CARTHUSIANS *TO* COCKCROFT

CARTHUSIANS (ORDO CARTUSIENSIS), an order of eremitical monks, were founded by St. Bruno (*q.v.*), a native of Cologne and a celebrated master of the cathedral school of Reims, who retired with six companions in 1084 to lead a hermit's life in the mountain valley of Chartreuse. north of Grenoble in France. Summoned to Rome in 1090 by his former pupil Odo, now Pope Urban II, Bruno declined all preferment and two years later obtained permission to retire to southern Italy, where he founded a second colony of hermits at La Torre (Calabria). Bruno's plantation resembled many of that age, which either became extinct or reverted to a more normal form of the monastic life, as did Savigny and Citeaux. The Chartreuse endured partly because of a succession of monks with strong vocations, partly because of the excellent judgment of Prior Guigo I who compiled a directory from the customs of the house (approved in 1133 by Innocent 11), and partly because of the skill with which Guigo and his successors adapted to their own requirements the constitutional machinery of the Cistercians. The Carthusians thus became a religious order, with a system of visitation and legislative general chapters. That they should have survived throughout the centuries, neither needing nor experiencing reform, may'be ascribed partly to the wise blending of cenobitic and eremitical elements in their life, but perhaps still more to their prudent strictness in testing recruits and to the absolute fidelity, amounting at times to an apparent rigidity, with which they have retained their way of life unchanged even in the varying conditions of the social life of the times.

The Carthusians spread slowly, but at the Reformation they had more than 200 houses in every country of Catholic Europe, and they were the spiritual influence behind much that was best in the 15th and early 16th centuries. In England there were nine Charterhouses (as the word Chartreuse was anglicized) in the middle ages, including Mount Grace (Yorkshire), of which extensive fragments remain, and the London (Smithfield) house. celebrated for its heroic resistance to the royal supremacy in religion claimed by Henry VIII. Some survivors of the English province lived to refound their life in the Netherlands, where they continued till suppressed in 1793. The northern European houses disappeared at the Reformation, but there was revival in the 17th century, especially in France and Spain, which were always recruiting grounds of the order. They suffered greatly under the emperor Joseph II and the French Revolution, but another revival followed, though the French Carthusians were exiled for a second time from the Grande Chartreuse in 1903, to return in 1940. The Carthusians returned to England from France in 1883. when they built a large monastery at Parkminster (Sussex), and in 1951 a foundation was made at Whitingham, Vt., in the United States.

In the early 1960s there were about 25 Charterhouses in the world. The order is governed by a general, the prior of the Grande Chartreuse, elected by the monks of his house; and by a general chapter that meets annually.

The Carthusians have always shunned publicity, and their saints have in general remained hidden in the cloister. St. Hugh, prior of the first English Charterhouse at Witham (Somerset), owed his canonization to his later activity as bishop of Lincoln (d. 1200). Among mystical writers Denis the Carthusian (d. 1471) and Iustus Lanspergius (d. 1535) are well known.

The Carthusian lives in a small house or "cell" with a workroom, oratory, bedroom and miniature garden; the houses surround three sides of the great cloister, the fourth being occupied by the church, chapter house and the cells of prior and procurator. The refectory, library, quarters of the lay brothers and guesthouse lie between the great cloister and the main gateway, the whole complex being surrounded with a wall (see MONASTERY: *Carthusians*). The monks study, pray, work, sleep and eat in their cells, repairing to the church only for the night office, vespers and the conventual and private mass, at which they have a rite of their own. They eat together only on Sundays and great feasts, when they also have a period of conversation. Their food is prepared by the lay brothers and delivered to a serving hatch in each cell; they wear a hair shirt and practice total abstinence from flesh meat, and on Fridays and other fast days they take only bread and water. The monks have two short periods of sleep, broken by the long night office, which is recited very slowly. They wear a white habit, scapular and hood, and in choir a white cowl. The lay brethren live in community; originally housed at a distance from the monastery, they still have a separate chapel and refectory, and work in the garden or farm and at crafts of various kinds. At the Grande Chartreuse, as the motherhouse is known, the lay

brothers distil the liqueur that bears the name of the motherhouse and of which the profits are distributed to neighbouring religious causes and charities (*see* CHARTREUSE; CHARTREUSE, LA GRANDE).

Carthusian nuns. with a few monasteries in France and Italy, and under the direction of the order, also are strictly enclosed and contemplative. Their rule is very similar to that of the monks, and the habit is also very similar except for a black veil and linen wimple.

The Carthusian vocation, with its solitude and silence and long hours of vocal prayer, has always been recognized as the hardest of accomplishment in the Roman Catholic Church, demanding unusual qualities of physical and psychological endurance. In consequence, members of other orders may, if they can satisfy its demands, transfer themselves to a Charterhouse. In practice many attempt the life but few persevere.

See M. Heimbucher, *Orden und Kongregationen,* vol. i, pp. 376–391 (1933–34); E. M. Thompson, *The Carthusian Order in England* (1930).

(M. D. K.)

CARTIER, SIR GEORGES ÉTIENNE, BART. (1814–1873). Canadian statesman and leading advocate of railway construction who played a leading part in the achievement of close political co-operation between French-speaking and English-speaking Canadians, was born in Lower Canada on Sept. 6, 1814. He was called to the bar in 1835, but after taking part in the rebellion of 1837 he was forced to spend several months in the U.S. as an exile. In 1848 he was elected to the Canadian legislative assembly and in 1857 he became leader of the Lower Canadian section in the Macdonald-Cartier administration. He was premier in the Cartier-Macdonald ministry of 1858–62. His alliance with Sir John Macdonald was a principal factor in the development of the Liberal-Conservative party of Canada. He promoted the abolition of seigneurial tenure in Lower Canada and the codification of the civil law of that province. His energy and optimism were largely responsible for the completion of the Grand Trunk railway and the resolve to build the Canadian Pacific. In the face of great opposition he led the movement that carried French Canada into federation (1864–67). He was knighted in 1868. He was minister of militia and defense in the first Macdonald administration after confederation. Defeated at the general election of 1872, another seat was found for him, but he died on May 20, 1873.

See biographies by Alfred D. Decelles (1904); J. Boyd (1914); B. Sulte (1919).

(D. C. C. M.)

CARTIER, JACQUES (1491–1557), French navigator who discovered the St. Lawrence river. was born at St. Malo, Brittany, in 1491. Commissioned by the French king, Francis I, to look for a northwest passage to the east, he left St. Malo in 1534 in command of an expedition consisting of two ships and 61 men On reaching Newfoundland he entered the Strait of Belle Isle, and by following the south side of the strait was led down almost the whole west coast of Newfoundland. Off St. George's bay a storm drove the ships out into the gulf. He mistook Magdalen and Prince Edward islands for the main shore on the south side of this great gulf. Following the coast of New Brunswick northward he was greatly disappointed to discover that Chaleur bay was not a strait. During a ten days' stay in Gaspé harbour Cartier made friends with a tribe of Huron-Iroquois Indians from Quebec, two of whom he carried off with him. On discovering the passage between the island of Anticosti and the Quebec shore it was decided to postpone the exploration of this strait until the following year. Heading eastward along the Quebec shore, Cartier soon regained the Strait of Belle Isle and reached St. Malo on Sept. 5.

Cartier set sail again from St. Malo with three vessels on May 19, 1535, and, passing through the Strait of Belle Isle, anchored on Aug, 9 in Pillage bay, opposite Anticosti, which he named the Bay of St. Lawrence, a name which spread to the gulf and the river. Proceeding through the passage north of Anticosti, Cartier anchored on Sept. 1 at the mouth of the Saguenay, which the two Indians informed him was the name of a kingdom "rich and wealthy in precious stones." Again on reaching the island of Orleans they told Cartier he was now in the kingdom of Canada, in reality the Huron-Iroquois word for village. Leaving his two larger vessels in the St. Charles, uhich there enters the St Lawrence, Cartier set off westward with the bark and the longboats. The bark grounded in St. Peter lake but the longboats reached the Huron-Iroquois village of Hochelaga, where Montreal now stands, on Oct. 2. Further progress was checked by the Lachine rapids. On his return to the St. Charles, where during the winter 25 men died of scurvy, Cartier sought further information about the kingdom of Saguenay, which he was informed could be reached more easily by way of the Ottawa. In order to give Francis I authentic information of this mythical northern Mexico, Cartier seized the chief and 11 of the headmen of the village and carried them off to France. This time he passed south of Anticosti and, entering the Atlantic through Cabot strait, reached St. Malo on July 16, 1536.

In the spring of 1541 Cartier set sail with five vessels and took up quariers at Cap Rouge, 9 mi. above Quebec. The seigneur de Roberval had been chosen to command; but when he did not arrive, Cartier made a fresh examination of the rapids of Lachine, preparatory to sending the men up the Ottawa river. Roberval at length set sail in April 1542, but on reaching St. John's, Nfd., met Cartier on his way back to France. The "precious stones" Cartier brought with him were found to be almost worthless, and for the time being French authorities lost interest in Canada; Roberval was recalled in 1543. Cartier died at St. Malo, on Sept. 1, 1557.

For further explorations in Canada *see* CANADA: History.

CARTILAGE, a specialized, dense connective tissue. forms most of the temporary skeleton of the mammalian embryo and the entire permanent skeleton of sharks and related fishes (*see* CHONDRICHTHYES). Cartilage provides models in which most bones develop and contributes an essential part to their growth mechanism. It persists in adult mammals at the joint surfaces, in the respiratory passages and in the ears, and in the anterior portions of the ribs.

The most widespread and most characteristic form of cartilage is described as hyaline, because of its glassy, translucent appearance. Its cells are chondrocytes, and they are found in spaces called lacunae in the intercellular substance, where they may be present singly or in groups or nests (*see* fig. 1). Except for the bare surfaces of cartilage in joint cavities, cartilage is covered externally by a firm layer of dense connective tissue, the perichondrium.

The characteristics of cartilage, responsible for its function as a supporting tissue, are given to it by its interstitial substance. This has a dense network of collagen fibres, embedded in the form of a very firm gel, three-fourths of the weight of which is water. This structure gives to cartilage the consistency of a plastic and a considerable tensile strength, and enables it to bear weight while retaining a certain degree of elasticity.

Cartilage has an important part in the formation of the body skeleton and in the continuation of its growth up to maturity. In the embryo most of the bones are preformed as cartilage models. These models are invaded by ingrowths of vascular connective tissue, leading to the formation of ossification centres. The vascular tissue erodes and removes the cartilage cells, this being accompanied by calcification of the cartilage matrix in advance of the disappearance of the cells. The next stage is deposition of bone on the remaining spicules of calcified cartilage, with the cavities within the bone being filled with bone marrow. Not all of the cartilage from the model is removed. A thin plate, the epiphyseal cartilage, remains at the junction of the epiphysis of the bone with its shaft. Within this plate, proliferation of cartilage cells continues throughout the period of growth; this proliferation occurs near the epiphyseal surface of the cartilage plate and results in the formation of rows or columns of cartilage cells. At the opposite face of the plate, invasion of the rows of cells by vascular connective tissue continues, resembling the invasion of the cartilage model, the cartilage cells being replaced by bone.

As the vascular tissue penetrates the rows of cartilage cells, the cells first become enlarged or hypertrophied and then disintegrate and disappear. At the same time the fibrous connective tissue that separates the columns of cells becomes calcified (*see* fig. 2), and this calcified matrix is then enveloped in layers of new bone.

The net result of the activity in and near the epiphyseal cartilage is that the plate remains at a constant thickness, while the shaft of

the bone increases in length. The cartilage plate, with its adjacent tissues, has been called the growth apparatus. At the end of the growth period, at different ages in different bones, the growth apparatus disappears, and growth in length is no longer possible. At this time, except in certain locations, as in the sternal portions of the ribs, cartilage disappears from the bony structures, leaving only a thin layer at the joint surfaces. Here it provides a smooth surface, lubricated by the joint fluid (synovial fluid), which makes it possible for the bones to carry the weight of the body. while moving easily and smoothly against one another at the joints.

In addition to hyaline cartilage, two other varieties of cartilage are found in mammals. Elastic cartilage is found in the external ear, in the larynx and in a few other locations. It differs from hyaline cartilage by its yellowish colour and by its greater opacity, flexibility and elasticity. Fibrocartilage is found in the intervertebral discs, in the attachment of tendons to bone and in some other similar areas, where it is a transitional form between cartilage and connective tissue and where it combines the stress-bearing properties of both. In the healing of fractures, the provisional callus, before its replacement by bone, is also formed of fibrocartilage.

Chemistry of Cartilage. — The gellike portion of the interstitial substance of cartilage, the chondromucoid, is characterized by a complex sugarlike substance containing sulfur and known as chondroitin sulfate. which is responsible for its staining properties The hypertrophic cartilage cells, before disintegrating and being replaced by bone during growth, accumulate considerable quantities of glycogen, which is also a complex sugar. At the same time these cells produce an enzyme. alkaline phosphatase, which they secrete into the surrounding cartilage matrix. Attempts were made to relate all three of these chemical substances to the mechanism of the calcification of cartilage matrix during its transformation into bone; as of the early 1960s these attempts had not met with success. See BONE; CONNECTIVE AND SUPPORTING TISSUE; JOINTS AND LIGAMENTS: SKELETON, VERTEBRATE; see also references under "Cartilage" in the Index volume.

CARTIMANDUA (1st century A.D.), client-queen of the tribe Brigantes (*q.v.*), a people of northern Britain. Tacitus first mentions her as delivering Caractacus (*q.v.*) to Rome in A.D. 51. In A.D. 57 she mas supported in civil strife with her consort Venutius by Roman forces, who had before quelled Brigantian disturbances in A.D. 48. In A.D. 69 she repudiated Venutius for Vellocatus, his armour-bearer, thereby losing Brigantian support and provoking Venutius to war with external help. Roman troops rescued her with difficulty and she disappears from history thereafter; the Brigantes were defeated and their country annexed by Petillius Cerealis in A.D. 71. Silver coins assigned to Cartimandua are known.

See I. A. Richmond, *Journal* of *Roman Studies*, vol. xliv, pp. 43–52 (1954). (I. A. RD.)

CARTOGRAPHY is the science and art of making maps and charts. See MAP; ATLAS.

CARTOON, originally a full-sized drawing or painting used as a model for a fresco painting, mosaic, tapestry, etc. (see FRESCO PAINTING: *Technique;* STAINED GLASS: Technique; TAPESTRY: Technique). A common modern meaning of cartoon is a single or multipanel satirical or humorous drawing, usually for reproduction in newspapers or periodicals (see CARICATURE AND CARTOON). For animated cartoons, see MOTION PICTURES: Animated *Cartoons*.

CARTOUCHE, a term applied in architecture to ornamentation in scroll form, especially to the elaborate, scrolled frames around tablets or coats of arms; by extension, the word is applied to any oval shape, or even to a decorative shield, whether scrolled or not It is also used for the oval frame enclosing the hieroglyphs of the name of an Egyptian royal personage, and also for the amulet of similar shape, worn in ancient Egypt as a protection against the loss of one's name, *i* e., personality.

CARTWRIGHT, EDMUND (1743–1823), English inventor of the power loom, younger brother of Maj John Cartwright, was born at Marnham, Nottinghamshire, on April 24, 1743, and educated at Wakefield grammar school and Oxford university. In 1779 he became rector of Goadby Marwood, Leicestershire. and in 1786 a prebendary in the cathedral of Lincoln. He would probably have passed an obscure life as a country clergyman had not his attention been accidentally turned in 1784 to the possibility of ap-

plying machinery to cotton weaving. He invented a power loom, for which he took out a patent in 1785; it was a rude contrivance, though it was improved by subsequent patents in 1786 and 1787, and gradually developed into the modern power loom Removing to Doncaster in 1785, he soon started a weaving and spinning factory, but in 1793 he had to surrender it to his creditors. A mill at Manchester in which a number of his machines were installed, was willfully destroyed by fire in 1792. In 1789 he patented a wool-combing machine, for uhich he took out further patents in 1790 and 1792; it effected large economies in the cost of manufacture. but its financial results were not more satisfactory to its inventor than those of the power loom, even though in 1801 parliament extended the patent for 14 years. In 1807 a memorial was presented to the government urging the benefits that had been conferred on the country by the power loom, and the house of commons voted him £10,000 in 1809. He then purchased a small farm at Hollander, near Sevenoaks, Kent. where he spent many years of his life. He died at Hastings, Sussex, on Oct. 30, 1823. Other inventions of Cartwright's included a cordelier or machine for making rope (1792) and a steam engine working with alcohol instead of water (1797), together with various agricultural implements.

See *A Memoir of . . Edmund Cartwright,* published anonymously (1843)

CARTWRIGHT, JOHN (1740–1824), English pamphleteer who devoted his life to promoting a radical reform of parliament, was descended from an old Nottinghamshire family and was born on Sept. 17, 1740. He was educated at Newark and in Yorkshire, subsequently entering the navy and serving under Lord Howe during the Seven Years' War. Ill health caused him to retire shortly before the revolt of the American colonies, whose cause he was one of the earliest to support. Three times he tried unsuccessfully to enter the house of commons. In conducting his agitation for parliamentary reform he employed the methods of propaganda which the antislave trade party had employed, but, on the short view, he was less successful than they, because the country was less prepared for sweeping constitutional change than it had been for ending the slave trade. In a long series of dull and repetitive pamphlets published between 1776 and 1824. he argued his case and helped to found the Society for Constitutional Information (1780) and the London Union society and the Hampden clubs (1812) Most of his proposals were later embodied in the People's Charter, and he was therefore a connecting link between the followers of John Wilkes and the Chartists (see CHARTISM). Unlike the radicals of the school of Tom Paine he had no wish to abolish either the monarchy or the house of lords, and at times would have contented himself with household instead of universal manhood suffrage; and he favoured a stiff property qualification for M P 's He opposed a standing army and favoured a national militia on the same grounds that he supported parliamentary reform. "A free parliament and a national militia were the real characteristics of our Constitution and the safeguards of our rights." His aim was to restore the constitution to what he erroneously believed to be its pristine democratic character In 1819 he was charged with others with conspiring to elect a person to be the parliamentary representative of the unrepresented town of Birmingham. and, being found guilty. was sentenced in June 1821 to pay a fine of £100. his age saving him from imprisonment. He died in London on Sept. 23, 1824. (A. AL)

CARTWRIGHT, PETER (1785–1872), Methodist circuit rider of the American frontier, was born on Sept. 1, 1785, in Amherst county, Va. His father, a veteran of the Revolutionary War, took his family to Kentucky in 1790. There Cartwright had little opportunity for schooling, but was exposed to the rude surroundings of the frontier, becoming a gambler at cards and horse racing. This came to an abrupt end when he was converted during the great western revival in 1801. He was received into the Methodist Episcopal Church in June, and in less than a year was licensed as an exhorter. In the autumn of 1802 he was commissioned to form a new circuit of preaching points in an unchurched wilderness around the mouth of the Cumberland river. In 1806 he was ordained deacon by Bishop Francis Asbury, and in 1808 he was ordained elder by Bishop William McKendree, under whose guidance he had done some studying. In the latter year he married Frances Gaines. An able and vigorous speaker, Cartnright preached thousands of times in his more than 60 years as frontier minister. He faced many difficult situations with courage, at times relying on his great physical strength. A forceful debater, he defended Methodism and vehemently denounced all other denominations. Though he was no abolitionist, he hated slavery; to be on free soil, he moved to Sangamon county, Ill., in 1824. He entered politics to oppose slavery, and was several times elected to the lower house of the Illinois general assembly. Cartwright recounted his colourful life in a famous *Autobiography* (1856), which has been often reprinted. He died near Pleasant Plains. Ill., Sept. 25. 1872. (R. T. H.)

CARTWRIGHT, SIR RICHARD JOHN (1835–1912), Canadian statesman noted for his vigorous attacks on tariff protection and his advocacy of free trade with the United States, was born at Kingston, Upper Canada, on Dec. 4, 1835, the son of an Anglican clergyman. In 1863 Cartwright entered the Canadian parliament as a Conservative but in 1869 he quarrelled with his leader, Sir John A. Macdonald. joined the Liberal party and from 1873 to 1878 he was finance minister in the Liberal government of Alexander Mackenzie. From 1879 to 1896 he was chief financial spokesman for the Liberal opposition, and when Wilfrid Laurier acceded to power in 1896 Cartwright became minister of trade and commerce. In 1898–99 he represented Canada on the Anglo-American joint high commission. In 1904 he retired to the senate, but retained his portfolio in the Laurier ministry. He was acting prime minister briefly in 1907 and in 1909–11 government leader in the senate. He died on Sept. 24, 1912, at Kingston, Ont. (W. R. GR.)

CARTWRIGHT, THOMAS (*c.* 1535–1603), English Puritan and leader of the Puritan party under Elizabeth I, was educated at Clare hall and St. John's college, Cambridge, and became a convinced Protestant. On the accession of Elizabeth he returned to the university to become in 1569 Lady Margaret professor of divinity. A year later he was deprived of the chair because of his criticisms of the Church of England as unscriptural. The last 30 years of his life were spent partly abroad—for several years he ministered at Antwerp—but mainly in England as master of a hospital at Warwick. The post was exempt from episcopal jurisdiction, but this did not save Cartwright from prosecution; from 1590 to 1592 he nas imprisoned. Besides writing biblical commentaries, he used his learning in attacking Richard Hooker and Archbishop John Whitgift and defending the Presbyterian leaders John Field and Thomas Wilcox. He helped to initiate Presbyterianism in the Channel Islands and strongly opposed the Brownists or Independents. He died at Warwick on Dec. 27, 1603.

See A. F Scott Pearson, *Thomas Cartwright and Elizabethan Puritanism (1925)*; *Cartwrightiana,* ed. *by A.* Peel and L. H. Carlson (1951). (G. F. N.)

CARTWRIGHT, WILLIAM (1611–1643), English dramatist and minor poet in the tradition of Ben Jonson, was born at Northway, Gloucestershire, in Sept. 1611. Educated at Westminster school and at Christ Church, Oxford, he became, according to Anthony & Wood. "the most florid and seraphical preacher in the university," and also reader in metaphysic. In 1642 he was named one of Charles I's council of war at Oxford and became junior proctor of the university in the following year. He died at Oxford on Nov. 29, 1643. As a scholar, wit and dramatist, Cartwright was much admired by his contemporaries; John Fell thought him "the utmost man could come to," and Charles I, who wore black on the day of Cartwright's funeral, declared that "since the muses had so much mourned for the loss of such a son it would be a shame . . . not to appear in mourning for the loss of such a subject" His plays were written before he took orders in 1638, and are fantastic in plot and stilted and artificial in treatment, The Ordznary (1635?) contains amusing satire of the Puritans. but does not justify its contemporary reputation.

Cartwright's *Comedies, Tragi-Comedies, With Other Poems* were published in 1651; G B Evans' edition has a critical study (1940).

CARÚPANO is a Caribbean seaport in Sucre state, Venez., situated on the Paria peninsula, 100 mi. N.E. of Barcelona. Pop

(1959 est.) 43,667. Apart from shipping, trading and fishing, it manufactures straw hats and other fibre products, lumber, pottery, soap and rum. There are petroleum fields to the south in the adjacent state of Monagas, but the oil is moved by pipeline eastward to Caripito or northward to Puerto La Cruz. The city is served by highways from the west, east and south, and has an airport. Salt is produced nearby. (L. WE.)

CARUS (MARCUS AURELIUS CARUS) (d. A.D. 283), Roman emperor 282–283, was probably either a Gaul or an Illyrian. Like his predecessors, he adopted the names Marcus Aurelius as part of his imperial titulature, but probably shared his son's family name Numerius. Prefect of the guard to the emperor Probus, he succeeded him as emperor late in 282, in Illyria. He sent his elder son Carinus to the army of the Rhine, and after a brief Danube campaign, led his army into Persia, where he penetrated more deeply than most Roman commanders, reaching the lands beyond the Tigris. There he died suddenly and mysteriously, allegedly struck by lightning, in the summer of 283. He was succeeded by his sons Numerian and Carinus. (JN. R. M.)

CARUSO, ENRICO (1873–1921), the most admired Italian operatic tenor of the 20th century, and the first singer whose qualities can be confirmed by posterity through the phonograph, whose value he was the first leading musician to recognize. Caruso was born in Naples, Feb. 25,1873. His debut there in 1894 was modest; but four years later he achieved fame, in Milan, in what was to be his most celebrated part, Rodolfo in Puccini's *La Bohkme.* In that year he sang Loris in the premiere of Umberto Giordano's *Fedora;* he was to create the chief tenor roles in Francesco Cilea's *Adriana Lecouvreur* and Alberto Franchetti's *Germania,* as well as in Puccini's *Fanciulla del West.* Puccini caused ill-feeling by denying him the similar privilege in his *Tosca* (1900), and shortly afterward Caruso made a point of including an aria from it in his first recording. His voice was a strong, easy and intensely appealing lyric tenor, unusually rich in lower registers, thrilling in high *tessitztra,* and abounding in warmth of feeling, vitality and smoothness. In 1902 he made his London debut at Covent Garden and the next year appeared at the Metropolitan opera house, New York, where he remained chiefly active. In his later years the voice became darker, larger, but also harder. His repertory embraced most of the major French and Italian tenor roles (including Verdi's Radames but not his Otello), as well as Italian ballad songs in profusion. He made a second reputation as a brilliant lightning caricaturist. He died of pleurisy in Naples on Aug. 2. 1921.

See D. P. B. Caruso, *Enrico Caruso, his Life and Death (1945).* (WI. S. M.)

CARVAJAL, ANTONIO FERNANDEZ (*c.* 1590–1659), a Portuguese Marrano or Crypto-Jew, who went to England in the reign of Charles I. He rendered considerable services to the Commonwealth by his extensive trade with the West Indies and was also politically useful to Oliver Cromwell. as he acted as intelligencer. When Manasseh ben Israel (*q.v.*) in 1655 petitioned for the return of the Jews, who had been expelled by Edward I, Carvajal took part in the agitation and boldly avowed his Judaism. Becoming the first endenizened Jew in England, he may be termed the founder of the Anglo-Jewish community.

CARVAJAL Y MENDOZA, LUISA DE (1568–1614), Spanish missionary in England, was born at Jaraicejo in Estremadura on Jan. 3, 1568. Moved by the execution of the Jesuit Henry Walpole in 1596, she decided to devote herself to the cause of the faith in England. With her share of the family fortune, she founded a college for English Jesuits at Louvain, Belg., uhich was transferred to Watten near St. Omer in 1612 and lasted till the suppression of the order. In 1605 she arrived in England and established herself under the protection of the Spanish ambassador. From his house she carried on an active and successful propaganda. She made herself conspicuous by her attentions to the Gunpowder plot prisoners, and won converts. partly by persuasion, partly by assisting the poor. She was arrested in 1608, but the protection of the Spanish ambassador and the desire of King James I to stand well with Spain secured her release. She died Jan. 2, 1614.

See L. Muñoz, *La Vida* y *Virtudes de la Venerable Virgen Doña Luisa de Carvajal y Mendoza* (1632), summarized by Southey in his *Letters From Spain and Portugal (1808).*

CARVER, GEORGE WASHINGTON (*c.* 1864–1943), U.S. Negro chemurgist and agricultural experimenter, devoted his life to agricultural research for the betterment of the south and his people. He was born about 1864, of slave parentage, near Diamond Grove, Mo. Eager for education, he worked his way through school. In 1894 he received his B.S. from Iowa State college, Ames. He worked there as a botanist until he received his M.S. in 1896, when he went to Tuskegee institute in Alabama. Persuading southern farmers to diversify their crops by planting soil-enriching peanuts and sweet potatoes instead of soil-exhausting cotton, Carver next solved the problem of finding uses for these crops, which had become overabundant as foodstuffs. From the peanut he made cheese, milk, coffee, flour, ink. dyes, soap, wood stains and insulating board, to list but a few of his 300 products. From the sweet potato came flour, vinegar, molasses, rubber, etc. Years before plastics from wood wastes were first attempted, he was making synthetic marble from wood shavings. In 1940 he donated his life savings of $33,000 to establish the Carver foundation to carry on his research. In 1923 he was awarded the Spingarn medal and in 1939 the Roosevelt medal. He died at Tuskegee, Ala., on Jan. 5, 1943.

CARVER, JONATHAN (1710–1780), early American explorer and author of a popular travel book, was born in Weymouth, Mass., April 13, 1710. After serving in the French and Indian War he joined the company of Maj. Robert Rogers (*q.v.*) to explore the great northwestern territories. Rogers sent him by the Fox-Wisconsin route to the Mississippi and up that river to the Falls of St. Anthony to visit the Sioux tribes. He spent the winter of 1766–67 at one of their villages on the Minnesota river. In the spring he started to return to Mackinac, but at the mouth of the Wisconsin river he met Capt. James Tute, in command of a party sent out by Rogers to explore a route to the Pacific ocean. Tute brought orders for Carver to join the party as draftsman and third in command. They proceeded up the Mississippi and crossed to and skirted the shores of Lake Superior to the Grand Portage. There they waited for supplies from Rogers, but his failure to send them caused Tute to abandon his expedition and return by the north shore of Lake Superior to the fort, where he arrived in Aug. 1768. Rogers had exceeded his powers in employing these agents, and Carver was never paid. After nine years of misfortune and poverty his book, *Travels Through the Interior Parts of North America in the Years 1766,1767, 1768,* was printed in London (1778). Its success was immediate, but this came too late to bring the author any material benefit. He died in London on Jan. 31, 1780, a broken old man, 69 years of age, and was buried in the potter's field. No narrative of early adventure and travel in America has ever approached the popularity of this work. At least 32 editions in English, French, German and Dutch were printed. The second part, dealing with the life and customs of the Indians, is largely plagiarized from earlier French writers, but this does not warrant discrediting the whole. Carver's original journals are in the British museum and substantiate the main facts of the first part of his book. Careful comparison leads to the conclusion that the book was written from memory. Besides the minor inaccuracies, the book is guilty of deliberate falsification when it denies Rogers credit for initiating the expedition and conceals the fact that Tute commanded it. (O. W. H.; X.)

CARVER, ROBERT (b. 1487), outstanding Scottish composer of the 16th century, was born in 1487. His only extant works, five masses and two motets, including one for 19 voices, are to be found in a large choir book compiled in the first half of the 16th century at Scone abbey, Perthshire, and now in the National Library of Scotland. The book also contains works by Robert Fayrfax and Guillaume Dufay. From information in this volume it appears that Carver took orders at the age of 16 and remained at the Augustinian abbey until at least 1546; after that date no more is known of him. In style his compositions, which were prepared for publication by Denis Stevens (American Institute of Musicology, 1959 *et seq.),* are similar to those of the rather earlier Eton choir book. (J. J. N.)

CARY, ALICE (1820–1871) and **PHOEBE** (1824–1871), U.S. poets, were born near Cincinnati, O., on April 26. 1820, and Sept. 4, 1824. The sisters' education was largely self-acquired, and their work in literature was always done in unbroken companionship. Their poems were first collected in a volume entitled Poems of Alice and Phoebe Cary (1850). Alice, who was much the more voluminous writer of the two, wrote prose sketches, novels and poems, the best of which treat the surroundings and friends of her girlhood. Her lyrical poem, "Pictures of Memory," was praised by Edgar Allan Poe. Phoebe published two volumes of poems (1854 and 1868), but is best known as the author of the hymn "Nearer Home," beginning "One sweetly solemn thought." Alice died in New York city, on Feb. 12, 1871, and Phoebe in Newport, R.I., on July 31, 1871.

CARY, HENRY FRANCIS (1772–1844), English translator of Dante, was born at Gibraltar on Dec. 6, 1772, and educated at Christ Church, Oxford. In 1756 he took orders; he was later assistant-librarian in the British museum. He died in London on Aug. 14, 1844. His Lives of English Poets and Early French Poets were published in 1846. His translation of The Birds by Aristophanes appeared in 1824 and his *Pindar* in *English* Verse in 1833. but he is best remembered for The Inferno (1805–06) and The Vzsion, or Hell, Purgatory, and Paradise of Dante (1814). Although Cary's blank verse hardly reproduces the strength of Dante's *terza* rima, his translation retains some of the vividness of the original and has great merit.

CARY, (ARTHUR) JOYCE (LUNEL) (1888–1957), English novelist of remarkable individuality, whose theme was that "we live in an everlasting battle. an everlasting creation," and whose diverse characters have a common creative energy and joy in creating. Born at Londonderry, N.Ire., Dec. 7, 1888, of an old Anglo-Irish family, he was educated at Clifton college, Edinburgh art school and Trinity college, Oxford. He served with the British Red Cross in the Montenegrin army in the Balkan War of 1912–13 and, having joined the colonial service in Nigeria (1914), in the Nigeria regiment in World War I until 1917, when he became a district officer. He returned to England in 1920, settling at Oxford, and devoted himself to writing until his death there on March 29, 1957.

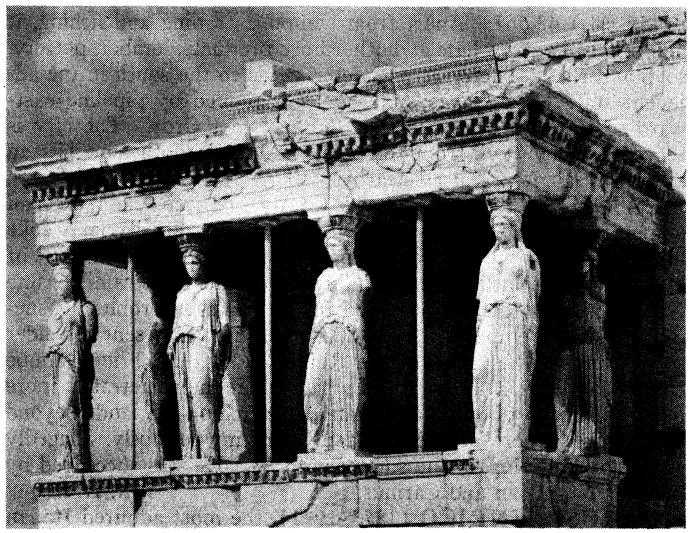
He published nothing until Aissa Saved (1932), not having found an idea of life that satisfied him as a basis for his work until then. His first seven novels (1932–41) have primitives as their central characters—h'igerians, Irish peasants and children; the last of these. *A* House of *Children* (1941), is based on his own childhood. Of his nine later novels, which portray life in 20th-century England, his first trilogy—Herself *Surprised* (1941), To Be a Pilgrim (1942) and The Horse's Mouth (1544)—is concerned largely with art, and the second trilogy—Prisoner of Grace (1952), Except the Lord (1953) and Not Honour More (1955)—with politics. He planned a third trilogy, on religion, but, afflicted with muscular atrophy, realized he would not live to complete it and so treated the theme in a single novel, The Captive and the Free (published posthumously in 1959). The trilogies are Cary's most impressive achievements; each volume is narrated by one of the three protagonists, thus giving a self-portrait and "mirror-image" portraits of the other two protagonists. This enabled him to add a dimension to his characterization, to give variety of range to his settings and to illuminate the central theme from many angles.

See W. Allen, Joyce Cary (1953); A. Wright, Joyce Cary (1958).

(W. D.)

CARYATID, a draped female figure employed instead of a column as an architectural support. Vitruvius in De Architectura (book i) related that caryatids represented women of Caryae, doomed to hard labour because the town sided with the Persians in 480 B.C. (a historical impossibility). Their origin may be traced back to mirror handles, ivory (nude) in Phoenicia and bronze (draped) in archaic Greece. In marble architecture they first appeared in pairs in three small buildings (treasuries) at Delphi (550–530 B.C.). A type (of which the missing original must date from about 460 B.C.) was copied in Roman times at Tralles in Asia Minor and Cherchel in North Africa, with variants elsewhere. The most celebrated instance is the caryatid porch of the Erechtheum (*q.v.*) with six such figures (420–415 B.C.). They were directly copied, in alternation with columns, in Hadrian's villa at Tivoli. There is an example also in the Villa Albani at Rome. Two colossal caryatids were used in the smaller propylon at Eleusis. They appeared in the upper stories of Agrippa's Pantheon and of the colonnade surrounding the forum of Augustus at Rome, as well as in the "Incantada" at Salonika From fanciful illustrations in early printed editions of Vitruvius, Jean Goujon almost succeeded in recreating the Erechtheum type in the Louvre (1550). They are also called canephoroe (*see* CANEPHOROS) or korai ("maidens"). For the male type, see ATLANTES.

(W. B. D.)



A F KERSTING

CARYATID PORCH OF THE ERECHTHEUM. 420–415 B.C., ON THE ACROPOLIS. ATHENS, GREECE

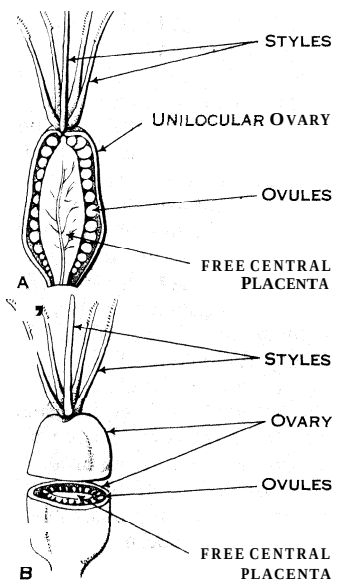
CARYOPHYLLACEAE, a family of dicotyledonous plants, containing about 80 genera with about 2,000 species, widely distributed, especially in temperate, boreal and arctic regions, and alpine situations.

The plants are herbs, sometimes becoming shrubby at the base, with opposite, simple, generally entire leaves and swollen nodes. The main axis ends in a flower (definite inflorescence), and flower-bearing branches are borne one on each side.

The flowers are regular, with five (or four) sepals which are free or joined to form a tube in their lower portion, the same number of petals, free and rising from below the ovary, commonly twice as many stamens, inserted with the petals, and a pistil of two to five carpels joined to form an ovary usually containing a large number of ovules on a central placenta and bearing two to five styles; the ovary is one-celled, or is completely partitioned, or incompletely septate at the base, into two to five cells; nectar is secreted at the base of the stamens. The fruit is a capsule containing a few or large number of small seeds and opening usually by apical teeth, or a utricle; the seed contains a floury endosperm and a curved embryo.

The family is divided into three well-defined subfamilies.

1. Paronychioideae: the sepals are free, petals lacking, and the fruit a one-seeded utricle. There are sev-



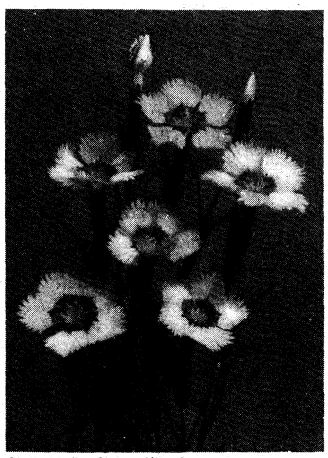
DETAIL OF THE MOUSE-EAR CHICKWEED (CERASTIUM HIRSUTUM)

(A), Pistil cut vertically and (B) pistil cut horizontally, the halves separated to show the interior of the cavity of the ovary

eral genera such as *Paronychia* (nailwort), *Scleranthus* and *Drymaria*.

2. Alsinoideae: the sepals are free and the flowers are open, with spreading petals, and the nectar which is secreted at the base of the stamens is exposed to the visits of short-tongued insects, such as small bees and flies; the petals are white in colour. It includes several genera, chiefly: *Cerastiurn* (mouse-ear chickweed), *Stellaria* (stitchwort and chickweed), *Arenaria* (sandwort), *Sagina* (pearlwort), *Spergula* (spurry) and *Spergularia* (sand spurry).

3. Silenoideae: the sepals are joined to form a narrow tube, in which stand the long claws of the petals and the stamens, partly closing the tube and rendering the nectar inaccessible to all but long-tongued insects such as the larger bees and Lepidoptera. The flowers are often red. It includes several genera of wide distribution: *Dianthus* (pink), *Silene* (catchfly, campion), *Lychnis* (bladder campion) and *Agrostemrna* (corn cockle). Several, such as *Lychnis vespertina* and *Silene nutans,* open their flowers and are fragrant in the evening or at night, when they are visited by night-flying moths.



J. HORACE MCFARLAND CO.

PINK (DIANTHUS), A REPRESENTATIVE OF THE TRIBE SILENOIDEAE

In North America the family is represented by about 300 species. most numerous in mountain regions and belonging chiefly to *Silene, Lychnis, Arenaria, Stellaria* and *Cerastium. Dianthus* (carnation and pink), *Silene, Tunica, Gypsophila, Arenaria, Cerastium* and others are choice garden plants.

Glucosides. saponins and alkaloids are to be found in most genera. Some, particularly *Drymaria,* are poisonous to livestock.

The carnation (*q.v.*) (*Dianthus caryophyllus*) is a half-hardy perennial. herbaceous but suffrutescent at the base. Of ancient horticultural origin, numerous varieties have been developed.

See F. Pax and K. Hoffmann, "Caryophpllaceae,"in A. Engler and K. Prantl, *Die Natürlichen Pflanzenfamilien,* ch. 16, pp. 275–367, fig. 120– 1jO (1934). (B. ME.)

CASA, GIOVANNI DELLA (1503–1556), Italian poet, author of a famous treatise on manners (*Il Galateo),* was born in the Mugello, near Florence, June 28, 1503, and studied in Bologna. In 1530 he went to Rome, and in 1544 became archbishop of Benevento, but was sent as papal nuncio to Venice; in 1555 Paul IV made him secretary of state. He died at Montepulciano, Nov. 14. 1556 Besides some youthful *rime bernesche* (satirical verse in the manner of Francesco Berni [*q.v.*]) Della Casa produced lyrical poems characterized by a majestic style, and political orations in which he expressed his sorrow for the calamities of Italy. The *Galateo* (1550–55), which derives its title from the name of bishop Galeazzo Florimonte. who suggested the work, expresses the author's witty and balanced mind, as well as the refinement of contemporary Italian society. It enjoyed wide and immediate popularity and was translated into many languages.

CASABIANCA, RAPHAEL, COMTE DE (1738–1825), French Revolutionary general, was born on Nov. 27, 1733, at Vescovato in Corsica, of a Corsican noble family. He was made lieutenant general of the forces and governor of the island by the Convention in place of Pasquale Paoli (*q.v.*) and was appointed general (March 19, 1794) during Paoli's subsequent revolt. He was made a senator on Dec. 25, 1799, and a count of the empire in 1808.

His nephew LOUIS DE CASABIANCA (1762–1798) entered the French navy and in 1798 was in command of the "Orient," the flagship of Adm. François Paul Brueys, at the battle of the Nile. When the admiral was killed, Casabianca, though badly wounded. fought the burning ship to the end and perished with most of the crew, including his ten-year-old son JACQUES DE CASABIANCA whose heroic refusal to leave his father is the subject of the ballad "Casabianca" by Felicia Hemans.

CASABLANCA (Arabic DAR EL-BEIDA, "the white house"), a port on the Atlantic coast of Casablanca province, Morocco, is situated at the head of a small bay between Rabat and Mazagan. Pop. (1960) 965,277 of which 778,780 were Moroccan Muslims, 72,026 Moroccan Jews and 114,471 Europeans and others. Although its origin is unknown, it seems to have been built on the site of a straggling Berber fishing village known in the 13th century as Anfa. It became a pirates' base for harrying Christian ships and. to put an end to these raids, the Portuguese destroyed it in 1468. During the 16th and 17th centuries the town remained in ruins and was uninhabited. Late in the 18th century it was rebuilt by the sultan Sidi Mohammed ben Abdallah who opened the port to foreign trade. In the following century Spanish, French, English and then German traders settled, increasing the town's commercial importance until by 1906 its trade exceeded that of Tangier. French occupation dated from 1907. In the early years of the French protectorate (1912–56) Marshal Louis H. G. Lyautey (*q.v.*) determined on a policy of expansion and development to make Casablanca the chief port of Morocco.

Inland from the docks and harbour is the original Arab to n or old medina, quite distinct from the modern buildings. Still walled in parts by its original ramparts, it is a maze of narrow streets and ahitewashed brick or stone houses. Before 1918, when the first European houses were built, the entire population of French, Muslims and Jews lived there. In modern times it houses almost all the Jewish population of Casablanca, the Jews having overflowed from the old mellah (Jewish quarter), forcing the Muslims to settle elsewhere. The great mosque built at the order of Sidi Mohammed ben Abdallah dates from the second half of the 18th century. In a semicircle outside the walls is the town built by the French. Avenues radiating from the Place de France are intersected by ring roads which reach to the coast on either side of the harbour: The Place de France, near the gateway of the old medina, is the business and administrative centre of the town, with banks, hotels and large modern stores. Farther south overlooking the gardens of the Parc Lyautey is the white cathedral of Sacré Coeur (1930) and nearby are the law courts and town hall. West of the Parc Lyautey and stretching toward the coast are the gardens and villas of residential districts like Anfa. where in Jan 1943 the Casablanca conference took place between Winston Churchill and Pres. Franklin D. Roosevelt after the Allied landing of Nov. 1942.

New Muslim districts have surrounded the French-built town just as the latter encircled the former medina. The new medina, called Derb-Sultan or Derb-Sidna, first developed around a palace which the sultan built close to the town after World War I. It is a modern Moorish-style group of buildings set in a high-walled garden. The construction of new houses was begun in 1923 to combat the squalid conditions of the Muslim encampments and shanty towns. The experiment was so successful that an almost self-contained town with its own schools, shops and mosques has grown to meet the requirements of the Muslim population.

To the northeast the road to Fedala leads to the industrial outskirts. and the road to Rabat, to the east, is lined with factories. With the exception of mining, nearly nine-tenths of Moroccan industry is centred in Casablanca. Since 1923 phosphates have been the town's main export but other important products include sugar, tobacco, cement and textiles, There are also brickworks, sawmills and a fish-canning factory. Carpetmaking is the only handicraft. of commercial importance remaining. Employment in the factories and port has attracted manpower from the southern regions of Marrakech and Agadir. Casablanca largely owes its rapid expansion to constant harbour development since the French protectorate was established in 1912. Three-quarters of Moroccan foreign trade now passes through the port.

The tonn is linked by road and rail with Marrakech to the south, and to the north and east with Rabat and Tangier, Fes and Oujda and beyond these to Oran, Algiers and Tunis. There are regular shipping services to Bordeaux, Marseilles and Dakar. Prior to the building of the American base at Nouaseur, 14 mi. from Casa-

blanca, the airfield at Camp-Cazes was the most important in Morocco. There are air services to France, Portugal, Algeria, Tunisia and west Africa.

CASABLANCA CONFERENCE, a World War II conference held in a suburb of Casablanca, Mor., in Jan. 1943, attended by Pres Franklin D. Roosevelt and Prime Minister Winston S Churchill. Generals Henri Giraud and Charles de Gaulle of France were also present Plans were made for the invasion of Sicily. President Roosevelt announced that "unconditional surrender" would be demanded of the Axis powers and suggested that the conference be termed the "unconditional surrender conference."

See WORLD WAR II CONFERENCES, ALLIED.

CASALE MONFERRATO, a town and episcopal see of Alessandria province, Piedmont. Italy, lies on the south bank of the Po on the Monferrato hills. Pop. (1957 est.) 38,632 (commune). A settlement existed there in the middle ages, known as San Evasio; the town was successively under the rule of the Alerami. Visconti and Palaeologi. It became the capital of the marquisate of Montferrat in 1435 and passed to the Gonzaga family in 1533 and was long the subject of dispute between France and Spain. The 11th–12th century basilica of S. Evasio has five naves and a restored façade; S. Domenico is an early Gothic church with a Renaissance portal; and there are fine palaces. The soil is fertile and rice is an important crop. Vines flourish in the hills and wine is exported. Lime. cement and artificial stone are produced; also agricultural machinery, electric appliances and tartaric acid. The town has good rail connections with Turin and other towns. (M. T. A N)

CASALS, PABLO (PAU) (1876–), Spanish musician, the leading cellist of his time, was born at Vendrell, near Tarragona. on Dec. 29, 1876. He studied with José Garcia in Barcelona in 1888 and in 1895 he was principal cellist at the Paris Opéra. He first appeared as a solo cellist in Paris and London in 1898 and in 1905 he formed a trio with Alfred Cortot and Jacques Thibaud In 1919 he founded and conducted the Orquestra Pau Casals in Barcelona to introduce orchestral music to the Catalan working classes. After the Spanish Civil War he refused to return to Spain and settled at Prades, in the French Pyrenees, where; after World War II, he organized annual festivals of chamber and orchestral music. His technique and his musicianship became the model of many later cellists. An annual Casals festival was inaugurated in 1957 in Puerto Rico, where he resided after 1956. His public performances away from Prades and Puerto Rico were few after 1950, although he appeared in 1960 at a Casals festival in Mexico, and in 1961 at a festival in Israel and at a White House concert in Washington, D.C.

See L. Littlehales, *Pablo Casals* (1949); *A.* Conte, *La Legende de Pablo Casals* (1950).

CASANOVA (DE SEINGALT), GIOVANNI JACOPO (1725–1798), the prince of Italian adventurers. *abbe',* soldier and diplomatist, was born in Venice on April 5?, 1725. the son of an actor. As a young man, he was expelled from the seminary of St. Cyprian for scandalous conduct and entered the service of Cardinal Acquaviva in Rome. In 1745 he was a violinist in the San Samuele theatre, Venice. At Lyons (1750) he entered the masonic order; and after two years in Paris he traveled to Dresden, Prague and Vienna. Back in Venice, in 1755, Casanova was denounced as a magician and sent to prison for five years in the Piombi. On Oct. 31, 1756, however, he achieved the spectacular escape described in his famous *Hzstoire de ma fuite* (1788; ed. by R. Vèze, 1929; Eng. trans. by A. Machen, 1925) and made his way to Paris, where he introduced the lottery (1757), gained a financial reputation and cut a figure in high society Casanova again set out on his travels in 1759, visiting the Netherlands (where he acquired the title of chevalier de Seingalt), southern Germany. Switzerland (where he met Voltaire), Savoy, southern France, Florence (whence he was expelled) and Rome (where the pope gave him the Order of the Golden Spur). He also spent some time in London. In Berlin (1764) he was offered a post by Frederick II. He then traveled to Riga, St. Petersburg and Warsaw. A scandal, followed by a duel, forced him to flee, and he eventually sought refuge in Spain. Between 1774 and 1782 Casanova acted as a spy in the service of the Venetian inquisitors of state. His last years (1785–98) were spent in Bohemia, as the librarian of Count von R'aldstein in the chateau of Dux (Duchcov), where he died on June 4, 1798.

Casanova's works include occasional verse, operatic librettos, a confutation of Amelot de la Houssaye's *Histoire du gouvernement de Venise* (1768), a translation of the *Iliad* (1775), the libel *Nè amori nè donne* (1782), and an imaginary voyage entitled *Icosameron* (5 vol. 1788; 1928) dealing with the remarkable adventures of two young people in the world of the Mégamicres at the centre of the earth. Apart from the *Histoire de ma fuite,* his best-known work is the *Mémoires e'crits par lui-même* (1826–*38;* best modern editions. 12 vol. 1922–*35*; and 2 vol., 1958; Eng. trans. by A. Machen, 1922; and unexpurgated, 1958–)—a vivid autobiography which provides a lively picture not only of the dissolute life of its author but also of 18th-century society in all the capitals of Europe.

CASAS GRANDES ("Great Houses"), a small village of Mexico, in the state of Chihuahua, notable only for remains nearby of impressive aboriginal buildings. Pop. (1950) 1,101. It is on the Casas Grandes river, about 35 mi. S. of Janos and 150 mi. N.W. of Chihuahua city. The village is on a branch of the railway between Ciudad Juárez and Mexico City; it also has an airfield. Although mention of the ruins was made by various Spanish chroniclers, the earliest usable accounts begin in 1819 and culminate in the descriptions provided by Guillemin Tarayre in his *Rapport sur l'exploration mineralogique des regiones mexicaines* (1867). Modern archaeologists systematically surveyed and analyzed the cultures represented in efforts to date the buildings and the people who occupied them; they were already ruined and abandoned when Spaniards came upon them in the 16th century. There are several large buildings, made of huge adobe blocks as much as 5 ft. thick, so nicely joined without mortar that an early observer said they were "born so." A principal edifice measures 800 ft. by 250 ft., with walls 40 to 50 ft. high, and may originally have contained six or seven stories. In the immediate vicinity of Casas Grandes are more than 2,000 mounds and ruined buildings, with numerous Surface objects of pottery and obsidian thickly strewn about. In addition to the building style, beautiful and skilfully made polychrome modeled pottery in a variety of colours and combinations is characteristic of the Casas Grandes complex. On the basis of available material, a fraction of the total, archaeologists hypothesize that there are seven periods of development, culminating in "Classic Casas Grandes" or what E. B. Sayles in his *An Archeological Survey of Chihuahua, Mexico* (1936) called the "Ramos Phase." (HD. C.; R. B. MCCK.)

CASATI, GAETANO (1838–1902), Italian geographer and traveler in Africa, the account of whose travels increased the knowledge of the headwaters of the Nile, was born at Lesmo on Sept 4, 1838. He entered the *bersaglieri* of the Italian army in 1859 and took part in the third and fourth wars of independence against Austria. Subsequently he was employed in making ordnance survey maps of Italy. In 1879 he left for the Bahr el Ghazal province of the Sudan, uhere he joined Romolo Gessi (Gessi Pasha), the Italian explorer who had conquered the province that year. He traveled widely in the region and visited the upper Uele basin of the Congo.

On the rise of the Mahdi he made his way to Lado, where he joined the governor of the equatorial province of the Sudan, Emin Pasha, in 1883. He was for some time Emin's agent in Unyoro,

was made prisoner, but escaped and rejoined Emin. In 1889 he accompanied H. ill. Stanley and Emin to Bagamoyo on the east African coast. and then returned to Italy. Later he published an account of his travels (Eng. trans., *Ten Years in Equatoria*, 1891). He died at Como on March 7, 1902.

CASAUBBN, ISAAC (1j59–1614), French scholar (later naturalized Englishj, famous for his erudition and industry as a classical commentator, was born in Geneva, Switz., on Feb. 18, 1559, of French refugee parents. On the publication of the edict of Jan. 1562, which allowed Protestants limited rights of assembly, the family returned to France and settled at Crest in Dauphin&, where Isaac's father became a pastor. Until he was 19, Isaac had no other instruction than could be given him by his father, who was away from home whole years together in the Calvinist camp, or fleeing with his family to the hills to hide from the fanatical bands of armed Catholics who patrolled the country. Thus it was in a cave in the mountains of Dauphiné, after the massacre of St. Bartholomew's day, that Isaac received his first lesson in Greek.

At 19 Isaac was sent to the Academy of Geneva, and in 1581 became professor of Greek. He remained there until 1596. He married twice, his second wife being Florence, daughter of the scholar-printer. Henri Estienne. Without the stimulus of example or encouragement, in a city peopled with religious refugees, and struggling for life against the troops of the Catholic dukes of Savoy, Casaubon made himself a consummate Greek scholar and master of ancient learning. His great wants were books and the sympathy of learned associates. He spent all he could save out of his small salary in buying books and in having copies made of such classics as were not then in print. The sympathy and help which Casaubon's native city could not afford him he endeavoured to supply by cultivating the acquaintance of the learned of other countries. Geneva, as the metropolis of Calvinism, received a constant succession of visitors. It was there that Casaubon made the acquaintance of young Henry Wotton, the poet and diplomatist, and of Richard Thomson ("Dutch" Thomson), fellow of Clare college, Cambridge, through whom the attention of Joseph Scaliger, settled in 1593 at Leiden, was directed to him. Scaliger and Casaubon began in 1594 a correspondence which culminates in a tone of the tenderest affection and mutual confidence. Influential French men of letters, the Protestant Jacques Bongars, the Catholic Jacques de Thou. and the Catholic convert Philippe Canaye, sieur du Fresne, aided him by presents of books and encouragement and endeavoured to get him invited, in some capacity, to France.

In 1596 Casaubon accepted an invitation to the University of Montpellier, with the titles of *conseiller du roi* and *professeur stipendié aux langues et bonnes lettres*. He held the professorship there only three years, for he was badly treated by the authorities. But the love of knowledge was gradually growing upon him and he began to perceive that editing Greek books was an employment more congenial to his peculiar powers than teaching. At Geneva he had first tried his hand on some notes on Diogenes Laertius. on Theocritus, and on the New Testament, the last undertaken at his father's request. His debut as an editor had been a complete Strabo (1587), of which he was so ashamed afterward that he apologized for its crudity to Scaliger, calling it "a miscarriage." This was followed by the text of Polyaenus, an *editio princeps*, 1589; a text of Aristotle, 1590; and a few notes contributed to Estienne's editions of Dionysius of Halicarnassus and Pliny's *Epistolae*. It is not until his edition of Theophrastus' *Charactères* (1592) that there is a specimen of that peculiar style of illustrative commentary. at once apposite and profuse. which distinguishes Casaubon among annotators. At the time of his moving to Montpellier he was engaged upon what is the capital work of his life, his edition of, and commentary on. Athenaeus.

In 1598 Casaubon was in Lyons. superintending the passage of his Athenaeus through the press. There he lived in the house of Méric de Vicq, *surintendant de la justice*, a Catholic whose connections were with the circle of liberal Catholics in Paris. In the suite of De Vicq. Casaubon visited Paris and was presented to Henry IV, who said something about employing his services in the "restoration" of the University of Paris. In 1600 Casaubon was summoned by De Vicq. who was then in Paris, to go to him in all haste on an affair of importance. The business proved to be the Fontainebleau conference, a public disputation betaeen the bishop of Evreux, Cardinal Duperron, and Duplessis-Mornay, a leading Protestant who had written a controversial work on the doctrine of the Eucharist. Casaubon allowed himself to be persuaded to sit as one of the referees and by so doing placed himself in a false position The issue'was so contrived that the Protestant party could not but be pronounced in the wrong. By concurring in the decision, which nas unfavourable to Duplessis-Mornay, Casaubon lent the prestige of his name to a court whose verdict, without him, would have been worthless. and confirmed the suspicions already current among the Reformed Churches that he was meditating abjuration. From this time he became the object of the hopes and fears of the two religious parties; the Catholics lavishing promises and plying him with arguments; the Reformed ministers Insinuating that he was preparing to forsake a losing cause and only haggling about his price. At the time it was not possible for the immediate parties to the bitter controversy to understand the intermediate position between Genevan Calvinism and Ultramontanism, to which Casaubon's reading of the Fathers had conducted him

Meantime the efforts of De Thou and the liberal Catholics to retain him in Paris were successful The king repeated his invitation to Casaubon to settle in the capital and assigned him a pension. No more was said about the university. The reform of the University of Paris had already closed its doors to all but Catholics. In Nov. 1604, however, Casaubon succeeded to the post of sub-librarian of the royal library. with a salary of 400 livres in addition to his pension.

Casaubon remained in Paris until 1610. Those ten years were the brightest period of his life. He had attained the reputation of being, after Scaliger, the most learned man of the age. He was placed above penury. He had such facilities for religious worship as a Huguenot could have. He enjoyed the society of men of learning. Above all, he had ample facilities for using Greek books, both printed and in manuscript. which no other place but Paris could at that period have supplied.

In spite of all these advantages Casaubon grew restless, and offers came to him from various quarters, from Nimes, from Heidelberg. from Sedan. His friends Jacques Lect and Giovanni Diodati wished, rather than hoped, to get him back to Geneva, but the principal source of Casaubon's uneasiness lay in his religion. The life of any Huguenot in Paris was hardly secure at that time, but Casaubon was exposed to persecution of another sort. Ever since the Fontainebleau conference, an impression prevailed that he was wavering It was known that he rejected the *outré* anti-popery opinions current in the Reformed Churches; that he read the Fathers and wished for a church after the pattern of the primitive ages. He was given to understand that he could have a professorship only by recantation. When it was found that he could not be bought, he was plied by controversy. By the king's orders Duperron uas untiring in his efforts to convert him. On the other hand, the Huguenot theologians, and especially Pierre du Moulin, chief pastor of the church of Paris, accused him of conceding too much, and of having departed already from the lines of strict Calvinistic orthodoxy.

When the assassination of Henry IV gave full rein to the Ultramontane party at court, Casaubon began to listen to overtures, which had been faintly made before, from the bishops and the court of England. In Oct. 1610 he went to England at the invitation of Richard Bancroft, archbishop of Canterbury. He had the most flattering reception from James I, aho was perpetually sending for him to discuss theological matters. The English bishops were equally delighted to find that the great French scholar was an Anglican ready made, who had arrived, by independent study of the Fathers, at the very *via media* between Puritanism and Romanism which was becoming the fashion in the English Church. Casaubon, though a layman, was collated to prebendal stalls at Canterbury and at Westminster, and a pension was assigned him from the exchequer. He was naturalized on Jan. 3. 1611. He still

retained his appointments in France, and his office as librarian. In order to retain their hold upon him, the government of the queen regent refused to allow his library to be sent over. It required a special request from James himself to get leave for Mme Casaubon to bring him a part of his most necessary books. Casaubon continued to speak of himself as the servant of the regent and to declare his readiness to return when summoned to do so.

Meanwhile his situation in London gradually developed unforeseen sources of discomfort. Not that he had any reason to complain of his patrons, the king and the bishops, but he had to share in their rising unpopularity. The courtiers looked with a jealous eye on a pensioner who enjoyed frequent opportunities of taking James I on his weak side—his love of book talk—opportunities which they envied him. His windows were broken by the roughs at night, his children pelted in the streets by day. On one occasion he himself appeared with a black eye, having received a blow from some ruffian's fist in the street. These outrages seem to have arisen solely from the cockney's antipathy to the Frenchman. Casaubon could not speak English. This deficiency excluded him altogether from the circle of the "wits"; either this or some other cause prevented him from being acceptable in the circle of the lay learned—the "antiquaries." Casaubon had to suffer also the open attacks of the Jesuit pamphleteers. They had spared him as long as there were hopes of converting him, but when he was committed to Anglicanism, even those previously friendly to him gave currency to the insinuation that he had sold his conscience for English gold.

But the most serious cause of discomfort in his English residence was that his time was no longer his own. He was perpetually being summoned to one or another of James's hunting residences that the king might enjoy his talk. The king and the bishops wanted to employ his pen in their literary warfare against Rome. They compelled him to write first one, then a second pamphlet on the subject of the day—the royal supremacy. At last, ashamed of thus misappropriating Casaubon's stores of learning, they set him upon a refutation of the *Annals* of Baronius, then in the full tide of its credit and success. Upon this task Casaubon spent his remaining strength and life. He died in London on July 1, 1614. His end was hastened by an unhealthy life of overstudy. and latterly by his anxiety to acquit himself creditably in his criticism on Baronius. He was buried in Westminster abbey.

Besides the editions of ancient authors which have been mentioned, Casaubon published with commentaries Persius, Suetonius and the *Scriptores Historiae Augustae.* The edition of Polybius, on which he had spent vast labour, he left unfinished. His most ambitious work was his revision of the text of the *Deipnosophistae* of Athenaeus, with commentary. The Theophrastus perhaps exhibits his most characteristic excellences as a commentator. The *Exercitationes in Baronium* are but a fragment of the massive criticism which he contemplated. His correspondence (in Latin) was finally collected by T. J. Van Almeloveen (1709), who prefixed to the letters a life of Isaac Casaubon. But the learned Dutch editor was acquainted with Casaubon's diary only in extract. This diary, *Ephemerides,* of which the manuscript is in the chapter library of Canterbury, was printed in 1850. It forms the most valuable record in existence of the daily life of a 16th-century scholar.

BIBLIOGRAPHY.—The most complete account of Casaubon remains the full biography by Mark Pattison (1875), 2nd and revised ed. by H. Nettleship (1892); *see* also *L* J. Nazelle, *Isaac Casaubon, sa vie et son temps* (1897). The British museum has a large collection of books containing manuscript notes by Casaubon. (M. PA.: X.)

CASCADE RANGE, a chain of mountains extending from Mt. Lassen in northern California to the Fraser river in southern British Columbia. In Canada the range is known as the Coast mountains. To the south of Mt. Lassen the range is separated from the Sierra Nevada range by the north fork of the Feather river. The Cascade range is bordered on the east by the Rocky mountains of northeastern Washington. by the Columbia plateau of Washington and Oregon and by the Basin range region. On the west lie the Puget Sound lowland, the Willamette valley and the Klamath mountains. The Cascades have the highest relief of the Pacific Northwest, ranging from near sea level on Puget sound to 14,410 ft. at Mt. Rainier.

The Cascade range is usually divided, in the latitude of Seattle, into two parts. the southern portion being covered almost entirely by extrusive igneous rocks. Numerous volcanic cones, Rainier, Adams (12,307), Hood (11,245), Jefferson (10,495), Three Sisters (10,354), Shasta (14,162) and Lassen (10,457), more or less dissected by glacier and stream action, rise above a plateau. the crest of which is only slightly dissected. Many of the younger lava flows, only a few centuries old, are almost devoid of vegetation. Lakes, many of igneous or glacial origin, are common. The most spectacular of these is Crater lake: which occupies the nearly circular caldera of a volcano which lost its top by a combination of explosion and subsidence. The northern Cascades are underlain by old sediments and metamorphic rocks which have been intruded by granitic batholiths. Glaciation and stream dissection have carved rugged canyons, leaving little of the original plateau surface.

The natural vegetation of the Cascades reflects the variation in rainfall, which reaches more than 100 in. on the western slope. Here the Douglas fir forest provides the largest stands of timber. The east slope is drier, with open stands of ponderosa pine, while the summit plateaus have pine, fir, spruce and hemlock. The higher peaks are generally above the timberline.

Lumbering is carried on in the region. The Cascades also provide water for cities: irrigation and hydroelectric power. The numerous parks, wilderness areas and national forests are popular for skiing, hiking. mountain climbing, fishing and hunting. Population is largely restricted to the lower fringing valleys such as Skagit, Yakima and Hood River.

Fenneman, *Physiography of Western United States* (1931). *See* also national parks and forests sections of Writers' Program, "American Guide Series," *New Washington,* rev. ed. (1950), *Oregon,* rev. ed. (1951). (S. N. D.)

CASCARA SAGRADA ("sacred bark"), the dried bark of *Rhamnus purshiana,* used in medicine as a laxative. The tree is cultivated in North America and Kenya. Cascara sagrada is prepared in both liquid and solid forms and is often prescribed in single and in divided doses. The activity is apparently due to the combined action of several substances, a number of which have been isolated. chiefly anthraquinones. (F. L. A.; X.)

CASE, SHIRLEY JACKSON (1872–1947), Canadian-U.S. theological scholar and educator, whose principal contribution to theological scholarship lay in his emphasis upon the importance of the social environment in the history of Christianity, was born Sept. 28, 1872, in Hatfield Point: N.B. After studying at Acadia university he went to Yale, where he received both his B.D. and his Ph.D. A brief tenure at Bates college, Lewiston, Me., was followed by his transfer to The University of Chicago, where he was professor of New Testament, then professor of church history, and from 1933 to 1938 dean of the divinity school. He died in Lakeland, Fla., Dec. 5, 1947.

Case's emphasis on social environment was applied, first of all, to the person of Jesus himself, as his *Jesus: A New Biography* (1927) makes clear. The same orientation characterized studies such as those on Christian millennialism (1918) and Christian supernaturalism (1929: rev. 1946). Case shared the interest of the "social gospel" in the relation between Christianity and society, but he used it more for scholarship than for social action.

CASEIN, the chief protein in milk and the essential ingredient of cheese. Skim milk gets its white turbidity from colloidal particles of calcium caseinate and calcium phosphate. There are 5×10^{13} particles in a cubic inch of skim milk, ranging in diameter from 3 to 78×10^{-7} in. Rennet changes casein to paracasein and clots calcium paracaseinate. Casein curdles from soured or acidified skim milk; calcium salts are left in the whey. Milk contains 3% of casein.

Properties.—Pure casein is an amorphous white solid without taste or odour. Commercial casein is slightly yellow. with a pleasant odour. Dry casein keeps well if protected from insects

and rodents; damp casein is quickly attacked by molds and bacteria and acquires a disagreeable odour. The specific gravity is 1.25 to 1.31. Casein is a mixture of phosphoproteins of differing molecular weight.

Casein is a lyophilic colloid akin to albumin and gelatin. Casein is isoelectric at pH 4.6 where its solubility in water is but 0.01%. It is amphoteric: below pH 4.6 casein forms moderately soluble salts such as casein chloride; above pH 4.6 casein forms salts with bases. Sodium caseinate and other alkali salts are soluble without limit: calcium caseinate, other alkaline earth salts and heavy metal salts are nearly insoluble. Caseinates readily form gels when slowly coagulated from concentrated solutions. Formaldehyde forms an insoluble compound with casein. Casein is insoluble in most organic solvents.

Paracasein is less lyophilic but otherwise identical with casein.

Manufacture. — Casein is usually made from skim milk, rarely from buttermilk, by one of three methods: (1) naturally soured casein curdles when enough lactic acid develops from fermentation of milk sugar by the ever present bacterium *Streptococcus* lactis; (2) acid casein is precipitated by adding dilute hydrochloric acid or sulfuric acid; (3) for rennet casein. warm skim milk is "set" with rennet extract until the calcium paracaseinate clots, after which the clot is cut into small pieces to allow the whey to drain. In all three methods the whey is drawn off. the curd washed with water. drained or pressed, dried in warm air, ground and packed for sale. Rennet casein retains much of the calcium phosphate from the milk.

Uses.—Casein is used in prepared foods, in medicines and in cosmetics. Minor industrial applications include the seasoning and dressing of leather, cleaners and polishes for white shoes, textile printing and sizing, insecticide sprays, soapmaking and many uses in which casein serves as a protective colloid, emulsifying agent or binder. Major applications of casein are paper coatings, glues, paints, plastics and man-made fibres.

Paper *Coatings.*—Book and art papers are coated with pigmented casein to provide a suitable surface for half-tone illustrations. A moderately alkaline solution of naturally soured or acid casein is mixed with a water slurry of the pigments. Formaldehyde or lime may be added for better resistance to water. The mixture is spread on the paper in a coating machine and dried.

Glues.—Wood joints made with casein glue withstand dampness for some time. Prepared casein glue is a powder composed of naturally soured or acid casein, lime, suitable sodium salts and a fungicide. The powder is dissolved in water shortly before the glue is used, whereupon the sodium salts precipitate part of the lime, release sodium hydroxide and dissolve the casein as sodium caseinate: later the rest of the lime slowly changes the sodium caseinate to insoluble calcium caseinate.

Paints.—Casein paints or distempers provide moderately washable. lustreless decoration for interior walls or for exterior masonry. Casein powder paints, to be mixed with water, are similar to casein glue in composition except for the further addition of pigments. Casein paste paints, to be diluted with water, are made by pigmenting weakly alkaline solutions of casein. Casein is also used as the emulsifying agent in emulsion paints, which are oil paints that can be thinned with water. See also WATER-COLOUR PAINTING: Technique; TEMPERA.

Plastics.—Molded plastics of casein resemble horn, ivory. ebony and marble in appearance. The principal use is for buttons for clothing. Rennet casein is granulated, moistened with water and kneaded thoroughly. Dyes or pigments may be added. The granules absorb the water and are softened. The material is then passed through a heated cylinder press with rotating screw from which soft plastic is extruded under pressure in rods or tubes. The soft plastic may then be molded in the desired shape. The shaped plastic is hardened by long soaking in formaldehyde solution after which it is slowly dried. See also PLASTICS: Casein Plastics.

Man-made Fibres.—Woollike textile fibres are made from casein by extruding an alkaline solution of casein through spinnerets of the kind used in making rayon and then hardening the fibres in an acid bath containing formaldehyde.

See E. Sutermeister and F. L. Browne, *Casein and its Industrial Applications* (1939). (F. L. BE.)

CASELLA, ALFREDO (1883–1947). Italian composer, pianist, conductor and teacher whose cosmopolitan outlook permeated 20th-century Italian music-making, was born in Turin, July 25, 1883, and studied piano under Louis Diémer in Paris, where he stayed till 1914. His early symphonies (1905–09) show the influence of Strauss and Mahler, and his later chamber and orchestral works that of Ravel and Stravinsky; but he established a more personal style in the ballet *La* Giara (1924) and in the orchestral works Scarlattiana (1926) and *Paganiniana* (1942). In 1917 he founded the *Società* Nazionale *di Musica* and helped to revive interest in early Italian music. He published valuable editions of the piano works of Bach, Mozart, Beethoven and Chopin. He died in Rome on March 5, 1947.

See A. Casella, *Music in* My *Time*, trans. by *S.* Norton (1955).

CASEMENT, SIR ROGER DAVID (1864–1916), Irish patriot, whose execution during World War I placed him among the foremost martyrs of the Irish nationalist cause, was born at Dun Laoghaire (formerly Kingstown), County Dublin, on Sept. 1, 1864. He was brought up by his uncle, an Ulster Protestant. He went to Africa in 1883, served in the Niger Coast protectorate, and then entered the British consular service (1892). He was appointed consul at Lourenço Marques for Portuguese East Africa in 1895, then at Luanda, for Angola, and at Boma, for the Congo Free State, in 1898. He returned to England in 1903, and held consular posts in Brazil between 1906 and 1911. Casement gained international fame for his two investigations into the methods of white traders, the first in the Congo (1901–03) and the second to the Putumayo river in Peru (1910–11). On both these expeditions Casement revealed atrocious cruelty by white traders and their agents in the exploitation of African and Indian labour. The report of his Congo investigation. published in Feb. 1904. led to the appointment of a Belgian commission which supported his findings and resulted in a change in the Congo government. His Putumayo report earned him a knighthood (1911), and created a sensation on its publication in 1912, although the advent of World War I prevented effective action being taken.

Casement retired in 1912 and returned to Ireland. Always a strong Irish nationalist, he was prominently associated with the formation of the Irish National Volunteers in 1913, and opposed the participation of Irishmen in World War I. Hoping that German assistance might be used to win Irish independence. he went via the United States to Berlin in Nov. 1914. He published anti-British pamphlets in 1915, and attempted to recruit a brigade, for service against England, from Irish prisoners of war, who, however, indignantly rejected his proposals. He found the Germans were not prepared to risk an expedition to Ireland, and, learning of the plans for an Irish rising at Easter 1916, he tried in vain to prevent it. He sailed for Ireland in a German submarine (April 12, 1916). The accompanying ship, with its load of German arms for the rebels, was captured, and Casement. landing at Banna Strand, County Kerry, was arrested on April 24 and taken to London.

Tried for treason before the lord chief justice, he was convicted and sentenced to death on June 29. His appeal against conviction was dismissed on July 18, and on Aug. 3, 1916, he was hanged at Pentonville prison, London, despite strong efforts to secure a reprieve. The extent to which opinion was unfavourably influenced by the private circulation of diaries reputedly written by Casement and containing detailed descriptions of homosexual practices was a matter of much subsequent controversy. The diaries themselves. the authenticity of which had been much disputed. were made available for inspection by scholars at the Public Record office. London, by the home secretary in July 1959. Most experts considered that the passages in question were in Casement's handwriting. This did not exclude the possibility of their having been copied. as was also suggested, from other sources.

MacColl, *Roger Casement* (1956); Alfred Noyes, *The Accusing Ghost: or Justice for Casement* (1957); *P.* Singleton-Gates and M. Girodias, *Black Diaries* (1959); *H.* Montgomery Hyde (ed.), *Trial of Sir Roger Casement* (1960). (P. N. S. M.)

CASERTA, a town and episcopal see in the province of the same name, Campania region. Italy, is situated 28 km. (17.4 mi.) N. of Naples by road. Pop. (1957 est.) 47.711 (commune). The old town (Caserta Vecchia) founded by the Lombards in the 9th century lies on hills 5 km. (3 mi.) N.N.E. and is dominated by St. Michael's cathedral (1135), which is a copy of that at Sessa Aurunca and preserves the type of the Latin basilica. Its pulpit is decorated with rich polychrome mosaic. The modern town was a village known as La Torre belonging to the Caetani family of Sermoneta until the erection of the royal palace in the 18th century. Begun by Luigi Vanvitelli (van Wittel) in 1752 for the Bourbon Charles III but not completed until 1774 for his son, Ferdinand IV, it forms a rectangle, the south front being 830 ft. long and 134 ft. high. The interior is richly decorated with marbles and the staircase, chapel and theatre are especially sumptuous. The extensive gardens on the hillside behind the palace are adorned with fountains and cascades, the water for which is brought by an aqueduct more than 27 mi. long with three lofty bridges, the largest being the Ponti della Valle (the Arches of the Valley) near Maddaloni. Two miles north is St. Leucio, a village founded by Ferdinand IV in 1789, with large silk factories. Caserta is on the main railway lines from Naples to Foggia and Rome.

In the Italian *risorgimento* (movement for political unity) the battle of the Volturno (1860) was fought round Caserta; the combat was particularly fierce at Old Caserta and the Arches of the Valley before Garibaldi defeated the Neapolitan forces. In World War II the royal palace served for a time as the headquarters of the Allied command and the surrender of the German army in Italy was signed there on April 29, 1945. Parts of it are now used for an air force officers' academy and a commercial school.

CASH. In commercial use, this term denotes coin and bank notes, as distinguished from promissory notes, drafts and other forms of obligations payable. Cash is legal tender and is by law acceptable in payment of all debts. Individuals and commercial establishments usually distinguish between cash on hand, meaning money in their own possession, and deposits left with an agent such as a bank. Cash in the bank, from the individual and business point of view, means a sum payable in cash immediately, during regular banking hours, on order, deposited in what is called a commercial or checking account. Individuals and businesses ordinarily keep their cash holdings at a minimum. They prefer to have the largt - part of their assets in physical goods, income-producing holdings and other contracts, securities and investments which may be converted into cash in the ordinary course of commerce or when the need arises.

Historically, cash was the name that British residents of the east gave. to native coins of small value and particularly to the copper coins of China, the native name for which was *tsien*. The English term was apparently derived from the Sinhalese *kasi* and Tamil *kasū*, a small coin. (O. R. G.)

CASHEL (CAISEAL MUMHAN, "stone fort of Munster"), a town and urban district of County Tipperary, Republic of Ireland, is 100 mi. S.W. of Dublin by road. Pop. (1956) 2.817. It is dominated by the Rock of Cashel (358 ft.), a limestone outcrop which, according to legend, the devil spat forth into the plain below after biting it from the Devil's Bit mountains, where a gap roughly corresponds to the rock's dimensions. The summit is crowned by a group of ruins which include remains of the defenses. St. Patrick's cathedral (adjoined by a round tower and Cormac's chapel), the bishop's castle, and an ancient cross on the pedestal of which the Munster kings were crowned. Tradition relates that the vision of an angel blessing the rock, seen by two swineherds during the 4th century, led the king of Munster to establish a stronghold there. Below the rock is Hore abbey, a Cistercian foundation (1272) and within the town a Dominican priory (1243). St. Patrick visited Cashel in A.D. 450 and baptized the reigning king. Some early bishops were also warriors, notably Olchobar who defeated Norse invaders nearby. In 1101 King Murtagh O'Brien granted the town to the Church. Henry II received the homage of Donnell O'Brien, king of Thomond, there in 1171 and in 1315 Edward Bruce held his Irish parliament. St. Patrick's cathedral (burned in 1495 by the earl of Kildare and stripped of its lead roof in 1749) undenvent restorations. Cashel also has a Georgian cathedral (1784), the seat of a Protestant bishop; the Catholic archbishopric of Cashel is at Thurles. Towns named Cashel also occur in counties Galway and Mayo.

CASHEW, the edible seed or nut of *Anacardium occidentale* (family Anacardiaceae), a polygamous. tropical and subtropical evergreen which ranges in size from a small shrub in poor, dry soil to a 40-ft. tree where soils are fertile and the humidity great. While the species is chiefly important for the nuts it produces, the wood is useful as material for shipping crates, boats, charcoal, etc.. and a gum similar to gum arabic is obtained from the stem. The species is related to the American poison ivy and poison sumac and, like them, must be handled with extreme care by persons susceptible to this kind of poisoning. Of eight known species, this is the only one cultivated as a food producer. The nut, which is shaped like a large, thick bean and is sometimes more than an inch long, forms in a most singular manner. It appears as though one of its ends had been forcibly sunk into the calyx end of a fleshy, pear-shaped fruit, called the cashew apple, which is about three times as large as the nut and of reddish or yellow colour. The cashew apple is much used where the tree grows, in beverages, jams and jellies, but is unimportant commercially. The nut has two walls or shells, the outer of which is smooth and glasslike over the surface, thin and somewhat elastic, but stout, and of olive-green colour until mature, when it becomes strawberry roan. The inner shell is considerably harder and must be cracked like the shells of other nuts. Between the shells, there is a brown oil which has an extremely blistering effect on the skin. This finds use as a lubricant and insecticide, and in the production of plastics. More than 8,000,000 lb. are produced annually.

The fruits are picked by hand, and the nuts are first detached, then thoroughly dried in the sun. By the primitive methods used in some localities, the dried nuts are roasted by being placed among burning logs, where the heat causes the outer shells to burst open and release the oil. The latter quickly catches fire, giving off fumes which are dangerous to the eyes and skin. By improved methods of roasting, the nuts pass through large revolving cylinders of sheet iron with perforated sides, which are made to revolve above well-controlled flames. The oil drains into containers below and is salvaged. The roasting process entirely dispels all poisonous properties.

Later, the inner shells are broken open by hand labour and the kernels given further heating treatment by which the skins are removed and the kernels made ready for consumption.

The cashew is indigenous to the tropics of Central and South America. It was discovered during the 15th century by Portugese missionaries, who took it to east Africa and India. It later became thoroughly established and very abundant at low altitudes near the seacoast in both places, and eventually throughout tropical countries generally. Until 1923 losses due to weevil infestation while in transit practically prohibited exports to distant countries. In that year, a process was discovered and patented for using hermetically sealed shipping containers within which the air had been replaced with carbon dioxide. This method largely eliminated losses. From that time, exports increased rapidly until World War II, the United States being the principal buyer. Annual purchases by the U.S. rose to more than 50,000.000 lb.. about 97% of the imports being from India. *See* also POISONOUS PLANTS.

(C. A. RD.; F. A. BY.)

CASHIER'S CHECKS: *see* CHECK.

CASHIN, SIR MICHAEL PATRICK (1864–1926), prime minister of Newfoundland in 1919, is remembered chiefly for his work as minister of finance during World War I. Born on Sept. 29, 1864, at Cape Broyle, Ferryland district, he was educated at St. Bonaventure's college (a high school) at St. John's, and became a fishery merchant. In the house of assembly he represented Ferryland from 1893 to 1923, and St. John's West from 1923 to 1924. Originally a Liberal, he became an independent in 1905 to oppose the Foreign Fishing Vessels act (the Bait act) by which Prime Minister Robert Bond tried to prevent

the sale of bait to U.S. fishermen. In 1908 Cashin joined with various independents and Conservatives under Edward Morris to form a new People's party and Morris became prime minister in 1909, with Cashin as minister of finance and customs (1909–19). In 1917 the People's party and the Liberal-Union opposition formed a National or coalition government, and Cashin launched a successful Victory Loan. When the Liberal-Union leader William Lloyd succeeded Morris as prime minister on Jan. 5, 1918, certain members of the People's party, including Richard Squires, withdrew their support from the wartime government, but Cashin remained at his post. However, when Cashin himself became prime minister on May 22, 1919, he took the step that led to his political defeat by breaking with William Coaker, president of the Fishermen's Protective union, in order to gain the support of mercantile elements who had supported Morris but had opposed the Lloyd ,administration. Squires, remaining in opposition, organized a Liberal Reform party on Aug. 21, with,the demagogic slogan, "the grafters must go." On Sept. 24 the Cashin government adopted the designation Liberal Progressive. Like Prime Minister Morris before him, Cashin was a Roman Catholic, and in the general elections of Nov. 3 he retained most of the Catholic seats. But Squires and Coaker swept almost all the rest of Newfoundland, the final result being: Liberal Reform 24, Liberal Progressive 12.

On Nov. 17, 1919, Cashin was succeeded as prime minister by Squires, but he continued to lead the Liberal Progressives (forerunners of the Progressive Conservatives) until 1923. He retired from politics in 1924, the year in which his party returned to power. He died at St. John's on Aug. 30, 1926. (G. O. R.)

CASHMERE, one of the finest and softest animal fibres used in the textile industry. Cashmere is the down fibre derived from the underfleece (pashm) of a domesticated Asian goat. The name cashmere became well known because of the fame of the beautiful shawls handwoven of pashm in the city of Srinagar, Kashmir.

The annual production of the three leading cashmere producing countries, China, Outer Mongolia and Iran, is estimated at between 7,000,000 and 9,000,000 lb. One goat yields from a few ounces to one pound of down fibre per year.

During the molting season, which lasts for several weeks in late spring, the goat herders remove the down from the goats with a coarse comb. In its raw state cashmere hair is an unsightly mixture of fine undercoat and coarse outercoat fibres in the form of loose locks, batches or rolls. The scouring yield for the main types ranges between 65% and 85%. The scoured cashmere, still a mixture of fine cashmere fibres and coarse hairs, undergoes further mechanical processing, such as dehairing and carding, to remove the coarse hairs; the final yield may be as high as 50% from the best-quality fibres or as low as 20% from the poorest quality.

The finest down fibres are grown by Chinese and Mongolian goats and have an average thickness of between 14.5 and 16.5 microns. (One micron = $\frac{1}{25,400}$ in.)

Cashmere is used mainly for producing high-quality knitwear, such as sweaters, men's hose, women's dress goods and coats, men's sport coats, top coats and overcoats.

The term cashmere is also applied to several distinct varieties and qualities of dress fabrics of lightweight texture either made from 100% wool or from combinations of wool and cotton or silk warps.

See CASHMERE GOAT; SHAWL. (W. v. B.)

CASHMERE (KASHMIR) **GOAT,** a breed of domestic goat valued for its soft silky wool (see CASHMERE), used in India for the manufacture of cashmere shawls. It varies in build and colour but the most highly esteemed has large ears, slender limbs, curved spreading horns not spirally twisted, and a long, straight, silky white coat. Beneath the outer coat of coarse hair the fluffy, soft underfur or pashm (present in all goats) is particularly luxuriant and forms the product for which the breed is valued. See also GOAT. (L. H. M.)

CASH ON DELIVERY, also known as Collect On Delivery and popularly known by the letters C.O.D., is a common business term indicating that goods must be paid for at the time of delivery The payment is due in cash but may be made by check if acceptable to the seller. The transfer agent very often used is the postal service, but it is common for consumer and business shipments to be sent C.O.D. by express companies. commercial truck forwarders or the seller's own delivery organization. C.O.D. sales usually involve a collection charge levied by the delivery agent and usually paid by the buyer. In retailing and wholesaling transactions, shipments are made on a C.O.D. basis when the buyer does not have a credit account with the seller and does not choose to pay in advance. C.O.D. terms are also often used when the amounts involved are small and the cost of advancing credit would be high in proportion to the size of the purchase.

C.O.D. general postal service was first introduced in Switzerland in 1849, India and Australia in 1877, the United States in 1913, Canada in 1922 and Great Britain in 1926. (0. R. G)

CASH REGISTER: see OFFICE MACHINES AND APPLIANCES.

CASIMIR I THE RESTORER (Pol. KAZIMIERZ ODNOWICIEL) (1016–1058). ruler of Poland, was the son of King Mieszko II and Richeza (Ryksa) of Lorraine. Brought up in a monastery, he began to rule on his father's death (1034), but was deposed about 1037 and exiled with his mother during a rising of the magnates against the royal power and a popular revolt against the lords, joined with the reaction in favour of paganism. The German kings Conrad II (1038) and Henry III (1039) helped him to regain his throne. An alliance with Yaroslav the Great, of Kiev, whose sister Dobronega he married, helped Casimir to regain Mazovia, after defeating Metslav (Maslaw), the self-appointed ruler of that province, in 1047.

Casimir also seized Silesia, then under Czech occupation, and in 1054 got Henry III's assent to this re-annexation on the proviso that tribute should be paid to the Czechs (this tribute, however, was soon discontinued). Casimir restored the state administration and the church organization that had been weakened by the troubles at the beginning of his reign. During his reign Aaron, bishop of Cracow, received the pallium of an archbishop, but the metropolitan see remained in Gniezno. Casimir I had three sons: Boleslaw II (*q.v.*) the Bold; Wladyslaw Herman; and Mieszko who died young.

See S. Ketrzynski, *Polska x–xi wieku* (1961). (A. GI.)

CASIMIR III THE GREAT (Pol. KAZIMIERZ WIELKI) (1310–1370), king of Poland from 1333, was born at Kowal in Kujavia, the son of Wladyslaw I Lokietek, king of Poland, and Jadwiga. princess of Kalisz. He was educated at the court of his brother-in-law, Charles I of Hungary (Charles Robert of Anjou-Naples), where he had a reputation for frivolity. When Casimir became king of Poland on April 24, 1333, his kingdom, consisting of the lately reunited provinces of Great and Little Poland. was at war with the Teutonic Order and with John of Luxembourg, king of Bohemia. who claimed the Polish crown. Casimir, preferring a wise diplomacy to bloodshed, began by temporarily neutralizing the Teutonic Order with the truce of Torun (Thorn) and by inducing the king of Bohemia, at the conference of Trencin (Trencsén) early in 1335, to relinquish his claims to Poland in return for a free hand in Silesia. At the congress of Visegrid, where Casimir and John were entertained by the king of Hungary. later in 1335, the differences between them were finally adjusted. Casimir paid a large sum of money to John, renounced Polish claims to sovereignty over Mazovia and agreed to collaborate with Charles of Hungary in acquiring Halicz (Halych) or Red Ruthenia. Moreover, John put forward suggestions for a peace between Poland and the Teutonic Order, on the basis that Casimir should cede eastern Pomorze and the Chelmno territory to the knights and that they should retrocede Kujavia and Dobrzyn to him, Finally, at a second conference at Visegrád in 1339, Casimir, who had no male issue, recognized Louis, Charles I's son, as the successor to the Polish crown. Louis contracting to confirm the privileges of the Polish gentry and clergy and to rule Poland through Poles only.

In 1340 the death of the last prince of Halicz and the ravaging of that principality by the Tatars induced Casimir and Charles to establish their joint influence there, and in 1344 the Ruthenian boyar Dmitro Detko was appointed starosta, or governor, in the

names of the two kings. In 1353 Lubart of Lithuania disputed the rule of Poland in that principality. Hungary coming to the assistance of Poland, Lubart was defeated and taken prisoner; but Casimir, to avoid a bloody war with Lithuania's Tatar allies. came to a compromise with Lubart whereby Poland retained Halicz with Lwow (Lviv), while the territories of Wlodzimierz (Volodymir). Belz and Brzesc (Brest) fell to Lithuania.

With the Teutonic Order, Poland's worst enemy, Casimir always preserved peace: the disputes between them were settled by the treaty of Kalisz (July 23, 1343), when the knights engaged for the first time to pay tribute to the Polish crown. Casimir, however, had trouble with Bohemia over Silesia. He invaded that country. took Wschowa and captured Prince Charles of Bohemia, but was besieged in Cracow by the retaliating Bohemians. Hungary hastened to his assistance, and the papacy restored peace in 1346.

Casimir codified the laws of Poland at Wislica and at Piotrkow in 1347; and in 1356 a supreme court of appeal was established. Casimir, the "peasant's king," put down aristocratic oppression, offenders being often put to death. Stimulated by the example of the Holy Roman emperor Charles IV, John's successor as king of Bohemia, who had founded the University of Prague in 1348, Casimir on May 12, 1364, established and richly endowed the first Polish university in Cracow. Casimir reorganized the state finances. He introduced the conscription of landowners for national defense. He founded towns, developed architecture (giving Poland "brick for wood") and protected home industries with tariffs, which led to a tariff war with Bohemia. He also encouraged immigration of the Jews. He unified Poland, making "one law, one king, one currency."

In the course of his reign Casimir subdued Volhynia, Podolia and the territory of Belz, beat the Russians as well as the Lithuanians and Tatars and finally acquired control over Mazovia. He set up a cordon of fortresses on his northeastern borders. His last political act was the conclusion of an alliance with Louis of Hungary against Charles IV at Buda in 1369. Casimir died on Nov. 5, 1370, as the result of a hunting accident. His last will, whereby his grandson Casimir of Pomerania was to be king of Poland after Louis of Hungary, was annulled by Louis and the Polish lords.

See Z. Kaczmarczyk, *Monarchia Kazimierza Wielkiego,* 2 vol. (1939–46) (R. N. B.; A. Gi.)

CASIMIR IV (Pol. KAZIMIERZ JAGIELLONCZYK) (1427–1492), king of Poland from 1445, was the second son of Wladyslaw II Jagiello. In his youth he was appointed grand prince of Lithuania by his father. He was crowned king of Poland in Cracow in June 1447, three years after the death of his elder brother, Wladyslaw III. Throughout life Casimir aimed at preserving the personal union between Poland and Lithuania and at recovering the lost western and northern lands of the old Poland. Thanks to his steadfast adherence to these principles, Poland in the 15th century became a great power.

Casimir tended to reinforce the royal power at the expense of the magnates and to rely rather on the support of the representatives of the gentry, to whom he granted the Nieszawa privilege in 1454, binding the king to obtain the consent of the land councils for new taxes and for the general levy.

Casimir finally subjugated the Teutonic Order after a 13 years' war, during which his subjects troubled him more than his enemies. In Oct. 1453 the cities and gentry of Prussia, in dispute with the order (which had been excommunicated by the pope and put under the ban of the Holy Roman empire), placed themselves under Casimir's overlordship; and on Feb. 4, 1454, they renounced their allegiance to the order. They then captured 57 towns and castles, and on March 4, 1454, Casimir incorporated Prussia with Poland, with a guarantee of autonomy and of freedom from taxation. The king, irritated by the parsimony of the estates, threatened to retire to Lithuania, but after the bloody victory over the order at Puck (Sept. 17, 1462) fortune favoured Poland. Finally the papacy intervened, and by the second peace of Torun (Thorn), on Oct. 19, 1166, all the western part of Prussia, with Chelmno and Malbork (Marienburg), called Royal Prussia, was ceded to Poland, while the remainder of Prussia was held by the knights as a fief of the Polish crown.

At the beginning of his reign Casimir had profited from the rivalry between Pope Nicholas V and the antipope Felix V to acquire for the crown the right of appointing bishops. This success was naturaliy resented in Rome. Popes Pius II and Paul II, however, adopted a more friendly attitude in the hope that Casimir would join in a crusade against the Turks. Thus Casimir was able to obtain papal acquiescence to the election of his son Wladyslaw (Czech Vladislav) as king of Bohemia in succession to George of Podebrady in 1471, though the pope would otherwise have preferred Matthias of Hungary.

Casimir died in, June 1492. (R. N. B.; A. Gi.)

CASIMIR-PERIER, JEAN PAUL PIERRE (1847–1907), French statesman, the fifth president of the third republic, was born in Paris on Nov. 8, 1847, the grandson of Casimir Périer, Louis Philippe's prime minister. He was deputy for Nogent-sur-Seine from 1876 and for Aube from 1885. Although very rich (he was one of the largest shareholders in the great coal and iron company of Anzin) and belonging to a family with strong Orleanist sympathies, he sat with the left-wing republicans. Having been undersecretary for education (1877–79), undersecretary for war (1883–85), vice-president of the chamber (1890–92) and president of the chamber (1893), he became prime minister on Dec. 4, 1893. His period of office was marked by the creation of the colonial ministry, by the repression of anarchist activities and by determined opposition to any revision of the constitution and to the separation of church and state. His resignation (May 22, 1894) was followed by his re-election (June 2) to the presidency of the chamber. He was elected president of the republic on June 27, 1894. Criticism from the left-wing members of the chamber, together with the fact that the prime minister, Charles Dupuy, failed to keep him informed of affairs, caused his resignation a few months later (Jan. 15, 1895). Abandoning politics, he became president of the Anzin company and devoted himself to business until his death in Paris on March 11, 1907.

CASKET LETTERS, the name given to eight letters and a series of irregular sonnets written by Mary, queen of Scots, to the earl of Bothwell, which were alleged by James, 4th earl of Morton, to have been found in a silver casket and which were used by Morton and the Protestant rebels of 1567 to implicate the queen in the death of Lord Darnley and to justify their rebellion. If the letters are genuine—particularly Letter II, or the Glasgow letter—they are evidence of Mary's complicity in the murder. Whether or not the letters are authentic must remain a matter of opinion for each historian, with two overriding considerations. the letters are probably only evidence against Mary, not for her; and even if the letters are completely spurious the circumstantial evidence may be sufficient to indicate Mary's guilt.

The history of the letters as seen by the anti-Marians can be summarized (see Malcolm Laing, History of Scotland, vol. i, 2nd ed., 1804). After receipt of the letters Bothwell deposited them (with other documents including the Darnley murder bond signed by the conspirators) in the casket, which itself was put in the care of Sir James Balfour (*q.v.*) of Pittendreich. After the defeat of Mary's forces at Carberry Hill (June 15, 1567), Balfour at Mary's request gave the casket to a servant of Bothwell; Balfour warned the Protestant lords; they intercepted the casket; but not before he or William Maitland (*q.v.*) had abstracted and destroyed the murder bond. The letters (which were in French) were translated into Scots and, for the benefit of the Westminster conference held by Queen Elizabeth to investigate the charges against Mary, into English. The English translations (or some text of them) were produced there on Dec. 14, 1568. Subsequent translations were made into Latin and French, the latter being regarded as the originals until 1754 (Walter Goodall, Exumination of *the* Letters, 1754). After the Westminster conference the original letters remained with Morton until his execution in 1581, when they came into the hands of William, 1st earl of Gowrie. Gowrie refused, as requested by Elizabeth, to send them to England, but when he was executed in 1584 the originals disappeared—possibly at the hands of Mary's son, James VI.

This narrative is open to attack at almost every point, but the battle has been fought chiefly on the authenticity of Letter II John Hosack's theory of forgery put forward in *Mary, Queen of Scots and her Accusers,* 2 vol., 2nd ed. (1870–74), held the field until the publication of Harry Bresslau's article, "Die Kassetenbriefe der Konigin Maria Stuart," *Historisches Taschenbuch* (1882), and T. F. Henderson's *The Casket Letters and Mary, Queen of Scots,* 2nd ed (1890). The discovery of the "Lennox narrative" and other papers of Darnley's father, Matthew, 12th earl of Lennox, brought Andrew Lang to the view that "the least difficult theory is that Letter II is in part authentic, in part garbled," in *The Mystery of Mary Stuart,* rev. ed. (1904) This was answered by Henderson in *Mary, Queen of Scots,* 2 vol. (1905), and Lang, on different grounds from Henderson, retracted his earlier view in "The Casket Letters," *Scottish Historical Review,* vol v (1908), and was convinced Mary "wrote the whole letter." Henderson restated his view in "Mr. Lang and the Casket Letters," *Scottish Historical Review,* vol. v (1908). Since then Maj. Gen. R H. Mahon has advanced arguments against the genuineness of Letter II in his *Indictment of Mary, Queen of Scots* (1923), *Mary, Queen of Scots* (1924) and *The Tragedy of Kirk o' Field* (1930); and J. B. Black in *The Reign of Elizabeth,* 1st ed. (1936), accepted the state of the argument as it was after 1907 but in the 2nd ed (1959)—using the criteria of the courtroom—came out strongly against the authenticity of the letters.

CASLON, the name of a family of English type founders.

WILLIAM CASLON (1692–1766), the first of the name, was born at Cradley. Worcestershire. In 1716, after an apprenticeship to a London engraver of gunlocks and barrels. he set up his own shop in which he did similar work, as well as silver chasing and the cutting of bookbinders' gilding tools and letter stamps. Under the patronage of William Bowyer, although at the suggestion of John Watts, Caslon became a letter designer and type founder. His success was almost instantaneous. From 1720 to 1780, few works were printed in England that did not use type from his foundry

Caslon's first commission was to cut a font of Arabic letters. Then came a modified roman, or old style, type face that later came to be called Caslon; it was first used in an edition of the works of John Selden published in 1726 by William Bowyer. Caslon's first specimen sheet of type faces was issued in 1734 and exhibited the Caslon roman and italic in 14 different sizes, together with other faces and a few "flowers," or ornaments. Caslon's types were soon in use all over Europe and in the American colonies, where a font was used to print the Declaration of Independence.

He modeled his letters after Dutch types, but most students of typographic arts of that day considered them much better His type faces were marked by more thin, delicate strokes and a freedom of vigour that was typically Anglo-Saxon. He introduced into his fonts a quality of interest, a variety of design and a delicacy of modeling that few Dutch type faces possessed. Dutch types were monotonous, but Caslon's fonts were not.

Although their popularity waned during the first half of the 19th century, they were revived in 1859 when a U.S. type foundry imported Caslon old style matrices; by 1900 leading makers of types and type-casting machines in the U.S. were producing this face in quantities. In the early 1960s, about 15 different variations of Caslon were available.

After Caslon died on Jan. 23, 1766, his eldest son, WILLIAM CASLON (1720–78), who had been his father's partner for a number of years, continued the business. Other descendants of the original Caslon continued to operate the type foundry until 1874. The foundry was still in operation in the early 1960s.

(W. V. HA.)

CASPER, a city in central Wyoming, U.S., and seat of Natrona county, is on the North Platte river 186 mi. N.W. of the state capital, Cheyenne. Casper was founded in 1888 as a small tent town when the Chicago and North Western railroad tracks approached from the east. It was named for a young lieutenant, Caspar Collins, who was massacred by Indians while trying to rescue a stranded wagon train; the present spelling of the city's name is the result of an error of the railroad clerk who filed the original plat. It was incorporated as a town in 1389 and became a city of the first class in 1917.

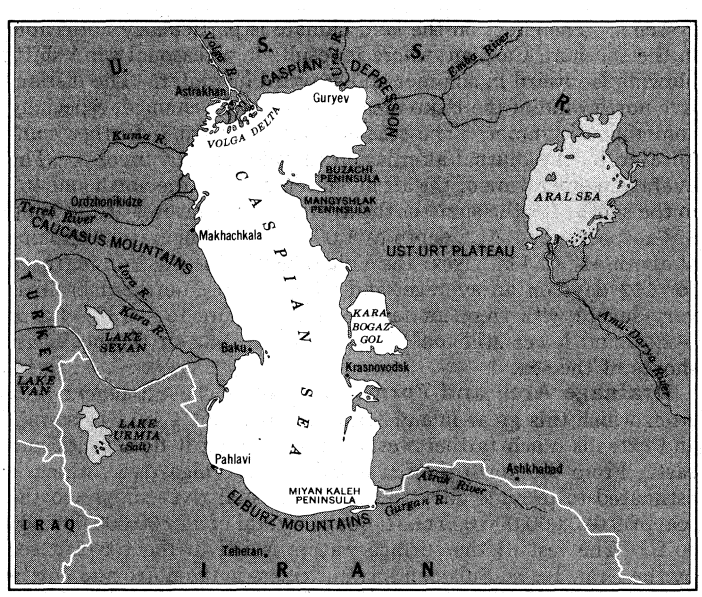
Almost from its birth Casper has been closely identified with the oil industry. To the north of the city. often known as the "Oil Capital of the Rockies," lies the remarkably long-lived Salt Creek oil field, which gave Casper its first impetus in the oil business in the 1890s. After that time, as other fields were developed, Casper continued to be the state's chief supplier, of oil industry equipment and services and its oil refining centre.

Although Casper is marked indelibly by oil, other industries provide diversification. Cattle and sheep have always been important in the city's economy and, since there are extensive grazing areas in all directions, the city is a wholesaling and retailing centre for a large hinterland. The North Platte river offers trout fishing; Casper Mountain park, owned by the city, is nearby. Old Ft. Casper, which guarded the main crossing of the North Platte in the days of the covered wagon, is also a city park. Casper college, a two-year public institution, was founded in 1943.

For comparative population figures *see* table in WYOMING: *Population.* (T. A. *LN.*)

CASPIAN SEA, largest inland salt lake of the world, between Europe and Asia, extending from 37° to 47° N., and from 47° to 55° E. Shaped roughly like the letter S, it is 745 mi. long from north to south, and 100 to 270 mi. wide. From 1830 until 1929, its average level was 84 ft. below sea level and its area was 169,300 sq.mi. From 1929 to 1956, the level of the Caspian sea dropped by about 8 ft. to 92 ft. below sea level. and its area was reduced to 152,239 sq.mi. The Caspian sea fills the deepest part of a vast depression between the Caucasus and central Asia, sometimes known as the Aralo-Caspian depression, which was once an inland sea. The name Caspian is derived from the ancient Latin name Caspium mare, which was named for the ancient Caspi people of Transcaucasia. The sea is also known as the Hyrcanian sea, in antiquity Hyrcanium mare.

Hydrography and Shores.—The huge lake basin of the Caspian sea can be divided into three distinct sections: (1) a northern shallow section adjoining the mouths of the Volga and Ural rivers, the two principal sediment-carrying tributaries of the Caspian sea; (2) a middle section with an average depth of about 700 ft. and a maximum of 2,592 ft.; (3) a deeper southern section with an average depth of 1,000 ft. and a maximum of 3,215 ft. The middle and southern sections are separated by a submarine ridge extending from the Apsheron peninsula of the Caucasus to the central



CASPIAN SEA, INLAND SALT LAKE FORMING DEEPEST PART OF THE ARALO-CASPIAN DEPRESSION

Asian shore near Krasnovodsk. All bays and inlets of the Caspian sea are quite shallow. They include the Kara-Bogaz-Gol, Komsomolets bay and Kaidak bay. The Kara-Bogaz-Gol, the largest of the Caspian inlets, is a subsidiary basin separated from the sea by a narrow sand bar and situated at a somewhat lower level. The sand bar is pierced by a strait 300 to 400 ft. wide. Prior to the reduction in level of the Caspian sea that began in 1929, a swift current flowed through the narrow strait into the Kara-Bogaz-Gol, which functioned as a natural evaporation basin for the Caspian sea, depositing mirabilite (Glauber's salt), which is a sodium sulfate decahydrate, as well as other salts, such as sodium chloride, magnesium chloride and magnesium sulfate. As a result of the drop of the Caspian's level, the steady one-way flow into the Kara-Bogaz-Gol ceased and an equilibrium was established. The Komsomolets bay (the former Mertvy Kultuk bay) and Kaidak bay, both situated in the northeastern part of the Caspian sea, have been transformed into salt flats as a result of the drop in the sea level.

The total shoreline of the Caspian sea is 4,000 mi. long, of which 3,350 mi. are in the U.S.S.R. and the rest in Iran. The Caspian shores are generally low-lying and consist of sandy and clayey sediments left by the Caspian marine transgressions of Quaternary times, as well as of recent fluvial and marine alluvial deposits. A distinctive type of shoreline is found west of the Volga delta, where the shore is gashed by a multitude of channels and lagoons, known in Russian as *liman,* separated by chains of hillocks, termed *bugor,* that extend even under the Caspian sea. As a result of the drop in sea level, the shoreline, here as elsewhere, has assumed a simpler and less convoluted outline. Along the western shore, mountain spurs of the Caucasus reach the Caspian sea only in a few places and are generally separated from the sea by wave-cut terraces. Tectonic processes that have been particularly intensive in the Caspian basin in Upper Tertiary and Quaternary times have resulted in relatively rapid and irregular vertical displacements of the shoreline. Because of these processes the elevated marine terraces of a given geologic stage are found at different elevations along the Caspian shores. Some shore sections have had a recent tendency to emerge, others to submerge.

Currents and Climate. — Currents follow the coasts in counterclockwise direction both in the deeper middle and southern sections of the Caspian sea. Along the Caucasus coasts, currents have a tendency of flowing southward from the Volga delta; along the east coast they go northward as far as the Mangyshlak peninsula. Because of the great latitudinal extent of the Caspian sea — through 11° of latitude — there are climatic differences in its various sections. The sea affects the climate of the surrounding land areas as a result of the formation of local areas of low pressure (in winter) and high pressure (in summer), with corresponding wind systems. The effect on the land climate is particularly noticeable in the southern Caspian, where it results in a seasonal wind shift, blowing landward in summer and seaward in winter. The distinctive north wind of the Baku area is strong and sustained, especially common in summer. The seasonal wind pattern is further complicated by the diurnal alternation of land and sea breezes. The average temperature of the air in winter is 16° in the north and 46° in the south; for the summer the average temperatures are 73° and 82° respectively. At a depth of 1,000 ft. the temperature remains at about 41° to 43°. Near the Volga mouths the Caspian is frozen for 112 days on an average, and winter in the northern basin is very severe with frequent falls of temperature to −13°, and to −22°, and lower still, on the Ust-Urt plateau on the northeast shores of the sea.

Drainage Area and Former Extent. — The catchment area from which this great inland sea is fed is about 1,441,311 sq.mi., and extends much farther west and north than it does south and east. From the north the sea is fed by the Volga river, which is estimated to provide about 80% of the total river supply to the sea, or 9,000,000,000,000 cu.ft. out of a total of 11,500,000,000,000 cu.ft. The rest of the surface waters is fed to the Caspian sea by the Ural, Terek, Sulak and Samur rivers in the north and northwest. and by the Kura, Aras, Safid Rud and Atrak rivers in the southwest and south.

The level of the Caspian was formerly about the same as that of the Black sea, with which it was connected before the emergence of the Caucasus mountain system in Tertiary times, as well as later, in Quaternary times. The former level of the Caspian sea is shown by evidences of erosion on the face of rocks that formed the original shoreline. Large portions of the vast region comprised between the lower Volga, the Aral-Irtysh watershed, the Dzungarian Ala-tau and the outliers of the Tien Shan are actually covered with Aralo-Caspian deposits, nearly always a yellowish-gray clay, which occasionally assumes the character of a more or less compacted sandstone of the same colour. These deposits attain their maximum thickness of 100 ft. east of the Caspian, and have in many parts been excavated and washed away by rivers or been transported by winds.

A key fossil that indicates the former extent of the Caspian waters is that of *Cardium edule,* a mollusk that penetrated into the Caspian sea from the Black sea during one of the late epochs of the Quaternary period. The exact limits of the ancient Aralo-Caspian sea are not exactly defined, except in the northwest where the Yergeni scarp south of Stalingrad constitutes an unmistakable barrier. Caspian marine deposits are known to exist 80 mi. north and 100 mi. east of the Aral sea, as well as in the Sarykamysh depression, 150 mi. south of the Aral sea. Hence the Aralo-Caspian sea is believed to have covered a vast expanse of territory in late Tertiary and post-Tertiary times, embracing large islands, such as the Ust-Urt, which divided it into an eastern and a western portion.

During the Ice Age of Quaternary times, the Caspian was once again linked with the Black sea by way of the Manych depression of the northern Caucasus. After the great icecap had thawed and a period of general desiccation set in, the Caspian began to shrink in area, and simultaneously its connections with the Black sea and the Aral sea were severed.

Level Changes and Water Balance. — The Russian geographer L. S. Berg, in a paper published 1934, investigated changes in the level of the Caspian sea during the historic period. Using ancient maps and documents for the period from 1550 to 1830, and water-level records kept after 1830, he established definite rhythmic cycles with relative maximums in the level about 1650, 1770 and 1900, and minimums about 1590, 1710 and 1840. The average length of each cycle was therefore 120 years. Projecting into the future, he predicted minimums for 1960 and 2080, and maximums for 2020 and 2140. However, other authorities reject the cyclic theory of level changes, citing increased solar activity in recent decades, which tends to reduce runoff and increase evaporation. These experts also note that the increased use of river water for irrigation, hydroelectric power generation and other economic uses, particularly on the Volga river, will tend to reduce the volume of water carried to the Caspian sea by its tributaries. An estimate of the water balance published in 1954 showed that the sea received a total of 14,000,000,000,000 cu.ft. of water a year, of which 11,500,000,000,000 was river supply and 2,500,000,000,000 precipitation. Water losses were figured at 14,700,000,000,000 cu.ft., of which 14,000,000,000,000 were attributed to evaporation and 700,000,000,000 to the outflow into the Kara-Bogaz-Gol. The problem of erasing the present deficit by increasing the water supply of the Caspian sea has occupied Soviet experts for many years. Many plans have been proposed, including the diversion of the rivers of northern European Russia to the Volga river; the diversion of the great Siberian streams — the Ob and the Yenisei — to the Aral sea and on to the Caspian, and the construction of a canal from the Sea of Azov, an arm of the Black sea, to the Caspian sea. None of these projects has reached the stage of implementation.

Salinity. — The average salinity of the Caspian sea is 13 per 1,000, which means that 1,000 lb. of Caspian water contain 13 lb. of salts. The average salt content of the world's oceans, by comparison, is 35 per 1,000. The chemical composition of the salts is distinguished by an unusually large percentage of sulfates (30.5%) compared with only 10% in ocean water, and a lesser percentage of chlorides (68%) compared with 90% in the oceans. The chemical composition of Caspian sea salts reflects the influence

of river waters, notably the Volga, which carries 33% sulfates and only 10% chlorides, most of its mineral matter consisting of calcium carbonate. Because of the proximity of the Volga mouths, salinity in the Caspian is lowest in the northern section and increases toward the middle and southern sections.

Economic Significance.—The Caspian sea plays a vital role in the economy of the U.S.S.R., and to a lesser extent of Ira?, as a source of fish and a means of water transportation. Both fisheries and navigation have been adversely affected by the drop in the level of the sea. The richest fisheries in the shallow northern portion of the Caspian sea off the delta of the Volga river have been most directly affected by the reduction of the area under water. Many fishing villages were left far from the receding waterline and had to be moved to new sites. Ports have been subjected to intense silting, requiring expensive dredging work and relocation of harbour installations. The importance of the Caspian in the total Soviet fish catch has sharply declined. In 1913 it accounted for 680,000 tons, or about two-thirds of the total catch; by 1955 the Caspian share had dropped to 450,000 tons, or 17% of the total catch. However, the Caspian continues to contribute several important types of fish, notably sturgeon, which is the source of caviar. Other Caspian fish are the roach, pike perch, pike, bream, catfish and gray mullet. The Caspian seal is also hunted.

The principal ports of the Caspian sea are Baku (*q.v.*), Makhachkala, Astrakhan (*q.v.*), Guryev and Krasnovodsk (*q.v.*) in the Soviet Union, and Pahlavi (*q.v.*) and Bandar Shah in Iran. By far the most important commodity carried by Caspian ships is petroleum. Until World War II, while the Caucasian oil fields contributed 70% or more of the U.S.S.R.'s crude oil, the Caspian tankers were engaged almost entirely in carrying crude oil and refined products from Baku and Makhachkala to Astrakhan, where they were transshipped to Volga river tankers for the industrial oil consumers of European Russia. Since World War II, Baku has lost its pre-eminence in favour of the newly developed oil fields of the Volga-Urals area. While Baku continues to ship about 10,000,000 tons of oil a year, a return movement has developed consisting of crude oil from the Volga-Urals area that is shipped for refining to the Baku area. Oil receipts at Baku, which were negligible as late as 1950, rose to 3,000,000 tons by the mid-1950s. The importance of Caspian sea navigation can be judged from the fact that it handles about one-third of all freight carried in Soviet seagoing ships. Baku alone handles one-half of all Caspian sea traffic, followed by Astrakhan and Krasnovodsk. (T. Sd.)

CASQUE: *see* HELMET.

CASS, LEWIS (1782–1866), U.S. army officer, ambassador and presidential candidate, was born at Exeter, N.H., on Oct. 9, 1782. He was educated at Phillips Exeter academy, joined his father at Marietta, O., about 1799, studied law there in the office of Return Jonathan Meigs (1764–1824), and was admitted to the bar at the age of 20. Four years later he became a member of the Ohio legislature. During the War of 1812 he served under Gen. William Hull, whose surrender at Detroit he strongly condemned, and under Gen. William Henry Harrison. He rose from the rank of colonel of volunteers to be major general of Ohio militia and finally to be a brigadier general in the regular C.S. army. In 1813 he was appointed governor of the territory of Michigan, which covered an area much larger than the present state. This position gave him the chief control of Indian affairs for the territory, which was then occupied almost entirely by natives, there being only 6,000 white settlers. During the 18 years in which he held this post he rendered valuable services to the territory and to the nation. His relations with the British authorities in Canada after the War of 1812 were at times very trying, as these officials persisted in searching U.S. vessels on the Great Lakes and in arousing the hostility of the Indians of the territory against the American government. To those experiences was largely due the antipathy for Great Britain that he manifested in his later career. He was secretary of war in President Jackson's cabinet in 1831–36, and it fell to him, therefore, to direct the conduct of the Black Hawk and Seminole wars.

In 1836 General Cass was appointed minister to France and became very popular with the French government and people. In 1842, when the Quintuple treaty was negotiated by representatives of England, France, Prussia, Russia and Austria for the suppression of the slave trade by the exercise of the right of search, Cass attacked it in a pamphlet which was probably instrumental in preventing the ratification of the treaty by France. In this same year the Webster-Ashburton treaty between Great Britain and the United States was concluded, and, as England did not thereby relinquish her claim of the right to search American vessels, Cass felt himself in an awkward position and resigned his post. His attitude on this question made him very popular in America. From 1845 to 1848 and from 1849 to 1857 he was a member of the U.S. senate. In 1846 he was a leader of those demanding the "re-annexation" of all the Oregon country south of 54° 40' or war with England, and was one of the 14 who voted against the ratification of the compromise with England at the 49th parallel. He loyally supported Polk's administration during the Mexican War, opposed the Wilmot proviso, and advocated the Compromise of 1850 and the Kansas-Nebraska bill of 1854,

In 1848 he received the Democratic nomination for the presidency, but owing to the defection of the so-called "Barnburners" (*see* FREE SOIL PARTY) he did not receive the united support of his party, and was defeated by the Whig candidate, Zachary Taylor. On account of his eminently conservative attitude on all questions concerning slavery, General Cass has been accused of pandering to the southern Democrats in order to further his political aspirations. His ideas of popular sovereignty, however, were not inconsistent with the vigorous democratic spirit of the west, of which he was a typical representative, and it is not clear that he believed that the application of this principle would result in the extension of slavery. As the west became more radically ,opposed to slavery after the troubles in Kansas, Cass was soon out of sympathy with his section, and when the Republicans secured control of the legislature in 1857 they refused to return him to the senate. President Buchanan soon afterward made him secretary of state, and in this position he at last had the satisfaction of obtaining from the British government an acknowledgment of the correctness of the American attitude with regard to the right of search. In Dec. 1860 he retired from the cabinet when the president refused to take a firmer attitude against secession and he remained in retirement until his death at Detroit. Mich., on June 17, 1866. He wrote for the *North American Review* and the *American Quarterly Review,* and published *Inquiries Concerning the History, Traditions and Languages of Indians Living Within the United States* (1823), and *France: Its King, Court and Government* (1840).

See Andrew C. McLaughlin, *Lewis Cass* (1899) in *the* "American Statesmen Series"; Frank B. Woodford, *Lewis Cass* (1950).

CASSAGNAC, PAUL GRANIER DE (1843–1904), French political writer, a Bonapartist and a notorious duelist, was born in Paris on Dec. 2, 1843. Becoming a journalist, he founded *L'Indépendance* in 1862 and also wrote later for *La Nation* and for *Le Pays* (*Journal de l'Empire*), edited by his father, Bernard Adolphe Granier de Cassagnac. In the Franco-German War he joined the Zouaves and was taken prisoner at the battle of Sedan.

After the war Cassagnac became editor of *Le Pays,* but the violence of his articles involved him in constant duels and caused the suspension of the paper in 1874. He left *Le Pays* because of differences with the Bonapartist pretender and founded an independent paper, *L'Autorité,* in 1886.

Elected deputy in 1876, Cassagnac supported Marshal MacMahon in his attempt to overthrow the republican constitution. Thereafter he made himself conspicuous for his extravagant and outspoken criticism of the regime. He was partisan of Gen. Georges Boulanger and advocated an alliance of all opposition parties against the republic. His many publications include *Empire et royautk* (1873) and *L'Histoire de la troisième république* (1875). He died in Paris on Nov. 4, 1904.

CASSANDER (*c.* 358–297 B.C.), king of Macedonia 305–297, was the son of Antipater (*q.v.*), regent of the Macedonian empire. After his father's death (319), refusing to acknowledge the new regent Polyperchon, he made war upon him and seized Macedonia

and most of Greece, including Athens (319–317), with the help of Antigonus I (*q.v.*). When Antigonus returned from the eastern provinces intending to reunite the empire under his own rule, however, Cassander joined with Ptolemy I, Seleucus and Lysimachus, to frustrate him (see LYSIMACHUS; PTOLEMIES; SELEUCID DYNASTY).

Between 315 and 302 he fought frequently with the generals and supporters of Antigonus in Greece. In 307 he lost Athens, and in the campaign of 303–302 all his other possessions south of Thessaly. But the defeat of Antigonus and his son Demetrius at the battle of Ipsus in Phrygia (301) made him secure. He had not taken the royal title until 305, although he had murdered Alexander IV and Roxana, the son and widow of Alexander the Great, about five years earlier. His ruthlessness toward Alexander's family was partly dictated by political considerations, as was his marriage to Thessalonice, daughter of Philip II of Macedonia, whose name he gave to one of his city foundations, Thessalonica (modern Salonika). In rebuilding Thebes, destroyed by Alexander, he showed the measure of his personal hatred for the dead king.

Like Ptolemy I in Egypt, Cassander deliberately created for himself a strong kingdom of limited territorial extent. He was no less a patron of the arts than other Hellenistic kings. The philosophers of the Peripatetic school, being hostile to Alexander, were well disposed to him. (R. H. SI.)

CASSANDRA, in Greek tradition, daughter of Priam, the last king of Troy, and his wife Hecuba. Cassandra was beloved of Apollo, who promised to bestow on her the spirit of prophecy if she would comply with his desires. Cassandra accepted the proposal, received the gift, and then refused her favours. Apollo revenged himself by ordaining that her prophecies should never be believed. On the capture of Troy she was ravished by Ajax, the son of Oileus, king of the Locrians, in the temple of Athena. In the distribution of the booty. Cassandra fell to the lot of Agamemnon and was murdered with him. There is no mention in Homer of prophetic gifts, which appear for the first time in Pindar and Aeschylus. She was worshiped together with Apollo, under the name of Alexandra.

CASSATION, an 18th-century work of orchestral or chamber music in several short movements similar to a serenade or a suite. Among suggested origins of the term are the Italian cassa, "a drum" (Mozart's cassations K. 63 and 69 open with marchlike movements), and the Austrian dialect expression gassatim gehen, "to go courting," which would explain the serenadelike nature of the cassation.

Cassation is also a legal term signifying quashing, annulling or reversing, hence court of cassation as the name for a court of appeal.

CASSATT, ALEXANDER JOHNSTON (1839–1906), U.S. railroad executive, was born of a well-to-do family in Pittsburgh, Pa., Dec. 8, 1839. He went to Europe with his family for travel and study. After returning to the United States he attended Rensselaer Polytechnic institute, Troy, N.Y., and graduated there in 1859 as a civil engineer. He obtained a position with the Pennsylvania railroad in 1861 and by 1870 had become general superintendent. He was a first vice-president of the railroad in 1882 when he retired at the age 42. In 1899 he was called back to serve as president and continued in that position until he died on Dec. 28, 1906. One of his greatest achievements was inaugurating the construction of the Pennsylvania terminal in New York city. (H. J. SG.)

CASSATT, MARY (1844–1926), **U.S.** artist, often called America's greatest woman painter, was born in Allegheny city (later part of Pittsburgh), Pa., May 22, 1844. From 1861 to 1865 she attended the Pennsylvania Academy of the Fine Arts. She worked briefly with Charles Joshua Chaplin in Paris but preferred to copy old masters and be on her own. After a trip home she went to Italy and spent eight months at Parma studying the works of Correggio. In 1872 she exhibited in the Paris Salon the first of five successive years. In 1877 Edgar Degas invited her to join the Impressionists, and she exhibited with them in 1879, 1880, 1881 and in their last show in 1886. Her own first one-man show was held at Durand-Ruel in 1891 where, two years later, she exhibited a considerably larger group.

Mary Cassatt greatly admired Gustave Courbet, but was especially allied with the Impressionist group. Degas more than anyone else was a close friend and greatly influenced her style in the late 1870s. In the 1880s she developed a more solid manner of painting with strong modeling. After the great exhibition of Japanese prints held in Paris in 1890, her emphasis was less on form and more on line and pattern. At this time she brought her print techniques to perfection in a series of ten coloured aquatints combining both drypoint and soft ground etching. Soon after 1900 her eyesight began to fail and by 1914 she had ceased all work.

Aside from her ability as an artist, recognized far more in France than in her native country, she had an unfailing sense of quality in pictures and was largely responsible for building up the great Havemeyer collection in New York.

Mary Cassatt died on June 14, 1926, at Château de Beaufresne, her country place north of Paris.

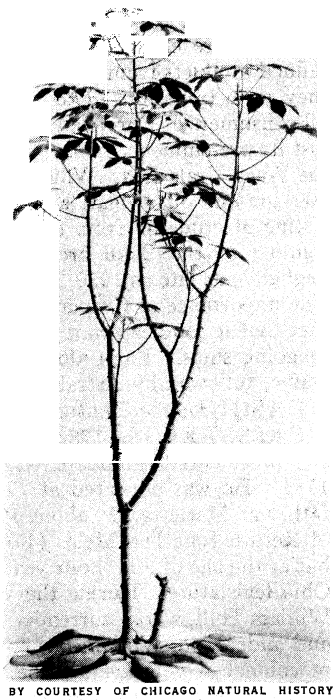
CASSAVA, the starchy root of two plants of the spurge family (Euphorbiaceae, *q.v.*), the bitter cassava, *Manihot* esczilenta, and the sweet cassava, *M. dulcis,* both important sources of food starches. They are herbaceous or semi-shrubby perennials with very large fleshy, cylindrical. tapering roots as much as 3 ft. long and 6 to 9 in. in diameter, and filled with milky juice. The slender stems, j to 9 ft. high, bear large, spreading, long-stalked leaves, with the blade divided nearly to the base into three to seven long, narrow segments. The plants are probably natives of South America, but the bitter cassava, which is the more important of the two in an economic sense, has been introduced into most tropical regions. and is extensively cultivated in west tropical Africa and the Malay archipelago. from which, as well as from Brazil and other South American states. its starch in the form of tapioca is a staple article of export.



BY COURTESY OF CHICAGO NATURAL HISTORY MUSEUM

COMMON CASSAVA (MANIHOT ESCULENTA)

The sap of the bitter cassava root contains hydrocyanic acid, and the root, being therefore highly poisonous. cannot be eaten in a fresh condition; while on the other hand the sweet cassava is perfectly innocuous, and is employed as a table vegetable. Exposure to heat dissipates the poisonous principle, and the concentrated juice is in that state used as a basis of cassareep and other sauces. From the bitter cassava roots many different food preparations are made in Brazil. The roots are preserved for use by being cleaned, sliced and dried; from such dried slices manioc or cassava meal, used for cassava cakes etc is prepared by rasping. The starch also is separated and used for food under the name of Brazilian arrowroot; and this. when agglomerated into pellets on hot plates, forms the tapioca (*q v*) of commerce.

CASSEL, (KARL) GUSTAV (1866–1945), Swedish economist, best known for his value theory. an attempt to escape the hedonism of English and Austrian economists. his theory of money, and an unswerving belief in the principle of free competition. He was born at Stockholm on Oct. 20. 1866, and from 1904 to 1933 was professor of economics in the University of Stockholm. Cas-

sel gained international prominence through his work on world monetary problems at the Brussels conference in 1920 and the League of Nations Finance committee in 1921. He mas a Swedish delegate to several meetings of the International Chamber of Commerce. When he was in the United States on a lecture tour in 1928, the banking and currency committee of the house of representatives invited him to appear at the hearings on monetary stabilization. In 1933 the Swedish government sent him to the World Economic conference at London. He died Jan. 14, 1945.

Among Cassel's published works are: *The Nature and Necessity of Interest* (1903); *The World's Monetary Problems* (1921); *Money and Foreign Exchange After 1914* (1922); *The Theory of Social Economy,* rev. ed. (1932); *The Crisis in the World's Monetary System* (1932); *I Förnuftets Tjanst* (autobiography), 2 vol. (1940–41). (E. W. SN.)

CASSEL: *see* KASSEL.

CASSERIUS, JULIUS (GIGLIO CASSERIO) (1552?–1616), Italian anatomist who gave the first detailed descriptions of the organs of speech and hearing. was born in Piacenza. He was employed as a servant by Hieronymus Fabricius, distinguished professor of anatomy and surgery at the University of Padua, where Casserius observed and became intensely interested in his master's anatomical investigations. Instructed by Fabricius and Hieronymus Mercurialis, he acquired such skill in anatomical dissection that in 1604 the university recognized him as the regular substitute in anatomical instruction for the aging Fabricius, who, however, still nominally held the chair. In addition, Casserius gave private instruction in anatomy in a special theatre built in his home. In 1609 Fabricius formally relinquished the chair of surgery to his assistant hut retained the chair of anatomy until 1613.

Casserius's first work. *De vocis auditusque organis historia anatomia* (1601), deals with the vocal and auditory organs and contains 37 fine illustrations by Joseph Maurer, a German artist. The *Pentaestheseion* (1609) again deals with the auditory organ and reproduces the 12 related plates from the earlier work as well as a text and new illustrations on the other sense organs. Casserius left unpublished a third work) *Tabulae Anatomicae,* covering the whole of human anatomy, for which 78 plates had been prepared. With one exception these were employed in a posthumous publication edited by Daniel Bucretius in 1627, as well as in the works of Adrian van der Spiegel (Spigelius) in 1615, successor to Casserius at Padua. Casserius's anatomical illustrations are a landmark of correctness and beauty, and his texts are notable for descriptive accuracy and detailed investigation into human and comparative anatomy.

CASSIA, the aromatic bark derived from *Cinnamomum cassia* (family Lauraceae), sometimes termed Chinese cinnamon. The bark is much thicker than that of true cinnamon; the taste is more pungent and the flavour less delicate, though somewhat similar to that of cinnamon. The properties of cassia bark depend on the presence of a volatile oil—the oil of cassia. Cassia bark is in considerable demand on the continent of Europe. being preierred to cinnamon by southern Europeans. The chief use is for flavouring liqueurs and chocolate, and in cooking generally. When ground as a spice it is difficult to distinguish cassia from cinnamon. and it is a common practice to substitute the cheap common spice for the more valuable article. Cassia buds, which have a pleasing cinnamon flavour, are believed to be the immature fruits of the tree that yields Chinese cinnamon. They are brought in considerable quantities from China and used as a spice and in confectionery.

Cassia pulp, used as a laxative, is obtained from the pods of *Cassia fistula,* or pudding pipe tree, a native of Africa that is cultivated in the West Indies and in southeast Asia. Some confusion occasionally arises from the fact that Cassia is the generic name of an extensive genus of leguminous plants. which, in addition to various other medicinal products, is the source of senna (*q.v.*) leaves. *See* also CINNAMON.

CASSIANUS, JOHANNES (JOHANNES MASSILIENSIS, JOHANNES EREMITA or JOHN CASSIAN) (360–435), monk and theologian, a leading exponent of Semi-Pelagianism in its early phase, was, according to the 5th-century chronicler Gennadius, a "Scythian" by birth. The current interpretation is that Cassianus was a Roman born in modern Rumanian Dobruja on the Black sea in 360. As a youth he became a monk and lived in Bethlehem and Egypt. About 399 he went to Constantinople, where he was ordained a deacon by John Chrysostom; in 405 he was ordained a priest in Rome. In 415 he moved to Marseilles and there founded the famous Monastery of St. Victor, of which he was abbot until his death. He also founded another monastery for women in the same region. Cassianus' overriding concern was the ascetical life. He was indeed a theologian. but his theology, the anti-Augustinian doctrine called Semi-Pelagianism, is dominated by his concept of monasticism. Cassianus never thought out his theory systematically, but the nuclear idea was that man's moral effort, born of his own initiative, draws grace from God, thus enabling man to strive successfully for salvation. His writings, especially the *Collations,* written as dialogues of the Fathers of the Desert, have influenced all western monasticism, and were themselves influenced by the life and action of the eastern monks. Besides the *Collations,* his work titled *De Institutis coenobiorum* must be mentioned. His theological dissertation De *Incarnatione Domini,* written against Nestorius at the request of Leo the Great, is an inferior work. Cassianus died in 435. He is treated as a saint by the Eastern Church, and in spite of past opposition there is liturgical veneration of him in southern France, where his feast day is July 23.

Cassianus' norks may be found in J. P. Migne, *Patrologia Latina,* vol. 49 and 50, and in M. Petschenig, *Corpus Vindobonense,* vol. 13 and 17 (1886 and 1888).

See O. Chadwick, *John Cassian, Study in Primitive Monasticism* (1950). (G. WL.)

CASSINI, the name of an Italian family of astronomers. four generations of whom succeeded each other in official charge of the observatory of Paris.

GIOVANNI DOMENICO CASSINI (1625–1712) was born at Perinaldo near Nice on June 8, 1625. Educated by the Jesuits at Genoa. he was nominated in 1650 professor of astronomy in the University of Bologna. In 166; he became director of the Paris observatory. and became a French subject in 1673. Between 1671–84 he discovered four Saturnian satellites. and in 167j the division in Saturn's ring *(see* SATURN); made the earliest sustained observations of the zodiacal light, and published. in *Les Éléments d'astronomie vérifiés* (1693), an account of Jean Richer's (1630–96) geodetical operations in Cayenne. He also made an extensive study of the eclipses of Jupiter's satellites with a view to using them for the determination of longitude at sea. Certain oval curves which he proposed to substitute for Kepler's ellipses as the paths of the planets were named after him "Cassinians." He died at the Paris observatory on Sept. 14, 1712.

A partial autobiography left by Giovanni Domenico Cassini was published by his great-grandson. Count Cassini. in his *Memoires pour servir à l'histoire des sciences* (1810).

JACQUES CASSINI (1677–1756). son of Giovanni Domenico Cassini. was born at the Paris observatory on Feb. 8, 1677. Having succeeded to his father's position at the observatory in 1712. he measured. in 1713. the arc of the meridian from Dunkerque to Perpignan, and published the results in a volume entitled *De la grandeur et de la figure de la terre* (1720) *(see* GEODESY). He wrote besides *Éléments d'astronomie* (1740').and died on April 18, 1756. at Thury, near Clermont. The first tables of the satellites of Saturn were supplied by him in 1716.

CESAR FRANÇOIS CASSINI DE THURY (1714–1784), son of Jacques Cassini, was born at the observatory of Paris on June 17, 1714. He succeeded to his father's official employments. continued the hereditary surveying operations. and began in 1744 the construction of a great topographical map of France. He became director of the Paris observatory in 1771, when the establishment ceased to be a dependency of the Academy of Sciences. Cassini de Thury died at Thury on Sept. 4, 1784. His chief works are: *Me'ridienne de l'observatoire de Paris* (1744), *Description géo-*

métrique de la terre (1775). and *Description géométrique de la France* (1784).

JACQGES DOMINIQCE CASSINI, Count (1748–1845), son of César François Cassini, was born at the observatory of Paris on June 30, 1748. He succeeded in 1784 to the directorate of the observatory; but his plans for its restoration and re-equipment were wrecked in 1793 by the French Revolution. After some months in prison in 1794, he withdrew to Thury. He completed his father's map of France, which was published by the Academy of Sciences in 1793. It served as the basis for the *Atlas National* (1791), showing France in departments. Cassini died at Thury on Oct. 18, 1845.

See C. Wolf, *Histoire de l'observatoire de Paris* (1902).

CASSINO, a town in the Frosinone province, Latium region, Italy. 140 km. (87 mi.) S.E. of Rome by rail, is situated in the valley of the Rapido river, against the foot of Monte Cassino. Pop. (1951) 7.431 (town); 19.256 (commune) (1957 est., commune) 21.243. Ancient Casinum. a Volscian town adjacent to the modern town on the lower slopes of the mountain with a citadel at the summit, passed under Roman control in 312 B.C. During the Samnite wars the colony of Interamna Lirenas was founded five miles to the southwest, controlling the Via Latina. After the Second Punic War, in which it played a modest part, the history of Roman Casinum was one of solid but uneventful prosperity. Profiting from the decline of Interamna and the transfer of the main line of the Via Latina to approximately that followed by the modern Via Casilina, it achieved municipal, and in due course colonial, status. In the 5th century it was the seat of a bishopric, but it suffered badly from the successive barbarian incursions. In 529, when St. Benedict of Nursia established the nucleus of his famous monastery on Monte Cassino (*q.v.*), the ancient citadel was already derelict. A remnant of the city below lingered on under the name of Castrum Casinum (later Castel San Pietro) and about 866 the remaining inhabitants deserted to the present site, originally called Eulogomenopolis, later San Germano. and since 1871 Cassino. The settlement was strengthened in the 9th century by the building of a castle, the Rocca Janula, where in 1139 Innocent II was besieged and captured by Roger II of Sicily, and where in 1230 Gregory IX made peace with Frederick II of Hohenstaufen. It was sacked by French troops in 1799.

The Benedictine monastery, stormed by the Lombards in 589 and by the Saracens in 884. and temporarily deserted, was each time refounded on the original site. The parent house of western monasticism, it was during the early middle ages an outstanding centre of the arts and of learning. Paulus Diaconus (*q.v.*; Paul the Deacon, d. *c.* 797) wrote his history of the Lombards there. founding a long tradition of historical scholarship; and the radical reconstruction of the abbey in the 11th century by the abbot Desiderius (later Pope Victor III) was a major event in the history of Italian architecture. In 1349 the buildings suffered from a severe earthquake, and in the 16th and 17th centuries church and monastery were almost entirely rebuilt. In 1944 Cassino was a key point of the German winter defensive line (Garigliano-Sangro), and in the course of four months' bitter fighting the abbey was shattered and the town totally destroyed. The flooding of the Rapido valley, accentuated by the results of heavy aerial bombardment, virtually precluded the use of armoured forces, and it was only after an intensive and costly infantry assault (May 11–20) that the Allies were finally able to break through. Town and monastery have both since been reconstructed on their previous sites, the former on a completely new plan, the latter following substantially the lines of its predecessor. Polish and British military cemeteries are nearby.

Of ancient Casinum the only monuments of note are the amphitheatre, the theatre and the ruins of the Cappella del Crocifisso, a Roman mausoleum converted into a church in the 10th century. Of the medieval town, little more than the site of the upper town, clustered around the ruins of the Rocca Janula. can now be made out; the remarkable centrally planned church of Sta. Maria delle Cinque Torri, built by abbot Theodemar (778-797), was completely destroyed in 1944. Very little of the earlier abbey buildings survived the radical reconstructions of the 16th and 17th centuries; of the latter the main architectural lines, but little or nothing of the decorative detail, proved to be recoverable. The famous bronze doors. cast in Constantinople for Desiderius in 1066, were found and restored. (J. B. W.-P.)

CASSINO (CASINO), a card game for two, three or four players. which probably takes its name from the word for a public gambling hall (casino). Forerunners of cassino include *callabra,* named for Calabria region at the "toe" of Italy, where it originated in the early 19th century, and *papillon* (butterfly), much played in 18th-century France.

The game is best played by two persons, or four players in two partnerships. although three can play, each for himself. The standard deck of 52 cards is used. An ace counts as 1. Other cards count their pip value. Face, or picture, cards have no numerical value and suits are not considered. In a two- or three-handed game, each player takes a turn at dealing unless each deal is a separate game, in which case the winner is the next dealer.

Play.—In the first deal of a two-handed game the dealer gives his opponent two cards; deals two, face up on the table; and gives two to himself. He then repeats this, giving himself, his opponent and the table a total of four cards each. After each hand is played, the dealer gives himself and his opponent four cards, two at a time, until all cards have been dealt. No cards are dealt to the table after the first deal. The dealer must announce "last" on beginning the final deal.

The goal in cassino is to take in cards from the table. A card from the hand may take all others of the same rank on the table. This is called "pairing" and is the only way face cards can be taken. Cards may also be won by "building."

In building, a card from the hand. whose value is equal to the combined pip count of two or more cards on the table. may take in those cards. A card from the hand may also be played upon one or more cards on the table with the intention of taking in the resulting combination on a later play. In doing this the player must announce "building," and the value of the card he intends to use to take in the build. This is particularly important if, for example, a trey from a player's hand were placed with a trey on the table. This might mean building six or threes.

To build, a player must have the proper card in his hand to take in the build on his next turn, even though he does not have to play it then if he can duplicate or increase the build or take in a pair, or an opponent's build.

The opponent may not capture individual cards in the build by pairing, but may take the entire build if he has the necessary card in his hand. He may also increase it by adding a card from his hand and taking the increased build later. A build cannot be taken by a player in the same turn in which he makes or increases it.

A double build may be made when cards amounting to the same total are available, but may not be increased. For example, a player builds four with two deuces. On his next turn, finding a trey and an ace on the table, he may take all of these with the four in his hand. If only a trey is on the table, he may add an ace from his hand, continuing to build fours, but may not take in the double build until his next turn.

When a player is unable or unwilling to take in, he may place a card from his hand on the table, face up. This is called "trailing." A player makes a "sweep" when he takes in all the cards on the table. Sweeps, condemned by some cassino players as a modern invention, were a regular feature of *papillon.* After the last card of the last hand is played, cards remaining on the table go to the player who was last to take in. This, however, is not a sweep.

Scoring.—After the pack is played out each player totals the points in his cards. Points are scored as follows:

Cards (a majority of the 52 cards)	3
Spades (a majority of the 13 spades)	1
Big cassino (the diamond 10)	2
Little cassino (the spade deuce)	1
Aces	1 each
Sweeps (not scored in all localities)	1 each

Game is commonly set at 21 points. If, during any deal, a player correctly claims to have 21 points, he wins, even though his opponent may have reached that total but failed to claim the

game. This is called "counting out." If counting out is not permitted and if both players reach 21 on the same deal, the points are counted in the order given in the scoring table.

Three-handed cassino, except for the additional player, is played in exactly the same way as the two-handed game, with the deal rotating clockwise.

Partnership Cassino.—In this form of the game four persons play in two partnerships. Turn to play and turn to deal rotate clockwise. After the last hand is played, cards taken by each partnership are combined and counted together. A player may help his partner by trailing cards he thinks may be useful, but may not build a rank he knows his partner holds unless he too holds a card of that rank in his hand.

Draw **Cassino.**—After the first deal in draw cassino, the rest of the pack is placed, face down, on the table to form the "stock." After each player takes his turn he restores his hand to four cards by drawing from the stock. When the stock is exhausted, the play continues as usual.

Royal **Cassino.**—Many experts consider this variation a superior test of skill. Face cards are used in building. A jack counts 11, a queen 12 and a king 13. An ace may be 1 or 14 at the holder's option.

Spade Casino.— Each spade won in spade cassino counts one point except the jack and the deuce which are worth two points. There is no score for a majority of spades since each counts individually. Game is 61 points, which may be scored on a cribbage board, and is won by the first player to count out.

Cassino is a very popular game for children because of the practice it offers in elementary arithmetic. For younger children, who have not reached the counting age, the game may be played without permitting builds. (R. L. Fy.)

CASSIODORUS (FLAVIUS MAGNUS AURELIUS CASSIODORUS SENATOR) (*c.* A.D. 490–*c.* 585), historian, statesman and monk, rendered a great service to posterity by helping to save the culture of Rome from being lost at a time of impending barbarism. A member of an influential family living at Scyllacium (Squillace) in Bruttium, south Italy, he was born not much before A.D. 490, and reached, if he did not pass, the age of 92. During the period of the rule of the Ostrogothic kings in Italy he held several important offices. He was quaestor during 507–511, consul in 514, and at the time of the death of Theodoric in 526 was *magister officiorum* ("chief of the civil service"). Under Athalaric he became in 533 praetorian prefect. Not long after 540 he retired from public service. A few years earlier he had proposed to the pope Agapetus the foundation of a Christian university in Rome. The troubles of the time made this impossible but Cassiodorus founded near his native place a monastery which was named Vivarium after neighbouring fishponds. It was his aim to perpetuate the culture of Rome. He was not a great writer nor a great scholar but his importance in the history of culture can hardly be overestimated. He collected manuscripts and enjoined his monks to copy pagan as well as Christian authors and to this is due the preservation of many authors, for his monastery set an example which was followed elsewhere in later centuries. His own works can be divided into two groups: (1) historical and political; and (2) theological and grammatical.

1. *(a)* The *Variae,* in 12 books, were published in or not much later than 537 and contain, as models of style, 468 official letters and documents which Cassiodorus composed in the names of Theodoric, Athalaric, Theodat and Vitiges, and his own edicts issued when he was praetorian prefect. The work is important as a source of historical knowledge and is of interest to the student of Latin style. It was edited by T. Mommsen in *Monumenta Germaniae Historica: Auctores Antiquissimi,* xii (1894) and there is a condensed English translation by T. Hodgkin (1886).

(b) The *Chronica,* covering the period from Adam to 519, the year of publication, are not accurate and are rather partial to the Goths. The work was edited by Mommsen in *Monumenta Germaniae Historica: Auctores Ant.* XI, i (1893).

(c) Surviving fragments of his panegyrics on Gothic kings and queens were edited by L. Traube at the end of Mommsen's edition of the *Variae.*

2. *(a)* The *De anima,* in which Cassiodorus drew upon Augustine and Claudianus Mamertus, discusses among other matters whether the soul has shape, its virtues, its origin and its seat and ends with an eloquent description of its life after death. The work was looked upon by Cassiodorus as an extra book to the *Variae* and was published almost at the same time.

(b) The *Institutiones diuinarum et saecularium litterarum,* is the most important of the works which Cassiodorus wrote with the aim of educating his monks in sacred and profane learning. The first part discusses the study of holy scripture and touches on the Christian fathers and historians. The second part, widely used in the middle ages, gives a brief exposition of the seven liberal arts, a kind of encyclopaedia of pagan learning regarded as indispensable for an understanding of the Bible. The *Institutiones* were edited by R. A. B. Mynors (1937) and translated into English with introduction and notes by L. W. Jones (1946).

(c) Cassiodorus wrote a commentary on the Psalms and short notes on the Pauline epistles, the Acts and the Apocalypse.

(d) The *De Orthographia,* a compilation made by Cassiodorus in his 93rd year from the works of eight grammarians, is valuable because it contains a number of extracts from works now lost. It was edited by H. Keil in *Grammatici Latini,* vii (1880).

Cassiodorus edited a Latin translation made by others of the *Jewish Antiquities* of Josephus and a Latin adaptation of the ecclesiastical histories of Theodoret, Sozomen and Socrates. The latter work has been edited by W. Jacob and R. Hanslik (1952).

Of the lost works of Cassiodorus the most important was the *Historia Gothica,* in 12 books, which has survived only in the meagre abridgement by Jordanes, edited by Mommsen (1882).

CASSIOPEIA, in Greek mythology, the wife of Cepheus and mother of Andromeda; in astronomy, a constellation of the northern hemisphere, easily recognized by the group of five stars forming a slightly irregular W. The most brilliant nova *(see* NOVA AND SUPERNOVA) on record broke out in this constellation in 1572 when it was observed by Tycho Brahe.

CASSIRER, ERNST (1874–1945), German-Jewish philosopher, remarkable for his interpretation and analysis of cultural values, was born at Breslau (Wroclaw) in Silesia on July 28, 1874, and educated at the universities of Berlin, Leipzig, Heidelberg and Marburg, where he was strongly attracted by the Neo-Kantianism of Hermann Cohen. After working first as *Privatdocent* in Berlin and then, during World War I, as a civil servant, he was in 1919 appointed professor of philosophy at Hamburg university, of which he became rector in 1930. Resigning his post when Hitler came to power, Cassirer went to teach at Oxford (1933–35), then at Goteborg in Sweden (1935–41) and finally in the United States. There he lectured at Yale university from 1941 to 1944 and then at Columbia university, where he died on April 13, 1945.

Cassirer's works include: *Leibniz' System* in *seinen wissenschaftlichen Grundlagen* (1902); *Das Erkenntnisproblem in der Philosophie und Wissenschaft der neueren Zeit,* 3 vol. (1906–20; Eng. trans., including a previously unpublished part, *The Problem of Knowledge: Philosophy, Science and History Since Hegel,* 1950); *Substanzbegriff und Funktionsbegriff* (1910; Eng. trans., *Substance and Function,* 1923), in which he attacks the view that a

concept is formed by abstraction from numbers of particular instances and argues that the concept, at least in its function as an instrument of human knowledge, is presupposed by any process of classifying particulars; *Philosophie der symbolischen Formen,* 3 vol. (*1923–29*, with index, *1931*; Eng. trans., *The Philosophy of Symbolic Forms,* 1953–57), an examination of the mental images and functions of the mind underlying every manifestation of human culture; *Sprache und Mythos* (1925; Eng. trans., *Language and Myth,* 1946); *Die Platonische Renaissance in England und die Schule von Cambridge* (1932; Eng. trans., *The Platonic Renaissance in England,* 1953); *Die Philosophie der Aufklärung* (1932; Eng. trans., *The Philosophy of the Enlightenment,* 1951); *Das Problem Jean Jacques Rousseau* (1932; Eng. trans., *The Question of Jean-Jacques Rousseau,* 1954); *Determinismus und Indeterminismus in der modernen Physik* (1936); *An Essay on Man* (1944); and *The Myth of the State* (1946).

CASSITERIDES, in ancient geography the name of islands regarded as being situated somewhere near the west coasts of Europe; the name is derived from the Greek for "tin"—*i.e.,* "Tin Islands." Herodotus (430 B.C.) had dimly heard of them. Later writers call them smallish islands off the northwest coast of Spain, which contained tin mines, or, as Strabo says, tin and lead mines. A passage in Diodorus derives the name rather from their nearness to the tin districts of northwest Spain. While geographical knowledge of the west was still scanty and the secrets of the tin trade were successfully guarded, the idea of tin-producing islands easily arose. Later, when the nest was better explored, it was found that tin actually came from two regions, northwest Spain and Cornwall. Neither of these could be called small islands or described as off the northwest coast of Spain, and so the Cassiterides were not identified with either by the Greek and Roman geographers. Instead, they became a third, ill-understood source of tin, conceived of as distinct from Spain or Great Britain. Modern archaeological research has enlarged knowledge of early sources of tin, and islands off the coast of Brittany which have tin-bearing sands have been suggested as the original Cassiterides. It may well be, however, that the name represents merely early and vague knowledge of the Greeks that tin was found overseas somewhere in or off western Europe.

CASSITERITE, or TINSTONE, is the mineral from which most of the world's tin is obtained. Named from the Greek word for tin, it is usually massive and granular but may also form pebbles and grains (stream tin), or reniform or kidney shapes with banded, radiating fibres (wood tin). The mines of Cornwall in England were for a long time the principal source of tin, and appreciable production also came from Portugal, Saxony, and Bohemia. Most of the world's cassiterite is mined in Malaya, Indonesia, Bolivia, Republic of the Congo, China, Thailand and Nigeria, although smaller amounts are produced in many other countries. Commercial production is principally from veins and placer deposits, but cassiterite is also a minor constituent in granites and pegmatites. Associated minerals are quartz, fluorite, topaz, tourmaline, wolframite, mica, feldspar and apatite.

Cassiterite crystallizes in the tetragonal system and crystals are generally short and prismatic; elbow-shaped twins also are found. Crystals are uncommon. Cassiterite is usually brown or black, has a hardness of 6 to 7, specific gravity of 6.8 to 7.1, and an adamantine to submetallic lustre. Occasionally it is yellow or white. The streak is white. Composed of tin dioxide, the formula is SnO_2 with Sn = 78.6% and O = 21.4%. The high specific gravity, high lustre, and white streak are distinguishing characteristics. For further discussion of occurrences, mining and metallurgy. and for its uses, *see* TIN. (A. F. HR.)

CASSIUS, the name of a distinguished Roman family, originally patrician. Its most important members are the following:

SPURIUS CASSIUS VECELLINUS (late 6th and early 5th century B.C.), said to have been three times consul. In his first consulate (502 B C) he defeated the Sabines; in his second (493) he made a treaty with the Latins, and dedicated the temple of Ceres in the Circus; in his third (486) he made a treaty with the conquered Hernici, and proposed an agrarian law to help the needy plebeians. This was violently opposed both by the patricians and by the wealthy plebeians. and Cassius was condemned and executed. The story is sometimes regarded as an invention of a later age, based on the proposals of the Gracchi and M. Livius Drusus. but it probably has a basis of fact. Further, his Latin treaty must be accepted. It endured until about 380, establishing peace throughout Latium, and providing that Rome and the Latins should on equal terms render mutual military aid.

The following Cassii are all plebeians. It has been suggested that the sons of Spurius Cassius either were expelled from, or voluntarily left, the patrician order in consequence of their father's execution.

GAIUS CASSIUS LONGINUS (1st century B.C.), consul 73 B.C. With his colleague, Terentius Varro Lucullus, he carried a law *(lex Terentia Cassia)* that facilitated the dispatch of Sicilian corn to Rome, and established a monthly distribution of five *modii* of corn to perhaps 40,000 people in Rome at the Gracchan price. Cassius was defeated by Spartacus in 72, gave evidence against Gaius Verres in 70. arid in 66 supported the Manilian law.

GAIUS CASSIUS LONGINUS (d. 42 B.C.), prime mover in the conspiracy against Julius Caesar. In *53* B.C. he served as quaestor in the Parthian campaign under M. Licinius Crassus, saved the remnants of the army after the defeat of Carrhae, and for two years successfully repelled the Parthian attacks on Syria. In 49 B.C. he became tribune of the plebs. The outbreak of the civil war in that year saved him from being brought to trial for extortion in Syria. He at first commanded part of the fleet of Pompeius. After Pharsalus he was pardoned by Caesar, who made him one of his legates. In 44 B.C. he became *praetor peregrinus* with the promise of the Syrian province for the ensuing year; yet he was one of the leading conspirators against Caesar, taking an active part in the actual assassination. Though soon forced to withdraw from Rome, he was given a corn commission and the province of Cyrene. but in September he left Italy for Syria. where he raised a considerable army, and defeated P. Cornelius Dolabella. to whom the province had been assigned by the senate. When in 43 M. Antonius (Mark Xntony). Octavian and Lepidus combined to form the triumvirate, he subdued Rhodes and joined Brutus at Sardis; with their combined armies, they crossed the Hellespont, marched through Thrace, and encamped near Philippi in Macedonia. Their intention was to starve out the enemy, but they were forced into an engagement. Brutus was successful against Octavian, but Cassius, defeated by Antony, gave up all for lost, and ordered his freedman to kill him.

QUINTUS CASSIUS LONGINUS (d. 47 B.C.), the brother or possibly cousin of the murderer of Caesar, quaestor of Pompeius in Further Spain in 54 B.C. In 49, as tribune of the plebs, he supported the cause of Caesar, by whom he was made governor of Further Spain. His oppression of the provincials led to an unsuccessful revolt at Corduba (Córdoba). Cassius punished the leaders with merciless severity. and made the lot of the provincials harder than ever. At last some of his troops revolted (48) and proclaimed the quaestor M. Marcellus governor of the province. Bogud, the king of Mauretania and Lepidus, the proconsul of Hither Spain, to whom Cassius had applied for assistance, arranged with Marcellus that Cassius should go free with the legions that remained loyal to him. Cassius sent his troops into winter quarters and took ship at Malaca (Málaga), but was wrecked at the mouth of the Ebro river (47). His tyrannical government of Spain had greatly injured the cause of Caesar.

GAIUS CASSIUS, called PARMENSIS from his birthplace Parma (d. after 31 B.C.), was one of the assassins of Julius Caesar, and after his death joined the party of Brutus and Gaius Cassius Longinus (the assassin). In 43 B.C. he was in command of the fleet that engaged Dolabella off the coast of Asia, but after the battle of Philippi he joined Sextus Pompeius in Sicily. When Sextus Pompeius was defeated at Naulochus by Agrippa and fled to Asia. Cassius went over to Antony, and was present at Actium (31j. He afterward fled to Athens, where he was put to death by Octavian. Cassius is credited with satires, elegies, epigrams and tragedies, and Horace, to judge from a remark in the *Epistles,*

thought well of his poetry. Nothing of his work survives: the hexameters with the title Cassii *Orpheus* are the work of a 16th-century humanist. The story that L. Varius Rufus took his tragedy *Thyestes* from a manuscript found among the papers of Cassius is due to a confusion.

GAIUS CASSIUS LONGINUS (1st century A.D.), Roman jurist, consul in 30, proconsul of Asia (40–41), and governor of Syria under Claudius (45–49). He was banished by Nero (65) to Sardinia. He was recalled by Vespasian and died at an advanced age. Cassius was a pupil of Massurius Sabinus, with whom he founded a legal school, the followers of which were called Cassiani. His chief work was the *Libri Juris Civilis* in ten books, which was used by the compilers of Justinian's Digest. (H. H. SD.)

CASSIUS, GAIUS AVIDIUS (d. A.D. 175), Roman general. Syrian by birth and son of a high civil servant of the emperor Hadrian, was director of operations in the war against Parthia (A.D. 162–165) nominally commanded by the emperor Lucius Verus, in which Avidius sacked Seleucia and Ctesiphon. Subsequently he was put in over-all charge of the eastern provinces, and in 172 he put down an agrarian rebellion in Egypt. In April 175, apparently on a false rumour of the death of the emperor Marcus Aurelius. he proclaimed himself emperor. Marcus set out for the east to combat him, but Avidius was assassinated in July by his own soldiery.

CASSIVELLAUNUS (1st century B.C.), a British chieftain, ruler of the Catuvellauni of Hertfordshire, whom he led against Julius Caesar during the latter's second expedition of 54 B.C. (see BRITAIN). After several indecisive engagements, Caesar took the principal fortified settlement (*oppidum*) of Cassivellaunus, identified by archaeological excavation at Wheathampstead (Hertfordshire). and granted him peace on condition of paying tribute and giving hostages.

See Caesar, *Gallic War, v,* 10–22; for Wheathampstead, R. E. M. Wheeler, *Verulamium, a Belgic and Two Roman Cities.* pp. 16–22 *(1936).* (I. A. RD.)

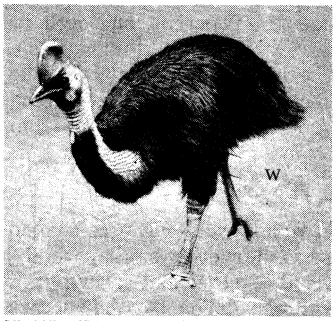
CASSOCK, a long-sleeved, close-fitting robe worn by the clergy and others engaged in ecclesiastical functions. Originally applied to the dress of soldiers and horsemen, and later to the long garment worn in civil life, the name came into ecclesiastical use somewhat late; it now survives in this sense alone. The cassock, though part of the canonical costume of the clergy, is not a liturgical vestment (see VESTMENTS, ECCLESIASTICAL).

In the Roman Catholic church the cassock must be worn by the clergy both in ordinary life (except in Protestant countries) and under their vestments in church. It varies in colour with the wearer's rank: white for the pope, red for cardinals, purple for bishops, black for the lesser ranks. The equivalent garment in the Eastern Orthodox churches is the rhason. In the Church of England the cassock, prescribed in 1604 as the canonical dress of the clergy, has been continuously, though not universally, worn by the clergy since the Reformation. It is now, however, usually only worn in church, at home or within the precincts of the parish. (J. J. PN.)

CASSONE: see CABINET FURNITURE.

CASSOWARY, a large flightless bird inferior in size only to the emu of Australia and the ostrich of Africa. Cassowaries belong to the genus *Casuarius,* containing six species. They are among the very few birds that can easily kill a man. They do this by jumping and stabbing forward with their powerful legs and toes. On each foot they have three toes, the innermost of which is fitted with a long, straight, stilettolike nail.

Cassowaries are confined to New Guinea (where they are actually the largest land animal) and to nearby islands. One species reaches the northeastern tip of Australia. Cassowaries live in family groups in tropical and mid-mountain forests; they are very wary but are easily detected because of the hollow, resonant sound of their deep, windy sighs. They are characterized by rudimentary wings, each with four or five veinless shafts up to 11 in. in length; they use these shafts to fend off obstructions as they run through the forest at speeds of up to 30 m.p.h. They also are protected by crown casques (helmets), and a long and thick, tough and slippery, hairlike covering on their wedge-shaped bodies. The feathers of cassowaries are doubled; that is, at the base of each shaft grows a secondary feather or aftershaft that is nearly as long as the main feather. In cassowaries, as in hawks and a few other birds, the female is larger than the male. After the female lays the three to six green eggs. the male attends to incubating them and caring for the young. The latter, which are hatched with prominent buff striping that tends to camouflage them, are soon able to look out for themselves.



BY COURTESY OF AUSTRALIAN NEWS AND INFORMATION BUREAU

COMMON CASSOWARY (CASUARIUS CASUARIUS)

The common cassowary (C. *casuarius*), which reaches a height of five feet, wears the largest helmet in the genus and displays a pair of grotesque red-tipped wattles under a dark blue throat. Like all cassowaries, it s ims readily, often taking to salt water beaches. It lives in pairs and feeds chiefly on fallen fruit, but it also feeds on all kinds of small animals. Seven races of the species occur on the islands of Aru and Ceram, and in western New Guinea and northern Australia.

Bennett's cassowary (C. *bennetti*), with seven races in the mountains of Jobi Island, New Britain and New Guinea, is a shorter, more robust bird without wattles, but with prominent blue and orange naked areas on the neck and with a moderate casque. This species is a favourite pet of native children. In native villages the young birds run about like puppies; old birds are confined to cribs only slightly larger than themselves, where they are fed garbage and plucked of their plumes, which are valuable in the native economy. The single-wattled cassowary (C. *unappendiculatus*), a species with eight races on Jobi and Salawati islands and in New Guinea. has a single wattle that hangs from the middle of the lower throat. Even the foot-tall chicks wear this distinctive adornment. Cassowaries form a distinct order of birds, the Casuariiformes, which also includes the emu of Australia. (E. T. GI.)

CASTAGNO, ANDREA DEL (1423–1457), Italian painter who, with Masaccio and the sculptor Donatello, was one of the great Renaissance naturalists of his period, was born at San Martino a Corella, near Castagno. He worked mostly in Florence and died there of the plague in Aug. 1457. When only 17 he was commissioned to paint the dead criminals who had been hanged for revolting against the Medici. a fresco long since lost.

His most important panels are the "Crucifixion" in the National gallery, London, and the "Assumption of the Virgin" in the Kaiser Friedrich museum, Berlin, executed in 1449. In Sant' Apollonia in Florence, now a museum, his most famous frescoes have been collected, the "Last Supper" with scenes from the Passion, the "Crucifixion" and his impressive series of famous men and women. His last known work is the equestrian portrait of the condottiere Niccolò da Tolentino, a fresco of 1456 in the cathedral. Castagno's teacher is not known, but his strong style reflects his Florentine predecessor, Masaccio, and the sculptor Donatello.

"THE YOUTHFUL DAVID." A LEATHER SHIELD PAINTED BY ANDREA DEL CASTAGNO

See G. M. Richter, *Andrea dal Castagno (1943).* (M. M. S.)

CASTANETS, musical instruments of percussion, perhaps Phoenician in origin, introduced into Spain by the Moors. They were used by the ancient Greeks, the Egyptians and also by the Romans. Originally shaped like a small boot, they later resembled a chestnut (*castaña*), from which wood they were made and from which they took their name. As *castañuelas* they became the characteristic instrument of the Spanish peasantry, and their use remains a feature of Spanish dancing.

Each pair of castanets consists of two hollowed-out, pear-shaped pieces of hardwood (now ebony, rosewood or other similar wood), sometimes ivory or even plastic, hinged together and sprung by a cord that is secured firmly to the thumb. The two halves are struck together by the fingers. The fingers of the left hand perform a simple rhythm on a larger pair (macho, male) while the right-hand fingers manipulate a more complicated dance rhythm on a smaller pair (*hembra,* female).

In the orchestra, the two bowls are attached to one or more handles, and played either singly or with a handle in each hand.

Another method is to secure the bowls to a block of wood by spring steel or elastic, and manipulate them with the fingers or with drumsticks. (J. BL.)

CASTE (INDIAN). No term in the literature of social science has been so misused and misinterpreted as "caste"; indeed it is arguable that the ambiguity of the term itself has been a major reason for the difficulty in reaching a clear understanding of the system it describes. The Hindu caste system is unique, not because it embodies any unique modal principles of social structure, but because of the many different principles of status evaluation which validate it and which are so intricately interwoven to form the pattern of Hindu life. While, therefore, it is justifiable to use "caste" as an adjective in describing social groups of various kinds organized according to these principles, its use as a descriptive noun is fraught with difficulty. The truth of the matter is that no sociological entities have been discovered in Hindu India which are sufficiently alike in all their characteristics or sufficiently uniform or homogeneous in composition to justify being classed together under the label "caste" used as a noun. There are thousands of groups in India which are divided one from the other either by rules of descent, rules of marriage, ritual, occupation, ideas about purity and pollution, or by various combinations of these criteria of differentiation. There are sufficient underlying similarities in the way these rules affect the composition of Hindu groups as a whole to justify identification of a castelike quality which distinguishes them all from otherwise similar groups in other societies. These similarities occur, however, not at one level in Hindu society nor in one particular kind of group, but at many levels and in many different kinds of groups. Thus, while it is misleading to write of castes because this implies the existence of a category of groups with similar structural characteristics, it is meaningful and useful to write of caste groups, denoting groups of various kinds which have a range of similar qualities despite their structural differences. By using "caste" as an adjective instead of as a noun it is possible to distinguish the differences as well as the similarities among Hindu groups, and to avoid the pitfalls of throwing together within one portmanteau term a number of dissimilar units.

Almost all the so-called castes in India differ from each other in composition, and in many cases it is difficult to discover any criteria by which they properly can be regarded as a unit at all. Take, for example, the so-called Brahman caste. This has been described as "the most heterogeneous collection of minute and independent subdivisions that ever bore a common designation." It is not an organized social entity, for its units neither meet nor associate with each other. It is not an occupational entity, for the Indian census tables show clearly that Brahmans pursue many occupations, including those of cultivator, labourer and cook. It is not a jural entity; the law-enforcing functions of the caste system are located in exogamous groups within which intragroup marriage is forbidden, in endogamous groups within which intragroup marriage is mandatory and in commensal groups which place restrictions on accepting food from outsiders. The "Brahman caste" does not correspond to any of these. It is not a status entity—though many of the lesser groups subsumed under the label occupy the summit of local caste hierarchies—because it is subdivided into groups so different in status that they will neither intermarry nor eat with each other (or interdine, to use the modern Indian phrase for commensality). Some of these lesser groups, for example the Mahabrahmans who officiate at the funerals of many caste groups, by their degraded occupations lowered themselves below the level of many so-called low castes. If "Brahman caste" conveys any meaning at all, it indicates at the most a vague putative descent group, but there seems to be no analytical advantage in describing it as such since its component parts have been separate social units for many centuries and none of the privileges or restrictions usually associated with common descent—such as the right of inheritance and succession or the rules of exogamy—apply in this case. It is largely because "caste" has been used as a descriptive noun to denote amorphous entities of this order as well as a wide range of real social groups—lineages, endogamous groups, commensal groups, aggregations of endogamous groups with a common origin or equal status and so on—that all the confusion of the past has arisen. In this article, therefore, "caste" will be used as an adjective denoting groups governed by the causal principles outlined in the section below on the nature of the Hindu caste system, and these groups themselves will be given the structurally descriptive labels (*e.g.,* endogamous group) normally used in sociological literature.

Origins and Historical Development.— The complexities of the Hindu caste system have presented a challenge to students of human behaviour for more than 2,000 years, and arguments concerning its true nature and development continue unabated. Many theories have been advanced concerning its origins, most of which proved unacceptable because they sought to establish one or two causal factors as fundamental, whereas historical evidence shows beyond doubt that many factors have played equally important roles in the creation of this unique system. The incursion of the Aryan-speaking invaders into north India, which is believed to have occurred about 1500 B.C., heralded a new era. Little is known about the Dasyu civilization which the Aryans destroyed save that archaeological evidence suggests that it was an urban civilization, with a highly developed and differentiated society in which good water supplies and sanitation received much attention. Elsewhere in India, to the east and in the Dravidian south, other old civilizations flourished in the midst of a host of smaller peoples and tribes divided from each other not only by natural barriers of mountains, rivers, jungles and deserts, but also by social barriers such as restrictions on marriage and eating. (See also INDIA: Social Institutions.)

In contrast to the defeated Dasyus, the conquering Aryans were rude barbarians possessed of an open-class society and a religion and customs (as in the Rigveda) very different from those in modern India. Their three social classes (varna: symbolic colours or complexions) were the warrior-rulers (Kshatriya; *q.v.*), the priests (Brahman; *q.v.*), and the commonalty (Vaishya), and any man could aspire to rise in class either by his own wisdom or prowess, or by favour of the rulers. The Aryan men were beef eaters and mighty drinkers of a potent liquor called Soma, the secret of which is lost in antiquity; their women were relatively emancipated and free to bestow their favours in a way which would be unthinkable today. Their religion was a simple and loving worship of the gods of the elements and of ancestor spirits, and their ritual included blood sacrifice of many creatures. There was no hint in their early hymns of any belief in the transmigration of souls nor of ideas concerning purity and pollution comparable to those of modern Hinduism.

As the centuries passed there was a gradual fusion of cultures. Rulers and ruled became assimilated into a common system, each borrowing, or being forced by circumstances to accept, the beliefs and customs of the other. The open-class system of the Aryans, which fitted ill with the closed-group system of the indigenous peoples, was first modified and finally changed beyond recognition. The first of these modifications was the stabilization of the order of precedence of the two upper classes. Ritual triumphed over the sword; the Brahman priesthood gained an ascendancy over

the Kshatriya rulers and established itself in the position of class supremacy which it has retained ever since. Meanwhile, a fourth class appeared at the bottom of the list below the Vaishya, a class of artisans (Shudra), of a completely new kind. distinguished from the three upper classes by the fact that its members were not permitted to perform the *upanayana* initiation rite which gave to members of these upper classes the proud title of *Duija,* the "twice-born." This fact and the absence of evidence that the Aryans had achieved any marked economic differentiation prior to their conquest of northern India suggest that the Shudra class was composed of artisan groups from the conquered Dasyus (*Dasa varna,* the enemy race, as opposed to Arya varna, the Aryan race) who had become assimilated into Aryan society through economic interdependence.

At the beginning of the Christian era the caste system as it is today was taking shape, though it was to remain possible, over many more centuries, for kings and princes to raise or debase the status of individuals and groups. Groups rather than classes had become the locus of status; the belief in a process of metempsychosis already validated differences in status; the sanctity of the cow had, been established; diet restrictions were associated with ideas about purity and pollution; the dangers of internal pollution were already evident in the status assigned to the children of anuloma as opposed to *pratiloma* marriage. The children of anuloma marriage, in which the mother is of equal or slightly lower status than the father, retain the status of their father in a degree proportionate to the difference in status between the two parents. The children of *pratiloma* marriage, in which the mother is of higher status than the father, are outcast, since the mother is defiled by her lowborn mate.

All this development in theories about the universe and about the nature of man—perhaps the most profound philosophical tour de force of all human thinking—took place in isolated seats of learning in a country which was itself divided up into numberless kingdoms, principalities and chieftainships large and small. Few areas of the world's surface have seen more bloodshed and rapine, more external aggression and internecine strife, more movement and intermixture of peoples, more comings and goings of policies, religions, creeds and customs, than the Indian subcontinent. Rulers rose and fell, nations flourished and disappeared into the limbo of the defeated, languages ebbed and flo ed with the tides of racial movement. Above all this turmoil and confusion only one thing remained constant—the Brahman priesthood and Brahmanical teachings. Though physical isolation and individual interpretations led in the end to numerous philosophical interpretations of the Vedic scriptures and several schools of law, there was enough consistency in their major premises to constitute a broad basis of agreement upon which the philosophical and spiritual validation of the caste system could be built. Slowly but surely Brahman teaching penetrated downward through all the multifarious peoples of India. creating a common bond which no secular authority could provide, interlinking their diverse beliefs into a consistent pattern, laying the foundation stones of a yet far-distant nationhood. It is this process of infiltration of ideas from various Brahman centres of learning into the mass of different peoples and tribes of India—each with its own ancient traditions, customs and religious beliefs—that accounts at once for the uniformities and for the diversities of the Hindu caste system. The teaching of some Brahman schools spread more widely than others; the cultures of some peoples proved more resistant than those of others; particular characteristics of these cultures differed in the way in which external pressures changed or modified them. As a result, there are exceptions to every rule of Hinduism and to every interpretation of caste.

When the British assumed control in India, caste restrictions had perhaps reached their zenith. J. H. Hutton records a number of extracts about south India, from the writings of British officials of the 19th and early 20th centuries. which contain elaborate distance tables laying down limits of approach within which the mere presence of the lowborn was held sufficient to pollute their betters. For example, a Nayar (*q.v.*) might safely approach a Brahman within a few feet, but could not touch him without defiling him. The presence of a Tiyan toddy-drawer was enough to pollute a Brahman at a distance of 36 paces, and that of a Pulayan at no less than 96 paces. As late as 1932 an Indian newspaper reported the presence in Tinnevelly (Tirunelveli) of a caste group, called the Purada-Vannan, so degraded by its occupation—that of washing the clothes of untouchables—that it was classed as unseeable and compelled to live a nocturnal existence.

The caste taboos of south India cannot be taken, of course, as representative of the situation throughout India—since there is a progressive diminution in the severity of these taboos from south to north—but they do afford the sharpest illustration of what has become, in modern times, a pressing political problem. These restrictions upon touching, approaching and even seeing, which divided the highborn from the lowborn, resulted in a wide range of practical steps to see that they never met if it could be avoided. The lowest caste groups—the so-called untouchables (*q.v.*)—were forbidden to enter temples and schools used by their betters; they had to draw water from different wells and often to use different paths; they had to live in separate hamlets remote from the villages they served as menials. Thus not only were their daily actions woefully restricted. but their children were prevented, by the ban on school entry, from securing the very education through which alone they could hope for social betterment.

The role of the British in this situation was very confused. As individuals, to whom freedom of thought and action was the breath of life, they protested vigorously against immutable caste barriers. As Christian missionaries, they preached the gospel of equality before the Lord, and took into the Christian fold many who wished to escape the restrictions of caste., As industrialists, they brought to India an immense economic development: new industries and hence new classes of employment; new economic desires and new means of satisfying them; new horizons and the road, rail, sea and air transport necessary to reach them. As administrators, however, they held aloof from the struggles for power and status within the caste system on the grounds that these were, in the main, religious matters in which it was not proper for an administration to intervene. While, therefore, they laboured on the one hand to further the social and economic emancipation of the people at all levels, on the other they resolutely refused to take any official part in an assault upon the very citadels of mystical belief which checked that emancipation at every step.

Meanwhile the vast increase in both economic and physical mobility which stemmed from new industries and better transport led to great movements of people: the Telegu- and Tamil-speaking caste groups to the rubber plantations of Burma and Malaya and to dock labour at many Asian ports; the central Indian hill tribes to mine work and to the tea plantations in Assam; the Uriyas to track maintenance on railways throughout India; the Biharis to Calcutta mills and factories, and people from all over India into pilgrimages to the Hindu holy places. Moreover, the use of public transport and the difficulty of distinguishing between high and low caste strangers made it impossible for even the most fastidious to escape touch pollution. At the same time work in factories, long-distance travel and residence in crowded kitchenless tenements in the big cities made it increasingly difficult to maintain the traditional food taboos. Fortifying these tradition-destroying influences, and receiving strength from them, was the yeast of political ferment which the British introduced into India with education and democratic local government. In time the forces of tradition and emancipation ranged themselves into powerful political parties, with the traditionalist Hindu Mahasabha on the one hand and the associations representing the scheduled castes of untouchables at the other.

The government of independent India, greatly daring, pronounced untouchability illegal (1949), threw open the temples and other holy places, and declared itself unequivocally opposed to the social barriers of caste. Few who know India would say, however, that the battle against caste has been won. The bitterness of the opposition to reform—a bitterness which resulted in the martyrdom of the national hero Mahatma Gandhi—is deeply rooted in beliefs which have withstood alike the assaults of Aryan nature worship, of Islam and of Christianity. Moreover. as will be shown.

there is a positive as well as a negative side to caste, great advantages to the ordinary man as well as disadvantages for the underprivileged. These positive advantages take the form of reciprocal co-operation at all levels of the caste system, the provision of help in the building of houses, in the tilling of fields, in the meeting of life crises such as birth, marriage and death, in economic and financial transactions, and in sickness and injury. The creation of an Indian welfare state may lift from the caste groups the burden of responsibility for many of these aspects of social co-operation, and a developed trade unionism may take over many of the economic duties which now fall upon them. In the meantime these positive advantages of the caste system are a force which cannot lightly be dismissed from calculations about the future.

The Nature of the Hindu Caste System.—Among the causal principles which together give uniqueness to the Hindu system are beliefs concerning: (1) the nature of the universe; (2) the relation between status, purity and pollution, and the process of metempsychosis; and (3) the relation between the Absolute Power and lesser gods, ancestor spirits and sprites which haunt hill and dell.

Associated with these causal principles are a number of modal principles governing the ways in which the units of caste society are composed: patrilineal, matrilineal, and bilineal descent; unilineal, bilineal and local exogamy; local group and kin group endogamy; commensality; polygamous marriage (now illegal), hypergamous marriage (marriages between lineages of different status, the higher of which will take wives from but not give daughters in marriage to the lower), widow marriage and even concubinage. A necessary first step toward an understanding of the Hindu caste system is, therefore, a brief statement concerning the interrelationships among the structure of Hindu social groups, the principles and practice of stratification within the system and its validation by mystical beliefs.

The Hindu social order is founded upon a number of basic units common to all wider groups of which they form part, and a number of other units which are to be found—in differing combinations—in some but not all of these wider groups. The basic units are: (1) the nuclear family, consisting of father, mother and their children; (2) the joint family, a two- or three-generation segment of a lineage (*i.e.*, grandfather and grandmother, their married sons and their wives and children, or, much more rarely, a group of brothers and their families), which uses resources in common, and often feeds and resides in common; (3) the lineage, a group of nuclear or joint families linked by known or putative descent (which may be patrilineal or matrilineal) from a common ancestor; and (4) the endogamous group, the all-important *jati*, composed of a number of intermarrying lineages whose members must marry within the group.

The other and more variably distributed groups are: (1) the polygamous family, which may be a polygynous group consisting of a man and his wives and their several children, or a polyandrous group consisting of a woman, her children, and the several husbands by whom she bore them; (2) the exogamous group, which may be a lineage or part of a lineage, a bilineal group of relatives on both paternal and maternal sides of the house, a *pravara* group (*i.e.*, a group of people who, though not closely related, regard intermarriage as repugnant because they come under the protection of the same personal saints, usually three), or a local group such as a village; (3) the commensal group, which may be coterminous with an endogamous group or may contain several endogamous groups which regard themselves as sufficiently equal in status to justify interdining; (4) the caste association, which may contain several commensal groups (though not necessarily all those which claim putative descent from a common ancestor, since there may be differences in status too wide to bridge) with enough economic or political interests in common to justify co-operation in certain aspects of social life; and (5) the class of caste groups (*e.g.*, the four varna of Sanskritic scriptures, and the Duija, or "twice-born," class of caste groups which are entitled to wear the sacred thread).

There are special activities to be performed, or special privileges to be enjoyed, at each of these levels of caste society. The nuclear and joint families are concerned with the day-to-day economic activities and with household ritual; the local lineage segment is brought in to lend its help and advice at births, marriages and deaths, and in the judgment of minor breaches of custom; the whole lineage, or the appropriate exogamous section, is taken into account when new marriage ties are considered; the wider endogamous group is consulted when major breaches of custom are judged or when disputes arise with other caste groups; the commensal group is concerned with some breaches of custom, with all attempts to modify caste status and with the feeding arrangements at big festivals; the caste association is brought into being to meet political ends and so on. There are few hard and fast rules, however; each minor situation is met by an ad *hoc* gathering of kinsmen equal to dealing with it, each major crisis by the summoning of an appropriate wider group.

Differences in ways of tracing descent and creating ties through marriage and exogamy result in a bewildering range of variations in the composition of endogamous groups in the Hindu system. Nevertheless these internal structural differences have little effect upon the social function of endogamous groups, since they are the principal locus of caste status, and it is from this fact that they derive their great importance in Hindu society.

Lesser groups within endogamous groups may vary in status according to primacy of descent and other reasons, but variation in the kind of group status generally associated with caste begins at the level of the endogamous group. Whatever the structure of such a group—whether it is composed of patrilineal or matrilineal lineages or of kin groups formed by polygynous, polyandrous, parallel- or cross-cousin marriage—its relations with other groups follow a uniform pattern. It possesses a status which is recognized as above or equal to or below that of neighbouring groups of the same kind. These neighbouring groups will react toward it in accordance with this status rating, accepting food from its members (even though they will not reciprocate), or eating with it, or refusing to eat with it, in the light of their relative positions in the status system. Status variations within endogamous groups have little significance outside them. Seen from within by one of its own members, such a group might appear to be composed of units of unlike status vis-à-vis each other. Seen from the outside, vis-à-vis members of other endogamous groups, all such units would appear as of one status, that of the endogamous group to which they belong.

The fact that caste status is located in endogamous groups rather than classes stems from a belief in retributive metempsychosis (karma; *q.v.*) and in an ordered universe in which animate creatures are arranged in a hierarchical order with humanity above all other forms of life and orthodox Brahmans above all other forms of humanity. Karma is regarded by some authorities (*e.g.*, J. H. Hutton) as a process of automatic retribution and by others (*e.g.*, S. Radhakrishnan) as "not a mechanical principle but a spiritual necessity. It is the embodiment of the mind and will of God. God is its supervisor—karmadhyaksah." It is a mystical law of retribution of which the machinery of execution is the caste system, and by virtue of which each man reaps what he sows. Status at birth is determined by the status of the endogamous group into which he is born. But the locus of reincarnation—in the person of a child of high or low degree—is determined by behaviour in previous existences. Those who behave well in one life achieve a higher status at rebirth, those who behave badly suffer a fall in status. An important point here is that goodness and badness of behaviour are judged not in terms of absolute moral values but, as will be seen later herein, in terms of attention to certain rules of life (dharma) which vary from one status level to another.

The relative status of endogamous groups in the Hindu social system is fixed by reference to several criteria, of which by far the most important is behaviour in relation to a corpus of beliefs which have been labeled (by H. N. C. Stevenson) as the Hindu pollution concept. Each endogamous group follows its own particular pattern of behaviour in this respect, and individuals are made to conform to these patterns by a variety of sanctions. Some of these sanctions are vested in the councils (*panchayats*) of endogamous groups and derive their force from the ultimate sanction

of expulsion from the group. Others are vested in civil courts and in local councils such as the village panchayat and derive their force from Brahmanic law.

These group behaviour patterns impose upon individual members both positive duties and negative prohibitions. The birth of a child, initiation, menstruation, marriage and death are all occasions which give rise to actions circumscribed by beliefs concerning pollution. Daily life, too, is similarly circumscribed, since the pollution concept governs the kinds of occupation appropriate to various status levels, the kind of food or drink that may be consumed and even the ways in which water may be drunk or pipes smoked or food cooked. It is the interrelationship between beliefs about the universe, about pollution and purity, and about stratification of kinship groups occupied by people passing through a process of metempsychosis that gives to the Hindu caste system its unique character.

The Hindu Pollution Concept.— It has been shown by Stevenson that the status of endogamous and commensal groups in the Hindu caste system (and hence of their individual members) is mainly dependent upon behaviour patterns which conform to, or infringe. certain rules of purity and pollution. There are a great number of such rules, but many are of minor importance and affect the status of only a limited number of caste groups. The really important rules—those, for example, which demarcate the touchable from the untouchable caste groups—are as follows: (1) that destruction of the Life Principle for a living (as in oilseed crushing, bird trapping, fishing) is polluting—a rule which accounts for the fact that the oilseed-crushing section of the Teli (oilman "caste") is of very low status, whereas the oil-selling section is of relatively high status; (2) that death and decay are polluting, and therefore all occupational association with them is polluting—a rule which accounts for the low status of all groups whose duties include officiating at funerals (*e.g.*, the low-caste Mahabrahmans) or the removal of the carcasses of dead animals; (3) that all human emissions are polluting, and therefore occupational association with these, too, is polluting—a rule which accounts for the low status of washermen, barbers, midwives and lavatory attendants; (4) that the cow is sacred above all other animals. and that killing it, flaying it, dealing in its skin, doing leatherwork, or eating its flesh is sinful, and therefore polluting—a rule which accounts for the low status of shoemakers and all the beef-eating caste groups; (5) that the drinking of alcohol is polluting—a rule which accounts for the fact that liquor selling has come to be almost exclusively a low-caste occupation; and (6) that marriage is a binding sacrament, and therefore the remarriage of widows is polluting—a rule which accounts for the continued ban on widow marriage.

A survey of the Indian census reports of the 20th century, many of which give information concerning efforts made by caste groups to achieve a rise in status, shows clearly that it is wrong behaviour in the light of the above-mentioned rules that looms largest in Hindu eyes. All such status-raising attempts commence with the holding of a meeting of the endogamous group or commensal group concerned, at which proposals are put forward, for example, to give up eating beef or drinking alcohol or marrying widows. The pattern of action then follows one of three lines: the whole group may accept the proposals and alter the pattern of group behaviour; the whole group may reject the proposals and continue to adhere to the traditional behaviour pattern; or more or less equal proportions may be for and against the proposals, resulting in fission of the group into two endogamous groups, one of which will follow the new pattern of behaviour and one the old, the former usually claiming a higher status than the latter and ceasing all social intercourse with it. When a whole group adopts new behaviour, or a breakaway group does so, their first step is to take a new name to indicate their changed status. Usually they will hyphenate their old caste name with that of a higher caste—a common choice being Rajput (*q.v.*)—and after the lapse of some generations, when the low-caste associations are fading into the past, they will drop the old half of the double name and retain only the new. Often they succeed, through time, in assimilating themselves completely to the higher status group by a series of marriages, which will be hypergamous in the first instance, but equal as their status rating rises. Many strenuous efforts were made by reforming caste groups to secure immediate recognition of their changed status, a later example being the Satnamis, but all failed. It is held that inbred group pollution cannot be voted away in a flash; it must be bred out by generations of improved behaviour.

There is a remarkable consistency about the way in which these rules concerning purity and pollution operate in different social situations. One example is the rule concerning human emissions. Every kind of human emission is polluting; breath, spittle, nasal mucus. semen, menses, urine, feces, sweat or body grease, even glances and shadows fall into this category. Direct occupational contact with any of these is polluting, but so, too, is secondary contact. For example, any caste group which eats the flesh of domestic pigs is of as low a status as a caste group which cleans latrines, because pigs are village scavengers and feces eaters. On the other hand, caste groups which eat only wild pig are not downgraded, because these are held to be clean feeders. As another example of consistency may be cited the relationship between external and internal pollution. External pollution, which can be removed by washing, is regarded as far less serious than internal pollution, which entails a purification ceremony involving the drinking of a cleansing agent such as Ganges water or Panchgavya (the five products of the cow—milk. ghee [clarified butter]. curds, urine and feces). Hence we find that the left hand, traditionally used to wash the body after defecation, is never used for eating because it might cause internal pollution; a man may have coitus with a low-caste concubine—provided he bathes after so doing—but may not eat food touched or cooked by her; a high-caste man having coitus with a low-caste woman can be cleansed by washing, whereas a high-caste woman having coitus with a low-caste man is internally polluted and therefore outcast; porous containers for food and water, such as earthenware pots, are regarded as more easily polluted than nonporous metal pots; almost any water may be used to bathe in, but drinking water is protected by a wide range of prohibitions because, though water will carry away external pollution by washing, it will also carry internal pollution into the body if accepted from polluted hands or vessels; food may be washed in almost any water, but may only be cooked in unpolluted water, since water penetrates food in cooking and so may pollute it internally; hookah pipes belonging to other people of lower status may be smoked only if the spittle-infected mouthpiece is removed and if the cupped hands are used as a funnel to inhale smoke, since this method obviates any danger of internal pollution. It should be noted that all of these examples concerning internal and external pollution have one important feature in common: they illustrate the way in which ideas about pollution uphold sound sanitary principles and, taken in conjunction with the elaborate sanitary arrangements evident in the ruins of the ancient Harappan cities, they indicate the probable antiquity of the beliefs underlying them.

To summarize this section, it has been seen: (1) that there are a few important and many minor rules concerning pollution that impose restrictions on caste-group behaviour and determine the ritual status of these groups; (2) that groups can change their status, over several generations, by changing their behaviour to conform with these rules; and (3) that these rules are consistent in their effect upon behaviour of many different kinds, The next step is to consider how these rules affect the status and behaviour of individuals.

Status Evaluation.— Status in Hindu society falls into two broad categories—secular status and ritual status (to use the term for mystical status generally used in anthropological literature)—which are derived from different sources and which manifest themselves in different ways and serve different ends. In general, secular status attaches to individuals and classes rather than to groups and is derived from such criteria as wealth, landownership, education, skill and sometimes, as in the case of government servants, from occupation. Its chief function is to provide additional temporal incentives for effort, and some amelioration, for those who find them intolerable, of the inescapable inequalities of ritual status. Ritual status, on the other hand, attaches to both individuals and groups with equal force and is derived from mystical

beliefs, particularly those noted in the previous section, which have been described by many authorities, notably S. V. Ketkar, as "the chief principle upon which the entire [caste] system rests."

There is an important difference in the ways in which the ritual status of the individual — as opposed to the ritual status of groups — affects both individual and group behaviour. Every Hindu possesses two kinds of ritual status, one kind deriving from his individual behaviour and the other from the behaviour pattern of the endogamous group into which he is born. It has been shown that group-derived ritual status cannot be raised during the lifetime of an individual, since the upgrading of group status involves generations of effort. Individual ritual status, on the other hand, is variable both upward and downward, and in this two-directional variability lies the key to advancement in status through the process of metempsychosis. By raising or lowering his individual ritual status above or below the level of his group-derived ritual status a person is able to project his soul into its next life at the level of individual ritual status acquired before death. The individual-status finishing point of one life is the group-status starting point of the next life. The advancements of individual ritual status gained in each lifetime are the steps up which the soul mounts into rebirths at higher group-status levels.

There are three pathways by which a person can proceed to raise his individual ritual status: (1) Dharma Marga, the path of duty or service; (2) Bhakti Marga, the path of devotion to the gods; and (3) Jnana Marga, the path of knowledge through realized experience.

Dharma Marga, the path of duty, is of the greatest sociological significance since it provides the mystical validation for the sanctions which uphold the rules of caste. Observance of dhnrma (the right way of life) is not a question of following some absolute standards of right behaviour; it implies, to each Hindu, following the rules of his particular endogamous group. Even if group behaviour demands what one could call sinful behaviour, such as the robbery practised by some criminal caste groups or the ritual murder of the Thugs, it is the duty of every Hindu to adhere to this group pattern, for it is ordained that he should do so and suffer whatever consequences befall. The proper achievement of the four main ends in life — dharma, or right living; *artha,* or wealth; kama, or artistic and cultural fulfillment; and finally moksha, or spiritual release — is only possible when wealth and happiness are sought in the context of *dharma,* which means the context of caste rules. There is no escaping this — "Each man is said to have his own specific nature (svabhava) fitting him for his own specific function (*svadharma*), and changes of *dharma* or function are not encouraged." The belief in Dharma Marga, therefore, is a powerful buttress to the Hindu status system, and to its rules and sanctions. It enforces upon the individual the duty of following the very patterns of behaviour which fix the position of his group in the status hierarchy and so enchain him. It rewards him for so doing by making adherence to duty a pathway to higher status in the next worldly life.

Bhakti Marga, the path of devotion, has no such divisive function; on the contrary, it binds people together through links of worship and benevolence. It involves the showing of devotion to the gods by attention to the appropriate ceremonies and festivals, by the performance of benefactions such as the building of shrines, temples, rest houses, wells, and (in later years) schools and hospitals, and by pilgrimages to Hindu holy places such as the Ganges river.

All of these activities, while raising the individual ritual status (*punya*) of those who perform them, also give pleasure, sustenance, shelter, or employment to others, thus maintaining the pattern of ancient rituals and creating new ones, welding together the discrete specialist groups and regions of Hinduism and giving a sense of oneness to the entire Hindu polity.

Jnana Marga, the path of knowledge or wisdom, has yet other effects. It involves the renunciation of social life and the withdrawal into asceticism, or meditation in the wilderness; it is for the individual to follow, not the group, and of all the paths it is the quickest route to that blessed final release (moksha) from the wanderings so earnestly desired by every Hindu soul. The merit acquired through the discipline and suffering on this path is enormous, enough not only to gain veneration in this life but also to secure release from several worldly existences in the round of metempsychosis. It is the element of renunciation in the path of knowledge that accounts for the paradox that whereas a low-caste man living a normal social life is despised, the same man, living the life of an ascetic. would be revered. Status is associated with privilege; hence status acquired in the context of social life constitutes a threat to the established privileges of higher status groups and is therefore strongly resisted. The ascetic withdrawn from social life, however, competes with no man for wealth, power, position or wives; hence his status constitutes no social threat and can, therefore, be conceded without demur. Improved communications led to vastly increased potentialities of pilgrimage, and as a result many thousands of charlatans have appeared at holy places masquerading as holy men. Nevertheless, genuine holy men soon become known, for even in rural India it is only possible to deceive some of the people some of the time.

The three paths to higher individual status, each in their different ways, serve to consolidate the caste system. The path of duty emphasizes and validates the division between status groups; the path of devotion emphasizes the unity of the system as a whole and links diverse groups in common worship and benevolence; the path of knowledge provides an escape from the chains of status for those who have the tenacity and physical fortitude, and underlines the important fact that throughout the system as a whole high status is linked with austerity and low status with licence.

The interaction of secular status and ritual status, and between individual and group-derived status, is complex in the extreme and has been much confused by overstressing the importance of group-derived status. There has been very little research into this important aspect of Hindu life, and all that may be said with assurance is that (1) individual ritual status fixes the position of the individual in relation to his afterlives; (2) group-derived ritual status fixes his position in the context of society; and (3) secular status modifies its impact on daily behaviour either by deepening status divisions, as when poverty coincides with low ritual status, or by reducing them, as when wealth or high temporal office comes to a man of low-caste status (the political leaders of the so-called untouchables providing a good example of this).

In concluding this section on status evaluation, mention must be made of the distinction between temporary and permanent pollution. The group-derived ritual status acquired by an individual at birth is permanent insofar as it cannot be raised within the context of group life. This permanence is, however, unidirectional; though it cannot be raised, it may be lowered by wrong actions. If, for example, a person commits sins of commission or omission concerning caste rules he may become temporarily polluted and suffer banishment until he has been purified by appropriate ritual. If his sin is such that his own group will not readmit him, or if he refuses to perform rites of purification, then his temporary pollution may become permanent. He — and his family if they do not abandon him — will have to seek new associates among similar outcasts or, as often happens, enter some established group so low in relative status as to be indifferent about who joins. Thus the outcast enters a new group relationship, and in so doing acquires a new and lower group-ritual status which will be inherited by his children. Similarly a whole endogamous group may lose relative status by wrong actions, carrying all its individual members down with it.

In practice, these ideas about purity and pollution have led to the creation of a particular kind of social mobility — that is, a group mobility — which is distinct from that found in any other society. Ritual status is linked to behaviour traits which can be changed, and groups change their ritual status by changing their behaviour pattern. In this milieu the position of the individual is very different from that of an individual in western society.

In the west — despite the fact that traces of ideas about purity and pollution somewhat similar to those found in Hindu India are discernible in the attitudes of certain white persons to Negro peoples — ritual status has little significance in social life. If a western individual raises his secular status by, for example, se-

curing promotion, that advance in status will be reflected throughout the whole context of his social life. He will move in higher circles, become a member of more exclusive social and recreational groups and may well marry his children into better-class families. The Hindu individual is not so fortunate. To him ritual status is as important as secular status. but he cannot usually raise them both at the same time. To raise his secular status he must remain within the context of social life and exert himself to gain wealth or poner or prestige, but in so doing he emphasizes the restrictions of ritual status, for over a wide field of social activities, including. for example, marriage and interdining, it is his ritual rather than his secular status which will determine the attitudes of others toward him. If his ritual status is relatively very low, increasing secular status may simply bring an added sense of frustration and unhappiness. On the other hand, if he wishes to raise his individual ritual status, the Hindu must relinquish social life altogether. Whereas a lowborn western man can aspire to an exalted state of grace and a high secular position at one and the same time, the lowborn Hindu must choose between one or the other. If he chooses high ritual status, he must cut himself away from kith and kin and become an ascetic—a social isolate.

The linking of the group mobility in the status system to behaviour patterns associated with the Hindu pollution concept had one all-important sociological consequence. It bridged the racial, cultural, linguistic and spiritual gulfs which divide the multifarious groups of India and slowly but surely brought them all, no matter what their colour, creed or class, within one all-embracing frame of status reference. In so doing it created an awareness of a wider social unity which, together with political unity, made possible the sense of nationhood which animates all Hindus.

Status and Occupation.—Contrary to popular belief in other lands. few Hindu caste groups of any size can be classed as occupational groups: the most that can be said is that some groups have a traditional lien on particular occupations and ritual tasks which their members may exercise if they so desire. The Indian census tables of the 20th century make it clear that for many decades a large proportion of the members of every caste group—in some cases as high a figure as 90%—follow occupations other than those specifically associated with their own group. Even among Indian writers there have been wide differences of opinion about the true relationship between caste and occupation. For example, S. V. Ketkar claimed that a man could take up any occupation save that of shoemaker or scavenger without losing caste status, but there is ample evidence that other occupations, such as that of washerman or barber, would also have this effect. G. S. Ghurye, with greater caution and accuracy, was content to state that agriculture, trade and military service are open to all caste groups without loss of status.

It appears, in actual fact, that the vast development of economic opportunity, which started during the British regime and continued thereafter with gathering momentum. created a situation in which two processes of change began to take place simultaneously. On the one hand, older caste groups such as the barbers and washermen are breaking down into smaller units because so many of their members no longer follow the traditional occupation and tend to despise those who do. On the other hand, new caste groups are being formed around new occupational specialisms —skilled mechanical work. semiskilled dock and plantation work and so on—because caste affiliations are used, all over India, to facilitate labour recruitment. Once a caste group has attached itself to a particular kind of work it soon increases its hold by bringing into it only fellow members of the same group. The system of providing a substitute (badli) of their own caste group to replace all who are away from work through sickness or holidays ensures that no other group is able to penetrate the economic preserve thus created. If the new occupations taken over in this way are markedly higher in status than the traditional occupation of the groups concerned, those who follow them may break away from the older groups as soon as they are sufficiently well established to do so, and from new endogamous or at least hypergamous units. If, as is often the case, there is no significant difference in status, the old caste groups will remain intact, acquiring a lien on new occupations without relinquishing their lien on the traditional one.

