samurai with the Confucian "superior man" and taught that his essential function was to exemplify virtue to the lower classes. Without disregarding the basic Confucian virtue, benevolence, Sokō emphasized the second virtue, righteousness, which he interpreted as "obligation" or "duty." This strict code of honour, affecting matters of life and death, demanded conscious choice and so fostered individual initiative while yet reasserting the obligations of loyalty and filial piety. Obedience to authority was stressed, but duty came first even if it entailed violation of statute law. In such an instance, the true samurai would prove his sincerity and expiate his crime against the government by subsequently taking his own life.

By mid-19th century, Bushidō standards had become the general ideal, and the legal abolition of the samurai class in 1871 made Bushidō even more the property of the entire nation. In the public educational system, with the emperor replacing the feudal lord as the object of loyalty and sacrifice, Bushidō became the foundation of ethical training. As such, it contributed both to the rise of Japanese nationalism and to the strengthening of wartime

civilian morale up to 1945. See also JAPAN: *The People*.

(D. M. EA.)

BUSHIRE (BUSHEHR), formerly Abu Shehr, a port of Iran near the head of the Persian gulf, is situated on the northern end of a flat peninsula which is connected with the mainland by a four- to six-mile wide neck of tidal marshes. It is the seat of the governor of the gulf ports administrative subdivision of the Fars-Banadar *ostan* (province). Pop. (1956) 18,431 (more Arab than Persian). On its frontage the town shows substantial two- and three-storied houses built in the peculiar gulf style, but the remainder, and the extensive bazaars, are poorly built. The ordinary water supply is slightly brackish; a limited amount of drinking water is obtainable from a condensing plant erected by the British outside the town. The climate is that of the gulf, oppressive with the combination of heat and humidity in summer, but moderated by northwestern winds at times. Many country houses are scattered about the parklike land south of the town.

Bushire has an outer and an inner anchorage, the former with deeper water but open to the winds; port equipment is mediocre. It is the terminus of the important ancient trade route to Shiraz, Isfahan and Teheran, which was rebuilt for motor traffic but is handicapped by several steep ascents like the famous Kotal-e Dokhtar and Kotal-e Pireh Zan (7,380 ft.). Teheran can be reached in four days. In the early 1930s the trade of Bushire amounted to about 40,000 tons annually but declined later. An additional amount of 50,000 tons of oil products is handled. Imports include sugar, cement and steel and largely exceed exports which include dried fruits: gums and raw cotton. The decline is a consequence of the construction of the Trans-Iranian railway, the headports of which are Bandar-e Shapur and Khorramshahr. Since the 1930s many people have left Bushire; others emigrate seasonally to Bahrain, Abadan and Kuwait. Two small textile mills are located at Bushire.

Bushire dates from comparatively modern times. Its forerunner was Rishire (Rishahr), about 5 mi. to the south on a small, fairly deep bay. Portuguese maps of the 16th and 17th centuries show Rishire as the chief emporium of the Persian coast. Its ruins were used as a quarry for Bushire. For a short time it was revived by the British during World War I. Bushire was founded and destined to be the base of the Persian navy by Nadir Shah in 1736. Though his scheme came to nothing, his interest in the town had the effect of concentrating there the trade of the Persian gulf—mainly at the expense of Bandar Abbas (*q.v.*). The British East India company finally transferred its trading activities in Persia from Bandar Abbas to Bushire in 1759 and Bushire became increasingly important. Bushire was temporarily occupied by British forces in the course of the war with Persia in 1856-57, and again during World War I. Its role during World War II was insignificant. The British consulate general was suppressed as a consequence of the oil conflict in 1951.

(H. Bo.)

BUSHMAN, a term derived from the early South African Dutch settlers' name for people known to the Hottentots as San, and to various Bantu groupings as Twa, Rwa or Sarwa. Formerly, it was held that Bushmen were readily identifiable in terms of physical features, language and culture. Hen-ever! close contact with other South African people has so reduced the efficacy of these criteria that modern practice tends to rely upon linguistic usage and impressionistic identification. Bushman languages make considerable use of click consonants: because of this, some linguists have placed them, along with Hottentot, Sandame and Hatsa, in the linguistic category known as Macro-Khoisan (see AFRICAN LANGUAGES; BUSHMAN LANGUAGES).