Status and **Commensality.**—Some authorities regard the practice of commensal reitrictions as the keystone of the Hindu caste system. Unlike the restrictions of endogamy, which are wholly divisive in their effect upon Hindu society, commensal rules deriving from the Hindu pollution concept are at once divisive and unifying They are divisive because they emphasize different degrees of purity and pollution. They are unifying because, unlike the rules of endogamy, which exclude all outsiders whether of high or low degree, commensal restrictions usually work in one direction only. All Hindu caste groups are arranged in a loose hierarchy, which varies in minor details from one region to another and in which groups of high status may give food to but mill not take food from groups of lower status. Thus, while this type of commensality emphasizes the status distinctions between groups, it also emphasizes the fact that all are parts of a wider system; in other words, it emphasizes the unity of Hindu society as a whole. A good deal of misunderstanding about commensal rules has arisen because it has been assumed. quite wrongly, that they refer only to the act of giving or taking food, or to the act of eating together. In fact they refer also to the method of preparation and presentation of food and vary according to the kind of food and the means used to cook it. A guest may eat in the house of a person of lo er status provided that the food is cooked and served by a person of equal or higher status, which explains why Brahman cooks are so popular in many parts of India. Uncooked food, such as fruit, may be accepted from anyone. since washing it in water will remove any pollution. Food cooked in water is highly vulnerable to pollution and may not be accepted if cooked by anyone of lower status than the recipient. On the other hand, food cooked in ghee. which is a powerful purifying agent, may be accepted from persons much lower in status, and so too may food such as popcorn, uhich has passed through the purification of fire.

Commensal restrictions deriving from sources other than the pollution concept take different forms. Tribal commensality, for example, which is often based upon the belief that only those under the protection of the same tribal gods should eat together, is usually two-directional, interdining being forbidden with all outsiders, high and low alike. This is why the acceptance of one-way instead of two-way commensal restrictions is one of the most important tests of assimilation of exterior tribes into the caste system. Then there is the kind of small kin group commensality derived from beliefs about the sanctity of the hearth, which is the resting place of lineage spirits. Thus, in some caste groups, families will join in feasts prepared by the caste authorities but mill refuse to allow even their married daughters to cook for them in the family hearth, on the grounds that marriage has taken them anay from the protection of the spirits of their natal lineage and placed them under that of the spirits of their marital home.

Status and **Religion.**—An important feature of Hindu ideas about purity and pollution is that they cross both religious and sectarian boundaries. Social behaviour is evaluated for ritual status purposes by a single standard—that of the Hindu pollution concept—regardless of the religious group to which the people belong. Religious beliefs are evaluated in relation to a different criterion, the degree of understanding of the Ultimate Truth concerning the nature of the Absolute Power. All religious beliefs are held to be partial revelations of the Ultimate Truth. Persons who worship the avatars, or incarnations of the Absolute Power—Vaishnavites, Shaivites, Buddhists, Christians—are regarded as superior to those who worship nature spirits. Those who through meditation and devotion receive a revelation of the Absolute Power are further advanced than the devotees of the avatars. Understanding of the Absolute Power is an aim to be achieved, but the way to achievement is different from that by which status in society is achieved.

In Hindu eyes it is possible for a person or a group to be advanced in understanding even though they may be degraded in behaviour. and vice versa, and thus all the main religious divisions of India have been invaded by status evaluations based upon the pollution concept. Converts to these religions. unless they change

their behaviour pattern as well as their faith, retain their Hindu ritual status. They tend, therefore, to form commensal and endogamous or at least hypergamous subgroups based upon this status as, for example, the Muslim Ghosi and Kingariya, who do not eat beef and limit their interdining to those among the Muslims who observe this Hindu restriction. Sectarian divisions within the Hindu fold, such as that between the followers of Vishnu and Shiva, have little effect upon ritual status unless they impose such differences in behaviour as the strict vegetarianism of some groups of the Jain sect.

Caste-Group Government. — The observance of caste rules and the maintenance of caste discipline are secured through a quasi-jural system of councils which are appointed by, and operate through, kinship and commensal groups and local sections thereof. It is common to find the officials of caste groups labeled with the titles of the old Indian princely courts — munsif, diwan, *sipahi* and so on, "all the way down from vice-president to orderly." Over a large part of India the symbol of the council is its mat, and that of its chairman or headman a turban. Where official posts are permanent they are usually hereditary, subject to mental fitness and good behaviour.

The primary task of these councils (*panchayat*) is to preserve the traditional ritual, the marriage and inheritance laws and the behaviour patterns associated with the pollution concept, which give to each caste group its particular social identity and status. They have also a number of secondary tasks of considerable importance, among which are: (1) the protection of the "trade union" rights of the caste groups and the settling of disputes among their members about such questions as the inheritance or sale of good will; (2) the licensing of activities which by custom require such permission from a caste-group authority; (3) the initiation of co-operative effort, such as the provision of scholarships at schools and universities, the building of temples and so on; and (4) the negotiation of agreements for caste-group members with local authorities such as the village council, with members of other caste groups and with the central government authorities.

Lower councils in the system are located at the level of (1) local brotherhoods (biradari, bhaiband), that is, the members of a lineage segment who live in the same village ward or village and who are able, therefore to co-operate effectively in daily life; and (2) local groups of intermarrying lineages who live in contiguous clusters of villages. The size of the units controlled by these lesser councils varies according to the practical possibilities of the local situation rather than nny traditional rules. Where villages are small, all members of a lineage will come under ona council; in large villages and in towns, where lineage segments may be widely dispersed, there may be more than one brotherhood council. Similarly, where villages are close enough together to make contact and consultation easy, local sections of endogamous groups, that i›, the lineages which have established marital ties with each other in neighbouring villages, may establish a local council to deal with affairs of particular interest to them.

It is difficult to determine where the ultimate authority in caste matters lies because of the overlapping jurisdictions of different courts administering differing codes of law. At the base of the jural pyramid there is the custom of the kinship and commensal groups of caste society and the customary law of the unassimilated tribes. Overlapping part but not all of this area of custom are different systems (*e.g.*, the *Makkathayam* and *Marumakkathayam* variants) of Brahmanic law. Overlapping both custom and Brahmanic law there is state law. Above the level of the caste courts there is a hierarchy of state courts, each level of which acts as a court of first instance in somr matters, and, in others, as a court of appeal against the judgments of the next lower court. A strongly disputed case concerning the custom of a caste group may go on appeal to the various levels of caste council until a final decision is reached at the top level, or, on the other hand, the case may be taken to a state court at some stage in the proceedings. Much depends on the nature of the case and the power of the caste-group councils. For example. a charge of breach of pollution rules brought before a weak caste council is sometimes answered by a countercharge of defamation in a state court. In contrast, caste-group councils are sometimes in a strong enough position to forbid their members to give evidence in state courts even about such serious matters as murder and robbery, and in such circumstances no appeal would be made to state courts against caste-council decisions.

In ancient days the kings and princes of India exercised appellate rights in caste matters and had the power not only to overturn the decisions of caste-group councils but also to raise or lower the status of the caste groups themselves. In the 20th century the position changed, mainly, it is claimed. because the British in India exercised such care not to interfere with local custom if interference could be avoided. It appears probable, however, that in practice the princes of old interfered less with caste custom, despite their powers, than the British who tried so hard not to do so. An ancient convention. which governed the actions of all prudent princes in those perilous times, laid down that, where local custom conflicted with Brahmanic law, local custom should prevail, provided only that no outrageous sin (such as, for example, the killing of cows) went unpunished. This convention, coupled with the tolerance of diverse ritual and beliefs inherent in the Hindu religion, was sufficient to preserve caste-group customs almost intact up to the advent of the British. Under British-Indian rule, too. there was a convention that such caste customs as were not repugnant to natural justice should be left untouched; but the greater power of the government, and its desire for administrative and judicial efficiency and uniformity, led to interpretation of this convention in a very different way. The application of western legal, social and moral principles, so different in many ways from those of Hindu India, caused far-reaching changes in administrative and judicial procedures which in themselves altered beyond recognition the balance of rights, duties and privileges of caste-group membership.

A single example will suffice to demonstrate the depth of these changes: the example of the Indian Evidence act. Cases coming before caste-group councils are discussed in open meetings in which all adult males of the group concerned are entitled to take part. Accuser and accused, together with all their witnesses, gather before the appointed elders and give their evidence in the presence of the opposed parties and of the assembled members of the caste group. In considering the likelihood of the offender's having committed the offense of which he is accused. the council will take into account every item of evidence that can be produced by either party, or by the onlookers, or even from the personal knowledge of the members of the council. The past histories of the contending parties. their moral excellence or turpitude, the state of their health and of their bank balances, and their relationship as kith, kin or business associate with those concerned will all be examined to see whether or not they have some bearing on the probabilities of the affair. In effect, even though these precautions do not obviate injustices altogether, they do at least lessen tensions and enable people to live together without an undue sense of frustration. Everyone is able to say everything he wants to say; every hidden influence, every cherished loyalty and carefully nurtured spite is exposed to the gaze of the whole caste group. If there are undercurrents too strong to be overcome, everyone knows what they are and why the council can do nothing about them.

The application of the Indian Evidence act to the procedure of the state courts of law created a situation almost diametrically opposed to these traditional processes of justice. Not only is the trying judge or magistrate often innocent of any knowledge of the caste customs of the parties concerned and of their local, kinship and business affiliations, but he is expressly forbidden, by criteria of relevance derived from an alien culture, to call for evidence which by rural standards (and Hindu India is four-fifths rural) is vital to the issues under discussion. Under the circumstances judgments are passed—with the best will in the world—which in the eyes of humble people, who have no understanding of the reasons underlying them, are a travesty of natural justice. The ignorant and bewildered peasantry, conscious only of their abysmal innocence of all things legal, have fallen completely into the hands of the hordes of third-rate pleaders, writers and

interpreters who throng the courts, because wealthier men, conscious of the advantages of taking cases to courts where they can employ more skillful lawyers than their opponents. bypass caste-group and village courts whenever possible. The primary result of this development was twofold. On the one hand, it weakened the power of caste government throughout India, since wealthy offenders could escape more easily the consequences of wrongdoing: on the other hand, it brought the state judicial processes into disrepute. In this tug of war between custom and law each undermined the disciplinary influence of the other, a reversal of the old pattern of Hindu society, in which each buttressed the other and in so doing fortified itself.

Caste government in the widest sense begins, of course, at the level of the nuclear family. As husband, a man has almost complete control over the actions of his wife, a control backed by the sanction of corporal punishment if and when necessary. As member of a lineage, the performer of ancestor rites and spokesman for those among whom the children of the family hold rights of succession and inheritance, the father, or mother's brother where matrilineal descent prevails, is vested with disciplinary rights over these children, to enable him to see that they conform to caste custom. It is at this level that responsibility rests for seeing that children are brought up in full knowledge of the ways of the caste group; it is here that they must be taught what they may or may not eat and drink, what occupations they may follow, what clothes and ornaments are appropriate to their station, how they must comport themselves toward other members of the caste group and toward outsiders and so on.

The next level of caste authority is found in the head of the joint family, where these exist. In joint families it is usually the eldest male who exercises — subject, naturally, to his being in full possession of his senses — the functions of manager of the group resources, arbiter in disputes between nuclear families within it and spokesman for it in dealings with the world outside it. Unfortunately, for it had helped to mitigate the pernicious influence of land subdivision and had conserved resources of all kinds, the joint family is steadily disappearing from the Hindu scene under the pressure of economic mobility, improved communications and widening opportunities of work for both men and women.

Then comes the council of the local brotherhood, smallest of the representative bodies in caste government, consisting of the heads of joint or nuclear families of a single lineage. The size of these brotherhood councils and the duties they perform depend largely upon such practical questions as the physical distance which divides the co-operating families, the kinds of task or ritual in which they co-operate, their numbers and the degree of agreement between them. Since lineages and often segments of large lineages are exogamous, observance of the rules of exogamy is one of the most important matters with which brotherhood councils have to deal; other important matters are succession, inheritance, the findings of bride price or groom price as their custom may demand, and trade-union activities. Precedence in brotherhood councils usually depends upon primacy of descent within the lineage, but every independent unit, whether joint or nuclear family, is entitled to representation, and every male has the right to attend meetings and have his say.

Next comes the most important level of caste government — the council of the endogamous group. Stress has been laid herein on the fact that the deepest division of status in the caste system is that which divides one endogamous group from another, and it is this fact which gives to endogamous group councils (or subcaste councils as they are often, and loosely, termed) their unique place in Hindu life. It has been seen that the boundaries of intermarriage are fixed largely by behaviour patterns associated with the pollution concept, and it is the maintenance or, if possible, the betterment of these behaviour patterns that is the main concern of these councils. Since endogamous groups tend to be fairly widely dispersed over a number of contiguous villages and towns, meetings of their councils are usually held only when a social occasion such as an important wedding or one of the annual festivals brings all members of the group together. Disputes are held in abeyance until such occasions, and if any serious breaches of taboos occur in the intervening periods. the offenders are temporarily outcast and denied all social intercourse with the group until their case has been tried and a decision reached. It is only on rare occasions that the councils of endogamous groups intervene in matters concerning employment, and then their intervention usually takes the form of supporting the strike of a local brotherhood by withholding all replacements of labour. Disputes over employment do occur between brotherhoods, but the little evidence that exists seems to indicate that these are settled by negotiation between the parties concerned and rarely reach the level of the endogamous group council.

Although village councils or *panchayat* are primarily local authorities rather than caste authorities, they play an important part in caste government. Every Indian village contains sections of many caste groups. Some of these, such as, for example, the Brahman priests. the washermen, musicians and sweepers, play a traditional role in village ritual and on many social occasions. All are econoinically or socially interdependent in some degree, and hence disputes in one caste group tend to spread to others as partisans take sides. For this reason the village council is always interested in caste affairs, and where the villagers are united and friendly. it is often called in to act as a court of arbitration when a caste council fails to reach a settlement that will restore peace.

The penalties inflicted by caste group councils vary according to the kind of offense committed. If the offense is against the rules of a particular caste group, as when a member of a vegetarian group is found eating meat, the penalties would include a purification ceremony to remove the internal pollution accruing from this act and also an order to pay a fine or give a feast to a specified number of caste brethren or Brahmans. If the offense is against values held in common by Hindus as a whole, as when a Hindu kills a cow, the penalties would include not only a severe purification ceremony and heavy penalties but also a penance to remind all in the neighbourhood of the folly of such ways. The penance may involve a pilgrimage to a holy place or a shameful circumambulation of the neighbouring villages dressed in dust and ashes with, perhaps. the tail of the martyred cow dangling from the neck. Execution of judgment is achieved by the simple process of suspending the offender from all group contacts until he has done what he was ordered to do. Of course some stubborn people do resist, and then much depends on the strength of the hold which the caste group has over them. Sometimes the battle of wills ends in the offender being thrown out of his caste group forever: sometimes he is able, by persuading a number of caste brethren to upset the suspension order by taking a meal with him, to force a reconsideration of the matter and perhaps a lighter sentence. Punishment for offenses against the general values of Hinduism is more difficult to escape, as in this case all the caste groups of the neighbourhood are united in condemnation, and the offender's own caste group would be ridiculed if it showed any weakness. In most cases the power of suspension is strong enough to achieve its end: indeed the social and psychological effect upon the individual is often sufficient to lead to suicide. Caste penalties, like caste commensality, are at once divisive and unifying. The penalties imposed for offenses against particular caste-group laws emphasize the difference between groups, and the penalties for offenses against the common values of all Hindus emphasize the underlying unity of the whole of Hindu society.

Incidentally, all caste-group councils up to and including the councils of endogamous groups are called *panchayat,* the usual term for a judicial body. The committees of wider associations in the caste system, on the other hand. are labeled *sabha,* and this difference in title emphasizes an important difference in function. *Sabhas* are advisory, not supervisory, at least insofar as behaviour taboos are concerned. Commensal groups composed of several endogamous groups of equal status will sometimes convene meetings of committees representing all concerned to discuss behaviour reforms, but, having come to agreements, these committees must leave implementation to the councils of the endogamous groups. If some of these lesser groups agree to carry out the new

policy and others do not, fission will occur and two new commensal groups will be formed, each adhering to the behaviour pattern agreed upon by its component groups. Nevertheless. there are certain matters in which the *sabhas* of commensal groups and caste associations can take positive action and among these, in modern times, are the provision of urban housing, both for workers and students, and of scholarships and bursaries to the universities. The subdivision of agricultural holdings and increased industrial opportunities in the larger towns and cities has led to a great flow from the land which in turn has created serious housing difficulties. In many cities these have been overcome by the building of tenements by caste associations for letting to members of the associated groups. These co-operative activities engender a certain rivalry between caste associations but have not resulted in any noticeable diminution of status differences between the endogamous groups of which they are formed.

A noticeable feature of caste government is the association of certain kinds of authority with different broad levels in the caste system as a whole. In general, permanent caste councils are associated with low status, and ad *hoc* councils, or a complete absence of formal caste government, with high status. There are several possible reasons to account for this, other than the oversimplified popular explanation that lower caste groups, being of coarser fibre, need stronger discipline. In the first place the highest caste level—that of orthodox Brahman groups—is the source from which flows the main body of Hindu law used in the courts of civil law. This law is recorded in the Vedic scriptures and in the commentaries made through the centuries by savants. A grounding in it is given to all orthodox Brahmans during their period of studenthood, and all are therefore capable of understanding what breaches of the law entail. Moreover, the Brahman priestly lineages, being linked by ties of ritual with the lay lineages to whom they administer, are widely dispersed over the length and breadth of India. They would find it almost impossible to summon a lineage council, let alone that of an endogamous group of lineages. In these circumstances it is not surprising to find that orthodox Brahmans, conscious of their eminence in society and of the fact that all important people know their law, allow public opinion to discipline their offenders, or when this fails, turn to the state courts for redress. Again, the Rajput lineages which practise hypergamous marriage do not form endogamous groups, for the very reason that their lineages differ in status, and therefore one finds that the highest level in their caste government is that of the exogamous group council. In short, the nature of caste government in groups of high status depends more upon their physical dispersion, marriage customs and other such criteria than on any correlation between high status and good behaviour. Nevertheless, there is no doubt that the absence of the more normal caste *panchayat* at the higher levels in the caste system is becoming accepted as a criterion of high status—an aim to be achieved by all those caste groups which have social ambitions—and this may have far-reaching effects upon the whole future of caste government.

It is interesting to speculate about the influence of British rule on the development of large-scale caste associations and such committees as caste *sabhas* and the Hindu Mahasabha. The British introduced the notion of large-scale democracy into a social system in which, in spite of its inequalities and rigidities, there existed already a high degree of small-scale democracy which was both well organized and articulate. From the beginnings of municipal elections in British India, politicians of all parties, including those, such as the Communists, who opposed status division, made full use of the caste structure as a potential machine. Its convenience in this respect may be of some importance to its continued survival in an era of state-wide democracy. (See also INDIAN LAW.)

The Assimilation of Tribal Groups.—Much was written about the plight of the numerous hill tribes living on the fringes of Hindu society, and many fears were expressed that assimilation into the caste system would lead to their ultimate degradation. Attention was concentrated, however, on changes in the pattern of tribal worship, and on the economic consequences of such governmental actions as the closing of forests to hunting and shifting cultivation. So writer pointed to the fact that these tribes have in their own hands the key to assimilation at a respectable status level. So long as they remain outside caste society, living isolated and self-sufficient lives, their pattern of social behaviour is their own affair. As soon as they become enveloped in Hindu society, ho ever, they come within the purview of the pollution concept. Such habits as premarital intercourse, marriage at maturity, divorce, widow marriage, the eating of domestic pork, fowl flesh, beef and other banned foods, all of which are common customs among these hill peoples, will no longer be tolerated as the whim of groups outside the system. They are regarded as sins against the Hindu behaviour pattern and, as such, automatically downgrade the offending groups. This is why so many once proud tribes have found themselves, after assimilation, "at the bottom of the caste ladder," even though they have given up their tribal gods and taken to the worship of Hindu gods in their efforts to please their neighbours. They discover too late that it is not the gods they worship that matter in status evaluation, but the way they eat, drink and make merry.

Assimilation of tribal groups follows the same general lines in all parts of India. The first feature of tribal society to come under pressure in Indian as in British-Indian days is its political structure. Central government laws are applied; central government officials take over many of the functions of the tribal leaders and councils. By this process of attrition tribal power is ground away until all that remains is the right to judge such offenses against tribal customs as do not fall within the competence of civil and criminal courts. The process is accelerated by the infiltration of caste groups of artisans—weavers, smiths, basketmakers, musicians and the like—who settle among the hill peoples and introduce functional specialism into their erstwhile unspecialized economy. These incomers, not being tribesmen, do not come under tribal law; they govern themselves under caste custom, as the tribesmen govern themselves under tribal custom, subject only to the central government laws. Thus the tribes soon, find themselves living in a stratified society in which they, the original landholders, have become outcasts because they still follow traditional behaviour patterns. Under these pressures the better-class families react in much the same way as better-class families in rising Hindu caste groups. They begin to copy the behaviour of high-caste groups. They give up degrading customs and attempt to persuade their cotribesmen to follow suit. If this is not possible, they break away in much the same way as sections of endogamous caste groups do when fission occurs. The reforming families cease interdining with those who refuse to follow their lead. They reduce marital links with them first by introducing hypergamous marriage by taking daughters from but refusing to give daughters to the "low-behaviour" lineages, and finally establish themselves as a self-governing endogamous and commensal group similar in every important respect to a Hindu caste group. Instances of such changes in status are to be found in every tribe.

The Future of the Caste System.—India's leaders have introduced many legislative, administrative and social measures in what is often described as the "war" against caste customs. Yet it was still possible in 1955 for a gathering of eminent Indian savants to record that "there is no sector of our life, private or public, that it [caste] does not permeate." Caste practices are not dying easily. The system still seemed, in the early 1960s, too flexible, too easily adaptable to changing conditions—as its application to electioneering and job preservation has shown—to be destroyed overnight. The greatest danger was that reformers might press on with change for political reasons before research had shown what ought to be preserved. It would be a tragedy if, through lack of understanding, the opponents of caste should destroy what was good in their efforts to eradicate its evils, or if, in their efforts to save what was good, its defenders should find themselves defending what ought to be destroyed.

CASTELAR Y RIPOLL, EMILIO (1832–1899), Spanish statesman, who was a powerful and consistent champion of republicanism in Spain in the second half of the 19th century, was born at Cádiz on Sept. 7, 1832. He was educated at Madrid university where he subsequently became professor of history. Active in politics, he soon achieved fame as an orator and notoriety for his speeches against the monarchy. When, for political reasons, he was deprived of his chair (April 1865), there were serious disturbances in Madrid. After the abortive republican rising of 1866, he was sentenced to death but escaped to France. Returning after the revolution of 1868, he entered the *Cortes* as a delegate for Saragossa, at the same time resuming his chair at the university. His campaign for a federal republic was successful after King Amadeo's abdication (Feb. 1873). Castelar entered the new government as minister of state, but disorder was so rife that the president of the executive, Estanislao Figueras, fled the country. The doctrinaires Francisco Pi y Margall and Nicolás Salmerón failed to control the situation; and Castelar, representing the extreme right, became president in September. He suspended the sittings of the *Cortes* and imposed a virtual dictatorship, but pursued a conciliatory policy, aimed at the restoration of law and order. Castelar's conservatism, however, alienated the extreme republicans; and at the end of 1873 it was evident that, if the *Cortes* reassembled, he would be deprived of the presidency. To avoid this, Manuel Pavía, captain-general of Madrid, proposed to him that he should dissolve the *Cortes.* Castelar refused and was defeated on Jan. 3, 1874. Thereupon Pavía staged a *coup d'état,* and the federal republic came to an end. Castelar returned from exile after the monarchy had been restored in the person of Alfonso XII, was elected to the *Cortes* as deputy for Barcelona and continued to advocate the establishment of a republic by peaceful means. As leader of the opposition, he championed religious toleration, universal suffrage and the abolition of slavery in Puerto Rico. Estranged from the extreme republicans, particularly in the period 1886–91, he often found himself on the side of P. M. Sagasta, the Liberal leader. He died at San Pedro del Pinatar. Murcia, on May 25, 1899. . Castelar left more than 90 works, including novels. memoirs, historical writings and voluminous collections of political speeches. (J. C. J. M.)

CASTEL GANDOLFO, village and castle in Roma province, Latium region, Italy, is situated in the Alban hills, 1,398 ft. above sea level, 13 mi. from Rome on the edge of the ancient crater that forms Lake Albano (*q.v.*). Area 5½ sq mi.; pop. (1951) 1,899. The castle belonged to the ducal family Gandolfi in the 14th century. It became the inalienable domain of the Holy See (1604) and afterward the summer seat of the pontiff. Within its precincts is the vast Apostolic or Papal palace which was erected at the instigation of Urban VIII (pope from 1623–44) and later enlarged and modified by popes Alexander VII, Clement XIII and Pius IX. Two architects collaborated in its construction, Carlo Maderno, who designed the face of St. Peter's, and Giovanni Lorenzo Bernini. The walls of the reception hall are covered with precious marble, brocades, and splendid tapestries and display panels by Carlo Dolci, Paolo Veronese, and Salvator Rosa. The palace. which has extraterritorial privileges, is surrounded by a magnificent terraced park built on the ruins of the villa of the Roman emperor Domitian.

After 1936 the famous Vatican observatory, founded by Gregory XIII (1572–85), was housed in the former Villa Barberini. In the square opposite the castle is the church of S. Tommaso da Villanova. the work of Giovanni Lorenzo Bernini. Castel Gandolfo possibly occupies the site of ancient Alba Longa (*q.v.*).

(M. T. A. N.)

CASTELLAMMARE DI STABIA, a seaport and episcopal see of Campania, Italy, in the province of Naples, is 17 mi. S.E. by rail from the city of Naples. Pop. (1957 est.) 61,788 (commune). It lies in the southeast angle of the Ray of Naples, below the ruined castle from which it takes its name. This was built by the emperor Frederick II. In 1310 Robert of Anjou built the Casa Sana, "House of Health" (a name corrupted to Quisisana), now a hotel; its park nas used by Boccaccio as the background for some of his *Decameron* tales. Because of the sea and mineral water baths (12 different springs) and its attractive situation below Punta Lattari, the town is a favourite summer resort. It has a large shipyard where the bathyscaphe used by Auguste Piccard for marine exploration was built. Nearby was the ancient Stabiae (*q.v.*), destroyed by an eruption of Vesuvius in A.D. 79.

(M. T. A. N.)

CASTELLÓN DE LA PLANA, a city of eastern Spain, is the capital of the province of the same name, which is the northernmost of the three forming the ancient kingdom of Valencia. The city lies 4 km. (2½ mi.) from the Mediterranean coast and 67 km. (42 mi.) N.N.E. of Valencia by road. Pop. (1960 est.) city 60.287; province 337,548. Area of province 6.669 sq.km. (2.579 sq.mi.).

The city of Castellón was first founded on top of the La Magdalena hill. In 1233 James I conquered it from the Moors and in 1251 authorized its removal to the plain (*plana*) on petition by the inhabitants. The town was then called Castellón de Burriana and later Castellón de la Plana. It was made the provincial capital in 1833 and in 1873 given the status of a city—the only one in the province.

The capital lacks direct communications with central Spain. The only connections by rail and main road are those of the Barcelona-Valencia route. There is a good network of bus services, a mining railway at Ojos Negros and a narrow-gauge line between Onda and El Grao (the port of the city) which clears about 600 vessels annually, mainly exporting fruit.

The province of Castellón is situated on a fertile plain, watered principally by the Mijares, or Millares, and by the Palancia; the other rivers are short and often run dry. There are a number of small interior mountain ranges, derived from the Ibérico sistema, which occasionally reach the coast. Alternating with these ranges are the coastal plains, broken up by areas of ancient volcanic activity. The Columbretes Islands off Castellón are volcanic remains of submerged craters. The coast is generally steep but with beaches at Benicarló and Vinaroz. The most notable natural regions are: the inhospitable Maestrazgo, with the city of Morella; the Tierra del Cid, centred on Lucena del Cid; and the valleys of the Mijares and Palancia.

Evergreen oaks, cork trees and pines predominate in the mountains. Dry farming is extensive, covering most of the province except the irrigated areas and lowlands of the coastal zone, where oranges, almonds, figs and pomegranates are grown. There are few minerals and little industry except the manufacture of ceramics (tiles) at Onda. Alcora and Villarreal, and of shoes at Vall de Uxó. About 200 small factories make hemp sandals. Fishing (sardines. mullet, anchovies) is centred on the ports of Burriana, Vinaroz and Benicarló.

CASTELNAU, MICHEL DE, SIEUR DE LA MAUVISSIÈRE (c. 1520–1592). French soldier and diplomat who was the author of remarkable *Mémoires,* but whose long and obscure career in the royal service was otherwise typical of that of many such younger sons of minor noble families without much money or in-

fluence. Born in Touraine, he visited Mediterranean countries and then took military service in Piedmont with Charles, cardinal de Lorraine, and later in Picardy with the duc de Montmorency, constable of France. After the peace of Câteau-Cambrésis (1559) he entered the royal service and was sent in 1560 on diplomatic missions to England, Germany, Savoy and Rome. In 1561 he accompanied the widowed Mary Stuart back to Scotland, where he stayed for a year.

In 1562 Castelnau interrupted his diplomatic career to return to soldiering in the king's army, fighting against the Huguenots in Brittany and Normandy. In 1572, however, Charles IX sent him to England, Germany and Switzerland to appease the anger aroused by the massacre of St. Bartholomew's day. In Sept. 1575, he was sent by Henry III as ambassador to Elizabeth I of England. He stayed there until 1585, but failed to negotiate a marriage between Elizabeth and Henry III's brother, François, duc d'Alençon.

The last years of his life were difficult. Refusing to join the League at the time when it dominated France, he was excluded from official appointments. His château of La Mauvissière had been destroyed in the previous warfare. Henry IV gave him a military command, but Castelnau died in poverty at Joinville in 1592.

Castelnau's *Mémoires* were written during his embassy in England, with an eye to the moral instruction of his son. Covering the years 1559–70, they provide a well-informed account of the beginnings of the religious wars. First published in France in 1621, they were re-edited during the 18th century. Castelnau also translated into French a Latin work of Petrus Ramus, the *Traicté des façons et coustumes des anciens Gaulois.*

CASTELNUOVO-TEDESCO, MARIO (1895–), Italian composer whose style is essentially romantic; was born in Florence, April 3, 1895, and studied composition there with I. Pizzetti. On the eve of World War II he immigrated to the U.S. and settled in Hollywood. He appeared as soloist in his second piano concerto and also wrote three violin concertos, a cello concerto and a concerto for guitar and orchestra. His orchestral works include an interesting series of overtures to 12 plays by Shakespeare, whose sonnets and poems he has frequently set to music. He also composed two Shakespearean operas. *The Merchant of Venice* (1956) and *All's Well That Ends Well* (1957). His chamber music is scored for a variety of combinations; his piano pieces are conceived as miniature symphonic poems; his songs retain the melodiousness of the Italian school; and his harmonies are opulent and often complex. (N. Sy.)

CASTELO BRANCO, CAMILO (1825–1890), the most prolific Portuguese novelist and a master of the Portuguese language. He was born in Lisbon on March 16, 1825, the illegitimate son of Manuel Botelho, and of a family afflicted with a hereditary tendency to insanity. He was left an orphan when still very young and was brought up by relatives living in the Trás-os-Montes region in northern Portugal. He studied in Oporto. where he also engaged in journalism and shared in the Bohemian *cafe'* life. As a result of a religious crisis he entered a seminary for a time. His chequered love affairs culminated in his conquest of Ana Plácido, the wife of an Oporto businessman. The two lovers were imprisoned (1861), an event which gave notoriety to a man who had already won repute as a writer, but in 1864, after the death of the lady's husband, they settled in the village of Seide in the Minho region. Camilo wrote unceasingly, producing, in addition to some verse of indifferent quality, plays, works of erudition and hard-hitting polemical writings, scores of novels of unequal merit. Suffering from ill health, almost blind, beset by misfortune and melancholy recollections of the past, he ended his life by his own hand at Seide on June 1. 1890.

A romantic by temperament and background, Camilo put much of his own life into his work. He wrote for the provincial middle-class, especially the womenfolk, who read avidly stories of thwarted love in which the rights of passion were defended against narrow prejudice. The incidents of his plots, which at times are on the level of the popular serial but at others have a truly tragic quality, are narrated with conciseness and vigour *(cf., O Romance d'um homem rico,* 1861; *Amor de perdição,* 1862, a famous novel representative of Portuguese sensibility; *Amor de salvação,* 1864; *O Retrato de Ricardina,* 1868). He did strive, however, to be natural, following the example of Balzac *(cf., Onde está a felicidade?* 1856; *Vingança,* 1858), and his novels faithfully reflect an age of transition, in which a decaying nobility was in conflict mith a victorious middle class. the latter being caricatured in the figure of the ridiculous *brasileiro,* the type of Portuguese who has grown rich in Brazil. A man of extremes! switching rapidly from the lyrical to the sarcastic, mith a view of life dominated by the concepts of sin and redemption through suffering, although at times rebellious and blasphemous, Camilo was nevertheless capable of a healthy good humour *(cf., Coracão, cabeça e estômago,* 1862; *A Queda d'um anjo,* 1866). Interested in relics of the past, he wrote historical novels *(Lucta de gigantes,* 1865; *O Santo da montanha,* 1866). His style, based on a great wealth and precision of vocabulary, reveals his close acquaintance with the Portuguese classics and with the people of the countryside whom he depicted so well.

In the *Novelas do Minho* (1875–77) he turns toward naturalism, joined to that spontaneous, dramatic yet sober realism already evident in some passages of the *Amor de perdição.* But, annoyed by the change in public taste, he parodied the new naturalist school in *Eusébio Macário* (1879) and its sequel *A Corja* (1880). He assimilated, however, with no hostile satirical intent, the impressionism in descriptive writing of Eça de Queirós and his followers, as can be seen in *A Brasileira de Prazins* (1882).

CASTELO BRANCO, a city of central Portugal, is situated in Beira Baixa province, 337 km. (209 mi.) N.E. of Lisbon by road. Pop. (1960) 66,020 (mun.). The city has Roman remains and is dominated by a castle. It is still partly enclosed by ancient walls. There are three wide main avenues: Nun' Alvares, Marshal Carmona and 28 de Maio. The main buildings are the cathedral, episcopal palace and the modern Turismo hotel. Castelo Branco is on the railway from Abrantes to Guarda. It manufactures cloth, including the traditional Castelo Branco counterpanes, and has a flourishing local trade in cork, wine, olive oil and cheese. The administrative district of Castelo Branco lies in the southeastern part of the province of Beira Baixa. Pop. (1960) 325,800; area 6,703 sq.km. (2,588 sq.mi.). (J. A. da C.)

CASTELO MELHOR, LUIZ DE VASCONCELOS E SOUSA, Conde de (1636–1720): Portuguese royal favourite who, as effective governor of the kingdom from 1662 to 1667 during the reign of Afonso VI, was responsible for the successful prosecution of the war against Spain, which led, in 1668, to Spanish recognition of Portugal's independence. Shortly after Afonso VI's coming-of-age in 1662, the king appointed Castelo Melhor his secret notary (*escrivão da puridade*), a position in which the favourite was able to exercise the functions of first minister. Castelo Melhor overcame the difficulties which had hitherto beset Portugal in the war against Spain, reorganizing the troops (now reinforced by an English contingent by virtue of the English king Charles II's marriage to Catherine of Braganza) and entrusting their command to competent generals. Consequently the war entered a victorious phase for Portugal (1663–65) and Spain began peace negotiations. Agreement proved difficult to attain and meanwhile the internal political situation in Portugal deteriorated. The king was obliged to dismiss Castelo Melhor on Sept. 9, 1667, shortly before he himself mas deprived of power. Castelo Melhor went into exile in Paris and then London, but in 1685 he was permitted to return to Portugal and, two years after that, to court. On the accession of John V (1706) he was appointed a councilor of state and he continued to occupy a position of dis-

tinction until his death on Aug. 15, 1720. (DA. A. P.)

CASTI, GIAMBATTISTA (1724–1803), Italian satirical poet and one of the first writers of comic opera librettos, was born at Acquapendente, Italy, Aug. 29. 1724. He entered the Church but abandoned the career of an ecclesiastic for that of a pleasure-seeking poet at the courts of Germany. Austria and Russia. At the court of Maria Theresa he attracted attention with his amusing *Novelle Galanti* which were later to be imitated in France. He became a favourite of Catherine II who inspired his satirical *Poema Tartaro* (1787). In Paris, where he settled in 1798, he championed the democratic cause. Casti's enduring work is *Gli Animali Parlanti* (1802; Eng. trans.. *Court and Parliament of Beasts,* 1819), an ironic version of the social conflicts thrown up by the French Revolution. He also wrote librettos for comic operas by Giovanni Paisiello and Antonio Salieri. He died in Paris on Feb. j. 1803.

CASTIGLIONE, BALDASSARE (1478–1529), Italian diplomat and author of *Il Cortegiano,* a famous Renaissance treatise on courtly manners, was born at Casatico, near Mantua, on Dec. 6, 1478, and educated in Milan at the humanist school of Giorgio Merula and Demetrius Chalcondyles. While at the court of Ludovico Sforza ("il Moro"), he learned the art of chivalry. In 1499 he entered the service of Francesco Gonzaga, marquis of Mantua, and in 1507 that of Guidobaldo da Montefeltro, duke of Crhino. He remained at Urbino until 1513, and after Guidobaldo's death (1508), continued to serve his successor, Francesco Maria della Rovere. In Urbino he met Pietro Bembo. Bernardo Bibbiena. Giuliano de' Medici. l'Unico Xretino (Bernardo Accolti), Ludovico da Canossa, Ottaviano and Federico Fregoso, who eventually became the interlocutors of his *Cortegiano,* and there he composed most of his minor works: including, besides Latin and Italian verses: the eclogue *Tirsi* (1506) and the prologue to Bibbiena's *Calundra.* He was sent to England in 1506 to receive the order of the garter on behalf of Guidobaldo. In 1509 he followed Della Rovere, commander of the papal army, in the war against Venice; in 1511 he took part with Julius II in the siege of Mirandola. For his services he was made count of Novilara, near Pesaro. As ambassador of the duke of Urbino he went in 1513 to the court of Leo X in Rome; in 1516 he was back in Mantua, where he married Ippolita Torelli (d. 1520). In 1524 he was appointed apostolic prothonotary and in 152j he was sent to Spain as papal nuncio to Charles V. After the sack of Rome by the Imperialists (1527) he was accused by Pope Clement VII of not having foreseen it. but he succeeded in proving his innocence of treacherous intention. He died in Toledo on Feb. 2, 1529, a year after the publication of his *Cortegiano,* which had been written in Rome and Mantua between 1513 and 1518.

The treatise, written in dialogue form, deals with the perfect courtier, the noble lady, and the relationships between the courtier and the prince. The courtier envisaged by Castiglione symbolizes the highest moral aspirations of the Renaissance. From the literary point of view the *Cortegiano* is one of the outstanding books of the century. It found immediate favour outside Italy and was translated into many languages. Sir Thomas Hoby's English version. *The Courtyer* (1561), was one of the most influential prose works of its day.

See B. Maier (ed.), *Il Cortegiano, con usa scelta di opere minori di B. Castiglione,* which includes a bibliography of earlier studies (1955). (G. A.)

CASTIGLIONE, GIOVANNI BENEDETTO (1616–1670). called in Italy IL GRECHETTO, and in France LE BENÉDETTE, Italian painter and printmaker of the Genoese school, was born in Genoa. Castiglione was a highly productive painter who left portraits, historical pieces and landscapes, but he excelled in fairs, markets and rural scenes with animals. He studied under Giovanni Battista Paggi, and Giovanni Andrea de Ferrari. In his etching he imitated the Netherlandish school. The prints of Van Dyck probably were the greatest stylistic influence upon him. He also knew some of Rembrandt's work intimately, but his style was closer to that of Jan Lievens. He was the first known practitioner of the monotype (*q.v.*). In his closing years he lived in Mantua, painting for the court, and died there in 1670. His brother Salvatore and his son Francesco studied with him and perpetuated his manner.

See A. Blunt, The *Drawings of G. B. Castiglione . . . at Windsor Castle* (1954).

CASTIGLIONE, BATTLE OF, was fought on Aug. 5. 1796, between the French under Napoleon Bonaparte and the Austrians under D. S. von Wurmser, in northern Italy. Bonaparte, having occupied Milan and Lombardy, was investing Mantua nhen Wurmser marched against him from the Tirol with 47.000 men. Bonaparte's 45.000 (of nhom 10,000 were at Mantua) nere at first dispersed over a front of 50 mi.. but Wurmser failed to defeat them in detail. partly because he sent 17.600 men under P. V. von Quosdanovich to the west of Lake Garda while he himself led 24,300 down the Adige. On July 29, the Austrians' appearance above Rivoli and advance on Brescia caused Bonaparte to order his troops to concentrate south of Lake Garda, where the Austrians nould unite and nhere he would occupy a central position. On July 30 he suspended the siege of Mantua, sacrificing his siege train to enjoy temporary numerical superiority. Wurmser entered Mantua on Aug. 1, but detachments of Quosdanovich'i force were worsted at Salo and Lonato on July 31 and at Brescia on Aug. 1. Seeing his error. Wurmser sent his vanguard to Castiglione, which he took, but lost to Augereau on Aug. 3. Wurmser's 25.000 men now held an over-long front. from Solferino to Medole. nhich Bonaparte could attack with 31,000 when Sérurier's troops arrived from Mantua. Neglecting the danger of Sérurier's division's turning his weaker flank at Medole, Wurmser extended his line toward Quosdanovich near Lonato, a movement that Bonaparte encouraged by pulling back the French left wing, so that Wurmser's reserves were to the north when Bonaparte's reinforcements outflanked the Austrian left wing. The advance of Augereau and Masséna in the centre prevented an Austrian change of front and brought on the collapse of the whole Austrian line. Decisively defeated. the Austrians withdrew to the Tirol. having lost 16,000 men (2,000 on Aug. 5) in a nine days' campaign. The French resumed the siege of Mantua.

(J. H. N.)

CASTILE, the name of the central region which comprises more than one-quarter of the area of peninsular Spain, represents the limits reached at the end of the middle ages by the kingdom of Castile proper, and by the Moorish kingdom of Toledo, nhich had been annexed to the Castilian cronn at the end of the 11th century. The former, known as Old Castile (Castilla la Vieja), contains the modern provinces of Ávila, Burgos, Logroiio, Palencia, Santander, Segovia, Soria and Valladolid. After the middle ages the name New Castile (Castilla la Nueva) uas given to the former kingdom of Toledo. It consists of the modern provinces of Ciudad Real. Cuenca, Guadalajara, Madrid and Toledo. The Sierra de Guadarrama forms the approximate dividing line betneen the two.

The name Castile — probably meaning "land of castles" — is first found in 800. when it nas applied to a small district at the foot of the Cantabrian mountains in the extreme north of the modern province of Burgos. This territory expanded during the 9th century but remained broken up into petty counties, whose rulers were nominated by the kings of Asturias and León, until these counties were united by Fernán González (c. 923–c. 970), the first count of all Castile. With him the history of Castile as a political entity really begins. He contrived to make the new county hereditary in his family, and thus secured a measure of autonomy for it under the kings of León. In the time of Fernán González the capital of the county was established at Burgos, where it was to remain, and expansion southward into Moorish territory occurred. Cnder counts Garcia Fernbndez (c. 970–1005) and Sancho Garcia (1005–17) the territory of Castile reached as far as the Douro (Sp. Duero) river. Relations with the kings of Léon, still nominally suzerains of Castile, were frequently bad.

The urge toward independence shown by the counts and people of Castile from the beginning has been variously explained. It seems likely that the regions conquered by the counts of Castile from the Moors were generally repopulated by emigrants from Cantabria. who had scarcely been affected by Arabic culture and custom, uhereas in León there was a large immigration of Mozarabs from the Moorish areas further south, thus establishing

marked social and other differences between the two regions. The kingdom of León was deeply conscious of its position as successor to the Visigothic empire of Hispania. but the county of Castile rejected the ancient Visigothic legal code (*Forum Judicum*), the basis of Leonese law, in preference for local customary law. Small, free proprietors were prominent among its people. and a considerable number of minor nobles (*infanzones*), rather than the traditional magnate families of León, made up the Castilian nobility. Later, however, the Castilians came to think of themselves as truer representatives than the Leonese of the Visigothic tradition.

In 1029 Castile lost its autonomy and passed into the hands of Sancho III (the Great) of Navarre. On his death (1035) he left it, as a kingdom, to his son, Ferdinand I. Under Ferdinand it was first united with León (1037–65), though the seniority of León in the partnership was still recognized. Castile was again united with León (1072–1157) under Alfonso VI and Alfonso VII (*see* ALFONSO, kings of Asturias, León and Castile) but thereafter the two kingdoms once more separated. The political and military hegemony of Castile over León was established by Alfonso VIII of Castile (1158–1214) who, in 1188, forced the king of León to do homage to him. By now, Castilian rule extended far south of the Tagus river and eastward to the modern frontiers of Aragon. The Leonese kings, however, never accepted the claims made by Castile to suzerainty and Alfonso IX of León refused, in consequence, to support Alfonso VIII in his wars against the Xlmohads. Castilian pursuit of political hegemony over León, therefore, partially weakened the Christian front against the Muslims. In 1230 Ferdinand III, already king of Castile, succeeded to the Leonese throne and both crowns were finally united under Castilian leadership.

An attempt by Castile to annex Portugal by force in 1383–85 failed. but a Castilian prince. Ferdinand of Trastámara, was successfully placed on the Aragonese throne. partly as a result of Castilian financial support and military force, in 1312. This move foreshadowed the personal union of the two crowns under Ferdinand and Isabella. The kingdom of Navarre was annexed by Castile in 1512.

Castilian political hegemony in Spain was an accomplished fact from the middle of the 12th century, and the chanceries of European courts in the later middle ages frequently identify Castile with Hispania. The final conquest of most of Andalusia was carried out by Castilian armies in the time of Ferdinand III. The literary language of Spain after its unification was the Castilian vernacular, and the centre of political and administrative power since then has always been in Castile. Nevertheless, opposition to the political hegemony of Castile from the other regions, which enjoyed complete or partial independence in the middle ages, has always remained strong and is still a live political issue, especially since the centres of modern industrial strength in Spain are now largely outside Castile, which, for geographical reasons, is an economically backward area. It has been claimed that medieval Castile was, in all respects, a more progressive kingdom than its neighbours. with a more developed sense of the unity and destiny of Spain. Some of these claims seem exaggerated. Castilian separatism undoubtedly weakened for several centuries the capacity of the kingdom of León to recover Moorish territory. After the close of the middle ages, at least, Castile and its people were, in many respects, markedly hostile to any departure from tradition. The real reason for the dominating part which Castile has played in Spanish history may well have been the superior martial spirit and military organization of its people. *See* also SPAIN: *History*. (P. E. *R.*)

CASTILHO, ANTÓNIO FELICIANO DE (1800–1875), Portuguese poet and an influential literary figure, was born in Lisbon, Jan. 28, 1800. He lost his sight at the age of six, but the devotion of his brother Augusto, and a retentive memory, enabled him to become an accomplished classical scholar. His first important work, *Cartas de Eco e Narciso* (1821). belongs to the pseudoclassical school but a more romantic note is sounded in the sentimental lyrics of *Amor e melancolia* (1828); full-blown romanticism is dominant in the melodramatic poetic legends, *A Noite do Castelo* and *Os Ciúmes do Bardo* (both 1836). Thereafter, while producing some verse in which the romantic tones are much modified! Castilho undertook much translating of the classical poets and wrote on social, political, pedagogical and literary themes. His lack of strong individuality and over-great respect for authority prevented him from achieving original work of real merit. Castilho died in Lisbon, June 18, 1875,

Salgado Júnior, "Castilho" in *Perspectiva da Literatura Portuguesa do Século XIX*, vol. i (1947); A. J. Saraiva and O. Lopes, *Histdria da Literatura Portuguesa* (1954). (N. J. L.)

CASTILLEJO, CRISTÓBAL DE (14901–ISSO), Spanish poet, remembered as one of the last to use exclusively the Spanish medieval metres. and for his protests in vigorous verse against the Italianate innovations of Boscán and Garcilaso. Castillejo was horn at Ciudad Rodrigo. Spain. When quite young he entered a Carthusian monastery, but in 1525 became secretary to Charles V's brother, Ferdinand of Austria, in whose service he spent the rest of his life, mostly outside Spain. He died at Vienna, probably on June 12, 1550.

His love poetry, addressed to an impressive number of ladies, is neat and free from artificiality; his satirical work is light and lively. His *Sermdn de Amores* (1542), which uses sacred phrases in profane contexts, was in part suppressed by the Inquisition.

See C. *L.* Nicolay, *The Life and Works oj C. de Castillejo* (1910). (C. C. SH.)

CASTILLON, BATTLE OF, the last battle of the Hundred Years' War, was fought on July 17, 1453. The English had been expelled from Gascony by the French in 1451, but after the arrival of an army at Bordeaux in Oct. 1452 under John Talbot, earl of Shrewsbury, parts of western Gascony, including the town of Castillon-sur-Dordogne, had returned to English loyalty. On July 13 or 14, 1453, the French arrived to besiege Castillon. Expecting an English attack, they first constructed a defensive position, enclosed by a ditch and earth rampart, east of the town. Shrewsbury hurried to relieve Castillon with 5.000–6,000 men, 1.000 of them mounted, and on July 17 surprised an enemy outpost. He then made a disastrous mistake: though his foot soldiers were still some way behind, he ordered an attack on the camp, apparently believing that the French were withdrawing. When the English horsemen found the camp defenses lined with soldiers and with cannon, Shrewsbury impetuously ordered a dismounted attack, and for an hour (during which some of the foot arrived) there was hard fighting, in which the cannon claimed numerous victims. At length a French sortie put the English to flight. The majority escaped, but many, including Shrewsbury, were killed or captured. Castillon surrendered on July 18. Gascony had now lost its only army, and the surrender of Bordeaux in October ended the war. The tactical importance of Castillon lies in the successful employment of cannon, which France had first used in the field at Formigny (1450).

See A. H. Burne, *The Agincourt War* (1956); *G.* Du Fresne de Beaucourt, *Histoire de Charles VII,* vol. v (1890). (J. W. SE.)

CASTILLO SOLÓRZANO, ALONSO DE (1584–1648?), Spanish novelist and playwright, whose ingenuity expressed itself best in his short stories, was born at Tordesillas (Valladolid). It is uncertain where and when he died. His stories are usually of adventure. but treated with wit and sophistication. Many of his tales are strung together by an artifice, or are arranged, in indirect imitation of the *Decameron,* within a framework. Examples are. *Jornadas alegres* ("Daytime Entertainments," 1626) and *Noches de placer* ("Evening Amusements," 1631) Of Castillo's novels the most important are *Las harpías en Madrid* (1631), *La niña de los embustes: Teresa de Manzanares* ("The Girl of Many Wiles: Teresa of Manzanares," 1632), *Las aventuras del Bachiller Trapaza* (1637) and its sequels: artificial, entertaining, picaresque novels which make much of the female *pícara* ("rogue") as protagonist or adjutant. As a dramatist Castillo was overshadowed by more brilliant contemporaries, but plays are included in his miscellanea which seem to have been influential abroad. (I. L. McC.)

CASTING. The process of giving shape to or reproducing an

object by pouring its material in liquid form into a mold.

See DIE CASTING; FOUNDING; METALLURGY; SCULPTURE TECHNIQUE; *see* also Index references under "Casting" in the Index volume.

CAST IRON, a wide range of iron-carbon-silicon alloys containing 2% to 4% carbon (much more than ordinary steels) along with varying amounts of silicon, manganese, sulfur and phosphorus. Cast iron, of which pig iron is a crude form, was the first of the ferrous metals to be cast. The Chinese are generally recognized to have produced the first objects of this metal, dating back to 513 B.C., while the first iron foundry in England is recorded to have been in Lincolnshire in A.D. 1161. Cast iron has occupied a place of great importance in the industrial world since the 18th century, but it was not until well after the close of the 19th century that iron founding (*q.v.*) became more of a science than an art.

Gray Iron.—The essential characteristic of cast iron is that much of the carbon is present as flake graphite, which gives it a gray-coloured fracture when broken and accounts for the name gray cast iron. Although gray iron is not as strong as steel, it does possess the very definite metallurgical advantages of lower melting and pouring temperatures. excellent fluidity and superior machinability. Gray iron is readily melted in a vertical-shaft. coke-fired furnace called a cupola. These and other attributes have led to its widespread use for many industrial purposes, including automobile motor blocks. agricultural and machinery parts, soil and pressure pipe, stove and furnace parts, hollow ware and ingot molds.

The strength of cast iron is most affected by its carbon content. since excess carbon is present in free flake form which weakens the steel-like matrix material. Hence the first means of increasing the strength of cast iron is to melt it with lower carbon levels. As this is done. the hardness increases until eventually the material loses its good machinability. It is at this point that alloys such as nickel, chromium, copper. molybdenum, vanadium and titanium are used to refine the graphite flakes and strengthen the matrix while still maintaining a hardness level that permits satisfactory machinability. Alloy contents. in addition to strengthening and toughening the iron. also increase its stiffness, pressure tightness. metal-to-metal wear resistance, and corrosion and heat resistance. In general they permit cast iron to be used in many services previously considered too demanding for this type of metal. Gray cast irons are usually catalogued in terms of tensile strength within a commercial range of 20,000 to 60,000 lb. per square inch (p.s.i.), the high side of the range often being in the form of alloyed irons.

The alloy content of ordinary cast iron generally does not exceed 3% to 4%. Special types of corrosion-resistant iron are made with greater alloy contents, for example. 11% to 17% silicon. 25% to 30% chromium or 20% to 30% nickel. The high-nickel types of iron possess an austenitic matrix structure (one with a solid solution of carbon or iron carbide in iron) and, in addition to corrosion resistance, possess many special properties such as being nonmagnetic and having thermal expansion characteristics either much lower or much higher than is the case for normal gray iron (see also ALLOYS: *Mechanical* Properties). The special properties developed by these highly alloyed types of cast iron have led to their widespread use.

White Iron.—The silicon content of gray cast iron is normally 1.5% to 3.0%. When this element is substantially lower a new type of cast iron is produced. It is called white iron because it shows a white fracture when freshly broken. The reason for the change is that with little silicon (0.3% to 1.0%) the compound iron carbide, or cementite (Fe_3C), present in all irons does not decompose into flake graphite and iron upon freezing and cooling to room temperature. Iron carbide is a very hard, brittle material and changes the nature of the iron drastically from its gray iron counterpart. White iron is very hard, stiff and unmachinable. It is widely used to resist wear and abrasion for such parts as grinding balls. chutes, mill liners and pulverizing elements. but its use is limited by its lack of toughness and relatively low strength.

By careful adjustment of silicon content and by the use of metal chillers placed in the sand mold to produce fast freezing at specific surfaces of a casting, it is possible to produce iron castings that are hard and white in part of their cross sections and gray and machinable in the balance. This process produces abrasion-resistant castings which can still be shaped by machining in certain areas. Such castings, usually called chilled iron castings, are used as freight car wheels and brake shoes, plowshares, pulverizer equipment parts, and rolls for steel mills.

The white and chilled varieties of cast iron are frequently alloyed with up to 1% chromium to prevent the breakdown of iron carbide into graphite. For withstanding extreme abrasion, white iron castings are often alloyed with up to 4.5% nickel and 2.0% chromium to produce very hard martensitic irons. These castings possess in the mold-cooled condition hardness equivalent to that of heat-treated steel. This type of white iron is widely used for steel-mill rolls and abrasion-resisting parts in the cement, ceramic, power and mining industries.

Malleable Cast Iron.—While cast iron possesses the advantages of being easily melted and readily cast into intricate shapes, it is a relatively brittle material because its matrix structure is interlaced with flakes of graphite. The first advance in overcoming this lack of toughness was the development by the French physicist René Antoine Réaumur (1683–1757), who in 1722 introduced malleable iron. This iron is made by lowering the carbon content of cast iron to 2.5% to 3.0% and casting it in the white condition; that is. free of flake graphite. These castings are then packed in hematite iron ore and given an extended heat treatment of five or six days at a bright red heat. The purpose is to remove most of the carbon by oxidation. This product, which is made in Europe, is called white heart malleable. It is stronger than ordinary cast iron and, more akin to steel, possesses considerable ductility and malleability because of the absence of flake graphite.

Another type of malleable iron, called black heart malleable. was developed in the United States by Seth Boyden about 1826. The manufacturing process is based upon casting the iron white, using lower carbon and silicon levels than in gray iron. and then annealing it at a red temperature so that the iron carbides are decomposed into temper carbon (clusters of finely divided graphite'~. The result is a metal that has excellent strength and toughness since it is not weakened by flake graphite. It is widely used for a great variety of small or thin-walled industrial castings such as automotive. agricultural machinery and railroad equipment parts. electrical and small pipe fittings. hardware and small tools. Black heart malleable iron requires an appreciably shorter annealing time than the white heart variety.

Ductile Iron.—This variety of cast iron also is known as nodular iron and spheroidal graphite (or S. G.) iron. Both white and black heart malleable iron represented a distinct advance in eliminating the greatest drawbacks of gray iron—lack of toughness and inability to be deformed. However. they too possess the disadvantage that castings are limited to relatively thin shapes with the bulk of production in castings being under $\frac{3}{4}$ in. in thickness. Substantially heavier castings are apt to possess flake graphite which would persist after annealing and destroy the iron's ductility. The extended high-temperature annealing treatment also is costly and time-consuming.

In 1948 H. Morrogh in England and K. D. Millis, A. P. Gagnebin and N. B. Pilling in the United States revealed methods of producing cast iron that was ductile in the as-cast condition. Morrogh based his discovery on the addition of cerium to molten iron, and his process is limited to high-carbon irons, over about 3.3% in most cases. The U.S. method introduced magnesium into the casting and can be used with cast iron of all carbon levels. The change in the nature of cast iron to produce ductile iron is brought about by replacing flake graphite with graphite in the form of tiny balls or spheroids, hence the alternate names nodular and spheroidal graphite iron. Of great importance is the fact that this graphite structure is developed in the as-cast condition, completely independent of any heat treatment. The method that has been most widely accepted by foundries throughout the world for producing ductile iron has been that incorporating magnesium, using a patented process available under license from The International Nickel Company. Inc., and affiliates.

This means that for the first time the gray-iron foundryman is able to treat what might normally be a low strength, brittle cast iron with an agent that transforms it into a material having strength superior to malleable iron and akin to cast steel. For instance, it is not unusual to treat an iron which would have a strength of 20,000 p.s.i. with flake graphite and produce a strength of over 100,000 p.s.i. with spheroidal graphite. Of great significance is the fact that this product still. retains the important attributes of cast iron — namely, low melting point, good fluidity and castability, and ready machinability — combined with the engineering advantages of steel in the form of strength, toughness and ductility. Whereas malleable iron is limited to relatively thin castings. ductile iron can be produced in sections from as thin as $\frac{1}{8}$ in. to as thick as 48 in. Whereas steel castings present difficult or insurmountable problems when made in complex shapes, ductile iron castings can be made quite readily in very intricate designs.

Ductile irons are really a whole family, of irons, just as are flake-cast irons and, like the latter, can be heat-treated and alloyed in various ways to produce special mechanical properties and superior corrosion, heat and wear resistance. Ductile irons are widely used in pipe. valves. gears, dies, machinery frames, automotive crankshafts, pump and compressor bodies, metalworking rolls, agricultural equipment parts and a host of other products. The development of spheroidal graphite cast iron opened a whole new vista for the iron foundryman and the designing engineer and represented a significant step forward in the history of metals. See also ALLOYS; METALLURGY: Iron and Steel; *see* also Index references under "Cast Iron" in the Index volume.

(K. A. DE L.)

CASTLE, a fortified residence, generally the stronghold of the king or lord of the territory in which it stands. The word is sometimes applied to prehistoric earthworks, as Maiden castle, Eng.: and, in modern times, in the various national forms of "castle"—*château, castello* or *Burg*—to princely mansions or countryseats. The word is derived from the Latin *castellum,* a diminutive of *castrum,* "a fortified place"; medieval writers often used such words as *castrum, castellum, oppidum* and *municipium* indiscriminately. In all cases of medieval usage the fundamental factor mas fortification applied to a town. a private residence or a tower. It is in the more general meaning of a medieval stronghold, at once a private residence and a fortress, that the word is used here.

Early Medieval Castles. — Fortifications as built by the ancients were for communal defense. Cities were surrounded by several lines of walls, one within the other, with the citadel occupying the highest or most advantageous position. The Greeks and Romans generally followed the communal concept in their fortifications; but the Byzantines, on the conquest of north Africa by Belisarius (A.D. 533–534), built throughout Algeria and Tunisia not only walled towns but also, in isolated sites commanding a valley or important pass, strong forts and towers in all respects like the castles built in western Europe during the 13th and 14th centuries. Aïn Tounga, guarding a pass in Tunisia, with its walls, corner towers, gate and keep, or donjon (*i.e.,* the strongest tower), is a striking instance.

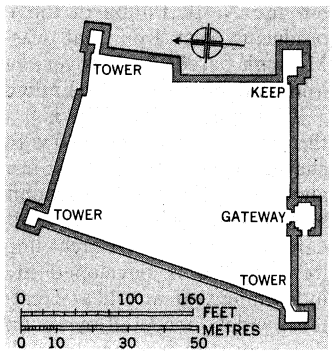

FIG. 1.—PLAN OF AÏN TOUNGA, NEAR *TESTOUR,* TUNISIA. 6TH CENTURY

During the dark ages, progress in the development of military architecture was confined almost entirely to the Byzantine empire, the western nations having no opportunity for such works; but from the 9th century onward progress in western Europe was rapid. Fortifications built in France in the 10th century often included a high mound encircled by a ditch and surmounted by the leader's particular stronghold, as at Blois and Saumur. Later, one or more wards: or baileys (grounds between encircling walls), were enclosed at the foot of the mound. During the 11th century this type of private fortress, known as the "motte (mound) and bailey" castle, spread over western Europe. Excavations carried out in 1949–50 at Abinger, Eng., revealed a small castle of this type. The mounds were hillocks, either natural, partly natural and partly artificial, or wholly artificial. according to the nature of the sites they occupied. If a natural hillock was at hand. and stone was plentiful in the neighbourhood. the round shell keep on the top, which contained the residential quarters, was built of stone. as at Launceston. Eng. If the hillock was only partly natural. the keep was often also of stone, the foundation being carried down to the firm soil; when the hillock was wholly artificial and timber was plentiful, the residential quarters were first built of wood.

Many of the early Norman castles built in England were of stone, as the outer shell of the Round tower of Windsor castle, built *c.* 1075; the shell keeps at Launceston and. Totnes, both *c.* 1080; and the rectangular White tower of the Tower of London, also c. 1080. In all cases the foundations were carried down to the natural soil. Many castles of later medieval periods, in districts where stone was scarce, were built of brick, as the round Château de Montaner, Hautes-Pyrénées, Fr. (*c.* 1380); the castle at Marienwerder, Ger. (Kwidzyn. Pol.), about the same period; and Kirby Muxloe, Waynflete and many other examples in England. In many cases the finely toned brickwork of the walls was decorated with a diaper of darker bricks.

The thickness of castle walls varied largely according to the natural strength of the sites they occupied, often varying greatly at ditierent points of the site; in Britain they were generally from 6 to 7 ft. thick, but they ranged from 5 ft. at Eynsford to 15 ft. at Caernarvon. The walls of fortifications on the continent of Europe and in the east were often much thicker: those of Pompeii were 65 ft.; those of the medieval forts of India were from 15 to 50 ft.; the walls of Peking were 75 ft.; and those of ancient Babylon (as finished c. 600 B.C.) were more than 85 ft. thick.

The windows of the living rooms during the early Norman period were small lights from 12 to 18 in. wide by 4 ft. high; toward the end of the 12th century they were often of twin lights, each 1 ft. 10 in. wide by 4 ft. 8 in. high, still closed by wooden shutters, as at Conisborough. At later periods they developed considerably in size until they reached the magnificent proportions of those of the great hall of Kenilworth castle. These windows were not so vulnerable as they appear to be today, for they were all protected by powerful iron grilles. Toward the end of the 13th century, glass began to take the place of wooden shutters, but it was still an expensive item and sparingly used.

The defense of the enceinte, or outer wall, of the castle was generally by means of one or more lines of moats, the moats being crossed in front of the gateways by drawbridges; *i.e.,* bridges which could be drawn back or raised from the inner side in order to prevent the moats being crossed. The gateway was often protected by a barbican. a walled outwork in front of the gate; and the passage through the gateway was defended by portcullises, doors and machicolations. Portcullises were generally made of oak, plated and shod with iron, and were moved up and down in stone grooves, clearing or blocking the passage. Machicolations were of two kinds, some being openings in the roof of the passage through which missiles were thrown on enemies forcing their way through, and others projecting out on corbels from the parapets of walls and gates through which lethal missiles could be thrown on the enemy below.

The baileys, or wards, at the foot of the mound were enclosed by palisades and later by walls and towers of masonry. Almost at the same time that the shell keep was being erected in western Europe, the rectangular keep, a more compact form of citadel, was also being built. Examples are the donjon at Loches, Fr.. built

ENGLISH CASTLES

Top: The Tower of London, an example of a high masonry structure introduced by the Normans. The White tower or keep was begun by William the Conqueror and completed about 1080

Centre left: Rochester castle, Kent, one of the best preserved of the rectangular type, of which the donjon at Loches, France, and the White tower of the Tower of London are other examples. It rises to 125 ft. at the top of the turrets; 12th century

Centre right: Hurstmonceux castle, Sussex, an example of a castellated mansion representative of the 15th century and one of the oldest brick buildings in England

Bottom left: The entrance to Alnwick castle. Northumberland, seat of the Percy family after 1309. The gateway was built in 1310–14. Alnwick, like Windsor, is a "shell" keep

Bottom right: Arundel castle, Sussex. The keep on the mound in the centre was built toward the end of the 11th century; the other parts were largely rebuilt in the 18th century

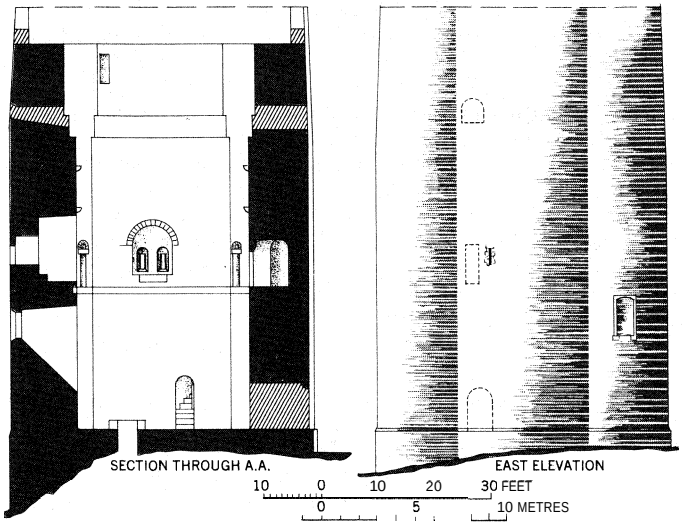

FIG. 2.—PLAN OF THE DONJON. CHÂTEAU DE HOUDAN, HOUDAN. FRANCE. 1130

about 1020; the White tower in the Tower of London; *c.* 1080; and the keep at Rochester, Eng., *c.* 1130. (*See* TOWER OF LONDON.)

The keep was the focal point of the castle, to which. in time of siege. the whole garrison retired when the outer works had fallen; it was therefore the strongest and most carefully fortified part of the defenses. It had a well, contained the private apartments, offices and service rooms, and held all the appointments necessary to sustain a long siege. Often the keep stood in line with the outer line of the defenses, so that while one side looked toward the bailey (or succession of baileys) commanding the operations of the defense there. the other side commanded the field and the approaches to the castle. The side of the keep exposed to the field also presented a line of escape.

Rectangular keeps were strongly built, had thick walls. generally buttressed, and were from two to four stories in height; often each story was divided into two or more compartments by partition walls. The entrance doorway was usually on the second story and was reached by a stairway built against the side of the keep, the stairway being contained in and protected by a forebuilding. From the entrance floor, access to the floors above and below was by means of mural stairways that either passed straight up within the walls or ascended spirally at one or more of the corners. The great hall was generally on the entrance Boor and often had a mural gallery around the walls at a level high above the floor. Mural chambers and latrines opened off the hall; the passages to the latrines had right-angle turns for sanitary reasons. Fireplaces were formed either in the outer walls or in the partition walls. There was generally a chapel within the keep or its forebuilding; at Dover there were two chapels, both in the forebuilding. In the keeps at both Newcastle upon Tyne (built 1172–77) and Dover (built 1181–87), in addition to the drawing place in the chamber at the wellhead. water was conveyed from this chamber to other drawing places in various parts of the keep through lead pipes buried in the walls.

Appearance of Circular Keeps.—Rectangular keeps had the great disadvantage of presenting vulnerable corners to the sapper and the battering-ram. since the enemy could be attacked from one side only and was sheltered by the corner against attacks from the other side. In the Levant the towers were often circular or multiangular and therefore presented no screen to the enemy at any point. On the other hand. a rectangular plan is much more convenient for the disposition of the rooms. It was not until the return from the third crusade at the end of the 12th century that round keeps were built generally. Meanwhile, keeps of transitional character. having the advantages of both forms, were being raised, as at Houdan, Provins. Gisors and Étampes, all in France, and at Orford, Longtown and York in England. That at Houdan, built *c.* 1130, is a good example: there are two stories, each of great height, the ground floor, containing the wellhead, being the storeroom; and the upper story the great hall. with chambers formed in turrets opening off from it. Internally the plan is square with slightly splayed corners; externally the body of the keep is circular with four round turrets protruding at four points an equal distance apart; the whole exterior surface could therefore be enfiladed from the battlements on the turrets as well as swept from those on the main body. When the custom arose of building the main private and service apartments in the bailey, as at Chateau Gaillard. Fr. (built 1196–98) the keep became a purely military structure forming the last line of defense. It is circular with a projecting prow at the Château Gaillard, and circular without any projection at Pembroke.

In the Levant. Byzantine traditions were followed during the 11th and 12th centuries; and with the powerful fortifications which fell into their hands as the result of conquest, the Saracens were able to defend themselves for long periods against the armies of the first crusade (1096–99), as at Nicaea, Antioch and Jerusalem. Following the conquest of Jerusalem in 1099 and the establishment of the Latin kingdom and principalities, powerful castles were raised in great numbers from Antioch in the north to the Gulf of Aqaba on the south. Fine examples of these castles are those of Saone, Margat and Krak des Chevaliers; the last, built in the 12th and 13th centuries, was the most powerful and imposing of all the crusader castles, and is the best preserved.

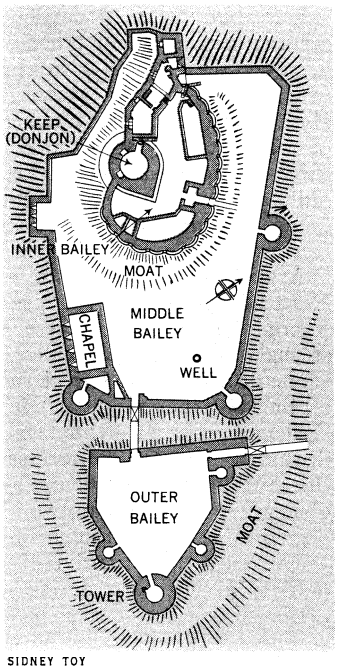

FIG. 3.—A PLAN OF THE BAILEY, CHÂTEAU GAILLARD, NEAR LES ANDELYS, FRANCE, BUILT 1196–98

Importance of the Castle's Site.—On their return to western Europe from the third crusade (1189–92). the crusaders proceeded to give effect to their experiences. They had observed the good qualities of Byzantine work, as well as the great execution wrought by the powerful siege engines then in use on both sides, and the dire effects of sapping and mining. The site now chosen for a new castle, where such choice was possible, was the summit of a precipitous hill. the citadel being backed against the cliff. The main defense was concentrated in the direction of approach. and here there were often two or three lines of advance fortifications: Château Gaillard and Pembroke castle in Wales (*c.* 1200) are typical examples. The living quarters, with the hall, domestic offices and chapel, were now all built in the court of the inner bailey. The keep (often no longer the residence but the last line of defense) was smaller than those built previously but of more powerful design.

Château Gaillard, near Les Andelys, stands on a precipitous cliff 300 ft. above the Seine river. Built by Richard I of England.

it was one of the most powerful castles of the day. It consisted of three baileys arranged in line; the outer bailey (triangular in plan! with the apex pointing toward the field) was completely surrounded by a moat, and there was another moat between the middle and inner baileys; in lieu of wall towers. the wall around the inner bailey was convolved on the outer face. The donjon, standing on the edge of the cliff. was circular except that the outer iace. on the side most open to attack. was brought to a point like the prow of a ship. to increase the difficulties of sapping and to deflect missiles hurled at it.

In the Upper Palatinate of Bavaria. Ger.. are some castles built on a natural pile of huge boulders, as at Falkenberg. dating *c.* 1290. This castle stands on a massive pile of rocks at the end of a promontory overlooking the Waldnaab river, the promontory being cut through in two places at the line of approach; the curtain follows the contour of the pile of rocks, and the donjon stands within a small courtyard. In mountainous countries the castle often consisted of a single tower, as at Troyenstein in the Austrian Tirol, built in the latter part of the 14th century. In Scotland and in the border counties between England and Scotland are many castles which consist. or consisted, only of a fortified tower or residence and a walled courtyard.

The Feudal Castle Till the Appearance of Firearms.— Apart from the question of defense and the ever-increasing aspiration for superior domestic amenities in design, there were powerful political issues involved in the rapid spread of castles. and they soon became a menace to the central authority. Because of the inroads of the Normans into France. Charles the Bald in 862 ordered the construction of fortresses'at all points to resist the invaders; but the multiplication of private strongholds became so great a menace to the authority of the crown that two years later he issued the Edict of Pistes ordering the destruction of all those which had been built without a royal licence. However, the inability of the central government to cope with the disorders of the period led to the introduction of feudalism, one of the main features of which was that a freeman provided the noble with the military services of himself and his retainers in exchange for the tenure of land; it also led to the further spread of private fortresses.

After Frankish ieudalism was introduced into Britain by the Normans. castles of the types described above were built everywhere. The power of these widely dispersed and well-situated strongholds of trusty nobles to subdue and hold in subjection whole districts was of great value to a strong king like William I of England; but the nobles in their iastnesses were quite ready to defy a weak or greatly embarrassed ruler. During Stephen's disturbed reign, "adulterine" castles (those which had not received the royal licence) sprang up. only to be destroyed after the treaty of 1153. For more than two centuries after the Conquest. castles played an important role in English political struggles.

The reign of Edward I of England was a brilliant period of military architecture, during which some of the most powerful castles of any age or country were built in Britain. Considerable attention was still paid to outworks. but the general tendency was to concentrate the defense on a foursquare castle enclosed by one or tn-o lines of walls and having a strong round tower at each corner of the inner line. Powerful gateways took the place of keeps: the difficulties of investment were increased by extensive outworks; and greater facilities for bringing in supplies and for escape in case of necessity were provided. Caerphilly and Harlech (both in Wales) are examples. Conway and Caernarvon (also in Wales), each built as part of the fortifications of the ton-n it dominates. though not of the square plan. embody these principles. In the 13th century, imposing residential tower houses, designed on elegant rather than on defensive principles. were built within the castles. as at Warkworth and Tattershall in England and at Vincennes and Pierrefonds in France. The disposition of the domestic quarters within the castle followed the general principle throughout the whole medieval period. though from time to time the desire for better amenities and more space led to the elaboration of the system, the great hall still remaining the focal point *(see* HALL). The military quarters were adjacent to the entrance gate.

The fortified positions in Russia. castle or city, followed generally the lines of development pursued in western Europe. except that timber was more extensively used until the 13th century. Moscow may be taken as an example of the later works. The Kremlin (the Russian word for "citadel") at Moscow, in the heart of the city; its existing fortifications were built in the 14th century, with later additions. It is triangular-shaped with sides about 750 yd. long and stands on rising ground at the junction of the Moskva river with its tributary Neglinnaya, the south side running along the river bank and the east side facing Red square. It is surrounded by a powerful wall, built of brickwork, varying in thickness from 13 ft. to 20 ft. and in height from 30 ft. to 70 ft. The wall is strengthened at intervals by large towers, has an embattled parapet and is pierced by four gateways and a postern, the postern having a secret passage to the river.

Prominent examples of castles in Great Britain are the Tower of London and the castles of Windsor, Caernarvon, Conway, Edinburgh and Stirling; in Ireland. Trim castle and Blarney castle. Some large modern houses, such as Balmoral castle, have no defensive features but are so called on account of their castellated design.

Medieval India.— The medieval castles of India form a distinct class. The greatest number of them, and they are profuse throughout that region. are perched on precipitous hills and include a city as well as a citadel. They are of great extent and are surrounded by formidable. often numerous, lines of walls with bastions at frequent intervals and powerful gates on the main roads of approach. The main gates are richly decorated with paneling and sculptured ornament. and the gateways are of great height to allow the passage of elephants with their howdahs and mounts. A special defense is heavy teak doors studded with many rows of sharp iron spikes to prevent their being forced open by elephants in time of attack.

The Effect of Firearms.— Development in the use of firearms was so rapid during the 15th and 16th centuries as to require a radical change in military architecture. In 1494 French troops marched through Italy, and with their guns reduced castle after castle with astonishing rapidity. The age of the medieval castle came to an end and the era of modern military fortification opened. The break with the past did not occur suddenly but extended over many years. During the reign of Henry VIII in England an interesting transitional type appeared in the form of coastal castles or forts, with semicircular bastions, that were built along the south and east coasts. as at Walmer, Deal, Camber and St. Mawes.

The principle governing the design of the new forts. constructed all over Europe, was that the 1%holebuilding should be concentrated in one compact block. Its low walls could be defended all around by artillery, the guns being mounted on pointed bastions and redans, as in France. Italy, Rhodes and Malta. From this period there was a complete break between military and domestic architecture; the former became a fort under the military control of the monarch, the latter an unfortified palace, mansion or hotel. (See FORTIFICATION : *Influence of Gunpowder.*)

The Siege of **Château Gaillard.**—The whole purpose of medieval deienses is best understood by perusal of the very vivid descriptions given by contemporary chroniclers. In 1203 Philip II of France marched toward the castle of Château Gaillard, then held for King John of England by Roger de Lacy. He took the town of Les Andelys at the foot of the hill on which it stood and laid siege to the castle above. Having regard to the strength of the castle. Philip decided to reduce it by famine; with this end in view he dug two lines of trenches running up the hill irom the water on one side and down to the river on the other. Philip's troops then sat down for about three months to await events; and there ensued one of the most terrible episodes in the history of the middle ages.

Some 1,400 persons from the town below had taken refuge in the castle. As supplies diminished, 1,000 of them departed and were allowed to pass the French lines. Later 400 others were sent forth. These latter were not allowed to pass through the lines but were condemned to pass a severe winter in the open, subsisting on such herbs as they could find in the valleys. Dogs

which were driven out of the castle were seized and eaten. Before the winter was over, nearly all the refugees had perished.

In the spring of 1204 Philip set up his siege engines on the high ground to the southeast and began his assault on the castle. His engines included *petrariae,* mangonels and a very high siege tower; he also built a long penthouse for the protection of those engaged in filling the castle ditches. To his attack the garrison replied vigorously with stones from their own engines, causing considerable loss to the besiegers. The French then began sapping operations, under the protection of their shields. The outer bailey was taken, and the French proceeded to attack the remaining works. They searched along the river bank for the outlet of the drain from the latrines, and after finding it they crawled up through the drain. penetrated into a building within the middle bailey. and succeeded in lowering the drawbridge between the outer and middle baileys so that the French troops could enter; and the middle bailey was taken.

Then the French, under the protection of one of their machines, proceeded to undermine the wall of the inner bailey; but by countermining on the other side. the garrison broke into the French tunnel and drove them out. By now the wall. weakened by being undermined on both sides and battered by a powerful *petraria* throwing enormous blocks of stone, was fractured; and the French. rushing through the breach, entered the inner bailey. Even then. none of the garrison surrendered, but all fought as long as it was possible to do so.

CASTLEBAR (CAISLEÁN AN BHARRAIGH), a market tonn in Connaught province, Republic of Ireland, lies 54 mi. S W. of Sligo by road. Pop. (1961) 5,482. Castlebar is the capital of County Mayo and stands at the head of Lough Castlebar or Lanach virtually in the centre of the county. In the late 1950s the Castlebar Anglers' association. which organizes the annual World Trout Fly Fishing competition on Lough Mask, 12 mi. S.. co-operated with the Inland Fisheries trust in clearing and restocking the adjacent naters. The settlement that grew up around Castlebany, the castle of John Bingham. was incorporated in 1613. The "Castlebar Races" nas the rout and pursuit (1798) of Gen. John Hely-Hutchinson's troops by invading French forces under Gen J. R. M. Humbert The French were later defeated by Gen. Gerard Lake (q *v*) at Ballinamuck. (D. V. O'D)

CASTLE DOUGLAS, a small burgh, Kirkcudbrightshire, Scot. Pop. (1961) 3 253. It lies at the north end of Carlingnark loch. about 8 mi S.W. of Dumfries. It is the chief business centre of east Galloway and its sheep and cattle sales are the largest in the southnest of Scotland. Until 1765 it was a village known as Causewayend (named for an old causeway in the loch) and afterward Carlingwark, but the discovery of marl in the lake brought it prosperity and it was bought in 1792 by Sir William Douglas and renamed after him. On one of the islets in the loch is a crannog, or ancient lake dwelling. Threave castle, the Douglas stronghold (1369–1455), 1½ mi. W. on an island in the Dee, was given to the National trust in 1948.

CASTLEFORD, a municipal borough in the West Riding of Yorkshire, Eng , 10 mi. S E of Leeds by road. Pop. (1961) 40.345. It was extended in 1938 to include Whitwood. Ferry Frystone, Glass Houghton and part of Xllerton Bywater, and incorporated in 1955. There are collieries and large glass bottle and chemical norks. It stands where Ermine street crosses the Aire river near its junction with the Calder and on the site of the Roman Legiolium. In 948 the name appeared as Ceasterford.

CASTLE GUARD, an arrangement under the feudal system by which the duty of finding knights to guard royal castles was imposed on certain baronies and divided among their knights' fees. The greater barons provided for the guard oi their castles by exacting a similar duty from their knights. In both cases the obligation was commuted very early for a fixed money payment, which, as "castle-guard rent," lasted down to modern times.

See J. H. Round, "Castle-Guard," in *Archaeological Journal,* vol. lix, and "Castleward and Coinage," in *The Commune of London* (1899); *S.* Painter, in *American Historical Review,* vol. xi, pp. 450–459 (1935); F. M Stenton, *The First Century of English Feudalism,* pp. 190–215 (1932)

CASTLEREAGH, ROBERT STEWART, VISCOUNT: *see* LONDONDERRY, ROBERT STEWART. 2ND MARQUESS OF.

CASTLE RISING, a small village of Norfolk, Eng., 4½ mi. K.E. of King's Lynn. Pop. (1951) 255. The fine Norman castle stands within a 12-ac. enclosure, formed by artificial ramparts of earth. and a dike, which is crossed by an ancient bridge. The keep is square and massive, and the Sorman carving, especially over the entrance, is very rich. The foundations of a small chapel were discovered outside the castle. The village of Castle Rising is the remnant of a town of past importance. It is mentioned in Domesday Book and was later granted to William de Albini, whose son built the castle. It passed to Isabella, queen of Edward II, in 1332 but was exchanged for Brest castle by Richard II. It reverted to the crown in the 14th century and so remained until Henry VIII exchanged it for other lands with Thomas Howard, duke of Sorfolk. A mayor is first mentioned in 1343 and a borough existed in the 15th century. A survey of 1589–90 declared that Castle Rising was an ancient borough by prescription. Castle Rising became a parliamentary borough in 1558, but was disfranchised in 1832, although a mayor was elected for special purposes until 1883. Its fairs and markets were formerly important.

The church of St. Laurence is late Norman, with rich ornamentation; it shons traces of considerable alteration in the Early English period. The Bede house, founded in 1614 by Henry Howard, earl of Northampton, is an almshouse for elderly ladies, nho still occasionally on Sundays wear the high hats and red cloaks of Stuart times.

CASTLETON, a village of north Derbyshire, Eng., 11 mi. N E. of Buxton by road. lies about 600 ft. above sea level, closely surrounded by limestone hills rising to heights of 1.400 to 1.700 ft. Pop. (1951) ill. It is visited for its caves and mines and for Peveril castle, now a ruin, perched on a cliff above the village. Penetrating this cliff is the Peak cavern, which from the 16th century has served as a workshop, rent-free, to families making rope and tnine. The Blue John cavern, source of a beautiful fluorspar knonn as Blue John, has fine stalactitic formations, as also has Treak Cliff cavern. Treak Cliff hill is said to be the norld's only remaining knonn source of Blue John spar, specimens of nhich are in the Vatican library in Rome and at Chatsnorth house in Derbyshire. The Speedwell cavern, ¾ mi. W. of the village, affords a boat trip along a subterranean canal whose waters reappear in the village stream.

Peveril castle owes its fame to its dominating position and to Sir Walter Scott's novel *Peveril of the Peak;* the iabric has been well repaired by the ministry of works. Before the Norman Conquest the site was held by Gernebern and Hundinc. and earthworks can still be traced. It was granted by William I to William Peveril, who built the castle. In 1216 William Ferrers, earl of Derby, took it from the rebellious barons and was made governor by Henry III, who in 1223 granted a charter for a weekly market. King Edward III settled the castle on his son John of Gaunt. and it thus became part of the duchy of Lancaster. Often used as a prison, it was almost impregnable. (J. R. WD.)

CASTLETOWN, the ancient capital of the Isle of Man (in Manx called Balla Cashtal), 8½ mi. S.W. of Douglas. Pop. (1951) 1,749. A small tidal harbour is formed by the outflow of the Silverburn into Castletown bay. Castle Rushen, in the centre of the town, is said to have been founded in 947–960 by Godred the Dane. The present building is essentially Korman largely rebuilt in the 14th century with additions in the 16th. Until the 18th century

it was the residence of the lords of Man. The massive keep is square and is surrounded by an outer wall with towers and a moat. The council chamber and courthouse were built in 1634. Near the castle is the old House of Keys, where the Manx parliament met until the removal of the seat of government to Douglas in *1862*.

King William's college (endowed in 1668, founded in its present form in 1833), 1 mi. *N.E.* of Castletown, is the principal school in the island. Beyond Derbyhaven, adjoining Castletown, is the Ronaldsway airport.

CASTOR AND POLLUX (the latter, in Greek legend, POLYDEUCES) were the children of Leda who, having consorted with Zeus (who had approached her in the form of a swan), laid an egg from which these two and their sister Helen (and Clytemnestra?) were hatched. There is some ancient confusion as to their paternity. Some hold that they were not the sons of Zeus but of Tyndareus, Leda's husband, with whom she had lain the same night. Others maintain that Castor was the son of Tyndareus, and thus a mortal, while Pollux was the son of Zeus.

The Twins, or Dioscuri, as they were also known, were inseparable and became renowned for their athletic ability. Castor for horsemanship and Pollux for boxing. Among their exploits were participation in the Caledonian boar hunt, sailing on the Argo, and rescuing Helen, who had been carried off by Theseus. They came into strife with their cousins Idas and Lynceus by carrying off their brides-to-be. Either this or a dispute over stolen cattle led to bloodshed among them. The details of the fight are variously recorded, but authorities agree that Castor, being mortal, was slain. Pollux did not wish to outlive his brother and refused immortality in which Castor had no share. Touched by such devotion, Zeus allowed them to remain together alternately in the heavens and the nether world. Later he transformed them into the constellation Gemini.

As deities they succored shipwrecked sailors and received sacrifices for favourable winds. They were associated with the luminous optical phenomenon occasionally observed at sea and later known as St. Elmo's fire. In Greece they were especially revered, probably originally as national heroes, by the Dorians, and particularly at Sparta where Tyndareus had been king.

The introduction of their cult at Rome (where Castor assumes a greater importance than Pollux) goes back traditionally to 484 B.C., and the building of their temple in the Forum followed a vow of Aulus Postumius at the battle of Lake Regillus. According to legend the Dioscuri fought on the side of the Romans and carried the news of victory to Rome. The present remains of the temple, of which three standing columns are a well-known landmark of the Roman Forum, date from a rebuilding in the Augustan era.

In art the Twins are represented as two youths, usually horsemen, holding spears. They wear egg-shaped helmets, symbolic of their origin, crowned with stars, commemorating their apotheosis.

See G. Wissowa, *Religion und Kultus deu Romer* (1912); **L. R.** Farnell, *Greek Hero-Cults and Ideas of Immortality* **(1921).**

(R. B. LD.)

CASTOR BEAN, the seed of the castor-oil or castor-bean plant or palma Christi (*Ricinus communis*), a single variable species belonging to the spurge family (Euphorbiaceae; *q.v.*). Originally African, it is now widely grown in tropic regions and warm temperate regions especially for the seeds, which yield the castor oil (*q.v.*) of commerce. In the tropics the castor-bean plant is a tree often reaching 40 ft. in height; but elsewhere, grown as an annual herb, it rarely exceeds 15 ft. The typical plant has large, smooth, five- to ten-lobed leaves, often three feet across; petalless flowers in one- to two-foot panicles; and brown, spine-covered capsular fruit containing three large and variously marked seeds, which contain, besides castor oil, the toxic principle ricin. There are numerous varieties of castor-bean plant, many of which make bold foliage displays in the garden. They are easily grown from seed planted in spring in any well-drained sandy or clay loam soil.

(J. M. **BL.; X.**)

CASTOREUM, an oily, viscid glandular secretion contained in two pairs of membranous sacs between the anus and external genitals of both sexes of the castor beaver, of which there are two types, the Siberian *(Castor fiber)* and the Canadian (C. *canadensis*). It is yellow or yellow-brown in colour, of a butterlike consistency, and has a highly disagreeable odour due to the presence of an essential oil. After the death of the animal, the sacs are removed and dried in smoke or in the sun; drying darkens and hardens the castoreum and reduces its odour. Castoreum is soluble in alcohol and is prepared for use as a tincture. In this form castoreum has a pleasant scent and is used in the blending of perfumes.

(E. L. Y.)

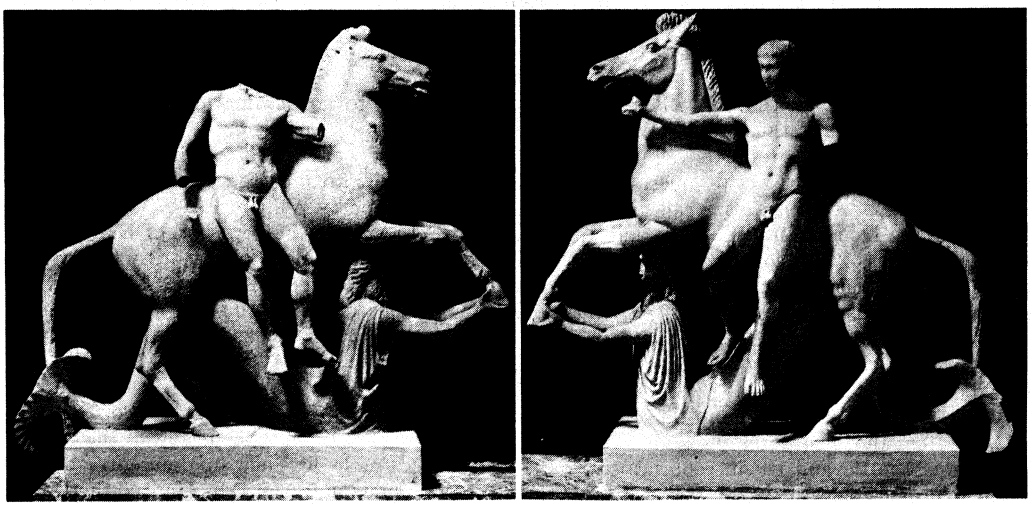
CASTOR OIL, the fixed oil obtained from the castor bean (*q.v.*). The beans, besides containing 35%–55% oil, contain also a very toxic protein: ricin, for which an antiserum has been produced by immunological methods.

Castor oil, obtained from castor-bean seeds by pressing or by solvent extraction; is clear and light coloured with a faint characteristic odour, and has a bland but slightly acrid and usually nauseating aftertaste. It consists almost entirely of triglycerides, the portion of minor constituents being small. The fatty acids of castor oil consist of ricinoleic acid, 91%–95%; linoleic acid, 4½%–5%; and oleic acid, dihydroxystearic acid and saturated fatty acids, slightly more than 1%. The oil is only partially soluble in petroleum ether but dissolves readily in alcohol, glacial acetic acid and chioroform.

India and Brazil produce 55%–65% of the estimated world production of castor beans and oil; the United States uses more than 50% of the world production, largely in industry.

Processing of castor oil for the preparation of useful derivatives involves several type reactions. Blown oils (oxidized oils) are prepared by bringing air or oxygen into intimate contact with the oil at temperatures of 176°–266° F. (80°–130° C.). Hard, waxlike fats are obtained by hydrogenation (chemical combination with hydrogen). Turkey red oil, long used as a dyeing aid and a forerunner of modern synthetic detergents, is produced by reaction of the oil with sulfuric acid. Materials useful in perfumes, and dibasic acids useful in the synthesis of resins and plasticizers, are produced by the decomposition of castor oil by heat or by heat coupled with exposure to alkali.

Materials most useful for drying oils are produced by de-



ALINARI

ANTIQUE SCULPTURE DEPICTING CASTOR (LEFT) AND POLLUX (RIGHT) IN THE NATIONAL MUSEUM, NAPLES

hydration without breaking the carbon chain.

The principal uses of castor oil, on the basis of tonnage consumed. are for the production of paint, varnish and related products (in the form of dehydrated castor oil), plasticizers (as esters or blown oils) and dibasic acids. Castor oil or its derivatives are also used in such items as cosmetics, hair oils. fungistatic preparations, printing inks, nylon plastics. all-purpose greases and hydraulic fluids, dyeing aids and textile finishing materials.

Medicinally, castor oil has been used as a cathartic (formerly its chief use); ricinoleic acid, a gut irritant, is liberated from the oil by gastric juices in the intestines. It acts in about five hours after ingestion, increasing peristaltic and segmenting movements in the small intestine and allaying the normal "antiperistalsis" in the large bowel. It should not be used in cases of chronic constipation since it aggravates the condition while relieving the symptoms. and can cause congestion of the pelvic organs. *See* also OILS, FATS AND WAXES. (L. R. DN.)

CASTRATO, a male soprano or contralto voice of great range, flexibility and power, produced as a result of castration before puberty *(see* SINGING). The *castrato* voice was first introduced while women were banned from church choirs and the stage. In 18th-century Italian opera the majority of male singers were *castrati* and over 200 of them sang in churches in Rome alone. The most famous of them all was Farinelli (*q.v.*). The roles created for them, *e.g.,* by Gluck and Mozart, are now sung by women.

See A. Heriot, *The Castrati in Opera* (1956).

CASTRÉN, MATTHIAS ALEXANDER (1813–1852), Finnish ethnologist and philologist, was born at Tervola. Kemi, on Dec. 2. 1813. After journeys through Lapland and Russian Karelia and a third journey that extended as far as Obdorsk (now Salekhard), he published his *Elementa grammatices Syrjaenae* and *Elementa grammatices Tscheremissae* (1844) He then undertook an exploration of Siberia, which resulted in a vast addition to previous knowledge, but seriously affected his health. The first fruits of his collections were published as *Versuch einer ostjakischen Sprachlehre* (1849). In 18jo he published a treatise *De affixis personalibus linguarum Altaicarum* and was appointed to the new chair of Finnish language and literature at Helsinki, becoming chancellor of the university in 1851. He was engaged on a Samoyedic grammar when he died on May 7, 1852. Five volumes of his collected works appeared from 1852 to 1858.

CASTRES, a town of southwestern France in the Tarn *département,* lies on the Agout river, 72 km. (45 mi.) E. of Toulouse by road, to which it is also connected by rail. Pop. (1954 census) 26,759. Churches (in baroque style) and other public buildings remain as evidence of the town's prosperity under Louis XIV. These include the church (former cathedral) of St. Benoit, and the *hôtel de ville* (former bishop's palace), designed by Jules Mansart, which houses a fine collection of Spanish paintings from the Goya museum, as well as the Jaurès museum and a public library (28,000 volumes). There are three technical colleges including Jean Jaurès lyceum.

Castres has been an active textile centre since the 13th century; about 9,000 workers are engaged in spinning, weaving and the hosiery trade. Castres machine tools are world famous.

The town came into being about 647 on the site of a Gallo-Roman camp, where a Benedictine monastery was founded (a Romanesque tower survives); the medieval city expanded round the monastery until 1317, after the Albigensian crusade, when Pope John XXII created a bishopric there which lasted until 1790. Guy de Montfort, brother of Simon de Montfort, handed down the seigneury in 1519, but from the middle of the 16th century the Reformation became established in the town and historians even styled it a Protestant republic. It was subdued under Louis XIII. The revocation (1685) of the Edict of Nantes jeopardized the economic life of the town and forced the most eminent Protestants to leave the country; but Castres took on a new lease of life under Louis XIV. (VA. B.)

CASTRO, EUGÉNIO DE (1869–1944), Portuguese poet, who introduced Symbolism into the literature of Portugal. was born in Coimbra on March 4, 1869. The son of a professor of mathematics at Coimbra university, he was at first educated in Coimbra and later attended the Curso Superior de Letras in Lisbon, completing his studies there in 1888. He then entered the diplomatic service and was appointed an attaché at the Portuguese legation in Vienna. He soon abandoned diplomacy. and for a time went to live in France where he frequented the café literary groups and was a witness of the impassioned gatherings associated with the Symbolists. In 1889 he returned to Coimbra, where by this time there were two student reviews. *Bohemia Nova* and *Os Insubmissos,* which rivaled each other in championing the cause of French Symbolism. Castro, who until then had remained faithful to the Portuguese lyrical tradition, collaborated in the second of these reviews and became the standard-bearer of the Symbolists.

Castro's first verses. *Cristalizações da Morte* and *Canções de Abril,* had been published in 1884, when he was 15, and had been traditional in style. In 1890 he published his *Oaristos* and, in 1891, *Horas,* which established him as the outstanding Portuguese representative of Symbolism: in its purely formal or decadent aspect. The preface to *Oaristos* is a manifesto of the new school, in which he says that he means to abandon the railway line along which what he calls the "mixed goods and passenger train" of Portuguese poetry had run hitherto and join "the express train of originality." A little later, he and Manuel da Silva Gaio, the movement's leading critical writer, founded the review *Arte* (1895–96), the organ of Portuguese Symbolism. International in character, the review contained work by some of the French Symbolists, among them Paul Verlaine. In 1903 Castro was appointed professor in the Industrial School of Brotero, and in 1914 he was elected to the chair of French literature in the University. of Coimbra. He was already a member of the Lisbon Academia das Ciências. He died in Coimbra on Xug. 17, 1944.

After 1891 his works reveal a gradual departure from Symbolist aesthetic standards — called by him *nefelibata* ("cloud-treading"), a term often used later to define the more formal phase of Portuguese Symbolism. They include: *Belkiss, Silva, Interludio* and *Tiresias* (1894); *Sagramor* (1895); *Salomé e outros Poemas* and *A Nereide de Harlem* (1896); *O Rei Galaor* (1897); *Saüdades do Céu* (1899); *Constança* (1900); *Depois da Ceija* (1901); *Poesias Escolhidas* (1902); *A Sombra do Quadrante* (1906); *O Anel* de *Polícrates* (1907); *O Filho Prddigo* (1910); and *O Cavaleiro das Mãos Irresistiveis* (1916). In his last phase, which began with *Camaféus romanos* (1921), Castro abandoned the "express train of originality" and accepted the standards of a kind of academic Parnassianism, which links him with his forebear, Sá de Miranda (*q.v.*). As well as many other volumes of poetry. he also published in two volumes (1926–27) a collection of articles written for the Argentine journal *La Nación.* A faultless artificer of verse, Castro is one of the most polished and frigid poets in early 20th-century Portuguese poetry.

CASTRO (RUZ), FIDEL (1927–), Cuban revolutionary leader who overthrew the regime of Fulgencio Batista in Jan. 1959, was born Aug. 13, 1927, in Oriente province. He was educated in Santiago and Havana and received his law degree from the University of Havana in 1950. During his university years Castro was active in student agitation and even in national and international political ventures. On July 26, 1953, he led a desperate and unsuccessful attack on a Santiago army barracks, intended to begin the overthrow of Batista, who had seized power in 1952. After being released by amnesty in 1955 he went to Mexico and began organizing an invading force of Cuban exiles. With a band of 82 men he landed in Cuba on Dec. 2, 1956, but most of the force was quickly killed or captured. Castro then began a guerrilla campaign in the Sierra Maestra mountains against Batista and took the name "26th of July movement" from the date of his 1953 attack. The movement gradually built up force until Batista was forced to flee Cuba on Jan. 1, 1959. Castro thereafter dominated the new government and became its prime minister in Feb. 1959.

In mid-1959 he forced out his hand-picked president, Manuel Urrutia, and supplanted him with Pres. Osvaldo Dorticós.

From the beginning of 1959 Castro undertook a dramatic and extreme program of social and economic revolutionary reform, characterized by summary executions of Batista followers and a considerable hatred of foreigners. His antipathy was directed especially against the United States, and as Cuban relations with that government deteriorated those with the U.S.S.R. and its satellites improved. In 1961 he was awarded the Soviet Union's Lenin peace prize. Castro's dramatic actions aroused intense interest in Latin America and. at least at first, great support and enthusiasm in Cuba. Some of the support of other Latin-American states, however. was tempered in 1961 by Castro's announcements that there would be no more elections in Cuba and that he had been a Marxist for years but had concealed the fact in order to further his revolutionary aims. *(See* also CUBA: *History.)*

Castro wrote *Pensamiento politico, económico, y social de Fidel Castro* in 1958.

See R. Brennan, *Castro, Cuba* and *Justice* (1959); J. Dubois, *Fidel Castro* (1959); G. Rodriguez Morejón, *Fidel Castro* (1959). (R. H. FI.)

CASTRO, INÊS DE (d. 1355), mistress, before his accession, of Pedro I of Portugal, and famous because of her tragic death, was an illegitimate daughter of Pedro Fernández de Castro, a Galician noble. She went to Portugal about 1340 with her cousin Constança, who shortly afterward married Afonso IV's eldest son and heir Dom Pedro. But Pedro was soon attracted to the beautiful Inês, and a violent passion sprang up between them. After the death of Constança (1345), they lived together and had several children. However, the influence of Inês and her two brothers over Dom Pedro aroused hostility at court and when, in 1354. Pedro declared himself pretender to the throne of Castile, Afonso IV decided to have Inês executed. On Jan. 7. 1355. after a dramatic interview at Coimbra, the king abandoned her to the assassins. After Pedro's accession (1357), her body was moved to a magnificent mausoleum at Alcobaça. Legend has it that Pedro caused the corpse to be crowned and made the courtiers kiss the hand of the dead Inês. Much has been written about Inês' love and tragic end; the story is related hy Camões in *Os Lusiadas,* by Luis Vélez de Guevara in his play *Reinar después de morir* and by Henri de Montherlant in his play *La Reine morte.* (V. R. R.)

CASTRO, JOÃO DE (1500–1548), viceroy of Portuguese India, who made important contributions to the science of navigation, was the son of Alvaro de Castro, governor of Lisbon. After 20 years' service in north Africa he went to India in 1538 and was at the relief of Diu in that year. He sailed with the fleet up the Red sea to Suez (1540–41) and, returning to Europe two years later, he campaigned against the Muslim pirates. In 1545 he again commanded a fleet in India, where his operations relieved Diu and Malacca. He was appointed viceroy in 1548 but on June 6 of the same year died in the arms of St. Francis Xavier at Goa.

De Castro was a pupil of the celebrated mathematician Pedro Nunes. His observations of magnetic variation discredited the association of longitude with variation and he was the first to note the deviation of the ship's compass needle created by the magnetic effect of iron objects. He recorded his scientific observations in three *Roteiros* (pilot books), compiled on his voyages from Lisbon to Goa, from Goa to Diu and from Goa to Suez. Editions of the three *Roteiros* were published respectively at Lisbon, 1882; Oporto, 1843; and Paris. 1833.

See Jacinto Freire de Andrade, *Vida de Dom Jodo de Castro* (1651), Eng. trans. by Sir Peter Wyche (1664); Diogo do Couto, *Decadas da Asia,* vol. vi (1616). (R. A. SN.)

CASTRO, JUAN JOSE (1895–), Argentine composer and conductor, one of the foremost exponents of South American modern music, was born in Avellaneda, March 7, 1895. He studied in Paris with Vincent d'Indy; returning to Argentina, he appeared as conductor of symphony orchestras and opera. In 1959 he was appointed dean of the Puerto Rico conservatory in San Juan. He won (1951) an international competition for the Verdi prize of La Scala, Milan, with his opera *Proserpina* y *el extranjero.* His works include a ballet *Mekhano* (1937), *Sinfonía Bíblica* (1932), *Sinfonía argentina* (1936) and *Corales criollos* for orchestra (1954). (N. SY.)

CASTRO, ROSALÍA DE (1837–1885), Spanish poet, the most outstanding modern writer in the Galician language. was born in Santiago de Compostela in Feb. 1837. In 1858 she married the historian Manuel Murguía (1833–1923), a champion of the Galician Renaissance. She died in the village of Padron, near Santiago. July 15, 1885. Although she was the author of a number of novels *(Fluvio,* 1861; *Ruinas,* 1864; *El caballero de las botas azules,* 186;; and *El primer loco,* 1881), she owes her immortality to her poetry, contained in *Cantares gallegos* (1863) and *Follas novas* (1880), both written in her own language, and *En las orillas del Sar* (1884), written in Castilian.

Part of her work (the *Cantares* and some of the poems in *Follas novas*) expresses with sympathetic power the spirit of the Galician people: their gaiety, simple wisdom and folklore. their resentment of Castilian domination. their love of their homeland and the sorrows of poverty and emigration. About 1867, however. Rosalía began to write more personally, describing in verse her own deepest feelings—remorse, repressed desire, the anguish of living, the desolation of spiritual loneliness, fear of death. the transience of affection, the feeling that everything is in vain. Thus her work, which is distinguished technically by a supremely skilled simplicity, blending popular poetic forms with metrical innovations which had considerable influence on later poets, is of both regional and universal significance. Her *Obras Completas* were edited with an introduction by Garcia Marti (1944); there is no critical edition. Selected poems irom *En las orillas del Sar* were translated by Griswold Morley, *Beside the River Sar* (1937).

See Mary Tirrel, *La mística de la Saudade* (1951); *7 Ensayos sobre Rosalía (1952).* (J. A. DO P. C.)

CASTROP-RAUXEL, a mining town of Germany. which after partition of the nation following World War II was included in the *Land* (state) of North Rhine-Westphalia in the Federal Republic of Germany. It is situated in the eastern part of the Ruhr district, 15 km. (9.3 mi.) N.W. of Dortmund and 10 km. (6.2 mi.) N.E. of Bochum. Pop. (1959 est.) 87,628. It has extensive open spaces, on one of which is a racecourse. Chief buildings of interest are the 16th-century moated castle of Bladenhorst; Goltlschmieding house. with a Renaissance fireplace of 1597, used as an international guest house by the Society of Moral Rearmament; and the 13th-century Romanesque-Gothic church of St. Lambert. Castrop and Rauxel are separate stations on two different lines of the Ruhr network. The town has docks on the Rhine-Herne canal. Coal mining and chemical works employ 60% of the wage earners. Castrop was first mentioned in A.D. 834 and grew into a town during the middle ages. Until 1609 it belonged to the dukedom of Kleve-Mark, thereafter it was Prussian. Castrop-Rauxel was created in 1926 by the amalgamation of the town of Castrop with 12 country districts. It mas damaged during World War II and was captured by the Allies in April 1945. (K. HA.)

CASTRO Y BELLVÍS, GUILLÉN DE (1569–1631), the most important of a group of dramatists that flourished in Valencia. Spain, at the end of the 16th century. Born at Valencia in 1569, he is notable chiefly as the author of *Las mocedades del Cid* (1599?), the original of Corneille's tragedy. In common with the works of the Valencian school in general, which had developed its own techniques before undergoing the influence of Lope de Vega, Castro's plays are unusual for their period in making no regular or systematic use of the *gracioso* (or comic servant) despite the author's close friendship with Lope himself. Though Castro did not take up residence in Madrid until he was 50, after a military and civil service career of some distinction in Yalencia and the Spanish dominions in Italy, he was particularly drawn to the literature of Castille as a source of dramatic themes. Three of his plays are based on the novels of Cervantes, and four on traditional ballads. a number of which, by a remarkably effective *tour de force,* he incorporated into the dialogue of his *Cid.* Castro died at Madrid in 16.31.

His works were first published in Yalencia in two parts between 1618 and 1625; there is a modern edition by E. Juliá Martinez (1925–27). (F. S. R.)

CASTRUCCIO CASTRACANI DEGLI ANTELMINELLI (1281–1328), Italian despot who ruled Lucca between 1316 and 1328, mas born at Castruccio, near Lucca, on March 29, 1281. The Antelminelli, a magnate family of merchants and money-changers owning rich metalliferous mines in Versilia, followed the "White" or Ghibelline interest in local, politics and suffered exile when the "Blacks" triumphed in 1300. While his parents. for reasons of trade, settled in Ancona. Castruccio seems to have spent the following years wandering about Italy and abroad, in part at least as a mercenary captain.

When the emperor Henry VII (*q.v.*) descended into Italy from Germany. the Ghibellines took new heart. Castruccio and his fellow exiles, in alliance with the Ghibelline leader Uguccione della Faggiuola, returned to Lucca in 1314. To strengthen his own position there, Castruccio helped Uguccione. already lord of Pisa. to gain power in Lucca as well (June 1314). In Dec. 1314 the commune of Sarzana elected Castruccio "vicar" and "protector" with powers that were confirmed in 1315 by the emperor-elect Frederick of Austria. Castruccio fought beside Uguccione in the defeat of the Florentines at Montecatini (Aug. 29. 1315). Shortly afterward Uguccione was overthrown, and Castruccio took his place as Ghihelline leader in Tuscany. In 1316 the commune of Lucca made him captain-general and *defensor* for six months, a grant later prolonged and finally extended for life in 1320. In that year he was also appointed vicar of Lucca, Versilia and Lunigiana by Frederick. Louis IV the Bavarian, having confirmed the vicariate, together with that of Pistoia, in 1324, created Castruccio hereditary duke of Lucca in 1327. His growing power brought Castruccio inevitably into conflict with the Florentines. on whom he inflicted a crushing defeat at Xltopascio on Sept. 23. 1325. His career of conquest ended with his sudden death at Lucca on Sept. 3, 1328.

Castruccio's principality barely survived him, and his family had become extinct in the male line by 1400. The memory of his name and personality inspired Machiavelli to compose a romantic life of him. as one model of a perfect prince.

CAST STEEL: **see** CRUCIBLE STEEL.

CASUAL LABOUR, a term used to denote irregular employment or the work force subject to or generally accepting such employment. If employment is discontinuous but has a recurring seasonal, weekly or monthly pattern, it is likely to be called seasonal rather than casual. Seasonally variable and even continuous employment may be filled by casual workers, in which instance the term clearly refers to the nature of the labour force or to the unstable character of employer-employee relations. Restaurant dishwashing illustrates continuous work that commonly is performed by casual labour. At the other extreme, casual work may be performed by regularly employed workers such as firemen and public utility repair crews. Thus, casual labour is not exclusively determined by the nature of the work. Employers' policies, the nature of industrial relations and the attributes of the work force also are determining influences.

The term is most often applied to the person whose employment normally, and not only periodically, consists of a succession of short-term jobs in which engagement is by the hour or the day or for the accomplishment of a specified task. His hiring carries no implication of his responsibility to stay or of the employer's responsibility to continue him in the future. He was typified during the late 19th and early 20th centuries by the dock worker. It was on the docks and in the related transport trades that casual labour was notably extensive, and it was here that the most intense and successful efforts at decasualization were made.

The irregularity of cargoes caused daily or weekly variations in the amount of work to be done at any one centre. The demand for dock labour was distributed among a multitude of employers with little co-operation among them. The effects of this varying and fragmented demand tended to be thrown mainly upon the labourers who were hired and discharged at short notice. Each centre of waterside employment required a larger number of men than it could employ regularly or adequately. From this it followed that each employer, in order to be able to call upon sufficient labour to satisfy his peak demand. tended to keep available a pool of potential labour; the aggregate of all these separate pools was much larger than mould have been necessary had there been co-operation among the various employers and centres of employment.

From the worker's viewpoint, the element of chance in securing employment was evidently the salient feature. At any centre he chose, he had to compete with a "struggling crowd" the great majority of whom were unknown to the employer or his agent. The effects of this irregular and unpredictable employment upon the individual were commented on by a number of sociologists at the end of the 19th and the early part of the 20th centuries. Speaking of casual labourers at the London docks in the 1880s, William Henry Beveridge said: "The knowledge that any man, whatever his experience, however bad his antecedents. might get a job at the Docks, attracted to their neighbourhood a perpetual stream of blackguards, weaklings, and failures from every other occupation. The experience, soon made, that regular attendance was not necessary to secure selection on days when work happened to be plentiful and the daily alternations of hard exercise and idleness rapidly developed in those who came. if they had it not before, the greatest irregularity of habits and physical or moral incapacity for continuous exertion." (*Unemployment,* Longmans Green & Co., 1930 ed.)

Other major industries, including construction, logging, sawmilling, railway maintenance, agriculture and the service trades, have in places and at times been highly casual. Caterers, hotels. restaurants and clubs hire casual labour for waiting on tables and doing kitchen work at banquets and other social functions; advertisers, theatres, stores and many other businesses employ people for short periods to distribute advertising matter. help load or unload trucks or other equipment, deliver merchandise or do odd jobs.

Casual jobs are accepted by widely differing categories of persons: some are ordinarily in regular employment but seek casual work to tide themselves over periods of unemployment; others are physically or psychologically incapable of steady employment; still others do casual work to supplement their principal source of income. But in the large majority of cases casual work is performed by casual labourers for whom it is their livelihood. Most of them are below par educationally, physically or psychologically; many are the victims of discrimination against race or colour. Patterns of living which depend upon picking up odd jobs are seldom desirable either for the individual or for society.

Decasualization.—Many forces have combined to exert pressure for the reduction or elimination of casual employment: employer realization that a reliable, efficient work force requires stable employment relations and more deliberate personnel policies; with sustained employment. unemployment insurance. vocational rehabilitation and other social services, fewer persons are available for short-term irregular work; collective bargaining has required more formal labour relations and the shifting of some of the burden of employment uncertainty from the backs of workers; and finally. modern governments, especially in wartime, have emphasized effective use of the labour force, including elimination of the wastes associated with casual employment.

During the first 30 years or so of the 20th century, a number of decasualization schemes or plans were set up in various British ports. In 1912 the port employers of Liverpool. the port-workers' trade union, the board of trade and the treasury co-operated to bring into existence the Liverpool dock scheme Another was set up in Bristol in 1916. The ministry of labour's port labour inquiry committee, appointed in 1930, found 31-plans in operation in various ports The report stated that by this date all major ports mere involved nith the exception of Glasgow and the Tyne and Wear ports, and that more than two-thirds of port transport workers were covered. The chief features of these schemes to

promote decasualization were that: (1) they were all registration schemes — that is, they involved the maintenance of a register of men who received preference in the selection of labour; (2) they were voluntary, operating without any legal sanction, though generally nith the assistance of the ministry of labour, which often provided secretarial or clerical help; (3) the majority were operated jointly by representatives of employers and of workers; (4) generally each plan provided for centralized hiring, though it was stated that in some ports this was found to be impracticable; (5) no provision was made for guaranteed minimum income. The committee considered the question of labour wastage and recruitment — obviously an important feature of decasualization schemes — but reached no very definite conclusions. It found that the registration plans had worked well and had brought into dock work a much better type of employee than was typical at the end of the 19th century; and the members of the committee felt that registration was an essential preliminary to any decasualization system.

During World War II it became imperative to introduce a greater measure of organization into dock work, partly because of the general labour shortage and partly because of the effects of bombing and the need for greater flexibility of the labour force. Statutory port registration committees were set up early in the war; and under the Dock Labour (Essential Work) order (1941) a National Dock Labour corporation. aith local boards. was appointed. The order also empowered the minister to make dock labour regulations, the essential points of which were that all port workers were to be registered; that all workers, when not actually in employment, automatically entered a reserve pool and were deemed to be in the employment of the corporation; and that, when in the reserve pool, they had to report to a control point as required, and, if not allocated to jobs, received attendance money. Thus a system of guaranteed pay was a feature of these regulations

Another phase in the process of dock labour decasualization began when, in 1946, the Dock Workers (Regulation of Employment) act was passed. Provision was made for the setting up of a National Dock Labour board, which succeeded the corporation in June 1947 and became responsible for the administration of the act. In addition, local dock labour boards were to be set up in each port or group of ports. The national board consists of a chairman and a vice-chairman and eight other members, four of these other members representing dock employers and four dock aorkers. All the members of the board are appointed by the minister of labour after consultation with the National Joint Council for the Port Transport Industry. Local boards also consist of representatives of dock workers and of employers in equal numbers. The chief functions of the national board are to maintain a labour force of a size suitable to the current conditions, to maintain a register of employers and a register of workers and to provide for the training and welfare of dock workers. All these functions, except the first, are also functions of the local boards, and much of the work of the national board is in fact carried on through these local agencies.

Similar decasualization programs have been initiated in Canada, Australia, New Zealand, India, France, the Netherlands, Belgium, Norway and Sweden. These programs vary considerably in detail. It may be said, however, that they all include some method of limiting the number of dockers competing for work by granting to certain of them a priority right in the port concerned. In some of the countries mentioned above the scheme operates under statutory provision: thus in Australia the Stevedoring Industry board was established by an act of 1949 and has the duty of maintaining the labour supply and of organizing and controlling waterside workers. In others, decasualization regulations are included in the collective agreements between employers and unions. The guarantee of a minimum income is embodied in such schemes as those of Australia, France and New Zealand, in which workers receive attendance money and (in New Zealand) a guaranteed minimum wage.

The unionization of U.S. longshoremen, particularly from the early 1930s onward, enabled the longshoremen to prevent easy access to longshore work by refusing to work with nonmembers or requiring nonmembers accepted for employment to have union permits, thus establishing union control over the labour supply. They established "dispatching halls" (hiring halls) in many ports, supervised by a joint committee of employer and union representatives or by the union. The hiring-hall system, which began at Seattle. Wash., in 1939, did much to change the casual labour situation on the docks to a regularized system of employment. The halls enabled the longshoremen to hold the dock work for those who made it their regular occupation and to divide the available work equitably among them. It insured the employers that experienced men would be systematically dispatched to the ships as needed. The system did not work without frictions, disputes and delays in the handling of shipping, but it markedly diminished the casual character of longshore work.

In other industries, the approaches to decasualization have been less formal. Nevertheless, with the advance of collective bargaining, more responsible employer policies and better personnel practices, the demand for casual labour has declined. On the supply side, the dependence on casual work also has declined. Vocational rehabilitation, unemployment insurance and national policies to maintain prosperity are the major forces that have reduced the extent of dependence on casual jobs.

CASUALTY INSURANCE. This type of insurance covers risks of loss associated with hazards to person and property, including legal hazards as well as those arising from accident and sickness It offersspecial protection to individuals, business firms and the professions, and is distinct from life insurance (*q.v.*).

UNITED STATES

The traditional forms of casualty insurance in the United States are automobile liability, workmen's compensation, employers' liability, accident, health, burglary, robbery, theft, glass, boiler and machinery, and general liability. Casualty companies also sell livestock, elevator, nuclear energy, credit, aviation and water damage Insurance. There is some trend toward inclusion within a single policy of traditional forms of casualty insurance'and property or inland marine insurance. The scope of protection afforded by casualty insurance has grown rapidly since World War II. Its use has been stimulated in the United States by the general economic gronth of the nation, increased size of the work force, broadening of the scope of the legal doctrine of negligence, gro - ing tendency to impose legal liability without fault, widespread claims, consciousness of injured and insured, increased use of automobiles and creation of new hazards brought about by developments in technology and the use of nuclear materials.

Accident Insurance. — This type covers hospital, medical and surgical expenses and also includes payments for loss of earnings in case of accident. Although sold separately, it is often combined with health insurance (*q.v.*). Hospital benefits are usually limited to a fixed amount per day and there is usually a maximum length of time for which benefits are payable. Medical benefits cover physicians' calls, both in and out of the hospital, X-rays, drugs and sometimes other hospital expenses. The extent of surgery protection depends upon the schedule attached to the policy listing the amount payable for each operation. Typical exclusions are war or acts of war, accidents while in the armed forces, suicide and aviation accidents. Coverage may include the periodic payment of benefits up to a fixed maximum in case of total disability or partial disability. A stated or principal sum is payable in case of accidental death and a capital sum is payable in case of loss of both eyes or any two limbs. (See also INDUSTRIAL ACCIDENTS.)

Travel insurance is a special form of accident insurance that has become popular in the 20th century. Insurance for air travel is one example. It is readily available at airports in varying amounts at small cost to cover a particular air journey.

Liability Insurance, — This is a form of casualty insurance sold by casualty and multiple-line insurance companies. Subject to certain limitations, the company agrees to pay on behalf of

the insured all sums he becomes legally obligated to pay as damages to someone else. The company promises to defend any suit brought against the insured alleging damage or injury, including groundless suits. The insurance is designed to reimburse a third party for injury to his person or damage to his property caused by the insured if the insured is under a legal obligation to pay. It is sometimes called "third-party insurance" because payment is made to a third party, not to the insured.

Liability policies often include medical payments clauses providing payment for reasonable medical expenses arising from the accident.

General liability insurance covers both direct and indirect or contingent liability. Direct liability insurance may be divided into personal liability, business liability and professional liability insurance. Contingent liability insurance, which covers the insured when he is indirectly liable, is available in special policies for owners, contractors, landlords, grantors and principals.

Examples of personal liability insurance are comprehensive personal and farmers personal liability insurance. The former provides broad protection against most of the risks of liability at relatively low cost for the insured and his family. Farmers personal liability insurance is similar but applies to farmers and their special liability risks.

Business liability insurance covers owners, landlords, tenants, manufacturers and contractors. Miscellaneous coverage such as elevator liability, which pays for liability arising out of the ownership. maintenance or use of elevators and equipment, is also available. Elevator collision insurance covering direct damage to the elevator is sometimes sold. Products liability insurance protects the insured business against claims for bodily injury or property damage that may arise from the use of its products.

Professional liability insurance covers druggists, physicians, surgeons, dentists, attorneys and other professional people. It pays on the insured's behalf sums which he shall become legally obligated to pay as damages because of injuries arising out of malpractice or mistake in rendering or failing to render professional service.

Contingent liability insurance, commonly called protective liability, is available in special policies for owners, contractors! landlords, tenants: grantors and principals. The insured is protected in case he is found legally obligated to pay sums for damages resulting from the actions or lack of actions of others. As an example, owners or contractors protective insurance pays on behalf of the insured such sums as he is legally obligated to pay because of bodily injury, sickness, death or property damage arising out of operations performed for him by independent contractors under his general supervision.

Automobile liability is a type of insurance by which the company promises to pay all sums that the insured shall become legally liable to pay as damages due to bodily injury or property damage arising out of ownership, maintenance or use of the automobile. In addition, the company defends any suit for damages alleging such injury or damage. (See MOTOR VEHICLE INSURANCE.)

Workmen's compensation is a type of insurance that provides for payment to employees of compensation for injuries suffered or disease contracted, the payments being such as are required by the workmen's compensation and occupational disease lams. Employers' liability insurance pays on behalf of the insured the sums he is legally obligated to pay as damages because of bodily injury by accident or disease sustained by any employee and not covered by either the workmen's compensation or occupational disease acts. (See WORKMEN'S COMPENSATION.)

Boiler and Machinery Insurance. — Under this heading is found insurance covering the owners of boilers, machinery and power plant equipment against the hazards attendant to the use of such equipment. The basic boiler and machinery policy provides coverage until the policy limit is reached for the following types of losses in the order named: (1) direct damage to the property itself resulting from covered accidents, such as explosion; (2) extra costs of making temporary repairs and of expediting repair of the property. including such items as overtime and extra cost of express and similar transportation; (3) property damage liability; (4) bodily injury liability; and (5) costs of defense, settlement and supplementary payments.

The inspection and loss prevention services of the insurance company are often of as much or greater importance than the insurance protection provided by the policies written under this heading. Most of the premium is for inspection, not insurance. Insurance companies furnish a staff of qualified inspectors who examine the insured equipment at periodic intervals and recommend changes. Pending correction of the defects, the company may suspend coverage by giving written notice to the insured. Some states require that boilers be inspected periodically. Insurance company inspections usually meet these requirements.

Other related forms of coverage include business interruption, residence boiler and machinery, consequential loss, power interruption, furnace explosion and outage insurance. Outage insurance protects for each unit of time, such as an hour, for which the object insured is out of use because of an accident.

Crop Insurance. — Insurance on growing crops is available to cover certain crops against one or more specified perils Direct loss to crop caused by hail is widely written and is sometimes extended to include nindstorm, fire. lightning, livestock and aircraft. The policy describes the kind of crop, the interest of the insured in such crop, the estimated yield per acre, the number of acres, insurance per acre, total amount of insurance and a description of the location of the crop that is insured. The company's liability is limited to a certain amount per acre. The insurance covers the crop while it is in the open on the described location but coverage can also be extended to include instances where the crop is in transit on the described premises as well as to private or public storage. The policy continues through growth and harvest of the crop.

Coverage of growing crops against direct loss from all risks is not generally available. The Federal Crop Insurance corporation has offered a form of crop insurance against certain losses due to crop failure. Some critics have objected that the federal program involves various noninsurance elements and is actually a form of subsidy.

Fire Insurance. — Fire insurance covers the insured against direct loss by fire or lightning to insured property. Insurance allied with fire includes extended coverage, windstorm and hail, explosion, vandalism and malicious mischief, water damage, nuclear energy, earthquake and volcanic eruption, aircraft and vehicle property damage and certain miscellaneous coverages. (See FIRE INSURANCE.)

Tornado and Windstorm. — This type of insurance covers direct loss by windstorm and hail. Windstorm is given a sufficiently broad interpretation to include tornado and cyclone. These perils may be protected against by writing a specific windstorm and hail policy, adding an endorsement to the fire insurance policy or through use of the extended coverage endorsement.

Water Damage Insurance. — This type of insurance provides protection against direct loss to the insured property caused by accidental discharge. leakage or overflow of water or steam from nithin various specified sources including plumbing systems. plumbing tanks used for water storage for the plumbing system. heating systems, elevator tanks and cylinders, industrial or domestic appliances. refrigerating systems and air conditioning systems. In addition, direct loss caused by accidental admission of rain or snow through defective roofs is included. Damages caused by floods, rising waters, backing up of sewers and failure of refrigerating or air conditioning equipment are not covered. This form of insurance is not widely sold; its use is confined mainly to areas where large water damage losses are likely to occur.

Plate Glass Insurance. — This is essentially an "all risks" coverage against glass breakage from any cause except fire, war, a nuclear reaction, radiation or radioactive contamination Protection is provided against loss from chemicals accidentally or maliciously applied. The policy also pays the cost of repairing or replacing frames when damage makes such repair necessary, cost of temporary plates or boarding up openings. and removing and replacing obstructions. The company agrees to pay the repair cost or replacement cost of the damaged glass. This is a relatively

small line of insurance as measured by amount of premiums written. Premium rates depend upon the size. type and use of the glass, its position in the building and the location of the building.

Burglary, Theft, Larceny, Robbery. — These types of insurance provide protection against loss resulting from certain illegal acts against property. These acts are usually specified but some policies are sufficiently broad so as to approach "all risks" coverage. The acts or hazards insured against are defined in the policies and sometimes vary according to the type of property covered. Burglary ordinarily involves unlawful entry accompanied by visible marks upon the exterior of the premises. Robbery involves the felonious taking of property from a person by violence, by putting him in fear of violence, by an overt felonious act committed in his presence or while he is rendered unconscious. Theft and larceny usually mean any act of stealing.

Riot and Civil Commotion. — This type covers direct loss by riot and by riot attending a strike or civil commotion. It includes direct loss caused by acts of striking employees of the owner or tenant of the premises while occupied by the strikers. A riot usually consists of an unlawful action by three or more people against another's person or property, or both. Any direct loss from pillage and looting which takes place at the site of the riot while it is going on is also included in this insurance.

Fidelity and Surety. — Fidelity bonds protect against loss caused by dishonest acts of persons covered by the bond. Surety bonds provide the surety will make good the obligor's default in performance of an obligation. Commonly referred to as bonding rather than insurance. these bonds are usually sold by casualty insurance companies. Many multiple-line insurance companies and bonding companies especially formed for this purpose also engage in fidelity and surety bonding. The activities of all such companies are closely supervised by the insurance regulatory authorities in the various states. (*See* FIDELITY AND SURETY BONDS.)

Multiple-Line Policies. — A multiple-line insurance policy combines within a single contract protection against both property and casualty risks. State regulatory authorities and legislation for many years prohibited such combination but these barriers have been removed and a company may sell both fire and casualty insurance. Life insurance: other than accident and health insurance, is sold only by life insurance companies. Following the grant of combination underwriting powers, multiple-line insurance policies have generally combined into a single policy types of insurance that were formerly found in several different policies and endorsements. Provision of "all risks" protection without specifying the fire and casualty perils, and without stating an individual premium for each peril, has been slower to develop. Multiple-line protection has long been available in inland marine insurance. where floater contracts are used to provide essentially "all risks" type of protection, including both property and casualty perils. Another way of providing multiple-line insurance coverage is to add a casualty insurance endorsement to a fire insurance policy.

Multiple-line insurance is available to cover both personal and business risks. Special personal policies have been designed for homeowners and tenants. Special business policies have been developed for manufacturers. merchants and other businessmen. Such policies provide protection against all risks or against a large number of specified perils subject to stated exclusions in either case. (V. G.)

GREAT BRITAIN AND EUROPE

In Great Britain casualty insurance is more commonly termed accident insurance. It consists of a number of different types of insurance, the origins of which have been associated with the industrial and commercial revolutions of the last 150 years. The main types or section5 are: personal accident and sickness; employers' liability; public liability; motor vehicle insurance (*q.v.*); engineering; burglary; and fidelity guarantee.

Accident and Sickness Insurance. — Personal accident insurance normally covers all accidents except those occasioned by mountaineering, winter sports. hunting, racing and other pursuits of a more than usually hazardous nature, nhich are only insurable on negotiated terms and conditions. The former general practice of excluding air travel is now substantially modified.

Accidents-Only Policies. — The commonest form of policy covers accidents only. It provides for payment of a capital sum in the event of death by accident, or the loss by accident of one or two limbs, or the sight of one or both eyes, and weekly benefits limited to a specified period in the event of temporary disablement. Rates vary according to the degree of risk indicated by the occupation of the proposer. Double benefits are provided if the insured person is killed or injured in certain defined accidents.

Accidents *and Specified* Diseases Policies. — Such policies are similar to accidents-only policies but provide weekly benefits in addition for certain specified diseases. An annuity is payable if the insured suffers prolonged total disablement, loses completely the sight of both eyes by disease or contracts paralysis in at least two limbs.

Accidents and All-Sickness *Insurance*.—This form of policy, in addition to granting the normal benefits in case of accidents, provides weekly benefits during any illness necessitating confinement to the house for not less than seven days. The all-sickness provision normally terminates when the insured reaches the age of 60. For the purpose of travel the accident section is world wide, but it is usual to limit cover under the sickness section of the policy to specified overseas territories.

Noncancellable Accident and Sickness Policies. — An ordinary accident or sickness policy is renewable each year at the option of the insurer, who may impose special terms for its continuance. Policies which cannot be so cancelled or revised are available. Premiums are on a higher level than for year-by-year contracts. and acceptance at the outset is subject to medical evidence of health. This noncancellable form of policy has not been adopted by European countries other than Great Britain.

Group Accident and Sickness Schemes. — Commercial policies to provide accident and sickness benefits for employees within certain employment categories are freely granted. Where wages are paid during disability from sickness or accident such a policy enables the employer to recoup these payments and thus to measure in advance his annual commitments in this respect. (See GROUP INSURANCE; HEALTH INSURANCE.)

Air Travel. — The growth of air travel had led to a demand for air travel accident insurance. Issued in the form of a travel coupon, personal accident insurance to cover holiday and business trips at home and overseas is now cheaply and conveniently available. Group policies to provide automatic coverage for employees of firms when traveling on business are also granted.

Employers' Liability. — In Great Britain the repeal of the Employers' Liability act of 1880 and of the various workmen's compensation acts led to fundamental changes in employers' liability insurance in the 20th century. Claims formerly falling under these acts were covered under the National Insurance (Industrial Injuries) act, 1946 An injured workman still retained a right of action at common law and such action could be pursued concurrently with a claim to benefit under the Industrial Injuries act.

In France the development of employers' liability has shown a marked similarity to that in Great Britain. Workmen's compensation acts dating back to 1898, under which insurance against the risks involved had been compulsory, were set aside in 1946 and liabilities were taken over by the state as part of the social security scheme. In Belgium, Italy, Spain, Switzerland and Scandinavia the liability of the employer is governed by compensation acts under which insurance is, in general, compulsory. In some European countries private insurance performs its part in satisfactorily implementing the law; in others this field of insurance is closed to the companies in favour of the state or of concerns under close state supervision.

In Great Britain an employer is personally responsible at common law to use reasonable care in providing safe working conditions for his employees. A breach of this personal duty is actionable and. subject to the defense of *volenti* non fit *injuria* (available where the employee knew that the working conditions were unsafe and consented to run the risk of injury) and to the plea of contributory negligence (available where the cause of the injury was partly the breach of the employer's duty and partly the

negligence of the injured employee), an injured employee can recover full pecuniary compensation for any damage attributable. to the breach of duty. The defense of "common employment" formerly open to an employer in respect of claims of his workmen was abolished by the Law Reform (Personal Injuries) act, 1948. The Fatal Accidents acts, 1846–1908, and the Law Reform (Miscellaneous Provisions) act, 1934, also broadened very considerably the common law liability of an employer.

Insurance offers a complete indemnity to the employer of his liability at law for bodily injury to, or disease contracted by, his servants or employees arising out of and in the course of their employment. This indemnity includes claimants' law costs and other costs incurred with the consent of the insurer. In addition, the insurer accepts responsibility for costs and expenses recovered from an insured by a claimant. It is customary for the insurer to indemnify the insured up to but not exceeding a specified sum for any one occurrence, but unlimited as to the amount paid in the aggregate on successive claims in any one year of insurance. Premium assessment is under two main headings: (1) domestic servants' insurance, rated at a premium per capita; (2) trade or business risks, rated at a percentage of the annual wages and allowances. but varying with the nature and extent of the risk. (See also WORKMEN'S COMPENSATION.)

Public Liability and Third-Party Risks.—A wide range of third-party liabilities exist. Whereas in Great Britain a liability may be imposed upon a person by the common law or may exist as the result of a statute, in continental European countries a person's responsibility for damage or injuries caused by any animal or object or thing under his control is fully dealt with under the codified laws of the particular country. Atomic energy is destined to affect civilian life in many ways as yet measurably unforeseen and must affect all types of insurance particularly public liability and third-party indemnities.

The liability which an insurer undertakes in this branch of the business is the legal liability of the insured in respect of claims made against him by third parties, arising out of the insured's own negligence, or the negligence of his servants, or possibly from nuisance or breach of contract. Some types of insurance include the third-party risk in the form of a special section of the policy, *e.g.,* motor insurance, where the policy may cover accidental damage to and theft of a vehicle and, in compliance with legislation, provide for third-party claims (see MOTOR VEIIICLE INSURANCE). The legal liability of a householder is automatically insured under the normal terms of the comprehensive householders' policy, the indemnity applying to accidents happening in or about the buildings, whether or not arising out of defects in the building. In general, accidents caused by fire or explosion are excluded from the cover under a public liability policy, but since each risk is rated according to its particular merits, the risk of fire or explosion can usually be covered by payment of an additional premium.

Changes in the law, such as the Lam Reform (Personal Injuries) act, 1948, the Law Reform (Limitations of Actions, etc.) act, 1954, the Hotel Proprietors' act. 1956, the Housing act, 1957, and the Occupiers' Liability act, 1957, have had considerable impact on third-party insurance practice. Case law, too, has had its repercussions and in general has revealed the need for high indemnity limits and for the widest possible protection.

Landlord and Tenant.—The Occupiers' Liability act introduced important changes in the liabilities of landlords and occupiers to third parties. Prior to the act the liability of the landlord was only to the tenant, on grounds of breach of contract, and he was not liable to other persons because he owed them no duty. Now, however, where premises are occupied by a person under a tenancy which puts on the landlord an obligation to that person for the maintenance or repair of the premises, the landlord may be made liable to all persons who, or whose goods, may from time to time be lawfully on the premises.

Professional Indemnities.—The degree of care and accuracy required from a professional person accepting a fee for giving advice on technical matters is of the highest possible standard, and it is the practice of solicitors. accountants. architects, surveyors, estate agents, doctors, dentists and the like to insure against claims arising from error or malpractice. Closely related to professional indemnities are those in respect of treatment risks. Hairdressers may be involved in actions for damages arising out of hair dyeing and the like, while serious claims have been made against beauty specialists.

Food Risks.—Third-party insurance is of equal importance to hotel, inn, restaurant and boardinghouse proprietors and to food manufacturers who may be involved in serious claims if foreign or deleterious matter is contained in food or drink supplied or manufactured by them. Policies issued to hotel proprietors offer indemnity against a wide range of legal liabilities arising from the Hotel Proprietors' act of 1863.

Any bodily injury, illness or damage arising out of any form of product sold or supplied may give rise to claims—often of catastrophic proportions—against the manufacturer, the distributor or the retailer held to be liable. The Sale of Goods act, 1893 (s. 14), deals with implied warranties and conditions concerning the quality or fitness of goods for any particular purpose, and insurance protection is granted under a separate contract, known as a Products Liability policy, or by an extension of a general public liability policy.

Personal Liability.—The common law liabilities of the individual follow him in his private pursuits. A carelessly driven golf ball, the swing of a stick or umbrella, a dropped match or cigarette end, hazards incidental to shooting, horse-riding or angling. the bite of a dog or a collision when walking or cycling are indications of the widespread nature of an individual's third-party liability which may lead to litigation and financial loss. Personal liability insurance grants an indemnity against negligent acts during such private activities. Under the family type of personal liability insurance an entire household, including servants, is protected against liability claims for a nominal premium.

Engineering Insurance.—The use of machinery involves manufacturers in certain special risks which are undertaken by engineering insurance companies. Unlike most other classes of insurance, which are designed to indemnify the insured after he has suffered loss, engineering insurance endeavours primarily to reduce the possibility that loss will occur. To this end, insured machinery is periodically inspected by skilled engineers to ascertain defects before they result in breakdown of plant. A very large proportion of the premiums received is expended upon these services, which enable the insured to receive the advice of experts as to methods of obtaining the utmost economy and efficiency from the plant.

The factory acts stipulate that all boilers under pressure must be periodically inspected by competent engineers. Such inspections are undertaken by the insurers in the terms of the boiler policy, which also indemnifies the insured in respect of claims made against him by third parties for personal injuries and covers damage to surrounding property caused by explosion. Law costs incurred with the consent of the insurers in defending claims are also included.

Policies are not confined solely to boilers but are issued for all classes of machinery working under pressure, *e.g.,* superheaters, calorifiers, hot-water and steam-heating boilers with heating pipes and radiators and other vessels working under steam, liquid air or gas pressure. Breakdown risks of air compressors, steam engines. pumps, oil engines, electrical plant and many other types of machinery are commonly insured and, subject to the exclusion of certain inexpensive parts, the breakage of any part of a machine proper while running. causing a sudden stoppage of the machine and necessitating repair before its work can be resumed, is covered. Periodical inspections of the plant are followed by the dispatch of engineers' reports to the insured containing advice as to its use, although noncompliance with the suggestions made does not invalidate the insurance.

Time-loss policies guarantee the payment to the insured of a fixed daily rate to cover the loss of time consequent upon the breakdown of engines, explosion of boilers or the collapse of flues.

Elevators, *Hoists and* Cranes.—For the purpose of public liability insurance, elevators are usually classified as either: (1) passenger elevators; (2) goods elevators; (3) service elevators; (4)

coal and coke elevators or hoists; (5) builders' hoists. Elevator insurance covers the risk of liability to third parties for personal injuries due or alleged to be due to defects or to negligence of attendants, in connection with the elevator, its gates, hatchways or shaft. Where elevators are driven by electric or hydraulic power breakdown insurances are often affected. The policy stipulates periodical inspection of the elevator by skilled engineers and, while the insured may select the engineer, subject to the insurers' approval, engineering insurance companies are willing to undertake these services. Policies similar in form to the elevator policy are issued for hoists and cranes, although the premiums required are frequently greater because of the increased possibility of goods falling upon third parties. Cranes of types liable to the risk of toppling and collapse may be specifically insured under a special form of policy.

Burglary, Housebreaking, Larceny, Theft.—In Great Britain, for insurance purposes, burglary is defined as forcible entry. with felonious intent, into a dwelling house by night; housebreaking is forcible entry, with felonious intent, into premises (not necessarily a dwelling house) by day; larceny is theft not preceded by forcible entry, *i.e.,* by persons lawfully on the premises or who have gained access without force; "theft" is a broader term than "larceny," the latter simply being a certain kind of theft meeting statutory requirements. In continental European countries the term "burglary" embraces housebreaking, larceny and theft, and in consequence no specific definitions apply as in Great Britain. In general, however, there is no material demand for this forrn of insurance on the continent.

Burglary policies fall under two main classifications: (1) private dwelling-house policies that ordinarily cover the risk of burglary, housebreaking and larceny; (2) business premises policies that do not include the risk of larceny and sometimes provide but limited protection in relation to burglary and housebreaking. The usual form of private house policy covers furniture, household goods and personal effects of every description, including gold and silver articles, jewelry and furs belonging to the insured or to members of his family or domestic servants who permanently reside with him. When the proportion of gold and silver articles, etc., exceeds in value one-third of the total value of the property insured, an additional premium rate is charged on the excess amount. Damage for which the insured is liable, caused to the dwelling house as a result of burglary, housebreaking or larceny is included in the cover provided by these policies. (See also FIRE INSURANCE.)

Policies issued in connection with business premises are more restricted in their scope than those applicable to private dwellings, and the risks covered are usually limited to those of burglary and housebreaking only. While in general business premises are, for the purpose of burglary insurance, classified according to trade, many varying factors enter into the calculation of the premium rate. The insurer will require details of any burglar alarm system and also the extent to which the premises are, or can be, otherwise protected. The extent of unoccupancy, the adequacy of the sum insured and the highest amount which thieves are likely to take at any one time are other factors for consideration.

Of the risks related to burglary insurance "all-risks" is perhaps the most important. Such insurance provides the fullest possible cover of valuables—gold and silver articles, jewelry, furs, cameras, pictures and the like—against loss or damage by fire or theft, loss in the ordinary meaning of that term or damage by accident of any kind. An all-risks policy usually operates anywhere within a stipulated geographical zone.

Insurance of Money.—The insurance of money under an ordinary business premise burglary policy is normally limited to cash in a safe and small amounts of cash in tills. A specific insurance on "money" extends to bank notes, treasury notes, checks, postal orders, money orders or cash. It protects against loss from robbery, theft or accident, either in or out of a safe on the insured's premises during business hours, and while in transit between the insured's premises and the bank. The premium is calculated from the total estimated carryings in the course of the year, the rate varying according to circumstances.

Glass Breakage.—There are many different kinds of insurable glass, *e.g.,* embossed, silvered, wired, muranese, opalite, marmorite, nonreflecting and also ornamental and lettered glass, often fixed in trade premises as a means of advertisement. The normal glass insurance policy covers "breakage from any cause except fire, explosion, earthquake, war and kindred risks." The policy is essentially an insurance against breakage; mere damage to the glass, *e.g.,* scratching or chipping, is not covered. By a policy condition, frames are not insured against damage unless specifically mentioned as additional cover, and it is provided that no liability exists under the policy for interruption or delay in business or for damage of any kind between the time of the glass breakage and its replacement, and that the liability for taking precautions to avoid damage to persons and property rests on the insured. Premiums are calculated according to the superficial area and type of glass to be insured. or. where this is not practicable, on values. Although the policy provides that the insurer may replace the broken glass or reimburse the insured in money, in practice most claims are settled by replacement.

Fidelity Guarantee.—This is one of the oldest classes of accident insurance. Its object is to provide protection against default by an individual appointed to a position of trust. Suretyship by private bondsmen dates back to the indefinite past, and corporate suretyship, termed fidelity guarantee, has been transacted by insurance companies for well over a century. The three main classes of fidelity bonds issued are: (1) commercial bonds for guaranteeing the fidelity of clerks, cashiers, travelers, managers, secretaries and the like; (2) government bonds applying to servants holding appointments under the crown; and (3) legal bonds for guaranteeing the fidelity of administrators in connection with probate court, receivers and managers in chancery and the like. The rate of premium charged depends largely upon the nature of the duties to be performed, the system of check exercised and the amount of cash under an individual's control. Where there are a number of individuals to be guaranteed, special policy forms, known as collective and floating policies are adopted. In continental European countries, fidelity guarantee business has a much narrower appeal and in the main is concerned with the granting of bonds guaranteeing the fidelity of government and administrative officials.

In the contingency section, bonds are issued in respect of missing title deeds, share certificates, bearer bonds and similar valuable documents; also in respect of missing beneficiaries, defects in title, forged transfers and restrictive covenants; and in connection with variation of a trust, issue risks and many other contingencies.

A public or other authority may, when placing important work in the hands of a contractor, ask for a guarantee that the work will be duly completed or completed within a certain time. In some cases the authority insists that the guarantee be given in the form of a guarantee bond from an insurance company. As in many other classes of casualty business, the premiums depend upon the class and magnitude of work undertaken and the reputation and standing of the proposer and consequently vary considerably. See also AVIATION INSURANCE; MARINE INSURANCE.

See *Accident, Fire and Marine Insurance Year Book.* (P. Ss.)

CASUAL WARD, the name given, under the British Poor laws between 1834 and 1948, to a building used for giving temporary shelter to vagrants. Under the Poor law as reformed in 1834, the duty of boards of guardians was to relieve not only destitute persons within their districts but also vagrants (tramps or casual paupers). Any vagrant or unemployed person walking from place to place and seeking work usually obtained an order for the casual ward from the relieving officer. Accommodation was rough and frugal and, in return for food and lodging. tasks such as chopping wood or scrubbing floors were generally imposed.

Under the Poor Lam act of 1930, casual wards became the business of the public assistance committees of county and borough councils, and joint vagrancy committees were established throughout the country to bring about a uniform system. The casual was admitted and supervised by trained officials and ordinarily was not allowed to discharge himself before the second morning (excluding Sunday) following admission unless he possessed a document from an employment exchange showing that he had an appointment with

a prospective employer. The standard of accommodation was higher than that customary before the 1930 act.

The National Assistance act (1948) reorganized the administration of casual wards, thereafter known as reception centres. They became the responsibility of the National Assistance board, though this body used the local authorities in carrying out its duties. The number of reception centres fell from 215 (July 1948) to 60 (Dec. 1958) and there was an important change in the principles under which they were run: they were regarded as means for rehabilitating those who used them (*e.g.,* by finding them employment) rather than as mere temporary shelters. See also POOR LAW.

(A. F. Ws.)

CASUARIIDAE, a family of large flightless birds living in New Guinea, northeastern Australia and nearby islands. Their large claws and bills make them extremely dangerous. See CASSOWARY.

CASUARINA, a genus of trees of the Casuarinaceae family containing about 35 species, chiefly Australian, but a few Indo-Malayan Several species are cultivated in the subtropical parts of the United States, especially the beefwood (C. *equisetifolia*), which has become widely naturalized in Florida. The long whip-like green branches of the casuarina are longitudinally grooved and bear at the nodes whorls of small scale leaves, the shoots resembling those of *Equisetum* (horsetail). The flowers are unisexual.

The staminate flowers are borne in spikes, each flower consisting of a central stamen which is surrounded by two scalelike perianth leaves. The pistillate flowers are borne in dense spherical heads; each flower stands in the axil of a bract and consists of two united carpels flanked by a pair of bracteoles; the long styles hang out beyond the bracts, and the one-chambered ovary contains two ovules. In the fruit, the bracteoles form two woody valves between which is a nutlet; the aggregate of fruits resembles small cones. Pollen is transferred by the wind to the long styles. The pollen tube does not penetrate the ovule through the micropyle but enters at the opposite end. The wood is hard, and several species are valuable timber trees.

From a fancied resemblance of the wood to that of the oak these trees are known as oaks, and the same species has different names in different localities, including she-oak, swamp oak, ironwood and beefwood.

CASUISTRY, as commonly used, is a term of reproach directed against real or alleged abuses of the application of reason to legal and ethical problems. In a more neutral sense, casuistry arises whenever reflective men undertake to determine rules for conduct in the circumstances of everyday life; that is, to resolve cases of conscience. Persons suspicious of the methods and outcomes of the deliberative process often regard the elaborate chains of argument and authority that mark discussions of such matters among the learned as sophistical "rationalization," or, to put the matter in a more traditional way, "casuistry."

Casuistry however has more often grown out of an effort to preserve the law than out of a desire to destroy it. The accommodation to the world that is allowed in casuistry becomes a "hedge around the law," making it proof against assault on the charge of being irrelevant to human needs and changing circumstances. It is not surprising, therefore, that casuistry appears in all complex legal and ethical systems. The Stoics, to whom the Roman law oned so much; the rabbis who composed the Talmud with a view to immortalizing the Law; the Muslim commentators on the Koran; and the Confucian sages—all, in this broad sense, were accomplished casuists.

No civilization, however, has given a greater scope to casuistry than has Christendom. The unique element in the medieval synthesis mas the orchestration, sometimes harmonic, sometimes dissonant, of the themes of conscience, casuistry and the cure of souls. The close connection of these three notions. and their associated institutions, is a decisive feature that distinguishes western patterns of cultural and social development from those of both the near and the far east.

The development during the 12th century of an extensive literature on the problems of conscience followed quickly upon the extension of the scope and authority of conscience by Peter Abelard and other schoolmen, and the requirement of regular annual confession by the fourth Lateran council of 1215 provided a vastly expanded public for the literature of casuistical divinity. Among the moral theologians and canon lawyers who prepared theological treatises and alphabetical handbooks of cases of conscience were Robert of Curzon (d. 12191, Raymond of Peñaforte (fl. 1234), John of Freiburg, Angelo da Clavasio and Silvester da Priero. Sustained criticism of the spirit and substance of these works begins with Luther, who cast the so-called "angelic *summa* of the cases of conscience" (*Summa* angelica de *casibus* conscientiae) of Angelo da Clavasio into the flames, along with the corpus of the canon law. A severer assault occurred in Catholic lands in the 17th century in the course of the conflict over probahilism (*q.v.*). Pascal's mocking exposé in his Provincial Letfers (1656–57) dealt a profound blow to the system of probabilism and to the sophistical elements in ultraprobabilist casuistry, but the distinctively medieval integration of conscience, casuistry and the cure of souls recovered from the probabilist crisis in the 18th century and still characterizes Catholic societies.

In Protestant countries casuistry has always seemed, as it seemed to the original reformers, a dubious enterprise. As Protestantism came to permeate whole societies, however, the need for moral guidance in cases of conscience appeared again, and Protestant works of casuistical divinity have been written since the middle of the 16th century, the high point occurring in the mid-17th century. In Lutheran Germany the works of J. H. Alsted and others may be mentioned. In England a massive literature is connected with the names of Bishop Joseph Hall, William Perkins, Richard Baxter, William Ames and, above all, Jeremy Taylor. Puritan works in this genre had a profound influence upon the thought and life of the American colonists in the 17th and 18th centuries.

Although the word "casuistry" hardly ever appears in contemporary philosophical or theological discussions, the issue remains alive. A new appreciation of casuistry is implied, for example, in the writings of the school of linguistic analysts, notably in Stephen Toulmin's *An* Examination of the Place of Reason *in Ethics* (1950) and in J. L. Austin's William James lectures at Harvard, titled Excuses. In sharpest contrast to this are the ethical intuitionists, the phenomenologists and the existentialists. Among theologians. the problem of casuistry finds on one side Reinhold Niebuhr, who recognizes both the necessity and the ultimate insufficiency of law and casuistry; and, on the other, Paul Tillich and Martin Buber, who reject casuistry in favour of the "trans-moral conscience."

The complaints that have been made against casuistry involve a complex of notions of which the following are perhaps central: (1) Casuistry is a device employed by sanctimonious and greedy priests and judges for ruling over the consciences of gullible men (Boccaccio and numerous medieval and Renaissance authors). (2) Casuistry inevitably involves a sophistical evasion of the "word of God." the "moral law" and the individual conscience (Pascal). (3) Casuistry gives continuing encouragement to a legalistic view of human existence and divine justice (Luther, Tillich). (4) Casuistry exaggerates the role of the free will in man's life. obscuring man's dependence on God's grace (Luther, Kierkegaard, Tillich). (5) Casuistry encourages man to perform acts out of the fear of law rather than the love of God or the moral universal (Luther, Kant). (6) Casuistry is in the violation of the inner light (George Fox and the Quakers). (7) Casuistry militates against the achievement of a rational ethic based on the greatest good of the greatest number (Jeremy Bentham). (8) Casuistry betrays the divine command of impulse and turns a deaf ear to the call of blood (D. H. Lawrence). (9) Casuistry dishonours the I-thou relationship by treating the moral impulse in an externalized fashion (Buber).

Except for the implicit approval of casuistry found in collections of trial reports and handbooks of cases of conscience, it is not easy to find many positive evaluations of casuistry. Professional interpreters of the law and political leaders, however, have never doubted its necessity. They have always assumed that it is the armature that conscience inevitably generates in its strivings to be

effective in the tangled circumstances of the here and now. A powerful expression of the sentiments of judges and scribes, who have always sensed that every community, even the holiest, must plod toward innovation through the seemingly circuitous devices of casuistry, may be found in Justice Benjamin Cardozo's The *Nature of the Judicial Process.* Ordinary men have generally agreed with this view, for it is their experience that "circumstances alter cases."

There is, therefore, a paradox to the problem of casuistry. Intuitionists, mystics and ecstatics abhor organized procedures for applying conscience to its cases; they feel too full of the spirit to accept voices of authority or the clashing claims of the group. Prudent men and judges strive above all to preserve the rule of law. In the absence of evidence that the verdict of conscience rests upon some acceptable common tradition or acknowledged rule, they are likely to resist the appeal to conscience as arbitrary and unconvincing. Judges are only too aware of the vast complications involved in the achievement of a just decision. As too few have realized, the problem of casuistry poses the eternal dilemmas —the dilemmas of the one and the many, permanence and change, tradition and innovation, the letter and the spirit.

The United Nations charter provided that warlike measures are permissible only if authorized by the Security council or the general assembly, or if necessary for "individual or collective self-defense" against "armed attack." *See* ARBITRATION, INTERNATIONAL; WAR. (Q. W.)

CAT, properly any member of the family Felidae, of which the domestic cat, *Felis catus,* is the type. The family includes the lion, tiger, leopard, jaguar, lynx, cheetah and numerous species of smaller cats *(see* CARNIVORE). The name "cat" is also applied to other mammals that are more or less catlike in appearance or behaviour. In Australia the dasyures, small weasellike marsupials, are called "native cats"; in the U.S. the spotted skunk, a mustelid, is often called the "civet cat," and the cacomistle, a member of the raccoon family, is commonly called the "ring-tailed cat."

GENERAL

Origin and Evolution. — The history of the cat family can be traced back through the fossil record about 40,000,000 years into Lower Oligocene times. The cat "pattern" seems to have been established very early in the evolution of modern mammals, for the early cats were already typical cats at a time when the ancestors of most other modern mammalian types were scarcely recognizable. Fossil cats from the Oligocene, such as *Dinictis,* are astonishingly similar to modern cats. *Dinictis* was about the size of a lynx, with catlike teeth and retractile claws, but a small brain. The cat pattern must have been very successful, for it remained essentially unchanged throughout the Tertiary while most other mammalian types were undergoing tremendous evolutionary changes.

In *Dinictis* and other early cats the canine teeth in the upper jaw were much larger than in modern cats. From this beginning the cat stock followed two different lines of dental evolution. In one line, the sabre-tooths, the upper canines grew larger and larger, whereas in the second line, the "typical" cats, these teeth became smaller. There were, of course, other differences in other parts of the body.

In the sabre-tooths (Machairdontinae) the upper canines were large sabrelike structures that extended below the chin when the mouth was closed; there was usually a flange on the chin that protected the ends of the sabres when they were not in use. The remaining teeth were not much different from those of other cats except that some of the smaller ones tended to disappear. The sabre-tooths were heavy, slow-moving creatures with heavy forequarters and relatively light hindquarters. About 10 genera are known as fossils. The largest, most advanced and best-known sabre-tooth is *Smilodon,* which was about the size of a modern lion and had canines up to 6 in. long. *Smilodon* became extinct in the Late Pleistocene, only a few thousand years ago. The bones of hundreds of individuals of this sabre-tooth have been found in the Rancho La Brea tar beds in Los Angeles, Calif.

Typical cats (Felinae) first appear in the Lower Pliocene, about 10,000,000 years ago, and have continued almost unchanged into modern times.

Cats are typically solitary animals, hunting their prey by stealth and overwhelming their victims in a short, quick rush or leap. Foot pads help them stalk their prey in silence. They can move very fast in a short dash but are not built for sustained speed. For example, the cheetah is generally credited with being the speediest of mammals since it is capable of speeds of 65–70 m.p.h., but it has little endurance and is soon exhausted. Cats generally are nocturnal in habit; they see best in semidarkness and rely mostly on sight in hunting, although hearing is also keen. The retina of the cat's eye is made extra sensitive to light by a layer of guanine; this substance causes the eye to shine at night in a strong light. The cat's sense of smell is not well developed. but tactile perception is increased by whiskers and by hairs on the inner surface of the ear.

The largest living cat is the tiger, which has been known to reach a weight of more than 500 lb., a height of 5 ft. and a length of 14 ft. Lions seldom exceed 400 lb., a height of $4\frac{1}{2}$ ft. and a length of 9 ft. Full-grown male pumas weigh 160–175 lb., although there are records of more than 200 lb.

One of the most characteristic features of cats is purring, a low continuous humming sound associated with pleasure or contentment. Purring has nothing to do with the true voice of the animal; the vibration frequency is far lower than that of the vocal cords. The mechanism of the purr is not well understood. Some have suggested that purring is produced by the false vocal cords, but this is unlikely. The fact that species of cats in which the hpoid apparatus is incomplete are unable to purr suggests that the whole hyo-laryngeal apparatus vibrates to produce the purr. (See *Classification* below.)

Structure. — The cats are the most highly specialized of all flesh-eating mammals. All cats, from the lion and tiger down to the smallest jungle cat, and including the various breeds of domestic cats, are very much alike in structure. They are powerfully built animals, but very supple. Because their muscle movements are well coordinated and they are adept at using their tails for balance, cats almost always land on their feet when they fall or are dropped. The brain is large and highly developed. In keeping with their carnivorous habits the gut is simple with a short intestine; the small intestine is only about three times the length of the body. The tongue in all cats has a patch of sharp, backward-directed spines near the tip, which has the appearance and feel of a coarse file; these spines help the cat pick up liquids with its tongue.

The most characteristic and specialized features are in the teeth and claws. The teeth (fig. 1) are designed for two functions only: stabbing and cutting. Stabbing is done with the canines, which are long, pointed teeth that project far beyond the other teeth and are capable of making deep puncture wounds. The canines are used in killing prey. Cutting is done with two teeth on each side in the back of the mouth, the fourth premolar in the upper jaw and the first molar in the lower jaw. Each of these has a long cutting blade running along the length of the tooth, and the two blades work against each other exactly like the blades of a pair of shears. They are used for cutting prey into pieces small enough to swallow. The rest of the teeth are more or less degenerate and nonfunctional; most of the cheek teeth do not even meet when the mouth is closed. The dental formula in all cats, for either side of both upper and lower jaws, is: incisors $\frac{3}{3}$, canines $\frac{1}{1}$, premolars $\frac{3}{2}$, molars $\frac{1}{1}$. The total number of teeth is 16 in the upper jaw and

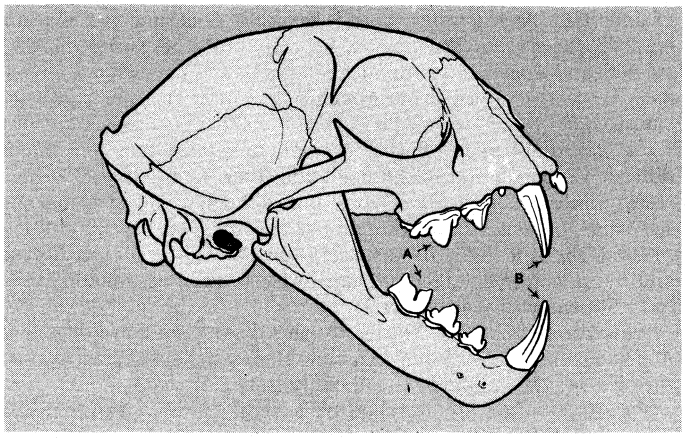

FIG. I.— SKULL OF CAT: (A) SHEARING TEETH; (B) CANINES

14 in the lower. Primary, or milk. teeth number 24; in the domestic cat these are replaced by the permanent teeth at about five months. Each half of the ja is hinged to the skull by a transverse roller that fits tightly into a trough on the underside of the skull, an arrangement that makes grinding movements impossible. Another dental characteristic shared by all cats is that they have no flat-crowned crushing teeth and therefore can only cut up their food instead of being able to chew it.

The cats are provided with a second weapon for subduing and holding prey: strong, sharp claws. To prevent the claws from becoming blunted by wearing against the ground there is a remarkable mechanism for retracting them when they are not in use (fig. 2). The claw is retracted or extended by rotating the end bone of the toe (which bears the claw) in an arc around the end of the next bone. Two tendons attached to several of the toe muscles are inserted into the bone that bears the claw, one tendon being inserted above the centre of rotation and the other below. When tension is applied above the centre of rotation (through the common tendon of the extensor digitorum longus, extensor digitorum brevis and interosseus muscles), the bone rolls upward and backward and the claw is retracted. When tension is applied below the centre of rotation (through the tendon of the flexor digitorum longus muscle), the bone rolls downward and forward and the claw is extended or "unsheathed." The action that unsheaths the claws also spreads the toes widely at the same time, making the foot more than twice as broad as it normally is and converting it into a truly formidable weapon. This claw-sheathing mechanism is present in all species of the cat family except the cheetah. It also occurs, though less perfectly developed, in some of the civets. Cats keep their front claws sharp by pulling with them against trees or other tough materials; the back claws are manicured by biting.

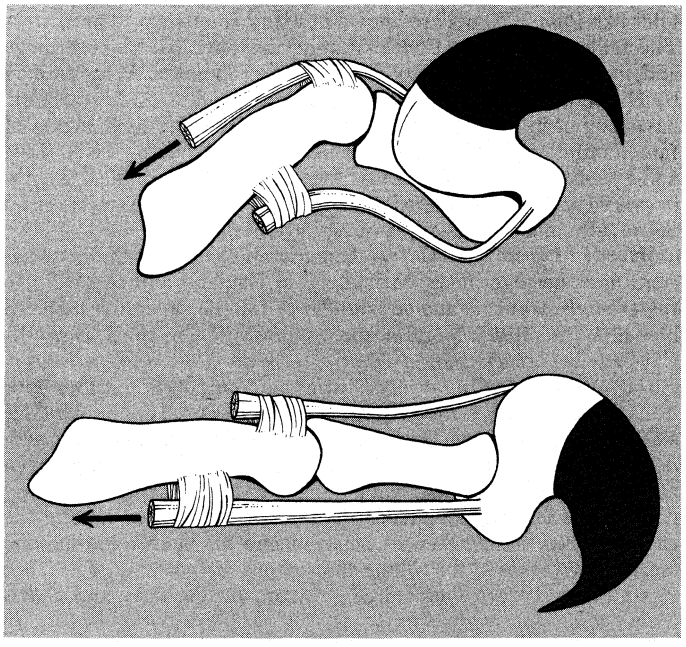

FIG. 2.— MOVEMENT OF RETRACTILE CLAW OF A CAT: (ABOVE) WHEN UPPER TENDON IS PULLED, CLAW IS RETRACTED; (BELOW) WHEN LOWER TENDON IS PULLED. CLAW IS UNSHEATHED

Geographic Distribution.— Cats are found in various species throughout the world except in the Australian region, Madagascar and the oceanic islands. They were absent in South America until the Panama land bridge was re-established in the Pleistocene (about 1,000,000 years ago); then both the sabre-tooths and true cats entered South America. The greatest concentration of species of cats is in southeastern Asia where as many as seven species may occur together in one area.

Seven species of cat are native to the U.S., although all do not occur together in any one place. The puma or cougar (Felis *concolor*) and the bobcat (L. *rufus*) were formerly distributed throughout the U.S. but have been extensivelv exterminated bv man. The lynx (L. canadensis) is a Canadian species that enters the northern states of the U.S. Several tropical species barely enter the U.S. along the Mexican borders of Texas, New Mexico and Arizona. These are the jaguar (Panthera onca), the ocelot (F. *pardalis*), the margay (F. *wiedii*) and the jaguarundi (F. yagouaroundi).

The only species of cat native to Europe is the European wildcat (Felis *sylvestris*). The range of this species formerly included Great Britain, central and southern Europe, and parts of central Asia. It is now much reduced in numbers and probably does not occur anywhere without at least a trace of the domestic cat in its constitution. In Great Britain the wildcat survives only in some Scottish forests. It has not been known in Ireland during historic times.

DOMESTIC CATS

Origin.— The domestic cat is a domesticated form of the African wildcat, Felis libyca, which is still widely distributed over Africa and southwestern Asia and interbreeds freely with the modern domestic cat. The colours and markings of the African wildcat are, detail for detail. those of the well-known tabby pattern of the domestic cat. The cat was domesticated by the ancient Egyptians. There are no authentic records of domestication earlier than 1500 B.C., although it may have taken place earlier. The cat was proclaimed a sacred animal in the 5th and 6th dynasties (2500–2300 B.C.), but it had not necessarily been domesticated at that time.

From Egypt the domestic cat spread slowly into the rest of the civilized world. It is not mentioned by any of the ancient writers until the 1st century A.D., except by those who had visited Egypt or had heard of the cat's existence there. Cats are not mentioned in the Salic laws of 8th-century Germany. The earliest record of cats in Great Britain dates back to about A.D. 936 when Howel Dda. prince of south central Wales, enacted laws for their protection.

It has been suggested that the ancestry of the Siamese and Burmese cats is distinct from that of other domestic breeds, representing a domestication of some oriental wild cat. In fact nothing is known of the ancestry of the Siamese-Burmese type, and there is no living species of oriental wild cat that would serve as ancestor.

Characteristics.— The domestic cat is noted for its independence and intractability, traits that endear it to some people but cause others to dislike cats intensely. These characteristics stem directly from the solitary and asocial habits so typical of all species of felids and are as much a part of the cat pattern as are the retractile claws or the typical felid dentition. It is noteworthy that the ancestors of man's other common household pet, the dog (and of most of his other domestic animals), were social animals that lived together in packs in which there was subordination to a leader. The dog readily transfers its allegiance from pack leader to human master. There is no such social background in the ancestry of the cat. Because of its temperament, the cat is able to revert to the wild state more quickly and more successfully than most other domestic animals.

The average weight of the adult American domestic short-hair,

as determined by H. B. Latimer on a random sample of 104 individuals, is 6.2 lb. for males and 5.4 lb. for females. These figures are often exceeded, weights of 28 lb. and more having been reported. Average lengths are 28 in. for males and 20 in. for females. Reliable average figures are not available for other breeds of cats.

A breeding female, called a queen, is in heat about three times a year, and the period lasts from three days to three weeks. During this period she usually "calls," a caterwauling that may be almost continuous. Some females do not call. Gestation lasts 55–69 days. and the kittens are born blind and helpless. There are usually four to eight young in a litter; Siamese cats usually have larger litters which may number eight or even nine. The young open their eyes in seven days, stop nursing at about four weeks and mature in five to tight months. Females reach reproductive age at six months; males can produce offspring after the age of about one year. The average life span of a cat is about 14 years, although many individuals live beyond 20 years.

Genetics. — Cats have never been bred for economic purposes; they are relatively slow breeders and their matings are extremely difficult to control unless the animals are completely confined. There has therefore been relatively little scientific breeding of cats, and the facts of inheritance in these animals are not well known.

The commonest basic coat colours in domestic cats are tabby. black, yellow and white. Various combinations and dilutions of these colours occur. Solid white is dominant to all colours, and tabby is dominant to black. The mode of inheritance of black is imperfectly understood; the possibility that it is sex linked is widely accepted, but this has never been proved. The dark seal brown of the Siamese is due to a different genetic factor than black; it is dominant to tabby. Tabby is known to be due to at least two sets of factors, one for banding and one for ticking. Tortoise shell, a piebald pattern of black, yellow and white, results from crossing black and yellow. In such crosses the female progeny is tortoise shell, the male progeny yellow or black. Thus the tortoise-shell pattern appears to be sex linked in some way, but rare male tortoise shells are known and other inconsistencies make an explanation through simple sex linkage untenable.

Maltese is a dilution of tabby, is recessive to intense colour and apparently is due to a single genetic factor. Siamese dilution, the typical coloration of Siamese cats, has been described as a case of imperfect albinism and has been compared to the Himalayan pattern in rabbits (see ALBINO). Its heredity is not well understood. There are also dilutions of the other ordinary colours: blue is dilute black, and cream is dilute yellow. White-spotting also occurs and is dominant to self-colour.

The long-haired coat, called Persian or Angora, appears to be a simple unit character. It is recessive to short-haired. Eye colour is known to be inherited, but its mode of inheritance is not well understood. Blue eye colour seems to be associated with dilution in coat colour; blue-eyed white cats are usually deaf, a fact that was commented on by Charles Darwin. Asymmetry of eye colour is known to be inherited. Polydactylism, the presence of extra toes, is inherited and behaves as a dominant to the normal condition. It appears to be due to a single gene. The extra toes occur on the inner or thumb side of the foot.

Common Diseases. — Cats are subject to a variety of diseases, some of them contagious and with high mortality. The commonest diseases are:

Panleukopenia.—Often miscalled feline distemper, this is the commonest contagious infectious disease in cats. It resembles distemper in dogs by being highly infectious and having a high mortality rate. The disease is seen most often in young cats. A cat affected with the acute form is severely depressed. runs a high fever and shows a pharyngitis and red streaking of the soft palate. The animal refuses to eat or drink, and there may be vomiting and diarrhea. There is very severe dehydration, and this is the most dangerous aspect of the disease. An animal that recovers is usually permanently immune. Immunizing vaccines are effective protective measures.

Feline Pneumonitis.—Sometimes called influenza or distemper, this disease is accompanied by manifestations of rhinitis, conjunctivitis, pharyngitis, low fever, moderate depression and loss of appetite. At the onset there is typically sneezing. lacrimation, nasal discharge and drooling. The course of the disease is protracted, and there is no permanent immunity. A recovered animal may be left with chronic bronchitis, chronic conjunctivitis or sinusitis.

Infectious Anemia. — This is a common disease but one that is difficult to diagnose. At the beginning there is moderate to high fever, weakness. sometimes vomiting. difficulty in breathing and severe depression. Later the animal becomes very weak and depressed, the coat loses its lustre, the inside of the mouth is pale and the spleen is enlarged. The disease usually responds readily to treatment with antibiotics.

Rabies. — Cats are less subject to this disease than are dogs, but it is known to occur in cats. An animal may be immunized against the disease; the immunity presumably lasts 3–4 years.

Parasites. — Cats are attacked by several kinds of external and internal parasites. External parasites are most commonly found on kittens but also occur on adults. The most frequent parasite is the flea, but lice, ticks, mites and fungi (*e.g.*, ringworm) also occur. Internal parasites include roundworms, hookworms and tapeworms.

The Cat in Religion and Witchcraft. — The cat has long played a role in religion and witchcraft. The cat is not mentioned in the Bible, but it figured prominently in the religions of ancient Egypt, the Norse countries and various parts of the orient. The Egyptians had a cat-headed goddess, named Ubasti, whose chief seat of worship was the city of Bubastis and who represented the life-producing power of the sun. Thousands of cat mummies have been discovered in Egypt, and there were even mouse mummies, presumably to provide food for the cats. More often, however, the cat has been associated with sorcery and witchcraft, and the superstitions regarding cats, common in all countries, are innumerable. Superstitions often took extremely vicious forms, and throughout the ages cats have been more cruelly mistreated than any other animal. Black cats in particular have long been regarded as having occult powers.

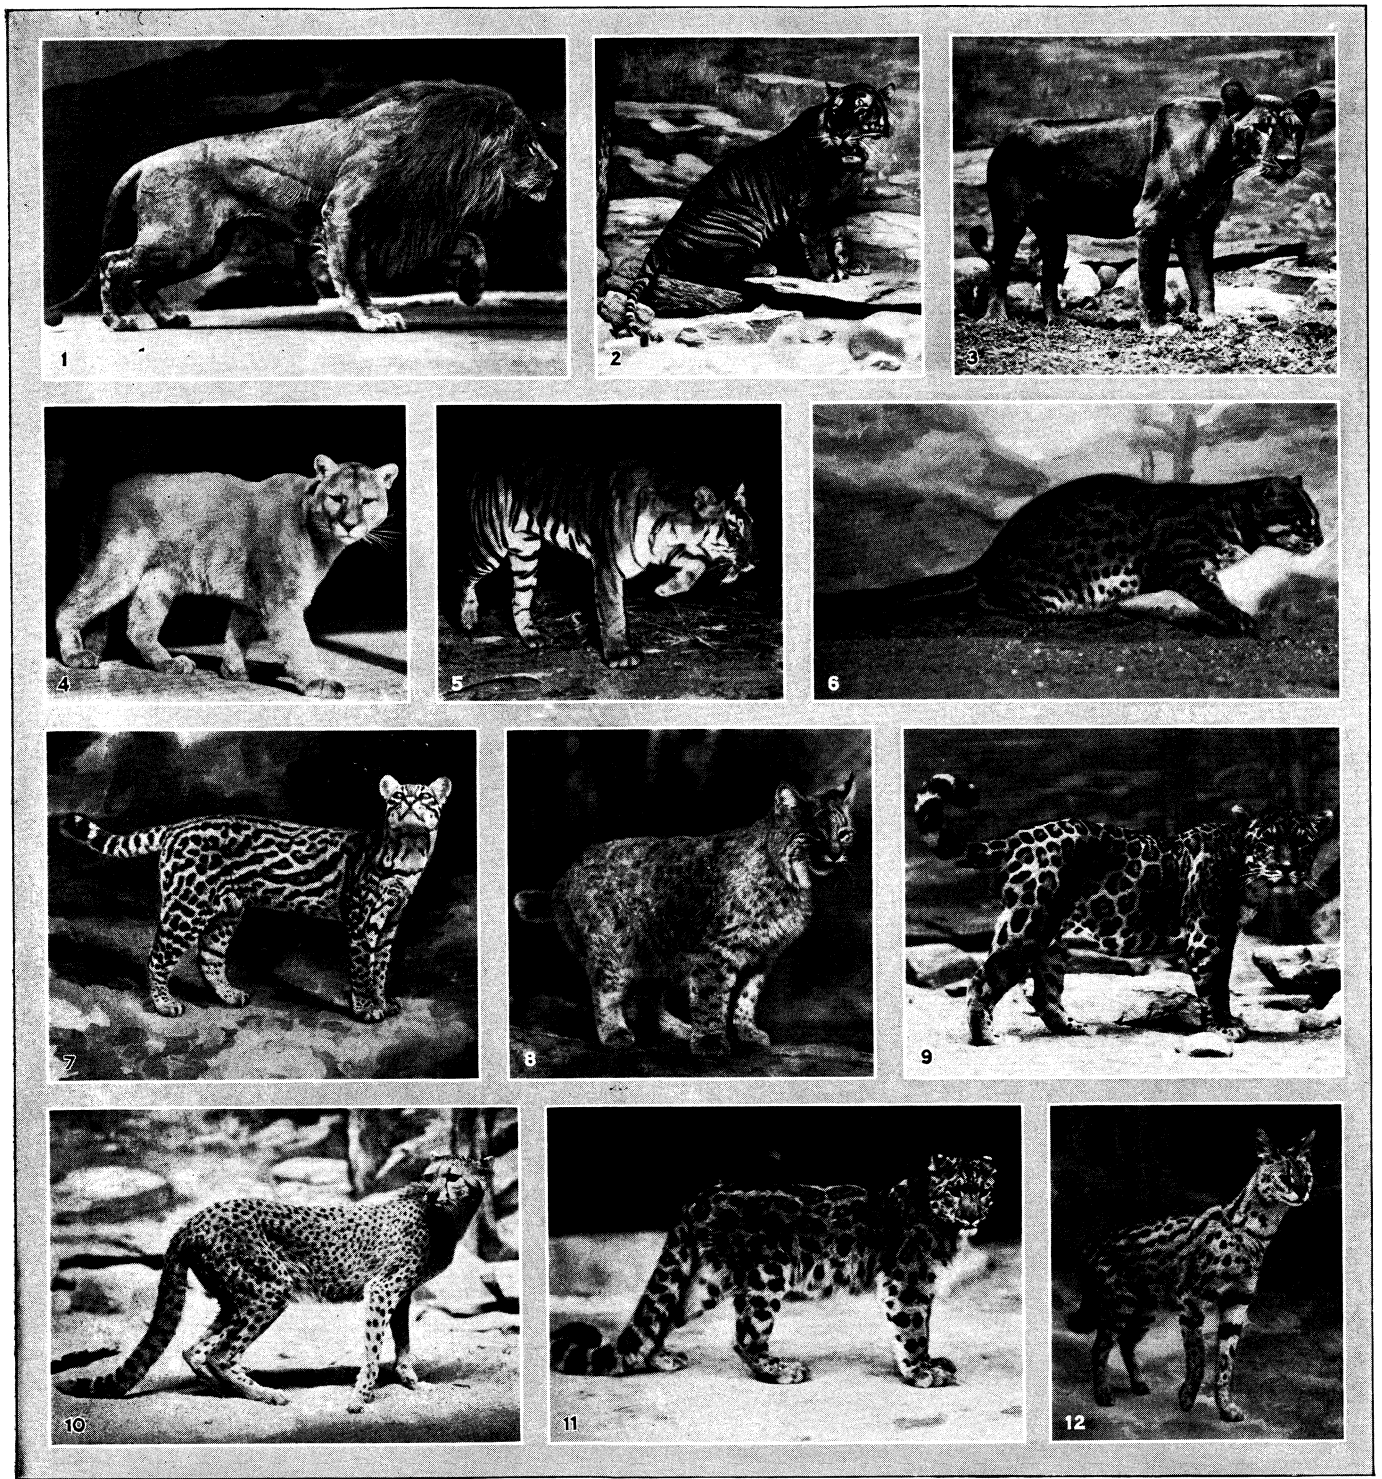
Many people dislike and even fear cats. In extreme cases fear of cats may become morbid and even be accompanied by typical symptoms of hysteria: paleness, profuse sweating, nausea and profound emotional disturbance, sometimes terminating in fainting. This condition, when induced as a reaction to cats, is called aelurophobia.

The Cat in Literature. — The cat is a familiar figure in nursery rhymes and stories. The legend of Dick Whittington and his cat is a particular favourite in Britain while different versions of folk tales like Puss in Boots are known in many countries. The writers Théophile Gautier and Charles Baudelaire have paid him homage and, in the 20th century, Rudyard Kipling ("The Cat Who Walked by Himself," The Just So Stories), Colette and T. S. Eliot. Cats have long been the subject of children's stories and have achieved fame in film cartoons in the persons of such heroes as Felix, Tom and Sylvester. The influence of the cat also appears most clearly in everyday language where its many-sided character is crystallized in proverbs and sayings as pithy as they are diverse.

Breeds of Domestic Cats. — Innumerable societies and associations have been formed, particularly in England and the U.S., to foster interest in cats and set standards for the several recognized breeds. The most important such organization in the U.S. is the Cat Fanciers association.

Cats are genetically far less plastic than dogs and therefore have not offered the same opportunities to fanciers. The tremendous size differences between large and small breeds seen in the domestic dog have no parallel in the domestic cat, nor has anything even remotely approaching the wide range of head shapes and body proportions in different breeds of dogs ever appeared among the cats. In cats the differences between one breed and another are largely differences in the colour and texture of the coat. The basic classification is into long-haired (Angora or Persian) and short-haired cats.

Most of the recognized breeds occur in both short-haired and long-haired varieties and except for hair length are judged by the same standards. Among the long-hairs, Angora was formerly dis-



BY COURTESY OF (1, 2, 3, 4, 6, 7, 8, 9, 10, 11, 12) NEW YORK ZOOLOGICAL SOCIETY, (5) FROM CHAMPION, "WITH A CAMERA IN TIGERLAND" (CHATTO AND WINDUS, LONDON; DOUBLEDAY, DORAN & CO., INC., NEW YORK)

MEMBERS OF THE CAT FAMILY FOUND IN AFRICA, ASIA AND AMERICA

1. Lion (Panthera *leo*), one of the two largest of the cat family, the other a tiger. It is found in Africa, Mesopotamia, Persia and India
2. The Bengal tiger (Panthera *tigris*), a fierce beast of prey which sometimes, especially in old age, becomes a man-eater
3. Lioness (*Panthera leo*), about a foot shorter than the adult male and generally considered more dangerous when attacked
4. Puma or mountain lion (Felis concolor). a large American cat extensively distributed from Canada to Patagonia. It is of a uniform colour
5. Tigress (*Panthera tigris*), somewhat smaller than the male but equally aggressive. especially when protecting her young
6. Leonard cat (Fells bengalensis), a small, savage wildcat of tropical Asia that feeds largely on game birds
7. Ocelot (Felis pardalis), an American forest cat ranging from Texas to Paraguay. Its fur is yellow or grey marked with spots
8. The red or bob-tail lynx (Lynx rufus), a North American species that ranges south to Mexico. Its reddish summer coat is less spotted
9. Jaguar (*Panthera onca*). the largest of American cats. It ranges from Texas to Patagonia and sometimes develops into a man-eater
10. Cheetah or Hunting Leopard (Acinonyx *jubata*), so called because it is used in the hunting of game. it is a native of Africa and Asia
11. The snow-leopard (Panthera *uncia*), an inhabitant of highland Central Asia. its name is suggested by its grey spotted fur
12. Serval (Felis *serval*), an African wildcat that preys on small quadrupeds and is prized by the natives for its skin, which is a spotted yellow

DOMESTIC CATS

1. White Manx (tailless) cat, Champion Chelsea, "Villish Mona Veen"
2. Siamese cat, Champion "Simple"
3. Abyssinian (silver) male cat, owned by Mrs. Carew-Cox
4. Striped Manx cat
5. White Persian cat, "Morvich," owned by Mrs. J. H. Clark
6. Black Persian, Champion "Sally Girl"
7. Tabby cat
8. Red Tabby Persian cat
9. Blue Persian cat
10. Blotched domestic cat
11. The manul or Pallas's cat
12. Striped domestic cat

tinguished from Persian but these have now become one as a result of interbreeding.

Recognized show breeds and the characteristics valued most highly by show judges include those listed below. Other varieties occur but are not recognized as show breeds.

Striped Tabby.—The ground colour of the coat is gray. The sides of the body, from shoulder to base of tail, are marked with vertical black stripes. A single black stripe runs down the center of the back from the head to the tip of the tail. On the face and near the root of the tail the stripes tend to break up into spots. There is a M-shaped black marking on the forehead and two horizontal black lines on the cheek. The legs are ringed with black bands called "bracelets." Eyes are of a green or hazel colour.

Brown Tabby.—The ground colour is ta ny. The sides are marked with black blotches or broad curved bands. Three black stripes run down the centre of the back. The markings of the face are similar to those of the striped tabby. 4 butterfly-shaped mark on each shoulder separates the head markings from the stripes on the back. The legs are ringed with black bracelets. Eyes are green, brown or yellow; orange or copper eyes are preferred.

Silver Tabby.—The ground colour is silver, overlaid with black markings similar to those in the brown tabby. Blue-green eyes are preferred.

Black.—The entire coat must be jet black, each hair being black from root to tip. Most black cats have a white spot on the breast, but such individuals cannot be exhibited as perfect black cats. Show specimens must have orange eyes without a trace of green.

Blue.—Often called maltese. The entire coat is uniform blue, ranging in different individuals from slate to lavender. Pale shades are preferred, and the darker colours are seldom seen. The approved eye colour is orange or deep copper.

Orange (Red) and Cream.—Separate classifications are given to these two colours. In both cases the colours must be solid, with no shadings or markings. Eyes must be copper or orange.

White.—The coat is pure white, not a hair of any other colour being allowed in a show cat. Eyes must be either blue or orange.

Tortoise Shell.—The colours are black, red and cream, distributed in distinctly separated patches. No white or tabby markings are allowed. The approved eye colour is copper or orange.

Tortoise Shell and White.—This is similar to tortoise shell except that white is also present. The eyes should be orange.

Abyssinian.—The coat is fawn coloured ticked with dark brown. There is some barring on the legs and tail, though for show purposes the less barring the better. Eyes may be green, yellow or hazel.

Siamese.—The coat is short and close-lying. and its fawn colour shades into cream on the chest and belly. The face mask, ears, feet and tail (called "points") are deep seal brown. The tail may be slightly kinked at or near the tip, but bobbed tails, screwed tails or pompon tails are not allowed. Eyes are blue. There are "blue point" and "chocolate" variants of Siamese.

Burmese.—The coat is very short and close-lying; the colour is sable brown except for slightly paler hues on the chest and belly. There is a clearly defined mask of darker brown on the face. The ears, legs and tail are the same colour as the mask. The tail may be slightly kinked near the tip. Eyes range from golden turquoise to yellow. This breed closely resembles the Siamese.

Manx.—A tailless breed, no vestige of a tail being permitted in show animals. The hind quarters are high. All coat colours are recognized.

CLASSIFICATION

All species of living cats are placed in the family Felidae, one of several families of Carnivora, the order of flesh-eating mammals. The closest living relatives of the cats are the hyenas (family Hyaenidae) and the civets (family Viverridae).

In 1916 R. I. Pocock, of the London zoo, showed that the living cats may be divided into two groups on the basis of the structure of the hyoid apparatus, a group of connected bones at the base of the tongue. In one group of cats one of the hyoid bones (the epihyal) fails to develop and is represented only by a threadlike ligament so that the tongue and larynx are loosely attached to the base of the skull. This group includes the large cats—lion, tiger, leopards, jaguar—which are placed together in the genus *Panthera.* These cats are unable to purr, their voice is a roar and the pupil of the eye is round. In the second group. the genus Felis, the hyoid develops normally and all such cats can purr but do not roar. The pupil is usually vertical but is round in a few species The genus Felis includes the mountain lion and all the numerous kinds of smaller cats including the domestic cat. The Canada lynx and bay lynx or bobcat are often placed in a separate genus, ***Lynx.*** The cheetah or hunting leopard has a normal hyoid but has nonretractile claws and differs from all other cats in other ways. It is placed alone in the genus *Acinonyx.*

CATACOMBS, subterranean cemeteries composed of galleries or passages with side recesses for tombs. The term. of unknown origin, seems to have been applied first to the subterranean cemetery under the basilica of S. Sebastian on the Appian Way near Rome, which became famous as the temporary resting place, it was believed, of the bodies of SS. Peter and Paul in the last half of the 3rd century. By extension, the word eventually came to refer to all the subterranean cemeteries around Rome. By a further extension of meaning, catacomb is used loosely to describe any underground complex of tunnels and chambers, whether originally designed for burials or not; the so-called catacombs of Paris, for example, are really abandoned stone quarries, first used for burials in 1787.

Catacombs were by no means a Christian or an exclusively Roman invention. The custom of burying the dead in underground rock chambers goes far back into antiquity, probably originating as a mimetic reproduction in permanent form of prehistoric house burials. Catacombs are found all over the Mediterranean world: in Malta, near the ancient capital of the island; in Sicily, near Taormina, Syracuse and elsewhere; in Egypt, near Alexandria and Cairo; in Syria, near Saida (the ancient Sidon); in Tunisia, near Susa (the ancient Hadrumetumj; and at many places in Italy, especially around Naples and in ancient Etruria. But "the catacombs" still means, in general usage, the early Christian catacombs of Rome. They are the most extensive, the best known and practically speaking the norm of this type of construction, and it is with the Roman catacombs that this article deals.

History.—In Etruscan and republican Roman times inhumation of the dead was generally practised, and extensive catacomb-like cemeteries developed around Clusium (Chiusi), Cerveteri and elsewhere. But by the 1st century A.D., cremation had become the normal practice of pagan Rome, and inhumation did not again become customary until the time of Hadrian (A.D. 117–138). So it was more on Jewish than on Roman precedent that early Christian catacombs developed. Accustomed from earliest times to practise inhumation in rock-cut tombs, the Jews found geological conditions around Rome that allowed them to continue to do so. The great plain surrounding the city is composed of three volcanic strata, one of which—granular tufa—is relatively easy to cut, porous so that it drains well and yet strong enough to support galleries and sizable chambers; the other strata—pozzuolana (sand) and lava stone—provided conveniently accessible building material and mortar. The first Jewish catacombs in Rome probably were begun before the Christian era. but in the earliest-known catacomb. near Monteverde in Trastevere, burials probably were begun in the 1st century A.D. Half a dozen other, later Jewish catacombs are known. easily identifiable by the seven-armed candlesticks marking the graves. But these Jewish catacombs were soon far surpassed in number and size by those developed for the rapidly growing Christian community of Rome.

Roman law prohibited cremations or burials within the city walls and further required that cemeteries not be located near

residential areas. Thus it is probable that the first Christian catacombs had to be abandoned and destroyed to make room for developing suburban areas as the city expanded beyond its 1st-century limits. especially during its great enlargement in Hadrian's time. The earliest that now remain are located in a rough circle about three miles from the centre of Rome, most of them, like the pagan tombs, near the main roads leading into the city; they are the crypt of S. Lucina and the catacombs of SS. Calixtus, Domitilla and Priscilla, all begun around the middle of the 2nd century A.D. Other well-known, slightly later catacombs are those of SS. Praetextatus (begun c. A.D. 185), Sebastian (c. 250) and Peter and Marcellinus (c. 300).

The major parts of the Christian catacombs — about 40 of which are known — belong to the 3rd century and the early part of the 4th. By A.D. 350 interment in them had become rare; it ceased altogether after the sack of Rome by Alaric in 410. Ruined by the Goths in the 6th century and later by the Lombards, they were abandoned completely after Popes Paul I and Paschal I transferred the holy relics of the martyrs elsewhere; their entrances caved in and their very existence was forgotten until they were rediscovered by chance in 1578. Since that time, notable scholars in every century have contributed to knowledge of them.

Description. — All the catacombs follow roughly the same pattern. Beginning as small private burial areas, they soon became extensive enough to be taken over by the church as communal property and administered by the bishop; with successive generations of use, they finally became vast labyrinths of narrow galleries, usually three to four feet wide, lighted and ventilated by light shafts spaced at wide intervals. Some galleries are hardly tall enough to permit walking upright: others have been cut down so deeply that there may be as many as 12 tiers of burials in long horizontal recesses in the walls; since the galleries were enlarged by deepening, the highest tiers are the oldest (fig. 2).

From the galleries open small rooms called cubicula, which were the original burial places (usually of a single family). Cutting of loculi or loci (grave niches) in the walls and even in the floors of the galleries was a later development, forced by numbers. In Christian cemeteries these niches usually were cut parallel to the gallery (in contrast to pagan areas, where they were at right angles), and sometimes held as many as four bodies, although one was the usual number. They were carefully closed by slabs of marble or huge tiles cemented together; when an epitaph was set up, it was painted or carved on the tiles (fig. 3). Table tombs and arched tombs sometimes are found; sarcophagi rarely. Loculi cut for later burials often damaged or destroyed earlier inscriptions and mural decorations.

Uses. — In the early Christian community catacombs served a variety of functions in addition to burial. Funeral feasts were celebrated in family vaults on the day of burial and on anniversaries. The Eucharist, which always accompanied funerals in the early Christian Church, was celebrated there; in some of the catacombs larger halls and connected suites of chapels functioned in effect as shrines for devotions to saints and martyrs. A famous example is the Triclia in the catacomb of S. Sebastian. to which countless pilgrims came to partake of memorial meals (*refrigeria*) in honour of SS. Peter and Paul and to scratch prayers to them on the walls.

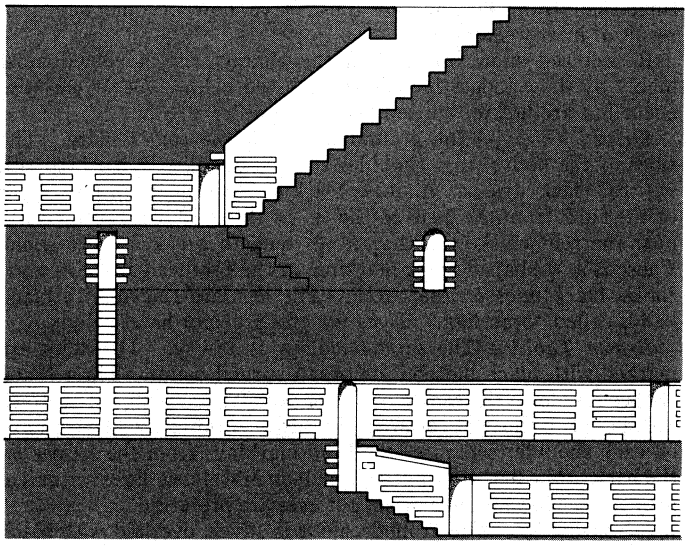

FIG. 2. — SECTION OF GALLERIES AT DIFFERENT LEVELS IN CATACOMBS OF ROME

The catacombs also, because of their intricate layout and access by secret passages to sand quarries and open country, could be used as hiding places during times of persecution and civil commotion. Pope Sixtus II and four deacons, for example, are said to have been captured and killed in the catacomb of S. Sebastian during Valerian's persecution (A.D. 258): later, Christians took refuge there during the barbarian invasions.

FIG. 3. — TYPICAL INSCRIPTIONS AND SYMBOLS ON LOCULI SLABS IN THE ROMAN CATACOMBS; GRAVES OF URBICA AND RUFINA

There seems no truth, however, in the widespread. belief that early Christians used the catacombs as secret meeting places for worship. By the 3rd century A.D. there were more than 50,000 Christians in Rome, and 50,000 persons could hardly go out to the catacombs every Sunday morning in secret. Furthermore, worship of anv kind would seem out of the auestion in the long, narrow corridors of the catacombs, and even the largest of the tomb chambers, such as the Chapel of the Popes in the catacomb of St. Calixtus, hardly holds 40 persons. Finally, Christians and pagans alike regarded death as unclean, so that while memorial meals or Masses for the dead might be celebrated in the tombs on appropriate occasions, regular public worship in such a place would be unlikely.

Architectural Significance. — Since they were not used as churches, the catacombs as such made little contribution to Christian church architecture. Nevertheless, they had some influence. The use of domical vaults over many cubicula may have some connection with the development of the dome as a Christian symbol of resurrection. More important was the development of memorial chapels above the catacombs, apparently inspired by the Roman tradition of sepulchral monuments. The earliest ones were very small, enclosing only enough space for an altar, officiants and a few worshipers (*e.g.*, the chapel of St. Sixtus, above the catacomb of St. Calixtus). Being entirely devoted to worship, the chapels may have contributed to the increasingly sacred character of church buildings as they developed from the mid-4th century on, in contrast to the half-secular character of earlier types. Later, catacomb chapels become much larger; an example is that dedicated

FIG. 1. — PLAN OF SECTION OF THE CEMETERY OF S. AGNESE AT ROME; A.D., 3RD CENTURY

by Sta. Costantia, *c.* 337–350. the outlines of which are still perceptible within the present 7th-century church of S. Agnese. To such buildings the later medieval development of crypts owes much, for its system of galleries beneath a semicircular apse, leading down to catacombs below, seems a clear forerunner of the annular crypt beneath the floor of many medieval churches.

Decoration. — Catacomb paintings provide the chief source of knowledge about primitive Christian art. Although the bulk of early Christian art was produced, of course, in the east, very little of it has survived Muslim iconoclasm, and practically none of what remains antedates the 5th century. In the catacombs, on the other hand, there is a great body of material illustrating the character and principles of Christian art from about 180 (no paintings are surely datable before then) to about 410 (after the sack of Rome in that year, the only important additions were a few commemorative paintings commissioned for the graves of martyrs by later popes). The important frescoes, generally speaking, are confined to cubicula, the earliest being in the catacombs of Domitilla and Priscilla and the crypt of Lucina. The greatest series preserved in any single room of the catacombs is in the Greek chapel in the catacomb of Priscilla.

The themes of the early frescoes are overivhelmingly drawn from the Old Testament. Most popular is the story of Jonah; other favourites are Daniel (represented standing between two lions, his arms upraised), Noah in the ark (in the same position), Abraham on the point of sacrificing Isaac, the three Hebrews in the fiery furnace, Susanna delivered from the Elders and Moses striking the rock to provide water for the Israelites in the wilderness. Even when New Testament subjects begin to appear, representations of Christ are noticeably rare. Thus the Annunciation and the Adoration of the Magi appear often, the Virgin and Child rarely; the Healing of the Paralytic is depicted without the Healer; the Miracle of Loaves and Fishes is suggested only by a "multitude" of seven seated in a semicircle with extra baskets of loaves beside them. Only in later paintings does the figure of Christ commonly appear, and then usually as the miracle worker, as in the Marriage at Cana or the Miracle of Loaves and Fishes.

FIG 5 — "THE MARRIAGE AT CANA." WALL PAINTING FROM THE CATACOMB OF SS. PETER AND MARCELLINUS, ROME: *c.* A D 300

From this may be deduced the real character and purpose of this art. it is not meant to record historical events but to present the truths of salvation and the hope of deliverance from sin and death. So the Miracle of Loaves and Fishes or the Marriage at Cana prefigure the Lord's Supper (by means of which the faithful partook of the eternal life of Christ); so Moses' delivering the Israelites from death by thirst under the old covenant is a "sneet foretaste" of Christ's providing the Water of Life under the new. Many, if not all. of the themes were suggested by the ritual and liturgy, as, for example, the ancient prayer for the dying (*Commendatio Animae*), which prays God to "deliver the soul of Thy servant. as Thou didst deliver Noah in the flood. Isaac from the sacrificing hand of his father, Daniel from the lions' den the three youths from the furnace of burning fire . . ." With this in mind. it is easy to understand why the deceased (as well as Noah, Daniel, etc.) are depicted in the *orante* position — standing, nith both arms raised; it is the gesture of thanksgiving for deliverance from death and sin.