Bushmen were at one time widely distributed throughout South Africa. At the beginning of the 1960s, people who were physically, culturally or linguistically similar to the classical Bushman stereotype numbered at least 50,000, of whom some 20,000 were in South-West Africa (9,000 in the area of Grootfontein and 11,000 in the northern native territories) and 30,000 in the northern half of the Bechuanaland protectorate.

Living Bushmen are held to be the product of many hybridizing elements, so that their physical features are describable only in general terms. They are of short stature, within a range of

55 to 63 in. Their skin, varying in colour between light yellow and reddish-brown, readily forms deep wrinkles and folds. Their head hair, which is short, of fine texture and dark in colour, becomes tightly coiled into small spiral knots. Their heads are small, relatively broad and low crowned, though showing a tendency to be narrower and less markedly low crowned among the more northerly Bushman groupings. They have broad, flattish faces; characterized by prominent foreheads, well-developed cheekbones and low, broad noses. The Bushman skeletal form is associated with an inward curvature of the lower spine that gives a prominent appearance to the buttocks. Steatopygia, the accumulation of fat in that region, is frequently noted but is of doubtful significance as an essential typological feature.

Bushmen are to be found living in one of three socioeconomic conditions. The remnants of southern groupings occur as isolated simple families living by hunting and food gathering, eked out with some local employment. Others have become subject to aliens, for whom they work as cattle herders (*e.g.*, the Sarwa of Bechuanaland and the Heikum of South-West Africa) or to whom they pay tribute. But at least half of the total Bushman population continues to live in independent groups practising a traditional hunting and food-gathering economy; *e.g.*, the Auen, Rung and Naron. As hunters, they use bows and poison-tipped arrows, throwing sticks and sometimes spears. The increasing scarcity of wildlife compels the Bushmen to place greater reliance upon the gathering of wild vegetables for their basic subsistence needs. Material possessions are few. Wood, reeds and animal products are the source of raw materials from which are made skin clothing, carrying bags, hunting weapons and water containers; beads are made from ostrich eggshell. Building shelters, collecting vegetables and firewood, drawing water and cooking are tasks formally assigned to women, while men are expected to manufacture utensils and make skin garments in addition to the daily task of hunting.

The introduction of adolescents into adulthood is formalized. Girls are treated individually with a ritual procedure that, among the northerly groupings, includes the allegorical eland dance. Among most surviving Bushmen, groups of boys are given training in hunting and are required to submit to ritual scarification. These and other ceremonial activities are directed by specialists who are also concerned with rain making and the magic of successful hunting; others of a similar kind treat physical ailments.

Little is known of the beliefs and cults of the present-day Bushman. They appear to consist of an ill-defined veneration of the moon and perhaps of the stars and planets, together with the praying mantis cult. The total Bushman community is loosely grouped into tribes, which are, in effect: cultural and linguistic groupings. These cultural communities have no marked social solidarity and rest ultimately on the use by all members of what they regard as a common language. Within some communities, people are fictionally relatable to others by virtue of sharing a common name. This device enables individuals to move outside band boundaries, and the limits of its practice mark the normal area of friendly intercourse.

Social Organization.— This rests upon an essential entity, the hunting band, comprising three or four families habitually camping together. In northwestern Bushman country, bands have a population of about 50–60 people, although elsewhere 25–30 is more usual. This band entity is of an organizational order similar to that of the Hottentot nomadic or settled patriarchal unit and the Tswana ward. Band members may camp together either permanently or for the winter season only, thereafter dispersing as single family groups. Being essentially nomadic, most Bushmen live in temporary encampments, although in northern Bechuanaland bands are found in semipermanent villages. Individual dwellings are little more than semicircular shelters constructed of branches laced together with twigs and thatched with grass.

Within the band the only structural element is the simple family composed of a husband and wife and their dependent children. It may occasionally be enlarged by polygynous marriage. In either case, the family normally occupies a single shelter, but if

the women of a polygynous family fail to live together agreeably, each wife may be given her own shelter. In many of the smaller bands all the component families are related, but such a relationship is not an essential qualification for band membership.

While marriage rules permit unions with all first cousins, in practice many marriages are contracted outside this preferential range. Under modern conditions marriages are increasingly contracted with members of different cultural groupings and even of different races. Only among the northwestern Bushman communities, where bands are larger, are marriage rules closely restrictive. There band exogamy is enforced and the marriage of all consanguineous kin prohibited. Under those conditions, sororal polygyny—marriage to two or more sisters—tends to be esteemed.