Further evidence of the nonnaturalistic and nonhistoric nature of this art is the wav earlier inscriptions and paintings nere so often defaced, destroyed or even painted over in the course of later burials. Paintings in prehistoric caves were treated in the same way. This suggests that in both cases art functioned as the materialization of a wish or prayer, a kind of tangible speech, that, once having served its purpose, lost its value and could be discarded or removed by some later petitioner with perfect propriety. Significant in this connection is the practice of *memoriae damnatio* in the catacombs; that is, a "blotting out" of some unworthy person by destroying his written name, precisely in the same manner (it would seem) as the pharaohs "made" history and "killed" their enemies by altering and destroying references to them in the monumental art and inscriptions of ancient Egypt.

In both style and subject matter the Christian painters of the catacombs borrowed heavily from contemporary Roman practice and precedent. Their generally loose, sketchy technique obviously derives from the kind of impressionistic brushnork that may be seen developing in the frescoes of Pompeii; while for subjects such as the Good Shepherd or the Miracle of Loaves and Fishes (and many more) the painters obviously dren equally on Greco-Roman types. such as Aristaeus the shepherd-hero, or conventional formulas for funeral feasts. But their allegorical and symbolic intent quickly transformed these borrowed elements into a distinctly Christian vehicle of artistic expression — most notably by substituting for the classical humanistic unities of time and space compositions organized in terms of transcendental relationships. (See also EARLY CHRISTIAN ART.)

In addition to paintings, the catacombs are rich in early Christian inscriptions. The majority are short, Greek (significantly enough) rather than Latin, simple expressions of confidence in salvation: "Julia, in peace nith the saints"; "in thy prayers pray for us, for we know that thou dwellest in Christ." Other inscriptions consist of graffiti scratched by pilgrims and visitors, as; *e.g.*, in the Triclia of the catacomb of S. Sebastian: "Paul and Peter. pray for Victor." Sometimes longer inscriptions honouring the martyrs were placed in the catacombs by later popes; most of

these are known only from literary records, the originals having disappeared during the barbarian raids.

In the catacombs, too, many smaller objects left at graves have been found: plates, lamps, several sorts of vessels and, of greatest interest, the "gold glasses"—so called because of the gold leaf medallions sealed in their glass bottoms.

CATALAN is a Romance language with nearly 6,000,000 speakers; it is spoken over an area of about 22,000 sq.mi., comprising Catalonia (approximately 3,400,000 speakers), an adjacent strip of Aragon with an average width of 15 mi. (100,000), Roussillon (260,000), Valencia (1,800,000) and the Balearic Islands (440,000). It was the official language in this area until 1716, and again in Catalonia from 1931 to 1939; it is still generally spoken in everyday life, in the cities as well as the countryside. More than one-tenth of the books published in Spain in 1927 were in Catalan; six Catalan daily newspapers were published in Barcelona in 1935.

Catalan is akin to Provençal and Spanish, but quite different from both, especially from Spanish. Catalan differs from Spanish in the following of its characteristics: a lack of rising diphthongs (*bé, bo* = Sp. *bien, bueno*); an abundance of falling diphthongs (*peu, pau, bou* = Sp. *pie, paz, buey*); the dropping of final vowels (*llop* = *lobo; dolç* = *dulce*); the palatal voiced sounds j, *z, tj, tz* and voiceless *x* (= *sh*); the infinitives and participles stressed on root syllables (*vendre, pres* = Sp. *vender, prendido*); and the periphrastic past (*vaig cantar* = Sp. *canté*). It is distinguished from Provencal in the following respects: *u* = Prov. *ü, o* = Prov. *au;* diphthongization differs (*mig* = Prov. *mieg, cull* = *cuelh, Déu* = *Dieu, creure* = *creire*); proparoxytone accentuation is preserved; and pronouns follow verb forms (*per donar-me* = *per me dounà*).

Dialectal and chronological differences within Catalan are very small: a 13th-century text of Raimon Lull is still generally understandable by modern speakers. There are two main dialect groups: occidental, which is subdivided into West Catalan (Ebro and Segre valleys) and Valencian; and oriental, which is subdivided into East Catalan, Balearic and Roussillonnais and which also includes the speech of Alghero, Sardinia, where Catalan was brought in the 14th century. These varieties present only minor differences (some details in pronunciation, conjugation and vocabulary), noticeable solely in the spoken language.

Catalan is the autochthonous continuation of Latin in Roussillon and most of Catalonia. A study of place names indicates that there was no language shift in this area after the fall of the Roman empire. However, the old toponymy of the Ebro valley, the Balearics and Valencia shows a somewhat different phonological type, because Catalan was imported into these areas by reconquest, when the Moors were expelled in the 12th and 13th centuries. *See* also PROVENCAL LANGUAGE; ROMANCE LANGUAGES.

CATALANI, ALFREDO (1854–1893), Italian composer whose operas enjoyed a vogue in Italy in the late 19th century, was born June 19, 1854, at Lucca and studied in Paris under François Bazin and in Milan under A. Bazzini. Following the production of his oriental eclogue *La Falce* (1876) he wrote between 1880 and 1886 the operas *Elda, Dejanire* and *Edmea.* Often based on poor librettos, his operas are written in a highly romantic style. His most successful was *La Wally* (1892), revived in 1905 by A. Toscanini and filmed in 1932. He died at Milan on Aug. 7, 1893.

See C. Gatti, *Catalani: La vita e le opere* (1953).

CATALAUNIAN PLAINS, BATTLE OF THE, was fought in Gaul in A.D. 451 by Attila (*q.v.*) and the Huns against a mixed Roman and Visigothic force led by the Roman general Aetius and the Visigothic king Theodoric I. The exact site of the battle is disputed. The name Catalauni is first found in Roman authors of the 4th century and denotes the town of Châlons-sur-Marne. The term Campi Catalaunici, which is used by a 5th-century chronicler and by Jordanes (*q.v.*) in connection with the battle, meant, as Jordanes states, a wide area of the plains of Champagne. According to one interpretation, therefore, the great battle was fought in the vicinity of Chblons. But Jordanes adds that this same site was also known as the Mauriac plains, and three other writers of the 6th century state that the battle was fought at Maurica. This place is mentioned in no other connection, but one authority describes it as situated five Roman miles from Augustobona Tricassium (Troyes), and there is no reason for doubting his assertion. On this interpretation the battle was fought not in the vicinity of Chblons but in that of Troyes.

Forcing contingents of his Germanic subjects to follow him, Attila crossed the Rhine early in the campaigning season of 451 and made for Urbs Aurelianensis (Orléans). He had actually entered Orléans before the arrival of Aetius and Theodoric forced him to withdraw, and he fell back to Maurica. The battle, which may have taken place in June, resulted in defeat for Attila, and the ferocity with which it was fought was long remembered. King Theodoric was killed, and according to Jordanes at least 165,000 men fell on each side, but this is an unlikely figure. When Attila began to withdraw from Gaul, Aetius was unable or unwilling to prevent him.

It is unlikely that this was one of the decisive battles of the world as historians have claimed. The empire of the Huns was too predatory and too transient to have held the rich civilization of Gaul in permanent subjection. If Attila had defeated his opponents he would undoubtedly have destroyed many of the Gallic cities and would have plundered widely, but he could hardly have established a realm of pastoral nomads in Gaul nor could he have altered the Latin and urban character of the country.

See E. A. Thompson, *A History of Attila and the Huns* (1948). (E. A. T.)

CATALINA ISLAND: *see* SANTA CATALINA.

CATALOGUE, SALES. A sales catalogue is a systematic presentation of a supplier's merchandise that is distributed as a reference book among prospective purchasers. Its basic functions are to inform prospective buyers as to what products are available from this supplier! describe the qualities of these products and tell how much they cost.

The catalogue is particularly valuable in increasing the productivity of salesmen, for it frees salesmen from the need to devote time to routine aspects of selling and often reduces the frequency with which calls must be made. As labour costs have risen steadily in virtually all English-speaking countries, catalogues have become increasingly important as partial substitutes for the work of salesmen. Although far less expensive than sales man power, catalogues are the most expensive form of advertising used by some companies. 'Because they are expensive, large catalogues are normally issued only once or twice a year, and their distribution is carefully controlled to avoid sending duplicate copies or giving catalogues to persons who are not prospective purchasers.

The fact that many manufacturers or suppliers offer such a wide assortment of products has given rise to catalogue service firms that perform a kind of wholesaling function. Most industrial purchasers are interested in only one group of products on a manufacturer's list. The catalogue service firms collect data from a number of suppliers, sort these data into product groups for various categories of purchasers and distribute this information

through individual specialized catalogues. In this way a manufacturer of widely assorted products need not distribute an expensive catalogue to buyers who may be interested in only one or two pages. Instead, the manufacturer merely submits the specifications of single products or groups of related products for inclusion in one of the specialized catalogues distributed by the catalogue service.

Catalogues are distributed to the general public by mail-order houses, trading-stamp companies, direct-selling firms and retail stores of many types, particularly department stores. These catalogues seek to stimulate sales through carefully chosen illustrations and descriptive text that provide all the important information on sizes, colours, fabrics and prices, and explain how to order the merchandise. Because a catalogue is a representative of the company within the customer's home, each company strives to make its catalogue dignified, precise, attractive and easy to use.

Catalogues issued by mail-order houses, direct-selling firms and trading-stamp companies include a high proportion of the items offered by the firm. Department stores, on the other hand, do not try to include all of the 100,000 to 200,000 items in any one catalogue. These stores often stress special promotions such as a Christmas gift catalogue or a spring fashion catalogue. To differentiate themselves from their numerous competitors, department stores and specialty shops present feature items in their catalogues in much the same way that feature items are displayed within the store. Samples of what can be found in the store are sufficient for this type of catalogue because, in addition to stimulating orders for the merchandise included in the catalogue, the store is primarily interested in persuading customers to come in and shop.

An important problem in catalogue preparation is the inclusion of prices, for it may be desirable to change them before the next catalogue is published. Because it is not feasible to issue a new catalogue to accommodate just a few price changes, some industrial and dealer catalogues omit prices entirely and furnish a separate up-to-date price list that may easily be changed. Other companies issue supplements to the original catalogues when price changes are necessary. Still other companies issue catalogues in loose-leaf binders so that pages may easily be added or replaced.

The choice of catalogue design and format depends largely on the nature of the items to be shown, the audience to be reached and the cost of the catalogue. In general, photographs are more effective than sketches, and photos in colour are preferred over those in black and white. Colour, typography, page layout and size of illustrations serve to emphasize each section of a catalogue while the arrangement of sections and the over-all printing of the catalogue can yield an impression of unity and quality to the catalogue itself and to the merchandise it contains.

CATALOGUING, LIBRARY. Basic to the organization of any library is a list or catalogue of its items, arranged methodically, usually alphabetically by author, subject and title, providing a description of each item and identifying it from all others, usually by a notation consisting of a combination of numbers and letters. Of the various classification schemes, the Dewey Decimal system and the Library of Congress system are widely used. In the Dewey Decimal system, devised by Melvil Dewey (*q.v.*), books are classified by numbers ranging from 000, the general classification: to 900, history, with decimal subdivisions: 800, literature; 810, American literature; 820, English literature; etc. Many libraries add a code number for the author's name. The Library of Congress classification scheme was planned for highly specialized or very large collections; it is commonly used in such libraries and in those in some universities.

For a bibliography on cataloguing and classification see LIBRARIES.

CATALONIA (Sp. CATALUÑA; Cat. CATALUNYA), a region of Spain comprising the four modern provinces of Barcelona, Gerona, Lérida and Tarragona (*qq.v.*), is the richest and most highly industrialized part of the country. Area 12,329 sq.mi. Pop. (1960 est.) 3,618,411. Formerly a principality of the crown of Aragon. Catalonia has always played an important role in the history of the Iberian peninsula and since the 17th century has been the centre of a separatist movement often dominating Spanish affairs. It occupies a triangular area in the northeastern corner of Spain, bordered by France and Andorra in the north, by Aragon in the west, by Valencia in the south and by the Mediterranean in the east. A mountainous zone, with more than one-third of its population concentrated in the city of Barcelona (*q.v.*), Catalonia is cut off orographically to the south and west; consequently for much of its history the region has exhibited closer ties with southern France than with the rest of Spain. Catalan (*q.v.*), the native language, is spoken also in Roussillon, north of the Pyrenees, and is quite different from Castilian Spanish.

Catalonia was one of the first Roman possessions in Spain, forming the northeastern portion of Hispania Tarraconensis. Occupied during the 5th century by the Goths, it was taken by the Moors in 712, but Charlemagne began the reconquest later in the 8th century, establishing the March of Gothia as a Frankish outpost. Gerona was taken in 785 and Barcelona, together with land reaching as far as the Llobregat river, in 801. This part of Catalonia was then incorporated into the kingdom of the west Franks, forming part of the Spanish march, and was ruled by successive counts (see BARCELONA, COUNTS OF) who continued the reconquest and quickly asserted their independence. Frankish suzerainty over Catalonia was soon only nominal and was completely rejected during the reign of Count Borrell (d. 991). From 1137. when Count Ramón Berenguer IV was betrothed to Petronila, queen of Aragon, Catalonia and Aragon mere united under the same ruler (see ARAGON). In the 13th and 14th centuries Catalonia monopolized the trade of the western Mediterranean. and Catalan mercenaries, known as the Catalan Grand company, intervened decisively in Italy and Greece (see ALMOGÁVARES). Catalan interests, which differed widely from those of Aragon, dominated the union until 1410, when the male line of the counts of Barcelona became extinct. Dissatisfaction in Catalonia with the new Trastámara dynasty steadily increased after 1412 until, during the reign of John II, it developed into a full-scale, but unsuccessful, rebellion (1462–72).

During the 16th century, after the marriage of John II's son Ferdinand with Isabella of Castile had brought about the unification of Spain. Catalonia was relegated to a position of secondary importance in Spanish affairs. This was because, first, the Turks seriously interfered with trade in the western Mediterranean, on which Catalan prosperity depended; and second, because the exploitation of Spanish America was reserved for Castile. By the 17th century the conflict of interests between Catalonia and Castile combined with the decline of the Spanish monarchy's prestige to produce the first of those separatist movements by which the history of Catalonia has since been characterized.

The trouble was caused by an economic crisis during the reign of Philip IV. The king's first minister. the conde de Olivares, wished to resolve his master's financial difficulties by imposing on the whole of Spain a degree of fiscal and administrative unity incompatible with the maintenance of the *fueros* of the lands of the crown of Aragon. The Catalans were not only determined to resist such efforts of centralization, but regarded the shortage of money as due to waste caused by inefficiency at Madrid and rash expenditure on foreign wars. The deadlock reached between Olivares and the Catalan and Aragonese *Cortes* in 1626 was unresolved when, in 1635, war broke out between Spain and France. This aggravated the king's financial position and led to the billeting in Catalonia of "foreign" Castilian troops, whose behaviour initiated a secessionist revolt (June 1640). The rebellious Catalans placed themselves under the protection of the French king Louis XIII, and civil war ensued in which French money and armed support were mainly responsible for keeping the Catalan insurgents in the field, especially after 1641. The fighting did not end until 1659 when, by the treaty of the Pyrenees, Philip IV came to terms with the French; for much of this time Catalonia was more a province of France than of Spain.

In the War of the Grand Alliance, French armies again invaded

Catalonia (1689) at the start of a long but successful campaign terminating in the capture of Barcelona in 1697. The same year, however, the French withdrew under the terms of the peace of Rijswijk.

In 1705, again motivated largely by a desire to ensure preservation of its *fueros,* Catalonia, together with Aragon and Valencia, declared its support for the archduke Charles in the War of the Spanish Succession (*q.v.*). In 1714, however, Catalonia was completely subjugated by Philip V's forces and its constitution and privileges mere abrogated. Catalonia subsequently lost nearly all its previous autonomy, but it gained by the encouragement given by the Bourbons to industrial development, while the termination of Castile's monopoly of the trade with Spanish America provided a fresh impulse for Catalan commerce and shipping.

Catalan separatism re-emerged in the 19th century in two forms: in rural areas in the support given to Carlism (*q.v.*) and in the towns in the demands of the manufacturers for high tariffs as protection against British and French competition. The Catalan national resurgence, however, really began with the literary *renaixensa* of the 1850s. This, at first, involved little more than holding competitions between Catalan poets and reviving medieval festivals like the Jocs Florals, but as the movement gathered strength, during the 1860s, more serious efforts were made to revive the use of Catalan (then only spoken in rural areas) as a living language, including the establishment of a Catalan newspaper and a theatre for Catalan plays. Politically, Catalan nationalism, which had been encouraged by the federal movement of 1868–73, became a serious force after 1876, when the defeat of the Carlists led the church to transfer its support to the new, rising movement for regional autonomy. It also then became a predominantly right-wing movement.

The loss of Cuba in 1898, a dramatic revelation of Spain's political and economic decline, served to revive in Catalonia feelings similar to those of 1640. The electoral victory won in 1901 by the new party, the Lliga Regionalista, showed that Catalan nationalism was politically a force of consequence, and the struggle for autonomy commenced in earnest. By 1913 a slight degree of home rule had been obtained under the *ley de mancomunidades,* but this measure was repealed ten years later by Primo de Rivera, who attacked all manifestations of Catalan separatism. Primo de Rivera's policy discredited the right-wing Lliga, attracted support for the nationalist movement from the hitherto uninterested lower middle classes and led to the formation of a left-wing coalition party, the Esquerra Republicana, led by Francesc Macib. The Esquerra won a sweeping victory in the municipal elections of April 1931, and two days later Macià proclaimed a Catalan republic. Thereafter a compromise was worked out with the central republic established at Madrid, and in Sept. 1932 the statute of autonomy for Catalonia was passed by the constituent *Cortes.* Catalonia played a prominent part in the history of the second republic in Spain and in the civil war of 1936–39 *(see* SPAIN: *History).* The nationalist victory in 1939 meant the loss of autonomy, and Gen. Francisco Franco's government adopted a repressive policy toward Catalan nationalism; conversely, Catalonia has been the most notable centre of opposition to Franco. (B. J. R.)

CATALPA, the common and generic name for 12 species of trees of the bignonia family (Bignoniaceae) native to eastern Asia, eastern North America and the West Indies. Catalpas have entire or shallowly lobed, opposite or whorled and usually long-stalked leaves. The showy flowers, borne in clusters terminating the branches, are white, yellow or purplish and more or less marked with yellow, purple or red. The fruit is a long, slender dry capsule containing numerous elongated, hairy or fringed seeds. The North American species are C. *speciosa,* the hardy catalpa, catawba tree or cigar tree, whose natural range is from southern Illinois and Indiana to Arkansas and Texas; and C. *bignonioides,* native from Georgia to Mississippi. Both are naturalized elsewhere in the United States. They and certain Asiatic species are grown as ornamental trees. Wood of the hardy catalpa, durable in contact with the soil, is used for posts and rails. (J. W. TT.)

CATALYSIS. Classically, the word catalysis means dissolution, destruction or ruin. J. J. Berzelius retained this meaning when, in 1836, he used the term to describe the chemical decomposition of a substance hastened by a second substance (a catalyst) that did not enter into the composition of the product formed. With use, the original meaning of catalysis was lost. The term was applied to synthesis (constructive) as well as decomposition (destructive) reactions that were accelerated by a substance (the catalyst) not permanently changed in the process. Since the catalyst is not permanently changed, it may be used over and over again. A small amount of catalyst can thus effect the conversion of a large amount of the substance being changed.

Catalysts may be gases, liquids and solids. They exert their catalytic effects on gases, liquids and solids to produce gases, liquids and solids. Although a few catalysts had been predicted for certain reactions, science in the early 1960s had not progressed to the point where it was possible to make general predictions concerning catalysts for desired reactions. Catalysts for one reaction are often worthless for other reactions. Thus. catalysis bears some of the aspects of an art rather than a science in spite of the many facts known about catalysts and catalytic reactions.

A catalyst can increase the rate of a reaction but it cannot change the position of the final equilibrium reached in a true equilibrium reaction. In a simple reaction such as

$$SO_2 + \tfrac{1}{2}O_2 \longrightarrow SO_3$$

the catalyst merely hastens the reaction toward equilibrium. Reactions involving organic compounds may be more complicated in that several reactions are possible. Some catalysts are selective in that they hasten only one of two or more possible reactions, leaving the others practically unaffected. For example, two common reactions of ethyl alcohol are:

$$C_2H_5OH \longrightarrow C_2H_4 + H_2O$$
$$C_2H_5OH \longrightarrow CH_3CHO + H_2$$

The first one is catalyzed by gamma alumina (a form of aluminum oxide), the second by copper, each to the practical exclusion of the other. In the absence of catalysts the two reactions occur simultaneously but only at a higher temperature than required for the catalytic reactions. It is the ability of catalysts to accelerate selectively one of several possible reactions that made catalysis so important in industrial organic chemistry.

Some of the most selective catalysts known, namely the enzymes, occur in nature. Each enzyme usually has a single function and will not act as a catalyst in any other way. In digestive processes, for example, a number of enzymes convert food molecules into smaller fragments that can be absorbed through the digestive wall.

It is entirely possible that some if not all of the vitamins and hormones are catalysts. They have the selective action that characterizes catalysts and, in most cases, a very small amount of substance can produce large effects.

PRACTICAL USES

Fixation of Nitrogen.— Catalysis is of great social as well as technical and scientific importance. The average man rarely comes directly in contact with industrial catalysts and, therefore, does not realize what they do for him and how they affect the course of his life or even his death. The part played by catalysts in the production of fixed nitrogen is a good example of such effects.

Fixed nitrogen is one of the essential ingredients of plant food and explosives. It is used in the form of ammonia or its derivatives, or as nitrates. Until about 1915, fixed nitrogen was obtained from Chilean saltpetre (sodium nitrate), from a few saltpetre (potassium nitrate) mines in the United States, Germany and elsewhere, from animal wastes and as a by-product of the coking of coal. At about that time, Fritz Haber and his co-workers produced synthetic ammonia by heating nitrogen and hydrogen under high pressure with a solid catalyst. Many different catalysts have since been used. The early ones were osmium and ruthenium. These were expensive, and so cheaper catalysts were sought and found. Commercial plants employing this process have been installed in every industrial nation in the world.

Another catalytic reaction serves to complement the above reaction. Fixed nitrogen is needed in the form of nitrates as well

as in the form of ammonia. Platinum catalysts were developed that catalyze the reaction between ammonia and the oxygen of the air to form nitrogen dioxide. which nith water produces nitric acid The over-all result is a high yield of nitric acid from the catalytic oxidation of ammonia.

These two catalytic reactions have made every nation independent or potentially independent. of Chilean nitrate or other natural nitrate deposits. The result has been a decline in the price of fixed nitrogen. an increase in consumption and healthier plants for the farmer with better and more economical food for the average man

These tno catalytic reactions also have their sinister aspects, for. until the advent of the atomic homh. fixed nitrogen was the backbone of both explosives and propellents Thus, much of the destruction of World War I and World War II can be associated with these catalytic reactions, for the wars would have been quite different if both sides had had to depend on Chilean nitrates for their explosives. (*See* NITRIC ACID AND NITRATES; NITROGEN. FIXATION OF.)

Motor Fuels.—Aside from its application in the fixation of nitrogen, catalysis has other important social implications. A large part, if not most, of the aviation gasoline used by all nations taking part in World War II was made nith the aid of catalysts. In the United States the catalysts were used primarily for the conversion of petroleum into hydrocarbons of good antiknock quality. (1) Petroleum oils were catalytically cracked by means of synthetic silica-alumina or acid-treated clay (montmorillonite) catalysts. Thi- process produced the "base" for the aviation gasoline, and it was responsible for a major part of the aviation gasoline produced. (2) Branched-chain paraffin hydrocarbons were synthesized by the so-called alkylation process using sulfuric or hydrofluoric acid catalysts. Usually, isobutane and mixed butylenes were the raw materials for the process. These were produced by the catalytic as well as the thermal cracking of petroleum. The branched-chain paraffinic product was blended with the "base" from catalytic cracking, (3) Catalytic isomerization of paraffins was used to convert *n*-butane into isobutane and n-pentane into isopentane. Anhydrous aluminum chloride provided the essential catalytic material for all the commercial paraffin isomerization processes. (4) Isopropylbenzene was produced from benzene and propylene by means of phosphoric acid catalysts. The isopropylbenzene was added to the gasoline to give extra power under take-off or combat conditions where fuel economy was not a consideration. The British catalytically produced tevt-butylbenzene from benzene and isobutylene and used it for similar purposes. (5) Propylene and butylene were catalytically polymerized with phosphoric and sulfuric acid catalysts. The product was a mixture of branched-chain octenes. These were catalytically hydrogenated with nickel or molybdenum catalysts to produce branched-chain octanes, which were used in the same way as alkylates, as described in (2) above. (6) Straight-run gasoline was converted to material suitable for use as aviation "base" by the hydroforming process. The major use of this process during World War II, hon-ever. was to produce synthetic toluene for manufacture of TNT. During the postwar period vastly superior processes of this general type came into wide use for manufacture of motor gasoline and of synthetic benzene, toluene and xylenes. (*See* also PETROLEUM: *Refining* of *Petroleum.*)

The Germans. the Japanese and, to a certain extent, the British used catalytic processes to produce aviation fuels from coal. Two major processes were used: (1) A part of the coal was converted by heat, steam and catalysts into hydrogen. The hydrogen was caused to react catalytically with more of the coal at high pressures to produce liquid hydrocarbons that were used directly or further processed. (2) By means of heat: steam and catalysts, the coal was converted into a mixture of carbon monoxide and hydrogen. These were used in the Fischer-Tropsch process; with catalysts containing nickel or cobalt, to produce synthetic hydrocarbons. Since these hydrocarbons were mostly of the straight-chain variety, they had poor antiknock properties and required further treatment to make good aviation fuel. These Fischer-Tropsch processes also produced diesel fuels of excellent quality as well as waxes and raw materials for synthetic fats and soaps. (*See* also HYDROGENATION: *Fischer-Tropsch Synthesis.*)

Other Commercial Applications.— Catalysts also are essential in the production of synthetic rubber. Most of the synthetic rubber produced in the United States has been made from butadiene ancl styrene, which are produced with catalysts.

Sulfuric acid. itself a catalyst for many reactions, is produced in huge quantities with the aid of vanadium oxide catalysts that enhance the oxidation of sulfur dioxide to sulfur trioxide.

Vanadium oxides, usually in combination with silver, are also used in the oxidation of naphthalene by air to phthalic anhydride. The consumer sees phthalic anhydride only after it has been transformed by the chemist into synthetic resins or into synthetic dyestuffs.

Methyl alcohol is produced from carbon monoxide and hydrogen. Zinc oxide-chromium oxide combinations are catalysts for this process. By the addition of potassium carbonate to the catalyst, *n*-propyl, isobutyl and higher alcohols are also produced. By means of a copper catalyst, methyl alcohol is converted into formaldehyde. Formaldehyde reaches the public as such or after it has been converted into synthetic resins, such as the phenol-formaldehyde and urea-formaldehyde plastics.

Even human food has felt the influence of catalysts. Many solid fats used for shortening or for making margarine have been produced by the catalytic hydrogenation of' oils with nickel as the catalyst. The catalyst is removed completely before the product is marketed.

THEORY OF ACTION

Catalysis may be divided into two broad branches depending on relations between the catalyst and the materials involved in the catalytic reaction. The branches are homogeneous catalysis and heterogeneous catalysis. In homogeneous catalysis there are no phase boundaries between the substances taking part in the reaction and the catalyst. Thus all reactions that involve only gases and are catalyzed by a gaseous catalyst are homogeneous. The same is true for reactions involving mutually soluble liquids or dissolved solids when the catalyst is soluble in the mixture.

In heterogeneous catalysis there is a phase boundary between the catalyst and the substances reacting. The commonest heterogeneous reactions are those involving solid catalysts with liquid or gaseous reactants.

Homogeneous Catalysis.— Suppose that a chemical reaction is occurring in the gaseous state, uninfluenced by the walls of the vessel. Suppose that an observer could follow the movement of all the individual atoms. He would notice persistent groupings of atoms (molecules) that move at velocities of the order of 1.000 m.p.h., colliding frequently with other molecules and emerging from the collision substantially unchanged. He would also notice that there are occasional collisions from which nevi molecules emerge, and perhaps that molecules occasionally fall apart in the absence of collisions. These events are called elementary reactions. Types of elementary reactions include:

$$A + B \longrightarrow C + D \qquad \text{(I)}$$
$$A + B \longrightarrow A + C \qquad \text{(II)}$$
$$A + B \longrightarrow C \qquad \text{(III)}$$
$$A \longrightarrow B + C \qquad \text{(IV)}$$
$$A + B + C \longrightarrow A + D \qquad \text{(V)}$$

It seemed reasonably certain in the early 1960s that reactions of all these types actually occurred. Depending upon the reaction under study, the observer might note the occurrence of only a single elementary reaction or of a number of different elementary reactions.

Such direct and detailed observations, of course, cannot be made, The objectives of reaction-rate theory, however, are to determine from the observable data what elemenrary reactions actually occur and nhat their rates are. and to interpret these rates in terms of interatomic forces and atomic dynamics.

Of the above elementary reactions, types II and V are inherently catalytic reactions. since A emerges unchanged. Type V corresponds to the combination of free atoms. or simple radicals such

as $-OH$. In such cases, momentum and conservation of energy make it impossible for combination to occur without a third body to remove some of the energy. There is little specificity in the effectiveness of various third bodies, and type V is a trivial and uninteresting example of catalysis. Likewise in the case of type II, the examples known in the early 1960s were few and unimportant.

The noncatalytic reactions of types I, III and IV may combine in many ways to produce a total reaction that represents catalysis. A simple illustration utilizing type I reactions is

$$A + B \longrightarrow C + D$$
$$C + E \longrightarrow B + F$$

giving as the ultimate result

$$A + E \longrightarrow D + F$$

catalyzed by B (or C). A specific example is

$$O_3 + ClO_2 \longrightarrow ClO_3 + O_2$$
$$ClO_3 + O_3 \longrightarrow ClO_2 + 2O_2$$
$$2O_3 \longrightarrow 3O_2$$

where the chlorine oxides are catalysts. In any complex mechanism of this character, it is more or less a matter of accident that the catalyst is regenerated. For this reason, there is little basis for distinguishing the theory of homogeneous gas phase catalysis from that of homogeneous gaseous reactions generally.

In solution, acids and bases are powerful catalysts for a wide variety of organic reactions. This special branch of the subject, in fact, has absorbed a predominant part of all modern scientific work on homogeneous catalysis. The original concept of acid and base catalysis was that the effective catalysts were the hydrogen and hydroxyl ions. There are a number of important reactions, such as the hydrolysis of esters and the inversion of sucrose, where the data available in the early 1960s were explicable on this basis. In general, however, it is necessary to invoke the modern definition of an acid as a substance tending to lose a proton and of a base as one tending to gain a proton, and to recognize that all acids and bases may act as catalysts.

The velocities of acid-base catalyzed reactions are strongly affected by the presence of neutral salts. It is customary to distinguish primary and secondary salt effects. The secondary salt effect occurs only in catalysis by weak electrolytes and is caused by increased dissociation of the weak electrolyte due to the presence of the neutral salt. This effect is purely thermodynamic in origin and for sufficiently dilute solutions may be quantitatively predicted by the Debye-Huckel theory. (See also QUANTUM MECHANCS: *Specific* Heats.)

The primary salt effect, on the other hand, occurs with all acid-base catalysts regardless of strength. It is specific to the reaction, the catalyst and the added salt. The primary salt effect is usually positive (increase in reaction rate due to salt) but for basic catalysts is sometimes negative. The explanation current in the early 1960s for the primary salt effect was based on J. N. Bronsted's equation

$$k = k_o \frac{f_A f_B}{f_X}$$

for the reaction rate constant k for the reaction

$$A + B \longrightarrow C + D$$

where f_A, f_B and f_X are the activity coefficients for A, B and X, the assumed "critical complex" or intermediate compound, and k_o is a constant. If this equation be granted, the calculation of primary salt effects then becomes a thermodynamic problem. Since definite information as to the critical complex, X, is limited to knowledge of its charge, this thermodynamic problem can be treated only approximately. The results, however, are consistent with experimental data on the primary salt effect.

The general picture of acid-base catalysis, from the standpoint of physical chemistry, is that the catalyst converts the reactant molecule to an ion by proton exchange and that the ion then reacts. The interest of the organic chemist in the same phenomenon is largely that of interpreting the nature of the subsequent reactions. It is impossible to discuss the details here but it may be mentioned that reactions subject to acid-base catalysis include esterification, bromination, isomerization, molecular rearrangements, dehydration, alkylation and polymerization.

Heterogeneous Catalysis. — The best established examples of heterogeneous catalysis involve solid catalysts and liquid or gaseous reactants. It is almost universally true that massive materials have little or no catalytic activity, and that active catalysts are highly porous and have total surface areas of 50–500 sq.m. per gram (5–50 ac. per pound).

Various theories have been proposed to explain the general nature of heterogeneous catalysis. In the early 1960s, however, there were few dissenters from the view that it involves a sequence of reactions in which the catalyst surface participates as an actual chemical reactant. The question of whether the entire surface participates, or only a relatively few "active centres" such as edge or corner atoms in crystals, was in dispute.

Study of the adsorption of gases on catalyst surfaces reveals two types of adsorption. The first type is called physical, or Van der Waals adsorption, since it is believed to be caused by intermolecular forces that do not disturb the existing valence bonds. The second type is called activated adsorption, or chemisorption, since it is believed to represent the creation of new valence bonds. With few exceptions, heterogeneous catalysis depends on activated adsorption.

The rate of every heterogeneous reaction, therefore, depends in principle upon rates of adsorption, reaction and deadsorption. By kinetic treatment of particular reaction mechanisms it is possible to reproduce the major features of experimental rate data, namely that the reaction order is usually low and that retardation not only by the products but by some of the reactants is frequent. The quantitative value of such kinetic treatments is impaired by the practical necessity of using oversimplified models.

Negative Catalysis. — This term has been applied frequently, and rather loosely, to factors that decrease the rate of reaction. On thermodynamic grounds a negative catalyst cannot produce an independently occurring reverse reaction. By definition, a negative catalyst cannot affect the reaction rate constant of any true elementary reaction. The only thing a negative catalyst can do, therefore, is to introduce additional elementary reactions, that may result in a lowered over-all reaction rate. This may be done either by stopping a reaction chain or by destroying a catalyst. The latter effect is usually referred to as poisoning. Poisoning may be either permanent or temporary. From a practical standpoint, poisoning is usually objectionable, although there are a few cases in which selective poisoning is put to practical use. Substances that retard reactions by breaking chains are frequently called inhibitors. They are of major importance in preventing deterioration of gasoline, lubricants, rubber, fats, oils and other important commercial products. *See* also ANTIOXIDANTS.

TECHNIQUE OF CATALYSIS

An outstanding feature of catalysis is that chemical composition alone does not provide an adequate description of a catalyst. It has been seen that a large surface area is generally essential. It is common practice to use an inert material of large surface area as a "support" or "carrier." The active catalyst may be deposited on the support by chemical means. Commonly used supports include activated carbon, diatomaceous earth, pumice, silica gel and alumina. The use of supports is advantageous in some cases because they reduce the cost of using an expensive catalyst material such as platinum or silver and in other cases increase the stability of the catalyst.

Whether supports are used or not, the details of catalyst preparation exert major effects on the properties of the finished catalyst. Some of these effects may be correlated with such properties as crystal structure, crystal size, surface area and residual impurities, but many of them are as yet unexplained.

In many cases a catalyst can be improved by the addition of small amounts of an additional component that is not a catalyst by itself. Such a substance is called a "promoter." Sometimes

a second promoter will still further enhance catalytic activity. In other cases a mixture of two catalytic materials will be more active than either alone: this effect is called a "synergism." In still other cases a catalyst may be composed of tno materials neither of which is active alone. Thus a catalyst composed of two materials may be a true two-component catalyst or a supported catalyst, or it may involve promotion of synergism.

It is possible to mention only a few of the heterogeneous catalysts that have proved useful. For hydrogenations, catalysts involving metallic nickel, iron, cobalt. platinum, palladium or copper: the oxides of copper, zinc or chromium: and the sulfides of molybdenum are common. For dehydrogenations the catalysts may involve: copper. platinum or palladium as metals; aluminum, magnesium. zinc. chromium and molybdenum as oxygen compounds; and nickel, molybdenum and tungsten as sulfur compounds. For oxidations the catalysts may involve: platinum and silver as metals; and vanadium, silver, copper and chromium as oxygen compounds. For dehydrations gamma alumina is by far the most largely used catalyst. Finally there is a group of apparently dissimilar "acid-acting" catalysts for Friedel-Crafts reactions (*q.v.*) and other reactions that involve carbonium ions. This group includes anhydrous aluminum chloride and bromide, boron fluoride, concentrated sulfuric and phosphoric acids, anhydrous hydrogen fluoride and the silica-alumina type of catalyst used for catalytic cracking.

All known heterogeneous catalysts deteriorate with use. A common and perhaps universal cause of deterioration is loss of surface area by recrystallization. In some cases there is also an actual change in crystal type, such as from gamma alumina to alpha alumina. In addition, most catalysts are subject to "poisoning." Poisons are classed as temporary and permanent. Temporary poisons are adsorbed relatively weakly at reaction conditions, and poisoning effects disappear quite rapidly when the poisons are no longer present in the material flowing to the catalyst. Permanent poisons are more strongly adsorbed, and their effects are not merely transient. Sulfur is a particularly common permanent poison for many metallic catalysts. An important "permanent" poison in some hydrocarbon reactions is a carbonaceous material of high molecular weight and of relatively low hydrogen content that is formed as a minor reaction product. This material is produced in many high-temperature reactions, such as catalytic cracking and dehydrogenation. It is common industrial practice to "regenerate ` the catalyst periodically by burning this "coke" under suitably controlled conditions. See also Index references under "Catalysis" in the Index volume. (C. L. T.; L. S. KL)

CATAMARCA, a northliestern province of Argentina, is separated from Chile by the cordillera of the Andes. Area 38,540 sq.mi. Pop. (1960) 172,407. The province. in general, is mountainous, with many high peaks always covered with snow. Between the mountain ranges are tablelands and valleys. some of which are fertile oases while others are completely arid. The sandy desert on the western side of the Sierra de Aconquija is knonn as the Argentine Sahara. The climate varies with altitude, but is for the most part warm and dry, with greater rainfall in the east than in the west.

The first settlement in Catamarca was founded by Spaniards in the early colonial period, the region being then under the jurisdiction of the viceroy at Lima. In 1943, when the Argentine government abolished and divided up the northern territory of Los Andes, the department of Antofagasta de la Sierra was incorporated in Catamarca. For many years after the liberation from Spain the caudzllos of the Catamarca region and their gaucho followers resisted the rule of the distant Buenos Aires government, and the wealthy landowners continued to have an independent spirit. In 1946 Pres. Juan Perón, to suppress local criticism of his regime, used his constitutional prerogative of "intervention" to depose the governor of the province and install a nominee of his own.

Scarcity of water has retarded the development of agriculture and cattle raising, and irrigation provides only a partial remedy. The largest crop is alfalfa for cattle fodder, and there are irrigated vineyards and olive groves. Two of the chief minerals exploited are wolfram and mica. Catamarca is famous for its woolen ponchos and cloth, woven mainly by women. The provincial capital and chief city, Catamarca, is connected by railway with the capital of the republic. Buenos Aires. 895 mi. distant. (GE P.)

CATAMARCA (SAP; FERNANDO DE CATAMARCA), capital of the northwestern Argentine province of the same name. It lies on the Rio del Valle de Catamarca, a river situated between the two south-pointing Andean spurs of the sierras of Ambato and Ancasti. The city is 230 mi. N.N.W. of Córdoba and 115 mi. S. of Tucumán. Pop. (1956 est.) 36.916. The sheltered valley. an oasis of fertility in a dry region, is partially wooded and produces fruit in abundance. Other agricultural products are wine, alfalfa, cotton and some cereals The industries include flour mills, tanneries. woodworking plants, meat-packing and other food-processing factories. A special product is the hand-woven poncho, or woolen cloak, for which the city has long been famous. Mica is mined nearby. Catamarca is a noted tourist centre because its winter climate is genial, the scenery is outstanding and there are hot springs in the nearby sierras. Road communications are more plentiful than rail links and there are air services to Rosario and Tucumán.

Catamarca was founded by Fernando de Mendoza in 1683; and it has many colonial buildings, an art gallery and a museum. The church of the Virgin of the Valley is a centre of pilgrimage. The attractive alameda (public park) has a central lake surrounded by paths and shrubberies. The city's administrative influence over the distinctive valley region has preserved local traditions and a strong community spirit. (G. J. B.)

CATANDUANES, an island province of the Republic of the Philippines, lies across Maqueda channel, off southeastern Luzon. It has an area of 552 sq.mi. and a population (1960) of 156.640. The island nas separated from Albay province in 1945. It is a hilly to rolling island on which general farming is carried on, nith coconut, rice. abaci (Manila hemp) and yams the chief crops. The first three are also the main exports. The capital and chief port is Virac, on the south coast. Pop. (1960) 34,435. (J. E. SR)

CATANIA, a city of Sicily, capital of Catania province. is situated on the Ionian seacoast in the broad plain of Catania, 27 km. (nearly 17 mi.) from Mt. Etna. It is 43 ft. above sea level. Pop. (1957 est.) 344,786 (commune). Catania is the seat of an archbishopric. Standing almost entirely on the lava left by various eruptions, the city slopes slightly downward from north to south. The climate is mild and pleasant.

Almost completely destroyed by an earthquake on Jan. 11, 1693, Catania was reconstructed according to a plan framed by the duke of Camastra. As a result, the centre of the city has a distinctly 18th-century appearance, with broad, straight streets flanked by churches and palaces. Modern Catania is, however, an industrial city and transportation centre. It is the terminus of the railway for Palermo, Messina and Syracuse; and the port, founded by the Bourbon government, is one of the most important in Italy. There are air services from Fontanarossa airport, 3 mi. S. of Catania. Industries include a variety of mechanical and chemical manufactures, food processing and fishing. Half of Sicily's refined sulfur comes from the factories of Catania. In addition, it is the marketing centre for the surrounding agricultural region and exports especially almonds and oranges.

Catania's cultural history might be said to begin with the tradition that the 6th-century Greek lyric poet Stesichorus of Himera was buried there. The University of Catania was founded in 1434 by Alfonso of Aragon, and its library (1755) possesses a number of important manuscripts dating from as early as the 14th and 15th centuries. The university buildings house the Accademia Gioenia (founded 1824) and the Società di Storia Patria per la Sicilia orientale (1904). The municipal library contains a 14th-century illuminated Bible attributed to the school of Pietro Cavallini and a considerable number of autographs, manuscripts and parchments.

Vincenzo Bellini, composer of the opera *Norma,* was born in Catania in 1801. His birthplace, preserved as a museum, contains his death mask, a harpsichord which he used and other memorabilia.

Forty years after his death in 1835, his remains were returned to Catania from Paris and interred in the cathedral. Other famous sons of the city were the poet Mario Rapisardi (1844–1912) and Giovanni Verga (1840–1922), founder of the literary school of *verismo,* who used his native Sicily as the background for many of his novels.

Buildings and Monuments. — The principal thoroughfare, beyond which appears smoking Mt. Etna, is the Via Stesicoro Etnea, named for the poet. Near the Piazza Stesicoro are the imposing ruins of a 2nd-century B.C. Roman amphitheatre. Elliptic in form, it originally measured 410 ft. by 345 ft., exceeded 98 ft. in height and seated 16,000 spectators. During the invasion of Theodoric, part of the material was used to rebuild the city walls. The remains of a Roman basilica are in the Piazza Mazzini. In the nearby Via del Teatro Greco stands the Greek theatre with a Roman superstructure. Attached to it is the Odeon, a smaller, semicircular building where rehearsals and contests mere held. There are also remains of Roman baths and aqueducts.

The Castello Ursino with its four angular towers, constructed in the 13th century for Frederick II by Riccardo da Lentini, served as a model of military architecture for several centuries. After being used for some time as a barracks, it was made into a museum. The collection includes numerous classical sculptures, some of great artistic value. There are also a number of medieval and Renaissance sculptures, collections of small Greek, Etruscan and Roman bronzes, Sicilian, Attic and Apulian vases and oriental antiquities and paintings, many by Sicilians.

The centre of modern civic life is the well-proportioned Piazza del Duomo, surrounded by 18th-century palaces and opening onto wide streets. Of the ancient fabric of the cathedral, founded by Roger I in 1090, there remain three apses of dark lava and part of the transept. After the 1693 earthquake the Norman building was reconstructed by the architects Fra Fiolamo Palazzotto and Giovanni Battista Vaccarini (1702–68), the latter of whom was responsible for the façade. In the chapel of Sta. Agata are kept a silver bust of the saint by Giovanni Bartolo of Siena and a reliquary, both 14th century, containing various relics exhibited on the saint's festival. Bellini's tomb is the work of the Florentine G. B. Tassere. Close by the cathedral is the 17th-century baroque church of the monastery of Sta. Agata, circular in form with a cupola supported on a polygonal drum. In the centre of the square stands the elephant fountain, erected in 1736 by Vaccarini. The dark lava elephant, surmounted by an Egyptian obelisk, is ancient, dating perhaps from Roman times. Also in the Piazza del Duomo is the town hall, another work by Vaccarini.

The 17th-century church of S. Nicolb, the largest in Sicily, offers a magnificent view from the drum of the cupola, 210 ft. above ground level. Connected with the church is a Benedictine monastery begun in the 14th century and completed three centuries later. It is said to be one of the largest in the world. Its ornamentation, although executed after the earthquake, retains the exuberance of 17th-century taste. The church of S. Carcere (18th century) has a 13th-century portal that once belonged to the cathedral. The 18th-century Porta Garibaldi achieves a striking effect as a result of the decorative contrast between its dark lava and white limestone.

History.—Catania (Lat. Catana or Catina) was founded in the second half of the 8th century B.C. when the Chalcidians of Naxos settled a colony at the foot of Mt. Etna. The city acquired importance with Hiero I, tyrant of Syracuse, and his son Deinomenes, who called it Aetna after the volcano. Following the extinction of Deinomenes' people, the ancient inhabitants restored the old name.

Catana was made a Roman colony by Octavian. The Christians there suffered under the persecutions of Decius and Diocletian and the Catanian martyrs included St. Agatha, patron saint of the city. (See AGATHA, SAINT.) After the barbarian invasions, Catania fell successively to the Byzantines, the Arabs and the Normans. The city was hostile to the Swabians and was ravaged by Henry VI and by Frederick II. The Aragonese sovereigns resided there. (See also SICILY; NAPLES, KINGDOM OF.)

During the 16th and 17th centuries the city was afflicted by civil disorders, incursions of pirates, epidemics, famines and natural disasters, including an eruption of Etna in 1669 and the earthquake of 1693. Later it became subject to the Bourbon kingdom of Naples. Civil disturbances occurring during an outbreak of cholera in 1837 were vigorously suppressed and when, in 1848, Catania joined the other cities of the island in claiming autonomy for Sicily, this movement was also put down by force.

During World War II, after the Anglo-U.S. army had landed in Sicily on July 9, 1943, the Germans defended Catania for several weeks in an attempt to extract themselves from an encircling movement, finally evacuating it on Aug. 5. (M. T. A. N.)

CATANZARO, a town and episcopal see of the Calabria region, Italy, capital of the province of Catanzaro, is located 51.5 km. (32 mi.) S.E. of Cosenza. It stands 1,125 ft. above sea level. Pop. (1957 est.) 69,179 (commune).

In the baroque church of S. Domenico is a Madonna del Rosonio (17th-century Neapolitan school) and the provincial museum contains a Madonna and Child, signed Antonello de Saliba (1508). From a public park, the Villa Margherita, there is a magnificent view as far as the sea. A funicular railway, descending through a tunnel, carries passengers from Catanzaro to the railway station at Catanzaro Sala, on a branch line connecting the two main lines along the east and west coasts of Calabria. Silk weaving gained the town an international reputation during the 17th and 18th centuries.

Founded about the 10th century as Catasonion, a Byzantine town, it was taken in 1059 by Robert Guiscard. Invading peoples from the Saracens to the Swiss, Normans and Angevins recognized its strategic and military importance. In 1528 it resisted a four-month siege by the French and was named magnifica e *fidelissima* by Charles V. It also played an important part during the Napoleonic Wars and the Risorgimento. The town was bombed by the Allies in World War II.

CATAPULT: see ENGINES OF WAR.

CATARACT, in medicine, any cloudiness (opacification) of the crystalline lens or the lens capsule of the human eye. See EYE, HUMAN: *Diseases of* the Lens; EYE, SURGERY OF: Lens.

CATARGIU, LASCAR (1823–1899), Rumanian statesman, one of his country's foremost Conservative leaders in the early years of its independence, was born on Nov. 13, 1823 (new style; Nov. 1, old style). He belonged to an ancient Walachian family, one of whose members had been banished in the 17th century and had settled in Moldavia. Under Prince Grigore Ghica (1849–56) Catargiu rose to be prefect of police at Iasi (Jassy). In 1858 he became a member of the divan ad *hoc* of Moldavia, a commission elected in accordance with the treaty of Paris (1856) to vote on the proposed union of Moldavia and Walachia. His strongly conservative views, especially on agrarian reform, induced the Conservatives to support him as a candidate for the throne in 1859. During the reign of Prince Alexandru Cuza (1859–66) Catargiu was one of the opposition leaders plotting to overthrow him and to secure a prince from western Europe instead. After Cuza's deposition he was one of the three regents before Prince Charles of Hohenzollern arrived to become prince of Rumania as Carol I. On Carol's accession (May 1866) Catargiu became president of the council, but he disagreed with his Liberal colleagues I. C. Bratianu and C. A. Rosetti and resigned in July. After eight more ministerial changes, culminating in the antidynastic agitation of 1870–71, Catargiu formed a stable Conservative cabinet, which lasted until 1876. He and his cabinet were subsequently threatened with impeachment for alleged electoral and financial corruption, but the proposal was withdrawn in 1878 and he remained in opposition until 1889, when he formed a short-lived cabinet in which he was also minister of the interior. Minister of the interior again in Ion Florescu's cabinet of March 1891 he again became president of the council in Dec. 1891 and retained this office until 1895. He died at Bucharest on April 11, 1899. (B. BR.)

CATARRHINA, the term used (in contradistinction to Platyrrhina; *q.v.*) to indicate the old world monkeys and apes. It refers to a distinguishing feature of these primates (*q.v.*): the nostrils (the intervening septum being narrow) are closely applied and pointed downward.

CATAWBA, the' principal tribe of the eastern division of the

Siouan stock of American Indians. The name is probably derived from the Choctaw *katápa,* meaning "divided" or "separated."

Formerly the dominant people of South Carolina. the Catawba also had divisions extending into North Carolina. In the 17th century the population was about 5.000, but by 1780 it had declined to about 500. In 1950 an estimated 374 Catawba were living on a small reservation in South Carolina.

The Catawba, who were at war with the Iroquois for a long time, furnished a valuable contingent to the South Carolina troops during the American Revolution. They retreated to Virginia upon the advance of British troops in 1780, but they later returned and occupied small towns on the Catawba river. They afterward lensed their land and about 1841 sold all of it except one square mile to the state. At that time a number of them went to the territory of the Cherokee in western North Carolina, but they did not remain long with their former enemies and soon returned to South Carolina. A vocabulary of about 300 words, collected by Oscar M. Lieber. the geologist. in 1856, was published in *Collections of the South Carolina Historical Society,* vol. ii (1858).

See James Mooney, "Catan-ba," in *Handbook of American Indians North* of *Mexico,* ed. by F. W. Hodge, Bureau of American Ethnology Bulletin 30, part 1 (1912) ; J. R. Swanton, "Early History of the Eastern Siouan Tribes," in *Essays* in *Anthropology Presented to A. L. Kroeber (1936).*

CATAWBA, a richly flavoured, large. red grape whose juice varies in colour from amber to pink with different extraction processes. A variety of *Vitis labrusca,* a North American and Asiatic species. it was grown in 1807 in Washington, D.C., and was named after the Catawba river in the nearby Carolinas about 1823. Its cultivation spread rapidly to Ohio. Ontario and the Finger lake section of New York. The vine is disease resistant, prolific and very late ripening, but a heavy yielder. The fruit. medium sweet and highly acid, is readily preserved and resistant to spoilage. Dry Catawba wine is used as a champagne base, and sweetened Catawba still wines are marketed under the varietal name. Much commercially bottled white grape juice is largely Catawba. (R. G. No.)

CATBIRD (*Dumetella carolinensis*), a North American bird of the thrasher family (Mimidae), about nine inches long, breeding from Nova Scotia to southeastern Texas. Its plumage is slate gray, with a black cap and tail and chestnut under tail coverts. It is noted for its distinctive song. which, although having much of the charm of its close relative the mockingbird, is interspersed with petulant mewing protests, hence its common name. The catbird winters in the southern states, in Cuba and from Mexico to Panamá. It is resident in Bermuda. In Australia the name catbird is given to any one of several bowerbirds (*q.v*) which voice catlike mewings, especially to *Ailuroedus crassirostris,* which builds no bower.

ALLAN D. CRUICKSHANK FROM NATIONAL AUDUBON SOCIETY

CATBIRD (DUMETELLA CAROLINENSIS)

CATBOAT, a small sailing boat having the mast located far forward and carrying only a single fore-and-aft sail. which may be either a Bermuda (three-sided) or a gaff (four-sided) rig. Lateral stability is generally provided by a centreboard, a dagger board or leeboards. Hull construction can be of planked wood, sheet plywood, molded plywood. molded reinforced plastic or aluminum. Many small dinghies used as yacht tenders, racing craft or beginner's boats are catboats. *See* also BOAT. (J. E. CE.)

CATCH, a specifically English name for rounds or perpetual canons designed to be sung by three or more voices. It may possibly derive from the 14th-century Italian *caccia* (*q.v.*), likewise a canonic form. but is in any case appropriate in that each singer has to take up or "catch" the tune in turn. Literary evidence shons that catch-singing was popular in the 16th century. but the first published collection. Thomas Ravenscroft's *Pammelia,* dates from 1609. Its success encouraged him to bring out two further publications, also containing some catches: *Deuteromelia* (1609) and *Melismata* (1611). John Hilton's *Catch That Catch Can* (1652) is probably the most famous of catch collections. but the zenith of the catch came with the Restoration, when the finest composers vied with one another in lavishing ingenuity and indecency on this originally humble form; Purcell ranks supreme on the first account and very high on the second. During the 18th century, when the Noblemen and Gentlemen's Catch club was founded (1761), catches became textually more polite and musically more insipid, although they retained their popularity among convivial musicians. Many of the best examples, however, remain in manuscript for obvious reasons. (J. J. N.)

CATCH CROP, a rapidly growing crop that occupies the soil for short periods to absorb. or "catch." nitrates that might otherwise be carried away in drainage waters. Such crops are usually grown between the times of two principal crops or between the rows of another crop. Rye, oats and vetch are frequently used. but other crops and plants, including weeds, may serve. When the immature plants are plowed under, the nitrogen absorbed is returned to the soil where it can again be used to nourish other plants. Many gardeners and farmers have found that they can improve their production efficiency by giving attention to the use of catch crops in their cropping systems.

In practice, however, the term catch crop is often used with other meanings. It can refer to quickly maturing crops grown between two principal crops for the purpose of keeping the land completely utilized. Defined in this way, catch crops may occupy idle land for longer periods of time and include more species of plants than under the more restricted definition given above. The crops serving as catch crops will be useful not only for conserving nitrates but also for soil protection, soil enrichment and as additional sources of feed for livestock.

Special crops planted between two principal crops for the purpose of protecting the soil against water and wind erosion are frequently called cover crops. They may also function as catch crops and as sources of organic matter for soil enrichment.

Crops planted between two principal crops chiefly for the purpose of soil enrichment are more accurately described as green manure crops. Legumes, because of their ability to obtain nitrogen from the atmosphere, are used more frequently for this purpose than nonlegume crops. In the North American corn belt, for instance. biennial sweet clover, a deep rooted legume. is widely used as a green manure crop. It is seeded in early spring in either fall- or spring-seeded grains and plowed under the following spring for corn. If conditions are favourable, as much as 100 lb. or more of atmospheric nitrogen and several tons of organic matter rich in nutrient minerals may be added to an acre of land. In addition to these benefits. the sweet clover or other green manure crops may also serve as catch and cover crops.

In view of the overlapping functions of catch, cover and green manure crops, it is difficult to use these classifications accurately. Some call all special crops planted between two principal crops catch crops. while others use the designations that best express the major purposes for which the crops are grown. (F. C. BR.)

CATCHMENT AREA, all the area from which precipitation would flow to a stream. *See* WATERSHED.

CATECHISM, a manual of instruction, usually of religious instruction, arranged in the form of questions and answers. Such questions and answers about the rudiments of faith belong to the oral tradition of many religions. but the catechism is a product of Jewish and especially of Christian history. Its primary purpose is indoctrination in faith and morals, but it serves also as a public confession of the faith of the church.

Although the origins of the Christian catechism are medieval, it was in the 16th century that the catechism established itself as a genre of Christian pedagogical literature. Following examples from St. Augustine and other Church Fathers, the medieval catechisms concentrated upon the meaning of faith (the Creed). hope (the Lord's Prayer) and charity (the Ten Commandments). The invention of printing and the religious conflicts of the Reformation combined to make the catechism an essential part of education both in the churches of the Reformation and in Roman Catholi-

cism. It was used to instruct the young, to win converts and to testify to the faith.

Lutheran. — In 1520 Martin Luther had brought out a primer of religion containing brief expositions of the three chief parts contained in the earlier catechisms, and other leaders of the Reformation published similar attempts. All these efforts were superseded in 1529 with the publication of Luther's Small Catechism, perhaps the most influential book produced by any Reformer. Adding discussions of baptism and the Eucharist to the usual three parts, Luther's Small Catechism has been the basic textbook of religious instruction in Lutheranism ever since. Luther's Large Catechism of 1529 was intended for use by the clergy both in preparation of their sermons and in religious instruction. The two catechisms of Luther were incorporated into the Book of Concord of 1580 and thus became parts of the public confession of the Lutheran Church (see CONCORD, BOOK OF). These works did much to mold the character of the German people and powerfully influenced other compilations in various communions. (See also CONFESSIONS OF FAITH, PROTESTANT: Lutheran Churches.)

Reformed. — In 1537 John Calvin at Geneva published his catechism for children, the Instruction and Confession of Faith for the Use of the Church of Geneva, which explained the Decalogue, the Apostles' Creed, the Lord's Prayer and the sacraments. It was the work of a man who knew little of the child mind, and, though it served as an admirable and lucid epitome of his famous Institutes, it was too long and too detailed for use in instructing children. Calvin came to see this, and in 1542 he drafted a new catechism that was much more suitable for teaching purposes. This was used in Geneva and in Scotland. The Reformed churches of the Palatinate, on the other hand, used the Heidelberg Catechism (1563), mainly the work of two of Calvin's disciples, Caspar Olevianus and Zacharias Ursinus. This work, perhaps the most widely accepted symbol of the Calvinist faith, is noteworthy for its emphasis on the less controversial aspects of the Genevan theology. As revised by the synod of Dort in 1619, it became the standard of most of the Reformed churches of central Europe, and in time of the Dutch and German Reformed churches of America. (See also HEIDELBERG CATECHISM.)

Presbyterian. — Since 1648 the standard Presbyterian catechisms have been those compiled by the Westminster assembly, presented to parliament in 1647, and then authorized by the general assembly of the Church of Scotland (July 1648) and by the Scottish parliament (Jan. 1649). The Larger Catechism, "for such as have made some proficiency in the knowledge of the Christian religion," is too detailed and minute for memorizing, and has never received anything like the reception accorded to the Shorter Catechism, which is "for such as are of weaker capacity." The work was done by a committee presided over first by Herbert Palmer, master of Queens', Cambridge, and then by Anthony Tuckney, master of Emmanuel. The Shorter Catechism, after a brief introduction on the end, rule and essence of religion, is divided into two parts: (1) the doctrines we are to believe (a) concerning the nature of God, (b) concerning the decrees of God and their execution; (2) the duties we are to perform (a) in regard to the moral law, (b) in regard to the gospel — inward duties (*i.e.*, faith and repentance) and outward duties as to the Word, the sacraments and prayer. It has 107 questions and answers, while the catechism of the Anglican Church has only 24, grouping as it does the Ten Commandments and also the petitions of the Lord's Prayer instead of dealing with them singly.

Roman Catholic. — The Roman Catholic Church had long been using catechisms, and these were multiplied with new emphasis as the church entered the Counter-Reformation. The most famous was that of the Jesuit Peter Canisius, first published in 1555, which went through 400 editions within 150 years. Another catechism that had a large circulation and greatly influenced later works was that of Robert Bellarmine (1597); in France those of Edmond Auger (1563) and J. B. Bossuet (1687) were outstanding. The Catechism of the Council of Trent, completed in 1566, was never intended as an ordinary catechism, being written for and addressed to parish priests to serve as model and guide in their instructions and sermons to the people. The Catholic Church, because its unity of doctrine is otherwise so safeguarded, has never adopted any one official catechism for all its members. Each bishop is free to adapt his method of instruction to local conditions. Many bishops, however, have desired a universal catechism; at the Vatican council (1869–70) the project was seriously discussed, with Bellarmine's catechism proposed as model. In more recent times well-known catechisms have been the Baltimore Catechism (1885) in the United States, the Catechism of Christian Doctrine ("Penny Catechism") in England (1898) and that of Joseph Deharbe (1847) in Germany. In the 20th century, pedagogical-catechetical congresses and periodicals stimulated new methods, which in turn produced new catechisms and aids.

Orthodox. — Peter Mogila composed the Orthodox Confession of the Catholic and Apostolic Eastern *Church,* a counteraction to the activities of the Jesuits and the Reformed Church that was approved at a provincial synod in 1640 and standardized by the synod of Jerusalem in 1672. Because of the conflict that called it forth, the Confession of Mogila is not only a manual of instruction but also a declaration of the unique emphases and doctrines of Eastern Orthodoxy against both Roman Catholicism and Protestantism. By order of the tsar Peter the Great a smaller catechism was drawn up in 1723. The catechisms of Levshin Platon (1762) and Philaret (1839), each in his day metropolitan of Moscow, are bulky compilations that cannot be memorized, though there is a short introductory catechism prefaced to Philaret's volume.

Anglican. — The catechism of the Church of England is included in the Book of Common Prayer. It has two parts: (1) the baptismal covenant, the Apostles' Creed, the Decalogue and the Lord's Prayer drawn up probably by Thomas Cranmer and Nicholas Ridley in the time of Edward VI, and variously modified between then (1549) and 1661; (2) the meaning of the two sacraments, written in 1604, on the suggestion of the Puritan faction at the Hampton Court conference, by John Overall, then dean of St. Paul's, and (probably) Alexander Nowell. This supplement to what had become known as the Shorter Catechism established its use as against the longer one, King Edward *VIth's* Catechisme, which had been drawn up in 1553 by John Ponet, bishop of Winchester, and enlarged in 1570 by Nowell, Overall's predecessor as dean of St. Paul's. By the rubric of the Prayer Book and by the 59th canon of 1603, the clergy are enjoined to teach the catechism in church on Sundays and holidays after the second lesson at evening prayer. This custom, long fallen into disuse, was revived during the 20th century, children going to church for a special afternoon service of which catechizing was the chief feature. Compared with the thoroughness of most other catechisms this one seems scanty, but it has a better chance of being memorized and its very simplicity has given it a firm hold on the inner life and conscience of devout members of the Anglican communion throughout the world.

Other. — Almost every Christian denomination has its catechism or catechisms. In 1898 the National Council of the Evangelical Free Churches in England and Wales published an *Evangelical* Free Church Catechism, representing directly or indirectly the beliefs of 60,000,000 or 70,000,000 avowed Christians in all parts of the world, a striking example of interdenominational unity. The School Catechism was issued in 1907 by a conference of members of the Reformed churches in Scotland, which met on the invitation of the Church of Scotland. In its compilation representatives of the Episcopal Church in Scotland co-operated, and the book, though "not designed to supersede the distinctive catechisms officially recognized by the several churches for the instruction of their own children," certainly "commends itself as suitable for use in schools where children of various churches are taught together."

The rise of the Sunday school movement in American Protestantism during the 19th century transformed the educational needs of the United States churches. Theoretically, the Sunday schools were to use the Bible as their textbook, but the "helps" compiled for both the teacher and the pupil soon supplanted the catechism as the commonest guide for instruction in Christianity. In the preparation of children for confirmation, however, the catechism remained important even for those denominations that did not em-

ploy it in the Sunday school. Objections to education by rote, which were prominent in the educational philosophy of the 20th century. appeared in the educational thought of the churches too and served to relegate the catechism to a secondary position. By the middle oi the 20th century the theological changes in American Protestanism associated with the movement sometimes called Neo-Orthodoxy or Dialectical Theology were helping to restore to the catechisms of the Reformation some of their lost prestige.

BIBLIOGRAPHY.—J. M. Reu, *Dr. Martin Luther's Small Catechism: a History of Its Origin, Its Distribution and Its Use* (1929), treats not only Luther's work but many others as well; *Où en est l'enseignement religieux?* (1937) is a detailed discussion of Roman Catholic catechisms from many lands. (A. J. G.; J. J. PN.)

CATECHU (CUTCH or CASHOO), an extract obtained from several plants (the derivation is from the Malay *Kachu*), itl: chief sources being the wood of two species of acacia. *A. catechu* and *.I. suma*, both natives of India. This extract is known as black catechu. A similar extract. known in pharmacy as pale catechu (*catechu pallidum*) and in general commerce as gambir or terra japonica, is produced from the leaves of *Uncaria gambir* and *U. acida*, cinchonaceous plants growing in the Indonesian archipelago. A third product to which the name catechu is applied is obtained from the fruits of the areca or betal palm, *Areca catechu*.

Ordinary black catechu usually is imported in three different forms. The first and best quality. known as Peru catechu, is obtained in blocks externally covered with large leaves; the second and less pure variety i in masses. which have been molded in sand; and the third consists of large cubes packed in coarse bags.

The wood of the two species of *Acacia* yielding catechu is taken for manufacture nhen the trees have attained a diameter of about one foot. The bark is stripped off and used for tanning. and the trunk is split up into small fragments that are covered with water and boiled. When the extract begins to thicken. it is decanted into iron pots and boiled down. When it has attained a thick sirupy consistency, it is poured into molds or on mats and allowed to harden by exposure to air and sun.

Catechu so prepared is a dark brown or, in mass. almost black substance. brittle and having generally a shining lustre. It is astringent, with a sweetish taste. In cold water it disintegrates. and in boiling water, alcohol, acetic acid and strong caustic alkali it is completely dissolved. Chemically it consists of a mixture of a peculiar variety of tannin termed catechutannic acid with catechin or catechuic acid. and a brown suhstance due to the alteration of both these principles.

Gambir, which is similar in chemical composition to ordinary catechu. occurs in commerce in the form of cubes of about an inch in size with a pale.brown or yellow colour and an even, earthy fracture. For the preparation of this extract the plants above mentioned are stripped of their leaves and young twigs. and these are boiled down in shallow pans. The juice is strained off. evaporated and, nhen sufficiently concentrated, cast into shallow boxes. where as it hardens and dries it is cut into small cubes.

Gambir and catechu are extensively employed in dyeing and tanning. For dyeing they have been in use in India from the most remote period, but it was not until the 19th century that they were placed on the list of European dyeing substances. Catechu is fixed by oxidation of the colouring principle, catechin, on the cloth after dyeing or printing; treated thus it yields a variety of durable tints of drabs, browns and olives with different mordants.

The principal consumption of catechu occurs in the preparation of fibrous substances exposed to water, such as fishing lines and nets. and for colouring stout canvas used for covering boxes and suitcases under the name of tanned canvas.

Gambir is used medicinally to a limited extent in the treatment of diarrhea. in the form of an alcoholic extract or in mixtures. (V. E.)

CATECHUMEN, a person receiving instruction in the Christian religion with a view to baptism. The catechumenate grew naturally out of Judaism. which as a missionary religion had to instruct recruits. These were admitted by circumcision and baptism, women by baptism only. There was a considerable body of potential proselytes on the fringe of Judaism. known as "God-fearers." who. if they shrank from circumcision themselves. generally had the rite performed on their sons.

The apostles are said to have instructed converts after baptism (Acts ii. 41–42); the earliest teaching was presumably an explanation of the messianic prophecies in the Old Testament. On the gentile mission Paul's strongest appeal was made to the "God-fearers," who had been already won for monotheism and Jewish standards of morality. The word *katechein* ("to sound over" or "through." "to instruct") applied to Christian instruction. presumably both before and after baptism. occurs in the New Testament in Luke i, 4; Acts xviii, 25; and Gal. vi. 6. As the gentile element in the church preponderated, instruction became more definite. In the 4th century, with the rise of heresy, detailed doctrinal teaching was given. By this time the postponement of baptism had become general: thus Constantine was not baptized till he was at the point of death. Accordingly a large proportion of Christians belonged to the catechumenate. Most of them were merely "adherents" of the church: others were under definite instruction for baptism. As infant baptism became genera!. the catechumenate decayed. The baptismal rites now used are clearly adaptations of rites intended for the reception of adult catechumens. In modern times the institution of the catechumenate has been revived in the mission field. See also BAPTISM. CHRISTIAN. (W. K. L. C.)

CATEGORICAL, in common usage, means "unconditional" or "direct and explicit in statement"; also, "pertaining to a category."

In Traditional Logic.—The word is derived. as Petrus Hispanus says (in *Summulae Logicales, c.* 1241. from the Aristotelian *kategorumenon* ("predicate") and thus means "predicative." *See* LOGIC ior an account of the traditional categorical propositions and categorical syllogism.

In Mathematics.— A set of postulates is said to be categorical if every two models of the postulates are isomorphic. For example, in the case of Peano's postulates for arithmetic (*see* POSTULATE), a model is a system of meanings for the three primitive terms, "o", "number," "successor," which renders all the postulates true. That the postulates are categorical means that any two such models are isomorphic. That is, given two models, it is always possible to find a correspondence between the numbers of one model and the numbers of the other mode!. such that every number of either one of the models corresponds to a unique number in the other model, such that the o of one model corresponds to the o of the other model, and such that, if the numbers x, y of one model correspond to the numbers x', y' of the other model respectively, then y' is the successor of x in the second model if and only if y is the successor of x in the first model. A categorical set of postulates thus determines uniquely the mathematical structure of a model, and in this sense no additional postulates are required (as distinguished from possible additional logical axioms [*see* AXIOM]). (AO. *C.*)

In Ethics.— Rant introduced the term "categorical imperative" for a moral law that is unconditional or absolute. or whose validity or claim does not depend on any ulterior motive or end. .According to Kant there is only one such categorical imperative, which he formulates variously. One formula is: "Act only on such a maxim as you can will that it should become a universal law." This is purely formal and expresses the condition of the rationality of conduct rather than the condition of its morality. Another formula given by Kant is: "So act as to trest humanity, whether in your own person or in another, always as an end, and never as only a means." *See* KANT, IMMANUEL; and ETHICS, HISTORY OF.

CATEGORY. The word "category" has come in unphilosophica! contexts to mean much the same as "class." "type" or "kind." Recruits to the armed forces may be put into different categories, according to their physical qualities or according to their technical qualifications.

Originally the word belonged to Greek legal parlance, in which it meant "that of which a person is accused." Xristotle borrowed it for the special purposes of logical theory. In his use the Greek verb from which "category" derives meant "to predicate something of something"; *e g*, to assert of Socrates that he is

a man, or is mortal, or is married to Xanthippe. Concentrating his attention upon simple assertions of the pattern "Socrates is such and such," Aristotle noticed that there are many important differences between the sorts of predicates that can be asserted of Socrates. To assert that Socrates is a man is to give a piece of information about Socrates of a radically different kind from that given by the assertion that Socrates is pale or that Socrates is older than Alcibiades. The first assertion tells us what Socrates is; the second tells us only what, at a particular moment, he is like in a particular respect; the third tells us only the result of a particular comparison between Socrates and Alcibiades. To put this point in another way, predicates like ". . . is a man" yield answers to the question "What is Socrates?"; predicates like ". . . is pale" yield answers to the question "What like (qualis) is Socrates?"; predicates like ". . . in the market place" yield answers to the question "Where is Socrates?"; and so on. No answer to the question "Where is Socrates?" or "How big is Socrates?" is any answer to the question "What is Socrates?"; and no answer to the question "What is Socrates?" is any answer to the question "Where is Socrates?" or "What is Socrates now doing?" Predicates belong to different kinds or types; they yield answers to different questions.

Aristotle came to use the Greek word from which our noun "category" derives to signify not just predicate, but predicate type. "Man" and "monkey" are different predicates, but they are predicates of the same type or category. "Socrates is a man" is one answer, "Socrates is a monkey" is another, though false, answer to the question "What is Socrates?" Aristotle listed sometimes ten, sometimes fewer categories or predicate types and coined technical titles for them, some of which came direct from common Greek interrogative words like our "What?" and "How big?" The later latinization of Aristotelian logic originated our category titles like "quality," "quantity," "relation," "substance," "state" (or "condition") and others.

This distinction between kinds of predicate was required by Aristotle in order to resolve a number of logical paradoxes. For example, Socrates could, in the course of a short time, cease to be taller and come to be shorter than Alcibiades; so he is not at the later date what he was at the earlier date. Yet he does not cease to be a human being. How can he not be what he used to be (namely taller than Alcibiades) and still be what he used to be (namely a human being)? The answer is that a change of relation is not a change of sort. Similarly, Socrates who was pale yesterday may be flushed today, without his ceasing to be what he was yesterday, namely older than Alcibiades. A change of (colour) quality (of face) is not a ehange of (temporal) relation (between dates of birth). Aristotle also noticed the important point that the same word may be employed sometimes in one category and sometimes in another. We may describe a person, a regimen and a place as healthy, yet a place or a course of exercise cannot be well or unwell. To call a place or a regimen "healthy" is to say that it makes or causes people to be in good health. "Healthy" can mean "health causing," or it can mean "health enjoying," and the things that can be asserted or denied to be health causing will or may be entirely different from the things, namely human beings and other living organisms, which can be asserted or denied to be in good health. A few words are category pervasive. The notions of *being, one* and *good* appear, in different modifications, in every category. Such terms came later to be called "transcendentals."

Aristotle himself showed no particular veneration for his lists of sometimes ten, sometimes fewer predicate types. He did not attempt to prove that his lists were exhaustive or that they did not contain some redundancies. Piety induced some of his followers to assume that all conceivable predicates must be lodged in one or other of Aristotle's ten niches; considerations of economy have induced other thinkers to compress the list of irreducible predicate types to two or three. The categories of quality and relation have been held to exhaust the radical predicate types. More harm than good has been done by such economies.

There is however one traditional amplification of Aristotle's basic scheme which, whether or not it was intended by Aristotle himself, has proved important in philosophy and logical theory. The subject term of a proposition of the pattern "Socrates is a man" or "Socrates is elderly" cannot be classified with any of the possible predicates in such propositions. The name of a particular person or thing or event is not the name of a sort or a quality or a relation or a magnitude, etc. Socrates is of a sort, for he is a man; he has qualities, for he is white and wise; he is in relations, for he is married to Xanthippe; and so on. But he is not himself a sort, a quality, a relation or a magnitude, etc. The word "Socrates" could not yield the answer to any question of the form "Of what sort is this?", "Where is it?", "How big is it?" Instead, it has been held that a word like "Socrates" stands for a particular "substance," and "substance" has consequently been used as the title of a type of term which is not a predicate term, but, a subject term. Various things can be asserted and denied of Socrates, but "Socrates" cannot be predicated, truly or falsely, of anything. It is not a possible predicate word. The idea that there may be various types of subject terms, as there are various types of predicates, has not been systematically developed—partly because the whole program of breaking all propositions alike down into subjects and predicates has come under effective criticism.

Kant converted the word "category" to a special use of his own, though he clearly believed that his scheme of ideas was closer to Aristotle's than it actually is. Kant was not interested in the different types of predicates predicable of a particular subject or substance, like Socrates. He was interested in the different types of judgment or proposition. In the three propositions "Socrates is mortal," "all men are mortal" and "some men are mortal," the predicates are not merely of the same type. They are the same predicate. But the three propositions differ from one another in another respect, that of what is sometimes called "logical form," in that the first is singular, being about one designated individual, the second is universal, being about every member of the class of men, while the third is particular, in being about some (at least one) undesignated members of the class of men. Socrates might be mortal without all men being mortal; Socrates could not be mortal without at least one member of the class of men being mortal, given that Socrates is a man. But some men might be mortal without Socrates being mortal; and we might know that all men are mortal without knowing that Socrates is mortal; since we might not know that Socrates was a man or even that there was anyone called "Socrates."

These differences of logical form are bound up with the implicational differences between the forces of "all . . . ," "some . . ." and "this . . ." (or "he" or "Socrates"). Other such differences are those hinging on the presence or absence of "not" (or some equivalent), the presence or absence of "if" or "or" (or their equivalents) and the presence or absence of "must" or "may" (or their equivalents). So, while Aristotle's list of categories derived from the study of the different types of predicates in simple, singular, affirmative propositions, Kant's doctrine starts from the consideration of the logically cardinal differences between simple and compound propositions, between affirmative and negative propositions, between universal, particular and singular propositions and between assertoric, apodictic and problematic propositions. Kant was not interested in the differences that had interested Aristotle.

For Aristotle, the notions of quality and quantity (or magnitude) were the types of such predicates as "white" or "sweet" and "six feet tall" or '(three hundredweight" respectively. For Kant, differences of "quality" are, in the first instance, the differences between affirmative and negative propositions, and differences of "quantity" are the differences between universal, particular and singular propositions. For Aristotle, "being taller than" signifies a different relation from "being older than." For Kant, "if a metal is heated, it expands" expresses a different relation from that expressed by "this metal is expanding" or that expressed by "either today is Monday or today is Tuesday."

Kant, then, borrowed and transformed the Aristotelian title of "category" and some of the Aristotelian subtitles, like "quality," "quantity" and "relation." But he employed them to mark not just the differences between the logical structures of propositions,

but sometning closely co-ordinated with them. Scientific knowledge, the sort of knowledge to which Isaac Newton had contributed so much, is expressed in systems of propositions or judgments. So too are metaphysical speculations. Propositions of both sorts would have to be of some logical form or other, either negative or affirmative; either universal or particular or singular; either categorical or hypothetical or disjunctive; either assertoric, apodictic or problematic.

The propositions expressing knowledge of things in space and time, however, embody these logical forms only in a specially restricted way, namely so as to be applicable to what human minds can perceive. The purely logical structure of subject-predicate belongs to any simple, singular, assertoric, affirmative proposition; but for a proposition of this structure to express empirical knowledge, it must assert that a spatiotemporal thing has at a given time a certain quality or is for a certain time in a certain state. The subject-predicate structure has to be geared down, so to speak, to the domain of perceivable things and happenings. Similarly, a proposition of natural science may be of the logical structure "if X, then Y"; but it cannot be merely of this structure. For it to apply to the actual world, it must assert a dependence of one temporal state of affairs from another; *i.e.,* a causal connection between events. Kant's categories are the ways in which the propositional structures extracted in logical theory function as the controlling principles of natural knowledge. The world disclosed by a Galileo or a Newton is a world of substances existing in space and time, changing and interacting according to causal laws. The questions put to nature are not whether there are substances existing, changing and interacting, but what substances there are and in what ways they change and interact.

At least a part of Kant's purpose was to explain the insolubility of certain speculative or metaphysical problems by showing that the very posing of these problems presupposed that the categories of, say, substance and causality apply as well to what is not as to what is empirical or phenomenal. He claimed to have proved, on the contrary. that the field of application of these and the other categories was as wide and only as wide as the field of what human beings do or might perceive. There are and must be answers to man's causal questions about empirically ascertainable events; there can be no answers to parallel questions about supposed states of affairs transcending human experiment and observation. Since Kant, the term "category" has tended to disappear from the technical parlance of philosophers and logicians. It has been so heavily loaded, perhaps, with disparate Aristotelian and Kantian connotations that philosophers and logicians have tried to find more noncommittal titles for their basic distinctions. The word "type" and the phrase "logical type," introduced by Bertrand Russell, have tended to displace the word "category," though it must not be supposed that either Aristotle's "category" or Kant's "category" is equivalent to Russell's "logical type."

One point needs further discussion. If it is asked what Aristotle thought that his category titles were titles of, no certain or unambiguous answer can be given. They were indeed titles for types of predicate, or, more broadly, types of "terms" (predicates or subjects) of simple, singular propositions. But to say this leaves open the question whether by "predicates" or, more broadly, "terms" reference is made (1) to the grammatical elements into which certain sorts of sentences are analyzed or (2) to things or entities for which such grammatical elements stand. Was Aristotle intending to classify certain classes of parts of speech, or was he intending to classify real things? Was he contributing to a branch of philology, or to the higher reaches of general taxonomy? Neither answer would be satisfactory; nor can either answer be safely fathered on to Aristotle.

Distinctions more or less akin to those which Aristotle drew are nowadays apt to be described not indeed as grammatical but as "semantic" distinctions—distinctions, that is, between kinds or modes of significance. It is possible and for certain purposes necessary to exhibit the general way or ways in which: for example, what is meant by "or" (or *"ou"* or *"oder"*) difiers from what is meant by "green" (or *"vert"* or *"grün"*). What is meant by the word "or" (or any equivalent expression) is clearly not a thing or a happening. So to specify its semantic function is not to put a thing or a happening into a species or a genus. On the other hand, to specify its semantic function is not just to say that "or" is an English conjunction, since what is being specified is not English as opposed to German or vice versa. On this view a category is a type of semantic function, neither a kind of linguistic expression nor yet a kind of thing or happening.

A child might be puzzled by the fact that while travelers can touch and photograph the North sea, travelers to the north pole can neither touch nor photograph it. It has to be explained to him not that the north pole differs from the North sea as an object, such as glass or air, differs from another object. such as wood or smoke, but rather that the expression "the north pole" and its equivalents do not have the same sort of meaning as the expression "the North sea" and its equivalents. "The North sea" is used to refer to a body of water in a certain place, whereas "the north pole" is used to refer to a certain place—at which there may indeed be now one ice hummock and now another. It is not itself an object. In short the expressions have different kinds of semantic function. Their meanings are of different logical types or of different categories. (G. **R.**)

CATENA, VINCENZO DI BIAGIO (*c.* 1470–1531), Italian painter of religious and portrait subjects who perpetuated the clarity and order of 15th-century painting during a time of great transition and progress in Venetian art, was probably born in Venice. His work reflects the development of the Venetian style from the mature art of Giovanni Bellini (1430–1516) to that of Giorgione, Titian and Palma Vecchio, and reveals its underlying Byzantine tradition.

Catena is known to have been a man of independent wealth who was active in humanist circles. His painting developed under the influence of Giovanni Bellini, from whose compositions he often borrowed liberally, but there is no evidence that he ever worked in the Bellini studio. In 1506 Catena and Giorgione were in partnership, as we learn from the inscription on the back of Giorgione's "Portrait of a Young Woman" in Vienna. and it is therefore surprising to find that Catena's characteristic early signed works from this period are still entirely Bellinesque in character. Catena's development in his ability to organize large compositions may be traced from the "St. Francis" altarpiece in the Venice academy (c. 1510) through the Palma Vecchio-influenced "Christ Giving the Keys to St. Peter" in the Prado (before 1520), to the "Martyrdom of St. Christina" in the church of Sta. Maria Materdomini, Venice (c. 1520), in which the belated flowering of the Giorgionesque and Titianesque influences upon him are revealed. **A** group of works showing Raphael's influence, often dated to his last years, may perhaps find a better place in the period 1515–20. This influence first appears in the signed "Portrait of a Man" in Vienna and reaches its climax in the "Holy Family With St. Anne" at Dresden.

The successful fusion of the old and new in Venetian painting is Catena's particular achievement and characterizes the work of the last decade of his activity, culminating in the "Judith" of the Querini-Stampalia gallery, Venice, and the "Warrior Adoring the Infant Christ" in London, in which his sense of formal values and his mature artistic individuality are revealed at their finest.

CATERHAM AND WARLINGHAM, an urban district of east Surrey. Eng.. 18 mi. S. of London and 7 mi. S. of Croydon by road Pop. (1961) 34,808. Attractively situated in the North Downs, about 75% of the area is within the metropolitan green belt and part within the Surrey hills area of outstanding natural beauty. This widespread area of steep wooded hills and valleys (altitude 400–800 ft.) has six distinct communities. Caterham Valley. Caterham-on-the-Hill, Warlingham, Whyteleafe. Woldingham and Chaldon. It is a dormitory residential district with some light industries, including engineering, chemicals, perfumery and printing. There are frequent rail and bus services to London

(B. J. S.)

CATESBY, ROBERT (1573–1605), chief instigator of the Gunpowder plot (*q.v.*), was born at Lapworth, Warwickshire. His father. Sir William Catesby, a country gentleman of some means. was, as an earnest Roman Catholic. both fined and imprisoned for refusing to conform to the Church of England. Robert Catesby, also a zealous Catholic, became, because of the sufferings of his father and of other recusants, a staunch opponent of the crown, apparently hoping to supplant the existing regime with a Catholic government. He had all of the qualities of a born conspirator: great determination, the ability to lead and influence others and a personal courage that sometimes bordered on foolhardiness. After his father's death (1598) he was constantly plotting against the crown. In the abortive revolt (1601) of the earl of Essex against Elizabeth I he was a ounded and imprisoned, although he was soon released after paying a huge fine. He sent secret agents to Spain (1602) in an attempt to promote a Spanish invasion of England and his activities were so suspect that shortly before Queen Elizabeth's death (March 1603) he was again committed to prison.

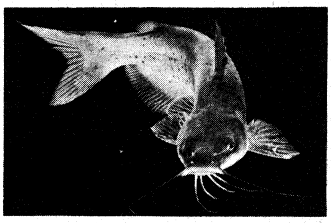
Catesby placed little faith in the promises of some toleration for English Catholics made by James I (1603–25), and as early as May 1603 he had conceived the idea of destroying both king and parliament by exploding gunpowder under the parliament building. Temporary concessions granted to the Catholics persuaded him to postpone the plot but in Jan. 1604, after a proclamation banishing priests had been issued, he confided his scheme to his cousin, Thomas Winter. Three other persons were brought into the plot by May 1604: Thomas Percy and John Wright, both intimate friends of Catesby, and Guy Famkes (*q.v.*), a soldier brought over from the Netherlands During the ensuing 18 months of preparation, Catesby never wavered in his determination and acted as a source of inspiration to his fellow conspirators. His fatal error was to include among the plotters Francis Tresham, whose note of warning to his brother-in-law. Lord Monteagle, led to the discovery of the plot. After the arrest of Guy Fawkes, Catesby and the remaining conspirators fled from London. Catesby ultimately reached Holbeche house, Staffordshire, where on Nov. 8, 1605, while resisting an attacking force, he was killed (R. C. Jo.)

CATFISH, the name generally given to fishes of the suborder Siluroidea, order Cypriniformes (Ostariophysi), in which the air bladder is connected with the internal ear by a chain of small bones, probably enabling the fishes to hear well. The name catfish refers to the long barbels or feelers about the mouth (recalling cat uhiskers), of which one pair supported by the upper jaw is always present; generally there are two pairs belon the chin and frequently another pair developed from the valves betneen the nostrils. The catfishes comprise a large and varied group containing probably about 2,000 species belonging to 28 different families; most are scavengers feeding on almost any kind of animal or vegetable matter The larger species have a good taste and are used for food. The spines of the dorsal and pectoral fins are generally present. Venom glands, associated with the spines, can cause painful injuries which may rarely kill humans Fossils are known dating from the Eocene (about 60.000.000 years ago) or later.

The siluroids are distinguished from the related cyprinoids (characins, minnows and electric eels) by having the body naked or armoured with bony plates, never normally scaled, and by a number of anatomical characters: the air bladder generally extends laterally so that on each side it is in contact with the skin above the pectoral fin.

Fresh-water Catfishes.—North America.—The catfishes of North America belong to the family Ictaluridae, which is peculiar to that continent. The Ictaluridae are closely related to the Bagridae of Africa and Asia, and like them and most siluroids have a short dorsal fin, with a spine, followed by a fleshy fin on the tail. The head is rather flat, with the mouth terminal and moderately wide, and the jaws have bands of small teeth; there are eight barbels. About 25 species are known.

Among the larger ictalurids are the blue catfish (*Ictalurus furcatus*) and the flathead catfish (Pylodictis *olivaris*) of the Mississippi valley; they may attain weights of more than 150 lb. These fishes scoop out a nest in the mud into which the female lays eggs. The male parent guards the eggs and later swims with the brood near the shore.



W. T. DAVIDSON FROM NATIONAL AUDUBON SOCIETY

CHANNEL CATFISH (ICTALURUS PUNCTATUS)

The madtoms (*Noturus* species), the smallest of the ictalurids, are the most dangerous; these commonly two- to three-inch roundtailed fish can inflict painful wounds with their pectoral spines.

Certain ictalurids are called bullheads (not to be confused with the marine bullheads or sculpins, family Cottidae); these square-tailed catfishes differ in several technical respects from the other ictalurids (see BULLHEAD).

Europe.—The European catfish (*Silurus glanis*), the "wels" of the Germans. is representative of the family Siluridae; it is said to reach a length of 10 ft. and a weight of 500 lb. (*Pangasianodon gigas* of southeastern Asia and *Brachyplatystoma filamentosum* of South America reach comparable sizes.) The wels has a very long tail, beneath which is the long anal fin. Another species (*Parasilurus aristotelis*) occurs in Greece; the remaining Siluridae are Asiatic.

South and Central America.—In South and Central America are no less than 11 families of catfishes, all native. *Diplomyste* species of Chile and Argentina, with toothed upper jaws, are the most primitive living catfishes, but other South American forms are highly specialized. Of the Bunocephalidae *Aspredo batrachus* is remarkable for the way in which the female carries the eggs on the abdomen, each egg being carried in a stalked "skin cup." The Trichomycteridae (Pygidiidae) include *Stegophilus* and *Vandellia*, little, slender, naked fishes that live parasitically on the gill filaments of other fishes, primarily large catfishes (*Brachyplatystoma*). Some of these parasitic fishes, especially the candiru (*Vandellia cirrhosa*), are said to enter the urethra of persons bathing; once in the passage, they distend the short spines with which the gill covers are armed and may thereby cause inflammation or even death to the victim.

The Loricariidae, with about 400 species, are mostly fishes that are covered by an armour of five series of overlapping bony plates on each side of the body; they hdve their lips expanded into a sucker by means of which they cling to stones. These catfishes feed mainly on mud and algae and have a very long intestine that is coiled like a uatch spring. In some species there are pronounced sexual differences, the males having broader and blunter heads, margined with spines or bristles or bearing branched tentacles on the snout In the mountain streams of the Andes the Loricariidae are represented by small forms (*Cyclopium* or Arges) known as "prenaillas"; in these regions there are no carnivorous fishes to attack them and they are completely naked. having lost the bony armour that protects the lonland forms. A number of these fishes have been observed to climb a precipice from a pothole to the stream above it, obtaining alternate holds with the sucker and the rough surface of the pelvic fins

The Callichthyidae are another armoured family, but with only two rows of plates on each side of the body. Species of *Callichthys* build nests of grass, sometimes placed in a hole scooped out of the stream bank; both parents guard the nest. In the heavily armoured Doradidae, as in the similar but unrelated Mochocidae of Africa, the air bladder is chiefly a sound-producing organ. Certain *Doras* species travel from one pond to another in the dry season, sometimes journeying all night.

Africa and Aria.—The Clariidae of Africa and Asia are air-breathing fishes provided with air chambers above the gills; in *Clarias* species special vascular treelike organs nearly fill the chamber, but in *Saccobranchus* these are absent and the air bladder extends backwards for half the length of the fish. Clarids are elongated, more or less eel-shaped, catfishes; in the dry season they burrow in the mud, hut some species are said to leave their burrows at night and crawl about on land in search of food.

The African Amphiliidae and the Indian Sisoridae have the lower surface of the head and abdomen flat and the paired fins horizontal, an adaptation to life in mountain torrents; in some

genera the lips form a sucker similar to that of the Loricariidae.

The electric catfish (*Malapterurus* electricus), family Malapteruridae, is widely distributed in Africa. The skin is soft, and immediately beneath it lies the electric organ, formed of rhomboidal cells of a fine gelatinous substance. Its electric organ differs from that of other fishes in being derived from the integumentary system, not the musculature. The Mochocidae, sometimes called upside-down catfishes because of their habit of flipping over during swimming, are limited to the fresh waters of Africa. Certain species of Synodontis, a genus common in the Nile, are white on the back and blackish beneath, a coloration connected with their habit of swimming belly upwards.

Marine Catfishes. — Nearly all the siluroids are fresh-water fishes, but two families are secondarily marine: the Ariidae, found on the coasts and in estuaries of all tropical countries; and the Plotosidae of the Indo-Pacific. The Ariidae are typical siluroids in form and structure of fins, whereas the Plotosidae have a long tail and the anal and caudal fins united. Most Ariidae have eggs as big as marbles, carried in the male's mouth for about one month.

See also FISHES. (C. Hv.)

CATGUT, a tough cord made from the intestines of certain animals, particularly sheep, and used for surgical ligatures and sutures, for the strings of violins and related instruments, and for stringing tennis rackets and archery bows. The ancient Egyptians and Babylonians, and the later Greeks and Romans, used the intestines of herbivorous animals for much the same purposes. The origin of the term "catgut" is obscure; it is not known if the intestines of cats were ever put to such uses.

The intestinal tubes of sheep used for catgut, called "runners," are thoroughly washed, cut in ribbons and scraped free of mucous membrane and circular muscle tissue. The ribbons are placed in an alkaline bath for several hours and then stretched on frames. While still moist they are removed, sorted as to size and twisted into cords of varying thicknesses. A smoothing and polishing operation completes the process.

Italian catgut is considered the best for stringing musical instruments. Surgical catgut is sterilized by heat supplied in progressive steps and maintained for several hours; surgical catgut frequently is also treated with an impregnating agent. (E. L. Y.)

CATHA, a shrub (*Catha edulis,* family Celastraceae) native to Arabia and to Africa from Ethiopia to the Cape of Good Hope. It is also cultivated, especially in Arabia, where it is called khat, kat or kasta. The Arabians make a kind of tea from the dried leaves and young shoots. These are also chewed extensively for their stimulant properties, which somewhat resemble those of coca.

CATHARI (CATHARS), a heretical Christian sect that flourished in western Europe in the 12th and 13th centuries. The Cathars can be distinguished from the other heretical sects of the period by their dualistic views and their organized church. Dualism in this sense means the belief that goodness exists only in the spiritual world of the good God; that the material world is evil and was created by an evil god or spirit called Satan; and thus that Good and Evil have two separate creators. Views containing similar implications had been common among the Gnostic sects in the early Christian centuries; these ideas had had their greatest influence on the middle east and on Christian literature in the religion of Mani (see MANICHAEISM), and were held in the early middle ages in the Balkans and the near east by the religious sects of the Paulicians and the Bogomils (*qq.v.*). The Cathars were closely connected with the last two, and they were sometimes known in the west as Publicani (a corruption of Pauliciani, but also an echo of the publicans of the New Testament) or Bougres (*i.e.,* Bulgarians, for Bulgaria was the home of the Bogomils); but most commonly as Cathari (Gr. Cathuroi, "pure") or Albigenses (the men of Albi, after one of their chief centres of influence in the south of France). The word "Albigenses," however, could refer to all the heretics of this region, both Cathars and Waldenses (*q.v.*).

Emergence of the Heresy. — After the fall of the Roman empire dualist heresies were virtually unknown in western Europe until about the year 1000. In the first half of the 11th century isolated groups of heretics appeared of whose doctrine little is known. Some of these groups may have been merely anticlerical and puritanical, like the later Waldenses, but some were certainly dualists. It is clear that these had learned their dualism by contact with the Bogomils, but the nature and extent of the contact is quite uncertain. These groups appeared in western Germany, Flanders, France and northern Italy. In the late 11th century no more was heard of them; then in the 12th century they reappeared in the same areas, revealing the same range of views.

The Gregorian reform of the church in the 11th century was accompanied by widespread popular enthusiasm. But the official church failed in the long run to contain and channel this enthusiasm. The growth of clerical education and the heightened emphasis on the importance of sacraments made of the clergy more a class apart and left the laity with little chance to develop their own initiative in the affairs of the church. It was among the unprivileged lower clergy, poorer knights, merchants and artisans that heresy became popular in the 12th century: among men and women often of considerable intelligence and enterprise but without the means of expressing their zeal (in their own view at least) within the Catholic Church. The heretical movement was one aspect of the religious revival of the day, and in part at least it was a by-product of the immensely rapid cultural, social and economic changes of the 11th and 12th centuries.

The period of most rapid growth came in the 30 years following 1140. At about this time the Bogomil church was reorganizing itself, setting up an episcopate, planning missions; and there is no doubt that Bogomil missionaries, as well as western dualists who had imbibed their doctrines in the Byzantine empire while on the second crusade (1147–49), were at work in the west in the middle of the century. The preaching of St. Bernard against the heresy proved unavailing, and from the 1140s the Cathars were an organized church with a hierarchy, a liturgy and a system of doctrine, though none of these ever became so coherent as their Catholic counterparts. About 1149 the first bishop established himself in the north of France; a few years later he established colleagues at Albi and in Lombardy. The authority of these bishops was not clearly defined; their status was confirmed and the prestige of the Cathar church enhanced by the visit of the Bogomil bishop Nicetas in 1167. He visited both Lombardy and the south of France, which was now becoming the most fruitful area of Cathar activity, held councils and established new bishoprics. In the following years more bishops were set up in Italy, until by the turn of the century there were 11 bishoprics in all, one in the north of France, four in the south (Albi, Toulouse, Carcassonne, Val d'Aran; two more were added later) and six in Italy (Concorezzo near Milan, Desenzano, Bagnolo, Vicenza, Florence and Spoleto). It was in the second half of the 12th century that the Greek word Cathari was first applied to them; its first known use was in Germany in 1163.

Two Parties. — The multiplication of bishoprics in Italy, however, was partly due to a doctrinal rift. Bishop Nicetas had come to the west in 1167 to instill into his colleagues a more thoroughgoing dualism than they had believed in hitherto. The difference corresponded to a divergence within the Bogomil churches themselves: between those who held that Satan, the creator of the world, had once been an angel of God who had fallen from grace, and those who held that he was an independent deity. The former view implied that God was the ultimate creator of the universe, and so involved a modified dualism; the latter — clearly stated in the Liber de *duobus principiis,* which was written by an associate of John de Lugio, the heretic bishop of Bergamo — was more radically dualist. On the whole the Cathars in the south of France accepted the more radical dualism; those in Italy became divided into two parties. The opposition between the two never involved out-and-out schism; they always agreed in their opposition to the Catholic Church. But it was a symptom of the divergences in Cathar doctrine from place to place and time to time which make it exceedingly difficult to define with precision.

Matter, they were all agreed, was evil. Man was an alien and a sojourner in an evil world, and his aim must be to free his spirit, which was in its nature good, and restore it to communion with

God. They believed in the ultimate redemption of spirits—though not always in universal redemption—but thought the process was slow since they believed in the transmigration of souls from man to man or from man to beast (for animals too had souls). There were strict rules for fasting, including the total prohibition of meat; to eat an animal's flesh was tantamount to cannibalism. Sexual intercourse was forbidden: they had a horror of procreation because it involved the imprisonment of more spirit in the world of flesh. Thus they believed passionately in celibacy and in every form of ascetic renunciation of the world; and they looked favourably on suicide, an attitude which made the more fervent of them impervious to persecution.

The extreme asceticism of Cathar doctrine made the Cathar church a church of the elect; and yet in France and northern Italy it became a popular religion. This involved a considerable process of adjustment, which was achieved, as is common in dualist or ascetic religions, by the division of the faithful into two bodies: the "perfect" and the "believers." The perfect were set apart from the mass of believers by an elaborate ceremony of initiation, or spiritual baptism, the *consolamentum*. Within the ranks of the perfect was a hierarchy of bishops and deacons, but they did not have the exclusive right of administering sacraments. The Cathars had two other sacraments apart from *consolamentum* and ordination: penance and breaking of bread. The breaking of bread was a kind of communion; they did not believe in transubstantiation. The perfect devoted themselves to contemplacion and were expected to maintain the highest moral standards, and it was the privilege of the believers to provide them with food and drink.

The believers could not be expected to attain the standards of renunciation of the perfect. Many believers underwent the *consolamentum* at the end of their lives, as many early Christians had received baptism on their death beds, so as to avoid the dire consequences of a lapse after being received among the elect. The enemies of the Cathars usually admitted the lofty standards of the perfect, but they accused the believers of all manner of vice. Sexual intercourse was officially forbidden but could not be entirely suppressed. Marriage, however, was regarded as organized vice, and particularly noxious; it seems that casual vice and sodomy were preferred. But the charges of the Catholics were doubtless exaggerated, and in course of time the Cathars came to conform themselves in a variety of ways to normal western standards.

The Cathar doctrines of creation led them to rewrite the biblical story—like all dualists they devised an elaborate mythology to replace it—and to reject the notion that the whole Bible was sacred. They viewed much of the Old Testament with reserve; some of them rejected it altogether; and in the vernacular Bibles they circulated there was much apocryphal matter. The New Testament was accepted but extensively reinterpreted. The orthodox doctrine of incarnation—of God, as it were, imprisoned in human flesh—was impossible to the Cathars. Jesus was an angel merely, who came to indicate the way to salvation not himself to provide it; his human sufferings and death were an illusion.

The Church's Attack.—The Cathar doctrines, therefore, struck at the roots of orthodox Christianity and of the social institutions of Christendom, and the authorities of church and state united to attack them. Some of the heretics of the 11th and early 12th centuries perished, but more often because of the zeal of the lay power or the violence of a mob than at the instruction of the ecclesiastical authorities. But the church's law had always envisaged the possibility that active persecution might be needed; and the catastrophic rapidity with which various heretical sects, and most notably the Cathars, grew in the middle of the 12th century led to a rapid development of the legal machinery. In 1184 Pope Lucius III and the emperor Frederick I Barbarossa joined at Verona in issuing the decree Ad abolendam, which laid down a procedure for ecclesiastical trial, after which an obdurate heretic would be handed over to the secular arm for punishment; and punishment meant confiscation of property, exile or even possibly death. Tradition, however, had already established burning as the most suitable punishment for the unrepentant heretic.

Pope Innocent III (1198–1216), like many of the church's leaders, preferred conversion to persecution. But the Cathars were not to be persuaded, and their triumphant progress looked like giving them dominance over the Catholic Church in southern France and northern Italy. By and large the Cathars did not recruit from the nobility; so large a proportion of them were artisans that they were commonly known as the Weavers, and it was under this title that their brief appearance in England in the 1160s was noted by William of Newburgh (*Historia rerum Anglicarum,* ii, 13) and other writers of the late 12th century. But in Provence and to a lesser extent in Italy they won the favour of the nobility. and even recruited some of them. Innocent III's attempts to force Raymond VI. count of Toulouse, to join him in putting down heresy ended in disaster; the papal legate Peter de Castelnau was murdered (Jan. 15, 1208), and the count was generally thought to have been an accessory to the crime. A crusade was proclaimed against the heretics, and a substantial army led by a group of barons from northern France proceeded to ravage Toulouse and massacre the inhabitants, both Cathar and Catholic. The Albigensian crusade was violent and cruel, but it seems that the more orderly persecution sanctioned by Louis IX, in alliance with the nascent Inquisition, was more effective in breaking the power of the Cathars. In 1244 the great fortress of Montségur near the Pyrenees, which had long contained a large nest of the perfect, was captured and destroyed. The Cathars had to go underground, and many of the French Cathars fled to Italy. where persecution was more intermittent.

Final Collapse.—Early in the 13th century the Dominican order was founded to provide learned preachers as able and as poor as the Cathars for the purpose (among others) of combating heresy. It was natural that they should often be employed by the papacy in inquiries into heresy; and it was out of these inquiries that the machinery of the Inquisition (*q.v.*) was gradually developed in the 13th century. In a very different way the other great order of friars founded about the same time, the Friars Minor or Franciscans, were almost equally dangerous to the Cathars. St. Francis also preached to the classes to whom the Cathars had especially appealed: but his message was a message of joy, and he brought home, as it had never been brought home before, that the world was God's world, and good. It is likely that the collapse of the Cathars was as much due to the failure of their appeal as to the fires of the Inquisition, and it is noticeable that they disappeared both in France and in Italy about the same time: although persecution was much more persistent north of the Alps. The hierarchy faded out in the 1270s; the dying embers of Cathar heresy lingered through the 14th century to be finally extinguished early in the 15th.

The Inquisition was their chief legacy to medieval Europe, for the future of the church was to be directly influenced far more by the sects that preached a puritanism and a return to the primitive church innocent of dualism. Of all the sects denounced in the decree Ad *abolendam,* only the Waldenses continue to exist in the 20th century.

(C. N. L. B.)

CATHARSIS (Gr. "purgation" or "purification"), a term that since the time of Aristotle has been associated with the question of the effects of tragedy on the spectators or on the actors. Aristotle maintained that tragedy and also certain kinds of music tend to purify the spectators and listeners by artistically exciting certain emotions which act as a kind of homeopathic relief from their own selfish passions. Goethe thought that the catharsis affects the actors rather than the spectators or readers. Lessing, however, held that it affects the spectators and readers and also maintained that catharsis takes the form of a sublimation of the emotions or their conversion into virtuous dispositions.

The term catharsis was introduced into psychiatry in 1895 by Sigmund Freud and Josef Breuer (Studien *über Hysterie*) to describe a method of treatment by which hysterical patients, under

hypnosis. relived, or at least remembered, the circumstances under which their symptoms originated, expressed the emotion accompanying those circumstances and thus were relieved of the symptoms. Though the term (sometimes used synonymously with abreaction) is no longer in common use among psychiatrists, the idea is in fact a major component of the theory and practice of psychoanalysis See also PSYCHOANALYSIS.

CATHARTIC, an agent used to relieve constipation. The term is used either in a general sense to refer to all agents of this class, or specifically to indicate one of a series differing in severity of action: in increasing order of intensity these are aperients, laxatives, cathartics, purgatives, physics, hydragogues and drastics.

Cathartics, using the term in the general sense, are divided into three groups on the basis of mode of action. The first group includes senna, cascara, aloe, jalap, colocynth, podophyllum, castor oil, croton oil, phenolphthalein and calomel, all of which act by irritating the intestinal tract to produce an increased rate of propulsion of the contents. Most of these are used little or not at all in professional medicine but are common ingredients in proprietary preparations. The second group consists of agents that act by increasing the bulk of the intestinal contents. Salts such as magnesium sulfate and sodium sulfate and hydrophilic (water-attracting) colloids such as agar, psyllium seed and methyl cellulose increase bulk by holding water in the intestinal tract, while bran simply furnishes indigestible fibre. The third group includes mineral oil and olive oil, which act by lubricating the tract and thus facilitating the passage of the intestinal contents.

Cathartics should be taken only upon the advice of a physician. Serious harm can result from an attempt to relieve gastrointestinal symptoms without knowing their cause. Indiscriminate or habitual use, based on the supposed importance of "regularity" fostered by the patent-medicine industry, has in many cases resulted in chronic constipation. (V. E.)

CATHARTIDAE, a family of new world vultures that includes the turkey vulture (turkey buzzard), the South American and California condors, and the black and king vultures. All are carrion eaters.

See VULTURE.

CATHAY, the name by which China became known to medieval Europe. It is derived from the Chinese Khitan, Mongol Kitat, Arabian Hitai and Russian Kitai, various names for the pre-Mongol people who swarmed out of southeastern Mongolia in the 10th century A.D. to conquer part of Manchuria and northern China, and held the area for about 200 years. Two Franciscan friars who visited Karakorum (*q.v.*), the ancient Mongol capital, in 1246 and 1254 may have been the first to introduce the names to Europe. In their day and later the Mongols called north China Kitai, south China Mangi, *i.e.*, "land of the Man"—an ancient Chinese name for the people south of the Yangtze river. After contact with China was broken in the 14th century. following the collapse of Mongol power, Europeans a-ere not sure that China and Cathay were one and the same until the Augustinian friar Martin de Rada of Spain in 1575 and the Jesuit Matteo Ricci in 1607 recorded the fact for their respective societies. Both Christopher Columbus and John Cabot, for example, thought they were bound for Cathay, and the former on his final voyage actually believed he had reached Mangi, which he described as contiguous to Cathay. (L. C. G.)

CATHEDRAL, an adjective frequently used as a noun to mean a cathedral church; that is, a church in which a bishop has his official seat or throne (Gr. cathedra). Cathedral churches are of different degrees of dignity; there are cathedral churches of simple diocesan bishops, of archbishops or metropolitkns, of primates, patriarchs and pope. A cathedral church is not necessarily large and magnificent, although most cathedrals, enriched by successive endowments, have become so. Since the territorial organization of the early church followed that of the Roman empire, cathedrals from the first were established wherever possible in towns, not in villages. In the early middle ages in the west the town in which a cathedral church was situated became known as the cathedral city. This article deals chiefly with cathedral churches in the west.

HISTORY

Early Organization. — The bishop by canon law was pastor of his cathedral church, which was the mother church of his diocese. This in early times was called his parish, a word later used for the smaller units into which the diocese was divided (see DIOCESE; PARISH). The cathedral clergy (priests, deacons, subdeacons and clerks in minor orders) originally formed the bishop's familia or household and lived a communal life with him, sharing the common goods of the church and helping to serve its large parish. In early times they were normally clerks, not monks, but their communities in England were often described as monasteria, a word which then had a less restricted meaning than it later acquired. Because of this some cathedral churches, such as York and Lincoln, which never had monks attached to them, have inherited the name minster or monastery. In time the common life was abandoned, and the clergy lived in separate houses near the cathedral church, but in the 8th and early 9th centuries the revival of the common life in a stricter form was advocated by ecclesiastical reformers in the Carolingian empire, chiefly as a means of enforcing celibacy among cathedral clergy. The most famous and successful rule for cathedral clergy at that time was composed by Chrodegang, bishop of Metz (742–66); this was based largely on the Benedictine rule, but was less strict in its requirements for individual poverty. At the Council of Aachen (816) it was incorporated in the much longer Institutio canonicorum, which became the basis for a widespread adoption of a common life at cathedral and collegiate churches throughout the empire. This movement influenced a number of cathedral churches during the period before the Norman conquest. The clergy who followed a rule of common life were called canons or canonical clerks, because they observed a definite rule (Gr. canon).

Secular and Regular Cathedrals. — From the 10th century two increasingly divergent movements can be traced in the history of the organization of communities of canons. On the one hand, attempts to enforce the common life met with more resistance; in times of unrest and relaxation of ecclesiastical discipline many cathedral canons acquired private property, lived in separate houses and divided a large part of the common estates and goods of their church into separate portions called prebends (*i.e.*, "provender") for themselves. Because of these separate possessions they were called "secular" canons. This division of common goods was recognized as permissible on the continent of Europe about the middle of the 11th century. In the religious revival of the same period, however, the "secularizing" movement led to a renewed demand for clergy to live the communal, apostolic life, and, as a result, in the early 12th century, many communities of canons adopted a strict form of common life under the rule of St. Augustine. They were called regular (Lat. *regula*, "rule") or Augustinian canons (*q.v.*), and their life soon became barely distinguishable from that of Benedictine monks. From this time cathedral churches were normally organized on either a regular or a secular basis.

On the greater part of the continent of Europe the regular cathedrals of the middle ages were served by chapters of Augustinian or Premonstratensian canons, although in parts of Germany and in Denmark some were served by Benedictine monks. In England the monastic revival of the 10th century had resulted in the introduction of Benedictine monks to serve three or four cathedrals, and in the ecclesiastical reorganization following the Norman conquest these were increased to nine. In Ireland at Downpatrick and in Sicily at Monreale, Benedictine cathedral chapters were also founded in the late 12th century under Anglo-Norman influence. Carlisle in England, Christ church (Dublin) in Ireland and St. Andrews in Scotland were Augustinian, while Whithorn, the cathedral church of Galloway, was Premonstratensian. All the other medieval cathedrals of Britain gradually became secular in the period following the Norman conquest.

Development in the Middle Ages. — In neither the regular nor the secular cathedrals was the early intimate association of bishop and cathedral clergy maintained. With the end of the missionary period of conversion and with the formation of parishes, the cathedral church lost its parochial character, and the interests of its clergy became centred in its services and government. Their

main function was the daily celebration of the canonical hours and Mass on behalf of the whole Christian community, while the bishop was increasingly drawn away from his cathedral church on diocesan. duties or affairs of state. The cathedral chapters always kept certain special links with their bishop and diocese. They continued to act as permanent trustees of episcopal property; their consent was necessary to episcopal acts which involved financial arrangements of the church and see; they sometimes exercised episcopal jurisdiction in a vacancy of a see and in 1215 were recognized as having the sole right to elect their bishop. But from the late 11th or 12th century most cathedral chapters controlled their own property, which was separate from that of the bishop. Their endowments steadily increased in the 12th and 13th centuries, and they assumed the position of independent corporations, jealous of their rights and privileges. They reached the peak of their power, wealth, prosperity, independence of their bishop and corporate spirit in the 13th century.

The constitutions of the regular cathedrals showed less variety than those of the secular cathedrals. The convent of regular canons or monks formed the chapter, of which the prior was head, and its government and way of life were ordered by the Benedictine or Augustinian rule. The two main characteristics of the secular constitutions were separate prebendal incomes for the canons and a system of home government at the cathedral based on a varying number of dignitaries who divided the administrative work among them and were supposed to be continuously resident. Within this framework was much local diversity. Generally it seems that the strong, independent chapter, with a dean as sole head under the bishop, developed first in northern France during the 10th and 11th centuries. Elsewhere about this time there was often a division between the spiritual authority in the chapter—exercised usually by a dean in Germany and the Low Countries and by an archpriest in southern France and Italy—and the temporal authority of a provost or archdeacon who administered the estates. In Germany, Scandinavia and parts of eastern and southern France the provost often later emerged as sole head of the chapter, while in Italy about half the cathedrals came to have archdeacons at their heads.

The English secular cathedral constitutions derived from those of Normandy or northern France, where the number, status and precedence of the dignitaries varied. The constitutions of Bayeux and Rouen probably were most influential. In the course of the 12th. 13th and 14th centuries the constitutions of the nine English secular cathedrals became remarkably homogeneous. This seems to have been the result not so much of a common origin or imitation of Norman or French models as of independent development and of the growing practice by the English chapters of borrowing each others' customs, particularly those of Salisbury. Their constitutions are usually described as "four-square," because they were based on four great dignitaries: (1) The dean was president of the chapter and had cure of souls of all the cathedral clergy; he was, however, no more than *primus inter pares* among the canons and shared his power with them and the other dignitaries. (2) The precentor was in charge of the music, liturgy and song school. (3) The chancellor was the chapter's secretary and supervised the cathedral schools of grammar and theology. (4) The treasurer guarded the church's treasures and provided lights and other material necessaries for the services. Under these were various deputies and other officers, such as the subdeacon, succentor, vice-chancellor, grammar master, lecturer in theology, subtreasurer, sacrists, masters or wardens of the fabric and common funds, some of whom were canons while others were vicars choral or chantry priests.

Possession of a prebend gave a canon the right to a voice in chapter. These prebends, or separate endowments for canons, normally increased during the 12th century and became fixed in number in the 13th century. Some great continental cathedrals, such as Cologne or Chartres, by the end of the 13th century had more than 70 canons and prebendaries forming the chapter. The prebends were of varying value, but many were sufficient to enable canons to be nonresident and do work at a distance from the cathedral in the rapidly expanding secular and ecclesiastical administrations and in the growing schools and universities of the 13th century. This was useful nork for society. but the increasing nonresidence of canons raised a major problem at the cathedrals in the 12th and 13th centuries. In time solutions mere found. Sonresidence was soon regarded as lawful for canons, since a canonry was without cure of souls and now that the number of canons had greatly increased it was no longer necessary for all to be present to maintain the daily services. Nonresident canons, however, were forbidden to share in the distributions of money and food from the common fund, which were kept for the residentiaries at the cathedral, and from the 13th century additional endowments were usually appropriated to the common fund rather than to the prebends. By the 14th century in the English secular cathedrals the canons were fairly clearly divided into residentiaries and nonresidents, the residentiaries forming a small inner chapter controlling the services and administration and the lesser clergy within the cathedral close.

The increase in numbers of the lesser clergy at the secular cathedral churches in the later middle ages provided a further reason why it was no longer necessary for all the canons to be resident. The vicars choral and minor canons at the English cathedrals, generally equal in number to the full body of canons, were required to have musical qualifications, and their main function was to sing the services. In French cathedrals there were corresponding bodies of *heuriers*, *matiniers* and demiprebendaries. These clergy soon formed in effect the working staffs of the cathedrals and in England by the mid-13th or 14th century were winning some degree of independence from the resident canons. They formed minor self-governing corporations, managing their own property and living in common halls of residence in the close. About the same time boarding houses and schools were being founded at English cathedrals for boy choristers. The number of chantry priests celebrating private masses and taking part in the main cathedral services was greatest in the 14th century; common halls of residence were founded and minor corporations formed by some of them. Thus the constitution of an English medieval secular cathedral, with its various groups of clergy enjoying some form of self-government under the general direction of the dean and chapter, was much less centralized than that of a cathedral monastery under its prior or than those of the new secular foundations of Henry VIII.

In the late 14th and 15th centuries developments usually regarded as characteristic of the post-Reformation period took place at most English secular cathedrals. The powers of king and bishop over the chapters increased. By the end of the 14th century bishops and deans ordinarily were appointed by papal provision. usually on royal nomination; election by the chapter was becoming no more than a formal ratification of the king's choice. From the second quarter of the 14th century the most usual method of appointment to canonries and prebends was papal provision, the pope providing many royal nominees; the proportion of these royal nominees increased steadily in the late 15th and early 16th centuries. At the same time the number of residentiary canons, vicars, choral and chantry chaplains at the cathedrals was decreasing. Partly this was due to slackness and neglect of duties, partly to economic causes. The endowments of the chapters' common funds had increased and canonical residence had become attractive and profitable in the 13th and 14th centuries, but the agricultural decline of the later 14th and early 15th centuries caused the distributions from the funds to fall in value, and the residentiaries did not encourage other canons to enter residence and share in them. The development was foreshadowed by which after the Reformation the residentiaries were reduced to a fixed number of from five to nine. The vicars choral were also finding that their fixed customary stipends from the individual canons, with the reduced revenues from their own common fund, were no longer sufficient to support the full body of vicars choral. During the same period the endowments of several older chantries were often united in order to support a single priest. (K. Es.)

Effects of the Reformation.— In territories where the churches of the Reformation were in the majority, the existing church buildings continued in use, including the cathedrals. Where bishops

were rejected either entirely or as a separate order, cathedrals became simple churches, though usually still called cathedrals. In Sweden the cathedral continued to be the seat of the Lutheran bishop and to be ruled by a dean and chapter. In England, where the order of bishops was retained, the cathedrals remained as the seat of the bishop, and those staffed by secular clergy kept their medieval organization. But at the dissolution of the monasteries under Henry VIII the eight cathedrals till then ruled by Benedictines received new statutes; these, together with the cathedrals of five new bishoprics, bec'ame known as "new foundations." In them the power of the dean tended to increase in later centuries. New cathedrals necessitated in the 19th and 20th centuries by the splitting up of dioceses because of increased population were generally ruled over by a provost and had not the funds to employ a staff of residential canons. (X.)

Roman Catholic Church.—The canon law of the Roman Catholic Church makes no architectural conditions for a cathedral, although a spacious sanctuary is desirable for the adequate performance of pontifical rites. It has been emphasized in modern times that size and splendour are in no way necessary attributes, and many cathedrals in later-created dioceses, especially in Africa, are very modest. The only canonical requirement is that they shall be consecrated and adequately endowed. As it lies exclusively with the pope to create a diocese and designate its see, so also does it lie with him to designate its cathedral, although the choice of the bishop or his decision to build one is normally accepted. Although a bishop may by exception simultaneously occupy two or more sees, each with its cathedral, there can never be more than one cathedral in a diocese. The bishop is bound to be present in his cathedral in Advent and Lent and on the feasts of Christmas, Easter, Pentecost and Corpus Christi, and he must normally perform ordinations there in the presence of the canons where chapters exist, as they do not for example in the United States, Canada, Australia or most of Ireland. (M. DK.)

Orthodox Church.—In the Orthodox Eastern Church the cathedral is the main church in a city where the bishop resides. It becomes the cathedral because it is the church where the bishop celebrates on great festivals, but the ordinary conduct of worship and the parochial duties are the responsibility of the cathedral clergy, who differ little in organization from the staff of any other parish. The system of cathedral chapters has never been developed.

In Russia, where the dioceses have always been few in number and vast in extent, the main church in any large town became known as a cathedral (*sobor*) even though no bishop was in residence there. The principal church of a big monastery also assumed the same name. The Moscow Kremlin since the 15th century has contained several cathedrals, the most famous being those of the Assumption, of the Annunciation and of the Archangels.

(N. M. Z.)

ARCHITECTURE

The architectural history of the west European cathedral begins with the first large Christian basilicas—old St. Peter's and others—built in Rome soon after the Christian church acquired legal status (313). The long colonnaded nave drew the worshiper's attention irresistibly to the eastern apse where stood the main altar and, behind that, the bishop's throne, later moved to a chancel between apse and nave (*see* APSE; CHANCEL; NAVE). In the metropolitan churches, though not usually those of other cities, this eastward drive was checked by the intrusion of a large transverse space called bema (*q.v.*), forerunner of the medieval transept (*q.v.*) and serving both to give room for ceremonial deployment before the altar and to withdraw the mystical focus of the church a little from the congregation. In later centuries the longitudinal and apsidal plan continued in use, with modifications, for many cathedrals and abbey churches (it is impossible to isolate the development of strictly "cathedral" buildings); the cathedral of S. Apollinare in Classe, Ravenna (534–539), was of this type, as was such a Carolingian abbey as Fulda (begun 802).

Hardly any of the typical features of the French High Gothic cathedral would have been possible without preliminary development in the Romanesque period (c. 1000–1200). Thus the *chevet* or cluster of apsidal chapels jutting from a passage or ambulatory laid round the main apse—chapels made necessary by increasing worship of saints and the growing custom of each canon saying Mass daily—is traceable at least to St. Martin at Tours of 997–1020; Durham had rib vaults, Nevers (Burgundy) a form of flying buttress and Autun (in the same province) pointed arcades almost half a century before the rebuilding of St. Denis abbey (c. 1135–44) as the first of the large true Gothic churches of the fle de France. In the High Gothic cathedral these features developed rapidly: nave vaulting (rediscovered in early Romanesque times to replace the inflammable flat timber roof of the basilicas) was lightened and carried to ever greater heights; translucent glass displaced solid stone wall. The eastward drive of the Early Christian church was replaced by an upward surge: Romanesque Durham was 80 ft. high to the crown of its vaults; Notre Dame, Paris (1163–1208), reached 115 ft.; Beauvais (1247–72) about 157 ft.

By comparison with the French, the English medieval cathedral was of long and low proportions; set within a cloistered precinct proclaiming its monastic or collegiate origin (viz., Canterbury), not jutting up directly from the street; entered through a quiet north porch rather than the spectacular western figure portals of the fle de France. French Gothic cathedrals were primarily centres of urban religious life as their siting indicates. English west fronts often had an impressive program of sculpture, as at Wells, Exeter and elsewhere.

The imagination of the Renaissance humanist-architect was captured anew by the aesthetic possibilities of the "central" plan; of a cathedral centrally domed and symmetrically disposed north, south, east and west, a plan fairly common in earlier times (Hagia Sophia, Constantinople, and S. Vitale, Ravenna, in the 6th century; Aachen cathedral of the 9th; St. Mark's, Venice, in the 11th). Bramante and Michelangelo proposed completely symmetrical plans for the rebuilding of St. Peter's, but the traditional needs of the church compelled Carlo Maderna to add to a long western nave, completed 1614. Sir Christopher Wren was faced with a similar difficulty and forced to a similar modification in the rebuilding of St. Paul's cathedral, London (1675–1711).

Neither the 19th century nor the modern architectural movement beginning in the 1880s produced a special cathedral style. Most architects freely adapted historical styles such as the Byzantine (Westminster cathedral, J. F. Bentley, 1896 *et* seq.) and Gothic (Liverpool, Sir G. G. Scott, 1903 *et* seq.; and the remodeled St. John the Divine, New York city, R. A. Cram and C. F. Ferguson, 1910 et seq.). However, in his designs for the new Coventry cathedral (approved 1951, modified 1952–53) B. Spence mainly rejected traditional architectural styles and used tent forms, facet, vaulting and other new features. A modern development of the centralized plan is shown in F. Gibberd's scheme (1960) for the Roman Catholic cathedral of Liverpool.

CATHELINEAU, JACQUES (1759–1793), a leader of the insurrection of the Vendée during the French Revolution, was born on Jan. 5, 1759, at Pin-en-Mauges in Anjou. In the first years of the Revolution, Cathelineau, a fanatical Catholic himself, listened to the exhortations of Catholic priests and royalist *émigrés* and joined the insurrection provoked by them against the

new government. In March 1793, with a band of peasants and smugglers, many of whom were relatives of his, he took the château of Jallais and the town of Chemillé. He then joined forces with other Vendean leaders, J. N. Stofflet and M. L. J. Gigot d' Elbée, and marched with them on Cholet, Vihiers and Chalonnes. With greatly increased troops. the leaders next took Beaupréau, Fontenay, Saumur and Angers in April, May and June 1793. The insurgents' first successes were largely due to surprise, and when they encountered stiffer resistance differences arose among their leaders. To avoid these rivalries, it is thought, Cathelineau was named generalissimo of the rebels, though his authority over the undisciplined troops was not increased by the new office. Finally the combined royalist forces tried to capture Nantes. Cathelineau entered the town in spite of the resistance of Gen. J. B. Canclaux. but he was killed on July 14, 1793, and the Vendean army broke up.

CATHER, WILLA SIBERT (1873–1947), U.S. novelist of the frontier. was born in Winchester, Va., Dec. 7, 1873, and at nine moved with her family to the Nebraska village of Red Cloud. There she grew up among the pioneering immigrants from Europe — Swedes, Bohemians. Russians. Germans — who were breaking the land on the Great Plains. At the University of Nebraska she showed a marked talent for journalism and story writing and on graduating in 189j obtained a position on a Pittsburgh "family" magazine. Later she worked as copy editor and music and drama editor of the *Pittsburgh Leader*. She turned to teaching in 1901, and in 1903 puhlished her first book of verses, *April Twilights*. In 1905 her first collection of short stories, *The Troll Garden*, led to her appointment as managing editor of *McClure's*, the New York muckraking monthly. After building up its declining circulation, she retired in 1912 to devote herself wholly to novel writing. During these years, frequent visits to the American southwest gave her an intimate acquaintance with a section of the country destined to figure significantly in her work.

Her first novel. *Alexander's Bridge* (1912), was a factitious story of cosmopolitan life. Under the influence of Sarah Orne Jewett's regionalism. however. she turned to her familiar Nebraska material. With *O Pioneers!* (1913) and *My Ántonia* (1918) she found her characteristic themes — the spirit and courage of the frontier she had known in her youth. *One of Ours* (1922), which won the Pulitzer prize, and *A Lost Lady* (1923), which made her famous. mourned the passing of the pioneer spirit in the middle west. In *Song of the Lark* (1915). the tales assembled in *Youth and the Bright Medusa* (1920) and *Lucy Gayheart* (1935) she reflected the other side of her experience — the struggle of a talent to emerge from the constricting life of the prairies and the stifling effects of small town life.

A mature statement of both themes is to be found in three long tales included in *Obscure Destinies* (1932). With success and middle age, however, Miss Cather experienced a strong disillusionment. Her feeling that her world had been swept away by the war is reflected in *The Professor's House* (1925) and her essays *Not Under Forty* (1936). Her solution was to write of the pioneer spirit of another age, that of the French Catholic missionaries in the southwest and the French Canadians at Quebec, in *Death Comes for the Archbishop* (1927) and *Shadows on the Rock* (1931). Her last novel, *Sapphira and the Slave Girl* (1940), marked a return to the Virginia of her ancestors and her childhood. Because of her admiration for French Catholicism, her readers often assume that Miss Cather, who was born a Baptist. underwent conversion to Catholicism. Actually she became an Episcopalian in 1926.

Miss Cather's novels were written with great simplicity and charm. They are nearly all "success" stories; they contain no love themes to speak of. nor do they explore the inner life of the characters. They exalt the American spirit and the conquest of material hardships in the new world. Her art is distinctly minor arid elegiac; of its kind it has genuine distinction, and has had wide appeal. She died on April 24, 1947, in New York city.

The early life of Miss Cather is told in Mildred R. Bennett, *The World of Willa Cather* (1951). (LN. E.)

CATHERINE (AIKATERINE), **SAINT,** OF ALEXANDRIA, a virgin martyr said to have died at Alexandria at the beginning of the 4th century; but she is nowhere mentioned before the 8th, and her historicity is doubtful. According to the legend, which exists in various versions, she was an extremely learned young girl of noble family who protested against the persecution of Christians under the emperor Maxentius, defeated the most eminent scholars in argument. broke the wheel to which she was tied and was then beheaded. It is said that after her death angels took her body to Mt. Sinai, where it was discovered about A.D. 800. In the middle ages she was one of the most popular saints. Her symbol being a spiked wheel, she is the patron saint of wheelwrights, and also of virgins and scholars. The story of her mystical marriage to Christ dates from the late middle ages. She is one of the 14 auxiliary saints and her feast day is Nov. 2j.

See M. J. F. R. I. H. Bremond, *Sainte Catherine d'Alexandrie* (1917); *H.* Thurston and D. Attwater (eds.), *Butler's Lives of the Saints*, vol. *4*, *pp.* 420–421 (1956). (H. C. G.)

CATHERINE, SAINT, OF BOLOGNA (CATERINA VIGRI) (1413–1463), a Poor Clare whose spiritual writings were very popular in Italy until the end of the 18th century, was born into a noble family at Bologna on Sept. 8, 1413. She was educated at the court of the princess of Este at Ferrara, and entered the order in 1432. In 1456 she founded in Bologna a convent of Poor Clares of which she was the abbess until her death there on March 9, 1463. She was canonized in 1712, and her feast day is March 9. Throughout her life St. Catherine had visions and revelations. Her chief work is *Lc arme necessarie alla bataglia spirituale*, composed in 1438 (Eng. trans. by A. G. McDougall, *The Spiritual Armour*, 1926).

Sre H. Thurston and D. Attwater (eds.) *Butler's Lives of the Saints*, vol. 1, pp. 536–539 (1956); J. Stiénon du Pré, *Ste. Catherine de Bologne* (1949). (H. C. G.)

CATHERINE, SAINT, OF GENOA (CATERINA FIESCHI ADORNO) (1447–1510), Italian mystic, was born in Genoa into a distinguished family and received a careful education. Her early aspirations to become a nun were frustrated by her relatives, who married her to Giuliano Adorno, a young man of difficult character. After several years of unhappiness she succumbed to the attractions of a gay life for a time, but was converted by a mystical experience in 1473, which marked the beginning of her life of close union with God. This she combined with the assiduous service of the sick in a hospital at Genoa, in which her husband joined her after he. too, had been converted. She died on Sept. 15, 1510. She was beatified in 1737, and her name was added to the Roman martyrology, with the title of saint, by Benedict XIV; feast day Sept. 15.

St. Catherine's two works, the *Trattato del Purgatorio* and the *Dialogo*, are the outcome of her mystical life. Her authorship of these has been denied, but according to Umile Bonzi da Genova a large part of both works is her own, though they received their final form only after her death. Together with her life, they were first printed in 1551 (Eng. trans. of works by C. Balfour and H. D. Irvine, 1946).

Bonzi, "L'opus Cathcrinianum et ses auteurs," *Revue d'ascétique et de mystique*, 16:351–380 (1935); U. Bonzi in M. Viller, *Dictionnaire de spiritualité*, vol. 2, col. 290–325 (1937). (H. C. G.)

CATHERINE, SAINT. DEI RICCI (CATERINA, formerly ALESSANDRA, DEI RICCI) (1522–1590), Italian Dominican mystic, was born at Florence on April 23, 1522. At the age of 13 she entered the Dominican convent at Prato, whose prioress she was from 1560 to 1590. She was famous for her visions of the Passion and her stigmatization, and was the author of letters (ed. by Fr. Sisto of Pisa. 1912) and other minor works. She died in Prato on Feb. 1 or 2, 1590. Her admiration for Savonarola delayed her canonization. which took place in 1746. Her feast day is Feb. 13.

See F. M. Capes, *St. Catherine dei Ricci* (1905). (H. C. G.)

CATHERINE, SAINT, OF SIENA (CATERINA BENINCASA) (1347–1380), the greatest of the 14th-century Italian mystics, was born at Siena in 1347, the daughter of a dyer. When she was about seven she had her first vision. About 1360 she became a tertiary of the Dominican order, joining the Sisters of Penitence of St. Dominic in Siena and rapidly gaining a wide reputation for her holiness and her severe asceticism.

When Florence was placed under an interdict by Pope Gregory XI in 1376, Catherine determined to take public action to secure a double aim: peace within the church itself and in Italy and a crusade against the Muslims. She went as an unofficial mediator to Avignon with her confessor and biographer Raymond of Capua. Her inission was unsuccessful and she mas virtually ignored by the Holy See, but she took advantage of being in Avignon to press her plans for a crusade. It was now clear to her that the return of the pope to Rome, an idea that she did not initiate and previously had not greatly encouraged, was the only way to bring peace to Italy and thus to facilitate a crusade. Catherine left for Tuscany the day after Gregory XI set out for Rome. At his request she went at the beginning of 1378 to Florence, where she was during the Ciompi revolt in June. After a short final stay in Siena, during which she completed her *Dialogo,* begun the previous year, she went to Rome in November, probably at the invitation of Pope Urban VI (*q.v.*), whom she helped in reorganizing the church. Then she tried to restore Joanna I of Naples, a supporter of the antipope Clement VII, to obedience to Urban. But her physical energy was exhausted; she died in Rome on April 29, 1380, attended by a smali group of disciples who had remained faithful to her throughout adversity. She was canonized in 1461 and declared patron saint of Italy in 1939. Her feast day is April 30.

Her writings (all of which were dictated) include *Il libro della divina dottrina,* better known as the *Dialogo,* about 380 letters and 26 prayers. They reveal an exceptional political flair as well as deep spirituality. The record which the *Dialogo* contains of her experiences in a state of ecstasy serves to illustrate her doctrine of the "inner cell" of the knowledge of God and of self into which she withdrew.

BIBLIOGRAPHY.—A complete edition of St. Catherine's works together with her *Life* by Raymond of Capua mas published in Siena (1707–21). The *Dialogo* was first published about 1475 (Eng. trans. by A. L. Thorold, 1925) and the letters in 1494 and 1500. *See* also M. *H.* Laurent, "Note di bibliografia cateriniana" in *Ecclesia* (1947); *Fontes vitae S. Cutharinae senensis historici,* ed. by *M.* H. Laurent and F. Valli (1936–42); R. Famtier, S. *Cutherine de Sienne: Essai de critique des sources* (1921–30) and *La Double Expérience de Catherine Benincasa* (1945); Alice Curtayne, *Saint Catherine of Siena* (1929).
(M.-H. LA.)

CATHERINE, SAINT, OF SWEDEN (KATARINA ULFSDOTTER) (1331–1381), the constant companion of her mother! St. Bridget of Sweden (*q.v.*), whom she succeeded as superior of the Brigittines (*q.v.*). Her husband, Egard Lydersson of Kyren, died shortly after she joined her mother in Rome in 1349. She did not return to Sweden until 1373 after St. Bridget's death. She took part in the ecclesiastical controversies of her time and supported Urban VI against the antipope. She died on March 24, 1381, as abbess of Vadstena. Her feast day is March 24.

See H. Thurston and D. Attwater (eds.), *Butler's Lives of the Saints,* vol. i, pp. 669–671 (1956). (H. C. G.)

CATHERINE I (1684–1727), empress of Russia, consort and successor of Peter the Great, was the daughter of a Lithuanian peasant who died when she was a child. Marfa Skavronskaya, as she was then called, became a servant in the home of Pastor Gliick, the Protestant superintendent of the Marienburg district, and married a Swedish dragoon called Johan. When the Swedes evacuated Marienburg (1702), Marfa became one of the prisoners of war of the Russian marshal B. P. Sheremetev, who sold her to Prince A. D. Menshikov (*q.v.*). At Menshikov's house Ptter the Great became her lover. In 1703, after the birth of their first daughter, Marfa was received into the Orthodox Church, when she was rechristened under the name of Catherine (Ekaterina) Alekseevna, the tsarevitch Alexis being her godfather. Peter, who had divorced the tsaritsa Eudoxia, then made Catherine his inseparable companion. She was with him during the campaign of the Pruth (1711), and he always attributed the successful issue of that disastrous war to her courage and *sang-froid.* He married her publicly in Feb. 1712. He was devoted to her, and she was able to act as a buffer between him and his advisers in his frequent accesses of rage.

By the *ukaz* of 1722, Peter reserved the right to designate his successor—to the exclusion of the grand duke Peter the only son of the tsarevitch Alexis. Though he never availed himself of this right, he had Catherine crowned as empress-consort in the Uspenski cathedral in Moscow on May 18 (new style; 7, old style), 1724. She attended Peter during his last illness and closed his eyes nhen he died on Feb. 8 (N S.; Jan. 28, O.S.), 1725. She was at once proclaimed empress regnant by Menshikov and Count P. A. Tolstoi, with support of the guards.

The Academy of Sciences, planned by Peter. was opened under Catherine (1725). The great administrative innovation of her reign, however, was the establishment in 1726, of the supreme privy council. nhich considerably reduced the roles of the senate and synod and concentrated executive power in the hands of a few persons. Menshikov. however. continued to dominate affairs and prevailed on Catherine to designate the grand duke Peter as her successor and to agree that he should marry Menshikov's daughter hfaria. Foreign policy was principally directed by the astute A. I. Osterman (*q.v.*). Tension grew up between Russia and Great Britain chiefly because George I feared that Russian protection of Charles Frederick of Holstein-Gottorp, who had married Catherine's daughter Anne, might result in Hanover's losing Bremen and Verden, which George had acquired since Charles Frederick had been deprived of Schleswig. A British squadron nas sent to the Baltic and anchored at Reval in the spring of 1726. Though the fleet was withdrawn after the empress had protested, she acceded to the Austro-Spanish league against Great Britain in Aug. 1726. Catherine died on May 17 (N.S.; 6, O.S.), 1727. Though quite illiterate, she had proved herself an extremely shrewd and sensible woman. (X.; Lo. L.)

CATHERINE II THE GREAT (1729–1796), empress of Russia from 1762 to 1796, was born at Stettin on May 2 (new style; April 21, old style), 1729, the daughter of the German prince Christian Augustus of Anhalt-Zerbst and his wife Johanna Elizabeth of Holstein-Gottorp. Her baptismal name was Sophia Augusta Frederica. In 1744 she was taken to Russia to be affianced to the grand duke Peter, nephew and heir of the empress Elizabeth. Frederick the Great of Prussia favoured the alliance, his objects being to strengthen the friendship between his kingdom and Russia, to weaken the influence of Austria in Russia and to ruin the chancellor A. P. Bestuzhev-Ryumin (*q.v.*), who was a partisan of the Austrian alliance. The diplomatic intrigue failed, but Sophia won the empress Elizabeth's affection and the marriage was finally decided upon. On July 9 (N.S.; June 28, O.S.), 1714. she was received into the Orthodox Church in Moscow and renamed Catherine (Ekaterina) Alekseevna. On Aug. 21 (N.S.; 10, O.S.), 1745, in St. Petersburg, she was married to the grand duke.

Catherine's married life was unhappy. as her husband was subnormal in physique and in mind and she despised him. Clever and ambitious, houever, she accepted the conditions of her marriage because they were a means to power. For 17 years, therefore, she matured her mind and avoided a breach nith Elizabeth. The marriage nas barren for its first nine years, and the only reason for supposing that the future emperor Paul (born in 1754) was Peter's son was his strong resemblance to Peter in appearance and character. Catherine's scandalous behaviour, meanwhile, was the talk of Europe. Many of her most trusted agents and ministers, both before and after she became empress, were also her lovers.

Accession.—The empress Elizabeth died on Jan. 5, 1762 (N.S.; Dec. 25, 1761. O S.). The grand duke then succeeded without opposition as Peter III. He committed every possible folly, groveled before Frederick the Great, insulted the church and threatened to divorce Catherine. She refrained from open opposition and acted nith the prudence that she had already shonn. In June, however, Peter retired to Oranienbaum, 18 mi. from St. Petersburg, leaving Catherine in Peterhof. Then Catherine's lover Grigori Grigorievich Orlov (*q.v.*) and his brother Aleksei persuaded the guards to undertake a *coup d'etat.* In the early morning of July 9 (N.S.;

June *28*, O.S.) Catherine was secretly escorted to St. Petersburg where she was enthusiastically acclaimed as empress in spite of the earlier scheme, put forward by Nikita Panin, for installing her merely as regent for her son Paul, who was simply proclaimed heir to the throne. The hatred felt for Peter made Catherine's accession to his place easy, and she issued a manifesto representing herself as the defender of the Orthodox faith and of the glory of Russia. Toward the evening, Catherine set forth at the head of her troops to Oranienbaum. Peter did not dare to resist and abdicated the next day. He was sent to a country house at Ropsha, where he died on July *17* (N.S.; *6*, O.S.), in the course of a scuffle during dinner. Aleksei Orlov, his custodian, claimed to be unable to remember how this had happened. Catherine, who had not decided what to do about Peter and who was alarmed at the prospect of being suspected of having instigated his murder, issued a second manifesto declaring that she accepted the throne for the good of the country. It was several years, moreover, before she could feel completely secure on the throne. She received a great shock in *1764* when a young officer Vasili Yakovlevich Mirovich attempted to restore the imprisoned emperor Ivan VI (*q.v.*) to the throne.

Internal Affairs. — Catherine the Great ruled Russia for 34 years. Though born a German, she identified herself completely with the Russian people. She was in the truest sense the successor of Peter the Great. Her private life was the object of unceasing curiosity and interest. and a mass of literature has grown up about her lovers and her relations with them. Catherine, however, was never dominated by her lovers, who were the instruments of her policy; it was she who governed Russia, not her favourites. Her main interests were intellectual and political, and her love affairs subsidiary. She was the disciple and friend of the French Encyclopaedists, especially of Voltaire, whose works had first awakened her mind. She corresponded with him, with D'Alembert and, more voluminously, with F. M. Grimm, who spent nearly a year at her court *(1777–78)* and found her conversation even more brilliant than her letters. Catherine also corresponded at intervals with Frederick the Great and with the Holy Roman emperor Joseph II. Her letters are graceful and witty and show real political and diplomatic insight. She was determined to make Russian society as cultivated as the society of Paris and Berlin. She insisted on a high standard of decorum and of manners at court, encouraged the nobles to travel and fostered the love of French culture. Attaching the greatest importance to education, she formed the first closed educational institutions for girls in Russia *(1764)*. She employed Grimm and others to collect works of art and antiquities for her and practised sculpture and painting herself. She had a passion for reading, made a digest of Blackstone's *Commentaries* and found Buffon's *Histoire naturelle* light reading. Her enthusiasm for Russian history led her to begin writing a history of Russia from the earliest times, and she completed a play, on Shakespearian lines, about the legendary Oleg. She also wrote numerous comedies, proverbs and tales. To find time for all her activities she rose at *5* A.M. and would sometimes work *15* hours a day.

Catherine had great charm and was loved by her servants. She was not revengeful and showed no hostility to her husband's advisers after she had usurped the throne. Nevertheless she possessed a streak of masculine hardness and showed no kindness to her son Paul, whom she deliberately kept at a distance as part of her policy. Her attention and care went to her grandson, the future Alexander I (*q.v.*), whose well-being and education she closely supervised from his very birth *(1777)*. She clearly intended to make him her successor instead of his father Paul, but in the end refrained from doing so.

A disciple of the Encyclopaedists, Catherine naturally began with the definite intention of carrying out domestic reform in Russia, in accordance with the contemporary practice of "enlightened despots." In the event, however, her foreign origins and the fact of her having usurped the throne made her dependent for support on the nobles, whose privileges she vastly increased (particularly by the administrative reform of *1775* and by the "Letter of Grace to the Nobility" of *1785)* and to whom she gave new powers over their serfs. She also increased their numbers by grants of crown land. The terrible conditions to which the peasants were reduced led to one revolt after another, culminating in the widespread rising on the Volga in *1773–75* under E. I. Pugachev (*q.v.*). The atrocities committed during the suppression of this rising were in startling contrast with the humanitarian tone of the "Instruction" (1767), which Catherine had drawn up for the grand commission summoned to Moscow in Dec. *1766* to advise on internal reform. This "Instruction," based principally on the works of Montesquieu and C. B. de Beccaria, was so radical that its circulation in France was forbidden, but very little came of the *18* months work of the grand commission until the promulgation, years later, of new ordinances on provincial government *(1775)* and on municipal government *(1785)*.

Catherine, however, introduced some remarkable measures for the care of the sick and needy. She founded a special medical college, which had to provide all towns with a regular medical service. Also, to set an example, she and her son submitted to the new practice of vaccination.

With the outbreak of the French Revolution, Catherine, like other European sovereigns, fell back on methods of repression. A. N. Radishchev, whose *Journey* From *St. Petersburg to Moscow (1790)* gave a frank account of the condition of the peasants, was banished to Siberia, although his sentiments were only those of Catherine's own "Instruction" of *1767*. Yet she had some able assistants in her domestic administration, notably J. J. Sievars and Count I. I. Betski. On economic problems she followed the teachings of Adam Smith.

Foreign Affairs. — Catherine conducted her own foreign policy. It aimed at the expansion of Russia and was brilliantly successful. Though she could not carry all her projects through, her foreign policy gave Russia unprecedented power and represented a continuation of Peter the Great's achievements. She knew how far she could safely go in the russification of frontier districts and showed a certain liberality to annexed populations.

Up to *1779* Catherine was guided by the idea of a "Northern accord" or "Northern system," which might have secured the political equilibrium of Europe. When this came to nothing, she turned to her famous Greek project, which aimed at expelling the Turks from Europe and restoring the Byzantine empire. In *1780*, during the American Revolution, she promoted "armed neutrality at sea."

The many great soldiers and diplomats whom she gathered round her obeyed her instructions implicitly. She had the gift of discovering ability and kept in close touch with all her servants. Among her generals were Aleksandr Mikhailovich Golitsyn, P. A. Rumyantsev, Petr Ivanovich Panin, A. V. Suvorov and G. A. Potemkin. Though Suvorov was one of Russia's greatest generals, Catherine never confided in him quite so much as in Potemkin, whose military abilities were mediocre, but who was first her lover, then her close friend and correspondent. It was at Potemkin's suggestion that she undertook her famous journey *(1787)* to the south, during which she visited recently acquired territories in the Crimea and also met Joseph II. Her chief advisers and assistants in foreign affairs were Nikita Panin, A. A. Bezborodko, N. V. Repnin, Dmitri Alekseevich Golitsyn and the Vorontsovs.

In *1772* the first partition of Poland took place (see POLAND: *History)*. The second and third partitions *(1793* and *1795)* unfortunately gave to Russia not only territories that were ethnically Russian or Ruthenian but also large parts of Poland proper not even coveted by Catherine. In Catherine's two wars against Turkey *(1768–74* and 1787–92), Russia won the Crimea and free access to the Black sea *(see* RUSSIA: *History)*. It was mainly Catherine's skilful diplomacy that finally secured Russia's territorial gains, both in the west and in the south, though her generals and ministers served her well.

Catherine died of apoplexy on Nov. *17* (N.S.; *6*, O.S.), *1796*, in St. Petersburg. Already in *1767* the grand commission had offered her the style of "the Great," but she did not use it herself. The Imperial Russian Historical society began the publication of her correspondence in *1867*. There is a collection of her writings edited by A. V. Pypin and published by the Russian Academy of Sciences, *12* vol. (1901–07), and editions of her *Mémoires* in French by A. Herzen *(1859)* and in English, *The Memoirs of Catherine the*

Great, by D. Maroger (1955). There are also English texts of her correspondence with Voltaire. together with the "Instruction" of 1767, ed. by W. F. Reddaway (1931); and of her correspondence with Sir Charles Hanbury-Williams, ed. by the earl of Ilchester and E. Langford-Brooke (1929).

CATHERINE (CATHERINE HOWARD) (d. 1542), fifth queen consort of Henry VIII of England, was one of the ten children of Lord Edmund Howard (d. 1539), a poverty-stricken younger son of Thomas Howard, 2nd duke of Norfolk (d. 1524). After her mother's death she lived with Norfolk's widow Agnes. In that lax household she had several lovers: Henry Mannock, her music teacher; Francis Dereham, who called her his wife; and her cousin Thomas Culpepper, to whom she may have been engaged. She was brought to the notice of Henry VIII by Stephen Gardiner, bishop of Winchester and rival of Thomas Cromwell. in 1540, when the king was tiring of Cromwell's policies and of his marriage with Anne of Cleves. Henry married Catherine privately on July 28, publicly acknowledged her as queen on Aug. 8 and for the next 15 months appeared much enamoured of her. But Thomas Cranmer, archbishop of Canterbury. informed him in Nov. 1541 of her misconduct before her marriage and further inquiry revealed more recent meetings with Culpepper and with Dereham, now her secretary. Dereham and Culpepper were executed in December and their accomplices imprisoned. All, like Catherine herself, denied any misconduct since her marriage. Parliament passed a bill of attainder against her, which declared it treason for an unchaste woman to marry the king (Feb. 11, 1542), and Henry, who seems to have been deeply and genuinely distressed, was invited to give it his assent by letters patent without any words or ceremony. Catherine, the least innocent, and in appearance the least unattractive, of Henry's wives, was beheaded in the Tower of London on Feb. 13, 1542.

See L. B. Smith, *A Tudor Tragedy* (1961). (R. B. WM.)

CATHERINE (CATHERINE PARR) (1512–1548), sixth queen consort of Henry VIII of England, was a daughter of Sir Thomas Parr (d. 1517) of Kendal, an official of the royal household. She had two husbands, Edward Borough (d. *c.* 1529) and John Neville, Lord Latimer (d 1542 or 1543), before she married Henry VIII on July 12, 1543. Small and not beautiful, but tactful and accomplished, she exerted a beneficial influence during the last years of the king's reign. She was on very friendly terms with his three children and took a close interest in their education. She also did what she could to mitigate religious persecution under the Act of Six Articles (1539) and, if John Foxe's Book of *Martyrs* may be believed, herself only escaped arrest on a charge of heresy by tactful flattery of the king. Soon after Henry's death in Jan. 1547 she married a former suitor, Thomas, Lord Seymour of Sudeley, brother of the protector Edward Seymour, duke of Somerset, who at first opposed the match. She died, shortly after giving birth to a daughter, at Sudeley castle, Gloucestershire, on Sept. 7, 1548. A woman of strong piety and considerable learning, Catherine wrote *A Lamentacion or Complaynt of a Sinner* (1548), which was published after her death. (R. B. WM.)

CATHERINE OF ARAGON (1485–1536), first queen consort of Henry VIII of England, youngest daughter of Ferdinand II of Aragon and Isabella of Castile, was born at Alcala de Henares on Dec. 16, 1485. and by the treaty of Medina del Campo (1489) was betrothed to Arthur (b. 1486), eldest son of Henry VII of England. The contract was renewed several times and in the autumn of 1501 Catherine came to England and married Arthur on Nov. 14. She spent the winter with him at Ludlow castle but there. on April 2. 1502. he died. Catherine was betrothed to the king's second son, Henry. in June 1503, and a papal dispensation was obtained for this alliance within the forbidden degrees of consanguinity. But after her mother's death (1504), these plans were interrupted by the struggle between her father Ferdinand and her Habsburg brother-in-law Philip of Burgundy for control of Castile, which. since it caused Ferdinand to ally nith France, necessarily drove Henry VII into alliance with the Habsburgs and Burgundy. The negotiations for Catherine's remarriage mere thus delayed and she became severely straitened for money. Then. suddenly, the death of Henry VII removed all obstacles. The young Henry VIII, reversing his father's policy, promptly married Catherine on June 11, 1509. For some years he showed himself an affectionate and, by contemporary princely standards, a not unfaithful husband. Catherine shared his interest in learning and letters, in music and dancing, even in sport. She shared also his hostility to France and encouraged him to revive the Spanish alliance and to embark upon the French war of 1511–14. While he was campaigning in France in 1513, she acted as regent and organized England's defenses against the Scottish invasion that was so decisively crushed at the battle of Flodden (Sept. 9).

But Ferdinand failed to play his promised part in the mar in 1512 and 1513, and, although the 1514 Paris report that Henry in his anger was contemplating a divorce was probably unfounded, he did make a separate peace, marrying his sister Mary to Louis XII (Oct. 1514). Louis' death (Dec. 31, 1514) and the mounting rivalry between Henry and the new French king, Francis I, soon cooled this entente; but Catherine's failure to produce a male heir to the throne was a more serious threat to her position. She gave birth to six children, including two sons, between Jan. 1510 and Nov. 1518, but all were stillborn or died in very early infancy, except Mary (b. 1516). The Wars of the Roses were still a living memory and it is clear that, as early as 1519–20, Henry's anxiety about the succession boded ill for the continuance of his marriage. The crisis was postponed for a few more years because in 1522, largely through Catherine's influence, her nephew and Ferdinand's grandson, the young emperor Charles V, pledged himself to marry Princess Mary in return for English aid in his war against France. This match with the ruler of the Empire, Spain and the Netherlands might. if the schemes to conquer France succeeded. bring to Charles and Mary "the whole monarchy of christendom" and this glittering prospect temporarily allayed Henry's anxiety about the succession. But when Charles, after beating the French at Pavia (Feb. 1525), not only refused to invade France but also jilted Mary for a Portuguese princess. the problem could no longer be shelved.

Henry's first step was to create Henry Fitzroy, his only illegitimate son, duke of Richmond — Henry VII's title before 1485 — and to give him precedence even over Mary. However, an illegitimate male heir was hardly better than a legitimate female heir; and probably by 1526 Henry's infatuation for Anne Boleyn was already encouraging more drastic action. He allowed a secret suit to begin, in May 1527, before archbishops Wolsey and Warham, for the annulment of his marriage to his brother's widow that had been so blighted by the curse of Leviticus (xx, 21). This came to nothing, for Catherine forewarned the pope and emperor and insisted that her cause should be tried at Rome. The case was difficult for Pope Clement VII, since Henry's demand for an annulment entailed the invalidating of a previous pope's dispensation. Moreover imperial troops had just sacked Rome (May 6, 1527) and made Clement practically a prisoner of Catherine's nephew the emperor Charles V. For a time the French invasion of Italy in 1528 made possible papal concessions that culminated in the decretal commission to cardinals Wolsey and Campeggio to try the case in England but when the legates opened their court (May 31, 1529) Catherine denied their jurisdiction and again appealed to Rome. A few weeks later the defeat of the French in Italy at the battle of Landriano (June 21) and Clement's final capitulation to Charles V at Earcelona (June 29) brought the revocation of the cause to Rome (July 1529) and a brief (March 1530) forbidding Henry to marry again until the papal verdict was pronounced.

But Clement was in no hurry to pronounce and Henry took the law into his own hands, finally separating from Catherine in July 1531. His new archbishop of Canterbury Thomas Cranmer annulled their marriage on May 23, 1533, four months after Henry had secretly married Anne Boleyn. Then followed the series of

acts repudiating all papal jurisdiction in England and the 1534 Succession act that declared Catherine's marriage null, bastardized Mary and made Anne's child heir to the throne. Only then, on March 23, 1534, did the pope at last declare Catherine's marriage valid. During these unhappy years she showed the same dignified obstinacy as in 1503–09, insisting that, as her marriage to Arthur had never been consummated, she was Henry's lawful wife. She refused to retire to a nunnery, or to exchange her title of queen for that of princess dowager or to accept the 1534 Succession act. Increasingly cut off from her friends, from reliable advisers, even from her daughter, her health eventually gave way and she died at Kimbolton, Huntingdon, on Jan. 7, 1536.

See G. Mattingly, *Catherine of Aragon* (1942). (R. B. WM.)

CATHERINE OF BRAGANZA (1638–1705), queen consort of Charles II of Great Britain, was born at Vila Viçosa, Port., on Nov. 25, 1638, daughter of the future king John IV of Portugal. She was a useful medium for contracting an alliance with England and negotiations for a marriage, begun during the reign of Charles I, were renewed immediately after the Restoration. On June 23, 1661, in spite of Spanish and Dutch opposition, the marriage contract was signed. By it England secured Tangier and Bombay, valuable trading privileges, religious and commercial freedom in Portugal and 2,000,000 Portuguese crowns (about £300,000) in return for military and naval support to be given to Portugal against Spain and liberty of worship for Catherine.

In May 1662 Catherine reached England, and the marriage took place in Portsmouth. Catherine had little personal charm, and Charles's preoccupation with his mistresses soon provoked a scene at court, where Catherine at first refused to receive the reigning favourite, Lady Castlemaine. Eventually, Catherine came to accept the position and showed considerable kindness to the king's mistresses and bastards. Charles, in return, generally treated her fairly kindly, but she always played a very secondary role at court. As the prospect of her bearing children diminished, schemes were set on foot to procure a divorce on various pretexts. As a Roman Catholic, Catherine was attacked by the inventors of the "popish plot." the murder of Sir Edmund Berry Godfrey was ascribed to her servants in 1678 and Titus Oates accused her of a design to poison the king. Oates brought a charge of high treason against her on Nov. 24, the commons passed an address for her removal from Whitehall and it was only the king's protection that saved her from having to stand trial in June 1679. On Nov. 17, in the house of lords, the earl of Shaftesbury moved for a divorce so that Charles might marry a Protestant, but the bill was opposed by the king and found little support among the peers. After the Oxford parliament (1680) Charles's influence revived and the queen's position was no more assailed.

During Charles's last illness in 1685 Catherine did much to assist his reconciliation with the Roman Catholic Church, and she exhibited considerable grief at his death. She interceded with generosity, but ineffectually, for the duke of Monmouth the same year. On June 10, 1688, she was present at the birth of the prince of Wales and later gave evidence before the council that he was in fact Mary of Modena's child. She maintained at first good terms with William and Mary, but the practice of her religion aroused jealousies, while her establishment at Somerset house was said to be the home of cabals against the government. She finally left England for Portugal in March 1692. In 1704 she was appointed regent of Portugal during the illness of her brother Pedro II. She died on Dec. 31, 1705.

See L. C. Davidson, *Catherine of Bragança* (1908); *J.* Mackay, *Catherine of Braganza* (1937). (H. G. Ro.)

CATHERINE DE MÉDICIS (1519–1589), queen consort of Henry II of France and regent during the minority of Charles IX, throughout whose whole reign she controlled royal policy, was born in Florence on April 13, 1519, the daughter of Lorenzo de' Medici, duke of Crbino, and Madeleine de la Tour d'Auvergne. In 1533 she was married to the duc d'Orléans, who in 1547 became king of France as Henry II. The marriage was barren for its first ten years, after which Catherine had five sons and five daughters. Throughout Henry's reign she played little part in politics, as he was completely under the influence of his mistress Diane (*q.v.*) de Poitiers, duchesse de Valentinois. In 1552. however, when Henry II left the kingdom for the campaign of Metz, Catherine was nominated regent, but only with very limited powers.

Catherine still had little authority when her eldest son became king as Francis II on Henry II's death in 1559, since Francis was under the influence of his consort Mary Stuart, whose uncles François, duc de Guise, and Charles, cardinal de Lorraine, were dominant at court. When Francis II died (Dec. 1560), however, Catherine became regent for the new king, his brother Charles IX. Though her regency ended in 1563 she dominated Charles for the rest of his life. (For the state of affairs with which he had to contend *see* FRANCE: History.) Perpetually anxious about her son's position. which was always threatened on the one hand by Guise ambitions and on the other by the pretensions of the Huguenot princes of the house of Bourbon and their allies, she did not hesitate to set the rival parties against each other when one group seemed to her too powerful. The house of Montmorency, however, on which she might have relied to hold the balance of power, was divided: the constable, Anne, duc de Montmorency, was a Catholic and eventually overcame his hostility to the Guises. whereas his nephews of the house of Chbtillon-Coligny were Huguenots. On April 1, 1560, Catherine had appointed Michel de L'Hospital as chancellor, and from 1560 to 1567 she sought to follow his policy of religious conciliation.

There can be no simple definition of Catherine's own religious policy. She had been brought up as a Catholic, but she was by no means a fanatical one; she cared more for power than for any doctrine. Her repeated efforts to reconcile Catholics and Huguenots may be regarded as reflecting a belief, such as was held by many of her contemporaries, in the possibility of peaceful coexistence between the two. On the advice of the chancellor de L'Hospital, she arranged the colloquy of Poissy (1561), which failed, however, to achieve any understanding between the disputing groups. The edict of Jan. 1562 and the peace of Amboise (1563) accorded a reasonable tolerance to the Huguenots.

The renewal of civil war in 1567 frightened Catherine and caused her to give more sympathy to the Catholic party. When she found, however, that the Huguenots could not be crushed by force of arms, she resorted again to a policy of conciliation (peace of St. Germain, 1570), began to negotiate her daughter Margaret's marriage to the Protestant Henry of Navarre (afterward Henry IV of France) and welcomed the admiral Gaspard de Coligny back to court. Coligny, however, then acquired such an influence over Charles that Catherine became alarmed, both at the diminution of her own influence and at the prospect of war against Spain, which Coligny was urging. She therefore fell back on the Guises. On Aug. 22, 1572, four days after Margaret's wedding to Henry of Navarre, an unsuccessful attempt was made on Coligny's life; and on Aug. 24, with Catherine's consent, the massacre of St. Bartholomew's day (*q.v.*) began. For Catherine the ultimate consequence of this was that the crown seemed to be identified with the Guise faction and could no longer count on ready support either from Huguenots or even from moderate Catholics against it.

Henry III, who succeeded his brother Charles in 1574. showed himself more independent of his mother but unable to control the Guises, who soon eclipsed both mother and son. A few days after his attempt to assert himself by the assassination of Henry de Guise (Dec. 23, 1588), Catherine died, at Blois, on Jan. 5, 1589.

Catherine brought from Florence her taste for luxury and beauty. She built and decorated the Tuileries in Paris and gave, as frequently as civil war permitted, sumptuous feasts *à l'italienne* at Fontainebleau, in the Louvre and in the Tuileries. There is an edition of her letters by H. de la Ferrière and G. Baguenault de la Puchesse, ten volumes (1880–1905).

CATHERINE OF VALOIS (1401–1437), queen consort of

Henry V of England. daughter of Charles VI of France by Isabella of Bavaria. was born in Paris on Oct. 27. 1401, and, with her brothers and sisters, was much neglected in childhood by reason of her father's frequent madness and her mother's selfish indifference. After his accession to the throne (March 1413), Henry V renewed the negotiations for his marriage to Catherine started by his father Henry IV. His demand for a large dowry and the restoration of Normandy and Aquitaine led to war, and the marriage did not take place until June 2, 1420. after the signing of the treaty of Troyes. Catherine was crowned in Westminster abbey in Feb. 1421 and gave birth to a son, afterward Henry VI, in the following December. She joined Henry in France in May 1422 and returned to England after his death in the following August, residing first at Windsor and later at Baynard's castle. London.

From about 1425 gossip associated Catherine's name with that of a Welsh squire, Owen Tudor, and they seem already to have been married when, in 1428. at the instance of Humphrey, duke of Gloucester. an act of parliament was passed forbidding her marriage without the consent of king and council. Tudor was imprisoned in 1436 and Catherine retired to Bermondsey abbey, where she died on Jan. 3,1437. By Tudor she had three sons and a daughter; the eldest son: Edmund, created earl of Richmond in 1452, was the father of Henry VII.

CATHODE, a "negative" electrode, the terminal by which electrons from a battery or other energy source enter an electrolyte, electron tube or any direct current load. *See* BATTERY; ELECTROCHEMISTRY; *see* also references under "Cathode" in the Index volume.

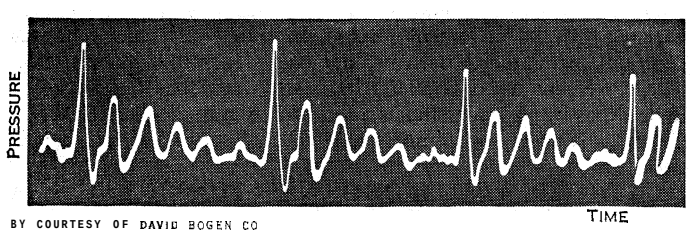
CATHODE-RAY OSCILLOSCOPE. This instrument makes use of a sharply focused electron beam to display scientific data on a luminescent screen similiar to that used in television.

As described in the article RADAR, the vacuum tube ordinarily used focuses the electrons emitted from a hot cathode into a narrow beam which serves as a pointer. The beam passes between two pairs of metal plates and is deflected in a horizontal direction by an amount proportional to the electrical voltage across one pair of plates while it is deflected vertically by the second pair. If desired, the intensity of the beam can be controlled by means of a third voltage placed on a metal mesh or grid near the cathode. After passing between the deflecting plates, the beam is allowed to impinge on a fluorescent screen which glows brightly at the point where the electrons hit it. The combination makes it possible to obtain a luminous graph relating the two applied voltages.

A typical application of the oscilloscope is illustrated by the accompanying figure. In order to form this pattern the voltage across the horizontal deflecting plates was changed at a uniform rate for about one thirtieth of a second, causing the spot to move from the left side of the screen to the right side with constant velocity.

At the same time the letter a as in "Britannica" was spoken into a microphone. The varying sound pressure at the microphone gave rise to a proportional voltage, and this after amplification was applied to the vertical plates resulting in a graph of the time variation of sound pressure.

Almost any graph can be plotted on the oscilloscope by generating horizontal and vertical voltages proportional to the lengths, velocities or other quantities to be studied. The main advantage of the device lies in the extreme speed with which events can be recorded: trace speeds of 200 in. in one-millionth of a second have been utilized.



BY COURTESY OF DAVID BOGEN CO

TIME VARIATION OF SOUND PRESSURE IN A SHORT a, AS IN "BRITaNNICA" (FIRST a)

Many variations of the oscilloscope tube have been made since the early one of Ferdinand Braun in 1897. Some for ultrafast measurements use patterns of microscopic dimensions; others for lecture purposes project the graphs on a motion-picture screen. It has become perhaps the instrument most generally used by radio laboratories and also by radio repairmen. It finds increasing use in almost all branches of engineering and science.

CATHODE RAYS are the streams of negatively charged particles leaving the negative electrode in a discharge tube containing a gas at a low pressure *(see* ELECTRICITY: *Magnetic Fields of Direct Currents: Masses of Electrons and Ions: Cathode Rays).* The cathode rays consist of electrons. Cathode rays have many applications, one of the chief being the excitation of X-rays by the impinging of swift electrons against a hard anticathode. This bombardment. besides exciting X-rays, generates a considerable amount of heat and the anticathode can be used as a cathode-ray furnace for melting small quantities of metal, etc. Forms of apparatus making use of the deflection of a beam of cathode rays by magnetic and electric fields are the cathode-ray oscilloscope (*q.v.*) or cathode-ray tube, which indicates the variation and values of an alternating current or voltage. and the cathode-ray manometer, in which a change of pressure is communicated to tourmaline (*q.v.*) crystals which become electrically charged and produce an electric field which is measured by a cathode-ray oscilloscope. The "picture" tubes of television and radar are other developments of the cathode-ray oscilloscope tube. *See* also ELECTRON TUBE. (H. B. LM.)

CATHOLIC, derived from a Greek word meaning "universal" and used by ecclesiastical writers since the 2nd century to distinguish the church at large from local communities or heretical and schismatic sects. A notable exposition of the meaning of the term as it had developed during the first three centuries was given by St. Cyril of Jerusalem in his *Catecheses* (348): the church is called catholic on the fourfold ground of its worldwide extension, its doctrinal completeness, its adaptation to the needs of men of every kind, and its moral and spiritual perfection. The theory that what has been universally taught or practised is true was first fully developed by St. Augustine in his controversy with the Donatists (393–420), but it received classic expression in a paragraph of St. Vincent of Lérins's *Commonitorium* (434), from which is derived the well-known formula "What all men have at all times and everywhere believed must be regarded as true." St. Vincent maintained that the true faith was that which the church professed throughout the world in agreement with antiquity and the consensus of distinguished theological opinion in former generations. Thus the term tended to acquire the sense of orthodox.

Some confusion in the history of the term has been inevitable as various groups that have been condemned by Rome as heretical or schismatic have not renounced their claim to the note of catholicity, so that in the modern world not only the Roman Catholic Church but also the Eastern Orthodox Church, the Anglican Church and a variety of national churches and minor sects claim to be catholic, if not the only true catholic church. From this point of view the meaning attached to the term catholic and the claim to catholicity will be conditioned by the theory of the nature and constitution of the church accepted, being rigid and exclusive or tolerant and comprehensive as that is rigid or tolerant. The earlier theologians of the Anglican Church were primarily interested in proving the agreement of Anglican theology with the teaching of the ante-Nicene fathers, but with the Oxford movement a school of theologians arose that interpreted the catholicism of the Church

of England in a much wider sense *(see* ENGLAND, CHURCH OF). A product of this school was the so-called "branch theory" of the church, which maintained that the Anglican, Roman and Eastern Orthodox churches were all branches of the one true catholic church, and that reunion could be achieved by concessions of these three divisions on controversial questions that divided them without affecting their catholic character. But this theory was repeatedly condemned by Roman theologians. It also failed to recommend itself to the Eastern Orthodox Church.

BIBLIOGRAPHY.—J. H. Newman, *Essays, Critical and Historical,* essay x, "The Catholicity of the Anglican Church"; C. Gore, *Catholicism and Roman Catholicism* (1923); *M.* J. Congar, *Divided Christendom* (1939).

CATHOLIC ACTION, in the words of Pope Pius XI, is "the participation of the laity in the hierarchic apostolate, for the defense of religious and moral principles, for the development of a wholesome and beneficent social action, under the guidance of the ecclesiastical hierarchy, outside and above political parties, with intention of restoring Catholic life in the family and in society" (1922). Four characteristics of this work usually are listed: (1) it must be organized; (2) it must be done by the laity; (3) it must be under the direction or "mandate" of the bishop; and (4) it must be the work of the church, in the fields of dogma, morals, liturgy, education and charity.

A distinction normally is drawn between general and specialized Catholic Action. General Catholic Action organizations, such as the Holy Name society or the Legion of Mary, are open to all Roman Catholics, or at least all of a given age. Specialized Catholic Action groups are limited to members of a given profession or interest group: workers, students, doctors, lawyers, married couples, etc. The most famous of the specialized groups is the Jocists (Jeunesse Ouvrière Chretienne; in English-speaking nations called the Young Christian Workers, Y.C.W.), founded by Father Joseph Cardijn in Belgium after World War I, an organized association of factory workers. The specialized movements attempt to bring Christian principles to the particular environments of which its members are part. They normally meet in small groups and discuss passages from the Scriptures and social problems, using the inquiry method of observation, judgment and action. In the United States the best-known specialized movements are the Christian Family Movement, the Young Christian Workers and the Young Christian Students.

Even though Pius XI could say that the Jocists "perfectly interpreted" the principles of Catholic Action, it is clear today that the specialized movements cannot claim a monopoly on the term. In an address to the World Congress of the Lay Apostolate, Pius XII suggested that the term be used in a generic sense to apply to all organized movements of the lay apostolate recognized as such either by the bishops on a national level or by the Holy See.

It is commonly held that besides Catholic Action in the strict sense there is a broader area of the lay apostolate involving activity in the temporal society in, for example, politics, labour unions and co-operatives — institutions that are not strictly ecclesiastical and not under the immediate authority of the hierarchy but that are open to the influence of Christian inspiration. In such work the layman acts as a Christian but not as a representative of the hierarchy.

See C. *K.* Murphy, *The Spirit of Catholic Action* (1943).

(W. J. Q.)

CATHOLIC APOSTOLIC CHURCH, a religious community that arose in England early in the 19th century. The name was intended by the members to express their unity with all Christians in the one universal church, not to designate any doctrinal separation from those holding the Apostles' Creed. There had been widespread prayer throughout Christendom for the outpouring of the Holy Spirit, especially in preparation for the second advent. The founders of this community believed that God's answer was a restoration of the gifts of the Spirit (I Cor. xii, 7–11), including prophecy, and also of the ministries of apostles, prophets, evangelists and pastors (Eph. iv, 11). The term "Irvingites" sometimes applied to the Catholic Apostolic Church is repudiated by its members; Edward Irving (*q.v.*), best known of the clergy who fostered these prayers, cared for those expelled from other bodies for the exercise of their spiritual gifts, but died in 1834 while the movement was in embryo. The work of reorganization was done by all the "apostles," but largely at the beginning by Henry Drummond whose house at Albury park, Surrey, became a centre of the movement. During 1832–35, 12 men were designated as apostles by others having a prophetic gift. On July 14, 1835, they were "separated" by the angels (bishops) of the local congregations to which they belonged, to engage with the ministers associated with them in a special work of blessing and intercession for the whole church. The apostles spent a year together studying the Scriptures, and then, by contacts with the Anglican, Roman Catholic, Eastern and Reformed churches, assimilated the special truths and forms of worship treasured by each. The result of these contacts was the production, in about the year 1836, of a testimony that warned of the judgments threatening through the existing conditions, ecclesiastical and political, and pointed to God's way of deliverance.

Churches were established throughout Europe. North America and Australia. Each church had an angel, priests and deacons, the duties of the last named including management of its temporal affairs. *The Liturgy and Other Divine Offices* provided services in which vestments, lights and incense were used. The ministers were supported by tithes. Ordinations ceased with the death of the last apostle on Feb. 3, 1901. In the early 1960s there were few ministers remaining, most churches were closed but members still cherished their hope. They explain their position by a comparison with the mission of John the Baptist. As he preceded the Lord's first coming. so this apostolic work witnessed to his second coming.

See E. Miller (a former member but later an opponent), *History and Doctrines of Irvingism* (1878); *P.* E. Shaw, *The Catholic Apostolic Church* (1946), *a* thesis by a nonmember.

CATHOLICOS, a title applied in eastern churches to certain ecclesiastical superiors; in earlier times it was sometimes used, like archimandrite and exarch, of a superior abbot. In the Syrian. Assyrian and Georgian churches the chief bishops held this title. In the Armenian church there are two: the supreme catholicos of Etzchmiadzin and the catholicos of Sis. In these churches the catholicos thus has the position of a superior patriarch: the title catholicos-patriarch is sometimes used. (H. M. W.)

CATHOLIC UNIVERSITY OF AMERICA, a national pontifical institution of higher learning at Washington, D.C., was founded at the third plenary council of Baltimore, Md.. in 1884, incorporated in 1887 and opened in 1889. *See* WASHINGTON, D.C.

CATHOLIC WORKER MOVEMENT, a Roman Catholic lay movement in the United States and Canada, emphasizing personal reform, radical agrarianism, absolute pacifism and the personal practice of the counsels stated in the Sermon on the Mount. The *Catholic Worker,* a monthly tabloid publication, was founded in 1933 by Dorothy Day at the instigation of Peter Maurin (d. 1949), who described himself as a peasant-philosopher and Christian radical. Maurin's program provided for round-table discussions of Christian social thought, the opening of houses of hospitality for all in need, and establishment of independent farming communes.

A group gathered in New York city under Miss Day's leadership put the program into action. Their example was followed by local groups in the United States and Canada, each of which operated independently. Before World War II there were 35 such groups, maintaining houses of hospitality and farming communes, scattered from Vermont to California. During the war the *Catholic Worker* maintained a strict pacifist position, but many young persons associated with the movement entered the armed services and houses of hospitality that had been in their charge went out of existence. The movement never regained its prewar influence but survived under Miss Day's leadership as a vital force in the Roman Catholic Church. It never sought nor was it granted ecclesiastical recognition. (J. C.)

CATHOLIC YOUTH ORGANIZATION (C.Y.O.), is an agency of the Roman Catholic Church serving youth in its religious, recreational, cultural and social needs; it was founded in Chicago in 1930 by Bishop Bernard Sheil. Membership is by participation,

and the range of activities is designed to appeal to all boys and girls, beginning at six years of age, with the objective of character development and delinquency prevention. The various diocesan C.Y.O. programs include, for example, orphans' homes, music departments, scholarships, vacation centres, lecture bureaus, cultural and social programs for high-school students and a variety of athletic activities.

The entirely autonomous diocesan C.Y.O. programs are affiliated with the National Council of Catholic Youth. (W. J. Q.)

CATILINE (LUCIUS SERGIUS CATILINA) (*c.* 108–62 B.C.), a contemptuous and decadent but courageous Roman aristocrat who turned demagogue and in 63 B.C. made an unsuccessful attempt to overthrow the government. He served under Pompey's father in the Social War of 89. acquired an unsavoury reputation under Sulla, was acquitted on a charge of incest with a vestal virgin in 73, became praetor in 68 and governed Africa in 67–66. Under prosecution for extortion, he could not stand for the consulship of 65 or 64, but was eventually acquitted.

Though later there was talk of a conspiracy (the so-called "first Catilinarian conspiracy") to murder the consuls and seize the government early in 65, the fact that M. Licinius Crassus at first supported Catiline as a candidate for the consulship of 63 (and, with Caesar, even bribed on his behalf) shows that he was not then considered the enemy of men of property. Because of the support of the optimates, the "new man" Cicero (*q.v.*) was elected, with Gaius Antonius Hybrida. Catiline was again defeated a year later, in July 63.

After this failure he planned by armed insurrection in Italy and arson in Rome to overthrow the government, cancel debts and seize power. Outside Rome he gained support, chiefly in Etruria (especially at Arretium [Arezzo] and Faesulae [Fiesole], where an impoverished former centurion of Sulla, Gaius Manlius, collected an army) and in Campania, from malcontents who were largely, but not exclusively, veterans of Sulla who had failed to succeed as farmers. In Rome Catiline attracted disappointed politicians, debtors, criminals and many discontented young men of good breeding. Cicero did not trust his colleague, a known associate of Catiline; nevertheless, despite the proclamation of military law (the "last decree") on Oct. 22 and Catiline's withdrawal from Rome on Nov. 8, after Cicero's first speech against him, the senate was not convinced of the danger until early on Dec. 3 when envoys of the Gallic Allobroges were arrested outside Rome with documents which incriminated the conspirators who had been left in Rome, including a praetor P. Cornelius Lentulus Sura, who had been consul in 71 and expelled from the senate in 70. The incriminated men were arrested and executed on Cicero's responsibility on Dec. 5, after a debate in the senate in which Cato (Uticensis), advocating the death penalty, carried the house against Caesar's speech in favour of life imprisonment. Of the various armies which took the field against the revolutionaries at Faesulae, now commanded by Catiline himself, the largest was under Gaius Antonius. When Catiline tried to get over the Apennines into Gaul in Jan. 62, he was engaged at Pistoriae (Pistoia) and was killed with most of his followers, fighting bravely against great odds.

CATINAT, NICOLAS (1637–1712), marshal of France, whose merit alone won him that dignity, was born on Sept. 1, 1637, son of a prominent Paris lawyer. Having joined the army, he received a captaincy in the French guards when Louis XIV noticed his courage at the siege of Lille (1667). From 1676 he was a staff officer employed by the marquis de Louvois, minister of war, in infantry organization; with his friend Vauban, he represented the thoughtful, hardworking background to the glory of king and army. A mission to Italy and a command at Casale (1682–87) taught him much about localities in Piedmont and about Victor Amadeus of Savoy. Lieutenant general in 1688, he shared with Vauban the real work in capturing Philippsburg on the Rhine. In 1690 the king and Louvois chose him for the small corps in the Alps. In fierce frontal attack (Aug. 18) at Staffarda he routed the duke of Savoy. He captured Susa and then proposed and executed the skilful diversion which took Nice. In March 1693 six great nobles and Catinat were made marshals. After a long defensive period in the Alpine valleys, reinforcements enabled him to save Pignerol (Pinerolo) in a bayonet fight at the battle of Marsaglia (Oct. 4). He was old and ill when the king sent him to Italy in 1701 at the beginning of the War of the Spanish Succession. When, for lack of troops. he retreated before Prince Eugène, Michel Chamillart, minister of war, sent the younger marshal de Villeroi to supplement him. Catinat indignantly watched Villeroi's failures. A wound sent Catinat back to France, and the king gave him the German command for 1702. He soon had to retire. He died at St. Gratien on Feb. 25. 1712. (I. D. E.)

CATION, a positively charged particle or ion which moves toward the negative electrode (cathode) during an electrolysis or an electrical discharge. The cation consists of a single atom or a group of atoms (radical) and bears a specific number of unit positive charges equal to its electrovalence. The silver ion (Ag^+) and the ammonium ion (NH_4^+) are both univalent cations while the mercurous ion (Hg_2^{2+}) and the cupric ion (Cu^{2+}) are bivalent cations. In solution the ion is usually in combination with a number of the solvent molecules. *See* also ELECTRICITY, CONDUCTION OF: *Conduction in Liquids;* ELECTROCHEMISTRY. (J. B. Ps.)

CATLIN, GEORGE (1796–1872), U.S. artist and author who specialized in painting American Indian scenes, was born July 26, 1796, at Wilkes-Barre, Pa. He practised law for a short time, but in 1823 turned to portrait painting, in which he was self-taught. Catlin had been interested in Indian life from his boyhood and in 1829 began a series of visits to various tribes, chiefly in the plains. He made more than 500 paintings and sketches, which he exhibited in a tour of the U.S. and Europe. In 1541 he published the two-volume *Letters and Notes on the Manners, Customs, and Condition of the North American Indians,* illustrated with many engravings.

In later years Catlin traveled through South and Central America, adding sketches to his collection. He died Dec. 23, 1872, in Jersey City, N.J. The bulk of the Catlin collection, which is mainly of ethnographic and historical interest, was acquired by the National museum. Washington, D.C.

His other works included *Catlin's North American Indian Portfolio: Hunting, Rocky Mountains and Prairies of America* (1845); *Catlin's Notes of Eight Years' Travels and Residence in Europe* (1848); *Life Among the Indians* (1867); *Last Rambles Amongst the Indians of the Rocky Mountains and the Andes* (1867).

See Harold McCracken, *George Catlin and the Old Frontier* (1959); Marvin C. Ross (ed.), *Episodes From Life Among the Indians and Last Rambles* (1959), both with illustrations.

CATO, MARCUS PORCIUS (called THE CENSOR) (234–149 B.C.), Roman statesman, orator and the first Latin prose writer of importance, whose reactionary and anti-Hellenic policy was opposed to the ideas exemplified by the Scipio family. Born of yeoman stock at Tusculum, he was bred to agriculture and fought in the Second Punic War, but his oratorical and legal skill and his rigid morality attracted the notice of L. Valerius Flaccus, who helped him to a political career at Rome. Quaestor under Scipio Africanus (204). aedile (199), praetor in Sardinia where he suppressed usury (198), this "new man" was elected consul for 195 with his friend Flaccus. As consul he opposed in vain the repeal of a measure that restricted female extravagance (*lex Oppia*) and then in an extensive and bitter campaign he repressed an insurrection in his province of Spain, for which he was granted a triumph. In 191 he served with distinction under Manius Acilius Glabrio at Thermopylae in the war against the Seleucid king Antiochus III, but later he denounced Glabrio and Q. Minucius Thermus in the law courts; after discrediting these men, who were political supporters of the Scipios, he attacked L. Scipio and Scipio Africanus (*q.v.*) and broke their political influence. This success was followed by his election to the censorship of 184, again with Flaccus as colleague.

His censorial activity reveals his policy, which aimed at pre-

serving the mos maiorum ("ancestral custom") and combating the Greek influences encouraged by, *e.g.*, the Scipios and T. Quinctius Flamininus, which Cato believed were undermining older Roman standards of morality. He passed measures against luxury and revised the list of the senate with exceptional severity; he checked the tax gatherers, and promoted much public building including the Basilica *Porcia* (the first basilica in Rome). His censorship impressed later generations, but his policy was too reactionary; his anti-Hellenic attitude was retrograde and lacked wide support. He continued to preach his social doctrine and to fight political battles in the law courts, being himself prosecuted several times. Thus he supported such measures as the lex Orchia against luxury (181) and the lex *Voconia* (169) which checked the financial freedom of women: he attacked M. Fulvius Nobilior for his conduct of the censorship of 179 and Sulpicius Galba (consul 144 B.C.) for his cruelty in Lusitania in 151, and spoke against the Athenian philosophers who visited Rome in 155. In later years he may have somewhat moderated the rigidity of his life and become more receptive of Greek influences: he certainly turned to moneymaking and capitalist farming on a considerable, if disguised, scale. Although he wished to protect the well-being of the provincials, his attitude to foreign affairs was narrowly Italian. He rejected the liberal philhellenic policy of the Scipios and wished to have as few contacts with the Greek east as possible. Thus in 167 he supported the granting of independence to Macedonia and opposed the idea of declaring war on Rhodes. But his embassy to Carthage (probably 153) convinced him that the revived prosperity and strength of Rome's old enemy constituted a new threat: constantly repeating the advice "Carthage must be destroyed," he lived long enough to see war declared on Carthage in 149.

A traditionalist who held the family in high regard as an institution. he was a hard husband, a strict father and a cruel master. He made a great contribution to Latin literature, being the author of the first history of Rome in Latin; but his only surviving work is a treatise on agriculture (De agri cultura) written about 160 B.C. It dealt with the production of wine, oil and fruit and with grazing, but although it contains details of old customs and superstitions, it was a modern and practical handbook based on Cato's own experience of the capitalist farming that was developing in Latium and Campania. The *Origines,* in seven books of which only a few fragments survive, related the traditions of the foundation of Rome and other Italian cities and treated Rome's history to his own day. In the later books he included some of his own speeches, but at the same time he omitted the names of generals in order to emphasize the corporate achievement of the state. If he proclaimed a simple style(rem *tene,* verba *sequentur:* "Keep to the subject and the words will follow"), he was not untouched by Greek influences, which can also be detected in his speeches. Of these he published over 150, but only meagre fragments survive. He also compiled an encyclopaedia and Praecepta ("maxims") for his son, and works on medicine, jurisprudence and military science. He wrote a Carmen de *moribus* in verse, but the verse proverbs, known as *Catonis* disticka, belong to imperial times. Thus if Cato's contribution to political life was conservative and narrow, failing to recognize or meet the needs of his day, his influence on the growth of Latin literature was immense.

CATO, MARCUS PORCIUS (called UTICENSIS) (95–46 B.C.), great-grandson of Cato the Censor and a leader of the optimates (the senatorial nobility) who tried to preserve the existence of the republic against powerful individuals, in particular Caesar. On the death of his parents, M. Porcius Cato was brought up in the house of his uncle, M. Livius Drusus (tribune 91). After serving in the ranks against Spartacus (72) and as military tribune in Macedonia (67), he became quaestor (64?), and showed so much zeal in managing the public accounts that he obtained a provincial appointment in Asia. He admired the discipline which L. Licinius Lucullus (*q.v.*) had enforced in his own eastern command, and supported his claims to a triumph, while he opposed the pretensions of Gnaeus Pompeius (*q.v.*). As tribune designate for 62 he supported the prosecution of Murena for bribery, and voted for the execution of the Catilinarian conspirators, thus incurring the resentment of Caesar. As tribune he opposed Metellus Nepos (who proposed the recall of Pompey to restore order) and increased the doles of cheap corn.

Cato's stubborn opposition to the wishes of Pompey, Caesar and Crassus helped to bring about their coalition in the so-called "first triumvirate." Cato's attempt, with Bibulus, to obstruct Caesar's agrarian legislation proved unsuccessful. Yet he was still an obstacle of sufficient importance for Pompey, Caesar and Crassus to desire to get rid of him. At Caesar's instigation he was sent to annex Cyprus (58). On his return two years later he continued to struggle against their combined powers in the city and became involved in scenes of violence and riot. As praetor in 54, he endeavoured to suppress bribery, in which all parties were equally interested. He failed to obtain the consulship of 51, and had decided to retire from public life when the civil war broke out in 49. He realized that the sole chance for the free state lay in supporting Pompey, whom he had formerly opposed. He was entrusted with the defense of Sicily, but finding it impossible to hold the island he joined Pompey at Dyrrachium. He was not present at Pompey's defeat by Caesar at Pharsalus, but after the battle he led a small remnant of their forces to Africa. After a famous march through the desert, he shut himself up in Utica, and even after the decisive defeat of the republican forces at Thapsus (46) he determined to keep the gates closed till he had evacuated his adherents by sea. When the last transports had left, he committed suicide.

During his last moments he had been reading Phaedo, Plato's dialogue on the immortality of the soul, but his own philosophy had taught him to act upon a narrow sense of immediate duty without regard to the future. He believed that he was placed in the world to play an active part, and when disabled from carrying out his principles, to retire gravely from it. He had lived for the free state, and it now seemed his duty to perish with it. He was a doctrinaire and obstructionist, an upright leader of the optimates in a corrupt age, and if he lacked constructive ideas he did not fail in courage nor in recognizing Rome's responsibilities to its provinces. His only surviving composition is a letter to Cicero (Ad Familiares, xv, 5). Immediately after his death Cato's character became the subject of discussion: Cicero's panegyric Cato was answered by Caesar's bitter Anticato. M. Junius Brutus (the assassin), dissatisfied with Cicero's work, produced another on the same subject; in Lucan's *Pharsalia,* Cato is represented as a model of virtue and disinterestedness. The Stoic nobles of the early principate regarded him as their saintly patron.

CATO, PUBLIUS VALERIUS (b. *c.* 100 B.C.), Roman poet and grammarian, was the leader of the "new" school of poetry (poetae novi, as Cicero calls them). Its follo ers rejected the national epic and drama in favour of the short mythological epics (*epyllia*), elegies and lyrics of the Alexandrian school. The great influence of Cato is attested by the anonymous lines quoted by the biographer Suetonius in his De grammaticis:

> *Cato grammaticus, Latina Siren,*
> *Qui solus legit ac facit poetas.*
> ("Cato the grammarian, the Latin Siren,
> sole critic and creator of poets . . .")

The compliments paid to his verse by contemporary poets also bear witness to his pre-eminence. According to Suetonius, Cato was a native of Cisalpine Gaul and lost his property during the Sullan disturbances. He lived to a great age and at the end of his life was very poor. Nothing is known of his grammatical treatises.

In the *Indignatio* (probably a prose work) he defended himself against the accusation that he was of servile birth.

Of his poems two titles survive, the *Lydia* and the *Diana* or *Dictynna*. Among the minor poems attributed to Virgil, however, is one called *Dzrae* (divided into two parts, *Dirae* and *Lydia*, by F. Jacobs). The *Dirae* consists of imprecations against the estate of which the writer has been deprived, and where he is obliged to leave his beloved Lydia; in the *Lydia*, on the other hand, the estate is envied as the possessor of his charmer.

Joseph Scaliger was the first to attribute the poem to this Cato, on the ground that he had lost an estate and had written a *Lydia*. Neither this attribution nor that to Virgil is acceptable. Probably the two poems were composed by an unknown author about 40 B.C.

CATS, JAKOB (1577–1660), Dutch poet, a writer of emblem books and didactic verse whose place in the affections of his countrymen is shown by his nickname. "Father Cats," was born in Brounershaven, Nov. 10, 1577. He took his doctor's degree in law at Orleans, practised at The Hague and, after visits to Oxford and Cambridge, settled in Zeeland, where he accumulated nealth by land reclamation. Becoming a magistrate, he was successively pensionary of Middelburg and Dordrecht and, from 1636 to 1651, grand pensionary of Holland. He took part in diplomatic missions to England, in 1627 to Charles I and in 1651–52, unsuccessfully, to Cromwell. His education, interests and political career gave him an international outlook, and he was in sympathy with such English Puritan writers as Henry Smith, Thomas Gathaker, William Gouge and especially Joseph Hall, whom he had met at Cambridge.

Cats was primarily a writer of poetic emblem books (*q.v.*) a type of literature popular in the 17th century, which consisted of woodcuts or engravings accompanied by verses pointing a moral. He used the emblem book to express the ethical ideas which the early Dutch Calvinists thought important, especially about love and marriage. By being the first to combine emblem literature with love poetry, and by his skill as a storyteller, he achieved enormous popularity. The sources on which he draws are chiefly the Bible and the classics, and occasionally Boccaccio and Cervantes.

His first book, *Sinn'-en minne-beelden* (1618), contained engravings with text in Dutch, Latin and French. Each picture has a threefold interpretation, dealing with what were for Cats the three elements of human life: love, society and religion. Perhaps his most famous emblem book is *Spieghel van den ouden ende nieuwen Tijdt* (1632), from which most of the quotations that have become household sayings are taken. It is written in a more homely style than his earlier works, in popular rather than classical Dutch. Two other *works — Houwelyck* (162 j) and *Trou-Ringh* (1637) — are rhymed dissertations on marriage and conjugal fidelity. the first describing the six stages of a woman's life, the second illustrating its theme by a series of well-told popular tales. In one of his last books. *Ouderdom, Buytenleven en Hojgedachten op Zorgh-vliet* (1655), Cats wrote movingly about old age.

Cats died at his country home, Zorgh-vliet, near The Hague, on Sept. 12, 1660. *See* DUTCH LITERATURE.

See P. J. Meertens, *Letterkundig Leven* in *Zeeland in de XVIe en de eerste helft van de XVIIe eeuw* (1943); G. A. van Es in *Geschiedenis van de Letterkunde der Nederlanden* (1949). A selection of Cats's works was translated into English by R. Pigot (1865). (J. C. B. C.)

CAT'S-EYE, any one of several distinct minerals valued as gem stones, their common characteristic being that when cut with a convex surface they display a luminous band. like that seen by reflection in the eye of a cat (chatoyancy). Precious, oriental or chrysoberyl cat's-eye, the rarest of all, is a chatoyant variety of chrysoberyl (*q.v.*) showing in the finest stones a very sharply defined line of light (*see* GEM). Quartz cat's-eye is the common form of cat's-eye, in which the effect is due to the inclusion of parallel fibres of asbestos. It is obtained chiefly from Ceylon, but, though coming from the east. it is often called occidental cat's-eye — a term intended simply to distinguish it irom the finer oriental stone. It is readily distinguished by its inferior density, its specific gravity being only 2.65, while that of oriental cat's-eye is as high as 3.7.

A greenish fibrous quartz, cut as cat's-eye, occurs at Hof and some other localities in Bavaria.

Crocidolite cat's-eye is a beautiful golden-brown mineral, with silky fibres, found in Griqualand West, South Africa, and much used as an ornamental stone, sometimes under the name of South African cat's-eye or tiger's-eye. It consists of fibrous quartz, coloured with oxide of iron, and results from the alteration of crocidolite, a variety of asbestos.

Corundum cat's-eye is star sapphire in which the star is imperfect and reduced to a luminous zone, producing an indistinct cat's-eye effect. (F. W. R.)

CATSKILLS, an area of low mountains and hills made famous by Washington Irving's character Rip Van Winkle. They are located in southeastern New York, which includes most of Greene and Ulster counties, and eastern Delaware and northern Sullivan counties. The name is derived from the Dutch name *Kaaterskill* (Wildcat creek). the name of one of the better-known cloves, or rocky glens, in the area. The eastern border of the Catskills is an escarpment that rises abruptly and with few breaks 1 500 to 2 000 ft. above the Hudson valley. The other borders are less distinct, but are marked by a general decrease in both elevation and relief to the more subdued terrain of the northern Appalachian plateau. The summits of the Catskills rise from 1,200 to 3,000 ft above the adjacent valley bottoms. and a score or more summits lie between 3.000 and 4.000 ft. above sea level. The highest elevation is Slide mountain (4,185 ft.). Structurally, the Catskills resemble the rest of the northern Appalachian plateau, consisting of gently dipping sedimentary rocks The much greater elevations in the Catskills are mainly due to the durability of the massive beds of Devonian sandstone and conglomerate that protect the weaker shales underneath from erosion.

New York state owns about 250,000 ac. of land in the Catskills. and the state constitution requires that this area remain in its natural condition. The unusually steep-sided valleys and massive rounded uplands comprise a large natural wilderness within easy reach of the New York metropolitan region. Heavily mantled with mixed broadleaf and needle-leaf forests, the area's beauty is made more spectacular by the deeply scored cloves. Improvements within Catskill state park include campsites, trails and a ski run. The more accessible, privately owned parts of the Catskills are developed intensively for recreation, and include youth camps, summer cottages. exclusive hotel resorts, hunting and fishing lodges and facilities for winter sports. A feature of the southern Catskills is a large Jewish resort colony, concentrated between Livingston Manor and Monticello, N.Y. The artificial lakes in the Catskills include the Ashokan, Downsville, Neversink, Rondout and Schoharie reservoirs, important to the water supply of the New York metropolitan region.

CATT, CARRIE CHAPMAN (née LANE) (1859–1947), U.S. leader in the woman suffrage and peace movements, was born in Ripon, Wis., Jan. 9, 1859. She graduated from Iowa State college, Ames, in 1880. After studying law for a short time, she served as a high-school principal (Mason City, Ia.) in 1881, and became one of the first women superintendents of schools in 1883. She married Leo Chapman (1884; d. 1886). an editor, then George W. Catt (1890; d. 1905), an engineer. From 1887 to 1890 Mrs. Catt worked to organize the Iowa Woman Suffrage association.

Mrs. Catt reorganized the National American Woman Suffrage association on political district lines, 1905–1915, and from 1915 until her death she was its president. In working for woman suffrage on a national scale. she trained women for direct political action and marshalled seasoned campaigners. After bitter opposition in the senate, congress submitted the 19th amendment to the states in June 1919 and it was ratified in Aug. 1920. *(See*

WOMEN'S SUFFRAGE: *The United States.)* In this period Mrs. Catt reorganized her suffrage association, *2,000,000* strong, as the League of Women Voters (*q.v.*).

Meanwhile, in *1902* she had founded the International Woman Suffrage alliance and was its president until *1923.* In *1911–12,* accompanied by Aletta Jacobs of the Netherlands, she made a feminist voyage around the world.

In *1925* she enlisted the co-operation of *11* national women's organizations in the National Committee on the Cause and Cure of War, to urge U.S. participation in world organization for peace. She was also a strong advocate of world disarmament and prohibition. Following World War II, she was keenly interested in the United Nations and used her influence to have qualified women placed on certain commissions. Mrs. Catt died in New Rochelle, N.Y., on March *9, 1947.*

Her works include *Woman Suffrage and Politics: the Inner Story of the Suffrage Movement* (1923), and with others, Why *Wars Must Cease (1935).*

See Mary Gray Peck, *Carrie Chapman Catt: a Biography (1944).* (*A.* F. Ro.)

CATTANEO, CARLO (1801–1869), an Italian intellectual and publicist of great influence during the *Risorgimento,* was born in Milan on June *15, 1801.* After practising as a schoolmaster, he graduated in law from the University of Padua in *1824.* His interests were always wide: a pupil of the philosopher G. D. Romagnosi, he early began to publish articles on many subjects and was especially interested in technical, commercial and agricultural improvement. He has been described as the first Italian positivist, but he was always more alive to practical and concrete issues than to speculative ones. Much of his writing appeared between *1839* and *1844* in his periodical *Il Politecnico.* Though often rash and excitable in his private relationships, Cattaneo in *Il Politecnico* usually advocated moderate and cautious practical reforms as the best means of Italian national regeneration. In spite of this, early in *1848,* the Austrian censors wanted him to be deported. Only the intervention of the viceroy, the archduke Rainer, saved him. He was therefore still in Milan when the March uprising took place. Being well known, he was made chief of the revolutionary council of war during the famous "Five Days." Soon enraged by the behaviour of Charles Albert (*q.v.*) of Sardinia, he came to believe that the revolution was being sacrificed to Piedmontese ambitions *(see* ITALY: *History).* After the Austrian recovery of Milan in August, Cattaneo left the city for Paris and later settled at Lugano. He lived by teaching and journalism until *1859,* when he returned to Milan to refound *Il Politecnico.* In *1867* he was elected a deputy to the parliament of the kingdom of Italy but could not bring himself to take the oath of loyalty to the house of Savoy. He died on Feb. *6, 1869,* at Castagnola, near Lugano. Among his many publications, the most important are the *Notizie naturali e civili su la Lombardia* (1844), which won him election to the Lombard institute, and *L'Insurrection de Milan en 1848 (1848*; new ed. by C. Spellanzon, *1949).* There are editions of his letters, *Epistolario,* by R. Caddeo, four volumes (1949–56), and of his historical and geographical works, *Scritti storici e geografici,* by G. Salvemini and E. Sestan *(1957).*

See A. and *J.* Mario, *Carlo Cattaneo (1884)*; *A.* Levi, *Il positivismo politico di Carlo Cattaneo (1928).* (*J. M.* Rs.)

CATTANEO, DANESE DI MICHELE (1509–1573), Italian sculptor, born at Colonnata, near Carrara, was a pupil of Jacopo Sansovino in Rome. It is said he was taken prisoner three times by the imperialists during the sack of Rome in *1527.* He fled to Florence, where he carved the marble bust of Alessandro de Medici, and then joined Sansovino in Venice. He was employed by his master on sculptures for the Libreria di San Marco and the Zecca, among his works being the "Apollo" crowning the fountain in the Zecca; the "St. Jerome" in San Salvatore; and the figures on the tombs of Leon Loredano in SS. Giovanni e Paolo and of Andrea Badoer in the Scuola di S. Giovanni Battista. He also worked in Padua for the church of Sant' Antonio. The fine bust of Pietro Cardinal Bembo *(1547)* on the tomb there is by his hand. At Verona he built the tomb of Gian Fregoso in S. Anastasia with the help of his distinguished pupil Gerolamo Campagna. He returned to Padua in *1572,* but death cut short his work on the reliefs for the Capella del Santo, which were completed by Campagna.

Cattaneo was also a poet; his poems *Dell'amor di Marfisa (1562)* were praised by Torquato Tasso. His grandson Niccolo collected his writings.

CATTELL, JAMES McKEEN (1860–1944), U.S. psychologist, whose interests and influence oriented United States psychology toward use of objective methods, study of individual differences, preparation of mental tests and application of psychology to practical affairs, was born at Easton, Pa., May *24, 1860.* He studied at Lafayette college in Easton and at the University of Leipzig, and from *1888* to *1891* held the first professorship in psychology at the University of Pennsylvania, Philadelphia. As professor at Columbia university, *1891–1917,* he exerted personally and through his students a major influence on the development of U.S. psychology and psychologists.

From *1885* to *1900* Cattell did substantial research on reaction time, reading and perception, association, psychophysics and individual differences. Later he made statistical studies of scientists and published in several editions the directory *American Men of Science (1906–39).* His work on scientists was related to a strong interest in scientific co-operation. Concern for practical utilization of psychology led him to found in *1921* the Psychological corporation, the first of many groups applying psychological techniques to practical affairs; he served for many years as its president. Through much of his life Cattell also edited successfully various scientific journals. He died Jan. *20, 1944.* (R. L. TE.)

CATTLE. The word "cattle," which etymologically merely denotes a form of property and is practically synonymous with "chattel," is by common usage a generic term for bovine animals. The animals included under the term are usually divided into the following six groups: (1) buffaloes (India, Africa, etc.); (2) bison (Europe and North America); (3) the yak (Tibet, etc.); *(4)* the gaur, gayal and banteng (India and southeast Asia); *(5)* eastern and African domesticated cattle (Brahman or zebu); and (6) western or European domesticated cattle. In addition to the two last-mentioned groups the India buffalo, yak, gayal and banteng have been domesticated. Apart from the buffaloes, which constitute a relatively primitive and rather distinct type, all the species enumerated are rather closely related. The buffaloes do not hybridize with the members of the other groups, but all the rest can be interbred without difficulty and the hybrids, or at least the female hybrids, are quite fertile. (For zoology *see* BOVIDAE. *See* also AUROCHS; BANTENG; BISON; BUFFALO; GAUR; GAYAL; OX; YAK.)

The ox was one of the earliest of all animals to be domesticated for agricultural purposes. In western Europe there is no evidence of domestication in Paleolithic times but there are plentiful remains in the Swiss lake dwellings and other deposits of Neolithic age. Domesticated cattle existed in Egypt about *3500* B.C., and possibly much earlier, while Babylonian remains have been assigned to still more remote ages.

In all likelihood the wild ancestors of European domesticated cattle belonged to one or more of the subspecies of the aurochs or urus *(Bos primigenius)* which were widely distributed in Europe, western Asia and northern Africa in prehistoric times. However, the earliest known domesticated ox in Europe was a small, slenderly built animal, with short horns, bearing all the marks of a prolonged existence under the care of man and contrasting markedly with the contemporary wild urus. The conclusion has been drawn that the original domestication did not occur in western Europe; probably the little ox *(Bos longifrons* or *Bos brachyceros),* together with corresponding types of sheep and pig, was brought from Asia by Neolithic man in his migrations. Later, in the Bronze Age particularly, a new and larger type of cattle, showing a closer resemblance to the European wild ox, made its appearance. Probably the *Bos longifrons* had been "graded up" by crossing with the wild type. The process was, however, not universal, and even modern breeds like the Jersey and Brown Swiss show a marked resemblance to the Neolithic type.

Whether the Brahman *(Bos indicus)* had a separate origin from

the western ox is not known; some authorities seek to relate it with the banteng or gayal. In shape, colour, habits and even in voice it presents many points of difference from western cattle; but the most striking of these, such as the presence of a hump, or the upward inclination of the horns, are not constant. Breeds exist in Africa, Spain, China and elsewhere which are intermediate between Brahman and European cattle, but it is likely that some of these, at least, have arisen from crossing.

The economic value of cattle arose from the docility of the males for draft and the aptitude of the females for supplying milk in excess of the requirements of their offspring. Ultimately they were utilized as food but this was in a sense secondary, and among some peoples their flesh was regarded. for religious or other reasons, as unfit for human consumption. The breeding and rearing of cattle for the primary purpose of supplying meat is a modern development.

Terminology. — In the terminology used to describe the sex and age of cattle, the male is first a bull-calf and if left intact becomes a bull; but if castrated he becomes a steer and in about two or three years grows to be an ox. The female is first a heifer-calf, growing into a heifer and becoming a cow. The age at which a steer becomes an ox and a heifer a cow is not clearly defined and the practice varies. A freemartin is a female bovine born as a twin to a bull and is usually barren. Both in the male and female emasculation is practised because the animals are assumed to fatten more readily; in the case of bulls intended for use as working oxen the object of emasculation, as in the case of stallions, is to make them quieter and more tractable in work.

BREEDS

The exact definition of a breed of cattle is difficult, although the term is commonly used and in practice well understood. It may be said generally to connote a particular type of animal which for a long period has been bred only with those of the same, or closely similar, type, and has hereditary characteristics which are transmissible to its offspring. In every breed, however long established, instances of atavism may and do occur, but these are eliminated and do not affect its general purity. Breeds have been established by generations of cattle breeders aiming at the attainment and preservation of a particular type and working on the principle that "like begets like." It is only within relatively recent times that the laws of heredity founded on the researches of Gregor Mendel have been studied as a science. *(See* also ANIMAL BREEDING.)

There are many old established breeds in Europe, for example, the Charolais and Normande of France, the Holsteins of the Netherlands, the Campagna di Roma of Spain and many others, but the British breeds are of particular interest because of their influence in building up the vast herds which furnish the supplies of beef on which other countries are largely dependent. *(See* BEEF.)

BEEF BREEDS

Shorthorn. — The Shorthorn is an example of improvement of beef cattle by selection within a breed. In the last quarter of the 18th century two brothers. Charles and Robert Colling, farming in Durham county, Eng., began to improve the local cattle of the Teeswater district of that county. Their efforts were supplemented by other constructive breeders, notably Thomas Bates and Thomas Booth in Yorkshire. As many cattle of this breed have been exported to other countries from Durham, they are often called by that name.

Shorthorns may be solid red, red with white markings, white or roan. Roan colour results from a mixture of red and white hairs. The Shorthorn is the only modern breed that has a roan colour, making this colouring an index of Shorthorn breeding. Colour, scale and blocky conformation are characteristics of the breed.

Shorthorns are found in practically every country of the world. They are numerous in North America, in South America (particularly in Argentina), in Europe, being the most popular breed in the British Isles, and are bred to some extent in Europe; in Australia they have long met with favour and have also been bred quite extensively in South Africa. In the United States, Shorthorns are most numerous in the corn belt states but have been used rather extensively in other areas for grading up native or scrub cattle.

The *Shorthorn Herdbook,* the first of its kind for cattle, was begun in 1822 by George Coates. It was published as a private compilation until 1874 when it was taken over by the Shorthorn society. The first U.S. *Shorthorn Herdbook,* which registers all types of Shorthorns except the Milking type in the United States, was published in 1846 and in 1867 the first Canadian *Shorthorn Herdbook* was issued.

Strains of Shorthorns have been selected for milk and butterfat production, as well as beef. In the United States they are called Milking Shorthorns; in Canada, Dual-Purpose Shorthorns; in England and Australia, Dairy Shorthorns. In England many herds of Shorthorn cattle still show the beef and milk combination developed by the early improvers of the breed. In the United States throughout large areas in the middle west as well as in parts of the New England states, Milking Shorthorns are popular.

The Polled Shorthorn, as the name implies, is a strain within the breed possessing all of the Shorthorn characteristics except horns. This strain of polled cattle was developed in the United States in the late 1880s and early 1890s through the use of naturally hornless registered Shorthorns found within the breed. While beef characteristics have been emphasized, many good milkers have been developed among Polled Shorthorns. Cattle of this breed were exported from the United States to Scotland during the late 1950s under a special federal research permit.

Lincolnshire Red Shorthorns are a specialized type of the original Shorthorn stock.

Hereford. — The Hereford is the product of generations of breeding work on the part of landed proprietors and tenant farmers of the fertile valleys in the county of Hereford, Eng. The breed is thought to have descended from the primitive cattle of the country. Herefordshire is noted for its luxuriant grasses, and in that district for many generations the Hereford was bred for beef and draft purposes. The characteristic colour, red with white face and white markings, has been fixed for only a comparatively short time. When the first herdbook was published in 1846, the editor grouped the breed into four classes: mottle faced; light gray; dark gray; and red with white faces. Twenty-five years later all but the last had practically disappeared. The outstanding characteristics of the breed are uniformity of colour, early maturity and ability to thrive under adverse conditions.

Herefords were first introduced into the United States in 1817 by Henry Clay, who imported a young bull, a cow and a heifer to his home in Kentucky. In 1860 Herefords were introduced into Canada by F. W. Stone of Guelph, Ont. In the range areas of North America, it has become the predominating breed from Canada on the north to Mexico on the south. In Great Britain it is chiefly bred in Herefordshire and vicinity although herds of this breed are found in Scotland, Ireland and Wales. The Hereford also has met with much success under range conditions of Australia, New Zealand, Argentina. Uruguay and southern Brazil.

The first *Hereford Herdbook,* published in 1846 as a private enterprise, was taken over by the Hereford Cattle Breeders' Association of England in 1884. The American Hereford Cattle Breeders' association was organized in 1881, and in 1934 the official name was changed to American Hereford association.

In the United States a polled Hereford strain was developed by Warren Gammon of Iowa by selecting naturally hornless registered Herefords. The number of Polled Herefords has increased rapidly and herds are found throughout the United States, including Hawaii. Polled Herefords have been exported to Canada, Mexico, South America, the Philippines and Australia. The American Polled. Hereford association is the national organization in the United States.

Angus. — This breed of black, polled beef cattle, for many years known as Aberdeen Angus, originated in the county of Aberdeen, Scot. Its ancestry is obscure. The breed was improved and the present type of the cattle fixed early in the 19th century by a number of constructive breeders among whom Hugh Watson and William McCombie were the most famous.

The characteristic features of the breed are black colour, polled

head, compact and low set body, fine quality of flesh and high dressing percentage. The Angus is a beef breed of the highest rank and for years purebred or crossbred Angus steers have held high places of honour at the leading fat stock shows in Great Britain and the United States. This breed was introduced into the United States in *1873* and after that date its influence spread widely in that and other countries.

The first *Polled Herdbook* of Aberdeen Angus cattle was issued in Scotland in *1862.* The American Aberdeen Angus Breeders' association was organized in *1883;* in *1959* the name was changed to American Angus association.

Devon.—Devons are neat, compact and symmetrical in form with a deep red colour. For centuries they were raised in their native home of north Devon, Eng., primarily for draft purposes, but early in the 19th century were improved for beef production. The *Devon Herdbook* was founded in *1851.* In south Devon, where the breed is also known as South Ham, the cattle are larger and are bred primarily for dairy purposes. Because of their adaptability and hardiness, Devons have found favour in New South Wales, South Africa, Brazil, the United States, Uruguay and the West Indies.

Dexter.—This breed, a subvariety of the Kerry, is thought to have arisen from crossing red cattle of the north Devon type with the native Kerry of southern Ireland. The Dexter is small, cows weighing from *500* to *800* lb. and bulls not more than *900* lb. The bodies are compact and round and the legs quite short. The colour is either black or red. The breed attained some popularity in southern Ireland and in England for both beef and milk production.

Galloway. — The beginnings of this breed of polled black cattle originating in Scotland are as obscure as those of the Angus. Although its native home is the ancient province or kingdom of Galloway in southnestern Scotland, it probably had a common origin with the Angus. The two breeds have much in common but the Galloway is distinguished by its coat of curly black hair. The breed has never attained the prominence of other beef breeds but has been used extensively in producing blue-gray crossbred cattle, obtained by breeding white Shorthorn bulls and Galloway cows. There is also a Belted Galloway, with a white belt encircling the body behind the shoulders. Organized effort to promote Galloway cattle began in *1862* with the publication of the *Polled Herdbook.* The first four volumes of this book included both Galloway and Angus. In *1877* an independent Galloway Cattle society was formed. The American Galloway Breeders' association was organized in 1882.

Highland or West Highland. — The native home of this breed, sometimes called Kyloes, is the upland region of western Scotland. Little is known of their early history though it is generally believed they are the aboriginal cattle in that district. A typical West Highland animal with wide spreading horns, long shaggy coat. sturdy frame, thick mane and heavy dewlap makes an impressive picture. The colour is variable, being yellow, red, black, brindle and a mixture of red and black with a tawny red predominating. No other breed of British ancestry equals the West Highland for hardiness and ability to thrive on scanty pasturage. Cattle of this breed are comparatively small and slow in maturing. The breed is not distributed widely outside its native home although some exportations were made.

Longhorn.—The Longhorn breed of Britain is to be distinguished from the longhorn cattle once numerous on the western ranges of the United States. The latter were descended from cattle brought to America by the Spaniards and are practically extinct. But a common characteristic of both is the excessive horn growth from which the name is derived. In England the Longhorn has been improved by selective breeding, but numerically the breed is of little importance. Shorthorns have largely displaced these cattle in most districts.

Sussex. — The Sussex breed, found in Sussex, and to some extent in Kent, Surrey and Hampshire, is descended from the original stock of the country and has probably undergone little change in outward appearance since the middle ages. The Sussex is a heavy muscular animal, dark red in colour and is valued as a good grazer where beef rather than milk is sought. It did not attain wide distribution and even in England was not widely bred outside its own county.

Red Poll. — The Red Poll breed represents a blending of the cattle which were common in Norfolk and Suffolk counties, Eng., for centuries. The horned, red, hardy Norfolk cattle were noted for their fleshing qualities while the larger framed, hornless Suffolks were exceptionally good milkers. The merging of these two bloodlines about *1846* provided the foundation for the present breed. The aim of breeders was to produce medium-sized, hardy, hornless cattle, red in colour, smooth and compact, and equally good as producers of beef and milk. The usefulness of the breed is well established the world over. Exportations nere made to the United States, Canada, South Africa, Australia, New Zealand and South and Central America.

Welsh. — The Welsh breed is black with fairly long horns. Until the beginning of the 20th century there were two types known as North and South Welsh, but they were amalgamated in *1904* when the Welsh Black Cattle society was formed and a common herdbook established. The cattle mature rather slowly but grow to a large size and furnish high-quality beef.

Africander. — The Africander is widely distributed throughout South Africa. Although the origin of the breed is not definitely known, it probably goes back to the Indian *(Bos indicus)* species and not to European *(Bos taurus)* cattle. The breed was produced by the *voortrekkers* who valued their oxen above all other farm possessions. Before and after the Great Trek *(1836)* a friendly rivalry existed among the farmers of South Africa to possess oxen that were uniform in conformation, shape of horns and colour markings, and that had hard, flinty feet and the straight easy action so desirable for trekking long distances.

The Africander has a hump over and slightly in front of the shoulders. This hump is more rounded, and blends more smoothly into the shoulder than that of Brahman cattle. The colour may vary from dark to light red but dark red is preferred. Later requirements aere for an early maturing, uniformly fleshed beef animal that maintains the hardiness of the earlier type. The Africander Cattle Breeders' society was formed in *1912* for the regulation and control of registrations of Africander cattle in the South African *Studbook.*

Brahman (Zebu). — The term Brahman was selected by the United States department of agriculture as the name of all breeds of Indian cattle in the United States. In South America and in Europe these cattle are known as zebus. Brahman cattle are characterized by a prominent hump above the shoulders, and an extreme development of loose, pendulous skin under the throat, on the dewlap. navel and the sheath of males. This pendulous skin provides a greater surface area and gives better heat regulation, which is important in hot climates. The rump is drooping. The head is long and narrow, ears are long and carried in a drooping manner, and horns differ widely according to sex and strain. The colour varies from shades of gray to black. Indian cattle. like those of Europe, vary in size, form and symmetry under the influence of local differences in climate, soil and available feed. In their native home. Indian cattle are used primarily for work and milk production. The majority of people of India are averse to killing them for food. Humped cattle of India were imported into the United States as early as *1849,* but the importations that had the widest influence were made in *1906* and in *1924.* These cattle were used in the Gulf coast area of the United States for crossing with the improved breeds of beef cattle to produce a type adapted to the hot, humid conditions prevailing in that region.

Santa **Gertrudis.**—This breed of cattle was developed by the King ranch in Texas. It resulted from crossing Brahman bulls of about seven-eighths pure breeding, and purebred Shorthorn cows. Over a period of years, beginning in *1920,* selective breeding was practised in which preference was given to red colour without sacrificing type and conformation. Santa Gertrudis cattle are. for the most part, solid red in colour with occasional small white markings, usually on the forehead or in the region of the flanks. They possess a slightly higher percentage of Shorthorn breeding than of Brahman.

Santa Gertrudis cattle are the heaviest of the beef breeds when

raised under similar conditions. They have great depth and length of body, with more loose skin about the neck, brisket and navel than the breeds of strictly British origin. They proved to be highly adaptable to the semitropical gulf coast.

Brangus.—This name is derived from the parental breeds, Brahman and Angus. The breed had its origin in the 1930s in the southern part of the United States, where a number of breeders employed a breeding program similar to that used by the King ranch in developing the Santa Gertrudis breed. The objective was to obtain animals carrying about three-eighths Brahman and five-eighths Angus blood.

The Brangus is usually black in colour and tends to resemble the Angus in conformation. It has a nearly smooth top line and has less dewlap and less loose skin about the navel than does the Brahman. Although total numbers of Brangus cattle have been relatively small, the breed proved itself useful in crossing with the native cattle of the coastal region. Like the Angus, the breed is polled. The American Brangus Breeders' association was organized in 1949.

Dairy Breeds

Holstein-Friesian. — The Holstein-Friesian breed originated in north Holland and Friesland. Its chief characteristics are large size and black and white spotted markings, sharply defined rather than blended. These cattle are believed to have been selected for dairy qualities for about 2,000 years. They have long been widely distributed over the more fertile lowlands of continental Europe where they are valued highly for their milk-producing ability. The milk, however, has a relatively low butterfat content.

When the Dutch colonized New York, they brought their cattle with them, but after the colony was ceded to the British crown and English settlers brought their own cattle, the Dutch cattle disappeared. The first exportation from Holland to the United States was in 1795, but the largest importations were made between the years 1879 and 1887. These cattle were registered in the *Holstein Herdbook* and the *Dutch Friesian Herdbook.* In 1885 the two associations united in the Holstein-Friesian Association of America, the largest dairy breed association in the United States.

The breed is widely distributed but usually is concentrated in areas having good fluid milk markets. Besides being well established in the lowland countries of western Europe, in England and throughout the United States, cattle of this breed are numerous in Canada, Australia, South America and South Africa. With the emphasis on the production of lean beef, the Friesian either as a purebred or crossed with a beef bull is playing an increasingly important part in beef production in Great Britain.

Jersey. — Within sight of the coast of Normandy in the English channel is a group of four small islands, the native home of two distinct breeds of dairy cattle — the Jersey and Guernsey. The island of Jersey, the largest of the group, has an extremely mild climate and cattle can be outdoors most of the year. It is believed that the Jersey is descended from French cattle. Its colour is usually a shade of fawn or cream but darker shades are common. The fawn or cream has been attributed to the cattle of Normandy and the darker colour to those of Brittany. Jersey cattle are relatively small in size. The purity of the breed was recognized in 1763, and in 1789 a law was passed prohibiting the importation of cattle into Jersey except for immediate slaughter. They have been introduced in large numbers into England, one of the earliest herds being formed in 1811. The first exportation of registered Jerseys to the United States was in 1850.

The Jersey is adaptable to a wide range of conditions and its distribution is world-wide. Jersey milk is remarkably rich in butterfat, and for that reason animals of this breed are in demand for crossing with native stock to improve the quality of milk. The Royal Jersey Agricultural society, founded in 1833, assumed supervision of the breed on the island of Jersey, while the English Jersey Cattle society, organized in the 1870s, became the registry association in Great Britain. The American Jersey Cattle club was organized in 1868, and under the supervision of this organization a register-of-merit system was established in 1903.

Guernsey. — The island of Guernsey, another of the Channel Islands, is the home of the Guernsey breed. Like the Jersey, this breed is thought to have descended from the cattle of nearby Normandy and Brittany. All the cattle of the Channel Islands were at one time known as Alderneys. After laws had been enacted prohibiting the importation of cattle to the islands except for slaughter, the Jersey and the Guernsey breeds came to be recognized. Guernsey cattle are fawn coloured, marked with white, and are larger than the Jersey breed. Guernseys are noted for the production of milk of a pronounced yellow colour.

The first Guernseys were exported to the United States in 1830, but it was not until 1880 that the export business became extensive. Numbers of Guernsey cattle are to be found also in England, Australia and Canada. The Royal Guernsey Agricultural and Horticultural society supervises the breed on the island of Guernsey, maintaining two herdbooks, one for general registration and the other for advanced registry. The American Guernsey Cattle club was organized in 1877 and supervises the advanced registry system and pedigree registration of Guernseys in the United States.

Brown Swiss. — The Brown Swiss is native to Switzerland and the breed is probably one of the oldest in existence. While these cattle are classified as a dairy breed in the United States. they are often considered a dual-purpose breed as they are heavier boned and thicker fleshed than the cattle of the Channel Islands breeds. The colour of the Brown Swiss varies from light brown or gray to a dark shade of these colours. Brown Swiss cows are good, persistent milkers, producing milk of average quality as compared with other breeds of dairy cattle.

This breed has found favour in Italy, Austria, Hungary, the United States, Mexico and the South American countries. Brown Swiss were first introduced into the United States in 1869. The Brown Swiss Cattle Breeders' Association of America, organized in 1880, supervises the registration of pedigrees and the register of production of Brown Swiss cattle in the United States.

Ayrshire.—The Ayrshire breed originated in Ayr county, southwestern Scotland, in the latter part of the 18th century and is considered to be the only special dairy breed to have originated in the British Isles. The body colour varies from almost pure white to nearly all cherry red or brown with any combination of these colours. The beef qualities of the breed are of secondary importance. The distribution of the breed is wide, and exportations have been made to many countries. It is strongly represented in Canada, the northeastern part of the United States and also on the continent of Europe, in South Africa. Australia, New Zealand, Puerto Rico, Mexico and Central America. The Ayrshire Breeders' Association of the United States of America fostered herd testing and a system of selective registration for approved sires of the breed.

Pedigree Cattle Breeding

Many breeds and subbreeds of cattle are distributed throughout the world. On the continent of Europe alone, between 40 and 50 distinct breeds are described. Great Britain is the home of 11 breeds which have been exported to the United States, and in addition as many more minor breeds of local importance. Selective breeding seems to have begun in England about 1770 as the result of the work of Robert Bakewell (*q.v.*), who was not only a pioneer breeder but is reported to have kept records on the progeny of his cattle in order to show their progress. The activities of the Colling brothers in improving the Shorthorn breed rank next to those of Bakewell in livestock improvement. The work begun by these breeders spread over Great Britain and had a lasting influence on livestock improvement throughout the civilized world. As the fame of British cattle spread to other countries, a demand was created for these improved breeds. They were exported to found new herds and to improve native cattle. Practically all modern pure breeds of farm animals became established before the practice of registration, issuing of pedigrees and publication of their respective herdbooks was begun.

The development of breed registry associations in the United States differs somewhat from that of Great Britain. where herdbooks remained open, for a time at least, to all animals that met certain requirements as to breed characteristics. The British

practice tended to broaden the base of the breed. Cattle breeders continue to direct their efforts toward further improvement of breeds. Individual excellence and pedigree are accepted as only a part of breed improvement, because the essential test of an animal's breeding ability is in the performance of its progeny. Nonselective testing and the use of progeny-tested animals for breed improvement received increasing attention by constructive breeders. The herd test and advanced register, or record-of-merit testing introduced by breeders of dairy cattle, the get-of-sire class, feedlot performance test for rate of gain and feed efficiency of the progeny, and slaughter test of the progeny of beef breeds are all useful in determining the utility value of registered cattle. Differences of opinion on the use of impartial ratings with pedigrees are usually based on whether the information gained by such measures has enough practical usefulness to be worth the cost.

Cattle breeding is rapidly changing from an art based on observation to a science based on Mendelian laws of inheritance and the application of the theories of population genetics.

The setting up of well-defined types by early breeders, followed by rigid selection of breeding stock, was the basis of present breeds. Most of the subsequent improvement in the common livestock of the norld was accomplished by the mating of purebred sires to common females. Even in this procedure best results were obtained when the females were selected with care and a high-quality registered sire was used. The effectiveness of this system of breeding is shown by the type of cattle found in the range area of the United States where most breeders have used registered bulls of the same breed for many generations. The result has been a uniform type of cattle in demand by feeders of the corn belt states.

Because of the long generation interval and the low reproductive rate of cattle. it is necessary for most breeding progress to result from the use of superior sires. Artificial insemination allows the extensive use of sires and thus has made possible an increase in the rate of improvement of cattle. The average dairy sire in an artificial insemination stud is mated to approximately 2,000 cows annually. Sires in natural service are mated to only 30 to 40 cows per year. From this comparison it is evident that sires placed in artificial insemination should be superior sires. In attempting to place superior sires in artificial insemination, various sire testing programs have been developed. For dairy sires some of these tests are the daughter average, the dam-daughter comparison, the contemporary comparison and special test stations. Where the daughters are distributed over many herds and the dams are not selected, the daughter average is a sufficient test. When these conditions are not met, it is necessary to use one of the other methods of testing. The special test stations would be of greatest help in areas nhere only a small fraction of cons are on test. Most testing of beef sires is done at special test stations. In choosing sires for use in artificial insemination, more emphasis is placed on the utilitarian measures of performance, such as meat and milk production, and less emphasis on breed type.

The mating of closely related animals proved highly successful in some cases and disastrous in others. Bakewell followed this practice, using animals of high merit, whereas Bates was not so successful. Breeders in the 20th century have followed this breeding practice only after using a sire so superior that a successor of equal or superior merit was difficult or impossible to find *(see* INBREEDING). Maintaining this standard of excellence by close breeding may also be possible when both parents are of high individual merit. Instances have occurred in which a new breed has been produced by crossing two or more well-established strains. In theory, the object of crossing two strains is to combine desirable characteristics possessed by each. Limiting factors are time and the expense of keeping the large numbers of animals necessary to fix the type. This system of breeding was followed in developing Polled Herefords. Polled Shorthorns, and the Santa Gertrudis and Brangus breeds. A purebred sire has often been mated to purebred or high-grade females of another breed for the production of market animals and commercial milk cows. Such crosses usually result in increased performance. Generally speaking, crossbreeding produces increased vigour over the mean of the parental breeds.

See also LIVESTOCK JUDGING; AGRICULTURAL EDUCATION AND RESEARCH.

NUTRITIVE REQUIREMENTS

The food requirements of cattle vary, depending to some extent on the purpose for which the animal is maintained. The larger part of the feed is required for normal body functions; the remainder is available for growth, fattening, reproduction and lactation. Sources of nutritive energy, protein, fat, minerals and vitamins are essential for the proper nutrition of cattle. Investigations of maintenance and production requirements have been of a highly technical nature and the results have provided feeding standards. As good pasture has a high content of protein, minerals and carotene, and is an economical source of nutritive elements, pasture improvement has received much attention *(see* GRASSLAND). Pasture not only tends to maintain fertility in the herd but also provides the cows with a surplus of various nutritive essentials that can be stored in their bodies and thus ensure them against such deficiencies that might occur from the feeding of low-quality roughage during the winter. Feeders found that a liberal feeding of protein is necessary for high milk production, with a tendency to supply this element in the form of a vegetable protein from green leafy legumes. Vitamin and mineral requirements also received considerable attention. The minerals most likely to be needed to supplement feeds are common salt, calcium, phosphorus, iodine and iron. Other minerals are sometimes required. Calcium and phosphorus requirements are closely associated, since the two elements together in nearly fixed proportions are stored in the bones and secreted in the milk. If either element is deficient in the feed, both bone building and milk secretion are hindered. Phosphorus deficiency is commoner than calcium deficiency, since the soil and hence the forage in some parts of the world is deficient in this element. Where cattle subsist almost entirely on the range it is practical to supply phosphorus (and perhaps other minerals) from sources other than grain and forage *(see* also FERTILIZERS AND MANURES: *Influence of Fertilizers on Livestock and Human Food).*

As with minerals, vitamins are perhaps of greater concern in rations for growing and breeding stock than for fattening cattle. Vitamin A appears to be the one most likely to be deficient in feeds for dairy cows, or for steers fattened in areas where green leafy forage and yellow grain are limited. Newborn calves have no reserve of this vitamin but it is supplied by colostrum. Carotene, the yellow plant pigment from which vitamin A is formed in the animal body, occurs in close association with the green colouring matter of pasture plants and other green forage. As a rule, the greener the colour of the hay, the greater the amount of carotene, but hay stored for long periods tends to lose much of its carotene though still retaining most of its colour. Cattle must have an adequate supply of vitamin D to enable them efficiently to assimilate and utilize the calcium and phosphorus in their feed. It is believed that farm animals of all types generally receive an adequate supply of this vitamin by exposure to the sun's rays, depending on the intensity of the sunlight and its concentration of ultraviolet rays. *See* also FEEDS, ANIMAL.

MANAGEMENT, CARE AND HANDLING

The management and care of beef and dairy cattle are highly specialized. In the United States, for example, the feeding of beef cattle in the corn belt states, the production of feeder and grass-fat cattle on the ranges of the west, and the production of milk in the dairy sections of the northeast and middle western states all require a high degree of skill with different equipment and in management. The range area is composed of plains and mountainous areas useful for grazing purposes.

Practical ranch operation commonly involves deferred and selective grazing to maintain the supply of forage, selection and culling of the breeding herd, controlled breeding, a mell-arranged water supply and the production of winter feed where necessary. All of these practices are conducive to the best condition of the breeding herd and a satisfactory crop of vigorous calves capable of making good gains.

On a well-managed ranch, a relatively high percentage of the investment is in the livestock rather than equipment. The range may be fenced or not, depending on the type of ranch. Corrals are used where large numbers of cattle are handled. In connection with the corral, a chute for holding cattle while being branded or vaccinated is desirable. Range cattle are branded as a means of identification. Brands are recorded by the owner in the state where the ranch is located *(see* BRANDING). Rounding up cattle or working the range is a time of great activity, especially when fat cattle are to be shipped, the breeding herd shifted to winter range, and calves separated from their dams to be sold as feeders or held on the ranch. The winter range is usually a pasture or range that offers some natural protection from storms and provides some grass or browse for grazing. When necessary, maintenance rations of cheap roughages or small amounts of protein supplement are fed during the winter or early spring.

The fattening of beef cattle in the United States is closely related to the production of calves and yearlings in the range area. The most important feeding area is the corn belt states of the middle west where calves or yearlings from the western ranges are fattened in drylots. These cattle are fed corn and hay in feed bunks with some silage, salt and minerals. Most feeders, to make a successful enterprise, combine hogs in the feedlot with the cattle whenever whole grains are being fed. The use of finely ground grains in cattle feeding, a practice commoner than formerly, may make unprofitable the combining of cattle and hogs in the feedlot. In the late 1950s the technique was developed of using hormones or hormonelike substances to increase the rate of daily gain. These were supplied either in the feed or by direct implantation in the animal's body. Inexpensive barns or sheds, feed racks and an adequate water supply are the most important items of equipment and together with feed and labour go to make up the feeding operation. By the early 1960s the use of such mechanical aids as self-unloading wagons, silo unloaders and conveyors for filling feed bunks were being employed on large farms and in large-scale commercial feeding operations to reduce man-hours of labour *(see* CROP-PROCESSING MACHINERY).

In the United States the maintenance of comparatively small breeding herds of registered cattle in many of the other states also requires specialization. Their care, management and breeding differ from those under which commercial range herds are handled. The registered cattle are produced primarily for breeding purposes and receive more attention and are fed more liberally as a rule than cattle produced primarily for slaughter.

Breeding herds are made up of highly selected individuals conforming to the standards of the breed. Cows are bred to calve throughout the year, but most of the calves are born late in winter or early in the spring. During the summer months these calves run with their dams and may be fed grain while on pasture. Cows are usually maintained on pasture and roughage produced on the farm. Young cattle are given every opportunity to develop as considerable income is derived from their sale, especially bulls, either at private sale or auction.

Dairy farming in the United States is usually distinct from the production of beef, but a certain amount of overlapping occurs. Approximately two-thirds of the dairy cows are specialized dairy breeds; the remainder consists of cattle of beef, dual-purpose and mixed breeding. In commercial herds, replacements are commonly bought but some breeders raise their own replacements in order to improve production and lessen the danger of disease. Good cattle-and modern methods of care and management are important factors in profitable dairying (see DAIRY INDUSTRY).

DISEASES OF CATTLE

The greatest universal hazard in rearing cattle is disease. The most destructive diseases are caused by bacteria, protozoa and filterable viruses, but fungi, parasites, poisons, malnutrition and metabolic disturbances also exact heavy tolls.

Contagious Diseases. — Foot-and-mouth disease (*q.v.*), or aphthous fever, probably is the most widespread and contagious of all infectious maladies of animals. Cattle and other cloven-footed animals, including swine, sheep and goats, are susceptible. The most rigid quarantines and restrictions of movements of animals and animal products frequently fail to control the spread of the malady. In the United States the immediate slaughter of affected and exposed animals completely eradicated the infection on a number of occasions after 1900. This procedure was followed in England and adopted from time to time in some countries on the European continent, but the proximity of areas in which the disease is established is a constant hazard.

The disease is prevalent in most of Europe, Asia, Africa and South America. In countries where the disease is enzootic or where infection recurs from adjoining infected countries, total eradication has been found economically unfeasible and measures to control the infection include prophylactic vaccination, using variations of the product originally developed by S. Schmidt of Denmark and O. Waldmann of Germany in the late 1930s. About 60,000,000 vaccinations of cattle, goats, sheep and swine were applied by the Mexico-United States Commission for Eradication of Foot-and-Mouth Disease in Mexico, where after a five-year campaign, the disease was eradicated in Sept. 1952. Approximately 1,000,000 animals were destroyed in the co-operative program financed by both countries.

Rinderpest (*q.v.*), or cattle plague, a highly fatal, contagious, filterable-virus disease, was widespread in the 19th century practically all over the world but did not occur in North America. Vigorous eradication measures were widely applied, and in the second half of the 20th century it remained oply in Asian countries and parts of Africa. The disease is characterized chiefly by severe gastrointestinal involvement. Control in countries where the disease is enzootic involves quarantines and use of preventive vaccines prepared with chemically inactivated tissue or virus attenuated by propagation in other species — goat, rabbit or chicken embryo.

Contagious pleuropneumonia, or lung plague, was prevalent in many countries before the 20th century. By means of quarantines and slaughter of affected animals, the disease was eradicated from Europe and North America. It persisted, however, in Asia, Australia and parts of Africa.

Tuberculosis (*q.v.*) in cattle is a widespread, chronic, bacterial disease caused by an organism closely related to that of human tuberculosis. Almost all mammals, including man, are susceptible to bovine tuberculosis. Cattle are relatively insusceptible, however, to the human and avian types of the infection. The bovine infection may be readily transmitted by infected milk and milk products. Pasteurization is an effective safeguard. The disease may be successfully controlled by quarantines and repeated application of the tuberculin test. The test is accurate to a high degree even in mildly affected animals. The infected animals may be placed in quarantine, thus reducing spread of the disease, or they may be slaughtered at once. The latter procedure, with quarantines and disinfection of infected premises, was followed in the United States. The extent of bovine tuberculosis, formerly averaging about 5% and much higher in some areas, was reduced to less than 0.2% in all parts of the U.S. Repeated testing is necessary, however, as long as any infection remains.

Brucellosis (*q.v.*), or Bang's disease, which is characterized by abortion and sterility, is a problem wherever breeding operations are conducted. The infection, caused by *Brucella abortus,* is prevalent to a greater or lesser extent throughout the world. Diseased animals are detected by tests of the blood or milk. Control may be effected by segregation or destruction of affected animals, with appropriate quarantine measures, with or without the aid of preventive vaccine. The most widely used vaccine is prepared with the so-called strain 19 of *Brucella abortus* which is especially useful in immature cattle. Man frequently contracts the infection, referred to as undulant fever, from infected cattle, swine or goats.

Mastitis, or inflammation of the udder, rivals all bacterial infections of dairy cattle in the aggregate loss it causes. It occurs in acute and chronic forms. Death rarely results but the infection, which may be due to streptococci, staphylococci or other organisms, causes alteration and material reduction of the milk secretion. Since the development of the sulfonamides and other

antibiotic agents such. as penicillin and streptomycin, considerable success has been achieved in treatment. The disease may be controlled by segregation of infected animals, sanitation and careful milking practices.

Johne's disease, or paratuberculosis, is a chronic disease of cattle, which causes considerable loss in Great Britain, North America and other parts of the world. The causative organism, Bacillus (*Mycobacterium*) *paratuberculosis,* produces a chronic dysentery which results in progressive emaciation and death in many cases.

Two acute, fatal. bacterial diseases of cattle are anthrax (*q.v.*) and black quarter (blackleg). These occur in quite definitely defined districts in widely separated parts of the world. In these enzootic areas, vaccination with biological products prepared from the respective causative bacteria is generally effective in control. Anthrax may be acquired by other animals, including man.

Others. — Bovines, like other ruminants: possess a complex stomach having four divisions, the largest of which, the rumen, or paunch, has a capacity of as much as 50 gal. (see RUMINANT). This anatomical peculiarity is responsible for frequent digestive disturbances. Bloat and impaction are common. Cattle also frequently suffer from perforations of the stomach by foreign metallic objects which are commonly ingested with the feed and cause death if they penetrate the heart sac.

Calves, especially those of the dairy breeds, commonly develop fatal intestinal disorders and pneumonia unless special care is taken in feeding, sanitation and housing.

Dairy cows are prone to develop metabolic diseases. Milk fever, or parturient paresis, is the commonest of these. It occurs usually just after parturition and invariably results in death if treatment is not given. Another such disease is acetonemia, or ketosis, in which there are acidosis, subnormal quantities of sugar in the blood and faulty fat metabolism, with excess formation of ketones in the body.

Cattle may be afflicted with other diseases, infectious and otherwise, which cause considerable losses. These include actinobacillosis and actinornycosis (wooden tongue and lumpy jaw); cowpox, which is closely related to smallpox; epithelioma (cancer eye); infectious keratitis (pinkeye); leptospirosis; leukemia; pasteurellosis (hemorrhagic septicemia); rabies; rickets; trypanosomiasis; mucosal diseases; vibriosis; rhinotracheitis (red nose); and external and internal parasites. (M. S. SN.; W. B. N.)

Parasites of Cattle. — Parasites of cattle, belonging to such zoological groups as protozoa, worms and arthropods, cause extensive economic loss. Successful control measures generally consist in attacking the various parasites at vulnerable points in their life cycles by following recommended management procedures including treatment.

The diseases caused by protozoa, or one-celled animals, are especially important in tropical and subtropical countries. Among the most destructive are piroplasmosis or tick fever, anaplasmosis, surra and nagana, or sleeping sickness (*q.v.*), transmitted by the tsetse fly (*q.v.*). All these diseases are caused by minute parasites that live in the red blood cells or in the blood stream, and are usually transmitted by bloodsucking arthropods such as ticks and flies; they are generally characterized by fever and destruction of the red cells. The monetary loss from these diseases is great. However, hy the second half of the 20th century practically all of these losses had been eliminated in the United States through eradication of cattle ticks by systematic dipping of ticky cattle in standardized arsenical dips. Control of other protozoan blood diseases, especially those transmitted by flies, proved less satisfactory.

Other protozoan diseases of cattle are coccidiosis and venereal trichomoniasis. Coccidiosis is an intestinal disease characterized by bloody diarrhea and emaciation. It is caused by sporozoan parasites that infect the inner lining of the intestine. The infection is largely in calves and is controlled by strict sanitation. Venereal trichomoniasis is caused by a small flagellate organism that is transmitted through coitus. Infection results in early abortion, sterility and other breeding difficulties.

The worm parasites are flukes, tapeworms and roundworms. The common liver fluke (*Fasciola* hepatica) lives in the bile ducts; it causes extensive damage to the liver and general unthriftiness of the infected animal. The complicated life history and control measures are the same as those discussed under diseases and parasites of sheep. (See SHEEP: Parasites of Sheep.)

Several species of tapeworms infest the digestive tract but these worms do not appear to cause extensive injury. The larval or bladderworm stage of the common tapeworm (*Taenia saginata*) of man occurs in the muscles and causes a condition known as "measly beef." Cattle acquire the infestation by swallowing the eggs while grazing on pastures that have been contaminated by excrement from tapeworm-infested persons.

Important roundworm parasites are lungworms, stomach worms and intestinal threadworms of which there are numerous species. All these worms are acquired by picking up the infective larvae while grazing. Roundworms cause unthriftiness, anemia and digestive disturbances, especially diarrhea. The injurious effects are most pronounced in calves and in animals under two years of age.

Sanitation, pasture rotation and avoidance of overstocking tend to control worm parasites. Medicinal treatment with anthelmintic drugs, especially phenothiazine, is of value in controlling stomach and intestinal roundworms.

The arthropod parasites include the ticks, mites, lice and flies. Aside from ticks and certain Aies that transmit tick fever, anaplasmosis and other protozoan blood diseases, the most injurious arthropod parasites are the warble flies, *Hypoderma lineatum* and H. bovis. These flies lay their eggs on the legs of cattle. In a few days the eggs hatch and the young larvae penetrate the skin. They then migrate through the tissues of the body and eventually reach the back. There the larvae or grubs, as they are sometimes called, complete their growth and produce swellings. The skin over each swelling becomes perforated and the holes so formed permit the larvae to breathe and to escape when they have completed their growth.

A somewhat similar fly larva (Dermatobia *hominis*), commonly referred to as nuche or gusano, infests cattle in Central and South America. The adult fly does not deposit its eggs directly on the skin as do the warble flies, but lays them on the bodies of mosquitoes and other bloodsucking insects. The eggs hatch and the larvae crawl onto the skin when the insect is feeding. Hatching is stimulated by the warmth of the victim's body. Ox warbles may be controlled to some extent by manual extraction of the grubs or by the use of dusts, dips or washes containing insecticidal substances such as rotenone. Research was underway in the early 1960s on the internal administration of insecticides for the destruction of larvae in the animal tissues. Since the heel fly does not travel far from the place where it emerged from its pupal case, community control programs have been found effective.

Other arthropods such as ticks, mites, lice and bloodsucking flies inflict considerable injury to animals by abstracting blood and causing irritation to the skin. Such parasites living habitually on their hosts may be controlled by the use of insecticidal dips, washes or dusts; flies are best controlled by destruction of their breeding places and by sprays. (E. W. PE.; W. B. N.)

CATTLE POPULATION

Approximately two-thirds of the world's cattle are in Europe, Asia and Africa while slightly less than one-third are found in the western hemisphere. The countries which lead in cattle population are India, the United States, Brazil, the U.S.S.R. and China. Cattle population in most European countries declined during World War II but showed rapid recovery following the war.

On all continents expansion of cattle numbers was noted during the early 1960s. Rapid gains occurred in the U.S.S.R., North America. South America and Africa, with a lower rate of increase in European countries. The cattle population of the world had reached nearly 1,000,000,000 head.

The increase in cattle numbers was reflected in larger outputs of beef and veal in the United States, the U.S.S.R., western Germany, France and the United Kingdom. The United States is by far the largest producer of beef and veal, the output being nearly one-third of the world supply. In Africa and South America. the expansion of modern meat-packing facilities and improvement of

transportation were incentives toward further development of the cattle industry there. Larger world milk production also accompanied the increase in cattle numbers. After the mid-1950s production was 20% above the 1934–38 yearly average. The United States, France, the Federal Republic of Germany (west Germany) and the United Kingdom are the largest producers of milk. New Zealand produces the most milk per capita, while Denmark, Ireland, Finland and Australia also are intensive dairy countries. Consumption of milk and milk products (milk-equivalent basis) is greatest in Ireland, Finland, New Zealand, Sweden, Australia and Canada.

A marked rise in registered cattle in the United States after World War II reflected a strong market for improved breeding stock. Among the beef breeds. new registrations of purebred Angus, Hereford and Polled Hereford increased from 582.000 to 825.000 in the ten-year period beginning 1550. New registrations of purebred dairy cattle showed a marked rise for Holstein-Friesians. from 181.000 to 274.000 for the same period, reflecting markets favouring milk for bottling rather than milk for butter-making. Among the dairy breeds registration of males declined markedly during the 1950s and at the end of this period comprised only 8%–12% of the total. Evidently the decline resulted from the increased use of artificial insemination and type-improvement programs sponsored by the breed associations. See also references under "Cattle" in the Index volume.

CATTLEYA, a genus of 40 or more species of tropical orchids that grow on other plants, although not as parasites. These large, showy, brilliantly coloured flowers are grown extensively in greenhouses and are the most popular of the florists' orchids. Several species and a large number of hybrids that are frequently richer in colour and more floriferous than the parents are extensively grown. *See* also ORCHID. (J. M. BL.)

CATULLUS, GAIUS VALERIUS (84?–54 B.C.) was the greatest lyric poet of Rome. As regards his names and the dates of his birth and death, the most important external witness is that of Jerome, in the continuation of the Eusebian *Chronicle.* Under the year 87 B.C. he states that Gaius Valerius Catullus. lyric poet, was born at Verona and under 57 B.C. he states that Catullus died at Rome when 30 years of age. There is no controversy as to the gentile name, Valerius. Suetonius, in his *Life of Julius Caesar,* mentions the poet by the names "Valerium Catullum." Other persons who had the cognomen Catullus belonged to the Valerian gens; *e.g.,* M. Valerius Catullus Messalinus, an informer in the reign of Domitian, mentioned in the fourth satire of Juvenal.

Inscriptions show. further, that Yalerius was a common name in the native province of Catullus and belonged to other inhabitants of Verona besides the poet and his family. Scholars have been divided in opinion as to whether his praenomen was Gaius or Quintus. and in the best manuscripts of the poems the volume is called simply *Catulli Veronensis liber.* For Gaius there is the undoubted testimony. not only of Jerome, which rests on the much earlier authority of Suetonius, but also that of Xpuleius. In support of Quintus a passage was quoted from the *Natural History* of Pliny, but the praenomen Quintus is omitted in the best manuscripts, and in other passages of the same author the poet is spoken of as "Catullus Veronensis."

Internal evidence shows that certain poems mere written two or three years after 57 B.C., the date of Catullus' death according to Jerome. Thus poem cxiii was composed in 5j B.C., lv either in that year or later, while xi. xxix. and xlv all appear to be written after Caesar's first invasion of Britain (55 B.C.). He is described by Ovid as "hedera juvenalia cinctus tempora" ("his youthful brow crowned with the ivy garland") — a description somewhat more suitable to a man who dies in his 31st year than to one who dies three or four years later. Since no poem is certainly later than 54 B.c., it is best to retain Jerome's reckoning of Catullus' age as 30 years but to suppose him to have lived from 84 to 54 B.C.

Jerome's statement that Catullus was born at Verona is confirmed by other authorities. His father was important enough to act as Caesar's host and it was probably at or near Verona that Caesar accepted the poet's apologies for the attacks on himself and hlamurra in xxix and Ivii; xciii may represent Catullus' reply to earlier advances on Caesar's part. The poet's attitude was not due to republican sentiment but the result of personal animosities. In xxix he arraigns Pompeius along with Caesar and in xi he recognizes the latter's greatness.

Catullus' complaints of poverty are not to be taken very seriously. He possessed a villa at Tibur as well as a retreat at Sirmio on Lake Garda, and the poems prove that he had the means to figure in the best society. Still his purse was often, no doubt, as he says. "full of cobwebs" (xiii).

On reaching manhood Catullus was sent to try his fortune at Rome. The premature death of his brother in Asia Minor seems to have recalled him to Verona (*cf.* lxviii). In 57 B.C. he made a belated attempt at a public career by accompanying Memmius, the patron of Lucretius. to Bithynia, of which province Memmius had been appointed governor. His hopes of lining his purse at the expense of the provincials were not realized, and in the spring of 56 B.C. he left Nicaea (xlvi) and returned to Italy. perhaps on his own yacht (*cf.* iv): en route he visited his brother's tomb in the Troad (ci). His delight at seeing Sirmio once more is charmingly expressed in xxxi. The poems show that his last years were divided between Verona and Rome. As a Transpadane, Catullus found many compatriots in the capital. and among them several representatives of the new movement in poetry led by Publius Valerius Cato, himself a native of Cisalpine Gaul.

The poems reveal him on terms of intimate friendship with certain of the younger members of this circle; *e.g.,* Calvus (xiv, 1. liii. xcvi), Cinna (x, xcv, cxiii) and Cornificius (xxxviii). He appears to have been acquainted with the two leading orators of the day — Cicero (xlix) and Hortensius (lxv and xcv). Among friends of less eminence he counted a Caelius (lviii) whom some identify with Cicero's protégé M. Caelius Rufus, thinking that lxix and lxxvii. addressed to a Rufus, refer to the same man; this is possible, but in that case another Caelius must be meant in c, since Cicero's friend was not a native of Verona. Particularly dear to Catullus, but otherwise unknown. were two friends. Veranius and Fabullus (ix, xii, xiii. xxviii. xlvii), while in i he dedicates his *libellus* to the biographer and historian Cornelius Nepos. who in later years left it on record that in his opinion Catullus and Lucretius were the two greatest poets of that period. Among Catullus' enemies the most furiously attacked in the poems — apart from Caesar and his lieutenant — are the pair Furius and Aurelius (xv, xvi, xxi, xxiii, xxiv, xxvi), and one Gellius who is the target of no fewer than seven epigrams. Other victims of his invective are Ravidus (xl) and Rufus (*see* above), his rivals in love; a freedman Thallus (xxv); a ridiculous fop Egnatius (xxxvii, xxxis). To a false friend Alfenus he writes more in sorrow than in anger (xxx).

The most important influence in Catullus' life was that of his mistress Lesbia. Her real name was Clodia; Catullus chose the

pseudonym for its connection with Sappho (li, a translation of a famous ode of Sappho, was perhaps a first tribute to his mistress' charms). There can be little doubt that Clodia was the notorious sister of the demagogue P. Clodius, married in 63 B.C. to Q. Metellus Celer and suspected of responsibility for his death in 59 B.C. Cicero mentions her several times in his letters and has left a graphic picture of this dangerous beauty in the speech (Pro *Caelio*), in which he defended M. Caelius Rufus (see above), also one of her lovers, against the charge of having tried to poison her. Though Cicero writes as an advocate and Catullus as a lover. their descriptions are not inconsistent and the final proof of identity is contained in lxxix, the Lesbius of which poem clearly covers a Clodius, not, however, the demagogue P. Clodius. but Sextus Clodius, a kinsman and associate of Publius, whom rumour represented as having relations with Clodia similar to those attributed to Lesbius by Catullus. An attempt to identify Lesbia with a younger sister and namesake of Metellus' wife. who married L. Lucullus and was divorced by him for alleged relations with her brother, appears unconvincing. Catullus was Clodia's lover during Metellus' lifetime (*cf.* lxxxiii); the husband's death apparently brought other rivals on the scene and Catullus' allegiance had been sorely tried before he left for Bithynia, but xi, the final renunciation, is subsequent to his return (see above). The data do not suffice to fix the course of the liaison more exactly.

Catullus' poetical activity began soon after his assumption of the toga virilis (cj. lxviii); references in the poems suggest that he sometimes published his pieces separately or in small groups (cj. 1; xvi; xlii; xliii; liv). Later (cj. i) he formed a collection of his compositions and dedicated it to Cornelius Nepos but it is' a moot point what this *libellus* contained, whether it was identical with the present collection, and, if not, how the latter was formed. As arranged in the manuscripts, the poems fall into three sections. viz., (1) i–lx, shorter lyric pieces; (2) lxi–lxviii, longer poems in a variety of metres; (3) lxix–cxvi, elegiac epigrams. The hypothesis most in favour is that the present collection was formed in outline by Catullus himself before his death and that afterward his literary executors inserted in the groups so arranged sundry other material discovered among his remains, including unfinished pieces like Ix.

Though Catullus was an Italian of the Italians in character and temperament, it is impossible to appreciate his poetry correctly except in relation to Greek and, more particularly, Alexandrian poetry. Like that of the other novi *poetae,* his work has two aspects. On the one hand there are the shorter pieces in which any and every emotion of the moment finds instant expression. on the other the poems which earned Catullus the title of *doctus* ("learned"), considerably longer than his nugae ("trifles") but short when compared with the *Annales* of a Volusius (xxxvi, xcv). The poet's debt to Alexandrian models in these longer compositions. though hard to compute because of the fragmentary survival of later Greek poetry, is universally admitted. Catullus himself declares lxvi to be a translation from Callimachus (*cf.* lxv); lxiv is cast in the mold of a Hellenistic *epyllion* ("narrative poem"); lxviii, a mixture of the personal and narrative elegy, framed as a letter to a friend, also has Alexandrian forebears; lxii adapts an epithalamium of Sappho after the manner of the later Greeks; even lxiii (the Attis), which gives an impression of striking originality, probably follows in the track of Callimachus or some other Alexandrian. The most original of these longer poems is probably lxi, the epithalamium for Manlius Torquatus and Vinia (or Iunia) Aurunculeia, since there Catullus has tried to fuse the native *versus Fescennini* with the Greek *hymenaeus;* it contains touches, *e.g.,* 216–220, marked by a tenderness otherwise unknown before Virgil. Even in the nugae Catullus' debt to Greece is greater than was earlier realized. Just as the life of the *Neoteroi* ("new poets") with its interest centred on love and letters had been anticipated by that of the later Greeks (compare 1 with the lines of Hedylus [*fl.* 290 B.C.] preserved in Athenaeus), so the forms. lyric *paignion* and elegiac epigram. to express these emotions had been fixed by the same predecessors. Hellenistic lyric surviving only in meagre fragments. Catullus' originality appears greater here than in his elegiacs, which can be compared with the epigrams of the Greek anthology, but metre (especially the scazon iambic and phalaecan hendecasyllabic), subject matter and often phrasing indicate his obligations. The poems on Lesbia's sparrow (ii and iii) and that on the yacht (iv) had Hellenistic prototypes and an Alexandrian element crops up even in such an ardent love poem as vii. Nevertheless. it is in these shorter pieces that Catullus is most Roman and most himself The attacks on the smaller fry who had incurred his displeasure often offend modern taste by their gratuitous obscenity, but the iambi on Caesar and his associates. which recall but far surpass in bitterness the popular lampoons current at the expense of the *imperator unicus*, were justly considered by their chief victim to have branded him with *perpetua* stigmata. On the other side the Lesbia cycle cannot be paralleled in ancient literature for sincerity of passion, passing through all the stages of joyous contentment, growing distrust and wild despair to the poignant adieu of the disillusioned lover.

BIBLIOGRAPHY.—*Editions and translations:* The current editions without commentary are those of R. A. B. Mynors (1958) and M. Schuster (1949). The best edition with commentary (in German) is that oi W. Kroll, 2nd ed. (1929). The best English commentary is still that of R. Ellis, 2nd ed. (1889). Volume vi of the Loeb Classical Library contains a text and translation of Catullus along with Tibullus and the *Pervigilium Veneris.* There is *a* translation into English by Jack Lindsay (1948).

General: Work on Catullus is excellently surveyed by R. G. C. Levens in *Fifty Years of Classical Scholarship,* ed. by M. Platnauer, pp. 284–305 (1954). Of many books mentioned therein attention may be drawn to A. L. Wheeler. *Catullus and the Traditions of Ancient Poetry* (1934); and E. A. Havelock, *The Lyric Genius of Catullus* (1939). (E. A. B.)

CATULUS, the cognomen, or third name, of a distinguished plebeian family in ancient Rome of the gens Lutatia. The following are its most important members:

GAIUS LUTATIUS CATULUS (3rd century B.C.), Roman commander during the First Punic War, consul 242 B.C. With a fleet of 200 ships, he occupied the Sicilian harbours of Lilybaeum and Drepanum. The Carthaginian relieving fleet was totally defeated near the Aegates Islands off western Sicily, March 10, 241, and Catulus shared in the triumph, though, on account of a wound, he took no part in the operations. (See PUNIC WARS.)

QUINTUS LUTATIUS CATULUS (2nd century B.C.), Roman general and consul with Gaius Marius (*q.v.*) in 102 B.C. In the war against the Cimbri and Teutoni (*qq.v.*) he was sent to hold the passage of the Alps; but was forced back over the Po river. In 101 the Cimbri were defeated on the Raudine plain, near Vercellae, by the united armies of Catulus and Marius. The chief honour being ascribed to Marius, Catulus became his bitter opponent. He sided with Sulla (*q.v.*) in 100 B.C., was included in the proscription list of 87 and committed suicide. He was distinguished as an orator and writer, and is said to have written the history of his consulship and the Cimbrian War. He figures in the De *oratore* of Cicero.

QUINTUS LUTATIUS CATULUS (*c.* 120–61 B.C.), son of the above, an influential and consistent supporter of the *optimates,* the conservative senatorial aristocracy. In 78 he was consul with M. Aemilius Lcpidus, who proposed the overthrow of the constitution of Sulla. Catulus vigorously opposed this, but Lepidus marched on Rome at the head of an army. He was defeated by Catulus and fled to Sardinia. In 67 and 66 Catulus unsuccessfully opposed the Gabinian and Manilian laws, which conferred special powers upon Pompey. As censor in 64 he opposed the attempt of M. Licinius Crassus to enfranchise the Transpadane Gauls. He consistently opposed Caesar, whose election in 63 to the office of *pontifex maximus,* against his own far stronger claim; was a bitter disappointment and whom he tried to implicate in the conspiracy of 63 organized by Catiline (*q.v.*). Caesar, in return, accused him in 62 of embezzling public money during the reconstruction of the temple on the capitol, though he later dropped the charge.

CAUCA, a department of Colombia, on the Pacific coast of South America; area 11,862 sq.mi., pop. (1961 est.) 520,680. The Western cordillera, traversing nearly its whole length from south to north, and the Central cordillera, forming a part of its eastern frontier, give a very mountainous character to the region. It in-

cludes the fertile and healthful valley of the upper Cauca, and a part of the coastal plain. The region is rich in mines and valuable forests, but has made very little progress in agriculture because of inadequate transportation facilities. Cattle raising and sugar, coffee and tobacco growing are the main activities. Capital of the department is Popayán (*q.v.*), pop. (1961 est.) 61,490.

CAUCA RIVER, Colombia. From its headwaters near Popayán the Cauca river flows in a northerly direction between the Central and Western cordilleras for 838 mi., joining the Magdalena river near Mompós. In its middle reaches the Cauca flows through the broad, fertile intermontane depression, the Valle del Cauca (elevation, 3,100–3,300 ft.) and continues below Cartago to the Caldas region, where it plunges through a box canyon cut jnto ash deposits. Through much of Antioquia it is also confined to a deep gorge, emerging onto the forested Magdalena lowlands near Cáceres, from whence it is navigable. The Valle del Cauca sector of the river, together with the adjacent coffee-growing uplands, has been organized under a regional authority, modeled after the Tennessee Valley authority, to promote a balanced agricultural, commercial and industrial development. The volcanic uplands drained by the Cauca river produce two-thirds of Colombia's coffee. (Js. J. P.)

CAUCASIAN LANGUAGES. This term is applied to the languages used on the Caucasian isthmus which do not belong to the Indo-European, or to the Semitic, or to the Ural-Altaic families. They are spoken by about 4,000,000 people.

It has been held, but not proved, that they may be a modern relic of an ancient Mediterranean stratum of languages. Even the most cogent presentations of this view (by Oštir, Vladimir Georgiev, Albert van Windekins and others) are adjudged inconclusive by objective critics. The Soviet linguist Nikolai Marr, who advocated it, has been discredited in Russia itself. While the theory has some evidence to make it plausibly attractive, it lacks extensive factual support.

They are divided into three groups—the east Caucasian, the west Caucasian and the south Caucasian. The east Caucasian group may be divided into eight branches: (1) The Chechen branch (the chief being the Chechen language of the middle course of the Terek and Dagestan); (2) Avaro-Andi (12 languages in west Dagestan, the chief being the Avar language); (3) Darghi (east Dagestan); (4) Samur (south Dagestan, the chief being the Kuri language. near Derbent); (5) Lakk or Kasi-Kumuk (central Dagestan); (6) Artchi (one village in central Dagestan); (7) Hinalugh (one village near the mountain Shah-Dag); and (8) Udi (two villages near the town Nukha). The west Caucasian languages have three branches: (1) Abhaz—region of Sukhum-Kale; (2) Ubykh—formerly dominant in the region of Sotchi, but now spoken only by a few families in Asia Minor; (3) Adyghe, with two dialects—Kabardi (in the so-called Kabarda, principal town Naltchik) and Kiakh or Cherkess (region of Kuban and the Caucasian shore of the Black sea). The south Caucasian languages are: (1) Georgian with its dialects; (2) Mingrelian and Laz; (3) Svanetian.

East Caucasian and west Caucasian are related and may be considered as two branches of the north Caucasian group. The relationship between this and the south Caucasian group has not, as yet, been scientifically proved, and in the present state of our knowledge the north Caucasian and south Caucasian groups must be considered as separate.

The north Caucasian languages are distinguished by an extraordinary abundance of consonants. Very characteristic of the system of north Caucasian languages are the lateral consonants. as well as a great number of consonants of the type k, pronounced in the deep back part of the palate. This superabundance of consonants is moderated in the east Caucasian group where consonants rarely come into contact with each other; but in west Caucasian languages the contact and combination of consonants occur very frequently, and the most complicated combinations, very difficult to pronounce for nonnative speakers, are admitted.

In the east Caucasian languages substantives are divided into classes or "genders"; their number varies in different languages (from two to six). In most cases. neither from the meaning of the aord nor from any outward formal symptom is it possible to knon to which class the substantive belongs. Very often the same substantive belongs in the singular to one class and in the plural to another. A consonant, specific for each group (*w*, b, d, *r*, *y*), is added as prefix, infix or suffix to the adjectives, verbs, pronouns, adverbs, etc., connected with the substantive. For example, the Avars say: Dow *tchi* wugo roqow—"this man is in the house"; *Dob* keto *bugo* roqob—"this cat is in the house"; Doy *thladi* Yigo roqoy—"this wife is in the house." Substantives, adjectives and pronouns are declined; an extraordinary number of cases is used to express ideas that in other languages are expressed by a combination of words with prepositions. The Tabassaran language has 35 cases. The system of declension is based on the opposition of Casus Agens to Casus Patiens. The Casus Agens is used for the logical subject of transitive verbs, and Casus Patiens for the logical object of transitive and logical subject of intransitive verbs. The outward distinction between Casus Agens and Casus Patiens is expressed in a different way by different substantives. Thus, in the Kuri language Lam—"ass"—has Agens *Lamra* and *ghum*—"smoke"—has Agens ghumadi. All other cases are derived from the Agens by adding different endings. The plural is also formed differently from different substantives, so that the declension of substantives in east Caucasian languages is full of irregularities. The same is true of conjugation in most of these languages. The verbal root, *i.e.*, the invariable part of all verbal forms, consists mostly of one consonant. Before it are the prefixes, indicating the aspect of the verb (*i.e.*, whether the action is considered as a lasting process or as a concluded action) and the gender signs mentioned above which agree with the Patiens of the sentence. After the root consonant come the elements, indicating time, mood and sometimes the person. There are many verbal forms and the difference of their meaning is often very subtle and difficult to define. The east Caucasian languages have therefore a complicated grammar with a great abundance and prodigality of forms. The same prodigality is found in the vocabulary; there are for instance special adverbs to indicate such notions as "five years ago," "four days later," etc.—these words having nothing in common with the corresponding numerals.

In the west Caucasian languages, declension is reduced to a minimum; the Adyghe and Ubykh languages have only three cases, the Abhaz has no declension at all. There are fewer verbal forms than in the east Caucasian languages. The basic vocabulary is small, so that many notions are expressed by compounds, *e* g., in Adyghe the beard is designated as "tail of the mouth." The characteristic peculiarity of west Caucasian languages is a fondness for combining words. Notwithstanding these differences between east and west Caucasian languages, there are still important similarities in both these groups—viz., in the most elementary words, personal pronouns, numerals, simple verb roots, so that there can be no doubt as to their relationship. There are also isolated similarities in the grammar, for instance the opposition of Casus Agens to Casus Patiens, traces of the different classes of substantives.

The phonological system of south Caucasian languages is simpler than 'hat of the north Caucasian; there is a striking fondness for the agglomeration of consonants (*e g.*, the Georgian. *mghwdl* is genitive for "priest"). There is only one gender. The declension is rich in case forms, but their formation is regular. The verb has a developed conjugation; the means of expressing personal forms through combination of certain prefixes and suffixes is complicated. In the south Caucasian languages the agreement of the verb with its subject and object varies with the tenses of the verb. In the present the subject is in the nominative and the object in the dative-accusative.

In the Aorist the subject is in a special case (Agens?) and the object in the nominative. in the perfect the subject is in the dative and the object in the nominative.

Georgian alone has an ancient written literature, beginning with the 5th century A.D., and in recent years books and newspapers have begun to appear in other Caucasian languages. *See* also GEORGIAN LANGUAGE.

(*N. S. T.; J.* WH.)

CAUCASOID, a term used to designate one of the major racial stocks of mankind, others including Mongoloid (*q.v.*) and Negroid (see NEGRO). From the shores of the Arctic ocean to Africa north of the Sahara, and from the Azores in the north Atlantic to Samarkand, in Soviet central Asia, there is a single geographical unit of mankind, comprising a large number of local races. Called the "Caucasian" race by J. F. Blumenbach (*q.v.*) in honour of the women of the Caucasus whom he admired, and often termed the "white" race, a more appropriate designation is the "European geographical race." In this way, the original geographical centre is defined, and the inclusion of purely local races is more clearly understood.

Growth of the European Geographical Race.—During much of the present era, growth of the European geographical race was limited by warfare, the food supply and disease. Then, rather suddenly, a number of events led to rapid population increase, especially in western and northwestern Europe. One was the discovery of the new world, which yielded new sources of wealth and important new crops including corn (maize) and the potato. A second event was the increasing control of communicable diseases. A third was the improved level of subsistence following the Industrial Revolution. There are over 600,000,000 members of the European geographical race, including 230,000,000 in the Americas, Australasia and South Africa.

Over the last 6,000 years there have been differential increases in the size of various local races of the European geographical race. At first, maximum population growth was attained in the middle east, then in the Mediterranean basin. In post-Columbian times northwestern Europe has seen the greatest expansion, spilling over into North America and Australia. The relative size of different local races has therefore been shifting in the wake of technological advancement and improved conditions of life.

Physical Characteristics.—Physically, the European geographical race is most varied, including such short-statured populations as the Lapps and such tall groups as the adjacent peoples of Scandinavia. Morphologically, there is the widest possible range in body build. and considerable variability in nose form, facial hair, balding and the form of the mouth and lips. Skin pigmentation varies from a near lack of melanin among some individuals of northwest European origin to considerable pigmentation in the southern and eastern limits. It is easier to describe the European geographical race, so variable within itself, by exclusion. Near-black skins, the spiral-tuft hair form, extremely broad noses and coarse straight hair are not native to this broad geographical area. (See also FACE; HAIR.)

Blood Groups and Biochemistry.—With respect to many of the blood groups, the European geographical race is indeed unique. The A_2 subgroup (in the ABO series) and the Rh-negative blood type (r) are practically limited to Europe. In contrast, the Rh_0 blood type (characteristic of Africa), the Diego positive (Di^a) blood type and the U-negative blood type are absent from Europe, north Africa and the middle east. Of the known haptoglobin types, Hp_1 and Hp_2, the former is commoner in Europe. Members of the European geographical race do not regularly excrete β-amino isobutyric acid (BAIB) as do Amerinds, Asians and some Oceanic peoples. (See also BLOOD: Individuality of Human Blood; BLOOD GROUPS.)

Comparison of Europeans (Caucasoid), Asians (Mongoloid) and Africans (Negroid) in the Frequency of Seoen Gene-Determined Traits

Trait	Europe (frequency)	Asia and Africa (frequency)
Blood type A_2 (a subtype of A)	3%–15%	Rare in Asia, under 5% in Africa
Blood type B	About 15%, lower in west, higher in east	Up to 30% in Africa. up to 40% in some Asian populations
Rh-negalive blood type	About 15%, highest among Basques	Rare in Africa and Asia
$Diego^+$ (Di^a) blood type	Rare	Up to 30% in various Asian populations, absent in Africa
Excretion of BAIB	Rare	Common in Asians, Amerinds and some Micronesians
Carabelli's cusp.	40%–80%	Rare in Africans, 1%–10% in Asians
Inability to taste PTC	17%–30%	Under 5% in Afri-Fans, under 15% in Chinese and Japanese

Regional Differences.—Nevertheless, there are marked regional and local differences in pigmentation, hair form and distribution, tooth size and morphology, middle-phalangeal hair patterns and frequencies of the various blood types. Type O blood, for example, is marginal and coastal in Europe, increasing in a south-north gradient. Blood group B increases along a west-east line, being most prevalent in the U.S.S.R. and the middle east. Rh-negative individuals are commonest among the Spanish Basques (*q.v.*), and the inability to taste various antithyroid drugs reaches a maximum in the Baltic.

Of particular importance is the distribution of various genetically determined traits apparently conveying some immunity to malaria. Among these may be listed thalassemia, primaquine type drug sensitivity or sensitivity to the broad (fava) bean—all at a maximum in the Mediterranean region or the middle east. Other inheritable disorders, particularly disadvantageous in warm climates, reach their peak frequency in the north and northwest.

Origins.—As is true for all geographical races, the origins of the European geographical race are shrouded in archaeological uncertainty. However, there is no real gap between the Paleolithic and the present. Some of the Upper Paleolithic peoples unquestionably lived on, and certain of their characteristics are reflected in the living populations of the United Kingdom, north Germany and Scandinavia. The origins of the "Mediterranean" peoples who appeared together with agriculture, domestic animals and cats in the Tigris-Euphrates and Nile valleys are problematic, but their subsequent migrations across Europe are archaeologically well documented.

Diversity of form and feature can to some extent be explained by waves of migrations across Europe from European Asia and the Mediterranean, and coastally through the Strait of Gibraltar to England and Ireland. Nevertheless, evidence favours the selective force of local environment as a prime cause of local differences, especially those involving the hemoglobins, the blood enzymes and the hemoglobin-fixing proteins. Residents of the cold climate areas evidence genetic adaptations to cold, while those from the warmest climates do not.

The past history of the European geographical race and its numerous local races has been facilitated by historical records, covering a 4,000-year span in some areas, and by archaeological remains which document human habitation for nearly 1,000,000 years. Many a city has been built over Neolithic villages, Mesolithic shell heaps and the bones and artifacts of fossil men. Investigations of these phenomena are being supplemented by studies of contemporary racial evolution. As in other parts of the world there are problems of origins, relationships and continuing change.

(S. M. G.)

CAUCASUS (KAVKAZ), a range of mountains extending for about 750 mi. from Anapa on the Black sea coast to the Apsheron peninsula on the western shores of the Caspian sea. In its broader meaning, the Caucasus region is usually taken to include a much more extensive part of the southern U.S.S.R., stretching from the plains of the Kuban and Terek in the north to the frontier with Turkey and Iran in the south. This area falls naturally into four main zonal divisions, two of lowland, two of mountains. Passing from north to south, these are: (1) The district of Ciscaucasia, otherwise known as the Korthern Caucasus or. in Russian, Predkavkazye. There the northern foothills of the Caucasus range grade down into the plains of the Kuban and Terek, which are

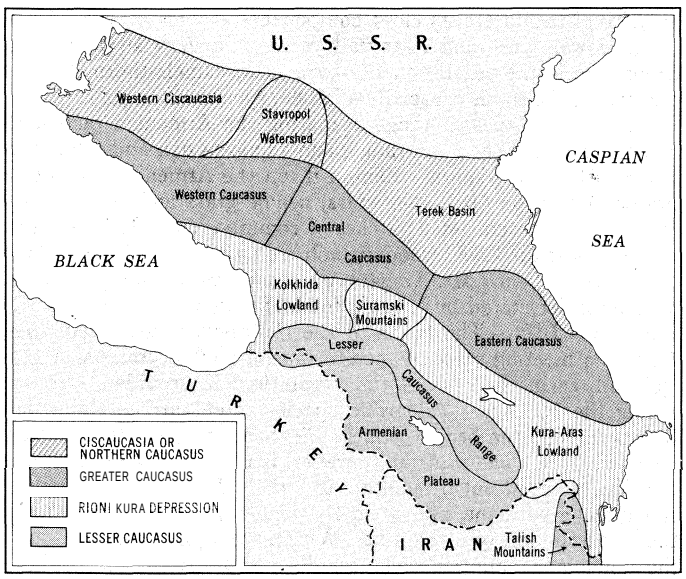
themselves separated by a low plateau in the region of Stavropol. (2) The Caucasus mountain range, termed in Russian geography the Greater Caucasus (Bolshoi Kavkaz). (3) The long depression drained by the Kioni and Kura rivers, which links the coasts of the Black sea and the Caspian. In its central part the Suram range forms a low watershed and connects the mountain system of regions (2) and (4). Together with the Lesser Caucasus, this district is conventionally known as Transcaucasia (Zakavkazye). (4) The term Lesser or Minor Caucasus is sometimes applied in a strict topographical sense to the range of mountains which limits the Rioni-Kura depression on the south and separates it from that part of the Armenian plateau which lies within the borders of the U.S.S.R. However, following the general usage in Soviet geography, the Lesser Caucasus (Maly Kavkaz) will here be taken to include all those mountainous districts, mostly falling within the basin of the Aras (Araks) river, which lie between the Rioni-Kura trough and the Turkish and Iranian borders.

TOPOGRAPHY AND GEOLOGY

Ciscaucasia.—The western part of this region drains to the Black sea through the Kuban river. It is an area (see map) of rich black soils and of adequate summer rainfall, and like the adjacent plains of the lower Don it is well suited to the growing of cereals. By contrast, to the east of the Stavropol watershed, the steppes of the Terek basin are semidesert and suffer extremes of temperature. The soil is of inferior quality, sandy and salty and of little use to the farmer. The Terek basin, which drains to the Caspian, was at one time occupied by an arm of that sea, and many districts of it are very poorly drained. For the most part it is given over to pastoral nomadism, but on its south side, near the Caucasus foothills, the rainfall increases and more permanent settlement is possible.

The Greater Caucasus.—About 750 mi. long and somewhat more than 100 mi. wide at its broadest, the main Caucasus range is generally considered to be the boundary between Europe and Asia. It resembles the Pyrenees rather than the Alps by reason of the straight lie of its main crest line and the general simplicity of its geological structure. Basically it is a single great anticlinal fold, thrown up at the start of the Miocene, partially worn away by erosion and later uplifted again and eroded afresh in the Pliocene period.

Erosion has exposed the oldest rocks, which form the core of the fold, along its highest part, made up of a belt of crystalline granites and gneisses. Intruding through these most ancient rocks and overlying them are some volcanic outpourings dating from the latest phase of folding and uplift in Pliocene times; the two highest peaks, Elbrus and Kazbek, are entirely composed of these recent lavas. Passing to the north and south of this central core, the geologic succession reveals metamorphosed schists of Paleozoic age, and after them various strata, successively more recent, of Jurassic, Cretaceous and Miocene age. These strata include marls, clays and limestones of varied degrees of hardness, and they have been worn by differential erosion into a series of stepped escarpments which are breached in gorges by the rivers on their way to the outlying plains. This effect is much more noticeable, however, on the northern slopes of the range where the angle of folding is relatively regular and gentle. In the process of folding the mountain range was pressed on its south side hard against a resistant block. the Dzirula massif, so that its slope on this side is much more abrupt and sheer than on the north. In detail, the Caucasus range falls naturally into three sections, the west, centre and east.



MOUNTAINOUS AND LOWLAND REGIONS OF THE CAUCASUS

The *Western Caucasus* begins as low hills in the vicinity of Anapa, just south of the mouth of the Kuban. The range becomes wider and higher as it is followed eastward, and beyond the Tuapse-Maikop railway it never falls below 3,000 ft. In the longitude of Sochi the main range is 7,000 ft. high. and beyond there it separates farther from the coast and rises to an average height of 11,500 ft. as far as Mt. Elbrus, where the Central Caucasus may be said to commence. The Western Caucasus receives a heavy rainfall at all seasons and is the wettest part of the entire range. In consequence it carries a dense cover of forest, snow fields and many glaciers. The snow line is at its lowest in this part of the range, sometimes descending to 8,000 ft. East of the Tuapse-Maikop railway this part of the range forms a singularly effective barrier to communication and is crossed by only one main road, the most westerly of the three great military highways over the Caucasus range. This is the Sukhumi military highway, running from Cherkessk to Sukhumi, along the valley of the Teberda, a tributary of the Kuban, across the Klukhori pass (9,239 ft.) to the valley of the Kodori. All the way from Anapa to Sukhumi the Western Caucasus skirts close to the Black sea coast. There is no natural harbour of significance along this shore except the wide bay of Novorossisk at the low western extremity of the range.

The *Central* Caucasus extends for more than 125 mi. between the two great volcanic peaks of Elbrus (18,481 ft.) and Kazbek (16,558 ft.). In this section the range reaches its highest and most impressive dimensions. The central range becomes split into two, consisting of parallel upfolds of granite separated by a syncline of soft black schistose rocks. Of these two chains, that to the north includes the highest peaks, having, in addition to Elbrus and Kazbek, the granitic heights of Koshtan-Tau (16,876 ft.) and Dykh-Tau (17,054 ft.). The southerly range, from Ushba to Uilpata, although it is on the average lower than that to its north, is the more continuous of the two, and forms the main watershed of the range. This is because the erosive power of the streams which flow to the north from the central section of the range is greater than that of those which flow southward, and as a result they have cut back through the northern range and dissected it into its separate peaks.

The Central Caucasus, being the highest section of the range, feeds many glaciers, especially on the southern slopes where the rainfall is heavier and the snow line higher. Two of the three great military highways of the Caucasus cross the range in this division. They are the Ossetian military highway, from Alagir to Kutaisi, which runs from the valley of the Ardon, a tributary of the Terek, across the Mamison pass to the valley of the Rioni, and the Georgian military highway from Ordzhonikidze to Tbilisi, leading from the valley of the Terek across the Krestovy pass (also known in earlier writings as the Darial pass or Caucasian Gates) to the valley of the Aragvi, a tributary of the Kura.

The Eastern Caucasus begins east of Mt. Kazbek and the Krestovy pass, which lies just to the south of it. At this point, two chains take off from the main range toward the south and southeast, the Kakhetia range and the Kartali range. They soon fall in height and become low plateaus of the foothills. The main range retains an elevation of about 10,000 ft. and broadens out on its northern slopes into the wide plateau of Dagestan (the "Abode of Mountains"). This is a limestone tableland, much dis-

sected by erosion and difficult of access. It attracts little rainfall and with its wide expanses of arid plain, broken up by occasional interior ranges, it resembles the central plateaus of Iran more closely than the wooded ranges of the Western and Central Caucasus. This Dagestan region is one of the most isolated and remote parts of the Caucasus and has provided a retreat for a great variety of fugitive ethnic types. Near the Caspian, the Caucasus breaks down sharply into a series of arid ranges which abut very close to the coast. The route from the north along the shore to the Apsheron peninsula is particularly constricted at the town of Derbent, where in the middle ages a defensive wall was built with the object, as in the case of the Great Wall of China, of restricting the passage of nomadic hordes. The Pass of Derbent is sometimes called the Iron or Caspian Gates, though this last usage may lead to confusion with the defile just east of Teheran which was known by that name in classical times.

The **Rioni-Kura** Depression. — This natural corridor across the Caucasian isthmus is clearly of the first importance as a routeway. It consists of a downfold between the main ranges of the Greater and Lesser Caucasus, but its structure is complicated by the intrusion in its central section of a block of ancient crystalline rock which reaches the dimensions of a small plateau. It does not bar communications, however, though the railway has to tunnel through it at the Suramski pass. To the west of the Suramski mountains and behind a very straight alluvial coast line lies the Kolkhida (Colchis) lowland, drained by the Rioni and its tributaries. This area is heavily watered at all seasons and its rich soils have often been reclaimed from marsh and forest. In sharp contrast, the Kura-Aras lowland to the east of the Suramski divide consists of parched steppe country, often eroded by streams and wind into forbidding "badland" topography. Much of this plain, which was at one time an arm of the Caspian, lies below sea level. Its summers are warm enough for subtropical crops and it has been in part reclaimed by means of irrigation.

The Lesser Caucasus. — Bordering the Rioni-Kura depression on its south side, the Lesser Caucasus range is not so much a distinct mountain system as a buttress which marks the northern limit of the high volcanic plateau of Armenia. Narrowest in the west but broadening out in the east into the Karabakh plateau, the Lesser Caucasus range reaches heights of between 10,000 and 12,000 ft. Its rocks are mainly of Secondary and Tertiary age, but it contains no Paleozoic core such as is found in the Greater Caucasus. Its folding and subsequent erosion followed much the same course as these processes in the major range, but the Lesser Caucasus underwent more rifting and fracture in the later stages.

Beyond the Aras river a small part of a distinct fold range, the Talish, is included within Soviet territory. Reaching a height of 8,182 ft., this range is structurally continuous with the Elburz chain of Iran, which runs along the southern border of the Caspian.

Behind these fold ranges to the south and west, the Armenian plateau is a region of wide tablelands and generally unaccentuated relief. the irregularities having been buried under immense outpourings of volcanic rocks, mainly andesites and basalts, of relatively recent Quaternary age. The greater part of this plateau stands at an elevation of more than 6,000 ft. and the highest point, the extinct volcano of Aragats, reaches 13,435 ft. There are, however, some sunken faulted troughs which sometimes lie at a lower level, notably the valley of the Aras, the main river of the plateau. The basin of Lake Sevan is also a slumped fragment of a once higher plateau, the outlet of which has been sealed by a flow of lava behind which the waters of the lake have accumulated. Surrounded by heights of up to 12,000 ft., the lake level stands at 6,279 ft. It may, however, be artificially lowered when the water of the lake is used for irrigation and for generating electricity.

Volcanism. — Although there are now no active volcanoes in the Caucasus region, the mineral springs of the area and the frequent earthquakes from which it suffers are legacies of its volcanic past. The best-known mineral springs, some of which are radioactive, are found in the Pyatigorsk region of the northern foothills and have long been used as spa resorts. There are other such springs in Transcaucasia. Earth tremors are particularly common on the south slope of the main Caucasus range near Tbilisi and on the Armenian plateau. The town of Shemakha on the southern Caucasus slopes was destroyed by an earthauake in 1902.

VEGETATION AND ANIMAL LIFE

Vegetation. — The plains of Ciscaucasia are prairie country with feather grass and needle grass, but for the most part the natural vegetation has been replaced there by cereal crops. On the Stavropol plateau, however, the rainfall increases to about 30 in. and woodlands of oak and ash will thrive. In the drier northeastern parts of Ciscaucasia, behind Kizlyar bay, the wormwood steppes are of little value except as seasonal pasture, and near the coast they grade into even more repellent salt marshes and sand dunes.

The Greater Caucasus mountains carry one of the richest forest reserves in the whole Soviet Union. The range of tree types is very wide, for these mountains formed a refuge where many Tertiary species survived the Ice Age and continued to thrive. The forests are particularly rich and extensive in the wetter western parts of the range, but farther east they become progressively thinner and many parts of Dagestan are completely treeless.

In the western part of the range the timber line stands at 6,600 ft., while in the eastern regions it is 600 ft. higher. Above this level birch thickets give way to clumps of Pontic azalea or trailing juniper, and these in turn to an alpine cover of low sedges and grasses with a whole range of flowers, including gentian, primrose, forget-me-not and violet. The alpine zone stretches from 7,000 ft. to the snow line about 3,000 ft. higher.

Between 4,000 and 6,300 ft. a belt of fir forests is sometimes found, including Caucasian fir and spruce with an intermixture of beech, maple and hornbeam. Below the fir zone, and occasionally replacing it as far up as the subalpine zone, lies the broadleaf deciduous forest which is the richest timber resource of the mountains. This forest is most luxurious at elevations between 2,000 and 4,000 ft., but on occasion it is found down to sea level. Sometimes it consists of almost pure stands of beech, with only occasional admixture of chestnut. Elsewhere it takes the form of a more mixed cover, dominated by oak but including the commercially valuable box and yew, which the Russians call redwood.

These broadleaf forests, which are particularly extensive on the southern slopes of the Caucasus range, once also covered the plain of the Rioni river, but there they were largely cleared to make way for cultivation. The Russian geographers class them as the Colchis type of liana forest, grouping them with the Crimean and far eastern forests which also contain climbing plants. The chief climbers in the Colchis forest are ivy, vine and clematis.

On the lower elevations near the coast, especially in the far western Caucasus above Novorossisk, low and dry scrub often replaces the broadleaf forest and gives a more Mediterranean aspect to the landscape. Scrub oak, oriental hornbeam and occasionally pistachio are its chief components.

The lower Kura and Aras valleys carry a very xerophytic or drought-resistant vegetation of *Astragalus*, camels-thorn, licorice and, where the soil is especially alkaline, species of *Salsola*.

The Lesser Caucasus range bordering the Armenian plateau is rather drier than the main range, and supports oak and hornbeam woods better than beech. Behind it, on the Armenian plateau, a prairie vegetation of feather grass, needle grass and fescue is interspersed with occasional patches of common pine. It is probable that the scattered oak woods which sometimes form a parkland landscape, as below Mt. Aragats, were once more widespread, but have been decimated by lopping for leaf fodder.

Animal Life. — The fauna of the Caucasus is extremely rich, for it is a meeting place of mediterranean and central Asian species and, as in the case of the vegetation, it provided a refuge during the Ice Age. Palearctic species found in the Caucasian forests include the bear, roebuck, elk, boar, fox, marten, badger, lynx and wolf. The squirrel, however, is not found and the bison was finally wiped out by hunters in 1928. The leopard, which is found along with the wildcat in the higher forests. there reaches the northern limit of its habitat. Within the alpine zone are found the mouflon or mountain sheep, the ibex or mountain goat and the Caucasian chamois.

The Caucasian National park, 384 sq.mi. in area, lies in the extreme north of the Caucasus mountains. It is a forested mountain area, with spruce, oak, beech and yew, and provides a refuge for red and roe deer, chamois, ibex, bear, Caucasian grouse and black cock. There also the Caucasian bison has been reintroduced.

The Rioni lowland contains, among other endemic forms of mediterranean type, the pheasant, which takes its name from the river, the Phasis of classical geography. The fauna of the lower Kura valley, by contrast, includes several central Asian species such as the gazelle antelope, the jackal, hyena and jumping mouse. On the Armenian plateau the Kurdistan fox, the wild goat and the Armenian mountain sheep are all species which this region shares with the mountains of Asia Minor.

HISTORY

Archaeology. — Food-gathering cultures of Mesolithic type, as represented by the discoveries at Nalchik in the Central Caucasus, continued in this region until quite late. They were replaced in the later part of the 3rd millennium B.C. by the Kuban culture, which left its remains in many thousands of burial mounds or kurgans on the steppes of Ciscaucasia. This Kuban culture, which lasted through the Late Bronze Age into Early Iron Age times, was undoubtedly stimulated by contact with the higher civilization of Mesopotamia. The grave furniture of the kurgans, as in the famous royal grave of Maikop, included metalwork of great refinement, often ornamented with animal motifs. **A** common weapon mas the shaft-hole battle-ax of copper, of a type also found in central and northern Europe. There is evidence that the distribution of this weapon resulted from a migration of horse-riding folk, the so-called Battle-Ax people, who spread Indo-European speech. Their place of origin is not certain, but it was more probably in the east than in the west of their area of spread.

A South Caucasian or Kura-Aras culture, again associated with rich metalnork and characterized also by tholoi, cyclopean masonry and burnished black pottery with incised spiral decoration, dates from the late 3rd millennium B.C. It has been found particularly in the kurgans of the Trialeti district, notably that of Beshtasheni. Pottery comparable with that of this culture has been found at Karaz near Erzurum (Turk.), at Geoy Tepe in Iranian Azerbaijan, in the Xmuq plain near Antioch in Turkey and as far away as Khirbet Kerak in Palestine.

Transcaucasia contains some fine church architecture dating from the 4th century onward including some very early pendentive~. Ashlar masonry was used there instead of the bricks more common in Byzantine architecture. The most extensive remains of this kind are in the ruins of the city of Ani in the Armenian Soviet Socialist Republic. (See CAUCASUS, PEOPLES OF.)

Early History. — The Caucasian isthmus, and more precisely the road which passes across it along the shores of the Caspian, is one of the two great routes along which nomadic peoples have moved at various times from central to southwestern Asia. The other route runs from Merv over the Elburz to Meshed or Herat. The chief significance therefore of the Caucasus in Asian history is as a gateway of migration. It also plays the part of an ethnic museum, for very many of the peoples who have passed this way have left detachments in the remoter parts of the mountains, particularly in Dagestan. Like Afghanistan farther east, Caucasia, along with Armenia, has often appeared in the role of a buffer zone between rival empires, Roman and Parthian, Byzantine and Arab. Ottoman, Persian and Russian.

The two greatest and longest lived of the many semi-independent states of the Caucasus in classical and medieval times were Georgia (earlier, Iberia) in the north and Armenia in the south. The culture and ethnic character of both can be traced back to the period of the breakup of the Hittite empire in the 12th century B.C., and both were converted to Christianity quite early.

Greek contact with the Caucasus region dates from the colonizing period between the 8th and 6th centuries B.C. when many settlements, like the Milesian outpost of Dioscurias, were set up on the Caucasian coasts of the Black sea. Prometheus was said to have been chained in the Caucasus mountains and Colchis was the setting for the Argonauts' search for the Golden Fleece. The conquests of Alexander the Great freed Georgia from Persian Achaemenid suzerainty, and despite Pompey's (Pompeius') imposition of Roman control in 65 B.C. after his defeat of Mithradates, the incursions of the Khazars in the 3rd century A.D. and Arab occupation of Tiflis (Tbilisi) in the 8th century, the state survived to reach its golden age between the 10th and 13th centuries. The country was overrun and devastated by the Mongols in 1234 and the following years, and again by the hordes of Timur at the end of the next century. Thus weakened, it was on many occasions obliged to submit in the later middle ages to Islamic rule, Persian or Ottoman. In 1783 the king of Georgia concluded an alliance with Russia in the hope of gaining protection from Islamic expansion. However, Russian demands became increasingly importunate and in 1801 it annexed the Georgian state. From that time, the history of Transcaucasia in the 19th century is one of ever-expanding Russian conquest.

Russian Penetration. — Russian interests in the Caucasus began early. In A.D. 943 Varangian or Russified Norse adventurers had sailed down the Caspian from the Volga and captured the fortress of Barda in Caucasian Albania. Subsequently certain marriage alliances were concluded between the Russian and Georgian royal families and in the 17th century Caucasian rulers were on several occasions constrained to ask for Russian help against their enemies. Peter the Great was the first to take advantage of the opportunities thus afforded to take possession of Caucasian territory. He occupied Derbent in 1722 and Baku in the following year. In 1770 Russian troops for the first time crossed the Caucasus range and took possession of Kutaisi. By 1785 all the northern region of the Caucasus was designated as a Russian province and, as already mentioned, Georgia was absorbed at the opening of the next century.

Two large groups of tribes in the middle Caucasus then acknowledged their subjection to the Russians, the Ossetes in 1802 and the Lezgians in 1803. Mingrelia fell in 1804 and the kingdom of Imereti in 1810. By the treaty of Gulistan in 1813, Persia ceded to Russia a wide area of the khanates of the eastern Caucasus, from Lenkoran northward to Derbent. Russia had little difficulty in acquiring by conquest from Persia in 1828 a stretch of the north Armenian plateau, including the entire plain of Yerevan, and was able to take over more territory in the same area from Turkey in the following year.

The resistance of the mountain tribes, particularly of the Circassians of Abkhasia and the Lezgians of Dagestan, was more fierce and protracted. During 30 years, from 1815 to 1845, the Russians could do little more than hold these mountain peoples at bay. Some were sustained by patriotic feelings, others by religious fervour. The Circassians of the Western Caucasus were largely quelled between 1832 and 1839, but farther east in Dagestan resistance by the Muslim tribes was carried on longer. A holy war was declared by the sheikh Kasi-Mullah and, after he was killed by the Russians, the struggle was continued by his son Shamil. He was finally captured in a remote fortress of Dagestan in 1859, though the main fighting had ceased four years before. The country was completely pacified by 1864, after which almost the entire Circassian nation, numbering perhaps 400,000, preferring exile to subjection, emigrated into Ottoman territory, leaving the Western Caucasus empty and desolate.

Without doubt, the protracted resistance of the peoples of the Caucasus delayed Russian plans for an attack on the Turks of Asia Minor. When these nations eventually came to conflict in the Russo-Turkish War of 1877–78, the Russian lines of communication in Armenia were ill prepared and the Turks were able to support an attempt by Circassian exiles to reoccupy their homeland. But this failed, and by the peace of Adrianople Russia succeeded in adding to its Transcaucasian territories the districts of Kars, Batumi and Ardahan. During the next 40 years the peoples of the Caucasus, and particularly the Armenians, endured Russian rule with increasing discontent and after the October Revolution of 1917 they cherished strong hopes for an independent Armenian republic and a federal republic to be governed by a Transcaucasian diet. These ambitions were thwarted after the Turks reoccupied, late in 1920, the districts of Batumi and Kars,

and the Russians hurried to counter by entering Yerevan.

Post-Revolutionary Period. — Under the Soviet system Transcaucasia was administered until 1936 as a single unit, the Transcaucasian Soviet Federated Socialist Republic. Under the new constitution of that year, it was subdivided into the three major partitions of the Armenian, Azerbaijan and Georgian Soviet Socialist Republics. Lesser nationalities, such as the Abkhaz, Adzhar and Ossete, are administered as autonomous soviet socialist republics or as oblasts.

The district of Ciscaucasia is included in Soviet geography in the regional complex known as the Lower Don and Northern Caucasus. Except in its western part, in Dagestan, the population of Ciscaucasia is predominantly Russian and Ukrainian, elements which entered the territory during its rapid period of development after the building of the Rostov-Baku railway line late in the 19th century. Over the 25 years after the arrival of the railroad, the population of the Kuban district doubled and the area under cultivation increased fivefold. The great cities of Ciscaucasia also largely grew up or expanded during this period and particularly after the Revolution, as the oil fields of the area increased their output.

At the extreme limit of their penetration into Russia, in the autumn of 1942, the German armies overran parts of Ciscaucasia and. in a drive toward the oil fields, they had by the end of October in that year reached the Georgian military highway leading to Tbilisi. The tide turned in November, when the Germans began to pull out of Caucasia to strengthen their forces on other sectors of the Russian front.

The attack left its mark on the economic geography of Ciscaucasia; in particular, there was much destruction in the oil fields of the Maikop district. More serious were its repercussions on the political geography of the area. Unlike the Crimea and the Lower Don, which are each administered as a single unit, the Crimean and Rostov oblasts respectively, the Northern Caucasus is composed of several Russian and autonomous non-Russian regions. These were reorganized as a result of the alleged collaboration with the German troops of four ethnic groups, which by nay of punishment were deprived of their identity and deported to other parts of the U.S.S.R. Thus the autonomous *oblast* of the Karachai was partitioned in 1943 between the Stavropol krai and the Georgian S.S.R. In the same year, the Balkar part of the Kabardino-Balkar A.S.S.R. (*q.v.*) was handed over to the Georgian S.S.R. and the name Balkar was deleted from the title of the republic. Also, the Chechen-Ingush A.S.S.R. (*q.v.*) was dissolved, most of its territory becoming part of the newly established Grozny oblast. All these were subsequently restored.

ECONOMIC SIGNIFICANCE

Production. — The Caucasus region is rich in raw materials for industry and includes many prosperous agricultural districts. Within it lie a number of large towns and the whole area supports a population of relatively high density. It is, however, remote from the capital and has only indifferent communication with the rest of the country. To the north of Ciscaucasia, moreover, there is a barrier of arid and thinly peopled steppe in the Manych depression, which separates the Caucasian region from the fertile plains of the lower Don and Volga. For these reasons it has been the policy of the central government to develop the Caucasus as an independent region, supplying as many as possible of its own wants, and to make it independent of heavy products in particular which would otherwise have to be brought from a distance.

Agriculture. — The steppes of the Kuban valley are given over to an economy of mixed farming and, in addition to winter sown wheat and barley, are able to export a surplus of sunflower seeds, tobacco, sugar beet and dairy produce. The drier eastern parts of Ciscaucasia were formerly inferior pastureland, but parts of these steppes around Salsk have been converted, by dry-farming techniques and by irrigation from the Terek, into valuable grain fields.

The Armenian plateau of Transcaucasia is another region where grain groming is combined with pastoralism. The plateau provides summer grazing, but in the cold season the animals are driven down to the lower valley of the Kura. From these regions there is a considerable surplus of cheese, for which Armenia is noted, as well as of wool, meat and hides. The development of the irrigation scheme at Mingechaur on the Kura was expected to reclaim wide areas of pasture in the Kura-Aras lowland for grain production, while on the Armenian plateau Lake Sevan was to be used as a natural reservoir and its waters drawn off to supply cotton plantations, vineyards and orchards by the Razdan river and middle Aras, especially around the town of Yerevan. Farther north, by the 1960s sugar beet was being grown successfully with the aid of irrigation near Leninakan, where it is refined.

Cotton is grown extensively on those parts of the Kura lowland in Azerbaijan which are irrigable, particularly on the Mugan, Mil and Shirvan steppes. The district specializes in high grades of cotton and Azerbaijan ranks second in the country to the Uzbek S.S.R. in the volume of its output. The crop is usually rotated there with lucerne.

Transcaucasia is particularly famous for its subtropical crops which cannot be grown elsewhere in the Soviet Union. These are raised along the Black sea littoral eastward from Gagra and widely in the lower Rioni valley or Kolkhida lowland of Georgia. They also thrive along a small section of the Caspian coast, the Lenkoran lowland, near the Iranian border. They include tea and citrus fruits, the two most important crops, and also tobacco, rice, camphor, prunes, almonds, olives, peaches and mulberries for sericulture. The wines of Georgia are well known and some are exported. The principal vineyards lie in the district of Kakhetia in the upper basin of the Alazani river. In the contribution it makes to the Soviet economy, Georgia may be compared to Florida in the United States.

Fisheries. — A small amount of fishing is carried on along the Black sea coast and the port of Yeysk has a canning factory. But the Caspian fisheries are more important and play a significant part in the economy of Azerbaijan. The most productive waters are around the mouth of the Kura river and just north of the Apsheron peninsula. Herring, carp and sturgeon form the main part of the catch, the bulk of which is destined for canning.

Forestry. — The forest reserves of the Caucasus region are carefully husbanded and are chiefly cut to supply some light industries in Georgia, where shuttles and spindles for textile machines are made from box. The great agricultural-machinery factories at Rostov-on-Don take their timber partly from the mountains in the vicinity of Maikop.

Minerals. — Iron is found at Dashkesan in Azerbaijan, and coal at Tkibuli and Tkvarcheli in Georgia. Armenia produces copper from Alaverdi and Zangezur and some of its volcanic rocks are quarried for building. To the east of Kutaisi, the manganese deposits of Chiatura in Georgia are the best in the world for quality and are second in quantity only to those of Nikopol in the Ukraine. Alunites, a source of aluminum, are mined at Zaglik in Azerbaijan. The chief mineral resource of the Caucasus region is its crude oil. There are fields of moderate size at Maikop, Grozny and in the district of Dagestan in the Caucasus, but the largest are in the Apsheron peninsula near Baku. For long this was the most productive field of Russia, but after World War II it was superseded in importance by the so-called "Second Baku" field of the southern Urals. Pipelines carry Baku oil to Batumi on the Black sea and that of the Caucasus foothills to Rostov and Makhachkala.

Water Power. — There are abundant reserves of power in the rivers of Georgia, and stations were set up on the Rioni and Sukhumi rivers and, largest of all, on the Khrami river, a right-bank tributary of the Kura. In Azerbaijan the largest enterprise is the hydroelectric installation at Mingechaur, built after World War II. An ambitious project was also begun to lower the level of Lake Sevan to reduce evaporation and to build eight hydroelectric stations along its outlet, the Razdan river.

Industries. — As part of the plan to make the Caucasus region self-sufficient, the Transcaucasian metallurgical plant was established at Rustavi near Tbilisi. Using iron ore from Dashkesan in Azerbaijan and coal from Georgia, this installation produces iron and steel for the machine-building industries of the area and for pipelines for the transport of oil and irrigation water. Machine

building is carried on at Baku, and at Sumgait nearby a large tube-rolling plant was set up, using metal from Rustavi. The chemical industry of the Baku district relies on the by-products of the oil refineries, and the output of fertilizers has rendered the region largely independent of the rest of the U.S.S.R. in this respect. The Baku district in the Apsheron peninsula contains the largest concentration of industries in the Caucasus region, but many of the larger towns elsewhere have factories. Kirovabad and Leninakan turn out textiles. Ordzhonikidze in the Caucasus foothills is a centre of production of nonferrous metals, Novorossisk manufactures farm machinery and cement and Grozny and Tuapse, equipment for the oil industry.

Recreation. — The Black sea littoral may be considered as the Soviet Riviera. Shielded by the mountains from cold continental winds, it enjoys an exceptionally mild minter. The picturesque situation with mountains rising from close by the shore, the abundance of subtropical fruits and the proximity of medicinal springs are additional appeals. Sochi, Matsesta and Anapa are all well-known resorts. The medicinal mineral springs about Pyatigorsk in the northern foothills of the main Caucasus range have also for long been the basis of a tourist industry.

Communications. — The area was first firmly linked with the more central districts of Russia by the railway from Rostov to Ordzhonikidze. which was laid in 1876. However, it was not until 1900 that this was extended beyond the Caucasus range, through the Pass of Derbent to Baku. Meanwhile in 1883 a railway was completed across the isthmus from Batumi to Baku, to serve the oil fields which were opened in the 1870s and to confirm the military control of these recently annexed districts. Before World War I branches were thrown forward from Tbilisi, by way of Leninakan to Kars and Tabriz (Iran) in the remoter parts of Transcaucasia. After the Russian Revolution the lower Aras valley was served by a railway and the Rioni lowlands were linked with the Ciscaucasian line by way of Tuapse. This last connection was completed during World War II. In that war, too. a new line was opened from Kizlyar to Astrakhan to replace the route to Rostov nhich had fallen into German hands. By the 1960s no railway crossed the main range of the Greater Caucasus.

DISTRIBUTION OF THE THREE MAJOR ETHNO-LINGUISTIC GROUPS OF THE CAUCASUS

CAUCASUS, PEOPLES OF. The Caucasus (*q.v.*) is one of the most complex ethnic areas in the world. It harbours more than 50 separate peoples, ranging from language communities with only a few hundred speakers to large national groups numbering millions. This diversity is not of recent date. The Greek geographer Strabo mentions (Geogmphy xi, 2, 16) that representatives of 70 peoples, all speaking different languages, used to gather in Dioskurias (Sukhumi) for their trade. Pliny the Elder relates (*Natural History* vi, 5, 1) that the Romans carried on their business there through 80 interpreters. Arab geographers called the Caucasus Jabal *al Alsine,* "Mountain of Languages."

The peoples of the Caucasus belong to four different language families: Paleocaucasian (see CAUCASIAN LANGUAGES), Indo-European, Turkic and Semitic. Whereas the representatives of the latter three groups are known to have immigrated to the Caucasus in historical times, the Paleocaucasian peoples already inhabited the area at the dawn of history. They fall into a northern and a southern group, which are generally assumed to be related to each other. though this has not been proved conclusively.

The South Paleocaucasian (or Kartvelian) peoples comprise the Georgians (lowland tribes: Kartlians, Kakhetians, Ingilo, Imeretians, Gurians and Adzhar; highlanders: Pshav, Tush, Khevsur, Racha, Lechkhum), the closely related Mingrelians and Laz. and the Svanetians. These peoples together constitute the Georgian nation (2,600,000). Their area of distribution is western Transcaucasia. Most of the Laz live on Turkish territory.

The North Paleocaucasian peoples, all highlanders, fall into a western and an eastern group. The western group contains the Circassians (*q.v.*; 305,000) along the Kuban and upper Terek basins (the latter group known as Kabardians) and the Abkhaz (80.000) south of the mountains on the Black sea coast, with the closely related Abazinians (20,000) north of the divide. The eastern group falls into six subgroups: (1) Veinakh (520,000) in the central Greater Caucasus, comprising the Chechen. Ingush and Bats; (2) Xvaro-Ando-Dido (260.000) in western Dagestan: (a) Avar. (b) Andi: Andi proper, Botlikh-Godoberi, Karata, Bagulal, Tindi, Chamalal, Akhvakh; (*c*) Dido: Khvarshi, Dido proper, Kapucha-Khunzal-Ginukh; (d) Archi; (3) Lak-Dargwa (210,000) in central Dagestan, comprising Lak and the Dargwa dialects: Dargwa proper. Kaitak, Kubachi; (4) Samurian (235.000) along the Samur river in southern Dagestan: Lezgian. Agul, Rutul, Tsakhur, Tabasaran, Budukh, Dzhek; (5) Khinalug (1,500); and (6) Udi (3,000) in a few villages in northern Azerbaijan.

The oldest references to peoples of Paleocaucasian stock are found in Assyrian sources and in the Bible; *e.g.,* the name of the biblical Meshech (Ezek. xxxix, 1; in Assyrian sources, Mushki) survives in the present-day Meskhi. one of the southernmost subdivisions of the Georgian Kartlians. In antiquity the Paleocaucasian peoples were known by a whole series of ethnic names: in western and central Transcaucasia the Colchi and Iberi (ancestors of the Mingrelians and Georgians); in eastern Transcaucasia the Albani; on the Black sea coast the Abasgi (Abkhaz). Cerceti (Circassians) and many others; in Dagestan the Leges (Lezgians); etc.

Of the Indo-European peoples, the ancestors of the Armenians

(2,500,000) entered Transcaucasia from Anatolia in the first quarter of the first millenium B.C.; their language has been strongly influenced by local (Paleocaucasian) elements. A second ancient Indo-European group in the Caucasus are the Ossetes (370,000), who live on both slopes of the central Greater Caucasus; they are a remnant of the eastern Iranian nomads who roamed in the south Russian steppes from the 7th century B.C. until the 4th century A.D. (when they were dispelled by the Huns) and who were successively known as Scythians, Sarmatians and Alans. Western Iranian elements include a small group of Kurds (50,000 in the U S.S.R.) in southern Transcaucasia (including 15,000 Yezidis, distinguished by their peculiar religion); the Talysh (89,000 in the U.S.S R.) in the southeast on the Caspian sea coast; and the Tat (86,000) on the Apsheron peninsula and in Dagestan. The latter include 8,000 Tat-speaking Jews known as Dagh *Chufuti* ("Mountain Jews"). The Caucasus harbours a sizable number of Greeks (153.000, mostly in Georgia) and a few thousand gypsies. known as Bosha in Armenia and as Karachi in Azerbaijan. The Slavic element (Russian and Ukrainian, partly Cossacks and partly more recent immigrants) accounts for more than one-third of the total population of the Caucasus (c. 6,500,000 out of 15,000,000); most of these 15,500,000) are concentrated in the northern Caucasus.

The Turkic world is represented first of all by the Oghuz-Turkic Azerbaijanians (2,800,000 in the U.S.S.R.); the Turkification of Azerbaijan was completed in the 11th century with the Seljuk invasion. In the northern Caucasus there are several groups of Kipchak Turks: the Kumpk (110,000) in the lower regions of Dagestan; the Noghai (35,000), concentrated mainly between the lower Kuma and Terek rivers; and the Karachai (70.000) and Balkar (40.000) in the highlands of the western Greater Caucasus. These groups immigrated between the 10th and 15th centuries. In the 17th century a small group of the Oghuz-Turkic Turkmens migrated from central Asia to the Kuma region in the northeastern Caucasus, where they are known as Trukhmen (15,000).

The only Semitic people in the Caucasus are the Aisor (or Assyrians. *c.* 20,000). who fled to Russian territory at the end of World War I; their language belongs to the Aramaic group of western Semitic. They live mainly in the cities.

The traditional economy of the peoples of the Caucasus is based on agriculture and cattle raising, supplemented by homecrafts. The main crops are millet, barley, wheat and corn. Wine growing is highly developed in Transcaucasia (especially Georgia, homeland of the famous Kakhetian wine). In addition, horticulture and beekeeping are engaged in, especially in the west. Pastoralism (mainly sheep raising) plays an important role in the higher and dryer areas (Dagestan, highland Armenia. Azerbaijan). The Kabardian breed of horses is famous. Crafts are especially developed in Dagestan; the goldsmiths of the village Kubachi are widely renowned. Dagestan, Armenia and Azerbaijan are centres of rug weaving.

In the treeless highland areas the villages consist of stone houses clustered together and built into the mountain slope, so that the roof of one house forms the front yard of the house above it. In the Western Caucasus the villages consist of individual homesteads surrounded by fences; the buildings are made of wood or of wattles coated with clay. A third type of house, found in central and eastern Transcaucasia, is the darbazi, characterized by a cupola-shaped, stepped vault (*gvirgvini*) on pillars, with an opening at the top which serves as a window and smoke flue. The Svanetians, Ossetes and the Georgian highlanders built defense towers into which the population could flee in case of an attack.

The common Caucasian men's costume is the cherkeska, a coat-like garment, cut to the figure, with wide sleeves and with cartridge holders sewn on the breast. This costume was borrowed by the Cossacks and through them became widely known abroad. The women's costume shows much local variation.

Everywhere in the Caucasus there are traces of a patriarchal clan system and a tribal organization of society. These features have been best preserved among the mountaineers. The tribal system gradually gave may to a system of village communities. Feudal relations developed especially in Georgia, Armenia and Azerbaijan (in Armenia they were soon obliterated by foreign domination) and in the northern Caucasus among the Kabardians and Kumyk. In older times, extended families of 50 persons and more lived together in one house. Exogamous rules were strictly observed, except in the highlands of Dagestan, where local endogamy is common. Adoptive relationships, including the so-called "milk-relationship," played a large role. Among the highlanders the customs of acquiring brides by abduction and of paying a bride-price (*kalym*) existed. Further typical Caucasian traditions were blood vengeance, respect for superior age, hospitality, a chivalrous attitude toward women and stress on military virtues.

The major religions in the Caucasus are Christianity and Islam. The Georgians are Eastern Orthodox Christians (except for some Islamicized groups on the periphery: Adzhar in the southwest. Ingilo in the east), while the Armenian-Gregorian Church split off from Byzantine orthodoxy as a result of the monophysite controversy (A.D. 451). In the struggle for survival of both nations the church has played a major role. Other Christian groups are the Udi, the Aisor and the majority of the Abkhaz and Ossetes. The remaining North Paleocaucasians and all the Turkic groups are Muslims—in the northern Caucasus. Sunnites; in Transcaucasia. both Sunnites and Shi'ites. Besides the Mountain Jews of Dagestan there are 20,000 Georgian-speaking Jews in Georgia. The peculiar religion of the Yezidis contains elements of Mazdaism, Judaism, Nestorian Christianity and Islam. Before the spread of Christianity (4th–5th centuries) Mazdaism was widespread in the Caucasus. Pagan beliefs and rites persisted especially among the highlanders. Typical features are the cult of ancestors, of trees, of the hearth (particularly the hearth chain), and a pantheon of patrons of various economic activities, including hunting and smithery.

Outstanding elements of Caucasian folklore are the north Caucasian epic of the Narts (mythical heroes) and the Prometheus legend known to many peoples of the Caucasus; *e.g.*, the Georgian legend of Amirani. The folk music of the Circassians and Georgians is remarkable for being polyphonic. The folk instruments comprise representatives of the violin and lute family, flutes, drums and castanets, the latter especially used for the accompaniment of a wide variety of dances, the best known of which is the *lezginka.* See also ARMENIA; AZERBAIJAN SOVIET SOCIALIST REPUBLIC; GEORGIA.

CAUCHON, PIERRE (c. 1371–1442), French ecclesiastic who presided over the trial of Joan of Arc, was born near Reims. He was educated at the University of Paris. of which he became rector in 1403. Having taken part in the Cabochien riots, he was banished from Paris on May 14, 1414, and took service with John the Fearless, duke of Burgundy. In 1420 he became bishop of Beauvais. In 1422 Cauchon, as a councilor of Henry VI of England, became a servant of his regent in France, the duke of Bedford. The capture of Joan of Arc in the diocese of Beauvais on May 24, 1430, gave Cauchon an excellent opportunity to serve the English. He took care to disguise the political revenge by conducting the trial according to inquisitorial procedure and by attempting to obtain from the Maid a confession which would save her life.

In 1432 Cauchon became bishop of Lisieux. He took part in the council at Basel in 1435. He died on Dec. 18. 1442. at Rouen.

CAUCHY, AUGUSTIN LOUIS, BARON (1789–1857), one of the greatest of modern French mathematicians. was born in Paris, on Aug. 21, 1789. and died at Sceaux (Seine) on May 23, 1837. He studied at the École Polytechnique and the École des Ponts et Chaussées, and practised for some time as an engineer.

His health failed in 1813, and his father's friends, Lagrange and Laplace, persuaded him to devote himself entirely to mathematics From 1816 onward he held three professorships in Paris. which he lost at the revolution of 1830, on declining to swear allegiance to Louis Philippe. A chair of mathematical physics was created

for him at the University of Turin. He spent some time traveling with the duke of Bordeaux. grandson of Charles X. and in 1838 returned to France, resuming his chair at the Ecole Polytechnique. Although acting only from the highest motives. Cauchy made himself objectionable to his colleagues by a self-righteous obstinacy and an aggressive religious bigotry.

The genius of Cauchy was promised in his simple solution of the problem oi Apollonius (*i.e.*, to describe a circle touching three given circles), which he discovered in 1805, and in his generalization of Euler's theorem on polyhedra in 1811. More important is his memoir on wave propagation, which obtained the *grand prix* of the institut in 1816. His greatest contributions to mathematical science, characterized by the clear and rigorous methods that he introduced, are mainly embodied in his three great treatises. *Cours d'analyse de l'École Polytechnique* (1821); *Le Calcul infinitésimal* (1823); *Leçons sur les applications du calcul infinitésimal à la géométrie* (1826–28). He clarified the principles of the calculus by developing them with the aid of limits and continuity and was the first to prove Taylor's theorem rigorously, establishing his well-known form of the remainder. Thus the first phase of modern rigour, giving a satisfactory basis for the calculus. originated in Cauchy's lectures and researches in analysis during the 1820s. To the same period belongs the development of his version of the theory oi functions of a complex variable, today indispensable in applied mathematics from physics to aeronautics. With equal originality. he made substantial contributions to the theory of numbers where, however, he went astray on Fermat's last theorem. He was one of the originators of the theory of permutation groups. In astronomy, he gave a shorter account than Leverrier's of the motion of the asteroid Pallas. In mechanics. he made many researches, substituting the notion of the continuity of geometrical displacements for the principle of the continuity of matter. In optics, he developed the wave theory, and his name is associated with the simple dispersion formula. In elasticity, he originated the theory of stress. His collected works, *Œuvres complètes d'Augustin Cauchy,* have been published in 27 volumes. *See* also references under "Cauchy, Xugustin Louis" in the Index volume.

See C. A. Valson, *Le Baron Augustin Cauchy: sa vie et ses travaux* (1868); *E. T. Bell, Men of Mathematics* (1937).

CAUCUS, a political term used in the U.S. of a special form of party meeting, and in Great Britain of a system of party organization. The word originated in Boston. Mass., in the early part of the 18th century. nhen it was used as the name of a political club, the Caucus or Caucas club. There public matters were discussed and arrangements made for local elections and the choosing of candidates for offices. A contemporary reference to the club occurs in the diary of John Adams in 1763; but William Gordon *(History of the Independence of the United States of America* [1788]) speaks of the Caucus as having been in existence about 50 years before the time of writing (1774) and describes the methods used for securing the election of the candidates. The derivation of the word has been much disputed. The most plausible origin is an Algonkian word, *kaw-kaw-was,* meaning "to talk." Indian words and names having been popular in America as titles for societies and clubs (*cf.* "Tammany"). In the Cnited States "caucus" is used strictly of a meeting either of party managers or of duty voters, as for instance a "nominating caucus," for nominating candidates for office or ior selecting delegates for a nominating convention. The caucus of the party in congress nominated the candidates for the offices of president and vice-president from 1800 until 1824, when the convention system was adopted. At the same time, the candidates for governor and lieutenant governor were nominated by the party members of the state legislatures in what was known as the legislative nominating caucus. Occasionally districts unrepresented in the legislature sent delegates to sit in with the members of the legislature when these nominations were made, and this was termed the mixed legislative nominating caucus. (*See* PRIMARIES.)

The word is used in the Cnited States to denote meetings of the members of a party in congress or in a legislature or a city council to determine matters of party policy on proposed legislation or legislative offices. "Caucus" first came into use in Great Britain in 1878 in connection with the organization of the Liberal Association of Birmingham by Joseph Chamberlain and F. Schnadhorst on strict disciplinary lines, more particularly with a view to election management and the control of voters, which became the model for other Liberal associations throughout the country. It was to this supposed imitation of the C.S. political "machine" that Lord Beaconsfield gave the name "caucus." and the name came to be uied. not in the U.S. sense oi a meeting. but of a closely disciplined system of party organization. chiefly as a stock term of abuse applied by politicians of one party to the controlling organization of its opponents.

CAUDATE, any of the salamanders and newts, amphibians of the order Caudata (from the Latin meaning tail-bearing). The earlier Greek derived names urodele and Urodela are also in use. The presence of a tail sets caudates apart from frogs and toads, and the presence of limbs sets them apart from caecelians (wormlike amphibians).

They are adapted to humid regions of the north temperate zone. and are not often found in the tropics. Caudates are usually inoffensive and secretive; most of them are small — three to eight inches long — although the giant salamander of the orient, *Megalobatrachus,* reaches a length of five feet.

Of the living caudates the following suborders may be mentioned: Cryptobranchoidea, containing 8 genera found in Asia and eastern North America; Meantes. consisting of 2 genera restricted to eastern North America; and Salamandroidea, containing about 50 genera found in all continents except Australia. The fossil record is scanty, the earliest representative caudate being *Prosiren elinorae* from the Lower Cretaceous of North America. *See* also AMPHIBIA; NEWT; SALAMANDER. (A. B. GR.)

CAUDINE FORKS, the *furculae Caudinae,* a narrow pass in the mountains in ancient Samnium near mod. Montesarchio in the *regione* of Campania, southern Italy (or possibly near Forchia) where the Samnites under Gavius Pontius defeated the Romans in 321 B.C. during the Second Samnite War.

See E. T. Salmon in *Journal* of *Roman Studies,* vol. 19 (1929).

CAUL, a portion of the amnion, or bag of waters, which is sometimes found remaining around the head of a child after birth. The term also is applied occasionally to the serous membrane covering the heart, brain or intestines. It is derived from the original meaning of a close-fitting woman's cap, especially one made of network. Many superstitions were attached to the infant caul; it was looked on as a sign of good luck and, when preserved, was kept as a protection against drowning.

CAULAINCOURT, ARMAND AUGUSTIN LOUIS DE, DUC DE VICENCE (1173–1827), French diplomat, ambassador and ultimately foreign minister under Napoleon, was born on Dec. 9, 1773, at Caulaincourt in Picardy, son of Gabriel Louis de Caulaincourt, a general of high social position. Gen. Lazare Hoche picked him out as a cavalry conscript in western France in 1795. Gen. J. B. A. Xubert-Dubayet took him as aide-de-camp at the ministry of war and in 1796–97 on his embassy at Constantinople. In 1799 Gen. J. Bernadotte made him colonel of a crack cavalry regiment, the 2nd Carabiniers. which he led at the battle of Hohenlinden (1800). Talleyrand, his father's friend. employed him in Russia (1801–02), where he greatly impressed Alexander I. Napoleon took him as aide-de-camp on his return. In March 1804 he was sent to Strasbourg to deal with royalist agents from beyond the Rhine; this led to the arrest of the duc d'Enghien. Caulaincourt was shocked at Enghien's execution and resented that Napoleon had exposed him to the charge of being an accomplice. As the emperor's grand equerry from 1803. Caulaincourt was at his side in the great battles. From Nov. 1807 to Feb. 1811 he was ambassador to Russia. working incessantly for peace against his master's arbitrary policy. Napoleon created him duc de Vicence (Vicenza) on March 19, 1805. Recalled in 1811, Caulaincourt had a seven-hour interview with Napoleon, who angrily called him a "Russian." Suffering the same taunts after the invasion of Russia began (1812), he asked to be sent to Spain, as far away from the emperor as possible. Pet he alone accompanied the emperor on his return in a sledge from Russia to Poland and on the dangerous

journey through Germany to Paris. His statement that Napoleon was surrounded by capable men who told him the truth deserves record; yet with all his devotion he never liked Napoleon personally.

Caulaincourt negotiated the armistice in Silesia (June 1813) and went to the abortive congress at Prague. After the battle of Leipzig, he replaced J. H. B. Maret as foreign minister. He was the "man of peace." but Napoleon mas not, and by mid-March 1814. the congress of Châtillon also failed. Finally Caulaincourt reached .Alexander I and. on April 10, 1314. signed the treaty which sent Napoleon to Elba; he was with him in the last grim week at Fontainebleau. In 1315. he resumed the hopeless task of being Napoleon's foreign minister. After Waterloo, Xlexander's intervention saved him from the Bourbon proscription. Henceforth he lived in retirement. still trying to clear his name of complicity in the Enghien case. He died of cancer in Paris on Feb. 19, 1827.

His *Mémoires*, ed. by J. Hanoteau, three volumes (1933; Eng. trans. 1950), are important. (I. D. E.)

CAULICULUS,. in architecture, a form like a stalk, crowned with leaves supporting scrolls, more leaves or other stalks; especially in the Corinthian capital, and in the branching scroll or rinceau (*q.v.*). *See* CAPITAL; *ORDER.*

CAULIFLOWER: *see* CABBAGE.

CAULLERY, MAURICE JULES GASTON CORNEILLE (1868–1958), French biologist famous for his work on invertebrates and on evolution. was born at Bergues. Sord, on Sept. j, 1868, and was educated at Douai and at the Ecole Sormale Supérieure, Paris. In 1909 he succeeded Alfred Giard in the chair and the directorship of the laboratory of "Evolution des êtres organisés" of the University of Paris (Sorbonne) and in the directorship of the marine zoological station of Wimereux, Pas-de-Caiais, founded by Giard in 1874 but destroyed during World War II. He held these posts until 1939. In 1928 he was elected member of the French Academy of Sciences and in 1948 he became foreign member of the Royal society. London. Caullery's numerous papers deal with the structure, life history and biology of parasitic protozoa and marine invertebrates; and he published books on different aspects of general biology, including *Les Problèmes de la sexualité* (1918), *Le Parasitism et la symbiose* (1923), *Le Problème de l'évolution* (1931). *Les Conceptions modernes de l'hérédité* (1935), *Lcs Progrès récents de l'embryologie expérimentale* (1939), *Organisme et sexualité* (1942) and *L'Histoire des sciences biologiques* (192j) forming part of *L'Histoire de la nation Française* by G. Hanotaux. He also became a co-editor of the *Bulletin biologique de la France et de la Belgique.* He died in Paris on July 15, 1958. (D. KN.)

CAULONIA, an ancient Greek city in southern Italy, in the country of the Bruttii. on Cape Stilo on the eastern coast of modern Calabria. 9 mi. from modern Caulonia. It was the southernmost of the colonies founded in Italy by the Achaeans (*q.v.*), established perhaps in the first half of the 7th century B.C. as an outpost of Croton (Crotone). It was always a small city. but its copious and beautiful coinage (from the second half of the 6th century B.C.) shows its importance. It took the side of Athens in the Peloponnesian War (431–404 B.C.). Destroyed by Dionysius of Syracuse in 389 B C. but soon afterward restored it was captured by Campanian troops during the invasion of Pyrrhus, king of Epirus (280–275 B C) and submitting to Hannibal in 215 B C., stood a siege (209 B C.) on Hannibal's side in the second Punic War. After this it declined. and Strabo mentions it as deserted. Excavations have revealed remains of the fortifications with towers of the Hellenistic period. Near the shore remains of a large Doric temple, a small temple and terra-cotta fragments of architectural structures were found. The excavated houses belong to a later period than the temples. The tombs date from the 6th to the 3rd centuries B.C. but are poor.

See P Orsi in *Monumenti Antichi,* vol. xxiii, 685 et seq. (1914), and vol. xxix, 409 *et seq* (1923).

CAUPOLICÁN (QUEPOLICÁN) (d 1558). an Araucanian Indian chief born in Palmaiquén Chile. early in the 16th century. With Lautaro, he led Indian resistance against the Spanish conquest of Chile. The Indians captured and executed Pedro de Valdivia after defeating him at Tucapel in Dec. 1553 Following Lautaro's defeat and death at the hands of Francisco de Villagrán at Mataquito in April 1557, Caupolicán organized his warriors to attack a powerful invading army under Don Garcia Hurtado de Mendoza. Don Garcia defeated the Indian chief at Monte Pinto, and soon afterward in another battle where the Indians lost 6.000 men. Caupolicán retired to the mountains near Cañete where he was captured by Capt. Alonso de Reinoso. He suffered a cruel death at Cañete in 1558. Much of the fame that Caupolicán has acquired is owed to the verses which the poet Xlonso de Ercilla y Zúñiga dedicated to him in *La Araucana.* (J. L. TR.)

CAUSALITY (CAUSATION). The word "cause" is derived from the Latin *causa,* the standard translation of the Greek *aition* and ***aitia.*** By the time it came into English. in the 13th century, the word already had a wide range of uses, some of them highly sophisticated, since it was a key term in science. philosophy and the law.

Sense I: Human Agency. — Both *causa* and its Greek equivalents were used in legal contexts to refer to the voluntary action of an agent for which he could he held responsible. The responsible person is the person whose action could have been otherwise and but for whose action the event under investigation would not have occurred. One can already detect here the idea of the point of application of a remedy. an idea which. as we shall see, is an important element in later uses.

Divorced from its association with the law courts, the word "cause" is used for any action which an agent performs in order to bring about an event or state of affairs (the effect). whether in nature or in another agent. Thus a man can cause a statue to be unveiled by pressing a button or cause another man to do something by offering him a bribe. In this sense (sense I), to cause an event to occur is to perform an action with the expectation and intention that the event will follow. The words "produce" and "bring about" are synonyms of "cause" and can be used either of the agent or of his action. We also have a vast number of more specislized verbs such as "hit." "kick." "lift" and "move" which may be said to express causal ideas.

When one man causes another to do something, the second man is. under some circumstances. said to act. not "of his own free will," but "under compulsion" or "under constraint." To have power over someone is to be able to constrain. compel or oblige him to do something. We shall see that the idea of compelling, like that of producing, plays a part in later senses of '.cause."

In ordinary life we are often concerned to produce, prevent or counteract events and states of affairs. hut our actions arc limited to the movements of our own bodies. I can move my own foot; I cannot, in the same sense. move a stone; but I can cause a stone to move by kicking it. To bring about any change in natural objects. it is necessary for us to know what action that we can perform will he followed by the desired change. Thus I cannot. of my own volition, heat water; but I can put a kettle on the fire. and I know that, if I do this in suitable circumstances, the water will he heated. It is often the case that the same change can be brought about by any of a number of alternative actions. Thus I can light a room either by pressing a switch or by drawing back the curtains or by striking a match. Each of these actions is called a "sufficient condition" of producing light; and since. in practice. it is usually required to know only that an action will be *sufficient,* not that it is *necessary,* to produce the effect. the word "cause" usually means sufficient condition. It is important to notice that, when we use "cause" in this way. the effect must he very broadly conceived. The sort of light produced by pressing a switch is very different from that produced by striking a match. The more narrowly the effect is specified the fewer will be the possible alternative sufficient conditions. Beheading, shooting through the heart and administering a dose of arsenic are all ways of causing death; but if the condition of the corpse is specified more narrowly than by the word "dead:" a number of these possible causes will be excluded.

A cause. in this sense. must clearly be prior in time to its effect. It need not be contiguous in space and time: but since we know from our everyday experience that the transmission of movement

from one body to another only occurs when the bodies are in contact. common sense always assumes that cause and effect are linked by a continuous substance. By igniting one end of a fuse I can cause an explosion to occur several minutes later and several yards away: but only if the fuse is unbroken.

Sense **II:** Causes in **Nature.**—By a natural transition the word "cause" is also used (sense II) for a natural event that stands in the same relation to some other event or state of affairs as the action stood in sense I. Thus the explosion that I caused (sense I) by lighting the fuse could have been caused (sense II) by some sparks from a locomotive. For a reason to be given later, the ideas of "producing" and "compelling" which belong naturally to "cause" in sense I were retained for "cause" in sense II. A cause (sense II) was thought to be. not merely the sufficient condition of its effect, but something which had the power to produce it.

A great part of our early education consists in the discovery of causes in these two senses. Thus. in order to achieve our most elementary aims, it is necessary for us to know that fire burns. that food nourishes and that bodily injury causes pain. The idea of cause has its roots in purposive activity and is employed in the first instance when we are concerned to produce or to prevent something. To discover the cause of something is to discover what has to be altered by our own activity in order to produce or to prevent that thing; but once the word "cause" comes to be applied to natural events, the notion of altering the course of events tends to be dropped. "Cause" is then used in a nonpractical, purely diagnostic way in cases where we have no interest in altering events or power to alter them. Thus we can speak of the cause of an eclipse or of an earthquake. The connecting link between the practical and the purely diagnostic uses is the idea of "sufficient condition." To discover the cause of an event is to discover something among its temporal antecedents such that, if it had not been present. the event would not have occurred.

Cause in the Practical Sciences.—The concept of cause is widely employed in the practical sciences. such as medicine and engineering. For in these sciences we are largely interested either in bringing about a certain state of affairs (*e.g.*, building a bridge) or in locating the sufficient condition of a state of affairs with a view to its removal (*e.g.*, discovering the cause of a disease or of the breakdown of a machine:). The procedure of a practical scientist differs from that of an ordinary intelligent man only in that he needs to be more careful and accurate in his diagnosis of causes and in that he is assisted in his diagnosis by being able to draw on a large fund of theoretical science (*e.g.*, physiology or mechanics).

From this it has been concluded that all science is the search for causes. This conception has been popular with philosophers such as Francis Bacon and J. S. Mill, who regarded science primarily as a means of acquiring power over nature. But to conclude that the statements of theoretical science must be fundamentally causal in form is to make the error of introducing into theoretical science a concept which has its roots in practical activity and which always bears the mark of its origin. Causal explanations necessarily (from the meaning of the word) spotlight a particular event or state of affairs and explain it in terms of temporally prior sufficient conditions: but theoretical sciences are not limited to this mode of explanation and have in fact tended to discard it in favour of other modes. (See *Historical Development,* below,)

Sense **III:** Cause as **Explanation.**—The word "cause" has also a wider use (sense III) in which it is equivalent to "explanation," whether or not the explanation is causal in senses I or II. Thus the word "because" can be used to introduce any type of answer to a question beginning "Why?" In this sense a cause need not be an action or event, but may be a state of affairs, a trait of character or. indeed, anything such that, if it were not present. the effect would not occur. Thus a husband's jealousy might be the cause of the breakdown of a marriage and the weakness of a link in a chain the cause of the chain's breaking. In the latter case the weakness of the link is not thought to.be the sole cause; for. in calling it the cause. we do not intend to imply that no other conditions were necessary. We know that many factors must be present in the antecedent other than that called "the cause"; for example. the weak link would not have broken if no strain had been put on it. For this reason Mill thought that the selection of one factor as cause from a total set of antecedents was arbitrary.

There is, however, always a reason for our choice. We single out, as cause, that factor which it is possible or convenient for us to alter in order to produce or to prevent the effect. The breaking point of a chain is a function both of the strength of its weakest link and of the load put on it; consequently we can prevent the weak link's breaking again either by replacing it by a stronger one or by refraining from subjecting it to such heavy loads. We select the weakness of the link or the weight of the load as cause according to the remedy which it is most desirable to apply. Similarly, mosquitoes are said to cause malaria, although, for malaria to occur. there must be human bodies as well as mosquitoes; but it would be impolitic to try to abolish malaria by eliminating the human race. In this sense of "cause" alternative explanations do not exclude each other; any number of them can be true, and the cause will be relative to the interests and abilities of the investigator.

Historical Development. — The connection between the three senses seems probably to lie in the historical fact that. when the serious investigation of nature began in the 6th century B.C.. it was customary to couch all explanations of natural events in anthropomorphic terms. The pattern of explanation appropriate to human zction. which already contained the idea of cause (sense Ij. was thought applicable to natural phenomena; and, this being so. it was inevitable that the idea of cause (sense II) should retain the anthropomorphic elements of producing and compelling. The idea that a cause (sense II) is an agent which has the power to produce its effect or to compel it to occur bedeviled philosophical and scientific accounts of causation until the matter was clarified by David Hume (see *Hume's Criticism of the Concept of Cause,* below) in the 18th century.

Cause from Aristotle to Copernicus.—For Aristotle all science was the search for causes (*i.e.*, explanationsj. His "four causes," which provided the framework of explanation until the 16th century. were four general types of answer to the question, "Why is something what it is?" Two of these causes, the material and the formal, we should regard as pertaining to the description of a thing rather than to a causal explanation of it. The material cause is the matter or "potential" from which the thing is made; the formal cause is. literally, the shape or, metaphorically. the structure or organizing principle which distinguishes it from other bits of the same matter (*see* FORM). Thus the material cause of a statue is a piece of bronze, the formal cause its human shape. A mathematical formula, for example the equation of a circle in Cartesian geometry, would be a formal cause.

Xristotle's efficient and final causes. on the other hand. correspond more closely to our uses of "cause." The efficient cause is the agent (*e.g.*, the sculptor) who brings the thing into being or imposes the form on the matter; the final cause is the purpose for which the thing is produced. That the whole scheme is anthropomorphic is shown both by the presence of the idea of "producing" in efficient cause and also by the fact that the final cause was thought to be, in the last resort. the only complete and satisfactory explanation of why a thing is what it is. The underlying idea is that everything does what it does because it is trying to achieve its purpose. In particular. all motion is explained as being due to a thing's attempt to come to rest at its natural resting place.

Cause in Renaissance Science. — In the period from Copernicus to Sir Isaac Newton the concept of causation underwent a change that may be described as the progressive elimination of the anthropomorphic elements in the Aristotelian conception. Two main strands can be detected in this change: (1) the attempt to refine the concept of cause (sense II) in such a way as to make it suitable for the purposes of theoretical science (see *The Refined Con,cept* of *Cause,* below); and (2) the transition from explanations in terms of efficient causes to explanations in terms of law.

Although the Xristotelian conception of explanation dominated the middle ages, a minority of mathematically minded scientists

continued to follow the tradition of Pythagoras and Plato. According to this tradition, to explain a phenomenon is to discover the laws which it obeys. The astronomer Ptolemy, in the and century A.D., maintained that it was legitimate to interpret the facts of planetary motion by means of any mathematical scheme which would "save the phenomena"; and Copernicus' heliocentric theory was accepted in the first instance. not because it was experimentally verified, but because it saved the phenomena with greater mathematical elegance than did its rivals. The 15th and 16th centuries witnessed a great revival of Platonism; Johann Kepler equated "causes" with "reasons" and regarded the cause of planetary motion as a set of lams from which the observed movements of the planets can be deduced. This view introduces the idea of necessity into that of causation, first in an anthropomorphic sense as the necessity by which objects are compelled to obey God's laws and secondly as the logical necessity which relates premisses to conclusions.

The transition from explanations in terms of efficient causes to explanations in terms of law was largely the work of Galileo. From the point of view of an analysis of causation the importance of his work is threefold. In the first place. he undermined Aristotelian explanations of why things move as they do by showing in a series of experiments that they do not move in the ways which the explanations presuppose. This discredited the whole enterprise of explaining phenomena in terms of final causes and thereby opened the way for other types of explanation. Secondly. the substitution of exact description for explanation (or. as it is sometimes put. of the question "How?" for the question "Why?") led eventually to a conception of science in n-hich all explanation just is description. A phenomenon is now said to be explained when the regularity which it exemplifies is able to be incorporated into a system of laws, for example. by being shown to be a logical consequence of those laws. In this nay Kepler's laws of planetary motion, which are compendious ways of describing the movements of the known planets, are said to be explained when they are shown to follow from Newton's general laws of motion nhen constants are substituted for the variables in Newton's laws. Thirdly. Galileo and his contemporaries limited their descriptions to those aspects of phenomena that can be measured. and the spectacular success of physics resulted in its being taken as a model for all the theoretical sciences. Hence scientific explanation came to be thought of as the discovery of functional correlations between variables. a conception from which the idea of efficient cause has disappeared.

Cause *in Newton's Philosophy*.—The full implications of this revolution in theoretical science were not, however. appreciated at the time. In Newtonian physics: the concept 'of efficient cause, with its attendant idea of "production" and the contrast between "caused" and "free." still survives as an anomalous element. In the first law of motion. "free motion" is said to be uniform motion in a straight line, and forces are introduced as the causes of deviation from free motion. All observed motions can be analyzed into two components, a free component (inertia) and a component due to a force acting. The second law states that the force acting on a body is always proportional to the product of its mass and acceleration; but Newton never regarded the word "force" just as a name for this product. As a natural scientist he eschewed speculation into the nature of forces, thinking it sufficient for scientific purposes that we should be able to calculate and observe their effects. But he always regarded a force as an unknown somewhat which is the efficient cause of observed motion.

In a modern statement of Newtonian mechanics this conception of forces as efficient causes disappears, what remains being a set of differential equations correlating the total state of an isolated system at any one time with its total state at any other time. An example will help to make this clear. Consider a moving billiard ball striking another which is at rest. From the point of view of common sense the movement of the first ball up to the moment of impact is one event (the cause) and the movements of the two balls after impact is another, complex event (the effect). From the standpoint of classical mechanics. however, the system is not divided into two events. It is considered as a single system in which there is at every time the same quantity of momentum. From the equations of motion of the system together with a specification of the position and velocity of each body in it at any given time. we can calculate (if we disregard disturbing factors such as friction) the position and velocity of each body in the system at any other time. Since the laws of mechanics are reversible in respect of time, the division of the system into an earlier and a later phase is irrelevant.

These two explanations do not conflict with one another and it would be a mistake to say that, if the explanation furnished by classical mechanics is true, the common sense explanation must be false. The concept of cause reappears naturally in any practical or diagnostic application of the laws of mechanics. For. if I want to impart a given velocity to the second ball, the laws of mechanics enable me to calculate the momentum that must be introduced into the system by the movement of my arm. Similarly, if I want to explain why the second ball moved as it did, I can calculate by means of the laws of mechanics the velocity with which a ball of known mass must have struck it.

The Refined Concept of **Cause.**—We must now return to the attempt to refine the concept of cause (sense II) for the purposes of theoretical science. It is this attempt that gives rise to most of the traditional philosophical problems about causation. These problems are mainly due (1) to a confusion between cause in sense II and cause in sense III whereby some philosophers have been led to suppose that all explanations of natural phenomena must be causal in sense II; and (2) to the retention of the elements of "producing" and "compelling" from sense I. Hobbes defined a cause as "the aggregate of all the accidents both of the agents hon- many so ever they be, and of the patient, put together; which when they are all supposed to be present, it cannot be understood but that the effect is produced at the same instant: and if any one of them be wanting, it cannot be understood but that the effect is not produced.'! The word "accident" is here used in a technical sense in which it is roughly equivalent to "quality."

This concept of cause resembles the unrefined concept (sense II) in that causal statements are made in qualitative. not quantitative, terms and in that it retains the idea of "producing." It differs, however, from the unrefined concept in many important ways. The causal relation is said to he logically necessary: the cause is a necessary as well as a sufficient condition of the effect, and cause and effect are contemporaneous. These ill-assorted elements cannot in fact be comprised within a single concept and it is not difficult to deduce absurdities from a concept so composed.

We have already seen that a cause in sense II is necessarily prior to its effect in time and that it is one element singled out from the total antecedent of the effect, the selection being relative to the interests and abilities of the investigator. We have also seen that the effect had to be more or less vaguely specified. In the refined concept both cause and effect must be precisely specified and the cause is the total necessary and sufficient condition. It now follows that cause and effect must be instantaneous events and must be contemporaneous with each other. For, if the cause has duration. however short, it cannot in its earlier phases be sufficient to produce its effect. since the effect does not occur. The total antecedent only becomes sufficient at the instant the effect occurs: at any prior time the supposed cause is not sufficient to produce the effect. and it follows that cause and effect must be contemporaneous. If this is so, the cause of the cause must be contemporaneous with it; so all causes and effects will be contemporaneous.

From argument such as this some philosophers have tried to prove the unreality of time and change; but all such arguments are illegitimate in that they depend on employing a concept of cause that contains self-contradictory elements. We cannot employ both the idea of producing and the idea of a total set of necessary and sufficient conditions in the same concept, since the idea of producing is essentially that of an action which. supervening on a given set of conditions, is followed by an event which would not have occurred if the action had not supervened, while the idea of a total set of necessary and sufficient conditions requires cause and effect to be contemporaneous.

Hume's Criticism of the Concept of Cause.—The full implications of the revolution in physics outlined above were first appreciated by David Hume, who shoned in the first. place that the relation of cause and effect is neither logically necessary nor observable in a single instance. It is not logically necessary since we can conceive of an event's being preceded by any other event whatsoever. and what we can conceive could (logically) occur. If in fact an event of a certain type is always preceded by the same other type of event, we only know this from experience.

Equally, the relation is not observable in a single instance since all that we observe in an instance is a succession of events; we do not observe in the earlier event that "power" or "agency" which is essential to the concept of cause. And if we cannot observe this in a single instance we cannot observe it in any number of instances. Nevertheless. Hume knew that when we call something a cause n-e intend to assert more than temporal priority and contiguity in time and place. The third element. which he called "necessary connection." had been thought to lie in the "efficacy" or "productive power" of the cause. But Hume saw that, divorced from their associations with human action. words such as "efficacy." "agency." "power" and "production" are mere synonyms for the necessary connection that they are supposed to explain. Finally Hume came to the view that for an assertion of causality we require. besides contiguity and succession. only that the succession should have been repeated many times without any contrary instance: and he held that the idea of necessary connection was the determination of the mind to pass from the idea of the cause to that of the effect. An assertion of cause is an expression of confident expectation based on habit.

As a contribution to the problem of induction Hume's analysis was of the greatest importance: but as an explanation of the idea of necessary connection it seems inadequate. Hume iailed to notice that this idea is really that of logical necessity transported from its proper place in a deductive system to an improper place in causal (sense II) explanations. When we say that the planets "must" move as they do. we do not mean that they are compelled to do so by efficient causes: we mean that the description of their observed motions follows logically from the laws of motion that we have adopted. The planets must move as they do. *if* Newton's laws are true and if the observations from which their movements are predicted were correct.

Following Hume. J. S. Mill defined the cause of a phenomenon as "the antecedent or concurrence of antecedents on which it is invariably and unconditionally consequent." The word "unconditionally" reintroduces the confusions inherent in the refined concept of cause. Since Mill was mainly interested in the social sciences, his theory represents a trend away from explanations in terms of mathematically forniulated laws toward the older view of causation as a relation between events qualitativelv described. His canons of induction require the analysis of complex events into factors and the discovery, by observation and experiment, of those factors which are invariably and unconditionally present when a certain phenomenon occurs and absent when it does not occur. Such an analysis. hon-ever. cannot be exhaustive without introducing the absurdities involved in the concept of an unconditional cause. Mill's canons of induction are useful in ordinary life and in the practical sciences. in iact wherever we are operating with the concept of cause (sense II) and do not attempt to refine it by requiring the cause to be necessary, sufficient and unconditional.

The Present State of the Question.— The notion of efficient cause survives in our ordinary language in such words as "produce." "bring about." "make." "due to." "result of" and "consequence of" and in the host of more specialized causal verbs. When the subject of these verbs is an inanimate thing the anthropomorphic element is a mere linguistic survival and does not (for most people) express anything present in thought: the cause is simply thought of as a sufficient condition discovered to be sufficient by experience.

In ordinary life we are not troubled by the logical problem of induction; that is to say. we do not stop to ask why the iact that a succession of events has been observed to occur many times should justify our expectation that it will occur again. The examination of this problem is beyond the scope of this article. (*See* INDUCTION.)

In the sciences. explanations are mostly of the type known as "hypothetico-deductive;" according to which observation suggests a generalization or law from which consequences can be deduced. The consequences can then be verified or falsified by controlled experiment or. where this is impossible, by observation. In the theoretical sciences, generalizations and laws usually take the form of functional correlations between variables, and the idea of efficient cause does not appear. Any set of laws which saves the phenomena is considered legitimate; but since a given set of phenomena can be saved by any of an infinite number of alternative sets of laws it is necessary to provide criteria for choosing one set rather than another. The usual criteria are mathematical simplicity (which is largely a matter of taste), comprehensiveness and predictive fruitfulness. The concept of efficient cause still appears within this framework in those sciences which depend largely on qualitative analysis and, especially, in the practical sciences. *See* SCIENCE; SCIENTIFIC METHOD; *see* also reierences under "Causality" in the Index volume.

CAUSE AND EFFECT: *see* CAUSALITY.

CAUSSES, the name given to districts of limestone plateaus in southwestern France. The name is derived from *cau,* the local form of *chaux* (*i.e.,* "lime"). The Grands Causses, in the *départements* of Aveyron and Lozère, form part of the Massif Central (*q.v.*) and over extensive areas lie between 3,000 and 4.000 ft. above sea level. They are dissected by the gorges of the Tarn and Aveyron rivers and present waterless, boulder-strewn surfaces with a scanty vegetation, though their present denuded character is the result of the ravages of sheep and goats that graze the plateaus. Settlement is concentrated within the narrow, sheltered valleys. The chief resource, apart from the tourist industry, is the rearing of sheep whose milk is used to make Roquefort cheese. The lambskins are made into gloves at Millau, formerly a woolen manufacturing town, situated on the western margin of the Causses at the exit of the Tarn gorge. Farther west. in Quercy and Périgord, are lower limestone plateaus, sometimes known as the Petits Causses and renowned for their cave remains of prehistoric man.

(AR. E. S.)

CAUSTIC, that which burns (Gr. *kaustikos,* "burning"). In medicine. the term refers to substances that destroy living tissues and so inhibit the action of organic poisons, as in bites, malignant disease and gangrenous processes. Such caustic substances include silver nitrate (lunar caustic), potassium and sodium hydroxides (the caustic alkalis), zinc chloride, an acid solution of mercuric nitrate, and pure carbolic acid (phenol).

In optics (geometrical optics) the term "caustic" is applied to the envelope of luminous rays after reflection or reiraction. In the first case the envelope is termed a catacaustic, in the second a diacaustic. Catacaustics are observed as bright curves .when light is allowed to fall on a curved polished riband of steel, such as a watch spring, placed on a table. By varying the curl-ature of the riband of steel or moving the source of light a variety of patterns can be obtained. The investigation of caustics. based as it is on the assumption of the law of the rectilinear propagation of light and the validity of the experimental laws of reflection and reiraction, is essentially of a geometrical nature. and as such attracted the attention of mathematicians of the 17th and succeeding centuries.

CAUSTIC SODA: *see* ALKALI MANUFACTURE; SODIUM.

CAUTERETS, a health resort of south\\-estern France in the *département* of Hautes-Pyrénées, 30 km. (19 mi.) S.W. of Lourdes by road. Pop. (1954) 1.033. It lies in the beautiful valley of the Gave de Cauterets, and is well known for its hot springs and as a resort for winter sports, to which thousands of visitors are

attracted annually. The mineral waters have been known at least since the 10th century. They became famous in the 16th century when Margaret of Angoulême, queen of Navarre, composed the *Heptameron,* on the model of Boccaccio's *Decameron,* while visiting the spa with her court. Cauterets also is a centre for excursions, the Pic du Monné (8,937 ft.), the Cabaliros (7.654 ft.), the Pic de Chabarrou (9,596 ft.), the Pic de Vignemale (10,-820 ft.) and other peaks being in its neighbourhood. The town is 9 km. (6 mi.) from Pierrefitte-Nestalas station on a secondary railway from Lourdes. Air services fly from Tarbes-Ossun airfield (40 km. [25 mi.] N.N.E.) to Barcelona, Brussels and Dublin.

(JE. LA.)

CAUTÍN, a province of southern Chile, bounded north by Malleco and Arauco, east by Argentina, south by Valdivia and west by the Pacific. Area 6,707 sq.mi.; pop. (1960) 393,041, including many European immigrants, principally Germans. Cautin lies within the temperate rain forest region of the south; its chief products are timber, cattle, grain and apples. The state railway from Santiago to Puerto Montt crosses the province from north to south; branch lines to such places as Cherquenco, Cunco, Tolten and Carahue provide good rail service to most parts of the province. Two partially navigable rivers cross the province from east to west, the Tolten and the Cautin, the lower reaches of the latter being known as the Rio Imperial. The province once formed part of the territory occupied by the Araucanian Indians, and Temuco (*q.v.*), the capital of the province, long remained the centre of greatest concentration of these people. Temuco, a city of 111,641 (mun.) inhabitants in 1960, is on the Rio Cautin. It is an important rail centre, market town, and gateway to the famous lake district of south Chile.

CAUVERY (KAVERI), a river of southern India. Rising in Coorg district, Mysore, high amid the Western Ghats, it flows generally southeast across the plateau of Mysore, and finally enters the Bay of Bengal through two principal mouths in Tanjore district of Madras state. Its length is 475 mi. Its uppermost course is tortuous, and its bed generally rocky with high banks covered with luxuriant vegetation. After passing through a narrow gorge, it widens to a breadth of 300 to 400 yd. across the plateau surface of Mysore but the bed is too rocky for navigation. In its plateau course the channel is interrupted by a number of anicuts or dams for irrigation. In Mysore the Cauvery forms the two islands of Seringapatam and Sivasamudram, which vie in sanctity with Srirangam Island lower down in Tiruchirapalli (Trichinopoly) district. Around Sivasamudram Island are the celebrated falls of the Cauvery, where the river branches into two channels, each making a descent of about 320 ft. After entering Madras state, the Cauvery forms the boundary between the Coimbatore and Salem districts. until it reaches Tiruchirapalli district. Sweeping past the historic rock of Trichinopoly, it again breaks at Srirangam Island into two channels, which enclose between them the delta of Thanjavur (Tanjore), the garden of southern India. The northern and larger channel is called the Coleroon (Kolidam). On the seaward side of the delta are the open roadsteads of Negapatinam (Nagapattinam, Negapatam) and Karikal. The only navigation on any part of its course is carried on in basketwork boats.

There is an extensive irrigation system in the delta. The Grand anicut (or weir), built in the 2nd century where the Cauvery divides into two channels, feeds the deltaic irrigation system of Thanjavur. A second anicut across the Coleroon (1836–38) was necessary to save the old system from the disaster of silting, but it also added to the irrigated area. The Mettur project, a dam and canal more than 200 mi. from the sea, was completed in 1938. It improved the water supply to more than 1,000,000 ac. already irrigated, added another 300,000 ac. and provided 50,000 kw. of electric power, thus creating an important industrial area. The Cauvery falls, under an older power scheme, provide electricity to Mysore and Bangalore and the Kolar gold mines.

The Cauvery is known to devout Hindus as Dakshini Ganga, or the Ganges of the south, and its entire course is holy ground.

(T. HER.; L. D. S.)

CAVA DE' TIRRENI, a town and episcopal see of the Campania region, Italy, in the province of Salerno, 6 mi. N.W. of the town of Salerno by rail. Pop. (1957 est.) 41,092 (commune). It lies in a rich cultivated valley surrounded by hills where cylindrical towers are used for pigeon shooting, a tradition derived from Lombardy. It is a favourite resort and centre for international sporting events.

One mile to the southwest is the village of Corpo di Cava with the Benedictine abbey of La Trinità della Cava. St. Alferius, who came from Cluny in 1011, founded the abbey in 1025 in a cave, naming it Trinità after a vision. Although most of the buildings were modernized in 1796, the Gothic cloisters remain. The archives contain parchments dating from the 8th century, and the library contains valuable manuscripts including a Visigothic Bible of the 7th century and the 11th-century Lombard Laws. (M. T. A. N.)

CAVAIGNAC, a French family, originally from Rouergue, that rose to prominence in the century following the Revolution. JEAN BAPTISTE CAVAIGNAC (1762–1829) was a lawyer in Toulouse before 1789 and then member of the Convention for his native *département* of Lot. A member of the committee of general security (*sûreté générale*), he was sent by the Convention to the western army fighting the Vendean insurrection. Having voted for Louis XVI's death, he was proscribed at the Restoration and died exiled in Brussels. His brother JACQUES MARIE CAVAIGNAC (1773–1855), who entered the army as volunteer in 1792 and commanded the cavalry of the XI corps in Napoleon's invasion of Russia (1812), served under the Restoration and the July monarchy as general inspector of the cavalry and was made a peer in 1839. Jean Baptiste's elder son, GODEFROY CAVAIGNAC (1801–1845), was one of the leaders of the republican secret societies under the Restoration. His chivalrous character made him one of the most popular democratic chiefs during the July monarchy. Representing the tradition of the first republic and the young opposition, he was also well known as a journalist, being a contributor to La Re'forme. His participation in all Parisian risings from 1830 to 1834 was an additional reason for his celebrity.

The most famous member of the family was Jean Baptiste's younger son LOUIS EUGENE CAVAIGNAC (1802–1857). He entered the army during the Restoration but was removed for republicanism in 1831. His uncle's protection helped his recall to the service in 1832, but he was sent to Algeria (as were many other opposition officers). He remained 16 years in Africa, with a very normal career. After the revolution of Feb. 1848, the provisional government designated him governor-general of Algeria and offered him the post of minister of war. He refused, at first, however, because the government would not allow him to bring troops to Paris, but he accepted some weeks later — probably on a personal appeal from Alphonse de Lamartine, who wanted to strengthen the moderates against the extremists. Public banquets and other demonstrations then provided a pretext for calling troops into Paris. After Louis Blanc and Albert (*qq.v.*) had been removed from the provisional government by the national constituent assembly, Cavaignac could perfect his plan, which was to exploit the next manifestation of the "reds" in order to crush them. The closing of the national workshops (*q.v.*) on June 22, 1848, and the consequent revolt gave him the opportunity that he wanted. Profiting from the lessons of the last revolution, he massed his troops in quiet parts of the city and waited for further regiments summoned from the provinces and being transported (for the first time) by railway. The delay and some local successes of the insurgents increased the panic in the assembly, and Cavaignac obtained the resignation of the provisional government and dictatorial powers for himself. He then attacked the insurgents with all his forces. After four days of fighting, systematic reprisals were begun against all socialist movements. This was the end of hopes for a democratic and social republic. In Dec. 1848, Cavaignac stood for the presidency, but Louis Napoléon Bonaparte was elected instead. Cavaignac went on to opposition and was even imprisoned in Dec. 1851. He retired into private life when Louis Napoléon became emperor. His son GODEFROY CAVAIGNAC (1853–1905) was also active in politics. He was minister of marine under Émile Loubet (1892) and minister of mar under Léon Bourgeois (1895–96) and under Henri Brisson (1898), after which he retired from politics.

CAVALCANTI, GUIDO (*c.* 1255–1300), outstanding member of a group of Italian poets often referred to as the "poets of the *dolce stil novo*" (*see* ITALIAN LITERATURE). He came of a distinguished Florentine Guelph family and married the daughter of the Ghibelline leader, Farinata degli Uberti. During the struggle between Black and White Guelphs in 1300. he was banished. was recalled when ill and died of malaria in Florence. He was a close friend of Dante, but they were eventually estranged.

Intelligent, sensitive and keenly interested in philosophy, Cavalcanti is one of Italy's finest lyric poets. His subject is love. and he is sometimes gay, but more often tormented or despairing, expressing a poignant sense of the spiritual destructiveness of unrequited love.

BIBLIOGRAPHY—L Di Benedetto (ed), *Rimatori del "Dolce Stil Novo"* (1939) containing texts; *The Translations of Ezra Pound,* ed by *E* Pound and H. Kenner includes some of Cavalcanti's lyrics (1953); J E Shaw, *Guido Cavalcanti's Theory of Love* (1949) (S. Rs.)

CAVALCASELLE, GIOVANNI BATTISTA (1820–1897), Italian writer on art and, with Giovanni Morelli (*q.v.*), a founder of modern Italian art-historical studies, was born at Legnago on Jan. 22, 1820. He became a student at the Accademia delle Belle Arti in Venice, and from early youth studied the art treasures of Italy. He visited the cities of Tuscany, and then set out to see the masterpieces of Italian art in foreign countries. During a stay in Germany in 1846 and 1847 he made the acquaintance of Joseph Archer Crowe (*q.v.*) in a post carriage between Hamm and Minden. The two young men felt drawn to each other and met again in Berlin, where they studied together in the museum. On his return to Venice Cavalcaselle took an active part in the revolution of 1848 against Austrian rule. He was arrested by Austrian gendarmes and narrowly escaped being shot. He then joined the forces of Garibaldi and was taken prisoner by the French in 1849. He arrived in miserable plight in Paris, where by good fortune he again met Crowe, and with his help went to London. The two friends occupied rooms together and worked on a history of early Flemish painters, published in 1857. In the same year Cavalcaselle returned to Italy. In 1864 Crowe and Cavalcaselle published their great work, *A New History of Italian Painting,* which was followed by the *History of Painting in North Italy.* Other joint works were *Titian* (1877) and *Raphael* (1882–8j). Cavalcaselle's independent writings are of less importance but his sketch books and notes, preserved in the Marciana library in Venice, are evidence of his method and range of knowledge.

Cavalcaselle was for some time secretary to Giovanni Morelli, and his traveling companion when Morelli compiled the inventory of the works of art in the Marches of Ancona for the Italian government. Toward the end of his life Cavalcaselle held office as inspector of fine arts in the ministry of education in Rome. He died on Oct. 31, 1897.

See vol. 1 of the 2nd Eng. ed. of A. Crowe and G. B. Cavalcaselle's *History of Paintzng in Italy,* ed. *by L.* Douglas (1903–14), which includes a biography. (P. J. MY.)

CAVALIER, JEAN (1681–1740). French Protestant soldier, who made his name as the guerrilla leader of the Camisards in one of the most terrible partisan wars in his country's history. was born at Mas Roux. near Anduze (in the modern *départements* of Gard), on Nov. 28. 1681, the son of a local shepherd. Brought up as a Protestant by his mother despite persecution, he went to Geneva in Sept. 1701 to avoid arrest for having participated in the early assemblies of the Protestant enthusiasts and prophets in Languedoc (*see* CAMISARDS). Shortly after his return the Camisards broke out in revolt (July 1702). Cavalier, then an apprentice baker 21 years old. showed not only gifts of his own as a prophet but also a genius for nar and soon became the chief commander in the insurrection.

Cavalier held religious meetings at the very gates of Alès on Christmas day 1702 and non a victory at Vagnas on Feb. 10, 1703. The victim of a surprise attack at Tour-de-Billot (April 30, 1703), he took terrible reprisals (Sept –Oct. 1703) and even threatened Nîmes itself. Finally. at Martignargues (March 4, 1704), he defeated one of Louis XIV's best regiments. A serious reverse at Nages (April 16, 1704) and the loss of his arsenal at Euzet (April 19) forced him to agree to an armistice at Pont-d'Avesnes (May 12). He made his submission at Nîmes on May 16, 1704. As he failed to secure liberty of conscience for his soldiers, they accused him of treachery and left him. Only about 100 of them accompanied him on his way to Neu-Brisach in Alsace, which he was now sent to garrison (June 21). From Mâcon, he went alone to Versailles, where Louis XIV refused to see him. Fearing arrest, he rejoined the Camisards and crossed with them to Switzerland (Aug. 26).

Thenceforward the soldier in him predominated over the religious enthusiast. He fought for Savoy in the Val d'Aosta (Sept. 1704–Oct. 1705) and under the British command in Spain, where in the battle of Almansa (April 25, 1707) he was wounded a dozen times during a savage hand-to-hand fight. After some years in the Netherlands as a colonel on half pay, he retired to a Huguenot colony at Portarlington in Ireland, His *Memoirs of the Wars of the Cévennes* appeared in 1726, at Dublin (2nd ed. 1727). Finally he was made a brigadier in the British army (1735). appointed lieutenant governor of Jersey (1738) and promoted to major general (1739). He died at Chelsea (London) on May 17, 1740.

See A. P. Grubb, *Jean Cavalier* (1931); *M.* Pin, *Jean Cavalier* (1936).
(L. **Ma.**)

CAVALIER (Late Lat. *caballarius,* "horseman"), a word with the same origin as the French *chevalier* (*q.v.*), designating originally a rider or cavalryman. In English the word "knight" was at first generally used to imply the qualities of chivalry associated with *chevalier* in French and with the kindred *cavaliere* in Italian and *caballero* in Spanish (*see* KNIGHTHOOD AND CHIVALRY), "cavalier" having rather the pejorative sense of "swashbuckling" and "overbearing" (as now when it is used as an adjective). In the English Civil War, however, it came to be adopted as their own specific designation by Charles I's supporters, who contemptuously called their opponents Roundheads; and at the Restoration the court party preserved the name, which survived until the rise of the term Tory (*see* WHIG AND TORY). In fortification, a cavalier was a work of great command constructed in the interior of a fort. bastion or other defense, so as to fire over the exterior parapet. The height of the cavalier made it an easy target, and it fell out of use late in the 19th century with the introduction of high-explosive shells.

CAVALIERI, (FRANCESCO) BONAVENTURA (1598–1647), Italian mathematician, who contributed to the development of geometry in the Renaissance. was born at Milan; his name also occurs in the forms Cavallieri, Cavaglieri, Cavalerius and de Cavaleriis. He became a Jesuit at an early age and later was inspired to study mathematics by reading a copy of Euclid. He was made a professor at Bologna in 1629 and held the post until he died.

In 1635 he wrote *Geometria indivisibilium continuorum nova quadam ratione promota,* in which he first stated his principle of indivisibles The form of the principle was unsatisfactory and was attacked by Paul Guldin. In reply to this attack Cavalieri wrote *Exercitationes geometricae sex* (1647), stating the principle in the more satisfactory form in which it was used by 17th-century mathematicians. This work also contained the first rigorous proof of Guldin's theorem relating to the volume of a solid of revolution. The theorem had occurred in the writings of Pappus and had been used in an unsatisfactory fashion by Kepler. Using the principle of indivisibles as a sort of integral calculus, Cavalieri solved a number of problems proposed by Kepler. Other books by Cavalieri are: *Lo specchio ustorio ovvero trattato delle settioni coniche* (1632), *Divectorium generale uranometricum, in quo trigonometriae logarithmicae fundamenta ac regula demonstrantur* (1632) and *Trigonometria plana et sphaerica* (1643). Cavalieri died at Bologna on Dec. 3. 1647.

The life of Cavalieri was written by P. Frisi (1776) and by F. Predari (1843). *See* also C B. Boyer, "Cavalieri, Limits and Discarded Infinitesimal~,'1n *Scripta Mathematica,* vol. viii (1941).

CAVALIERI, EMILIO DE' (*c.* 1550–1602), one of the first Italian composers of dramatic music, was born in Rome about 1550.

On the accession in 1589 of the grand duke Ferdinand I of Tuscany, whom he had known in Rome, Cavalieri followed him to Florence, where he became a leader of the artistic life of the Medici court and a rival (rather than a colleague) of other dramatic composers such as Giulio Caccini and Jacopo Peri. He wrote music for pastorals and masques but is historically most important for La *Rappresentazione* di Anima e di Corpo, given in 1600 in Rome after his return there. This sacred allegorical drama, didactic in intention, has often been mistakenly called the first oratorio. Although varied with recitatives, arias, ensembles and choruses, it is undeniably monotonous, since Cavalieri's invention is never very lively.

Cavalieri died at Rome, March 11, 1602. (N. Fo.)

CAVALLI, (PIETRO) FRANCESCO (1602–1676), the most important Italian opera composer of the mid-17th century, was born at Crema, Feb. 14, 1602, the son of Gian Battista Caletti-Bruni. He assumed the name of his Venetian patron, Federigo Cavalli. In 1617 he became a singer in the choir of St. Mark's, Venice, directed by C. Monteverdi and subsequently held various posts there, becoming maestro *di cappella* in 1668. He died in Venice on Jan. 14, 1676. During his lifetime Cavalli had a considerable influence on European taste. La *Didone* (1641) is perhaps his most interesting work, but it was his *Egisto,* given in Paris in 1646, that initiated the rivalry between French and Italian styles. As a dramatic composer Cavalli ranks with J. B. Lully as a true successor of Monteverdi. His music is intended for a small string orchestra, and his operas require no trained chorus. He wrote few concerted numbers for soloists, but his works have signs of the beginnings of the formal recitative aria technique, sometimes even with a da capo section. Compensation for the level character of his music was provided by the brilliant costumes and lavish sets, devised by Jacopo Torelli and others, without which, in spite of their dramatic power and grotesque humour, Cavalli's works are incomplete. Although performed throughout Italy, these *dramme* per *musica* were generally written especially for the public opera houses that flourished in 17th-century Venice like the modern motion picture theatres. Although 27 of his 42 operas are preserved in manuscript in the library of St. Mark's, only the first act of Giasone (1649) and some extracts are available in a modern edition (Gesellschaft fur *Musikforschung,* edited by R. Eitner, vol. xi, 1883).

See H. Prunières, *Cavalli et l'opéra italien au* 17" *siecle* (1931); *E.* Wellesz, "Cavalli und der Stil der Venezianischen Opera von 1640–60" in *Studien zur Musikwissenschaft* (1913). (S. T.)

CAVALLINI, BIETRO (c. 1250–*c.* 1330), Roman painter, ranks with Cimabue and Giotto as one of the founders of Italian painting. Much of his work has been destroyed, but his activity can be reconstructed through the careful description of his work given in the Commentaries of Lorenzo Ghiberti. Mentioned in 1273 in connection with work in Sta. Maria Maggiore, Rome, and in 1308 in Naples, he was responsible for fresco cycles in S. Paolo fuori le Mura, Rome (about 1282–97, known through copies). Sta. Cecilia in Trastevere (1291–93, traces survive), S. Giorgio in Velabro (after 1295) and for the apse mosaic in Sta. Maria in Trastevere (1291).

Cavallini's later style is represented by frescoes in Sta. Maria Donna Regina, Naples. Both in his treatment of space and in his figure style, Cavallini appears as an innovator of great significance, whose influence dominates the decoration of the upper section of the walls of the nave of S. Francesco at Assisi (see GIOTTO).

(J. W. P.-H.)

CAVALLOTTI, FELICE CARLO EMMANUELE (1842–1898), Italian journalist and political leader of the extreme left, was born in Milan on Dec. 6, 1842. In the campaigns of 1860 and 1860 he fought in the Garibaldian corps, but he first attained notoriety by his antimonarchical lampoons in the Gazzetta di *Milano* and the Gazzettino rosa between 1866 and 1872. Elected to parliament in Sept. 1873, he succeeded to the leadership of the extreme left in 1886 on Agostino Bertani's death. His eloquent invective and his advocacy of democratic reform made him the most popular man in Italy next to Francesco Crispi, against whom he waged an unceasing campaign. He was killed in Rome in a duel with Ferruccio Macola, editor of the Gazzetta *di* Venezia, on March 6, 1898.

See A. de Mohr, *Felice Cavallotti: la vita* e *le opere* (1899).

CAVALRY, a military force mounted on horseback, formerly an important element in the armies of all major powers. When employed as part of a combined military formation its main duties included observing and reporting information about the enemy; screening movements of its own force; pursuing and demoralizing a defeated enemy; maintaining a constant threat to an enemy's rear area; striking suddenly at detected weak points; turning exposed flanks; and exploiting a penetration or breakthrough. A force on horseback could move faster than foot soldiers and could traverse terrain that was too rough for tanks or other combat vehicles. But during the latter part of the 19th century, largely as a result of the introduction of repeating rifles and machine guns, cavalry lost much of its former value. By the time of World War I a cavalry charge against a line of entrenched troops armed with rapid-firing small arms was simply suicidal. Cavalry organizations soon abandoned horses for armoured fighting vehicles and became known as mechanized cavalry or armoured cavalry, but even the name was eventually dropped.

The U.S. army organization act of 1950 eliminated cavalry as a branch and established a new branch named "armour," specifically describing it as a continuation of the cavalry. All traditions, honours, missions and the role of cavalry were inherited by armour. In the U.S. army there still existed armoured cavalry units that were assigned reconnaissance and screening missions similar to the missions formerly given cavalry units, but by the 1950s there were no horse-mounted cavalry units in either the U.S. or British armies. The U.S.S.R., however, had about 12 horse cavalry divisions numbering approximately 4.500 men each.

Cavalry Tactics.—The two most primitive types of soldier are the foot soldier and the horse soldier, the first being characteristic of early European warfare and the second of early Asian warfare. In southern Europe (countries south and west of the Danube and the Rhine) few suitable breeds of war horses existed in ancient times; hence the weakness of Roman cavalry and of early Grecian cavalry. When infantry met infantry, battles were decided by superior numbers, armament, discipline or tactics. When cavalry met cavalry, as in Scythia, battles were seldom decided at all, but usually degenerated into skirmishes, forays and scattered pursuits. In hilly country, such as most of Greece, cavalry was normally impotent to attack infantry, as exemplified in the Greco-Persian Wars (490–479 B.C.); while in open plain land, so frequently found in Asia Minor, it could destroy infantry by besieging it in the field, as happened to Crassus at Carrhae in 53 B.C. The truth of the matter is that the two arms were complementary, each providing the other with powers not inherent in either separately. Infantry in an advance was useless unless its rear services were protected, and so also was cavalry in the advance, unless the positions won by it could be held so that its forward movement might not be interrupted.

The art of making an advance through a hostile country has always depended on the power of pushing forward a secure and movable base in order to develop additional offensive power from it. Once infantry and cavalry were combined, the first formed the movable base and the second provided the offensive power. The function of cavalry in any armed force was to provide mobility near and on the battlefield, and at the same time be able to engage in offensive and defensive fighting, whether independently or in conjunction with other arms.

When the advance merged into the attack, three targets would present themselves: the enemy's infantry, his cavalry and his baggage train. If the baggage train could be seized and held, the severest possible blow could be dealt the enemy's organization; commanders therefore tried to make sure that their supply services would be well protected by the battle front. Infantry could oppose frontal attacks by enemy infantry but if it were attacked in flank or rear by the opposing infantry or cavalry it would be taken at a tremendous disadvantage.

Throughout history flank protection was furnished by cavalry. The infantry front may be pictured as a slowly moving wall be-

hind which were assembled the supply services, and on the flanks of mhich were hinged two cavalry wings, which. like doors, could swing forward and backward, "flapping" away any hostile force which might attempt to raid the baggage train or attack the infantry in the rear.

The first objective in battle. therefore, was to destroy one or both of the hostile cavalry wings, for then the opposing infantry wall would be open to attack on its flanks and rear. If, meanwhile, its front could be so vigorously attacked by the infantry that it would be unable to turn to right or left, a cavalry attack on its flanks or rear would be likely to prove decisive.

In brief, the object of infantry was to provide a base of operations for cavalry. The power of cavalry lay first in its ability to overcome the enemy cavalry, and second in its ability to develop enough speed to circumvent an infantry front and attack it in the rear before it could face about. In the case of an organized army, facing about from front to flanks or rear was an extremely difficult and dangerous operation—impossible while the front was being vigorously attacked. (See TACTICS.)

Early Cavalry.—During the early classical age tactical organization was based on the nature of the country rather than on any idea of weapon co-operation or combination between the arms. Thus, in Sparta there was practically no cavalry. while in Scythia mounted bonmen alone existed. Nevertheless, as soon as the Asian horsemen came into contact with European foot soldiers, as they did in the 5th century B C., the problem of tactical co-operation, namely, how to equip arm and maneuver a body of men so that offensive poner could be developed from a protective base, was thrust to the fore This problem was solved by Philip of Macedon, whose solution was put to use and further developed by his son Alexander the Great (See MACEDONIAN ARMY.)

The backbone of Philip's army was the phalanx, or infantry mass. Armed with the *sarissa,* a pike from 18 to 21 ft long, it formed an impenetrable hedge of spears to cavalry attack though it offered a somewhat vulnerable target to archers, either mounted or on foot. Recognizing the strong protective power of the phalanx, Philip 7%as one of the first among the ancients to grasp the fact that stability of organization alone is insufficient to guarantee that disruption of the enemy force would be followed by its annihilation. The phalanx could not pursue without breaking its formation. It was not armed for the pursuit, and in the pursuit the pursued almost invariably moves faster than the pursuer, whether both are on foot or mounted. To render the act of annihilation possible. Philip added to the phalanx a superb force of cavalry in the proportion of one trooper to every six heavy foot soldiers. This cavalry he organized in three bodies: heavy armoured cavalry for the charge, his companion cavalry being the most notable corps; light cavalry. or hussars, for reconnaissance and outpost work; and dragoons who could fight either on foot or on horseback.

The tactics that Alexander developed from this organization nere equally simple and astonishingly effective. Advancing in parallel order against the enemy, he would push forward his right wing nhile his centre. protected on its left by the left cavalry wing. held the enemy to his ground Alexander would then deliver a series of terrific punches at his opponent's left with his right wing cavalry in an effort to penetrate or envelop the enemy's flank. At the battles of the Granicus (334 B.C.), Issus (333 B C) and Gaugamela (331 B C) his companion cavalry decided the day, and at the battle of the Hydaspes (326 B.C.) his cavalry so completely dislocated the Indian army that his phalanx was able to disrupt it. (See ALEXANDER III THE GREAT.)

The Roman Period.—From the days of Alexander onward, cavalry, because of its mobility. became the decisive arm. Hannibal's use of cavalry was superb. as the battles of the Trebbia (218 B C.) and of Cannae (216 B.C.) testify. In both of these the Carthaginian cavalry completely dislocated the Roman legions by a rear attack. In the Roman armies the lack of good cavalry proved their ruin. and it was not until such a force was raised and trained by Scipio Africanus that the Carthaginians were eventually defeated at the battle of Ilipa (206 B C) and annihilated at that of Zama (202 B C.). At Ilipa Scipio defeated Hasdrubal by a double envelopment carried out by infantry and cavalry, and at Zama he smashed Hannibal by holding him in front with infantry and striking his rear with cavalry. (See PUNIC WARS.)

During the days of Julius Caesar, the most serious defeat sustained by the Romans was that of Crassus at the hands of Surenas, the Parthian general, whose entire force was composed of mounted archers and heavy cavalry. The Parthians, adopting an improved form of Scythian tactics, won a decisive victory in the battle of Carrhae (53 B.c.); of the 40,000 Romans who crossed the Euphrates, 20.000 were killed and 10,000 made prisoners. The Parthian success resulted from the inability of the Romans to develop offensive pomer from a moving base. Their organization did not enable them to ward off shock and envelopment, while that of their enemy did permit enveloping and charging. In this battle the heavy Parthian cavalry provided the necessary stability for the attack of their mounted bowmen, and the distraction effected by this attack enabled the heavy cavalry of the Parthians to dislocate and disrupt the Roman legions.

From the battle of Pharsalus (48 B.C.) the legion learned for a time how to hold its own against cavalry, mainly by employing cavalry. Under Diocletian (A.D. 245–313) cavalry rose from one-tenth lo one-third of the infantry, and numbered about 160.000; but this great mass of horsemen was withdrawn from the infantry, and by being formed into a frontier guard lost its offensive spirit. Meanwhile a steady decline took place in the infantry. Mercenaries were enlisted, discipline was relaxed, pay increased and armour discarded because of its weight. Of the latter Vegetius wrote: "... to avoid fatigue, they allow themselves to be butchered shamefully like cattle."

This separation of infantry and cavalry was the main tactical cause of the decline of Rome's military power. The unsupported Roman cavalry. trained as frontier police and for protective duties, was no match for the fierce barbarian horsemen who were then harassing the empire. From the first irruption of the Goths, in the year 248, the Roman cavalry was steadily increased until by the reign of Constantine (288–337) cavalry composed the principal part of the Roman armies; but all in vain. At Adrianople (see EDIRNE) in 378 three Roman legions sent against the Visigoths were overwhelmed and practically annihilated. The Gothic horsemen, having perfected a newly devised stirrup, rode and fought with a vigour and deadliness new to the mounted warrior. Caught massed under a blazing sun, the Roman flank was struck relentlessly by the Gothic horse, and again the dislocation of the Romans. which heralded their disruption, was effected by a cavalry rear attack. The emperor Valens lost his life. and 40,000 legionnaires perished. From that day cavalry was to become the predominant arm for a thousand years, while the infantry deteriorated into a mere auxiliary.

In Europe the hardy and warlike barbarian tribes, fighting chiefly on horseback, soon flooded the Roman provinces. By A.D. 410 the Goths under Alaric captured Rome, and the "mistress of the world" was handed over to the licentious fury of the Huns. The barbarian advance culminated in the battle of Chalons (451), where Attila, after uniting Germany and Scythia, was met and defeated by Aetius and Theodoric. This was the last victory won by imperial Rome in the west; the dark ages descended upon western Europe, and in the conduct of war that area entered the epoch of the iron-clad lancer.

The Dark Ages.—From the days of Justinian (483–565) to those of the fourth crusade, which resulted in the sack of Constantinople (1204), highly organized armies comprising well-equipped heavy and light cavalry were maintained by the eastern empire. In Africa, Belisarius in 533 won the decisive victory of Tricameron (*q.v.*) over the Vandals primarily by the use of cavalry. In the west, however, military art virtually disappeared, and as principalities took form and feudalism mas established the common folk were virtually prohibited from taking part in the "noble" trade of war, which was carried on by raiding and pillaging barons. Cavalry remained the predominant arm and sought perfection not through improved tactics or organization but through armour. By the opening of the 9th century the old military organization of Rome had been replaced by comparatively small bands of mailed knights followed by a mob of retainers who pillaged the country-

side. In England, in the Low Countries and in Switzerland infantry was still maintained but was so ill-equipped that when confronted by cavalry in open or even semiopen country it was forced to seek protection behind palisades, as was the case with the Saxons at Hastings (1066).

To the knight of the middle ages the protective base of his offensive power was not the infantry mass, as it had been with the Romans. but the armour he wore, his mobility being provided by his horse. (See ARMOUR, BODY.) As long as he was not met by equally well mounted and armoured antagonists this combination of mobility and protection proved tactically irresistible, though seldom did it lead to profitable strategical results. But as soon as he was so met, it became neutralized; tactics then were utterly deteriorated and were replaced by mob fighting.

The Crusades.—The self-contained protective power of cavalry was demonstrated during the crusades, for in spite of the poor discipline of the Christian knights and their very rudimentary knowledge of tactics, normally their casualties were remarkably small. At the battle of Hazarth (1125), Baldmin lost only 24 men, while the Turkish losses amounted to 2,000; at Jaffa (Joppa) (1191) 2 crusaders were killed on one side and 700 Turks on the other. The crusaders, however, lost large numbers of horses, and as the rabble of beggars and vagrants who accompanied them were useless as infantry (further, the code of chivalry did not sanction their use), at times it became necessary for knights to fight on foot or to abstain from fighting altogether.

This involuntary change in tactics caused the crusaders to rediscover the value of the protective infantry base as a mobile fortress from uhich mounted knights could sally forth. In 1248 Louis IX of France adopted this change intentionally. Near Damietta he landed his knights and drew them up on foot in order of battle to cover his disembarkation. The interesting point to note in these operations is that the action of these knights foreshadowed the approaching revival of infantry: "They formed up in serried ranks, placed their bucklers upright in the sand before them, and resting their long lances on the top of their shields, presented an impenetrable array of steel points, before which the Muslim horse fell back in confusion."

Another trend during this period was the reintroduction of plate armour. It rendered the knight on foot practically invulnerable to infantry attack, but when he was mounted it sacrificed his mobility to protection. This seriously influenced the value of the dismounted base, for armour had become so heavy that the dismounted knight was unable to move far on foot. At the battle of Tagliacozzo (1268), Conradin's Ghibelline knights were so heavily armoured that Charles of Anjou's cavalry, after having exhausted them by repeated charges, rolled them out of their saddles by seizing them by their shoulders.

Mongol **Cavalry.**—With signs of cavalry power diminishing in the west, there appeared in the east the highest development of the mounted warrior. In the latter part of the 12th century there arose on the plains of Mongolia the most formidable cavalry warrior of human annals, Genghis Khan. (See JENGHIS KHAN.) Utilizing the horsemanship and spirit of conflict which permeated the character of his people, he created vast organized mounted hordes that swept the entire northern and eastern areas of Asia. It is alleged that a mounted force of 700,000 men, held together by iron discipline, rode to his will. Death was the penalty for turning back during action without an order or for neglecting to pick up equipment dropped by a front-file man. The khan recognized the powers of co-ordinated and disciplined cavalry. Vigilant and ceaseless training perfected a standard for tactical measures. "A man of my bodyguard," Genghis Khan had announced, "is superior to a regimental commander of another division."

The tactical skill of the Mongols had been developed in the stress of war. They had learned to keep track of an enemy's movements while concealing their own. In maneuver for battle they had learned not to depend on commands given by a voice. which often cannot be heard in the uproar of moving mounted men Regiments signaled their movements by raising black or white flags during the day and by a similar use of coloured lanterns at night. Other signals were given by the use of whistling arrows, which emitted sound through a hollow pierced head. They hid their formations at times behind a drifting smoke screen. The Mongol hordes, unlike the crusaders, formed movements of deadly intensity by virtue of their disciplined co-ordination. Followed by immense trains of wagons and great herds of cattle, they could exist for years off the country invaded. They fought mainly with arrows, avoided close struggle and strove to destroy their enemies from afar with projectile weapons. 'There was a fluidity and flexibility in their movements found wanting in the fixed, cumbersome ranks of European forces.

After the death of the great khan, 150,000 Mongols under the able Sabutai in 1235 marched westward and threatened to conquer all of Europe. In the next six years this enormous horde had marched one-fourth the distance around the world. Sabutai swept through present-day Russia and on to the plains of Hungary and Poland. Eastern Europe from the Carpathians to the Baltic fell under his domain.

Armour and Archery.—The leaders of western Europe learned little concerning the capacity of highly mobile cavalry in great numbers presented to them by the Mongolian mounted men. They continued to increase the thickness of their armour, largely because of improvements in the longbow and the crossboiv.

At the siege of Abergavenny, in 1182, it is recorded that Welsh arrons could penetrate an oak door four inches thick. As no chain mail could withstand such a blow, plate armour was worn over the mail shirt. But as armour increased in weight, natural obstacles began to play a decisive part on the battlefield. When ground could not be crossed on horseback it had to be crossed on foot, and the knight deprived of his horse lost much of his tactical value; consequently an able enemy sought every means in his power to compel him to dismount. One of these means was choice of ground; another was archery.

At the battle of Dupplin (1332), Edward Balliol and Henry de Beaumont defeated the earl of Mar not by reckless charges but by skilful weapon co-operation. The majority of their knights were dismounted and formed into a phalanx, their flanks protected by archers, while 40 mounted knights were kept in reserve. The earl of Mar charged the phalanx, which remained unshaken; his knights, immobilized by the archers on the flanks, were routed by Balliol's mounted squadron. This battle was the birth of a new era in tactics —the tactics of bow, pike and lance combined. It formed the mold in which all the English operations of the Hundred Years' War were cast, a war which proved disastrous to the French chivalry, as the battles of Crécy (1346), Poitiers (1356) and Agincourt (1415) testify.

Providing suitable protective armour for horses proved to be an insurmountable problem for the cavalry. At Crécy (where gunpowder was first introduced) the horse proved the weak link in the French organization. Of Poitiers, the next great battle, Jean le Bel wrote of the French knights: "All fought on foot, through fear that, as at the battle of Crécy, the archers would kill their horses."

Meanwhile in Switzerland infantry armed with pike and halberd, fighting in phalangeal order. were taking toll of German and Austrian cavalry; and in Bohemia. Jan Zizka employed wagons to create a movable fortress knonn as the *Wagenburg* ("wagon fort"), against which his enemy's cavalry shattered itself in vain. As wealth increased, mercenaries once again came to the fore. Being professional soldiers whose pay as well as whose lives depended on their art they developed sound tactics.

From the battle of Poitiers onward cavalry fell into a rapid decline. The French knights learned nothing, and as the bow and pike destroyed them a new weapon arose in the crude bombards of the 14th century uhich was destined to revolutionize the whole art of war, to reduce cavalry to the position it held in the days of the Scythians and to advance infantry to the heyday of the Spartan phalanx. At the battle of Formigny (1450), three small culverins threw the English archers into disorder, and at Morat (1476) Charles the Bold of Burgundy was defeated by the Swiss who made good use of 6,000 hand guns.

Cavalry in the Age of Gunpowder.—For 1,000 years cavalry had sought to combine protection and mobility. When this was no

longer possible, because armour could be penetrated by the bullet, a solution was sought by arming the cavalry with firearms. Armour grew lighter and the knight exchanged his lance for the petronel, a type of hand cannon, in order to fire on infantry in place of charging them. This form of attack was used by the French at the battle of Cerisoles, in 1544, and proved effective because the attack could be prolonged indefinitely. Against such organized Scythian tactics the infantry was powerless until the arquebus was improved. Soon the petronel was replaced by the arquebus-à-rouet, and a little later by the nheel-lock pistol, said to have been used by the German cavalry at the battle of St. Quentin in 1557. *(See* SMALL ARMS. MILITARY.)

The lance then vanished, and attempts were made to develop cavalry mobility by mixing squadrons with infantry units. As early as the battle of Pavia (1525), the marquis of Pescara had adopted this organization, and though in a clumsy way it linked firepower with shock. the mobility of cavalry was so limited by the pace of the infantry that the cavalry attack was reduced to a walk. About 1550. Marshal Charles de Brissac mounted a number of his infantrymen on horseback, and the era of the modern dragoon, or mounted infantryman, was initiated.

During the Thirty Years' War (1618–48) the employment of cavalry increased, cavalry mobility being sought not through its own firepower but through that of infantry, and especially artillery. Supported by artillery, Gustavus Adolphus' cavalry rode forward, fired their pistols and charged home uith the sword. At Breitenfeld (1631) and at Lutzen (1632) his cavalry played the decisive part. In England he was emulated by Oliver Cromwell — the battle of Grantham (1643) was decided by the sword, as were Marston Moor (1644) and Naseby (1645). In France the reversion to shock tactics nas also followed as Henri Turenne issued instructions to his cavalry to use the sword alone. The impetuous prince de Condé did likewise. In Germany, however, Raimund Montecuccoli still favoured firearms for cavalry; he considered the lance useless and looked upon the horses of his dragoons solely as a means of conveyance.

This change is significant and cannot alone be attributed to the genius of such cavalry leaders as Gottfried Pappenheim and Gustavus. The underlying reason for it is probably to be found in the universal adoption of the matchlock and the consequent reduction in the number of pikemen. The matchlock was a slow-loading and unreliable weapon. especially in rainy weather when infantry was likely to be surprised in mist or fog. It was on such occasions that cavalry frequently proved itself the decisive arm, up to the adoption of the percussion cap in the 1830s.

During the 18th century the idea of the shock effect of cavalry continued to grow. The duke of Marlborough used cavalry in mass. Blenheim (1704) was decided by cavalry, and so mas Malplaquet (1709).

Under Frederick the Great. cavalry once again reached its zenith. Out of 22 of his battles at least 15 were won by the cavalry arm working in close co-operation with gun and musket. In his regulations for cavalry Frederick wrote: "They will move off at a fast trot and charge at the gallop, being careful to be well closed together. His Majesty will guarantee that the enemy will be beaten every time they are charged in this way." The exploits of F. W. Seydlitz and H. J. von Zieten proved that Frederick was not wrong. Rossbach (1757) was a great cavalry victory, and so, in a lesser degree, was Zorndorf (1758). The secret of Frederick's success lay not only in the artillery preparation nhich heralded the charge nor in his system of attack but in the training of his troopers.

The American Revolution (1775–81) provides no example of outstanding cavalry work, nor do the French Revolutionary Wars, except for the brilliant charge of the English 15th hussars at Villers-en-Couché (1794), where 300 British and Austrian cavalry charged and routed 10,000 French infantry and cavalry, driving them into Cambrai with a loss of 1 200 men. The slowing down of the shock first became perceptible in Napoleon Bonaparte's campaign in Egypt, when the norld-famed mameluke cavalry failed to make any real impression on his infantry squares. At Mt. Tabor (1799) 6,000 French infantry under Jean Kléber gained a decisive victory over 30,000 Turks and mamelukes. From that battle onward to World War I the power of cavalry steadily declined.

The Napoleonic Wars. — Napoleon relied on all arms. but particularly on firepower. In spite of the many cavalry charges executed during his wars, his cavalry mas pre-eminently a strategic force for observation and protection and a tactical force for pursuit. Because of his strategic employment of cavalry, no commander was ever more completely informed at all times of the movements and composition of the hostile army than was Napoleon.

His early maneuvers, conceived after careful synchronization of time and space factors. were made practical by skilfully led cavalry. Far-flung columns, well in advance of his main armies, not only kept him posted of hostile movements but were influential in maneuvering an enemy into an area of Napoleon's own selection. Once contact was gained by main bodies, the cavalry invariably was withdrawn to the flanks or to the rear in reserve. While mounted charges mere executed, they nere made at that period in battle nhen the enemy was shattered by fire and the keen discernment of Napoleon foresaw conclusive results. From the flanks and rear his cavalry was able to deliver the decisive thrust or to pursue a routed enemy, which meant destruction rather than an orderly retirement and the ability to fight again after reconcentration and reorganization. At Eylau (1807) Napoleonic cavalry, encountering the Russian Cossacks, was confronted for the first time by a mobile element of its own quality; pursuit proved impossible, and strategic reconnaissance ineffective.

In the emperor's subsequent campaigns of 1812–14, superior enemy cavalry nullified any real victory, and in the retreat from Moscow was responsible mainly for the gradual disintegration of the Grande Armée. The freedom of maneuver, the basis of Napoleon's success. had been reversed.

The Napoleonic Wars nere followed by 40 years of profound military coma. In 1823 Capt. John Norton of the 34th English regiment invented the cylindroconoidal bullet. He received no encouragement, for the duke of Wellington considered that the Brown Bess could not be bettered, yet Norton's bullet was the greatest military invention since the flintlock. In 1849 Capt. Claude Minié, of the French army, invented a rifle and a similar projectile. In England Sir William Napier opposed the adoption of the new bullet. as he considered that it would destroy the infantry spirit by turning infantry into "long-range assassins." It was adopted, however; it had a range of 1,000 yd., and it sealed the doom of the cavalry charge.

The Crimean War (1853–56) taught soldiers nothing new regarding cavalry except to emphasize its misuse by ill-informed commanders of combined arms and to demonstrate the gallantry and spirit of the arm. The battle of Balaklava gave to the world only the famed epic of the charge of the Light brigade and evidence of the courage, discipline and combative will to close with an enemy so characteristic of the British mounted warrior. *(See* BALAKLAVA, BATTLE OF.) (J. F. C. F.; J. K. H.; X.)

The Mounted Rifleman. — In the American Civil War (1861–65). a pronounced transition in cavalry tactics took form. The evolution of its tactics suitched radically irom the accepted European tenets of that day. The Confederate states, largely rural and agricultural. were able to create promptly a powerful mounted force to be used in cavalry roles. The Union, largely of urban population, organized cavalry at a sloner pace and employed it, at first. on the futile assignments of outpost. convoy, messenger and other associated activities. Employing cavalry in large units, Robert E. Lee was able to reap the benefit of decisive victories during the first two years of the war. His own intentions were always screened from the enemy, while their movements and dispositions habitually were known to him. By May 1862 the Union, finally awake, assembled 10.000 horse into a cavalry corps. At Chancellorsville (*q.v.*) this formidable cavalry force mas dispatched southward on a useless raid. Lee's cavalry. under Gen. J. E. B. Stuart. discovering an open flank on the Union right, skilfully screened the movement of Gen. "Stonewall" Jackson's corps. which launched a powerful surprise attack resulting in one of the most complete victories of Confederate arms.

By 1863 cavalry tactics on both sides had become concerned principally with dismounted action, which proved so effective that the mounted charge was a rarity thereafter. The eventual defeat of Lee mas made possible in part through the able employment of a highly mobile cavalry and infantry force under Gen. Philip Sheridan. Repeated attacks against the Confederate lines of supply effected their dislocation by depriving them of a protected base. Increased po er of weapon fire forced a new development of the cavalry dragoon or mounted rifleman — not to be confused with mounted infantry, which utilized horses only as transportation and habitually fought dismounted; the mounted rifleman was trained and equipped to fight either dismounted or mounted. The revolver, introduced in this war, proved to be a formidable cavalry weapon.

Both before and after the Civil War, from the early 1830s until 1890, as settlement moved westward, U.S. cavalry forces were employed to protect the expanding frontiers from the American Indian, the Mexican raider and the American bandit. The thinly held outposts were kept constantly on the move.

The wars that occurred in Europe after 1865 were marked by a complete disregard of the cavalry lessons learned from the American Civil War. The Austro-Prussian War (1866) saw 56,000 cavalrymen still armed with the lance and sabre charging in the face of the breech-loading needle gun and the Minié rifle. In the Franco-German War (1870–71) a cavalry force of 96,000 took the field similarly equipped. Its tactics called only for mounted action. French cavalry had learned nothing since Waterloo. The Germans were bold and resourceful, using their cavalry strategically with good effect to cover their own movements and to discover those of the enemy. The massed charge was attempted— Jean A. Margueritte failed, Adalbert von Bredow succeeded, but at terrific cost. His was the last successful massed boot-to-boot cavalry charge in military history.

Theodore Roosevelt and his Rough Riders were not only overpublicized during the Spanish-American War in 1898 but were credited with gaining valuable ground through mounted charges which never actually took place. For example. at the charge up San Juan hill the only man mounted was Colonel Roosevelt.

In South Africa (1899–1902) the Boers, accepting the lessons of the American Civil War, fought with large numbers of mounted riflemen who moved hither and yon, came and went, attacked and retired almost at will. The British faced this type of action initially with a force in which infantry predominated. The few cavalry regiments included were armed with swords or lances and depended mainly on these weapons for combat. Not until British mounted elements were reorganized on a dragoon basis were the British able to conquer a people immeasurably their inferior in numbers and resources.

In the Russo-Japanese War (1904–05) cavalry action of little consequence occurred. The outstanding note was the absence of the lance and sword, which were nowhere seen. In combat the rifle was supreme; any thought of reliance on the sword was banished. The few achievements of Russian cavalry in this war came through the effect of firearms. Little use was made of the cavalry masses which Aleksei Kuropatkin organized and equipped on the European model of massed action. Japanese cavalry, with few exceptions, carried out its duties with the carbine (a shortened rifle) and usually in close touch with its own infantry.

World War I. — During World War I, little use was made of the potential power of cavalry available to both sides. The limitations which the bullet placed on cavalry movement begot the trench; for had cavalry been able to move, the construction of entrenched fronts would have been all but impossible. On the western front, ten German cavalry divisions (approximately 70.000) faced ten French cavalry divisions and one British. The tool was there for the appearance of a master of the art of war capable of visualizing the power and capabilities of a numerous cavalry on missions of inspired and skilful design. There was need for mounted riflemen, not the European cavalry of that day relying principally on the sword and lance in mounted action. The French cavalry was split into useless detachments. The only sizable force, under Sordet, was marched futilely over the whole of southern Belgium and northern France; his operations availed nothing. The single British cavalry division, operating collectively as a unit, rendered invaluable assistance to the main forces by employing ground fire to delay the German advance south of Mons until reorganization behind it was effected. While its grand plan conceived a powerful enveloping thrust southward through northwestern France, the Germans made little use of the potential power of their cavalry to aid that operation. Their mounted forces were scattered over the fronts of several field armies rather than assembled for a decisive effort.