Bushman social entities or bands, in contrast with Hottentot and Tswana social organization, are not combined in any way to form wider groups such as clans or states. Each band is an autonomous, land-holding unit. The leadership of most bands is assumed as occasion demands by skilled hunters or by the older men, but bands living in northeastern South-West Africa have hereditary chiefs who are little more than heads of family groups. The bands, like other social entities of this kind, are self-regulating in a completely informal manner. Personal wrongs are adjusted on the principle of "self-help" or, if of a grievous nature, by blood vengeance. Public wrongs that offend the total band are subject to penal sanctions. The essential feature of Bushman society is the absence of any organization wider than that of the fundamental, readily identifiable, self-contained social and administrative entity, the band. See also Index references under "Bushman" in the Index volume.

BIBLIOGRAPHY.—D. F. Bleek, *The Naron* (1928); I. Schapera, *The Khoisan Peoples of South Africa* (1951); P. V. Tobias, "On the Survival of the Bushmen," *Africa*, vol. xxvi, pp. 174–186 (1956); Elizabeth M. Thomas, *The Harmless People* (1959). (V. G. J. S.)

BUSHMAN LANGUAGES are spoken in southern Africa and belong to the same linguistic family as the Hottentot languages (see **HOTTENTOT: Language**).

Classification.— There has been considerable confusion about the membership of these two major branches, or subfamilies, of what has in recent times come to be called the click or Macro-Khoisan language family. Nonlinguistic considerations, such as the great cultural differences between the pastoral Hottentots and the hunting and food-gathering Bushmen, have been introduced into discussions of the problem; in addition, Carl Meinhof's classification of the Hottentot languages as Hamitic, on the basis of a few very tenuous typological resemblances, further bedeviled the situation, and attempts to re-examine the matter were inhibited by his eminence and stature as an Africanist. The result has been that the Bushman and Hottentot languages have been regarded by many as genetically quite distinct, and even when the over-all relationship has been acknowledged it has been generally assumed that the languages spoken by peoples of Bushman culture constitute a category quite distinct from those spoken by peoples of Hottentot culture. Thus in the past a subdivision of the Bushman languages into three groups, termed Northern, Central and Southern, has been generally accepted. The so-called Central Bushman languages are very closely related to the Hottentot tongues and should be classified in one linguistic branch with them.

To avoid the confusion arising from the cultural connotations of the terms Hottentot and Bushman, it is preferable to use the terms "Khoi" and "San" for the linguistic divisions. Some of the Bushman languages, *i.e.*, spoken by peoples of Bushman culture, are of Khoi type, while others are of San type. There are the following major divisions within the Macro-Khoisan family:

1. Khoi branch
 - a. Hottentot group, including Nama, !kora (almost extinct), Grikwa (extinct)
 - b. Central Bushman group, including Naron, Hie, G/wi, G//ana, /aba
2. San branch
 - a. Northern Bushman group, including //ãũ//?ē, !kuŋ, !o!kuŋ
 - b. Southern Bushman group, including jauni, N/usan, ≠khomani, !xōŋ
3. Sandawe (Tanganyika)
4. Hadza (Tanganyika)

E. O. J. Westphal recognizes a greater affinity between Sandawe (*q.v.*) and the Hottentot and Central Bushman group languages, which requires the inclusion of Sandawe in the Khoi branch, and he suggests a closer relationship between Hadza and the Northern and Southern Bushman groups, which would include Hadza in the San branch. Information on the vast majority of the Macro-Khoisan languages, however, is still fragmentary, so that any attempt at internal classification remains highly tentative. Their unique phonological structures present special problems, and relatively little linguistic research has yet been carried out. Listing and classification is complicated by the existence of numerous nicknames, used, *e.g.*, by the Bantu peoples, and of orthographically variant forms of their own names as recorded by different writers. Their inaccessibility in the desert regions of the Kalahari, their nomadism and the lack of social units larger than the hunting band (seldom more than an extended family) all serve to complicate both field research and attempts to keep track of their ethnic or linguistic affiliations.

Geographic Distribution. — Following the tentative classification set out above, discussion of the Bushman languages is here confined largely to those of the San branch, but references are made to the languages of the Khoi branch wherever necessary. Geographically, the Bushman groups are distributed roughly as follows: Northern group (San) in southern Angola, northeastern areas of South-West Africa, northwestern regions of Bechuanaland protectorate; Southern group (San) in the southwestern areas of Bechuanaland protectorate, adjacent regions of South-West Africa and northern Cape Province; Central group (Khoi) in the central and northern regions of the Bechuanaland protectorate.