On the eastern front, Russia produced initially 24 cavalry divisions (approximately 200,000 horsemen), but like the leaders of ancient Rome the Russian commanders expended the potential po er of this force by scattering it along an entire frontier. The armies of Alexander Samsonov and Paul Rennenkampf invaded East Prussia with forces totaling 400,000 combined arms to meet the most crushing defeat of the war at Tannenberg. The decisive victory of the Germans was made possible largely by the success of a single German cavalry division in delaying the army of Rennenkampf.

Later Russia increased its cavalry to 54 divisions; but with military leaders unable to cope with the requirements of massed co-ordination, this vast force accomplished little. It was, indeed, the indirect cause of breaking down the transportation system of the country by the requirements of forage.

Cavalry achievements in this war reached their highest plane in Palestine under Marshal Edmund Allenby, an outstanding commander of mobile troops. At Armageddon, Sept. 1918, Allenby faced a strong Turkish army with a superior force of combined arms including three cavalry divisions and bombardment aviation. Crushing the enemy right, he dispatched his cavalry not against the hostile flank but against the rear. Fleeing Turkish elements crowded into the ravines and defiles which characterized the terrain. Halted and confused by combat aviation, they were annihilated when struck by the charging cavalry columns. The lesson of Armageddon lay not so much in the prowess of ground mobility as in the example of the formidable power of such forces when supported by fire from the air.

Four years of stabilized warfare on the continent of Europe contributed little to the concept of cavalry tactics, but a wholly new element came into the picture with the tank and other motor vehicles. After the war, armoured divisions were formed to include all supporting arms needed in modern warfare: infantry, artillery, signal, engineers, etc. These divisions were organized for missions requiring independent action. using great mobility and firepower. They had to win their way against bitter opposition by cavalry enthusiasts and at the same time develop their tactics and improve their equipment. which included tanks, armoured cars and trucks.

World War II and After. — Cavalry tactics and traditions lived on in the dashing advances made by armoured units in World War II, but the day of horse cavalry had passed. The United States army employed only one cavalry regiment, and that was during the early weeks of the war in the vain defense of the Philippine Islands. The reorganization of the U.S. army that took place in March 1942 abolished the office of chief of cavalry and greatly strengthened the air force and the newly created armoured force. The British army had earlier taken similar steps. The U.S.S.R. employed 39 divisions of horse cavalry to advantage in special situations where terrain features were unfavourable for armoured vehicles. But at no time in World War II or in the Korean war was cavalry the decisive factor it had been in earlier ages, and in most campaigns it played no part at all. In view of climatic and geographic conditions in the European republics of the Soviet Union, the Caucasus and especially in Turkestan and the far east, conventional cavalry divisions were maintained in the U.S.S.R. during the 1950s. However, a high proportion of the World War II divisions were superseded by mechanized formations. In spite of a few dissenting voices, most military men were in agreement after World War II that horse cavalry was obsolete.

(J. K. H.; C. W. HE.; W. H. Z.)

CAVAN (CABHÁN), one of the three counties of the old province of Ulster (*q.v.*) which are part of the Republic of Ireland, is bounded on the northeast by County Monaghan, southeast and south by Meath and Westmeath, and southwest by County Longford. while the long northwestern spur of Cavan runs between County Leitrim and the Northern Ireland frontier. on the other side of which is Fermanagh. The land area is 728 sq.mi. In 1961 the population of the county was 56,597, compared with 233,158 in 1541. Three-quarters live outside villages and towns, of which the largest are Cavan (3,207), the county town, Cootehill and Belturbet. Administration is by a county manager advised by an elected county council. The diocese of Kilmore, resembling the ancient kingdom of Brefni. has a Roman Catholic cathedral in Cavan and a Church of Ireland cathedral in the parish of Kilmore. County Cavan returns four members to *duil eireann* (house of representatives).

In the northwest is part of the Carboniferous upland stretching from Sligo to Monaghan, consisting of sandstones, shales and limestones with plateaulike upper surfaces rising to at least 1.500 ft. (Cuilcagh mountain. 2.188 ft.). The uplands are intersected by deep valleys, such as those of the river Swanlinbar and Lough Macnean. As the uplands cease toward the main valley. that of the Erne, the landscape becomes dominated by the drumlins which alternate with lakes. rivers. peat bogs or drained lowland pastures. On the east of the Erne valley the countryside is floored by Ordovician and Silurian shales and slates, which form lines of hills rising to 1.100 ft. There, too, however. the drumlins persist as low whale-backed hills, and in the hollows there are countless lakes, some covering several square miles. others mere ponds, while yet others have been completely infilled by silt; probably all have been substantially reduced by this means. Around Kingscourt, in the east, some Triassic rocks are exposed, including a clay used for brickmaking and a gypsum deposit used for wallboard and plaster. The winters are mild with January average temperatures of 40°–41° F. and July averages of 57°–59° F., with 30–40 in. average annual rainfall.

The farms are mainly small or medium-sized, averaging 30–40 ac. Of the improved land about one-tenth is used for crops, chiefly oats and potatoes, one-fifth for hay and the rest is pasture. Cattle are raised for meat and milk. County Cavan shares the Ulster tradition of home industries and flax processing, but, although flax growing was revived during and after World War II, little was being grown in the early 1960s. In Cavan there is a bacon factory, while creameries are scattered through the countryside. The towns are market centres with some small industries: such as shoe factories at Belturbet and at Baillieborough! where there is also a sawmill. Near Cootehill there is an estate now largely forested.

Main roads converge on Cavan from Belfast, Dublin and Athlone. but the railway line from Belfast through Cavan to Inny junction and the light railway through Belturbet to Arigna are now only used for freight. (T. W. FR.)

History. — The Cavan district is mentioned in accounts of the life of St. Patrick where it is told how the saint found on the plain of Moyslaught an idol called Crom Cruaich (said to be the chief god of Ireland and worshipped with human sacrifice) surrounded by twelve other idols. Moyslaught was near the village of Ballymagauran on the Leitrim border of Cavan. Cavan formed part of a kingdom of Brefni (this name is given a varied range of spellings) which included Leitrim. At Croaghan, near Killeshandra, successive chiefs of the O'Rourkes were inaugurated as princes of Brefni. In later times Cavan, or east Brefni, became distinctively Brefni O'Reilly; and Leitrim, or west Brefni, became Brefni O'Rourke. Brefni long resisted penetration by Anglo-Norma11 adventurers; and the O'Reillys of Cavan were not permanently brought under English rule until the Ulster war at the close of the reign of Elizabeth I. Although previously regarded as part of Connaught, Cavan was designated part of Ulster in the reign of James I and was brought within the scheme for the Plantation of Ulster in the years following 1608. The chief incoming landlords were English and Scottish in about equal numbers.

(HU. S.)

See Philip O'Connell, *The Diocese of Kilmore* (1937), *The Schools and Scholars of Breiffne* (1942).

CAVAN (CABHÁN, "The Hollow Place"), an urban district and county town of County Cavan. Republic of Ireland, 85½ mi. S.W. of Dublin by rail. Pop. (1961 j 3,207. Cavan was the seat of the O'Reilly chieftains whose principal residence was on Tullymongan hill. O'Reilly of Breifne (d. 1491) and Owen Roe O'Neill (d. 1649) were buried in the Franciscan friary founded in 1300 by Giolla O'Reilly, of which only the belfry tower remains. In 1690 the town was sacked by Gen. William Wolseley's Enniskilleners who defeated James II's troops under the duke of Berwick. Cavan is the seat of the Roman Catholic diocese of Kilmore. which includes parts of counties Leitrim, Fermanagh, Meath and Sligo; its modern Romanesque cathedral was dedicated in 1942. The town has some linen trade.

CAVATINA, a musical form, the diminutive of *cavata* (from the Italian *cavare*, "to dig out"), which in early 18th-century cantatas, notably those of J. S. Bach, was a short, epigrammatic vocal piece following the recitative and preceding the arioso. The cavatina is an operatic song, of which there are examples in the operas of Mozart, Weber and Rossini. generally of brilliant character and in one or two sections but without repetition. The term was also used as a title of songlike instrumental works, such as one movement of Beethoven's string quartet opus 130, and a violin piece by Joachim Raff.

CAVE, EDWARD (1691–1754), English printer and founder of the first English magazine, was born at Newton. Warwickshire, Feb. 27. 1691. He entered the grammar school at Rugby. where his father was a cobbler. but was involved in pranks which cost him the headmaster's favour and the hope of proceeding to the univerxity. After many vicissitudes he became apprentice to a London printer and was sent to Norwich to conduct a printing house and weekly paper. While engaged in printing and journalism, he obtained employment in the post office (1723) and presently a clerkship of franks. retiring only in 1745. He meanwhile undertook the exchange of news between London and provincial papers. In 1728 he was implicated with others in a charge of breach of privilege. In 1731 he bought a printing house and set up a press at St. John's Gate. Clerkenwell, and launched the *Gentleman's Magazine (see* PERIODICAL). of which he remained proprietor during his lifetime, editing it under the pseudonym of Sylvanus Urban, Gent. This, the first magazine of modern type, was modeled on Pierre Motteux's *Gentleman's Journal* (1692). It offered extracts and abridgments from the contemporary press. "with some other matters of Use or Amusement that will be communicated to us," In 1732 he began to issue from surreptitious and often scanty reports accounts of the debates in both houses of parliament. and in 1738 was censured for printing the king's answer to an address before it had been announced by the speaker. Thenceforth the debates appeared as those of the "senate of Great Lilliput."

In 1747 he mas reprimanded for publishing an account of the trial of Lord Lovat and discontinued the reports. beginning afresh with brief accounts of transactions in parliament in 1752.

From Cave Samuel Johnson got his earliest regular literary employment, on these debates and in other writing and editing. Cave was, moreover, concerned in the publication of several of Johnson's works besides those which appeared (in whole or in part) in the magazine: notably, *London*, the *Life of Savage*, *Irene* and the *Rambler*. On his death in London. on Jan. 10, 1754, Johnson wrote a sympathetic obituary notice.

(M. M. Ls.)

CAVE, a cavity in rock large enough for human entrance and traverse. Cavern is nearly synonymous, hut generally means a large cave or a large connected group of caves. A rock shelter is

a cave whose mouth is the largest cross section of the cavity and whose roof has adequate projection out over the floor. Collapse of part of the cave roof to make a hole completely through to the surface constitutes one common type of sinkhole, a cave without a roof.

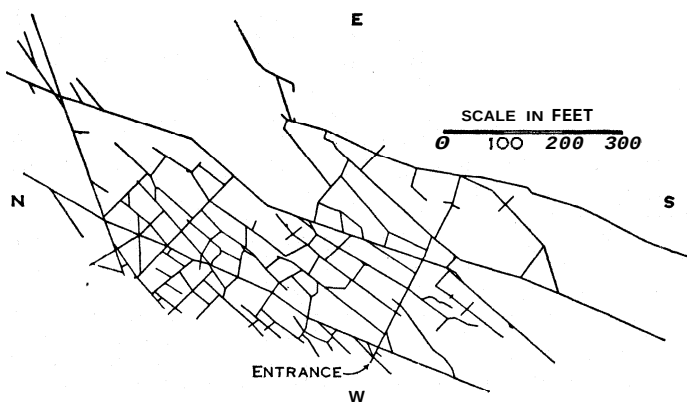
Origin. — Caves may originate with the making of the rock which encloses them or they may be secondary to the rock making. To the first group belong caves in congealed lava flows. made generally by freezing of the surface of the lava stream while the deeper portion remains liquid and continues to flow. Failure of supply under these conditions may allow the fluid lava to drain out and leave a linear hollow tube perhaps tens of feet in diameter.

Most caves belong to the second group, having been made by removal of material after the enclosing rock was made. Some of these occur along exposed coasts where mechanical erosion occurs under vigorous wave attack. These sea caves are not limited to any particular kind of rock and they lack marked linearity and subterranean extent. Rock shelters commonly are the result of crumbling and falling away of weak rock on a hillside beneath stronger rock which forms the roof.

Limestone and Dolomite Caves. — These rocks contain the largest caves and the largest number of caves of the earth's surface. They are all secondary, having been made by the solvent action of circulating ground water. These calcareous rocks, slightly soluble in pure water, are more rapidly attacked if the water has brought organic acid or carbon dioxide down from the surface in it. The circulation occurs chiefly along the usually horizontal bedding planes and the commonly vertical joint cracks. the water moving under gravity to lower levels and to eventual escape as springs and seepages. The sides of these primitive passages are attacked and the dissolved material removed: thus enlargement results. From perhaps a multitude of such early water routes, integration of the subterranean water system proceeds by greater enlargement. of more favourably located routes and abandonment of less favoured ones.

Limestone and dolomite caves have been discovered in well drillings below the water table (upper level of saturated rock) and therefore completely filled with water. Some caves are enterable in dry weather only, being completely filled during the rainy seasons. Many are traversable at all times. although they carry perennial streams on their floors. Some lack streams entirely, but possess shapes and wall sculptures that indubitably are of solutional origin.

The question therefore arises as to whether caves in calcareous rock (1) have been made in large measure by solutional and abrasional stream work on the floor while only air occupied the upper part of the cave. and thus have been deepened and perhaps widened in the manner by which surface streams enlarge their valleys or (2) have been made at some earlier time when the water table was higher in the rock, the cave being completely filled at the time. Lowering of the water table occurs in any region as the surface streams deepen their valleys and thus provide lower exits for seepages and springs. Thus, by this second view. enterable limestone and dolomite caves, with streams on their floors, are going through a second episode in their development. They are still water routes, but their enlargement now is occurring only in the basal portions.



PLAN OF MARK TWAIN CAVE. HANNIBAL, MO.

An outstanding example of a cave system in which the ground plan was determined entirely by vertical joints and in which development occurred almost wholly below an earlier, higher water table

The many caves possessing solutional shapes on their ceilings seem to require. for their origin, a tube-full flow, like that of a water main. The ground plan of many caves suggests the street system of a city, a multitude of narrow, linear, intersecting passages having been developed along two or more sets of nearly vertical joints in the rock. This lack of integration into one main water course with tributary courses argues strongly for origin in the saturated zone below the water table.

There are many horizontally extended caves under hills whose catch of rainfall never could have provided the ground-water flow recorded and whose directional control of any ground-water circulation does not fit the cave pattern. Such caves must be older than the hills and valleys of the region and are therefore judged to be products of the second method of origin.

A limestone or dolomite cave therefore is, or once was, a subterranean water course, its length far greater than its width or height. During a large part of its development it functioned like a pipe line. the flow occurring under hydrostatic conditions. After lowering of the water table. the cave became more like a roofed valley. with a free surface stream on its floor for a time, perhaps to the present.

Secondary Deposits. — Most enterable caves have ceased to grow larger; instead, they are suffering decrease in size from the secondary deposition of calcium carbonate in the form of travertine and stalagmites on the floor. draperies and curtains on the walls, and stalactites on the ceiling. The deposited material has been obtained from the roof rock by downward percolating rain water since air came to occupy the cave. To these secondary growths caves owe much of their beauty and most of their interest to the average visitor. Forms of the deposits are extraordinarily varied, chiefly in vertical dimensions, and fancy sees in them an almost unbelievable range of resemblances to forms already in the beholder's experience. The usual pure white of the calcium carbonate may be mottled and shaded with delicate hues of red, yellow and gray. Translucency may characterize some of the deposits and lend added charm.

Primitive Shelter. — Primitive man in all lands has utilized the natural shelter provided by caves, the rock shelter type having been his favourite. His tools, weapons, ornaments, hearths, the bones of his kills, even his wall pictographs and paintings have provided archaeologists with so much information that "cave man" has become a popular term for our early ancestors (see ARCHAEOLOGY: Prehistory). Ice Age (Pleistocene) extinct carnivores — cave bear, cave lion, cave hyena — also used available caves south of the ice sheets of Europe and North America as refuges and dens, their remains being preserved in earthy floor deposits and beneath secondary floors of travertine.

(J. H. Bz.)

Regions Famous for Caves. — The most famous cave area in the world is probably that which lies in the calcareous Alps of central and southern Europe stretching from France through Switzerland and Austria to Yugoslavia. In this area are found the deepest caves yet descended by man, the Gouffre Berger, near Grenoble, France (3,680 ft.); the world's longest surveyed cave, the Holloch in Switzerland (more than 37.6 mi.); and some of the world's largest caverns, notably the Elizabeth Casteret cavern in the French Alps (1.300 ft. long, 500 ft. wide and over 150 ft. high). Many caves also contain glacier ice, such as the Eisriesenwelt, near Salzburg, Aus., which is a series of ice caves more than 2½ mi. long and at a height of 5,400 ft. The great size and depth of the Alpine caves is due to the highly faulted limestones and to solution caused by the rainy and snowy climate.

In southwestern Europe the outcrops of limestone are less extensive than those in the Alps, and the caves are smaller and horizontal rather than vertical in type; stalactites and stalagmites are usually insignificant, though Aven Armand and Padirac, in the Causses (*q.v.*) of southern France, are exceptions. The Mediterranean regions contain some fine caves, especially in the

Bottom right: View of the lake in New St. Michael's cave in the Rock, Gibraltar

Rock of Gibraltar, in Malta and in Lebanon; these caves are now mainly dry, and were probably formed under more pluvial climatic conditions.

In the United States the most famous cave areas are in Kentucky, Missouri and New Mexico. The Mammoth cave and its neighbours. the Flint Ridge (Floyd Collins. Crystal) caves possess the world's greatest development of horizontal cave passages, over 150 mi. in all having been explored. The deepest caves in the United States are Neff's cave, Utah (1,186 ft.), and Carlsbad caverns, N.M. (1,320 ft.); both occur in desert regions where they have been formed by deep ground-water solution.

Well-known caves also exist in the Himalayas, in Malaya and Indochina, in South Africa and in Australia (Nullarbor plains). Large caves are numerous in the limestone areas of the humid tropics, and they usually contain much travertine and stalagmite; this is a consequence of the high rainfall and temperatures in these areas. Tropical caves are also renowned for the large numbers of bats which inhabit them, as for example in Windsor cave, Jamaica.

Many of the caves mentioned have been opened up and commercialized and are accessible to the general public.

Speleology.—Speleology is the scientific study of caves from all points of view. It includes the discovery of and the technique of exploration in caves; cave surveying and photography; the study of the geological and chemical problems connected with their origin and development; the physical and meteorological conditions in caves; the study of cave fauna and flora; and the study of cave deposits, both calcareous and noncalcareous, except where these form a series of layers important from an archaeological standpoint. Speleology is thus a complex science, involving a knowledge of many disciplines.

Modern speleology dates from the middle of the 19th century and the first speleological society was founded in France in 1895. Most countries of the world, including the United States and the U.S.S.R., have societies for the promotion of speleology. Great advances have been made in the study of caves since 1930 and the first International Congress of Speleology was held in Paris in 1953. The exploration of the world's deepest caves necessitates the use of many different types of ladders and of complex engineering techniques; camping for long periods underground is frequently essential. Submerged passages at the level of the water table can only be explored by the trained members of cave diving groups. Thus speleology is a "sporting" science, involving certain risks; it attracts many amateurs, sometimes known in the United States as "spelunkers."

The study of speleology has many interesting everyday applications. This is particularly true in the field of hydrology where a knowledge of caves and springs and the movements of underground water are often needed to prevent water pollution. The best-known applications are probably those connected with the tracing of underground water flow; for this, fluorescein, a chemical compound which colours water a vivid green, is frequently used. Countries which possess large areas of limestone terrain, such as France and Yugoslavia, engage trained speleologists to help solve many of their distinctive hydrological problems; speleology has been of use in the settlement of at least one international hydrological dispute (at Casteret).

France, Italy and Yugoslavia all possess biospeleological research stations. At these stations, the biological aspects of caves are given particular attention, including the study of cave-dwelling bats and other animals. *See* articles on various caves, such as FINGAL'S CAVE; FLINT RIDGE CAVE SYSTEM; KENT'S CAVERN; LURAY CAVERN; MAMMOTH CAVE; POSTOJNA; WYANDOTTE CAVE, etc.; *see* also references under "Cave" in the Index volume.

CAVEAT EMPTOR, a Latin phrase meaning "Let the buyer beware." It represents a legal rule in the purchase and sale of personal property that the buyer purchases at his own risk in the absence of an express warranty, or unless the law implies a seller's warranty or there is found to have been fraud in the transaction. *See* SALE OF GOODS.

CAVELL, EDITH LOUISA (1865–1915), British nurse, famous as a popular heroine of World War I, was born at Swardeston, Norfolk, on Dec. 4, 1865. She entered the nursing profession in 1895, and in 1907 was appointed the first matron of the Berkendael institute, Brussels (which became a Red Cross hospital in World War I). There she did a great deal to raise the standard of nursing. After the German occupation of Belgium she became involved in an underground group, formed to help English, French and Belgian soldiers reach the Dutch frontier. The soldiers were sheltered at the Berkendael hospital, and provided with money and guides obtained by the Belgian, Philippe Baucq. About 200 men had been sheltered when in Aug. 1915 Edith Cavell was arrested, with several others. They were court-martialed on Oct. 7 and 8 and she was sentenced to death on Oct. 9, after making a full confession. Despite the efforts of the American and Spanish ministers to secure a reprieve, she was shot, with Baucq, in Brussels on Oct. 12. Her execution, on a charge which did not include espionage, was considered outrageous and damaged Germany's reputation among the nonbelligerent countries. Edith Cavell gained wide fame for her courage and sincerity. summed up in her celebrated statement "I realize that patriotism is not enough. I must have no hatred or bitterness towards anyone."

See A. A Hoehling, *Edith Cavell* (1958).

CAVENDISH, LORD FREDERICK CHARLES (1836–1882), English statesman who was murdered by Irish nationalists in Phoenix park, Dublin, the day after his arrival in Ireland as chief secretary, was born at Eastbourne. Sussex, on Nov. 30, 1836. second son of the 7th duke of Devonshire. His family's position took him into parliament as of right; he was M.P. for the West Riding of Yorkshire from 1865. The year before he had married Lucy, daughter of the 4th Baron Lyttelton. She was Mrs. Gladstone's niece, and Gladstone came to admire and trust Lord Frederick. especially after taking him as private secretary in 1872; he looked to him as the future leader of the parliamentary Liberal party. Lord Frederick held minor office in 1873–74 and was financial secretary to the treasury from April 1880, supervising the bulk of the department's business as Gladstone's financial right-hand man. At the height of the Irish crisis in May 1882 Gladstone asked him to undertake the thankless and dangerous office of chief secretary for Ireland. He crossed to Dublin on the night of May 5. On the evening of May 6 he walked across the Phoenix park with T. H. Burke, the permanent undersecretary. Burke was attacked by a party of Irishmen armed with knives; Cavendish tried to defend him, and both were killed. Four of their assassins, members of a secret society called the "Invincibles," were betrayed and hanged in 1883.

Lord Frederick's widow, who outlived him by 43 years, was a noted philanthropist and greatly influenced Gladstone's decision to remain in politics for the sake of Ireland. Her ***Diary,*** two volumes (1927), gives a striking picture of the Victorian aristocracy.

(M. R. D. F.)

CAVENDISH, GEORGE (1500–1561?), won a minor but lasting reputation through a single work, his *Life* of Cardinal Wolsey, a landmark in the development of English biography, an important document to the student of Tudor history and a rare source of information on the character of the author himself. About 1526 Cavendish entered Wolsey's service as a gentleman usher and remained loyal to him from the height of his power to his rapid fall under the disfavour of Henry VIII. This position of trust afforded Cavendish a valuable eyewitness impression of the cardinal, especially in his final days of crumbling magnificence. After Wolsey's death in 1530 Cavendish left public employment

and retired to Suffolk, where in 1557 he completed his *Life*, undertaken in his later years partly with the intention of supplying a truthful report of the cardinal's career.

Although the fact that Cavendish was a Catholic and his mention of dangerous political issues obstructed the printing of the complete *Life* during the reign of Elizabeth I, its factual and literary value caused it to circulate freely in manuscript, and it thus provided a source for chronicles such as those of John Stow and Raphael Holinshed, for poems and for plays such as Shakespeare's *Henry VIII*. The first printed version, published in 1641, *The Negotiations of Thomas Woolsey*, was so mangled by party propagandists as to render it a polemical tract; and the reissue of this bad text throughout the rest of the 17th and the 18th centuries fostered the idea that it was a controversial work. Not until 1810 did Christopher Wordsworth attempt to restore the original by issuing in his *Ecclesiastical Biography* a text based upon original manuscripts. In 181 j S. W. Singer published a more completely restored text. At this time also the authorship, long attributed to George Cavendish's brother William, was correctly assigned to George by internal evidence. The question is discussed by Joseph Hunter in a pamphlet reprinted in Singer's edition.

The various acceptable texts subsequently printed reaffirmed Cavendish's gift for biographical writing. Despite his habit of moralizing, his occasional inaccuracies and his limited view of Wolsey's larger policies. Cavendish applied to his subject methods of concrete observation in matters of behaviour, gesture and speech, so that in his shapely and unaffected narrative the figure of the cardinal emerges with an air of life. Besides thus anticipating later biographical principles, Cavendish, though still close to medieval tragedy in conceiving Wolsey's rise and fall as governed by Fortune's wheel, moved away from the older idea that biographies should deal only with saints or royal personages.

See the edition of the *Life* by F. S. Ellis in the Temple Classics (1899) and the first scholarly edition, with notes and introduction, by Richard S. Sylvester (1958); *see* also A. F. CAVENDISH, HENRY (1731–1810), English chemist and physicist; was a pioneer in the study of gases. Elder son of Lord Charles Cavendish, brother of the 3rd duke of Devonshire, and Lady Anne Grey, daughter of the duke of Kent, he was born at Nice, France, on Oct. 10, 1731. He was sent to school at Hackney in 1742 and in 1749 entered Peterhouse, Cambridge, which he left in 17j3 without taking a degree. Until he was about 40 he seems to have enjoyed a moderate allowance from his father (d. 1783), but in the latter part of his life an aunt left him a fortune which, together with his patrimony, made him one of the richest men of his time. It was commonly said that he was the richest of the philosophers and the most philosophical of the rich. He was a regular attendant at the meetings of the Royal society, of which he became a fellow in 1760, and he dined every Thursday with the club composed of its members. Otherwise, he had little intercourse with society; indeed, his chief object in life seems to have been to avoid the attention of his fellows. He had little communication with his relatives, and even Lord George Cavendish, his second cousin, whom he made his principal heir, he saw only for a few minutes once a year. His dinner was ordered daily by a note placed on the hall table, and his women servants were instructed to keep out of his sight on pain of dismissal. In person he was tall and rather thin; his dress was old-fashioned and singularly uniform, and was inclined to be shabby about the times when the precisely arranged visits of his tailor were due. He had a slight hesitation in his speech, and his air of timidity and reserve was almost ludicrous. He never married. He died at Clapham on Feb. 24, 1810.

Cavendish's scientific work was wide in its range. He took for his motto, "Everything is ordered by measure, number and weight." The papers he himself published form an incomplete record of his researches, since many of the results he obtained became generally known only years aiter his death; yet the Institute of France in 1803 chose him as one of its eight foreign associates. His first communication to the Royal society, a chemical paper on "Factitious Airs" (1766), dealt mostly with "inflammable air" (hydrogen), which he mas the first to recognize as a distinct substance, and "fixed air" (carbon dioxide). He determined the specific gravity of these gases with reference to common air, investigated the extent to which they are absorbed by various liquids and noted that the air produced by fermentation and putrefaction has properties identical with those of fixed air obtained from marble. In 1783 he described observations he had made to determine whether or not the atmosphere is constant in composition; after testing the air on nearly 60 different days in 1781 he could find. after 400 determinations in the proportion of oxygen, no difference of which he could be sure, nor could he detect any sensible variation at different places. Two papers on "Experiments on Air," printed in the *Philosophical Transactions* for 1784 and 1785, contain his great discoveries of the compound nature of water and the composition of nitric acid. Starting from an experiment, narrated by Joseph Priestley, in which John Warltire fired a mixture of common air and hydrogen by electricity, with the result that there mas a diminution of volume and a deposition of moisture, Cavendish burned about two parts of hydrogen with five of common air and noticed that the only liquid product was water. In another experiment he fired by electric spark a mixture of hydrogen and oxygen in a glass globe, similar to the apparatus now called "Cavendish's eudiometer," and again obtained water. Proceeding with these experiments he found that the resulting water contained nitric acid. In the second of the two papers he gives an account of the methods by which the composition of nitric acid was discovered. He observed also that a small fraction, about $\frac{1}{120}$, of the "phlogisticated air" of the atmosphere differed from the rest. In this residue he doubtless had a sample of the inert gas argon, which was only recognized as a distinct entity more than 100 years later by J. W. Rayleigh and Sir William Ramsay (*qq.v.*). In the meantime, many able chemists, including such masters as J. L. Gay-Lussac and R. W. von Bunsen, had made "complete" analyses of atmospheric air. It may be noted that, while Cavendish adhered to the phlogistic doctrine, he did not hold it with anything like the tenacity that characterized Priestley. Thus, in his 1784 paper on "Experiments on Air," he remarks that not only the experiments he is describing but also "most other phenomena of nature seem explicable as well, or nearly as well," upon the Lavoisierian view; but he did not accept it and continued to use the language of the phlogistic theory. Experiments on arsenic, published for the first time in 1921, showed that Cavendish had investigated the properties of arsenic acid about ten years before K. W. Scheele. He showed that arsenic oxide contained less phlogiston (*i.e.*, more oxygen) than arsenious oxide, which in turn contained less than free arsenic.

Cavendish's work on electricity anticipated the researches of C. A. Coulomb, Michael Faraday and others. He investigated the capacity of condensers and constructed a series of condensers with which he measured the capacity of various pieces of apparatus, using the "inch of electricity" as the unit of capacity. He discovered specific inductive capacity and measured this quantity; he showed that electric charges are confined to the surface of a conductor and that the inverse square law of force between charges holds to within 2%. Cavendish introduced the idea of potential under the name of "degree of electrification." He investigated the power of different substances to conduct electrostatic discharges (*Phil. Trans.*, 1775) and completed an inquiry which amounted to an anticipation of Ohm's law.

Cavendish took up the study of heat. and had he published his results promptly he might have anticipated Joseph Black (*q.v.*) as the discoverer of latent heat and of specific heat. He published a paper on the freezing point of mercury in 1783, and in this paper he expressed douht of the fluid theory of heat. He regarded heat as a manifestation of internal motion of the smallest particles, whereas Black considered it to be material in nature.

Cavendish's last great achievement was his series of experiments to determine the density of the earth (*Phil. Trans.*, 1798). The figure he gives for the specific gravity of the earth is 5.48, but in

fact the mean of the 29 results he records works out at 5.448. Other publications of his later years dealt with the height of an aurora seen in 1784 (*Phil. Trans.*, 1790), the civil year of the Hindus (*Phil. Trans.*, 1792) and an improved method of graduating astronomical instruments (Phil. *Trans.*, 1809). Cavendish also had a taste for geology and made several tours in England for the purpose of gratifying it.

A *Life* by George Wilson (1818–59), printed for the Cavendish society in 1851, contains an account of his writings, both'published and unpublished, together with a critical inquiry into the claims of all the alleged discoverers of the composition of water. Some of his instruments are preserved in the Royal institution, London, and his name is cornmemorated in the Cavendish Physical laboratory at Cambridge.

In 1921 the previously published work, together with a number of unpublished experiments. appeared under the title *The Scientific Papers of the Honourable Henry Cavendish, F.R.S.; Vol.* I, *The Electrical Researches,* revised with preface and notes by Sir J. Larmor; *Vol. II, Chemical and Dynamical,* edited by Sir Thomas Edward Thorpe. with additions by Charles Chree and others.

CAVENDISH, MICHAEL (*c.* 1565–1628), English composer whose surviving works show a small but genuine talent, was a member of the landed gentry and therefore an amateur musician. He contributed to Thomas East's *Whole Booke of Psalmes* (1592), and in 1598 published a collection of his own music containing 20 airs with lute accompaniment (and alternative arrangements for four voices) and eight madrigals for five voices: of these the airs have been printed in *The English School of Lutenist Song Writers,* 2nd series, vol. 11 (1920–32) and the madrigals in The *English Madrigal School,* vol. 36 (1913–24), both ed. by E. H. Fellowes. Cavendish died in London on July 5, 1628. (J. J. N.)

CAVENDISH (CANDISH), **THOMAS** (1560–1592), English navigator and freebooter, was the third circumnavigator of the globe. Born in Trimley St. Martin, Suffolk, he was baptized on Sept. 19. 1560. In 1585 he accompanied Sir Richard Grenville to America. Soon returning to England, he undertook an elaborate imitation of Drake's great voyage. On July 21, 1586, he sailed from Plymouth with 123 men in three vessels, only one of which (the "Desire." of 140 tons) returned. By way of Sierra Leone, the Cape Verde Islands and Cape Frio in Brazil, he coasted down to Patagonia (where he discovered "Port Desire:" his only important contribution to knowledge), and passing through the Straits of Magellan fell upon the Spanish settlements and shipping on the west coast of South and Central America and of Mexico. Among his captures was the treasure galleon the "Great St. Anne," which he seized off Cape St. Lucas. the southern extremity of California (Nov. 14, 1587). Touching at the Ladrones, Philippines, Moluccas and Java. he rounded the Cape of Good Hope and arrived at Plymouth on Sept. 9–10, 1588, with much plunder. having circumnavigated the globe in two years and 50 days. In 1591 he planned a fresh American and Pacific venture. John Davis (*q.v.*) accompanied him. but the voyage (undertaken with five vesselsj was an utter failure. Cavendish died and was buried at sea, on the way home, probably in Map 1592.

See E. S. Payne, *Voyages of the Elizabethan Seamen to America,* 2 vol. (1893–1900).

CAVIAR (CAVIARE), the roe (eggs) of various species of *Acipenser* or sturgeon prepared, in several qualities, as an article of food. The word is common to most European languages and supposed to be of Turk or Tatar origin, but the Turk word *khavyar* is probably derived from the Italian *caviala;* the word does not appear in Russian.

The best caviar, which can only be made in winter and is difficult to preserve, is the loosely granulated, almost liquid kind, known in the U.S.S.R. as ikra. It is prepared by beating the ovaries and straining through a sieve to clear the eggs of the membranes, fibres and fatty matter; it is then salted with from 4% to 6% of salt. The difficulty of preparation and of transport made it a table delicacy in western Europe. where it has been known since the 16th century, as is evidenced by Hamlet's "His play . . . pleased not the million, 'twas caviare to the general."

Caviar is eaten either as an hors d'oeuvre, particularly in the U.S.S.R. and northern Europe, with kummel or other liqueurs, or as a savoury, or as a flavouring to other dishes. The coarser quality, in the U.S.S.R. known as *pajusnaya* (from *pajus,* the adherent skin of the ovaries), is more strongly salted in brine and is pressed into a more solid form than the ikra; it is then packed in small barrels or hermetically sealed tins. This forms a staple article of food in eastern Europe and the U.S.S.R., where the best forms of caviar are made. The greater quantity of the coarser kinds are exported from Astrakhan, the centre of the trade. Large amounts are made each year for export in America and also in Germany, Norway and Sweden. The roe of tunny and mullet pickled in brine and vinegar is used, under the name of botargo, along the Mediterranean littoral and in the Levant.

CAVITE, a city and province on the island of Luzon, Republic of the Philippines. The city is located on a forked tongue of land in Manila bay, southwest of Manila (pop. [1960] 54,882). Chartered in 1940, it is a compact residential city, with many people commuting daily to work in Manila. At the outer edge of the city is a naval base, which was captured by Commodore George Dewey, of the United States navy, May 1, 1898. From 1898 until 1941 the Sangley Point naval base was the chief Asian base and fueling station for the U.S. navy, which continues to maintain a naval air station there.

Cavite province was long a revolutionary centre against the Spanish, and the home province of Emilio Aguinaldo, the insurrection leader against both Spain and the United States.

The northern part of the province is a wide strip of lowland devoted to rice cultivation. Along the coast, pond raising of fish, saltmaking and coastal fishing are important. People of many coastal towns work in Manila. The southern upland district has richer soils and better climatic conditions, producing bananas, pineapples: papayas and other fruits and a wide variety of fresh vegetables and flowers, which are delivered to the Manila markets by daily trucking services. Many tourists visit Tagaytay, a resort city chartered in 1938 (pop. [1960] 7,100). Located on the southern volcanic crater rim of the upland at about 2.000 ft. elevation. it is somewhat cooler than Manila. Tagaytay overlooks Taal lake, located below the rim in the core of an exploded volcano which occasionally shows mild activity. The city of Trece Martires (pop. [1960] 4,304), in the lowland, was chartered in 1954 and replaced the city of Cavite as the provincial capital. (J. E. SR.)

CAVOUR, CAMILLO BENSO, CONTE DI (1810–1861), Piedmontese statesman. the conservative whose exploitation of international rivalries and of revolutionary movements brought about the unification of Italy under the house of Savoy. with himself as the first prime minister of the new kingdom. was born at Turin on Aug. 10, 1810. the son of the marchese Michele Benso di Cavour. His mother (née Adèle de Sellon) was Swiss and a Calvinist, and this may help to explain the liberal and anticlerical tendencies which soon made Cavour lose favour under the reactionary government of King Charles Albert (*q.v.*) of Sardinia-Piedmont. After being dismissed from his post as page to the king. he became an army officer in the engineers. As the second son in an aristocratic family he had to earn his own living. and it was his strongly mathematical bent which made him prefer the engineers. The July revolution of 1830 in France moderated his radicalism and taught him that a traditional monarchy could also be liberal and avoid the extremes of revolution and reaction. Thus his political doctrine of the *juste milieu* ("happy mean") was learned from the France of Louis Philippe. That example further encouraged opposition to Charles Albert! and he resigned from the army in 1831.

As a political career seemed impossible for a liberal in contemporary Turin. Cavour turned to the management of his father's estate at Leri. There he proved highly successful, introducing new agricultural methods, new crops. new breeds of animals. He traveled widely to study foreign techniques of agriculture. He popularized the use of artificial manures in Piedmont as well as

English experiments with subsoil drainage. Agriculture always remained his chief hobby, and Leri his favourite residence. A growing interest in finance once led him to gamble away a large part of his father's money on the Paris stock exchange. But in the end he became very rich. He was a pioneer in developing banks and was one of the first to see the possibilities of railway transport in Italy and of a consequent industrial revolution. In 1832 he helped to found a famous agricultural society at Turin. This soon became an undercover institution for political discussions too, and it stressed the need for having an all-Italian and not merely a Piedmontese membership.

Revolution and Reform, 1848–49.—During his travels Cavour renewed his political interests by making a close study at first hand of the British and French constitutions. He also published serious analyses of the English poor-law system and the Irish problem As a friend of Cesare Balbo and Vincenzo Gioberti (*qq.v.*) he shared the interest which all progressives at Turin nourished in the possibility of ending the predominant Austrian influence in the Italian peninsula. In 1847 Charles Albert yielded to contemporary trends sufficiently to grant some press freedom in Piedmont, and Cavour took advantage of this to found a newspaper bearing the significant title of *Il Risorgimento*. At once he began advocating the *juste milieu* of constitutional monarchy as the only way of avoiding the more radical revolution which Giuseppe Mazzini (*q.v.*) wanted. The victory of Mazzini would have meant the end of the monarchy, the end of aristocratic predominance at Turin and the end of Piedmontese hopes to conquer and absorb the other provinces of Italy. When revolution broke out elsewhere in Italy. Cavour took a leading part in asking Charles Albert to forestall worse dangers by granting liberal reforms. The king was reluctantly induced to grant a parliamentary constitution (March 4, 1848), albeit a conservative document which hardly allowed much power to the representatives.

Cavour showed great skill as a journalist, even though his own language was French and his articles had to be written in Italian. Without doubt he carried weight both with public opinion and with the king. In March 1848, when the Milanese rose in a popular rebellion against Austrian rule in Lombardy, Cavour at once advocated uar, seeing this as a chance not only to undermine Austrian influence but also to extend the frontiers of Piedmont and to prevent the threatening victory of republicanism in Milan and Venice. Charles Albert declared mar on April 5, but unfortunately military incompetence was made even more disastrous by regional and political differences between the conservative Piedmontese and the more radical Milanese. After defeat by the Austrians, an armistice was declared.

Meanwhile, in Piedmont, parliament had met under the new constitution. Cavour stood for election. His influence was not strong enough for him to succeed in April 1848. but he was returned at a later election in the following June and showed his political colours by sitting on the right among the conservatives. He spoke Italian with great hesitation, his voice was poor and he completely lacked rhetorical skill, but his intellectual power and clarity of mind uere remarkable, and his good common sense and experience of parliamentary government in other countries were shortly to make him an expert in this unfamiliar method of politics. For the moment. however, he was regarded with some distrust. and in the elections of Jan. 1549 he was not elected. But he shared with many other people the desire to fight Austria once again in order to regain the influence which Piedmont had lost. War was declared again, but after a campaign which lasted only a few days the Piedmontese were totally defeated at Novara on March 23. 1849. Charles Albert saved the dynasty from disaster by a prompt abdication, and his son Victor Emmanuel II (*q.v.*) succeeded him. Peace was declared and forced on to an unwilling parliament. Cavour lamented the incompetence uhich had brought these two defeats and was now determined to make a career in politics. He had at last discovered his own abilities and was determined to try to use them in securing the independence of Italy. He mas returned to parliament again in June 1849, and by Oct. 1850 he was minister of agriculture. industry and commerce in the government of Massimo d'Azeglio (*q.v.*).

Internal and Foreign Policy, 1850–58.—For the next ten years until his death, Cavour dominated Piedmontese politics. Almost at once he altered the pattern of trade by bringing duties down, having learned from Richard Cobden the advantages of free trade. As minister of finance in 1851 he reorganized the kingdom's finances and persuaded European banking houses to invest heavily in this little country. Then he undermined the position of his colleagues in the cabinet and tried to force D'Azeglio to resign and give place to him. Foiled in this, he made a secret "marriage" (*connubio*) with Urbano Rattazzi (*q.v.*) and the moderate left; then resigned for a few months when D'Azeglio heard about it; and by Nov. 1852 had succeeded in becoming prime minister himself. In this slightly disreputable maneuver he already showed the qualities for which he became famous: an enormous self-confidence, an impatience with any junior position, a lack of scruple and a tremendous flair for diplomacy and for sensing the movement of public opinion.

Finance and foreign policy were Cavour's particular fields. His policy for what he called "the aggrandisement of Piedmont" was going to cost money, and his severe taxation won him much unpopularity, while his loans built up a huge national debt. His first challenge to Austria came in 1853 when, after a Mazzinian outbreak in Milan, the Austrians confiscated the estates of certain Lombards who had become naturalized Piedmontese. Cavour broke off diplomatic relations in order to show that Piedmont nas now the champion of Italian independence. In Jan. 1855 he joined the Anglo-French alliance against Russia (*see* CRIMEAN WAR), dragooned into this action by the king against his own instincts and against the vote of his cabinet. General A. La Marmora was sent to the Crimea with 15,000 troops but to Cavour's dismay the war was over before these soldiers had time to distinguish themselves, and many people at home naturally objected to this apparent waste of national resources in a motiveless war so far from Italy. Cavour attended the peace congress at Paris, hoping to secure as compensation the permission to annex Parma or Modena. All he won was the apparent acceptance of his country as the leading state of Italy. The British foreign secretary, Lord Clarendon, however, publicly raised the question of Italy and censored the harsh government of Pius IX in the papal states and Ferdinand II in the kingdom of the Two Sicilies. Here was matter for future exploitation.

Incidentally, at Paris, Cavour learned how he might play on the French emperor Napoleon III's ambition and compromise him in the Italian question. He also began the process of persuading Daniele Manin and other ex-Mazzinian revolutionaries to support the Piedmontese monarchy as their best hope of winning a resurgence of Italy.

Cavour's next step was to try to provoke a European war against Austria from which Piedmont might emerge with enlarged frontiers. At first he hoped for British support in such a nar and traveled to London to arrange it. He soon saw his mistake and switched to France. Napoleon III at heart remained a revolutionary who hoped to gain popularity at home by winning glory abroad, and in return for his help the kingdom of Sardinia could give him Savoy and Nice. Napoleon's sympathies were temporarily cooled by Felice Orsini's attempt on his life in Jan. 1858; but Cavour pacified him by passing the restrictive De Foresta press law in April at French insistence and also gave up his alliance with Rattazzi and the moderate left, Napoleon then summoned Cavour secretly to Plombières (Vosges) in July, where they agreed on a plan. Piedmont was to organize an insurrection in central Italy against Austria, and this was to be made the pretext for mar. A North Italian state was to be formed in ahich Piedmont should annex Lombardy. Venetia and central Italy down to Ancona (thus including part of the papal states) France would receive Savoy and possibly Nice. with the further satisfaction of a marriage between Prince Napoléon Joseph ("Plon-Plon"; *see* BONAPARTE) and Victor Emmanuel's daughter Clotilda.

The War of 1859.—At last in 1859 Cavour was on the verge of success. While insisting that his own intentions were peaceful, he openly arraigned Austria as a warmonger. In fact, however, he was bending all his resources to engineering war against a reluctant

Austria. He employed the radical Società Nazionale to organize conspiracy in Austrian Italy. Lombard citizens were welcomed as volunteers in the Piedmontese army. Garibaldi was made a general and employed to organize a corps of volunteers. On Jan 10, 1859, the king. in orders suggested to him by Napoleon. spoke of the "cry of pain" (*grido di dolore*) that was reaching him from all parts of Italy. In this and other ways Cavour succeeded in making Austria send more troops to Italy as a safety measure, and these troop movements were then made to appear as an act of provocation nhich justified Piedmontese countermeasures. On Jan. 30 the king's 15-year-old daughter was married to Kapoleon's disreputable middle-aged cousin, as arranged, and Napoleon thus won for his dynasty more status among other crowned heads of Europe. A secret military convention mas also signed in Jan. 1859 (and backdated to 1858), by which Piedmont promised Savoy and Nice to France in return for the expulsion of the Austrians from Italy.

Cavour was single-minded enough about war, but Napoleon was in two minds, having to reckon with a pacifist public opinion in France and a powerful Catholic element in the population which was bound to dislike any dismemberment of the papal states. The French army was also unwilling to fight, especially after talks with their Piedmontese colleagues. So Napoleon suddenly backed down and supported the idea of a European congress instead. Cavour was beside himself. He threatened to fight Austria alone, to fight Great Britain too, to bring the United States in against Great Britain and to implicate Kapoleon by publishing their private correspondence. Napoleon tried to calm him and gave him to understand that he would only have to put off his war for 12 months. Cavour eventually had to submit when, on April 18. 1859, an ultimatum arrived from France virtually ordering him to disarm and accept the congress as a means of settling the Piedmontese grievances against Austria. This was in fact a triumph for British diplomacy, which was sympathetic to Piedmont but strongly averse to Cavour's policy of engineering a war and upsetting the whole fabric of Europe for selfish interests of his own. Cavour gave in. So complete was his apparent failure that he threatened suicide. The very next day, however, the military party in Vienna persuaded the Austrian emperor to send Cavour an ultimatum of their own, threatening to fight if Piedmont did not disarm at once. Cavour brilliantly recovered his poise and gave the sort of polite answer that forced the Austrians to put themselves in the wrong by declaring war. France was bound by treaty to defend Piedmont from aggression, and British sympathies at once veered strongly round against Austria for so disturbing the peace.

When war broke out (see ITALY: History), the French and Piedmontese defeated the Austrians in several encounters, while insurgents in Parma, Modena, Florence and Bologna expelled the various ducal families and the papal legate and set up provisional governments of their own. Cavour saw here a chance of increasing his acquisitions in the war even over and above what he had agreed nith Kapoleon. and therefore sent special commissioners to these central provinces to take charge in the name of Ring Victor Emmanuel. This naturally alarmed Kapoleon, who already was meeting growing hostility from Prussia and did not want to have to contend with papal censure as well. So on July 8, 1859, he concluded an armistice with Austria at Villafranca in Lombardy, not even bothering to tell Cavour in advance. Cavour's position had in any case been weakened by the war, for the military had taken over and the king paid little attention to his prime minister. The king had already quarreled several times with Cavour, over the Crimean War, over Cavour's insistence on dissolving the Piedmontese monasteries in 1855 and over his daughter Clotilda's marriage; Victor Emmanuel did not like playing the constitutional monarch in the limited way which Cavour wished. After Villafranca, Cavour at once went to see the king at Monzambano in eastern Lombardy and in highly disrespectful language tried to insist that the king should repudiate the armistice. The king, however, was there much more realistic than Cavour and preferred to accept the latter's resignation. It was arranged that Lombardy should belong to Piedmont, but that Venetia should remain Austrian. It was also resolved that the deposed princes should be reinstated in central Italy and that the pope should be made president of an Italian confederation.

For six months Cavour was out of office. A Rattazzi-La Marmora coalition signed peace at Ziirich in Nov. 1859. Cavour still remained the most important political figure in the country and soon he was able to see Villafranca in a more favourable light: Savoy and Nice had not been surrendered; freedom of action had been won from the slightly compromising association with Napoleon; and this apparent split from Napoleonic France won the more active support of Great Britain. Lord Palmerston now informed France and Austria that he would never tolerate their armed intervention in favour of the despots of central Italy. This doctrine of nonintervention was to prove of great use in 1860, because Cavour had now made Piedmont unquestionably the strongest and most liberal state in Italy, with greatly increased chances of hegemony there if only other states could be kept from intervening.

The Treaty of Turin (1860).—Cavour's name now carried so much prestige at Turin that the king, with no great pleasure, mas forced to reinstate him in power (Jan. 1860). Napoleon was still reluctant to allow Piedmont to grow too strong and would not agree to Piedmontese annexation of the central duchies. Cavour, however, now brought up again the question of Savoy and Nice, the two provinces of the kingdom of Sardinia on the French side of the Alps. The result was that on March 24 a treaty was signed at Turin ceding these two provinces to France (confirmed by local plebiscites in April). In return for this, Napoleon withdrew his opposition to the annexation of central Italy. Plebiscites were organized to give the required verdicts, and on April 2, 1860, a parliament met at Turin representing not only Lombardy and Piedmont but also Parma, Modena, Tuscany and the papal Romagna. Cavour had a difficult moment in this parliament explaining why he had alienated national territory to France, but in the end he obtained a majority. One important person who broke with him over this was Garibaldi (*q.v.*).

The Annexation of the Two **Sicilies.**—The next stage in Italian unification opened when Garibaldi. furious with Cavour and the conservatives, moved over once more toward the Mazzinian belief that Italy must not be made as the piecemeal process of absorption into Piedmont, but rather as a collective creation of something altogether new. Garibaldi sailed with his famous Thousand from Quarto near Genoa, on May 15, 1860, landing at Marsala in Sicily and destroying the whole fabric of Bourbon government in Sicily and Naples. Cavour had been hoping that the south would stay quiet. In the prevalent state of public opinion he did not dare to stop Garibaldi, and he secretly continued negotiating with the Bourbon king Francis II at Naples to arrange a possible division of Italy between him and Victor Emmanuel. No sooner, however, had Garibaldi scored his first successes than Cavour also sent secret aid to this radical buccaneer, hoping to keep a foot in both camps and to gain whether Garibaldi was victorious or not. On the other hand, when Garibaldi conquered Sicily and showed signs of wanting to cross over to the mainland, Cavour became frightened. Piedmontese agents were ordered to take over Garibaldi's provisional government in Sicily, and others were sent to forestall him in Naples by winning over the Bourbon army. They failed in both cases and only served to push deeper the cleavage between radical nationalists and conservative nationalists.

Cavour now took his most courageous decision of all, deciding to annex all that was left of the papal states except Rome. This would not only acquire further provinces for Piedmont, but he could pretend that it was needed in order to prevent the radical Garibaldians from marching on Rome first (Napoleon still kept a garrison of French troops in Rome to defend the pope). So Cavour unscrupulously engineered an insurrection inside the papal states to give colour to the Piedmontese invasion. A battle was fought against the tiny papal army at Castelfidardo near Ancona, on Sept. 18, 1860. and as soon as possible the Piedmontese marched down into Neapolitan territory. For on Oct. 1. 1860, Garibaldi was meeting his first serious opposition. and it was necessary on the one hand to prevent his being defeated by the Bourbons and on the other to ensure that he handed his conquests of Naples

and Sicily over to Cavour and the conservatives. Garibaldi had little option, but he gave in magnanimously. The parliament at Turin quickly approved the annexation of Sicily and Naples as well as of the papal states. The old subalpine parliament was then dissolved and another summoned to represent the various regions of the new Italy which had now been created. Before it could meet, Cavour took care to introduce as much as possible of the laws and administrative procedures of Piedmont into the new provinces, because he rightly sa how difficult it would be for the new deputies to agree on such problems. When the chamber met in March 1861, it showed a large majority in favour of Cavour. Victor Emmanuel was declared king of Italy, but he was to be styled Victor Emmanuel II because Cavour insisted (against the wishes of Mazzini and Garibaldi) that Italy was a continuation or projection of Sardinia-Piedmont.

The Roman Question in 1861.—The problems facing this newly created kingdom were enormous, and unfortunately Cavour had only three months left to live. He had just enough time to turn his attention to the question of Rome, and he defied Catholic feeling in Europe by confirming that this city would one day be annexed to and form the capital of Italy. At the same time he introduced the anticlerical legislation of Piedmont into the recently conquered papal provinces and the south, dissolving the monasteries and making bishops submit to certain state controls. Here he overestimated his strength. Mistakenly he thought that the Vatican would accept his policy of "a free church in a free state." Some negotiations did in fact take place with the Roman curia, but in the end the papacy refused even to recognize the new state's existence. Its rulers were excommunicated, and the friar who absolved Cavour on his deathbed was punished by his superiors. The radical cleavage thus created in Italian society lasted till 1929.

Death.— Another almost unbridgeable division in 1861 was that between Cavour and Garibaldi. Cavour tried not to seem too publicly ungrateful to the national hero, but he could not afford any concessions to him. Garibaldi was treated ungenerously, and so were the officers in Garibaldi's volunteer regiments. A dramatic fight in parliament took place between these two men in April 1861 and perhaps hastened Cavour's death. For some time Cavour had been unwell and irritable, and he had had to carry too much of the strain of these last few years. A fever took him and he was bled too severely by the doctors. He died on June 6, 1861, and was buried at Santena where his family had their country house, to the southeast of Turin. His early death, at the age of only 50, was a tragic blow to his country.

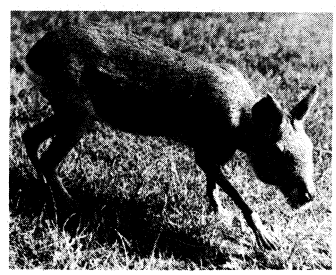
Character and Achievement.— Cavour was one of the cleverest and most successful statesmen in 19th-century Europe. His good sense, pugnacity and perseverance were notorious, as were his personal charm and likability. Not being a doctrinaire nationalist, he had tended, up to 1856 at least, to think of Italian unity as Mazzinian nonsense. Nevertheless, as a born opportunist, he exploited every situation as he found it, and in the last resort the need to contain the revolutionary Garibaldi forced him into certain actions which made him one of the most successful nationalist leaders of the age. Paradoxically it was Cavour who thus realized Mazzini's lifelong dream of Italian unity, even having to use the latter's favourite method of popular insurrection which Cavour himself had earlier so often condemned.

Cavour in his lifetime earned an unenviable reputation for duplicity. He had to depend on the deliberate and unscrupulous provocation of war, and this was bound to give him a thankless part to play in international life. When he died, Italy had still not developed a viable system of parliamentary politics; national sentiment was still far from unified; the budget had been catastrophically unbalanced. Perhaps if Cavour had been more willing to share his power, he could have trained other leaders to succeed him and apply his methods to such problems. Unfortunately his disappearance from politics served to show up the weakness of his country, as it also showed up how much the unification of Italy had been due to the skill of this one remarkable man.

BIBLIOGRAPHY.—There are editions of Cavour's speeches, *Discorsi parlamentari,* by mrmhers of the Italian chamber of deputies, 11 vol. (1863–85), and by A. Omodeo, L. Russo and A. Saitta, 11 vol. (1932–58). For his letters *see* L. Chiala (ed.), *Lettere edite ed inedite del Conte di Cavour,* 7 vol. (1883–87), supplemented by two publications of the Commissione Reale Editrice, *Il Carteggio Cavour-Nigra, 1858–61* (1926) and *Cavour e l'Inghilterra* (1935), containing Cavour's letters to England. For his other writings *see* D. Zanichelli, *Gli Scritti del Conte di Cavour* (1892).

For biography *see* W. de la Rive, *Reminiscences of the Life and Character of Count Cavour* (1862), the work of an intimate friend; G. Massari, *Il Conte di Cavour* (1873); *E.* Artom, *L'Opera politica del senatore Isacco Artom nel Risorgimento italiano* (1905), a life of Cavour's devoted private secretary; W. R. Thayer, *Life and Times of Cavour* (1911); *P.* Matter, *Cavour et l'unité italienne* (1926); A. J. Whyte, *The Early Life and Letters of Cavour* (1925) and *The Political Life and Letters of Cavour* (1930); *D.* Mack Smith, *Cavour and Garibaldi, 1860* (1954). (*D. M.* SH.)

CAVY, any rodent of the family Caviidae of South America. The guinea pig (Cavia *porcellus*), which is widely used as a pet and for laboratory experiments, is a cavy native to Peru. It mas domesticated for food by the Incas. True cavies (Cavia) are gray or brown, agouti-patterned, rat-sized, short-legged, terrestrial animals with small ears and no externally visible tail. They are diurnal-and are one of the-most frequently seen mammals of the mountains of Peru, Bolivia and western Argentina. One native name for the guinea pig is "cuí," alluding to the cry made by the animal when captured. Less prolific than their domestic brethren, they breed in their first year of life and principally in spring months, producing a litter of one or two young. They live in burrows and are vegetarians. (See also GUINEA PIG.)



W. SUSCHITZKY

PATAGONIAN CAVY OR MARA (DOLICHOTIS AUSTRALIS)

Other kinds of cavies also are herbivorous. Rock cavies (*Kerodon*) of eastern Brazil resemble large, gray guinea pigs. Mountain, marsh and pampas cavies (*Galea* and Microcavia) of the plains of Bolivia and central Argentina are like small gray or brown guinea pigs, but with shorter ears and legs. "Patagonian hares" (*Dolichotis*) and "woodland rabbits" (Pediolagus) are large, grayish, rabbit-like cavies with longer ears, legs and tail; they inhabit the plains and open woodlands of Argentina. (E. T. Ho.)

CAWDOR, a village and civil parish of Nairnshire, Scot. Pop. (1951) 823. The village is situated $6\frac{1}{4}$ mi. S.S.W. of Nairn by road and 3 mi. from Gollanfield Junction railway station. In the vicinity is a large distillery. The castle was the scene, according to the tradition perpetuated by Shakespeare, of the murder of King Duncan by Macbeth, thane of Cawdor (or Calder), in 1040. Since the old central tower, the oldest part of the structure, dates from 1454, and seemingly had no predecessor, the tradition has no foundation in fact. The building stands on the rocky bank of Cawdor burn. a right-bank tributary of the Nairn. The massive keep with small turrets is the original portion of the castle, and to it were added, in the 17th century, the modern buildings forming two sides of a square. It is the seat of the earls of Cawdor.

Kilravock (pronounced Kilrawk) castle, $1\frac{1}{2}$ mi. W. of Cawdor, commands the left bank of the Nairn. Its keep dates from 1460, and the later buildings belong to the 17th century. It has been continuously tenanted by the Rose family, who settled at Kilravock in 1293, after which date son succeeded father in direct descent. Queen Mary I was received at the castle in 1562, and Prince Charles Edward was entertained four days before the battle of Culloden.

CAWNPORE: see KANPUR.

CAXIAS, LUIZ ALVES DE LIMA E SILVA, DUQUE DE (1803–1880), Brazilian statesman and his country's greatest military hero, was born Aug. 25, 1803, in Rio de Janeiro. He received his schooling as a cadet at the royal military academy and saw his first combat in the war for independence in Bahia in 1823. Caxias distinguished himself in the Uruguayan campaign, 1825–28, and organized the forces that maintained order in Rio de Janeiro following the abdication of Dom Pedro I in 1831. Sent in 1837 as governor and military commander of the province of

Maranhão, where a separatist revolt was in progress, he established his reputation as a brilliant military strategist and a generous victor. He was employed in a similar capacity to quell rebellions in Minas Gerais, São Paulo and Rio Grande do Sul between 1841 and 1845. Caxias led the Brazilian forces in the war against Argentine dictator Juan Manuel de Rosas. 1851–52, and, at the age of 64, was called upon to turn the tide of the war against the Paraguayan dictator. Francisco Solano López. For his exploits he was rewarded successively with the titles of baron, count. marquis, and, after his capture of Asunción in 1869, duke of the empire. A senator and prominent leader of the conservative party, he served for many years as minister of war and for two terms was president of the council of ministers of the empire, 1866. 1875–78. He died at Rio de Janeiro on May 7, 1880. (R. E. P.)

CAXTON, WILLIAM (*c.* 1422–1491), the first English printer, was born in the weald of Kent. In 1438 he was apprenticed to Robert Large, a rich mercer, who in the following year became lord mayor of London. Large died in 1441 and Caxton moved to Bruges, the centre of the European wool trade: during the next 30 years he became an increasingly prosperous and influential member of the English trading community in the Low Countries. In 1453 he was admitted to the livery of the Mercers' company, and in 1463 took up the duties of "Governor of the English Nation of Merchant Adventurers? in the Low Countries—a post of great authority over his fellow merchants. He exercised this office with energy and distinction, and was several times employed as ambassador to negotiate commercial treaties. Some time in 1470 he ceased to be governor and entered the service of Margaret, duchess of Burgundy, sister of Edward IV, where Caxton was certainly established by March 1471, possibly as her financial adviser. He continued to be employed on occasion as the king's agent in commercial affairs until 1475.

But his interests were turning to literature. In March 1469 he had begun to translate *The Recuyell of the Historyes of Troye,* but losing confidence, he laid it aside. However, the duchess Margaret commanded him to finish it, which he did on Sept. 19, 1471, in Cologne. It was in Cologne, where he lived from 1470 to the end of 1472, that he learned about printing. In the epilogue to Book III of the *Recuyell* he tells how his "pen became worn, his hand weary, his eye dimmed" with copying the book; so he "practised and learnt" at great personal cost how to print it. He bought a press and two fonts of type, reproducing contemporary book hand, probably from John Veldener of Louvain, and had the help of Colard Mansion, a well-known scrivener and illuminator of Bruges. He set up a press about 1474 and the *Recuyell,* the first book printed in English, was published at Bruges in 1473. In the same year he translated from the French another book in English, *The Game and Playe of the Chesse* (in which chess is treated as an allegory of life), which appeared with the publication date 1476.

Two or three other works were printed in Bruges in French, but toward the end of 1476 Caxton returned to England and established his press at the Almonry in the city of Westminster at the sign of the Red Pale. From then on he devoted himself entirely to writing and printing. His first-known piece of printing is an *Indulgence* issued by Abbot Sant on Dec. 13. 1476 By the time of his death in 1491, Caxton had published about 100 items of various kinds. His wife died in 1490 and a daughter survived him.

As the pioneer of printing in England, Caxton showed no great typographical originality, and produced no books of remarkable beauty. but he filled the hungry with many good things. The new interest in Latin and Greek, insofar as it existed in England. was already catered for by the continental presses, but Caxton served English culture perhaps better than he knew by concentrating on satisfying what was still the essentially late-medieval, taste of readers of the vernacular. He did not aim only at one level of society. Some of his books were produced primarily for noble readers; thus the first dated book printed in England, *Dictes and Sayenges of the Phylosophers,* was a translation made by the Earl Rivers and published by his request. It appeared on Nov. 18, 1477 (only one copy, in the John Rylands library, Manchester, survives with the colophon, in which this date is given). Three editions were, however, published in Caxton's lifetime, suggesting that its appeal was in no way limited. Kings, nobles and rich merchants among his friends were Caxton's patrons and sometimes commissioned special books. His varied output of books of chivalric romance, conduct, morality, history and philosophy, including the encyclopaedia, *The Myrrour of the World* (1481), the first English illustrated book, shows that he catered also for a general public made up of the gentry, "clerks," and indeed almost all who could read. The large number of service books and devotional works which Caxton published were the staple reading of most literate persons and may well have represented the firm commercial basis of his enterprise. Caxton also printed practically all the English literature available to him in his time; for example, Chaucer's *Canterbury Tales* (1478? and 1484) and other poems by Chaucer; John Cower's *Confessio Amantis* (1483); Sir Thomas Malory's *Morte d'Arthur* (1485); and much of John Lydgate. The chief exception is Langland's *Piers Plowman.* The high standard of accuracy and clarity for which he constantly strove is illustrated by his reprinting *The Canterbury Tales* from a better manuscript when he was told how bad was the text of his first edition. A number of his books bear his initials, W. C., with his device. This has been fancifully interpreted, but it is probably no more than a clean-line representation of his own seal, representing "an eagle's head erased." It was adopted with minor alterations by his successor Wynkyn de Worde.

BY COURTESY OF THE JOHN RYLANDS LIBRARY

CAXTON'S DEVICE. CONSISTING OF HIS INITIALS AND TRADE-MARK. FOUND IN 11 OF HIS BOOKS AND BROADSIDES

Caxton translated 24 books, some of them immensely long. Besides these and his editorial labours and his own prologues and epilogues, he added an eighth book of his own to John of Trevisa's translation of Ralph Higden's history, the *Polychronicon,* though it is of little worth. His editing of Malory was shown by E. Vinaver, *The Works of Sir Thomas Malory* (1947), to be much more extensive than had been suspected, and apart from his curious chapter-divisions Caxton's alterations are nearly always improvements. He translated from French, Latin and Dutch. working at great speed. He is fairly accurate but his style is usually clumsy, though in translation as in his original writings he improved with practice. In his prologues and epilogues he makes interesting and valuable remarks on his problems of translation and on the use of English at the time, as in the prologue to the *Eneydos* (1490); and he sometimes comments on books and life with considerable shrewdness and judgment, as in the prologue to the *Morte d'Arthur.* Occasionally he rises to a bell-told anecdote.

For an account of Caxton's place in the history of printing. *see* PRINTING.

BIBLIOGRAPHY.—Standard works are those by W. Blades, *The Life and Typography of William Caxton,* rev. ed. (1882); S. de Ricci, *A Census of Caxtons* (1909); E. G. Duff, *William Caxton* (1905) and *Fifteenth Century English Books* (1917). *See* also *The Prologues and Epilogues of William Caxton,* ed. by W. J. B. Crotch for the Early English Text Society, OS CLXXVI (1928), containing the fullest biographical account. There are numerous modern reprints of his works, especially by the Early English Text society, and a number of modern facsimiles. (D. S. B.)

CAYAPA, a tribe of South American Indians, belonging to the Barbacoan linguistic stock or substock. Their habitat is the lower Cayapas river and adjacent coasts in northern Ecuador. Traditionally they formerly lived in the upland region around Quito, moving to the coast a short time before the first appearance of Europeans.

They became much mixed with Negroes, and relatively little of their original culture survived. The basic social and economic unit is the one-family household. The main occupation is agriculture, but the Cayapa are also good hunters and fishermen, as well as skilful canoe-builders.

See S. A. Barrett, "The Cayapa Indians of Ecuador," Museum of the American Indian, *Indian Notes and Monographs,* no. 40 (1925).

CAYENNE, capital of French Guiana, is a port standing at the northwestern end of the fle de Cayenne formed by the estuaries of the Cayenne and the Mahoury rivers. Pop. (1954) 11,458. It was founded by the French in 1643 and was long the centre of French penal settlement in Guiana. Its streets, built on a rectangular pattern, are lined by brick or wooden houses of one or two floors. The Church of the Holy Saviour and the Jesuits' house are of some antiquity; and there are other interesting buildings, including the prefecture, around the Place d'Armes. To the west, Mont Cépérou and Fort Saint-Michel dominate the harbour. The sea wind mitigates the heat, and the climate, though humid, is healthful. Fever is kept down by draining the marshes and by spraying with insecticides.

The harbour is poor, so large ships unload at Larivot (a few kilometres distant) or at the fles du Salut. Three times a month a ship goes between Cayenne and Fort-de-France. Martinique; and four international airlines maintain services. Timber, rosewood essence, rum and gold are exported in small quantities.

An avenue running along the sea front joins Cayenne to the suburbs of Chaton and Montabo. where are located the buildings of the Institut Français d'Amérique Tropicale, the Institut Pasteur and a hotel.

See also GUIANA: *French Guiana.* (HU. DE.)

CAYENNE PEPPER (GUINEA PEPPER, SPANISH PEPPER. CHILLI). a preparation of finely ground, dried, mature fruits of variously highly pungent or "hot" forms of *Capsicum jrutescens.* The large, sweet garden peppers (including Pimiento) are horticultural varieties of the same species, belonging to the family Solanaceae. The true or black pepper belongs to the family Piperaceae *(see* PEPPER).

Capsicum frutescens, native to the American tropics, is widely grown in both temperate and tropical zones. The plants are herbaceous or semiwoody, frost-tender, many-branched perennials one and one-half feet to five feet tall; they are usually cultivated as annuals. The leaves are alternate, ovate and pointed; the flowers have five white petals sometimes tinged with green, yellow or purple. The fruits are two- to four-lobed, fleshy, thin-walled, nondehiscent, containing many yellowish, disk-shaped seeds attached to a spongy central placenta. The fruits of most very "hot" varieties are slender, from one to ten inches long, and red, yellow or purplish when ripe.

Commercial cayenne pepper in the United States is made from the fruits, minus the steins, of any of several highly pungent varieties produced in the southern and western states and in other countries. It is used principally as a condiment but small amounts are used in medicine as a counterirritant. In the U.S., 8,000 to 9,000 ac. of all kinds of "hot" peppers, including the Cayenne variety, are grown annually. No data are available on the Cayenne variety alone, but the commercial crop probably is from 2,000 to 3,000 ac. *See* CAPSICUM. (V. R. B.)

CAYEY is an interior town in the central part of Puerto Rico, with a population of 19,755 in 1960. Founded in 1774, the town derives its name from an Indian term for "a place of water." The Spanish military highway which connects San Juan on the Atlantic coast with Ponce on the south Caribbean coast goes through Cayey. The altitude of the town is 1,300 ft., and through the valley in which it is located runs the La Plata river. The principal product of the agricultural area is tobacco, and the hills around the town are dotted with drying sheds and warehouses. The climate of Cayey was so agreeable, the average temperature being 71°, that Spaniards, followed by Americans, established a military post in the town. The road from Cayey to Guayama is perhaps one of the most scenic on the island. (T. G. Ms.)

CAYLEY, ARTHUR (1821–1895), English mathematician, who for his range, analytical power and originality ranks high among 19th-century mathematicians, was born at Richmond, Surrey, on Aug. 16. 1821. He was educated at Trinity college, Cambridge, where, after being senior wrangler and first Smith's prizeman, he was awarded a fellowship (1842–45); but his reluctance to take religious orders prevented his continuance at Cambridge. In 1846 he entered at Lincoln's Inn; while practising law he met J. J. Sylvester, and the two spent much time discussing mathematics, in particular the new theory of algebraic invariants in which they were pioneers. Cayley was called to the bar in 1849 and practised at the same time as he was publishing his brilliant mathematical papers, In 1863, the year of his marriage, he was elected to the newly established Sadlerian chair of pure mathematics at Cambridge, which he occupied, with great distinction, until his death at Cambridge on Jan. 26, 1895.

Cayley's goo-odd mathematical notes and papers, published at Cambridge in 13 large quarto volumes (1889–98), treat of nearly every subject of pure mathematics, as well as theoretical dynamics and astronomy. His major contribution is the series of ten memoirs on algebraic forms, or quantics. in which he developed the theory of algebraic invariants and allied topics (1854–78). Other notable works deal with the theory of matrices, group theory, the geometry of n dimensions, the concept of the "absolute" in geometry, which links projective geometry to non-Euclidean geometry and which, with the work of F. Klein (*q.v.*) on the subject, is of great historical importance; researches on singularities of curves and surfaces, enumerative geometry, rational transformation and correspondences between curves. the configuration of the 27 lines on a cubic surface; and in analysis, the theory of elliptic functions, conformal transformation and the attraction of ellipsoids. He also produced two British association reports (1857, 1862) on theoretical dynamics and the moon's mean motion.

Cayley's lectures at Cambridge attracted very few students; among them, however, was A. R. Forsyth, who succeeded him in the Sadlerian chair. It was Forsyth who introduced into England the new theory of functions which had been making great progress in France and Germany, and who thus brought English mathematics back into the main stream, from which it had diverged after Newton's time. Thus. indirectly, Cayley played a great part in founding the modern British school of pure mathematics.

See Eric *T.* Bell, *Men of Mathematics* (1937). (L. R.)

CAYLEY. SIR GEORGE (1773–1857), British scientist, founder of thd science of aerodynamics and widely recognized as the originator of the modern airplane, was born at Scarborough, Yorkshire. Dec. 27, 1773. Absorbed from childhood by problems of flight, he discarded the ornithopter idea of flapping wings and devoted himself to the problems of the fixed-wing airplane, the helicopter and the airship. By I799 he had established the basic configuration of the modern airplane, with fixed wings, fuselage and tail unit with a combined elevator and rudder. In 1804 he flew the first of his successful model gliders, and in 1809–10 published his first researches, which form the basis of modern aerodynamics. He devoted much of his life to aeronautical research and writing, including—for the first time in history—streamlining; longitudinal and lateral stability; the movement of the centre of pressure; the region of low pressure (and resulting lift) on the upper surface of wings; rudder and elevator action; and superposed wings (triplanes, etc.). The culmination of his aeronautical work came in 1849 and 1853, when he built two full-size gliders, the second of which, with his unwilling coachman on board, made the first man-carrying glider flight in history.

Cayley also invented the light-tension wheel (forerunner of the cycle wheel), the expansion air engine (hot air engine) about 1805, and the crawler-type tractor (1825); he founded the Regent Street Polytechnic institution in London (1839). Among other fields in which he did research were scientific education, land reclamation, acoustics, railway equipment, lifeboats, ballistics, optics and electricity. He was also, for a short period, the Whig member of parliament for Scarborough. He died at Brompton hall, Yorkshire, on Dec. 15, 1857.

See J. L. Pritchard, *Sir George Cayley* (1961); C. *H.* Gibhs-Smith, *Sir George Cayley's Aeronautics* (1962). (C. H. G.-S.)

CAYLUS, ANNE CLAUDE PHILIPPE DE TUBIERES, COMTE DE (1692–1765), French archaeologist, engraver and man of letters. Born at Paris on Oct. 31, 1692, he was the only son of the Marquise de Caylus, the celebrated memoirist

and cousin of Madame de Maintenon. After a brilliant career in the army during the war of the Spanish succession, he resigned his commission and traveled widely in Europe and the middle east, where he acquired a lasting interest in archaeology. On his return to Paris he devoted himself to engraving and later became an active member of the Academies of Painting and Sculpture and of Inscriptions.

He wrote a seven-volume *Recueil d'antiquités égyptiennes, étrusques, grecques, romaines et gauloises* (1752–67), several books for artists and various minor works, published under the collective title *Oeuvres badines* (1787). Although he was a benefactor of the School of Fine Arts, where he founded three prizes, his artistic patronage was capricious and brought him into disrepute. Gaiety and the absence of moral restraint characterized the circles in which his private life was passed. He died at Paris on Sept. 5, 1765. (P. Ly.)

CAYMAN (CAIMAN), the name applied to several broad-snouted crocodilians of South America. The black cayman (*Melanosuchus niger*) of the Amazon is a large species, reaching 16 ft. in length. The smaller spectacled caymans (*Caiman* species) are extremely abundant in tropical America. *See* CROCODILIA.

CAYMAN ISLANDS, a British colony in The West Indies, including Grand Cayman, Little Cayman and Cayman Brac, low-lying coral islands in the Caribbean. They have a total area of 100 sq.mi., and a population (1960) of 7,616, of which four-fifths live on Grand Cayman. This island lies 190 mi. W.N.W. of Jamaica and has two towns, Georgetown (the capital) and Bodden Town. Grand Cayman is 22 mi. long and 4–8 mi. broad. The lesser Caymans lie between 60 and 90 mi. E.S.E. of Grand Cayman; Cayman Brac is distinguished by a massive central limestone bluff. Coasts are reefed and rocky: there are no rivers.

The Caymans, previously a dependency of Jamaica, became self-governing in July 1959. The governor of Jamaica governs with the advice and consent of the elected assembly, and is bound to visit once a year; he is otherwise represented by an administrator. Primary education is free and compulsory.

Turtles provide the main livelihood of the islands, and the chief exports are turtle products; the manufacture of thatch rope from the thatch palm is a declining industry. Trade is mainly with the United States and Jamaica. Tourism is increasing because of improved accommodations and communications. There are regular airplane flights from Kingston, Miami, San José and Panama City to Owen Roberts airfield, Grand Cayman; and there is an airstrip on Cayman Brac.

The islands were discovered in 1503 by Christopher Columbus who named them Tortugas from the abundance of turtles. They were not occupied by the Spaniards but were colonized in the 18th century from Jamaica by the British.

See *Colonial Office List* (H.M.S.O., annually). (R. To.)

CAYUGA, a tribe of North American Indians of Iroquoian speech, being one of the Five Nations of the Iroquois league, who originally inhabited the region bordering Cayuga lake in central New York state. When first visited by the French Jesuit Father René Ménard in 1656 their three towns occupied the land east of the lake above the marshes south of the Seneca river. *Goi-o-gouen,* "where boats were taken out," corrupted from the name of their main town and the country, was the seat of the mission of St. Joseph; *Thiohero,* "amid the rushes" (St. Stephen), stood to the north; and *Onontare'* (St. René), named for a hill opposite on the same river, was farther north. They numbered about 1,500, with 300 warriors and about 100 houses. As the "fourth fire" of the Iroquois longhouse, they were considered "offspring" or "nephews" of the Onondaga to the east and the Seneca to the west, and together with the Oneida were called "younger brothers." In council parlance, the ten chiefs who represented them in the league were designated "the people of the Great Pipe."

Ancient Cayuga had abundant fish, game and water fowl, and boasted of hunters even more famous than their women were for corn production; when their storage pits were depleted in the 1750s, they borrowed from the Onondaga. Throughout history they have been a composite people. When they had a refuge settlement north of Lake Ontario, they took in Huron and Erie captives to replace war losses, and after the 1675 defeat of the Andaste (Susquehanna), they made satellites of broken Algonkian (Conoy and Nanticoke) tribes from the tidewater country, Siouan-speaking bands (Tutelo and Saponi) from the Piedmont, and various central Algonkians. They claim Logan the Mingo (*see* LOGAN, JOHN) as one of their own. Fishcarrier led their war parties out of Niagara during the American Revolution, after which they sold their New York lands and moved as loyalists to Grand River, Canada where today on Six Nations reserve about 1,500 descendants perpetuate the language and maintain a rich ceremonial life. About 200 live among the Seneca nation in western New York, and perhaps 100 in Oklahoma. *See* also IROQUOIS (*W.* N. F.)

CAYUSE, an Indian tribe (of the Waiilatpuan linguistic family [*see* SAHAPTIN]) that formerly inhabited northeastern Oregon and part of Washington and was noted for its horses and warlike character.

They were closely allied with the Wallawalla and Nez Percé tribes, and there was a great deal of intermarriage, particularly with the latter tribe. The Cayuse signed the treaty of 1855 establishing the Umatilla reservation, where they then lived. The tribe's population was officially given as 404 in 1904, but no Cayuse of pure blood was found on the reservation at the beginning of the 20th century.

Marcus Whitman (*q.v.*), who had established a mission near the present city of Walla Walla, Wash., in 1838, his wife and 12 others were massacred in an attack by the Cayuse in 1847. The Indians blamed Whitman, who was a doctor, for the large number of deaths caused by disease. Volunteer troops carried on a prolonged, indecisive campaign against the tribe until five Indians, who confessed to the murders, were voluntarily surrendered in 1850.

In the western states of the United States the term cayuse refers to an Indian pony. In *Three Thousand Miles Through the Rocky Mountains* (1869), A. K. McClure used the word in this sense in his remark that "Twice our kiyuse broke nearly out of the harnass. . . . The kiyuse is never perfectly tamed."

CAZEMBE, the name of a former powerful African kingdom on the Luapula river in Northern Rhodesia. The kingdom was created in the 17th century when the supreme Lunda chief, Mwata Yamvwa, sent Cazembe, one of his lieutenants, on an expedition to eastern Katanga in order to reconquer dispersed Lunda groups. Cazembe became the hereditary title of the ruler of the kingdom. In the course of this expansion various smaller Cazembe chiefdoms were created in Katanga, but all were subordinate to that of the Cazembe on the Luapula, who himself remained a vassal of the Mwata Yamvwa. About 1875 Cazembe was conquered by Msiri, an east African adventurer of the Nyamwezi tribe, and after his death the kingdom disintegrated. The country was first visited toward the close of the 18th century by the Portuguese Manoel Caetano Pereira and F. J. M. de Lacerda, and David Livingstone went there in 1868. The successor of the Cazembe title remained paramount over a large part of the Luapula valley.

See J. Slaski, *Peoples of the Lower Luapula Valley* (1951). (D. P. Bi.)

CAZIN, JEAN CHARLES (1841–1901), French painter, etcher and ceramic artist, known for his idealistic landscapes in the general tradition of Millet and Corot, and for his historical paintings, was born at Samer, Pas-de-Calais, on May 25, 1841. Early in his career he accompanied Alphonse Legros to England where he made designs for the Fulham pottery, and came under the stylistic influence of the Pre-Raphaelites, as is evidenced in his religious pictures of that period.

His attempt to revive the art of encaustic painting attracted some attention. He won many important awards in Paris, and was decorated by the French government. He died at Le Lavandou, Var, on March 27, 1901.

CEANOTHUS, a showy genus of North American shrubs and woody vines of the buckthorn family (Rhamnaceae; *q.v.*), comprising more than 50 species found chiefly in the Pacific coast region, 30 of which are native to California. The small white or blue flowers are borne in handsome dense panicles or umbels. Several are grown as garden plants. Only two species occur east of the Rocky mountains—the New Jersey tea (C. *americanus*), so called

because its leaves were used as tea during the American Revolution. and C. *ovatus*. The genus attains its maximum development in the foothills and mountains of California. often constituting a considerable part of the chaparral. Noteworthy representatives are the California lilac and the Oregon tea-tree (*qq.v.*).

CEARÁ, a northern state of Brazil, bounded north by the Atlantic, east by the Atlantic and the states of Rio Grande do Norte and Paraiba, south by the state of Pernambuco and west by the state of Piaui; and having an area of 57,102 sq.mi. Only a very small percentage of the population, which numbered 3,337,856 (1960), is of European origin, the large majority being *mestiços*. There are few Negroes.

The state lies partly upon the northeast slope of the great Brazilian plateau and partly upon the sandy coastal plain. Its surface is a succession of great terraces, facing north and northeast, formed by the denudation of the ancient sandstone plateau which once covered this part of the continent; the terraces are seamed by watercourses, and their valleys broken by hills and ranges of highlands, usually described as mountain ranges. but in fact only the remains of the ancient plateau, capped with horizontal strata of sandstone and having a remarkably uniform altitude of 2.000 to 2.400 ft. The flat top of such a range is called a *chapada* or *tabuleiro,* and its width in places is from 32 to 56 mi.

The boundary line with Piaui follows one of these ranges. the Serra Ibiapaba, which unites with another range on the southern boundary of the state known as the Serra do Araripe, Another range, or escarpment, crosses the state from east to west: but is broken into two principal divisions. each having several local names. These ranges are not continuous. the breaking down of the ancient plateau having been irregular and uneven. The higher ranges intercept considerable moisture from the southeast trade winds! and their flanks and valleys are covered with forest, but the plateaus are either thinly wooded or open campo. These upland forests are of a scrubby character and are called caatingas.

The sandy coastal plain, with a width of 12 to 18 mi.. is nearly bare of vegetation; behind it there is a more elevated region with broken surfaces and sandy soil which is amenable to cultivation and produces fruit, cotton and most tropical products where conditions are favourable. The rivers of the state are small and, with one or two exceptions, become completely dry in the dry season. The largest is the Jaguaribe, which flows entirely across the state in a northeasterly direction with a length varying from 210 mi. to an estimated 46j mi. The year is divided into a rainy and a dry season, the rains generally beginning in October and lasting until December. The soil of the interior is thin and porous and does not retain moisture; consequently the long dry season turns this part of the country into a barren waste (*sertão*), relieved only by vegetation along the river courses and mountain ranges and by the hardy. widely distributed carnauba palm (*Copernicia cerifera*), which in places forms groves of considerable extent. Sometimes the rains fail altogether, and then a drought (*sêca*) ensues. causing famine and pestilence throughout the entire region. The most destructive droughts recorded were those of 1711, 1723, 1777–78, 1790, 1825, 1844–45 and 1877–79, the last-mentioned destroying nearly all the livestock in the state and causing through starvation and pestilence the deaths of nearly 500,000 persons—more than half the population—while thousands more were obliged to emigrate to other states. However, the calamity of drought is only in part a natural calamity. The long history of destructive land use, during which the cover of natural vegetation has been repeatedly stripped away. has destroyed whatever capacity to retain moisture the soil originally may have had.

There are two railroads running inland from the coast: the Baturité line from Fortaleza to Crato in the southern part of the state, and to Patos in the state of Paraiba; and the Sobral line from Camocim to Crateús, about 210 mi. The railways were built by the national government after the drought of 1877–79 to give work to the starving refugees. Great dams are also being constructed and extensive irrigation systems laid out.

The state of Ceará became a bishopric of the Roman Catholic Church in 1853, the bishop having his residence at F'ortaleza. The state is represented in the national congress by 3 senators and 17 deputies. The capital, Fortaleza (*q.v.*), sometimes called Ceará, is the principal commercial centre and shipping port. The principal towns are Juàzeiro do Norte, Aracati, Baturité, Acarau, Crato, Maranguape and Sobral.

The territory of Ceará included three of the *capitanias* originally granted by the Portuguese crown in 1534. The first attempts to settle the terrirory failed. and the earliest Portuguese settlement was made near the mouth of the Rio Camocim in 1604. The French were already established on the coast. with their headquarters at São Luis (Maranhão). Ceará was occupied by the Dutch from 1637 to 1654, and became a dependency of Pernambuco in 1680; this relationship lasted until 1799, when the *capitania* of Ceará was made independent. The *capitania* became a province in 1822 under Dom Pedro I. A revolution followed in 1824. the president of the province was deposed 1j days after his arrival. and a republic was proclaimed. Internal dissensions broke out, the new president was assassinated, and after a brief reign of terror the province resumed its allegiance to the empire. Ceará was one of the first provinces of Brazil to abolish slavery.

(R. D'E.; X.)

CEAWLIN (d. 593), king of the West Saxons from 560 to 592, was included by Bede in his list of kings who held an imperium over all lands south of the Humber, and hence was entered among the Bretwaldas in the Anglo-Saxon Chronicle. Before he became king he helped his father Cynric to defeat the Britons at Barbury in 556. He and his brother Cutha defeated King Aethelberht of Kent in 568. He won an important victory against the Britons at Dyrham in 577, killing three kings and winning the cities of Cloucester, Cirencester and Bath. Thus he opened the valley of the lower Severn to Saxon colonists and divided the Britons of Devon and Cornwall from those of Wales. He fought at Fethanleag (probably the Fethelée in Stoke Lyne, Oxfordshire, mentioned in a 12th-century charter) in 584. but in spite of an initial success, he returned home angry. A king called Ceol obtained at least part of the West Saxon kingdom in 591, and Ceawlin was driven out in 592 after a battle at Woden's Barrow (now Adam's Grave), Wiltshire. and was killed in 593.

(D. WK.)

CEBU, an island province (Visayan SUGBU) of the central Philippines, includes the main island of Cebu (1,703 sq.mi.), the Camotes group to the northeast. Mactan Island (*q.v.*) on the east and Bantayan Island to the northwest, totaling 1.880 sq.mi. It is the most densely populated of the larger Philippine provinces (pop. [1948] 1,123,107; [1960] 1,310,439, or 717 per square mile). The native-born Cebuanos have been migrating to Mindanao for more than 200 years to relieve the population pressure. The province is divided into 26 municipalities, plus the central urban district of Cebu city, which is the provincial capital.

The island of Cebu has a range of low mountains running down its centre. The main island is of sedimentary rocks. overlain by coral limestone. It has only narrow coastal plains except for the Bogo plain in the far north. and has few harbours. Its climate is rather dry. and the coral and limestone soils do not yield good rice crops. The Bogo plain is mainly a commercial sugar-cane area, but small farms cultivate maize. coconut. yams. agave (sisal) and tobacco. The island does not feed itself, and maize, rice and other foodstuffs are imported. Coal, copper and limestone for cement are mined in the central hill country.

Important towns and municipalities on the east coast (north to south! are Bogo, a port and market town; Danao, a poor port and a trade and pottery-making centre near coal mines; Liloan, a local market town; Mandaue, just north of Cebu city and an important port; Opon, on the west side of Mactan Island across a narrow channel from Cebu city, important for its oil port installations: Naga, south of Cebu city. near coal and limestone mines and the centre of cement manufacture; Sibonga, a trade centre and local port; Xrgao, a port, cotton textile and pottery-making centre; and Dalaguete, a local trade centre on the southeastern coast. On the west coast in the north are Tubaran, a large trade and transport centre; Toledo, opposite Cebu city, a local port and

transport centre; and Dumanjug on the southwestern coast, a transport and trade centre. (J. E. SR.)

CEBU, CITY OF, chartered in 1936, is one of the largest Philippine cities (pop. [1960] 259,194) and capital of the island province of Cebu. Its location on the east coast, sheltered by Mactan Island, makes it an excellent port.

Cebu is one of the most historic spots in the Philippines. An important native port occupied the site when Ferdinand Magellan. commander of the first circumnavigatory expedition, landed there on April 7. 1521. It was on Mactan Island that he met the native chief Sicatuan (Humabon) and sealed a blood compact, only to lose his life later in a battle with another chief, Lapulapu, who has become a modern Filipino hero. The image of the Santo Niño (the Holy Child), now housed in San Augustin church, is said to date from this period, and what is reputed to be Magellan's wooden cross still stands in the city plaza. Miguel López de Legazpi and Friar Urdaneta arrived in Cebu on April 27, 156j. to found the first Spanish settlement and the first Catholic mission; and for the six years until Legazpi's removal to Manila. Cebu was the Spanish colonial capital. Cebu continued to be an important Spanish centre of control in the south. Cebuanos took a prominent part in the insurrection against both Spain and the United States.

A coastal railway operated north and south of the city prior to World War II, but was abandoned in 1948. The city proper was almost completely destroyed by the Japanese in May 1942 in reprisal for guerrilla operations. American liberation occurred on March 27, 1945, with the port intact, and later rebuilding greatly improved and enlarged the city. Cebu is a Roman Catholic see. Good highways encircle the island and cross the central mountain range near the city, making it easily accessible from all parts of the island.

The Spanish banned foreign trade with Cebu until by royal decree of 1860 it was declared open. Located among the Visayan Islands, Cebu has become the chief coconut products exporter, and exports also large amounts of abaci (Manila hemp), sugar and timber. It imports little foreign goods, running a poor second to Manila in foreign trade. As an interisland trade centre: however, Cebu stands out, leading Manila in freight and passengers. It is a key station on the domestic airline network, and many industrial and commercial companies maintain branches there. In the late 1950s manufacturing plants began to locate in Cebu, and industry began to augment the commercial trade on which the city formerly depended. (J. E. SR.)

CEBUANO (SUGBUHANON) is the major dialect of Bisayan (*q.v.*), the language with the largest number of first speakers in the Philippines. It is the mother tongue of about 5,000,000 Filipinos, of more than half of all speakers of Bisayan and of about one-fourth of the Philippine population.

The difference between Cebuano and other Bisayan dialects is quite large, almost as great as that between different languages. Nevertheless, there is a certain amount of mutual intelligibility between it and these others, as exemplified in Sagay in northern Negros, where both Hiligaynon and Cebuano are spoken. Like Hiligaynon, Cebuano is an 1-dialect as against Samaran (Samar-Leyte), an r-dialect; *e.g.,* Cebuano, Hiligaynon *ulan,* Samaran *uran,* "rain." On the other hand, Cebuano differs in many ways from Hiligaynon; *e.g.,* Cebuano *a:koq,* Hiligaynon *a:kon,* "mine."

Cebuano speakers are distributed over eastern Negros, Cebu, Bohol, western Leyte, Camotes and the northern and western coast of Mindanao, including the entire Surigao peninsula. It is still spreading along the northern coast of Mindanao as a consequence of Bisayan expansion there and has become the lingua franca used by the pagan and Moro peoples of the area to communicate with the settlers. Except for this region, however, there is little tendency to acquire Cebuano as a second language. Cebuano speakers thus constitute the largest single cultural-linguistic unit in the Philippines.

Despite the relatively large number of its speakers, literary publication in Cebuano has been nearly nonexistent; even disregarding Tagalog, the national language, there is more literary publication in some of the Luzon languages with far fewer speakers. This unusual circumstance is attributable to the distance of the Cebuano area from Manila, the cultural centre of the Philippines. Because of its overwhelming dominance in its own areas, however, Cebuano is used in local publications. Two dailies published in Cebu city are in Cebuano and English. A number of weeklies are published either in Cebuano or in Cebuano and English. Although most of the weeklies are published in the Cebuano-speaking area, Bisaya, the Cebuano weekly with by far the largest circulation, is published in Manila. Cebuaho films likewise make up a large part of the Filipino films produced in the vernacular because of the large prospective audience for such entertainment. (I. DN.)

CECCHETTI, ENRICO (1850–1928), Italian ballet dancer and teacher, was noted for his part in training many distinguished artists, including Anna Pavlova, Alicia Markova, Cia Fornaroli, Leonide Massine and Serge Lifar.

Both of Cecchetti's parents were dancers, and he was born on June 21. 1850. in a dressing room at the Tordinona theatre. Rome. A pupil of Giovanni Lepri, he became a brilliant technician, noted for his dazzling pirouettes. Popular throughout Europe, he appeared with outstanding success in Manzotti's ballet Excelsior at La Scala, Milan, and in London. At the Mariinsky theatre. St. Petersburg. he created the roles of the Bluebird and Carabosse in Tchaikovsky's The Sleeping *Beauty.*

Cecchetti taught many dancers of the Russian Imperial ballet and, later, the Diaghilev Ballet Russe. From 1925 he directed the ballet school at La Scala. He continued to teach until stricken during a lesson the day before he died! Nov. 13, 1928. The Cecchetti method of ballet training is widely used in the Cnited States and Great Britain. (LN. ME.)

CECCO D'ASCOLI (popular name of FRANCESCO DEGLI STABILI) (1267–1327), Italian astrologer and poet, whose heretical opinions made him fatal enemies, and whose links with Dante helped to ensure his fame. was born in or near Ascoli Piceno. Professor of astrology in Bologna, he was condemned as a heretic in 1324 and went to Florence, where he became astrologer to Duke Charles of Calabria. Having aroused the suspicion of the church and the enmity of a leading physician, Dino del Garbo, he was tried again there and burned at the stake in the autumn of 1327.

His Latin works (commentaries on the astronomical work of Joannes de Sacrobosco and the astrological work of Alcabizio) are merely compilations, as is his more famous encyclopaedic vernacular poem, *L'Acerba* (The meaning of the title is not clear; perhaps it indicates the sourness of his doctrine and of his style.) Cecco's polemics are particularly directed against Dante, whose astrological theories he did not accept. Artistically rough, the Acerba would be scarcely remembered but for its attack on Dante and its author's tragic end.

See *L'Acerba,* ed by A Crespi (1927); A Beccaria, "I bioarafi di Cecco d'Ascoli e le fonti per la sua storia," etc, in *Memorie della* R. Accad *di Scienze di* Torino, *S II,* lviii (1908). (G A.)

CECIL, the name of one of England's most famous and politically influential families. which is represented by two branches. holding the marquessates of Exeter and Salisbury. both descended from William Cecil. Lord Burghley. Elizabeth I's lord treasurer. Burghley's many inquiries concerning the origins of his family created for them more than one splendid and improbable genealogy. but they in fact began as small gentry at Xlltyrynys in Walterstone, a Herefordshire parish on the Welsh border. The first recorded Sitsilt, Syssell or Seisill (the name was variously spelled until Burghley established the form Cecil) was a THOMAS. whose son PHILIP had two sons, RICHARD, the elder, who made his will in 1508. and DAVID (d. c. 1537). The elder line remained, undistinguished, at Alltyrynys until Richard's great-great-grandson MATTHEW died childless in 1598, leaving the estate, considerably encumbered, to Sir Robert Cecil (see below). David. however, moved out, after the manner of younger sons. In the train of his mother's relation, Sir David Philips, he probably joined Henry VII at the battle of Bosworth (1485) and certainly became afterward a yeoman of his guard. Philips was steward of a manor, near Stamford in Lincolnshire, belonging to the king's mother, the Lady Margaret Beaufort, and in 1494 David Cecil became a freeman of Stamford. There he prospered. He was three times mayor, rep-

resented the town in parliament and in 1532–33 was sheriff of Northampton. Under Henry VIII he became yeoman of the chamber and sergeant at arms, besides receiving several profitable leases. keeperships and other favours. His son RICHARD (d. 1553) became a page in the king's chamber in 1517. was present at the Field of Cloth of Gold (1520) and rose to be yeoman of the wardrobe. He had some share in the distribution of monastic lands. and left. by his wife. Jane Heckington (d. 1588), the son WILLIAM who, as Lord Burghley and Elizabeth I's principal minister. was to be the founder of the family fortunes (see BURGHLEY, WILLIAM CECIL).

Burghley's elder son. THOMAS, was created earl of Exeter by James I, and his descendant, the 10th earl, was raised to a marquessate in 1801 (see EXETER, EARLS, MARQUESSES AND DUKES OF). This elder line has remained seated at Burghley, the great mansion built by their ancestor, the 1st Lord Burghley. Burghley's second son, ROBERT: principal secretary to Elizabeth from 1596, was created earl of Salisbury by James I in 1605 (see SALISBURY. ROBERT CECIL). He was forced to exchange his house, Theobolds, with the king for Hatfield, where he built, but did not live to inhabit, the new Hatfield house whose library contains the famous collection of state papers retained by his father and himself.

His descendant, JAMES (1748–1823), 7th earl, was lord chamberlain to George III and was raised to a marquessate in 1789. The 3rd marquess was the 19th-century prime minister (see SALISBURY, ROBERT ARTHUR TALBOT GASCOYNE-CECIL), three of whose sons took an active part in politics (see SALISBURY, JAMES EDWARD HUBERT GASCOYNE-CECIL; CECIL OF CHELWOOD, EDGAR ALGERNON ROBERT CECIL; QUICKSWOOD, HCGH RICHARD HEATHCOTE GASCOYNE-CECIL). Their brother, LORD WILLIAM GASCOYNE-CECIL, was bishop of Exeter from 1916 until his death in 1936.

ROBERT ARTHUR JAMES (1893–), 5th marquess of Salisbury, was born on Aug. 27, 1893, and succeeded his father. the 4th marquess, in 1947. During World War II he held various major political offices. He was twice leader of the house of lords (1942–45 and 1951–57) and was lord president of the council from 1952 to 1957. In 1957, on the resignation of the prime minister, Sir Anthony Eden, he was one of the elder statesmen who advised the queen on the appointment of a successor. In 1957, disapproving of the government's policy over Cyprus, he resigned his offices. His brother LORD DAVID CECIL (1902–) was born on April 9, 1902. The author of several well-known historical and literary biographies and works of criticism, he was appointed Goldsmith's professor of English literature at Oxford university in 1948.

See A. L. Rowse, "Alltyrynys and the Cecils," *English Historical* Review, vol. lxxv (1960). (R. B. WM.)

CECILIA, SAINT (2nd or 3rd century), one of the most famous Roman martyrs of the early church and historically one of the most discussed. According to the legend, which dates from the late 5th century, she was a noble Roman virgin who had vowed her virginity to God as a child. When she was married against her will to Valerian, a pagan, she told him that an angel of God wished her to remain a virgin. He promised to respect this wish if he were allowed to see the angel. She replied that he would do so if he were baptized. On his return from baptism he found Cecilia talking to the angel. She then converted his brother Tiburtius, who also saw the angel. Both men were martyred before her. She herself distributed all her possessions to the poor, which enraged the avaricious prefect Almachius, who ordered her to be burned in the bath. But the flames refused to touch her, and so she was finally beheaded. She was buried in the catacomb of St. Callistus. At the beginning of the 9th century Pope Paschal I discovered her relics in the catacomb of Praetextatus and had them moved to a church in Rome which was then called Sta. Cecilia in Trastevere. As the legend mentioned her interest in music, she became the patroness of church music and is often represented in art playing the organ. Her feast day is Nov. 22.

See *Butler's* Lives *of the Saints,* ed. *by H.* Thurston and D. Attwater, 4:402–405 (1956). (H. C. G.)

CECIL OF CHELWOOD, EDGAR ALGERNON ROBERT CECIL, 1ST VISCOUNT (1864–1958), British statesman, who played a major part in the creation and work of the League of Nations. known before his elevation to the peerage as Lord Robert Cecil, third son of the 3rd marquess of Salisbury, was born in London on Sept. 14. 1864. He was educated at Eton and University college. Oxford. and was called to the bar by the Inner Temple in 1887.

In 1906 he entered parliament as Conservative member for East Marylebone, but although he opposed the Liberals' education bill, on many questions he took a heterodox position. Thus his opposition to the tariff reform policy of Joseph Chamberlain cost him his seat between 1910 and 1911. when he was returned at a by-election for Hitchin, retaining this seat until 1923. He opposed the disestablishment of the church in Wales, but supported the women suffragists, though he did not palliate their offenses against law and order. In 1918 he had the satisfaction of carrying a resolution "to amend the law with respect to the capacity of women to sit in Parliament."

During World War I, Lord Robert was in office from May 1915 until the Armistice. As undersecretary for foreign affairs, then as minister of blockade and lastly as assistant secretary of state for foreign affairs. he was mainly concerned with the vital question of blockade. He resigned at the general election of 1918 because he could not agree to treat Welsh disestablishment as a *fatt accompli.* Though no longer a minister of the crown, he nevertheless went over to Paris in 1919 where he served as chairman of the Supreme Economic council, and played a principal part in drafting the covenant of the League of Nations. After the peace he advocated increasingly full co-operation in the work of the League. In 1920 he attended the first assembly of the League in Geneva as a representative of South Africa. In parliament he steadily drifted into opposition to the coalition ministry, and in 1923 he joined Stanley Baldwin's first cabinet as lord privy seal. He was raised to the peerage in Dec. 1923. In Nov. 1924 he became chancellor of the duchy of Lancaster. On several occasions he represented Great Britain on the council of the League of Nations. As the principal British representative on the disarmament commission at Geneva in 1926–27 he found that his instructions necessitated a policy not in complete accordance with his convictions, and in 1927 he resigned from the Baldwin administration. President (1923–45) of the League of Nations union. Lord Cecil remained uncompromisingly loyal to the League covenant. He was a principal promoter of the "Peace Ballot" in 1934 and he was one of the few parliamentarians to vote against the Munich settlement in 1938. In 1937 he was awarded the Nobel peace prize. He published an account of the inception of the League and his own work for it in A Great *Experiment* (1941). A largely autobiographical study, *All* the *Way,* appeared in 1949. He died at Tunbridge Wells on Nov. 24, 1958. (H. G. N.)

CECROPIA, in botany. a genus of trees (family Moraceae, *q.v.*), native to tropical America. They are of rapid growth, yielding a light wood used for making floats. C. *peltata* is the trumpet tree, so-called from the use of its hollow stems by the Uaupé Indians as a musical instrument. It is a tree reaching about 30 ft. in height, with a large spreading head and deeply lobed leaves 12 in. or more in diameter. The hollows of the stems and branches are inhabited by ants, which, it has been claimed, in return for the shelter thus afforded and food in the form of succulent growths on the base of the leaf stalks, repel the attacks of leaf-cutting ants that would otherwise strip the tree of its leaves. This is an instance of myrmecophily; *i.e.,* a living together for mutual benefit, or symbiosis, of ants and a plant.

For cecropia moth see SATURNIID MOTH; BUTTERFLY AND MOTH.

CECROPS, traditionally the first king of Attica in ancient Greece. He was said to have divided the inhabitants into 12 communities and to have instituted the laws of marriage and property and a new form of worship. The introduction of bloodless sacrifice, the burial of the dead and the invention of writing were also attributed to him. He is said to have acted as umpire during the dispute of Poseidon and Athena for the possession of Attica. As one of the autochthons of Attica, Cecrops is represented as human in the upper part of his body, while the lower part is shaped like a dragon. This was rationalized by supposing that he

invented marriage; *i.e.*, joined the unlike natures of man and woman.

CEDAR, the name applied to a variety of trees, both gymnosperms and angiosperms (*qq.v.*), most of which are evergreen and have aromatic, often red or red-tinged, wood which in many cases is decay-resistant and insect-repellent. In a technical sense the word is used only for trees of the coniferous genus *Cedrus,* which differs in many respects from the popular conception of cedars. It has been estimated that perhaps 70 different kinds of wood bearing the name cedar in one form or another are in the trade.

The true cedars (*Cedrus* species) are related to the larches and pines and are placed with them in the pine family (Pinaceae). Most authorities recognize at least three species in the genus, but the distinctions between them are slight, and they may represent geographic races of one species; the species are so variable, especially in their horticultural forms, that they overlap extensively. Native to North Africa and Asia. they are easily grown in warm, equable regions. In the C.S. most are at home in California and some of the southern states; a few—a variety of *Cedrus libani* and *Cedrus atlnntica*— *may* be grown as far north as southern New England. Cedars are cultivated in warmer portions of Europe, especially in England. as ornamentals. All have rather short, sharp needles arranged in a close spiral on spurlike branches. The pollen is produced in narrow, erect cones up to several inches in length; and the seeds are borne in similar but larger cones, several inches in diameter and up to six inches in length at maturity. When the reddish-brown seed cones are ripe (in about two or three years), the cone scales separate and fall away from the central axis, which remains on the bough.

The deodar or god tree, *Cedrus deodara,* forms forests in the mountains from Afghanistan to the northwest Himalayas at elevations of from 5,500 to 12,000 ft. It has a close-grained, long-fibred, scented and highly resinous wood; the timber, which is resistant to the action of water, is used in a variety of ways. The leaves—long. slender. dark bluish-green needles—give an overall pale-green foliage effect. The tree, with its great drooping branches and branchlets, makes a handsome and picturesque sight. for which reason it is much cultivated as an ornamental. Its rapid growth and eventual great size make it unsuitable for all but the larger gardens, however. Several leaf-colour and growth-form variants are available.

The Atlas cedar, *Cedrus atlantica,* occurs in the Atlas mountains of Torth Africa from elevations of 4,000 to 6,000 ft.. usually in scattered groves. It has shorter and denser foliage than the deodar, usually with a grayish cast. or, in other varieties, a silvery-white, bluish-gray or yellowish cast. Form variants—narrow-pyramidal, branchlets drooping, etc.—are also cultivated. *Cedrus atlantica* var. *glauca,* with foliage a striking bluish-gray, is widely grown in California and in England.

The cedar of Lebanon. *Cedrus libani,* is the best known of the cedars because of its frequent appearance in art and literature, especially in the Scriptures, as a symbol of power and longevity. The tree grows, chiefly in groves which may include over a thousand individual trees. at elevations of about 6,000 ft. in the Mount Lebanon province of Lebanon and on the higher slopes of the Taurus and Anti-Taurus mountains in Turkey.

The cedar of Lebanon, a fairly rapid grower, reaches a height of from 60 to 100 ft. and usually develops several erect leading branches, which by their ramification produce a very broad flat crown. The side branches often extend horizontally for considerable distances from the trunk and, with their numerous spreading branchlets, give the tree its distinctive tiered appearance. Old trees are gnarled and majestic, and the aspect of a dense grove truly awe-inspiring.

While the tips of the leaders droop as in the deodar, the branchlets of C. *libani* are not pendent, and the leaves are much shorter than in that species. *Cedrus libani* is very similar to C. *atlantica* in the size and shape of its needles, but the latter usually has but a single leader and does not have a tiered appearance.

The wood of the cedar of Lebanon is reddish-brown. fragrant and light. Because of its coarse grain, spongy texture and tendency to shrink, it finds less use than that of other species. *Cedrus libnni* and its varieties are possibly the least hardy of the genus.

A variety of C. *libani,* having shorter leaves and cones, is largely restricted to the island of Cyprus.

Among the angiosperms, the mahogany family (Meliaceae) has the largest number of so-called cedars, especially in the genus *Cedrela.* Several species of *Cedrela* have fine durable wood used for timber and, among other things, cigar boxes, chests and closets. *Cedrela odorata* (Jamaican red cedar) and *C. toona (Toona ciliata,* Australian red cedar) are the most important. Other woods called cedar are found in this family and the following families: Ulmaceae, Cunoniaceae. Leguminosae, Rutaceae. Simaroubaceae. Euphorbiaceae, Anacardiaceae. Celastraceae. Sterculiaceae. Araliaceae, Boraginaceae, Bignoniaceae and Rubiaceae.

The great majority of so-called cedars, however, are conifers. The eastern red cedar of America is a juniper (*Juniperus virginiana)* and is much used in cabinetmaking. for posts and in the manufacture of pencils. The Bermuda cedar is *J. bermudiana,* and the Spanish cedar is *J. thurifera* (although the name also is applied to *Cedrela odorata).* In the western Cnited States. *Libocedrus decurrens* is known as incense cedar, and *Chamaecyparis lawsoniana* as Port Orford cedar. The Japanese redwood or cedar is *Cryptomeria japonica.* Other genera of gymnosperms which are often called cedar are: *Torreya, Cupressus, Thuja, Callitris, Athrotaxis, Podocarpus, Pinus* and *Widdringtonia.*

CEDARBIRD (CEDAR WAXWING): *see* WAXWING.

CEDAR RAPIDS, a city of east central Iowa, U.S., the seat of Linn county, is on the Cedar river in an agricultural region that emphasizes corn production and livestock feeding. Pop. (1960) city, 92,035: standard metropolitan statistical area (including all of Linn county) 136,899. The Sauk and Fox Indians relinquished title to the region in the 1830s and the power possibilities of the river soon attracted pioneers to the site of Cedar Rapids. A town charter was obtained in 1849 and a city charter in 1856. hlajor periods of city growth occurred between 1870 and 1890, during World War I and after 1940. Many early settlers came from the Ohio valley and mid-Atlantic states.

By 1900, however, 39% of the county population was of foreign birth or descent and included 3,195 Bohemians and 1,100 Germans. Czechoslovak culture still marks urban life there. The most important manufacturing plants produce radio and electronic equipment, cereals. corn products, meat products and road building and mining machinery.

Coe college, a liberal arts college supervised by the Presbyterian Church, obtained its charter in 1881 although its history began with the founding of Cedar Rapids Collegiate institute in 1851.

Iowa Masonic library contains one of the oldest and largest Masonic collections in the U.S. The city has a symphony orchestra and a community and children's theatre. Palisades-Kepler State park lies to the southeast. (A. G. Bo.)

CEDAR RIVER, a nonnavigable stream in Minnesota and Iowa, named after the stands of red cedar along its lower course. From its source in southern Minnesota it flows southeasterly across Iowa to within ten miles of the Mississippi river and then swings abruptly southwestward to join the Iowa river instead. Over its course of 329 mi.. the river drops about 730 ft. The stream is young geologically, and only in places where the glacial material has been removed is the underlying bedrock exposed. *(See* STRATIGRAPHY.) In the Palisades-Kepler State park near Cedar Rapids, Ia.. wooded rocky cliffs rise from 30 to 75 ft. above the valley floor.

Hydroelectric power is developed at seven small dams, whose total capacity is under 5,000 kw. The drainage basin comprises 7,819 sq.mi., most of which is fertile agricultural land. Major cities along the river include Austin, Minn., and Charles City. Cedar Falls, Waterloo and Cedar Rapids, Ia. The Cedar river's principal tributaries are the Little Cedar and Shell Rock rivers. (E. HG.)

CEDRINUS, GEORGE (fl. 11th century A.D.). compiled a world history *(Synopsis historiarum)* from the creation to 1057. The earlier part is based on the so-called pseudo-Symeon. an

anonymous chronicle which draws on Theophanes (*q.v.*). After Theophanes ends, Cedrinus borrows heavily from John Scylitzes (*q.v.*). He has therefore little independent value, but is important for textual and source problems. and provides the only published version of the Greek text of Scylitzes. Practically nothing is known of his life; he may have been a monk.

Moravcsik, *Byzantinoturcica,* i, 2nd ed., pp. 273–275 (1958); Georgije Ostrogorski, *History of the Byzantine State,* p. *188* (1956).

(J. M. HY.)

CEFALÙ, a town, port and road junction of northern Sicily, in the province of Palermo, lies 68 km. (42 mi.) E. of Palermo at the foot of a 1,233-ft.-high promontory. Pop. (1957 est.) 12,775 (commune). An episcopal see and formerly capital of the surrounding district, it is an important junction on the railroad line between Palermo and Messina. On the promontory, site of the ancient city, stands the so-called Temple of Diana. a pre-Hellenic sanctuary of megalithic construction (9th or 8th century B.C.). Near the Porta Garibaldi and the Porta Guidecca are the remains of a megalithic wall dating from the 6th century B.C. The external part of the Norman cathedral is well preserved and is finely decorated on the outside with interwoven spiral arches. On each side of the façade is a massive four-story tower, and the portal is beautiful though somewhat damaged. The interior was considerably restored in the 16th and 17th centuries. The arches and their abutments with arabesque molding rest on granite columns with figures carved on the capitals, possibly the work of local artists. The mosaics in the apse and in the first spaces between the arches of the choir (1148) are among the most beautiful in Sicily. The Osterio Magno is an interesting medieval building. The Museo Mandralisca contains a collection of ancient vases and coins and the portrait of "Ignoto" by Antonello da Messina. Cefalh is a tourist centre. Grapes, olives and citrus fruits are cultivated. Fishing is important and there is a canning industry.

The ancient Cephaloedium first appeared in history on the occasion of its alliance with Himilco (see SICILY: *Carthaginian Wars*) in 395 B.C. Valued for its strategic natural position, it was in turn conquered by Dionysius, Agathocles and the Carthaginians, from whom the Romans seized it in 254. The new town was founded at the foot of the coastal mountains by Roger II in A.D. 1131. the year in which the cathedral was begun. (G. A. DI R.j

CEGLED, a characteristic town of the Alföld or Great Hungarian plain, is located in Hungary, 64 km. (about 40 mi.) S.E. of Budapest. between the Danube and the Tisza. Pop. (1960) 37,943 (mun.). At Cegléd the main railroad line from Budapest divides, one section continuing southeast to Szeged and the other northeast to Debrecen. The principal road from Budapest through eastern Hungary also passes through the town. Cegléd is a well-established market for agricultural products with a traditional export of corn, poultry and fruit. The fruit market and nursery gardens for young trees are well known. Ceglird shared the Calvinist traditions which were widespread in that part of Hungary. (H. G. S.)

CEILING, the overhead surface or surfaces covering a room; the underside of a floor or a roof. It is often used to hide the floor and roof construction. The term is also employed, technically, for any finished boarding or sheathing and especially for a type of narrow, thin board, tongued and grooved, with a molding on the edge.

Ceilings have been favourite places for decoration from the earliest times: by painting the flat surface, as in the case of Egyptian tombs; by emphasizing the structural members of roof or floor, as in the beamed ceilings of the period of Francis I in France or the ceilings of Italian medieval churches (*e.g.,* S. Miniato at Florence); by treating it as a field for an over-all pattern of relief (*e.g.,* the earlier rooms of Hampton Court palace near London).

Of Greek ceilings little is known, except for some of marble over temple porticoes, decorated with small. sunk panels or coffers, with molded edges, and the field further decorated in polychrome. Roman ceilings were rich with relief and painting. as is evidenced by the vault soffits of Pompeian baths. Italian Renaissance architects found in similar examples inspiration for much of their most charming painted and relief decoration in stucco. and Robert Adam's 18th-century designs for ceilings ornamented with ovals, fans, hanging garlands, delicate scrolls and little painted panels have the same origin. The general Gothic tendency to use structural elements decoratively led to the rich development of the beamed ceiling, in which large cross girders support smaller floor beams at right angles to them, beams and girders being richly chamfered and molded and often painted in bright colours (the Palazzo Davanzati in Florence coctains numerous late 14th-century examples).

In the Renaissance, ceiling design was developed to its highest pitch of originality and variety. Three types were elaborated. The first was the coffered ceiling, in the complex design of which the Italian Renaissance architects far outdid their Roman prototypes. Circular, square, octagonal and L-shaped coffers, with their edges richly carved and the field of each coffer decorated with a rosette, abounded. Occasionally pendants were placed at the intersections (the Hall of the Two Hundred in the Palazzo Vecchio at Florence and various rooms of the ducal palace at Mantua are good examples). The second type consisted of ceilings wholly or partly vaulted, often with arched intersections. with painted bands bringing out the architectural design and with pictures filling the remainder of the space, as in the loggia of the Farnesina villa in Rome, decorated by Raphael and Giulio Romano. In the baroque period. fantastic figures in heavy relief, scrolls, cartouches and garlands were also used to decorate ceilings of this type; *e.g.,* the Pitti palace, Florence; many French ceilings of the Louis XIV style are similar.

In the third type, particularly characteristic of Venice (*e.g.,* the doge's palace), the ceiling became one large framed picture. (*See* RENAISSANCE ARCHITECTURE; BAROQUE AND POST-BAROQUE ARCHITECTURE.) (T. F. H.)

In contemporary architecture ceilings may be divided into two major classes—the hung ceiling and the exposed ceiling. With

BY COURTESY OF THE ITALIAN STATE TOURIST OFFICE, E N I.T

BEAMED CEILING. BASILICA OF S. MINIATO AL MONTE, FLORENCE. ITALY; 11TH CENTURY

ceilings hung at some distance below the structural members some architects have sought to conceal great amounts of mechanical and electrical equipment, such as electrical conduits, air-conditioning ducts, water pipes, sewage lines and lighting fixtures. The ceiling may be smooth plaster applied to metal lath (*e.g.* Rockefeller centre, N.Y.), translucent plastic, or aluminum egg crating (*e.g.* Manufacturer's Trust Co.. N.Y.). Other architects, emphasizing the aesthetic of the exposed structural system. delight in revealing the mechanical and electrical equipment. In response to this desire many structural systems have been developed that have an expressive power in themselves and make admirable ceilings (*e.g.* Johnson Wax offices, Racine, Wis.. by Frank Lloyd Wright, 1939, and the Exposition hall in Turin, Italy, by P. L. Nervi, 1947). See INTERIOR DECORATION. (H. Mr.)

CELAENAE, an ancient fortress city of Phrygia, at the site of the modern town of Dinar. in the Afyonkarahisar *il* of Turkey. It was the starting point of the march of Cyrus (401 B C.) with the 10,000 against Artaxerxes. Its acropolis long held out against Alexander the Great in 333. In Seleucid times, in order that it should benefit from the growing commerce on the great eastern trade route, Antiochus Soter refounded it on a more open site as Apamea (*q.v.*). West of the acropolis were the palace of Xerxes and the agora. in or near which is the cavern whence the Marsyas, one of the sources of the Buyukmenderes (Maeander), issues. (WM. C. B.)

CELANDINE (*Chelidonium majus*), a member of the poppy family (Papaveraceae), an erect branched herb from one to two feet high. It has yellow sap, much-divided leaves and yellow flowers. nearly an inch across, succeeded by narrow, thin pods, each opening by a pair of fine valves, separating upward.

The plant grows in waste places and hedgerows, and is probably an escape from cultivation. It is common in Britain and has become widely naturalized in eastern North America. in open grounds. roadsides and in woods from Maine to Ontario and Illinois southward to North Carolina. The lesser celandine is a species of *Ranunculus* (R. Ficaria), a small low-growing herb with smooth heart-shaped leaves and bright yellow flowers about an inch across, borne each on a stout stalk springing from a leaf-axil.

JOHN MARKHAM

CELANDINE (CHELIDONIUM MAJUS)

CELASTRACEAE, the staff tree family of about 45 genera and 500 species of trees and shrubs, often twining, with simple, mostly deciduous leaves, widely distributed. A few of the genera containing species that are cultivated for ornament are *Celastrus, Euonymus, Maytenus* and *Pachistema.* See CLIMBING BITTERSWEET; EUONYMUS. (J. M. BL.)

CELEBES (SULAWESI) is one of the four Greater Sunda Islands in Indonesia. Pop. (1956 est.) 6,404,516. Area (including adjacent islands) 72,986 sq.mi. The island extends from 1° 45′ N. to 5° 37′ S. and from 118° 49′ E. to 125° 5′ E.

Physical Geography. — From the backbone of the island, which runs north and south, three long peninsulas project northeast. east and southeast. respectively, the first being the longest. These peninsulas form great gulfs on the eastern side—from north to south, the gulfs of Tomini or Gorontalo, Tolo and Bone, the first being the largest. Thus the island is a curious shape and its length, 637 mi.. and coast line, 3,536 mi.. are quite disproportionate to its breadth, which averages between 36 and 120 mi. and at one point narrows to 9 mi. No place in Celebes is as far as 70 mi. from the sea. Celebes is situated in a very deep sea, between Borneo on the west. which is in a shallow sea on a shelf off the continent of Asia, and New Guinea to the east, also in a shallow sea, on a shelf projecting from Australia. The coast is dangerously fringed by drying coral reefs with many shoals and banks.

The whole island is mountainous. Two parallel ranges run from north to south in the main central mass, and a northern extension of this traverses the entire northern arm of Celebes to Manado From these ranges a single range projects northeastward to the extreme end of the eastern arm of the island, and two parallel ranges run. in a southwesterly direction, throughout the greater part of the southeastern arm. The great central ranges (with Kambuno, 9.678 ft , and Baliase, 9.596 ft . in the centre, and Rantekombola or Mario. 11.320 ft., and Lompobatang or the peak of Bonthain, 9,514 ft., in the southern arm) throw out large spurs which dominate the central and western parts of Celebes. In the extreme northeast (Mt. Klabat, 6.634 ft.) and south the mountains are volcanic, some in the former region being active, while *solfataras* and hot springs are found in blinahasa. Wide rift valleys between the mountain ranges contain several lakes—in the north, Tondano. 1.968 ft. above sea level, 8 mi. long and 3½ mi. wide, Limboto, Batudako and Bolanosau: in the central nucleus. Lake Lindu; farther south. Tempe and Sidenreng (monsoon lakes); and east of these, extending into the southeastern arm, the principal lakes of the island. Poso. Matana and Towuti. These three are very deep. Matana having been sounded to 1,936 ft. and Poso to 1.673 ft.

SHELL

FISHING CRAFT IN THE HARBOUR AT MAKASAR, CELEBES

The rivers of Celebes are short and unimportant. Waterfalls and rapids are frequent, the mouths are obstructed by bars and there is very little coastal plain, save at the head of the Gulf of Bone and near Makasar (Macassar) and among mangrove swamps of the north coast of the Gulf of Tomini. The Djenemedja, which flows into the Gulf of Bone, is nide and navigable for some distance from its mouth. The Poso, nhich enters the Gulf of Tomini, is also wide and navigable, for very small craft, to Paluasi. The Sadang, entering the Gulf of Mandar on the southwest coast. has many affluents and is navigable by sampans. The La Solo, southeast. admits steamers for 16 mi. from its mouth. The rivers of Gorontalo are very small. The best natural harbours are Manado bay, Amurang bay, Kuandang bay and Dondo bay on the north coast: Tambu bay, Parepare bay and Palu bay (Donggala) on the west coast; Gorontalo and Poso in the Gull of Toinini. with the Gulf of Poh. which penetrates eastward for 22 mi.; the bays of Tomori. Kendari and Staring in the Gulf of Tolo; and the bays of Mekongga, Palopo, Usu (Luwu) and Sopang in the Gulf of Bone. Off the west coast is the Spermonde (Sangkarang) archipelago, a number of low islands surrounded by coral reefs; off the south coast. Salajar or Kabis. At the end of the southeastern peninsula are several islands, of which the most important are Kabaena. Muna, Wowoni and dutung. They are separated from the peninsula by the straits of Tioro and Wowoni. both dangerous. The

Banggai and Peleng islands lie off the eastern extremity of Celebes and geographically resemble it, but the Banggai group is administratively a part of the Moluccas.

In the Gulf of Tomini are the Schildpad or Togian Islands, extending for nearly 80 mi. east and west, the chief of them Talatakoh, Togian and Batudaka. The Sangihe (Sangi) Islands (*q.v.*) form the northeast extension of Celebes toward Mindanao in the Philippines, which is continued by the Talaud group, northeast of these. They belong administratively to Celebes.

Geology.—The situation of Celebes between the two shelves of the Asian and Australian continents makes its geology especially interesting. The broad central block is a complex of igneous rocks, with granite, gneiss. diorite and amphilbolite characters, pierced in places by later eruptives, mostly Tertiary. This block is enclosed around its base by Cretaceous rocks, overlaid by Tertiaries and Recent alluvial deposits toward the coasts. In the southeast corner of the block there is a broad band of pre-Tertiary tuffs, fringed occasionally by coral limestone. The northern part of the Gulf of Bone is widely bordered by Pleistocene and alluvial deposits, resting in the northeast upon Late Tertiaries. A band of old igneous rocks stretches from near Palopo across the Gulf of Bone and the southeast peninsula to the Gulf of Tolo.

The meridional ridge of Celebes has an axis of crystalline schist, tourmaline quartzite and glaucophane schist, penetrated and overlaid by andesite and basalt, flanked by tuffs and overlaid by Late Tertiary Orbitoides limestone. The southern extension from the central block shows Late Tertiary limestone, raised in parts to a height of more than 3.000 ft.. where portions of the Archaean foundation are revealed. East of the central block is a faulted and depressed area of crystalline schists and metamorphosed shales, uith gneiss and metamorphic limestones. The southeastern and eastern peninsulas are, in the main. a broken crustal block with igneous rocks. Metamorphics run southward along the Gulf of Bone inland. A series of Pleistocene to Recent rocks passes near to the north of Muna Island, with no Tertiaries except a small patch on Butung Island. Around Mekongga bay is a fringe of coral limestone which borders Kabaena, covers more than two-thirds of Muna, all except the centre of Butung and all of Wowoni and the small islands north of it. There are indications of Jurassic rocks south of Lake Matana and metamorphics reappear in Peleng Island. The northeastern peninsula has northern and southern belts. The northern belt consists mostly of sedimentary rocks, Cretaceous or Tertiary. some altered by metamorphism. This belt runs parallel with the coast and is separated by a parallel fault line from the southern belt, which consists of granites, gneisses, schists and intrusives, with Archaean schists and altered rocks, caught in faults; the valleys are filled with Recent deposits. Older rocks, Cretaceous and Tertiary, are preserved in occasional east and west bands, and in places near the south coast there are fringes of coral limestone. Minahasa is volcanic and differs structurally from any other portion of Celebes.

Climate.—The climate of Celebes is hot but is tempered by sea winds. which reach every part of it. Mean temperature ranges between 86° and 72°, with absolute extremes of 94° and 66°; it falls to below 50° at high altitudes on the mountains. There is rain in all months, though relatively little in the east monsoon, June to October. Makasar has an annual total of 115 in., Manado 109, but in the mountains it is much higher (Rantepao, in the southwest central section, has 160 in.). Rift valleys on the west side tend to be very dry (Palu has 21 in.). The number of rainy days varies from 194 at Rantepao to 81 at Palu, and is about 150 in Makasar and Manado.

Animal Life.—Celebes has the poorest fauna in the archipelago in number of species; yet among these it has animal forms with close allies nowhere else in the world except in the three neighbouring islands of Batjan, Buru and Jolo. Most interesting are the babirusa or pig deer, so named by the Malays from its long, slender legs and curved tusks, resembling horns; the black-crested baboon (*Cynopithecus* nigrescens), akin to the African baboon; and the anoa, or dwarf buffalo, hunted extensively for its flesh. There are peculiar varieties of other indigenous animals, including five squirrels, a pig, a deer, two wood rats and two marsupials. Celebes has a number of peculiar species of parrots, woodpeckers, hawks, cuckoos, hornbills. starlings, flycatchers and pigeons; the brush turkey is found there. Crocodiles are common. There are snakes of various kinds, and many peculiar species of beetles and butterflies. There is a distinct cleavage between the fresh-water fishes of Borneo and Celebes.

Although it has species which belong neither to the one nor to the other, the fauna of Celebes is more Asian than Australian and the island is established as a transitional region between the oriental and Australian zoological regions. It is one of the oldest parts of the archipelago.

Vegetation.—Much of Celebes is still covered with forest, especially around the Gulf of Tolo where it is almost primeval and practically without tracks or clearings. The vegetation grows on the sides of precipitous and almost vertical mountain slopes, and the scenery is exceedingly varied and picturesque. The rift valleys are extremely fertile, and there are extensive plateaus at varying heights where there is rich pastureland. The flora, which shows many resemblances to that of the Philippines, is more Asian in character in the west of the island and more Australian in the east. While the trees of the lower mountain slopes differstrongly from those of Java and are smaller, the alpine flora is very similar. There are many kinds of palms—fanleaf, rattan, sago and *Arenga* saccharifera, which gives fibre for ropes, juice for sugar and a beverage known as sagwire. Bamboo. breadfruit, tamarind and coconut trees flourish.

People.—There are at least six quite different peoples of Celebes—the Toala, Toradja, Bugis, Makasars, Minahassen and Gorontalese. The Toala are found scattered all over the island. sometimes living in communities among other peoples as a result of having been enslaved by them. It is thought that they represent the true aborigines of Celebes. They are short and dark and have wavy or curly hair, a broad, flat nose, prominent mouth and receding chin. They are undeveloped and uncivilized, partly nomadic, shy jungle dwellers, quiet and good-tempered, with a distinct language of their own.

The Toradja are a collection of tribes in central, southeast and east Celebes. Living in isolated groups, in a very thinly populated country, they differ considerably in development. Of Malayo-Polynesian stock, they are divided into highland and lowland people. In some parts they intermingled with the Toala; in others they came under a Bugis and Makasarese civilizing influence. Mostly pagan (with increasing Muslim and Christian elements, however), they gradually began to give up their inaccessible fortified villages for neat little settlements of houses standing each in its own garden, and to become reconciled to the government prohibition of head-hunting and divination by spear throwing. Courteous and good-tempered when their confidence has been gained, they are agriculturists with only a few industries such as plaiting, pottery, wood carving and ironworking. Bark clothing is worn in remote districts; Malayan-style cotton garments where there is contact with more advanced cultures. Many ornaments are worn and teeth are filed. Society is organized on the family basis, and the tribe is an extension of the family, a man choosing a wife from another branch of his own family. There are no social distinctions or tribal chiefs and women have, comparatively, a high position, being able to choose their own husbands. The Toradja collect forest produce and grow rice, possess their own language, with many dialects, and Christian schools have been well received by them.

The Bugis and Makasars, probably of Toradja descent, came into touch with Hindu culture in southern Celebes. their home, and later were converted to Islam. They are now all Muslims, but with traces of Hinduism and paganism. Well built, fairly light skinned and energetic, they are keen traders, proud, passionate and vindictive, devoted to feasting, gambling and cockfighting. As shipbuilders and seafarers they are unsurpassed in the archipelago; their excellent proas are to be found everywhere in Malayan seas. Society is both endogamic and exogamic, with survivals of a matriarchate, but Islamic law and customs tend to displace all others. Both peoples are abstemious, feed chiefly on rice, maize and fish. eating buffalo flesh on festive occasions only;

clothing is Malayan in style. They are extremely industrious. but their industries are not in a high state of development. Weaving is one of the chief, cotton sarongs of fine material being exported in large numbers from Mandar. Plaited goods of superior quality are made in Bone, gold- and silversmiths are mostly in Makasar, Gowa, Mandar and Bone, ironworkers in Luwuk, Laiwui and Mandar, while shipbuilders flourish in Pambauwang, around Bira and elsewhere. A peculiar written alphabet, shared by Bugis and Makasar, is used also by some of the tribes of northern Celebes and by people of Sumbawa. The Makasar language and Bugis, to which it is nearly allied, belong to the Malayo-Javanese group. Arabic letters are used for religious literature and books in Arabic are read. There is a slight native literature, historical, legal, epistolary and poetic. The Bugis and Makasars, like other groups in Celebes and throughout the archipelago, began to adopt Malay as a lingua franca and then began to learn standard Indonesian.

The Minahassen are quite distinct from the other inhabitants of Celebes; they are closely related to the people of the islands of Siau and Sangihe, and are probably descended from a partly Caucasian immigrant race from the north which settled there and in the Philippines. They have a very light skin (some of the women have red cheeks and lips), lighter than any other race in the archipelago, high nose, prominent lips, widely separated eyes, stiff, short, black hair and pleasant features, and they are tall and strong. In the early 19th century they were a savage, war-like race, constantly engaged in raids and head-hunting. Protestant missions, starting in 1827, converted them and the Minahassen came to be among the most westernized people in the archipelago. They live in European style (each village has its church and school). are clean, sober and industrious. Many formerly served in the Dutch colonial army and police, and they compete successfully with Amboinese and Eurasians as clerks, teachers and the like. Their native tongue was largely superseded by Dutch, which in turn was replaced officially by Indonesian. Their territory is in the extreme northern tip of the island and their number is about 500.000.

The Gorontalese, who live in the west and south of the northeastern peninsula, are of the Toradja family, not related to the Minahassen, and largely Muslim, a short. smooth-haired, and rather light-skinned people. There is a marked difference between the people of the coast and inland. (J. O. M. B.)

Archaeology. — The earliest evidence of human habitation in Celebes is afforded by the stone implements of the Toalian culture of the southwestern part of the island. This is regarded as Mesolithic and is characterized by stone flakes and blades and. in its later stages, by arrowheads. Human remains associated with it are of small people with small teeth, very distinct from the usually large-toothed people of Melanesian type whose remains accompany the Hoabinhian Mesolithic of Indochina and Malaya. The Toalian culture was discovered near the beginning of the 20th century by the cousins Sarasin and was intensively studied by H. R. van Heekeren.

A Neolithic site near Galumpang in western central Celebes was excavated by Van Stein Callenfels. Some hand axes of Mesolithic type were found, together with typical Neolithic tools including quadrangular adzes, tanged adzes, arrowheads and curious violin-shaped stone tools resembling a type found in the Neolithic of Japan. The tanged adzes resemble those of Indochina and Hong Kong, and the assemblage seems to indicate that the Neolithic of Celebes had its origin in the region north and east of the island.

No indigenous early metal age culture is known from Celebes, the few celts and other bronze objects that have been found being probably importations. (M. W. F. T.)

History. — The general theme of the history of Celebes is one of contrast and conflict between coastal and interior peoples, the former consisting of seafaring and trading colonists, the latter of indigenous tribes. In the century preceding the coming of the Europeans, Muslim sultanates of coastal Malays had established themselves firmly in southern Celebes.

The Portuguese appear to have discovered and established some influence in Celebes in 1512 when they were monopolizing the spice trade of the Moluccas. The sultan of Makasar, as head of the state of Gowa (southwestern Celebes), favoured the Portuguese and the English, who later attempted to get a footing in Celebes. This annoyed the Dutch, who defeated the sultan early in the 17th century despite help given to him by the Portuguese. In 1607 a Dutch settlement at Makasar began to establish a firm trade footing in southern Celebes. The Dutch then used the sultan to check the power of Ternate in the Moluccas, and with their friendship he was able to subdue Bone, a rival state in southeast Celebes, and to hold Luwu. He grew too powerful, however, and the Dutch (1654) conquered the island of Tidore in spite of a Makasarese fleet. War with Gowa, interrupted only by indecisive treaties, lasted till 1667, when the Dutch admiral Speelman crushed Gowa and the Makasarese. with help from Bone, and imposed the Bongay treaty. Gowa abandoned all claims to supremacy. surrendered lands to the Dutch East India company to which it left its trade monopoly, and fell into decay. Bone's growth in power led the Dutch later to protect the independence of Gowa but the Dutch used their Bugis allies of Bone in the early wars in Java. and during the British occupation of Java Stamford Raffles had to send an expedition to Celebes against the unruly Bugis. When Dutch power in Java was restored. a Dutch expedition had to be sent to Bone; but it was not until 1848 that Bone submitted to the Bongay treaty in a revised form. Later conflicts led to complete loss of independence for Bone (1905) and Gowa (1911). The state of Luwu had signed the Bongay treaty in 1667, but it was not until after the Bone War, in 1861, that the Dutch succeeded in establishing any real influence there. Manado, on the northern coast, was first colonized by the Spaniards. and settlers were attracted from neighbouring islands. The sultan of Ternate also claimed suzerainty over it, and fairly early in the 17th century the Dutch entered into relations with the inhabitants to protect them from both Spaniards and Ternate. In 1657 the capital and fort were built at Manado and a trade agreement was signed for the delivery of a certain amount of ironwood annually. In 1677 the Sangihe and Talaud islands and, later, certain small kingdoms on the north coast were placed under the rule of the Dutch governor of Ternate, and from that time onward Dutch influence expanded until the conquest of the East Indies by the Japanese during World War II. In 1949 Sulawesi became part of the Republic of Indonesia. Thereafter there were a number of political disturbances and open rebellions in the island. The central government, however, maintained control over the port towns and surrounding areas.

Administration and Economy. — Celebes and the adjacent islands are divided into two provinces: Sulawesi Tenggara-Selatan (Southeast and South) and Sulawesi Utara-Tengah (North and Central), with populations, respectively, of about two-thirds and one-third of the whole. Southeast and South Sulawesi is divided into nine districts: Kota (city) Makasar, Makasar, Bonthain, Bone, Parepare, Mandar, Torea, Luwuk and Southeast Sulawesi. North and Central Sulawesi is divided into Sangihe and Talaud (Islands), Minahasa, Kota (city) Manado, Bolaang-mongondow, Sulawesi Utara, Donggala and Poso.

The economically most advanced parts, with a fairly dense population. are the south arm and the tip of the northeast arm. The coastal plains of Makasar and Bonthain produce dry-land crops (*e.g.*, maize [corn], cassava, yam, beans) and wet rice where adequate water is available. Virginia-type tobacco is cultivated on the phosphorous sandy soils of Bonthain. Salt is produced along the coast. The granary of Celebes is the wide alluvial plain — a former sea strait — with a northwest-southeast axis, centring on Tempe and Sidenreng lakes. Maize is grown on the lake bottoms and swamplands that dry out in the east monsoon. The catch of lake fish is a secondary source of income. Rice cultivation. which is also important, is dependent either on rainfall or on irrigation works, as near Watampone (Bone) and especially in the Sadang river area northeast of Parepare. The Sadang project, initiated in the 1930s and completed after World War II under Dutch administration. serves over 150,000 ac. of sawah (paddy fields). A dam and hydroelectric station on the Sawito river (east of Parepare) provide power for pumping the water to higher ground. Much of the rice and maize surplus is exported via Parepare.

Palima, the outlet on the east coast. is seriously impaired by silt-i t The higher grounds beyond the coastal plains are a sparsely populated savanna landscape, with lontar palms and groves of teak, especially on the dry east side. A fairly good road runs along the coasts of the south arm with connecting branches through its interior. The chief port and trade centre as well as the capital of Southeast and South Celebes is Makasar, with a population of about 250,000. It is the main entrepôt for southern Celebes and also for much of eastern Indonesia.

The other economically advanced area is in the northeast, centring on Minahasa. There the mainstay of the economy is copra, the dried meat of the coconut. largely produced by small holders on the fertile volcanic soils. Dry field crops and rice (especially around Lake Tondano) are grown, but there is a food deficit The less populated districts to the west of Minahasa and the Sangihe and Talaud islands to the north are also important copra producers. Forest products, including timber. rattan, copal and dammar, are exported. There is also some sulfur production The main port is Manado (est. pop. 65.000) on the nest side of the island's north tip. on a mountain slope overlooking a beautiful bay. Rough seas during the northwest monsoon endanger shipping from November to March. Manado was formerly known as a very clean and neat town of parklike appearance with, as the capital of northern Celebes, many government buildings and regional offices. It was severely bombed in World War II and rehabilitation was slow. Roads lead across the peninsula past Tomohon, a pretty mountain town and mission centre, and Tondano. on the lake of that name, to Kema, a small port on the south coast, frequently used instead of Manado in the northwest monsoon season. Westward a road leads from Manado along the coast to Amurang. another port on a broad bay. Outside the towns the population of Minahasa lives in villages strung out along the roads West of hlinahasa the main port is Gorontalo. There is much fishing in the seas surrounding northern Celebes, including that of tuna. centring on the port of Aertembaga.

The east and southeast arms of Celebes are hardly touched by modern civilization. The population is sparse; subsistence agriculture is practised on temporary fields and there is some export of copra and forest products. There are few roads, and government control over the interior is loose. Kendari is the administrative centre of southeast Celebes, and Poso of the north central and eastern section. Roads lead from both towns across the interior to the opposite coasts. There are nickel deposits in southeast Celebes, some of which are exploited, near Kolaka and Malili An interesting area is the Toradja highlands, opened to western civilization early in the 20th century by governmental and missionary activity. A road leads from the lake plain in central south Celebes northward through the rugged, fantastically shaped. limestone mountains to Rantepao on the headwaters of the Sadang and down again like a corkscrew to Palopo on the coast. Wet rice cultivation was introduced in 1907, and the hardy, energetic Toradjas practise it on a wide scale, also growing some coffee. However, shifting cultivation and burning for game hunting have destroyed much of the forest cover, resulting in serious soil erosion and, in the plains, silting of rivers. (J. O. M B.)

CELEBES SEA, enclosed by the island chains of Indonesia and the Philippines, measures about 420 mi. from north to south and 520 mi. east to west, and is 165,000 sq.mi. in area. It is bounded on the north by the Sulu archipelago and Mindanao, on the east by the Sangihe Island chain, on the south by Celebes (Sulawesi) and on the west by Indonesian Borneo (Kalimantan) and British North Borneo. Main access is from the south via the Makasar straits.

The Celebes sea occupies a large downfaulted block. More than half the sea is over 2.000 fathoms deep. the greatest recorded depth being 3.400 fathoms. The edges of this enclosed basin are seen in the line of volcanic cones in northern Celebes and Sangihe Islands as well as the mountains of the Sulu archipelago and Mindanao.

Fishing is important and there is much coastwise and interisland trade in marine produce, copra, coffee. timber and forest products. Although the Dutch seized parts of Celebes and the Sangihe group early in the 17th century, the Celebes sea itself was long dominated by traders and pirates from Borneo. Celebes and the Sulu archipelago. and did not come under colonial control until late in the 19th century. (L. A. P. G.)

CELERY (Apium graveolens), a succulent, hardy biennial plant of the family Umbelliferae (q v). Celery is native to the near east and eastern Mediterranean area. It was known to the ancient Greeks and Romans but apparently not much earlier, since names for it in very ancient languages are lacking. It was used until the 17th century only as a flavouring or for its supposed medicinal qualities; the first record of its use as food was in France in 1623. The ancient forms were similar to. if not the same as, smallage, an herb still grown for flavouring. Celery with large, fleshy, succulent, upright petioles appeared after the late 1700s.

In the first season of growth celery normally produces only a dense, erect rosette of leaves having very large, overlapping, long, thick, succulent petioles and compound leaves. After a period of rest imposed by temperature near freezing, a large. branched flower stalk grows three to five feet. Small white flowers are borne in somewhat open compound umbels. The "seeds" are halves of tiny two-parted fruits called schizocarps, and are among the smallest seeds of cultivated plants. Both yellow and green varieties are popular; the finest quality is found among the modern green varieties of the Ctah and Pascal types. The "hilling' of soil high up on celery plants to blanch the stalks and make them mild in flavour became much less common with the introduction of varieties free of objectionably strong flavour. In the United States celery is grown chiefly in California, Florida, Michigan and New York.

Celeriac (Apium *graveolens*, var. *rapaceum*) or turnip-rooted celery is a form having a large edible root instead of large petioles. (V. R. B.)

CELESTA, an instrument of percussion resembling in shape a small piano. usually heard in a large orchestra. Patented about 1886 by Auguste Mustel, it consists of a series of small metal bars that are set in vibration by hammers operated by a pianoforte action and keyboard. Each metal bar is resonated by a wooden box or similar chamber. the fundamental thus being reinforced. The bars are sustained and controlled by a foot pedal. Pressure on the pedal lifts a felt pad from the bars. permitting the use of short or sustained notes. It has normally a chromatic range of four octaves. The celesta is frequently used in the standard repertoire of the modern orchestra. Tchaikovsky. in his *Nutcracker Suite* (1891–92). being one of the first composers to write for it. It should not be confused with the dulcitone (or typophone), an instrument equipped with graduated steel tuning forks instead of metal bars. (J. BL.)

CELESTIAL MECHANICS is the branch of astronomy that deals with the mathematical theory of the motions of celestial bodies. The foundation was laid by Sir Isaac Newton by the publication in 1687 of his *Philosophiae Naturalis* Principia *Mathematica*, usually referred to as the Principia. Here he published the three laws of motion which express the principles of mechanics. consolidating progress begun with the pioneer work of Galileo Galilei earlier in the 17th century.

Newton also formulated the universal law of gravitation, which states that any two particles of mass in the universe attract each other with a force that varies directly as the product of the masses and inversely as the square of the distance between them. These foundations permit the statement of a problem in celestial mechanics in the form of a set of equations of motion, ordinary differential equations of the second order. A proper understanding of the subject requires knowledge of this branch of mathematics.

An important triumph of Newton's was that Kepler's three laws of planetary motion, which had been derived empirically by Johann Kepler, were obtained as a consequence of the law of gravitation in conjunction with the laws of motion, applied to the problem of two bodies (see ORBIT, in which basic technical terms used in this article are defined).

The next in order of difficulty is the case in which three bodies are considered, the famous problem of three bodies. The solar

system. consisting of the sun and nine known principal planets, all but three surrounded by one or more satellites, constitutes a problem of many bodies.

The significant circumstance that the mass of the sun is about 1,000 times that of the most massive planet, Jupiter, makes the sun's gravitational attraction far outweigh the mutual attractions of the planets. This suggests a process of successive approximations that has become the standard procedure in the mathematical theory of planetary motion, the deviations from elliptic motion being called the perturbations. In the case of the moon's motion the earth produces the principal attraction. Notwithstanding the very great mass of the sun, the effect of the sun's attraction is a small fraction oi that of the earth owing to the close proximity oi the latter. However, in the case of some satellites the perturbations produced by the sun's attraction may reach very sizable amounts. The mutual attractions of the component stars in triple and quadruple systems of stars suggest other interesting problems in celestial mechanics.

During the 18th century powerful analytical methods, made possible by the development of differential and integral calculus, were applied to the problems of celestial mechanics. These methods were generally successful in accounting for the observed motions of bodies in the solar system.

The moon's motion was an apparent exception until this problem was finally solved during the second quarter of the 20th century *(see* Moos). The observed deviations between observations and theory were shown to be caused not by defects in the theory but by lack of uniformity of the earth's rotation. This led, in 1950, to the introduction of .'ephemeris time:" which is independent of the earth's rotation, but based on the observed motions of the moon and the sun. Ephemeris time may thus be regarded to be the independent variable of Newtonian mechanics.

Relativity Effects. — It is now recognized that the Newtonian laws sf motion and law of gravitation are approximations to the true laws governing the motions of celestial bodies *(see* RELATIVITY).

In the motion of the perihelion of the innermost planet, Mercury, and in a very few other cases: relativity effects are large enough to be revealed by the most precise observations. A comparison between observations and theory. in which the perturbation's are properly taken into account, confirms the excess of the motion of the perihelion in the amount of 43 seconds of arc per century, as required by the theory of relativity. This is one of the most convincing observational proofs of that theory.

The effect diminishes rapidly for planets at a greater distance from the sun. In the case of the earth the relativity advance of the perihelion is about four seconds of arc per century, just large enough to be confirmed by observations. Because of the smallness of the relativity effects in problems in celestial mechanics the justified procedure is to continue the use of the equations of motion following from the classical theory, and to apply the small 'relativity corrections, if at all necessary, in a minor adjustment of the results.

Gravitational Attraction of Finite Bodies. — The Newtonian law of gravitation is stated for particles, not for bodies of finite extent. It was shown by Newton that bodies the masses of which are arranged with perfect spherical symmetry attract each other in accordance with the law of gravitation as if the masses were concentrated in the centres of the respective spheres. It is found that the effect of nonsphericity diminishes rapidly with the distance between the bodies. Hence in the solar system in which the principal bodies are all nearly spherical and the distances, as a rule. large compared with the dimensions of the bodies. it is in many cases permissible to treat the planets and satellites as point masses.

Interesting exceptions are exhibited by the orbits of the inner satellites of outer planets and of artificiai earth satellites. The gravitational attraction exerted by a rotationally flattened planet on a nearby satellite differs appreciably from that exerted by a spherical body with the same mass. The principal observable effects are a backward motion of the node and a motion of the line of apsides. The rates of these motions depend primarily on the radius of the orbit. on the inclination of the orbital plane to the planetary equator and on the degree of concentration of mass in the interior of the planet. Observed data may therefore reveal significant information concerning the distribution of mass within the planet. The most important applications have been made for Jupiter and Saturn from their inner satellites and for the earth from artificial satellites.

Other Branches of the Subject. — A related branch of celestial mechanics is the gravitational theory of rotating liquid or gaseous masses with applications to the earth and the other larger planets. Astrophysical applications to close double stars have become increasingly important (see GEODESY and PRECESSION OF THE EQUINOXES). Newton explained the ocean tides as caused by the gravitational attraction of the moon and the sun. Sir George Howard Darwin, in addition to developing modern methods of tidal analysis and tidal prediction, also treated the cosmogonic aspect of tidal theory in his work on the development of the earth-moon system *(see* TIDES).

The various subjects described are recognized branches of celestial mechanics, which may be understood to embrace all of gravitational astronomy.

Planetary Theory. — An important method for the treatment of planetary perturbations was introduced by Joseph Louis Lagrange (1736–1813). In an elliptic orbit the six orbital elements have constant values, completely determined by the three coordinates and the three components of the velocity at any time. Since the attractions by other planets cause a planet to follow a path differing from a fixed ellipse, the elements of its orbit so determined will necessarily vary with the time. Hence one may describe the "perturbed" orbit of a planet by giving the elements as functions of the time. Lagrange's method provides a process for deriving analytical expressions for the derivatives of the varying elements. These expressions are rigorous, but their integration requires the introduction of a process of successive approximations. The ordinary procedure gives rise to the presence of terms proportional to the time, in addition to periodic terms, in the final expressions for the elements. The terms proportional to the time, t, are called secular terms. Their presence raises such questions as whether the eccentricity of a planetary orbit may increase indefinitely, endangering the stability of the planetary system. Such a conclusion would be very superficial. The terms obtained in further approximations, having higher powers of t as factor, will modify the terms obtained in the earlier approximations in a manner that cannot be foreseen without appropriate mathematical analysis.

The integration of the periodic terms introduces divisors of the form $kn + k'n'$, in which n, n' are the mean motions of the two planets, and k, k' integers, both positive and negative. In the mean longitude the squares of these divisors occur. Whatever the mean motions, there will always be linear combinations $kn + k'n'$, small compared with either of the mean motions. n or n'. Such small divisors cause large coefficients in long-period terms, with the principal effect in the mean longitude. The motions of the planets Jupiter and Saturn furnish one of the most interesting illustrations of the effects of small divisors. The annual motions of the two planets are very nearly in ratio 5 to 2, which produces a long-period term with period of about 900 years. The amplitude of the perturbation in the mean longitude is 1,196 seconds of arc in Jupiter and 2,908 seconds of arc in Saturn. These are "the great inequalities" in the motions of these planets the cause of which was discovered by Laplace in 1786. The small divisors in celestial mechanics are related to the more general problem of resonance in mechanical systems.

A more direct approach to the solution of the perturbation problem is that in which the perturbations in the co-ordinates are obtained directly. Among the methods of this type that mere employed with success may be mentioned those of Pierre Simon de Laplace and of Simon Newcomb. The apparent advantages are largely cancelled, however, in cases of planetary motion in which large perturbations due to small divisors are an important feature. In such cases a method in which the mean longitude is obtained has decided advantages. By an ingenious procedure, P. A.

Hansen succeeded in deriving a method that combines the advantages of the two solutions of the perturbation problem. This method has been tested in numerous applications, and mas chosen by G. W. Hill for his theory of Jupiter and Saturn, the most difficult problem among the principal planets.

An accomplishment that demonstrated strikingly the power of the theory of planetary motions was the discovery of the planet Neptune in *1846*. Its presence and location in the sky had been predicted with astonishing accuracy by J. C. Adams and by U. J. J. Leverrier from deviations in the motion of the planet Uranus *(see* NEPTUNE). Attempts were made to discover planets beyond Neptune by a similar procedure, but the discovery of Pluto at the Lowell observatory in 1930 must be ascribed to perseverance in systematic search rather than accuracy of prediction by mathematical theory.

Secular Variations. — Planetary theories of the types described are entirely satisfactory for the immediate purposes of astronomy: the construction of tables that represent the motion of a planet for a limited time, say, a few thousand years. For questions concerning the stability of the solar system or, generally, its configuration in the very distant past and future such representations of planetary motion are insufficient. The question arose whether the secular terms occurring in planetary theories could be avoided. Lagrange obtained a solution in which he ignored the periodic terms. Retaining only the terms of the lowest power in the elements he obtained for the variation of the elements two sets of linear differential equations with constant coefficients, the eccentricity and perihelion appearing in one set, the inclination and node in the other. For the principal planets of the solar system, excluding Pluto, these equations have been solved in closed trigonometric form. In a solution of this type one obtains for the eccentricity and perihelion of each planet expressions containing eight trigonometric terms, the separate terms constituting oscillations with periods ranging from 57,000 years to 2,100,000 years.

Similar expressions are obtained for the elements defining the positions of the orbital planes in space. These results give at least some indication of the long-period fluctuations in the elements of the planetary orbits. They should, however, be applied with caution. Further approximations present the same difficulty of small divisors as is met in the case of the periodic perturbations of the ordinary planetary theory.

The asteroids or minor planets furnish a rich field of application of the processes of celestial mechanics. The existence of the gaps in the ring of asteroids leads to the difficult theory of resonance in planetary motion. The application of the theory of secular variations led K. Hirayama to the discovery of five families of minor planets. He concluded that the members of each family must be fragments of a larger parent body. *(See* ASTEROIDS.)

Satellite Motion. — A common feature of all satellite problems is that the motion proceeds at a much more rapid rate than among planetary orbits. In the moon's motion the line of apsides goes through a revolution in about 9 years, the node in 19 years. These periods should be compared with the periods of tens or hundreds of thousands of years that affect the motions of the perihelia and nodes of planetary orbits. Consequently, in a satellite theory one cannot permit the appearance of the time in the coefficients of perturbation terms in the manner in which they are tolerated in planetary theories. One must aim at expressions free from this defect.

The most complete solution of a satellite problem is the lunar theory. Elaborate investigations have also been devoted to the satellite systems of Jupiter and Saturn. These systems present cases of resonance that are among the more interesting problems of celestial mechanics.

Modern Methods. — From the time of Lagrange until the present, mathematical astronomers have made attempts to introduce the more perfect methods used in the lunar theory into the problem of planetary motion. A method similar to that used by Charles Eugène Delaunay in the lunar theory has been applied to planetary problems, but its application to the entire system of principal planets would be exceedingly laborious.

G. W. Hill opened up a new approach to problems in celestial mechanics by his use of a periodic orbit as a first approximation to the lunar theory. This subject was very fully investigated by H. Poincaré, whose work has led to a clearer understanding of the mathematical questions involved.

The analytical difficulty of many problems in celestial mechanics led to the introduction of the method of numerical integration: a step-by-step numerical solution of the differential equations. The method was formerly used on a modest scale for calculating the motions of asteroids and comets, and also in mathematical researches in the problem of three bodies. Undertakings of wider scope have become possible with the introduction of high-speed calculators. An example is the calculation of the co-ordinates of the five outer planets over an interval of 400 years with an accuracy that leaves little to be desired (see ***Bibliography***); this would formerly have been a hopelessly laborious undertaking. Numerical integration with high-speed computers has also been used extensively for the calculation of the paths of artificial satellites, especially if allowance must be made for atmospheric drag, and of rockets to the moon and nearby planets.

The General Problem of Three Bodies. — This problem possesses ten known integrals, all of an algebraic character. Such an integral is a function of the co-ordinates and momenta of the three bodies that remains constant throughout the motion. The original equations of the problem form a system of the 18th order, nine differential equations of the 2nd order. With the aid of the ten integrals, the "elimination of the nodes" and the elimination of the time. the system may be reduced to one of the sixth order. This reduction was actually made by Lagrange and improved by later authors by the use of the canonical form of the equations. The reduction of the problem of three bodies with the aid of known integrals suggested that, if additional integrals were discovered, the problem might be further reduced and even completely solved. All such attempts failed; finally H. Bruns, in 1887, proved that no further algebraic integrals of the three-body problem exist. Soon afterward Poincaré proved that no further integrals uniform with respect to the elliptic elements exist. This result is of the greatest importance since it proves that the developments in trigonometric series used in the astronomical methods cannot converge for all values of the constants within a finite range. It does not exclude such a representation in the case of particular orbits; obvious examples are furnished by the periodic solutions and by the particular solutions which were first studied by Lagrange *(see* TROJAN PLANETS).

The simplified problem in which one of the three bodies has negligible mass and moves in the orbital plane of the two massive bodies, which are supposed to move in circular ,orbits, is the so-called restricted problem. The system of equations is one of the fourth order with one known integral, the Jacobian integral. Let $1 - m$ and m be the masses of the finite bodies; r, r_1, r_2, the distances of the infinitesimal mass from the centre of the mass and the two bodies respectively, and V the velocity of the infinitesimal mass in a co-ordinate system the origin of which is at the centre of mass and which rotates uniformly with the period of revolution of the finite masses. The Jacobian integral, if the units of time and distance are conveniently chosen, is then

$$r^2 + \frac{2(1-m)}{r_1} + \frac{2m}{r_2} = V^2 + C,$$

C being an arbitrary constant. By putting $V^2 = 0$ one obtains a single family of curves with C as parameter. These "curves of zero velocity" may be looked upon as barriers in the sense that an orbit for which the constant of the Jacobian integral equals C can never cross any of these curves of zero velocity for which C' exceeds C. The curves of zero velocity were first introduced by Hill with application to the moon's motion and have figured prominently in more recent studies of the restricted problem.

A totally different approach to the solution of the problem of three bodies was made by using developments in powers of a variable related to the time. If applied to the original equations the method fails owing to the singularities of the differential equa-

tions that correspond to collisions. These singularities may be removed by suitable changes of variables, a procedure known as regularization. The first significant step in this direction was made by P. Painlevé. In 1912 K. F. Sundmann obtained a solution for the general problem of three bodies that can be expanded as power series which are convergent, but not uniformly so, for all values of the time. This result is of great theoretical interest.

In the restricted problem, the use of the Jacobian integral permits the elimination of one of the velocity components. Hence the motion can be represented completely by a trajectory in a three-dimensional phase space comparable with a streamline in a noncompressible fluid. This approach permits an attack upon problems that were not accessible by other methods. The earlier developments are due to Poincaré; important advances were made by G. D. Birkhoff, especially on questions concerning the probability that a trajectory returns to the same small region in space.

BIBLIOGRAPHY.—An elementary exposition of the principles of celestial mechanics is found in Russell, Dugan and Stewart, *Astronomy,* vol. i, ch. x (1945). Introductory treatises are: F. R. Moulton, *Introduction to Celestial Mechanics,* 2nd ed. (1914); H. C. Plummer, *An Introductory Treatise on Dynamical Astronomy* (1918); W. M. Smart, *Celestial Mechanics* (1953). The standard treatise covering developments through the 19th century is F. Tisserand, *Traité de Mécanique Céleste,* 4 vol. (1889–96). Excellent chapters on the mathematical aspects of the problem of three bodies are contained in E. T. Whittaker, *A Treatise on the Analytical Dynamics of Particles and Rigid Bodies,* 4th ed. (1937). CELESTIAL NAVIGATION: *see* NAVIGATION.

CELESTIAL SPHERE, the apparent surface of the heavens, on which the stars might seem to be fixed like jewels. Greek scholars attributed the rising and setting of the stars to the daily westward rotation of the sphere around an axis thrust through a globular earth. Copernicus taught that the supposed rotation of the sphere is the motion of the celestial scenery caused by the earth's daily rotation from west to east. The earth's axis is directed northward to the north celestial pole, marked roughly by Polaris, the pole star, at the end of the Little Dipper's handle. *See* ASTRONOMY: *The Celestial Sphere.*

(R. H. BR.)

CELESTINA, LA, is the title by which one of the most celebrated Spanish works of prose fiction—the *Comedia* (or *Tragicomedia*) *de Calisto y Melibea*—has been popularly known since soon after it was first published (Burgos?, 1499). The popular title is taken from the chief character, the formidable bawd whose deeply explored personality dominates the tale of two young lovers who, in achieving the consummation of their inordinate passion, bring disaster on themselves and the other major characters. *La Celestina* is written entirely in dialogue, and exists in two forms, one of 16 and the other of 21 "acts." It was not intended for stage performance. The originality and vitality of the work owe much to the way in which the author contrives to disclose his characters as complex, autonomous beings existing in their own right, and in a convincingly everyday environment which is, however, not fixed geographically or temporally. Even the Celestina, despite her corrosive contempt for those who attempt to suggest that there is anything in life more powerful than the sexual urges, is, like all the other characters, treated with understanding and some compassion. Ironic humour, sometimes decidedly coarse, is not excluded; nevertheless, the book, which makes no attempt to impose Christian solutions to the problems it presents, is pervaded by a sense that fate is an undiscriminatingly hostile force against which human efforts are vain. La *Celestina* reflects, to some extent, the stoical doctrines set out in Petrarch's Latin *Opera.* It also owes a debt to Latin 11th-century humanistic comedy.

La Celestina was reprinted in Spanish, sometimes with important textual modifications, well over 100 times between 1499 and 1634. It was also translated into all the principal European languages, including Latin and Hebrew. It was originally published anonymously, but it seems probable that the author of both the 16- and 21-act versions was Fernando de Rojas (d. 1541), a converted Jewish lawyer from Puebla de Montalbán. His assertion that he found the long first act of La *Celestina* already completed by an unidentified author has received some confirmation from a comparison of its sources, language and content with those of the rest of the book with which it is, however, astonishingly well integrated. The tone of the work is consistent with the emotional situation of the highly literate, but socially and psychologically insecure, community of Spaniards of Jewish descent whose persecution had been intensified toward the end of the 15th century.

BIBLIOGRAPHY.—The best modern critical edition is M. Criado del Val and G. D. Trotter, *Tragicomedia de Calixto y Melibea* (1958); F. de Rojas, *Celestina: a Novel in Dialogue,* trans. by L. B. Simpson (1955) is a useful modern English translation of the 16-act version; *see* also S. Gilman, *The Art of La Celestina* (1956). (P. E. R.)

CELESTINE (CAELESTINUS), the name of five popes and one elected pope who did not reign.

ST. CELESTINE I (d. 432), pope from 422 to 432, was a deacon in Rome when he was elected to succeed Boniface I on Sept. 10, 422. His restoration of the priest Apiarius was checked in 426 by African bishops, but the Gallic prelates deferred to his directives. To confute Pelagianism, the pope in 429 dispatched Germain of Auxerre to Britain. In 431 he sent Palladius as first bishop to the Irish. Celestine condemned the teaching of Nestorius in Aug. 430 and entrusted Cyril of Alexandria with the recantation. Upon receipt of the council of Ephesus' report, he gave papal approval to Nestorius' deposition. Celestine died on July 27, 432, and in the Roman martyrology he is commemorated on the anniversary; his feast is observed on April 6 in Ireland. (H. G. J. B.)

CELESTINE II (Teobaldo Buccapecus or Buccapecorini) was elected in Dec. 1124, after the death of Calixtus II, and assumed the name Celestine. He would have been Celestine II, but he resigned after a few days in favour of Honorius II and is therefore not counted in the official list of popes.

CELESTINE II (Guido di Città di Castello) (d. 1144), pope from 1143 to 1144, studied under Peter Abelard, with whom he remained on friendly terms even after the latter's condemnation at the council of Sens. He was made cardinal deacon in 1127 by Honorius II and cardinal priest around 1134 by Innocent PI. whom he was elected to succeed on Sept. 26, 1143. As pope, Celestine removed Innocent II's interdict against King Louis VII of France. He died March 8, 1144.

CELESTINE III (Giacinto Bobo-Orsini) (c. 1106–1198), pope from 1191 to 1198, was a Roman, son of Petrus Bobonis, from whom also the Orsini family was descended. At his election on March 30, 1191, to succeed Clement III, he was about 85 years old and had been cardinal deacon of Sta. Maria in Cosmedin ever since the pontificate of Celestine II; like Celestine II he had been a student and friend of Abelard. Giacinto had carried out many important legations in Germany, Spain and Portugal; Thomas Becket considered him his most reliable friend at the Roman curia. It would seem that Celestine III's conciliatory and temporizing policy toward the young emperor Henry VI was caused not by senile weakness, as has been asserted: but rather by moderation and patience: his successor, Innocent III, was to reap the fruits of this policy. Celestine's pontificate, however, was overshadowed by the spectacular successes of Henry, who had succeeded his father Frederick Barbarossa in 1190, had been crowned emperor by Celestine himself, and through his wife Constance, the daughter of Roger II, had also become ruler of the kingdom of Sicily. Henry not only ignored the fact that Sicily had been a vassal of the papal see since Nicholas II (1059), but, contrary to a treaty between Frederick Barbarossa and Clement III, also failed to restore the full extent of the papal states to the pope. According to one contemporary source Henry offered Celestine a considerable part of the revenues of the German church in compensation for full renunciation of the papal states, but the pope did not accept, since possession of the papal states was then the papacy's only guarantee of independence. He also refused to make the imperial dignity hereditary. In spite of the anxiety that the emperor's ambitious projects caused the pope, he never excommunicated him, not even

when Henry imprisoned the returning crusader king of England, Richard Lion-Heart. Yet Celestine gave only half-hearted support to Henry's own crusade, which would probably have led to a Latin conquest of the Byzantine empire a few years earlier than it actually occurred. But Henry died in 1197, at the age of 32, a few months before the nonagenarian pope, who died on Jan. 8, 1198.

CELESTINE IV (Goffredo Castiglioni) (c. 1187–1241), pope during 1241, a Milanese, nephew of Pope Urban III, had been made cardinal priest of St, Mark's in 1227 and cardinal bishop of Sabina in 1239 by his predecessor Gregory IX. whom he was elected to succeed on Oct. 25, 1241. He was the first pope to be elected in a conclave, which had been set up under most inhuman circumstances and shocking sanitary conditions by the senator of Rome. Matthew Rosso Orsini, who thus hoped to break the deadlock in the College of Cardinals. Celestine, an old and sick man, died on Nov. 10, less than a month after his election, and was succeeded by Innocent IV.

ST. CELESTINE V (Peter of Morrone) (d. 1296), pope during 1294, was born c. 1209 or 1210 in the county of Molise in south Italy. He came from a poor family, probably of Isernia. In his youth he had been a Benedictine monk, but soon had become a hermit and lived in the high Abruzzi mountains, in the Maiella and on Monte Morrone near Sulmona. His extremely rigorous asceticism, comparable with that of the eastern desert fathers, attracted a number of followers, and Peter became the head of an eremitical congregation that was incorporated into the Benedictine order by Pope Urban IV. Peter himself, however. spent most of his life in natural caves or primitive cells in the mountain wilderness.

In his cell on Monte Morrone, situated about 3 000 ft. above Sulmona and still extant as the Chapel of S. Onotrio, the octogenarian hermit to his surprise and dismay was informed by an embassy from the College of Cardinals that he had been chosen pope on July 5. 1294. This election u-as due chiefly to two causes: first, the inability of the cardinals, dominated by the rival Roman families of the Orsini and Colonna, to agree on a pope from their own midst to succeed Nicholas IV, as a result of which the see of St. Peter was left vacant for over two years; second, the widespread belief, nurtured by the Franciscan Spirituals and other propagators of the prophecies of Joachim of Fiore, that the church should and would be reformed by a papa angelicus, an ascetic on the papal throne, who would bring back to the centre of Christendom the poor and humble way of life of the apostles. It was Cardinal Latino Malabranca who actually proposed Peter as pope; he found no real opposition and the election soon became unanimous. Having reluctantly accepted the papal dignity because of the perilous situation of the leaderless church, Celestine was crowned in his own congregation's church of Sta. Maria di Collemaggio in the Abruzzi town of Aquila, which he entered riding on an ass in a Christlike *adventus* ceremony.

It was all the more unfortunate that the new pope, though a holy man, lacked many of the qualities of great leadership and could in no way be compared to such reformers of medieval religious life as St. Bernard of Clairvaux or St. Francis of Assisi. He lacked education, experience of the world and judgment of men. His high office he saw chiefly as a distraction from his ascetic struggle for the salvation of his own soul. At the same time he distrusted the cardinals who had elected him. It was not surprising under these circumstances that he soon became utterly dependent on the clever political schemer who had been his temporal sovereign. Charles II of Anjou, the king of Naples. Soon after his coronation Celestine went to Naples and filled the curia with Neapolitan and French cardinals and in general with creatures of Charles II; he also greatly favoured his congregation of hermits, called after him the Celestines, and the Franciscan Spirituals to whom he permitted secession from the main part of their order (a solution that much later was to become permanent after a long struggle). Celestine granted benefices on all sides, some of them to more than one person at the same time. His exhortations to peace between Naples and Aragon, France and England, were weak and ineffectual.

It soon became clear that the unhappy man on the throne of St. Peter was not the expected angelic pope, that a great dream had not come true. Celestine himself realized that it was dangerous for the church as well as for his own soul if he continued as pope, and after consultation with the cardinals, he resigned on Dec. 13, 1294. There can be little doubt that Dante (Inferno, iii, 59 ff.) had Celestine in mind when he spoke of him *che fece* per *viltate il* gran *rifiuto,* thus rather unjustly calling a coward the man who had had the courage to terminate an impossible situation.

After Cardinal Benedict Caetani had become his successor as Boniface VIII, Celestine's resignation was called unlawful by some of his followers. Boniface and the majority of the cardinals therefore thought it wise to keep the former pope under supervision. He was not allowed to return peacefully to his native mountains. On the point of making good his escape across the Adriatic sea, the old hermit was captured by Neapolitan officials and extradited to Boniface VIII, who kept him interned in a small cell-like room of the castle of Fumone near Ferentino, where he died on May 19, 1296. He was canonized by Clement V in 1313, and his feast is celebrated on May 19.

CELESTINES (ORDO CAELESTINENSIS), an extinct order of hermits founded about 1260 by Peter of Morrone, later Pope Celestine V (see CELESTIKE), in an attempt to unite the eremetical and cenobitical modes of life. The Benedictine rule was taken as the basis of the life, but was supplemented by regulations notably increasing the austerities practised. During the founder's lifetime the order spread rapidly from the mother abbey of Sulmona, Italy, and eventually there were 150 monasteries in Italy, France, Saxony, Bohemia and the Netherlands. During the French Revolution and its aftermath their houses were destroyed. *See* also BEKEDICTINES.

CELESTITE, a mineral composed of strontium sulfate, is mined as a source of strontium for the preparation of various strontium salts used in sugar-beet refining and the manufacture of fireworks, fusees and other pyrotechnic products. It occurs chiefly in sedimentary rocks, particularly limestones and is found in many places throughout the world. It is commonly associated with relatively soluble minerals such as gypsum, anhydrite and rock salt. It occurs occasionally in vein deposits.

Celestite, with the formula $SrSO_4$, is similar to barite ($BaSO_4$). A complete range in the proportions of strontium to barium is possible (the property termed solid solution; see MINERALOGY) so that all gradations in composition and physical properties exist between the celestite and barite (*q.v.*) end members of the range.

The name celestite is applied to those varieties in which the number of strontium atoms is greater than those of barium. Most specimens of celestite, however, contain only slight amounts of barium.

Celestite occurs in orthorhombic crystals, commonly with well-developed crystal faces. It ranges from colourless to white to pale blue in colour. Generally it has a specific gravity of approximately 3.9 and is heavy for a nonmetallic mineral. Celestite can be distinguished with certainty from barite only by careful determination of properties such as composition, specific gravity and refractive indexes. It is much less common than barite.

(D. M. H.)

CELEUS, the legendary first king of Eleusis. When the goddess Demeter, wandering in search of her daughter Persephone, had reached Eleusis disguised as an old woman, Celeus made her the nurse of his infant son Demophon. When the mother surprised her in the act of burning his mortal parts so as to give him immortality, Demeter disclosed her divinity. She commissioned Celeus' son Triptolemus (*q.v.*) to distribute her gift of corn to mankind. and Celeus erected her first temple. Thus began the important shrine of Demeter at Eleusis. (H. W. PA.)

CELIBACY, the state of being unmarried. which may be assumed for religious or nonreligious motives. This article deals with religious celibacy, primarily the celibacy of the Christian clergy.

Outside Buddhism, Jainism and Christianity, religious celibacy has been little practised. Traces of it are found among the early American Indians and in early Babylonia, the Romans had their vestal virgins, and Islam produced some who practised celibacy for mystical reasons. Buddhism enjoins celibacy on its clergy and monks. If a monk has been married, the marriage is dissolved on his entrance into the monastic life. The prohibition seems to have been strictly observed in early Buddhist monasticism. In Japan. however, Shinran (1173–1262), founder of the True Pure Land sect. tried to abolish the celibacy of priests. monks and nuns. for reasons very like those of Martin Luther; but the stricter practice survived among some. In the 15th century Tson-k'a-pa introduced monastic celibacy into Tibet, where it had lapsed. and while it is still practised there today, its status is said to be somewhat precarious. Jainism resembles Buddhism in its attitude to celibacy.

The link between Christianity and Judaism. and the acceptance of the Old Testament by the Christian church, tended to perpetuate in the early church the esteem the Hebrews had for marriage and numerous children. The New Testament does not impose celibacy on the ministers of the Gospel: although it does require that a "bishop" be married only once (Tit. i. 5 ff.); apparently this is a prohibition not of bigamy but of second marriage for the clergy. Jesus proposes celibacy as an example of superior virtue (Matt. xix. 12). and St. Paul recommends it (I Cor. vii, 8–10; 32 ff.) without imposing it.

Celibacy of the clergy does not appear to have been obligatory during the first Christian centuries. The opinion formerly held by some, that celibacy was of apostolic origin, has been largely abandoned. Freedom of choice was the norm. The writings of Tertullian, Clement of Alexandria, Origen, Eusebius of Caesarea. Cyril of Jerusalem, Jerome and Epiphanius make it clear. however. that many Christian clergymen did in fact practise celibacy. and in both east and west celibacy always has been enjoined on monks and nuns.

In the 4th century the discipline of celibacy for the clergy tended to take a fixed form in-ecclesiastical legislation, but the development in the east differed from that of the west. In the east married men were ordained and allowed to live in wedlock, though marriage after ordination was not permitted. Such was the decision of the councils of Ancyra (314), Nicaea (325). Gangra (*c.* 350) and the Trullan council of 692. Only bishops were required to leave their wives, who had to enter a monastery. The legal position of the eastern churches has remained the same, though since the 17th century the marriage of subdeacons after ordination has been tolerated in some places. Since the 9th century, bishops usually have been chosen from among the celibate monks. The Copts. Jacobites and Armenians tolerate the marriage of deacons; the Nestorians and Ethiopians permit priests to marry, and the Nestorians for a long time permitted bishops to live in wedlock.

The eastern churches united to Rome follow the decrees of the early eastern councils in this matter. The St. Thomas Christians of Malabar, however, adopted celibacy for the clergy in the 19th century, and the Syrian and Coptic churches united with Rome also have moved in the direction of a celibate clergy. In 1929 the Holy See reserved to priests living in celibacy the right to minister to the faithful of eastern rites living in the Americas.

In the west the council of Elvira in Spain (c. 306) decreed that "it be entirely forbidden bishops, priests, deacons and all clergy placed in the ministry to live with their wives and beget sons. Whoever does this, let him be deprived of the distinction of the clergy" A decretal of Pope Siricius in 386 ordered celibacy for "priests and levites." This decree was renewed by Innocent I (pope 401–417), and at the beginning of the 5th century Leo I (Epistle xiv) explained it so as to include subdeacons explicitly.

This law has remained in force ever since, though during the early middle ages it was violated frequently. St. Boniface. St. Chrodegang of Metz and Charlemagne did what they could to revive its observance, and enforcement of celibacy was one of the principal aims of the reform of the clergy under St. Gregory VII (pope 1073–85). The first (1123) and second (1139) Lateran councils declared the marriages of priests invalid. and Alexander III in 1180 extended this impediment to deacons and subdeacons.

The reforming Council of Trent (1545–63) retained the earlier laws, including the Lateran decree, and the law of Trent was incorporated in the Codex *juris canonici* of 1917. During the Reformation, Pius IV (pope 1559–65), under pressure from the emperors Ferdinand I and Maximilian II, thought of exempting Germany from the law, but his successor. St. Pius V, definitely abandoned the project. During the French Revolution many priests and some bishops married without the appro\-a1 of Rome. The Old Catholics when they broke with Rome permitted bishops and priests to marry. The schismatic Czechoslovak church also abolished celibacy in the 1920s. According to the press, Pius XII allowed some former Protestant ministers who had joined the Roman Catholic Church to live with their wives, but in the absence of the official documents it is impossible to give the conditions attached to the concession. John XXIII, following the example of Gregory XVI, Pius IX and Pius XI. was firm and peremptory in rejecting suggestions that the law might be reconsidered.

The early Protestants rejected obligatory celibacy as something beyond any human power to impose, as contrary to the practice of the early church and as a source of scandal. Martin Luther characterized celibacy as a papal invention against the eternal word of God; John Calvin denounced the prohibition of marriage as contrary to the word of God and to all justice. In more recent times this attitude has been considerably softened by a number of Protestant leaders.

Critics have maintained that the Roman Catholic Church through the law of celibacy sought power by isolating the secular clergy from the laity. The church, however, maintains that its legislation is spiritually motivated. The priest is the mediator between God and man. and celibacy facilitates the accomplishment of this function. Unmarried priests can be concerned about the things of God; the married priest would have to care for a family and consider the rights of his aife. Much of his time and energy would necessarily be given to nonreligious preoccupations. Furthermore the laity would find it more difficult to show to a married priest the confidence that is required for the successful direction of souls.

See H. Thurston, "Celibacy of the Clergy," in the *Catholic Encyclopedia,* vol. iii, pp. 481–488; J. Viollet *et* al., in *Catholicisme,* vol. ii, col 754–769. (E. A. R.)

CELJE (Ger. and Ital. CILLI), a town of Slovenia. Yugos., is situated in mountainous country on the Savinja river, 75 km. (47 mi.) E.N.E. of Ljubljana by road. Pop. (1961) 16,487. The picturesque town is notable for its old houses and churches and re-

mains of walls and castles, as well as for its many factories. It is one of the most industrialized towns in Yugoslavia. Celje is on the railway from Maribor to Zidani Most, where it joins the main Zagreb-Ljubljana line. Antimony and zinc are mined nearby and enameled iron utensils are manufactured.

The Romans captured Celje. probably a Celtic settlement. in 15 B.C. Claudius made it a Roman municipium in A.D. 50, calling it Claudia Celeia. Its temple of Mars was famous. The Roman sewerage system. rediscovered in the second half of the 19th century. is in use. Incorporated with Aquileia under Constantine, Celje was destroyed by the Slavs at the end of the 6th century. From 1350 to 1455 it was ruled by the powerful counts of Cilli, who had their castle on a hill southeast of the town. Later the town became subject to the Habsburgs. A part of Yugoslavia after 1918, it was annexed by Germany in 1941 during World War II, and set free in April 1945. (V. De.)

CELL, in biology, the basic structural living unit forming the bulk of the tissues of animals and plants of visible dimensions. Although cells vary somewhat in size, each type in a particular tissue and in a particular species is fairly uniform. Bacterial cells are among the smallest, being seen at the limits of visibility of the ordinary compound microscope (*q.v.*); yolks of birds' eggs are among the largest cells. For voltaic, dry and concentration cells *see* Battery; for gas cell *see* Hydrogen Ions; for standard cell *see* Instruments, Electrical Measuring.

The precise meaning of the term cell in biological literature is set forth in the article Cytology (*q.v.*). When the term came into usage in biology, it referred to the smallest units of structure that the microscope could reveal in the animal or plant body. First used by Robert Hooke (1665) for the minute cavities of cork, a tissue which he described as made up of "little boxes or cells," it is a survival from the microscopic descriptions of plant structure made by 17th-century botanists, and as such is really a misnomer, for tissues of animals rarely display the honeycomb-like appearance of pith, cork, etc., when examined microscopically.

Today the cell is recognized to be a complex, consisting of a number of well-defined structures (nucleus, mitochondria, etc., each concerned with particular cell functions), so that it is no longer possible to define the cell as the ultimate structural unit of living matter. On the other hand, it is a physiological unit, the "working area" for those microscopic bodies within. It is the delimitation of this characteristic complex of microscopically visible units by a boundary, the cell membrane, which possesses the physical property of differential permeability to different kinds of molecules that characterizes the individual cell. which has thus come to be regarded as a unit of physiological activity of a certain order.

The fact that the respective contributions of the maternal and paternal parents to the physical constitution of the offspring are derived in each case from a single cell of the parent body has revolutionized the study of heredity and has stimulated a considerable body of research which makes it possible to envisage the structural basis of hereditary transmission and the determination of sex.

Thus the cell doctrine. *i.e.*, the recognition of the cell originally as the structural unit of the body and later as a unit of physiological activity, has exerted its influence on every department of biological thought since the doctrine was formulated by M. J. Schleiden and Theodor Schwann in 1839.

See Biology; Plants and Plant Science; Zoology.

(L. T. H.; X.)

CELLA, in architecture, the Latin name corresponding to the Greek *naos*, used for the enclosed room or sanctuary of a Greek or Roman temple or any building of similar plan. *See* Greek Architecture; Roman Architecture; Temple Architecture.

CELLE, a town of Germany which after partition of the nation following World War II was included in the *Land* (state) of Lower Saxony in the Federal Republic of Germany. It is situated on the southern edge of Lüneburger Heide and on the Aller river at the highest point of navigation. 38 km. (24 mi.) N.E. of Hanover by road, on the main railway line from Hanover to Hamburg. Pop. (1959 est.) 56,429. The old part of the town has a large number of half-timbered houses dating from the 16th to the 18th century, among them the Hoppernerhaus (1532) and the grammar school (1603). The parish church (1308–1675) contains the tombs of the dukes of Celle and a vault where Princess Sophia Dorothea, divorced wife of George Louis of Hanover, later George I of England, and Queen Caroline Matilda of Denmark are buried. In the ducal palace (1292) is the oldest theatre in Germany still in use (1674–75). The suburb of West Celle has many houses of the nobility in the French baroque style and the Bomann-Museum, specializing in exhibits from Lower Saxony.

Celle has several technical colleges. Industries include candles, dyes, biscuits, insulators, mining equipment, petroleum, potash and gravel. Spinning is carried on and there are extensive tree nurseries.

Celle was founded in 1292, the old town, Altencelle. having been founded about 1248. It was the residence of the dukes of Brunswick and Lüneburg from 1378 to 1705. On April 25, 1858, the first boring for raw petroleum ever made took place at Wietze, a short distance northwest of Celle. In World War II Celle was occupied by Allied forces in April 1945. (Ju. R.)

CELLINI, BENVENUTO (1500–1571), Italian goldsmith and sculptor, author of a celebrated autobiography, was born in Florence on Nov. 3, 1500. Resisting the efforts of his father to train him as a musician, he was apprenticed as a metalworker in the studio of the Florentine goldsmith Andrea di Sandó Marcone. Banished to Siena as a result of a brawl in 1516, he was back in Florence during 1517–19 and then moved to Rome. Prosecuted for fighting in Florence in 1523 and condemned to death, he fled again to Rome, where he worked for the bishop of Salamanca, Sigismondo Chigi and Pope Clement VII. Cellini participated in the defense of Rome in 1527, when, by his own account, he shot the constable of Bourbon and the prince of Orange.

After the sack of Rome he returned to Florence, and in 1528 worked in Mantua, making a seal for Ercole Cardinal Gonzaga. Moving back to Rome in 1529, he was appointed *maestro delle stampe* at the papal mint, and in 1530–31 executed a celebrated morse (clasp for a cope) for Clement VII. Like so many of Cellini's works in precious metals, this was melted down, but its design is recorded in three 18th-century drawings in the British museum, London. The only survivors of the many works he prepared for the pope are two medals made in 1534.

Guilty of killing a rival goldsmith, Cellini was absolved by Pope Paul III, but in the following year, having wounded a notary, he fled from Rome and settled in Florence, where he executed a number of coins for Alessandro de' Medici. After a further year in Rome: he paid a brief visit to France, where he was received by Francis I, a portrait medal of whom is the sole relic of the journey. On his return to Rome in 1537, he was accused of peculation and imprisoned. He escaped, was once more imprisoned and was finally released in 1539 at the instance of Ippolito Cardinal d'Este of Ferrara, for whom he executed a seal (original lost; lead impression in the museum at Lyons). Again invited to France by Francis I, he arrived at Fontainebleau in 1540, carrying with him an unfinished saltcellar which he completed in gold for the king in 1543. This, Cellini's only fully authenticated work in precious metal (now in the Kunsthistorisches Museum, Vienna), is the supreme example of Renaissance goldsmith's work. In 1542 Cellini was granted letters of naturalization by the king, and in 1544 received a royal commission for 12 silver candlesticks decorated with figures from mythology. The scheme of one of these, representing Juno, is recorded in a drawing in the Louvre, Paris. Also in 1543–44 he modeled and cast a large bronze lunette of the Nymph of Fontainebleau for the entrance to the palace (now in the Louvre). For a projected fountain at Fontainebleau he prepared a model for a colossal figure of Mars (lost).

In 1545 Cellini left Paris precipitately and returned to Florence, where he was welcomed by Cosimo I de' Medici and entrusted with the commissions for his best-known sculpture, the bronze Perseus in the Loggia dei Lanzi, and for a colossal bust of the grand duke (now in the Museo Nazionale, Florence). Flying to Venice in 1546 to escape charges of immorality, Cellini com-

pleted the bust by 1548. In the same period he restored an antique torso from Palestrina as a Ganymede and carved marble figures of Apollo and Hyacinth, and of Narcissus; all three works are now in the Museo Nazionale, as is a small relief of a greyhound made as a trial cast for the Perseus (1545). A bronze bust of Bindo Altoviti (Gardner museum. Boston) was executed by Cellini in Florence, probably in 1550. After the unveiling of the Perseus (1554), he began work on a marble crucifix destined for his own tomb in SS. Annunziata; this is now in the church of the Escorial. Two designs for the seal of the Academy of Florence (British museum and Graphische Sammlung, Munich) date from 1563. His autobiography was begun in 1558 and completed in 1562, and in 1565 he began work on his important treatises of goldsmith's work and sculpture. the *Trattato dell'oreficeria* and the *Trattato della scultura.* Cellini died in Florence on Feb. 13, 1j71.

As an artist Cellini was not only a craftsman of surpassing taste and skill, but a sculptor of great significance, enjoying a position of importance both in France and in Florence, where he executed all but one of his large-scale works. He declares in his *Treatise on Sculpture* that he "always had a desire to do some great works in marble," and the tone of frustration and disappointment that runs through his autobiography is due in the main to the failure of his contemporaries to supply scope for his transcendent gifts. His Perseus is perhaps the greatest statue produced in Florence by any member of the generation after Michelangelo's, and the scene of Perseus rescuing Andromeda originally let into its base (now in the Museo Nazionale) leaves no doubt of his talent as an artist in relief. The Escorial crucifix is greatly superior to the work of his rivals B. Ammanati and Bandinelli.

Cellini's fame; however, is mainly due to his record of his own life. First printed in Italy in 1728, the autobiography was translated into English (1771), German (1796) and French (1822) and, launched on the tide of the romantic movement, gained immediate popularity. Dictated to an amanuensis, it is composed in colloquial language with no literary artifice, and gives a first-hand account of the writer's experience in the Rome of Clement VII, the France of Francis I and the Florence of Cosimo de' Medici. Despite its manifest exaggerations and its often boastful tone. it is a human document of surprising frankness and incomparable authenticity. and thanks to it we know Cellini's character more intimately than that of any other figure of his time.

BIBLIOGRAPHY.—The best Italian ed. of Cellini's autobiography is that of O. Bacci, *Vita di Benvenuto Cellini* (1901); the standard Eng. trans, is by J. A. Symonds (1887; reprinted with notes and bibliography as *The Life of Benvenuto Cellini Written by Himself,* 1949). On Cellini's works *see* E. Plon, *Benvenuto Cellini, orfèvre, médailleur, sculpteur* (1883); *E.* Camesasca, *Tutta l'opera del Cellini* (1955). For the *Trattati see* C. CELLO: *see* VIOLIN FAMILY.

CELLOPHANE, a thin film of regenerated cellulose, usually clear and transparent, used primarily as a flexible packaging material. While the word "cellophane" is a trade-mark in England, France. Canada and many other countries, in the United States it became, by court decision, a generic term.

In 1892 the English chemists C. F. Cross and E. J. Bevan discovered viscose. a solution of cellulose treated with caustic soda (sodium hydroxide) and carbon disulfide. Six years later C. H. Stearn was granted a British patent for producing films from viscose. It was not until 1911, however, that J. E. Brandenberger, a Swiss, designed a machine for continuous production of a strong, transparent film. Brandenberger coined the term "cellophane" by combining parts of "cellulose" and "diaphane," the French word for "transparent."

World War I delayed large-scale development. In 1920 a French company, La Cellophane, was formed, and a cellophane plant was built at Bezons, near Paris. Three years later E. I, du Pont de Nemours & Co. acquired rights from La Cellophane to manufacture the product in the United States and produced the first U.S.-made cellophane at Buffalo, N.Y., in 1924.

Several factors contributed importantly to cellophane's growth. Moistureproof cellophane, invented in 1927 by W. H. Charch and K. E. Prindle, gave the film new usefulness as a protective wrap for foods. By the early 1960s about 90% of the U.S. production was moistureproof, and about 70% of the total went to the food industry. More than 50 varieties of cellophane had been developed. Basically, the film is transparent, odour resistant. tough, greaseproof and gas impermeable. It can be made in various thicknesses and colours. By applying special coatings, it can be made moistureproof, partially moistureproof, and heat-sealing.

Cellophane manufacture starts with steeping of sheets of wood pulp in caustic soda to form alkali cellulose. After excess liquids are removed, the sheets are shredded, aged to control molecular weight, and discharged into steel drums known as barattes. Carbon disulfide is added to the slowly rotating barattes, forming sodium cellulose xanthate. The xanthate is dissolved in another caustic solution to form viscose. Carefully ripened viscose is piped to the casting machine, where it is extruded through a metal slit into an acid bath in which it coagulates to a film and is regenerated into cellulose. Driven rolls carry the film through a further series of baths where it is washed and bleached. and softening materials are added. The film then enters the dryer. passing over heated rolls and through circulating hot air. Finally? it is mound up in mill rolls. which may weigh as much as 950 lb. and contain up to 5 mi, of film. If the cellophane is to be coated, the film is led through a coating bath. over doctor knives or rolls to remove excess coating and to distribute the coating evenly, and then through drying and humidifying chambers.

Finished mill rolls are commonly slit to widths required for use on automatic packaging machinery, though some are unwound on large drums to be cut and trimmed to sheet form for use in hand-wrapping operations. (J. L. BL.)

CELLULOID, the first synthetic plastic material. also known as xylonite or artificial ivory. The invention of Celluloid in 1870 in the U.S. is commonly ascribed to J. W. Hyatt and I. S. Hyatt, who first realized the necessity of working cellulose nitrate, camphor and alcohol under heat and pressure. Their efforts were based upon earlier investigations by A. Parkes and D. Spill in Great Britain. In the U.S., "Celluloid" is a trade name. Celluloid is a homogeneous colloidal dispersion of cellulose nitrate and camphor. Its commercial importance persists because of its good properties: resilience; high tensile strength (up to 12,000 lb. per square inch); toughness; a density of 1.40; high lustre; low cost; uniformity; resistance to water, oils and dilute acids; ready workability; and the great variety of colours, from transparent crystal and pastel shades through bizarre mottles and pearls, in which it can be fabricated.

Since it is based upon a nitrate ester of cellulose, a long-chain polymer, Celluloid is thermoplastic in character. It can be worked in molds at 200° to 220° F., and it becomes brittle at −70° F. At room temperatures it may be sawed, drilled, turned. planed. buffed and polished. Direct sunlight or storage above 120° F. will discolour it, and decomposition sets in above 365° F. The inflammability is best controlled by the use of it in articles of thick cross section, or as a sheath covering other materials that dissipates heat more rapidly.

Although less inflammable synthetic polymers have replaced Celluloid in such markets as safety glass and telephone mouthpieces *(see* PLASTICS: *Synthetic Resin Plastics),* it was still widely used in the early 1960s. Manufacture was carried out in Austria, Belgium. France, Germany, Great Britain, Japan, the U.S.S.R., Switzerland and the U.S.

CELLULOSE is the main ingredient of cell walls of higher plants and comprises at least one-third of all vegetable matter. It is a carbohydrate (*q.v.*) and the most abundant of naturally occurring organic compounds.

Cellulose has no function in human diet except as roughage, since it is resistant to digestive juices. Its availability as food for cows, horses and other herbivorous animals is due to the fact that their digestive tracts are able to retain it long enough for the digestive process to be accomplished by microorganisms. Termites and other destructive insects digest the cellulose content of

wood by the action of amoeboid protozoa.

Cotton and wood, the principal sources of industrial cellulose are about 90% and 50% cellulose, respectively. Flax, hemp, cotton, hard wood, soft wood and other sources contain celluloses of different molecular weight and fibre structure, associated with varying amounts of natural bonding agents such as sap, lignin, resins and minerals. Though cellulose may be derived from many vegetable sources, the original cost, difficulties in collection and quality limitations of purified fibre have kept wood and cotton linters (hairs from cottonseed) the chief industrial sources.

USES OF CELLULOSE AND DERIVATIVES

The mere mention of such products as rayon, cellophane, plastics and lacquers suffices to recall the enormous development which took place after 1920 in industries based on cellulose and its derivatives. The principal industrial applications of cellulose and its derivatives are so numerous and varied that they can be only summarized here.

Purified Natural Cellulose Fibres.—Textiles.—Cotton is the natural fibre most widely used; flax and ramie are used to a much smaller extent.

Paper.—Purified fibres for papermaking are obtained from wood, grasses and straws, seed hairs (cotton rags and cotton linters) and bast fibres (flax).

Miscellaneous.—Vulcanized fibre, plastics fillers, filtering media and surgical cotton.

Regenerated Cellulose and Cellulose **Derivatives.**—*Lacquers.*—Nitrocellulose lacquers are used for spray-coating automobiles, airplanes and furniture; and for dip-coating hardware, brush handles and other mass-production items. Cellulose acetate propionate and cellulose acetate butyrate are used in clear metal finishes for outdoor use. Ethyl cellulose is used in coatings for ignition cables in automobile and airplane motors and other coatings requiring flexibility at low temperatures.

Plastics.—Nitrocellulose plastics (Celluloid) have the best combination of physical properties, apart from heat sensitivity and inflammability, of all the thermoplastic materials; large volume uses are eyeglass frames and sanitary supplies. Cellulose acetate is used widely in making plastics by injection molding and where flame resistance is important; *e.g.,* in motor housings and electric light ornaments. Cellulose acetate butyrate plastics are used where water resistance and dimensional stability are important; *e.g.,* in steering wheels and various types of piping. Ethyl cellulose plastics are tough over the widest range of temperature and are used in hammer heads and flashlights.

Rayon—Viscose rayon, cellulose acetate rayon and cuprammonium rayon.

Films and *Foils.*—Nitrocellulose, long used for photographic films, has generally been replaced by the safer cellulose acetates. Cellulose acetate propionate and cellulose acetate butyrate films are used where high dimensional stability is required; e g., aerial mapping. Thin sheets of regenerated cellulose (cellophane), cellulose acetate and ethyl cellulose are used for merchandise packaging. Regenerated cellulose is made from nitrocellulose for the production of sausage casings.

Textiles.—Artificial leather is made by coating cotton fabrics with solutions containing nitrocellulose and other ingredients. Aircraft fabric coatings may contain nitrocellulose, high-substitution cellulose acetate, cellulose acetate butyrate or cellulose acetate propionate. Flexible finishes on garment and upholstery leathers are produced with nitrocellulose lacquer emulsions. Hydroxyethyl cellulose and sodium carboxymethyl cellulose are used in textile sizes. Sodium carboxyrnethyl cellulose is also used as a detergent aid in textile washing.

Coated Paper and Cellophane.—Lacquer coatings containing nitrocellulose or other cellulose derivatives improve the grease and oil resistance, washability and electrical properties of paper. The moistureproof coating on cellophane contains nitrocellulose and a small amount of wax. Paper disks coated with ethyl cellulose are used for sound recording in the home. Methyl cellulose is used to greaseproof paper. Sodium carboxymethyl cellulose is used in special papers because it improves fibre bonding.

Adhesives.—Cellulose derivatives are used in a wide variety of special adhesives.

Explosives.—Nitrocellulose is a minor ingredient in blasting gelatin and the major ingredient in smokeless powders, including rocket powder.

Thickening Agents.—Methyl cellulose and sodium carboxymethyl cellulose are used to increase the viscosity of certain food products (*e.g.,* ice cream), textile finishes, printing pastes, latex dispersions, paints, oil well drilling mud, and pharmaceuticals.

INDUSTRIAL PREPARATION

Cellulose (wood pulp) is prepared from wood by removal of the noncellulosic constituents. The following pulping processes are the ones most widely used: (1) the sulfite process. which employ> a solution of calcium bisulfite and sulfur dioxide; (2) the soda process, in which a sodium hydroxide solution is used; and (3) the sulfate process, in which pulping is effected by a solution of sodium hydroxide and sodium sulfide; a modern modification of this process involves an acid hydrolysis of the wood prior to the conventional treatment. (The sulfate process was so named because sodium sulfate is the raw material used for the production of the sodium sulfide.) Most of the so-called dissolving wood pulps used in the manufacture of cellulose derivatives are prepared by the sulfite process. As ordinarily prepared, these sulfite pulps contain 88% to 90% alpha-cellulose; alkaline purification treatments are used to obtain pulps with higher alpha-cellulose contents. The alpha-cellulose content of a cellulose pulp. *i.e.,* the portion insoluble in 17.5% sodium hydroxide at 20° C.. serves as a rough measure of its purity. Increasing amounts of dissolving wood pulp are also being made by the modified sulfate process mentioned above.