In former times, Bushman and Hottentot peoples ranged very widely in Cape Province, Orange Free State, Basutoland and Transvaal, but these are almost entirely extinct. Only the scantiest record of their languages remains and their relationship and classification are a matter of conjecture.

Phonology. — The most striking feature of the Bushman languages, as of all the Macro-Khoisan tongues, is their extensive and unique use of click sounds (*see* CLICKS). There are certain Bantu languages, notably those of the Nguni (Zulu-Xhosa) group, which have acquired these consonants as a result of contact with the Khoisan peoples. However, the plain nonclick consonants are obviously fundamental in the Bantu languages, whereas in the Khoisan languages the clicks dominate and form the basis of the consonantal phonology. They constitute a complete or near-complete, consistent and fully symmetrical series, whereas the non-click consonants are often haphazard and asymmetrical in their pattern distribution. The clicks also occur much more frequently than the other consonants, most word roots having an initial click consonant. These features indicate that the clicks are the original consonants of these languages and that many of the nonclick consonants may be later acquisitions or developments.

Six positional types of clicks occur, but no one language is known to employ more than five of them. Most of the languages have four types, usually represented by / (dental), ≠ (alveolar), ! (palatal), // (alveolar-lateral). In addition, most of the Southern group languages have a labial click, ⊙, while a retroflex click, ///, has been reported for one language, !khū, of the Northern group. Each of the clicks may be voiceless, voiced or nasalized, and further combinations may occur with glottalized, aspirated and velar fricative releases. The following table illustrates the series of basic clicks and combinatory clusters occurring in //ǃũ//ǂē (Northern group):

	Dental	Alveolar	Palatal	Lateral
Voiceless	/	≠	!	//
Voiced	g/	g≠	g!	g//
Nasalized	n/	n≠	n!	n//
Glottalized	/ʔ	#ʔ	!ʔ	//ʔ
Aspirated	/h	≠h	!h	//h
Voiceless velarized	/x	≠x	!x	//x
Voiced velarized	g/ɣ	g≠ɣ	g!ɣ	g//ɣ
Aspirated velarized	/hx	≠hx	!hx	//hx
Nasalized aspirated	n/h	n≠h	n!h	n//h

The nonclick consonants are characterized by the absence in most of the languages of a voiceless labial stop, *p*, although there is

usually a voiced labial stop, *b*. The bilabial fricative, *β*, is common but the dentilabials, *f* and *v*, have not been recorded, and the lateral *l* is rare, whereas a flapped *r* or *d* occurs regularly. The glottal catch, ʔ, has consonantal function in all the languages, and velarized and glottalized release of stop consonants is common. The following nonclick consonants, including some clusters, have been recorded for //ǃũ//ǂē:

Labial	Dental	Alveolar	Prepalatal	Velar	Glottal
b	t	ts	tš	k	ʔ
	d	dz		g	
	t'	tsʔ			
	dh	tsh	tšh	kh	
		dzh			
m	dɣ	tsx		kxʔ	
		tshx	tšhx	khx	h
		s	š	x	
		z	ž		
		r		ŋ	w

There are usually at least six vowel phonemes, *i*, *e*, *a*, *o*, *u*, and central *a*, all of which may be nasalized, *e.g.*, *ã*, or occur with contrast of long : short. Vowel clusters (diphthongs) are common. For many of the languages pharyngalization or "pressing" of vowels has been reported, but it is not clear precisely what the function of this feature is.

Syllabic structures may consist of a single vowel (V) or consonant (C), or sequences of as many as four clustered consonants with one or two vowels. Syllables of the type CVC also occur, usually with nasal consonants in final position, and monosyllabic words consisting of click consonant plus syllabic nasal are common. Root words are mostly monosyllabic, and forms with three or more syllables are obvious compounds in most cases. All Bushman languages are tone languages and as many as five tonal levels or glides have been reported, but it is doubtful whether more than three of these are phonemically distinctive.

The following examples illustrate some of these syllabic and tonal features, the syllables being separated by hyphens and the tones distinguished by acute accent (high), grave accent (low) and unmarked (mid).