The tremendously increased demand for wood pulp, particularly for the paper industry, has focused attention on the need for high-yield pulping processes to conserve wood supplies. This has stimulated the industrial use of the semichemical pulping processes.

Cotton is the purest naturally occurring form of cellulose. Raw cotton contains, on an ovendry basis. less than 10% of noncellulosic impurities which include proteins, fats and waxes pectic substances, carbohydrates and inorganic compounds. Chemical cotton for the manufacture of cellulose derivatives is prepared from cotton linters, which are the short fibres removed from cotton seeds after the long fibres have been taken off by ginning for use in textiles.

The cotton linters are purified by pressure digestion at 130° to 180° C. with a solution containing 270 to 5% sodium hydroxide and by a subsequent bleaching to remove colour bodies. Chemical cotton contains about 99% alpha-cellulose.

The viscosity of cellulose, or, more precisely, the viscosity of aqueous solutions of cuprammonium hydroxide and of cupriethylenediamine hydroxide and cellulose at some definite concentration, is an important property by which the product is characterized for industrial use.

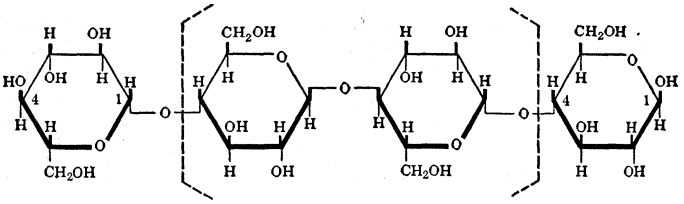
The moisture content of cellulose, which has an important effect on its chemical behaviour and on its mechanical and electrical properties, rises or drops with increase or decrease in the relative humidity of the atmosphere. The moisture content reached on desorption is higher than that reached on adsorption and varies somewhat with the source and purity, and with the treatment. Thus, for a bleached surgical cotton, the moisture content varies from about 4.6% at 30% relative humidity to about 7.9% at 60% relative humidity; the corresponding figures for a bleached sulfite pulp are 5.6% and 9.5%. High-temperature drying reduces the ability of cellulose fibres to absorb moisture whereas mercerization causes a marked increase in moisture sorption.

CHEMISTRY OF CELLULOSE

Chemical Constitution.—Elementary analysis of the purest available form of cellulose, obtained by purification of cotton, shows that it is composed of 44.4% carbon, 6.2% hydrogen and 49.4% oxygen. These figures correspond to the theoretical composition of a hexose anhydride with the formula $C_6H_{10}O_5$. The hexose anhydride is identified as anhydroglucose (specifically

anhydroglucopyranose) by the fact that hydrolysis of cellulose gives an almost quantitative yield (more than 95%) of glucose.

Each anhydroglucose unit contains three alcoholic hydroxyl groups, two secondary and one primary, which can be esterified or etherified. Considerable evidence is available to show that the molecular weight of cellulose is much greater than that of a single anhydroglucose unit. Controlled hydrolysis of cellulose has yielded cellobiose. cellotriaose, cellotetraose and cellopentaose, which contain two, three, four and five anhydroglucose units, respectively. These and other observations prove clearly that cellulose molecules are made up of many anhydroglucose units linked together by primary beta-glucosidic linkages as shown in the figure.



STRUCTURAL FORMULA OF CELLULOSE MOLECULE. THE CHEMICAL UNIT WITHIN BRACKETS IS REPEATED INDEFINITELY

In the formula, as shown in the figure, the glucose unit at the extreme right has a potential aldehyde group at position 1, uhereas the other terminal glucose unit contains an extra free hydroxyl group at position 4. The potential aldehyde group cannot be detected readily in cellulose of high molecular weight; however, even cellulose whose molecular weight has been reduced somewhat by acid hydrolysis exhibits an aldehydric reducing action. In cellulose which have been treated with oxidizing agents, the aldehyde group has usually been converted to a carboxyl group.

Conclusive evidence has been accumulated to show not only that cellulose has an extremely high molecular weight but also that all the molecules in any sample of the substance are not of the same molecular weight. The evidence for this nonuniformity with respect to molecular weight includes the results of fractional solution and fractional precipitation experiments. Molecular-weight determinations on unfractionated samples of cellulose or its derivatives will, therefore, yield only average values. The usual cryoscopic and ebullioscopic methods are unsuitable for determining large molecular weights. The viscosity method is the simplest and most useful method of molecular-weight determination. It depends on the relation between the molecular weight of a sample of cellulose (or of a cellulose derivative) and the viscosity of a dilute solution of the material. The viscosity method is not an absolute one and must be standardized against the osmotic-pressure, light-scattering or ultracentrifuge method. Some typical molecular weights based on viscosity measurements are given in the accompanying table:

Fibre Structure. — Microscopic examination of the gross structure of native cellulose fibres reveals that. although they have diverse structural patterns, they also have some general structural similarities. The cotton fibre is composed of a primary wall. uhich is the thin outer sheath of the fibre and is the portion first formed during growth; a thick secondary wall formed by deposition of cellulose inside the primary wall; and a central canal or lumen. The thin primary wall contains wax and pectic materials in addition to cellulose. The secondary wall has a layered structure resulting from the deposition of daily growth rings, each of which contains one compact and one porous layer. Although woods contain a wide variety of cells, the tracheid fibres are of chief interest since they constitute most of the fibres in commercial wood pulps. In wood, the fibres are separated from each other by layers of an intercellular substance known as the middle lamella and consisting chiefly of lignin. The fibre proper contains a primary and a secondary wall (both composed largely of cellulose) and a lumen. Investigations nith the electron microscope show that the cell walls of all native cellulose fibres are made up of small fibrous elements known as fibrils. whose width may be as small as 0.000001 in.

X-ray examination of cellulose fibres yields diffraction patterns which show that they are made up, to a large extent, of crystalline cellulose. At least two general types of crystal structure have been observed — native and hydrate. With the exception of the cellulose in the marine alga ***Halicystis*** which has the hydrate structure. all naturally occurring fibres have the native structure. The hydrate structure occurs in mercerized fibres and in cellulose regenerated from solution or from a derivative.

The X-ray diffraction patterns of native fibres indicate that their crystallinity is discontinuous and that each fibre is an aggregate of small crystalline areas (crystallites or micelles) and amorphous, intercrystalline areas. It is believed that cellulose chains crystallize in such a way that the crystalline regularity is interrupted by irregular regions which behave as amorphous matter toward X-rays and also toward the penetration of swelling and dispersing agents; there is probably a continuous transition between crystalline and amorphous areas of such nature that an individual cellulose chain may pass through several regions of complete order and complete disorder.

Cellulose Degradation. — In the degradation of cellulose, chemical changes occur which result in a reduction of the chain length of the cellulose molecules and, hence. in a weakening of the fibre structure. In the heterogeneous acid hydrolysis of cellulose, the reaction is nonuniform in that the amorphous areas are preferentially attacked so that the reaction appears to stop at a viscosity level which is a function of the size and the amount of crystalline cellulose present. In a true homogeneous hydrolysis, a quantitative recovery of glucose is not observed since there is a tendency for the glucose molecules to recombine and to reform a polymer which is not cellulose but is definitely a polysaccharide. In some cases, cellulose is deliberately degraded to bring about a desired reduction in the viscosity of the cellulose and of the derivatives made from it. In the hydrolytic degradation which is catalyzed by hydrogen ions (*i.e.*, aqueous solutions of acids), cleavage of 1:4 beta-glucosidic linkages between anhydroglucose units occurs with the formation of two new terminal glucose units. One of these is characterized by the presence of a reducing hemiacetal group, the other by an extra hydroxyl group. If the hydrolysis is carried to completion, the cellulose is converted almost quantitatively to glucose. If only partial hydrolysis takes place, degraded products are obtained to which the name hydrocellulose has been given. A wide variety of hydrocelluloses can be prepared. Their properties are determined by the conditions of the hydrolytic treatment. In general, degradation of cellulose by acids is accompanied by a decrease in viscosity and in tensile strength; by an increase in reducing power and in solubility in aqueous alkalies.

The oxidation of cellulose is, as a rule, heterogeneous in character. In those cases where a specific reaction is observed, as with periodate or lead tetracetate, the reagent system has the ability to swell and to penetrate the crystalline as well as the amorphous region, thus allowing a uniform attack. When such smelling is not possible, the amorphous regions are oxidized and reoxidized, producing a nonuniform product which rapidly loses all of its fibrous characteristics.

Cellulose can be degraded by oxidizing agents under a wide variety of conditions, and consequently oxycelluloses of widely varying properties can be obtained. Oxidation is of importance in certain commercial operations, such as bleaching. and the reaction of cellulose with oxygen in the presence of alkali in the preparation of viscose and cellulose ethers. In general, oxycelluloses of the reducing type are formed with neutral or acid oxidizing media, whereas alkaline media yield the acidic type of oxycellulose.

Cellulose is also subject to mechanical degradation which is quite comparable to hydrolysis or thermal decomposition in its severity. The extreme of such action is observed in a vibrating

ball mill where the characteristic crystalline X-ray structure is lost and becomes that of the amorphous background and viscosity breakdown is extremely rapid and severe. Such effects, particularly the viscosity reduction, are also observed in the mechanical processing in the textile industry. but to a far lesser extent.

Degradation of cellulose takes place on heating, the extent of degradation depending on the temperature and duration of heating. In general, heating lowers the tensile strength of cotton and regenerated cellulose fibres. The degradation by heat is slower in the absence of oxygen. Drastic destruction occurs on heating at relatively high temperatures. Of the derivatives, cellulose acetate seems to possess the best heat stability and nitrocellulose the poorest. Cellulose suffers loss in fibre strength and viscosity on exposure to light. This degradation is accelerated by oxygen, certain metallic catalysts and some dyes; other dyes seem to exert an inhibiting effect. Degradation by light is influenced by temperature and moisture.

A variety of bacteria, fungi and protozoa causes decomposition of cellulose with the ultimate production of carbon dioxide and water. The ability of ruminants, horses and insects to digest cellulose is believed to be caused by the presence in their intestines of cellulose-decomposing bacteria and fungi.

DERIVATIVES

In the preparation of cellulose derivatives the hydroxyl groups are replaced by substituent groups. The degree of substitution is customarily designated by the average number of hydroxyl units replaced per anhydroglucose unit. Thus, a derivative in which all the hydroxyl groups have been substituted is said to have the maximum substitution of 3.0. If analysis shows that, on the average, 2.5 hydroxyl groups have reacted, the product has a substitution of 2.j. Each molecule contains hundreds of hydroxyl groups and practically all of these are replaced when fully substituted derivatives are prepared; *e.g.*, cellulose triacetate, trimethyl cellulose. However, most of the derivatives which have attained industrial importance are not fully substituted and contain appreciable amounts of free hydroxyl groups. The chance for reaction of any hydroxyl group is affected by its position in the anhydroglucose unit, by the presence of neighbouring hydroxyl groups and by the position in the fibre structure of the molecule to which it is attached. The rate of reaction of cellulose fibres is determined by the rate of diffusion of reagent to the individual hydroxyl groups. Diffusion is rapid in the amorphous areas of fibres and relatively slow in the crystalline areas. Swelling of the fibres will accelerate diffusion and, hence: the rate of reaction. If swelling takes place uniformly throughout each fibre, the reaction will proceed uniformly. These factors are usually of importance in the preparation of uniform derivatives with substitution less than 3.0.

Uniform substitution in all cellulose molecules is obtained directly when reaction takes place in solution, as in the case of etherification of cellulose dissqlved in an aqueous solution of a quaternary ammonium base; any effect caused by fibre structure is eliminated and the distribution of ether groups along the molecule is determined by the relative reactivities of the hydroxyls and by chance. As would be expected in a homogeneous reaction of this type, the primary hydroxyls are more reactive than the secondary hydroxyls.

Nitration of cellulose is unique in that uniform reaction takes place even though fibre structure is retained throughout the reaction. This behaviour is caused by the fact that nitration is an equilibrium reaction which is apparently unaffected by fibre structure, and that the extent of nitration is determined by the composition of the nitrating acid. Cellulose formate is the only other common derivative whose preparation involves an equilibrium reaction; in this case, however, the product dissolves in the esterification reagent. The partially substituted organic acid esters which are of industrial importance (*e.g.*, cellulose acetate) are prepared by first esterifying completely in a medium in which the product dissolves and then uniformly removing some of the substituent groups by hydrolysis while the cellulose ester is in solution. It will be apparent from the foregoing discussion that derivatives with substitution less than 3.0 are not mixtures of cellulose and stoichiometric compounds having substitution of 1, 2 or 3. This view is supported by numerous fractionation experiments on commercial derivatives, in which it was found that the substitution of the individual fractions fell within a comparatively narrow range.

In the preparation of derivatives, substituent groups are introduced into the cellulose molecule; these produce marked changes in physical properties and thereby determine the industrial usefulness of the derivatives. This effect on properties is determined both by the nature of the substituent group and by the degree of substitution. The mechanical and other physical properties of cellulose and cellulose derivatives are affected by their average molecular weight. If their molecular weight is too low, they yield plastics with poor strength or lose their ability to form films or fibres. An increase in molecular weight above the lower limit causes a marked improvement in the strength of plastics, films and fibres. There is also an upper limit beyond which further increase in molecular weight causes only slight improvement in strength. The physical properties are also affected by molecular-weight distribution, that is. by the relative numbers and sizes of the molecules that make up the average value. In particular, the presence of relatively small molecules of cellulose or cellulose derivatives exerts a harmful effect on their strength properties.

In industrial operations, the viscosity of derivatives is used as a measure of molecular weight. The viscosity is controlled by selecting cellulose of a given viscosity for the starting material, by regulating the conditions of the reaction and, in some cases, by appropriate aftertreatment of the cellulose derivative. As in the case of cellulose itself. the viscosity of derivatives is determined on a solution of standard concentration by the capillary viscometer or falling-sphere methods.

Cellulose Esters.—Cellulose nitrate, which is usually referred to as nitrocellulose, is the only ester of cellulose and an inorganic acid which is produced commercially. It is prepared by nitrating cellulose with a mixture of nitric acid, sulfuric acid and water. After removal of most of the acid mixture, the fibrous nitrocellulose is given a series of washing treatments to remove last traces of acid and so obtain a product of good stability. The extent of nitration, which is usually designated by the nitrogen content, and the other properties of nitrocellulose are determined to a large extent by the composition of the nitration reagent and the other reaction conditions. For many purposes, the viscosity of nitrocellulose may be controlled by selecting cellulose of the proper viscosity and by regulating the reaction conditions. In the manufacture of low-viscosity nitrocelluloses for use in lacquers, the product is usually given a special treatment after nitration to reduce the viscosity to the desired level. In the best method for the reduction of viscosity, an aqueous suspension of nitrocellulose is heated under pressure in a continuous digester. Cellulose trinitrate (14.14% N) is not produced commercially because it is difficult to prepare and has limited solubility in common solvents. Bitrocelluloses containing 12.5% to 13.5% nitrogen (substitution 2.4–2.8) are used in explosives; those containing about 12% nitrogen (substitution 2.2) are used in lacquers, photographic film and cement, and Celluloid plastics and special lacquers are made with nitrocelluloses containing about 11% nitrogen (substitution 2.0). Cellulose sulfates have been made on a semicommercial scale. Cellulose phosphates have also been prepared but are of only academic interest. The use of sulfuric acid in the reagent mixtures used to nitrate and acetylate cellulose results in the introduction of a small amount of sulfate groups into nitrocellulose and cellulose acetate. Because these sulfate groups exert an adverse effect on the stability of these products; special treatments are used to eliminate sulfate groups and to counteract the effect of any traces that are not removed.

The esters of cellulose with organic acids may be prepared by treating cellulose with the appropriate acid, acid anhydride or acid chloride. Literally hundreds of such esters had been prepared by mid-20th century, but only a few of them had attained technical importance. Formic acid is the only organic acid which

will effect appreciable esterification of cellulose by direct reaction with it. Cellulose formate has not been used commercially because of its poor resistance to hydrolysis. Cellulose acetate, the most important of the cellulose organic acid esters, is prepared by treating cellulose with more than three moles of acetic anhydride in a suitable solvent such as acetic acid or methylene chloride, in the presence of a catalyst such as sulfuric acid. The product of this reaction is primary cellulose acetate, which approximates cellulose triacetate in substitution (acetyl content, 44.8%). Cellulose triacetate, or products approaching that degree of substitution. are in a period of increasing interest both for textiles and for photographic and X-ray film. By adding to the homogeneous primary acetate reaction mixture an excess of water over that required to decompose unreacted acetic anhydride, the reaction is reversed and acetyl groups are uniformly removed by hydrolysis; the hydrolysis reaction is stopped at the desired point by the addition of a base to neutralize the catalyst. The cellulose acetate is precipitated from solution by the addition of water. and then given a series of washing treatments to remove last traces of acid and thereby ensure good stability. In this way products are obtained with acetyl contents ranging down to about 37% acetyl (substitution about 2.2) and which are soluble in acetone and other solvents. These cellulose acetates find wide use in the manufacture of rayon, plastics and photographic film. Mixed cellulose esters, such as cellulose acetate propionate and cellulose acetate butyrate, attained industrial importance because of their great moisture resistance and wider compatibility with plasticizers than ordinary cellulose acetates. These mixed esters are prepared by esterifying cellulose with mixtures of the appropriate acid anhydrides.

Cellulose xanthate is an important derivative of cellulose which has only a transitory existence in the process of preparing viscose rayon and cellulose film. In the first step in the process, cellulose is treated with a solution of 18% sodium hydroxide to form so-called alkali or soda cellulose. After removal of the excess sodium hydroxide solution. the alkali cellulose is allowed to stand in contact with air (aging) to reduce viscosity to a desired level. The alkali cellulose is then treated with carbon disulfide to form cellulose xanthate. In commercial practice, slightly more than one xanthate group is introduced for each two anhydroglucose units in the cellulose molecule. The cellulose xanthate is dissolved in 6% sodium hydroxide solution to yield the solution commonly known as viscose, which is then ripened to effect partial decomposition of the cellulose xanthate and to improve its coagulation properties. The ripened viscose is extruded continuously in the form of threads or films into an acid precipitating bath; the regenerated cellulose is then suitably washed and dried.

Cellulose Ethers. — The cellulose ethers which have attained industrial importance include ethyl cellulose, methyl cellulose, carboxymethyl cellulose. hydroxyethyl cellulose and benzyl cellulose. In most cases. these ethers are prepared commercially by the interaction of cellulose and the halide or sulfate of the appropriate alcohol in the presence of an alkali: usually sodium hydroxide. Presumably, alkali cellulose is formed as an intermediate product. The extent of etherification is determined by the reaction temperature and the relative proportions of cellulose, alkali, etherifying agent and water in the reaction mixture. Commercially, the methyl, carboxymethyl and hydroxyethyl ethers are produced only in the lox-substitution types which are soluble in water or in diiute solutions of an alkali. The preparation of the hydroxyethyl ether is unique in that it may be carried out by treatment of alkali cellulose either with ethylene chlorohydrin or with ethylene oxide. Carboxymethyl cellulose is prepared by treating alkali cellulose with sodium chloroacetate. Carboxymethyl cellulose will dissolve completely in water if some or all of its carboxyl groups are neutralized by NaOH, KOH or NH_4OH. All of the ethyl and benzyl ethers of cellulose produced commercially are of the types which are soluble in organic solvents; *i.e.*, with substitution more than 2.0. Ethyl cellulose possesses good resistance to acids and alkalies, high flexibility at low temperature, good electrical properties, solubility in a wide range of solvents and ready compatibility with many resins and plasticizers. These properties have won for ethyl cellulose nide use in protective coatings and plastics. Benzyl cellulose has not attained wide use because of its poor stability on exposure to light or to the action of oxygen at elevated temperatures.

Cellulose Addition Compounds. — Cellulose has the ability to form addition compounds with a variety of reagents. Although some investigators believe that the formation of alkali cellulose is a physical process. others believe that the mode of reaction of alkali cellulose in etherification indicates that it is a compound of the alcoholate type. (A true alkoxide sodium cellulosate. is formed nhen cellulose is treated with a solution of sodium or sodamide in liquid ammonia.) However, the most widely accepted view is that alkali cellulose is an addition compound of the type $(C_6H_{10}O_5)_x.(NaOH)_y$. The results of X-ray analysis indicate that cellulose may form several different addition compounds with alkali. the compositions of nhich are determined by the type of cellulose used. the alkali concentration and the temperature. Treatment with aqueous solutions of alkalies (usually sodium hydroxide) has two important practical applications: (1) the modification of the physical and chemical properties of fibres, as in mercerization: and (2) the preparation of alkali cellulose as an intermediate in the manufacture of viscose and cellulose ethers. The ability of aqueous solutions of cuprammonium hydroxide and of strong acids to dissolve cellulose seems to depend on the formation of addition compounds So-called cuprammonium rayon is prepared by extruding a cuprammonium hydroxide solution of cellulose in the form of filaments into an acid precipitating bath where the cellulose is regenerated.

CELOSIA, a fairly large genus of tropical herbs or shrubs of the amaranth (*q.v.*) family, the cultivated members being herbaceous annuals. Their stems and branches are terminated by dense chaffy spikes of minute flowers that are enlarged, flattened, crested or otherwise modified and often brilliantly coloured. *See* COCKSCOMB. (J. M. BL.)

CELSIUS, ANDERS (1701–1744), Swedish astronomer and inventor of the centigrade thermometer. was born on Nov. 27, 1701, in Uppsala, where he was professor of astronomy (1730–44). At Nurnberg he published in 1733 a collection of 316 observations of the aurora borealis made by himself and others from 1716 to 1732. In Paris he advocated the measurement of an arc of the meridian in Lapland, and took part. in 1736, in the expedition organized for the purpose by the French academy. Six years later he described the centigrade thermometer in a paper read before the Snedish Academy of Sciences *(see* THERMOMETRY: *Early Development).* Celsius died at Uppsala on April 25, 1744.

He arote *Nova methodus distantiam solis a terra determinandi* (1730); *De observationibus pro figura telluris deternzinanda* (1738); besides many less important norks. The centigrade thermometer is often called by his name.

See W Ostwald's *Klassiker der exacten Wissenschaften,* no. 57 (1904), where Celsius' memoir on the thermometric scale is given in German with critical and biographical notes.

CELSIUS SCALE: *see* THERMOMETRY.

CELSUS (fl. probably *c.* A.D. 178), eclectic Platonist and the most retealing representative of the pagan reaction against Christianity, perhaps lived in Rome or Alexandria. He is knonn solely through the fragments of his nork "The True Doctrine" or "True Word" or "True Discourse" *(Alethes Logos).* preserved in the reply of Origen, *Contra Celsum,* nritten in 248. Celsus' main thesis is that Christianity is a breach with the ancient cultural and religious tradition of the human race, reaching back to the immemorial past of the golden age. This polytheistic tradition,

which is the "true doctrine," has already been gravely corrupted by the Jews with their social exclusiveness and their interpretation of monotheism to mean the rejection of all religions other than their own. But Judaism, however eccentric, is tolerable because national. Christianity, characterized by similar social and religious exclusiveness, has the additional demerit of claiming proselytes from all races. Its missionary success is a threat to the Roman empire, both because the now neglected gods may not continue to be propitious and because the Christians are failing in social duty by their reluctance to serve in the army and in public life. The weight of Celsus' attack falls upon the Christian arguments from Jesus' miracles and the prophecies fulfilled in his life. The miracles are insufficiently attested: the Virgin Birth covers a story of illegitimacy; the resurrection hangs on the testimony of a hysterical female. The prophecies are so obscure that one cannot be sure of the reference to Jesus, and if they were as clear as the Christians claim why did the Jews fail to believe in him? Even if both miracles and prophecies are accepted, how are they superior to the healings of Asclepius or the predictions of Delphi? Philosophically, the nerve centre of Celsus' attack lies in his critique of the biblical doctrine of God, evaluated from the standpoint of an eclectic Platonist. He denies the possibility of an Incarnation partly because the transcendent God cannot be involved in matter, partly because the universality of providence excludes the particularity of a special revelation in history. Celsus' intention is neither destructive nor unconciliatory; he admits that the Christians have some good ideas, but thinks them derived from misunderstandings of Greek sages. His defense of the old polytheism uses weapons forged in the Christian arsenal, in addition to his positive philosophical arguments based upon the so-called "middle" Platonism of the age before Plotinus.

Chadwick (1953); fragments of Celsus collected by R. Bader, *Der Alethes Logos des Kelsos* (1940). *See* also C. Andresen, *Logos und Nomos. Die Polemik des Kelsos wider das Christentum* (1955). (HY. C.)

CELSUS, AULUS CORNELIUS (1st century A.D.), the greatest Latin medical writer. As the son of the patrician family of the Cornelii he spent his life in Rome, probably not as a physician but as a widely learned gentleman. The contemporary physicians ignored his *De medicina,* the most important section of his encyclopaedic treatise, which also dealt extensively with agriculture, the military art, rhetoric, philosophy and jurisprudence. With the Renaissance, however, the *De medicina* was one of the first medical books to be printed (1478). It subsequently passed through numerous editions and became one of the most popular medical textbooks of the era. Written in a superb style that won for him the title of *Cicero medicorum,* his medical treatise deals with diseases treated by diet and regimen and with those amenable to drugs and surgery. Among those treated by diet and regimen appear the first mention of insanity *(insania)* and heart disease *(cardiacus).* His surgical chapters contain the first accounts of the use of ligature and excellent descriptions of lateral lithotomy and herniotomy. The introduction to his work establishes him also as one of the first medical historians, and much of the present knowledge of Hellenistic medicine, Alexandrian anatomy and surgery is derived from his *Prooemium.*

See *Celsus:* De *Medicina* with an Eng. trans. by W. G. Spencer, 3 vol. (1935–38). (I. V.)

CELT (KELT), a name derived from the plural form *Keltoi* used by Greek geographers, from at least the late 6th century B.C., to denote a great barbarian people widespread in transalpine Europe and in the Iberian peninsula. Whether *Keltoi* was the name of a particular tribe or possessed a wider significance is not known, but the name continued in use by Greek and Latin writers (Lat., *Celtae)* as descriptive of all the interrelated barbarian tribes who dwelt in the regions cited, and who, in the 4th and 3rd centuries B.C., expanded into Italy and the Balkans. The name is not known from any ancient source in connection with the British Isles, and modern usages, which are often inexact, are appropriations stemming from philological deductions made by 16th and 17th century scholars that the Gaelic and Welsh languages were derived from the speech of the ancient Celts of which there are fragmentary records in classical authors and in epigraphy. Greek writers in the 3rd century B.C. made use of *Galatai* (whence "Galatians") as a name for the Celts, and from the 2nd century B.C., *Galli* (whence "Gauls") was used in Latin.

For the origin of the Celts, archaeology shows that the Late Hallstatt culture, in the 6th and early 5th centuries B.C., included the territory known from Greek reports to have been in Celtic occupation, and it is in this cultural setting that Greek luxury objects, mainly bronze and pottery vessels for wine drinking, are found in barbarian chieftains' graves in southwest Germany, and adjacent parts of Burgundy and Switzerland. The earliest Greek imports date to the mid-6th century B.C., and it would appear that the wealthy recipients, who controlled trade routes along the river systems of the Rhône, Seine, Rhine and Danube, were the predominant and unifying element amongst the Celts. The antecedents of these warrior chieftains can be traced back to the earlier part of the 7th century B.C. in Bavaria and Bohemia whence they subsequently moved westward. In this more easterly region, as well as westward up the Danube, and across the Rhine far into France both toward Britain and southwestward into Spain, there already existed the extensive culture province of the North Alpine Urnfield culture. The bearers of this Late Bronze Age culture had colonized and intermixed with older populations throughout all this zone from about the 12th century B.C. The Urnfield people are likely to have spoken dialects that led to Celtic, and to have supported the essentially Indo-European institutions that link the Celts with Italic and other, more easterly, Indo-European peoples. In their westward movement the Hallstatt warriors thus overran peoples of their own kind. incidentally introducing the use of iron, one of the reasons for their own overlordship. For the centuries after the establishment of trade with the Greeks at Massilia, the archaeology of the Celts can be followed with greater precision. By the mid-5th century B.C., the La Tène culture, and its distinctive art style, had begun to emerge amongst the Celts centred on the middle Rhine where trade with the Etruscans, rather than with the Greeks, was now becoming predominant. The La Tène culture went through a number of phases and regional variations between the 5th and 1st centuries B.C., and by this means can be followed the migrations of Celtic tribes in regions beyond the range of contemporary history, as into central and eastern Europe and to the British Isles.

The irruptions of the Celts into Italy at the beginning of the 4th century B.C., and into the Balkans some decades later, are evidenced archaeologically in the same way, and support Greek and Latin historical sources. While it is probable that Celtic bands had penetrated into northern Italy from earlier times. the year 400 B.C. is the generally accepted approximate date for the beginning of the great invasion of migrating tribes whose names, Insubres, Boii, Senones and Lingones, were recorded by later historians. Rome was sacked about 390 B.C., and raiding bands wandered about the whole peninsula and reached Sicily. The Celtic invaders had come through the central Alpine passes, and had settled mainly in Etruscan territory. There is some evidence to suggest a considerable depopulation of parts of southern Germany and Switzerland at this time. The Celtic territory south of the Alps came to be known as Gallia Cisalpina (Cisalpine Gaul), and its warlike inhabitants remained an ever-constant menace to Rome until their defeat at Telamon in 225 B.C. Dates connected with the Celts in their movement into the Balkans are: 335 B.C. when Alexander the Great received delegations of Celts living near the Adriatic, and 279 B.C. when Delphi was sacked but the invaders suffered defeat at the hands of the Aetolians. In the following year, three Celtic tribes crossed the Bosporus into Asia Minor, and created widespread havoc. By 276 B.C. they had settled in parts of Phrygia, but continued raiding and pillage until finally quelled by Attalus I of Pergamum in about 230 B.C. In Italy, Rome had established supremacy over the whole of Cisalpine Gaul by 192 B.C. and in 124 B.C. had conquered territory beyond the western Alps: the *provincia* (Provence).

The final episodes of Celtic independence were enacted in Transalpine Gaul (Gallia Transalpina) which comprised the whole ter-

ritory from the Rhine and the Alps westward to the Atlantic. The threat was two-fold: Teutonic tribes pressing westward toward. and across, the Rhine, and the Roman arms in the south poised for further annexations. The Teutonic onslaught was first felt in Bohemia, the land of the Boii, and in Noricum, a Celtic kingdom in the eastern Alps. The assailants were known as the Cimbri, a people generally thought to have originated in Jutland. A Roman army sent to the relief of Noricum in 113 B.C. was defeated, and thereafter the Cimbri, now joined by the Teutoni, ravaged widely in Transalpine Gaul overcoming all Gaulish and Roman resistance. On attempting to enter Italy, these marauders were finally routed by Roman armies in 102 and 101 B.C. There is no doubt that many Celtic tribes, formerly living east of the Rhine, had been forced to seek refuge west of it at this period and later, when the menace of Ariovistus and the Suebi gave Julius Caesar the opportunity (58 B.C.) to begin the campaigns which led to the annexation of the whole of Gaul.

The Celtic settlement of Britain and Ireland is deduced mainly from archaeological and philological considerations. The only direct historical source for the identification of an insular people with the Celts is Caesar's report of the migration of Belgic tribes to Britain, but the inhabitants of both islands were regarded by the Romans as being closely related to the Gauls. The archaeology of the settlement in both islands is complex and different, and in view especially of linguistic differences, account has to be taken of late Urnfield and Hallstatt elements in the 7th and 6th centuries B.C., as well as of subsequent migrants bearing the La Tbne culture and of Gaulish refugees in the 1st century B.C.

In the eyes of Greeks and Romans, the Celts were remarkable for their height, muscularity and fair colouring. These were characteristics of the warrior class rather than of the whole population, and skeletal remains point to considerable variations in stature and head form. Information on Celtic institutions is available from various classical authors and from the body of ancient Irish literature. The social system was threefold: king, warrior aristocracy and freemen farmers. The druids, who mere occupied with magico-religious duties, were recruited from families of the warrior class, but ranked higher. As in other Indo-European systems. the family was patriarchal and kinship was recognized by agnatic descent. Landownership was vested in the kin which was also responsible for many social obligations. The household was of the archaic joint type consisting of a man with his wives, children and grandchildren. The status of women seems to have varied considerably according to rank and the prosperity of the community.

The basic economy of the Celts was mixed farming, and, except in times of unrest, single farmsteads were usual. Owing to the wide variations in terrain and climate, cattle raising was more important than cereal cultivation in some regions. Hill forts provided places of refuge, but warfare was generally open and consisted of single challenges and combat as much as of general fighting. It is doubtful if fighting was actually conducted from chariots although they were used on the field for display and retreat. The decapitation of foes was practised for ritual purposes, and naked combat was an archaic form of invoking magical protection. Trousers, perhaps an eastern innovation, were worn by men of the Cisalpine Gaulish tribes from at least the 3rd century B.C., and are attested in the 1st century B.C. in Transalpine Gaul, but a belted tunic, or shirt, with a cloak seems to have been the most widespread form of male dress. Women wore a single long garment with a cloak. Coarse linen as well as wool was employed, and bright colours were popular. The Celts were noted for their high spirits and love of war and excitement generally. They were hospitable, fond of feasting, drinking and quarreling, and incapable of prolonged concerted action. La Tène art witnesses to their aesthetic qualities, and they greatly prized music and many forms of oral literary composition.

CELTIBERIA, an area of northeastern central Spain occupied in ancient times by tribes of mixed Iberian and Celtic stock (see IBERIANS) from the 3rd century B.C. onward. They inhabited the hill country between the sources of the Tagus (Tajo) and Iberus (Ebro) rivers including most of the modern province of Soria and much of the neighbouring portions of Guadalajara and Teruel.

Celtiberia was a term loosely used by ancient authors, but Strabo, Livy, Polybius and Poseidonius agree that the Celtiberians in the strict sense were the Arevaci, Belli, Titti and Lusones. Their settlements were most common in the plains of Soria but also included earlier castros ("camps") on hills in Soria and the modern province of Logroño. The basic population of Celtiberia was that of the southeastern Almeria culture of the Bronze Age (see SPAIN: History) over which lay a stratum of Hallstatt (*q.v.*) invaders who occupied these lands shortly before 600 B.C. The tribal name Pelendoni is possibly connected with this Hallstatt people, who in turn were subjected to the invasion of the Arevaci, who dominated the neighbouring Celtiberian tribes from their powerful strongholds at Ocilis (mod. Medinaceli) and Numantia (c. 300 B.C.).

The Belli and the Titti were settled in the Jallón valley with the Sierra del Solorio separating them from the Lusoni to the northeast. The Titti occupied a triangle of land to the south of the Belli and had an important city at Segeda. Mundobrega (mod. Munébrega) was the chief city of the Lusones and their name survives in modern Luzón in the northeast of the Guadalajara province. Although all the limits of Celtiberia are ill-defined, the southeastern is least certain. Ptolemy, writing in the 2nd century A.D., mentions Arcobriga (in the province of Guadalajara) as a city in this region, but it might well have belonged to the Carpetani who checked their spread southward. To the east were the strong post-Hallstatt Vaccaei, but in the west a number of ill-defined tribes, perhaps also of mixed racial affinities, lay between the Celtiberians and the Iberian Edetani.

The material culture of Celtiberia was strongly influenced by that of the Iberian people of the Ebro valley as the planning and masonry of Celtiberian villages such as Calatañazor, Izarra and Ocenilla shows. The pottery technique is also of Iberian derivation. Bronze implements and weapons are largely retarded Hallstatt types (antennae-handle swords and horse-shaped fibulae) but there are also La Tbne-B fibulae (see LA TÈNE). Horse bits, daggers, swords and shield-fittings attest the warlike nature of the Celtiberians.

The Celtiberians first submitted to the Romans in 195 B.C., but they were not completely under Roman domination until 133 B.C. when P. Cornelius Scipio Aemilianus (later surnamed Africanus) destroyed Numantia (*q.v.*), a town of about 8,000 inhabitants. It was restored under the emperor Augustus, but meanwhile the Romans had built the city of Clunia (mod. Peñalba de Castro) as an administrative centre of Celtiberia, and built other towns at Termantia, Uxama (Osma) and Arcobriga.

CELTIC CHURCH, a title that may stand as a general description of the early Christian church in the British Isles and Brittany, and more particularly from about the middle of the 5th century until the Norman Conquest, when, weakened and distracted by two centuries of Viking invasions and its own inner decline, its organization and special customs disappeared before the reforming zeal of the Norman kings and ecclesiastics. Christianity, following the Roman armies and settlers, mas well established in these regions by the 4th century and shared in the general life of the church of the west for another century and a half. The close links existing between Britain and the continent during this period are well illustrated by visits such as those of followers of the Pelagian heresy and of St. Germain of Auxerre (429), their antagonist, while it was through Gaul that monasticism spread to Britain from the east, more particularly under the influence of the monastery of Lérins (in the Mediterranean, off Cannes), which had a Briton, Faustus, as abbot as early as 433.

Among the formative British figures of this period may dimly be perceived St. Ninian in the regions of Galloway, St. Dyfrig (Dubricius) in Herefordshire and southwest Wales, St. Illtud in Glamorgan and, more clearly, St. Patrick (*q.v.*) in Ireland.

After this period, however, from about 450 onward, there was a great change. Saxon invasions exterminated Christianity in England and isolated the Christians in the southwest, Wales, north Britain and Ireland. Thereafter their own conservatism, the ecclesiastical narrowness of St. Augustine of Canterbury and his followers, and national pride made out of such matters as differing dates of Easter and variants in tonsures — themselves theologically unimportant — barriers behind which grew up two churches where previously there had been only one; for a century and a half Christians in the British Isles were divided from one another. The decisive defeat of the Saxons in the battle of Mt. Badon (*c.* 500) was followed by a long period of peace for British Christians, and it was then that the foundations were laid for the great expansion that lasted from the 6th to the 9th centuries and gave to Celtic Christianity its form and special characteristics.

Historical information, in any strict sense of the term, especially for the earlier periods, is extremely scanty, for most of the extant "lives" of British saints were composed not earlier than the 11th century for other than historical purposes, though they often preserve earlier sources. For the later periods information survives only as it has been edited by interested persons whose prejudiced outlook on the Celtic Church was due at least as much to national and political causes as to ecclesiastical differences.

Certain general characteristics of the church, however, can be distinguished. In doctrine and worship it was one with the rest of western Christendom; in both respects it was orthodox and catholic. The charges of heresy later brought against it are misleading; such charges were weapons common to the armoury of both the Celtic Church and its opponents and were freely used in controversy by both sides.

Organization. — The Celtic Church was above all monastic in its inspiration and organization. The revival and expansion that followed the Anglo-Saxon invasions owed everything to monks of devoted austerity, holiness of life and learning. Their asceticism was sometimes extreme and often took unusual forms, but about their devotion there can be no question, and it secured for the monasteries and abbots the principal part of the organization and rule of the British church. Among them, too, special honour was paid to hermits and anchorites, and such ascetics as the Culdees (*q.v.*), who became in a real sense the representatives and defenders of national traditions and customs in religion. The church continued to be episcopal in the sense that such rites as consecration and ordination were always to be reserved to bishops and that only those ordained by them could celebrate the Eucharist, but there was no metropolitan or diocesan organization. Authority of this kind seems to have been disliked, and Celtic missionaries and preachers carried this dislike with them when they went abroad (*e.g.*, the Irish successors of St. Columban gave endless trouble to the diocesan authorities in Gaul throughout the 6th and 7th centuries in this matter). Many abbots, however, such as St. David (*q.v.*) and St. Teilo in south Wales, were themselves bishops; the episcopal office was much sought after and numerous monks were elevated to it. With the breakup of Celtic Christendom as a result of the Scandinavian invasions in the 9th and 10th centuries, arid the flight of many Christians abroad, the weakness of this lack of unified organization became apparent. Numerous bishops, subject to no diocesan authority, wandered about the continent, becoming an ecclesiastical menace, so that there developed on the part of the Holy See what has been described as a "marked tendency to look with suspicion on all who came from the islands."

Evangelism. — Another characteristic of the Celtic Church was its evangelistic zeal. British and Irish monks converted Brittany, colonized numerous and inaccessible islands, founded on the continent such important monasteries as St. Gall, Luxeuil and Bobbio, and carried the gospel in every direction. What missionaries like St. Columba and St. Columban (*qq.v.*) achieved was almost incredible, but their comparative lack of interest in consolidating and organizing what they had started meant that their work often had to be continued by men of different culture and tradition, such as St. Boniface (*q.v.*), whose more lasting achievements have tended to obscure the pioneering work of the "men from the islands."

Learning. — The Celtic Church was also a learned church. Classical learning was preserved in such schools as those of St. Illtud, perhaps at Llanilltud Fawr (the modern Llantwit Major) in south Wales, where Gildas, the 6th-century author and champion of monasticism, was brought up, of the Sulien family at Llanbadarn Fawr in the 11th century and others in south Wales, and in Armagh and Clonmacnoise and similar establishments in Ireland. Particular attention was paid there, too, as might be expected, to the study of the Scriptures, and it was Irish masters who taught the Scriptures to such saints as Aldhelm, Alcuin, Willibrord and Chad. Welsh and Irish figures of the 9th century, such as Asser, Johannes Scotus Erigena and Sedulius Scottus, are but the outstanding figures among a number who enriched the intellectual life of Christian Europe from the treasures of the Celtic Church. Collections of ecclesiastical laws and regulations, such as the 6th-century *Canones Wallici,* and the more important *Collectio canonum Hibernensis,* were widely read and copied and played a considerable part in contemporary continental reform movements. More important and influential were the penitentials and the penitential system they developed. Some of these were Welsh and some were Irish, associated with names of such great monastic leaders as David, Finnian and Columban. They all reveal the great importance attached in the Celtic Church to sacramental confession, among both monks and clergy and the laity, and it is not too much to say that it was these penitentials that led to the disappearance of public penance and reconciliation of penitents and the development of private confession and the sacrament of penance (*see* CONFESSION; PENITENTIAL).

Artistic Achievement. — In the field of the arts, particularly sculpture, metalwork and the illumination of manuscripts, the contribution of the Celtic Church was notable. A large number of stone memorials and crosses survive, and the "high crosses" of Ireland such as the "cross of Muiredach" are of great artistic merit; so also is the metalwork of the many shrines, such as that made for St. Patrick's bell now in the Dublin museum. But it is in illuminated manuscripts that the strange genius of the Celtic Church found its most characteristic and brilliant expression. The Irish monastic *scriptoria* in particular produced numerous copies of religious books, some of which, such as the probably 8th-century Book of Kells and the Lindisfarne Gospels, must be ranked among the finest illuminated manuscripts in the world. Their fertility of invention, their grotesque fancies, the felicity and complexity of their interlacing patterns, and the devotion and patience that lie behind them provide no small clue to an understanding of the church from which they came (see ILLUMINATED MANUSCRIPTS).

CELTIC LANGUAGES. The Celtic languages form one branch of the Indo-European (*q.v.*) family, being distinguished (1) by certain phonological characteristics such as the loss of initial and intervocalic *p* (Irish *athair* "father") and the change of *ē* to *ī* (Gaulish *-rix,* Irish *rí,* "king"); (2) by lexical peculiarities; *e.g.,* Irish *nert,* Welsh *nerth,* "strength"; Irish *már,* Welsh *mawr,* "great"; Gaulish *Nertomarus* (personal name), "of great strength." On both geographical and chronological grounds they fall into two divisions, usually known as Continental and Insular.

Continental Celtic is the generic name for the languages spoken by tribes known to classical writers as Keltoi and Galatae, over an area stretching from Gaul to Iberia in the south and Galatia in the east, and over a period of roughly 1,000 years, from the

middle of the 1st millennium B.C. to the middle of the 1st millennium A.D. The great bulk of the material consists of the names of persons, tribes and places recorded by classical writers; only in Gaul and northern Italy are inscriptions found, and the interpretation of these is in cases doubtful. Given the nature of the evidence, knowledge must be confined largely to the phonology and vocabulary of these languages and no certain conclusions can be reached as to their historical development or the differences between them. The Insular languages are those of the British Isles and of Brittany: there is some evidence of them from classical sources, but the main body of the material consists, first, of inscriptions and. second, of literature from the 7th century onward; they are divided into two groups, Goidelic (from Old Irish *Goídel,* modern Irish *Gael)* and Brythonic (from Welsh *Brython* "Briton"), representing the descendants of the Celtic languages of Ireland and Britain. respectively. There are no traces of dialects of Goidelic, and the modern Irish dialects, together with Scottish Gaelic and Manx. are all modern developments of Old Irish. In the Brythonic group there is evidence that the language of northern Britain (Pictish; *q.v.*) was somewhat different from that of the rest of the country; it was the latter, however, which split up, as a result of the English invasions, into the languages known as Welsh, Breton and Cornish. The outstanding difference between the Goidelic and Brythonic groups is that in Goidelic the IE labio-velar (*qu̯* appears first, in the Ogham inscriptions (see *Irish,* below), as *q,* later losing its labial quality and coinciding with *k* (written *c),* while in Brythonic this sound becomes *p.* Since Continental Celtic shares the latter development, the Celtic languages are sometimes divided into Q-Celtic and P-Celtic, the first group being represented only by Irish, while the second contains all the other known Celtic languages; it may be doubted, however, whether a division based on the realization of one phoneme is a useful one.

The reconstruction of common or primitive Celtic is of necessity very tentative: while Continental evidence is invaluable for the phonology, most of the information as to morphology is derived from Irish, the most archaic of the Insular languages. It has been suggested that Celtic stood in an especially close relationship to Italic, and P. J. A. Meillet went so far as to speak of a period when an Italo-Celtic nation existed, toward the end of the 2nd millennium B.C.; the fact that the *q/p* opposition existed inside Italic too (Lat. *quattuor,* but Oscan *petora,* like Gaulish *petor-*) no doubt seemed to support this theory, but much of the argument is based on accidental resemblances (*e.g.,* the Irish future in *f-* and the Latin future in *b-)* or on formations like the deponents and passives in *-r,* which at one time were known mainly in Italic and Celtic but have since been found in Hittite and Tocharian as well. The common features which are certain, such as the genitive singular ending *-i* of o-stems and the superlative formations (Lat. *-issimus;* Irish *-em,* Welsh *-haf,* from *-isamo*), are hardly sufficient to justify the assumption of a special relationship, and the whole concept of an Italo-Celtic unity was powerfully criticized by C. J. S. Marstrander who based his arguments mainly on the lack of agreement in vocabulary.

The Continental Celts found themselves neighbours of the Germanic peoples and were often confused with them by classical writers, but it is permissible to infer that the Celts had attained a higher stage of social organization than the Germans from the existence of words like Gothic *reiki* and *andbahts* (modern German *Reich, Amt),* which appear to be borrowed from Celtic *rigion,* "kingdom," and *ambactos,* "officer." To the Greeks and Romans, however, they represented a lower civilization; Celtic words in Greek are restricted to those describing Celtic institutions, like *bardoi;* and while in Latin they are somewhat better established, they belong usually to a few restricted categories, such as war (*lancea* "lance"), transport (*carrus* "baggage wagon," *carpentum* "carriage") and agricultural products *(cervesia* "beer"). But the last stronghold of Continental Celtic fell with Caesar's conquest of Gaul, where it was rapidly replaced by Latin, though it probably lingered on in remote places until the 5th century, and J. U. Hubschmied advanced strong arguments for believing that Alemannic directly replaced Celtic in the territory of the Helvetii. The extent to which the Celtic substratum influenced the Latin spoken in Gaul and thus contributed to the evolution of French is a much-disputed problem: apart from a number of words, mainly belonging to rural life (*mouton* "sheep," *ruche* "hive," *arpent* "acre," *bruyère* "heath," etc.), it was suggested that the change of *u* to [*y*] and of *ct* to *it* (*e.g., nuit* from *noctem*), both of which have parallels in the Brythonic languages, are of Celtic origin, but these changes in Brythonic can hardly be dated before the 6th century, so that the exact nature of the Celtic influence remains very uncertain.

When the Romans first invaded Britain it would appear that, with the solitary exception of a non-Indo-European Pictish which shared the far north with a Celtic Pictish, the whole island was of Celtic speech. The Roman occupation had no permanent effect on the Brythonic language, apart from the introduction of a great number of loanwords; although Latin was the language of the administrators and of the towns, it is probable that Brythonic had regained most of this ground by the time the English raids began to assume the status of an invasion, that is, by the middle of the 5th century. It is during the 5th and 6th centuries, the period of the consolidation of the English power, that Brythonic develops into the languages known as Welsh, Breton and Cornish. The change is a drastic one, comparable with the evolution of French from Latin: whereas Brythonic, like Continental Celtic, was an archaic Indo-European language of the same type as Latin, Greek or Sanskrit, the new languages, having lost nearly all their final syllables and undergone considerable internal reductions, are of the modern European type. It would be easy to account for this rapid evolution by saying that, a time of troubles is likely to accelerate linguistic development, were it not for the fact that a precisely parallel evolution from Goidelic, a language of the old type, to Irish takes place during the same period, when the only foreign influences of importance were those associated with the introduction of Christianity.

The new languages, the only forms of Celtic which are known thoroughly, present a considerable number of peculiarities, many of which are innovations, and scholars such as J. Rhŷs and J. Pokorny suggested that these may be due to the presence of a large non-Celtic substratum. The most remarkable phonological feature is the development of a double series of consonants, long, strongly articulated consonants being opposed to short, weak ones; while the two series were originally merely phonetic variants, the strong variety occurring in initial position, as a result of gemination, and in certain consonant clusters, the opposition gradually became phonological, *i.e.,* phonematic, in the same way in which *rr* and *r* have become differentiated in Spanish. In the languages as now known considerable phonetic changes have taken place in the system; in Irish the opposition strong:weak in the stops has been replaced by the opposition stop:spirant, while in the Brythonic languages this development has taken place only in the voiced stops, the opposition with the unvoiced stops being strong unvoiced:weak voiced. These changes by themselves are not very different from the lenition of intervocalic consonants which occurs in the Romance languages (*cf.* Welsh *pader* from Lat. *pater,* Sp. *padre* from *patrem*), but in Insular Celtic they occurred not only inside the word, but also inside the phrase, so that the initial consonant of a word preceded by another word ending in a vowel is weakened; when the final syllables were lost in the evolution to the modern languages these variations remained and a system of initial mutations was thus set up. If, for example, we assume a Goidelic nominative and genitive *sindos kattos koilos, sindi katti koili,* we find in Old Irish in, *catt coel, in chaitt choil,* where the *k* sounds in strong position before *s* have been preserved. but the weak intervocalic variety appears as *ch.* These alternations become a system of initial mutations which form an essential part of the grammar of the Insular Celtic languages; thus, in Irish, *a* means "his," "her" or "their" according to the mutation which follows.

Morphologically, the most striking feature of the Insular languages is the verbal system, best preserved in Old Irish. There are two verbal flections, absolute and conjunct, according to the absence or presence of a preverbal particle; thus *beirid* "he bears,"

ní beir "he does not bear." These forms appear to derive from the Indo-European primary and secondary endings, but how these came to be used in this way is not clear. The stressed pronouns cannot function as either subject or object of the verb; if it is wished to stress the subject an emphatic particle is added and the object pronoun is either proclitic or enclitic to the verb; thus *beirid-som* "he bears," *beirthi* "he bears it," *do-beir* "he gives," *da-mbeir* "he gives him." It may be noted that the pronouns are enclitic to the prepositions also, so that from *for* "upon," come *form* "on me." *fort* "on thee," and so on. This system of conjugated prepositions, as it is usually called, is found in both branches of Insular Celtic, but it is impossible to reconstruct common forms, thus suggesting that they are parallel developments. But the outstanding point in the verbal system is the part played by the verbal noun, which is a true noun, followed by the genitive case; in both branches it is used from the earliest times in construction with the verb "to be" to indicate continuous action: Irish *tdim ag dul,* Welsh *yr wyf yn mynd,* "I am going," literally "I am at going" (the prepositions used are of different origins in Irish, Welsh and Breton). The history of the Insular Celtic languages shows a steady expansion of the use of the verbal noun at the expense of the finite forms of the verb; where Old Irish expressed the perfect by a verbal prefix or similar devices (*léicis* "he threw," *ro lkic* "he has thrown"), modern Irish and Welsh have *táim tréis dul, yr wyf wedi mynd,* "I have (just) gone," literally "I am after going." It will be seen that these developments have striking analogies in English, and it is hard to resist the conclusion that the development of the latter has been influenced by its geographical position.

Breton is the descendant of the Brythonic dialects brought to Armorica (Brittany) in the 5th and 6th centuries by refugees from the English invasions, and there is therefore a faint possibility, though no conclusive evidence, that Continental Celtic may still have lingered on when Insular Celtic was imported; Breton *brug* shows the same treatment of initial u- as Fr. *bruyère,* in contrast to Welsh *grug.* Old Breton, however, which is known only from glosses from the 9th century onward, is very close to Old Welsh and Old Cornish. Literary texts are not found until the 15th century: these, which are mainly mystery plays and similar ecclesiastical material, are written in a standardized language, heavily laden with French loanwords, called Middle Breton. From the 17th century onward, the modern dialects appear, usually divided into those of Léon, Cornouaille and Tréguier, all of which have the stress accent on the penultimate syllable, and that of Vannes, which has a final accent, as well as many other individual features. (D. GE.)

Cornish, the native language of the people of Cornwall, was an analytical language which developed from a southwestern dialect of the older synthetic Brittonic. In phonology, morphology and syntax it was nearer to Breton than to Welsh. Distinguishing features of its phonology were the early change of medial and final *t* and *d* into *s* or *z,* the absence of nasal mutation (except sporadically as in Breton) and the regular provection (or "hardening") of *b, d, g, gw, v, th* into *p, t,* c, *qu, f, t.* Like Breton it used the past participle in passive verbal constructions and the verb "to do" as an auxiliary to a degree not found in Welsh. English influence on its orthography, vocabulary and syntax was far greater than on Welsh even in medieval times. Until the 15th century the river Tamar was the boundary between English and Cornish, but by about 1600 Cornish was spoken only in the westernmost parts of Cornwall; by 1735 it was losing ground even in those parts, and by about 1800 it was virtually dead. Attempts to revive the language as a spoken and literary medium have had but artificial results. Certain Cornish words have survived in the English of Cornwall, and Cornish place names occur from the Tamar to Land's End. (T. Js.)

Gaulish is the name given to the Continental language, or languages, formerly spoken in Gaul; in spite of the existence of nearly 200 inscriptions, little is known about the language beyond a limited vocabulary and certain declensional forms. All the evidence points to its having belonged to the P-Celtic rather than the Q-Celtic group, for none of the occurrences of the sound *q,* such as *equos* in the Coligny Calendar, can be traced with certainty to a Celtic q^u; the treatment of original *u,* however, differs from that of Insular Brythonic, as is shown by Fr. *bruyère* as opposed to Welsh *grug.* There is sufficient variety in the forms of the attested words to lend some support to Caesar's statement that dialect variations existed, but there is not enough material to arrive at any conclusions as to their nature.

Irish.—The history of Irish may be divided into four periods: (1) that of the Ogham inscriptions *(see* OGHAM WRITING), probably A.D. 300–500; (2) Old Irish, 600–900; (3) Middle Irish, 900–1200; (4) Modern Irish, 1200 to the present day. This division is, of course, arbitrary, and archaizing tendencies confuse the situation, especially during the period 1100–1600, after which the literary language ceases to dominate and the modern dialects, among which may be reckoned Scottish Gaelic and Manx, appear.

Although there are more than 300 Ogham inscriptions, none is of more than a few words and the great majority are names in the genitive case, so that their evidence is almost entirely phonological. No doubt the system of strong and weak consonants which is characteristic of Insular Celtic had already been evolved at this time, but the Latin alphabet, on which the Ogham alphabet is based, offered no means of distinguishing these phonetic variations, the more so since the weak stops had not yet developed into spirants. The sound *q* is still distinguished from k, and original final syllables are preserved. These inscriptions are the only remains of the archaic or Goidelic period of Irish.

The Latin alphabet was introduced into Ireland in the 5th century and by the end of the 6th century was being used to write Irish; the problems of interpretation are complicated by the fact that the British pronunciation was used so that, *e.g.,* internal *-t-* and *-c-* are usually to be read as *d* and *g.* Old Irish *Pdtraic* is to be read *Pádraig,* as it is spelled in modern Irish. The weak forms of the consonants could only be written where there were Latin spellings which could be utilized: *ll:l, rr:r, nn:n, c:ch, t:th, p:ph* and, with the help of the *punctum delens, s:ṡ, f:ḟ;* but many ambiguities remain; *e.g., a bráthair* can stand for either "his brother" or "her brother," only sporadically being written *ab-bráthair* in the latter case. Nor was the Latin alphabet capable of dealing with the new system of consonant quality which appears in Irish alone among the Celtic languages; from Celtic nominative singular and plural *bardos, bardi,* come Welsh *bardd, beirdd,* with a vowel alternation of the same kind as in English "foot," "feet," but in Irish it becomes *bard, baird,* where the *i* of the second word is purely graphic and serves to indicate that the following consonants are palatalized. All consonants have two pronunciations, velarized and palatalized, as in Russian, and in the case of the continuants *l, n* and *r* which continued to oppose strong and weak forms, there were therefore four distinct varieties of each sound.

It was suggested by T. F. O'Rahilly that the Goidels were comparative latecomers to Ireland and that there was a previous Brythonic population which formed a linguistic substratum. But, although there is a remarkably large number of Brythonic loanwords in Irish, they are recognizable precisely because they show a distinctive Brythonic development which can hardly be placed earlier than the 6th century and are thus contemporary with the great bulk of Latin loanwords in Irish, which bear the stamp of British origin. There is, however, a small number of Latin loanwords which were borrowed at a sufficiently early date for them to undergo the same changes as native Celtic words, that is, not later than the 5th century; there is no way of determining the earlier limit. These are sometimes known as the *Cothriche* loanwords, this being the old form of *Patricius,* showing early substitution of *q* (later *c)* for *p* as well as the Irish lenition, as opposed to the *pdtraic* loanwords, which come into Irish in their British form and remain substantially unchanged.

Old Irish, which represents a language which has just emerged from the archaic stage, has a remarkably complex structure of compound verbs and infixed pronouns which survives for some centuries but is simplified in the Middle Irish period to a point resembling that which the earliest recorded Welsh had already reached, the infixed pronoun being replaced by the independent pronoun, first as object and then as subject, when it takes the third person form of the verb. This tendency, which can be traced

to the beginning of the modern Irish period, has developed farthest in Scottish Gaelic and Manx where, as in modern Danish, there is only one verbal form for each tense. Southern Irish is considerably more conservative.

Manx.—Very little is known of the linguistic history of the Isle of Man. but a strong Scandinavian element is evident both in the place names and in the Manx language itself, which was first written down in the version of the Book of Common Prayer made by Bishop Phillips in 1610. Manx is clearly an Irish dialect, but its sound system in the 17th century is hard to determine, since it was written down in an orthography based on that of English; by the time that the first scientific study was made the language was far advanced in decay. The Prayer Book and later documents show that the morphological system had also evolved considerably, declension and verbal flection having been almost abandoned and the latter being replaced by constructions using the verbal noun. No native speakers now exist.

Scottish Gaelic.—Scottish Gaelic does not emerge as a distinct dialect until the 16th century: although Irish was introduced into Scotland from Ireland about the end of the 5th century there is no evidence that the language spoken in Scotland began to diverge from that of Ireland until a late period. The modern language, especially in the Hebrides. shows many innovations, notably a displacement of the opposition between voiced and unvoiced stops to one between unaspirated and aspirated voiceless stops. Scottish Gaelic, like Manx, has lost the Irish nasal mutation and has shifted the verbal system in the same way as Welsh, the continuous present *(tha mi a' dul* "I am going") replacing the old present forms, which in turn take on a future meaning *(théid mi* "I will go"), with the consequent loss of the old future tense.

(D. GE.)

Welsh, known to those who speak it as *Cymraeg,* the language of the *Cymro* "a fellow countryman," developed from British, the language spoken by the ancient Britons. This was a fully inflected language, with terminations for person, number, case, gender, mood and tense, like Latin or Greek. These terminations have been lost in Welsh, or, to be more exact, the final syllable of every word has been lost. There must have been a strong stress accent in British on the penult, so that the syllables before and after it were pronounced lightly. In the course of time this led to the universal dropping of final syllables, and in many cases other unaccented syllables were either lost or their vowels were shortened. The first change, when completed, marks the passing of British into Welsh.

But the shortened Welsh word suffered further changes, which must have started in the British period. A consonant between two vowels was mutated (*p, t, c* became *b, d, g,* etc.) even when the first vowel came at the end of a previous word; *e.g., landa Petri* "the church of Peter," became *llan Bedr; merca teca* became *merch deg* "a pretty girl," etc. Many feminine nouns ended in *-a,* and the initial of a following adjective, if a mutable consonant. was thus flanked by vowels and was regularly mutated. By analogy, this became the rule for all; every feminine noun preceded by the article and every adjective following a feminine noun mutates in Welsh. So this consonantal change must have happened before the final syllable was lost completely. Similarly, if the final syllable in British contained a long vowel (*ā, ī, ū*), this affected certain vowels in the penult; *e.g., ī* affects *ă* to *ei.* British *branos* "a crow," became *bran* in Welsh, but *branī,* genitive singular or nominative plural, gave *brein* in medieval Welsh, *brain* in modern Welsh. This was a purely phonetic change, but in later Welsh it became one of the signs of the plural *(cf.* English *man, men).* To explain it we must go back to the British form.

In the verb, too, dropping the final syllable must have meant considerable confusion and a fairly long period mas required before a regular pattern appeared. Indeed the process went on and on and is uncompleted even now.

At what time the main changes had become standardized and a new language nas born is very difficult to decide in the absence of contemporary documents. It can only be conjectured that the last centuries of the Roman occupation were the most likely period for the evolution of British into Welsh. Latin by then had long been the language of the army, administration, law, commerce and town life generally. British lived on in the wilder country districts where romanization was not so complete. On the departure of the Romans, the men of the hills were called on to take the lead in repelling the raids of Picts, Scots and Saxons. These new leaders and their followers spoke a different language, a rough, uncouth. clipped form of the old British. By A.D. 550 this had been developed into a language fit to be employed by bards to sing the praises of the new heroes. Aneirin sang to the Gododdin, Taliessin to Urien. the opponent of Ida (547–559) and Cynan, the father of the Selyf who fell at the battle of Chester in *c.* 615. That is the Welsh tradition and it fits the known facts. How much of the late versions of their poems is authentic is another matter. Cadwallon, slain near Hexham in 633–634, is praised in stanzas resembling Aneirin's Y *Gododdin.* The death in 642 of Domnall Brecc, king of the Scots, in battle with the men of Strathclyde, is the joyous theme of another poem, now added to Y *Gododdin.* There are plentiful indications in Bede (before 735) that Welsh is well established; *e.g.,* personal and place names, such as *Carlegion, Bancor, Brocmail, Dinoot;* still more in Nennius (*Mailcun, Cunedag, Morcant*) who wrote about 796.

The inscriptions on stones tell the same tale; there are Welsh forms of the names on the Llangaffo stone *(c.* 620) and the whole is in Welsh on the Towyn stone *(c.* 750). Glosses in 9th-century manuscripts are fairly frequent, but by that time Welsh was in common use.

Sir John Morris-Jones divides the history of Welsh into periods: Early Welsh up to the 8th century; Old Welsh from the beginning of the 9th to the end of the 11th century; Medieval Welsh from the beginning of the 12th to the end of the 14th century; and Modern Welsh from Dafydd ap Gwilym to the preaent day. He notes that the language of the bards from the 14th to the 16th century might be called Early Modern Welsh and then Late Modern Welsh might represent the literary language from the printing of the Scriptures in the 16th and early 17th centuries to modern times.

CELTIC LITERATURE: *see* BRETON LITERATURE; CELTIC LANGUAGES; CORNISH LITERATURE; IRISH LITERATURE; SCOTTISH LITERATURE; WELSH LITERATURE.

CELTIC MYTHOLOGY. Although the Celts of Gaul understood Greek. they do not appear to have committed their own myths to writing. There is thus no mass of contemporary material such as is found concerning the myths of the classical world. The Celtic mythology that exists was either written down from oral tales by Christian writers hundreds of years after the myths were a functional part of pagan religious life, or to some extent collected by modern students of folklore. A considerable body of ancient literature indeed has survived. particularly from Ireland and Wales. but since it was already of great antiquity when it was written down, scholars differ widely over its interpretation and also as to what is myth (*i.e.,* fabrication of a religious nature) and what is legend (the true story of actual events distorted by frequent retelling). Two types of story illustrate this.

First. a large body of tales exists, known in Irish as *imramha* ("rowing about," "voyaging"), which ranges from prosaic tales of Irish saints traveling to Iceland, Greenland and perhaps America, to fabulous stories of pagan heroes adventuring in quest of lands beyond the sunset. It seems reasonable to suppose that these *imramha* are legends, for there is a complete gradation from the matter of fact to the magical. Nonetheless K. Meyer and A. Nutt use the magical type of tale to demonstrate a supposed Celtic belief in a happy otherworld beyond the western ocean. Second, in the cycle of Cú Chulainn (often wrongly described as a saga) opinions have differed as to whether the hero, Cú Chulainn, mas a god, a man or even a wooden idol. Whatever Cú Chulainn may have been, there is no doubt that the cycle contains much genuine mythology.

In spite of the magic way in which Cú Chulainn is said to have been conceived (his mother, Dechtire, swallowed the god Lug in a draft of wine), it seems probable that he was once a real man and that the Tuatha De Danann, his relatives. were really human and not the gods that some writers have supposed. Cu Chulainn does, however, become involved in incidents where real gods undoubtedly appear.

The Tuatha Dé Danann themselves are the "branch" of the goddess Dana or Danu. She was evidently. like Isis, known by a great number of names. more than 30, of which the Badb. the Cailleach and Macha are the most in evidence. Dana is clearly the great earth mother or the female principle. She is the Celtic Artemis of classical writers: with the fruitful earth and all animal creation under her control. She is goddess of life and death and, as Morrigan or Black Annis, a great slaughterer of men. Her consort Dagda is a rustic Hercules, representing the male principle at a time when descent was matrilineal and the organization of the tribe matriarchal.

The great mother's magic horse, represented as having one leg and being impaled on a chariot pole, suggests links with the Scythians to the north of the Black sea, while many of her characteristics are so like those of the Hindu goddess Kali that. coupled with the known survival of hippogamy in Donegal in the middle ages, it seems probable that these Irish stories belong to a religion which spread from some unknown source both westward and to the southeast. perhaps 3.000 years ago.

The *Táin Bó Cuálnge,* the major portion of this Cu Chulainn epic. is believed to have been written down *c.* A.D. 700, and several ancient copies of it exist. But as the events described in it belong. as Sir William Ridgeway pointed out. to the Irish Early Iron Age. 700 years before the epic was written down, much embroidery has accumulated in their frequent repetition.

The Welsh tales collected in the *Mabinogion* (*q.v.*) were stabilized at a much later period. and *The White Book* of *Rhydderch,* the earliest surviving manuscript to contain any considerable number of them. dates from the beginning of the 14th century. Here again myth is hard to separate from legend, but a definite underworld. Annwn. can be observed with a king. Arawn, who has relations with the world of men, in much the same manner as that found in classical mythology. The first tales of the *Mabinogion* are myths in which gods, such as Maponus (Mabon), who are known from other contexts. figure largely. It is clear. however. that they belong to a later religious concept than those of the Cú Chulainn cycle in Ireland. The emphasis is no longer on the mother, and the society which composed the myths was patriarchal and patrilineal. Both the Cu Chulainn cycle and the *Four Branches* of the *Mabinogion* are pre-Christian and perhaps of much the same date, but the Welsh stories indicate a change of orientation. There are many links between the two: characters, presumably gods. and magic attributes such as life-giving caldrons are common to both. A Welsh form of *imramha* is also found in the bardic poems of Taliessin, whose work is supposed to date from the 6th century.

There is no doubt that the bulk of mythical tales was once very great and that what remains is but a small fraction of the whole. The work of numerous students of folklore in Scotland and England indicates that similar myths, often relating to the same gods. were once spread over the whole country. The Cailleach, the great mother, is found in western Scotland as well as in Ireland. She mas known as Dana: or Black Annis, in the midlands and Porkshire, as Magog, or Macha, from Land's End to East Anglia. In Italy, with her consort Lucifer, Dana, or Tana, taught her people magic, just as in Ireland and Scotland her people, the DC Danann, were famous as magicians. Magog is also known far to the east beyond the Carpathians.

Little Celtic mythology survives from Cornish or Breton sources, but the folklore is voluminous and to a large extent remains to be carefully sifted. It seems clear that it belongs to the Welsh rather than the Irish phase. See also IRISH LITERATURE; WELSH LITERATURE.

CELTIS (CELTES), **CONRADUS** (German name, KONRAD PICKEL) (1459–1508), the greatest German humanist and an outstanding Latin lyrical poet, was born on Feb. 1, 1459, at Wipfeld near Würzburg. He studied at Cologne and Heidelberg, lectured at various German centres of humanism. was crowned poet laureate by Frederick III at Nürnberg in 148; (the first German to receive this honour), spent two years in Italian humanist circles, studied mathematics and astronomy at Cracow and became professor of poetry and rhetoric in Ingolstadt in 1491. In 1497 Maximilian I appointed him professor in Vienna. Celtis founded, on Italian models; the *Sodalitas litternria Rhenana* at Heidelberg

and the Viennese *Sodalitas Danubiana;* in 1502 he became head of the new *Collegium poetarum et mathematicorum* at Vienna. He died in Vienna on Feb. 4, 1508.

Celtis' manuscript discoveries included Hrotswitha's plays and the so-called *Tabula Peutingeriana,* a map of the Roman empire. Among his scholarly works were editions of Tacitus' *Germania* (1500), Hrotswitha's plays (1501) and the 12th-century poem on Barbarossa, *Ligurinus* (1507). The patriotism which partly inspired these editions is an important element in Celtis; German greatness past and present is a recurrent theme, as in his inaugural lecture at Ingolstadt (*Oratio,* 1492), where in a nationalistic, anti-Italian tone he commends the study of poetry, eloquence and philosophy as a foundation for personal and political virtue. Celtis' masques with music, *Ludus Dianae* (1501) and *Rhapsodia* (1505), were early forerunners of baroque opera. His greatest work, however, is his lyric poetry: *Odes* (published posthumously, 1513)—Celtis aimed at being the German Horace—; *Epigrams* (in manuscript till 1881); and especially *Amores* (1502), poems of forthright sensuality and true lyrical intensity, presented in an elaborate symbolical framework characteristic of the age. By his range and versatility, his poetical power and skill, Celtis is the greatest German humanist and supreme German poet of his age; he has no rival until Goethe.

See L. Forster (ed.), *Selections From Conrad Celtis* (1948), with texts. translations, commentary, introduction and full bibliography; L. W. Spitz, *Conrad Celtis: the German Arch-Humanist* **(1957).**

(J. R. WE.)

CELTIS is a genus of about 70 species of trees and shrubs of the northern hemisphere and tropics. The plants, belonging to the elm family (Ulmaceae; *q.v.*), are deciduous or, rarely, evergreen. *See* HACKBERRY.

CELTIUM: *see* HAFNIUM.

CEMBALO (CLAVICEMBALO), the Italian word for harpsichord (*q.v.*), originally derived from the Latin *clavis* a "key," and *cymbalum* a "psaltery" or a "dulcimer": hence *clavicymbalum,* a psaltery with keys. Cembalo is used also in Germany synonymously with *Kielflügel,* the German word for harpsichord.

(R. A. Ru.)

CEMENT. The word "cement" is from the Latin verb "to cut," and originally had reference to stone cuttings used in lime mortar. Thus, it is logical that in the middle ages the mortar itself was commonly called cement. In correct modern usage, cement generally means only the chemical binder, and the term may be used with respect to any material serving such a purpose.

Ranking, in volume of production, far above all other cements are the general construction cements—powdered inorganic cementitious materials that are mixed with water and sand to make mortar; and with water, sand and larger stone particles to make concrete. This article is concerned primarily with such cements; others, to which the term "adhesive" is in general applicable, are discussed below, under *Adhesive Cements,* and in the article ADHESIVES.

Some modern organic plastics are attaining some use as cementitious building materials. When called cements they are often actually mortars, carrying inert filler. They are classed, in this article, among the adhesive cements.

Most construction cements are hydraulic cements; *i.e.,* ones that are not only mixed with water but will set and harden under water. They are composed of the commoner oxides of the earth's crust, and depend for their hydraulic property on chemical compounds of lime that react with water. Of the hydraulic cements, by far the most important is portland cement—the direct descendant of older types which it has largely supplanted. Portland-slag and portland-pozzolan cements are blends containing portland cement.

In the early 1960s, world production of hydraulic cement was over 350,000.000 short tons. The United States produced more than any other country, while the U.S.S.R., Federal Republic of Germany, Japan, China, Italy, France and Great Britain were other large producers.

Because of the great importance of portland cement, it is given major attention in this article; other cementitious materials are briefly discussed under *Other Cements.*

PORTLAND CEMENT

Portland cement is a finely ground powder, usually gray, which when mixed with water hardens and develops strength primarily because of a large content of anhydrous calcium silicates. These and other constituents react chemically with the water by hydration and hydrolysis. The most common raw materials are limestone and clay or shale. The raw mix is finely ground and heated to about 1,500° C. to decompose the calcium carbonate and recombine the calcium oxide; a partly fused clinker of marble size and larger is produced. The clinker is then ground, almost always with a small amount of calcium sulfate (gypsum), which retards set. Portland cements with special properties are produced by varying the oxide composition, and also by adding small amounts of chemical agents at the clinker-grinding stage or later.

Early investigators advanced divergent theories as to why portland cement forms a rigid, strongly coherent mass when it reacts with water. It has since been established that a colloidal gel of high internal surface area is formed. Whatever the extent of direct chemical continuity, it is apparent that large internal surface forces may also be involved.

How **Portland Cement Is Used.**—A mixture of cement and water is called neat cement paste, whether fresh or hardened. In some grouting operations, including oil-well cementing, the paste is used as such. Generally, however, it constitutes the hardening ingredient in mortar or concrete. This use of sand and stone filler, called aggregate, is an economy, and also reduces shrinkage. The cement paste ordinarily amounts from 20% to 35% of the volume of the concrete. Since plain concrete is not nearly so strong in tension as in compression, steel reinforcement is embedded in structural concrete to provide greater strength in tension. (For information on the technology of concrete, *see* CONCRETE.) Another use of portland cement is in soil-cement mixtures, used as pavement base. Portland cement is also mixed with asbestos fibre and water, and processed to make special products.

In the United States, the annual tonnage of concrete made with portland cement greatly exceeds the combined tonnage of all other construction materials. Concrete is used in residential, farm and public building construction; in pavements, dams, bridges, silos, piping, tanks, reservoirs, revetments, swimming pools, ornamentation, etc. Like organic plastics, it derives much of its utility from the fact that it is readily cast or molded into shape.

Concrete is used extensively for shielding against nuclear radiation. It is used around reactors and particle accelerators, and for construction of radiation shelters. Sometimes special, heavy aggregates are used to reduce required thicknesses.

History.—The Egyptians used impure gypsum plaster as mortar in pyramid construction. Slaked lime was used by the Greeks, and the Romans probably learned of its utility from them. Both the Greeks and Romans made a pozzolanic mortar by mixing finely ground volcanic material with lime, sand and water. Pozzolana hardens by reacting chemically with the lime. The name derives from the Italian town Pozzuoli. where a suitable volcanic tuff was found. The Romans also used powdered pottery fragments as pozzolana. The pozzolanic cements made by mixing such materials with lime and water were found to be resistant if exposed to water, and were for a long time the only cements known to be suitable for such exposure. Pozzolanic cement was used in such structures as the Roman Pantheon, and Colosseum. In the middle ages the quality of mortar declined. It was commonly a sand-lime mortar, and the lime was poorly burned.

In 1756 when John Smeaton was commissioned to rebuild the Eddystone lighthouse off Cornwall, Eng., a lime-pozzolana mortar was the recognized material for underwater construction, but it was not always satisfactory. Smeaton experimented and found that the better limes were those made from limestone containing considerable clay. He is thus credited with being the first to recognize what constitutes a hydraulic lime. In 1796, James Parker in England patented a hard-burned impure lime. His product, which he called Roman cement, attained wide use. It was essentially a natural cement (see *Other Cements,* below) in that it did not slake (absorb water and crumble) but required grinding. This was true of natural cements produced, from the late 1820s,

in the United States from "cement rock." A considerable natural-cement industry developed.

In 1824, a process for making "portland cement" was patented by Joseph Aspdin in England. He chose the name because of a fancied resemblance of the cement products to portland stone, a limestone quarried at Portland, Eng. Aspdin, by having conferred the name, is commonly considered to be the inventor of what has become the modern portland cement. Authorities recognize, however, that the matter is controversial because of other similar early developments. Modern portland cement is a logical scientific development from natural cement.

Methods of production have naturally changed greatly over the years. Early firing was in stationary. intermittently operated kilns. Production was on a small scale and the cement was ground with millstones. Kilns underwent various changes, but the most striking was the introduction of the rotary kiln. In 1877, T. R. Crampton obtained a British patent on a rotary kiln process for cement, but it was not a success. Frederick Ransome obtained British and U.S. patents in 1885 and 1886 for a process that achieved first success in the United States and led eventually to complete adoption of the rotary kiln for production of portland cement in that country. In Europe the continuously operating shaft kiln has remained a competitor.

MODERN PRODUCTION OF PORTLAND CEMENT

Raw Materials

Cement raw materials may be divided into those essentially supplying the lime component (calcareous), the silica component (siliceous), the alumina component (argillaceous) and the iron component (ferriferous). In the United States and Canada 30 different raw materials are used as listed in Table I. The oxide composition of various cement raw materials is given in Table II.

Table I.—*Raw Materials for the Production of Portland Cement*

Calcareous	Argillaceous	Siliceous	Ferriferous
Cement rock	Clay	Sand	Iron ore
Limestone	Shale	"Traprock"	Iron calcine
Marl	Slag	Calcium silicate	Iron dust
Alkali waste	Fly ash	Quartzite	Iron pyrite
Oyster shell	Copper slag	Fuller's earth	Iron sinters
Coquina shell	Aluminum ore refuse		Iron oxide
Chalk	Staurolite		Blast-furnace flue dust
Marble	Diaspore clay		
	Granodiorite		
	Kaolin		

Cement rock is a low-magnesium limestone containing clay. The Jacksonburg limestone of the Lehigh valley (Pa.) is a well-known example.

Limestones are composed essentially of calcium carbonate, varying minor percentages of magnesium carbonate and mechanically admixed impurities of clay and sand. Clay and sand are not objectionable impurities when the rock is used for the manufacture of portland cement. They supply the alumina, silica and iron oxide necessary for the formation of the desired silicates in the cement. The term "limestone" is used to include all carbonate rocks containing major quantities of calcium. However, because of its high magnesium content, dolomite (a carbonate of calcium and magnesium), cannot be used for the production of portland cement.

Table II.—*Per Cent Oxide Composition of Typical Cement Materials*

Type	SiO_2	Al_2O_3	Fe_2O_3	CaO	MgO	Ignition loss
Limestone	1.2	0.5	0.4	54.0	0.6	43.2
Limestone	5.6	1.0	0.5	50.7	0.8	41.2
Cement rock	14.2	4.8	1.6	40.2	2.8	34.2
Sand	89.7	2.4	0.7	0.6	0.7	5.9
Clay	67.8	14.3	4.5	0.9	1.2	8.0
Shale	63.0	20.0	5.5	0.7	2.7	6.0
Pyrite cinders	6.3	2.1	86.7	0.02	0.1	2.6
Slag	37.8	11.4	1.0	46.1	2.0	—
Sea shells (washed)	1.5	0.4	1.2	52.28	0.7	41.8
Fly ash	51.2	25.6	8.5	1.6	0.9	8.6

Marls are earthy, friable accumulations of calcareous material secreted by plants and animals in lakes and marshes. Over long periods of time the skeletal remains of plants mixed with shells of animals may form beds as much as 30-ft. thick, containing substantial tonnages of material suitable for cement manufacture.

Shell marls consist of mixtures of fossil shells, shell fragments and varying amounts of clay and sand.

A process used in several places in England and France is based on simultaneous production of sulfuric acid and portland cement from gypsum with addition of argillaceous components.

Oyster and clam shells of recent origin have been collected and burned for lime from Nova Scotia to Texas. Tonnage adequate for cement manufacture, however, is not known on the Atlantic coast of North America. In San Francisco bay shells occur in brackish water deposits as much as 30-ft. thick, and are suitable for cement manufacture. Along the Gulf of Mexico, oyster shells are the principal source of lime for cement manufacturers at Corpus Christi and Houston, Tex., Baton Rouge, La., and Mobile, Ala.

Coquina shells, used in Florida, are excavated under water and cleaned completely or partially of their sand content by washing.

Chalk, a soft, friable form of calcium carbonate of high purity, is used for cement manufacture in Denmark, England, France and Belgium, where it occurs abundantly.

Clay and shale must be added where alumina and silica are not present in the limestone in sufficient amounts (and this is true for operations other than those based on cement rock). Clay is earthy, easily disintegrated and widely distributed; shales are composed of clay minerals deposited in water in thin layers and subjected to some pressure and cementation, with some lithification. Shales are weak rocks but do not disintegrate as readily as the unconsolidated clays and therefore require grinding.

Basic blast-furnace slag may be substituted in part for the raw materials used in the production of portland cement. The slag is mixed with limestone and serves to introduce a part of the lime, silica, alumina and iron oxide.

FIG. 2.— FLOW OF MATERIALS THROUGH A CEMENT-MANUFACTURING PLANT SHOWING BOTH WET- AND DRY-PROCESS METHODS

A raw material which was not used much in the first half of the 20th century but which showed promise of becoming important is fly ash from power stations employing direct-firing coal mills. Such fly ash has a composition fairly close to that of portland-cement argillaceous raw material.

Iron materials commonly used are iron ores, pyrite cinders (the product of the calcination of pyrite) and mill scale (from hot-rolling of steel).

PROCESSING

Processing of the raw materials into finished cement embraces four stages (see fig. 2): (1) size reduction (blasting, crushing, grinding) to obtain the fineness and surface which will permit the chemical reactions to take place between the components, and formation of the cement compounds during the subsequent pyroprocessing (burning); (2) blending, correction and homogenization of the raw mix to obtain exactly the desired composition and uniformity; (3) liberation of carbon dioxide (calcination) and burning to form new compounds; (4) fine pulverization of kiln product (clinker). with addition of gypsum.

Crushing.—Various types of crushers are used in the cement industry depending on the nature (hardness, lamination, quarry-product size) of the rock. These include gyratory crushers in which a steel cone moves eccentrically inside a cone-shaped housing; jaw crushers in which the rock is broken between breaker plates whose motion is substantially horizontal; roll crushers where the reduction takes place between two rolls or between one roll and a breaker plate, the rolls frequently being equipped with case-hardened steel teeth; hammer mills in which the rock is fractured by heavy hammers swung from a horizontal shaft and flung against the rock by centrifugal action; and impact mills, a variation of hammer mills where no internal grates are required and where the hammers bounce the pieces of rock against breaker plates. When hammer mills are used, the rock is sometimes screened ("scalped") for removal of pieces too large to be handled by the crusher.

Grinding. — The various components are usually moved from raw material storage by overhead crane and deposited in roughly the desired proportions in concrete bins above feed hoppers serving the grinding mills.

In the grinding of the raw materials, two processes are used: the dry process in which the materials are dried to less than 1% moisture and then ground to a fine powder; and the wet process in which the grinding takes place with addition of water to the mills to produce a pulp or "slurry."

The use of the two processes in the United States is distributed approximately as shown in Table III.

TABLE III.—*U.S. Use of Wet and Dry Processes in Grinding Cement*

Distribution	Per cent wet	Per cent dry
By production capacity	58	42
By plants	60.5	39.5
By number of kilns		

Dry Process.--The product is normally reduced from a size of 2 to 2½ in. to a powder of from 75% to 90%, passing a 200-mesh sieve. The first stage, reducing the material size to approximately 20 mesh, may be done in vertical, roller or ball-race mills. Another type, the so-called ball mill, is a cylindrical machine equipped with heavy lining plates. It rotates at from 15 to 18 r.p.m. and is charged with 4–5 in. iron or steel grinding balls. The second stage is done in tube mills, which are similar to ball mills but are longer and of smaller diameter. Tube mills are charged with grinding balls of ¾ to 2 in. The tumbling, cascading and cataracting motions of the balls inside the mills reduce particle sizes by impact and attrition.

Frequently ball and tube mills are combined into a single machine consisting of two or three compartments, separated by perforated steel diaphragms and charged with grinding media of different sizes. This is called a compartment mill. In the process of grinding. an important relationship exists between the maximum size of the product being ground and the size of the grinding media.

Dry-process ball mills, compartment mills and tube mills may all be operated in closed circuit with air separators which separate the mill stream into coarse and fine fractions. The coarse fraction is returned to the mill for further grinding, whereas the fine frac-

tion may pass on to another mill or to silos.

Before limestone, cement rock and shale can be ground to a fine powder it is frequently necessary to dry them to remove free water. Such drying may take place in cylindrical dryers, typically 6 to 8 ft. in diameter and 60 to 150 ft. long. The heat is supplied from a combustion chamber. If coal is used for fuel, the chamber is stoker-fired to keep the flames from impinging directly on the material. In modern installations the drying and grinding operations are frequently combined by supplying hot air from an oil-, coal- or gas-fired furnace to the grinding system.

The finely ground raw meal is conveyed by pneumatic pumps, or by elevators and screw conveyors, to concrete silos. Frequent sampling of the finished product, followed by circulation, agitation and homogenization, enable the operators to arrive at the final blend by proportionate withdrawal from several silos. The final blend is again agitated and homogenized for one to two hours and is then ready to be conveyed to the kiln department.

Wet Process.—Ball, tube and compartment mills of essentially the same construction as for the dry process are used for grinding. Water or clay slip is added at the feed end of the initial grinder together with the roughly proportioned amounts of limestone and other components. Vertical mills are rarely suitable for wet grinding. The closed circuit involves vibrating screens to remove oversize particles for return to the ball mill, and rake classifiers, hydroseparators and cyclones for the tube-mill product. In modern installations wet grinding is sometimes accomplished in ball mills alone, operating with excess water in closed circuit with classifiers, hydroseparators and thickeners.

Finished slurry is then conveyed by centrifugal pumps to slurry basins designated as mixing, correcting, blending and storage basins according to their functions. Sedimentation and segregation in all tanks are prevented by constant agitation, by either compressed air or mechanical agitators or both. When a correcting tank is full, a representative sample is analyzed, and desired amounts can be drawn from various tanks into one or several blending tanks for complete homogenization. The output of the blending tanks is pumped to an agitated storage tank, or a kiln basin, which holds a supply equivalent to three to seven days' production. In this manner any remaining small fluctuations in the slurry composition are further equalized, providing a uniform kiln feed.

Beneficiation.—Cement raw materials can almost always be proportioned to provide the correct chemical composition, but in some cases it has been found to be economically advantageous to use froth flotation for removal of carbon and excess silica or alumina from quarry-run materials and thus avoid selective quarrying.

Burning.—The kiln department is especially important in a cement plant, since fuel consumption is a major item in the cost of manufacture and since the quality of the finished cement depends on the proper heat-treatment. Since raw- and finish-grinding departments most often are designed with higher capacities than those of the kiln department, a steady, high kiln output is also of the greatest importance for obtaining a low plant overhead.

Vertical kilns or shaft kilns, of the type used during the infancy of the cement industry, and still used in modernized versions in Europe, are not used in the United States and Canada for the production of portland cement, but in some locations are used for the burning of natural cement. The fuel economy of a shaft kiln is highly attractive, but it requires considerable labour for operation and the production capacity is relatively low.

The modern rotary kiln consists of a welded or riveted steel cylinder from 6 ft. in diameter and 60 ft. long (now rare) to $18\frac{1}{2}$ ft. in diameter and 610 ft. long. These cylinders ride on steel tires and roller supports; they incline a few degrees, and rotate at a speed of between 50 and 90 revolutions per hour. The kiln feed or raw mix ("slurry" for wet-process kilns and "raw meal" for dry-process kilns), fed into the upper end, flows slowly through the kiln in a matter of hours, leaving the discharge end as clinker. Heat is supplied at the discharge end by combustion of coal, fuel oil or natural gas, providing a process temperature of 2,600" to 3,000' F. For protection of the steel shell and for conservation of heat, rotary kilns are lined with refractories. The combustion gases pass through the kiln in counterflow to the material and leave the kiln through its feed end at temperatures of 600" to 1,600" F. depending on kiln length and process used.

Fuel consumption in dry-process kilns can be kept to a minimum through the use of internal heat exchangers, consisting of steel or ceramic crosses and flights, and by preheaters. The so-called suspension-gas preheater lets the raw meal pass through a system of cyclones, in countercurrent with kiln exit gases. When entering the kiln the feed is highly preheated, improving fuel economy and increasing materially the capacity of the rotary kiln.

In still another system (which may be termed semi-dry) the raw meal is mixed with 10% to 12% water and formed into pellets of one inch maximum size. These pellets are either dried and partially calcined on a slowly traveling grate through which the hot exit gases from the rotary kiln are passed, or are fed directly to the rotary kiln.

Wet-process kilns are somewhat longer than dry-process kilns inasmuch as a portion of the length (between $\frac{1}{4}$ and 3) is used for evaporation of the slurry water. Such kilns are also equipped with elaborate heat exchangers consisting of heavy chains suspended in loops or curtains inside the kilns to increase the surface of slurry exposed to the gases and to facilitate the heat transfer from the gas stream to the material.

Hot clinker from the rotary kilns goes to clinker coolers which serve the dual purpose of reducing the temperature of the clinker before it is stored or ground and regaining the clinker heat for reuse inside the kiln as preheated secondary or primary combustion air.

Modem rotary kilns are equipped with intricate control systems. Visual inspection is also possible by means of openings at the discharge end. Using coloured glasses, a trained operator can inspect for consistency of the semi-molten charge, size of clinker, place of the exothermic reaction, ring formation, colour and flame position.

Fuels.—The selection of kiln fuel is a matter of economics: the coal, oil or natural gas is selected which can be purchased at lowest cost per 1,000 B.Th.U., consistent with dependability of supply, uniformity and quality. In the United States and Canada, coal, oil and gas are used in cement plants, singly or in combination, or one fuel can be used as the main supply with another as a stand-by.

The manipulation of the combustion process in a cement kiln requires great skill and is of the highest importance to the quality of the clinker, fuel economy, production capacity of the kiln and preservation of the refractory lining.

Clinker Storage.—The cooled clinker is conveyed by drag chains, vibrating troughs or steel-band belt conveyors to storage. It is considered important to store the clinker under a roof, particularly in northern wet climates. This is true even though the exposed surface of clinker may be less than 1,000th of the exposed surface of finished cement of the same weight and though only a small amount of hydration would take place if the kiln clinker were wetted. At some plants, however, it has been found satisfactory to store large quantities of clinker outdoors, either unprotected or covered.

Finish Grinding.—The final stage in the manufacturing process involves grinding the clinker with a 4%–6% addition of gypsum. This product is the finished cement. The mills, essentially similar to the roller, race, ball, compartment and tube mills described under dry-process raw grinding, almost invariably use closed circuits with air separators. Cement fineness, formerly measured by the percentage passing certain screen sizes (*e.g.*, 96% passing a 200-mesh sieve and 90% passing a 325-mesh sieve), is now most frequently indicated in specific surface (surface area per gram). This measure can be determined by the Wagner (turbidity) method or the Blaine (air permeability) method. Both are relative indicators. The Blaine method lends itself to quick process control, whereas the Wagner method makes possible calculations of particle-size distribution. The average size of cement grains is about 10 microns (μ).

From the finish mill the cement is pumped pneumatically to silos and stored, ready for shipment. There it is again thoroughly tested for complete conformance to specifications. Total silo capacity

for cement plants may be between 10% and 24% of annual production, depending on whether the plant is located in the southern part of the U.S., where the seasonal pattern of construction is fairly level, or in a northern climate where construction and cement shipments are interrupted by the winter months.

The finished product may be shipped in bulk or in paper bags. Specially designed hopper cars or trucks, railroad boxcars, and barges are used.

Composition and Testing

In Great Britain, portland cement must meet specifications of the British Standards institution. In the United States, the specifications of the American Society for Testing and Materials (ASTM) are typical. Most countries place maximum limits on ignition loss, insoluble residue, magnesia (MgO) and sulfur trioxide (SO_3). Respective percentage limits of 3, 1, 5 and 2.5 are fairly typical. These respective limits protect against undue exposure, adulteration, delayed expansion and expansion from excess calcium sulfate. Where permitted. additions other than calcium sulfate and water are commonly limited to about 1%. Other chemical limitations are sometimes imposed concerning oxides, oxide ratios or calculated compounds. When certain reactive aggregates must be used, a maximum limit of 0.6% may be placed on alkali oxides.

Portland cements must meet physical requirements for fineness, setting time, soundness and strength. Because of the high fineness of modern cements. sieving tests are being supplemented and supplanted by determinations of specific surface by the sedimentation and air-permeability methods. By the latter method. the usual product in the United States has a specific surface of 2,800 sq cm. per gram or better. British specifications do not require so high a value.

So-called initial and final setting times are determined by the increasing resistance of neat cement paste to weighted needles (Gillmore or Vicat). Initial set must generally not occur short of 30 to 60 min. Final setting time is generally limited to 10 hours.

Soundness is evaluated by expansion tests, generally involving heat-treatment of neat cement pastes previously cured for one day. In the Le Chatelier test, used in Great Britain and many other countries, a split cylindrical mold with projecting indicators gives the expansion of the specimen after a period in boiling water. The ASTM specifies an autoclave treatment of neat bars, which must not expand more than 0.8%.

Tensile- or compressive-strength tests, or both. may be required. Tension tests are made with small figure-eight-shaped mortar briquettes. Compression tests are made with mortar cubes or cylinders. Because of different test conditions, strength requirements of the various countries are usually not closely comparable. Mortar tensile strength requirements for general construction cement seldom exceed 400 lb. per square inch (p.s.i.), or 28 kg. per square centimetre. even after 28 days of moist curing. In contrast, compressive strength requirements run up to several thousand pounds per square inch. Strengths of mortar and concrete are greater the lower the water-cement ratio, and they continue to increase even for years under prolonged moist curing.

Composition and Its Effect on Properties. — The approximate oxide composition ranges — given in Table IV — are wide enough to cover most portland cements of practically all types.

Table IV.—*Composition Ranges of Portland Cement*

	Per cent
Lime, CaO	60 –67
Silica, SiO_2	17 –25
Alumina, Al_2O_3	3 – 8
Iron oxide, Fe_2O_3	0.5– 6
Magnesia, MgO	0.1– 5.5
Alkali oxides, Na_2O+K_2O	0.5– 1.3
Sulfuric anhydride, SO_3	1 - 3

Source: F. M. Lea, *The Chemistry of Cement and Concrete*, revision of book by Lea and Desch, Edward Arnold Ltd., London (1956).

Tests made for free iuncombincd) CaO generally show less than 2%, and often less than 1%. Compounds formed in the clinker are tricalcium silicate ($3CaO.SiO_2$), dicalcium silicate ($2CaO.SiO_2$), tricalcium aluminate ($3CaO.Al_2O_3$) and a ferrite phase commonly calculated as tetracalcium aluminoferrite ($4CaO.Al_2O_3.Fe_2O_3$). A shortened symbolism has developed which represents these solids as C_3S, C_2S, C_3A and C_4AF. The amounts of these compounds that can theoretically be formed can be calculated from the amounts of the four oxides of which they are composed.

In modern technology, the calculated amounts of these compounds provide a basis for estimating the properties of the cement. Early strength development is attributed largely to C_3S, whereas, with continued moist curing, C_2S causes increase in strength at the later ages. The need for retardation of set is attributed mainly to the C_3A, and the content of C_3A is related inversely to ability of the concrete to resist disintegration by sulfate-bearing water. Raising the amount of C_4AF, by raising the iron-oxide content of the mix without increasing the alumina content, is one means of reducing the amount of C_3A. The C_3A and C_3S are the compounds that release the most heat when the cement hydrates, or hardens.

Standard Types of Portland Cement. — The ASTM has defined five types of portland cement. identified in the specification (C150–61) by the Roman numerals I to V. These types, discussed below, serve to indicate variations in properties that can be brought about by varying composition and fineness.

Type 1. — ASTM type I cement is intended for general concrete construction where special properties are not necessary. The British counterpart is "ordinary" portland cement. Type I is less restricted in chemical composition than the other types. A representative composition is 48% C_3S, 27% C_2S, 12% C_3A and 8% C_4AF.

Type 11. — This cement is intended for use where concrete may be exposed to moderate sulfate action or where no more than moderate liberation of heat is advisable. The desired properties are obtained by placing moderate limits on C_3A and C_3S.

Type 111. — Type III is high-early-strength portland cement, the British counterpart of nhich is called "rapid hardening." It is high in fineness, and at least moderately high in C_3S. It develops good strength within one day, and is used where concrete must be placed in service as soon as possible.

Type lV. — This is called low heat cement, and has a British counterpart with the same name. It is used where considerable thicknesses of concrete are required and temperature rise might be excessive, thus leading to excessive volume change and cracking. The British specification has direct limitations on heat evolution. The ASTM specification places limits on C_3A and C_3S. Type IV cement is generally produced only for special, large projects.

Type V. — This cement, which also is not always available. is for use where high sulfate resistance is required. It is low in C_3A. A sulfate-resistant portland cement known in Europe as Ferrari cement has a weight ratio of Al_2O_3 to Fe_2O_3 between about 0.6 and 1.0.

Air-Entraining Cement. — The ASTM adds "A" to its type numbers to indicate air-entraining cement. Various organic chemicals may be added in amounts up to a few hundredths of 1% (by weight of cement) to entrain fine bubbles in the mix. A concrete containing 4% to 7% by volume of these fine air bubbles has greatly increased resistance to scaling from frost action. The entrained air also produces a more workable mix.

Special Portlands. — Portland cements modified by small additions of chemical agents have acquired such names as oil-well, plastic, waterproofed and hydrophobic cement. Oil-well cement for use at the high temperatures in deep wells is prepared or treated to avoid quick set, The plastic cements have improved workability and may be used in stucco or exterior plaster. The waterproofed cements are treated to improve the resistance of the concrete to penetration by water. Hydrophobic cement is treated to minimize adsorption of water vapour during storage before use.

Coloured portland cements are made by adding pigment to either the white or gray cement. A white portland cement can be produced from materials very low in iron oxide.

Portland Blends. — Portland cement is sometimes ground with other material of cementitious value, gypsum being added as desired. The portland-slag and portland-pozzolan cements have al-

ready been mentioned. In these types, the portland cement and the other material are both substantial proportions of the whole, but the proportions are widely different in different instances.

In portland-pozzolan cement, the pozzolana—a siliceous material—reacts with lime liberated by hydrolysis of the portland cement. Natural pozzolanas are commonly of volcanic origin. Artificial ones include furnace fly ash and certain burned earths, clays and shales. The portland-pozzolans have a lower rate of heat liberation than type-I portlands. With proper curing they develop comparable eventual strengths if good pozzolana is used. Some of these cements protect against alkali-aggregate reaction.

In portland-slag cements a quick-cooled high-lime blast-furnace slag is used which is cementitious when activated by lime. Portland-slag cement has properties comparable with those of portland cement. It has relatively low heat evolution.

Expanding cements have been developed, for special purposes, in which portland cement is blended with expansive material. The original expansive cement, produced in France, relies for its expansion on formation of calcium sulfoaluminate hydrate.

Masonry cements are commonly made by finely grinding portland cement with limestone and an air-entraining agent. The entrained air improves workability, and the limestone, though not cementitious, is considered desirable as a filler.

Blends of portland cement with natural cement are sometimes made. Also portland cement and high alumina cement (see below) are sometimes mixed to obtain a quick-setting product.

OTHER CEMENTS

Other Hydraulic Cements.—The hydraulic limes and natural cements, made by calcining lumps of natural clayey limestone, are usually distinguished by the ability or lack of ability of the calcined lumps to slake in water. The hydraulic limes slake sufficiently to avoid the necessity of grinding, and are commonly sold as the screened, hydrated product. The natural cements require grinding. In both cases the firing temperatures are lower than for portland cement, but some recombination of lime occurs and is responsible for the hydraulic properties—which are, however, of relatively low order. Since the development of portland cement, the markets for these earlier products have dwindled.

Pozzolanic and slag cements, made by using hydrated lime with the pozzolana or slag, are employed in some countries but are of less general utility than their counterparts in which portland cement replaces the lime.

A superior type of slag cement, called supersulfated cement in Great Britain, is made by grinding slag with calcium sulfate. It develops good strength and shows sulfate resistance.

High alumina cement, also called aluminous cement, and in France *ciment* fondu, differs from portland cement in being dependent on calcium aluminates rather than calcium silicates for its strength development. It is manufactured by fusing a mixture of limestone and bauxite. The calcium aluminates formed are lower limed than C_3A. The cement gives high early strength, and has refractory qualities.

Other Construction Cements.—The limes produced by calcination of nonclayey limestones are not hydraulic, and are not ordinarily called cements. They are supplied both as quicklime (CaO) and hydrated lime. They are used in plasters and mortars that harden by drying out and reacting with carbon dioxide from the air. For stronger mortar, the lime may be partly replaced by portland cement.

Various gypsum plasters are made by partial or complete dehydration of gypsum (*q.v.*), $CaSO_4.2H_2O$, commonly with addition of special retarders or hardeners. They set and harden by recombining with water. Pure plaster of Paris, $CaSO_4.\frac{1}{2}H_2O$, sets very quickly. With added retarder it is called wall or hard wall plaster. For especially hard-finish plaster, the gypsum is completely dehydrated at high temperature, and chemicals such as alkali sulfate, alum or borax are added. Keene's, Mack's and Parian cements are hard-finish plasters. Hair or fibre and lime or clay may be added to the wall plasters during manufacture. Except for some finish coats, plaster coats are sanded.

Magnesium oxychloride cement, also called Sorel cement, is obtained in the hardened state by mixing magnesium oxide with a solution of magnesium chloride. Fibrous matter and sand are also incorporated. The cement is used mainly for flooring, but also for plaster, tile, decorations, etc. Prolonged contact with water is detrimental.

Refractory mortars are sometimes made with refractory aggregate, and clay as binder, and depend for strength development on vitrification of the clay as the temperature is raised. In other refractory mortars, high alumina cement may also be used. Other "air-setting" mortars consist of refractory aggregate, clay and sodium silicate solution. Additional chemicals may be used as binders or fluxes. Often the purpose is to produce only a temporary bond (as in making refractory brick) until vitrification can take over. For such a purpose, lime, hydraulic cement or organic materials such as tar may be used.

Pipe-sealing Cements.—In the gas and oil industries several kinds of jointing cements or pipe-sealing preparations are used. Among these are lead paints, graphite and oil, shellac in methyl alcohol, litharge and glycerin, iron filings and ammonium chloride, and various pasty materials.

Adhesive Cements.—The ancient water-soluble adhesives based on protein glues, vegetable gums and starches are now supplemented by both aqueous dispersions and organic solutions of synthetic plastics. Household rubber, pyroxylin and other cellulose cements are examples of adhesives that bond by the drying out of organic solvent.

Ancient waxes and pitches and the sulfur, asphalt and coal-tar cements are hot-melt cements similar in function to the modern polymeric thermoplastic solids that soften and become adhesive under the action of heat.

In contrast, thermo-setting plastics are generally low-molecular-weight chemicals or "pre-polymers" that are polymerized and set by heating or by chemical action of catalysts or curing agents. Of this nature are the phenolic, furan, epoxy, urea and melamine resins. All can act as adhesives.

Some adhesives, based on rubber or other elastomers, remain tacky and are used as removable pressure-sensitive tape, labels, etc.

Adhesives are often spoken of as cements even when used only to form thin films. Often, however, distinction is made between adhesives and cements, or mortar cements, that are based on adhesives but involve the use of a filler, or fine aggregate.

Catalyzed thermo-setting cements are used in special chemical-resistant masonry, and even for more general construction purposes. Epoxy resin cements bond strongly to concrete.

Bituminous, rubber and synthetic resin emulsions have been used integrally in concrete, along with portland cement, to confer special properties.

Silicate cements are generally based on aqueous sodium or potassium silicate solution as adhesive, usually with addition of graded silica as filler. The newer ones are mixed with a chemical agent at time of use, to obtain quicker set. Dental silicate cements, however, do not contain silicate solutions but glasses or fritted silicate reactive to phosphoric acid. *See* ADHESIVES; MORTAR IN BUILDING.

(A. A. BA.; C. F. CL.; H. H. ST.)

CEMENTATION, a metallurgical term which describes a process of introducing elements into the outer layer of metal objects by means of diffusion at high temperatures. As an example, an iron object packed in carbon and heated at a temperature lower than its melting point will gradually absorb carbon so that a layer of high carbon steel is formed on the low carbon core.

Continued heating will give complete conversion of the iron to steel; this was the method used for making steel until the development of modern processes. (*See* also METALLURGY: *Heat-Treatment: Surface Hardening;* NITRIDING; SURFACE HARDENING.)

Cementation is also the term used for obtaining a metal from solution through displacement by a more active metal. One commercial application is to add iron scrap to copper sulfate solutions so as to precipitate "cement" copper. (*See* COPPER: *Commercial Production Processes: Precipitation.*)

Geologists refer to the deposition of mineral matter in the spaces between grains of sediment as cementation. The most common cements are silica, either as quartz or chalcedony, calcite, and iron oxide.

Such cementation is one of the means by which sediments are converted into rock.

See SEDIMENTARY ROCKS. (A. W. S.)

CEMENT ROCK. A cement rock is an argillaceous (clayey) limestone whose composition is such that it may be used for the manufacture of cement without the addition of other earth materials or with the addition of only relatively small amounts of such materials. Some cement rocks contain the mineral quartz as silt or sand particles along with their argillaceous component. The principal carbonate in cement rocks employed for portland cement manufacture is calcium carbonate; magnesium carbonate must be low, in accordance with the usual specifications for portland cement raw materials. High-calcium limestone, clay or shale may be blended nith the cement rock to modify its composition. Rock used for making natural cement, sometimes referred to as a natural-cement rock, is of similar character to that mentioned above but the allouable amount of magnesium carbonate is flexible. Both dolomitic and calcitic argillaceous limestones have been used as natural-cement rocks.

CEMETERY, literally a sleeping place, the name applied by the early Christians to the places set apart for the burial of their dead. These were generally outside the city walls and unconnected with churches, the practice of interment in churches or churchyards being unknown in the first centuries of the Christian era. The term cemetery has, therefore, been appropriately applied in modern times to the burial grounds, generally extramural, which have been substituted for the overcrowded churchyards of populous parishes.

United States. — In the United States cemeteries were the final outgronth of individual burial places on the farms or near the homes of the earliest settlers. Later the burial place was connected with the church. a custom that is not entirely obsolete. Prominent men were buried beneath the church building during the 17th and 18th centuries, but the crowded conditions together with the fact that the practice was recognized as unsanitary caused it to be abandoned. In villages and small touns the church "graveyards" grew into disrepute many years ago because of the neglect they were subjected to. There was no provision for care of such burial places except the slight attention a sexton mould give, and disorder resulted. Detached cemeteries have been in use in the United States since 1832 when Mt. Auburn was established in Boston. Philadelphia soon after set up some notable burial places, and Greenwood in New York city had its beginning in 1842. From 1860 churchyard burials have gradually been discontinued until today they are but exceptions to the rule of beautiful community cemeteries. From single burial plots on private property, to church graveyards, to cemeteries and now to "memorial parks" where the graves are marked with flat metal markers instead of the customary gravestones, has been a notable transition

During the days when cemeteries were maintained by and in connection with the church, members and their families were entitled to a burial site. No expense was attached to the burial except the cost of opening the grave. The absence of funds for upkeep, however, led to the deterioration of the property and to the ultimate abandoning of that type of burial. In the modern cemetery, lots are sold by the city or village, if owned by such a body, or by the association, which has charge. A definite fee is charged for perpetual care, and a charge is made for opening the grave and other duties performed by the sexton or superintendent Generally speaking, cemeteries are supposed to be maintained with no idea of profit, and this is the case in a great majority of places.

Some religious denominations, notably the Roman Catholic Church, have their own cemeteries, though not in connection with the church building itself. The Jews have many burial sites. and now and then one comes across a cemetery maintained by one of the Protestant sects. Throughout the country there are many cemeteries maintained by the Masonic or other fraternities for their own members and members of their families.

There are many state and national cemeteries in the United States that have been created by statute for the burial of army and navy men and men connected with state institutions (*see* NATIONAL PARKS; ARLINGTON NATIONAL CEMETERY; WAR GRAVES).

England. — By the middle of the 18th century in England, the consequences of overcrowded churchyard burial and the lack of adequate space for further burial within city limits had become a matter of public apprehension.

From 1840 to 1855 attention was repeatedly called to the unsanitary condition of the London churchyards by the press and by parliamentary committees, the first of which reported in 1843. The vaults under the pavements of the churches and the small spaces of open ground surrounding them were crammed nith coffins. In many of the buildings the air was so polluted that it was a direct source of disease and death to those nho frequented them.

In the churchyards coffins were placed tier above tier in the graves until they were within a few feet (or sometimes even a few inches) of the surface, and the level of the ground was often raised to that of the lower windows of the church. To make room for fresh interments the sextons had recourse to the surreptitious removal of bones and partially decayed remains, and in some cases the contents of the graves were systematically transferred to pits adjacent to the site, the grave diggers appropriating the coffin plates, handles and nails to be sold as waste metal. As a result of these practices the neighbourhood of the churchyards was always unhealthy and their sight intolerable.

In all the large towns these evils prevailed in a greater or lesser degree. In London, however, because of the immense population and the consequent mortality, it forced itself more readily upon public attention; and after more than one partial measure of relief had been passed the churchyards were, with a few exceptions, finally closed by the act of 1855.

The cemeteries, which occupy a large extent of ground on all sides of the city, became the burial places of the metropolis. Several London cemeteries had been established by private enterprise before the parsing of the Burial act of 1855 (Kensal Green cemetery dates from 1832), but that enactment marks the time from which the general development of cemeteries in Great Britain and Ireland began. Burial within the limits of cities and tonns mas almost everywhere abolished, and where it was still allowed it was surrounded by safeguards that made it practically Innocuous. The increasing practice of cremation (*q.v.*) has assisted in the movement for disposing of the dead in a more sanitary manner; and the practice of burying the dead in more open, ventilated coffins, and abandoning the old system of family graves, has had considerable effect in improving the situation.

In England a cemetery was made either the property of a private company incorporated by act of parliament or of a local authority and was made subject to the Cemeteries Clauses act, 1847, the Public Health act, 1875, and the Public Health (Interments) act, 1879. For further legislation and practices regarding cemeteries and burial, *see* DEATH (LEGAL ASPECTS); FUNERARY RITES AND CUSTOMS.

CENACLE, the term applied to the eating room of a Roman house in which the supper (cena) or latest meal was taken. It was sometimes placed in an upper story. The Last Supper in the New Testament was taken in the cenacle, in the "large upper room" cited in Mark (xiv, 15) and Luke (xxii, 12).

The Society of Our Lady of the Cenacle, a society of Roman Catholic nuns founded at La Louvesc, France, in 1826, provides facilities for retreats for women; hence, the term also has come to signify a retreat house.

CENCI, BEATRICE (1577–1599), famous for her tragic history and for the fables to which it gave rise, was born in Rome on Feb. 6, 1577, the daughter by his first wife of Francesco Cenci (1549–98), a vicious and violent Roman nobleman of great wealth and influence. Francesco had 12 children by his first wife, but his second wife, Lucrezia Petroni, brought him none. He was constantly embroiled with his family and in 1595 he took Lucrezia, with Beatrice, to the lonely castle of La Petrella in the province of Aquila, imprisoning them there in the upper rooms and treating them with great brutality. After various attempts at freedom, Beatrice found refuge in a liaison with the castellan, Olimpio Calvetti. With Calvetti, her brother Giacomo and others, she finally planned the murder of her father. He was assassinated on Sept. 9, 1598, and his body thrown from a balcony to create the appearance of an accident. The facts, however, soon came out, and the whole Cenci family was arrested. Lucrezia, Giacomo and Bernardo, another brother, confessed the crime, and Beatrice, who at first denied everything even under torture, also ended by confessing. Great efforts were made to obtain mercy for the accused, but Pope Clement VIII refused to grant pardon. In Rome, on Sept. 11, 1599, Beatrice and Lucrezia were beheaded, and Giacomo was torn with red-hot pincers, killed with a mace, drawn and quartered. Bernardo's penalty, because of his youth, was commuted to perpetual imprisonment, and after a year he was pardoned. The Cenci property was confiscated, and this, it was rumoured, was the pope's object in destroying them.

The story of the Cenci has been the subject of poems, dramas and novels and occupies a larger place in literature than in history. Shelley's tragedy (1819) and F. D. Guerrazzi's novel (1854) may be mentioned.

BIBLIOGRAPHY—A. Bertolotti, *Francesco Cenci e la sua famiglia* (1877); C. Ricci, *Beatrice Cenci* (1923; Eng. trans. 1926); L. Pastor, *History of the Popes From the Close of the Middle Ages,* vol. xxiv (1933). (P. J. J.)

CENNINI, CENNINO DI DREA (c. 1370–*c.* 1440), late medieval Italian painter and writer on art, was born near Florence and was supposedly a pupil of Agnolo Gaddi for 12 years. No authenticated paintings by his hand have been discovered and his fame rests upon his *Il* Libro dell 'Arte or Trattato *della* Pittura, the first Italian art treatise in the Giottesque tradition. Painting, according to Cennini, holds a high place among human occupations because it combines theory or imagination with the skill of hand, "to discover things not seen, hidden by the shadow of natural objects." The aspiring painter is advised to study with a master as early and for as long as possible. to copy from the masters and to cultivate a steady hand by moderate living. Detailed instructions are given for the preparation of pigments and brushes and for painting panels and walls. There are directions for other tasks, such as painting on glass and making of casts from life. Two manuscript copies of the treatise are preserved in Florence. Various editions of the Italian text have been printed including one by D. V. Thompson (1932), who also brought out an English translation in 1932–33. Translations have been made into French and German.

See V. and *R.* Borradaile, *Student's Cennini* (1942).

CENOBITE, one who shares a communal religious life under vows, as opposed to living solitarily as a hermit (*q.v.*) or anchorite. A mixture of the eremitic and the cenobitic life is found in the Carthusian order and in the lavra system of the Orthodox Eastern Church. See further MONASTICISM.

CENOMANI, in ancient times one of the largest Celtic tribes to settle in Cisalpine Gaul, occupying territory in the modern Italian *regioni* of Lombardy and the Veneto. Their territory was probably bounded by the Ollius (Oglio), Padus (Po), and Athesis (Adige) rivers with the Insubres as their western and the Veneti as their eastern neighbours: their principal towns were Brixia (Brescia), Verona, Cremona (until the foundation of a colony there in 218 B.C.), and possibly Bergomum (Bergamo). They were allies of Rome against their kinsmen led by the Boii and Insubres in the Gallic war of 225; and though they joined the rising led by the Carthaginian general Hamilcar in 200 soon after the Second Punic War, they deserted the Insubres during the battle at Lacus Larius (Como) in 196, and secured a satisfactory treaty from the Romans (though in common with other Gallic states they accepted a provision, perhaps inserted at their own request, that none of their members should receive Roman citizenship). Their subsequent history followed that of the rest of Cisalpine Gaul.

The origin of the Cenomani is doubtful. Pliny states that they had lived in Gaul near Massilia (Marseilles), but in imperial times a tribe called Cenomani Aulerci lived in the modern *département* of Sarthe. The *civitas Cenomanorum* gave its name to the town cf Le Mans which under the ancient name of Suindinum or Vindinum was its capital.

CENOTAPH, a monument or tablet to the memory of a person whose body is buried elsewhere. The custom arose from the erection of monuments to those whose bodies could not be recovered, as in the case of drowning. The term is often used of the monuments raised in many places in memory of those who perished in war; *e.g.,* the cenotaph in Whitehall, London; the Soldiers' and Sailors' monument, New York city. See also SCULPTURE, SEPULCHRAL; TOMB.

CENOZOIC ERA, the latest major division of geologic time, starting about 70,000,000 years ago and extending to the present. Generally the era is divided into two periods: Tertiary (*q.v.*), which ended about a million years ago; and Quaternary (*q.v.*), which is in progress. Evidence bearing on geologic history improves with recency and the Cenozoic periods are divided into well-established epochs. In order of decreasing age the Tertiary epochs are Paleocene, Eocene (*see* EOCENE AND PALEOCENE), Oligocene, Miocene and Pliocene (*qq.v.*); the Quaternary epochs are Pleistocene (*q.v.*) and Recent. Major crustal movements of the era include formation of the Alps, Himalaya and related mountain chains of Eurasia and northern Africa; repeated uplifts of the American Cordilleras; development of great island arcs within the Pacific ocean and the Caribbean region; and broad continental uplifts. Widespread glaciation occurred in the northern and southern hemispheres during the Pleistocene epoch.

Geologic Time Chart

System and Period	Series and Epoch	Distinctive Records of Life	1,000 Years
CENOZOIC ERA			
Quaternary	Recent	Modern man	11
	Pleistocene	Early man	1,000
Tertiary	Pliocene	Large carnivores	
	Miocene	Whales, apes, grazing forms	
	Oligocene	Large browsing mammals	
	Eocene	Rise of flowering plants	
	Paleocene	First placental mammals	70,000
MESOZOIC ERA			
Cretaceous		Extinction of dinosaurs	130,000
Jurassic		Dinosaurs' zenith, primitive birds, first small mammals	160,000
Triassic		Appearance of dinosaurs	200,000
PALEOZOIC ERA			
Permian		Reptiles developed, conifers abundant	235,000
Carboniferous			
Upper (Pennsylvanian)		First reptiles, coal forests	260,000
Lower (Mississippian)		Sharks abundant	285,000
Devonian		Amphibians appeared, fishes abundant	320,000
Silurian		Earliest land plants and animals	350,000
Ordovician		First primitive fishes	400,000
Cambrian		Marine invertebrates	500,000
PRE-CAMBRIAN TIME			
		Few fossils	3,500,000–4,000,000

5. Talma's tomb in the Père Lachaise cemetery, Paris
6. Graveyard of the Ages, in Canton, southern China

Deciduous trees, well-developed in late Mesozoic time, the era of middle or intermediate evolution of life, have remained dominant in the Cenozoic, or era of modern or recent life, with much further diversification. Continued evolution of plants includes development of grasses. cereals and fruits. which have become suitable foods for specialized types of animals, Birds have evolved from the Mesozoic reptilelike ancestors into a legion of modern forms. . Mammals, small and primitive in early Cenozoic time, rapidly became diversified, commonly with increase in size. Some large types became extinct in mid-Tertiary; others, including horses, elephants and camels, evolved with continued specialization and generally increased size into the Quaternary. Primitive men lived in early Pleistocene time, and modern man witnessed widespread glaciation in norihern lands In addition to the separate articles on the periods and epochs of the Cenozoic referred to above *see* GEOLOGY; PALAEOBOTANY; PALAEONTOLOGY. (C. R. L)

CENSER: see INCENSE; THURIBLE.

CENSOR, in ancient Rome, the title of two magistrates who took the census (from Lat. *censere,* "to assess"). the registration of individual citizens and property. Instituted in 443 B.C., perhaps to relieve the consuls of this duty. they were, like them, elected in the *comitia centuriata* (see COMITIA), and only with a consul presiding. At first patricians alone were eligible, but plebeians were elected from 351 onward. Re-election was prohibited in 265. Intervals between elections were about five years, but tenure was limited to 18 months. Acts of one censor were invalid without the assent of his colleague, but decisions of the two were valid without appeal. As no substitutions were allowed, the death or abdication of one censor removed his colleague from office. Their acts did not bind their successors. Though without imperium (see EMPIRE), fasces or lictors (*qq.v.*), they held the highest auspices, sat on curule chairs, wore the toga *praetexta* (the toga with a purple border worn by curule magistrates).

The functions of the office eventually raised it above the consulship in dignity, and made it the crown of a political career. After 300 B.C. all but three censors were of consular rank. Their functions were: (1) the registration of citizens, old and new. with estimates of the value of their property. in tribes and classes. the former as a basis for voting in the tribal and plebeian assemblies, and for the levy for military service, the latter for assignment to centuries in the centuriate assembly; (2) the assessment of liability to tax based on the value of the citizen's property; (3) exclusion from public functions, such as a place in a tribe or a century, voting, military service, membership in the equites (*q.v.*), change of tribal registration, and assignment to the aerarii (*q.v.*), of citizens on moral grounds for disgraceful or criminal acts. (This function was known as the regimen *morum* or guardianship of public morals, and the action resulted in a stigma; *infamia*); (4) a solemn religious act of purification of the citizen body and vows for its future well-being (lustrum), which closed the census. Subsequently further functions were added: (5) the selection of the senate (*q.v.*), just before 312 by the *lex Ovinia;* and (6) various financial functions such as the leasing of contracts for the repair and the construction of public buildings and for the collection of taxes.

The censorship was suspended during the dictatorship of L. Cornelius Sulla and suspended, not abolished, during the rule of the emperor Augustus. The last regular censors were elected in 22 B.C., but the emperors assumed censorial powers; Claudius (A.D. 47–48) and Vespasian (in 73) took the title, and Domitian was censor for life.

In modern times the word "censor." apart from its use in connection with censorship proper (see CENSORSHIP), is used in some institutions, notably in academic ones, for one who exercises supervision over the conduct of others: for instance, as a title for certain offices in some universities in the United Kingdom. The Council of Censors, in U.S. constitutional history, was the name given to a council provided by the constitution of Pennsylvania. 1776–90, and by the constitution of Vermont, 1777–1870. Under both constitutions the Council of Censors was elected once in seven years, to inquire into the working of the government departments, the conduct of the state officers and the working of the laws, and to discover whether the constitution had been violated in any particular. The Vermont Council of Censors, limited in number to 13, had power to call a convention if it thought the constitution required amending. A convention summoned by the council in 1870 amended the constitution by abolishing the censors.

CENSORSHIP. "Every idea is an incitement," said Justice Oliver Wendell Holmes. Censorship—*i.e.,* restriction on ideas prior to, or prosecution following. their publication — historically was based on the principle that ideas are alnays important as incitements to action, as guarantors of salvation or damnation of the soul or as confessions of character, and therefore in any case a matter of grave social concern Recognition of nhat Holmes spoke of as "free trade in ideas" was a late development in history and has never been universally accepted. The history of censorship demonstrates that every idea may be an incitement to persecution.

But the history of censorship. fortunately. was also the history of liberty and toleration; otherwise there would have been no growth of political, social and religious ideas, and mankind would be without an intellectual history. Certainly a large part of history was the struggle of liberty against forces of repression—against ignorance and superstition, love of ease and fear of change, vested interests and love of power.

It seems that historically religious ideas were the first target of censorship, through persecution for blasphemy and heresy; then with the development of strong states came political ideas, with persecution for sedition and treason; most recently came ideas relating to the emotional and. more especially, the sexual nature of man, leading to persecution for obscenity. New means of communication called for new measures of control: this was true of the printing press, the cinema! the radio and television, the establishment of public libraries, the development of textbooks for school use and the introduction of the paperback book and the comics.

HISTORICAL DEVELOPMENT

Means. — The English common law as known to Sir William Blackstone conceived of censorship as previous restraint on publication. This form of censorship was achieved through official licensing of newspapers, plays and books, or their suppression before publication. Another form of previous restraint was the requirement of a licence to permit distribution of a publication in a public place or from door to door, or to permit the making of a speech in a public place. Previous restraint was also imposed on thc disclosure of official data considered confidential, secret or restricted—*i.e.,* censorship on sources of information. When suppression could not be achieved the government resorted to prosecution after publication, charging that the matter published or distributed constituted a criminal offense for which imprisonment or other punishment was the sanction.

Censorship was also achieved through administrative withholding or withdrawal of postal privileges or punishment for illegal use of the mail, and through bans on imported books imposed by customs officials.

Legislative investigations into opinions, affiliations and publications have had the effect of censorship, mainiy, perhaps, by leading to self-policing policies adopted by some communications industries seeking to ward off legislative enactments that would mean governmental control or regulation. The effects of censorship were also accomplished by voluntary citizen groups which used persuasion or mass pressure, involving the threat of economic boycotts, to keep publications that they considered offensive off newsstands and bookstalls and to edit or suppress movie scripts.

Greek.—For the western world it may be that the Athenians and Ionians were the first to assert the principle that persuasion is better than coercion. The first laws that imposed limits on

speech were those that protected reputation. Truth, however, was a defense, so that the major value remained liberty of expression, not security of reputation. Philosophers questioned the appearances of the material world, and sophists and dramatists placed before the masses questions that went to the foundations of the political, religious and moral world.

But occasionally there were instances of repression and persecution. In Periclean Athens (5th century B.C.) the philosopher Anaxagoras was fined for impiety. Likewise Protagoras was charged with blasphemy; he fled from Athens but his books were burned. Euripides probably was prosecuted for impiety. A law repressing dramatic invective was enforced for two years in wartime but was repealed in 437 B.C. Phrynichus was fined for presenting a play that brought to mind the destruction of Miletus, and the Athenians "forbade forever" the acting of that (lost) play. These laws seem not to have intimidated authors and philosophers. In fact, free speech came to be accepted as the most important differentiation between the citizen and the slave or the alien.

Yet history concedes that the most famous Athenian of all, Socrates, mas the first martyr to freedom of speech. Socrates was executed in 399 B.C., when he was 70 years of age. Because he exercised freedom of inquiry to the annoyance of some fellow citizens, Socrates was charged with worshiping strange gods and corrupting the youth.

In Plato's *Apology* Socrates pleaded for intellectual freedom by asserting the supremacy of his conscience over the verdict of the jury and by maintaining that when he exercised freedom of inquiry he mas a public benefactor — that free discussion had a supreme public value. Socrates was, then, not only the first great martyr to freedom of speech, but also the first philosopher to formulate a rational, principled defense of this freedom.

His pupil Plato cannot, however, be reckoned among the defenders of intellectual liberty. In his *Republic* Plato said that he would, in the ideal state, establish a censorship of fables. Censors would reject and prohibit tales that they considered bad, and mothers and nurses would be permitted to relate to children only authorized tales. Furthermore, he would censor the plays of dramatists who tell untruths about the gods. Art, to Plato, could function only as an aid to education; and what might be harmful to the young should be prohibited. In the *Laws* Plato would punish for impiety in deed or word.

The point of view of Plato is one that dominated Greek and Roman society and much of Christian civilization: namely. that religion is not a purely personal affair; that a man lives his life — and his religion — openly, in the city, in public view. From this standpoint censorship is inevitable. The view that public life does not exhaust man's nature, that man has also a private life, that his religion and opinions are his private affair and that therefore he must have and enjoy liberty of conscience — this view was a late development in history.

Roman. — Although the word "censor" is derived from the ancient Roman censor (*q.v.*), a public official who had charge of the census and supervision of public morals, one does not find much about censorship in ancient Roman history. During the republic the liberty to criticize was highly valued. Lucilius, Catullus and other writers published strong epigrams against Pompeius (Pompey) and Caesar by name and there were at that time many political pamphlets in circulation that spared neither names nor insults. During the Second Punic War only Naevius was brought to punishment for ridiculing a leading Roman family. According to some authorities this satirist was punished on the basis of a provision in the Twelve Tables (451 B.C.) protecting reputation from offensive speech. Early in the 2nd century B.C. a law imposed a fine for defamation by name from the stage. But under the empire restraints appeared in the senate, the popular assembly and the courts. Virgil and Horace hid their meanings in cryptonyms because repression was extended from drama to verse.

There were prohibitions against seditious speech and writing. Yet the tradition of free speech was strong and many instances of unrestrained speech survived. Augustus (27 B.C.–14 A.D.), by extending the *lex majestatis*, made it possible for his successors to repress criticisms. In A.D. 8 he banished Ovid. Tacitus cites cases of severe punishment for writings allegedly seditious but certainly scurrilous. Caligula (37–41), when overcome by illness, used harsh, repressive methods and ordered a writer who had published a few double-edged lines to be burned alive. Nero (54–68) deported his critics and burned their books. Domitian (81–96) suppressed free speech. Because a historian made slighting references to him in his history Domitian had him put to death and his secretaries crucified; he ordered a slanderer thrown to the dogs in the arena and a dramatist was put to death for having reflected on him adversely. Juvenal was banished for writing protests against the moral laxity in the court of Domitian.

Under the empire Rome practised a policy of toleration toward all religions and religious opinions and there was no punishment for blasphemy. "If the gods are insulted," said Tiberius, "let them see to it themselves." But the Jews and Christians were an exception. While to pagans worship of the imperial person or image was a political act, like an oath of loyalty, to the Jews and Christians it was idolatry; and so Roman toleration was not extended to them.

Christianity. — The persecution of Christians ended when, in 313, the emperor Constantine issued the Edict of Milan, which decreed toleration of Christianity and its legal equality with paganism. Constantine, following the edict, persecuted disobedience and instituted orthodox conformity. In 380 the emperor Theodosius I was baptized and he made Christianity the established state religion. Theodosius defined orthodox Christianity and made Christian heresy a crime against the state. Then the church and the Roman government began to persecute pagan and Christian heretics. In 445 an edict of Theodosius II declared that the pope would be the final authority in church government and that the state would use force to compel obedience to the decisions of the pope These edicts set the pattern for the maintenance of Christian orthodoxy and the persecution of heresy for well over 1,000 years. It was believed that the safety of society was dependent upon Christian unity and that Christians had the duty not only to maintain the purity of the faith themselves but also to seek out and exterminate heretics.

The theory of the church was that it had the right and the duty to prohibit books that were opposed to faith or morals, as defined by the church, or that in some other way endangered man's eternal salvation, and that the secular force had the duty to carry out the decisions of the clergy against heretics, heresy and immoral publications.

The first formal condemnation of a book was issued by the Council of Nicaea in 325 against a book by Arius, declared to be heretical. Eight years later Constantine ordered the burning of all books by Arius under pain of death. In 400 Theophilus, the patriarch of Alexandria, in council with other Egyptian bishops, condemned the books of Origen. This pattern was frequently followed In 496 Pope Gelasius issued a decree at the Roman synod that contained a catalogue of books that had been condemned and prohibited. The church reached the peak of its power under Innocent III at the beginning of the 13th century; but at the same time fear of the spread of heretical opinions became more intense and the church began to systematize its efforts to exterminate heresy and heretics. In 1215 Innocent decreed that it was the duty of every Christian to seek out and "exterminate" heretics. In 1233 Gregory IX instituted the Inquisition and turned over to the Franciscan and Dominican orders the power to investigate, judge and sentence heretics. The secular authorities co-operated by punishing heretics as the foulest criminals, often burning them at the stake. In 1252 Innocent IV authorized the use of torture in heresy trials to elicit confessions.

With the invention of printing in the 15th century it was thought necessary to institute preventive censorship by examining manuscripts before publication and authorizing or prohibiting their publication. In 1487 a papal bull was promulgated ordering that no works were to be published without prior ecclesiastical permission and this was to be granted only after thorough examination of the manuscript. In 1521 the emperor Charles V issued an edict making it a civil offense to publish a book proscribed by the

church and providing for prior ecclesiastical censorship. In 1542 Paul III instituted the Universal Roman Inquisition or Congregation of the Holy Office. one of whose functions was the examination and condemnation of heretical and immoral books. The first Roman Index of prohibited books was published by the congregation in 1559. Five years later Pius IV published the Index of the Council of Trent (1564) which contained, in addition to a catalogue of forbidden books, ten general rules regulating the censorship. expurgation and reading of books. In 1271 Pius V formed the Congregation of the Index. which was entrusted with all functions relating to the censorship and prohibition of books; but the Holy Office continued to enjoy jurisdiction to examine and proscribe books. In 1753 Benedict XIV promulgated rules to be followed in the censorship and prohibition of books and these rules constitute the norm subsequently followed by the Congregation of the Index and the Holy Office. In 1897 Leo XIII issued new legislation without replacing that of Benedict XIV. Perhaps the most important provisions in the legislation of Leo XIII are the broad prohibition of hooks *ex professo* obscene and the requirement that all the faithful must submit for previous censorship books dealing with religion or morality. Benedict XV abolished the Congregation of the Index in 1917 and assigned its duties to the Holy Office. Editions of the *Index librorum prohibitorum* have been frequently published. Over 4,000 books were on the Index by mid-20th century.

Reformation.—The leaders of ihe Protestant Reformation in the 16th century — John Calvin, John Knox, Martin Luther, Huldreich Zwingli, Martin Bucer. Théodore de Bèze—claimed liberty of conscience for themselves but denied the same liberty to others. They did not believe in religious liberty or even toleration except as temporary expedients needed in a struggle for power. Like the Roman Catholic Church. the reformers placed heavy emphasis on obedience to authority and preservation of social order and on the indissoluble. intimate connection between a religious establishment (if a reformed church) and the state. They sought out and persecuted papists and heretics.

The same forces of persecution operated in England in that century. Henry VIII in 1531 coinpelled the English clergy to recognize him as head of the Church of England, displacing the pope. In 1534 parliament enacted the Act of Supremacy, which declared the king to be head of church and state and vested in him final authority over creed and church government as well as power to declare and punish heresies. He beheaded Thomas More and John Fisher in 1535 for their refusal to acknowledge his supreme power over religion and he persecuted William Tyndale and burned copies of his English translation of the New Testament — thus persecuting both papists and reformers. Under his successor Edward VI (1547–53) the Reformation was welcomed to England and Catholics were persecuted. Under Mary (1553–58), Anglicans and Protestant reformers were persecuted; non-Catholic preaching, teaching. worship and books were prohibited: and Thomas Cranmer, archbishop of Canterbury, and Hugh Latimer, bishop of Worcester, were burned at the stake as heretics. Under Elizabeth (1558–63) the kingdom reverted to Anglicanism and she persecuted both Catholics and Puritan reformers. Thus. whoever was in power sought to achieve conformity by coercion.

But the Reformation had in it the seed of liberty of conscience; for its origin was due, in part, to the assertion of the priority of conscience over authority. This in time inevitably led to claims of liberty against the reformers themselves. It became apparent that it was inconsistent to affirm both personal conscience and theocratic power, for the former involves liberty and pluralism, the latter compulsion and uniformity. But the libertarianism that was latent in Protestantism took a long time to make itself effective. It was aided by the development of the secular, national states. which had political and economic interests that at times made intolerance itself intolerable; and it was aided by the principle that every man had the right to read and study the Bible, for this meant that a diversity of interpretations would necessarily result, leading to a diversity of sects.

From Censorship to Liberty. — In 1531 Henry VIII established the first licensing system under secular authority with ecclesiastics as licensers. This system of controlling writers and publishers was continued in one may or another until 1695. The end of the 17th century and the beginning of the 18th mark the start of the modern period, in which emphasis shifted from censorship and persecution to toleration and liberty. Men at that time were beginning to share with Michel de Montaigne, their 16th-century forerunner, his hatred of cruelty and violence, and 71ere thinking with him that "it is setting a high value on one's opinions to roast men on account of them." They also were beginning to respond to the influence of some of the Renaissance humanists, *e.g.,* Sébastien Castellio (*De Haereticis,* 1554). They also were influenced by Faustus Socinus, forerunner of modern Unitarianism, who in 1574 repudiated coercion in the interests of religion. John Robinson (*Justification* of *Separation from the Church,* 1610), William Chillingworth (*The Religion of Protestants a Safe Way to Salvation,* 1638) and Jeremy Taylor (*The Liberty of Prophesying,* 1647) wrote influential tracts advocating a measured toleration. In the American colonies Roger Williams demonstrated that in his Rhode Island settlement it was possible for Protestants and Catholics. and even Jews and atheists, to live together in peace (1644); and Lord Baltimore, a Catholic. established the mutual toleration of Catholics and Protestants in the colony of Maryland (1632). John Clarke and William Penn worked in the same libertarian spirit in the colonies, and in the next century they were followed by Thomas Paine. Benjamin Franklin: Thomas Jefferson, George Mason and James Madison.

The Toleration act of 1689, a statute granted by William and Mary, provided freedom of worship to nonconforming Presbyterians, Congregationalists, Baptists and Quakers; but it excluded Catholics and Unitarians. (Unitarians were not freed of all disabilities until 1813, Catholics until 1829, Jews until 1858 and atheists until 1888.)

Almost simultaneously with the promulgation of the Toleration act. John Locke's first *Letter Concerning Toleration* (1639) was published. This tract was the first systematic repudiation of the view that dominated ancient and medieval society; namely: that religion is a matter of supreme communal concern and belongs to a man's public or social life. Locke, on the contrary, argued that states are constituted for the maintenance and enhancement of only the secular interests of men and that they have nothing to do with religious beliefs arid observances. Toleration should extend to nonconformists and even pagans; but Locke excepted Catholics and atheists. Apart from his exceptions, Locke's theory, marking off a private sphere on which the state may not trespass, remained firmly fixed in liberal thought as a support of freedom of speech, press and religion.

Another classic rationale of freedom from censorship was John Milton's *Arcopagitica:* a *Speech for Libcrty of Unlicensed Printing* (1644). To Milton the first freedom was "the liberty to know, to utter, and to argue freely according to conscience, . . ." Milton's arguments against censorship and for the maximum liberty of expression were less theoretical and doctrinaire than Locke's argument a half-century later, for Milton tried to show the social evil of censorship and the social utility of liberty. John Stuart Mill's essay *On Liberty* (1859) was written in the spirit of the *Areopagitica,* while much of American constitutional law relating to the first-amendment freedoms of religion, speech, press and assembly has developed in the spirit of the Lockean theory.

MODERN AND CONTEMPORARY WORLD

At the end of the 18th century the fruit of the libertarian thought of that and the preceding century, joined with propulsive material forces, was evidenced in the American Declaration of Independence (1776) and the American Revolution, in the French Revolution and Declaration of the Rights of Man and of the Citizen 11789) and in the adoption, in 1791, of the Bill of Rights to the United States constitution. The reverberations of these events were heard everywhere but some nations responded by intensifying their means of repression and becoming more autocratic, while other nations responded by adopting liberalizing attitudes and measures and becoming more democratic. England, the United States and France continued to exert libertarian influences.

The prime instance of suppression of liberties (following the end of h'aziism in Germany and Fascism in Italy) occurred in the Union of Soviet Socialist Republics. Andrei Vishinsky wrote authoritatively in *The Law of the Soviet State* (Eng. trans. by Hugh W. Babb, 1948): "In our state, naturally, there can be no place for freedom of speech, press, and so on for the foes of socialism." But in this totalitarian country there was no freedom of speech and press even for the friends of socialism who wished to express some criticism or raise some questions. The test in a totalitarian country was not whether the publication was treasonable or seditious, but whether it tended to advance official ideology. Following Nikita Khrushchev's secret address on the crimes of Joseph Stalin (Feb. 24–25, 1956) there was some relaxation of the strict censorship over speech and press but the nature of a dictatorship made reliance on any relatively liberal policy hazardous.

After the first quarter of the 19th century prosecutions for blasphemy became rare in the U.S. and England. It became widely recognized that such prosecutions were more scandalous than were the publications. The public and governmental interest moved away from the blasphemous to the obscene, and the interest in the latter was sustained for over 150 years.

Obscene Literature. — As long as books were expensive and literacy was confined to a small minority there was little concern over obscene literature. But as public education and cheap books reached the masses, guardians of public morals made their appearance and stimulated governments to suppress obscene writings. (The Society for the Suppression of Vice was founded in England in 1802; Anthony Comstock founded the New York Society for the Suppression of Vice in 1873.) Following the end of licensing in Great Britain in 1695 efforts were made to persuade the courts that censorship could be achieved through the operations of the common law. In Curll's case (1728) prosecution for publication of an obscene libel mas sustained under common law.

The modern law of obscene literature takes as its point of departure Lord Campbell's act (Obscene Publications act, 1857). In the Hicklin case (1868) Lord Chief Justice Alexander Cockburn held that the test for obscenity under the statute was "whether the tendency of the matter charged as obscenity is to deprave and corrupt those whose minds are open to such immoral influences, and into whose hands a publication of this sort may fall." The test of literary morality was what a father could read aloud in his own home. While there were many successful prosecutions for outright pornography, the law was also invoked against works of literary merit and works with a social or moral purpose. In addition to prosecutions other sanctions were used: seizure of books by the post office, customs officials or police, and their destruction.

The law was subject to continuous attack, for it was widely felt that it often compelled authors to falsify social realities. The law was also attacked for reducing literary standards to the level of what was morally proper for the young. The application of the law by judges in specific cases was also attacked, for judges permitted prosecutions on the basis of isolated passages; and judges also refused to permit evidence of the author's intent or purpose or of his literary reputation, or testimony of recognized literary critics. The law was also attacked because the prosecutions were often directed against booksellers, who were indifferent to the fate of the attacked book.

In some respects these faults in the law or its use no longer obtain. Notable progress was made by Justice Wintringham Norton Stable in a case before him in Old Bailey (central criminal court, Londonj in R. v. *Warburg* (1954). In charging the jury Justice Stable laid down the Hicklin test of obscenity but made a sharp differentiation between "filth for filth's sake" and literature. The former type of publication has no message, no inspiration, no thought; it is just "filthy bawdy muck" and such publications are obscene libels. The latter type of publication is one in which the author has "an honest purpose and an honest thread of thought"; it should not be condemned because it deals with the realities of life, love and sex. He told the jury that sex is not dirty or a sin, and that the literary-moral-legal test ought not to be what is suitable for a 14-year-old schoolgirl to read. He also stated his belief that novels are not to be belittled, for they are valuable sources of knowledge about the way people act, feel and think. The jury brought in a verdict of acquittal.

In 1954 an undertaking was initiated in parliament to change Lord Campbell's act and the effort resulted in enactment of the Obscene Publications act (1959), the most important provisions of which are: (1) that a person shall not be convicted if publication was "in the interests of science, literature, art or learning"; (2) that the opinion of experts as to the literary, artistic, scientific or other merits of the publication may be admitted as evidence; (3) that the work is to be read as a whole; and (4) that authors and book publishers may speak in defense of the work though they have not been summoned in the case. In Nov. 1960 a jury in London found that D. H. Lawrence's *Lady Chatterley's Lover* was not obscene.

In the U.S. the Hicklin test was taken over by the courts and Lord Campbell's act was more or less duplicated by every state legislature. In the federal courts two acts of congress were relevant: an act regulating imports and an act concerning nonmailable matter. The latter, by far the more important one, was passed in 1873. It was the use of the former statute, however, that ushered in the more modern law of obscenity.

Until the law was changed by congress, customs officials prevented the entry of such classics as Rousseau's *Conjessions,* Voltaire's *Candide* and Boccaccio's *Decameron.* In 1930 ccngress amended the Tariff act to authorize the secretary of the treasury to admit classics and books of recognized scientific or literary merit when imported for noncommercial purposes. In 1933 an attempt was made to keep out a copy of *Ulysses* by James Joyce. When the case came before Judge John M. Woolsey of the federal district court in New York city he held that the bock was not legally obscene. In his opinion Judge Woolsey referred to the reputation of the book in the literary world and took into consideration the intent with which the book was written. The judge read the book in its entirety and not merely the passages singled out by officials. The use of "dirty words" in "a sincere and honest book" did not make the book "dirty." The book should be tested by its effect "on a person with average sex instincts," for the law is concerned only with "the normal person."

Several decisions of the U.S. supreme court had a liberalizing effect. In 1957 the court held that a state may not prohibit the sale of a book generally to the public because of its tendency to affect adversely the morals of youth. While holding that obscene publications are not subject to the first-amendment guaranty of freedom of the press, the court held that the standards for judging obscenity must be such as will "safeguard the protection of freedom of speech and press for material which does not treat sex in a manner appealing to prurient interests." Accordingly the court rejected the Hicklin test as unconstitutionally restrictive since it permitted judgment on the basis of the effect of isolated passages on the most susceptible persons. A book must be judged as a whole and only its effects on a normal person may be considered. When tested by these decisions many state statutes may be of doubtful constitutionality and earlier federal and state decisions that banned works may not serve as binding precedents.

The dramatic change in the law effected by court decisions can be seen in the treatment of *Lady Chatterley's Lover,* mentioned above. In 1928 the book was published in Italy. Through devious ways copies reached England and pirated editions appeared in the U.S. despite the vigilance of officials. In 1959, however, the book was published by a reputable publisher in New York city. The U.S. post office department banned the book from the mails but the federal courts set aside the ban, holding that the book did not fall within the category of "hard-core pornography."

Policing the Comics. — Throughout the English-speaking world there was concern over the problem of comic books, which achieved phenomenal circulation records in the mid-20th century. In 1911 the first publication devoted exclusively to comics appeared but it was not until the late 1930s that it became apparent that there was a lucrative market for the newsstand sales of this type of publication. By mid-20th century comic publications had become big business.

At the same time — following World War 11 — a rise in juvenile

delinquency was noted almost everyuhere in the world and much of the blame was placed on the comics. Demands for their suppression or regulation were widespread and many states adopted statutes specifically regulating the publication, sale or distribution of comics. Since the constitutionality of the legislative approaches was uncertain, however, there was aidespread reliance on informal actions. Local and state officials and citizen groups in communities acted on the basis of lists prepared by private agencies and endeavoured to persuade dealers to withdraw from sale comics on these lists. Frequently the police co-operated by turning over to dealers or distributors lists of objectionable publications. In several states the legislatures set up commissions to examine publications and advise prosecutions. In some instances the procedures led to black-listing paperback books and magazines as well as comics. When tested in the courts, informal official censorship activities were generally declared illegal. But such tests were seldom tried, for the distributor or vendor, though suffering economic injury, found it less burdensome to implement the censorship black list than to risk having himself placed on an economic or social black list.

Self-policing by comics publishers was undertaken. In 1948 the Association of Comics Magazine Publishers was formed and the members adopted a code banning "sexy, wanton comics," "sadistic torture" and other offensive material. In 1954 the Comics Magazine Association of America was formed. Its code prohibited torture, glorification of crime, salaciousness and other evil features, and insisted that the stories should show the triumph of virtue over vice. It was not possible to measure the success or failure of these self-regulation policies. But efforts to censor publications, especially magazines, comics and paperback books, have not abated, especially on the level of local police and local citizen-group action. There is similar legislation in the United Kingdom, *e.g.*, the Children and Young Persons (Harmful Publications) act of 1955.

Motion Pictures.— Prior restraint was directed more at motion pictures than at any other medium of expression. The first movie censorship measure was an ordinance of the city of Chicago adopted in 1907. In 1915 the U.S. supreme court held that motion pictures were not protected by the free-speech guaranty of the first amendment; they were, said the court, mere "spectacles."

Between 1922 and 1927 there was growing indignation over the unconventional conduct of some movie stars and over sensational films and there was a movement for strong controls. The motion-picture producers responded with a plan for self-regulation that resulted in the Motion Picture Association of America Production code. Compliance was universal until a number of films that were denied the seal of approval were exhibited successfully. In 1956 certain features of the code were relaxed to permit more latitude in dealing with drug addiction, race relations, childbirth and the use of certain swearwords.

Official censorship perhaps proved to be weaker than self-regulation. In 1952 the supreme court, overruling its earlier decision, held that films are protected by the free-speech guaranty of the constitution. Following this and subsequent decisions some state courts declared their state censorship laws unconstitutional. While at one time there were about 90 local censorship boards, their number was sharply reduced and the legal foundation of whatever remained of film censorship on the state or local level was badly shaken. The supreme court struck down censorship of films that are "sacrilegious," "immoral" or "prejudicial to the best interests of the people." In 1959 the court condemned as unconstitutional the ban on the film "Lady Chatterley's Lover." The broad grounds of the decisions would probably make subsequent punishment no less difficult than prior restraint had become.

In Great Britain censorship is achieved through the county licensing of motion-picture theatres; the licences are dependent upon condition that the licensee will exhibit only films that have the approval of the British Board of Film Censors (a private body founded in 1912 that enjoys no statutory foundation but is supported by the film trade). There is no written code; each film is judged on its merits. Some films receive an "A" certificate; which means that they may be shown only to adults. It was argued that this system of classification resulted in the approval of films for adults that otherwise might have been banned. One unforeseen result was the establishment of many small cinemas that specialize in foreign films devoted to sex and nudism. The British Board of Film Censors said that there was no ban on any subject, provided the subject was treated with sincerity and restraint.

The Stage.— In the United States censorship of the legitimate stage seldom was discussed in mid-20th century. There was no legal authority — as was the case with films — devoted specially to acting as guardian over the morals of stage productions. Theatres were licensed generally on an annual basis by local authorities and the apprehension that a licence might not be renewed served as a restraint. The general obscenity laws applied to the stage but prosecutions were extremely rare.

In London the lord chamberlain, senior officer of the royal household, became censor of plays by a law of 1843 that provided that the lord chamberlain may ban a play if he considers the ban necessary "for the preservation of good manners, decorum, or of the public peace. . ." The licensing rules provided that there must be no stage profanity or impropriety of language, no indecency of dress, dance or gesture, no oifensive personalities or representations of living or dead persons, nor anything likely to produce a breach of the peace or a riot. Sacrilege was ground for a ban. About 1,100 plays were examined annually, of which about 1% were banned. In 1949 a bill in parliament to abolish play censorship failed. To avoid jurisdiction of the lord chamberlain, small theatres for members were formed, where private performances were presented.

By the 1950s about 250 plays had been banned by the lord chamberlain: including plays that were shown on the U.S. stage. Critics of the censorship system charged that it had a crippling effect on the stage as a cultural force and that it was an aristocratic relic that had no place in a democracy. Responding to the criticism. the lord chamberlain liberalized the rules and the leading private-membership theatre went out of existence because its sponsors felt that its purpose had been achieved.

Broadcasting.— In the Cnited States radio and television stations operated on licences from the Federal Communications commission (FCC), which began its operations in 1934. The Communications act of 1934 expressly prohibited censorship or interference with free speech. There was, therefore, no direct broadcast censorship. However, a station's licence was reviewed every three years and, upon an application for renewal, the FCC reviewed the applicant's total performance; licences were granted as being in the public interest. Criteria for public interest or public service were not formalized. The FCC was given power, by an act of 1952, to suspend a licence for obscenity. In the quarter-century after 1934 only 12 station licences were revoked and only one licence was not renewed.

In 1939 the radiobroadcasting industry adopted a code dealing with program and advertising content and in 1952 an industry-wide code for television was adopted. Extensive monitoring was done by the broadcasting industry for program and advertising content. The television code of 1952, more detailed than the code for radio, emphasized the station's active responsibilities but neither code was directed toward morality as much as mas the movie code. Newscasts were not generally subject to prebroadcast editing. Most editorial changes on programs involved references to sex.

In addition to self-policing, broadcasting was responsive to pressures from various groups. Concern was expressed over the degree of control of programs exercised by commercial sponsors, for there was evidence of many changes in content as a result of pressure from the sponsor or its advertising agency.

The disclosures in 1959–60 of widespread "fixing" of quiz shows and "payola" led to grand-jury and legislative investigations in the U.S. A congressional committee in 1960 concluded that self-regulation by the broadcasting industry had proved to be insufficient and that the FCC had been too passive as a guardian of the public interest. The committee called for stricter regulation; for statutory remedies, including possibly a ban on control of programs by advertisers; for closer checks by the FCC on the performance

of licensees; for the licensing of the networks; and for more competition among companies for licences. But the broadcasting industry, the FCC and the public generally were reluctant to resort to measures that might lead to censorship by government.

(M. R. K.)

Most of the problems mentioned do not exist in Great Britain. Broadcasting in sound and television is carried out by the British Broadcasting corporation (BBC) and, in television only, by the Independent Television authority. The BBC is not a government department, but a public corporation created by royal charter. It derives its legal powers from its licence and agreement with the postmaster general but, subject to the requirements of its charter, it enjoys complete independence in the day-to-day operations of broadcasting, including programs and administration. The BBC may not derive any revenue from advertising in programs.

Censorship as such does not exist in independent television in Great Britain. Many of the problems experienced in the United States do not arise, because the nature of British independent television is radically different from that of U.S. commercial television. The Independent Television authority was established by the Television act, 1954, to provide broadcasting services, but it does not itself produce any programs. Contractors appointed under the act are responsible for this, and they sell advertising time just as a newspaper sells space. The advertiser has no control whatever over the programs. The Television act lays down broad principles of program standards, concerned with over-all balance, good taste and political impartiality. It is the duty of the authority to ensure that programs provided for it by the contractors fulfill these standards. (X.)

School Textbooks.— Some states in the United States have textbook commissions that select textbooks for the public schools; in some states the selection was made by committees of the local school boards; in some communities the selection was left to the school staff or individual teachers. State commissions and local textbook committees sometimes were subjected to pressures from business, political, religious, racial and other groups. Before the American Civil War textbooks were screened to favour or to oppose sectional interests. In the 1920s they were fought over because of questions of evolution and pro- or anti-British attitudes. Textbooks were often changed in response to pressures and changes in the textbooks were made by authors and publishers to accommodate the wishes of groups. After World War II the targets were statements that might be interpreted as favourable to Russia, Communism, Marxism or Socialism, and textbook authors who had been affiliated with suspect organizations.

Libraries.— In 1953 President Eisenhower spoke out against book burning. He spoke at a time when public libraries were targets of groups who sought the removal or destruction of books that they considered "un-American." One proposal urged by a pressure group was that books that they considered pro-Communist should be labeled as such and placed in special sections. Libraries were also charged with refusing to buy conservative or anti-communist books and with favouring books that were "soft" on Communism.

The American Library association, the American Book Publishers Council, Inc., and other groups fought these efforts at library censorship. In 1948 the "American Library Bill of Rights" was published by the American Library association, stressing the need to resist "all abridgement of the free access to ideas and full freedom of expression. . ." In 1951 the same group opposed hook labeling as an attempt to prejudice the reader and as a censor's tool. In 1953 these organizations released their statement on "The Freedom to Read," in which they cautioned against private groups and public authorities who sought to remove, censor or label books. They affirmed their duty "to make available the widest diversity of views and expressions, including those which are unorthodox or unpopular with the majority."

Freedom of Information.— 111Near v. *Minnesota* (1931), in holding that previous restraint on newspapers was unconstitutional, the U.S. supreme court said that exceptional circumstances may justify such restraint—*e.g.*, in wartime a prohibition on publication of sailing dates of transports or the number and location of troops. But, in fact, government censorship extends far beyond these obvious instances. Wartime restraints were retained long after the need for them passed: and the restraints served to stifle political, economic and social expression. Much information was kept from the public; government agencies kept information from other government agencies. Newspapers in particular claimed that a climate of official secrecy had been developed that kept information from the public; as a consequence, from 1949 newspaper editors systematically promoted public understanding of the need for "freedom of information"; and committees of congress conducted extensive investigations. A report for the American Civil Liberties union made in 1955 stated that the situation had become aggravated and cited many examples of information officially withheld that had no relation to national security. These secrecy practices curtailed the power of the press and of congress, it was argued. A congressional committee report in 1958 pointed out that "science and secrecy have collided head on in the United States. Thus far, secrecy has dominated." The report stated: "There should be no attempts to hide discoveries of the basic laws of nature made in the past, present, or future." Another congressional committee report made in 1958 concluded: "Federal officials appear addicted to the doctrine that they alone can decide what is best for the people to know about their own Government. This dangerous attitude has reached the point where Federal officials are boldly proclaiming that they will decide what even the Congress shall and shall not know about the operations of Federal departments and agencies."

As a result of the numerous investigations and reports congress in 1958 passed a law to change the law of 1789 on which many government officials based their policy to withhold information. The 1789 act was designed to help President Washington set up his cabinet departments and give their heads authority in their organization and management, and provided that a department head should control the custody, use and preservation of records, papers and property. In the 1958 amendment of that law congress provided that the earlier law "does not authorize withholding information from the public or limiting the availability of records to the public." After passage of this act it was pointed out, however, that 80 statutes authorizing secrecy remained on the books. The 1946 Administrative Procedure act vested wide powers in government officials to withhold information and this act was not changed by the 1958 statute.

The same problem of secrecy often was noted on state and local levels. A special problem was the public agency that refused to make its meetings open to the press and public. In some states newspaper editors organized to win support for open-meeting legislation.

There was no direct censorship in Great Britain and in other countries where the tradition of press freedom is strong but the governments of these countries probably imposed restrictions on news sources; since the restrictions had not been the subject of legislative investigations, however, little was known about them. In Great Britain a voluntary Press council was set up in 1953 to safeguard high standards of journalism and the free flow of news. The clearest restraints in Great Britain are exercised on the reporting of court cases while they are pending and, through the Official Secrets acts of 1911 and 1920, on the dissemination of information obtained in the course of their work by persons in confidential government employment. Elsewhere, as in the U.S.S.R., the nations of the Communist bloc, Spain, Portugal, Turkey, Egypt and other countries, there was either strict censorship or strict laws that amounted to indirect controls over the press, including foreign correspondents.

Freedom of information is a problem with which the United Nations showed continuous concern. In 1955 the Economic and Social council urged all member states to cease the practice of censoring outgoing news dispatches in peacetime in order to provide a free flow of information throughout the world and to facilitate the unrestricted transmission of news by telecommunication services.

Birth-Control Literature.— In 1873 the U.S. congress banned

the use of the mails to birth-control literature. Several states followed with similar statutory bans and in 1890 the Tariff act forbade the importation of such literature. While the laws on this subject have changed very little, in practice such literature is generally unmolested. Judge Woolsey in 1931 ordered the admission of books on this subject as imports from England; in mid-20th century periodical literature and books dealing with techniques of birth control passed through customs and the mails and were openly sold everywhere, even in Connecticut and Massachusetts, states that had gone furthest in efforts to keep information on the subject from readers. In 1959 test cases the Connecticut courts upheld the ban on physicians' giving advice on birth control to patients and the case went up to the United States supreme court which in 1961 declined to rule on the law's constitutionality.

Postal Censorship.—The first postal law on obscenity in the U.S. was enacted in 1865 but the basic law was the so-called Comstock act of 1873. Basically it was a prohibition against sending obscene matter through the mail and it declared it to be a felony to import obscene matter, to deposit such matter in the mails and to transport such matter in interstate or foreign commerce for sale or distribution. Congress provided that matter deposited in the postal system for transmission should be divided into four classes, and that mail of the second, third and fourth classes shall be wrapped in such a manner as to facilitate the examination of its contents. The government may not open sealed letters or mail sent first class. Printed matter sent other than first class is not entitled to the protection of the fourth amendment against unreasonable search and seizure. Newspapers and magazines are sent by second-class mail, which is relatively inexpensive and its use is, therefore, referred to as a privilege. In the important *Esquire* case (1946) the supreme court held that the post office may not cancel the second-class mailing privilege of a periodical because the magazine was not considered to be for the "public good" while concededly not obscene. The court rejected the argument that the use of the mails is a privilege which the government may regulate at will; it cast doubt on the power to revoke mailing privileges affecting future publication on the ground of the past publication of obscenity.

In 1951, in compliance with the Administrative Procedure act, the post office set up hearing procedures for "nonmailability" cases. An adverse decision may be appealed to the courts (as was done in the case of *Lady Chatterley's Lover* in 1959–60). A publisher against whom a decision had been rendered might ship by private express but this was normally prohibitively expensive. It should be noted, however, that there were about 35,000 postmasters, not many of whom undertook to examine books offered for mailing, and book rulings made in Washington, D.C., were not circularized locally.

There was, however, the "hard-core" type of pornography that presented heavy problems for the authorities. A 1959 congressional committee report spoke of this as "big business." In 1958 the post office received complaints from 50,000 persons, mainly indignant parents, and in fiscal 1959 there were more than 70,000 complaints.

Propaganda from abroad falls within the jurisdiction of the customs bureau, but this agency worked closely with the post office. The 1938 Foreign Agents Registration act required registration of foreign principals engaged in the United States in the dissemination of "political propaganda." In 1939–40 it became apparent that much Nazi propaganda was being sent to the U.S., though there were no disclosed resident "foreign principals." The propaganda mas seized by the post office and destroyed. After the start of the Korean war in 1950 a similar problem developed with respect to Communist propaganda. But much of this material was addressed to libraries, scholars and journalists, who claimed the right to receive the publications. The department also held up pacifist and other publications. After considering objections to its actions the post office modified its rules to exempt from screening all materials not coming from behind the "iron curtain."

The handling of foreign propaganda, as well as of "hard-core" pornography, were problems that had vexed the authorities—as well as congress, the courts and citizens generally—for many years; they presented difficult questions of constitutional law, public policy, public administration, administration of the criminal law and the freedom to know.

CENSUS, an enumeration of people, houses, firms or other important items in a country or region at a particular time. Used alone, the term usually refers to a population census—the type to be described in this article. However, many countries, including the Cnited States, take censuses of housing, manufacturing and agriculture.

Since it relates to a particular moment of time, a census differs from registration statistics. A census corresponds to an inventory in business, whereas registration statistics (called vital statistics when they refer to human events) correspond to the daily record of sales, purchases and other transactions. To a certain extent, census and registration statistics can be substituted for each other. For instance, by enumerating women by age, duration of marriage and number of children ever born, a census provides information on natality (birth rate) in a population even when the record of births and marriages is inadequate. Normally, however, both census enumeration and continuous registration are used to obtain a knowledge of population dynamics. For example, birth and death rates are calculated by dividing the number of births and deaths registered during a certain period by the average population living during that period.

Censuses, being expensive, are taken only at infrequent intervals: every ten years in many countries, every five years or at irregular intervals in other countries. In noncensus years the population is estimated with the aid of vital statistics if these are sufficiently satisfactory. For instance, the population in postcensal year X equals the population at the last census plus the births, minus the deaths, plus or minus the net migration during the intervening years.

History.—Strictly speaking, the modern population census began to evolve only in the 17th century. Before that time, inventories of people, taxpayers or valuables were certainly made, but the methods and purposes of such inventories were different from modern ones. The most important difference was that early inventories were made to control particular individuals; *e.g.,* to identify who should be taxed, inducted into military service or

forced to n-ork. Since it was usually not to an individual's interest to be counted or to give correct information for these purposes, the premodern enumerations tended to be inaccurate. A second difference was that early inventories did not seek to count all the people or even a representative sample of them but only those in particular categories, such as, family heads or males of military age. The Old Testament mentions two military enumerations: one at the exodus of the fighting men of Israel and the nonmilitary Levites (Num. I, 45–47); the other by Joab at the command of David (I Chron. XXI). In Babylonia in the 3rd millennium B.C., a complete cadastral survey, *i.e.*, of real estate, and an agricultural census appear to have been made for fiscal purposes, and surveys arc known to have been made in ancient Persia, China and Egypt. Every five years, the Romans enumerated citizens and their property to determine their liabilities. This practice was extended to include the entire Roman empire in 5 B.C. After the collapse of Rome the practice was discontinued until the modern period. The main exception was the Domesday inquest of England in 1086 made to acquaint William the Conqueror with the landholders and holdings of his new domain. Under the threat of siege. the German city of Nürnberg made an almost complete count of its people in 1449.

The modern idea of a population census as a complete enumeration of all the people and their important characteristics for purposes of understanding the basic structure and trends of the society rather than for identifying and controlling particular individuals slowly arose in the 17th and 18th centuries. There is no such thing as "the first census" because, although early efforts embodied one or another modern feature, none of them embodied all modern features. Perhaps the first effort in an area larger than a city to count everyone at successive intervals was made in La Nouvelle France (Quebec) and Acadie (Nova Scotia), where 16 enumerations were made between 1665--1754. In 1749 the Swedish clergy, who had long kept lists of parishioners. was required to render returns from which the total population of Sweden (including Finland) was obtained. and a similar development began in Denmark in 1787. Certain Italian states conducted approximately accurate enumerations: Sardinia in 1773 and 1795; Parma in 1770; and Tuscany in 1766. Enumerations occurred in several German states from 1742 onward. Although several American colonies, such as I'irginia in 1624–25 and subsequently, had made full enumerations, the United States made history when it took its first census in 1700. not only because of the size of the area enumerated and the efiort to obtain data on characteristics of the population, but also because of the political purpose for which it was undertaken: representation in congress on the basis of population. England took its first census in 1801, and although France tried to do so in 1800 and 1806 the administrative machinery was poor and the results untrustworthy until 30 years later.

Only gradually did the early census takers learn what was basic information and how to obtain it. The first United States census did not. for example, secure data on occupation, birthplace, marital status or exact age. A five-year age classification of whites was provided ,by the 1800 census, but other items had to wait until later, and until 1850 the unit used was the family rather than the individual. In England no satisfactory attempt was made to secure age data until 1841, and no effort to secure marital status until 1851.

The history of modern census taking thus involves three parallel developments: (1) the invention and gradual spread of the idea of country-wide enumerations for general scientific and governmental purposes; (2) the improvement of administrative machinery, techniques and accuracy of enumeration, including legal safeguards assuring that individual answers would be kept in confidence: and (3) the deepening and systematization of the types of information ohtained. All three developments tended to increase the effectiveness of censuses as sources of essential information.

It is a mistake to think that in the history of each country there is a date, marked by the first census, before which the size and characteristics of the population were totally obscure and after which they were totally clear. Usually some fragmentary information based on partial enumerations and administrative evidence was available even before the first census, and afterward some time was required before the census record became reasonably full and accurate. As the countries pioneering in census taking gradually \\-orked out better systems of enumeration, however, these could be transferred to new countries without repeating all the trials and errors. Canada's first dominion-vide census was taken in 1871; India's in 1871–72; and Egypt's in 1897. In fact. the rise in census taking after 1850 was remarkable, as can be seen from the following table:

Decade	No of national censuses	Decade	No of national censuses
1855–64 . . .	42	1915–24 . . .	64
1865–74 . . .	39	1925–34 . . .	75
1875–84 . . .	55	1935–44 . . .	66
1885–94 . . .	53	1945–54 . . .	88
1895–1904. . .	61	1955–64 . . .	99
1905–14 . . .	63		

In addition to the national censuses. others were taken in colonial territories, parts of countries, cities, etc. It is estiinated that in the decade after World War II at least 150 countries or areas took censuses collecting individual data on more than 2,000,000,000persons. The large number of countries having censuses in the 1950s was partly due to the United Nations program, World Census of 1950. A similar program in 1960 proved equally successful. Sot only does the United Nations encourage countries to take censuses, but it sponsors regional statistical committees which suggest minimum standards and offer technical assistance in the planning and conduct of enumerations. When China reported a census in 1953, the last large part of the world was removed from demographic darkness. The population of the entire world is now known with a degree of accuracy never before approximated, and the structure of populations (including their socio-economic characteristics) and their patterns of change are understood as never before.

Modern Census Procedure.— Because of their expense and their compulsory and confidential character, censuses are conducted by governments under enabling legislation with public funds. Censuses refer to a precisely delimited territory and subareas, and for this reason are normally planned and conducted with the aid of detailed maps. They aim to enumerate every person within the designated territory. Occasionally, but fortunately with growing rarity, a country elects to ignore some segment of the population in its census (usually aborigines) but, if so, it still should enumerate every person within the included categories. A de *jure* census tallies people according to their regular or legal residence, whereas a de jacto census allocates them to the place where enumerated — normally where they spend the night of the day enumerated. By either method, the reported territorial distribution is according to where people sleep (nighttime population) rather than where they work (daytime population). For this reason the population of central cities is usually far less than the number employed there and that of suburbs far more than those employed in suburbs.

In addition to being precise as to territory, the census must be precise as to time; accordingly, a specific moment is almost almays selected. This "census moment," often fixed at midnight, becomes the chronological line separating the included from the excluded. All persons born after the census moment or dying before it are excluded; all others are included. The census moment is also the reference point for certain kinds of questions. such as age, marital status and citizenship. Although some questions, such as occupation or labour-force participation. refer to a period of time rather than an infinitesimal moment, clarity requires that the exact limits of the period be specified. The need for time precision is necessary because the actual enumeration may take days or weeks. Since during this period many people will have moved about, died or been born, the census is taken as of a certain day, hour and moment.

Most data in a population census refer to individuals as the units. Information applying to a group, such as size of household or composition of the family, is compiled from information on the individuals comprising the group. By obtaining information re-

lating to individuals as units, the census can be cross-tabulated to find the degree of association bet een individual characteristics.

A census provides a picture of the population as of a given moment. Although some of its questions relate to the individual's past, such as birthplace, previous residences, education and number of children ever born, each census is better as a current report than a historical record. Historical trends in the size, location and structure of the population are properly revealed only by a succession of censuses; therefore, most nations attempt to take censuses at regular intervals, and publications of census results usually include comparison with previous census returns. Accurate trend analysis requires that categories and definitions either remain unchanged or, if changed, be capable of readjustment for comparative purposes. This need for standardization of definitions over periods of time conflicts with another need; namely to gather information that is more precise, more instructive or more relevant to current conditions than that formerly gathered. For instance, in the United States the great depression created an intense interest in unemployment, yet there was no reliable information on the subject. The 1930 census had, like its predecessors, asked whether or not the person was "gainfully occupied" but, if not, there was no way of telling whether it was because he or she could not find work, did not want to work, was a housewife, etc. Therefore, a new concept was incorporated in the United States in the 1940 census: the concept of the "labour force," including those seeking work as well as those working during a specified period. Since the results were not comparable to the previous figures on the "gainfully occupied," the determination of labour-force history in the United States requires statistical adjustments that only a professional demographer acquainted with the data can make.

The requirement that all individuals be enumerated does not mean that all individuals must actually be interviewed. A wife may supply information about her husband; a mother may supply information about her children. Nor does it mean that every question be answered about every individual. If all individuals are enumerated, that is, counted and categorized on a few basic questions, there then exists a basis for sampling with respect to other questions. Such sampling may be done at the time of the census enumeration, as when the persons whose names fall on a certain line of the census sheet are asked additional questions, or it may be done at other times. For example, the United States bureau of the census conducts sample surveys between censuses in order to obtain information of current interest about the population.

Widespread suspicion of the validity of sampling techniques long delayed their use in census taking. If for important purposes. such as voting or the allocation of government funds, the numbers of the population in small areas are required accurately, it is desirable that all individuals should be counted; at the same time at least some characteristics, such as sex and age, would usually be obtained for all. For other characteristics it may not only be sufficient, but even preferable that they are obtained on a sample basis, for instance, so that the staff collecting and handling these data may be only those well trained for the purpose. Modern theory of sampling enables the sample design to be so chosen that adequate accuracy is achieved and that the margin of error is calculable.

In the 1940 census of the United States, certain questions were asked of only a sample of the population and this procedure was extended in 1950 and 1960. At the 1961 census of England and Wales, even the important question of occupation was asked on a sample basis. Another use of sampling in census taking, used in the Great Britain census of 1951. is to obtain a summary set of tabulations with the minimum of delay. The first census of the Sudan in 1955–56 was entirely on a sample basis, and indeed could not have been taken otherwise, because of limitations on funds and skilled personnel.

The machinery used to analyze the results has a profound influence on the whole census. In the 19th century when tabulations were made manually, no complex questions were asked because of the impossibility of analyzing them. This situation was entirely changed with the introduction of punched-card machinery into the analysis of the United States census, which other countries have progressively followed. Modern electronic machinery is leading to a second revolution and, by permitting complex tabulations to be made quickly, has moved the bottlenecks to the data-transfer stages, when the written records are converted for machine use and when the tabulated results are to be turned into print. When adequate mechanical methods are devised to perform these data-transfer operations, it will be possible to make available the results of a census soon after the enumeration. The importance of this is clear from the fact that a census records the instantaneous position which becomes out-of-date and less true with the passage of time.

Scope of Census Information. — Since census information is obtained by using a fixed questionnaire for interviewing, there are two broad types of resulting data: direct data, the answers to specific questions on the schedule; and derived data, the facts discovered by classifying and interrelating the answers to various questions. Direct information, in turn, is of two sorts: items such as name, address, etc., used primarily to guide the enumeration process itself; and items such as birthplace, marital status and occupation, used directly for the compilation of census tables. From the second class of direct data, derived information is obtained, such as total population, rural-urban distribution and family composition. The specific questions on the schedule depend on the interests and condition of the particular country at the time. For example, if there is only one language spoken in the country, no purpose is served by asking a language question. If virtually all people over ten years of age are literate, nothing is gained by asking about reading ability. The following is the list suggested by the United Nations:

Direct *Topics* (Geographical) 1. Place enumerated and/or place of usual residence; (Familial) 2. Relation to head of household or family; (Demographic) 3. Sex; 4. Age; 5. Marital status; 6. Children ever born; 7. Birthplace; (Economic) 8. Type of activity; 9. Occupation; 16. Industry; 11. Employer-employee status; (Social and Political) 12. Citizenship; 13. Language; 14. Ethnic or religious affiliation; (Educational) 15. Literacy or level of education; (16) School attendance. *Derived Topics:* 17. Total population; 18. Population of towns and local areas; 19. Urban-rural distribution; 20. Household or family composition. Possible additional topics include prior place of residence (for understanding internal migration), farm-tenure status, income, labour-force participation, duration of marriage and number of prior marriages.

A survey of 52 countries taking censuses in the decade after World War II showed that all of them obtained data on items 1, 3, 4 and 5 and on one or more of items 8 to 11. In addition, the number of countries getting information on relation to head of household or family was 51; birthplace, 49; citizenship, 49; education, 45; religion, 32; fertility, 31; language, 26.

Accuracy of Census Information. — Census information may be incomplete (due to a failure to enumerate everyone) or inaccurate. Accuracy depends on the skill and conscientiousness of enumerators and on the knowledge and veracity of respondents. Carefully selected and trained enumerators can do a great deal to check answers and avoid errors. If the respondent is answering questions about himself or members of his immediate family, he is likely to know the facts; but if a landlady or distant relative is answering, the replies may be partly guesstvork. Also, questions that reflect on one's prestige or good name tend to elicit false replies. In the United States, for example, people tend to overstate their educational achievement, adult u-omen tend to understate their age and divorced persons often record their marital status as single or widowed. Inaccuracy can sometimes be corrected by checking one answer against another in the editing and coding of completed schedules; and it can often be detected when data are cross-tabulated. Checks can also be made by using other sources, such as vital statistics, civil registration, etc.; in fact, there are now ways of checking and classifying censuses according to their apparent degree of accuracy. A lay attitude of utter skepticism concerning census accuracy is as fallacious as the attitude that census results, once published, are absolutely true. No census is completely accurate, yet practically none is completely worthless. Information known to be defective often yields useful knowledge. The charge is sometimes made that a country has falsified its census to show more people than it actually has. If, however,

the results of the census are published in tables where the data are cross-tabulated, it is virtually impossible to "inflate" a census without detection by demographers.

Uses of Census Data. — The population census is probably the most prolific and fundamental source of information about a nation It is a multipurpose instrument serving a nide range of goals, both practical and scientific. It reveals not only the basic demographic trends. such as population growth, internal redistribution, urbanization and alterations in the age and sex structure, but also contributes indispensably to a knowledge of changes in the nation's occupational and industrial composition, in its level of living, education and employment and in its regional and group differentiation. Knowledge derived from the census underlies the attainment of other kinds of knowledge. For example, the census is essential to the drawing of samples for all kinds of surveys: for the computation of birth and death rates and the making of life tables; for the analysis of economic development and business cycles. Above all, the census makes possible the estimation of future trends and is therefore essential to all kinds of planning: national, local. public and private. It is essential for knowing future military and economic manpower potentials, future consumer needs. forthcoming school requirements, future growth in metropolitan areas, potential costs of social security measures, future requirements for highways, utilities, parks, water, energy and health services. Given its great utility. there is little wonder that the census is now a necessary feature of virtually every nation, and that the information provided by censuses over the world is contributing to a *revolutionary* expansion of global economic, sociological and demographic knowledge.

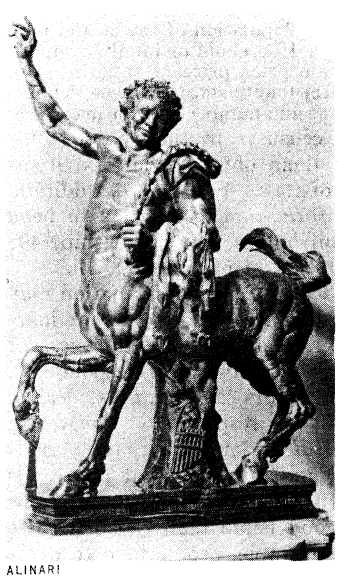
CENSUS OF PRODUCTION: *see* ECONOMIC PRODUCTIVITY.

CENTAUR (Gr. *kentauros*), in Greek mythology, the name of a race of beings part horse, part man, dwelling in the mountains of Thessaly and Arcadia. They are usually said to be the offspring of Ixion, king of the Lapithae, and they are best known for their fight (centauromachy) with their kinsmen the Lapithae. caused by their attempt to carry off the bride of Pirithous, son and successor of Ixion. In later times they are often represented drawing the car of Dionysus, or bound and ridden by Eros, in allusion to their drunken and amorous habits. Their general character is that of wild, lawless and inhospitable beings, the slaves of their animal passions, with the exception of Pholus and Chiron *(see.* CHIRON). The centaur Nessus plays a special part in the traditional legend of Hercules' death.



ALINARI

A CENTAUR. GREEK SCULPTURE. IN THE CAPITOLINE MUSEUM, ROME

The centaurs have been variously explained in modern times by a fancied resemblance to the shapes of clouds. or as spirits of the rushing mountain torrents or winds, etc. Perhaps the likeliest suggestion is that they are a distorted folk tale in which wild inhabitants of the mountains and the savage spirits of the forests have been combined in half-human, half-animal form. In early art they were represented as human beings in front, with the body and hind legs of a horse attached to the back; later, they were men only as far as the waist. They fight using rough branches of trees as weapons. In classical art the defeat of the centaurs by the Lapithae (*q.v.*) was used to typify the triumph of civilization over barbarism, and law over disorder. For this reason depictions of the story are to be found in religiously significant contexts; for example. on the metopes of the south side of the Parthenon and on the west pediment of the great temple of Zeus at Olympia.

(H. W. PA.)

CENTAUREA, a genus of the family Compositae (*q.v.*), containing about *500* species. almost all natives of the old world, nith the principal centre in the Mediterranean region. The plants are herbs with entire or cut, often spiny-toothed, leaves and ovoid or globose involucres surrounding a showy head of tubular, oblique or two-lipped florets, the outer of which are usually large and neuter, the inner bisexual.

The only native North American species, the basket flower or American star thistle (C. *americana*), is a robust annual two to six feet high, with very showy rose-coloured or purplish flower heads. three to five inches across. It is found in dry plains from Missouri to Louisiana, and westward to Arizona and Mexico, and is also grown as an ornamental plant.

I HORACE MCFARLAND CO

BASKET FLOWER (CENTAUREA AMERICANA)

In eastern North America the brown knapweed (C. *jacea*), the scabious knapweed (C. *scabiosa),* the Tirol knapweed (C *vochinensis*), the spotted knapweed (C. *maculosa*), the yellow star thistle (C. *solstitialis*) and the rayless centaury *(C. melitensis*) are more or less extensively naturalized. On the Pacific coast C. *melitensis,* there known as Napa thistle, is a troublesome weed, especially in California, as is also C *solstitialis.*

Four species, all naturalized in North America, are native in Great Britain. C. *nigra* is the knapweed, common in meadows and pastureland; C. *cyanus* is the bluebottle, bachelor's button or cornflower (*q.v.*), well known as a weed, much grown as a garden annual and the national floral emblem of Germany; *C. calcitrapa* is the star thistle, a rare plant with rose-purple flower heads enveloped by involucral bracts which end in a long, stiff spine.

The best-known garden plants are the dusty miller (C. *cineraria)?* the cornflower, the sweet sultan (C. *moschata*) and the mountain bluet (C. *montana).*

CENTAURUS (the Centaur), in astronomy, a southern constellation (invisible in northern lands) rich in bright stars and globular clusters.

The two stars α and β constitute a binary and are known as the southern Pointers since they point to the Southern Cross. α Centauri, the third brightest star in the sky and our nearest neighbour, is 4.3 light-years (parallax = *0.75"*) away. It is almost a replica of the sun, having nearly the same brightness and mass but slightly lower surface temperature.

There is also a third; widely separated, faint companion called Proxima Centauri because it is the nearest known star.

The constellation also contains ω Centauri. which is the finest example of a globular star cluster; it is probably the nearest object of this class but the distance is no less than *20,000* light-years. Photographs of it show more than *6,000* stars within a circle of 20' diameter, but the number must be much greater.

(A. S. E.)

CENTAURY, any herb of the old-world genus *Centaurium,* family Gentianaceae (*q.v.*). The common centaury of Europe, C. *confertum,* occurs in dry pastures and on sandy coasts in Great Britain and is often cultivated for ornament.

The centaury group presents a great number of varieties, differing from each other in length of stem, degree of branching, width and shape of leaves and laxity or closeness of the inflorescence.

CENTIGRADE SCALE: *see* THERMOMETRY: *Early Development.*

CENTIPEDE, a wormlike animal with a distinct head, one

pair of many-jointed feelers (antennae) and a long, segmented body, each typical segment of which is provided with a single pair of walking legs. Within the phylum Arthropoda (*q.v.*) the centipedes form the class Chilopoda.

Natural History. — Centipedes are typically carnivorous in habit, running after their prey. The victim is seized and poisoned by venom injected from the tips of poison claws formed by the first pair of trunk limbs. In all centipedes except *Scutigera* (fig. 1) the head is markedly flattened and adapted for catching and eating prey in shallow crevices. By day centipedes live predominantly under stones or bark and in woodland litter and soil; by night they walk abroad foraging for food. *Scutigera* alone hunts by day; it is the fastest runner and possesses the best-developed eyes, features associated with the ability to catch flies.

Centipedes have a world-wide distribution on land, a few inhabit the seashore and can tolerate temporary immersion i[illegible] salt water, none live in iresh water, a[illegible] h[illegible] largest [illegible] up to [illegible] in. in length, are found in tropical countries. Fossil centipedes occur i[illegible] amber of [illegible] t all older remains tentatively referred to t[illegible] class [illegible]a [illegible] prob[illegible] ti[illegible]

Alth[illegible] t[illegible] may benefit man by [illegible] ti[illegible] slugs snd th[illegible] pests, [illegible] ti[illegible] ill beneficial insects as well. Somet[illegible] they become vegetarians: *Haplophilus subterraneus* has been known to damage celery, lettu[illegible] and on[illegible] i[illegible] s[illegible] Although [illegible] cer ti[illegible] ar[illegible] harml[illegible] to man, the bite of large tropical sorts may occasionally be painf[illegible] and cause danger to life.

FIG. 1. — HOUSECENTIPEDE (SCUTIGERA COLEOPTRATA), OF THE ORDER SCUTIGEROMORPHA. RUNNING AT FULL SPEED

Structure. — The head (fi[illegible] 2) of a [illegible] p[illegible] bears, besides the [illegible] t[illegible], three pairs [illegible] f [illegible] th[illegible] appendages th[illegible] l[illegible] and the first and se[illegible] maxillae. Right [illegible]d left first maxillae together form a kind of lower lip (labium) to the mouth. The second maxillae, which lie behind the first, somewhat resemble the walking legs and are not at all like an insect labium. Eyes, in the form of one or many pairs of ocelli, are present in most species other than those which penetrate most deeply into the soil, namely the Geophilomorpha and the family Cryptopidae among the Scolopendromorpha. Abundant head glands supply the mouth parts with fluids used to groom the body and legs.

The head, body and limbs are invested with a cuticle which, though flexible elsewhere, is stiffened to form dorsal, ventral and lateral plates or scutes, differently arranged in the various orders (fig. 3). The dorsal scutes are similar on each segment in the slow-moving Geophilomorpha (fig. 4). Fast running is made possible by, among other things, the dorsal scutes of alternate segments being long and extensively linked by muscles to other scutes, tendons and limb bases. This heteronomy is clear in *Scolopendra* (fig, 5) and more marked in *Lithobius* (fig. 6[A]). In *Scutigera* the alternating very short scutes are invisible. The last three segments of the body, the pregenital, genital and anal segments, are without walking legs.

The cuticle bears a fatty layer at its surface serving to hinder drying of the body under arid conditions; no centipedes, other than *Scutigera,* can survive in a dry atmosphere for long because of the lack of adequate control of the respiratory openings (spiracles) (fig. 3).

The digestive tube is simple (fig. 6[B]); it receives the products

FIG. 2. — HEAD OF SCOLOPENDRA CINGULATA

(A) ventral view showing mouth parts displayed by cutting off poison claw and right maxilla 2 and pulling up right maxilla 1 (detail of separated mandible at upper left); (B) left side showing claw and maxillae in normal position; (C) left lateral view

of the salivary glands near the mouth, and posteriorly, where digestion is complete, a pair of excretory (Malpighian) tubes empty their products to the hind-gut which opens on the anal segment.

The brain, composed of supra- and subesophageal ganglia, surrounds the throat and continues as the ventral nerve cord below the gut. Smaller nerves pass out in each segment to supply muscles and sense organs.

The heart is a simple tube situated above the gut, sending blood from behind forward, outward snd downward to supply the large vsscular spaces which bathe the internal organs. Air tubes or tracheae open on the lateral body surface, except in *Scutigera* where the spiracles are dorsal. Air is carried to all parts of the body by the branching tracheae, but in the Scutigeromorpha the blood transports respiratory gases to the tissues from short tracheae.

Reproduction. — The reproductive system and associated glands vary in different species. The single ovary and the testes (numbering from 1 to 24) lie above the gut and below the heart. The main ducts open on the genital segment. Because of the retiring and nocturnal habits of centipedes little is known about their reproduction. Copulation has not been observed and

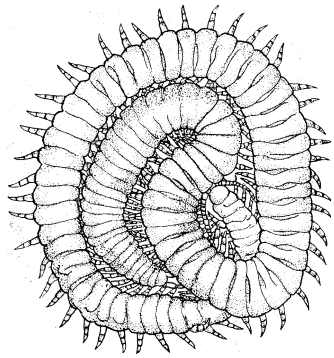
FIG. 3. — SIDE VIEW OF THREE BODY SEGMENTS OF COMMON EUROPEAN CENTIPEDE, LITHOBIUS FORFICATUS, ARROWS SHOW POSITION OF REST OF LEG. STIPPLING SHOWS HARDENED COVERING

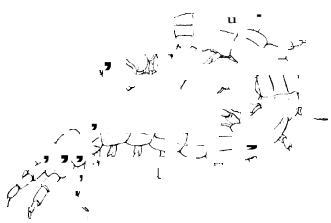
it appears that in at least two cases fertilization is achieved without it, the female picking up sperm previously deposited on a web by the male; possibly this phenomenon is of general occurrence throughout the group. Some (subclass Epimorpha) lay a clutch of eggs which the female guards by curling herself round them until they hatch. Others (subclass Anamorpha) pass each egg separately to a pair of gonopods which hold the egg and roll it in the soil, particles of which stick to the shell and camouflage it. The egg is then abandoned.



BY COURTESY OF HUGH MAIN

FIG 7.—ORYA BARBARICA, OF THE ORDER GEOPHILOMORPHA

The egg is rich in yolk which supplies food for the developing young. The embryo is first differentiated on the surface of the yolk mass and grows at the expense of the yolk, which finally comes to lie internally in the alimentary canal. Body movements result in the rupture of the egg membranes which hitherto have served to protect the embryo and retain its moisture. Thereafter the young centipedes fend for themselves.



BY COJRTESY OF HUGH MAIN

FIG 5.—SCOLOPENDRA MORSITANS, OF THE ORDER SCOLOPENDROMORPHA

Both sexes of many Geophilomorpha are able to produce light from the secretion of glands on the ventral scutes of the body segments which leaves a luminous trail. Sternal or thigh glands produce also a sticky secretion of unknown function similar to that emitted from the posterior legs of *Lithobius* (fig. 6[B]).

Classification.— The two subclasses Epimorpha and Anamorpha are well defined. Members of each group have perfected the ability to run fast, but by different gaits and associated body structures.

Epimorpha.—In this subclass the young hatch with the full number of body segments and walking legs. Full size is attained after a series of molts. Two orders are present:

1. Scolopendromorpha, *e.g.*, Scolopendra *morsitans* (fig. 5). These are fleet runners having 20 to 22 pairs of legs. Stability is maintained with as few as two or three legs on each side'of the body pushing against the ground at a particular moment. The powers of burrowing are limited.

2. Geophilomorpha, *e.g., Geophilus carpophagus* and Orya *barbarica* (fig. 4). These forms are less fleet but expert at burrowing by alternately making the body long and thin and then short and thick in the manner of an earthworm. The changes of body shape depend upon the presence of very many telescopic joints and an external armour which freely bends but is very strong. The body possesses from 31 to 177 leg-bearing segments.

Anamorpha.—In the subclass Anamorpha the young hatch with usually 7 but sometimes 12 pairs of legs. Subsequent molting of the skin is followed by growth and the appearance of additional body segments and legs, repeated until the full number is attained; thereafter further molts lead to the attainment of full size. Two orders are present:

1. Lithobicmorpha, *e.g., Lithobius forficatus* (fig. 6). The body is shorter, with 14 pairs of legs used in running; these animals are as fleet as the Scolopendromorpha, and are unable to burrow by changing their body thickness. The last pair of conspicuous legs are used as holdfasts or as sensory organs.

2. Scutigeromorpha, *e.g.*, the common house centipede Scztigera *coleoptrata* (fig. 1). The legs are very long but numerically simiIar to those of Lithobiomorpha, a number in both orders suited to give easy running by the fastest practicable gaits. Body undulations during fast running are under greater control than in other centipedes, allowing as many as four successive legs to overlap one another during their forward stroke without causing stumbling. The feet are highly specialized to give a good plantigrade grip. even on vertical surfaces. Other centipedes run on the tips of their claws.

(S. M. MA.)

CENTLIVRE, SUSANNA (c. 1670–1723), English dramatist whose farcical comedies are in the tradition of the Restoration comedy of manners. Many accounts have been given of her adventurous life. She was possibly born in Ireland, and it has been suggested that she spent some time at Cambridge university, disguised as a boy, before living as a strolling actress. Later she married an army officer. subsequently killed in a duel, and in 1707 she married Joseph Centlivre, "yeoman of the mouth" to Queen Anne.

Of her 19 plays her outstanding successes were *The Busy* Body (1709) and The *Wonder: A Woman* Keeps a Secret (1714), which continued to be produced in both England and the United States until well into the 19th century.

Apart from early attempts at tragedy, her plays are all comedies bordering on broad farce. She also published interesting letters and poems. She was a friend of George Farquhar, Nicholas Rowe and Sir Richard Steele, and most of the well-known actors of the period appeared in her plays. She died in London on Dec. 1, 1723.

See J. W. Bomyer, The Celebrated *Mrs. Centlivre* (1952).

CENTRAL, the smallest, most densely settled department of Paraguay (area 1,024 sq.mi.; pop. [1960 est.] 190,420), lies south and east of the capital, Asunción, which is the administrative centre of the department but independent of it. Bounded on the west by the Paraguay river, it is the heart zone of the country and has its major road network and many long-established settlements which process the products of a rich agricultural lowland. These include rice, sugar, maize, cotton; and petitgrain from Yaguarón, a town with one of Paraguay's finest Jesuit-built churches. It6 (*q.v.*) is another important centre of historical interest.

(G. J. B.)

CENTRAL AFRICAN FEDERATION: see RHODESIA AND NYASALAND, FEDERATION OF.

CENTRAL AFRICAN REPUBLIC (RÉPUBLIQUE CENTRAFRICAINE), an independent landlocked state in west-central

Africa. was until 1958 the territory of Cbangi-Shari in French Equatorial Africa. Bounded north by Chad, east by Sudan, south by the Republic of the Congo (formerly Belgian Congo) and the Republic of Congo (formerly French Congo) and west by Cameroon, the Central African Republic has a population (1959 est.) of 1,187.097 and an area of 241,699 sq.mi.

Physical Geography. — The country forms a plateau ridge averaging 2,000–3,000 ft. and trending east-northeast, forming a watershed between the Congo and Chad basins. The ridge rises toward the Yade massif in the west and in the east reaches 4.593 ft. in the Bongo massif, but a central saddle allows easy access between Bangui and the headstreams of the Shari river.

The granitic summits of the Tade massif decline eastward into sandstone plateaus dissected by the Nana (upper Sanga) and Lobaye rivers. In the east gneisses and quartzites predominate, also surfaced with sandstone but with occasional isolated granitic knolls. The crest of the main watershed is of metamorphic rocks and quartzites, which northward are overlain by sandstones of the final continental period, Tertiary sandstones of the Chad basin and more recent alluviums.

The republic extends from the equatorial to the tropical zone; the climate has a rainy season (June to October) with southwest monsoon winds and a dry season (October to March) brought by the northeast trade wind or harmattan. The southern part belongs to the region of equatorial heat and humidity and has an even temperature averaging about 80" F., with diurnal variations of 15°–20°. The rainfall is highest in the upper Ubangi. in the southeast (71 in. annually) and in the Yade massif (59 in.), and from there decreases to about 47 in. The country is mostly in the savanna zone, well wooded in the south (acacias, baobab, monkey bread trees and cotton trees) but treeless in the north. In the south the density of trees indicates the proximity of the rain forest, which along the course of-the rivers extends deep into the savanna area. The dense forest zone is the home of the gorilla and chimpanzee and of arboreal creatures such as monkeys, giant squirrels. bats. snakes, birds and insects. Fish, crocodiles and hippopotamuses abound in the rivers. The savanna is inhabited by grazing animals, particularly by many species of antelope; hyena are numerous; lions occur sporadically.

People. — The population is very thin and unevenly distributed. Moreover it is not homogeneous. forming a mosaic of racial groups of which the principal are the Baya in the west and the Banda and Mandja in the centre. (See AFRICA: *Ethnography* [*Anthropology*]: *West Central* Africa.) Cattle-raising Fulani infiltrate from the west, but the population is essentially an agricultural one, growing millet! sorghum and cassava on ground prepared by burning the topsoil. The capital and only large town is Bangui (*q.v.*).

(J. D.)

History.—Bifacial hand axes of Acheulean form have been discovered beside the M'bali river northwest of Bangui. At one time, when the rain forest extended farther north, Pygmies appear to have lived in the region.

Early riverain tribes were the Banziri and Sanga. In the 19th century, under pressure from slave traders in Sudan, four waves of migration peopled the savanna: Baya and Mandja from the north; Banda and Xzande (*q.v.*) from Bahr el Ghazal (southwest Sudan). The slave traders raided as far as the Ubangi river, but were resisted by the Azande, who were organized in kingdoms by the feudal dynasty of the Xvongara. The German explorer Georg August Schweinfurth (*q.v.*) followed one of the slaving bands and journeyed over part of the Azande territory (1870). Bantus from the south occupied the southwest region; petty sultanates (Bangassou, Rafai, Zemio) were created along the Bomu river, the right headstream of the Ubangi. Over the rest of the country political unity did not go beyond the tribe; cannibalism and wars were rife. Some trading (salt, ivory, slaves) took place along the river.

H. M. Stanley, descending the Congo in 1877, discovered the mouth of the Ubangi, whose lower course was in 1885 surveyed by the British missionary explorer George Grenfell. The Ubangi became the boundary between French territory and the Congo Free State (later Belgian Congo) as far as latitude 4° N. The post of Bangui was established by the French on the right bank in 1889 but in the following year the administrator was murdered by local tribesmen. Victor Liotard, who had been appointed governor by Pierre Savorgnan de Brazza (*q.v.*), occupied the confluence of the Bomu and Uele. The northern frontier of the Belgian Congo in this region. for some time disputed with France, was in 1894 fixed at the Bomu river. In 1897 an expedition from Brazzaville under Jean Baptiste Marchand (*q.v.*) ascended the Bomu, crossed to the Bahr el Ghazal and reached the Nile at Fashoda (Kodok) in July 1898, provoking the "Fashoda incident" between France and Great Britain. The resulting crisis was settled by the Anglo-French agreement of 1899 which fixed the frontier between Sudan and French Congo (as the French territories in equatorial Africa were then called') along the watershed between the Congo and Nile basins. Pacification of this part of the colony was achieved by 1911.

In the north the French attacked the slave-trading sultans who had caused so much damage and misery. Sultan Senoussi. a vassal of the triumphant Rabah Zobeir (*q.v.*), in 1891 caused the assassination of the explorer Paul Crampel. In 1900 Émile Gentil, who had succeeded in reaching Lake Chad in 1897. led a military expedition from Bangui and assisted the forces of F. Foureau and F. J. A. Lamy from Algeria in the battle of Kousseri, which resulted in the death and decapitation of Rabah. Senoussi was destroyed by a further expedition in 1911.

French partition of the colony between great commercial concessionaires led to abuses denounced by André Gide in *Voyage au Congo* (1927). From 1928 the governor encouraged the cultivation of cotton and created a good network of roads. The Ubangi-Shari colony, a division of French Equatorial Xfrica, became in 1936 an overseas territory of France with an elected assembly. Diamond mining and the creation of peasant holdings provided new resources. and the capital Bangui grew rapidly; the route of a Bangui-Chad railway was surveyed.

The former priest Barthélemy Boganda, leader of the Mouvement pour l'Évolution Sociale de l'Afrique Noire, became president of the grand council of French Equatorial Xfrica in 1937. In 1958 Ubangi-Shari became an autonoinous state of the French Community under its new name of République Centre-Africaine. Boganda, who dreamed of a "United States of Latin Africa," was killed in an air accident in 1959 and was succeeded as president by his cousin David Dacko. On Aug. 13, 1960, following the signature of transfer and co-operation agreements with France, the independence of the republic was proclaimed at Bangui.

(Hu. DE.)

Economy and Communications. — Themain export is cotton, which is grown by numerous planters, especially on the Yade massif and around Bambari. Other export crops are coffee, grown particularly in the southwest, rubber from the Lobaye river region, sisal in Haute-Sanga and oil palm products. Timber extraction has decreased in importance, but livestock has increased with Fulani influence. Before the development of cotton, mining was of some importance, but in the 1950s gold mining ceased to be profitable and diamond production (which in 1932 reached 156.000 carats) decreased; most of the mining is near Berbérati. Except for breweries (Bangui) and plants for cotton ginning and sisal cleaning. the only important industrial development is at Bouali (40 mi. N.W. of Bangui) where a hydroelectric power station supplies a textile combine.

Economic progress is impeded by the absence of railways or seacoast. Most export products travel down the Ubangi and Congo rivers, or by road westward to Yaoundé or Duala in Cameroon. There are regular airline services from Bangui to main centres in west and central Africa and to Paris and Rome, with feeder services to Berbérati, Bambari and other places in the republic.

(J. D.)