<i>m-ba</i>	"my father"	≠wi	"caracal"
ʔ <i>a-ba</i>	"your father"	≠xwi	"hair," "feathers"
ǂ <i>ba</i>	"his father"	≠hxwi	"tail of animal"
<i>m</i>	"eat"	/xi	"foot," "paw," "toe"
/m	"sun," n.	g/ɣi	"scorpion"
n/ǂm	"spring hare"		
to-m	"approach," v.	#a	"plain," n.
m-m̄	"suck," as an infant	≠ã	"await," v.

Morphology. — There is considerable variation in the morphological structures of the Bushman languages. Those of the Central group (Khoi), like the Hottentot languages, have a fairly extensive range of suffixal inflections of substantives to express number, gender and case. They commonly have three categories of grammatical number: singular, dual and plural. There are three genders or classes of nouns: masculine, feminine and common. However, strong, tall or slender objects are treated as masculine, and weak, short or round ones as feminine, so that the classification extends beyond strict distinctions of sex. The so-called case inflections are actually postpositional particles or enclitics, expressing temporal, locative, associative, instrumental and possessive relationships, but sometimes variant forms of the gender suffixes are required with these. The possessor precedes the thing possessed. Examples from Naron:

	Masculine	Feminine	Common
Sing.	<i>kweba</i> "man"	<i>kwesa</i> "woman"	<i>kwe</i> "person"
Dual	<i>kwetšara</i> "two men"	<i>kwesara</i> "two women"	<i>kwekhara</i> "two persons"
Plural	<i>kwe//kwa</i> "men"	<i>kweši</i> "women"	<i>kwene</i> "people"
Masculine sing.	<i>kwe-ba</i> <i>kwe-m-di</i> <i>kwe-m kwe</i>	"a man" ... "a man's . . ." "with a man"	

These languages have an extensive series of pronouns representing the three persons, numbers and genders. Adjectives may either precede or follow the nouns which they qualify and some are inflected suffixally while others are invariable. In verb conjunction various tense particles or auxiliaries are employed, usually preceding the verb itself. In most accounts these auxiliaries have been recorded as separate words, but further investigation may reveal some or all of them to be affixal. In all the languages, particles and inflectional elements rarely incorporate click consonants, which occur almost exclusively in word roots.

By contrast with the Central group (Khoi) languages, those of the Northern and Southern groups (San) have no system of gender inflections or distinctions, except sometimes in pronouns. To specify the sex of an animal, for example, its name is associated with a word meaning "male" or "female," or perhaps "man" or "woman." There are only two categories of grammatical number, singular and plural, though the distinction is not at all regularly observed. In the Northern group, a type of plural can be formed by suffixing *-sì*, which appears to be none other than the third person plural pronoun meaning "they." With some forms having a collective or quantitative significance, *-sì* occurs regularly; e.g., in //ãũ//?é, *msì* "food"; *wãàsì* "all," "everyone"; *tsisì* "clothing," but in general no distinction between singular and plural is made unless to emphasize specifically the plurality of the objects referred to, whereupon *-sì* is suffixed. Thus: *gumì* "cattle" (one or more); *g'wì* "spotted hyena," "spotted hyenas"; *n!um* "stone," "stones"; *ǀari* "guinea fowl" (one or more). However, there are a few instances in this language where a number distinction is regularly observed either by the use of two entirely different words or by a difference of tone: *!hwãã* "a man"; *n//ae* "men"; *ǀu* "a person"; *ǀú* "people."

In the Southern group, distinctions of number are commonly not expressed, but the use with nouns of pronominal forms meaning "this one" and "they" does occur, e.g., in ≠khomani, while reduplication of the noun is used to express the plural in /xam and sometimes elsewhere. Adjectives usually precede nouns in the Northern group, but follow them in the Southern group. In all the San languages the word denoting the possessor precedes that signifying the thing possessed. In the Northern group no possessive particle occurs; in the Southern group it is usually *-ka*. Verb-tense distinctions are achieved mainly by the use of auxiliaries preceding the verb itself, as in the Central group. The sentence order in the San languages is subject-verb-object; in the Central group (Khoi) it is usually subject-object-verb.

In general five distribution classes of words (parts of speech) may be recognized for Bushman languages—nouns, pronouns, adjectives, verbs and particles—but, except for the nouns in the Central group and some pronouns, there are no intrinsic features by which words can be identified as belonging to one or another of these categories. For example, a word can be identified as a verb only by establishing its potentiality for association with tense particles in verbal constructions: except in the languages where gender and number affixes are a regular feature, nouns can be identified only by their potentiality for association with a plural or possessive suffix, etc., or in specific syntactic sequences with verbs. However, there are probably many instances of word roots with dual potentialities; e.g., in //ãũ//?é the root *!ǀ* is either a verb, meaning "die," or a noun, meaning "death" (cf. English "cut," verb, noun or adjective).

Vocabulary. — As may be expected, the Bushman languages are rich in terms for the things of everyday life, including animal and plant life, hunting and food-gathering, weapons and veld lore. Obviously they lack terms for the technical devices and philosophical abstractions of western civilization. Numerals occur only for "one" and "two" or sometimes for "three," any greater number generally being designated "many." Having no domestic animals or many other possessions, there is no need for counting, and the tendency is to specify each object individually. This manifests itself in other ways; for example, the //ãũ//?é do not appear to have any generic terms for "snake" or "game animal," but each distinctive species of snake or other animal has its own name. Furthermore, when designating parts of wholes or associated

things, specifying compounds are extensively used in a fashion which appears redundant to speakers of European languages: *ǀu-/ǀí* "person-foot," *dzu-/ǀí* "ostrich-foot," instead of simply */ǀí* "foot"; *daa-ǀuwa* "fire smoke," *ǀoro-ǀúwá* "tobacco smoke," rather than *ǀuwa* "smoke." However, many other such formations have parallels in European languages, as *g≠γwà-n/i* "kneecap," lit. "knee-head"; *≠úm-!háá* "thigh" or "calf," lit. "leg-meat." In contrast with this specificity, there are intriguing instances of the reverse: */ǀí* "foot" or "toe"; *g≠ǀú* "hand" or "finger"; *≠xwí* "feather," "hair," "wool" or "whisker[s]"; *≠hwí* "string," "twine," or the plant used for making twine; *ku* "breast," "nipple," "teat," "udder" or "milk."

BUSHMASTER (*Lachesis mutus*), a member of the venomous pit viper family, Crotalidae, that occurs from Costa Rica and Trinidad to eastern Brazil. Since it is confined to humid forest regions, it is seldom encountered. It is a handsome snake with a row of dark rhombs on a dull reddish or yellowish background. The scales are tuberculate, giving it a rough appearance. It is unique among the American pit vipers because it lays eggs; it is also the longest, reported to attain 12 ft. Rodents constitute the principle food. The species does very poorly in captivity.

BUSHNELL, HORACE (1802–1876), U.S. theologian of great originality and subtlety, sometimes referred to as the "father of American religious liberalism," was born in Litchfield township, Conn., on April 14, 1802. The family moved to a farm in New Preston, Conn., in 1805. Bushnell joined the local Congregational church in 1821 and in 1823 entered Yale college, planning to become a minister. These plans changed, however; after graduation in 1827 he taught school for a time, served as associate editor of the *New York Journal of Commerce*, then returned to Yale to study law (tutoring in the college at the same time). Following a decisive religious experience in 1831, he entered the Yale theological department. In 1833 he was ordained minister of the North Congregational church in Hartford, Conn., where he served with distinction until 1859 when ill health forced his resignation. Thereafter he devoted himself chiefly to writing on theological subjects. Bushnell stood between the orthodox tradition of Puritan New England and the new romantic impulses represented by Ralph Waldo Emerson, Samuel Taylor Coleridge and, above all, Friedrich Schleiermacher (*q.v.*). Yet he was more than a mediator; his own contributions were large and long-lasting.

Bushnell's first major publication, *Christian Nurture* (1847);

2nd ed., 1861), was probably also his most influential. Though concerned chiefly with baptism, the family and education, it was also a thorough critique of the great emphasis placed on the conversion experience by revivalism. Stressing the churchlike quality and redemptive role of the family, as well as the familylike quality of the church, Bushnell insisted that a child of Christian parents should never know when he had not been a Christian. *God in Christ* (1849) consisted of a dissertation on language and three addresses dealing with the divinity of Christ, the atonement and problems of dogma and spirit in the reviving of religion. The dissertation on language expressed a persistent Bushnellian theme, emphasizing the social, symbolic and evocative nature of language, especially when it deals with religious faith and the mysteries of God. This controversial volume was amplified and defended in *Christ in Theology* (1851), with special attention being given to the metaphoric aspects of theological language and to an "instrumental" view of the Trinity. In *Nature and the Supernatural* (1858) he defined "nature" as that realm of being which is governed by law, the "supernatural" as that which is not in the train of cause and effect but which acts upon the chain from without. Seeing both as constituting the one "system of God," he sought to defend from skeptical attack the Christian position on sin, miracle, incarnation, revelation and Christ's divinity. *The Vicarious Sacrifice* (1566) and *Forgiveness and Law* (1874) provide more complete statements on his moral view of the atonement and his deepening understanding of God's sacrificial love. He died at Hartford on Feb. 17, 1876.