CENTRAL AMERICA, the aggregation of independent republics and United States and British dependencies which occupies the isthmian bridge between Mexico (North America) and Colombia (South America). The region includes Guatemala. Honduras. El Salvador. Nicaragua, Costa Rica, Panamá the Panama Canal Zone and the crown colony of British Honduras (claimed

by Guatemala as Belize). The low latitude land area, flanked by the Caribbean sea and the Pacific ocean, extends from latitude 7° 15' N. to latitude 18° 30' N., and from longitude 77° W. to longitude 92° 15' W., or roughly 990 statute miles east and west by 770 mi. north and south. The total area is approximately 200,000 sq.mi. The population, about 11,000,000, has one of the highest rates of increase in the world.

The term Middle America (*q.v.*) is sometimes used as a synonym for Central America. However, geographers usually consider Middle America to include Mexico, the West Indies and Central America.

This article is divided into the following main divisions and sections:

I. PHYSICAL GEOGRAPHY

Central America is more suitably defined as a regional political concept than as a concept in physical geography.

A. Geology and Physiography

The isthmian land mass of Central America, an area of considerable geologic complexity, is dominated by a mountain backbone made up of the elements of two orographic systems. The older mountain system, consisting of a nuclear core of Archean or early Paleozoic rocks and a mantle of volcanic materials, lies in Guatemala, Honduras, Nicaragua and British Honduras. Within the area enormous troughs caused by faulting and folding are prominent relief features. To the southeast, chiefly in Panamb and Costa Rica but extending through southwestern Nicaragua, is the young system of mountains which finally sealed the marine portal between North America and South America. Both upland areas are flanked by narrow coastal plains.

Prominent and striking features of the Central American highlands are the two great series of peaks, most of them young volcanoes (possibly Pre-Miocene in places, definitely Pliocene to Recent), which trend northwest to southeast in gentle convex arcs toward the Pacific. The volcanoes, more than 100 large and 150 minor ones in all, overlie a broad base of older lava and ash beds. The two series of volcanic mountains may be traced from Chiapas (southern Mexico) through Guatemala and El Salvador, and through Nicaragua and Costa Rica into Panamb. Each series lies nearer the Pacific than the Caribbean. Each has a length of approximately 350 mi. (excluding Chiriquí in western Panamá because of its isolation from the others). The lines of volcanoes converge in the region of the Gulf of Fonseca. A broad Pacific belt, southeastward to Panamb, is subject to frequent and violent seismic activity characteristic of such highly unstable volcanic areas. Some earthquakes are associated with eruptive activity, others with faulting. A number of cities have thus been destroyed, notably Antigua Guatemala in 1773 and modern Guatemala City in 1917–18. Seismic disturbances occur with such frequency about San Salvador that the surroundings are termed the Valley of the Hammocks (Valle de las hamacas). Ash eruptions may cover wide areas, as was spectacularly illustrated by the tremendous explosion (1835) of Cosigiiina, Nic., which spread ash and pumice over a radius of about 600 mi.

1. Northwestern Highland. — The nuclear Central American highland, composed of granitic and diverse metamorphosed sedimentary rocks, is a complex folded and faulted region dominated by east-west arcs of parallel ranges and valleys. The region, a western segment of the Greater Antilles orographic system, extends into southern Mexico. Collectively northwestern Central America, southern Mexico and the Antillean islands and submarine ridges are termed the Antillian, Caribbean or Middle American system. As an orographic system it is distinct from the north-south trending structures of North America and South America.

Old Mountains. — The oldest-known geologic formations in northwestern Central America are Paleozoic, usually designated as Pre-Permian, since no rocks of proved age older than Permian have been found. Most so-called Carboniferous rocks are of Early and Middle Permian age, and Pre-Cambrian or Archean formations may be no older than Middle Paleozoic. It is probable that the area was insular during part of the Paleozoic era and was linked to the Greater Antilles, although separated from North and South America by narrow straits'. Faulting severed the Antillean link during various periods of geologic history, especially in the Late Cenozoic.

Principal among the mountains of the oldest periods of folding and faulting are the central Guatemalan Sierra de Chuacbs and Sierra de las Minas. (Continuing their trend northwestward into Mexico is the Sierra Madre de Chiapas.) Just south of the trough followed by the Motagua river, and roughly parallel in strike with the Sierra de Chuacbs, are the Honduran Sierra de la Grita, Sierra Espíritu Santo and the Picos de Omoa. A structural system outlier is the granite-cored Maya mountains in British Honduras.

Other east-west striking mountains of Permian granites, gneisses and schists lie in Honduras and northern Nicaragua. They appear as short, steep and rugged ranges separated by structural basins. While there is little order in the intricately dissected highland, a northern and somewhat higher southern group of cordilleras may be discerned. These mountains, lower than the old Guatemalan mountains, are similar in height and ruggedness to such interior Nicaraguan mountains as the cordilleras Isabella and de Darién (undetermined age) and the Huapi mountains.

Almost all of the old rock mountain region may be characterized as having considerable relief, the high ridges being deeply fretted with the canyons and gullies tributary to the master depressions that lead toward the Caribbean. In central Guatemala mountain summits reach elevations of over 8,000 ft., and in Honduras and Nicaragua many of them attain 5,000 to 8,000 ft. elevation. Master streams may follow valley floors a half mile to a mile below the sharp divides. At intermediate elevations are a few rolling or hilly basins.

Mountains of Middle and Recent Geologic Times. — Except for the recent and currently active volcanoes which have developed over the older terrain in the south and west, the highlands were uplifted to their present elevations during Mesozoic and Cenozoic (especially Pliocene) time. In central Guatemala, to the north and east of the areas mantled by volcanic materials, lies a band of highlands where nearly horizontal Cretaceous beds occur over large areas. The most impressive of such mountain areas is the Sierra de los Cuchumatanes horst, an elevated block which is contiguous with the Mesa Central of Chiapas (Mexico). The east-west, southward-facing front of this great limestone block rises to a high point of more than 12,000 ft., higher than all the great

volcanoes to the south except Tajumulco (13.812 ft.). It presents a nearly straight 40-mi. east-west wall more than 10,000 ft. in elevation above sea level and with relief heights above the Río Negro from 3.000 to 5,000 ft. This is the dominant single relief block in all the highlands of Central America. The lofty summits are smoothly rolling, with sinkholes characteristic of karst topography in limestone areas, but around the margins of the massif profound canyons drop away to breathtaking depths. Following the crescentic arc farther eastward through the Alta Verapaz, the Pliocene orogeny is manifested in other features of step and block faulting. mostly minor as to relief except for the hill lands south of the Cockscomb mountains of British Honduras.

Major *Structural* Depressions.—Several structural troughs create prominent relief features in northern Central America. In north-central Guatemala the southern wall of the Sierra de los Cuchumatanes overlooks the valleys of the east-flowing Rio Negro and the west-flowing Saleguá (Usumacinta and Grijalva drainage basins, respectively). The Motagua and Polochic rivers. which follow a more direct, generally eastward, course to the Caribbean, occupy deep, ancient furrows. With a strike that is transverse to the nuclear mountain structure, the Honduras depression crosses Central America from north to south. This major fault zone is marked by the Humuya-Ulúa and Goascorán valleys and the intermediately located elevated Plain of Comayagua, a densely populated area some 40 mi. long and 5–15 mi. wide. Many of the rivers of southern Honduras flow through deep box canyons cut in lava beds. and this incision by drainage accentuates structural lines.

Volcanism.—In Guatemala, Honduras and Nicaragua mantles of ash and lava cover an area of 525 mi. northwest-southeast extent and up to 125 mi. in breadth. The mantle of Upper Tertiary or Quaternary ash and lava is deepest in southwestern Guatemala where, found at its highest elevation, it forms the continental divide. The mantle becomes thinner toward the Caribbean.

Studding the Pacific slope of the eruptives-covered highland in Guatemala, and lying to the southwest of the continental divide, is a series of striking northwest-aoutheast trending volcanic peaks. The string of young volcanoes is parallel to and less than 50 mi. from the Pacific coast. Among the cones are the simple and well-formed Tajumulco (13,812 ft.) and Tacaná (13,333 ft.). Southeastward from these, multiple peaks are common: Santiaguito-Santa Maria (12,362 ft.), Atitlán-Tolimán (11,565 ft.) and Colina-Acatenango (12,992 ft.); the first-named of each pair is the coastward and younger vent. For centuries Colina has been intermittently active; Santiaguito, active for relatively few years, has had rapid, continued growth. As with the case of Santa Maria (1902), lateral explosions and the birth of new basal cones result from the blocking of openings by lava, especially by the highly viscous and rapidly solidifying andesitic extrusion.

In El Salvador. where the eruptives are darker and more basaltic, the elevation of the volcanic highlands decreases toward the east. The double row of inactive and semiactive volcanoes includes peaks that rise to between 3.600 and 7.600 ft. Among them may be singled out Izalco (6.183 ft.), "Lighthouse of the Pacific," intermittently active from the 17th century.

Several basins lying in the region of eruptives have fertile soils and long histories of occupation and intensive cultivation. Among these is the Quezaltenango basin, situated at 7,500 ft. elevation. It is drained by the Samalá, one of a number of Pacific streams that follow sharp gradients through the broad gaps which separate the volcanoes. In some cases drainage has been disturbed. and lakes formed, as a result of volcanism. The beautiful Lake Atitlán, which marks a cauldron subsidence, is partly dammed by volcanic ash. Lake Amatitlán, a scenic resort arta for the capital, lies within a down-dropped block. In El Salvador lakes

FIG. 2.— THE IZALCO VOLCANO IN EL SALVADOR. CALLED "THE LIGHTHOUSE OF THE PACIFIC" BECAUSE ITS INTERMITTENT ERUPTIONS ARE SEEN FOR MILES

Coatepeque and Ilopango occupy collapsed, basin-shaped depressions. Between El Salvador's northwest to southeast trending corridor of volcanoes and basins and the steep-faced highlands of Honduras lies a structural corridor which is occupied by broad tablelands composed of eruptives. The area is drained by the Lempa river, a stream that turns westward across the line of coastal volcanoes to enter the Pacific.

2. Southeastern Uplands.— Although the arcuate mountain system of Panami and Costa Rica is more or less parallel to the nuclear system of northwestern Central America, the two are distinct geologic regions. In addition to the narrow S-shaped Isthmus of Panamá and Costa Rica, the system includes the west Nicaraguan range of coastal volcanoes and the lake-occupied Nicaraguan depression. At its narrowest point, near the Panama canal, the isthmus is about 40 mi. wide, and at its widest part, the Nicoya peninsula, it is more than 150 mi. across.

The land bridge which southeastern Central America forms between northwestern Central America, North America and South America dates from the Late Miocene-Pliocene periods. Earlier, the land links had been broken in the Late Eocene period in Nicaragua-Costa Rica and in Panamá, and in the westerly area during Middle Miocene. The breaches permitted the circulation of water between the Atlantic and Pacific oceans and the development of closely related marine floras and faunas on both coasts. The connecting link between the continents was created by volcanic action, a ridge being formed upon an elongated submarine arch. Intrusive mountains were uplifted upon the ridge crest in Late Miocene-Pliocene, and through the later Pliocene and the Pleistocene were further built up by numerous highly active explosive type volcanoes. The eruptions raised the ridge above sea level. Thereby, intermigration of animals and plants was resumed: first between South America and Central America-West Indies; then (Pliocene to present), after the closing of the Tehuantepec (Mexico) portal, between South America and North America. Several orders of mammals, including some marsupials and primates, probably crossed the Cretaceous-Eocene land bridge from North America to South America, and four orders definitely crossed the later Pliocene-Pleistocene bridge. These included the carnivores, proboscidians, artiodactyls and perissodactyls.

Panamá.—Panamá's axis of rugged low mountains is highest in the eastern and western extremities of the country, and lowest at the Canal Zone where the Panama canal is cut through the isthmus. From an elevation of less than 300 ft. in the Canal Zone the steep-sided hills arc eastward and southeastward as the San Blas and Darién ranges. Although elevations generally do not exceed 4,000 ft., there are peaks that rise to 6,100 ft. in the Serrania del Darién. This eastern segment of the intrusive backbone lies near and parallel to the Caribbean coast. Its western counterpart, more centrally located on the isthmus, is the abruptly rising mountain area which culminates in the 6,000 to 9,272 ft. peaks of the Serrania de Tabasará (Cordillera de Talamanca). The isthmian backbone broadens and rises to the west before entering Costa Rica. In western Panamá many of the peaks exceed 6,500 ft.; the inactive volcano of Chiriqui reaches 11,411 ft. Though primarily volcanic, some sedimentaries, especially limestones, shales and sandstones of the Early Cenozoic cover the igneous rocks. This is best seen in the east, near the Colombian border. The limited Tertiary marine beds of Panamá are thinner and less folded than those of Costa Rica. Folding parallels the coast and often is asymmetric, with steeper slopes toward the Caribbean, especially notable in Darién. A number of north-south thrust faults cut across central Panamá and seemingly have locally affected relief and drainage.

To the south of and parallel to the core highlands are several isolated remnants of a coast range. From east to west they are the Serrania de Baud6 and the hilly peninsulas of Azuero (Panamá), Burica (Panamá-Costa Rica border), Osa and Nicoya (Costa Rica). Intermediate between the peninsular remnants and the isthmian backbone are lowlands that suggest a central valley.

Costa *Rica.*—In Costa Rica the highlands maintain the massiveness which marks the west Panamanian mountains. The intrusive Cordillera de Talamanca has substantial bulk above 4,500 ft. elevation. This largest and highest range in the country attains 12,533 ft. in Cerro Chirripó Grande which is the nonvolcanic summit of an ample crest zone where elevations exceed 8,000 ft. From the cordillera toward both coasts extend great steep-sided mountain buttresses. Two of these link with the Cordillera Brunquena, a range flanking the Pacific coastal plain, thus embracing the moderately high (1,000 to 3,000 ft.) basins of the General and Coto Brus rivers.

The Candelaria highland or Meseta Central is the 3,000 to 4,000 ft. high rolling upland which occupies the transverse gap between the Cordillera de Talamanca and the more northerly Cordillera Central and Cordillera Volcánica. This highland zone of good volcanic and alluvial soils, the core area of Costa Rica's economic, political and cultural life, is drained by the Reventazón and Grande de Tárcoles river systems. Respectively, the valleys afford routes by which Atlantic and Pacific coastal plains are reached.

The Cordillera Central is a nearly west-east trending volcanic pedestal from which rise the Poás (8,875 ft.). Barba (9,533 ft.), Irazú (11,260 ft.) and Turrialba (10,919 ft.) volcanoes. Contiguous and to the northwest of this file of massive peaks is the Cordillera Volcánica, a northwest-southeast trending range which is studded with several peaks that rise to between 4,500 and 6,200 ft. elevation.

Nicaragua.—An extension of the geology of the Costa Rican mountain arc and a continuation of the Cordillera Volcánica may be traced in the line of Nicaraguan coastal volcanoes which reaches the Gulf of Fonseca. This corridor of hills and volcanic peaks, the Cordillera de los Marrabios and Sierras de Managua, is separated from the older highlands of central Nicaragua by the structural depression which contains lakes Managua and Nicaragua (the latter about 110 mi. by 45 mi.) and the San Juan river.

The low trough that cuts diagonally across Nicaragua is the locus of most of the economic, cultural and political life of the country. Managua (the capital) and Granada are situated in the interlakes area, and the second city, León, is nearby but on the Pacific slope. The strategic value of the lowland corridor as a transisthmian route has been recognized for a long time. It was seriously considered for the interocean crossing before the Panama canal was built; it remains a possible alternate canal route. The formation of the lakes may have occurred with the Pleistocene growth of the line of volcanoes which began to form in Oligocene or Early Miocene time.

3. Lowlands.— Besides the structural trough of Nicaragua, the Central American lowlands are restricted to plains along both coasts and to the slightly elevated limestone plain of northern Guatemala (Petén) and British Honduras. This limestone terrain, a southerly continuation of the Yucatán peninsula (Mexico), and the east coast plain of Honduras and Nicaragua are the most extensive lowland areas.

Petén and British Honduras.— In northern British Honduras and Petén, Mesozoic and Cenozoic rocks underlie the plains that rise gently from east to west. Inland from the Caribbean the limestones are warped into a subdued northeast to southwest trending

series of ridges and troughs. The land which lies at 200–300 ft. elevation in the western part of the colony hardly exceeds 500 ft. in Petén, where the alignment of topographic features parallels that of the southerly mountains. Ill-defined lines of surface drainage, sinkholes and knobs are characteristic of this limestone (karst) topography.

Caribbean *Lowlands.*—The Caribbean lowlands are narrow corridors of alluvium-surfaced marine Pleistocene beds that lie between the mountains and the sea. As a rule the plains are less than 10 to 15 mi. wide, but they may exceed 50 mi. width between the Patuca (Honduras) and Escondido (Nicaragua) rivers. Although the inner margin of the plains may be elevated a few feet, the bulk of the lowlands is poorly drained. Meandering rivers, swamps and tidal lagoons are common; good harbours are lacking.

Broad fingers of lowland reach into the interior along structural furrows. The ernbnyments into the steep-flanked northwestern highlands are numerous. The Polochic and Motagua valleys in Guatemala. and the Ulúa and Aguán valleys in Honduras, are especially important as communications corridors and farming areas. Banks and low cays are common along the shore. Only the Bay Islands (Islas de la Eahia). north of Honduras, have much relief (elevations to 700 and 1.100 ft.).

Pacific Lowlands.—The Pacific lowlands, which rarely exceed a 25 mi. breadth and are generally much narroner, lie behind a straight coast in Guatemala and El Salvador. To the southedst irregularities in the coast line are provided by the gulfs of Fonseca, Nicoya, Dulce, Chiriqui and Panamá, and by the hilly peninsulas of Nicoya, Osa and Azuero. Swamps and bars skirt much of the Pacific coast; there are few good harbour sites.

B. Climate

By far the greater part of Central America has tropical climatic conditions. Cooler, temperate conditions are limited to the higher mountain and intermountain basin and plateau areas.

1. Temperatures.— Locally. throughout Central America, as in certain other parts of tropical Latin America, climates are usually classified into three simple vertical groups: *tierra* caliente, "hot land"; tierra *templada,* "temperate land"; and tierra fria, "cold land." This corresponds uith and probably stems from the old division of the earth into torrid, temperate and frigid zones dating back to the ancient Greeks. It is difficult to fix any limits to these climates. which are altitudinally conditioned thermal zones. The tierra *caliente* is, of course, the lowest in elevation above sea level. Citing western Guatemala as a typical illustration, this is approximately from 26° C. (78.8° F.) mean annual temperature at sea level to 22" C. (71.6° F.) at 1,000 m. (about 3,281 ft.) above mean sea level. The *tierra* templada extends upward from this point to about 1.900 m. (6,234 ft.), where the annual temperature is normally about 17° C. (62.6" F.). Above that, in the upper mountains and valleys, is the tierra *fria,* culminating with about 5° C. (41° F.) at the summit of Tajumulco volcano (13 812 ft. or 4.211 m.), the highest point in Central America. Both toward the equator and on the eastern side of Central America's uplands climate zones are slightly higher. Any temperature limits can be set arbitrarily, but for world comparisons the Koppen tropical and mesothermal (*i.e.,* temperate) types (with the coldest months warmer and cooler. respectively, than 18° C. [64.4° F.]), are valid in Central America. The Koppen tropical-mesothermal isotherm (equal-temperature line) follows about the 1,450-m. (4,756-it.) isohyps or contour line, which is just in the centre of the temperate zone of local usage.

2. Rainfall.— This has far greater seasonal variability than temperature, and is not taken into account in the above climate classification. It is, however, the basis for the seasonal distinctions. summer (*verano*) being the dry season, with its clear skies, warm sun and pleasant weather, and minter (*invierno*) being the more dismal rainy season, when cloudy skies actually may reduce daytime temperature maxima to points below those of *invierno.* It must be borne in mind that *verano* is climatologically winter, for the sun during that season (November through April) is higher south of the equator most of the time. Conversely, local winter is climatological summer, the rainy season (May through October), with maxima in June and September. This seasonal rainfall regime is characteristic of the Pacific lowlands which have the Koppen tropical savanna climate. Highland regions nearer the Pacific coast, as in southwestern Guatemala, El Salvador, Honduras and Nicaragua, have the cooler phase of the summer-rain, winter-dry type. Toward the southeast the dry season is shorter, as the total annual rainfall for the region as a whole tends to increase. San José, Costa Rica. has five months of dry season (Dec.–April), and Balboa, Canal Zone. has only three months (Jan. to March), as compared with the six dry months of similarly situated stations in northwestern Central America.

The Pacific coast is in general drier than opposite points on the Caribbean. The greater rainfall of the Caribbean coast can be seen in comparing the annual rainfall of Colón, at the north end of the Panama canal, more than 127 in., with Balboa Heights, at the south end of the Panama canal about 40 mi. away, with 69 in. Colón has two slightly drier months in winter (Feb.–March). East coastal Nicaragua and Costa Rica are especially rainy, Greytown (San Juan del Norte) having recorded an annual average of more than 260 in. Similarly, highlands toward the Caribbean side have rainfall distributed more evenly through the year, as seen as far inland as the Alta Verapaz (Cobán area) of Guatemala. The importance of rainfall concentrated along windward slopes may be observed in the southern (Pacific) Guatemala coffee belt. The area of superior production is favoured by a fairly long sesson of orographic rain (dry season reduced to Dec.–March) and cool highland conditions. Annual precipitation there ranges between 400 and 550 cm. (160 and 220 in.), according to exposure, in altitudes between 700 dnd 1.400 m. (about 2.300 and 4.600 ft.). Deep valleys are generally much drier than adjacent highland areas. This is evident not only in the east-west structural valleys of Guatemala, where rain shadow conditions exist with respect to both northerly and southerly rain-bearing winds, but also in such north-south troughs as the Honduras depression.

3. Weather.— Diurnal ranges of temperature generally exceed annual ranges in Central America, as elsewhere in the tropics. In highland Guatemala. for example, daily variations of 15° C. (27° F.) are common in the dry season, while the annual range is less than 5° C. (9° F.). The prevailing minds in most of the region are northeasterly (between east-northeast and north-northeast), characteristic of the northern hemisphere trade winds, especially strong in the winter half year. Northers, strong. gusty north winds which may blow for several days, occur in northern Central America, into El Salvador; they are anticyclonic fronts of cold polar air masses that roll across North America in winter. They bring exceedingly clear skies, even in the afternoon. Because of the narrowness and dominantly marine nature of the isthmus of Central America, land-and-sea breezes are well developed. There in the tropics. daytime heating of land surfaces, especially in the mountains, is intense, creating low pressure and onshore winds. These oppose the trades and, in the dry months of the Pacific region, result only in cloudiness from midmorning to shortly after dark. In the rainy season, when the sun is nearly overhead at noon, or is even to the north, the trades are weakened and southerly winds with greater intensity bring rain. Hail is rare, usually coming in March and April in the high northern mountains. At night, as the land cools, especially in the highlands, the land breeze sets in. Over the southern coast the sky may be swept clear before midnight by a trade wind-strengthened land breeze. At the height of the rainy season there may occur cloudy nights and continuous rain night and day for several days. Mountain fog above 5.000 or 6,000 ft. is common at such times, as it is in afternoons throughout most of the year. On the north coast, as in Honduras, the northerly sea breeze joins forces with the northeast trades, which are strongest in winter, so that there is actually a winter maximum of rainfall in certain sections (La Ceiba to Puerto Castilla. for example). Rain throughout most of Central America comes usually in the form of intense tropical thunderstorms, from late morning to evening in normal rainy-season weather or at any time of day during periods of *temporales,* or stormy wet spells. At such times relative humidity is constantly high. Hurricanes occasionally strike the northern Caribbean coast,

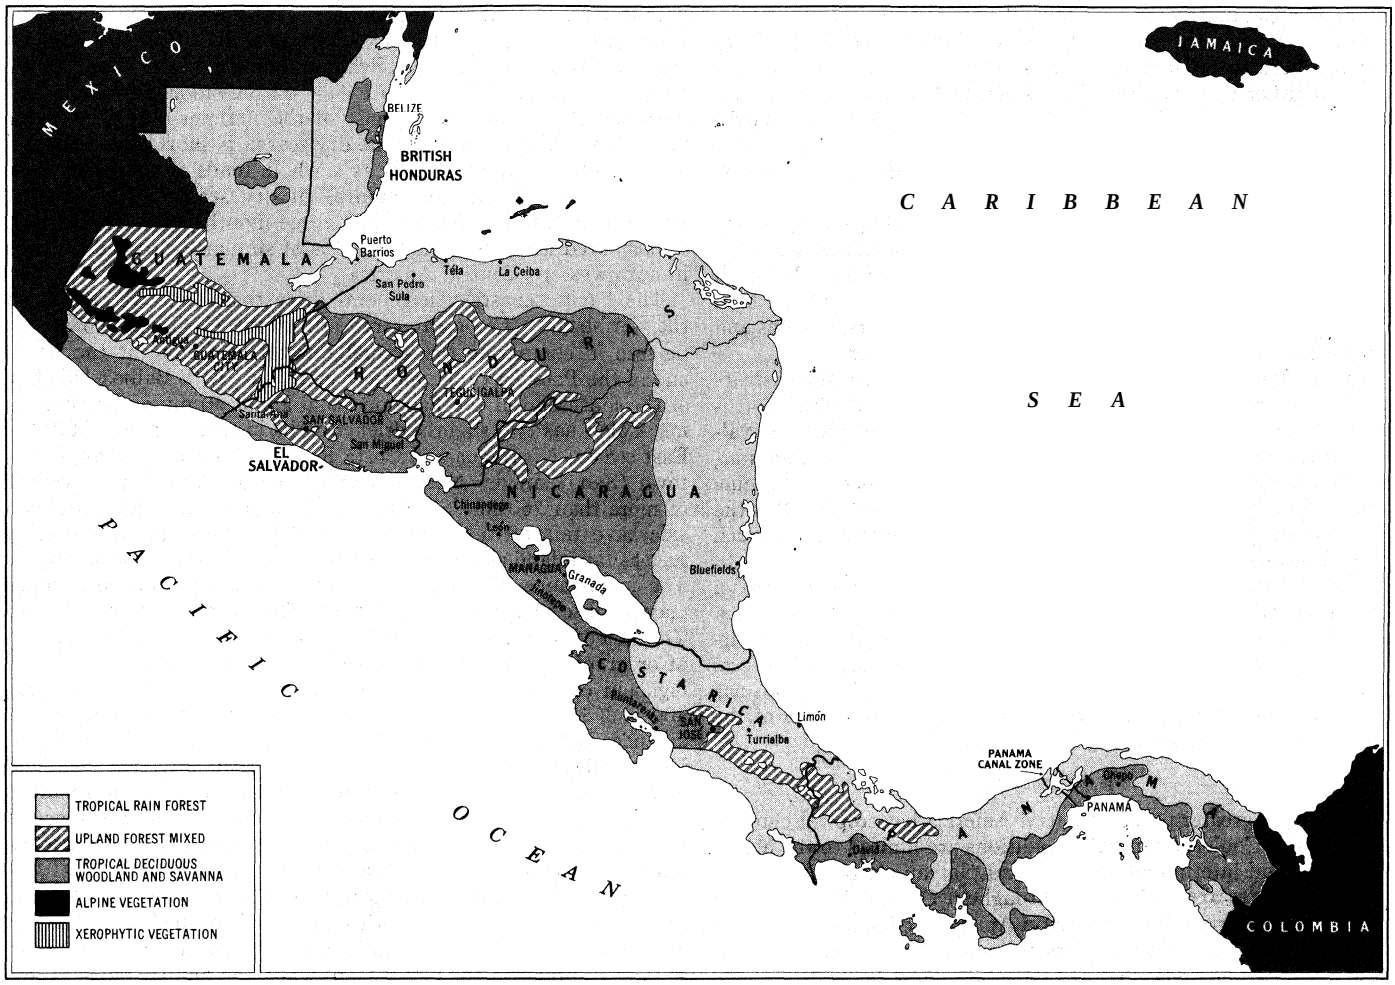

FIG. 3.— NATURAL VEGETATION OF CENTRAL AMERICA

from late July to early October. Belize especially has suffered the effects of these outer-tropical storms, and great destruction has been caused by them in the banana area around Puerto Barrios, Guat., but away from these coasts the effects of such storms are slight.

C. Vegetation

The flora of Central America is exceptionally diversified, there being thousands of species of many types of plants. This variety is an expression of such factors as the transitional situation between South American and North American phytogeographic regions; areal differences in temperature and precipitation; and local variation in soil (edaphic) conditions. South American, austral flora has extended northward across the Central American land bridge into Mexico. North American, boreal flora occurs from Guatemala to the Nicaraguan depression, and some of its elements are found in Costa Rica. Within this transitional area plant distribution patterns are due to such edaphic factors as soil depth, porosity, water table level and exposure to salinity.

Certain broad groupings may be made with the numerous and infinitely complex plant communities that occur in Central America; however, the boundaries between designated vegetation regions seldom are clearly marked. The heavy tropical rain forest is more or less coincident with the hot lowlands, tierra *caliente,* of the Caribbean. A deciduous forest or a scrub forest with grass ground cover occurs along much of the Pacific tierra caliente, where precipitation is moderate and seasonal. Bordering the lowlands along both coasts is a ribbon of mangrove swamp and strand vegetation. With elevation the hot country plants are gradually replaced by oak and pine and other mid-latitude (North American) or highland (South American) plants. Thus, the rain forest of the northeast and the deciduous woodland of the southwest merge into the mixed highland forests of conifers, oak and other hardwoods. The tierra templada vegetation is supplanted at higher elevations by coniferous forests and alpine cover. Everywhere, from shore line to upland crests, man has been a significant factor in altering the vegetation. Fire, the plow and livestock have been the chief instruments causing change.

1. Tropical Rain Forest.—The most extensive broad vegetation type is the tropical rain forest, found largely along the Caribbean coastal plain and flanking highland slopes to about 2,500 or 3,000 ft., but also occurring on the lowlands and adjacent mountains in southern Costa Rica and, to a lesser extent, in Panamá. The forest contains a bewildering array of plant species. Generally the tree species are scattered, rather than occurring in pure stands; and many of these broadleaf evergreens become forest giants. Viewed from above, the interlocking crowns of the tall trees form a billowing sombre-green expanse of foliage. Common among the slender trunked canopy makers are the moraceous (Castilla, Ficus, *Brosimum*), the meliaceous (Swietenia, Cedrela), sapotaceous (Manilkara, Chrysophyllum), and lauraceous genera, Ceiba, and many other species. An understory of medium-sized trees (like Carica, *Inga,* Pithecolobium, Guarea) and palms occurs. Treelike species of ferns are abundant in some areas. Commoner is the occurrence of a thin ground cover of shade-tolerant herbaceous plants and shrubs (as Piper, *Siparuna*), some broad-leafed grasses and monocotyledonous plants (like Heliconia, Calathea, *Costus*). Serpentine lianas and slender hanging vines, and such epiphytes as orchids and bromeliads, add to the luxuriance of the forest. In their external aspect the forests are similar to other tropical rain forests of the world, as in the Amazon and Congo valleys and in parts of the East Indies.

Fresh water, open or wooded swamps and marshes are extensive. Appearing in them are grasses and sedges and a number of such

aquatic species, as *Sagittaria, Pontederia, Pistia* and *Thalia.*

Along the shore, around brackish lagoons, and inland along sluggish streams on both the Caribbean and Pacific coasts rise thickets of mangrove (*Rhizophora mangle;* also *Laguncularia* and *Avicennia)* and other salt-tolerant plants. The mangrove swamps also extend along the coastal margins of plains where deciduous forests predominate.

2. Tropical Deciduous Woodland and Savanna. — Second most extensive among the generalized vegetation regions of Central America is the deciduous woodland and savanna that cloaks most of the Pacific lowlands and slopes to about 2,500 or 3 000 ft., and which also appears in the northern part of British Honduras. The plants are more or less dormant for half the year. during the winter dry season (generally November through April). When the tegetation bursts from the dormant stage after the first rains, a dreary gray and brown open woodland is eclipsed with lush greens.

The vegetation tends to form an open parkland in which the deciduous trees are interspersed by innumerable tall savanna grasses, sedges and low herbaceous plants. Near nater courses, gallery forests develop. In general. the trees of the Pacific woodland are smaller than those of the Caribbean lowlands, but tall trees with great spreading crowns are present. Among the larger trees are the *Hura, Enterolobium cyclocarpum, Ceiba pentandra, Casia grandis, Ficus* and *Bombax;* representative smaller trees are the *Coccolobis, Hymenaea, Cochlospermum, Chlorophora* and *Guazuma:* various palms appear as well.

In British Honduras a coniferous and broadleaf deciduous open woodland occurs. The pine (*Pinus caribaea)* and associated broadleaf trees and palms extend over many square miles of deeply neathered coarse soils in the eastern and northern lowlands and on the northern flank of the Maya mountains. Similar woodlands, and characteristic grass and sedge ground cover, may occupy the deeply weathered alluvia of the inner lowlands in eastern Honduras and northeastern Nicaragua.

3. Xerophytic Vegetation. — Within the highlands of Guatemala, Honduras and El Salvador there are areas where prevailing semiarid conditions have resulted in the development of vegetation that is predominantly thornbush, cactus and scrubby trees. The deep middle portion of the Rio Negro or Chixoy valley (Guatemala). and the upper Aguán valley (Honduras) are notable areas of xerophytic cover.

4. Mixed Upland Forests. — Through the zone 2,500–5,000 ft. above sea level there occurs a transition upward from tropical forest and woodlands to vegetation that is more or less temperate in appearance and origin. The belt is not sharply limited vertically, and there are differences of flora between Caribbean and Pacific slopes. Furthermore, ravines and ridges in the path of the humid trade winds are densely wooded, while on leeward slopes and in sheltered valleys and basins there exists an open woodland. Some plants are unique to the belt, but floras of lower and of higher elevations are present. Very large trees, chiefly oaks (*Quercus*), occur but commonly the forest members are not as large as trees in lower elevations. Epiphytes are numerous.

Although oaks and species of *Lauraceae, Euphorbiaceae* and *Melastomaceae* form the larger part of the open parklike forest, there are several thousand square miles in Honduras, Nicaragua and Guatemala where pines, chiefly *Pinus oocarpa,* and various broadleaf species produce the open woodland. In either case, ground cover is provided by various species of flowering plants and short grasses.

Mountain areas of 4,500 ft. or greater elevation, commonly enveloped in clouds by day and drenched with rain at night, develop a dense cloud forest composed of moss. fern and other epiphyte-swathed broadleaf trees of varying size. vegetation and soil, alike, are saturated with moisture. Dominant over large arras of the cold and wet highlands are oaks (*Quercus*), but the flora may be exceedingly diverse over short distances.

Much of the mixed hardwood and coniferous forest has been cleared for cultivation or seared by pastoralists, charcoal gatherers and lumbermen. The pressure on the forests has been greatest in Guatemala, Costa Rica and El Salvador. As in Honduras and Nicaragua, cleared land has been planted to maize and other subsistence crops and to coffee, or it has developed into volunteer or planted grazing land.

5. Alpine Vegetation. — In the highest mountain areas coarse. giant bunch grass, somewhat larger than the common types of the Andean highlands of northern South America. is common. In highland Guatemala it is widely used for roof thatch Cypress trees, junipers and pines grow on the higher ridges and summits. often in almost pure stands at elevations above 10,000 ft. There also, where summits are smooth and rolling as on the high Cuchumatanes alpine meadons of short grasses and low flowering plants of many colours are typical. Most of the plants are boreal. In the moorlike islands of alpine vegetation that appear above 9.800 ft in Costa Rica and western Panamá the flora is similar to that of the *páramo* in the northern Andes.

D. Animal Life

The animal life of Central America reflects a transitional situation between South American, Neotropical, and North American, Nearctic faunas. Although the pattern of transition is complex, the fauna is more Neotropical than Nearctic in all classes of vertebrates except the reptiles. Presumably the strength of the South American representation reflects the suitability of the Central American environment to tropical fauna. The fractions of the southern and northern faunas that interlap become larger, and the zones of overlap greater, with the higher vertebrate forms. Among strictly fresh-water fishes the overlapping that occurs, northward from Guatemala, involves a very few representatives at the family level. The overlap of more salt-tolerant families extends from Lake Nicaragua northward. Transition among the amphibians. largely at the family level. involves relatively more of the faunas; there are families that extend beyond Central America (from the south: caecilians, leptodactylids, brevicipitids, hylids; from the north: plethodontid salamanders. ranids, bufonids). The reptile fauna has a complex distributional pattern that includes northern, southern and some endemics or relict genera and families of reptiles. The bird fauna includes distinct transitional genera and species, migrant and nesting Nearctic groups, and many Neotropical groups. The distribution patterns of many northern and southern genera, species and families extend beyond the limits of Central America, a situation reflecting the birds' relatively great powers of dispersal. An overlapping of northern and southern mammals involves a number of elements that extend well south or north of Central America.

II. NATURAL RESOURCES

A. Water Resources

The Caribbean slope of Central America which receives abundant precipitation the year around, has plentiful water resources. The Pacific side of Central America is less well endowed, but the supply usually is adequate for existing agricultural and domestic requirements. Irrigation is employed on the Pacific banana plantations and, to a lesser degree, in highland farming areas; pump and gravity irrigation may be resorted to locally in such rain-shadow areas of Caribbean drainage as the middle Motagua valley.

Hydraulic resources are substantial but barely tapped. Hydroelectric development is most advanced in Costa Rica and El Salvador, but only the latter has readily available poner. Its fortunate situation is an outgrowth of completion of the Lempa river power plant. In the other countries thermal electric power is more important, but there is a general shortage of electricity. The installation of generating facilities is greatest near the capitals. although the vicinity of San Pedro Sula, Honduras. is well served.

Except for the interoceanic canal across Panamá. the Central American waterways are of little value in transportation. Lakes Managua. Nicaragua and Izabal. and the lower stretches of rivers on both coasts are used by small powered craft and dugouts.

B. Soils

The soils of the humid Caribbean lowlands and Panamá's Pacific coast tend to be of superficial fertility, nith shallow humus leaf

mold underlain by leached and sometimes cemented subsoils. The best land for farming is found to be the natural levee strips of silt loam and light clay loam. Such land is reasonably fertile and fair to well drained. Once abandoned, the gardens or fields are soon swallowed in a tangle of second growth herbs, vines, shrubs and small trees, among them *Cecropia, Ochroma* and *Trema*.

The better farming areas within the deciduous woodland and savanna region of the Pacific lowlands are developed on soils recently rejuvenated by a thin layering of volcanic ash, or weathered from older volcanic materials of greater depth. Eastern El Salvador's cotton lands and the country's densely populated west-central coffeeand subsistence farming areas (upland) are of weathered volcanic materials. Nicaragua's good soils are volcanic too, as are the transported soils of the Pacific coastal plain and adjacent mountain slopes of Guatemala. The northwestern part of the Guatemalan plain, especially near the volcanoes, has areas of excellent and deep silt loams.

The pine forests of the northwestern uplands may be associated with infertile reddish-brown or black clay soils derived from granitic or acidic metamorphosed sedimentary and volcanic rocks. Adjacent broad-leafed forests are associated with moderately fertile soils weathered from the old-rock parent materials. Some of the finest soils of Central America have developed in association with the magnificent primeval forests of the Costa Rican highlands. In the cordilleras Volcánica, Central and (to a lesser extent) Talamanca volcanic parent materials have weathered into friable brown to light brown clay loams. The densely populated Meseta Central possesses deep, excellent dark gray-brown to dark brown silt loams. Elsewhere in Central America the upland volcanic soils can be fairly good too. However, soil erosion is a widespread problem.

C. Minerals

Although Central America's mineral endowment is imperfectly known, the resource potential is thought to be relatively modest. Gold, silver, zinc, lead and very small amounts of other nonferrous metals are produced. The rare metals have been mined since the pre-Columbian (placer gold) and Spanish periods. In recent years the ore concentrates, which are exported for refining, have contributed a small share of the value of Central American foreign trade. However, for many years gold has been an important exchange earner in Nicaragua; the metal, generally found in quartz ores, is produced at Siuna, Pis Pis and a half dozen other mines. El Salvador, Honduras and Costa Rica also mine some placer and vein gold. Silver, which may be recovered from gold ores, lead and zinc ores, or which may be the principal product mined, is produced in Honduras; and to a lesser degree El Salvador, Nicaragua and Guatemala. Guatemala's mines, chiefly near Cobán, yield most of Central America's limited zinc and lead, but neighbouring El Salvador and Honduras have some production.

No commercial deposits of the mineral fuels are known; however, since World War II foreign capital has undertaken petroleum exploration in the lowlands adjacent to the Caribbean. The negligible results are a disappointment to the republics, which spend substantial sums on imported petroleum products. Mineral construction and ceramic materials are widely used but capital involvement is modest. Bricks, tiles and pottery are made. Cement is manufactured in Guatemala (Guatemala City), Nicaragua (south of Managua) and El Salvador (Acajutla).

D. Land Use

1. Agriculture. — Subsistence farming is the predominant activity of the Central American people, however commercial agriculture is of major significance to national economies. The noncommercial peasant farming is developed around crops and techniques which are indigenous to the new world; make, beans, squash, some tropical root crops (yucca or sweet manioc and sweet potato) and tree fruits are tended in small fields or gardens. The maize acreage is the greatest of all crops. Important staples grown almost everywhere (up to about 5,000 ft.) are bananas and plantains.

Export-oriented commercial agriculture is based largely on plantation techniques and the old world crops, coffee and bananas. Commonly the coffee and banana properties are large, but there are many districts where small operators, who are essentially subsistence farmers, also produce export commodities. The lesser crops may enter domestic as well as foreign commerce and include cotton, cacao, abaci, henequen, essential and cooking oils. Crops which are raised on a large scale and primarily for the domestic markets include sugar cane and rice. Tobacco and produce, and wheat and potatoes (in the highlands) are farmed on a small scale. The rearing of beef cattle, an important and traditional branch of husbandry, is in the hands of large lando ners.

With the exception of El Salvador and Panamá, the Central American countries generally are able to produce their basic food requirements. Nevertheless, wheat, dairy products, cooking oils and various preserved foodstuffs are imported.

Subsistence agriculture occurs throughout Central America. Commercial food crop production for the domestic market is best developed in the highlands or in the Pacific lowland areas of traditional settlement. These populated areas are served mainly by roads and railways. The rearing of beef cattle predominates in highlands and the Pacific lowlands where open forests and savannas and a drier climate prevail. Nevertheless, cattle may be numerous near the Caribbean, as in northern Honduras.

Coffee and bananas, which represent about four-fifths of Central America's exports, have different physical requirements for growth. The more important crop, coffee, is raised in the highlands. Superior growing conditions prevail in areas having elevations of 2,000 to 5,000 ft., volcanic soils and a distinct dry season. Major production occurs in districts on the Pacific slope of Guatemala and El Salvador, in the central plateau of Costa Rica and in the upland areas north and south of Lake Managua. Bananas for export are produced in the tropical lowlands of the Caribbean and Pacific sides of Central America. The Caribbean coastal areas of Guatemala, Honduras, Costa Rica and Panami were areas of early 20th-century plantation development, but the more recent plantings have been made on great tracts near the Pacific. Generally speaking, rail and port facilities have been constructed to serve the banana and coffee industries. Other export crops of the lowlands include cotton, abacá, henequen, various vegetable oils, cacao and coconuts. Abacá, cacao, coconuts and African oil palm plantings are commoner in the humid Caribbean lowlands. Cotton, henequen, sesame and essential oils are more successful on the drier Pacific lowlands.

2. Forestry. — Central America possesses extensive timber resources, more than one-half of the territory of all countries except El Salvador being forested. The principal forest reserves cloak the mountains and skirting lowlands of the Caribbean slope, but the deciduous woodlands and the forests of the Pacific also constitute a source area for many products. Timber, cabinet and dyewood, gums (notably chicle) and resins, medicinal products and tannins are cut or gathered in Central America. Among the more important Caribbean lowland wood products historically are mahogany, Spanish cedar, lignum vitae and logwood. Exploitation has always been hampered by the heterogeneous nature of the tropical forests and the difficulty of penetration. However, where the rivers are navigable to small craft and rafts lumbering has occurred. By the mid-20th century pine from the forests of British Honduras, eastern Honduras and northeastern Nicaragua had supplanted the tropical hardwoods in the export trade. Plywood is manufactured in eastern Guatemala and northern Honduras. In general, the forest industry production methods and equipment are old. The activity, most important to British Honduras. Honduras, Nicaragua and Panamá, accounts for a small share of the value of regional foreign trade. In all areas, but most apparent in the Pacific lowlands, there has been considerable destruction of forests by charcoal producers, lumbermen, farmers and livestock raisers.

3. Industries. — Manufacturing in Central America is concerned with the processing of agricultural commodities for export and the production of consumer goods and construction materials for domestic use. The establishments that process for export in-

clude coffee mills, cotton gins, hard fibre mills, tanneries and sawmills. The industrial facilities which serve the small national markets usually manufacture foodstuffs. beverages, tobacco products, textiles. footwear and apparel, pharmaceuticals and chemicals. Industry is fostered by customs protection and other incentive legislation; transportation costs or the perishable nature of the product may also create an advantage for the local manufacturer Factories are small.

Among the republics. industrialization probably is most advanced in densely populated El Salvador. and least developed in Honduras San Pedro Sula vies with the capital. Tegucigalpa, for leadership in manufacturing. Elsewhere the capitals tend to be the chief industrial centres. British Honduras has little industry.

(J. T)

III. ANTHROPOLOGY

The great diversity in cultural and physical types in Central America stems from three basic factors: (1) the Indian cultures before the Spanish conquests were diverse; (2) the various indigenous groups reacted differently to conquest and colonization; (3) four centuries of culture contact, immigration and intermixture resulted in local differences in cultural and racial blending. Any single locality, therefore. may be occupied by several groups of different cultural and ethnic origins or degrees of blending.

A. Ethnology

Richard N. Adams (1956) proposed a classification of culture types based upon eight major traditions that entered into the Central American culture scheme The three most important, in terms of their total contribution, are the Spanish-American, the Meso-American and the South American. The first is predominantly Spanish, the second is Indian or mixed Indian-Spanish and the third is Indian, but of a different origin from the second. Other traditions, derived from Africa, the Antilles, China, Europe-North America and India, are represented by such groups as the Black Carib of Honduras, the widely scattered Antillean Negroes of Panamá and offshore islands of Honduras, and various European and North American urban dwellers.

1. Spanish-American Tradition. — Local varieties of this tradition have been referred to as creole or Ladino. Adams distinguishes three regional variants. each having developed in relative isolation under the influence of different aboriginal populations. These are (1) the Europeanized Ladinos of Guatemala, El Salvador, Honduras, Nicaragua and the Guanacaste peninsula of Costa Rica; (2) the predominantly white peoples of the Meseta Central (highlands) of Costa Rica; and (3) the Panamanian interior dwellers. There is a general cultural similarity among the three stemming from their common Spanish origins and speech. Each includes urban classes, rural labourers and peasantry.

A stable peasantry is found dispersed throughout Central America, comprising between 40% and 90% of the national agricultural populations. Farms vary greatly in size, and land holdings may be privately owned. rented or sharecropped. Many Spanish-American peasants practise a subsistence agriculture much like that of their Indian neighbours, although with more stress on cash crops and participation in a regional market economy. They also differ from the Indians in their greater use of advanced cultivation equipment and methods, such as steel plows, irrigation and fertilization. Many employ Indians or landless peasants as seasonal labour. There is considerable local specialization in such crafts as pottery. weaving and basketry, or in such industries as sugar production, tilemaking, clothing manufacture, tanning, candlemaking and carpentry. These specialties usually take the form of home industries, although small-scale factories are common in highland Guatemala. Small town dwellers, in addition to agricultural activities, very commonly engage in small-scale commerce. They are the usual proprietors of small stores, taverns and pharmacies.

The family throughout Central America is the basic unit of social organization Family organization is especially stable where members are a landowning group. Regionally, nearly one-half of the families may originate in common-law marriage. even where civil or church weddings are the ideal. The *compadrazgo* (a formal relationship between the godfather and the father of a child) is found everywhere, and godparents are sought for baptism, marriage and confirmation. This cornpadre relationship is one of great mutual respect. It is possible in most communities to distinguish at least two social classes on the basis of wealth. land ownership or the age and importance of one's family. The names of these classes vary locally—*e.g.,* la *primera* or la sociedad for upper classes and *los pobres,* la *segunda* or *gente humilde* for lower classes. There is little social intercourse or intermarriage between classes.

Spanish-Americans are predominantly Roman Catholic. Orthodox practice with regard to baptism, confirmation, marriage and funeral customs may be affected, however, according to whether or not a priest is readily available. Many small communities are visited by a priest only three or four times annually. The following religious customs are observed widely: the novena, or nine nights of prayer, following a death; prayer in the home to the house saint; pilgrimages to shrines, *e.g.,* to Esquipulas in Guatemala; and observance of a child's death with a fiesta. Holy Week, All Saints day and Christmas are important celebrations. but the titular fiesta to the village patron saint is everywhere the principal annual religious event. Financing and organizing this event is frequently done by a permanent society such as a *cofradía* ("religious brotherhood") that is devoted to the town saint. Fiestas may include Masses, processions and novenas, as well as dancing, fireworks, games and sports events.

Spanish-American peasants share with their Indian neighbours many folk beliefs concerning sickness and curing. This is especially true in areas isolated from modern medical aid. These notions include a belief in witchcraft, *mal* de *ojo* ("evil eye"), susto (loss of soul through fright) and *hijillo* (an emanation of human corpses that causes sickness). There are well-defined cures for many of these, and the curandero ("lay curer") may specialize in one or more of them, using herbs, medicines and massage, or magical techniques.

2. Meso-American Tradition. — This complex of historically related cultures, primarily Maya Indian in origin, in preconquest times extended over much of Chiapas, the Yucatan peninsula. Guatemala, British Honduras and the western parts of Honduras and El Salvador. Adams subdivided this tradition into three components, according to the degree of assimilation to Spanish-American cultures. The least modified groups he calls "traditional Indians." The "modified Indians" represent an intermediate stage and the most thoroughly assimilated are the "Ladinoized Indians."

Traditional Indians speak one or more native languages or dialects, but not Spanish, and they preserve their distinctive local costumes. They are best represented by such conservative communities in highland Guatemala as Todos los Santos, Chichicastenango and the villages surrounding Lake Atitlán. Each of these communities centres in a small political unit called a *municipio.* The *municipio* is, in general, culturally isolated from neighbouring groups, and the occupants of each are distinguishable by their colourful costumes, dialect and perhaps economic specialty. These Indians practise a family-based subsistence economy, growing maize, beans and squash with the use of age-old techniques. Almost the only concession to modern technology is the use of the steel hoe, machete. axe and rarely the ancient wooden plow. The lake villages often specialize in such European introductions as onions, beets, cabbages and carrots. But the traditional attitude toward maize as sacred is widely preserved. All of these Indians participate to some degree in a regional market economy. selling local specialties such as pottery, blankets. woodcraft products or vegetables to acquire the cash needed for small purchases. Typically, local affairs are regulated by a combined political-religious hierarchy. whose officials hold office alternately in the church and in civil administration. These two functions are regarded by the Indian as inseparable. Indian religion is an interesting combination of Roman Catholic and Maya elements. Church festivals are frequently the occasion for rites directed to ancient images; but the Indian sees no conflict, and regards himself as a devout Catholic. Aboriginal attitudes toward disease and witchcraft are especially prominent, but even these areas are influenced by

Spanish-American folk beliefs. The Indians have wholeheartedly adopted the cult of the saints and the annual ceiebration of the patron saint's day is the outstanding event in each village. Indians tend to be weak in the observances of orthodox Catholicism. and church neddings, confirmation and communion are the exception rather than the rule. The *compadrazgo* system is strong, as it is among Spanish-Americans. Indians frequently seek out Ladinos to act as *compadres.*

Those Meso-Americans classified as modified Indian and Ladinoized Indian represent further degrees of assimilation to the Spanish-American tradition. Modified Indians are bilingual, speaking Spanish as well as an Indian tongue, and the men have given up the distinctive costume of the community. Communities retain certain features of Indian social organization, but communication nith outsiders is more frequent, and older religious elements tend to pass out of existence.

The Ladinoized Indian speaks only Spanish, and may be almost indistinguishable from his Spanish-American neighbour. Some regard themselves as Indians, others not. Groups representing these extremes are found scattered throughout Guatemala, as well as in parts of Honduras and Kicaragua, often living in close proximity to traditional Indian communities.

3. South American Tradition. — Indians in this category are distributed from Honduras and El Salvador to the Colombian border of Panamá. Contemporary groups are survivors of aboriginal populations that were generally of a less developed cultural level than the Meso-Americans. They stem from various groups, some of which were culturally unrelated and there is no simple way of classifying them on the basis of historical relationships. Adams recognises several regional subtraditions, but the resemblances within each are largely the result of common environment and postconquest developments. These regional traditions are: (1) Talamanca—including small enclaves of Bribri, Boruca, Cabecar and Terraba in Costa Rica; (2) Jicaque — the Torrupan in central Honduras and the Yoro Jicaque of Yoro. Honduras; (3) Atlantic Lowland — the Paya of Honduras, the Mosquito and Sumo of Honduras and Nicaragua, the Rama of Rama Cay, Nic., and a very few Guatuso in northern Costa Rica; (4) Matagalpa—a few restricted groups in Matagalpa, Nic.; *(5)* Guaymi — a series of communities in Bocas del Toro and Chiriquí, Pan.; (6) Cuna — comprising the Cuna Indians of the Atlantic coast and San Blas Islands of Panamá; and (7) Choco — scattered groups in central Darién, Pan.

Because of the extensive displacement of peoples following the conquest, few of these groups can be regarded as direct descendants of aboriginal tribes. Some may comprise remnants of several earlier tribes. Nearly all have undergone serious deterioration of their former cultural patterns, and few can be regarded as traditional Indians (see above). Often the Indian group is so nearly like the neighbouring Spanish-American in physical type and culture that its definition as Indian is purely a social matter.

Few of these groups have been the subject of study by anthropologists, and little is known of general cultural similarities. In most cases the family is an independent subsistence unit, and practises a slash-and-burn type of agriculture, using primitive tools and techniques. They plant a wide variety of crops of both American and European origin—maize, cassava, yams, rice, sugar cane and many more. Kearly all families keep pigs and chickens, but larger animals are scarce. Hunting and fishing, employing the gun, bow and arrow, spear or blowgun, vary locally in economic importance. Dugout canoes are widely used for fishing and transportation.

The family is usually monogamous. but a few groups, such as the Guaymí, Bribri and Cuna practise a limited polygyny. Social groups intermediate between the family and the community, such as clans or lineages, have been reported for the Guaymi, Kribri and Choco. Many communities enjoy a measure of political autonomy within a national political structure.

In their religious organization the Indians of Honduras, El Salvador and Kicaragua resemble the traditional and modified Indians of the Meso-American area. The Sumo and Mosquito Indians have been exposed to Protestant missionary activities, but still retain many aboriginal religious elements. The Jicaque of Montaña del Flor, Honduras, and the Guaymi. Cuna and Choco have been influenced by Roman Catholicism, but have considerably modified borrowed beliefs. The Christian God. for example. may be interwoven into aboriginal myths. Ancient shamanistic practices are also common, but among all groups the aboriginal belief systems seem to be deteriorating.

B. Language

Few regions of comparable size can match the linguistic diversity of Central America. Over 100 Indian languages and many more dialects are spoken. Classifications are highly tentative, since modern studies of single languages are scarce. According to Korman A. McQuown, who has modified an earlier classification by J. Alden Mason, 5 of the 17 major language families found in Latin America are represented in Central America. The two dominant families, in terms of area covered and number of speakers, are the Macro-Penutian and the Macro-Chibchan.

Macro-Penutian, with affiliates extending far northward into the United States, is represented in Central America by several subfamilies. or stocks. The Mayan stock is the largest in total number of speakers. and includes the Mame, Chol, Lacandon, Itza, Jacalteco. Chuj, Kanjobal, Aguacateco, Ixil, Kekchi, Quiche, Cakchiquel and Pokomam of Guatemala; the Cholti and Chorti of Guatemala and Honduras; and the Achi and Poton of El Salvador. The only other Macro-Penutian stock represented in Central America is the Uto-Aztecan, which includes scattered small enclaves such as the Pipil in Guatemala, El Salvador and Honduras, the Alaguilac in eastern Guatemala, the Nahuatlate in the northwest of Nicaragua, the Nicarao of western Nicaragua, the Bagaz and Desaguadero of Costa Rica and Sigua of western Panami.

Rlacro-Chibchan, which is distributed widely in northwestern South America, is the dominant language family in the southern part of Central America (see South American **Languages**). The major stocks are (1) the Misumalpan, including the Mosquitoan and Sumoan languages of the Atlantic lowlands of Honduras and Nicaragua, and possibly the Matagalpan of western Honduras; and (2) the Chihchan, including the Western Chibchan languages of Costa Rica, the Pacific Chibchan languages of Panamá (Move, Murire, Valiente) and the Eastern Chibchan of southern Nicaragua.

Of the remaining families, the Macro-Oto-Manguean is sparsely represented by the Mazateco of the Petén, Guat., the Choluteca in western Honduras and scattered groups along the Pacific coast of Nicaragua and Costa Rica. Hokan-Siouan languages are even fewer — the Maribichicoa in El Salvador and the Subtiaba in Nicaragua. Cariban is confined to perhaps a single language. the Paparo of eastern Panamá. A broad band of unclassified or poorly classified languages extends across Honduras and Costa Rica, and includes the Paya, Lenca, Xinca and Jicaque. Some linguists believe, however, that these four may be affiliated with the Macro-Penutian languages. Numerous widely scattered and nearly extinct languages also remain unclassified.

The northern part of Central America, then, is linguistically part of the North American continent. whereas the southern part is linked with South America. The dividing line appears to run somewhat north of the Honduras-Nicaraguan boundary line, thereby including parts of El Salvador in the Chibchan area. It has been suggested that some of the unclassified (possibly Macro-Penutian) languages along this border entered the area very early, with only scattered groups remaining. Somewhat later intrusives included the Mayan and some Uto-Aztecan languages. The main Uto-Aztecan entry, however, probably corresponded with the late movement of Nahuatl tribes. ultimately extending as far south as Costa Rica. There was evidently some northward movement of South American languages at the time of the conquest.

C. Physical Anthropology

The wide range of physical types in Central America is the product of four centuries of admixture between aboriginal populations and postconquest immigrants. Of the latter the Spanish Caucasoid types are the dominant element, with Negroes and

mixed Indian-Negro (Black Carib) rating second. Small groups, which have mixed little with native populations, include non-Spanish Europeans, Chinese and near eastern peoples. The last-named may be known locally as *Turcos*, or Arabes.

The dominant Indian-Spanish physical component ranges from nearly unmixed Indian through every degree of blending to typical Spanish types. The dominance of one element over the other in any one locality stems from the same historical factors discussed above (see *Ethnology*). The Meseta Central, which is culturally Spanish-American, is predominantly Caucasoid. Guatemala, El Salvador and Honduras show the highest proportion of Indian admixture.

It is virtually impossible, however, to state with certainty the proportion of Indians to non-Indians in any Central American country. National census figures are not reliable guides because such terms as Indian, Ladino or mestizo have social and cultural as well as biological significance. Many individuals classified as Indians are physically indistinguishable from Ladinos.

Terms such as zambo, mulatto or chombo reflect a similarly confused situation for areas of Negro admixture. Many gradations of colour receive social recognition locally, and the significance of the term Negro is not everywhere the same. The highest percentages of Negro admixture are found in Panamá and Honduras.

The Maya Indians of Meso-America represent a fairly distinctive physical type. They are described as short—5 ft. to 5 ft. 4 in. for the men, and somewhat shorter for the women. The body build is slight, with medium musculature, although leg and neck muscles may be overdeveloped from carrying heavy burdens. Head hair is straight and black, baldness is rare, and body hair is sparse. The forehead is low, and cheekbones high and broad. A slight epicanthic fold gives the eyes a Mongoloid appearance. In profile the rather striking Maya Indian type closely resembles the ancient Mayas as represented in painting and sculpture—sloping forehead and chin, long, convex nose and full lips, with the lower lip drooping slightly. Skin colour varies from light to dark brown with a reddish tinge.

The few existing blood group studies show that Central American Indians share with most North and South American Indians the high frequencies of blood types O and M.

Outside the Meso-American area the Indians appear to be somewhat less uniform in physical type, attesting perhaps to their highly diverse origins. Existing descriptions vary considerably in designating skin colour, hair form and stature. Skin colour is most commonly described as dark brown. Studies of the Mosquito, Sumo, Paya and Cuna list statures ranging from just under 5 ft. to 5 ft. 2 in., apparently somewhat less than the averages for Maya Indians. Hair is usually black and may be straight or wavy. Body build is generally heavier than among Mayas. Lips may be full, but not thick. The Mongoloid eye fold and sacral spot (a temporary bluish spot at the base of the spine in infants) are widely reported.

See INDIAN, LATIN-AMERICAN; AMERICAN ABORIGINAL LANGUAGES; CENTRAL AND NORTH AMERICAN LANGUAGES; and articles on the individual countries.

BIBLIOGRAPHY.—Julian H. Steward (ed.), *Handbook of South American Indians*, Bureau of American Ethnology, *Bulletin* 143, vol. *4* and 6 (1948), contains numerous articles on languages and cultures of Central America. IV. HISTORY

The Mayas, one of the most highly developed Indian civilizations, flourished in Central America for centuries before the arrival of the Spaniards, who first sighted the area probably in 1501, and who were in the Panamá region constantly after 1509. The remainder of Central America was overrun in the early 1520s from Panama and Mexico.

All Central America, except Panamb, was included in the captaincy general of Guatemala, a part of the viceroyalty of Nueva España, with its capital in Mexico City. Considerable gold was found during the years immediately following the conquest, but the settlers of present-day Guatemala, Honduras, Nicaragua and El Salvador soon turned to agriculture based upon Indian labour. In Costa Rica the standard pattern became independent smaller farmers of European origins who worked family plots. Throughout the colonial period Panama was important as the link between the mineral-rich viceroyalty of Peru (Nueva Andalucia) and Spain.

The captaincy general of Guatemala won its independence from Spain in 1821, without resort to costly military action. The short-lived Mexican empire of Augustín de Iturbide (*q.v.*) assumed jurisdiction over Central America for several months in 1822–23. Following the downfall of Iturbide, a Central American confederation was formed. Separatism, old disputes and conflicting political theories led to the dissolution of the confederation in 1839, and the five constituent states of Guatemala, El Salvador, Nicaragua, Honduras and Costa Rica became independent republics. Panamb, which won its independence along with Colombia, Venezuela and Ecuador, formed a part of Colombia until 1903. British Honduras (Belize), dating from 1638, is the only European colony on the Central American mainland.

For over a century, following the winning of independence, the republics were highly unstable, and wars between them were common—these conditions were factors in U.S. intervention in the area. By the mid-20th century the leadership of the republics had shown a growing tendency to settle differences by arbitration. For more detailed treatment, see LATIN AMERICA; MAYA INDIANS; AZTEC; and the various countries. (J. J. J.)

V. POPULATION

1. Number and Distribution.— Censuses taken during 1950 in all parts of Central America except British Honduras showed a total of almost 9,000,000 persons in the area, or the equivalent of 42.2 inhabitants per square mile (see Table). In the late 1950s this figure had risen to approximately 10,000.000, and thereafter continued to increase by about 180,000 annually.

The population of Central America is highly concentrated in the valleys and on the slopes of the chain of mountains which parallel the Pacific coast, at no great distance inland, from Guatemala to Panamá. Especially high is the density of population along the chain of active and extinct volcanoes that runs through the central portion of El Salvador and in the uplands of Guatemala. The lowlands in which Managua (capital of Nicaragua) is located, the Meseta Central in Costa Rica and the parts of Panamá which adjoin each end of the Canal Zone likewise are heavily populated. There also are densely inhabited areas in the highland portions of Honduras.

By the mid-20th century the main towns and cities of Central America had shown a rapid growth and development: Guatemala City had nearly 300,000 inhabitants, while San Salvador (capital of El Salvador), Panama city and Managua had populations of well over 100,000; San José (capital of Costa Rica) had nearly 90,000; Tegucigalpa (capital of Honduras) had more than 70,000; and Belize (capital of British Honduras) over 20,000. Nevertheless, the population throughout most parts of Central America remains rural to a very high degree. In 1950 percentages of the inhabitants living outside places of 2,500 or more were as follows: Costa Rica, 72.5; El Salvador, 74.2; Guatemala, 76.8; Honduras, 82.8; Nicaragua, 72.6; and Panamb, 70.2.

2. Composition.— The racial composition of the population in Central America is extremely varied. Guatemala's 1950 census classified 53.6% of its population as indigenous or Indian, and persons of mixed Indian and white ancestry (Ladinos) undoubtedly constitute all but a small fraction of the remainder. Mestizos make up the overwhelming proportion of the population in both Honduras and El Salvador. In the former, 89.9% of the population was classified as mestizo and 6.7% as Indian by the 1950 census; and in the latter, 92.3% was classed as of mixed Indian and white descent by the 1930 census. A native non-Indian of predominantly European culture traits is called a Ladino, which is

usually, though not necessarily, synonymous with mestizo. A person of pure Indian blood, by adopting a predominance of traits derived from Europe, may become a Ladino.

Negroes and mulattoes form a considerable share of the inhabitants of the extensive and sparsely populated Atlantic coastal plain of Honduras and Nicaragua—the so-called Mosquito Coast—and of adjacent British Honduras. They are the descendants of fairly recent arrivals who reached Central America from the British possessions in the Caribbean, and they have mixed to a considerable extent with the native Indians who formerly occupied the area. Their presence in Honduras is responsible for 2.1% of that country's inhabitants being classified as Negroes in 1950, and for the fact that the 1946 census of British Honduras indicated that 68.3% of its inhabitants were Negroes or mulattoes.

Probably about 20% of Nicaragua's population is white and 10% Negro, with mestizos and mulattoes accounting for the remainder. Practically no full-blooded Indians remain in Nicaragua. However, in the population of mixed blood, mestizos greatly outnumber mulattoes.

The population of Costa Rica is almost exclusively white. In the 1950 census 97.7% of the population was so classified. Only a few thousand Indians remain. Negroes and mulattoes make up only about 2% of the population, and nearly all of them are located in the lowlands along the Atlantic coast.

Panamá's 1940 census classified 11.1% of the country's population as white, 13.3% as Negro, 9.0% as indigenous or Indian, 65.3% as mestizo (which includes mulattoes). and 1.3% as belonging to other races. The proportion of Indians in the population was considerably understated, since the figure given included only those in tribal groups, such as the San Blas, whose location on islands off the coast and in the most remote parts of the mountains had enabled them to preserve their racial purity, their native tongues and their customary ways of life. These groups were not considered as part of the civil population. On the other hand, large numbers of Indians or cholos who no longer had a tribal organization, who spoke Spanish and who professed Christianity were considered as part of the civil population and classified as mestizos.

The sexes are fairly equally represented in the populations of most of the major civil divisions throughout Central America. However, males are considerably fewer than females in British Honduras and in the Panama Canal Zone, where a heavy excess of men among the foreign born exerts a significant effect. In 1950 the number of males per 100 females in each of the political divisions was as follows: Costa Rica. 99.7; El Salvador, 98.0; Guatemala, 102.3; Honduras. 100.5; Nicaragua, 97.1; Panamá, 103.5; British Honduras. 94.2; and the Canal Zone, 139.1.

Because both birth and death rates are high throughout most of Central America, the population is heavily concentrated in the younger ages and those in the advanced ages are relatively few in number. In fact by 1950 in all the political divisions. except the Canal Zone, more than 40% of the population was less than 15 years of age, and the proportion of those 65 and over ranged from 2% to 4%.

3. Growth of Population. — The population of Central America is increasing rapidly, probably at an annual rate of over 2.5%. Between 1940 and 1950 the rate for the area as a whole averaged 2% (*see* Table), and since that time a continued fall in the death rate with little or no change in the birth rate no doubt has speeded up substantially the rate of population increase.

Natural increase accounts for all excrpt a minute fraction of the population increase in the area as a whole. Only in Panamá, which attracts many immigrants from Jamaica and other British possessions in the West Indies, and from neighbouring Colombia and smaller numbers from places throughout the world, is immigration from outside the area a significant factor in the population growth. However, a large flow of population from El Salvador to Honduras and from Nicaragua to Costa Rica affects substantially the rates of gronth in those specific countries.

In Costa Rica, El Salvador and Guatemala, where nearly all the births are registered. the birth rate varies betneen 45 and 50 per 1,000 population. In the other countries. in which the birth statistics are less reliable, the ratio of children under 5 years of age to women aged 15–44 shows rather conclusively that the rates of reproduction are equally high.

Area and Population Statistics in Corcntries of Central America, 1950–60

Political unit	Area (sq. mi.)	Population (1960 est.)	Persons per sq. mi.	Increase in inhabitants, 1950–60	Annual rate of increase (%)
Republics	199,050	12,031,469	60.4	3,352,896	3.4
Costa Rica	19,575	1,171,441	59.8	370,566	4.1
El Salvador	8,260	2,612,000	316.2	756,083	3.5
Guatemala	42,042	3,822,233	90.9	1,031,365	3.0
Honduras	43,277	1,883,480*	43.5	514,875	3.3
Nicaragua	57,143	1,474,549	25.8	417,526	3.4
Panamá	28,753	1,067,766†	37.1	262,481	2.9
Dependent areas	9,425	132,465	14.1	20,423	...
British Honduras	8,867	90,343†	10.2	31,123‡	3.1
Canal Zone	558	42,122	113.2§	−10,700	...
Total	208,415	12,163,934	58.3	3,311,118	3.3

*1961 census. †1960 census. ‡Increase over 1946 census. §Computed on a basis of 372 sq. mi. land area.

The mortality statistics for most of the area are so incomplete and unreliable that few sound conclusions may be based upon them. It is known in a general way, however, that the death rates in most of the countries had been high (probably at an annual rate of 25 deaths per 1,000 population); and that after 1940 these rates were falling sharply. As a result, unless there is a sharp reduction in the birth rate, by the 1970s the population in many parts of Central America is likely to have increased by more than 3% per year.

CENTRAL AMERICAN FEDERATION (ORGANIZATION OF CENTRAL AMERICAN STATES), a union composed of the republics of Guatemala, El Salvador, Honduras. Nicaragua and Costa Rica. From the 1520s until 1821 they were small provinces of the Spanish empire and were normally ruled by a captain-general in Guatemala. In 1821 the provinces gained independence from Spain without warfare. For about 15 months thereafter Central America was part of the ill-fated Mexican empire of Augustín de Iturbide (*q.v.*), but separated upon his overthrow in 1823. The folloxing year the Federal Republic of Central America was created, with a constitution that permitted a great amount of state autonomy and gave the federal government supreme authority only in foreign affairs. This weak central government, although directed by the notable statesman. Francisco Morazán, had almost no income and lacked the military force to subdue the frequent disorders among the states. Poor communications. jealousy of the power of Guatemala and inexperience in self-government led to secessions and the end of the federation about 1839.

Since 1842 about 25 formal attempts have been made to reconstitute a Central American nation. For example, in 1885 Justo Rufino Barrios attempted to unite the nations by force. In 1896 three of the states created the Greater Republic of Central America, which gained diplomatic recognition from many nations. But invariably the efforts failed. In spite of many similarities among the peoples, old fears, meddling in one another's affairs and continued localism have prevailed. After World War II the endeavours became less political and more economic in nature and enjoyed some success. Agreement on a charter for the Organization of Central American States was reached in Oct. 1951 but because of disputes among the members the organization did not begin to function until 1955. Concrete measures were taken in the 1950s to establish a customs union and common msrkets, and to facilitate travel and educational opportunities. To many Central Americans the unity of the five nations remains an unfulhlled but desirable dream. They feel that a new federation would bring greater prosperity and stability. (T. L. K.)

CENTRAL AND NORTH AMERICAN LANGUAGES. The aboriginal languages of Central and North America are extremely numerous and highly diverse, a fact which complicates the problem of their classification. (For a general discussion of the languages of the Americas, *see* AMERICAN ABORIGINAL LANGUAGES.) The problem is further complicated by lack of data; for a great many of the languages of this region there nere

in the early 1960s too little lexical data (texts and vocabularies) on which to base an adequate classification.

Linguistic stocks or families are set up by intensive and detailed comparison of languages in respect to sound feature: grammar and vocabulary. When such comparison, in the case of two'or more languages, reveals systematic resemblances among them in sound feature. grammar and vocabulary, these languages are said to belong to a single stock, which means, in historical terms, that they are derived from a common ancestral or protolanguage.

It is relatively easy for linguists to make preliminary classifications of this sort, and linguists are in agreement in respect to most of the smaller groups of Central and North America. the members of which are as obviously related as English and German or Spanish and Portuguese. Further research has suggested that some of these smaller groups may be more remotely related, so replacing the numerous small linguistic stocks by relatively few larger ones. In the early 1960s the evidence for the larger groupings was not in all cases incontestable, and more work had to be done before any but a tentative statement of the more remote relationships could be demonstrated.

Languages North of Mexico.—The first comprehensive classification of the languages north of Mexico was published by J. W. Powell in 1891. He recognized no less than 56 stocks. later revised to 55 (see the 1915 map'issued by the Bureau of American Ethnology). The revised list is given below with modifications in nomenclature to bring it into harmony with current usage.

The distribution of these jj stocks is uneven; 37 of them were either entirely or largely in territory draining into the Pacific, and 22 of these had a coast line on the Pacific. Only seven linguistic stocks bordered the Atlantic coast and languages of 10 stocks (apart from Arawak) the coast of the Gulf of Mexico. The most widely distributed stocks were: Eskimoan, which included Eskimo dialects ranging from east Greenland west to southern Alaska and East cape, Siberia, as well as the Aleut of the Alaska peninsula and the Aleutian Islands (see ESKIMO-ALEUT LANGUAGES); Algonkian. which embraces a large number of languages spoken along the Atlantic coast from eastern Quebec and Cape Breton Island south to the coast of North Carolina, in the interior of Labrador, in the northern part of the drainage of the St. Lawrence. in the country of the three upper Great Lakes and the upper Mississippi, and west into the plains of the Saskatchewan and the upper Missouri; Iroquoian. which consists of languages originally spoken in three disconnected areas—the region of Lakes Erie and Ontario and the St. Lawrence, eastern Virginia and North Carolina, and the southern Allegheny country (Cherokee); Muskogian (including Natchez), which occupied the Gulf region from the mouth of the Mississippi east into Florida and Georgia and north into Tennessee and Kentucky; Siouan, divided into four geographically distinct groups—an eastern group in Virginia and North and South Carolina, a small southern contingent (Biloxi) in southern Mississippi, the main group in the valley of the Missouri (eastern Montana and Saskatchewan southeast through Arkansas), and a colony of the main group (Winnebago) in the region of Green Bay, Wis.; Caddoan, spoken in the southern plains (from Nebraska south into Texas and Louisiana) and in an isolated enclave (Arikara) along the Missouri in North and South Dakota; Shoshonean, which occupied the greater part of the Great Basin area and contiguous territory in southern California and the southwestern plains (Texas), also, disconnected from this vast streteh, three mesas in the Pueblo region of northern Arizona (Hopi); Athapaskan, divided into three geographically distinct groups of languages—Korthern (the valleys of the Mackenzie and Yukon, from just short of Hudson bay west to Cook inlet, Alaska, and from Great Bear lake and the Mackenzie delta south to the headwaters of the Saskatchewan), Pacific (two disconnected areas, one in southwestern Oregon and northwestern California, the other a little south of this in California), and Southern (large parts of Arizona and New Mexico: with adjoining regions of Utah, Texas and Mexico)—besides isolated enclaves in southern British Columbia, Washington and northern Oregon; and Salishan, in southern British Columbia, most of Washington. and northern Idaho and Montana. with two isolated offshoots, one (Bella Coola) to the north on the British Columbia coast, the other (Tillamook) to the south in northwestern Oregon.

The remaining 46 stocks, according to Powell's classification, in alphabetical order, were: Atakapa (Gulf coast of Louisiana and Texas); Beothuk (Newfoundland; extinct); Chimakuan (northwestern Washington): Chimariko (northwestern California); Chinook (lower Columbia river, in Washington and Oregon); Chitimacha (southern Louisiana); Chumash (southwestern California), Coahuiltecan (lower Rio Grande. in Texas and Mexico); Coos (Oregon coast); Costanoan (western California south of San Francisco bay); Esselen (southwestern California; extinct); Haida (Queen Charlotte Islands and part of southern Alaska); Kalapuya (northwestern Oregon); Karankawa (Texas coast); Karok (northwestern California); Keres (certain Rio Grande pueblos, New Mexico); Kiowa (southern plains, in Kansas, Colorado. Oklahoma and Texas); Kootenay (upper Columbia river, in British Columbia and adjoining parts of Idaho and Montana); Lutuami, consisting of Klamath and Modoc (southern Oregon and northeastern California); Maidu (eastern part of Sacramento valley, California); Miwok (central California); Piman or Sonoran (southern Arizona and south into Mexico as far as the state of Jalisco); Pomo (western California north of San Francisco bay); Sahaptin (middle Columbia river valley, in Washington, Oregon and Idaho); Salinan (southwestern California); Shastan or Shasta-Achomawi (northern California and southern Oregon); Takelma (southwestern Oregon); Tanoan (certain pueblos in New Mexico, Arizona and originally also in Chihuahua. Mex.): Timuqua (Florida; extinct); Tlingit (southern Alaska); Tonkawa (Texas); Tsimshian (western British Columbia); Tunica (Mississippi river, in Louisiana and Mississippi); Waiilatpuan, consisting of Molala and Cayuse (northern Oregon); Wakashan. consisting of Kwakiutl and Nootka (coast of British Columbia); Washo (western Nevada and eastern California); Wintun (north central California); Wiyot (northwestern California); Yakonan (Oregon coast); Yana (northern California); Yokuts (south central California); Yuchi (Savannah river. in Georgia and South Carolina); Yuki (western California); Yuman (lower Colorado river valley. in Arizona, southern California and south into all or most of Lower California); Yurok (northwestern California); Zuñi (pueblo of New Mexico). To these was later added, as distinct from Yakonan, Siuslaw (Oregon coast).

This complex classification of native languages in North America was very probably only a first approximation to the historic truth. There nere clearly far-reaching resemblances in both structure and vocabulary among linguistic stocks classified by Powell as genetically distinct.

Certain resemblances in vocabulary and phonetics were undoubtedly due to borrowing of one language from another, but the more deep-lying resemblances, such as could be demonstrated, for instance, for Shoshonean, Piman and Nahuatl (Mexico) or for Athapaskan and Tlingit, were doubtless due to a common origin greatly obscured by the subsequent operation of phonetic laws, grammatical developments and losses, analogical disturbances and borrowing of elements from alien sources.

It was impossible to say at mid-century what was the irreducible number of linguistic stocks that should be recognized for America north of Mexico, as scientific comparative work on these difficult languages was still in its infancy. The following reductions of linguistic stocks which were proposed may be looked upon as either probable or very possible. (1) Wiyot and Yurok, to which might have to be added Algonkian (of nhich Beothuk may be a very divergent member; (2) Iroquoian and Caddoan; (3) Cto-Aztecan, consisting of Shoshonean, Piman and Nahuatl; (4) Athapaskan and Tlingit, uith Haida as a more distant relative; (5) Mosan, consisting of Salish, Chimakuan and Wakashan; (6) Xtakapa, Tunica and Chitimacha; (7) Coahuiltecan. Tonkawa and Karankawa; (8) Kiowa and Tanoan; (9) Takelma, Kalapuya and Coos-Siuslaw-Yakonan; (10) Sahaptin, Waiilatpuan and Lutuami; (11) a large group known as Hokan, consisting of Karok. Chimariko, Shastan. Yana, Pomo. Washo, Esselen, Yuman. Salinan, Chumash and, in Mexico, Seri and Chontal; (12) Penutian, consisting of Miwok-Costanoan. Yokuts, Maidu and Wintun. (E. SA.)

Edward Sapir, in 1929, proposed that all of the languages north

of Mexico (plus a number in Mexico and Central America) might be put into six major divisions. often called superstocks or phyla. (*See* INDIAN, NORTH AMERICAN: *Language;* INDIAN, LATIN-AMERICAN.)

Sapir called this grouping "suggestive but not demonstrable in all its features"; he clearly meant it to serve more as a guide to future historical research than as a completed classificatory scheme. Research after 1929 had not by the early 1960s verified all aspects of the Sapir classification. The Eskimo-Aleut, Nadene and Aztec-Tanoan divisions appeared to be fairly well substantiated but there was still much to be done before the remaining three superstocks could be said to be proven.

Languages of Mexico and Central America.—The classification of the languages of Mexico and Central America was not nearly so advanced as for America north of Mexico. Most authorities agreed on the following list of 24 linguistic stocks. but there was little agreement on the more remote relationships suggested for some of them.

(1) The Yuman languages of Lower California (clearly related to languages of the same designation spoken in the United States). (2) Serian (northwestern Mexico'). (3) Tequistlacecan (Oaxaca state) and (4) Supanecan (Subtiaba in Nicaragua and Tlappanec in Guerrero state) probably belong to Sapir's Hokan-Siouan: no. 1–3 to Hokan proper and no. 4 to the larger Hokan-Coahuiltecan subdivision. Also included here. hut with less certainty, were four extinct language groups of Mexico: Coahuiltecan. Tamaulipecan and Janambrian of northeastern Mexico, and Waicurian of the southern portion of Lower California.

(5) Tarascan. a small group of languages spoken in Michoacán, was not included in any larger grouping.

(6) Otominn (central Mexico). (7) Popolocan (Puebla and Oaxaca). (8) Mazatecan (Oaxaca). (9) Triquean (Oaxaca) and (10) Chorotegan (Chiapas) were often grouped together in the larger Otomanguean family.

(11) Mixtecan (Guerrero, Puebla and western Oaxaca). (12) Chinantecan (Oaxaca and western Veracruz) and (13) Zapotecan (Oaxaca) were said by some to he related and to form. with Otomanguean. a Slacro-Otomanguean stock. The evidence for this relationship was weak.

(14) Taracahitinn (northwestern Mexico). (15) Aztecoidan (Coran and Nahuatlan of central Mexico; Nahuatlan languages were also found in a number of isolated southern enclaves. in Oaxaca state. Salvador, Guatemala. Nicaragua and Costa Rica) and (16) Piman (northern Mexico and southwestern Cnited States) were clearly related and formed. with the Shoshonean languages of the Cnited States, the Uto-Aztecan subdivision of Sapir's Aztec-Tanoan.

(17) Mayoid included Huastecan of the northeastern coast region of Mexico and Mayan of Yucatan and neighbouring states of southern Mexico, British Honduras, western Honduras and Guatemala.

(18) Mizocuavean. a small group of languages, including Mixe-Zoque (or Zoquean) of Oaxaca. Yeracruz. Chiapas and Tabasco, and, with less certainty, Huave of the coast of Oaxaca. Two extinct languages, of which some small record remains. were also included: Tapachultec of southeastern Chiapas and Aguatec of Guatemala.

(19) Totonacan of Hidalgo. Puebla and the coast of Yeracruz.

Sapir. in 1929, included no. 18 (which he called Mexican Penutian) in his Penutian superstock; subsequently others suggested that no. 1;., 18. 19 and Macro-Otomanguean (no. 6-13) were possibly members of a still larger Macro-Penutian stock. The evidence for this hypothesis was very slight, and it should also be noted that neither Sapir's Mexican Penutian nor the proposed Macro-Oto-hlanguean were clearly established.

(20) Xincan of southeastern Guatemala, (21) Lencan of Honduras and Salvador. (22) Jicaquean of northern Honduras and (23) Payan of Honduras were as yet unrelated to any other languages of Mexico or elsewhere.

The same was true of (24) Misumalpan, made up of Mosquitoan (coast of Nicaragua and Honduras). Sumoan (eastern Nicaragua and southern Honduras) and Matagalpan (Nicaragua), although it was suggested that these languages bore a remote relation to Chibchan in South America (*see* SOUTH AMERICAN LANGUAGES).

Proposed Classification of American Indian Languages North of Mexico (and Certain Languages of Mexico aizd Central America)

I. *Eskimo-Aleut*

II. *Algonkin-Wakashan*

- A. Algonkin-Ritwan
  - 1. Algonkin
  - 2. Beothuk
  - 3. Ritwan
    - *a.* Wiyot
    - b. Yurok
- B. Kootenap
- C. Mosan (Wakashan-Salish)
  - 1. Wakashan (Kwakiutl-Nootka)
  - 2. Chimakuan
  - 3. Salish

III. *Nadene*

- A. Haida
- B. Continental Nadene
  - 1. Tlingit
  - 2. Athapaskan

IV. *Penutian*

- A. Californian Penutian
  - 1. Miwok-Costanoan
  - 2. Yokuts
  - 3. Maidu
  - 4. Wintun
- B. Oregon Penutian
  - 1. Takelma
  - 2. Coast Oregon Penutian
    - *a.* Coos
    - *b.* Siuslaw
    - *c.* Yakonan
  - 3. Kalapuya
- C. Chinook
- D. Tsimshian
- E. Plateau Penutian
  - 1. Sahaptin
  - 2. Waiilatpuan (Molala-Cayuse)
  - 3. Lutuami (Klamath-Modoc)
- F. Mexican Penutian
  - 1. Mixe-Zoque
  - 2. Huave

V. *Hokan-Siouan*

- A. Holian-Coahuiltecan
  - 1. Holran
    - *a.* Northern Hokan
      - (1) Karok, Chimariko, Shasta-Achomawai
      - (2) Yana
      - (3) Pomo
    - b. Washo
    - *c.* Esselen-Yuman
      - (1) Esselen
      - (2) Yuman
    - d. Salinan-Seri
      - (1) Salinan
      - (2) Chumash
      - (3) Seri
    - e. Tequistlatecan (Chontal)
  - 2. Subtiaba-Tlappanec
  - 3. Coahuiltecan
    - *a.* Tonkawa
    - b. Coahuilteco
      - (1) Coahuilteco proper
      - (2) Cotoname
      - (3) Comecrudo
    - c. Karankawa
- B. Yuki
- C. Keres
- D. Tunican
  - 1. Tunica-Atakapa
  - 2. Chitimacha
- E. Iroquois-Catldoan
  - 1. Iroquoian
  - 2. Caddoan
- F. Eastern group
  - 1. Siouan-Yuchi
    - *a.* Siouan
    - b. Yuchi
  - 2. Natchez-Muskogian
    - *a.* Iiatchez
    - *b.* Muskogian
    - *c.* Timucua (?)

VI. *Aztec-Tanoan*

- A. Uto-Aztecan
  - 1. Nahuatl
  - 2. Piman
  - 3. Shoshonean
- B. Tanoan-Kiowa
  - 1. Tanoan
  - 2. Kiowa
- C. Zuñi (?)

Languages belonging to two South American stocks were spoken in Central America: Cariban, spoken in one or two dialects on the coast of Honduras and British Honduras (these came there in post-conquest times from the West Indies) and Chibchan, spoken in Costa Rica, Panamá and Nicaragua.

CENTRAL BANK, an institution such as the Hank of England or the U.S. federal reserve system that is charged with responsibility for regulating the size of a nation's money supply and the availability and cost of credit. Regulation of the availability and cost of credit may he nonselective or may be designed to influence the distribution of credit among competing uses. The

objective of a central bank in peacetime is to promote monetary stability and sound economic growth; in wartime, its objective is to promote the use of the nation's productive and financial resources in the war effort. Central banks also have other important responsibilities. Generally these include acting as fiscal agents and financial advisers to the government, overseeing the operation of the banking system, clearing checks and serving as correspondents for foreign central banks. Central banks are operated for the public welfare and not for maximum profit.

The modern central bank has had a long evolution, dating back to the establishment of the Bank of England (*q.v.*) in 1694. In the process central banks have become varied in authority, autonomy, functions and instruments of action. Virtually everywhere, however. there has been a vast broadening of central bank responsibility for promoting economic stability and growth. There has also been increasing emphasis on the interdependence of monetary and other national economic policies, especially fiscal and debt-management policies.

The broadened responsibilities of central banks have led to growing government influence in their affairs. This increased influence has taken a variety of forms in different countries: among them have been outright nationalization, representation of the minister of finance on the central bank's board of directors, greater government influence in the selection of the other members of the board, and the establishment of procedures for settling conflicts between the central bank and the government, and to ensure that the government's point of view prevails.

The responsibility of central banks for promoting economic stability and growth arose mainly from the depression of the 1930s. At that time the view developed that central banks in the past had devoted too much attention to prevention of overissuance of their bank notes and to the preservation of unlimited convertibility of these notes into gold at a fixed rate of exchange, and that too little attention had been given to maintaining total economic activity at high levels. In nearly all countries, the powers of central banks to extend credit were liberalized in order to free them from the need to pursue deflationary policies during recessions. Nevertheless, reliance on monetary policy diminished and there was increased emphasis on the potentialities of government spending, taxation and debt management. In many countries, elaborate systems of foreign exchange controls, frequently administered wholly or partly by the central bank, replaced the earlier systems of unrestricted convertibility of the currency into gold and foreign currencies.

During World War II the principal concerns of central banks in warring nations were the financing of the nations' war efforts and restricting the availability of credit for civilian use. In other countries, the problem was to prevent scarcity of imports from causing serious inflation. In the immediate postwar period, the problem in war-damaged nations was to facilitate reconstruction of viable patterns of production and consumption. In the United States, it was to prevent the huge wartime accumulations of liquid assets from generating rampant inflation while the economy was shifting to peacetime production. In the raw-material-producing countries, especially in Latin America, the problem was to avert wartime-accumulated foreign exchange from being dissipated on imports of foreign goods of little value to economic development. The nature of monetary problems during the war and immediate postwar periods led to greater governmental influence in the making of central bank policy and to the development of a variety of new instruments for regulating the availability of credit.

After adjustments to peacetime conditions were made, the primary concern of central banks became, and has continued to be, the maintenance of high levels of output and employment without inflation and deterioration in the nation's international balance of payments. Anti-inflationary monetary policies were adopted by governments in many countries, notably in Germany. Another important development in central banking during the 1950s was the great progress made toward restoring the unrestricted external convertibility of European currencies and toward reducing exchange restrictions in Latin America and the far east. The International Monetary fund (*q.v.*), which may be described as a "central bank for central banks," played a leading role in promoting the removal of international currency restrictions and in bringing about a system of international consultation and co-operation on monetary and foreign exchange problems, and a renewed confidence in the importance of sound monetary policies.

Central banks regulate the money supply primarily by expanding and contracting their assets. An increase in a central bank's assets causes a corresponding increase in its deposit liabilities (or note issue), and these, in turn, provide the funds that serve as the cash reserves of the commercial banks—reserves that commercial banks, by law or by custom, must maintain, and generally in a prescribed proportion of their own deposit liabilities. As banks acquire larger cash balances with the central bank, they are in a position to expand their own credit operations and deposit liabilities to a point where the new, larger cash reserves no longer produce a reserve ratio greater than the minimum set by law or custom. A reverse process occurs when the central bank contracts the volume of its assets and liabilities.

The typical operations by which central banks alter the volume of their assets may be summarized as follows:

Open-Market Operations.—These consist mainly of purchases and sales of government securities, but operations in bankers' acceptances and in certain other types of paper often are permissible. Open-market operations are an effective instrument of monetary regulation only in countries with well-developed securities markets. Open-market sales of securities by the central bank, by draining off cash reserves from the commercial banks, can be used to force these banks to borrow from the central bank and, in conjunction with a high discount rate, can compel them to tighten their lending policies. Open-market sales, by reducing the capacity of the banking system to extend credit and by tending to drive down the prices of the securities sold, also tend to raise interest rates generally. The rise in interest rates forces other financial institutions to offer a higher rate of return on their obligations and. given the reduced availability of bank credit. enables them, like banks, to command a higher rate of return on their loans and investments. Thus, the impact of open-market sales is not limited to the banking system. It is diffused throughout the economy; however, the impact tends to be greatest on banks, because they are more directly affected via the loss of cash reserves. Conversely, purchases of securities by the central bank tend to lead to credit expansion by the financial system and to lower interest rates.

Open-market operations also can be used to stabilize government security prices, thereby assisting the treasury in the management of the national debt; however, the effect on bank reserves may conflict with the central bank's existing credit policy. This situation existed in the United States in the postwar period, until the Treasury-Federal Reserve accord of March 4, 1951.

Loans **to** Banks.—Such loans, generally called "discounts" or "rediscounts," are short-term advances against commercial paper or government securities to enable banks to meet seasonal or other special temporary needs for funds. The Bank of England deals with discount houses rather than directly with banks, but the effect on bank reserves is similar. The provision of such funds is one of the most important functions of central banks. The rate of interest charged is known as the "discount rate" or "rediscount rate." By raising or lowering the rate, the central bank can regulate the cost of such borrowing. The level of and changes in the rate also indicate the views of the central bank on the desirability of greater tightness or ease in credit conditions.

Some central banks, especially in countries which lack a broad capital market, extend medium- and long-term credit to banks and to government development corporations in order to facilitate the financing of domestic economic development expenditures and to alleviate the deficiency of savings. Such longer-term lending is not regarded as an appropriate central bank activity by most authorities, however, and is regarded as a dangerous source of inflationary pressures.

Other Loans.—Direct government borrowing from central banks generally is frowned upon and commonly is subject to statutory limitations; nevertheless, in many countries the central

bank is the only large source of credit for the government and is used extensively. Some central banks make loans to private business but such loans are considered to be commercial banking rather than central banking operations.

Purchases and Sales of Gold and Foreign Exchange.—Central banks buy and sell gold and foreign exchange to stabilize the international value of their own currency and to provide an international reserve for use in periods of need. Prior to the 1930s. the authority of most central banks to issue currency and (less commonly) to incur deposit liabilities was limited by statutory requirements fixing the maximum amount of these obligations in relation to the international reserve. Such requirements have been lowered or eliminated by many countries, however, either because they blocked expansions of the money supply considered essential to domestic stability and development or because they "locked up" gold or foreign exchange needed for payments abroad.

Other Types of Central-Bank Credit Control.——>fany central banks have authority to fix and to vary, within limits, the minimum cash reserves that banks must hold against their deposit liabilities. Changes in reserve requirements are an effective instrument both to offset and to substitute for large changes in the supply of reserves. The U.S. federal reserve system was the first central bank to obtain this power as a normal means of credit control (1935). but most other central banks later were given such authority. In some countries, the reserve requirements against deposits provide for the maintenance of certain assets in addition to cash: such requirements are sometimes called "minimum liquidity ratios." Most commonly, the other assets are government securities. Generally. the purpose is to encourage or require banks to invest in such assets to a greater extent than they otherwise would be inclined to do, and thus to limit the extension of credit for other purposes. In Europe, such minimum liquidity ratios were used extensively following World War II and the Korean conflict to prevent banks from disposing of large holdings of government securities in order to expand their loans to private borrowers. During and after World War II many countries felt a need to regulate the availability of credit for particular purposes. such as the purchase of consumer durables, houses and imports of nonessential goods. Their central banks were therefore empowered to impose various selective credit controls. Such controls may apply to nonhank as well as to bank lenders. The federal reserve board in the United States. for example. has had authority to control stock market credit since 1934. Sometimes selective measures, such as specially low discount rates or permission to include certain assets as part of required reserves. are used to encourage specific types of credit.

Relations With the Government.— Notwithstanding a trend toward government ownership of central banks and of co-ordination of their policies with governmental fiscal and economic policies, central banks—even when nationalized—generally have a large measure of autonomy. Because governments are under constant political pressures to increase their spending without increasing taxes in proportion, they tend to follow inflationary policies which a central bank. somewhat removed from such pressures, can help to moderate. A recognition of the value of such a check on their inflationary propensities is the principal reason why governments in most countries permit central hanks to have some degree of autonomy and freedom in determining and implementing monetary policy. Ultimately, however, the preservation of such freedom depends on strong public support of the central bank at times of disagreement with the government; otherwise. the government may be subject to no deterrence from revoking the bank's freedom whenever its exercise is an irritation to the government. CENTRAL FALLS, a city of Providence county, with a land area of 1.2 sq.mi., is the smallest municipality in Rhode Island, U.S. On the Blackstone river north of Pawtucket. Central Falls was separated from the town of Smithfield in 1871 and was incorporated as a city Feb. 21. 1895. It produces a variety of manufactured goods. Historically. it is known as one of the places where the Indian leader King Philip wreaked vengeance upon the white settlers. A tablet at High and Aigan streets marks the spot where a company of Plymouth soldiers was ambushed by Indians on March 26, 1676. Points of interest are Jenks park and the Adams Memorial library. For comparative population figures see table in RHODE ISLAKD: *Population.* (J. O. S.)

CENTRAL MASSIF: see MASSIF CENTRAL.

CENTRAL PROVINCE, CEYLON, covers 2.290 sq.mi. of mainly hilly country renowned for its fine scenery. The larger part of the province lies to the west of the north-south axis of Ceylon's highland mass; it is drained from that axis by the upper Mahaweli Ganga and its tributaries. but a smaller area drains northward to the Kala Oya. It is well watered. with rain at most seasons of the year although the northward-draining valleys lie in part in the dry zone. which has pronounced seasonal drought during the southwest monsoon. The remainder of the province lies to the east of the highland axis and falls precipitously from an altitude of over 6.000 ft. in the Knuckles range and over 8.000 ft. near Nuwara Eliya to under 100 ft. along the middle Mahaweli Ganga: the lower areas there have a dry zone climate, modified by altitude as the slopes are scaled. The province as a whole thus has a very varied pattern of relief and climate; within a few miles around Kandy (*q.v.*), the provincial capital. one can pass from the greenest of wet zone gardens to the brown aridity of dry zone slopes. (See also CEYLON: *Physical Geography.*)

Mixed evergreen and deciduous forest survives over much of the dry zone parts of the province; elsewhere forest has been replaced by cultivation, or has degenerated into poor grassland.

The lowland dry zone parts of the Central province were in ancient times the scene of considerable activity and settlement: the remains of this period may still be seen in such places as Sigiriya, a famous hilltop fortress-palace built by Kasyapa I (A.D. 478–496); Elahera and Minipe (ancient irrigation works); and Dambulla (cave-temples). Gradually, under pressure from Tamils from the north. the centre of gravity shifted to the hills. where, for example. Gampola was the capital of a kingdom (14th century) and Kandy the seat of the last independent Sinhalese kings. The British took over in 1815.

The population of the Central province in 1953 was 1,366,685, with Kandyan Sinhalese in an over-all majority, though locally (as for example in Nuwara Eliya district) Indian Tamil estate workers predominate. The chief towns (1953 pop.) are Kandy, 57,200; Matale, 17,244; Nuwara Eliya, 14,405, the three district capitals; and Gampola, 10.773; Nawalapitiya, 9.862; and Hatton-Dickoya, 10,242, the last-named entirely a creation of the planting industry.

Agriculture of two main types occupies most of the people of the Central province. The first type is that of the Sinhalese peasantry, who grow rice (in the dry zone by irrigation), coconut, areca palm and tea. The second type is that of estates, with European or Ceylonese managers and Indian Tamil or Sinhalese labourers, who produce tea and to a lesser extent rubber and cocoa for export. It was largely to assist the plantations that the skilfully engineered railway and the good road network were developed.

For bibliography see CEYLON. (B. H. F.)

CENTRAL PROVINCE, KENYA, in east Africa, is bounded on the west and north by the Rift Valley and Northern provinces and on the south and southeast by the Southern province and the extraprovincial district of Nairobi. The population in 1948 was 1,367,513, including 2,349 Europeans and 6,075 other non-Africans. Area 11,093 sq.mi. in 1960. The province lies over 5,000 ft. above sea level in the centre and west. where it is dominated by Mt. Kenya and the Aberdare range, but the land falls away to less than 3.000 ft. in an eastern strip adjacent to the Tana river. In this eastern area and in the northwest the

Basement rocks appear from beneath the covering of Tertiary-Recent volcanics which occupies the rest of the province. The land over 5.000 ft. normally has sufficient rain for agriculture, except in the northwest where the average annual fall is less than 30 in At Nyeri (6.000 ft.) the mean maximum temperature for the year is 68° F. and the mean minimum 52°. The soils, mostly fertile. of the humid areas range from dark brown loams to dark red clays. The forest cover they formerly supported has been cleared for agriculture, except in the forest reserves of the Aberdares and Mt Kenya.

There are seven districts: Kiambu. Thika, Fort Hall, Nyeri (which takes its name from the headquarters of the Central province), Embu, Meru and Nanyuki. The Kikuyu (q **v.**) live especially in Kiambu, Fort Hall and Nyeri; the Embu and the Meru occupy the districts which bear their names; while Xanyuki and Thika and parts of Kiambu and Nyeri are the sites of European settlement. The district densities of population in Kiambu and Fort Hall were well over 400 per square mile at the 1948 census. The characteristically dispersed pattern of African settlement was modified in the program of "villagization" adopted following the Mau Mau rebellion of the early 1950s (see KENYA: History) Landless Kikuyu were resettled on the Mwea-Tebere irrigation area of southeastern Embu. African district councils function as organs of local government alongside the county councils under which the townships and the areas of European rural settlement are grouped. Thika, Nanyuki and Nyeri, none of them large, are the principal townships.

There was an intensification of African agriculture in this rich terrain. accompanied by consolidation of holdings and improved husbandry. Coffee. tea. wattle and pineapples are grown by Africans as cash crops, and there is considerable market gardening around Nairobi. European coffee, tea and sisal plantations are in the south, whereas in the north the natural grazing of Nanyuki is suited for raising beef cattle and sheep, and in both areas there is some dairying. Industries are few, but Thika is a centre of miscellaneous industrial development and Ruiru manufactures sisal products A branch railway connects Nairobi with Nanyuki, and a road following the same direction continues to complete the circuit of Mt. Kenya.

See L. H. Kolbe and S. J. Fouché, *Land Consolidation and Farm Planning in the Central Province (1959).*

(S. J.K.B.; R.S.O.)

CENTRAL PROVINCE, TANGANYIKA, one of the nine provinces of the independent state created in 1961, lies on the eastern margins of the central plateau of Tanganyika (*q.v.*). Pop. (1957) 886.962. Area 35.200 sq.mi. The plateau edge is marked in the east of the province by a belt of hills and escarpments from the Kondoa range to the Rubeho mountains in the southeast, rising to 1.500 ft. above the plateau and the Masai steppe farther east (both about 4,000 ft. above sea level). The granitic rocks forming the plateau and the Archean metamorphic limestones of the Masai steppe are overlain by superficial deposits. In the northwest are volcanic rocks and banded ironstones of the Nyanzian system Much of the drainage of the province is to dischargeless basins; in the northwest to the Wembere depression and Lake Eyasi and west of Dodoma to the Bahi swamp. The Mukondokwa (Mkondoa) river, a tributary of the Wami, has cut back through the hills to drain the area east of Dodoma. In the southwest and south the Njombe and Kisigo systems join the Great Ruaha which flows through a narrow gorge to the coastal plain.

The mean annual rainfall varies from less than 20 in. south of Dodoma to 20–30 in. over the rest of the province. There are wide year-to-year variations and semiarid conditions prevail. The rainy season is from November to April with maxima in March and April. For six months annually there is almost complete drought. Maximum temperatures are high. frequently over 90° F., but the daily range of about 20° brings relatively cool nights. There is little seasonal variation in temperature.

Soils are mostly plateau types The most fertile are the brown to black soils in the valley bottoms which are sometimes calcareous, and the red loams on limestone and red fan-slope soils near Kongwa. Fertility is limited by the climate, and soils are saline in areas of inland drainage. Deciduous thicket covers much of the province, with a transition from the Acacia-Commiphora communities of the Masai steppe to the miombo, or open woodland (Brachystegiaj, in the west. Grasslands occur in the valley bottoms and seasonal swamps. Areas of bush are infested with tsetse fly. (J. M. KE.)

People. — At the time of the 1957 census the population of the province included 879.421 Africans and 7,541 non-Africans, almost one-half of them Indians.

The largest tribe is the Gogo (276,800), which is the sixth largest tribe in Tanganyika. They are primarily pastoralists who of necessity have become cattle-keeping agriculturists. Other tribes are the Turu or Arimi (178.400) in the Singida, Iramba and Manyoni districts; the Iramba (98,700) in the Iramba and Singida districts; and the Rangi (99.000). Burungi (11,700) and Sandawe (24.000) in the Kondoa district. The Sandawe (*q.v.*) are thought to be related to the Hottentots. being somewhat reddish in colour, speaking with a language full of "clicks" and having little in common with their neighbours. Provincial headquarters is at Dodoma, a rapidly growing town at the junction of the Great North road and the Central railway. In the 1957 census it was the only town with a population of more than 5,000. having 13.435 inhabitants.

Economy. — The economy of the province is to a large extent dependent on its livestock. Cattle, hides and skins, and clarified butter are among the more important products. Beeswax, honey and gum are gathered from the wilds. There is a small fishing and salt-making industry at the Bahi swamp. Having such an uncertain rainfall, the area is periodically subject to food shortages. Maize, bulrush millet, sorghum, peanuts. beans, rice. onions. castor and sunflower seed are among the crops grown. Gum arabic collected from the bush forms a supplementary cash crop. In an attempt to combat the devastating effects of the sporadic rainfall a large program of dam building was carried out, especially in the Dodoma district, and, in addition, innumerable *hafirs* (small dams, often handmade) were constructed. In the Kondoa district the same climatic factors, combined with an increase in both population and stock, brought about a critical situation, with almost insoluble problems of erosion and overstocking. In other areas, land for cultivation and stockkeeping was being won from the tsetse fly by the discriminative clearing of bush.

The province is not one of the more highly mineralized areas, although in the past the Sekenke mine in the Iramba district produced a considerable amount of gold and was the source of the metal for the famous "Tabora sovereigns" made locally by the Germans during World War I. Copper, graphite. mica, corundum and nickel deposits are also known to exist. A phosphate deposit was discovered near Bahi and chrysoprase near Itiso. The United. Kingdom Atomic Energy authority bas an office in Dodoma, where it assists with prospecting and with the development generally of uranium deposits in east Africa. The Central railway from Dar es Salaam to Lakes Tanganyika and Victoria runs through the province. The Kondoa district is famous for its rock paintings and the province contains a large variety of game, including elephant, rhinoceros, lion and. notably, greater kudu. (J. P. MT.)

CENTRAL REGION, GHANA, was created in 1960 from the eastern part of the former Western region. Pop. (1960) 725,-993. Area 3,656 sq.mi. It has a 90-mi. coast line along the Gulf of Guinea: west Africa, approximately between the mouths of the Pra and Densu rivers. Northward it is bordered by the Pra and its tributary the Ofin. The region occupies the southeast corner of the dissected peneplain of southern Ghana. A markedly undulating surface, mostly below 500 ft., is produced by the predominant Pre-Cambrian granites; drainage is by short streams (Ayensu. Nakwa, Ochi) often terminating in lagoons. Patches of Pre-Cambrian metamorphic rocks among Paleozoic and more recent sedimentaries form a coast of picturesque bays and promontories.

Except in the drier littoral zone, where the vegetation is mostly scrub and grass. the rainfall is 40–60 in. annually and supports semideciduous tropical forest on "ochrosols," or fertile loams, suitable for cocoa and forest staples. In the drier coastal zones

less fertile lateritic soils predominate.

Historically the region is one of the most interesting in the republic. The strongholds of early European trading are seen in coastal settlements with old forts such as Elmina (Portuguese, 1482) and Cape Coast, once the British capital, crowning the rocky headlands, Later developments in other parts of Ghana greatly reduced the importance of the coastal settlements.

Population is densest in three zones: along the coast, encouraged by the coastal main road linking Takoradi and Accra; in the rich northern agricultural zone served by the Central railway; and around Dunkwa and the routes radiating from it. The largest town is the regional capital. Cape Coast (*q.v.*), with a population in 1960 of about 41.000. The headquarters of the five administrative districts are Cape Coast, Dunkwa, Swedru and the coast towns of Winneba and Saltpond. Other centres are Nyakrom, Senya Beraku and Elmina.

Coastal fisheries are widespread and the roadstead ports of Cape Coast and Winneba attract some commerce, but the chief significance of the coastal section lies in the production of copra and limes around Cape Coast and the extraction of salt at Elmina. By the 1960s the real wealth of the region lay in the cocoa, bananas and other food staples of the northern forested zone. In the northwest, where the region forms a panhandle between the Ashanti and Western regions, a gold-dredging industry is centred on Dunkwa, which is also the focus of an important production of forest timber and of a small rubber industry. (EK. A. B.)

CENTRAL SCHOOL (GREAT BRITAIN), a special kind of senior elementary school established in some areas of England and Wales during the second and third decades of the 20th century to provide three or four years of postprimary (terminal) education, usually with a practical bias, for pupils of 11 and upward. There were two main types: selective (usually by examination), introduced in London in 1911, and nonselective to which the older children were drafted from contributory schools in the district. With the institution of secondary education for all by the Education act, 1944. central schools ceased to exist as such, most of them developing as secondary schools. See SECONDARY EDUCATION; EDUCATION, HISTORY OF.

CENTRIFUGE is commonly defined as a machine using centrifugal force for separating materials of different densities, but has the broader connotation of any machine designed for the specific purpose of subjecting materials to a sustained centrifugal force. Being of essentially the same nature as gravitational force. centrifugal force can be employed to accelerate or greatly accentuate many processes otherwise dependent on the comparatively meagre attraction of gravity. Apparently this fact was early recognized, for it is known that centrifugal machines were used in the 10th century A.D. for extracting tung oil.

Centrifugal Force.—As enunciated by Sir Isaac Newton in his famous laws of force and motion, a freely moving body tends to travel in a straight line, and if directed along a curved path, it will exert a force against the directing or restraining object in its continual effort to "fly off" onto a straight tangential course. For example, it is a familiar observation that an object revolving in a circle exerts a force away from the centre of rotation. Also, there is general appreciation of the fact that the amount of this force can be increased by increasing either the angular velocity of rotation *(S)*, the mass of the object *(M)* or the radius (R) of the circle through which the object moves. Perhaps not so generally appreciated is the fact that whereas the centrifugal force is directly proportional to the radius and to the mass, it is, as examination of the formula below will show, proportional to the square of the angular velocity. For example, doubling the number of revolutions per minute will increase the centrifugal force by a factor of 4 (equals 2 times 2); increasing the speed by a factor of 10 will increase the force by a factor of 100 (equals 10 times 10).

The actual amount of centrifugal force **(F)**, expressed in dynes (1 gram of force = 980 dynes), is given by:

$$F = \frac{\pi^2 S^2 MR}{900}$$

where S is in revolutions per minute, M is in grams and R is in centimetres.

In order that a clearer concept of the amount of centrifugal force acting on an object may be provided, the force is often compared directly with the weight (pull of gravity) of the object and the amount of force is stated as so many "times gravity" or so many "g's."

For example, an object revolving at the rate of 600 r.p.m. in a circle having a radius of 10 cm. (equivalent to 3.94 in.) generates a centrifugal force which is 41 times gravity. Through the use of special research apparatus, forces greater than 5,000,000 times gravity have been produced by spinning small metal rotors of about pea size at speeds exceeding 1,000,000 r.p.m.

The rotating element of a centrifuge is usually driven about a fixed axis by an electric motor, or by an air turbine in some high-speed machines, and is variously known as a rotor, rotator, bowl, drum or centrifugal. For the minimizing of vibration and strain on the shaft and bearings, it is essential that a loaded rotor be well balanced; *i.e.*, that the total mass be so distributed about the axis of rotation that the resultant of all the elemental forces is zero. If the bearings are suited to high speeds and if ample power is available to overcome the frictional resistance of the bearings and the surrounding air, the only limitation to the speed of a well-balanced rotor is the strength against rupture of the material from which it is made.

For example, a 15-cm. (6-in. diameter) Duralumin rotor used in certain biological studies and designed especially for high speeds has a limiting speed for routine operation of about 60,000 r.p.m. In a rotor of given design, the maximum angular velocity obtainable before rupture is to a close approximation inversely proportional to the rotor's diameter. Thus, a small rotor having only one-half the diameter of a larger one can be as safely rotated at twice the angular velocity and with the production at the periphery of twice the centrifugal force.

Effect on Liquids.—Of special importance is the centrifugal behaviour of liquids. particularly those in which is suspended solid particulate matter of small size or globules of an immiscible fluid; *e.g.*, the suspended particles in a water-oil emulsion. The net force acting on any portion of the liquid is the vector resultant of both the centrifugal force and the force of gravity. However, in general the force of gravity is so small in comparison with the centrifugal force generated during operation that its effect may be neglected in the present discussion of principles. In the centrifugal field of force, the liquid tries to distribute itself as far as possible from the axis of rotation, filling the outer portions of the container and forming a free surface which is everywhere equidistant from the axis and hence cylindrical in shape.

Any suspended particles which are more dense than the suspending liquid tend to migrate toward the periphery, while any having a lower specific gravity move toward the surface. The rapidity with which this migration proceeds is dependent on the intensity of the centrifugal force, the difference between the density of the particle and that of the suspending liquid, the viscosity of the liquid, the size and shape of the particle and to some extent the concentration of the particles and the degree to which they are electrically charged. The net motivating force exerted on the particle is the difference between the centrifugal force acting on it and the opposing buoyancy of the liquid, the buoyancy being equivalent to the centrifugal force acting on the volume of liquid displaced by the particle. In a steady state of migration, this net motivating force must be equal to the viscous drag of the liquid. For spherical, electrically neutral particles in dilute suspensions this resistance has been shown by G. G. Stokes to be given by the following relationship:

$$f = 6 \pi \eta r s$$

where f is the resistance in dynes, η is the viscosity in poises, r is the radius of the particle in centimetres and s is the speed of migration in centimetres per second.

Equating the expressions for the resistive and the net motivating forces and solving for s, one finds that the rate of movement is proportional to the square of the particle's radius:

$$s = \frac{\pi^2 S^2 R (\delta - \rho) r^2}{4050\eta}$$

where δ and p are the densities of the particle and the suspending fluid respectively. Thus. all other things being equal, a particle having a diameter 10 times that of a given particle will require only 1/100 as much average centrifugal force to move a given distance in a given time. The table, though somewhat oversimplified for the sake of clarity, gives some idea of actual requirements for particles of various sizes. the assumption being made that no remixing occurs within the fluids. Actually, remixing is a definite problem in the centrifugation of small particles at high sveeds and is discussed in the next section.

*Sedimentation of Spherical Particles Suspended in Aqueous Media**

Assumed diameter of particle, in cm. (1 cm.=0.39 in.)	Examples of particles in size range of same order	Average centrifugal force necessary to produce sedimentation of 1 cm. in 10 min., expressed as number times gravity	Approx. no. of r.p.m required, assuming average distance of liquid from axis of rotation to be 10 cm.
1/1,000 . . .	Red blood cells	1.8	120
1/10.000 . . .	Typhus rickettsia	180	1,200
1/100,000 . . .	Influenza virus	18,000	12,000
1/1,000,000 . .	Protein molecules	1,800,000	120,000†

*Assuming viscosity equal to that of water, specific gravity of medium equal to 1 and the average specific gravity of particles equal to 1.3 (order of magnitude for many biological materials).

†Because of the limited strength of materials speeds above approximately 50,000 r.p.m. are not feasible with rotors of the assumed size', At this speed an hour or more would be required to produce the indicated sedimentation of animal proteins.

From the foregoing discussion, it is clear that a practically complete separation of the suspending medium and the suspended phase can be produced if the centrifugation is allowed to continue until all particles have collected against the outer wall of the rotor. It should also be noted that a partial separation of two groups of suspended particles of different size can be effected by allowing centrifugation to continue only long enough for all of the larger particles to be completely packed into the sediment, since then many of the small particles will still be suspended in the fluid. If purification of the larger, as well as the smaller particles is desired, the supernatant fluid can be drawn off and the sediment resuspended in some suitable liquid and subsequently centrifuged again to effect further separation. This process may be repeated any number of times.

Industrial Centrifuges. — There are numerous industrial applications of centrifugal force. Thick-walled metal pipe and tubing are cast by pouring the molten metal into cylindrical molds which are then rotated while the metal sets into the solid state. Perforated rotating drums or baskets are used for extracting fluids from various natural products after crushing, for throwing off the excess water from washed clothes and for retaining sugar crystals while the liquor in which the crystallization took place is drained off under the action of centrifugal force. However, the greatest advantage of the centrifugal method is realized in fractionating fine suspensions of solid or liquid material. The cream separator is a familiar example.

Though variously modified to suit the particular application, most machines employed for such purposes are of the continuous-flow type, as illustrated by **(A)** in fig. 1. The bowl or rotor, generally cylindrical in shape, is provided with a central opening to permit the continuous introduction of liquid during operation, and with one or more exit ports from which the centrifuged fluid can overflow and be thrown into collectors.

In the simplest type of machine, only one exit port is provided for the supernatant fluid, the sedimented particles being collected in the precipitated form after the rotation has been stopped. In other machines two overflow passages are used, one being at the level of the supernatant fluid and the other leading from the peripheral section of the fluid to an exit port located at a slightly greater radial distance than the overflow for the supernatant fluid. With this arrangement both a "light" fraction (supernatant) and a "heavy" fraction (of increased density because of increased concentration of heavier material or loss of lighter material) of fluid can be continually collected, the flow being kept sufficiently rapid to prevent complete sedimentation of the particles if they are of such a nature as to pack easily into a semisolid sediment.

In many cases, centrifugal bowls are provided with a series of laminations, usually conical in shape and known as separators. Subdividing the fluid into thin layers generally has the effect of speeding up the separating process by reducing the distance through which a particle has to move before its effective removal from the main body of fluid. As soon as a particle reaches the mall of a separator, it can collect with other particles into larger groups that will slide along the wall into the heavy fraction at the

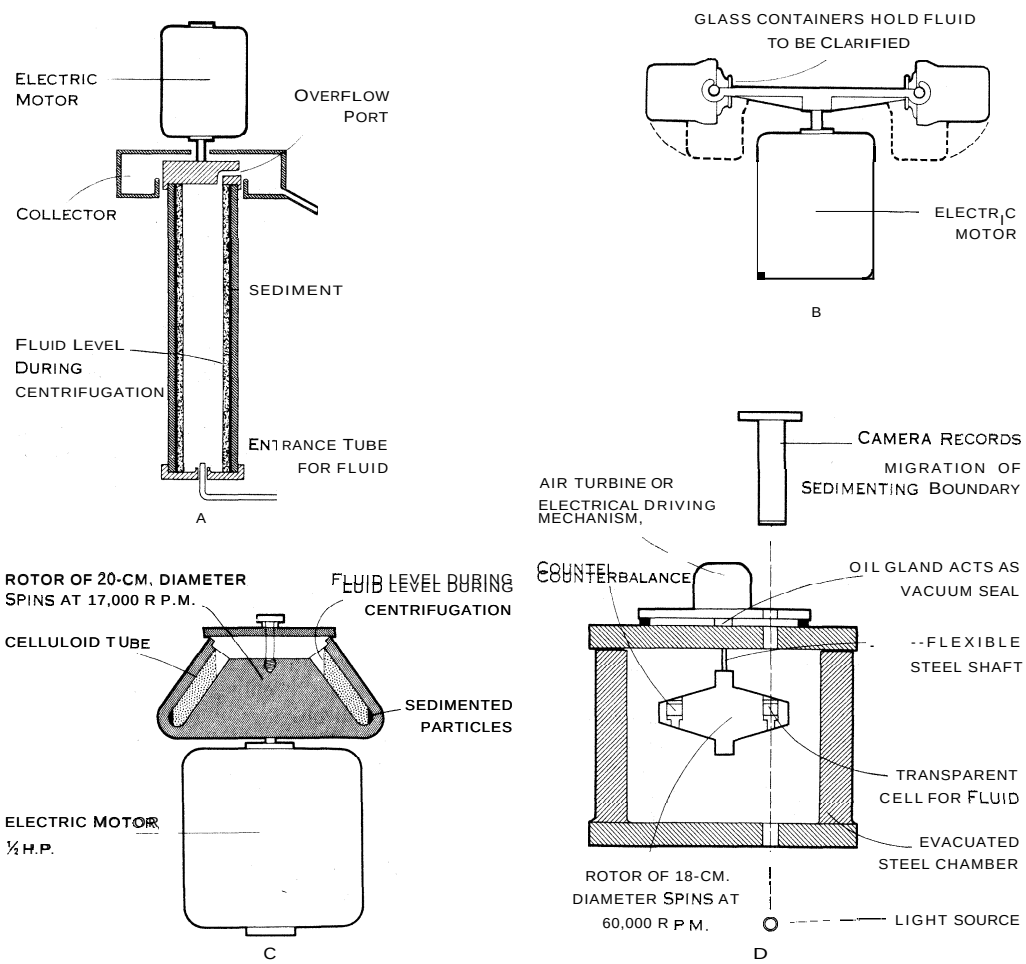

FIG. 1. — PRIMARY CENTRIFUGAL METHODS: (A) INDUSTRIAL CENTRIFUGE OF CONTINUOUS-FLOW TYPE; (B) LOW-SPEED LABORATORY CENTRIFUGE WITH SWINGING BUCKETS; (C) LABORATORY CENTRIFUGE WITH INCLINED TUBES: (D) OPTICAL ULTRACENTRIFUGE FOR MEASUREMENT OF SEDIMENTATION RATES AND DETERMINATION OF PARTICLE SIZES

periphery, or toward the surface if the particles are of low density. Such an arrangement also minimizes stirring and remixing as the fluid flows through the centrifuge.

Laboratory Centrifuges. — Centrifuges are used extensively in biological and chemical laboratories for the clarification of fluids and for the concentration and purification of various biological and chemical agents.

Most laboratory centrifuges are of the swinging-bucket type (B in fig. 1) or, for work at higher speeds especially, of the inclined-tube type (C in fig. 1).

Submicroscopic disease agents such as influenza virus, smallpox virus, yellow fever virus and the virus of infantile paralysis are nearly always obtained in the presence of considerable extraneous material of both larger and smaller particle size. They might be found in the excreta, blood or other body fluids of an animal, or they might be recovered from ground extracts of certain tissues such as those of the brain or the lungs, Through the process of differential centrifugation already described, these biological agents can be partially purified for further study or for practical purposes such as the manufacture of vaccines.

Laboratory centrifuges of proper design may be used not only for preparative purposes but for semiquantitative investigation as well. As a matter of fact, such a study in various degrees of refinement is usually a preliminary step in selecting appropriate rotational speeds and centrifugation times for a desired purification procedure. If excessive convective disturbances and remixing within the fluid can be avoided, the approximate size of the sedimenting particles can be computed by determining the minimum time required at a given speed for a definite amount of sedimentation and applying the previously discussed formula for spherical particles. The method depends on the sampling of the centrifuged column of fluid at various levels and the determination, by specific biological, physical or chemical tests, of the amount of the respective agent present in each sample. In less quantitative work, almost all of the supernatant fluid may be drawn off into one sample and compared with the sediment after resuspension in fresh fluid.

Two practical difficulties often limit the efficiency of the sedimentation process and make quantitative determinations of sedimentation rate uncertain if not impossible. One involves the remixing caused by the tendency of the fluid to continue revolving as the centrifuge is decelerated to rest. The other involves convection currents caused by slight differences in the temperature of the liquid at different levels, and it is most serious with small particles which require long periods of centrifugation. Since convection is essentially a buoyancy phenomenon, its intensity is stepped up almost directly in proportion to the amount of centrifugal force, and hence convection can be caused by extremely small temperature differences, such as might arise from the difference in the amount of frictional air resistance suffered by a rotor at its periphery and at its centre.

The first difficulty can largely be avoided by using small centrifuge containers and by packing the particles under study into a semisolid sediment before stopping the centrifuge. Air resistance, and hence almost all convection. can be avoided by spinning the rotor within an evacuated chamber according to a method developed by E. G. Pickels and J. W. Beams, illustrated by (D) in fig. 1.

The elimination of air resistance also makes possible the attaining of high rotational speeds with relatively little expenditure of energy.

For small volumes of solution a very fast preparative centrifuge was constructed in 1951 by K. Beyerle and co-workers in Germany. Unlike all other centrifuges. in which the tubes are evenly distributed around the axis of rotation, this centrifuge contains only a single tube in a holder of special design. With a 7.5-c.c. tube the solution could be subjected to a centrifugal field of 500,000 times gravity at 84,000 r.p.m. With a 1.5-c.c. tube a field of 900,000 times gravity has been obtained at a speed of 120.000 r.p.m.

The Analytical **Ultracentrifuge.**—More precise determinations of particle size and weight can be made by centriluging the suspension in a cell fitted with transparent windows and recording photographically the progress of the sedimentation (see D in fig. 1). This method was first used by T. Svedberg and J. B. Nichols in 1923 and was widely applied thereafter to determine the sedimentation rates and sizes of many submicroscopic particles, particularly protein molecules and viruses. Svedberg and H. Rinde proposed for the first optical centrifuge the name ultracentrifuge. denoting an instrument suitable for quantitative measurement. However, it became general practice to associate the term ultracentrifuge with any type of centrifuge operating at speeds of more than about 20,000 r.p.m.

Two different types of measurements may be carried out in the ultracentrifuge, viz., sedimentation velocity and sedimentation equilibrium. In the first instance when all of the suspended particles are of the same size, as might be the case with a solution of hemoglobin molecules, for example, the particles within any elemental zone of fluid, and hence within the same field of force, will migrate through the liquid at the same rate. Thus, the particles originally at the inner surface of the fluid will form a "rear line of march," or moving boundary. which demarcates the supernatant fluid and the sedimenting solute. It is by photographic recording of the continually changing position of this boundary at repeated intervals that precise determinations of sedimentation rate are made. From the sedimentation rate, in turn, the size or molecular weight of the particles can be determined if the shape factor is eliminated by a measurement of the diffusion constant. If particle groups of differing size are present, each group will form a separate boundary which sediments at a rate characteristic of the particle size. From a study of such multiple boundaries, the composition (from the standpoint of size) of the suspended matter in various biological fluids can be determined and reinvestigated following various treatments.

In the sedimentation equilibrium type of experiment the speed of the ultracentrifuge is so low (usually of the order of 6,000 r.p.m.) that no sharp boundary is formed, but a gradual displacement of the dissolved material takes place until equilibrium is established between sedimentation toward the periphery of the cell and diifusion in the opposite direction. Typically. a higher concentration obtains at the bottom of the cell and a lower concentration at the top, From the distribution of the dissolved substance at equilibrium, the molecular weight of the dissolved molecules may be calculated. or if this is known. the variation of its activity coefficient (set. SOLUTIONS) with concentration may be determined. By this method substances having molecular weights from about 50 up to more than 50,000,000 have been studied. A great advantage of this type of experiment is that small quantities of material are required.

Migrating boundaries may be detected either through the absorption of visible or ultraviolet light by the sedimenting particles or through the refraction of transmitted light occasioned by the concentration gradient existing at the boundary. The first ultracentrifuges to operate at more than 50,000 r.p.m. were driven by an oil turbine about a horizontal axis in a hydrogen atmosphere at reduced pressure. As illustrated in fig. 1, most ultracentrifugal rotors are spun in an evacuated chamber about a vertical axis, and power is supplied by an air turbine or a special electric motor. For supporting the load at high speeds with a minimum of frictional resistance, successful use has been made of air bearings, magnetic bearings and mechanical bearings of novel design.

The rotor is connected to the driving mechanism through a flexible steel shaft, about & in. in diameter, which permits a limited degree of self-balancing.

Following World War II, electrically driven ultracentrifuges operating at speeds up to 60,000 r.p.m. became available for both analytical and preparative purposes in biochemical and other research laboratories. Through refinements the analytical method was made applicable in certain cases even to small molecules of simple chemical structure. This was accomplished through a layering of clear solvent above the solution during acceleration of the ultracentrifuge. An initially sharp sedimentation boundary was thus formed away from the meniscus and its rate measured in spite of the slow sedimentation and rapid diffusion, which otherwise

would prevent the formation of a measurable boundary by such small particles.

In some cases it is important to know whether a certain biological activity sediments at the same rate as one of the known components in a naturally occurring fluid. For this purpose various separation cells have been devised. In these, the cell content is subdivided and the re-mixing, usually occurring when the rotor is stopped, is prevented. After the conclusion of the experiment the content in the different sections may be analyzed and the rate of sedimentation for the active substance may be calculated from the distribution of the activity.

The ultracentrifuge has played an important role in the development of modern biochemistry and biophysics. By means of this apparatus it was shown in the early 1930s that most of the soluble

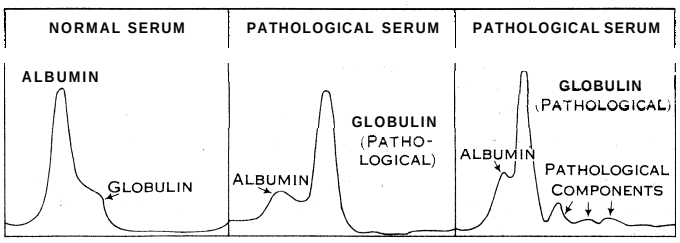

FIG. 2.— SEDIMENTATION DIAGRAMS FROM NORMAL HUMAN SERUM AND FROM TWO PATHOLOGICAL SERA OBTAINED FROM PATIENTS WITH MULTIPLE MYELOMA. THE SPEED OF THE CENTRIFUGE WAS 59.780 R.P.M. THE DIAGRAMS SHOW CONDITIONS AFTER ONE HOUR OF ULTRACENTRIFUGATION. THE AREA UNDER A PEAK IS PROPORTIONAL TO THE CONCENTRATION OF THE CORRESPONDING COMPONENT

proteins in solution exist as well-defined molecular units. At that time, this was contrary to the general view of the nature of protein molecules and gave a new impetus to the study of these substances.

In the preparation and purification of proteins and biologically active substances from naturally occurring biological fluids the ultracentrifuge has been of great help in deciding how to conduct a number of fractionations. Several hitherto unknown proteins have been discovered by this method. It has been used also in the study of the purity of protein preparations. Combined with electrophoretic analyses it is generally the most direct way to test the purity of a sample of a soluble protein.

In clinical research it has been used as an instrument for characterizing the serum proteins in various types of diseases accompanied by marked change in serum protein composition. The sedimentation diagram for a normal human serum and for two pathological sera from two cases of multiple myeloma is shown in fig. 2. It is seen that the relative amount of albumin is much reduced in the pathological sera: whereas the globulin is increased. Fig. 2 also shows the presence of some faster sedimenting components. In the case of a certain rare disease, Waldenstronis macroglobulinemia, the final diagnosis for many years could be made only on the basis of the sedimentation diagram.

Beginning about 1950 hundreds of thousands of ultracentrifuge experiments were made on human sera in order to study the correlation between the lipoproteins in serum and arteriosclerosis.

Sedimentation studies of high molecular weight materials other than proteins have also yielded important results. The particle size distribution of synthetic high polymers and various plasma substitutes has been determined and attempts have been made to relate various properties of those materials to their particle size distribution.

See T. Svedberg and K. O. Pedersen, *The Ultracentrifuge* (1940); E. G. Pickels, "Ultracentrifugation," *Methods in Medical Research* (1952). (E. G. P.; K. O. P.)

CENTRING, a term applied to the temporary construction built to support arches, etc.. while they are setting. Thus, in the case of an arch, the carpenter forms a "turning piece," shaped to take the bricks or masonry and properly tied and braced. This is strutted in position when the arch is completed by the bricklayer or mason. As soon as the work is set, the centring is carefully removed. which is called striking the centring. The same method is used in building brick sewers. The origin of the word centring is obvious from the primary use in centred arches, but the same term is applied to the use of scaffold boards to support concrete floors while they are setting hard. *See* ARCH AND VAULT; BRICKWORK; CARPENTRY.

CENTUMVIRI, a court of civil jurisdiction in ancient Rome (from Lat. *centum,* "hundred," and *vir,* "man"), which was probably instituted after 241 B.C., perhaps about 150. The judges originally numbered 105, 3 from each of the 35 tribes, but increased under the emperor Augustus until they later numbered 180. Elected in the 1st century B.C. by the *comitia tributa (see* COMITIA), they were selected by lot during the empire. and met in the Basilica Julia. Ex-quaestors *(see* QUAESTOR) were the presiding officers at the end of the 1st century B.C. but later were replaced by *decemviri stlitibus judicandis* ("board of ten for the trial of lawsuits"). They functioned only as *judices* since the *praetor urbanus* or *peregrinus (see* PRAETOR) conducted the proceedings in *jure* (preliminary hearing), and decided the choice between this court and a single *judex.* The *centumviri* judged a wide range of civil claims *(vindicationes),* especially inheritance claims, through which they influenced the law of succession.

See A. H. J. Greenidge, *Legal Procedure of Cicero's Time* (1901); *H.* F. Jolowicz, *Historical Introduction to the Study of Ronzan Law,* 2nd ed., pp. 203–205 (1952); *A.* Berger, *Encyclopaedic Dictionary of Roman Law,* p. 387 (1953). (T. R. S. B.)

CENTURION, in the ancient Roman army, the commander of a *centuria,* the 60th part of a legion. The 60 centurions in a legion were arranged in a complicated order of rank with wide variation in authority and responsibility from top to bottom. The senior centurion in each legion, the *primipilus,* participated in councils of war with the tribunes and *legati.* The senior centurion of a maniple or cohort was the commanding officer of those tactical units. Since the centurion was of plebeian origin and was promoted from the ranks, he is usually considered a noncommissioned officer. The duties of senior centurions, however, resembled those of modern company officers and battalion commanders. The ratio of centurions to men in the ranks (60 centurions to 4,200 men) was much less than the analogous ratio in modern armies. *See* also ARMY; ROMAN ARMY; LEGION. (Do. A.)

CENTURIPE, a town of Sicily, in the province of Enna, is situated 54 km. (33 mi.) W. of Catania by road, 2,380 ft. above sea level. Pop. (1957 est.) 10,760 (commune). Until 1863 it was called Centorbi (anc. Centuripae). It is surrounded by deep ravines caused by erosion. Its chief features are the remains of the classical city including Hellenistic houses with wall paintings. baths and cisterns and a number of substruction walls on the steep slopes, mostly of the Roman period. Hellenistic terra cottas (including especially some small molded female figures) and finely painted vases of local manufacture were discovered and a large number of tombs excavated. The civic museum and the Palazzo Communale have exhibits of local antiquities. The chief industries are the cultivation of cereals and the extraction of chalk from the numerous caves. There are mineral springs.

Thucydides called Centuripae a Sicel city. It allied itself with Athens against Syracuse and remained independent (apart from the Syracusan tyrant Agathocles' domination) until the First Punic War. Cicero, perhaps exaggerating, called it the largest and richest city in Sicily. It appears to have suffered considerably in the war against Sextus Pompeius and not to have regained its prosperity under the empire. Frederick II partly destroyed it in 1232 and its ruin was completed by Charles of Anjou. It was later rebuilt by Francesco Moncada, count of Xdernb, and his descendants ruled it as a county until 1813.

In 1860 Centuripe passed to the kingdom of Italy. In World War II it was captured by the Allies, after heavy fighting. on Aug. 3, 1943. (M. T. A. N.)

CENTURY PLANT. The century plant is a name given to *Agave americana* from the erroneous supposition that it flowers only when 100 years old. *See* AGAVE.

CEPHALIC INDEX, the percentage of breadth to length in any skull. The longer diameter of a skull. the antero-posterior diameter, is taken as 100; if the shorter or transverse diameter exceeds 80 the skull is broad (brachycephalic), if between 80 and

75 it is mesaticephalic. and if below 75 dolichocephalic (see RACES OF MANKIND; SKULL).

CEPHALOCHORDA, a subphylum of the animal phylum Chordata; these fishlike animals. represented by *Amphioxus* and its allies. are of interest because of their primitive chordate features.

See AMPHIOXUS; CHORDATE.

CEPHALONIA (Lat. CEPHALLENIA; Gr. KEFALLINIA), the largest of the Ionian Islands on the west of the Greek mainland. Pop. (1961) 46,302. Its length is 32 mi. and its breadth varies from about 27 mi. in the south to less than 3 mi. in the promontory opposite Ithaca. Area is 297 sq.mi. The whole island is mountainous. the main range running from northwest to southeast. Cephalonia (anc. Mt. Aenos; 5,341 ft.) frequently has snow for several months. There are few permanent streams except the Rakli. and springs are likely to fail in dry summers.' In the west a gulf runs up from the south, a distance of about 7 mi.; on its east side is the chief town, Argostolion (*q.v.*), and on its west the rival city of Lixourion. About 5 mi. from Argostolion is the Venetian castle of S. Giorgio. The ruins of Crane are close to Argostolion, those of Pale to Lixourion. On the other side of the island the remains of Same are on the bay of Samis, those of Pronni farther south above the vale of the Rakli. Near the village of Skala is a nameless site with Roman baths and tessellated pavements, a brick temple and rock tombs. Many Mycenaean tombs were found near Mazarata and Diakata. Only a small proportion of the soil is under cultivation. and the grain production is meagre. The chief crop is the currant, in which Cephalonia surpasses Zante. The fruit is smaller than that of the Peloponnesus, and has a peculiar flavour. Grapes are grown for wine. The olive crop is of importance, and cotton is grown on the low ground.

Manufactures are few: lace from aloe fibre, Turkey carpets and basketwork in the villages and boatbuilding at both the principal towns. Of all the seven Ionian Islands Cephalonia and Zante (*q.v.*) are the most purely Greek.

History. — The island was an important Mycenaean centre, and was known to Homer as Same. It took little part in the Persian War; in the Peloponnesian War it sided with the Athenians. The town of Pale supported the Aetolian cause and was vainly besieged by Philip V of Macedonia in 218 B.C. In 189 B.C. all the cities surrendered to the Romans, but Same afterward revolted and was reduced only after a siege of four months. The island was presented by Hadrian to Athens, but it appears again later as "free and autonomous." After the division of the Roman empire it was attached to Byzantium till 1082, when it was captured by Robert Guiscard, who died, however, during the revolt of 1085. In 1204 it was assigned to Gaius, prince of Tarentum, who accepted the protection of Venice in 1215. After 1225 it was held with Santa Maura (mod. Leukas) and Zante by the Tocco family at Naples. Formally made over to Venice in 1350 by the prince of Tarentum, it fell to the Turks from 1479 to 1500, but Venice held it again till the fall of the republic.

For some time it was administered for the French government. In 1809 it was taken by the British, under whom it advanced in material prosperity, but was several times the scene of political disturbances. After its annexation to Greece in 1864 it was broken up into 20 demarchies, each with its separate jurisdiction and revenues, and the police system was abolished. In 1941 it was occupied by Italy, and was liberated in 1944. In 1953 it suffered a severe earthquake.

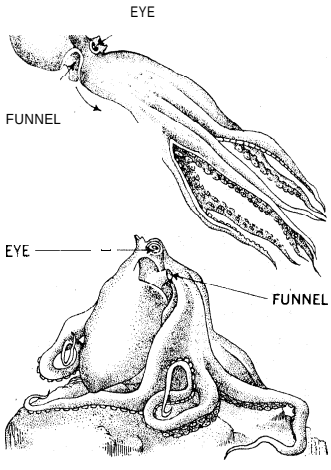
See also CORFU; IONIAN ISLANDS. (J. Bo.)

CEPHALOPODA, a small group of highly organized invertebrate animals of exclusively marine distribution constituting a class of the phylum Mollusca. About 130 genera and 650 species of living cephalopods are known, of which the octopus, squid and cuttlefish (*qq.v.*) are the most familiar representatives. The extinct forms, however, outnumber the living, the class having attained very great diversity in late Paleozoic and Mesozoic times (ranging from 70,000,000 to 235.000.000 years ago). Of extinct cephalopods the ammonites (*q.v.*) and belemnites are the best known examples.

This article is divided into the following sections:

I. INTRODUCTION AND NATURAL HISTORY

1. General Features. — The Cephalopoda agree with the rest of the Mollusca in general structure and appear to have the closest affinity with the Gastropoda (snails, periwinkles, limpets, etc.). They have a more or less elongate body (visceral mass) covered by a fleshy mantle. The latter may secrete a shell and encloses a cavity in which the gills are suspended. The alimentary canal is furnished with the characteristic molluscan rasping tongue or radula. These animals differ from the rest of the Mollusca primarily in that the head and foot are approximated, the mouth being situated in the middle of the foot, and that the edges of the foot are drawn out into a number of fleshy appendages (arms and tentacles). The area just above the edge of the foot is formed into a peculiar organ of locomotion. the funnel. The majority of living cephalopods possess fins, and their shell is internal and in a reduced or degenerate condition. Many fossil cephalopods, encumbered with a large external shell, were poor swimmers. Most modern cephalopods, unhampered by a large shell, are among the best adapted of all animals for active life in the sea. Nevertheless the living *Nautilus* (*q.v.*) retains the shell in a complete condition and is not a vigorous swimmer.



FROM A LANG, 'LEHRBUCK DER VERGLEICH ANAT 1892

FIG. 1.—AN OCTOPUS (OCTOPUS VULGARIS) (TOP) SWIMMING BY MEANS OF WATER EXPELLED THROUGH FUNNEL; (BOTTOM) AT REST

For invertebrate animals the Cephalopoda attain a large average size. The giant squids (*Architeuthis* species) are actually the largest living invertebrates, the Atlantic species *Architeuthis princeps* attaining a total length of more than 60 ft., including the extended tentacles. Some squids and octopuses, honever, are no more than an inch long; the average-sized octopus usually has arms no longer than 12 in., and rarely longer than 36 in. The shell of the fossil ammonite *Pachydiscus seppenradensis,* from Cretaceous rocks in Westphalia, measures 6 ft. 8 in. in diameter; it is considered the largest shelled mollusk. Although not such a flourishing group as they were in earlier geologic time. the Cephalopoda are still one of the major groups of marine animals. They are relentless enemies of Crustacea and small'fishes. and are, in turn, the principal prey of toothed whales and other marine carnivores. The bizarre appearance of Cephalopoda, the sinister eyes and the secretive habits of some of the shore-living forms have made them a subject of legend among imaginative peoples. Authors have not hesitated to exaggerate the horrors of the attack of a giant squid or an octopus.

CUTTLEFISH, OCTOPUSES AND SQUIDS OF THE MEDITERRANEAN

1. Squid *(Todarodes sagittatus)*
2. Common squid *(Loligo vulgaris)*
3. Octopus *(Rossia macrosoma)*
4. Squid *(Loligo marmorae)* discharging the ink which squids eject as a screen against their enemies
5. Paper nautilus *(Argonauta argo)*
6. Octopus *(Scaeurgus tetracirrus)*
7. Octopus *(Ocythoe tuberculata)*
8. Common cuttlefish *(Sepia officinalis)*
9. *Sepiola aurantiaca*
10. Eggs of cuttlefish *(Sepia officinalis)*
11. Common octopus *(Octopus vulgaris)*

Denis de Montfort and Victor Hugo have invested them with a melodramatic violence that has taken root in popular fancy. Nor is this reputation for ferocity entirely unmerited, especially among the giant squids, insofar as attacks on human subjects are concerned.

2. Economic Uses. — Cephalopods occur in very large numbers in the sea and form one of the greatest potential food resources of the oceans. They are eaten by man in many parts of the world, although they never have been accepted generally in North America or northern Europe. Besides being a direct source of food for mankind, they are indirectly important since they furnish a large part of the diet of the sperm whale and some of the smaller whales and seals which are economically important. In Nova Scotia the squid *Illex* supports an important bait fishery, the catch of codfish being in direct relation to the squid catch. Squids, cuttlefishes and octopuses are eaten and highly prized along the shores of the Mediterranean, in India, Indochina, Malaysia, China, Japan and the Pacific islands.

China and Japan lead in consumption of cephalopods. Japan, one of the leading fisheries nations of the world, lands about *600,000* tons of squid annually, the greater part being Todarodes *pacificus,* in some sections amounting to about 60% of the total landings. The catch in China is also high but statistics are inadequate, only cuttlefish with an annual catch of about *80.000* tons being reported. In Europe Italy leads with a catch of about *22,000* tons. In North America about *11,000* tons are landed, of which nearly one-half are landed in eastern Canada.

Cephalopods are taken in a variety of ways, the squids usually by nets at night after they have been attracted by powerful electric lights. They also are caught by jigging with hand lines and by trolling. Octopuses are taken in fish traps, in earthen pots strung together in long lines or by searching them out in their lairs and spearing them.

Cephalopods are prepared in many ways. In Japan they are largely split and sun-dried, but are often canned in the U.S. and in Spain and Portugal, bemg put up in the last two mentioned countries in olive oil. The fresh product is either boiled or more often fried, and when well prepared somewhat resembles scallops in flavour.

3. Distribution. — The Cephalopoda are exclusively marine animals. There are numerous littoral species, but few have been reported from even slightly brackish water and one from the mouth of a fresh-water stream (Hoyle, 190'7). The squid *Lolliguncula brevis* occurs along the Florida coast in several areas having a salinity of *15–17* parts per thousand or per mille (‰). Cephalopods are eliminated, except as wanderers, from the Baltic sea because of lowered salinities. On the other hand, they have been found in certain areas of the Suez canal where salinities are higher than in the oceans. There is some evidence that in parts of the open sea that differ only slightly in salinity there may be a varying cephalopod fauna.

Geographical Distribution. — The geographical distribution of the Cephalopoda is still incompletely known. In general the open ocean pelagic and bathypelagic forms are cosmopolitan in warm and temperate waters; for example, Ommastrephes *bartrami, Onychoteuthis* banksi, Cranclzia scabra, Liocranckia reinhardti, etc. On the other hand, the ommastrephids in general are limited by genera to particular oceans or to continental waters. Even some species of bathypelagic habitat are limited to one ocean. This is undoubtedly due in part to the type of larvae that they have. The Octopoda, as a result of their bottom dwelling habits, show stronger restrictions in their distribution, but Octopus *vulgaris* and **O.** macropus, both species with small eggs and hence planktonic larvae, have gained world-wide distribution. Several species, including *Bathypolypus* arcticus, are known to occur along both sides of the North Atlantic. *Illex* illecebrosus, the common northern American squid. has its southern boundary in Europe at about the English channel, replaced to the southward by I. *coindeti*. In general, the pelagic and planktonic cephalopods conform in their distribution to the other pelagic animals. They are limited by the salinity and temperature barriers of certain of the major ocean currents such as the Canaries current that segregates a northeastern Atlantic fauna and the Agulhas current that separates the temperate fauna of the Atlantic and the Indo-Pacific. Although these currents are barriers to the surface fauna, they undoubtedly have much less effect upon the bathypelagic species. It should be pointed out that knowledge of the geographical distribution of the cephalopods is still limited by the status of their systematics; finer differences may show more segregation than is presently known.

Vertical Distribution. — The vertical distribution of cephalopods, like the geographical distribution, is also incompletely known. Some general conclusions can be drawn, however. Nautilus moves vertically through the water, living near the bottom, and has been obtained at a depth of about *550* m. It is fished in the Philippines, however, when it comes into shallow water. In the Sepioidea the Sepiidae (Sepia) are littoral, whereas the Sepiolidae (Heteroteuthis, *Sepiola)* dwell on or near the bottom down to considerable depths. In the Teuthoidea, the Myopsida (Loligo) are coastal forms, whereas the Oegopsida are oceanic, living from the surface to depths in excess of *5,450* m.

In general the oceanic species may be grouped by families according to their depth range. The Lycoteuthidae, Enoploteuthidae, and Ommastrephidae normally occur from the surface to about *500* m.; the Onychoteuthidae from the surface to *150–200* m.; and the Histioteuthidae and Chiroteuthidae range from the surface to over 1,500 m. Chiroteuthis lacertosa has been taken at a depth of about *5,400* m. The Cranchiidae are planktonic animals, drifting more or less at the mercy of the currents. although certain forms such as *Mesonychoteuthis hamiltoni* and Liocranchia reinhardti in the adult stage may be active predatory species.

The larvae of both octopuses and squids are usually planktonic in the surface layers. The Octopoda occur from the surface of the open ocean (*Tremoctopus*) to the deep bathypelagic layers (Eledonella at about *5,300* m.); most are bottom-dwelling forms restricted to the continental shelf and its slope. One group, the Cirrata, are deep-sea in habitat, showing many adaptations for this mode of life.

Schooling. — Alcide d'Orbigny, in his account of the Mollusca of South America, asserted that the Cephalopoda are in general sociable, *i.e.,* gregarious, and this statement is certainly true of Nautilus, which are found together in droves (A. Willey, 1902). Nevertheless, Jatta, who made a special study of the Mediterranean forms, was of the opinion that only certain pelagic forms are gregarious (Todarodes, Ocythoe). W. Rees and G. Maul have also reported schools of the large oceanic squid *Thysanoteuthis* rhombis at Madeira. Although there is no proof that numbers constitute gregariousness, octopus "villages" also have been reported and A. E. Verrill adduced evidence that the shoaling of young Loligo *pealei* off the coast of New England is not accidental.

The breeding season also has a marked effect on the local distribution of certain Cephalopoda. The common cuttlefish (Sepia *officinalis*) comes into shallow'water in the spring and summer to breed, and migrations of a similar nature have been observed in other forms (Loligo, *Alloteuthis*).

4. Nutrition. — The majority of living Cephalopoda are carnivorous and live principally on Crustacea. They also feed on small fishes. A food cycle has been shown in the New England *Illex,* in which the adults feed upon young mackerel and the adult mackerel in turn feed upon the young squid. *Octopus vulgaris* feeds also upon bivalve mollusks and sometimes causes severe losses in the lobster industry. Squid are also cannibalistic, feeding upon their own kind and other related species. The smaller oceanic squid probably feed primarily upon small fish, copepods, heteropods and caridean shrimp. The Cirrata, which have reduced musculature and radula, indicating a loss of activity and of masticatory power, probably feed on bottom debris or minute plankton. G. C. Robson, from a study of the anatomy of the giant squid, Architeutlzis, decided that this animal, despite its size and reputed ferocity, probably is a bottom scavenger living along the continental slope.

The Cephalopoda are fed upon by the toothed whales, porpoises, dolphins, large fish, seals and sea birds. The stomachs of sperm

uhales are often found to contain whole small to giant squids and fragments of arms, mandibles and sucker rings.

5. **Colour,** Luminescence and **Behaviour.**—*Colour* Changes.—Colour in the Cephalopoda is determined by a cutaneous system of contractile cells (chromatophores) containing pigment and an underlying layer of iridescent or reflecting cells (iridocytes). The iridocytes are closely packed beneath the skin in the Decapoda, giving these animals their iridescent hues, but in the Octopoda they are deeper and more diffused. The chromatophores, innervated by certain nerves, can he widely expanded to reveal the colours of the pigment or tightly contracted to the point of disappearance. The pigments are brown, black, red, yellow or orange-red, but there are variations. No cephalopod contains all these colours, but is limited usually to only three. By combinations of these three colours, a variety of other colours can be produced. E. V. Cowdry has studied colour changes in the common octopus, and J. Z. Young and others have studied them in other species.

E. V. Cowdry has described the colour patterns of Octopus *vulgaris* at Bermuda, and other species have been studied at Naples. While certain colour patterns are protective, resembling the background on which the animal rests, others appear to indicate emotion, varying from fear to rage, and whole series of colours may pass over the animal in rapid successive waves.

Skin Changes.—The skin itself may be changed from smooth to rough to papillae or even arborescent projections. Octopus *arborescens* from the Indo-Pacific possesses sculpture of the last type, whereas *O. hummelincki* from the West Indies possesses straplike papillae that blend with the background of marine plants of the coral reefs.

"Ink" Ejection.—One of the chief aids in escaping from enemies, however, is the ink that all but some of the deep sea octopods can eject when in danger. This has commonly been likened to a smoke screen behind which the animal may escape. While this is true for the octopods, it also may serve to deaden temporarily the organs of smell and sight in fishes like the moray eel that prey upon octopods. In the squids, however, the ink is ejected as a cigar-shaped body about the size of the squid itself, the ink coagulating in the water. With this "dummy" left behind, the squid contracts its chromatophores, becomes colourless and speeds away.

Luminescence.—In certain of the Decapoda, notably those that live in the intermediate depths, special light organs (photophores) are developed on and uithin the mantle, arms and head. No light organs are known in Nautilus or the Octopoda, but they are found in the Vampyromorpha and in numerous groups of the Sepioidea and Teuthoidea. In most of the Teuthoidea the light is produced by a luciferin-luciferase reaction (see BIOLUMINESCENCE). In many of the Sepioidea, especially those in which the light organ is associated with the ink sac, the light is said to be produced by symbiotic luminescent bacteria. In some of the Sepioidea that dwell in deep water, luminescent ink is produced.

The value of bioluminescent organs in the Cephalopoda is still a matter of conjecture. It has been thought that in certain of the smaller squids they are used in mating play. While this may be true of some of the shore squids, it is unlikely that such is the case in the deep-water forms such as *Pyroteuthis* or *Calliteuthis*. In these animals bioluminescent organs are more likely of value for species recognition by the two sexes. These organs may also be used for attracting planktonic prey, as has been shown for certain light producing fishes. This may be the case in *Chiroteuthis lacertosa*, which is equipped with a large light organ at the end of the tentacular club that is surrounded by a cluster of dangling hooks.

In *Calliteuthis* a remarkable asymmetry is found in the head: one eye is nearly twice the diameter of the other. It has been suggested that the large eye is functional in deep water, where the only light is that produced by luminous animals, and the small eye functions near the surface in increased illumination.

Behaviour.—The behaviour of Octopus has been studied by many workers at the Zoological station at Naples. These animals have been credited with behaviour approaching true intelligence. J. Z. Young and his colleagues have demonstrated that they are capable of remembering and learning to a much higher degree than has been shown for any other invertebrate.

6. Historical Background.—Although the study of the Cephalopoda was initiated by Aristotle, modern investigation of their morphology dates from Cuvier, who gave them the name by which they are now known. H. de Blainville (1777–1850) and Alcide d'Orbigny (1802–57) laid the foundation of cephalopod systematics. The great monograph of d'Orbigny, *Histoire* Nnturelle, *générale* et *particulaire, des* Cephalopodes *acetabulifères,* vivants et *fossile,* is a landmark in systematic zoology; it included descriptions of fossil as well as living species. R. Owen contributed substantially to the knowledge of the morphology of the class. R. A. von Kolliker may be said to have founded the embryological study of cephalopods (1843), and Alpheus Hyatt (1868) led the way in early paleontological studies.

The first great modern teuthologist, J. Steenstrup of Copenhagen, in a long series of papers placed the modern systematic study of cephalopods on a firm foundation. A. E. Verrill led the study of the group in America and first made known (1882) the complexity and richness of the rare deep-sea fauna from his studies of the waters off the New England coast.

W. E. Hoyle described (1886) the rich collections obtained by

the "Challenger" expedition. Since then many investigators have contributed to our knowledge of the living and fossil forms. Particular mention must be made of A. Naef, who subjected the living and fossil forms to a synthetic treatment. The monumental work by Robson on the octopods has been followed by a modern statistical treatment by Grace Pickford. W. Adam has cleared away much of the confusion in the cuttlefish. The systematic treatment of the cephalopods is now turning toward monographic studies and revisions, although many new species remain to be described. The study of the habits, ecology and bathymetric distribution of cephalopods are rewarding fields still awaiting investigation.

II. FORM AND FUNCTION

1. Body Plan. — The view has been widely accepted that in the Cephalopoda the surface of the foot has become very much shortened as compared with that of other mollusks. The length of the body has been reduced, while its height increased. This modification of what may be assumed to be the original molluscan plan is held to have been brought about by the foot shifting forward until it joined the head, the edges of the foot growing round and encircling the mouth. It will be seen in the section *Development* (below) that this process is actually indicated in the embryo, so that on this, as well as other grounds, the current view as to how the cephalopod organization mas attained may be regarded as substantially accurate. As to which surface of a cephalopod should be called anterior and which posterior: in most cephalopods, nith the major exception of the octopods (octopuses and nautiloids), the long axis of the body becomes horizontal, like that of a fish, and the anterior surface is more appropriately termed "upper" or "dorsal" and the posterior surface "under" or "ventral."

The viscera of a generalized cephalopod such as that illustrated in fig. 4 are covered by a dome-shaped or elongated sheath of skin, the mantle, which is in close contact with the body anteriorly. Ventrally the mantle is free and encloses the mantle cavity, the space into which the gills project and the excretory and reproductive systems open.

Before the visceral mass is the head-foot. on the ventral side of nhich is a muscular tube, the funnel. There are eight long, prehensile arms in octopuses and argonauts (order Octopoda) and ten in squids and cuttlefishes (order Decapoda). Many other

smaller cephalopods may have numerous small and comparatively weak appendages: *Nautilus* has about *90.* The circlet of arms encircles the mouth.

2. Relation to Life Habits. — The main divergences of structure are indicated in the section *Classification* (below); but, for the sake of rendering clear the importance of some of the details that follow, it is necessary to introduce two important facts: (1) Nautilus with its external, coiled shell represents a more

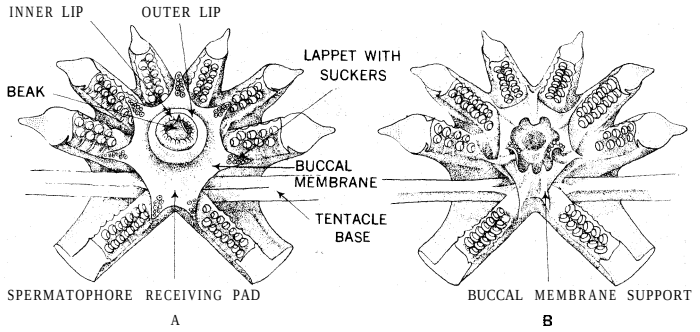
primitive and less specialized group, the subclass Tetrabranchia; and (2) the subclass Dibranchia (including octopuses, squids, etc.) have acquired a more active and vigorous mode of life that has led to certain marked departures in structure and function from the type represented by *Nautilus* and (it is assumed) the fossil ammonites. Among the Dibranchia themselves certain important habitudinal divergences are established, and hand in hand with these are associated certain structural and physiological adaptations. *e.g.,* to a sluggish life spent in the great depths of the sea, to a floating life in the mid-waters or to a more active and aggressive existence near the surface. The following account attempts to present the main structural and physiological features of the cephalopods in relation to their mode of life.

The fossil nautiloids and ammonites were in all probability mainly shallow-water animals living near the bottom. They relied for protection on a calcareous external shell and their speed of movement was probably inconsiderable. The modern *Nautilus* represents this mode of life very closely.

The Dibranchia are, on the whole, more active, and swimming or floating has become their characteristic mode of locomotion.

Associated with their active life, the dibranchians show the following features in their external organizations. The mantle, uhich in the majority of mollusks and in the Tetrabranchia has a passive role. merely containing the viscera and secreting the shell, has become involved in the mechanism of locomotion. It has almost entirely lost the rigid shell and has become highly muscular. Its expansion and contraction produce a locomotory water current by drawing water into the mantle cavity and expelling it through the funnel. The rapid ejection of this jet of water enables the animal to execute quick backward movements. A locking mechanism seals the mantle opening while the locomotory jet is under compression: a cartilaginous stud or ridge on each side of the edge of the mantle fits securely into a pair of corresponding sockets on the head.

The funnel, which in *Nautilus* is represented by two muscular folds that meet in the middle line, is, in the Dibranchia, completely fused forming a tube.



FROM A. NAEF, "FAUNA UND FLORA DES GOLFES VON NEAPEL (1923)

FIG. 6.—MOUTHFIELD OF A SQUID (LOLIGO VULGARIS) WITH OUTSPREAD ARM STUMPS: (A) BUCCAL MEMBRANE OUTSPREAD SHOWING SUCKERS ON LAPPETS; (B) BUCCAL MEMBRANE CLOSED SHOWING SUPPORTS

Additional locomotor appendages in the shape of fins are developed from the sides of the mantle. These may become very large and no doubt assist in balancing the animal.

The circumoral appendages, which are many and feebly developed in *Nautilus*, are fewer in number but larger and more muscular in the Dibranchia. These appendages are provided with suckers, which in the squids and other decapods are furnished with horny, often toothed rims. In certain dibranchians the teeth of the suckers are modified as large and formidable hooks. In the decapods two of the arms are specially modified as longer and more powerful tentacles used in the capture of prey.

3. Internal Supporting Structures and **Viscera.**—All the Cephalopoda have an internal cartilaginous covering of the main ganglia of the nervous system. In the Dibranchia this is more complete than it is in *Nautilus*. It encircles the ganglia and constitutes a kind of skull. Besides this structure various Dibranchia are secured by skeletal supports of the muscles that are found at the base of the fins and in the "neck," gills and arms.

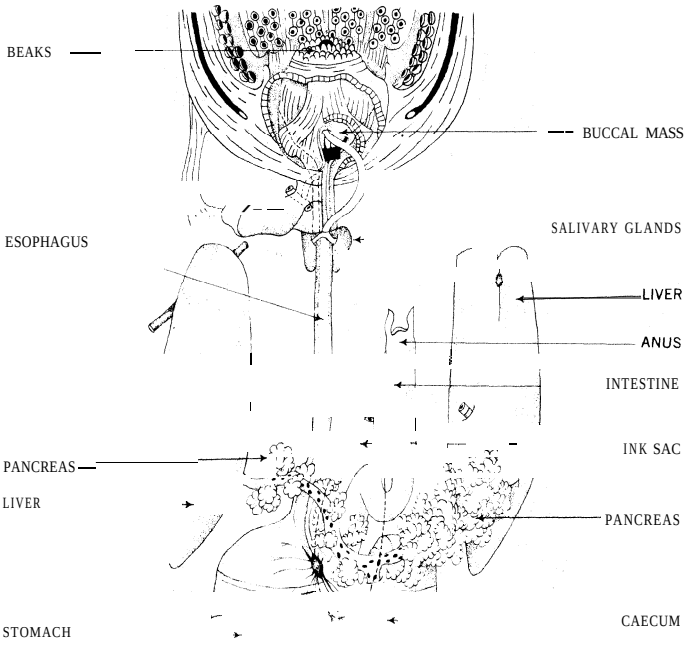
FIG. 7.—TENTACULAR CLUB OF A SQUID (GALITEUTHIS ARMATA)

The alimentary system of the Cephalopoda consists of a muscular buccal mass. furnished with a pair of jaws (mandibles) and a rasping tongue (radula); esophagus; salivary glands; stomach; caecum; liver; and intestine. Efficient mastication is secured by the powerful mandibles and sharp-pointed teeth of the radula. In the Octopoda the esophagus is expanded to form a crop. In the deep-sea Cirrata, which apparently feed on bottom debris, the radula is frequently degenerate or absent and there is a "second stomach," a capacious dilatation of the intestine. In the Dibranchia the pancreatic element of the liver is partly separated from the latter. Nearly all the members of this subclass have near the anus an intestinal pouch into which is secreted a dark fluid, the sepia, or ink. This ink can be forcibly discharged, the dark cloud thus formed in the water often serving as a means of escape from enemies (see *Distribution and Natural History*). This so-called ink sac is absent in *Nautilus* and in certain deep-sea Octopoda.

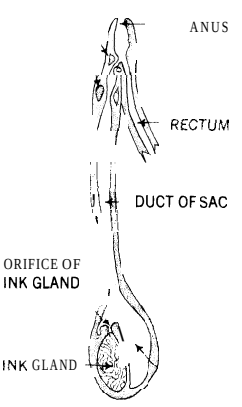
4. Circulatory and Respiratory Systems.—The Cephalopoda, in contrast to the other mollusks, possess a closed circulatory system of blood vessels, with the exception of *Nautilus* in which it is partly lacunar. The blood of cephalopods contains a blue respiratory pigment, hemocyanin, a copper compound dissolved in the plasma. The circulatory system has three hearts, one systemic and two branchial, one at the base of each gill. These modifications all are associated with the highly mobile and energetic life of the cephalopods in contrast to the sedentary habit of the rest of the mollusks. The mechanism of respiration is likewise more efficient in the Dibranchia, the rhythmical contractions and expansions of the mantle musculature causing a circulation of water over the gills. The featherlike gills, each consisting of a central axis with a row of lamellae on either side, are suspended freely in the mantle cavity. In the Decapoda the gill may possess as many as 40 lamellae per side; however, that number is reduced in the Octopoda, the common octopus possessing only 9–11



LIVERPOOL UNIVERSITY PRESS (AFTER D H TOMPSETT 1939)

FIG. 8 — DIGESTIVETRACT OF A CUTTLEFISH (SEPIA), PRINCIPAL ORGANS SPREAD APART

and abyssal forms (Cirroteuthidae) even fewer. Unlike other mollusks, the cephalopods do not respire through the mantle, only through the gills.



FROM CAMBRIDGE NATURAL HISTORY, VOL III MACMILLAN & CO LTD (1895)

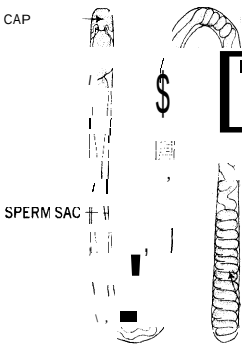
FIG. 9—INK SAC OF A CUTTLEFISH (SEPIA), SHOWING ITS RELATIONSHIP TO THE RECTUM

5. Excretion.—The excretion of nitrogenous waste is carried out exclusively by the kidneys; the liver, which in certain other mollusks has an excretory as well as digestive role, does not participate in this function. There are four kidneys in *Nautilus* and tno in the Dibranchia.

***6.* Nervous** System.—The central nervous system of the Cephalopoda is highly developed, the major ganglionic centres being concentrated in the head. This condensation of the central nervous system is found in *Nautilus* and perfected in certain Dibranchia. In some of the cuttlefish (Sepioidea) the cerebral centres are subdivided for specialization and the pedal ganglia are divided into brachial and epipodial elements which innervate the arms and funnel respectively. In certain Teuthoidea the mantle is innervated by giant paired dorsal axons, the largest nerve fibres known. Such axons are found in all of the

powerful swimming squids but are absent in feeble swimmers such as the giant squid, *Architeuthis*. The sense organs of the Cephalopoda are eyes, rhinophores (olfactory organs), statocysts (organs of equilibrium) and tactile organs. In *Nautilus* the eyes are open pits without lenses. In the Dibranchia the eyes are very complex and approach those of the vertebrates in efficiency.

7. Reproductive System.— The sexes are usually separate in the Cephalopoda, but G. E. Pickford has reported a case of hermaphroditism in a specimen of *Octopus vulgaris* from Trinidad. Sexual dimorphism is common but is usually expressed in slight differences of size and in the proportion of various parts. In some species there is a preponderance of males and in others a preponderance of females. In the paper nautilus *(see* NACTILUS) the males are much smaller than the females; they exhibit one of the greatest size discrepancies in the animal kingdom.



FROM "BULLETIN OF MARINE SCIENCE OF THE GULF AND CARIBBEAN," VOL I

FIG. 10.—SPERMATOPHORE STRUCTURE OF AN OCTOPUS (OCTOPUS BURRYI)

The female reproductive system is simple, consisting usually only of posterior gonads and paired oviducts.

In the males the system is complicated by a series of chambers or sacs along the course of the *vas deferens;* these sacs produce long tubes (spermatophores) to contain the spermatozoa, the final sac (Needham's organ) also being used for their storage. The spermatophores are complicated structures containing a sperm reservoir, mid-part, horn, cap and delicate triggering mechanism for the release of the spermatozoa. Since spermatophores vary from species to species they are important taxonomic characters.

During courtships (see *Reproduction and Development)* the spermatophores are deposited on the female either within the mantle cavity or on a pad below the mouth by means of a specially modified arm termed the hectocotylus. The hectocotylized arm in *Octopus* bears a spoonlike terminal organ. In the Teuthoidea a much larger section of the arm may be modified; often the suckers are degenerate and the distal half of the arm bears rows of long slender papillae, although special pouches and large flaps may often be found. The modified arm of *Nautilus* is termed the spadix. G. C. Robson suggested that the modifications of the arm in the Teuthoidea may serve in exciting the female and termed it the nuptial arm.

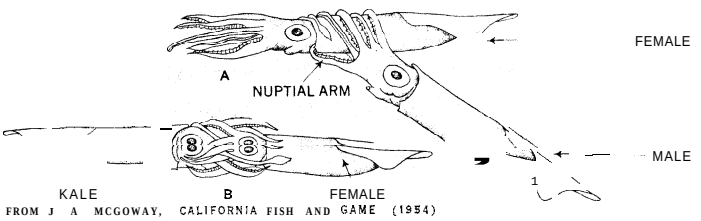
III. REPRODUCTION AND DEVELOPMENT

1. Mating and Spawning.— Little is known about the mating habits of cephalopods. E. Racovitza has described in general outline the mating behaviour of the common octopus. The male and female remained some distance apart while the male first caressed the female with the tip of the hectocotylized arm. The male then inserted the tip of his arm into the mantle cavity of the female, remaining for over an hour, during which time the sperm bundles traveled down the longitudinal groove of the arm. In the cuttlefish> according to L. Tinbergen, the pair of *Sepia* swim side by side. the male indulging in some "love play" with his arms. Eventually, mating takes place by the pair intertwining their arms and remaining together while the spermatophores are placed on the inner side of the female's mouth membrane. **A** somewhat similar type of mating has been shown for the Pacific coast squid, *Loligo opalascens,* which however do not pair off. In octopuses and cuttlefishes the life span is not known but it probably includes several spawning seasons. In the smaller squids such as *Loligo,* however, the males usually die after mating and the females after spawning.

The eggs of most coastal species are laid inshore and are attached singly or in clusters to floating material, or more frequently to bottom objects, coral fragments, algae, etc. Practically nothing is known about the spawn or spawning of the oceanic squids, but G. Pickford has found eggs of the Vampyromorpha and has correlated their vertical distribution with water density. Parental care is exhibited only by octopuses in which the female broods over the eggs. In all the others known, with the exception of *Argonautn,* which broods its eggs in her egg-case shell, the eggs are left to the mercy of predators. Those squids that attach their eggs to the bottom engulf them in a gelatinous mass that protects them from fungus attack and at the same time deters such predators as fish.

2. Development.— The embryological development of *Nautilus,* unfortunately not yet known, may hold clues to the phylogeny of the cephalopods. The eggs of all cephalopods are provided with



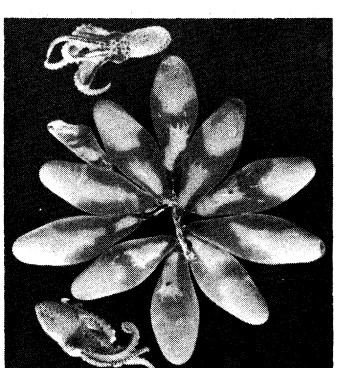
FROM J. A. MCGOWAY, CALIFORNIA FISH AND GAME (1954)

FIG. 12.— COPULATING SQUID (LOLIGO VULGARIS): (A) POSITION WHEN SPERMATOPHORES ARE TRANSFERRED TO MANTLE CAVITY: (B) POSITION WHEN SPERMATOPHORES ARE TRANSFERRED TO BUCCAL SPERM RECEPTACLE

a remarkable amount of yolk so that, unlike that of the rest of the Mollusca, the segmentation is incomplete and restricted to one end of the egg. The embryo is likewise iocaiized at this end. and the ectoderm appears stretched out over a large mass of yolk. Later on, a sheet of cells is developed below the ectoderm, commencing from that edge of the ectoderm at which the anus is subsequently developed; after this, cells migrating inward from the ectoderm give rise to the mesendoderm.

The mouth in the early stage of development is not surrounded by the arm rudiments. The latter arise as outgrowths of the lateral and posterior edges of the primordial embryonic area. These outgrowths pass forward during later development until they reach and encircle the mouth. The funnel arises as a paired outgrowth of the same area, a condition that is retained in the adult *Nautilus;* however, in the Dibranchia the two portions fuse together in the median line. The further development of the Cephalopoda varies somewhat after the germ layers have been developed, depending on whether there is a yolk-sac or not.

The embryo of *Sepia, Loligo* and *Octopus* is provided with a yolk-sac that may become partly internal. In certain Decapoda presumed to be archaic there is less yolk, and the yolk-sac is practically absent ("oigopsid embryo" of Grenacher). Nevertheless. although the latter mode of development may be regarded as less specialized than that of the heavily yolked egg. *e.g.,* of *Sepia,* there is no certain indication in the development of any known cephalopod of those larval phases



BY COURTESY OF GENERAL BIOLOGICAL SUPPLY HOUSE, INC

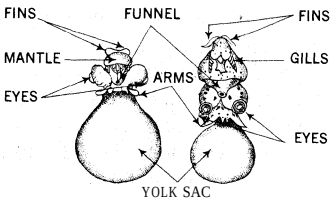
that characterize the development of other Mollusca. The embryological history of the members of the Cephalopoda reveals as much specialization and differentiation from the more primitive molluscan type of development as does the structure of the adult.



FROM "CAMBRIDGE NATURAL HISTORY," VOL. III, MACMILLAN & CO., LTD. (1895)

FIG. 14.—TWO STAGES IN DEVELOPMENT OF EMBRYO OF A SQUID (LOLIGO VULGARIS): (LEFT) EARLY: (RIGHT) MORE ADVANCED

At hatching from the egg, the animal may closely resemble the adult and take up its definitive habitat or it may go through a larval stage, differing widely from the adult, and spend a considerable time in the plankton as part of the drifting life of the sea. In those octopods with small eggs *(Octopus vulgaris)* the larvae are planktonic, spending upwards of several weeks in the plankton, and the *Macrotritopus* stage of *Scaeurgus* may greatly prolong its larval life until a favourable bottom is found. In those octopods with large eggs *(Octopus briareus)* the young resemble the adult and immediately assume a bottom life.

In the Sepioidea the young closely resemble the adults and spend only a short interval in the passive stage. In the Teuthoidea, however, especially among the Oegopsida, the larvae differ widely from the adult, *e.g.,* the *Rhynchoteuthis* stage of the ommastrephids, the *Doratopsis* stage of *Chiroteuthis,* etc.

IV. PHYLOGENY AND EVOLUTION

1. Nautiloids and **Ammonoids.**—The evolutionary history of the Cephalopoda is complicated by the lack of fossil records of the soft parts. It is assumed—based upon the soft parts of *Nautilus,* the oldest surviving cephalopod—that the Nautiloidea and Ammonoidea shared in the possession of four gills and other anatomical structures. Similarly, knowledge of the evolution of the Octopoda suffers from lack of verifiable fossil remains.

The Nautiloidea, as represented by *Nautilus,* have coiled, chambered shells with a median tube or siphuncle, smooth septa, simple sutures and simple external sculpture. The earliest forms are from the Upper Cambrian.

In *Orthoceras* is found the unmistakable chambered shell and median siphuncle of the nautiloid. The shell, however, is straight, not coiled. Later the shell becomes coiled like that of the true *Nautilus* whose ancestors are found in Triassic rocks. Modern *Nautilus* did not actually appear until the Early Tertiary.

From this brief sketch, and assuming that the Mollusca are a homogeneous group, it seems reasonable to suppose that the primitive Mollusca from which the Cephalopoda sprang were provided with a simple, caplike shell not unlike that of a limpet and perhaps similar to the primitive deep-sea gastropod *Neopilina.* With elongation of the shell (by additional shell being secreted around the rim) and the formation of septa or partitions, the primitive nautiloid shell could be formed. The elongate shell of *Orthoceras* would no doubt become unmanageable and coiling would result as in the Gastropoda.

The second order of Tetrabranchia. the Ammonoidea, are ranked as tetrabranches from shell characters, but their anatomy is unknown. In contrast to the nautiloids they have a marginal siphon, a persistent embryonic whorl (protoconch) at the apex of the shell, wrinkled septa and complex sutures and external sculpture. They also have a tendency toward uncoiling. Ammonites are customarily derived from Devonian forms with straight shells such as *Bactrites,* which itself has certain nautiloid traits. Coiled ammonites appear in the Upper Devonian (*Goniatites*), and thereafter follow a great variety of forms. The ammonites became extinct in the Cretaceous after having become the largest class of the Cephalopoda.

FIG. 16.—PARTIALLY COILED CRETACEOUS AMMONITES (ABOUT ¾ NATURAL SIZE). (TOP) CRIOCERAS EMERICIANUM; (BOTTOM) HETEROCERAS EMERICIANUM

2. Modern **Cephalopods.**—The history of the dibranchiate Cephalopoda is dominated by one main evolutionary theme. Modern squids, cuttlefishes and octopods are distinguished from the nautiloid and ammonoid forms by the possession of an internal and partly degenerate shell that is straight except in *Spirula,* which has a coiled and wholly internal shell. The position and state of the shell in the Dibranchia is due to the progressive overgrowth of the shell by the mantle and the formation round the shell of a secondary sheath, the various parts of which eventually become larger than the shell itself. The loss of the true shell probably occurred uith the change to an active swimming life during uhich period stronger pallial muscles developed. This change also resulted in the shift in position of the shell for stability of the animal in a horizontal swimming position.

There is no direct evidence of forms connecting the Tetrabranchia with the Dibranchia, but A. Naef cites certain orthoceratoid nautiloids that approach the oldest Dibranchia.

It is not until Triassic times that one hnds in *Aulacoceras* unmistakable evidence of the modification of the shell. This tendency is seen at its best in the belemnites. The modification consists primarily in the apex of the shell (phragmocone) being enclosed in an external calcified sheath, the guard, and in the development of an accessory plate, the pro-ostracum, at the anterior end of the shell. The animals possessing these features, and having an ink sac and hooks on their suckers, were undoubtedly dibranchiates. Through various lines of descent. mostly shown by modification of the shell, the belernnites pave rise to *Spirula* (aith a coiled shell); cuttlefish (with calcified phragmoconal septa forming a thick shell). and the Teuthoidea (with loss of phragmocone and guard and the persistence of the pro-ostracum as a horny "pen"). These forms appeared in

the Jurassic and are probably derived from belemnitelike ancestors. Of living Teuthoidea *Ommastrephes* preserves a trace of the phragmocone.

The shell is greatly reduced in the Octopoda, persisting only as fine cartilaginous stylets or as somewhat better-developed fin supports (in Cirrata), both of which are usually regarded as vestiges of the shell. There is little knowledge of the ancestry of the group. The Vampyromorpha are considered by some to be a possible connecting link between the squids and the Octopoda. *Palaeoctopus newboldi,* from the Cretaceous of Syria. affords no clue to the early stages of the ancestry of the Octopoda. Of the modern forms the Cirrata (*Cirroteuthis*), despite much specialization in relation to the abyssal habitat, are an older group than the true octopods (*Octopus, Eledone* and the Argonautidae).

V. CLASSIFICATION

Little progress was made in the higher classification of the cephalopods from the time of d'Orbigny (1838) until the German school. under the influence of A. Naef and G. Grimpe, brought about a revised classification firmly based upon comparative anatomy and embryology. The classic system is given in the table on the left and that of Grimpe (1922) on the right.

Class. Cephalopoda	Class. Cephalopoda
Subclass 1. Tetrabranchia	Subclass 1. Protocephalopoda
Order 1. Nautiloidea	Order 1. Nautiloidea
Order 2 Ammonoidea	Order 2. Ammonoidea
Subclass 2. Dibranchia	Subclass 2. Metacephalopoda
Order 1. Decapoda	Order 1. Octopoda
Suborder 1. Myopsida	Suborder 1. Cirrata
Suborder 2. Oegopsida	Suborder 2. Palaeoctopoda
Order 2. Octopoda	Suborder 3. Incirrata
Suborder 1. Cirrata	Order 2. Decapoda
Suborder 2. Incirrata	Suborder 1. Sepioidea
	Suborder 2. Teuthoidea
	Suborder 3. Belemnoidea

In 1940, Pickford proposed a new order of cephalopods, Vampyromorpha, for the archaic but living deep-sea *Vampyroteuthis infernalis.* This order is thought by some to represent a link between the Decapoda and the Octopoda. A somewhat different classification incorporating the new order is given below. This scheme is apparently preferred by the paleontologists and is accepted by most neontologists (taxonomists of recent organisms).

Class. Cephalopoda
- Subclass 1. hTautiloi&a
- Subclass 2. Ammonoidea
- Subclass 3. Coleoidea
  - Order 1. Belemnoidea
  - Order 2. Sepioidea
  - Order 3. Teuthoidea
    - Suborder 1. Myopsida
    - Suborder 2. Oegopsida
  - Order 4. Vampyromorpha
  - Order 5. Octopoda
    - Suborder 1. Palaeoctopoda
    - Suborder 2. Cirrata
    - Suborder 3. Incirrata

While in both Grimpe's classification and the one shown directly above, the terms Tetrabranchia (nautiloids and ammonoids) and Dibranchia (all living Cephalopoda except *Nautilus)* are abandoned, the names are still conveniently used in general discussions of cephalopod groups. It is presumed that *Nautilus,* with four gills and four kidneys and a lacunar circulatory system, is the most primitive form. Since the fossil nautiloids and ammonoids are known only from their shells, it is unsafe to assume a similar anatomy, such as four gills, etc., although the living and fossil nautiloids and ammonoids undoubtedly represent natural units.

The classification of the Dibranchia proposed by Naef and Grimpe involves a more fundamental change. The primary division into Octopoda and Decapoda follows traditional lines, but it still places too high an emphasis upon the Octopoda as a major group, while lessening the importance of the Sepioidea and the Belemnoidea. The essential relationship of these groups is better shown by placing them as orders under the subclass Coleoidea. The division of the living Decapoda into Sepioidea and Teuthoidea cuts across the heterogeneous Myopsida, dividing them into two unequal but more homogeneous groups.

In the new classification the Myopsida, retained as a suborder under the Teuthoidea, contain the Loliginidae and the new family Pickfordiateuthidae as well as the problematical family Promachoteuthidae. The large families Sepiidae and Sepiolidae, as well as the Sepiadariidae, Idiosepiidae and Spirulidae, form the order Sepioidea. Some authorities may argue that the Sepiidae are more closely related to the Loliginidae than to *Spirula* with its wholly internal coiled shell, but C. Chun has advanced convincing arguments for the relationship of *Spirula* with the Sepiidae. The classification is still probably imperfect, and more information is needed from the fields of anatomy and embryology before a more definitive scheme is evolved.

CEPHALOTAXACEAE, an old world family of shrubs or small trees in the order Coniferales of the gymnosperms. There are two genera: *Cephalotaxus,* the plum yew, which occurs in Japan, China and India; and *Amentotaxus,* of western China. Two of the five or more species of *Cephalotaxus* are sometimes cultivated as specimen plantings or for hedges, and a fatty oil is reportedly obtained from the seeds of C. *drupacea.* The plants have leaves generally similar to those of the yew, but larger and with a sharper point at the tip. In the Cephalotaxaceae the staminate, or pollen-bearing, cones are in clusters on short axillary peduncles. The cones have about 12 scales, each of which usually bears three pollen sacs. The ovulate, or seed-bearing cones, are rather specialized. They are borne on short peduncles and are composed of several opposite pairs of cup-shaped bracts, each with two erect ovules. Ordinarily only one ovule enlarges to form a large. olivelike, fleshy seed.

Embryogeny in the Cephalotaxaceae is relatively advanced. Only simple polyembryony occurs, but this appears to be a derived condition. The mature embryo has two cotyledons. The Cephalotaxaceae appear to be related to the Taxaceae, but the resemblances may be superficial, since the latter are basically different from the Coniferales. (R. W. H.; X.)

CEPHALUS, the legendary ancestor of an Attic family, was traditionally a great hunter, and his legends are connected with this idea. He was beloved by the Dawn (Aurora or Eos), who carried him off for a time, as she did other great hunters. With his hound Laelaps (Hurricane), he overcame the vixen of Teumessus, which ravaged Boeotia. The vixen was magically incapable of being caught and the hound of failing to catch his prey; Zeus solved the impasse by turning both to stone. But the most popular tale about Cephalus in later Greek and Roman literature concerned his wife Procris. Cephalus' devotion to hunting aroused in her jealous suspicions that he went out to meet a rival. She followed him, and when he called on a cloud or a breeze to cool him, she, thinking that this was the name of his mistress, emerged from a thicket and was fatally struck by her husband who mistook her for his prey. Some versions add such fanciful details as that his spear was magically incapable of missing its mark. Later legends by false etymology made Cephalus the founder of the Ionian island community of Cephalonia and linked him with the ancestry of Odysseus. (H. W. PA.)

CEPHEUS, in Greek mythology, the father of Andromeda (*q.v.*); in astronomy, a constellation of the northern hemisphere. The class of stars known as Cepheid variables gets its name from δ Cephei, a typical example (*see* STAR). This star was discovered by J. Goodricke in 1785. The period is 5.37 days and the range of magnitude is from 3.6 to 4.2. The star β Cephei is also a famous Cepheid variable; although its range of brightness is only 0.05 mag., its variability was detected by Paul Guthnick of Berlin university by photoelectric measurements.

CEPHISBDOTUS, the name of two Greek sculptors, one a son and the other a near relative of Praxiteles. The latter must have flourished about 400 B.C. A noted work of his was Peace bearing the infant Wealth, of which a copy exists at Munich. Peace is a Madonnalike figure of a somewhat conservative type. He made certain statues for the city of Megalopolis, founded in 370 B.C. Of the work of the younger Cephisodotus there are no remains; he flourished in the latter part of the 4th century B.C., and was noted for portraits of Menander, of the orator Lycurgus and others.

CER, the Greek name for a destructive spirit. Popular belief attributed death and illness to the action of these impersonal powers, often spoken of in the plural (Ceres). The word is also used of an individual's doom, with a meaning resembling the notion of destiny. In Greek art the Ceres are perhaps the small winged figures often associated with scenes of battle and death, though they can rarely be identified with certainty. In literature they are often described as black and occasionally as possessing fangs and claws. In the Attic festival of the Anthesteria, the spirits of the dead, when they were expelled from the house, were addressed as Ceres, whence some scholars suppose that this was the original meaning of the word. (H. W. PA.)

CERACCHI, GIUSEPPE (1751–1802), Italian sculptor, whose works are representative of the neoclassic manner, was born on July 4, 1751, either in Rome or in Corsica. After receiving a prize from the Academy of St. Luke (1771) he went to England where he soon secured numerous commissions and, among other things, executed bas-reliefs for the Adams brothers. He became the teacher of the celebrated amateur sculptor Anne Seymour Damer and perhaps his name is now chiefly remembered for his statue of her as the muse of sculpture (British museum). He also designed Lord Chatham's monument in St. Paul's cathedral, London. The only known bust of Sir Joshua Reynolds is by Ceracchi. He went to America, where he did a bust of Washington, but, disappointed in his expectations there, returned to Europe. In 1801 he was implicated in a plot on the life of Napoleon and was executed in Paris on Jan. 30, 1802. It is said that he went to the guillotine in a car of his own design. (A. K. McC.)

CERAM (SERAM, SERAN), an island, 216 mi. long, in the Moluccas group, Indonesia, lies 3° S. and between 127° 45' and 131° E. It is due east of Buru, from which it is divided by the Manipa or Buru strait, in which are the islands of Manipa, Kelang and Boano. Pop. (1957 est.) 96,797. Area (with adjacent islands) 7,191 sq.mi. The island, which geologically is composed mostly of eruptive rocks and crystalline schists in the middle and western portions and of crystalline chalk in the east, is very mountainous. a fine range of mountains traversing it from east to west. The highest peak is Binaija (6,798 ft.) in the central part, and four others exceed 6,000 ft. In some places the mountains extend right to the coast bounding the many bays; in others wide stretches of lowland are sometimes fringed with swamps by the seashore.

There are many rivers, running mostly to the north; they are partly navigable for small craft only during the rainy season and often dry up altogether during the period of drought. Comparatively little is known of the interior of the island. With Ceram are included Ceram-Laut, a cluster of islands on a coral reef about 20 mi. long, Geser and Kilwaru, the Gorong (or Goram) Islands (Suruaki, Gorong and Manawoka), the Watubela group and the Tioor Isles, all of which lie southeast of Ceram. The larger islands are of Tertiary (Miocene) formation, and the others of Recent coral. None has hills of over 1,000 ft. and most are thickly wooded, while Suruaki has extensive swamps. Many of the Watubela Islands have rugged hills covered with coconut palms, and some of the Tioor group are entirely waterless as a result of the nature of their coral rock.

Ceram is covered with dense tropical forests which provide excellent timber (ironwood is general) and yield a variety of forest products, including cajuput oil, dammar and wild nutmeg. In the swamps of the coast and valleys the sago palm thrives. Both the flora and the fauna of the island lack variety and characteristic specimens. The cassowary is the outstanding feature of the fauna, which includes deer, cuscus, pig, shrews, cockatoos, lories, hornbills and birds of paradise, and there are many species of fish in the rivers. The climate is hot and moist, the rainfall being heavy, and earthquakes occur.

The people of the interior are of a mixed Malay-Papuan stock. They are largely pagan in religion, wear little in the way of clothing, live in houses built on piles and use as weapons the bow and

arrow, parang and lance. They have a patriarchal social system and a form of marriage sometimes endogamic, sometimes exogamic. Women have a good position among them and are well treated. Ceramese, a language without either script or literature (although there are traditional songs which have been handed down orally), is divided into 35 different dialects and is closely related to the indigenous language of Amboina. Malay is used commonly on the coasts. Weaving is known in some parts, and weapons and plaited goods are manufactured. China plates and dishes are considered objects of the highest value and long ceremonial feasts are characteristic. The Ceramese are a strong and muscular people and extremely independent. The inhabitants of the middle and east were far more peaceful in their ways than those of the west. who were fierce head-hunters. However, modern civilization has affected all the groups as a result of increasing trade facilities and the provision of schools in many districts. Along the coast are Muslim and Christian settlements.

Fishing, hunting and the production of sago flour from wild trees are the chief means of existence for the tribes of the interior. The coastal inhabitants grow some rice, maize and root crops, but they, too, have sago as their staple food. They export copra, cajuput oil and some other forest products. There are a few tobacco and coffee plantations. Near Bula bay (east coast) is a small petroleum field. Amanhai, in the south (centre), has a good harbour. Other ports of call are Piru (west), Wahai (north), Tehoru (south) and Bula (east). Roads are nonexistent. There is an airfield at Bula.

In the mid-17th century a fort established at Cambello extended Dutch influence, with help from Ternate, which claimed suzerainty. The power of Amboina later helped the Dutch acquire the whole island, although there was some resistance when they destroyed clove plantations in order to uphold Amboina's monopoly. Expeditions were made against the interior, but the island was quiet after 1910. During World War II Ceram was occupied by the Japanese. In 1950 the Christians joined in the abortive secession attempt of the South Moluccan republic *(see* AMBOINA). Guerrilla warfare continued in some areas of the island. (J. O. M. B.)

CERAMICS: *see* POTTERY AND PORCELAIN.

CERARGYRITE (HORN SILVER), the name usually applied by mineralogists to naturally occurring silver chloride, though sometimes taken to include the bromide and iodide as well, or mixtures of them. Cerargyrite is an important ore of silver, occurring in considerable quantity in the oxidation zone of silver lodes in dry climates, such as Chile, Peru, and Broken Hill in New South Wales, where the surface waters are rich in chlorides, bromides and iodides; it is also found widely in the western mining districts of the United States. It usually forms hornlike masses; it is very soft, being easily cut with a knife. and generally of a dirty gray or yellowish colour. Crystals, though rarely found, usually are cubic. (R. H. RA.)

CERATOSTIGMA, a genus of hardy perennial herbs or shrubs called leadwort, belonging to the Plumbaginaceae family and native to Ethiopia, China and the Himalayas. It is related to *Plumbago* but differs in having flowers in dense clusters rather than in spikes and in other technical characteristics. The only species of note is *Ceratostigma plumbaginoides (Plumbago larperttae),* a hardy bedding plant 10 to 12 in. high, producing its deep-blue flowers late in the fall. It will thrive in any fairly good garden soil in a sunny, sheltered location, and may be propagated by root division. In cold regions this plant needs protection during winter. (R. T. V. T.)

CERBERUS, in Greek mythology, the dog who guarded the entrance to the lower world. According to Hesiod in his *Theogony,* Cerberus was a 50-headed monster, the offspring of Typhon and Echidna. He was variously represented with one, two or (usually) three heads. often mith the tail of a snake or mith snakes growing from his head or twined round his body. One of the tasks imposed upon Hercules was to fetch Cerberus from below to the upper world, a favourite subject of ancient vase paintings.

CERCIDAS (3rd century B.C.) of Megalopolis. Greek poet, philosopher and politician, who wrote satiric poems in the cynic tradition. A family friend and political supporter of Aratus of Sicyon, leader of the Achaean league, he secured the support of Antigonus Doson for the league against Cleomenes III of Sparta and the Aetolians. He commanded 1,000 Megalopolitans at the battle of Sellasia (c. 222 B.C.) when Cleomenes was finally defeated, and he may have been responsible for the new constitution adopted at Megalopolis in 211 B.C. Only a few quotations from his verses were known until 1911 when parts of a number of new poems were published from papyri found at Oxyrhynchus. These are meliambic, *i.e.,* lyrical in form and metre but satiric in content. and the language is a literary Doric. Cercidas delivers bitter attacks on the wealthy classes and seems to contemplate the redistribution of their wealth to the poor. Yet he had also led the opposition to Cleomenes, the champion of radical social reform in the Peloponnese, and he may have wanted moderate reforms. His satirical comments on social customs may have influenced Lucilius and Horace, but his poems are fragmentary and difficult to interpret.

Knox, *Herodes, Cercidns and the Greek Choliambic Poets* (1929). *See* also J. U. Powell and E. A. Barber (eds.), *New Chapters in the History of Greek Literature* (1921); D. R. Dudley, *History of Cynicism* (1937). (G. B. KD)

CERCIDIPHYLLUM, a genus of plant!: of the Cercidiphyllaceae family. The only member of the genus (and of the family) is *C. japonicum,* the katsura tree, native to Japan. It is a hardy, ornamental, shrubby tree of pyramidal habit, almost columnar when young, with handsome light green foliage, purplish when unfolding and turning bright yellow or partially scarlet in autumn. Commonly there are several trunks, usually 20–30 ft. in height, but sometimes attaining 100 ft.

C. japonicum var. *sinense,* from western China, usually consists of a single trunk which may exceed 100 ft. It is the largest of all broad-leaved trees known from China; the trunk is often free of branches for nearly 50 ft. above the ground and may attain a girth of 25 ft. or even more. (J. M. BL.; X.)

CERDIC (d. 534), founder of the West Saxon kingdom, is said to have landed at Cerdicesora in 494 or 495. One tradition dates his conquest of Wessex in 500, another in 519. The Anglo-Saxon Chronicle associates his son Cynric with him, and says they captured the Isle of Wight in 530, giving it later to their kinsmen Stuf and Wihtgar. However, the oldest versions of the West Saxon genealogies show that Cynric mas Cerdic's grandson, and too much reliance should not be placed in the annals of this early period. The chronicle enters his death in 534. Later Saxon kings derived their right to rule through descent from him. Some scholars consider that his name is Celtic.

CEREALS. Cereals, or grains, are members of the grass family that are cultivated primarily for their starchy seeds (technically, dry fruits), nhich are used for human food, feed for livestock, and as a source of industrial starch. Wheat, rice, maize (called corn in the U.S.), rye, oats, barley, sorghum and some of the millets are the common cereals.

Cereals were among the first plants to be domesticated, having been grown long before the beginning of recorded history. Each of the world's great civilizations has depended upon cereals as a major source of food. When ancient man learned to grow cereals he was able to produce more than enough food for his own immediate needs, thus making possible settled communities and the development of the arts and sciences that distinguish civilized man from the savage. Grain storehouses have been found in many excavated ruins: wheat and barley storehouses in Mesopotamia, Egypt, Greece and Italy, and storage places for maize in the ruins and caves of the Mayas, Aztecs, Incas and other peoples of the western hemisphere.

Wheat. rice and rye are gronn primarily for consumption as human food. while much of the maize. barley, oats and sorghum grown in North America. Europe and Australia is fed to livestock to produce meat, dairy and poultry products. Countries that have

an inadequate supply of all kinds of starchy foods generally consume large quantities of cereal foods, while some other countries with adequate starch supplies convert a larger portion into animal products. Large quantities are shipped from countries having a surplus into areas not producing enough to meet their needs. They are inexpensive foods and can be handled and shipped in bulk without loss or deterioration in quality. Increasing quantities of maize and sorghum are being utilized industrially in surplus-producing countries such as the U.S. A few of the more important products are starches, dextrose, sirups, pastes, edible oils and industrial alcohols.

Types.—Wheat has been an important cultivated crop since prehistoric times. Many scientists believe it originated in southwestern Asia. Varieties now being grown probably are the results of complex hybridization in nature among at least three wild species. Wheat is adapted to a wide range of climatic conditions. with important acreages being grown in over 50 countries. It does best in temperate regions where annual rainfall is between 13 and 35 in. and where there are cool, dry seasons. In some semiarid areas wheat is grown in alternate years, utilizing water accumulated by keeping the soil bare during the year of no crop. Shortage of water limits the yield on much of the wheatland of the world. although warm, dry weather is desirable during the ripening period. High rainfall at this period delays ripening, damages the straw and interferes with harvesting operations. Heavy rainfall also favours the development of wheat diseases and may cause nutrients to be leached from the soil.

Rye is botanically related to wheat and barley, all belonging to the tribe Hordeae. It probably was cultivated first in Turkestan after having grown as a weed for many years in barley and wheat fields. It was unknown during the ancient Egyptian and Greek civilizations. Rye is the most productive grain on poor soils and will survive more severe winters than other cereals. It is the main food grain in parts of Europe and Asia.

Barley is a crop of ancient origin, having been cultivated by Swiss lake dnellers in the Stone Age. It is one of the most widely adapted crops, being produced in temperate regions throughout the world. It is used for livestock feed and malt production and to a lesser extent for human food.

Oats are believed to have been cultivated first in western Europe during the Iron and Bronze Ages. Now they are grown in temperate regions, especially the corn belt of the U.S. and in Canada and northern Europe. Some varieties are adapted to warmer climates, such as those of the Mediterranean regions.

Rice is believed to have originated in the orient more than 5,000 years ago. It is the principal cereal grown for food in the tropics and warmer. humid parts of the temperate zone. Rice requires a large amount of moisture for its growth, and most of it is cultivated with four to eight inches of water on the land. It is the major food crop for about half the people of the world. It responds with high yields to the intensive cultivation practised in the orient, where about 95% of the world crop is produced.

Maize originated in the western hemisphere and was introduced into Europe and Asia by the early explorers. It is a highly domesticated crop that has been cultivated for 5,000 years or longer. Because of its great diversity of types, maize can adapt to environmental conditions ranging from sea level to 10,000-ft. altitudes and from the tropics to latitudes throughout the temperate zones. The development of hybrid maize has greatly improved the crop and given impetus to production in many parts of the world. It is the highest yielding grain crop.

Sorghum is an important grain crop that probably originated in tropical Africa. Its growth requirements and uses are similar to those for maize but its tolerance to heat and drought permits it to be grown in areas where maize is not a successful crop.

Production. — Cereal production is highly mechanized in many of the major producing areas; thus a small proportion of the population provides the world supply. Surplus-producing areas in Canada, the U.S , Australia, Argentina and the Ukraine of the U.S.S.R. ship large quantities to industrialized and densely populated areas.