Bushnell's thought was bitterly attacked by conservatives, and in 1852 North church withdrew from the local consociation in order to preclude an ecclesiastical heresy trial. Nevertheless his thought was so coherent, his argumentation so plausible and his manner of expression so persuasive that his interpretation of Christianity norked a powerful influence on the course of liberal theology in America. He remains a major figure in the country's intellectual history. He is perhaps best remembered for his perceptions of the social dimension of the person, faith and sin, and of the organic, contextual character of human groups (such as the family, the congregation or the nation). In a time of cultural fragmentation and intellectual ferment he profoundly illuminated the spiritual, moral and philosophical significance of these social relationships.

Most of Bushnell's works were reissued after his death, including six volumes of sermons and essays: *Sermons for the New Life* (1858), *Christ and His Salvation* (1864), *Work and Play* (1864), *Moral Uses of Dark Things* (1868), *Sermons on Living Subjects* (1872) and *Building Eras in Religion* (posthumously edited). *Spirit in Man: Sermons and Selections* (1903) contains previously unpublished papers and a bibliography by Henry B. Learned. *Christian Nurture*, ed. by L. A. Weigle, was reissued in 1916. Bushnell's moderate and cautious views on social issues were set forth in *A Discourse on the Slavery Question* (1839); *The Census and Slavery* (1860); and *Women's Suffrage, the Reform Against Nature* (1869). An essay on "Science and Religion" (1868) shows his resistance to Darwinian evolutionary theory.

BIBLIOGRAPHY.—On Bushnell's life and thought see the biographies by Mary Bushnell Cheney, a devoted and scholarly daughter (1880; 2nd ed., 1903); Theodore T. Munger (1899); and Barbara M. Cross (1958). (S. E. A.)

BUSHRANGERS were men who lived, during the 19th century, in the Australian bush on the proceeds of robberies. They traveled on horseback, raiding highways, country towns and isolated dwellings and then disappearing into the bush country. At times there may have been considerable economic and social justification for this activity: the first bushrangers were convicts who escaped from the small early settlements and often from the harsh discipline of the lash and from unfair treatment by those in authority. The early bushrangers became such a problem that a Bushranging act was passed in New South Wales in 1830 and remained in force until convict bushrangers had practically disappeared at the date of gold discoveries in 1851. These, however, provided new incentive for highway and bank robberies, and, in the 25 years which followed, bushrangers gained fame and notoriety. The late 1860s and 1870s saw some renewed causes, if not

justifications, of their activities. Most of the usable land had been taken up, and the exhaustion of alluvial gold meant that hundreds of thousands of men were forced to seek land or employment under unfavourable conditions. Legislation was enacted which reflected both the power of the wealthy and the impotence of the poor. The resultant contest for land brought unfairness, corruption and unscrupulousness. These circumstances encouraged crime, and sympathy for the bushrangers was often as widespread as was the feeling of social grievance.

The members of the Kelly gang were really the last of the bushrangers. They lived in northeastern Victoria and graduated to bushranging from cattle stealing, which, with a concomitant hatred of the police, was more general than many cared to admit. However, Ned Kelly (see KELLY, EDWARD) and his gang were hardened criminals with no more honour than desperate men can afford. There are little or no grounds for beliefs about wrongful suspicions and arrests (assumed to excuse the Kellys) or for claims that they respected women and had the willing support of the people. Yet the contest between the Kellys and the police seems to have been treated as if the bushrangers were in the right and as if the authority of the police was to be denied. The arrest of Ned Kelly and the killing of his companions at Glenroan in June 1880 was, however, a great relief to farmers and townspeople in Victoria and New South Wales. (J. F. C.)

BUSH WREN, the name given to a family of birds (Acanthisittidae) confined to the highland forests of New Zealand. There are four species of these tiny, wrenlike forms, related to the tyrant flycatchers (see FLYCATCHER).