The cereals are attacked by many diseases and insect pests and are subject to damage by drought, heat, cold and other adverse conditions. Scientific research since about 1900 has contributed much toward overcoming these hazards and increasing and stabilizing production. Plant breeders have produced varieties that resist many diseases and insect pests, are better adapted to growing conditions, are suited for mechanized production, and possess qualities that increase their value to consumers. Entomologists, plant pathologists and chemists have developed pesticides and other means for pest and disease control. Agronomists have devised fertilization and cultural practices that give higher yields per acre. (L. **A.** TA.)

CEREALS IN THE DIET

Nutritional Values. — The dietary properties of the entire seed of wheat, rice, barley, rye, maize, oats and millet resemble each other in most respects. They are all deficient in calcium and vitamin A (except yellow maize), and the biological value of their protein moiety is lower than that of the proteins of milk. meats and eggs. When any one of these cereals is supplemented with calcium, vitamin A and a source of proteins of animal origin, it is rendered nutritionally more complete.

Under the chronic conditions of scarcity of foods that prevailed generally in most parts of the world before the invention of modern farm machinery from 1840 on, cereals remained the most important food crop, although the yields were low because of inferiority of varieties and poor cultivation technique. With the development of modern machinery and improved varieties, wheat production has been enormously increased. The price range of cereal products is small compared with prices of foods such as meats, milk. eggs, fruits and vegetables other than the potato. Bread grains and potatoes are the cheapest foods. Whenever economic conditions lower the incomes of families or increase the cost of foods, the tendency has been for people to subsist more largely on bread and potatoes. Since the potato is not constituted so as to supply the essential food elements missing in cereals, such diets are nutritionally inadequate.

Improvements in Flour. — An especially important factor for nutritional considerations in connection with the milling of white flour (as opposed to whole meal) is the removal of the germ and the outer layers of the wheat, which are, with the exception of the outermost or bran layer, the most nutritious parts of the grain. Removal of the outer parts of the wheat grain is facilitated by the use of the roller mill, which, toward the end of the 19th century, superseded the millstones of ancient times as a machine for milling. The fat present in whole meal may become rancid on long storage, but there is only about half as much fat in white flour as there is in whole meal. Modern white flour contains only the protein moiety of the grain that has the lowest nutritive value. In addition, a large proportion of the vitamins and mineral elements are milled out and go into stock feed. Modern white flour is milled to satisfy public taste; experience has shown that demand for brown or whole meal bread does not much exceed 5%, even when attempts are made to publicize its merits. Because of the spoilage problems connected with marketing a more highly nutritious flour for bread-making, it is clear that there is much to justify modern milling processes from the economic point of view. As a World War II measure Canada introduced a long extraction wheat flour known as Canada Approved flour, which represented about 85% of the wheat berry as compared with ordinary flour, which retains only the least nutritious 70% of the wheat. Later, Great Britain adopted the practice of manufacturing a similar flour. Such flour is superior to ordinary white flour in nutritive value, being superior in vitamin and mineral nutrient values and in the quality of its proteins. In the interest of health it would be advisable to adopt such flour to the maximum extent to which commercial transport and storage of flour permit.

Improved Bread. — The practice of improving the quality of commercially baked bread by the use of nonfat milk solids instead of water in preparing the bread mix became general in the Cnited States after World War I. As much as 6% of nonfat milk solids in bread greatly improves the nutritive value of the loaf by compensating for all of the nutritive deficiencies of white flour except

Iron. Four to six per cent milk bread becomes stale less rapidly than does bread made without milk, crumbs less on cutting. and otherwise makes a highly desirable bread. This method of improving bread has become popular with bakers.

Following the development of synthetic production of several of the vitamins and consequent lowering of their cost, the British government in 1935 ordered that white flour should be enriched with vitamin B (thiamin), niacin and iron to certain nutrient levels, and with creta praeparata (calcium carbonate). In the United States, enrichment with thiamin, niacin, riboflavin and iron has become general, with calcium and phosphorus additions optional. While it is true that such enrichment of a white flour bread may safeguard the health of people whose diets are of low quality, it is not clear that it is a wise policy to pay for the inclusion of the vitamins and iron in diets of good to high quality, which, there are good reasons for believing, represent those of a large majority of the people in areas where enriched bread is manufactured. An excess of vitamins has not been shown to be of benefit.

It is a wise policy to promote the manufacture of bread of the highest possible nutritive value. It would seem desirable nutritionally to include small percentages of wheat germ, corn (maize) germ. dried brewers' yeast, rice polishings, as well as the maximum amount of nonfat milk solids, in commercial bread. Such a policy would go far toward justifying the milling of highly refined flour of good keeping quality. At the same time the nutritionally superior parts of the grain that have hitherto been used largely for animal feeding would be used to improve human nutrition. For homemade bread see FOOD PREPARATION.

Nonwheat Food Products. — Maize meal (corn meal) and corn grits are widely used as human food, especially in the southern United States, in parts of Italy, Rumania, Egypt and elsewhere. Since maize contains about one-fifth as much niacin as does wheat, pellagra, which is due to niacin deficiency, has been common only where corn is extensively used as a bread grain or as corn-meal mush (polenta). The milling of maize by modern machinery produces a meal for human consumption that is as much depleted in nutrients as is white flour. Barley and rye are extensively used as human food only in areas where wheat does not yield well.

Rye is milled by a gradual reduction process which, however, differs from the wheat milling system in several respects, but whole meal is often used for rye bread. Where barley is used as bread grain it is not milled refined as is wheat but is employed as essentially whole meal products. Oats are prepared for human consumption by dehulling the kernels, which are then cut, steamed and rolled to produce rolled oats, or ground to make oatmeal and oat flour. Rolled oats and oatmeal represent practically the entire kernel of the oat.

Where wheat or other cereals are marketed for use as breakfast cereals. it is advisable to provide products that represent the entire seed because of their superior food values. But even whole-wheat cereals are deficient in thiamin after toasting.

Rice is second only to wheat in the quantity grown and used as human food. Being the one cereal that grows in swampy land, it forms the principal food of many millions of people in the warmer and wetter areas of the world. The flavour of whole rice is generally less relished than is that of polished rice. Polishing is desirable for the same commercial reason as is the refining of white flour: it improves the keeping qualities. Polishing removes the bran and aleurone layers from the surface of the kernel and also the germ. Polished rice closely resembles highly refined (and unfortified) white wheat flour in dietary properties. Attempts have been made, and some progress achieved. in the distribution of "undermilled" rice and steamed rice. The former product contains some of the outer layers (silverskin) of the grain, and some germ. In the preparation of steamed rice the grain is steeped in water warm enough to facilitate permeation of the grain and gelatinization of the surface starch. These processes, which serve to retain the thiamin content of rice, have been promoted as a means of preventing the disease beriberi. which afflicts people whose diet is too largely derived from polished rice.

Sorghums and the seeds of several grasses, popularly known as millets, are the least palatable of the cereals and are eaten from necessity rather than from choice. The use of these seed grains is most common in semiarid regions of the U.S.S.R., northern Asia and Africa, where other grains cannot be produced.

Proper Dietary Use of Cereals. — Cereals in the early 1960s were the least expensive and most important food sources of calories, thiamin and protein, even though cereal protein is of rather poor quality compared with proteins of animal origin. Because of their dietary deficiencies, especially when refined derivatives of cereals are eaten. the ideal way to use cereals in the diet is in menus in which occur liberal amounts of milk and milk products, meats, eggs, fish, poultry, together with appropriate atnounts of green and yellow vegetables and some fresh vegetable foods suitable for eating in the uncooked state for their antiscorbutic properties. The fact is well established that none of the common foods is nutritionally complete when eaten as the sole source of nutriment. The keynote to successful nutrition is the selection of foods that supplement each other and collectively make a complete diet with no nutritional shortcomings. (E. V. M.)

Processed Breakfast Cereals. — Processed breakfast cereals, referred to in the food industry as the R-T-E (ready-to-eat) cereals, have taken their place in the modern diet with a per capita consumption in the U.S. in the early 1960s of seven to eight pounds annually. R-T-E cereals, in the form of flakes, puffs, shreds, biscuits and granules, represented the beginning of a new era in the food industry — convenient prepackaged foods.

The industry had its origin with the vegetarians and food faddists of the 19th century and grew out of a succession of inventions, including graham crackers in 1829 by Sylvester Graham, a temperance lecturer-food faddist, who promised to save souls through the stomach; Granula (forerunner of Grape-Nuts) in 1863 by James C. Jackson of Jackson sanitarium, Danville, N.Y.; Shredded Wheat, by Henry D. Perky (1893); and Puffed Wheat, by Alexander Anderson (1902).

With the formation of the Western Health Reform institute in Battle Creek, Mich., by the Seventh-Day Adventists in 1866, Battle Creek was destined to become the "cereal capital of the world." The institute — later the Battle Creek sanitarium — under the leadership, beginning in 1876, of John Harvey Rellogg. became a norld-famous health centre. Kellogg, a physician, surgeon, inventor and writer, exposed many people to his cereal grain foods that nere later to form the basis for this new industry.

Sensing the possibilities of the sanitarium's health foods that he ate as a patient, C. W. Post organized the Postum Cereal company in 1897 and began the promotion and sale of Postum, and later Grape-Nuts. The Postum Cereal company was the parent company in the founding of the General Foods corporation.

W. K. Rellogg left his brother, John Harvey Kellogg, and the sanitarium and formed a cereal company in 1906. The growth of the processed cereal industry provided the impetus for the development of a packaging industry, an advertising and promotion industry. and later a whole host of prepackaged convenience foods.

The various flaked, shredded, puffed and granular products were invented and patented by individuals who developed their own equipment and process for manufacturing. These patents and knowledge have been closely held by individual companies. Thus, aside from patent hles. there is little common knouledge regarding the manufacture of cereal products. The process involves cooking, forming (flaking, shredding or extruding) and toasting or gun puffing.

Heavy promotion (competitive selling with subsidiary inducements) has been a characteristic of this industry since its inception. The box-top self-liquidating premium, the pack-in premium, and the cutouts have taken their turn as sales inducements for these products. These have been supported by intensive advertising programs using all types of media.

The closely held patents. the requirements for heavy expenditures in equipment development, and the large advertising and promotion requirements have tended to concentrate the industry among a few manufacturers. A handful of companies produce millions of pounds and billions of packages of cereals each year.

The original concept of a crisp, dry product to which milk is added before serving has remained unchanged through the years.

The forms of cereal have also remained unchanged. Variety has been provided by new shapes, vitamin fortification, sugar coating and protein supplementation.

Cereals became identified early as breakfast foods and have maintained this position. They have changed from "health foods" to "high energy foods," and their use has spread to other English-speaking countries, generally through the expansion of American companies.

See GRAIN PRODUCTION AND TRADE and the articles on the various cereals. such as BARLEY: CORN; WHEAT, etc. See also references under .'Cereals" in the Index volume. (V. D. Lu.)

CEREBELLUM, one of the major divisions of the brain. See BRAIN.

CEREBRAL PALSY implies a paralysis (loss of volitional control over a motor function) resulting from some disorder of the brain (cerebrum) suffered either before or at birth or during infancy. The meaning of the term cerebral palsy is broad. including commonly all motor disturbances attributable to a cerebral disorder of early life. In precise medical language the term is shunned. Specifically, however, two types of infantile cerebral palsy are meant: spastic and athetosic. In the spastic type there is a more or less severe paralysis of the voluntary movements. with a spastic contracture of the extremities either on one side of the body (infantile hemiplegia) or on both sides (diplegia). In the latter case, spastic contracture and paralysis are usually more prominent in the lower extremities than in the arms and hand (Little's type of diplegia), or only the legs may be affected (paraplegia). In the athetosic type the voluntary movements may not be actually paralyzed, and spastic contractures may be slight or absent. Instead there are slow, changing, mobile spasms in the face, neck and extremities, either on one side (hemiathetosis) or, more frequently, on both sides (double athetosis). with resulting involuntary movements in the whole body or its parts. with facial grimacing and inarticulate speech (dysarthria). which increase under stress or excitement. In the spastic type. the cerebral damage affects especially the nerve cells and connections of the cerebral cortex (outer gray matter), either of one cerebral hemisphere (contralateral to paralysis) as in infantile hemiplegia, or of both hemispheres as in diplegia. In the athetosic type. damage to the brain affects especially the basal ganglia (deep gray matter) underlying the cerebral cortex.

Cerebral palsy does not necessarily imply mental retardation; many children affected with cerebral palsy grow to be mentally competent adults. However, any cerebral disorder in early life may result in impairment. sometimes severe. of the subsequent intellectual and emotional development. Epileptic attacks in the form of convulsive seizures. especially in the parts affected by the paralysis, occur in many children with cerebral palsy (see EPILEPSY). In the spastic type of cerebral palsy, mental retardation and epileptic attacks are particularly frequent. In the athetosic type the incidence of severe mental retardation is much lower, and occurrence of convulsive seizures is exceptional. Children affected with athetosis may be perceptive and intelligent; however, because of the involuntary movements and dysarthria, they are often unable to communicate by intelligible words or signs and so may appear mentally retarded.

The causes of cerebral palsy are multiple and vary from case to case. Heredity plays a role in only a small number of cases. It may manifest itself in neoplastic malformations of nerve cells! interstitial tissues and blood vessels of the brain with tendency to produce tumours, as in tuberous sclerosis. angiomatosis and related congenital defects; or it may express itself in an abnormal chemistry of the brain. Embryonic malformations of the brain, and fetal diseases due to transplacental infections, maternal diabetes. blood dyscrasias and similar affections, with disturbance of placental circulation and fetal metabolism and nutrition, are commoner causes of cerebral palsy than is heredity. Incompatibility of parental blood types, leading to severe jaundice of the newborn, may cause brain damage and cerebral palsy. Embryonic malformations and fetal diseases of any cause predispose to premature birth or to malpresentation and difficult delivery, and hence to asphyxia at birth. Asphyxia at birth is probably the commonest immediate cause of a great majority of cerebral palsies. Postnatal diseases, particularly infections of infancy and childhood. severe head injuries and accidents of poisoning (with heavy metals, such as lead, or with other toxic substances in food, drink or respired air; *e.g.,* carbon monoxide) are other less common causes of cerebral palsy.

Treatment with the so-called muscle-relaxant drugs is at best palliative. temporary in effect and limited in value. In some cases of particularly awkward dislocation of the posture, severing of the tendons of contractured muscles may contribute to improvement in efficiency of motor performance, but usually the benefit gained does not 'justify the effort. The use of mechanical devices to correct posture or to counteract spasm and contracture may make it possible for the child to stand alone and walk after a fashion, and so may facilitate other volitional movements, provided intellectual faculties are not severely curtailed. In some cases of infantile hemiplegia associated with disturbances of emotional behaviour, with convulsions and with signs of progressive impairment of intellectual development, surgical removal of the affected cerebral hemisphere proved to be of benefit for the further development of the child, provided the operation w s performed before puberty. In all cases of cerebral palsy, however, the basic program of treatment should aim at the psychological management, education and training of the child, to develop whatever sensory, motor and intellectual assets are still available to him in order to compensate for the physical liabilities. The child should be exposed to the normal demands and stimulations of his natural social and physical surroundings. care being taken that the challenge is commensurate with his ability to meet these demands and to respond to stimulations adequately, with a reasonable chance for gratification to the child in his attainments. (P. I. Y.)

CEREBROSPINAL FLUID: see MENINGES AND CEREBROSPINAL FLUID.

CEREMONIALISM: see RITUAL; WORSHIP.

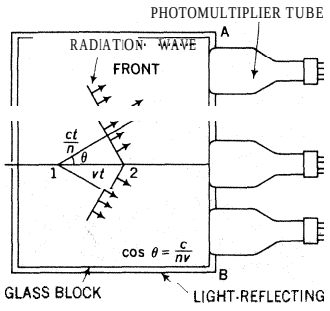
CERENKOV, PAVEL ALEKSEEVICH (1904–), Soviet physicist awarded the 1958 Nobel prize for physics. jointly with I. E. Tamm and I. M. Frank. "for the discovery and interpretation of the Cerenkov effect," was born in 1904. The Cerenkov effect is defined as the emission of light waves by electrons or other electrically charged atomic particles moving in a medium at any speed greater than the velocity of light in that medium (see CERENKOV RADIATION). This effect is analogous to the formation of an acoustic "bow wave" by a bullet or aircraft moving through air at supersonic velocity.

Cerenkov's contribution to these researches was made in 1934 when he was a research student under S. I. Vavilov at the Institute of Physics of the Academy of Sciences of the U.S.S.R., where he continued to work. His work includes studies on electron radiation carried out jointly with Frank and Tamm, for which all shared the Stalin prize in 1946. (W. J. Bp.)

CERENKOV RADIATION, light radiated by a charged particle when the particle passes through an optically transparent medium at a speed greater than the speed of light in the medium. In 1934 P. A. Cerenkov observed that when a beam of high-energy electrons penetrated a transparent liquid, light was emitted. He was able to show that this light was not the usual phosphorescence and fluorescence that is frequently observed when substances are struck by high-energy electrons, but that it was generated only when the velocity of the electrons was greater than the velocity of light in the liquid. He also observed that the light emitted was strongly polarized. In 1937, I. M. Frank and I. E. Tamm developed a theory of the phenomenon. In 1958 the Nobel prize in physics was given to these three men for the discovery and the

theoretical explanation of the Cerenkov effect. Since that time Cerenkov light has been observed from gases and solids as well as liquids.

The theory developed by Frank and Tamm shows that whenever a charged particle traverses a transparent medium with a velocity v which is greater than c/n, where c is the velocity of light in free space and n is the index of refraction of the medium, light will be radiated by the particle. This light is emitted at a characteristic angle θ to the path of the partible sueh that $\cos\theta = c/nv$. The reason for this relation may be seen in the accompanying figure. where the part of the wave front emitted when the particle is at position 1 advances through the medium with a velocity c/n so that after a time t, it has traveled a distance ct/n, whereas the particle itself has traveled only a distance of vt. Furthermore, it may be shown that the light is polarized, with its electric vector in the plane of the figure, and that its spectrum is continuous and more concentrated at the blue end.



CHARGED PARTICLE WITH VELOCITY v TRAVELS FROM POSITION 1 TO POSITION 2 IN A BLOCK OF GLASS IN TIME t, WHEREAS THE VELOCITY OF LIGHT IN THE GLASS IS c/n. THUS THE WAVE FRONT MOVES AT ANGLE θ. THE LIGHT MAY BE DETECTED BY PHOTOMULTIPLIER TUBES ATTACHED TO FACE OF BLOCK

The amount of light emitted by a fast particle in traversing a substance such as water is very small, there being only about 250 photons (quanta of light) emitted in the visible region of the spectrum per centimetre of path. However, an intensely radioactive source such as a nuclear reactor, when surrounded by water, will generate enough high-energy electrons in the water so that the Cerenkov light emitted by them is easily seen. In fact, Marie Curie observed that radium salts emit a pale bluish light when dissolved in distilled water.

Cerenkov radiation in a gas has been demonstrated by observing with photomultiplier tubes the minute flashes of light emitted by extremely high-energy cosmic ray particles as they traverse the earth's atmosphere. Since the velocity of light in gases at atmospheric pressure is very nearly equal to c, the energy that a charged particle must have in order to emit Cerenkov radiation is very high. For instance. protons traveling through air must have an energy greater than about 5.5×10^{10} electron volts before they will radiate.

Cerenkov radiation has been extensively used in high-energy nuclear physics to detect charged particles and to measure their velocity. The general principle of a common form of Cerenkov counter is illustrated in the figure. The particle to be detected travels through the material of index of refraction n and the light radiated is detected by photomultiplier tubes with their cathodes located at the plane AB. The material is surrounded by a light-reflecting substance, except at the points where the photomultipliers are attached. The refractive substance may be glass, liquid, or a gas confined under high pressure in order to adjust its reflective index to a specific value. Such a detector will respond to all particles whose velocity is greater than c/n. More elaborate detectors have been constructed in which only light emitted at a certain angle θ is allowed to fall upon the photomultiplier cathode. Such a detector will respond only to charged particles whose velocity is $v = c/n\cos\theta$. Another form of Cerenkov counter consists of a large cube of lead glass, perhaps 12 in. on a side, with photomultipliers arranged over one face. Such a detector will respond to high-energy photons which generate showers of electron-positron pairs in the lead glass. The total amount of light emitted from such a shower is proportional to the energy of the incoming photon. Hence, with this type of detector it is possible to measure the total energy of the incoming photon.

See J. V. Jelley, *Cerenkov Radiation and Its Applications* (1958); J. Marshall, "Cerenkov Counters," *Ann. Rev. Nuclear Sci.*, 4:141–156 (1954). (A. V. T.)

CERES, goddess of the growth of food plants, worshiped, alone or with the god Cerus. over a considerable part of ancient Italy. Her name, "creatress," may be of Oscan origin. Her cult was early overlaid by that of Demeter (q v), who was widely worshiped in Sicily and Magna Graecia. On the advice of the Sibylline books, a cult of Ceres, Liber and Libera was introduced into Rome in 456 B.C. to check a famine (*see* also LIBER AND LIBERA) Liber and Libera seem to represent the Iacchos and Kore of the Eleusinian cult, and the ritual of this worship was largely if not wholly Greek. The temple, which was built on the Aventine hill in 453 B.C. and was of Etruscan shape but decorated by Greek artists, became a centre of plebeian activities, religious and political. Ceres was regarded as the patroness of the corn trade, which seems to have been early in plebeian hands.

The chief festivals of this cult were the Ludi Ceriales, introduced before 202 B.C., and ultimately lasting from April 12 to 19; an annual festival, instituted before 217 B.C., celebrated in secret by the women and apparently dealing with the union of Kore and Hades; from 191 B.C. on, a fast (Jejunium Cereris) held at first every five years, but subsequently every year on Oct. 4. All these were on Greek lines.

See G. Wissowa, *Religion und Kultus der Römer, 2nd* ed. (1912).

CERIGNOLA, an episcopal town of southeast Italy, in the region of Puglia, province of Foggia, is situated on high ground marking the southern limit of the Puglia tableland, 124 m. (407 ft.) above sea level. It is 37 km. (23 mi.) S.E. of Foggia by road, on the main railway line from Milan, Ancona and Foggia to Bari and Brindisi. Pop. (1957 est.) 54,205 (commune). The philologist Nicola Zingarelli (1860–1935) was born at Cerignola and Mascagni composed *Cavalleria Rusticana* there in 1850. The annual festival of the Madonna di Ripalta takes place on Sept. 8. Vines, olives, almonds, wheat and oats are cultivated and there is trade in merino and mattress wool. The town suffered damage at the hands of barbarians and Saracens. On April 28, 1503, the Spaniards defeated the French below the town, making the kingdom of Naples a Spanish province. Cerignola later passed to the princely families of Caracciolo and Pignatelli. In World War II it was captured by the Allies in Sept. 1943. (M. T. A. N.)

CERINTHUS (fl. *c.* A.D. 100), a Christian heretic, to confute whose errors, according to Irenaeus, John wrote his Gospel, was probably born a Jew in Egypt. Little is known of his life save that he was a teacher and founded a short-lived sect of Jewish Christians with Gnostic tendencies (*see* GNOSTICISM). He apparently taught that the world was created by angels, from one of whom the Jews received their imperfect Law. The only New Testament writing Cerinthus accepted was the Gospel of Matthew. Jesus, the offspring of Joseph and Mary, received Christ at his baptism as a divine power revealing the unknown Father. This Christ left Jesus before the passion and the resurrection. Cerinthus admitted circumcision and the sabbath, and held a form of millenarianism.

Eusebius in his church history quotes a story that Irenaeus heard from Polycarp: the apostle John. on learning that Cerinthus was in a bathhouse he was entering, rushed out exclaiming that the building would collapse since the enemy of truth was within.

See J. Danièlou, *The'ologie du Judéo-Christianisme* (1958). (G. Q.)

CERIUM, the most abundant of the rare-earth group of chemical elements, is a metal of iron-gray colour that is slowly oxidized in air. It reacts rapidly with boiling water, liberating hydrogen, and in wire form burns brilliantly when heated. The symbol for cerium is Ce, the atomic number is 58 and the atomic weight is 140.12. The estimated terrestial abundance is 0.00461%. Four stable isotopes are known: Ce^{136}, Ce^{138}, Ce^{140} and Ce^{142}.

Cerium and its compounds have a number of practical applications. Tetravalent (ceric) salts. which are powerful but stable oxidizing agents, are used in analytical chemistry to determine oxidizable substances such as ferrous iron. The dioxide is employed in the optics industry for fine polishing of glass and as an opacifier in porcelain coatings; cerium nitrate is used in the manufacture of Welsbach incandescent gas mantles; other salts are employed in the ceramic, photographic and textile industries. The metal is an ingredient of the carbon-impregnated arcs used for

illumination in the motion-picture, television and related industries. Along with other rare-earth metals, cerium is a constituent of numerous ferrous and nonferrous alloys; a superior high-temperature alloy for jet engines contains about 3% cerium with magnesium. Misch metal (50% cerium. 25% lanthanum, 15% neodymium and the other 10% consisting of other rare earths and iron) is used for lighter flints, as a deoxidizer in various alloys and in vacuum tubes as a getter to remove traces of oxygen.

Cerium was discovered in 1803 by Jons Berzelius and Wilhelm Hisinger working together and independently by M. H. Klaproth. It was named after the asteroid Ceres, which had been discovered in 1801. Cerium occurs in monazite, bastnasite, cerite and many other minerals; monazite is the important commercial ore. Along with praseodymium and terbium, cerium is different from the other rare earths in that it forms compounds in which it is tetravalent; it is unique in that it is the only rare earth that forms solutions containing the tetravalent ion. Procedures for separating and purifying cerium usually are based on the fact that only cerium is easily oxidized in aqueous solution to the plus four oxidation state. One common scheme involves oxidation of the trivalent cerium in a rare-earth nitrate solution of low acidity by potassium bromate; the tetravalent cerium nitrate hydrolyzes to precipitate the insoluble basic nitrate practically free from other rare earths. Solvent extraction of tetravalent cerium is also used.

The nearly white oxide formed by air ignition of cerium salts is CeO_2; it is insoluble in hydrochloric or nitric acids but is soluble in sulfuric acid. Most tetravalent cerium salts are orange to yellow in colour, as are solutions containing the Ce^{4+} ion. In its trivalent oxidation state, cerium behaves as a typical rare earth; its ionic radius is 1.034 Å. Neither the 4+ nor 3+ form produces sharp, discrete lines in the ultraviolet, visible or near-red spectral regions, but certain broad absorption bands have been used for analysis. Tetravalent cerium, with no 4f electrons, is diamagnetic, while trivalent cerium, with one unpaired 4f electron, is paramagnetic.

Cerium metal is prepared by electrolysis of the anhydrous fused halides or by thermoreduction of the halides with alkali or alkaline earth metals. It is about as soft and ductile' as tin and is a powerful reducing agent. The melting point is 804" C.; its density is 6.768 g. per millilitre for the face-centred cubic structure; other forms are known to exist.

See also references under "Cerium" in the Index volume.

(LD. B. A.)

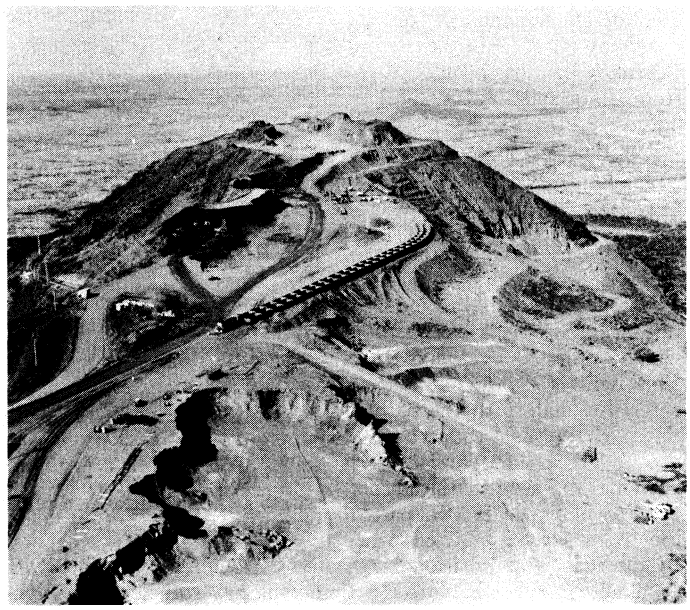
CEROGRAPHY, the art of painting in wax. *See* ENCAUSTIC PAINTING.

CERRITO, FANNY (FRANCESCA) (1817–1909), Italian ballerina noted for the brilliance, strength and vivacity of her dancing. Born in Naples on May 11, 1817, she worked under Salvatore Taglioni, made her debut in 1832 and sprang into international fame in London, 1840. Her greatest role was in *Ondine,* created for her by Jules Perrot in London, 1843. Two years later she appeared with Marie Taglioni, Carlotta Grisi and Lucile Grahn in Perrot's famous *Pas de* Quutre.

Fanny Cerrito's favourite partner was Arthur Saint-Léon, whom she married in 1845. A noted choreographer, he arranged *La Fille du Marbre* for her Paris Opéra debut in 1847. They separated in 1851. One of the few women to achieve distinction as a choreographer during the 19th century, she staged *Rosida* (London, 1845) and *Gemma* (Paris, 1854). After appearances in Russia: she retired in 1857. She died in Paris on May 6, 1909.

See Ivor F. Guest, Fanny *Cerrito* (1956). (LN. ME.)

CERRO BOLÍVAR, a mountain of iron ore 1 mi. wide, 4½ mi. long and 2.631 ft. above the surrounding grasslands just north of the Guiana highlands, Venez., is one of the most important mineral discoveries of the 20th century. It lies 90 mi. S.W. of Puerto Ordaz, a river port at the confluence of the Caroní and Orinoco. The ore is sent by rail to this port for loading into ocean-going vessels which navigate the Orinoco and its distributary on the delta, the Boca Grande, for 187 mi. to the Atlantic. The mountain, which is thought to contain 500,000,000 tons of high-grade ore (a mixture of hematite, limonite and a small percentage of magnetite, with an average 63.5% iron),



INFORMATION SERVICE, EMBASSY OF VENEZUELA

CERRO BOLÍVAR, A MOUNTAIN OF IRON ORE. VENEZUELA

lies in a region geologists believe to contain reserves of as much as 2,000,000,000 tons. The ore deposits have an average thickness of 230 ft. Cerro Bolivar was discovered in 1947 during the United States Steel corporation's world-wide search for new sources of iron ore. Mining is possible the year round, and millions of tons of ore are shipped annually to the U.S., Europe and Japan for manufacture into pig iron and steel. (L. WE.)

CERRO DE PASCO, a mining town in the highlands of central Peru and capital of the department and province of Pasco (*q.v.*), is located 110 mi. N.E. of Lima, to which it is connected by rail and an all-weather highway. Pop. (1958 est.) 26.000. The town, one of the world's highest (elevation 13,973 ft.). owes its location to the discovery of rich silver ores in 1630 and for about two centuries was one of the world's chief sources of silver. In the late 19th century when the silver ores had been almost depleted. Cerro de Pasco declined in population; but in the 20th century its importance was regained as a result of the mining of copper, gold, lead, zinc and bismuth. Nearby are the vanadium mines at Minaragra. Mining is made difficult at the high altitude because of the rarified air, and only the richness of the ores makes continued production possible. The copper is smelted at La Oroya to the southeast. (P. E. J.)

CERRO GORDO, a mountain pass about 60 mi. N.W. of Veracruz, Mex., where the U.S. army under Gen. Winfield Scott first met serious resistance (April 1847) on its march to Mexico City during the war between the United States and Mexico. ~ d - vance units of Scott's army reached Plan del Rio, a few miles from Cerro Gordo, on April 11, 1847. There they met detachments from Gen. Santa Anna's Mexican army, which numbered about 12,000 and was entrenched in the pass. The next few days were spent in reconnaissance, during which Scott arrived with the main body of his 8,500-man army. This reconnaissance (conducted in part by Capt. Robert E. Lee and other officers who won fame in the American Civil War) discovered a rough path that passed around the position of the defenders, and Scott decided upon a flanking movement to attack the Mexican forces from the rear. Before this plan could be executed, fighting broke out on the afternoon of April 17 around two hills held by the Mexicans and facing the front lines of the invaders. This fighting was continued on the early morning of the 18th, when the Mexican forces fled in disorder. The battle had been decided while the flanking movement was still in process. The defenders had lost about 1.100 men in killed and wounded and about 3.000 were taken prisoner. U.S. losses were about 400, of whom 63 were killed. The state of Santa Anna's forces precluded further organized defense in that vicinity, and Scott moved on to Puebla, the second city of Mexico,

and later to Mexico City. *See* also MEXICAN WAR, THE.

BIBLIOGRAPHY.—R. S. Henry; *Story of the Mexican War (1950)*; C. W. Elliott, *Winfield Scott, the Soldier and the Man* (1937); Justin H. Smith, *The War with Mexico,* 2 vol. (1919). (G. J. S.; H. W. BY.)

CERRO LARGO, a department in northeast Uruguay, established in 1837, bordering Brazil. Its population (1954 est.) was 118,947, of whom 36,000 lived in hlelo. the departmental capital. Most of Cerro Largo's 5,317 sq.mi. is ranch country. with more than 700.000 cattle and 1,700,000 sheep counted in the early 1960s. Corn. wheat, rice. grapes. fruit and forage crops are grown. Melo, founded as an outpost against smuggling in 1795, still has a colonial air, but is rapidly becoming modernized. (M. I. V.)

CERTHIIDAE, the creeper family of small songbirds, found in North America. Europe. Asia and Australia. These birds have thin, curved bills, are weak fliers and usually are seen creeping up a tree trunk. *See* TREE CREEPER; BROWN CREEPER.

CERTIFIED CHECK (CHEQUE): *see* CHECK.

CERTIFIED PUBLIC ACCOUNTANT (C.P.A.), an accountant who has received the certificate of a certified public accountant and who holds a valid permit to practice under the laws of his state. In most cases he has passed a comprehensive examination covering the theory of accounts, accounting practice. auditing and commercial lam, and has met certain experience and educational requirements.

The C.P.A. offers services to the public for a fee and adheres to a strict code of professional conduct. He may be called on to perform a variety of services for his clients. As an independent auditor. the C.P.A. expresses an unbiased opinion of his client's financial condition and results of operations. He prepares, tax returns and gives advice concerning possible tax consequences of planned business decisions. The management services he performs include consultation on the design and installation of accounting systems and on operations research projects in the field of accounting (*q.v.*). (A. R. CE.)

CERUSSITE, a mineral consisting of lead carbonate, $PbCO_3$, is an important ore of lead (*q.v.*); it contains 77.5% of the metal Cerussite occurs in large quantities in the upper oxidized portions of lead deposits and is found in many localities. It is an abundant ore at Leadville, Colo, and in other mining districts of the western United States. The name is derived from the Latin *cerussa*, "white lead." It crystallizes in the orthorhombic system, and often forms pseudohexagonal twins like those of aragonite (*q.v.*), with nhich it is similar in crystalline form or isomorphous It also occurs in compact granular or fibrous forms. It is usually colourless or white, sometimes gray or greenish, and is usually more or less transparent: some nell-formed crystals have a brilliant lustre. Its hardness is 3 to 3.5 and density 6.5. Unlike anglesite (lead sulfate) it effervesces with dilute nitric acid. (CL. F.)

CRYSTAL STRUCTURE OF CERUSSITE FROM BROKEN HILL, NEW SOUTH WALES, AUSTR.

CERUTTI, GIUSEPPE ANTONIO GIOACCHINO (1738–1792), French writer and politician who enjoyed considerable influence as a pamphleteer during the Revolutionary era. Born at Turin on June 13, 1733. he was brought up by Jesuits and became a member of the Society of Jesus. which he vigorously defended in *Apologie générale de l'institut et de la doctrine des jésuites* (1762). Later he became an equally fervent advocate for the claims of the *tiers état* and his pamphlets, including *Mémoire pour le peuple français* (1788), enjoyed great popularity. In 1790 he was one of the founders. with R. Saint-Etiènne and P. Crouvelle, of the weekly news bulletin, *La Feuille villageoise,* designed to inform the rural population of the progress of the Revolution. Though elected a member of the legislative assembly, he was able to address it only once before his death at Paris, on Feb. 3, 1792.

CERVANTES SAAVEDRA, MIGUEL DE (1547–1616), Spanish novelist, playwright and poet, creator of Don Quixote. was born in the university city of Alcalá de Henares, the second son and fourth of seven children of Rodrigo de Cervantes and Leonor de Cortinas. The exact date is not recorded. the choice of name (Miguel = Michael) suggesting Michaelmas (Sept. 29); he was baptized on Oct. 9, 1547. Rodrigo led an unsettled and precarious existence as an apothecary-surgeon. He was apparently resident in Valladolid in 1554 and appears to have moved his family to Madrid when Philip II established that city as his capital in 1561. He is met with in Seville in 1564–65, and again in Madrid from 1566. Somewhere, as a boy. Cervantes saw the famous actor-manager and dramatist Lope de Rueda, of whom he writes enthusiastically in the preface to his plays and who possibly first fired his passion for the drama. He may have had some schooling in Valladolid and again with the Jesuits in Seville. No reierence to him is known between baptism and 1569, when Juan Lopez de Hoyos, professor of Latin at the Studium of Madrid. edited a volume of exequies to Philip II's third wife, Elizabeth de Valois. In it appeared a sonnet, four redondillas and an elegy by Cervantes, "our dear and beloved pupil." The term "pupil." at age 21, is perplexing. On Sept. 1j. 1569, a warrant was issued for the arrest of one Miguel de Cervantes, missing from the capital, against whom sentence had been pronounced of the loss of his right hand and ten years' exile "for wounds inflicted on Antonio de Sigura in Madrid." This could explain a request from Rome to his father for legal testimony to his legitimate birth and old Christian stock. The certificate to this effect is dated Dec. 22, 1569. Years later, in the dedication of the *Galatea,* he wrote of having been chamberlain in Rome to Giulio Acquaviva, who became cardinal in 1j70.

On Sept. 16, 1571, he sailed from Messina as a common soldier on board the "Marquesa" in the armada led by Don John of Austria against the Turks. At the battle of Lepanto (Oct. 7, 1j71) the "Marquesa" was in the thick of the conflict. Though ill with fever, Cervantes fought gallantly and received three gunshot wounds, one permanently maiming his left hand—"to the greater glory," as he says. "of the right." By April 1572 he was again fit for duty and, accompanied by his younger brother Rodrigo, he shared in the naval engagement off Navarino on Oct. 7, 1572; in the capture of Tunis on Oct. 10, 1573; and in the unsuccessful expedition to the relief of La Goletta in the fall of 1574, with periods of garrison duty at Palermo and Naples. Anxious for promotion. he procured himself letters of commendation from Don John and the viceroy of Sicily, obtained leave to return to Spain and embarked, again with his brother, on the "Sol" out of Naples on Sept. 20, 1575.

Six days later. off Marseilles, the "Sol" was attacked by three Turkish galleys; Cervantes. his brother and other Spaniards were captured and taken to slavery in Algiers. There he was closely guarded. the letters he carried suggesting him to be a person of consequence worth a high ransom. In 1j76 he tried to escape. but a Moor whom he had induced to guide him and other captives to Oran deserted them on the way. and the baffled fugitives had to return to Algiers. where Cervantes was treated with additional severity. Early in 1577, priests of the Order of Mercy arrived with 300 crowns sent by his parents, a sum which was insufficient to free him but which served to ransom his brother. Another attempt at escape in September again failed through betrayal. and Cervantes. brought before the viceroy of Algiers, Hassan Pasha. was threatened with death. His heroic bearing caused Hassan instead to buy the prisoner for his own service. In 1578 he incurred sentence of 2,000 strokes for appealing for help to the Spanish governor of Oran; again punishment was remitted. His family continued its efforts. In March 1578 his father presented a petition to the king setting forth Cervantes' services. His

mother obtained in 1579 a licence authorizing the trading from Valencia to Algiers of goods to the value of 2,000 ducats; and she herself raised: with a daughter, 300 ducats toward his ransom, entrusting the money to two Trinitarian monks. Late that year Cervantes plotted to secure a frigate on his own, but was again betrayed. Hassan once more spared his life, declaring that "so long as he had the maimed Spaniard in safe keeping, his Christians, ships and city were secure." The two Trinitarians arrived in Algiers on May 29. 1580, just as Hassan's term of office ended. Their funds fell short of the 500 gold ducats he demanded. but Christian traders in the town made up the balance and, on Sept. 19, when Cervantes, who was to follow Hassan to Constantinople as a slave, was already on board ship, he was granted his freedom. He sailed for Spain late in October, landed at Denia and proceeded to Madrid. where he signed on Dec. 18 a statement concerning his release.

It seems certain that soon after this he visited Portugal, then lately incorporated in the Spanish crown, and in May 1581 he set out from Tomar on a mission to Oran. Returning eventually to Madrid, frustrated in his hopes of official employment. he consorted with writers and turned his hand to the writing of plays. In the *Adjunta al Parnaso* he mentions as "worthy of praise" a number which are ascribed to the years 1582–87: "but the one I esteem and pride myself on most was and is *La Confusa,* which, with all respect to as many cloak-and-sword plays as have been put on the boards up to now, may well stand out as good among the best." Of these "twenty or thirty," all of which, he tells us, were acted, only El *Trnto de Argel* and *La Numancia* have survived, in manuscript copies discovered in 1784. In 1584 he obtained licence to print a pastoral novel. *La Gulaten.* Published in Alcalá de Henares in 1585 and twice reprinted during his lifetime (Lisbon. 1590; Paris. 1611), it remained his own favourite and for over 30 years. and still on his deathbed. he kept promising a second part.

On Dec. 12. 1584, he married Catalina de Palacios Salazar y Vozmediano of Esquivias, a girl 18 years his junior. who hrought him a modest dowry of some vineyards and an orchard, various items of furniture, four beehives. 45 hens and chickens and one rooster. It was probably a year or two earlier that he had a daughter. Isabel de Saavedra. by one Ana Franca de Rojas. By his wife he had no children. and Isabel figured ,much in his life in later years. His father's death on June 13. 1588, doubtless increased his responsibilities as the man of a household of many women, including his sisters and a niece, and gave new urgency to the search for a livelihood.

In 1587 he went to Seville, presumably alone. to seek employment in the provisioning of the Invincible Armada, this marking the beginning of a 11-year hiatus in his literary career. Excommunication for excessive zeal in requisitioning grain belonging to the dean and chapter of Seville at Ecija initiated a long chapter of mischances and dire financial straits in this new role of commissary to the navy. in which he was retained after the defeat of the Armada. On May 21, 1590, he petitioned the king for one of four posts then vacant in the Indies: an accountantship in New Granada, the governorship of a province in Guatemala. the position of auditor to the galleys at Cartagena. the chief magistracy in La Paz. The petition, referred to the Council for the Indies, was there annotated: "Let him look for something nearer home"; and he continued as commissary. In Nov. 1590 he had to borrow the price of a suit of clothes; in Aug. 1592 his sureties were called on to make good a deficiency in his accounts. Meanwhile his thoughts still ran on the stage; and on Sept. 5, 1592, he contracted with one Rodrigo Osorio of Seville to write six plays at 30 ducats apiece. payment to be withheld were each not to prove, to Osorio's satisfaction, "one of the best ever produced in Spain." Nothing came of the agreement. Within a fortnight Cervantes was for some days in prison at Castro del Río, again on charges of illegal requisitioning at Ecija. Accounting difficulties with the exchequer led him into deeper and deeper water. In mid-1596 he entrusted to a banker in Seville 7,400 reals for payment to the treasury in Madrid. The banker absconded. and not until Jan. 1597 was the money recovered. In Sept. 1597 Cervantes was committed to Seville jail and held for three months for failure to guarantee compliance with an order that he present himself in Madrid within 20 days. With this incident his official employment appears to have terminated. although in 1599 and again in 1601, the government was still summoning him to Madrid to clear up his accounts.

The years 1600–03 are a blank. The possibility that he may have rejoined his wife in the tranquil obscurity of Esquivias is reinforced by the only thing to be inferred with certainty of this period—that he mas busily engaged in the writing of *Don Quixote.* Philip III had removed the capital to Valladolid in 1601, and when Cervantes reappeared in Valladolid, in the middle of 1604. it was to see to the publication of a manuscript which was then ready for press. Licence to print was granted for Castile on Sept. 26, and in Jan. 1605 *El Ingenioso Hidalgo Don Quixote de la Mancha* appeared, in Madrid, with a dedication to the duke of Béjar that seems to have brought the author no return in patronage. The book had an immediate success. Within a few weeks of publication three pirated editions were issued at Lisbon. A second authorized edition, with minor revisions, was hurried out in Madrid with a privilege extending now to Aragon and Portugal, and two other reprints appeared in Yalencia in the same year. It was reissued in Brussels (1607 and 1611), Madrid (1608) and Milan (1610). With the exception of Mateo Alemán's *Guzmán de Alfarache,* no Spanish book of the period achieved such currency. Thomas Shelton's English version of 1612 mas the earliest translation.

A stabbing affray outside Cervantes' first-floor lodging in Valladolid on June 27, 1605, that landed him and his womenfolk in jail for a week on suspicion, shows him to be still living in difficult circumstances. For three years thereafter he is again lost to view, to reappear in 1608 in Madrid: now once more the capital. There he was much harassed by an interminable series of legal squabbles over financial matters in which he was involved by his daughter and her second husband; and when in mid-1610 the count of Lemos was appointed viceroy of Naples, Cervantes sought escape by aspiring to an appointment in his train. The hope did not materialize. but in dedicating to the count the second part of *Don Quixote* Cervantes paid tribute to the generous support received in his last years from him, as also from Bernardo de Sandoval, cardinal-archbishop of Toledo. Earlier, in 1609, he had been received into the newly founded fraternity of Slaves of the Most Blessed Sacrament; about the same time his wife took the habit of the Third Order of St. Francis. In 1612 he joined the Academia Selvaje, a new literary club to which Lope de Vega belonged.

He was now entering on his third period of literary activity. The 12 *Novelas ejemplares* appeared in 1613. dedicated likewise to the count of Lemos. There followed in 1614 the *Viaje del Parnaso,* a burlesque poem on the poets of the day with an admirably whimsical postscript, the *Adjunta al Parnaso,* in prose. He returned to his first enthusiasm with the *Ocho comedias* y *ocho entremeses nuevos* (1615), genially admitting in the prologue that these, written "some years previously," had found no favour with managers, whence his acceptance of an offer of publication from a bookseller. In the foreword to the *Novelas ejemplares* Cervantes had promised speedy appearance of a sequel to *Don Quixote.* He was at work on the 59th chapter of this when he learned of the publication at Tarragona, 1614, of a spurious *Segundo tomo del ingenioso hidalgo Don Quixote de la Mancha* by one Alonso Fernandez de Avellaneda of Tordesillas. The book was not devoid of literary talent and robust humour. What stung most was an insolent preface taunting Cervantes with physical defects and moral infirmities. Cervantes hurried on with his own second part, allowing some bitterness against Avellaneda to creep in, and it appeared toward the end of 1615. It too was speedily reprinted, in Brussels and Valencia (both 1616) and in Lisbon (1617), with a first translation: into French, in 1618. From the Barcelona edition of 1617 onward both parts appeared together.

Los Trabajos de Persiles y Sigismunda, which appeared posthumously in 1617 and ran through eight editions in two years, proved his last work. A long *historia setentrional,* he made bold

to claim for it that it would be either the worst or the best work of imagination in the language. The brief dedication to his patron, a most moving and gallant leavetaking, he penned on his deathbed, on April 19, 1616. He had already received extreme unction, and on April 23, in his house in the Calle de León, he died. Next day he was buried in the Trinitarian convent in the Calle de Cantarranas; no stone marked his grave, and no will is known. His wife survived till 1626 and his daughter till 1652, when his line became extinct.

WORKS

Cervantes, once he found himself as a writer, was characterized by a consistent self-confidence allied to much probing of his gifts and limitations, and by a profound preoccupation with the relationship between life and literature. He began with poetry, plays and a pastoral novel, imitation of established literary kinds and of other authors being the accepted mode of entry into literature as a career. When finally convinced of his own inventive faculty. he applied himself not to wringing success from competition in well-trodden fields but to striking out in directions of his own. He set himself to kill the romance of chivalry as then current, and in so doing brought into existence what was in effect a new kind, the modern novel. He was the true creator for Spain of the psychological short story. His last work, a vast allegory of the Catholic faith, he himself held to be his greatest. Esteemed until comparatively recently as an inspired but uninstructed genius who wrote a masterpiece by accident, he is recognized now as having not merely kept abreast of contemporary thought but as one who was notably independent in his own thinking, deliberate in his aims and in his every effect.

His fascinated interest in literary theory. which makes whole chapters of Don *Quixote* read like a running commentary on Aristotle, may date from the years of service in Italy. Though he never makes reference to it. the publication in Madrid in 1596 of Alonso López Pinciano's *Philosophia antigua poética* would seem, however, to have been the decisive influence in his literary career, leading him back to letters after the long hiatus following the *Galatea,* and giving him the sense of purpose and direction he had lacked before. This most penetrating of all the Spanish Renaissance treatises on poetics is concerned no less with aesthetics, and proclaims its derivation from Aristotle, already implicit in the title, in the philosophic approach to literature that informs it throughout. By implication it contains, among much else, a sustained attack on Lope de Vega and the comedia, with their open repudiation of classical authority; and this Cervantes echoes in his unwillingness, rather than inability, to write to their pattern, and in his call for some form of dramatic censorship. His claim in 1614 for the lost La Confusa of his earliest period (that it could stand with the best cloak-and-sword plays ever written) shows him unpersuaded to the end; and his Ocho comedias, printed when they had failed to make their way to the boards, could be reprinted by B. A. Nasarre in 1749, after a century and more of oblivion, as deliberate exercises in absurdity, parodying the established *comedia* as Don Quixote had parodied the novel of chivalry. The theory is untenable: Cervantes believed every literary kind good in itself if properly informed, and sought to inform the drama, not with whatever most appealed to the groundling (as did Lope de Vega), but with such reasonableness and relevance to life as would commend it to the cultured minority. He failed, lacking the sense of dramatic tension, just as he lacked skill in the economic contriving and unfolding of plot. Individual scenes in his earliest plays, instinct with lofty patriotism in La Numancia, or with grim experience in El Trato de *Argel*, have power to grip, and explain his much greater success in the *entremés* or interlude. Here. in a brief sketch, characters taken from life are caught and pilloried in a revealing situation developed, for the most part. in the raciest of prose (the plays are in verse) and with unfailing vis *comica.*

The *Galatea* was Cervantes' other wrong turning. The pastoral novel, pseudoclassic in lineage and transplanted from Italy to Spain by the Portuguese Jorge de Montemayor (c. 1559), had imposed a fashion. Cervantes' characters are no shepherds, but "very discreet courtiers" who discourse endlessly in prose and verse on the nature of true love without ever coming to grips with life. This doubtless explains the author's own dissatisfaction with the work, though again not with the kind, that clearly responded to some deep idealistic strain in his make-up. Hence the constant alluding to a second part. As promised originally, this would have been the mere exploiting of the popular success he had hoped, and failed. to win with the first. As promised early in Don Quixote, and often thereafter, it would have reflected his new-found concern with the interrelationship of literature and life; and his failure to discharge the promise suggests that, much as he obviously longed to, he never succeeded in working out in his mind the form that reflection should take within the pastoral framework.

Don **Quixote.**—In Don *Quixote* Cervantes discovered his true bent. That its initial purpose was to discredit through parody the "false and absurd" romances of chivalry, which for a century had exercised a hypnotic attraction on readers of all classes, cannot be questioned: it is reiterated in the last sentence of the book. Don Quixote, a modest country gentleman so hypnotized, sets out to resurrect the institution of knight-errantry. Admirably sane in everything else, he mistakes inns for castles, windmills for giants, criminals on their way to the galleys for victims of tyranny, and sees at every turn a wrong reserved for him to right. He is brought back to his village at length a prisoner in a cage, believing himself enchanted. A second sally, that takes him much farther afield, ends with his defeat in a duel, the penalty being his abandonment of the profession of chivalry, and he returns home to die of disillusion. But Cervantes makes equally clear—notably through the mouth of the canon in part i, 47–48—that he did not abominate the romance' of chivalry as such. Remoteness from life, failure to instruct as well as delight, ignorance of the literary "rules," particularly in the matter of verisimilitude and of the role of the fable in poetic creation: these grosser failings of its practitioners had obscured the true possibilities of the chivalric romance as the modern equivalent of the classical epic, free to range not so much over geographical space as through the whole gamut of society and experience. All this was to be learned or inferred from López Pinciano, as likewise it was to be seen that poetry resided not in the accident of verse but in the conception; that poetic truth was superior to historic and of a more universal validity; and that the epic might not only be cast in prose rather than verse but could dispense with its traditional rooting in historic fact. That it should carry conviction to the reader was what mattered. Don Quixote, the knight-errant broughtup against harsh reality and defeated by it every time, even—and most cruelly—when he believes himself triumphant, is sufficient counterblast to the absurdities of an Amadís de Gaula moving in outer space, and is also a figure of mingled fun and pathos in his own right.

But while the knight's adventures are relevant to the book's satirical purpose, Cervantes soon realized the new and constructive possibilities inherent in his design. The discovery can be dated from part i, 4, where he sends Don Quixote back to his village to procure himself a squire. Adventure thereafter serves a second and higher purpose—to provide both a framework and subject matter for two men talking as they travel the roads of Spain. There can be few themes current in the age which the two do not discuss, but it is the abiding themes that recur: the meaning and purpose of existence, the nature of reality and of truth, the relativity of judgment and hence of values, the inner springs of character. And out of this play of mind on mind comes Cervantes' perception of "character in solution," where in earlier fiction it had been essentially static. Not merely do Don Quixote the idealist and Sancho Panza the realist interact almost to the point of exchanging roles; but the reader's interest is subtly transferred from adventure in itself to its effect on the adventurer. In all these respects—the play of dialogue, the interplay of character, a scope coextensive with society and with the mind of man itself, a constant delving beneath the surface of appearances and of experience for their deeper significance—Don *Quixote* may properly be held to be at once the first and still the greatest of modern novels. Its all-pervading humanity makes it also one of the world's most loved books, as it is, after the Bible, the most widely translated.

Novelas Ejemplares.—Five of the 12 *Novelas ejemplares* belong to the Italianate vein of amorous intrigue, perilous adventure and incredible coincidence; in this, as in their innocence of serious intention, they are separated by an abyss from the others and may be held to date from before 1596. Cervantes' claim of originality—"I am the first to write short stories in Spanish"—and of "exemplariness" applies to the seven remaining. These show him exploring the realization that art is not reality but the imitation of reality, fancy-free within the bounds of verisimilitude, and much concerned, as reality is not, with form. The function of experience he sees now as being not to supply the writer with theme, incident or character—that falling to the creative imagination—but to invest these with a meaning and bearing on life. The contrast may be pointed between *El Cautivo,* a much earlier tale, inserted in *Don Quixote,* that is in large part a transcript of the author's years of captivity in Algiers, and *El Coloquio de los perros,* the last and best of the *Novelas ejemplares,* in which two dogs, discovering themselves possessed one night of the power of speech, dissect the follies and absurdities of that strange creature, man. Both are cast autobiographically: one is compact of the facts, the other of the lessons, of experience. It is in this sense, and not in that of conventional morality, that these tales are exemplary. They throw their several lights on human nature and on problems of human relations. The one lesson they would teach is that discretion is the supreme virtue, indispensable to the achieving alike of inner harmony and of the larger harmony with one's fellows and with nature. They are new in the sense that Cervantes. with the same general body of Aristotelian precept before him as in *Don Quixote,* is seeking to forge for himself a set of rules for this minor type of literature nhich had hitherto been ignored by the lawmakers. The seven tales can be seen as a succession of experiments. and if achievement is relative (for Cervantes, with his tendency to discursiveness, hankered instinctively after the larger canvas of the novel), he does establish the preeminence of character over incident, of form over content: "Some tales are pleasing in themselves, others in the mode of telling."

Persiles y **Sigismunda.**—*Persiles* y *Sigismunda* is commonly considered an enigmatic aberration in the unfolding of Cervantes' genius. The author's own opinion of it has been stated, and no other of his works enjoyed the same immediate popularity. It was inspired by the *Aethiopian Hzstory* of Heliodorus, exalted by Lopez Pinciano both as a true epic and as great poetry, and specifically linked by him with the romance of chivalry. Here was, in fact, a romance of chivalry written to the rules, and Cervantes set himself to the writing of another such, his confidence deriving from the fact that at last he had before him both a body of precept and an example. Where he parted company from Heliodorus, again with warrant from his mentor, was in giving to his work an allegorical and deeply religious purpose. Knights and ladies are pilgrims now in search of truth, not the Platonic, philosophical truth of *Don Quixote* but the revealed truth of the Catholic faith. The pilgrimage, begun in the errant north, ends in Rome. Cervantes' closing years showed an increasing concern with religion, and this had come to seem to him the noblest, most chivalrous enterprise of all. In placing his talents at the service of a cause, he knowingly forfeited the universal appeal of *Don Quixote,* just as in placing so much of the action in lands unknown to him, he jeopardized his cardinal principle of verisimilitude. He remained to the end, and remains, the supreme master of the Spanish tongue.

That mastery derives in part from wide reading—how wide is revealed in the "scrutiny of the books" in *Don Quixote* part i, 6—and from an ear sensitive to every nuance of a language just then come to maturity. The constant concern, as his powers developed, to distil experience into dialogue, allied to a repugnance for pedantry and affectation, gives his style the flexibility and naturalness of conversation at its best. Sancho Panza, drawing so effectively from the bottomless well of Spanish proverbs, is as good a talker as his master, and an effective foil to the latter's gravity and eloquence. And informing the whole is the sweet reasonableness, the infinite charity and humanity of Cervantes' own mind, always more concerned to understand than to judge. In this, too, reside his abiding greatness and the universality of his appeal.

CESALPINO, ANDREA (CAESALPINUS, ANDREAS) (1519–1603), Italian botanist and physician famous for his classification of plants based essentially on fruit and seed characters, was born in Arezzo in Tuscany on June 6, 1519. He studied anatomy and medicine at the University of Pisa, where he took his doctor's degree in 1551, and in 1555 became professor of materia medica and director of the botanical garden. Appointed physician to Pope Clement VIII, he removed in 1592 to Rome, becoming professor at the Sapienza. He died in Rome on Feb. 23, 1603.

Cesalpino was perhaps the most distinguished botanist of his time. His work, *De Plantis libri xvi* (1583), was the source from which various subsequent writers, and especially Robert Morison (1620–83), derived their ideas of botanical arrangement. Linnaeus himself gratefully avowed his obligations to Cesalpino. Cesalpino was also distinguished as a physiologist, and it has been claimed that he had a clear idea of the circulation of the blood. His other works include *Daemonum investigatio peripatetica* (1580), *Quaestionum medicarum libri ii* (1593). *De Metallicis* (1596) and *Quaestionum peripateticarum libri v* (1571).

See L. C. Miall, *The Early Naturalists* (1912) and *V.* Viviani, *Vita ed Opere di Andrea Cesalpino* (1922).

CESARI, GIUSEPPE (1568?–1640), called CAVALIERE D'ARPINO, also IL GIUSEPPINO, Italian painter and architect, was born in Rome. Under papal patronage he enjoyed extensive commissions and widespread fame, but his art was often the centre of great controversy. He stood between Annibale Carracci's theoretical eclecticism, and Caravaggio's antitheoretical naturalism, and was publicly reproached by both. Cesari was said to have corrupted taste in painting as Giambatista Marino had in poetry. He died in Rome in 1640. His brother Bernardino assisted in many of his works.

CESAROTTI, MELCHIORRE (1730–1808), Italian poet and literary critic whose translations of Ossian influenced the development of Italian romanticism, was born at Padua on May 15, 1730. He was educated in the seminary of his native city, where he later taught rhetoric (1751–60). In 1761 he entered the household of the Grimani family in Venice as a tutor; and in 1768 he was appointed to the professorship of Greek and Hebrew at Padua university. Cesarotti won fame with his sonorous verse translation (1763–72) of the fragments attributed by James Macpherson to the Gaelic bard "Ossian"—a sequence of poems that had considerable influence not only on his admirer, the poet Ugo Foscolo, but also on the development of romantic sensibility in Italy as a whole. Cesarotti's other works include translations

of Demosthenes, of the *Iliad* and of Voltaire's tragedies; an epic poem, *Pronea* ("Providence"; 1807) in praise of Napoleon; a wealth of *Rime* and *Lettere*, and two important essays on aesthetics: the *Saggio sulla filosofia delle lingue* (1785)—a synthesis of 18th-century linguistic theory—and the *Saggio sulla filosofia del gusto* (1785).

Cesarotti died on Nov. 4, 1808.

BIBLIOGRAPHY.—Cesarotti's works are published as follows: *Opere*, 40 vol. (1800–13); *Opere scelte*, ed. by G. Ortolani, 2 vol. (1945–46); *Poesie di Ossian*, ed. by G. Balsamo Crivelli (1924); *Saggio sulla filosofia dclle lingue*, ed. by R. Spongano (1943). See also V. Alemanni, *Un filosofo delle lettere* (1894); W. Binni, *Preromanticismo italiano* (1948); G. Marzot, *Il gran Cesarotti* (1949). (D. M. WE.)

CESENA, a town in the Emilia-Romagna region, northern Italy, in Forli province, is situated on the Savio river where it leaves the Apennines to cross the plain to the Adriatic sea, 82 km. (51 mi.) E.S.E. of Bologna by road. It is on the main railway line from Milan and Bologna to Ancona, Bari. Brindisi and Lecce. Pop. (1957 est.) 76.133 (commune). The town is dominated by a medieval fortress, on a hill (Rocca Malatestiana), built 1381–1450 and partially rebuilt 1466–80. The 14th–15th-century cathedral, largely Gothic, has a romanesque portal. Renaissance Biblioteca Nalatestiana, a complete medieval library built by Matteo Nuti for Malatesta Novello in 1452, retains a medieval atmosphere with the original desks and chained books. On a hill to the southeast, the church of Sta. Maria del Monte has many fine paintings, a collection of old votive pictures and beautiful 16th-century carved stalls. The town is an important mining and agricultural centre and many tourists attend races held there.

The ancient Caesena was a station on the Via Aemilia and a fortress in the wars of Theodoric and Narses. In 1357 it was heroically defended by Cia, wife of Francesco Ordelaffi, lord of Forli, against the papal troops under Cardinal Albornoz. In 1377 it was sacked and destroyed by Cardinal Robert of Geneva (afterward the antipope Clement). It was then held by the Malatesta of Rimini until 1465 when. after the death of Malatesta Novello, it came under the domination of the church. Both Pius VI (b. 1717) and Pius VII (b. 1740) were born at Cesena. In World War I1 it was captured by Allied forces on Oct. 20, 1944.

(AN. DO.)

CESIS (TSESIS, Russian VENDYEN, German WENDEN), a town in the Latvian Soviet Socialist Republic of the U.S.S.R., is on the main railway from Riga to Pskov. Pop. (1959) 13,900. The castle (1283), destroyed in 1577 by Ivan IV, was restored, and St. John's church dates from 1283. Located near land and water routes to Novgorod and Estonia. Cesis was a 13th-century Hanse town. Long the seat of the Livonian knights, the town was under Polish-Lithuanian rule from 1361 to 1629; it was conquered and held by Sweden until 1721 and then passed to Russia. In 1918 Cesis was incorporated in the newly formed state of Latvia, and in 1919 the Germans, who occupied the town in World War I. were defeated in the vicinity by Estonian and Latvian forces. In 1940 it was occupied by Soviet troops and except for the German occupation, July 1941 to Oct. 1944. it has remained in Soviet hands.

Cesis is a popular summer resort in the "Livonian Switzerland." Mainly an agricultural centre, it also manufactures building and road materials. (J. A. Bo.)

CESIUM (CAESIUM), a rare metallic element of the alkali group, symbol Cs, atomic number 55, chemical atomic weight 132.91, was the first element discovered by the use of the spectroscope *(see* SPECTROSCOPY: *Historical Spectroscopy)*. Two blue lines of unknown origin in the flame spectra of certain mineral water concentrates led R. Bunsen and G. R. Rirchoff to claim the discovery of cesium (Latin *caesius*, "sky blue") in 1860. Chemically very similar to the other members of the alkali group (lithium, sodium, potassium, and rubidium), its earlier discovery was overlooked not merely because of its scarcity but through confusion with potassium.

Occurrence.—Although rare, cesium is widely distributed in nature, occurring in certain mineral waters and soils and in minute concentration in sotne granites and pegmatite dikes. It is approximately half as abundant as lead and about seventy times as abundant as silver. V. M. Goldschmidt estimated the abundance of cesium in the earth's crust to be about 7 parts per million. Cesium is commonly found in association with lithium in lepidolite in concentrations ranging up to 0.7% and with potassium in carnallite. The chief cesium-bearing mineral is pollucite. a hydrated cesium aluminum silicate whose theoretical composition corresponds to $Cs_4Al_4Si_9O_{26}.H_2O$. Pollucite deposits of commercial interest have been found in the Black hills of South Dakota. The extraction of cesium from pollucite is accomplished by digestion of the finely pulverized ore with either hydrochloric or sulfuric acid. In the early 1960s southern Africa was the principal producer of cesium ores.

Uses.—Comparatively little commercial use has been made of cesium metal or its compounds because of its rarity. Its principal value is in photoelectric cells where advantage is taken of the fact that cesium, in common with other alkali metals, emits electrons when illuminated by visible light. For the same reason it is widely used in the pickup tubes of television cameras. Cesium salts mixed with a reducing agent provide a source of cesium metal for use as a "getter" for scavenging the last traces of gas from vacuum tubes. In the early 1960s there was increasing interest in cesium-137 as a source of gamma rays both for medical and industrial radiology. The advantage of cesium-137 over cobalt-60 for such applications is its long half life of 30 years.

Properties.—Twenty-one isotopes of cesium have been identified, ranging in mass number from 123 to 144. All are synthetic radioactive nuclides except for the naturally occurring stable isotope of mass number 133. The radioactive isotopes decay with half lives ranging from less than one minute to 2.0×10^6 years with the emission of electrons, positrons! or gamma rays, or by K-capture.

Cesium is the most reactive of all metals, melting and inflaming spontaneously on exposure to air and decomposing water with explosive violence. Despite its reactivity. cesium metal may be prepared comparatively easily either by the electrolysis of fused cesium cyanide or by the reduction of cesium chloride with calcium metal. A silvery white metal in its pure state. cesium acquires a brass-coloured tarnish in the presence of a trace of oxygen. It is one of the softest metals and is readily cut by knife even at liquid nitrogen temperatures. Cesium metal has the body-centred cubic structure with a unit cell parameter of 6.05 A. Its gram atomic volume (69.95 c.c.) is the largest of all elements. The following table lists a number of its important physical properties.

Physical Properties of Cesium

Density of solid at 20° C., g. per c.c.	1.90
Melting point, °C.	28.45
Boiling point, °C.	690
Coefficient of thermal expansion, linear	97×10^{-6}
Atomic radius, Å.	2.35
Ionic radius, Å.	1.69
Heat of fusion, cal. per g.	3.76
Heat of vaporization, cal. per g.	120
Ionization potential, v.	3.89
Standard Electrode potential, v.	3.02

Cesium is univalent in all of its compounds, a consequence of the ease with which its outermost (6s) electron is removed. The outer electron configuration of the neutral atom is $5s^25p^66s^1$, and the large atomic radius, low ionization potential, large atomic volume. high coefficient of compressibility and many related properties of the metal are all consequences of the low binding energy of the 6s electron to the nucleus. The intervening electrons effectively screen the valence electron from the charged nucleus. Cesium ion is isoelectronic with xenon, and owes its stability (lack of higher valence states) to the complete occupation of the 5s and 5p electron levels.

Compounds.—Cesium forms all the usual simple salts. such as the chloride, carbonate, sulfate, and nitrate which resemble the corresponding salts of potassium and rubidium. The crystal structure of cesium chloride. bromide and iodide differs from that of other alkali metal halides because of the large radius of the cesium ion. The perchlorates and chloroplatinates of these three alkali metals are sparingly soluble in water and are used in their analysis. No completely quantitative gravimetric separations of cesium from potassium or rubidium have been devised. although the double salt

of cesium and antimony chlorides ($3CsCl.2SbCl_3$) is more or less satisfactory. In low concentrations cesium and the other alkalies are determined by flame photometry.

In addition to the monoxide (Cs_2O) cesium forms three additional compounds with oxygen, viz., the dioxide (Cs_2O_2), the sesquioxide (Cs_2O_3) and the tetroxide (Cs_2O_4 or CsO_2). Polyhalides, such as CsI_3, CsI_4, CsClIBr and even $CsI_9.1\frac{1}{2}C_6H_6$, are favoured because of the large radius of the cesium ion. In all of these compounds cesium is univalent. Like the other alkali and alkaline earth metals cesium forms a nonvolatile salt with hydrogen, in which hydrogen plays the unusual role of the negative ion. Compounds in which cesium replaces a hydrogen atom in either aliphatic or aromatic hydrocarbons are typically colourless solids, nonvolatile, and insoluble in most organic solvents. Cesium triphenyl methyl. however, is a blood-red solid which is sparingly soluble in ether. Mono- and di-substituted derivatives of acetylene have been prepared for all the alkali metals, including cesium. They are colourless crystalline solids which may be prepared by the action of acetylene on a liquid ammonia solution of the metal or by the direct action of acetylene on the molten metal. Cesium acetylide reacts violently with water, regenerating acetylene and yielding an aqueous solution of cesium hydroxide.

CESKE BUDEJOVICE (Ger. BUDWEIS), a city of Ceske Budejovice region, Czechoslovakia, at the junction of the Malse river with the Vltava (Moldau), lies in the centre of one of the curious lake regions of southern Bohemia. Pop. (1957 est.) 63.862. Ceske Budejovice is a navigation head on the Vltava for very small craft. It is an old city and had a strong German element up to the time of World War II. The main feature is the great square in the heart of the city, surrounded chiefly by 18th-century buildings. Ceske Budejovice has always had a vigorous, if small-scale, economic existence. It has a trade in lignite mined locally and timber from the south-Bohemian forests. and various manufactures of long standing, including the one-time Hardmuth pencil factories. Budweiser beer and porcelain industries. In 1827 the first railway in the Habsburg territories, horse drawn on wooden lines, was opened between Ceske Budejovice and Linz. The city is an important road and rail intersection point.

(H. G. S.)

CESNOLA, LUIGI PALMA DI (1832–1904), Italian-American soldier and archaeologist. was born at Rivarolo, near Turin, Italy, on July 29, 1832. Educated as a professional soldier, he served with distinction on the continent and. on emigrating to the United States in 1860, opened an officers' training school in New York city. The almost immediate outbreak of the American Civil War drew him into the Union army as a colonel. He was wounded, imprisoned and discharged with the rank of brigadier general and a presidential appointment as United States consul in Cyprus (he served concurrently as Russian consul there). His duties were light, and he developed an archaeological fervour which, in over ten years of exploration and excavation, resulted in his amassing the largest and richest collection of Cypriote antiquities in the world. The bulk of this collection was acquired in 1872 by the New York Metropolitan Museum of Art; part of it is still on exhibit there. He was appointed director of the museum in 1879 and held this post with distinction until his death in New York city on Nov. 21, 1904. In 1897 he was awarded the medal of honor for an action he took part in during 1863.

An ugly series of charges against the authenticity of parts of his collection, in 1880–82, resulted in libel suits, newspaper publicity and eventually the complete exoneration of Cesnola. The accuracy of his records regarding objects in his collection has been repeatedly challenged, but modern scientific research has tended to vindicate him on every verifiable point.

Cesnola published *Cyprus, Its Ancient Cities, Tombs, and Temples* (1877); *The Metropolitan Museum of Art* (1882). and the monumental work *A Descriptive Atlas of the Cesnola Collection* (1884–1903).

See John L. Myres, *A Descriptive Atlas of the Cesnola Collection of Cypriote Antiquities in the Metropolitan Museum of Art, New York,* pp. xiii–xxi (1914). (J. H. Yo.)

CÉSPEDES, PABLO DE (1538–1608), Spanish poet, painter, sculptor and architect, was born at Córdoba and educated at Alcalá de Henares, where he studied theology and oriental languages. On leaving the university he went to Rome, where he became the pupil and friend of Federigo Zuccaro, under whose direction he studied particularly the works of Raphael and Michelangelo. In 1560, while he was yet in Rome, proceedings were taken against him by the Inquisition at Valladolid, but they were dropped. He returned to Spain a little before 1577 and received a prebend of the cathedral at Córdoba, where he resided till his death. Cristobal de Vera, Juan de Peñalosa and Zambrano were among his pupils. His "Last Supper" at Córdoba was much admired in his time. Cespedes was author of several opuscules in prose on subjects connected with his profession. His poem on "The Art of Painting," containing a glowing eulogy of Michelangelo, is considered among the best didactic verse in Spanish. The few remaining fragments were first printed by Francisco Pacheco in his treatise *Del arte de la pintura,* in 1649.

CÉSPEDES Y MENESES, GONZALO DE (1585?–1638), Spanish writer of histories and short stories, is best known for a romance, *Poema Trdgico del Español Gerardo, y Desengaño del Amor Lasciuo* (1615–17), translated (1622) by Leonard Digges as *Gerardo the Unfortunate Spaniard, or a Patterne for Lasciuious Lovers,* and drawn upon by John Fletcher for two plays, *Tlte Spanish Curate* (licensed 1622) and *The Maid in the Mill* (licensed 1623). Céspedes was born in Madrid. but when his *Historia apologética en los Sucessos del Reyno de Aragdn y su Ciudad de Zaragoxa, años de 1591 a 1592* (1622) was confiscated, he moved to Saragossa and later to Lisbon. While in exile, he published *Historias Peregrinas y Ejemplares* (1623), short stories which, like those of *Poema Trdgico,* show considerable imagination and insight into character, despite an affected style; and the first part of a *Historia de Felipe III* (1631), a fulsome eulogy for which he was rewarded with the post of official historiographer to the Spanish king. Céspedes died in Madrid, Jan. 27, 1638.

See the introduction by E. Cotarelo y Mori to a reprint (1906) of *Historias Peregrinas.*

CESSIO BONORUM, literally "a cession of goods," was, in Roman law, a voluntary surrender of goods by a debtor to his creditors. It did not amount to a discharge of the debt unless the property ceded was sufficient for the purpose, but it secured the debtor from personal arrest. The creditors sold the goods, applying the proceeds to their claims. The procedure of *cessio bonorum* enabled the debtor to avoid infamy, and though his after-acquired property might be proceeded against he could not be deprived of the bare necessaries of life. The main features of the Roman law of *cessio bonorum* were adopted in Scots law, and also in the French and several other legal systems. In England it exists under the internal regulations of certain commercial bodies, such as the recognized stock exchanges. In Scotland the process of *cessio bonorum* was abolished by the Bankruptcy (Scotland) act. 1913.

CESTI, PIETRO ANTONIO (1623–1669), one of the leading Italian composers of the 17th century, was born at Arezzo, Aug. 5, 1623, and studied in Rome. He moved to Venice, where the first of his 15 known operas, *Orontea,* was produced (1649). In 1652 he became *maestro di cappella* to the archduke Ferdinand of Austria at Innsbruck, a post he combined for a time with membership in the papal choir. From 1666 until 1669 he was vice-*kapellmeister* to the imperial court in Vienna. He died in Florence on Oct. 14, 1669.

After Francesco Cavalli, Cesti was probably the best-known composer of his generation. Throughout the 17th century his operas were frequently performed in Italy and elsewhere. He wrote sacred and secular music, the former influenced by the Roman school, the latter by the Venetian. Though his works are too rare for the tracing of any development of style, they show an originality uncommon at that time. Christ Church, Oxford, possesses an important manuscript collection of 18 secular and 3

sacred cantatas. His most sumptuous opera, *Il Pomo d'oro* (1667), appeared in a modem edition (*Denkmäler der Tonkunst in Österreich*, vol. iii–iv, 1896–97) and La *Dori* (1661) in *Gesellschaft für Musikforschung*, vol. xi (1883).

See F. Coradini, "P. Antonio Cesti," *Rivista Musicale Italiana* (1923). (S. T.)

CESTODA, a class (or subclass) of parasitic flatworms commonly called tapeworms. *See* TAPEWORM.

CETACEA, the order of mammals that includes whales, dolphins and porpoises. *See* WHALE.

CETEWAYO (KETSHWAGO) (d. 1884), king of Zululand from 1873 to 1879 and the last of the great Zulu kings, was born about 1834, the eldest son of Mpande who was recognized as king of Zululand when Britain annexed Natal in 1843. As Mpande's physical disabilities reduced his active share in government Cetewayo became increasingly influential in Zulu affairs, especially after the battle of the Tugela (1856) where he defeated and killed Nbulazi, his brother and rival. In 1861 Theophilus Shepstone, secretary for native affairs in Natal, visited Zululand to witness his formal recognition as heir to the throne. Although Cetewayo was suspicious of the good faith of the Natal government, which had afforded protection to two of his brothers, his relations with it remained fairly amicable; and after Mpande's death in 1872 Shepstone again visited Zululand, this time to install Cetewayo as king (1873) and to impress upon him the need for more humane government.

Shepstone was anxious to maintain the integrity of Zululand against the encroachment of Transvaal Boers who asserted that Cetewayo had promised them territorial concessions; but after the annexation of the Transvaal (1877) Shepstone shifted his ground and supported Boer claims. However in 1873 a Natal commission reported in Cetewayo's favour, denying any cession of land to the Boers. Fear of Transvaal reactions to this report, and a probably unfounded belief that Cetewayo was threatening colonial security, precipitated the Zulu war. The high commissioner, Sir Bartle Frere, seized on minor incidents—Cetewayo's violation of the Natal frontier to recapture fugitives, his failure to observe his coronation "promises," his expulsion of missionaries from Zululand—as a pretext to wage a preventive war. He delayed publication of the boundary commission's report until Dec. 1878, and accompanied it with an ultimatum to Cetewayo. The demands, as Frere had anticipated, were not accepted; and Lord Chelmsford's army moved into Zululand in Jan. 1879 to enforce them. Though defeated at Isandhlwana, the British were able to check the Zulus at Rorke's Drift, finally destroying their power at Ulundi (July 1879). The Zulu military power was broken, and Cetewayo was captured in August and exiled to Cape Town.

Zululand was then divided among 13 chiefs. However Cetewayo was allowed to visit England in 1882 to plead for his release. A portion of his former kingdom was restored to him, and in Jan. 1883 he was once more installed by Shepstone. But he did not long survive his return. Defeated by a rival chief, he was compelled to seek the protection of the British resident at Eshowe, and died there on Feb. 8, 1884. *See* also ZULULAND: *History*. (G. B. No.)

CETHEGUS, in ancient Rome the cognomen or third name of a patrician family of the *gens Cornelia*.

MARCUS CORNELIUS CETHEGUS (d. 196 B.C.), Roman general and orator, was *pontifex maximus* and curule aedile, 213 B.C. In 211, as praetor, he had charge of Apulia; later, he was sent to Sicily, where he proved a successful administrator. In 209 he was censor, and in 204 consul. In 203 he was proconsul in Upper Italy, where, in conjunction with the praetor P. Quintilius Varus, he defeated Mago, Hannibal's brother, in the Padus (Po) valley, forcing him to leave Italy during the Second Punic War. He had a great reputation as an orator: the poet Ennius calls him *suadae medulla* ("the essence of persuasion") and Horace calls him an authority on the use of Latin words.

GAIUS CORNELIUS CETHEGUS (d. 63 B.C.) joined the conspiracy of Catiline (*q.v.*) in the hope of getting his debts canceled. When Catiline left Rome in 63. Cethegus remained behind as leader of the conspirators with P. Lentulus Sura. He undertook to murder Cicero and other prominent men, but was hampered by the dilatoriness of Sura. He was condemned to death, and executed, with Sura and others, on the night of Dec. 5.

See Sallust, *Catiline*, 46–55

CETINA, GUTIERRE DE (1515?–1555?), Spanish poet and soldier, whose madrigal "Ojos claros serenos" is one of the most famous of Spanish poems. was born at Seville After serving in Italy and Germany, he retired from the army in 1545, railing for Mexico in 1546. On a second visit in 1554 he was wounded in a brawl in La Puebla de los Xngeles. He died before 1557. A follower of Boscán and Garcilaso de la Vega, Gutierre de Cetina wrote extensively in Italianate metres under the name of Vandalio; his sonnets and epistles are elegant. Much of his verse consists of translation from Petrarch, Ariosto. Ludovico Dolce and Ausias March, and he mas influenced by Luigi Tansillo and Pietro Bembo, as well as by classical poets such as Martial, Juvenal and Ovid.

See A. M. Withers, *The Sources of the Poetry of Gutierre de Cetina* (1923). (J Gs)

CETINJE, former capital of Montenegro, one of the republics of Yugoslavia, is situated in the mountains of southwest Montenegro, 128 km. (80 mi.) E.S.E. of Dubrovnik and 48 km. (30 mi.) E. of Titograd (Podgorica) by road. Pop. (1961) 9,345. The town, 2,068 ft. above sea level, is dominated by Mt. Lovcen (5,738 ft.). The fortified monastery became the residence of the prince-bishops, theocratic rulers of Montenegro (*q.v.*). The Biljarda (1847) was the home of Bishop Petar Petrovic Njegos (Peter 11), the greatest Serbian poet. Among other fine buildings is the palace of King Nicholas, the last independent Montenegrin ruler. The main industries are agriculture and tourism. Founded in 1484, Cetinje had a printing press at the monastery by 1493. It was occupied by Austria from 1916 to 1918. and after World War I was incorporated into Yugoslavia. In World War II it was occupied by the Italians in April 1941, and from July 1911 until late 1944 was the scene of continuous fighting. In 1945 the capital was moved from Cetinje to Titograd. (V. DE.)

CETTE: *see* SÈTE.

CETUS ("The Whale"), in astronomy, a constellation of the southern hemisphere, fabled by the Greeks to be the monster sent by Neptune to devour Andromeda, but which was slain by Perseus. It contains the long-period variable star Mira Ceti (*o* Ceti), which was the first star recognized to be variable (by Fabricius in 1596). It usually ranges from the ninth to the third magnitude in about 340 days; but this kind of variation is always rather irregular. It has a companion distant rather less than a second of arc. The companion was first suspected from spectroscopic observations; when looked for visually it was easily seen, but it is difficult to understand why it had escaped notice in a star which was so continually studied. The companion is itself a very interesting star, possessing an unusual type of spectrum with bright lines. (A S. E.)

CEUTA (Arabic SEBTA), a Spanish military station and free port on the north coast of Morocco, Africa, administered with Cádiz province. Pop. (1950) 56,909. At its eastern end is a promontory marking the southeastern point of the Straits of Gibraltar, which between Ceuta and Gibraltar are 14 mi. wide. The highest of the seven hills of the headland is Mount Acho (636 ft.), the ancient Abyla. one of the "Pillars of Hercules." A narrow isthmus connects the promontory to the mainland. The old tonn covers the low ground of the isthmus at the western end of which is a moated fort dating from the Portuguese occupation, and the new town spreads along the hills to the west To the northwest of the isthmus is the port, protected by breakwaters. At the quayside is the terminus of the railway to Tetuán, which is also linked by road. Five centuries of Christian occupation have given the town an appearance more Spanish than Moorish.

There were successive Carthaginian, Greek and Roman colonies there, the last said to have been called Septem Fratres, whence came the Arabic and Spanish names. It was held in turn by the Vandals, Goths and Byzantines; the Byzantine governor Count Julian invited the Arabs, whom he had successfully resisted, to invade Spain (710–711). Long contended for by Berber and Spanish-Moorish dynasties, Ceuta became a commercial and in-

dustrial city, noted for its brassware and its trade in ivory. gold and slaves. It is said to have had the first paper factory in the west. In 1415 it was captured by the Portuguese. passed to Spain in 1580 and was definitely assigned to Spain by the treaty of Lisbon (1688). It often withstood siege by the Moors; that by Mulai Ismail beginning in 1674 lasted 26 years. Occupied by British troops in 1810, with Spanish consent, it was returned to Spain at the close of the Napoleonic Wars. From Ceuta, during the "national movement" of 1936, General Franco dispatched an expedition to Spain. (G. L. M.)

CEVA, GIOVANNI (1647 or 1648–1734), Italian mathematician and engineer, was professor in Mantua most of his life. His book De Re *Nummaria* (1711) is one of the first works in mathematical economics. Ceva's theorem concerns the transversals from a point to the vertices in a triangle.

TOMASSO CEVA (1649–1736), his brother. was a poet and mathematician who taught mathematics at the Jesuit college in Milan. He is best known for his literary works. which appeared in several editions: Jesus Puer (1690); *Philosophia novo-antiqua* (1704); Sylvae (2nd ed., 1704). A collection of his mathematical works, mainly geometrical in nature, was published from 1695 to 1699. (O. OE.)

CÊVENNES, highlands in southern France, formed by the uptilted southeastern-margin of the Massif Central (*q.v.*), overlooking the lower Rhône valley and the plain of Languedoc. The highest parts rise well above 5.000 ft. and experience long, snowy winters. The Cévennes form part of the watershed between Atlantic and Mediterranean drainage, and the Mediterranean slope is gashed by the valleys of torrents that descend steeply toward the Rhône and the Mediterranean coast. Cultivation of the vine, the olive and fruits extends up the valleys, but mulberry growing, which was at one time widespread on the slopes, is largely abandoned. Although sericulture has declined, there are still some textile mills in the Cévennes valleys. Heavy industries are represented on the small Alls coalfield. Sheep are grazed on the high pastures, but in small numbers. Although the name Cévennes signifies wooded slopes, the highlands have been largely denuded of woodland, and by 1960 afforestation had made only modest beginnings. especially on the Aigoual. The secluded valleys of the Cévennes provided a refuge for dissenters during the religious wars of the 16th century, and Protestantism is still well represented there. (AR. E. S.)

CEYLON (Sinhalese from Sanskrit SRI LANKA; Tamil ILAM or ILANKAI), a large island in the Indian ocean and a self-governing member of the Commonwealth of Nations. Pop. (1953) 8.097.895. It is 270 mi. long and 140 mi. wide at its broadest part and has an area of 25,332 sq.mi., about half the size of England. It lies between 5° 55′ and 9° 50′ N. and between 79° 42' and 81° 52′ E., and is situated southeast of Cape Comorin in India, from which it is separated by the 33-mi.-wide Palk strait.

This article contains the following sections and subsections:

I. PHYSICAL GEOGRAPHY

1. Geology and Structure. — Ceylon is essentially a detached portion of the Deccan plateau of south India and, like it, is underlain almost everywhere by hard, old Pre-Cambrian rocks. As in most areas of similar geologic make-up, the precise origins and relationships of the rocks leave much room for disagreement and for alternative interpretations; this is especially true in Ceylon where systematic geologic mapping was late in beginning. It has become usual to recognize that a broad belt in the centre of the island consists of the Khondalite series, altered sediments like those making up the series of the same name in Madras and Orissa. Schists, quartzites and crystalline limestones are all to be found. Some authorities consider that these rocks are disposed in a synclinorium pitching northward. This would certainly explain the trend of the pronounced strike features that make such a mark on Ceylon's relief; *e.g.,* the east-west ridges at the southern end of the main central highland mass, the bow-shaped hills and valleys to the southwest of this mass in the province of Sabaragamutva, and the long quartzite edges that run north and northeast from the highlands to terminate in the imposing and beautiful headlands of Trincomalee. It is to the Khondalite series that most of Ceylon's scanty mineral wealth owes its origin: graphite from mines in the solid rock and gems of high quality chiefly from alluvium derived from that rock.

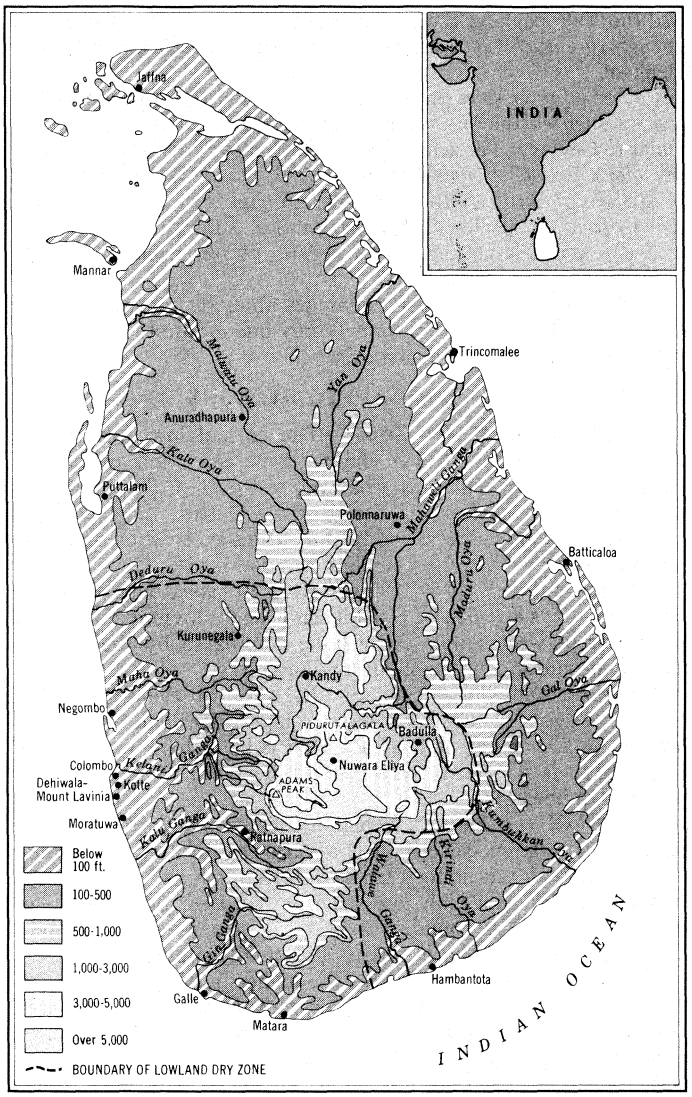
In a broad belt to the east of the Khondalites and in a narrower and less continuous belt to the west. there outcrop the gneisses and schists of the Vijayan series. The geologic map of Ceylon is also complicated by various ancient intrusions, including charnockites that further demonstrate the island's kinship with south India.

Ceylon is mainly made of crystalline rocks and this has important economic consequences. There is little hope of coal or oil or of rich reserves of underground water (which is, in fact, confined to certain bands, to joints and fissures and to the layer of surface weathering); and there is little chance of fertile soils on ancient crystalline rocks in the tropics.

There are certain exceptions to these generalizations. Miocene limestones occupy the Jaffna peninsula in the far north together with the outlying islands and also stretch, in less pure form, down the northwest coast; these give underground water. Alluvium occurs in the larger valleys and also stretches in broadish bands behind sand bars along parts of the east and west coasts. Pleistocene plateau deposits are shown in the northwest on some maps, but these may be no more than residual products of weathering.

2. Physiography. — The south central part of Ceylon is a hilly region of great and varied beauty known to the Sinhalese as Uda Rata (upcountry). The highest land there, that over 5,000 ft., is disposed very much in the shape of an anchor with a north-south shank. The shank is broken into two parts by the deep valley of the east-west reach of the Mahaweli Ganga, Ceylon's biggest river. To the north of this valley rises the Knuckles range (6,112 ft.); to the south lies the fine scenery round the hill station of Nuwara Eliya, including the highest summit in Ceylon, Pidurutalagala (8,281 ft.), a rounded and not very distinguished mountain. To the south of this the shank joins the two hooks of the anchor in Horton plains, an elevated tableland much of which lies above 7,000 ft.

The western hook of the anchor includes the fine pyramid of Adams peak (*q.v.*; 7,360 ft.) and encloses between itself and the shank a basin drained partly by tributaries of the circuitous Mahaweli Ganga and partly by streams flowing more or less directly to the west coast. It seems reasonably clear that the Mahaweli headwaters are under attack from these west coast streams, notably from the Kelani Ganga, and that some of them have breached the hook ridge to effect actual capture. There is a great difference in level between adjacent valleys where one Bows to the Kelani and the other to the Mahaweli, a situation that is exploited by the important Laksapana hydroelectric station. The



CEYLON SHOWING PHYSICAL FEATURES AND MAJOR TOWNS AND CITIES

western basin as a whole is a region of considerable relief and forms one of the principal tea-growing districts; its routes converge on Kandy.

There is a corresponding eastern basin that of Uva, centring on Badulla and draining northward to the Mahaweli Ganga through deep valleys separated by considerable ridges. It is noteworthy that the hook enclosing this basin is nowhere breached by east-flowing streams, perhaps because these are dry zone streams with much less potency than the Kelani and its neighbours. The south edge of the two hooks of the anchor forms a great. continuous mural scarp; at the point known as "World's End" (7,142 ft.) there is a breath-taking drop of 5,000 ft. or more.

Upcountry Ceylon. the region that can be described in terms of the anchor and its two basins, ends at about the 1.000-ft. contour. Between this contour and the west coast lies a region of mainly westward-sloping valleys separated by hills falling in altitude as the sea is approached until, at Colombo itself, they are little more than low, laterite-covered humps. Some have seen a stepped appearance in these hills and interpreted the relief of Ceylon in terms of successive peneplains though in the early 1960s much more work remained to be done on this problem. To the southwest of the central hills the steady descent to the sea is interrupted by the outlying hill mass of Rakwana. To the east of the eastern hook a number of east-flowing streams. like the Gal Oya, find their way between considerable isolated hills, such as the great landmarks known from their shapes as Friar's Hood and Westminster Abbey. and then between smaller inselberglike features, to form deltas in the east coast alluvium. To the north of the main hill mass there stretches for over a hundred miles a rolling country cut by rivers flowing at more or less right angles to the coast and diversified by strike ridges and by many isolated hills. Some of the latter, like Ritigala (2.514 ft.), are large; some, like Sigiri or Sigiriya. a former hill fortress. are spectacular; and all add charm to this ancient Rajarata (the "king's country").

The limestone Jaffna peninsula is. in fact, a raised coral reef, rising to 50 ft. or so above sea level; it is a flattish country with occasional rocky hillocks. A number of offshore islands, such as Kayts, are made of the same limestone material.

Apart from the Jaffna peninsula and islands. the exposed southwest and the rocky headlands formed by the quartzite ridges running out to sea at Trincomalee. the coasts of Ceylon are low and consist largely of spits, bars and other constructional forms. The great bar south of Batticaloa, behind which a lagoon is gradually being filled up by the east-flowing rivers, is a most interesting feature.

3. Climate. — Temperatures at or near sea level in Ceylon are high and show little variation from month to month. Thus the mean monthly temperature at Colombo varies only irom 79.5" F. in December to 82.1" F. in Way. In the northern half of the island and in the east, the dry zone, the hottest month is slightly hotter (*e.g.*, Trincomalee, 77.8" F. in January to 85.4" F. in June) and in the hottest weather the daily maximum is apt to exceed 100° F. With increasing height shade temperatures naturally fall but are very much less than sun temperatures. At Nuwara Eliya (6,170 ft.) monthly average shade temperatures are around 60° F. and frost is not unknown in the cooler months.

In terms of rainfall and its effects, Ceylon is a country of great contrasts. The southwestern sector of the island. including the western basin within the western hook, is well watered at almost all seasons, and high humidity often makes high temperatures seem even hotter. This sector. the wet zone, receives rain from the southwest monsoon (late May until August or September), from the so-called northeast monsoon (December until February) and also in intermonsoon periods. The annual total varies from 75 in. north of Colombo to over 200 in. in the hills; the precise pattern of maxima and minima varies from station to station with exposure and other factors, but nowhere in this zone, except in years of rain failure, is there a real dry season.

In all other sectors of the island, on the other hand, there is a very marked dry season during the southwest monsoon, some rather variable intermonsoon rain and a heavy concentration of rainfall during the northeast monsoon. Annual totals vary from 40 in. in the northwest and southeast to more than 75 in. In the lowland dry zone the dry season is a period of acute drought and of burned-up vegetation, but low humidity conditions are somewhat mitigated in the upland dry zone, which may be roughly equated with the Uva bafin. Moreover, dry zone rainfall is subject to considerable and often critical variability. Not surprisingly. the dry zone is a region where from ancient times irrigation has been practised as a way of insuring against hckle rains in the wet season and of cultivating in the absence of rain in the dry season. Since there is little underground water outside the Jaffna peninsula, irrigation means reliance on rivers. Given the radial pattern of Ceylon's drainage. it follows that most rivers in the wet zone (uith the notable exception of the hfahaweli Ganga) flow only through the wet zone, and that dry zone rivers, rising in the dry zone. receive little water during the dry season and degenerate into mere strings of pools. Tank irrigation, with storage of water from wet season to ensuing dry season, is the traditional answer to the problem.

4. Vegetation. — Ceylon's natural vegetation, where it remains, bears the clear imprint of relief, climate and the hand of man. The lowland wet zone and lower western slopes of the hills were formerly covered by dense tropical evergreen forest similar to the familiar rain forest. Very little of this remains outside the somewhat scanty forest reserves. The region is mainly either under cultivation, covered by coarse grassland (*talawa*), probably the result of repeated burning, on the loner slopes of the outermost foothills or, over a rather wider area, by wet low fernland dominated by *Gleichenia linearis*, *kekilla* to the Sinhalese. Much of

the lowland dry zone is still forested, although the rate of clearing is accelerating, with mixed evergreen and deciduous woodland adapted to seasonal droughts. Much of the forest is probably secondary, the result of partial regeneration after shifting cultivation. Much, too, is of poor quality, but some valuable timber trees, notably ebony and satinwood, are to be found. A certain amount of teak has been planted. In some places, especially in the eastern dry zone, the climax forest is replaced by grassland of savannalike aspect, the damana of the Sinhalese, probably as a result of clearing followed by repeated burning. In the extreme northwest and southeast and on dry zone coastal sand bars the forest degenerates into thorn scrub.

Upcountry there must once have been an interesting succession of altitudinal belts. The remains of these are still discernible, but much has been cleared for cultivation or replaced by grasslands. On the wetter hills, for example, wet evergreen forest from 4,000 to 8.000 ft. varies little in composition but varies greatly in physiognomy and structure. The trees become increasingly gnarled and dwarfed. the undergrowth becomes lighter and eventually a fascinating elfin forest is reached. Above 5,000 ft. in these wetter hills there occurs a secondary grassland often known as wet patana, which consists mainly of rough tussocks of *Chrysopogon zeylanicus;* Rhododendron arboreum occurs there in stunted form. In the drier Uva hills and elsewhere it is difficult to determine what the climax vegetation was, for square mile after square mile of rolling hilly country is covered with dry patana, a coarse dry grassland which also extends into many parts of the western basin between 1,500 and 5,000 ft. The grassland is dominated by *Cymbopogon confertiflorus* and subject to periodic burning. Some have thought dry *patana* to be true climatic climax vegetation, others have more convincingly argued that the climax is forest and that dry patana is the result of clearing and burning.

Soils.—The visitor to the island may conclude from observation of the vitality and verdure of the natural and cultivated trees of the wet zone, or even from the rather more weary yet still green appearance of much dry zone forest, that Ceylon is a country blessed by great fertility of soil. In point of fact these qualities of the vegetation derive almost entirely from climate and from the rapid turnover of plant nutriment in a tropical environment. The soil itself. like that of many another tropical region based on old, long-weathered crystalline rocks, is for the most part poor and relatively infertile.

Much work remains to be done before the pattern of Ceylon's soil geography becomes clear. Some generalizations, however, are possible. It is clear, for example, that everywhere in the lowlands there is a tendency to laterization; that is, to the eventual removal by leaching of all but hydroxides of iron and aluminum and some quartz. The process has gone further in true laterites, which occur in parts of the wet zone and exhibit the characteristic layer of concretions. Where erosion has brought these to the surface, poor and almost uncultivable soils result. In other parts of the wet zone and in the dry zone the process has not gone so far, but in all these red soils humus and calcium contents are low, phosphorus content is poor and potash content variable. In lowland regions of fairly prominent relief there is a tendency for leaching to be strongest on watersheds and for valley bottoms to accumulate nutrients and other soil constitpents; many valley bottoms have, in fact, blue-gray paddy soils of gley type, which contrast with the red soils higher up the slopes.

There are certain areas of abnormal soils: red loams of terra rossa type on Jaffna limestones, other lime-rich soils on crystalline limestone belts and soils of variable fertility or salinity on alluvium. Of the various types of secondary grassland, *talawa,* dry patana and damana are apt, in part at any rate. to be underlain by poorer, shallower or truncated versions of adjacent forest soils; wet patana has its own characteristic black humic soils, with a profile topped by 12 to 18 in. of peaty loam.

5. Animal Life.—Ceylon is renowned for its wildlife. but by the 1960s the advance of cultivation had already confined some of the more interesting species of birds to the few remaining wet zone forests and even the dry zone fauna was in danger. Two fine national parks exist, the Wilpattu park on the northwest coast and the Yala park on the southeast coast, but these are not large enough to ensure the preservation of certain species, notably the elephant.

Ceylon's fauna shows many signs of insularity. Certain Indian species such as the tiger are absent, while other species are peculiar to Ceylon. These include the Ceylon sambar (Rusa unicolor unicolor), Russell's viper (*Vipera russelli pulchella*) and a number of species of birds. Other notable animals include the elephant and leopard, a species of bear, monkeys, squirrels, many kinds of snake and a large number of species of birds, many of great beauty.

Ceylon, like many tropical countries, abounds in species of ant, mosquito and other insects, though only one mosquito (Anopheles *culicifacies*) is a vector of malaria.

II. GEOGRAPHIC REGIONS

1. The Lowland Wet Zone.—The coastal lowlands form a narrow, hot humid belt down the wet zone coast and are densely populated. There is a large urban population in Colombo and its satellites and in a string of other towns. Outside the towns and the coastal fishing villages, paddy and garden cultivation and commercial crops (rubber and coconut) are dominant.

The coconut belt is a triangle with its apex just north of Colombo. It is a region of coastal sands and alluvium and, inland of valleys between low lateritic hills, dominated by the production of coconut, mainly in small holdings.

The ridge and valley country fills most of the province of Sabaragamuwa and consists mainly of high ridges and valleys following the Khondalite strike. Rainfall is high there and some of the country is still fairly wild, but its northern part is Ceylon's principal rubber area.

2. The Hills.—The Kandy region consists mainly of the lower part of the western basin, and is a very beautiful region of hills and valleys with much steep land. Rainfall is high. Many traditional-style Kandyan Sinhalese villages with their paddy and gardens are still to be found, but there is also much commercial cultivation of tea on both estates and small holdings.

The tea region proper occupies the higher portions of the western basin and is largely devoted to tea cultivation on large estates. It is an area of heavy rainfall and strong relief. The Uva basin (the eastern basin) is a distinctive region of ridges and valleys within encircling high ground, with Sinhalese valley villages, tea estates and wide stretches of open patana grassland. It has a marked dry season.

3. The Lowland **Dry** Zone.—This zone includes all lowland areas subject to a pronounced dry season. The west coast is a region of low relief, of low rainfall and of sparse population away from a northward extension of the coconut belt. The Jaffna peninsula and islands form a region of limestone terrain, of dense rural settlement by Ceylon Tamils and of a large urban population in and around Jaffna. Paddy, tobacco and other crops are grown.

The east coast lowlands consist of alluvium behind sand bars and are also largely peopled by Ceylon Tamils who grow paddy on the alluvium and coconut and other crops elsewhere. Trincomalee and Batticaloa are the local towns. The southeast coast is a low region, dry and rather desolate, with a sparse population except in the western part where restored irrigation works have attracted cultivators.

Bintenne is the name given to the region of confused relief between the mural scarp of the central hills and the eastern coastal lowlands. It is a difficult region, for long sparsely peopled, though in the early 1960s part of it was being opened up under the Gal Oya development scheme. The north centre is a rolling plain with inselbergs (*q.v.*), the Rajarata of ancient Sinhalese civilization. It is a country of many small villages clustering around little tanks and, increasingly, of new settlement under restored irrigation works. Anuradhapura is the regional centre.

III. THE PEOPLE

1. Ethnic Groups.—The population of Ceylon is increasing rapidly; it rose by over 1,000,000 in the three years following the 1953 census. The main centres of population are Colombo, Jaffna,

Kandy, Galle, Negombo, Kurunegala and Nuwara Eliya. Ceylon nationals as a whole are known as Ceylonese and include two principal language groups, Sinhalese and Ceylon Tamils (*q.v.*). Smaller groups are the Ceylon Moors, the descendants of seafaring Arab merchants; Malays, whose ancestors once formed Malay regiments; Burghers, mainly descendants of the Dutch; Eurasians; and a small number of naturalized Europeans, Indians and other nationalities. The Sinhalese are of two main types: low-country Sinhalese, who inhabit the plains and have been affected by four centuries of European impact; and Kandyans from the mountains and dry zone jungles, who have been so affected for only 150 years. The possibly aboriginal Veddas are almost completely intermixed with Sinhalese. The various groups in Ceylon in 1953 are given in the table.

Ethnic Groups in Ceylon, 1953 Census

Group	Number	Group	Number
Low-country Sinhalese	3,469,512	Malays	25,464
Kandyan Sinhalese	2,145,193	Indians*	1,021,660
Ceylon Tamils	884,703	Europeans	6,508
Ceylon Moors	463,963	Others	33,042
Burghers and Eurasians	45,950		

*Mainly Tamils.

Ceylon Tamil society reproduces in modified form the caste and other features of Indian society. Sinhalese society, though Buddhist, is also stratified on caste lines, the Goigama or cultivators being both the most numerous and traditionally the highest caste. The Karava (fishers) and Salagama (cinnamon peelers) rose to prominence after Portuguese days and include some of the wealthiest of the Ceylonese.

2. Religion. — The Sinhalese are mainly Buddhists and the Tamils are principally Hindus. Moors and Malays are uniformly Muslims, but a considerable proportion of all other groups are Christian. The distribution of religions in 1553 was as follows: Buddhists 5,217,143; Hindus 1,614,004; Christians 714,874; Muslims 541,812. Religion plays a large part in Ceylonese life. The public holidays, 22 in all, are based on religious festivals, and pilgrimages feature prominently in both business and pleasure. The most famous pilgrimage is the ascent of Adams peak. Another goal of pilgrims and tourists is the Temple of the Tooth in Kandy, wherein is enshrined the sacred tooth relic of the Lord Buddha. The Perahera, or annual torchlit temple procession, in which gorgeously caparisoned elephants and hundreds of dancers take part, draws thousands of devotees and sightseers. At Anuradhapura (*q.v.*) is the famous 2,000-year-old bo tree, an offshootof the tree under which Buddha meditated. A revival of Buddhism was associated with developments in Sinhalese nationalism and a section of the Buddhist priesthood was very much concerned in the electoral success of S. W. R. D. Bandaranaike in 1956.

(B. H. F.)

IV. ARCHAEOLOGY

Geographically and culturally Ceylon is closely related to India, with which its prehistoric culture sequence has much in common although certain phases found in India are absent in Ceylon. However, archaeological research in Ceylon, at least until the early 1960s, was chiefly directed toward the study and preservation of monuments of the historic period.

The island falls into two main cultural regions: the southern, mountainous and with a high rainfall, which retains its Sinhalese character; and the northern, flatter and with a lower rainfall, which has much in common with the Tamil plains of India.

No certainly identifiable tools of the Early or Middle Stone Age had been found in the island by the early 1960s. The earliest human culture to be identified is the Late Stone Age, remains of which are found chiefly in the south. The outstanding feature of this culture is its highly developed stone industry (sometimes referred to as the Bandarawelan or Balangodan industry), which includes geometric microliths and extremely fine bifacially worked points, almost entirely made of crystalline or vein quartz. The industry shows traces of a Middle Stone Age tradition of stone working, such as is found on the mainland of India, combined with Late Stone Age techniques. It has close parallels in southeastern India. It is found at extensive open-air factory sites such as Bandarawela on the southeastern hills and in the occupation deposits of caves and rock shelters, many of which were inhabited by the Veddas, into modern times. At the latter the industry is associated with an extensive bone industry, grinding stones, hearths and numerous snail shells. In the topmost layers iron tools and pottery of the early Buddhist period are also found. Burials suggest that the culture can be associated with the ancestors of the modern Veddas. There are rock paintings in certain caves, including depictions of elephants and riders.

No remains of the Neolithic or Chalcolithic cultures which spread through peninsular India in the 2nd millennium B.C., with their distinctive painted pottery and ground stone axes, had been found in Ceylon by the early 1960s. but further exploration. particularly in the drier parts of the north, might well reveal them. That there was an extension of the south Indian Iron Age into the island is attested by the finds of megalithic remains, stone cist graves and circles, mainly in the north, and terra-cotta elephant-formed sarcophagi, and of urn burials in the North-Western province. There typical black-and-red pottery, sometimes with scratched ownhs' marks, was found. These marks included some which resemble letters of the early Brahmi inscriptions of India and Ceylon (from the 3rd century B.C.), and the discovery of similar black-and-red pottery in the lowest levels of Anuradhapura suggests that this invasion, probably of Tamil speakers, may not have been earlier than the colonization of Ceylon by north Indian settlers.

(B. AL.; F. R. A.)

V. HISTORY

The salient fact in Ceylon's long history is the coming of the Sinhalese ("lion race," a term of totemistic origin) from India, probably about 550 B.C. The two events next in importance are the introduction of the Buddhist religion from India in the 3rd century B.C. and the coming of the Portuguese, the first of the invaders from Europe, early in the 16th century. For the first period outside influences on Ceylon were wholly Asian; for the second, largely European, bringing a gradual but only partial westernization by three successive colonial powers. Freedom from foreign domination was gained in 1948.

The history of Ceylon has been strongly influenced by the geography of the island. A study of this geography, therefore (see above), is essential to the understanding of the events set out below. When the Sinhalese arrived they found the Veddas still in the hunting stage of civilization. The newcomers came from northwestern or northeastern India, possibly both, and brought with them a knowledge of agriculture and the use of iron. The name Ceylon derived by various stages from Sinhaladwipa "the island of the Sinhalese."

1. Buddhism. — Cevlon's traditional historv was first set down in writing in the 6th century A.D. Written records thereafter are continuous. The early history is in the form of an epic, the Mahavamsa. based on ancient legends and written in the Pali language by Buddhist bhikkhus ("monks"). In the 3rd century B.C. the great Indian ruler Asoka (*q.v.*) became converted to Buddhism and determined to spread his religion far and wide. He sent to Ceylon a *bhikkhu* named Mahinda, possibly his son, and later Mahinda's sister, a *bhikkhuni* ("nun"), brought with her a branch of the bo tree under which the Buddha was sitting when enlightenment came to him. Mahinda set forth the dharma (*dhamma*), the noble teaching of the Buddha, which King Tissa (Devanampiyatissa) gladly adopted. It was propagated by Sinhalese *bhikkhus,* vowed to poverty and celibacy. They lived first in caves, later in viharas ("monasteries"), and depended for their living on charity. Not only did they bring the *dhamma* but also the arts of writing. architecture and sculpture. The ruins of the viharas are plentiful in Ceylon, especially in the ancient capitals of Anuradhapura and Polonnaruwa. The type of Buddhism they introduced mas the simplest and purest form, Theravada (*see* GAUTAMA BUDDHA).

Anuradhapura became the headquarters of the Sangha (the order of *bhikkhus*). Their dagobas, vast domes of brick, usually

bell-shaped, topped by a kind of spire and built over relic chambers, remain ruined or restored. King Tissa built the first of these, the Thuparama. He also had the bo tree branch planted with great ceremony. Buddhism spread rapidly throughout Ceylon, imposing itself on top of ancient cults, traces of which survive among the people.

2. Sinhalese and Tamil Kings. — During the next century another element, the Tamils, racially and linguistically different from the Sinhalese, came to the island from southern India. They conquered the Rajarata and the Sinhalese kings took refuge in Ruhuna. Thence, at the end of the century, one of them. Duttha Gamani. emerged, slew the Tamil king Elara in single combat and regained the Rajarata. He did much to rehabilitate the Buddhist religion and built the most famous of all the dagobas, that of Ruanveli.

For the next few centuries the descendants of this king and then a dynasty 'from a rival clan ruled the Rajarata. They were faced with internal troubles from the semi-independent rulers of the other parts of the island, and with spasmodic invasions from southern India, with whose kingdoms — Chola, Pandya, Chera and Kalinga — they maintained sometimes friendly, sometimes hostile relations. They encouraged and protected the Sangha, even though it had split into sects. One of them, Mahasen (4th century A.D.) even looked favourably on the introduction of Mahayana, a somewhat different type of Buddhism, but it did not take root.

It was Mahasen who first started large-scale irrigation works in the Rajarata. For centuries landholders had dug wells and constructed small reservoirs called tanks. but under Mahasen vast tanks with great stone dams were constructed. irrigating thousands of acres. One of them. the Minneriya, still irrigated 4.500 ac. in the 1960s.

During those centuries a quite advanced civilization developed under the influence of Buddhism. Many of the kings were beneficent rulers and some showed marked administrative and military ability. More than one is credited with setting up a medical service. Nor were the arts — sculpture. painting, poetry and the study of language — neglected. The ruins of many fine buildings survive, notable among which are those erected to house the venerated tooth of the Buddha, sent to Mahasen by a south Indian ruler. The evidence of foreign writings and inscriptions points to an established trade on the west coast, carried on, in earlier centuries, by merchants from northern and southern India, from Iran and occasionally from Greece and Rome, later by Arabs and Chinese.

The story of the Sinhalese kings up to the 10th century is of little general interest. They tried with varying success to bring the whole island under their actual rather than nominal rule. The best known of them is the parricide Kasyapa who built the rock fortress of Sigiri (*q.v.*), still one of the great sights of Ceylon.

Invasion by the Chola king Rajaraja I early in the 11th century and foreign occupation till 1070 brought about the move of the capital to Polonnaruwa, the ruins of which are of remarkable interest and beauty (see INDIAN ARCHITECTURE: Ceylon; INDIAN ART: Ceylon). The Cholas were driven out by Vijayabahu I. A successor of his in the next century, Parakramabahu I, who came to the throne in 1153 or 1164, is the greatest in Sinhalese annals. This king showed a very high order of both military and administrative skill. He restored the standards of the Buddhist religion and, for the time being. imposed unity on its sects. He was a great builder of temples and palaces. Above all, he renovated the irrigation system and encouraged better methods of agriculture. He is credited with the saying: "Not even a little of the water that comes from the rain must flow into the ocean without being made useful to man."

However, Parakramabahu's capital works, particularly his unremunerative viharas and palaces. and most of all his foreign wars against Burma (successful) and southern India (unsuccessful), must have put an unbearable strain on his kingdom's economy. After him the Sinhalese kingdom made a slow retreat southward from Tamil invaders and settlers. The capital city was moved from place to place, till by the 16th century it had reached Kotte, a few miles from Colombo (*q.v.*), which even at that time was the centre of a considerable trade, largely in the hands of the Moors, Muslims from Arabia and India. Meanwhile a Tamil kingdom was established in the northern peninsula of Jaffna, and Tamils settled there and down the northeastern coast, where their descendants continued to predominate. Only one Sinhalese king, Parakramabahu VI, succeeded in bringing them under his rule.

3. The Portuguese. — The beginning of the 16th century brought new invaders. In 1505 Portuguese ships anchored off Colombo. At Kotte the Portuguese made a treaty with the king, who gave them permission to trade in cinnamon, then an important export. They came again 12 years later, and were allowed to build a fort. Thenceforward they took advantage of the divisions among the Sinhalese rulers with skill and duplicity, took over their lands in the southwest and confined them mainly to the Malayarata, the kingdom of Kandy. On more than one occasion the Portuguese were driven back by the Sinhalese, and were saved only by reinforcements from Goa. the Portuguese headquarters in India. On other occasions they invaded the Kandyan kingdom, but though they managed to reach the city, the difficulty of communications and the unhealthy climate always brought them to disaster.

Just before the turn of the century the Portuguese formally took over the sovereignty of Ceylon in the name of their king, Philip II of Spain. Although this involved them in war with the Dutch, who had become a strong maritime power, the Portuguese had several incentives for keeping Ceylon. First was its strategic importance. Second was the trade, particularly in cinnamon, areca nuts and precious stones, of which they had deprived the Moors. Their third objective was the propagation of Christianity. They sent out missionaries. Jesuits and friars, who converted thousands of lower-caste Sinhalese and Tamils, but their earnest efforts to convert the kings and higher caste people had little success.

The Portuguese intermarried with the Sinhalese and Tamils. Many of their social customs had a permanent effect on the low-country Sinhalese and most of those who became Christians, actually or nominally, took Portuguese names, which remained very common among that section of the people. But the main legacy of the Portuguese was the Roman Catholic religion, which in the 20th century still claimed many thousands of followers.

4. The Dutch. — Quite early in the 17th century the Portuguese had to face Dutch opposition. In 1602 the Dutch East India company was to exploit the rich trade of south Asia. Once it gained control of the Indian ocean, the Portuguese in Ceylon were doomed. The Dutch negotiated with Rajasinha II, the king of Kandy, and undertook to drive out the Portuguese. By 1644 they had captured Batticaloa and Trincomalee on the east coast and two west coast seaports, Galle and Negombo, and after a few years of uneasy peace they attacked again, and in 1656 took Colombo after a hard-fought six-month siege.

Rajasinha had understood that the Dutch would restore the old territories of the Sinhalese kings in return for a trading monopoly, but the Dutch found plenty of excuses for keeping the fortresses they had captured. Henceforward the kingdom of Kandy was confined to the upcountry area, with only a few outlets to the coast.

The Dutch ruled more efficiently than the Portuguese, although their taxation was systematic and heavy. Their headquarters in Batavia sent many able governors to Ceylon, but their main interest was always trade, particularly in cinnamon. Toward the middle of the 18th century the Dutch became increasingly afraid of the English and French East India companies, which they had thus far succeeded in barring from the Ceylonese trade. In 1739 the royal line died out in Kandy and the last Sinhalese king's brother-in-law, a Nayakkar from south India, was put on the throne. He was hostile to the Dutch, and this led in the 1760s to a Dutch invasion of the kingdom. They were unable to hold it, but made an advantageous treaty by which they won the whole seaboard, a trade monopoly and an undertaking that the king would have no dealings with other countries.

In spite of these successes, Dutch power was declining. Their land policy was disliked by the low-country Sinhalese, and the Kandyan kings intrigued with both French and English. Their rule came to an end during the Napoleonic Wars. It left two major legacies. The first was the Roman-Dutch law which remains as the highly respected basis of the legal system. The other was the

Dutch Burgher community. Unlike the Portuguese, the Dutch intermarried comparatively little with the Sinhalese and Tamils. When their occupation ended a number of their people, including some of mixed descent, stayed on, speaking Dutch and practising the religion of the Dutch Reformed church. The Dutch language gave way to English, but the Dutch Burgher community kept its identity and for most of the 19th century its members occupied the minor posts in government and mercantile offices. Many left Ceylon in the mid-20th century.

5. **British** Rule. — Following the refusal of the Dutch governor in 1795 to admit British troops, the British East India company sent a well-equipped expedition to Ceylon which captured first Trincomalee and then Colombo, after a peculiar intrigue by which a Swiss mercenary regiment which had been part of the Colombo garrison was bought and changed sides. It seemed doubtful for a time that the British would keep Ceylon, but the East India company pressed hard for it, and it was taken over by the treaty of Amiens in 1802. The short time it was under company rule was unfortunate, for the British and Indian officials who were sent from Madras knew little about Ceylon and cared less. Distrusting the local officials. they scrapped the former system of administration. This led to a revolt in 1797 and Frederick North, who was sent out from England as governor, restored the old system. The control of trade was left with the company, but in 1802 Ceylon became a crown colony.

The kingdom of Kandy presented a problem. Some of the Kandyan chiefs, dissatisfied with their Tamil king, entered into a somewhat dubious intrigue with North. In 1803 he sent an expedition which captured and garrisoned Kandy, but the garrison was weakened by sickness and, surrounded by the Sinhalese, it surrendered and was massacred. Once the Napoleonic Wars were over. however, in 1815 Sir Robert Brownrigg, then governor, sent a force which easily defeated and captured the king, who received little support from the chiefs. Brownrigg made a treaty with them, guaranteeing their rights and privileges and the protection of the Buddhist religion. However, the chiefs and the bhikkhus soon became dissatisfied with the new regime and in 1818 a serious rebellion broke out, which was repressed severely after considerable difficulty. After this a proclamation greatly modified the treaty. The ancient kingdom ceased to exist and although there were a few revolts. as in 1820 and 1848, these were easily suppressed.

The subsequent history of Ceylon was peaceful. Its most interesting aspects in the 19th century were concerned with administration and economics and in the 20th. with constitutional development and social change. Up to the 1830s the government found it hard to make ends meet. Cinnamon, as a result of competition from the Dutch East Indies, was a dwindling asset, but in the 1820s the cultivation of coffee, on a plantation basis, was begun and with government encouragement thousands of acres of upcountry jungle were cleared and planted. The Sinhalese villagers refused to undertake the arduous, regular work involved, so the European planters imported Tamil labour from southern India, thus creating a problem that remained unsolved. Another result was the building of roads and, later, of railways, primarily for the planting districts but eventually for the whole island.

Coffee went through more than one crisis until, in the 1880s, it was wiped out by plant disease. Much money was lost, but the economy of Ceylon was saved by the planting of cinchona (for quinine) and later of tea, which became and remained its mainstay. Toward the end of the 19th century a second cash crop was introduced: rubber, cultivated mostly in the foothills of the mountain massif on which the tea estates flourished. Many Sinhalese and Tamils became owners of rubber estates and small holdings. The plantation system even spread to the centuries-old coconut cultivation, though coconuts remained mainly a staple product of the peasant economy. Some Ceylonese successfully established graphite mines.

The development of export crops on a plantation scale meant a great growth of external trade. and Colombo became a big business centre and a great port. With the opening of the Suez canal in 1869 it became more than ever a port of call for world shipping and for refueling, especially after an adequate harbour had been constructed. The export and import business, with the accompanying banking and insurance enterprises, were, like tea planting. for a long time exclusively in European hands, but eventually a new Ceylonese middle class grew up, and Sinhalese and Tamils, who first found clerical employment in government and mercantile offices, to an increasing degree came to man all ranks of the government service and later entered into planting and business management.

The history of administration under British rule is one of slow progress. In the early days civil servants' duties were confined to the maintenance of law and order, the local administration of justice and the collection of revenue, but with growing specialization came separate departments such as public works, irrigation, forests, survey, agriculture, postal and railway services and police. The higher ranks were for many years filled by British officers. With the growth of education in Ceylon and of a more liberal colonial policy in Britain, however, these posts became increasingly open to the sons of the upper and middle classes of Ceylon, regardless of caste.

The development of education was of basic importance. It stemmed from two sources: the necessity for staffing government and mercantile offices, and the propagation of religion, mainly the various denominations of Christianity. Hence it had a distinctly western slant, particularly on the secondary and higher levels where the medium of instruction was always English. The government, at first inclined to leave education to the missionaries, was impelled to establish state schools and in 1921 founded a university college which attained university status in 1942.

The Buddhists and Hindus entered the field of "English education" in the 20th century, but the old system of *pirivena* schools attached to Buddhist *viharas* somehow maintained itself and, after the Buddhist revival, expanded. Two of these schools, Vidyodaya and Vidyalankara, were granted university status in 1959.

One of the most significant factors in the modern history of Ceylon was the revival of Buddhism and Hinduism, in reaction against the activities of the Christian missionaries. The Buddhist Theosophical society and other societies for promoting Buddhism and Buddhist education sprang up and with them came a revival of oriental studies. These movements without doubt contributed materially to the development of nationalism in Ceylon, and perhaps of racialism as well.

All of these developments, and particularly the growth of an educated middle class, could not but promote a rising demand for constitutional advance. As early as 1833 the Colebrooke commission, which initiated important reforms such as the abolition of forced labour, had recommended the establishment of executive and legislative councils, to include representation from the communities of the island. Little was done in this direction during the 19th century, though some progress was made with the setting-up of local government authorities.

Early in the 20th century the new middle class was insistently demanding more representative government. A beginning was made in 1912, with the provision of an elected "educated Ceylonese" representative in the legislative council. Constitutional reform in India had its effect in stimulating demand for progress in Ceylon. During World War I (which affected Ceylon hardly at all) a religious riot was put down with severity. The result was to arouse nationalism to a remarkable degree and the Ceylon National Congress was founded. The result of the consequent agitation and of the increasingly liberal policy of the United Kingdom government was the introduction of two measures of reform (1920 and 1924) by which an unofficial Ceylonese majority was created in the legislative council and given considerable financial control. These reforms failed to satisfy the congress, in which the leading figures were low-country Sinhalese. In 1928 a royal commission was sent out from Britain which recommended sweeping reforms, including universal adult suffrage and the creation of a hoard of ministers, together with a scheme of executive committees in the new state council to give its elected members some acquaintance with the business of administration. The royal commission's proposals were accepted and the reforms came into operation in 1931.

But the Ceylonese, as they had come to be called, wanted full

responsible government on the Westminster model. It was delayed by World War II, during which Ceylon, in danger for a time from the Japanese and heavily garrisoned, put forward a vigorous war effort. Even before the war was over, however, the Ceylonese renewed their demands, and in 1945 another royal commission, under Lord Soulbury. was sent out. As a result nearly all the demands were met, and when the new constitution came into operation, in Oct. 1947 the grant of full independence was announced. It took effect four months later.

6. Independence. — The new constitution followed the Westminster model closely. (See *Constitution and Government*, below.) The first prime minister was D. S. Senanayake, a Sinhalese of remarkable political wisdom. The cabinet included Tamil and Muslim as well as Sinhalese ministers. The peaceful transition of Ceylon from a colonial to an independent status within the Commonwealth of Nations was regarded as a model throughout the democratic world.

In 1951 the United National party (the U.N.P.. the government party) split, Bandaranaike leading the dissident group. The next year the prime minister was killed in a riding accident and his son, Dudley Senanayake, the minister of agriculture, succeeded him and went to the country successfully. He resigned not long after, partly on grounds of health, and his place was taken by Sir John Kotelawala. For various reasons the U.N.P. was losing popularity in the island and in a general election in 1956 was decisively defeated by the Sri Lanka Freedom party (S.L.F.P.) led by Bandaranaike, who had formed a coalition with one of the three Marxist groups in parliament, and a Sinhalese party which was strongly nationalist and Buddhist.

Bandaranaike found it difficult to run this somewhat mixed cabinet and to carry out all his election promises. In foreign policy he followed a neutralist line exemplified by the termination of an agreement made in 1947 that the British government should retain the use of the naval base at Trincomalee and the air base at Katunayaka. In internal politics he was a moderate socialist. His government introduced a measure to make Sinhalese the official language. This incensed the Tamil community, always fearful of being dominated, and they began to demand a federal constitution. The relations between the two communities rapidly deteriorated, and in May 1958 severe rioting broke out. There were attacks on Tamils living in the Sinhalese areas and many casualties.

Bandaranaike was assassinated in 1959 for reasons which were obscure. After his assassination his government carried on an uneasy existence under Dahanayake, a one-time leftist who had become much more moderate; it finally collapsed as a result of internal dissensions. An election in March 1960 had an indecisive result, with the U.N.P., again under Dudley Senanayake, as the largest party. He formed a government, but the other parties immediately combined against it and brought it down. Another election in July brought back the S.L.F.P., now under Bandaranaike's widow, with an over-all majority. Sirimavo R. D. Bandaranaike became the first woman prime minister in commonwealth history. Her policy followed her husband's: neutralism in foreign policy; moderate socialism at home (the idea of nationalizing foreign-owned estates was given up); the encouragement of Sinhalese language and culture; Ceylon to become a republic, but to remain with the commonwealth. In Dec. 1960 the government took over control of schools belonging to religious bodies, and there were some disorders protesting the move. (S. A. P.)

VI. ADMINISTRATION AND SOCIAL CONDITIONS

1. Constitution and Government. — The main lines of the constitution of Ceylon were prepared by the Ceylonese ministers in 1943–44 and approved with some amendments by the Soulbury commission in 1945. It was enacted as the Ceylon (Constitution) Order in Council, 1946. Before it took full effect, however, the government of the United Kingdom agreed that Ceylon should become an independent country within the commonwealth. Effect was given to this decision by the Ceylon Independence act, 1947, and the Ceylon Independence Order in Council, 1947. Dominion status was attained on Feb. 4, 1948 but in 1957 it was decided to produce a new republican constitution and a joint select committee of both houses of parliament was established to work out the details. The committee had done no more than produce an interim report when it was discharged through the dissolution of parliament in 1959.

Under the constitution of 1946–47, the sovereign is represented by a governor general and there are two hcuses of parliament. The senate consists of 30 members, half elected by the house of representatives by single transferable vote and the other half nominated by the governor general. One-third of the members retire every second year. The house of representatives consists of 151 members elected by Ceylon citizens over the age of 18 and 6 members appointed by the governor general to represent minority interests. Better minority representation is also secured by distributing extra seats in sparsely populated provinces, in which the minorities are more numerous. Ordinary cabinet government is provided for in accordance with British constitutional conventions, the prime minister and other ministers being, subject to the collective responsibility of the cabinet, in charge of the government departments. The appointment, dismissal and disciplinary control of public servants is, however, vested in an independent public service commission.

Colombo is the seat of government and for administrative purposes Ceylon is divided into nine provinces (Western, Central, Southern, Northern, Eastern. North-Western, North-Central, Uva and Sabaragamuwa) which are subdivided into 21 administrative districts. The latter are in charge of government agents and assistant government agents who are responsible to the ministry of home affairs. There are four types of local authorities: rural village committees (407), rural town councils (42), urban councils (36) and municipal councils (7).

The judges of the supreme court are appointed by the governor general and have the same independent status as the high court judges in England. Other judicial officers are appointed, dismissed and subjected to disciplinary control by an independent judicial services commission. The common law of Ceylon is the Roman-Dutch law, but there has been much importation of English law, especially in commercial matters, and the personal laws of the Kandyans, the Jaffna Tamils and the Muslims have been retained. Civil and criminal procedure is essentially English and the penal code is based on that of India.

Responsibility for defense and external affairs is vested in the prime minister, subject to cabinet control. The small armed forces are modeled on those of the United Kingdom. The police are controlled by an inspector general responsible to the minister of home affairs.

2. Social Conditions. — The mass of the people are peasants, but the population multiplied ten times between the British occupation in 1799 and the mid-20th century while the land available for peasant cultivation tended to contract. Many peasant families are therefore landless and subdivision of holdings has made most of them insufficient to maintain the families dependent upon them. In the lowlands there is some employment on the coconut estates planted by Ceylonese. In the hill country the tea and rubber estates were planted by Europeans and Indians and the labour was Indian, though in later years Ceylonese workers replaced some of the Indians.

The plantation industries made possible the development of the towns, especially Colombo, Kandy and Galle, as administrative and commercial centres. Industries, though actively encouraged by successive governments, are few and on a small scale. In commerce there was a considerable replacement of European and Indian employees after 1947, but there was much unemployment which was likely to continue until plans for industrialization matured.

The high birth rate and the low death rate make heavy demands for social services. Education, accounting for the largest item in the budget, is free from primary school to the University of Ceylon (est. 1942). Almost all children are at school between the ages of 6 and 11 and a high proportion continue until the age of 16 or 18. Even in 1946 the standard of literacy was unusually high for Asia (70.1% among males and 43.8% among females) and it continued to rise rapidly.

The second expensive service is health. Cholera, smallpox and malaria have been virtually wiped out, but in the early 1960s there was still a great deal of tuberculosis and diseases caused by parasitic worms were common. Other social services are not highly developed. Few of the recommendations of the social services commission of 1946 were carried out, chiefly because of their expense. Taxation, both direct and indirect, is high. Income tax, for instance, ranges from 10% on Rs. 6,000 to 85% on Rs. 120,000.

(W. I. J.)

VII. THE ECONOMY

Ceylon, a member of the Colombo plan (*q.v.*), is an underdeveloped country with a low per capita income (about £38 or $108 per capita per year), but it is more fortunate in this and other respects than many other southeast Asian countries. A ten-year plan published in 1959 sought to raise per capita income by at least one-third by the late 1960s.

1. Production. — Over half of the gainfully employed persons in Ceylon are engaged in agriculture, which also supplies more than half of the national income. The peasant economy of Ceylon was and to a large extent remains centred on the cultivation of rice combined with the growing of coconut, other tree crops and vegetables on unirrigated land and, in the dry zone, of grains and other crops grown by shifting cultivation. Technical standards are relatively low, but seem to be improving.

The replacement of *chena* or shifting cultivation by more stable agriculture raises many problems. Experiments are under way on the growing of sugar, cotton and other new crops and there are efforts to recolonize the dry zone.

The many large estates growing tea, rubber and, to a lesser extent coconut, which contrast strongly with peasant villages, produce mainly for export. In the 1960s the export economy involved many Ceylonese landowners and cultivators and large numbers of small holdings. Nearly 80% of the coconut acreage was in units other than estates, while almost 40% of the tea acreage and 70% of the rubber was owned by Ceylonese individuals. The export sector was narrowly based, being dependent almost entirely on tea, rubber and coconuts (the traditional spices playing a very small part); it was therefore subject to instability because of market fluctuations. It was, however, very valuable, contributing 35%–40% of the national income. With most of the larger estates it was also a very efficient sector; the small holdings tended to lag behind. Little land was available for expansion of these crops because of the inability of tea and rubber to grow in the dry zone and the coconut being limited to where ground water exists or can be provided. The ten-year plan was, in the absence of much suitable new land, primarily concerned with increasing yields of export crops on existing acreages.

Tea is grown mainly upcountry, that from high altitudes being of exquisite flavour and excellent reputation, but it is also grown in lowland parts of the wet zone. Rubber is essentially a lowland wet zone crop, though it climbs into the lower hills. Coconut grows all along the wet zone coast, in the coconut-belt triangle north of Colombo, in the Jaffna peninsula and on the east coast.

Forestry employs only a few hundred persons but is of local importance in the wilder parts of the wet zone and in the dry zone. Fisheries employ nearly 40,000 persons who are mainly sea fishers using traditional methods.

Mining and quarrying employ just over 9,000 persons, nearly half in stone quarrying. The graphite and gem-stone industries of part of the Khondalite belt (see *Geology,* above) make some contribution to exports. Ceylon has no great mineral potential, but iron ore may be worth working, as are ilemnite and monazite sands.

In the absence of coal or oil, Ceylon's only source of power lies in its water resources. There are hydroelectric stations at Laksapana, on the western edge of the hills and in the Gal Oya valley. In the 1960s traditional craft products were still made, including exquisite silver and lacquer work. The most important industries, however, are those that process the products of the export sector. There are also factories making cement, cotton goods, soap and other products, and an expansion of industries (notably cement, sugar, fertilizers and textiles) was envisaged under the ten-year plan.

2. Trade and Finance. — In the early 1960s the imports and exports of Ceylon generally maintained an average value of £130,000,000–£140,000,000 per year. There was usually a favourable visible balance of trade, though in 1957 there was an adverse balance of £8,000,000. Tea, rubber and coconut products normally accounted for 90% or more of the exports; imports were made up mainly of rice and other foodstuffs, manufactures and raw materials. Principal recipients of exports included the United Kingdom and other commonwealth countries, the United States and China. Imports came mainly from India, China, the rice-producing countries of southeast Asia (*e.g.,* Burma) and the United Kingdom.

Ceylon's unit of currency is the rupee, of the same value as the Indian rupee. There is a central bank and, in addition to the Bank of Ceylon, a number of old established banking concerns operate in the country.

3. Communications. — Bus services and railways are state-owned. Ceylon has about 15,000 mi. of motor roads and 900 mi. of railways, nearly all of the latter being of broad (5-ft. 6-in.) gauge. This network is, however, very unevenly distributed over the country. In general the lowland wet zone and the upcountry areas are very well serviced but, apart from the Jaffna peninsula, the dry zone as a whole has poorer facilities. There are regular air services from Colombo via Jaffna to Trichinopoly, and Air Ceylon, with connections to London.

CÉZANNE, PAUL (1839–1906), perhaps the most profound and significant of French 19th-century painters, was born at Aix, the ancient capital town of Provence, on Jan. 19, 1839. His father, a banker, had at first been in trade as a hatter and had married

one of his workgirls. Paul was educated at the Collège Bourbon at Aix, where he formed an intimate friendship with Émile Zola. The two boys were inspired by a love of the classics, particularly of Virgil, through whom, perhaps, Cézanne realized the beauty of his native country. Both decided to consecrate themselves to art. Zola settled down to a literary career in Paris, but Cézanne, after a short period as a law student, endeavoured to comply with his father's wish that he should carry on in the management of the family bank. After failing in this he was allowed to settle in Paris and attend the Atelier Suisse, where he was expected to prepare himself for the examinations of the École des Beaux-Arts, which he never passed. He arrived in Paris in 1863.

Cezanne became known as one of the most extreme of the young revolutionary painters, the bitterest in his denunciation of official art and of Ingres who, then in his old age, was regarded as the head of the reactionaries. In this way he became acquainted with the group of painters who encircled Manet, and were later known as the Impressionists. At this period he was most influenced by Delacroix and by the baroque painters whom Delacroix studied. by Rubens and Tintoretto. The colour theories of Delacroix. coupled with the "law of simultaneous contrast." formulated by the chemist Michel Chevreul, by the end of the 1860s were beginning to be taken up by the young artists with whom Cezanne was familiar. His ambition was to create grandiose compositions of a purely imaginative description, expressive of his own moods, using either violently dramatic themes—"Les Assassins," "L'Autopsie," "Lazare"—or lyrical motifs—"Le Jugement de Paris," "Dejeuner sur l'herbe." He also painted a series of portraits in which dramatic and psychological effects were undertoned. In these the influence of Gustave Courbet is evident. They are painted with broad strokes, the palette knife plowing up and planting down an exceedingly thick and dense impasto. In all these early works the colour is reduced to a few simple notes in which black: white, earth reds and yellows predominate. The tension of Cezanne's imaginative life shows itself in the tuniultuous vehemence of these early compositions. His outlook on nature seems to have been confined for the most part to the search for motifs of chiaroscuro suitable to dramatic effects. He showed at this stage nothing of the curiosity about natural effects of colour which distinguished the Impressionist group. A few still lifes of this period, however, show how much greater his native endowment was in this direction than in the one he was consciously pursuing; but even in these latter the dramatic evocations of the thing seen are what chiefly interested him.

During the years 1872–73 a great change came over Cézanne. He spent the summers of these years at Auvers-sur-Oise in the company of Camille Pissarro, one of the foremost In~pressionists. Pissarro. who was some years older than Cézanne, had already discovered his personal style and perfected a methodical and precise technique adapted to it. Cézanne learned for the first time to look on nature with a curious and contemplative gaze and learned the process of recording the results thus obtained. Above ail, the whole world of atmospheric colour was thus revealed to him. Certain pictures painted by Cézanne in these years approximate very nearly to Pissarro's work but they show Cézanne's greater power of organizing form (*e.g.*, the "Maison du pendu à Auvers" of 1873, in the Louvre) and the greater profundity of the conceptions that the contemplation of natural appearance provoked in his intensely passionate nature. For these years, then, Cézanne may be counted an Impressionist.

But Cézanne's response to appearances gave him a notion of design more vigorously constructed, and evocative of far deeper feelings, than any that the Impressionists envisaged. Cezanne always believed in some underlying reality of a permanent kind, more consonant with the deeper instincts of human nature. The Impressionist vision was both too casual and too imperfectly organized for him. It missed part of the truth that the older masters had apprehended. Cézanne summed up his own attitude by saying that his ambition was to do Poussin over again after nature; *i.e.*, to incorporate into a clearly organized formal unity, like Poussin's, the vision of natural appearance as enriched by Impressionist researches. From this point Cézanne's personal vision and his personal expression of it were established. Such changes ds his style

ARCHIVES PHOTOGRAPHIQUES

"MAISON DU PENDU À AUVERS" ("THE HOUSE OF THE HANGED MAN AT AUVERS") BY PAUL CÉZANNE; 1873. IN THE LOUVRE. PARIS

underwent in the succeeding decades were only gradual modifications of what he had established once for all. The essentials of that style were due, as noted above, to the special use he made of the Impressionist vision. They were based upon the most rigorous construction of the design by means of the interplay of clearly articuiated planes. But the movement of these planes, their salience and recession; was interpreted quite as much by changes in local colour as by the definition of form by light and shade. A characteristic of Cezanne's completely realized manner is the extreme simplicity of the approach. the fact that objects are presented in full frontal aspect. In nearly all his portraits the sitter is placed nearly in the centre of the canvas, the head and body being seen nearly in full face. In the landscapes a similar treatment is found; objects are extended in planes parallel to the picture plane, and frequently the main mass is centrally placed. Such extreme symmetrical simplicity of approach takes us back to the practice of the Italian primitives and is violently opposed to the principles of baroque composition as followed by most of Cézanne's predecessors and by himself in his early period. Cézanne was not the only artist to absorb and then react against the methods of the pure Impressionists; Renoir, Seurat and his disciples, Gauguin and Van Gogh to a greater or lesser extent abandoned their habit of making a sensitir-e but indiscriminate ocular record of what lay before them and attempted to reconcile what they had learned with a discipline of form and structure. For this reason the group came to be known as postimpressionist, though the term hardly suffices to link the aims of, for instance, Seurat with those of Van Gogh.

Such an exaggeratedly simple disposition would probably strike us as crude and uninteresting if it were not that within the volumes Cézanne places before us in this elementary fashion his analysis of changes of surface and plastic movement is pushed to an extraordinary degree, and this is accompanied by innumerable slight modulations of colour so that the whole surface takes on something of the infinity of natural appearance. This practice he developed with ever-increasing power. In the 1870s and early 1880s. the almost laborious scrutiny of infinitesimal colour changes led him to load the canvas with repeated layers of colour. though without ever losing purity and intensity. This method achieves its greatest power in the "Still Life With a Fruit Dish" (Lecomte collection, Paris) painted at the end of the 1870s. In the next decsde Cezanne spent less and less time in Paris and continued his researches alone in the neighbourhood of Aix and his family house, the Jas de Bouffan, which, together with an independent income, passed into his hands on his father's death in 1886. He now began to seek the same complexity of surface with thinner layers of colour, and his increasing use of water colour during the critical period after 1885 probably influenced his practice in oil paint. Together with this he

tended at this time to simplify the colour changes, adopting even a regular principle of colour sequences to express movements away from the highest relief of any given volume. Superfluous material was pared away, and in many works of this time portions of white ground vied with and punctuated the areas carrying the colour and modeling. All this was strictly in keeping with his philosophical conception of the aim of painting. In everything he did he sought a synthesis in uhich the most rigorously logical plastic structure should be combined with the utmost liveliness of surface; that is to say, he sought, without losing the infinitude of natural appearance, to give to it an intelligibility and a logical coherence nhich it lacks This, no doubt, is more or less the problem of all painting; what distinguishes Citzanne is his endeavour to attain this synthesis when each of the opposite terms is at its highest pitch. The irreconcilability of these ideals may have been responsible for Cézanne's transformation from a violently outspoken youth to a solitary, pertinacious and analytically minded man.

To the last decade of the 19th century belong some of his most celebrated works: the portrait of Geffroy, uhich is perhaps unequaled in modern art for the completeness of its realization the complexity and assurance of its harmonies; several compositions of men seated at a cafe' table and playing cards, of monumental simplicity; and a series of landscapes dominated by the pyramidal mass of Mont Sainte-Victoire. Even to the end of his life. Cézanne cherished the hope of creating poetical designs of nude figures in landscape, after the manner of some of Giorgione's and Titian's pictures. But in this he mas hampered by his extreme reluctance to draw from the nude model. and most of these grandiose attempts remain failures.

At the very end of his life there seems to have been a kind of reappearance in Cézanne of the romantic tendencies of his youth. His paintings became richer, more intense and vivid in colour. more agitated in rhythm. more vehement in accent; they also departed more and more from the careful analysis of natural appearance of the middle period, as though his long apprenticeship to nature had ceased and he felt free to follow unhesitatingly his instinctive feeling. In the 1880s and 1890s his very name had become almost unknown in the larger art circles of Paris, though he never lacked a fe enthusiastic admirers in that city and in Belgium. Gradually, however. his fame began to circulate among artists. and in 1904 a retrospective exhibition of his works in the Autumn salon revealed to the public this almost unknown genius. It was his only foretaste of his posthumous fame. He died at Aix on Oct. 23, 1906.

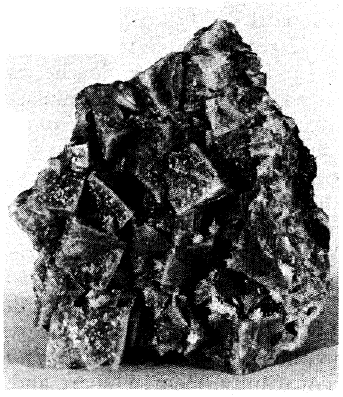
C.G.S. SYSTEM, a system of units which takes as a basis the centimetre, the gram and the second. See PHYSICAL UNITS and ABSOLUTE UNITS.

CHAADAEV, PETR YAKOVLEVICH (*c.* 1794–1856), Russian philosopher whose ideas of Russian history precipitated the controversy between the opposing intellectual camps of Slavophils and westernizers, was born in Moscow. After leaving the university there he became an army officer and took part in the Napoleonic campaign. During 1823–26 he traveled in Europe and afterward lived in seclusion in Moscow, writing in French his *Lettres Philosophiques* (1827–31). The first letter (the only one to be published during his lifetime) appeared in the review *Teleskop,* in Russian translation, in 1836. A defense of western European culture and a sweeping negation of a Russian cultural tradition, it provoked a storm of patriotic indignation and unprecedented discussion. The periodical was banned, its editor exiled and Chaadaev himself declared insane and forbidden further publication. In his unfinished "Apology of a Madman," also written in French, he attempted. without recanting, to exonerate himself before the authorities. Chaadaev was profoundly religious and, though remaining Orthodox, sympathetic touard the Roman Catholic Church, which he admired for its civilizing influence. He had affinities with both Slavophils and westernizers. but his advocacy of a western path of development for Russia divided him from the former, and his religio-historical conception from the latter.

Chaadaev died in Moscow on April 26 (new style; April 14, old style), 1856.

BIBLIOGRAPHY.—Three of the *Letters,* including the first, were published in French by F. Gagarin in *Oeuvres Choisies de Pierre Tschadaieff* (1862). The remaining five *Letters,* discovered in 1918, were published in Russian by D. Shakhovskoy in *Literaturnoe nasledstvo,* no. 22–24 (1935). *See* H. Falk, *Das Weltbild Peter J. Tschaadejews* (1954); M. O. Gershenzon, *Zhizn i myshlenie* (1908); Ch. Qui.net, *Tchaadaev* et *les Lettres philosophiques* (1931); P. S. Shkurinov, *P. Ya. Chaddaev: Zhizn, deyatel nost, mirovozzrenie* (1960). (E. HL.)

CHABAZITE, a mineral species belonging to the group of zeolites. It occurs as white to flesh-red crystals which vary from transparent to translucent and have a vitreous lustre. The crystals are rhombohedral, and the predominating form is often a rhombohedron closely resembling cubes in appearance, and the mineral was in fact early (in 1772) described as a cubic zeolite. A characteristic feature is the twinning, the crystals being in many cases interpenetration twins with the corners of small crystals in twinned position projecting from the faces of the main crystal. A flat lenticular form of crystal is also common, this variety being known as phacolite (from the Greek for "a lentil"). The hardness is 4.5, and the specific gravity 2.08 to 2.16.



B M SHAUB

CRYSTAL MASS OF CHABAZITE FROM WASSON'S BLUFF, NOVA SCOTIA

Chemically, chabazite is a complex hydrated calcium and sodium silicate. The composition is. however. variable, and is best expressed as an isomorphous mixture (see ZEOLITE). Chabazite occurs with other zeolites in the amygdaloidal cavities of basaltic rocks; occasionally it has been found in gneisses and schists. Gmelinite may be mentioned here. since it is closelv related to chabazite. It forms large flesh-red crystals usually of hexagonal habit. and was earlv known as soda chabazite, having the composition of chabazite, but with sodium predominating over calcium. (L. J. S.)

CHABOT, PHILIPPE, SEIGNEUR DE BRION (1492?–1543), admiral of France under Francis I, whose favour raised him from the petty nobility of Poitou to glory and the vicissitudes of power. As well as the seigniory of Brion, he held the titles of comte de Charny and comte de Buzançais. A companion of Francis I in his childhood, he rose to prominence after that king's accession (1515). In the war between Francis and the Holy Roman emperor Charles V. he took part in the defense of Marseilles (1524) and was captured with Francis at the battle of Pavia (1525). He was made admiral of France and governor of Burgundy after the negotiation of the peace of Madrid {Jan. 1526), being thereafter known as the admiral de Brion. In 1535 he commanded the army for the invasion of Piedmont. Both at court and in military commands, honever, he had the constable Anne, duc de Montmorency. as his rival; and his enemies, particularly the chancellor Guillaume Poyet, conspired to get him accused of peculation. He was sentenced to banishment, to the confiscation of his estates and to the payment of a large fine in Feb. 1541; but the king's mistress, Anne de Pisseleu, duchesse d'Étampes, intervened to procure him the king's pardon in March and he was reinstated, Montmorency and Poyet being disgraced. He died on June 1, 1543, shortly before the trial of Poyet.

Though he was no seaman, Chabot took some interest in his duties as admiral of France and did much to promote Jacques Cartier's expedition to Canada. (Ro M.)

CHABRIAS (d. c. 357 B.C.), Athenian mercenary who commanded with distinction for the Athenians against various enemies

and for the kings of Cyprus and Egypt. In 388 B.C. he defeated the Spartans on Aegina and commanded the fleet sent to assist Evagoras. king of Cyprus, against the Persians. In 378, nhen Athens joined Thebes against Sparta, he defeated Agesilaus near Thebes. On this occasion he invented a maneuver, uhich consisted in receiving a charge kneeling on the left knee, nith shields resting on the ground and spears pointed toward the enemy. In 376 he defeated the Spartan fleet off Naxos but. when he might have destroyed the enemy, remembering the trial of the generals after the battle of Arginusae, he delayed to rescue survivors. In 366, together nith Callistratus, he was accused of treachery in advising the surrender of Oropus to the Thebans. He was acquitted, and about 361 he accepted a command under Zedhor (Tachos), king of Egypt who had revolted against Persia. On the outbreak of the Social War or "War of the Allies" (357) he joined Chares in the command of the Athenian fleet. He lost his life in an attack on the isiand of Chios, probably in the same year.

See H W. Parke, *Greek Mercenary Soldiers* (1933).

CHABRIER, (ALEXIS) EMMANUEL (1841–1894), French composer whose best works reflect the verve and wit of the Paris scene of the 1880s and who was a musical counterpart of the early Impressionist painters. Born at Ambert, Puy-de-Dôme, in the Auvergne, on Jan. 18, 1841, he was attracted in his youth to both music and painting. He studied law in Paris from 1858 to 1862. During these years he also studied the piano with Edouard Wolf and harmony and counterpoint with T. Semet and A. Hignard. His tech'nical training was, however, limited, and in the art of composition he was self-taught. From 1862 to 1880 he was employed at the ministry of the interior, producing during this period the operas *L'Étoile* (187;) and *L'Éducation manquée* (first performed with piano accompaniment, 1879; with orchestra, 1913). Two unfinished operettas were sketched out between 1863 and 1865 in co-operation with Paul Verlaine. He was closely associated with the Impressionist painters, particularly with Edouard Manet from whom he purchased *Le Bar aux Folies-Bergère.*

After hearing Wagner's *Tristan und Isolde* at Munich in 1879 Chabrier left the ministry to devote himself exclusively to music. As chorusmaster at the Concerts Lamoureux, he helped to produce a concert performance of *Tristan* and became associated with Vincent d'Indy, Henri Duparc and Gabriel Faure as one of the group known as "Le Petit Bayreuth." Chabrier's best music was written between 1881 and 1891, when after visiting Spain, where he was inspired by the folk music, he had settled at La Membrolle (Touraine). It includes the piano works *Dix Pièces pittoresques* (1881), *Trois Valses romantiques* (1883) for two pianos and *Bourrée fantasque* (1891); the orchestral works. *España* (1883) and *Joyeuse Marche* (1888); the opera. *Le Roi malgré lui* (1887); and six songs (1890). Less successful was his opera *Gwendoline* (1886). The last three years of his life were marked by a mental and physical collapse. He died in Paris on Sept. 13, 1894. One act of his unfinished opera, *Briséis,* was posthumously produced in concert form (1897).

Chabrier's music, frequently based on irregular rhythmic patterns or on rapidly repeated figures derived from the *bourrée* of his native Auvergne, was inspired by both broad humour and a sense of caricature. Among his songs, the "Ballade des gros dindons" and the "Villanelle des petits canards" are satirical period evocations of farmyard scenes. His melodic gifts, developed by the popular songs of the Paris *cafks-concerts,* were abundant though inclined to coarseness. In his piano and orchestral works he developed a sophisticated Parisian style which served as a model for the 20th-century composers, Francis Poulenc and Georges Auric. His orchestration was remarkable for novel instrumental combinations conceived as aural equivalents of the primary colours used by the early Impressionist painters. In *España* his use of the brass and percussion anticipated effects in Igor Stravinsky's *Petrouchka.*

Chabrier was also a notable letter writer, the collection of his published letters being valued for its literary as well as its musical interest, and for its streak of spontaneous Rabelaisian humour.

(E. LR.)

CHACHOENGSAO, a province in southern Thailand at the northeast corner of the upper Gulf of Siam; area, 2,093 sq.mi., pop. (1960) 314,360. The western portion, a continuation of the great Central plain, through which the Bangpakong river flows into the sea, supports most of the population. Rice milling is the major industry. About 8.000 long tons of salt are produced annually along the short coast line, and the government operates a large distillery. Chachoengsao, the capital, also known as Paetriu (pop., 1957 est., 18,951), is a river port 38 mi. by railroad from Bangkok. (G. W. SK.)

CHACMA, the Cape baboon, *Papio (porcarius) comatus,* inhabiting the mountains of South Africa as far north as the Zambezi. The largest baboon (the size of an English mastiff), this powerful old-world monkey is blackish-gray in colour with a tinge of green due to the yellow rings on the hairs. Unlike most of its tribe, it is a good climber. The chacma, like other baboons! is omnivorous, and sometimes is destructive to crops. *See* also BABOON; PRIMATES.

CHACO (EL CHACO), a province of Argentina (pop. [1960] 535,443; area 38.468 sq.mi.), bounded north by Forniosa, east by the Republic of Paraguay and Corrientes, south by Santa Fe and west by Santiago del Estero and Salta. It is part of the Gran Chaco (*q.v.*) which includes adjoining lands of Paraguay and part of Bolivia. The Chaco is a large lowland plain, covered with scrub forest and patches of grassy savanna. It borders on the tropical zone and the summers are hot and humid. Heavy rainfall, in combination with the flat terrain, produces widespread flooding during the summer. The Bermejo and Guaycuru rivers cross the province but do not provide adequate drainage. Winters are mild and quite dry. The economic development of the Chaco has been retarded by the climate, the lack of markets and transportation facilities, and tropical pests, notably the locust. Assets of the region include the quebracho tree (a source of tannin), cotton and cattle. Resistencia (*q.v.*) is the capital. Chaco was known as the province of Pres. Juan Perón during the period 1950–55. (J. L. TR.)

CHACONNE, an exotic, sensual dance of Spain, but of doubtful ancestry and etymology. At the French court of the 17th and 18th centuries it was transformed into a solemn dance in $\frac{3}{4}$ time, becoming the concluding dance of court balls. Later it appeared in the theatre as an extended finale, especially in the operas of Gluck, Jean Phillipe Rameau and Jean Baptiste Lully.

As a musical form the chaconne attained great stature. It and its musical twin, the passacaglia, developed along identical lines into three of the important forms of musical literature, rondo. theme and variations, and the passacaglia. A famous example of the chaconne appears in the last movement of J. S. Bach's Fourth Sonata for solo violin.

See PASSACAGLIA; VARIATIONS. (L. HT.)

CHACO WAR. A long dispute over the ownership of the Chaco Boreal caused this conflict between Bolivia and Paraguay. The area involved was about 100,000 sq.mi. north of the Pilcomayo river and west of the Paraguay river. Both countries maintained military posts in the disputed region. On Dec. j, 1928, Paraguay started a war of incidents by attacking Fortín Vanguardia, a Bolivian post in the extreme northeast of the Chaco. Bolivians retaliated a few days later with raids against Paraguayan posts. The Pan-American conference on conciliation and arbitration, then meeting in Washington, D.C., vainly endeavoured to prevent a war.

Armed clashes in the Chaco became so numerous and serious that both countries began to move more troops to the region. A full-scale war obviously threatened late in 1931 and definitely got under way in 1932, although it is difficult to determine exactly when the series of incidents should be called a war. Strong Bolivian attacks, which captured Paraguayan positions in the northern Chaco, began on June 15, 1932, and were followed by a

successful attack in the central Chaco against Fortín Boqueron. Paraguay then ordered mobilization on Aug. 1 and two weeks later Eusebio Ayala became president.

Paraguayan forces under Lt. Col. José Felix Estigarribia mounted their first major offensive against Fortín Boqueron, which fell at the end of September. The rest of the year despite a few sharp engagements was one of preparation. The German general Hans Kundt, recalled by Bolivia to command the army he had trained, concentrated his forces in the south to attack Fortín Nanawa. Battles along the Nanawa front continued with heavy casualties for several months. Paraguay formally declared war on May 10, 1933, and neutrals intensified futile efforts to end the conflict.

General Estigarribia launched a series of attacks along an extended iront late in October and made such impressive gains that Pres. Daniel Salamanca replaced General Kundt with Gen. Enrique Peñaranda. At the end of a short truce, from Dec. 19, 1933 to Jan. 8, 1934, Estigarribia renewed his drive against the key Bolivian post of Ballivibn on the Pilcomayo river. There for nearly five months, from March to July, occurred the heaviest fighting of the war. Ballivián fell on Nov. 17 and a few days later President Salamanca's enemies forced his resignation.

Paraguay's advance continued into indisputably Bolivian territory in Jan. 1935. After reaching the Parapetí river Estigarribia was forced to fall back several miles and assume the defensive against desperate Bolivian counterattacks. A truce was finally signed on June 12, 1935. By the peace treaty of July 21, 1938, Paraguay gained clear title to about 70,000 sq.mi. of the disputed area. Approximately 100,000 men had lost their lives in the war.

CHAD (CEADDA), **SAINT** (d. 672), first bishop of Lichfield, was the brother of St. Cedd, with whom he was educated at Lindisfarne under St. Aidan and whom he succeeded as abbot of Lastingham. In 664, at the request of King Oswy, he was consecrated bishop of the Northumbrians (with his see at York) by Wini, the West Saxon bishop, although Wilfrid had gone to France for consecration to the same see. On Wilfrid's return in 669 Chad humbly resigned York, and with Oswy's approval was given the see of Lichfield instead. He is said to have founded a monastery at Barrow. His feast day is March 2.

See *Butler's Lives of the Saints,* ed. by *H.* Thurston and D. httnater, vol. i, pp. 457–459 (1956).

CHAD, LAKE, a lake of central Africa, lying between 12° 50' and 14° 10' N. and 13° to 15° E., is situated in an immense basin of the same name, on the borders of Nigeria and of the republics of Cameroon, Niger and Chad. It is a lake held in by sand dunes: the remains of a much larger "paleochadian sea" which expanded even in the Quaternary period three successive times. It lies 922 ft. above sea level, in the Sahelian zone, between desert and savanna. It is bounded to the northeast by the dead dunes of Kanem, which run northwest-southeast and which are 100 ft. or less, in height. In all this northeast region the shores of the lake are sharp, clearly shaped into peninsulas and islands and underlaid with channels following the line of the dunes. In the southwest and the southeast, on the other hand, where the tropical rivers flow into the lake, in particular the Komadugu Yobe and the Shari, the shores are flat and swampy. The lake itself is composed of two basins separated by the Great Barrier, through which there is only a single permanent channel. They are shallow, being from 13 to 23 ft. deep in the northern lake, 10 to 16 ft. in the southern lake, and occasionally reaching 35 ft. But these depths vary with the area of the lake, which ranges from 3,850 to 9,946 sq.mi. The northern lake, although the deepest, may dry up altogether because the Great Barrier impedes the circulation of water from the southern. Evaporation deprives the lake of an area of water of about seven feet a year. To this must be added smaller losses through infiltration. In addition the lake is filling up with sand carried on the northeast mind, with plants, papyrus and ambatch (*Aeschynomene elaphroxylon*), and with deposits from the Shari whose delta advances at the rate of 165 to 330 ft. every year. Depending on the year, the level of the lake rises and its area extends. The highest levels were 922 and 932 ft. during the 19th century. Low from 1940 to 1950. it again rose until 1958. to the extent of flooding its banks. When the level is high the southern lake is diverted toward the lowest areas of the basin, the "low countries of the Chad," which are in the north, near Borku. This diversion is a string of basins, the Bahr el Ghazal or Soro, which is partially inundated when the lake floods. There is little salt in the waters of the lake, although the waters of the Shari contain 40 gm. per cubic metre and evaporation increases the salt content to as much as 400 gm. per cubic metre away from the delta. The banks are fertile and the lake is rich in fish. It has been thought that the lake was in danger, in the near future, of disappearing through evaporation and through being filled up by sand, river deposits and vegetation, and finally through the capture of the Logone, a tributary of the Shari at Fort-Lamy, by the Benue. When in flood the Logone is diverted westward, in the direction of the lakes Boro, Fianga and Tikem, into which flow the waters of the Kabi. These lakes empty into the Mayo-PC, a headstream of the Benue. There does not seem to be any immediate danger of river capture and it could be prevented.

Traffic on the lake is hindered by the waves and by papyrus reeds. Although it is confined to communication with the post at Bol, various peoples live on its banks. The islands are inhabited by Yedina fishermen, better known by the name of Buduma, and by Kuri who make boats from bundles of reeds and also raise cattle. The Kanembu, in the dunes, are farmers and herdsmen and they mine natron in the natural basins.

Exploration. — Lake Chad is supposed to have been known by report to Ptolemy and is identified by some writers with the Kura lake of the middle ages. It was first seen by white men in 1823 when it was reached by way of Tripoli by Walter Oudney, Hugh Clapperton and Dixon Denham. By them the lake was named Waterloo. In 1850 James Richardson, accompanied by Heinrich Barth and Adolf Overmeg, reached the lake, also via Tripoli, and Overweg was the first European to navigate its waters (1851). The lake was visited by Eduard Vogel (1855) and by Gustav Nachtigal (1870), the last named investigating its hydrography in some detail. Because of an exaggerated belief in its economic importance there was, during the partition of Africa, a "race" for Lake Chad; in 1890–93 its shores were divided by treaty between Great Britain, France and Germany. The first of these nations to make good its footing in the region was France. A small steamer, brought from the Congo by Émile Gentil, was in 1897 launched on the Shari and, reaching the Chad, navigated the southern part of the lake. A British force under Col. T. L. N. Morland visited the western or Bornu side of the lake at the beginning of 1902, and in May of the same year the Germans reached Chad from the Cameroons. In 1902–03 French officers made detailed surveys of the southeastern and eastern shores and the adjacent islands. In 1905 Boyd Alexander, a British officer, found that the lake then contained few stretches of open water. Later travelers found a good deal of open water; the extent of the water varying from year to year. One of the ancient trade routes across the Sahara from Tripoli to Kuka in Bornu strikes the lake at its northwest corner, but this has lost much of its former importance.

CHAD, REPUBLIC OF (RÉPUBLIQUE DU TCHAD). an independent state of north central Africa, a member of the French Community, is bounded on the north by Libya, on the east by the Republic of the Sudan, on the south by the Central African Republic and on the west by the Republic of Cameroon, the Federation of Nigeria and the Republic of Niger. It has an area of 495.752 sq.mi. and a population in 1961 of 2,674,990. The capital is Fort-Lamy and other towns are Fort-Archambault, Moundou and Abéché.

Physical Features. — North of Lake Chad the country is desert, Saharan in character. The summer wet season lasts less than three months and the rainfall varies from 9.9 in. in Kanem to less than 2 in. on the Ennedi plateau. During the long, dry season the prevailing wind is the arid harmattan, blowing from the northeast. The thorny vegetation is confined to the wadies. Southward the rainfall increases rapidly to reach more than 47 in., and the Sahelian steppe of mimosas gives way gradually to a savanna where the fauna is extraordinarily rich. The watercourses are bahrs, permanent rivers which swell with the summer rains to flood the huge plains, making them inaccessible from July to mid-November.

The Saharan Chad is closed on the north by the Tibesti massif (see TIBESTI). To the south and east the plateaus are separated by sandy plains. They rise again in the Erdi and the Ennedi (4,000–4,600 ft.) where they are composed of primary and secondary sandstones rising toward the south, cut out into escarpments and eventually resting on the granite core, which reappears in the south. The valleys of the Ennedi and Tibesti converge toward the low countries of the Chad, immense plains where the sand is driven into dunes by the harmattan. The lowest-lying of these plains is the Djourab. It is only when the plateaus of the Tibesti are reached that oases appear, the most important being those of Borku.

The basin of the Sudanese Chad is divided by the dunes of Kanem, which enclose Lakes Chad and Fitri, and by outcrops of the crystalline bed, sometimes startlingly dominated by strange ridges, sometimes cut up into huge hills, as in the Wadai. These outcrops enclose on the southeast the huge marshy basin of the Bahr Aoiik, but the Shari and Lpgone are able to spread out their alluvial deltas in the southwest without hindrance.

The People. — In the Saharan and Sahelian regions the population includes nomadic shepherds, of whom the principal are the Teda and Daza of the Tibesti and the Ennedi; some groups spread as far as the Kanem. Farther south, Arabs have advanced as far as the Sahel. They keep camels, and those who are sufficiently near to the savanna raise cattle, migrating from north to south with the rains. Fulani (Peuls), who also keep cattle, have advanced as far as Baguirmi. The inhabitants of Kanem, in the north, cultivate millet and raise cattle, as do the Kotoko in the south; the latter also catch fish, which constitute the principal diet of the depressed peoples of the lake, the Buduma. The inhabitants of Baguirmi, Fitri and Wadai grow millet, as do the Saras and related groups, robust tribes living on the southern plains. (J. D.)

History. — The region of the eastern Sahara and Sudan from Fezzan, Bilma and Chad in the west to the Nile valley was well peopled in Neolithic times, as sites discovered attest. Probably typical of the earliest populations were the Negroid cave dwellers described by Herodotus as inhabiting the country south of Fezzan. The ethnographic history of the region is that of gradual modification of this basic stock by the continual infiltration of nomadic, and increasingly arabicized, white African elements, entering from the north via Fezzan and Tibesti and, especially after the 14th century, from the Nile valley via Darfur. According to legend, the country around Lake Chad was originally occupied by the Negroid "Sao." This vanished people is probably represented today by the Kotoko, in whose country, along the banks of the Logone and the Shari, there was unearthed in the 1950s a medieval culture notable for work in terra cotta and bronze.

The relatively large and politically sophisticated kingdoms of the central Sudan were the creation of Saharan Berbers drawn southward by their continuous search for pasturage and easily able to impose their hegemony on the fragmentary indigenous societies of Negroid agriculturalists. This process was intensified by the expansion of Islam. There are indications of a big immigration of pagan Berbers into the central Sudan early in the 8th century.

In medieval times the most important of these states was the kingdom of Kanem, immediately northwest of Lake Chad, which owed its pre-eminence to the command of the southern terminus of the trans-Saharan trade route to Tripoli. It was founded about A.D. 800 by the Sefawa dynasty, which came from Borku and claimed an ultimately Yemenite origin. Fourteenth-century Kanem was torn by internal dissensions and increasing pressure from the related Bulala kingdom of Fittri on its eastern borders. About 1380 the Sefawa dynasty was obliged to withdraw westward to reconstitute its power in Bornu (now in Nigeria), whence Kanem was reconquered by the Bulala under Mai Idris (reigned 1507–09). Kanem-Bornu achieved the height of its power under Mai Idris Alooma (reigned 1580–1603), who revived Islam and imported Turkish mercenaries and firearms. Medieval Kanem was the centre from which Islam, and with it an islamized Sudanic culture, was diffused throughout the central Sudan.

Products of this culture were the kingdoms of Baguirmi and Wadai which emerged in the early years of the 17th century out of the process of conversion to Islam. In the 18th century the Arab dynasty of Wadai was able to throw off the suzerainty of Darfur and extend its territories by the conquest of eastern Kanem. Slave raiding and trading at the expense of pagan populations to the south constituted an important element in the prosperity of all these Muslim states. In the 19th century they were in full decline, torn by continual wars and internecine feuds. Baguirmi, always a buffer between its more powerful neighbours of Bornu and Wadai, suffered most and was finally extinguished by the destruction of its capital, Massénya, by Rabah Zobeir (*q.v.*) in 1893.

Rabah, in the years 1883–93, carved out an empire which briefly comprised Kanem, Baguirmi and Wadai. By this time the partition of Africa was entering its final phase. The first French mission reached the Shari in 1891. In 1900 three French columns converged upon Chad from south, west and north. Rabah was overthrown and the traditional Kanembu dynasty was re-established under French protection. The pacification of the whole area of the present republic was barely completed by 1914, and between World Wars I and II paternalistic French rule was unprogressive. After 1945 the territory shared in the constitutional advance of French Equatorial Africa (*q.v.*).

An autonomous republic within the French Community was proclaimed in Nov. 1958, and complete independence, though still within the community, was attained on Aug. 11, 1960. (D. H. J.)

The Economy. — In addition to camels, there are large numbers of cattle and sheep in the republic. They are exported, on foot, to Nigeria, Cameroon and the Republic of Congo, while there are slaughterhouses and refrigeration plants at Fort-Archambault, Abéché and Fort-Lamy. Meat, leather and hides represent one-eighth of the value of exports. Almost all the remainder is accounted for by cotton, the principal product of the southern plains, which was introduced in 1928. Other crops of increasing importance are rice, particularly in the valley of the Logone, and peanuts.

One of the great problems of Chad is its great distance from the sea and its lack of communications. The Benue and the Shari, which are only navigable when in flood, are supplemented by tracks which are, on the contrary, impassable in the wet season. Nevertheless Fort-Lamy is joined by road to Bangui and the Ubangi river, in the direction of Brazzaville, and an east-west road links the railways of Nigeria with the Republic of the Sudan. Fort-Lamy is also a focal point for air transport. (J. D.)

CHADDERTON, an urban district of Lancashire, Eng., on the lower slopes of the Pennines, 1 mi. W. of Oldham and 5 mi. N.E. of Manchester. Pop. (1961) 32,494. It remains primarily a textile town, despite the decline in the number of cotton mills under a concentration scheme in the late 1950s. Industries also include the production of aircraft and electrical equipment. One of the largest electricity generating stations in Lancashire and Yorkshire is located there. Chadderton hall (now demolished) and Foxdenton hall were both possessed by the de Trafford family, whose name is perpetuated in Trafford park (now an industrial estate) and Old Trafford. (L. ST.)

CHADWICK, SIR EDWIN (1800–1890), English reformer, who made important contributions toward improving sanitary conditions in Britain during the first half of the 19th century. He was born at Longsight, near Manchester, Jan. 24, 1800, and was educated for the bar. His essays in the *Westminster* Review introduced him to the notice of Jeremy Bentham, who en-

gaged him as a literary assistant. In 1832 he was employed by the royal commission on the poor laws as an investigator. and in 1833 he was made a full member of that body. In conjunction with Nassau W. Senior he drafted the report of 1834 which procured the passing of the new poor law. His special contribution was the institution of the union as the area of administration. In 1834 he was appointed secretary to the poor law commissioners. His relations with his official chiefs became much strained, and the disagreement. among other causes. led to the dissolution of the poor law commission in 1846. Chadwick's chief contribution to political controversy nas his constant advocacy of entrusting certain departments of local affairs to trained and selected experts. instead of to representatives elected on the principle of local self-government. His report on *The Sanitary Conditions of the Labouring Population* (1842) is a valuable historical document. He was a commissioner of the board of health for improving the water supply. drainage and cleansing of great towns, from its establishment in 1848 to its abolition in 1854. He was made knight commander of the Bath in 1889 and died at East Sheen, Surrey. on July 6. 1890. *See* also PUBLIC HEALTH: *Great Britain.*

CHADWICK, FRENCH ENSOR (1844–1919), U.S. naval officer and historian. was born in Morgantown, W.Va.. on Feb. 29, 1844. and entered the U.S. Naval academy at Annapolis. Md., on Sept. 28. 1861. He was the first U.S. naval attache in London: a member of the U.S.S. "Maine" court of inquiry in 1898; and commanding officer of the U.S.S. "New York" and chief of staff to Adm. W. T. Snmpson at the battle of Santiago. July 3, 1898 *(see* SPANISH-AMERICAN WAR OF 1898). Regarded as a scholarly and able officer, Chadwick became a rear admiral while serving as president of the Naval War college (1900–03), and afterward commanded the South Atlantic squadron. He was the author of volume xix of the "American Nation Series." *Causes of the Civil War* (1906); *Relations of the U.S. and Spain: Diplomacy* (1909); *The Spanish-American War,* 2 vol. (1911); and editor of *The Graves Papers and Other Documents Relating to the Naval Operations of tlze Yorktown Campaign* (1916). He died in New York city on Jan. 27, 1919, (J. B. HN.)

CHADWICK, GEORGE WHITEFIELD (1854–1931). U.S. composer of the so-called New England group, whose music is rooted in the traditions of European romanticism, was born in Lowell, Mass.. Nov. 13, 1854. He studied organ and music theory in Boston and in 1877 went to Germany to study under Carl Reinecke and S. Jadassohn in Leipzig and J. G. Rheinberger in Munich. Returning to America in 1880, he was engaged as instructor in music theory at the New England conservatory in Boston; in 1897 he became its director and held this post until his death in Boston on April 4, 1931. As an educator he played an important role in American music; among his pupils were Horatio Parker, Henry Hadley and F. S. Converse. He also conducted orchestral and choral concerts.

Chadwick was a firm believer in the representational meaning of music; most of his orchestral works bear programmatic titles. In his harmonic writing he followed the procedures of German romantic music; there are also some Wagnerian characteristics. In the scherzo of his Second Symphony, Chadwick made use of Negro spirituals, one of the few instances of utilization of American folk materials in his compositions.

The list of Chadwick's works is considerable and includes three symphonies (1882, 1885, 1894); the concert overtures *Rip van Winkle* (1879), *Thalia* (1883), *Melpomene* (1887). *Adonais* (1898). *Euterpe* (1903); symphonic poems *Aphrodite* (1912), *Tam o'Shanter* (1915), and *The Angel of Death* (1917); the cantatas *Phoenix expirans* (1892) and *The Lily Nymph* (1893); a burlesque opera *Tabasco* (1894); lyric drama *Judith* (1901); numerous choruses; five string quartets; a piano quintet; and many songs and organ pieces. Chadwick also published a textbook, *Harmony* (1897; revised 1922). (S. SY.)

CHADWICK, HECTOR MUNRO (1870–1947), as professor of Anglo-Saxon at Cambridge university, 1912–41, made a notable contribution to the development of an integral approach to Anglo-Saxon studies. Chadwick began his career as a classical philologist, but early turned to the history and literature of Britain in the dark ages. first the Germanic and later also the Celtic. *Studies in Anglo-Saxon Institutions* (1905): *The Origin of the English Nation* (1907); *The Heroic Age* (1912); and. in collaboration with his wife, *The Growth of Literature* (3 vol., 1932–40) are his most important works. The first two are valuable for the light they throw on the early history of the Anglo-Saxons. The third shows Chadwick developing a method of comparative literature, and, by comparison of Greek and Germanic heroic poetry, elaborating the concept of the "Heroic age" as a stage in the growth of civilization reflected in early epics. In *The Growth of Literature* this is applied to every kind of early literature, thus brilliantly illuminating the origin and development of many literary genres in Greek, Germanic, Celtic, Slavonic, Sanskrit, Eskimo, Polynesian, etc.

Chadwick always insisted on treating a civilization as a whole. Britain in the dark ages meant to him not only history and institutions. but also the literature, archaeology, art, languages. place names, etc.. of all the peoples who lived there. He founded at Cambridge the School of Archaeology and Anthropology, section B, of which this total approach was the essence. He died at Cambridge, Jan, 2. 1947. (K. H. J.)

CHADWICK, SIR JAMES (1891–), British physicist who received the Nobel prize for physics in 1935 for the discovery of the neutron. He was born in Manchester on Oct. 20, 1891, and was educated at the universities of Manchester and Cambridge, studying also under H. Geiger at Charlottenburg institution: Berlin. In 1923 he was appointed assistant director of research in the Cavendish laboratory, Cambridge.

In 1927 he was elected a fellow of the Royal society and was awarded the Hughes medal in 1932. In 1933 he became professor of physics in the University of Liverpool. His discovery of the neutron (*q.v.*), a hitherto undetected constituent of the atom. electrically neutral and with a mass approximately equal to that of a proton. provided a new weapon for atomic disintegration, since neutrons, being electrically uncharged! could penetrate undeflected to the atomic nucleus.

Chadwick was knighted in 1945 and was awarded the Copley medal in 1950 and the Franklin medal in 1931. He was sometime head of the atomic energy research establishment. Didcot, Berkshire, and in 1948 was elected master of Gonville and Caius college, Cambridge. He published many researches on radioactivity and related problems and wrote (with Lord Rutherford and Sir Charles Ellis) *Radiations From Radioactive Substances* (1930).

(D. McK.)

CHAEREMON (fl. middle 4th century B.C.), Athenian dramatist. n·rote comedy as well as tragedy. according to the lexicon *Suidas,* and the title of his *Achilles, Slayer of Thersites* suggests that this was a satyric drama. In the *Poetics,* Aristotle described his *Centaurus* as a rhapsody in all kinds of metres. Xristotle also observed that Chaeremon's work was intended for reading, not representation. The fragments of Chaeremon are correct in form and have an easy rhythm. but are marred by a florid style. It is not certain whether he is the author of three epigrams in the Palatine Anthology which bear his name.

For fragments of Chaeremon's work see A. Nauck (ed.), *Tragicorum Graecorum Fragmenta (1926). See* also Pauly-Wissowa, *Real-Encyclopädie der classischen Altertumswissenschaft,* vol. ix (1899).

CHAERONEA, a fortified town on Mt. Petrachus above a small modern village which was formerly called Kapraina, Greece, guarding the entry into the northern plain of Boeotia, was the scene of two important battles, both described by Plutarch, who was a native of Chaeronea. In 338 B.C. Thebes, Athens and other states made their last stand against the rising power of Macedonia (*see* GREECE, *History*). The Greek army of about 35,000 infantry held a defensive position almost *2* mi. long, stretching from the foothills east of Chaeronea to the river Cephissus: the Athenians held the left wing and the allied line of heavily armed hoplites stood eight ranks deep in the plain except on the extreme right where the sacred band of Thebans had a deeper formation on the river bank. The Macedonian infantry was less heavily armed but more mobile and better trained, and the Macedonian cavalry was far superior. Philip of Macedonia: commanding the phalanx of approximately

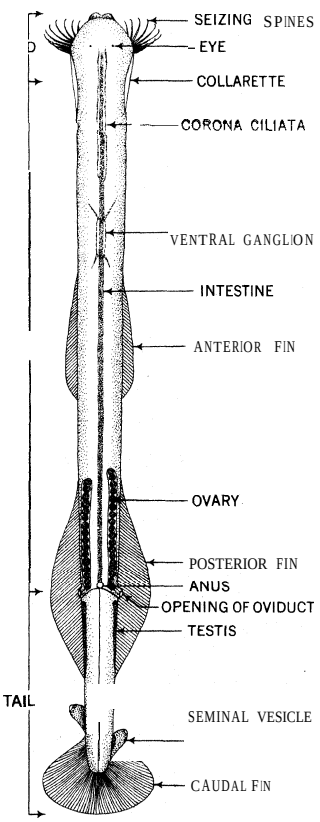
30.000 infantry, and his son Alexander, commanding the cavalry on the left wing, advanced across the plain with the line aslant so that the infantry on the right came into contact first with the Athenians. Philip then retreated with his infantry on the right, drew the Greek line forward to its left front in pursuit and created a gap near the enemy's right wing where the Thebans stood firm. Into this gap Alexander charged, and simultaneously Philip delivered a powerful attack with his phalanx and routed the Athenians. The Greek line broke in flight, the sacred band being annihilated. Having demonstrated his superiority, Philip called off the pursuit. The tomb of the Macedonians who fell fighting on the right wing is probably marked by the surviving statue of a lion sirting on its haunches.

In 86 B*C*. the Rornan general L. Cornelius Sulla checked the advance of Mithradates VI of Pontus. Sulla was outnumbered by three to one. but his infantry was superior in fighting power and discipline. The Pontic general Archelaus, relying on scythed chariots and squadrons of cavalry, advanced southward to engage Sulla's army of *15,000* infantry and *1,500* cavalry, which lay in the plain north of Chaeronea with cavalry on either flank. Sulla attacked first with his left wing and centre, holding back his right wing and keeping cohorts in reserve on both flanks. While Archelaus tried to overlap both Roman wings, Sulla used his reserves skilfully, broke through the enemy's left wing and caused a general flight.

See N. *G*. L. Hammond, "The Two Battles of Chaeronea," *Klio, 31* (1938). (N. G. L. H.)

CHAETOGNATHA. The chaetognaths, or arrowworms, form a small phylum that includes eight genera and more than 40 species, the majority in the genus *Sagitta*. They are characterized by delicate. elongate. transparent bodies that are divided by two septa into head, trunk and tail segments. The chaetognaths are small. enterocoelous. bilaterally symmetrical, hermaphroditic animals that lack well-developed respiratory, circulatory and excretory structures.

The head is usually armed on each side with 6 to 12 seizing spines, or chaetae, and one or two rows of minute teeth. Two small dark eyes are located dorsally with a mouth on the ventral surface. The head can be covered by an epidermal layer, the hood, which is pulled forward to enclose the teeth and spines. It is retracted when the spines are used. According to L. H. Hyman a dorsal ridge of epidermal cells forms, at the head end, the corona ciliata, or ciliary loop, a structure peculiar to arrowworms. A thin clear cuticle secreted by the underlying epidermal cells covers the body. Beneath the epidermis are four principal bands of longitudinal muscle that control the swimming movements. Arrowworms swim spasmodically by a few quick flips of the caudal fin. The head musculature is complex and allows movements of the spines and teeth and the swallowing of prey. Chaetognaths are predaceous, feeding principally on copepods, other small crustacea and occasionally fish larvae. The mouth opens into a short pharynx that leads directly into a straight intestine, which terminates in an anus at the septum between the trunk and tail. A medial mesentery extending dorsoventrally supports the alimentary canal and continues into the tail segment. The nervous system consists of a cerebral ganglion with lateral nerves. One pair extends posteriorly and connects with a large ventral ganglion on the surface of the trunk. Additional nerves leave the ventral ganglion and spread over the surface of the body.



ARROWWORM (SAGITTA BIPUNCTATA). 12 MM. LONG

Both ovaries and testes are found in all chaetognaths. The ovaries are attached on either side of the posterior portion of the trunk cavity; when mature they may extend forward half the length or more of the trunk. An oviduct lies on the outer side of each ovary. The oviduct encloses a sperm tube that allows the sperm to penetrate the ovary and fertilize the mature eggs. Cross fertilization has been observed in one species (*Spadella cephaloptera)*. The fertilized eggs press through the walls of the oviduct and move posteriorly, leaving the oviduct near the tail septum. The testes, which lie along either side of the tail segment, are separated from the ovaries by a septum that divides the trunk and the tail. Clusters of motile sperm are budded off the anterior ends of the testes. These sperm balls circulate in the tail cavity of many species. finally passing through a sperm duct to the seminal vesicles, where they are stored prior to discharge. The fertilized eggs are laid in small numbers and drift in the sea until they hatch a day or two later. Development is direct; the young chaetognath is 1 mm. or less in length and resembles the adult.

Although limited in number of species, chaetognaths are extremely abundant in all the oceans and seas of the world. They have been reported from the open ocean in quantities of less than one to several per cubic metre of water. Nearer shore they are often more numerous. A size gradient is also evident. Mature specimens of 5 mm. or less are taken in tropical waters. In contrast, in deep water or in arctic or antarctic waters specimens of *20* mm. and over are common. By volume chaetognaths form an appreciable fraction of the zooplankton and without doubt are important in the economy of the sea. They are also useful as indicators of water movements in certain localities.

Establishing the correct phylogenetic position for the chaetognaths is difficult. Various authors have related them to a number of phyla including the annelids, arthropods, mollusks, echinoderms and chordates. Superficially their resemblance to nematodes is notable. The covering of cuticle, the longitudinal bands of muscle in the elongate body, the straight intestine, together with the lack of many organs form the basis for this similarity but the presence of a coelom. the three divisions of the body, the well-developed head and distinctly different reproductory system hinder including them in the same group as the nematodes.

CHAETOPODA, originally a zoological class, including all the Annelida (*q.v.*), except the Echiurida (*q.v.*). Later it was used by some workers to cover the classes Archiannelida, Polychaeta, Oligochaeta, Hirudinea (leeches) and Myzostomidae, and by others to include only the Polychaeta and Oligochaeta. The characteristic feature of Chaetopoda is the possession of bristles (setae). The term is now obsolete.

CHAFARINAS (ZAFARIN) ISLANDS (Arabic, **DJAFERIN**), a group of three small rocky islands off the northeastern coast of Morocco, Africa, 6.8 mi. N.W. of the mouth of the Wadi Moulouya. Pop. *(1950)* 67. They are probably the *très insulae* of the *Antonini Itinerarium,* a Roman roadbook of the 3rd century AD. Occupied by Spain since 1847, they form a semicircle off Cabo del Agua, providing the best anchorage along this coast. They are waterless, uncultivated and almost without vegetation. The largest island, Congreso, to the west, and the smallest, Rey, to the east, are uninhabited, Rey serving as a cemetery. The central island, Isabella II, dominated by a lighthouse, contains the garrison, all their provisions and water being sent from Spain.

To improve the anchorage, Isabella II and Rey were formerly joined by a breakwater. which was breached by a storm in 1914. (J.-J. Ds.)

CHAFEE, ZECHARIAH, JR. (1885–1957), U.S. lawyer, scholar and teacher, known for his writings on civil liberties, was born at Providence, R.I., on Dec. 7, 188 j. Graduating from Brown university in 1907, Chafee was associated briefly with his father's foundry business; but in 1910 he entered the Harvard law school, from which he graduated in 1913. In the fall of 1916 he was called from the Providence bar to the faculty of that school. where he made equity, negotiable instruments and unfair competition his principal subjects of interest and instruction. It was in his work in equity that Chafee first found himself concerned with the problems of free speech, issues to which he devoted much of his attention throughout the rest of his career. His first book on this subject, Freedom of Speech (1920), which was rewritten and republished as Free Speech in the United States (1941), quickly became the leading text of U.S. libertarian thought and did much to affect the development of constitutional law. The vitality of Chafee's achievement came in considerable part from his broad cultivation. his abundant learning in Anglo-U.S. history and his technical competence as a lawyer. His notable gifts as legal historian were best shown in his introduction to the Records of *the Suffolk* County *Court, 1671–1680* (1933). His technical proficiencies as lawyer were revealed in the federal Interpleader act of 1936, of which he was the draftsman. Among Chafee's other writings were: *The* Inquiring *Mind* (1928); *Some* Problems of *Equity* (1950); *Blessings* of Liberty (1956); *Government and Mass Communications,* 2 vol. (1947). He died in Boston on Feb. 8, 1957. (M. DEW. H.)

CHAFER, a term used to distinguish the beetles of the family Scarabaeidae, and more especially those species which feed on leaves in the adult state. For the characteristics of the Scarabaeidae, see BEETLE. This family includes a large number of beetles, some of which feed on dung and others on vegetable tissues.

The cockchafers (*q.v.*) and their near allies belong to the subfamily Melolonthinae, and the rose chafers to the Cetoniinae; in both, the beetles eat leaves, and their grubs spend a long life underground devouring roots. In Europe the Melolonthines that are usually noted as injurious are the two species of cockchafer (*Melolontha melolontha* and M. *hippocastani*), large heavy beetles with black pubescent prothorax, brown wing covers and an elongated pointed tail process; the summer chafer (*Amphimallon solstitialisj* is a smaller pale brou-n beetle.

In the United States, Melolonthines of the genus *Phyllophaga* (popularly known as May beetles or June beetles) may do considerable damage to strawberries, corn (maize), wheat. grass crops and nursery stock. The most important species is probably *Phyllophaga rugosa*, which frequently is very destructive to corn.

In the spring the adult chafers fly about during the night, mating and feeding on foliage; they return to the soil at daybreak, After mating, the female crawls one to several inches into the soil to lay her pearly white eggs. The larvae—heavy, soft-skinned grubs. with hard brown heads provided with powerful mandibles. three pairs of well-developed legs and a swollen abdomen—appear in two to three weeks. As they grow, they become strongly flexed toward the ventral surface, and lie curled up in their earthen cells, feeding on roots. The larval life lasts several years, and in hard frosts the grubs go deep into the soil.

Pupation takes place in the autumn, and though the perfect insect emerges from the cuticle very soon afterward, it remains in its underground cell until summer. The grubs of chafers, when turned up by the plow, are greedily devoured by poultry, pigs and various wild birds.

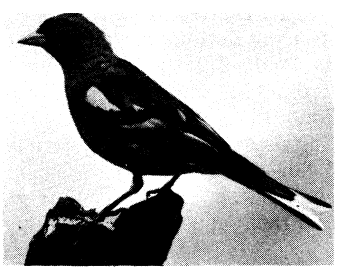
CHAFFEE, ADNA ROMANZA (1842–1914), U.S. army officer. was born April 14, 1842, in Orwell, O. He enlisted in the 6th cavalry regiment July 22, 1861, and was a member of that regiment for 25 years. It was with the army of the Potomac through most of the Civil War. Chaffee was commissioned 2nd lieutenant in May 1863, was wounded and taken prisoner at Gettysburg! refused to be paroled and was abandoned with other wounded. On Feb. 22, 1865, he was made 1st lieutenant.

After the war the 6th cavalry was sent to Texas, and in 1867 Chaffee resigned, planning to enter private business. He was persuaded to change his mind, was restored to his rank, and served in the southwest until the Spanish-American War broke out, rising to the rank of lieutenant colonel. He served in the Spanish-American War, and at its conclusion was made chief of staff of the military governor of Cuba until May 1900. He became a colonel in May 1899.

Chaffee commanded the U.S. troops in China during the Boxer uprising, and was military governor of the Philippine Islands July 1901–Sept. 1902. In 1904 he was promoted to lieutenant general and detailed as chief of staff. He retired Feb. 1, 1906, and died in Los Angeles. Calif., Nov. 1, 1914.

CHAFFEE, ADNA ROMANZA (1884–1941), U.S. army officer who is remembered as the "father of the armoured force," was born on Sept. 23, 1884, in Junction City, Kan., the son of Gen. A. R. Chaffee (*q.v.*). He accompanied his father during the Boxer Relief expedition in China. Graduating from the U.S. Military academy in 1906, he was commissioned in the cavalry. Outstanding skill as a horseman soon led to his assignment to the Mounted Service school and the French Cavalry school. During World War I he advanced rapidly to the grade of colonel and served with distinction in the St. Mihiel and the Meuse-Argonne offensives. Chaffee subsequently held many important troop and staff assignments and graduated from the School of the Line, Ft. Leavenworth, Kan., and the Army War college, Washington, D.C. By 1928, as a member of the war department general staff, he was the foremost advocate of an armoured force of all arms and initiated planning for such a force. Later he joined the 1st cavalry, mechanized, which became the nucleus of the force that eventually included 16 armoured divisions and 139 separate battalions. Chaffee. who was promoted through the grades to major general, died in Boston. Mass., on Aug. 22, 1941. The decisive role of U.S. armour in the great campaigns of World War II testifies to the soundness of Chaffee's ideas. (P. M. RT.)

CHAFFINCH, a bird (Fringilla coelebs), belonging to the finch (*q.v.*) family (Fringillidae), distinguished, in the male sex, by the deep grayish-blue of its crown feathers, the yellowish-green of its rump. two conspicuous bars of white on the wing coverts and the pinkish-brown passing into wine-red of the throat and breast. The female is drab. but shows the same white markings as the male; the young males resemble the females until after the first autumn molt. The chaffinch breeds early: and its song may be heard in late winter. The nest—moss and wool, lined with grass and feathers—is built on low trees and bushes. It lays four or five eggs of a pale bluish buff, streaked and spotted with purplish red. In spring the chaffinch is destructive to early flowers, and to young radishes and turnips; in summer it feeds on insects and their larvae, while in autumn and winter its food consists of grain and other seeds. On the continent of Europe the chaffinch is a favourite songbird. In winter chaffinches form small flocks, often composed solely of males. The continental chaffinch (F. c. coelebs) ranges generally over Europe to tree limit in the north, wintering southward. The British chaffinch (F. c. gengleri) is a breeding resident. Allied races are found in northwest Africa, the Canaries, Azores and Madeira islands. (*G.* F. Ss.)



M. S. WOOD

CHAFFINCH (FRINGILLA COELEBS)

CHAGALL, MARC (1887–), one of the important painters of the 20th century, was born of Jewish parents at Vitebsk, Belorussia, on July 7, 1887. From 1907 to 1910 he studied in St. Petersburg, for a while with Léon Bakst, then left for Paris. The idiom of his early pictures ("Death," 1908; "Birth," 1909) was strengthened and clarified by contact with the paintings of Gauguin, Van Gogh, the Fauves and, in 1911, the Cubists. Then his pictures became "constructions" based on the expressive quali-

BY COURTESY OF THE STEDELIJK MUSEUM, AMSTERDAM, NETH

ties of both pictorial and formal elements. The pictorial elements derived from childhood experiences in the small Russian-Jewish town, from impressions transmitted through the icon, or from spontaneously created images of symbolic meaning; and they combined with formal elements by virtue of their inner poetic force, rather than according to the rules of logic. This art, which preceded Surrealism. is an expression of psychic reality ("I and the Village" and "Hommage à Apollinaire," 1911).

In 1914 Chagall returned to Vitebsk ("Above Vitebsk," 1914) and, after the Revolution, an increase in the compositional freedom of his work (murals, State Jewish theatre, Moscow, 1918) may be noted. In 1922 he left Russia for Berlin, where he made his first lithographs and engravings ("My Life"). These were followed, in Paris, where he lived from 1923 to 1941, by "Dead Souls" (1923–27), "Fables of La Fontaine" (1927–30) and "The Bible" (1931–56). Contact with France increased the purely painterly features of his art; and flowers, dreamlike scenes of lovers and animals became the principal motifs. At the same time, themes of religious significance made their appearance ("Falling Angel," 1923, 1933, 1947; "Crucifixions," 1939–43). An autobiography he had written in Russia was published in France in 1931 as Ma **Vie.** From 1941 to 1948, Chagall lived in the United States creating scenery and costumes for the ballets *Aleko* and *Firebird;* then, in 1950, he settled at Vence, France ("Paris" cycle, 1951–53; new biblical paintings, 1949–56; circus series, 1956–59; scenery and costumes for the ballet *Daphnis* and Chloe, 1958). During this period his work showed a heightened psychic reality, expressed through colour, as well as intensified symbolic meaning.

CHAGAS' DISEASE: see TRYPANOSOMIASIS.

CHAGGA, an important Bantu-speaking Negro tribe, numbering about 240,000, who live on the southern slopes of Kilimanjaro in northern Tanganyika. In pre-European days they perfected a system of irrigation which carried water many miles by conduit from the mountain to their banana and millet gardens. Efficient crop production permitted a high population density. Since the 1920s, coffee has been an important cash crop and the people are now extremely wealthy in comparison with their neighbours.

The Chagga have an elaborate system of initiation for boys and girls, and age sets (*q.v.*) are instituted every ten years or so.

The people are descended from immigrants of various tribes who migrated into the once forest-covered foothills. Most of the 400 main clans are of Kamba origin; others are from Teita, Masai (*q.v.*) and other tribes. Neighbouring groups were thus diverse in origin, culture and language and formed distinct political entities which generally controlled their own system of irrigation. There was much intermingling and also warfare between groups. The original leaders of the immigrant clans were later succeeded by chiefs, who sometimes controlled more than one clan, but there was no paramount chief until Marealle was established in this position by the German administration in 1893. Thomas Marealle, son of the first paramount, was paramount chief from 1951 to 1960 when the office was abolished in favour of a tribal council with an elected president. See also AFRICA: *Ethnography* (Anthropology): East Africa.

CHAHAR (CH'A-HA-ERH), a province of the Inner Mongolian region of China from 1929 to 1952, then absorbed by the Inner Mongolian Autonomous Region, Hopeh and Shansi provinces. Area (1948) 107,705 sq.mi., pop. (1948 est.) 2,185,774. Except for the southern tip, now within Hopeh, it lies outside the Great Wall, spreading east into the Greater Khingan mountains and elsewhere to the Mongolian plateau and the basin of the Gobi desert. Essentially Mongol grazing lands, the area has been increasingly penetrated by Chinese farmers, merchants and administrators since the 17th century. Kalgan (Chang-chia-k'ou) is Peking's closest gateway, marked by the Peking-Suiyuan railway. Good quality iron ore is mined at Hsuanhua, 90 mi. N.W. of Peking. A new regional industrial centre is rising in the Silingol Mongol league on the eastern border at Silinhot (pop., 1953, 9,000) while the railway to Ulan Bator, completed in 1955, joins the Outer Mongolian line at P'ang-pei on the northwest border. CHAIKOVSKI, NIKOLAI VASILIEVICH (1850–1926), Russian socialist whose life exemplifies the ironic fate of the Russian intelligentsia of his time, as he was one of the spiritual mentors of the Narodniki (Populists) in his youth, but ended his political career fighting communism as vehemently as he had once opposed tsarism, in the cause of democracy and ethical socialism. Born at Vyatka on Dec. 26, 1850, Chaikovski joined a radical students' circle in St. Petersburg in 1869 and subsequently became its leader, so that it took his name. His followers, disillusioned by the terrorist extremism associated with the ruthless S. G. Nechaev, at first welcomed Chaikovski's emphasis on moral self-improvement, but later swung to the left, favouring active revolutionary propaganda among the masses. Considering this development premature, Chaikovski broke away and became converted to a new "religion of humanity," an idealistic blend of Comtian positivism and the millennarianism characteristic of the sectarian Raskolniki. To test his beliefs in practice and point the way to the perfect future society, he emigrated to the United States in 1873 and established a small socialist commune in Kansas (1875). The experiment soon failed; Chaikovski, returning to western Europe, now sought to realize his former ideals by more conventional methods of political action. As his views mellowed, he became more appreciative of democratic institutions and political liberties. He returned to Russia in 1907 and subsequently played a leading part in the cooperative movement.

During 1917, as a leader of the Popular Socialist party and an ardent opponent of the proposals for a separate peace for Russia in World War I, Chaikovski tried to combat the growing influence of the Bolsheviks, whose November coup he condemned as a tyrannical usurpation of power from the democratically elected con-