BUSINESS CODES, a term applied to principles or standards of fair and ethical practice observed or agreed upon by particular industries or business groups. After the decade preceding World War I businessmen became increasingly concerned with the ethical aspects of their activities and with the inability of common law and statutes to prevent some members of most industries from cheating consumers and using unfair methods of competition against their competitors. Business codes are more or less systematic attempts to translate the ethics of the majority into standards of conduct enjoined upon all. During the 20th century this crystallizing and universalizing of business ethics has had its most notable development in the United States. (For European experience see CARTEL.)

Nature of Business Codes.—The salient fact about business codes is that they are the product of a consensus among the businessmen concerned and the result of agreements on the part of those who will be governed by the codes. They are not imposed from without, but spring from within the group whose interests they are designed to advance. The interests of this relatively small group of businessmen overlap, in part, the interests of society in general; in part, also, the two sets of interests are inconsistent. The community of interest may be utilized to make business codes effective instruments of social control. The conflict of interest, on the other hand, can turn business codes into vehicles of private aggrandizement and public exploitation. A particular business code may socialize extreme manifestations of the ruggedly individualistic competitive spirit by proscribing unfair methods of competition, or it may develop, formalize and perpetuate restraints of trade. In fact, most business codes combine these social and selfish elements. They are useful instruments of social control, but they require public supervision to ensure that they shall be adequately socialized in purpose and effect.

Except where they have become law, business codes depend for their effectiveness upon moral suasion and group pressure. These sanctions are applied to those who refuse to subscribe to the code as well as to those who accept it, but they are not sufficiently severe to compel determined individualists to conform to the standards of the majority of the trade. The result is that the practical force of a business code tends to weaken just at the point where the code is most needed. A code may be effective where compliance with its standards is willing and unanimous, but it tends to break down where compliance must be compelled.

The term "business code" usually connotes a written document in which the standards of a given industry are set forth in system-

atic fashion. In a looser sense, however, every trade or business may be said to have its own code of ethics, even if that code is nothing more than the inarticulate body of conventions, prejudices and convictions which some particular group adopts as the common basis of its conduct. The unwritten code of every business is simply its prevailing morality.

Written business codes, ordinarily drafted under the auspices of trade associations, imply inadequacy of the prevailing morality as a sound basis for the activities of the trade. These formal codes typically proscribe such competitive practices as fraud, disparagement of a competitor's goods, sales below cost, enticement of a competitor's customers or employees, industrial espionage and the like. The fact that such practices are specifically prohibited is some evidence that the prevailing morality has permitted them to flourish. The code often is a statement of ideals, not a description of practice. It tends to raise levels of conduct by stating unattained goals as rules, but it also tends to fall into contempt if practice falls short of principle. If the code persuades the public that an industry's practices are substantially in accord with its principles, it may obscure the need for corrective measures and produce unmerited good will. A good business code is not, from the viewpoint of the trade as a whole, entirely selfish, but recognizes, in addition to obligations of members of the trade to one another, their obligations to customers, suppliers and employees, and to the general public and the government. In practice most business codes have combined good features with bad. They have emphasized rights at the expense of duties and have been designed primarily to benefit the trade and protect it against regulation from without. However, they also have tended to raise prevailing standards of business practice and to educate the trade to observe the higher standards stated.

Professional Codes v. Business Codes.—Codes of business ethics originated in the learned professions, and today their highest development is to be found in the codes of ethics governing such professions as law and medicine. These professional codes are the result of circumstances peculiar to the learned professions, but the professional character of business management may in time come to be accepted as the product of analogous circumstances. The learned professions are bound together in a common discipline which creates a spirit of fraternity, scholarship and public service. The professional practitioner does not deal at arm's length with his patient or client; the business principle of caveat *emptor* cannot apply where experts sell their services to laymen. The customer is a client or a patient, not an opponent in the game of trade. Some gratuitous services to clients and patients are contemplated; in principle the profession is devoted to public service, and financial gain presumably is secondary. Professional codes recognize duties to the cause of learning, to clients or patients and the public, as well as to colleagues.

Business codes do not rest upon the same intellectual and philanthropic basis. Business typically calls for skill, not learning, and the objective is profit, not service. Nevertheless, the development of business codes suggests an awakening professional attitude among many businessmen. This attitude is a product of corporate enterprise, which has divided the classic functions of entrepreneurship between investors and managers.
